13.2.7 Download to CPU (S7-1200)

The data of the Motion Control technology objects are saved in the data blocks. The conditions for downloading of "blocks" therefore apply when loading a new or modified technology object.

⚠ CAUTION

Possible malfunctions of the axis when loading without hardware configuration

The hardware configuration is modified when the following modifications are made to the axis or encoder configuration:

- Modification of the pulse generator (PTO)
- Modification of the HW limit switch address
- Modification of the homing switch address
- Modification of the address of the PROFIdrive telegram
- Modification of the address of the analog output
- Modification of address of enable output or ready input

If the modified configuration of the axis or encoder is loaded with the shortcut menu commands "Software" or "Software (all blocks)" without downloading the hardware configuration, the axis may malfunction as a result.

Ensure that the current hardware configuration is downloaded to the CPU under the listed conditions.

Download in CPU S7-1200 RUN mode (from firmware version V2.2)

For CPU S7-1200 from firmware version V2.2, when loading in CPU RUN mode it is checked whether it is possible to load without stopping the CPU.

The following conditions apply when loading data blocks in RUN mode:

	Download to load memory	Download to work memory
Data block modified values	Yes	No
Data block modified structure	Yes (as of firmware V4)	Yes (as of firmware V4) • When downloading with reinitialization • For variables in system reserve for downloading without reinitialization
	No (firmware V2.2...3)	No (firmware V2.2...3)
New data block	Yes	Yes
Data block deleted	Yes	Yes

Also note the following when deleting data blocks and downloading data blocks with reinitialization:

- The axis must be disabled when downloading a positioning axis technology object.
- When downloading a command table technology object, no MC_CommandTable command with this command table must be active (parameter "Busy" = FALSE).
- When downloading an MC_Power instance data block, no MC_Power instruction must be active (parameter "Busy" = FALSE).

From technology version V3.0, Motion Control technology objects (data blocks) can also be downloaded in CPU RUN mode.

Technology objects lower than V3.0 cannot be downloaded in CPU RUN mode.

Select one of the actions described below to download the modified version of a Motion Control technology object (from version V3.0) to the work memory:

- **Technology object positioning axis and command table**
  Change the CPU operating mode from STOP to RUN.
- **Technology object positioning axis**
  Disable the axis and execute a "Restart" using the Motion Control instruction "MC_Reset".
- **Technology object command table**
  Ensure that the command table is not being used. Download the data block of the command table to the work memory using the extended instruction "READ_DBL".

13.2.8 Commissioning (S7-1200)

13.2.8.1 Axis control panel (S7-1200)

Use the axis control panel to move the axis in manual mode, to optimize the axis settings, and to test your system.

The axis control panel can only be used if an online connection to the CPU is established.

Note

Response times of the axis control panel

The response time during axis control panel operation depends on the communication load of the CPU. Close all other online windows of the TIA Portal to minimize the response time.

You can adjust the timeout in the start dialog.

"Manual control" button

Click "Manual control" to move the axis in manual control mode. Start by disabling the axis in the user program using Motion Control instruction "MC_Power". In "Manual control" mode, the axis control panel takes over master control for the axis functions. The user program has no influence on the axis functions until manual control is ended.

CAUTION

Additional axes in automatic mode

The Manual control is active for one axis only. If additional axes are in automatic mode, dangerous situations may arise as a result.

In this happens, disable all other axes.

"Automatic mode" button

Click "Automatic mode" to end the "Manual control" mode. The axis control panel passes back the master control and the axis can be controlled by the user program again. The axis must be re-enabled in the user program and homed, if required.

Complete all active traversing motions before switching to automatic control; otherwise, the axis will be braked with the emergency stop deceleration.

"Enable" button

Click "Enable" to enable the axis in "Manual control" mode. When the axis is enabled, the axis control panel functions can be used.

If the axis cannot be enabled because certain conditions are not met, note the error message in the "Error message" box. Information on eliminating errors is available in the appendix under "List of ErrorIDs and ErrorInfos". After the error has been corrected, enable the axis again.

"Disable" button

Click "Disable" if you want to temporarily disable the axis in "Manual control" mode.

"Command" area

Operation in the "Command" area is only possible if the axis is enabled. You can select one of the following command inputs:

- **Jog**
  This command is equivalent to Motion Control command "MC_MoveJog" in the user program.
- **Positioning**
  This command is equivalent to the Motion Control commands "MC_MoveAbsolute" and "MC_MoveRelative" in the user program. The axis must be homed for absolute positioning.
- **Homing**
  This command is equivalent to Motion Control command "MC_Home" in the user program.
  - The "Set reference point" button corresponds to Mode = 0 (direct homing absolute)
  - The "Active homing" button corresponds to Mode = 3 (active homing)

  For active homing, the homing switch must be configured in the axis configuration. The values for approach velocity, homing velocity, and reference position offset are taken from the axis configuration unchanged.

Depending on the selection, the relevant boxes for entry of setpoints and the buttons for starting the command are displayed.

Jerk limitation can be activated and deactivated using the "Activate jerk limit" button. By default, the jerk is applied with 10% of the configured value. This value can be changed as required.

"Axis status" area

If "Manual control" mode is activated, the current axis status and drive status are shown in the "Axis status" area. The current position and velocity of the axis are displayed at "Process values".

Click "Acknowledge" to acknowledge all cleared errors.

The "Info message" box displays advanced information about the status of the axis.

"Current values" area

This area displays the current position and velocity of the axis.

Error message

The "Error message" box shows the current error. In "Manual control" mode, the error entry can be deleted by pressing the "Acknowledge" button once the error is eliminated.

Note

Initial values for velocity, acceleration / deceleration and jerk

For safety reasons, the "Velocity", "Acceleration/deceleration" and "Jerk" parameters are initialized with values equivalent to only 10% of the configured values when the axis control panel is activated. The "Jerk" parameter is only used for technology object "Axis" V2.0 and higher.

The values in the configuration view displayed when you select "Extended parameters > Dynamics > General" are used for initialization.

The "Velocity" parameter on the control panel is derived from the "Maximum velocity" and the "Acceleration/deceleration" parameters from "Acceleration" in the configuration.

The "Velocity", "Acceleration/deceleration" and "Jerk" parameters can be changed in the axis control panel; this does not affect the values in the configuration.

Guidelines on use of motion control (Page 6168)

13.2.8.2 Tuning (S7-1200)

The movement of axes with drive connection via PROFIdrive/analog output is position-controlled.

The "Tuning" function supports you in determining the optimal gain (Kv factor) for the control loop (Page 6220) of the axis. The axis velocity profile is recorded by means of the Trace function for this purpose for the duration of a configurable positioning movement. Then you can evaluate the recording, and adapt the gain accordingly.

The "Tuning" function for the positioning axis technology object can be found in the project tree under "Technology object > Commissioning".

The "Tuning" dialog is divided into the following areas:

- Master control
- Axis
- Optimize gain setting
- Trace

Note

No transfer of the parameters

The configured parameter values are discarded after master control is returned. Transfer the values as needed into your configuration.

Start of optimization

The trace is started at the same time the optimization starts. A timeout can be adapted in the start dialog for this.

Master control

In this area, you can take over master control of the technology object, or return it to your user program:

- **"Activate" button**
  With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. Note the following when taking over master control:
  - To take over master control, the technology object must be disabled in the user program.
  - Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with the error ("ErrorID" = 16#8203).

  CAUTION

  Additional axes in automatic mode

  The master control is only applied for the selected technology object. If additional axes are in automatic mode, dangerous situations may arise as a result.

  In this happens, disable all other axes.

- **"Deactivate" button**
  With the "Deactivate" button, you return master control to your user program.

Axis

In this area, enable or disable the technology object for operation with the axis control panel/ tuning:

- **"Enable" button**
  With the "Enable" button, you enable the selected technology object.
- **"Disable" button**
  With the "Disable" button, you disable the selected technology object.

Optimize gain setting

You make the settings for optimization of the gain in this area:

- **"Forward" button**
  With the "Forward" button, you start a test step for optimization in the positive direction.
- **"Backward" button**
  With the "Backward" button, you start a test step for optimization in the negative direction.
- **"Stop" button**
  You can use the "Stop" button to end the current movement for optimization and end trace recording.
- **"Customize dynamics" check box**
  Select this option to adapt the acceleration and the maximum acceleration for the optimization.
- **Acceleration**
  In this field, you configure the acceleration for a test step.
- **Maximum velocity**
  In this field, you configure the maximum velocity for a test step.
- **Measurement duration**
  The measurement duration is recalculated and entered depending on the selected acceleration, velocity and distance.
  You can adapt the value of the measurement duration afterwards.
- **Gain**
  In this field, you configure the actual gain of the position controller (Kv).
  The gain takes effect when it is entered. If the gain of the position controller (Kv) is too large, this can lead to an error on the drive.

Trace

The Trace function is displayed in the lower area of the "Tuning" dialog.

With each test step, a Trace recording of the required parameters is automatically started and displayed after completion of the test step. After master control has been returned, the Trace recording is deleted.

You will find a full description of the Trace function in the section on using the trace and logic analyzer function in the TIA Portal help.

13.2.9 Programming (S7-1200)

13.2.9.1 Overview of the Motion Control statements (S7-1200)

You control the axis with the user program using Motion Control instructions. The instructions start Motion Control commands that execute the desired functions.

The status of the Motion Control commands and any errors that occur during their execution can be obtained from the output parameters of the Motion Control instructions. The following Motion Control instructions are available:

- MC_Power: Enable, disable axis as of V6 (Page 4094)
- MC_Reset: Acknowledge fault, restart technology object as of V6 (Page 4099)
- MC_Home: Home axes, set reference point as of V6 (Page 4100)
- MC_Halt: Stop axis as of V6 (Page 4105)
- MC_MoveAbsolute: Absolute positioning of axis as of V6 (Page 4108)
- MC_MoveRelative: Relative positioning of axis as of V6 (Page 4112)
- MC_MoveVelocity: Move axis at set velocity as of V6 (Page 4115)
- MC_MoveJog: Move axis in jog mode as of V6 (Page 4119)
- MC_CommandTable: Run axis commands as motion sequence as of V6 (Page 4122)
- MC_ChangeDynamic: Change dynamic settings of axis as of V6 (Page 4124)
- MC_ReadParam: Continuously read motion data of a positioning axis as of V6 (Page 4126)
- MC_WriteParam: Write tag of positioning axis as of V6 (Page 4128)

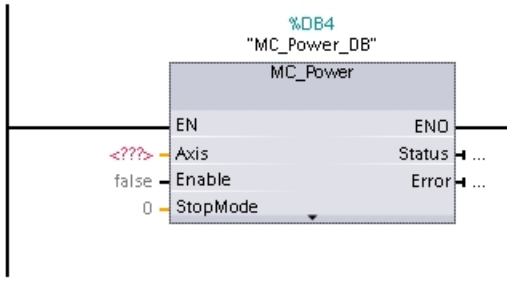
13.2.9.2 Creating a user program (S7-1200)

In the section below you learn how to create a user program with the basic configuration for controlling your axis. All available axis functions are controlled using the Motion Control instructions to be inserted.

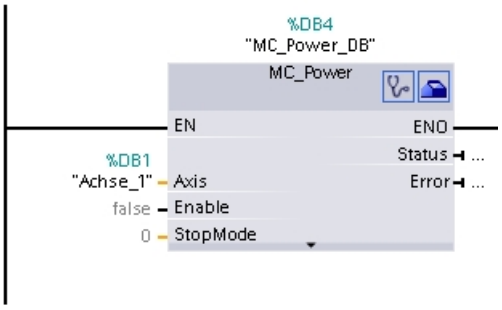
Requirement



- The technology object has been created and configured without errors.

Before creating and testing the user program, it is advisable to test the function of the axis and the corresponding parts of the system with the axis command table.

Procedure

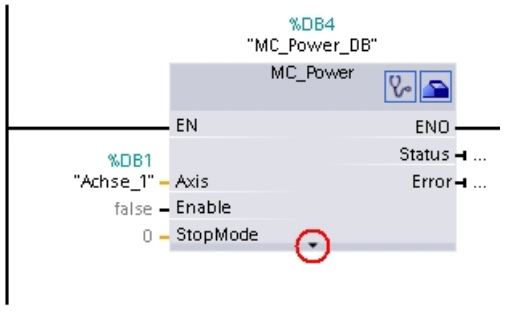


Proceed as follows to create the user program in accordance with the principles described below:

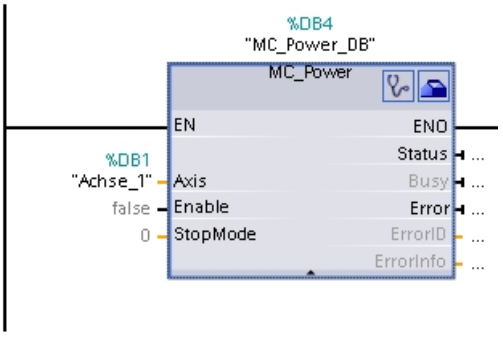
1. In the project tree, double-click your code block (the code block must be called in the cyclic program).
   The code block is opened in the programming editor and all available instructions are displayed.
2. Open the "Technology" category and the "Motion Control" and "S7-1200 Motion Control" folders.
3. Use a drag-and-drop operation to move the "MC_Power" instruction to the desired network of the code block.
   The dialog box for defining the instance DB opens.
4. In the next dialog box, select from the following alternatives:
   Single instance
   Click "Single instance" and select whether you want to define the name and number of the instance DB automatically or manually.
   Multi-instance
   Click "Multi-instance" and select whether you want to define the name of the multi-instance automatically or manually.
5. Click "OK".
   The Motion Control instruction "MC_Power" is inserted into the network.

Parameters marked with "<???>" must be initialized; default values are assigned to all other parameters.
Parameters displayed in black are required for use of the Motion Control instruction.

6. Select the technology object in the project tree and drag-and-drop it on <???>.



After the selection of the technology object data block, the following buttons are available:



Click the stethoscope icon if you want to open the diagnostics dialog for the technology object.

Click the toolbox icon if you want to open the configuration view of the technology object.

Click the arrow down icon to view additional parameters of the Motion Control instruction.

The grayed-out parameters now visible can be used optionally.

7. Add your choice of Motion Control instructions in accordance with steps 3 to 6.

Result

You have created the basic configuration for axis control in the user program.

Initialize the input parameters of Motion Control instructions in other parts of the user program to initiate the desired jobs for the "Axis" technology object.

Evaluate the output parameters of the Motion Control instructions and the tags of the data block to track the initiated jobs and the status of the axis.

Refer to the detailed description for details on the parameters of Motion Control instructions.

13.2.9.3 Programming notes (S7-1200)

When creating your user program, note the following information:

- **Cyclic call of utilized motion control instructions**
  The current status of command execution is available via the output parameters of the motion control instruction. The status is updated with every call of the motion control instruction. Therefore, make sure that the utilized motion control instructions are called cyclically.
- **Transfer of parameter values of a motion control instruction**
  The parameter values pending for the input parameters are transferred with a positive edge at input parameter "Execute" when the block is called.
  The motion control command is started with these parameter values. Parameter values that are subsequently changed for the motion control instruction are not transferred until the next start of the motion control command.
  Exceptions to this are input parameters "StopMode" of motion control instruction "MC_Power" and "Velocity" of motion control instruction "MC_MoveJog". A change in the input parameter is also applied with "Enable" = TRUE or "JogForward" and "JogBackward".

- **Programming under consideration of the status information**
  In a stepwise execution of motion control jobs, make sure to wait for the active command to finish before starting a new command. Use the status messages of the motion control instruction and the "StatusBits" tag of the technology object to check for completion of the active command.
  In the examples below, observe the indicated sequence. Failure to observe the sequence will display an axis or command error.
  - **Axis enable with motion control instruction "MC_Power"**
    You must enable the axis before it can take on motion jobs. Use an AND operation of tag <Axis name>.StatusBits.Enable = TRUE with output parameter Status = TRUE of motion control instruction "MC_Power" to verify that the axis is enabled.
  - **Acknowledge error with motion control instruction "MC_Reset"**
    Prior to starting a motion control command, errors requiring acknowledgement must be acknowledged with "MC_Reset". Eliminate the cause of the error and acknowledge the error with motion control instruction "MC_Reset". Verify that the error has been successfully acknowledged before initiating a new command. For this purpose, use an AND operation of tag <Axis name>.StatusBits.Error = FALSE with output parameter Done = TRUE of motion control instruction "MC_Reset".
  - **Home axis with motion control instruction "MC_Home"**
    Before you can start an MC_MoveAbsolute command, the axis must be homed. Use an AND operation of tag <Axis name>.StatusBits.HomingDone = TRUE with output parameter Done = TRUE of motion control instruction "MC_Home" to verify that the axis has been homed.
- **Override of motion control command processing**
  Motion control jobs for moving an axis can also be executed as overriding jobs.
  If a new motion control command is started for an axis while another motion control command is active, the active command is overridden by the new command before the existing command is completely executed. The overridden command signals this using CommandAborted = TRUE in the motion control instruction. It is possible to override an active MC_MoveRelative command with a MC_MoveAbsolute command.
- **Avoiding multiple use of the same instance**
  All relevant information of a motion control command is stored in its instance.
  Do not start a new command using this instance, if you want to track the status of the current command. Use different instances if you want to track the commands separately. If the same instance is used for multiple motion control commands, the status and error information of the individual commands will overwrite each other.
  In the user program, each axis must be called with a separate call of the Motion Control instruction "MC_Power" with a separate instance data block.
- **Call of motion control instructions in different priority classes (run levels)**
  Motion Control instructions with the same instance may not be called in different priority classes without interlocking. To learn how to call locked motion control instructions, refer to "Tracking commands from higher priority classes (run levels) (Page 6294)".

Behavior of the Motion Control commands after POWER OFF and restart (Page 6272)

Monitoring active commands (Page 6272)

Error displays of the Motion Control statements (Page 6283)

Tracking jobs from higher priority classes (execution levels) (Page 6294)

13.2.9.4 Behavior of the Motion Control commands after POWER OFF and restart (S7-1200)

A POWER OFF or CPU-STOP aborts all active motion control jobs. All CPU outputs, including pulse and direction outputs, are reset.

After a subsequent POWER ON or CPU restart (CPU RUN), the technology objects and the motion control jobs will be reinitialized.

All actual data of the technology objects as well as all status and error information of the previously active motion control jobs are reset to their initial values.

Before the axis can be reused, it must be enabled again using the Motion Control instruction "MC_Power". If homing is required, the axis must be homed again with Motion Control instruction "MC_Home". When an absolute encoder is used, homing is retained after POWER OFF.

Programming notes (Page 6270)

Monitoring active commands (Page 6272)

Error displays of the Motion Control statements (Page 6283)

13.2.9.5 Monitoring active commands (S7-1200)

Monitoring active commands (S7-1200)

There are three typical groups for tracking active Motion Control commands:

- **Motion control instructions with output parameter "Done"**
- **Motion control instruction "MC_MoveVelocity"**
- **Motion control instruction "MC_MoveJog"**

Motion control instructions with "Done" output parameter (S7-1200)

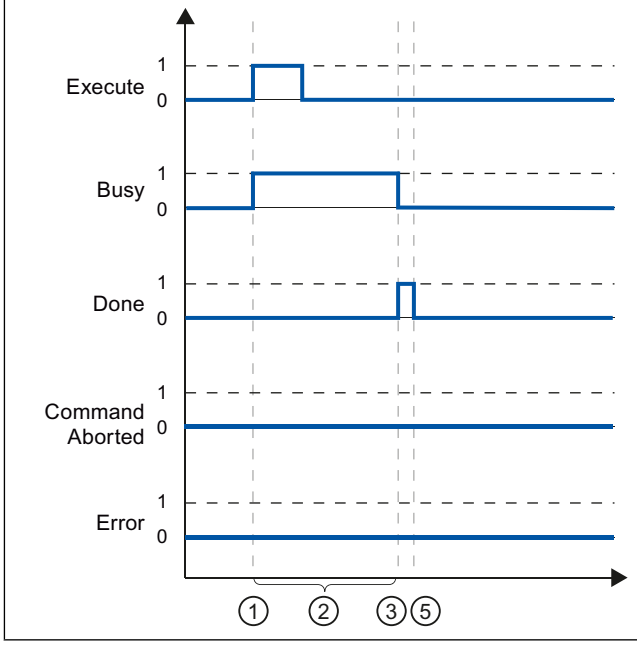
Motion control instructions with the output parameter "Done" are started via input parameter "Execute" and have a defined conclusion (for example, with Motion Control instruction "MC_Home": Homing was successful). The command is complete and the axis is at a standstill.

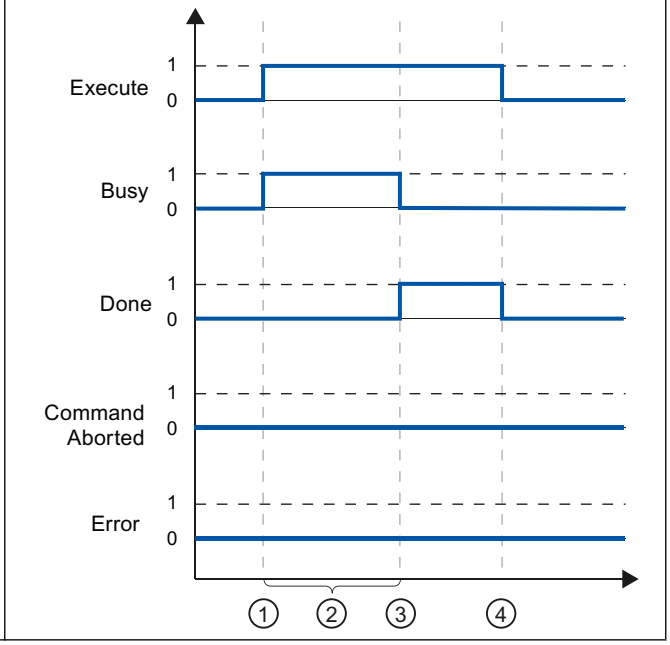
The commands of the following Motion Control instructions have a defined conclusion:

- MC_Reset
- MC_Home
- MC_Halt
- MC_MoveAbsolute
- MC_MoveRelative
- MC_CommandTable (technology object as of V2)
- MC_ChangeDynamic (technology object as of V2)
- MC_WriteParam (as of technology object V4)
- MC_ReadParam (as of technology object V4)

The output parameter "Done" indicates the value TRUE, if the command has been successfully completed.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending. The Motion Control instruction "MC_Reset" cannot be aborted and thus has no "CommandAborted" output parameter. The Motion Control instruction "MC_ChangeDynamic" is completed immediately and therefore has no "Busy" or "CommandAborted" output parameters.



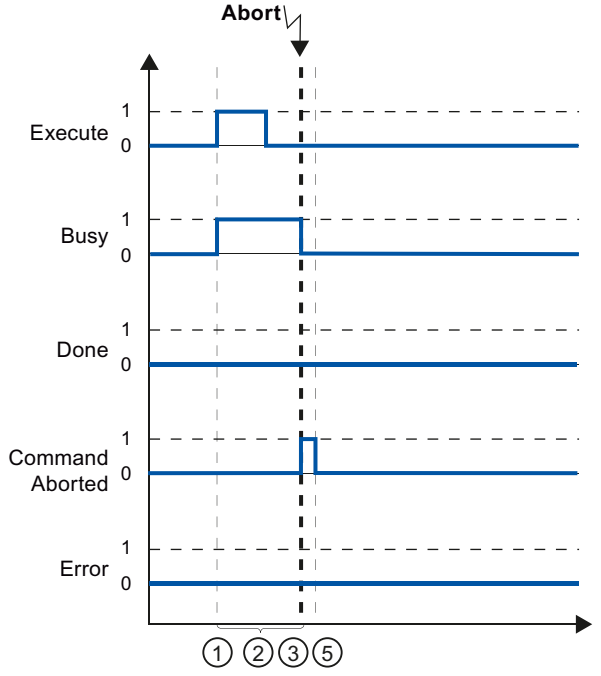


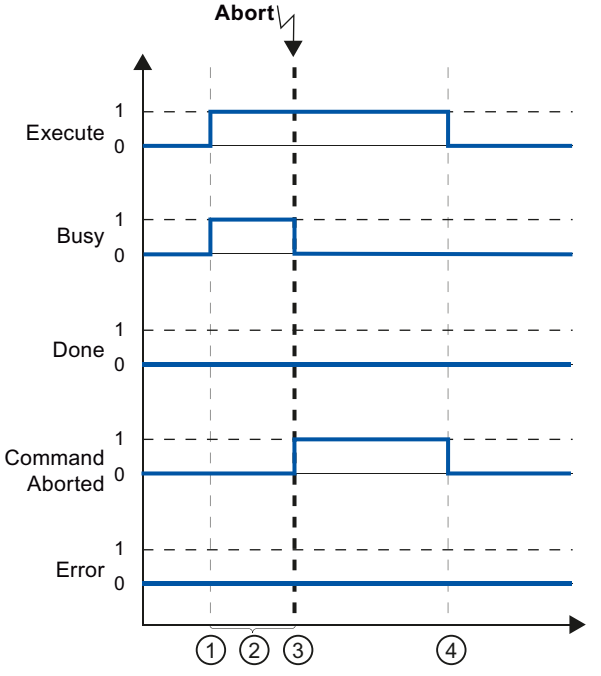
During execution of the Motion Control command, the output parameter "Busy" indicates the value TRUE. If the command has been completed, aborted, or stopped by an error, the output parameter "Busy" changes its value to FALSE. This change occurs regardless of the signal at input parameter "Execute".

Output parameters "Done", "CommandAborted", and "Error" indicate the value TRUE for at least one cycle. These status messages are latched while input parameter "Execute" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

Complete execution of command



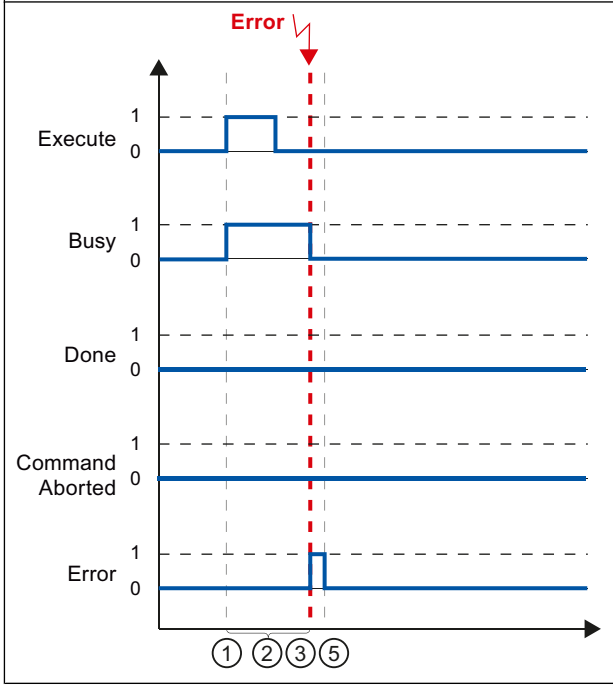


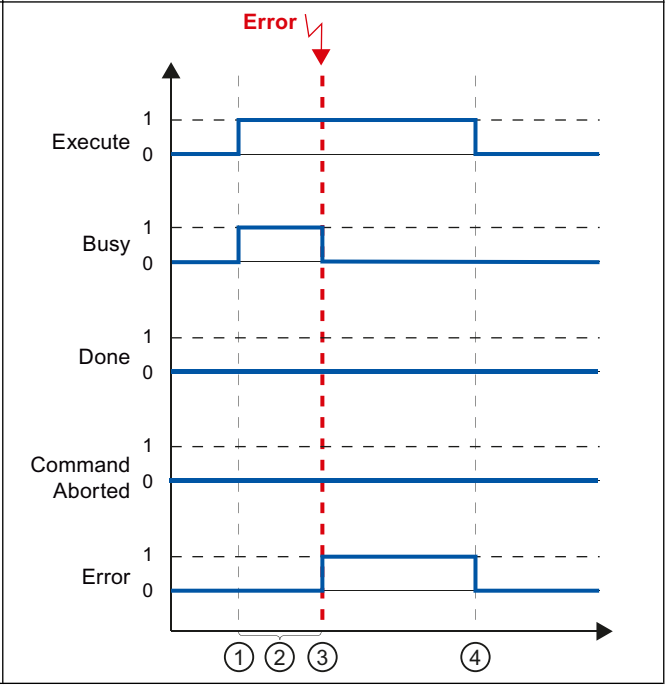
If the Motion Control command has been completely executed by the time of its conclusion, this is indicated by the value TRUE in output parameter "Done". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Done":

"Execute" changes its value to FALSE **during processing** of the command	"Execute" changes its value to FALSE **after completion** of the command
	

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	With conclusion of the command (for example, for Motion Control instruction "MC_Home": Homing was successful), output parameter "Busy" changes to FALSE and "Done" to TRUE.
④	If "Execute" retains the value TRUE until after completion of the command, then "Done" also remains TRUE and changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the command is complete, "Done" indicates the value TRUE for only one execution cycle.

Abort command





If the Motion Control command is aborted during execution, this is indicated by the value TRUE in output parameter "CommandAborted". The signal status of the input parameter "Execute" influences the display duration at the output parameter "CommandAborted":

"Execute" changes its value to FALSE **before** the command is aborted.	"Execute" changes its value to FALSE **after** the command is aborted.
	

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	During command execution, the command is aborted by another Motion Control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.
④	If "Execute" retains the value TRUE until after the command is aborted, then "CommandAborted" also remains TRUE and changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the command is aborted, "CommandAborted" indicates the value TRUE for only one execution cycle.

Error during command execution

If an error occurs during execution of the Motion Control command, this is indicated by the value TRUE in the output parameter "Error". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Error":

"Execute" changes its value to FALSE **before** the error occurs	"Execute" changes its value to FALSE **after** the error occurs
	

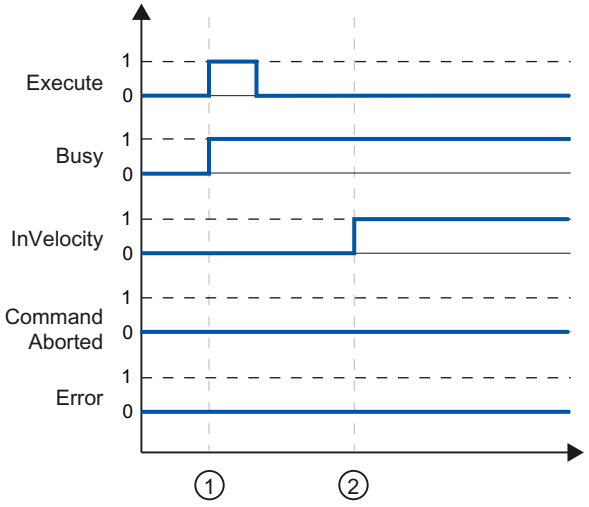
①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	If "Execute" retains the value TRUE until after the error occurs, then "Error" also remains TRUE and only changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the error occurs, "Error" indicates the value TRUE for only one execution cycle.

Motion control instruction MC_MoveVelocity (S7-1200)

A "MC_MoveVelocity" command is started with a positive edge at the "Execute" parameter. The command objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

The motion of the axis can, for example, be stopped with an "MC_Halt" command.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending.

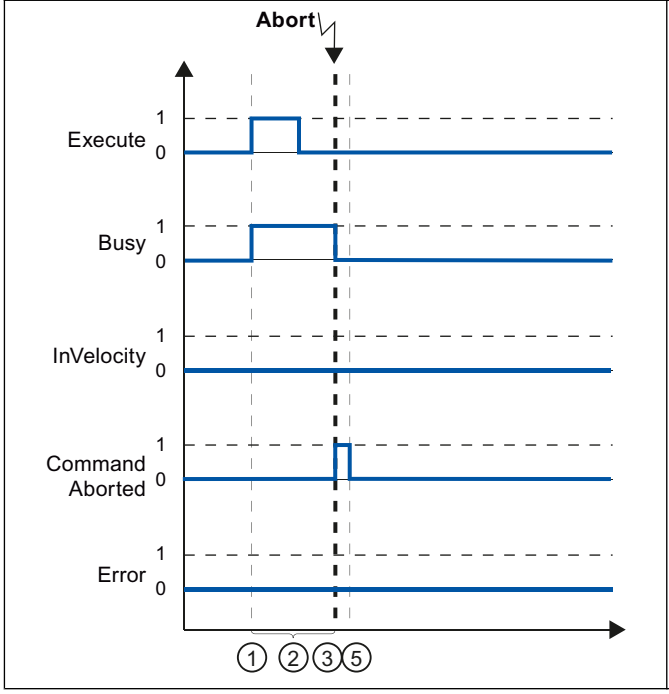


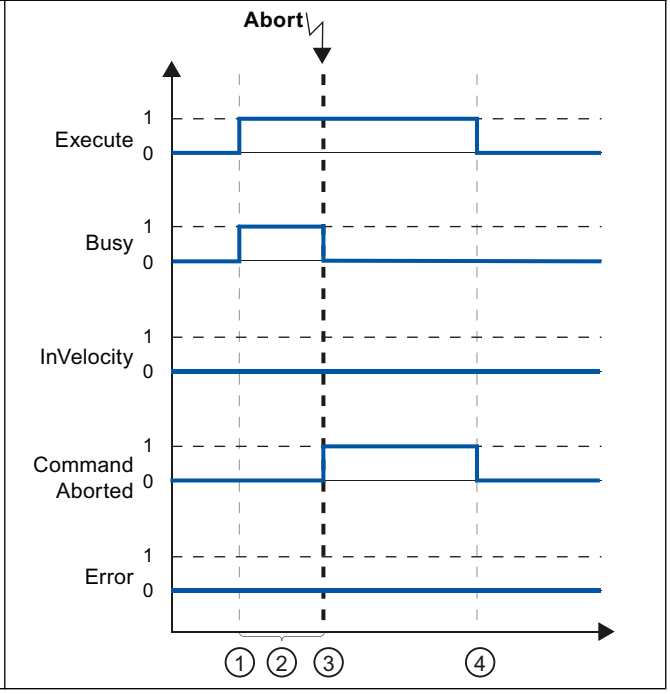
During execution of the Motion Control command, the output parameter "Busy" indicates the value TRUE. If the command has been stopped by another command or by an error, the output parameter "Busy" changes its value to FALSE. This change occurs regardless of the signal at the input parameter "Execute".

The output parameters "CommandAborted" and "Error" show the value TRUE for at least one cycle. These status messages are latched while input parameter "Execute" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

The parameterized velocity is reached





If the Motion Control command has been executed by the time the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity". The parameter "Execute" has no effect on the indication duration in the "InVelocity" parameter.

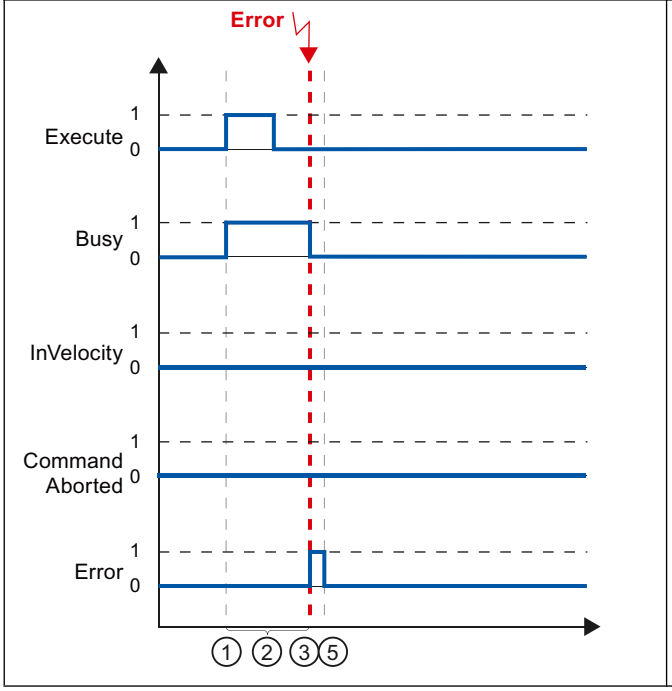
①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the FALSE value before or after the parameterized velocity has been reached. While the job is active, the parameter "Busy" shows the value TRUE.
②	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE. The "Busy" and "InVelocity" parameters retain the TRUE value until the "MC_MoveVelocity" command is overridden by another Motion Control command or stopped by an error.

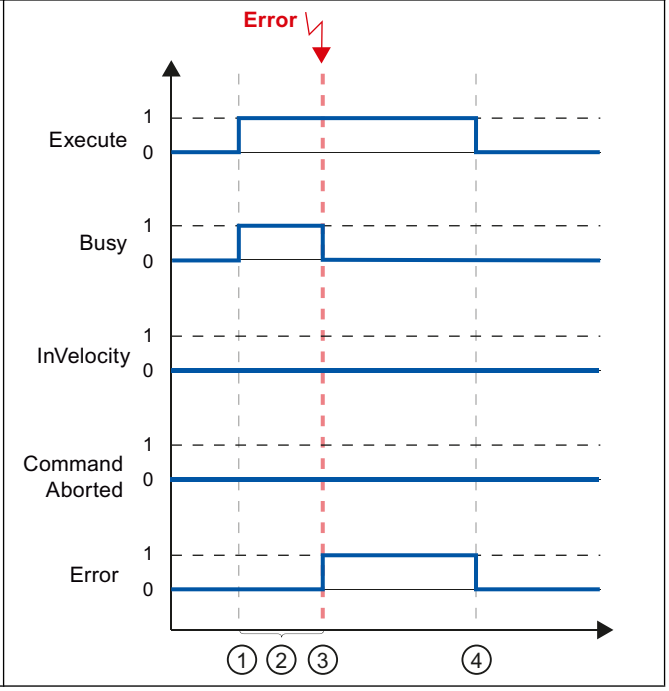
The command is aborted prior to reaching the parameterized velocity

If the Motion Control command is aborted before the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "CommandAborted". The signal status of input parameter "Execute" influences the display duration at the output parameter "CommandAborted".

"Execute" changes its value to FALSE **before** the command is aborted.	"Execute" changes its value to FALSE **after** the command is aborted.
	

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after the command is aborted.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	During command execution, the command is aborted by another Motion Control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.
④	If "Execute" retains the value TRUE until after the command is aborted, then "CommandAborted" also remains TRUE and changes its status to FALSE together with "Execute".
⑤	If "Execute" has been reset to FALSE before the command is aborted, "CommandAborted" indicates the value TRUE for only one execution cycle.





Note

Under the following conditions, an abort is not indicated in output parameter "CommandAborted":

The parameterized velocity has been reached, input parameter "Execute" has the value FALSE, and a new Motion Control command is initiated.

An error has occurred prior to reaching the parameterized velocity

If an error occurs during execution of the Motion Control command before the parameterized velocity has been reached, this is indicated by the value TRUE in the output parameter "Error". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Error":

"Execute" changes its value to FALSE **before** the error occurs	"Execute" changes its value to FALSE **after** the error occurs
	

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after the error has occurred.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	If "Execute" retains the value TRUE until after the error has occurred, then "Error" also remains TRUE and only changes its status to FALSE together with "Execute".
⑤	If "Execute" has been reset to FALSE before the error occurs, "Error" indicates the value TRUE for only one execution cycle.

Note

Under the following conditions, an error is not indicated in output parameter "Error":

The parameterized velocity has been reached, input parameter "Execute" has the value FALSE, and an axis error occurs (software limit switch is approached, for example).

The error of the axis is only indicated in the "MC_Power" Motion Control instruction.

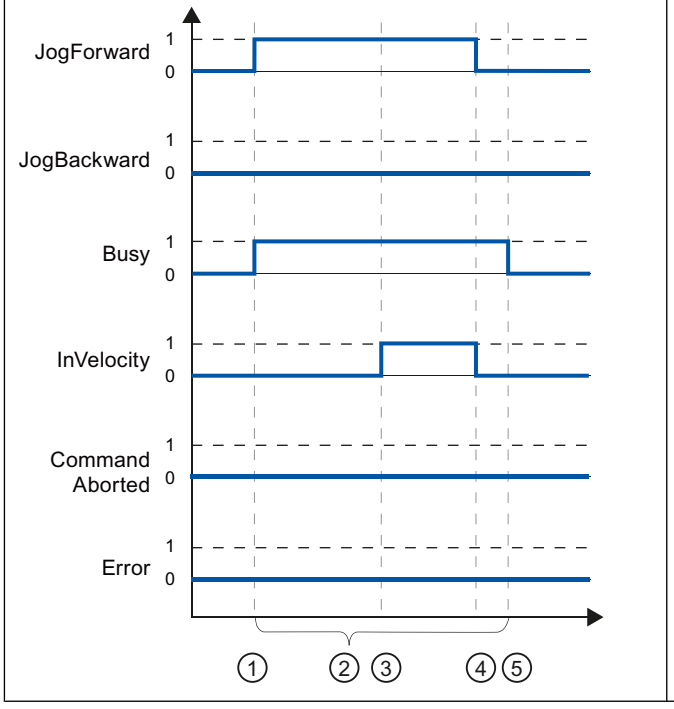
Motion control instruction MC_MoveJog (S7-1200)

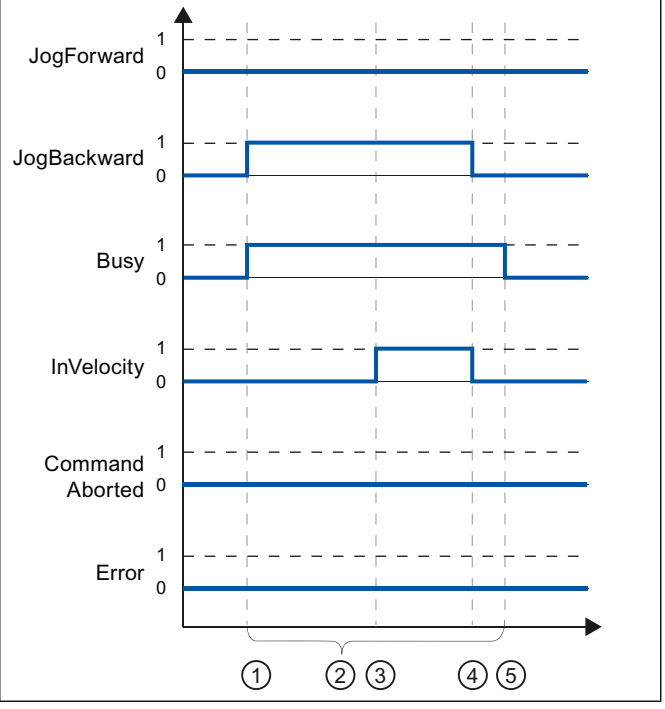
The commands of Motion Control instruction "MC_MoveJog" implement a jog operation.

The motion control commands "MC_MoveJog" do not have a defined end. The command objective is fulfilled when the parameterized velocity is reached for the first time and the axis travels at constant velocity. When the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity".

The order is complete when input parameter "JogForward" or "JogBackward" has been set to the value FALSE and the axis has come to a standstill.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending.



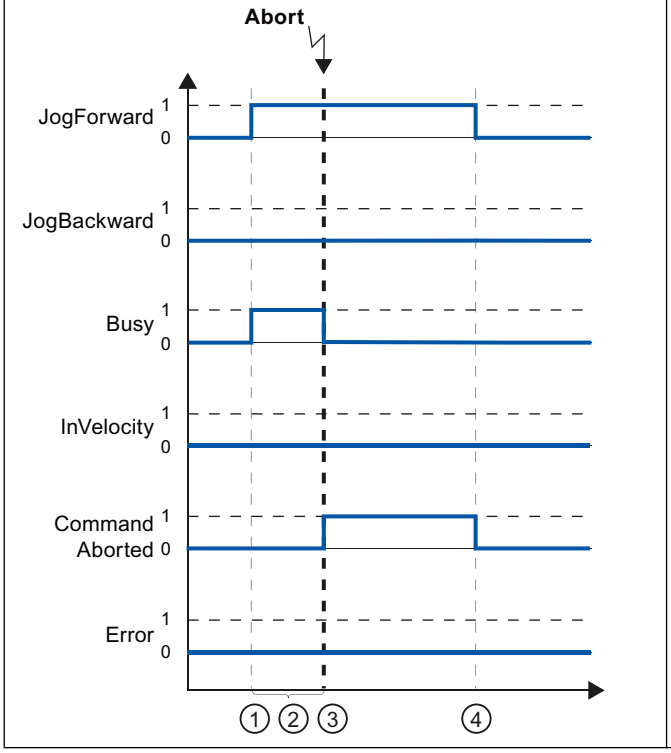


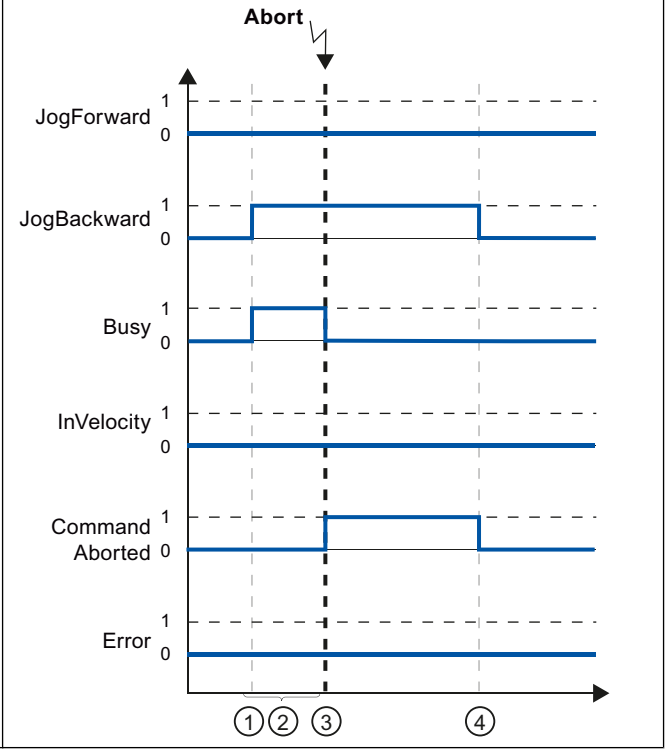
During processing of the motion control command, the output parameter "Busy" indicates the value TRUE. If the command has been completed, aborted, or stopped by an error, the output parameter "Busy" changes its value to FALSE.

The output parameter "InVelocity" indicates the status TRUE, as long as the axis is moving at the parameterized velocity. The output parameters "CommandAborted" and "Error" indicate the status for at least one cycle. These status messages are latched as long as either input parameter "JogForward" or "JogBackward" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

The parameterized velocity is reached and maintained





If the motion control command has been executed by the time the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity".

Jog mode is controlled by input parameter "JogForward"	Jog mode is controlled by input parameter "JogBackward".
	

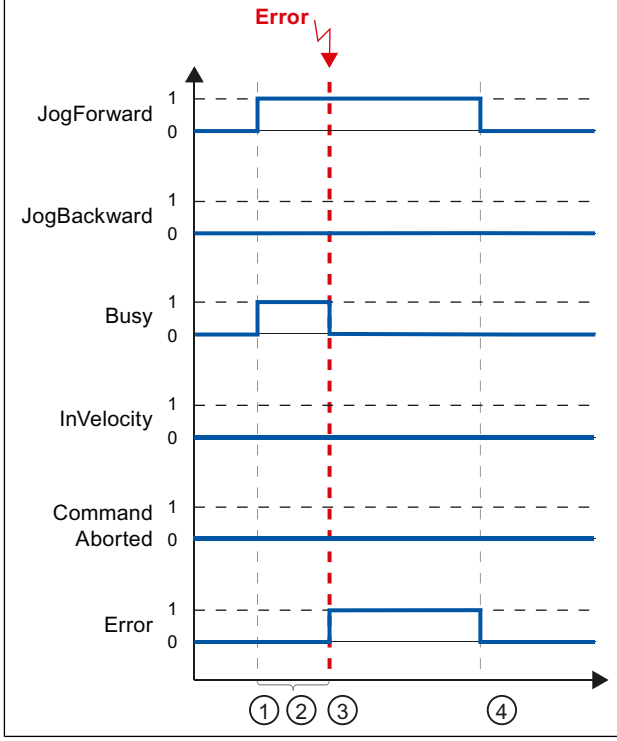
①	The command is started with a positive edge at the input parameter "JogForward" or "JogBackward".
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	When the parameterized velocity is reached, the output parameter "InVelocity" changes to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the axis motion ends. The axis starts to decelerate. As a result, the axis no longer moves at constant velocity and the output parameter "InVelocity" changes its status to FALSE.
⑤	If the axis has come to a standstill, the motion control command is complete and the output parameter "Busy" changes its value to FALSE.

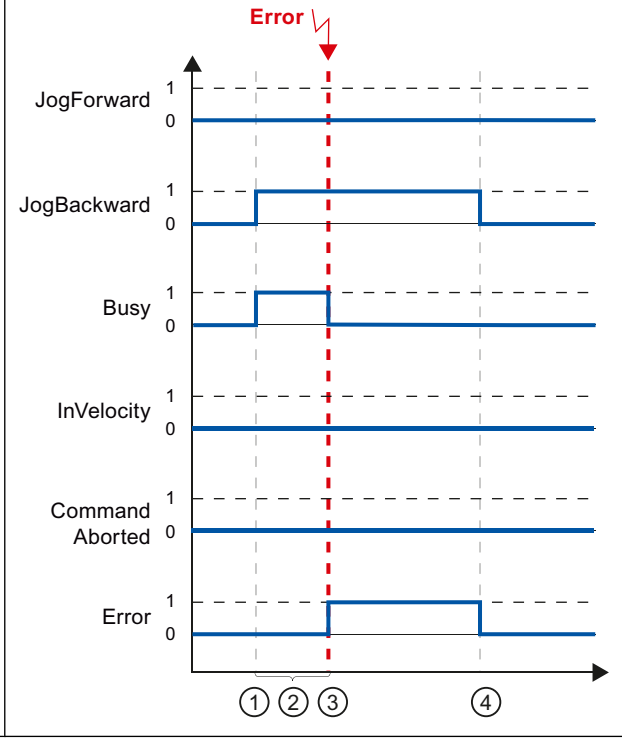
The command is aborted during execution

If the motion control command is aborted during execution, this is indicated by the value TRUE in output parameter "CommandAborted". The behavior is independent of whether or not the parameterized velocity has been reached.

Jog mode is controlled by input parameter "JogForward".	Jog mode is controlled by input parameter "JogBackward".
	

①	The command is started with a positive edge at the input parameter "JogForward" or "JogBackward".
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	During command execution, the command is aborted by another motion control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the output parameter "CommandAborted" changes its value to FALSE.





Note

The command abort is indicated in the output parameter "CommandAborted" for only one execution cycle, if all conditions below are met:

The input parameters "JogForward" and "JogBackward" have the value FALSE (but the axis is still decelerating) and a new motion control command is initiated.

An error has occurred during command execution

If an error occurs during execution of the motion control command, this is indicated by the value TRUE in output parameter "Error". The behavior is independent of whether or not the parameterized velocity has been reached.

Jog mode is controlled by input parameter "JogForward".	Jog mode is controlled by input parameter "JogBackward".
	

①	The command is started with a positive edge at the input parameter "JogForward" or "JogBackward".
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the output parameter "Error" changes its value to FALSE.

Note

An error occurrence is indicated in the output parameter "Error" for only one execution cycle, if all the conditions below are met:

The input parameters "JogForward" and "JogBackward" have the value FALSE (but the axis is still decelerating) and a new error occurs (software limit switch is approached, for example).

13.2.9.6 Error displays of the Motion Control statements (S7-1200)

The Motion Control instructions indicate any errors in motion control commands and the technology object at the output parameters "Error", "ErrorID" and "ErroInfo" of the Motion Control instructions.

Error display at output parameters "Error", "ErrorID" and "ErrorInfo"

If the output parameter "Error" indicates the value TRUE, the complete command, or portions thereof, could not be executed. The cause of the error is indicated by the value in output parameter "ErrorID". Detailed information about the cause of the error is returned by the value in output parameter ErrorInfo. We distinguish between the following error classes for error indication:

- **Operating error with axis stop (for example, "HW limit switch was approached")**
  Operating errors with axis stop are errors that occur during runtime of the user program. If the axis is in motion, it is stopped with the configured deceleration or emergency stop deceleration, depending on the error. The errors are indicated in the error-triggering Motion Control instruction and in the Motion Control instruction "MC_Power".
- **Operating error without axis stop (for example, "Axis is not homed")**
  Operating errors without axis stop are errors that occur during runtime of the user program. If the axis is in motion, the motion is continued. The errors are only indicated in the Motion Control instruction which triggers the error.
- **Configuration error in Motion Control instruction (for example "Incorrect value in parameter "Velocity")**
  Parameterization errors occur when incorrect information is specified in the input parameters of Motion Control instructions. If the axis is in motion, the motion is continued. The errors are only indicated in the Motion Control instruction which triggers the error.
- **Configuration error on technology object "Axis" (for example, "Value for "Acceleration" is invalid")**
  A configuration error exists if one or more parameters are incorrectly configured in the axis configuration or if editable configuration data have been modified incorrectly during runtime of the program. An axis in motion is stopped with the configured emergency stop deceleration. The error is indicated in the error-triggering Motion Control instruction and in Motion Control instruction "MC_Power".

- **Configuration error on technology object "Command table" (for example "Value for "Velocity" is invalid")**
  There is a configuration error if one or more parameters are incorrectly set in the axis command table or if programmable configuration data have been modified incorrectly during runtime of the program. If the axis is in motion, the motion is continued. The errors are only indicated in the "MC_CommandTable" Motion Control instruction.
- **Internal error**
  When an internal error occurs, the axis is stopped. The errors are indicated in the error-triggering Motion Control instruction and, in some cases, in the Motion Control instruction "MC_Power".

A detailed description of the ErrorIDs and ErrorInfos, as well as their remedies, is available in the Appendix (Page 6386).

13.2.9.7 Restart of technology objects (S7-1200)

Description

After the CPU is switched on, or after technology objects are downloaded into the CPU, the system automatically initializes the technology objects with the start values from the technology data block. If restart-relevant changes are detected during a reload into the CPU, a restart of the technology object is automatically performed.

If restart-relevant data have been changed in RUN mode by the user program, then the technology object must be reinitialized by the user in order for the changes to be used.

If changes in the technology data block should also be retained after the restart of the technology object, then you must write the changes to the start value in load memory using the extended instruction "WRIT_DBL".

Restart necessary

If a restart of the technology object is necessary, this will be indicated under "Technology object > Diagnostics > Status and error bits > Status messages > Restart required", and in the tags of the technology object <Axis name>.StatusBits.RestartRequired.

Restarting a technology object

A restart of the technology object is triggered by the user by means of the "MC_Reset" Motion Control instruction, with parameter "Restart" = TRUE.

A restart resets the "Homed" status of a technology object with incremental actual values (<Axis name>.StatusBits.HomingDone).

13.2.10 Axis - Diagnostics (S7-1200)

13.2.10.1 Status and error bits (technology objects as of V4) (S7-1200)

You use the "Status and error bits" diagnostic function to monitor the most important status and error messages for the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The status error messages have the following meaning:

Status messages

Status message - Axis	Description
Enabled	The axis is enabled and ready to be controlled via Motion Control commands. (Tag of technology object: <Axis name>.StatusBits.Enable)
Homed	The axis is homed and is capable of executing absolute positioning commands of Motion Control instruction "MC_MoveAbsolute". The axis does not have to be homed for relative positioning. Special situations: • During active homing, the status is FALSE. • If a homed axis undergoes passive homing, the status is set to TRUE during passive homing. (Tag of technology object: <Axis name>.StatusBits.HomingDone)
Axis error	An error has occurred in the "Axis" technology object. Additional information about the error is available in automatic control at the ErrorID and ErrorInfo parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error. (Tag of technology object: <Axis name>.StatusBits.Error)
Control panel active	The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the "Axis" technology object. The axis cannot be controlled from the user program. (Tag of technology object: <Axis name>.StatusBits.ControlPanelActive)
Restart required	A modified configuration of the axis was downloaded to the load memory in CPU RUN mode. To download the modified configuration to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this. (Tag of technology object: <Axis name>.StatusBits.RestartRequired)

Status message - Drive	Description
Ready	The drive is ready for operation. (Tag of technology object: <Axis name>.StatusBits.DriveReady)
Drive error	The drive has reported an error due to loss of its "Drive ready" signal. (Tag of technology object: <Axis name>.ErrorBits.DriveFault)

Status message - Motion	Description
Standstill	The axis is at a standstill. (Tag of technology object: <Axis name>.StatusBits.StandStill)
Acceleration	The axis accelerates. (Tag of technology object: <Axis name>.StatusBits.Accelerating)
Constant velocity	The axis travels at constant velocity. (Tag of technology object: <Axis name>.StatusBits.ConstantVelocity)
Deceleration	The axis decelerates (slows down). (Tag of technology object: <Axis name>.StatusBits.Decelerating)

Status message - Motion type	Description
Positioning	The axis executes a positioning command of the Motion Control instruction "MC_MoveAbsolute", "MC_MoveRelative" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.PositioningCommand)
Travel with velocity specification	The axis executes a command with velocity specification of the Motion Control instruction "MC_MoveVelocity", "MC_MoveJog" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.VelocityCommand)
Homing	The axis executes a homing command of the Motion Control instruction "MC_Home" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.HomingCommand)
Command table active	The axis is controlled by Motion Control instruction "MC_CommandTable". (Tag of technology object: <Axis name>.StatusBits.CommandTableActive)

Limit switch status messages

Limit switch status message	Description
Low SW limit switch has been reached	A software limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.SWLimitMinActive)
High SW limit switch has been reached	A hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.SWLimitMaxActive)
Low HW limit switch was reached	The low hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.HWLimitMinActive)
High HW limit switch was reached	The high hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.HWLimitMaxActive)

Error messages

Error message	Description
SW limit switch has been reached	A software limit switch was reached or exceeded. (Tag of technology object: <Axis name>.ErrorBits.SWLimit)
HW limit switch has been reached	A hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.ErrorBits.HWLimit)
Invalid direction of motion	The motion direction of the command does not match the configured motion direction. (Tag of technology object: <Axis name>.ErrorBits.DirectionFault)
PTO already in use	A second axis is using the same PTO (Pulse Train Output) and HSC (High Speed Counter) and is enabled with "MC_Power". (Tag of technology object: <Axis name>.ErrorBits.HWUsed)
Encoder	Error in the encoder system. (Tag of technology object: <Axis name>.ErrorBits.SensorFault)
Data exchange	Error in communication with a connected device. (Tag of technology object: <Axis name>.ErrorBits.CommunicationFault)
Positioning	The axis was not correctly positioned at the end of a positioning motion. (Tag of technology object: <Axis name>.ErrorBits.PositionigFault)
Following error	The maximum permitted following error was exceeded. (Tag of technology object: <Axis name>.ErrorBits.FollowingErrorFault)
Encoder values are invalid	The encoder values are invalid. (Tag of technology object: <Axis name>.StatusSensor.State)
Configuration error	The "Axis" technology object was incorrectly configured or editable configuration data were modified incorrectly during runtime of the user program. (Tag of technology object: <Axis name>.ErrorBits.ConfigFault)
Internal error	An internal error has occurred. (Tag of technology object: <Axis name>.ErrorBits.SystemFault)

The output window below shows the first reported and still unacknowledged error.

13.2.10.2 Motion status (S7-1200)

Use the "Motion status" diagnostic function to monitor the motion status of the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The displayed status information has the following meaning:

Status	Description
Current position	The "Current position" box indicates the current axis position. If the axis is not homed, the value indicates the position value relative to the enable position of the axis. (Tag of technology object: <Axis name>.Position)
Current velocity	The "Current velocity" box indicates the current axis velocity. (Tag of technology object: <Axis name>.Velocity)
Target position	The "Target position" box indicates the current target position of an active positioning command or of the axis command table. The value of the "Target position" is only valid during execution of a positioning command. (Tag of technology object: <Axis name>.StatusPositioning.TargetPosition)
Remaining travel distance	The "Remaining travel distance" box indicates the travel distance currently remaining for an active positioning command or the axis command table. The "Remaining travel distance" value is only valid during execution of a positioning command. (Tag of technology object: <Axis name>.StatusPositioning.Distance)

13.2.10.3 Dynamics settings (S7-1200)

Use the "Dynamics settings" diagnostic function to monitor the dynamic limits of the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The displayed status information has the following meaning:

Dynamic limit	Description
Acceleration	The "Acceleration" box indicates the currently configured acceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.Acceleration)
Deceleration	The "Deceleration" box indicates the currently configured deceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.Deceleration)

Dynamic limit	Description
Emergency deceleration	The "Emergency deceleration" box indicates the currently configured emergency stop deceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.EmergencyDeceleration)
Jerk (axis technology object as of V2)	The "Velocity" box indicates the current axis step velocity configured. (Tag of technology object: <Axis name>.DynamicDefaults.Jerk)

13.2.10.4 PROFIdrive frame (S7-1200)

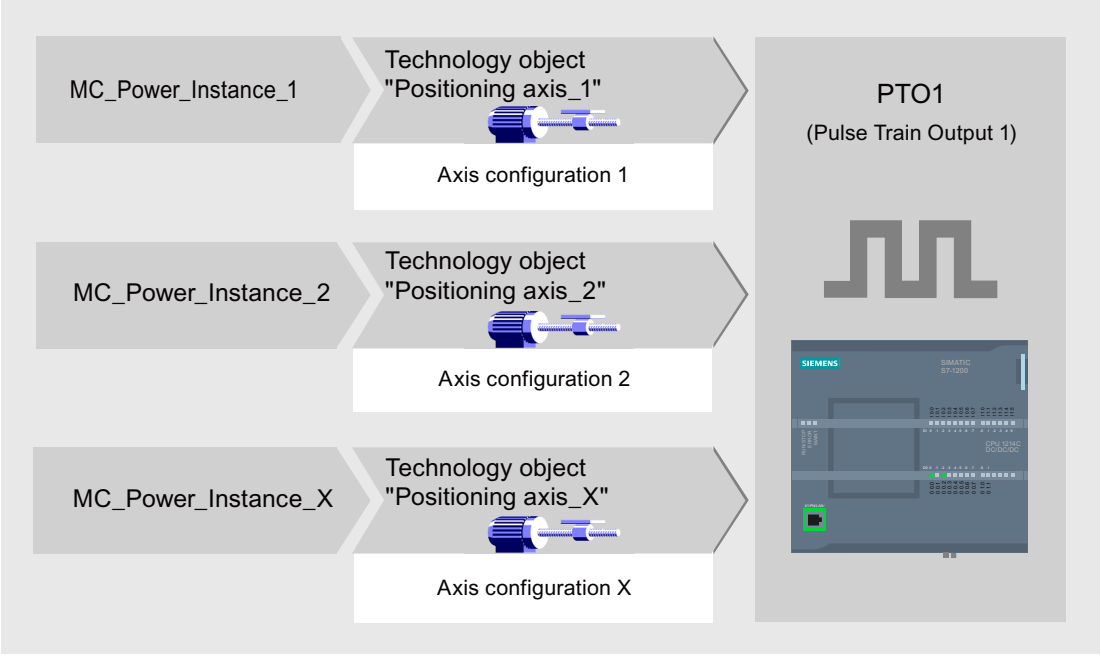
The "Technology object > Diagnostics > PROFIdrive telegram" diagnostics function is used in the TIA Portal to monitor the PROFIdrive telegrams returned by the drive and encoder. The display of the Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive telegram from the drive to the controller:

- Status words "SW1" and "SW2"
- The setpoint speed that was output to the drive (NSET)
- The actual speed that was signaled from the drive (NACT)

"Encoder" area



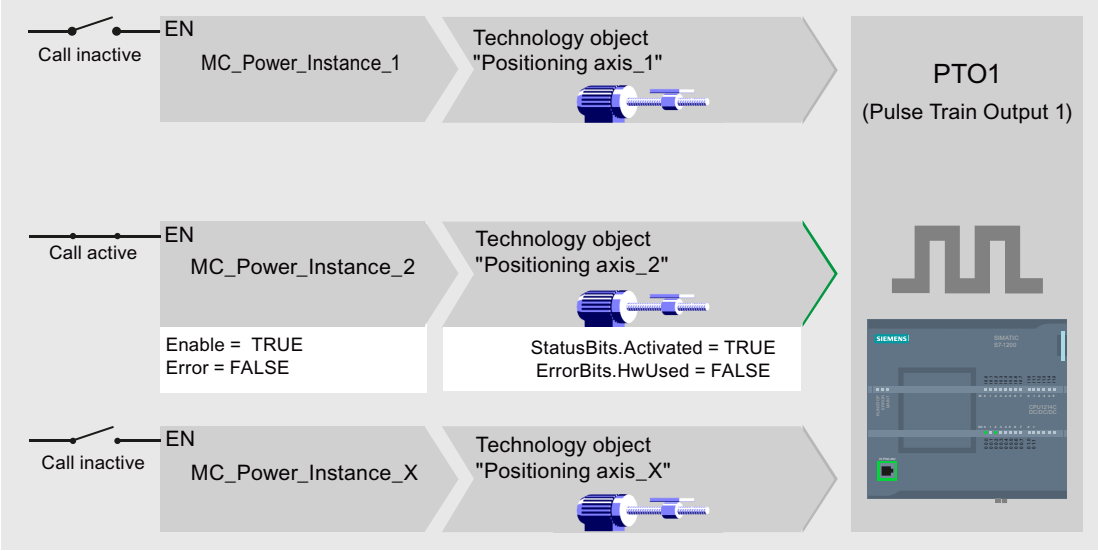
This area displays the following parameters contained in the PROFIdrive telegram from the encoder to the controller:

- Status word "G1_ZSW"
- The actual position value "G1_XIST1" (cyclic actual encoder value)
- The actual position value "G1_XIST2" (absolute value of the encoder)

13.2.11 Appendix (S7-1200)

13.2.11.1 Using multiple axes with the same PTO (S7-1200)

Use the Motion Control functionality of the CPU S7-1200 to run multiple positioning axis technology objects with the same PTO (Pulse Train Output) and thus with the same CPU outputs. This is appropriate, for example, if different axis configurations are to be used for different production sequences via one PTO. As described below, it is possible to switch between these axis configurations as often as necessary. The following diagram presents the basic functional relationships:

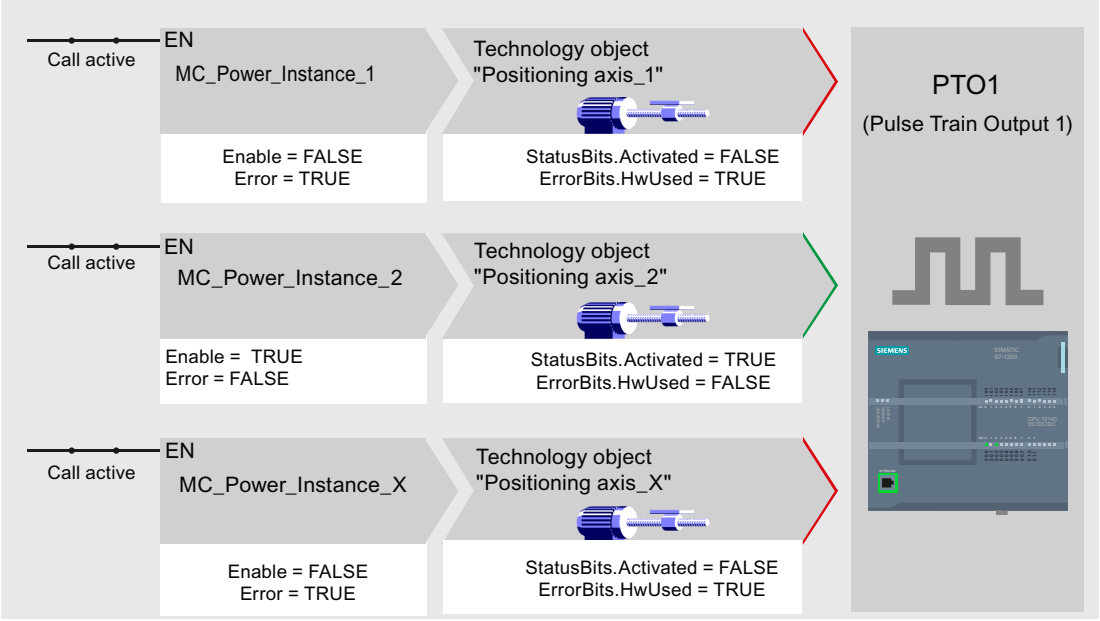


In this example, several positioning axis technology objects, each with its own axis configuration, use the same PTO. Each axis must be called in the user program with a separate call of Motion Control instruction "MC_Power" with a separate instance data block. Only one axis at a time may use the PTO. The axis that is currently using the PTO indicates this with tag <Axis name>.StatusBits.Activated = TRUE.

Switchover of the positioning axis technology object

The program scheme described below shows you how to switch between different technology objects and, thus, between different axis configurations. To use the same PTO with multiple axes without error indications, only the Motion Control instructions of the axis currently being used may be called.

The following diagram presents this principle using Motion Control instruction "MC_Power" as an example:



The tags of the activated axis ("Positioning axis_2" here) show the following typical indicators in the user program:

- <Axis name>.StatusBits.Activated = TRUE
- <Axis name>.ErrorBits.HWUsed = FALSE

To switch from one positioning axis technology object to another, follow the steps described below. In the example, a switch is made from "Positioning axis_2" to "Positioning axis_1":

1. End any active traversing motions of activated "Positioning axis_2"
2. Disable "Positioning axis_2" with the associated Motion Control instruction "MC_Power" using input parameter Enable = FALSE
3. To verify that "Positioning axis_2" has been disabled, use an AND operation of output parameter Status = FALSE of Motion Control instruction "MC_Power" and technology object tag <Axis name>.StatusBits.Enable = FALSE.
4. Deactivate the conditional call of the Motion Control instructions for "Positioning axis_2".
5. Activate the conditional call of the Motion Control instruction for "Positioning axis_1". At the first call of the corresponding Motion Control instruction "MC_Power", "Positioning axis_2" is deactivated and "Positioning axis_1" is activated.
6. Enable "Positioning axis_1" with the associated Motion Control instruction "MC_Power" using input parameter Enable = TRUE.
7. To verify that "Positioning axis_1" has been enabled, use an AND operation of output parameter Status = TRUE of Motion Control instruction "MC_Power" and technology object tag <Axis name>.StatusBits.Enable = TRUE.

It is also always possible to cyclically call all Motion Control instructions of all axes working with a single PTO.

When an axis is enabled (here "Positioning axis_2"), this axis becomes active.

In contrast to the conditional call, the Motion Control instructions of the deactivated axes (here "Positioning axis_1" and "Positioning axis_x") indicate errors. The tags of these axes indicate the status <Axis name>.StatusBits.Activated = FALSE and <Axis name>.ErrorBits.HWUsed = TRUE.

Use the conditional call of the Motion Control instructions if you want to implement the user program without error indicators.

13.2.11.2 Using multiple drives with the same PTO (S7-1200)

If multiple drives are to be used, they can be run with a common PTO (Pulse Train Output) using changeover. The following diagram represents the basic circuit design:

The changeover between drives can be controlled, if required, by the user program via a digital output. If different axis configurations are required for the different drives, a changeover between these configurations is required for the PTO. For additional information on this topic, refer to "Using multiple axes with the same PTO (Page 6290)".

13.2.11.3 Tracking jobs from higher priority classes (execution levels) (S7-1200)

Depending on the application, it may be necessary to start Motion Control commands (for example, interrupt-controlled) in a higher priority class (execution level).

The Motion Control instructions must be called at short intervals for status monitoring. Motion Control commands cannot be sufficiently closely monitored if the higher priority Motion Control commands are called only once or at too great an interval. Tracking in such cases can be carried out in the cycle OB. An instance data block that is not currently being utilized must be available for each start of a higher priority Motion Control command. Refer to the following flow chart to see how you start Motion Control commands in a higher priority class (for example, hardware interrupt OB) and continue tracking in the program cycle OB:

Depending on the frequency of the Motion Control commands you want to start, you will have to generate a sufficient number of instance data blocks. Users determine which instance data block is currently used in the DBx_used tags.

Start of Motion Control command in the hardware interrupt OB

Binary queries of the DBx_used tags (orange) are used to find an instance data block not currently in use. If such an instance data block is found, the utilized instance data block is marked as "used" (green) and the Motion Control command is started with this instance data block (blue).

Any other program sections of the hardware interrupt OB are then executed, followed by a return to the program cycle OB.

Tracking of started Motion Control commands in the program cycle OB

All instance data blocks available in the cycle OB are checked to determine if they are currently in use by means of the DBx_used tag (violet).

If an instance data block is in use (Motion Control command is being processed), the Motion Control instruction with this instance data block and input parameter Execute = TRUE is called to read out the status messages (red).

If the command is complete or has been aborted, the following actions are taken next (blue green):

- Call of Motion Control instruction with input parameter Execute = FALSE
- Resetting the DBx_used tag

This completes the command tracking, and the instance data block is now available for use again.

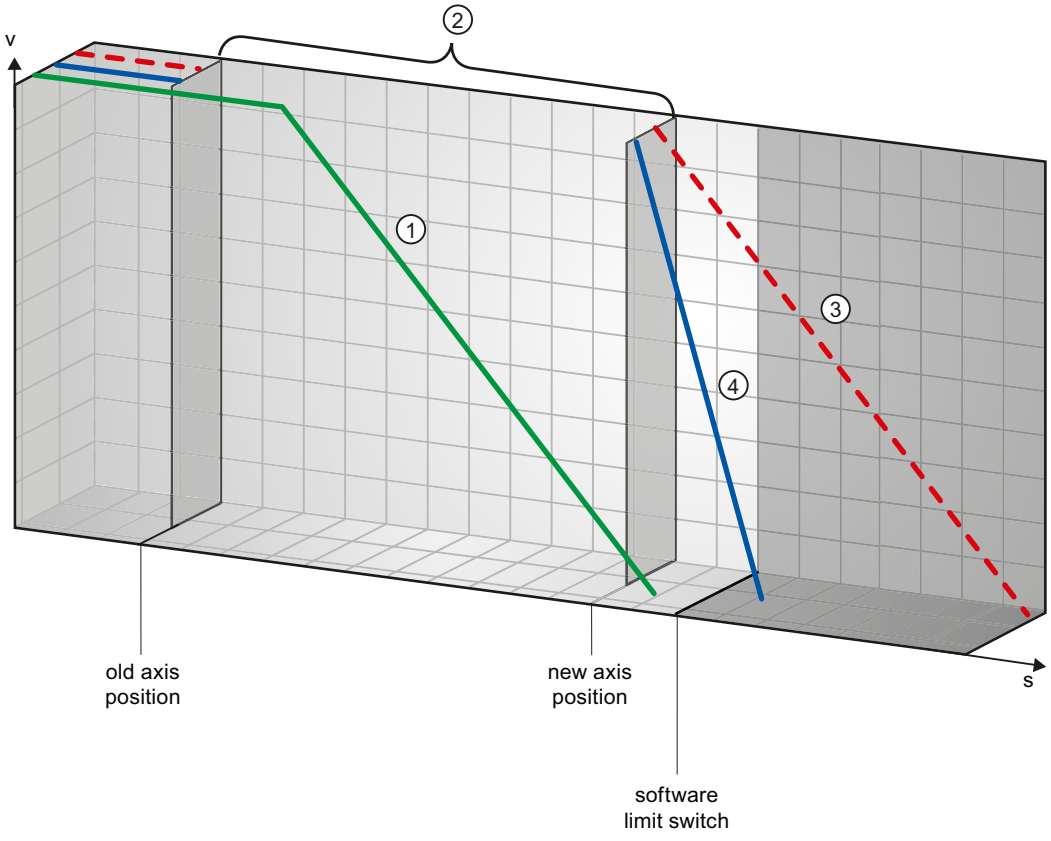
13.2.11.4 Special cases when using software limit switches for drive connection via PTO (S7-1200)

Software limit switches in conjunction with a homing operation (S7-1200)

Due to unfavorably parameterized homing jobs, the braking action of the axis may be influenced at the software limit switch. Take the following examples into consideration when developing your program.

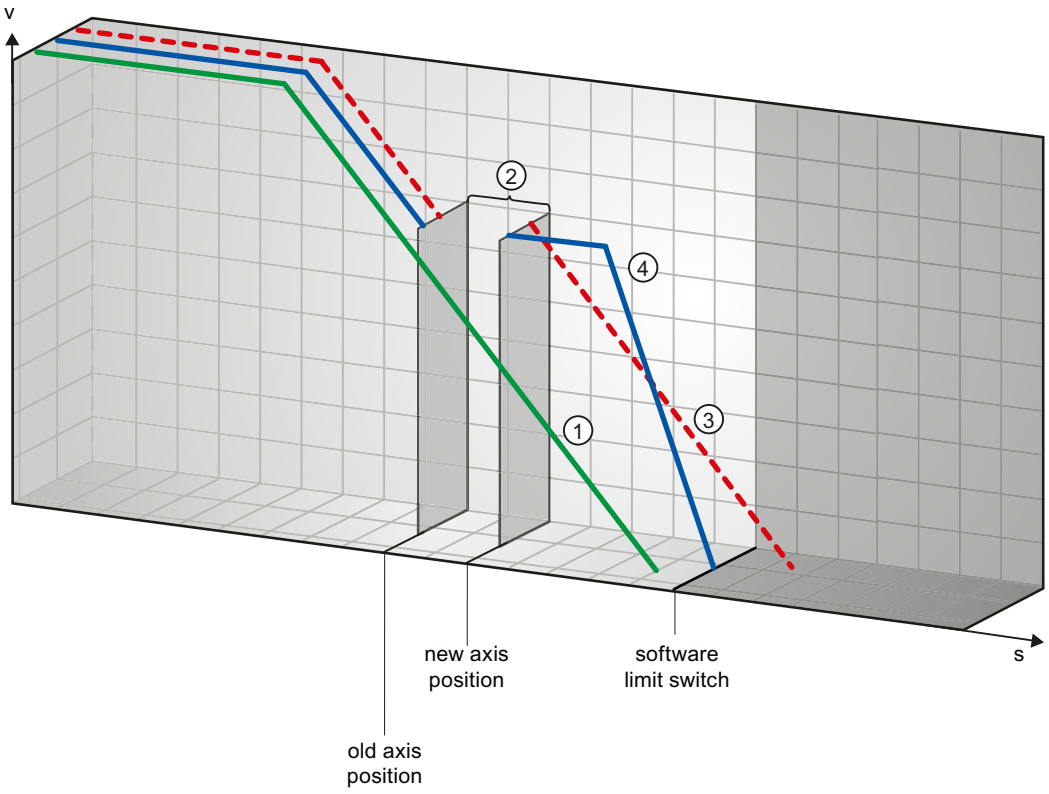
Example 1:



During a travel command, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. It is still possible to bring the axis to a standstill before reaching the software limit switch:

①	The green curve shows the motion **without** the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. Following constant motion, the axis brakes at the configured emergency stop deceleration and comes to a standstill at the position of the software limit switch.

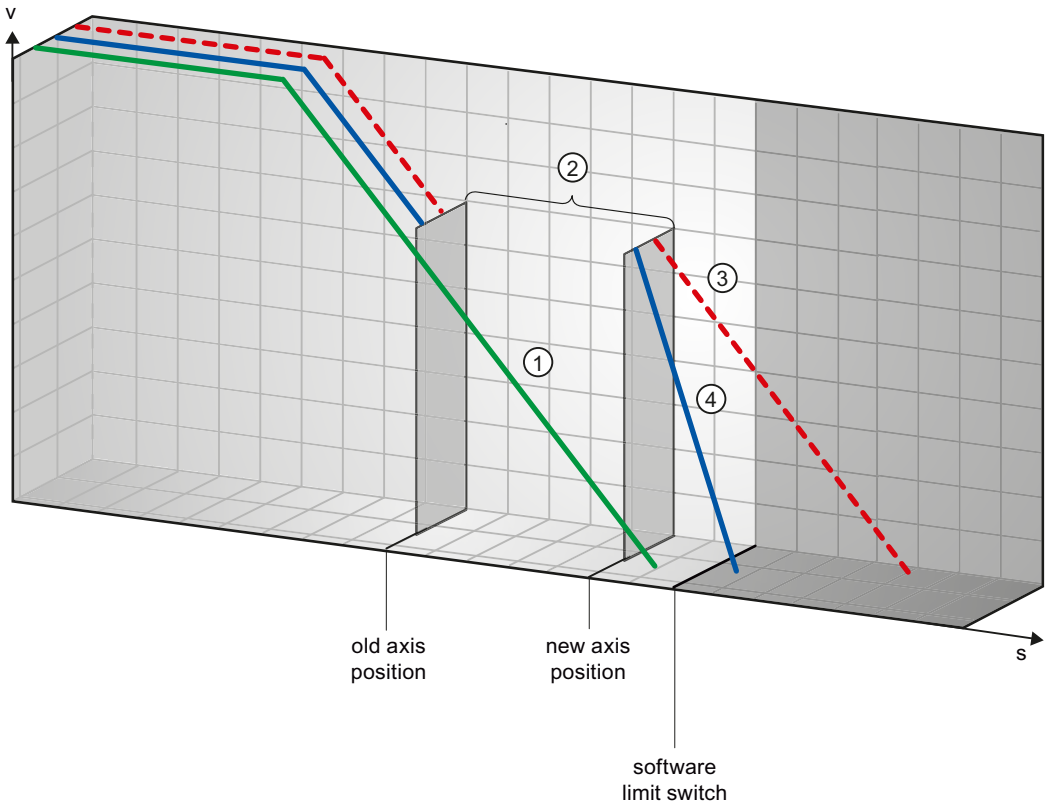
Example 2:



During a travel command, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. In contrast to example 1, it is no longer possible to bring the axis to a standstill before reaching the software limit switch. The axis overruns the position of the software limit switch.

①	The green curve shows the motion **without** the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position well after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. The axis brakes with the configured emergency stop deceleration. However, the emergency stop deceleration is not sufficient to stop the axis at the position of the software limit switch. The position of the software limit switch is overrun.

Example 3:



During a braking operation, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. It is still possible to bring the axis to a standstill before reaching the software limit switch:

①	The green curve shows the motion **without** the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. Following constant motion, the axis brakes at the configured emergency stop deceleration and comes to a standstill at the position of the software limit switch.

Example 4:

During a braking operation, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. In contrast to example 3, it is no longer possible to bring the axis to a standstill before reaching the software limit switch. The axis overruns the position of the software limit switch.

①	The green curve shows the motion **without** the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position well after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. The axis brakes with the configured emergency stop deceleration. However, the emergency stop deceleration is not sufficient to stop the axis at the position of the software limit switch. The position of the software limit switch is overrun.

Software limit switches in conjunction with dynamic changes (Page 6301)

Response of the axis when position limits are triggered (Page 6201)

Software limit switches and software limit switch position changes. (S7-1200)

An incorrect change in the position of the software limit switch during the runtime of the user program can abruptly reduce the distance between the current axis position and the position of the software limit switch.

The axis response is similar to that described in Software limit switches in conjunction with a homing operation (Page 6296).

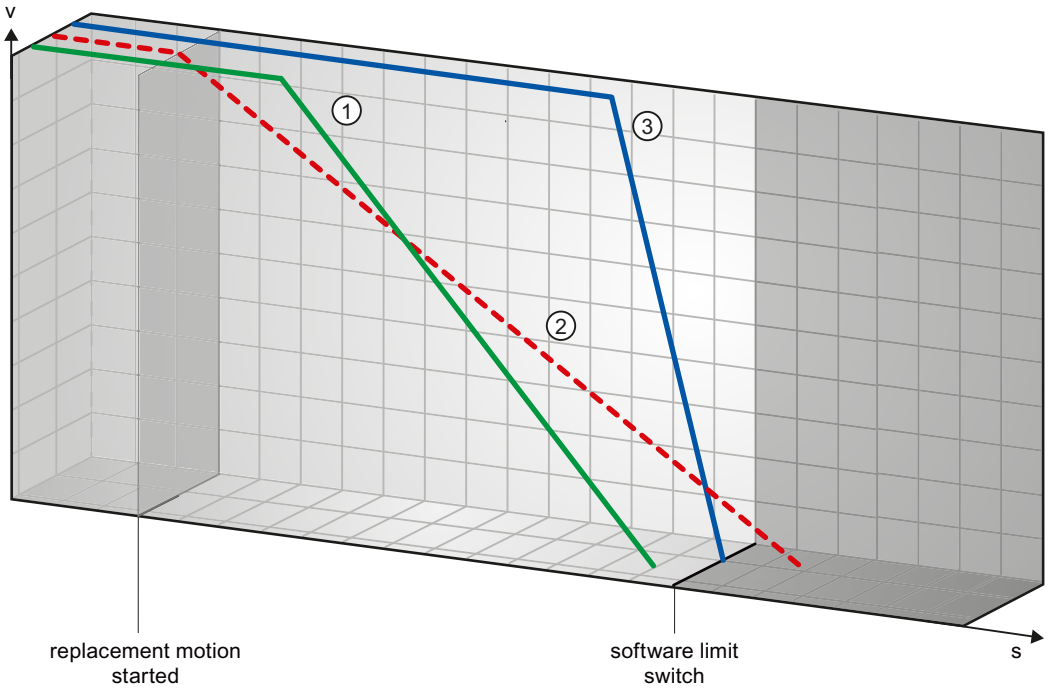
Software limit switches in conjunction with a homing operation (Page 6296)

Software limit switches in conjunction with dynamic changes (Page 6301)

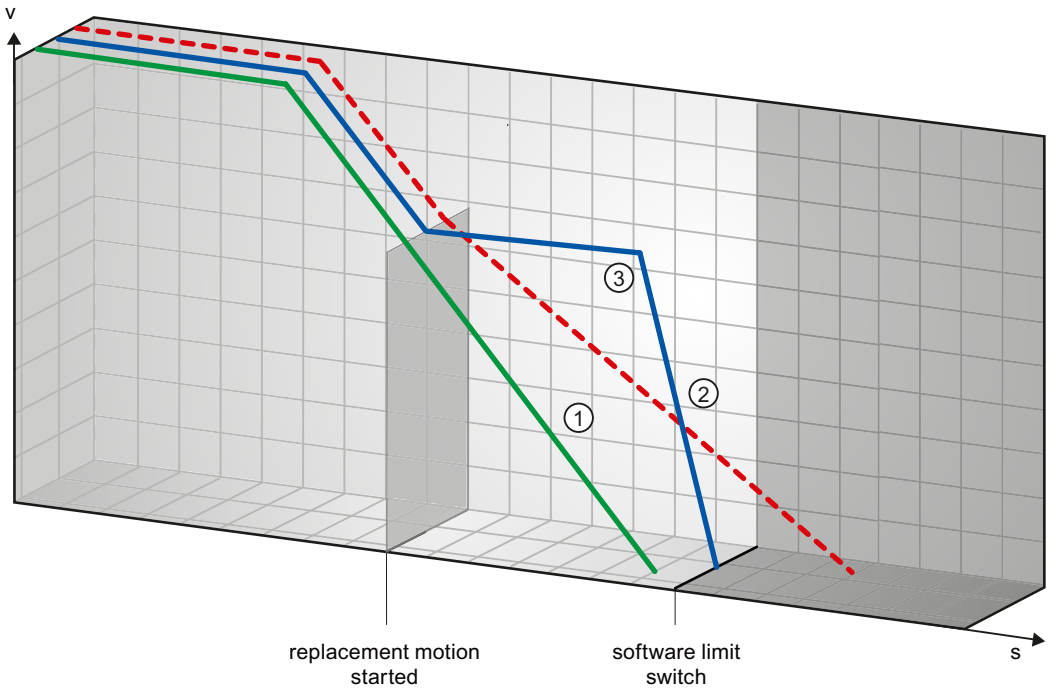


Response of the axis when position limits are triggered (Page 6201)

Software limit switches in conjunction with dynamic changes (S7-1200)

It is possible to influence the deceleration of the axis in the area of the software limit switches in conjunction with overriding motion commands. This applies when the overriding motion command is started with a lower deceleration (tag <Axis name>.DynamicDefaults.Deceleration). Take the following examples into consideration when developing your program.

Example 1:



During axis motion, an active motion command is overridden by another motion command with a lower deceleration:

①	The green curve shows the motion of an active command **without** this command being overridden. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	Based on the overriding motion command with lower deceleration, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
③	Because braking with the configured deceleration of the overriding motion command is no longer sufficient, the axis actually follows the blue curve. Following a constant motion, the axis brakes at the emergency stop deceleration and comes to a standstill at the position of the software limit switch.

Example 2:

During braking of the axis, an active motion command is overridden by another motion command with a lower deceleration:

①	The green curve shows the motion of an active command **without** this command being overridden. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	Based on the overriding motion command with lower deceleration, the axis would theoretically be stopped at a position well after the software limit switch (red curve).
③	Because braking with the configured deceleration of the overriding motion command is no longer sufficient, the axis actually follows the blue curve. Following a constant motion, the axis brakes at the emergency stop deceleration and comes to a standstill at the position of the software limit switch.

Response of the axis when position limits are triggered (Page 6201)

13.2.11.5 Reducing velocity for a short positioning duration (S7-1200)

The CPU can reduce the velocity of a positioning command when the planned positioning duration is < 2 ms.

The velocity of command execution will then be reduced for the entire duration. The reduced velocity (pulses per s) is calculated as follows:

- Reduced velocity = Number of pulses to be output * 500Hz

Velocity is **not** reduced if the planned positioning duration is >= 2 ms.

13.2.11.6 Dynamic adjustment of start/stop velocity (S7-1200)

The configuration of your velocity limits (start/stop velocity and maximum velocity), the dynamic values (acceleration, deceleration and jerk) and the target speed of the traversing command may under certain circumstances result in the start/stop velocity being dynamically adjusted by the CPU.

This is for example the case when, due to a low configured start/stop velocity, the time required for the first pulses would be longer than that possible for the entire acceleration. The first pulse is in these cases output at a greater velocity than the configured start/stop velocity. The subsequent pulses are also dynamically adjusted to ensure the acceleration process can be completed in the specified time.

Ensure in the event of any pulse loss that the hardware (drive) you use is adjusted to this situation, or change the dynamic settings of your axis to avoid dynamic adjustment of the start/stop velocity.

13.2.11.7 Move the axis without position control for servicing (S7-1200)

If service is required, it may be necessary to move a PROFIdrive drive or a drive with an analog drive interface without position control.

This may be the case for example with invalid or incorrect encoder values.

The following Motion Control instructions influence the status of the position control:

Enable position-controlled drives without position control with MC_Power

Start the axis with the Motion Control instruction MC_Power StartMode = 0 in non-position-controlled operation.

The non-position-controlled mode is in effect until another Motion Control instruction changes the status of the position control.

MC_MoveVelocity

MC_MoveVelocity with PositionControlled = FALSE forces non-position-controlled operation.

MC_MoveVelocity with PositionControlled = TRUE forces position-controlled operation.

The selected position-controlled operation is retained even after the termination of MC_MoveVelocity.

MC_MoveJog

MC_MoveJog with PositionControlled = FALSE forces non-position-controlled operation.

MC_MoveJog with PositionControlled = TRUE forces position-controlled operation.

The selected position-controlled operation is retained even after the termination of MC_MoveJog.

MC_Home, MC_MoveRelative, MC_MoveAbsolute

The Motion Control instructions MC_Home, MC_MoveRelative and MC_MoveAbsolute force position-controlled operation.

The position control remains active even when the command has ended.

MC_Halt

The Motion Control instruction MC_Halt is executed in position-controlled and non-position-controlled operation.

The status of the position control remains unchanged.

13.2.11.8 List of ErrorIDs and ErrorInfos (technology objects as of V6) (S7-1200)

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

Depending on the error reaction, the axis is stopped in the case of operating errors with stop of axis. The following error reactions are possible:

- **Remove enable**
  The setpoint zero is output and the enable is removed. The axis is braked depending on the configuration in the drive, and is brought to a standstill.
- **Stop with emergency stop ramp**
  Active motion commands are aborted. The axis is braked with the emergency stop deceleration configured under "Technology object > Extended parameters > Dynamics > Emergency stop ramp" without any jerk limit and brought to a standstill.

Operating error with axis stop

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8000		Drive error, loss of "Drive ready"		-
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8001		**Low SW limit switch has been tripped**		-
	16#000E	The position of the low SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch	
	16#000F	The position of the low SW limit switch was reached with the emergency stop deceleration		
	16#0010	The position of the low SW limit switch was exceeded with the emergency stop deceleration		Remove enable
16#8002		**High SW limit switch has been tripped**		-
	16#000E	The position of the high SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch	
	16#000F	The position of the high SW limit switch was reached with the emergency stop deceleration		
	16#0010	The position of the high SW limit switch was exceeded with the emergency stop deceleration		Remove enable
16#8003		**Low HW limit switch was reached**		For drive connection via PTO (Pulse Train Output): Stop with emergency stop ramp For drive connection via PROFIdrive/analog output: Remove enable
	16#000E	The low HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.	
16#8004		**High HW limit switch was reached**		For drive connection via PTO (Pulse Train Output): Stop with emergency stop ramp For drive connection via PROFIdrive/analog output: Remove enable
	16#000E	The high HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8005		**PTO/HSC are already being used by another axis**		-
	16#0001	-	**The axis was configured incorrectly:** Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller	
			More than one axis is to run with one PTO: Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (See also Using multiple axes with the same PTO (Page 6290))	
16#8006		**A communication error in the control panel has occurred**		Remove enable
	16#0012	A timeout has occurred	Check the cable connection and press the "Manual control" button again	
16#8007		**The axis cannot be enabled**		-
	16#0025	Restarting	Wait until the axis restart is complete.	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.	
16#8008		**Invalid direction of motion**		-
	16#002E	The selected motion direction is not allowed.	• Adjust the motion direction and restart the command. • Adjust the allowed direction of rotation in the technology object configuration under "Extended parameters > Mechanics". Restart the command.	
	16#002F	A reversing motion is not possible with the selected motion direction.		
16#8009		**Reference switch/encoder zero mark not found**		Stop with emergency stop ramp
	16#0033	Error in the configuration, hardware or installation of the encoder or at the homing switch.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#800A		**Alarm message from encoder**		Remove enable
	16#0001	-	Check the device with regard to function, connections and I/Os.	
	16#0034	Hardware error at encoder		
	16#0035	Encoder dirty		
	16#0036	Error during reading of encoder absolute value	Compare the encoder type in the drive or encoder parameter P979 with the configuration data of the technology object.	
	16#0037	Zero mark monitoring of the encoder	Encoder reports error in zero mark monitoring (fault code 0x0002 in Gx_XIST2, see PROFIdrive profile). Check the plant for electromagnetic compatibility (EMC).	
	16#0038	Encoder is in "Parking" state	• Search for the cause of the error in the connected drive or encoder. • Check whether the error message was possibly triggered by a commissioning action at the drive or encoder.	
	16#0040	PROFIdrive: Encoder on bus failed (station failure).	Check the device with regard to function, connections and I/Os.	
	16#0041	PROFIdrive: Signs of life of encoder faulty.		
16#800B		**Range violation of the position**		Remove enable
	16#0039	Range violation in positive direction	Home the axis to a valid actual value range.	
	16#003A	Range violation in negative direction		
	16#003B	The change of the actual position in a position control clock cycle is greater than the modulo length.	Adjust the modulo length of the employed encoder.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#800C		**Alarm message from drive**		Remove enable
	16#0001	-	Check the device with regard to function, connections and I/Os. In the "Tuning" dialog box, select a smaller gain (Kv).	
	16#003C	PROFIdrive: Drive signal "Control requested" failed.		
	16#003D	PROFIdrive/analog drive connection: Drive has shut down.		
	16#003E	PROFIdrive: Drive on bus failed (station failure)		
	16#003F	PROFIdrive: Signs of life of drive faulty.	• Check the device with regard to function, connections and I/Os. • Compare the clock parameters of HW Config (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be configured with the same clock cycle time.	
16#800D		**The permitted following error was exceeded**		Remove enable
	16#0001	-	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of following error monitoring.	
16#800E		**Error at the hardware limit switch**		Remove enable
	16#0042	Illegal free travel direction with active hardware limit switch	The programmed direction of movement is disabled due to the active hardware limit switch. Retract the axis in the opposite direction.	
	16#0043	Hardware limit switch polarity is reversed, axis cannot be freed	Check the mechanical configuration of the hardware limit switch.	
	16#0044	Both hardware limit switches are active, axis cannot be freed		
16#800F		**Error in target range**		Remove enable
	16#0045	Target range not reached	Target range was not reached within the positioning tolerance time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.	
	16#0046	Exit target range again	The target range was exited within the minimum dwell time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8010		**Position of the low SW limit switch is greater than that of the high SW limit switch when the axis is not a modulo axis**		Remove enable
	16#0001	-	Change the position of the software limit switches.	
16#8011		**Approach velocity to the homing switch / zero mark equals zero.**		Remove enable
	16#000A	Value is less than or equal to 0.	Approach velocity > Select zero	
16#8012		**Homing velocity for setting the home position equals zero.**		Remove enable
	16#000A	Value is less than or equal to 0.	Homing velocity > Select zero	
16#8013		**The axis cannot occupy the PTO because it is being used by "CTRL_PTO".**		Remove enable
	16#0001	-	Select another PTO in the configuration.	

Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8200		**Axis is not enabled**	
	16#0001	-	Enable the axis; restart the command
16#8201		**Axis has already been enabled by another "MC_Power" instance**	
	16#0001	-	Enable the axis with only one "MC_Power" instance
16#8202		**The maximum number of simultaneous motion control commands has been exceeded (max. 200 commands for drive connection via PTO (Pulse Train Output), max. 100 commands for drive connection via PROFIdrive/analog output)**	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
16#8203		**Axis is currently operated in "Manual control" (axis control panel)**	
	16#0001	-	Exit "Manual control"; restart the command
16#8204		**Axis is not homed**	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
16#8205		**The axis is currently controlled by the user program (the error is only displayed in the axis control panel)**	
	16#0013	The axis is enabled in the user program	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
16#8206		**Technology object not activated yet**	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
16#8207		**Command rejected**	

ErrorID	ErrorInfo	Description	Remedy
	16#0001	-	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt".
	16#0018	The axis cannot be moved with a command table while it is being actively or passively homed.	Wait until direct or passive homing is complete.
	16#0019	The axis cannot be actively or passively homed while a command table is being processed.	Wait for command table to finish or abort the command table with a motion command, for example, "MC_Halt".
	16#0052	The specified position exceeds the numerical limit.	Enter a valid position value at the Motion Control instruction.
	16#0053	The axis is ramping up.	Wait until the axis is ready for operation.
	16#0054	Actual value is invalid	To execute a "MC_Home" command, the actual values must be valid. Check the status of the actual values. The variable of the technology object <axis name>."StatusSensor.State" must show the value 2 (valid).
	16#006B	Call only prohibited in position-controlled mode	Enable the axis with position control with the "MC_Power" with StartMode = 1.
16#8208		**Difference between maximum and start/stop velocity is invalid**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#8209		**Invalid acceleration for technology object "Axis"**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#820A		**It is not possible to restart the axis**	
	16#0013	The axis is enabled in the user program	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	Exit "Manual control"; restart again
	16#002C	The axis is not disabled.	Disable the axis; restart the command
	16#0047	The technology object is not ready for restart.	Download the project again.
	16#0048	Condition for restart of the technology object is not satisfied.	Disable the technology object.
16#820B		**It is not possible to execute the command table**	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.
16#820C		**No configuration available**	
	16#0001	-	Internal error Contact the hotline.
	16#0014	The selected hardware is used by another application	

Block parameter error

ErrorID	ErrorInfo	Description	Remedy
16#8400		**Invalid value at parameter "Position" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
16#8401		**Invalid value at parameter "Distance" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
16#8402		**Invalid value at parameter "Velocity" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
	16#0024	Value is less than 0	
	16#0030	Value has an incorrect number format or is outside the valid number range	
16#8403		**Invalid value at parameter "Direction" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
16#8404		**Invalid value at parameter "Mode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	The direction reversal is activated at the hardware limit switch, despite the fact that the hardware limit switches are disabled	• Activate the HW limit switch using the variable <axis name>.PositionLimits_HW.Active = TRUE, restart the command • Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0055	Invalid mode at incremental encoder	Start a homing process for an incremental encoder using parameter "Mode" = 0, 1, 2, 3.
	16#0056	Invalid mode at absolute encoder	Passive and active homing ("Mode" = 2, 3) are not possible for an absolute value encoder. Start a homing process for an absolute encoder using parameter "Mode" = 0, 1.
16#8405		**Invalid value at parameter "StopMode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again
16#8406		**Simultaneous forward and backward jogging is not allowed**	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.

ErrorID	ErrorInfo	Description	Remedy
16#8407		**Switching to another axis with instruction "MC_Power" is only permitted after disabling the active axis.**	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.
16#8408		**Invalid value at parameter "Axis" of the Motion Control instruction**	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#8409		**Invalid value at parameter "CommandTable" of the Motion Control instruction**	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#840A		**Invalid value at parameter "StartStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001D	The start step is greater than the end step	
	16#001E	Value is greater than 32	
16#840B		**Invalid value at parameter "EndStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001E	Value is greater than 32	
16#840C		**Invalid value at parameter "RampUpTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840D		**Invalid value at parameter "RampDownTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840E		**Invalid value at parameter "EmergencyRampTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840F		**Invalid value at parameter "JerkTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#8410		**Invalid value at parameter "Parameter" of the Motion Control instruction**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000B	Address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0028	Data type of VARIANT pointer "Parameter" and "Value" do not match.	Use a suitable data type; restart command
	16#0029	VARIANT pointer "Parameter" does not point to a data block of the technology object.	Correct the VARIANT pointer; restart the command
	16#002A	The value at the VARIANT pointer "Parameter" cannot be read.	Correct the VARIANT pointer; restart the command
	16#002B	The value at the VARIANT pointer "Parameter" cannot be written.	Correct the VARIANT pointer or value; restart the command
	16#002C	The axis is not disabled.	Disable the axis; restart the command
16#8411		**Invalid value at parameter "Value" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
16#8412		**Value at "Start Mode" parameter of the Motion Control instruction invalid**	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again

Configuration error of the axis

ErrorID	ErrorInfo	Description	Remedy
16#8600		**Parameter assignment of pulse generator (PTO is invalid**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
16#8601		**Parameter assignment of the high-speed counter (HSC) is invalid**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
16#8602		**Invalid parameter assignment of "Enable output"**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8603		**Invalid parameter assignment of "Ready input"**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8604		**Invalid "Pulses per motor revolution" value**	
	16#000A	Value is less than or equal to zero	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8605		**Invalid "Distance per revolution" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#000A	Value is less than or equal to zero	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8606		**Invalid "Start/stop velocity" value**	
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
16#8607		**Invalid "maximum velocity" value**	
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8608		**Invalid "Acceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8609		**Invalid "Deceleration" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#860A		**Invalid "Emergency stop deceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#860B		**Value for position of the low SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	The position value of the low software limit switch is greater than that of the high software limit switch	
16#860C		**Value for position of the high SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary

ErrorID	ErrorInfo	Description	Remedy
16#860D		**Invalid address of the low HW limit switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#860E		**Invalid address of the high HW limit switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#860F		**Invalid "home position offset" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8610		**Invalid "approach velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8611		**Invalid "Homing velocity" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8612		**Invalid address of the homing switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#8613		**During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured**	
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8614		**Invalid "Jerk" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#001F	Value is greater than the maximum jerk	
	16#0020	Value is less than the minimum jerk	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8615		**Value for "Unit of measurement" is invalid**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8616		**Address of homing switch is invalid (passive homing as of V4)**	

ErrorID	ErrorInfo	Description	Remedy
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8617		**Value of variable <axis name>.Sensor.Sensor[1].ActiveHoming.Mode is invalid**	
	16#0011	The selection value is invalid (Valid value: 2 = Homing via digital input)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8618		**Value of variable <axis name>.Sensor.Sensor[1].PassiveHoming.Mode is invalid**	
	16#0011	The selection value is invalid (Valid value: 2 = Homing via digital input)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8619		**Value of variable <axis name>.Actor.Type is invalid**	
	16#0011	The selection value is invalid (Valid value: 2 = Connection via pulse interface)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861A		**Value for "Permitted direction of rotation" is invalid**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#002D	"Both directions" not allowed when direction output is deactivated	
16#861B		**Faulty load gear factors**	
	16#0031	Valid is invalid.	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#861C		**Illegal combination of data for homing with incremental encoder**	

ErrorID	ErrorInfo	Description	Remedy
	16#0031	Valid is invalid.	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861D		**The set encoder mounting type is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].MountingMode**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861E		**The configuration of the measuring wheel circumference of the encoder is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.DistancePerRevolution**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861F		**The configuration for the resolution of the linear encoder is faulty. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.Resolution**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8620		**The set fine resolution for Gn_XIST1 is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist1**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8621		**The set fine resolution for Gn_XIST1 in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist1 is not consistent with the setting in PROFIdrive parameter P979**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary

ErrorID	ErrorInfo	Description	Remedy
16#8622		**Invalid value for the configuration date <Axis name>.Actor.Interface.AddressIn or <Axis name>.Actor.Interface.AddressOut**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8623		**The value set in the variable <axis name>.Sensor.Sensor[1].Type is invalid.**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8624		**The set encoder system is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].System**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8625		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.MinDwellTime**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8626		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.Window**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8627		**The configuration of the PROFIdrive interface of the actual value is faulty. Invalid value in <Axis name>.Sensor.Sensor[1].Interface.AddressIn or <Axis name>.Sensor.Sensor[1].Interface.AddressOut**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8628		**Faulty controller factors**	
	16#0030	Value has an incorrect number format or is outside the valid number range	The value for the gain or the precontrol of the control loop is faulty. • Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary (<Axis name>.PositionControl.Kv, <Axis name>.PositionControl.Kpc)
16#8629		**Limit for standstill signal is faulty. Invalid value in <Axis name>.StandStillSignal.VelocityThreshold**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862A		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.ToleranceTime**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862B		**Inconsistent PROFIBUS parameterization; the sum of Ti and To is greater than one DP cycle**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#862C		**Parameter of standstill monitoring is faulty. Invalid value in <Axis name>.StandStillSignal.MinDwellTime**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862D		**Parameter of following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MinValue**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862E		**Invalid value for the configuration date <Axis name>.Modulo.Length**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862F		**Invalid value for the configuration date <Axis name>.Modulo.StartValue**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8630		**Invalid value for the configuration date <Axis name>.Actor.DriveParameter.ReferenceSpeed**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8631		**The set fine resolution for Gn_XIST2 is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist2**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8632		**The number of determinable encoder revolutions is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.DeterminableRevolutions**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8634		**Parameter of the following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MaxValue**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8635		**Parameter of the following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MinVelocity**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8636		**Controller factor is incorrect. Invalid value of the precontrol factor <Axis name>.PositionControl.Kpc**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8637		**Invalid value for the configuration date <Axis name>.Sensor.Sensor[1].Interface.Type**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8638		**Invalid value for the configuration date <Axis name>.Sensor.Sensor[1].Interface.HSC**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8639		**Error at the drive**	
	16#0049	Configuration error at device	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#004A	The technology needs a smaller servo clock.	Internal system error. Check the project for consistency and reload it into the controller.
	16#004B	Device driver not initialized during ramp-up.	To enable a technology object, the actuator driver must be initialized. Execute the command again later.
16#863A		**Communication to the drive is faulty**	
	16#004C	Configuration error at device	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004D	The device driver needs a smaller servo clock.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004E	Error in internal communication with the device	Check the project for consistency and reload it into the controller.
16#863B		**Error at encoder**	
	16#0049	Configuration error at device	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#004A	The technology needs a smaller servo clock.	Internal system error. Check the project for consistency and reload it into the controller.
	16#004B	Device driver not initialized during ramp-up.	To enable a technology object, the actuator driver must be initialized. Execute the command again later.
16#863C		**Communication with encoder is faulty**	

ErrorID	ErrorInfo	Description	Remedy
	16#004C	Configuration error at device	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004D	The device driver needs a smaller servo clock.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004E	Error in internal communication with the device	Check the project for consistency and reload it into the controller.
16#863D		**Communication to the device (drive or encoder) is faulty**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0055	The requested logical address is invalid.	• Connect a suitable device. • Check the device (I/Os). • Check the topological configuration in HW Config. • Compare the configuration of HW Config and the technology object.
	16#0056	The requested logical output address is invalid.	
	16#0057	The requested logical output address is invalid.	
16#863E		**Value of variable "ControlPanel.Input.TimeOut" is invalid (axis control panel)**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the value in the variables of the technology object <axis name>.ControlPanel.Input.TimeOut. The value is specified in milliseconds (ms).
16#863F		**Invalid value for the configuration date <Axis name>.Actor.DriveParameter.MaxSpeed**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the reference value in the drive and in the configuration of the technology object to Actuator.MaxSpeed/2. With analog drive connection, correct the reference value in the drive and in the configuration of the technology object to Actuator.MaxSpeed/1.17.
16#8640		**Error with automatic transfer of drive parameters in the device**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the value.
	16#0059	The device is not assigned to any SINAMICS drive unit or does not support the services required for the adaptation.	Disable automatic transfer of the parameters in the device. Complete the required parameters in the axis configuration and reload the axis configuration in the device.
	16#005A	Automatic transfer of parameters canceled due to insufficient resources.	
	16#005B	The parameters can only be automatically transferred when the device is connected directly to an I/O area.	

ErrorID	ErrorInfo	Description	Remedy
	16#005C	Maximum speed/velocity (p1082): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	Check the causes. Disable automatic transfer of the parameters in the device if you cannot eliminate the causes. Complete the required parameters in the axis configuration and reload the axis configuration in the device.
	16#005D	Maximum torque/force (p1520): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#005E	Maximum torque/force (p1521): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#005F	Fine resolution torque/force limiting (p1544): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#0060	Nominal speed/velocity (p2000): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#0061	Nominal torque/force (p2003): Either the parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
16#8641		**Error with automatic transfer of encoder parameters in the device**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the value.
	16#0059	The device is not assigned to any SINAMICS drive unit or does not support the services required for the adaptation.	Disable automatic transfer of the parameters in the device. Complete the required parameters in the axis configuration and reload the axis configuration in the device.
	16#005A	Automatic transfer of parameters canceled due to insufficient resources.	
	16#005B	The parameters can only be automatically transferred when the device is connected directly to an I/O area.	

ErrorID	ErrorInfo	Description	Remedy
	16#0062	Encoder system (r0979[1/11].0): Either a parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	Check the causes. Disable automatic transfer of the parameters in the device if you cannot eliminate the causes. Complete the required parameters in the axis configuration and reload the axis configuration in the device.
	16#0063	Encoder resolution (r0979[2/12]): Either a parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#0064	Encoder fine resolution Gx_XIST1 (r0979[3/13]): Either a parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#0065	Encoder fine resolution Gx_XIST2 (r0979[4/14]): Either a parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
	16#0066	Number of determinable encoder revolutions (r0979[5/15]): Either a parameter does not exist or its value cannot be read or is outside the permitted limits. Reading of parameters has been aborted due to an error signaled by the hardware.	
16#8642		**Configuration is internally adapted**	
	16#0067	1: Illegal value for Actor.MaxSpeed (Actor.MaxSpeed greater than 2*Actor.ReferenceSpeed) Remedy: set e.g. P2000 = P1082 in drive.	Adjust values.
16#8643		**Inconsistency between the configuration of the axis and the drive configuration**	
	16#0068	The configured telegram type is not compatible with the telegram type on the device (P922 or P2079).	Synchronize the telegram type in the configuration of the axis and in the configuration of the drive.
	16#0069	A function module with linear motor is set in the drive.	Set rotation motor in drive.
16#8644		**Inconsistency between the configuration of the axis and the encoder configuration**	
	16#0068	The configured telegram type is not compatible with the telegram type on the device (P922 or P2079).	Synchronize the telegram type in the configuration of the axis and in the configuration of the encoder.
	16#006A	The encoder on the drive is not an absolute encoder (P979).	Synchronize the encoder type in the configuration of the axis and in the encoder configuration.
16#8645		**The maximum velocity cannot be reached with the configured drive and axis parameters.**	
	16#0001	-	Adapt drive or axis configuration and load configuration in the device.
16#8646		**Illegal value in Sensor.Interface.Number**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the value and load configuration in the device.
16#8647		**Simulation is not supported for PTO axes**	
	16#0001	-	Disable simulation

Configuration error of the command table

ErrorID	ErrorInfo	Description	Remedy
16#8700		**Value for "Command type" in the command table is invalid**	
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
16#8701		**Value for "Position / travel path" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
16#8702		**Value for "Velocity" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
16#8703		**Value for "Duration" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0021	Value is greater than 64800 s	
	16#0022	Value is less than 0.001 s	
16#8704		**Value for "Next step" in the command table is invalid**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0023	The command transition is not permitted for this command	

Internal errors

ErrorID	ErrorInfo	Description	Remedy
16#8FFF		**Internal error**	
	16#F0**	-	POWER OFF and POWER ON the CPU If this does not work, contact Customer Support. Have the following information ready: • ErrorID • ErrorInfo • Diagnostic buffer entries

13.2.11.9 Tags of the positioning axis technology object as of V6 (S7-1200)

Position tag as of V6 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.Position				
Setpoint position of the axis (indicated in the configured unit of measurement) If the axis is not homed, the tag indicates the position value relative to the enable position of the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

Velocity tag as of V6 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.Velocity				
Setpoint velocity of the axis (indicated in the configured unit of measurement)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

Actuator tags as of V6 (S7-1200)

Legend

Data type	Data type of variable
Start value	Start value of variable

Access	Access to the variable in the user program:	
	R	The variable can be read in the user program.
	WP	If the axis is disabled (MC_Power.Status = FALSE), the variable can be written with the Motion Control instruction "MC_WriteParam".
	-	The variable cannot be used in the user program.
Effective	Specifies when a change to the variable takes effect:	
	2	For drive connection via PTO (Pulse Train Output): When axis is enabled
HMI	The variable can be used in an HMI system (according to the access to the variable in the user program).	

<Axis name>.Actor.Type				
Drive connection • Positioning axis technology object as of V5: 0 = The drive is connected via an analog output. All movements of the axis are position-controlled. 1 = The drive is connected via PROFIdrive telegrams. All movements of the axis are position-controlled. 2 = The drive is connected via a pulse interface. • Positioning axis technology object V4: The drive is connected via a pulse interface.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DInt	2	R	-	X

<Axis name>.Actor.InverseDirection				
Invert direction FALSE = The direction is not inverted. TRUE = The direction is inverted.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X
		WP	2	-

<Axis name>.Actor.DirectionMode				
Permitted direction of rotation 0 = Both directions 1 = Positive direction 2 = Negative direction				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Int	0	R	-	X
		WP	2	-

<Axis name>.Actor.DataAdaption				
Automatic transfer of drive parameters in the device 0 = Disabled 1 = Enabled				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DInt	0	R	-	X

<AxisName>.Actor.Interface.AddressIn (Positioning axis technology object as of V5)				
Input address for the PROFIdrive telegram (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<AxisName>.Actor.Interface.AddressOut (Positioning axis technology object as of V5)				
Output address for the PROFIdrive telegram (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.EnableDriveOutput				
Enable output (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.DriveReadyInput				
Ready input (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.PTO				
Pulse output (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DWord	0	-	-	-

<AxisName>.Actor.DriveParameter.ReferenceSpeed (Positioning axis technology object as of V5)				
Reference value (100%) for the setpoint speed of the drive (N-set) The setpoint speed is transmitted in the PROFIdrive telegram as a standardized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, provided the drive permits this.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	3000.0	R	-	X

<AxisName>.Actor.DriveParameter.MaxSpeed (Positioning axis technology object as of V5)				
Maximum value for the setpoint speed of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	3000.0	R	-	X

<Axis name>.Actor.DriveParameter.PulsesPerDriveRevolution				
Pulses per motor revolution				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DInt	1000.0	R	-	X
		WP	2	-

Start value	Start value of variable The start value can be overwritten by the axis configuration.	
Access	Access to the variable in the user program:	
	RW	The variable can be read and written in the user program. The variable can be written with Motion Control instruction "MC_WriteParam".
	R	The variable can be read in the user program.
	WP	If the axis is disabled (MC_Power.Status = FALSE), the variable can be written with the Motion Control instruction "MC_WriteParam".
	-	The variable cannot be used in the user program.

Effective	Specifies when a change to the variable takes effect:	
	1	For drive connection via PTO (Pulse Train Output): When axis is activated (<axis name>.StatusBits.Activated variable changes from FALSE → TRUE), disabled, or enabled
	2	For drive connection via PTO (Pulse Train Output): When axis is enabled
	5	For drive connection via PTO (Pulse Train Output): The next time an MC_MoveAbsolute, MC_MoveRelative, MC_MoveVelocity, MC_MoveJog, MC_Halt, MC_CommandTable, or active MC_Home command is started (Mode = 3)
	6	For drive connection via PTO (Pulse Train Output): When a MC_MoveJog command is stopped
	10	For drive connection via PROFIdrive/analog output: With the next call of the MC-Servo [OB91]
HMI	The variable can be used in an HMI system (according to the access to the variable in the user program).	

<axis name>.PositionLimits_HW.Active				
Activation of the hardware limit switches FALSE = The hardware limit switches are deactivated. TRUE = The hardware limit switches are activated.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RW	1, 5, 6, 10	X

<axis name>.PositionLimits_HW.MinSwitchLevel				
Selection of signal level that is present at the CPU input when the low hardware limit switch is reached FALSE = Low level (Low-active) TRUE = High level (High-active)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X
		WP	2	-

<axis name>.PositionLimits_HW.MinSwitchAddress				
Symbolic input address of the low hardware limit switch (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<axis name>.PositionLimits_HW.MaxSwitchLevel				
Selection of signal level that is present at the CPU input when the high hardware limit switch is reached FALSE = Low level (Low-active) TRUE = High level (High-active)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X
		WP	2	-

<axis name>.PositionLimits_HW.MaxSwitchAddress				
Input address of the high hardware limit switch (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

Homing tags as of V6 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag The start value can be overwritten by the axis configuration.	
Access	Access to the tag in the user program:	
	RW	The tag can be read and written in the user program. The tag can be written with Motion Control instruction "MC_WriteParam".
Effective	Specifies when a change to the tag takes effect:	
	1	For drive connection via PTO (Pulse Train Output): When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE → TRUE), disabled, or enabled
	8	For drive connection via PTO (Pulse Train Output): When an active homing command is started
	10	For drive connection via PROFIdrive/analog output: With the next call of the MC-Servo [OB91]
HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.Homing.AutoReversal				
Activation of auto reverse at the hardware limit switch during active homing FALSE = Auto reversal at the hardware limit switch is deactivated. TRUE = Auto reversal at the hardware limit switch is activated.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RW	1, 8, 10	X

<Axis name>.Homing.ApproachDirection				
Approach and homing direction of axis during active homing FALSE = Negative approach direction for finding the homing switch and negative homing direction TRUE = Positive approach direction for finding the homing switch and positive homing direction				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	TRUE	RW	1, 8, 10	X

<Axis name>.Homing.ApproachVelocity				
Approach velocity of the axis during active homing (indicated in the configured unit of measurement)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	200.0	RW	1, 8, 10	X

<Axis name>.Homing.ReferencingVelocity				
Homing velocity of the axis during active homing (indicated in the configured unit of measurement)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	40.0	RW	1, 8, 10	X

HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.FollowingError.EnableMonitoring				
Enable following error monitoring FALSE = Following error monitoring disabled TRUE = Following error monitoring enabled				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	TRUE	R	-	X

<Axis name>.FollowingError.MinValue				
Permissible following error at velocities below the value of "MinVelocity".				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	10.0	R	-	X
		WP	10	-

<Axis name>.FollowingError.MaxValue				
Maximum permissible following error which may be reached at the maximum velocity.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	100.0	R	-	X
		WP	10	-

<Axis name>.FollowingError.MinVelocity				
MinValue" is permissible below this velocity and is held constant.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	10.0	R	-	X
		WP	10	-

StatusPositioning tags as of V6 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.StatusPositioning.Distance				
Current distance of axis from target position (indicated in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute", "MC_MoveRelative", or the axis control panel.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

<Axis name>.StatusPositioning.TargetPosition				
Target position of the axis (indicated in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute", "MC_MoveRelative", or the axis control panel.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

<AxisName>.StatusPositioning.FollowingError (Positioning axis technology object as of V5)				
Current following error of the axis (indicated in the configured unit of measurement) FollowingError = 0.0 for drive connection via PTO (Pulse Train Output).				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

StatusBits tags as of V6 (S7-1200)

Legend

Data type	Data type of variable	
Start value	Start value of variable	
Access	Access to the variable in the user program:	
	RCCP	The variable can be read in the user program and is updated at each cycle control point.
	RP	The variable can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding variables is determined at the start of the command.
Effective	Specifies when a change to the variable takes effect.	
HMI	The variable can be used in an HMI system.	

<Axis name>.StatusBits.Activated				
Activation of the axis FALSE = The axis is not activated. TRUE = The axis is activated. It is connected to the assigned PTO (Pulse Train Output). The data of the technology data block will be updated cyclically.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Enable				
Enable status of the axis FALSE = The axis is not enabled. TRUE = The axis is enabled and ready to accept Motion Control commands.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HomingDone				
Homing status of the axis FALSE = The axis is not homed. TRUE = The axis is homed and is capable of executing absolute positioning commands. The axis does not have to be homed for relative positioning. The status is FALSE during active homing. The status remains TRUE during passive homing if the axis was already homed beforehand.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Done				
Command execution on the axis FALSE = A Motion Control command is active on the axis. TRUE = A Motion Control command is not active on the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Error				
Error status on the axis FALSE = No error is active on the axis. TRUE = An error occurred on the axis. Additional information about the error is available in automatic control at the "ErrorID" and "ErrorInfo" parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.StandStill				
Standstill of the axis FALSE = The axis is in motion. TRUE = The axis is at a standstill.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.PositioningCommand				
Execution of a positioning command FALSE = A positioning command is not active on the axis. TRUE = The axis is executing a positioning command of the "MC_MoveRelative" or MC_MoveAbsolute Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.VelocityCommand				
Execution of a command with velocity specification FALSE = A command with velocity specification is not active on the axis. TRUE = The axis is executing a motion command with velocity specification of the "MC_MoveVelocity" or MC_MoveJog Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HomingCommand				
Execution of a homing command FALSE = A homing command is not active on the axis. TRUE = The axis is executing a homing command of the "MC_Home" Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.CommandTableActive				
Execution of a command table FALSE = A command table is not active on the axis. TRUE = The axis is controlled by "MC_CommandTable" Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.ConstantVelocity				
Constant velocity FALSE = The axis is accelerating, decelerating, or at a standstill. TRUE = The setpoint velocity has been reached. The axis is moving at constant velocity.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Accelerating				
Acceleration process FALSE = The axis is decelerating, moving at constant velocity, or at a standstill. TRUE = The axis is accelerating.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Decelerating				
Deceleration process FALSE = The axis is accelerating, moving at constant velocity, or at a standstill. TRUE = The axis is decelerating.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.ControlPanelActive				
Activation status of the axis control panel FALSE = "Automatic mode" is activated. The user program has control priority over the axis. TRUE = The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the axis. The axis cannot be controlled from the user program.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.DriveReady				
Operational status of the drive FALSE = The drive is not ready. Setpoints will not be executed. TRUE = The drive is ready. Setpoints can be executed.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.RestartRequired				
Restart of axis required FALSE = A restart of the axis is not required. TRUE = Values were modified in the load memory. To download the values to the work memory while the CPU is in RUN mode, the axis must be restarted. Use the MC_Reset Motion Control instruction to do this.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.SWLimitMinActive				
Status of the low software limit switch FALSE = The axis is kept within its configured work area. TRUE = The low software limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.SWLimitMaxActive				
Status of the high software limit switch FALSE = The axis is kept within its configured work area. TRUE = The high software limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HWLimitMinActive				
Status of the low hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The low hardware limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HWLimitMaxActive				
Status of the high hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The high hardware limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<axis name>.StatusBits.AxisSimulation				
Simulation enabled FALSE = Simulation is disabled TRUE = Simulation is enabled				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<axis name>.StatusBits.NonPositionControlled				
Position control enabled FALSE = The axis is not in position-controlled mode. TRUE = The axis is in position-controlled mode.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

ErrorBits tags as of V6 (S7-1200)

Legend

Data type	Data type of tag
Start value	Start value of tag

Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.ErrorBits.SystemFault				
Internal system error				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.ConfigFault				
Incorrect configuration of the axis				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.DriveFault				
Error in the drive. Loss of the "Drive ready" signal.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.SWLimit				
Software limit switch reached or exceeded				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.HWLimit				
Hardware limit switch reached or exceeded				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP	-	X

<Axis name>.ErrorBits.DirectionFault				
Impermissible motion direction				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP, RP	-	X

<Axis name>.ErrorBits.HWUsed				
Another axis is using the same PTO (Pulse Train Output) and is enabled with "MC_Power".				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<AxisName>.ErrorBits.SensorFault (Positioning axis technology object as of V5)				
Error in the encoder system				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.CommunicationFault (Positioning axis technology object as of V5)				
Communication error Error in communication with a connected device.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.FollowingErrorFault (Positioning axis technology object as of V5)				
Maximum permitted following error exceeded				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.ErrorBits.PositioningFault (Positioning axis technology object as of V5)				
Positioning error The axis was not correctly positioned at the end of a positioning motion.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

Update of the technology object tags (S7-1200)

The status and error information of the axis indicated in the technology object tags is updated at each cycle control point.

Changes to the values of configuration tags do not take effect immediately. For information on the conditions under which a change takes effect, refer to the detailed description of the relevant tag.

13.2.11.10 Versions V1...5 (S7-1200)

CPU outputs relevant for motion control (technology version V1...3) (S7-1200)

The number of usable drives depends on the CPU, the number of PTOs (pulse train outputs) and the number of available pulse generator outputs.

The following tables provide information about the relevant dependencies:

Maximum number of PTOs

The maximum number of controllable PTOs (drives) depends on the article number of the CPU:

CPU article number	Number of PTOs
xxxxxxx-1xx**30**-xxxx	2
xxxxxxx-1xx**31**-xxxx	4

The maximum number of controllable PTOs (drives) applies regardless of the use of a signal board.

Usable pulse generator outputs

The CPU provides one pulse output and one direction output for controlling a stepper motor drive or a servo motor drive with pulse interface. The pulse output provides the drive with the pulses required for motor motion. The direction output controls the travel direction of the drive.

Pulse and direction outputs are permanently assigned to one another and form a pulse generator output. Onboard CPU outputs or outputs of a signal board can be used as pulse generator outputs. You select between onboard CPU outputs and outputs of the signal board during device configuration under Pulse generators (PTO/PWM) on the "Properties" tab.

The following table shows the number of usable drives per CPU or signal board:

CPU		On-board	Signal board				
			DI2/DO2 x DC24V 20kHz	DI2/DO2 x DC24V 200kHz	DO4 x DC24V 200kHz	DI2/DO2 x DC5V 200kHz	DO4 x DC5V 200kHz
CPU 1211C, CPU 1212C, CPU 1214C (MLFB - article number xxxxxxx-1xx**30**-xxxx)	DC/DC/DC	2	2	2	2	2	2
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1211C (MLFB - article number xxxxxxx-1xx**31**-xxxx)	DC/DC/DC	2	3	3	4	3	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1212C (MLFB - article number xxxxxxx-1xx**31**-xxxx)	DC/DC/DC	3	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1214C (MLFB - article number xxxxxxx-1xx**31**-xxxx)	DC/DC/DC	4	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1215C	DC/DC/DC	4	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2

The following table shows the address assignment of the pulse and direction outputs:

CPU S7-1200		PTO1 outputs [1]		PTO2 outputs [2]		PTO3 outputs [1]		PTO4 outputs [2]	
		Pls.	Dir.	Pls.	Dir.	Pls.	Dir.	Pls.	Dir.
CPU 1211C, CPU 1212C, CPU 1214C, CPU1215C (DC/DC/DC)	CPU	Ax.0	Ax.1	Ax.2	Ax.3	Ax.4	Ax.5	Ax.6	Ax.7
	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3

CPU S7-1200		PTO1 outputs [1]		PTO2 outputs [2]		PTO3 outputs [1]		PTO4 outputs [2]	
		Pls.	Dir.	Pls.	Dir.	Pls.	Dir.	Pls.	Dir.
CPU 1211C, CPU 1212C, CPU 1214C, CPU 1215C (AC/DC/ RLY)	CPU	-	-	-	-	-	-	-	-
	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3
CPU 1211C, CPU 1212C, CPU 1214C, CPU 1215C (DC/DC/ RLY)	CPU	-	-	-	-	-	-	-	-
	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3

x = Initial byte address of onboard CPU outputs (default value = 0)

y = Initial byte address of signal board outputs (default value = 4)

[1] If a DC/DC/DC CPU variant is used together with a DI2/DO2 signal board, the signals of the PTO1/3 can be generated via the onboard CPU outputs or via the signal board.

[2] If a DC/DC/DC CPU variant is used together with a DO4 signal board, the signals for PTO1/3 or PTO2/4 can be generated via the onboard CPU outputs or via the signal board.

PTO3 and PTO4 are only available for CPUs with the article numbers xxxxxxx-1xx**31**-xxxx.

Note

Access to pulse generator outputs via the process image

The firmware takes control via the corresponding pulse generator outputs if the PTO (Pulse Train Output) is selected and assigned to an axis.

With this takeover of the control function, the connection between the process image and I/O output is also disconnected. Although the user has the option of writing the process image of pulse generator outputs via the user program or watch table, this is not transferred to the I/O output. Accordingly, it is also not possible to monitor the I/O output via the user program or watch table. The information read reflects the value of the process image and does not match the real status of the I/O output.

For all other CPU outputs that are not used permanently by the CPU firmware, the status of the I/O output can be controlled or monitored via the process image, as usual.

Limit frequencies of pulse outputs

The following limit frequencies apply to the pulse outputs:

Pulse output	Limit frequencies for technology object positioning axis V1	Limiting frequencies of the technology object positioning axis V2/V3 with CPU < V3.0	Limiting frequencies of the technology object positioning axis V2/V3 with CPU V3.0
On-board (MLFB article number xxxxxxx-1xx**30**-xxxx)	2 Hz ≤ f ≤ 100 kHz	2 Hz ≤ f ≤ 100 kHz	1 Hz ≤ f ≤ 100 kHz
On-board (MLFB - article number xxxxxxx-1xx**31**xxxx)	2 Hz ≤ f ≤ 100 kHz (PTO 1+2) 2 Hz ≤ f ≤ 20 kHz (PTO 3+4)	2 Hz ≤ f ≤ 100 kHz (PTO 1+2) 2 Hz ≤ f ≤ 20 kHz (PTO 3+4)	1 Hz ≤ f ≤ 100 kHz (PTO 1+2) 1 Hz ≤ f ≤ 20 kHz (PTO 3+4)
Signal board DI2/DO2 x DC24V 20kHz	2 Hz ≤ f ≤ 20 kHz	2 Hz ≤ f ≤ 20 kHz	1 Hz ≤ f ≤ 20 kHz
Signal board DI2/DO2 x DC24V 200kHz	2 Hz ≤ f ≤ 100 kHz	2 Hz ≤ f ≤ 200 kHz	1 Hz ≤ f ≤ 200 kHz
Signal board DO4 x DC24V 200kHz	2 Hz ≤ f ≤ 100 kHz	2 Hz ≤ f ≤ 200 kHz	1 Hz ≤ f ≤ 200 kHz
Signal board DI2/DO2 x DC5V 200kHz	2 Hz ≤ f ≤ 100 kHz	2 Hz ≤ f ≤ 200 kHz	1 Hz ≤ f ≤ 200 kHz
Signal board DO4 x DC5V 200kHz	2 Hz ≤ f ≤ 100 kHz	2 Hz ≤ f ≤ 200 kHz	1 Hz ≤ f ≤ 200 kHz

Drive signals

For motion control, you can optionally parameterize a drive interface for "Drive enabled" and "Drive ready". When using the drive interface the digital output for the drive enable and the digital input for "drive ready" can be freely selected.

Acceleration/deceleration limits

The following limits apply to acceleration and deceleration:

Acceleration/deceleration	Value (CPU < V3.0)	Value (CPU V3.0)
Minimum acceleration/deceleration	2.8E-1 pulses/s^2	5.0E-3 pulses/s^2
Maximum acceleration/deceleration	9.5E+9 pulses/s^2	9.5E+9 pulses/s^2

Jerk limits

The following limits apply to the jerk:

Jerk	Value (CPU < V3.0)	Value (CPU V3.0)
Minimum jerk	4.0E-2 pulses/s^3	4.0E-3 pulses/s^3
Maximum jerk	1.5E+8 pulses/s^3	1.0E+10 pulses/s^3

CPU outputs relevant for motion control (Page 6143)

Configuration dialogs (S7-1200)

V1...3 (S7-1200)

Configuration - General ("Axis" technology object V1...3) (S7-1200)

Configure the basic properties of the "Axis" technology object in the "General" configuration window.

Axis name:

Define the name of the axis or the name of the "Axis" technology object in this box. The technology object is listed under this name in the project navigation.

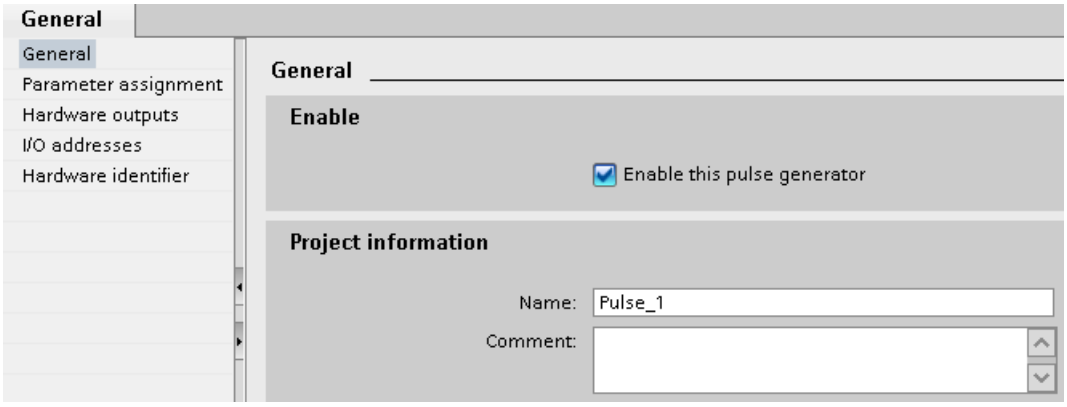
Hardware interface

The pulses are output to the power unit of the drive by fixed assigned digital outputs.

In CPUs with relay outputs, the pulse signal cannot be output on these outputs because the relays do not support the necessary switching frequencies. A signal board with digital outputs must be used to enable you to work with the PTO (Pulse Train Output) on these CPUs.

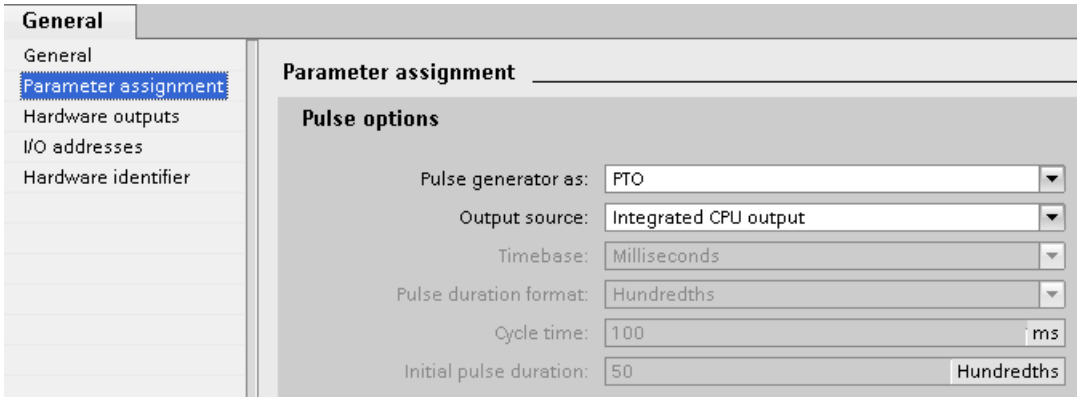
Note

The PTO requires the functionality of a fast counter (HSC). An HSC is used for this purpose with CPU version <V3.0. The HSC is then no longer available to the user. An internal HSC is used for this with CPU version ≥ V3.0.



The count can not be evaluated from its input address.

The assignment between PTO and HSC is fixed. When the user activates PTO1, it is connected to the HSC1. If the PTO2 is activated, this is connected with the HSC2.



In the "Pulse generator selection" drop-down list, select the PTO (Pulse Train Output) which is to provide the pulses for controlling the stepper motors or servo motors with pulse interface. If the pulse generators and high-speed counters are not used elsewhere in the device configuration, the hardware interface can be configured automatically. In this case, the PTO selected in the drop-down list is displayed with a white background. The interfaces used are listed in the output boxes "Output source", "Pulse output", "Direction output" and "Assigned fast counter".

Proceed as follows if you wish to change the interfaces or if the PTO could not be automatically configured (entry in the "Pulse generator selection" drop-down list is highlighted in red):

1. Click on the "Device configuration" button.
   The pulse generator device configuration opens.
   Enlarge the property window of the device configuration if the configuration of the pulse generator is not visible.

2. Select the "Enable this pulse generator" check box.
3. Select the "Parameter assignment" entry in the area navigation.
   The "Parameter assignment" opens.

4. In the "Pulse generator as:" dropdown list select the "PTO" entry.
5. In the "Output source:" dropdown list select the "Integrated CPU output" or "Signal board output" entry. The "Signal board output" entry can only be selected for PTO1 or for PTO1 and PTO2 depending on the installed signal board. For more detailed information, see section: CPU outputs relevant for motion control (Page 6143)
6. Go back to the axis configuration.
   Unless the corresponding fast counter has already been used elsewhere, the PTO boxes of the "General" axis configuration are not shaded red. If this is not the case, correct the configuration based on the error messages.

User unit

Select the desired unit for the dimension system of the axis in the dropdown list. The selected unit is used for additional configuration of the "Axis" technology object and for displaying the current axis data.

The values at the input parameters (Position, Distance, Velocity, ...) of the Motion Control instructions also refer to this unit.

Note

Later changing of the dimension system may not be converted correctly in all the configuration windows of the technology object. In this case check the configuration of all axis parameters.

The values of the input parameters of the Motion Control instructions may have to be adapted to the new unit of measurement in the user program.

See also

Configuration - General (Page 6184)

Configuration - Homing ("Axis" technology object V1) (S7-1200)

Configure the parameters for active and passive homing in the "Homing" configuration window. The homing method is set using the "Mode" input parameter of the Motion Control instruction. Here, Mode = 2 means passive homing and Mode = 3 means active homing.

Reference point switch input

Select the digital input for the reference point switch from the drop-down list. The input must be interrupt-capable. The onboard CPU inputs and the inputs of an inserted signal board can be selected as inputs for the reference point switch.

Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a reference point switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the reference point switch, the reference point may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the reference point switch.

Permitting direction reversal after reaching the HW limit switch (active homing only)

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be activated for direction reversal. If the CPU firmware V1.0 is used, both hardware limit switches must be configured. If CPU firmware as of V2.0 is used, only the hardware limit switch in the approach direction must be configured.

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The reference point switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

Note

Use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low
- Increase the configured acceleration/deceleration
- Increase the distance between hardware limit switch and mechanical stop

Approach / homing direction (active and passive homing)

With the direction selection, you determine the "approach direction" used during active homing to search for the reference point switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the reference point switch to carry out the homing operation.

Refer to the table under "Reference point switches" for the effect of the approach direction setting on passive homing.

Side of the reference point switch (active and passive homing)

- Active homing
  This is where you select whether the axis is homed on the low or high end of the reference point switch.

  Note

  Depending on the start position of the axis and the configuration of the homing parameters, the homing procedure sequence can differ from the diagram in the configuration window.

- Passive homing
  With passive homing, the traversing motions for purposes of homing must be implemented by the user via motion commands. The end of the reference point switch on which homing occurs depends on the following factors:

  – "Approach direction" configuration

  – "Reference point switch" configuration

  – Current travel direction during passive homing

  The table below presents details on the effect of factors:

Influencing factors:			Result:
Configuration Approach direction	**Configuration Reference point switch**	**Current travel direction**	**Homing on Reference point switch**
Positive	"Bottom side"	Positive direction	**Top side**
		Negative direction	**Bottom side**
Positive	"Top side"	Positive direction	**Bottom side**
		Negative direction	**Top side**
Negative	"Bottom side"	Positive direction	**Bottom side**
		Negative direction	**Top side**
Negative	"Top side"	Positive direction	**Top side**
		Negative direction	**Bottom side**

Velocity (active homing only)

In this box, specify the velocity at which the reference point switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ approach velocity ≤ maximum velocity

Homing velocity (active homing only)

In this box, specify the velocity at which the axis approaches the reference point switch for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ Homing velocity ≤ Maximum velocity

Home position offset (active homing only)

If the desired home position deviates from the position of the reference point switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the reference point switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- -1.0e12 ≤ home position offset ≤ 1.0e12

Home position

The position configured in the Motion Control instruction "MC_Home" is used as the home position.

Configuration - Homing ("Axis" technology object V2...3) (S7-1200)

Configuration - Homing - General (Axis technology object V2...3) (S7-1200)

Configure the reference point switch input for active and passive homing in the "Homing - General" configuration window.

Reference point switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

See also

Sequence - Active homing (Page 6215)

Configuration - Homing - Passive (Axis technology object V2...3) (S7-1200)

Configure the necessary parameters for passive homing in the "Homing - Passive" configuration window.

The movement for passive homing must be triggered by the user (e.g. using an axis motion command). Passive homing is started using Motion Control instruction "MC_Home" with input parameter "Mode" = 2.

Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

Home position

The position configured in the Motion Control instruction "MC_Home" is used as the home position.

Note

If passive homing is carried out without an axis motion command (axis at a standstill), homing will be executed upon the next rising or falling edge at the homing switch.

Configuration - Homing - Active (Axis technology object V2...3) (S7-1200)

Configure the necessary parameters for active homing in the "Active homing" configuration window. Active homing is started using Motion Control instruction "MC_Home" with input parameter "Mode" = 3.

Permit auto reverse at the hardware limit switch

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be enabled for the reversal of direction (at least the hardware limit switch in the direction of approach must be configured).

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The homing switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

Note

If possible, use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low.
- Increase the configured acceleration/deceleration.
- Increase the distance between the hardware limit switch and the mechanical endstop.

Approach/homing direction

With the direction selection, you determine the approach direction used during active homing to search for the homing switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the homing switch to carry out the homing operation.

Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

Velocity

In this box, specify the velocity at which the homing switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ approach velocity ≤ maximum velocity

Homing velocity

In this box, specify the velocity at which the reference point switch is to be approached for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ Homing velocity ≤ Maximum velocity

Home position offset

If the desired home position deviates from the position of the homing switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the homing switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- -1.0e12 ≤ home position offset ≤ 1.0e12

Home position

The position configured in the Motion Control instruction "MC_Home" is used as the home position.

Changing configuration of dynamic values in user program ("Axis" technology object V1...3) (S7-1200)

You can change the following configuration parameters during runtime of the user program in the CPU:

Acceleration and deceleration

You can also change the values for acceleration and deceleration during runtime of the user program. Use the following technology object tags for this purpose:

- <Axis name>.Config.DynamicDefaults.Acceleration
  for changing acceleration
- <Axis name>.Config.DynamicDefaults.Deceleration
  for changing deceleration

Refer to the description of the technology object tags (Page 6420) in the appendix for information on when changes to the configuration parameters take effect.

Emergency stop deceleration

You can also change the value for the emergency stop deceleration during runtime of the user program. Use the following technology object tag for this purpose:

- <Axis name>.Config.DynamicDefaults.EmergencyDeceleration

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

NOTICE
After changes to this parameter, it may be necessary to adapt the positions of the hardware limit switches and other safety-relevant settings.

Jerk limit (as of technology object "Axis" V2.0)

You can also activate and deactivate the jerk limit at runtime of the user program and change the value for the jerk. Use the following technology object tags for this purpose:

- <Axis name>.Config.DynamicDefaults.JerkActive
  for activating and deactivating the jerk limit
- <Axis name>.Config.DynamicDefaults.Jerk
  for changing the jerk

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

See also

Changing the configuration of dynamics in the user program (Page 6209)

V4 (S7-1200)

Configuration - General (positioning axis technology object as of V4) (S7-1200)

Configure the basic properties of the positioning axis technology object in the "General" configuration window.

Axis name

Define the name of the axis or the name of the positioning axis technology object in this field. The technology object is listed under this name in the project tree.

Hardware interface

The pulses are output to the power unit of the drive by fixed assigned digital outputs.

In CPUs with relay outputs, the pulse signal cannot be output on these outputs because the relays do not support the necessary switching frequencies. A signal board with digital outputs must be used to enable you to work with the PTO (Pulse Train Output) on these CPUs.

Note

The PTO requires the functionality of a high-speed counter (HSC). An internal HSC is used for this, the count of which cannot be evaluated.

Selecting the pulse generator

In the drop-down list, select the PTO (Pulse Train Output) which is to provide the pulses for controlling the stepper motors or servo motors with pulse interface. If the pulse generators and high-speed counters are not used elsewhere in the device configuration, the hardware interface can be configured automatically. In this case, the PTO selected in the drop-down list is displayed with a white background.

"Device configuration" button

This button takes you to the settings for the pulse options in the device configuration of the CPU.

Signal type

Select the desired signal type in the drop-down list. The following signal types are available:

- **PTO (pulse A and direction B)**
  A pulse output and a direction output are used for controlling the stepper motor.
- **PTO (count up A, count down B)**
  One pulse output each for motion in positive direction and negative direction is used for controlling the stepper motor.
- **PTO (A/B phase offset)**
  Both pulse outputs for Phase A and for Phase B run at the same frequency.
  The period of the pulse outputs is evaluated at the drive end as a step.
  The phase offset between Phase A and Phase B determines the direction of the motion.
- **PTO (A/B phase offset - quadruple)**
  Both pulse outputs for Phase A and for Phase B run at the same frequency.
  All positive edges and all negative edges of Phase A and Phase B are evaluated as a step at the drive end.
  The phase offset between Phase A and Phase B determines the direction of the motion.

Pulse output (signal type "PTO (pulse A and direction B)")

Select the desired output for the pulse output in this field.

You can select the output using a symbolic address or assign it to an absolute address.

Activate direction output (signal type "PTO (pulse A and direction B)")

You can deactivate and activate the direction output in "pulse and direction" mode. This option enables you to limit the motion direction.

Direction output (signal type "PTO (pulse A and direction B)")

Select the desired output for the direction output in this field.

You can select the output using a symbolic address or assign it to an absolute address.

Pulse output up (signal type "PTO (count up A, count down B)")

Select the desired pulse output for motions in positive direction in this field.

You can select the output using a symbolic address or assign it to an absolute address.

Pulse output down (signal type "PTO (count up A, count down B)")

Select the desired pulse output for motions in negative direction in this field.

You can select the output using a symbolic address or assign it to an absolute address.

Phase A (signal types "PTO (A/B phase offset)" and "PTO (A/B phase offset - quadruple)")

Select the desired pulse output for Phase A signals in this field.

You can select the output using a symbolic address or assign it to an absolute address.

Phase B (signal types "PTO (A/B phase offset)" and "PTO (A/B phase offset - quadruple)")

Select the desired pulse output for Phase B signals in this field.

You can select the output using a symbolic address or assign it to an absolute address.

User unit

Select the desired unit for the dimension system of the axis in the drop-down list. The selected unit is used for further configuration of the positioning axis technology object and for displaying the current axis data.

The values at the input parameters (Position, Distance, Velocity, ...) of the Motion Control instructions also refer to this unit.

Note

Later changing of the dimension system may not be converted correctly in all the configuration windows of the technology object. In this case check the configuration of all axis parameters.

The values of the input parameters of the Motion Control instructions may have to be adapted to the new unit of measurement in the user program.

Configuration - Drive signals (positioning axis technology object V4) (S7-1200)

Configure the output for drive enable and the input for the "Drive ready" feedback signal of the drive in the "Drive signals" configuration window.

Drive enable is controlled by Motion Control instruction "MC_Power" and enables power to the drive. The signal is provided to the drive via the output to be configured.

The drive signals "Drive ready" to the CPU if it is ready to start executing travel after receipt of drive enable. The "Drive ready" signal is reported back to the CPU via the input to be configured.

If the drive does not have any interfaces of this type, you will not have to configure the parameters. In this case, select the value TRUE for the ready input.

See also

Configuration - Mechanics (positioning axis technology object V4) (Page 6379)

Position limits (Page 6198)

Dynamics (Page 6203)

Homing (positioning axis technology object as of V2) (Page 6211)

Configuration - Mechanics (positioning axis technology object V4) (S7-1200)

Configure the mechanical properties of the drive in the "Mechanics" configuration window.

Increments per motor revolution

Configure the number of pulses required for one revolution of the motor in this box.

Limits (independent of the selected unit of measurement):

- 0 < Pulse per motor revolution ≤ 2147483647

Distance per revolution

In this box, configure the load distance per motor revolution covered by the mechanical system of your unit.

Limits (independent of the selected unit of measurement):

- 0.0 < Distance per revolution ≤ 1.0e12

Permitted direction of rotation (technology version as of V4)

Configure this box to determine whether the mechanics of your system are to move in both directions or only in the positive or negative direction.

If you have not activated the direction output of the pulse generator in the "PTO (pulse A and direction B)" mode, the selection is limited to the positive or negative direction.

Invert direction

You can use the "Invert direction" check box to adapt the control system to the direction logic of the drive.

The direction logic is inverted according to the selected mode of the pulse generator:

- **PTO (pulse A and direction B)**
  - 0 V at direction output ⇒ positive direction of rotation
  - 5 V/24 V at direction output ⇒ negative direction of rotation

  The specified voltage depends on the hardware used. The indicated values do not apply to the differential outputs of CPU 1217.
- **PTO (count up A, count down B)**
  The outputs "Pulse output down" and "Pulse output up" are swapped.
- **PTO (A/B phase offset)**
  The "Phase A" and "Phase B" outputs are swapped.
- **"PTO (A/B phase offset - quadruple)**
  The "Phase A" and "Phase B" outputs are swapped.

Relationship between the signal type and the direction of travel (Page 6146)

Position limits (Page 6198)

Dynamics (Page 6203)

Homing (positioning axis technology object as of V2) (Page 6211)

Configuration - Homing - Passive (Positioning axis technology object V4) (S7-1200)

Configure the necessary parameters for passive homing in the "Homing - Passive" configuration window.

The movement for passive homing must be triggered by the user (e.g. using an axis motion command). Passive homing is started using Motion Control instruction "MC_Home" with input parameter "Mode" = 2.

Homing switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

Home position

The position configured in the Motion Control instruction "MC_Home" is used as the home position.

Note

If passive homing is carried out without an axis motion command (axis at a standstill), homing will be executed upon the next rising or falling edge at the homing switch.

Configuration - Homing - Active (Positioning axis technology object V4) (S7-1200)

Configure the necessary parameters for active homing in the "Active homing" configuration window. Active homing is started using Motion Control instruction "MC_Home" with input parameter "Mode" = 3.

Homing switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

Allowing direction reversal at the hardware limit switch

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be enabled for the reversal of direction (at least the hardware limit switch in the direction of approach must be configured).

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The homing switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

Note

If possible, use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low.
- Increase the configured acceleration/deceleration.
- Increase the distance between the hardware limit switch and the mechanical endstop.

Approach/homing direction

With the direction selection, you determine the approach direction used during active homing to search for the homing switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the homing switch to carry out the homing operation.

Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

Approach velocity

In this box, specify the velocity at which the homing switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ approach velocity ≤ maximum velocity

Homing velocity

In this box, specify the velocity at which the homing switch is to be approached for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity ≤ Homing velocity ≤ Maximum velocity

Home position offset

If the desired home position deviates from the position of the homing switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the homing switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- -1.0e12 ≤ home position offset ≤ 1.0e12

Home position

The position configured in the Motion Control instruction "MC_Home" is used as the home position.

Diagnostics - Status and error bits ("Axis" technology object V1...3) (S7-1200)

You use the "Status and error bits" diagnostic function to monitor the most important status and error messages for the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The status error messages have the following meaning:

Status of the axis

Status	Description
Enabled	The axis is enabled and ready to be controlled via Motion Control commands. (Tag of technology object: <Axis name>.StatusBits.Enable)
Homed	The axis is homed and is capable of executing absolute positioning commands of Motion Control instruction "MC_MoveAbsolute". The axis does not have to be homed for relative positioning. Special situations: • During active homing, the status is FALSE. • If a homed axis undergoes passive homing, the status is set to TRUE during passive homing. (Tag of technology object: <Axis name>.StatusBits.HomingDone)
Axis error	An error has occurred in the "Axis" technology object. Additional information about the error is available in automatic control at the ErrorID and ErrorInfo parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error. (Tag of technology object: <Axis name>.StatusBits.Error)
Axis control panel enabled	The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the "Axis" technology object. The axis cannot be controlled from the user program. (Tag of technology object: <Axis name>.StatusBits.ControlPanelActive)
Restart necessary	A modified configuration of the axis was downloaded to the load memory in CPU RUN operating mode. To download the modified configuration to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this.

Drive status

Status	Description
Drive ready	The drive is ready for operation. (Tag of technology object: <Axis name>.StatusBits.DriveReady)
Drive error	The drive has reported an error due to loss of its "Drive ready" signal. (Tag of technology object: <Axis name>.ErrorBits.DriveFault)

Status of the axis motion

Status	Description
Standstill	The axis is at a standstill. (Tag of technology object: <Axis name>.StatusBits.StandStill)
Acceleration	The axis accelerates. (Tag of technology object: <Axis name>.StatusBits.Acceleration)
Constant velocity	The axis travels at constant velocity. (Tag of technology object: <Axis name>.StatusBits.ConstantVelocity)
Deceleration	The axis decelerates (slows down). (Tag of technology object: <Axis name>.StatusBits.Deceleration)

Status of the motion mode

Status	Description
Positioning	The axis executes a positioning command of the Motion Control instruction "MC_MoveAbsolute", "MC_MoveRelative" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.PositioningCommand)
Travel with velocity specification	The axis executes a command with velocity specification of the Motion Control instruction "MC_MoveVelocity", "MC_MoveJog" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.SpeedCommand)
Homing	The axis executes a homing command of the Motion Control instruction "MC_Home" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.Homing)
Command table active (as of technology object Axis V2.0)	The axis is controlled by Motion Control instruction "MC_CommandTable". (Tag of technology object: <Axis name>.StatusBits.CommandTableActive)

Error messages

Error	Description
Lower SW limit switch was reached	The lower software limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMinReached)
Lower SW limit switch was exceeded	The lower software limit switch has been exceeded. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMinExceeded)
Upper SW limit switch was reached	The upper software limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMaxReached)
Upper SW limit switch was exceeded	The upper software limit switch has been exceeded. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMaxExceeded)
Lower HW limit switch was reached	The lower hardware limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.HwLimitMin)
Upper HW limit switch was reached	The upper hardware limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.HwLimitMax)
PTO and HSC already in use	A second axis is using the same PTO (Pulse Train Output) and HSC (High Speed Counter) and is enabled with "MC_Power". (Tag of technology object: <Axis name>.ErrorBits.HwUsed)
Configuration error	The "Axis" technology object was incorrectly configured or editable configuration data were modified incorrectly during runtime of the user program. (Tag of technology object: <Axis name>.ErrorBits.ConfigFault)
Internal error	An internal error has occurred. (Tag of technology object: <Axis name>.ErrorBits.SystemFault)

ErrorIDs and ErrorInfos (S7-1200)

List of ErrorIDs and ErrorInfos (technology objects V4...5) (S7-1200)

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

Depending on the error reaction, the axis is stopped in the case of operating errors with stop of axis. The following error reactions are possible:

- **Remove enable**
  The setpoint zero is output and the enable is removed. The axis is braked depending on the configuration in the drive, and is brought to a standstill.
- **Stop with emergency stop ramp**
  Active motion commands are aborted. The axis is braked with the emergency stop deceleration configured under "Technology object > Extended parameters > Dynamics > Emergency stop ramp" without any jerk limit and brought to a standstill.

Operating error with axis stop

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8000		**Drive error, loss of "Drive ready"**		-
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary	
16#8001		**Low SW limit switch has been tripped**		-
	16#000E	The position of the low SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch	
	16#000F	The position of the low SW limit switch was reached with the emergency stop deceleration		
	16#0010	The position of the low SW limit switch was exceeded with the emergency stop deceleration		Remove enable
16#8002		**High SW limit switch has been tripped**		-
	16#000E	The position of the high SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch	
	16#000F	The position of the high SW limit switch was reached with the emergency stop deceleration		
	16#0010	The position of the high SW limit switch was exceeded with the emergency stop deceleration		Remove enable

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8003		**Low HW limit switch was reached**		For drive connection via PTO (Pulse Train Output): Stop with emergency stop ramp For drive connection via PROFIdrive/analog output: Remove enable
	16#000E	The low HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.	
16#8004		**High HW limit switch was reached**		For drive connection via PTO (Pulse Train Output): Stop with emergency stop ramp For drive connection via PROFIdrive/analog output: Remove enable
	16#000E	The high HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.	
16#8005		**PTO/HSC are already being used by another axis**		-
	16#0001	-	**The axis was configured incorrectly:** Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller	
			More than one axis is to run with one PTO: Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6290))	
16#8006		**A communication error in the control panel has occurred**		Remove enable
	16#0012	A timeout has occurred	Check the cable connection and press the "Manual control" button again	
16#8007		**The axis cannot be enabled**		-
	16#0025	Restarting	Wait until the axis restart is complete.	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8008		**Invalid direction of motion**		-
	16#002E	The selected motion direction is not allowed.	• Adjust the motion direction and restart the command. • Adjust the allowed direction of rotation in the technology object configuration under "Extended parameters > Mechanics". Restart the command.	
	16#002F	A reversing motion is not possible with the selected motion direction.		
16#8009		**Reference switch/encoder zero mark not found**		Stop with emergency stop ramp
	16#0033	Error in the configuration, hardware or installation of the encoder or at the homing switch.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.	
16#800A		**Alarm message from encoder**		Remove enable
	16#0001	-	Check the device with regard to function, connections and I/Os.	
	16#0034	Hardware error at encoder		
	16#0035	Encoder dirty		
	16#0036	Error during reading of encoder absolute value	Compare the encoder type in the drive or encoder parameter P979 with the configuration data of the technology object.	
	16#0037	Zero mark monitoring of the encoder	Encoder reports error in zero mark monitoring (fault code 0x0002 in Gx_XIST2, see PROFIdrive profile). Check the plant for electromagnetic compatibility (EMC).	
	16#0038	Encoder is in "Parking" state	• Search for the cause of the error in the connected drive or encoder. • Check whether the error message was possibly triggered by a commissioning action at the drive or encoder.	
	16#0040	PROFIdrive: Encoder on bus failed (station failure).	Check the device with regard to function, connections and I/Os.	
	16#0041	PROFIdrive: Signs of life of encoder faulty.		
16#800B		**Range violation of the position**		Remove enable
	16#0039	Range violation in positive direction	Home the axis to a valid actual value range.	
	16#003A	Range violation in negative direction		
	16#003B	The change of the actual position in a position control clock cycle is greater than the modulo length.	Adjust the modulo length of the employed encoder.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#800C		**Alarm message from drive**		Remove enable
	16#0001	-	Check the device with regard to function, connections and I/Os. In the "Tuning" dialog box, select a smaller gain (Kv).	
	16#003C	PROFIdrive: Drive signal "Control requested" failed.		
	16#003D	PROFIdrive/analog drive connection: Drive has shut down.		
	16#003E	PROFIdrive: Drive on bus failed (station failure)		
	16#003F	PROFIdrive: Signs of life of drive faulty.	• Check the device with regard to function, connections and I/Os. • Compare the clock parameters of HW Config (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be configured with the same clock cycle time.	
16#800D		**The permitted following error was exceeded**		Remove enable
	16#0001	-	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of following error monitoring.	
16#800E		**Error at the hardware limit switch**		Remove enable
	16#0042	Illegal free travel direction with active hardware limit switch	The programmed direction of movement is disabled due to the active hardware limit switch. Retract the axis in the opposite direction.	
	16#0043	Hardware limit switch polarity is reversed, axis cannot be freed	Check the mechanical configuration of the hardware limit switch.	
	16#0044	Both hardware limit switches are active, axis cannot be freed		
16#800F		**Error in target range**		Remove enable
	16#0045	Target range not reached	Target range was not reached within the positioning tolerance time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.	
	16#0046	Exit target range again	The target range was exited within the minimum dwell time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.	

ErrorID	ErrorInfo	Description	Remedy	Error reaction
16#8010		**Position of the low SW limit switch is greater than that of the high SW limit switch when the axis is not a modulo axis**		Remove enable
	16#0001	-	Change the position of the software limit switches.	

Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8200		**Axis is not enabled**	
	16#0001	-	Enable the axis; restart the command
16#8201		**Axis has already been enabled by another "MC_Power" instance**	
	16#0001	-	Enable the axis with only one "MC_Power" instance
16#8202		**The maximum number of simultaneous motion control commands has been exceeded (max. 200 commands for drive connection via PTO (Pulse Train Output), max. 100 commands for drive connection via PROFIdrive/analog output)**	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
16#8203		**Axis is currently operated in "Manual control" (axis control panel)**	
	16#0001	-	Exit "Manual control"; restart the command
16#8204		**Axis is not homed**	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
16#8205		**The axis is currently controlled by the user program (the error is only displayed in the axis control panel)**	
	16#0013	The axis is enabled in the user program	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
16#8206		**Technology object not activated yet**	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
16#8207		**Command rejected**	

ErrorID	ErrorInfo	Description	Remedy
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt".
	16#0018	The axis cannot be moved with a command table while it is being actively or passively homed.	Wait until direct or passive homing is complete.
	16#0019	The axis cannot be actively or passively homed while a command table is being processed.	Wait for command table to finish or abort the command table with a motion command, for example, "MC_Halt".
	16#0052	The specified position exceeds the numerical limit.	Enter a valid position value at the Motion Control instruction.
	16#0053	The axis is ramping up.	Wait until the axis is ready for operation.
	16#0054	Actual value is invalid	To execute a "MC_Home" command, the actual values must be valid. Check the status of the actual values. The tag of the technology object <Axis name>."StatusSensor.State" must show the value 2 (valid).
16#8208		**Difference between maximum and start/stop velocity is invalid**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#8209		**Invalid acceleration for technology object "Axis"**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#820A		**It is not possible to restart the axis**	
	16#0013	The axis is enabled in the user program	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	Exit "Manual control"; restart again
	16#002C	The axis is not disabled.	Disable the axis; restart the command
	16#0047	The technology object is not ready for restart.	Download the project again.
	16#0048	Condition for restart of the technology object is not satisfied.	Disable the technology object.
16#820B		**It is not possible to execute the command table**	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.
16#820C		**No configuration available**	
	16#0001	-	Internal error Contact the hotline.

Block parameter error

ErrorID	ErrorInfo	Description	Remedy
16#8400		**Invalid value at parameter "Position" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	

ErrorID	ErrorInfo	Description	Remedy
16#8401		**Invalid value at parameter "Distance" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
16#8402		**Invalid value at parameter "Velocity" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
	16#0024	Value is less than 0	
16#8403		**Invalid value at parameter "Direction" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
16#8404		**Invalid value at parameter "Mode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	The direction reversal is activated at the hardware limit switch, despite the fact that the hardware limit switches are disabled	• Activate the HW limit switch using the tag <Axis name>.PositionLimitsHW.Active = TRUE, restart the command • Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0055	Invalid mode at incremental encoder	Start a homing process for an incremental encoder using parameter "Mode" = 0, 1, 2, 3.
	16#0056	Invalid mode at absolute encoder	Passive and active homing ("Mode" = 2, 3) are not possible for an absolute value encoder. Start a homing process for an absolute encoder using parameter "Mode" = 0, 1.
16#8405		**Invalid value at parameter "StopMode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again
16#8406		**Simultaneous forward and backward jogging is not allowed**	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
16#8407		**Switching to another axis with instruction "MC_Power" is only permitted after disabling the active axis.**	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.
16#8408		**Invalid value at parameter "Axis" of the Motion Control instruction**	

ErrorID	ErrorInfo	Description	Remedy
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#8409		**Invalid value at parameter "CommandTable" of the Motion Control instruction**	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#840A		**Invalid value at parameter "StartStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001D	The start step is greater than the end step	
	16#001E	Value is greater than 32	
16#840B		**Invalid value at parameter "EndStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001E	Value is greater than 32	
16#840C		**Invalid value at parameter "RampUpTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840D		**Invalid value at parameter "RampDownTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840E		**Invalid value at parameter "EmergencyRampTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840F		**Invalid value at parameter "JerkTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#8410		**Invalid value at parameter "Parameter" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000B	Address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0028	Data type of VARIANT pointer "Parameter" and "Value" do not match.	Use a suitable data type; restart command
	16#0029	VARIANT pointer "Parameter" does not point to a data block of the technology object.	Correct the VARIANT pointer; restart the command
	16#002A	The value at the VARIANT pointer "Parameter" cannot be read.	Correct the VARIANT pointer; restart the command
	16#002B	The value at the VARIANT pointer "Parameter" cannot be written.	Correct the VARIANT pointer or value; restart the command
	16#002C	The axis is not disabled.	Disable the axis; restart the command

ErrorID	ErrorInfo	Description	Remedy
16#8411		**Invalid value at parameter "Value" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command

Configuration error of the axis

ErrorID	ErrorInfo	Description	Remedy
16#8600		**Parameter assignment of pulse generator (PTO is invalid**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
16#8601		**Parameter assignment of the high-speed counter (HSC) is invalid**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
16#8602		**Invalid parameter assignment of "Enable output"**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8603		**Invalid parameter assignment of "Ready input"**	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8604		**Invalid "Pulses per motor revolution" value**	
	16#000A	Value is less than or equal to zero	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8605		**Invalid "Distance per revolution" value**	
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#000A	Value is less than or equal to zero	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8606		**Invalid "Start/stop velocity" value**	
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
16#8607		**Invalid "maximum velocity" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8608		**Invalid "Acceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8609		**Invalid "Deceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#860A		**Invalid "Emergency stop deceleration" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#860B		**Value for position of the low SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	The position value of the low software limit switch is greater than that of the high software limit switch	
16#860C		**Value for position of the high SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#860D		**Invalid address of the low HW limit switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#860E		**Invalid address of the high HW limit switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#860F		**Invalid "home position offset" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8610		**Invalid "approach velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8611		**Invalid "Homing velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8612		**Invalid address of the homing switch**	
	16#000B	Invalid address	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000C	The address of the falling edge is invalid	
	16#000D	The address of the rising edge is invalid	
16#8613		**During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured**	

ErrorID	ErrorInfo	Description	Remedy
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8614		**Invalid "Jerk" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#001F	Value is greater than the maximum jerk	
	16#0020	Value is less than the minimum jerk	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8615		**Value for "Unit of measurement" is invalid**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8616		**Address of homing switch is invalid (passive homing as of V4)**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8617		**Value of tag <Axis name>.Sensor.Sensor[1].ActiveHoming.Mode is invalid**	
	16#0011	The selection value is invalid (Valid value: 2 = Homing via digital input)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8618		**Value of tag <Axis name>.Sensor.Sensor[1].PassiveHoming.Mode is invalid**	

ErrorID	ErrorInfo	Description	Remedy
	16#0011	The selection value is invalid (Valid value: 2 = Homing via digital input)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8619		**Value of tag <Axis name>.Actor.Type is invalid**	
	16#0011	The selection value is invalid (Valid value: 2 = Connection via pulse interface)	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861A		**Value for "Permitted direction of rotation" is invalid**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#002D	"Both directions" not allowed when direction output is deactivated	
16#861B		**Faulty load gear factors**	
	16#0031	Valid is invalid.	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#861C		**Illegal combination of data for homing with incremental encoder**	
	16#0031	Valid is invalid.	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861D		**The set encoder mounting type is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Mounting-Mode**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#861E		**The configuration of the measuring wheel circumference of the encoder is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.DistancePerRevolution**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary

ErrorID	ErrorInfo	Description	Remedy
16#861F		**The configuration for the resolution of the linear encoder is faulty. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.Resolution**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8620		**The set fine resolution for Gn_XIST1 is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist1**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8621		**The set fine resolution for Gn_XIST1 in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist1 is not consistent with the setting in PROFIdrive parameter P979**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8622		**Invalid value for the configuration date <Axis name>.Actor.Interface.AddressIn or <Axis name>.Actor.Interface.AddressOut**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8623		**The value set in the tag <Axis name>.Sensor.Sensor[1].Type is invalid.**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8624		**The set encoder system is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].System**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8625		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.MinDwellTime**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary

ErrorID	ErrorInfo	Description	Remedy
16#8626		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.Window**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8627		**The configuration of the PROFIdrive interface of the actual value is faulty. Invalid value in <Axis name>.Sensor.Sensor[1].Interface.AddressIn or <Axis name>.Sensor.Sensor[1].Interface.AddressOut**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8628		**Faulty controller factors**	
	16#0030	Value has an incorrect number format or is outside the valid number range	The value for the gain or the precontrol of the control loop is faulty. • Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary (<Axis name>.PositionControl.Kv, <Axis name>.PositionControl.Kpc)
16#8629		**Limit for standstill signal is faulty. Invalid value in <Axis name>.StandStillSignal.VelocityThreshold**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862A		**Parameter of position monitoring is faulty. Invalid value in <Axis name>.PositioningMonitoring.ToleranceTime**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862B		**Inconsistent PROFIBUS parameterization; the sum of Ti and To is greater than one DP cycle**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#862C		**Parameter of standstill monitoring is faulty. Invalid value in <Axis name>.StandStillSignal.MinDwellTime**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862D		**Parameter of following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MinValue**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862E		**Invalid value for the configuration date <Axis name>.Modulo.Length**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#862F		**Invalid value for the configuration date <Axis name>.Modulo.StartValue**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8630		**Invalid value for the configuration date <Axis name>.Actor.DriveParameter.ReferenceSpeed**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8631		**The set fine resolution for Gn_XIST2 is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.FineResolutionXist2**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8632		**The number of determinable encoder revolutions is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].Parameter.DeterminableRevolutions**	

ErrorID	ErrorInfo	Description	Remedy
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8633		**The specified approach direction of the homing switch for passive homing is invalid. Invalid value in <Axis name>.Sensor.Sensor[1].PassiveHoming.Direction**	
16#8634		**Parameter of the following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MaxValue**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8635		**Parameter of the following error monitoring is faulty. Invalid value in <Axis name>.FollowingError.MinVelocity**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8636		**Controller factor is incorrect. Invalid value of the precontrol factor <Axis name>.PositionControl.Kpc**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8637		**Invalid value for the configuration date <Axis name>.Sensor.Sensor[1].Interface.Type**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8638		**Invalid value for the configuration date <Axis name>.Sensor.Sensor[1].Interface.HSC**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8639		**Error at the drive**	
	16#0049	Configuration error at device	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#004A	The technology needs a smaller servo clock.	Internal system error. Check the project for consistency and reload it into the controller.
	16#004B	Device driver not initialized during ramp-up.	To enable a technology object, the actuator driver must be initialized. Execute the command again later.

ErrorID	ErrorInfo	Description	Remedy
16#863A		**Communication to the drive is faulty**	
	16#004C	Configuration error at device	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004D	The device driver needs a smaller servo clock.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004E	Error in internal communication with the device	Check the project for consistency and reload it into the controller.
16#863B		**Error at encoder**	
	16#0049	Configuration error at device	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#004A	The technology needs a smaller servo clock.	Internal system error. Check the project for consistency and reload it into the controller.
	16#004B	Device driver not initialized during ramp-up.	To enable a technology object, the actuator driver must be initialized. Execute the command again later.
16#863C		**Communication with encoder is faulty**	
	16#004C	Configuration error at device	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004D	The device driver needs a smaller servo clock.	• Connect a suitable device. • Check the device (I/Os). • Compare the configuration of HW Config and the technology object.
	16#004E	Error in internal communication with the device	Check the project for consistency and reload it into the controller.
16#863D		**Communication to the device (drive or encoder) is faulty**	
	16#0030	Value has an incorrect number format or is outside the valid number range	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0055	The requested logical address is invalid.	• Connect a suitable device. • Check the device (I/Os). • Check the topological configuration in HW Config. • Compare the configuration of HW Config and the technology object.
	16#0056	The requested logical output address is invalid.	
	16#0057	The requested logical output address is invalid.	

ErrorID	ErrorInfo	Description	Remedy
16#863E		**Value of tag "ControlPanel.Input.TimeOut" is invalid (axis control panel)**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the value in the tags of the technology object <Axis name>.ControlPanel.Input.TimeOut. The value is specified in milliseconds (ms).
16#863F		**Invalid value for the configuration date <Axis name>.Actor.DriveParameter.MaxSpeed**	
	16#0030	Value has an incorrect number format or is outside the valid number range	Correct the reference value in the drive and in the configuration of the technology object to Actuator.MaxSpeed/2. With analog drive connection, correct the reference value in the drive and in the configuration of the technology object to Actuator.MaxSpeed/1.17.

Configuration error of the command table

ErrorID	ErrorInfo	Description	Remedy
16#8700		**Value for "Command type" in the command table is invalid**	
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
16#8701		**Value for "Position / travel path" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
16#8702		**Value for "Velocity" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
16#8703		**Value for "Duration" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0021	Value is greater than 64800 s	
	16#0022	Value is less than 0.001 s	
16#8704		**Value for "Next step" in the command table is invalid**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0023	The command transition is not permitted for this command	

Internal errors

ErrorID	ErrorInfo	Description	Remedy
16#8FFF		**Internal error**	
	16#F0**	-	POWER OFF and POWER ON the CPU If this does not work, contact Customer Support. Have the following information ready: • ErrorID • ErrorInfo • Diagnostic buffer entries

Special cases when using software limit switches for drive connection via PTO (Page 6296)

List of ErrorIDs and ErrorInfos (technology objects V2...3) (S7-1200)

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

Operating error with axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8000		**Drive error, loss of "Drive ready"**	
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary
16#8001		**Low SW limit switch has been tripped**	
	16#000E	The position of the low SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch
	16#000F	The position of the low SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the low SW limit switch was exceeded with the emergency stop deceleration	
16#8002		**High SW limit switch has been tripped**	

ErrorID	ErrorInfo	Description	Remedy
	16#000E	The position of the high SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch
	16#000F	The position of the high SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the high SW limit switch was exceeded with the emergency stop deceleration	
16#8003		**Low HW limit switch was reached**	
	16#000E	The low HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.
16#8004		**High HW limit switch was reached**	
	16#000E	The high HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.
16#8005		**PTO/HSC are already being used by another axis**	
	16#0001	-	**The axis was configured incorrectly:** Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller
			More than one axis is to run with one PTO: Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6290))
16#8006		**A communication error in the control panel has occurred**	
	16#0012	A timeout has occurred	Check the cable connection and press the "Manual control" button again
16#8007		**The axis cannot be enabled**	
	16#0025	Restarting	Wait until the axis restart is complete.
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.

Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8200		**Axis is not enabled**	
	16#0001	-	Enable the axis; restart the command
16#8201		**Axis has already been enabled by another "MC_Power" instance**	
	16#0001	-	Enable the axis with only one "MC_Power" instance
16#8202		**The maximum number of simultaneously active Motion Control commands has been exceeded (maximum of 200 commands for all motion control technology objects)**	

ErrorID	ErrorInfo	Description	Remedy
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
16#8203		**Axis is currently operated in "Manual control" (axis control panel)**	
	16#0001	-	Exit "Manual control"; restart the command
16#8204		**Axis is not homed**	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
16#8205		**The axis is currently controlled by the user program (the error is only displayed in the axis control panel)**	
	16#0013	The axis is enabled in the user program	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
16#8206		**Technology object not activated yet**	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
16#8207		**Command rejected**	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt".
	16#0018	The axis cannot be moved with a command table while it is being actively or passively homed.	Wait until direct or passive homing is complete.
	16#0019	The axis cannot be actively or passively homed while a command table is being processed.	Wait for command table to finish or abort the command table with a motion command, for example, "MC_Halt".
16#8208		**Difference between maximum and start/stop velocity is invalid**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#8209		**Invalid acceleration for technology object "Axis"**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#820A		**It is not possible to restart the axis**	
	16#0013	The axis is enabled in the user program	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	Exit "Manual control"; restart again
16#820B		**It is not possible to execute the command table**	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.

Block parameter error

ErrorID	ErrorInfo	Description	Remedy
16#8400		**Invalid value at parameter "Position" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
16#8401		**Invalid value at parameter "Distance" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
16#8402		**Invalid value at parameter "Velocity" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
	16#0024	Value is less than 0	
16#8403		**Invalid value at parameter "Direction" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
16#8404		**Invalid value at parameter "Mode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	The direction reversal is activated at the hardware limit switch, despite the fact that the hardware limit switches are disabled	• Activate the hardware limit switch using the tag <Axis>.Config.PositionLimits_HW.Active = TRUE, restart the command • Correct the configuration and download it to the controller; enable the axis and restart the command
16#8405		**Invalid value at parameter "StopMode" of the Motion Control instruction**	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again
16#8406		**Simultaneous forward and backward jogging is not allowed**	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
16#8407		**Switching to another axis with instruction "MC_Power" is only permitted after disabling the active axis.**	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.
16#8408		**Invalid value at parameter "Axis" of the Motion Control instruction**	

ErrorID	ErrorInfo	Description	Remedy
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#8409		**Invalid value at parameter "CommandTable" of the Motion Control instruction**	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
16#840A		**Invalid value at parameter "StartStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001D	The start step is greater than the end step	
	16#001E	Value is greater than 32	
16#840B		**Invalid value at parameter "EndStep" of the Motion Control instruction**	
	16#000A	Value is less than or equal to 0.	Correct the value; restart the command
	16#001E	Value is greater than 32	
16#840C		**Invalid value at parameter "RampUpTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840D		**Invalid value at parameter "RampDownTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840E		**Invalid value at parameter "EmergencyRampTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	
16#840F		**Invalid value at parameter "JerkTime" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#000A	Value is less than or equal to 0.	

Configuration error of the axis

ErrorID	ErrorInfo	Description	Remedy
16#8600		**Parameter assignment of pulse generator (PTO is invalid**	
	16#000B	The address is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
16#8601		**Parameter assignment of the high-speed counter (HSC) is invalid**	
	16#000B	The address is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	

ErrorID	ErrorInfo	Description	Remedy
16#8602		**Invalid parameter assignment of "Enable output"**	
	16#000B	The address is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8603		**Invalid parameter assignment of "Ready input"**	
	16#000B	The address is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8604		**Invalid "Pulses per motor revolution" value**	
	16#000A	Value is less than or equal to zero	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
16#8605		**Invalid "Distance per revolution" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#000A	Value is less than or equal to zero	
16#8606		**Invalid "Start/stop velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
16#8607		**Invalid "maximum velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
16#8608		**Invalid "Acceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
16#8609		**Invalid "Deceleration" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
16#860A		**Invalid "Emergency stop deceleration" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value is higher than the high hardware limit	
	16#0004	Value is lower than the low hardware limit	
16#860B		**Value for position of the low SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
	16#0007	The position value of the low software limit switch is greater than that of the high software limit switch	
16#860C		**Value for position of the high SW limit switch is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
16#860D		**Invalid address of the low HW limit switch**	
	16#000C	The address of the falling edge is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000D	The address of the rising edge is invalid	
16#860E		**Invalid address of the high HW limit switch**	
	16#000C	The address of the falling edge is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000D	The address of the rising edge is invalid	
16#860F		**Invalid "home position offset" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
16#8610		**Invalid "approach velocity" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
16#8611		**Invalid "Homing velocity" value**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
16#8612		**Invalid address of the homing switch**	
	16#000C	The address of the falling edge is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#000D	The address of the rising edge is invalid	
16#8613		**During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured**	
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
16#8614		**Invalid "Jerk" value**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#001F	Value is greater than the maximum jerk	
	16#0020	Value is less than the minimum jerk	
16#8615		**Value for "Unit of measurement" is invalid**	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"

Configuration error of the command table

ErrorID	ErrorInfo	Description	Remedy
16#8700		**Value for "Command type" in the command table is invalid**	
	16#0001	-	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
16#8701		**Value for "Position / travel path" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0005	Value is outside the number range (greater than 1.0E+12)	
	16#0006	Value is outside the number range (less than -1.0E+12)	
16#8702		**Value for "Velocity" in the command table is invalid**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
16#8703		**Value for "Duration" in the command table is invalid**	
	16#0002	The value has an invalid number format	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0021	Value is greater than 64800 s	
	16#0022	Value is less than 0.001 s	
16#8704		**Value for "Next step" in the command table is invalid**	
	16#0011	The selection value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online and restart the command, if necessary
	16#0023	The command transition is not permitted for this command	

Internal errors

ErrorID	ErrorInfo	Description	Remedy
16#8FFF		**Internal error**	
	16#F0**	-	POWER OFF and POWER ON the CPU If this does not work, contact Customer Support. Have the following information ready: • ErrorID • ErrorInfo • Diagnostic buffer entries

Using multiple axes with the same PTO (Page 6290)

List of ErrorIDs and ErrorInfos (technology objects V1) (S7-1200)

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

Operating error with axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8000		**Drive error, loss of "Drive ready"**	
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary
16#8001		**Lower SW limit switch has been tripped**	
	16#000E	The position of the lower SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch
	16#000F	The position of the lower SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the lower SW limit switch was exceeded with the emergency stop deceleration	
16#8002		**Upper SW limit switch has been tripped**	
	16#000E	The position of the upper SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch
	16#000F	The position of the upper SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the upper SW limit switch was exceeded with the emergency stop deceleration	
16#8003		**Lower HW limit switch was reached**	
	16#000E	The lower HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.
16#8004		**Upper HW limit switch was reached**	
	16#000E	The upper HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.
16#8005		**PTO/HSC are already being used by another axis**	
	16#0001	-	**The axis was configured incorrectly:** Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller
			More than one axis is to run with one PTO: Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6290))

Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
16#8200		**Axis is not enabled**	
	16#0001	-	Enable the axis; restart the command
16#8201		**Axis has already been enabled by another "MC_Power" instance**	
	16#0001	-	Enable the axis with only one "MC_Power" instruction
16#8202		**The maximum number of simultaneously active Motion Control commands was exceeded (maximum of 200 commands for all motion control technology objects)**	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
16#8203		**Axis is currently operated in "Manual control" (axis control panel)**	
	16#0001	-	Exit "Manual control"; restart the command
16#8204		**Axis is not homed**	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
16#8205		**The axis is currently controlled by the user program (the error is only displayed in the axis control panel)**	
	16#0001	-	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
16#8206		**Technology object Axis not yet enabled**	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
16#8207		**Command rejected**	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt". The other homing type can then be started.

Block parameter error

ErrorID	ErrorInfo	Description	Remedy
16#8400		**Invalid value at parameter "Position" of the Motion Control instruction**	
	16#0002	Number format of value is invalid	Correct the "position" value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$)	
	16#0006	The value is outside the number range (less than $-1e^{12}$)	
16#8401		**Invalid value at parameter "Distance" of the Motion Control instruction**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	Number format of value is invalid	Correct the "Distance" value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$)	
	16#0006	The value is outside the number range (less than $-1e^{12}$)	
16#8402		**Invalid value at parameter "Velocity" of the Motion Control instruction**	
	16#0002	Number format of value is invalid	Correct the "Velocity" value; restart the command
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
16#8403		**Invalid value at parameter "Direction" of the Motion Control instruction**	
	16#0011	Invalid selection value	Correct the selection value; restart the command
16#8404		**Invalid value at parameter "Mode" of the Motion Control instruction**	
	16#0011	Invalid selection value	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	Axis reversal is activated at the HW limit switch, despite the fact that the hardware limit switches are disabled	• Activate the hardware limit switch using the tag <axis>.Config.PositionLimits_HW.Active = TRUE, restart the command • Correct the configuration and download it to the controller; enable the axis and restart the command
16#8405		**Invalid value at parameter "StopMode" of the Motion Control instruction**	
	16#0011	Invalid selection value	Correct the selection value; enable the axis again
16#8406		**Simultaneous forward and backward jogging is not allowed**	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
16#8407		**Switching the axis with Motion Control instruction "MC_Power" is only permitted after disabling the axis.**	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.

Configuration error

ErrorID	ErrorInfo	Description	Remedy
16#8600		**Parameter assignment of pulse generator (PTO is invalid**	
	16#000B	Address is invalid	Correct the configuration of the PTO (Pulse Train Output) and download it to the controller
16#8601		**Parameter assignment of the high-speed counter (HSC) is invalid**	
	16#000B	Address is invalid	Correct the configuration of the HSC (High Speed Counter) and download it to the controller
16#8602		**Invalid parameter assignment of "Enable output"**	
	16#000D	Address is invalid	Correct the configuration and download it to the controller
16#8603		**Invalid parameter assignment of "Ready input"**	

ErrorID	ErrorInfo	Description	Remedy
	16#000D	Address is invalid	Correct the configuration and download it to the controller
16#8604		**Invalid "Pulses per motor revolution" value**	
	16#000A	Value is less than or equal to zero	Correct the configuration and download it to the controller
16#8605		**Invalid "Distance per revolution" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#000A	Value is less than or equal to zero	
16#8606		**Invalid "Start/stop velocity" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
16#8607		**Invalid "Maximum velocity" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
16#8608		**Invalid "Acceleration" value**	
	16#0002	Number format of value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
16#8609		**Invalid "Deceleration" value**	
	16#0002	Number format of value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
16#860A		**Invalid "Emergency stop deceleration" value**	
	16#0002	Number format of value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
16#860B		**Value for position of the lower SW limit switch is invalid**	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	Number format of value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	The value is outside the number range (greater than $1e^{12}$)	
	16#0006	The value is outside the number range (less than $-1e^{12}$)	
	16#0007	The position value of the lower SW limit switch is greater than that of the upper SW limit switch	
16#860C		**Value for position of the upper SW limit switch is invalid**	
	16#0002	Number format of value is invalid	• Download error-free configuration to the controller; enable the axis again with instruction "MC_Power" • Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary
	16#0005	The value is outside the number range (greater than $1e^{12}$)	
	16#0006	The value is outside the number range (less than $-1e^{12}$)	
16#860D		**Invalid address of the lower HW limit switch**	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	
16#860E		**Invalid address of the upper HW limit switch**	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	
16#860F		**Invalid "home position offset" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0005	The value is outside the number range (greater than $1e^{12}$)	
	16#0006	The value is outside the number range (less than $-1e^{12}$)	
16#8610		**Invalid "approach velocity" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
16#8611		**Invalid "Homing velocity" value**	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
16#8612		**Invalid address of the reference point switch**	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	
16#8613		**During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured**	
	16#0001	-	Correct the configuration and download it to the controller

Internal errors

ErrorID	ErrorInfo	Description	Remedy
16#8FFF		**Internal error**	
	16#F0**	-	POWER OFF and POWER ON the CPU If this does not work, contact Customer Support. Have the following information ready: • ErrorID • ErrorInfo • Diagnostic buffer entries

Config.DynamicDefaults tags V1...3 (S7-1200)

Legend

Data type	Data type of tag
Start value	Start value of tag The start value can be overwritten by the axis configuration.

Access	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect.	
	1	When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	2	When axis is enabled
	5	The next time an MC_MoveAbsolute, MC_MoveRelative, MC_MoveVelocity, MC_MoveJog, MC_Halt, MC_CommandTable or active MC_Home command is started (Mode = 3).
	6	When a MC_MoveJog command is stopped
HMI	The tag can be used in an HMI system.	

<Axis name>.Config.DynamicDefaults.Acceleration					
Acceleration of axis (specified in the configured dimension unit)					
Data type	**Start value**	**Access**	**Effective**		**HMI**
Real	4.8E+001	RW	5	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0	

<Axis name>.Config.DynamicDefaults.Deceleration					
Deceleration of axis (specified in the configured dimension unit)					
Data type	**Start value**	**Access**	**Effective**		**HMI**
Real	4.8E+001	RW	5, 6	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0	

<Axis name>.Config.DynamicDefaults.EmergencyDeceleration					
Emergency stop deceleration of axis (specified in the configured dimension unit)					
Data type	**Start value**	**Access**	**Effective**		**HMI**
Real	1.2E+002	RW	2, 5, 6	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0	

<Axis name>.Config.DynamicDefaults.JerkActive ("Axis" technology object as of V2.0)				
TRUE = the jerk limit is activated				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RW	1, 5	X

<Axis name>.Config.DynamicDefaults.Jerk ("Axis" technology object as of V2.0)				
Jerk during axis acceleration and deceleration ramp (specified in the configured unit of measurement)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	1.92E+002	RW	1, 5	X

Config.Homing tags V1...3 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag The start value can be overwritten by the axis configuration.	
Access	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect.	
	1	When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	7	When a passive homing command is started
	8	When an active homing command is started
HMI	The tag can be used in an HMI system.	

<Axis name>.Config.Homing.AutoReversal

TRUE = Direction reversal at hardware limit switch enabled (active homing)
FALSE = Direction reversal at hardware limit switch disabled (active homing)

Data type	Start value	Access	Effective		HMI
Bool	TRUE	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.Direction

TRUE = Positive approach direction to search for reference point switch and positive homing direction (active homing)
FALSE = Negative approach direction to search for reference point switch and positive homing direction (active homing)

Data type	Start value	Access	Effective		HMI
Bool	TRUE	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.SideActiveHoming ("Axis" technology object as of V2.0)				
TRUE = Homing on high end of the reference point switch (active homing) TRUE = Homing on lower end of the reference point switch (active homing)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	TRUE	RW	1, 8	X

<Axis name>.Config.Homing.SidePassiveHoming ("Axis" technology object as of V2.0)				
TRUE = Homing on high end of the reference point switch (passive homing) TRUE = Homing on lower end of the reference point switch (passive homing)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	TRUE	RW	1, 7	X

<Axis name>.Config.Homing.RisingEdge (as of technology object "Axis" V1.0)				
TRUE = Homing with negative signal edge of the reference point switch (active homing) FALSE = Homing with positive signal edge of the reference point switch (active homing) For information on the effect of the tag on passive homing, refer to the description in "Configuration - Homing".				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.Config.Homing.Offset					
Home position offset /specified in the configured unit of measurement (active homing)					
Data type	**Start value**	**Access**	**Effective**		**HMI**
Real	0.0	R RW	-	Technology object "Axis" V1.0	X
			1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.FastVelocity					
Approach velocity / specified in the configured unit of measurement (active homing)					
Data type	**Start value**	**Access**	**Effective**		**HMI**
Real	2.0E+002	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.SlowVelocity				
Homing velocity / specified in the configured unit of measurement (active homing)				
Data type	**Start value**	**Access**	**Effective**	**HMI**

<Axis name>.Config.Homing.SlowVelocity					
Real	4.0E+001	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.FallingEvent				
Tag cannot be evaluated in the user program.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DWord	DW#16#00000000	-	-	-

<Axis name>.Config.Homing.RisingEvent				
Tag cannot be evaluated in the user program.				
Data type	**Start value**	**Access**	**Effective**	**HMI**

MotionStatus tags V1...3 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.MotionStatus.Position				
Current position of the axis (specified in the configured unit of measurement) If the axis is not homed, the tag indicates the position value relative to the enable position of the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	R	-	X

<Axis name>.MotionStatus.Velocity				
Current velocity of the axis (specified in the configured unit of measurement)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	R	-	X

<Axis name>.MotionStatus.Distance				
Current distance to the target position of the axis (specified in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute" or "MC_MoveRelative" or of the axis command table.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	R	-	X

<Axis name>.MotionStatus.TargetPosition				
Target position of axis (specified in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute" or "MC_MoveRelative" or of the axis command table.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	R	-	X

StatusBits tags V1...3 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.StatusBits.Activated				
TRUE = The axis is activated. It is connected to the assigned PTO (Pulse Train Output). The data of the technology data block will be updated cyclically.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Enable				
TRUE = The axis is enabled and ready to take on Motion Control commands.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.HomingDone				
TRUE = The axis is homed and is capable of executing absolute positioning commands. The axis does not have to be homed for relative positioning. The status is FALSE during active homing. The status remains TRUE during passive homing if the axis has already been homed.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Done				
TRUE = No Motion Control command is active on the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Error				
TRUE = An error occurred in the axis technology object. Detailed information about the error is available in automatic mode in the "ErrorID" and "ErrorInfo" parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.StandStill				
TRUE = The axis is at a standstill.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.PositioningCommand				
TRUE = The axis is executing a positioning command.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.SpeedCommand				
TRUE = The axis is executing a travel command at predefined velocity.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Homing				
TRUE = The axis is executing a homing command of the "MC_Home" Motion Control instruction or axis command table.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.CommandTableActive				
TRUE = The axis is controlled by Motion Control instruction "MC_CommandTable".				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.ConstantVelocity				
TRUE = The axis travels at constant velocity.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Acceleration				
TRUE = The axis accelerates.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.Deceleration				
TRUE = The axis decelerates (slows down).				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.ControlPanelActive				
TRUE = The "Manual control" mode has been enabled in the axis command table. The axis command table has control priority over the "Axis" technology object. The axis cannot be controlled from the user program.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.DriveReady				
TRUE = The drive is ready.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.StatusBits.RestartRequired				
TRUE = Values were modified in the load memory. To download the values in the CPU RUN operating mode to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.ErrorBits.SystemFault				
TRUE = Internal system error.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.ConfigFault				
TRUE = Incorrect configuration of axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.DriveFault				
TRUE = The drive has reported an error due to loss of its "Drive ready" signal.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.SwLimitMinReached				
TRUE = The lower software limit switch has been reached.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.SwLimitMinExceeded				
TRUE = The lower software limit switch has been exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.SwLimitMaxReached				
TRUE = The upper software limit switch has been reached.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.SwLimitMaxExceeded				
TRUE = The upper software limit switch has been exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.HwLimitMin				
TRUE = The lower hardware limit switch has been approached.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.HwLimitMax				
TRUE = The upper hardware limit switch has been approached.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

<Axis name>.ErrorBits.HwUsed				
TRUE = A second axis is using the same PTO (Pulse Train Output) and is enabled with "MC_Power".				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	R	-	X

Position tag V4...5 (S7-1200)

Legend

Data type	Data type of tag
Start value	Start value of tag

Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.Position				
Setpoint position of the axis (indicated in the configured unit of measurement) If the axis is not homed, the tag indicates the position value relative to the enable position of the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	R	The tag can be read in the user program.
	WP	If the axis is disabled (MC_Power.Status = FALSE), the tag can be written with the Motion Control instruction "MC_WriteParam".
	-	The tag cannot be used in the user program.
Effective	Specifies when a change to the tag takes effect:	
	2	For drive connection via PTO (Pulse Train Output): When axis is enabled
HMI	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<Axis name>.Actor.Type				
Drive connection • Positioning axis technology object as of V5: 0 = The drive is connected via an analog output. All movements of the axis are position-controlled. 1 = The drive is connected via PROFIdrive telegrams. All movements of the axis are position-controlled. 2 = The drive is connected via a pulse interface. • Positioning axis technology object V4: The drive is connected via a pulse interface.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DInt	2	R	-	X

<Axis name>.Actor.InverseDirection				
Invert direction FALSE = The direction is not inverted. TRUE = The direction is inverted.				
Data type	**Start value**	**Access**	**Effective**	**HMI**

<Axis name>.Actor.InverseDirection				
Bool	FALSE	R	-	X
		WP	2	-

<Axis name>.Actor.DirectionMode				
Permitted direction of rotation 0 = Both directions 1 = Positive direction 2 = Negative direction				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Int	0	R	-	X
		WP	2	-

<AxisName>.Actor.Interface.AddressIn (Positioning axis technology object as of V5)				
Input address for the PROFIdrive telegram (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<AxisName>.Actor.Interface.AddressOut (Positioning axis technology object as of V5)				
Output address for the PROFIdrive telegram (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.EnableDriveOutput				
Enable output (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.DriveReadyInput				
Ready input (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
VREF	-	-	-	-

<Axis name>.Actor.Interface.PTO				
Pulse output (internal parameter)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DWord	0	-	-	-

<AxisName>.Actor.DriveParameter.ReferenceSpeed (Positioning axis technology object as of V5)				
Reference value (100%) for the setpoint speed of the drive (N-set) The setpoint speed is transmitted in the PROFIdrive telegram as a standardized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, provided the drive permits this.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	3000.0	R	-	X
		WP	2	-

<AxisName>.Actor.DriveParameter.MaxSpeed (Positioning axis technology object as of V5)				
Maximum value for the setpoint speed of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	3000.0	R	-	X
		WP	2	-

<Axis name>.Actor.DriveParameter.PulsesPerDriveRevolution				
Pulses per motor revolution				
Data type	**Start value**	**Access**	**Effective**	**HMI**
DInt	1000.0	R	-	X
		WP	2	-

StatusPositioning tags V4...5 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.

Effective	Specifies when a change to the tag takes effect.
HMI	The tag can be used in an HMI system.

<Axis name>.StatusPositioning.Distance				
Current distance of axis from target position (indicated in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute", "MC_MoveRelative", or the axis control panel.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

<Axis name>.StatusPositioning.TargetPosition				
Target position of the axis (indicated in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute", "MC_MoveRelative", or the axis control panel.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

<AxisName>.StatusPositioning.FollowingError (Positioning axis technology object as of V5)				
Current following error of the axis (indicated in the configured unit of measurement) FollowingError = 0.0 for drive connection via PTO (Pulse Train Output).				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Real	0.0	RCCP, RP	-	X

StatusBits tags V4...5 (S7-1200)

Legend

Data type	Data type of tag	
Start value	Start value of tag	
Access	Access to the tag in the user program:	
	RCCP	The tag can be read in the user program and is updated at each cycle control point.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tags is determined at the start of the command.
Effective	Specifies when a change to the tag takes effect.	
HMI	The tag can be used in an HMI system.	

<Axis name>.StatusBits.Activated				
Activation of the axis FALSE = The axis is not activated. TRUE = The axis is activated. It is connected to the assigned PTO (Pulse Train Output). The data of the technology data block will be updated cyclically.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Enable				
Enable status of the axis FALSE = The axis is not enabled. TRUE = The axis is enabled and ready to accept Motion Control commands.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HomingDone				
Homing status of the axis FALSE = The axis is not homed. TRUE = The axis is homed and is capable of executing absolute positioning commands. The axis does not have to be homed for relative positioning. The status is FALSE during active homing. The status remains TRUE during passive homing if the axis was already homed beforehand.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Done				
Command execution on the axis FALSE = A Motion Control command is active on the axis. TRUE = A Motion Control command is not active on the axis.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Error				
Error status on the axis FALSE = No error is active on the axis. TRUE = An error occurred on the axis. Additional information about the error is available in automatic control at the "ErrorID" and "ErrorInfo" parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.StandStill				
Standstill of the axis FALSE = The axis is in motion. TRUE = The axis is at a standstill.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.PositioningCommand				
Execution of a positioning command FALSE = A positioning command is not active on the axis. TRUE = The axis is executing a positioning command of the "MC_MoveRelative" or MC_MoveAbsolute Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.VelocityCommand				
Execution of a command with velocity specification FALSE = A command with velocity specification is not active on the axis. TRUE = The axis is executing a motion command with velocity specification of the "MC_MoveVelocity" or MC_MoveJog Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HomingCommand				
Execution of a homing command FALSE = A homing command is not active on the axis. TRUE = The axis is executing a homing command of the "MC_Home" Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.CommandTableActive				
Execution of a command table FALSE = A command table is not active on the axis. TRUE = The axis is controlled by "MC_CommandTable" Motion Control instruction.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.ConstantVelocity				
Constant velocity FALSE = The axis is accelerating, decelerating, or at a standstill. TRUE = The setpoint velocity has been reached. The axis is moving at constant velocity.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Accelerating				
Acceleration process FALSE = The axis is decelerating, moving at constant velocity, or at a standstill. TRUE = The axis is accelerating.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.Decelerating				
Deceleration process FALSE = The axis is accelerating, moving at constant velocity, or at a standstill. TRUE = The axis is decelerating.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.ControlPanelActive				
Activation status of the axis control panel FALSE = "Automatic mode" is activated. The user program has control priority over the axis. TRUE = The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the axis. The axis cannot be controlled from the user program.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.DriveReady				
Operational status of the drive FALSE = The drive is not ready. Setpoints will not be executed. TRUE = The drive is ready. Setpoints can be executed.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.RestartRequired				
Restart of axis required FALSE = A restart of the axis is not required. TRUE = Values were modified in the load memory. To download the values to the work memory while the CPU is in RUN mode, the axis must be restarted. Use the MC_Reset Motion Control instruction to do this.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.SWLimitMinActive				
Status of the low software limit switch FALSE = The axis is kept within its configured work area. TRUE = The low software limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.SWLimitMaxActive				
Status of the high software limit switch FALSE = The axis is kept within its configured work area. TRUE = The high software limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HWLimitMinActive				
Status of the low hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The low hardware limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

<Axis name>.StatusBits.HWLimitMaxActive				
Status of the high hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The high hardware limit switch was reached or exceeded.				
Data type	**Start value**	**Access**	**Effective**	**HMI**
Bool	FALSE	RCCP, RP	-	X

Using online and diagnostics functions 14

14.1 Displaying accessible devices

Accessible devices are all devices connected to an interface of the programming device / PC that are turned on. Devices that allow only restricted configuration using the currently installed products or that cannot be configured at all can also be displayed.

To speed up the display in large networks with many network devices, the PROFINET device names are displayed in a slightly adapted form for PROFINET devices. Unicode-specific characters in the PROFINET device name are converted into ASCII-compatible characters using the Punycode method (according to RFC 3492).

Displaying accessible devices in the project tree

To display accessible devices at an interface of the programming device / PC, follow these steps:

1. Open the "Online access" folder in the project tree.
2. Click on the arrow to the left of the interface to show all the objects arranged below the interface.
3. Double-click "Update accessible devices" below the interface.
   You can see the progress of the search in the status bar. If you have found the desired device before the search is completed, you can cancel the search. To do this, click on the cross to the right of the progress bar.
   The status of the search is indicated with an symbol at the interface.

	The interface is available. The search is performed.
	The interface is available. The search is cancelled.
	The interface is available. The search is completed.

   The network stations that have been found through the search are displayed below the interface.
4. Optional: Select the interface in the project tree. Then open the overview window in the detail view to display more details for the respective devices. More details include, for example, the device type, the MAC address or the configured device name.
   The detailed display of the devices in the overview window can take some time in networks with many devices because each individual device must submit the details.

Displaying accessible devices in a table

To display accessible devices in an easy to read table outside the project tree, follow these steps:

1. Select the "Accessible devices" command in the "Online" menu.
   The "Accessible devices" dialog is displayed.
2. Select the type of interface from the "Type of the PG/PC interface" drop-down list.
3. Select the required interface of the programming device / PC from the "PG/PC interface" drop-down list.
4. Click the "Start Search" button.
   The accessible devices at the selected interface of the programming device/PC are displayed in the table. The connection line between PG/PC and the network is closed and displayed in green in the graphic. If no devices are accessible at an interface, the connection line is displayed as a dashed line.
5. To go to a device in the project tree, select the device from the list of accessible devices and click the "Show" button.
   The selected device is highlighted in the project tree.

Displaying additional information about the devices in the project tree

To display additional information on the individual accessible devices in the project tree, follow these steps:

1. Click on the arrow to the left of one of the accessible devices in the project tree.
   All data available online, for example blocks and system data, is displayed for known devices. If additional editing options are available for a device with the shortcut menu, the device is shown in black text. You have only read access to the objects with a gray background, such as blocks.

Changing the device configuration online (Page 6477)

Default setting online connection data (Page 6481)

Overview window (Page 262)

14.2 Changing the device configuration online

You can assign parameters to some devices, preferably in small hardware setups, directly online. You do not need to create a project or have offline data to do this. In this way, you can quickly and easily change the device configuration. You do not need to compile the hardware configuration or perform a download. Depending on the device, either all changes become active immediately or they are written to the device only after confirmation.

Requirement

- The device must support online parameter assignment. You can learn whether or not your specific devices support this function in the device manual.
- The device must be connected to the PG/PC and available in the list of accessible devices.

Procedure

To change the device configuration online, follow these steps:

1. Show the accessible devices on the interface via which the device is connected. To learn how to show the accessible devices, see the chapter "Showing accessible devices (Page 6475)".
2. Expand the device to display the lower-level elements.
3. Double-click the "Parametrize device" item.
   A configuration page for the device opens in the work area.
4. Make all required settings.
   With some devices, the new settings take effect immediately.
5. Optionally, depending on the device: Click on the "Upload to device" button.
   The settings are transferred to the device.

14.3 Connecting devices online

14.3.1 General information about online mode

Online mode

In online mode, there is an online connection between your programming device / PC and one or more devices.

An online connection between the programming device/PC and the device is required, for example, for the following tasks:

- Testing user programs
- Displaying and changing the operating mode of the CPU
- Displaying and setting the date and time of day of the CPU
- Displaying module information
- Comparing blocks
- Hardware diagnostics

Before you can establish an online connection, the programming device/PC and the device must be physically or remotely connected. As an alternative, some devices support a simulation mode. In this case, a connection to the device is simulated via the PLCSIM virtual interface.

After establishing a connection, you can use the Online and Diagnostics view or the "Online tools" task card to access the data on the device. The current online status of a device is indicated by an icon to the right of the device in the project tree. You will find the meaning of the individual status icons in the relevant tooltip.

Note

Some online functions depend on the scope of the installed software or whether a project is open.

Standby or hibernation of the programming device / PC

If the programming device / PC is changed to the standby or hibernation mode when there is an online connection, all online connections are terminated. When the programming device / PC wakes up from hibernation, the online connections are not automatically re-established.

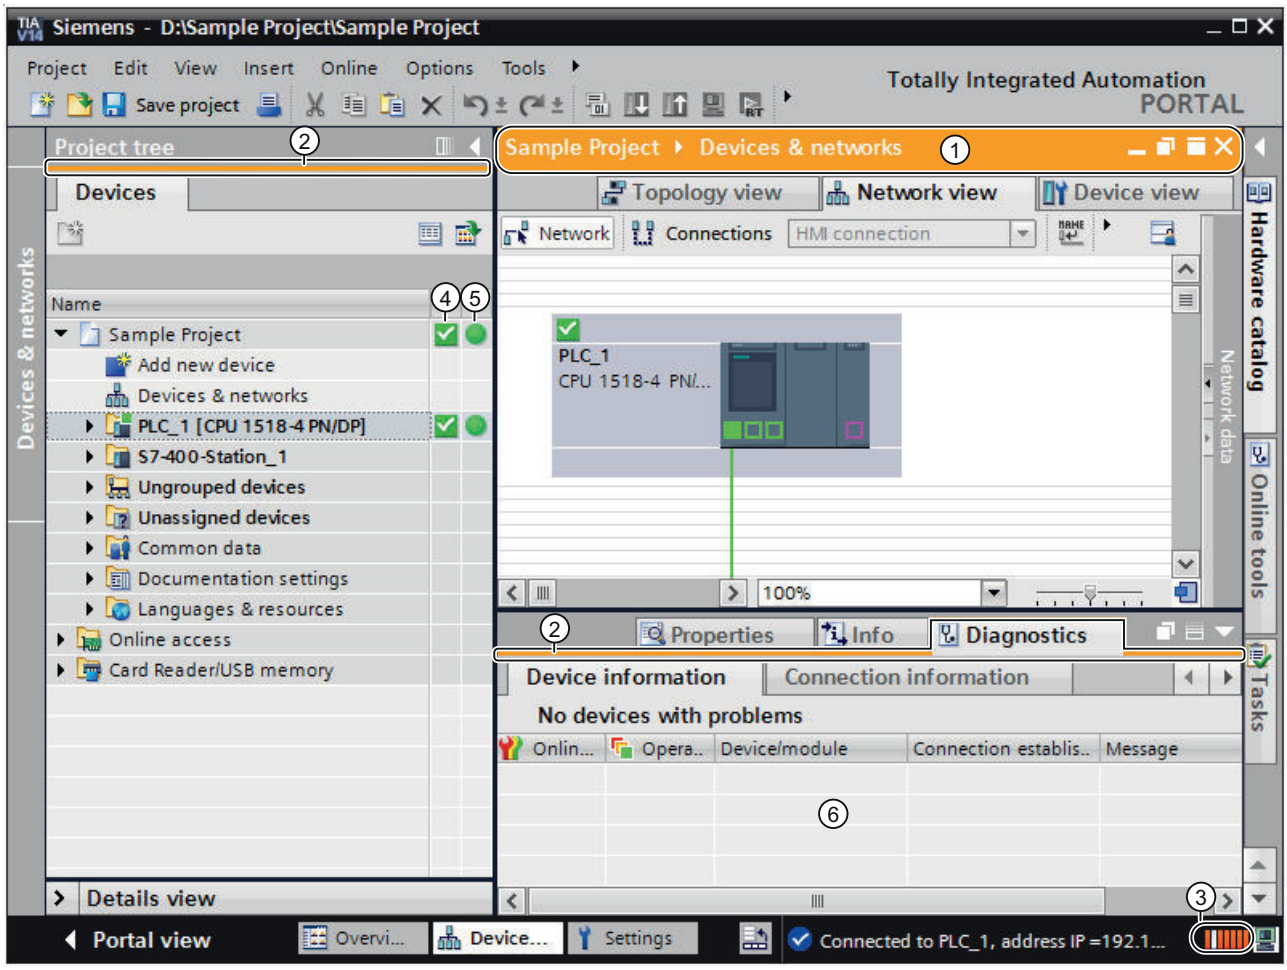
Note that suddenly terminating an online connection can lead to loss of data or a connected device may interrupt program execution.

Performing an LED flash test

In many online dialogs you can perform an LED flash test, if the device connected online supports this feature. If you select the "Flash LED" check box, an LED flashes on the currently selected device. This feature is useful, for example, when you are not sure which device in the hardware configuration corresponds to the station currently selected in the software.

Read any additional information and learn about the possible limitations to the LED flash test in the respective device documentation.

See also



View in online mode (Page 6480)

Overview of the online and diagnostic settings (Page 235)

14.3.2 View in online mode

Online displays

After the online connection has been established successfully, the user interface changes. If a device is unavailable, this is indicated by a symbol. The following figure shows a device connected online and the corresponding user interface:

① The title bar of the active window gets an orange background as soon as at least one of the devices currently displayed in the editor has been successfully connected online. If one or more devices are unavailable, a symbol for a broken connection appears in the title bar of the editor.

② The title bars of inactive windows for the relevant station now have an orange line below them.

③ An orange, pulsing bar appears at the right-hand edge of the status bar. If the connection has been established but is functioning incorrectly, an icon for an interrupted connection is displayed instead of the bar. You will find more information on the error in "Diagnostics" in the Inspector window. In addition, the status line indicates if there is an online connection to the SIMATIC hardware via the TIA Portal Cloud Connector.

④ The left column in the project tree indicates the diagnostics status for hardware objects in online mode through symbols.

⑤ The right column in the project tree indicates the comparison status for software objects in online mode through symbols. A comparison of the online and offline state is performed automatically. Differences between online and offline objects are displayed in the form of symbols.

⑥ The "Diagnostics > Device information" area is brought to the foreground in the Inspector window.

Online connection abort

The online mode and its display are retained as long as at least one device is connected online. If the online connection of one or more devices breaks, the TIA Portal remains in online mode. The display of the TIA Portal changes to offline mode only when there is no longer an online connection for any device.

Online connection via the TIA Portal Cloud Connector

If you use the TIA Portal in a virtual environment, you have the opportunity to create an online connection via the TIA Portal Cloud Connector to SIMATIC hardware that is connected to a user device. If the online connection is made via the TIA Portal Cloud Connector, the following symbol is displayed in the status bar:

You can find instructions on how to use the TIA Portal in a virtual environment (private cloud) on the installation disk in the directory "Documents\Readme\<language directory>". You can open the PDF document "TIAPortalCloudConnectorHowTo<Sprachkennung>.pdf" here.

See also

General information about online mode (Page 6478)

Basics of project data comparison (Page 358)

14.3.3 Default setting online connection data

If you prefer to use a specific network interface of your programming device/PC to establish an online connection, you can preset this interface. The specified connection path is then already selected in the dialogs for online connection.

Procedure

To specify a default connection path, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are opened.
2. Select the "Online & Diagnostics" entry in the area navigation.

3. In the "Preset connection path for online access" area, specify the type of the PG/PC interface as well as the interface itself.
4. Select the "Use preset connection path for online access" check box.

Downloading project data to a device (Page 350)

Online access (Page 6495)

Overview of the online and diagnostic settings (Page 235)

14.3.4 Establishing or changing an online connection

To use the online functions of a device, specify the connection path the first time you establish the connection.

Requirement

At least one PG/PC interface is installed and is physically connected to a device, for example, with an Ethernet cable. As an alternative, it is also possible to establish virtual online connections using PLCSIM.

Procedure

To establish or change an online connection, follow these steps:

1. Select one or more devices for the online connection in the project tree.
2. Select the "Go online" command in the "Online" menu.
   - If the device has already been connected online, the online connection is automatically established using the previously specified connection path.
   - If there was no previous connection or if the device address is not located in the same subnet of the programming device/PC, the "Go online" dialog opens.

   If you want to change a specified connection path, select the "Extended go online" command instead in the "Online" menu. The "Go online" dialog box is opened again in this case.

3. Select the connection path:
   - Select the type of interface from the "Type of the PG/PC interface" drop-down list.
   - Select the interface of your programming device/PC from the "PG/PC interface" drop-down list.
     No selection is necessary if you have already defined a programming device/PC interface in the settings.
   - Select the interface or the subnet for the connection from the "Connection to interface/ subnet" drop-down list. Select a direct connection if no S7 gateway is connected in between. Select the matching subnet for the connection to the programming device or PC if the device can be accessed via an S7 gateway. Select the item "Try all interfaces" if the device has several interfaces and you do not know by which of the interfaces the device is connected to the programming device/PC.
     If you selected an MPI or PROFIBUS subnet, the bus parameters configured in the programming device/PC interface are applied at this point.
   - If the device is accessible via a gateway, select the gateway that connects the two subnets involved in the "1st gateway" drop-down list.
4. Optional: If no devices can be accessed by the selected connection path, a dashed connecting line is displayed between the programming device/PC and the device. This is the case, for example, when the device is connected with the network by a NAT router. To display all devices that are switched on and connected to an interface of the programming device/PC, select the entry "Show accessible devices" from the drop-down list and click "Start search" again.
5. Optional: You have two options to access the device despite a different subnet: Use the two options in administered networks only after consultation with the administrator.
   - Assign a static address to the programming device/PC interface under Windows.
   - During the creation of the online connection, an additional IP address in the same subnet as the device is temporarily assigned to the interface of the programming device/PC. Click "Go online" and confirm the next prompt.
6. Click the "Start search" button.
   Devices which can be reached by the set connection path are displayed in the table of the target devices. The connection line in the graphic on the left is displayed as solid.
7. Optional: Run a flash test. Select the "Flash LED" check box on the left in the graphic. You use the flash test to check that you have selected the correct device. The flash test is not supported by all devices.
8. Select the target device in the table and confirm the selection with "Go online".
   The online connection to the selected target device is established.

Result

After the online connection has been established, the title bars of the editors change to orange. An orange progress bar is also shown in the title bar of an editor and in the status bar. In the project tree, status symbols show the difference between online and offline objects.

The set connection path is stored for future connection attempts.

With automatic assignment of the programming device/PC address the dialog reappears when the computer is restarted. The connection must be re-established in this case.

Note
Undoing actions

You cannot undo actions once you have established an online connection.

Note
Using direct connections or subnets

An online connection between programming device/PC and connected devices is possible either via direct connection or via subnet.

Simultaneous connection of the devices over different subnets is not possible if these are physically connected through the same interface. Simultaneous connections to different subnets are only possible through routed connections.

Simultaneous connection of devices through a subnet and through direct connections using the same interface is not possible.

Canceling an online connection (Page 6484)

Connecting online with several devices (Page 6485)

View in online mode (Page 6480)

Assigning a temporary IP address (Page 6501)

Influence of user rights (Page 280)

14.3.5 Canceling an online connection

Procedure

To terminate the existing online connection, follow these steps:

1. Select the device for which you want to disconnect the online connection in the project tree.
2. Select the "Go offline" command in the "Online" menu.
   The online connection is disconnected.

Note

Undoing actions

You cannot undo actions once you have disconnected an online connection.

See also

Establishing or changing an online connection (Page 6482)

14.3.6 Connecting online with several devices

You can establish an online connection to several devices at the same time without needing to select individual devices previously in the network view.

Requirement

- No device must be selected
- At least one PG/PC interface is installed and is physically connected to a device, for example with an Ethernet cable. As an alternative, it is also possible to establish a virtual online connection using PLCSIM or a remote connection.

Procedure

To establish an online connection to several devices at the same time, follow these steps:

1. Select the project in the project tree.
2. Select the "Go online" command in the "Online" menu.
   The "Select device for opening the online connection" dialog opens with a table of all available devices.
3. Select the devices to which you want to establish an online connection in the "Go online" column.
4. Click the "Go online" button.

Result

Without any further prompt for confirmation, a connection is established to all selected devices if a connection was already established to the selected devices at least once. If there was no previous online connection, the "Go online" dialog opens. In this case, first configure the online connection as described in the section "Go online and Go offline (Page 6482)".

See also

Establishing or changing an online connection (Page 6482)

Assigning a temporary IP address (Page 6501)

14.3.7 Disconnecting online connections of multiple devices

You can disconnect the online connections to multiple devices at one time without needing to select individual devices beforehand in the network view.

Requirement

- No device is selected.
- There is currently an online connection to at least one device.

Procedure

To terminate the online connections to multiple devices at one time, follow these steps:

1. Select the "Go offline" command in the "Online" menu.
   The "Select devices" dialog opens with a table of all available devices.
2. Select the device for which you want to terminate the online connection in the "Go offline" column.
3. Click the "Go offline" button.

Result

The online connection to the all the selected devices is terminated.

14.4 Creating a backup of an S7 CPU

14.4.1 Backup options for S7 CPUs

You will make a number of changes to your automation system over time, for example, add new devices, replace existing devices or adapt the user program. If these changes were to result in undesirable behavior, you can restore the automation plant to an earlier version. To continue working without interruptions after replacing individual devices, you can accept existing programs and values. The CPUs offer different options for backup and restoration of the hardware configuration and software.

Backup options

The table below provides an overview of the backup and restoration options of S7 CPUs:

	Snapshot of the monitored values	Upload from device (software)	Upload device as new station (hardware and software)	Download backup from online device
Use case	Restoring a specific status of a data block. The actual values of data blocks including time stamp are accepted in the project.	Upload blocks on a CPU to the project.	Upload of hardware configuration and software from a device to the project.	Create a complete backup of a CPU as restore point. The backup copy is consistent and cannot be changed or opened.
Requirement	The CPU has already been created in a project. The data blocks must be identical online and offline.	The CPU is created in the project.	The device is available in the hardware catalog of TIA Portal. Any necessary HSPs or GSD files are installed.	-
Possible in mode	RUN, STOP	RUN, STOP	RUN, STOP	STOP
Possible for F-CPUs	Yes	Yes	No	Yes
Backup can be edited	Yes	Yes	Yes	No

Backup contents

The table below shows which data you can upload and back up with which options:

	Snapshot of the monitored values	Upload from device (software)	Upload device as new station (hardware and software)	Download backup from online device
Actual values of the data blocks	Snapshot is possible	Upload is possible	Upload is possible	Backup is possible
Software blocks	-	Upload is possible	Upload is possible	Backup is possible
PLC tags (tags and constants names)	-	Upload possible for S7-1200 and S7-1500 CPUs	Upload possible for S7-1200 and S7-1500 CPUs	Backup is possible
Technology objects	-	Upload is possible	Upload is possible	Backup is possible

	Snapshot of the monitored values	Upload from device (software)	Upload device as new station (hardware and software)	Download backup from online device
Hardware configuration	-	-	Upload is possible	Backup is possible
Monitoring tables (web server)	-	-	Upload is not possible	Backup is possible
Local data, bit memories, timers, counters and process image	Snapshot is not possible	Upload is not possible	Upload is not possible	Backup is possible
Archives and recipes (PLC)	-	-	-	Backup is possible
General data on the SIMATIC Memory Card, for example, help for program blocks or GSD files	-	-	-	Backup is possible

Special considerations during backup of actual values

The "Backup from online device" type of backup backs up the actual values of the tags that are set as retentive. To ensure consistency of the retentive data, disable all write access to retentive data during the backup.

Actual values of the non-retentive data are reset to their start values during a transition from STOP to RUN mode. When the CPU is backed up only the start values of non-retentive data are backed up.

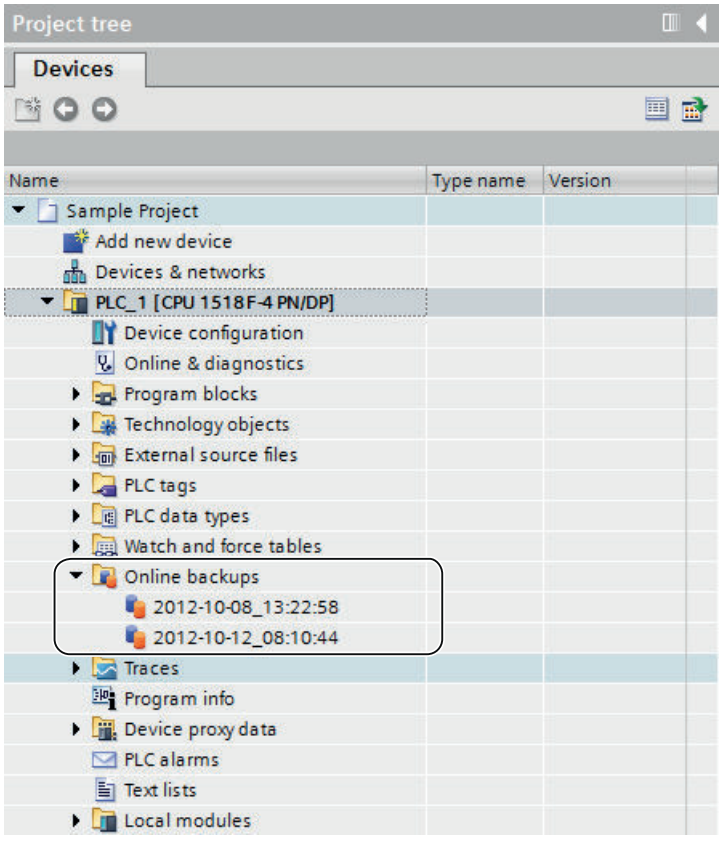
Loading project data from a memory card (Page 356)

14.4.2 Backing up S7-300 and S7-400 CPUs (S7-300, S7-400, PC)



14.4.2.1 Creating a backup of a device (S7-300, S7-400, PC)

Backing up the software and hardware configuration of an S7-300/400 CPU

If you have already downloaded a configuration to an S7-300/400 CPU, it is advisable to make a backup. You may have modified the configuration and want to test the new configuration. Before you download the new configuration to the CPU, you can create a backup of the current device state and then restore the current configuration at a later date. The backup is performed with the current values of the CPU. In the case of S7-400 CPUs with fail-safe function, the initial values are backed up.

You can create as many backups as you want and store a variety of configurations for a CPU. The backups are named with the name of the CPU and the time and date of the backup. You can find the backup in the project tree under the CPU in the "Online backups" folder.

The following figure shows an S7-319 CPU for which two backups were created:

See also

Backup options for S7 CPUs (Page 6487)

14.4.2.2 Restoring the software and hardware configuration of a device (S7-300, S7-400, PC)

If you have backed up the configuration of a device at an earlier point in time, you can transfer the backup back to the device. The saved configuration is then restored on the device.

Requirement

You must have previously configure the device and stored a backup of the device in the project.

Procedure

To restore older software and hardware state on a device, follow these steps:

1. Open up the folder of the device in the project tree to display the lower-level objects.
2. Open the "Online backups" folder.
3. Select the backup you want to restore.
4. In the "Online" menu, select the "Download to device" command.
   - If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays alarms and recommends actions needed for the loading operation.
   - If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device.
     See also: Establishing and terminating an online connection
5. Check the alarms in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

   Note

   Performing the proposed actions during operation of the plant can cause serious damage to property or injury to persons if there are functional disturbances or program errors.

6. As soon as downloading becomes possible, the "Load" button is enabled.
7. Click the "Load" button.
   The backup is transferred to the device and device is restored. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
8. Click the "Finish" button.

14.4.2.3 Backing up a device configuration (S7-300, S7-400, PC)

You can back up the configuration of an S7-300/400 CPU in the TIA Portal. So you can download and test a new configuration to a device without any risk. If needed, you can restore the initial configuration of the CPU.

Requirement

- The CPU has already been created in the project.
- The CPU is online. If there is no online connection yet, an online connection is established during the backup.

Procedure

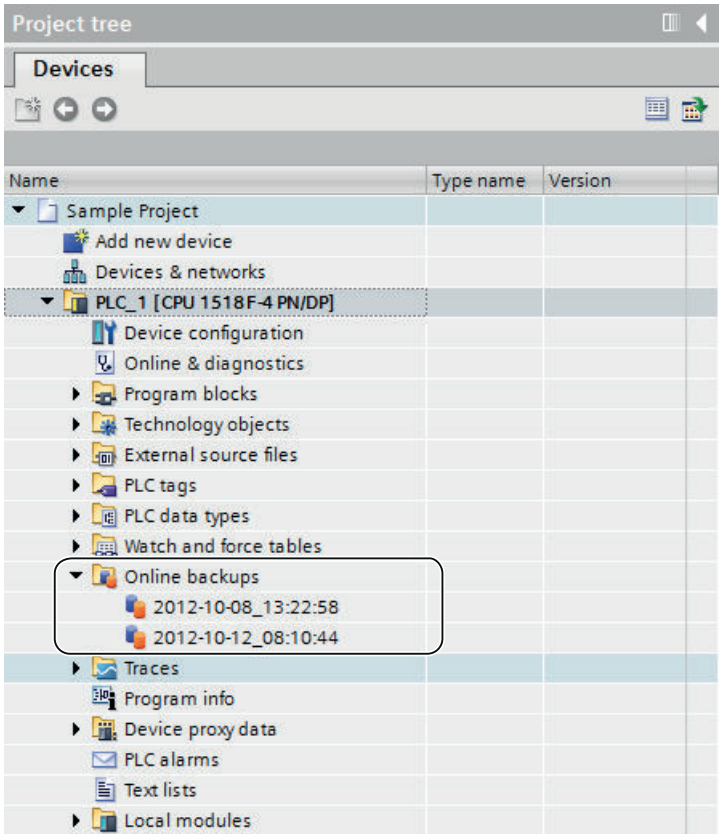
To create a backup of the current configuration of a CPU, follow these steps:

1. Select the CPU in the project tree.
2. Select the "Backup from online device" command in the "Online" menu.

Result:

A backup of the entire hardware configuration and software is created. The backup is stored in the project tree in the "Name of the CPU > Online backups" folder. The backup is assigned the name of the CPU with the time and date of the backup. You can rename the backup, but you cannot make any changes to the contents of the backup.

14.4.3 Backing up S7-1200 and S7-1500 CPUs (S7-1200, S7-1500, S7-1500, S7-1500)



14.4.3.1 Creating a backup of a device (S7-1200, S7-1500, S7-1500, S7-1500)

Backing up the software and hardware configuration of a CPU

If you have already downloaded a configuration to an S7-1200/S7-1500 CPU, it may be useful to make a backup. You may have modified the configuration and want to test the new configuration. Before you download the new configuration to the CPU, create a backup of the current device version. You can restore the current configuration at a later time.

You can create as many backups as you want and store a variety of configurations for a CPU. The backups are named with the name of the CPU and the time and date of the backup. You can find the backup in the project tree under the CPU in the "Online backups" folder.

The following figure shows an S7-1500 CPU for which two backups have been created:

Scope of the backup

The backup includes all data that are needed to restore a particular configuration version of a CPU. The following data is backed up, for example:

- Contents of the memory card
- Retentive memory areas for example of data blocks, counters, and bit memory
- Other retentive memory contents, such as IP address parameters

The backup is performed with the current values of the CPU. Entries in the diagnostic buffer are not included in the backup. The current time of day is not backed up for an S7-1500 CPU.

See also

General information on loading (Page 348)

Backup options for S7 CPUs (Page 6487)

14.4.3.2 Backing up a device configuration (S7-1200, S7-1500, S7-1500, S7-1500)

You can back up the configuration of a CPU in the TIA Portal. So you can download and test a new configuration to a device without any risk. If needed, you can restore the initial configuration of the CPU.

The CPU goes to STOP while a backup is being created. If an access level is configured for the CPU, you need the password for read access to the CPU.

Requirement

- The CPU has already been created in the project.
- The device is connected to the programming device/PC directly via the PROFINET interface of the CPU. PROFIBUS interfaces of the CPU and interfaces of CMs/CPs are not supported.
- The CPU is online. If there is no online connection yet, an online connection is established during the backup.
- The CPU is in "STOP" mode.

Procedure

To create a backup of the current configuration of a CPU, follow these steps:

1. Select the CPU in the project tree.
2. Select the "Backup from online device" command in the "Online" menu.
   If necessary, you must enter the password for read access to the CPU and confirm that the CPU should enter "STOP" mode.

Result:

A backup of the entire hardware configuration and software is created. The backup is stored in the project tree in the "Name of the CPU > Online backups" folder. The backup is assigned the name of the CPU with the time and date of the backup. You can rename the backup, but you cannot make any changes to the contents of the backup.

An entry is created for each backup operation in the diagnostic buffer of the CPU.

Restoring the configuration of a device (Page 6493)

14.4.3.3 Restoring the configuration of a device (S7-1200, S7-1500, S7-1500, S7-1500)

If you have backed up the configuration of a device at an earlier point in time, you can transfer the backup back to the device. The saved configuration is then restored on the device.

The CPU goes to STOP while a backup is being loaded to the CPU. If an access level is configured for the CPU, you need the password for write access to the CPU.

WARNING

Download backups with unknown content

If you activate the recommended actions during download during plant operation, you can cause serious damages or injuries in case of malfunctions or program errors.

Make sure that the backup contents do not include a configuration which results in unexpected plant behavior.

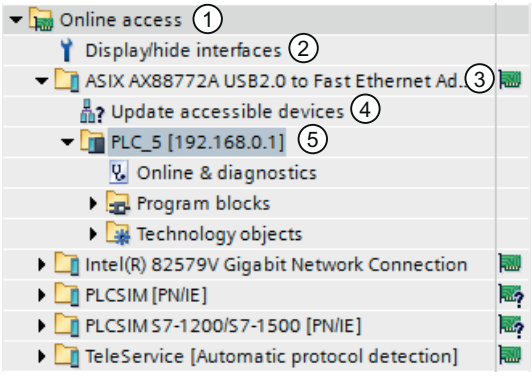
Requirement

- The device is configured and a backup of the device is stored in the project.
- The device is connected to the programming device/PC directly via the PROFINET interface of the CPU.
- The CPU is in "STOP" mode.
- You have the password for read access to the CPU, if an access level was configured.

Procedure

To restore older software and hardware state on a device, follow these steps:

1. Open up the folder of the device in the project tree to display the lower-level objects.
2. Open the "Online backups" folder.
3. Select the backup you want to restore.
4. In the "Online" menu, select the "Download to device" command.
   - If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays alarms and recommends actions needed for the loading operation.
   - If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device.
     See also: AUTOHOTSPOT
5. Check the alarms in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.
6. As soon as downloading becomes possible, the "Load" button is enabled.
7. Click the "Load" button.
   The backup is transferred to the device and device is restored. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
8. Click the "Finish" button.
   If necessary, you must enter the password for read access to the CPU and confirm that the CPU should enter "STOP" mode.
   The contents of the backup are restored on the CPU. The CPU is then restarted.



14.5 Configuring the PG/PC interface

14.5.1 Online access

Online access of the project

In the "Online access" folder of the project tree, you will find all active interfaces of your programming device/PC. Each interface icon provides you with information on the status. You can also display the accessible devices and display and edit the properties of an interface using the shortcut menu.

The following figure shows the "Online access" folder in the project tree:

① "Online access" folder in the project tree

All interfaces installed in the programming device/PC are displayed in the "Online access" folder.

② Show/hide interfaces

Use the function "Show/hide interfaces" to show or hide individual interfaces.

③ Status display for the interfaces

The current status of an interface is indicated by an icon to the right of the name. You can see the meaning of the icon in the tooltip.

④ Updating the list of accessible devices.

This function is available for each hardware interface of the programming device/PC. Software interfaces, such as a remote connection, do not offer this function.

⑤ Devices connected via the respective interface with the programming device/PC

The type of the device and its status are displayed by the preceding icon.

Displaying or updating accessible devices

You have the following options if you want to display all devices accessible online on your programming device/PC:

- Display of the accessible devices on a single interface of the programming device / PC in the project tree. In the project tree, you can also display additional information about the individual accessible devices.
- Display of the accessible devices of all interfaces in a list.

See also:AUTOHOTSPOT

Overview of icons for accessible devices

The accessible devices are identified with an icon according to their type and status. The following is an overview of all icons and their meaning.

	Icon for unidentified modules This icon is displayed whenever the identification of a module is not yet complete or when the identification of a module was not successful, for example, because the required online data could not be read.
	Icon for the following device types: • PLCs • SIMOCODE pro devices • IE/PB links • CPs of PC systems • SCALANCE head modules • S7-300 and S7-400 CPs • PROFINET IO devices and PROFINET CPs • SCALANCE modules and gateways that could not be identified
	PROFINET IO devices, encoders, switchgear, sensors and identification systems that were replaced by similar devices because these could not be identified
	Icon for the following device types: • HMI devices • PROFINET IO devices of the HMI type if these could not be identified and were therefore replaced by a similar device
	PROFINET IO devices of the drive type that could not be identified and were therefore replaced by a similar device
	PROFINET IO devices of the type development kit and network components that could not be identified and were therefore replaced by a similar device
	PROFINET IO devices of the type TeleService adapter that could not be identified and were therefore replaced by a similar device

Displaying and modifying interface properties (Page 6498)

14.5.2 Basics of assigning parameters for the PG/PC interface

Options for connecting to target systems

If the devices of the project are connected via different subnets, you assign a suitable network access to each PG/PC interface to be able to establish online connections to the target systems. The following interfaces are automatically supported:

- MPI
- PROFIBUS
- Industrial Ethernet (ISO and TCP/IP)

You can make various settings for the interfaces. The following sections explain the parameter settings you can make.

Note

Note that changes to interface parameters have a direct influence on the operating system and the programming device / PC. Remember that some parameter settings can only be changed if you have adequate user rights.

See also

Setting parameters for the Industrial Ethernet interface (Page 6499)

Setting parameters for the MPI and PROFIBUS interfaces (Page 6503)

14.5.3 Showing or hiding interfaces

To improve clarity, it is possible to hide individual interfaces of the PG/PC in the project tree and to show them again when necessary.

Procedure

To show or hide individual interfaces, follow the steps below:

1. Open the "Online access" folder in the project tree.
2. Double click on the "Display/hide interfaces" icon.
   The "Display/hide interfaces" dialog opens.
3. Enable or disable the required interfaces in the "Display in the project tree" column.
4. Click the "Apply" button.
   The changes are applied. The view of the interfaces in the "Online access" folder is refreshed.

14.5.4 Displaying and modifying interface properties

Introduction

For each interface, you can display and, in some cases, modify properties, for example the network type, address, and status.

Procedure

To open the properties, follow these steps:

1. Right-click on the required interface below "Online access" in the project tree.
2. Select the "Properties" command from the shortcut menu.
   A dialog containing the properties of the interface opens. On the left of the dialog, you will see the area navigation. You can view the current parameter settings in the individual entries in the area navigation and, if necessary, change them.

14.5.5 Adding interfaces

You have the option of installing additional interfaces after installation of the TIA Portal.

Procedure

To install an interface at a later time and add it to the TIA Portal, follow these steps:

1. Install or update the drivers in the operating system once you have installed the interface hardware.
2. Close the TIA Portal if it is still open.
3. Open the Windows control panel.
4. Open the entry "Setting the PG/PC Interface" in the Control Panel.
   The "Setting the PG/PC Interface" dialog opens.
5. Make any necessary changes to the interface configuration and confirm them with "OK".
   You have to click "OK", even if you have not made any changes.
6. Restart the TIA Portal.

Result

The newly installed interface is now displayed in the project tree under the "Online access" folder.

14.5.6 Setting parameters for the Ethernet interface

14.5.6.1 Setting parameters for the Industrial Ethernet interface

Options in the parameter settings for the Industrial Ethernet interface

When setting parameters for the Industrial Ethernet interface, you have the following options:

- Parameters dependent on the operating system
  The Industrial Ethernet interface has parameters that are set in the operating system and are valid for all connected devices. These parameter settings are only displayed here, they can, however, be changed in the network settings of the operating system.
- Parameters that can be set in the software

Note

Note that changes to interface parameters have a direct influence on the operating system and the programming device / PC. Remember that some parameter settings can only be changed if you have adequate user rights.

Parameters for the Industrial Ethernet interface

The following table contains an overview of the parameters of the Industrial Ethernet interface that are set by the operating system and can be changed by the user.

Parameter settings that cannot be changed	Parameters that can be set
MAC address	Fast acknowledge at the IE-PG access and for TCP/IP
DHCP server activated/deactivated	Timeout at the IE-PG access and for TCP/IP
APIPA activated/deactivated	LLDP
IP address	Additional, dynamic IP addresses for the network adapter
Subnet mask	-
DNS addresses	-
DHCP addresses	-

See also

Connecting the PG/PC interface to a subnet (Page 6500)

Setting parameters for the Ethernet interface (Page 6501)

Assigning a temporary IP address (Page 6501)

Managing temporary IP addresses (Page 6502)

Influence of user rights (Page 280)

14.5.6.2 Displaying operating system parameters

The Ethernet interface is part of the operating system. All parameters of the network adapter can therefore be adapted in the network settings of the operating system.

You can display the following parameters in the software:

- Physical address of the network adapter
- Assignment of the IP address by a DHCP server activated or deactivated
- Assignment of a private IP address by the operating system activated or deactivated
- Current static IP address
- Assigned subnet mask
- DNS addresses
- DHCP addresses

If you want to modify the parameter settings, please refer to the documentation of the operating system or the network adapter.

Displaying current parameters of the Ethernet interface

To display the current parameters of the Ethernet interface, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Select "Configurations > Industrial Ethernet" in the area navigation.

See also

Setting parameters for the Ethernet interface (Page 6501)

14.5.6.3 Connecting the PG/PC interface to a subnet

If you have created several subnets, you can specify the subnet to which the Ethernet interface is connected.

Procedure

To select the subnet to which the Ethernet interface is connected, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Go to "General > Assignment" and select the subnet to which you want to connect the Ethernet interface of the programming device / PC in the "Connection to subnet" drop-down list.
4. Close the dialog with "OK".

14.5.6.4 Setting parameters for the Ethernet interface

You can adapt some parameter settings relating to the network protocol directly in the software.

Requirement

You must have adequate user rights.

See also: Influence of user rights (Page 280).

Procedure

To change parameter settings relating to the network protocol, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Select "Configurations > IE-PG access" to adapt the protocol settings relevant for network management.
   - Select the "Fast acknowledge" check box to achieve faster reaction times with smaller network packets.
   - From the "Timeout" drop-down list, select the maximum time that can elapse before a network node is detected.
4. To activate the LLDP protocol and discover the network topology more accurately, set the "LLDP active" check box in "Configurations > LLDP".
5. Select "Configurations > TCP/IP" to adapt the TCP/IP protocol for network traffic during runtime.
   - Select the "Fast acknowledge" check box to achieve faster reaction times with smaller network packets.
   - From the "Timeout" drop-down list, select the maximum time that can elapse before there is a timeout during communication with a network node.

See also

Influence of user rights (Page 280)

Displaying operating system parameters (Page 6500)

14.5.6.5 Assigning a temporary IP address

Adding a dynamic IP address

If the IP address of a device is located in a different subnet from the IP address of the network adapter, you will first need to assign an additional IP address with the same subnet address as the device. Only then is communication between the device and the programming device / PC possible.

The assignment of an additional temporary IP address is also proposed automatically if you want to perform an online action and the current IP address of the programming device/PC is not yet in the correct subnet.

A temporarily assigned IP address remains valid until the next time the programming device/PC is restarted or until you delete it manually.

Note

You require adequate permissions to be able to assign a temporary IP address.

See also: Influence of user rights (Page 280)

See also

Managing temporary IP addresses (Page 6502)

14.5.6.6 Managing temporary IP addresses

If the IP address of a device is located in a different subnet from the current permanently assigned IP address of the network adapter, a suitable IP address from the subnet of the device is temporarily assigned to the network adapter.

You can display all temporarily assigned addresses and delete them. Note that IP addresses that you manually assigned in the operating system are not displayed in the TIA Portal.

Requirement

To delete, you require adequate permissions.

Procedure

To display and delete temporarily assigned addresses, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Select "Configurations > IE-PG access".
   A table with the assigned IP addresses is displayed.
4. Click the "Delete project-specific IP addresses" button to delete all the IP addresses at one time.

See also

Influence of user rights (Page 280)

14.5.6.7 Resetting the TCP/IP configuration

If you have changed the TCP/IP protocol settings, you can reset them to the defaults.

Procedure

To restore the TCP/IP configuration to the default settings, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Select "Configurations > TCP/IP".
4. Click the "Standard" button to reset all the settings.

14.5.7 Setting parameters for the MPI and PROFIBUS interfaces

14.5.7.1 Setting parameters for the MPI and PROFIBUS interfaces

Possible parameter settings for the MPI and PROFIBUS interfaces

The following parameter settings can be made for the MPI and PROFIBUS interfaces:

- Automatic configuration: You can use automatic detection functions to find out whether a device is connected to the PG/PC interface over PROFIBUS or MPI.
- Selecting a default configuration for PROFIBUS or MPI that can be adapted later.

Device- and network-related settings for MPI and PROFIBUS

You can set device- and network-related parameters for MPI and PROFIBUS interfaces. Device-related parameters are local settings for the interface. Network-related parameters, on the other hand, must match up on all devices.

MPI interface parameters you can modify

You can adapt the following default parameters for the MPI interface:

Device-related parameters	Network-related parameters
Is only master	Highest address
Own address	Transmission rate
Timeout	

PROFIBUS interface parameters you can modify

You can adapt the following default parameters for the PROFIBUS interface:

Device-related parameters	Network-related parameters
Is only master	Highest address
Own address	Transmission rate
Timeout	Profile

Device-related parameters	Network-related parameters
	Bus parameters
	Number of masters on bus
	Number of slaves on bus

Note

Behavior when a subnet is assigned

If you permanently assign a subnet from the project to the interface, the subnet settings of the project take precedence. In this case, the settings for the respective interface cannot be changed.

See also

Basics of assigning parameters for the PG/PC interface (Page 6497)

14.5.7.2 Setting MPI or PROFIBUS interface parameters automatically

Setting up automatic bus parameter detection

If you select an interface with automatic detection of the bus parameters (for example CP 5611 (Auto)), you can connect the programming device or PC to MPI or PROFIBUS without needing to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute.

Requirement

- Masters that distribute bus parameters cyclically are connected to the bus.
- In PROFIBUS networks, the cyclic distribution of bus parameters is enabled.
- The interface is not assigned to a subnet. If you assign a subnet in the properties of the interface, the settings for the subnet in the project take precedence. In this case, the settings for the automatic interface configuration cannot be changed.

Procedure

To enable automatic bus parameter detection, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Go to "General > Configurations > Active configuration" and select the setting "Automatic protocol detection".
4. Go to "Configurations > Auto configuration > Local settings" and select the address of the PG/PC interface in the "Own address" drop-down list.
5. If you then want to display the current bus settings, click the "Network detection" button.

See also

Setting parameters for the MPI interface (Page 6505)

Setting parameters for the PROFIBUS interface (Page 6507)

14.5.7.3 Setting parameters for the MPI interface

Changing the parameter settings of the MPI interface

The network-related parameters and bus parameters for the MPI network can be adapted. You should first select a default setting and then adapt this to the specific situation.

Requirement

The interface is not assigned to a subnet. If you assign a subnet in the properties of the interface, the settings for the subnet in the project take precedence. In this case, the interface configuration cannot be changed.

Setting defaults for the MPI interface

To adapt the parameters of the MPI interface, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Go to "General > Assignment" and select the subnet with which you want to connect the interface in the "Connection to subnet" drop-down list.
4. Under "General > Configuration", select a default for the device and network-related parameters. The defaults are suitable for most configurations. Select one of the following settings:
   - Automatic protocol detection
     You can connect the programming device to MPI or PROFIBUS without having to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute. Prerequisite for the automatic detection is a connection to the bus master, which distributes the bus parameters cyclically. With PROFIBUS subnets, cyclic distribution of bus parameters may not be deactivated (default PROFIBUS network setting).
   - MPI
     The "MPI" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.
   - PROFIBUS
     The "PROFIBUS" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.

Changing the default parameter settings

To adapt the default settings to your requirements, change the parameter setting where necessary in "Configurations > MPI".

You can set the following device-related parameters:

- Is only master
  An additional verification function to prevent bus disruptions when connecting the PG/PC to the network is disabled because the programming device or PC is the only master on the bus.
  - Do not enable this option unless you have only connected slaves to your programming device or PC.
  - If the "Is only master" check box is enabled, it is not possible to identify the directly connected device in the "Accessible devices" window.
- Own address
  This setting relates to the programming device or PC on which you call up the parameter settings of the interface. Set the local device address of your programming device or PC here.
  - This address must be unique throughout the network.
  - The programming device or PC is addressed using this address in the MPI network.
- Check
  This enables an additional safety function to prevent bus disruptions when connecting the PG/PC to the network. The driver checks whether the local address is already being used by another station. Active as well as passive stations are taken into consideration in this case. The driver monitors this on the PROFIBUS. The connection of the PG/PC to the network will take longer with the automatic check. To use the check, the driver must support the function. Furthermore, the "Is only master" option must not be selected.
- Timeout
  Set a higher timeout value if, for example, you have problems with long response times on the network.

You can set the following network-related parameters:

- Highest address:
  Select the configured highest device address. Make sure that the same highest device address is set for all devices of a PROFIBUS or MPI network.
- Transfer rate:
  Here, you select the transmission speed to be used on the MPI network.

See also

Setting MPI or PROFIBUS interface parameters automatically (Page 6504)

14.5.7.4 Setting parameters for the PROFIBUS interface

Changing the parameter settings of the PROFIBUS interface

The network-related parameters and bus parameters for the PROFIBUS network can be adapted more precisely. You should first select a default setting and then adapt this to the specific situation.

Requirement

The interface is not assigned to a subnet. If you assign a subnet in the properties of the interface, the settings for the subnet in the project take precedence. In this case, the interface configuration cannot be changed.

Setting defaults for the PROFIBUS interface

To adapt the parameters of the PROFIBUS interface, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Go to "General > Assignment" and select the subnet with which you want to connect the interface in the "Connection to subnet" drop-down list.
4. Under "General > Configuration", select a default for the device and network-related parameters. The defaults are suitable for most configurations. Select one of the following settings:
   - Automatic protocol detection
     You can connect the programming device to MPI or PROFIBUS without having to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute. Prerequisite for the automatic detection is a connection to the bus master, which distributes the bus parameters cyclically. With PROFIBUS subnets, cyclic distribution of bus parameters may not be deactivated (default PROFIBUS network setting).
   - MPI
     The "MPI" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.
   - PROFIBUS
     The "PROFIBUS" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.

Changing the default parameter settings

To adapt the default settings to your requirements, change the parameter setting where necessary in "Configurations > PROFIBUS".

You can set the following device-related parameters:

- Is only master
  An additional verification function to prevent bus disruptions when connecting the PG/PC to the network is disabled because the programming device or PC is the only master on the bus.
  - Do not enable this option unless you have only connected slaves to your programming device or PC.
  - If the "Is only master" check box is enabled, it is not possible to identify the directly connected device in the "Accessible devices" window.
- Own address
  This setting relates to the programming device or PC on which you call up the parameter settings of the interface. Set the local device address of your programming device or PC here.
  - This address must be unique throughout the network.
  - The programming device or PC is addressed using this address in the PROFIBUS network.
- Check
  This enables an additional safety function to prevent bus disruptions when connecting the PG/PC to the network. The driver checks whether the local address is already being used by another station. Active as well as passive stations are taken into consideration in this case. The driver monitors this on the PROFIBUS. The connection of the PG/PC to the network will take longer with the automatic check. To use the check, the driver must support the function. Furthermore, the "Is only master" option must not be selected.
- Timeout
  Set a higher timeout value if, for example, you have problems with long response times on the network.

You can set the following network-related parameters:

- Highest address:
  Select the configured highest device address. Make sure that the same highest station address is set for all devices of a PROFIBUS network.
- Transfer rate:
  Here, you select the transmission speed to be used on the PROFIBUS network.
- Profile:
  You have a choice of four alternatives for the PROFIBUS settings. "DP", "Standard" and "Universal (DP/FMS)" are predefined settings that you cannot change. If you select "User-defined", you can adapt the bus parameters yourself.
  - If you have selected "User-defined", go to "Configurations > PROFIBUS > Bus parameters" in area navigation.
  - If you have selected one of the defaults (DP, Standard or Universal (DP/FMS)), you should select the "Include" check box in "Configurations > PROFIBUS > Bus parameters > Additional parameters". You can then set the number of masters and slaves on the bus. This allows a more precise calculation of the bus parameters and potential bus disruptions can be prevented. The option cannot be selected with a user-defined profile.

See also

Overview of the bus parameters for PROFIBUS (Page 6509)

Setting MPI or PROFIBUS interface parameters automatically (Page 6504)

14.5.7.5 Overview of the bus parameters for PROFIBUS

Introduction

The PROFIBUS subnet will only function problem-free if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

It may be possible for the bus parameters to be adjusted depending on the bus profile. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

The displayed parameters are valid for the entire PROFIBUS subnet.

Meaning of the individual parameters

- Tslot: Wait-to-receive time (slot time)
  The wait-to-receive time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner.
- Max. Tsdr: maximum protocol processing time (max. station delay responder)
  The maximum protocol processing time defines the time after which the responding device must have processed the protocol.
- Min. Tsdr: minimum protocol processing time (min. station delay responder)
  The minimum protocol processing time specifies the minimum time required by the responding device to process the protocol.
- Tset: Trigger time (setup time)
  The trigger time is the time that may lapse between the reception of a data frame frame and the reaction to it.
- Tqui: Quiet time for modulator
  The quiet time for modulator specifies the time required to change from sending to receiving.
- GAP factor: GAP update factor (GAP factor)
  The GAP update factor specifies the number of token rotations before a new device is included in the token ring.
- Retry limit: maximum number repeated calls (retry limit)
  This parameter defines the maximum number of attempts (message frame repeats) made to reach a node.
- Trdy: Ready time
  The ready time is the time for an acknowledgment or response.
- Tid1: Idle time 1
  Idle time 1 specifies the delay time after receiving a response.
- Tid2: Idle time 2
  Idle time 2 specifies the delay time after sending a call without a response.

- Ttr: Target rotation time
  The target rotation time is the maximum time made available for a token rotation. During this time, all active devices (masters) receive the token once. The difference between the desired token round-trip time and the actual token round-trip time decides how much time is left for masters to send data message frames to the slaves.
  As the minimum target rotation time (Ttr), select a value = 5000 times the HSA (Highest Station Address).
- Watchdog: Watchdog
  The watchdog time specifies the time after which a device must be addressed.
  As the minimum watchdog time, select a value = 6250 times the HSA.

Note

If you want to create a user-defined bus profile, note that the minimum target rotation time (Ttr) should be 5000 times the HSA (highest PROFIBUS address). The minimum watchdog time should also be 6250 times the HSA.

Setting parameters for the PROFIBUS interface (Page 6507)

14.5.7.6 Resetting the MPI or PROFIBUS configuration

If you have changed the MPI or PROFIBUS protocol settings, you can reset them to the defaults.

Requirement

The interface is not assigned to a subnet. If you assign a subnet in the properties of the interface, the settings for the subnet in the project take precedence. In this case, the interface configuration cannot be reset to the default values.

Procedure

To restore the MPI or PROFIBUS configuration to the default settings, follow these steps:

1. Select the MPI/PROFIBUS interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.
   The dialog for configuring the interface opens.
3. Select "Configurations > MPI" or "Configurations > PROFIBUS", depending on the interface properties you want to reset.
4. Click the "Standard" button to reset all the settings.

14.6 Using the trace and logic analyzer function

14.6.1 Preface

Purpose of the documentation

The diagnostics options available with the trace and logic analyzer function are described in this documentation. Depending on the device used, the recording options can vary.

Required basic knowledge

In order to understand this documentation, the following knowledge is required:

- General knowledge in the field of automation
- Knowledge about the use of Windows-based computers
- S7-1200/1500 CPUs, ET 200SP, ET 200Pro
  - Knowledge of the SIMATIC industrial automation system
  - Knowledge of working with STEP 7
- SINAMICS G120
  - Knowledge of working with the drive
- SINAMICS S120
  - Knowledge of working with the drive

Validity of the documentation

This documentation applies to all products of the S7-1200, S7-1500, SINAMICS G120 and SINAMICS S120 product family as of TIA Portal V14.

Conventions

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

"mySupport"

With "mySupport", your personal working area, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en/).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Further support

- The range of technical documentation for the individual SIMATIC products and automation systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the online ordering system is available on the Internet (https://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

14.6.2 Description

14.6.2.1 Supported hardware

If a device supports the trace and logic analyzer function, "Traces" is offered for selection in the project tree below the device.

The following devices (Page 6557) support the trace and logic analyzer function:

- SIMATIC S7-1200 CPUs (as of firmware version V4.0)
- SIMATIC S7-1500, ET 200SP and ET 200Pro CPUs
- SIMATIC S7-1500 software controller
- SINAMICS G120
- SINAMICS S120
- SIRIUS SIMOCODE pro (with Simocode ES)
- SIRIUS soft starter 3RW (with Soft Starter ES)

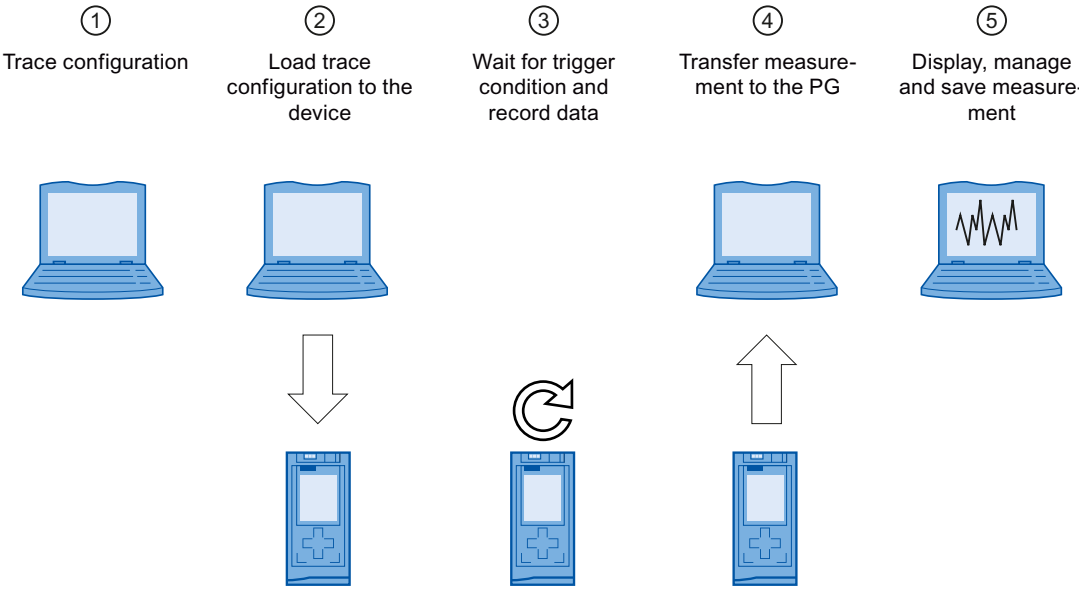
14.6.2.2 Recording of measured values with the trace function

Introduction

The trace and logic analyzer function can be called in the project navigator (Page 6517) by double-clicking an entry in the "Traces" system folder. The measurements on the memory card can also be read and displayed via the diagnostic interface of the Web server.

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU. The number of installed traces is hardware-dependent.

The recordings are saved on the device and, when required, can be read out with the engineering system (ES) and saved permanently. The trace and logic analyzer function is



therefore suitable for monitoring highly dynamic processes. The recorded values are overwritten when the recording is activated again.

Active recordings from the axis control panel are displayed in the "Traces" system folder as installed traces. Recordings can be added to the measurements in the curve diagram of the axis control panel or the PID via a shortcut menu command.

Depending on the device (Page 6557) used, the recording options can vary.

A quick start (Page 6537) for working with the trace and logic analyzer function can be found in the Operation section.

The following figure shows the method of operation of the "Traces":

① Trace configuration on the programming device (PG) in the TIA Portal

You can specify the signals to be recorded, the duration of the recording and the trigger condition in the trace configuration. The trace configuration depends on the device and is described at the respective device (Page 6557).

② Transferring the trace configuration from the PG to the device

You can transfer the complete trace configuration (Page 6544) to the device when an online connection is established.

③ Waiting for the recording

If the installed trace configuration is activated (Page 6545), then the recording is performed independently of the PG. The recording is started as soon as the trigger condition is satisfied.

④ Transferring the measurement from the device to the PG

The saving of the measurement in the project (Page 6547) stores the measurement in the opened project of the TIA Portal. The measurement can be saved at any time after completing the recording, irrespective of the time of the measurement.

⑤ Evaluating, managing and saving the measurement

Numerous options are available for the evaluation of the measurement in the curve diagram and in the signal table (Page 6546). Various display types are possible, for example, a bit representation for binary signals.
Signal waves from different measurements can be put together as an overlay measurement and compared with each other.
Measurements can also be exported and imported as a file.
With the saving of the project (Page 6547) in the TIA Portal, the measurements transferred to the project are also saved.

Supported TIA Portal features

The following TIA Portal features are supported as of V14:

- Saving of trace configurations and measurements in libraries
- Multiuser support for trace configurations and measurements (offline data)

14.6.2.3 Trace configuration, recording, installed trace and measurement

This section explains the meaning and relationships of the terms: trace configuration, recording, installed trace and measurement.

Trace configuration

Implement the following settings in the trace configuration:

- Signals to be recorded
- Recording conditions
  - Sampling
  - Trigger
  - Installed measurements (memory card)

Recording

A recording is performed in the device. There is only one recording for each installed trace configuration. When a new recording is started, the old recording is overwritten.

An installed recording is not retentive (it is lost when the device is switched off/on) but can be saved permanently in the project as a measurement.

Installed trace

An installed trace consists of a trace configuration and optionally a recording. The maximum number of installed traces depends on the device.

The trace configuration is stored retentively on the device. The retentivity of the trace configuration may also be configurable depending on the device, e.g. with the S120.

Measurement

A measurement consists of a trace configuration and a recording, provided that recorded data is present. Each installed trace can be saved as a measurement in the project.

The recording of a measurement can be viewed offline.

The configuration for a measurement can be transferred to the “Traces” folder using drag & drop.

Installed measurements (memory card)

The folder contains measurements that are saved on the device (e.g. on the memory card). These measurements are retentive and can only be deleted by the user.

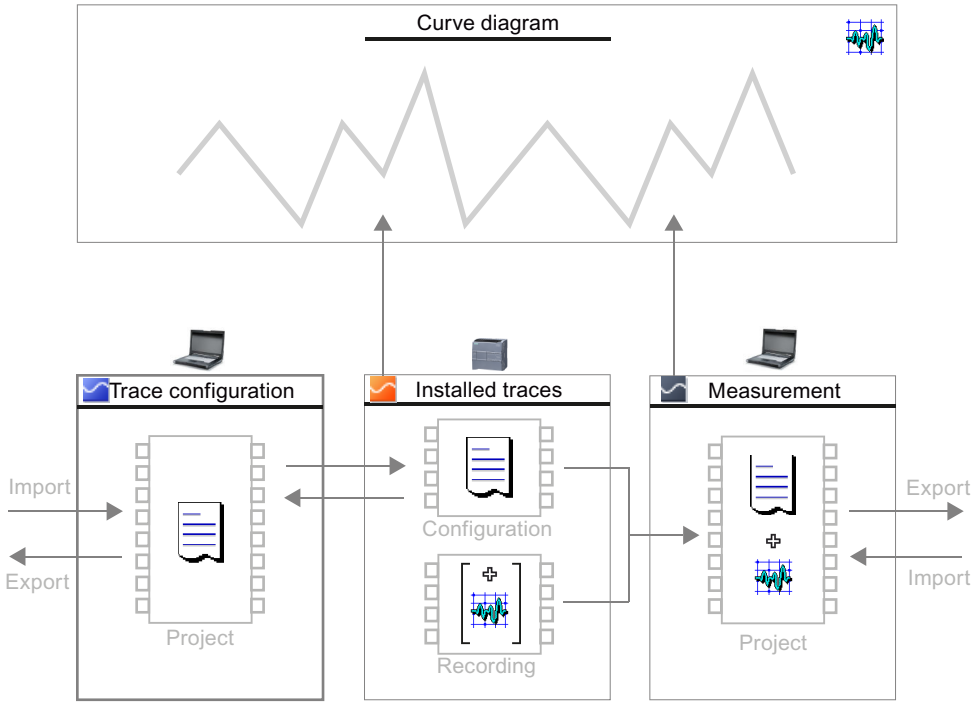
The installed measurements can be transferred to the Measurements folder using drag & drop and are then saved as measurements in the project.

Trace configuration with an installed trace of the same name

Usually, there is a trace configuration in the project with the same name for an installed trace. When there is an online connection, this trace is displayed with the icon in the project tree.

See also User interface - “Traces” project tree folder (Page 6519).

Overlay measurement



The overlay measurement allows a comparison and analysis of signals from different measurements with each other.

The measurements can be synchronized with each other and displayed as overlay measurements.

14.6.2.4 Data storage

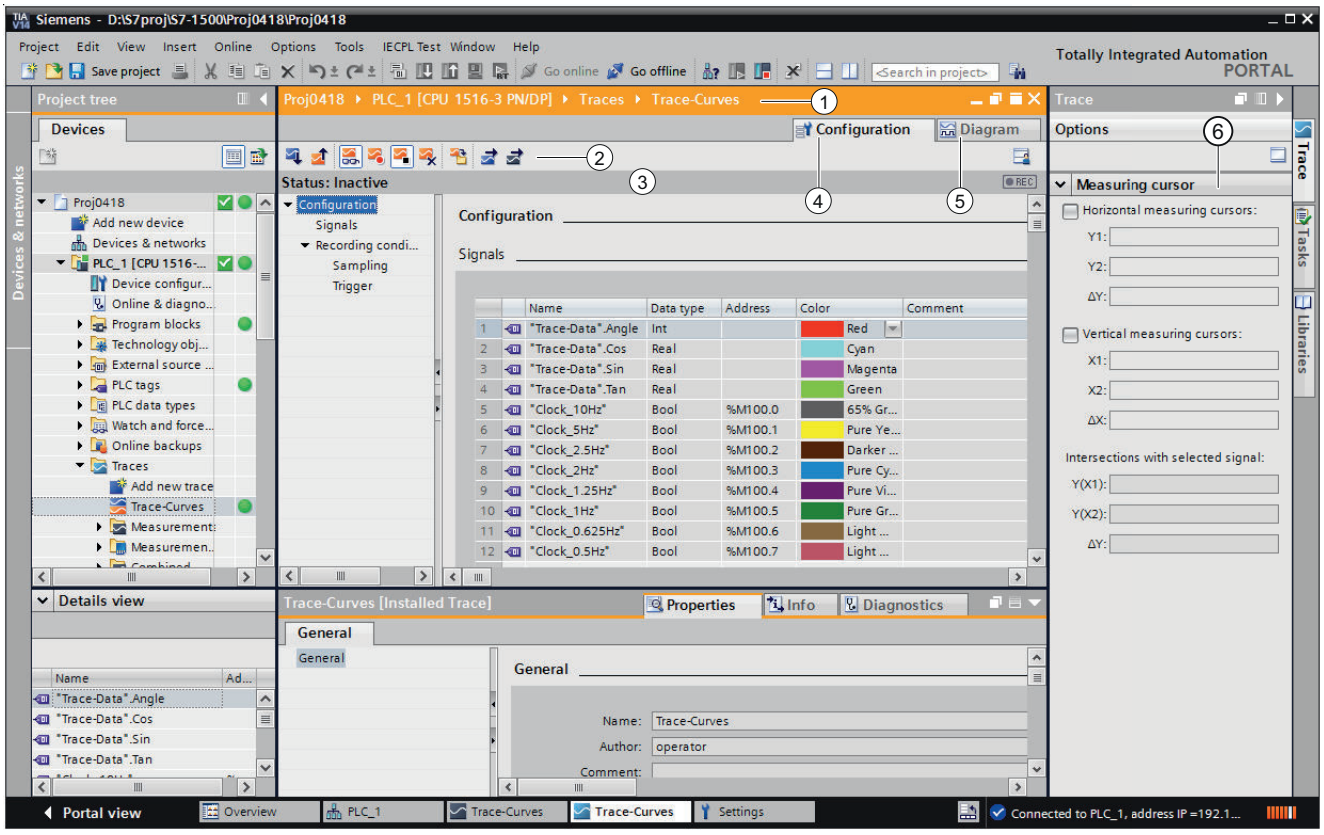
The trace toolbar and the curve diagram also enable the transfer of the trace configuration and the viewing of the recording.

The following figure is a schematic diagram of the data storage:

Note

Saving the trace configuration and measurement

You save the trace configuration and measurement with the project in the TIA Portal.



If you close the project without saving, the trace configurations and the measurements transferred to the project are discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

14.6.3 Software user interface

Display areas

The user interface of the trace and logic analyzer function consists of several areas.

The example in the figure below shows the division of the user interface in the TIA Portal:

	Project navigator
Management and creation of the trace and measurements directly in the project tree and via context menu commands.	
	Working area

	① Title bar of the working area Shows the device to which the current display belongs.
	② Trace toolbar Buttons for managing the trace in the project and device: • Activation/deactivation of installed traces • Deletion of installed traces • Transfer of trace configurations and measurements between the device and the project • Export of trace configurations and measurements • Switchover between offline and online display
	③ Status display of the trace Display of the current status of the recording.
	④ Configuration tab Device-specific configuration of the recording duration, trigger condition and signal selection. See Device-specific descriptions (Page 6557).
	⑤ Diagram tab Display of the recorded values as a curve diagram and the signals from the displayed measurement.
	Signal selection tab Display of all signals that are contained in the overlay measurements.
"Trace" task card Display of the measurement cursor data ⑥ and snapshots.	
Inspector window Display of general information about the trace configuration	

14.6.3.1 Project navigator

User interface - “Traces” project tree folder

Trace configurations and installed traces are displayed in the "Traces" folder.

More information about the “Traces” sub-folder is provided in the following sections.

Double-click a trace to open the corresponding "Diagram" or "Configuration" tab in the working area.

Icons in the "Traces" folder

The following table explains the icons in the "Traces" folder:

Icon	Description
	Add trace configuration Double-click the icon to add a new trace configuration.
	Trace configuration (offline) Double-click the icon to open the "Configuration" tab.
	Installed trace (online) The icon is only displayed when there is no offline trace configuration of the same name for the installed trace. Double-click the icon to open the "Diagram" tab.
	Trace configuration with an installed trace of the same name If the button is deactivated, the trace configuration from the project is displayed. The trace corresponds to a trace configuration. If the button is activated, the trace configuration from the device is displayed. The trace corresponds to an installed trace. Double-click the icon to open the "Diagram" tab.

Status

When there is an online connection, the status is displayed in the right-hand column of the project tree. The status is also displayed as tooltip above the respective icon.

The following table shows the meaning of the icons:

Icon	Description
	Online and offline configuration are identical
	Online and offline configuration are different
	Configuration only exists online

Shortcut menu commands

The following table shows the shortcut menu commands for the "Traces" system folder:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
“Add new trace”	Inserts a new trace configuration and opens the configuration tab.
"Import trace configuration"	Imports a trace configuration from a file.

The following table shows the shortcut menu commands for trace configurations and installed traces / :

Shortcut menu command	Trace configuration	Installed trace	Description
"Copy"	x	-	Copies the trace configuration of the selected objects to the clipboard.
"Paste"	x	-	Inserts a trace configuration or measurement from the clipboard.
"Delete"	x	x	Deletes the selected objects from the project tree or from the device.
"Rename"	x	-	Switches the selected object to the editing mode.
"Export trace configuration"	x	-	Exports a trace configuration as a file with the extension "*.ttcfgx". For compatibility reasons, the "*.ttcfgx" file extension will be supported in V12, but does not contain any information about the device family.

The trace configuration can also be copied device-wide.

Several objects can be selected.

User interface - “Measurements” project tree folder

The “Measurements" folder shows the saved measurements.

Icons in the “Measurements" folder

The following table explains the icons in the “Measurements" folder:

Icon	Description
	Measurement (offline) Double-click the icon to open the "Diagram" tab. The configuration for a measurement can be transferred to the “Traces” folder using drag & drop.

Shortcut menu commands

The following table shows the shortcut menu commands for the "Measurements" system folder:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
"Import measurement"	Imports a measurement from a file with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.

The following table shows the shortcut menu commands for measurements :

Shortcut menu command	Description
"Copy"	Copies the trace configuration of the selected objects to the clipboard.
"Paste"	Inserts a measurement from the clipboard.
"Delete"	Deletes the selected objects from the project tree or from the device.
"Rename"	Switches the selected object to the editing mode.
“Generate new overlay measure-ment”	Generates a new overlay measurement with the selected measurements.
"Export measure-ment"	Exports a measurement with the last saved standard view The measurement is saved with the extension "*.ttrecx" or "*.csv". For compati-bility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.

The measurements can also be copied device-wide.

Several objects can be selected.

User interface - “Installed measurements (memory card)” project tree folder

The folder shows all measurements present on the memory card. The folder is only displayed when there is an online connection to the device.

Drag folders or measurements contained here to the “Measurements” system folder using drag & drop. This transfers the measurements to the project.

Icons in the "Traces" folder

The following table explains the icons in the system folder :

Icon	Description
	Folders generated automatically with information on the recording start time The name of the folder cannot be changed.
	Installed measurement Double-click the icon to open the "Diagram" tab. The time stamp in the name shows the occurrence of the trigger event.

Shortcut menu commands

The following table shows the shortcut menu commands for the folder :

Shortcut menu command	Description
"Copy"	Copies the selected objects to the clipboard.
"Delete"	Deletes the selected objects from the project tree and from the device.

The following table shows the shortcut menu commands for measurements :

Shortcut menu command	Description
“Open”	Opens the measurement in the “Diagram” tab.
"Copy"	Copies the selected objects to the clipboard.
"Delete"	Deletes the selected objects from the project tree and from the device.
"Export measure-ment"	Exports a measurement as a file with the extension "*.ttrecx" or "*.csv". For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
“Properties”	Displays the general properties of the measurement (Page 6536).

Several objects can be selected.

User interface - “Overlay measurements” project tree folder

The system folder “Overlay measurements" shows the configured overlay measurements.

Icons in the “Overlay measurements" folder

The following table explains the icons in the system folder “Overlay measurements”:

Icon	Description
	Add new overlay measurements Double-click the icon to add a new overlay measurement and open the “Diagram” tab.
	Overlay measurement Double-click the icon to open the "Diagram" tab.

Shortcut menu commands

The following table shows the shortcut menu commands for the system folder “Overlay measurements" or for a group folder contained within this:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
“Add new overlay measurement”	Inserts a new overlay measurement and opens the “Diagram” tab.

The following table shows the shortcut menu commands for overlay measurements:

Shortcut menu command	Description
“Open”	Opens the selected overlay measurements in the working area.
"Import measurement"	Imports a measurement from a file with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
"Copy"	Copies the selected objects to the clipboard.

Shortcut menu command	Description
"Paste"	Inserts measurements, measurements from installed traces or overlay measurements from the clipboard. Multiple objects can be inserted from the clipboard if they are all of the same type.
"Delete"	Deletes the selected objects from the project tree or from the device.
"Rename"	Switches the selected object to the editing mode.
“Properties”	Displays the general properties for the overlay measurements.

The overlay measurements can also be copied device-wide.

Several objects can be selected.

14.6.3.2 Working area

User interface - trace toolbar

Tools are available for handling the trace via buttons.

The following table shows the functions of the buttons:

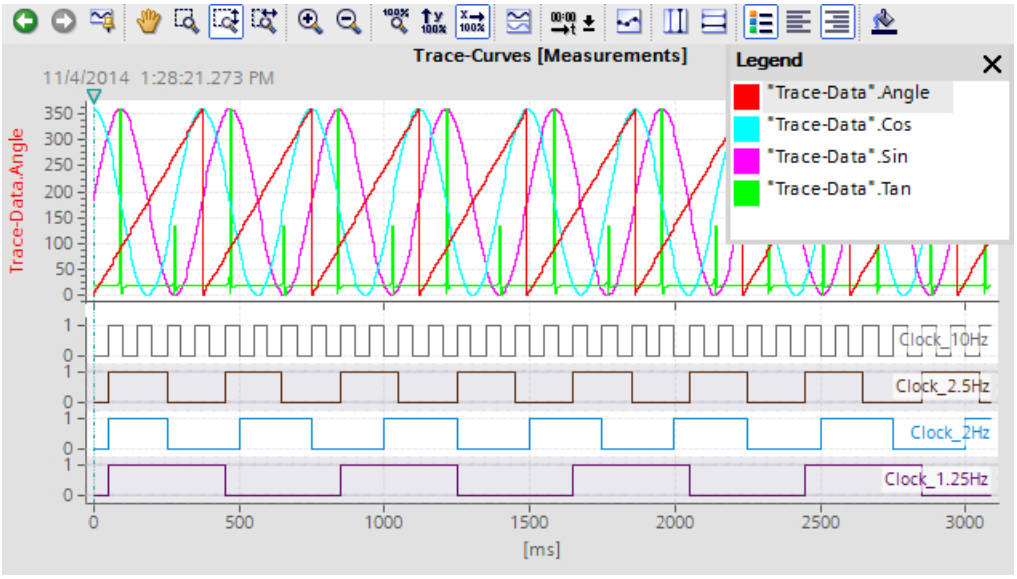
Icon	Description
	Transfer the selected trace configuration to the device The selected trace configuration is transferred to the device.
	Transfer the selected trace configuration from the device The selected trace configuration is transferred from the device to the project.
	Observe on/off Change of the display between online and offline. **Note** Once monitor and automatic scaling are activated at the same time, no more actions can be undone using the “Undo” button. **Note** When an installed trace is first started the display in the curve diagram is set to automatic scaling by default. Make sure when the recording is restarted that any changes to the scaling settings are retained. Reactivate automatic scaling manually if necessary in order to monitor the recording.
	Activate recording If the recording of an installed trace is repeated, then the settings relevant for the display (curve diagram and signal table) are also retained for the new recording. **Note** When a recording is restarted, the previously recorded values are lost. To save the recorded values, save the measurement in the project (Page 6547) before you activate the recording again.
	Deactivate recording
	Delete installed trace Deletes the selected trace from the device.

Icon	Description
	Transfer the selected measurement from the device to the project The measurement is added to the "Measurements" system folder. **Note** In order to be able to save the installed trace data as a measurement, it must first have been displayed once in the curve diagram. The recording data is loaded from the device when displayed. If necessary wait until the display is updated, as only the displayed data is transferred to the project in all cases.
	Export trace configuration Exports a trace configuration as a file with the extension "*.ttcfgx". For compatibility reasons, the "*.ttcfgx" file extension will be supported in V12, but does not contain any information about the device family.
	Generate a trace configuration Generates a new trace configuration from the measurement.
	Export measurement with the settings from the current view Exports a measurement as a file with the extension "*.ttrecx" or "*.csv". For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
	Import measurement (only with overlay measurements) Imports a measurement from a file with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
	Select a measurement (only with overlay measurements) The drop down list box contains the imported measurements. Select the desired measurement to display the configuration.

User interface - Configuration tab

User interface - Configuration

The trace configuration depends on the device and is described at the respective device (Page 6557).



User interface - Diagram tab

User interface - curve diagram

The curve diagram displays the selected signals of a recording. Bits are shown in the lower diagram as a bit track. You can adjust the display of the signals in the signal table (Page 6529) and with the toolbar of the curve diagram.

Setting options and displays in the curve diagram

The following figure shows an example of the display in the TIA Portal:

The scale in the diagram applies to the selected (highlighted in gray) signal in the legend. The legend can be moved and its size can be adjusted with the mouse.

The ▽ icon shows the device trigger time with a vertical line.

Functions using the mouse wheel

The following table shows which functions are possible in the curve diagram using the mouse wheel:

Function of the mouse wheel	Description
Move the curve diagram vertically	Turning the mouse wheel moves the display in the upper curve diagram up or down. If the signals are arranged in traces the display for the group is shifted that is located below the cursor. The cursor must be positioned above the upper curve diagram.
Move the curve diagram horizontally	Turning the mouse wheel with the <Shift> button pressed down moves the display in the curve diagram to the left or the right. The cursor must be positioned above the curve diagram.
Zoom in and zoom out	Turning the mouse wheel with the <Ctrl> button pressed down zooms in or out of the display in the curve diagram. The cursor position is the starting point for zooming in or out. The value axis of the lower curve diagram (bit tracks) is not affected. The cursor must be positioned above the curve diagram.

Shortcut menu commands

The following table shows the shortcut menu commands in the curve diagram:

Shortcut menu command	Description
"Save diagram as image"	Exports the current display in graphic format, e.g. as a bitmap.
"Copy image to clipboard"	Copies the current display to the clipboard.
"Center measurement cursors"	Positions the activated measurement cursors at a central point in the current display.
"Add to measurements" (only axis control panel and PID)	Adds the displayed recording to the "Measurements" system folder.
“Automatic bit track height"	Automatically adjusts the height of the bit tracks and thereby determines the size of the lower curve diagram. The setting is automatically deactivated once you change the space allocation between the curve diagrams manually. **Note** You can change the vertical space allocation between the upper and lower curve diagram. To do this drag the time axis of the upper curve diagram up or down with the mouse.

Toolbar of the curve diagram

Tools are available for adapting the display via buttons.

The following table shows the functions of the buttons:

Icon	Function	Description
	Undo zoom	Undoes the zoom function executed last. If several zoom functions have been executed, they can be undone step-by-step.
	Redo zoom	Redoes the last undone zoom function. If several zoom functions have been undone, they can be redone step-by-step.
	Standard view	Uses the current view as standard for this recording. If the trace recording is shown again later, the standard view is restored.
	Move view	Moves the display with the mouse button pressed.
	Zoom selection	Selection of an arbitrary range with the mouse button pressed. The display is scaled to the range selection.
	Vertical zoom selection	Selection of a vertical range with the mouse button pressed. The display is scaled to the range selection.
	Horizontal zoom selection	Selection of a horizontal range with the mouse button pressed. The display is scaled to the range selection.
	Zoom in	Enlargement of the display. The ranges of the time axis and value axis are reduced every time the button is clicked. The curves are displayed larger.

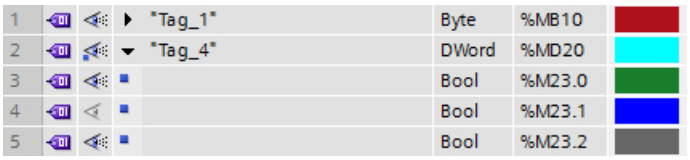
Icon	Function	Description
	Zoom out	Reduction of the display. The ranges of the time axis and value axis are increased every time the button is clicked. The curves are displayed smaller.
	Display all	Scales the display of the available data so that the entire time range and all values are displayed.
	Automatic scaling of the value axis	Scaling of the display so that all values are displayed for the currently displayed time range. The relative scaling ratio between the signals may change. **Note** The automatic scaling of the value axis is stopped when the zoom function is activated for the value axis. This button reactivates the automatic adjustments to the minimum/maximum values.
	Show the overall time range	Scaling of the display so that the values in the value range currently displayed are displayed for the overall time range. The value range displayed only then changes if “Display all values”  is activated. **Note** The automatic scaling of the time axis is stopped when a zoom function is activated for the time axis. This button reactivates the automatic adjustments for the time range.
	Arrange in tracks	Activate or deactivate the trace arrangement. When the trace arrangement is activated the signals are arranged among themselves with the relevant value axes. Signal groups are displayed in the same trace. This setting does not affect the display for the bit tracks.
	Unit changeover of the time axis	Switching the unit of the time axis The following units are adjustable: • Measurement points • Time (relative time related to the trigger time) • Absolute time
	Display samples	The samples are displayed as small circles on the curves.
	Display vertical measurement cursors	Display of the vertical measurement cursors. The vertical position of the two measurement cursors can be moved with the mouse. The associated measured values and the difference of the measurement cursors corresponding to the position are shown in the signal table. Display the “Measurement cursor” pane (Page 6534) in the Trace task card in order to display further information.

Icon	Function	Description
	Display horizontal measurement cursors	Display of the horizontal measurement cursors. The horizontal position of the two measurement cursors can be moved with the mouse. Display the “Measurement cursor” pane (Page 6534) in the Trace task card in order to display the values or to reposition the measurement cursor through entering the position.
	Display chart legend	Showing or hiding of the legend in the curve diagram and the bit track labels.
	Align the chart legend to the left	Display of the legend and the bit track labels on the left side of the curve diagram.
	Align the chart legend to the right	Display of the legend and the bit track labels on the right side of the curve diagram.
	Change background color	Changeover between various background colors.

User interface - signal table

The signal table lists the signals of the selected measurement and provides setting options for some properties. If recording data of installed traces is displayed and the settings are changed in the signal table, these settings are retained until there is a change to the offline mode. If the installed trace is added to the measurements, the current settings of the signal table are saved in the measurement.

The signals can be sorted using drag-and-drop. The bits of a signal can be resorted within a signal.



Setting options and displays in the signal table

The following figure shows an example of the display in the TIA Portal:

			Name	Data type	Address	Color	Scaling group	Min. Y scale	Max. Y scale	Y(t1)	Y(t2)	Del..	Unit	Comment
1			"Trace-Data".Angle	Int			Temp	-99.99987...	360	188	183	-5		
2			"Trace-Data".Cos	Real			Temp	-99.99987...	360	-99....	-99....	-0....		
3			"Trace-Data".Sin	Real				-99.99971...	99.999969...	-13....	-5.0...	8.6...		

The following table shows the settings and displays of the recorded signals:

Column	Description
	Static display of the signal icon
	Selection for the display in the curve diagram The point indicates that at least one bit has been selected for display as bit track for the signal in the bit selection.
"Name"	Display of the signal name A click on the name of a displayed signal updates the scale in the curve diagram.
“Measurement”	Display of the measurement (in the “Diagram” tab only with overlay measurements) Shows the name of the measurement to which the signal belongs.

Column		Description
		Open bit selection Individual bits can also be selected for the following data types for display as a bit track in the lower curve diagram. • Byte, Word, DWord, LWord • SInt, USInt, Int, UInt, DInt, UDInt, LInt, ULInt Example of an opened bit selection for the DWORD data type:  Select or deselect the relevant bit for display by clicking the icon.
"Data type"		Display of the data type
"Address"		Display of the address of the signal The field remains empty with optimized / type correct tags.
"Color"		Display and setting option for the color of the signal
"Signal group"		Display or input of the signal group name for one signal group The Y-scales are scaled identically for all signals of one signal group. Enter an identical signal group name for those signals that are to be scaled identically. Signals can be removed from the signal group by deleting the signal group name. The signal groups can be saved via the function "Use current view as standard" (button). **Note** Binary signals cannot be grouped.
	Gray field for chain icon	Move the cursor over the gray field or the chain icon (or) to add the signal to a signal group or delete the signal from the signal group. Clicking the chain icon adds the signal to a signal group or creates a new signal group. Clicking the chain icon removes the signal from the signal group. For a selected signal with signal group, the chain icon displays all signals of the same signal group.
	Input field	The input field displays the signal group name. As an alternative to the chain icon, you can assign or delete a group name via text input in this field.
"Min. Y-scale"		Display or input of the minimum value for the scaling of the signal
"Max. Y-scale"		Display or input of the maximum value for the scaling of the signal
"Y(t1)"		Display of the value at the position of the first measurement cursor
"Y(t2)"		Display of the value at the position of the second measurement cursor

Column	Description
"ΔY"	Display of the value difference between the first and the second measurement cursor
"Unit"	Display of the unit (e.g. for used-based values from technology objects)
"Comment"	Display and input option for a comment about the signal

Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Cannot be selected.
"Rename"	Cannot be selected
“Display signal(s)”	Displays the selected signals in the curve diagram.
“Hide signal(s)”	Hides the selected signals in the curve diagram.

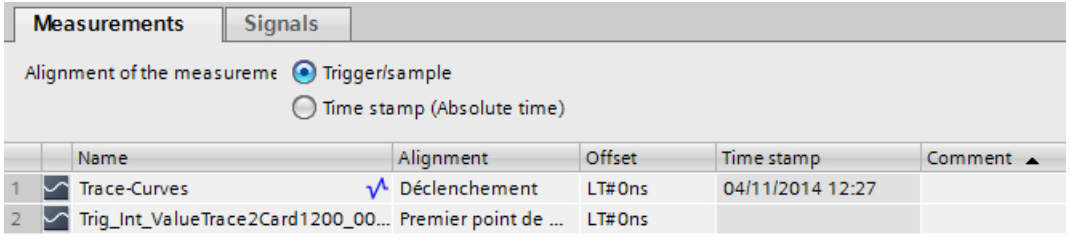
Use of the signal table (Page 6552)



Using the signal group in the signal table (Page 6553)

User interface - Measurements (overlay measurements)

The Measurements tab displays the individual measurements and among other things provides the setting options for synchronization.

Setting options and displays in the Measurements tab

The following figure shows an example of the display in the TIA Portal:

The following table shows the settings and displays for the measurements:

Column		Description
Alignment of the measurements		
	“Trigger/ measure- ment point"	Alignment of the measurements in accordance with the trigger or measurement point The individual zero point for the measurement is predefined in the table under the “Alignment” column.
	“Time stamp (absolute time)”	Alignment of the measurements in accordance with their time stamp The signals are aligned in accordance with the time from the absolute time stamp.
Table columns		
		Static display of the measurement icon
	"Name"	Display and change options for the measurement name The name must be a unique one and can be changed.
	“Alignment”	Alignment of the measurement (only adjustable with the “Trigger/measurement point” check box activated) Determines the individual zero point for a measurement. All signals for the measurement are displayed in relation to this zero point. The following settings are possible: • Trigger • First measurement point following the trigger event • First measurement point • Last measurement point
	"Offset"	Offset related to the time axis Moves the measurement left or right by the offset stated on the time axis. The offset can also be transferred via the clipboard to the cell from the ΔX value of the measurement cursor. See Align measurements precisely (overlay measurements) (Page 6555).
	“Time stamp"	Display of the trigger time
	"Comment"	Display and input option for a comment about the signal

Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Cannot be selected.
"Rename"	Switches the selected cell to the editing mode.

Shortcut menu command	Description
"Import measurement"	Imports a measurement from a file, e.g. with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
"Export measurement"	Exports a measurement as a file with the extension "*.ttrecx" or "*.csv". For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.

User interface - Signal selection tab (overlay measurements)

User interface - Signal selection (overlay measurements)

The Signal selection tab shows the signals for all measurements and allows signals that are presented in the signal table of the diagram to be preselected.

Setting options and displays in the Signal selection tab.

The following figure shows an example of the display in the TIA Portal:

		Availa...	Measurement	Name	Data type	Address	Comment
1		☑	Trace-Curves	"Trace-Data".Angle	Int		
2		☑	Trace-Curves	"Trace-Data".Cos	Real		
3		☑	Trace-Curves	"Trace-Data".Sin	Real		
4		☐	Trace-Curves	"Trace-Data".Tan	Real		
5		☑	Trace-Curves	"Clock_10Hz"	Bool	%M100.0	
6		☑	Trace-Curves	"Clock_5Hz"	Bool	%M100.1	

The following table shows the settings and displays for the table:

Column	Description
	Static display of the signal icon
"Available in the diagram"	Selection for the display in the curve diagram When the selection is activated the signal is transferred to the signal table for the curve diagram.
“Measurement”	Display of the measurement to which the signal belongs
“Name”	Display of the signal name
“Data type “	Display of the data type
"Address"	Display of the address (not for symbolic tags)
"Comment"	Display of a comment on the signal

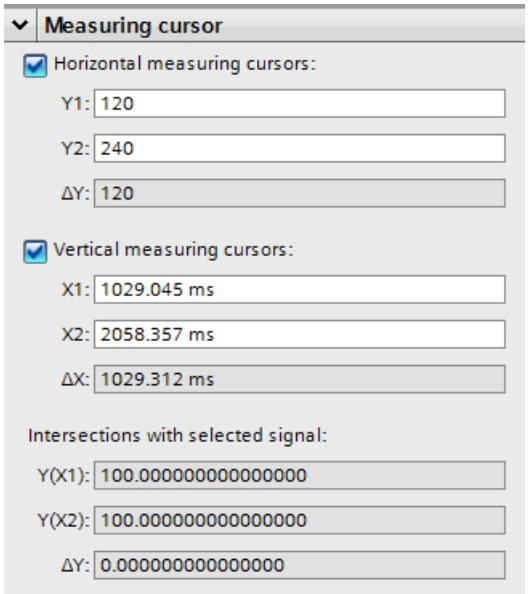
You will find further information on the specific settings in User interface - signal table (Page 6529).

Shortcut menu commands

The following table shows the shortcut menu commands for the signal selection:

Shortcut menu command	Description
"Copy"	Copies the content of the selected lines to the clipboard.
“Display selection in the signal table”	The selected signals are displayed in the signal table and are available in the diagram.
“Remove selection from the signal table”	The removed signals are not available in the diagram.

Several objects can be selected.



14.6.3.3 Trace task card

User interface - Measurement cursor pane

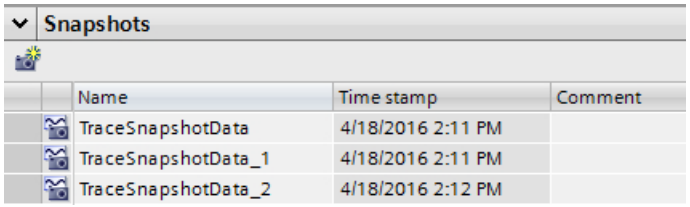
The “Measurement cursor” pane shows the position of the measurement cursor in the curve diagram and the values at the intersection points.

Setting options and displays of the "Measurement cursor” pane

The figure below shows the "Measurement cursor” pane:

The following table describes the settings and displays:

Setting/display		Description
Horizontal measurement cursor		
	Y1	Position of first measurement cursor The value states the position in relation to the scale of the signal currently selected. You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	Y2	Position of the second measurement cursor The value states the position in relation to the scale of the signal currently selected. You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	ΔY	Display of the position difference between the first and the second measurement cursor
Vertical measurement cursor		
	X1	Position of first measurement cursor You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	X2	Position of the second measurement cursor You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	ΔX	Display of the position difference between the first and the second measurement cursor
Intersection points with selected signal		
	Y(X1)	Display of the value at the position of the first measurement cursor
	Y(X2)	Display of the value at the position of the second measurement cursor
	ΔY	Display of the value difference between the first and the second measurement cursor



User interface - Snapshots pane

The “Snapshots” pane allows the user to save and restore different views for a measurement.

A snapshot is taken of the current view in the “Diagram” tab. The snapshots are saved in the measurement with the project.

Setting options and displays of the “Snapshots” pane

The figure below shows the “Snapshots” pane:

The following table shows the functions of the buttons:

Icon	Description
	Generate snapshot of the current view Saves the current view as a snapshot in the “Diagram” tab.

The following table shows the settings and displays:

Column	Description
	Static display of the snapshot icon
“Name”	Display and change options for the name
“Time stamp"	Display of the snapshot generation time
"Comment"	Display and input option for a comment

Several rows can be selected and deleted.

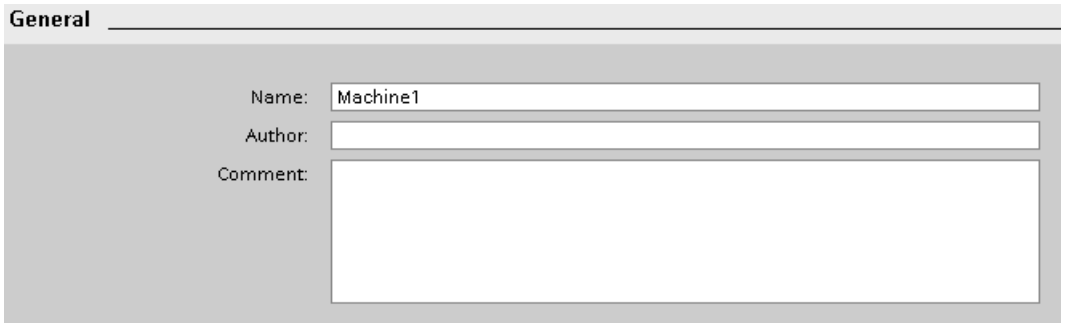
Double-clicking on a row opens the measurement with the saved view in the “Diagram” tab.

Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
“Restore snapshot”	Shows the measurement with the saved view in the “Diagram” tab.
"Delete"	Deletes the snapshot
"Rename"	Switches the cell to the editing mode

Several rows can be selected and deleted.



14.6.3.4 Inspector window

User interface - General

The "General" area shows the name of the trace configuration and input fields for the author and a comment.

Input options and displays in General

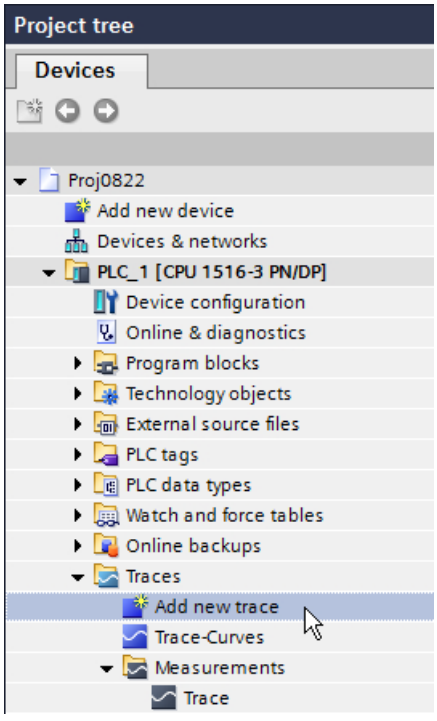
The following figure shows an example of the display in the TIA Portal:

The following table shows the input fields and displays:

Column	Icon	Description
"Name"	-	Name of the trace configuration.
"Author"	-	Author of the trace configuration
"Comment"	-	Input field for a comment. You can enter a line break with <Shift+Return>.

14.6.4 Operation

14.6.4.1 Quick start



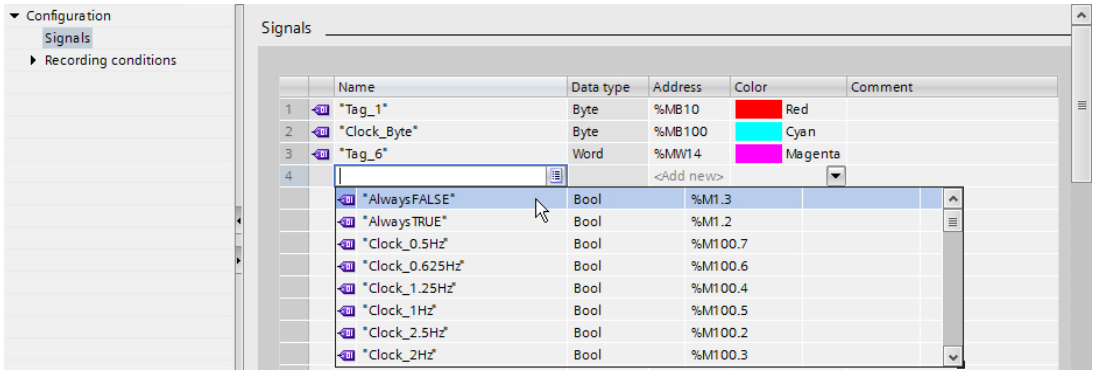
This description shows the steps for a recording of the S7-1500 CPU as an example. The displayed settings can differ depending on the device.

Requirement

A device is configured that supports the trace and logic analyzer function.

Creating a trace

The following figure shows the project tree with the "Traces" system folder below the device:

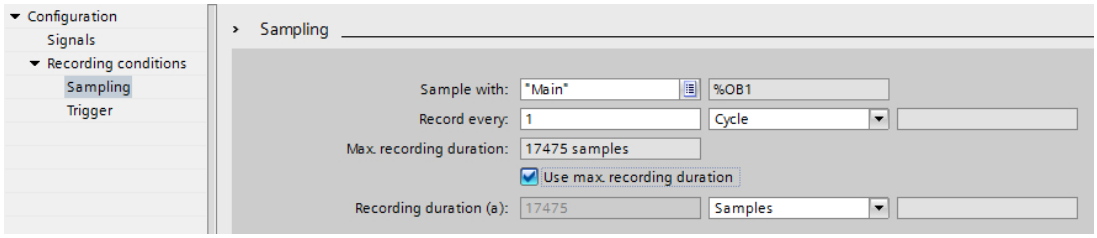


Procedure:

1. Double-click the "Add new trace" entry.
   A new trace configuration is created and the “Configuration" tab opens in the working area.
2. Adapt the name of the trace configuration by clicking the text.

Selecting signals

The following figure shows the configuration of the signals:

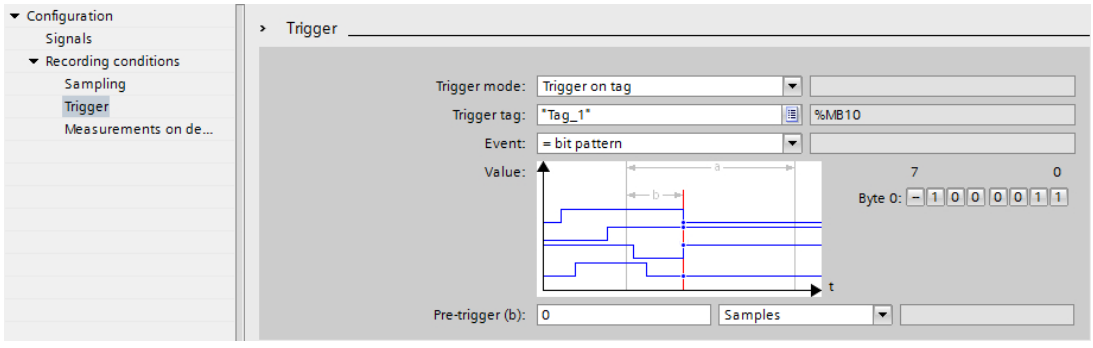


Procedure:

1. Select the signals to be recorded in the "Signals" area.
   Or:
2. Drag one or more signals, e.g. from a tag table, and drop them in the signal table.

Configuring the recording cycle

The following figure shows the configuration of the sampling:



Procedure:

1. Configure the sampling.

Configuring the trigger

The following figure shows the configuration of the trigger:

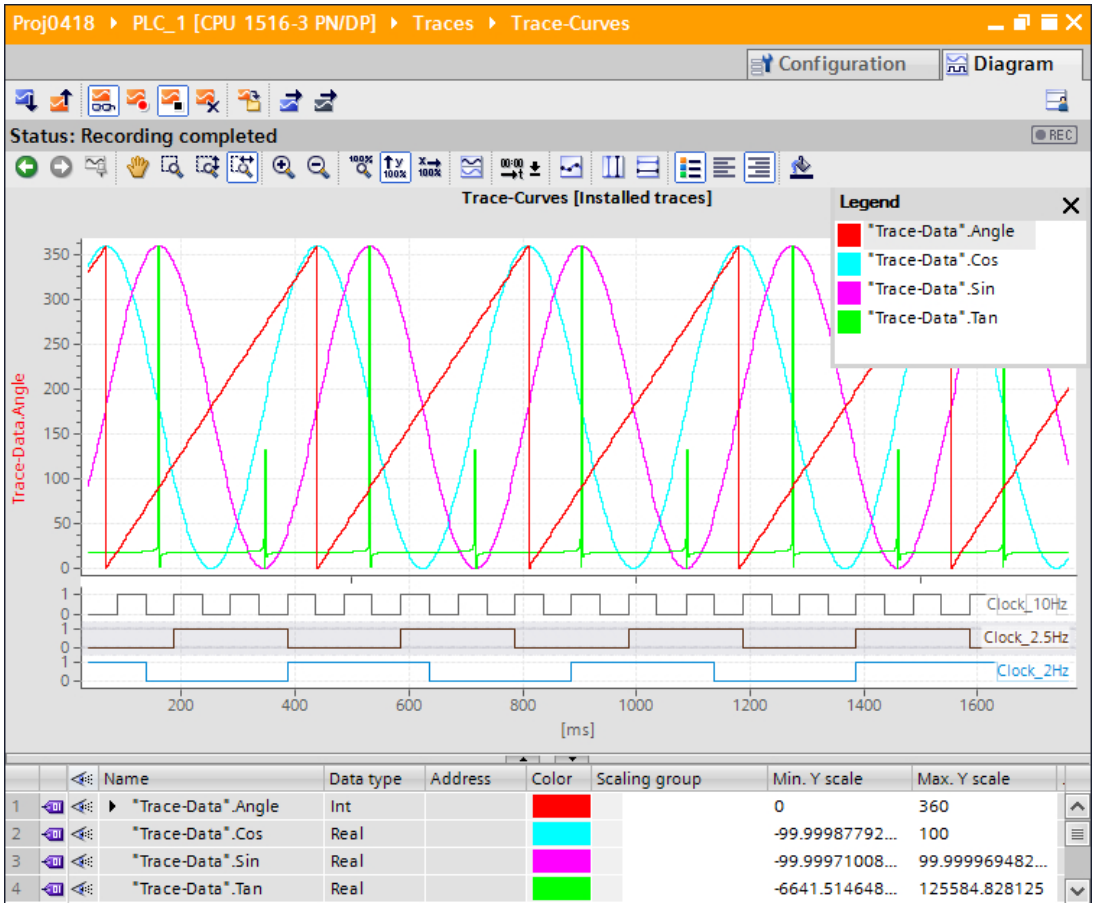
Procedure:

1. Configure the trigger mode and the condition for the selected trigger.

Transferring the trace configuration to the device

Procedure:

1. Transfer the trace configuration to the device with the button.
   The following functions are executed:
   - An online connection is established to the device.
   - The trace configuration is transferred to the device.
   - The monitoring is activated.
   - The display switches to the "Diagram" tab.



Activating a recording

Procedure:

1. Click the button.

Displaying the recording

The following figure shows the curve diagram with a recording:

Procedure:

1. Wait until the "Recording" or "Recording completed" status is displayed in the status display of the trace.
2. Switch to the "Diagram" tab.
3. Click the icon of a signal in the signal table.
   The individual bits of the signal are offered for display as a bit track.
4. In the signal table, select or deselect the individual signals and bits for display with the icon.

Saving the measurement in the project

Procedure:

1. Transfer the measurement to the project with the button.
   The measurement is displayed in the project tree under the "Measurements" system folder.

See also

User interface - trace toolbar (Page 6524)

14.6.4.2 Using the trace function - overview

Requirement

A device is configured in the TIA Portal that supports the trace and logic analyzer function and to which an online connection has been established.

Procedure

The following table shows a procedural overview with typical steps when working with the trace and logic analyzer function.

Step	Description
1	Creating a trace (Page 6542)
2	Configuring the trace (Page 6549)
3	Transferring the trace configuration to the device (Page 6544)
4	Activating/deactivating an installed trace (Page 6545)

Step	Description
5	Monitoring the recording (Page 6546)
6	Saving measurements in the project (Page 6547)
7	Displaying the recording (Page 6546)
8	Analyze an ongoing recording (Page 6546)
9	Compare records (overlay measurements) (Page 6554)

See also

Displaying a configuration (Page 6542)

14.6.4.3 Project tree

Creating a trace

Traces can be created in the form of trace configurations in the project navigator.

The following instructions describe how you can create a trace configuration under the "Traces" system folder

Procedure

To create a trace configuration, proceed as follows:

1. Double-click the "Add new trace" entry.

A new trace configuration is created.

Displaying a configuration

Requirement

A trace configuration, an installed trace, a measurement or an overlay measurement is available in the "Traces" system folder.

Procedure

To display a trace configuration, proceed as follows:

1. Double-click the appropriate icon of a trace configuration, an installed trace, a measurement or an overlay measurement in the project tree.
   The "Configuration" or "Diagram" tab opens in the working area.
2. If required, click the "Configuration" tab for the display.

Note

Write protection

The configuration data of an installed trace and in all measurements is displayed with write protection.

See also

User interface - “Traces” project tree folder (Page 6519)

Displaying a diagram

Requirement

An installed trace, a measurement or an overlay measurement is available in the "Traces" system folder.

Procedure

To display a diagram, proceed as follows:

1. Double-click the appropriate icon of an installed trace, a measurement or an overlay measurement in the project tree.
   The "Configuration" or "Diagram" tab opens in the working area.
2. If required, click the "Diagram" tab for the display.

See also

User interface - “Traces” project tree folder (Page 6519)

Apply overlay measurement

Overlay measurements can be applied in the project tree with a comparison function for different measurements.

The following instructions describe how you can create an overlay measurement under the “Overlay measurements" system folder

Requirement

A device is configured that supports the trace and logic analyzer function.

Procedure

To apply an overlay measurement, proceed as follows:

1. Select one or more measurements in the “Measurements" system folder.
2. Drag the measurements to the “Overlay measurements” system folder.

A new overlay measurement is created.

Configuring objects in groups

You can set up groups in system folders in the project navigator. Use this option to configure the view for multiple objects.

The following instructions use measurements as an example in order to describe how to consolidate the measurements into groups. The same functionality is also available for the Traces and Overlay measurements system folders.

Requirement

Measurements are available in the “Measurements" system folder.

Procedure

Proceed as follows to configure measurements into groups:

1. Select the shortcut menu command “Add new group” by right-clicking on the “Measurements" system folder.
   A new group folder is created.
2. Assign a meaningful name to the new group.
3. Repeat step 1 until all required groups have been created.
   (Sub-groups (groups within groups) can also be created.)
4. Drag & drop the corresponding measurements to the group folder that has been created.

14.6.4.4 Working area - general

Transferring the trace configuration to the device

Requirement

- A valid trace configuration is in the "Traces" system folder.
- The maximum number of installed traces has not been reached yet.

Procedure

To transfer a trace configuration to the device, proceed as follows:

1. Open a valid trace configuration in the working area.
2. Click the button.

Result

The trace configuration is transferred to the device.

Activating/deactivating an installed trace

Requirement

- There is an online connection to the device.
- There is a trace in the device.
- The installed trace is displayed in the working area.
- The button is activated for viewing the displayed trace.

Activating an installed trace

To activate the recording for an installed trace, proceed as follows:

1. Click the button.
   The installed trace is activated and starts the recording according to the configured trigger condition. The trigger condition is device-specific and described in Section "Configuration" below the respective device (Page 6557).
   The current status of the recording is displayed in the status display of the trace.

   Note

   When a recording is restarted, the previously recorded values are lost.

   To save the recorded values, save the measurement in the project (Page 6547) before you activate the recording again.

Deactivating an installed trace

To deactivate an activated installed trace, proceed as follows:

1. Click the button.
   The installed trace is deactivated.
   The status display of the trace changes to "Inactive".

Displaying the recording

Requirement

- There is an online connection to the device.
- There is a trace with recording in the device.

Or:

- A measurement is in the "Measurements" system folder.

Procedure

To display the recording, proceed as follows:

1. Select an installed trace.
2. Double-click the selected trace.
3. If required, activate the button for viewing.

Or:

1. Select a measurement in the "Measurements" system folder.
2. Double-click the selected measurement.

Result

The recording is displayed in the "Diagram" tab.

See also

User interface - “Traces” project tree folder (Page 6519)

Analyze an ongoing recording

Requirements

- An ongoing recording is displayed in the "Diagram" tab.

Save the data currently recorded as a measurement

To analyze a certain time range for an ongoing recording, follow these steps:

1. Click the button.
   The data recorded up to now is added to the measurements.
   The current recording is not affected by this and continues running uninterrupted.

Analyze the measurement

To display the saved measurement, follow these steps:

1. In the "Measurements" system folder double-click the measurement that has just been saved in order to open it
   The “Diagram” tab for the measurement opens in the working area.

See also

Displaying the recording (Page 6546)

Working area - Diagram tab (Page 6550)

Saving measurements in the project

Requirement

- There is an online connection to the device.
- There is a trace with recording in the device.
- The installed trace data must have been displayed at least once in the curve diagram. The recording data is loaded from the device for the display.

Procedure

To save a recording in the project, proceed as follows:

1. Open the installed trace with the recorded data.
2. If required, make sure that the current data is loaded from the device by activating the button.
3. After activating the button wait until all data has been loaded and displayed.
4. Click the button.
   The measurement is added to the "Measurements" system folder.
5. Save the project in the TIA Portal.

Note

Generate measurements

A measurement of an installed trace can be generated at any time.

Use this functionality e.g. to save the data recorded up until this point in a recording and to analyze it as a static measurement.

Exporting and importing measurements

Requirement

At least one measurement is in the "Measurements" system folder for export.

Exporting measurements

To export a measurement, proceed as follows:

1. Right-click a measurement in the "Measurements" system folder and select the shortcut menu command “Export measurement".
2. Select a folder, a file name and a data type to save the measurement.
3. Click the "Save" button.

Importing measurements

To import a measurement, proceed as follows:

1. Right-click in the "Measurements" system folder and select the shortcut menu command "Import measurement".
2. Select the file e.g. of the "*.ttrecx" file type with the measurement to be imported.
3. Click the "Open" button.
   The imported measurement is displayed with the file name in the "Measurements" system folder.

Note

Export and import trace configurations

The same functionality is available for exporting and importing trace configurations.

Transferring the trace configuration from the device to the project

Requirement

- There is an online connection to the device.
- There is a trace in the device.

Procedure

To transfer a trace configuration to the project, proceed as follows:

1. Open an installed trace.
2. If required, activate the button for viewing.
3. Click the button to transfer the trace configuration from the device.

Result

The configuration is taken over as new trace configuration in the "Traces" system folder.

A trace configuration of the same name is overwritten in the system folder.

Deleting installed traces

Requirement

- There is an online connection to the device.
- There is a trace in the device.

Procedure

To delete an installed trace, proceed as follows:

1. Open an installed trace.
2. If required, activate the button for viewing.
3. Click the button.
   A confirmation prompt opens.
4. Confirm the prompt for deletion.

Or

1. Select one or more installed traces / in the project tree.
2. Press <Del> to delete the installed traces.
   A confirmation prompt opens.
3. If required, select an option for deletion and confirm the prompt.

14.6.4.5 Working area - Configuration tab

Configuring the trace

Requirement

The "Configuration" tab is open in the working area.

Configuring the trace

In the configuration, you specify the recording and trigger conditions and select the signals to be recorded.

See Section "Configuration" below the respective device (Page 6557).

Note

Saving the trace configuration

You save the trace configuration with the project in the TIA Portal.

If you close the project without saving, the configuration is discarded.

See also

Displaying a configuration (Page 6542)

14.6.4.6 Working area - Diagram tab

Use of the curve diagram

The curve diagram shows the signals of a recording selected in the signal table.

The display area can be zoomed as required. Measurement cursors can be used to select individual values for display in the signal table.

The following operating instructions describe the use of the curve diagram and of the measurement cursors as examples.

Requirements

- An installed trace or a measurement has been selected for display.
- The  button is activated to monitor an installed trace.
- The "Diagram" tab is open in the working area.

Monitor an ongoing recording.

To display all of the data in an ongoing recording, proceed as follows:

1. Activate “Display all" via the  button.

The entire time range and all values for the ongoing recording are displayed.

To display a consistent time window in an ongoing recording, proceed as follows:

1. Activate “Display all" via the  button.
2. Select the desired time range via the  button.

The trend view is updated while the scaling of the time range remains the same.

Evaluation of a certain instant of a recording

To display the values for a specific sample, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required position in the recording. The values of the signals are displayed in the signal table and in the “Measurement cursor” pane of the “Trace” task card.

Evaluation of the difference between two samples

To display the difference, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move both measurement cursors with the mouse to the required samples in the recording. The values of the signals and the difference are displayed in the signal table and in the “Measurement cursor” pane of the “Trace” task card.

Using horizontal measurement cursors

To check whether a certain value has been reached, proceed as follows:

1. Display the horizontal measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required value of the recording. The values of the measurement cursors for the selected signal are displayed in the “Measurement cursor” pane of the “Trace” task card.

Moving the time range displayed

Proceed as follows to move the time range displayed:

1. Select a time range via the button.
2. Move the curve to the desired time range by turning the mouse wheel with the <Shift> key pressed down.

Bringing a signal into the foreground

1. Display the legend via the button.
2. Click a signal in the legend.

Or:

1. Click a signal in the curve diagram.

The signal is displayed in the foreground and is highlighted/selected in the signal table. The value axis is updated for the selected signal.

See also

Displaying a diagram (Page 6543)

User interface - curve diagram (Page 6525)

User interface - signal table (Page 6529)

Use of the signal table

The signal table shows the signals of an installed trace or a measurement. The preselected signals in the signal selection are displayed with an overlay measurement. You can show or hide individual signals for the display in the table and adapt the properties for the display. Individual bits can be selected for some data types and displayed as a bit track.

The following operating instructions describe the operation of the signal table.

Requirements

- An installed trace or a measurement has been opened in the "Diagram" tab.
- The  button is activated to monitor an installed trace.
- For the display of individual bits as a bit track:
  at least one recorded signal supports the display as a bit track.

Display or hide individual signals and change the color

To adapt the display to suit your requirements, proceed as follows:

1. Click the icon of the respective signal in the  column to select or deselect it for the display.
2. Click in the "Color" column for the respective signal and select a color.
   The default color for the signal changes.

Bringing a signal into the foreground

1. In the signal table, select the line of the signal.
   The Y-scale of the signal is displayed.
   The signal curve is brought into the foreground in the curve diagram.

Selecting individual bits for display as a bit track

To display individual bits as a bit track in the lower curve diagram, proceed as follows:

1. Click the icon of a signal in the signal table.
2. Click the  icon in the open bit selection of the signal.
   The bits are selected or deselected for display.

See also

Displaying the recording (Page 6546)

Using the signal group in the signal table

Individual signals can be scaled identically in a signal group, which makes it easier to compare the curve characteristics.

Binary signals cannot be grouped.

The following operating instructions describe how to work with the signal group.

Note

Saving signal groups

The signal groups can be saved individually for each measurement via the "Use current view as standard" function (button).

If the signal groups and the project are not saved then the signal groups created will be lost when the "Diagram" tab is closed.

Requirements

- An installed trace or a measurement is displayed.
- The button is activated to monitor an installed trace.
- The "Diagram" tab is open in the working area.
- There are at least two signals in the signal table that are not of the BOOL type.

Assigning signals to a signal group

To apply a signal group and assign signals to this group, proceed as follows:

1. In the signal table, select the line or cell of the required signal.
2. Click the gray field in the "Signal group" column.
   The sequence icon is displayed in the gray field and the name of the signal group is pre-assigned: Group
3. Click the gray fields of further signals that are to be assigned to this signal group.

Or:

1. Click in the text field of the "Signal group" column for a signal to be grouped.
2. Enter a name for the group.
3. Enter the same group name in the respective text fields for further signals or select the group name via the drop-down list.

The Y-scales of the grouped signals are scaled with the values of the signal that was selected first. Changes to a scale value always affect the entire group.

Removing signals from a signal group

To delete the assignment of a signal to a signal group, proceed as follows:

1. Click the sequence icon for the required signal in the "Signal group" column.

Or:

1. Click the text field for the required signal in the "Signal group" column.
2. Press the <Del> key.

Or:

1. Select the respective text field in the "Signal group" column for several signals using the <Shift> and <Ctrl> keys.
2. Press the <Del> key.

The signals are removed from the signal group or the signal group is deleted.

Compare records (overlay measurements)

Requirement

- An overlay measurement is created or is created implicitly by dragging the measurements to the system folder “Overlay measurements”.
  See also AUTOHOTSPOT.

Adding measurements for comparison

To compare measurements, insert the measurements to be compared to the overlay measurements. Proceed as follows for this:

1. In the project tree drag one or more measurements from the system folder “Measurements" to the icon for the overlay measurement.

Or:

1. Import saved measurements via the “Import measurement” shortcut menu command.

A copy of the measurements is added to the overlay measurement.

Note

Changes to the settings for measurements within the overlay measurement have no impact on the original measurements. The original measurements remain unchanged.

Select signals of the measurements for the signal table

Proceed as follows to select the signals for the signal table in the “Diagram” tab:

1. Double-click on the icon for the overlay measurement in the project tree.
   The tabs for the overlay measurement will be displayed in the working area.
2. Click the “Signal selection" tab in the working area.
   The signals for all measurements are displayed in the table.
3. Activate or deactivate the signal check box for those signals that should be visible or should not be visible in the signal table.

The activated signals are displayed in the signal table of the “Diagram” tab.

Use of the signal table

Proceed as follows to open and use the signal tables:

1. Click the “Diagram" tab in the working area.
2. Click on the “Signals” tab within the “Diagram” tab.
3. Use the signal tables as described under AUTOHOTSPOT.

Align measurements

Proceed as follows to align the time axis for the measurements for the comparison:

1. Click on the “Measurements” tab within the “Diagram” tab.
2. Select the alignment for the measurements via the check box.
3. Adjust the alignment and if necessary set an offset for the alignment of the individual measurements.

The measurements are aligned with each other accordingly on the time axis.

(The precise alignment of two measurements is described in the next section.)

Use of the curve diagram

Proceed as follows to open and use the curve diagram:

1. Click the “Diagram" tab in the working area.
2. Use the curve diagram as described under AUTOHOTSPOT.

Align measurements precisely (overlay measurements)

Requirement

- An overlay measurement is applied.
- Measurements for comparison are added to the overlay measurement.

- Signals of the measurements for the signal table are selected.
- The “Diagram” tab for the overlay measurement opens in the working area.

Align measurements precisely with position difference ΔX

Proceed as follows to align the time axis for two measurements precisely:

1. Display the vertical measurement cursors via the button.
2. Zoom into the time range, e.g. with the button until you are able to position the first measurement cursor precisely on the desired reference point for the first measurement.
3. Move the first measurement cursor with the mouse to the required position.
4. Search for the reference point for the second measurement, e.g. by switching to “Display all” with the button.
5. Zoom into the time range, e.g. with the button until you are able to position the second measurement cursor precisely on the desired reference point for the second measurement.
6. Move the second measurement cursor with the mouse to the required position.
7. Open the “Trace" task card.
8. In the “Measurement cursor” pane select the position difference value ΔX.
9. Copy the value to the clipboard.
10. Insert the value from the clipboard into the Offset cell of the first or second measurement.

Both measurements are precisely aligned with each other at the desired measurement points.

Note

When inserting the position difference as the offset make sure that you also adjust the leading character as necessary.

Printing a recording

The curve diagram supports the saving of the display as a graphic and the copying of the display to the clipboard. Also use these functions (Page 6525) for printing.

14.6.5 Devices

14.6.5.1 S7-1200/1500 CPUs

Recordable variables

Device-dependent recording of tags

The following list shows the operand areas from which tags can be recorded:

- Process image input
- Process image output
- Bit memory
- Data blocks

Data types

Elementary data types can be recorded. The availability of the individual data types depends on the device used:

The following table lists the elementary data types:

Data types	Note
Binary numbers	
BOOL	-
Bit strings	
BYTE	-
WORD	-
DWORD	-
LWORD [1)]	Symbolic name required
Integers	
SINT	-
USINT	-
INT	-
UINT	-
DINT	-
UDINT	-
LINT [1)]	Symbolic name required
ULINT [1)]	Symbolic name required
Floating-point numbers	
REAL	-
LREAL	Symbolic name required

1) Not supported by S7-1200.

Lifetime of the installed trace configuration and recorded values

Installed trace configurations are retained after POWER OFF. The recording is activated again after the restart of the CPU.

Recorded values are lost during the restart.

Note

Downloading a configuration to the device in the "STOP" operating state

Note that after downloading a configuration in the "STOP" operating state, you must check the installed traces and, if required, reactivate them or transfer them again.

Note

If trigger tags that affect the address are changed, the trace configuration must also be transferred to the device again.

This is the case for example, when a data block is shortened or extended or the data type is changed.

Recording levels

The following list shows the execution levels that can be selected for the recording cycle:

- Program cycle - OB 1
- Time-of-day interrupt - OB 1x
- Time-delay interrupt - OB 2x
- Watchdog interrupt - OB 3x
- Synchronized processing cycles - OB 6x, not OB 60
- MC-PreServo - OB 67
- MC-Servo - OB 91
- MC-Interpolator - OB 92
- MC-PostServo - OB 95

Note

The measured values are recorded at the end of the OB after the processing of the user program.

Quantity structure

The following table shows the maximum quantity structure that can be recorded with the trace and logic analyzer function:

Device	Maximum number of installed traces	Maximum number of signals per trace configuration
S7-1200 (as of firmware version V4.0)	2	16
S7-1500	At least 4 (depending on the CPU type)	16

Example of CPU 1516-4 PN/DP

- Maximum of 3854 samples for 16 signals from PLC tags of the DWORD data type
- Maximum of 21844 samples for 16 signals from PLC tags of the BOOL data type
- Maximum of 58250 samples for 1 signal from a PLC tag of the BOOL data type

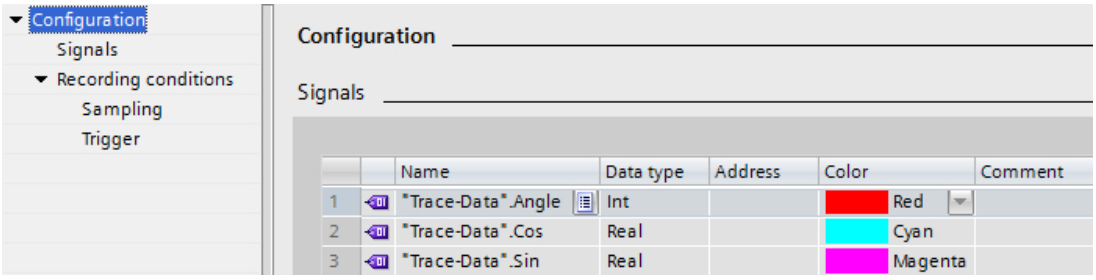
Further information can also be found in the form of FAQs under the ID 102781176 (http://support.automation.siemens.com/WW/view/en/102781176).

CPU load through trace recording

A trace recording increases the runtime of the respective recording level that can result in an execution level overflow with high utilization of the CPU.

Remedy for execution level overflow:

- **Change the trace configuration**
  1) Configure fewer tags and signals.
  2) Then increase the number of tags and signals up to the maximum number of signals step-by-step without an execution level overflow.
- **Select a slower recording level**



Software user interface of the configuration

Structure of the user interface

Display areas in the "Configuration" tab of the working area

The settings options differ depending on the configured device.

The following figure shows an example of the display in the TIA Portal:

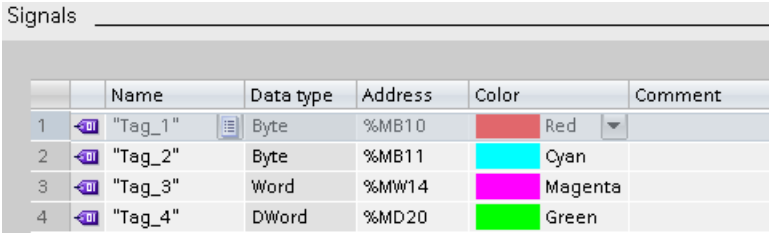
The area navigation provides the following entries for selection:

- Configuration
  - Signals (Page 6560)
  - Recording conditions (Page 6561)

Displaying and changing properties of a trace configuration

A trace is selected in the project tree and displayed in the "Configuration" tab.

The trace configuration can only be changed offline and is displayed online with the write protection.



User interface - Signals

The "Signals" area shows a table in which the signals to be recorded are configured for the selected trace configuration.

Signals can also be inserted in the table using drag-and-drop.
The signals can be sorted using drag-and-drop.

Setting options and displays in "Signals"

The following figure shows an example of the display in the TIA Portal:

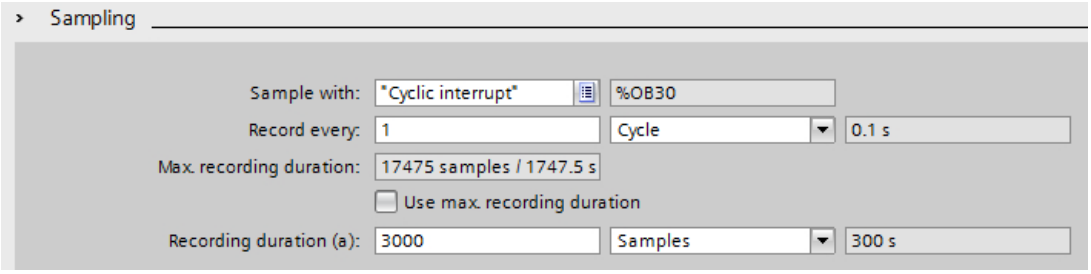
The following table shows the settings and displays:

Column	Icon	Description
		Display of the signal icon for a selected signal.
"Name"	-	Input field for the name or address of the signal. **Examples:** • “Data_block_1”.pressure • M0.0 • DB1.DBW3
-		Button to open the signal selection table. The button is displayed when the table line is selected. Clicking the icon opens a table which offers possible signals for selection. The selected signal is displayed in the input field.
"Data type"	-	Text field with display of the data type for the signal.
"Address"	-	Input field for the address of the signal. The field remains empty with optimized / type correct tags.
"Color"	-	Text field for display and selection of the color. Click the signal color to open the color selection dialog.
"Comment"		Input field for a comment on the signal.

Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard to the selected line. The existing contents are overwritten.
"Delete"	Deletes the selected lines from the table or deletes the content of the selected cell.
"Rename"	Switches the selected cell to the editing mode.



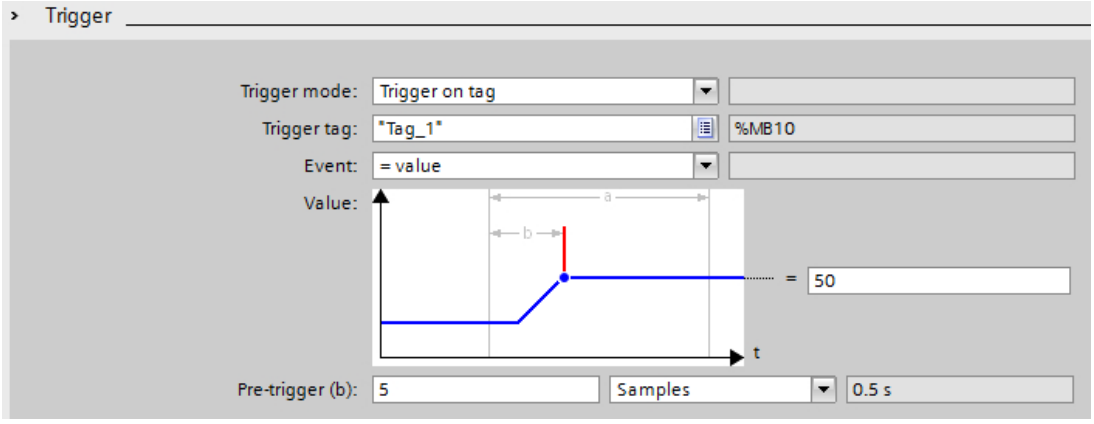
Recording conditions

User interface - Recording conditions

The "Recording conditions" area shows the trigger condition for the selected trace configuration and in which cycle, how fast and how long the recording is made. Configuration is possible when the trace configuration is displayed in offline mode or online mode with deactivated viewing .

Setting options and displays in "Recording conditions"

The following figure shows an example of the settings for the sampling in the TIA Portal:

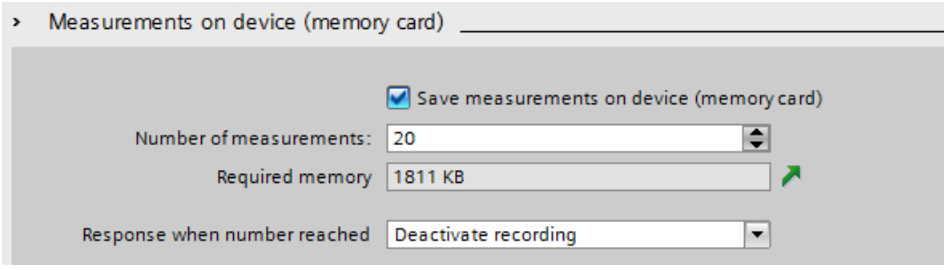


The following table explains the settings and displays:

Setting/display		Description
"Recording time"		
	Recording level entry field	Selection of the recording time. See Recording levels (Page 6558)
	Address of the OB text field	Detailed information on the selected recording time.
"Record every"		
	Reduction entry field	Input of the reduction in relation to the reduction ratio and the unit.
	Reduction ratio drop-down list	Selection of the reduction ratio unit The following settings are possible: • "Cycle" • "s" (setting option depends on the recording level selected under “recording time”)
	Sampling time text field	Display of the sampling time, taking into account the configured reduction and the selected unit (only for constant bus cycle time OBs).
"Max. recording duration"		
	Max. recording duration text field	Displays the calculated maximum recording duration. The "Max. recording duration" depends on how many signals are recorded and the data type of these signals.
	"Use max. recording duration"	Set the recording duration to the maximum value. When the checkbox is activated, the recording duration is set to the maximum possible recording duration. The set reduction in the "Record every" input field is taken into account. The recording duration is also adapted when additional signals are added. Further information can also be found in the form of FAQs under the ID 102781176 (http://support.automation.siemens.com/WW/view/en/102781176).
"Recording duration"		
	Recording duration entry field	Input of the recording duration in relation to the selected unit. If the "Recording duration = max. recording duration" checkbox is activated, entries are overwritten by the value displayed in "Max. recording duration".

Setting/display		Description
	Unit drop-down list	Selection of the unit for the recording duration. The following settings are possible: • "Samples" The maximum number of samples recorded is the number for which parameters are assigned under recording duration. • "s" (setting option depends on the recording level selected under “recording time”)
	Calculated recording duration text field	Display of the calculated recording duration (only for constant bus cycle time OBs)

The following figure shows an example of the settings for the trigger in the TIA Portal:



The following table explains the settings and displays:

Setting/display		Description
"Trigger mode"		Selection of the trigger mode.
	Trigger mode drop-down list	The following settings are possible: • "Record immediately" The recording is made immediately after the device is activated. • "Trigger on tag" The recording is made as soon as the installed trace is activated and the configured trigger condition is fulfilled.
	Text field	-
"Trigger tag"		The "Trigger tag" specifies a signal that triggers the recording.
	Trigger tag entry field	Enter a signal. **Examples:** • "DataBlock_1".Temperature • M0.0 • DB1.DBW3 See also Data types for trigger tags (Page 6566).

Setting/display			Description
			Opens the signal selection table. Clicking the icon opens a table which offers possible signals for selection as trigger tag. The selected signal is displayed in the input field.
	Trigger tag address text field		Display of the trigger tag address. With purely symbolic signals the field remains empty.
"Event"			The events that can be used on this trigger tag are offered for selection according to the data type of the trigger tag. The event can only be configured when a valid signal has been entered as trigger tag.
	Trigger events drop-down list		Event selection for which the trigger tag is checked. The entries in the drop-down list are described in Section Trigger event (Page 6566).
	Text field		-
"Value"			Configuration of the selected event. The configuration options differ depending on the format of the trigger tag and the selected event. SeeTrigger event (Page 6566).
"Pre-trigger"			"Pre-trigger" defines the number of samples that are already recorded before the actual trigger condition is fulfilled. If the trigger event occurs immediately or shortly after the activation of the recording, this may result in a shorter recording duration. Examples of "Recording duration (a)" = 20 samples and "Pre-trigger (b)" = 5 samples: • Case 1: Trigger event occurs 50 samples after activation of the recording Actual recording duration (a) = 20 samples • Case 2: Trigger event occurs 2 samples after activation of the recording Actual recording duration (a) = 17 samples
	Duration entry field		Input of the duration in relation to the selection in the drop-down list.
	Unit drop-down list		Selection of the unit The following settings are possible: • "Samples" • "s" (setting option depends on the recording level selected under “recording time”)
	Resulting pre-trigger duration text field		Display of the calculated "Pre-trigger" duration (only for recording in constant bus cycle time OBs)

The following figure shows an example of the settings for the saving of installed measurements:

Note

Available memory in the device (memory card)

The memory in the device (memory card) is partly used by system-relevant functions or reserved for that purpose.

Thus it is not possible for the entire memory to be used for saving measurements.

For further information please refer to the Function Manual Structure and Use of the CPU Memory (https://support.industry.siemens.com/cs/us/en/view/59193101).

Note

Memory requirements upon restart

Following a device reboot the maximum number of measurements saved in the device is the number configured under “Number of measurements”.

With repeated restarts note that the measurements already saved are not overwritten and the “Number of measurements” configured in the device is saved once again.

The following table explains the settings and displays:

Setting/display	Description
“Saving of installed measurements (memory card)”	Repeat measurement automatically and store in the device retentively This setting is only possible with “Trigger on tag” trigger mode. The measurements are stored on the “primary” memory card. **Note** Only completed measurements are saved on the device. Any recording deactivated by the user is not saved on the device. **This function is available with the following firmware versions:** • S7-1200 as of V4.2 • S7-1500 as of V2.0
“Number of measurements”	Input of the number of measurements to be saved on the card.
“Memory requirements”	Display of the expected memory requirement for all measurements

Setting/display	Description
	Displaying memory usage Shows the tab with the memory usage
“Behavior if number reached”	Selection for the behavior once “Number of measurements” is reached The following settings are possible: • “Deactivating a recording” The measurements are repeated until the “Number of measurements on the card” is reached. • “Overwrite oldest recording” The measurements are saved in a ring buffer and repeated until the user deactivates the recording. Once the number of measurements exceeds the “Number of measurements on the card” the oldest measurement on the card is overwritten in each case. **Note** Note that write processes that are repeated frequently may damage the card.

Data types for trigger tags

The following table shows the supported data types for the trigger tag:

Memory requirement and format of the number	Data type
1 byte	BOOL
8-bit integers	SINT, USINT, BYTE
16-bit integers	INT, UINT, WORD
32-bit integers	DINT, UDINT, DWORD
64-bit integers	LINT, ULINT, LWORD (not S7-1200)
32-bit floating-point numbers	REAL
64-bit floating-point numbers	LREAL

Trigger event

Depending on the selection in the drop-down list, the further settings differ for the "event".

The individual events are described below.

"=TRUE"

Supported data types: Bit (Page 6566)

The recording starts when the state of the trigger is TRUE.

"=FALSE"

Supported data types: Bit (Page 6566)

The recording starts when the state of the trigger is FALSE.

"Rising edge"

Supported data types: Bit (Page 6566)

The recording is started when the trigger state changes from FALSE to TRUE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Rising signal"

Supported data types: Integers and floating-point numbers (Page 6566)

The recording is started when the rising value of the trigger reaches or exceeds the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling edge"

Supported data types: Bit (Page 6566)

The recording is started when the trigger state changes from TRUE to FALSE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling signal"

Supported data types: Integers and floating-point numbers (Page 6566)

The recording is started when the falling value of the trigger reaches or falls below the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"In the range"

Supported data types: Integers and floating-point numbers (Page 6566)

The recording starts as soon as the value of the trigger is in the value range configured for this event.

"Outside of the range"

Supported data types: Integers and floating-point numbers (Page 6566)

The recording starts as soon as the value of the trigger is outside the value range configured for this event.

"Value change"

All data types are supported.

The value is checked for change when the recording is activated. The recording starts when the value of the trigger changes.

This trigger event is supported as of V13 SP1. Older versions of the TIA Portal cannot interpret the trigger. Note that no explicit information is output in this case. This can occur, for example,

when the trace is transferred from a CPU to a TIA Portal less than V13 SP1 or a trace configuration is imported.

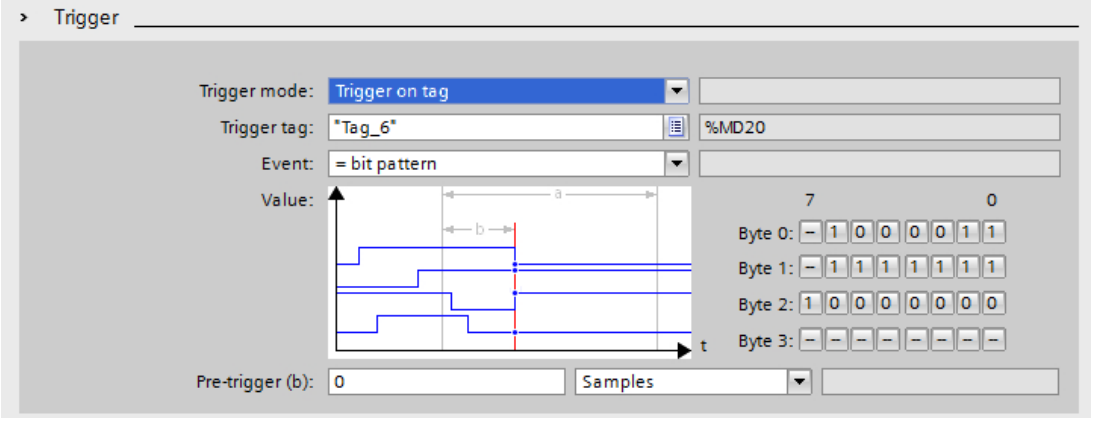
"= value"

Supported data types: Integers (Page 6566)

The recording starts when the value of the trigger is equal to the value configured for this event.

"<> "<> value"

Supported data types: Integers (Page 6566)



The recording starts when the value of the trigger is not equal to the value configured for this event.

"= bit pattern"

Supported data types: Integers (Page 6566)

The recording starts when the value of the trigger matches the bit pattern configured for this event.

The following figure shows the setting options for a "bit pattern":

It is possible to switch between the icons by clicking the respective button.

The following table shows the icons:

Icon	Description
–	Bit is not evaluated
0	Bit is checked for FALSE
1	Bit is checked for TRUE

"<> bit pattern"

Supported data types: Integers (Page 6566)

The recording starts when the value of the trigger does not match the bit pattern configured for this event.

See also

Configuring the trigger conditions (Page 6570)

Configuration

Trace configuration - overview

The configuration of the recording conditions and the signals to be recorded is device-specific.

Requirement

A trace configuration has been created and opened in the working area of the "Configuration" tab.

Procedure

The following table shows the procedure for configuring.

Step	Description
1	Documentation of the configuration (optional) Enter a comment and an author for the configuration in the Inspector window.
2	Selecting signals (Page 6569) Select the signals to be recorded in the "Signals" area.
3	AUTOHOTSPOT Select a recording time, a cycle and the duration in the "Recording conditions" area.
4	Configuring the trigger conditions (Page 6570) In the "Recording conditions" area, select whether the recording is to be performed immediately or depending on a trigger condition.
5	Configure installed measurements (memory card) (Page 6571) In the "Recording conditions" area, select whether the recording is to be saved on the device (memory card).

Selecting signals

Requirement

- A trace configuration has been created and opened.
- The "Signals" area is open in the "Configuration" tab.

Procedure

To configure the signals to be recorded, proceed as follows:

1. Select a signal. The following options are available:
   - In the "Name" column, click the button and select a tag.
   - Enter the symbolic tag name in the cell in the "Name" column.
   - Enter the address directly in the "Address" column.
   - Drag a signal to the table using drag-and-drop.
2. Click in the "Color" column and select a color for the display of the signal.
3. Click in the "Comment" column and enter a comment for the signal.
4. Repeat the procedure from step 1 until all the signals to be recorded have been entered in the table.

Configuring the recording cycle and duration

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.

Procedure

To configure the cycle and the duration of a recording, proceed as follows:

1. Click the button for the recording time.
2. Select an OB for the recording time (Page 6558).
3. Select a unit for the reduction factor in the drop-down list for "Record every".
4. Enter the factor for the reduction in the input field for "Record every".
5. Select a unit in the drop-down list for "Recording duration".
6. Specify the recording duration.
   The following options are available:
   - Enter a value for the duration in the input field for "Recording duration".
   - Activate the "Use max. recording duration" checkbox.

Configuring the trigger conditions

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.

"Record immediately" trigger condition

To start the recording immediately, proceed as follows:

1. Select the "Record immediately" entry in the drop-down list for "Trigger mode".
   The input fields for the trigger tag are hidden.

"Trigger on tag" trigger condition

To start the recording depending on a condition, proceed as follows:

1. Select the "Trigger on tag" entry in the drop-down list for "Trigger mode".
2. Select a trigger tag. The following options are available:
   - Click the button for the trigger tag and select a tag.
   - Enter the address or the symbolic name of the tag directly in the input field for the trigger tag.

   A drop-down list with events and input fields is displayed. The display depends on the data type of the tag.
3. Configure the event.
4. Select a unit for the pre-trigger in the drop-down list for "Pre-trigger".
5. In order to record a period before the trigger event, enter a value greater than 0 in the input field for the pre-trigger.

Note

Cyclic test of the trigger condition

The trigger condition is checked in every cycle irrespective of the setting in "Record every". To reliably identify the trigger, the trigger signal must be present for at least one full cycle.

Note

No evaluation of the trigger during saving

No new trigger can be evaluated provided that the recording is saved.

Configure installed measurements (memory card)

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.
- The “Trigger on tag” trigger mode is set.
- The firmware on the device supports the recording of an installed measurement.

Procedure

Proceed as follows to save the installed measurement (on the memory card):

1. Select the "Save measurements on device (memory card)" check box.
2. Enter the number of measurements that ought to be saved on the card in the “Number of measurements” entry field.
3. Set the desired behavior once the “Number of measurements” has been reached in the “Behavior if number reached” drop-down list.

14.7 Establishing a remote connection with TeleService

14.7.1 Basics of working with TeleService

14.7.1.1 Introduction to TeleService

Introduction

TeleService gives your controller telecommunication capability. You can manage, control and monitor distributed plants centrally by means of remote connections.

Scope of functions

TeleService allows you to use the range of TIA portal functions via a telephone network or an Internet connection by establishing a remote connection to a remote system. The online connection allows you to edit a remote system in the usual way with the TIA Portal.

Advantages

Using TeleService offers the following advantages:

- You can easily access even remote sections of plants and include them in a complete system.
- You can offer rapid help and support in the event of faults in a remote system without having to go there yourself.
- You can employ your resources effectively.
- It significantly reduces costs.
- It can significantly reduce plant downtimes.
- It improves the efficiency of your plant.

See also

TeleService functionality (Page 6574)

14.7.1.2 TeleService functionality

TeleService fields of application

TeleService offers the following the fields of application:

- **Access to remote systems (remote maintenance):**
  You can manage, control, and monitor remote systems centrally by means of remote connections.
  This is possible with an S7-300/400 CPU, an S7-1200 CPU and an S7-1500 CPU and a TS Adapter MPI or a TS Adapter IE.
- **Establishing connections from and to remote systems (PG-AS remote link):**
  You can use PRODAVE MPI V5.0 and newer to establish a remote connection to a remote system, and the communications instruction "PG_DIAL" to establish a remote connection from a remote system.
  This is possible with an S7-300/400 CPU and a TS Adapter MPI.
- **Data exchange between systems (AS-AS remote link):**
  The communications instruction "AS_DIAL" allows two automation systems to exchange process data over the telephone network.
  This is possible with an S7-300/400 CPU and a TS Adapter MPI.
- **Sending a text message from a system:**
  An automation system can send a message (SMS) via a GSM wireless modem using the communications instruction "SMS_SEND" ".
  This is possible with an S7-300/400 CPU and a TS Adapter MPI.
- **Sending an email from a system**
  An automation system can also send an email with the following communications instructions and a TS Adapter IE .
  - S7-300/400 CPUs (CPU S7-31x-2PN/DP or CPU 41x-3PN/D) use the instruction "AS_MAIL"
  - S7-1200 CPUs use the instruction "TM_MAIL"
  - S7-1500 CPUs use the instruction "TMAIL_C"

14.7.1.3 Telephone book at TeleService

Introduction

By double clicking the "phone book" folder in the project tree you open the phone book editor displaying the TeleService phone book.

Each version of the TIA Portal has its own "global phone book". If a global phone book from an earlier version of the TIA Portal is found in a more recent version of the TIA Portal, you will be asked once if you want to import this phone book.

This gives you the advantage of being able to import the system data from the previous version into the more recent version of the TIA Portal.

Global phone book properties

The global phone book is used in TeleService to manage specific system data that are required to establish a remote connection.

When you open the phone book for the first time, you will see an empty phone book with all available columns; in all other cases, the last phone book edited is displayed.

You can enter any number of systems in a phone book. Systems contain the data required for establishing a remote connection, for example, the name and location of the device and the phone number to be dialed, along with all country-specific details. With VPN connections, you can enter an IP address or a DNS name instead of the phone number.

The TS adapters used for establishing the connection are distinguished by color, depending on whether a TS Adapter MPI or a TS Adapter IE is used for establishing the connection.

14.7.2 Working with the phone book

14.7.2.1 Basics on working with the phone book

Working with the phone book

You have the following options when working with a phone book:

- Open phone book
- Save phone book
- Import phone book data
- Export phone book data
- Printing the phone book
- Use phone book data to establish a remote connection

You can implement these functions simply and easily by using the buttons in the phone book toolbar.

Note

Access to phone books

The phonebook is user specific in TeleService. However, it is not possible to access the global phone book with more than one instance of the TIA portal at the same time.

See also

Open phone book (Page 6577)

Saving phone book (Page 6578)

Exporting phone book data (Page 6580)

Printing the phone book (Page 6581)

Structure of the phone book (Page 6576)

14.7.2.2 Structure of the phone book

Introduction

A global phone book in TeleService is used to manage the data you require for establishing a remote connection. Once you have created the connection data and saved it in the phone book, you can access it each time you want to establish a remote connection.

Structure of the phone book

The integrated global phone book in TeleService contains the following columns:

Column name	Description
Plant name	Enter a name for your system.
Adapter type	Select the TS Adapter type used in the drop-down list: TS Adapter MPI or TS Adapter IE.
Connection type	Select the required connection type: Dial-up connection or VPN connection.
Area code	Enter the required area code. This column is only active with dial-up connections. This column cannot be edited for VPN connections.
Phone number/remote address	Enter the required connection data for establishing the remote connection. For dial-up connections, this can be a phone number, and for VPN connections a DNS name or an IP address.
Fingerprint	Enter the corresponding fingerprint for establishing a VPN connection to the TS Adapter IE Advanced.
Country	Enter the country code. This column is only active with dial-up connections. This column cannot be edited for VPN connections.
User name	Enter the user name you have logged on under.
Password	Enter the password for this user name.
Group	Enter the group if you have carried out grouping.
Company	Enter the company to be contacted.
Department	Enter the relevant department.
Street	Enter the street.
Town/City	Enter the town or city to which the remote connection is to be established.
Comment	Enter a comment if required.

Showing or hiding columns

You can show or hide the individual columns. To do so, select the required column header and open the shortcut menu with the right mouse button.

14.7.2.3 Symbols in the phone book

Meaning of the TeleService icons

The following table shows the meaning of the TeleService icons:

Symbol	Meaning
	Open the global phone book
	Imports a phone book
	Exports a phone book
	Establishes a remote connection
	Terminates the active remote connection
	Establishes a remote connection or terminates it
	Displays the connection to a TS Adapter IE in the phone book
	Displays the connection to a TS Adapter MPI in the phone book
	Adds a new row to the phone book
	Inserts a new row in the phone book

14.7.2.4 Manage phone book

Open phone book

Opening phone books

To open the phone book, follow these steps:

1. In the project tree, double-click on the "Phone book" folder under "Online access" > "TeleService".
2. The phone book opens so that you can enter or edit the required system data.

Inserting rows in the phone book

Inserting rows in the phone book

To insert a new row in the phone book, follow these steps:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button in the toolbar.

Result

A new row is inserted in the phone book above the selected row.

Showing and hiding columns in the phone book

Showing and hiding columns

To show or hide columns in the phone book, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.
   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

Result

The respective columns are shown or hidden when displaying the phone book.

Saving phone book

Saving phone books

When you exit the phone book editor or the TIA Portal, you are asked whether you want to save the global phone book.

Click "Yes" to save the phone book.

Importing phone book data

Introduction

It is possible to import the phone book data from an external file or from an older version of the TIA Portal.

Requirement

You have already created an import-capable phone book file.

You have already created a phone book with an older version of the TIA Portal.

Importing phone book data from a phone book file

To import phone book data from a phone book file, follow these steps:

1. Open the "TeleService" folder under "Online access" in the project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Import" button in the toolbar.
4. Confirm the prompt asking if you want to save the current state of the phone book with "Yes", if applicable, and specify the location for storing the phone book in the dialog that follows.
5. If you do not want to save the current state of the phone book, answer the prompt with "No". In the subsequent dialog, select the phone book file to which the current phone book should be stored.
6. Close the dialog box with "OK".

Result

The imported phone book data is displayed in the global phone book.

Note

Defining dialing rules

Dialing rules must be defined before the "area code" and "country" columns in the imported phone book can be edited for dial-up connections.

To define dialing rules, follow the link in the history.

Importing phone book data from an older version of the TIA Portal

To import phone book data from an older version of the TIA portal, follow these steps:

1. Open the "TeleService" folder under "Online access" in the project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Import" button in the toolbar.
4. Confirm the prompt asking if you want to save the current state of the phone book with "Yes", if applicable, and specify the location for storing the phone book in the dialog that follows.
5. If you do not want to save the current state of the phone book, answer the prompt with "No".
6. Enter the following path in the dialog that follows: "%appdata%\siemens\automation \TeleService\GlobalTeleServicePhoneBook.tel".
7. Close the dialog box with "OK".

Result

The phone book data imported from the older version of the TIA Portal is displayed in the global phone book.

Note

Defining dialing rules

Dialing rules must be defined before the "area code" and "country" columns in the imported phone book can be edited for dial-up connections.

To define dialing rules, follow the link in the history.

See also

Defining dialing rules (Page 6581)

Exporting phone book data

Introduction

It is possible to export phone book data to an external file.

Requirement

You have already created a phone book under TeleService with the corresponding system data.

Procedure

To export the phone book data, follow these steps:

1. Open the "TeleService" folder in project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Export" button in the toolbar.
4. In the next dialog box, select where the current phone book is to be exported.
5. Close the dialog box with "OK".

Result

The exported phone book data are saved in the specified export file.

Printing the phone book

Printing phone books

You can print out all or some of the data in a phone book.

Proceed as follows:

1. Open the phone book.
2. Select the **Project > Print** menu command or click on the appropriate button in the toolbar. The "Print" dialog will open.
3. Specify whether you wish to print the complete phone book or just part of it and set all other options.
4. Start the print job with "OK".

Result

The phone book data is printed on the default printer. If the printout is more than one page long, an identifier is printed after the page number at the bottom right corner of the page to indicate that there is another page. The last page does not have this symbol, indicating that no more pages are to follow.

Defining dialing rules

Procedure

To define location-specific dialing rules, follow these steps:

1. Open the "Online access" folder in the TIA Portal and select the "TeleService" folder.
2. Use the shortcut menu to access the "TeleService" properties.
3. In the dialog that follows, open the "Advanced settings" tab and activate the "Use dialing rules" option.
4. Click the "Adapt" button.
5. In the dialog that follows, enter the required location information for connection establishment.
   - For new locations, enter the country or region and the corresponding area code.
   - If required, set the correct destination code and pre-dial line for local/long-distance calls.
   - Select your chosen dialing mode for the location.
6. Exit the dialog by clicking "OK".
7. In the next dialog, select the location from which you wish to dial, and click "OK".

8. In the TeleService dialog that follows, check that the correct location appears under "Location".
9. Confirm your entries by clicking "OK".

Note

Modem operation on a local loop or extension

You do not need to specify a pre-dial line if you operate your modem on a local loop (main telephone line). The fields for the pre-dial lines for local calls and long-distance calls must be empty.
If you operate your modem on an extension, you should enter the pre-dial lines which need to be called to access a local loop.

Example of the use of dialing rules

The following example illustrates the use of location-specific dialing rules for the city of Karlsruhe in Germany.

- In the TeleService phone book, you enter the phone number "1234567", without the area code and without the country code.
  Result:
  The phone number "1234567" is always dialed, irrespective of the location of the caller.
- In addition to the phone number "1234567", you enter the location-specific dial parameters for the Karlsruhe area code "0721" and the country code "+49" for Germany in the TeleService phone book.
  Result:
  "1234567" is dialed from Karlsruhe.
  "07211234567" is dialed from other towns in Germany.
  "00497211234567" is dialed from other countries.

Note

Display in the phone book

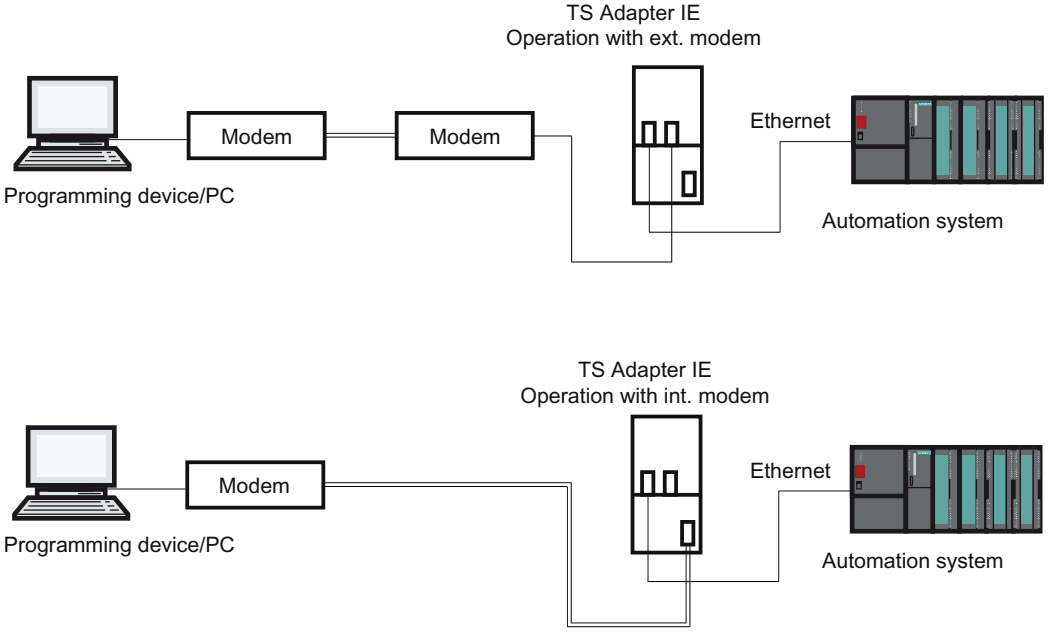
The "area code" and "country" columns in the TeleService phone book can only be edited once you have defined the dialing rules as detailed above.

14.7.3 Remote connections as dial-up connections

14.7.3.1 Basics for establishing a dial-up connection

Using a TS Adapter for dial-up connections

A TS Adapter is needed for establishing a remote dial-up connection using TeleService.



The TS Adapter is used to prepare an automation system for use with TeleService by connecting it to a telephone network via a modem. The TS Adapter has an integrated parameter memory in which a parameter set for TeleService operation is stored.

With the function "export adapter parameter", different parameter sets can be saved in external files, and reloaded in the TS Adapter via the function "import adapter parameter".

Establishing a remote dial-up connection

You can choose between a number of different TS Adapters, each of which offers a different functionality and different connection options.

The figure below shows two possible configurations for establishing a dial-up connection to a system with the TS Adapter IE.

Overview of possible TS Adapter:

The TS Adapter comes in the following versions:

- TS Adapter II (also designated "TS Adapter MPI")
- TS Adapter IE Standard (also designated "TS Adapter IE")
- TS Adapter IE Basic (also designated "TS Adapter IE")

Designation "TS Adapter"

In the following pages, the designation "TS Adapter" stands for all versions. The relevant product designation is listed beside information which only applies to a specific version, for example, "TS Adapter II" or "TS Adapter IE Standard".

Note

For more detailed information on your TS Adapter, please refer to the documentation supplied with the TS Adapter.

See also

Short description of the TS adapter MPI (Page 6592)

Short description of the TS adapter IE (Page 6599)

Exporting adapter parameters (Page 6597)

Importing adapter parameters (Page 6598)

14.7.3.2 Telephone networks and modems

Supported telephone networks and modems

Telephone networks which can be used

TeleService can be used with digital networks (ISDN), analog networks and wireless networks (with GSM technology). This version supports a remote connection to a TS Adapter.

Modem support

TeleService has been implemented to be independent of the modem. This means that all standard modems which can be installed in the Windows Control Panel and are visible as modems can also be used by TeleService.

The choice of modem type is determined primarily by the existing hardware of the programming device/PC and the telephone network to be used.

The following modem types/media are supported:

- Modems (external modems at the COM interface, internal modems and PCMCIA cards)
- External ISDN adapter at the COM interface or USB interface
- Internal ISDN adapter with virtual COM interface (for example AVM CAPI port)
- External ISDN modems (ISDN adapter with integrated analog modem functionality) at the COM interface or USB interface
- Radio network modems with GSM technology, PCMCIA adapter card or data cable and mobile phone

Gateways

Gateways between the various telephone networks are in principle possible. Remote connections from an ISDN adapter to an analog modem and vice versa only function with special ISDN telephone adapters.

Performance in telephone networks

The data throughput of a remote connection depends on the modem and telephone network used and the quality of the telephone line.

Installing the local modem

Introduction

If you have already installed a modem for data transfer in your operating system, this modem can also be used for TeleService.

If a modem has not yet been installed for your operating system, one must be installed before you can establish a remote connection with TeleService.

Procedure

Proceed as follows:

1. Make sure your programming device/PC and the modem are switched off.
2. Physically connect the external modem to a COM or USB interface on your programming device/PC. You can also install an internal modem or a PCMCIA card in accordance with the manufacturer's specifications.
3. Now switch on the modem and then the programming device or the PC.

Result

Plug-and-play modems are recognized and installed automatically by the operating system. Dialogs will take you through the installation procedure.

Note

Modems without plug-and-play

If your modem is not recognized automatically when switched on, you will have to install it yourself using the Control Panel.

Please refer to the information in the documentation supplied with your modem.

Connecting and configuring the remote modem

Introduction

A modem must also be connected to the remote system before you can work with TeleService. This modem is designated the "remote modem".

Configuring the remote modem

The modem receives all parameters required for operation from the TS Adapter connected. These include data for initializing the modem and settings for serial transmission between the TS Adapter and the modem.

The data required for the remote modem is specified during the configuration of the TS Adapter.

The modem may be internal or external depending on the TS Adapter used.

How to connect a TS Adapter with an internal modem

1. Switch off the TS Adapter.
2. Connect the TS Adapter to the automation system.
3. Connect the TS Adapter to the telephone line.
4. Switch on the TS Adapter.

How to connect a TS Adapter with an external modem

1. Switch off the modem.
2. Connect the TS Adapter to the automation system.
3. Connect the TS Adapter to the modem using a modem cable.
4. Connect the modem to the telephone line.
5. Switch on the modem.
6. Switch on the TS Adapter.

Note

Please note the following information on configuring the remote modem:

- The default parameters for the modem and the serial port set in the TS Adapter should in most cases ensure successful operation; changes in the parameter assignment will only be needed in rare cases.
- You need only change the parameter assignment of the TS Adapter if a modem connection is not established or if factory settings are to be adapted or optimized.
- TS Adapter parameter assignment can be changed via either a direct or a remote connection.

14.7.3.3 Access protection for dial-up connections

Access protection information

Introduction

When you assign the parameters for your TS adapter, you can restrict access to the parameters of the TS adapter and access to remote systems.

Scope of access protection

Access protection only exists for remote connections; TS adapter parameter assignment can be accessed at any time in direct connection mode.

Access protection also exists in direct connection for the TS adapter IE.

Access protection information

The TS Adapter MPI is not delivered with access protection activated. There is a default password for the TS adapter IE.

The first user who assigns the parameters for this adapter can therefore activate access protection by defining the password for a user and/or a callback number.

This is a multi-level access protection with several users, each with or without administrator rights. For the TS adapter MPI there is only one adminstrator and no more than two users.

For a modem connection, only an administrator can define the two users and change and, if necessary, delete their settings. Those logged in as users can only change their own passwords and their own callback numbers. However, with the TS adapter MP you can access the process of assigning parameters of the TS adapter in direct connection, without restriction.

Advantages

Access protection offers the following advantages:

- Unauthorized access by persons outside the system is almost impossible.
- The plant operator bears most of the telephone costs.

TeleService callback options

Callback variants

The costs of a telephone connection are normally borne by the caller who establishes the dial-up connection.

TeleService can, however, be used so that after a short initial connection the modem connection is established again in the opposite direction, in other words initiated by the TS Adapter (callback). In this case, the plant operator bears the costs of the callback.

There are two callback variants in TeleService:

1. Callback to a number specified during connection establishment.
2. Callback to a number stored on the TS Adapter.

Levels of protection

Introduction

You can set up one of two possible levels of access protection for TeleService access to the TS Adapter. Different options are available with each protection level.

Access protection options

Access protection level 1:

The TS Adapter is protected by the user name and password. You can access the TS Adapter via any telephone line and specify any callback number during connection establishment.

Access protection level 2:

The TS Adapter is protected by the user name, password, and the callback number. You can only access the TS Adapter from one telephone connection per user.

The table below sets out the above conditions for the various protection levels:

Level of access protection	Administrator/User password	Callback number
1	enter	do not enter
2	enter	enter

Logging on to TS Adapter

When you log on to the TS Adapter and after you have set up access protection, enter your user name, the corresponding password and, if desired, a callback number:

Level of access protection	Administrator/User password	Callback number
1	enter	do not enter or enter any callback number
2	enter	do not enter

If you have entered a callback number during connection establishment (access protection level 1) or have stored a callback number in the TS Adapter (access protection level 2), the modem connection is disconnected and the TS Adapter calls the specified number back.

Setting up access protection and callback number for the TS adapter

Introduction

During the parameter assignment for the TS adapter MPI in TeleService, you can set up access protection and a callback number for the parameter assignment of the adapter and connection to the remote system. The following describes the parameter assignment for a TS adapter MPI. The parameter assignment of a TS adapter IE is carried out in analog. The specific method is described in the web help of this adapter.

Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Accessible nodes".

Procedure

To set up access protection for the TS adapter, proceed as follows:

1. Click on the command "Assign TS Adapter MPI parameters" in the project tree.
2. Open the "Access security" tab.
3. Enter a password for your user name and/or number that you want the modem to call back following logon.
   - If you are an administrator, you can change all the settings for administrators and users, and delete or create users.
   - If you are logged on as a user, you can only change your own settings (password and callback number).
4. Confirm all entries before exiting the dialog with "OK".
5. Click the "Yes" button to confirm the following query.

Result

The parameter assignment for the access protection and the callback number is saved in the non-volatile memory of the TS adapter MPI.

Note

Important points to note when setting up access protection:

- The settings in the "Modem" tab must correspond to the conditions at the plant if callback functionality is to be guaranteed.
- Entering an incorrect callback number in the role of "ADMIN" user will mean you are no longer able to access the TS Adapter MPI over a remote connection!
- Test the callback number before you enter it as the "ADMIN" user by calling the given callback number during connection establishment (access protection level 1).

Complete a callback in TeleService

Callback options

Two different callback variants can be set up in TeleService.

The following callback options are available:

- Callback to a number specified during connection establishment.
- Callback to a number stored on the TS Adapter

Callback to a number specified during connection establishment

1. In the project tree of the TIA Portal, click the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. In the "Adapter type" drop-down list, select the adapter type used.
5. Select the "dial-up connection" under "Connection type" if it is not already selected.
6. Select the modem you are using under "Local Settings".
7. Enter the phone number to be dialed in the appropriate box or open the phone book by clicking on the button behind it and take the desired phone number from the phone book.
8. Enter your user name and associated password of the TS adapter.
9. If you want a "Connection setup with callback", select the appropriate option button.

10. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection. Any remote connection is displayed under "Status".
11. Enter the desired callback number in the dialog that follows.

Result

The remote connection to the desired system is made with callback.

The connected system is shown with the corresponding icon in the project tree.

Note

This procedure is useful if the costs of the modem connection are to be borne by the plant operator and if the actual callback number is not fixed, which means callback is not always to the same receiver. It is particularly useful for mobile users.

Callback to a number stored on the TS Adapter

1. Assign the parameters for the desired callback number in the TS adapter.
2. Establish a connection to the TS adapter as described above, and observe the following features:
   - Enter the user name and password for which the callback number parameters are assigned in the TS adapter.
   - The check box "Establish a connection with callback" does not have to be selected, since the callback number is already known by the TS adapter.

Result

Callback to a number stored on the TS adapter has been established. If a remote connection is established, the callback occurs from the remote system.

Note

This procedure offers the highest level of access protection. However, it does pose a risk: if the callback number stored on the TS Adapter is not correct, it will no longer be possible to access the TS Adapter over a modem connection. The device can in such a case only be put back into operation by changing the parameter settings on site.

14.7.3.4 TS adapter MPI

Short description of the TS adapter MPI

TS Adapter MPI:

The designation "TS Adapter MPI" is a collective term for allTS Adapter with an MPI/DP interface.

The TS Adapter MPI comes in the following versions:

- As TS Adapter I (parameters cannot be assigned via the TIA Portal)
- as TS Adapter II

The table below provides a short description of the functionalities. For detailed information on your TS Adapter, please refer to the documentation supplied with your TS Adapter.

TS Adapter II:	
Direct connection	Connection via the Universal Serial Bus (USB). The firmware can be replaced. The modem is integrated or can also be connected as external modem. The TS Adapter II switches automatically between the modems. As long as no external modem is connected, the adapter will use the internal modem.
There are two variants	• With internal analog modem. An external modem can also be connected to the RS232 port. • With internal ISDN adapter. An external modem can also be connected to the RS232 port.

Use of the designation "TS Adapter"

For TeleService the designation "TS Adapter" is the generalization for all versions. The relevant product designation is listed beside information which only applies to a specific version of a TS Adapter, for example, "TS Adapter II", "TS Adapter IE Standard" or "TS Adapter IE Basic".

How the TS adapter MPI works

How the TS Adapter MPI Works

In line with the configuration, the TS Adapter MPI connects the serial port or USB port of your programming device/personal computer (direct connection) or the serial port of a modem (modem connection) to the MPI/PROFIBUS network of your automation system.

The TS Adapter MPI has a non-volatile memory. Parameters for the following functions are stored in this memory:

- The MPI/PROFIBUS network (network parameters)
- The mode of the modem used

- The serial port to the modem
- Access protection

Default parameter assignment

The TS Adapter comes with default parameter assignment. The parameters can be set and saved to the non-volatile memory of the TS adapter in a parameter assignment session.

When "Direct connection" is configured, the TS Adapter will only use the network parameters for access to the MPI/PROFIBUS network.

In the "Modem connection" configuration, all the parameters stored on the TS Adapter will be activated.

Note

For more detailed information on the configuration of your TS Adapter, please refer to the documentation supplied with it.

Operating a TS adapter MPI in direct connection mode

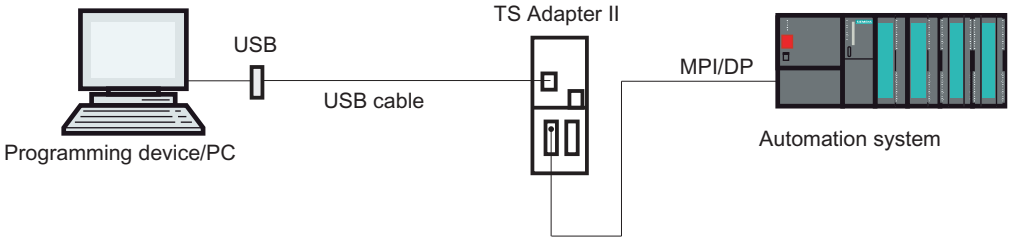
Direct connection with TS Adapter MPI

The direct connection is used to assign the parameters of the TS Adapter MPI. The same configuration also allows you to go online in the TIA Portal and thereby check the assigned MPI/PROFIBUS parameters for bus compatibility. This means that (as with a PC adapter) SIMATIC S7/C7 systems can be accessed via the MPI/DP interface without an MPI/ PROFIBUS module occupying a slot for a programming device/PC.

Access protection for the TS Adapter is not active in direct connection configuration. This means that the parameter assignment of the TS Adapter can be changed without any problems, for example by importing adapter parameters.

Note

Display of the TS Adapter MPI in the TIA Portal



As soon as you have connected a TS Adapter MPI to the programming device/PC via the USB interface, the "TS Adapter" folder is displayed in the project tree in the TIA Portal.

When you open the folder, you can assign the parameters of the connected TS Adapter MPI via the following dialog.

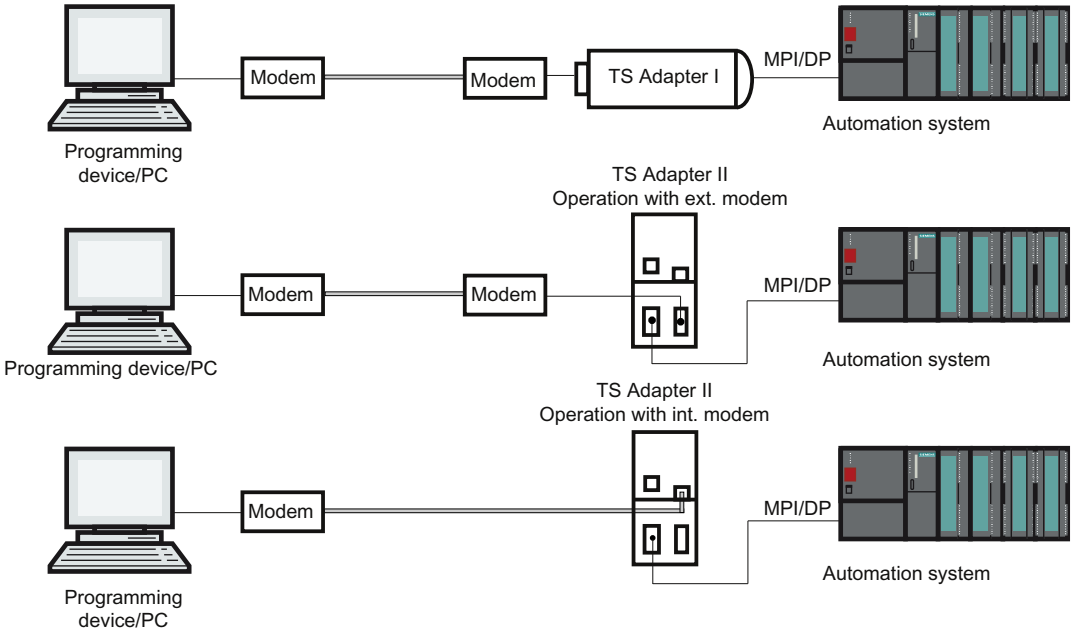
Establishing the direct connection for TS Adapter MPI

Direct connection mode means there is a direct connection via the TS Adapter MPI between the programming device/personal computer on which TeleService is installed and the automation system. No modem is required.

The figure below shows the configuration of the TS Adapter MPI with a direct connection.

Operating a TS adapter MPI in modem connection mode

Introduction to the modem connection with TS Adapter MPI



This configuration allows you to dial into a remote system. To do this, you establish a remote connection to a remote system using TeleService on a telephone network. Via the established modem connection you can then process the selected plant as usual with the TIA Portal.

Establishing a modem connection with TS Adapter MPI

This connection between the programming device or PC on which TeleService is installed and the automation system in which the TS Adapter MPI is inserted in the MPI/DP interface is made through a modem route.

The configuration therefore includes the programming device or PC via the telephone network and the TS Adapter MPI on the MPI/DP interface of the automation system.

The figure below shows the structure of the modem connection.

Note

Parallel operation between direct and modem connection

The TS Adapter II has two connections for communication with PG/PC, both of which can be connected at the same time. At the same time, connect the USB interface with the PG/PC and the modem interface with the telephone network.

In this configuration you can either use the direct or the modem connection.

A parallel operation is **not** possible!

TS adapter MPI configuration options

Useful information on configuring the TS Adapter MPI

The TS Adapter MPI can be configured in both direct connection mode and via an existing remote connection.

The following parameter assignment options are available:

- Reconfiguration (Page 6596)
- Restoring default parameter assignment (Page 6597)
- Importing adapter parameters (Page 6598)
- Exporting adapter parameters (Page 6597)
- Setting up access protection (Page 6589)

Parameter assignment

Configure your TS Adapter in accordance with the documentation supplied with the TS Adapter. It will detail the exact procedure for parameter assignment.

Note

Please note the following when configuring the TS Adapter MPI

- If you change the current parameter settings when there is an established remote connection, there is a risk it will not subsequently be possible to establish a modem connection with the modified parameters. The TS Adapter MPI can in this case only be configured in direct connection mode.
- This means that either parameter assignment must be carried out with a programming device/personal computer at the plant location or the TS Adapter MPI must be brought to the location of the local programming device/personal computer in order to be configured.

Positive acknowledgement

During parameter assignment, the data is written to the non-volatile memory of the TS Adapter MPI. The parameter assignment process is not acknowledged positively until all precautions have been taken to ensure that parameter changes have been carried out correctly and will thus survive a power failure.

Changes become effective for the TS Adapter MPI as follows:

- The serial parameters, the modem parameters and the parameters for access protection are activated once the remote connection has been terminated.
- The modified network parameters are activated immediately.

Configuring TS adapter MPI

Introduction

The TS Adapter MPI can be configured in both direct connection mode and via an existing remote connection in modem connection mode.

The following describes the method for assigning parameters.

Requirement

A TS Adapter MPI is connected to your computer and the folder "TS Adapter" is displayed in the project tree under "Online access".

Procedure

To assign the parameters for the TS Adapter MPI im Direktanschluss , follow these steps:

1. Double-click the "Online access" folder in the project tree.
2. Open the required folder:
   - The "TS Adapter" folder for a direct connection.
   - For an existing remote connection, the "TeleService" folder followed by the folder with the required system name.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "OK".

Result

The configured parameters are saved in the non-volatile memory of the TS Adapter MPI. Parameter assignment is then complete.

Restoring default parameter assignment for TS adapter MPI

Introduction

You can restore the default, factory state parameters of the TS Adapter MPI.

Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

Procedure

To restore the default parameter assignment for the TS Adapter MPI, follow the steps below:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Reset" button under "General".
5. Confirm your entries with "OK".

Result

The TS Adapter MPI default parameters set on delivery are restored.

See also

TS adapter MPI configuration options (Page 6595)

Exporting adapter parameters

Introduction

You can export the configuration of a TS Adapter MPI to an external file. The configuration saved in this file can be imported in turn into any number of TS Adapter MPI.

This can for example be useful if you want to assign identical parameters to multipleTS Adapter MPI or if you want save, document or distribute the parameter set.

Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

The parameter is stored on the TS adapter.

Procedure

To export the adapter parameters of a TS adapter MPI, follow the steps below:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Export" button.
5. A window will open in which you can select the file to which you wish to export the configuration of the TS Adapter MPI.
6. Confirm with "Save".

Result

The parameters of the TS Adapter MPI are saved in the specified file (*.tap). The export of the adapter parameters is now complete.

Importing adapter parameters

Introduction

You can import the configuration of a TS Adapter MPI from a previously created export file (*.tap).

The configuration saved in this file can be imported into any number of TS Adapter. This can for example be useful if you want to assign identical parameters to multiple TS Adapter MPI.

You can import parameters locally in direct connection mode or via an existing remote connection in modem connection mode.

Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

Procedure

To import the adapter parameters of a TS Adapter MPI:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Import" button.

5. A dialog will open in which you can select the file to which you wish to import the configuration of the TS Adapter MPI.
6. Confirm the next dialog with "Yes".

Result

The parameters selected are saved in the non-volatile memory of the TS Adapter MPI. Adapter parameter import is then complete.

14.7.3.5 TS adapter IE

Short description of the TS adapter IE

TS Adapter IE

The designation "TS Adapter IE" is a collective term for allTS Adapter with an Ethernet port.

The TS Adapter IE comes in the following versions:

- as TS Adapter IE Standard
- as TS Adapter IE Basic

The tables below provide a short description of the functionalities. For detailed information on your TS Adapter, please refer to the documentation supplied with it.

TS Adapter IE Standard:
Direct connection by means of Industrial Ethernet (IE). Firmware update possible. Modem integrated or external. The TS Adapter IE cannot automatically switch between modems like the TS Adapter II. Parameters are assigned via a Web interface.
There are 2 variants:
• With internal analog modem. An external modem can also be connected to the RS232 port.
• With internal ISDN adapter. An external modem can also be connected to the RS232 port.

TS Adapter IE Basic:
Direct connection by means of Industrial Ethernet (IE). Firmware update possible. Plug-in modules. Parameters are assigned via a Web interface.
There are 4 variants:
• TS Adapter IE Basic MODEM: Basic device TS Adapter IE Basic with TS Module MODEM for operation on the analog telephone network.
• TS Adapter IE Basic ISDN: Basic device TS Adapter IE Basic with TS Module ISDN for operation on ISDN telephone systems.
• TS Adapter IE Basic GSM: Basic device TS Adapter IE Basic with TS Module GSM for operation on the GSM radio network.
• TS Adapter IE Basic RS232: Basic device TS Adapter IE Basic with TS Module RS232 for connecting an external modem.

Use of the designation "TS Adapter"

"TS Adapter" is used in the TeleService online help as a general designation for all versions. The relevant product designation is listed beside information which only applies to a specific version of a TS Adapter, e.g. "TS Adapter I", "TS Adapter II", "TS Adapter IE Standard" or "TS Adapter IE Basic".

How the TS adapter IE works

How the TS Adapter IE works

The TS Adapter IE connects the telephone network or the serial port of a modem with the Industrial Ethernet of your automation system.

The TS Adapter IE has a non-volatile memory. Parameters for the following functions are stored in this memory:

- The mode of the modem used
- The serial port to the modem
- Access protection

Default parameter assignment

The TS Adapter IE comes with default parameter assignment. The parameters can be set and saved to the non-volatile memory of the TS adapter in a parameter assignment session.

Note

For more detailed information on the configuration of your TS Adapter, please refer to the documentation supplied with it.

Connection Types

Connection types of the TS Adapter IE Basic

The following diagrams show the connection types possible with the TS Adapter IE Basic.

Direct connection

In the direct connection to the PG/PC, you can set the TS Adapter IE Basic through Ethernet.

Note

The operation of the TS Adapter IE Basic without a TS module is not permitted.

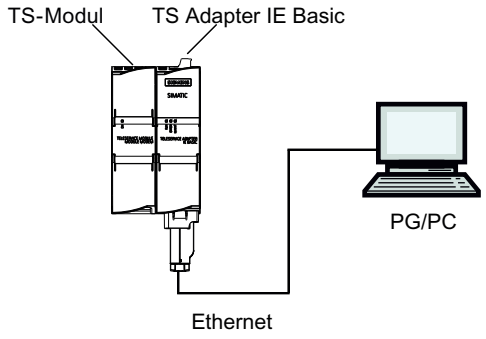


Figure 14-1 Direct connection

Connection to the telephone network

In order to have a direct connection to the telephone network, you must connect the TS Adapter IE Basic together with one of the following TS modules:

- TS Module Modem
- TS Module ISDN

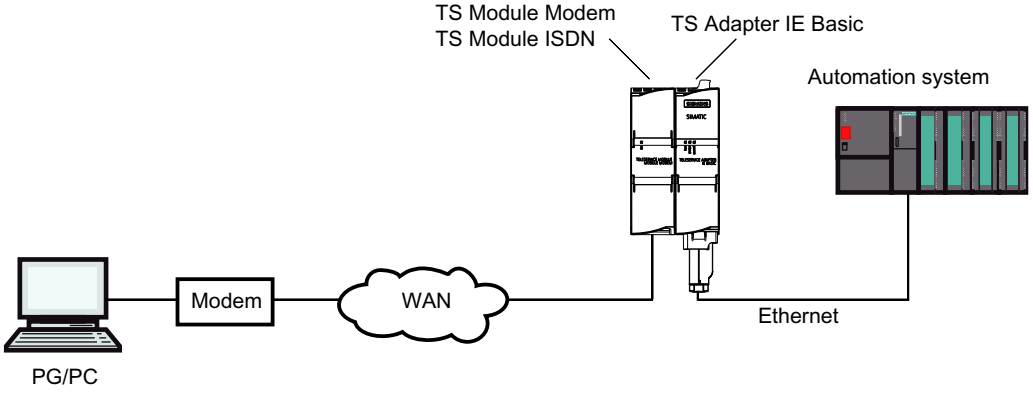

Figure 14-2 Direct connection to the telephone network

More information about the TS modules can be found in the *TS Adapter modular* manual.

Connection to the GSM network

In order to connect to the GSM network, you must operate the TS Adapter IE Basic together with this TS module:

- TS Module GSM

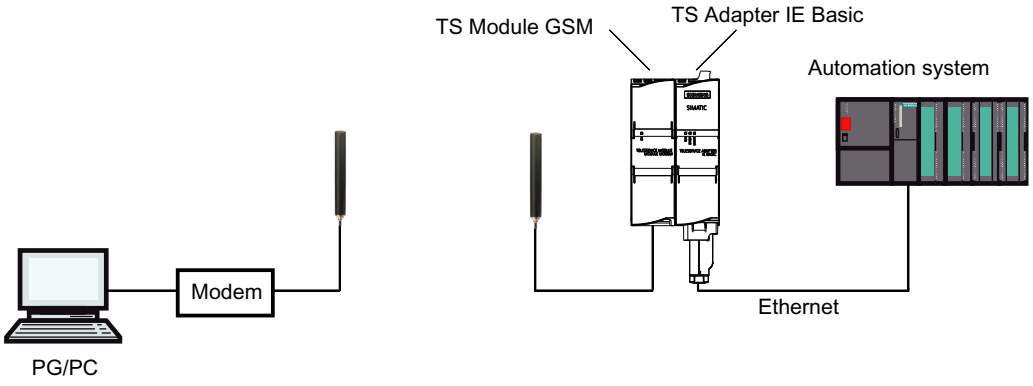

Figure 14-3 Connection to the GSM network

More information about the TS modules can be found in the *TS Adapter modular* manual.

Connection to the telephone network through an external modem

For the connection to an external modem, you must operate the TS Adapter IE Basic together with this module:

- TS Module RS232

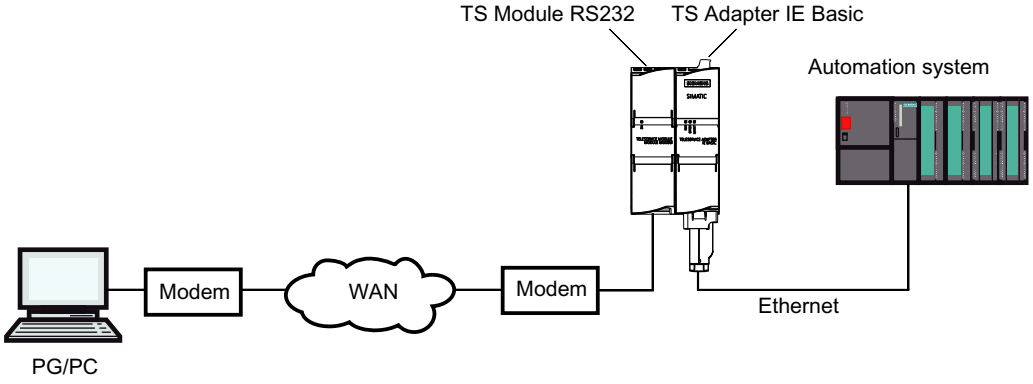

Figure 14-4 Connection to an external modem

More information about the TS modules can be found in the *TS Adapter modular* manual.

TS Adapter IE parameter assignment options

Useful information for configuring the TS Adapter IE

The TS Adapter IE is configured via a Web interface.

Web help associated with the parameter assignment interface is made available for the configuring the TS Adapter IE.

The following parameter assignment options are available:

- Reconfiguration
- Restoring default parameter assignment
- Importing adapter parameters
- Exporting adapter parameters

Note

Parameter assignment

Configure your TS Adapter in accordance with the documentation supplied with the TS Adapter. It will detail the exact procedure for parameter assignments.

Parameter assignment for TS Adapter IE

Introduction

The TS Adapter IE can be configured in both direct connection mode and via an existing remote connection in modem connection mode.

Both parameter assignment options are described below.

Specific details for assigning parameters of the TS Adapter IE can be obtained from the TS Adapter IE documentation.

Parameter assignment of the TS Adapter IE in direct connection

Requirement

There is a LAN connection to your TS Adapter IE.

The TS Adapter IE Basic is connected to the power supply.

Procedure

To assign the parameters for the TS Adapter IE , follow these steps:

1. In the project tree of the TIA Portal, open the "Online access" folder.
2. Double-click on the Ethernet port of your computer.
3. Double-click on the "Display accessible nodes" command. The TS Adapter IE is then displayed.

4. Double-click on the <TS Adapter IE> folder and then on "Online and diagnostic", and assign the desired IP address to the TS Adapter IE in the following dialogs. Please note that the IP address of the PG/PC interface card is located in the same subnet as the IP address that you issue for the TS Adapter IE.
5. Update the view in the project tree for the "Accessible nodes", so that the TS Adapter IE is displayed with the newly allocated IP address.
6. Open the folder <TS Adapter IE> in the device list.
7. Double-click the command "Assign TS Adapter IE parameters". The allocated web interface opens for assigning the parameters of the TS Adapter IE.
8. Complete the "logon" for the web interface.
9. Set the required parameters in the individual tabs of the dialog.
10. Confirm your entries with "Save settings".

Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE. Parameter assignment is then complete.

Parameter assignment of the TS Adapter IE using a remote connection

Requirement

There is an established remote connection to a TS Adapter IE .

Procedure

1. In the project tree of the TIA Portal, open the "Online access" folder.
2. Open the "TeleService" folder followed by the required system folder.
3. Double-click the command "Assign TS Adapter IE parameters". The associated web interface for assignment of the TS Adapter IE parameters opens. The "logon" for the web interface takes place automatically with the login data of the remote connection.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "Save settings".

Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE. Parameter assignment is then complete.

14.7.3.6 Establishing a dial-up connection to a remote system

Establishing a dial-up connection

Introduction to establishing a remote dial-up connection

A dial-up connection is established when you use TeleService to dial into a remote system via a telephone network. The programming device/personal computer is connected to the telephone network with TeleService via a modem. At the other end, the automation system is connected to the telephone line via a configured TS Adapter and a modem.

Requirements

A local modem is installed and configured.

The TS Adapter is located in the remote system.

A remote modem is installed and parameters have been assigned.

Proceed as follows:

1. In the project tree of the TIA Portal, click the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. In the "Adapter type" drop-down list, select the adapter type used.
5. Under "Connection type", select "Dial-up connection".
6. Select the modem you are using under "Local settings".
7. Enter the phone number to be dialed in the appropriate box or open the phone book by clicking on the button behind it and take the desired phone number from the phone book.
8. Enter your user name and the corresponding password.
9. If you want a "Connection setup with callback", select the appropriate option button.
10. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection. Any remote connection is displayed under "Status".

Result

The dial-up connection to the desired system is established.

The dialog closes as soon as the dial-up connection is established. The following message appears in the status bar of the TIA Portal: "Remote connection is up". You can now use the remote connection with the TIA Portal and communicate with the automation system.

Connection cannot be established

If the connection cannot be established, try to find the cause using the "Notes on troubleshooting".

Terminating the connection

Once you have finished editing the remote system, exit the remote connection in the project tree by double-clicking on the entry "Establish/disconnect remote connection".

By exiting the TIA Portal, you are also terminating the remote connection.

Terminating a dial-up connection

Terminating an active dial-up connection

Note

Terminating the dial-up connection

You should go offline in the TIA Portal before you terminate the remote connection.

Proceed as follows:

1. Double-click the "Set up/close remote connection" entry in the TIA Portal.
2. Confirm the prompt in the dialog that follows with "Yes".

Result

The connection is terminated.

14.7.4 Remote VPN connections

14.7.4.1 Basics for establishing a VPN connection

Using a TS Adapter IE Advanced for VPN connections

A TS Adapter IE Advanced is required to establish a VPN connection using TeleService.

VPN definition

VPN stands for "Virtual Private Network". This is a private network of computers based on a public network infrastructure.

VPN is used to create a connection that is as secure as possible between devices in a private network at different locations and the gateway of another network.

A VPN device has direct access to the gateway in the other network over an encrypted connection.

VPN connections

When a VPN connection is established with TeleService, a CA certificate and a unique fingerprint generated from it are used for the unique identification of the TS Adapter IE Advanced. The VPN connection allows a communication that is secure from tapping and manipulation between the remote PC and the TS Adapter.

If you want to establish a VPN connection to multiple remote networks, you will require a separate TS Adapter IE Advanced as an interface for each network. The networks connected by the TS Adapter can used identical IP addresses internally. Only the external IP addresses (WAN) of the TS Adapters need to be different.

Only one VPN connection to a TS Adapter is possible at any one time.

Note

Authentication

Please not that the CA certificate exclusively authenticates the TS Adapter IE Advanced.

As in the case of dial-up connections, users are authenticated via the login (user name and password).

Therefore, use only a secure password for the login.

- Establishing VPN connections (Page 6613)
- Terminating VPN connections (Page 6614)

14.7.4.2 Basics of CA certificates

Introduction

To establish a secure VPN connection with TeleService, you need to generate a CA certificate with a unique fingerprint when you configure the TS Adapter IE Advanced.

You can install this CA certificate on every PC that should have access to the TS adapter IE advanced.

- Using the automatic download in the TeleService connection dialog, by entering the fingerprint for the CA certificate
- Manually by using the Microsoft® Management Console.

Definition of CA certificate

A CA certificate is a digital certificate issued by a "certificate authority" or "certification authority", hereinafter referred to as "CA". In the case of the TS Adapter IE Advanced, self-signed certificates are used; the certification authority in this case is the TS Adapter IE Advanced itself.

Certificates for "SSTP" (Secure Socket Tunneling Protocol) and "HTTPS" (Hypertext Transfer Protocol Secure) are derived from the CA certificate.

CA certificates contain a "key" and additional information used for authentication and for encrypting and decrypting confidential data. Additional information includes the validity period, references to certificate revocation lists, etc. which are included in the certificate by the CA.

Using CA certificates with TeleService

A CA certificate with a unique fingerprint is generated by the TS Adapter to uniquely identify the TS Adapter IE Advanced as connection partner for the remote PC.

This CA certificate must be saved in the Windows certificate store of your programming device/ PC before you can establish a VPN connection. When you access the Web server using a direct connection, a security warning will appear if no CA certificate exists. In such cases, however, you can choose to ignore the warning and allow the connection.

Note

Handling CA certificates

Specialist knowledge of the operating system is required for handling CA certificates. CA certificates should only be managed by trained personnel!

You require administrator rights to manage CA certificates.

Definition of fingerprint

The fingerprint is a 20-byte hexadecimal expression. It provides a unique value for a CA certificate and is used to identify a specific CA certificate.

A fingerprint is calculated dynamically using the SHA-1 algorithm and is not physically contained in the CA certificate.

Use of fingerprints with TeleService

The CA certificate is used to uniquely identify the TS Adapter IE Advanced as connection partner. A unique 20-byte fingerprint of this certificate is generated each time a CA certificate is generated by the TS Adapter IE Advanced. It is calculated automatically by the TS Adapter IE Advanced when the certificate is generated. Each certificate has a specific, unique fingerprint. This fingerprint must be transferred securely to your computer, for example by phone or in an encrypted e-mail. You need to enter this fingerprint in the connection dialog when establishing a VPN connection with TeleService, unless the CA certificate is already saved on your PC in the Windows certificate store.

You will find the fingerprint for your TS Adapter IE Advanced in the web interface for the TS Adapter IE Advanced. To open the web interface, double-click the command "Assign TS Adapter IE parameters" in the device list in the TIA Portal. Perform the Web login to view the fingerprint in the "Security > Certificates" tab.

CA certificate download during connection establishment

When the connection is established, TeleService checks whether a suitable CA certificate is installed in the Windows certificate store of your programming device/PC. If an appropriate certificate is found, the VPN connection is established as an SSTP connection (Secure Socket Tunneling Protocol).

If no appropriate CA certificate is found, the CA certificate is first loaded by the corresponding TS Adapter IE Advanced. The TS Adapter IE Advanced is called by the remote address entered in the connection dialog. If this download of the CA certificate is successful, the fingerprint of the downloaded CA certificate is calculated and compared with the fingerprint entered in the connection dialog. If the two fingerprints match, a dialog opens and you are prompted to save the CA certificate in the Windows certificate store of your programming device/PC. You require administrator rights to save the CA certificate.

The VPN connection is then established.

See also

- Installing CA certificates for VPN connections (Page 6609)
- Deleting CA certificates for VPN connections (Page 6612)

14.7.4.3 Installing CA certificates for VPN connections

Installing CA certificates

To establish a secure VPN connection between your programming device/PC and a remote system with TeleService, you require a valid CA certificate generated by the TS Adapter IE Advanced. This must be saved in the Windows certificate store of your programming device/PC.

A CA certificate can be installed manually or using an automatic download.

CA certificates are managed with the Microsoft® Management Console.

Note

Handling CA certificates

Specialist knowledge of the operating system is required for handling CA certificates. CA certificates should only be managed by trained personnel!

You require administrator rights to manage CA certificates!

Requirement

A CA certificate has yet to be installed in the Windows certificate store on your computer.

Installing CA certificates using the automatic download

Proceed as follows:

1. Log on to the system as administrator.
2. Transfer the fingerprint for the CA certificate from the TS Adapter IE Advanced to your computer using a "secure route", for example by phone or in an encrypted e-mail.
   You will find the fingerprint for your TS Adapter IE Advanced in the web interface for the TS Adapter IE Advanced. To open the web interface, double-click the command "Assign TS Adapter IE parameters" in the device list in the TIA Portal. Perform the Web login to view the fingerprint in the "Security > Certificates" tab.
3. In the project tree of the TIA Portal, click the "Online access" folder.
4. Click on the "TeleService" folder it contains.
5. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
6. Select the "TS Adapter IE" as Adapter type from the drop-down list.
7. Under "Connection type", select "VPN".
8. Enter the IP address / DNS name for the TS Adapter IE Advanced to be contacted in the relevant field. Alternatively, you can apply any existing data from the phone book by clicking the corresponding button.
9. Enter your user name and the corresponding password.
10. Copy the fingerprint displayed in the web interface for the TS Adapter IE Advanced to the "Fingerprint" column.
11. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection.

12. No valid CA certificate is found, because no CA certificate has been installed on your PC yet.
    A "normal" connection (not a VPN connection) is therefore established and the certificate required is downloaded from the TS Adapter IE Advanced to the working memory of your computer. The fingerprint is then calculated (SHA-1 algorithm) and compared with the fingerprint entered in the connection dialog. If the two fingerprints match, a dialog opens and you are prompted to save the CA certificate in the Windows certificate store of your programming device/PC.
13. Confirm that you want to save the CA certificate.

Note

Restart of STEP 7 required after renewal of CA certificate

STEP 7 must be restarted after renewal of the CA certificate on the TS Adapter IE Advanced before the remote connection can be established with the help of the new fingerprint. Otherwise, it may not be possible to store the CA certificate in the Windows certificate memory and the remote connection cannot be established.

Result

The VPN connection to the required TS Adapter IE Advanced is established. The dialog closes once the connection is established.

Manual installation of CA certificates

Proceed as follows:

1. Log on to the system as administrator.
2. Open the Windows Certificate Manager on your programming device/PC with the Microsoft® Management Console.
   Click "Start", enter "mmc" in the search field and press ENTER.
   The console will open.
3. Open the "File" menu and click "Add/remove snap-in...".
   The "Add/remove snap-in..." dialog will open.
4. Double-click "Certificates" in the "Snap-in" list and select "Computer account" in the dialog that opens.
5. Select "Local computer" in the next dialog and click "Finish" and "OK".
   The console root opens and the "Certificates (local computer)" folder appears.
6. Open the displayed "Certificates (local computer)" folder and click "Trusted certification authorities".
7. Click the "Certificates " folder and use the shortcut menu to access the command "All tasks" > "Import...".
8. Note the information that appears in the "Certificate - Import wizard" dialog and click "Next".
9. In the dialog that follows, click "Browse ..." and select the required CA certificate.
10. Then click "Next" twice and subsequently "Finish" to install the CA certificate.

Result

The selected CA certificate is installed at the specified location in the Windows certificate memory.

Note

Additional information ...

... on installing CA certificates can be found using the "F1" button in the online help of your operating system.

14.7.4.4 Deleting CA certificates for VPN connections

Deleting CA certificates

Proceed as follows:

1. Log on to the system as administrator.
2. Open the Windows Certificate Manager on your programming device/PC with the Microsoft® Management Console.
   Click "Start", enter "mmc" in the search field and press the ENTER KEY.
   The console will open.
3. Open the "File" menu and click "Add/remove snap-in...".
   The snap-in selection dialog will open.
4. Double-click "Certificates" in the "Snap-in" list and select "Computer account" in the dialog that opens.
5. Select "Local computer" in the next dialog and click "Finish" and "OK".
   The console root opens and the "Certificates (local computer)" folder appears.
6. Open the displayed "Certificates (local computer)" folder and click "Trusted certification authorities".
7. Open the "Certificates" folder, select the required CA certificate and click "Delete" in the shortcut menu.
8. Confirm the next prompt with "Yes".

Result

The selected CA certificate is deleted from the list of available certificates.

14.7.4.5 Establishing a VPN connection to a remote system

Establishing VPN connections

Introduction to establishing VPN connections

A VPN connection is established when you use TeleService to connect to a remote system over the Internet.

Your programming device/PC with installed TIA Portal is connected to the Internet at one end for this. At the other end, the automation system is connected to the Internet via the WAN (Wide Area Network) interface of the configured TS Adapter IE Advanced.

Requirement

Your programming device/PC is connected to the Internet.

There is a TS Adapter IE Advanced in the remote system.

The TS Adapter IE Advanced has been configured and is connected to the Internet.

The CA certificate required for identifying the TS Adapter has been generated and installed in the Windows certificate store of your programming device/PC.

Proceed as follows:

1. In the project tree of the TIA Portal, click the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. Select the "TS Adapter IE Advanced" as "Adapter type" from the drop-down list.
5. Enter "VPN" as "connection type".
6. Enter the IP address / DNS name for the TS Adapter IE Advanced to be contacted in the relevant field. Alternatively, you can apply any existing data from the phone book by clicking the corresponding button.
7. Enter your user name and the corresponding password.
8. Click the "Establish" button to establish the required VPN connection. This button only becomes active once you have entered all the parameters needed for establishing the remote connection.

Result

The VPN connection to the required system is established. "Status" indicates the progress in establishing the connection. The dialog closes once the VPN connection is established. The following message appears in the status bar of the TIA Portal: "Remote connection is up". You can now use the remote connection with the TIA Portal and communicate with the automation system.

Connection cannot be established

If the connection cannot be established, try to find the cause using the "Notes on troubleshooting".

Note

Rules for IP addresses

- Only use IP addresses which have not yet been assigned in the plant network.
- If the IP address configured for the TS Adapter IE Advanced has already been assigned in the system network, the TS Adapter IE Advanced can only be addressed by its MAC address.

See also

Installing CA certificates for VPN connections (Page 6609)

Terminating VPN connections

Terminating an active VPN connection

Note

Terminating the VPN connection

You should go offline in the TIA Portal before you terminate the VPN connection.

Proceed as follows:

1. Double-click the "Set up/close remote connection" entry in the TIA Portal.
2. Confirm the prompt in the dialog that follows with "Yes".

Result

The VPN connection is terminated.

14.7.4.6 TS Adapter IE Advanced

Short description of the TS Adapter IE Advanced

TS Adapter IE Advanced

The TS Adapter IE Advanced has the following properties:

- Direct connection over Industrial Ethernet (IE), 2 ports
- WAN (Wide Area Network) interface for VPN connections
- Firmware update supported
- Plug-in modules
- Parameters are assigned via a Web interface.

Note

Further information on the TS Adapter IE Advanced

For detailed information on your TS Adapter, please refer to the documentation supplied with your TS Adapter.

Connection types

TS Adapter IE Advanced connection types

The following diagrams show the types of connection possible with the TS Adapter IE Advanced.

Direct connection

In the direct connection to the programming device/PC, you can set the TS Adapter IE Advanced parameters over the Ethernet.

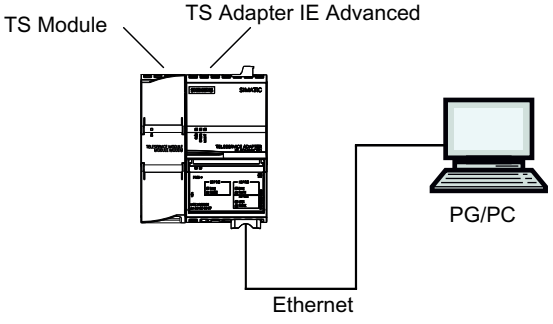

Figure 14-5 TS Adapter IE Advanced - direct connection

Connection to the Internet (DSL modem/router)

In order to connect to the Internet, you must operate the DSL modem/router at the WAN connection of the TS Adapter IE Advanced.

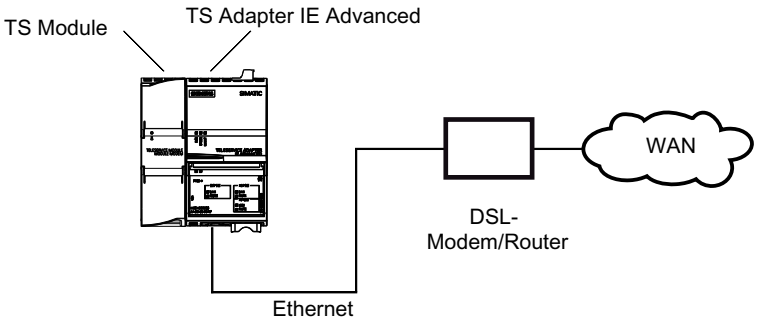

Figure 14-6 TS Adapter IE Advanced - connection to the Internet

Connection to the company network (Intranet)

In order to connect to the Intranet, you must operate plant network (Ethernet) at one of the two LAN connections of the TS Adapter IE Advanced.

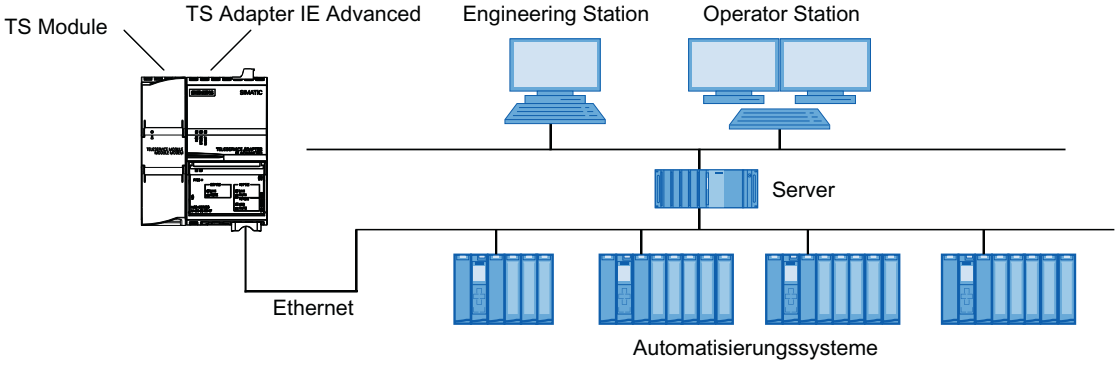

Figure 14-7 TS Adapter IE Advanced - connection to company network (Intranet)

Additional information

For more detailed information on the TS modules, please refer to the documentation supplied with your TS Adapter IE Advanced.

TS Adapter IE Advanced parameter assignment options

Basics on configuring the TS Adapter IE

The TS Adapter IE Advanced is configured via a Web interface.

Web help in the Web interface is available for assigning TS Adapter IE Advanced parameters.

Parameter assignment options include:

- Reconfiguration
- Restoring default parameter assignment
- Importing adapter parameters
- Exporting adapter parameters

Note

Parameter assignment

Configure your TS Adapter IE Advanced in accordance with the documentation supplied. This details the exact procedure for parameter assignment.

Parameter assignment for TS Adapter IE Advanced

Introduction

The TS Adapter IE Advanced can be configured in both direct connection mode and via an existing remote connection.

Both parameter assignment options are described below.

Specific details on assigning parameters for the TS Adapter IE Advanced are available in the TS Adapter IE Advanced documentation.

Assigning parameters for the TS Adapter IE Advanced in direct connection

Requirement

There is a LAN connection to your TS Adapter IE Advanced.

Procedure

To assign parameters for the TS Adapter IE Advanced, follow the steps below:

1. In the project tree of the TIA Portal, open the "Online access" folder.
2. Double-click on the Ethernet port of your computer.
3. Double-click on the "Display accessible nodes" command. The TS Adapter IE Advanced is then displayed.
4. Double-click on the "TS Adapter IE Advanced" folder and then on "Online and diagnostics", and assign the desired IP address to the TS Adapter in the dialogs that follow. Please note that the IP address of the programming device/PC interface card must be located in the same subnet as the IP address that you assign for the TS Adapter IE Advanced.

5. Update the view in the project tree for the "Accessible nodes", so that the TS Adapter IE Advanced is displayed with the newly assigned IP address.
6. Open the folder "TS Adapter IE Advanced" in the device list.
7. Double-click the command "Assign TS Adapter IE parameters". The corresponding web interface opens for assigning TS Adapter parameters.
8. Complete the "logon" for the web interface.
9. Set the required parameters in the individual tabs of the dialog.
10. Confirm your entries with "Save settings".

Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE Advanced. Parameter assignment is then complete.

Assigning parameters for the TS Adapter IE Advanced using a remote connection

Requirement

There is an established remote connection to a TS Adapter IE Advanced..

Procedure

1. In the project tree of the TIA Portal, open the "Online access" folder.
2. Open the "TeleService" folder followed by the required plant folder.
3. Double-click the command "Assign TS Adapter IE parameters". The associated web interface for assignment of the TS Adapter IE parameters opens. The "logon" for the web interface takes place automatically with the login data of the remote connection.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "Save settings".

Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE Advanced. Parameter assignment is then complete.

14.7.5 CPU controlled TeleService remote connections

14.7.5.1 Overview of CPU controlled remote connections

Introduction

TeleService offers a range of options for establishing remote connections; these differ according to the CPU used. The initiative for establishing a connection starts from the CPU. The communication instructions given below are used for the individual connection options.

Connection establishment with S7-300/400 CPUs

The following communication instructions are available:

- Communication instruction "PG_DIAL": Establish remote connection to programming device/PC
- Communication instruction "SMS_SEND": Send text message (SMS)
- Communication instruction "AS_DIAL": Establish remote connection to AS
- Communication instruction "AS_MAIL": Transfer email

Connection establishment with S7-1200 CPUs

The following communication instruction is available:

- Communication instruction "TM_MAIL": Transfer email

Connection establishment with S7-1500 CPUs

The following communication instruction is available:

- Communication instruction "TMAIL_C": Transfer email

Note

Description of individual communication instructions

More detailed information on the available communication instructions can be found in the information system of the TIA Portal in the "References > Communication > TeleService" directory.

See also

TS Adapter IE parameter assignment options (Page 6602)

TM_MAIL: Transfer email (Page 4676)

14.7.5.2 Establishing a connection from and to remote systens (PG-AS-remote coupling)

Remote plant access to a programming device/personal computer

Introduction

You can establish a remote connection to and communicate with a remote system using the application TeleService and a TS Adapter MPI. The initiative for establishing the remote connection comes from the programming device/personal computer.

However, events which require rapid intervention often occur at a remote system. In such cases, the automation system can initiate a remote connection to a programming device/ personal computer if an asynchronous event occurs.

The graphic below shows the components which are required for establishing a connection from a plant to a programming device/personal computer.

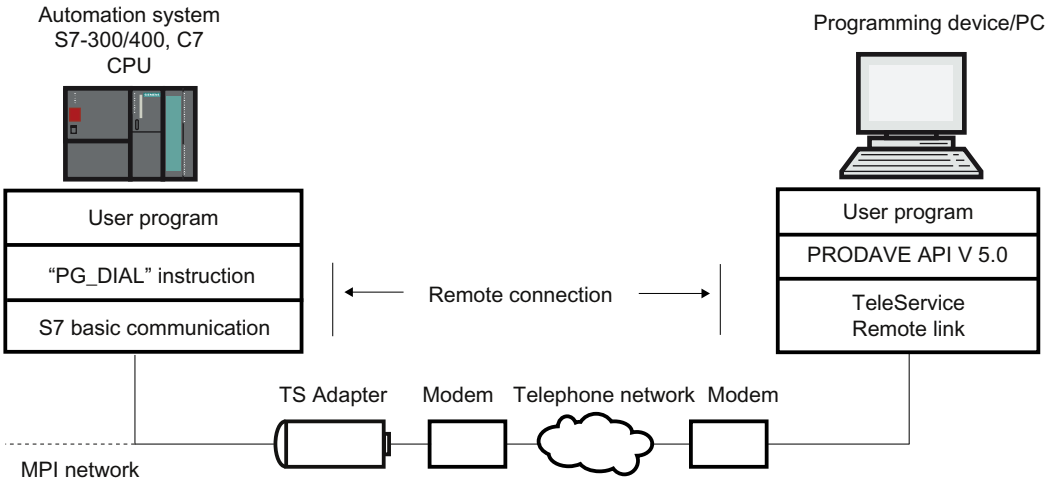

Figure 14-8 How the "PG_DIAL" communications instruction works

Requirements for establishing a connection

Introduction

Certain hardware and software requirements must be fulfilled if a remote system is to establish a remote connection to a programming device/personal computer. These requirements are detailed below.

Hardware requirements:

The only hardware required for establishing a remote connection from a remote system to a programming device/personal computer is that needed for accessing the remote system from the programming device/personal computer.

Your user program calls the "PG_DIAL" communication instruction to establish the connection. This can only be executed on an S7-300 or S7-400 CPU on which S7 basic communication is implemented.

A TS Adapter I , version 5.0 or later, or a TS Adapter II must be used.

Software requirements on the system side:

The "PG_DIAL" communication instruction is included in the scope of delivery of TeleService and is installed when the TIA Portal is installed. You will find the installed communications instructions in the task card of the block editor in the folder "Communication > TeleService".

If a remote system is to establish a remote connection to a programming device/PC, the user program of the system must call the "PG_DIAL" communication instruction.

Software requirements on the programming device/PC side:

You require a software product on the programming device/PC which, with TeleService, waits for a call from a remote system, recognizes this call and informs your user program.

14.7.5.3 Data exchange between remote systems (AS-AS-remote coupling)

AS-AS remote link basics

Introduction

The AS-AS remote link allows two automation systems to exchange process data via the telephone network.

Requirement

Communication instruction "AS_DIAL" is available if you use a CPU from the S7-300/400 family.

Definition: Local and remote automation system

- The automation system from which the initiative to establish the remote connection originates is described as **local**.
- The automation system to which the remote connection is to be established is described as **remote**.

Data exchange over the AS-AS remote link

Data exchange is carried out using specific communication instructions for non-configured S7 connections. Use the communication instruction "AS_DIAL" to establish a remote connection to the automation system.

More detailed information on establishing the connection can be found in the information system in the directory "References > Communication > TeleService".

The following graphic shows the components required for establishing a connection from a local to a remote automation system.

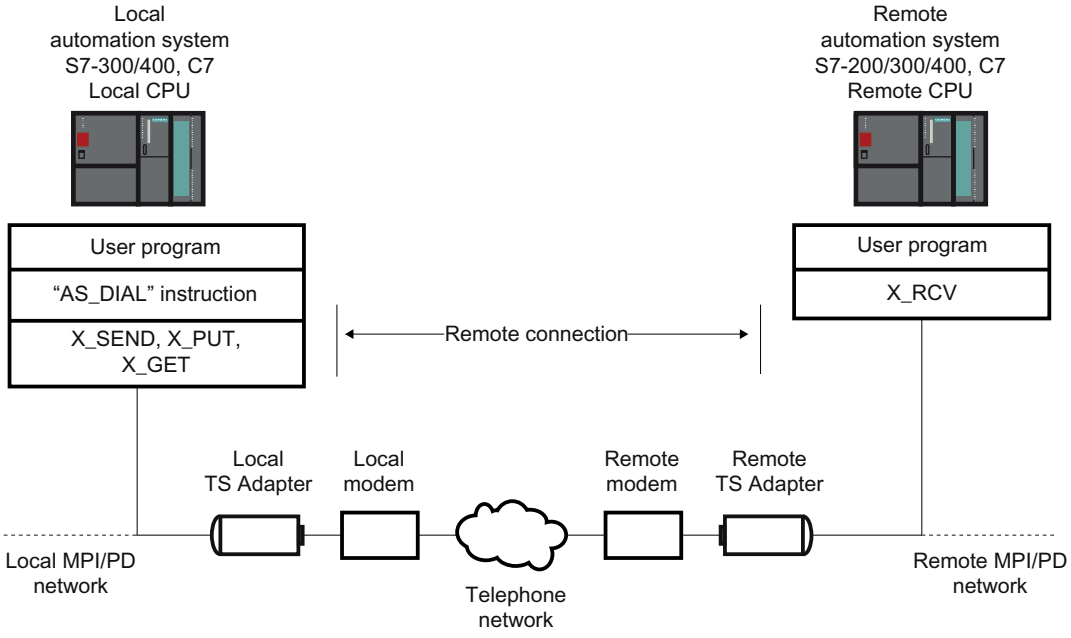

Figure 14-9 Data exchange over the AS-AS remote link

Hardware and software requirements for AS-AS remote link

Introduction

Certain hardware and software requirements must be fulfilled before a local automation system can establish a remote connection to a remote automation system. These requirements are detailed below.

Hardware requirements

The only hardware you need for transferring process data from a local to a remote automation system is that also needed for accessing the respective automation system from the programming device/personal computer.

To establish and terminate the remote connection, the user program of the TIA Portal of the local CPU calls a communication instruction. This communication instruction can be executed on an S7-300/400 CPU or a C7 CPU. The communication instruction requires S7 basic communication to be implemented on the CPU. The remote CPU must also support S7 basic communication.

A TS Adapter I, version V5.1 or later, or a TS Adapter II must be used.

Software requirements

The "AS_DIAL" communication instruction is included in the scope of delivery of TeleService. When installed, the instruction is integrated in the library of the TIA Portal in the task card of the Communication instructions folder under TeleService. In order to establish and terminate a remote connection to a remote automation system from a local automation system, the "AS_DIAL" communication instruction must be called in the user program of the TIA Portal on the local CPU.

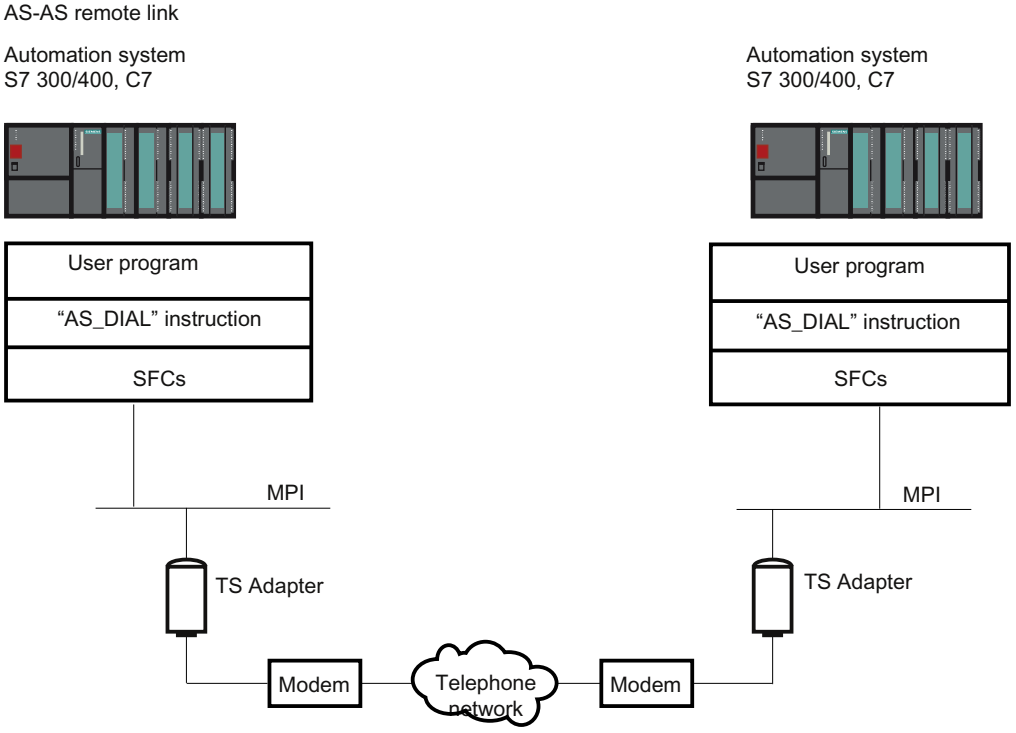

Figure 14-10 Hardware and software requirements for AS-AS remote link

14.7.5.4 Send SMS from a system

Requirements for sending an SMS

Introduction

Certain hardware and software requirements must be fulfilled before a system can send an SMS. These requirements are detailed below.

Hardware requirements

To send an SMS from a system, you will require a GSM wireless modem and a TS Adapter MPI.

A TS Adapter I, version V5.2 or later, or a TS Adapter II must be used.

Software requirements on the system side

The "SMS_SEND" communication instruction is included in the scope of delivery of TeleService. When installed, the instruction is integrated in the library of the TIA Portal in the task card of the Communication instructions folder under TeleService. If a system is to send an SMS, the user program of the system must call the "SMS_SEND" communication instruction.

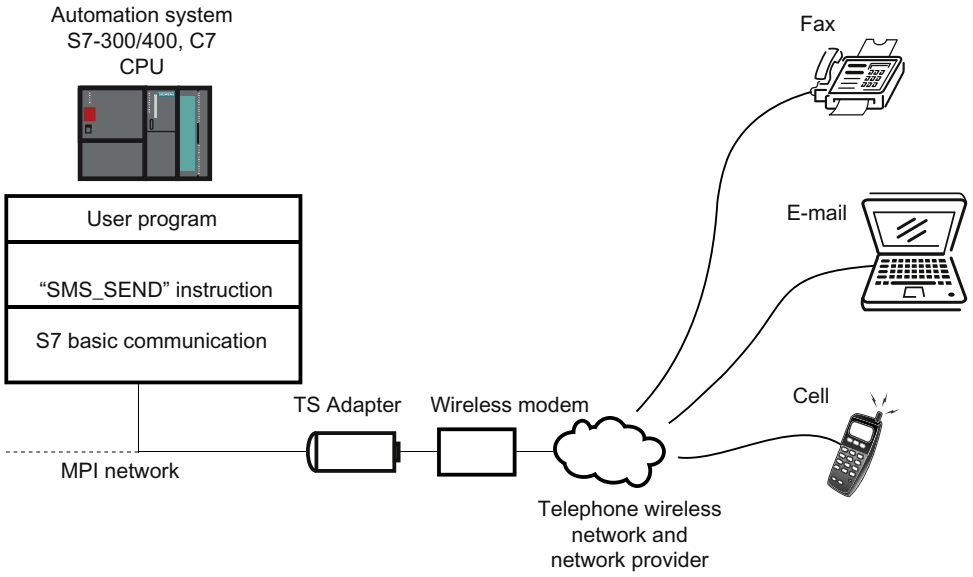

Figure 14-11 How the "SMS_SEND" communication instruction works

Note

You may be able to send an SMS not only to a cell phone but also to an email address or a fax device by using additional services offered by the cell phone service provider.

14.7.5.5 Send an email from a system

Requirements for sending e-mails

Introduction

The following hardware and software requirements must be fulfilled if a system is to send an email:

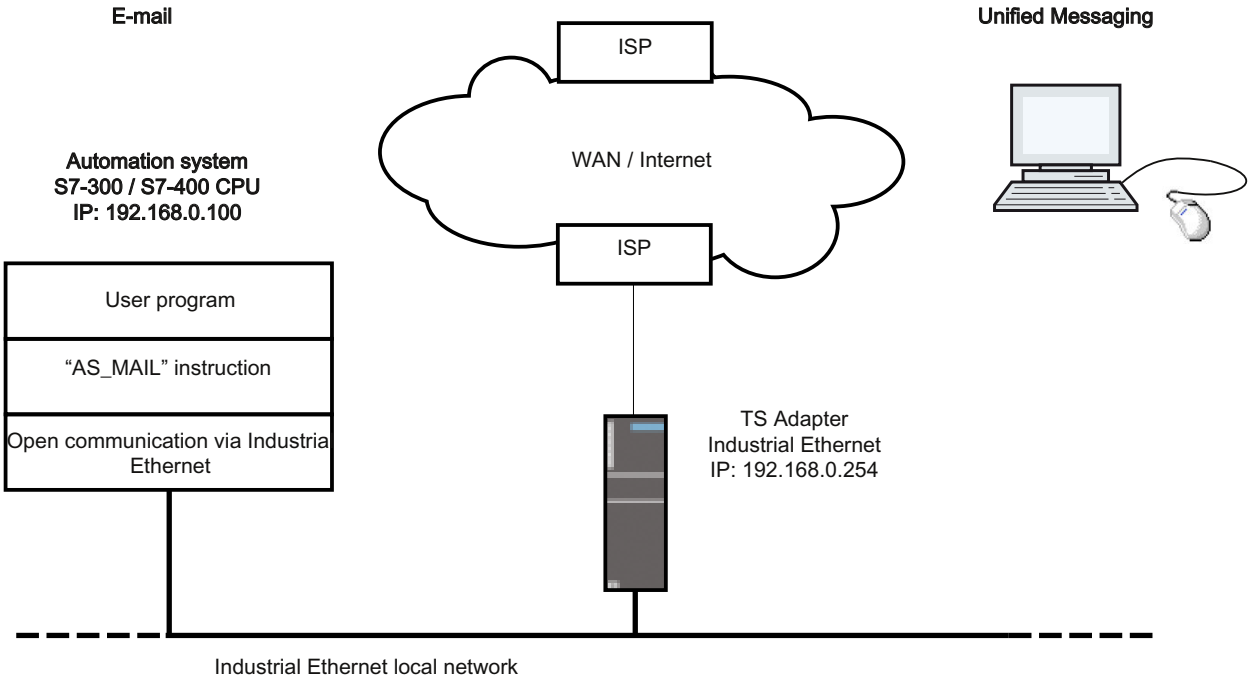
Hardware requirements

You need a TS Adapter IE to send an email from a system and one of the CPUs listed below:

- a CPU 31x2 PN/DP as of firmware version V2.5
- a CPU 41x-3 PN/DP
- a CPU of the S7-1200 series
- a CPU of the S7-1500 series

Software requirements on the system side

Various communication instructions are included in the scope of delivery of TeleService depending on the CPU. When installed, they are integrated in the library of the TIA Portal in the task card of the Communication instructions folder under TeleService.



If a system is to send an email, the user program of the system must call the corresponding CPU-dependent communication instruction.

The following communication instructions are available for sending an email:

- S7-300/400 CPUs: Uses the communication instruction "AS_MAIL": Transfer email
- S7-1200 CPU V2.x and V3.x: Uses the communication instruction "TM_MAIL": Transfer email
- S7-1200 CPU >V4.0: Uses the communication instruction "TMAIL_C": Transfer email
- S7-1500 CPUs: Uses the communication instruction "TMAIL_C": Transfer email

The respective communication instruction transfers an email from a CPU to a mail server by means of the Simple Mail Transfer Protocol (SMTP) with the "LOGIN" authentication method. The data is transferred unencrypted with this SMTP process.

The figure below shows an example with the "AS_MAIL" communication instruction:

The "Use gateway/router" property must also be set for the Ethernet interface in the configuration of the CPU on which the "AS_MAIL" communication instruction runs. (available in the device configuration under Ethernet addresses and there under IP protocol)The IP address of the Ethernet interface of the TS Adapter IE is to be specified as "Address".

Note

You can find further information in the task card in the "Communication instructions" folder under TeleService.

14.7.6 Notes on troubleshooting

14.7.6.1 General information on troubleshooting for modem problems

Introduction

The information below should help you establish and eliminate the causes of any modem problems.

1. Enable "Record log file" for data traffic between PG/PC and modem. The entries in this file can provide valuable information for determining the cause of errors.
2. Switch on the loudspeaker on your local modem. Select a volume loud enough to be clearly heard.
   You can then hear whether:
   - there is a dial tone at the connection
   - the modem called is busy
   - the modem called accepts the call.

Common modem problems

Modem connection problems are among the most common modem problems:

- Modem connection is not established
- Modem connection is interrupted

The topics below contain tables detailing possible causes and providing information on eliminating the error in question.

See also

Dial-up connection to the TS Adapter is not established (Page 6628)

Dial-up connection from the TS Adapter is not established (Page 6630)

Modem connection is interrupted (Page 6631)

Modem alarms (Page 6632)

Recording a log file for the modem (Page 6627)

14.7.6.2 Recording a log file for the modem

Introduction

It is advisable to record a log file as this makes it easier to find the causes of faults in a modem.

Procedure:

Proceed as follows:

1. Activate the properties dialog of the modem used via the "Phone and modem options" option in the Control Panel.
2. Check the settings of the "Log" option in the "Diagnostics" tab and, if necessary, change the log file settings so that the file is recorded.

Result:

Activity between the programming device/personal computer and the modem are entered in the log file. If there are problems establishing the connection, you can evaluate the data recorded in the log file to determine the cause of the error.

14.7.6.3 Dial-up connection to the TS Adapter is not established

Dial-up connection to TS Adapter is not established

The table below sets out possible causes and how to eliminate them if no remote connection to the TS Adapter can be established.

Possible cause	Check/Remedy
Cabling faulty	• Are all the connecting cables connected correctly? • Are the connectors loose?
Dial parameters for main telephone line and extension incorrectly set	• Do the properties and dial parameters of your modem match the phone connection to main phone line or extension? • Do not specify a dial-out code in the "Dial parameters" dialog if you operate your modem on a local loop (main telephone line). The fields for the dial-out code for local calls and long-distance calls must be empty.
Dialing mode incorrectly set	• Is the correct dialing mode (tone/pulse) set in the dialog for the dial parameters of your modem? • Use a connected telephone to check the connection on which you want to operate the modem. You should hear crackling noises on the telephone during pulse dialing and tones of varying pitches during tone dialing. Set the corresponding dialing mode in the modem dial parameters.

Possible cause	Check/Remedy
Dial disable active	• The dial disable function is a country-specific modem property which, depending on the modem, becomes effective after one or more unsuccessful attempts to establish a connection. • If your modem still does not respond after several attempts to dial, the dial disable function may be active. Characters are still sent to the modem after the dial command but the modem does not start the dialing process. The driver receives a general error message. • Refer to the modem documentation for information on how the dial disable function is implemented for your modem. • Create a log file (Page 6627) (modemlog.txt) in which the activities between the programming device/personal computer and modem are recorded. Then check whether the file contains an entry caused by dial disable (e.g. DELAYED).
Phone connection defective or busy	• Connect a phone and check whether a dial tone can be heard on this connection. • Any analog phone connected on the same connection must be hung up. You cannot establish an additional modem connection on this connection if there is an existing phone connection.
Serial parameters set incorrectly	• Are the correct values entered in the "Settings" tab for modem properties (8 data bits, no parity, 1 stop bit)? Is the correct COM interface set in the "General" tab for the modem properties?
Initialization string of the TS Adapter is not suitable for the modem.	• Familiarize yourself with the modem initialization string requirements and set the string accordingly. Procedure for configuring the TS Adapter IE (Page 6600)
Settings for error correction between the modem at the TS Adapter and the modem at the PC/programming device are not compatible.	• Adapt the modem settings. Useful information on configuring the TS Adapter MPI (Page 6595) Restoring the default parameter assignment of a TS Adapter MPI (Page 6597) Procedure for configuring the TS Adapter IE (Page 6596)

14.7.6.4 Dial-up connection from the TS Adapter is not established

No callback from TS Adapter

The table below sets out possible causes and how to eliminate them if there is no callback from the TS Adapter.

Possible cause	Check/Remedy
Errors in the location or call settings in the TS Adapter	Check the TS Adapter parameter assignment: • Are the dialing mode and dial-out code set correctly for your phone connection? • Does the modem at the TS Adapter support the characters configured for the dial-out code? • Is "Wait for dial tone before dialing" deactivated for an extension?
Initialization of modem insufficient	Check the string for modem initialization: • The modem may require a further initialization in order to establish a remote connection. • Properties of the modem initialization string for the TS Adapter MPI
Callback number is incorrect	Check the configuration of the callback number you assigned.

No call from TS Adapter MPI

The table below sets out possible causes and and how to remedy them if there is no call from the TS Adapter MPI.

Possible cause	Check/Remedy
Phone number is incorrect	Is the required number being transferred to the communication instruction "PG_DIAL" ?
TS Adapter MPI parameter assignment incorrect	Check the TS Adapter MPI parameter assignment: • Are the dialing mode and dial-out code set correctly for your phone connection? • Does the modem at the TS Adapter MPI support the characters configured for the dial-out code? • Is "Wait for dial tone before dialing" deactivated for an extension?

14.7.6.5 Modem connection is interrupted

Modem connection is interrupted

The table below sets out possible causes and and how to remedy them if the modem connection is interrupted.

Possible cause:	Check / Remedy:
Metering pulses in the line	Metering pulses will be generated if you have applied to the phone company for a metering clock. This may mean that the modem no longer recognizes the carrier signal and switches off. • Set a longer waiting or switch-off time at the modem. • Have the metering pulse deactivated by the phone company.
Shielding	• Are the connection cables used shielded sufficiently? • Make sure that the modem cables do not run next to power cables and that they are as far as possible from power supply units and monitors.
Protocol timeout	• Set fixed monitoring times.
Automatic connection termination	• Deactivate the option that terminates an existing connection automatically after a specified time without data transfer ("Terminate after idle of ...").
Data flow control deactivated	• Click on the "Extended" button in the "Settings" tab of the modem properties and activate the following options in the dialog displayed (if available and not yet set): – Data flow control – Hardware (RTS/CTS) – Data compression – Error control
Initialization string of the TS Adapter is not suitable for the modem	• Set the modem initialization string in accordance with the following requirements. See also: TS Adapter IE parameter assignment options (Page 6602)

See also

TS adapter MPI configuration options (Page 6595)

14.7.6.6 Checklist for troubleshooting the modem

Introduction

The following list should help you establish the potential cause of any problems with the modem. The help topics below set out how and in which dialogs you define the relevant settings.

Modem connection cannot be established:

- Check the cabling and the connections.
- Check whether the correct dialing mode (tone/pulse) is set.

- If your modem does not react after several attempts to dial, a dial disable function may be active. Familiarize yourself with dial disable on your modem.
- Are you operating your modem on a main telephone line or on an extension line? Configure the properties and dialing parameters of the modem accordingly.
- Enable the log file option in the advanced properties. The next attempt to establish a connection will then be recorded in a file in the Windows directory.
- Ensure that the ISDN TAs used work with the same B and D channel protocol.

The modem connection is terminated:

- Metering pulses can have a negative affect on a connection. Have the pulses deactivated by your telephone company.
- Set fixed monitoring times.
- Deactivate the option that terminates an existing connection automatically after a specified time without data transfer (idle).
- Make sure that you have activated RTS/CTS for data flow control.

14.7.6.7 Modem alarms

Information in the log file

The modem alarms are entered in a log file if you have activated the recording function.

The log file contains the following information:

Alarm:	Possible cause:	Remedy:
NO DIALTONE	A phone call may currently be being carried out on this line.	• Repeat the process once the phone call is over.
NO CARRIER	The device dialed is not ready, is not a modem or cannot establish a connection in the set operating mode.	• Check the numbers and the settings.
BUSY	The device dialed is busy.	• Try again later.
DELAYED: ...	Dial disable	• Refer to the modem documentation for information on how the dial disable function is implemented for your modem and if necessary remove it.

14.7.6.8 Possible error messages with VPN connections

VPN connection to TS Adapter IE Advanced is not established

The table below sets out possible errors and how to eliminate them if no VPN connection to the TS Adapter IE Advanced can be established.

Possible errors	Check/Remedy
The error message "The webpage cannot be displayed" appears when the Web interface is accessed.	• Note: This problem occurs when the Windows certificate store contains a CA certificate with the same name as the CA certificate which has just been generated. • If a CA certificate for this TS Adapter is already installed in the Windows certificate store and you have generated a new CA certificate on the TS Adapter, you need to remove the old CA certificate from the Windows certificate store and install the newly generated CA certificate. • See also: Installing CA certificates for VPN connections (Page 6609) • See also: Deleting CA certificates for VPN connections (Page 6612)
Error message: "Unexpected error in application".	• Check whether other users have been saved in the TS Adapter IE Advanced user database. • The user "Administrator" cannot establish a remote connection.
Error message: "No corresponding CA certificate was found in the Windows certificate store".	• Use the automatic certificate download. Enter the fingerprint in the corresponding field in the connection dialog. • See also: Establishing VPN connections (Page 6613) Or • Export the CA certificate from the Web interface of the TS Adapter IE Advanced and install it manually in the Windows certificate store. • See also: Installing CA certificates for VPN connections (Page 6609)
Error message: "The remote address specified does not correspond to the remote address of the TS Adapter".	• You must use the remote address which you specified in the TS Adapter IE Advanced to establish the connection. • You cannot use the IP address if you have entered the DNS name (and vice versa).
Error message: "The signature of the certificate could not be verified".	• If you have generated a new CA certificate on the TS Adapter IE Advanced, you need to delete the old CA certificate from the Windows certificate store and install the new one. • See also: Deleting CA certificates for VPN connections (Page 6612) • See also: Installing CA certificates for VPN connections (Page 6609)
Error message: "Protocol error"	• Check that the IP address of the service PC is set in the configuration of the TS Adapter IE Advanced (Parameters > Plant network)
Error message: "Connection setup error."	• Check to make sure that the LAN IP-address of the TS Adapter IE Advanced and the IP address of your network cards are in the same subnet. If this is the case, deactivate this network card before you establish the remote connection.
An e-mail cannot be sent.	• Check whether there is a network/Internet connection at the WAN port. • Check whether the mail server is accessible. • Check whether the outgoing connections in the TS Adapter IE Advanced are valid. • Check whether the SMTP port in the firewall is open for outgoing connections.

14.8 Simulating devices with S7-PLCSIM

14.8.1 Simulation of devices

Introduction

You can use the TIA Portal to run and test the hardware and software of the project in a simulated environment. The simulation is performed directly on the programming device or PC. No additional hardware is required.

The simulation software provides a graphical user interface for monitoring and changing the configuration. It differs according to the currently selected device.

Integration in the TIA Portal

The simulation software is fully integrated in the TIA Portal but is only supported by certain devices. Therefore, the button for calling the simulation software is only active if the selected device supports simulation.

The simulation software for some devices requires its own virtual interface to communicate with the simulated devices. The virtual interface can be found in the project tree under the "Online access" entry next to the physical interfaces of the programming device/PC.

Once you have opened the software, additional help on the simulation software is available via a separate link.

See also

Starting the simulation (Page 6634)

14.8.2 Starting the simulation

Some devices can be simulated with additional software. You therefore do not have to have the actual devices to perform comprehensive testing of your project.

Procedure

To start the simulation software, follow these steps:

1. Select the device you want to simulate, for example, in the project tree.
2. Select the "Simulation > Start" command in the "Online" menu.
   This calls the simulation software.

See also

Simulation of devices (Page 6634)

Using Team Engineering 15

15.1 Shared commissioning of projects

15.1.1 Basics for shared commissioning

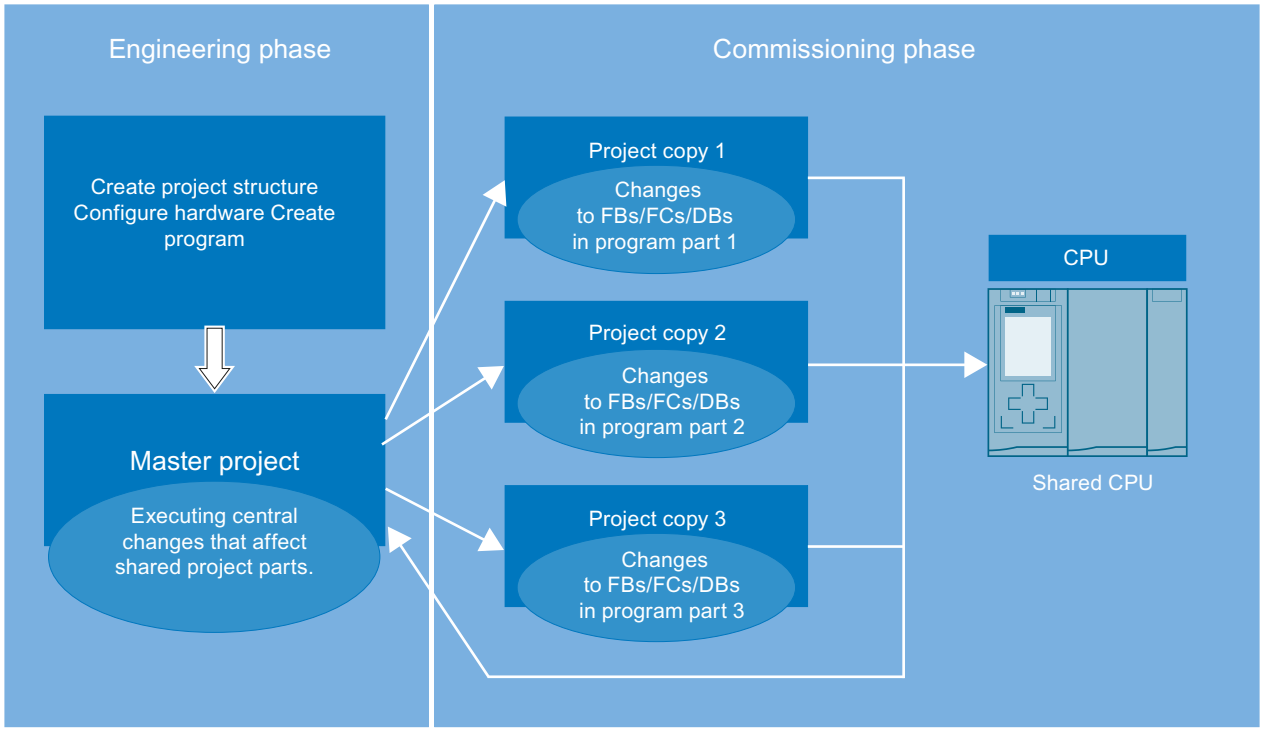
Introduction

As part of Team Engineering , you have the option to perform shared commissioning of projects. Several editors can access one CPU at the same time with up to five Engineering Systems (ES) in this process.

A special advantage is that parts of a master project can be edited independently and offline at the same time during the commissioning phase. The changes of the other editors are displayed in the dialog "Software synchronization" during loading and synchronized automatically, if possible.

Depending on the firmware version of the CPU in use, certain online functions can also be executed at the same time from several Engineering Systems on the shared CPU, for example:

- Monitoring blocks on the CPU
- Modifying and forcing blocks on the CPU
- Trace functions



The following online functions cannot be executed at the same time:

- Loading: Only one ES can load to the CPU.

You can also find additional information on the topic of Team Engineering at Service and support in Siemens Industry online support (http://support.automation.siemens.com/WW/view/en/82142829).

Creating a master project

A "master project" structured according to the specified rules (Page 6642), which already contains the complete configured hardware configuration with all required tags and blocks, is used as the basis for the shared commissioning. This project is loaded in the jointly used CPU and then distributed as "master project" by means of project copies to up to five participating Engineering Systems.

Working with project copies

Each Engineering System only processes the parts it was assigned within the specific project copy. This is especially important to avoid conflicts during loading and unintentional overwriting of blocks that were already modified by other Engineering Systems.

Each ES loads its parts to the shared CPU after editing. The TIA Portal helps you during download to the CPU. The changes made since the last download are displayed in the dialog "Software synchronization before loading to a device" (hereafter referred to as "synchronization dialog"), by means of an online-offline comparison. You are provided recommendations during download to the CPU about how you can synchronize the offline data you have edited with the existing online data.

If there are "competing changes", you may have to synchronize them manually.

Competing changes are:

- when different editors edit the same block in different project copies at the same time.
- when PLC tags (I, Q, M, T, C) are added, changed or deleted in the project copies.

- when blocks that have relations to the hardware configuration are edited in the project copies.
- when F blocks are edited in the project copies.

Each editor loads their changes only after all conflicts have been removed.

The procedure for editing and loading of project copies can be repeated as often as necessary by the individual Engineering Systems until the shared commissioning is complete.

Integrating project copies into the master project once again

The individual project copies must once again be integrated into the master project at the end of commissioning at the same time. This way you also back up the data that only exist in the offline projects and have not been downloaded to the CPU. These include, for example, the project languages and text lists created in the project copies.

To do this, open the master project and one project copy as reference object. You determine the differences between the two projects by performing an offline/offline comparison using the comparison editor. Copy the edited objects from the respective project copy to the master project. Repeat this step for all project copies.

When the shared commissioning is completed, you have an executable master project with all created project data.

The integration of the project data into the master project is required even if you determine during the commissioning phase that the shared central elements need to be expanded or corrected, for example, the PLC tag table needs to be expanded, or a new hardware component needs to be added.

Notes on compatibility

The following compatibility rules apply to shared commissioning:

- If an Engineering System with TIA Portal V13 or later is online on the CPU and performs a download, a second ES cannot establish an online connection, regardless of the version.
- If an Engineering System with TIA Portal < V13 is online on the CPU, a second ES cannot establish an online connection, regardless of the version.

Team Engineering

As part of Team Engineering , you have the option to perform shared commissioning of projects. Several editors can access one CPU in parallel and at the same time with multiple Engineering Systems (ES) in this process.

Shared commissioning

In shared commissioning, multiple Engineering Systems work together and in parallel on one CPU as part of team engineering.

Master project

The master project is a basic project for shared commissioning. It is a project structured according to the specified rules which already contains the fully configured hardware configuration with all required tags and blocks. This project is loaded into the jointly used CPU and then distributed as "master project" by means of project copies to the participating Engineering Systems. Each Engineering System only processes the parts it was assigned within the specific project copy. The project copies are then integrated into the master project once again.

Project copy

Project copies are created from structured master projects when working with team engineering and distributed to the participating Engineering Systems for editing. Each Engineering System only processes the parts it was assigned within the specific project copy as part of shared commissioning. The individual project copies are once again integrated into the master project at the end of shared commissioning.

See also

Requirements for shared commissioning (Page 6638)

Procedure for shared commissioning (Page 6639)

15.1.2 Requirements for shared commissioning

Software and hardware requirements

For shared commissioning of projects, the minimum software and hardware requirements for the installation of TIA Portal V13 or later must be met.

The following requirements also apply:

Software:

- You have installed TIA Portal V13 or later and the "SIMATIC STEP 7 Professional" software package on the involved Engineering Systems.
- The same software version must be installed on all Engineering Systems.
- The master project must have been created with a project of V13 or later, which has been updated to the version of the TIA Portal used in the engineering system.
- After switching from a lower to a higher TIA Portal version, all involved engineering systems must use this version.
- After switching from a lower to a higher TIA Portal version, the master project must centrally adapted and new project copies must be transferred to the engineering systems involved.

Hardware:

- You have access to a fully configured CPU S7-1500 as of firmware version V1.5.
- The involved Engineering Systems can establish an online connection to this CPU.

Requirements for shared, parallel working on the project

The following requirements are in effect for shared commissioning of projects:

- You have created a project with complete hardware configuration and fully programmed user program that can be commissioned.
- The project was downloaded to the CPU and defined as "master project".
- Multiple Engineering Systems have access to this CPU and can establish an online connection to this CPU.
- You are familiar with the defined rules and procedures for working together on one CPU.

Note on compatibility mode

The functions for shared commissioning are not available in compatibility mode.

See also

Basics for shared commissioning (Page 6635)

Procedure for shared commissioning (Page 6639)

Rules for shared commissioning (Page 6642)

15.1.3 Procedure for shared commissioning

Introduction

If you are performing shared commissioning of a project as part of team engineering, it is very important that all editors of the project observe a defined procedure.

Only when the specified procedure is observed are changes and corrections in the project automatically synchronized and applied, and changes of individual editors not unintentionally overwritten during loading or even lost in case of competing changes.

Procedure for creating the master project

The master project is created in the following steps:

1. Create a master project that includes the entire project structure.
2. Fully configure the hardware for the master project.
3. Define a language as project language, which must also be used exclusively by all participating engineering systems.
4. Create all tags and blocks that are required in the master project.

5. Create your own folders and groups for the blocks to be edited by the individual engineering systems.
6. Create a fully programmed and executable user program.
7. Download the master project to the shared CPU.
8. Save the master project following every download.

For this, also observe the Rules for shared commissioning (Page 6642).

Procedure for shared commissioning

Shared commissioning takes place with the following steps:

1. Download the master project to the shared CPU.
2. Create copies of the master project and distribute them to the editors involved in the project on the associated engineering systems.
3. Inform all editors who is to edit the specific parts of the project copies and who may download to the CPU.
4. Have the project copies edited in the individual engineering systems.
5. After editing, the individual engineering systems download the changes one after the other to the CPU.
6. All changes are automatically detected during loading by means of an online-offline comparison. The displayed synchronization dialog offer you recommendations for synchronizing the modified data when possible. You may first have to download blocks that were edited by other editors to your ES before you can download your changes to the CPU. This may be needed to update the corrections of the other editors that have already been downloaded to the CPU in your project copy.
   The following synchronization options are available:
   - Download block: There are edited blocks on the CPU that must be updated in your project copy.
   - Download block: There are new blocks on the CPU that must be downloaded to your project copy.
   - Blocks with competing changes: System-supported synchronization is not possible in this case; the conflict must be resolved manually.
7. Manually resolve any conflicts that may occur due to competing changes or changes to central objects.
8. Download your project copy to the CPU when all conflicts have been removed.
9. Save your project copy following every download.
10. Repeat editing of project copies and download to the CPU as often as necessary until shared commissioning is complete.
11. Integrate the completely edited project copies into the master project once again in order to also back up the project data that only exist offline.

You should also observe the Rules for shared commissioning (Page 6642).

Procedure for manual synchronization of competing changes

Manual synchronization of competing changes is performed in the following steps:

1. Start the comparison editor to manually resolve a conflict displayed in the synchronization dialog during download to the CPU. Select the shared CPU in the project tree and select the "Compare > Offline/Online" command in the shortcut menu. You can define certain actions depending on the status of the objects. Note, however, that you can only perform actions in one direction during synchronizing.
2. First, select the action "Upload from device" for all blocks that were changed by other editors on the CPU and which you want to apply.
3. If necessary, perform a detailed comparison of the blocks to identify differences between your offline blocks and the online blocks loaded on the CPU.
4. Manually correct the competing changes to the blocks.
5. Then download the affected blocks to the CPU using the "Continue without synchronization" command.
6. Save your project or project copy following every download.

For this, also observe the Rules for shared commissioning (Page 6642).

Note

To prevent online changes occurring again while an engineering system is being manually synchronized, no downloading to the shared CPU should be performed by another participating engineering system during the manual synchronizing.

Procedure for integrating project copies into the master project

You integrate project copies into the master project with the following steps:

1. Open the master project and the project copy to be integrated as a reference object.
2. Copy the program parts you have edited from the respective project copy to the master project and confirm overwriting the existing objects. You can also use the comparison editor to apply your program parts to the master project.
3. Save the master project and download it to the shared CPU with the "Continue without synchronization" command.
4. Save the master project following every download.

For this, also observe the Rules for shared commissioning (Page 6642).

Procedure for modifying central objects within the master project

Modification of central objects that have an effect on all program parts is performed with the following steps:

1. Stop further processing of the project copies.
2. Integrate all existing project copies one after the other into the master project as described above.
3. Download the master project to the shared CPU with the "Continue without synchronization" command.
4. Make the required modification on the shared objects such as in the hardware configuration, for example, or in the PLC tag table. The procedure is the same for modification of other central objects such as technology objects, F blocks, OBs, etc.
5. Download the master project into the CPU once again when modification is complete.
6. Save the master project following every download.
7. Distribute the updated project copies to the respective engineering systems for further processing.

For this, also observe the Rules for shared commissioning (Page 6642).

See also

Basics for shared commissioning (Page 6635)

Requirements for shared commissioning (Page 6638)

Rules for shared commissioning (Page 6642)

15.1.4 Rules for shared commissioning

Introduction

If you are performing shared commissioning of a project as part of team engineering, it is very important that all editors of the project observe predefined rules for successful cooperation.

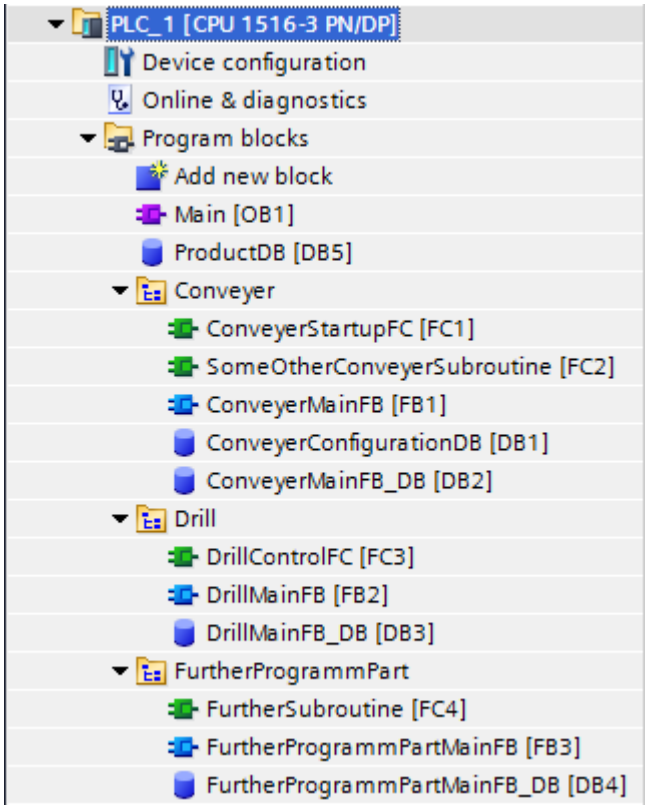
Rules for the master project

The following rules are to be observed:

- Create a master project that is suitable for shared editing.
- Divide the user program into program parts that are independent of each other.
- Use "Groups" to visually separate the program parts from each other.
- Use a main OB and a central FC for each program part which calls the functions of the part program.

- If possible, create a separate PLC tag table for each part.
- In the master project, specify a project language which cannot be changed in the project copies.
- If you want to exchange data between the program parts, use the FC and FB interface parameters (IN, OUT, INOUT) or global data blocks.
- Use global data blocks to save the data for the individual program parts, no bit memories.
- Do not assign different names for blocks with identical addresses.
- Do not assign identical names for blocks with different addresses.

Example of the program structure in the master project



Here is an example of a team-capable, structured master project that is suitable for parallel editing during shared commissioning.

The program parts to be edited by the individual Engineering Systems are:

- Program part 1: "Conveyer"
- Program part 2: "Drill"
- Program part 3: "FurtherProgramPart"

Each program part contains a "main FB", which calls the specific lower-lever functions for this program part.

Example: In the "Conveyer" program part, the "ConveyerMainFB" calls the "ConveyerStartupFC" function.

In team engineering, this subdivision within the project structure allows the parallel editing of individual program parts and the automatic synchronization of changes during the shared commissioning phase.

Rules for shared working on one CPU

Observe the following rules for shared working:

- Editor only edits the blocks they have been assigned in the project copy in the assigned groups.
- Only OBs, FBs, DBs, FCs and UDTs may be changed in the project copies, which means the following program elements must **not** be edited in the project copies:
  - Hardware configurations
  - PLC tag table
  - Technology objects
  - Text lists and project language
  - F blocks
- Global data blocks should be used in programming instead of bit memories.
- IEC timers and counters should be used during programming instead of SIMATIC timers and counters.
- The project language specified in the master project may not be changed in the project copies.

Rules for editing shared, central objects

Observe the following rules for shared central objects:

- Changes to shared central objects always have to be made by means of the master project. These objects include:
  - Hardware configurations
  - PLC tag table
  - Technology objects
  - Text lists and project language
  - F blocks
- Before the shared central objects can be modified in the master project, the various working versions within the project copies must first be integrated into the master project once again.
- The modification can then be made within the master project, and the master project can then be downloaded to the shared CPU.
- Once modification is complete, new project copies can be created and distributed to the Engineering Systems for further processing.

Rules for working with organization blocks

Observe the following rules for editing OBs:

- OBs can only be created in the master project. If you create new OBs in a project copy, they **cannot** be synchronized.
- OBs that already exist in the master project and that have already been downloaded to the CPU, can be modified in the respective project copies. These OBs are automatically synchronized during downloading.

Rules for downloading to the CPU

Observe the following rules for downloading:

- Editors can download the project copies one after the other to the CPU; only one Engineering System can download at any given time.
- The online connection of the involved Engineering Systems can be maintained when downloading the blocks (hardware may only be downloaded in the master project).
- Perform the synchronization that is offered automatically in the synchronization dialog during download. This ensures that changes from other editors are not unintentionally overwritten.
- Correct the name conflicts that are shown in the synchronization dialog, which you rename in your offline block before downloading to the CPU. A name conflict is indicated if you want to download to the CPU a block that already exists with identical name on the CPU.

- So-called "competing changes" must be corrected manually. Competing changes come about when two editors work on the same block on two Engineering Systems at the same time. The first editor can still download his or her changes to the CPU without any problems. However, if the second editor wants to download the same block with the changes the editor has made, the synchronization dialog displays a conflict that cannot be removed automatically. The previous changes made to this block would be undone by overwriting during download. The editors have to decide in this case which change is to be applied and which one is to be discarded. Alternatively, you can manually merge the changes with the help of the detailed comparison of the blocks in the comparison editor.
  Such changes should always be avoided by implementing a good project structure and corresponding agreements between the editors.
- Changes to central objects are displayed in the synchronization dialog but cannot be synchronized automatically. Changes to central objects and to the hardware configuration always have to be made by means of the master project.
- Save your project or project copy following every download.

Note

Creating and subsequent deleting of objects in the project copies

Please note that a software synchronization is also required before downloading when you create a new object in a project copy and then delete this again immediately afterwards.

The creation of an object causes a change in the internal data management which cannot be undone by the subsequent deleting of the object. As a result it is necessary to perform a synchronization before the next loading if the newly created object was deleted immediately thereafter and no change in the existing object is visible within the project copy.

Rules for online functions

The following rules are to be observed when using online functions:

Loading:

- Only one Engineering System can download data to the CPU at any given time.
- Other Engineering Systems can use additional online functions during the download, such as monitoring and controlling.

Monitoring and controlling:

- Up to five Engineering Systems can be monitored and controlled simultaneously on the CPU blocks.
- A specific code block can only be monitored and controlled by one Engineering System at a time.
- However, additional Engineering Systems can simultaneously monitor and control other code blocks.

NOTICE
Danger due to modifying an identical operand in parallel with different modify values in more than one watch table When working with more than one watch table, avoid modifying identical operands permanently multiple times with different modify values. If an identical operand is modified permanently with different modify values at the same time in different watch tables, all watch tables will display the last modified value, because the modify value assigned last will be used in this case.

Force

- Forcing can only be implemented on the CPU from one Engineering System at a time.
- The Engineering Systems that starts the forcing has taken over the force job exclusively. Although the other Engineering Systems receive the information that a force job is running, they cannot access this job to make changes. Use the command "Update forced operands" to update all operands and values currently being forced on the CPU in the open force table. All forced operands in the open force table are updated with the relevant values. A red "F" is displayed in the first column indicating which operands are being forced.
- As soon as the Engineering System to which the force job belongs ends the online connection, the force job can be applied by another ES that establishes an online connection to the CPU and has executed the "Update forced operands" command. This enables the "Force all" and "Stop forcing" buttons and you can select these functions.

Trace functions:

- Up to four Engineering Systems can perform trace functions simultaneously.
- The Engineering Systems that starts the tracing has taken over the trace job exclusively. Although the other Engineering Systems can see this job in the trace editor, they cannot access it.
- As soon as the Engineering System to which the trace job belongs closes the trace editor, the trace job can be taken over by another ES that re-opens the trace editor.

15.2.1 Basics of Inter Project Engineering (IPE)

Introduction to Inter Project Engineering (IPE)

The functionality of Inter Project Engineering, hereinafter referred to as IPE, is used to exchange the controller data in a source project between different projects with the help of a device proxy.

You can then transfer this data to other projects, for visualization in HMI, for example, and use it there for further configuration.

Inter Project Engineering gives you a simple way of providing controller data from a PLC programming across multiple projects for an HMI configuration.

Using the object "Device Proxy Data", you exchange controller data across multiple projects consistently and easily without redundant configuration overheads.

This makes it possible for HMI project engineers to work on a project without the hardware configuration having to be present in their project. This means they can work on the PLC project and on the HMI project at the same time.

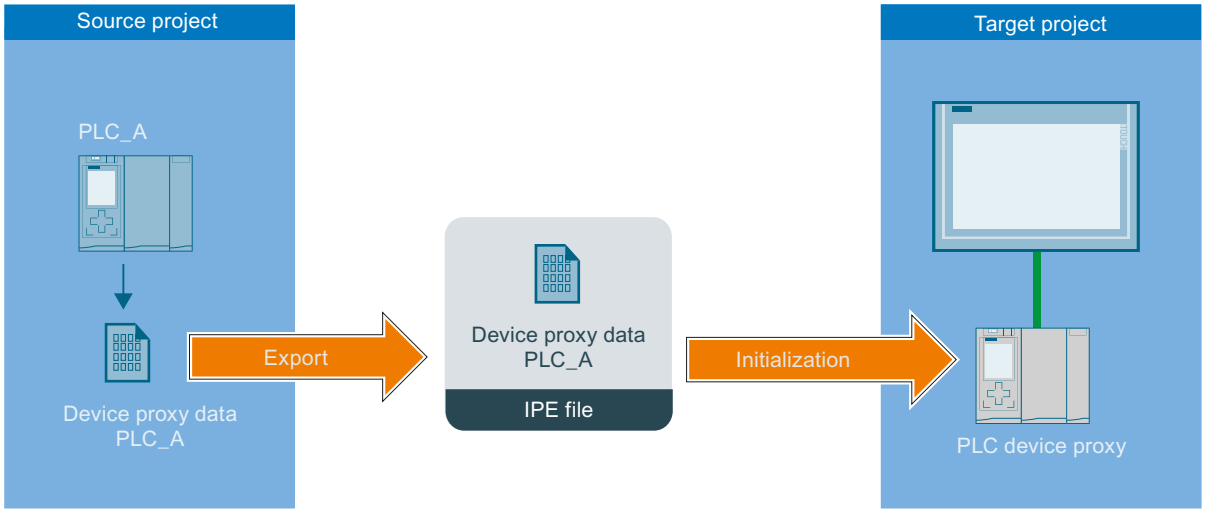
You can exchange the following controller data between projects via the device proxy:

- Program blocks
- Technological objects
- PLC tags
- PLC alarms

The following data is automatically included in the exchange:

- Controller interfaces
- Configured communication processors and communication modules

This automatic data exchange ensures that the interfaces and the configured communication processors and modules are transferred along with the data you selected. This data is required to allow you to continue working consistently and without problems in your target project.



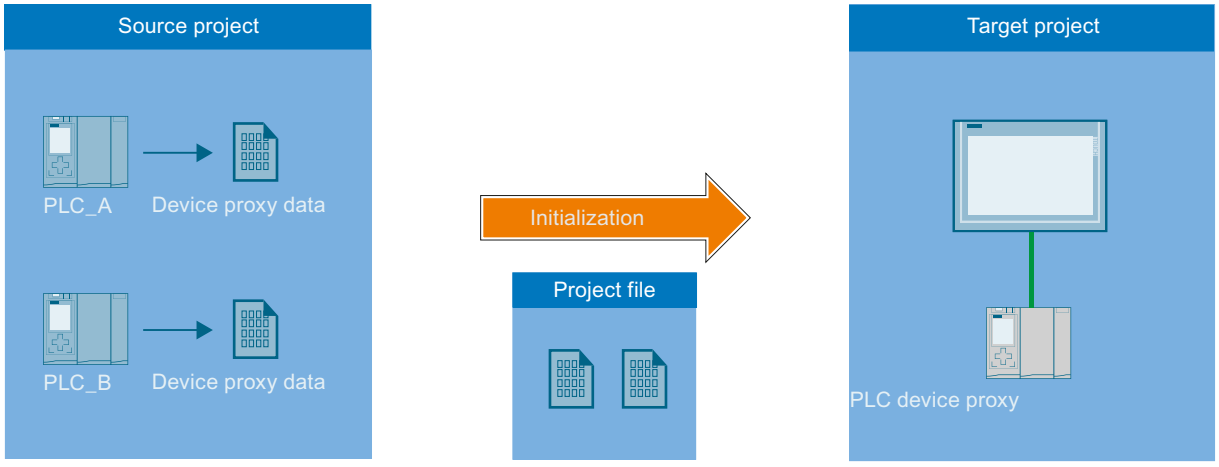
Cross-project data exchange

The following options are available for cross-project data exchange with Inter Project Engineering:

- Exchanging controller data via IPE file
- Exchanging controller data via project file

Exchanging controller data via IPE file

The figure below shows cross-project data exchange via an IPE file.



The PLC controller data from the source project is transferred to the PLC in the target project via the object "Device Proxy Data".

PLC data that is exchanged via an IPE file must originate from TIA Portal projects of V13 or higher.

Exchanging controller data via a project file

The figure below shows cross-project data exchange via a project file.

The PLC controller data from the source project is transferred to the PLC in the target project via a project file.

You can easily transfer and continue to use controller data from older TIA Portal projects as well as STEP 7 Classic projects that are not integrated in TIA Portal in your current TIA Portal projects.

Inter Project Engineering (IPE)

The functionality of Inter Project Engineering, also referred to as "IPE", is used to exchange the controller data in a source project between different projects with the help of the "Device proxy data" object.

IPE

The functionality of Inter Project Engineering, also referred to as "IPE", is used to exchange the controller data in a source project between different projects with the help of the "Device proxy data" object.

IPE file

The IPE file includes CPU controller data from a source project which is transferred with the "Device proxy data" object to the CPU in the target project.

Project file

The project file transfers CPU controller data from a source project to the CPU in the target project. You can conveniently transfer and continue to use controller data from older TIA Portal projects as well as STEP 7 Classic projects that are not integrated in TIA Portal in your current TIA Portal projects.

Device proxy data

The "Device proxy data" object supports consistent data exchange of CPU controller data across projects between a source project and a target project without redundant configuration.

Data exchange across projects with IPE

The Inter Project Engineering (IPE) functionality gives you the following options for consistent data exchange across projects:

- Exchanging PLC data via an IPE file
- Exchanging controller data via a project file

Both files transfer CPU controller data from a source project to a CPU in the target project.

Requirements for Inter Project Engineering (IPE) (Page 6651)

Overview for working with Inter Project Engineering (IPE) (Page 6651)

15.2.2 Requirements for Inter Project Engineering (IPE)

Software and hardware requirements

To use the functionality of Inter Project Engineering, the minimum software and hardware requirements for the installation of TIA Portal V13 or higher must be met.

The following requirements also apply:

- You have installed TIA Portal V13 or higher and the "SIMATIC STEP 7 Professional" software package.
- You are using a CPU of the S7-1200/1500 or S7-300/400 series.
- The same software version must be installed on all involved controllers.

Requirements for IPE

The requirements for accepting controller data from projects are as follows:

- You have created a project with hardware configuration and PLC data that can be transferred to another project.
- You have made sure that the project is consistent before you transfer the controller data by means of the "Device proxy data" object.
- You are familiar with the defined procedures for Inter Project Engineering.

Notes on compatibility mode

The functions for Inter Project Engineering are not available in compatibility mode.

Basics of Inter Project Engineering (IPE) (Page 6648)

Overview for working with Inter Project Engineering (IPE) (Page 6651)

15.2.3 Overview for working with Inter Project Engineering (IPE)

Exchanging controller data across projects

You can use the functionality of Inter Project Engineering to exchange existing controller data between different projects with the help of a "Device proxy" and to continue using this data in another project. The "Device proxy" provides you with a consistent and convenient way of exchanging data between projects without redundant configuration work.

Procedure for exchanging controller data via an IPE file

To exchange data via an IPE file, follow these steps:

1. Using TIA Portal, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.
4. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.
   Result: The "Device Proxy Data" object has been created.
5. Select the required device proxy data in the project tree and double-click the object to open it in the editor.
6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for export of the controller data.
   In the "Define content" area of the editor select which of the existing controller data you wish to export as IPE file and click "Export device proxy data".
7. In the subsequent dialog, enter the name and storage location for the IPE file to be created and click "Save". You will be notified as soon as the export has been completed successfully.
   Result: The selected controller data has been exported as an IPE file.
8. In your target project, create a device proxy to be able to import the controller data contained in the IPE file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
9. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
10. Select the previously created IPE file to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.
    Result: The controller data from the source project contained in the IPE file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

Procedure for exchanging controller data via a project file

When exchanging controller data via a project file, device proxy data can either be predefined in the source project or it can be defined and selected from the target project.

Follow these steps to exchange data via a project file:

1. Using TIA Portal V13 or higher, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.

4. Open the TIA Portal project from which you want to import the controller data into the target project.
5. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.
   Result: The "Device Proxy Data" object has been created.
6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for the device proxy data.
7. In the "Define content" area of the editor select which of the existing controller data you want to provide by means of the device proxy data.
8. Click "Save" to save the changes in the project.
   Result: You have successfully saved the selected controller data in your device proxy data.
9. In your target project, create a device proxy to import the controller data contained in the project file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
10. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
11. Select the previously created project file with the prepared device proxy data to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.
    Result: The controller data from the source project contained in the project file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

Procedure for updating already transferred controller data

System requirements for the update:

The following requirements must be met for updating already transferred controller data with the help of the already created "Device Proxy Data" object:

- You are using the same project for the update as for the previous transfer of the controller data.
- You are using the already created "Device Proxy Data" for transfer of the controller data.
- You have not made any changes to the hardware configuration or the communication interfaces in the meantime. You can add new hardware components.

Updating procedure:

1. Open the TIA Portal project from which you want to update the controller data in the target project.
2. Double-click the existing "Device Proxy Data" object and select under content which controller data you want to make available for the update.
3. Save the project or export the IPE file once again.
4. Open the required target project in the TIA Portal.

5. Click the existing device proxy in the target project and select the "Update device proxy" command from the shortcut menu.
6. Select the source which is to be used for the update, and confirm the selection.
7. In the following dialog, select under "Device" the CPU that was previously used as source, from which the controller data is to be re-imported.
8. Under "Defined device proxy data", select the required object and exit the dialog with "OK".
9. The update is then started and the selected device proxy data is transferred from the source project to the device proxy in the target project.

After the successful updating of the controller data, you can continue with the configuration in your target object and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

Requirements for Inter Project Engineering (IPE) (Page 6651)

15.2.4 Creating "Device proxy data" in the source project

Introduction

In order to exchange controller data across projects you require the "Device proxy data" object that can transfer the controller data of the associated CPU as an IPE file in the source project.

Creating a "Device proxy data" object in the source project

Proceed as follows to create a new "Device proxy data" object:

1. Open the "Device proxy data" folder below the CPU to which you want to create a "Device proxy data".
2. Click the command "Add new device proxy data".

Result

The "Device proxy data" object has been created and is displayed in the project navigation below the associated CPU.

The created "Device proxy data" contains the controller data of the associated CPU.

15.2.5 Creating an IPE file by means of the "Device proxy data"

Opening the "Device proxy data" and defining the content for an IPE file

Proceed as follows to create an IPE file by means of a "Device proxy data":

1. Open the required "Device Proxy Data" with a double-click in the "Device Proxy Data" folder in the project tree below the CPU.
2. Enter the required settings for the "Device proxy data" object in the editor under "General" or apply the default setting. You can change the name and enter a comment for export of the controller data.
3. In the "Define content" area of the editor select which of the existing controller data of the CU you wish to export as an IPE file and click "Export device proxy data".
4. In the subsequent dialog, enter the name and storage location for the IPE file to be created and click "Save". You will be notified as soon as the export has been completed successfully.

Result

The selected controller data have been exported as an IPE file.

15.2.6 Using controller data from other projects with IPE

15.2.6.1 Using controller data from other projects in an HMI device

Basics on controller data

Introduction

In the source project of the PLC, you can select which controller data is to be stored as device-proxy data.

To this end, you create a device proxy data from a configured PLC.

Which controller data can be exchanged?

The following controller data can be exchanged via IPE:

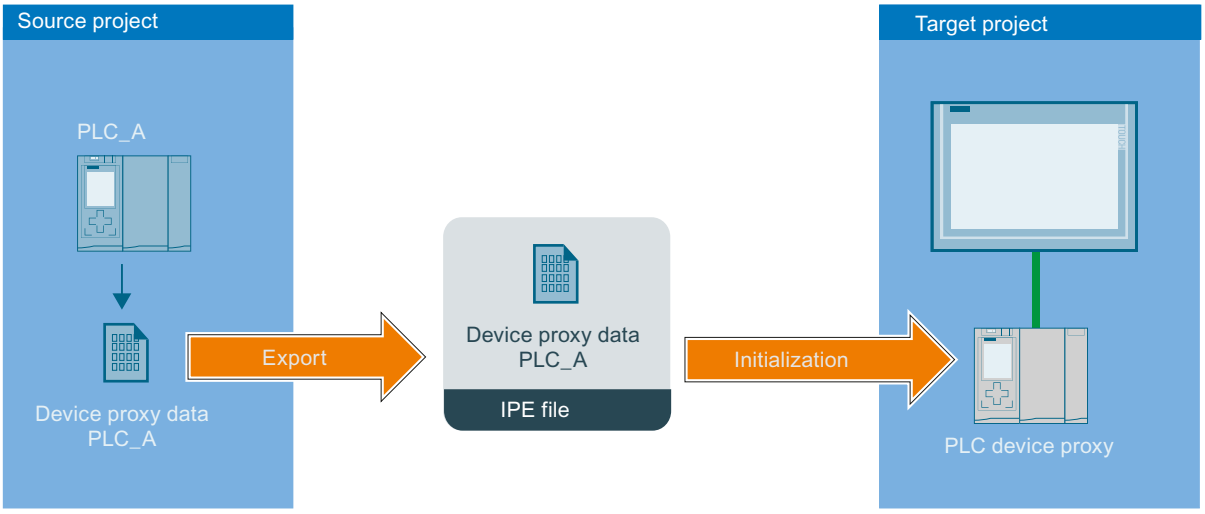
- Data blocks
- Technology objects
- PLC tags
- PLC supervisions and PLC alarms

The following information is exchanged automatically:

- Interfaces of the PLC
- Configured communication processors and communication modules at the PLC

Initializing a device proxy via an IPE file

Initializing device proxy via an IPE file



How does initialization of a device proxy via an IPE file work?

You can exchange controller data between two or more projects using IPE files.

Due to their small data volume, you can send IPE files by e-mail, for example.

You can create multiple IPE files with different device proxy data for each PLC.

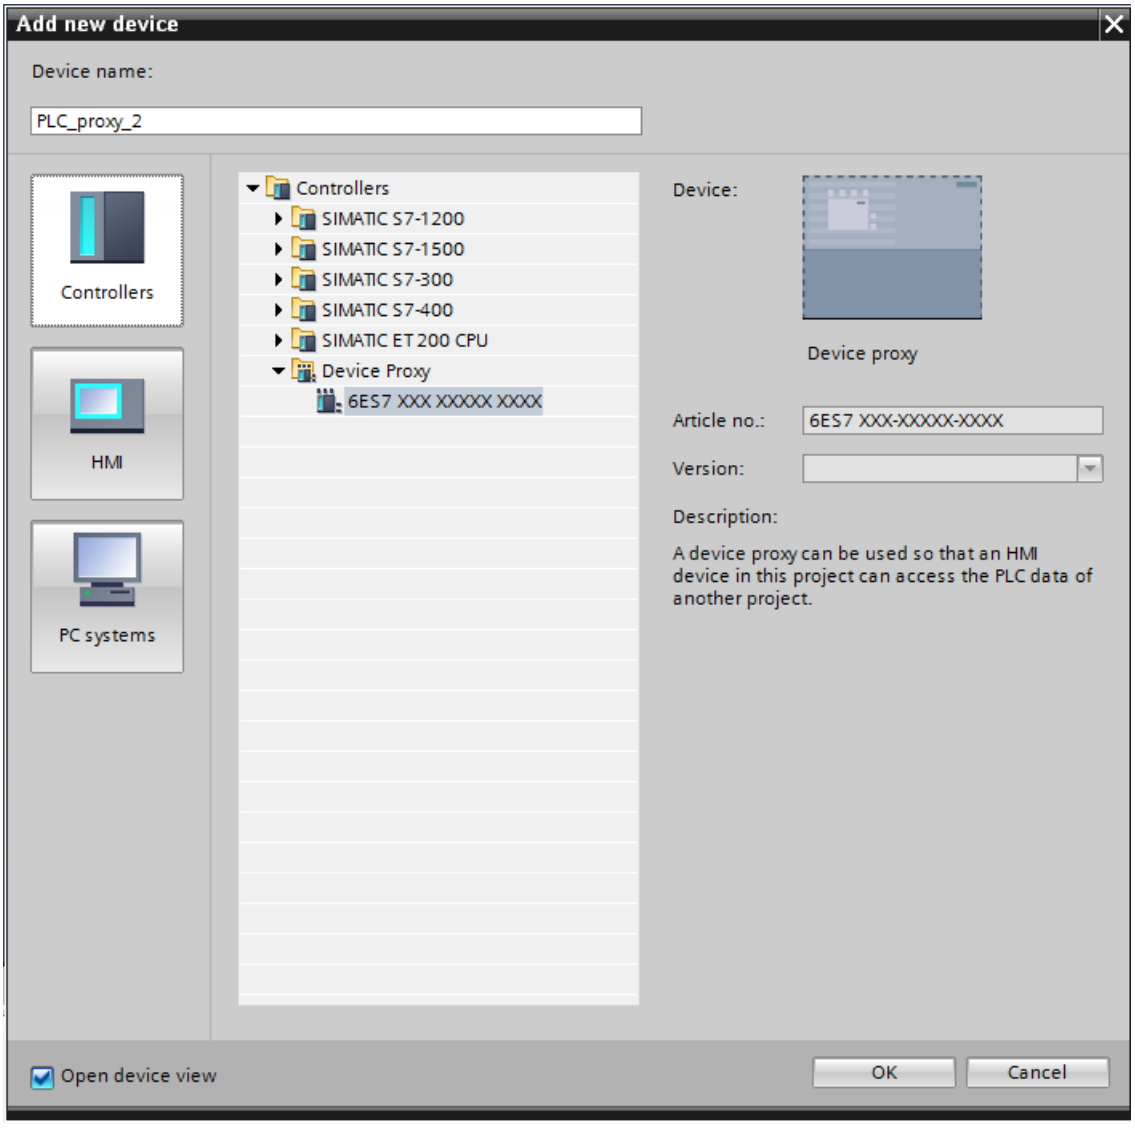
A device proxy can only be filled with one device proxy data record in the target project.

- An IPE file is exported from the source project.
  The IPE file contains device proxy data of the PLC "PLC_A".
- A device proxy is created in the target project.
- In the target project, the device proxy is then initialized with the device proxy data from the IPE file.
- Following initialization, all device proxy data from the IPE file is contained in the device proxy.
- If changes are made in the source project, the device proxy of PLC_A in the target project can be updated via the new IPE file.

Initializing a device proxy via an IPE file

Introduction

You initialize device proxy data using a dialog on the device proxy in the TIA Portal.

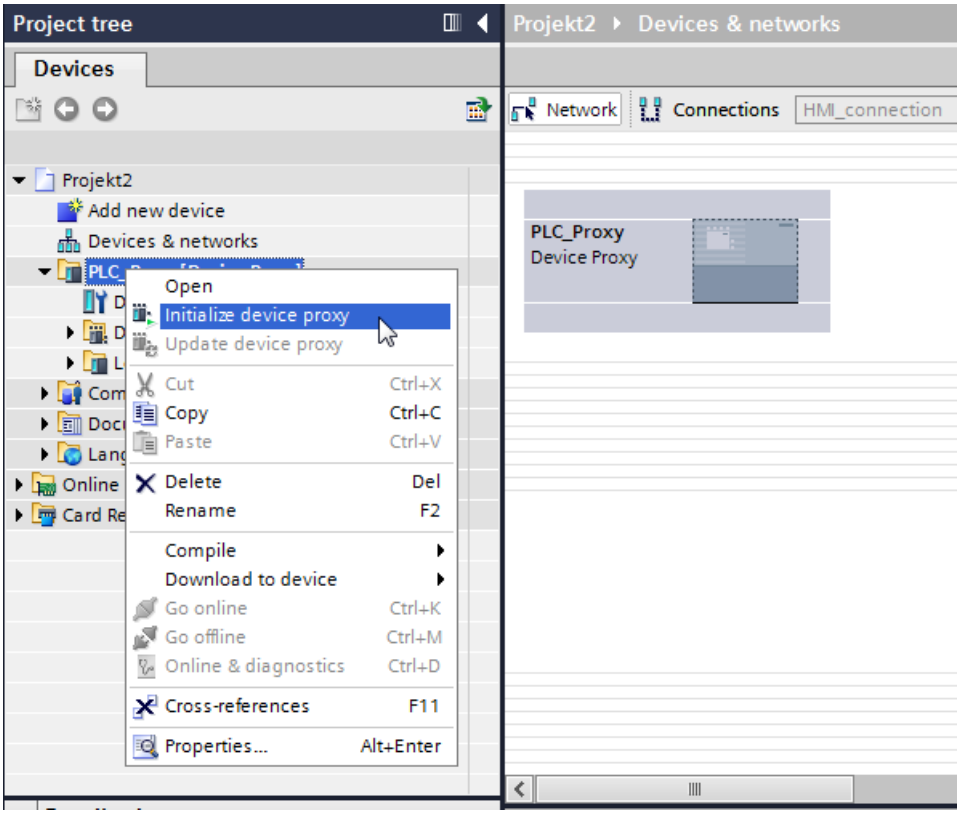


The IPE file contains the device proxy data from the source project.

Requirement

IPE file is available.

Procedure



1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".

A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in the project tree.

4. Click "Initialize device proxy" in the shortcut menu.

5. Select the IPE file and click "Open".
   The "Initialize device proxy" dialog opens.

Note

You cannot select the device proxy data before initialization in the target project.

All device proxy data included in the IPE file is transferred.

Initialize the device proxy via project file if you want to select specific device proxy data before initialization: Initializing a device proxy via a project file (Page 6662)

6. Click "OK".
   Initialization of the device proxy is started.

Result

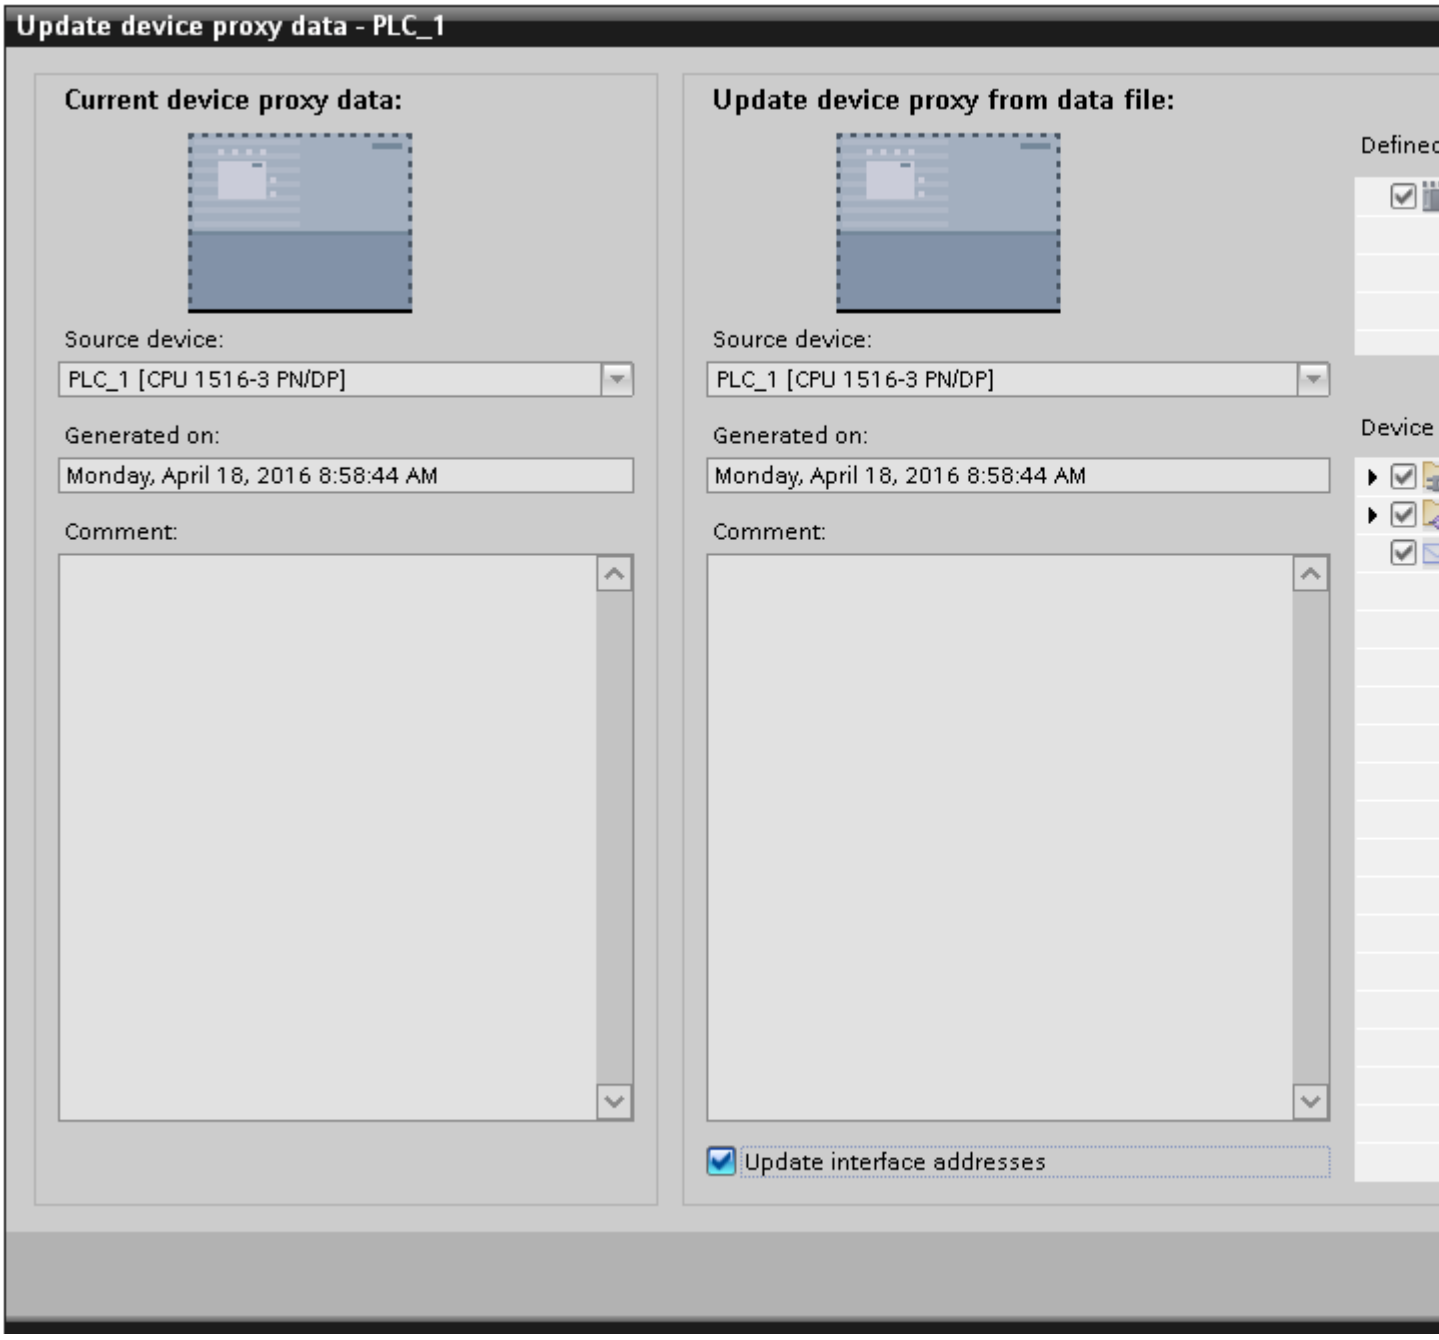
Following initialization, all device proxy data from the IPE file is contained in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

Updating a device proxy via an IPE file

Introduction

If changes were made to the device proxy data in the device proxy source project, the device proxy data can be updated in the target project.



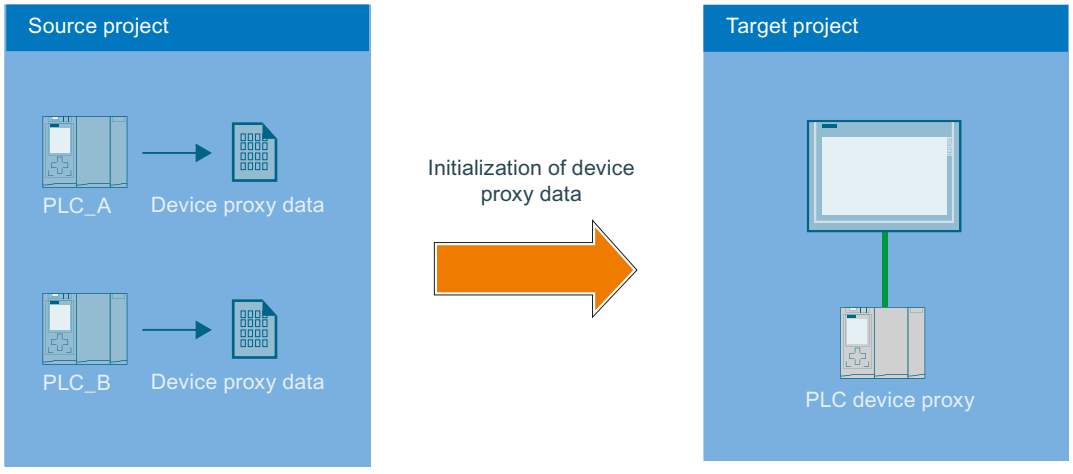
Requirement

- New IPE file contains the device proxy data from the source project.
- A device proxy has already been initialized using an IPE file in the target project.

Procedure

1. Select the device proxy in the project tree.
2. Click "Update device proxy" in the shortcut menu.

3. Select the IPE file.



4. Select whether you wish to update the PROFINET or PROFIBUS addresses.
5. Click "OK".

Initializing a device proxy via a project file

Initializing a device proxy via a project file

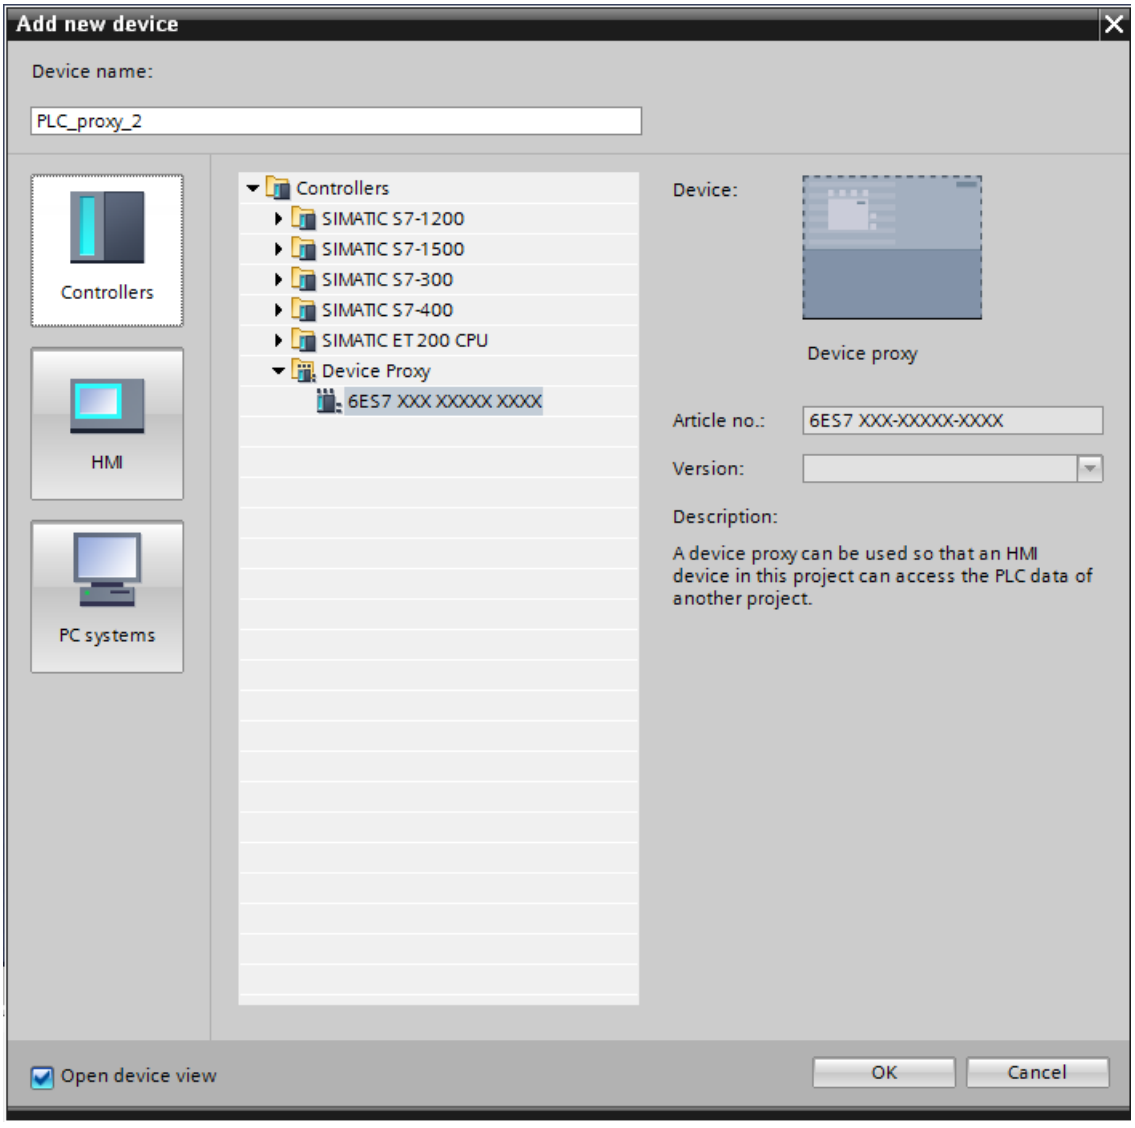
How does an initialization via project file work?

You can transfer controller data using a project file in your TIA Portal project:

- There are two PLCs in the source project.
- Device proxy data objects of the two PLCs are created in the source project.
- The source project is saved.
- A device proxy is created in the target project.
- The source project (*.ap13) is first selected using the command for the initialization of device proxy in the device shortcut menu.
- The "PLC_A" and "PLC_B" controllers are available for selection and their device proxy data have already been created.
- After selection of device proxy data of "PLC_A", the data is stored in the PLC_Proxy of the target project.
- Changes from the source project can be transferred by an update via the project file.

Initializing a device proxy via a project file

Introduction

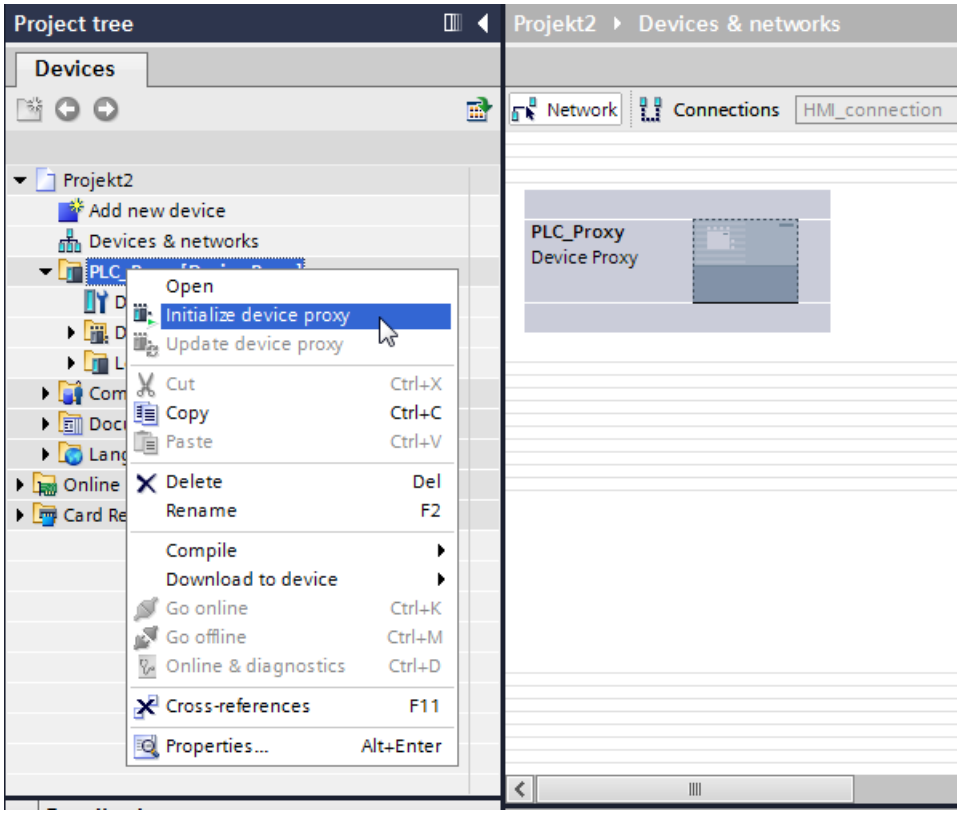


You initialize the device proxy using a project file.

Requirement

Project file (*.ap*) is available.

Procedure



1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".

A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in the project tree.

4. Click "Initialize device proxy" in the shortcut menu.

5. Select the following entry in the "Open device proxy data source" dialog:
   "TIA Portal projects (*.ap*)"
6. Select a project file and click "Open".
   The "Initialize device proxy" dialog opens.
7. Select a device proxy data object already created from an available PLC to initialize the device proxy.
8. Click "OK".

Note

During initialization of the device proxy a check is automatically carried out whether the selected data are consistent and can be imported into the target project. If the source project contains inconsistent data, compile your source project.

Result

Following initialization, the controller data from the project file in the selected device proxy data object is stored in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

Initializing via STEP 7 V5.5 projects

You can find more information about importing control data from projects prior to TIA Portal V11 in the section Integrated configuration with WinCC and Simatic Manager (Page 6674).

You can find additional information in the FAQ with entry ID: 73502293 (http://support.automation.siemens.com/WW/view/en/73502293)

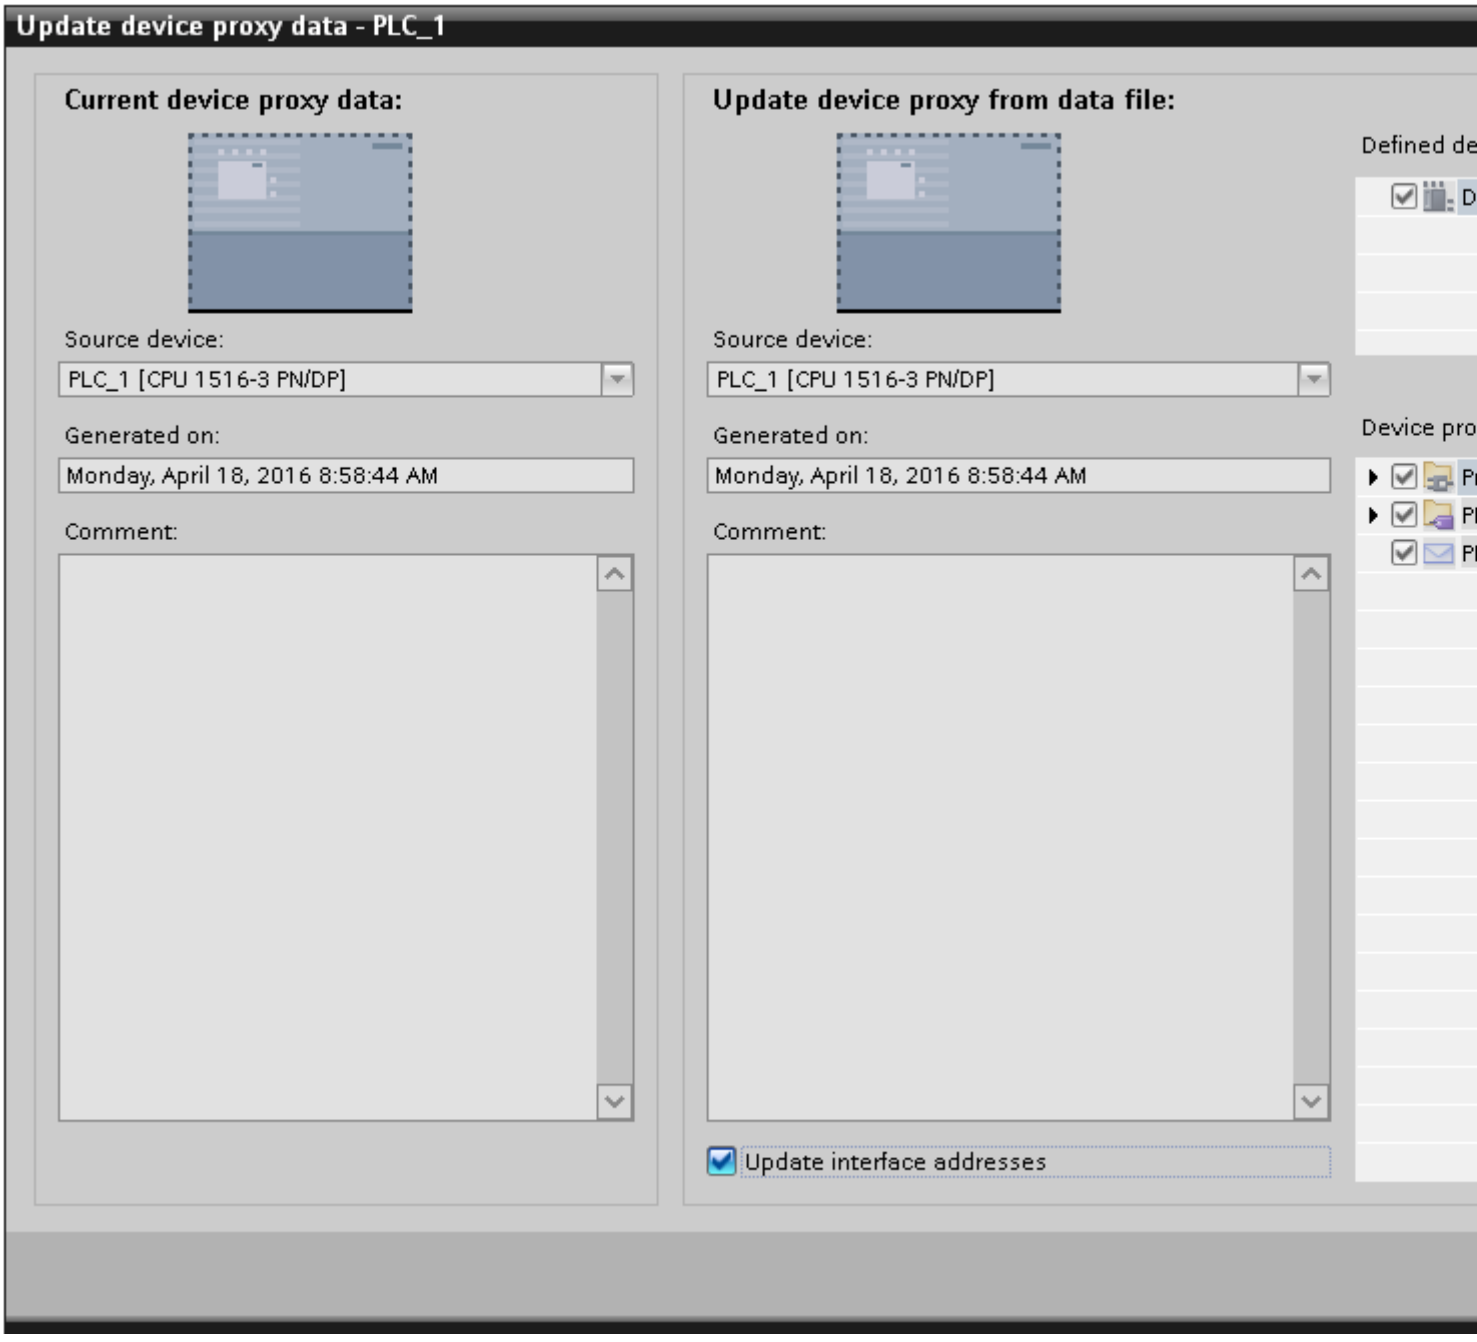
See also

Integrated configuring with WinCC and SIMATIC Manager (Page 6674)

Updating a device proxy via a project file

Introduction

If changes have been made to the controller data in the source project of the device proxy, you can update the device proxy in your TIA Portal project.



Requirement

- Project file has been generated from the source project of the device proxy.
- A device proxy that has already been initialized is available in the target project.

Procedure

1. Select the device proxy in the project tree.
2. Click "Update device proxy" in the shortcut menu.

3. Select the project file.
   The "Update device proxy" dialog opens.

4. Select a device.

   Note

   If you have created several device proxy data objects in the source project, you need to select one device proxy data object.

   Note

   Already initialized device proxies cannot be overwritten with controller data from a different PLC.

5. Select whether you wish to update the PROFINET or PROFIBUS addresses.
6. Click "OK".

15.2.6.2 Communication with device proxies

Basics of communication with device proxies

Introduction

Data exchange between the HMI device in your target project and existing controller from the source project is enabled in the TIA Portal using device proxies. You initialize a device proxy with device proxy data from the source project and link the HMI device to the device proxy PLC in the target project.

The HMI device and the device proxy PLCs can communicate with each other directly via a subnet or across multiple subnets. For communication across multiple subnets, you need to configure a device proxy-PLC as a router that connects the HMI device and the target PLC.

The communication between connection partners is possible via the following connections:

- PROFINET
- PROFIBUS
- MPI

Setting network parameters

In the TIA Portal, you connect the HMI device and the device proxy PLC in the "Devices & Networks" editor.

Once you have connected an HMI device with the device proxy PLC, adapt the properties of the network parameters. Note the

network parameters from the source project and enter them in the properties of the network connection between the device proxy PLC and the HMI device.

Note

IPE does not transfer data to the network configuration. You therefore configure the required networks in the target project manually so that the network configuration in the target project corresponds to the configuration in the source project. The subnet IDs of the devices in the target project in particular must correspond to each other and to the IDs of the devices in the source project. Otherwise, communication will not be possible between the source device and the HMI devices in runtime

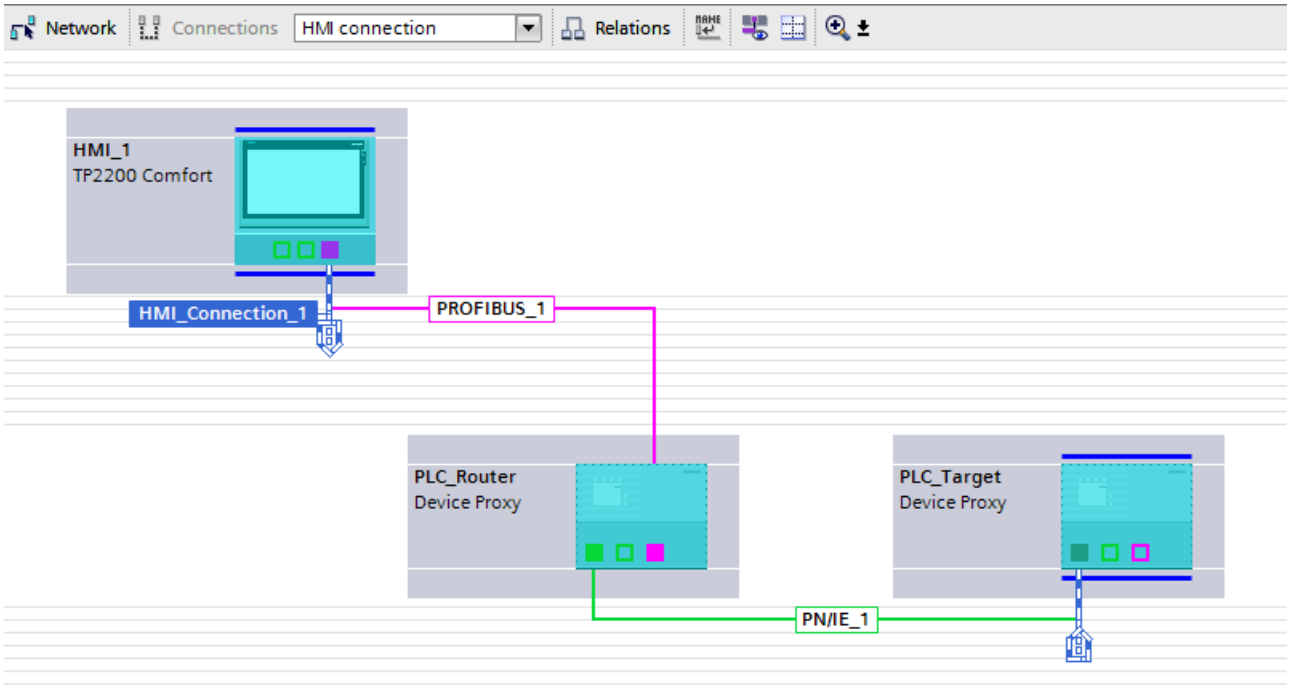
Depending on the connection, provide the following parameters:

Connection	Parameters
Ethernet	S7 subnet ID
MPI PROFIBUS	S7 subnet ID Highest address Transmission rate Bus parameters

Communication via S7 routing

To establish a routed connection to these connection partners, a router must be interposed. Configure both the router and the target PLC as device proxies.

The router and the target PLC can be initialized with an IPE file, TIA Portal project file or a STEP 7 V5.5 project file.



Modules with communication capability (CPUs or CPs) used to establish gateways between the subnetworks must have routing capability.

The S7 routing settings can be edited in the relevant interface properties.

You can configure the S7 routing connection in the "Devices & Networks" editor.

Note

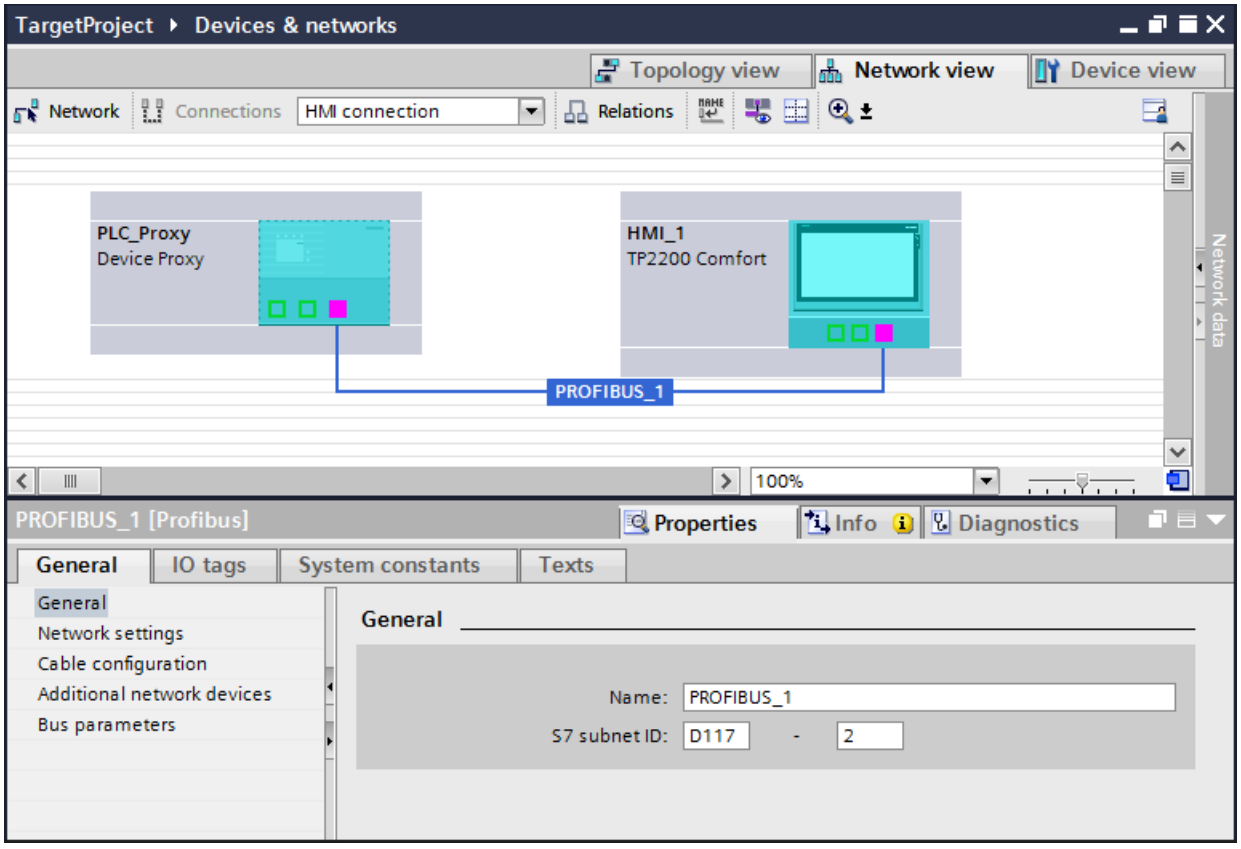
A routed connection must be configured in the source project for a routed connection to a connection partner that was loaded with the source project data.

The routing path is determined in Runtime by the system and cannot be influenced by the user. During configuration, it is not possible to generate information about a faulty connection. All relevant routing paths have to be mapped in the TIA Portal exactly as they were configured in STEP 7 source project.

Configuring a direct connection

Introduction

In the target project, configure a direct connection between a device proxy PLC and an HMI device in "Devices & Networks" editor.
The following configuration describes a network for the following communication partners:



- HMI device
- Device proxy PLC

Requirements

- Device proxy data were exported from the source project
- An HMI device has been created in the target project
- A proxy device has been created

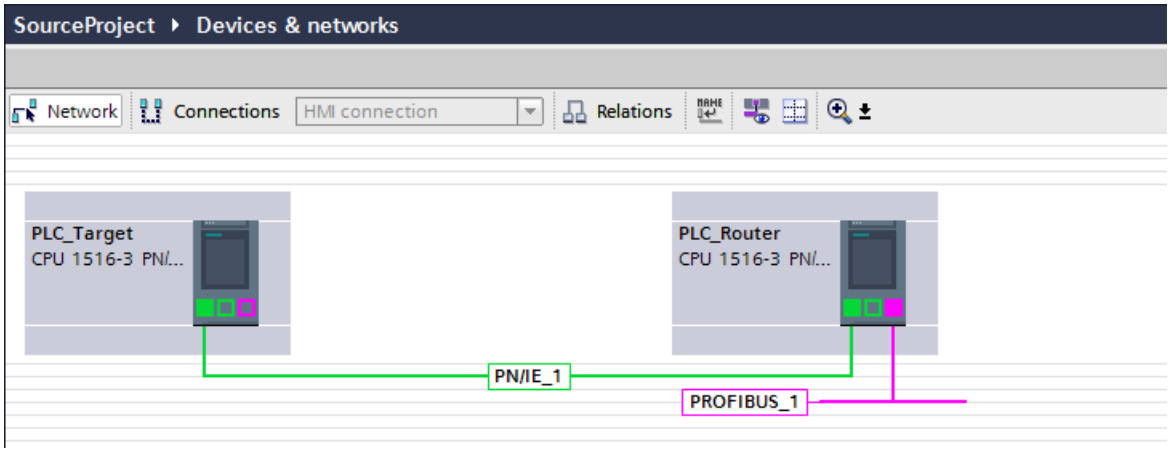
Procedure

1. Note the subnet ID of the connection in the source project.
   For an MPI or PROFIBUS connection, also note also the highest address, the transmission speed and the bus parameters.
2. Initialize the device proxy in the target project with the device proxy data from your source project.
3. Connect the communication interfaces of the HMI device and of the device proxy PLC.
   The corresponding S7 subnet is automatically generated.

4. Transfer the parameters that you noted from the source project into the parameters of the TIA project:
   - Enter the S7 subnet ID under "Properties > General".
   - Enter the highest address and the transmission rate under "Properties > Network Settings".
   - Enter the bus parameters under "Properties > Bus parameters".

Configuring a routed connection

Introduction



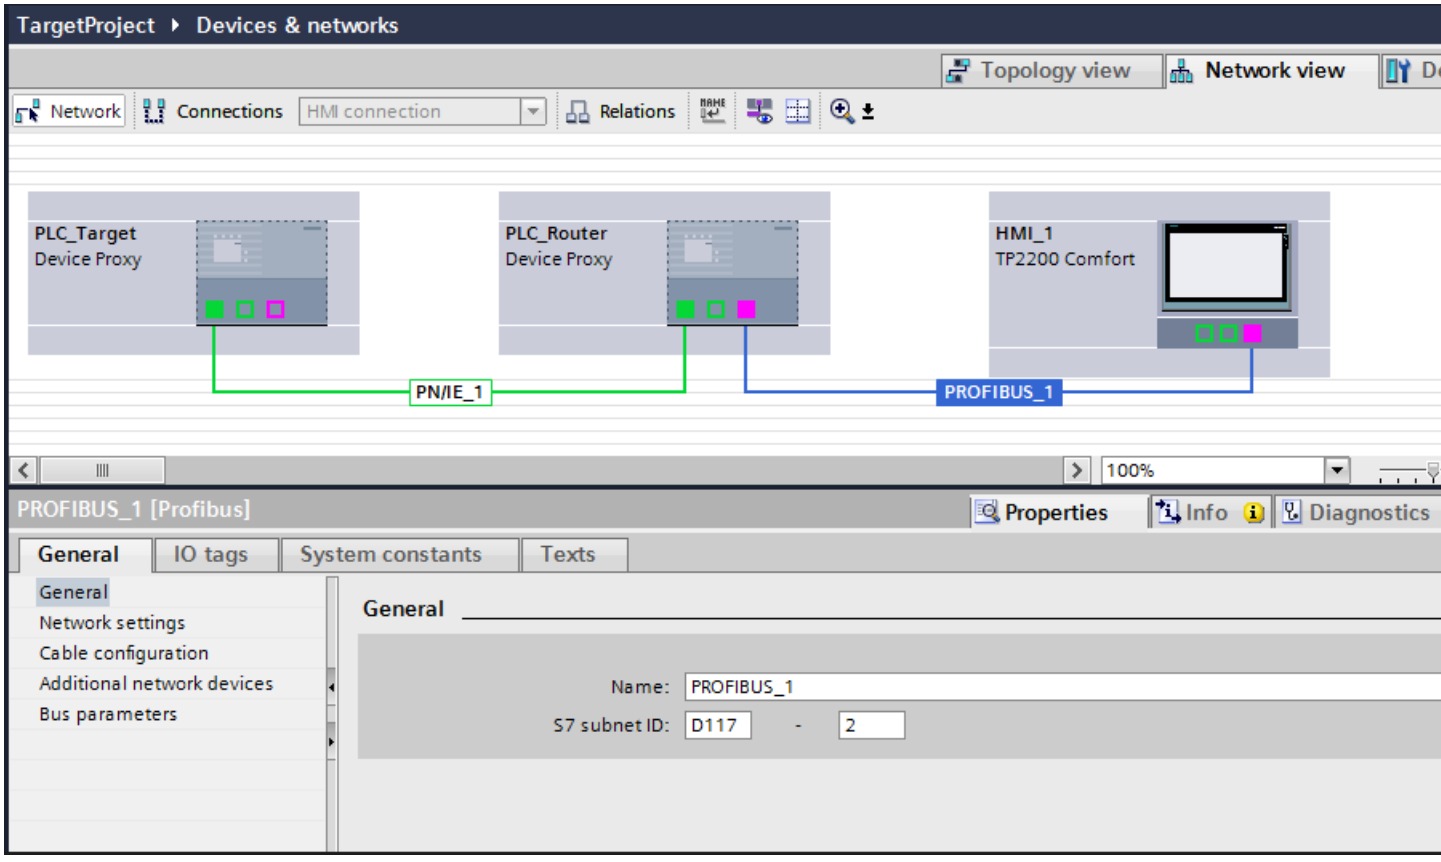
The HMI device and the device proxy PLCs can communicate with each other across multiple subnets. For a routed connection, configure a device proxy PLC as a router between the HMI device and the target PLC.

Note

For a routed connection to the connection partner from the source project, a routed connection must be configured in the source project.

The following configuration describes a network for the following communication partners:

- HMI device
- Device proxy PLC as router
- Device proxy PLC as target PLC
  All subnets that are involved in the routing between the HMI device and the target PLC must be configured in the source project. They must be identically configured in the target project.

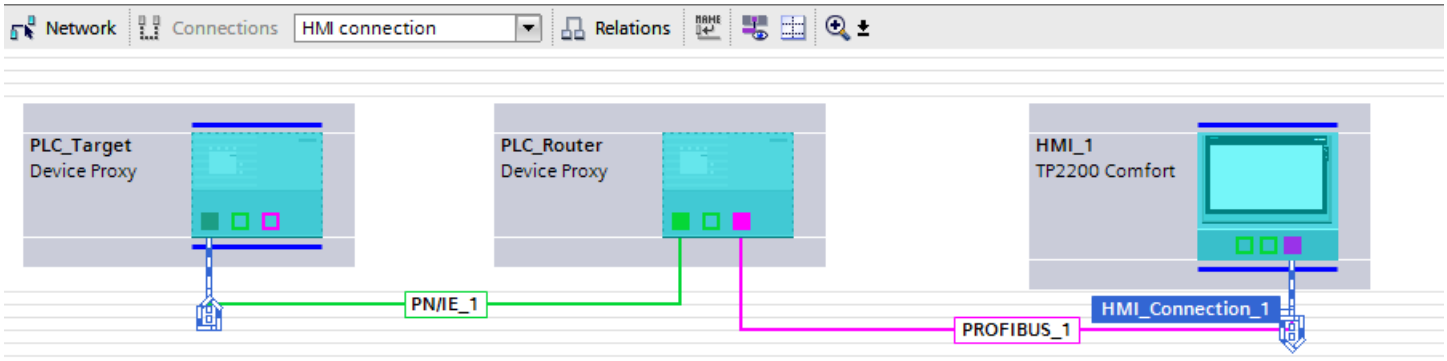


Requirements

- Device proxy data were exported from the source project
- An HMI device has been created
- Two device proxies have been added

Procedure

1. Note the subnet IDs of the connections in the source project.
   For a PROFIBUS connection, also note also the highest address, the transmission speed and the bus parameters.
2. Initialize the source proxy in the target project with the device proxy data from your source project.
3. Create the network connection between the HMI device and the router as well as between the router and the target PLC as it was configured in the source project.
4. Click the "Connections" button.
5. Connect the communication interfaces of the HMI device and of the router.
   Router and target PLC are connected automatically.
6. Create an HMI connection between the HMI device and the target PLC using drag-and-drop operation.
   The "Connect with subnet" dialog opens.



7. Select "Add S7 routed connection".
   The routing connection is created.

8. Transfer the parameters that you noted from the source project into the parameters of the TIA project:
   - Enter the S7 subnet ID under "Properties > General".
   - Enter the highest address and the transmission rate under "Properties > Network Settings".
   - Enter the bus parameters under "Properties > Bus parameters".

Result

The created connection is displayed in the "HMI connections" editor.

15.2.6.3 Integrated configuring with WinCC and SIMATIC Manager

Basic principles for configuring with WinCC and SIMATIC Manager

Integrated configuring with WinCC and SIMATIC Manager

The TIA Portal provides the option to create PLC programs and the HMI configurations using a uniform user interface.

In some cases it is still necessary, for technical or customer-specific reasons, to create the PLC program with the "STEP 7 V5.x" software and the HMI configuration with the WinCC software (TIA Portal).

You can directly access the PLCs configured in the SIMATIC Manager and their current data via the device proxy PLC and integrate this into WinCC (TIA Portal).

Requirement

- WinCC with version V13 or higher
- SIMATIC Manager STEP 7 with version V5.4 SP3 or higher
- In SIMATIC Manager all required software option packages that are used in the STEP 7 project must be installed.
- The project must be consistent in the SIMATIC Manager.

Supported PLCs

- S7-300 PLC
- S7-300F PLC
- S7-400 PLC
- S7-400F PLC

- S7-300 T-PLC
- ET200 PLC (IM 151-x CPU)

Supported alarm procedures

- Discrete alarm types
- Analog alarm types
- Signal system fault (SFM)
- Alarm_S, Alarm_SQ, Alarm_D, Alarm_DQ

Initializing a device proxy via a STEP 7 project file

Introduction

A connection to a CPU within the SIMATIC Manager is established through the initialization. After successful initialization the tags and messages contained in the SIMATIC Manager are also available in the WinCC project.

Initializing a device proxy PLC

1. Initialize the device proxy via the project file (*.s7p) of your STEP 7 project.
   In the "Initialize device proxy" dialog, select the CPU, program blocks, symbols and PLC messages for the device proxy.
2. After successful initialization the selected data are displayed in the program folders in the project tree.

Note

The data are not processed in WinCC (TIA Portal). Only reading access to the tags is available. Changes to the STEP 7 program are always carried out in the SIMATIC Manager.

Note

Support of H-PLCs

IPE functionality in the TIA Portal also supports the use of H-PLCs from STEP 7 as of V5.5. Only the master H-PLC is relevant during the initialization of the device proxy.

Display of the original name of the source device

1. Open the device configuration of the device proxy PLC.
2. Select "Device view"".
3. Open "Properties > General > General > Device proxy information".
   The original name is displayed under "Proxy source".

Creating a network connection between HMI and PLC

As when using a "Standard PLC", you configure a network connection between the used HMI device and the device proxy PLC.

1. In the device configuration select "Network view".
2. Mark the device proxy PLC and enter the same connection properties under "Properties" that the PLC program has in the SIMATIC Manager.
3. Network and connect the two devices.

Note

Network connection and addresses

Irrespective of whether you have created an Ethernet connection or a PROFIBUS connection, check the respective addresses and bus parameters of the modules used and if necessary adapt these. If you use PROFIBUS, observe the additional information under Adapting network parameters (Page 6676).

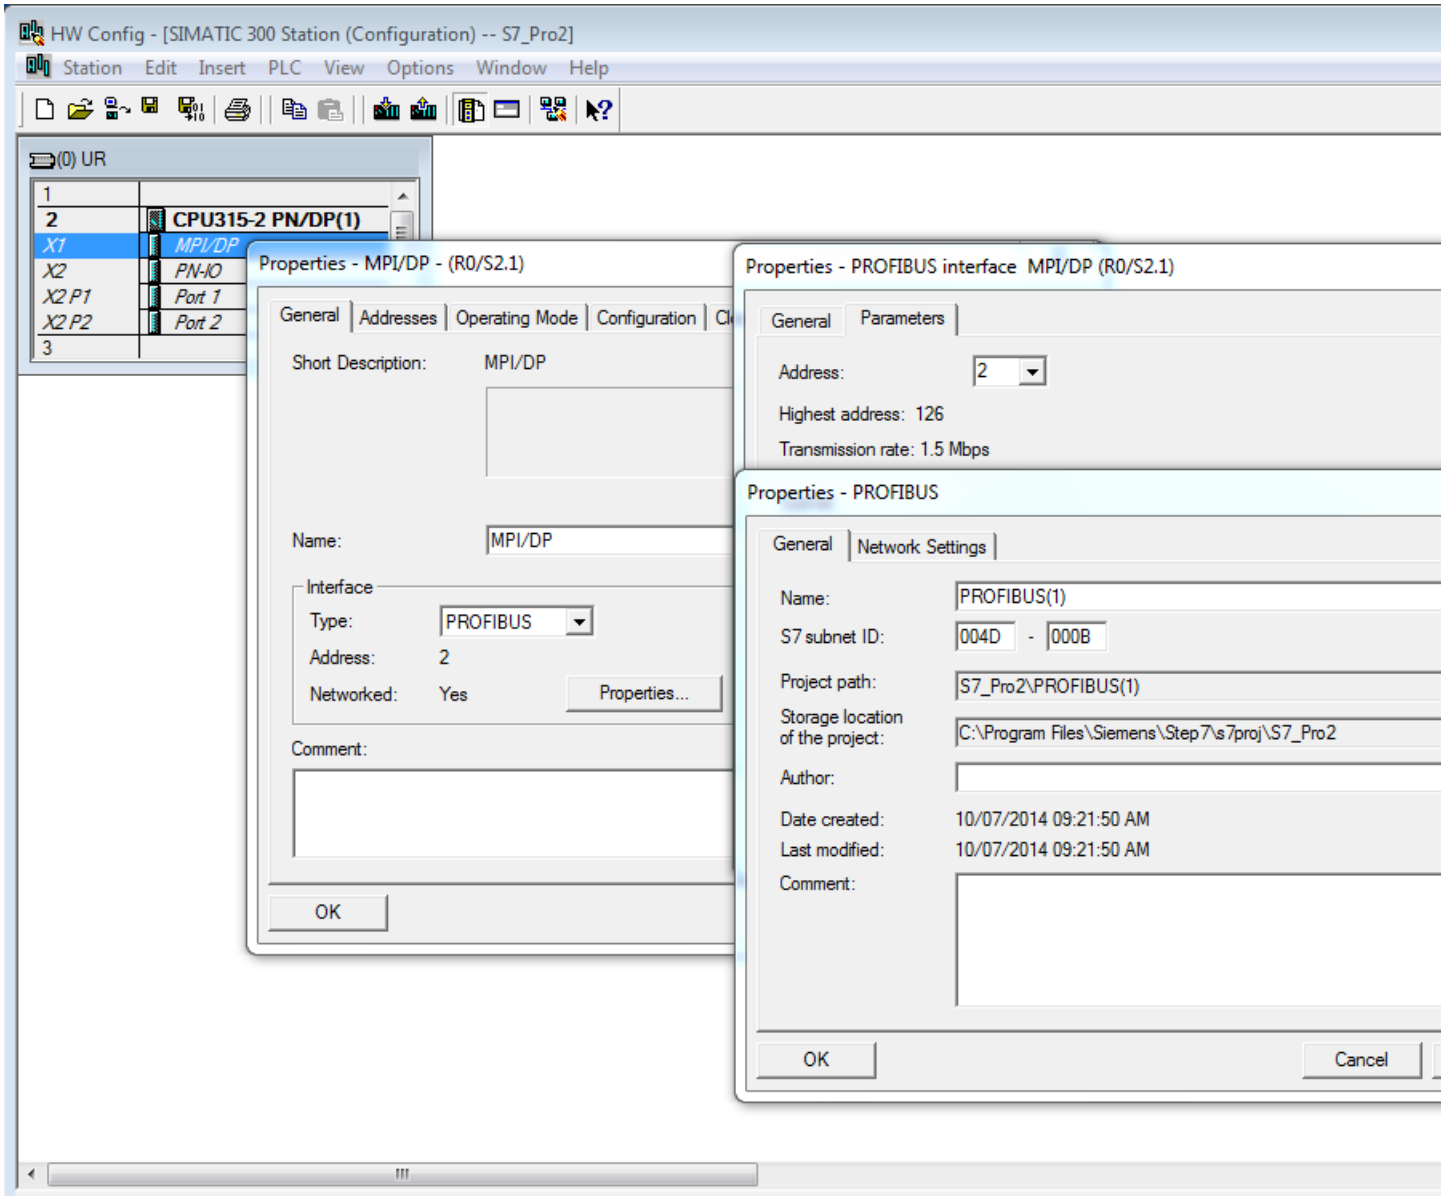
Adapting network parameters

Introduction

If you have networked an HMI device with the device proxy PLC, you have to adapt the properties of the parameters in the STEP 7 5.x project in the following cases:

- You have a STEP 7 V5.x project. The HMI devices in this project created with WinCC flexible were migrated to WinCC (TIA Portal) and networked with the device proxy PLC.
- You have a STEP 7 V5.x project. The HMI devices were configured only with WinCC (TIA Portal) and are networked with the device proxy PLC.

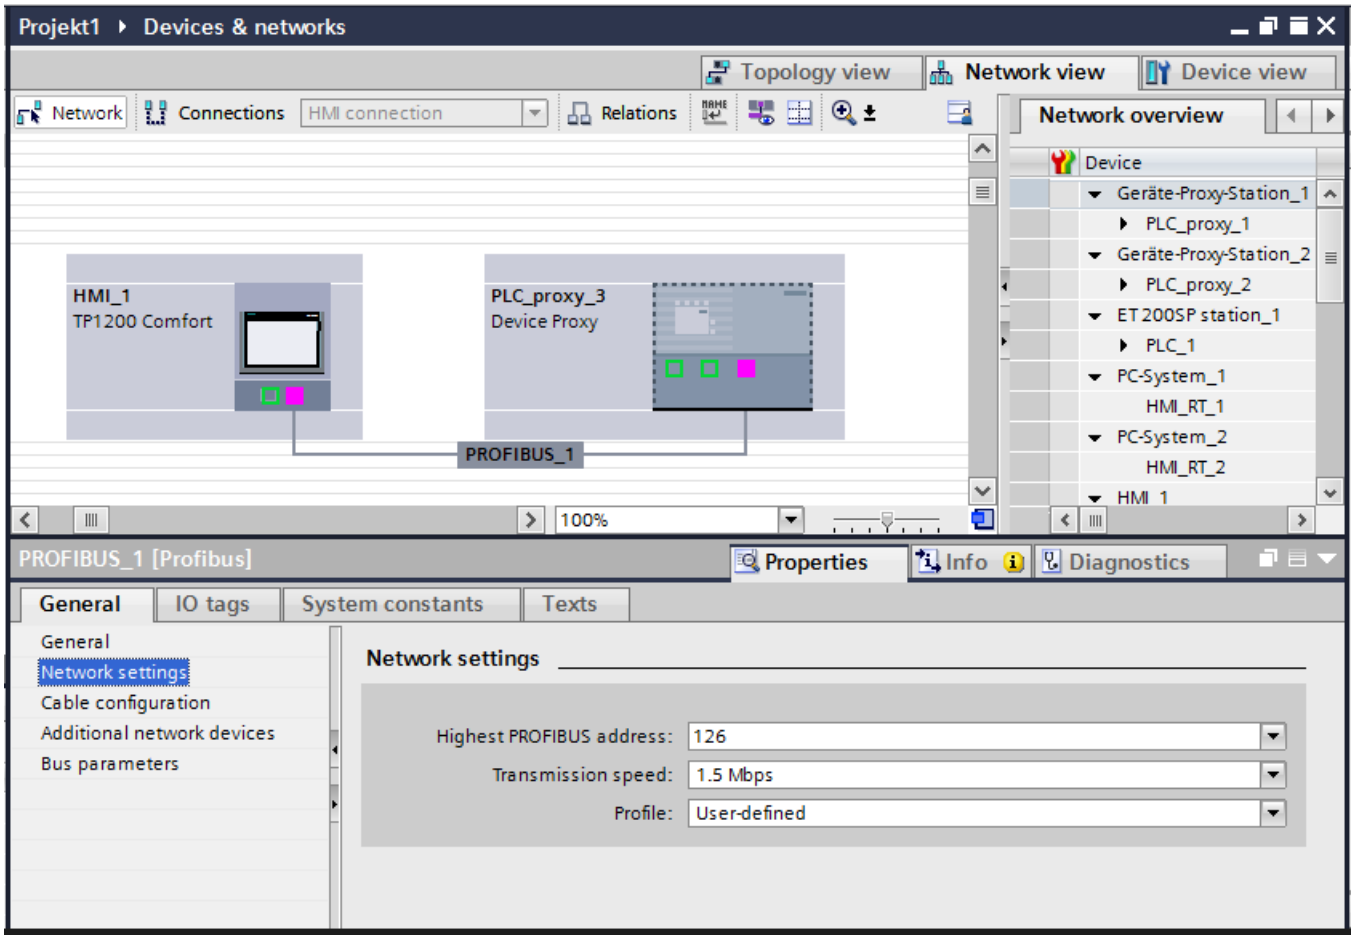
Depending on the connection, provide the following parameters:



Connection	Parameters
Ethernet	S7 subnet ID
MPI PROFIBUS	S7 subnet ID Highest address Transmission rate Bus parameters

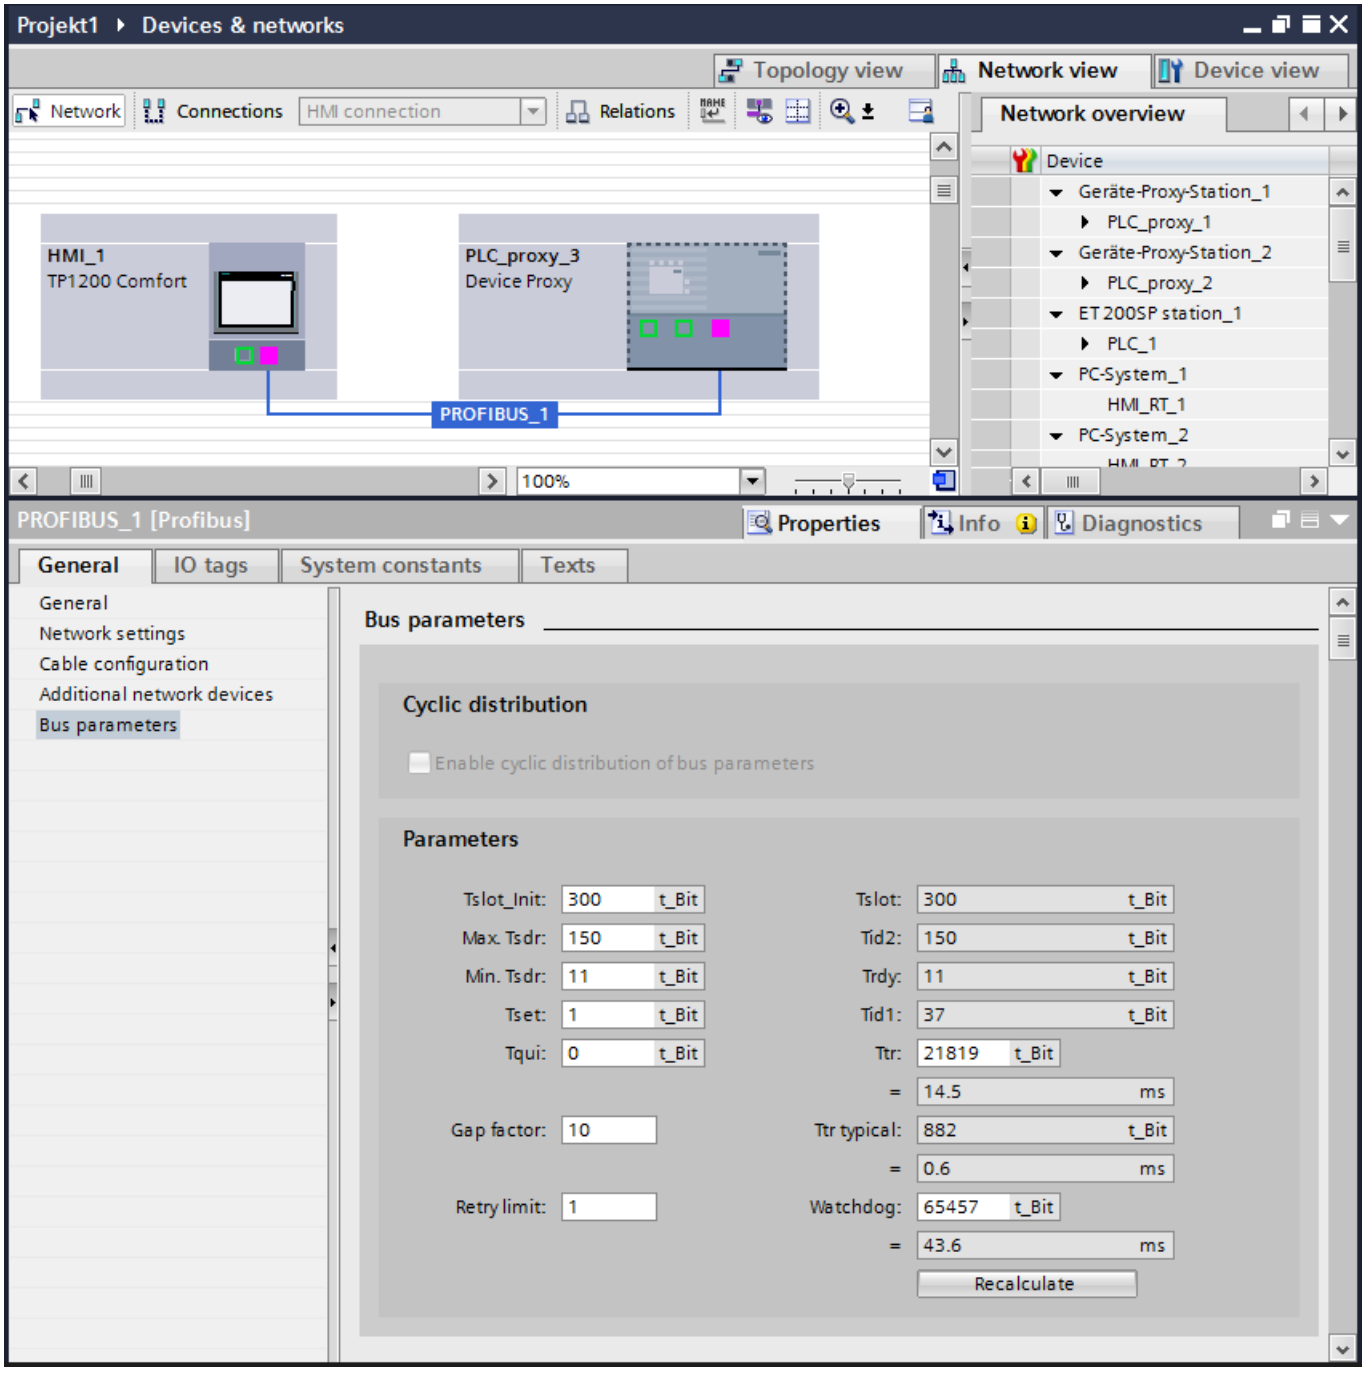
Record the parameters in the STEP 7 project and enter these in the TIA Portal at the properties of the network connection.

Adapting network parameters



1. Open the hardware configuration of the CPU in the SIMATIC Manager.
2. Open the object properties of the PROFIBUS interface of the CPU.
3. Select the "Properties..." button under "General" in the "MPI/DP properties" dialog. The "Properties – PROFIBUS interface" dialog is opens.

4. Select the "Properties..." button under "Parameters" in the "Properties - PROFIBUS interface" dialog.
   The "Properties - PROFIBUS" dialog is opens.
5. Note the S7 subnet ID.



6. If you adapt the PROFIBUS connection, record the "Highest address" and "Transmission rate" parameters in the "Network settings" dialog box.
7. If you adapt the PROFIBUS connection, select the "Bus Parameters" button in the "Properties - PROFIBUS" window under "Network settings".
   Note the bus parameters listed there.
8. In "Devices & Networks" editor of the TIA Portal, select the network connection between the device proxy PLC and the HMI device.

9. Select the "User-defined" profile under "Properties > General> Network Settings".

10. Transfer the parameters that you noted from the STEP 7 configuration into the parameters of the TIA project:
    - Enter the S7 subnet ID under "Properties > General".
    - Enter the highest address and the transmission rate under "Properties > Network Settings".
    - Enter the bus parameters under "Properties > Bus parameters".

Checking inconsistent data

Introduction

During initialization of a device proxy a check is automatically carried out whether the selected data are consistent in the source project and can be imported into the target project. If the source project contains inconsistent data, repair them in the source project in the SIMATIC Manager.

The following tools are available for determining and repairing the inconsistent data in STEP 7 V5.x:

- "Check block consistency" for checking data blocks and alarms
- "Symbol Editor" for checking the symbols

Note

You can find additional information on "Check block consistency" and "Symbol editor" in the STEP 7 V5.x documentation.

Checking data blocks and messages

1. Open the source project in the S7 SIMATIC Manager.
2. Mark the block folder in the project window.
3. Select the "Check block consistency..." entry from the shortcut menu.
   The "Check block consistency" editor opens.
4. Select the "Program > Compile" command from the menu.
   Inconsistencies in the blocks are corrected automatically and objects are compiled.
5. If an inconsistency cannot be corrected automatically, an error message is output. By double-clicking the error message you jump to the faulty object. Correct the inconsistencies manually and save the project afterwards.

Checking symbols

1. Open the source project in the S7 SIMATIC Manager.
2. Start the Symbol Editor by double-clicking the symbol table.
   The Symbol Editor is opened.
3. Invalid global symbols in the table are marked in red.
4. Repair or delete the invalid symbols.

Adapting tags and connections

Introduction

Adapt the connection names and synchronize the tags for establishing the connection after the migration.

When the HMI device is networked with the device proxy PLC the system creates a connection and assigns a connection name. If an HMI connection already existed, adapt the new connection name.

Adapting the connection name

1. Copy the previous connection name.
2. Delete the existing connection.
3. Replace the new connection name by the previous name.

Symbolic connection of the tags

1. Call up the tag editor.
2. Select all the tags.
3. Click "Synchronize to compare with PLC tag".
   The "Options for synchronizing WinCC tags" window opens.
4. Select the options "Data type and absolute address agree" and "Replace WinCC tag name by the PLC tag name" in the window.
5. Click "Synchronize".
   Synchronization of the tags is carried out.

Updating a device proxy via a STEP 7 project file

Introduction

The data of the device proxy PLC have to be updated whenever changes are made in the SIMATIC Manager that affect the HMI device. This is, for example, the case when address area in the data blocks have been changed or extended.

Updating device proxy data

1. Update the data of the device proxy via the project file (*.s7p) of your STEP 7 project.
2. In the update dialog. select the same CPU that you also used during the initialization of the device proxy PLC as the data source.
   An update with a different hardware configuration is not allowed.

3. Through the dialog you have the possibility to select newly created data blocks from the SIMATIC Manager additionally.
   Only selected objects are imported in the TIA Portal project.

   Note

   All the data that were selected during the previous initialization are automatically selected again as well. You should only change this default setting if you consciously want to remove data from the device proxy PLC. If, for example, the DB1 was included in the TIA Portal project through the initialization, and you now deactivate the DB1, the DB1 is deleted from the TIA Portal project during updating.

4. Confirm the selection using the "OK" button.
   Updating of the tags is started.
5. The addresses of the tags were adapted automatically through the symbolic connection of the tags.
   This completes updating of the tags.

Including tags from the SIMATIC Manager

Introduction

Through the initialization of the device proxy PLC you have included the tags from the SIMATIC Manager into the WinCC project.

In WinCC, you insert tags of the device proxy PLC directly into an HMI screen or a screen object.

Inserting a tag into the HMI configuration

1. Open the folder with the program blocks of the device proxy PLC in the project tree.
2. Select the block that contains the tags.
3. All the tags of the selected block are displayed in the detail view.
4. Drag&drop the tag from the detail view into the working area.
   An I/O field with the selected tag is created. Carry out further settings in the Inspector window.

Alternatively configure an I/O field in the HMI screen and drag&drop the tag into the I/O field.

Result

The tag from a block of the device proxy PLC is inserted into the HMI project and connected with the I/O field.

Configuring the "Direct keys" system function

Introduction

If you want to integrate HMI devices that can only be configured with WinCC (TIA Portal), for example SIMATIC HMI Comfort Panels, into the hardware configuration of the SIMATIC Manager, you require the corresponding matching GSD/GSDML files.

The required GSD/GSDM files for WinCC are located in FAQs mutual configuration with WinCC (TIA Portal) and STEP 7 V5.x (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=4&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid4=20229806&objaction=csopen)

Installing GSD files

1. Open the hardware configuration in the SIMATIC Manager.
2. Select the "Options > Install New GSD Files" menu command.
   The "Install GSD files" dialog is displayed.
3. Use the "Browse" button to select the file folder that contains the GSD files.

   Note

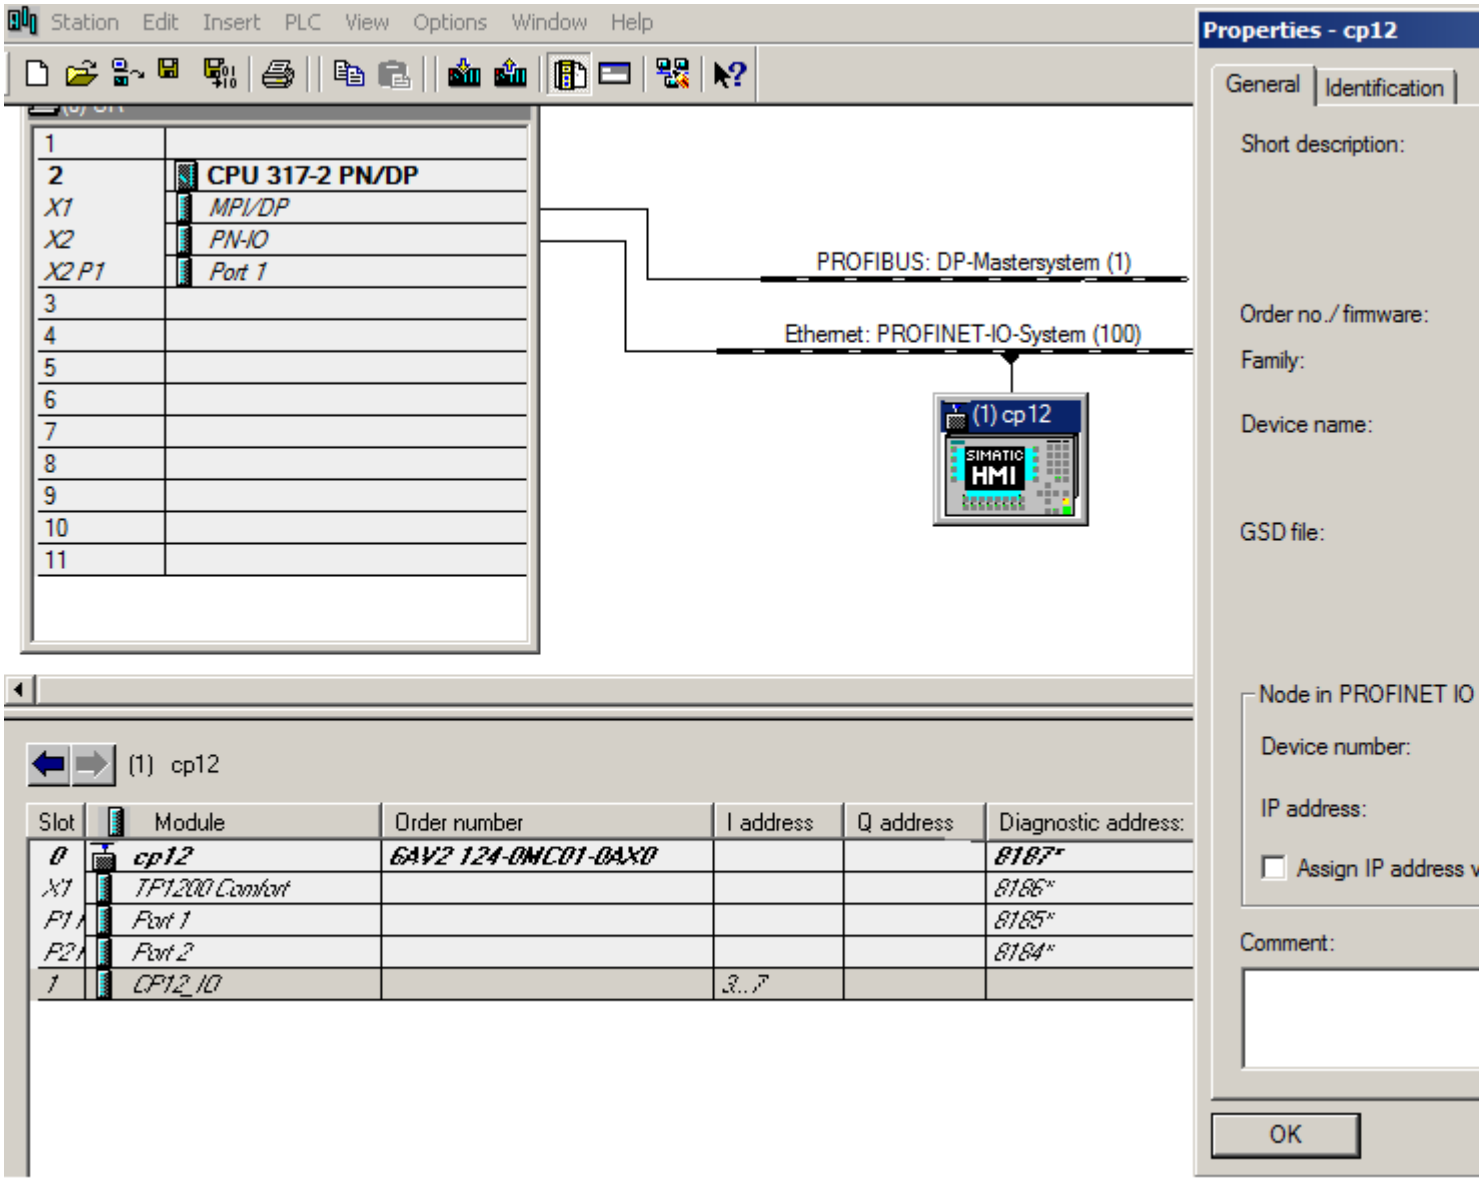
   PROFINET / PROFIBUS storage paths in the SIMATIC Manager

   The GSDML files for the HMI devices are located in the hardware catalog under „PROFINET IO > HMI > SIMATIC HMI > GSD > KP/x“.

   The GSD files for the HMI devices are located in the hardware catalog under „PROFIBUS DP > Weitere FELDGERÄTE > MMI > SIMATIC_HMI > HMI CP_x“.

4. Mark all the files and click the "Install" command button.

PROFINET connection: PROFINET IO direct keys



1. Note the properties used for the HMI device to be replaced.
   Take particular note of I/O addresses, device name, device number and diagnostic addresses if these are evaluated.
2. Remove the existing GSD file.
3. Drag&Drop the configured HMI device type from the hardware catalog onto the displayed PROFINET IO bus.
4. Adapt the properties as noted.

   Note

   Take the rules for the names of PROFINET IO devices into consideration for the device name. Use only lower-case characters and no special characters for the device name.

5. Confirm the entries with OK.

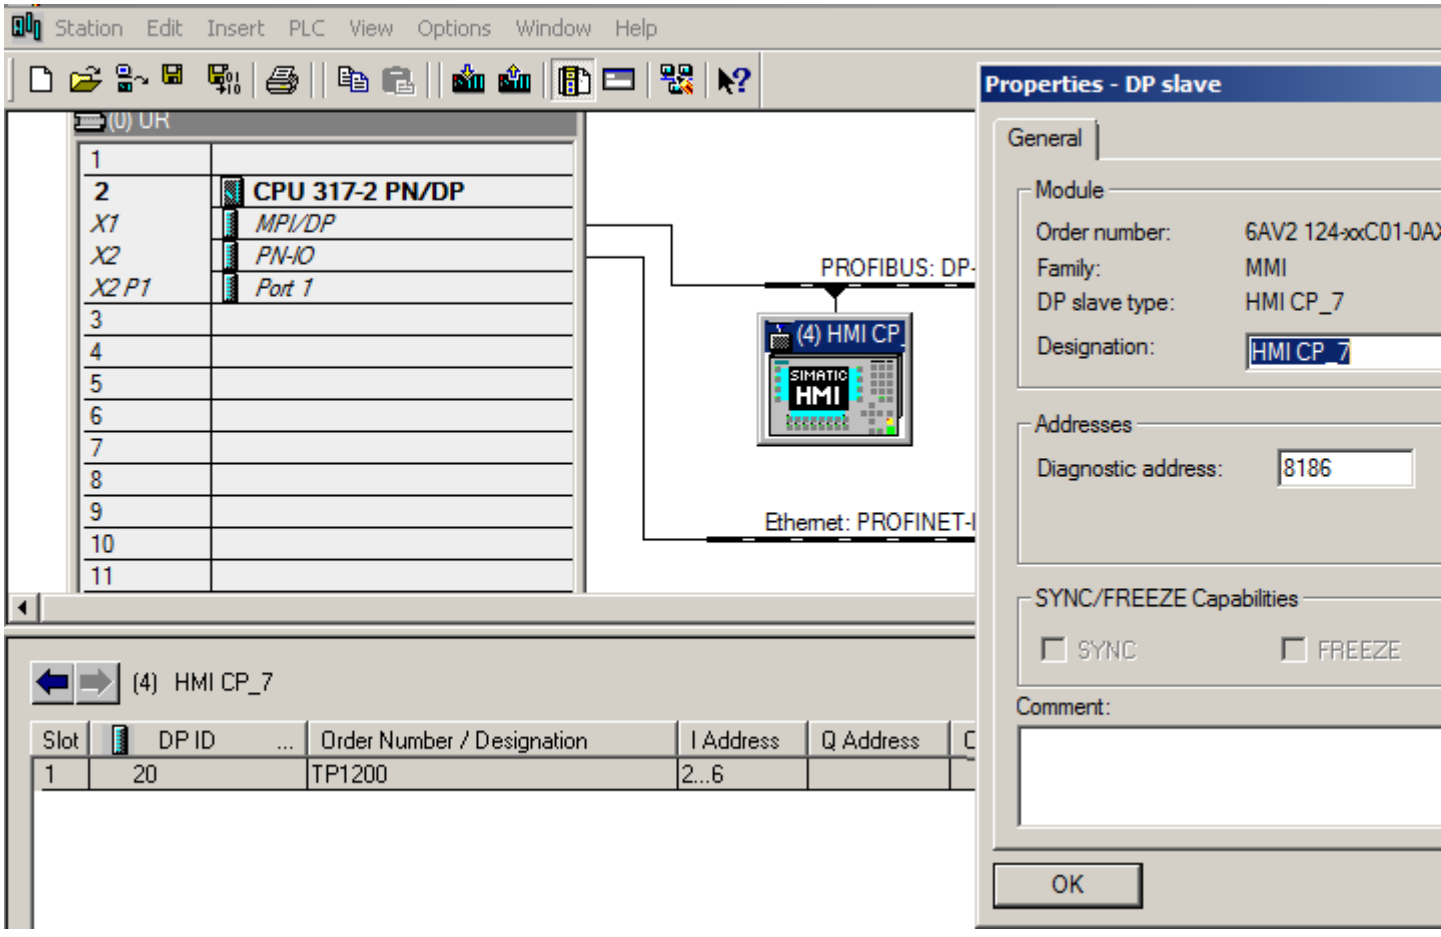
6. Save and compile the configuration and transfer the hardware configuration to the controller.

7. Open the device configuration of the TP1200 Comfort and change to the "Device view".
8. Enter the PROFINET device name in the properties of the configured HMI device in WinCC under "Properties > General > PROFINET interface X1 > Ethernet addresses".
   To assign the PROFINET device name, deselect the option "Generate PROFINET device name automatically".

   Note

   The PROFINET name in the WinCC configuration must correspond to the PROFINET name stored in the SIMATIC Manager.

PROFIBUS connection: PROFIBUS DP direct keys



Please note that the direct keys are configured in the SIMATIC Manager.

Note

If direct keys to several CPUs are configured from one panel, the direct keys will only function on one CPU.

The further CPUs display a bus / group error.

1. Note the properties used for the HMI device to be replaced.
   Take particular note of I/O addresses, device name and diagnostic addresses if these are evaluated.
2. Remove the existing GSD file.
3. Drag-and-drop the GSD module that contains the configured HMI device type from the hardware catalog to the PROFIBUS DP bus displayed.
4. Adapt the properties I/O address, device name, PROFIBUS address and diagnostic address as previously noted.
5. Confirm the entries with OK.
6. Save and compile the configuration and transfer the hardware configuration to the controller.

7. Open the device configuration of the HMI device that you want to use and change to the "Device view".
8. Network the PROFIBUS interface in the properties of the configured HMI device under "Properties > General > MPI/DP interface X2 > PROFIBUS address > Network interface with".
9. Specify the PROFIBUS address at "Parameters".

Note

The PROFIBUS address in the WinCC configuration must correspond to the PROFIBUS address stored in the SIMATIC Manager.

15.3 Using Multiuser Engineering

15.3.1 Introduction to Multiuser Engineering

Introduction

In the TIA Portal V14, you have the option of working with Multiuser Engineering .

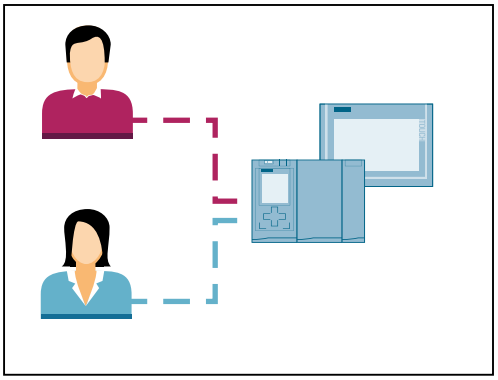
The advantage of this is that you can work with multiple users simultaneously in multiuser projects. This approach significantly reduces the configuring times for your projects. You can commission your plant faster and start production sooner.

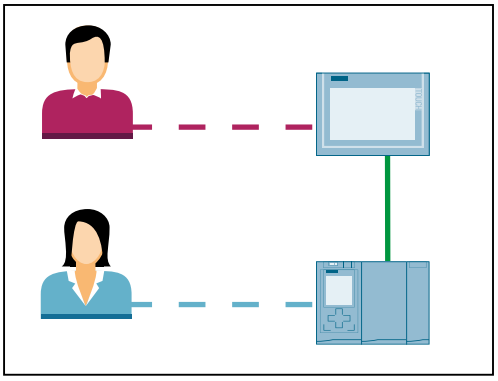
In Multiuser Engineering, you can also use other functionalities of Team Engineering , such as working together on a CPU and exchanging data with Inter Project Engineering (IPE).

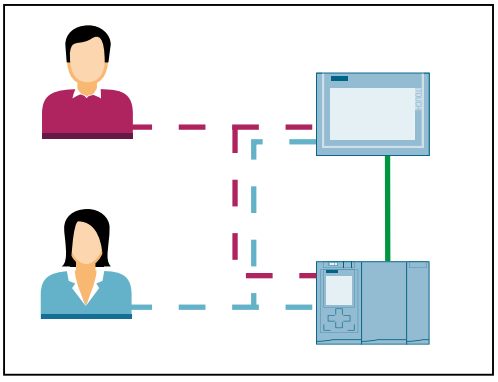
This is how Multiuser Engineering works in TIA Portal:

1. Project management is located either on a local or external server.
2. Different users work in local sessions, based on the projects managed by the server.
3. Users work independently from each other in local sessions.
4. The changes from the local sessions are transferred to the server project on check-in.
5. Checked-in changes from other editors are displayed and can be conveniently applied.

Note







Working efficiently with Multiuser Engineering

When working in parallel in multiple local sessions, you should correct errors that occur at an early stage so that the distributed work on a shared project stays efficient.

Therefore, it is recommended to first compile pending changes before check-in in the multiuser editor. Several compiling options are available for this. If compiling errors are indicated, you should correct them remove before check-in.

Compiling pending changed before check-in ensures that you are checking in and transferring an error-free project to other editors.

Different options are available for working simultaneously on a multiuser project, as can be seen in the table below:

Application scenarios for Multiuser Engineering	
Scenario 1: Several configuration engineers work *across multiple devices* on different objects. In this scenario, each configuration engineer works on the objects assigned to them on different devices.	
Scenario 2: Several configuration engineers work *device-oriented* on different objects. In this scenario, each configuration engineer works on the objects assigned to them on only one device.	
Scenario 3: Several configuration engineers work *technology-based* on different objects. In this scenario, each configuration engineer works on defined technological objects (e.g. Motor_1 or Motor_2) on all existing devices.	

By working on different objects, such as different tags, blocks, PLC tags, interrupts, screens, text and graphic lists, technology objects etc., on one or multiple devices within a multiuser project at the same time, you can make your configuration times more effective and reduce them significantly.

Supported objects for Multiuser Engineering (Page 6699)

15.3.2 Overview of the mode of operation with Multiuser Engineering

Introduction

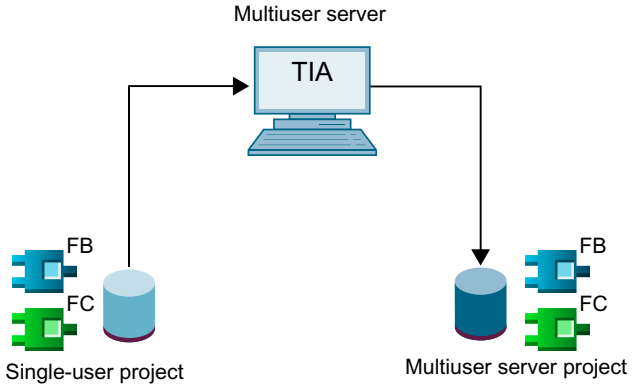
If you want to work with multiple users simultaneously in multiuser projects, specific procedures should be observed.

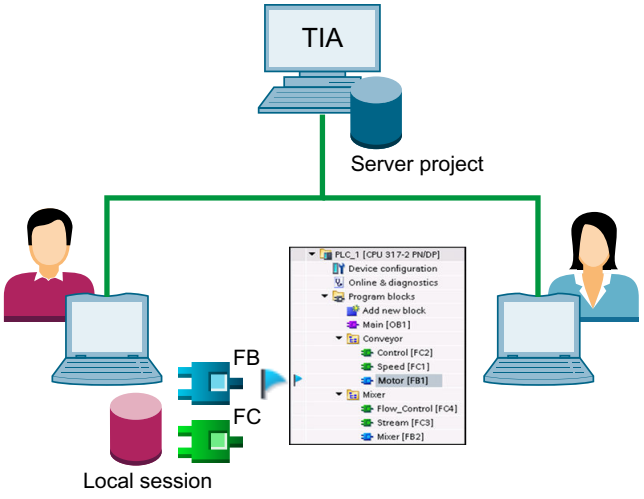
Below you will find an overview of the general mode of operation with Multiuser Engineering.

Application example

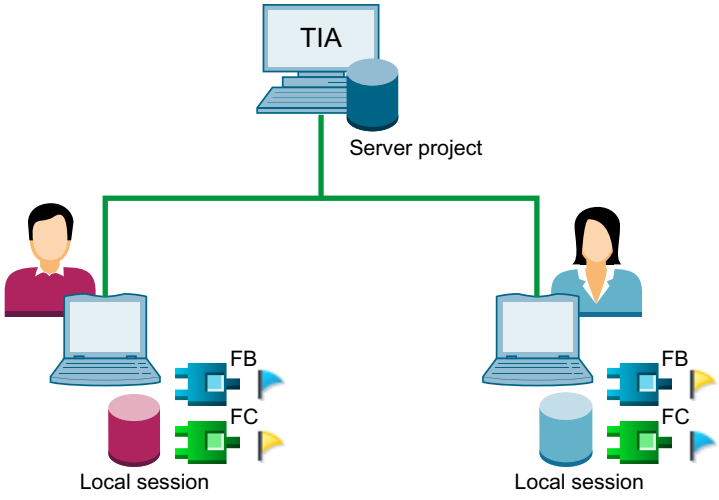
You can find an application example for working with Multiuser Engineering at:

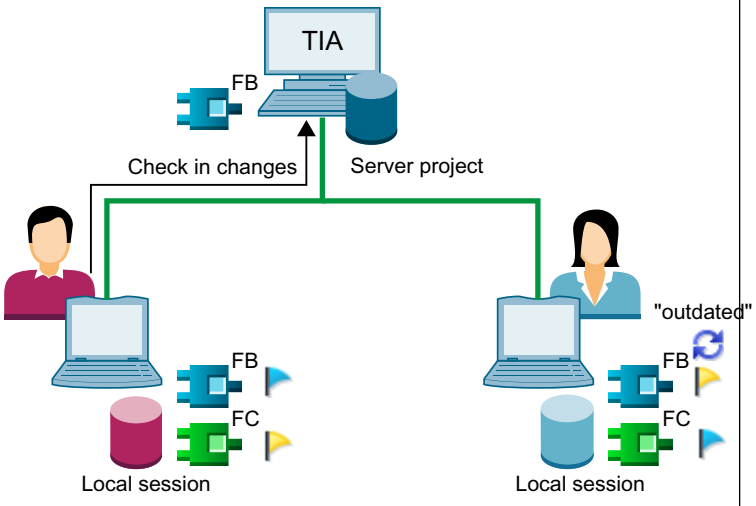
https://support.industry.siemens.com/cs/ww/en/view/109740141 (https://support.industry.siemens.com/cs/ww/en/view/109740141)



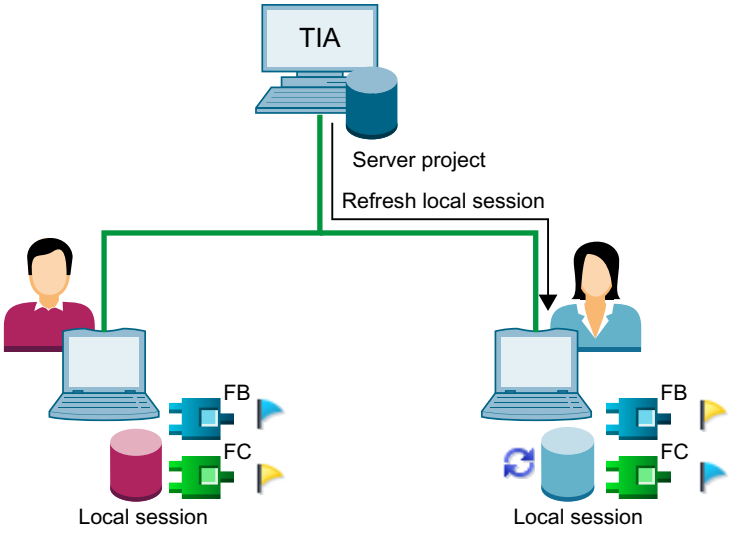


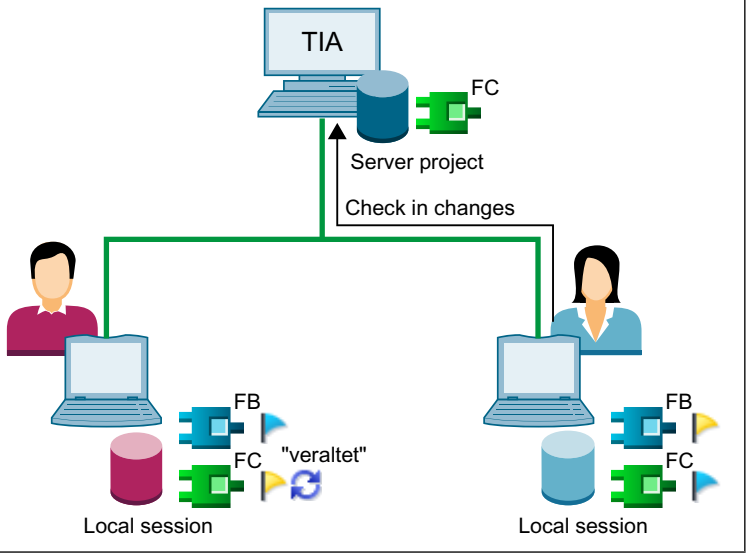
Requirements for working with Multiuser Engineering



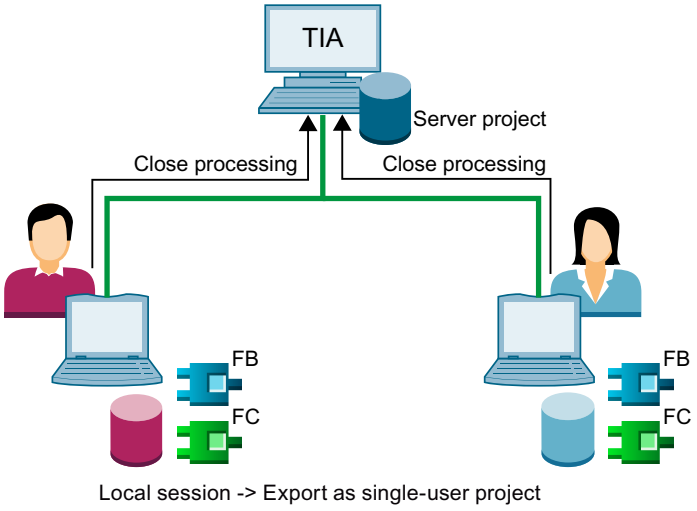


Please observe the following rules for working in multiuser projects:





- Before they can be used as multiuser projects, the projects to be edited should already contain the entire hardware configuration, the required blocks, connections and global settings.
  For more information on this topic, refer to: Requirements for multiuser projects (Page 6703)
- Avoid working on the same objects simultaneously by consulting beforehand with the other editors.
- All global settings, such as changes within the device configuration, must be made in the server project view (i.e. in the central server project).
- All objects of a multiuser project can be edited in the server project view. You can also edit objects that do not support the Multiuser Engineering functionality.



Overview of the mode of operation with Multiuser Engineering

To use the Multiuser Engineering functionality, carry out the following steps:

Action	Example
1. Create multiuser project on the server You install a multiuser server and upload a single-user project to the multiuser server that is being used. • The project should be structured so that the requirements for multiuser projects are fulfilled. **Result:** By uploading a project to the multiuser server, you generate a multiuser server project out of the single-user project.	
2. Create local session for "Editor 1" You create a "local session" as copy of the server project on your computer. • Each editor marks the object they want edit in their local session. • Various objects can be edited at the same time by several users in the various local sessions. **Result:** Objects marked in their own local session are identified with a blue flag. The flags are also displayed in the project tree and the editors of the TIA Portal.	

Action	Example
3. Create local session for "Editor 2" You create a second local session so that the second editor can edit their task in their own local session. • The second editor also marks the object they want to edit in their local session. **Result:** Objects marked in their own local session are identified with a blue flag. Objects marked in another local session are identified with a yellow flag. Therefore, each editor also sees which objects they are working on or which other editors are working on.	
4. Checking in the changes by "Editor 1". As soon as the work in the local session has reached a certain working version, check the changes into the multiuser server project. • The changes to marked objects are applied in the multiuser server project by the check-in. • After the check-in, "Editor 2" is shown in their local session that a object is "outdated". **Result:** The changes of "Editor 1" are transferred to the server project. "Editor 2" can refresh their local session with the new server data, if required.	

Action	Example
5. "Editor 2" updates their local session "Editor 2" is shown in their local session that an object is available in a newer version in the server project and updates their local session. • The newer version is applied by the refresh and inserted in their own local session. • All unmarked objects are overwritten with the current server version, all marked objects are retained. **Result:** The changes from the server project are transferred to the local session of "Editor 2".	
6. "Editor 2" checks in changes to server project "Editor 2" has completed their changes in the local session and checks their blue-marked objects into the multiuser server project. • The changes to marked objects are applied in the multiuser server project by the check-in. • After the check-in, "Editor 1" is shown in their local session that an object is "outdated". **Result:** The changes of "Editor 2" are transferred to the server project. "Editor 1" can refresh their local session with the new server data, if required.	

Action	Example
7. Processing is completed The processing of the various configuration tasks in the local sessions has been completed. **Result:** All changes are checked in to server project. The local sessions and the server project are synchronized. There are no more markings in the local sessions. You can save the multiuser server project as single-user project and continue to use it in TIA Portal as usual. **Note**: If required, you can export the local sessions as single-user project and continue to work on them as usual in the TIA Portal.

Exporting a local session as single-user project (Page 6787)

15.3.3 Basics of the multiuser server concept

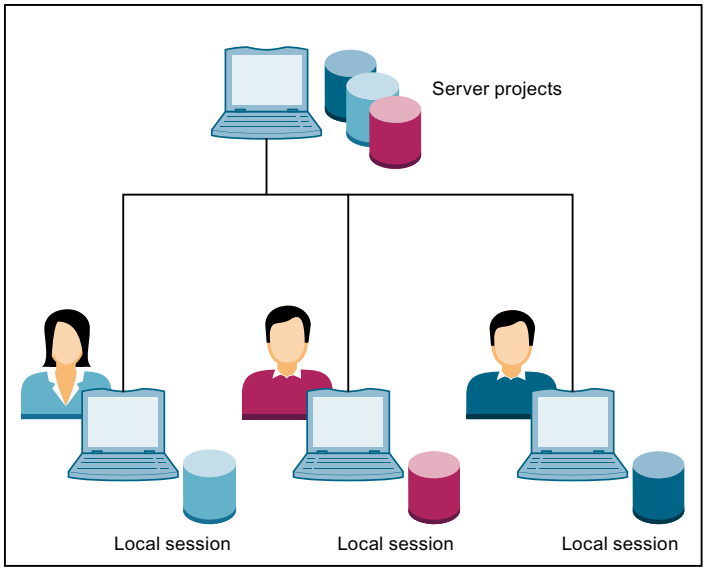
Introduction

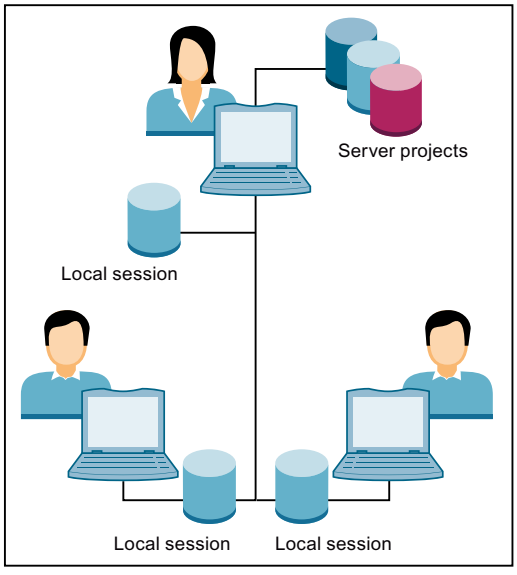
To work with Multiuser Engineering , you need a multiuser server that manages your multiuser projects and the local sessions.

With the help of the multiuser server you can:

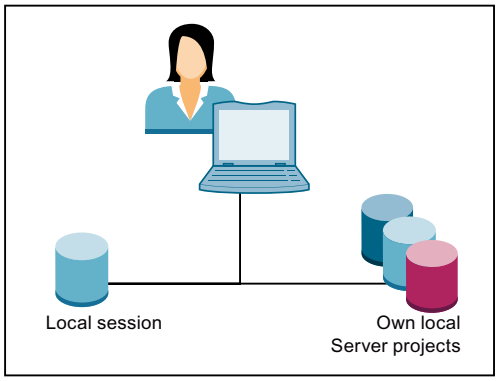
- Create new multiuser server projects in which multiple users can work at the same time.
- Display and manage existing server projects.
- Create and manage local sessions.

Requirement





To use the functionality of the multiuser server, you must have installed the multiuser server software suitable for your version of the TIA Portal (e.g. TIA Portal V14 and multiuser server V14) or use the local multiuser server that was installed by default.



Possible server constellations

Different server constellations for the Multiuser Engineering functionality are available in TIA Portal V14 or higher:

1. The "local" multiuser server that is automatically installed in the TIA Portal.
2. The so-called "temporary multiuser server" in which the server functionality is implemented on a workstation.
3. The multiuser server that is implemented as dedicated external server for long-term collaboration.

The table below provides an overview of working with the possible server constellations.

Overview of possible server constellations for Multiuser Engineering	
1. Multiuser server as dedicated server • The multiuser server can be installed with the TIA Portal or as a standalone product. • This configuration is usually the one that is used as "office network configuration". • The multiuser server runs on a separate computer. • This server constellation can be reached at all times and supports integrated working "around the clock" by default. • The multiuser server must be installed and configured.	
2. Temporary multiuser server: • Editors of the multiuser project can apply the server function to their computer. • This configuration is also a possible "office configuration". • The temporary multiuser server must be installed and configured.	

Overview of possible server constellations for Multiuser Engineering	
3. Local multiuser server: • The local multiuser server runs on the computer of the respective editor. • It is available immediately without additional installation and configuration because it is installed with the TIA Portal. • There is no multiuser license request for the local multiuser server. • The local multiuser server cannot be accessed from other computers over a network. • The local multiuser server is suitable for learning and testing the Multiuser Engineering functionality because it does not require server installation or configuration. • The local multiuser server can also be used for separate project management with "rollback" function.

Overview of the mode of operation with Multiuser Engineering (Page 6689)

Requirements for working with Multiuser Engineering (Page 6696)

Supported objects for Multiuser Engineering (Page 6699)

15.3.4 Requirements for working with Multiuser Engineering

System requirements

The same hardware and software requirements as for working with TIA Portal V14 apply to working with Multiuser Engineering in V14 .

For information about the regulations in place for the products you have installed, go to "Installation" > "System requirements for installation".

Note

Identical software installation as requirement for working with Multiuser Engineering

To work with Multiuser Engineering without any restrictions, it is important that the same software products of the TIA Portal are installed with identical product versions on all Engineering Systems used.

Note

Access to the Multiuser server

Users can only receive access to the Multiuser server if they are **not** included in the local administrator group of the Multiuser server.

Note

Access to the Multiuser server project

Users can only receive access to the Multiuser server project if they are included at least as a "Member" in the "User Management" of the Multiuser server.

Multiuser server

To work with the full functionality of Multiuser Engineering, you need an installed multiuser server.

You need administrator rights in part for installing, configuring and administering the multiuser server.

The multiuser server is configured and administered with the supplied multiuser tools.

Two alternative procedures are available for this purpose:

- Using the graphical user interface
- Using the multiuser administrative tools and power tools which are executed with the command line.

You can configure and administer the multiuser server using a convenient user interface or with command line commands. Both procedures lead to an identical result.

A detailed description of the procedure is available under "Installing the multiuser server (Page 6711)" and under "Configuring and administering the multiuser server (Page 6714)".

Multiuser network profiles

You have the option of setting the required performance capability for the network profile you are using in the settings for the TIA Portal.

To do so, select the required profile from the drop-down list in the TIA Portal under "Options" > "Settings" > "Multiuser" > "Multiuser network profiles".

You will find a detailed description of the network profiles at Setting the multiuser network profiles (Page 6767)

Licensing for Multiuser Engineering

For working with Multiuser Engineering , you only need a license for a specific version (Floating License) and an associated License Key when you are working with a multiuser server.

As long as you are only using the local multiuser server with limited functionality, you do not need an additional license for the installed TIA Portal.

You can either include the License Key in the installation of the TIA Portal or transfer it using the Automation License Manager after the installation. Multiuser Engineering checks whether a valid license key exists as soon as you open a local session to edit objects.

If a valid license key is found, the local session is opened and you can work in the local session without restrictions.

If a valid license key is not found, you will receive an error message.

You can temporarily activate a "Trial" license to work in a local session.

Once the "Trial" license has expired, you need a valid multiuser license to work in local sessions.

A license is not required for the following actions in the context of Multiuser Engineering:

- Configuring and starting the multiuser server
- Opening the multiuser project management
- Adding projects to the multiuser server
- Creating local sessions
- Deleting local sessions
- Exporting local sessions as single-user projects

Note

Handling licenses

Please observe the general information on handling licenses in the TIA Portal. This information is available in the "Installation" section of the respective products in the information system.

Archiving and retrieving projects

The archiving and dearchiving of local sessions is not supported by Multiuser Engineering.

Archiving and retrieving of multiuser projects results in invalid local sessions, because the connection to the multiuser server is interrupted by these actions.

Opening a local session as reference project

It is not possible to open a local session as reference project when working with Multiuser Engineering. This prevents a local session from being opened multiple times simultaneously and therefore becoming invalid.

Length of the path and file names in Multiuser Engineering

If the path and file names have more than 259 characters in total, an error message is displayed when you are working with Multiuser Engineering. You are notified that the used names are too long and that the requested action cannot be performed for this reason. Shorten the path names or file names in this case so that the required action can be performed.

See also

Setting the multiuser network profiles (Page 6767)

15.3.5 Supported objects for Multiuser Engineering

Introduction

The Multiuser Engineering functionality is available for almost all objects in TIA Portal V14 or higher.

Objects that do not support this functionality yet can be edited in the local session but cannot be marked.

This means they are **not** applied to the server project during check-in. The changes to such objects are again overwritten with the contents of the server project and lost after check-in and after a refresh in the local session.

You can edit unmarked objects in the server project view.

You should make version changes to instructions in the server project view.

In Multiuser Engineering, it is also possible to work with the Team Engineering functionality, such as working on a shared CPU and data exchange via Inter Project Engineering (IPE).

Objects supported by STEP 7 for Multiuser Engineering

The objects listed below for the STEP 7 product are supported:

- Blocks:
  OB, FB, FC, global DBs and instance DBs
- PLC data types and constants:
  With the exception of system data types generated automatically by the system.
- Tags:
  With the exception of system tags that are created and deleted by the system.
- Interrupts:
  With the exception of system interrupts.
  Program interrupts can only be marked for editing together with the associated FB or DB.
- Interrupt classes:
  With the exception of system interrupt classes
- Text lists:
  With the exception of system text lists
- Watch and force tables
- Library elements of the project libraries

- Technology objects:
  With the exception of technology objects for Standard Motion Control and Advanced Motion Control.
- Trace functionality:
  With the exception of online configurations

Objects supported by WinCC for Multiuser Engineering

The objects listed below are supported for the WinCC product:

- Screens:
  With the exception of global screen, overview screen, slide-in screens and global filtering of the alarm view.
- Scripts:
  With the exception of the header file "GlobalDefinitions.h".
- Tags:
  With the exception of system tags, recipe tags, archive tags and raw data tags generated by the system.
- Alarms:
  With the exception of system alarms, controller alarms, predefined system alarm classes (including "Safety Warnings" for KTP700F, KTP900F), system class groups and system alarm groups as well as message blocks.
- Text lists, graphic lists and C text list entries

NOTICE
Editing unsupported objects in the local session Objects that are not supported can be edited in a local session but cannot be marked. Changes to unsupported objects are **not** applied to the server project during check-in. Changes to such objects are lost after check-in and after a refresh in the local session, because they are once again overwritten with the contents of the server project. You can, however, edit such objects that are not supported in the usual way in the server project view.

15.3.6 Settings for working with Multiuser Engineering

Introduction

For working with Multiuser Engineering you can make the following multiuser-specific settings in the

TIA Portal under "Options > Settings" on the "Multiuser" tab:

- General
- Multiuser server connection

- Multiuser network profiles
- Searching in the project
- Storage settings
- Compilation settings

The individual setting options are described below.

General

In the "General" settings, you can select whether the editors opened in the local session are to be hidden when the server project view is opened.

This option is disabled by default.

Multiuser server connection

This dialog is used to add new server connections for a selected multiuser server.

- To create this connection, click the "Add server connection" button.
- In the following dialog box, enter the server name and the associated host and port under "Server Name".
- Select the required transmission protocol for the server connection. "http" is selected by default as transmission protocol.
- Click "Add".

The new multiuser server connection is added and displayed.

See also Introduction to the multiuser server (Page 6766).

Multiuser network profiles

You have the option to select from the drop-down list the required network profile that matches the performance capability of the network you are using

The selected multiuser network profile determines the time until a timeout message is generated.

You will find a detailed description of the individual network profiles at Setting the multiuser network profiles (Page 6767).

Searching in the project

The data for the search must be indexed in order for the global search to also work in local sessions. This option is enabled by default so that the indexing for the search is always executed during check-in.

This is the recommended setting.

If you disable this option, the indexing is not executed during check-in but instead at a different time.

The indexing data is then transferred first as file to the multiuser server. However, a search in the local session is only possible after indexing has been successfully completed. If no indexing was performed during check-in, this can result in somewhat longer waiting times when searching and prolong the check-in times of other editors that have activated this option.

Storage settings

Here you can define where your local sessions and your multiuser server projects will be saved.

- Storage location currently used
  This option is enabled by default.
- Defining a storage location by default
  Select the respective required storage location here by navigating to the required location. Click "Browse" for this purpose. Your settings are applied as default.

Compilation settings

Define here the required compilation settings for your local sessions. The settings made here are applied as defaults in the multiuser editor and can no longer be changed there.

Select the required settings.

- Compile before check-in
  This option is enabled by default and means that a compiling process is executed before the check-in.
- Compilation settings:
  This setting defines the extent to which the software changes are compiled. You have the following options.
  - Marked objects (changes only)
    The changes made to the marked objects for the selected device are compiled together with the device-specific objects.
  - Device software (changes only)
    The changes made to the marked objects are compiled together with the software version on the assigned devices.
    Example: You have marked and changed several objects that belong to more than one device (for example to CPU_1 and to CPU_2). These marked objects are compiled together with the software versions of both CPUs during compiling.
- Disable compilation settings in the multiuser editor
  If you activate the option, you can no longer change the compilation settings in the multiuser editor.
  The settings you made here then apply as default.

Setting the multiuser network profiles (Page 6767)

Introduction to the multiuser server (Page 6766)

15.3.7 Requirements for multiuser projects

Introduction

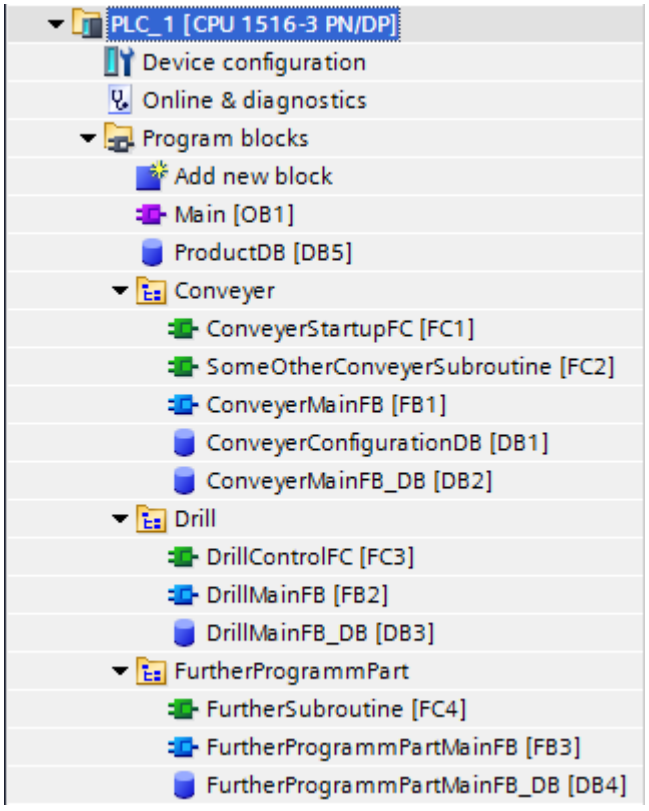
To work with Multiuser Engineering simultaneously and in parallel, it is very important that the multiuser server project that serves as the work basis is clearly structured.

Requirements for multiuser server projects

To create multiuser capable server projects, start with a single-user project that fulfills the following requirements:

- The project should already include the hardware configuration with all required connections.
- Divide the user program into program parts that are independent of each other.
- Create a useful, technology-oriented project structure with folders and groups for the objects to be edited by the individual users.
- When structuring the project, make sure that multiple users can work with the different project directories simultaneously and exclusively.
  Example: One user edits the blocks in group 1 while another user simultaneously edits the blocks in group 2.
- Use a main OB and a central FB or FC for each program part which calls the functions of the subprogram.
- If possible, create a separate PLC tag table for each group.
- You should define in advance all needed project languages that are to be used by the engineering systems involved.
- If possible, create all connections that are to be edited in the multiuser project.
- Define the screen resolution and specify the size of the HMI screens.
- Use global data blocks to save the data for the individual program parts, no bit memories.
- When you load a single-user project created according to these rules to a multiuser server, it becomes a multiuser project.
- Edit the defined objects of the multiuser project simultaneously with multiple users in the local sessions. When you create new objects in the local sessions, make sure that you use different symbolic names.

Example of a server project for multiple users



The figure below shows an example of a server project for multiple users with a clear structure that permits parallel editing of individual objects in the context of Multiuser Engineering .

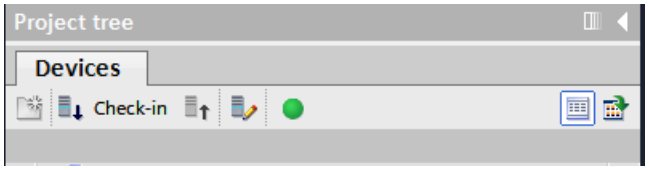
Each program part contains a "main FB", which calls the specific lower-lever functions for this program part.

The program parts edited by the individual Engineering Systems are:

- Program part 1: "Conveyer"
- Program part 2: "Drill"
- Program part 3: "FurtherProgramPart"

In the "Conveyer" program part, the "ConveyerMainFB" calls the "ConveyerStartupFC" function.

15.3.8 Operator controls in Multiuser Engineering



15.3.8.1 Multiuser icons in the user interface

Introduction

When you are working with Multiuser Engineering and a local session is open, you can see multiuser-specific icons in the TIA Portal user interface.

Multiuser icons in the toolbar

The Multiuser Engineering user interface shows the following icons in the toolbar when a local session is open:

Icon	Meaning
	**Check-in** When you click this icon, the multiuser editor opens in the change view. In the modification view, all objects marked for check-in are displayed and you can select and check in the desired objects.
	**Refresh** When you click this icon, the multiuser editor opens in the "Refresh" view. In this view, you can, if you wish, refresh your local session with the new contents of the server project.
	**Open/close server project** When you click this icon, the multiuser server project associated with your local session is opened for editing. You can then make your changes directly in the server project.
	**Server status "connected"** This icon indicates that the associated multiuser server is available.
	**Server status "locked"** This icon indicates that the associated multiuser server is currently being used by a user and is therefore locked. The server is also displayed as locked when a user is working the server project view. If you place the mouse pointer on this icon, you will receive additional information about the lock.
	**Server status "not connected"** This icon indicates that the associated multiuser server is not connected.
	This overlay icon shows that a newer version of the server project is available on the multiuser server.

Icons for display of multiuser projects

The following icons are displayed for multiuser projects and local sessions in the user interface:

Icon	Meaning
	**Multiuser server** This icon identifies a multiuser server.
	**Multiuser project** This icon identifies a multiuser project associated with a multiuser server.
	**Local session** This icon identifies a local session that is associated with a multiuser project that is assigned to a multiuser server.

15.3.8.2 Multiuser icons in the user interface

Introduction

When working with Multiuser Engineering , multiuser-specific icons are displayed in the TIA Portal user interface which make it easier for multiple users to work at the same time. A unique, user-specific visualization is intended to make collaboration within multiuser projects and in local sessions more effective and transparent.

Marking objects

To edit an object using Multiuser Engineering, it should first be "marked". Only objects marked for check-in can be transferred into the server project after editing.

Marking can only be added for "marked objects". Objects that cannot be edited in the local session also cannot be marked.

Such objects can, however, be edited in the server project view.

The icons described below show you which objects were marked by you or other editors.

Icons for marking in Multiuser Engineering

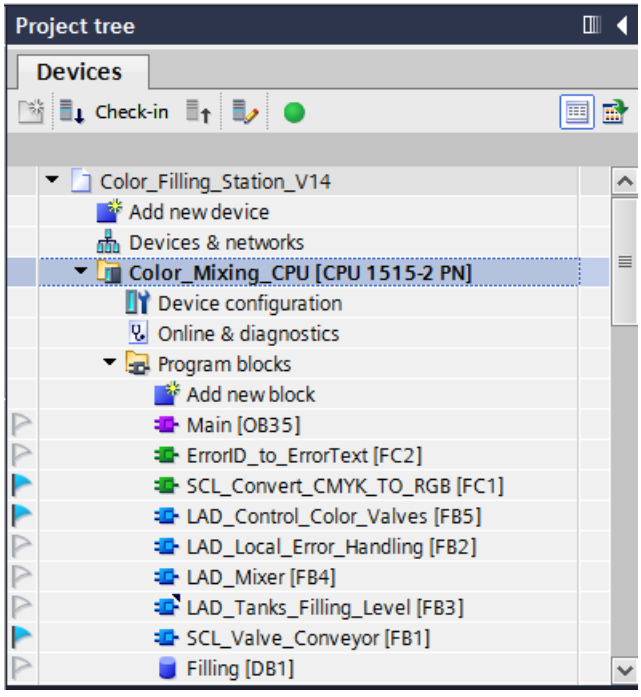
The following icons are used for marking in Multiuser Engineering :

Icon	Meaning
	**Markable object** This object can be marked for check-in by clicking it.
	**Marked object** The object was marked in your own local session for check-in.
	**Marked object** The object was marked for check-in in a different session or in the server project view.
	**Marked object with conflict** The object was marked for check-in in multiple local sessions or in a local session and in the server project view and causes a conflict. An object should only be marked for check-in once within the entire multiuser working area (with the local session and within the server project view). An object marked in red can still be checked in. However, the check-in may cause unwanted overwriting in the server project because only the last checked in version is applied in the server project.
	**Object is outdated** If one of the icons mentioned above Is also identified with this overlay, the object does no longer correspond to the latest version of the server project and should definitely be updated. If the object is checked in without refresh, the editing of the other user is overwritten and thus cancelled. The refresh ensures that all editors of a multiuser project have a consistent version.

Note

Objects without flags

Note that objects without flag can only be edited in the server project view and not in the local session.



Display of multiuser markings in the TIA Portal

When you are working with Multiuser Engineering in the local session or in the server project, the multiuser-specific markings are displayed in the following views of the TIA Portal in all editors:

- In the project tree
- In the detail view
- In the overview window
- In the library views

An additional first table column is available in all table displays within the project tree when working with Multiuser Engineering. The first table column is reserved for the multiuser-specific markings described above.

The following figure shows an example of multiple selected objects in the project tree:

15.3.8.3 Multiuser banner in the user interface

Introduction

When working with Multiuser Engineering , you are supported by the display of multiuser-specific banner texts in editors.

Banner texts include notes and warnings on the further procedure which make your work easier.

Banner texts can be expanded and collapsed by clicking the yellow circle with the exclamation point.

Example of a multiuser banner text

Functionality of the multiuser banner texts

Banner texts are displayed both when working into the local session and when working in the server project view.

As soon as you need additional information to work with Multiuser Engineering , a yellow banner text appears.

The multiuser banner texts have the following function:

- Information about how to edit the opened object:
  - Banner texts point out, for example, that the opened object has not been selected for check-in yet and your changes therefore cannot be applied to the server project.
  - Or they make you aware that this specific object cannot be edited in the local session but only in the server project view.
- Links make for easier execution of the further sequences required.
  - You can use the links, for example, to conveniently mark the open object or open the server project view in which you will continue editing.

As soon as you have executed the required sequences in the individual editors, the banner texts are partially deleted in the editor once again and you can continue working as usual.

15.3.8.4 Functionality of the multiuser editor

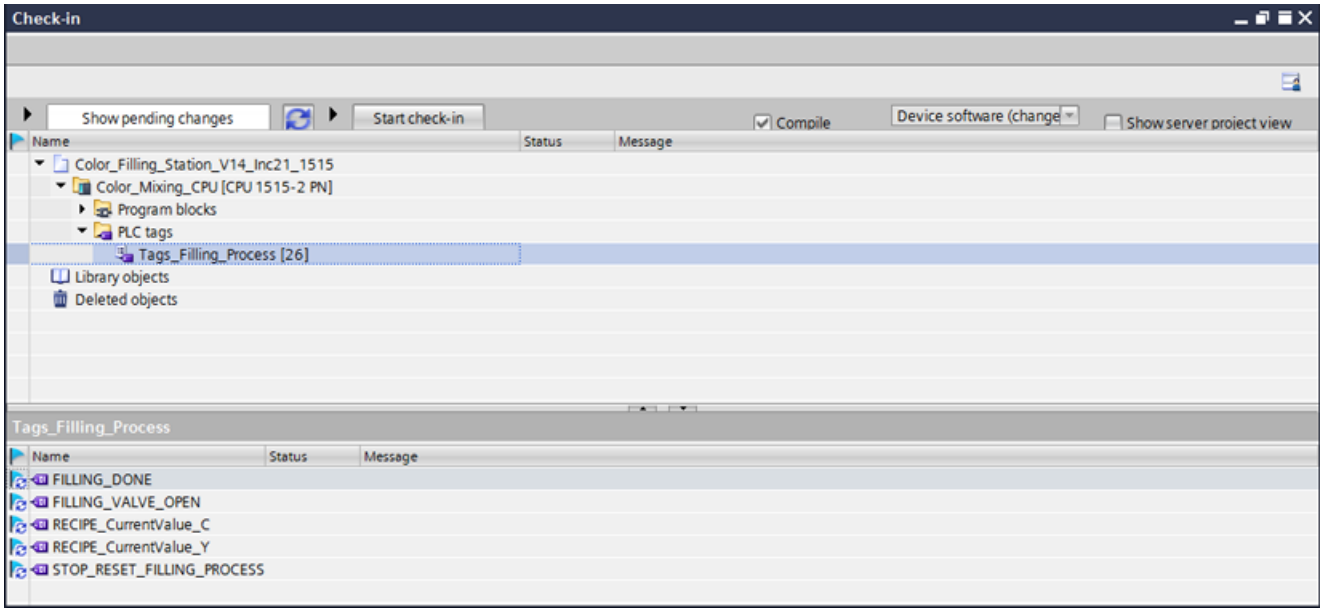
Introduction

You can call the multiuser editor with the "Check-in" and "Refresh local session" buttons in the Multiuser Engineering toolbar.

The multiuser editor has two different views, depending on the button with which the editor was started in the multiuser toolbar:

- "Check-in" view: Opened by clicking the "Check-in" button in the toolbar of the project tree.
- "Refresh" view: Opened by clicking the "Refresh local session" button in the toolbar of the project tree.
  The "Update" view can always be opened even if the local session does not contain any objects that can be updated.

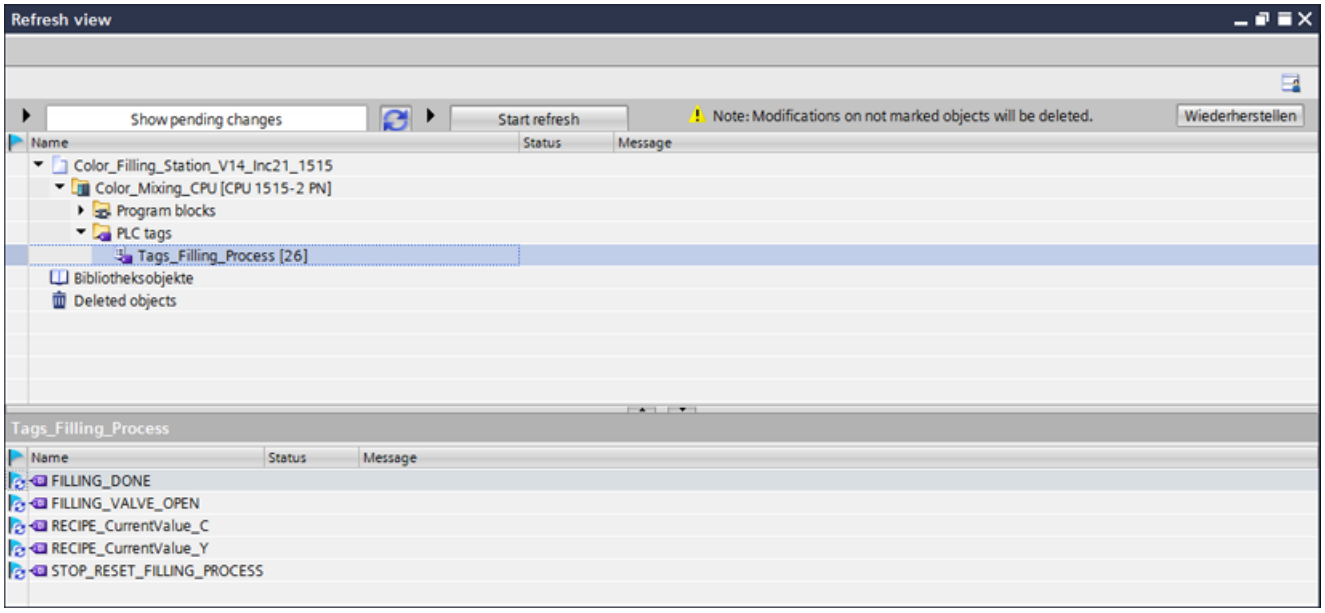
The structure of the multiuser editor is the same in both views, but each view offers different buttons and options.



Note

Displaying in the multiuser editor

If you have opened the multiuser editor and simultaneously make changes in your local session, these changes are only visible in the open editor after a "Refresh". To do this, click the "Refresh" button (circular arrow) in the open editor.



Multiuser editor in the "Check-in" view

The figure below shows an example of the multiuser editor in the "Check-in" view:

Multiuser editor in the "Refresh" view

The figure below shows an example of the multiuser editor in the "Refresh" view:

Structure of the multiuser editor

The multiuser editor has the following structure:

1. Toolbar:

Shows the icon for saving the layout settings.

2. Button area:

Shows the multiuser-specific buttons for the check-in and refresh.

3. Working area:

Shows the change view prior to check-in or refresh.

- Shows all objects marked in the local session for check-in and refresh as these are also displayed in the project tree.
- Shows the status messages with the results for the check-in and the refresh.
- The "PLC_Tags" folder can be opened.
  Clicking on the tag table in the bottom window in the detail view shows the tags selected for check-in.
- The "Library objects" folder is only displayed when library objects were marked for check-in.
  If the folder is selected, the selected library objects are displayed in the detailed view.
- The "Deleted objects" folder is only displayed if objects were deleted in the local session.
  If the folder is selected, all objects that were deleted in the local session are displayed in the detailed view.

4. Detailed view:

Shows information on lower-level elements (in this case, the selected PLC tags) and status messages.

Note

Procedure for working with the multiuser editor

The procedures for working with the multiuser editor are described in detail in the sections below.

15.3.9 Installing and uninstalling the Multiuser server

15.3.9.1 Notes on the installation of the multiuser server

Introduction

Installation of the multiuser server gives you access to the Multiuser Engineering functionality that is available with TIA Portal V14.

You can install the multiuser server as follows:

- Together with the installation of the TIA Portal.
- As standalone installation by means of a separate installation process without TIA Portal.

Note

Administrator rights are required for the server installation.

Installation of the multiuser server with the TIA Portal

The multiuser server is installed together with the following TIA Portal products:

- SIMATIC STEP 7 Basic V14.0
- SIMATIC STEP 7 Professional V14.0
- SIMATIC WinCC Basic V14.0
- SIMATIC WinCC Comfort/Advanced V14.0
- SIMATIC WinCC Professional V14.0

The multiuser server is usually activated in the product selection by default and is then installed with the TIA Portal. Check the settings during installation of the TIA Portal. You can find the specific default settings for the multiuser server during setup when selecting the product in the "Tools" directory. By selecting or clearing the options, you can specify if the multiuser server is to be installed along with the TIA Portal or not.

Installation of the multiuser server as standalone installation

The installation of the multiuser server can also be a standalone installation.

A description of automated installation is also available on the product DVD in the directory "Documents\Readme\<language directory>".

Identical TIA Portal versions during installation

When installing different TIA Portal products on various clients, make sure that all participants use the same versions of software products for the installation.

For example, if you have installed STEP 7 Professional, WinCC Advanced and Safety as well as the multiuser server with version V14.0, all other Team Engineering participants must also have installed this software in identical versions.

The service packs and updates must be installed for all products at the same time.

Installation path

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

Antivirus programs

During the installation, read and write access to installed files is necessary. Some antivirus programs block this access. We therefore recommend that you disable antivirus programs during the installation of the multiuser server and enable them again afterwards.

15.3.9.2 Installing the multiuser server

Introduction

The multiuser server V14 can be installed as part of the TIA Portal V14 installation or as standalone product.

A description of automated installation is also available on the product DVD in the directory "Documents\Readme\<language directory>".

Installation rules

Multiple versions of the multiuser server can be installed on a computer, but only one version of the multiuser server can be run with the corresponding version of the TIA Portal.

Example: The multiuser server V14.0 can only be run with TIA Portal V14.0.

Requirements for installation

The same requirements apply to the installation of the multiuser server V14.0 as for the installation of the TIA Portal V14.0.

For more details, see: AUTOHOTSPOT

Installing the multiuser server with the TIA Portal

Follow these steps for installation:

1. Note the requirements for the installation of the selected software package.
2. Start the setup program of the required product by inserting the installation medium into the respective drive.
3. Select the preferred settings and click the "Install" button.
4. Make sure that the multiuser server is selected in the product selection and observe the notes in the setup dialogs.

Result

The multiuser server is installed on your computer together with the TIA Portal.

Installing the multiuser server as standalone product

Follow these steps for installation:

1. Note the requirements for the installation of the multiuser server.
2. Start setup for the standalone installation of the multiuser server with a double-click on the self-extracting .exe file "TIA_Portal_Multiuser_Server_V14.exe". You can find these files in the directory "Support" on the corresponding product DVD.
3. Select the preferred settings and click the "Install" button.
4. Follow the instructions in the setup dialogs.

Result

The multiuser server is installed on your computer.

15.3.9.3 Uninstalling the multiuser server

Introduction

You can use the Control Panel to remove the multiuser server.

Requirements for removal

There is a multiuser server installed on your computer.

Uninstalling the multiuser server

Proceed as follows for removal:

1. Open the Control Panel.
2. Click on "Uninstall a program" in the Control Panel.
   The "Uninstall or change a program" dialog opens.
3. Right-click the entry for the "Multiuser server" in the "Uninstall or change a program" dialog, and click "Uninstall".
   A security prompt appears.
4. Click "Yes" to confirm this prompt.

Result

The multiuser server is removed from your computer.

15.3.10 Configuring and managing the multiuser server

15.3.10.1 Options for configuring and administering the multiuser server

Introduction

The following options are also available for configuring and administering the multiuser server:

- Using the graphic tools (Configuration Tool and Administration Tool).
- Using the command line tools (Multiuser Administrative Tools and Multiuser Power Tools).

You can configure and manage multiuser server with both methods.

The graphical tools are easier to operate using the graphical user interface. The command line tools have a somewhat wider range of functions with respect to the error log. You can compress and send the error logs as a zip file.

You have the option of using the procedure you prefer.

Administrator rights are required for configuring the multiuser server irrespective of the selected procedure.

You need administrator rights for some for administrative tasks (for "User Management") and users' rights.

Note

Available languages

The tools for configuring and administering the multiuser server are available in English only.

Configuration and administration with the graphic tools

The graphic tool provides you with a very convenient way of configuring and administering the multiuser server.

You see at a glance all setting options and can activate these by selecting the corresponding options.

You can find the exact procedure in: Using the graphic tool (Page 6715)

Configuration and administration with the command line tools

The configuration of the multiuser server is performed with the administrative tools.

The power tools are used for administering the multiuser server.

The power tools for performing administration tasks on the multiuser server are also available to you within the TIA Portal.

You can find the exact procedure in: Using the command line tools (Page 6734)

Note

Working with the command line tools

For working with the command line tools, you should have prior experience handling inputs in the command line.

If you lack this experience, you should use the more user-friendly graphic user interface for configuring and administering the multiuser server.

See also

Using the command line tools (Page 6734)

Using the graphic tool (Page 6715)

15.3.10.2 Using the graphic tool

Introduction to the graphic multiuser tools

Introduction

The multiuser server can be easily configured and administered with the help of the graphic tools.

You use the "ConfigurationTool" to configure the multiuser server.

You use the "AdministrationTool" to administer the multiuser server.

You need administrator rights in some areas to configure the multiuser server.

Note

Configuration tool and Administration tool

The user interfaces for both tools are available in English only.

Requirement

The multiuser server is installed.

Steps for configuring the multiuser server with the "Configuration Tool"

To configure the multiuser server, the following steps are required:

- Open the graphic tool for the multiuser server configuration with administrator rights.
- To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
- Click on the "Multiuser Server V14 Configuration" entry to open the Configuration Tool.
- Enter the required information and click "Install service".

You can find the exact procedure in: Configuring a multiuser server with the graphic tool (Page 6717)

Steps for administering the multiuser server with the "Administration Tool"

To administer the multiuser server, the following steps are required:

- Open the graphic tool for the multiuser server administration.
- To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
- Click on the "Multiuser Server V14 Administration" to open the Administration Tool.
- Insert a connection to the desired multiuser server and enter the data for the administration of the server.
- Assign the desired roles and rights for working with the newly created multiuser server connection under "User Management".
- Administer your local sessions under "Sessions".
- Under "History", you will find the complete history with all activities for your projects.

You can find the exact procedure in: Administering a multiuser server with the graphic tool (Page 6721)

See also

Configuring a multiuser server with the graphic tool (Page 6717)

Administering a multiuser server with the graphic tool (Page 6721)

Configuring a multiuser server with the graphic tool

Introduction

You use the graphic "Configuration Tool" to configure the multiuser server.

Note
Configuration Tool

- The user interface for the Configuration tool is available in English only.
- You need administrator rights to work with the Configuration Tool.

The following functions can be executed with the "Configuration Tool":

"Server status" area

- Contains the above-displayed contents the first time the Configuration tool is opened. This area is not editable.
- Once the configuration has been successfully completed, the server can be uninstalled, started and stopped in this area.

"Connection settings" area

- Allows you to select the connection data.

"Security" area

- Offers the option to create a new certificate or to use an existing certificate for a selected https connection.

"Storage" area

- Allows you to select the storage location for multiuser projects.
- Specifies how many project versions are available as "rollback".

Note
Changes to existing inputs

To apply changes to existing inputs in the Configuration tool, you must click the "Apply" button.

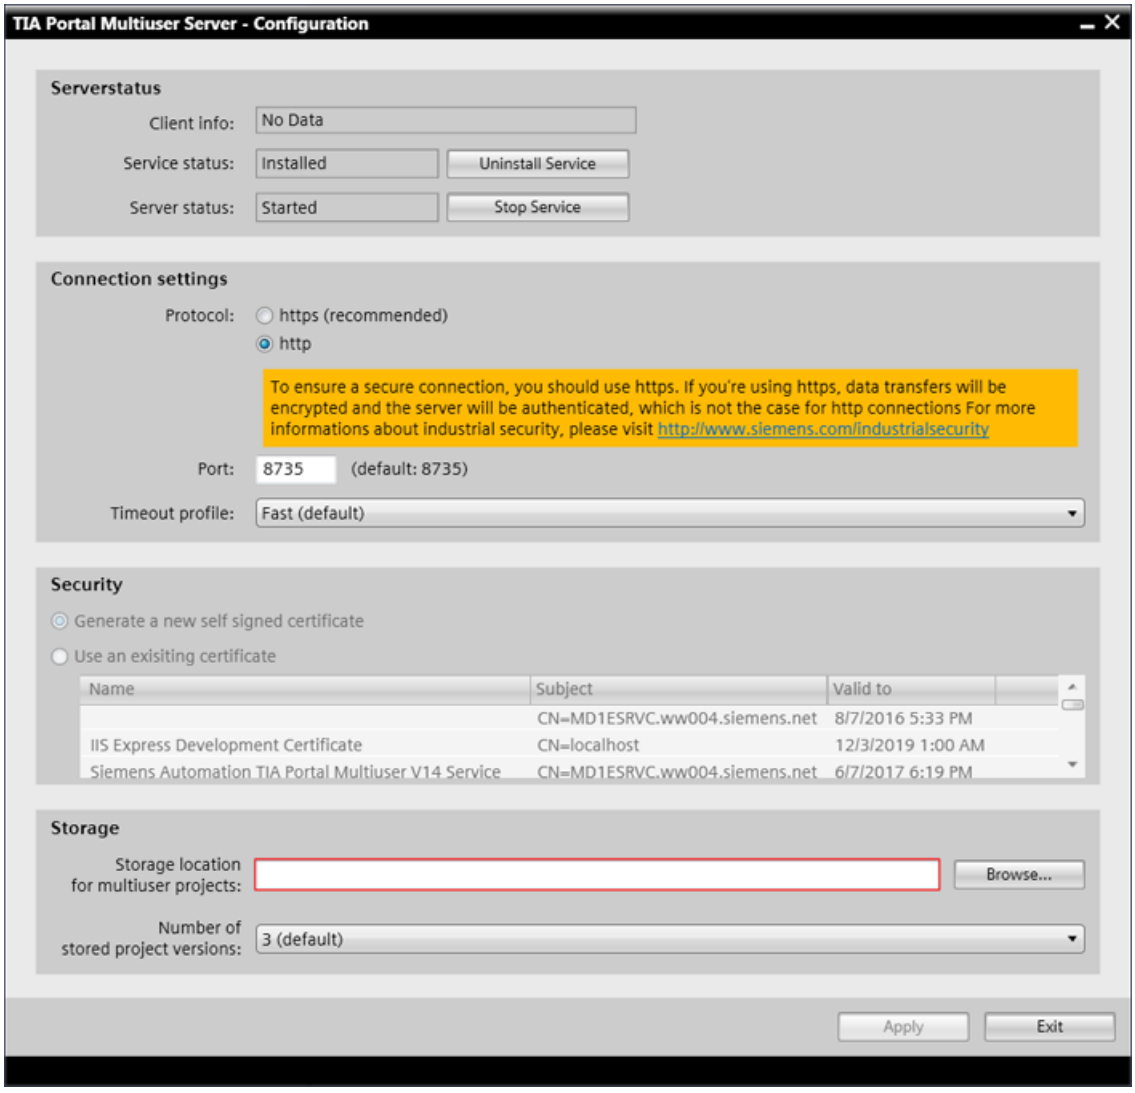
Note

Memory space on the multiuser server

For the project management, you need to have sufficient free space on the multiuser server, depending on the project size and the number of project revisions.

Basically, the provided space should be at least five times the expected size of the project.

When using more than three project revisions, the free memory space must be increased accordingly. You set the number of project revisions when configuring the multiuser server.



Generally, you should provide sufficient storage capacity and also take into account or evaluate the messages of the operating system as the memory space decreases.

Requirement

The multiuser server is installed.

User interface of the Configuration tool

The user interface of the Configuration tool contains the following the first time it is opened:

Configuring the multiuser server with the "Configuration Tool"

To configure the multiuser server, follow these steps:

1. Open the graphic tool for the multiuser server configuration with administrator rights.
   To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   Click on the "Multiuser Server V14 Configuration" entry.
   The user interface of the Configuration Tool then opens.
2. In the "Connection settings" area, select the desired protocol.
   Default selection is "http". The text with yellow background is hidden as soon as you click on "https".
   With "https", communication is encrypted and a certificate is requested. This means communication has a higher security level than the unencrypted "http" communication.
3. Enter the desired port for the server connection if you do not want to use the default setting.
4. Select the desired "Timeout profile" for the server from the drop-down list.
   This setting defines the timeout behavior for the server.
   You have the option of selecting between three profiles: "Fast", "Middle" and "Slow", where the default setting is "Fast".
5. "Security" area: If you have selected "https" as the protocol, the "Security" area is activated.
   Select the desired option for the certificate.
   You have the option of creating a new certificate or using an existing certificate on your computer.
   If you activate the first option, a new certificate is created after successful completion of the configuration.
   If you activate the second option, you can click on the desired certificate in the displayed list of certificates to select it.
6. Under "Storage", specify the desired storage location for multiuser projects. You can enter the path directly or navigate to the desired location via "Browse".
7. Select the number of project versions to be stored from the subsequent drop-down list.
   Three project versions are saved by default.
   You can choose to store between "1" and "10" project versions.
8. Click "Install service" to complete the configuration.

Result

A message informs you that the configuration of the multiuser server was successful.

In the "Server status" area, you will find the URL for the multiuser server and the fingerprint for the generated certificate under "Client info".

Example: https://XY12345.ww00X.siemens.net:8735/

C35F81B179062BA92A3EAE4DBF18B0DEA9F50D8A

If you access the server from the client side, you should always check the certificate in order to ensure secure communication with the multiuser server. The configuration of the multiuser server is now complete.

Error correction in the Configuration tool

If warnings or errors occur, you will find specific information about these in ServerConfiguration.log.

Proceed as follows:

1. Click on "View Log" in the yellow highlighted area in order to open ServerConfiguration.log.
2. Correct the errors and warnings displayed in the log file.
3. Restart the Configuration tool if it is no longer open.
4. Click the "Install Service" button.

Result

A message informs you that the configuration of the multiuser server was successful.

The configuration of the multiuser server is now complete.

Administering a multiuser server with the graphic tool

Introduction

You use the graphic "Administration Tool" to manage the multiuser server.

Note

Administration Tool

- The user interface for the Administration tool is available in English only.
- To work with the Administration Tool, you need administrator rights for "User Management".
- The Administration Tool is also available outside the multiuser server.

The following functions can be performed with the "Administration Tool":

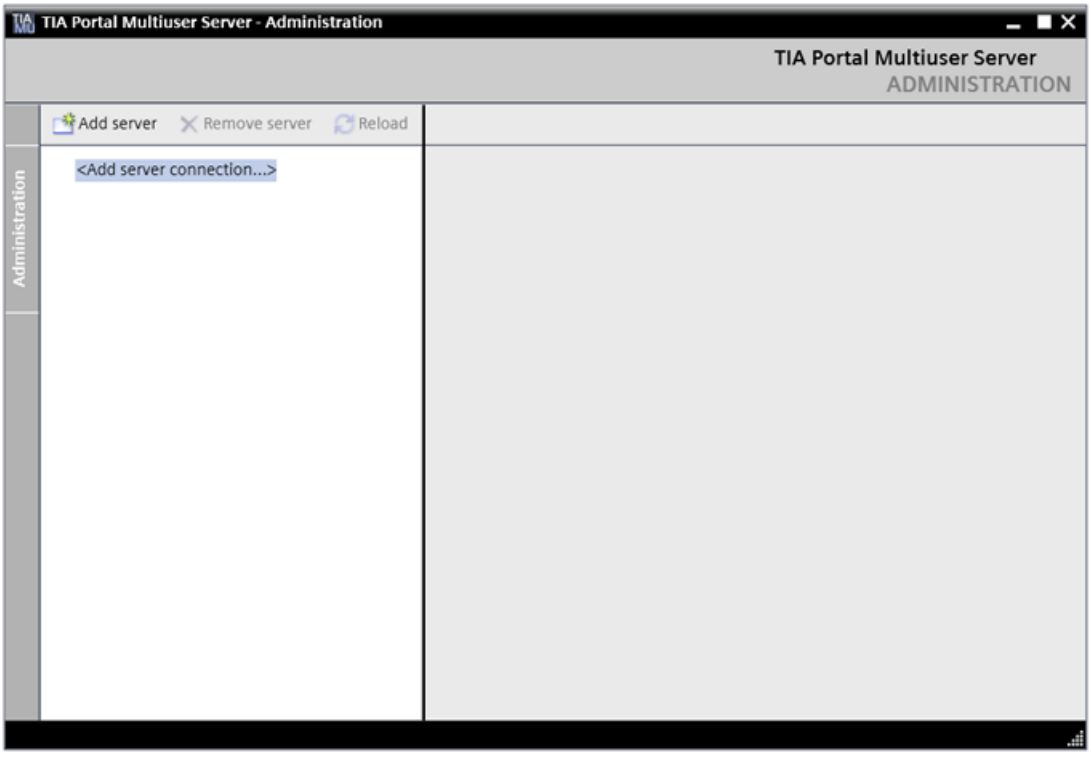
1. Add and delete server connections ("Add server" and "Remove server")
2. Define "User Management" for the server connections ("Manager", "Contributor", "Member")
3. Manage existing multiuser projects and sessions
   - Specify user management for projects and sessions: ("Manager", "Contributor", "Member")
   - Projects: Lock, unlock, and delete ("Lock/Unlock project", "Delete project")
   - Sessions: Display and delete ("Delete selected session")
4. Show "History": Project history with all data and display of the stored project revisions ("Rollback to selected revision" and "Export selected revision")

Requirement

The multiuser server is installed.

The multiuser server has already been configured.

You have already created projects as multiuser projects and created local sessions in the TIA Portal.



Note

Multiuser projects and local sessions

If you have not yet created multiuser projects and local sessions on the multiuser server in the TIA Portal, no information regarding these will be displayed when you administer the multiuser server.

User interface of the Administration tool

The user interface of the Administration tool has the following appearance the first time it is opened:

Structure of the Administration Tool

The left side of the tool shows you a list of configured server connections once you have established a connection to the multiuser server via "Add server connection".

On the right side, you receive additional information about the objects selected on the left in a detail view.

Both pages contain their own toolbar for executing the displayed administration functions.

The view can be expanded and collapsed by clicking the "Administration" button.

Note

"Reload" button

Clicking this button updates the display for the selected object in the Administration Tool.

The exact procedures for working with the Administration tool are described in the following.

See also

Configuring a multiuser server with the graphic tool (Page 6717)

Adding and deleting a new server connection

Introduction

You can add and delete new multiuser server connections with the graphic "Administration" tool.

These commands can be executed using the commands in the toolbar or from the shortcut menu.

Note

Administration Tool

- The user interface for the Administration tool is available in English only.
- You need administrator rights to work with the Administration tool.

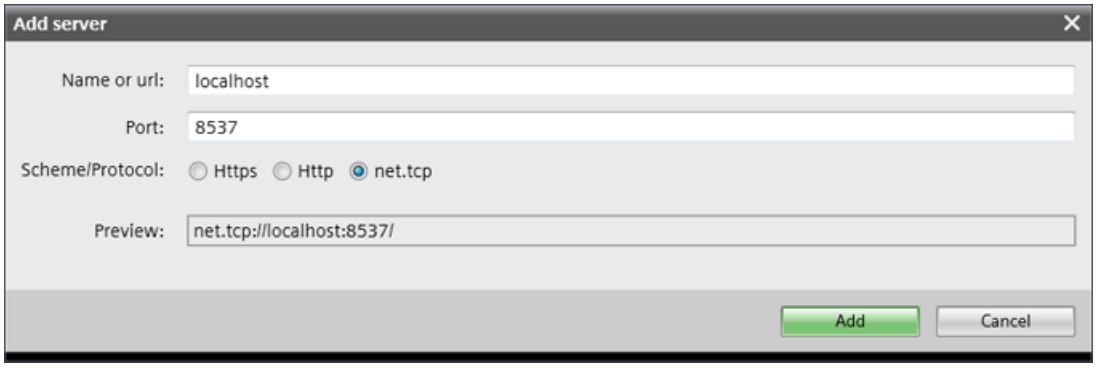
Requirement

The multiuser server is installed.

The multiuser server has already been configured.

You have already created projects as multiuser projects and created local sessions in the TIA Portal.

Note



Multiuser projects and local sessions

If you have not yet created multiuser projects and local sessions on the multiuser server in the TIA Portal, no information regarding these will be displayed when you administer the multiuser server.

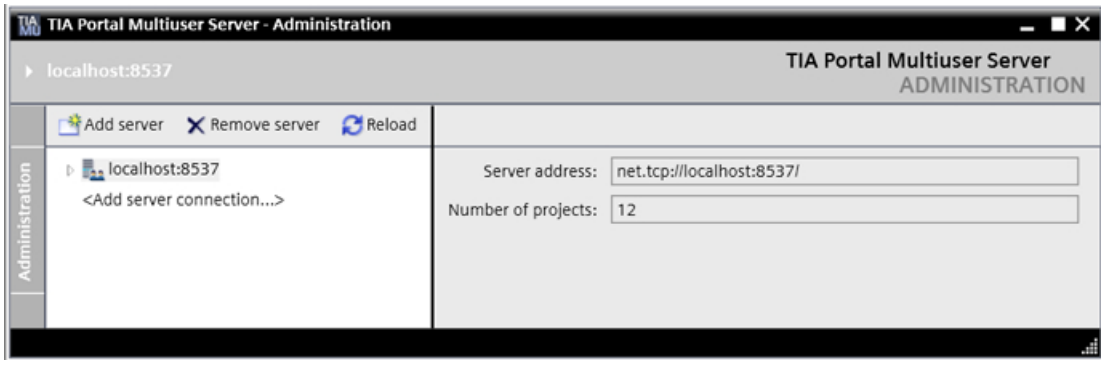
Adding a new server connection

Proceed as follows:

1. Open the graphic tool for the multiuser server administration.
   To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   Click on the "Multiuser Server V14 Configuration" entry to open the Configuration Tool.
2. Click "Add server connection".
3. In the dialog that follows, enter the desired connection data for your server connection as shown by way of example in the graphic:

Note

Connection information for the local multiuser server



If you want to connect to the local multiuser server, you must start it first.

The local multiuser server is started automatically when you open a local session in the TIA Portal.

Alternatively, you can restart the local multiuser server by double-clicking on the file "Siemens.Automation.Portal.LocalServer.exe" under "bin" in the installation directory of the TIA Portal.

You can see the connection information for the local multiuser server after opening the displayed command window.

4. Click on "Add" to add the server connection. Servers in

5. Click on the triangle of the new server connection to activate the connection and view the project list.
6. If you use an "https" connection, you are prompted to confirm the validity of the displayed certificate.
   You have already specified the utilized connection protocol when configuring the multiuser server under "Connection settings".
   Compare the fingerprint of the displayed certificate with the certificate generated during configuration.
   Click "OK" when both fingerprints match.
7. If the multiuser server does not recognize the login data you used, you are prompted to enter alternative connection data for access to the server.
   Enter alternative login data that the multiuser server recognizes in the displayed "Sign in" dialog under "Sign in as another user".

Result

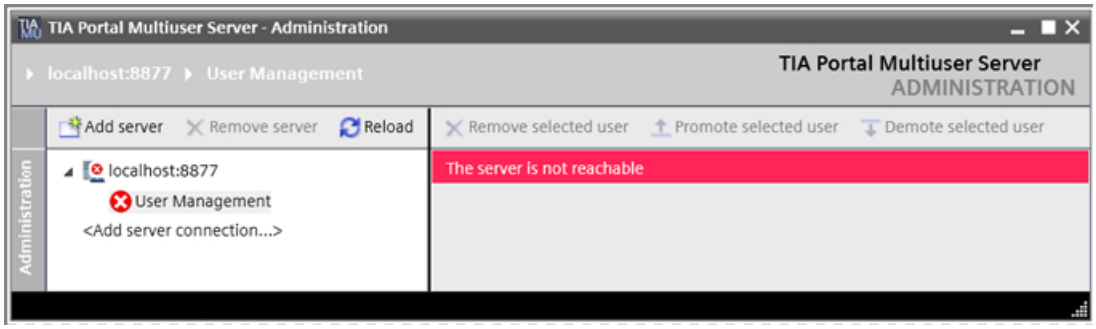
The new server connection is displayed in the left part of the Administration tool.

You see the number of existing multiuser projects on the right.

If you expand the new server connection in the left area, you see a list of all existing projects and other setting options.

Delete an existing server connection

Proceed as follows:



1. Select the desired server connection on the left side of the Administration tool.
2. Click on the "Remove server" button or select the command "Remove" from the shortcut menu.
3. Confirm the next prompt with "Yes".

Result

The selected server connection is deleted.

Accessibility of the multiuser server

If the multiuser server is not accessible, you receive the following error message:

Proceed as follows:

1. Check the displayed connection data.
2. Ensure that the selected server is started.
3. Delete the invalid server connection by clicking on it and then clicking "Remove server".
4. Confirm the next prompt with "Yes".
5. Click "Add server" and create a new server connection to a started multiuser server with valid connection data.

Result

The new server connection is displayed with valid connection information on the left.

Define "User Management" for the multiuser servers and projects

Introduction

With the graphical "Administration Tool", you specify the rights for working with multiuser server connections, multiuser projects and local sessions. The rights concept is based on the Windows access rights for folders and files.

You can find the "User Management" entry in the Adminstration Tool below each server connection as well as below each project and each local session. Depending on where you call the "User Management", you specify the corresponding authorizations.

You use the "User Management" to specify explicit personal authorizations for the following roles:

- Manager (full access)
- Contributor (partial access, no deleting)
- Member (read-only authorization)

The following functions can be executed for each role using the buttons:

- "Add new": Adds new users with the corresponding authorizations.
- "Remove selected user: Removes the selected user
- "Promote selected user": Moves the selected user up to the next higher authorization group.
- "Demote selected user": Moves the selected user down to the next lower authorization group.

The rights that are specified for the server connections are passed on to the authorizations for projects and local sessions.

Note

Administration Tool

- The user interface for the Administration tool is available in English only.
- You need administrator rights to work with the "User management".
- After changing the permissions, the project must be restarted.

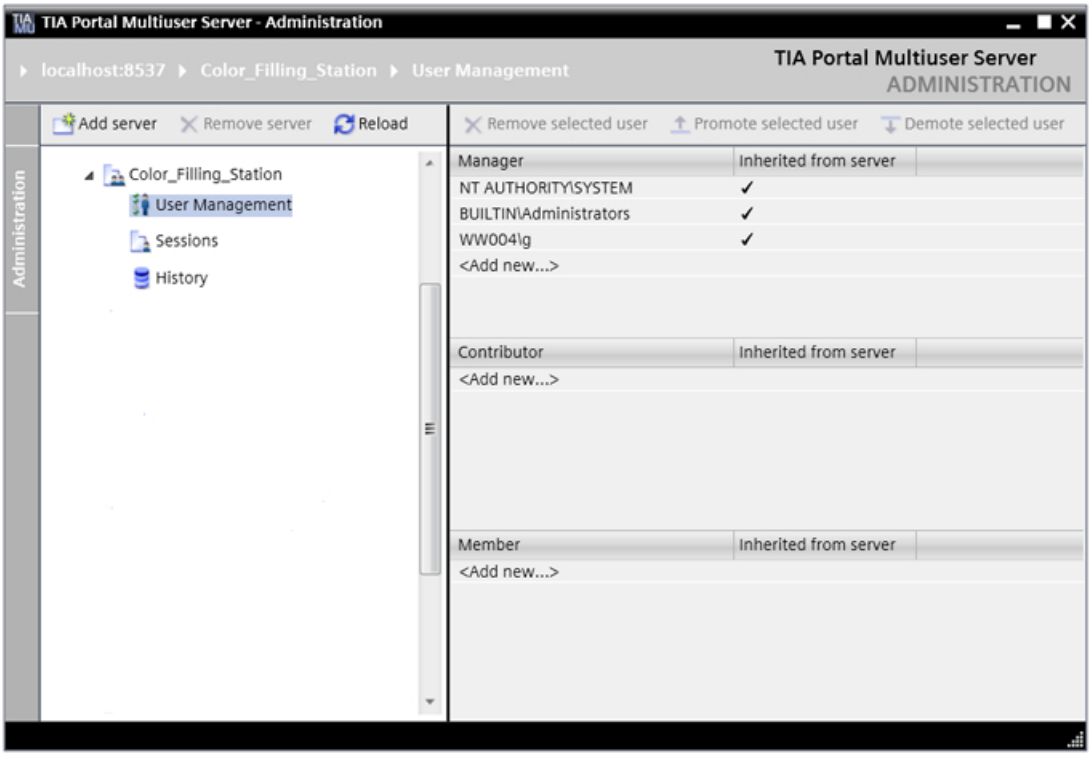
Requirement

The multiuser server is installed.

The multiuser server has already been configured.

You have already created projects as multiuser projects and created local sessions in the TIA Portal.

Note



Multiuser projects and local sessions

If you have not yet created multiuser projects and local sessions on the multiuser server in the TIA Portal, no information regarding these will be displayed when you administer the multiuser server.

Assigning access rights

Proceed as follows:

1. Open the graphic tool for the multiuser server administration.
   - To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   - Click on the "Multiuser Server V14 Administration" to open the Administration Tool.
2. Double-click "User Management" below the desired entry on the left side.
   - When you click on "User Management" below a server, you assign the rights for working with the server.
   - When you double-click "User Management" below a project, you assign the rights for working with the project.
3. "User Management" opens and displays the possible settings on the right side. You already see which rights have been assigned for the associated server connection. These rights are inherited for the projects.

4. Click on "Add new" to add new users for the displayed roles.
5. Enter the required data in the subsequent Windows dialog and click "OK".
6. You can use the "Demote selected user" and "Promote selected user" buttons to move users up and down to other permission groups.
7. You can use the "Remove selected user" button to remove the selected user again.
8. Assign the desired rights and roles via "User Management" for both the server as well as for the lower-level projects and sessions.

Managing multiuser projects and local sessions

Introduction

You can manage the sessions created for a project with the graphical "Administration Tool".

Under "Sessions", you can see the local sessions for the selected multiuser project.

You can find the "Sessions" entry in the "Administration Tool" below each project.

Note
Administration Tool

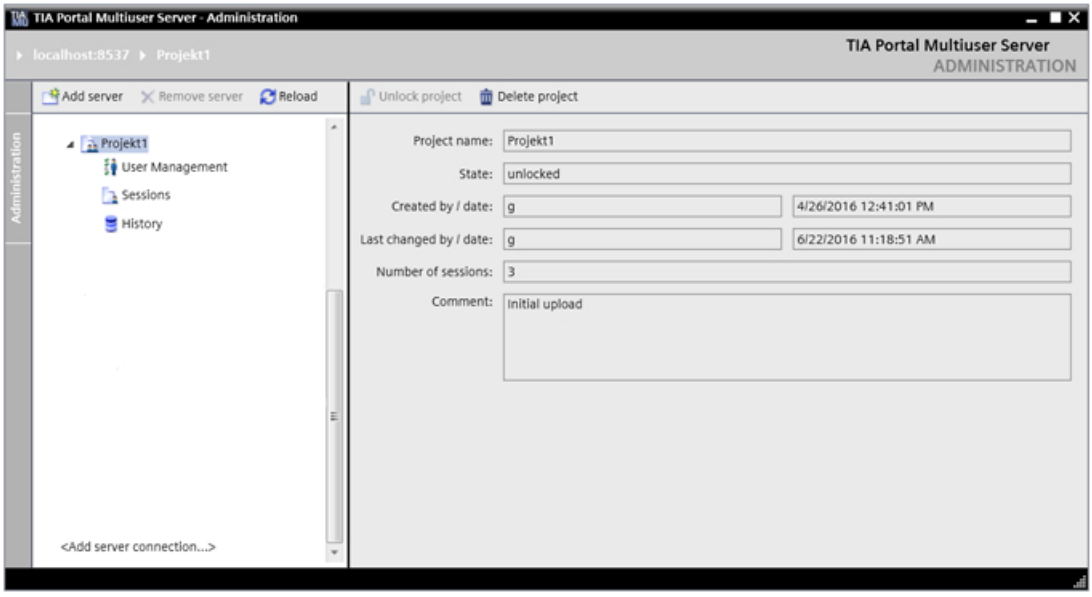
The user interface for the Administration tool is available in English only.

Requirement

The multiuser server is installed.

The multiuser server has already been configured.

You have already created projects as multiuser projects and created local sessions in the TIA Portal.



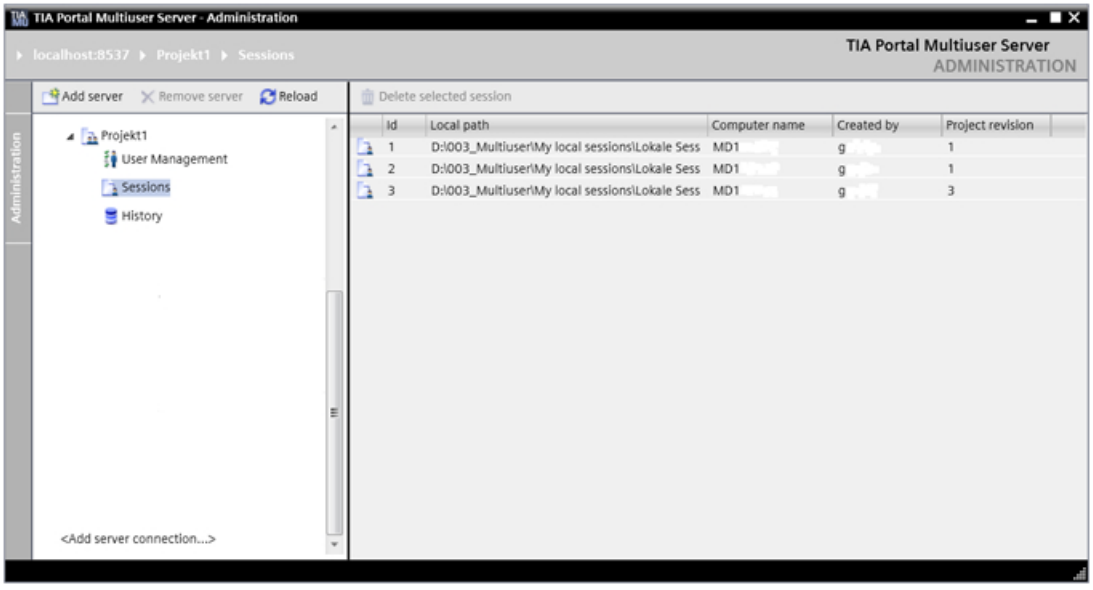
Note
Multiuser projects and local sessions

If you have not yet created multiuser projects and local sessions on the multiuser server in the TIA Portal, no information regarding these will be displayed when you administer the multiuser server.

Display project details and manage projects

Proceed as follows:

1. Open the graphic tool for the multiuser server administration.
   - To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   - Click on the "Multiuser Server V14 Administration" to open the Administration Tool.
2. Click on the desired project so that the project details are displayed on the right side.
   The following information about the projects is displayed:
   "Project name": Displays the project name
   "State": Displays the project status ("locked" or "unlocked").
   "Created by / date": Editor who created the project and the creation date for the project.
   "Last changed by / date": Editor who last amended the project and the change date for the project.
   "Number of sessions": Number of local sessions that belong to the project.
   "Comment": Display of project comments, if available.



3. To delete a project, select the respective project and then click on the "Delete project" button. Projects can only be deleted if there are no local sessions for them.
4. Confirm the next prompt to delete the project.
5. To unlock a locked project, select the respective project and then click on the "Unlock project" button.
6. Confirm the next prompt to unlock the project.

Display and delete local sessions

Proceed as follows:

1. Open the graphic tool for the multiuser server administration.
   - To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   - Click on the "Multiuser Server V14 Administration" to open the Administration Tool.
2. Click on "Sessions" on the left below the desired multiuser project.
3. The following information on the existing sessions is displayed on the right in the "Administration Tool".
   "Id": Increments the existing sessions.
   "Local path": Displays the set local disk space for the sessions.
   "Computer name": Displays the name of the computer where the session is located.
   "Created by": Displays the name of the creator.
   "Project revision": Displays the project version to which each session belongs.

4. Select the desired session and click on the "Delete selected session" button to delete it.
5. In the following dialog, click "OK" to delete the selected session.

Note

Number of project revisions

You set the number of project revisions when configuring the multiuser server.

For more details, see: Configuring a multiuser server with the graphic tool (Page 6717)

See also

Configuring a multiuser server with the graphic tool (Page 6717)

Show "History" for projects

Introduction

You can view the history of the created projects with the graphical "Administration Tool".

You can also perform a "rollback" to a desired revision and export a project as "single-user project".

You can find the "History" entry in the "Administration Tool" below each project.

Note

Administration Tool

The user interface for the Administration tool is available in English only.

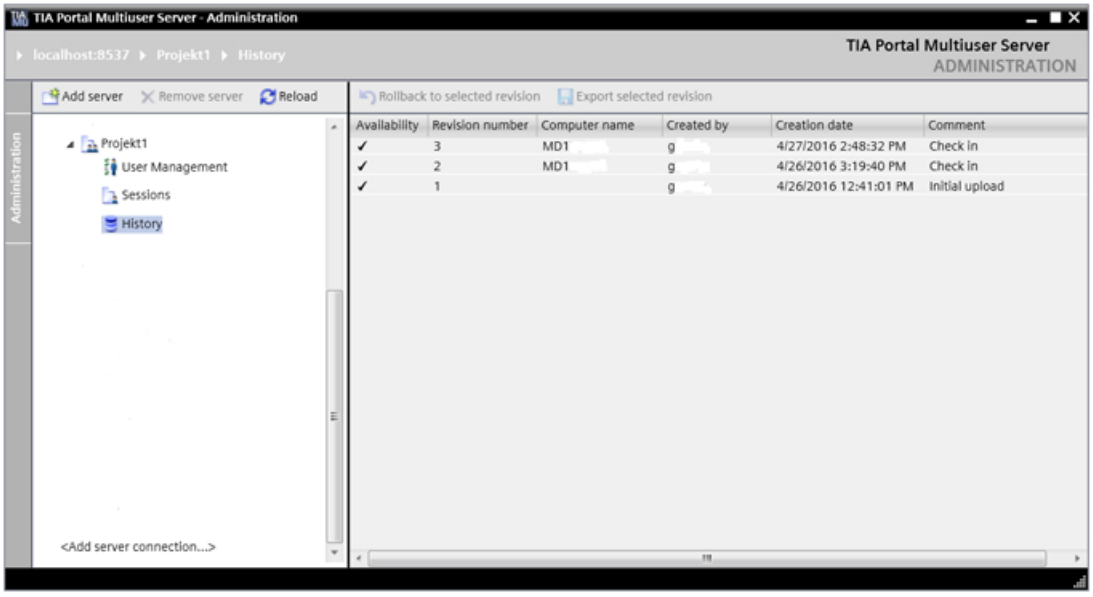
Requirement

The multiuser server is installed.

The multiuser server has already been configured.

You have already created projects as multiuser projects and created local sessions in the TIA Portal.

Note



Multiuser projects and local sessions

If you have not yet created multiuser projects and local sessions on the multiuser server in the TIA Portal, no information regarding these will be displayed when you administer the multiuser server.

Show "History"

Proceed as follows:

1. Open the graphic tool for the multiuser server administration.
   - To open the start menu, click the command "Start" > "All Programs" > "Siemens Automation".
   - Click on the "Multiuser Server V14 Administration" to open the Administration Tool.
2. Click on "History" on the left below the desired multiuser project.
   The history displays all existing project revisions.
   The following information on the existing sessions is displayed on the right in the "Administration Tool".
   "Availability": Indicates whether the session on the server is still available.
   "Revision number": Displays the revision number.
   "Computer name": Displays the name of the computer on which the revision was created.
   "Created by": Displays the name of the creator.
   "Creation date": Displays the creation date of the revision.
   "Comment": Displays the comment for the revision, if any.

3. You can use the "Rollback to selected revision" button to roll back a selected session to the selected revision.
4. A new line is then created showing the new revision with the comment "Rollback to revision <number>".
5. To export the revision as a single-user project, click on the "Export selected revision" button.
6. Select the desired storage path in the subsequent dialog and click "OK".

15.3.10.3 Using the command line tools

Introduction to the multiuser command line tools

Introduction

The multiuser server can be configured and managed with the help of the Multiuser Administrative Tools and the Multiuser Power Tools.

Administrator rights are required for the configuration of the multiuser server with the Administrative Tools.

User rights are required for administrative tasks with the Power Tools.

The Multiuser Power Tools are also available in the TIA Portal for administrative tasks on the multiuser server.

Requirement

The multiuser server is installed.

Steps for the configuration of the multiuser server with the Administrative Tools

The server is installed and managed using a command line command.

To configure the multiuser server, the following steps are required:

- Call the multiuser server Administrative Tools with administrator rights.
- The complete installation is executed with the command:
  `musrv.exe install -r d:\TIA\SRV -p 5080 -b https`
- The project directory (repository) is created automatically.
- The definition of the protocol and the port address is already contained in this command, together with the integrated certificate administration for secure HTTPS communication.
- Windows tools are used to create new certificates and select existing certificates.
- You can find additional commands for configuring the multiuser server here: Commands for configuring the multiuser server (Page 6738)

Note

Enabling the firewall port

The specified port is automatically enabled in the firewall for access to the multiuser server.

Managing the multiuser server with the power tools

To manage the multiuser server, the following steps are required after installation of the server:

- To access the multiuser server, a port may have to be enabled in the firewall.
- To manage the multiuser server, the multiuser management or the multiuser server power tools must be called.
- You can find additional commands for managing the multiuser server here: Commands for managing the multiuser server (Page 6741)

User and rights management

The user and rights management for the multiuser server is based on the user management for the Windows user accounts.

- Project-specific rights assignment is possible.
- The use of group guidelines enables simple, fast and clear assignment of rights.

Project management

Project management enables a fast overview of existing projects and associated local sessions.

Multiuser projects and local servers can be conveniently managed.

The project management can be automated by scripts (batch files).

Error messages

If an action cannot be executed successfully, a corresponding error message is displayed.

You can find the error descriptions in the corresponding tools by calling the help for the tools:

Calling help in the administrative tools:

- Open the Administrative Tools as follows:
- Copy the command "musrv" to the command line and press "Enter".

Calling help in the power tools:

- Open the Power Tools as follows:
- Copy the command "mupt" to the command line and press "Enter".

Configuring the multiuser server with the administrative tools

Introduction

Before you can use the installed external multiuser server as part of Multiuser Engineering , the server must be configured.

When you configure the multiuser server using the Multiuser Administrative Tools , you use the commands described below, which you execute in the command line.

The following actions are automatically executed when you input the "Install" command described below:

- The Windows service for the multiuser service is installed.
- A firewall activation for the specified port is added via a TCP connection.
- Performance monitoring installed to monitor the multiuser server.
- The storage directory, called "Repository", is created if it does not already exist.
- The "binding" is defined, whether you use "https" (recommended) or "http" as transfer protocol.
- The "fingerprint" to confirm a valid certificate is transferred to the server.

The multiuser server can then be used.

Note

You need administrator rights to configure the multiuser server.

Requirement

The multiuser server is installed.

Note

The commands as well as the associated help and information texts within the command line are only available in English.

Procedure

To configure the multiuser server, follow these steps:

1. Open the tool for the multiuser server configuration with administrator rights. Under "bin" in the installation directory of the TIA Portal, double-click on the file "start-musrv.bat" to do this.
2. Copy the following command for server configuration with the required parameters to the command line and press "Enter".
   Command:
   ```
   => musrv install -r <repository-path> -p <port> -b <binding> -h
   <certificate-hash>
   => musrv install
   ```
   Example of the entry:
   ```
   musrv install -r c:\TIA\SERVER -p 5080 -b https -h <certificate-
   hash>
   ```
3. If the command "musrv install" could not be executed successfully, you receive an error message for which you can view an explanation.
   Once these commands have been executed successfully, the multiuser server is configured.

Configuration example

If you do not enter any parameters, the system will prompt you interactively for the required parameters.

Command	Description
Define "Repository-path" Used in the above example: `-r c:\TIA\SERVER`	Enter the name and the path of the directory (Repository) in which the server is to save the files. If you enter a new directory that does not exist yet, the directory is automatically created by the system. **Important note:** This directory and the data storage is retained even after deleting the server. If you reinstall the multiuser server after deleting it and enter an existing directory as "Repository", the data is also available on the new server without any restrictions.
Define "Port" Used in the above example: `-p 5080`	Enter the port you want to use for communication with the multiuser server.
Define "Binding" Used in the above example: `-b https`	Define whether you want to use "https" (recommended) or "http" as transfer protocol. With "https", communication is encrypted and a certificate is requested. This means communication has a higher security level than the unencrypted "http" communication.

Command	Description
"Certificate hash" = fingerprint for the certificate used	For secure server communication, enter the fingerprint for the certificate you created or the certificate used. For more information on creating a certificate, refer to the Help for the respective Windows operating system.
"Run service" = start service Example: `musrv start`	Use it to start the Windows service for the multiuser server.

You can find additional commands for configuring the multiuser server here: Commands for configuring the multiuser server (Page 6738)

Commands for configuring the multiuser server

Introduction

The commands for configuring the multiuser server are available in the Multiuser Administrative Tools .

Observe the basic procedures for configuring the multiuser server: Configuring the multiuser server with the administrative tools (Page 6736)

Note

The commands as well as the associated help and information texts within the command line are only available in English.

Commands for configuring the multiuser server

The commands listed below are available:

Command	Description	Possible entries
"Install"	Installs the multiuser server and enables communication with the server. A configuration example is available at: Configuring the multiuser server with the administrative tools (Page 6736)	**Parameters:** • -r, --repository: Directory in which the server data is to be stored. • -p, --port: Port number for the server access • -b, --binding: Specifies the protocol for the communication (http or https) • -c, --certhash: Fingerprint of the certificate which is to be used for secure data transfer (is only required for https). **Example**: `musrv install -r <repository-path> -p <port> -b <binding> -h <certificate-hash>`
"Config"	Displays the current configuration of the multiuser server and offers optional dynamic configuration parameters.	**Parameters:** • -t, --timeout: (optional): Definition of the utilized timeout profile ("fast", "middle" or "slow"). • -d, --debug: (optional): Defines whether runtime debug information is displayed by the server. Note: If you use the option "-d", no debug logs are displayed. **Example:** `musrv config -d`

"Start/Stop"	Starts or stops the multiuser server.	**Parameters:**
		• [-f], [--force]: (optional): Activates the command without further query
		Example:
		`musrv start`
		`musrv stop`

"Uninstall"	Uninstalls the multiuser server. Uninstallation can also take place with Windows mechanisms.	**Parameters:** • - [-f], [--force]: (optional): Activates the command without further query **Example:** `musrv uninstall`

Configuring the multiuser server with the administrative tools (Page 6736)

Managing the multiuser server with the power tools

Introduction

To manage server projects and local sessions on the multiuser server as part of Team Engineering , use the commands described below that can be executed with the help of the Power Tools in the command line.

The multiuser server can be managed via the Power Tools from any computer on which TIA Portal and Power Tools are installed.

Your entries are stored in a "Session memory" and are then available the next time the Power Tools are opened.

Note

You need user rights to manage the multiuser server.

Requirement

The multiuser server is installed and a port is enabled in the Windows firewall so that the multiuser server is accessible.

Procedure

To manage the multiuser server, follow these steps:

1. Open the Power Tool for the multiuser server administration with administrator rights. Under "bin" in the installation directory of the TIA Portal, double-click on the file "start-mupt.bat" to do this.
2. Copy the command "mupt" to the command line and press "Enter".
   The help for the multiuser power tools is displayed.
3. Enter the required command for server management in the command line and press "Enter".
   The available commands are described under: Commands for managing the multiuser server (Page 6741)
4. If the command could not be executed successfully, you receive an error message.

See also

Commands for managing the multiuser server (Page 6741)

Commands for managing the multiuser server

Introduction

The commands for managing the multiuser server are available in the Multiuser Power Tools .

Note

The commands as well as the associated help and information texts within the command line are only available in English.

"User names" and "Role names"

"User names":

All "User names" that are used must take the following format into account:

- <domain-or-machine-name>\<account>, e.g. ww004\adgrfl0 or MD17E4MC\adgrfl0.
- If the <domain-or-machine-name> is not assigned, Windows will automatically propose a corresponding domain for the account.

"Role names":

The following "Role names" with the corresponding access rights are available:

- Member (only read access)
- Contributor (read & write access)
- Manager (read and write access and role management).

Commands for managing the multiuser server

The commands listed below are available:

Command	Description	Possible entries
"Display project"	Lists all projects on the current multiuser server.	**Parameters:** • -s, --server: Multiuser server URI address **Example:** `%InstallDirectory% > mupt project show -s http://192.168.0.100:8057/` **Help:** • "show-projects -?"
"Delete project"	Deletes specific projects on the multiuser server	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Definition of the project to be deleted • -f --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > project remove -s http://192.168.0.100:8057/ -p MyProject` **Help:** • "delete-project -?"
"Display Sessions"	Lists all local sessions that are part of the current server project.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Selection of the project **Example:** `%InstallDirectory% > mupt session show -s http://192.168.0.100:8057/ -p MyProject` **Help:** • "show-sessions -?"
"Delete Session"	Deletes the selected local session on the multiuser server	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Selection of the project • -i, --id: Session identification number • -f, --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > mupt session remove -s http://192.168.0.100:8057/ -p MyProject -i 15` **Help:** • "delete-session -?"

Command	Description	Possible entries
"Remove project lock"	Removes the lock for the multiuser project	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Selection of the project • -f, --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > mupt project unlock -s http://192.168.0.100:8057/ -p MyProject` **Help:** • "remove-projectlock -?"
"Show check-in history"	Displays the check-in history for the selected server and the selected local session.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Selection of the project • -i, --id: Session identification number • -u, --user: User name by which to filter. • -d, --date: Date by which to filter. • -r, --revision: Project revision by which to filter. • -f, --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > mupt checkin show -s http://192.168.0.100:8057/ -p MyProject` **Help:** • "show-checkinhistory -?"
"Show server access rights"	Displays the defined user rights for the selected server.	**Parameters:** • -s, --server: Multiuser server URI address **Example**: `%InstallDirectory% > mupt user show -s http://192.168.0.100:8057/` **Help:** • "show-serveraccessrights -?"
"Modify server access rights"	Modifies the access rights for the selected server.	**Parameters:** • -s, --server: Multiuser server URI address • -r, --role: Selecting the role • -u, --user: User name by which to filter. • -f, --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > mupt user add -u user1 -r Manager -s http://192.168.0.100:8057/` **Help:** • "modify-serveraccessrights -?"

Command	Description	Possible entries
"Remove server access rights"	Removes the access rights for the selected server.	**Parameters:** • -s, --server: Multiuser server URI address • -u, --user: User name by which to filter. • -f, --force: (optional): Activates the command without further query **Example:** `%InstallDirectory% > mupt user remove -u user1 -s http://192.168.0.100:8057/` **Help:** • "modify-serveraccessrights -?"
"Show project access rights"	Displays the defined user rights for the selected project.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Project name for which the user rights are to be listed. **Example**: `%InstallDirectory% > mupt user show -s http://192.169.0.100:8057/ -p MYProject` **Help:** • "show-projectaccessrights -?"
"Modify project access rights"	Modifies the user rights for the selected project.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Project name for which the user rights are to be listed. • -r, --role: Selecting the role • -u, --user: User name by which to filter. • -f, --force: (optional): Activates the command without further query **Example**: `%InstallDirectory% > mupt user add -u user2, user3 -r Member -p MyProject -s http://192.168.0.100:8057/` **Help:** • "modify-projectaccessrights -?"

Command	Description	Possible entries
"Remove project access rights"	Removes the access rights of the selected user for the selected project.	**Parameters:** • -s, --server: Multiuser server URI address • -u, --user: User name by which to filter. • -p, --project: Project name for which the user rights are to be listed. • -f, --force: (optional): Activates the command without further query **Example**: `%InstallDirectory% > mupt user remove -u user3 -p MyProject -s http://192.168.0.100:8057/` **Help:** • "remove-serveraccessrights -?"
"Export project to single user"	Exports the multiuser project as single-user project to the specified path.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Project name for which the user rights are to be listed. • -t, --path: Selection of the storage path **Example**: `%InstallDirectory% > mupt project export -s http://192.168.0.100:8057/ -p MyProject -t D:\MyDirectory\` **Help:** • "export-projectassingleuser -?"

Command to reset the server to an older revision

The command listed below is available. This command can only be executed if the server is not locked.

"Project rollback"	Resets the server to an existing older revision.	**Parameters:** • -s, --server: Multiuser server URI address • -p, --project: Project name for which the user rights are to be listed. • -v, --revision: Revision number of the project to which it is to be reset. • -f, --force: (optional): Activates the command without further query **Example**: `%InstallDirectory% > mupt project rollback -s http://192.168.0.100:8057/ -p MyProject -v 132`

15.3.10.4 Confirm the certificate for a multiuser server

Introduction

When working with Multiuser Engineering , you must first specify the SSL Server certificate in order to establish a secure connection to an installed multiuser server. As soon as you start working in a local session for the first time after installation of the server, you are prompted to confirm the displayed certificate.

When an existing certificate has expired, you are prompted to confirm it again.

The mechanisms provided by Windows are used for managing the SSL server certificates.

If you do not confirm the SSL server certificate, a connection to the multiuser server cannot be established.

Requirement

You have installed TIA Portal V14 or higher and the required multiuser server software.

The multiuser server must be configured and started with the help of the multiuser tools.

You are working in the local session for the first time.

Confirm the certificate for a multiuser server

To confirm the certificate for the multiuser server, follow these steps:

1. When you are working with a connected multiuser server for the first time, for example, when opening a local session, the operating system automatically prompts you to confirm the server certificate for the multiuser server.
2. Check whether the displayed certificate is trustworthy. If so, click "OK" in the dialog that appears to confirm the certificate for the "TIA_Multiuser_Server".

Result

The dialog is closed. The certificate for the multiuser server is considered trustworthy and saved permanently.

15.3.10.5 Enter access data for the multiuser server

Introduction

When you are working with Multiuser Engineering and have installed a multiuser server, you must log on to the multiuser server if an authentication is required.

In this case the multiuser server prompts you to log on. A dialog is displayed in which you can enter the access data.

You have two options for logging on:

- Logon with your current Windows-user name und password
- Logon with the access data of a different user

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

The multiuser server must be configured and started with the help of the Power Tools.

Enter access data for the multiuser server

To enter the user data, follow these steps:

1. Select the required option in the dialog by clicking it.
   – For logon with your current login, the user name is already entered and cannot be edited.
   – Alternatively, you can log on with the access data of a different user.
2. To do so, select the second option and enter the respective data for "User name" and "Password".
3. Click "OK".

Result

If authentication was successful, the dialog is closed and the connection to the multiuser server is being established.

15.3.10.6 Transferring server data to other multiuser servers

Introduction

If you work with Multiuser Engineering and have installed a multiuser server, you can transfer existing server data to another multiuser server without data loss.

The data can be transferred to the same computer or to a another computer.

Requirement

You have installed TIA Portal as of V14 and at least one multiuser server.

The multiuser server must be configured and started.

Transfer multiuser server data to other multiuser servers

To transfer the server data of a multiuser server to another multiuser server, follow these steps:

1. Stop the active multiuser server.
   - Open the graphic ConfigurationTool for the multiuser server configuration with administrator rights.
   - Open the start menu by clicking the command "Start" > "All Programs" > "Siemens Automation".
   - Click on the "Multiuser Server V14 Configuration" entry. This will open the user interface of the Configuration Tool.
   - In the "Server status" area, click on the "Stop service" button.
2. Uninstall the "old" multiuser server.
   For more details, see: Installing and uninstalling the Multiuser server (Page 6711)
3. Copy the entire repository with the existing server data to the new storage location, for example, to another computer.
4. Install the multiuser server on the new computer.
   For more details, see: Installing and uninstalling the Multiuser server (Page 6711)
5. Configure the new storage directory for the new multiuser server.
   For more details, see: Configuring a multiuser server with the graphic tool (Page 6717)
6. Start the new multiuser server. In the Configuration Tool, click on "Start service" in the "Server status" area.

Result

The server data were transferred without data loss to the new multiuser server.

See also

Configuring a multiuser server with the graphic tool (Page 6717)

Installing and uninstalling the Multiuser server (Page 6711)

15.3.10.7 Reading out error log for multiuser server

Introduction

To check the multiuser server functionality, you can read out the error logs. When server errors occur, the error logs provide you with additional information on the error messages displayed in the user interface.

A separate log file is created by the server for each day. The log files are not deleted automatically.

Reading out the error log of a multiuser server

To read out the error log, follow these steps:

1. Open the directory for the respective multiuser server in your archiving.
2. Select the desired log file under the path <Repository>\logs.
3. Open the requested log file to check the content

Reading out error logs for a multiuser project

To read out the error log, follow these steps:

1. Open the directory for the respective multiuser server in your archiving.
2. Select the desired log file under the path <Repository>\proj\<Project name>\logs.
3. Open the requested log file to check the content.

Note

Reading out the error log

Keep in mind that the error log cannot be read out when you are working in debug mode.

Check and/or change the server configuration in the command line via the administrative tools using the command "musrv config".

Make sure that the option "-d" is not selected.

Reading out Windows event view

The event view is a tool with which detailed information about important events can be displayed on the computer. The event view can be helpful for dealing with problems and errors.

The following security relevant events relating to the multiuser server also receive an entry in the Windows event view:

- If a user wants to the start the multiuser server and the multiuser server does not "know" this user; i.e. the user is not logged in on the server.
- If a user with an incorrect password want to log onto the multiuser server.

To read out the event view, follow these steps:

1. Click "Start" > "Control Panel" > "System and Security" > "Administration". Alternatively, click "Start" and enter "Event view" in the search field.
2. Double-click to open the Event view.
3. Under "Windows protocols" click "Security" to display the logged security relevant events related to the multiuser server.

Result

The logged security relevant events for the multiuser server are shown in a list.

15.3.10.8 Error log for multiuser server packed as Zip file

Introduction

To check the multiuser server functionality, you can read out the error logs. When server errors occur, the error logs provide you with additional information on the error messages displayed in the user interface.

You have the option of packing all existing error logs into a Zip file to forward these, if necessary, to Customer Support for example.

To do so you must log yourself in as Administrator directly on the server. It is not possible to execute this action via the TIA Portal or via the administrative and power tools.

Packing error logs as Zip file

To create a Zip file for error logs, follow these steps:

1. Log onto the multiuser server as administrator.
2. Execute the command "musrv ziplogs".
3. Alternatively, you can execute the command with the following options:
   - -n, --name: Entering the storage path for the Zip file
   - -f, --force: Overwrites any already existing files without prompt.

Result

The Zip file with all existing error logs for the multiuser server is created.

15.3.10.9 Information on response of the multiuser server to errors

Introduction

The response of the multiuser server after the occurrence of an error is described below.

If an error occurs, you receive a corresponding error message.

Behavior of the server after the occurrence of an error

The multiuser server exhibits the following behavior after the occurrence of an error:

Project lock:

- Information on which project is locked may get lost after a server error.
- This information is no longer available after a restart.

Errors that occur during "Upload from device" or "Download to device":

- The refresh of the local session cannot be performed. The action is aborted with an error message.
- The check-in cannot be executed. The action is aborted with an error message.
- Any already loaded data are removed again from the server, the server has the same status as before the start of the faulty action.

Note

Manual restart of the server

The server has to be manually restarted after the occurrence of an error.

An automatic start of the server only occurs after the next restart of the computer on which the server is running.

15.3.10.10 Supported network configurations for the multiuser server

Requirements for successful client-server communication

Introduction

Below is an overview of the requirements for successful client-server communication in the context of Multiuser Engineering with:

- Network communication
- Certificate management
- Authentication

Requirements for network communication

The network used must allow HTTPS communication between client and server.

There are two ways of doing this:

- Direct TCP communication between client and multiuser server via the enabled server port.
  - No outbound firewall settings blocks communication on the workstations.
  - No incoming firewall settings blocks communication on the server.
  - Both the multiuser server and all workstations are in the same IP network (without routing).
  - If a router is installed in between, the router should not block communication via the selected server port.
- Indirect communication via an HTTPS proxy server.
  - An HTTPS proxy server is available.
  - The HTTPS proxy server is configured at the client end in the Windows system and enabled for communication.

Requirements for certificate management

To establish secure communication, you should use "HTTPS". With "HTTPS", communication is encrypted and a certificate is requested. This means communication has a higher security level than the unencrypted "http" communication.

To establish HTTPS communication, the multiuser server must be configured in such a way that it uses a valid HTTPS certificate for data encryption.

- The certificate in the Windows certificate store is used on the multiuser server.
- The certificate must be currently valid and registered for use with "http.sys".
- The fingerprint of the certificate must be handed over to the client.

Requirements for authentication

Windows mechanisms are used for the authentication of the communication with the multiuser server.

Multiuser Engineering supports both authentication through domain accounts and authentication through local Windows accounts.

- Authentication with domain account
  - Both the client and the multiuser server are members of the same Windows domain.
  - A valid user account for this domain is used.
  - Both the client and the multiuser server can establish network communication to the domain server.
  - The requirements for using a secure https communication must be met.

- Authentication with local account
  - A local account on the multiuser server must be used for authentication.
  - The requirements for using a secure HTTPS communication must be met.

Note

NTLM authentication on the multiuser server

NTLM is used for authentication on the multiuser server. For security reasons, we recommend you activate NTLM V2, which has been used as standard since Windows 2000, and not NTLM V1.

NTLM V2 offers a logon method more secure than NTLM V1.

Note

In the following sections, you can find more information about supported network configurations for the multiuser server.

See also

Network with dedicated multiuser server (Page 6753)

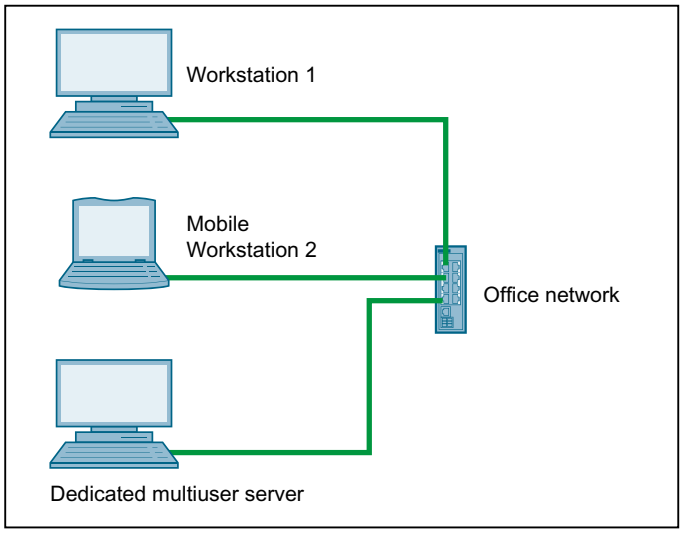
Network in a Windows domain with Internet access via proxy (Page 6762)



Network with dedicated multiuser server

Introduction

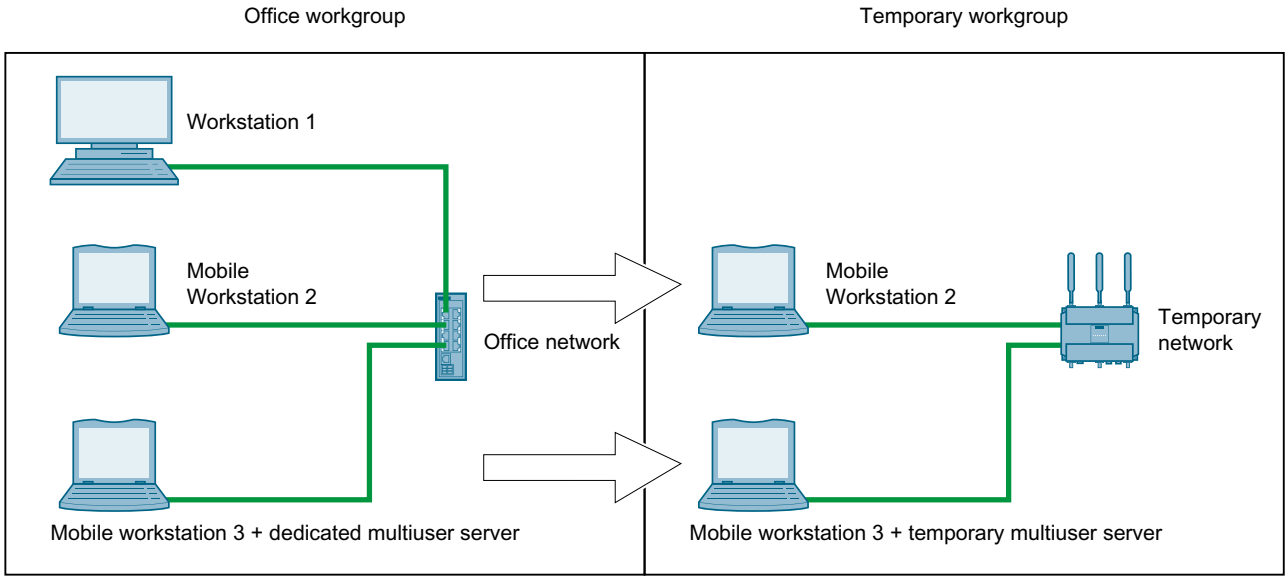
Below, you can find information on a server configuration with a dedicated multiuser server in an office network.

The graph shows the possible structure of such a configuration:

Office network with dedicated multiuser server

Description of the network configuration with a dedicated multiuser server

The network configuration should meet the following requirements.



Configuration	Description
Network environment	**Configuration:** • Various Windows workstations on which the TIA Portal is installed. • A dedicated Windows server, which is installed as a multiuser server. • All workstations and servers are located in the same network.
Network	**Requirements:** • There is a direct TCP connection between the workstations and the multiuser server via the selected port. • No outbound firewall settings blocks communication on the workstations. • No incoming firewall settings blocks communication on the server. • Both the multiuser server and all workstations are in the same IP network (without routing). • If a router is installed in between, the router should not block communication via the selected server port. • Either no proxy server is configured, or there is a local bypass. The "Bypass proxy server for local addresses" option should be selected in the Windows settings for a local area network.
Authentication	**User accounts and Windows workgroups:** • These must be created locally on the multiuser server. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Name and password for authentication are queried on all workstations. • Only local accounts of the server system can be used for authentication. **Note**: The Windows authentication can be used to query name and password. You have to create local accounts, which are identical to the accounts that exist on the multiuser server. This procedure allows the server to automatically authenticate a local account with identical logon information for an existing server account. **Restriction:** User accounts and groups cannot be managed centrally; local users and groups are required for this. This configuration is therefore unsuitable for enterprise networks.

Network with temporary multiuser server

Introduction

Below, you can find information on a server configuration with a temporary multiuser server in an office network.

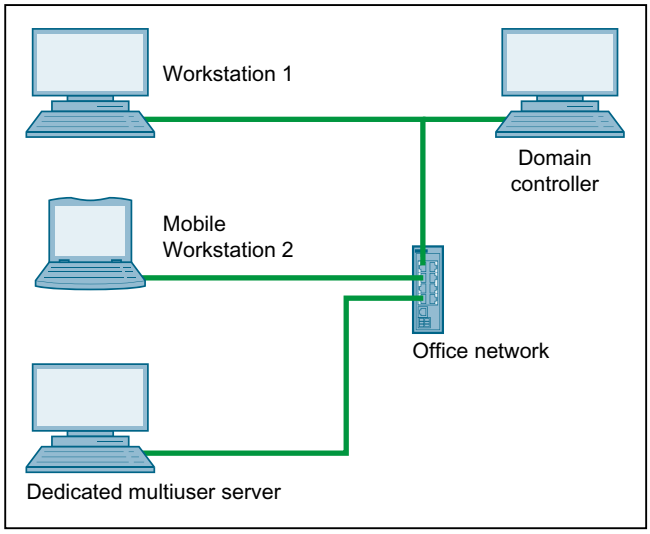
The graph shows the possible structure of such a configuration:

Office workgroup
Temporary workgroup
Workstation 1
Mobile
Workstation 2
Office network
Mobile
Workstation 2
Temporary
network
Mobile workstation 3 + dedicated multiuser server
Mobile workstation 3 + temporary multiuser server

Description of the network configuration with a temporary multiuser server

The network configuration should meet the following requirements.

Configuration	Description
Network environment	Configuration: • Various Windows workstations on which the TIA Portal is installed. • A temporary Windows server, which is installed as a multiuser server at one of the workstations. The office environment may be left, for example, to perform commissioning in a factory. • All workstations and temporary multiuser servers are located in the same network. • With the temporary multiuser server, the office environment can be left and work can still continue.
Network	Requirements: • There is a direct TCP connection between the workstations and the multiuser server via the selected port. • No outbound firewall settings blocks communication on the workstations. • No incoming firewall settings blocks communication on the server. • Both the multiuser server and all workstations are in the same IP network (without routing). • If a router is installed in between, the router should not block communication via the selected server port. • Either no proxy server is configured, or there is a local bypass. The "Bypass proxy server for local addresses" option should be selected in the Windows settings for a local area network.
Authentication	User accounts and Windows workgroups: • These must be created locally on the multiuser server. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Name and password for authentication are queried on all workstations. • Only local accounts of the server system can be used for authentication. Note: The Windows authentication can be used to query name and password. You have to create local accounts, which are identical to the accounts that exist on the multiuser server. This procedure allows the server to automatically authenticate a local account with identical logon information for an existing server account. Restriction: User accounts and groups cannot be managed centrally; local groups are required for this. This configuration is therefore unsuitable for enterprise networks.



Network in a Windows domain

Introduction

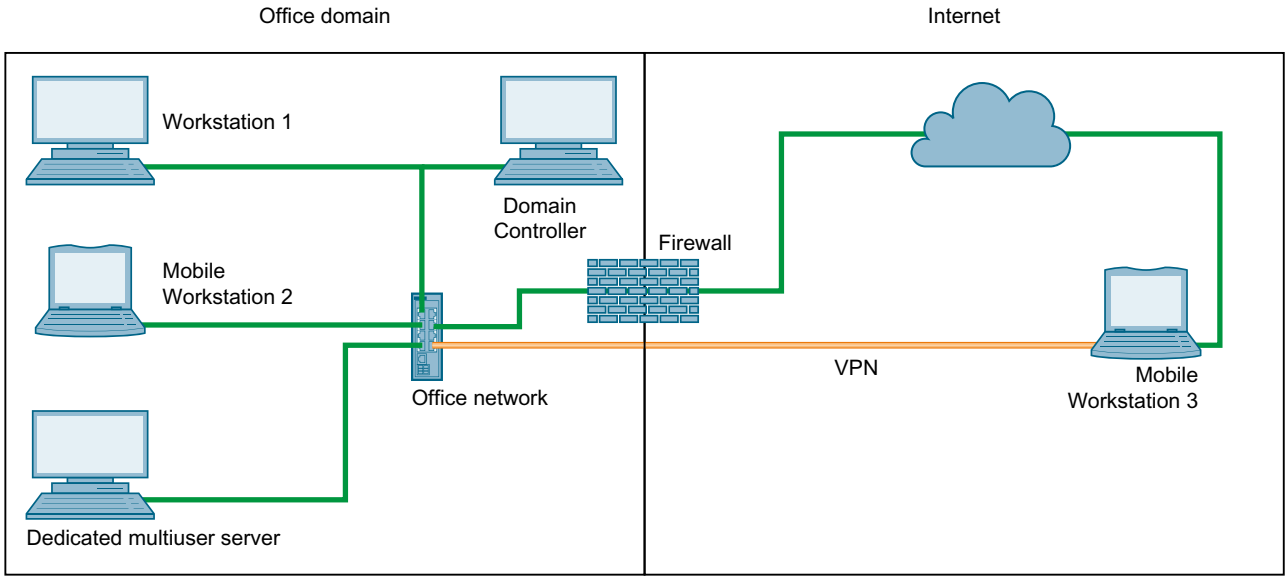
Below, you can find information on a server configuration with a dedicated multiuser server in a Windows domain.

The graph shows the possible structure of such a configuration:

Network within a Windows domain

Description of the network configuration in a Windows domain

The network configuration should meet the following requirements.



Configuration	Description
Network environment	**Configuration:** • All Windows workstations on which the TIA Portal is installed are members of the same domain. • A dedicated Windows server as a multiuser server is also located in the same domain. • All workstations and multiuser servers use the same LAN (Local Area Network). • All workstations and multiuser servers can connect to the domain controller.
Network	**Requirements:** • There is a direct TCP connection between the workstations and the multiuser server via the selected port. • No outbound firewall settings blocks communication on the workstations. • No incoming firewall settings blocks communication on the server. • Both the multiuser server and all workstations are in the same IP network (without routing). • If a router is installed in between, the router should not block communication via the selected server port. • Either no proxy server is configured, or there is a local bypass. The "Bypass proxy server for local addresses" option should be selected in the Windows settings for a local area network.
Authentication	**User accounts and Windows workgroups:** • These must be created on the domain controller. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Users at workstations on which the TIA Portal is running are automatically authenticated with their domain logon information. **Note**: You can also log on with other valid logon data on the multiuser server. **Restriction:** This configuration is not suitable for temporary server configurations, since they also need access to the domain controller.

Network in a Windows domain with Internet access via VPN

Introduction

Below, you can find information on a server configuration with a dedicated multiuser server in a Windows domain with VPN (Virtual Private Network).

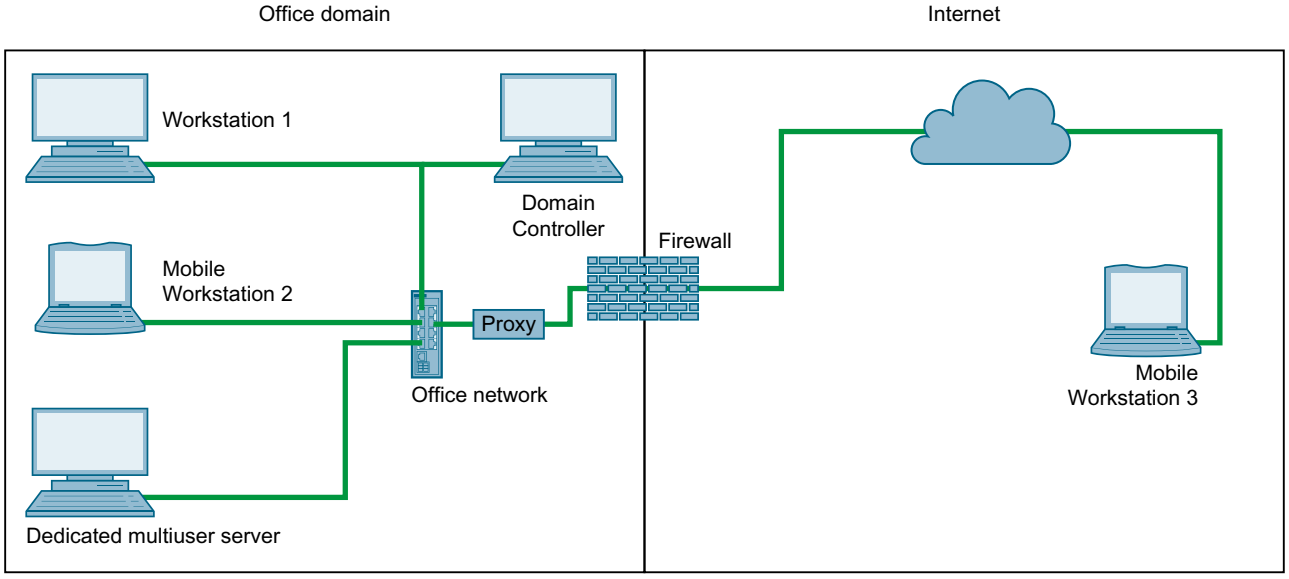
The graph shows the possible structure of such a configuration:

Office domain
Internet
Workstation 1
Domain Controller
Firewall
Mobile Workstation 2
Office network
VPN
Mobile Workstation 3
Dedicated multiuser server

Description of the network configuration in a Windows domain with VPN

The network configuration should meet the following requirements.

Configuration	Description
Network environment	**Configuration:** • All Windows workstations on which the TIA Portal is installed are members of the same domain. • A dedicated Windows server as a multiuser server is also located in the same domain. • All workstations and multiuser servers use the same LAN (Local Area Network). • Both workstations and the multiuser server have access to the domain controller. • Workstations can also be connected to the LAN via VPN.
Network	**Requirements:** • There is a direct TCP connection via the selected port between the workstations and the multiuser server. • No outbound firewall settings blocks communication on the workstations. • No incoming firewall settings blocks communication on the server. • Both the multiuser server and all workstations are in the same IP network (without routing). • If a router is installed in between, the router should not block communication via the selected server port. • Either no proxy server is configured, or there is a local bypass. The "Bypass proxy server for local addresses" option should be selected in the Windows settings for a local area network. • For security reasons, we recommend using VPN solutions, such as "Routing and Remote Access Service". • For security reasons, it is strongly recommended to set up a firewall. It is not necessary to open a port in the firewall for multiuser server when using VPN.



Configuration	Description
Authentication	Authentication is performed based on the current configuration selected. **User accounts and Windows workgroups when configured as an office workgroup:** • These must be created locally on the multiuser server. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Name and password for authentication are queried on all workstations. • Only local accounts of the server system can be used for authentication. **Note**: The Windows authentication can be used to query name and password. You have to create local accounts, which are identical to the accounts that exist on the multiuser server. This procedure allows the server to automatically authenticate a local account with identical logon information for an existing server account. **Restriction:** User accounts and groups cannot be managed centrally; local users and groups are required for this. This configuration is therefore unsuitable for enterprise networks. **User accounts and Windows workgroups with configuration as Windows domain:** • These must be created on the domain controller. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Users at workstations on which the TIA Portal is running are automatically authenticated with their domain logon information. **Note**: You can also log on with other valid logon data on the multiuser server. **Restriction:** This configuration is not suitable for temporary server configurations, since they also need access to the domain controller. Communication with a remote computer through a VPN demonstrates typical performance limitations for all client-server applications. The multiuser server is also affected.

Network in a Windows domain with Internet access via proxy

Introduction

Below, you can find information on a server configuration with a dedicated multiuser server in a Windows domain with intranet/Internet access via a proxy.

The graph shows the possible structure of such a configuration:

Office domain
Internet
Workstation 1
Domain
Controller
Firewall
Mobile
Workstation 2
Proxy
Office network
Mobile
Workstation 3
Dedicated multiuser server

Description of the network configuration in a Windows domain with proxy

The network configuration should meet the following requirements.

Network environment	**Configuration:** • All Windows workstations on which the TIA Portal is installed are members of the same domain. • A dedicated Windows server as a multiuser server is also located in the same domain. • All workstations and multiuser servers use the same LAN (Local Area Network). • Both workstations and the multiuser server have access to the domain controller. • Workstations outside the LAN can also be connected to the LAN via a proxy server.
Network	**Requirements:** • There is a direct TCP connection between the workstations and the multiuser server via the selected port. • No outbound firewall settings blocks communication on the workstations. • No incoming firewall settings blocks communication on the server. • Both the multiuser server and all workstations are in the same IP network (without routing). • If a router is installed in between, the router should not block communication via the selected server port. • Either no proxy server is configured, or there is a local bypass. The "Bypass proxy server for local addresses" option should be selected in the Windows settings for a local area network. • For security reasons, it is not recommended to make the multiuser server available on the Internet. • For security reasons, it is strongly recommended to set up a firewall to accept the incoming connections to the selected port. • The proxy server must accept HTTPS communication and forward it to the multiuser server on the selected port.

Authentication	Authentication is performed based on the current configuration selected. **User accounts and Windows workgroups when configured as an office workgroup:** • These must be created locally on the multiuser server. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Name and password for authentication are queried on all workstations. • Only local accounts of the server system can be used for authentication. **Note**: The Windows authentication can be used to query name and password. You have to create local accounts, which are identical to the accounts that exist on the multiuser server. This procedure allows the server to automatically authenticate a local account with identical logon information for an existing server account. **Restriction:** User accounts and groups cannot be managed centrally; local users and groups are required for this. This configuration is therefore unsuitable for enterprise networks. **User accounts and Windows workgroups with configuration as Windows domain:** • These must be created on the domain controller. • This must be configured in accordance with the multiuser rights and roles for servers and projects. • Users at workstations on which the TIA Portal is running are automatically authenticated with their domain logon information. **Note**: You can also log on with other valid logon data on the multiuser server. **Restriction:** This configuration is not suitable for temporary server configurations, since they also need access to the domain controller. Communication with a remote computer through a proxy demonstrates typical performance limitations for all client-server applications. The multiuser server is also affected.
Port	**Note**: Sometimes it is only possible to use port "443" for an https connection on a proxy server. A port other than "443" for an https connection cannot be set on some proxy servers. In this case, you need to install the multiuser server on port "443" as well.

15.3.11 Working with the multiuser server

15.3.11.1 Introduction to the multiuser server

Introduction

To be able to work with the full functionality of Multiuser Engineering , you need a multiuser server, which manages your multiuser projects.

The multiuser server must be installed first and then configured and started with the help of the multiuser tools.

The connections to the multiuser server in the TIA Portal can then be configured and administered using the "Options" > "Settings" > "Multiuser" command.

In the TIA Portal, you can execute the following actions for the server connections:

- Add new multiuser server connections.
- Create, edit, and delete existing multiuser server connections

Properties of the multiuser server

The multiuser server has the following properties:

- You need administrator rights to install and configure the multiuser server.
- The installation of the server requires settings in the Windows firewall and may require a certificate.
- The multiuser server is configured and administered by an administrator with the supplied multiuser tools.
- The server is available to all editors of the multiuser project and it can also be accessed from the outside.
- The multiuser server can be started and administered outside the TIA Portal.
- The "Alias" assigned as the name for the multiuser server is used as an identifier and may not be changed at a later point in time.

Quantity structure for the multiuser server

For efficient work with Multiuser Engineering, you can create up to 100 multiuser server connections.

When you have reached this number, you receive a message informing you that you cannot create any new server connections. Once you have deleted any server connections that are no longer required, you can once again create new connections up to the maximum number.

The following configuration limits are available for a multiuser server depending on the respective hardware:

Number of projects on the multiuser server	**Standard multiuser server (application as a temporary multi-user server)** **Hardware:** **Field PG M5 Advanced (or equivalent)** **Intel® Core™ i5-6440EQ up to 3.4 GHz·,16 GB RAM (32 GB for large projects)** **SSD with 50 GB of available disk space** **Network 1 GB** **15.6" Full HD Display (1920 x 1080)**
Maximum number of server projects per server:	100
Maximum number of local sessions per server:	200
Maximum number of local sessions per server project:	25

Note

Server hardware

When more powerful server hardware is used, even higher quantities are possible.

Editing the multiuser server connection (Page 6770)

Deleting the multiuser server connection (Page 6772)

15.3.11.2 Setting the multiuser network profiles

Introduction

When working with Multiuser Engineering you have the option of selecting between three different network profiles, depending on the performance capability of your own network.

The selected network profile determines the time until a timeout message is generated.

Available multiuser network profiles

The following network profiles are available for working with the multiuser server:

Network profile	Area of application
"Fast"	• Office environment • Gigabit/Ethernet • Stable and mostly interference-free network environment
"Medium"	• Office environment, small workgroup with fixed location • Fast Ethernet, WLAN, VPN connections • Good network environment, rare interference
"Slow"	• Commissioning, non-stationary workstations • WLAN connection • Interference possible (machines, electrical installations)

Setting the multiuser network profiles

To set the network profiles in the TIA Portal, follow these steps:

1. In the TIA Portal, select the command "Options" > "Settings" > "Multiuser".
   The available options for the network profiles are displayed in the following dialog.
2. From the drop-down list for "Multiuser network profiles", select the desired profile.

Result

The selected connection profile is activated.

Note

The timeout behavior of the current network profile is not affected at the changeover.

15.3.11.3 Adding a new multiuser server connection

Introduction

If you work with Multiuser Engineering and have installed a multiuser server, you can add up to 100 server connections to the multiuser server in the TIA Portal.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

The multiuser server must be configured and started with the help of the power tools.

Adding a new multiuser server connection

To add a new multiuser server connection, follow these steps:

1. In the TIA Portal, select the command "Options > Settings > Multiuser".
   The "Multiuser server connections" tab is open and all existing server connections are displayed.
   If no multiuser server connection has been configured yet, only the entry for the "Local multiuser server" is available.
2. In the following editor, click the "Add server connection" command in the "Server name" column.
   If the maximum number of 100 server connections has already been reached, you receive a message informing you that you first have to delete one of the existing server connections before you can add a new one.
   If it is possible to add a new server connection, the "Add new Multiuser server connection" dialog box opens.
3. Enter the name for the multiuser server in the "Server name" field.
   You can use a maximum of 256 characters for the name and the path. The name can include letters, numbers and commas.
   You will be notified if the entered name is already being used or if the path is longer than 256 characters in total.
4. Select the required transmission protocol (https or http) for the multiuser server. The "http" protocol is selected by default.
5. Enter the required host and port for the server connection.
   You will be notified if the entered host and/or port is already in use.
6. Click "Add".

Result

The new multiuser server connection is added and displayed under "Options > Settings > Multiuser".

15.3.11.4 Displaying the multiuser server connection

Introduction

When you are working with Multiuser Engineering you can display the existing server connections to the multiuser server in the settings of the TIA Portal.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

The multiuser server must be configured and started with the help of the multiuser tools.

Displaying the multiuser server connection

To display the existing multiuser server connections, follow these steps:

1. In the TIA Portal, select the command "Options > Settings > Multiuser".
   The existing multiuser server connections are displayed in the "Server name" column in the next editor.
2. If you are looking for a specific server connection, click the "Server name" or "Host" column headers to sort the content.

Result

The existing multiuser servers are displayed in the editor under "Options > Settings > Multiuser"

15.3.11.5 Editing the multiuser server connection

Introduction

When you are working with Multiuser Engineering you can edit the existing server connections to the multiuser server in the settings of the TIA Portal.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

The multiuser server must be configured and started with the help of the multiuser tools.

Editing the multiuser server connection

1. In the TIA Portal, select the command "Options > Settings > Multiuser".
   All existing multiuser server connections are listed in the next dialog in the "Server name" column.

   Note

   It is not permitted to edit a multiuser server connection that is used in a currently open local session.

2. If necessary, click the "Server name" or "Host" column headers to sort the contents.
3. Double-click the server connection that you wish to edit.
   Result: The "Edit multiuser server connections" dialog box opens.
4. You can enter the desired changes here.
   - The "Server name" field cannot be edited.
   - The entry in the "Host" field can be edited.
     You can navigate to the required host by clicking the button with the dots.
   - The entry in the "Port" field can be edited.

5. If possible, select "https" as the transmission protocol to ensure secure data exchange with encryption and certificate.
6. Click "OK" for the changes to become effective.

Result

Your changes for the selected multiuser server connection are applied and displayed under "Options > Settings > Multiuser".

15.3.11.6 Restore multiuser server connection

Introduction

When you are working with Multiuser Engineering the existing server connection to the multiuser server can be interrupted.

If this is the case, you will receive a corresponding error message after about 30 seconds.

You have different options, depending on whether you are working in the local session or in the server project view.

You have the following options when you are working in the local session:

- Restore the server connection
- Save and close the local session
- Close the local session without saving

You have the following options when you are working in the server project view:

- Restore the server connection
- Discard changes

Possible procedure in the local session

To restore a multiuser server connection, follow these steps:

1. Click "Restore" in the displayed dialog.
   If the server connection can be restored, the dialog closes and you can continue working without restrictions.
2. Click "Save and close the local session", if you are not continuing to work at the moment but want to save your changes.
3. Click "Close local session", if you want to exit the local session without storing it.

Possible procedure in the server project view

To restore a multiuser server connection, follow these steps:

1. Click "Restore" in the displayed dialog.
   If the server connection can be restored, the dialog closes and you can continue working without restrictions.
2. Click "Discard changes", if you exit the server project view without saving it and want to discard any changes you may have made.
   The server project view closes. The associated local session does not open, because there is currently no connection to the multiuser server.

15.3.11.7 Deleting the multiuser server connection

Introduction

When you are working with Multiuser Engineering you can delete the existing server connections to the multiuser server in the settings of the TIA Portal.

You can create, edit and delete up to 100 multiuser server connections in the TIA Portal.

Note

Keep in mind that you can only delete a server connection if all existing local sessions for this server connection were deleted beforehand.

Keep in mind that a connection from a local session to a deleted multiuser server connection is no longer possible.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

The multiuser server must be configured and started with the help of the multiuser tools.

Deleting the multiuser server connection

To delete an existing multiuser server connection, follow these steps:

1. In the TIA Portal, select the command "Options > Settings > Multiuser".
   All existing multiuser server connections are listed in the "Server name" column in the next editor.
2. If necessary, click the "Server name" or "Host" column headers to sort the contents.
3. Select one or more server connections that you wish to delete and click "Delete" in the shortcut menu.
   The "Delete" dialog box opens.
4. Click "Yes" to confirm the next message and to delete the selected server connection permanently.

Result

The selected multiuser server connection is deleted and is no longer displayed under "Options > Settings > Multiuser".

15.3.12 Working with the local multiuser server

15.3.12.1 Introduction to the local multiuser server

Introduction

To work with Multiuser Engineering , you need a multiuser server that manages your multiuser projects.

A local multiuser server is always installed automatically together with the installation of the TIA Portal and cannot be deleted. It does not require a separate software installation.

The local multiuser server is displayed in the list of Multiuser servers as the first entry under the non-editable "Local Multiuser Server" name and can be called with the " Options" > "Settings" > "Multiuser" command.

Advantages of the local multiuser server

The local multiuser server offers the following advantages:

- You can try out Multiuser Engineering without having to install a dedicated multiuser server first.
- You can buffer your work progress on the local multiuser server.

Requirement

To use the functionality of the local multiuser server, TIA Portal V14 or higher must be installed.

Properties of the local multiuser server

Unlike a dedicated multiuser server, the local multiuser server offers only limited functionality.

The local multiuser server has the following properties:

- It is only available to one user on their computer and cannot be deleted.
- It can only be started within the TIA Portal.
- It can only be called from the computer on which the local session is running that is assigned to this local multiuser server.
- It does not support management tasks.
- Its settings do not have to be adapted for the firewall and it does not need certificates.
- Only the port can be edited; the server name and host cannot be changed.

See also

Configuring the local multiuser server (Page 6774)
Displaying the local multiuser server (Page 6775)
Starting the local multiuser server (Page 6775)
Exiting the local multiuser server (Page 6777)

15.3.12.2 Configuring the local multiuser server

Introduction

A local multiuser server is installed by default during installation of the TIA Portal by default.

It is displayed in the list of multiuser servers as the first entry and can be called with the command " "Options > Settings > Multiuser server".

Requirement

You have installed TIA Portal V14 or higher.

Configuring the local multiuser server

To configure the local multiuser server, follow these steps:

1. In the TIA Portal, select the command "Options > Settings > Multiuser server".
   All existing multiuser servers are displayed in the next dialog in the "Server name" column.
2. If necessary, click the "Server name" or "Host" column headers to sort the contents.
3. Double-click the entry "Local multiuser server".
   The "Server connection" dialog opens.
4. Enter your changes.
   - The "Server name" and "Host" fields cannot be edited for the local multiuser server.
   - The entry in the "Port" field can be edited. Enter the required port here.
5. Click "OK" for the changes to become effective.
   Result: Your changes to the local multiuser server are applied and displayed under "Options > Settings > Multiuser server".

Note

It is not permitted to configure the local multiuser server while it is connected to an open local session.

If a local session has already been created and the local multiuser server is only reconfigured afterwards, the server must first be stopped and then restarted to prevent the existing local session from becoming invalid.

See also

Exiting the local multiuser server (Page 6777)

15.3.12.3 Displaying the local multiuser server

Introduction

A local multiuser server is installed by default during the installation of the TIA Portal.

Requirement

You have installed TIA Portal V14 or higher.

Displaying the multiuser server

To display the local multiuser server, follow these steps:

1. In the TIA Portal, select the command "Options > Settings > Multiuser server".
   In the next editor, the local multiuser server is displayed as the first entry in the "Server name" column.
   The dedicated multiuser servers you have created are listed below this.

Note

The local multiuser server cannot be deleted.

The local multiuser server is displayed with the uneditable server name "Local Multiuser Server" in all languages.

15.3.12.4 Starting the local multiuser server

Introduction

A local multiuser server is installed by default during the installation of the TIA Portal.

It is displayed in the list of multiuser servers as the first entry and can be called with the command " "Options > Settings > Multiuser server".

Starting the local multiuser server

To start the local multiuser server, follow these steps:

1. In the TIA Portal, select the command "Project > Manage multiuser projects".
   The "Manage multiuser projects" dialog box opens.
2. In the "Select server" box, select the local multiuser server from the drop-down list. It is displayed under the name "Local Multiuser Server".
   - Any existing server projects are listed here. The individual columns include detailed information on the respective project and on which user has made which changes and when. If required, you can change the arrangement of the columns.
   - You will be informed if a connection to the selected server is not possible.
   - If the local multiuser server has not yet been started, you will be asked if you want to start it now.
3. Confirm the next query as to whether the local multiuser server is to be started on your computer with "Yes".

Result

The connection to the local multiuser server is being established. A command window opens and shows that the server is now activated.

Note

Although the connection to the local multiuser server is terminated by closing the TIA Portal, this server is not stopped automatically.

To stop the local multiuser server, you must close the displayed command line.

Opening the local session assigned to the local multiuser server

As soon as you open a local session that is assigned to the local multiuser server and when the local multiuser server has not ben started, you are queried if you want to start the local multiuser server.

If you answer this query with "Yes", the local multiuser server is started and the local session is opened for editing.

You cancel the process with "No".

Note

Keep in mind that you can only delete a server connection if all existing local sessions for this server connection were deleted beforehand.

Keep in mind that a connection from an existing local session to a deleted multiuser server project is no longer possible.

15.3.12.5 Exiting the local multiuser server

Introduction

When you open a local session that is assigned to the local multiuser server , a prompt appears asking whether the local multiuser server is to be started. When the local session is ended or the TIA Portal is closed, the local multiuser server is not automatically ended.

The local multiuser server must be explicitly ended.

Requirement

The local multiuser server was started.

Procedure

To end the local multiuser server, follow these steps:

1. Terminate the local multiuser server by closing the displayed command line.

15.3.13 Creating and managing multiuser server projects

15.3.13.1 Introduction to working in multiuser server projects

Introduction

Once the multiuser server has been installed and then configured and started with the help of the multiuser tools , you can manage the multiuser server projects in the TIA Portal.

Managing the multiuser server projects

When you execute the command "Project > Manage multiuser server projects", all existing server projects for the existing server connections are displayed in the next dialog box.

The local multiuser server is displayed first in the list of existing server connections, because it always exists (by default).

If you have not added a multiuser server project yet, the list is empty.

If server projects already exist, they are displayed. From the drop-down list, select the required server connection for which all existing server projects are then listed.

You can execute the following actions with the individual buttons:

- Add and delete server connections.
- Add new server projects to the selected server connection.
- Delete existing server projects.

- Create new local sessions for a server project.
- Open existing local sessions.

Note
Displaying server projects

Server projects can only be displayed when a connection to the multiuser server exists and it has been started.

You will be notified if a connection could not be established.

Note
Deleting server projects

To prevent inconsistencies in the project management, server projects must not be deleted "manually" with the Explorer in the storage directory.

In the context of Multiuser Engineering, server projects must always be deleted with the Multiuser Tools.

All associated local sessions must be deleted before a server project can be deleted.

15.3.13.2 Adding a new multiuser server project

Introduction

When working with Multiuser Engineering, you must first create a multiuser server project. A multiuser server project is created by adding a standard project (single-user project) to the previously installed multiuser server and then be able to use this project as a multiuser server project.

Note
Multiuser server projects

Observe the requirements described under Requirements for multiuser projects (Page 6703), which a multiuser project has to fulfill.

Requirement

- The TIA Portal V14 is installed on your computer and executable.
- The multiuser server V14 is installed and can be accessed.

Procedure

To create a multiuser server project, follow these steps:

1. In the TIA Portal, click the menu command "Project > Manage multiuser server projects".
2. Select the required sever connection from the drop-down list in the next dialog box.
3. In the last row, click the "Add project to the server" button.
4. Set the required path to the single-user project or navigate to the required directory via the "..." button.
5. Select the project which you want to add as multiuser server project.
6. Enter the necessary information under "Details".
   The server project name is always preset and cannot be edited.
7. The "Create local session" button is enabled by default. Disable this button if you do not want to create a local session for the newly added multiuser server project.
8. Click "Add".
   If the selected project already exists as multiuser server project or is currently opened by another user, you will be notified.

Result

The selected single-user project is added as new multiuser server project and displayed under "Project > Manage multiuser server projects".

If the option "Create local multiuser session" was selected, a new local session is created and opened.

See also

Requirements for multiuser projects (Page 6703)

15.3.14 Working in the local session

15.3.14.1 Creating and managing a local session

Creating a local session

Introduction

To work with Multiuser Engineering , you must create a local session. The local session is always assigned to a specific multiuser server project.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project.

Procedure

To create a local session, follow these steps:

1. In the TIA Portal, select the command "Project > Manage multiuser projects".
   The "Manage multiuser projects" dialog box opens.
2. Select the required multiuser server in the drop-down list.
3. Select the required project from the displayed list and click "Create new local session".
   The "Create local session" dialog box opens.
4. In the "Create local session" dialog box, check your selection regarding the multiuser server and the multiuser server project.
   The displayed selection cannot be modified in this dialog box.
   If the displayed selection is not want you wanted, click "Cancel" and start again with step 1.
5. Add the detailed information to the local session:
   - Enter a valid path for storage of the local session or use the corresponding button to navigate to the required location.
   - Assign a name for the directory in which the local session is to be saved. The directory is created implicitly if it does not exist yet.
   - If required, enter a comment for the local session.

     Note

     Keep in mind that the author for the local session was already entered by default in this dialog box and cannot be edited.

   - The "Open local session" button is selected by default and causes the new local session to open as soon as it has been created. If desired, deactivate this button.
6. Click the "Create" button to execute this action.
   A message indicates that the local session is being created.

Result

The newly created local session is opened and displayed.

Exporting a local session as single-user project (Page 6787)

Opening a local session

Introduction

You have different options for opening a local session:

- In the TIA Portal with "Recently used projects"
- In the TIA Portal with the associated Multiuser server project
- With the Windows Explorer when the TIA Portal is closed

As soon as you open a local session that is assigned to the local multiuser server, a prompt appears asking if you want to start the local multiuser server, if it has not yet been started. Click "Yes" to start the local multiuser server and to open the selected local session.

Note

Instructions for opening local sessions:

- A renamed or deleted local session can no longer be opened.
- A local session cannot be opened when the associated server is not available.
- A local session cannot be opened as a reference project.

When opening a local session that meets one of the criteria listed above, you will see a note informing you that the session cannot be opened. In this case a prompt asks whether you want to export this local session as single-user project.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project and a valid local session.

Opening a local session

To open a recently used local session, follow these steps:

1. In the TIA Portal, select the command "Project > Open".
   The "Open project" dialog box opens with a list of recently used projects and sessions. The icons in the first column help you distinguish between single-user projects and multiuser projects.
2. Select the preferred local session and click "Open".

Result

The selected local session is opened.

Opening a local session by means of the associated server project

To open a local session via the associated server project, follow these steps:

1. In the TIA Portal, select the command "Project > Manage multiuser projects".
   The "Manage multiuser projects" dialog box opens.
2. Select the required multiuser server in the drop-down list.
3. Select the desired local session from the displayed list and click the "Show local session" button.
   The "Open local session" dialog box opens and displays all existing local sessions for the selected server.
   The entry in the first row is selected by default.
4. Select the preferred local session and click "Open".

Result

All opened dialog boxes are closed and the selected local session is opened.

Opening a local session with the Windows Explorer

To open a local session with the Windows Explorer, follow these steps:

1. While the TIA Portal is closed, navigate to the directory in which your local sessions are stored in Windows Explorer.
2. Select the preferred local session with the file extension "*.als14" and double-click it.

Result

The TIA Portal is started and the selected local session is opened.

Note

You close a local session as you would a single-user project with the command "Project > Close".

Opening a local session from a different storage location

To open a local session that has been moved to another storage location in the meantime, follow these steps:

1. In the TIA Portal, select the command "Project > Open".
   The "Open project" dialog box opens with a list of recently used projects and sessions.
2. Select the preferred local session and click "Open".
   You are notified that you are trying to open a local session from a different storage location.
3. Confirm this query with "OK" if you want to execute the action.

Result

The selected local session is opened from the new storage location.

The information about the new storage location is saved in the associated server.

Exporting a local session as single-user project (Page 6787)

Saving a local session

Introduction

You have different options for saving a local session:

- As "local session" with the file extension "*.als14"
- After an export as "single-user project" with the file extension "*.ap14".

When you export and save a local session as single-user project, you can continue to edit this project in the familiar way without multiuser functionality.

While working in the local session, you save this as usual as local session in order to continue to work in the context of Multiuser Engineering .

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project and a valid local session.

Procedure

To save a local session, follow these steps:

1. Open the local session:
2. Make your required changes.
3. In the TIA Portal, select the command "Project > Save".

Result

The local session is saved on the associated multiuser server with the file extension "*.als14".

Closing a local session

Introduction

You close a local session as you would a single-user project with the command "Project > Close".

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project and a valid local session that is open.

Procedure

To close a local session, follow these steps:

1. In the TIA Portal, select the command "Project > Close".
2. Confirm the next prompt with "Yes" if you want to save your changes.

Result

The local session is closed.

Deleting a local session

Introduction

To avoid inconsistencies in multiuser projects, you **cannot** delete a local session in the usual way with the command "Project > Delete project...".

Local sessions can only be deleted in the context of the multiuser functionality and depending on the associated multiuser server project.

Note

If you have manually deleted a local session with the Windows Explorer from the storage directory, it is still displayed in the "Local sessions" dialog box but can no longer be opened.

Delete this local session again explicitly in the multiuser context as described in the procedure below.

Local sessions that existing in the multiuser server can also be deleted with the Multiuser Tools in the server management. For more details, see:Commands for managing the multiuser server (Page 6741)

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project and a valid local session.

The local session you wish to delete must not be open.

Procedure

To delete a local session in the TIA Portal, follow these steps:

1. In the TIA Portal, select the command "Project > Manage multiuser projects...".
   The "Manage multiuser projects" dialog box opens with a list of sessions available for the selected server.
2. Select the respective server from the drop-down list.
3. Select the relevant server project from the list and click the "Show local session" button.
4. In the next dialog box "Open local session", select the respective session and click the "Delete" button.

   Note

   A local session cannot be deleted if it is open; the delete command is inactive in this case.

   In this case, close the local session first and click the "Delete" button once again.

5. Confirm the next query regarding deletion with "Yes".

Result

The selected local session is deleted and it is also deleted from the list of existing local sessions.

Displaying all local sessions associated with a server project

Introduction

You have the option of displaying all local sessions associated with a multiuser server project in the TIA Portal.

Requirement

You have installed TIA Portal V14 or higher and a multiuser server.

You have created an executable multiuser server project and a valid local session.

Displaying all local sessions

To display all local sessions belonging to a server project, follow these steps:

1. In the TIA Portal, select the command "Project > Manage multiuser projects".
   The "Manage multiuser projects" dialog box opens and displays all existing server connections for the multiuser server.
2. Select the required server connection.
   All server projects associated with this server connection are listed.
3. Select the relevant server project and click the "Show local sessions" button.
4. The "Open local session" dialog box opens and displays all existing local sessions for the selected server project.
   The entry in the first row is selected by default.
   If you want to open a local session, select the respective session and click "Open".

Result

All existing local sessions for the selected server project are displayed.

Exporting a local session as single-user project (Page 6787)

Exporting a local session as single-user project

Introduction

When working with Multiuser Engineering, you have the option of exporting a local session as single-user project.

This is beneficial when a local session can currently not be opened, for example, because the multiuser server is not available.

However, a local session may also become invalid and can therefore no longer be opened.

A local session becomes invalid for the following reasons:

- When the local session was renamed.
- When the local session has been moved to a different storage location.
- When the settings for the associated server have been changed and the server is no longer available for this reason.

If a local session is detected to be invalid when opened, you will receive a query as to whether you want to export the session as a single-user project.

This means you can save the work results from the local session in a single-user project and still use them.

You can apply the changes from the exported local session into your multiuser server project once again by copying them.

You also have the option of exporting a local session with the multiuser Power Tools.

For more details, see: Commands for managing the multiuser server (Page 6741)

Exporting a local session as single-user project

To export a local session as single-user project, follow these steps:

1. Click the command "Project > Manage multiuser projects".
2. Select the respective server from the drop-down list in the displayed dialog box.
3. Select the relevant server project and click the "Show local sessions" button.
4. Select the local session and click "Export as single-user project" in the shortcut menu. In the next dialog box, the name of the local session and the file extension ".ap14" are already preset.

5. Under "Export to" enter the preferred storage location or navigate to the preferred storage location and click "Export".
   Alternatively, you will be notified by the system that the local session is invalid when you open it.
6. Confirm the subsequent query whether you want to export the invalid local session as single-user project with "Yes".
   The "Export as single-user project" dialog box opens. The name of the local session and the name of the export file are preset and cannot be edited.
7. Enter the preferred export path or navigate to the preferred storage location and click "Export".

Result

The local session is exported as single-user project and saved under the set storage path.

The export dialog box is closed and the server project list is displayed once again.

15.3.14.2 Editing objects in the local session

Introduction to working in local sessions

Introduction

Within the context of Multiuser Engineering , to work simultaneously with multiple users in a multiuser project, each editor must create their own local session.

The respective editor can make changes in one or more local sessions, check them in to the multiuser server project and thus publish them.

After check-in, the changes from the local session are once again available to all editors in the server project. They can be reused and modified once again in subsequent local sessions.

Procedure when working in local sessions

The following steps are necessary to work as multiuser in the engineering tasks that have been assigned to you in a local session:

- You have installed TIA Portal V14 or higher and a multiuser server.
- Alternatively, you can use the local multiuser server installed by default.
- You have created an executable project for working with Multiuser Engineering.
- You have loaded the prepared project to the multiuser server and thus created a multiuser project.
- You have coordinated the task and the configuration limits for working in the local sessions with the other editors.
- You have created a local session for each engineering task.

Rules for working in local sessions

The following rules apply to working in local sessions:

- A local session is always assigned to a defined multiuser server and a defined multiuser server project.
- Each local session includes different tasks for different editors who are assigned to a multiuser server projects.
- A local session receives the file extension "*.als14" when it is saved and must not be renamed in Windows Explorer.
- While a local session is open, the associated multiuser server connection and the associated multiuser server project must not be renamed, moved or deleted.
- Local sessions can no longer be opened and edited when the associated multiuser server or the associated multiuser server project have been deleted.
- A local session cannot be opened without a server connection.
- A local session cannot be opened as reference project.
- A local session can be exported as single-user project and edited further without multiuser functionality.
- A local session cannot be archived or retrieved. These actions are possible as soon as the local session is once again edited as single-user project.
- Working with external tools is not possible in the local session. Changes by external tools in local sessions are lost after the local session is checked in and refreshed. External tools that make changes to the file structure of a multiuser project may only be used in the server project view.
- Changing of user-defined documentation is not possible in the local session. Changes to existing user-defined documentation are lost after the local session is checked in and refreshed. Changing of user-defined documentation is only possible in the server project view.

Note

Renaming objects in local sessions

Objects should be renamed only in the server project view, since this does **not** cause any inconsistencies in the server project.

When renaming objects in the local session, you must ensure that all objects affected by the renaming and their places of use are also marked and checked in the server project. Otherwise, you get compiling errors and an inconsistent server project due to partial renaming.

Before checking the places of use of the renamed object, you should be careful not to create conflicts (red flags) when marking and you should not mark any outdated objects; otherwise, you will overwrite the work of another user when checking in.

Note

Editing library objects in local sessions

Library objects should be edited only in the server project view, since this does **not** cause any inconsistencies in the server project.

With version changes to library objects in the local session, for example, when you create new versions of type instance objects, you must ensure that all relevant objects have been marked with a version change and checked into the server project.

Otherwise, you get compiling errors and an inconsistent server project from creating new versions.

Note

You can find detailed instructions on working with local sessions in the sections below.

See also

Displaying usage info for marked objects (Page 6794)

Check-in objects to the server project (Page 6797)

Possible conflicts during check-in (Page 6800)

Possible error messages during check-in (Page 6803)

Marking objects for editing

Introduction

For objects to be edited in Multiuser Engineering at the same time, each editor must mark the objects they want to edit in their local session.

You can mark objects within the local session as follows:

- With the shortcut menu command "Mark objects for check-in".
- By clicking the displayed flags in the project tree and in the individual editors of the TIA Portal.

In this version of the TIA Portal, edited objects are only marked automatically when objects are deleted.

For marking of objects, multiple selections are also possible via the shortcut menu. A prerequisite for the marking is that the selection includes at least one object that can be marked. If the multiple selection does not include an object that can be marked, the shortcut menu commands are possibly not active.

Rules for marking objects

The following rules apply to marking:

- The markings and the marking column in the project tree and in the individual editors are only displayed in the context of Multiuser Engineering.
- Objects that can be marked are identified by a gray flag in the project tree and in the editors.
- You can only mark objects that can be edited with Multiuser Engineering.
- If an object does **not** have a gray flag in front of it, this object cannot be marked and it should not be edited in the local session as the changes cannot be checked into the server project. Such objects that cannot be marked should be edited in the server project view.
- Some higher-level directories cannot be marked themselves, but the individual objects in the folder can be marked.
  Example: "PLC tag table": The PLC tag table itself cannot be marked, but the individual tags in the open tag table can be marked.
- You mark them by clicking the gray flag or with the shortcut menu. The flag is shown in color as soon as an object has been marked.
- The color of the flags provides additional information about the marking:

Icon	Meaning
	Object can be marked for check-in.
	Object is marked in own local session.
	Object is marked in a different local session that is part of the same multiuser server project.
	Conflict: The object was marked in multiple sessions simultaneously.

Note

Changes to objects that are not marked

Changes to objects that are not marked in the local session are possible but **cannot** be applied to the server project.

These changes are lost after update of the local session, because they are once again overwritten with the contents of the server project.

As soon as you want to edit an object that is not marked, a banner text is displayed in the open editor. This banner text contains information on the further procedure.

Procedure for marking objects

To mark objects in a local session, follow these steps:

1. Open the required local session and click on the displayed gray flag to mark an object for check-in.
2. Alternatively, you can select the required object and mark it with the shortcut menu command "Mark object for check-in".
3. Mark all objects in your local session that you currently want to edit. You can make multiple selections for marking. After marking, you can edit and save the objects as usual.

Note

Multiple selections

Once > = 50 objects are selected in the local session, both shortcut menu commands are active simultaneously: the command for marking the objects as well as the command for unmarking.

Result

The marked objects are displayed with a blue or red flag.

If a blue flag is displayed, the object can be edited in the local session.

If a red flag is displayed, you have a conflict that has to be resolved through coordination with the other editors.

Note

Markings with conflict (red flag)

A marking conflict must be resolved by agreement of the editors, and a sequence for editing the marked objects must be specified. To solve the conflict, one editor must unmark the objects.

See also

Introduction to working in local sessions (Page 6788)

Unmarking objects (Page 6793)

Displaying usage info for marked objects (Page 6794)

Unmarking objects

Introduction

For objects to be edited in Multiuser Engineering at the same time, each editor must mark the objects they want to edit in their local session. The objects marked for check-in can also be unmarked.

This is necessary primarily in a conflict (indicated by a red flag) in which multiple editors have marked the same object for check-in in their respective local session.

Note

Markings with conflict (red flag)

A marking conflict must be resolved by agreement of the editors, and a sequence for editing the marked objects must be specified. To solve the conflict, one editor must unmark the objects.

Procedure

To unmark objects in a local session, follow these steps:

1. Open the local session and click on the displayed blue or red flag to unmark an object.
2. Alternatively, you can also select the required object and delete the marking with the shortcut menu command "Unmark".

Result

The objects that are no longer marked and objects marked as conflict are displayed as follows:

Icon before	Action	Icon after
	Unmark	
	Unmark	

See also

Introduction to working in local sessions (Page 6788)

Marking objects for editing (Page 6791)

Displaying usage info for marked objects (Page 6794)

Displaying usage info for marked objects

Introduction

For objects to be edited in Multiuser Engineering at the same time, each editor must mark the objects they want to edit in their local session.

To avoid multiple marking of objects and any marking conflicts caused by it, you receive the following information for marked objects:

- User: Indicates who has marked the object
- Computer: Indicates on which computer the object was marked.
- Storage location: Indicates where the object was marked: in a local session or in the server project view.

This information helps you coordinate the further procedure for marked objects or objects that are marked with a conflict with the other users.

Show usage info

To display the usage info for marked objects, follow these steps:

1. Select a yellow or red marked object in your local session or in the server project view.
2. Call the "Usage info" command from the shortcut menu.

Result

The "Usage info" dialog box opens and displays the above-mentioned information for the marked object.

Note

Markings with conflict (red flag)

A marking conflict must be resolved by agreement of the editors, and a sequence for editing the marked objects must be specified. To solve the conflict, one editor must unmark the objects.

Marking objects for editing (Page 6791)

Unmarking objects (Page 6793)

Refresh local session

Introduction

For objects to be edited in Multiuser Engineering at the same time, each editor must mark the objects they want to edit in their local session. Objects are labeled as "outdated" when their version is newer in the server project than in the local session.

You can refresh these objects in the local session by clicking the "Refresh local session" icon in the multiuser toolbar.

Other users may have created new objects or deleted objects in the server project that are not yet displayed in your local session.

These new objects are also displayed in your local session after a refresh.

The contents of "outdated" objects in the local session are overwritten with the more recent contents of the server project during the refresh.

Note

Refresh local session

- The button to refresh the local session opens the view "Refresh", even if there are no objects to be refreshed in your local session. In this case, the button "Start refresh" is disabled in the editor.
- During the refresh, all changes to **unmarked objects** in your local session are overwritten with the contents of the server project. The marked objects remain unchanged.
- You can undo the refresh of the local session if required by clicking the "Restore" button. Your local session will then be restored with the contents prior to the refresh.

Refresh procedure

To refresh objects in a local session, follow these steps:

1. Open the local session that contains the objects that are to be updated.
2. Click the "Refresh local session" button in the multiuser toolbar.
   The multiuser editor opens in the refresh view and shows all objects marked in your local session. The objects you have marked are not overwritten during the refresh. Only unmarked objects are overwritten with the contents of the server project.
3. Click the "Start refresh" button to start the refresh.
   You are kept up-to-date on the progress of the refresh. You will receive an error message if an error occurs.
4. You receive the message that the refresh was completed successfully. Click "OK".

Result

All unmarked objects in your local session were refreshed.

The objects marked in your local session were **not** synchronized with the server version.

Note

Online/offline differences after the refresh

After downloading to the device, the online information on the loaded objects is stored in the local session in the TIA Portal. This enables a comparison between the online and offline version. However, because this online information is not checked in on the server, this information is no longer available in the local session after a refresh. If you then work online on the device after the refresh, the TIA Portal cannot perform a comparison because of missing information. The objects are displayed with online/offline differences although the contents of the objects are identical.

To correct this, perform a new complete download to the device after a refresh of the local session.

Restoring the local session after the refresh

Introduction

Unmarked objects which have a newer version in the server project can be updated in the local session. The unmarked objects in the local session are overwritten with the more recent contents of the server project during the refresh.

You can undo the refresh of the local session if required. To do this, click the "Restore" button in the multiuser editor after the refresh. Your local session will then be restored with the contents prior to the refresh.

Note

"Restore" button

The "Restore" button is only active after a refresh has been performed as long as a restore of the contents of the local session with the last version is possible.

The "Restore" button is inactive if no restore of the local session can be performed, for example because no refresh was performed.

Closing and opening the editor has no impact on the "Restore" button. If a refresh is available that can be undone, the button is still active even if you close the editor and open it again.

Procedure to restore the local session

To restore the local session after the refresh, follow these steps:

1. Open the local session for which you have performed a refresh, if you have closed this in the meantime.
   Start with step 3 if the refresh view is still open.
2. Click the "Refresh local session" button in the multiuser toolbar to open the multiuser editor in the refresh view.
3. Click the "Restore" button to restore the version of the local session before the last refresh.
4. In the next dialog box, click "Yes" to answer the prompt.
5. When errors occur, you receive an error message that you have to acknowledge.
6. When the restore is successfully completed, you receive a message. Click "OK".

Result

Your local session was successfully restored with the version before the last refresh.

See also

Introduction to working in local sessions (Page 6788)

Check-in objects to the server project

Introduction

After editing marked objects in the local session, you can check the changes into the server project.

The following rules apply to check-in:

- Only changes to marked objects are applied during check-in to the server project.
- If you have edited unmarked objects or objects that cannot be marked in the local session, these changes are **not** applied during check-in.
- During the refresh of your local session after check-in, changes to unmarked objects and objects that cannot be marked are overwritten with the contents of the server project.
- When deleting unmarked objects in the local session, these objects are once again present in your local session after the refresh. Because these objects still exist in the server project, they are once again added to the local session.
- You will receive an error message with additional information if an error occurs during check-in. Correct the errors that occurred as specified, either in your local session or in the server project view. Then start the check-in process again.
- During check-in and editing of objects in the server project view, the respective user works exclusively on the multiuser server. The server is therefore locked for all other users. The server status is shown as "not available" in the toolbar during exclusive editing. You can nevertheless create a new local session and refresh local sessions.

Options for the check-in

Compile

You have the option to compile the changes made in the local session before check-in.

Note

Options displayed for the compilation during check-in

The options displayed for the compilation during the check-in depend on the settings made in the TIA Portal under "Options > Settings > Multiuser" for "Compilation settings" .

The compiling options may be deactivated in the multiuser editor based on these settings.

Compile mode

The compile mode defines the extent to which the software changes are compiled. You can select the following options from the drop-down list:

- Marked objects (changes only)
  The changes made to the marked objects for the selected device are compiled together with the device-specific objects.
- Device software (changes only)
  The changes made to the marked objects are compiled together with the software version on the assigned devices.
  Example: You have marked and changed several objects that belong to more than one device (for example to CPU_1 and to CPU_2). These marked objects are compiled together with the software versions of both CPUs during compiling.

Display server project view

When you enable this option, you have the possibility before check-in to again display your changes to the marked objects in the server project view together with the current contents of the server project.

You can mark and edit all objects in the server project view and unmark them. After this, you can either save your changes in the server project or discard your changes and exit the server project view without further action.

Requirement

The connection to the multiuser server exists and the server is available.

You have marked the objects edited in the local session for check-in.

Procedure for check-in of changes

To check-in the changes from the local session to the server project, follow these steps:

1. Open the local session that you want to check in.
2. Click the "Check-in" button in the multiuser toolbar.
   The multiuser editor opens in the "check-in" view and shows all objects marked in the local session that are applied to the server project during check-in.
3. Open the displayed folders and check the objects displayed and marked for check-in.

4. Select the preferred options for check-in.
   - "Compile": Select the required setting from the drop-down list.
   - "Open server project view": When you click this options, the server project view is opened in the project tree prior to check-in.
5. Click "Start check-in" after reviewing to check the displayed objects into the multiuser server project.
   - If you have opened the server project view, you can check in your changes with the "Save changes" button. If you click "Discard changes", your changes are not applied in the server project.
   - If you want to keep the marking in the local session even after the check-in, you must select the option "Keep markings for objects".
   - If you have marked and checked in only some of your changes, you should perform **no refresh** to retain your changes to the unmarked objects.
6. If check-in was successful, you receive a message to this effect.
7. If check-in was unsuccessful and aborted due to errors, you receive a corresponding error message. Correct the specified errors in your local session or in the server project view. Then start the check-in process again.

Result

Your local session is refreshed and opened with the contents of the server project after successful check-in.

- The local session will include all changes after the refresh that have been checked in in the server project in the meantime.
- If new objects were added to the server project, these objects are now also visible in your local session.
- If objects were deleted in the server project, these objects now no longer exist in your local session.
- Your markings in the local session are automatically deleted if you have not selected the option "Keep marking for objects".
- The server connection is released once again after check-in. The server status changes in the display within the toolbar from "busy" to "available".

Editing objects in the server project view (Page 6809)

Possible conflicts during check-in

Introduction

Errors can occur during check-in of changes from the local session to the associated multiuser server project that may prevent successful check-in.

The error constellations listed below can be easily avoided through coordination between editors and by observing the recommended procedures.

Possible naming conflicts during check-in

Naming conflicts during check-in arise when identical names are used for different objects in different local sessions.

Example:

- Editor 1 creates the tag "Motor_1" in their local session.
- Editor 2 also creates a tag "Motor_1" in their local session.

Result:

Editor 1 can check in their changes without errors.

Editor 2 **cannot** check in their changes. When they want to check in their changes they receive an error message due to a naming conflict and the check-in is aborted. The error must be removed in the local session.

Possible conflicts when creating devices in the local session

If an editor adds new devices with marked objects in a local session, for example, a new CPU with blocks, the result will be a conflict during check-in.

Example:

- Editor 1 creates a new CPU with two function blocks in their local session.
- Editor 1 marks the blocks appropriately before editing them.

Result:

Editor 1 receives an error message during check-in because the newly created CPU cannot be found in the server project. The transfer of devices is currently not supported in Multiuser Engineering. Check-in is aborted in this case and the server project view opens. Editor 1 can copy their newly created objects directly to the server project. This means the editing work is not lost.

Possible conflicts when renaming objects in the local session

Objects should be renamed only in the server project view, since this does **not** cause any inconsistencies in the server project.

When renaming objects in the local session, you must ensure that all objects affected by the renaming and their places of use are also marked and checked in the server project. Otherwise, you get compiling errors and an inconsistent server project due to partial renaming.

Before checking the places of use of the renamed object, you should be careful not to create conflicts (red flags) when marking and you should not mark any outdated objects; otherwise, you will overwrite the work of another user when checking in.

Possible conflicts when changing the device type in the local session

If a device type is changed in a local session, e.g. a "CPU_1" of the type S7-15xx is replaced or renamed, the objects marked in the "old" CPU may no longer be displayed in the local session.

Possible conflicts when deleting devices in the server project

If devices with included objects are deleted in the server project, it may result in a transfer error.

Example:

- Editor 1 works in their local session on marked objects that are part of "CPU_1".
- In the meantime, editor 2 deletes "CPU_1" in their server project view and saves the changes in the server project.

Result:

Editor 1 receives an error message during check-in because "CPU_1" no longer exists in the server project. In this case, editor 1 can add their edited objects in the server project view. The editor either copies "CPU_1" completely to the server project or they add the edited blocks to an existing CPU in the server project.

Possible scenarios during check-in of objects that are deleted in the server project

When you check in objects that are already deleted in the server project, these objects are recreated.

Example:

- User 1 edits the marked tag "Tag_1" in their local session that is part of a group that includes a tag table with multiple tags.
- User 2 deletes this group with its entire tag table in the server project view and saves the changes in the server project.

Result:

User 1 ignores the display that "Tag_1" is outdated, continues working on it and checks in the changes. The group with the tag table is created once again in the server project, but it now only includes the tag "Tag_1".

Renaming objects

You should avoid renaming objects in the local session as it results in naming conflicts during check-in. If objects must be renamed, they should be renamed directly in the server project view. Any local session with marked objects that is associated with this server project must not be present at the same time.

Possible name conflicts when checking in deleted but not marked objects

In the change view, you can also adapt the markings for the displayed objects. If the marking of a deleted object is removed in the change view and this object still has a name conflict with another object in the server project, the check-in cannot be performed.

Without the marking, the information about the deletion of the object cannot be transferred to the server. Therefore, an identical name for an object created or renamed in the local session is still occupied by the previous object. During check-in, this results in a critical transfer error that must be corrected in the local session.

Example:

- User 1 deletes the text list "TL_1" in his local session. The deleted text list is automatically marked and thereby transferred at the next check-in on the server.
- User 1 accidentally deletes the marking for deleted text list "TL_1" before check-in in the change editor. Removing the marking means that the information about the deletion of the text list "TL_1" in the local session is not transferred to the server project. The text list "TL_1" still exists in the server project.
- User 1 now creates a new text list, also named "TL_1", in the local session. The user marks this newly created text list and wants to check it into the server project.

Result:

- Since the original text list "TL_1" is still present in the server project, however, the newly created text list "TL_1" in the local session causes a critical transfer error during check-in.
- The error must be corrected in the local session by renaming the newly created "TL_1", for example, to "TL_1_new".
- After this, the check-in can be performed by updating the local session. After the update, both text lists are again available in the local session and User 1 can delete the unneeded text list "TL_1" and check in the change.

Different project languages in server project and local session

If a project language is changed in a local session, these changes are lost in the local session after check-in and after refresh.

If a project language is subsequently deleted in the server project view, this project language no longer exists in the server project.

Changes to the project languages should always be made only directly in the server project view. Note that no local sessions with marking to this server project were edited or opened.

Opening and closing the server project view (Page 6808)

Possible error messages during check-in

Introduction

The following described error messages can occur during check-in of marked changes from the local session to the multiuser server project :

- Transfer error
- Compilation error

The procedure for dealing with these error messages is described below.

Transfer error

The following actions are automatically executed when transfer errors occur during check-in:

- An error message will inform you about the type of error that has occurred and the next steps. After acknowledgment, this message is closed.
- In the case of a critical transfer error, the status prior to check-in is restored in the local session as well as in the server project. Changes are not lost. Correct the error in your local session.
- If the transfer error can be corrected in the server project view, the server project view is opened. Correct the error in the server project view.
- The faulty objects are displayed and identified in the multiuser editor in the "Check-in" view.
- The multiuser server locked for check-in is released once again if the errors are corrected in the local session.
- The multiuser server remains locked in the server project view during error correction. Note that no other user can check in their changes during this time period.

Correcting transfer errors

After occurrence of a transfer error, you have the following options for the action to take:

1. Correct the errors in your local session or in the server project view.
2. Then start the check-in process again so that an error-free project can be checked in.

Compilation error

If the option "Compile" is selected during check-in, a compilation process takes place after transfer of the marked changes to the server project with the selected option. The following compile modes are available:

- Marked objects (changes only)
  The changes made to the marked objects for the selected device are compiled together with the device-local objects.
- Device software (changes only)
  The changes made to the marked objects are compiled together with the software version on the assigned devices.

Note

Options displayed for the compilation during check-in

The options for compiling that are displayed during check-in are dependent on the settings made in the TIA Portal under "Options > Settings > Multiuser" in "Compilation settings" .

The compiling options may be deactivated in the multiuser editor due to these settings.

If the compiling process is completed successfully, the changes from the local session are automatically transferred to the server project.

The following actions are taken when a compilation error occurs:

- The progress indicator for check-in is closed, and the check-in is stopped.
- The faulty objects are displayed and identified in the multiuser editor in the "Check-in" view.
- The multiuser server remains locked in the server project view during error correction. Note that no other user can check in their changes during this time period.

Correcting compilation errors

After occurrence of a compilation error, you have the following options for the action to take:

1. Correct the indicated errors in your local session or in the server project view.
2. Then start the check-in with compilation again so that an error-free project can be checked in.

Ignoring compilation errors

You also have the option of ignoring the indicated compilation errors and checking in a project with errors.

NOTICE
Check-in with compilation errors This action is possible but not recommended! To enable efficient work to continue for all editors involved, you should check in only error-free projects on the multiuser server whenever possible.

Introduction to working in local sessions (Page 6788)

Deleting objects in the local session

Introduction

When working with Multiuser Engineering , you can delete objects in the local session.

The following rules apply to deleting objects:

- Deleted objects are no longer displayed in the local session.
- The "Undo" function can be use to undo the "Delete" action in the local session.
- Deleted objects are automatically marked by the system and displayed in the "Deleted objects" folder.
- If you unmark a deleted an object in the multiuser editor, the deleted object is **not** checked-in in the server project. This means that the deleted object is **not** deleted in the server project. The now deleted but not checked-in object is only displayed after the next refresh.
- When deleting unmarked objects in the local session, these objects are once again present in your local session after the refresh. Only marked objects are transferred during check-in. Since the deleted objects could not be marked, the deletion is not applied in the server project. During the next refresh of the local session, these objects are once again added to the local session.

Requirement

The connection to the multiuser server exists and the server is available.

Procedure for deleting objects

To delete object in the local session, follow these steps:

1. Open the required local session.
2. Delete the requested marked object or delete an unmarked but markable object.
3. Click the "Check-in" button in the multiuser toolbar.
   The multiuser editor opens in the "check-in" view and shows all objects marked in the local session that are applied to the server project during check-in. The objects deleted in the local session are displayed in the "Deleted objects" folder.
4. Check the objects displayed and marked for deletion. You can unmark any objects that are already marked if you do not want to delete them after all.

5. Select the preferred options for check-in:
   - "Compile": When you click this option, your changes are compiled with the option "Software, changes only" prior to check-in. This means that the software changes you have made are compiled with all their dependent objects in the server project.
   - "Open server project view": When you click this options, the server project view is opened in the project tree prior to check-in. The server project view shows you in advance the content of the current server project with your changes marked for check-in. You can mark and edit all objects in the server project view and unmark them.
6. Click the "Check-in" button to check in the displayed objects into the multiuser server project. If you want to keep the markings in the local session even after check-in, you must select the option "Keep markings".
7. If check-in was unsuccessful and aborted due to errors, you will receive the corresponding error messages. Correct the errors in your local session or in the server project view. Then start the check-in process again.

Result

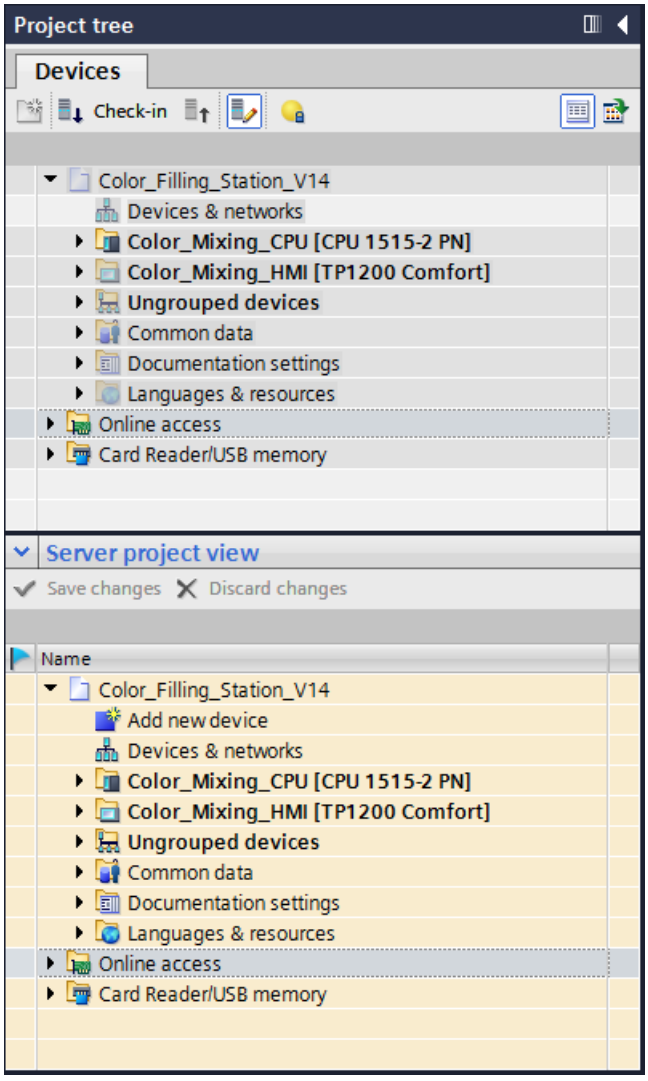
Your local session is refreshed and opened with the contents of the server project after successful check-in.

- The local session will include all changes after the refresh that have been checked in in the server project in the meantime.
- If new objects were added to the server project, these objects are now also visible in your local session.
- The objects deleted in the server project, now no longer exist in your local session.
- Your markings in the local session are automatically deleted if you have not selected the option "Keep objects marked".
- The server connection is released once again after check-in. The server status changes in the display within the toolbar from "busy" to "available".

15.3.15 Working in the server project view

15.3.15.1 Introduction to working in the server project view

Introduction



In Multiuser Engineering , you have the option of working directly in the server project view in addition to working in local sessions.

The server project view can be opened for editing with the icon in the multiuser toolbar.

Structure of the server project view

The server project view shows the current content of the server project in the project tree below the local session against a yellow background.

The figure below shows an example of a multiuser project opened in the server project view:

Actions in the server project view

You can perform the following actions in the server project view:

- The server project view lets you work directly in the server project.
- All existing objects can be edited in the server project view, even those that could not be edited in the local session.
- In the server project view you can work with the functionality of Inter Project Engineering (IPE) and exchange data between CPU and HMI via a PLC proxy.
- Shared working on one CPU is also supported during shared commissioning.

- Blocks or larger program parts from a CPU should only be uploaded in the server project view.
- You can also make changes to the configuration with the help of external tools in the server project view. This function is not supported when working in the local sessions.
- Changes to user-defined documentation, such as adding new user texts, should only be made in the server project view.
- The objects that are to be edited must also be marked for editing in the server project view so that other editors see that these objects are being changed.
- You can save or discard the changes made in the server project view with the "Save changes" and "Discard changes" buttons.
- Any changes you have made will be saved directly in the server project with the save step.

Note

Restrictions when working in the server project view

The following conditions apply as soon as the server project view is open:

- The local session is locked to prevent editing.
- The server is locked for the other editors.
- The icon for the server status is shown in yellow in the toolbar.

See also

Editing objects in the server project view (Page 6809)

15.3.15.2 Opening and closing the server project view

Introduction

The server project view lets you edit all objects that are available in the server project.

You have the following options to open the server project view:

- Using the icon in the multiuser toolbar
- Using the link displayed in the banner texts
- Using the button in the multiuser editor in the "Check-in" view

You will receive a message if the server project view cannot be opened because the server is currently in use by another editor and locked.

Displayed contents in the server project view

The server project view always shows the latest version of the multiuser server project.

If the server project view is opened in the "Check-in" view in the multiuser editor, it also shows the changes made in the local session in addition to the current content of the server project. This means it offers a preview of how the server project will look after check-in of the changes made in the local session.

Opening the server project view

To open the server project view, follow these steps:

1. Open the required local session.
2. In the multiuser toolbar, click the "Open/close server project view" icon.
   Or you can click "Check-in" in the multiuser toolbar and then click "Open server project view before check-in" in the multiuser editor that opens.
   Alternatively, you can also click on the link in a displayed banner text.

Closing the server project view

To close the server project view, follow these steps:

1. In the multiuser toolbar, click the "Open/close server project view" icon once again.
2. If you have made changes in the server project view, you will be prompted as to whether you want to save or discard the changes.
3. Click "Yes" to save your changes or "No" to discard them.
   Alternatively, you can click on the corresponding button in the server project view before you close it to save or discard your changes.

Result

The server project view is closed.

The local session is opened once again for editing.

The server is released again; the server status is displayed in green.

Introduction to working in the server project view (Page 6806)

Editing objects in the server project view (Page 6809)

15.3.15.3 Editing objects in the server project view

Introduction

In the context of Multiuser Engineering you can also edit objects directly in the server project view .

The server project view lets you edit all objects in the server project view, even those that must not be edited in the local session.

Working in the server project view is an exclusive working directly in the multiuser server project. The multiuser server is locked for other editors while you are working in the server project view. The associated local session cannot be edited during the working in the server project view.

You also have to mark the objects you want to edit in the server project view. This enables you to ensure that other editors in your local session can see that you are currently editing these objects. Marking conflicts can hereby be avoided.

Note

Marking of identical objects in the local session and in the server project view

Keep in mind that a marking conflict is displayed with red flag if you mark an object more than once, even if both markings belong to the same editor.

Editing objects in the server project view

You can, for example, perform the following actions in the server project view:

- Adding new objects that did not exist previously in the server project.
- Add or change hardware configuration and connections.
- Perform version changes on the instructions used.
- Working with Inter Project Engineering (IPE).
- Editing all objects regardless of whether these are marked or not.
- Renaming, moving and deleting objects.
- Establishing an online connection to a CPU and downloading or uploading objects.
- Executing all functions of the TIA Portal supported by Multiuser Engineering.

Procedure for editing objects in the server project view

To edit objects in the server project view, follow these steps:

1. Open the required local session.
2. In the multiuser toolbar, click the "Open/close server project view" icon.
   The server project view is then shown against a yellow background below the local session in the project tree.
   The server project view is closed again the next time you click this icon.
3. Mark the objects you want to edit in the server project view by clicking on the flag in front of them.
   Alternatively, you can also edit unmarked objects in the server project view.
4. Make your required changes.
5. Save your changes by clicking the "Save changes" button.
   If you do not want to apply your changes to the server project, click "Discard changes".

Result

The changes made in the server project view are saved in the server project.

- The server project view is closed and the local session is once again released for editing.
- The markings are removed in the server project view.
- The local session is **not** automatically refreshed with the new contents of the server project.

15.3.15.4 Renaming objects in the server project view

Introduction

When you work with Multiuser Engineering , object can be renamed.

Rules for renaming objects

The following rules apply to renaming objects:

- You should avoid renaming objects in the local session as it can lead to naming conflicts during check-in.
- The renaming of objects should always be performed in the server project view.
- When objects are renamed in the server project view, the objects to be renamed must have no markings within local sessions.
- Name conflicts may occur due to the renaming. During renaming in the project, make sure that you do not again use an already used name.
- To avoid unintended references of objects, conflicts that occur during renaming are not automatically corrected.
- The renaming of devices does not create any conflicts for objects within a device, as devices are not identified by their name but by their ID.
- However the renaming of devices may create conflicts with any existing references between devices (PLC and HMI).
- After objects have been renamed, the other editors should refresh their local sessions.

Requirement

The connection to the multiuser server exists and the server is available.

No other local session to this server project is open.

Renaming objects

To rename objects in the server project view:

1. Open the required local session.
2. In the multiuser toolbar, click the "Open/close server project view" icon.
   The server project view is then shown against a yellow background below the local session in the project tree.
   The server project view is closed again the next time you click this icon.
3. Mark the required objects in the server project view and rename these.
4. Click the "Save changes" button to apply the changes in the multiuser server project.

Result

The changes made in the server project view are saved in the server project.

- The server project view is closed and the local session is once again released for editing.
- The markings are removed in the server project view.
- The local session is **not** automatically refreshed with the new contents of the server project.
