Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Table of contents

1 System overview of STEP 7 and WinCC....37

1.1 Scaling of STEP 7 and WinCC in the TIA Portal....37

1.2 Options for STEP 7 and WinCC Engineering....39

1.3 Options for S7-1500 Runtime....40

1.4 Options for STEP 7 Engineering System....41

1.5 Options for WinCC Engineering and Runtime systems....42

2 What's new in TIA Portal....45

2.1 What's new in TIA Portal V14 SP1....45
2.1.1 Introduction....45
2.1.2 SIMATIC STEP 7....45
2.1.3 SIMATIC WinCC....48
2.1.4 SIMATIC STEP 7 Safety....49
2.1.5 SINAMICS Startdrive....51
2.1.6 SINUMERIK STEP 7 Toolbox....51
2.1.7 Runtime options....52

2.2 What's new in TIA Portal V14....54
2.2.1 Introduction....54
2.2.2 SIMATIC STEP 7....54
2.2.3 SIMATIC WinCC....57
2.2.4 SINAMICS Startdrive....58
2.2.5 SIMOTION SCOUT TIA....59
2.2.6 SIMOCODE ES V14....59
2.2.7 Engineering options....60
2.2.8 Runtime options....62

3 Readme....65

3.1 Notes on the TIA Portal....65
3.1.1 General notes....65
3.1.2 Notes on libraries....67
3.1.3 Notes on memory cards....68
3.1.4 Notes on the hardware configuration....69
3.1.5 Notes on instructions....69
3.1.6 Notes on using the TIA Portal in a virtual environment (private cloud)....70
3.1.7 Information on working with Multiuser Engineering....71

3.2 STEP 7 Basic....73
3.2.1 Security information....73
3.2.2 Notes on use....74
3.2.3 Editing devices and networks....75
3.2.3.1 General information on devices and networks....75
3.2.3.2 Use of modules on the S7-1200....76
3.2.3.3 CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX....77
3.2.3.4 F-CM AS-i Safety ST for ET 200SP....77

3.2.3.5 S7 routing via IE/PB Link....77
3.2.3.6 Notes on online and diagnostics....78
3.2.3.7 Network components....79
3.2.4 Programming a PLC....81
3.2.4.1 General notes on PLC programming....81
3.2.4.2 Instructions....83
3.2.4.3 Testing the user program....84
3.2.4.4 Compatibility of PLC programs from older versions....85
3.2.5 Inter Project Engineering (IPE)....94
3.2.5.1 Notes on IPE....94
3.2.6 Technological functions....94
3.2.6.1 Notes on technological functions (S7-1200)....94
3.3 WinCC Basic....97
3.3.1 Security information....97
3.3.2 News....98
3.3.3 Notes on use....99
3.3.4 Migration....100
3.3.5 Engineering System....102
3.3.5.1 Screens and Screen Objects....102
3.3.5.2 Tags and connections....106
3.3.5.3 Alarm system and alarm displays....107
3.3.5.4 System functions....108
3.3.5.5 Recipes....108
3.3.5.6 User administration....109
3.3.5.7 Communication....109
3.3.6 System-wide functions....111
3.3.7 Compiling and loading....112
3.3.8 Runtime....115
3.3.8.1 Notes on operation in Runtime....115
3.3.8.2 Notes on operation of panels in Runtime....117
3.3.9 HMI devices....118
3.3.9.1 Notes on HMI devices....118
4 Installation....123
4.1 Notes on the installation....123
4.2 System requirements for installation....125
4.2.1 Notes on licenses....125
4.2.2 Notes on the system requirements....126
4.2.3 System requirements STEP 7 Basic....127
4.2.3.1 Licensing of STEP 7....127
4.2.3.2 Handling licenses and license keys....129
4.2.3.3 Software and hardware requirements STEP 7....131
4.2.4 System requirement for WinCC Basic....135
4.2.4.1 Software and hardware requirements....135
4.2.4.2 Parallel installation....139
4.2.4.3 Licenses and Powerpacks....139
4.3 Installation log....145
4.4 Starting installation....146
4.5 Displaying the installed software....148

4.6 Modifying or updating installed products....149
4.7 Repairing installed products....151
4.8 Starting to uninstall....153
4.9 Installing updates and support packages....155
4.9.1 Checking availability of updates and support packages and installing them....155
4.9.2 Providing updates on a company-internal server....159
4.9.3 Configuring a company-internal server for updates....160
4.10 Installing and uninstalling the migration tool....164
4.10.1 System requirements....164
4.10.2 Installing the migration tool....164
4.10.3 Uninstalling the migration tool....165
4.11 Installing and uninstalling the multiuser server....166
4.11.1 Notes on the installation of the multiuser server....166
4.11.2 Installing the multiuser server....167
4.11.3 Uninstalling the multiuser server....168
5 Migrating projects and programs....171
5.1 Overview of Migration Options....171
5.2 Migrating projects to a TIA Portal project....173
5.2.1 Migration of projects with the TIA Portal....173
5.2.2 Check migration readiness of hardware components....174
5.2.3 Preparing projects with the migration tool....175
5.2.3.1 Migrating projects with the migration tool....175
5.2.3.2 Calling the migration tool....177
5.2.3.3 Creating a migration file....177
5.2.4 Migrating projects....178
5.2.5 Displaying the history of the migration....180
5.2.6 Display migration log....180
5.2.7 Migrating WinCC flexible projects....181
5.2.7.1 Basics (WinCC flexible)....181
5.2.7.2 Migrating engineering data (WinCC flexible)....186
5.2.7.3 Migrating runtime data (WinCC flexible)....197
5.2.7.4 Migrating integrated projects (WinCC flexible)....199
5.2.7.5 Reference (WinCC flexible)....203
5.2.8 Migrating integrated projects....211
5.2.8.1 Migrating an integrated project (S7-300, S7-400)....211
5.2.8.2 Post-editing integrated projects....213
5.2.8.3 Converting unspecified CPUs into specified CPUs....214
5.2.8.4 Creating an integrated HMI connection....216
5.2.8.5 Re-linking HMI tags....218
5.2.8.6 Delete non-integrated HMI connection....219
5.3 Migrating S7-1200 to firmware as of V4 (S7-1200)....221
5.3.1 Basic information on upgrading to V4 (S7-1200)....221
5.3.2 Migrating to V4 (S7-1200)....223
5.3.3 Special considerations after migrating to V4 (S7-1200)....224
6 Introduction to the TIA Portal....227
6.1 Getting started....227

6.1.1 Getting Started Documentation....227

6.2 User interface and operation....229
6.2.1 Starting, setting up, and exiting the TIA Portal....229
6.2.1.1 Starting and exiting the TIA Portal....229
6.2.1.2 Overview of the program settings....230
6.2.1.3 Overview of the settings for software updates....232
6.2.1.4 Overview of the script and text editor settings....232
6.2.1.5 Overview of the print settings....233
6.2.1.6 Overview of library settings....234
6.2.1.7 Overview of settings for searching in a project....234
6.2.1.8 Overview of the settings for cross-references....234
6.2.1.9 Overview of the settings for managing window layouts....234
6.2.1.10 Overview of settings for basic integrity check....235
6.2.1.11 Overview of the online and diagnostic settings....235
6.2.1.12 Changing the settings....236
6.2.1.13 Exporting and importing settings....236
6.2.2 Layout of the user interface....238
6.2.2.1 Views....238
6.2.2.2 Portal view....239
6.2.2.3 Project view....240
6.2.2.4 Library view....243
6.2.2.5 Project tree....243
6.2.2.6 Work area....247
6.2.2.7 Inspector window....255
6.2.2.8 Task cards....257
6.2.2.9 Reference projects....259
6.2.2.10 Details view....260
6.2.2.11 Overview window....262
6.2.2.12 User interface layout....266
6.2.3 Keyboard operation in the TIA Portal....270
6.2.3.1 Operation of the TIA Portal with the keyboard....270
6.2.3.2 Displaying an overview of all keyboard shortcuts....270
6.2.3.3 Basic functions of the TIA Portal....270
6.2.3.4 Using project-related functions....272
6.2.3.5 Arranging windows....272
6.2.3.6 Navigating through the program interface....273
6.2.3.7 Customizing editors....275
6.2.3.8 Editing objects....276
6.2.3.9 Text editing....277
6.2.3.10 Editing tables....278
6.2.3.11 Using online functions....279
6.2.3.12 Using the on-screen keyboard....280
6.2.4 Special features specific to the operating system....280
6.2.4.1 Influence of user rights....280
6.2.4.2 Expanding user rights....281

6.3 Help on the information system....283
6.3.1 General remarks on the information system....283
6.3.2 Opening the information system....288
6.3.3 Using the information system....289
6.3.4 Searching the information system....291
6.3.4.1 Basics of searching....291

6.3.4.2 Searching help topics....292
6.3.4.3 Examples of searching in the information system....293
6.3.5 Using favorites....295
6.3.6 Copying code examples into the program....296
6.3.7 Displaying more information in the Siemens Industry Online Support....297
6.3.8 Printing help topics....298
6.3.9 Configuring the display of tooltips and tooltip cascades....299
6.3.10 Assembling customized documentation....300
6.3.11 Safety Guidelines....301

6.4 Find and replace....303
6.4.1 Basics of searching....303
6.4.2 Search entire project....304
6.4.2.1 Basics for search in the project....304
6.4.2.2 Overview of the search editor....305
6.4.2.3 Search in entire project....307
6.4.2.4 Creating a new search index manually....308
6.4.2.5 Enabling and disabling "Search in project"....309
6.4.2.6 Examples for searching in the project....310
6.4.3 Searching and replacing in the editor....312
6.4.3.1 Basics for search in open editors....312
6.4.3.2 Overview of the "Find and replace" palette....314
6.4.3.3 Searching and replacing in the editor....315

6.5 Undoing and redoing actions....316
6.5.1 Basics of undoing and redoing actions....316
6.5.2 Undoing an action....317
6.5.3 Redoing an action....318

7 Editing projects....321

7.1 Creating and managing projects....321
7.1.1 The basics of projects....321
7.1.2 Creating a project....322
7.1.3 Opening projects....323
7.1.4 Saving projects....325
7.1.5 Closing projects....326
7.1.6 Removing projects from the project list....326
7.1.7 Deleting projects....327
7.1.8 Displaying properties of the project....328
7.1.9 Using logs....329
7.1.10 Security of industrial plants....330
7.1.11 Importing and exporting CAx data....331

7.2 Compatibility of projects....333
7.2.1 Compatibility between TIA Portal versions....333
7.2.2 Using projects created with optional software....334
7.2.3 Compatibility mode....334
7.2.4 Upgrading projects....335
7.2.4.1 General information on upgrading projects....335
7.2.4.2 Upgrading projects....336
7.2.4.3 Upgrading multiuser engineering projects....338
7.2.4.4 Upgrading know-how protected blocks....338
7.2.5 Compatibility with the plant configuration....339

7.3 Archiving and retrieving projects....341
7.3.1 Working with project archives....341
7.3.2 Creating a project archive....341
7.3.3 Retrieving compressed project....342

7.4 Using reference projects....344
7.4.1 Basics of reference projects....344
7.4.2 Opening and closing a reference project....344
7.4.3 Comparing reference projects....345

8 Editing project data....347

8.1 Compiling and loading project data....347
8.1.1 Compiling project data....347
8.1.1.1 General information on compiling project data....347
8.1.1.2 Compiling project data....348
8.1.2 Loading project data....348
8.1.2.1 General information on loading....348
8.1.2.2 Downloading project data to a device....350
8.1.2.3 Downloading project data to a memory card....352
8.1.2.4 Uploading project data from a device....354
8.1.2.5 Loading project data from a memory card....356

8.2 Comparing project data....358
8.2.1 Basics of project data comparison....358
8.2.2 Carrying out an online/offline comparison....360
8.2.3 Carrying out offline/offline comparisons....361
8.2.4 Using the compare editor....362
8.2.4.1 Overview of the compare editor....362
8.2.4.2 Show and hide table columns....369
8.2.4.3 Filtering the compare editor view....370
8.2.4.4 Running a detailed comparison....371
8.2.4.5 Updating the comparison results....372
8.2.4.6 Set comparison criteria....373
8.2.4.7 Synchronizing non-identical objects....374
8.2.4.8 Changing the view....376

8.3 Protecting project data....378
8.3.1 Protection concept for project data....378
8.3.2 Revoking access rights for devices....378

8.4 Printing project contents....380
8.4.1 Printing project documentation....380
8.4.1.1 Documentation settings....380
8.4.1.2 Printout of project contents....381
8.4.1.3 Changing the print settings....382
8.4.1.4 Specifying the print layout....383
8.4.1.5 Entering document information....384
8.4.1.6 Managing cover pages and frames....385
8.4.1.7 Designing cover pages and frames....388
8.4.1.8 Displaying print preview....394
8.4.1.9 Printing project data....397
8.4.2 Printing module labels....399
8.4.2.1 Print function for module labels....399
8.4.2.2 Printing labels....400

8.4.2.3 Exporting labeling data as XML....402
8.4.2.4 XML schema of the export file....403
8.4.2.5 Determining the print area offset....406
8.5 Working with multi-language projects....407
8.5.1 Project text basics....407
8.5.2 Categories of user texts....409
8.5.3 Select project languages....409
8.5.4 Setting the editing language....410
8.5.5 Translating all project texts in tabular form....410
8.5.6 Translating project texts....411
8.5.7 Translating project texts using reference texts....411
8.5.8 Exporting project texts....412
8.5.9 Importing project texts....414
8.5.10 Application examples for multilanguage projects....415
8.6 Working with text lists....417
8.6.1 Text lists....417
8.6.2 Creating user-defined text lists....418
8.6.3 Editing user-defined text lists....419
8.6.4 Editing system-defined text lists....419
8.7 Using memory cards....421
8.7.1 Basics about memory cards....421
8.7.2 Adding a user-defined card reader....421
8.7.3 Accessing memory cards....422
8.7.4 Displaying properties of memory cards....423
8.8 Using cross-references....425
8.8.1 Using cross-references....425
8.9 Providing user-defined documentation....426
8.9.1 Using user-defined documentation....426
8.9.2 Specifying settings in the TIA Portal....428
8.9.3 Specifying settings with an XML file....429
8.9.4 Creating a homepage....431
8.9.5 Conventions for the creation....432
8.9.6 Calling user-defined documentation....435
8.9.7 Displaying the call log....436
8.9.8 Creating user-defined documentation....436
9 Using libraries....439
9.1 Library basics....439
9.2 Using libraries in different TIA products....441
9.3 Using the "Libraries" task card....443
9.3.1 Overview of the "Libraries" task card....443
9.3.2 Using the element view....445
9.4 Using the library view....447
9.4.1 Overview of the library view....447
9.4.2 Opening and closing the library view....449
9.5 Using library management....451
9.5.1 Overview of the library management....451
9.5.2 Opening library management....454

9.5.3 Filtering the display of types....454
9.5.4 Displaying instances in the project....455
9.5.5 Displaying cross references of an instance....456
9.5.6 Displaying relations to other library objects....457

9.6 Using global libraries....458
9.6.1 Creating a global library....458
9.6.2 Compatibility of global libraries....459
9.6.3 Opening a global library....459
9.6.4 Upgrading global libraries....460
9.6.5 Defining library languages....461
9.6.6 Displaying properties of global libraries....462
9.6.7 Displaying logs of global libraries....463
9.6.8 Saving a global library....463
9.6.9 Closing a global library....464
9.6.10 Deleting a global library....465
9.6.11 Archiving and disabling global libraries....466
9.6.11.1 Working with archives of global libraries....466
9.6.11.2 Archiving global libraries....466
9.6.11.3 Retrieving global libraries....467
9.6.12 Using global corporate libraries....468
9.6.12.1 Basics of corporate libraries....468
9.6.12.2 Creating a configuration file for corporate libraries....470

9.7 Using master copies....472
9.7.1 Basics on master copies....472
9.7.2 Adding master copies....473
9.7.3 Filtering master copies....474
9.7.4 Using master copies....475

9.8 Using types and their versions....476
9.8.1 Basics on types....476
9.8.2 State of type versions....478
9.8.3 Displaying a released type version....479
9.8.4 Displaying properties of a type or version....480
9.8.5 Working with types in the project library....481
9.8.5.1 Adding types to the project library....481
9.8.5.2 Block requirements....482
9.8.5.3 Referencing of objects within a block....483
9.8.5.4 Duplicating types....484
9.8.5.5 Using types of the project library....485
9.8.5.6 Displaying types for an instance....487
9.8.5.7 Creating a test version of a type....487
9.8.5.8 Editing test version of a type....489
9.8.5.9 Creating an editing version of a type....489
9.8.5.10 Performing a consistency check for a version....490
9.8.5.11 Discarding versions....490
9.8.5.12 Discarding all versions within a folder....491
9.8.5.13 Release versions....491
9.8.5.14 Releasing all versions within a folder....493
9.8.5.15 Updating the project to the latest versions....494
9.8.5.16 Remove the link between instance and type....495
9.8.6 Working with types in global libraries....496
9.8.6.1 Adding types to a global library....496

9.8.6.2 Using types from a global library....497
9.8.6.3 Updating the project to the latest type versions....498
9.8.7 Assigning a version....500
9.9 Multiuser Engineering in libraries....502
9.9.1 Multiuser Engineering with library elements....502
9.9.2 Checking in types and master copies....504
9.10 Updating and upgrading types of a library....505
9.10.1 Updating library with the types of another library....505
9.10.2 Upgrading types in an existing project....506
9.10.3 Example of the updating and upgrading of types....509
9.11 Defining the project languages in the project library....514
9.12 Creating folders in a library....515
9.13 Editing library elements....516
9.14 Harmonizing names and path structure....518
9.15 Clean up library....519
9.16 Comparing library elements....520
9.17 Exporting library texts....521
9.18 Importing library texts....523
10 Editing devices and networks....525
10.1 Configuring devices and networks....525
10.1.1 Hardware and network editor....525
10.1.1.1 Overview of hardware and network editor....525
10.1.1.2 Overview of settings for hardware configuration....526
10.1.1.3 Network view....527
10.1.1.4 Device view....530
10.1.1.5 Device view: Objects in the device view....532
10.1.1.6 Device view: Area for unplugged modules....535
10.1.1.7 Topology view....536
10.1.1.8 Inspector window....539
10.1.1.9 Inspector window: Displaying UDTs....542
10.1.1.10 Hardware catalog....544
10.1.1.11 Browsing the hardware catalog....547
10.1.1.12 Enabling product support....548
10.1.1.13 Displaying product support for hardware components....549
10.1.1.14 Printing hardware and network configurations....550
10.1.1.15 Printing: Changing settings....552
10.1.1.16 Printing: Enabling page break preview....552
10.1.1.17 Keyboard operation: Navigation in the editor....552
10.1.1.18 Keyboard operation: Editing objects....554
10.1.2 Configuring devices....555
10.1.2.1 Introduction to configuring hardware....555
10.1.2.2 Adding a device to the hardware configuration....556
10.1.2.3 Adding an unspecified CPU....557
10.1.2.4 Selecting a CPU....559
10.1.2.5 Selecting fail-safe modules....560
10.1.2.6 Rack: Basics....561

10.1.2.7 Rack: General slot rules....563
10.1.2.8 Rack: Inserting a module....564
10.1.2.9 Select hardware component....566
10.1.2.10 Copying a hardware component....570
10.1.2.11 Moving a hardware component....571
10.1.2.12 Replacing a hardware component....572
10.1.2.13 Renaming hardware component....573
10.1.2.14 Deleting a hardware component....575
10.1.2.15 Editing properties and parameters....575
10.1.2.16 Input and output addresses in the address overview....577
10.1.2.17 Update module version....580
10.1.2.18 Distributed I/O in the project tree....581
10.1.2.19 Comparing devices....583
10.1.3 Configure networks....585
10.1.3.1 Networking devices....585
10.1.3.2 Communication via connections....607
10.1.3.3 Displaying and configuring topology....702
10.1.3.4 Industrial Ethernet Security....720
10.1.3.5 Secure Communication (S7-1500)....915
10.1.4 Creating configurations....958
10.1.4.1 Configuring automation systems (S7-1200)....958
10.1.4.2 Configuring PC systems....1096
10.1.4.3 Configuring AS-i devices....1146
10.1.4.4 S7-1200 CM/CP....1157
10.1.4.5 SCALANCE X, W and M....1228
10.1.4.6 Configuring PROFIBUS DP (S7-1200)....1735
10.1.4.7 Configuring PROFINET IO....1762
10.1.4.8 Bus coupling with PN/PN coupler....1812
10.1.4.9 Integrating external tools....1813
10.1.4.10 Loading a configuration....1815
10.1.5 Additional information on configurations....1826
10.1.5.1 Identification systems....1826
10.1.5.2 Distributed I/O....1907
10.1.5.3 IPv4 routing with CP 1543-1 / CM 1542-1....2020
10.1.5.4 IPv6 configuration....2020

10.2 Device and network diagnostics....2022
10.2.1 Hardware diagnostics....2022
10.2.1.1 Overview of hardware diagnostics....2022
10.2.1.2 Showing non-editable and current values of configurable module properties....2033
10.2.1.3 Showing the current values of dynamic modules properties....2040
10.2.1.4 Checking a module for defects....2043
10.2.1.5 Changing the properties of a module or the programming device/PC....2051
10.2.1.6 Diagnostics in STOP mode....2070
10.2.1.7 Online accesses in the Online and Diagnostics view....2072
10.2.1.8 Checking PROFIBUS DP subnets for faults....2075
10.2.2 Connection diagnostics....2078
10.2.2.1 Overview of connection diagnostics....2078
10.2.2.2 Displaying the connection status using icons....2079
10.2.2.3 Detailed connection diagnostics....2080

11 Programming the PLC....2085

11.1 Programming basics....2085

11.1.1 Operating system and user program....2085
11.1.1.1 Operating system....2085
11.1.1.2 User program....2085
11.1.2 Blocks in the user program....2086
11.1.2.1 Linear and structured programming....2086
11.1.2.2 Overview of the block types....2088
11.1.2.3 Organization blocks (OB)....2088
11.1.2.4 Functions (FCs)....2089
11.1.2.5 Function blocks (FB)....2090
11.1.2.6 Global data blocks (DB)....2091
11.1.2.7 Global ARRAY data blocks (DB)....2092
11.1.2.8 Example of the use of ARRAY data blocks....2092
11.1.2.9 Instance data blocks....2100
11.1.2.10 CPU data blocks....2101
11.1.2.11 Blocks with optimized access....2102
11.1.3 Block calls....2107
11.1.3.1 Principles of block calls....2107
11.1.3.2 Call hierarchy....2108
11.1.3.3 Instances....2110
11.1.3.4 Parameter transfer at block call....2122
11.1.4 Using and addressing operands....2134
11.1.4.1 Basic information about operands....2134
11.1.4.2 Keywords....2135
11.1.4.3 Using tags within the program....2140
11.1.4.4 Constants....2142
11.1.4.5 Addressing operands....2147
11.1.5 Handling program execution errors....2172
11.1.5.1 Causes of error....2172
11.1.5.2 Overview of mechanisms for error handling....2174
11.1.5.3 EN/ENO mechanism....2177
11.1.5.4 Evaluating errors with output parameter RET_VAL....2198
11.1.5.5 Use of the instructions GET_ERROR and GET_ERR_ID....2202
11.1.5.6 Example of how to handle program execution errors....2203

11.2 Programming recommendations (S7-1200, S7-1500)....2209
11.2.1 The new S7-1200/1500 CPU functions and programming recommendations at a glance (S7-1200, S7-1500)....2209
11.2.2 Symbolic addressing (S7-1200, S7-1500)....2213
11.2.3 Indirect addressing of ARRAY components (S7-1200, S7-1500)....2215
11.2.4 Using the DB_ANY data type (S7-1200, S7-1500)....2218
11.2.5 Using PLC data types (UDT) (S7-1200, S7-1500)....2229
11.2.6 Using MOVE instructions in STL (S7-1500)....2233
11.2.7 Using IEC timers and counters (S7-1200, S7-1500)....2235

11.3 Data types....2239
11.3.1 Overview of the valid data types....2239
11.3.2 Binary numbers....2243
11.3.2.1 BOOL (bit)....2243
11.3.2.2 Bit strings....2244
11.3.3 Integers....2248
11.3.3.1 SINT (8-bit integers) (S7-1200, S7-1500)....2248
11.3.3.2 USINT (8-bit integers) (S7-1200, S7-1500)....2249
11.3.3.3 INT (16-bit integers)....2250

11.3.3.4 UINT (16-bit integers) (S7-1200, S7-1500)....2251
11.3.3.5 DINT (32-bit integers)....2252
11.3.3.6 UDINT (32-bit integers) (S7-1200, S7-1500)....2253
11.3.3.7 LINT (64-bit integers) (S7-1500)....2254
11.3.3.8 ULINT (64-bit integers) (S7-1500)....2255
11.3.4 Floating-point numbers....2257
11.3.4.1 REAL....2257
11.3.4.2 LREAL (S7-1200, S7-1500)....2258
11.3.4.3 Invalid floating-point numbers....2259
11.3.5 Timers....2261
11.3.5.1 S5TIME (duration) (S7-300, S7-400)....2261
11.3.5.2 TIME (IEC time)....2262
11.3.5.3 LTIME (IEC time) (S7-1500)....2263
11.3.6 Date and time....2264
11.3.6.1 DATE....2264
11.3.6.2 TIME_OF_DAY (TOD)....2264
11.3.6.3 LTOD (LTIME_OF_DAY) (S7-1500)....2265
11.3.6.4 DATE_AND_TIME (date and time of day) 2265
11.3.6.5 LDT (DATE_AND_LTIME) (S7-1500)....2266
11.3.6.6 DTL (S7-1200, S7-1500)....2267
11.3.7 Character strings....2269
11.3.7.1 Character....2269
11.3.7.2 Character strings....2270
11.3.8 PLC data types (UDT)....2277
11.3.8.1 Basics of PLC data types (UDT)....2277
11.3.8.2 Transferring a tag of the PLC data type (UDT)....2281
11.3.8.3 Addressing PLC data types (UDT)....2281
11.3.9 STRUCT data structure (anonymous structures)....2282
11.3.9.1 Basic information on STRUCT....2282
11.3.9.2 Structure of a STRUCT tag....2284
11.3.9.3 Addressing STRUCT components....2285
11.3.9.4 Transferring tags of the STRUCT data type....2285
11.3.10 ARRAY....2286
11.3.10.1 Basic information on ARRAY....2286
11.3.10.2 Structure of an ARRAY tag....2290
11.3.10.3 Addressing ARRAY components....2292
11.3.10.4 Transferring tags of the ARRAY / ARRAY[*] data type....2294
11.3.10.5 Examples of how to use ARRAYs....2298
11.3.11 Pointer....2302
11.3.11.1 POINTER (S7-300, S7-400, S7-1500)....2302
11.3.11.2 ANY (S7-300, S7-400, S7-1500)....2305
11.3.11.3 VARIANT (S7-1200, S7-1500)....2308
11.3.12 Parameter types....2325
11.3.12.1 Parameter types....2325
11.3.13 System data types....2326
11.3.13.1 System data types....2326
11.3.14 Hardware data types....2328
11.3.14.1 Hardware data types....2328
11.3.15 Data type conversion for S7-1500: (S7-1500)....2330
11.3.15.1 Overview of data type conversion (S7-1500)....2330
11.3.15.2 Implicit conversions (S7-1500)....2333
11.3.15.3 Explicit conversions (S7-1500)....2382

11.3.16 Data type conversion for S7-1200 (S7-1200)....2465
11.3.16.1 Overview of data type conversion (S7-1200)....2465
11.3.16.2 Implicit conversions (S7-1200)....2467
11.3.16.3 Explicit conversions (S7-1200)....2487
11.3.17 Data type conversion for S7-300, S7-400 (S7-300, S7-400)....2531
11.3.17.1 Overview of data type conversions (S7-300, S7-400)....2531
11.3.17.2 Implicit conversions (S7-300, S7-400)....2533
11.3.17.3 Explicit conversions (S7-300, S7-400)....2545

11.4 Instructions (S7-1200, S7-1500)....2568
11.4.1 Example libraries (S7-1200, S7-1500)....2568
11.4.1.1 Sample Library for Instructions (S7-1200, S7-1500)....2568
11.4.1.2 Library of General Functions (S7-1200, S7-1500)....2570
11.4.2 Asynchronous instructions (S7-1200, S7-1500)....2571
11.4.2.1 Difference between synchronous and asynchronous instructions (S7-1200, S7-1500)....2571
11.4.3 Basic instructions (S7-1200, S7-1500)....2574
11.4.3.1 LAD (S7-1200, S7-1500)....2574
11.4.3.2 FBD (S7-1200, S7-1500)....2895
11.4.3.3 SCL (S7-1200, S7-1500)....3219
11.4.4 Extended instructions (S7-1200, S7-1500)....3455
11.4.4.1 Date and time-of-day (S7-1200, S7-1500)....3455
11.4.4.2 String + Char (S7-1200, S7-1500)....3490
11.4.4.3 Process image (S7-1500)....3562
11.4.4.4 Distributed I/O (S7-1200, S7-1500)....3571
11.4.4.5 PROFIenergy (S7-1200, S7-1500)....3728
11.4.4.6 Module parameter assignment (S7-1500)....3782
11.4.4.7 Interrupts (S7-1200, S7-1500)....3795
11.4.4.8 Alarms (S7-1200, S7-1500)....3882
11.4.4.9 Diagnostics (S7-1200, S7-1500)....3930
11.4.4.10 Pulse (S7-1200)....3991
11.4.4.11 Recipes and data logging (S7-1200, S7-1500)....3995
11.4.4.12 Data block functions (S7-1200, S7-1500)....4045
11.4.4.13 Addressing (S7-1200, S7-1500)....4073
11.4.5 Technology (S7-1200, S7-1500)....4094
11.4.5.1 S7-1200 Motion Control (S7-1200)....4094
11.4.5.2 High-speed counters (S7-1200)....4194
11.4.5.3 PID Control (S7-1200, S7-1500)....4199
11.4.6 Communication (S7-1200, S7-1500)....4383
11.4.6.1 S7 communication (S7-1200, S7-1500)....4383
11.4.6.2 Open User Communication (S7-1200, S7-1500)....4418
11.4.6.3 Web server (S7-1200, S7-1500)....4575
11.4.6.4 Communications processor (S7-1200, S7-1500)....4584
11.4.6.5 TeleService (S7-1200)....4676

11.5 Program editor....4684
11.5.1 Overview of the program editor....4684
11.5.2 Using the keyboard in the program editor....4688
11.5.3 Enlarging the programming window....4693
11.5.4 Setting the mnemonics....4695
11.5.5 Displaying symbolic and absolute addresses....4696
11.5.6 Find instructions....4697
11.5.7 Use instruction versions....4697
11.5.7.1 Basic information on instruction versions....4697

11.5.7.2 Upgrade project and instructions....4699
11.5.7.3 Update program in the current PLC....4699
11.5.8 Using instruction profiles....4701
11.5.8.1 Basics of instruction profiles....4701
11.5.8.2 Creating new instruction profiles....4701
11.5.8.3 Opening and editing instruction profiles....4703
11.5.8.4 Activating and deactivating instruction profiles....4704
11.5.8.5 Deleting instruction profiles....4705
11.5.9 Using autocompletion....4706
11.5.9.1 Basics of autocompletion....4706
11.5.9.2 Using autocompletion in graphic programming languages....4706
11.5.9.3 Using autocompletion in textual programming languages....4707
11.5.10 General settings for the PLC programming....4708
11.5.10.1 Overview of the general settings....4708
11.5.10.2 Changing the settings....4711
11.5.11 Eliminating syntax errors in the program....4711
11.5.11.1 Basic information on syntax errors....4711
11.5.11.2 Finding syntax errors in the program....4712
11.5.12 Changing the programming language....4713
11.5.12.1 Rules for changing the programming language....4713
11.5.12.2 Change the programming language....4713

11.6 Creating and managing blocks....4714
11.6.1 Creating blocks....4714
11.6.1.1 Block folder....4714
11.6.1.2 Creating organization blocks....4715
11.6.1.3 Creating functions and function blocks....4716
11.6.1.4 Creating data blocks....4716
11.6.1.5 Using blocks from libraries....4718
11.6.1.6 Copying and pasting blocks....4719
11.6.1.7 Entering a block title....4723
11.6.1.8 Entering a block comment....4724
11.6.2 Specifying block properties....4725
11.6.2.1 Basics of block properties....4725
11.6.2.2 Overview of block properties....4726
11.6.2.3 Block time stamps....4730
11.6.2.4 Displaying and editing block properties....4732
11.6.3 Managing blocks....4733
11.6.3.1 Opening blocks....4733
11.6.3.2 Saving blocks....4734
11.6.3.3 Closing blocks....4735
11.6.3.4 Renaming blocks....4735
11.6.3.5 Deleting blocks offline....4736
11.6.3.6 Deleting blocks online (S7-300, S7-400)....4737
11.6.3.7 Deleting CPU data blocks....4737
11.6.4 Using external source files....4738
11.6.4.1 Basics of using external source files....4738
11.6.4.2 Rules for programming external source files....4740
11.6.4.3 Saving blocks as external source files....4741
11.6.4.4 Inserting external source files....4743
11.6.4.5 Opening and editing external source files....4743
11.6.4.6 Generating blocks from external source files....4744

11.7 Protecting blocks....4746
11.7.1 Protecting blocks....4746
11.7.2 Connecting the password provider....4748
11.7.3 Show available password provider....4750
11.7.4 Recording activities of the password providers....4751
11.7.5 Define the type of password assignment....4753
11.7.6 Setting up and removing block copy protection (S7-1200, S7-1500)....4754
11.7.7 Setting up and removing block write protection....4755
11.7.8 Setting up block know-how protection....4758
11.7.9 Opening know-how protected blocks....4759
11.7.10 Printing know-how protected blocks....4760
11.7.11 Changing a password....4761
11.7.12 Removing block know-how protection....4762

11.8 Declaring the block interface....4764
11.8.1 Overview of the block interface....4764
11.8.2 Rules for declaring the block interface....4765
11.8.2.1 General rules for declaring the block interface....4765
11.8.2.2 Valid data types in the block interface (S7-300, S7-400)....4767
11.8.2.3 Valid data types in the block interface (S7-1200, S7-1500)....4768
11.8.2.4 Setting the retentivity of local tags....4769
11.8.3 Declaring the block interface....4771
11.8.3.1 Layout of the block interface....4771
11.8.3.2 Declaring local tags and constants in the block interface....4772
11.8.3.3 Declaring a local tag in the program editor....4773
11.8.3.4 Declaring tags of the ARRAY data type....4775
11.8.3.5 Declaring tags of STRUCT data type....4777
11.8.3.6 Declare variables of the STRING and WSTRING data types....4778
11.8.3.7 Declaring tags based on a PLC data type....4778
11.8.3.8 Declaring higher-level tags....4779
11.8.3.9 Declaring multi-instances....4780
11.8.3.10 Declaring parameter instances....4781
11.8.3.11 Hiding parameters during the block call....4782
11.8.3.12 Declaring predefined actual parameters....4783
11.8.3.13 Editing the properties of local tags and constants....4784
11.8.3.14 Edit table of the block interface....4788
11.8.4 Updating the block interface....4791
11.8.5 Extending the block interface (S7-1200, S7-1500)....4793

11.9 Programming data blocks....4795
11.9.1 Basic principles for programming of data blocks....4795
11.9.2 Structure of the declaration table for data blocks....4797
11.9.3 Creating data blocks....4798
11.9.4 Updating data blocks....4800
11.9.5 Extending data blocks (S7-1200, S7-1500)....4801
11.9.6 Creating a data structure for global data blocks....4802
11.9.6.1 Declaring tags of elementary data type....4802
11.9.6.2 Declaring tags of the ARRAY data type....4803
11.9.6.3 Declaring tags of STRUCT data type....4804
11.9.6.4 Declaring tags of the STRING data type....4806
11.9.6.5 Declaring tags based on a PLC data type....4806
11.9.7 Defining start values....4807
11.9.7.1 Basic information on start values....4807

11.9.7.2 Defining start values....4808
11.9.8 Setting retentivity....4809
11.9.8.1 Retentivity of tags in data blocks....4809
11.9.8.2 Setting retentivity in an instance data block....4809
11.9.8.3 Setting retentivity in a global data block....4810
11.9.9 Editing the properties of tags in data blocks....4811
11.9.9.1 Properties of the tags in data blocks....4811
11.9.9.2 Changing the properties of tags in instance data blocks....4814
11.9.9.3 Changing the properties of tags in global data blocks....4816
11.9.10 Editing the declaration table for data blocks....4817
11.9.10.1 Inserting table rows....4817
11.9.10.2 Inserting table rows....4817
11.9.10.3 Deleting tags....4818
11.9.10.4 Automatically filling in successive cells....4818
11.9.10.5 Show and hide table columns....4819
11.9.10.6 Editing tags with external editors....4819
11.9.11 Online and diagnostic functions for data blocks....4820
11.9.11.1 Editing data blocks in online mode....4820
11.9.11.2 Overview of the online and diagnostic functions in data blocks....4822
11.9.11.3 Monitoring tags....4823
11.9.11.4 Modifying tags....4824
11.9.11.5 Loading start values as actual values....4825
11.9.11.6 Creating a snapshot of the actual values....4826
11.9.11.7 Loading snapshots as actual values....4828
11.9.11.8 Copying the snapshot to the start values....4830
11.9.11.9 Using setpoints during commissioning....4831

11.10 Declaring PLC tags....4837
11.10.1 Overview of PLC tag tables....4837
11.10.2 Structure of the PLC tag tables....4838
11.10.3 Rules for PLC tags....4840
11.10.3.1 Valid names of PLC tags....4840
11.10.3.2 Permissible addresses and data types of PLC tags....4840
11.10.4 Creating and managing PLC tag tables....4843
11.10.4.1 Creating a PLC tag table....4843
11.10.4.2 Grouping PLC tag tables....4844
11.10.4.3 Opening the PLC tag table....4845
11.10.5 Declaring PLC tags....4846
11.10.5.1 Entering a PLC tag declaration....4846
11.10.5.2 Setting the retentivity of PLC tags....4848
11.10.6 Grouping PLC tags for inputs and outputs in structures....4849
11.10.6.1 Other useful information regarding structured PLC tags....4849
11.10.6.2 Creating structured PLC tags....4851
11.10.7 Declaring global constants....4852
11.10.7.1 Rules for global user constants....4852
11.10.7.2 Rules for global system constants....4853
11.10.7.3 Declaring global constants....4854
11.10.8 Editing properties....4855
11.10.8.1 Editing the properties of PLC tags....4855
11.10.8.2 Editing properties of global constants....4857
11.10.9 Monitoring of PLC tags....4858
11.10.9.1 Monitoring of PLC tags....4858
11.10.10 Editing PLC tag tables....4859

11.10.10.1 Inserting a table row in the PLC tag table....4859
11.10.10.2 Copying entries in the PLC tag table....4859
11.10.10.3 Deleting entries in the PLC tag table....4860
11.10.10.4 Sorting rows in the PLC tag tables....4860
11.10.10.5 Automatically filling in cells in the PLC tag table....4861
11.10.10.6 Show and hide table columns....4861
11.10.10.7 Exporting and importing PLC tags....4862

11.11 Declaring PLC data types (UDT) 4867
11.11.1 Structure of the declaration table for PLC data types....4867
11.11.2 Creating PLC data types....4868
11.11.3 Delete PLC data types....4869
11.11.4 Renumbering PLC data types....4869
11.11.5 Programming the structure of PLC data types....4870
11.11.5.1 Declaring tags of elementary data type....4870
11.11.5.2 Declaring tags of the ARRAY data type....4871
11.11.5.3 Declaring tags of STRUCT data type 4872
11.11.5.4 Declaring tags based on a different PLC data type....4873
11.11.6 Editing tag properties in PLC data types....4874
11.11.6.1 Properties of tags in PLC data types....4874
11.11.6.2 Changing the properties of tags in PLC data types....4875
11.11.7 Editing the declaration table for PLC data types....4875
11.11.7.1 Inserting table rows....4875
11.11.7.2 Inserting table rows....4876
11.11.7.3 Deleting tags....4876
11.11.7.4 Automatically filling in successive cells....4876
11.11.7.5 Show and hide table columns....4877

11.12 Creating LAD programs....4878
11.12.1 Basic information on LAD....4878
11.12.1.1 LAD programming language....4878
11.12.1.2 Overview of the LAD elements....4878
11.12.2 Settings for LAD....4881
11.12.2.1 Overview of the settings for LAD....4881
11.12.2.2 Changing the settings....4881
11.12.3 Working with networks....4882
11.12.3.1 Using networks....4882
11.12.3.2 Inserting networks....4883
11.12.3.3 Selecting networks....4884
11.12.3.4 Copying and pasting networks....4885
11.12.3.5 Deleting networks....4885
11.12.3.6 Expanding and collapsing networks....4886
11.12.3.7 Inserting network title....4887
11.12.3.8 Entering a network comment....4888
11.12.3.9 Navigating networks....4889
11.12.4 Inserting LAD elements....4890
11.12.4.1 Rules for the use of LAD elements....4890
11.12.4.2 Prohibited interconnections in LAD....4892
11.12.4.3 Inserting LAD elements using the "Instructions" task card....4893
11.12.4.4 Inserting LAD elements using an empty box....4893
11.12.4.5 Selecting the data type of a LAD element....4894
11.12.4.6 Using favorites in LAD....4897
11.12.4.7 Insert block calls in LAD....4899

11.12.4.8 Inserting complex LAD instructions....4903
11.12.4.9 Using free-form comments....4904
11.12.5 Editing LAD elements....4907
11.12.5.1 Selecting LAD elements....4907
11.12.5.2 Copying LAD elements....4908
11.12.5.3 Cutting LAD elements....4908
11.12.5.4 Pasting an LAD element from the clipboard....4909
11.12.5.5 Replacing LAD elements....4909
11.12.5.6 Inserting additional inputs and outputs in LAD elements (S7-1200, S7-1500)....4910
11.12.5.7 Removing inputs and outputs (S7-1200, S7-1500)....4911
11.12.5.8 Deleting LAD elements....4912
11.12.6 Inserting operands into LAD instructions....4913
11.12.6.1 Inserting operands....4913
11.12.6.2 Wiring hidden parameters....4914
11.12.6.3 Displaying or hiding tag information....4915
11.12.7 Branches in LAD....4916
11.12.7.1 Basic information on branches in LAD....4916
11.12.7.2 Rules for branches in LAD....4917
11.12.7.3 Inserting branches into the LAD network....4918
11.12.7.4 Closing branches in the LAD network....4918
11.12.7.5 Deleting branches in LAD networks....4919
11.12.8 Crossings in LAD....4919
11.12.8.1 Basic information on crossings in LAD....4919
11.12.8.2 Inserting crossings....4920
11.12.8.3 Rearranging crossings....4920
11.12.8.4 Deleting crossings....4921
11.12.9 Rungs in LAD....4922
11.12.9.1 Basic information on rungs in LAD....4922
11.12.9.2 Insert rung....4923
11.12.9.3 Deleting a rung....4923
11.12.10 LAD programming examples....4924
11.12.10.1 Example of controlling a conveyor belt....4924
11.12.10.2 Example of detecting the direction of a conveyor belt....4926
11.12.10.3 Example of detecting the fill level of a storage area....4928
11.12.10.4 Example of calculating an equation....4931
11.12.10.5 Example of controlling room temperature....4933

11.13 Creating FBD programs....4937
11.13.1 Basic information on FBD....4937
11.13.1.1 FBD programming language....4937
11.13.1.2 Overview of the FBD elements....4937
11.13.2 Settings for FBD....4939
11.13.2.1 Overview of the settings for FBD....4939
11.13.2.2 Changing the settings....4940
11.13.3 Working with networks....4940
11.13.3.1 Using networks....4940
11.13.3.2 Inserting networks....4941
11.13.3.3 Selecting networks....4942
11.13.3.4 Copying and pasting networks....4943
11.13.3.5 Deleting networks....4943
11.13.3.6 Expanding and collapsing networks....4944
11.13.3.7 Inserting network title....4944
11.13.3.8 Entering a network comment....4946

11.13.3.9 Navigating networks....4947
11.13.4 Inserting FBD elements....4948
11.13.4.1 Rules for the use of FBD elements....4948
11.13.4.2 Inserting FBD elements using the "Instructions" task card....4949
11.13.4.3 Inserting FBD elements using an empty box....4950
11.13.4.4 Selecting the data type of an FBD element....4951
11.13.4.5 Using favorites in FBD....4954
11.13.4.6 Inserting block calls in FBD....4956
11.13.4.7 Inserting complex FBD instructions....4960
11.13.4.8 Using free-form comments....4961
11.13.5 Editing FBD elements....4964
11.13.5.1 Selecting FBD elements....4964
11.13.5.2 Copying FBD elements....4964
11.13.5.3 Cutting FBD elements....4965
11.13.5.4 Pasting an FBD element from the clipboard....4966
11.13.5.5 Replacing FBD elements....4966
11.13.5.6 Adding additional inputs and outputs to FBD elements (S7-1200, S7-1500)....4967
11.13.5.7 Removing instruction inputs and outputs (S7-1200, S7-1500)....4968
11.13.5.8 Deleting FBD elements....4969
11.13.6 Inserting operands in FBD instructions....4970
11.13.6.1 Inserting operands....4970
11.13.6.2 Wiring hidden parameters....4971
11.13.6.3 Displaying or hiding tag information....4972
11.13.7 Branches in FBD....4973
11.13.7.1 Basic information on branches in FBD....4973
11.13.7.2 Rules for branches in FBD....4974
11.13.7.3 Inserting branches in FBD networks....4974
11.13.7.4 Deleting branches in FBD networks....4975
11.13.8 Logic paths in FBD....4976
11.13.8.1 Basic information on logic paths in FBD....4976
11.13.8.2 Inserting a logic path....4977
11.13.8.3 Deleting a logic operation path....4977
11.13.9 FBD programming examples....4978
11.13.9.1 Example of controlling a conveyor belt....4978
11.13.9.2 Example of detecting the direction of a conveyor belt....4980
11.13.9.3 Example of detecting the fill level of a storage area....4982
11.13.9.4 Example of calculating an equation....4986
11.13.9.5 Example of controlling room temperature....4988
11.14 Creating SCL programs....4991
11.14.1 Basics of SCL....4991
11.14.1.1 Programming language SCL....4991
11.14.1.2 Expressions....4992
11.14.1.3 Arithmetic expressions....4993
11.14.1.4 Relational expressions....4995
11.14.1.5 Logical expressions....5000
11.14.1.6 Operators and operator precedence....5001
11.14.1.7 Value assignments....5002
11.14.1.8 Calculating with floating-point numbers (REAL and LREAL) in SCL....5005
11.14.1.9 Calculating with constants in SCL....5010
11.14.2 Settings for SCL....5013
11.14.2.1 Overview of the settings for SCL....5013
11.14.2.2 Changing the settings....5014

11.14.3 The programming window of SCL....5015
11.14.3.1 Overview of the programming window....5015
11.14.3.2 Customizing the programming window....5016
11.14.3.3 Formatting SCL code....5017
11.14.3.4 Expanding and collapsing sections of code....5018
11.14.3.5 Navigate to definitions....5019
11.14.3.6 Using bookmarks....5020
11.14.4 Entering SCL instructions....5023
11.14.4.1 Rules for SCL instructions....5023
11.14.4.2 Entering SCL instructions manually....5024
11.14.4.3 Inserting SCL instructions using the "Instructions" task card....5024
11.14.4.4 Surround program code with structure elements....5026
11.14.4.5 Working with regions....5026
11.14.4.6 Defining the data type of an SCL instruction....5034
11.14.4.7 Displaying or hiding tag information....5036
11.14.4.8 Using Favorites in SCL....5037
11.14.4.9 Insert block calls in SCL....5039
11.14.4.10 Expanding and reducing the parameter list....5048
11.14.4.11 Insert pragmas (S7-1200, S7-1500)....5049
11.14.4.12 Inserting comments....5050
11.14.5 Editing SCL instructions....5051
11.14.5.1 Selecting instructions....5051
11.14.5.2 Copying, cutting and pasting instructions....5052
11.14.5.3 Deleting instructions....5052
11.14.6 SCL programming examples....5053
11.14.6.1 Example of controlling a conveyor belt....5053
11.14.6.2 Example of detecting the direction of a conveyor belt....5055
11.14.6.3 Example of detecting the fill level of a storage area....5057

11.15 Compiling and loading blocks....5061
11.15.1 Compiling blocks....5061
11.15.1.1 Basic information on compiling blocks....5061
11.15.1.2 Compiling blocks in the project tree....5063
11.15.1.3 Compiling blocks in the program editor....5064
11.15.1.4 Correcting compilation errors....5065
11.15.2 Downloading blocks for S7-1200/1500 (S7-1200, S7-1500)....5066
11.15.2.1 Introduction to downloading blocks (S7-1200, S7-1500)....5066
11.15.2.2 Downloading blocks in the "RUN" operating mode to the device (S7-1200, S7-1500)....5070
11.15.2.3 Downloading blocks from program editor to device (S7-1200, S7-1500)....5074
11.15.2.4 Downloading blocks from the project tree to the device (S7-1200, S7-1500)....5076
11.15.2.5 Uploading blocks from device (S7-1200, S7-1500)....5078
11.15.2.6 Downloading blocks to a memory card (S7-1200, S7-1500)....5079
11.15.2.7 Uploading blocks from a memory card (S7-1200, S7-1500)....5081
11.15.2.8 Switching off the sequencer prior to loading a GRAPH DB (S7-1500)....5081

11.16 Comparing PLC programs....5083
11.16.1 Basic information on comparing PLC programs....5083
11.16.1.1 Introduction to comparing PLC programs....5083
11.16.1.2 Comparing blocks and PLC data types....5085
11.16.1.3 Comparing PLC tags....5086
11.16.1.4 Comparison of PLC programs based on checksums....5086
11.16.2 Comparing blocks....5088
11.16.2.1 Comparing blocks in the compare editor....5088

11.16.2.2 Performing detailed block comparisons....5089
11.16.3 Comparing PLC tags....5115
11.16.4 Comparing PLC data types....5117

11.17 Displaying program information....5120
11.17.1 Overview of available program information....5120
11.17.2 Displaying an assignment list....5121
11.17.2.1 Introduction to the assignment list....5121
11.17.2.2 Layout of the assignment list....5122
11.17.2.3 Symbols in the assignment list....5123
11.17.2.4 Displaying an assignment list....5124
11.17.2.5 Setting the view options for the assignment list....5124
11.17.2.6 Filter options in the assignment list....5125
11.17.2.7 Defining filters for assignment list....5126
11.17.2.8 Filtering an assignment list....5127
11.17.2.9 Defining retentive memory areas for bit memories....5128
11.17.2.10 Enabling the display of retentive bit memories....5129
11.17.3 Displaying the call structure....5129
11.17.3.1 Introduction to the call structure....5129
11.17.3.2 Symbols in the call structure....5131
11.17.3.3 Layout of the call structure....5132
11.17.3.4 Displaying the call structure....5133
11.17.3.5 Setting the view options for the call structure....5133
11.17.3.6 Introducing the consistency check in the call structure....5134
11.17.3.7 Checking block consistency in the call structure....5135
11.17.4 Displaying the dependency structure....5135
11.17.4.1 Introduction to the dependency structure....5135
11.17.4.2 Layout of the dependency structure....5137
11.17.4.3 Symbols in the dependency structure....5137
11.17.4.4 Displaying the dependency structure....5138
11.17.4.5 Setting the view options for the dependency structure....5139
11.17.4.6 Introducing the consistency check in the dependency structure....5139
11.17.4.7 Checking block consistency in the dependency structure....5140
11.17.5 Displaying CPU resources....5141
11.17.5.1 Introducing resources....5141
11.17.5.2 Layout of the "Resources" tab....5143
11.17.5.3 Displaying resources....5144
11.17.5.4 Selecting the maximum load memory available....5145

11.18 Displaying cross-references....5146
11.18.1 General information about cross references....5146
11.18.2 Structure of the cross-reference list....5147
11.18.3 Settings in the cross-reference list....5149
11.18.4 Displaying the cross-reference list....5152
11.18.5 Sorting the cross-reference list....5153
11.18.6 Filter options for cross-references....5155
11.18.6.1 Introduction to filtering of cross-references....5155
11.18.6.2 Creating user-defined filters for cross-references....5157
11.18.6.3 Editing and deleting user-defined filters....5161
11.18.6.4 Exporting and importing user-defined filters....5163
11.18.6.5 Setting a filter as the default setting....5165
11.18.6.6 Duplicating a filter....5166
11.18.6.7 Filtering the cross-reference list....5166

11.18.7 Printing the cross-reference list....5167
11.18.8 Adding a new object to the cross-reference list....5168
11.18.9 Show overlapping accesses in the cross-reference list....5169
11.18.10 Restoring cross-references after project upgrade....5171
11.18.11 Displaying and editing cross-references in the Inspector window....5172

11.19 Testing the user program....5175
11.19.1 Basics of testing the user program....5175
11.19.2 Testing with program status....5176
11.19.2.1 Introduction to testing with program status....5176
11.19.2.2 Setting the call environment....5178
11.19.2.3 Switching test with program status on/off....5180
11.19.2.4 Monitoring loops....5182
11.19.2.5 Monitoring structures....5184
11.19.2.6 Editing blocks during the program test....5185
11.19.2.7 Modifying tags during monitoring....5186
11.19.2.8 Switching display formats in the program status....5187
11.19.2.9 Examples of program status display....5188
11.19.3 Testing with the watch table....5196
11.19.3.1 Introduction to testing with the watch table....5196
11.19.3.2 Layout of the watch table....5197
11.19.3.3 Basic mode and expanded mode in the watch table....5198
11.19.3.4 Icons in the watch table....5199
11.19.3.5 Creating and editing watch tables....5200
11.19.3.6 Entering tags in the watch table....5202
11.19.3.7 Monitoring tags in the watch table....5211
11.19.3.8 Modifying tags in the watch table....5216
11.19.4 Testing with the force table....5224
11.19.4.1 Introduction for testing with the force table....5224
11.19.4.2 Safety precautions when forcing tags....5225
11.19.4.3 Layout of the force table....5226
11.19.4.4 Basic mode and expanded mode in the force table....5227
11.19.4.5 Icons in the force table....5228
11.19.4.6 Open and edit force table....5229
11.19.4.7 Entering tags in the force table....5230
11.19.4.8 Monitoring tags in the force table....5238
11.19.4.9 Forcing tags in the force table....5241
11.19.4.10 Stop forcing tags....5249

12 Visualizing processes....5253

12.1 Creating screens....5253
12.1.1 Basics....5253
12.1.1.1 Elements and basic settings....5253
12.1.1.2 Working with screens....5259
12.1.1.3 Working with templates....5263
12.1.1.4 Working with styles and style sheets....5268
12.1.2 Working with objects and object groups....5283
12.1.2.1 Working with objects....5283
12.1.2.2 Working with object groups....5317
12.1.2.3 Configuring the keyboard access....5323
12.1.2.4 Examples....5326
12.1.3 Working with text lists and graphics lists....5329
12.1.3.1 Working with text lists....5329

12.1.3.2 Working with graphics lists....5337
12.1.4 Dynamizing screens....5347
12.1.4.1 Basics on dynamizing screens....5347
12.1.4.2 Dynamization with animations....5349
12.1.4.3 Dynamizing with system functions....5357
12.1.5 Working with function keys....5359
12.1.5.1 Working with function keys....5359
12.1.5.2 Assigning function keys globally....5361
12.1.5.3 Local assignment of function keys....5363
12.1.5.4 Assigning a function to a function key....5364
12.1.5.5 Assigning operator authorization for a function key....5366
12.1.5.6 Assigning a graphic to a function key....5368
12.1.5.7 Configuring LED tags....5370
12.1.5.8 Example: Using function keys for screen navigation....5372
12.1.6 Working with layers....5374
12.1.6.1 Basics on working with layers....5374
12.1.6.2 Moving objects on layers....5375
12.1.6.3 Setting the active layer....5376
12.1.6.4 Showing and hiding layers (Basic Panels, Panels, Comfort Panels, RT Advanced)....5377
12.1.6.5 Renaming layers....5378
12.1.7 Configuring screen navigation....5380
12.1.7.1 Basics on screen navigation (Basic Panels, Panels, Comfort Panels, RT Advanced)....5380
12.1.7.2 Assigning screen change to button (Panels, Comfort Panels, RT Advanced, RT Professional)....5380
12.1.7.3 Assigning screen change to function key (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5382
12.1.8 Display and operating elements....5382
12.1.8.1 Device dependency of the objects....5382
12.1.8.2 Objects....5383

12.2 Working with Tags (Basic Panels)....5421
12.2.1 Basics (Basic Panels)....5421
12.2.1.1 Basics of tags (Basic Panels)....5421
12.2.1.2 Overview of HMI tag tables (Basic Panels)....5422
12.2.1.3 External tags (Basic Panels)....5423
12.2.1.4 Addressing external tags (Basic Panels)....5425
12.2.1.5 Internal tags (Basic Panels)....5428
12.2.1.6 User-defined PLC data types (UDT) (Basic Panels)....5429
12.2.2 Working with tags (Basic Panels)....5430
12.2.2.1 Creating tags (Basic Panels)....5430
12.2.2.2 Editing tags (Basic Panels)....5435
12.2.2.3 Configuring tags (Basic Panels)....5443
12.2.3 Working with arrays (Basic Panels)....5463
12.2.3.1 Basics on arrays (Basic Panels)....5463
12.2.3.2 Creating array tags (Basic Panels)....5466
12.2.3.3 Examples of arrays (Basic Panels)....5467
12.2.4 Working with cycles (Basic Panels)....5468
12.2.4.1 Cycle basics (Basic Panels)....5468
12.2.5 Archive tags (Basic Panels)....5469
12.2.5.1 Basic principles for data logging....5469
12.2.5.2 Working with data logs (Basic Panels)....5470
12.2.6 Displaying tags (Basic Panels)....5480
12.2.6.1 Outputting tag values in screens (Basic Panels)....5480

12.2.6.2 Configuring trend displays for values from the PLC (Basic Panels)....5480

12.3 Working with alarms....5483
12.3.1 Basics....5483
12.3.1.1 Alarm system in WinCC (Basic Panels)....5483
12.3.1.2 Alarm types....5484
12.3.1.3 Alarm states (Basic Panels)....5486
12.3.1.4 Alarm classes....5487
12.3.1.5 Acknowledgment....5489
12.3.1.6 Alarm groups (Basic Panels, Panels, Comfort Panels, RT Advanced)....5491
12.3.1.7 Alarm number (Basic Panels, Panels, Comfort Panels, RT Advanced)....5492
12.3.2 Working with alarms....5492
12.3.2.1 Alarm components and properties (Basic Panels)....5492
12.3.2.2 Configuring alarms....5493
12.3.2.3 Configuring alarm output....5507
12.3.2.4 Acknowledging alarms....5512
12.3.3 Logging Alarms....5515
12.3.3.1 Basics on alarm logging....5515
12.3.3.2 Creating an alarm log....5517
12.3.3.3 Logging alarms....5519
12.3.3.4 Configuring an alarm view for logged alarms (Advanced)....5520
12.3.3.5 Configuring alarm buffer overflow (Advanced) (Basic Panels, Panels, Comfort Panels, RT Advanced)....5521
12.3.3.6 Log response to language switching in runtime....5521
12.3.3.7 Managing logging behavior when Runtime starts....5522
12.3.3.8 Controlling the Logging in relation to the Fill Level....5523
12.3.4 Operating alarms in Runtime....5525
12.3.4.1 Alarms in Runtime (Basic Panels)....5525
12.3.4.2 Simple alarm view, simple alarm window in runtime (Basic Panels)....5527
12.3.4.3 Alarm window, alarm view in Runtime (Basic Panels, Panels, Comfort Panels, RT Advanced)....5528
12.3.4.4 Alarm indicator in Runtime (Basic Panels)....5530
12.3.4.5 Acknowledging alarms (Basic Panels)....5531
12.3.5 Reference....5532
12.3.5.1 System functions for alarms (Basic Panels)....5532
12.3.5.2 System events....5532

12.4 Working with logs....5561
12.4.1 Log basics....5561
12.4.2 Properties of logs....5561
12.4.3 Storage locations of logs (Basic Panels)....5563

12.5 Working with recipes....5565
12.5.1 Basics....5565
12.5.1.1 Definition and applications....5565
12.5.1.2 Examples for using recipes....5566
12.5.1.3 Structure of recipes....5566
12.5.1.4 Displaying recipes....5568
12.5.1.5 "Recipes" editor....5568
12.5.1.6 Flow of data for recipes....5571
12.5.1.7 Synchronization of recipe data records with the PLC....5572
12.5.2 Displaying and editing recipes in Runtime....5573
12.5.2.1 Simple recipe view....5573
12.5.2.2 Configuration options of the simple recipe view....5574

12.5.2.3 Advanced recipe view (as of V13) (Basic Panels, Panels, Comfort Panels, RT Advanced)..5578
12.5.2.4 Configuration options of the advanced recipe view (V13 or higher) (Basic Panels, Panels, Comfort Panels, RT Advanced)....5579
12.5.2.5 Behavior of the recipe view in Runtime....5581
12.5.2.6 Exporting and importing recipe data records (Panels, Comfort Panels, RT Advanced). ...5582
12.5.3 Configuring recipes....5583
12.5.3.1 Creating and Editing Recipes....5583
12.5.3.2 Configuring the display of recipes....5591
12.5.4 Using recipes in Runtime....5595
12.5.4.1 Using the simple recipe view....5595
12.5.4.2 Using the advanced recipe view....5602
12.5.5 Example....5609
12.5.5.1 Example of creating a recipe (Basic Panels, Panels, Comfort Panels, RT Advanced).....5609
12.6 Configuring user administration....5612
12.6.1 Basics....5612
12.6.1.1 Field of application of the user administration (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5612
12.6.1.2 Form of the user administration (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5612
12.6.1.3 Users (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional).....5613
12.6.1.4 Users work area (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)..5615
12.6.1.5 User groups (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional). ...5615
12.6.1.6 User groups work area (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5616
12.6.1.7 Settings for the user administration (Basic Panels)....5617
12.6.1.8 Target groups in the user administration (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5619
12.6.2 Setting up the user administration (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5620
12.6.2.1 Administering users for Runtime (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5620
12.6.2.2 Managing users in Runtime (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5627
12.6.2.3 Configuring access protection (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5636
12.6.3 Reference....5637
12.6.3.1 Objects with access protection (Basic Panels)....5637
12.6.3.2 Default user groups and authorizations (Basic Panels, Panels, Comfort Panels, RT Advanced)....5638
12.6.4 Examples....5638
12.6.4.1 Example: Configuring a button with logon dialog box (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5638
12.6.4.2 Example: Logging the logon and logoff events (Basic Panels, Panels, Comfort Panels, RT Advanced)....5639
12.6.4.3 Example: Structure of user management (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5640
12.6.4.4 Example: Creating and configuring authorizations (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5642
12.6.4.5 Example: Configuring a button with access protection (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5642
12.6.4.6 Example: Creating user groups and assigning authorizations: (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5644

12.6.4.7 Example: Creating users and assigning them to a user group (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5646
12.7 Working with system functions....5649
12.7.1 Basics....5649
12.7.1.1 System functions (Basic Panels)....5649
12.7.1.2 Use of system functions (Basic Panels)....5650
12.7.2 Working with function lists....5651
12.7.2.1 Basic of the functions list (Basic Panels)....5651
12.7.2.2 Properties of a function list (Basic Panels)....5652
12.7.2.3 Configuring a function list (Basic Panels)....5652
12.7.2.4 Editing a function list (Basic Panels)....5654
12.7.2.5 Executing a function list in Runtime (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5655
12.7.3 Example....5655
12.7.3.1 Changing the operating mode on the HMI device with the current display (Basic Panels, Panels, Comfort Panels, RT Advanced)....5655
12.7.4 Reference....5659
12.7.4.1 Function list....5659
12.7.4.2 Events....5763
12.8 Planning tasks....5780
12.8.1 Basics....5780
12.8.1.1 Field of application of the Scheduler (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5780
12.8.1.2 Working with tasks and triggers (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5781
12.8.1.3 Work area of the "Scheduler" editor (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5781
12.8.1.4 Function list (Basic Panels)....5783
12.8.1.5 Triggers (Basic Panels)....5783
12.8.1.6 Planning tasks with event triggers (Basic Panels, Panels, Comfort Panels, RT Advanced)....5784
12.8.2 Examples....5786
12.8.2.1 Example: Update user following change of user (Basic Panels, Panels, Comfort Panels, RT Advanced)....5786
12.9 Using diagnostics functions....5788
12.9.1 Configuring system diagnostics....5788
12.9.1.1 System diagnostics basics (Basic Panels)....5788
12.9.1.2 System diagnostics views (Basic Panels)....5788
12.9.1.3 Configuring the system diagnostic view (Basic Panels)....5791
12.10 Communicating with controllers....5792
12.10.1 WinCC Basic V14 SP1 - Communication....5792
12.11 Using global functions....5793
12.11.1 Working with libraries....5793
12.11.1.1 Basics on libraries....5793
12.11.1.2 Overview of the library view....5795
12.11.1.3 Master copies and types....5797
12.11.1.4 Libraries in WinCC....5797
12.11.1.5 Managing libraries....5800
12.11.1.6 Managing objects in a library....5810
12.11.1.7 Using types and their versions....5815
12.11.2 Importing and exporting project data....5819

12.11.2.1 Importing and exporting project data....5819
12.11.2.2 Importing and exporting recipes....5820
12.11.2.3 Importing and exporting alarms....5824
12.11.2.4 Importing and exporting tags....5831
12.11.2.5 Importing and exporting text lists....5837
12.11.2.6 Importing and exporting project texts....5841
12.11.3 Using cross-references....5844
12.11.3.1 General information about cross references (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5844
12.11.3.2 Special considerations when working with the cross-reference list....5844
12.11.3.3 Rewiring tags in the screens (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5845
12.11.3.4 Textual cross-references: Overview (Basic Panels)....5848
12.11.3.5 Invalid cross-references (Basic Panels)....5849
12.11.4 Managing languages....5851
12.11.4.1 Languages in WinCC....5851
12.11.4.2 Language settings in the operating system....5852
12.11.4.3 Operating system settings for Asian languages....5852
12.11.4.4 Setting project languages....5853
12.11.4.5 Creating one project in multiple languages....5856
12.11.4.6 Using language-specific graphics....5862
12.11.4.7 Languages in Runtime....5865
12.11.4.8 Example of multilingual configuration....5873
12.11.5 Replacing devices....5875
12.11.5.1 Basics (Basic Panels, Panels, Comfort Panels, RT Advanced)....5875
12.11.5.2 Device-specific functions....5876
12.11.5.3 Adjusting screens to the new device....5879
12.11.6 Copying between devices and editors....5884
12.11.6.1 Basics....5884
12.11.6.2 Copying and pasting....5886
12.11.6.3 Copying between different RT and ES versions (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5889
12.11.7 Using WinCC version compatibility....5891
12.11.7.1 Basics on version compatibility (Basic Panels, Panels, Comfort Panels, RT Advanced) ..5891
12.11.7.2 Editing projects of a previous WinCC version (Basic Panels, Panels, Comfort Panels, RT Advanced)....5893
12.11.7.3 Upgrading projects (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5894
12.11.7.4 Upgrading a global library (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5895
12.11.7.5 Changing between device versions (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5896
12.11.7.6 Changing the device version (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5897
12.11.8 Viewing memory card data....5898
12.11.8.1 Basics (Basic Panels, Panels, Comfort Panels)....5898
12.11.8.2 Working with backups....5898
12.11.9 HMI device wizard basics (Basic Panels, Panels, Comfort Panels)....5900
12.11.10 Managing colors centrally....5902
12.11.10.1 Basic principles for color management....5902
12.11.10.2 Finding and replacing colors....5903
12.11.11 Exchanging controller data from other projects....5905

12.12 Compiling and loading....5906
12.12.1 Establishing a connection to the HMI device....5906
12.12.2 Runtime settings....5907
12.12.2.1 Runtime settings....5907
12.12.2.2 Configuring display in Runtime (Comfort Panels)....5909
12.12.2.3 Configuring operation in Runtime....5910
12.12.2.4 Compatibility check with the controller (Panels, Multipanels, Comfort Panels, Mobile Panels, RT Advanced)....5911
12.12.2.5 Password protection in runtime....5912
12.12.3 Compiling and loading projects....5914
12.12.3.1 Overview of compiling and loading projects....5914
12.12.3.2 Compiling a project (Basic Panels, Panels, Comfort Panels, RT Advanced, RT Professional)....5915
12.12.3.3 Loading projects....5916
12.12.3.4 Compiling and loading with multiuser engineering (Basic Panels)....5922
12.12.3.5 Runtime start....5925
12.12.4 Simulating projects....5926
12.12.4.1 Simulation basics....5926
12.12.4.2 Simulating a project (Panels, Comfort Panels, RT Advanced)....5928
12.12.4.3 Working with the tag simulator (Basic Panels, Panels, Comfort Panels, RT Advanced)....5930
12.12.4.4 Simulation restrictions....5931
12.12.5 Reducing the project size (Basic Panels, Panels, Comfort Panels, RT Advanced)....5932
12.12.6 Basics of operating in Runtime....5933
12.12.6.1 Overview (Basic Panels)....5933
12.12.6.2 Operation with the touch screen....5934
12.12.6.3 Operation with keys....5938
12.12.6.4 Navigating in the display (BS)....5942
12.12.6.5 Triggering an action....5943
12.12.6.6 Entering a value....5943
12.12.6.7 Moving operator controls....5944
12.12.6.8 Displaying infotext....5945
12.12.6.9 Changing Runtime language....5946
12.12.7 Entering bar codes with optical handheld readers....5946
12.12.8 Security on the HMI device....5948
12.12.8.1 Signature basics (Basic Panels, Panels, Comfort Panels, RT Advanced)....5948
12.12.8.2 Switching off the signature check (Basic Panels, Panels, Comfort Panels, RT Advanced)....5949
12.12.9 Servicing the HMI device....5949
12.12.9.1 Overview of HMI device maintenance (Basic Panels)....5949
12.12.9.2 ProSave....5950
12.12.9.3 Backup of HMI data....5951
12.12.9.4 Backing up and restoring data of the HMI device....5952
12.12.9.5 Updating the operating system....5953
12.12.9.6 Updating the HMI device operating system....5954
12.12.10 Reference....5956
12.12.10.1 Error messages during loading of projects....5956
12.12.10.2 Adapting the project for another HMI device....5957
12.12.10.3 Establishing a connection to the HMI device....5958

12.13 Performance features....5960
12.13.1 General technical data....5960
12.13.1.1 Permitted characters....5960
12.13.1.2 Recommended printers....5961

12.13.1.3 Memory requirements of recipes for Basic Panels....5961
12.13.2 Performance features of the devices....5962
12.13.2.1 Basic Panel (Basic Panels)....5962
12.13.2.2 Basic Panel 2nd Generation (Basic Panels)....5966

12.14 Migrating to WinCC in the TIA Portal....5970
12.14.1 Overview of the migration to WinCC in the TIA Portal....5970
12.14.2 Libraries....5970
12.14.3 Screens and templates....5972

13 Using technology functions....5975

13.1 PID control....5975
13.1.1 Principles for control....5975
13.1.1.1 Controlled system and actuators....5975
13.1.1.2 Controlled systems....5976
13.1.1.3 Characteristic values of the control section....5978
13.1.1.4 Pulse controller....5980
13.1.1.5 Response to setpoint changes and disturbances....5984
13.1.1.6 Control Response at Different Feedback Structures....5985
13.1.1.7 Selection of the controller structure for specified controlled systems....5993
13.1.1.8 PID parameter settings....5994
13.1.2 Configuring a software controller....5994
13.1.2.1 Overview of software controller....5994
13.1.2.2 Steps for the configuration of a software controller....5996
13.1.2.3 Add technology objects....5997
13.1.2.4 Configure technology objects....5998
13.1.2.5 Call instruction in the user program....5999
13.1.2.6 Downloading technology objects to device....6000
13.1.2.7 Commissioning software controller....6001
13.1.2.8 Save optimized PID parameter in the project....6001
13.1.2.9 Comparing values....6002
13.1.2.10 Parameter view....6005
13.1.2.11 Display instance DB of a technology object....6023
13.1.3 Using PID_Compact (S7-1200, S7-1500)....6023
13.1.3.1 Technology object PID_Compact (S7-1200, S7-1500)....6023
13.1.3.2 PID_Compact V2 (S7-1200, S7-1500)....6024
13.1.3.3 PID_Compact V1 (S7-1200, S7-1500)....6044
13.1.4 Using PID_3Step (S7-1200, S7-1500)....6060
13.1.4.1 Technology object PID_3Step (S7-1200, S7-1500)....6060
13.1.4.2 PID_3Step V2 (S7-1200, S7-1500)....6061
13.1.4.3 PID_3Step V1 (S7-1200, S7-1500)....6079
13.1.5 Using PID_Temp (S7-1200, S7-1500)....6096
13.1.5.1 Technology object PID_Temp (S7-1200, S7-1500)....6096
13.1.5.2 Configuring PID_Temp (S7-1200, S7-1500)....6097
13.1.5.3 Commissioning PID_Temp (S7-1200, S7-1500)....6118
13.1.5.4 Cascade control with PID_Temp (S7-1200, S7-1500)....6126
13.1.5.5 Multi-zone controlling with PID_Temp (S7-1200, S7-1500)....6133
13.1.5.6 Override control with PID_Temp (S7-1200, S7-1500)....6135
13.1.5.7 Simulating PID_Temp with PLCSIM (S7-1200, S7-1500)....6139

13.2 Using S7-1200 Motion Control (S7-1200)....6140
13.2.1 Introduction (S7-1200)....6140
13.2.1.1 Motion functionality of the CPU S7-1200 (S7-1200)....6140

13.2.1.2 Hardware components for motion control (S7-1200)....6141
13.2.2 Basics for working with S7-1200 Motion Control (S7-1200)....6143
13.2.2.1 Stepper motor on the PTO (S7-1200)....6143
13.2.2.2 PROFIdrive drive / analog drive connection (S7-1200)....6150
13.2.2.3 Hardware and software limit switches (S7-1200)....6164
13.2.2.4 Jerk limit (S7-1200)....6165
13.2.2.5 Homing (S7-1200)....6166
13.2.3 Guidelines on use of motion control (S7-1200)....6168
13.2.4 Using versions (S7-1200)....6168
13.2.4.1 Overview of versions (S7-1200)....6168
13.2.4.2 Changing a technology version (S7-1200)....6172
13.2.4.3 Compatibility list of variables V1...3 <-> V4...5 (S7-1200)....6172
13.2.4.4 Compatibility list of variables V4...5 <-> V6 (S7-1200)....6175
13.2.4.5 Status of limit switch (S7-1200)....6176
13.2.5 Positioning axis technology object (S7-1200)....6177
13.2.5.1 Integration of the positioning axis technology object (S7-1200)....6177
13.2.5.2 Tools of the positioning axis technology object (S7-1200)....6180
13.2.5.3 Adding a positioning axis technology object (S7-1200)....6182
13.2.5.4 Configuring the positioning axis technology object (S7-1200)....6183
13.2.6 Technology object command table (S7-1200)....6241
13.2.6.1 Use of the command table technology object (S7-1200)....6241
13.2.6.2 Command table technology object tools (S7-1200)....6241
13.2.6.3 Adding the technological object command table (S7-1200)....6242
13.2.6.4 Configuring the command table technology object (S7-1200)....6243
13.2.7 Download to CPU (S7-1200)....6260
13.2.8 Commissioning (S7-1200)....6261
13.2.8.1 Axis control panel (S7-1200)....6261
13.2.8.2 Tuning (S7-1200)....6264
13.2.9 Programming (S7-1200)....6266
13.2.9.1 Overview of the Motion Control statements (S7-1200)....6266
13.2.9.2 Creating a user program (S7-1200)....6267
13.2.9.3 Programming notes (S7-1200)....6270
13.2.9.4 Behavior of the Motion Control commands after POWER OFF and restart (S7-1200)....6272
13.2.9.5 Monitoring active commands (S7-1200)....6272
13.2.9.6 Error displays of the Motion Control statements (S7-1200)....6283
13.2.9.7 Restart of technology objects (S7-1200)....6284
13.2.10 Axis - Diagnostics (S7-1200)....6285
13.2.10.1 Status and error bits (technology objects as of V4) (S7-1200)....6285
13.2.10.2 Motion status (S7-1200)....6288
13.2.10.3 Dynamics settings (S7-1200)....6288
13.2.10.4 PROFIdrive frame (S7-1200)....6289
13.2.11 Appendix (S7-1200)....6290
13.2.11.1 Using multiple axes with the same PTO (S7-1200)....6290
13.2.11.2 Using multiple drives with the same PTO (S7-1200)....6293
13.2.11.3 Tracking jobs from higher priority classes (execution levels) (S7-1200)....6294
13.2.11.4 Special cases when using software limit switches for drive connection via PTO (S7-1200)....6296
13.2.11.5 Reducing velocity for a short positioning duration (S7-1200)....6302
13.2.11.6 Dynamic adjustment of start/stop velocity (S7-1200)....6303
13.2.11.7 Move the axis without position control for servicing (S7-1200)....6303
13.2.11.8 List of ErrorIDs and ErrorInfos (technology objects as of V6) (S7-1200)....6304
13.2.11.9 Tags of the positioning axis technology object as of V6 (S7-1200)....6328
13.2.11.10 Versions V1...5 (S7-1200)....6364

14 Using online and diagnostics functions....6475

14.1 Displaying accessible devices....6475

14.2 Changing the device configuration online....6477

14.3 Connecting devices online....6478
14.3.1 General information about online mode....6478
14.3.2 View in online mode....6480
14.3.3 Default setting online connection data....6481
14.3.4 Establishing or changing an online connection....6482
14.3.5 Canceling an online connection....6484
14.3.6 Connecting online with several devices....6485
14.3.7 Disconnecting online connections of multiple devices....6486

14.4 Creating a backup of an S7 CPU....6487
14.4.1 Backup options for S7 CPUs....6487
14.4.2 Backing up S7-300 and S7-400 CPUs (S7-300, S7-400, PC)....6489
14.4.2.1 Creating a backup of a device (S7-300, S7-400, PC)....6489
14.4.2.2 Restoring the software and hardware configuration of a device (S7-300, S7-400, PC)....6490
14.4.2.3 Backing up a device configuration (S7-300, S7-400, PC)....6490
14.4.3 Backing up S7-1200 and S7-1500 CPUs (S7-1200, S7-1500, S7-1500, S7-1500)....6491
14.4.3.1 Creating a backup of a device (S7-1200, S7-1500, S7-1500, S7-1500)....6491
14.4.3.2 Backing up a device configuration (S7-1200, S7-1500, S7-1500, S7-1500)....6492
14.4.3.3 Restoring the configuration of a device (S7-1200, S7-1500, S7-1500, S7-1500)....6493

14.5 Configuring the PG/PC interface....6495
14.5.1 Online access....6495
14.5.2 Basics of assigning parameters for the PG/PC interface....6497
14.5.3 Showing or hiding interfaces....6497
14.5.4 Displaying and modifying interface properties....6498
14.5.5 Adding interfaces....6498
14.5.6 Setting parameters for the Ethernet interface....6499
14.5.6.1 Setting parameters for the Industrial Ethernet interface....6499
14.5.6.2 Displaying operating system parameters....6500
14.5.6.3 Connecting the PG/PC interface to a subnet....6500
14.5.6.4 Setting parameters for the Ethernet interface....6501
14.5.6.5 Assigning a temporary IP address....6501
14.5.6.6 Managing temporary IP addresses....6502
14.5.6.7 Resetting the TCP/IP configuration....6502
14.5.7 Setting parameters for the MPI and PROFIBUS interfaces....6503
14.5.7.1 Setting parameters for the MPI and PROFIBUS interfaces....6503
14.5.7.2 Setting MPI or PROFIBUS interface parameters automatically....6504
14.5.7.3 Setting parameters for the MPI interface....6505
14.5.7.4 Setting parameters for the PROFIBUS interface....6507
14.5.7.5 Overview of the bus parameters for PROFIBUS....6509
14.5.7.6 Resetting the MPI or PROFIBUS configuration....6510

14.6 Using the trace and logic analyzer function....6511
14.6.1 Preface....6511
14.6.1.1 Security information....6512
14.6.2 Description....6513
14.6.2.1 Supported hardware....6513
14.6.2.2 Recording of measured values with the trace function....6513
14.6.2.3 Trace configuration, recording, installed trace and measurement....6515

14.6.2.4 Data storage....6516
14.6.3 Software user interface....6517
14.6.3.1 Project navigator....6519
14.6.3.2 Working area....6524
14.6.3.3 Trace task card....6534
14.6.3.4 Inspector window....6536
14.6.4 Operation....6537
14.6.4.1 Quick start....6537
14.6.4.2 Using the trace function - overview....6541
14.6.4.3 Project tree....6542
14.6.4.4 Working area - general....6544
14.6.4.5 Working area - Configuration tab....6549
14.6.4.6 Working area - Diagram tab....6550
14.6.5 Devices....6557
14.6.5.1 S7-1200/1500 CPUs....6557

14.7 Establishing a remote connection with TeleService....6573
14.7.1 Basics of working with TeleService....6573
14.7.1.1 Introduction to TeleService....6573
14.7.1.2 TeleService functionality....6574
14.7.1.3 Telephone book at TeleService....6574
14.7.2 Working with the phone book....6575
14.7.2.1 Basics on working with the phone book....6575
14.7.2.2 Structure of the phone book....6576
14.7.2.3 Symbols in the phone book....6577
14.7.2.4 Manage phone book....6577
14.7.3 Remote connections as dial-up connections....6583
14.7.3.1 Basics for establishing a dial-up connection....6583
14.7.3.2 Telephone networks and modems....6584
14.7.3.3 Access protection for dial-up connections....6587
14.7.3.4 TS adapter MPI....6592
14.7.3.5 TS adapter IE....6599
14.7.3.6 Establishing a dial-up connection to a remote system....6605
14.7.4 Remote VPN connections....6606
14.7.4.1 Basics for establishing a VPN connection....6606
14.7.4.2 Basics of CA certificates....6607
14.7.4.3 Installing CA certificates for VPN connections....6609
14.7.4.4 Deleting CA certificates for VPN connections....6612
14.7.4.5 Establishing a VPN connection to a remote system....6613
14.7.4.6 TS Adapter IE Advanced....6615
14.7.5 CPU controlled TeleService remote connections....6619
14.7.5.1 Overview of CPU controlled remote connections....6619
14.7.5.2 Establishing a connection from and to remote systens (PG-AS-remote coupling)....6620
14.7.5.3 Data exchange between remote systems (AS-AS-remote coupling)....6621
14.7.5.4 Send SMS from a system....6623
14.7.5.5 Send an email from a system....6624
14.7.6 Notes on troubleshooting....6627
14.7.6.1 General information on troubleshooting for modem problems....6627
14.7.6.2 Recording a log file for the modem....6627
14.7.6.3 Dial-up connection to the TS Adapter is not established....6628
14.7.6.4 Dial-up connection from the TS Adapter is not established....6630
14.7.6.5 Modem connection is interrupted....6631
14.7.6.6 Checklist for troubleshooting the modem....6631

14.7.6.7 Modem alarms....6632
14.7.6.8 Possible error messages with VPN connections....6633

14.8 Simulating devices with S7-PLCSIM....6634
14.8.1 Simulation of devices....6634
14.8.2 Starting the simulation....6634

15 Using Team Engineering....6635

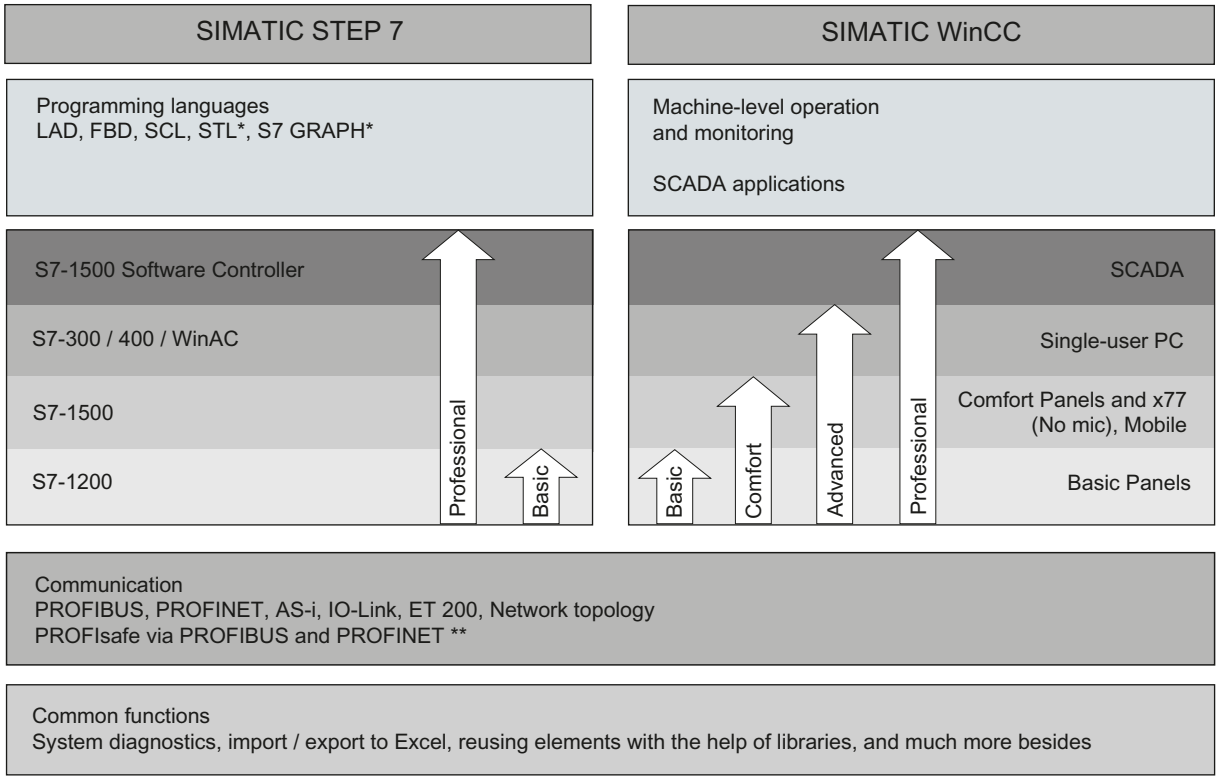
15.1 Shared commissioning of projects....6635
15.1.1 Basics for shared commissioning....6635
15.1.2 Requirements for shared commissioning....6638
15.1.3 Procedure for shared commissioning....6639
15.1.4 Rules for shared commissioning....6642

15.2 Exchanging data with Inter Project Engineering (IPE)....6648
15.2.1 Basics of Inter Project Engineering (IPE)....6648
15.2.2 Requirements for Inter Project Engineering (IPE)....6651
15.2.3 Overview for working with Inter Project Engineering (IPE)....6651
15.2.4 Creating "Device proxy data" in the source project....6654
15.2.5 Creating an IPE file by means of the "Device proxy data"....6655
15.2.6 Using controller data from other projects with IPE....6655
15.2.6.1 Using controller data from other projects in an HMI device....6655
15.2.6.2 Communication with device proxies....6667
15.2.6.3 Integrated configuring with WinCC and SIMATIC Manager....6674

15.3 Using Multiuser Engineering....6687
15.3.1 Introduction to Multiuser Engineering....6687
15.3.2 Overview of the mode of operation with Multiuser Engineering....6689
15.3.3 Basics of the multiuser server concept....6693
15.3.4 Requirements for working with Multiuser Engineering....6696
15.3.5 Supported objects for Multiuser Engineering....6699
15.3.6 Settings for working with Multiuser Engineering....6700
15.3.7 Requirements for multiuser projects....6703
15.3.8 Operator controls in Multiuser Engineering....6704
15.3.8.1 Multiuser icons in the user interface....6704
15.3.8.2 Multiuser icons in the user interface....6706
15.3.8.3 Multiuser banner in the user interface....6708
15.3.8.4 Functionality of the multiuser editor....6708
15.3.9 Installing and uninstalling the Multiuser server....6711
15.3.9.1 Notes on the installation of the multiuser server....6711
15.3.9.2 Installing the multiuser server....6712
15.3.9.3 Uninstalling the multiuser server....6713
15.3.10 Configuring and managing the multiuser server....6714
15.3.10.1 Options for configuring and administering the multiuser server....6714
15.3.10.2 Using the graphic tool....6715
15.3.10.3 Using the command line tools....6734
15.3.10.4 Confirm the certificate for a multiuser server....6746
15.3.10.5 Enter access data for the multiuser server....6746
15.3.10.6 Transferring server data to other multiuser servers....6747
15.3.10.7 Reading out error log for multiuser server....6748
15.3.10.8 Error log for multiuser server packed as Zip file....6750
15.3.10.9 Information on response of the multiuser server to errors....6750
15.3.10.10 Supported network configurations for the multiuser server....6751
15.3.11 Working with the multiuser server....6766

15.3.11.1 Introduction to the multiuser server....6766
15.3.11.2 Setting the multiuser network profiles....6767
15.3.11.3 Adding a new multiuser server connection....6768
15.3.11.4 Displaying the multiuser server connection....6769
15.3.11.5 Editing the multiuser server connection....6770
15.3.11.6 Restore multiuser server connection....6771
15.3.11.7 Deleting the multiuser server connection....6772
15.3.12 Working with the local multiuser server....6773
15.3.12.1 Introduction to the local multiuser server....6773
15.3.12.2 Configuring the local multiuser server....6774
15.3.12.3 Displaying the local multiuser server....6775
15.3.12.4 Starting the local multiuser server....6775
15.3.12.5 Exiting the local multiuser server....6777
15.3.13 Creating and managing multiuser server projects....6777
15.3.13.1 Introduction to working in multiuser server projects....6777
15.3.13.2 Adding a new multiuser server project....6778
15.3.14 Working in the local session....6779
15.3.14.1 Creating and managing a local session....6779
15.3.14.2 Editing objects in the local session....6788
15.3.15 Working in the server project view....6806
15.3.15.1 Introduction to working in the server project view....6806
15.3.15.2 Opening and closing the server project view....6808
15.3.15.3 Editing objects in the server project view....6809
15.3.15.4 Renaming objects in the server project view....6811

Index....6813



System overview of STEP 7 and WinCC

1

1.1 Scaling of STEP 7 and WinCC in the TIA Portal

Scope of performance of the products

The following graphic shows the scope of performance of the individual products of STEP 7 and WinCC:

* Only for STEP 7 Professional for S7-300 / 400 / WinAC and S7-1500
** With installed optional package "STEP 7 Safety Advanced"

STEP 7

STEP 7 (TIA Portal) is the engineering software for configuring the SIMATIC S7-1200, S7-1500, S7-300/400 and WinAC controller families. STEP 7 (TIA Portal) is available in two editions, depending on the configurable controller families:

- STEP 7 Basic for configuring the S7-1200
- STEP 7 Professional for configuring S7-1200, S7-1500, S7-300/400 and Software-Controller (WinAC)

WinCC

WinCC (TIA Portal) is an engineering software for configuring SIMATIC Panels, SIMATIC Industrial PCs, and Standard PCs with the WinCC Runtime Advanced or the SCADA System WinCC Runtime Professional visualization software.

WinCC (TIA Portal) is available in four editions, depending on the configurable operator control systems:

- WinCC Basic for configuring Basic Panels
  WinCC Basic is included with every STEP 7 Basic and STEP 7 Professional product.
- WinCC Comfort for configuring all panels (including Comfort Panels, Mobile Panels)
- WinCC Advanced for configuring all panels and PCs with the WinCC Runtime Advanced visualization software
  WinCC Runtime Advanced is a visualization software for PC-based single-station systems. WinCC Runtime Advanced can be purchased with licenses for 128, 512, 2k, 4k, 8k and 16k PowerTags (tags with a process interface).
- WinCC Professional for configuring panels and PCs with WinCC Runtime Advanced or SCADA System WinCC Runtime Professional. WinCC Professional is available in the following editions: WinCC Professional for 512 and 4096 PowerTags as well as "WinCC Professional max. PowerTags".
  WinCC Runtime Professional is a SCADA system for structuring a configuration ranging from single-station systems to multi-station systems including standard clients or web clients. WinCC Runtime Professional can be purchased with licenses for 128, 512, 2k, 4k, 8k, 64k, 100k, 150k and 256k PowerTags (tags with a process interface).

With WinCC (TIA Portal), it is also possible to configure a SINUMERIK PC with WinCC Runtime Advanced or WinCC Runtime Professional and HMI devices with SINUMERIK HMI Pro sl RT or SINUMERIK Operate WinCC RT Basic.

1.2 Options for STEP 7 and WinCC Engineering

The following cross-product options are available for STEP 7 and WinCC Engineering:

- TIA Portal Multiuser (multiple users work jointly on a TIA Portal project)
- TIA Portal Cloud Connector (access to local interface using RDP)
- TIA Portal Teamcenter Gateway (connection to Teamcenter)
- SIMATIC Visualization Architect (creating HMI contents based on STEP7 projects)
- SIMATIC Energy Suite (energy management)

1.3 Options for S7-1500 Runtime

The engineering of the following functions is integrated in the engineering packages of SIMATIC STEP 7 Professional and/or SIMATIC Energy Suite. The enabling takes place in CPU context:

- SIMATIC ProDiag (machinery and plant diagnostics for S7-1500 and SIMATIC HMI)
- SIMATIC OPC UA S7-1500 (connection of any third-party devices to the S7-1500)
- SIMATIC Energy Suite S7-1500 (energy management)

1.4 Options for STEP 7 Engineering System

The following options are available for STEP 7 Engineering:

- SIMATIC STEP 7 Safety Basic/Advanced (safety programs for F-CPUs)
- SIMATIC S7 PLCSIM Advanced (Virtual Controller S7-1500)
- SIMATIC Target 1500S™ for Simulink® (add-on for Simulink®)

1.5 Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional options allow you to extend the functionality in some cases to increase the range of available tasks.

Option for Basic Panel

The following add-on is available for Basic Panels:

- WinCC Sm@rtServer (remote operation)

Options for Comfort Panels, Mobile Panels

The following extension options are available for Comfort Panels and Mobile Panels:

- WinCC Audit (audit trail and electronic signature for regulated applications)
- SIMATIC ProDiag (machinery and plant diagnostics for S7-1500 and SIMATIC HMI)

Option for Multi Panels

The following add-on is available for Multi Panels:

- WinCC Audit (audit trail and electronic signature for regulated applications)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Advanced

The following possible extensions are available for WinCC Runtime Advanced:

- WinCC SmartServer (remote operation)
- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)
- WinCC Audit (audit trail for regulated applications)
- SIMATIC ProDiag (machinery and plant diagnostics for S7-1500 and SIMATIC HMI)

Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

Options for WinCC Runtime Professional

The following possible extensions are available for WinCC Runtime Professional:

- WinCC Client (standard client for structuring multi-station systems)
- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC / UserArchives)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)
- WinCC ControlDevelopment (extension by means of customer-specific controls)
- WebUX (platform and browser-independent operation and monitoring via the Web)
- SIMATIC Information Server 2014 (Web-based and browser-independent analysis and reports of historic process data)
- SIMATIC Process Historian 2014 (plant-wide archive server for messages and process data)
- Industrial Data Bridge (configurable connections to databases and IT systems)
- Redundancy (increased availability due to redundant server)
- SIMATIC ProDiag (machinery and plant diagnostics for S7-1500 and SIMATIC HMI)

Note

In contrast to WinCC V7, functions from the WinCC /OPC-Server and WinCC / ConnectivityPack options are incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

What's new in TIA Portal

2

2.1 What's new in TIA Portal V14 SP1

2.1.1 Introduction

Description

All important new features compared to the present version V14 are summarized here. You can find additional details on the various topics in the individual sections of the product documentation.

2.1.2 SIMATIC STEP 7

Description

All important new features of STEP 7 are shown grouped together based on the engineering workflow.

Hardware configuration

- New PS 60W 24/48/60VDC HF system power supply for the S7-1500 provides an energy buffer for data backup of up to 20 MB in the CPU.
- Tabular configuration of the I/O channels for modules of the ET 200MP DI HF and ET 200MP DO HF including copy-and-paste and auto-complete function
- Editing of devices names in the graphic views
- Enhanced zooming and optimized (multiple) selection in the graphic network and topology view
- Overview of I/O tags of an entire device (such as an ET 200SP station)
- Easy removal of unused GSD files in the project
- Wizard enhancement for UDP Multicast for Open User Communication (OUC) with S7-1500

Editors for programming languages

- In SCL program code structured tags and ARRAY elements can be replaced by other tags using drag-and-drop operation.
- In the SCL editor, it is possible to switch between insert and overwrite mode.

- In SCL, selected program code segments can be simply enclosed with specific structure elements, such as "IF..Then".
- The detailed comparison of individual blocks can be started directly from the project tree (offline/offline, but also online/offline).
- In LAD/FBD, the tag comment can be shown directly at the point of use.
- The F7 functions ("Open block/PLC data type…") can also be started with focus inside editors.
- Generating external source file from blocks: The export of objects as external source file takes into consideration the PLC data types (UDTs), multi-instances and all called blocks defined in the block interface.
- All the PLC instructions used can be updated to the latest version release in the "Instructions" task card.

New instructions

- The values can be moved between tags of the data type BYTE, WORD, DWORD, LWORD and tag ARRAYs of the data type BOOL using the new instructions "SCATTER" and "GATHER" for the S7-1200/1500. As a result, control and status words can, for example, be simply broken down into single bit signals and reassembled.
- Information about the inserted SIMATIC memory card - such as the memory size, the amount of storage space used or the number of already completed write/delete actions (as percentage) – can be read out using the "GetSMCInfo" instruction.
- The "Polyline" instruction maps the input value to the output value using a characteristic curve. The characteristic curve is defined as a polyline (with up to 50 interpolation points).

Language innovations

- PLC data types (UDT) and ARRAY comments can be modified instance-specific.
- The assignment of various PLC data types (UDTs) with the same structure but different symbolic names is supported.
- S7-GRAPH blocks as of version 4.0 enable the initial value acquisition of the disturbed operands. The actual values of the signal states of Boolean operands and the results of comparator operations in interlocks and transitions are recorded continuously from the time of activation of the initial value acquisition, even if no error occurs. The signal states are stored for each cycle in the GRAPH instance data block. A maximum of 32 signal states are recorded per interlock or per transition of a GRAPH step.

Libraries

- Project libraries and global libraries can now be separately translated into additional foreign languages.
- Simplified upgrading of types (blocks, PLC data types) in an existing project library.
- The user-defined help can be now also be started in the context of the project language. Until V14, this was only possible in the context of the TIA Portal language.

Messages/diagnostics

- The display of the alarm display in the Inspector window has been optimized and functionally enhanced with new functions such as "Receive alarms" and "Freeze alarms".

Migration

- The local constants for ARRAY limits that are used in the SCL sources are retained during the migration from STEP 7 V5.x to TIA Portal.

Trace

- Switching the display format (for example: A WORD can be shown in hexadecimal format, as signed or unsigned INT)
- The scroll bar of the X axis has a small preview window ("Time range display"), with which you can recognize which are has just been zoomed.

System functions

- CAx data based on XML, for exchange of ECAD system for example, can be exported and re-imported.
- Filters are supported for cross-references that are freely definable by the user, for example, in order to find multiple accesses to tags.
- The TIA Portal can be connected to an external password manager via a password provider. This offers the advantage that passwords do not have to be released. This increases the security of the program code.

SIMATIC Ident

The technology object (TO) for SIMATIC Ident connects the hardware configuration of communication modules and readers to the programming of an S7-1200 and S7-1500 controller. The TO hereby prevents incorrect settings and detects errors in the parameter assignment.

Hardware configuration:

- The plant builder assigns a "unique name" to each communication module / reader with which it can be identified by both commissioning engineers and programmers.
- The parameter assignment of each communication module, reader or reading point is set via the TO.
- The Ident devices can be configured with a single click for operation with the TO using the "Auto Configuration" button.

New instructions:

- All instructions for SIMATIC Ident have been revised for the collaboration with the TO. You can find the instructions in the TIA Portal under "Optional packages" > "SIMATIC Ident".
- The hardware addressing of a reader to the instructions has been changed so that the reader is selected through the "unique name" which was defined in the TO. There is no need, therefore, for the previous searching, noting and transferred of the HW identifier and logical address.
- Optional inputs at the instructions are hidden. The user thus recognizes immediately the important parameters that are required for a function.
- The programmer no longer has to assign parameters to the hardware. Only the RESET_READER instruction, which has no other input parameters, is needed for the PLC startup, regardless of the reader connected. The instruction acquires the required parameters from a data area which was configured with the TO.

Diagnostics:

- The last messages which were reported by the instructions to the application can be displayed with the TO.
- A time stamp and the exact error text help to achieve fast analysis of the error.

2.1.3 SIMATIC WinCC

Function enhancement - Openness

- Support of HMI faceplates
- Support of HMI slide-in screens
- Support of HMI pop-up screens

Enhancements for SIMATIC HMI panels

- SIMATIC HMI BASIC Panels:
  - Unicode CSV export of recipes for Basic Panels
  - Changing of IP addresses of controllers and additional SIMATIC components (such as CPs) via the HMI device.
  - Support for Chinese, Japanese, Korean, Russian and Arabic fonts in the browser.
- Updating of tested network cameras (AXIS M1013, AXIS M1011, D-Link DCS-942L, D-LINK 4701E, Siemens CCMS2025).
- Installation/deinstallation of Word, Excel, Win Mediaplayer, IE via ProSave.
- Unlimited number of usable scripts for Comfort.
- Configuration for Startup (additional value "60s" for RT start time and system function for Restart Panel).
- Additional system functions in the "Zones" editor for Mobile Panels.

Enhancement for SIMATIC Runtime Advanced

- Camera displays for showing live video streams from network cameras
- Enhancements of the PDF display (search and copy)
- License-free use of the Sm@rtServer on Runtime Advanced (similar to Comfort Panels)

Integration of SINUMERIK Operate (GUI and data) in Runtime Advanced

- Access to SINUMERIK Operate user interface via new NC operator display in screens of RT Advanced (also multitouch operation)
- Access to SINUMERIK NCU data via separate SINUMERIK channel

Enhancements for SIMATIC Runtime Professional

- Support for OPC UA DA client
- New VBS methods for screen windows. This provides you with the option of temporarily switching off the operability of the screen window.
- Customization of the recipe view. This provides you with the option of adapting the properties of the controls (buttons or table elements).

2.1.4 SIMATIC STEP 7 Safety

Description

SIMATIC STEP 7 Safety Basic/Advanced V14 SP1, the high-performance option package for programming fail-safe S7 controllers for the Totally Integrated Automation Portal V14 SP1.

Station upload

The consistent hardware and software upload enables a loading of project data (including safety-related project data) from a fail-safe S7-1500 CPU*) to a programming device / PC. The project data are loaded without an additional generation step and are consistently available in the TIA Portal for immediate continued work.

*) As of firmware version V2.1

Configuration control

With Safety V14 SP1, the configuration control (option handling) for SIMATIC fail-safe I/O devices is supported in the following configurations:

- Distributed in an F-CPU S7-300/400/1200/1500
- Centrally in an F-CPU S7-1500 (including fail-safe ET200SP CPUs)

Cross-project IO controller I-device communication

Safety V14 SP1 enables cross-project communication of fail-safe S7-1200/1500/1500 software controllers to S7-300/400/1200/1500 I-devices. The I-device project can be easily created with STEP 7 Safety V13 (or higher) or also S7 Distributed Safety V5.4, exported as GSD file, and imported into the IO controller project.

Global F-IO Status block

Fail-safe F I/O devices provide a wide range of status information about the status of the channel and module using the QBAD tags and the value status bits.

In the Safety Administration editor, you can create a default FB for each F-runtime group in order to record and further process any channel, communication or fail-safe I/O errors, even in automation systems with very large volumes of project data. The value status bits and the QBAD tags of the fail-safe I/O used in the corresponding F-runtime group are evaluated and the result of the evaluation is made available at the "QSTATUS" output.

You can use the default FB in the standard program.

Openness

You can use the Openness command set in STEP 7 Safety, as in the standard version. This requires that no password is set for the safety-relevant project data. The use of Openness in production operation is not permitted.

Supported functions include the following:

- Working with libraries (deleting, copying, instancing and upgrading elements etc.)
- Importing tags, tag tables, PLC data types (UDTs), etc.
- Compiling of SW, blocks, PLC data types (UDTs).
- Plugging/deleting F-CPUs and fail-safe I/O
- Copying/deleting F-CPUs and fail-safe I/O from master copies
- Configuring networks
- Compiling software (including the safety program)
- Reading/configuring F-parameters of the F-CPU
- Reading/configuring F-parameters of the fail-safe I/O
- Reading, declaring or deleting fail-safe tags in the PLC tag table
- Updating the project to the latest type versions of F-blocks

2.1.5 SINAMICS Startdrive

Startdrive for G120

- Optimized and enhanced commissioning wizard:
  - The two former wizards for the standard commissioning and the operation under a SIMATIC Motion Control axis are combined in a single wizard
  - Integration of the selection of message frame, brake resistor, motor-side filter, temperature sensor, and selection of the motor, also via the motor code number
- Online/offline parameter comparison
- Support for Windows 10

Startdrive option for S120

- Automatic hardware configuration
- Support for drive-based extended safety with graphic parameterization masks
- Support for torque motors (1FW3, 1FW6)
- Networking with ET200 SP CPU
- Support for Windows 10

2.1.6 SINUMERIK STEP 7 Toolbox

Product features

The SINUMERIK STEP 7 Toolbox V14 SP1 is an option package for SIMATIC STEP 7 Professional V14 SP1 (TIA Portal) with additional setup.

Scope of functions

The SINUMERIK STEP 7 Toolbox V14 SP1 enables the configuration of the SINUMERIK hardware in the TIA Portal using the following functionalities and tools:

- Addition of the following modules of SINUMERIK 840D sl to the hardware catalog (as of firmware V4.5 SP2):
  - NCU 710.3B
  - NCU 720.3B
  - NCU 730.3B
  - NX10.3
  - NX15.3
- Addition of the ADI4 module to the hardware catalog
- Basic SINUMERIK PLC program for the versions
  - V4.5.x.x
  - V4.7.x.x
  - V4.8.x.x
    The basic PLC program is installed in the form of the "SINUMERIK 840D sl PLC Basic Program" system library using the SINUMERIK STEP 7 Toolbox V14 SP1.
- Support for hardware migration
- Creating SINUMERIK PLC commissioning logs, PLC hardware upgrade logs and reload logs
- Exporting of PLC symbols for SINUMERIK Operate
- Importing of SINUMERIK user alarm texts
- Creating SINUMERIK PLC logs
- PROFINET IO IRT support for NCK
- Support for SINUMERIK Safety Integrated and Safety Integrated plus
- NC-VAR-Selector (external tool)

2.1.7 Runtime options

Description

The following new options are only offered as a runtime option with TIA Portal V14 SP1. The ProDiag product is are already integrated into the existing STEP 7 and WinCC products and only needs to be licensed when used on the real hardware. In comparison with the Engineering options, the runtime options are not version-dependent.

SIMATIC ProDiag

- S7-GRAPH blocks as of version 4.0 enable the initial value acquisition of the disturbed operands.
- The initial values can be displayed on the HMI device using the "PLC code view" object and the faulty operands can be detected immediately in the case of error (criteria analysis). The initial values remain stored until they are overwritten by a new error.
- For the initial value acquisition, all instructions are supported which are supported in an S7-GRAPH function block for transitions and interlocks. For bit logic operations, the status of the operand is stored. For comparator operations, the result of the comparison is stored.

SIMATIC Energy Suite S7-1500

SIMATIC Energy Suite as an integrated option for the TIA Portal for the first time efficiently combines energy management with automation, bringing energy transparency to production. In addition, the configuration work is significantly reduced due to the simplified configuration of components for energy recording.

Functions:

- Integrated and intuitive configuration of energy management
- Automatic generation of the PLC energy program for S7-1500 for basic energy data (energy and power)
- Archiving to WinCC Runtime Professional or to a PLC-internal SIMATIC memory card
- Seamless connection to SIMATIC Energy Manager PRO

New in V14 SP1:

- Enhancement of the automatic PLC program generation with additional energy data (currents, voltages, frequency)
- In addition to the manual energy data export, the automatic export is now also offered (for example, start of the export of the energy data of the last week, each Monday at 00:15 hrs)
- Program generator: Detailed representation of the generation progress and configuration error messages.

2.2 What's new in TIA Portal V14

2.2.1 Introduction

Description

All important new features compared to the present version V13 SP1 are summarized here. You can find additional details on the various topics in the individual sections of the product documentation.

2.2.2 SIMATIC STEP 7

Description

All important new features of STEP 7 are shown grouped together based on the engineering workflow.

Hardware configuration

- Support of the S7-1500 T-CPU family, with the Motion Control functions "constant velocity" and "cam disks".
- Support of the new CPU 1518(F)-4 PN/DP ODK (Open Development Kit), which enables C/C++ functions created via the SIMATIC ODK 1500S to be integrated into the user program
- Support of the CPU 1516pro (F)-2 PN
- Support of the new S7-1500 failsafe software controller
- IO devices can be grouped in the project tree to quickly find and technologically merge devices.
- The arrangement of the devices in the topological view can be synchronized with the network view.
- Own profiles can be defined in the hardware catalog for easy and quick access to frequently used modules.

Editors for programming languages

- Separate editors are available for the new technology objects Output Cam, Cam Track and Measuring Input. There is also a convenient cam disk editor for the S7-1500T controllers.
- SCL networks can be inserted into a LAD/FBD block.
- "Regions" can be used in SCL program code to improve structuring and navigation.
- You can hide the block parameters when calling the block in LAD or FBD.

- The comparison of PLC programs has been thoroughly revised and enables the quick and convenient comparison of source code with many filter options.
- Networks in the programming editors for LAD / FBD / STL are automatically displayed as they were when you last exited the block.

Language innovations

- ARRAYs of variable length can be passed with ARRAY[*].
- Multiple instances can be declared in ARRAYs in the block interface and called in loops. This helps to significantly reduce the program code and provides better readability and more efficient programming when processing the same program objects.
- The data type DB_ANY can also be used for technology objects. This allows technology objects to be handled more flexibly in the program. An "ARRAY of DB_ANY" may be a list of positioning axes, for example.
- Instances can be passed as a parameter in the "InOut" section of the block interface so that only one dedicated instance needs to be selected in the call.
- Message texts and comments for up to 3 languages can be loaded into the PLC S7-1500 and changed online.

Messages/diagnostics

- Using the new "Get_Alarm" instruction, messages can be directly read from the message server of the S7-1500 CPU and, sent and to a higher-level reporting system (e.g. process control system), for example.
- With the instruction "GET_DIAG" in Mode 1, the diagnostic data are output in the DIS structure. Bit 15 of the parameter IOState of this structure outputs the signal status "1" when a network / hardware fault has occurred.

Trace

- The Trace function enables different measurements to be displayed in a shared diagram ("overlaid measurements").
- In addition, with the Trace function, after completion, messages can be stored on the memory card independently of the power supply, and if required, can be automatically restarted.

Online functions

- Restructuring of the toolbar in the DB editor with the possibility to reinitialize complete data blocks with the defined start values.
- Structures in the block can be observed directly in the Inspector window including the call environment.

System functions

- The new global search enables cross-project searching for PLC and HMI objects. In addition, the search results can be restricted by filter. A "GoTo" function is also available.
- TIA Portal settings can be exported or imported and stored on a central server. If the server path is available, for example, the stored settings are used automatically as "default" every time you restart the TIA Portal.
- Innovative help/information system with tab technology, improved search function and the possibility to filter information by device families.
- The new cross-reference list provides a quick overview of the use of objects and devices within the project.
  - Support of overlapping accesses (PLC tags)
  - Support of know-how-protected blocks
  - Access to Individual elements of an ARRAY
  - Representation of objects which occur both in HMI and PLC devices
  - Free entry of objects to be searched for in the cross-reference list possible
  - Various filter options
  - Convenient and central provision of updates in company networks.
  - A company server can be configured with the TIA Automation Corporate Configuration Tool. The available updates / support packages are stored on the server and are thus available to users.

S7-PLCSIM

- Quick start of S7-PLCSIM in compact mode and without a simulation project.
- Devices can be exchanged in the simulation project so that existing TIM tables and sequence entries can continue to be used without any problems.
- Sequences can be automatically started on the basis of a trigger condition.
- Sequences can be temporarily deactivate.
- Decentralized I/O devices can be simulated in the device view.

Motion Control applications

- Pre-configured and integrated connection and configuration of the SINAMICS V90 PN drive message to a Motion Control technology object of SIMATIC S7-1500.
- Automatic data synchronization between the controller and the drive.

See also

Engineering options (Page 60)

Runtime options (Page 62)

2.2.3 SIMATIC WinCC

Configuring screens

- New view on distributed I/Os of the system diagnostic controls.
- Improvements of controls:
  - New scroll bar with configurable colors.
  - Dynamic number of commands in the drop-down menu for recipe control.
  - Expansion of the slider, bar, gauge controls with up to four limits.
- New "Siemens TIA Portal Icons" fonts.
- Graphics library includes new graphics and completely revised structure.

Working with tags

- Symbolic address multiplexing of PlcUDT instances within a ARRAY variable of a data block.
- Hierarchical IntelliSense for connecting PLC data to HMI tags.

SIMATIC Panels and SIMATIC WinCC Runtime Advanced

- Transfer of configuration via USB stick / SD card for Basic Panels 2ndGeneration, Comfort Panels, Outdoor Panels, Mobile Panels and WinCC Runtime Advanced.
- Sm@rt Server Option for Basic Panel 2nd Generation.
- The safety of the following features has been enhanced:
  - The following components are signed:
    Comfort and Mobile Panel: Runtime, ProSave options and Runtime add-ons.
    Basic Panels 2nd Generation: Image of the panel
  - Security of passwords used in Runtime
  - Web browser connection to a Sm@rtServer via HTTPS protocol possible and secure connection from a Web SmartClient to the Sm@rtServer possible.
- The maximum number of power tags in WinCC Runtime Advanced was increased to 16K.

WinCC Runtime Professional

- WebUX option
  Platform and browser-independent operation and monitoring via the Web.
- Process diagnostics option
  When a process fault occurs, process diagnostics provide information about the cause and location of the error and supports troubleshooting.
- Extension: Quantity structure for 1200/1500 PLCs
  There can now be 64 connections to S7-1200/1500.

- Extension: Multitouch for certain controls
  Gestures can now be used to move the display area of controls (trend-based controls, grid-based controls, axis controls).
- Harmonization: Licenses for WEBNAVIGATOR, DATAMONITOR and WebUX
  The license type of Web options can be counted consistently. These SCADA options as of V7.4 or V14 in the future will have uniform MLFBs and therefore there will no longer be separate MLFBs for Runtime Professional.

See also

Engineering options (Page 60)

Runtime options (Page 62)

2.2.4 SINAMICS Startdrive

Simplified commissioning and simplified (remote) servicing

Extended routing functionality for communication between Startdrive and drive:

- Routing across various PROFINET systems
- Routing from PROFIBUS to PROFINET

Simple modification of a project to the machine

Upgrade G120 firmware version in the Startdrive project (beginning with firmware version 4.4)

Reuse of the parameter assignment across various performance ranges.

Also for G120C

Faster access to Smartdrive download package in SIOS

- No waiting time for export control
- Starting with the Startdrive V13 SP1, export restriction no longer applies (export identifier AL=N, ECCN=N)

More efficient configuration

Optimized compilation time of the S7-CPU for networked drives configured with Startdrive

Modification of the supplied S7 data blocks for drive control

Drive library now without know-how protection

Simplified commissioning

Assignment of PROFINET device names is now easy to do in the project navigation and in the HWCN network view via the shortcut menu of the drive.

Simplified update process

Automatic installation of Startdrive HSPs and updates via the TIA Portal Updater

Support for new hardware

New 1FP1 synchronous Reluktanz motors are supported.

No manual update required

HSPs for Sinamics Firmware V4.7.3 and V4.7.6 are integrated.

2.2.5 SIMOTION SCOUT TIA

Description

The SIMOTION P platform (PC-based) is now available in the TIA Portal. (Planned for approx. 3 months after release of STEP 7)

- You can now upload the hardware configuration for SIMOTION devices.
- Additional PROFINET functions for SIMOTION devices:
  - Shared I-device
  - Shared device
  - Seamless Media Redundancy (MRPD)
  - "Check of VendorID/DeviceID" and "Overwriting of the NameOfStation" (automatic configuration of the topology)
  - Address tailoring (modular machines)

2.2.6 SIMOCODE ES V14

Routing via Ethernet - PROFINET

SIMOCODE ES V14 supports routing to SIMOCODE pro devices with PROFINET. Devices can now also be reached from an engineering station with SIMOCODE ES V14 Premium via Ethernet, if they are not directly connected to the PROFINET network to which the SIMOCODE pro devices are connected. This improves the capabilities of the software in systems in which SIMOCODE pro devices are used with PROFINET.

Migration of SIMOCODE ES 2007 group files

Configurations created with SIMOCODE ES 2007 in which the parameter files for SIMOCODE pro devices have been assembled into "group files", can now be migrated directly to one and the same TIA Portal V14 project without additional configuration steps. This function improves the handling of the software when migrating from SIMOCODE ES 2007 to SIMOCODE ES V14 TIA Portal.

Improved editor functions for charts with SIMOCODE pro interconnections

With SIMOCODE ES V14 Standard and Premium, CFC-based charts can be copied in whole or part, saved as library elements and reused. This feature simplifies the handling of recurrent configurations for typical configurations.

Clear presentation of all the important parameter settings in the parameter editor

All important parameter settings for fast commissioning of a motor feeder can be displayed and edited in a new overview in SIMOCODE ES V14, which significantly helps to improve clarity.

Uniform presentation of recorded trends for measured values

Measured values and data recorded online and offline with SIMOCODE ES "Live Trend" and "Analog Value Recording" functions are displayed using the TIA Portal "Trace" function. The operation of this function has been significantly improved thanks to the TIA Portal-wide standardization.

2.2.7 Engineering options

TIA Portal Multiuser

TIA Portal Multiuser Engineering enables several users to simultaneously work together on a project. This reduces configuration times considerably and enables quicker commissioning of projects.

The basic principle:

- An independent server application carries out project management. The server application can be installed independent of a TIA Portal.
  or
  project management is located on a server. The server can be installed independent of a TIA Portal.
- Different users work in local sessions, based on the projects managed by the server.
- Users work independently from each other in local sessions; changes made by other editors are displayed and can be applied.
- The changes from the local sessions are transferred to the server project on check-in.

TIA Portal Teamcenter Gateway

The TIA Portal Teamcenter Gateway allows you to store and manage TIA Portal projects and global libraries in the Teamcenter. The operation is performed in the TIA Portal.

TIA Portal Cloud Connector

The TIA Portal Cloud Connector lets you access local PG/PC interfaces and the SIMATIC hardware connected to them in the TIA Portal engineering even though the engineering itself is operated in a private cloud using Remote Desktop.

SIMATIC Energy Suite

SIMATIC Energy Suite as an integrated option for the TIA Portal for the first time efficiently combines energy management with automation, bringing energy transparency to production. In addition, the configuration work is significantly reduced due to the simplified configuration of components for energy recording.

- Integrated and intuitive configuration of energy management
- Automatic creation of PLC energy program for S7-1500
- Archiving to WinCC Runtime Professional or to a PLC-internal SIMATIC memory card
- Seamless connection to SIMATIC Energy Manager PRO

SIMATIC S7-PLCSIM Advanced

S7-PLCSIM Advanced is suitable for the simulation of an S7-1500 PLC. Compared to standard S7-PLCSIM, S7-PLCSIM Advanced provides the following additional features:

- API for interfacing with co-simulations
- Multiple, distributed instances possible
- Adjustable, virtual time
- Web server and OPC UA access

SIMATIC ODK 1500S

The SIMATIC ODK 1500S enables the development of function libraries with the high-level languages C/C++ for ODK-capable SIMATIC S7-1500 PLCs. These function libraries can be directly loaded and run directly from the user program. ODK-capable S7-1500 PLCs:

- S7-1500 Software Controller (CPU 1507S (F))
- ET 200SP Open Controller (CPU 1515SP PC (F))
- S7-1500 Advanced Controller (CPU 1518(F)-4 PN/DP ODK)

SIMATIC Target 1500S™ for Simulink®

SIMATIC Target 1500S™ for Simulink® is an add-on for Simulink from MathWorks. It enables the integration of Simulink models directly in the program cycle of an ODK-capable S7-1500 PLC.

- Enables model-based development with MATLAB® and Simulink for SIMATIC controllers
- Seamless integration in Simulink as a so-called target file
- No C/C++ or ODK know-how required
- Support of the Simulink external mode for direct monitoring and control of model parameters in the controller from Simulink
- The generated program code can be executed on the CPUs 1507S(F) V2.0, CPU 1515SP PC (F) V2.0 and CPU 1518(F)-4 PN/DP ODK.

SIMATIC Visualization Architect

The SIMATIC Visualization Architect (SiVArc) enables easy, fast and flexible automated production of HMI content based on the STEP 7 user program.

- Supported HMI devices:
  Comfort Panel, Mobile Panel 2nd Generation, WinCC RT Professional, WinCC RT Advanced
- Supported HMI objects:
  Screens, text lists, power tags, captions, buttons, I/O fields, symbolic I/O fields, graphic I/O fields, switches, round buttons
- Configuration via control editor
- Templates are managed through libraries

2.2.8 Runtime options

Description

The following new options are only offered as a runtime option with TIA Portal V14. The products ProDiag and OPC UA S7-1500 are already integrated into the existing products STEP 7 and WinCC and only need to be licensed when used on the real hardware. In comparison with the Engineering options, the runtime options are not version-dependent.

SIMATIC ProDiag

SIMATIC ProDiag enables precise and fast machine and plant diagnostics for SIMATIC S7-1500 and SIMATIC HMI:

- Central cycle-precise time stamp of error messages
- Automatic generation of monitoring logic and message calls
- Automatic update of the SIMATIC HMI when changes are made to message configuration for 3 languages

- HMI systems do not have to leave runtime mode in the event of changes
- Is directly available in the language editors LAD, FBD, SCL and STL.
- Monitoring can be parameterized later on F blocks and know-how protected blocks
- Central project definition of message structure
- Alarm texts are automatically derived from existing information in the project
- Simple visualization of the HMI through prepared controls

SIMATIC OPC UA S7-1500

The OPC UA S7-1500 option allows easily connection of any third-party devices to the S7-1500 via the OPC UA server integrated in the S7-1500 CPU:

- OPC UA server directly in S7-1500
- OPC UA data access, read/write, subscription to value changes
- Security
- XML export for offline configuration of OPC UA clients

SIMATIC Energy Suite S7-1500

10 energy objects are supplied with the SIMATIC Energy Suite Engineering. Additional energy objects can be extended by the Runtime packages.

WinCC / WebUX

WinCC / WebUX allows us to monitor plant processes over the Internet or Intranet using mobile devices and if required, to also control them. The software offers a visualization solution which is suitable for HTML5 and SVG-capable browsers, independent of the operating system – and which does not require engineering work.

Readme

3

3.1 Notes on the TIA Portal

3.1.1 General notes

The information in this readme file supersedes statements made in other documents.

Read the following notes carefully because they include important information for installation and use. Read these notes prior to installation.

Using new functions of service pack 1 in compatibility mode

If you are using a project in compatibility mode and are using a new function of the TIA Portal V14 SP1, the project is automatically upgraded to project version V14 SP1 in most cases.

To use the following functions, however, upgrade the project manually beforehand to project version V14 SP1:

- Assigning various PLC data types (UDTs) with the same structure but different symbolic names
- Selection of the new instructions SCATTER, GATHER, GetSMCinfo and polyline

Safety note for block protection

If a block is protected by a password that was entered manually, manual input is always required to edit the block or its protection settings. This is true even if a password provider contains a password with the same content at a later time.

Upgrading from TIA Portal V13 SP1 projects with master copies from TIA Portal V10.5

Before upgrading a project, check if the master copies created with TIA Portal V10.5 are contained in its project library. This is necessary, for example, when you receive a message during the upgrade about an S7-1200 CPU with firmware version V1.0 used in the project, even though you have not configured such a CPU. The CPU is a master copy in the project library in this case.

Before upgrading a project with master copies from TIA Portal V10.5, therefore, do the following:

1. Use each master copy created with the TIA Portal V10.5 once in the project.
2. Delete the affected master copies from the project library.
3. Create the master copy again with the objects from the project.
4. Save the project in TIA Portal V13 SP1.

You can then upgrade the project to the latest version.

Display of Asian characters in the TIA Portal

Due to a change in behavior in Microsoft Windows, it may occur that texts are not displayed correctly in the TIA Portal when a Chinese TIA Portal is installed on another Asian operating system (e.g. Korean). To view the texts in TIA Portal correctly, open the Windows Control Panel and select "English" under "Language for non-Unicode programs". Note, however, that this may cause display problems in other programs.

Installing new .Net versions or .Net service packs

- Close the TIA Portal before installing a new .Net version or a new .Net service pack on your programming device/PC.
- Restart the TIA Portal only after successful installation of the new .Net version or the new .Net service pack.

Notes on handling

- If a project in the list of projects last used is located on a network drive that is not connected, you may experience delays when opening the "Project" menu.
- When you insert a CPU, you may need to wait for some time if the project editor is open at the same time. This generally takes longer when you insert the first CPU in a newly created project. To be able to continue working at a good pace, you should close the project text editor before inserting a CPU.
- The alarm "Application is not responding" may appear in Windows 7 with functions that take a long time to run (loading the CPU for example). If this occurs, wait until the function has correctly finished.
- If you have installed a Microsoft mouse with IntelliPoint, you may find that it superimposes components over the buttons of the title bar. If this is the case, uninstall the IntelliPoint software from Microsoft.
- Enabling the "Virtual Desktop" options with NVIDIA graphics cards can cause problems. In this case, disable the "nView virtual desktop manager" of your NVIDIA graphics driver.

Working with automatically synchronized network drives

A TIA Portal project consists of multiple files that are saved together in one directory. If you store a project that is automatically synchronized on a network drive or in a cloud directory (e.g. Dropbox, Syncplicity or GoogleDrive), this can lead to data loss if the synchronization only takes place partially or asynchronously. For this reason, we do not recommend editing TIA Portal projects directly on synchronized network drives or in cloud directories. Always close the TIA Portal project before synchronization and make sure that all directories and files from the project directory are synchronized together and completely. You may wish to disable automatic synchronization while working with the TIA Portal. The synchronization itself must be implemented in such a way that the current (local) project data replaces the project data on the network drive or in the cloud directory.

Entry of decimal places

With certain Windows language settings, it may occur that the entry of values with a comma as decimal place is not recognized (entering "1,23" leads to an error). Instead, use the international format ("1.23").

Information on the TIA Portal in online support

Overview of the most important technical information and solutions for the TIA Portal in the Siemens Industry online support.

Internet link: TIA Portal in Siemens Industry online support (https://support.industry.siemens.com/cs/ww/en/view/65601780)

All information on service and support in the Siemens Industry online support:

Internet link: Service and support in Siemens Industry online support (https://support.industry.siemens.com/cs/de/en/)

Here, you can also subscribe to the newsletter that provides you with latest information relating to your products.

Starting the TIA Portal

When you start the TIA Portal, Windows attempts to update the Certificate Revocation List (CRL) of "windowsupdate.com".

If no Internet access is available and there are multiple DNS servers, a timeout may occur and delay the start of the TIA Portal.

3.1.2 Notes on libraries

Contents

Information that could not be included in the online help and important information about product characteristics.

Comparing library elements

If master copies and types have the same name, the corresponding objects in the project are overwritten when the action "Copy" is used. Please note that this takes place without a prompt. The same behavior occurs when the name of the master copy is different to the name of the type, but an object within the master copy has the same name as the type.

Library setting: "Disable editing of the type version number"

You can use the library setting "Disable editing of the type version number" to prevent that the type version number can be assigned by the user for the actions "Release version" and "Assign version". By activating the library setting, the type version number can not be changed by the user. The build number is still incremented automatically when a version is released or assigned. When the high limit of the build number in a block (999) has been reached, the version number is incremented in the next block.

3.1.3 Notes on memory cards

Contents

Information that could not be included in the online help and important information about product characteristics.

Notes on SIMATIC memory cards

The SIMATIC memory cards have been formatted and set up by Siemens for use with S7-1200 and S7-1500 modules. This format must not be overwritten; otherwise, the card will no longer be accepted by the modules. Formatting with Windows tools is therefore not permitted.

Behavior in case of open force job

Note that an active force job is retained even after you have loaded a new project to the SIMATIC memory card. This means you should first delete the active force job before you remove a SIMATIC memory card from the CPU and before you overwrite the card in the PC with a new project. If you use a SIMATIC memory card with unknown content, you should format the SIMATIC memory card before the next download.

Access protection for memory cards in USB card readers

By improving the security mechanisms for online access and engineering of S7-1500 CPUs, the data storage on memory cards has been changed. For this reason, this version of STEP 7 cannot evaluate the passwords of the configured protection level when reading project data from memory cards that is accessed via a USB card reader. The changed response affects the memory cards for CPUs of the S7-1200/1500 series. Therefore, use physical safeguards to protect critical project data on memory cards for these devices.

Note

This restriction is not related to online access to devices or the know-how protection of program blocks.

3.1.4 Notes on the hardware configuration

Content

Information that could not be included in the online help and important information about product characteristics.

Subnet addressing for CP 1613 and CP 1623

CP 1613 and CP 1623 are communication modules with microprocessor. To ensure secure management of communication links, these are processed on the module. The protocol stack in your PC is used for diagnostic purposes (SNMP, DCP). To allow both protocol stacks (i.e. CP 1613/23 Firmware and CP 1613/23 NDIS access) access to the same partners, is recommended to place both stacks of a module in the same subnet.

Editing a device IP address

Do not use the address range from 192.168.x.241 to 192.168.x.250 when editing a device IP address. If necessary, this address range is automatically assigned by the system to a programming device. Depending on the subnet mask, this applies also for all network classes.

Drivers for the CP 5512 communications processor

The drivers for the CP 5512 are no longer included in this software version. If you want to use the CP 5512, the following needs to be installed prior to the installation of this software:

http://support.automation.siemens.com/WW/view/78453460 (http://support.automation.siemens.com/WW/view/en/78453460)

Please note that the CP 5512 can be used with a maximum of Windows 7 32-bit. As of Windows 8 or with 64-bit operating systems, the CP 5512 is not compatible.

Note

Since 2009, the functional successor the USB 2.0 module CP 5711 has been available.

3.1.5 Notes on instructions

Contents

Information that could not be included in the online help and important information about product characteristics.

Instructions not valid for all CPU firmware versions

The firmware version of your CPU determines the following:

- Whether a specific instruction is available for this CPU:
  - If you select CPU 1211C DC/DC/DC with firmware version V1.0, for example, the extended instruction "T_COMBINE" will not be available to you. It is grayed out in the "Instructions" task card.
  - However, if you select CPU 1211C DC/DC/DC with firmware version V3.0, the extended instruction "T_COMBINE" will be available to you in versions V1.1 and V1.2.
- Which versions of the instruction are available. You can select the different versions in the "Version" column of the "Instructions" task card.

3.1.6 Notes on using the TIA Portal in a virtual environment (private cloud)

Contents

Information that could not be included in the online help and important information about product characteristics.

Instructions for using the TIA Portal in a virtual environment (private cloud)

You can find instructions on how to use the TIA Portal in a virtual environment (private cloud) on the installation disk in the directory "Documents\Readme\<language directory>". You can open the PDF document "TIAPortalCloudConnectorHowTo<language ID>.pdf" here.

The TIA Portal Cloud Connector can be used with the Windows 7 (64-bit) and Windows 8.1 (64-bit) operating systems. Using the TIA Portal Cloud Connector with Windows 10 is in development.

Environment variables "TiaUserSettingsPath" and "TiaDefaultProjectPath"

The environment variables "TiaUserSettingsPath" and "TiaDefaultProjectPath" can be used to set the location of the user and project settings different from the system default. This can be used, for example, to save the user and project settings at a central location.

You can find additional information on the use of environment variables in the Instructions on Using the TIA Portal in a Virtual Environment (Private Cloud).

Note on using self-signed certificates when using HTTPS as the communication protocol

Microsoft regularly checks whether the certificates in the Windows Certificate Store are from a trusted source. Certificates from untrusted sources are deleted. Therefore, ensure that your self-signed certificates are signed with a secure certificate.

3.1.7 Information on working with Multiuser Engineering

Contents

Information that could not be included in the online help and important information about product features of Multiuser Engineering and about the multiuser server.

Installation of the multiuser server gives you access to the "Multiuser Engineering" function that is available with TIA Portal V14.

Microsoft system account for multiuser server

When the multiuser server is installed, a Microsoft system account is created for the multiuser server. Microsoft changes the password cyclically for this account.

If the password for this account has expired, the password needs to be changed and then the multiuser server needs to be restarted.

Error message during start of the multiuser server

If an error message is displayed during or after the installation of the multiuser server indicating that the service cannot be started for the multiuser server V14, the following procedure is recommended:

1. Open the Windows event view and check whether an error entry with the error number "1069" is present.
2. If this is the case, information on how to proceed is provided below.
   Internet link: FAQ with ID 109739926 (https://support.industry.siemens.com/cs/ww/en/view/109739926)
3. Alternatively, you can contact Customer Support directly.
   Internet link to Customer Support: TIA Portal in Siemens Industry online support (https://support.industry.siemens.com/cs/ww/en/view/65601780)

Working with active monitoring jobs and forcing jobs in the local session

Active monitoring jobs and forcing jobs must be closed before a check-in or update in the local session. It is not possible to check in or update in the local session while monitoring or forcing jobs are active.

Working in the local session with the "Keep local session" option

If the "Keep local session" option is selected after the check-in, all checked-in objects in the local session appear as outdated, even if their content is identical.

Working with the NTFS file system

Make sure that the Multiuser-server repository is shared only on NTFS partitions.

FAQ with ID 109739926 (https://support.industry.siemens.com/cs/ww/en/view/109739926)

3.2 STEP 7 Basic

3.2.1 Security information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

Network settings

The following tables show the network settings of each product you need to analyze the network security and to configure external firewalls:

STEP 7 Basic					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound/outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
RFC 1006	102	TCP	Outbound	S7 communication	Communication to the S7 controller via Ethernet/PROFINET for programming and diagnostic purposes.

STEP 7 Basic					
DCP	---	Ethernet	Outbound	PROFINET	The DCP protocol (Discovery and Basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
SNMP	161	UDP	Outbound	PROFINET	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
* Default port that can be changed by user configuration					

WinCC ES Basic (without simulation)					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound/outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
* Default port that can be changed by user configuration					

Simulation RT Basic					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
Ethernet/IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication to the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

3.2.2 Notes on use

Contents

Information that could not be included in the online help and important information about product characteristics.

Online operation

Simultaneous online operation of STEP 7 V5.5 or earlier versions and STEP 7 Basic V14 is not approved.

Simultaneous online connections on an S7-1200 CPU

It is not possible to establish an online connection from multiple instances of the TIA Portal simultaneously to the same S7-1200 CPU.

Removing/inserting the memory card

After removing or inserting a memory card, always perform a memory reset on the CPU in order to restore the CPU to a functional condition.

Removing and inserting Ethernet modules

If Ethernet modules are removed and re-inserted during operation, you must boot the PC; otherwise, the "Accessible devices" functionality in STEP 7 or NCM PC will not display all devices. While the PC boots, Ethernet modules must be activated.

Loading project data with TIA Portal V12 and V13 (S7-1200)

If you load the project data of an S7-1200 CPU with the TIA Portal V13, you can no longer use TIA Portal V12 to access this data. To do this, first restore the factory settings of the CPU. Read the additional information on this in the online help under "How to reset a CPU to factory settings".

Compatibility

The device configuration and program of an S7-1200 CPU must always be configured with the same STEP 7 version. Usually, the TIA Portal makes sure that no version conflicts occur by outputting appropriate notifications during loading to the device.

This automatic verification is not possible with S7-1200 CPUs with firmware version V1.x. In this case, users themselves must ensure that no version conflicts occur.

3.2.3 Editing devices and networks

3.2.3.1 General information on devices and networks

Contents

Information that could not be included in the online help and important information about product characteristics.

S7 PCT IO-Link

The S7 Port Configuration Tool is available for free download at the following link.

http://support.automation.siemens.com/WW/view/37936752 (https://support.industry.siemens.com/cs/ww/en/view/32469496)

3.2.3.2 Use of modules on the S7-1200

Content

Information that could not be included in the online help and important information about product characteristics.

Use of modules on the S7-1200

The modules listed below are not supported on the S7-1200.

Family	Module	Order number
S7-300 FMs	SM 338	6ES7 338-4BC01-0AB0
	FM 350-1	6ES7 350-1AH03-0AE0
	FM 350-2	6ES7 350-2AH00-0AE0, 6ES7 350-2AH01-0AE0
	FM 351	6ES7 351-1AH01-0AE0, 6ES7 351-1AH02-0AE0
	FM 352	6ES7 352-1AH02-0AE0
	FM 355 S	6ES7 355-1VH10-0AE0
	FM 355 C	6ES7 355-0VH10-0AE0
	FM 355-2 C	6ES7 355-2CH00-0AE0
	FM 355-2 S	6ES7 355-2SH00-0AE0
S7-300 PtP-CP	CP 340	6ES7 340-1AH02-0AE0, 6ES7 340-1BH02-0AE0, 6ES7 340-1CH02-0AE0
	CP 341	6ES7 341-1AH01-0AE0, 6ES7 341-1AH02-0AE0, 6ES7 341-1BH01-0AE0, 6ES7 341-1BH02-0AE0, 6ES7 341-1CH01-0AE0, 6ES7 341-1CH02-0AE0
Network component	Diagnostics repeater	6ES7 972-0AB01-0XA0
ET 200S	1 Count 24 V	6ES7 138-4DA04-0AB0
	1 Count 5 V	6ES7 138-4DE02-0AB0
	1 Step 5 V	6ES7 138-4DC00-0AB0, 6ES7 138-4DC01-0AB0
	2 pulses	6ES7 138-4DD00-0AB0, 6ES7 138-4DD01-0AB0
	1 SI	6ES7 138-4DF01-0AB0
	1 SI Modbus	6ES7 138-4DF11-0AB0
	1 SSI	6ES7 138-4DB02-0AB0, 6ES7 138-4DB03-0AB0
	1 Pos Universal	6ES7 138-4DL00-0AB0
	SIWAREX	7MH4910-0AA01, 7MH4912-0AA01, 7MH4920-0AA01
ET 200M	SIWAREX	7MH4 900-2AA01, 7MH4 900-3AA01, 7MH4 950-1AA01, 7MH4 950-2AA01

Loading S7-1200 module comments to the PG/PC

In central configurations with S7-1200, comments of modules, submodules and signal boards are not loaded. With CPs/CMs, only the comments of the IE interface or DP interface are loaded. In distributed configurations with ET 200SP or ET 200MP, only the comment of the channels is loaded from the I/O modules.

3.2.3.3 CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

Contents

Information that could not be included in the online help and important information about product characteristics.

CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

The module AS-Interface CP 343-2 (article no.: 6GK7 343-2AH01) can be inserted in an expansion rack of the SIMATIC S7 Embedded Controller EC31-RTX (article no.: 6ES7 677-1DDxx-0BB0), but the CP 343-2 cannot be operated with the EC31-RTX.

3.2.3.4 F-CM AS-i Safety ST for ET 200SP

Content

Information that could not be included in the online help and important information about product characteristics.

F-CM AS-i Safety ST (3RK7 136-6SC00-0BC1) from HSP0070

When using an F-CM AS-i Safety ST (3RK7 136-6SC00-0BC1) using HSP0070 in TIA Portal V13.0, after updating to Service Pack 1, the HSP0070 (F-CM AS-i Safety ST) must be updated to version V2.0. This is necessary to allow use of the module in TIA Portal V13 Service Pack 1.

3.2.3.5 S7 routing via IE/PB Link

Content

Information that could not be included in the online help and important information about product characteristics.

S7 routing via IE/PB Link

In the following situations, no routing via the IE/PB Link PN IO is possible:

- S7 routing between two CPUs of the S7-1500
- S7 routing of PG connections to CPUs of the S7-1200/1500
- S7 routing of HMI connections to CPUs of the S7-1200/1500

This behavior relates to the IE/PB Link with firmware version V2.1 (6GK1 411-5AB00).

3.2.3.6 Notes on online and diagnostics

Contents

Information that could not be included in the online help and important information about product characteristics.

Hardware detection followed by online connection

When the "Online > Hardware detection" command is performed for an unspecified CPU, the online configuration is not loaded from the CPU. If you do not load the configuration resulting from the hardware detection to the CPU, the device and network views will always show a difference between the offline and online configurations. It will appear that there are different configurations in the online and diagnostic views, although the MLFBs are identical in the actual CPU and the offline CPU.

Transferring numerous and large trace measurements from the device (memory card)

Transferring trace measurements from the device to the project increases the memory requirement.

Avoid copying a large number of measurements with large amounts of data at the same time lead to high memory consumption and extended periods needed for copying.

Deleting measurements in the device (memory card) (S7-1200)

Do not delete any measurements in the device as long as a trace in the device still generates new measurements on the memory card.

3.2.3.7 Network components

Network components (STEP 7 Basic)

Security modules

Migration of projects with Ethernet CPs and activated security functions

In STEP 7 V5.5 projects that contain Industrial Ethernet CPs with activated security functions, the security settings are disabled during migration to STEP 7 Professional.

If necessary, follow these steps after the migration:

1. Activate the security functionality.
2. Configure the required security settings.

Migration of IP access protection lists when activating the security functions

An active IP access protection list is converted to firewall rules when security functions are activated. These rules are visible in advanced firewall mode and can be adjusted there. The advanced firewall mode is activated automatically.

Security online diagnostics of S7 CPs

Security online diagnostics of a CP with security capability is only possible if the online connection is established directly via the CP. If the online connection was established by STEP 7 via the CPU to the station, with the "Connect online" button on the security diagnostics page "Security" > "Status" of the security CP you can establish a direct connection to the CP to run security online diagnostics. As an alternative, you can also terminate the online connection to the CPU and enter the IP address of the CP in the "Station address" input box under the entry "Online access" in online diagnostics.

IKE mode

When negotiating the key in phase 1 the IKE mode "Main" should be preferred. This mode normally provides a reliable procedure compared with the "Aggressive" mode. One reason for using the "Aggressive" setting is when you have VPN groups with different pre-shared keys.

The IKE "Aggressive" mode should not be used in conjunction with certificates. In the IKE "Aggressive" mode, only use pre-shared keys.

A security module must not be used in VPN groups that use different IKE modes.

Downloading configuration data to an S7-300/400 via a VPN tunnel

When you download configuration data via the gigabit interface of a CP x43-1 Advanced to an S7-300/S7-400 station, the path via which the download takes place is stored in the project. If the project is then downloaded via a VPN tunnel established between a SCALANCE S module and the CP x43-1 Advanced, the download fails due to the changed path.

To download via the VPN tunnel, follow the steps below:

1. Using the "Go online" button, connect the engineering station to the gigabit interface of the CP x43-1 Advanced.
2. Disconnect the online connection to the CP x43-1 Advanced.
3. Download the project to the station via the gigabit interface of the CP x43-1 Advanced.

VPN tunnel establishment with 1200/1500 CPs capable of VPN

The establishment of VPN tunnel connections by 1200/1500 CPs capable of VPN with the authentication method "pre-shared key" is only possible if the VPN connection partner is also a 1200/1500 CP capable of VPN. The establishment of VPN tunnel connections by a 1200/1500 CP capable of VPN to all other VPN connection partners is only possible with the "certificate" authentication method.

Security configurations from old projects

Before a security configuration from an older STEP 7 version in STEP 7 V14 can be used, a user with administrator rights needs to log in to this security configuration in STEP 7 V13 SP1 and save the project. After opening the project in STEP 7 V14, a user must log on again to the security configuration with administrator rights. Thereafter, it is possible to use this security configuration in STEP 7 V14.

Copying security modules between STEP 7 instances

Copying security modules between different instances of STEP 7 is not supported.

Device certificates for CP 1543-1 V2.0 and CP 1543SP-1

For CP 1543-1 V2.0 and CP 1543SP-1, only those device certificates that are assigned to the module via the local certificate manager as device certificates are loaded to the module. This assignment takes place in the local security settings of the module in the "Certificate manager" entry via the "Device certificates" table editor. The certificates of the global certificate manager are available for the certificate assignment.

No fallback VPN profiles for CP 1200/1500

Fallback VPN profiles are not supported by the CP 1200/1500. Configured fallback VPN profiles are therefore not loaded on the CP 1200/1500.

Media converters

When you migrate a project, you need to reconfigure the media converters.

3.2.4 Programming a PLC

3.2.4.1 General notes on PLC programming

Contents

Information that could not be included in the online help and important information about product characteristics.

Using the "TDiag_StatusExt" system data type

Alternatively to the "TDiag_Status" system data type, the extended system data type "TDiag_StatusExt" can be used to obtain more detailed information about the cause of a connection break. In particular, the reading out of the structure element "LastConnErrTimeStamp" causes the CPU to switch to "Defect" system state and must not be used currently.

Upgrading know-how-protected blocks

Know-how protected blocks that were set up with a version <V14 can be loaded without entering the password in the controller and can be run after upgrading from V13 SP1 to V14. To edit a know-how protected block in V14, remove the know-how protection and reset it when done. The block can then be renumbered and renamed in the know-how-protected state (S7-1200 / S7-1500).

- For know-how protected blocks that were set up with V13 SP1:
  - To edit a know-how protected block in V14, remove the know-how protection and reset it when done. The block can then be renumbered and renamed in know-how-protected state.
- For know-how protected blocks that were set up PRIOR TO V13 SP1:
  - To edit, remove the know-how protection in V13 SP1 and reset it when done.

Information about network security

For communications access between the TIA Portal and CPU or between HMI (except for HMI access using "GET/PUT communication") and CPU, there are integrated security functions. These provide greater protection from manipulation and higher access protection. To protect against unauthorized network access to a CPU with standardized communications access such as "GET/PUT", "TSEND/TRCV", "Modbus", "FETCH/WRITE", you should also take suitable additional measures (e.g. cell protection concept).

Online/offline differences in the project tree (S7-1200 FW V2.0 and V2.1)

If you use the instruction "WRIT_DBL: Write to data block in the load memory" to change a data block, the resulting difference between online and offline block is initially not displayed correctly by the symbols in the project tree. The difference is only shown when you terminate an online connection and then go back online.

Loading inconsistent programs to a device

In TIA Portal, it is not possible to load inconsistent programs to a device without a consistency check. During the loading process, all blocks of the program are implicitly checked and are compiled again in the event of inconsistencies. If, however, there are programs on your CPU which were loaded with earlier versions of STEP 7, these programs could demonstrate inconsistencies.

In this case, note the following:

If you load an inconsistent program from a device, you will not be able to load the program unchanged to the device afterwards, because a consistency check always takes place during the loading process and existing inconsistencies are corrected.

Changed access rights for displaying the comparison status

Valid for:

- **CPU 1500 < V2.0 (as well as ET200 SP and Software Controller)**
- **CPU 1200 V4.0 and V4.1**

As of TIA Portal V14, the required access rights for displaying the comparison status of blocks have changed for the specified CPUs from the S7-1200/1500 series.

Previously, you only needed the "HMI access" access level for the listed CPUs to display the comparison status. As of V14, you need the "read access" access level to display the comparison status.

This change means that you are prompted to enter the password for "read access" when you go online.

If you only have the password for "HMI access", you can still establish an online connection.

In this case, click "Cancel" in the password prompt for read access and enter the password for "HMI access" in the subsequent dialog. The online connection is then established with the available "HMI access rights", but no comparison status of the blocks is displayed.

Only questions marks are displayed in place of the icons for the comparison status.

Valid for:

- **CPU 1200 <=V3.x.**

As of TIA Portal V14, there is now a password prompt for the above specified CPUs when you go online for displaying the comparison status of blocks, provided that these CPUs are configured with write protection and/or read protection.

If you do not know the password for access to read-protected blocks on a protected CPU, you can still establish an online connection.

In this case, leave the displayed password prompt dialog with "Cancel".

The online connection is still established, but no comparison status of the blocks is displayed.

Only questions marks are displayed in place of the icons for the comparison status.

Data exchange between standard and F-program when using Team Engineering

To ensure data consistency between standard and safety program, you should:

• Not exchange data via bit memory, but rather using global data blocks.

• Limit access between safety programs and standard user programs to two standard data blocks.

You can find information on this in the section 5.13 of the Programming Guidelines under: https://support.industry.siemens.com (https://support.industry.siemens.com/cs/document/81318674/programming-guideline-and-programming-styleguide-for-s7-1200-and-s7-1500?dti=0&lc=en-WW)

Avoid using PLC data types generated by the system in libraries

Some instructions generate their own PLC data types during instancing which are saved in the "PLC data types" project folder. However, you should not use these system-generated PLC data types in any library, because they may be recreated by the system at any time and may result in an unfavorable system behavior.

See also

https://support.industry.siemens.com (https://support.industry.siemens.com/cs/document/81318674/programming-guideline-and-programming-styleguide-for-s7-1200-and-s7-1500?dti=0&lc=en-WW)

3.2.4.2 Instructions

Contents

Information that could not be included in the online help and important information about product characteristics.

Optimizing the run time of instructions such as "Serialize", "Deserialize", "CMP", which can process structures

A series of instructions (e.g. "Serialize: Serialization", "Deserialize: Deserialization", "CMP" (comparator) and "MOVE: Copy value") can process very large, complex structured tags. In doing so, the CPU analyzes the form of the tag structure and executes the corresponding instruction for each substructure contained in the total structure or for all contained elementary components.

With a very complex structure, this structure analysis may lead to an unexpected increase in the run time of the corresponding instruction. In addition to the complexity of structured tags specified in the operation, the total number of anonymous structures declared in the program also has an effect on the run time. A very large number of different anonymous structure definitions can also increase the run time.

Solution:

- Avoid anonymous structures These are structures that are defined directly on the tag with the keyword "Struct" and not through a user-defined data type (UDT).
- Avoid multiple declaration of data structures that are structured very similarly. Try to assemble these into a structure declaration.
- Avoid the declaration of numerous individual tags in structures and data blocks, if they have the same data type and represent an array of the function. In this case, you should use the ARRAY data type if possible.

Instruction "Get_IM_Data: Reading identification and maintenance data"

Currently, the "Get_IM_Data" instruction outputs the error code 16#0000 when a string that is too short is used at the DATA parameter.

The 16#8752 error code would be correct. You can find the corresponding description of the 16#8752 error code in the description of the instruction in the information system.

3.2.4.3 Testing the user program

Testing with the watch table

Contents

Information that could not be included in the online help and important information about product characteristics.

Multiple access to the same CPU

Access to a CPU from a PG/PC is permitted only when a TIA Portal is open. Multiple access to the same CPU is not permitted and can lead to errors.

Loading data blocks during an active control job

Note

Loading changed data blocks during an active control job can result in unforeseen operating states. The control job continues to control the specified address, although the address assignment may have changed in the data block. Complete active control jobs before loading data blocks.

Testing programs converted from older STEP 7 versions

To monitor and test a program converted from an older STEP 7 version, you first need to compile and download the program with the current STEP 7 version.

Changed display formats in the watch table

The number of display formats has been reduced so that display formats that are used but no longer supported are reset to the defaults during a project upgrade.

Example: Pointers can now only be shown in "Pointer" or "Hexadecimal" format.

Testing with the force table

Contents

Information that could not be included in the online help and important information about product characteristics.

Example

If I/O access to the address "IB0:P" takes place in the user program, it is not permitted to force the following I/O address areas: I0.0:P, IB0:P, IW0:P and ID0:P.

Changed display formats in the force table

The number of display formats has been reduced so that display formats that are used but no longer supported are reset to the defaults during a project upgrade.

Example: Pointers can now only be shown in "Pointer" or "Hexadecimal" format.

3.2.4.4 Compatibility of PLC programs from older versions

Compatibility of PLC programs from versions prior to V14.1

Content

Information that could not be included in the online help and important information about product characteristics.

Compatibility

In V14 SP1 you can generally continue to use all programs that were created with older versions of the TIA Portal. However, because improvements were made to the compiler and errors corrected there in V14 SP1, it can occur in rare cases that the program reacts differently after the upgrade or that you have to adjust the program code manually. These cases are described in detail below.

In addition, you have the option of editing the project in compatibility mode. You can find additional information on the compatibility under "Compatibility of projects".

Program loops in SCL

In S7-1200/S7-1500 it is not possible to change the index of a program loop from within the loop with SCL.

The following program example would therefore be invalid:

```
FOR #i := 1 TO 10 DO
#i := #i + 1;
END_FOR;
```

As of TIA Portal V14 SP1, a more exact syntax check is conducted in this regard during compilation and a syntax error is output.

CASE statements in SCL

Labels without associated "GOTO" instruction are no longer permitted in a CASE statement. A syntax error is signaled.

ARRAYs of multi-instances

In some cases ARRAYs of multi-instances could not be correctly be addressed in V14 when individual tags within a multi-instance had the retentivity setting "Set in IDB". This behavior has been corrected in V14 SP1.

If you have used such tags in your program, you may have to recompile the affected block after upgrading.

Parameter type "Block_DB" for entry of the instance DB

In LAD and FBD, you cannot enter the instance DB of an instruction using an input of the data type "BLOCK_DB". This behavior has been made uniform for all CPU families and all block types.

As of TIA Portal V14 SP1, a syntax error is output.

If you have transferred instance DBs in your program with the help of the "Block_DB" data type, you change your program. Instead use a parameter instance to transfer the instance during runtime.

Compatibility of PLC programs from versions prior to V14

Content

Information that could not be included in the online help and important information about product characteristics.

Compatibility

In principle, you can continue to use in V14 all PLC programs that were created with older versions of the TIA Portal. However, because improvements were made to the compiler and errors corrected there in V14, it can occur in rare cases that the program reacts differently after the upgrade or that you have to adjust the program code manually. These cases are described in detail below.

Representation of the BCD format

The representation of the BCD format has changed in regard to the sign from TIA Portal V13 SP1 to TIA Portal V14.

The values in BCD format are show without signs in version V13 SP1.

As of version V14, the values in BCD format are show with sign. This can lead to an altered representation of the values in BCD format.

Integers (decimal system)	Hexadecimal numbers	Representation in V13 SP1	Representation in V14
0	16#0000	BCD#0	BCD#0
-26215	16#9999	BCD#9999	BCD#-999
1365	16#0555	BCD#555	BCD#555
21845	16#5555	BCD#5555	BCD#555
4096	16#1000	BCD#1000	BCD#0
-28672	16#9000	BCD#9000	BCD#0

Instructions "SET_BF: Set bit field" and "RESET_BF: Reset bit field"

The response of the instruction in regard to the structures has changed from TIA Portal V13 SP1 to TIA Portal V14.

In version V13 SP1, the number of bits that set or reset are always indicated at the input. This also applies, for example, if you have specified a structure of data type of the STRUCT or ARRAY PLC data type. If you want, for example, you want set or reset 10 bits and the structure contains only 5 bits, then the following 5 bits within the address sequence is also set or reset.

With structures of the type PLC data type, in version V14 STRUCT or ARRAY the number of bits contained in the structure represents the maximum number of bits that can be reset: If you specify the value "20", for example, and the structure only contains 10 bits, only these 10 bits are set. If you specify the value "5", for example, and the structure contains 10 bits, then exactly 5 bits are set.

Unused bits of PLC data types (UDT) with firmware >= V1.8.1

The unused bits of PLC data types in standard memory areas are occupied or overwritten, for example, for a PLC data type that contains 4 bits.

With firmware versions < V1.8.1, you could not use the unused bits of a PLC data type elsewhere.

With firmware version >= V1.8.1, all bits are occupied or overwritten even if only 4 bits are used.

Note

Address assignments

Ensure you do not assign the same absolute address twice to different symbolic address assignments.

Explicit data type conversion in SCL (S7-1200) with firmware >= V4.2

With firmware versions < V4.2, the string was transferred aligned to the right and filled with leading spaces during explicit data type conversion of SINT/INT/DINT/REAL_TO_STRING/ WSTRING in SCL.

Example: REAL_TO_WSTRING(12) = ' 1.200000E+1'

As of TIA Portal V13, the string is displayed with a leading sign during explicit data type conversion of SINT/INT/DINT/REAL_TO_STRING/WSTRING in SCL and transferred aligned to the left.

Example: REAL_TO_WSTRING(12) = '+1.200000E+1'

SCL: EN/ENO mechanism with block parameters of data type (W)STRING (S7-1200/1500)

As of TIA Portal V14, it is checked whether block parameters of data type (W)STRING are truncated when parameters are transferred during runtime. This can occur if formal and actual parameters have different declared lengths. If the declared length of the target parameter during runtime is insufficient to accept the (W)STRING, the (W)STRING is truncated and the enable output ENO is set to "FALSE".

If you evaluate the enable output ENO in your program, the semantics of your program may change.

Forwarding STRING parameters between optimized blocks and standard blocks (S7-1200/1500)

Prior to TIA Portal V14, no length information about STRINGs was transferred when parameters were transferred between optimized and non-optimized blocks. This meant that access errors not detected by the ENO mechanism could occur during the further processing of the STRING. The enable output ENO remained at TRUE despite an access error.

As of TIA Portal V14, the STRING length information is transferred and access errors are monitored by the ENO mechanism. If you evaluate the enable output ENO in your program, the semantics of your program may change.

Length declaration for constants of the "STRING" data type

Length declarations are no longer permitted for local and global STRING constants. If your program includes length declarations, for example, "MyStringConst [7]", these are automatically removed during the upgrade. This change has no semantic effect on your program, however.

Changing the base data type for HW_ANY from WORD to UINT

The hardware data type "HW_ANY" is used to identify any hardware component, such as a module. In V14, the base data type of "HW_ANY" was changed from WORD to UINT. After the conversion to V14, compiling errors can therefore occur if you have assigned an explicit WORD constant (such as W#16#1) or a tag of data type WORD at a parameter of data type "HW_ANY".

In this case, change the notation of the constant (e.g. to 16#1) or change the data type of the tag to UINT.

Length of block comments

As of TIA Portal V14, the block comments must not exceed a length of 32767 Unicode characters.

Syntax check of the instructions "SR:Set/reset flip-flop" and "RS:Reset/set flip-flop"

Inputs, outputs, bit memories as well as static or local data can be used as operands at the "S" input. Use of constants is not permitted. So far, the use of the constants "0" and "1" was not rejected by the syntax check. The syntax check was improved in TIA Portal V14 so that the use of "0" or "1" is now rejected at the "S" input. You may now receive an error message during the compiling of a program that has been compiled without errors up to this point. Change your program in this case and use a permitted operand.

Any pointer: Access to optimized data

For a CPU of the S7-1500 series, the ANY pointer can also only point to memory areas with "Standard" access mode. Access to optimized data is not permitted with an ANY pointer.

A more detailed syntax check of ANY pointers is performed as of TIA Portal V14. Access to optimized data is now rejected. You may now receive an error message during the compiling of a program that has been compiled without errors up to this point.

"(L)REAL" data type

With 64-bit Windows versions, the LREAL data type is sometimes evaluated differently than with the previous 32-bit versions of Windows. A difference may occur when rounding and (L) real values of constants in the least significant bit.

The potential difference is in the last digit of the mantissa and in most cases therefore only has a slight effect on the accuracy.

If you evaluate the last digit of the mantissa, the semantics of your STEP 7 program may change after the conversion.

"ST" parameter for IEC timers

The "ST" parameter of an IEC timer is used internally and it is prohibited to write it. This why this parameter is no longer visible as of TIA Portal V14. If you have write access in your program to the "ST" parameter, an error message is generated during compiling after the upgrade.

If you exchange data with Inter Project Engineering and you have access to the "ST" parameter with HMI, you must first export the project and then re-import it into the proxy CPU. Only then does the "ST" parameter disappear in the HMI configuration.

Implicit data type conversion for block parameters of the "DB_ANY" data type

When accessing a block parameter of the "DB_ANY" data type with the syntax DB_ANY. %DB(B|W|D), no implicit data type conversion was performed previously. The bit pattern of the source value was simply converted into the target data type. If the target data type was smaller than the source data type, an overflow occurred and the written value may have been wrong or inaccurate. The enable output ENO is not set to "FALSE" when accuracy is lost or runtime errors occur.

As of V14, conversion is performed according to the rules of implicit data type conversion when parameters are passed with the syntax DB_ANY.%DB(B|W|D). Note that after the upgrade a different value may be written and the semantics of your program may change. In addition, the enable output ENO is set to "FALSE" when a runtime error occurs.

Interface of organization blocks with standard access

The interface of organization blocks with standard access must have a minimum size of 20 bytes. In older versions of the TIA Portal, only the interface of OB1 was checked with regard to the minimum size during the compilation run. As of V14, interfaces of all organization blocks are checked. You may now receive an error message during the compiling of a program that has been compiled without errors up to this point.

Compatibility of PLC programs from versions prior to V13.1

Content

Information that could not be included in the online help and important information about product characteristics.

Compatibility

In principle, you can continue to use in V13 SP1 all programs that were created with older versions of the TIA Portal. However, because improvements were made to the compiler and errors corrected there in V13 SP1, it can occur in rare cases that the program reacts differently after the upgrade or that you have to adjust the program code manually. These cases are described in detail below.

Unused bits of PLC data types (UDT) with firmware >= V1.8.1

The unused bits of PLC data types in standard memory areas are occupied or overwritten, for example, for a PLC data type that contains 4 bits.

With firmware versions < V1.8.1, you could not use the unused bits of a PLC data type elsewhere.

With firmware version >= V1.8.1, all bits are occupied or overwritten even if only 4 bits are used.

Note

Address assignments

Ensure you do not assign the same absolute address twice to different symbolic address assignments.

Explicit data type conversion in SCL (S7-1200) with firmware >= V4.2

With firmware versions < V4.2, the string was transferred aligned to the right and filled with leading spaces during explicit data type conversion of SINT/INT/DINT/REAL_TO_STRING/ WSTRING in SCL.

Example: REAL_TO_WSTRING(12) = ' 1.200000E+1'

As of TIA Portal V13, the string is displayed with a leading sign during explicit data type conversion of SINT/INT/DINT/REAL_TO_STRING/WSTRING in SCL and transferred aligned to the left.

Example: REAL_TO_WSTRING(12) = '+1.200000E+1'

Reading an invalid peripheral input

In the TIA Portal as of version 12, the error code 16#2942 for the reading of an invalid peripheral input is only output if you have programmed the faulty access in such a way that this becomes effective, for example %MW10 := “InvalidWordAccess":P, and does not lie within an irrelevant sequence. For example, this would be #tmp := “InvalidWordAccess":P, if the tag #tmp is not used in the rest of the program block.

Instruction "S_CONV: Convert character string"

The EN/ENO mechanism behaves differently in TIA Portal V13 SP1 than in TIA Portal V13.

In version V13, the ENO enable output returns the signal state "0" in case of error, even if you have deactivated the ENO enable output. If you have switched an additional instruction to the EN enable output, this is then not executed.

In version V13 SP1, the ENO enable output returns the signal state "1" in case of error, if you have deactivated the ENO enable output. If you have switched an additional instruction to the EN enable output, this is then executed as expected.

Instruction "MUX: Multiplex" (SCL)

Up to and including TIA Portal V13, the value of the tag at the input parameter was output unchanged as a function value, even if the K parameter had a negative integer. This behavior has changed in TIA Portal V13 SP1.

In TIA Portal V13 SP1, if you use a tag with a valid data type at the input parameters of the MUX instruction and the K parameter is a negative integer, the value of the tag is changed. You can find the valid data types in the description of the MUX instruction in the information system.

Instruction "DEMUX: Demultiplex" (SCL)

Up to and including TIA Portal V13, no value was output at the OUTELSE output parameter if the value of the K parameter was < 0. In contrast, the value of the IN input parameter was output at the OUTELSE output parameter if the value of the K parameter was > available outputs. This behavior has changed in TIA Portal V13 SP1.

In the TIA Portal V13 SP1, if you specify at the K parameter a value that is outside the available outputs (K < 0 or K > available outputs), then the value of the IN input parameter is output at the OUTELSE output parameter.

Instructions "READ_DBL: Read from data block in the load memory" and "WRIT_DBL: Write to data block in the load memory"

TIA Portal V13 SP1 reports a compilation error if you use "READ_DBL" V1.0 or "WRIT_DBL" V1.0 and access a data block with the attribute "Only store in load memory" using the parameter DSTBLK.

Instead, use version 1.2 of both instructions.

"READ_DBL instructions: Read from data block in the load memory" and "WRIT_DBL: Write to data block in the load memory" (SCL)

As of TIA Portal V13 SP1, the "READ_DBL" and "WRIT_DBL" instruction in SCL are subject to the same strict syntax rules as all other programming languages:

In TIA Portal V13, it was possible to specify "standard" data blocks at the SRCBLK and DSTBLK parameters that contained tags with different data types.

As of TIA Portal V13 SP1, the individual tags contained must have the same data type for both "standard" as well as for "optimized" data blocks; otherwise, compiling errors are reported.

Function values (Return)

As of TIA Portal V13 SP1, more stringent syntax rules apply to function call:

It is checked that the function value (Return) is written in any case, even if multiple possible program paths can be run through in the function. Therefore, there is no longer any risk that the function values will accidentally not be written during runtime.

However, you may possibly receive syntax errors in functions during compiling, which it was still possible to compile without errors in V13. In such cases change the program code so that the function valve is written in all possible program paths.

Example:

SCL

```
IF #MyIn1 = #MyIn2 THEN
   #Block_3 := #MyIn1 + 1;
END_IF;
```

In this example, the function value of "Block_3" is not written if the condition of the IF instruction is not fulfilled. The function value then contains an undefined value.

SCL

```
#Block_3 := #MyIn1;
IF #MyIn1 = #MyIn2 THEN
   #Block_3 := #MyIn1 + 1;
END_IF;
```

In this example the function valve of "Block_3" is definitely written in the program, since "MyIn1" is set as default before the IF loop is completed.

Comparing the hardware data types HW_IO and HW_DEVICE

As of TIA Portal V13 SP1, there is a stricter syntax rule that is valid for the comparison of the data types HW_IO and HW_DEVICE:

Up until and including TIA Portal V13 it was possible to compare the data types HW_IO and HW_DEVICE directly with each other.

If you want to compare these data types in TIA Portal V13 SP1 you have to first create a tag of the data type HW_ANY in the section "Temp" for the block interface and then copy the LADDR (from data type HW_DEVICE) to the tag. It is then possible to compare HW_ANY and HW_IO.

EN/ENO mechanism for STRING conversion

Conversion	Description
Strg_TO_Chars: Convert character string to Array of CHAR	The ENO enable output returns the signal state "0" even if you have deactivated the ENO enable output: • For an invalid character at the CHARS parameter • For an invalid ARRAY index at the PCHARS parameter • If the sum of the PCHARS and STRG parameters exceeds the length of the target ARRAY.
Chars_TO_Strg: Convert Array of CHAR to character string	The ENO enable output returns the signal state "0" even if you have deactivated the ENO enable output: • If the sum of the PCHARS and CNT parameters exceeds the length of the source ARRAY.

3.2.5 Inter Project Engineering (IPE)

3.2.5.1 Notes on IPE

Contents

Information that could not be included in the online help and important information about product characteristics.

Using system diagnostics in the device proxy

To use the "system diagnostics" function in an IPE device proxy, for example, a system diagnostics view, insert the PLC alarms as content of a device proxy.

3.2.6 Technological functions

3.2.6.1 Notes on technological functions (S7-1200)

Parameters of the technology objects in TIA Portal Openness

You can find a list of the available technology object parameters in the product information "Parameters of the technology objects in TIA Portal Openness" on the internet (https://support.industry.siemens.com/cs/ww/en/view/109744932).

S7-1200 Motion Control - variable <axis name>.StatusBits.NonPositionControlled

Contrary to the information in the online help, the content of the variable <axis name>.StatusBits.NonPositionControlled has the following significance:

Position control enabled

FALSE = The axis is in position-controlled mode.

TRUE = The axis is in non-position-controlled mode.

S7-1200 Motion Control - Data connection for PROFIdrive drives and PROFIdrive encoders through a data block

Compile the data block for the data connection before you use it in the configuration of the axes. The required offset addresses are calculated this way.

S7-1200 Motion Control - "ReferenceMarkPosition" parameter at MC_Home

The "ReferenceMarkPosition" parameter shows the position at which the technology object was homed (homing mark), valid for "Done" = TRUE.

However, in TIA Portal V14 (S7-1200 Motion Control V6.0), the "ReferenceMarkPosition" parameter shows the position at which the technology object was homed (homing mark), plus the configured home position offset (<TO>.Sensor[n].ActiveHoming.HomePositionOffset).

If you configure a home position offset ≠ 0.0, you cannot use the "ReferenceMarkPosition" parameter of the "MC_Home" Motion Control instruction.

S7-1200 Motion Control – ErrorID 16#8400

ErrorInfo 16#0030 has been supplemented for ErrorID 16#8400:

ErrorID	ErrorInfo	Description	Remedy
16#8400		**Invalid value at parameter "Position" of the Motion Control instruction**	
	16#0002	The value has an invalid number format	Correct the value; restart the command
	16#0005	Value is outside the number range (greater than 1E+12)	
	16#0006	Value is outside the number range (less than -1E+12)	
	16#0030	Value has an incorrect number format or is outside the valid number range	

PtP module with CM 1243-5 PROFIBUS Master

You have to make the following settings in the instance DB of the instructions when using the PtP modules CM PtP RS232 BA, CM PtP RS422/485 BA, CM PtP RS232 HF, CM PtP RS422/485 HF and CM PtP with a CM 1243-5 PROFIBUS Master with firmware ≤ V1.3.4:

- **Send_P2P**
  max_record_len = 240
- **Modbus_Master**
  Send_P2P.max_record_len = 240
- **Modbus_Slave**
  Send_P2P.max_record_len = 240

3.3 WinCC Basic

3.3.1 Security information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under

http://www.siemens.com/industrialsecurity (http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx)

Passwords

Various passwords are set by default in WinCC. For security reasons, you should change these passwords.

- For the user "Administrator", the default password is "administrator".

Communication via Ethernet

In Ethernet-based communication, end users themselves are responsible for the security of their data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to overload of the device.

Network settings

The following tables show the network settings of each product which you need in order to analyze the network security and for the configuration of external firewalls:

WinCC Basic (without simulation)					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
ALM	4410*	TCP	Inbound, Outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
* Default port that can be changed by user configuration					

WinCC Simulation for Basic Panels					
Name	**Port number**	**Transport protocol**	**Direction**	**Function**	**Description**
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
EtherNet/IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

3.3.2 News

News about the TIA Portal

You can learn about the latest news about various topic areas of the TIA Portal in Siemens Industry Online Support.

All news concerning WinCC can be found here: News (http://support.automation.siemens.com/WW/view/en/88360672)

3.3.3 Notes on use

Contents

Information that could not be included in the online help and important information about product features.

Virus scanners during installation

Virus scanners should be disabled during the installation of WinCC.

Change in response after upgrading

The new WinCC version contains new features and improvements as compared to the previous version. The new version may therefore demonstrate slight differences in the names or the response of properties and functions after the upgrade. Unlike in previous versions, the standard properties of newly created objects can also be changed.

These differences in response may lead to errors when compiling the project.

Working with styles

Please note that the system styles are reset to the default style "WinCC Dark" after upgrading the project to V14.

To restore the system style that you had set before upgrading the project, follow these steps:

1. Open the Runtime settings of the HMI device.
2. Select the desired system style under "Style of the HMI device".

Compatibility with WinCC V13

In WinCC V14, it is not possible to save the project in the WinCC V13 format.

Specifying the time of modification in the overview window

The times of modification displayed in the overview window only refer to changes to the object itself. Changes to subordinate objects, e.g. screen objects in a screen, do not cause the time of the last change to the screen to change in the overview window.

Installing East Asian project languages on a PC without Asian operating system

If you select an East Asian project language on a PC that does not have an Asian operating system installed, the default font is marked as invalid in the "Runtime settings > Language & font" editor.

To resolve this problem, open the "Regional and Language Options > Languages" dialog in the Control Panel and enable the "Install files for East Asian languages" option.

PostScript fonts

Only TrueType fonts can be used in the TIA Portal. PostScript fonts are not supported.

3.3.4 Migration

Contents

Information that could not be included in the online help and important information about product features.

Project languages in WinCC

WinCC V14 does not support all project languages that were available in WinCC flexible, such as Arabic. If you receive an empty project as the result of your migration, you may want to check the set editing language. Do not set the project languages that are not supported as editing language in the source project. Proceed as follows:

1. Open the project with WinCC flexible.
2. Change the editing language to English, for example.
3. Save the project.
4. Restart the migration.

Migrating an integrated project with ProTool objects

The "PROTOOL option package(s) missing in STEP 7" error message output during migration of a WinCC flexible project that is integrated in STEP 7 indicates that WinCC flexible 2008 SP3 is installed on your system. Moreover, the project still contains objects that were configured using ProTool. Do not open the project with WinCC flexible 2008 SP3! To migrate the project, proceed as follows:

1. Open the project in the SIMATIC Manager.
2. Execute the "Save as" command in the "File" menu.
3. Enable the option "With reorganization" in the "Save project as" dialog.
4. Click OK.
5. Copy the project back to the original computer.
6. Restart the migration.

Migrating a WinCC V7 project: Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

Migrate the WinCC V7 project to WinCC V14. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

Progress bar

As long as the progress bar still shows a value of 100%, the software is still busy running remaining tasks such as the closing of references. The software will not respond to user input while this status is given.

Supported project languages in WinCC V7

Due to different Windows DotNet versions, there may be different names in WinCC V7 and the TIA Portal within the same language. This may result in different sorting orders in the same project.

The following table shows some examples with English spelling:

WinCC V7.x	TIA Portal
Bengali (Bangladesh)	Bangla (Bangladesh)
Bengali (India)	Bangla (India)
Chinese (Simplified, PRC)	Chinese (People's Republic of China)
Chinese (Simplified, Singapore)	Chinese (Singapore)
Chinese (Traditional, Hong Kong S.A.R)	Chinese (Hong Kong S.A.R)
Chinese (Traditional, Macao S.A.R)	Chinese (Macao S.A.R)
Chinese (Traditional, Taiwan)	Chinese (Taiwan)
French (Monaco)	French (Principality of Monaco)
Oriya (India)	Odia (India)
Sami (Inari, Finland)	Sami, Inari (Finland)
Sami (Skolt, Finland)	Sami, Skolt (Finland)
Sami, Northern (Norway)$Sami	Sami, Northern (Norway)
Spanish (Bolivarian Republic of Venezuela)	Spanish (Venezuela)
Spanish (Spain, Traditional Sort)	Spanish (Spain)
Spanish (Spain, International Sort)	Spanish (Spain)
Yakut (Russia)	Sakha (Russia)

3.3.5 Engineering System

3.3.5.1 Screens and Screen Objects

Contents

Information that could not be included in the online help and important information about product features.

Screen objects after HMI device replacement

If you upgrade a device to the new HMI device versions, you should check the screens contained in the project. Because of the new appearance and improved operability, texts of symbolic I/O fields may not be completely legible and may be concealed by operator controls.

Grouping of screen objects

When you group screen objects in WinCC, performance problems can arise in WinCC in the case of large nesting depths.

ActiveX and .NET controls

ActiveX and .NET controls are always positioned in the foreground in runtime.

The configuration of ActiveX and .NET controls on levels is not supported.

Use of bitmaps as icons

In Windows 8 and Windows 8.1, the use of bitmaps with a size of 48x48 pixels and a color depth of 32 bits as icons is not supported.

Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

You then migrate the WinCC V7 project to WinCC V12. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

Border line of "Graphic I/O field" object

In WinCC V14, the dynamization of the border line of the "Graphic I/O field" object in "Two states" mode has no effect during runtime.

Dynamization of instances of a faceplate type in a group

You are using the instance of a faceplate type in an object group. The properties of the instance are also displayed as properties of the group. Any dynamization with tags, scripts or animations of the group is not displayed in Runtime.

Preview in screen window

You use your own designs with shadows for screen objects. The screen objects can be displayed in a screen window.
The shadows of the screen objects are not displayed in the preview of the screen window. The response occurs only in the engineering system. It is displayed correctly in Runtime.

Many visually different screen objects

The use of screen objects with many visually different properties (e.g. many different styles) can reduce performance in runtime and can increase the amount of available memory space used. Avoid using, for example, very many different corner radii: 0 pixel, 1 pixel, 2 pixels, 3 pixels, etc.

Dynamization of grouped objects (RT Professional)

For groupings with multiple nestings (group in group, faceplate in group, group in faceplate, etc.), only the events of the outermost group and the innermost objects can be used for dynamization with system functions. System functions that are configured at events of the lower-level group or lower-level faceplate are not executed.

The configuration of simultaneous motion animation of an object group within this group can be executed in runtime in a way other that what is expected. Check the sequence of the execution in Runtime and adapt the configuration if necessary.

Number of characters in text fields, lists and alarm texts

The number of characters that can be used in the text of a screen object is not constant. Control instructions and formatting are taken into consideration when entering text data and the maximum number of characters is reduced accordingly.

Transparency in WinCC as of V13

Transparent graphics can be displayed without any problems in Runtime. This is true for all Comfort Panels and WinCC Runtime Advanced as of version 13.0.
To use the transparency in a graphic view or in a graphic I/O field, the "Fill pattern" property must be set to "Transparent" and the property "Use transparent color" must be disabled.

If the property "Use transparent color" is enabled in a device as of version 13.0, the transparency of the graphic is lost and the transparent pixels are displayed in black. We recommend that you check the "Use transparent color" property at the points of use of transparent graphics after upgrading existing projects to device version 13.0 or higher. If the graphics are not displayed correctly, disable this property.

Displaying SIMOTION PLC websites in the HTML browser

If the SIMOTION PLC websites are not displayed correctly in the HTML browser, insert ""/basic"" after the website URL to display the websites in basic mode.

Display differences between the configuration and the display on the HMI device

The display of the text configured in a screen object may be different on the HMI device due to the display configuration. If you are using the options for automatic size adjustment in the configuration, check the display on your HMI device in every language.

If texts that were configured with the "Fit object to contents" option cannot be displayed in full, they are reduced slightly on the HMI device. If this reduction leads to a distorted display of texts, disable the "Fit object to contents" option and expand the text with additional blanks. Optionally, you can increase the width of the object or use a shorter formulation for the text.

Exporting and importing function keys

Function keys are synchronized during the import. If a function key is created in the global screen and the key is empty in the screen, the corresponding function key will use the global definition in all screens.

If you want to disable the global use of function keys after the import, define empty keys in the screens and import the screen types in the following order: Global screen, templates, screens.

If you want to ensure when exporting the screens that the global definition of a function key is not used by the template or by the global screen, create an empty function key in the screen. Select the required function key in the screen, then enable the "Use global assignment" property and disable it again.

Corner radius of the "Symbolic I/O field" object

The "corner radius" property is not available for a symbolic I/O field on Comfort Panels or RT Advanced.

The corner radius that you specify for the "Symbolic I/O field" object in the style editor has no effect in the screen editor for these target systems.

PLC code view

The following data types are not supported by the PLC Code Viewer:

- Date and time: DATE, TOD, LTOD, DT, LDT
- Characters: CHAR, WCHAR, STRING

Complete DTL structures are not supported. Only single elements of DTL structures are supported.

Jump from a monitoring alarm to the PLC code view

For the jump from a monitoring alarm to the PLC code view, the instance name must conform to the following naming convention <FB name>_DB when using supported local operands in a function block.

Note: The jump to a function or an organization block is only possible if only global operands are used.

The following restrictions apply to viewing upstream networks:

- The upstream network must not contain any tags from the Temp or InOut section of an FB.
- The following data types may not be used for tags:
  - STRING
  - WSTRING
  - CHAR
  - WCHAR
  - S5TIME
- No array element may be used with a tag to be used as an index.
- Only bit slicing is supported for slice access.

Special features: Operands and UDTs

Operands that are declared in the "#Temp" or "#InOut" area are generally not supported by the PLC code view. This applies both to elementary data types and to data types that are contained in UDTs.
Data types of a UDT can be declared in the "#In" and "#Out" area and displayed in the PLC code view. The same limitations as for elementary data types apply to the data types of the UDT.

Updating an FUP network in the PLC code view

When an FUP network contains a counter or time instruction that is not interconnected to output Q, the status of the network is not updated in the PLC code view in runtime. To refresh the status of the network in the in PLC code view, interconnect the output to an fill tags yet unused.

Faceplates for Runtime Advanced

When configuring styles at the faceplate type, the "Use style/design" property has to be available in the interface before the "Style item appearance" property is used in the interface of the faceplate. Otherwise, the style at the instance of the faceplate is lost when the configuration is updated.

GRAPH overview for Runtime Professional

When upgrading to V14, the signature of the C function at the "Click" event is changed. The propertyName parameter from the previous versions has been removed. Functions that access this parameter are shown as faulty after the upgrade.

Updating faceplates with the UDTs of the type "IEC timer"

The "ST" element was automatically removed from the user-defined PLC data types (UDT) that use the "IEC timer" data type. Adapt the faceplates containing these UDTs to a new version of the UDT without an ST element.

A detailed description of this can be found in the FAQ with the entry ID "109740393" in the SIMATIC Customer Online Support.

Unsupported PLC data types (UDTs)

The unsupported, user-defined PLC data types (UDTs) cannot be selected as a faceplate property.

Higher-level controls with visibility animation

The higher-level configuration of table-based controls with visibility animation can lead to problems for touch operation with devices using the operating system Windows CE/Embedded Compact.

See also

http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/62101921)

3.3.5.2 Tags and connections

Contents

Information that could not be included in the online help and important information about product features.

Multiplexing tags on a Basic Panel

If you multiplex a tag with an external tag on a Basic Panel, the address is read from the PLC in runtime during the first read cycle. The value of the address read is not available until the second read cycle.

Tag names in faceplates

Use of the "." or "@" character in names of tags in faceplate types is not permitted. Do not use these special characters in the tag names in faceplates.

Tags with symbolic addressing and "Char Array" data type (RT Professional)

Tags with symbolic addressing and the "WString" data type are not released for communication of RT Professional and SIMATIC S7-1200 V3.

Length specification for tags of the "String" type

The length specification for the internal HMI tags of the "String" type have no effect in the "Tag" editor. If you want to limit the tag length of an input field or output field, for example, limit the length using VB scripting or C scripting.

Tag of the “String” type for connections with SIMOTION controllers.

The length of the String tags must not exceed 210 characters for SIMOTION controllers.

It is possible to create a String tab with more than 210 character in the engineering system. However, the tag in question is not written in Runtime. A message stating that the value limit is outside the tag appears.

In this case, adjust the length of the String tag.

Tags under "Tag box ID"

The tag that you configure under "Tag box ID" with "Runtime Settings > General" may only be used in read-only mode.

No values may be written in this tag, however, they may be read in scripts, for example, or output to screens.

Array elements in WinCC

If you have connected an HMI tag with an array from a STEP 7 data block which does not start with a low limit of 0, the array elements are mapped in WinCC to the low limit of 0.

To ensure that you do not have to rethink between the STEP 7 indices and the WinCC indices when accessing the individual array elements, the low limits of arrays should also start at 0 in STEP 7.

Duration of the initialization of historical data

Initialization of the archives on some storage media can take up to 5 minutes. The successful completion of initialization is confirmed by a system message once it has been completed. If there a lack of any storage medium for archiving when Runtime starts, the appearance of the system message can also take up to 5 minutes.

Use of 64-bit data types

The use of 64-bit data types may result in a slight loss of accuracy as these data types are mapped in the HMI channel to the data type Double. It is therefore possible that integer data types are displayed with decimal places.

3.3.5.3 Alarm system and alarm displays

Contents

Information that could not be included in the online help and important information about product properties.

Tags in alarm texts of Runtime Advanced

Tags of data type WChar or WString cannot be displayed in the alarm view in Runtime Advanced.

Boolean tags in alarm logs

Bool type tags are recognized as 0 and -1 in the alarm log. If you use a text list that is controlled by a tag of the type Bool in an alarm log, then add the entry for the value -1 to the corresponding text list.

Duration of the initialization of historical data

Initialization of the archives on some storage media can take up to 5 minutes. The successful completion of initialization is confirmed by a system message once it has been completed. If there a lack of any storage medium for archiving when Runtime starts, the appearance of the system message can also take up to 5 minutes.

PLC alarms

A PLC alarm is only visible in the "Alarm" editor of an HMI device when the FB calls for this alarm have been invoked in an OB.

3.3.5.4 System functions

Content

Information that could not be included in the online help and important information about product properties.

The "SimulateTag" system function on Basic Panels

If you use the system function "SimulateTag" with a short cycle time on a Basic Panel, the HMI device may be overloaded.

3.3.5.5 Recipes

Contents

Information that could not be included in the online help and important information about product features.

Arrays in recipe elements

If you have configured both an array as well as the elements of this array for recipe elements of a recipe, the loading of data records aborts with the following error message: "290055: Import of data records aborted with error"

Use either the array or just the array elements for recipe elements of a single recipe.

Saving recipes on Comfort Panels

Recipes should be preferably saved on the SD card rather than in the built-in flash memory.

3.3.5.6 User administration

Contents

Information that could no longer be included in the online help and important information about product features.

3.3.5.7 Communication

Contents

Information that could not be included in the online help and important information about product features.

Connection interruptions with Mitsubishi PLCs

After multiple connection interruptions, a situation may arise where all the connection resources of the Mitsubishi PLC are in use and the connection can no longer be established. We recommend that you check these connection resources in the PLC program of the controller and enable them again.

Limited number of possible HMI connections

An error message is displayed during compilation of a device indicating that the configuration of the HMI connection in the "Devices & Networks" editor is invalid. The reason may be that the maximum number of possible connections of the HMI device or PLC has been exceeded.

Check the maximum number of available connections. Consult the device manuals of the devices you are using.

Use of PROFINET IO with panel HMI devices

When using PROFINET IO to connect the direct keys and LEDs of HMI devices to the PLC, you can define an offset for the address area of the inputs and outputs during configuration in HW Config.

The following restriction applies when a PROFINET IO-capable S7-400 CPU is used with one of the HMI devices listed below:

The offset for the start of the address area of the inputs must not be greater than the offset for the start of the address area of the outputs.

The restriction applies to the following HMI devices:

- OP 177B
- OP 277
- Mobile Panel 177

To configure the address parameters, open the PLC that contains the CPU of the 400 series in HW Config. Select the HMI device that is connected via PROFINET IO from the station window of HW Config. A table with the properties of the HMI device is displayed at the bottom of the station window in the detail view. Select the line containing the addresses of the HMI device in the table and open the object properties using the shortcut menu.

Enable the "Addresses" tab in the "Object properties" dialog. Configure the offset for the inputs under "Inputs > Start". Configure the offset for the outputs under "Outputs > Start".

Changing IP settings and device name of a PLC in the Control Panel of the HMI device

The Control Panel is open in the "Service and Commissoning > IP-Adaptation" menu on the HMI device. If you want to change the IP settings or the device name of a PLC, note the following:

In the Engineering System, you need to have activated the following options in the Inspector window of the PLC under "Properties > General > PROFINET interface > Ethernet addresses" beforehand:
- "Set IP address using a different method" and
- "Set PROFINET device name using a different method".

HMI connections in WinCC V14

HMI connections to SIMATIC S7-1200 controllers with firmware versions earlier than V2.0 are not possible in WinCC V14.

Connections via PROFIBUS DP

When a connection between a PLC and an HMI device via PROFIBUS DP is interrupted and then re-established, sporadically all other PROFIBUS DP connections in the communication network are interrupted and re-established.

De-energize the disconnected station before reconnecting it.

"Set the IP suite (address) of the PLC in the Control Panel" with SIMATIC S7-1200 V1

The function "Set the IP suite (address) of the PLC in the Control Panel" has not been approved for the following PLCs:

- SIMATIC S7-1200 V1

Switching a connection

A connection may be interrupted when it is switched from an HMI device to a SIMATIC S7-300/400, to a SIMATIC S7-1500 or to a SIMATIC S7-1200 PLC.

Note the following settings in the SIMATIC S7-1500 or SIMATIC S7-1200 controllers:

- Absolute addressing of tags
- The "Disable PUT-GET communication" option must be selected
- The "Complete protection" protection level may not be set

Raw data communication in redundant projects

Simatic.NET, Named Connections and various communication blocks, such as BSEND/BRCV, for example, can only be used to a limited extent in a redundantly configured PC station because the connection parameters for the redundant partner server cannot be configured.

Getting diagnostics data by means of HMI devices

In contrast to the description of diagnostics icons for modules and devices in the information system, the following icon has the meaning specified here for HMI devices:

Icon	Meaning
	No diagnostics data is available.

Enabling/disabling a connection in Runtime (Basic 2nd Generation)

Contrary to the description in the online help, the alarms of the respective controller are displayed after a connection is disabled. The system diagnostics for this controller is also available.

3.3.6 System-wide functions

Contents

Information that could no longer be included in the online help and important information about product features.

Using system diagnostics in the device proxy

To use the system diagnostics function in an IPE device proxy, for example, a system diagnostics view, insert the PLC alarms as content of a device proxy.

Initialize device proxy with data from a V13 project

You cannot initialize a device proxy with data from a V13 project in a project with the version V13 SP1.
Upgrade the V13 source project to version V13 SP1 to initialize the device proxy in the target project with the data from the source project.

Import and export of library texts

The following objects are not supported when importing and exporting library texts:

- Import: Recipes, Recipe elements, Recipe data records, HMI alarms, Text list entries, Screens, Reports.
- Export: Text list entries, Screens, Reports.
- Import and export of library type "Screen".

3.3.7 Compiling and loading

Contents

Information that could no longer be included in the online help and important information about product features.

Compiling and loading

If internal errors or warnings occur during compiling, compile the complete project using the command "Compile > Software (rebuild all)" in the shortcut menu of the HMI device.

Before you start productive operation with your project, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.

If you are using HMI tags that are connected to control tags in your project, compile all modified blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

Incorrect installation of ProSave

If you receive an error message during installation of ProSave when loading data to a target device or maintenance of an HMI device, then you cannot remedy this error using the repair function of setup. Remove ProSave via the Control Panel. Then start setup and install the "ProSave" component again.

Checking the address parameters

During compilation of an HMI device in the project tree with the command "Compile > Software" in the shortcut menu, the address parameters of the HMI device, such as the IP address, will not be checked. If you want to ensure that the address parameters are checked as well, you will have to compile the HMI device using the "Compile" button in the "Devices & Networks" editor of the toolbar.

Error message when downloading data to the PLC

A panel and a PLC are connected and communicating with other.

If a tag is accessed while downloading data from the panel to the PLC, an error message is displayed on the panel.

Delayed reaction in the "Extended download to device" dialog

If the settings in the "Extended download to device" dialog for "Type of the PG/PC interface" and "PG/PC interface" do not match the settings on the HMI device, this can result in the application not responding for up to a minute.

Extended download with an S7-1200 and a Comfort Panel

An S7-1200 PLC and a Comfort Panel are located in the same physical network as the PG/PC. You open the "Extended download to device" dialog for the Comfort Panel.

If you enable the option "Show all accessible devices", it may occur that the application stops responding.

OP77A, OP73, TP177A: Loading projects

When loading a project to an HMI device, it can happen that Runtime is not automatically ended, even though "Remote Transfers" is activated in the Panel.

If this happens, stop Runtime and manually set the transfer mode on the HMI device.

Project transfer via USB

If you have connected more than one HMI device via USB to your configuration PC, project transfer is only possible to the last connected device.

Comfort panels as of device version 13.0: Backing up data while loading projects

If the transfer is interrupted for Comfort Panels with a device version 13.0 or higher, WinCC automatically ensures that no data is lost and that existing data is only deleted on the HMI device after complete transmission.

Loading projects to a file

The "Load project to file" functionality is only available in Runtime Advanced devices with version V13 or older.

Displaying characters in transfer alarms

If characters are not displayed correctly in the transfer alarms during transfers to HMI devices with the device version V12 or older, please check the region and language settings in Windows. Set the corresponding language under "Language for non-Unicode programs".

Missing fonts (panels)

The following fonts no longer belong to the standard installation pack in Windows 10 and are not pre-installed:

- MS PGothic (is used as standard for displaying Japanese characters)
- Gulim (is used as standard for displaying Korean characters)
- MingLiU for Chinese (is used as standard for displaying Chinese characters for Taiwan, Hong Kong and Macao)

If a font is not installed, an error message is displayed in the engineering system. The error message appears in every TIA Portal session if you navigate to “Runtime settings > Language and font” or open screen objects which use the missing font. The missing font is replaced with a suitable font by the TIA Portal.

Missing fonts cause problems during compilation and in Runtime.

For example, if you open an error-free V13 SP1 project that was created on a configuration PC with Windows 7 on a configuration PC of V14 SP1 with the Windows 10 operating system, error messages can be output during compilation because of the fonts that are not installed.

You can find more detailed information on fonts in Windows 10 at https://support.microsoft.com/en-us/kb/3083806 (https://support.microsoft.com/en-us/kb/3083806)

Solution

1. Compile the project before you transfer it to your HMI device. How to determine whether the fonts you require are missing.
2. Install these fonts and/or the corresponding Windows language pack.

Alternatively, you can also compile the projects with substitute fonts.

The missing font is saved in the configuration. As soon as this font is available again, it is displayed and used in the configuration.

Reducing the project size

When compiling your HMI device, a message appears informing you that the size of your project is approaching the system limits for the corresponding HMI device. In this case, perform a complete compilation of the software to reduce the project size. To do this, use the command "Compile > Software (rebuild all)".

http://msdn.microsoft.com/en-us/library/ms968493.aspx (http://support.microsoft.com/default.aspx?scid=kb;EN-US;224305)

3.3.8 Runtime

3.3.8.1 Notes on operation in Runtime

Contents

Information that could not be included in the online help and important information about product features.

Focus in runtime

If you have configured a low-contrast combination of focus color and border color in a V12 project, the focus may no longer be identifiable after changing the HMI device version in Runtime. Change one of the two colors.

Language behavior - Layout of on-screen keyboard

The layout of the on-screen keyboard does not change when you switch to a runtime language that is not installed for the keyboard layout.

In this case, the language setting for the keyboard remains set at the most recent valid language or the language setting for the default keyboard layout of Windows is used.

Tag values exceed the maximum length

You enter a character string in a string tag via an I/O field. If the character string exceeds the configured number of tags, the character string will be shortened to the configured length.

Empty alarm texts

Runtime is running with a project. The project is saved on a network drive.

In the event of interruptions to the network drive connection, Runtime may attempt to load alarm texts from the network drive.

In the event of disconnection, the alarm window or the alarm view remains empty.

To avoid this, copy the project to a local drive before the starting the project in Runtime.

Large logs delay the ending of Runtime (Basic Panels 2nd Generation)

When very large logs are used, ending Runtime can take a long time. Use segmented logs as an alternative to very large circular logs.

Complete download in Service mode

If you need to perform a "complete download" to the OS in Service mode from the engineering station, Runtime automatically stops and then starts again.

The project is then no longer in Service mode.

In this state, the power supply is interrupted and WinCC Runtime no longer starts automatically on the OS.

Remedy:

1. Switch the project manually to Service mode after you have performed the "complete download".
2. Close the project manually.
3. Enable Service mode.
4. Start Runtime again using the surrogate icon in the taskbar.

Slow reaction of SmartServer

The following programs may start and respond very slowly under Windows 7 and Windows 2008 servers:

- HMI TouchInputPC
- SmartServer: <Ctrl+Alt+Del> shortcut in the logon dialog

The delay is caused by the callback for the Internet certificate validation.

Remedy:

You can find the following files
on the product DVD under:
Support\Windows7\CRL_Check or CD_RT\ Support\Windows7\CRL_Check\:

- DisableCRLCheck_LocalSystem.cmd
- DisableCRLCheck_CurrentUser.cmd

1. Run the "DisableCRLCheck_LocalSystem.cmd" file with administrator rights. Select the command "Run as administrator" from the shortcut menu of the file.
2. Reboot the PC.

If the problem persists, follow these steps:

1. Double-click the file and run the "DisableCRLCheck_CurrentUser.cmd" file with user rights.
2. Reboot the PC.

Note

The callback for the certificate validation is disabled for all users or PCs. To restore the original state, perform the following files:

- RestoreDefaults_LocalSystem.cmd
- RestoreDefaults_CurrentUser.cmd

You can find the files in the following directory of the product DVD:

- Support\Windows7\CRL_Check or CD_RT\Support\Windows7\CRL_Check\

Ending screensaver on the Sm@rtServer

When the screensaver is active on the Sm@rtServer on the server HMI device, you require write access to the Sm@rtClient side in order to end the screen server on the server HMI device.

Avoiding corrupt files during power failure

If a power failure occurs in Windows systems while the WinCC system is active, files may be corrupt or destroyed. Operation with the NTFS file system provides better security.

Secure, continuous operation is only ensured by using an uninterruptible power supply (UPS).

3.3.8.2 Notes on operation of panels in Runtime

Contents

Information that could not be included in the online help and important information about product features.

License transfer via S7USB

You always need to run WinCC to transfer a license to a panel via S7USB.

Using the mouse wheel in Runtime

The use of the mouse wheel in Runtime is not supported on all panels.

Basic Panels: Backup on the memory card of the PLC

Create the backup file "A.psb" on the memory card of the PLC. An error, for example a connection break, occurs when creating the backup.
This will create a corrupt file on the memory card of the PLC. Such a file has "~$" as prefix. Delete the file with the prefix "~$" if you want to save a backup again under the same name "A.psb".

Basic Panels: Panel Data Storage and S7-1500F

The "Panel Data Storage" PDS function cannot be used on Basic Panels in conjunction with S7-1500F when the password for the protection level "Full access incl. fail-safe" is used.

"Panel Data Storage" function on Basic Panels

The "Panel Data Storage" (PDS) function provided by Basic Panels is only supported by SIMATIC S7-1200 as of firmware V4.0 and SIMATIC S7-1500. For the PDS function, the panel must be connected directly with the CPU and must not be connected via the CP.

Fonts with file extension ".ttx"

The fonts with the file extension ".ttx" are available on all panels and Runtime Advanced and can be correctly displayed on all devices, for example, the "WinCC_flexible_smart" font.

Mass data transfer with USB

If you have installed Windows 10 on the configuration PC, the "USB" transfer channel is not available.

This restriction applies to the following devices and tools:

- Basic Panels: KP300 Basic, KP400 Basic, TP1500 Basic
- Panels: OP and TP of 70 series, 177 series and 270 series
- Multi Panels: Multi Panels of the170 series, 270 series and 370 series
- Mobile Panels: 170 series and 270 series
- WinCC Engineering System
- "ProSave" service tool

Note

The "USB" transfer channel remains available if Windows 7 or Windows 8 is installed on the configuration PC.

Solution

Use other transfer channels to transfer the project data, such as the "Industrial Ethernet" or "PROFIBUS DP" channel.

3.3.9 HMI devices

3.3.9.1 Notes on HMI devices

Contents

Information that could not be included in the online help and important information about product features.

If the PC goes into standby or hibernate mode while the transfer is in progress, the panel status after interruption of the transfer is not defined.

Multi-key operation

Unintentional actions can be triggered by multi-key operation:

- When you are using a key device, you cannot press more than two function keys at the same time.
- When you are using a touch device, a standard PC or a panel PC, you can only press one function key or button at the same time.

HMI devices with high communication load

S7 Diagnostics should be enabled if a Panel is assigned many connections to PLCs or other HMI devices. Otherwise, you will risk overload on the Panel.

TS Adapter with Ethernet interface

If an HMI device is connected via Ethernet and a TS adapter, it can not be reset to factory settings.

Simulation with real PLC connection

The access point used by the simulation is independent from the settings of the engineering system and can only be altered in the Control Panel with the "Setting PG/PC Interface" tool. If the PLC connection is terminated right after the start of the simulation with alarm 140001, you should check the access point used by the simulation with "Setting PG/PC Interface".

1. Double-click "Setting PG/PC Interface" in the Control Panel. A dialog opens.
2. Select "S7ONLINE" in the "Access point of application" field as standard for HMI.
3. Select the interface in the "Interface Parameter Assignment Used" area.
4. Exit the dialog "Setting PG/PC Interface" with OK

Simulation of the Basic Panels

Use an output field in an alarm text to output an external tag. The content of the output field will always be displayed with "0" during simulation.

Upgrading Basic Panels to device version V12

Before you upgrade Basic Panels from device version V11 to device version V12, transfer the image of the V11 SP2 Update 5 or higher to the devices.
In the "SIMATIC ProSave [OS Update]" dialog, select the setting "Reset to factory settings".

In this way, you always start a functional update of the image.

Affected devices:

- KP300 Basic mono PN
- KP400 Basic color PN
- KTP400 Basic color PN

Basic Panels 2nd Generation

Basic Panels 2nd Generation support the Sm@rtServer option.

If you are not using a USB hub, select the USB port USB_X60.1 as storage path.

HMI devices with operating system Windows CE 5.0 or higher

Owing to a modified client-server communication security setting, the time difference between the HMI device (client) and PC (server) must not exceed 1 day. If you back up recipe data from the HMI device on a network drive, for example, make sure that the time is set correctly on the PC (server) and the HMI device (client).

Floating point numbers on MP 277, MP 377, TP 177B 4" and CP4

Only floating point numbers in the range from 10^{-293} ... 10^{+307} are displayed correctly on the HMI devices MP 277, MP 377, TP 177B 4" and CP4. If the tag value is outside this range, it is displayed as 0.

Restrictions for the HMI device, MP 377 15" Touch daylight readable

The following functions are not supported in WinCC V12 for the MP 377 15" Touch daylight readable HMI device:

- Option: Sm@rtServer
- System function: SetAndGetBrightness
- Direct keys

Connection switch in the Control Panel with Basic Panels

If you use the "Override protected connection information" function, the following restriction applies:

You cannot perform a connection switch in the Control Panel of a Basic Panel from a PLC without a protection level to a PLC with a "Complete protection" level.

Mobile Panel

Communication between fail-safe Mobile Panel and a S7-1200F is not possible with V14.0 and will not be enabled until a later update.

Mobile Panels 277F IWLAN

Mobile Panels 277F IWLAN are approved for use with CPUs of the type S7-1500F with WinCC V13 SP1 Update 4.

If this connection is not established automatically after the panel is switched on or after a fail-safe connection to a CPU S7-1500F is interrupted, a STOP/RUN transition needs to be performed on the CPU.

Affected MLFBs:

- 6AV6645-0EB01-0AX1
- 6AV6645-0EC01-0AX1
- 6AV6645-0EF01-0AX1
- 6AV6645-0GB01-0AX1
- 6AV6645-0GC01-0AX1
- 6AV6645-0GF01-0AX1

Using Mobile Panel 277F IWLAN in the industrial environment

To avoid communication problems between the HMI device and access point, observe the following:

IWLAN planning: Wireless connection between the HMI device and access point

- Wireless field planning needs to be carried out. Radar influences need to be taken into consideration for channels requiring Dynamic Frequency Selection (DFS).
- Avoid radio frequency interference from other devices, such as hand-held devices with Bluetooth or WLAN functionality.
- For adjacent access points, use data channels that are separated by at least one wireless channel (e.g. 36 and 44 rather than 36 and 40).
- Do not place several access points in the immediately vicinity of one another. We recommend a minimum distance of 5 m.
- For the Mobile Panel 277F IWLAN, use the "Software retry number" 15 instead of the default value 3.

Using the "Rapid roaming" function with iPCF-MC

- Always use iPCF or iPCF-MC (rapid roaming) for PROFIsafe communication.
- Use the same SSID for all access points.
- The "Background scan" should be switched off on the HMI device ("Background scan interval" for the HMI device = 1 (default value)).
- Use the same "Management channel" and different, non-overlapping "Data channels" for all access points.
- Configure the "PN-IO cycle time" higher than the "iPCF scan cycle time".
- Observe the configured timeout when assigning PROFIsafe parameters.

"Zone ID/Connection point ID" tag of a Mobile Panel 277 IWLAN V2

The tag used for the "Zone ID/Connection point ID" must be of data type INT for Mobile Panel 277 IWLAN V2 devices. Adapt this data type if necessary when migrating a project.

Mobile Panels 277F IWLAN (RFID tag): F_DB_STATES

The F_DB_STATES block is no longer supplied with WinCC V14. The block F_DB_STATES serves only for data exchange. You can configure a block to replicate the function of the F_DB_STATES, however. Note the description of the F_DB_STATES in the operating instructions of your HMI device or in the information system.

IPC427D

If an IPC427D is configured in a V12 or V13 project in which IE1 of the PC station is assigned and the device version of the PC station changes from V1 to V2 after upgrading to V14, the interface assignment of CP_IE_1 must initially be set to "None, or different Windows settings" and then changed to "SIMATIC PC Station" before compiling the project . Then, the project can be compiled without errors.

Sm@rtServer with KTP Mobile Panels

The evaluation of the safety operation via PROFIsafe is only guaranteed if the Sm@rtServer is disabled on the panel.

The use of Sm@rtServer on devices without a safety function is not recommended.

Printing alarms (Mobile Panels 2nd Generation)

It is not possible to print alarms as PDF or HTML when the internal memory "/flash" is selected as "Storage Location". To print alarms as PDF or HTML, select an SD memory card or a USB stick as storage location.

System functions in the zone editor on KTP Mobile Panels

In contrast to what is described in the help, the logon and logoff of the current user cannot be initiated by system functions. Use the ShowLogonDialog system function to log users onto the HMI device via the logon dialog.

For KTP700F Mobile and KTP900F Mobile, system functions that are configured to the "Connected" event are duplicated.

DHCP on KTP 400 PN, KTP 700 PN and KTP 900 PN

Operation with DHCP is not recommended for the KTP 400 PN, KTP 700 PN and KTP 900 PN devices.

In some circumstances, it is possible that the device will no longer boot. If that is the case, detach the network cable and reboot the device. After it has successfully started up, please assign a fixed IP address.

Installation 4

4.1 Notes on the installation

Contents

Information that could not be included in the online help and important information about product characteristics.

Installation in a virtual environment (private cloud)

You can find instructions on how to install the TIA Portal in a virtual environment (private cloud) on the installation data medium in the directory "Documents\Readme\<language directory>". You can open the PDF document "TIAPortalCloudConnectorHowTo<language ID>.pdf" here.

Automated Installation

A description of automated installation is available on the product DVD in the directory "Documents\Readme\<Language directory>".

Use of the same versions of TIA Portal products during installation

When installing different TIA Portal products, make sure that you use the same versions of service packs and updates for the installation. For example, if you have installed SP1 for STEP 7 V13, you must also install SP1 for WinCC V13. The service packs and updates must be installed for all products at the same time. Do not start the TIA Portal until all products have been upgraded.

You can download the service packs from the Internet under Siemens Industry online support (https://support.industry.siemens.com/cs/de/en/).

Target directory of the installation

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

Use of antivirus programs

During the installation, read and write access to already installed files is necessary. Some antivirus programs block this access. We therefore recommend that you disable antivirus programs during installation of the TIA Portal and enable them again afterwards.

Compatibility with V12 SP1 and V13

Empty projects from previous versions are installed in the installation directory under .. \<INSTALLDIR>\Sample Projects to allow the current TIA Portal to be opened in compatibility mode. These projects must be copied to a local directory with full access before they can be used. For more information on this, refer to FAQ ID 82169157.

FAQs on the TIA Portal

FAQs on the TIA Portal are available under FAQs (http://support.automation.siemens.com/WW/view/en/28919804/133000).

4.2 System requirements for installation

4.2.1 Notes on licenses

Availability of licenses

The licenses for the products of the TIA Portal are usually supplied on an installation data medium and transferred automatically by the Automation Licence Manager during the installation process of the TIA Portal.

Before you uninstall the TIA Portal, you must transfer and back up the licenses still required. Use the Automation License Manager for this purpose.

Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you uninstall the TIA Portal, the Automation License Manager remains installed on your system.

Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA Portal, register the need for license keys automatically with the Automation License Manager . If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

Note

For additional information on how to manage your licenses with the Automation License Manager , refer to the documentation supplied with the Automation License Manager .

Displaying the installed software (Page 148)

Modifying or updating installed products (Page 149)

Repairing installed products (Page 151)

Starting to uninstall (Page 153)

Installation log (Page 145)

4.2.2 Notes on the system requirements

System requirements for individual products

The system requirements may differ depending on the products you want to install. You should therefore check the individual system requirements of your products.

If you want to install several products, make sure that your system meets the demands of the product with the highest requirements.

Displaying PDF files

To be able to read the supplied PDF files, you require a PDF reader that is compatible with PDF 1.7 e.g. Adobe (R) Reader version 9.

Displaying the Welcome Tour

You need the Adobe (R) Flash Player Version 9 or higher to start the Welcome Tour for the TIA Portal.

4.2.3 System requirements STEP 7 Basic

4.2.3.1 Licensing of STEP 7

Introduction

You require a License Key to license the following STEP 7 editions:

- STEP 7 Basic
- STEP 7 Professional

You can install the corresponding License Key when you are installing STEP 7 or transfer it using the Automation License Manager after the installation has been completed.

Licenses for STEP 7

The following licenses with the corresponding license keys are available:

- STEP 7 Basic
- STEP 7 Professional
- STEP 7 Professional Combo

Validity of license keys for older versions of STEP 7

With a valid License Key for V14.x of STEP 7 Professional and STEP 7 Professional Combo, you can also operate older versions of STEP 7 without restrictions. The following table provides more detailed information about this:

Edition	License	Valid for
STEP 7 Basic V14.x	STEP 7 Basic	• STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5
STEP 7 Professional V14.x	STEP 7 Professional	• STEP 7 Professional V14.x • STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5
STEP 7 Professional V14.x	STEP 7 Professional Combo	• STEP 7 Professional V14.x • STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 Basic V10.5 • STEP 7 V5.5 • STEP 7 V5.4 • STEP 7 Professional 2010 • STEP 7 Professional 2006

Starting without a valid license key

If you start an edition of STEP 7 without a valid License Key , the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a Trial License. However, this license is valid for a limited period only and expires after 21 days.

When the Trial License expires, the following scenarios can occur:

- STEP 7 has never been licensed on the PC in question:
  - Operations requiring a license can no longer be performed in STEP 7.
- STEP 7 was already licensed on the PC in question:
  - A window requiring acknowledgment presents an alert for non-licensed mode every 10 minutes and for every action requiring a license.

License requirements for simulation

You do not require additional licenses when you use the menu command "Online > Simulation" to start the simulation in STEP 7.

If the following conditions are met, the appropriate licenses for the edition of STEP 7 you have installed are also required for the simulation.

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

Licenses for the TIA Portal Cloud Connector

For working with the TIA Portal Cloud Connector, you need a valid License Key for each device that you specify as "User device" in the TIA Portal Cloud Connector. The License Key is also required if the TIA Portal is installed on this device. A License Key is not required for devices that you are using as "remote device".

See also

Handling licenses and license keys (Page 129)

4.2.3.2 Handling licenses and license keys

Introduction

In each case, you require a valid License Key to use STEP 7 Basic and STEP 7 Professional.

Installing license keys

When you install STEP 7 Basic, the License Key is installed automatically during setup. When you install STEP 7 Professional you will be prompted at the end of the setup to transfer the license from the supplied storage medium to your PC.

If you want to install additional License Keys, you have to use the Automation License Manager to do this.

When you install a license, the associated license key is removed from the license key storage location.

NOTICE
Destruction of license keys by copying It is not possible to copy a License Key. The copy protection prevents the license keys from being copied. If you attempt to copy a License Key this will be destroyed.

Uninstalling license keys

License keys are always uninstalled using the Automation License Manager. You uninstall a License Key in the following cases:

- When backing up data.
- If you no longer require the license.

You can then use a valid license on another PC or HMI device.

Data backup

When backing up data on the HMI device or creating a backup during device replacement, remove the License Keys on the HMI device. To do this, open the Automation License Manager and back up the uninstalled license key to another storage location.

NOTICE
Destruction of license keys on PCs Start by removing all license keys in the following situations: • Before you format the hard disk. • Before you compress the hard disk. • Before you restore the hard disk. • Before you start an optimization program that moves fixed blocks. • Before you install a new operating system. Read the description of Automation License Manager ("Start > Siemens Automation > Documentation"). Observe all warnings and notices.

On PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used, the license key storage location may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. Save all license keys of an HMI device to the same storage location.

NOTICE
Always keep the original storage location of the license keys.

Invalid license after time zone change

The installed license no longer functions in the following case.

- If you change the time zone on a PC as follows:
  From a time based on a complete hour to a time not based on a complete hour.
  Example: You change the time zone from GMT +3:00 to GMT +3:30.

To avoid this inconvenience, uninstall the license key using the Automation License Manager under the time zone setting that was set when the license key was installed.

This behavior does not apply to the Trial License.

Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage location.
- If the license key disappears during its transfer to the destination drive.

You can use the Automation License Manager to repair the defective license. To do this, use the "Restore" function or the "Restore wizard" of the Automation License Manager. To perform this restore operation you must contact Customer Support.

You can find more detailed information on the Internet: http://support.automation.siemens.com (http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002)

Licensing of STEP 7 (Page 127)

4.2.3.3 Software and hardware requirements STEP 7

System requirements for installation

The following table shows the minimum software and hardware requirements that have to be met for installation of the "SIMATIC STEP 7 Basic" software package:

Hardware/software	Requirement
Processor	Intel® Core™ i3-6100U, 2.30 GHz
RAM	4 GB
Hard disk	S-ATA with at least 8 GB available memory space **
Network	From 100 Mbit

Hardware/software	Requirement
Screen resolution	1024 x 768
Operating systems *	**Windows 7 (64-bit)** • Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 8.1 (64-bit)** • Windows 8.1 • Windows 8.1 Professional • Windows 8.1 Enterprise **Windows 10 (64-bit)** • Windows 10 Home Version 1607 • Windows 10 Professional Version 1607 • Windows 10 Enterprise Version 1607 • Windows 10 Enterprise 2016 LTSB • Windows 10 Enterprise 2015 LTSB **Windows Server (64-bit)** • Windows Server 2012 R2 StdE (full installation) • Windows Server 2016 Standard (full installation)

* Including all security updates up to Microsoft Security Bulletin Summary for February (MS17-Feb). For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft Web site.

** For operation of SIMATIC STEP 7 Basic we recommend free storage space of at least 20 GB

Recommended PC hardware

The following table shows the recommended software and hardware for the operation of STEP 7 Basic.

Hardware/software	Requirement
Computer	SIMATIC FIELD PG M5 Advanced or higher (or comparable PC)
Processor	Intel® Core™ i5-6440EQ (up to 3.4 GHz)
RAM	16 GB or more (32 GB for large projects)
Hard disk	SSD with at least 50 GB available memory space
Network	1 Gbit (for multiuser)
Monitor	15.6" Full HD Display (1920 x 1080)

Supported virtualization platforms

You can install the "SIMATIC STEP 7 Basic" software package on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 6.0
- VMware Workstation 12.5
- VMware Player 12.5
- Microsoft Hyper-V Server 2016

The following operating systems are recommended as host operating systems for these virtualization platforms:

Operating system	VMware vSphere Hypervisor (ESXi)	VMware Workstation	VMware Player	Microsoft Hyper-V
Windows Server 2016 Standard (full installation, 64-bit)	-	-	-	x
Windows 7 Professional SP1	x	x	x	-
Windows 7 Enterprise SP1	x	x	x	-
Windows 7 Ultimate SP1	x	x	x	-
Windows 10 Professional Version 1607	x	x	x	-
Windows 10 Enterprise Version 1607	x	x	x	-
Windows 10 Enterprise 2016 LTSB	x	x	x	-

x: Can be used as host operating system

-: Cannot be used as the host operating system

The following guest operating systems are recommended for installing "SIMATIC STEP 7 Basic" within the selected virtualization platform:

Operating system	VMware vSphere Hypervisor (ESXi)	VMware Workstation	VMware Player	Microsoft Hyper-V
Windows Server 2008 R2 StdE SP1 (full installation, 64-bit)	-	-	-	x
Windows Server 2012 R2 StdE (full installation, 64-bit)	-	-	-	x
Windows Server 2016 Standard (full installation, 64-bit)	-	-	-	x
Windows 7 Professional SP1	x	x	x	x
Windows 7 Enterprise SP1	x	x	x	x
Windows 7 Ultimate SP1	x	x	x	x
Windows 10 Professional Version 1607	x	x	x	x

Operating system	VMware vSphere Hypervisor (ESXi)	VMware Workstation	VMware Player	Microsoft Hyper-V
Windows 10 Enterprise Version 1607	x	x	x	x
Windows 10 Enterprise 2016 LTSB	x	x	x	x

x: Can be used as guest operating system

-: Cannot be used as the guest operating system

Note

- The same hardware requirements apply to the host operating system as for the respective TIA products.
- The plant operator must ensure that sufficient system resources are available for the host operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.
- When you use Microsoft Hyper-V, accessible stations cannot be displayed.

Supported security programs

The following security programs are compatible with "SIMATIC STEP 7 Basic":

- Antivirus programs:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 11.0
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2016
  - Windows Defender (as of Windows 8.1)
  - Qihoo "360 Total Security Essential" 9.7

  The last update of the virus pattern was on 08 MAR 2017.
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.2.0

4.2.4 System requirement for WinCC Basic

4.2.4.1 Software and hardware requirements

Introduction

Specific requirements for the operating system and software configuration must be met for the installation.

Note

WinCC is generally authorized for use in a domain or workgroup.

However, be aware that domain group policies and restrictions of the domain may hinder the installation. If this happens, remove the computer from the domain prior to installing Microsoft Message Queuing, Microsoft SQL Server and WinCC. Log onto the computer in question locally with administrative rights. Then perform the installation. After successful installation, you can enter the WinCC computer back into the domain. If the domain group policies and restrictions of the domain do not impede the installation, the computer need not be removed from the domain during the installation.

Be aware that domain group policies and restrictions of the domain may also hinder operation. If you cannot avoid these restrictions, run the WinCC computer in a workgroup.

Consult with the domain administrator if needed.

Installation requirements

The following table shows the minimum software and hardware requirements that have to be met for the installation of the "SIMATIC WinCC Basic" software package:

Hardware/software	Requirements
Processor type	Intel® Core™ i3-6100U 2.30 GHz
RAM	4 GB
Free hard disk space	S-ATA with at least 8 GB available memory **

Hardware/software	Requirements
Operating systems *	**Windows 7 (64-bit)** • Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 **Windows 8.1 (64-bit)** • Windows 8.1 • Windows 8.1 Professional • Windows 8.1 Enterprise **Windows 10 (64-bit)** • Windows 10 Home Version 1607 • Windows 10 Professional Version 1607 • Windows 10 Enterprise Version 1607 • Windows 10 Enterprise 2016 LTSB • Windows 10 Enterprise 2015 LTSB **Windows Server (64-bit)** • Windows Server 2012 R2 StdE (full installation) • Windows Server 2016 Standard (full installation)
Screen resolution	1024 x 768
Network	From 100 Mb
Optical drive	DVD-ROM
Software	Microsoft .Net Framework 4.6.2

* Including all security updates up to Microsoft Security Bulletin Summary for February (MS17-Feb). For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft Web site.

** For operation of SIMATIC WinCC Basic, we recommend free storage space of at least 20 GB.

Simultaneously opening multiple instances of WinCC on a configuration PC can also increase the hardware capacity required.

Note

"Aero Glass Style" of Microsoft Windows 7

A powerful graphics card is required for "Aero Glass Style". It requires DirectX9 capabilities and 128 MB of dedicated graphics memory.

The performance of the architecture of the graphics system can significantly influence the performance of WinCC.

Recommended hardware

The following table shows the recommended hardware for the operation of SIMATIC WinCC.

Hardware	Requirements
Computer	As of SIMATIC FIELD PG M5 Advanced (or comparable PC)
Processor	As of Intel® Core™ i5-6440EQ (up to 3.4 GHz)
RAM	16 GB or more (32 GB for larger projects)
Hard disk	SSD with at least 50 GB available memory space
Monitor	15.6" Full HD Display (1920 x 1080)
Network	From 1 GB
Optical drive	DL MULTISTANDARD DVD RW

Supported virtualization platforms

You can install the "SIMATIC WinCC Basic" software package on a virtual machine. For this purpose, use one of the following virtualization platforms:

- VMware vSphere Hypervisor (ESXi) 6.0
- VMware Workstation 12.5
- VMware Player 12.5
- Microsoft Windows Hyper-V Server 2016

All released operating systems can be used as host operating systems on a virtualization platform.

Note

- The same hardware requirements apply to the guest operating system as to the respective TIA products.
- The plant operator must provide sufficient system resources for the guest operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.

Supported security programs

The following security programs are compatible with "SIMATIC WinCC Basic":

- Virus scanners:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 11.0
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2016
  - Windows Defender (as of Windows 8.1)
  - Qihoo "360 Total Security Essential" 9.7

  The last update of the virus patterns will be performed 08/03/2017.
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.2.0

Installing Microsoft .Net Framework

You will be prompted to install the required .Net Framework version if this cannot be performed by the WinCC installation. A restart may be necessary after installation of .Net Framework.

Security settings during installation

When you install WinCC V14 SP1, security settings are changed in your operating system.

The security settings in question are listed during the installation.

You must confirm the changes to the security settings.

If you make changes to your operating system after the installation, the changes to the security settings made by the installation of the TIA Portal could be changed.

You can restore the changes to the security settings made by the installation of the TIA Portal: "Start > All Programs > Siemens Automation > Security Controller > Restore settings".

SQL instance of WinCC V14 SP1

A new WinCC SQL 2014 instance is installed with the installation of WinCC V14 SP1. If you already had a WinCC version installed, you must uninstall the WinCC instance of older SQL servers before the installation.

See also

Licensing of WinCC Engineering System (Page 139)

http://support.microsoft.com/kb/917607 (http://support.microsoft.com/kb/917607)

4.2.4.2 Parallel installation

Parallel installations in TIA Portal V14

You will be prevented from starting the TIA Portal if you perform a non-permitted parallel installation of STEP 7 and WinCC. The following parallel installations are permitted in the TIA Portal:

- STEP 7 V14 and WinCC V14

A dialog opens during installation to inform you of any inconsistencies in your parallel installation. The following parallel installations are permitted:

- WinCC V14 and RT Advanced V14
- WinCC V14 and RT Professional V14

The engineering system and Runtime must always be of the same version after an installation.

Parallel installation of WinCC V14 and other SIMATIC HMI products

Parallel installation of WinCC V14 and versions of WinCC flexible earlier than WinCC flexible 2008 SP1 is not allowed.

Parallel installation of WinCC V14 with versions of WinCC earlier than WinCC V7.0 SP2 is not allowed. Parallel installation of WinCC V14 with WinCC V7.0 SP2 or WinCC V7.0 SP3 is not allowed for:

- WinCC V 14 Professional
- WinCC V 14 Runtime Professional

Parallel use

If the term "Combo" appears in the name or license key of the software after installation, the use of the following products/versions is permitted in accordance with paragraph 4.3 of the General Terms and Conditions (see also setup text):

- With the license "WinCC V14 Comfort Combo": WinCC flexible 2008 Standard
- With the license "WinCC V14 Advanced Combo": WinCC flexible 2008 Advanced

4.2.4.3 Licenses and Powerpacks

Licensing of WinCC Engineering System

You require a license key for the following:

- WinCC Engineering System, for example, WinCC Professional
- Add-ons for WinCC Engineering System

You can install the license key during the installation of WinCC. You transfer licenses for the WinCC add-ons after installation with the Automation License Manager.

Starting without a valid license key

If you start WinCC without a valid license, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license for Engineering editions WinCC Basic, Comfort/Advanced, and Professional expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.
  - Operations requiring a license can no longer be performed in WinCC.
- WinCC was already licensed on the PC in question.
  - Non-licensed mode is indicated every 10 minutes and at every action requiring a license by a window, which you must acknowledge.

License requirements for simulation

When you want to start simulation in WinCC using the "Online > Simulation> With tag simulator" menu command, you do not need licenses for WinCC Runtime or for add-ons that require a license.

If the following conditions are met, you will need the appropriate licenses for WinCC Runtime and add-ons that require a license even for simulation:

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

You start the simulation with the "Online > Simulation > Start" menu command.

Validity of license keys for older versions of WinCC

With a valid license key for WinCC Basic V14.x, you can also operate older versions of WinCC without restrictions:

Edition	License	Validity
WinCC Basic V14.x	WinCC Basic	• WinCC Basic V11.0 SP2 • WinCC Basic V12.0 • WinCC Basic V13.0 • WinCC Basic V14.0

See also

Software and hardware requirements (Page 135)

Licensing of HMI devices (Page 140)

Working with license keys (Page 141)

Licensing of HMI devices

Non-PC-based HMI devices are always equipped with "Runtime licenses". A license key is not required for runtime operation.

A license may be required for an add-on for non-PC-based HMI devices. The license key of the respective license always activates one add-on for use.

License key

In order to license non-PC-based HMI devices with license keys, the "SIMATIC HMI License Manager Panel Plugin" add-on is needed.

WinCC Setup installs this add-on by default. You open the License Manager Panel Plugin in the Automation License Manager with the "Edit > Connect Target System > Connect HMI Device" menu command.

If WinCC is not installed, an installation of ProSave 7.2 or higher is required.

Note

Further information on license handling can be found in the Automation License Manager help.

Note

Verify that the current version of the operating system (or higher) is installed on the HMI device before you start licensing. If necessary, update the operating system using ProSave.

Non-licensed mode

Runtime add-ons can be used for a short time without restrictions without a valid license. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

See also

Licensing of WinCC Engineering System (Page 139)

Working with license keys

Introduction

You transfer a license key to the HMI device in the following cases:

- To use the WinCC engineering system
- To operate WinCC Runtime
- To use add-ons for WinCC Runtime on PC-based HMI devices
- To use add-ons on non-PC-based HMI devices

You transfer a license key from the HMI device in the following cases:

- When backing up data
- If you no longer require the license

You can then use this license on another PC or HMI device.

When you transfer a license to an HMI device, the associated license key is removed from the license key storage location.

Note

A license key cannot be copied. The copy protection employed prevents the license keys from being copied.

Data backup

You transfer the license keys from the HMI device for data backup on the HMI device or as a backup for device replacement.

You use the Automation License Manager to back up license keys from an HMI device to the storage area of the license keys.

NOTICE

Destruction of license keys on non-PC-based HMI devices

License keys transferred as a result of backup/restore operations are destroyed in the case of the following HMI devices.

- 270 series
- 370 series

Carry out the following before beginning restoring:

- Use the Automation License Manager and ProSave to check whether license keys are on the HMI device.
- Transfer the license keys present on the HMI device to a storage location.
  After restoring has been carried out, transfer the license keys back to the HMI device.

NOTICE

Destruction of license keys on PCs

Transfer all license keys to a storage location in the following cases:

- Before you format the hard disk
- Before you compress the hard disk
- Before you restore the hard disk
- Starting an optimization program that moves fixed blocks
- Installing a new operating system

Read the description of Automation License Manager ("Start > Simatic Automation > Documentation"). Observe all warnings and notices.

The license key storage location on PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used may contain multiple license keys. This capability

means you can store multiple licenses of the same type at one location. For the backup, use a single storage location for all license keys present on an HMI device.

Note

Always keep the original storage location of the license keys.

Invalid license after time zone change

The transferred license no longer functions in the following case.

- If you change the time zone on a WinCC PC as follows:
  - From a time based on a complete hour to a time not based on a complete hour. Example: You change the time zone from GMT +3:00 to GMT +3:30.

To work around this, transfer the license key from the HMI device with a time zone setting that was set when the license key was transferred to the HMI device.

Example:

You transferred the license key to the HMI device with a time zone setting based on a full hour. Then, also transfer the license key from the HMI device with a time zone setting based on a full hour.

This behavior does not apply to the trial license.

Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage area.
- If the license key disappears during its transfer to the destination drive.

Note

Resetting of the system date to an earlier time causes all licenses to be become defective.

You can use the Automation License Manager to repair the defective license. Use the "Restore" function or the "Restore Wizard" of the Automation License Manager for this purpose. You must contact Customer Support in order to restore the license. For additional information see: http://support.automation.siemens.com (http://support.automation.siemens.com)

Note

The Runtime software can also be operated without errors if the license is missing or defective. The system alerts you at brief intervals that you are working in non-licensed mode.

Note

If you start the WinCC Engineering System without a valid license key, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.
  WinCC can no longer be started.
- WinCC was already licensed on the PC in question.
  WinCC can be started. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

Licensing of WinCC Engineering System (Page 139)

4.3 Installation log

Function of the installation log

The progress during the following installation processes is logged in a file:

- Installing products
- Modifying or updating already installed products
- Repairing an existing installation
- Uninstalling products

If errors occur during the installation process or warnings are issued, these can be evaluated with the help of the log file. You can do this yourself or contact product support.

Installation logs storage location

The log file is the most recent file with the file extension ".log" and the name of which that starts with "SIA".

The location of the log file is stored in the environment variable "%autinstlog%". You can enter this environment variable in the address bar of Windows Explorer to open the folder with the log files. Alternatively, you can navigate to the corresponding directory by entering "CD %autinstlog%" in the command line.

The storage location is dependent on the operating system, e.g. "C:\ProgramData\Siemens\Automation\Logfiles\Setup" in English-language Windows.

Setup_Report (CAB file)

To make it easier to provide Product Support with all necessary files, an archive file that contains the installation log and all other required files is saved in CAB format. This log can be found at "%autinstlog%\Reports\Setup_report.cab". Send this CAB file to Product Support if you need assistance with installation. With this information, Product Support can determine whether the installation was executed properly. CAB files that were generated during earlier installation processes are saved with a date ID in the "Reports" directory.

4.4 Starting installation

Introduction

Software packages are installed automatically by the setup program. The setup program starts once the installation medium has been inserted in the drive.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To install the software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the product languages opens.
6. Select the languages for the product user interface, and click the "Next" button.

   Note

   "English" is always installed as the basic product language.

   The dialog for selecting the product configuration opens.
7. Select the products you want to install:
   - If you wish to install the program in a minimal configuration, click on the "Minimal" button.
   - If you wish to install the program in a typical configuration, click on the "Typical" button.
   - If you wish to personally select the products to be installed, click on the "User-defined" button. Then select the check boxes for the products you wish to install.
8. If you want to create a shortcut on the desktop, select the "Create desktop shortcut" check box.
9. Click the "Browse" button if you want to change the target directory for the installation. Note that the length of the installation path must not exceed 89 characters.

10. Click the "Next" button.
    The dialog for the license terms opens.
11. To continue the installation, read and accept all license agreements and click "Next".
    If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.
12. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.
    The next dialog displays an overview of the installation settings.
13. Check the selected installation settings. If you want to make any changes, click the "Back" button until you reach the point in the dialog where you want to make changes. Once you have completed the desired changes, return to the overview by clicking on "Next".
14. Click the "Install" button.
    Installation is started.

    Note

    If no license key is found during installation, you have the chance to transfer it to your PC. If you skip the license transfer, you can register it later with the Automation License Manager.

    Following installation, you will receive a message indicating whether the installation was successful.

15. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
16. If the computer does not reboot, click "Exit".

Result

The TIA Portal along with the products and licenses you have ordered and the Automation License Manager have been installed on your computer.

Starting to uninstall (Page 153)

4.5 Displaying the installed software

You can find out which software is installed at any time. In addition, you can display more information on the installed software.

Procedure

To display an overview of the software installed, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens. You will see the installed software products in the dialog. Expand the entries to see which version is installed in each case.
2. If you would like to display additional information on the installed automation software, click the link on the "Detailed information about installed software" dialog.
   The "Detailed information" dialog opens.
3. Chose the topic you want more information about in the area navigation.

Repairing installed products (Page 151)

Starting to uninstall (Page 153)

Installation log (Page 145)

4.6 Modifying or updating installed products

You have the option to modify installed products using the setup program or to update to a new version.

Blocks with know-how protection from earlier versions of the TIA Portal are not automatically upgraded with the project. Remove the know-how protection of the blocks before you update the TIA Portal. Then set up the know-how protection with the current version of TIA Portal. For more detailed information, refer to the information system.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To modify or update installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Modify/Upgrade" option button and click the "Next" button.
   The dialog for selecting the product languages opens.
7. Select the check boxes of the product languages that you want to install. You can remove previously installed product languages by clearing the corresponding check boxes.

   Note

   Note that the product language "English" cannot be removed.

8. Click the "Next" button.
   The dialog for selecting the product configuration opens.
9. Select the check boxes of the components that you want to install. You can remove previously installed components by clearing the corresponding check boxes.

10. Click the "Next" button.

    Note

    Note that you cannot change the target directory because the existing installation is being modified.

    If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.

11. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.
    The next dialog displays an overview of the installation settings.

12. Click the "Modify" button.
    This starts the installation of the additional components.

    Note

    Following installation, you will receive a message indicating whether the existing installation was successfully changed.

13. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".

14. If the computer does not reboot, click "Exit".

Result

The existing installation has been modified on your computer.

4.7 Repairing installed products

You have the option to repair installed products by completely reinstalling them using the setup program.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To repair installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Repair" option button, and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Repair" button.
   This starts the repair of the existing installation.

   Note

   Following installation, you will receive a message indicating whether the existing installation was successfully repaired.

8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Result

The installed products have been reinstalled.

4.8 Starting to uninstall

Introduction

Software packages are removed automatically by the setup program. Once started, the setup program guides you step-by-step through the entire removal procedure.

You have two options for removing:

- Removing selected components via the Control Panel
- Removing a product using the installation medium

Note

The Automation License Manager will not be removed automatically when you remove the software packages, because it is used for the administration of several license keys for products supplied by Siemens AG.

Removing selected components via the Control Panel

To remove selected software packages, follow these steps:

1. Open the Control Panel with "Start > Control Panel".
2. Click "Programs and Features".
   The "Uninstall or change a program" dialog opens.
3. Select the software package to be removed and click the "Uninstall" button.
   The dialog for selecting the setup language opens.
4. Select the language in which you want the dialogs of the setup program to be displayed and click "Next".
   The dialog for selecting the products you want to remove opens.
5. Select the check boxes for the products that you want to remove and click "Next".
   The next dialog displays an overview of the installation settings.
6. Check the list with the products to be removed. If you want to make any changes, click the "Back" button.
7. Click the "Uninstall" button.
   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Removing a product using the installation medium

To remove all software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Select the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click "Read product information" or "Read installation notes".
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Uninstall" option button and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Uninstall" button.
   Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

4.9 Installing updates and support packages

4.9.1 Checking availability of updates and support packages and installing them

By default, the TIA Portal checks automatically if new software updates or support packages are available, for example, Hardware Support Packages (HSPs). The automatic search for updates takes place after each computer restart and then cyclically every 24 hours. You can also deactivate the automatic search at any time or reactivate it. You can also search for updates manually.

If updates are found, you can download and install them.

Note

Updates and support packages from TIA Portal V13 or higher are supported.

Deactivate or activate automatic search for software updates

To deactivate or reactivate the automatic search for software updates, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Deselect the "Check for updates daily" check box if you want to deactivate the automatic search for software updates.
4. Select the "Check for updates daily" check box if you want to reactivate the automatic search for software updates.

Manually searching for software updates

If you want to search for software updates manually, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens.
2. Click "Check for updates".
   The "TIA Updater" opens and the available updates are displayed.

Or:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Click "Check for updates now".
   The "TIA Updater" opens and the available updates are displayed.

Or:

1. Open the TIA Updater with "Start > All Programs > Siemens Automation > Totally Integrated Automation UPDATER".
2. Click "Check for updates".
   The available updates are displayed.

Setting the server

You must set the corresponding server depending on whether you want to download updates and/or support packages from the TIA Automation Update Server or from a company-internal server. To do this, follow these steps:

1. Open the TIA Updater.
2. Click "Options" and select the "TIA Automation Software Update Server" option in the dialog that appears in the "Server used to check for updates" area.
   The software searches for available updates on the server of the manufacturer.

Or:

1. Open the TIA Updater.
2. Click "Options" and select the "User-defined server" option in the dialog that appears in the "Server used to check for updates" area.
3. Enter the server URL which you received from your administrator.
   The software searches on your company's server for available updates.

You can set a different server on which the updates are to be searched for at any time. However, changing this setting is blocked during a download process. After switching the server, all downloaded updates and support packages are displayed, even if they are not available on the currently set server.

Downloading and installing software updates separately

To download and install available software updates and support packages, follow these steps:

1. If the TIA Updater is not displayed, open it in one of these ways:
   - If the automatic search has found updates, you receive a message in the information area of the Windows taskbar and the icon for the TIA Update is displayed in the information area. Click either the message or the icon to open the TIA Updater.
   - Click "Installed software" in the "Help" menu and then "Check for updates".
   - In the Windows Start menu, click "Start > All Programs > Siemens Automation > Automation Software Updater".
2. Click "Download" in the line of the update or support package that you want to install. The update or support package is downloaded. The associated "Install" button becomes active as soon as the download process has been completed.

   Note

   Please note the following:

   1. You can initiate multiple download processes simultaneously.
   2. You can log off or also shut down the computer while the download process is running. In such cases, the download process continues in the background as soon as you log on again.
   3. In some cases, a link to an external web page is displayed instead of the "Download" button. In this case, download the software update from this site and install it manually.

3. Close the TIA Portal if it is still open.
4. In the TIA Updater, click the "Install" button of the software package you want to install. The installation dialog appears.

   Note

   Please note the following:

   1. It is not possible to install multiple updates simultaneously.
   2. Do not log off during an installation and do not shut down the computer. This avoids inconsistent versions of the software on your computer.

5. Click "Next".
   The selected product is installed.

Downloading and installing several support packages in one step

To download and install available support packages in one step, proceed as follows:

1. Activate the required lines. You have several options for this:
   - To download and install all displayed support packages, activate the check mark in the title of the list.
   - To download and install several support packages, select the first required support package, hold down the <Ctrl> key and then select all further required support packages. Then set the check mark in one of the selected lines.
   - To download and install several support packages in a certain order, select the first required support package, hold down the <Shift> key and then select the last required support package.
2. Click the "Download and Install" button.
3. After downloading click "Next" in the displayed dialog to start the installation. A dialog box is then displayed which informs you about the progress of the installation.

Note

Only support packages that are not subject to export restrictions can be downloaded and installed.

Alternative procedures for the installation of support packages

Another procedure is available for the installation of a support package. To do this, follow these steps:

1. Click "Support packages" in the "Options" menu of the TIA Portal.
   The "Detailed information" dialog opens. A table lists all support packages from the directory that you selected as the storage location for support packages in the settings.
2. If you want to install a support package that is not in the list, you have the following options:
   - If the support package is already on your computer, you can add it to the list by selecting "Add from file system".
   - If you add a support package from the "Service & Support" page on the Internet, first you download it by selecting "Download from the Internet". Then you can add it from the file system.
3. Select the support package that you want to install.
4. Click "Install".
5. Close and then restart the TIA Portal.

Installation log (Page 145)

4.9.2 Providing updates on a company-internal server

Introduction

Using the TIA Updater Corporate Configuration Tool, you can configure a company-internal server on which the available updates/support packages are stored and can be made available to the users.

Requirement

You must have administrator rights.

Adding updates from the TIA Automation Software Update Server

To add updates from the TIA Automation Software Update Server, follow these steps:

1. Open the TIA Updater Corporate Configuration Tool.
   The available updates are displayed.
2. Click the "Add update" button and select the "Add TIA Automation Software Update Server" check box in the dialog that appears.
3. In the dialog "Add update from TIA Automation Software Update Server", select the required updates (software and support packages) and click "Add".
   If updates are already located on the company-internal server, these are grayed out. You cannot load them again. During the download process, the status and the remaining time is displayed in the dialog.

Canceling the download process

To cancel the process, follow these steps:

1. Click the "Cancel download" button.
2. Click "Yes" to confirm the dialog that appears.
   The download of the update is cancelled and it is deleted from the list.

Deleting updates from the company-internal server

To delete updates, follow these steps:

1. Select the required updates and click the "Remove" button.
2. Click "Yes" to confirm the dialog that appears.
   The selected updates have been deleted from the list.

Server options

In the dialog "TIA Automation Software Update Server", click "Settings" to determine the following:

1. Under "Server path", specify the folder in which the downloads are to be saved. You can select either a local drive or a network drive.

   Note

   When you work directly on the server, the target directory is a equivalent to the provision directory on the server. All changes are applied directly. This procedure is not recommended, as conflicts can occur with active downloads.

   We recommend that you work on another computer; the target directory can be any directory. The content of this directory must then still be copied to the provision directory. Here, also, make sure that no conflicts occur with active downloads.

2. Select the check box "Always run server in background (icon is shown in the taskbar)", if the server is to always run in the background.
3. Confirm your entries with "OK".

4.9.3 Configuring a company-internal server for updates

Introduction

To provide available updates and support packages to users from a central location, you must configure a company-internal server. Use the Microsoft Server Manager to do this. The procedure for creating and configuring the server with the Microsoft Server 2008 R2 operating system is described below.

Note

Please note that the structure of the start menu and the storage location of the programs may vary depending on the different operating systems.

For more detailed information on operating the Server Manager, refer to the Microsoft help.

Requirement

You must have administrator rights.

Install Web server role (IIS)

To install the required Web server role, follow these steps:

1. Open the start menu by clicking the command "Start" > "All programs" > "Administration" and select the "Server Manager".
2. Click "Add roles" under "Role overview".

3. Use the "Add roles" wizard to add the Web server roles.
   Before the wizard starts, it is verified that a complex password has been assigned to the administrator, that the network settings have been configured accordingly and that the latest Windows security updates have been installed.
4. Note the pre-selected role services that are installed by default, and then select the additional role service ASP.NET.
5. Select the required features and click "Next".
6. To complete the installation, click "Close".
   The Web server role has been added.

Create website

1. Click "Roles > Web Server (IIS) > Internet Information Services (IIS) Manager".
2. In the "Bindings" area, right-click "Sites" and then click "Add website".
3. In the "Add website" dialog box, enter a display name for the website in the "Website name" field, for example "TIAPortalUpdates".
4. In the "Physical path" field, enter the physical path of the folder in which the website is located or click the button to browse (...), in order to search for the folder in the file system.
5. Click "OK".

Check website

1. In the area "Connections > Sites", select the website you created. Activate the "Browse directory" entry in the "Features" view.
2. To check whether the website is displayed with content, select the menu command "Manage website > Browse". The updates available in the virtual directory are now displayed in the dialog that appears.

Add MIME type

1. Double-click "MIME type" in the "Features" view.
2. Click "Add" in the "Actions" area.
3. Enter .* in the "File name extension" text field in the "Add MIME type" dialog.
4. Enter a MIME type in the "MIME type" text field. For example, enter "all/files".
5. Click "OK".

Add BITS-IIS server extension

1. Click "Server Manager" in the tree view.
2. In the "Feature overview" section, click "Add features".
3. In the wizard for adding features, select the options "Background Intelligent Transfer Service (BITS)" and "IIS server extension".
4. Follow the instructions of the wizard, which may also include installing the required software.

Activate BITS-IIS server extension

1. Switch to the virtual directory in the IIS Manager.
2. Double-click "BITS-Uploads" in the Features view of the virtual directory.
3. Select the "Allow clients to upload files" check box and click "Apply".

Create a self-signed server certificate

1. In the "Connections" area, navigate to the level which you want to manage.
2. Double-click "Server Certificates" in the "Features" view.
3. Click "Create Self-Signed Certificate" in the "Actions" area.
4. In the "Create Self-Signed certificate" dialog, enter a display name for the certificate in the "Specify a friendly name for the certificate" field and click "OK".

Create SSL binding

1. Expand the "Sites" entry in the "Connections" area, and then click the site to which you want to add a binding.
2. Click "Bindings" in the "Actions" area.
3. In the "Site Bindings" dialog, click "Add".
4. In the "Add Site Binding" dialog, select the certificate you created under "Type" "https" and under "SSL certificate" and then click "OK".

Verify SSL binding

1. In the "Actions" area, click the previously created binding under "Browse website".
   An error page is opened in Internet Explorer, because the self-signed certificate was created by your computer.
2. Click "Continue to this website (not recommended)".
   This message is no longer displayed when you add the certificate to the "Trusted Root Certification Authorities" certificate memory.

Configure SSL settings

1. Double-click "SSL settings" in the "Features" view.
2. Use one of the following procedures in the "Client certificates" area of the "SSL Settings" dialog:
   - Select "Ignore" if no client certificates are to be accepted even if a client has a certificate.
   - Select "Accept" if client certificates are to be accepted.
   - Select "Require" if client certificates are to be required. The "Require SSL" option must be activated to allow the "Require client certificates" option to be used.
3. Click "Apply" in the "Actions" area.

Distributing updates to different areas

It may be the case that different departments need different updates or support packages. In this situation, we recommend operating multiple servers which offer different updates and support packages. Proceed as follows:

1. Set up different company-internal servers as described above.

or

1. Install the Web server role.
2. Set up multiple websites.
   Make sure that you assign unique names for these websites and the physical paths so that there will be no confusion.
3. Set the features described above for the Web server or the websites.

You can now store the required updates and support packages for the different departments in the defined directories.

4.10 Installing and uninstalling the migration tool

4.10.1 System requirements

System requirements for the migration tool

The following system requirements apply to the use of the migration tool:

- All products used to create the source project must be installed. The following products are supported:
  - STEP 7 V5.4 SP5
  - WinCC V7.3 with the latest updates
  - WinCC flexible 2008 SP3
  - Integrated projects from STEP 7 V5.4 and the WinCC products listed above
  - STEP 7 Distributed Safety V5.4
  - SINUMERIK STARTER and Startdrives
  - As of SIMOTION SCOUT V4.4
    You need the SCOUT Migration Tool PlugIn in the corresponding SCOUT TIA version to migrate SIMOTION SCOUT projects.
- All optional packages needed to process the STEP 7 project are installed. For example, all HSPs for the devices used in the source project are required.

4.10.2 Installing the migration tool

Distribution of the migration tool

You can find the migration tool in the "Support" directory on the installation DVD of the TIA Portal. Alternatively, it is available for download from the Siemens Industry Online Support. For some products, (such as SIMATIC Failsafe or SIMOTION) additional plug-ins are required for the migration tool. These plug-ins can also be downloaded from the Siemens Industry Online Support or installed from the installation DVD of the specific products.

Normally, the migration tool is installed without the TIA Portal. Because the TIA Portal has its own integrated migration function, a separate installation of the migration tool is not necessary.

Procedure

To install the migration tool, proceed as follows:

1. Download the installation file from the Siemens Industry Online Support, or use the installation file from the "Support" directory of the installation DVD of the TIA Portal to perform the installation.
2. Run the installation file.
   The setup program for the migration tool will open.
3. First, select the language in which the setup should be displayed and click the "Next" button.
   The page for selecting the software language is displayed.
4. Since the migration tool is provided exclusively in English, you cannot choose any other language for the installation. Therefore, click "Next" to proceed to the next step.
   The page for selecting the product is displayed.
5. The migration tool consists solely of a software component. Therefore, the migration tool is already selected.
   To create a Desktop icon for starting the migration tool, select the check box "Create Desktop icon". Then click the "Next" button.
   The page for confirming the licensing terms is shown.
6. Click on an entry in the list of license terms to read the selected license term. If you agree with all license terms, select the check box "I accept the terms of the displayed license agreement". Then click the "Next" button.
   An overview of the installation is displayed.
7. Click the "Install" button.
   The installation is performed with the displayed settings.

4.10.3 Uninstalling the migration tool

The migration tool can be removed using the Control Panel.

Procedure

To remove the migration tool, follow these steps:

1. Open the Control Panel.
2. Double click on "Add or Remove Programs" in the Control Panel.
   The "Add or Remove Programs" dialog opens.
3. Select the entry for the migration tool in the "Add or Remove Programs" dialog, and click the "Remove" button.
   A security prompt appears.
4. Click the "Uninstall" button to confirm this prompt.
   The migration tool will be removed.

4.11 Installing and uninstalling the multiuser server

4.11.1 Notes on the installation of the multiuser server

Introduction

Installation of the multiuser server gives you access to the Multiuser Engineering functionality that is available with TIA Portal V14.

You can install the multiuser server as follows:

- Together with the installation of the TIA Portal.
- As standalone installation by means of a separate installation process without TIA Portal.

Note

Administrator rights are required for the server installation.

Installation of the multiuser server with the TIA Portal

The multiuser server is installed together with the following TIA Portal products:

- SIMATIC STEP 7 Basic V14.0
- SIMATIC STEP 7 Professional V14.0
- SIMATIC WinCC Basic V14.0
- SIMATIC WinCC Comfort/Advanced V14.0
- SIMATIC WinCC Professional V14.0

The multiuser server is usually activated in the product selection by default and is then installed with the TIA Portal. Check the settings during installation of the TIA Portal. You can find the specific default settings for the multiuser server during setup when selecting the product in the directory "Tools". By selecting or clearing the options, you can specify if the multiuser server is to be installed along with the TIA Portal or not.

Installation of the multiuser server as standalone installation

The installation of the multiuser server can also be a standalone installation.

A description of automated installation is also available on the product DVD in the directory "Documents\Readme\<language directory>".

Identical TIA Portal versions during installation

When installing different TIA Portal products on various clients, make sure that all participants use the same versions of software products for the installation.

For example, if you have installed STEP 7 Professional, WinCC Advanced and Safety as well as the multiuser server with version V14.0, all other Team Engineering participants must also have installed this software in identical versions.

The service packs and updates must be installed for all products at the same time.

Installation path

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

Antivirus programs

During the installation, read and write access to installed files is necessary. Some antivirus programs block this access. We therefore recommend that you disable antivirus programs during the installation of the multiuser server and enable them again afterwards.

4.11.2 Installing the multiuser server

Introduction

The multiuser server V14 can be installed as part of the TIA Portal V14 installation or as standalone product.

A description of automated installation is also available on the product DVD in the directory "Documents\Readme\<language directory>".

Installation rules

Multiple versions of the multiuser server can be installed on a computer, but only one version of the multiuser server can be run with the corresponding version of the TIA Portal.

Example: The multiuser server V14.0 can only be run with TIA Portal V14.0.

Requirements for installation

The same requirements apply to the installation of the multiuser server V14.0 as for the installation of the TIA Portal V14.0.

For more details, see: AUTOHOTSPOT

Installing the multiuser server with the TIA Portal

Follow these steps for installation:

1. Note the requirements for the installation of the selected software package.
2. Start the setup program of the required product by inserting the installation medium into the respective drive.

3. Select the preferred settings and click the "Install" button.
4. Make sure that the multiuser server is selected in the product selection and observe the notes in the setup dialogs.

Result

The multiuser server is installed on your computer together with the TIA Portal.

Installing the multiuser server as standalone product

Follow these steps for installation:

1. Note the requirements for the installation of the multiuser server.
2. Start setup for the standalone installation of the multiuser server with a double-click on the self-extracting .exe file "TIA_Portal_Multiuser_Server_V14.exe". You can find these files in the directory "Support" on the corresponding product DVD.
3. Select the preferred settings and click the "Install" button.
4. Follow the instructions in the setup dialogs.

Result

The multiuser server is installed on your computer.

4.11.3 Uninstalling the multiuser server

Introduction

You can use the Control Panel to remove the multiuser server.

Requirements for removal

There is a multiuser server installed on your computer.

Uninstalling the multiuser server

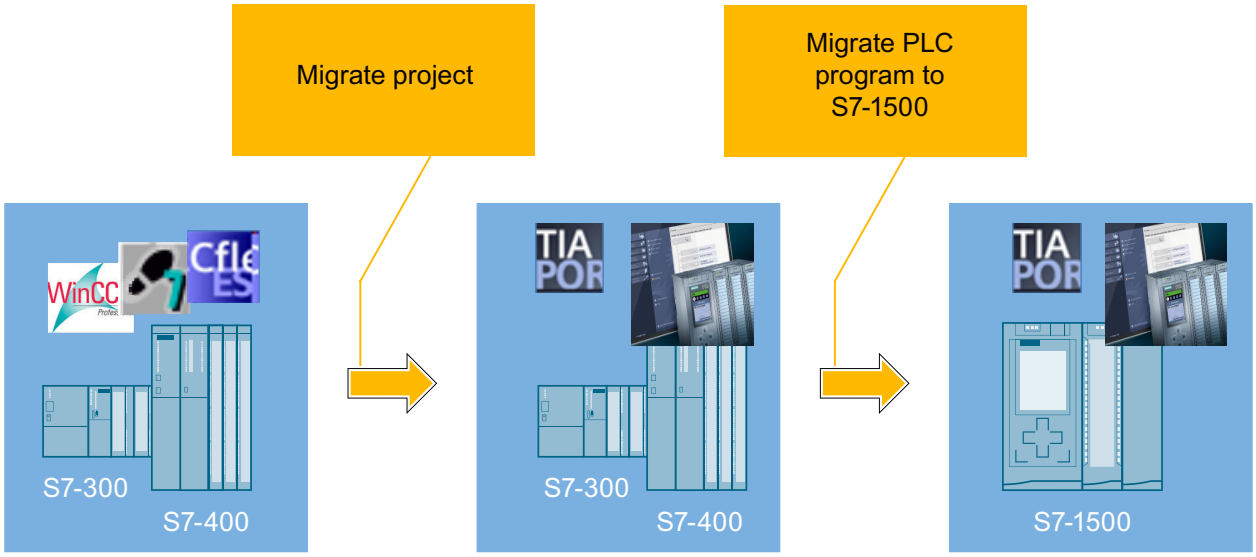
Proceed as follows for removal:

1. Open the Control Panel.
2. Click on "Uninstall a program" in the Control Panel.
   The "Uninstall or change a program" dialog opens.
3. Right-click the entry for the "Multiuser server" in the "Uninstall or change a program" dialog, and click "Uninstall".
   A security prompt appears.
4. Click "Yes" to confirm this prompt.

Result

The multiuser server is removed from your computer.

Migrating projects and programs



5

5.1 Overview of Migration Options

Migration paths

If you want to continue to use existing projects or programs with the latest version of the TIA Portal and the S7-1500, you have several options for migrating projects.

The following graphic provides an overview of the migration options:

Migrating projects to the TIA Portal

You use the "Migrate project" function to migrate projects that were created outside of the TIA Portal, for example, with STEP 7, WinCC, WinCC flexible, or SINUMERIK.

The result of the project migration is a TIA Portal project that you can use with your existing S7-300/400 series hardware and existing HMI devices.

Migrating PLC programs from S7-300/400 to S7-1500

To migrate a PLC program within the TIA Portal from an S7-300/400 series device to an S7-1500, you use the PLC migration.

The result of the PLC migration is an executable PLC program that is automatically adapted to the new system architecture of the S7-1500 as far as possible.

Optimizing PLC program for S7-1500

You also have the option to optimize your program for the S7-1500 by employing newly introduced programming methods. The optimization enables you to effectively use the higher performance, innovated memory technology and new features of the S7-1500 system.

Upgrading projects

You can also continue to use projects from previous versions of the TIA Portal. However, these projects do not need to be migrated. You can upgrade projects from previous versions to the current version of the product. You can find additional information on compatibility and upgrading projects in the section "AUTOHOTSPOT".

Note

Additional support for migration

You can find the latest information about PLC migration in the Siemens Industry online support:

Migration of complete systems:

http://support.automation.siemens.com/WW/view/en/83558085 (http://support.automation.siemens.com/WW/view/en/83558085)

Migration of controllers:

http://support.automation.siemens.com/WW/view/en/83557459 (http://support.automation.siemens.com/WW/view/en/83557459)

Migration of visualization:

http://support.automation.siemens.com/WW/view/en/76878921 (http://support.automation.siemens.com/WW/view/en/76878921)

Migration of communication:

http://support.automation.siemens.com/WW/view/en/83558087 (http://support.automation.siemens.com/WW/view/en/83558087)

If you need further support, please contact SIMATIC Customer Support.

5.2 Migrating projects to a TIA Portal project

5.2.1 Migration of projects with the TIA Portal

Migration of existing projects

You can migrate projects from earlier automation solutions to the TIA Portal. Each time you migrate, a new project is created for the migrated data with which you can then work. Any TIA Portal projects already open are closed first.

The migration is then displayed in the table of the project history. From there, you have access to the migration log that is created automatically for the migration.

After the migration of hardware configurations and program blocks from earlier automation solutions, first check the functionality of the migrated project before you use it in productive operation.

Supported products for migration

Refer to the chapter "System overview STEP 7 and WinCC" to find out which products are available for the TIA Portal. All products listed there are generally supported by the TIA Portal during migration.

Any additional requirements that must be met depend on the initial products that were used and the currently installed products. For more information on the migration options for your products, you can, for example, refer to the Siemens Industry Online Support and the documentation of your software products.

See also: Scaling of STEP 7 and WinCC in the TIA Portal (Page 37)

Procedure during migration

The migration process is divided into the following basic steps:

1. Preparing the initial project
   If the software for editing the initial project is not installed or not fully installed on the programming device/PC with the TIA Portal, or if the initial project is an integrated project, you must first convert the initial project to a migration file. To do this, install the migration tool on a programming device/PC on which the required software for editing the initial project is installed. Then, use the migration tool to convert the initial project, and copy the file to the programming device/PC on which the TIA Portal is installed. You can omit this step if the initial project and its associated software are on the same programming device/PC as the TIA Portal, and if the initial project is not an integrated project.
2. Performing migration
   Perform the migration within the TIA Portal. For the migration, specify as source either the migration file which you created with the migration tool or the initial project when all required software has been installed.

3. Checking the migration log
   A migration log is created for each migration. It contains information about modified project parts. You can call the log under "Common data > Logs" in the project tree or in the project history. After completion of the migration, the migration log will be displayed in the TIA Portal. Check the log following completion of the migration.
   If the migration failed, an XML file is created as a log under "\Logs" in the project directory. You can use any XML editor to open this log and view the reasons why the migration failed.
4. Correcting the migrated project
   Because the configurations of the initial project may not always be completely compatible with the TIA Portal, all configurations may not be reproduced identically in the migrated project. You should therefore work through the points in the migration log systematically. If you have not included the hardware configuration in the migration, you also have to convert the unspecified devices to the appropriate hardware.

Including the hardware configuration in the migration

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You therefore convert the unspecified devices into suitable devices after the migration and recreate any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated. You can check with a tool (Page 174) to see which hardware components are supported.

See also

Display migration log (Page 180)

Scaling of STEP 7 and WinCC in the TIA Portal (Page 37)

5.2.2 Check migration readiness of hardware components

Introduction

Siemens offers a tool that can be used to check whether the hardware configuration used in an initial project is ready for migration to the TIA Portal.

Components integrated via GSD or GSDML files cannot be checked. For such modules, check manually in the TIA Portal whether the modules are available in the hardware catalog. If the modules are not available there, install the required GSD or GSDML files in the TIA Portal. You can obtain the required files from the manufacturer of the components.

In the result you can also see which software products and licenses have to be available on the programming device/PC with the installation of the TIA Portal to perform a migration. You can also see as of which firmware version the individual modules of the initial project are supported in TIA Portal. The result of the check can be output in a Microsoft Excel file or in PDF format.

Download

The tool for checking the migration readiness is available for download in the FAQs of the Siemens Industry Online Support under entry number 60162195 (http://support.automation.siemens.com/WW/view/en/60162195).

Source files for the check

To check readiness, you require one of the following source files which contains the article number of the hardware used in the initial project:

- .cfg file
  You can export the .cfg file from HW Config (STEP 7) with the menu command "Export as .cfg file" in the "Station" menu. The .cfg file contains all MLFBs of the devices used in the currently open station.
- Microsoft Excel file (in .xls file format)
  Regardless of the initial project used, you can create a Microsoft Excel list containing all MLFBs of the devices you want to migrate.
- File in .csv format
  The article numbers that are to be checked can also be saved to a .csv file instead of a Microsoft Excel list. To do this, use a standard text editor and enter the MLFBs separated by comma and without space after the comma. Save the text file with the extension ".csv".

Tool for checking migration readiness (http://support.automation.siemens.com/WW/view/en/60162195)

5.2.3 Preparing projects with the migration tool

5.2.3.1 Migrating projects with the migration tool

Preparation for migration

In many cases, a project that you wish to migrate will not be located on the same programming device/PC on which the latest version of the TIA Portal is installed. Therefore, the initial project must first be converted to a compatible format for the migration. The same applies to integrated projects.

After creation of the migration file, you copy the migration file to the programming device/PC on which the current version of the TIA Portal is installed. In the TIA Portal, you enter the migration file as the source for the migration and can create a project in the current file format of the TIA Portal.

Procedure for migration with the migration tool

The following steps are necessary to prepare a migration with the migration tool:

1. Install the migration tool on the programming device/PC where the source project is located. To do this, download the installation file from the Siemens Industry Online Support or install the migration tool from the setup DVD of the TIA Portal.
2. Start the migration tool, and use it to convert the source project to the migration file format with the file extension ".am14".
   For this step, make sure that all software needed to process the source project is installed on the programming device/PC. This also includes all necessary service packs, hardware support packages and all expansion software that is needed to process the initial project. If individual products are not installed it may not be possible to perform the migration or the migration may be incomplete.
3. Copy the migration file to the target system on which a current version of the TIA Portal is installed.
   Note that the target system must have been installed with all software needed to configure the complete set of devices contained in the migration.
4. Perform the migration within the TIA Portal and specify the migration file with the extension ".am14" as the source.
5. Once migration is complete, check the migration log and systematically work through the information provided there for the newly created project. Read the information in the Inspector window with special care after the first compilation of the configuration.

Including the hardware configuration in the migration

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You therefore convert the unspecified devices into suitable devices after the migration and recreate any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated. You can check with a tool to see which modules are supported.

See also

Migration of projects with the TIA Portal (Page 173)

Migrating projects (Page 178)

Calling the migration tool (Page 177)

Creating a migration file (Page 177)

5.2.3.2 Calling the migration tool

Starting the migration tool

During the installation, a "Migration to TIA Portal V14" shortcut is created by default in the Start menu under "Siemens Automation > Migration Tool". Click this shortcut.

Alternatively, you can call the migration tool directly in Windows Explorer. During the installation, the migration tool is saved by default in one of the following folders:

- On a 64-bit operating system:
  C:\Program Files (x86)\Siemens\Automation\MIGTOOL_V14\Bin
- On a 32-bit operating system:
  C:\Program Files\Siemens\Automation\MIGTOOL_V14\Bin

To start the migration tool, click the "Siemens.Automation.MigrationApplication.exe" file in one of the directories.

See also

Creating a migration file (Page 177)

5.2.3.3 Creating a migration file

The section below describes how you can use the migration tool to convert the initial project to a migration file that can be read by the TIA Portal. Following conversion, this file is transferred to the target system and migrated there.

You can specify whether the migration file should contain the entire project, including the complete hardware configuration and the associated software, or whether you want to migrate the software only.

Requirement

- The suitable, original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Procedure

To create the migration file, proceed as follows:

1. Select the path of the source file for the migration in the "Storage Location (Path)" field.
2. Specify the project parts that are to be migrated:
   - Select the "Include HW and Network data during the migration" check box to migrate not only the software but also the complete hardware parts and the network configuration of the project.
   - Select the "Copy SCADA runtime data" check box if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.
3. Select the path and the file name for the migration file in the "Intermediate file" field.
4. Click the "Migrate" button.

Result:

A migration file is created. You now copy this file to the target system and migrate this file in the TIA Portal.

See also

Migrating projects (Page 178)

Calling the migration tool (Page 177)

Migrating projects with the migration tool (Page 175)

5.2.4 Migrating projects

Requirement

- A converted file in the format ".am14" is already available or the original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Read the additional information on the requirements in the help for the respective products installed.

Note

System hibernation during the migration

While a migration is running, the system should not be changed to the standby or hibernate mode. Otherwise the migration will be aborted.

Procedure

To migrate a project, follow these steps:

1. Select the "Migrate project" command in the "Project" menu.
   The "Migrate project" dialog opens.
2. Specify the path and the file name for the project to be migrated in the "Source path" field.
   Select a project either in the ".am14" migration format or in the format of the initial project.
3. To include the hardware configuration in the migration, select the "Include hardware configuration" check box.
   If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the hardware configuration in the migration before the conversion with the migration tool .
4. Select the "Copy WinCC Runtime Professional data" check box, if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.
   If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the SCADA runtime data in the migration before the conversion with the migration tool .
5. Select a name for the new project in the "Project name" box.
6. Select a path in the "Target path" box where the new project is to be created.
7. Enter your name or the name of another person responsible for the project in the "Author" field.
8. Enter a comment in the "Comment" box, if you require one.
9. Click "Migrate".

Result

The initial project is converted and a message appears after conversion is complete. The newly created project is then opened in the project view, and the migration log is opened in the TIA Portal.

Even if the migration failed, a project directory is created and a migration log in the form of an XML file is generated in this directory. The completion message that appears after the migration contains a link to this XML file. Click the link to open the XML file. Alternatively, you can find the XML file in the project directory under "\Logs".

See also

Post-editing integrated projects (Page 213)

Display migration log (Page 180)

Migrating projects with the migration tool (Page 175)

Creating a migration file (Page 177)

5.2.5 Displaying the history of the migration

If a project was created by migration, the migration will be listed in the table of the project history. You can open the migration log in the table. The time of the migration is also shown.

Procedure

To display the migration in an overview table, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.
   The dialog with the properties of the project opens.
3. Select the "Project history" group in the area navigation.
   The overview table is displayed.

5.2.6 Display migration log

A log is created for each successful migration. The log contains the following information:

- Migrated objects
- Modifications to objects made during migration
- Errors that occurred during migration
- In certain cases a link to more help with specific events.
  In this case, click the question mark to obtain more help.

Procedure

To display the log file of the migration, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.
   The contents of the log are displayed in the work area.

See also

Migration of projects with the TIA Portal (Page 173)

5.2.7 Migrating WinCC flexible projects

5.2.7.1 Basics (WinCC flexible)

Migration (WinCC flexible)

Introduction

You can continue to use projects in WinCC from WinCC flexible. The following version of WinCC flexible is supported:

- WinCC flexible 2008 SP2

The following sections describe the operating devices that are supported and the required conditions for a successful migration.

Projects from ProTool and from earlier versions of WinCC flexible cannot be migrated directly to WinCC. If you wish to continue to use such projects in WinCC, you must first migrate them to a supported version of WinCC flexible.

See also

Object support during migration (WinCC flexible) (Page 187)

Projects from Migrating WinCC flexible projects (WinCC flexible) (Page 183)

Compiling and loading a migrated project (WinCC flexible) (Page 185)

Migrating runtime data (WinCC flexible) (Page 197)

Migrating integrated projects (WinCC flexible) (Page 199)

Supported HMI devices (WinCC flexible) (Page 186)

Migration of data types (WinCC flexible) (Page 203)

Basics on migration (WinCC flexible)

Introduction

During migration, the project data from a WinCC flexible project are converted to the new format of WinCC. The data will not be evaluated to see if they are consistent in the project you want to migrate. If errors or warnings are output in a source project during compilation, these will not be resolved as part of the migration. This means you should be able to compile the project without errors prior to migration. Note the scope of a project during migration. The features of WinCC apply for migration. For more information on this topic, refer to the "Visualize Processes > Performance Features > Engineering System" chapter in the online help.

Unique object names

The objects are clearly identified by the folders in which they are contained in WinCC flexible. Screen elements in groups are clearly identified by the group name.

In WinCC, an object name must be unique within an HMI device. The name of screen elements must be unique within a screen.

The uniqueness of the name is verified during migration. If a name is not unique according to the new rule, the object in question will be renamed. A renamed object will receive the suffix "#Mign", where "n" stands for a sequential number.

Example:

In WinCC flexible, tags located in different folders may have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means tags with the same name from different folders will be renamed during migration.

Tags are renamed as follows:

Before migration	After migration
Folder_1/Tag_1	Folder_1/Tag_1
Folder_1/Tag_2	Folder_1/Tag_2
Folder_2/Tag_1	Folder_2/Tag_1#Mig1
Folder_2/Tag_2	Folder_2/Tag_2#Mig1
Folder_3/Tag_1	Folder_3/Tag_1#Mig2
Folder_3/Tag_2	Folder_3/Tag_2#Mig2

Affected objects

The following objects are renamed if necessary:

- Screens
- Screen objects
- Recipes
- Tags

Cancelling migration

The migration is cancelled in the following cases:

- If the project to be migrated is opened in the engineering system or in Runtime.
- If not enough memory space is available on the hard disk to create a a copy for migration of the project.
- If the migration cannot address the project database due to problems with the installed SQL-Server.
- If the migration cannot address the project database due to missing user authorization.

- If you select the "*.hmi" file for the migration in an integrated project. You must select the "*.s7" file for the migration in an integrated project.
- If the project was created with a version not supported by the migration.

Saving the project in the migration format

You do not have to execute the migration of a WinCC flexible project completely on the PC on which the project is available. You can prepare the migration by saving the project in the migration format. The migration tool is available for saving a WinCC flexible project in the migration format. The migration tool exports the engineering data from the WinCC flexible project and saves the data in the migration format "*.AM11".

For the actual migration, copy the data in the migration format to a PC on which the TIA Portal is installed.

See the section "AUTOHOTSPOT" for more information on the migration tool.

Projects from Migrating WinCC flexible projects (WinCC flexible)

Introduction

When you migrate a project, data from a WinCC flexible project is loaded into a new project for WinCC. A new project is therefore created automatically for project migration. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project to a re-started TIA Portal.

Information on the migration of an integrated project can be found in the section Migrating integrated projects (WinCC flexible) (Page 199).

If you only want to save the project in migration format, you can use the migration tool. See AUTOHOTSPOT for additional information.

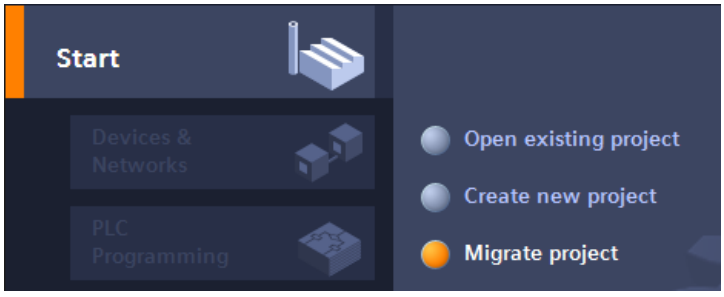
Note

Further support for migration

You find current information on migration in the Siemens Industry Online Support:

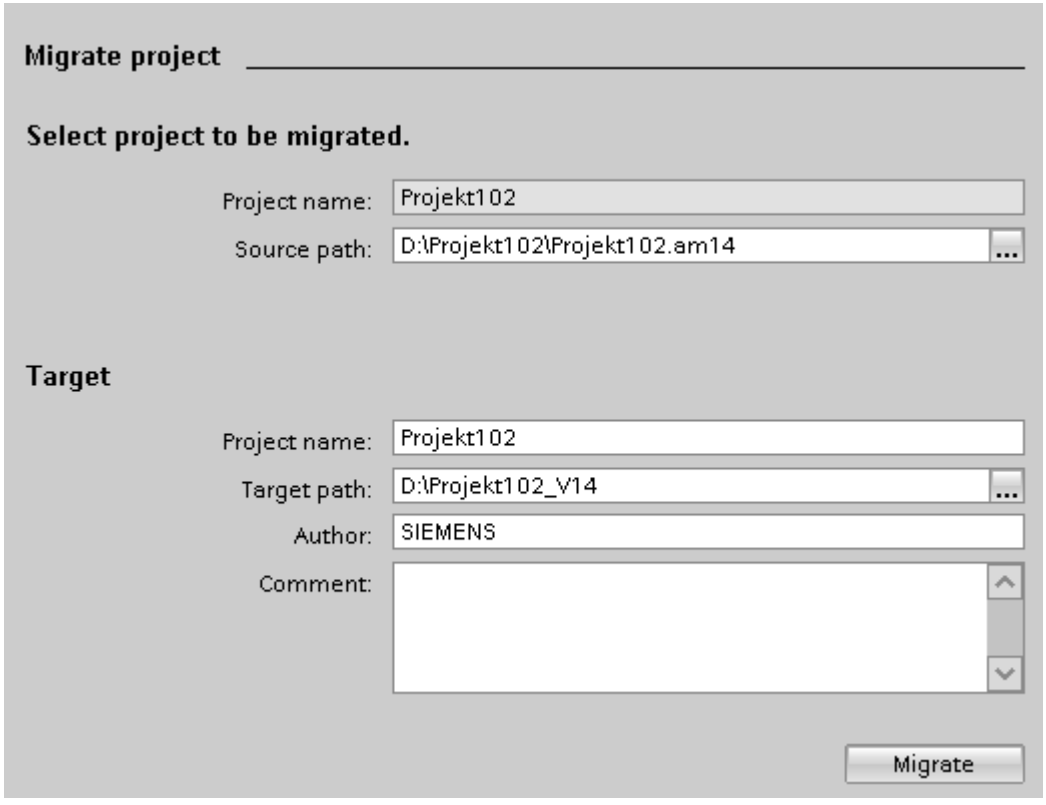
Migration of visualization

If you need further assistance, please contact the SIMATIC Customer Support.



Requirement

- A project from WinCC flexible is available.
- The project is not open in WinCC flexible.



Procedure

Migrate a project in the Portal view as follows:

1. Select the action "Start > Migrate Project".

2. In the "Source path" box, navigate to the project you want to migrate.

3. Select the WinCC flexible project file "*.hmi" or "*.am14".

4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - The project is saved and a message displayed upon completion of the migration. The message contains a link that you can use to open the log file.

When migration is complete, you will find a newly created device for each migrated HMI device in the project tree. These devices contain the migrated data, such as screens, alarms and tags.

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log file as follows:

1. Open the "Common data > Logs" folder in the project tree. It contains the logs of all previously performed migrations.
2. Double-click the required migration log.
   The log is opened.

See also

Migrating integrated projects (WinCC flexible) (Page 199)

Compiling and loading a migrated project (WinCC flexible)

Compiling a migrated project

Once you have successfully migrated a WinCC flexible project, you need to recompile it before loading it to the HMI device. The project will only compile successfully if it was capable of error-free compiling prior to migration.

If errors occur during compilation of the migrated project, they have to be eliminated.

Once compiling is successfully completed, load the project to the HMI device.

Settings for download to the HMI device

The settings for loading the HMI device are not included in the migration. Once you have migrated the project, you must configure the settings for loading.

Select the HMI device in the project tree and select "Loading in device > Software (complete loading)" from the shortcut menu. The "Extended download to device" dialog opens. Configure

the required settings for the interface. Click the "Load" button. The project is recompiled and the dialog "Load preview" is opened.

Expand the "Overwrite" entry and verify the settings for the following options:

- Would you like to overwrite the existing user administration data from this device
- Would you like to overwrite the existing recipe data on HMI system

Configure the options as you want to use them in the project in the future. Subsequently, load the project to the HMI device.

5.2.7.2 Migrating engineering data (WinCC flexible)

Supported HMI devices (WinCC flexible)

Introduction

Note that WinCC only supports the following HMI device types when migrating projects from WinCC flexible:

- KTP400 Basic mono PN
- KTP400 Basic mono PN Portrait
- KTP600 Basic DP
- KTP600 Basic DP Portrait
- KTP600 Basic PN
- KTP600 Basic PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic mono PN Portrait
- KTP1000 Basic DP
- KTP1000 Basic PN
- TP1500 Basic PN

WinCC only supports the functions provided by these HMI device types.

If your WinCC flexible project contains an HMI device that is not supported by WinCC, then the migration process will abort. To migrate the project, you must change the HMI device in WinCC flexible to a HMI device type supported by WinCC.

There may be some functions in a WinCC flexible project that are not supported by a Basic Panel, for example, because the device type has been switched. These unsupported functions are not migrated.

Adaptations before migration

If the HMI device has changed in the project being migrated, the project needs to be recompiled before migration. The compilation process will adjust the size of the screens and screen elements.

Changes of values of object properties by the migration (WinCC flexible) (Page 189)

Object support during migration (WinCC flexible)

Introduction

When migrating projects from WinCC flexible, all configuration data involving an HMI device supported by WinCC will be migrated. Basically, all object types and functions that are available and can be mapped to the new project environment will be fully migrated.

Some global object types are not migrated, for example, dictionaries and global libraries.

Supported object types

The following object types are supported for migration:

- Animations
- Scheduler
- User administration
- Area pointer
- Screens
- Screen template
- Data types
- Function lists
- Graphics lists
- Display and operating elements
  Migration supports all display and operating elements available on the supported HMI devices.
- Alarms
- Alarm classes
- Alarm groups
- Project library
- Project languages

- Recipes
- Runtime languages
- Runtime scripting
- System functions
- Texts
- Text lists
- Tags
- Connections

Unsupported object types

The following object types are not supported by migration:

- Global libraries
- Dictionaries
- Project versions
- Change log

Migration of the screen template

WinCC offers an extended concept for working with screen templates. WinCC offers a global screen and several templates for each device. During migration of a template from WinCC flexible, the objects contained there and the properties configured in the template are migrated to different templates of WinCC.

The following objects are migrated to the "global screen" of WinCC:

- Alarm window
- Alarm indicator
- Function keys of HMI devices with function keys

All other objects and properties are migrated to a template of WinCC.

The connection of the objects and properties to the respective template is automatically adapted.

Migration of system functions

The names of some system functions have changed in WinCC.

System functions which have changed their names are renamed.

This concerns the following system functions:

Function name in WinCC flexible	Function name in WinCC
IncreaseValue	IncreaseTag
DecreaseValue	DecreaseTag
SetValue	SetTag

See also

Supported HMI devices (WinCC flexible) (Page 186)

Changes of values of object properties by the migration (WinCC flexible) (Page 189)

Changes of values of object properties by the migration (WinCC flexible)

Introduction

The standardization of object properties from WinCC V7 and WinCC flexible requires changes to the object properties during the migration process. The migration calculates the changes in such a way that the representation of the objects after migration is the same as prior to migration. Changes made during migration result in different units of measurements and values in the configuration for some object properties.

Migrating the font settings of an object

In WinCC V7 and WinCC flexible, the unit of measurement "point" is used to denote the size of the fonts used for an object. In WinCC, the unit of measurement "pixel" is used to denote the size of the fonts used for an object. During migration, the font size is converted accordingly to ensure that the representation of the font is the same size at zoom level 100%. Due to the different units of measurement, the numerical values for the font sizes change after migration.

Example:

Font style before migration	Font style after migration
Arial 10 points	Arial 13 pixels
Arial 16 points	Arial 21 pixels
Tahoma 10 points	Tahoma 13 pixels
Tahoma 16 points	Tahoma 21 pixels

Migration of object margins

In WinCC flexible, some objects permit the entry of values <0 and >127 for setup of the object margins for the configuration of the representation. In WinCC, the value range for object margins is limited to values between 0 and 127. Migration changes values <0 to "0" and values >127 to "127".

Object support during migration (WinCC flexible) (Page 187)

Migration tags (WinCC flexible)

Introduction

You need to make some special considerations when migrating tags. The following aspects should be distinguished:

- Migrating data types of tags
- Migrating internal tags
- Migrating external tags
- Tag names

Migrating data types

WinCC features some other data types and uses different data type names than WinCC flexible. When migrating a relevant tag, the data type from WinCC flexible is mapped to the corresponding data type in WinCC. You can find additional details on this in the section "Migration of data types (WinCC flexible) (Page 203)".

Migrating tags

Tags are always fully migrated. Only the data type names and tag names may change due to migration.

Migrating names of tags

In WinCC flexible, tags located in different folders can have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means tags with the same name from different folders will be renamed during migration. You can find additional details on this in the section "Basics on migration (WinCC flexible) (Page 181)".

Basics on migration (WinCC flexible) (Page 181)

Migration of data types (WinCC flexible) (Page 203)

Supported HMI devices (WinCC flexible) (Page 186)

Migration of alarm classes and alarm groups (WinCC flexible)

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Alarms
System	System
Warnings	Events

The names of the alarm classes can be changed as necessary after migration.

Migrating alarm groups

Migration will migrate only those alarm groups actually in use.

Alarm groups with an ID from 1-31 will be migrated 1:1.

A corresponding alarm group is created in WinCC for each alarm class in the system. These alarm groups created by the system are assigned IDs beginning with the number 32 and consecutively incremented. The 4 pre-defined alarm classes in every WinCC project are automatically given IDs 32-35 by their alarm groups. Additionally created alarm group and an additional ID is assigned to each user-defined alarm class. Therefore, the IDs for alarms groups with IDs > 31 may be changed after migration. This step also changes the assignment of the alarm group names to the IDs.

Example:

In the example, you can see the assignment of the IDs in WinCC for the migration.

Alarm groups	ID in WinCC flexible	ID in WinCC	
Alarm group 1-16	1-16	1-16	Default for alarm groups from system alarms
Alarm group 17-31	17-31	17-31	Custom alarm groups
		32-35	Default in WinCC for alarm groups of pre-defined alarm classes.
Alarm group 32	32	36	Changed assignment of ID to alarm group in WinCC
Alarm group 33	33	37	Changed assignment of ID to alarm group in WinCC

Also note:

When migrating alarm groups that supposedly have the same group name, the migration adapts the name. This occurs, for example, when a group name contains a space at the end of the name. The migration deletes all existing spaces at the end of names. If two groups obtained the same group names due to this deletion, the migration adds the suffix "# Mign" to the group name of the following alarm groups, where "n" stands for a sequential number.

Example:

The following alarm groups exist in WinCC flexible:

"AlarmGroup_18"

"AlarmGroup_18 " - group name contains one space

"AlarmGroup_18 " - group name contains two spaces

"AlarmGroup_18" is the alarm group with the highest number.

Result after migration:

"AlarmGroup_18"

"AlarmGroup_18#Mig1"

"AlarmGroup_18#Mig1.1"

Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Errors
System	System
Warnings	Warnings

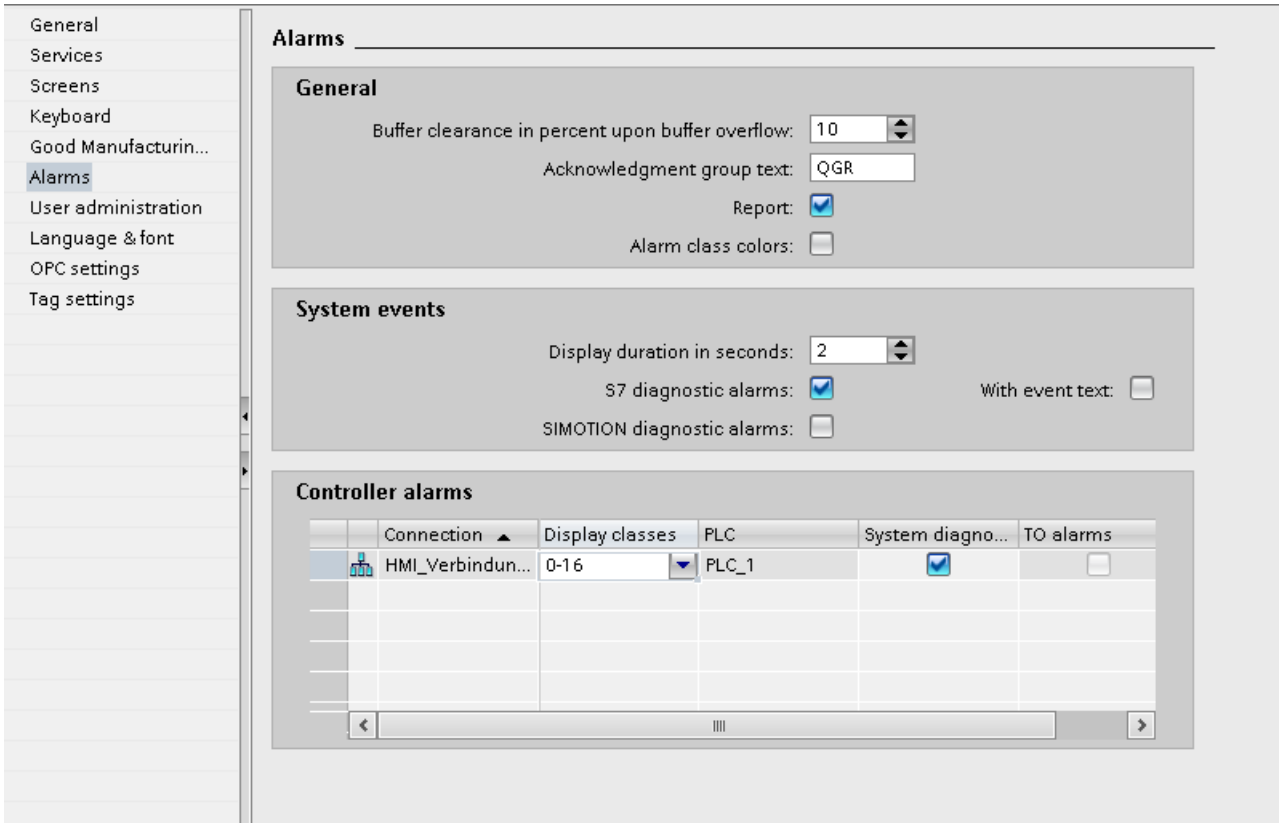
The names of the alarm classes can be changed as necessary after migration.

Display of ALARM_S messages and SIMATIC SFM messages

In WinCC flexible you can activate the display classes for ALARM_S messages in integrated projects. In WinCC flexible, you activate the display of SIMATIC SFM messages via a separate setting. The separate setting for activating the display of SIMATIC SFM messages is not required in WinCC. You control the display of SIMATIC SFM messages, and also the display of ALARM_S messages in WinCC only by activating the corresponding display class.

The changed concept may cause the display of messages to change following migration.

If all the display classes for ALARM_S messages are activated and the display of SIMATIC SFM messages is deactivated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are displayed following migration.



To ensure that only ALARM_S messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to deactivate this display class in WinCC.

If all the display classes for ALARM_S messages are deactivated and the display of SIMATIC SFM messages is activated in the WinCC flexible project , ALARM_S messages and SIMATIC SFM messages are not displayed following migration.

To ensure that only SIMATIC SFM messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to activate this display class in WinCC.

The display class is dependent on the settings in STEP 7. The default setting for SIMATIC SFM messages in Step 7 is the display class "0". To activate the display in WinCC, the display class "0" must be activated.

You activate the display class in WinCC in the Runtime settings of the respective HMI device in the "Messages" category.

See also

Supported HMI devices (WinCC flexible) (Page 186)

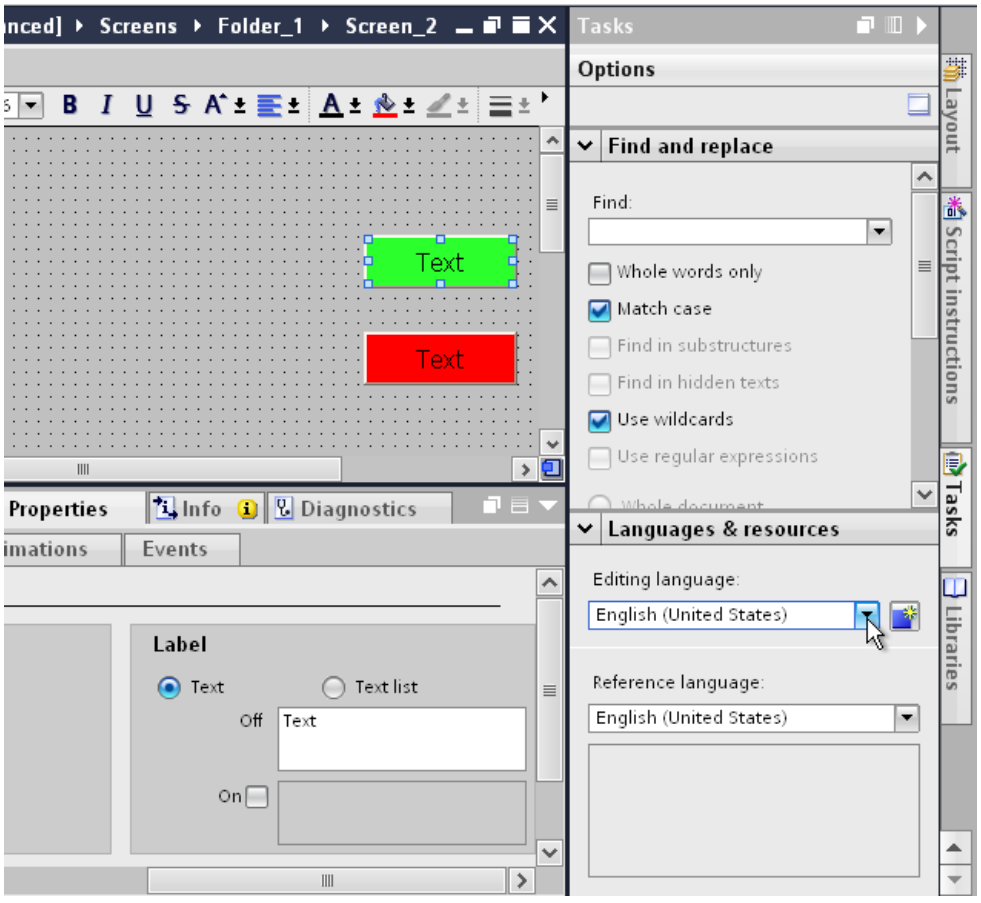
Migration of language-dependent contents (WinCC flexible)

Introduction

WinCC offers the same options for configuring projects in different languages as those available in WinCC flexible. All languages supported by WinCC are included in the migration of a project.

Migrating language-dependent content

The following language-dependent content is migrated:



- Project languages
- Project texts
- Fonts for display in runtime
- Language-dependent graphics

You need to consider the following when migrating language-dependent content:

- The operating system on the PC performing the migration must support the project languages used in the project.
- The fonts used for runtime display must be installed on the PC performing the migration.
- Dictionaries are not supported by the migration.

Editiing language of integrated projects following migration

During migration of an integrated project, the project components to be migrated from STEP 7 and WinCC flexible also bring their respective settings for the editing language. In WinCC there is only one editing language for all project components. Migration activates for the mgrated project the editing language which was set in STEP 7 prior to migration. If this setting is not the same as the setting from WinCC flexible, the configured texts are no longer visible in WinCC. No text is displayed at the usage locations, or only the entry "Text" can be seen. To make the texts visible, you must change the editing language. Click the "Tasks" taskcard at the right-hand edge of the TIA portal and select the correct editing language in the "Language & Resources" area.

Unsupported languages

The migration of language-dependent content depends on whether or not WinCC supports the respective language.

If a project only contains project languages not supported by WinCC, the project will not be migrated.

If a project contains supported and unsupported project languages, only the supported languages will be migrated. The editing language and reference language are set to a supported language.

The following languages are not supported by WinCC:

- Arabic
- Hebrew
- Dhivehi
- Gujarati
- Kannada
- Tamil
- Telugu
- Urdu
- Punjabi
- Persian
- Syrian

Supported HMI devices (WinCC flexible) (Page 186)

Migrating libraries (WinCC flexible)

Introduction

You need to consider two different cases when migrating from libraries:

1. Migrating a project library
2. Migrating a global library

Migrating a project library

A project library is stored together with the project data in the project file. For this reason, a project library is migrated with the same restrictions as the project data.

Migrating a global library

Global libraries are not supported by the migration. The library objects used in the project will be migrated, however. The library objects are copied when used in the project and then no longer have a connection to the library.

To migrate a global library, you must copy or move the objects contained in the library to the project library. The objects are then included in the migration. In WinCC, you move the migrated objects to a new global library that is created. You can copy or move both individual objects or entire library categories.

5.2.7.3 Migrating runtime data (WinCC flexible)

Migrating runtime data (WinCC flexible)

Introduction

When migrating a project, only the configuration data will be migrated. The runtime data are not affected. You need to update the runtime data following migration.

The runtime data consists of the following:

- Runtime project
  The runtime project contains the compiled project data.
- Recipe data and user administration
  The recipe data and user administration are data that can be changed in runtime.

Migrating runtime data

You update the runtime project by compiling the project in WinCC again and loading it to the HMI device.

If the recipe data and user administration were changed in runtime, you need to back up this information from the HMI device before you load the migrated project. You can then load the migrated project to the HMI device. Finally, you load the saved recipe data and user administration back to the HMI device.

See also

Migration (WinCC flexible) (Page 181)

Backing up recipe data and user administration (WinCC flexible) (Page 197)

Restoring recipe data and user administration (WinCC flexible) (Page 198)

Backing up recipe data and user administration (WinCC flexible)

Introduction

To continue using the recipe data and user administration in a migrated project, you first need to back up this data from the HMI device. Then load the data into the migrated WinCC project. Use ProSave to back up the data.

Requirement

- The WinCC flexible project is running on the HMI device in Runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to back up the recipe data and user administration:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Backup" tab.
4. Select the "Recipes from the device memory" entry in the "Data type" box.
   Do not select "Complete backup" because otherwise you will not be able to select separately when restoring the recipe data.
5. Navigate to the desired location in the "Save as" box and click "Start Backup".
   The recipe data are saved.
6. Select "User administration" in the "Data type" box and click "Start Backup".
   The user administration is saved.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC flexible. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

Alternatively, you can back up the recipe data and user administration via the ProSave integrated in WinCC flexible. Start WinCC flexible and select the menu command "Project > Transfer > Backup". Back up the recipe data and user administration as described in steps 4-6.

Migrating runtime data (WinCC flexible) (Page 197)

Restoring recipe data and user administration (WinCC flexible) (Page 198)

Restoring recipe data and user administration (WinCC flexible)

Introduction

To continue using saved recipe data and user administration after the migration, you first need to compile the migrated project and load it to the HMI device. You can then transfer the saved data to the HMI device. Use ProSave to restore the data.

Requirement

- The migrated project has been transferred to the HMI device and is running in runtime.
- The HMI device is connected to a PC on which ProSave is installed.

Procedure

Proceed as follows to load the saved recipe data and user administration to the HMI device:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Restore" tab.
4. Navigate to the location of the saved recipe data in the "Opening..." box and select the file.
5. Click "Start Restore".
   The recipe data will be transferred to the HMI device..
6. Repeat steps 4-5 to restore the user administration.
   The user administration will be transferred to the HMI device.

For additional information refer to the online help for ProSave.

Alternative procedure

ProSave is automatically installed with WinCC. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

You can also restore the recipe data and user administration via the ProSave integrated in WinCC. Start WinCC and select the menu command "Online > Device maintenance > Restore". Restore the recipe data and user administration as described in steps 4-6.

Migrating runtime data (WinCC flexible) (Page 197)

Backing up recipe data and user administration (WinCC flexible) (Page 197)

5.2.7.4 Migrating integrated projects (WinCC flexible)

Migrating integrated projects (WinCC flexible)

Introduction

The controllers and HMI devices contained in a project integrated in STEP 7 are linked together by the configuration. The configuration data of WinCC flexible and STEP 7 are also connected. When an integrated project is migrated, the complete project will be migrated with components from WinCC flexible and STEP 7. The connections remain intact.

Note

It is advisable to compile and save an integrated project in WinCC flexible before you migrate it. You can be sure that the data in WinCC flexible and STEP 7 is synchronized if compilation was completed without errors.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the WinCC flexible component as those for the migration of a non-integrated WinCC flexible project. The objects and properties contained in the WinCC flexible component must be supported by WinCC, for example, the HMI device or the communication driver. The "Online" property must be activated on the configured connection. A connection with deactivated "Online" property is not migrated.

In addition to the requirements for the WinCC flexible component, there are also requirements for the STEP 7 component of the integrated project. The objects and properties contained in the STEP 7 V5.4 SP5 or V5.5 component must be supported in STEP 7. For detailed information, refer to the documentation for STEP 7.

To fully migrate an integrated project and then edit it, the following components must be installed on the PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC flexible 2008 SP2 or WinCC flexible 2008 SP3
- STEP 7

If you only want to save the project in migration format, you can use the migration tool. See Basics on migration (WinCC flexible) (Page 181) for additional information.

An integrated project is always fully migrated. If you only want to migrate the WinCC flexible project it contains, you need to separate it from the STEP 7 project before the migration. To separate the project from the integrated form, open the project in STEP 7 V5.4 SP5 or V5.5. Open the WinCC flexible project in the SIMATIC Manager. The project is opened with WinCC flexible. In WinCC flexible, select the menu command "Project > Copy project from STEP 7". WinCC flexible saves a non-integrated copy of the project.

See also

Basics on migration (WinCC flexible) (Page 181)

Migrating an integrated project

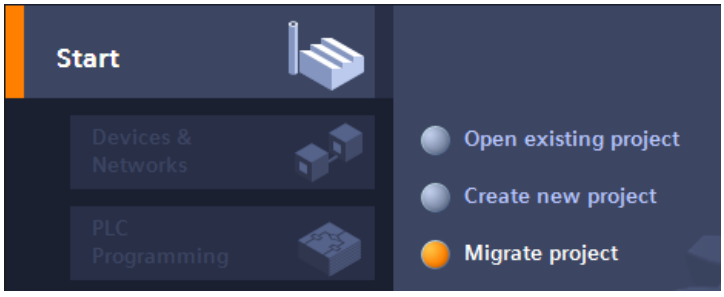
Introduction

When migrating an integrated project, the components from both the WinCC flexible project and the STEP 7 project will be migrated. This means you need to select the project file with the file extension "*.s7p" for migration. During migration, the data is copied from the existing project and migrated to a new project. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

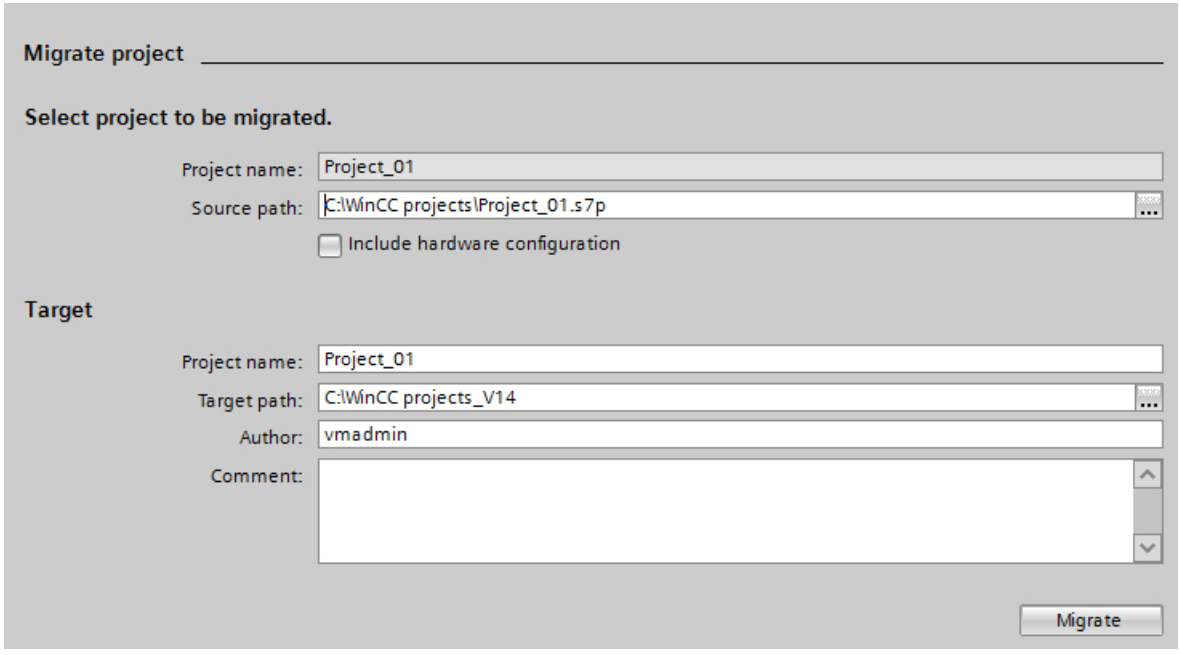
You should only migrate a project to a re-started TIA Portal.

If you only want to save the project in migration format, you can use the migration tool. For more information, refer to basics of migration (WinCC flexible).



Requirement

- STEP 7 V5.4 SP5 or STEP 7 V5.5 and all option packages used are installed.
- STEP 7 and all option packages used are installed.
- The TIA Portal is restarted.
- No project is open in WinCC.
- An integrated project is available.
- The integrated project is not open.



Procedure

To migrate an integrated project in the portal view, follow these steps:

1. Select the action "Start > Migrate Project".

2. In the "Source path" box, navigate to the project you want to migrate.

3. Select the "*.s7p" project file.
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. To migrate the project with the hardware configuration, enable "Include hardware configuration".

6. Click "Migrate".
   A new project is created and migration of the data is started:
   - The Project view opens.
   - The progress of the migration is shown in a migration window.
   - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
   - All information about the migration is saved in a log file.
   - A message is displayed upon completion of the migration. The message contains a link that you can use to open the log file.
7. Once migration is completed, save the project.

Once the migration is complete, you will find a newly created device for each migrated HMI device and controller in the project tree. These devices include the migrated data.

Note

Integrated projects with alarm views

The alarm classes in the alarm view can be disabled during migration of the project. Once migration of the project is complete, check the settings in the alarm view. Enable the required alarm classes in the Inspector window of the alarm view if needed under "Properties > General".

Opening the migration log at a later point in time

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log file as follows:

1. Open "Common data > Logs" in the project navigation.
2. Double-click the log file. The migration log opens.

5.2.7.5 Reference (WinCC flexible)

Migration of data types (WinCC flexible)

Introduction

To harmonize the data types used by controllers and HMI systems, some types of internal HMI tags are renamed. The naming takes place in accordance with IEC conventions. Because only the names change, there are no changes to the internal tags for the configuration.

The following table describes the mapping of data types from WinCC flexible to the data types in WinCC.

Migration of data types

The internal data types are mapped as follows during migration:

Internal data types WinCC flexible	Internal data types WinCC
Bool	Bool
Char	SInt
Byte	USInt
Int	Int
UInt	UInt
Long	DInt
ULong	UDInt
Float	Real
Double	LReal
String	WString
DateTime	DateTime

Migrating external data types

See the following pages for how to map the available communication drivers.

Special considerations for some data types

There are special considerations to be made when migrating external tags that contain data types of a SIMATIC S7-300/400 PLC.

Mapping of the S7 data type "Char"

The S7 data type "Char" is a data type for mapping characters according to the specification. However, since this data type is often used for reading and writing numerical values, it is mapped in WinCC to the S7 data type "Byte". If this should be the case during migration, an alarm will appear in the output window.

If the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

If the S7 data type "Char" is used for mapping characters, you must change the configuration after migration. To represent characters, use the data type "String".

When an integrated project is migrated, the data type "Char" in WinCC is also migrated to the data type "Byte". With a connected PLC tag, the data type "Char" remains "Char". As a result of changing the data type of the HMI tag, symbolic addressing of the tags in question is not migrated. After migration. the tags are interconnected by absolute addresses and continue to work. If you want to restore symbolic addressing, you have to change the configuration accordingly after the migration.

Mapping an array of the S7 data type "Char"

An array of the S7 data type "Char" is mapped to an array of the data type "Byte" during migration.

If an array of the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to an array of the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

Mapping of the S7 data type "Counter"

An external tag with the S7 data type "Counter" with counter address is mapped to the S7 data type "Counter". The address will be retained.

If an external tag with the S7 data type "Counter" addresses a data block or a bit memory address, it is is mapped to the S7 data type "Word". The address will be retained. The migration sets the coding to "SimaticBCDCounter".

The S7 data type "Counter" has a value range of 0-999. When supplied by the S7 data type "Word" the value range may be exceeded on the PLC side. Ensure that you are observing the value range.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Counter_Actual_Value	Counter	C10	BCD coded counter value
Counter_Setpoint_Value	Counter	DB10.DBW200	BCD coded counter value
Counter_Setpoint_Value#2	Counter	MW20	BCD coded counter value

WinCC

Tag	S7 data type	Address	Coding	Comment
Counter_Actual_Value	Counter	%C10	<Standard>	BCD coded counter value
Counter_Setpoint_Value	Word	%DB10.%DBW200	SimaticBCDCounter	BCD coded counter value
Counter_Setpoint_Value#2	Word	%MW20	SimaticBCDCounter	BCD coded counter value

Mapping of the data type "StringChar"

In WinCC there is no corresponding data type to which the "StringChar" data type can be mapped. Mapping in WinCC depends on the property "Length" of the S7 data type.

A tag of the "StringChar" data type with the "Length" property > 1 is migrated to an array of the S7 data type "Char". The length of the array corresponds to the length of the originally configured data type "StringChar".

If the property "Length" = 1, the data type in WinCC is migrated to an array of the S7 data type "Char" with length = 1. The expression for an array with an element is "Array[0 ..0] of Char".

Mapping of the S7 data type "Timer"

An external tag with the S7 data type "Timer" with timer address is mapped to the S7 data type "Timer". The address will be retained.

If an external tag with the S7 data type "Timer" addresses a data block or a bit memory address, it is is mapped to the S7 data type "S5 Time". The address will be retained.

Example:

WinCC flexible

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	T10	BCD coded timer value
Timer_Setpoint_Value	Timer	DB10.DBW200	BCD coded timer value
Timer_Setpoint_Value#2	Timer	MW20	BCD coded timer value

WinCC

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	%T10	BCD coded timer value
Timer_Setpoint_Value	S5Time	%DB10.%DBW200	BCD coded timer value
Timer_Setpoint_Value#2	S5Time	%MW20	BCD coded timer value

Migration of data types (WinCC flexible) (Page 203)

5.2.8 Migrating integrated projects

5.2.8.1 Migrating an integrated project (S7-300, S7-400)

Introduction

In integrated projects, you use SIMATIC controllers and WinCC components together in a project. When an integrated project is migrated, the complete project will be migrated with components from WinCC and STEP 7. Configured connections between control and visualization remain intact.

Migrating an integrated project

When migrating an integrated project, the same requirements apply for the STEP 7 component as those for migration of a non-integrated STEP 7 project. The objects and properties contained in the WinCC component must also be supported in WinCC (TIA Portal).

For an operating station (OS) to be migrated, it has to be located below a PC station and the WinCC application in the project tree of SIMATIC Manager. The following figure shows the assignment of the operating station within the initial project:

Additional migration requirements for integrated projects can be found in the documentation for WinCC.

Also note that the initial project must be compiled before the migration.

In order to fully migrate an integrated project, the following components must be installed on the programming device/PC for the migration:

- STEP 7 V5.4 SP5
- WinCC V7.3 with the latest update or WinCC Flexible 2008 SP2 or SP3

To be able to fully post-edit an integrated project, the latest version of the following components must be installed on the PC for post-editing:

- STEP 7 Professional
- WinCC Basic, WinCC Comfort/Advanced or WinCC Professional, depending on the components used

Using the migration tool

It is necessary to use the migration tool under the following circumstances:

- The initial project is not located on the same programming device/PC as the installation of the TIA Portal.
- SCADA devices are included in the initial project. These can only be migrated with the migration tool.
- WinCC Professional V14 and STEP 7 with WinCC V7.3 cannot be installed on the same programming device/PC. Therefore, integrated projects with WinCC V7.3 parts must be prepared for migration using the migration tool.

Migration of the STEP 7 part of an integrated project

An integrated project is always fully migrated. Individual components cannot be migrated on their own. You can only migrate the included STEP 7 project alone, if you have previously deleted all HMI stations in the SIMATIC stations in the SIMATIC Manager and then recompiled the project in NetPro.

Alternatively, you can open the project in an installation of STEP 7 V5.4 SP5 without an installation of WinCC. Then, save the project again and select the "Reorganize" function during saving. The WinCC parts are then automatically removed when the copy is saved.

You can then migrate the STEP 7 project without the WinCC project.

Migration of an integrated project with the hardware configuration

In integrated projects, HMI devices are migrated even if the hardware configuration is not included in the migration. The STEP 7 part of the hardware configuration, including network configurations, and connections and interrupts, is migrated only if you include the hardware configuration in the migration. Otherwise, unspecified modules will be created for the STEP 7 devices and you will need to convert them into suitable modules after the migration.

HMI modules that are plugged into a PC station are converted to a separate Station during the migration. If you perform the migration without including the hardware configuration, the

migrated project then contains a non-specified SIMATIC PC Station and a SIMATIC PC Station with the HMI devices. References to HMI devices are not imported during migration. When the hardware configuration is included, the migrated project contains two separate stations: the HMI Station and the PC Station.

Storage location of an integrated WinCC project

If you migrate an integrated project, the HMI part of it must be on the same PG/PC as the STEP 7 part of the project. If the HMI part is on a different PG, then only the STEP 7 part will be migrated.

Unsupported objects

The following components are not supported for migration:

- STEP 7 multiproject
  A STEP 7 multiproject cannot be migrated. Migration will be canceled.
- Central Archive Server - CAS
  If a CAS is part of an integrated project, then the migration will be carried out but the CAS data will not be migrated.

See also

Post-editing integrated projects (Page 213)

5.2.8.2 Post-editing integrated projects

If you have migrated an integrated project without hardware configuration, unspecified CPUs are used instead of the CPUs of the original project. Since no connection can exist between an unspecified CPU and an HMI device, connections from the source project are also imported only unspecified.

Procedure

To continue to use an integrated project after the migration, follow these steps:

1. Convert the unspecified devices into suitable devices again.
2. Restore the integrated HMI connection between the HMI device and the PLC.
3. Connect all HMI tags to the newly created integrated connection.
4. Restore the connection between HMI tags and PLC tags.
5. Delete the non-integrated HMI connection.

In the following chapters a sample project is used to describe the individual steps in more detail.

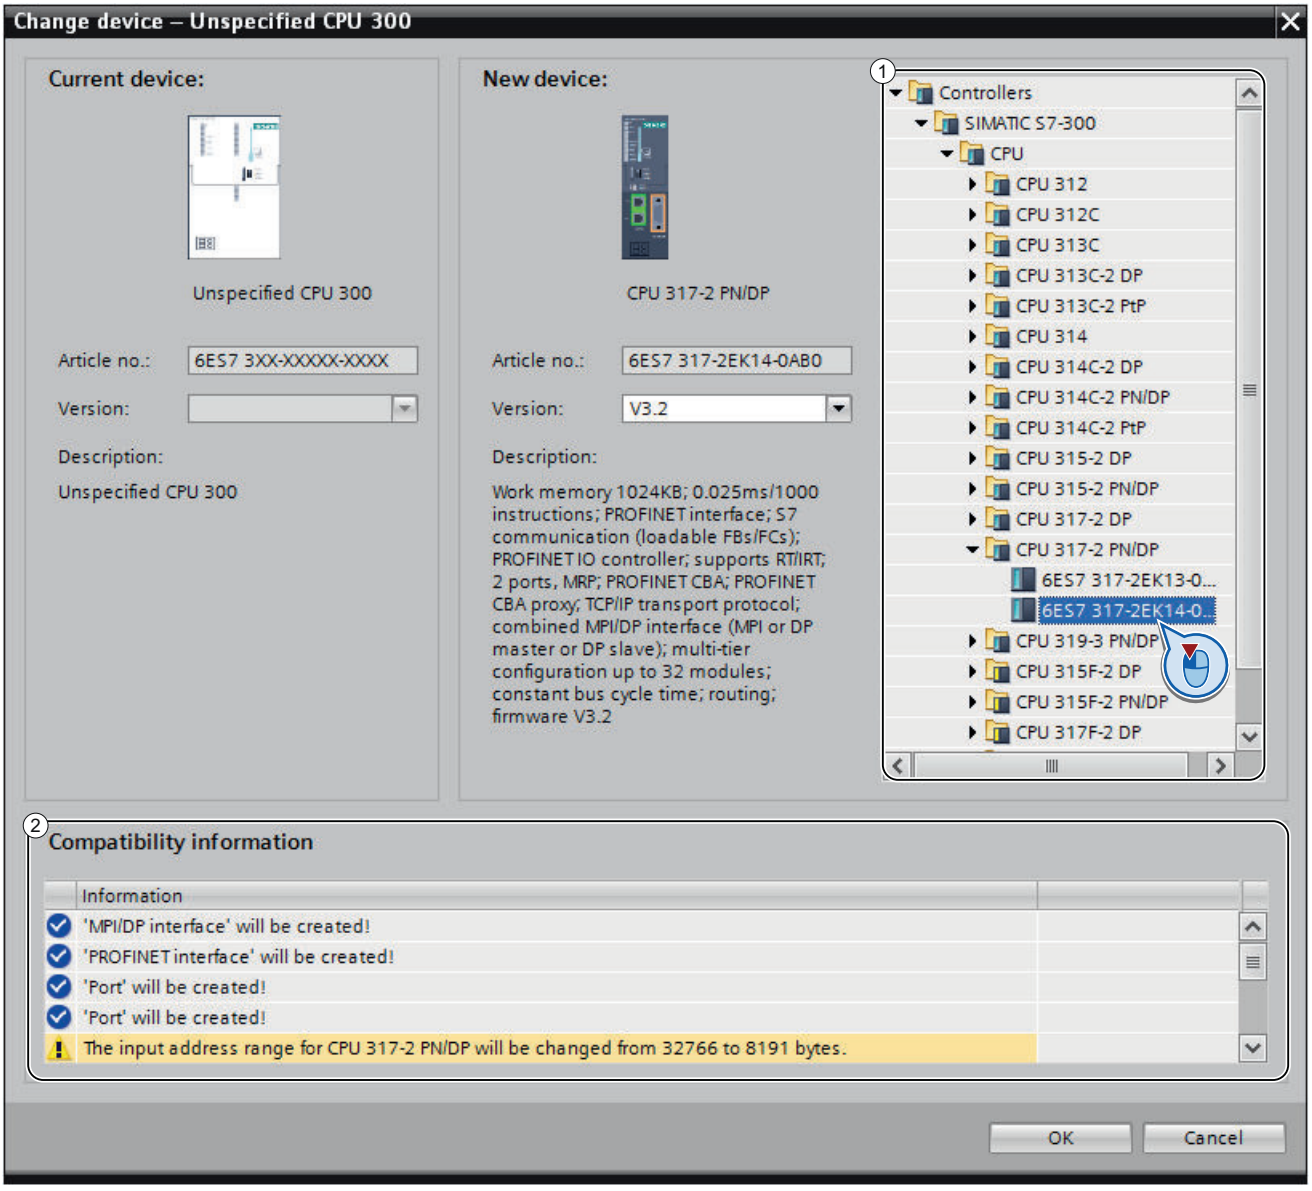
See also

Converting unspecified CPUs into specified CPUs (Page 214)

Creating an integrated HMI connection (Page 216)

Re-linking HMI tags (Page 218)

Delete non-integrated HMI connection (Page 219)



5.2.8.3 Converting unspecified CPUs into specified CPUs

The first step after the migration without hardware configuration is the conversion of the unspecified CPUs into specified CPUs. Unspecified CPUs are placeholders for certain CPUs from the hardware catalog that are not currently known. You can define general parameters and home the CPUs already in the user program. However, the project is not fully functional until the unspecified CPU has been specified.

Specifying a CPU using module replacement

To use module replacement to specify an unspecified CPU, follow these steps:

1. Select the unspecified CPU in the network or device view.
2. Select the "Replace device" command in the shortcut menu.
   The "Replace device" dialog opens.

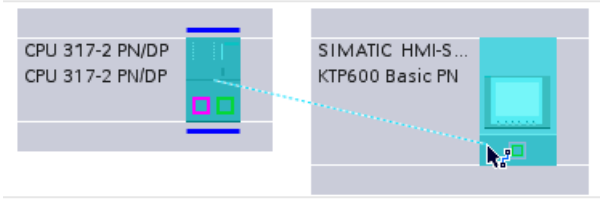
3. Under "New device" in the tree structure, select the module with which you want to replace the unspecified CPU. (Area 1)
   "Compatibility information" provides you with information on the extent to which the selected CPU is compatible with the configuration in source project. (Area 2)
4. Click "OK".
5. Perform the above-described steps for all unspecified CPUs.

See also

Creating an integrated HMI connection (Page 216)

5.2.8.4 Creating an integrated HMI connection

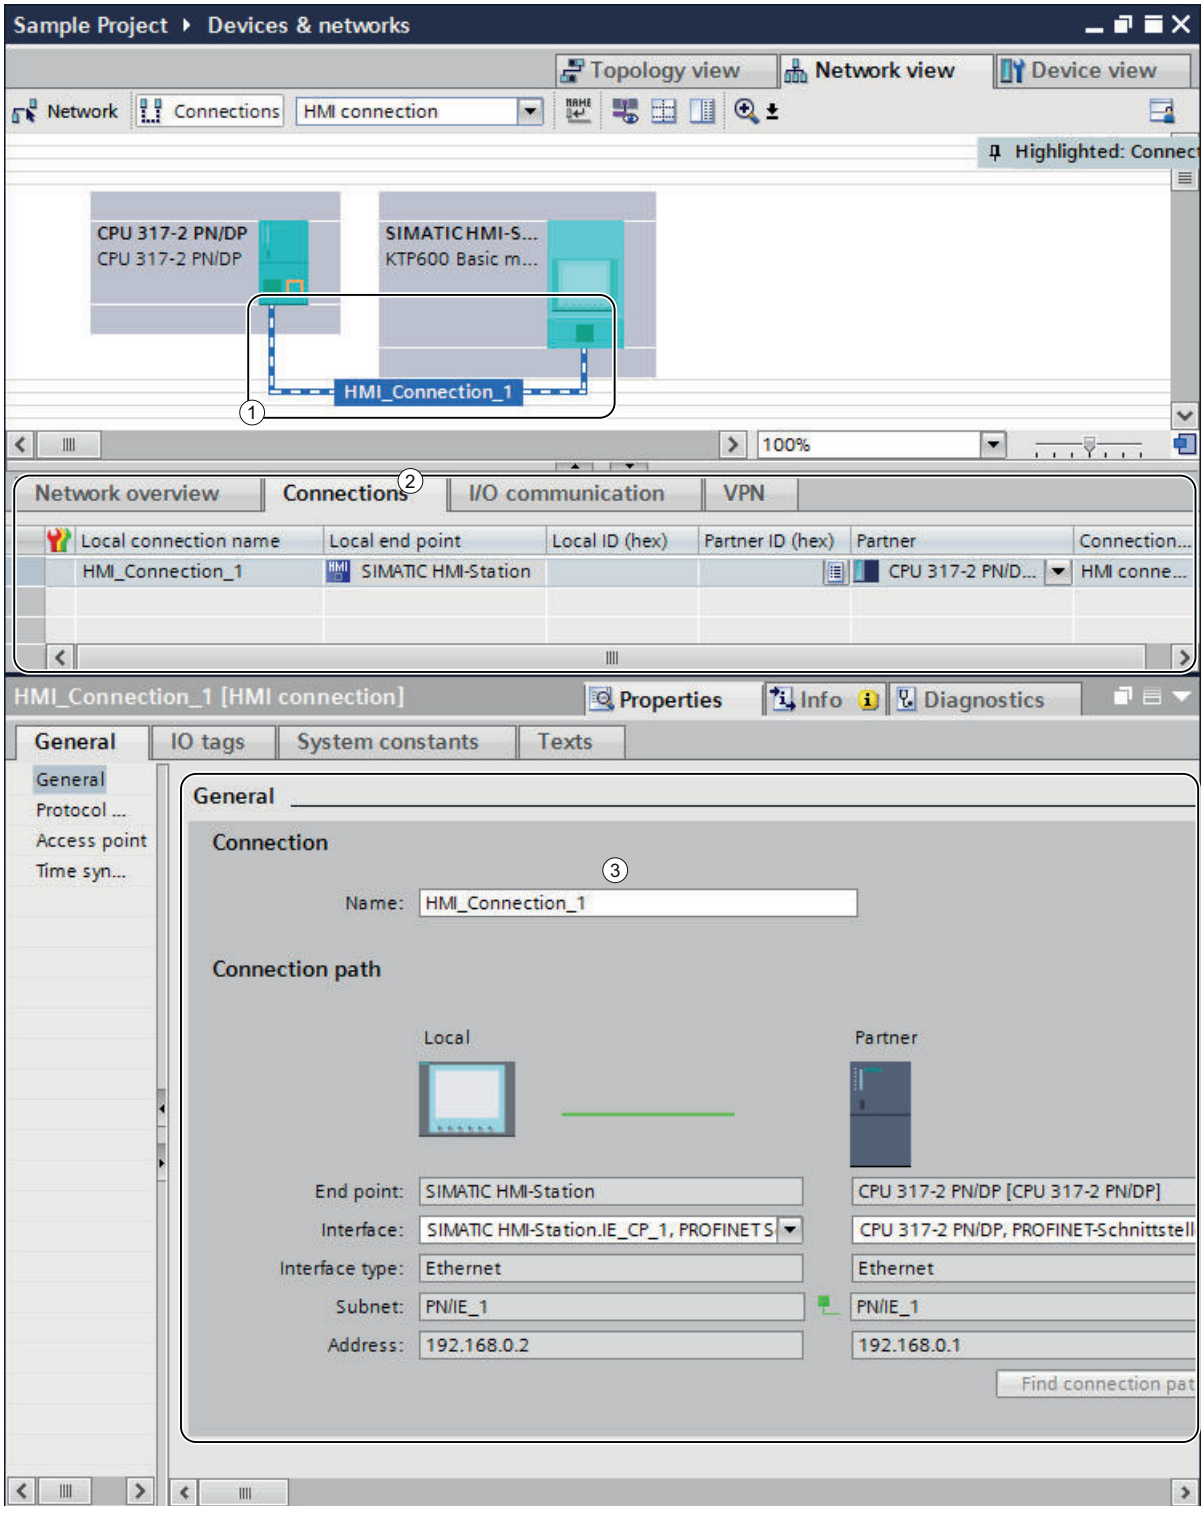
After you have specified the unspecified CPU, establish the connection to the HMI-device.



Procedure

To create a connection graphically, follow these steps:

1. On the toolbar, click the "Connections" icon. This activates connection mode.



2. Select the connection type "HMI connection" in the adjacent drop-down list.
   The network view highlights in color all CPUs and HMI devices that can be used for an HMI connection.
3. You can now have the connection path automatically determined, or explicitly select a connection path via specific interfaces:
   - Allow connection path to be automatically determined
     Select the source CPU for a connection. Drag the mouse to the target components. Confirm the connection endpoint with another mouse click.
     Alternatively: While holding down the shift button, select the target components and with the right mouse button select the "Add new connection" command.
   - Selecting an explicit connection path from interface to interface
     Click on the subnet interface in the device for which you want to create a connection. Hold down the mouse button, drag the cursor to the relevant interface in the target device and then release the mouse button.

Result

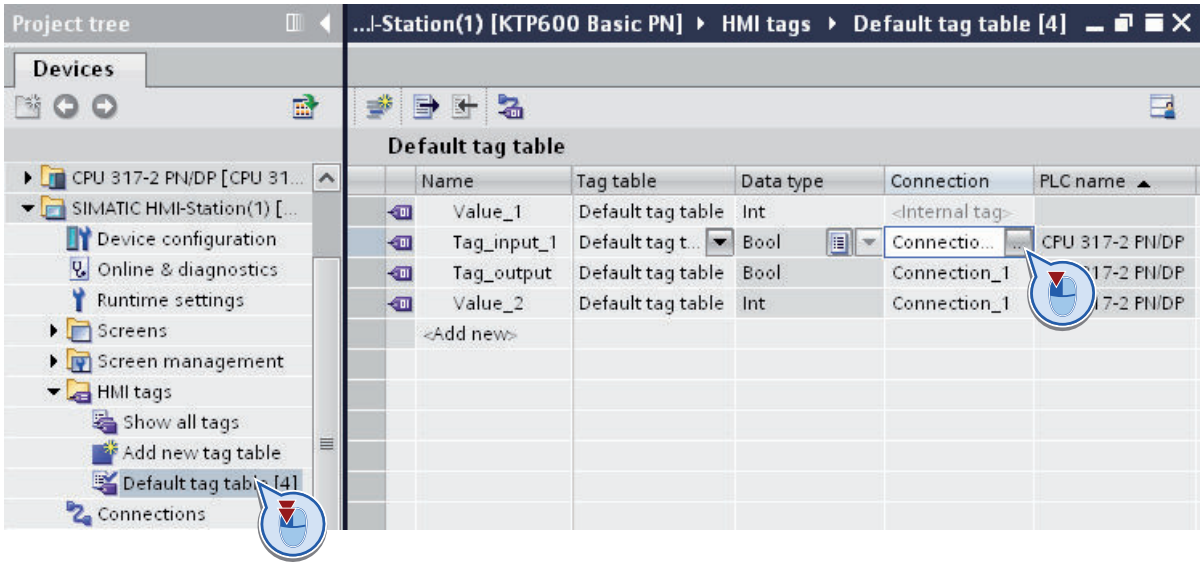
The following figure shows the state after the integrated connection has been created:

① An integrated HMI connection is created and highlighted in the network view.

② The connection is shown in the connection table of the components.
③ The connection can be edited in the connection properties.

See also

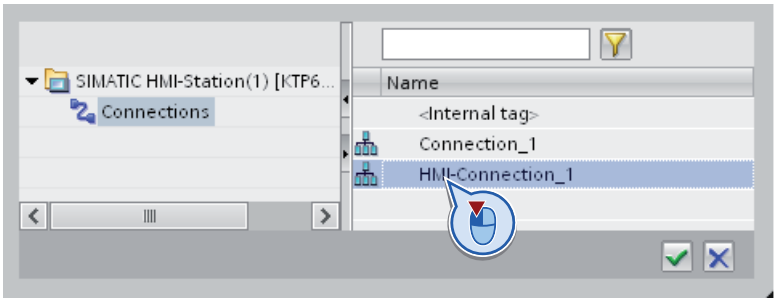
Re-linking HMI tags (Page 218)



5.2.8.5 Re-linking HMI tags

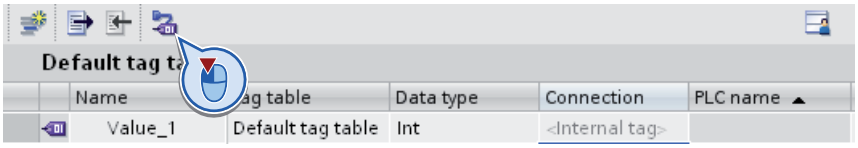
When you have created a new HMI connection between the CPU and HMI device, you have to assign the existing HMI tags to the new connection. Perform the following steps for each line in the relevant tag table.

Procedure



To re-link HMI tags, follow these steps:

1. In the project tree, navigate to the HMI tags and double-click the relevant tag table to show this in the work area.
   The tag table opens.



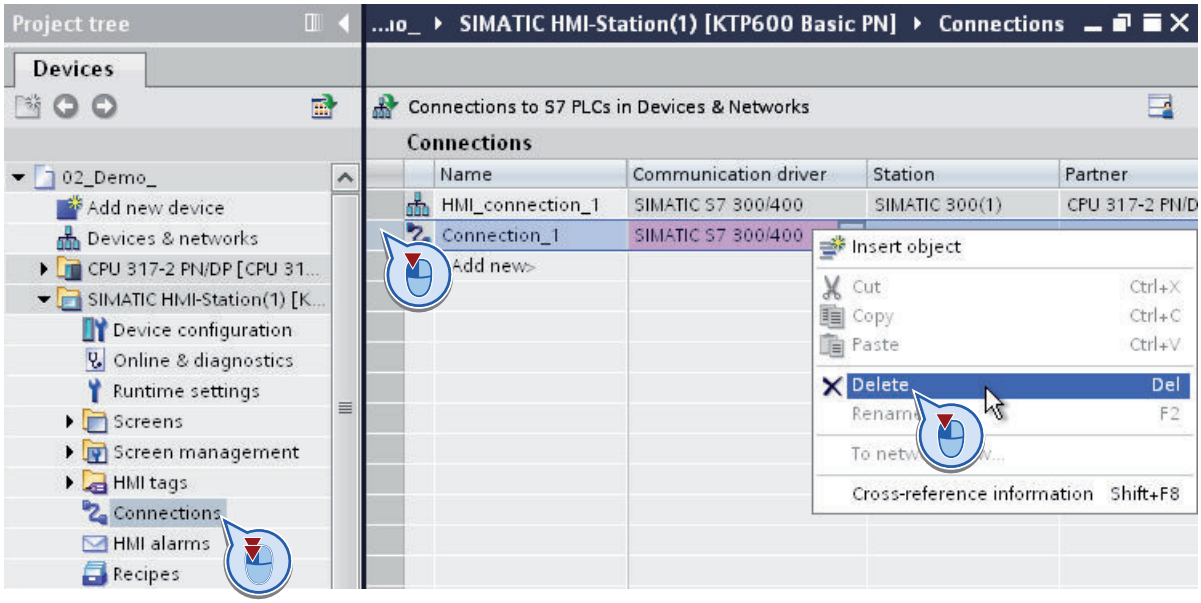
2. Click the " ... " button in the "Connection" column.
   A dialog box for selecting the connection opens.

3. Select the newly established HMI connection.

4. Click the "✓" button to apply the selected connection.
5. On the toolbar, click the "Re-connect PLC tag" button.

See also

Delete non-integrated HMI connection (Page 219)



5.2.8.6 Delete non-integrated HMI connection

Finally, you can remove non-integrated HMI connections that still remain from the source project.

Procedure

To delete the non-integrated HMI connections, follow these steps:

1. In the project tree, open the HMI device and double-click the "Connections" entry. The connection table opens.

2. Select the row with the old connection in the table.
3. Select the "Delete" command in the shortcut menu of the connection line.
4. Perform the above-described steps for all non-integrated HMI connections of the source project.

5.3 Migrating S7-1200 to firmware as of V4 (S7-1200)

5.3.1 Basic information on upgrading to V4 (S7-1200)

Introduction

If you have used a CPU with firmware version V3 in your project and want to upgrade to a CPU with firmware V4.0 or later, you can easily replace the device.

The TIA Portal offers the "Change device" function for this purpose. The project remains unchanged when the device is replaced. You can continue using the programs that you created with firmware version V3.

Rules

The following basic rules apply when replacing a device:

- Replacing a device is only possible if the project was created based on a CPU with firmware version V3.0. If your project was created based on firmware version V1.0 or V2.0, create a new CPU with firmware version V3.0 offline in the project, and copy your program to this CPU.
- It is not possible to replace a V4 CPU with a V3 CPU. If you want to continue using the existing V3 CPU, create a copy of this CPU before replacing the device.
- The program cannot be transferred to the new CPU via a memory card. Instead, use the "Change device" function, which is described in the following sections.

HMI panels

Configured HMI panels are treated differently during device replacement depending on the firmware version of the panel and the communication mode.

The following table shows the HMI connections that are supported with the migration:

Firmware version of the panel	PUT/GET communication	Migration to V4
V11 or later	No	S7-1200 does not support this configuration. Upgrade the firmware of the HMI panel to V12.0. Then compile and load the configuration.
V11 or later	Yes	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.
V12 or later	No	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.

During compilation of the program, you receive specific information on migrating the HMI panel.

Note

HMI TP 177B 4"

The HMI TP 177B 4" with firmware version V11.0.2 cannot be operated with S7-1200 V4. Replace the panel with a new device, if necessary.

S7-1200 expansion modules

If you are already using the following centrally plugged S7-1200 modules in your system, you must perform a firmware update for these modules in order to guarantee operation with S7-1200 V4.

- ASi - Master - CM 1243
- DP - Master - CM 1243-5
- WAN CP - CP1243-1

Newly shipped S7-1200 modules have the latest firmware installed ex works.

Protected blocks

Blocks equipped with know-how protection or copy protection cannot be converted to V4. If the project contains protected blocks, you must remove the protection prior to migration.

If these are supplied blocks and you do not know the password, ask your supplier either for the password or for a V4-compatible block.

WARNING

Preventing personal injury and material damage

Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 in Siemens Industry Online Support:

http://support.automation.siemens.com/WW/view/en/82140966 (http://support.automation.siemens.com/WW/view/en/82140966)

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Migrating to V4 (Page 223)

Special considerations after migrating to V4 (Page 224)

5.3.2 Migrating to V4 (S7-1200)

Requirement

- A CPU with firmware version V3 is available in the project.
- The project contains no protected blocks.

Procedure

Proceed as follows to replace a CPU:

1. Select the V3 CPU you want to replace.
2. Select the "Change device" command in the shortcut menu.
   The "Change device" dialog box appears.
3. Under "New device" in the tree structure, select the V4 CPU with which you want to replace your current V3 CPU.
4. Click "OK".
   The existing CPU is replaced by the new one.
5. Select the new CPU and select the "Compile > Hardware and software (only changes)" command in the shortcut menu.
   The device configuration and the user program are compiled again.
6. Optional: If necessary, apply know-how protection or copy protection to individual blocks in the program.
7. Select the new CPU and select the "Download to device > Hardware and software (only changes)" command in the shortcut menu.
   The device configuration and the user program are loaded into the new CPU.
   This completes the device replacement.

⚠ WARNING

Preventing personal injury and material damage

Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 in Siemens Industry Online Support:

http://support.automation.siemens.com/WW/view/en/82140966 (http://support.automation.siemens.com/WW/view/en/82140966)

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

See also

Basic information on upgrading to V4 (Page 221)

Special considerations after migrating to V4 (Page 224)

5.3.3 Special considerations after migrating to V4 (S7-1200)

Functional changes in V4

S7-1200 V4 offers significantly enhanced functionality. The most important functional changes that you need to consider after migrating from V3 are described briefly below.

You can find more information on S7-1200 in the "SIMATIC S7-1200 Automation System" system manual:

https://support.industry.siemens.com/cs/ww/en/view/65601780 (http://support.automation.siemens.com/WW/view/en/65601780)

Organization blocks

With S7-1200 V4, you can specifically set the interruptibility of each organization block used. When a device is replaced, all the organization blocks are configured as non-interruptible, to ensure that the executability of your V3 program remains unchanged. The OB priorities from the V3 program also remain unchanged. After migration, you can change the settings for priority and interruptibility as needed.

The behavior of diagnostic interrupts in V4 has changed as follows:

In V3, the start information always contained information on the triggering module, including the channel number. In V4, this information is only generated for a pending diagnostics event. If no diagnostic event is pending, for example, because the fault has already been corrected, only the triggering module is indicated.

Access levels

S7-1200 V4 offers an extended access level concept. The following table shows how the protection levels of the V3 firmware are indicated in V4:

V3 protection level	V4 access level	Meaning
No protection	Full access (no protection)	Unrestricted access without password protection.
Read-only	Read access	HMI access and unimpeded communication between CPUs without password protection. A password is required for changes (write access) in the CPU and for changing the operating mode of the CPU (RUN/STOP).
Write/read protection	HMI access	HMI access and unimpeded communication between CPUs without password protection. A password is required to read the data in the CPU, for changes (writing) in the CPU, and for changing the operating mode of the CPU (RUN/STOP).
-	No access (complete protection)	No access without password input. A password is required for HMI access, for reading the data in the CPU, for changing (writing) data in the CPU, and for changing the operating mode of the CPU (RUN/STOP).

Instruction libraries

After migration to S7-1200 V4, instructions from the libraries of the firmware version V3 are still available. This ensures that you can continue to use your program unchanged. In addition, S7-1200 V4 offers many new instructions which are also compatible with the instructions of the S7-1500.

You can find more information on the instruction libraries in the "SIMATIC S7-1200 Automation System" system manual:

https://support.industry.siemens.com/cs/ww/en/view/65601780 (http://support.automation.siemens.com/WW/view/en/65601780)

Motion Control

When a device is replaced, the Motion Control objects from the libraries of the firmware versions V1 and V2 are replaced with the corresponding objects from the V3 libraries. The objects from V3 libraries are compatible so that you can continue to use the programs unchanged.

The libraries of the S7-1200 V4 offer many new Motion Control functions, which are compatible with the functions of the S7-1500. If you want to use V4 libraries, select them on the "Instructions" task card after replacing the device.

You can find more information on the new Motion Control functions in the "SIMATIC S7-1200 Programmable controller" system manual.

https://support.industry.siemens.com/cs/ww/en/view/65601780 (http://support.automation.siemens.com/WW/view/en/65601780)

Web server

The following settings for operation via a web server are transferred from the V3 CPU to the V4 CPU during device replacement:

- Activate web server on this module
- Permit access only with HTTPS

If you want to operate the V4 CPU via a web server, you need to set up user accounts with assigned user rights in the user management. Only the standard web pages are available to standard users without any additional rights.

Note

Additional support

You can find the latest FAQs about migrating to S7-1200 V4 in Siemens Industry Online Support:

http://support.automation.siemens.com/WW/view/en/82140966 (http://support.automation.siemens.com/WW/view/en/82140966)

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Communication via PUT/GET

Communication via PUT/GET is enabled after the device replacement. Note that the new integrated connection types offer a security standard higher than PUT/GET communication. If you do not use PUT/GET communication, you should disable it.

Introduction to the TIA Portal 6

6.1 Getting started

6.1.1 Getting Started Documentation

Getting Started with the TIA Portal

The Getting Started documentation is available to help you begin using the TIA portal.

The Getting Started documentation contains instructions which show you, step-by-step, how to create a project in the TIA Portal and give you the chance to get a quick overview of all the possibilities the TIA Portal offers you.

Contents

The Getting Started documentation describes the creation of a continuous project for STEP 7 and WinCC that is expanded with each section. You start with simple basic functions, and use more complex ones as you continue with the creation of the project.

In addition to the step-by-step instructions, the Getting Started documents also give you background information that explains the functions used and illustrate how they relate to each other.

Target audience

The Getting Started documents are intended for beginners, but are also useful for users migrating from previous versions of SIMATIC STEP 7 and WinCC.

Getting Started documentation

You can download the Getting Started documents via the following links:

- Step-by-step instructions for simple operation of the TIA Portal (STEP 7 Basic, S7-1200)
  https://support.industry.siemens.com/cs/ww/en/view/40263542 (http://support.automation.siemens.com/WW/view/en/40263542/0/en)
- Configuration of an automation solution with STEP 7 Professional/WinCC Advanced (S7-300)
  https://support.industry.siemens.com/cs/ww/en/view/54430386 (https://support.industry.siemens.com/cs/ww/en/view/54430386)
- Multimedia Getting Started for S7-1500:
  http://www.siemens.com/s7-1500-getting-started (http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/_content/EN/content_en.html)

6.2 User interface and operation

6.2.1 Starting, setting up, and exiting the TIA Portal

6.2.1.1 Starting and exiting the TIA Portal

Starting the TIA Portal

To start the TIA Portal, follow these steps:

1. In Windows, select "Start > All Programs > Siemens Automation > TIA Portal V14".
   The TIA Portal opens with the last settings used.

Exiting the TIA Portal

To exit the TIA Portal, follow these steps:

1. In the "Project" menu, select the "Exit" command.
   If the project contains any changes that have not been saved, you will be asked if you wish to save them.
   - Select "Yes" to save the changes in the current project and close the TIA Portal.
   - Select "No" to close the TIA Portal without saving the most recent changes in the project.
   - Select "Cancel" to cancel the closing procedure. The TIA Portal will remain open if you select this option.

6.2.1.2 Overview of the program settings

Overview

The following table shows the application settings that you can make:

Group	Setting	Description
General settings	User name	The user name of the user. The user name is stored in the project properties when a new project is created.
	User interface language	Language for the program interface
	Mnemonic	Specifies the mnemonics for programming: "German" uses the German mnemonics, for example, "E1.0". "International" uses international mnemonics, for example, "I1.0". For information on the differences in the mnemonics of the individual commands, refer to the description of the relevant programming language.
	Show list of recently used projects	Number of entries in the list of recently used projects in the "Project" menu
	Load most recent project during startup	The last opened project is opened automatically after the TIA Portal starts.
	Displaying truncated text in full	Texts which are truncated due to their length are displayed in a tooltip.
	Show tooltips (context-sensitive help is available)	Tooltips are displayed and you get context-sensitive help. If this function is disabled, you can open the tooltip with <F1>. The setting also affects rollouts with context-related syntax errors and input aids in STL.
	Open cascade automatically in tooltips	After a brief time, the tooltips automatically expand to display a cascade containing additional help. If this option is cleared, the tooltips must be manually expanded.
	Show hidden banner	Banners with additional information in the editor are hidden from display by default.
Reset to default	All application settings	All changes that you made in the TIA Portal after installation are undone.
	Layout of the editors	Resets the complete layout of the application to the factory state.
	Show all alarm windows	All alarm windows whose appearance was manually suppressed are displayed again.
Start view	Most recent view	Starts the program in the last view that was used. This can be either the portal view or the project view.
	Portal view	Starts the TIA Portal in the portal view every time, irrespective of the last view you worked in.
	Project view	Starts the TIA Portal in the project view every time, irrespective of the last view you worked in.
Import/export settings	Export settings to file	Opens a dialog in which you can export the selected program settings to a file.
	Import settings from file	Enables the import of previously exported program settings from a file.
Central settings	Storage location for central settings	Here you define the storage location for the file in which the settings are stored centrally.

Group	Setting	Description
View for objects in overview	Details	When several views are available, the detail view opens by default, for example, in the overview window.
	List	When several views are available, the list view opens by default, for example, in the overview window.
	Thumbnails	When several views are available, the symbol view opens by default, for example, in the overview window.
Storage settings	Recently used storage location	When a project is saved the first time, the most recently used file path is set by default.
	Default storage location	Enables the specification of file paths for: • Projects • Libraries • Configuration file for corporate libraries
	Storage location for new and retrieved projects	Enables the specification of the storage path for projects. New projects are created automatically in this path.
	Storage location for libraries	Enables the specification of the storage path for global libraries. When you create a new library, it is automatically saved to this path.
	Storage location for the configuration file for corporate libraries	Shows the path for the configuration file for the company libraries. The path cannot be changed.
Data exchange	Storage location for data import	Imported files are searched for at this storage path by default.
	Storage location for data export	This is the default storage path for the data export.
	Storage location for support packages	When support packages are downloaded, they are stored in the specified storage path and can be installed from there.
	Storage location for log files	Log files are stored at the location specified here.
	Storage location for archiving of projects	This storage path for the filing project archives is set by default.
User documentation	Show user-defined documentation in the selected editing language	The user documentation is opened in the project editing language (Shift + F1). If the user documentation does not exist in the selected editing language, the English version is opened by default.
	Display call log for user-defined documentation	Shows call logs for user documentation. Alarms for calling user-created help files are output in the Inspector window. This makes it easier to identify and correct difficulties in calling user-created help. This function is particularly useful when creating your own help files.
	Search for user-defined documentation in a central directory	Enables the saving of user-defined documentation in a directory outside the current project directory in order, for example, to make documentation available across projects.
	Central directory for user-defined documentation	Enables the specification of the storage path on which user help files for user-defined documentation can be stored.

See also

Starting and exiting the TIA Portal (Page 229)

Resetting the user interface layout (Page 269)

Changing the settings (Page 236)

Configuring the display of tooltips and tooltip cascades (Page 299)

6.2.1.3 Overview of the settings for software updates

Overview

The following table shows the available settings for software updates:

Group	Setting	Description
TIA Portal update	Check for updates daily	Checks if updates are available after every restart of the computer and then every 24 hours. If updates are found, you receive a message in the information area of the Windows taskbar.
	Check for updates now	Starts the search for updates and displays the result in the TIA Updater.

6.2.1.4 Overview of the script and text editor settings

Overview

The following table shows the available settings for script and text editors:

Group	Setting	Description
Font	Font type and size	Sets the font type and size for the text in text editors.
Font colors	Color settings	You can choose the colors for individual text elements from the respective drop-down lists in the text editors. Optional settings are available for the following text elements: • Text • Keywords • Comments • Operators • Scripts • Standard functions • Instructions/system functions • Constant strings • Numeric constants • Constant tags • Tags • Object models • Formal parameters
	Reset to default	Resets all font colors in editors to their factory settings.
Tabs	Tab width	Sets the width of tabs.
	Use tabs	Enables the use of tabs.
	Use spaces	Specifies use of space characters instead of tabs.

Group	Setting	Description
Indent	None	Text entries are not automatically indented.
	Block	The lines or the selected paragraph are automatically indented.
	Smart	The lines or the selected paragraph are automatically indented. All unnecessary spaces are also removed.
View	Show white spaces	Shows control characters within a text.
STL (Statement List)	Font type and size	Sets the font type and size for STL program code.
SCL (Structured Control Language)	Show line numbers	Shows the row numbers in SCL programs.

Changing the settings (Page 236)

6.2.1.5 Overview of the print settings

Overview

The following table shows the available settings for printing:

Group	Setting	Description
General	Always print table data as pairs of values	Tables are printed as a list and not in tabular form. The corresponding values are listed for each column. Enable this option, for example, if you want to print a table that is too large for the print area.
	Timeout for print job (minutes)	If elements cannot be completely printed, a message is displayed after the configured timeout in minutes.
Hardware configuration	Active graphic view	The graphics of network and device view are included in the printout.
	Active table	A table associated with an editor is included when printing with the editor.
PLC Programming	Zoom factor	Specifies the size in which blocks are to be printed out.
	With interface	The interfaces of blocks are included in the printout.
	With comments	Comments on blocks are included in the printout.
	With line numbers	The line numbers of the program code are printed for text-based programming languages.
Motion & Technology	Dialog display/graphic	The content of the editor is printed out as a graphic if the editor supports this.
	Table	The parameters of the technology objects are printed out in the form of a table.
HMI screens	Show tab order	In the printout you can specify the order in which the runtime objects can be selected with the TAB key.

Changing the settings (Page 236)

6.2.1.6 Overview of library settings

Overview

The following table shows the library settings that you can make:

Group	Setting	Description
Type connection	Disable the shortcut menu command "Terminate connection to type"	When the setting is enabled, the instance of a type in the project tree can no longer be separated from the type in a library with the help of the shortcut menu. The shortcut menu command "Terminate connection to type" is disabled.

6.2.1.7 Overview of settings for searching in a project

Overview

The following table shows the available settings for searching in a project:

Group	Setting	Description
Search in project	Activate "Search in project"	Enables or disables the search in project.
	Recreate search index	Regenerates the search index for the search in project.

6.2.1.8 Overview of the settings for cross-references

Overview

The following table shows the available settings for cross-references:

Group	Setting	Description
Recreate the cross-reference information	Recreate the cross-reference information	Creates new cross-reference information about the selected project.

6.2.1.9 Overview of the settings for managing window layouts

Overview

The following table shows the available settings for managing window layouts:

Group	Setting	Description
Manage all window layouts	Active	Enables the selection of a window layout when additional window layouts are created in addition to the default window layout.

6.2.1.10 Overview of settings for basic integrity check

Overview

The following table shows the available settings for the basic integrity check:

Group	Setting	Description
Basic integrity check	Enable basic integrity check when opening a project	By default activates the option to run the basic integrity check in the "Open project" dialog. In addition, the basic integrity check is performed automatically when opening projects from the list of recently opened projects, the reference projects as well as in multi-user engineering. Depending on the scope and application, the check may be quite time-consuming especially when using multi-user engineering.
	Enable basic integrity check when opening a library	Activates the automatic basic integrity check when opening libraries. Depending on the scope and application, the check may be quite time-consuming.

Changing the settings (Page 236)

6.2.1.11 Overview of the online and diagnostic settings

Overview

The following table shows the settings that you can make for the online and diagnostic functions:

Group	Setting	Description
Preset connection path for online access	Type of the PG/PC interface	Specifies the type of the PG/PC interface that is used as the presetting in the dialogs for online access, e.g., in the "Go online" dialog.
	PG/PC interface	Specifies a particular PG/PC interface that is used as the presetting in the dialogs for online access, e.g., in the "Go online" dialog.
	Use preset connection path for online connection	Activates or deactivates the presettings for the PG/PC interface. If the check box is selected, the connection path specified in the settings is used as the presetting in the dialogs for online access.
Alarm display	Multiline	Displays the alarms in the Inspector window using multiple lines.
	Autoscroll	When a new alarm occurs, the display scrolls automatically to this alarm.
	Archive size	Maximum number of alarms that can be displayed in the Inspector window. If the set number of alarms is exceeded, older alarms are automatically deleted.

6.2.1.12 Changing the settings

Procedure

To change the settings, proceed as follows:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation to change the settings described in the previous sections. Or click on one of the other entries in area navigation to make settings for your installed products.
3. Change the settings.

Result

The change will be adopted immediately, there is no need to save it explicitly.

6.2.1.13 Exporting and importing settings

Exporting and importing settings

You can export settings of the TIA Portal to a file. When you import the settings, they are applied together. This function makes it possible to send settings to other users. Likewise, system settings can be specified centrally, to provide a unified environment for multiple engineering PCs. The TIA Portal searches for a initialization file at startup. When a initialization file is found, the settings saved therein are automatically applied after rebooting. If a more recent version of this file is available, the local settings are updated.

You can export all settings, for example:

- Language of the user interface
- Path of the company libraries
- Path of the user-defined documentation
- Window layouts
- Profiles of the hardware catalog

The initialization files are version-specific and can be imported automatically within a product version, but not in other versions of the product.

Exporting settings

You can export settings of the TIA Portal to a file, for example, to back them up or to share them with other users.

Procedure

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. Select the "General" entry in the area navigation.
3. In the "Import/export settings" area, click on the "Export settings ..." button.
   The "Export settings" dialog opens.
4. Select the settings for the export.
   - Click "Select all" to select all the settings for the export.
   - Click "Deselect all" to then select individual settings for the export. It all the nested settings are selected as well.
5. If you want to accept the settings selected from previous export operations, for example for a different use of the initialization files, select the check box "Use selection from a previous export file" and enter the file in the box.
6. Enter a file name for the initialization file in the "File name" box.
7. Click "Export".
   Settings are exported to a file with the extension ".tps14".

Note

Empty entry fields in the export file

Entry fields, such as "Central settings", are available in the settings. If you do not fill out one of these entry fields and nevertheless select the initialization for the export, an empty initialization will be exported. If the subsequently import the initialization file, the corresponding local settings are overwritten by the empty contents of important initialization file.

If you do not want these fields to be deleted by an import, disable the non-filled entry fields during export of the initialization file.

Importing settings automatically

When the TIA Portal starts up, you can automatically import the settings from a initialization file, for example, to incorporate a centrally defined environment.

Procedure

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. Select the "General" entry in the area navigation.
3. In the "Central settings" area, click on the "Browse" button.

4. Select the setting file with the extension ".tps14".
5. Click "Open".
   The settings are applied after a restart of the TIA Portal.

Note

Priority of central settings

Central settings have priority over manually imported settings and override them.

Importing settings manually

You can import settings of the TIA Portal manually from a initialization file, for example, to take over settings from other users.

Procedure

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. Select the "General" entry in the area navigation.
3. In the "Import/export settings" area, click on the "Import settings ..." button.
4. Select the setting file with the extension ".tps14".
5. Click "Open".
   The settings are applied after a restart of the TIA Portal.

6.2.2 Layout of the user interface

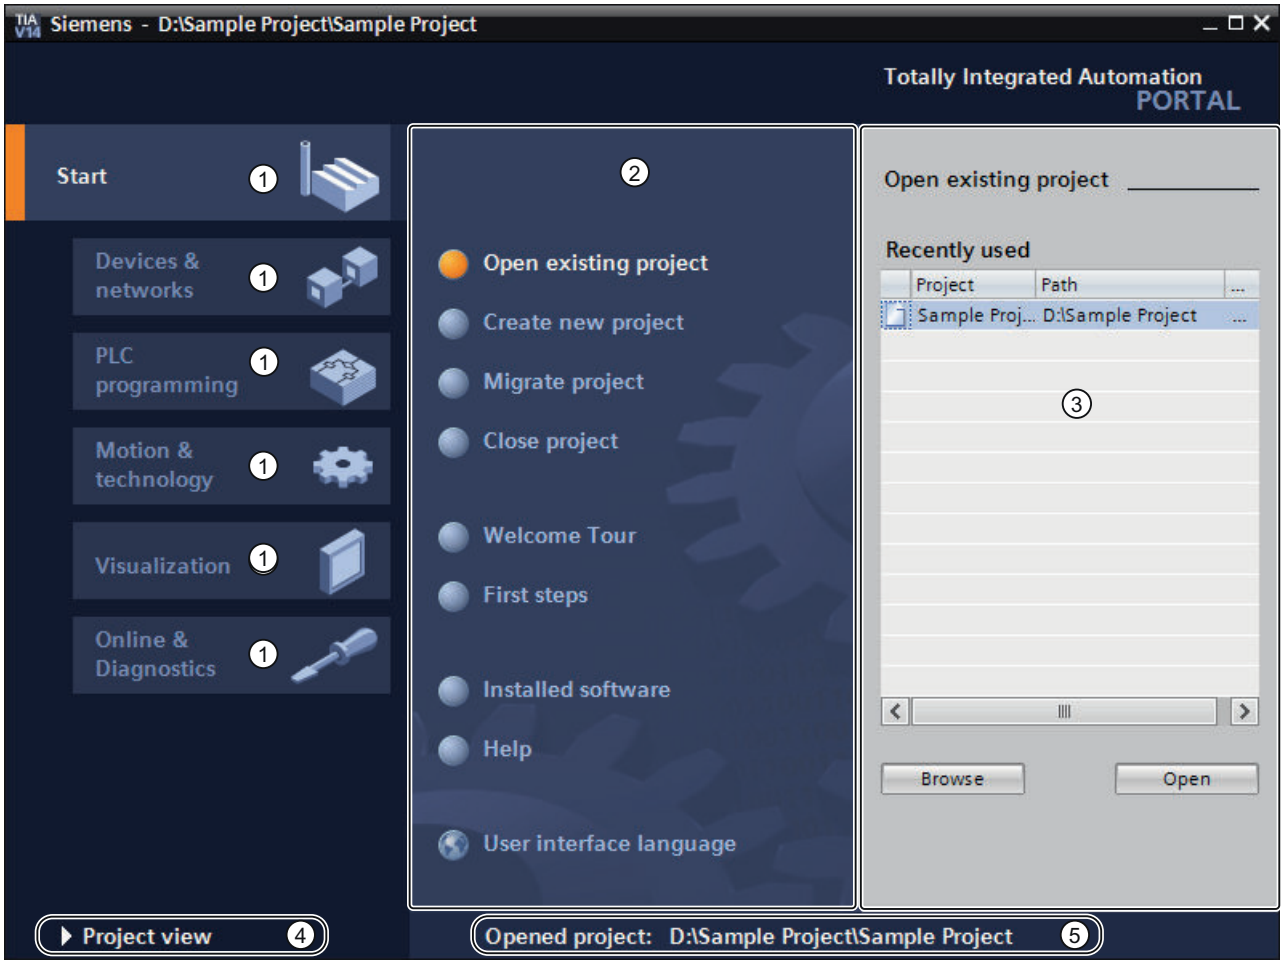
6.2.2.1 Views

Views

Three different views are available for your automation project:

- The portal view is a task-oriented view of the project tasks.
- The project view is a view of the components of the project, as well as the relevant work areas and editors.
- The library view (Page 243) shows the elements of the project library and the open global libraries.

You can change over between the two views using a link.



6.2.2.2 Portal view

Purpose of the portal view

The portal view provides you with a task-oriented view of the tools. Here, you can quickly decide what you want to do and call up the tool for the task in hand. If necessary, the view changes automatically to the project view (Page 240) for the selected task.

Layout of the portal view

The following figure shows an example of the components in the portal view:

① Portals for different tasks
② Actions for the selected portal
③ Selection panel for the selected action
④ Switch to project view
⑤ Display of the project that is currently open

Portals

The portals provide the basic functions for the individual task areas. The portals that are provided in the portal view depends on the products that have been installed.

Actions for the selected portal

Here, you will find the actions available to you in the portal you have selected. You can call up the help function in every portal on a context-sensitive basis.

Selection panel for the selected action

The selection panel is available in all portals. The content of the panel adapts to your current selection.

Switch to project view

You can use the "Project view" link to change to the project view.

Display of the project that is currently open

Here, you can obtain information about which project is currently open.

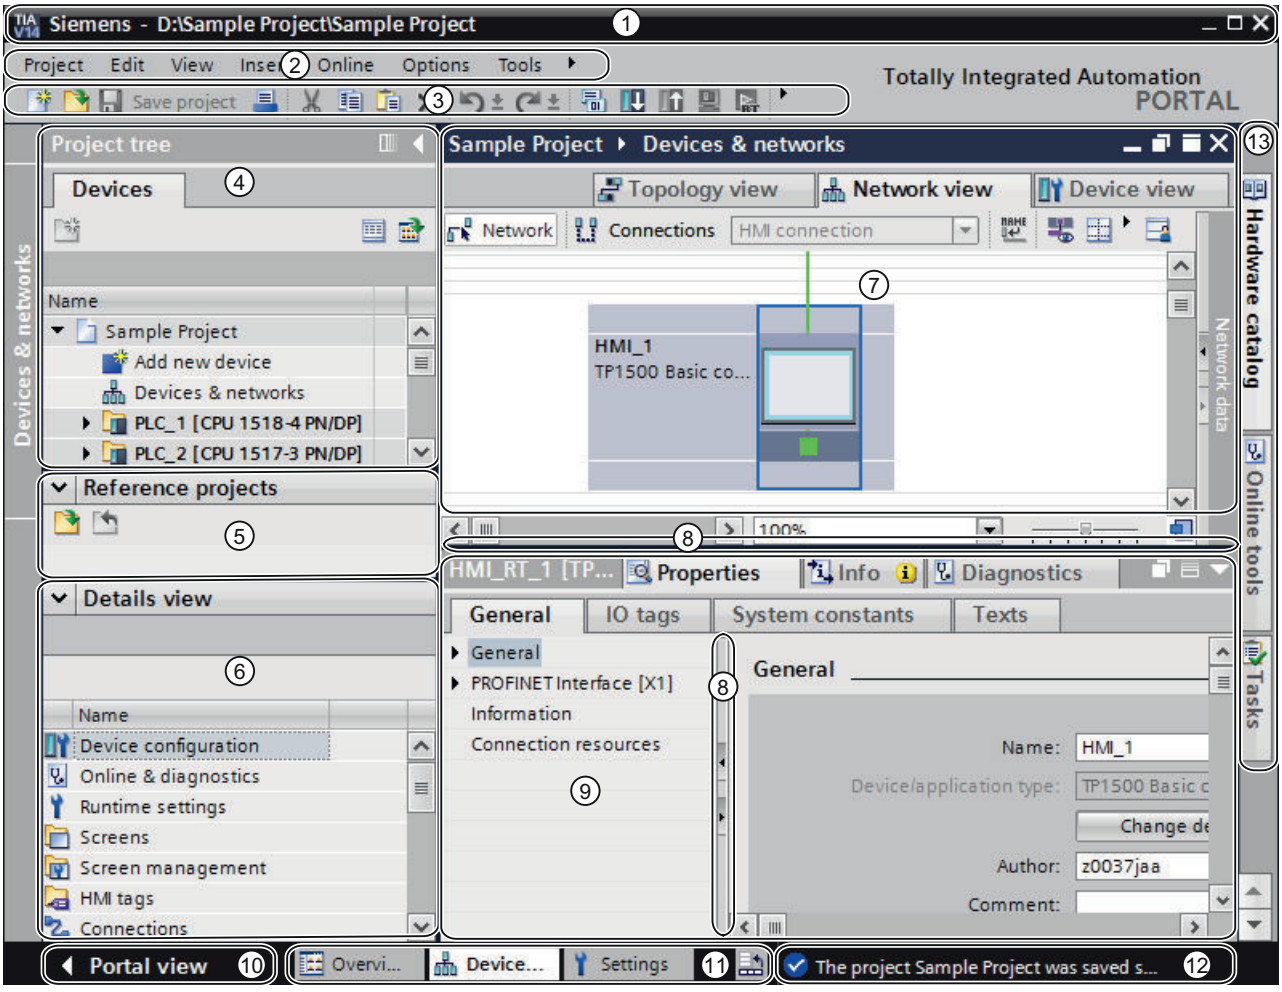
Inspector window (Page 255)

Basics on task cards (Page 257)

Details view (Page 260)



6.2.2.3 Project view

Purpose of the project view

The project view is a structured view of all components of the project.

Layout of the project view

The following figure shows an example of the components of the project view:

① Title bar
② Menu bar
③ Toolbar
④ Project tree (Page 243)
⑤ Reference projects (Page 259)
⑥ Details view (Page 260)
⑦ Work area (Page 257)
⑧ Dividers
⑨ Inspector window (Page 255)
⑩ Changing to the portal view (Page 239)
⑪ Editor bar
⑫ Status bar with progress display
⑬ Task cards (Page 257)

Title bar

The name of the project is displayed in the title bar.

Menu bar

The menu bar contains all the commands that you require for your work.

Toolbar

The toolbar provides you with buttons for commands you will use frequently. This gives you faster access to these commands.

Dividers

Dividers separate individual components of the program interface. The arrows on the dividers allow you to display and hide the adjacent sections of the user interface.

Changing to the portal view

You can use the "Portal view" link to change to the portal view.

Editor bar

The Editor bar displays the open editors. This allows you to quickly switch between open elements. If you have opened numerous editors, you can display the editors of the same type as a group.

Status bar with progress display

In the status bar, you will find the progress display for processes that are currently running in the background. This also includes a progress bar that shows the progress graphically. Hover the mouse pointer over the progress bar to display a tooltip providing additional information on the active background process. You can cancel the background processes by clicking the button next to the progress bar.

If no background processes are currently running, the status bar displays the last generated alarm.

Basics of the work area (Page 247)

6.2.2.4 Library view

Function of the library view

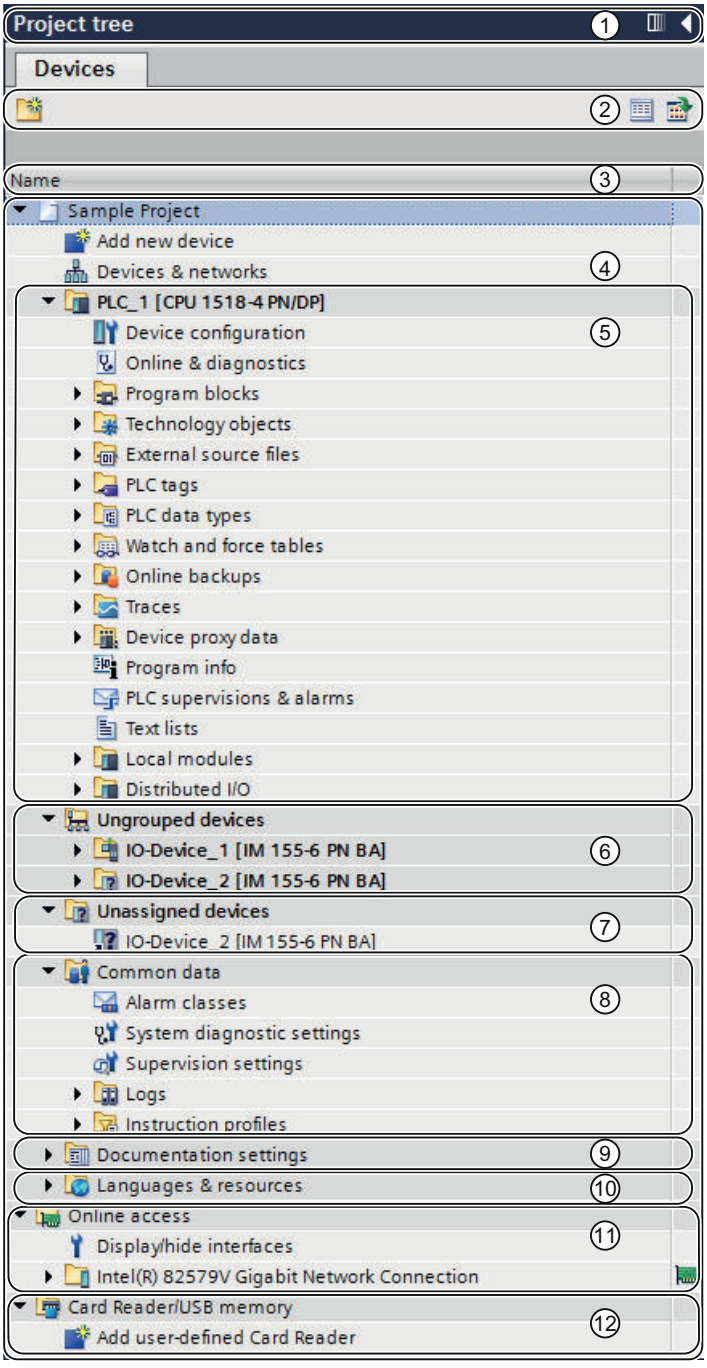
The library view provides an overview of the elements in the project library and the open global libraries. You can switch to the library view using the "Libraries" task card.

See also: Overview of the library view (Page 447)

6.2.2.5 Project tree

Function and structure of the project tree

Function of the project tree



Using the project tree features gives you access to all components and project data. You can perform the following tasks in the project tree:

- Add new components
- Edit existing components
- Scan and modify the properties of existing components

You can select the objects of the project tree either with the mouse or via the keyboard by typing the first letter of the desired object. If more than one object begins with the same letter, the next lower object is selected. The project tree must be the focused user interface element in order for you to select an object with its initial letter.

Layout of project tree

The following figure shows an example of the project tree areas:

① Title bar
② Toolbar
③ Table header
④ Project

⑤ Devices
⑥ Ungrouped devices
⑦ Unassigned devices
⑧ Common data
⑨ Documentation settings
⑩ Languages & resources
⑪ Online access
⑫ Card Reader / USB memory

Title bar

The title bar of the project tree has a button for automatically and manually collapsing the project tree. Once it is collapsed manually, the button is "Reduced" to the left-hand margin. It changes from an arrow pointing left to one that is pointing right, and can now be used to reopen the project tree. You can use the "Collapse automatically" button collapse to project tree automatically when you do not need it.

See also: Maximizing and minimizing the work area (Page 249)

Toolbar

You can do the following tasks in the toolbar of the project tree:

- Create a new user folder; for example, in order to group blocks in the "Program blocks" folder or group devices.
- Navigate forward to the source of a link and back to the link itself.
  There are two buttons for links in the project tree. You can use these to navigate from the link to the source and back.
- Show an overview of the selected object in the work area.
  When the overview is displayed, the lower-level objects and actions of the elements in the project tree are hidden.

Table header

The "Name" column is shown by default. You can also show the columns "Type name" and "Version". If you are showing the additional columns, you see the name of the respective type as well as the version used for instances of types from the library.

Project

You will find all the objects and actions related to the project in the "Project" folder, e.g.:

- Devices
- Languages & resources
- Online access

Device

There is a separate folder for each device in the project, which has an internal project name. Objects and actions belonging to the device are arranged inside this folder.

Ungrouped devices

All distributed I/O devices in the project are collected together in the "Ungrouped devices" folder.

Unassigned devices

Distributed I/O devices that are not assigned to a distributed I/O system appears as links in the "Unassigned devices" folder.

Common data

This folder contains data that you can use across more than one device, such as common alarm classes, logs and scripts.

Documentation settings

In this folder, you can specify the layout for the printed project documentation.

Languages & resources

You can determine the project languages and texts in this folder.

Online access

This folder contains all the interfaces of the programming device / PC, even if they are not used for communication with a module.

Card Reader / USB memory

This folder is used to manage all card readers an other USB storage media connected to the programming device / PC.

Showing and hiding columns (Page 247)

Showing and hiding columns

You can show additional columns in the project tree, if necessary. These additional columns show the name of the type associated with an instance as well as its version number.

Procedure

To show or hide additional table columns for the associated type and its version number, follow these steps:

1. Click the "Display/hide column heading" in the toolbar of the project tree.
   The column view of the project tree is enabled and a table header is displayed.
2. Right-click on the table header of the project tree.
3. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.
   The selected columns are displayed or hidden.

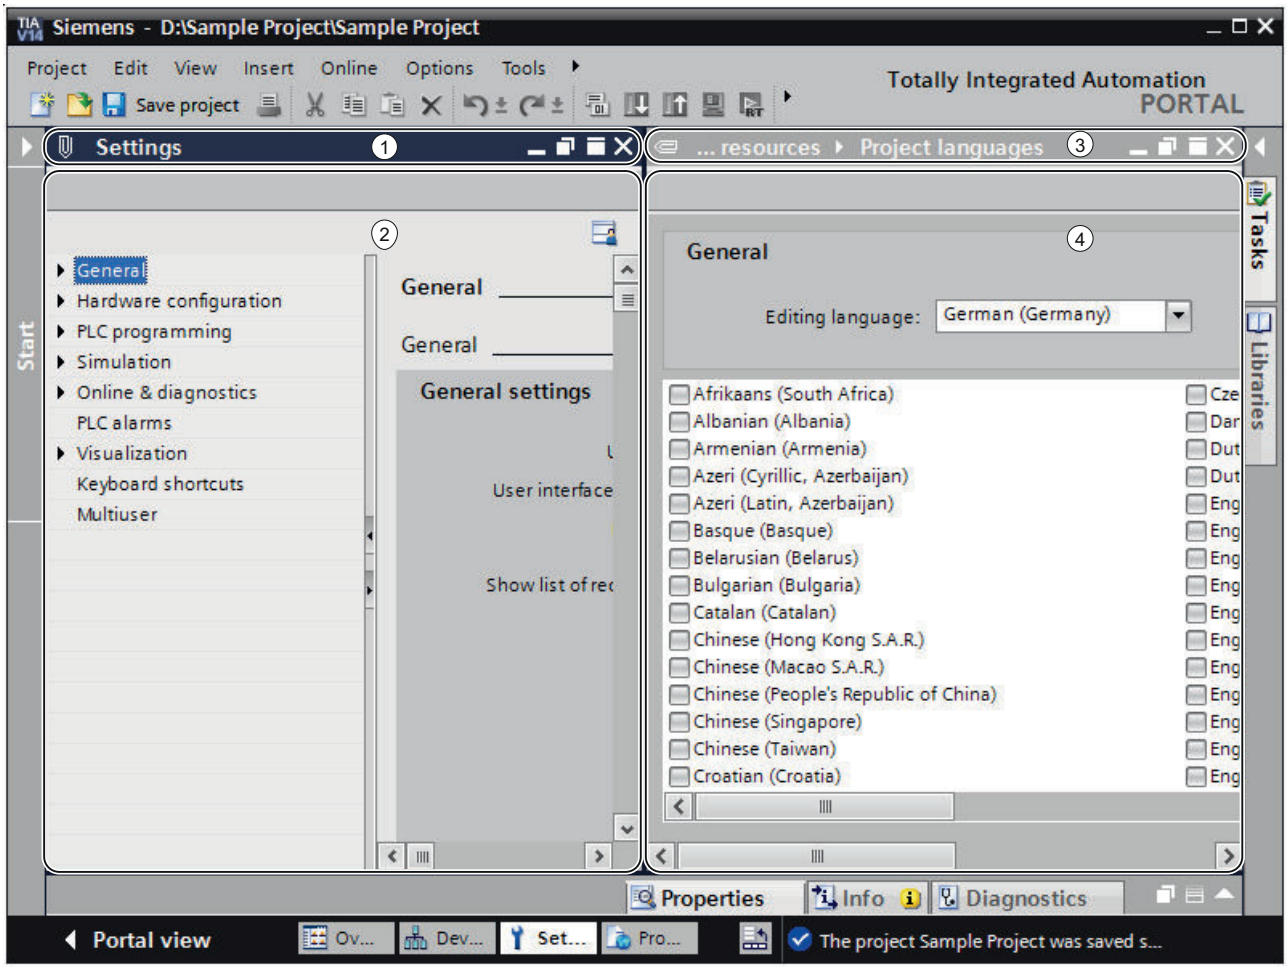
Function and structure of the project tree (Page 243)

6.2.2.6 Work area

Basics of the work area

Function of the work area



The objects that you can open for editing purposes are displayed in the work area. These objects include, for example:

- Editors and views
- Tables

You can open several objects. However, normally it is only possible to see one of these at a time in the work area. All other objects are displayed as tabs in the Editor bar. If, you would like to view two objects at the same time when performing certain tasks, you can tile the work area either horizontally or vertically or undock elements of the work area. If no objects are open, the work area will be empty.

Layout of the work area

The following figure shows an example of a vertically split work area:

① Title bar of left-hand editor
② Work area of left-hand editor
③ Title bar of right-hand editor
④ Work area of right-hand editor

Switching between the elements in the work area (Page 254)

Saving a layout of editors and tables (Page 268)

Save user interface layout (Page 266)

Maximizing and minimizing the work area

You have the option to adapt the work area to make it as large as possible. You can use the following function for this:

- Maximizing the work area
  You can close the task cards, project tree and inspector window with a single click. This increases the size of the work area. You can minimize the work area again at any time in order to return to the previous view.
- Collapsing task cards, project tree, and Inspector window automatically
  You can use the "Collapse automatically" option for the task cards, project tree, and Inspector window. This function causes these items to collapse automatically when you don't need them.

Maximizing and minimizing the work area

To maximize the work area, follow these steps:

1. Open an element such as an editor or a table.
   The element appears in the work area.
2. Click the "Maximize" button in the title bar of the element.
   The task cards, project tree and inspector window collapse, and the work area is shown with its maximum dimensions.

To minimize the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the displayed element.
   This restores the view that existed before the work area was maximized. That is, if the task cards, project tree, or Inspector window were expanded before, they will be expanded again.

Collapsing task cards, project tree, and Inspector window automatically

To collapse the task cards automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the task cards.
   The task cards collapse when you click anywhere outside the task cards.
2. To use the task cards, click the collapsed task cards.
3. The task cards expand and are available for use. The "Collapse automatically" option remains enabled.

To collapse the project tree automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the project tree.
   The project tree collapses when you click anywhere outside the project tree.
2. To use the project tree, click the collapsed project tree.
   The project tree expands and is available for use. The "Collapse automatically" option remains enabled.

To collapse the Inspector window automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the Inspector window.
   The Inspector window collapses when you click anywhere outside the Inspector window.
2. To use the Inspector window, click the collapsed Inspector window.
   The Inspector window expands and is available for use. The "Collapse automatically" option remains enabled.

To disable the automatic collapse option, follow these steps:

1. Click "Expand permanently" again in the relevant window.
   The Collapse automatically" option is disabled, and the window remains expanded.

Minimizing and maximizing elements of the work area (Page 254)

Switching between the elements in the work area (Page 254)

Saving a layout of editors and tables (Page 268)

Splitting the work area

You can split the work area vertically or horizontally.

Procedure

To split the work area vertically or horizontally, follow these steps:

1. In the "Window" menu, select the "Split editor space vertically" or "Split editor space horizontally" command.
   The element you have clicked and the next element in the Editor bar will be displayed either next to one another or one above the other.

Note

If no elements are open in the work area, the "Split editor space vertically" and "Split editor space horizontally" functions will not be available.

Using grouped elements of the work area (Page 252)

Minimizing and maximizing elements of the work area (Page 254)

Switching between the elements in the work area (Page 254)

Saving a layout of editors and tables (Page 268)

Floating the work area elements

You can float work area elements in their own separate window:

- Editors
- Tables
- Setting windows
- Task cards
- Inspector window

You can embed floating elements again in the work area at any time.

Floating the work area elements

To float work area elements, follow these steps:

1. Click the "Float" button in the title bar of the element.
   The element will be released from the work area and displayed in its own window. You can now place the window wherever you wish. If you have minimized the window, you can restore it via the editor bar.

Embedding elements in the work area

To embed elements in the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the element.
   The element will appear in the work area again.

See also

Basics of the work area (Page 247)

Switching between the elements in the work area (Page 254)

Saving a layout of editors and tables (Page 268)

Using grouped elements of the work area

If you have opened several similar elements as editors or spreadsheets, you can have them displayed in the editor bar as a group. You can use these groups as follows:

- Displaying individual elements of a group
- Displaying all elements of a group in separate windows
- Embedding all displayed elements of a group in the work area
- Minimizing all displayed elements
- Closing all elements of a group

You can undo the grouping of similar elements at any time.

Grouping or ungrouping similar elements

To group similar elements in the editor bar or ungroup them again, follow these steps:

1. Click on the "Group editors/Ungroup" button on the right in the editor bar.
   Each time you click the button, similar elements are grouped or existing groups are dissolved. The icon of the button changes slightly here to enable you to quickly identify the mode in which you are working. The configured mode is retained even after the elements are closed.

Displaying individual elements of a group

To display individual elements of a group, follow these steps:

1. In the editor bar, click the group containing the element you want to display.
   All list of all available elements of the group is displayed.
2. Click the element that you want to display.

Displaying all elements of a group in separate windows

To display all elements of a group in separate windows, follow these steps:

1. In the editor bar, right-click the group whose elements you want to display.
2. Select "Restore group" in the shortcut menu.
   All elements of the group are displayed in separate, overlapping windows. Move the windows in order to see the individual element, or choose an element via the group in the editor bar.

Embedding all displayed elements of a group in the work area

To embed all elements of a group displayed in separate windows in the work area again, follow these steps:

1. In the editor bar, right-click the group whose elements you want to embed.
2. Select "Embed group" in the shortcut menu.
   All elements of the group are embedded in the work area again.

Minimizing all displayed elements

To minimize all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to minimize.
2. Select "Minimize group" in the shortcut menu.
   All elements of the group are minimized. However, the minimized elements remain open and can be quickly maximized again via the group in the editor bar.

Closing all elements of a group

To close all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to close.
2. Select "Close group" in the shortcut menu.
   All elements of the group are closed. The group is removed.

Minimizing and maximizing elements of the work area

You can minimize the elements that are open in the work area, such as editors or tables, as needed. However, an element remains open even if it has been minimized, and can quickly be maximized again using the editor bar.

Minimizing elements in the work area

To minimize elements in the work area, follow these steps:

1. Click the "Minimize" button in the title bar of the element.
   The element is minimized, but can still be accessed via the editor bar.

To minimize all elements at the same time, follow these steps:

1. In the "Window" menu, select the "Minimize all" command.

Maximizing elements in the work area

To maximize elements in the work area again, follow these steps:

1. Click the required element in the editor bar.
   The element is maximized and appears in the work area.

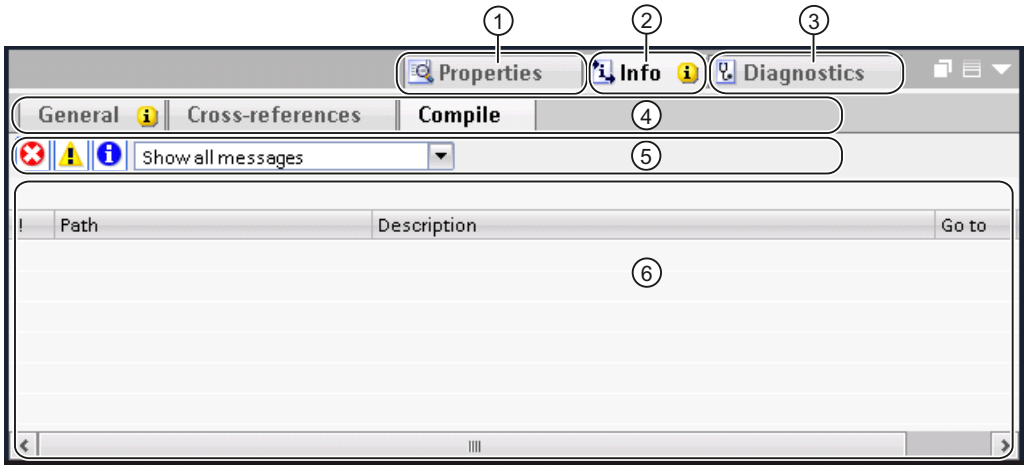
6.2.2.7 Inspector window

Function of the Inspector window



Additional information on an object selected or on actions executed are displayed in the inspector window.

Layout of the Inspector window

The following figures show the components of the Inspector window:

① "Properties" tab
② "Info" tab
③ "Diagnostics" tab
④ Area navigation within the "Properties" tab
⑤ Content of the "Properties" tab

① "Properties" tab
② "Info" tab
③ "Diagnostics" tab
④ Navigation through additional tabs within a tab (only available in the "Info" and "Diagnostics" tabs)
⑤ Toolbar (only available in the secondary "General" and "Compile" tabs of the "Info" tab)
⑥ Content of the "Compile" tab in the "Info" tab

"Properties" tab

This tab displays the properties of the object selected. You can change editable properties here.

"Info" tab

This tab displays additional information on the object selected, as well as alarms on the actions executed (such as compiling).

"Diagnostics" tab

This tab provides information on system diagnostics events, configured alarm events, and connection diagnostics.

Navigation within the tabs

You can use area navigation and the lower-level tabs to display the information you require within the tabs.

Toolbar

You can use the toolbar in the "General" and "Compile" tabs within the "Info" tab to specify which types of alarms are to be displayed. You can enable or disable the display for the following alarm types:

- Errors
- Warnings
- Information

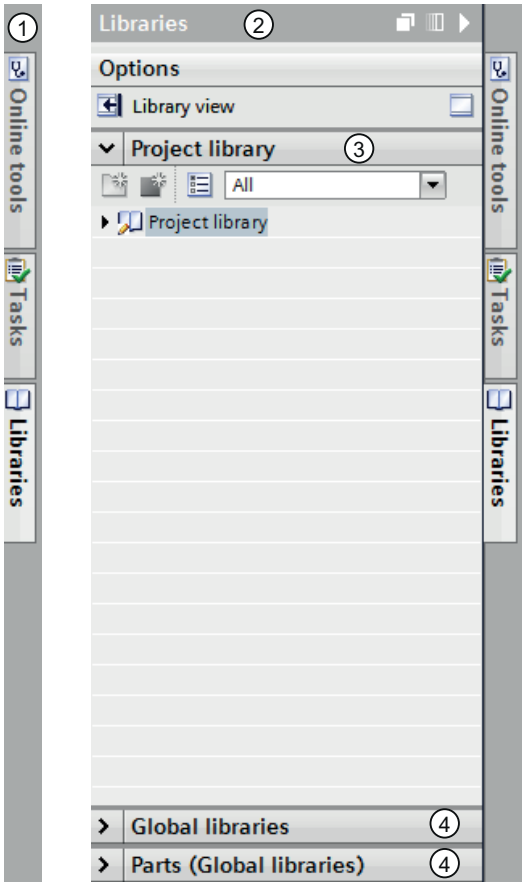
6.2.2.8 Task cards

Basics on task cards

Function of task cards



Depending on the edited or selected object, task cards that allow you perform additional actions are available. These actions include:

- Selecting objects from a library or from the hardware catalog
- Searching for and replacing objects in the project
- Dragging predefined objects to the work area

The task cards available can be found in a bar on the right-hand side of the screen. You can collapse and reopen them at any time. Which task cards are available depends on the products installed. More complex task cards are divided into panes that you can also collapse and reopen.

Layout of task cards

The following figure shows an example of the bar with the task cards:

① Task cards closed
② Task card open
③ Opened palette of a task card
④ Closed palette of a task card

Inspector window (Page 255)

Portal view (Page 239)

Project view (Page 240)

Details view (Page 260)

Changing the pane mode

You can choose between two pane modes:

- Single pane mode:
  Only one pane is open at any given time. If you open another pane, the previously opened pane is closed automatically.
- Multi-pane mode:
  You can open several panes at the same time.

Procedure

To change the pane mode, follow these steps:

1. Click the "Change pane mode" button above the panes inside a task card.

6.2.2.9 Reference projects

Function of reference projects

In the "Reference projects" palette, you can open other projects in addition to the current project. These reference projects are write-protected and cannot be edited. However, you can drag the objects of a reference project into your current project and further edit them there. You can also compare the objects of a reference project to the objects of your current project.

Layout of the "Reference projects" palette

The following figure shows the layout of the "Reference projects" palette:

① Title bar
② Toolbar
③ Opened reference projects

Title bar

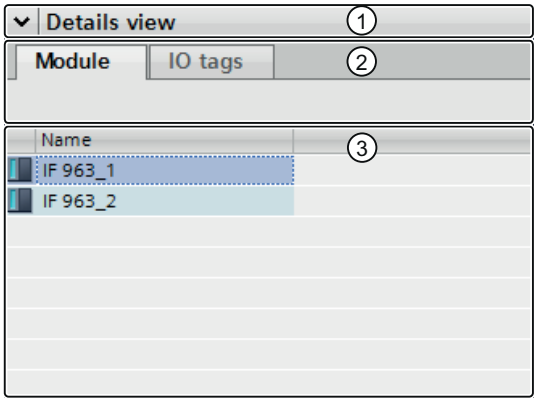
The arrow for closing the palette is located in the title bar of the "Reference projects" palette. Once it is closed, the direction in which the arrow is pointing changes from downwards to right. It can now be used to reopen the palette.

Toolbar

The toolbar contains buttons for opening and closing reference projects.

Opened reference projects

Opened reference projects are displayed as read-only with their objects and their hierarchical structure.



6.2.2.10 Details view

Purpose of the details view

The detail view shows certain content of the selected object is in the overview window or in the project tree. This might include text lists or tags.

Layout of the details view

The following figure shows an example of the details view:

① Title bar
② Tab
③ Content of the selected object

Title bar

The arrow for closing the details view is located in the title bar of the details view. After it has closed, the direction in which the arrow is pointing changes from left to right. It can now be used to reopen the details view.

Tab

The tab displayed in the detail view depends on the selected object.

- The "Modules" tab is displayed when you select a device, a device link or a folder that contains one of these objects.
  The "Modules" tab displays the installed modules or sub-modules of a device in the detail view, when you select the device itself or a device link in the project tree.
- The "IO tags" displays existing IO tags for selected devices and device links to below the "Local modules" folder or a device folder. The name of the simple tag or data element of a PLC data type is displayed in addition to the data type and the address.

  Note

  If a simple tag is defined for a channel address but it is also within the address range of the data element of a PLC data type, only the name of the simple tag is displayed.

Objects

The displayed content varies depending on the selected object. You can move the content of objects from the details view to the required location using drag-and-drop.

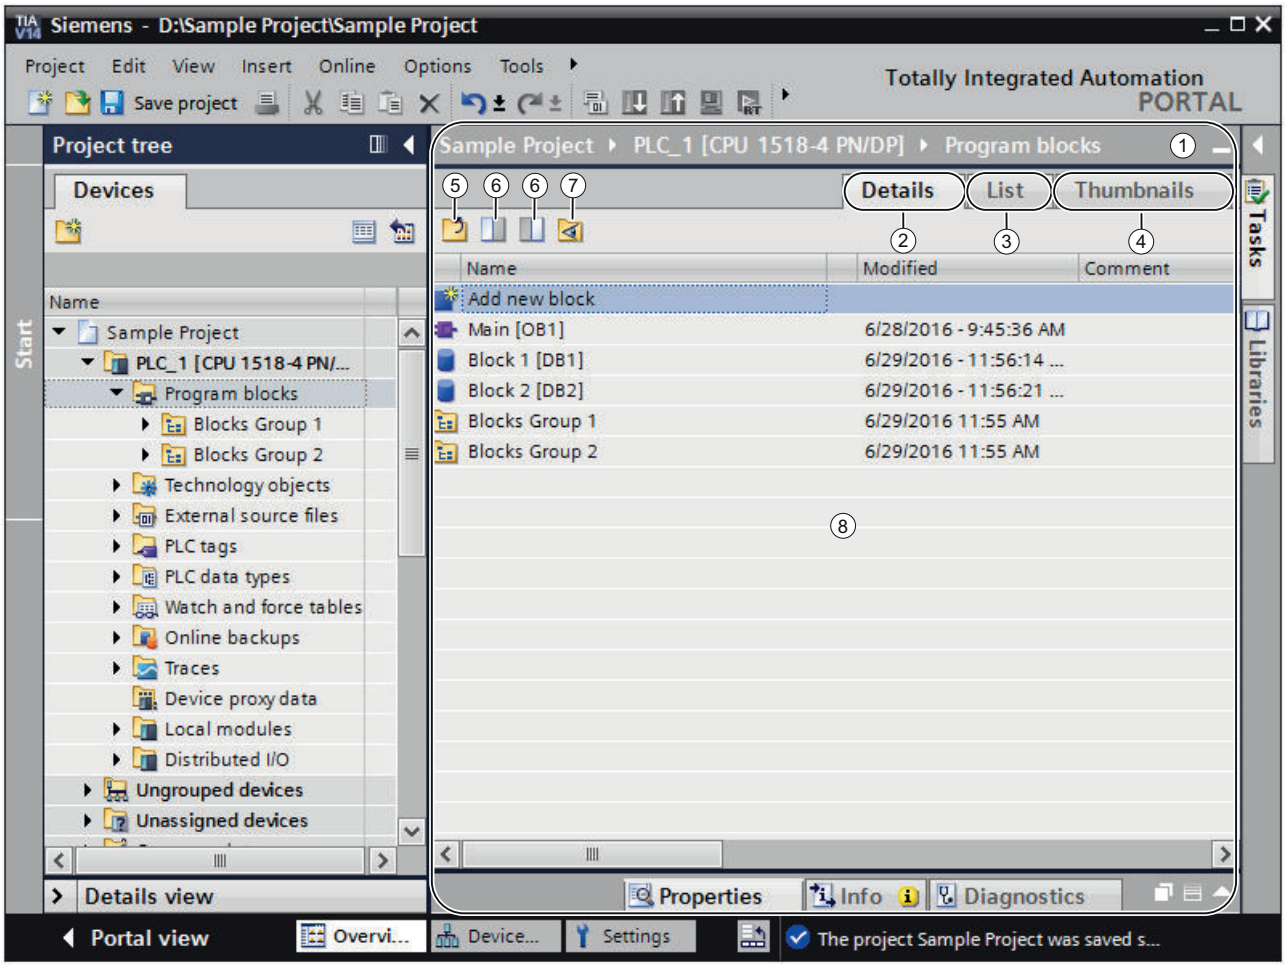
Project view (Page 240)

6.2.2.11 Overview window

Overview window

Functions of the Overview window



The Overview window supplements the project tree. The Overview window shows the contents of the folder currently selected in the project tree.

In addition, you can perform the following actions in the Overview window:

- Open objects
- Display and edit the properties of objects in the Inspector window
- Rename objects
- Call object-specific actions from the shortcut menu
- Compare objects side by side
- Perform various object operations, such as inserting objects from the library via drag-and-drop and moving, copying, pasting, and deleting objects

Layout of the Overview window

The following figure shows the components of the Overview window:

① Overview window

② Switch to the Details view

③ Switch to the List view

④ Switch to the Icon view

⑤ Move to higher level

⑥ Split the overview window in two. Either the right or left half of the overview window is synchronized. Clicking again cancels the split.

⑦ All elements within a selected folder are displayed even if these are located in lower-level groups. This option is only available in details view.

⑧ Contents of the object selected in the project tree.

Display forms of the Overview window

The content of the Overview window can be displayed as follows:

- Details view
  The objects are displayed in a list with additional information, such as the date of the last change.
- List view
  The objects are displayed in a simple list.
- Icon view
  The objects are displayed as icons according to category.

Comparing objects in the overview window (Page 264)

Sorting the details view of the overview window (Page 265)

Overview of the library view (Page 447)

Comparing objects in the overview window

You can display the contents of two folders or objects side by side in the Overview window. The Overview window is split in half and you can display different contents on the left and right sides.

In addition, you can use a drag-and-drop operation to move objects between the split windows. Thus, for example, you can move contents from one window to the other.

Procedure

To split the Overview window in half or cancel the split, follow these steps:

1. In the toolbar, click on the "Synchronize left side" or "Synchronize right side" icon to split the overview window. Either the left or the right side of the overview window synchronized with the contents of the selected object in the project tree.
2. To cancel the split, click again on the previously selected icon.

See also

Overview window (Page 262)

Sorting the details view of the overview window

You have several options for adapting the display in the details view of the overview window:

- Adding additional columns
  Some columns are hidden by default to increase clarity. You can display hidden columns if needed. The columns available depend on the selected object.
- Display of folder contents in a flat hierarchy
  Folder contents can be displayed in a flat hierarchy. All the content is displayed at once even if it is located in different groups.
- Sorting the table columns
  You can sort individual columns of the table in ascending or descending order.

Showing or hiding columns

To show or hide additional table columns, follow these steps:

1. Right-click the title bar of the table.
2. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.

Displaying folder contents in flat hierarchy

To display the content of a folder in a flat hierarchy, follow these steps:

1. Select the required folder in the project tree or in the library navigation of the library view.
2. Click the "Show subordinate elements" icon in the toolbar.
   All elements are displayed at once in the table even if they are located in subfolders.

Sorting a table in ascending or descending order

To sort the table by a column in ascending or descending order, follow the steps below:

1. Click the table header of a column if you want to sort the column in ascending order.
2. Click again on the same column of the table header to sort the column in descending order.
3. Click a third time on the table header of the same column to cancel the sorting.

6.2.2.12 User interface layout

Save user interface layout

Options for backing up the user interface layout

When you make a change to the user interface, this is retained even after a restart of the TIA Portal. A change to the user interface layout includes, for example, moving a window or adjusting the size of an editor.

In addition to the automatic saving of the user interface layout, you have the option of manually backing up specific layouts:

- Save the window layout
  You can save the layouts of the windows and editors of the TIA Portal manually and restore these at a later time. It is possible to call five window layouts using a key combination. Use this function, for example, if you are working with a notebook to which you connect an external monitor when necessary. You can create a window layout for mobile use on the notebook display and another layout for when you work at the office with an external monitor.
- Save the layout within editors
  With some editors, you can adjust the display. You can, for example, adjust the width of tables or show or hide individual table columns.

Managing window layouts (Page 268)

Saving a layout of editors and tables (Page 268)

Resetting the user interface layout (Page 269)

Basics of the work area (Page 247)

Save window layout

You can save the current window layout in order to call it again in the same form at a later time.

Procedure

To save a window layout, follow these steps:

1. Arrange all windows in the way in which you want to save them.
2. In the "Window" menu, select the "Save window layout as" command.
   The "Save current window layout as" dialog opens.
3. Enter a name for the window layout in the "Name" field.

4. Enter a description of the window layout in the "Description" field in order to be able to identify the window layout more easily later.
5. Click "Save".

Result

The new window layout is saved in the last position after the existing saved window layouts. The first five window layouts can be called using a key combination.

See also

Save user interface layout (Page 266)

Load window layout

If you have already saved a window layout, you can load this, allowing you to quickly adjust your work environment to the respective conditions. You can load the first five window layouts using quick access via the "Window" menu or via a key combination.

If you load a window layout and then make changes to the arrangement of the window, you can restore the originally saved window layout.

Using quick access to load window layouts 1 to 5

To load one of the first five saved window layouts, follow these steps:

1. In the "Window" menu, select a window layout or select the key combination <Alt+Shift+[1 ... 5]>.

Loading additional window layouts

To load a window layout that is not among the first five window layouts, follow these steps:

1. In the "Window" menu, select the "Additional window layouts" command.
   The "Manage all windows layouts" dialog opens.
2. Select the desired window layout.
3. Click "OK".

Restore window layout

To go back to a saved window layout, follow these steps:

1. In the "Window" menu, select the "Restore window layout" command or select the key combination <Alt+Shift+0>.

See also

Save user interface layout (Page 266)

Managing window layouts

You can carry out the following actions with existing window layouts:

- Changing the order of window layouts
  The order of the window layouts is important, as the first five window layouts can be called directly via the "Window" menu and via a key combination.
- Select a window layout
  If a window layout is not one of the first five window layouts, you can call it using the "Manage all window layouts" dialog box.
- Deleting window layouts

Procedure

To manage the existing window layouts, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. In the area navigation, navigate to the entry "General > Manage all window layouts".
3. Select a window layout.
   The selected window layout is immediately activated.
4. Click the "Up" or "Down" symbol to move the window layout up or down.
5. Click the "Delete" symbol to delete the selected window layout.

See also

Save user interface layout (Page 266)

Saving a layout of editors and tables

You have the option of adapting editors and tables to meet your requirements. For example, you can hide columns in tables that you don't need. You can then save your customized view.

Procedure

To save the layout of editors and tables in the work area, follow these steps:

1. Adapt the editor or table according to your requirements.
2. Click the "Save window settings" button in the editor or table.

Result

The layout is saved. When you reopen the editor or table, this layout will be used.

Minimizing and maximizing elements of the work area (Page 254)

Switching between the elements in the work area (Page 254)

Save user interface layout (Page 266)

Resetting the user interface layout

Every change you make to the layout of the user interface is saved. The changes are thus available even after a restart of the TIA Portal. For example, if you change the height and width of a text editor or the division of a table, your changes are retained so that you don't have to re-customize elements every time.

In some cases, however, it may be helpful to restore the original layout settings; for example, if another user prefers a different arrangement of the user interface.

Procedure

To reset the user interface settings to the default, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. Click the "Reset to default" button under "Reset to default > Editor layout".

Result

The default settings for the user interface are restored.

6.2.3 Keyboard operation in the TIA Portal

6.2.3.1 Operation of the TIA Portal with the keyboard

You can navigate through the TIA Portal using the keyboard, for example if you do not have a mouse available at the given moment. Many functions are also accessible via keyboard shortcuts. You can find an overview of all keyboard shortcuts in the settings for the TIA Portal.

In the following sections, you will learn how to navigate in the TIA Portal using the keyboard, edit objects, and customize the TIA Portal to your needs.

See also

Displaying an overview of all keyboard shortcuts (Page 270)

6.2.3.2 Displaying an overview of all keyboard shortcuts

You can display an overview of all keyboard shortcuts.

Procedure

To display an overview of all available keyboard shortcuts, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The settings of the TIA Portal are displayed.
2. Open the "Keyboard shortcuts" entry in the area navigation.
   You can see an overview of all keyboard shortcuts, which are valid for the currently installed products.

6.2.3.3 Basic functions of the TIA Portal

Below, you will learn how you can use the basic functions of the TIA Portal using only your keyboard.

Using the basic functions of the TIA Portal with the keyboard

The following table shows how you can access basic functions of the TIA Portal with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Change between the project view and the portal view	<Alt+F7>	
Change between the project view and the library view	<Alt+F5>	
Open the online and diagnostics view	<Ctrl+D>	
Start Runtime	<Ctrl+Shift+Z>	
Display cross-references	<Shift+Alt+F11>	
Cross-reference information	<Shift+F11>	

Function	Keyboard shortcut	Menu command
Open the Help system If you need help on the TIA Portal, press <F1>.	<F1>	Help > Show help
Cancel the current action	<Esc>	
Find	<Ctrl+F>	
Replace an object You can replace found objects when searching in the editor.	<Ctrl+H>	
Find next If you have started a search in the editor, you can jump to the next hit with <F3>.	<F3>	
Print object	<Ctrl+P>	Project > Print
Run default action of the object	<Enter>	
Action	<F5>	
Scroll horizontally to the right	<Ctrl+Arrow right>	
Scroll horizontally to the left	<Ctrl+Arrow left>	
Open block/PLC data type	<F7>	

Operating menus

The following table shows how you can navigate through menus using the keyboard:

Function	Keyboard shortcut
Start keyboard shortcuts in the menu You can access the menu using the <Alt> key and then continue to navigate with the arrow keys to scroll through the menu. Confirm your selection of the menu command with <Enter>.	<Alt>
Go directly to a specific menu You can go directly to an individual menu command by holding down the <Alt> key. There is an underlined letter for each menu command. Press the <Alt> key along with the underlined letter.	<Alt+underlined letter in respective menu>
Open shortcut menu of an object With the shortcut menu key (on Microsoft Windows compatible keyboards), you can open the shortcut menu of the selected object. Alternatively, you can use <Shift+F10> if you are not using a Microsoft Windows compatible keyboard. You can use the arrow keys to scroll through the shortcut menu and select a menu command with <Enter>.	<Shortcut menu key> Alternative: <Shift+F10>

Operating expandable elements

The following table shows how you can operate expandable elements using the keyboard:

Function	Keyboard shortcut
Expand a folder in a tree With <Arrow right>, for example, you expand a folder in the project tree.	<Arrow right>
Close a folder in a tree With <Arrow left>, for example, you collapse a folder in the project tree.	<Arrow left>
Open a drop-down list You can open drop-down lists with <F4> and then navigate with the arrow keys to scroll through the drop-down list. Finally, press the <Enter> key to confirm your selection.	<F4>

Function	Keyboard shortcut
Open autocompletion	<Ctrl+Space> <Ctrl+I>
Show object selection	<Ctrl+J>

6.2.3.4 Using project-related functions

Editing a project

Function	Keyboard shortcuts	Menu command
Open a project	<Ctrl+O>	Project > Open
Close a project	<Ctrl+W>	Project > Close
Save a project	<Ctrl+S>	Project > Save
Save a project under a different name	<Ctrl+Shift+S>	Project > Save as
Delete a project	<Ctrl+E>	Project > Delete project
Print project	<Ctrl+P>	Project > Print
Undo last action	<Ctrl+Z>	Edit > Undo
Redo last action	<Ctrl+Y>	Edit > Redo

Calling up the help function

Function	Keyboard shortcuts	Menu command
Calling up the help function	<F1> or <Shift+F1>	Help > Show help

6.2.3.5 Arranging windows

Below, you will learn how to open and close individual windows of the TIA Portal and work with saved window layouts using the keyboard.

Opening and closing windows

The following table shows how you can open and close windows with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Open/close project tree	<Ctrl+1>	View > Project tree
Opening/closing the detailed view	<Ctrl+4>	View > Details view
Opening/closing the overview	<Ctrl+2>	View > Overview
Opening/closing a task card	<Ctrl+3>	View > Task card
Open libraries	<Ctrl+Shift+L>	
Open hardware catalog If you are in the device or network view, the hardware catalog opens.	<Ctrl+Shift+C>	
Open/close inspector window	<Ctrl+5>	View > Inspector window

Function	Keyboard shortcut	Menu command
Open the "Properties" tab in the inspector window	<Ctrl+6>	
Open the "Info" tab in the inspector window	<Ctrl+7>	
Open the "Diagnostics" tab in the Inspector window	<Ctrl+8>	
Display or hide reference projects	<Ctrl+9>	
Display the on-screen keyboard You can display a keyboard on the screen, for example, to operate with a touch screen.	<Ctrl+Shift+K>	
Close all editors	<Ctrl+Shift+F4>	Window > Close all

Using saved window layouts

You can save individual window arrangements and restore them at a later point in time. The following table shows how you to access saved window layouts with keyboard shortcuts:

Function	Keyboard shortcut	Menu command
Restore active window layout If you use a saved window layout and have made changes to the program interface in the meantime, you can restore the original state of the active window layout with <Alt+Shift+0>.	<Shift+Alt+0>	Window > Restore window layout
Load window layout You can use <Alt+Shift+[number of the window layout]> to activate the first of the five saved window layouts.	<Shift+Alt+[Number of the window layout]>	Window > Window layout 1 to 5

6.2.3.6 Navigating through the program interface

The TIA Portal is divided into various user interface areas, for example, individual windows, toolbars, and editors. If you want to work with the keyboard within an interface area, you first have to place the focus on it. Below, you will learn how to place the focus on individual interface areas using the keyboard. You will also learn how to move within an interface area in the TIA Portal using the keyboard.

Switching between interface areas and editors

The following table shows how to move between individual interface areas of the TIA Portal:

Function	Keyboard shortcut
Move clockwise between the interface areas You can use the <F6> key to move clockwise between the individual interface areas of the TIA Portal. The interface area currently in focus is highlighted with a blue title bar. If you are in the project tree, for example, and press the <F6> key, you jump to the currently open editor. If you press <F6> again, the task cards are in focus. If you press <Shift+F6>, on the other hand, you move counterclockwise between the work areas.	<F6>
Move counterclockwise between the interface areas With <Shift+F6> you move counter-clockwise between the interface areas of the TIA Portal.	<Shift+F6>

Function	Keyboard shortcut
Go to the next open editor With <Ctrl+Alt+Arrow right> you go to the next open editor. You can see the open editors in the editor toolbar.	<Ctrl+Alt+Arrow right> Alternative: <Ctrl+F6>
Go to the previous open editor With <Ctrl+Alt+Arrow left>, you go to the last opened editor.	<Ctrl+Alt+Arrow left> Alternative: <Ctrl+Shift+F6>
Go to the next higher section of the interface area With <Shift+Esc>, you move to the next higher section of the program interface. If, for example, you have selected a device in the project tree and you press <Shift+Esc>, the entire project navigation is put into focus.	<Shift+Esc> Alternative: <Alt+Arrow up>
Go to the next lower section of the interface area With <Enter>, you place the focus on the next lower section of the program interface. For example, if you have just opened the properties of a device in the Inspector window in order to assign parameters to the device, press <Enter> to go one level deeper in the program interface. You can then navigate to the desired parameter using the Tab key.	<Enter> Alternative: <Alt+Arrow down>

Navigation within interface areas and editors

The following table shows how you can navigate within a user interface area using the keyboard:

Function	Keyboard shortcut
Jump to the next element within an interface area You can use the Tab key to jump from one element to the next within a work area. If, for example, you have opened the properties of a device and want to jump from one field to the next, press the Tab key. Any changes you have made to the current text box are applied in this case.	<Tab>
Jump to the previous element within an interface area With <Shift+Tab>, you can jump to the previous element in a work area, for example, a previous text box. Any changes you have made to the current text box are applied in this case.	<Shift+Tab>
Jump to the higher-level element within an interface area With <Shift+Home> you can jump to the higher-level element of a work area, e.g., to the higher-level folder in the project tree.	<Shift+Home>
Move to the next tab within an interface area If an interface area is divided into separate tabs, you can move between the tabs with the shortcut keys <Ctrl+Tab>. If, for example, you are in the "Properties" tab of the Inspector window and you want to jump to the "Info" tab, press the shortcut keys <Ctrl+Tab>.	<Ctrl+Tab>
Go to the previous tab With <Ctrl+Shift+Tab>, you move to the most recently open tab within an interface area.	<Ctrl+Shift+Tab>

Function	Keyboard shortcut
Jumping to the toolbar of an editor You can use the <Alt+F10> key to jump to the toolbar of an editor. For example, if you have opened the print preview and want to switch to the next page of the printout in the toolbar, press <Alt+F10>. Then, use the arrow keys to navigate to the appropriate icon in the toolbar and confirm the selection with <Enter>.	<Alt+F10>
Use arrows on the divider to display or hide user interface components The table in the work area can be minimized and maximized. First, navigate to the work area and use the Tab key to place the focus on one of the little arrows on the separator line above the table. The arrows have the focus as soon as they are highlighted in blue. Then, press the space bar to minimize or maximize the table.	<Space>

6.2.3.7 Customizing editors

Below, you will learn how to arrange editors using the keyboard. You will also learn how to select the display size and the area within a graphical editor.

Arranging and customizing editors

The following table shows how to arrange open editors above and below each other or side-by-side, and how to close an open editor:

Function	Keyboard shortcut	Menu command
Close active editor	<Ctrl+F4>	
Split editor space vertically If, for example, you have opened the overview window and the network view and want to display them side-by-side, press the <F12> key.	<F12>	Window > Split editor space vertically
Split editor space horizontally You can display two open editors in the work area above and below each other.	<Ctrl+F12>	Window > Split editor space horizontally
Remove window split If you have displayed two editors in the work area horizontally or vertically in split mode, you can remove the split with <Alt+Shift +F12>.	<Alt+Shift+F12>	Window > Unsplit editor space

Customizing the display in an editor

The following table shows how you how to zoom in and out in graphical editors and how to move the area selection in an editor:

Function	Keyboard shortcut
Zoom in step-by-step in an editor With <Ctrl> and the <Plus> key on the numeric keypad of the keyboard, you can zoom in on the display of the editor.	<Ctrl+Plus> Alternative: <Ctrl+Scroll up>
Zoom out step-by-step in an editor Use the <Ctrl> and the <Minus> key on the numeric keypad of the keyboard to zoom out of the display of the editor.	<Ctrl+Minus> Alternative: <Ctrl+Scroll down>

Function	Keyboard shortcut
Set view in the editor to 100% Press <CTRL+0> to enlarge or reduce the current view in a graphical editor to 100%.	<Ctrl+0>
Move the area selection of the editor If you hold down the spacebar, you can move the displayed section of an editor using the mouse.	<Space>

6.2.3.8 Editing objects

Selecting objects

The following table shows how to select individual objects, for example, devices in the project tree:

Function	Keyboard shortcut	Menu command
Select an object located at the left, right, above or below	<Arrow keys>	
Jump to the first object within the current interface area The first object in the interface area currently in focus is selected. In the project tree, this would be the project node at the top, for example.	<Home>	
Jump to the last object within the current interface area The last object in the interface area currently in focus is selected, for example, the last item in the project tree.	<End>	
Select all objects in an area All objects in the work area currently in focus are selected.	<Ctrl+A>	Edit > Select all
Select multiple objects If you want to select several objects that are not located directly next to each other, you first have to move the focus (gray outline of an object) to the next desired object using <Ctrl+Arrow keys>. The current selection is maintained. Then, press the space bar to select the new focused object as well. Repeat this process until all desired objects are selected.	<Ctrl+Arrow keys> + <Space>	

Editing objects

The following table provides an overview of all the keyboard shortcuts required for editing objects:

Function	Keyboard shortcut	Menu command
Insert new object A new object is inserted depending on your current context. If, for example, you are in the device view, the "Add Device" dialog opens for creating a new device.	<Ctrl+N>	
Open object	<Enter>	
Rename an object	<F2>	Edit > Rename
Copy an object	<Ctrl+C> Alternative: <Ctrl+Ins>	Edit > Copy

Function	Keyboard shortcut	Menu command
Cut an object	<Ctrl+X> Alternative: <Shift+Delete>	Edit > Cut
Paste an object	<Ctrl+V> Alternative: <Shift+Insert>	Edit > Paste
Delete an object	<Del>	Edit > Delete
Compile an object	<Ctrl+B>	Edit > Compile
Open properties of an object Many objects in the TIA Portal have editable properties. Press the shortcut keys <Alt+Enter> to display the properties of an object.	<Alt+Enter>	-

6.2.3.9 Text editing

Below, you will learn how to operate text editing functions using only the keyboard.

Editing text

The following table shows the basic editing functions for text:

Function	Keyboard shortcuts
Switch to insert or overwrite mode	<Insert>
Exit edit mode	<Esc>
Delete	<Del>
Delete characters	<Backspace>
Confirm entry in a text box and leave the text box	<Return>
Line break in a multiline text box In a multiline text box, hold down the <Shift> button to create a line break.	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

Navigating within a text area

The following table shows how to navigate in a text area with the keyboard:

Function	Keyboard shortcuts
Jump to start of line	<Home>
Jump to end of line	<End>
Jump to start of text	<Ctrl+Home>
Jump to end of text	<Ctrl+End>
Jump to the previous page	<PgUp>
Jump to the next page	<PgDn>
Confirm entry in a text box and leave the text box	<Return>

Function	Keyboard shortcuts
Line break in a multiline text box	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

Selecting text

The following table shows how to select text with the keyboard:

Function	Keyboard shortcuts
Expand selection to the word at the left or right The text or current text selection is marked up to the end of word. If you are at the beginning or end of a word, the previous or next word is selected.	<Ctrl+Shift+Arrow left or Arrow right>
Expand selection to beginning of line	<Shift+Home>
Expand selection to end of line	<Shift+End>
Expand selection to beginning of text The text is selected up to the beginning or the end.	<Ctrl+Shift+Home>
Expand selection to end of text The text is selected up to the beginning or the end.	<Ctrl+Shift+End>

6.2.3.10 Editing tables

Below, you will learn how to navigate with the keyboard in tables, edit individual fields, and select parts of tables.

General keyboard operation in tables

The following table shows how you can edit tables using only the keyboard:

Function	Keyboard shortcut
Place a cell in edit mode	<F2> or <Return>
Confirm entry and exit edit mode	<Enter>
Cancel editing and discard changes	<Esc>
Open drop-down list in a cell Open the drop-down list with <F4>. Use the arrow keys to select the desired entry and then confirm the selection with <Return>.	<F4>
Close drop-down list in a cell and discard changes	<Esc>

Navigate in tables

The following table shows how you can navigate within a table using the keyboard:

Function	Keyboard shortcut
Go to line	<Ctrl+G>
Go to the next cell	<Arrow keys>

Function	Keyboard shortcut
Go to the next editable cell on the right	<Tab>
Go to the next editable cell on the left	<Shift+Tab>
Move a screen upwards	<PgUp>
Move a screen downwards	<PgDn>
Go to the first cell in the row	<Home>
Go to the last cell in the row	<End>
Go to the first cell in the table	<Ctrl+Home>
Go to the last cell in the table	<Ctrl+End>
Go to the top cell in the column	<Ctrl+Arrow up>
Go to the bottom cell in the column	<Ctrl+Arrow down>
Insert table row below	<Alt+Ins>
Insert line break in an entry field/insert table row above	<Ctrl+Return>

Selecting areas in tables

The following table shows how you can select areas within a table using the keyboard:

Function	Keyboard shortcut
Select column	<Ctrl+Space>
Select line	<Shift+Space>
Select all cells	<Ctrl+A>
Expand selection by one cell	<Shift+arrow keys>
Extend selection up one page	<Shift+PgUp>
Extend selection down one page	<Shift+PgDn>
Expand selection up to the first row	<Ctrl+Shift+Arrow up>
Expand selection down to the last row	<Ctrl+Shift+Arrow down>
Expand selection to the first cell in the row	<Ctrl+Shift+Arrow left>
Expand selection to the last cell in the row	<Ctrl+Shift+Arrow right>

6.2.3.11 Using online functions

Controlling online functions with the keyboard

The following table provides an overview of the shortcut keys that you can use for the online functions of the TIA Portal:

Function	Keyboard shortcut	Menu command
Establish an online connection	<Ctrl+K>	Online > Go online
Go offline	<Ctrl+M>	Online > Go offline
Download project data to the device	<Ctrl+L>	Online > Download to device

Function	Keyboard shortcut	Menu command
Show accessible devices This opens a dialog showing all devices that are connected to the PG/PC interface of the PG/PC.	<Ctrl+U>	Online > Show accessible devices
Start CPU The CPU is set to "RUN" mode. The CPU must be online for this.	<Ctrl+Shift+E>	Online > Start CPU
Stop CPU The CPU is set to "STOP" mode. The CPU must be online for this.	<Ctrl+Shift+Q>	Online > Stop CPU
Start simulation The hardware and software of the project can be tested in a simulated online environment, without the modules actually being online.	<Ctrl+Shift+X>	Online > Simulation > Start

6.2.3.12 Using the on-screen keyboard

Introduction

When working with the TIA Portal, you also have the Microsoft on-screen keyboard available.

Displaying the on-screen keyboard

To display the on-screen keyboard, follow these steps:

1. In the "View" menu, select the "Screen keyboard" command.

Exiting the on-screen keyboard

To exit the on-screen keyboard, follow these steps:

1. In the "File" menu of the on-screen keyboard, select the "Exit" command.

6.2.4 Special features specific to the operating system

6.2.4.1 Influence of user rights

Restrictions when user rights are limited

The software provides several functions that require direct access to the hardware of the programming device / PC and therefore also to the installed operating system. To make full use of the range of functions, the software must cooperate closely with the operating system. To ensure problem-free interaction, you should therefore be logged on to the operating system with adequate user rights.

In particular, you may not be able to use functions requiring an online connection or those that change the settings of interface cards if you work with limited user rights.

Recognizing restricted functions

You can recognize functions requiring special rights as follows:

- A shield icon is displayed beside the function.
  
  The function can be used but is regulated by the user account control.
- A box is grayed out and cannot be accessed.
  You require administrator privileges to access the box. In some operating system environments, you can obtain administrator privileges by entering an administrator password.

Note

A box being grayed out does not necessarily mean a lack of rights. You should also check the additional information in the tooltip cascades to find out the conditions for editing the box.

6.2.4.2 Expanding user rights

Counteracting restrictions due to user rights

Certain functions may not be available if you are not logged on to the operating system with adequate rights. You can counteract these restrictions in the following ways:

- Enabling of extended rights using Windows user account control
- Logging on to the operating system with administrator privileges
- Using temporary administrator rights

Enabling extended rights using Windows user account control

To be able to use a function indicated by the shield icon of the Windows user account control, follow these steps:

1. Click on the box or button with the shield icon.
   The security prompt of the Windows user account control opens.
2. Follow the instructions of the Windows user account control and, when prompted enter an administrator password, if possible.

The function can now be used once without restrictions.

Logging on to the operating system with administrator privileges

To be able to use a function that is disabled due to lack of user rights, follow these steps:

1. Close the software.
2. Log off from the operating system.
3. Log on to the operating system with administrator privileges.
4. Restart the software.

Using temporary administrator rights

To obtain administrator privileges temporarily, follow these steps:

1. Click the "Change settings" button. You will find this button in dialogs that allow the temporary assignment of administrator privileges.
   An operating system dialog box for entering an administrator password opens.
2. Enter an administrator password.

The settings can be temporarily changed. When you call the dialog again, the procedure must be repeated.

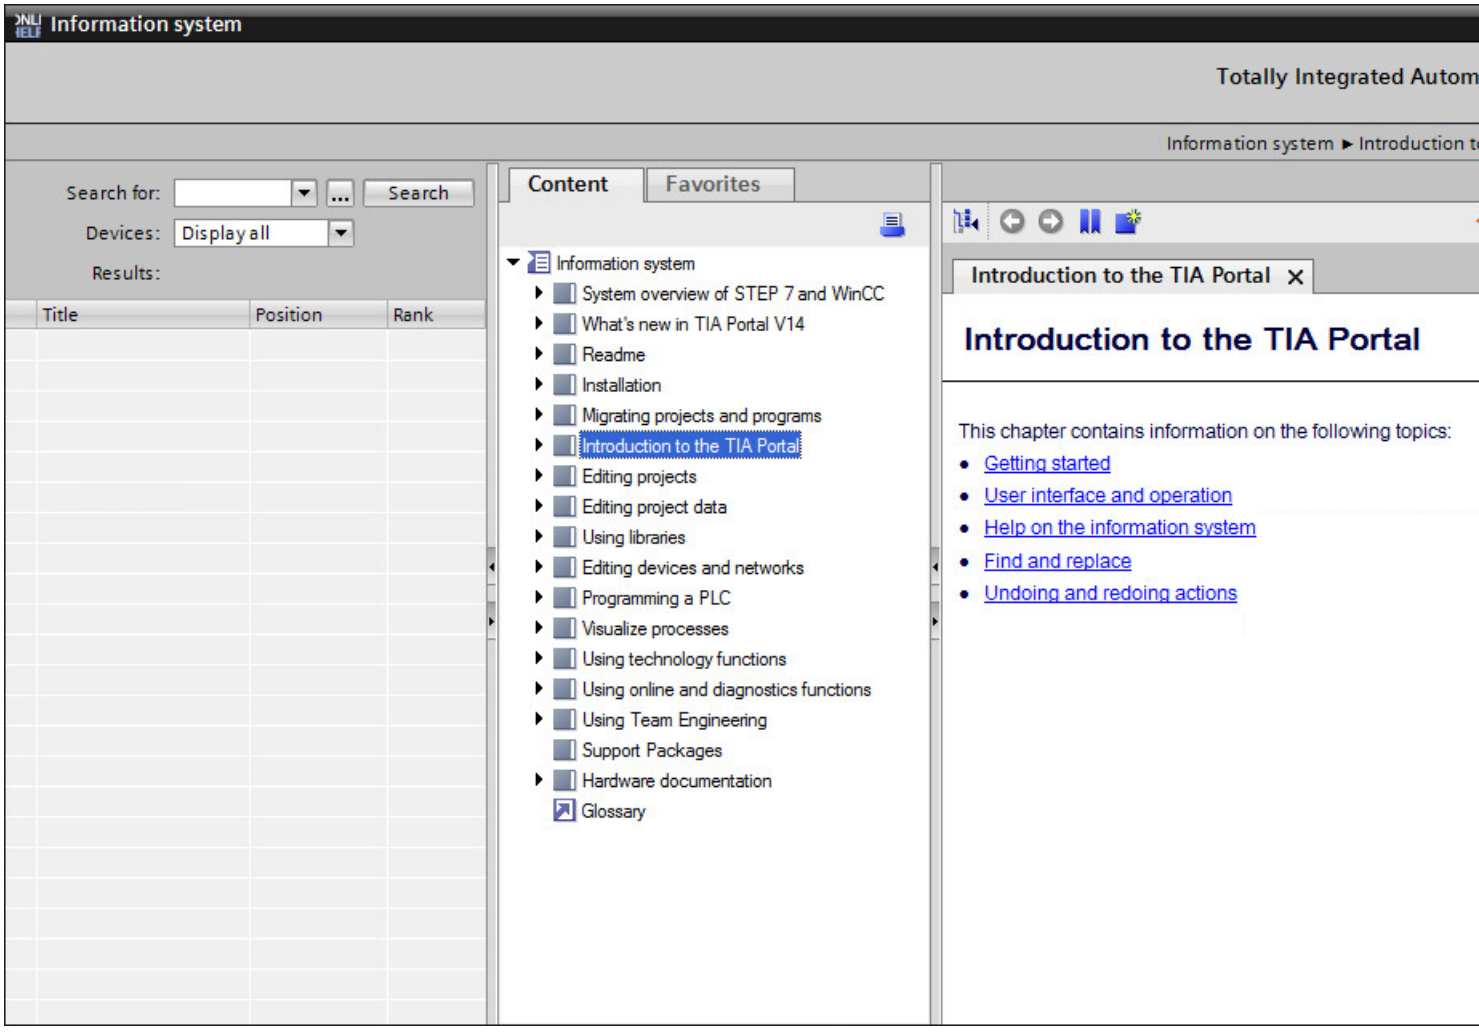
Note

This function is not supported by all operating systems. If no "Change settings" button is present or the button is grayed out, you will need to log on to the operating system with administrator privileges instead.

6.3 Help on the information system

6.3.1 General remarks on the information system

Quick answers to your questions



The information system of the TIA Portal helps you solve your problems and offers the required help topics at each step of the configuration.

While working with the program, you receive the following support:

- Information system with all the background information, step-by-step instructions and examples that you need when working with the TIA Portal.
- Tooltips for information on elements of the user interface, for example text boxes, buttons and icons. Some of the tooltips are supplemented by cascades containing more precise information.
- Help on the current context, for example on menu commands when you press the <F1> key.
- Help on messages
- Roll-outs for correct inputs in dialog boxes
- Banner on the software interface

Information system

The information system opens in a separate window. The following figure shows the information system for the TIA Portal:

The information system is divided into the following areas:

- Search area
  In the search area, you can perform a full text search across all help topics.
- Navigation area
  You can find the table of contents and favorites in the navigation area.
- Content area
  The help pages appear in the content area. You can open multiple tabs to view various help pages at the same time.

The arrows on the window dividers allow you to display and hide the individual sections. You can open both the search area and the navigation area to increase the contents area as needed.

Buttons in the contents area

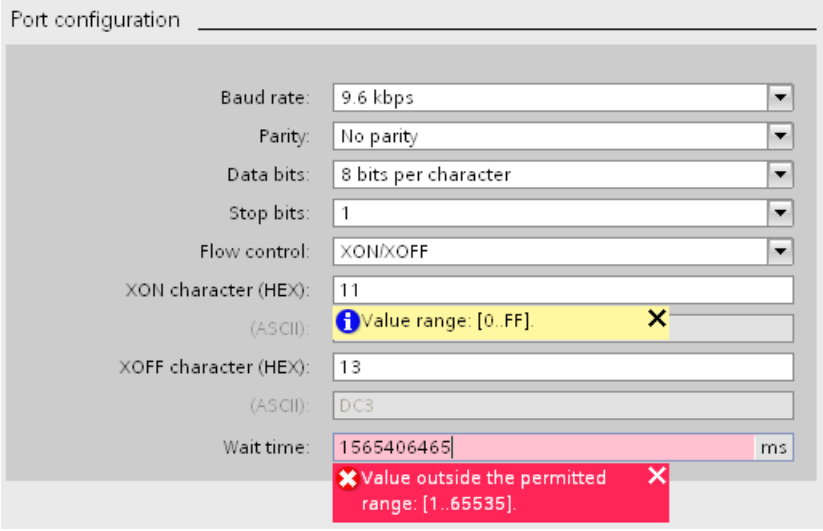
The following buttons are available in the contents area of the information system:

Button	Function
	Synchronize Shows the position of the open help topic in the table of contents.
	Forward / backward Navigates through the history of the help topics previously opened in this tab.
	Favorites Adds the current help topic to the favorites.
	New tab Opens a new, empty tab.
	Home page Displays the start page of the information system.
	Printing Prints the current help topic.
	Help Displays help on the information system.

Identification of the topics according to the information type

The information system provides you with a wide range of information. The help topics are identified by different symbols depending on the type of information they contain. Symbols tell you at a glance what kind of information you have just opened.

Symbol	Information type	Explanation
	Operating instructions	Describes the steps to follow in order to carry out a particular task.
	Example	Contains a practical application example that explains how to solve an automation task.
	Factual information	Provides background information on the functions of the TIA Portal and provides basic knowledge.
	Reference	Provides detailed reference information about instructions and objects for reference.



Identification of the topics according to the target system

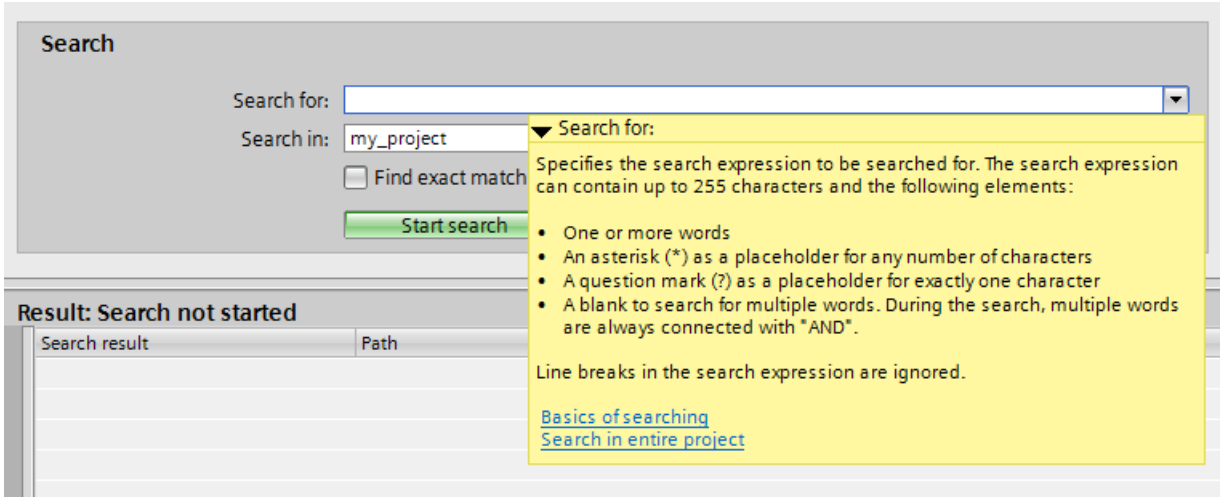
Depending on the scope of the installation, the help system may contain sections or pages that apply to specific devices only. To be able to recognize such sections or pages at first glance, you will find a note in brackets in the table of contents. The search results in the full text search are marked in the same way if they only apply to a specific device. You will find an icon in the title bar of such pages. Move the cursor over the icon to obtain information about the valid target system.

Roll-out

Certain text boxes offer information that rolls out and helps you to enter valid parameters and values. The roll-out informs you about permitted value ranges and data types of the text boxes.

The following figure shows a roll-out (yellow) and a roll-out error message (red), which indicates an invalid value:

The roll-out is closed as soon as you exit the window or click the x in the upper right corner.

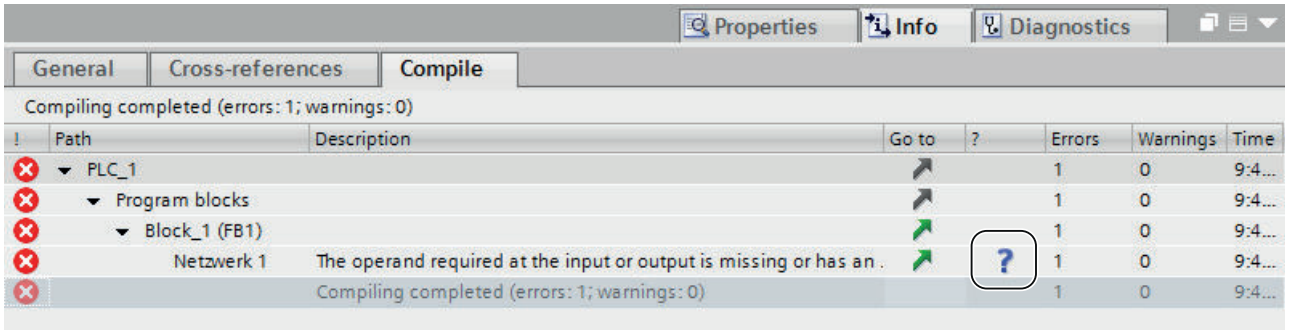


Tooltip

User interface elements offer brief information in the form of a tooltip.

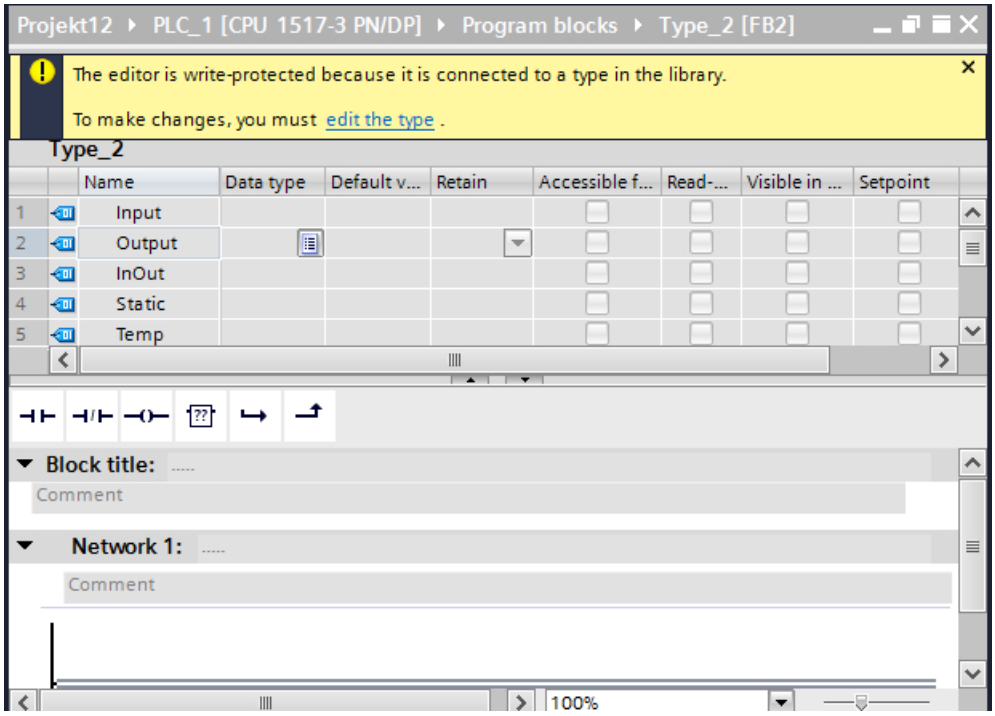
Tooltips, which have an arrow icon on the left, contain additional information in tooltip cascades. If you position the mouse pointer briefly over the tooltip or click the arrow icon, this information is displayed. The automatic display of tooltip cascades can be disabled.

If additional information is available, a link to the corresponding help topic appears in the cascade. If you click on the link, the corresponding topic opens in the information system.



The following figure shows a tooltip with opened cascade:

Help on messages



Numerous actions are accompanied by messages in the Inspector window of the TIA Portal. The messages give information about whether or not an action was successful. In addition, you see which changes have been made in the project. Further help is available for some messages. If further help is available for an message, you access the help by clicking the question mark symbol.

The following figure shows the "Info" tab in the Inspector window with several messages and a question mark symbol:

Banner on the software interface

In some editors, you can obtain additional support with banners at the top of the editor. The following figure shows a banner for an open library type:

To hide the banner, click on the vertical blue bar at the left edge of the banner or on the x in the upper right corner. To expand a collapsed banner, click on the information symbol at the top left of the opened editor. In the settings of the TIA Portal, you can specify that banner is to be hidden by default.

If multiple banners are available in an editor, the most relevant banner is displayed first. To move to the next banner, scroll to the next banner at the bottom right corner.

Configuring the display of tooltips and tooltip cascades (Page 299)

Using user-defined documentation (Page 426)

6.3.2 Opening the information system

Opening the information system with the menu

To access the information system on the home page, follow these steps:

1. Select "Display help" command from the "Help" menu.

The start page of the information system opens.

Opening the information system with <F1>

To access the information system and help for the current context, proceed as follows:

1. Select an object for which you want to view the help, for example, a menu command or a program element.
2. Press <F1>.

The information system opens. If information on the current context is available, the appropriate topic appears. If no information on the current context is available, the home page of the information system is displayed.

Opening the information system via tooltip cascades

To open the information system from a tooltip cascade, proceed as follows:

1. Move the mouse pointer over an object with a tooltip cascade.
   The tooltip cascade opens. If additional information is available, the tooltip cascade contains links to the corresponding help topics.
2. Click on a link.

The information system opens and the additional help topic appears.

Opening help for error messages

Numerous actions are accompanied by messages in the Inspector window of the TIA Portal. If help on such a message is available, a blue question mark appears behind the message.

To view the help for a message, follow these steps:

1. Display the Inspector window.
2. Click on the blue question mark behind a message.

The information system opens and the help error message appears. It contains an exact description of cause of the error and how to remedy it.

Calling user-defined documentation (Page 435)

Using the information system (Page 289)

6.3.3 Using the information system

Opening a help topic in the current tab

To open a help topic in the current tab, follow these steps:

1. Click on the help topic in the table of contents.

Or:

1. Double-click on the help topic in the list of search results.

Opening a help topic in a new tab

To open a help topic in a new tab, follow these steps:

1. Select the help topic in the table of contents or in the list of search results.
2. Select the "Open in new tab" command from the shortcut menu.

Or:

1. Click on the "New tab" button in the contents area of the information system.
   A new empty tab opens.
2. Click on the help topic in the table of contents or double-click on the help topic in the list of search results.

Closing a tab

To close a tab, follow these steps:

1. Click on the cross at the right in the tab.
   The current tab is closed.

Or:

1. Click on the tab.
2. Select the "Close other tabs" command from the shortcut menu.
   All tags except the current one will be closed.

Showing the history

The history of the previously opened help topics is stored individually for each tab. To remove a help topic from the history, follow these steps:

1. In the contents area of the information system, click the "Forward" or "Backward" buttons to scroll chronologically through the history.

Displaying the position of a help topic in the table of contents

To display the position of the open help topic in table of contents, follow these steps:

1. Position the mouse pointer on the help topic.
2. Click "Synchronize" in the contents area of the information system.

Displaying help for the information system

To display the help on the information system, follow these steps:

1. Click on the "Help" button in the contents area of the information system.

6.3.4 Searching the information system

6.3.4.1 Basics of searching

Introduction

You have the option to search the information system for terms. You are provided a search area for this.

Search options

You can search for the following text:

- Search for a word:
  `<Search term>`
  This finds all help pages that contain the search term exactly or in a slightly changed form.
- Search for several words:
  `<Search_term_1 Search_term_2 ... Search_term_n>`
  This finds all help pages that contain all search terms exactly or in a slightly changed form. Neither the order nor the distance between the search terms plays a role here.
- Search for phrases
  `<"Search_term_1 Search_term_2 ... Search_term_n">`
  This finds all help pages that contain all search terms in the exact order specified. To find a phrase, place your search expression in quotation marks.

You can further specify your search with additional criteria:

- Boolean search with "AND":
  `<Search_term AND Search_term>`
  `<Search_term + Search_term>`
  You can link your search terms using the Boolean "AND" operator. This finds all help pages that contain all search terms exactly or in a slightly changed form.
  Alternatively, you can enter multiple search terms even without the operators "AND" or "+". This too finds all help pages that contain all search terms.
- Boolean search with "OR":
  `<Search_term OR Search_term>`
  `<Search_term - Search_term>`
  You can link your search terms using the Boolean "OR" operator. This finds all help pages that contain one of the search terms exactly or in a slightly changed form.
- Negate search with "NOT"
  `<Search_term_1 NOT Search_term_2>`
  `<Search_term_1 ! Searchterm_2>`
  You can negate a search term with "NOT". You must enter at least one additional search term for this purpose, however. This finds all help pages in which "Search_term_1" occurs. Pages in which "Search_term_2" occurs are not included in the hits, since this search term has been negated.

- Fuzzy search with "~"
  `<Search~>`
  You can place a tilde ("~") after the search term. This finds all help pages in which the search term appears with approximately this spelling.
- Distance search with "~<proximity>"
  `<"Search_term_1 Search_term_2" ~proximity>`
  The proximity search allows you to find help pages where two search terms are no further apart than the defined distance. Enter the proximity as a positive integer. Enter the two search terms in quotes. There should be no gap between the tilde ("~") and the space.

Search filter

You can limit the search to a specific device or a device series by specifying a device as a search filter:

- If you select a device as a filter criterion, the keyword is only searched for in the pages or sections that apply to the specified device.
- If select the "Show all" option from the list instead of specifying a device, the search term is sought throughout the entire information system.

Extended search

You can also use the extended search to search the information system. It offers the same search options as the default search. However, you also obtain direct information about the possible selections for search options.

See also

Searching help topics (Page 292)

Examples of searching in the information system (Page 293)

6.3.4.2 Searching help topics

To quickly find the required information, you can perform a full text search across all help topics.

Procedure

To search the information system for a specific terms, follow these steps:

1. Open the search area.
2. In the "Find what" box, enter the search term or select a recently searched phrase from the drop-down list.
3. Optional: To obtain information on the search options, click "...".
   The "Extended search" dialog opens. It shows an overview of all options.
4. Optional: In the "Devices" selection box, select a device as a search filter.

5. Click "Find".
   The search is performed and the results are listed:
   - The title of the help topic found is displayed in the "Title" column.
   - The "Position" column shows the section containing the help topic.
   - The relevance of the topic to the search term appears in the "Rank" column.

   You can change the sorting by clicking on the header of a column.
6. Double-click on a search result or select the "Open in new tab" command in the shortcut menu.

Result

The help topic opens in the contents area.

To display the location of the open help topic in the table of contents, click on the "Synchronize" button.

See also

Basics of searching (Page 291)

Examples of searching in the information system (Page 293)

6.3.4.3 Examples of searching in the information system

Examples of the search for one word

Searching for a word finds all help pages that contain the search term exactly or in a slightly changed form. Terms that contain special characters must be enclosed in quotes:

- Search for `<PLC data type>`
  This finds all pages containing the words "PLC data type", "PLC data types" or similar related terms.

Examples if searching for several words

Searching for multiple words finds all help pages that contain all search terms exactly or in a slightly changed form. Neither the order nor the distance between the search terms plays a role.

- Search for `<variant example>`
  This finds all pages containing the terms "variant", "VARIANT", "variant instruction" and "example", "examples" or similar related terms.
- Search for `<LED tag>`
  This finds all pages containing the terms "LED tag", "LED-tag", "LED status of the tag" or similar related terms.

Examples of searching with phrases

Searching with phrases finds all help pages that contain all search terms in the exact order specified. To find a phrase, place your search expression in quotation marks.

- Search for `<"examples for using recipes">`
  This finds all pages containing the terms "Examples for using recipes" or similar terms in the specified order.

Examples of the Boolean search with "AND"

A Boolean search with "AND" finds all help pages that contain all search terms exactly or in a slightly changed form. Neither the order nor the distance between the search terms plays a role.

- Search for `<user groups AND authorization>`
  This finds all pages containing the terms "user groups", "user group" and "authorization", "authorizations" or similar related terms.
- Search for `<examples AND "Use in the recipes">`
  In this example, the Boolean search using "AND" is combined with the phrase search: This finds all pages containing exactly the terms "use in the recipes" in the specified order and "examples" at any position.

Examples of the Boolean search with "OR"

A Boolean search with "OR" finds all help pages that contain one or more of the specified search terms exactly or in a slightly changed form.

- Search for `<block OR function>`
  This finds all pages containing the terms "block", "blocks" and/or "function", "functions" or similar related terms.
- Search for `<block OR function OR function block>`
  This finds all pages containing the terms "block", "blocks" and/or "function", "functions" and/or "function block", "function blocks" or similar related terms.

Examples of the Boolean search with "NOT"

A Boolean search with "NOT" finds all help pages that contain the specified search terms but not the negated search terms.

- Search for `<alarm CPU NOT GRAPH>`
  This finds all pages containing the terms "alarms", "alarm" and "CPU" but not the word "GRAPH".
- Search for `<alarm NOT GRAPH CPU>`
  This finds all pages containing the terms "alarms", "alarm" and "CPU" but not the word "GRAPH".
- Search for `<alarm NOT CPU NOT GRAPH>`
  All pages containing the term "message" are found but not the word "GRAPH" and not the word "CPU".

Examples of the fuzzy search with "~"

A fuzzy search finds all help pages in which the search term appears with approximately this spelling.

- Search for `<trends~>`
  This finds all pages containing the terms "trend", "trend bit", "trend value", "trend display" "trend recording" or similar related terms.

Examples of a proximity search with "~ <distance>"

A proximity search finds all help pages where two search terms are no further apart from each other than the defined distance.

- Search for `<trend measurement~10>`
  This finds all pages in which the terms "trend" and "measurement" are no more than 10 words apart.

Examples of searching with filters

When searching with a filter, keywords are searched for only in the pages or sections that are valid for the specified device.

- Search for `<example>` with search filter "S7-1500"
  This finds all pages containing the terms "example", "examples" or similar related terms and that apply to S7-1500.
- Search for `<SCL>` with search filter "S7-400"
  This finds all pages containing the term "SCL" and that apply to S7-400.

6.3.5 Using favorites

Using favorites

You can save individual help pages or sections as favorites. This saves you searching for the help topic a second time.

Favorites are retained even if you close the TIA Portal. They are still available when the information system opens the next time.

Saving favorites

To save a page or section as a favorite, follow these steps:

1. Open the page or the section that you want to save as a favorite.
2. Click on the "Add to favorites" button.
   Or:

1. Select a page or section in the table of contents.
2. Select the "Add to favorites" command in the shortcut menu.

The help topic or chapter is saved as a favorite and is available the next time you open the help system.

Calling favorites

To open a page from your favorites, follow these steps:

1. Open the "Favorites" tab.
2. Double-click on the help topic that you want to open.
   Or:

1. Open the "Favorites" tab.
2. Select the shortcut menu command "Open in new tab".

The help topic opens in the contents area of the current tab or in a new tab.

Go to position in the table of contents

To navigate from your favorites to the position of the subject in the table of contents, follow these steps:

1. Select the topic in the favorites where you want to go in the table of contents.
2. Select the shortcut menu command "Go".
   The menu command is enabled only when you select a topic that is included in the table of contents. Context-sensitive help topics, for example, help on syntax errors, are not included in the table of contents. The "Go to" is not executable for this.

The table of contents opens and expands at the desired position.

Deleting favorites

To delete an entry from the favorites, proceed as follows:

1. Open the "Favorites" tab.
2. Select the topic you want to remove from the list.
3. Select the "Remove" command from the shortcut menu.

6.3.6 Copying code examples into the program

Many help topics include code examples that illustrate instructions and functions for programming in the TIA Portal. You can copy code examples in the programming languages SCL and STL and use them directly in your program.

Example

You recognize an example that can be copied by the "Copy" symbol in the header of the program example:

SCL

```
"Tag_Result1" := ABS("Tag_Value");
"Tag_Result2" := ABS("Tag_Value1"*"Tag_Value2");
```

Procedure

To copy a code example, follow these steps:

1. Open the Help topic with the sample program you require.
2. Click on the "Copy" button in the header of the program example.
   The program code is copied to the clipboard.
3. Open the programming editor and insert the copied code. To do this, select the "Paste" command in the shortcut menu.
   The copied program code is inserted from the clipboard into the program code being edited.

6.3.7 Displaying more information in the Siemens Industry Online Support

The information system provides an introduction to the "TIA Portal Information Center" in the Siemens Industry Online Support. Here you obtain additional up-to-date information about the TIA Portal, for example, application examples, training opportunities, FAQs, hardware documentation and much more.

Note

Internet connection required

To access the information in Siemens Industry Online Support, you need an Internet connection.

Procedure

To open more information in Siemens Industry Online Support, follow these steps:

1. Open the start page of the information system. You have the following options here:
   - Select the top entry in the table of contents. The entry has the title "Information system".
   - Select the "Home page" button in the contents area.

   The start page of the information system opens. The "TIA Portal Information Center" displayed at the bottom of the home page.
2. Click on the screen of the "TIA Portal Information Center".
   The "TIA Portal Information Center" opens.

6.3.8 Printing help topics

You have the following options for printing the contents of the information system:

- You can print the selected sections or pages from the index together. You can select any content of the information system. It need not involve contents of contiguous sections. The selected content will be printed in a print-optimized layout with pagination.
- You can print a single open page.

Print sections or pages from the table of contents

To print the contents from the table of contents, follow these steps:

1. Open the table of contents of the information system.
2. Click on the "Print" button in the "Contents" tab.
   The "Print" dialog opens.
3. In the "Print" dialog, select the sections and pages that you want to print.
4. Click the "Print" button to print the selected information.
   The standard print dialog box opens.
5. Select the printer on which you want to print the information.
6. Click "Properties" if you want to make additional printer settings.
7. Confirm your entries with "OK".
   The information is printed on the selected printer.

Printing single opened page

To print a single page, follow these steps:

1. Open the page to be printed in the contents area of the information system.
2. Select the "Print" button in the contents area.
3. The standard print dialog box opens.
4. Select the printer on which you want to print the information.
5. Click "Properties" if you want to make additional printer settings.
6. Confirm your entries with "OK".
   The page is printed on the selected printer.

6.3.9 Configuring the display of tooltips and tooltip cascades

Configuration options for tooltips and tooltip cascade

You can customize the display of tooltips and tooltip cascades to suit your needs. You can make the following settings:

- Display or hide truncated texts
  Sometimes texts may be too long for a text field. The texts are then fully displayed in a tooltip when you hover your mouse over the text field. You can enable or disable this function.
- Enable or disable tooltips
  Tooltips provide more detailed information about an element of the user interface. You can also have tooltips displayed in a cascade. If you disable the tooltips, the cascade with context-sensitive help is also no longer displayed. However, you have the option of manually displaying the tooltip for the currently active interface element by pressing <F1>. The setting also affects rollouts with context-related syntax errors and input aids in STL.
- Enable or disable automatic opening of tooltip cascades
  By keeping the mouse pointer over a tooltip for a brief time, any available cascades are displayed automatically. You can enable or disable the automatic display of cascades. When automatic display is disabled, you must open the cascade manually if necessary. To do this, click on the arrow icon in the tooltip.

Procedure

To configure the display of tooltips and tooltip cascades, follow these steps:

1. Select the "Settings" command in the "Options" menu.
2. Select the "General" group in the area navigation.
3. Select or clear the individual check boxes in the "Tooltips" area to suit your needs. The "Open cascade automatically in tooltips" check box is only available if you have enabled the display of tooltips.

See also

General remarks on the information system (Page 283)

6.3.10 Assembling customized documentation

Customized documentation

In the Siemens Industry Online Support, in the "mySupport Documentation" category, you can assemble customized documentation that is tailored to your needs. All configurable manuals and operating instructions of the Siemens Industry Online Support are available to you for this purpose. You can select the parts that are of interest to you and combine them into in a library to form personal documentation. You can organize the documentation using folders in your personal library. The folders will later become the individual chapters of your custom documentation.

You can open "mySupport Documentation" here:

https://support.industry.siemens.com/My/ww/en/documentation (https://support.industry.siemens.com/My/ww/en/documentation)

Requirement

- The manuals or operating instructions used must be configurable. You can recognize configurable manuals by the suffix "configurable" in their name.
- To use all the functions, you have to register in the Siemens Industry Online Support and log on.

Documentation in different languages

You can change the language of the assembled documentation to German, French, Spanish, Italian and Chinese. This gives you the possibility, for example, to gather relevant information for a specific project and make it available to colleagues who speak other languages.

Export function in the documentation

You can perform an export at any part of your library in various formats (PDF, XML, RTF).

Help on creating documentation

You can find more help on creating and using custom documentation in the Siemens Industry Online Support:

https://support.industry.siemens.com/My/ww/en/documentation (https://support.industry.siemens.com/cs/helpcenter/en/index.htm)

6.3.11 Safety Guidelines

Safety guidelines

This Help manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury will result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury may result if proper precautions are not taken.

⚠ CAUTION

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

Note

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

Prescribed Usage

Note the following:

WARNING

This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens. Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

6.4 Find and replace

6.4.1 Basics of searching

Introduction

You can use the following search options within TIA Portal:

- Search entire project
- Searching and replacing in the editor
- Browsing the hardware catalog

In addition, individual products in TIA Portal offer more search options.

Search entire project

You can search the entire project for a specific text. The search editor helps you in the search, for example, by further limiting the search. All objects containing the search text are displayed clearly in a table. You can open each object in the search editor to view the relevant location.

Searching and replacing in the editor

You can search for texts in the editors. The search function finds all texts containing the search key in the currently opened editor. The results are selected in sequence in the opened editor.

You also have the following options:

- Narrowing down the search with additional options
- Replacing found texts

Which additional options are available and which types of text can be searched for depends on the installed products and the open editor.

Browsing the hardware catalog

You can search for a specific hardware component in the hardware catalog.

See also: Browsing the hardware catalog

Searching and replacing in the editor (Page 315)

Search in entire project (Page 307)

6.4.2 Search entire project

6.4.2.1 Basics for search in the project

Introduction

You can search the open project for a specific text (search term). The search term can be one word, several words or parts of words. Only spaces are considered as word limits. You can use search terms that are up to 255 characters long. You can create any complex search terms using wildcards. You can also limit the search to specific areas, objects or object properties. Uppercase and lowercase letters are not taken into account in the search.

For the search, an index of the texts of the editors which can be searched in the project is built up automatically in the background. The search index is updated with each change. You cannot start the search before indexing is complete. You can generate the search index again at any time.

Note that the search index is saved with the project. This may increase the file size of the project. If you want to pass on the project, you can reduce the file size by archiving or minimizing the project. The search index is removed in this case. You can also completely disable the search in the project if necessary.

In the case of changes to STEP 7 objects, e.g. name changes of tags, PLC data types or blocks, you must update the point of use of the these object before any search in the project in order that the search can take these changes into account. To do this you can, for example, recompile your program.

The search only includes the texts in the set editing language. The search index is generated again when you change the editing language. This may take some time, depending on the number of texts in the project.

The search editor helps you with your search. In it, you can specify search options and start the search. After the search is completed, the search editor lists the objects which contain the search text. You can open the individual objects directly from the search editor.

Search options

The following options are available for the search:

- Limit search:
  - Search in: You can select the sections of the project that are to be searched.
  - Find exact match: Finds exactly the text you have entered. The search term is searched as individual word or as phrase. You cannot use wildcards in the search term when you use this option, for example, when you enter "*" or "?" the search is exactly for these characters.
  - Limit search: You can limit the search to specific object properties or object types.
- Use "*" as wildcard for any number of characters and "?" as wildcard for exactly one character within a word:
  When you use the "*" or "?" wildcards in a search term, you will receive whole words that match this search term as hits. When you enter "Motor*start", for example, you will receive hits such as "Motor starter" or "Motor1_Start" but not "Starting motors" or "Start motor1". An implicit wildcard search is always conducted. If you enter "Motor" as search term, for example, the search also finds the texts "Motor_ON", "Motor starter" and "123_Motor". This corresponds to the explicit wildcard search with the search term "*Motor*". You can deactivate the implicit wildcard search by enabling the option "Find exact match".

Replace texts in the project

You have the option to replace individual texts in the project. To do this, you can open the location immediately after a search by double-clicking on the hit list and editing the text. Once it is changed, the text is automatically indexed again. If you then want to open the next match, you receive a message that offers you the chance to refresh the hit list. In this way, you can replace a text in the entire project until the hit list no longer shows results.

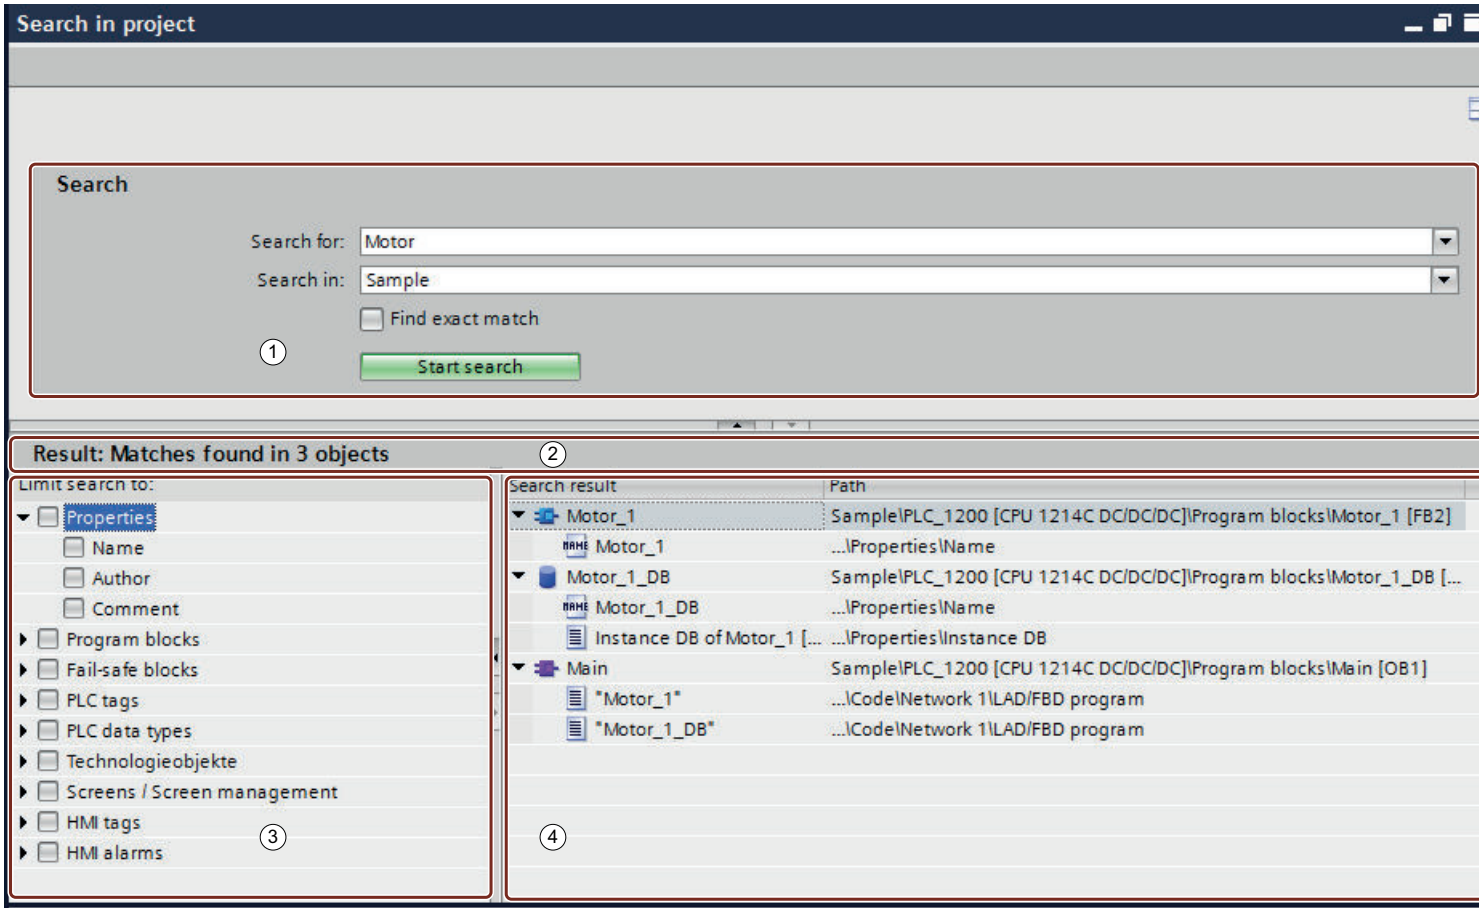
Examples for searching in the project (Page 310)



6.4.2.2 Overview of the search editor

Function of the search editor

The search editor searches the entire project for specific texts and represents the search results clearly in a table.

Layout of the search editor

The figure below shows the components of the search editor:

① Search mask

② Status bar

③ Search filter

④ Results list

Search mask

You enter the search term in the search mask and limit the search area. You also have the option to select "Find exact match" which means the search is limited exactly to the entered search term in the project and similar text passages are ignored. You start the search in the search mask.

Status bar

The status bar includes information about the search result.

Search filter

You can use the search filter to further limit the search results. If you have not activated any filters, the search includes all objects and object properties. If you activate a filter, only the search results which match the filter setting are displayed.

Results list

The results list shows all objects which include the search term. Double-click on a search result to open the corresponding editor and highlight the reference.

6.4.2.3 Search in entire project

Requirement

A project is open.

Procedure

To search the current project for a specific text, follow these steps:

1. Enter the search term in the text box for the search in the TIA Portal toolbar.
2. Click "Search in project".
   The search editor opens and a search for the search term is conducted across the entire project. The objects containing the search text are listed in the overview.

Note

You cannot enter any search options with this search. The entire project is searched and all objects that can be searched are included in the search. If you want to further limit the search or use search options, you can start the search once again. To do so, follow the alternative instructions under "Or" as of step 2.

Or:

1. Open the search editor in one of two ways:
   - Select the "Search in project" command in the "Edit" menu.
   - Right-click an object in the project tree and select the "Search in project" command from the shortcut menu. The object is set as default search area in the "Search in" box.
   - Make sure that the focus is outside of an editor that supports an editor-specific search and press the shortcut <Ctrl+F>.
2. Enter the search term in the "Search" box, or select a term from the list of terms for which you have already searched.
3. To search exactly for the search term, select the check box "Find exact match". You cannot use wildcards in the search term when you use this option, for example, when you enter "*" or "?" the search is exactly for these characters.
4. To limit the search area, select the sections you want to include in the search under "Search in".
5. To limit the search to specific objects or object properties, select the objects or object properties you want to include in the search under "Limit search to".
6. Click "Start Search".
   The objects containing the search text are listed in the overview.
7. Double-click an object to open it.

6.4.2.4 Creating a new search index manually

For the search, an index of the texts of the editors which can be searched in the project is built up automatically in the background. The search index is updated with each change. You cannot start the search before indexing is complete. You can also generate the search index manually at any time.

Procedure

To automatically generate the search index, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. In the area navigation, select the group "General > Search in project".
3. Click "Recreate search index".

Result

The indexes of the project are generated again.

6.4.2.5 Enabling and disabling "Search in project"

You can disable "Search in project" centrally, if you do not need it. If necessary, you can enable again it at any time. By default, "Search in project" is enabled.

Procedure

To disable or enable "Search in project", follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. In the area navigation, select the group "General > Search in project".
3. Select or clear the "Search in project" check box.

6.4.2.6 Examples for searching in the project

Examples for use of property and object filters

The search editor offers filters in the "Limit search to" area which you can use to limit the search to specific properties or objects. Keep in mind the following mechanism:

- If you do not activate any filters, the search term is searched in all objects and properties that can be searched within the set search area.
- If you activate filters, only the selected properties or objects are searched.

Examples for use of property and object filters:

- Search for an object with the name "Motor1":
  Enter the search term and activate the filter "Name". All objects which include "Motor1" in their name are found.
- Search for an object which includes the text "Motor1" either in its name or in a comment:
  Enter the search term and activate the filters "Name" and "Comment". All objects which include "Motor1" in their name or in the comment are found.
- Search for a block with the name "Motor1":
  Enter the search term and activate the filters "Name" and "Block". All blocks which include "Motor1" in their name are found.
- Search for a block which includes the text "Motor1" either in its name or in a comment:
  Enter the search term and activate the filters "Name", "Comment" and "Block". All blocks which include "Motor1" in their name or in the comment are found.
- Search for a block or a technology object with the name "Motor1":
  Enter the search term and activate the filters "Name", "Block" and "Technology object". All blocks or technology objects which include "Motor1" in their name are found.

When entering the search term, note the following examples for searching for a term or several terms.

Examples for the search for one term

When your search entry consists of only one term and the option "Find exact match" is disabled, the search is always an implicit wildcard search. The system adds the wildcard "*" in front of and behind the search term. You can insert wildcards in the search term yourself to conduct an explicit wildcard search. If you want to find exactly the term you have entered, select the option "Find exact match". Uppercase and lowercase letters are not taken into account in the search.

Examples for the search for one term:

- Search for "motor", "Find exact match" option is disabled
  An implicit wildcard search is conducted. The search term is interpreted as "*motor*" and all terms which include "motor" are found, for example, "motor", "motor_1", "Motorstart" or "Start_Motor".
- Search for "m*tor" (explicit wild card search), "Find exact match" option is disabled
  The search term is interpreted as "*m*tor*" in this wildcard search. This means terms, such as "motor", "motor_1", "Start_Motor", "GLOB.Mode.motor[1]" or "Mo_tor" are also found.

- Search for "motor", "Find exact match" option is enabled
  No wildcards are used for the search, which means only the terms "motor" and "Motor" are found.
- Search for "m*tor" (explicit wild card search), "Find exact match" option is enabled
  The character "*" is no longer a wildcard and is interpreted as a regular character. The search only finds the character strings "m*tor" and "M*tor" but not, for example, the terms "motor", "", "Motormotor_1".

Application examples:

- If you want to determine from where the "GLOB_DB.MODE.FG[6].IN.ERROR_DROP_START" element of a data block is accessed, you can use the cross-reference list. If access takes place by indirect addressing (e.g. with "#GLOB.MODE.FG[#FgNr].IN.ERROR_DROP_START := TRUE;"), however, the cross-reference list does not return any results. Use a wildcard search for "MODE.FG[*].IN.ERROR_DROP_START" across the entire project in this case.
- You want to find all instances where "ERROR_DROP_START" is used. Perform a search for "ERROR_DROP_START" across the entire project. The search also finds all "ERROR_DROP_START" elements within the "FG[]" array.

Examples for the search for multiple terms

When you enter a search term which consists of multiple terms and the "Find exact match" option is disabled, you will find those objects which include all these terms. The texts can appear in any order. If you want the terms to appear exactly as you have entered them in an object, select the "Find exact match" option. Uppercase and lowercase letters are not taken into account in the search.

Examples for the search for multiple terms:

- Search for "motor start", "Find exact match" option is disabled
  All objects which include "motor" and "start" are found. It does not matter how far apart they are from each other or in which order they appear. Possible hits therefore include: "Motor start", "start my motor", "my motor is in start mode"

  Note

  The texts of a column are treated as a text object in data blocks and in block interfaces. Therefore, the search also returns data blocks and blocks in which the terms occur distributed over different lines.

- Search for "motor start*", "Find exact match" option is disabled
  As with the search for a word, an implicit wildcard search is always conducted for all words with a multiple word search. This means it is not necessary to explicitly enter a wildcard character. "motor start*" is interpreted as "*motor* *start*" and the same hits are found as with "motor start".

- Search for "motor start", "Find exact match" option is enabled
  When the option "Find exact match" is enabled, only objects which include both terms one after the other as a phrase are found. The search finds the search term, for example, in objects which include the texts "push motor start button" or "motor start on". No hits are returned for "start motor", "motorstart", "start my motor", "my motor is in start mode".
- Search for "motor start*", "Find exact match" option is enabled
  The character "*" is no longer a wildcard and is interpreted as a regular character. The search only finds objects in which the character string "motor start*" appears in uppercase or lowercase letters. "motor starting", "start my motor", "motor start", "Motor Start", "motor start_mode" do not result in any hits.

Application examples:

- You want to find out where you have used the function "Setbit" to set the "MotorOn" tag. To do so, conduct a search for "setbit motoron".
- You want to find a specific network comment but you only know that it includes the words "CPU" and "Cycle". To do so, start a search for "CPU cycle".

6.4.3 Searching and replacing in the editor

6.4.3.1 Basics for search in open editors

Introduction

You can start a search which is limited to the editor currently open in the workspace. You can customize the search as follows to suit requirements:

- You can optimize the search with additional options.
- You can specify the search area.
- You can specify the search direction.

Additional options for searching

You can refine the search with the help of the following additional options:

- Whole words only
  Only whole words are taken into account for the search. Compound words that contain the search key as a part are ignored.
- Match case
  Upper- and lowercase letters are taken into account in the search.
- Find in substructures
  The search also includes texts contained in another object.
- Find in hidden texts
  Texts that are assigned to another text but that are currently hidden are also included in the search.
- Use wildcards
  Enter an asterisk as the wildcard for any number of characters. Example: You want to search for all words starting with "Device". Type in "Device*" in the search key box. Enter a question mark as the wildcard, however, if you only want to exclude a single character.
- Use regular expressions (for searching in scripts only)
  A regular expression is a character string used to describe sets of values and for filtering. This allows you to create complex search patterns.

The additional options available depend on the installed products and the editor opened.

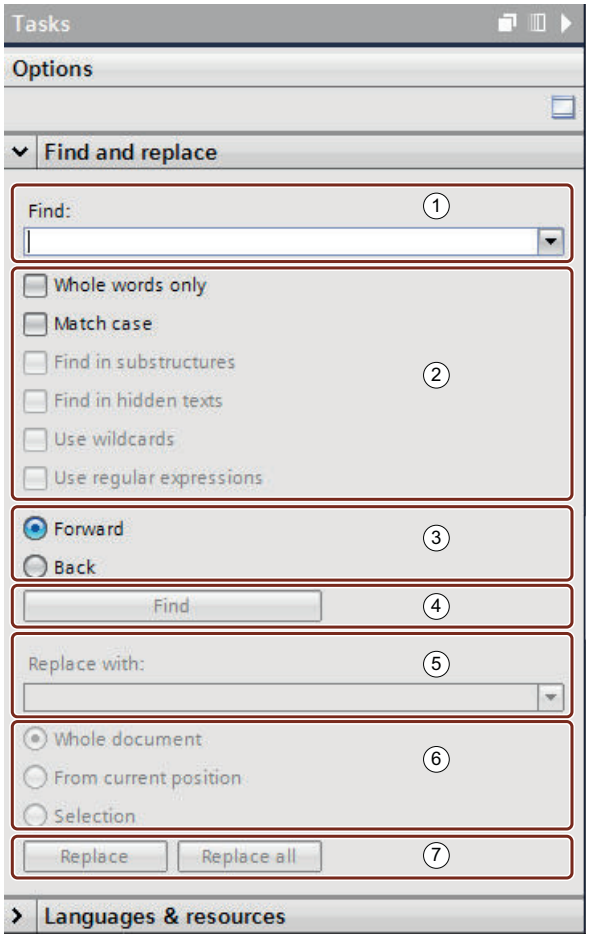
Search area and search direction

You have the following options for define the search area:

- Whole document
  The entire is searched regardless of the current selection and position.
- From current position
  The search starts at the current position. Depending on the search direction, all texts above or to the left or below or to the right of the current position are not included in the search.
- Selection
  The search term is only searched for in the current selection.

You can define the search direction independent of the search area:

- Down
  Search takes place in editor from top to bottom or from left to right.
- Up
  Search takes place in editor from bottom to top or from right to left.



6.4.3.2 Overview of the "Find and replace" palette

Function of the "Find and replace" palette

The "Find and replace" palette in the "Tasks" task card lets you search in an open editor. It includes all options that you need for an efficient search.

Layout of the "Find and replace" palette

The following figure shows the components of the "Find and replace" palette:

① Enter search terms

② Additional options

③ Search direction

④ Start search

⑤ Enter replacement term

⑥ Replace area

⑦ Replace

6.4.3.3 Searching and replacing in the editor

You have the option to search for text in an editor or to replace it.

Start search

Follow these steps to start the "Find and replace" function:

1. Select the "Find and replace" command in the "Edit" menu or open the "Find and replace" pane in the "Tasks" task card.
   The "Find and replace" pane opens.
2. Enter a term in the "Find" drop-down list.
   As an alternative, you can select the most recent search key from the drop-down list.
3. Select the options desired for the search.
4. Using the option buttons, select the starting point for the search and the search direction.
5. Click "Find".
   The first hit is marked in the editor.
6. Click "Find" again to display the next hit.
   The next hit is marked in the editor. Repeat this step as needed until you reach the last hit.

Replacing the search key

You have the option of replacing hits individually or automatically replacing all the found texts, if the respective editor supports this function. Follow these steps to replace terms:

1. Enter a term in the "Find" drop-down list.
   As an alternative, you can select the most recent search key from the drop-down list.
2. Select the options desired for the search.
3. Click the "Find" button to start a search for the specified search key.
   The first hit is displayed in the editor.
4. In the "Replace" drop-down list, enter the text you wish to use to replace the search key.
   As an alternative, you can select one of the last entered texts from the drop-down list.
5. Click the "Replace" button to replace the selected hit with the specified text.
   The found text is replaced and the next hit is marked in the editor.
   Repeat this procedure until you have replaced all the desired hits. To skip to the next hit without replacing the marked word, click the "Find" button instead of "Replace".
6. Click "Replace all" to automatically replace all hits at once.

Basics of searching (Page 303)

Search in entire project (Page 307)

6.5 Undoing and redoing actions

6.5.1 Basics of undoing and redoing actions

Function

You can undo performed actions at any time. For this purpose, every action you perform is saved in an action stack. When undoing actions, the stack is processed from top to bottom. In other words, if you undo an action that lies further down in the stack, all actions located above it in the stack will also be undone automatically.

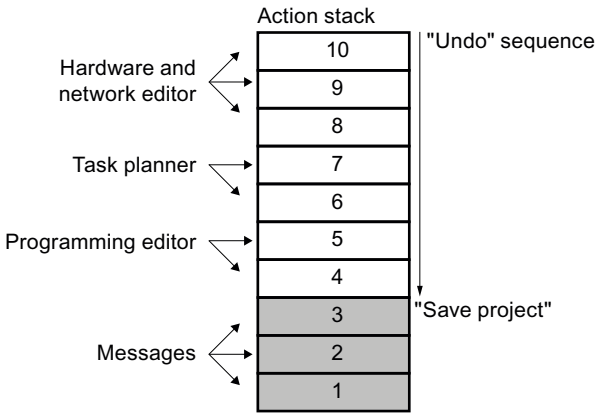
You can redo previously undone actions until you execute a new action. Once you execute a new action, it is no longer possible to redo previously undone actions.

Particularities for undoing

There are a few actions that empty the action stack. You cannot undo these actions or the actions performed before these actions. The following actions empty the action stack:

- Saving
- Project management (creating a new project, opening project, closing a project, deleting a project)
- Deleting unused GSD files
- Establishing an online connection

Keep in mind that the action stack is emptied every time you establish an online connection. This means that the actions executed offline cannot be undone once the online connection is established. You can undo all actions which you subsequently execute online, even after the online connection has been terminated.



Displaying the action stack

The "Undo" button in the toolbar is enabled as soon as you perform an action that can be undone. This button is split; you can use the arrow down portion to open a drop-down list. containing all actions of the action stack that you can undo. If you had performed actions in an editor other than the currently displayed editor, the corresponding editor is also displayed as a subheading. This allows you to always identify the point at which the undo operation will be applied. The subheadings are removed from the list when the editor responsible can no longer undo actions.

Actions you have undone are entered in the action stack from where they can be redone. Here, you can redo actions you have undone. The display of actions you can redo it is analogous to the display of the actions that you can undo.

Example of undoing actions

The figure below shows how actions performed in various editors and tables are undone:

In this example, you cannot undo actions 1 to 3 because the project was saved. You can undo actions 4 to 10 in the order indicated by the direction of the arrow. In other words, you must undo action 10 first. Once you have undone action 8, you cannot then undo action 5. You must first undo actions 7 and 6. As the final step in the sequence, you can then undo action 4. You also have the option of undoing several actions in a single step by undoing an action located further down in the action stack. All actions located above it in the stack will be undone automatically.

The same principle also applies to redoing of actions.

See also

Undoing an action (Page 317)

Redoing an action (Page 318)

6.5.2 Undoing an action

The following options are available for undoing actions:

- Undoing the last action only
  Only the last action performed is undone.
- Undoing as many actions as required
  Multiple actions in the action stack are undone in a single step.

Undoing the last action only

To undo the last action performed, follow the steps below:

1. Click the "Undo" button in the toolbar.
   - If the action was not performed in the currently displayed editor, a confirmation prompt appears.
   - If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.
   The editor in which the action was performed is displayed and the action is undone.

Undoing as many actions as required

To undo multiple actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Undo" button in the toolbar.
   This opens a drop-down list containing all actions you can undo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to undo.
   The chosen action and all actions in the stack located above the chosen action are undone. If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.
   The editors in which the actions were performed are displayed and the actions are undone.

See also

Basics of undoing and redoing actions (Page 316)

Redoing an action (Page 318)

6.5.3 Redoing an action

You have the option of redoing an action that has been undone, so that you can return to the status present before "Undo" was performed. However, this is only possible until you perform a new action. The following options are available for redoing actions:

- Redoing the last undone action only
  Only the last undone action is redone.
- Redoing as many undone actions as required
  Multiple undone actions in the action stack are redone in a single step.

Redoing the last undone action only

To redo the last undone action, follow the steps below:

1. Click the "Redo" button in the toolbar.
   - If the action is not being redone in the currently displayed editor, a confirmation prompt appears.
   - If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.
   The editor in which the action was undone is displayed and the action is redone.

Redoing as many undone actions as required

To redo multiple undone actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Redo" button in the toolbar.
   This opens a drop-down list containing all actions you can redo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to redo.
   The chosen action and all actions in the stack located above the chosen action are redone. If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.
   The editors in which the actions were undone are displayed and the actions are redone.

Undoing an action (Page 317)

Editing projects 7

7.1 Creating and managing projects

7.1.1 The basics of projects

Projects contain data and programs resulting from the creation of an automation solution. The data assembled in a project include, for example:

- Configuration data on the hardware structure and parameter assignment data for modules
- Project engineering data for communication over networks
- Project engineering data for the devices
- Logs for important events in the life cycle of the project

Project version

The project version defines the version of the TIA Portal for which a project is compatible. A project that is compatible with the current version of the TIA Portal is provided in project version V14 SP1 (or V14 in compatibility mode) of the TIA Portal.

You can view the project version of an already opened project in the project properties. To do so, select the "Software products in the project" entry in the "General" tab of the properties dialog. In the table, you can see all products and their versions, which are required for editing the open project.

Project hierarchy

Data is stored in a project in the form of objects. Within the project, the objects are arranged in a tree structure (project hierarchy).

The project hierarchy is based on the devices and stations along with the configuration data and programs belonging to them.

Common data of the project and online access, for example, are also displayed in the project tree.

Basic integrity check

The engineering software features a base-protective mechanism to detect changes in the essential custom project data (e.g. blocks, hardware configuration). Causes for changes to the project data, for example, can be tampering outside the engineering software or defects in the data storage medium.

The test of the configuration data is optional upon request, because, depending on the scope and application, it as can be time consuming, especially if you use multiuser engineering. You change the default for the test in the settings of the engineering software.

If a change is detected during a test, contact Siemens Customer Support. You can continue to work with the project data. Continue work at your own risk.

Note

Reduced working speed when basic integrity check is activated

If you enable the basic integrity check in the settings of the engineering software, the operating speed of the engineering software is reduced.

7.1.2 Creating a project

Procedure

To create a new project, follow these steps:

1. Select the "New" command in the "Project" menu.
   The "Create a new project" dialog opens.
2. Enter a project name and path or accept the suggested settings.
3. In the "Version" drop-down list, select the project in which you want to create the project version.
   If you select "V14", the project is compatible with the TIA Portal V14 without installed Service Pack 1.
4. Click the "Create" button.

Result

The new project is created and displayed in the project tree.

Displaying properties of the project (Page 328)

Saving projects (Page 325)

Closing projects (Page 326)

Removing projects from the project list (Page 326)

Deleting projects (Page 327)

7.1.3 Opening projects

You recognize projects of the TIA Portal by their file name extension ".ap[version number]". Projects of current version have the file name extension ".ap14". Projects with the version V14 and V14 SP1 can be opened immediately. Upgrade projects with the project version V13 SP1 before opening.

Procedure

To open an existing project, follow these steps:

1. Select the "Open" command in the "Project" menu.
   The "Open project" dialog box opens and the list of recently used projects is displayed.
2. Select a project from the list and click "Open".
3. If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder and open the project file.
4. To check whether the project has been changed without permission, select the check box "Activate basic integrity check". The basic integrity check may take some time to complete.
5. Click the "Open" button.
   The project is opened. If you have selected a project from V13 SP1 version of the TIA Portal, the "Upgrade project" dialog opens. You can find more information on upgrading projects under "Upgrading projects (Page 336)".

Checking for missing software components

When opening existing projects, an automatic check is made to determine if the appropriate software is installed for all modules used within the project. If you try to open a project with modules that are not supported by the current scope of installation of the TIA portal, a message appears on opening the project informing you of the missing software components. If the software components are not absolutely required to open the project, the project can still be opened.

Reaction to missing software components

Unsupported modules of a project are handled as follows:

- Display of the modules on the user interface
  - The unsupported modules are displayed in the project tree with all of their lower-level objects. However, the modules themselves cannot be processed in editors or in the inspector window. When possible, a replacement module is used that best matches the original module. Replacement modules are indicated by an exclamation mark.
  - Display of properties in tables is limited. This applies in particular to the display of network parameters, such as the IP address.
- Functional limitations
  - Unsupported modules cannot be printed out or compiled.
  - An online connection cannot be established to the modules. It is therefore also impossible to download.
  - To change the device type, the device must first be deleted and then re-inserted. The "Change device type" function is not supported.
  - Copying and inserting lower-level objects, such as blocks, is possible although the device itself cannot be copied and inserted.
  - The network configuration cannot be changed with replacement modules within the network view.
  - Cross-references can be displayed. However, the cross-references only reflect the status last saved within the project because on online comparison with the original module cannot be made.

Opening a global library (Page 459)

7.1.4 Saving projects

You can save the project at any time either under the same or a different name. You can even save a project when it still contains elements with errors.

Saving a project

To save a project, follow these steps:

1. Select the "Save" command in the "Project" menu.
   All changes to the project are saved under the current project name. If you are editing a project from an earlier version of the TIA Portal, the file extension of the project is also retained and you can continue to edit the project in the earlier version of the TIA Portal.

Project Save as

To save a project under another name, follow these steps:

1. Select the "Save as" command in the "Project" menu.
   The "Save current project as" dialog opens.
2. Select the project folder in the "Save in" box.
3. Enter the new project name in the "File name" box.
4. Confirm your entry with "Save".
   The project is saved under the new name and opened.

Note

Undoing actions

Keep in mind that you cannot undo actions once you have saved the project.

Deleting projects (Page 327)

7.1.5 Closing projects

Procedure

To close a project, follow these steps:

1. Select the "Close" command in the "Project" menu.
   If you have made changes to the project since the last time you saved it, a message is displayed.
2. Decide whether or not you want to save the changes.

Deleting projects (Page 327)

7.1.6 Removing projects from the project list

You can remove projects from the list of recently used projects. The project data is retained on the storage medium.

Procedure

To remove a project from the list of recently used projects, follow these steps:

1. Select the "Delete project" command in the "Project" menu.
   The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.
3. Click the "Remove" button.
4. Click "Yes" to confirm the prompt in order to remove the project from the list.

Result

The project is no longer displayed in the list of recently used projects. If you open the project again, it will be added to the list again.

Deleting projects (Page 327)

7.1.7 Deleting projects

Deleting removes the entire project data from the storage medium.

Requirement

The project you want to delete is not open.

Procedure

Follow the steps below to delete an existing project:

1. Select the "Delete project" command in the "Project" menu.
   The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.
   If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file.
3. Click the "Delete" button.
4. Click "Yes" to confirm. This starts the deletion of the project.

Result

The entire project folder is deleted from the file system.

Saving projects (Page 325)

Closing projects (Page 326)

Removing projects from the project list (Page 326)

7.1.8 Displaying properties of the project

You can display the properties of a project. In the "General" tab you find the following project properties in the area navigation:

- Metadata for the project
  This includes the following information: creation time, author, file path, project size, copyright, project languages, etc. Many of the properties can be changed.
- Project history
  The project history contains an overview with important events in the project life cycle. Here, for example, you can see the version of the TIA Portal used to create a project and whether it has been upgraded in the meantime. If a project was created during a migration, for example, this is also indicated in the project history table with the date and time of the migration. If a log was created for an event, you can also call the log directly.
- Support packages in the project
  An overview of the add-on software needed to work with all devices in the project is displayed. In addition, installed GSD files are listed (device description files for other devices in the hardware catalog).
- Software products in the project
  You can display an overview of all installed software products needed for the project. The "Version" column shows the project version of the respective software with which the project is stored.

In the "Protection" tab you specify that blocks can be simulated after the compilation with SIMATIC S7-PLCSIM Advanced. To do this, select the check box "Support simulation during block compilation". By default, the function is disabled.

Procedure

To display the project properties, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.
   The dialog with the properties of the project opens.
3. Select the project properties in the area navigation that you want to have displayed.

Saving projects (Page 325)

Closing projects (Page 326)

Removing projects from the project list (Page 326)

Deleting projects (Page 327)

7.1.9 Using logs

For some operations within the TIA Portal, logs are created automatically in the background. These logs document changes in the project. Logs are created automatically, for example, when you migrate projects and programs or when you update instances from the library.

Logs are displayed in the "Common data" folder in the project tree. They are stored together with the project in the project folder and can therefore be read independently of the programming device/PC used as soon as you have opened the project. The log can be filtered for errors, warnings, and information.

In addition to displaying them in the TIA Portal, logs can also be printed.

Displaying logs

To open a log, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.
   The contents of the log are displayed in the work area.
3. Optional: To show or hide a particular category of alarms, activate or deactivate the button for "Errors", "Warnings", or "Information" in the toolbar.

Deleting logs

To delete a log, follow these steps:

1. Select the log in the project tree.
2. Press <Del>.
   The selected log is deleted from the project directory and removed from the project tree.

7.1.10 Security of industrial plants

In addition to numerous advantages, the ongoing digitization of industrial automation is accompanied by increased vulnerability of industrial plants. The TIA Portal and the SIMATIC products already have several features that ensure secure operation of your plant, for example:

- Know-how protection of blocks
- Basic integrity protection for projects to protect projects against manipulation
- The protection and security functions of CPUs

Further information and the possibility for reporting security problems can be found online at the following link:

Whitepapers and additional information (https://www.industry.siemens.com/topics/global/en/industrial-security/support/Pages/white-papers.aspx)

Industrial Security

Industrial Security goes beyond the security regulations and measures in office environments. Industrial Security is a comprehensive approach to protecting industrial plants. The approach is designed to protect against unauthorized access, sabotage, espionage and malicious tampering. Industrial security ensures the following factors:

- Availability
  Availability has highest priority in industrial plants. Downtime must be kept as low as possible.
- System and data integrity
  A third party should not be able to unlawfully modify the plant and any of its data.
- Confidentiality
  Information on the industrial plant and data must not fall into the hands of unauthorized third parties.

Comprehensive approach

In addition to the security features integrated in the TIA Portal, Industrial Security requires more comprehensive measures. Observe the following security aspects:

- Plant safety
  - Access protection against unauthorized persons
  - Physical access protection for critical components
- Network security
  - Controlled interfaces between an office and plant network, for example, through firewalls
  - Segmentation of the plant network
- System integrity
  - Use of anti-virus and whitelisting software
  - Compliance with maintenance and update processes
  - User authentication for the machine or plant operator
  - Integrated access protection in automation components

7.1.11 Importing and exporting CAx data

CAx files are XML files that you create in the TIA Portal and that you can swap between different installations or with other tools such as ECAD systems. The files contain the following information:

- Hardware configuration of a single device or an entire project (without parameter assignment)
- Folder hierarchies (groups)
  The folder hierarchy is restored for the import.
- Association of a device to a subnet
  When importing, the devices stored in the CAx file are reconnected to the same subnet.
- Addresses of the devices
- Address areas of inputs and outputs
- Profinet I/O systems and PROFIBUS DP master systems

Requirements

- The "Openness" add-on package is installed.
  If you have not installed the add-on package, install it from the TIA Portal installation DVD. The add-on package is stored in the "\support" folder on the DVD.
- A project is open.

Exporting the CAx file of a project

1. In the "Tools" menu, click on "Export CAx data...".
2. In the "CAx Export" dialog, select a directory for the file to be exported.
3. If necessary, change the file name and confirm with "Save".
   The exported file receives the file extension ".aml".
   You see the status of the export in the "Info > General" tab of the Inspector window.

Exporting the CAx file of a device

1. Highlight the exported devices in the project tree.
2. Select "Export CAx data ..." from the shortcut menu.
3. In the "CAx Export" dialog, select a directory for the file to be exported.
4. If necessary, change the file name and confirm with "Save".
   The exported file receives the file extension ".aml".
   You see the status of the export in the "Info > General" tab of the Inspector window.

Import CAx file of a device or a project

1. In the "Tools" menu, click on "Import CAx data...".
2. Select a CAx file in a directory in the "CAx Import" dialog.
3. Click the "Open" button.
   You receive feedback about the status of the import of devices, for example error messages, in the inspector window in the "Info > General" tab.

Import options with name conflicts of stations

If you want to import a CAx file and the currently open TIA Portal project included stations with identical names, a conflict arises. A dialog for setting the import options opens. Before you import the file, you select how the stations with the same name are to be merged. The stations from the CAx file can be optionally renamed and grouped together in a new folder.

Note

Default name of the folder

The folder for the stations to be imported are named "ParkingLot" by default.

You can specify the name of the new folder yourself. To do this, open the settings and navigate to the "CAx" item. Enter the name for the folder with "Settings for conflict resolution" in the "Name of store for devices that already exist in the project" field.

Optionally, you can also specify that the stations triggering a conflict are either not to be imported or replaced by stations of the same name in the currently open TIA Portal project.

7.2 Compatibility of projects

7.2.1 Compatibility between TIA Portal versions

With the TIA Portal V14 SP1, you can also open projects that were created with the version V14 of the TIA Portal. You need to upgrade projects from previous versions of the TIA Portal to the current version before opening them.

Opening projects from previous versions of the product

The following table shows the response of the TIA Portal when opening projects from a previous version of the product:

Version of the TIA Portal (file extension of the respective version)	Response when opened with the current version of the TIA Portal
V10.5 (.ap10) V11.x (.ap11) V12 (.ap12) V12 SP1 (.ap12) V13 (.ap13)	Projects from previous versions of V13 SP1 of the TIA Portal cannot be directly opened with TIA Portal V14 SP1. When you attempt to open the project, a message prompts you to open the project with the version V13 SP1. If you open the project with TIA Portal V13 SP1 version, the project is upgraded to the project version V13 SP1 after your confirmation and is assigned the file extension ".ap13".
V13 SP1 (.ap13)	Once you give your confirmation, the project is upgraded project version V14 SP1 upon opening and obtains the file extension ".ap14".
V14 (.ap14)	The project is opened in compatibility mode.

Backward compatibility of the current version of the TIA Portal

Projects that you save in the current project version V14 SP1 are not backward compatible due to the expanded functionality over previous versions. Projects in version V14 SP1 can be only be opened with TIA Portal V14 SP1 or higher.

7.2.2 Using projects created with optional software

A wide range of optional software is available for the TIA Portal. This includes hardware support packages, for example. When you open a project that was created with optional software but the optional software is not installed, the following will occur:

- Software components which are not absolutely required are missing:
  A dialog appears listing the missing software components. After the project is opened, its properties are displayed. You now have the opportunity to install missing components. All the devices contained in the project are available even if you do not install the missing components. However, you can only work with the devices that are supported by the currently installed software.
  Devices which are not supported because software components are missing are identified by the following symbol in the project tree:
  
- Essential software components are missing:
  A dialog appears listing the missing software components. The essential software components are marked. The project can only be opened if you install the missing software components.

Saving projects (Page 325)

Closing projects (Page 326)

Removing projects from the project list (Page 326)

Deleting projects (Page 327)

Compatibility of global libraries (Page 459)

7.2.3 Compatibility mode

When you create or open a project that was created with V14 project version and do not upgrade it, the project is in compatibility mode. As long as you do not use functions that have been newly added to TIA Portal V14 SP1, you work in compatibility mode. The project remains backward compatible and can be continue to be opened and edited with TIA Portal V14. You only have to upgrade the project when you use features newly added with Service Pack 1. The backward compatibility is lost in this case.

Global libraries are always created in the most recent format and are not backwards compatible, even if the project is opened in compatibility mode.

Libraries in compatibility mode

If you use global libraries in compatibility mode, observe the following:

- System libraries
  In compatibility mode, only system libraries that can be used with the project version of the opened project are displayed. Once you upgrade the project, the system libraries that can be used with the current version of the TIA Portal are also displayed.
- Custom global libraries
  You can load global libraries created with the TIA Portal V14 SP1 in compatibility mode. However, once you use elements from the library that are not compatible with the version of the TIA Portal V14, you must upgrade the project to project version V14 SP1.

Adding supported devices from hardware support packages

To projects in compatibility mode, components can be added that were supplied at a later date for TIA Portal V14 as part of a Hardware Support Package (HSP). To continue working with the project in TIA Portal V14, install the appropriate hardware support package in TIA Portal V14.

Loading hardware configuration and software in compatibility mode

When you load the hardware configuration and software in compatibility mode on a device, the device remains compatible with the TIA Portal V14. The device can be continued to be loaded with the TIA Portal V14 and all online functions are available.

Upgrading projects

You need to upgrade the project to use the full range of functions of the current version. You automatically receive a corresponding message when you use a function that was newly added with Service Pack 1. Upgrading converts the project to the current project version and exits compatibility mode. The full range of functions of the current version becomes available.

7.2.4 Upgrading projects

7.2.4.1 General information on upgrading projects

A project from the version V13 SP1 of the TIA Portal can be opened only after they have upgraded the project to the current version of the TIA Portal. When you open the project, you are prompted to upgrade the project.

To learn about the options available with other product versions of the project, refer to the section "Compatibility between TIA Portal versions (Page 333)".

Upgrading modules with know-how protection

Blocks with know-how protection are not automatically upgraded with the project. Remove the know-how protection of the blocks before you upgrade the project:

- For V13 SP1 projects
  Remove the know-how protection with TIA Portal V13 SP1.
- For V14 projects
  Remove the know-how protection with TIA Portal V14 or the TIA Portal V14 SP1 in compatibility mode.

Set up know-how protection again afterwards with the latest version of the TIA Portal. You can find additional information in the section "Upgrading know-how protected blocks (Page 338)".

Upgrading global libraries

Global libraries are not upgraded automatically together with the project because they are independent of projects. If you want to continue using global libraries from older versions of the TIA Portal, upgrade the global libraries as well. You can find more information on upgrading global libraries in the section "Compatibility of global libraries (Page 459)".

Instruction version

The instructions that you use to create your user program may be in different versions. Different product versions of the TIA Portal can contain different instruction versions. You have the option to upgrade the project and instructions to the latest version. You can then use the new instruction versions. After upgrading, the new instruction versions are not automatically used in your program. You can update your program to use the new versions. You can find more about "Instruction versions" in the "Programming editor" section.

Multiuser Engineering

To upgrade multiuser engineering projects, read about the prescribed procedure in the section "Upgrading multiuser engineering projects (Page 338)".

See also

Using projects created with optional software (Page 334)

Upgrading projects (Page 336)

7.2.4.2 Upgrading projects

The following will show you how to upgrade projects from earlier versions of the TIA Portal.

Upgrading projects from TIA Portal V13 SP1

To upgrade a project from TIA Portal V13 SP1, follow these steps:

1. Select the "Open" command in the "Project" menu.
   The "Open project" dialog box opens and the list of recently used projects is displayed.
2. Select a project from the list and click "Open".
3. If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder and open the project file.
   The "Upgrade project" dialog box opens.
4. Confirm the upgrade of the project with "OK".
   The project will be upgraded and opened in the current version of the project.
5. Compile the hardware and software of all devices in the project.

Upgrading TIA Portal V13 SP1 projects with master copies from TIA Portal V10.5

Before upgrading a project, check if the master copies created with TIA Portal V10.5 are contained in its project library. This is necessary, for example, if you receive a message during the upgrade about an S7-1200 CPU with firmware version V1.0 used in the project, even though you have not configured such a CPU. The CPU is a master copy in the project library in this case.

Before upgrading a project with master copies from TIA Portal V10.5, therefore, do the following:

1. Use each master copy created with the TIA Portal V10.5 once in the project.
2. Delete the affected master copies from the project library.
3. Create the master copy again with the objects from the project.
4. Save the project in TIA Portal V13 SP1.

You can then upgrade the project to the latest version.

Upgrading projects from the TIA Portal V13 or earlier

Projects of product version V13 or earlier cannot be upgraded and opened with the TIA Portal. First upgrade projects from TIA Portal V13 or earlier with the product version V13 SP1. Then upgrade the projects with the current version of the TIA Portal again to the project version V14 SP1.

You can find additional information on upgrading projects from earlier product versions in the Siemens Industry online support (https://support.industry.siemens.com/cs/ww/en/view/109476392).

7.2.4.3 Upgrading multiuser engineering projects

The following will show you how to upgrade multiuser engineering projects.

Procedure

To upgrade multiuser engineering projects, follow these steps:

1. Before upgrading, save all existing local sessions in the multi-user server project.
2. Save the multiuser server project as a single-user project.
3. Upgrade the single-user project.
4. After the upgrade, create a multiuser project again from the single-user project.
5. Create the local sessions again from the upgraded multiuser project for all workers.

See also

Upgrading projects (Page 336)

Introduction to Multiuser Engineering (Page 6687)

7.2.4.4 Upgrading know-how protected blocks

For security reasons, the know-how protection of blocks is tied to the version of the TIA Portal with which the know-how protection was set up. This means blocks that were assigned know-how protection in an earlier product version cannot be opened and edited with the previous password after the upgrade. However, the blocks can be downloaded to the controller and are executable. If you want to open and edit the block after the upgrade, remove the know-how protection of the blocks and set it up again.

Procedure

To upgrade know-how protected blocks, follow these steps:

1. Remove the know-how protection of the blocks from the previous version in the "Edit" menu with the "Know-how protection" command.
   For more detailed information, refer to section "Removing know-how protection for blocks".
2. Upgrade the project as described in the section "Upgrading projects (Page 336)".
3. Set up the know-how protection of the blocks from the current product version again in the "Edit" menu with the "Know-how protection" command.
   For more detailed information, refer to section "Setting up know-how protection for blocks".

7.2.5 Compatibility with the plant configuration

To be able to use all the online functions, the plant configuration with TIA Portal V14 SP1 must be compatible to the project version of the opened project. The following factors for the compatibility are especially relevant when designing the plant:

- Hardware and its firmware version
  The individual devices and their firmware version must be supported by the TIA Portal V14 SP1 and within the opened project.
- The user program on the respective devices
  All blocks and instructions on the devices must be available in TIA Portal V14 SP1 and ready for using with the project version of the opened project.

Influence of the project version on compatibility

With TIA Portal V14 SP1, you can edit projects in compatibility mode for project version V14. If you have opened a project in compatibility mode, you can only load the hardware configuration and software of the system which is compatible with the TIA Portal V14. If the hardware configuration or the software in the plant uses the functionality of a newer version of the TIA Portal, it cannot be loaded with a project in compatibility mode. To load the hardware configuration or software of the plant in this case, upgrade the open project to the current version of the TIA Portal.

With CPUs of the S7-1200 and S7-1500 product series, you see the project version with which the blocks on the CPU are compatible on the display, on the Web server and in the online and diagnostics view of the TIA Portal. Note, however, that a compatible version of the project alone is not enough to work with the CPU. The CPU itself and its firmware version must be compatible with the installed version of the TIA Portal and the various installed products.

You can see the project version of the currently open project in the project properties.

Incompatible blocks

An online/offline comparison is performed for the configured device with an existing online connection. If the modules available online are incompatible with the project version of one project, incompatible blocks in the project tree are indicated as such by the following symbol:

Loading hardware configuration and software on a device

If you want to load the hardware configuration or software on a device that was last loaded with TIA Portal V13 SP1 or an earlier version, then load the entire hardware configuration and software to the device again. It is not possible in this case to only load the changes. On devices that were last loaded TIA Portal V14 or higher, you can only load the changes to the hardware configuration and software.

Displaying properties of the project (Page 328)

7.3 Archiving and retrieving projects

7.3.1 Working with project archives

Archiving and transferring projects

If you work for a long time with a project, large files may result, especially with extensive hardware configurations. Therefore, you may want to reduce the size of the project, for example, when you archive it to an external hard drive, or when you send it via e-mail and require a smaller file size.

You can create a project archive to reduce the size of the project. TIA Portal project archives are compressed or uncompressed files, each containing an entire project including the entire folder structure of the project. Before the project directory is compressed into the archive file, all files are reduced to their essential components to further decrease the size of the project.

Project archives have the file extension ".zap[version number of the TIA Portal]". Projects created with TIA Portal V14 have the file extension ". zap14".

To open a project archive, retrieve the project archive. By retrieving it, the archive file with the included project files is extracted to the original project directory structure.

Retrieving compressed project (Page 342)

Creating a project archive (Page 341)

7.3.2 Creating a project archive

You can reduce the required storage space of the currently open project by archiving the project in a compressed file.

Note

The most recently saved state of the project is used for archiving. Therefore, save the project before using the archiving function. This will ensure that your most recent changes are included in the archived project.

Procedure

To archive a project, follow these steps:

1. Select the "Archive ..." command from the "Project" menu.
   The "Archive project" dialog box opens.
2. To create a compressed archive file, select the "TIA Portal project archive" option.

3. If you do not want to archive the search index and the HMI compile result, select the option "Discard recoverable data".
   You can restore the discarded data if needed.
4. To add a date and time automatically, select the "Add date and time to the file name".
   The extension is shown in the "Resulting file name" box behind the selected file name.
5. Enter a file name in the "File name" box.
6. Select the path to the archive file.
   You can set the default directory under "Options > General > Storage location for project archives".
7. Click "Archive".

Result

A compressed file with the extension ".zap14" is generated.

The archive file contains the complete project directory. The individual files of the project are also reduced to the essential components in order to save space.

See also

Working with project archives (Page 341)

Retrieving compressed project (Page 342)

7.3.3 Retrieving compressed project

You extract project archives of the TIA Portal with the "Retrieve" function. This restores the project directory structure including all project files.

Requirement

No project is open.

Procedure

To extract a project archive, follow these steps:

1. Select the "Retrieve" command in the "Project" menu.
   The "Retrieve archived project" dialog opens.
2. Select the project archive.
3. Click "Open".
4. The "Find folder" dialog opens.
5. Select the target directory to which the archived project should be extracted.
6. Click "OK".

Result

The project is extracted to the selected directory and opened immediately. If you extract a project archive that includes a project from the product version V13 SP1, you may have to upgrade the project. You will automatically receive the corresponding prompt as soon as you open the project. The same rules apply that are described in the chapter "Using projects created with optional software (Page 334)". The search index and HMI compile result are automatically restored in the background.

7.4 Using reference projects

7.4.1 Basics of reference projects

Introduction

You can open other projects as a reference in addition to the current project. You can use these reference projects as follows:

- You can drag individual objects from a reference project into the current project and then edit them.
- You can open specific objects, for example, code blocks from a reference project as read-only. But this is not possible for all elements.
- You can use an offline/offline comparison to compare devices of the reference project to devices from the current project.

Note that reference projects are read-only. You cannot change the objects of a reference project.

Projects that were created with an older version of the TIA Portal or with a different installation package can also be opened as reference projects. The same compatibility rules apply here as for normal opening of a project from an older version of the TIA Portal.

See also: Compatibility of projects (Page 334)

See also

Comparing reference projects (Page 345)

Opening and closing a reference project (Page 344)

Reference projects (Page 259)

7.4.2 Opening and closing a reference project

Opening a reference project

To open a reference project, follow these steps:

1. In the "View" menu, select the "Reference projects" check box.
   The "Reference projects" palette is displayed in the project tree.
2. In the "Reference projects" palette of the project tree, click on "Open reference project" in the toolbar.
   The "Open reference project" dialog box opens.

3. Navigate to the desired project folder and open the project file. TIA Portal V14 projects have the extension ".ap14". Older projects of the TIA Portal have the extension ".ap[version number]".
4. Click "Open".
   The selected project is opened as a read-only reference project.

Closing a reference project

To close a reference project, follow these steps:

1. In the "Reference projects" palette of the project tree, select the reference project you want to close.
2. Click on "Close reference project" in the toolbar.
   The selected reference project is closed.

See also

Basics of reference projects (Page 344)

Comparing reference projects (Page 345)

Reference projects (Page 259)

7.4.3 Comparing reference projects

Introduction

You can compare devices from reference projects with devices from both the current project as well as from the same or another reference project or from a library.

Note

Please note the following:

- You cannot specify actions for the comparison objects, since the reference projects are write-protected.
- You can perform a detailed comparison for the comparison objects, if the type of comparison object generally allows a detailed comparison.
- When comparing reference projects, you can always switch between automatic and manual comparison.

Procedure

To compare the objects of a reference project to the device data of the current project, follow these steps:

1. In the project tree, select the device whose data you want to compare to the data of a reference project and which allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Open the "Reference projects" palette in the project tree.
4. Select the device of a reference project that you want to compare to the device data from the current project.
5. Drag the device from the reference project into the right drop area of the compare editor.
   You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object properties and the corresponding object of the assigned device are clearly shown in the property comparison.
   You can drag other devices into the drop areas from the current project, a library or from a reference point at any time to start a new comparison. It does not matter which device you drag into the drop area.
6. If needed, perform a detailed comparison of objects for which this type of comparison is possible.

Note

You can start the detailed comparison directly from the reference project for blocks, PLC tags and PLC data types. You can find additional information in the section "Comparing PLC programs".

Editing project data

8

8.1 Compiling and loading project data

8.1.1 Compiling project data

8.1.1.1 General information on compiling project data

Compiling project data

During compilation, project data is converted so that it can be read by the device. Hardware configuration data and program data can be compiled separately or together. You can compile the project data for one or more target systems at the same time.

The following project data must be compiled prior to loading:

- Hardware project data, for example, configuration data of the devices or networks and connections
- Software project data, for example, program blocks or process screens

Note

While a device is being compiled, no additional compiling process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for operator control and monitoring devices.

Scope of the compilation

When you compile project data, you have the following options depending on the device involved:

- Hardware and software (only changes)
- Hardware (only changes)
- Hardware (rebuild completely)
- Software (only changes)
- Software (rebuild all)
- Software (reset memory reserve)

See also

Compiling project data (Page 348)

8.1.1.2 Compiling project data

The following section describes the general procedure for compiling project data in the project tree. You will find details of how certain objects are compiled and any special points to note in the online help of the product.

Procedure

To compile project data, follow these steps:

1. In the project tree, select the devices whose project data you want to compile.
2. Select the option you require in "Compile" submenu of the shortcut menu.

Note

Note that the options available to you depend on the selected device.

The project data is compiled. You can check whether or not the compilation was successful in the Inspector window with "Info > Compile".

See also

General information on compiling project data (Page 347)

8.1.2 Loading project data

8.1.2.1 General information on loading

Introduction

In order to set up your automation system, you need to load the project data you generated offline on the connected devices. This project data is generated, for example when configuring hardware, networks, and connections or when programming the user program or when creating recipes.

The first time you download, the entire project data is downloaded. During later loading operations, only changes are downloaded.

You can download the project data to devices and memory cards.

Note

While a device is being compiled, no additional download process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for operator control and monitoring devices.

Possible options for downloading

Depending on the object you want to download, you have the following options:

- Hardware and software (only changes)
  Both the hardware configuration and software are downloaded to the destination if differences exist between the online and offline versions.
- Hardware configuration
  Only the hardware configuration is downloaded to the destination.
- Software (only changes)
  Only the objects that differ online and offline are downloaded to the destination.
- Load PLC program to device and reset
  All the blocks are loaded to the destination and all values are reset to their initial state. Be aware that this also applies to retentive values.

You can also upload project data already contained in a device back to your project. You have the following options:

- Upload entire device as new station
  The hardware configuration of the device and the software on the device are loaded in the project.
  All relevant data of the device is uploaded to the project.
- Upload software of a device
  Only the blocks and parameters from the device are uploaded to an existing CPU in the project.

In both cases, during loading all instances of library types are connected again with the corresponding version of the type in the project library. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

Downloading with synchronization

In team engineering, it is possible for several users to work on one project with several engineering systems at the same time and to access one S7-1500 CPU. To ensure consistency within the shared project, it is necessary to synchronize the changed data prior to loading so that nothing gets overwritten unintentionally.

If differences are detected between the online and offline data management within the shared project that were caused by a different engineering system, automatic synchronization of the data to be loaded is offered when loading.

In this case, the "Synchronization" dialog displays the data to be synchronized with the current status (online-offline comparison) and the possible actions.

Use case	Recommendation	Synchronization
One or more blocks on the CPU (online) are more recent than in the engineering system (offline).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The blocks in the engineering system are updated prior to loading.
One or more new blocks have been created and exist only on the CPU (online).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The new blocks are added to the engineering system prior to the download.

Use case	Recommendation	Synchronization
One or more blocks on the CPU have been deleted.	The blocks should also be deleted prior to the download in the engineering system.	Automatic synchronization is not possible. The blocks deleted on the CPU should be manually deleted in the offline project in the engineering system.
One or more blocks on the CPU and in the engineering system are different. This is the case when a different user has changed blocks to which you have also made corrections and has already downloaded them to the CPU.	These blocks with competing changes must be adapted manually. You decide in this case which changes you are going to accept. If the blocks on the CPU are to be retained, you should adopt these blocks from the CPU in your engineering system before downloading to the CPU. If the blocks that you have changed are to be applied, you can continue with the download without synchronization.	Automatic synchronization is not possible: The affected blocks on the CPU or in the engineering system must be adapted manually. One of the existing block versions (online or offline) will be overwritten in the process.
There are differences in the hardware configuration on the CPU (online) and in the engineering system (offline).	Differences in the hardware configuration must be adapted manually. You decide in this case which hardware configuration you are going to accept. If the existing hardware configuration on the CPU is to be retained, you should adopt this in your engineering system prior to downloading. If you want to apply the hardware configuration you changed, you can continue downloading without synchronization.	Automatic synchronization is not possible: The hardware configuration must be adapted manually. One of the existing hardware configurations (online or offline) will be overwritten.

If required, you can use the "Force download to device" command to download blocks without synchronization.

Downloading project data to a memory card (Page 352)

Uploading project data from a device (Page 354)

8.1.2.2 Downloading project data to a device

The following section describes the general procedure for downloading project data to a device. You will find details of how certain objects are downloaded and any special points to note in the online help of the product.

Requirement

- The project data is consistent.
- Each device to which you want to download is accessible via an online access.

Procedure

To download the project data to the selected devices, follow these steps:

1. Select one or more devices systems in the project tree.
2. Right-click on a selected element.
   The shortcut menu opens.
3. Select the option you require in the shortcut menu of the "Download to device" submenu.

   Note

   Note that the options available to you depend on the selected device.

   When necessary, the project data is compiled.

   – If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
   – If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device. You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command.
     See also: AUTOHOTSPOT
4. Check the messages in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

   ⚠ WARNING

   Preventing personal injury and material damage

   Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors.

   Make sure that no dangerous situations can arise before you start the actions.

   As soon as loading becomes possible, the "Load" button is enabled.
5. Click the "Load" button.
   The loading operation is performed. If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are required for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
6. Click the "Finish" button.

Result

The selected project data was downloaded to the devices.

See also

General information on loading (Page 348)

Downloading project data to a memory card (Page 352)

Uploading project data from a device (Page 354)

8.1.2.3 Downloading project data to a memory card

You have the option of loading project data to a memory card. For CPUs of the S7-300/400 series you can also explicitly download the user program to a memory card inserted in the CPU.

To download project data to a memory card, you have the following options:

- Dragging project data to a memory card
- Writing project data to a memory card
- Downloading user program to a memory card that is inserted in a CPU of the S7-300/400 series

Requirement

A memory card is displayed.

See also: Accessing memory cards (Page 422)

Downloading project data to a memory card

To download project data to a memory card, follow these steps:

1. In the project tree, drag the project data you want to download to the memory card.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.
2. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
3. Click the "Load" button.
   The loading operation is performed.

Or:

1. In the project tree, select the project data that you want to download.
2. To do this, right-click the selection and select the "Copy" command from the shortcut menu. You can also use the key combination <Ctrl+C>.
3. Right-click the memory card and select the "Paste" command from the shortcut menu. You can also use the key combination <Ctrl+V>.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.

4. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
5. Click the "Load" button.
   The loading operation is performed.

Or:

1. In the project tree, select the project data that you want to download.
2. Select the "Card Reader/USB memory > Write to memory card" command in the "Project" menu.
   The "Select memory card" dialog opens.
3. Select a memory card that is compatible with the CPU.
   A button with a green check mark is activated at the bottom of the dialog.
4. Click the button with the green check mark.
   If necessary, the project data is compiled. The "Load preview" dialog then opens. This dialog displays alarms and recommends actions needed for the loading operation.
5. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
6. Click the "Load" button.
   The loading operation is performed.

Downloading the user program to a memory card in the CPU (S7-300/400 only)

To download the user program to a memory card in a CPU of the S7-300/400 series, follow the steps below:

1. Select a CPU of the S7-300/400 series in the project tree.
2. Select the "Download user program to memory card" command in the "Online" menu.
   The "Load preview" dialog opens. This dialog displays alarms and recommends actions needed for the loading operation.
3. Check the alarms and select the actions in the "Action" column, if necessary.
   As soon as downloading becomes possible, the "Load" button is enabled.
4. Click the "Load" button.
   The loading operation is performed and the "Load results" dialog is displayed. This dialog displays alarms and suggests possible actions.
5. Check the alarms and select the actions in the "Action" column, if necessary.
6. Click the "Finish" button.

General information on loading (Page 348)

Downloading project data to a device (Page 350)

Uploading project data from a device (Page 354)

8.1.2.4 Uploading project data from a device

The following section describes the general procedure for uploading project data from a device. Which project data you can upload from a device depends on the products installed.

You have the following options for uploading project data from a device to your project:

- Uploading as a new station
  With this option you upload existing project data of a device to your project as a new station.
- Uploading project data of a device
  With this option you upload project data from the device to an existing CPU in the project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during uploading. If no suitable type is yet available for an uploaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library. You can only upload library types in the state "in test" that are saved on the device to the project, if the released type version on which the test version is based is available in the project library.

Requirement

- A project is open.
- The hardware configuration and software to be uploaded must be compatible with the TIA Portal. If the data on the device was created with a previous program version or with a different configuration software, please make sure they are compatible.

Uploading as a new station

To upload the complete device to your project, follow these steps:

1. Select the project name in the project tree.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu.
   The "Upload device to PG/PC" dialog opens.
3. Select the type of interface you want to use for the uploading operation in the "Type of the PG/PC interface" drop-down list.
4. Select the interface to be used from the "PG/PC interface" drop-down list.
5. Click the "Configure interface" button to the right of the "PG/PC interface" drop-down list to adapt the settings for the selected interface.
   See also: AUTOHOTSPOT
6. Display all compatible devices by selecting the relevant option and clicking the "Start search" command. In the accessible devices table, select the device from which you want to upload project data.
7. Click on "Load".
   Depending on the selected device, a dialog appears in which you have to enter additional information, such as the position of the module rack.
   The project data of the device is uploaded to the project. You can edit it offline and then download it to the device again.

Uploading project data of a device

To upload only project data from one device to your project, follow these steps:

1. Establish an online connection to the device from which you want to download the project data.
   See also: AUTOHOTSPOT
2. Select the device in the project tree.
   The "Upload from device (software)" command in the "Online" menu is enabled.
3. Select the "Upload from device (software)" command in the "Online" menu.
   The "Upload preview" dialog box opens.
4. Check the alarms in the "Upload preview" dialog, and select the necessary actions in the "Action" column.
   As soon as uploading becomes possible, the "Upload from device" button is enabled.
5. Click the "Upload from device" button.
   The loading operation is performed.

Loading of project data from a different project version from a device

When the commands "Upload from device (software)" and "Loading the device as new station (hardware and software)" are executed in the "Online" menu, it is checked whether the project data on the device was created with a different version than the opened version of the TIA Portal.

If the project data was created with a different project version, the "Upload preview" dialog provides you with information on whether all upload requirements are met.

Note the information on the requirements for loading and, if necessary, select a command in the selection menu in the "Action" column.

The "Upload from device" button is enabled as soon as the view has been updated and uploading is possible.

Special features when using data blocks from other product versions

Data blocks that were created with a different product version of the TIA Portal cannot be opened and edited with the current product version. You can find additional information in the section "AUTOHOTSPOT".

Downloading project data to a memory card (Page 352)

8.1.2.5 Loading project data from a memory card

You have the following options for uploading project data from a memory card to your project:

- Upload project data of the memory card as a new station
  With this option you upload the project data of a memory card to your project as a new station.
- Upload project data of the memory card to an existing device
  With this option you upload project data of a memory card to an existing device in your project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during loading. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

Requirement

- A project is open.
- The memory card is displayed.
  See also: Accessing memory cards (Page 422)
- The hardware configuration and software to be uploaded must be compatible with the TIA Portal. If the data on the memory card was created with a previous program version or with different configuration software, please make sure they are compatible.

Uploading project data as a new station

To upload project data from a memory card to your project, follow these steps:

1. In the project tree, select the project data you want to upload.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu.

Or:

1. In the project tree, drag the memory card folder to the project.

Or:

1. Right-click on the memory card.
2. Select "Copy" in the shortcut menu.
3. Right-click on the project.
4. Select the "Paste" command in the shortcut menu.

Uploading project data to an existing device

To upload the project data of a memory card to an existing device, follow these steps:

1. In the project tree, drag the folder of the memory card to a device in the project or copy the memory card and paste the data into a device.
   The "Upload preview" dialog box opens.
2. Check the alarms in the "Upload preview" dialog, and select the necessary actions in the "Action" column.
   As soon as uploading becomes possible, the "Upload from device" button is enabled.
3. Click the "Upload from device" button.
   The loading operation is performed.

8.2 Comparing project data

8.2.1 Basics of project data comparison

Function

You can compare project data of the same type in order to determine possible differences. In principle, the following comparison methods are available:

- Online/offline comparison
  With this comparison method you can compare the software of objects of a device with the objects of a project. This is only possible when you establish an online connection to the device.
- Offline/offline comparison
  With this comparison method you can either compare the software or the hardware. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide for the software as well as the hardware comparison whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually.
- Detailed comparison
  For some objects, for example, blocks, you can also perform a detailed comparison in addition to the online/offline and offline/offline comparison. This involves opening the blocks to be compared beside each other and highlighting the differences.

A simple online/offline comparison is performed as soon as you establish an online connection. During this process, comparable objects in the project tree are marked with icons that represent the result of the comparison. You can also run a more comprehensive online/offline and offline/offline comparison in the compare editor. When you compare software, you can also select actions for non-identical objects in the comparison.

Note

- Not all objects allow all types of comparison. Which comparison method you can use for which project data depends on the products installed.
- Compile your user program before you start a comparison or detailed comparison. After each change of the program during a comparison, repeat this step before you update the result of the comparison. This ensures that the comparison shows the current status.
- When monitoring a module, note that a difference of the time stamp can also exist with an online/offline comparison if the block is recompiled with code change. The checksum remains unchanged. In this case download the block to the device and restart the monitoring.

Comparison using checksums

The online/offline and offline/offline comparison of software objects uses checksums that are generated for certain data of the objects. The objects are only the same if their checksums are identical.

Note

Time stamps continue to be used for online/offline comparison for CPUs of the S7-300/400 series.

The data of an object are divided into the following two categories:

- Source data
  Source data are all the data of an object which you can directly influence, such as the name of the object, source code, comments or programming language. The properties that you can edit here may differ depending on the object.
- Target data
  All compiler and runtime data are the target data. These data may have no direct influence, since they are produced by the system based on their source data. Once again here, the characteristics differ depending on the object.

The following table provides an overview of the areas of the property comparison:

Category	Area	Description
Source data	Safety	Checksum for safety objects You can find additional information about the comparison of safety objects in the "Comparing safety programs" section of the online help for SIMATIC Safety.
	Interface without comments	Checksum of all the tags of the block interface of the first layer. Comments of the tags are not part of the checksum.
	Code without comments	Checksum of the source code. Block and network comments are not included in the checksum.
	Comments (multi-language)	Checksum of all block comments and network comments
	Language configuration	Online/offline comparison: Displays the languages that are loaded to the device during the loading process. Offline/offline comparison: Displays the enabled languages in the project.
	Event	Checksum of all event-relevant data of an organization block (OB).
	Properties	Checksum of all configurable properties of an object.
	Configuration of technology objects	Checksum of the technology-specific settings of a technology object.
	Alarm configuration	Checksum on all alarm-specific settings of an object.
	Supervision configuration	Checksum of all supervision settings of an object.
Target data	Compilation and runtime data	Checksum of data for compiling and relevant for loading.
	Time stamp	Time stamps for S7-300/400 CPUs that are created by the system for compiling and downloading. Only available when an online connection is available.

Note

- Note that the object determines which checksums are actually used for the comparison.
- The value settings of technology objects are also transferred to the checksum of the block interface.
- For know-how protected blocks that were created in an older version, the checksums "Code without comments" and "Comments (multi-language)" are not displayed under "Source data".

Running a detailed comparison (Page 371)

Using the compare editor (Page 362)

8.2.2 Carrying out an online/offline comparison

The online/offline comparison lets you compare objects of a device with objects of a project.

Requirement

The project tree is open.

Procedure

To perform an online/offline comparison, follow these steps:

1. Select a device in the project tree that allows online/offline comparison.
2. Select the "Compare > Offline/online" command in the shortcut menu.
3. If you have not already established an online connection to this device, the "Go online" dialog opens. In this case, set all the necessary parameters for the connection and click "Connect".
   The online connection is established and compare editor opens.

Result

All objects that exist online and offline are displayed. The symbols in the compare editor and in the project tree show you the status of the objects. In the compare editor, you can now define certain actions for the objects, depending on their status.

Carrying out offline/offline comparisons (Page 361)

Using the compare editor (Page 362)

Running a detailed comparison (Page 371)

8.2.3 Carrying out offline/offline comparisons

With offline/offline comparison you have the option to compare the project data of two devices. You can carry out a software as well as a hardware comparison. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually. For a software comparison, the following options are available as well:

- For objects that are not identical, you can specify actions to eliminate the differences.
- You can specify the criteria that should be used for the comparison.

You can drag any other device to the drop area at any time to perform further comparisons.

Requirement

The project tree is open.

Performing an offline/offline comparison for software

To perform an offline/offline comparison for software, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane.
   All existing objects of the selected devices are displayed depending on the settings of the compare editor in the "Software" tab and an automatic comparison is carried out. You can identify the status of the objects based on the symbols in the compare editor. If needed, specify an action for non-identical objects to eliminate the differences.
4. If needed, define the comparison criteria.
5. Select an object to display the details of the property comparison.
6. If you want to carry out a manual comparison, click on the button for switching between automatic and manual comparison in the status and action area. Then select the objects that you want to compare.
   The properties comparison is displayed. You can identify the status of the objects based on the symbols.

Performing an offline/offline comparison for hardware

To perform an offline/offline comparison for hardware, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane.
4. Open the "Hardware" tab.
5. If you want to carry out a manual comparison, click on the button for switching between automatic and manual comparison in the status and action area. Then select the objects that you want to compare.
   The properties comparison is displayed. You can identify the status of the objects based on the symbols.

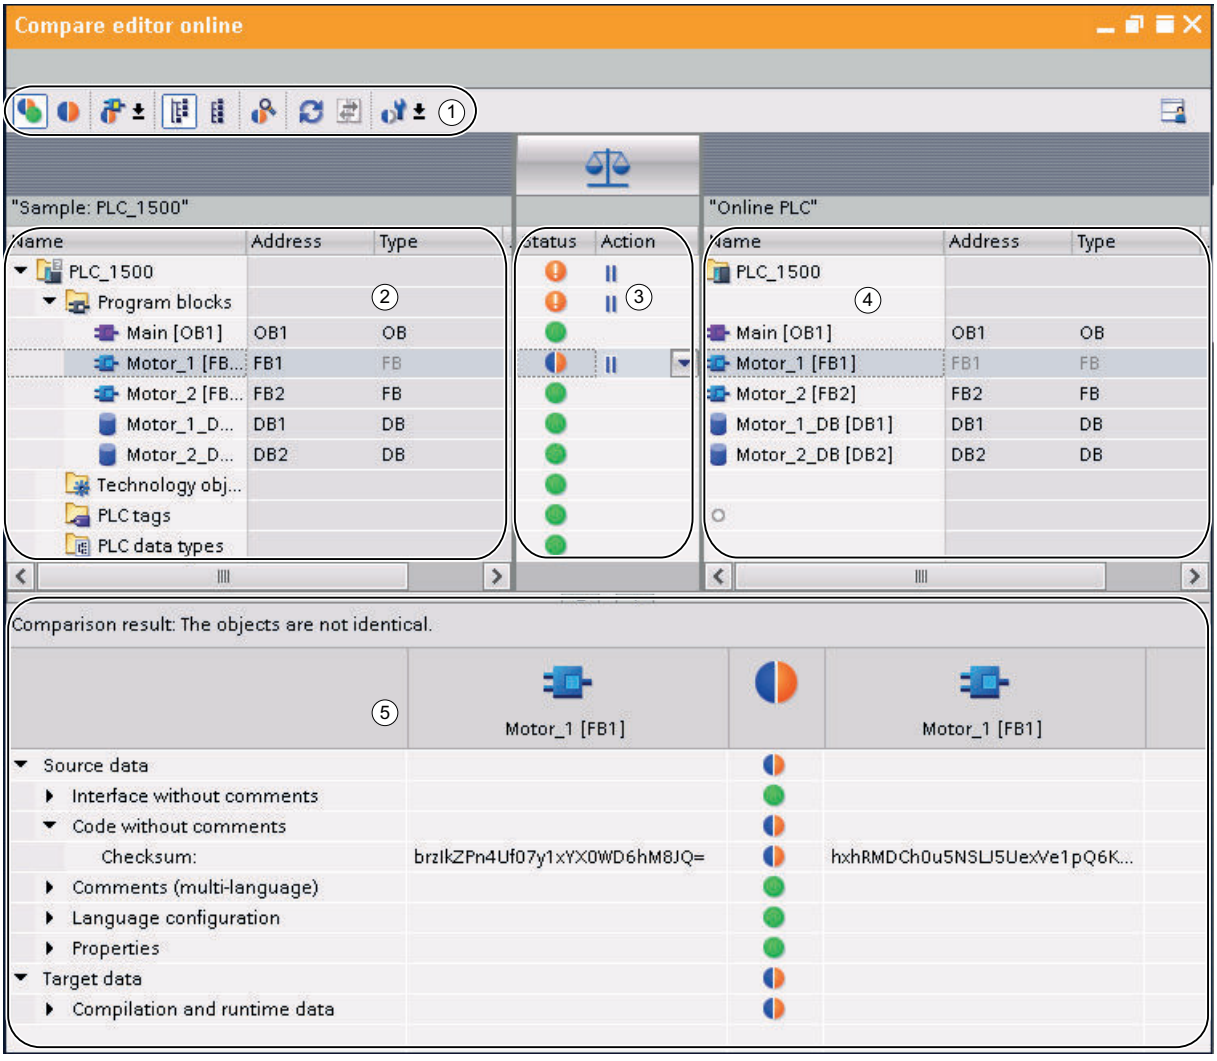
Using the compare editor (Page 362)

Running a detailed comparison (Page 371)

8.2.4 Using the compare editor



8.2.4.1 Overview of the compare editor

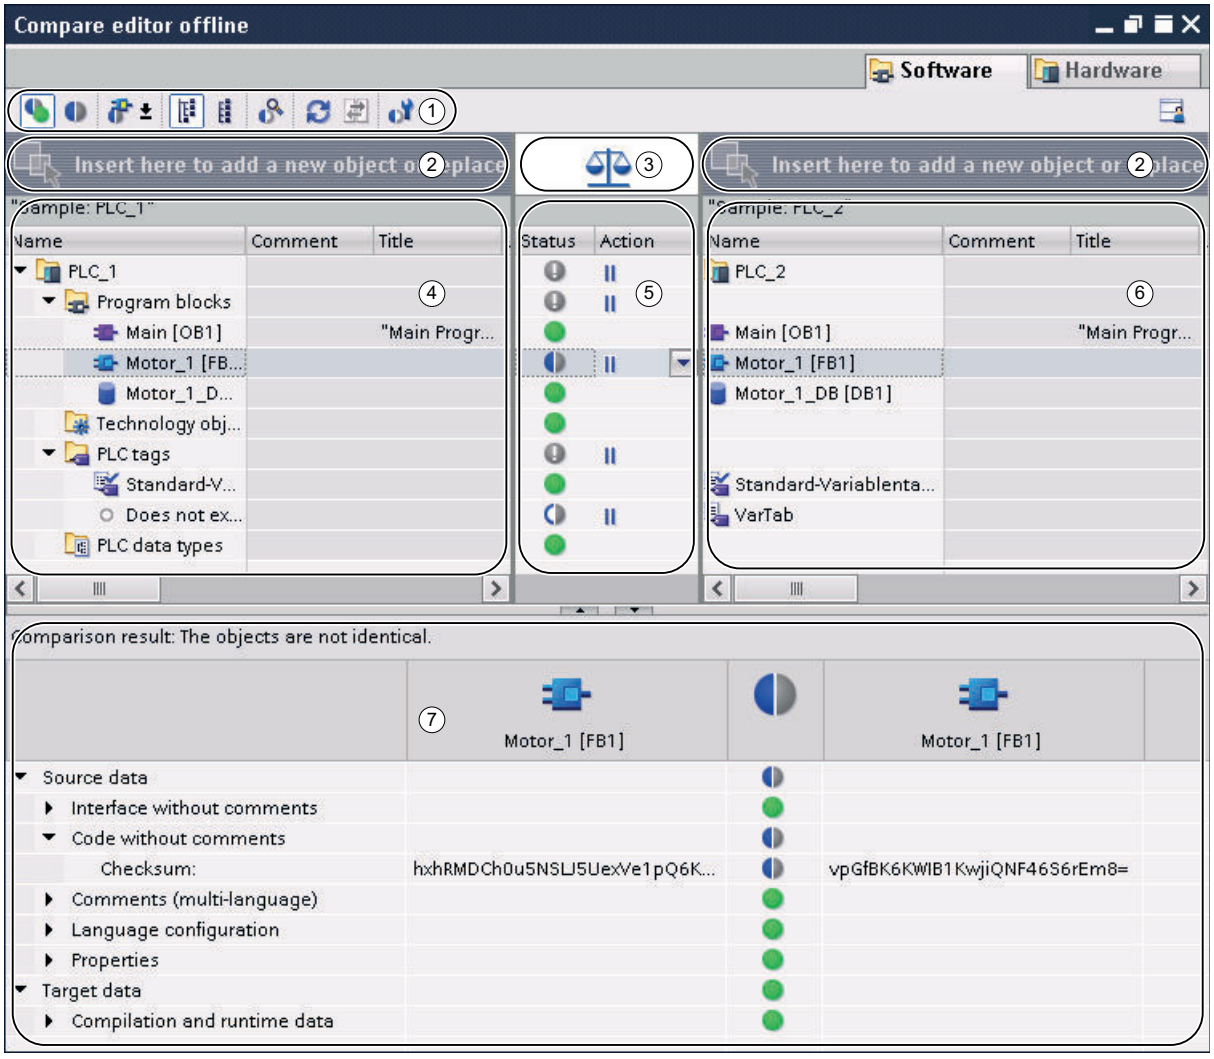
Function

The compare editor gives an overview of the results of a comparison in a table. The appearance varies slightly depending on whether it is an online/offline comparison or a hardware/software comparison.

Layout of the compare editor

The following figure shows the layout of the compare editor for an online/offline comparison:

① Compare editor toolbar



② Left comparison table

③ Status and action area

④ Right comparison table

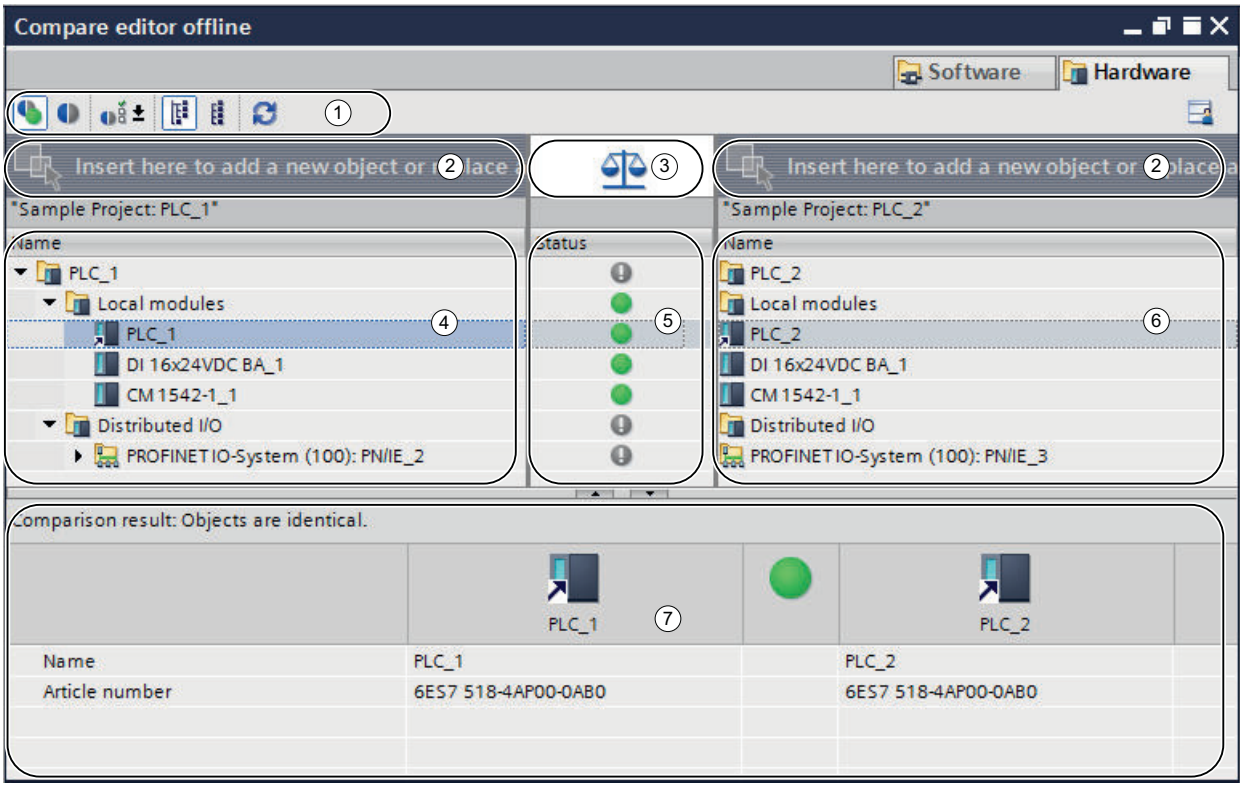
⑤ Property comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (software):

① Compare editor toolbar

② Drop areas

③ Button to toggle between automatic and manual comparison



④ Left comparison table

⑤ Status and action area

⑥ Right comparison table

⑦ Property comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (hardware):

① Compare editor toolbar

② Drop areas

③ Button to toggle between automatic and manual comparison

④ Left comparison table

⑤ Status area

⑥ Right comparison table

⑦ Property comparison

Compare editor toolbar

With the toolbar, you can access the following compare editor functions:

- Show identical and different objects
  You can show identical objects if you want to view the comparison in full.
- Show only objects with differences
  You can hide identical objects to make the comparison easier to follow.
- Show additional filters available (only online/offline comparison and offline/offline comparison for software)
  You can define which objects are to be compared.
- Display available assignment criteria (only offline/offline comparison for hardware)
  You can specify the criterion according to which the modules are to be assigned to each other for the comparison.

- Changing the view
  You can choose between a hierarchical and a flat view. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure.
- Start detail comparison (only online/offline comparison and offline/offline comparison for software)
  You can start a detailed comparison for objects to show the individual differences. This function is, however, not available for every object.
- Refresh the view
  After you have modified objects, you can update the comparison results using this function.
- Execute actions (only online/offline comparison and offline/offline comparison for software)
  You can synchronize non-identical objects using specific actions.
- Set comparison criteria (only online/offline comparison and offline/offline comparison for software)
  You can specify which criteria are to be used in the comparison. Disabled criteria do not affect the overall result of the comparison.

Drop areas

In the case of an offline/offline comparison, you can drag the devices you want to compare into the drop areas. In the case of a software comparison, the devices to be compared can originate from the opened project, from reference projects, from the project library or from global libraries. However, note that you can only drop complete libraries into the right drop area. In the case of a hardware comparison, you can compare devices from the opened project or from reference projects.

Button to toggle between automatic and manual comparison

With an offline/offline comparison, you can switch between automatic and manual comparison. In the case of automatic comparison, the objects to be compared are assigned automatically to each other. In the case of a manual comparison, you can select the objects that are to be compared.

Comparison tables

Comparison tables show the objects of the devices being compared to one another.

The following table shows the meaning of the columns of the comparison table:

Column	Description
Name	Name of the compare object
Comment	Comment on the compare object
Title	Title of the compare object
Address	Address of the compare object
Numbering	Type of numbering for the comparison object
Type	Type of compare object
Language	Programming language set for the compare object.

Column	Description
Time stamp interface	Time of the last modification to the block interface
Time stamp code	Time of the last modification to the source code
Author	Name of the author of the compare object
Version	Version of the compare object
Family	Name of the object family
Load memory	Memory usage of the load memory of the compare object
Work memory	Memory usage of the work memory of the compare object
Modified on	Time of last modification
Optimized block access	Indicates whether "Optimized block access" is enabled for a block.
Signature	Signature of the comparison object (SIMATIC Safety*)
Interface signature	Signature of the block interface of the comparison object (SIMATIC Safety *)

* You can find additional information about the comparison of safety objects in the "Comparing safety programs" section of the online help for SIMATIC Safety.

Not all columns are available in every comparison type. For the hardware comparison, for example, the comparison tables contain only the "Name" column.

Not all columns are shown in the default setting. However, as in all table editors, you can show or hide the columns as required and sort according to individual columns.

Status and action area

The status and action area offers the following options:

- You can view the results of automatic comparison. The results are displayed with symbols.
- In an online/offline comparison and an offline/offline comparison for software, you can specify actions for non-identical objects.

Status and action symbols

The following table shows the comparison results symbols for an online/offline comparison:

Symbol	Description
	Folder contains objects whose online and offline versions differ
	Result of comparison is either not known or cannot be displayed for the following reasons: • No rights available for access to a protected CPU. • The loading process on the CPU was executed with a TIA Portal version earlier than V14.
	Online and offline versions of the object are identical
	Online and offline versions of the object are different
	Object only exists offline

Symbol	Description
	Object only exists online
	This comparison criterion is disabled and the associated checksum is not incorporated into the comparison result.

The following table shows the comparison results symbols for an offline/offline comparison:

Symbol	Description
	Reference program
	Version compared
	Folder contains objects of which the versions compared differ
	Results of the offline/offline comparison are not known
	The versions of the object compared are identical
	The versions of the object compared differ
	Object only exists in the reference program
	Object only exists in the version compared
	Hardware comparison only: Although the lower-level objects of the container are identical, there are differences between the containers themselves. Such a container may be a rack, for example.
	Hardware comparison only: The lower-level objects of the container are different. There are also differences between the containers. Such a container may be a rack, for example.
	This comparison criterion is disabled and the associated checksum is not incorporated into the comparison result.

The following table shows the symbols for possible actions in a software comparison:

Symbol	Description
	No action
	Overwrite the object of the compared version with the object from the reference program
	Overwrite the object of the output program with the object from the compared version
	Different actions for the compare objects in the folder

Property comparison

The property comparison compares the properties of the selected compare objects. The result is displayed with symbols. Only the property comparison is made with a manual comparison so that the status and action area remains empty. With automatic comparison, you can perform the property comparison in addition to the comparison in the comparison tables.

Changing the view (Page 376)

8.2.4.2 Show and hide table columns

In a software comparison, you can show or hide the columns of comparison tables as required.

Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.
   The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.
5. In order to show or hide multiple columns, click "More" and select or clear the check boxes of the corresponding columns in the "Show/Hide" dialog.

Result

The columns in both the left and the right comparison table are shown or hidden.

Synchronizing non-identical objects (Page 374)

Changing the view (Page 376)

8.2.4.3 Filtering the compare editor view

You can improve the clarity of the compare editor using the following filters:

- Hiding identical comparison objects
  You can hide comparison objects which have identical online/offline or offline/offline versions. Any such comparison objects you have hidden can also be shown again at any time.
- Selecting displayed objects
  In an online/offline comparison or an offline/offline comparison for software, you can specify the objects for which the comparison results are to be shown.

Requirement

The compare editor is open.

Hiding identical comparison objects

To hide identical objects, follow these steps:

1. Click on the "Show only objects with differences" button in the toolbar.
   Only the elements that differ online and offline are displayed.

Showing identical comparison objects

To show identical objects again, follow these steps:

1. Click on the "Show identical and different objects" button in the toolbar.
   All elements will be displayed.

Selecting displayed objects

To select the objects for which comparison results should be displayed, follow these steps:

1. Perform an online/offline or an offline/offline comparison for software.
2. Click the arrow of the button "Show additional filters available" in the toolbar.
3. Select the required filter.

Set comparison criteria (Page 373)
Synchronizing non-identical objects (Page 374)
Changing the view (Page 376)

8.2.4.4 Running a detailed comparison

Note

Please note the following:

- Not all objects allow a detailed comparison. The project data for which you can perform a detailed comparison depends on the products installed. A detailed comparison of the hardware components is not available for hardware comparison.
- For blocks, PLC tags and PLC data types, you can start the detail comparison directly from the project tree. You can find additional information in the section "Comparing PLC programs".

Procedure

Proceed as follows to perform a detailed comparison:

1. First, perform an online/offline or an offline/offline comparison for software.
   The compare editor opens.

   Note

   You can only perform a detailed comparison for objects that are listed in the left as well as the right comparison table.

2. In the compare editor, select the object for which you want to perform a detailed comparison.
3. Click the "Start detailed comparison" button in the toolbar.

Result

The object and its associated comparison partners are opened in their appropriate editors. The editors are arranged next to each other to provide you with a quick overview of the differences. You can find more information with the description of the respective data type.

Synchronizing non-identical objects (Page 374)
Changing the view (Page 376)

8.2.4.5 Updating the comparison results

As soon as you change an object, the comparison results are no longer valid and must be updated.

Note

For online/offline comparisons, you should note that changes in the device may result in the system automatically updating the comparison editor if objects in the comparison are affected by the change. This can have the following results:

- Some of the actions you have defined may become invalid, for example if the device no longer contains the object in question. Objects with such invalid actions will be highlighted so you can define new, valid actions.
- The selection you made before the automatic update may also be cancelled.

Requirement

The comparison editor is open.

Procedure

To update the comparison results, follow these steps:

1. Click the "Refresh view" button in the toolbar.
   The comparison results are updated.

   Note

   Please note that the "Refresh view" button will not be available while the comparison editor is loading or synchronizing content.

Running a detailed comparison (Page 371)
Set comparison criteria (Page 373)
Synchronizing non-identical objects (Page 374)
Changing the view (Page 376)

8.2.4.6 Set comparison criteria

You have the option to set to criteria to be taken into account for a comparison. The specified criteria are applied to all objects of a comparison, if they are available for an object. If a criterion for an object is not available, for example, "Code without comments" for data blocks, the comparison result for this checksum is considered to "match".

For a criterion that you disabled, you can still view the checksums for the overall comparison result although it is not used. Disabled comparison criteria for the property comparison are indicated by the filter icon. The filter symbol can also be displayed in the upper area of the comparison editor when no checksums should be used in the comparison result based on the selection of comparison criteria.

Note

With an online/offline comparison, the comparison criteria have no influence on the result of comparison in the project tree. Note that there may be different results in the project tree and comparison editor.

Procedure

To define the criteria to be taken into account for the comparison, follow these steps:

1. In the toolbar, click on the arrow of the "Display further comparison criteria" button.
2. Select all the criteria that should be considered for the comparison.
3. Clear all the criteria that should be considered for the comparison.
4. Click the button with the green check mark at the bottom of the drop-down list.
5. Click on the button with the x to close the drop-down list without applying the changes.

Result

Only the enabled criteria are taken into account for the comparison.

Changing the view (Page 376)

8.2.4.7 Synchronizing non-identical objects

Specifying actions

If you have performed a comparison, you can specify the actions to be performed for non-identical objects in the compare editor. You cannot select any actions for identical objects. Note that you cannot execute any actions during hardware comparison.

In the case of an online/offline comparison, only synchronization actions in one direction are permitted, in order to retain program consistency. Thus, for example, you can load multiple blocks to a device or from a device, but you cannot perform a combination of loading actions in one synchronization action. In this case, the first action you set in the compare editor determines the synchronization direction. For example, if you specify for a block that the offline block is to be loaded to the device, then the other objects can also only be loaded to the device via a synchronization action. To load objects from the device again, first select the "No action" option. You can then specify the action settings again as required. Or, you can perform a new comparison.

Note

Note the following CPU-specific aspects when defining actions:

- S7-300/400: You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks.
- S7-1200/1500: You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks. If you have performed an online/offline comparison and select download to the device as action, a consistent download is executed. If you upload the object from the device to the project, however, you can also upload individual blocks.

Requirement

The compare editor is open.

Procedure

To select an action for a non-identical object, follow these steps:

1. In the status and action area, click in the "Action" column on the cell of the object for which you want to define an action.
   The cell changes to a drop-down list.
2. Click on the drop-down list.
3. Select the action you want.
   The action set will be carried out for the object in question the next time synchronization is performed.
   If you have accidentally changed the action you had selected, you can undo the change before the next synchronization.
4. To restore the previously set action selection, right-click the action in the status and action area that you want to restore.
5. Select the "Restore last selection" command in the shortcut menu.

Filtering the compare editor view (Page 370)

Updating the comparison results (Page 372)

Synchronizing objects (Page 375)

Synchronizing objects

Synchronization executes the actions you have specified for non-identical objects. Note, however, that in the case of an online/offline comparison you can only perform actions in one direction in one synchronization action.

Requirement

- The compare editor is open.
- The desired actions have been selected.

Procedure

To synchronize objects, follow these steps:

1. Click the "Execute actions" button in the toolbar.

Result

The actions you specified for the objects are performed.

8.2.4.8 Changing the view

You can choose between a hierarchical and a flat view for the left comparison table. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure. In the right comparison table, the objects are always displayed flat.

Setting the hierarchical view

To set the hierarchical view, follow these steps:

1. Click the "Display in hierarchical view" button in the toolbar of the compare editor.

Setting the flat view

To set the flat view, follow these steps:

1. Click the "Display in flat view" button in the toolbar of the compare editor.

8.3 Protecting project data

8.3.1 Protection concept for project data

Introduction

You can protect your project data from unauthorized access. These include, for example:

- Access protection for devices
- Copy and display protection of objects
- Restrictions for printouts of know-how-protected objects

For objects with know-how protection, this protection is also retained after the object is pasted into a library. Note that every protection mechanism is not available for all objects. How to protect specific objects is described in the online help of the product.

Companies can also specify the use of a password provider to protect blocks. To do so, the central settings must be adjusted and all users must integrate the corresponding password providers in the TIA Portal. The passwords provided by a password provider can subsequently be used. You can find additional information in the section "Protecting blocks".

Revoking access rights for devices

If you want to execute a function that is password-protected by means of the device protection level, you are prompted to enter a password. When the password is entered correctly, you can execute the required function. The access right is retained on the device until you close the TIA Portal.

If you want to reactivate password protection while the TIA Portal is open, you can explicitly revoke the access rights for a device. As a result, certain functions for the protected device cannot be executed until the correct password is entered again. You specify the functions for which a password must be entered when you assign the device protection level.

See also

Printing project data (Page 397)

8.3.2 Revoking access rights for devices

Requirement

- A protection level has been set for the device.
- A protected function for the device has been enabled by entering the password.

Procedure

To revoke the access rights for the device, follow these steps:

1. Select the device for which you want to revoke access rights in the project tree.
2. Select the "Delete access rights" command in the "Online" menu.

Result

The access rights are revoked, and starting from now the user will be prompted to enter the password again to execute a password-protected function on the device. The function can only be executed if the correct password is entered.

If the device has an online connection, it will be disconnected.

See also

Protection concept for project data (Page 378)

8.4 Printing project contents

8.4.1 Printing project documentation

8.4.1.1 Documentation settings

Introduction

Once a project is created, the contents can be printed in an easy-to-read format. You may print the entire project or individual objects within the project. A well-structured printout is helpful when editing the project or performing service work. The printout can also be used for your customer presentations or as full system documentation.

You can prepare the project in the form of standardized circuit manuals and print it in a uniform layout. You can limit the scope of the printout. You have the option to print to the entire project, individual objects along with their properties, or a compact overview of the project. In addition, you can print the contents of an open editor.

Improving the printout with frames and cover pages

You can design the appearance of the printed pages according to your own requirements, for example, to add your own company logo or the corporate design of your company in the project documentation. You can create any number of design variants as frames and cover pages. The frames and cover pages are stored in the project tree under the item "Documentation settings" and are part of the project. You can insert placeholders for data from previously entered document information within the frames and cover pages. These will be filled automatically with the appropriate metadata during printing.

If you want to avoid designing your own template, there are ready-made frames and covers pages available. These include templates complying with the ISO standard for technical documentation.

Modular structure of a printout

An printout generally consists of the following components:

- Cover page (only when printing from the project tree)
- Table of contents (only when printing from the project tree)
- Name and path of an object within the project tree
- Object data

Printout of the cover page or the table of contents can be deactivated in the "Print" dialog.

See also

Creating frames (Page 386)

Creating a cover page (Page 386)

Editing cover pages and frames (Page 388)
Entering document information (Page 384)
Print function for module labels (Page 399)

8.4.1.2 Printout of project contents

Availability of print function

The following contents can be printed:

- An entire project in the project tree
- One or more project-related objects in the project tree
- Contents of an editor
- Tables
- Libraries
- Diagnostics view of the Inspector window

It is not possible to print in the following areas:

- Portal view
- Detailed view
- Overview window
- Compare editor
- All tabs of the Inspector window, except the diagnostics view
- All task cards, except the libraries
- Most of the dialogs
- Properties and devices of the programming device/PC not related to the project, for example online portals and connected card readers.

Scope of printout

To be able to print, at least one printable element has to be selected.

If a selected object is printed, all subordinate objects are also printed. For example, if a device is selected in the project tree, all of its data is also printed. If you select the entire project in the project tree for printing, all project contents are printed with the exception of the graphical views. These have to be printed separately. Items in the project tree that are not part of the project cannot be printed. For example, this includes online portals and connected card readers and USB memory devices.

When table contents are printed, all lines in the table in which a cell is selected are printed. In order to print one or more table columns, the desired columns must be selected. If no individual cells or columns are selected, the entire table is printed.

Limitations when printing

In general, it is possible to print all objects that can be visualized on the user interface. Conversely, this means that you cannot print objects that you do not have access to. If a printout fails, possible reasons may include the following:

- A valid license does not exist for displaying an object.
- There is no device description for an object.
- A software component needed to display an object is not installed.

See also

Printing project data (Page 397)

8.4.1.3 Changing the print settings

Changing the print settings

You can specify general print settings that are retained even after the TIA Portal is closed and re-opened. Some settings are dependent on the products installed. The following settings are possible in every case:

Always print table data as pairs of values

If this option is selected, tables are not printed in tabular format but rather as a pairs of key and value.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

Printing mask editors

- Always print data in tables
  All parameters of technology objects are printed in tabular format.
- Print mask graphics if possible
  If the utilized editor supports this function, the contents of the editor are not printed as a table but rather as a complete graphic as it appears on the screen.

Procedure

To change the print settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General" group.
3. Select the desired default settings in the "Print settings" area.
   The changes are applied immediately and are retained for all projects, even after the TIA Portal is closed.

See also

Overview of the print settings (Page 233)

8.4.1.4 Specifying the print layout

Specifying the print layout

If you do not want to rely on ready-made print templates, you can specify your own cover page or your own layout for the individual pages. Your designs are saved together with the respective project.

Your designs for the cover page and your templates for the page layout can be found in the project tree under the "Documentation information" group. You will also find metadata on the project there under the entry "Document information". For subsequent print operations, you can customize the appearance of the printout in the "Print" dialog using the saved cover pages and page layout templates and the available metadata.

Designing the cover page

The cover page can be customized. You can insert a background graphic and provide placeholders for text on the page. The placeholders are automatically filled with data from a documentation information during printing.

Cover pages are located in the project tree under the "Documentation information > Cover pages" group.

Designing the content page

The regular pages of a printout can contain the following elements:

- Frame with static content, such as a company logo
- Placeholders for text, such as the name of the project, the page number, and the time the printout was started
  Several different values for the individual placeholders can be specified in the document information. Other values, such as the project name, are preassigned and are inserted automatically during printing.
- Footnote
  The footnote is always output below the content area.
- Content area
  You can specify an area where the printed content is to be embedded.

The design of the content pages is saved in Frames. The individual frames are located in the project tree under the "Documentation information > Frames" group.

8.4.1.5 Entering document information

You can enter metadata in the document information for every project. In addition, a print frame and a cover page are specified in the document information. You can create different information, if required, to enable you to quickly switch between different document information containing different information, frames, cover pages, page sizes, and page orientations when printing. For example, this is useful if you want to generate printouts in different languages and different document information is provided for each language.

In the documentation editor, you can specify placeholders on the cover page or in the frame of the regular pages. These placeholders can be automatically replaced with metadata from the documentation information during printing.

The various document information are therefore part of the printing function and specify the print layout and print content.

Procedure

To add metadata, follow these steps:

1. To create new document information, double-click "Add new document information" under "Documentation information > Document information" in the project tree.
   The new document information is created and opened immediately.
2. Enter a name for the set in the "Name" field.
3. Fill in the individual fields with the metadata for the project.

8.4.1.6 Managing cover pages and frames

Using cover pages and frames

Uses for cover pages

You can give your plant documentation printouts a professional appearance by adding a cover page. You can design your own cover page or use ready-made cover pages. Ready-made cover pages can be adapted and stored again as a template.

Cover pages can be saved in global libraries where they are available for use across projects.

Cover pages are designed for use as a right printed page only.

Uses of frames

You can embed the regular pages of your plant documentation inside a consistently uniform page frame. The frame can contain placeholders for project metadata, which is stored in the document information. It can also contain graphic elements that you design yourself.

You can create your own frames or rely on ready-made page frames. You can adapt a ready-made page frame and then store it again as a new frame.

Like cover pages, frames can be saved in global libraries where they are available for use across projects.

Frames are designed for use on right printed pages only.

Cover pages and templates in the project tree

Cover pages and frames associated with the project are stored in the project tree under the entry "Documentation information". There are separate folders here for frames and cover pages.

The following actions are available in the project tree for cover pages and frames.

- Creating your own subfolders
- Copying and pasting
- Inserting cover pages and frames from the "Documentation templates" system library
- Copying cover pages and templates to a global library

Cover pages and templates in libraries

The "Documentation templates" system library contains a few cover pages and templates that are available in every project. The cover pages and templates can be moved from there to the project tree using a drag-and-drop operation. You can then adapt the cover pages and templates in the project tree according to the requirements of your project.

Cover pages and templates can be moved from the project tree to a global library. Afterwards, these are available in every project.

Overview of the "Libraries" task card (Page 443)

Using ready-made frames and cover pages (Page 387)

Designing cover pages and frames (Page 388)

Creating frames

You can create any number of frames for each project. The frames are stored in the project tree below the "Documentation information > Frames" group. You can assign a frame to all document information. When you select document information for printing, its associated frame is used.

Procedure

To create a new frame, follow these steps:

1. Double-click the entry "Add new frame" below the "Documentation information > Frames" group in the project tree.
   The "Creating frames" dialog opens.
2. Enter a name for the frame in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new frame is created. The frame is then opened automatically in the documentation editor where it can be edited.

Editing cover pages and frames (Page 388)

Creating a cover page (Page 386)

Creating a cover page

You can create any number of cover pages for the printout for each project. The cover pages are stored in the project tree below the the "Documentation information > Cover pages" group. You can assign a cover page to all document information. When you select specific document information for printing, its associated cover page is used.

Procedure

To create a new cover page, follow these steps:

1. Double-click the entry "Add new cover page" below the "Documentation information > Cover pages" group in the project tree.
   The "Add new cover page" dialog box opens.
2. Enter a name for the cover page in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

Result

A new cover page is created. The cover page is then opened automatically in the documentation editor where it can be edited.

Editing cover pages and frames (Page 388)

Creating frames (Page 386)

Using ready-made frames and cover pages

The TIA Portal comes with some ready-made frames and cover pages. These can change according to your wishes.

Procedure

To create and edit the ready-made frames and cover pages, follow these steps:

1. Open the "Global libraries" pane in the "Libraries" task card.
2. In the "Templates" folder, open the "Cover Pages" or "Frames" folder.
3. Drag a cover page or a frame from one of the folders into the project tree and drop it into one of the following folders:
   - For frames: "Document information > Frames"
   - For cover pages: "Document information > Cover pages".

   The ready-made frame or cover page can now be used in the project.
4. Double-click on the new entry in the project tree click to edit the frame or the cover page.

8.4.1.7 Designing cover pages and frames

Editing cover pages and frames

The documentation editor is a graphical editor which allows you to design frames and cover pages for your plant documentation. You can place images or text elements on the frame and the cover pages in the document editor. The text elements are either static or they are automatically filled during printing with the data from the document information that you have selected in the print dialog.

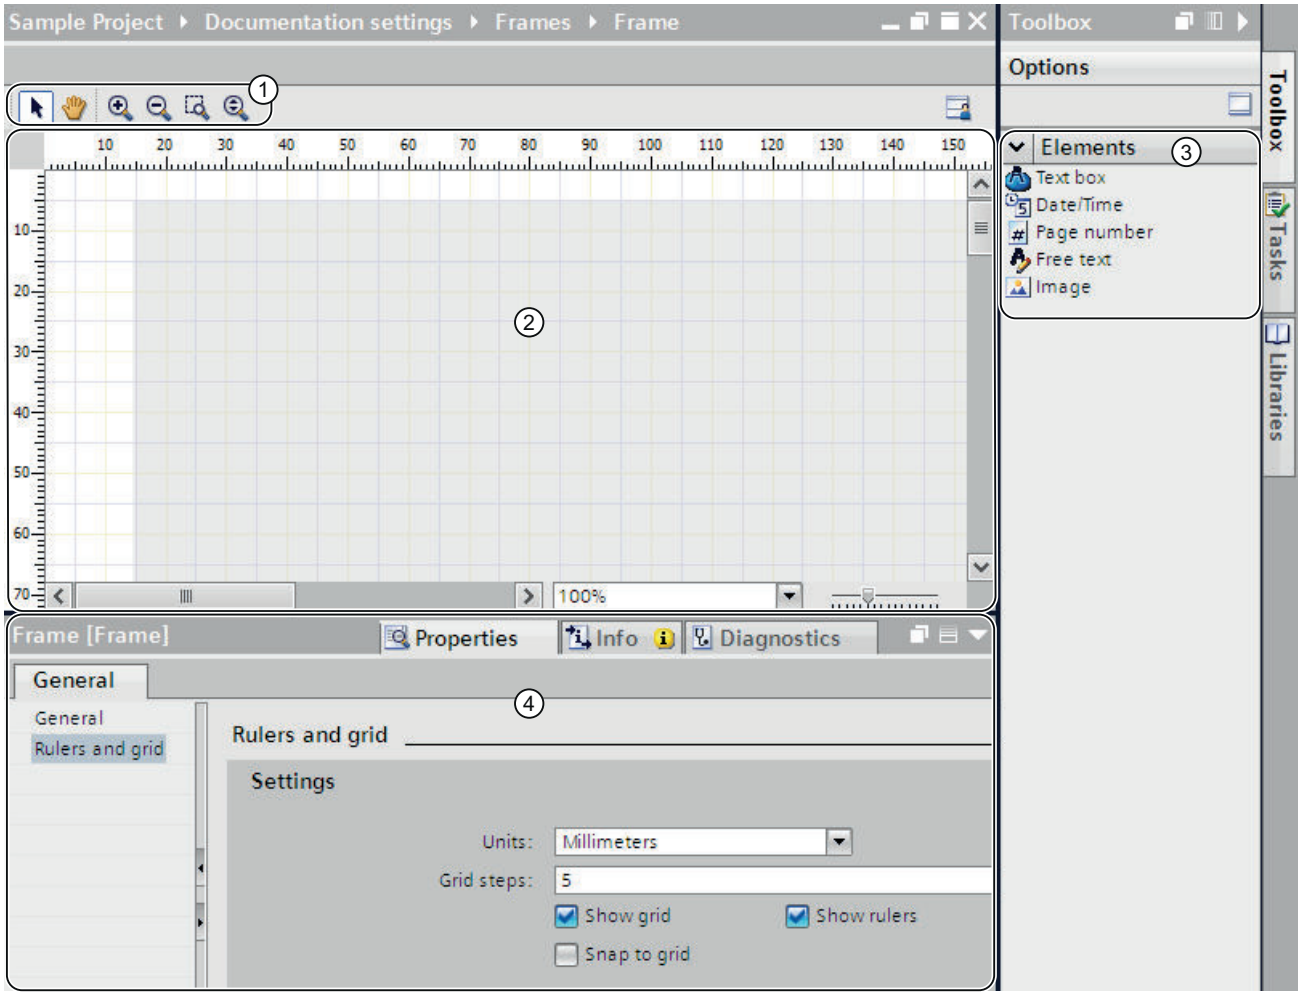
Procedure

To edit a cover page or a frame in the documentation editor, follow these steps:

1. In the project tree, double-click on the entry for an existing cover page or frame under the "Documentation information > Frames " or "Documentation information > Cover pages" group.
   The documentation editor opens.
2. Design the cover page or frame as desired.
3. Close the documentation editor.
   The changes to the cover page or frame are applied automatically.

See also

Creating a cover page (Page 386)



Creating frames (Page 386)

General operation of the documentation editor (Page 389)

General operation of the documentation editor

Components of the documentation editor

The following figure provides an overview of the components of the documentation editor:

① Toolbar

The toolbar provides the following tools (from left to right):

- Arrow tool
  Enables object selection.
- Navigation tool
  Allows shifting of the partial page.
- Zoom-in button
  Magnifies the page display incrementally.
- Zoom-out button
  Reduces the page display incrementally.
- Zoom with selection
  Adapts the page size to a selected work area.
- Dynamic zoom
  Adapts the page width to the work area.

② Work area

You can design the cover page or frame in the work area.

③ "Toolbox" task card

The "Toolbox" task card contains various types of placeholders that you can use on the cover sheet or frame. The placeholders can be placed in the work place using a drag-and-drop operation.

④ Properties in the Inspector window

You can display and modify the properties of the currently selected object in the "Properties" tab of the Inspector window. For example, you can modify the properties of the page, format text, specify the position of objects on the page, etc.

Operation in the documentation editor

The following basic functions are available in the documentation editor:

- Drag-and-drop functionality
  The documentation editor is a graphic editor. which means you can place objects anywhere with the mouse. An image of the page is displayed in the work area. This image corresponds to the ultimate print layout.
  If you want to select objects on the page in order to move them or modify their properties, the arrow tool must be activated in the toolbar.
- Zoom function
  You can use the zoom function to change the size of the page display. You have two options for changing the page size:
  - Via the buttons in the toolbar
    Select the "Zoom in" or "Zoom out" magnifying glass button in the toolbar of the documentation editor. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.
    To zoom in on a particular area, select the "Zoom with selection" tool and use the mouse to drag an outline around the area you want to focus on.
    To continuously zoom in or zoom out of the work area, use the "Dynamic zoom" tool. To magnify the page display, click anywhere on the work area, and then hold down the mouse button while dragging the mouse toward the top of the page. To reduce the page display, drag the mouse toward the bottom of the page.
  - Via the zoom bar
    You can also use the zoom bar (located in the bottom right corner of the work area) to change the display size. Select a percentage value from the drop-down list or enter a percentage value. Alternatively, you control the display size using the slider.
- Navigation over the page
  In addition to scrolling, you the option of changing the partial page with the navigation tool. To change the partial page with the navigation tool, select the Hand button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.

Using and adapting the positioning aids

You have various aids at your disposal to help you position elements on the page:

- Rulers
  Rulers are affixed to the page margins in the work area.
- Page grid
  A grid is placed underneath the page in the work area.

You can display, hide or adapt the positioning aids in the Inspector window under "Properties > Rulers and grid". You can make the following settings:

- Units:
  Specify the unit of measurement for the grid and the rulers.
- Grid steps:
  Specify the width of the grid.
- Show grid:
  Specify whether the grid is to be displayed or hidden.

- Snap to grid:
  Specify whether objects are to be aligned automatically to the grid. If the option is selected, the grid lines function like a "magnet".
- Show rulers:
  Specify whether the rulers are to be displayed.

Editing cover pages and frames (Page 388)

Specifying the print area (Page 392)

Inserting placeholders for metadata (Page 392)

Specifying the print area

An area within the frame is provided for the actual printed contents. The project data is then always inserted inside this defined and uniformly consistent area within the frame. You can adjust the size of the print area.

Requirement

A frame is open in the documentation editor.

Procedure

To define an area for the printed contents, follow these steps:

1. Click on the slightly darker area within the page display in the documentation editor to select the area for the print content.
   This opens the properties of the area to be printed in the Inspector window.
2. Enter the position of the print area on the X and Y axes in the Inspector window.
3. Specify the width and height of the print area in cm in the Inspector window.

Alternatively, you can change the width and position of the print area in the graphic display of the page. To do so, use the mouse to drag the margins of the print area until the desired size and position are achieved.

See also

Creating frames (Page 386)

General operation of the documentation editor (Page 389)

Inserting placeholders for metadata

You can provide placeholders on the cover page and in a frame. The placeholders are automatically filled with metadata from documentation information during printing, if they are placeholders for text. Alternatively, you can add non-modifiable data, such as free text or an image.

All elements are arranged in numbered Z-Orders. If objects overlap, you can determine in which sequence these are to be arranged.

Types of placeholders

The following types of placeholders are available to you:

- Text field
  The text field stands as a placeholder for a text element from a document information. In the properties of the text field, you set which text from a document information should be automatically inserted during printing.
- Field for date and time
  A date and time are inserted instead of the placeholder when printing. This can be the date of creation or the point in time when the last change was made to the project. In the properties of the Inspector window, you specify which date or time is printed.
- Page number
  The correct page number is automatically applied when printing.
- Free text
  You can enter freely selectable text in the properties of the text field. The text is static and is not influenced by the document information selected at the time of printing.
- Image
  Select the image file in the properties of the placeholder in the Inspector window. Images in the formats BMP, JPEG, PNG, EMF or GIF are possible.

Requirement

An cover page or frame is open in the documentation editor.

Procedure

To insert placeholders for metadata on the cover sheet or in a frame, follow these steps:

1. Drag a field from the "Toolbox > Elements" task card to the work area of the documentation editor.
   The placeholder is inserted. The placeholder properties are shown in the Inspector window and can be edited there.
2. Select the metadata to be inserted during printing from the "Text" drop-down list in the Inspector window under "Properties > General > Text box". Alternatively, you have the option of entering free text or selecting an image depending on the type of placeholder.
3. In the Inspector window under "Properties > General > Position and size", specify the position of the placeholder on the X and Y axis and enter the width and height of the text box in cm. You specify the sequence of the objects in the "Z-Order" field, if these overlap. The smaller the value, the further down an object is located.
4. In the Inspector window, go to "Properties > View" and select the font formatting and the orientation of the text as well as the alignment of the text. You cannot make this setting for images.

8.4.1.8 Displaying print preview

Creating a print preview

Creating a print preview

You can create a preview of the printout. Document information can be chosen for this, in the same way as for the actual printout. In this way, you preview the selected frame and, if applicable, the cover sheet. The settings are retained for later printing.

Procedure

To create a print preview and to set the scope of the later printout, follow these steps:

1. Select the "Print preview" command in the "Project" menu.
   The "Print preview" dialog opens.
2. Select the frame layout you want to use for the printout.
   - In the "Document information" drop-down list, select the documentation information you want to use later for the printout.
   - Select the "Print cover page" check box to print the cover page, which is specified in the selected document information.
   - Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.
3. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
   - Select "All" to print out the entire content of the editor.
   - Choose "Selection" to print only the objects currently selected in the editor.

4. Select the print scope under "Properties".
   - Select "All" to print all configuration data of the selected objects.
   - Select "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor that supports this function.
   - Select "Compact" to print out an abbreviated version of the project data.
5. Click "Preview" to generate the preview.
   A print preview is created in the work area.

Note

Wait time for extensive documents

It can take several minutes to generate the print preview in the case of very extensive projects. You can continue working normally in the meantime on systems with adequate resources. The progress of the print preview is shown in the status bar.

See also

Operation within the print preview (Page 396)

Operation within the print preview

Functions within the print preview

The print preview shows an exact image of the subsequent printout. You can use the buttons in the toolbar to modify the print preview display. The following functions are available (from left to right):

- Navigation mode
  Allows shifting of the partial page.
  To change the partial page with the navigation tool, select the arrow button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.
- Zoom function
  - "Zoom in" and "Zoom out"
    Magnifies or reduces the page display.
    To zoom in or zoom out the display incrementally, select the corresponding button. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.
    To zoom in on a particular area, enable the "Zoom with selection" icon and use the mouse to drag an outline around the area you want to focus on.
    To zoom dynamically through the page, select the button "Zoom in / zoom out dynamically". With pressed mouse button, scroll down over the page to zoom in. Scroll up to zoom out.
  - Percentage value in the drop-down list
    Specifies the display size of the page in percent.
    Enter a percentage value or select a percentage value from the drop-down list. Alternatively, choose the "Fit to page" option from the drop-down list to adapt the page size to the work area. Or, choose "Fit to width" to adapt the page width to the work area.
- "Forward" and "Backward"
  Each change in the partial page, the page count, or the display size is saved in a history in the background. You can use the "Forward" or "Backward" button to return to the previous view or the next view.
- Page navigation
  - "First page"
    Jumps to the first page
  - "Previous page"
    Goes to the previous page.
  - "Page number" input field
    Shows the current page. To jump directly to a page, enter the page number of the page you want to view.
  - "Next page"
    Goes to the next page.
  - "Last page"
    Jumps to the last page.

Creating a print preview (Page 394)

8.4.1.9 Printing project data

You have two options for printing out project data:

- Print immediately using default settings by means of the "Print" button in the toolbar.
  The button is only active if a printable object is selected.
- Printout with additional setting options with the "Project > Print" menu command.
  For example, you can choose a different printer or specific documentation information or you can specify whether a cover page and table of contents are to be printed. In addition, you can specify the print scope or display a print preview prior to printing.

Requirement

- At least one printer is configured.
- The objects to be printed are not protected.
  The print scope for protected objects is limited. Disable the know-how protection to print the objects in full.

Printing project data

To print out data from the current project or the entire project with additional setting options, follow these steps:

1. Select the entire project in the project tree in order to print out the entire project. To print only individual elements within a project, select them in the project tree.
2. Select the "Print" command in the "Project" menu.
   The "Print" dialog opens.
3. Select the printer in the "Name" box.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the frame layout you want to use for the printout.
   - Select the documentation information in the "Document information" drop-down list.
     The frame stored in the document information is used for the printout. All placeholders within the chosen frame are filled with the metadata from the selected document information.
   - Select the "Print cover page" check box to print the cover page, which is stored in the selected document information.
   - Select the "Print table of contents" check box to add a table of contents to the printout.

   The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.

6. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
   - Select "All" to print out the entire content of the editor.
   - Select "Selection" to print only the objects currently selected in the editor.
7. Select the print scope under "Properties".
   - Select "All" to print all configuration data of the selected objects.
   - Select "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor.
   - Select "Compact" to print out an abbreviated version of the project data.
8. Click "Preview" to generate a print preview in advance.
   A print preview is created in the work area.
9. Click "Print" to start the printout.

Note

Scope of the "Print" dialog

The options available in the "Print" dialog vary depending on the elements to be printed.

Result

The project data is prepared in the background for printing and then printed on the selected printer. The status bar shows the progress of the print operation. You can continue working normally while data is being prepared for printing.

The print results and any errors or warnings are listed in the Inspector window under "Info" at the conclusion of the print job.

Canceling a print job

To cancel an active print job, follow these steps:

1. Click the blue cross in the status bar next to the progress display for the printout.
   The printout is aborted.

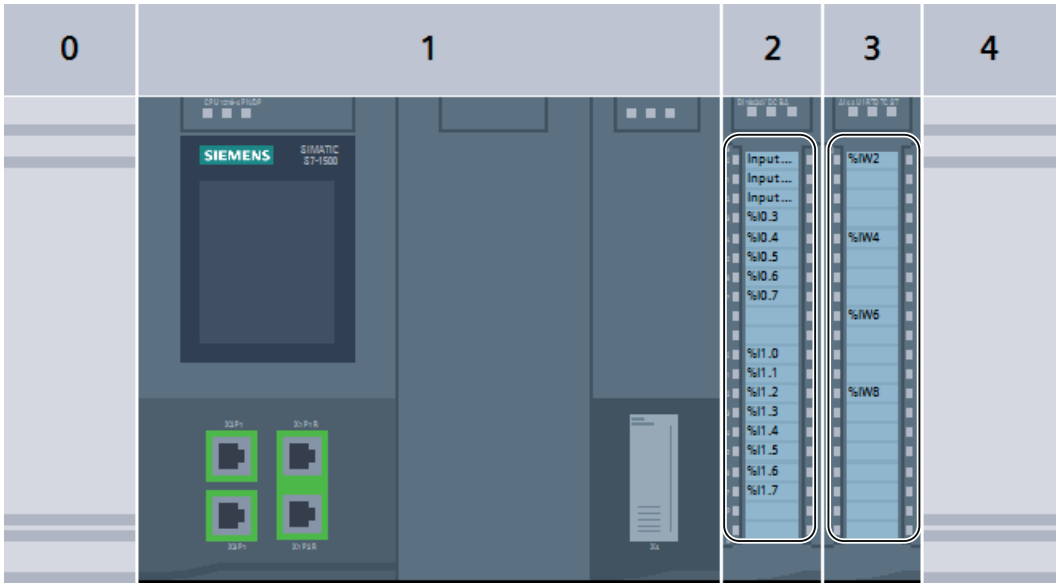
Designing cover pages and frames (Page 388)

8.4.2 Printing module labels

8.4.2.1 Print function for module labels



Printing of module labeling strips for hardware modules

You can print labeling strips for the modules in your project with the help of the TIA Portal. The labeling strips are custom-fit to each module and can contain the following printed information:

- Symbolic name of the input or output
- Absolute address of the input or output
- Symbolic name and additionally the absolute address of the input or output. The order of the information can be specified.

The modules are displayed graphically in the device view. If you set the zoom level in the device view to at least 200%, the labels for the individual modules will be visible. The printout on the labeling strip corresponds to the representation of the labeling in the device view.

The following figure shows an example of two modules in the device view on which the labeling of the inputs and outputs is visible:

Export and further editing as Microsoft Word file

The labeling strips are first exported as a Microsoft Word file (.docx) before they are printed. The file can be further edited with commonly available word processing programs such as Microsoft Word. The individual labeling strips are represented as a table in the .docx file.

The character spacing of the text within the table is adapted by default, so that texts are not truncated. If you want to prevent this from stretching or compressing the text too much, change the character spacing of the text in the table cell properties.

Printing the labeling data to an XML file

As an alternative to printing the labeling strips, you can output the addresses of the inputs and outputs of a module to an XML file. You can use the export to an XML file for devices for which no ready-made labeling strips are available. You can also use the export to an XML file to create labeling strips with another program. The program must be able to transform the data of the XML file into an input format that is suitable for the labeling system. The schema of the XML file is available in the section "XML schema of the export file (Page 403)".

Print media

You can print the labeling strips either on ready-made print sheets or on standard DIN A4 paper. You can separate the individual labeling strips from the ready-made print sheets and insert them in the designated labeling areas of your modules. If you print on standard paper, the individual labeling strips must be cut out. Cut marks are automatically included on the printout and serve as aids.

Because the paper feeds of printers differ slightly, the printout may be slightly offset on the paper. When the labeling strips are printed on ready-made sheets, printing that is accurate to the millimeter is important. Otherwise, the text will not be fit exactly inside the stamped area. In addition, if the printing is imprecise, the labeling of an input or output may no longer be congruent with the channel status displays of the module. To ensure precise printing, you can enter an offset value for your printer in the TIA Portal. For information on how to determine the proper offset value for your printer, refer to Chapter "Determining the print area offset (Page 406)".

See also

Exporting labeling data as XML (Page 402)

XML schema of the export file (Page 403)

Printing labels (Page 400)

Determining the print area offset (Page 406)

Documentation settings (Page 380)

8.4.2.2 Printing labels

You can print labeling strips for the modules in your project if provision has been made for attaching labels to the utilized modules. The labels are first exported to a Microsoft Word file (.docx). A separate .docx file is created for each module family (for example, for all selected S7-1500 modules). The labels are always printed from the word processing program.

Requirement

The following requirements apply to printing of labeling strips:

- The chosen modules must support the printing of labels. Otherwise, the data can only be output to an XML file.
- A word processing program that supports Microsoft Word DOCX files must be installed, e.g., Microsoft Word 2010 or later.
- You need the ready-made labels for your modules or commercially available DIN A4 paper.

Procedure

To print labeling strips for hardware modules, follow these steps:

1. In the project tree, select the modules for which you want to print labeling strips.
   - You can select one or more stations in order to print out labeling strips for all modules plugged into these stations.
   - Alternatively, select the desired modules below the stations in the "Local modules" folder.
2. Right-click one of the devices, and select the "Export labeling strips" command from the shortcut menu.
   The "Export labeling strips" dialog opens.
3. In the "Content of the labeling strip" area, select the data to be printed on the labeling strip:
   - Select "Symbolic name" in order to print the symbolic name of the input or output (corresponds to the contents of the "Name" column in the IO tag table).
   - Select "Absolute address" in order to print the absolute address of the input or output (corresponds to the contents of the "Address" column in the IO tag table).
   - Select "Absolute and symbolic address" or "Symbolic and absolute address" in order to print both addresses. Printing takes place according to the specified order.
4. In the "Export format" area, define how the labeling data will be output.
   - Select "Print on SIEMENS labeling sheet" if you are printing on a ready-made label sheet for your modules.
   - Select "Print on plain DIN A4 page" if you are printing on standard DIN A4 paper.
5. Select correction values for your printer in the "Offset print area", if required. The correction values are used for correct alignment of the print area. Correction values are only necessary if you are printing on ready-made labeling strips.
   - Enter a correction value, in millimeters, in the "Vertical offset" field. A negative value shifts the print area upward. A positive value shifts the print area downward.
   - Enter a correction value, in millimeters, in the "Horizontal offset" field. A negative value shifts the print area to the left. A positive value shifts the print area to the right.
6. In the "Path" field, select the path where the exported files will be stored.
7. Click the "Export" button to start the export.
   The export files are created.
8. Open the DOCX files with a conventional word processing program, such as Microsoft Word, and change the design of the labeling strips if necessary.

9. Print out the labeling strips from your word processing program. Use the paper that you specified in the Export dialog for this.
10. If you are using ready-made sheets, separate the labeling strips at the stamped lines provided for that purpose. When standard DIN A4 paper is used, you must cut out the labeling strips.

See also

Determining the print area offset (Page 406)

Exporting labeling data as XML (Page 402)

8.4.2.3 Exporting labeling data as XML

The TIA Portal supports a large number of different modules and can be continually expanded using Hardware Support Packages, for example. Ready-made labeling strips are not available for every supported module. However, you can still use the TIA Portal to label inputs and outputs of modules that are not supported. First, you export the absolute and symbolic addresses of the inputs and outputs to a standardized XML file. Then, you import the XML file to an external program for printing the labels. In this program, you prepare the data to suit your modules and print out the labels.

Procedure

To export labeling data for hardware modules as XML, follow these steps:

1. In the project tree or network view, select the modules for which you need labeling strips.
   - You can select one or more stations in order to export the input and output addresses of all modules plugged into these stations.
   - Alternatively, select the desired modules below the stations in the "Local modules" folder.
2. Right-click one of the devices and select the "Export module labeling strips" command from the shortcut menu.
   The "Export labeling strips" dialog opens.
3. In the "Export format" area, select the "Export to XML file" option.
4. In the "Path" field, select the path where the XML file will be stored.
5. Click the "Export" button to start the export to an XML file.
   The XML file is created with the name "<Project name>_IO_Channels.xml".

        <xs:complexType>
          <xs:sequence>
          <xs:element name="Module" maxOccurs="unbounded">
          <xs:complexType>
            <xs:sequence>
            <xs:element name="IOChannel" maxOccurs="unbounded">
            <xs:complexType>
              <xs:sequence>
                <xs:element name="Address" type="xs:string"></
xs:element>
               <xs:element name ="Tag" type="xs:string"></xs:element>
              </xs:sequence>
            <xs:attribute name="Number" type="xs:int"></xs:attribute>
            </xs:complexType>
            </xs:element>
            </xs:sequence>
            <xs:attribute name="Name"></xs:attribute>
          </xs:complexType>
          </xs:element>
          </xs:sequence>
          <xs:attribute name="Name" type="xs:string"></xs:attribute>
        </xs:complexType>
        </xs:element>
        </xs:sequence>
        <xs:attribute name="Name" type="xs:string"></xs:attribute>
      </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
  </xs:element>
</xs:schema>
```

Example of an XML file

The following example shows an XML file that contains the labeling data for an S7-1500 CPU with a digital input module and an analog input module:

```
<?xml version="1.0" encoding="UTF-8"?>
<Stations>
  <!-- The CPU is specified first -->
  <Station Name="S71500/ET200MP-Station_1">
    <Rack Name="Rack_0"> <!-- Name of the rack -->
      <Module Name="Sample S7-1500" /> <!-- Name of the CPU -->
     <Module Name="DI 16x24VDC BA_1"> <!-- Name of the digital input
module -->
       <!-- The individual channels of the digital input module are
specified -->
        <IOChannel Number="0">
          <Address>%I0.0</Address>
          <Tag>Input Value 1</Tag> <!-- Symbolic address of input 0
-->
        </IOChannel>
        <IOChannel Number="1">
          <Address>%I0.1</Address>
          <Tag>Input Value 2</Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%I0.2</Address>
          <Tag>Input Value 3</Tag>
        </IOChannel>
        <!-- All other channels follow -->
      </Module>
      <Module Name="AI 4xU/I/RTD/TC ST_1"> <!-- Name of the analog
input module -->
        <!-- The individual channels of the analog input module are
specified -->
        <IOChannel Number="0">
          <Address>%IW2</Address>
          <Tag> <!-- Symbolic addresses are not specified for the
analog input module. -->
          </Tag>
        </IOChannel>
        <IOChannel Number="1">
          <Address>%IW4</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="2">
          <Address>%IW6</Address>
          <Tag>
          </Tag>
        </IOChannel>
        <IOChannel Number="3">
          <Address>%IW8</Address>
          <Tag>
          </Tag>
```

```
      </IOChannel>
    </Module>
    <Module Name="Sample S7-1500" />
    <Module Name="DI 16x24VDC BA_1">
      <IOChannel Number="0">
        <Address>%I0.0</Address>
        <Tag>Input Value 1</Tag>
      </IOChannel>
      <IOChannel Number="1">
        <Address>%I0.1</Address>
        <Tag>Input Value 2</Tag>
      </IOChannel>
      <IOChannel Number="2">
        <Address>%I0.2</Address>
        <Tag>Input Value 3</Tag>
      </IOChannel>
      <!-- All other channels follow -->
    </Module>
    <Module Name="AI 4xU/I/RTD/TC ST_1">
      <IOChannel Number="0">
        <Address>%IW2</Address>
        <Tag>
        </Tag>
      </IOChannel>
      <IOChannel Number="1">
        <Address>%IW4</Address>
        <Tag>
        </Tag>
      </IOChannel>
      <IOChannel Number="2">
        <Address>%IW6</Address>
        <Tag>
        </Tag>
      </IOChannel>
      <IOChannel Number="3">
        <Address>%IW8</Address>
        <Tag>
        </Tag>
      </IOChannel>
    </Module>
  </Rack>
 </Station>
</Stations>
```

Exporting labeling data as XML (Page 402)

8.4.2.5 Determining the print area offset

If you are using a ready-made label sheet, the printing on it must be applied precisely so that the text is properly oriented on the prestamped labels and will have the proper fit relative to the channel status displays of the module. However, the paper feeds vary slightly from one printer to another. For this reason, you must enter a suitable correction value for your printer in the TIA Portal, if necessary. The print area is then shifted in the exported .docx file in such a way that the printing fits precisely on the ready-made label sheet.

The settings for shifting the print area are stored for the specific Windows user. If you log on to Windows using a different user name, you have to enter the correction values again.

The procedure for determining the correction value for your printer is described below.

Requirement

- You require a ready-made label sheet.
- You must have access to the actual printer that you will use subsequently for the printout. The printer must be made ready for printing on standard DIN A4 paper.

Procedure

To determine the correction value for your printer, follow these steps:

1. Print out a label sheet on standard DIN A4 paper, as described in Chapter "Printing labels (Page 400)".
2. Compare the printout on the DIN A4 paper with the ready-made label sheet.
3. If the print area is offset, you must use correction values.
   - Using a ruler, measure the horizontal offset relative to the ready-made label sheet. This will be entered later in the "Horizontal offset" field of the Export dialog box for the printing. If the print area is offset to the right, a negative correction value must be entered. If the print area is offset to the left , a positive correction value must be entered.
   - Using a ruler, measure the vertical offset relative to the ready-made label sheet. This will be entered later in the "Vertical offset" field of the Export dialog box for the printing. If the print area is offset downward, a negative correction value must be entered. If the print area is offset upward, a positive correction value must be entered.

8.5 Working with multi-language projects

8.5.1 Project text basics

Texts in different languages in the project

When you enter texts while working on a project, you would normally do this in your own language. If you then pass on the project to someone else who does not know this language, this person will require a translation of the relevant texts to a language they know. This is why all texts can be translated. In this way, you can ensure that anyone who is subsequently confronted with the texts sees the texts in his/her language of choice.

Project language

Project languages are all languages in which a project will later be used. Based on the editing language, all the texts can be translated to the various project languages. You specify the languages that will be available in the project tree under "Languages & Resources > Project languages".

Editing language

Every project has an editing language. When you enter texts, these are always created in the editing language. You should therefore make sure that the editing language set is the language in which you enter the texts. This avoids problems if you translate the texts later.

The editing language does not depend on the language of the user interface. You could, for example, set English as the user interface language, but use Italian as the editing language. If you enter texts, these will be created in the project language "Italian" in this case, although the user interface of the TIA Portal is displayed in English.

You set the editing language in the project tree under "Languages & Resources > Project languages > Editing language".

Reference language

The reference language is used as a template for translation. The text is displayed in the reference language for each text box in the "Tasks > Languages and resources" task card. You therefore know which text that belongs in a text box, even when no text is entered in the currently selected editing language.

User texts and system texts

For clarification purposes, a distinction is made between user texts and system texts:

- User texts are texts that the user created.
- System texts are texts that are created automatically according to the configuration in the project.

You manage the project texts in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can, for example, manage the following project texts in more than one language:

- Block titles and block comments
- Network titles and network comments
- Comments in tables
- Alarm texts
- Operator-relevant texts
- Text lists
- Labels of buttons
- Display names of recipes

Translating texts

The following procedures are available to translate texts.

- Translate all texts used in the project in tabular form
  You can enter the translations for the individual project languages directly in the "Project texts" table. You can find the table in the project tree under "Languages & Resources > Project texts".
- Specify text assigned to individual objects in the Inspector window
  In the Inspector window, you can translate the texts that are assigned to the currently selected objects. Columns are displayed in a table for all available project languages. You can enter the translations for each text in the columns.
- Translating texts using reference texts
  You can change the editing language for shorter texts. All the text cells are filled again with the default values and can be filled in the current language. As orientation, you can display what you last entered in the box in the reference language. To do this, select the "Tasks" task card and open the "Languages & resources".
- Exporting texts and translating them externally
  With larger volumes of text, you can export the texts to an Office Open XML file and translate them in a conventional table calculation program. You then import the translated list again into the TIA Portal.

Note

Using East Asian project languages

You need Microsoft Windows at least in the Professional version or higher to display East Asian project languages. Microsoft Windows in the Professional version must be installed in the local language. With the "Ultimate" or "Enterprise" versions, it is sufficient to install the appropriate language pack.

Overview of the program settings (Page 230)

Changing the settings (Page 236)

Application examples for multilanguage projects (Page 415)

8.5.2 Categories of user texts

Overview of text categories

Below you will find an overview of the categories of user texts that you can select for export.

Text categories	Usage
Formatted alarm text	
HMI scree	Text that appears in an HMI screen
HMI comments	Text that appears in a comment in Runtime
HMI Runtime	
Category for text lists	
Multilingual text category	
Alarm class text	
Alarm text	Text that appears in a message display
SiVArc configuration	
Other text categories	

8.5.3 Select project languages

All the texts can be displayed within a project in the same language that you selected for your software user interface. This means that all project texts must exist in the corresponding language. You can select the available project languages yourself.

Procedure

To select the project languages, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree.
   The elements below this are displayed.
2. Double-click on "Project languages".
   In the work area, you will see a list of languages that you can select.
3. Select the required languages.

Result

All texts can be displayed in the activated languages if there is already a translation for these languages.

8.5.4 Setting the editing language

All the texts in the project are created in the editing language when they are entered. If you change the editing language, all future text input will be stored in the new editing language.

Procedure

To change the editing language, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The lower-level elements are displayed.
2. Double-click on "Project languages". The possible settings for the project languages are displayed in the work area.
3. Select the editing language in "General > Editing language".

8.5.5 Translating all project texts in tabular form

You can display and edit all project text used in the currently open project in a list. User and system texts are separated into two different lists for clarity. Both lists contain a column for each project language. Enter the translations of the texts in the respective columns.

Requirement

You have selected at least one further project language.

Procedure

To translate text in the project-wide list, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The elements below this are displayed.
2. Double-click "Project texts". A list with the user texts in the project is displayed in the work area.
3. Click on "System texts" if you you want to edit the list of system texts rather than the user texts.
4. You can improve the clarity of the lists if you have a lot of texts.
   - To group identical texts and to translate them all at once, click the "Switch on/off grouping" button in the toolbar.
   - To hide texts that do not have a translation, click the "Filter for empty texts on/off" button in the toolbar.
   - To further limit the displayed project texts to certain devices, select the devices for which you want to display project texts in the drop-down list.
5. Enter the translation of the project texts in the relevant column.

8.5.6 Translating project texts

If you want to edit the text of individual objects, it would be too difficult to locate the matching text in the table with all project texts. For this reason, there is a table in the Inspector window in which only the texts assigned to the currently selected objects are displayed. In the table, you can add missing translations for individual project languages or change existing texts.

Requirement

Enter a text in at least one project language for the texts to be translated.

Procedure

To edit the text of the currently selected object, follow these steps:

1. Select the object whose text you want to edit.
2. Open the "Properties" tab in the Inspector window.
3. Open the lower-level "Texts" tab in the inspector window.
   A table with all the texts that belong to the selected objects is displayed. The table contains one column for the currently selected editing language and the reference language, as well as additional columns for the other project languages.
4. Add or change the entries in the table for each project language.

See also

Application examples for multilanguage projects (Page 415)

8.5.7 Translating project texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for the newly set language, the input boxes are empty or filled with default values.

If you enter text in an input box, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Note

The display of reference texts depends on the installed products and is not supported by every editor.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. In the "Tasks" task card, select the "Languages & Resources" pane.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text box, translations that already exist in other project languages are shown in the "Tasks > Languages & Resources" task card.

8.5.8 Exporting project texts

You can export project texts for translation and then reimport them. The texts are exported to an Office Open XML file with the extension ".xlsx". This can be edited in Microsoft Excel or a number of other spreadsheet programs.

The following export options are available:

- Exporting individual project texts
  You can select individual texts in the project texts editor and then export the selected texts.
- Exporting project texts of a device
  When you have selected a device, the "Properties > Texts" tab of the Inspector window includes all texts that are part of the respective device. Here you can export all texts that are part of the respective device.
- Exporting all user texts or system texts at once
  You can either export all texts in the project or further limit the export by categories.

Note

Row limit in Microsoft Excel

Note that spreadsheet programs may be able to process only a certain number of rows. Microsoft Excel 2003 supports a maximum of 65536 rows, for example. Later versions of Microsoft Excel support significantly more rows.

Exporting individual project texts

To export individual project texts, follow these steps:

1. Open the "Languages & Resources" folder in the project tree.
   The lower-level elements are displayed.
2. Double-click "Project texts".
   The project texts editor opens.
3. Choose the "User texts" or "System texts" tab in the editor, depending on which texts you want to export.
4. Select the project texts you want to export.
5. Click "Export project texts" on the editor toolbar.
   The "Export" dialog box opens.
6. In the "Source language" drop-down list, select the reference language from which you want to translate.
7. In the "Target language" drop-down list, select the editing language into which you want to translate the texts. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
8. Specify a file path and a file name for the export file in the "Select file for export" input box.
9. Click "Export".

Exporting project texts of a device

1. To export all project texts that are part of a specific device, follow these steps:
2. Select the device and open the device properties in the Inspector window.
3. Open the "Texts" tab in the Inspector window.
4. On the toolbar, click the "Export project texts" icon.
   The "Export" dialog box opens.
5. In the "Source language" drop-down list, select the reference language from which you want to translate.
6. In the "Target language" drop-down list, select the editing language into which you want to translate the texts. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.

7. Specify a file path and a file name for the export file in the "Select file for export" input box.
8. Click "Export".

Exporting all system or user texts

To export all project texts, follow these steps:

1. Select the "Export project texts" command in the "Tools" menu.
   The "Export" dialog box opens.
2. In the "Source language" drop-down list, select the reference language from which you want to translate.
3. In the "Target language" drop-down list, select the editing language into which you want to translate the texts. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
4. In "Select content", select the check box "User texts" to export user texts. To export system texts, select "System texts". To export both user texts and system texts, select both check boxes.
5. In "Select content", select the required text categories for the user texts or the system texts.
6. In the "Export file" input field, specify a file name for the export file.
7. In the "Path" input field, select a path in the data system to which the export file is to be saved.
8. Click "Export".

Application examples for multilanguage projects (Page 415)

Importing project texts (Page 414)

8.5.9 Importing project texts

After external compilation in a table calculation program, you import the project texts into the TIA Portal. You can import the project texts at the following locations:

- The "Tools" menu
- In the toolbar of the project texts editor
- In the properties of a device
  When you have selected a device, the "Properties > Texts" tab of the Inspector window includes all texts that are part of the respective device. You can also import the texts of the device at this location.

Importing project texts

To import a file containing project texts, follow these steps:

1. Select the "Import project texts" command in the "Tools" menu.
   Alternatives:
   - Click the "Import project texts" icon in the toolbar of the project texts editor.
   - Select a device and open its properties in the Inspector window. Open the "Texts" tab and click the "Import project texts" icon in the toolbar.
2. The "Import" dialog box opens.
3. Select the path and the file name of the import file from the "Select file for import" field.
4. Select the "Import source language" check box if you have made changes to the source language in the export file and you want to overwrite the entries in the project with the changes.
5. Click "Import".

Exporting project texts (Page 412)

8.5.10 Application examples for multilanguage projects

Let us assume you are working in a team with colleagues some of whom speak English, some French and some German. You have created a project with the TIA Portal and have already created a functioning configuration.

To allow your other colleagues to be able to keep track of the project, you would like all devices being used to have comments in English and German. First, you would like to enter the comments in German. Following this, to save time and costs, you want to have the texts translated into English in a spreadsheet program by an external translation office.

In addition to this, you also want a single comment for a particular device in French so that your French-speaking colleague can continue working on this device.

The section below describes an example of how you can achieve this with the tools of the TIA Portal.

Translating the project into English

To enter the comments in German and to have them translated into English later, follow these steps:

1. Set the editing language to "German" and fill all the comment boxes with the relevant texts in German.
   On the device selected from the French-speaking colleague, enter, for example "Unser neues Gerät" in German first.
   All the comments are now stored in German.
2. Export all user texts to an Office Open XML file with the extension ".xlsx".

3. Have the user texts contained in the file translated into English in a spreadsheet program such as Microsoft Excel.
4. Import the file into the TIA Portal after it has been translated.
   All texts are now available in German and English.

Translating a single comment field to French

To translate an individual comment field to French, follow these steps:

1. Open the comment box for the device on which the French-speaking colleague will be working.
2. Open the "Languages & resources" pane in the "Tasks" task card.
3. Set "French" as the editing language in the "Languages & Resources" pane. As the reference language, set, for example, "English".
   Since no translation has yet been installed in French, the comment box is empty. In the "Languages & Resources" pane, the English translation "Our new device" is displayed as a reference.
4. Orientating yourself on the English reference text enter "Notre nouvel appareil" in the comment box.
   The comment for this device is now available in the languages German, English and French.

Project text basics (Page 407)

Exporting project texts (Page 412)

Translating project texts (Page 411)

8.6 Working with text lists

8.6.1 Text lists

Introduction

You can centrally manage texts to be referenced in alarms. All the texts are stored in text lists. Each text list has a unique name with which you can call up its content. A range of values is assigned to each text in a text list. If a value from a range of values occurs, the corresponding text is called up.

All the texts can be translated to all project languages. Here, you have two options available:

- You can enter the translation of the texts in a list. You will find the list in the project tree under "Languages & Resources > Project texts".
- You can export all texts to a file in Office Open XML format and enter the translation in a spreadsheet program. The translations can then be imported again. Only export the data to areas that are protected with appropriate access mechanisms. Only import files that originate from trusted sources.

The texts are translated into the other project languages within the framework of the project texts. In the text lists editor, you only have to manage the assignment of individual texts to a text list.

Each device in a project can have its own text lists. Device-specific text lists relate to only one device in the project and are therefore only valid for this device. For this reason, they are arranged under a device in the project tree. Device-specific text lists can be user-defined or created by the system.

Text lists editor

The text lists editor is divided into a bottom and top area. The top area displays the individual text lists. As soon as you select a text list, the included texts and the associated value ranges are displayed in the lower area. You can sort the table columns in the text lists editor in ascending and descending order by clicking the table header of the respective column.

User-defined and system-defined text lists

There are two types of text lists:

- User-defined text lists
  You can create user-defined text lists yourself and fill them with texts; in other words, you can specify value ranges and the corresponding texts yourself. With user-defined text lists, the name of the text list begins with "USER" as default. You can change this name to any suitable name.
- System-defined text lists
  System-defined text lists are created by the system. These always involve texts relating to devices. They are automatically created as soon as you insert a device in the project. With system alarms, the name of the text list begins with "SYSTEM". The name of the text list and the ranges of values it contains cannot be modified. You can only edit texts assigned to individual value ranges.

User-defined text lists	System-defined text lists
You can create new text lists and delete existing text lists.	You cannot create new text lists or delete text lists.
You can add and delete value ranges in the text lists.	You cannot add or delete value ranges in the text lists.
You can specify both the value ranges as well as the associated texts.	You can only edit the text associated with one value range.

See also

Exporting project texts (Page 412)

8.6.2 Creating user-defined text lists

You can create user-defined text lists for individual devices.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To create user-defined text lists, follow these steps:

1. Click on the arrow to the left of a device in the project tree.
   The elements arranged below the device are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device are displayed in the work area listed in a table.

3. Double-click on the first free row in the table.
   A new user-defined text list is created.
4. Enter a name for your new text list in the "Name" column.
5. Select if you want to specify the value ranges in decimal, binary or in bits from the drop-down list in the "Selection" column. Depending on the device, there may be further options available at this point.
6. Enter a comment in the "Comment" column.
   A new user-defined text list is created and you can now enter the value ranges and texts.

8.6.3 Editing user-defined text lists

You can enter value ranges and the corresponding texts in user-defined text lists. User-defined text lists are always located below a device in the project tree.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To add to user-defined text lists with value ranges and texts, follow these steps:

1. Click on the arrow to the left of a device in the project tree.
   The elements arranged below are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Select a text list in the table.
   The contents of the selected text list are displayed in the work area. There, you can enter a value range and assign texts to the individual value ranges.
4. Enter the value ranges you require in the "Range from" and " Range to" columns. The entry must be made in the numeric format selected for the text list.
5. Enter a text for each value range in the "Entry" column.

8.6.4 Editing system-defined text lists

In system-defined text lists, you can modify the individual texts assigned to a value range.

System-defined text lists are always located below a device in the project tree.

Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

Procedure

To edit texts in system-defined text lists that are assigned to a value range, follow these steps:

1. Click on the arrow to the left of a device in the project tree.
   The elements arranged below are displayed.
2. Double-click on "Text lists".
   All the text lists assigned to the device are displayed in the work area listed in a table.
3. Select a text list in the table.
   The contents of the selected text list are displayed in the work area. Here, you can add to or edit the texts assigned to a value range.
4. Enter a text for each value range in the "Entry" column.

8.7 Using memory cards

8.7.1 Basics about memory cards

Introduction

Memory cards are plug-in cards that come in a variety of types and can be used for a variety of purposes. Depending on the device type or device family, memory cards can be used for purposes, such as:

- Load memory of a CPU
- Storage medium for projects, firmware backups, or any other files
- Storage medium for performing a firmware update
- Storage medium for the PROFINET device name

For information regarding the technical variants of the respective memory cards and general information on their handling, refer to the respective documentation for the device. For information on handling memory cards in the TIA Portal, refer to the online help under the keyword "Memory Card".

NOTICE
Memory card is unusable for SIMATIC devices If you use a SIMATIC memory card for non-SIMATIC purposes or you format it incorrectly, you will overwrite the internal structure of the SIMATIC memory card. The structure is not recoverable and the SIMATIC memory card becomes unusable for SIMATIC devices. Do not use memory cards for non-SIMATIC-related purposes, and do not format SIMATIC memory cards with third-party devices or Windows tools.

8.7.2 Adding a user-defined card reader

Introduction

If your card reader is not detected automatically, you can add it manually.

Requirement

The project view is open.

Procedure

To add a card reader, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Add user-defined Card Reader" command in the "Project" menu.
   The "Add user-defined Card Reader" dialog opens.
3. In the drop-down list box, select the path for the card reader.
4. Confirm your entries with "OK".

See also

Basics about memory cards (Page 421)

Accessing memory cards (Page 422)

Displaying properties of memory cards (Page 423)

8.7.3 Accessing memory cards

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Note

You cannot work with multiple memory cards at one time. Only insert one memory card into the card reader.

Procedure

To access memory cards, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Card Reader / Show USB memory" command in the "Project" menu.
   The "Card reader / USB memory" folder is displayed in the project tree.
3. Open the "Card Reader / USB memory" folder.
   You can now access the memory card.

Note

If data from a non-installed product is stored on the memory card, the folders that contain these data are shown in gray. You receive an error message when you attempt to access such a folder. Install the corresponding product if needed.

See also

Basics about memory cards (Page 421)

Adding a user-defined card reader (Page 421)

Displaying properties of memory cards (Page 423)

8.7.4 Displaying properties of memory cards

You can display the properties for the utilized memory cards. Note that different memory cards with different properties must be used, depending on the device.

Requirement

- A memory card is inserted in the card reader.
- The project view is open.

Procedure

To display the properties of a memory card, follow these steps:

1. Right-click on the memory card for which you want to display the properties.
2. Select the "Properties" command in the shortcut menu.
   The "Memory Card <name of the memory card>" dialog opens. The properties are displayed in this dialog.

Adding a user-defined card reader (Page 421)
Accessing memory cards (Page 422)

8.8 Using cross-references

8.8.1 Using cross-references

Introduction to cross-references

The cross-reference list provides an overview of the use of objects within the project. You can see which objects are interdependent and where the individual objects are located. Cross-references are therefore part of the project documentation.

You can also jump directly to the point of use of an object.

Which objects you can display and localize in the cross-reference list depends on the installed products.

See also

Displaying cross references of an instance (Page 456)

8.9 Providing user-defined documentation

8.9.1 Using user-defined documentation

User-defined documentation for project or library contents

Over time, you create your own contents in a project or a library. Your own contents include, for example, blocks, tags or library types. While the functionality of the TIA Portal is described in the supplied help system, there is no help for the contents you have created yourself. You can create your own user-defined documentation to explain to other employees how your project works or how to use individual library types.

You can provide user-defined documentation in the available user interface languages. The default user interface languages in the TIA Portal are English, German, French, Spanish, Italian, and Chinese. You need to observe a few conventions when you create user-defined documentation so that the help matching an object can be opened.

You create the user-defined documentation either in one of the supported Office formats or as compiled HTML help in CHM format.

Possible areas for user-defined documentation

You can offer user-defined documentation in the following areas of the TIA Portal, for example:

- Project tree
- "Libraries" task card and library view
- Some editors, depending on the products installed, for example:
  - Program editor
    The programming languages LAD, FBD, STL, SCL and GRAPH are supported. Block calls also support the connection of user-defined documentation.
  - "Screens" editor
    Uses of screens and instances of HMI faceplates are supported in the "Screens" editor.

Directories for user-defined documentation

Save the user-defined documentation in one of the following directories:

- Project folder
  If you create user-defined documentation for objects within a project, save this help in the project folder. The user-defined documentation is also included when you pass on the project.
- Directory of a global library
  If you create user-defined documentation for objects within a global library, save the user-defined documentation in the directory of the global library. The user-defined documentation is also included when you pass on the global library.
- Central directory on the hard drive or a network drive
  You can store the user-defined documentation in a central directory on the hard disk or on a network drive. In this way, you have access to the user-defined documentation in each project or you use the documentation on a network drive together in the team. You specify the central file directory for the user-defined documentation using an XML file or in the settings of the TIA Portal.

Homepage for the user-defined documentation

You can create a separate homepage for each language version of the user-defined documentation. The homepage for the user-defined documentation can contain general help for a project or for a library. The homepage must be saved in the central storage directory for user-defined documentation.

Calling the user-defined documentation

If user-defined documentation is available for an object, you call it with the keyboard shortcut <Shift+F1>. The user-defined documentation is always opened with the standard program specified for the respective file format in Microsoft Windows.

Once you have pressed <Shift+F1>, certain directories are searched in a fixed order for user-defined documentation. The search order is given below:

1. Search in the central directory for user-defined documentation
   1.1 Search for a CHM file
   1.2 Search for documentation in other file formats
2. Search in the project or library directory
   2.1 Search for a CHM file
   2.2 Search for documentation in other file formats

The search is initially performed in the language directory for the currently set user interface language of the TIA Portal. If no help is contained in this language directory, the search for user-defined documentation is performed in the same order in the English language directory.

As soon as user-defined documentation is found in one location, the user-defined documentation is opened and the search is canceled. If no user-defined documentation is found in any of the directories, a search for a homepage for user-defined documentation is performed in the order presented above. The search for a homepage is again initially performed

in the language directory for the currently set user interface language. If no homepage is found there, the English language directory is searched.

Call log

You can display a call log for the user-defined documentation for easier connection of the user-defined documentation. The alarms within the log indicate the directories in which documentation is searched for and whether the call of the user-defined documentation is successful. In addition, the file name that is expected for the file is indicated. This allows you to identify how you must name your documentation and the directories in which you must save the user-defined documentation. The call log has the same sequence as the one used to search for user-defined documentation or a homepage.

The log is displayed in the Inspector window in the "Info" tab. Before you can display the call log, you must first enable the call log in the settings of the TIA Portal or using an XML file.

See also

Conventions for the creation (Page 432)

Specifying settings with an XML file (Page 429)

Creating a homepage (Page 431)

Creating user-defined documentation (Page 436)

Calling user-defined documentation (Page 435)

General remarks on the information system (Page 283)

8.9.2 Specifying settings in the TIA Portal

You specify the following settings for user-defined documentation in the settings of the TIA Portal:

- Displaying the call log in the Inspector window
  A log of the call of user-defined documentation is displayed on the 'Info > General' tab of the Inspector window. The log helps you to adhere to the conventions for calling user-defined documentation.
- Search for user-defined documentation in a central file directory
  You can save user-defined documentation in a directory outside the current project directory in order, for example, to make documentation available across projects.
- Central directory for user-defined documentation
  You store cross-project documentation in the central file directory for user-defined documentation.

Note

XML configuration file takes precedence over the settings of the TIA Portal

If you use an XML configuration file and have specified settings for user-defined documentation there, the settings in the XML file take precedence. As soon as you refresh the XML configuration file or restart the TIA Portal, the settings from the XML file are applied. The settings that you have made in the TIA Portal lose their validity.

Procedure

To specify a central storage location for user help, follow these steps:

1. Select the "Settings" command in the "Options" menu.
2. Open the "General > General" area.
3. Navigate to the "User documentation" section.
4. Select the "Display call log for user-defined documentation" check box in order to display a log of the call of the user-defined documentation in the Inspector window.
5. Select the "Search for user-defined documentation in a central directory" check box in order to store user-defined documentation in a cross-project directory.
6. Specify the path to where you save the cross-project documentation in the "Central directory for user-defined documentation" field.

See also

Specifying settings with an XML file (Page 429)

8.9.3 Specifying settings with an XML file

As an alternative to settings in the TIA Portal, you can make settings for the user-defined documentation in an XML file. The XML file is the same file you use for integrating corporate libraries.

If you use an XML configuration file and have specified settings for user-defined documentation there, the settings in the XML file take precedence. As soon as you refresh the XML configuration file or restart the TIA Portal, the settings from the XML file are applied. The settings that you have made in the TIA Portal lose their validity.

You can set the following options in the XML configuration file:

- Displaying the call log in the Inspector window
  A log of the call of user-defined documentation is displayed on the 'Info > General' tab of the Inspector window. The log helps you to adhere to the conventions for calling user-defined documentation.
- Search for user-defined documentation in a central file directory
  You can save user-defined documentation in a directory outside the current project directory in order, for example, to make documentation available across projects.
- Central directory for user-defined documentation
  You store cross-project documentation in the central file directory for user-defined documentation.

Procedure

To specify settings for the user-defined documentation, follow these steps:

1. Create an XML file named "CorporateSettings.xml", if you are not yet using an XML configuration file for the integration of company libraries. If you are already using a configuration file, proceed with step 3.
   The configuration file must be saved with "UTF-8" coding.
2. Save the file in the following directory on your computer:
   C:\ProgramData\Siemens\Automation\Portal V14\CorporateSettings\
3. Enter the content listed below into the XML configuration file.
4. Adapt the attributes for display of the user-defined documentation. The meaning of the individual elements is available in the comments in the XML configuration file. Use the value "true" to activate a function. Use the value "false" to deactivate a function.

Content of the XML configuration file

The XML configuration file must have the following content:

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
 <Settings.Settings ID="0">
  <ObjectList>
   <Settings.General ID="1" AggregationName="General">
    <!-- Here you find the settings for global company libraries, if available. -->
    <ObjectList>
     <Settings.UserDocumentation ID="2" AggregationeName="UserDocumentation">
      <!-- In the following section, you specify the values for display of the user-defined
documentation. -->
      <AttributeList>
       <!-- Activates or deactivates the display of the access log. -->
       <DisplayLogInformation>
        <Value>true</Value>
       </DisplayLogInformation>
      <!-- Activates or deactivates the search for user-defined documentation in a central
directory. -->
       <EnableLookupFromCentralStorageLocation>
        <Value>true</Value>
       </EnableLookupFromCentralStorageLocation>
       <!-- Specifies the central directory for user-defined documentation. -->
       <CentralStorageLocation>
        <Value>D:\CorporateDocumentation\UserDocumentation\</Value>
       </CentralStorageLocation>
      </AttributeList>
     </Settings.UserDocumentation>
    </ObjectList>
   </Settings.General>
  </ObjectList>
 </Settings.Settings>
</Document>
```

Specifying settings in the TIA Portal (Page 428)

Calling user-defined documentation (Page 435)

Creating a homepage (Page 431)

Creating a configuration file for corporate libraries (Page 470)

8.9.4 Creating a homepage

You can design a homepage for user-defined documentation. The homepage can be an HTML page that you save either within a CHM file or in the directory of the relevant language. You

can also use other file formats approved for user-defined documentation. You design the homepage of the user-defined documentation outside the TIA Portal.

Procedure

To create a homepage, follow these steps:

1. Design a file in HTML format or in any other file format approved for user-defined help.
2. Name the file "Home".
3. Copy the file to the central directory for user-defined documentation on the hard disk or on a network drive:
   <Central directory for user-defined documentation>\<Folder for the respective language>
4. If the respective language folder does not exist yet, create the folder now.
   Alternative: If you are creating the homepage for a CHM file, place the homepage in the main directory of the CHM file.

Sample configuration for the homepage

Below you see the correct path for the following conditions:

- The user-defined documentation is in Spanish.
- The homepage is an HTML file.

The path for these conditions is as follows:

<Central directory for user-defined documentation>\es-ES\Home.html

See also

Specifying settings with an XML file (Page 429)

Using user-defined documentation (Page 426)

Conventions for the creation (Page 432)

Calling user-defined documentation (Page 435)

Displaying the call log (Page 436)

Creating user-defined documentation (Page 436)

8.9.5 Conventions for the creation

You must observe some conventions to ensure that user-defined documentation is called at the correct location:

- the user-defined documentation must be saved in the correct directory.
- The file name must be exactly the same as the object name in the TIA Portal.

To prevent malicious code from being executed on your computer, only file formats that are considered as relatively safe are permitted.

Supported file formats

Create the user-defined documentation in one of the following file formats:

- Microsoft Word (.docx)
- Microsoft Excel (.xlsx)
- Microsoft PowerPoint (.pptx and .ppsx)
- HTML pages (.htm or .html)
- Microsoft XPS (.xps)
- Rich Text Format (.rtf)
- Text documents (.txt)
- Compiled HTML help (.chm)
- PDF documents (.pdf)

You save the homepage of the user-defined documentation in HTML format or save the homepage within a CHM file.

NOTICE
Infection of the computer with malicious code If the user-defined documentation contains malicious code, it can infect your computer. Especially HTML pages and CHM files can contain malicious code. Make sure that the user-defined documentation comes from a trustworthy source. You should also use the standard security measures, such as the use of a firewall and an up-to-date virus scanner.

Directories for user-defined documentation

Save the user-defined documentation in one of the following directories:

- Project folder:
  UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>
- Directory of a global library:
  UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>
- Central directory on the hard drive or a network drive:
  <Central directory for user-defined documentation>\<Folder for the respective language>
  \<Object category>\

The user-defined documentation must be located in the suitable subfolder for the respective language. The table below shows the respective language folders for the user languages installed as default:

Language	Subfolder
German	\de-DE
English	\en-US
Spanish	\es-ES

Language	Subfolder
French	\fr-FR
Italian	\it-IT
Chinese	\zh-CN

The language folder must contain a separate subfolder for each object category. Create the corresponding subfolders for objects for which you are providing user-defined documentation. Always use the English designation of the object category. The table below shows the English designations of the most important object categories in the TIA Portal:

Object category	English designation
HMI screens	Screens
Organization blocks (OB)	Organization Blocks
Function blocks (FBs)	Function Blocks
Functions (FCs)	Functions
Data blocks	Data Blocks
Types in the library	Library Types
Master copies in the library	Master Copies
The project node in the project tree	Projects
All types of folders in the project tree, in the project library or in global libraries	Folders
All types of links in the project tree, for example, "Add new block", "Add new device", etc.	ShortCut
Libraries in the "Libraries" task card or in the library view	Libraries

If you are not sure of the English designation for an object category, change the user interface language of the TIA Portal to English. Alternatively, open the user-defined documentation for an object with <Shift+F1> and check in the call log which designation is expected for the object category.

Permitted file names

The file name must be exactly the same as the object name in the TIA Portal.

There are, however, restrictions for file names under Microsoft Windows. The same restrictions apply to the file system used to format the hard drive. The file name may only include certain characters and must not exceed a specific length. The restrictions for file names differ depending on the Windows version and the file system used for the hard drive.

To ensure that the help call works, read up on possible restrictions in the Microsoft Windows documentation.

Special features of CHM files

You store CHM files directly in the respective language folder. The folder for the respective object category must be included in the actual CHM file. Within the compiled CHM file, the names of the individual HTML files must also be exactly the same as the object names in the TIA Portal.

Note

Opening CHM files on network drives

If CHM files are saved on a network drive, the CHM files are not displayed correctly in more recent versions of Microsoft Windows. This behavior is determined by the security guidelines of the operating system. All versions of Microsoft Windows as of Windows Server 2003 SP1 are affected.

You can bypass the security guidelines by changing the registry database in Microsoft Windows.

To not compromise the security of your computer, save the CHM files only locally on your computer and do not change the registry database.

See also

Using user-defined documentation (Page 426)

Creating a homepage (Page 431)

8.9.6 Calling user-defined documentation

The user-defined documentation is opened in the language that is currently set as the user interface language. If there is no user-defined documentation available in the currently set user interface language, the English version of the user-defined documentation opens. If no user-defined documentation exists, a homepage is searched for.

Requirement

You have already saved user-defined documentation or a homepage according to the conventions.

Procedure

To open the user-defined documentation, follow these steps:

1. Select the object for which you want to display the user-defined documentation.
2. Press <Shift+F1>.
   The suitable user-defined documentation or the homepage opens.

See also

Using user-defined documentation (Page 426)

Opening the information system (Page 288)

Creating a homepage (Page 431)

Specifying settings with an XML file (Page 429)

Displaying the call log (Page 436)

8.9.7 Displaying the call log

Use the call log to check whether the user-defined documentation is connected correctly. The call log shows the directories in which the search is performed for user-defined documentation or a homepage. The call log also displays the names that the individual files must have in order to call the user-defined documentation.

Requirement

The call log is enabled in the settings of the TIA Portal or using an XML configuration file.

Procedure

To display the call log, follow these steps:

1. Open the "Info" tab in the Inspector window.
2. Open the "General" tab.
3. Select the object for which you want to call the help.
4. Press <Shift+F1>.
   If possible, the matching user-defined documentation or the homepage of the user-defined documentation is opened. In any case, you will be informed in the Inspector window about which user-defined documentation is opened. You may be shown the directories in which no user-defined documentation was found.

See also

Calling user-defined documentation (Page 435)

Creating a homepage (Page 431)

8.9.8 Creating user-defined documentation

You create user-defined documentation for individual elements within a project or global library outside the TIA Portal. You can create the user-defined documentation in all available user interface languages.

If you create the user-defined documentation as CHM file, the procedure for creating the help is somewhat different to the creation process for other file formats.

Note the information provided in chapter "Conventions for the creation (Page 432)".

Creating user-defined documentation as single file

To create user-defined documentation as a single file, follow these steps:

1. Create a file in a valid file format.
2. Name the file identically to the object for which you want to call the user-defined documentation.
   If you are offering help for a library type, for example, name the help file identical to the type.
3. Depending on whether you are creating the user-defined documentation for project contents or for contents of a global library, copy the file to one of the following storage locations:
   - project folder under "UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>"
   - Directory of a global library under "UserFiles\UserDocumentation\<Folder for the respective language>\<Object category>"
   - Central directory on the hard drive or a network drive:
     <Central directory for user-defined documentation>\<Folder for the respective language>\<Object category>\

   If the respective language folder or the folder for the object category does not exist yet, create the required folders before copying the file.

Sample configuration for user-defined documentation

Below you see the correct path for the following conditions:

- The user-defined documentation is intended for a type in a global library.
- The user-defined documentation is in French.
- The type is called "commande de moteur".
- The user-defined documentation is supplied with the global library.
- The user-defined documentation is created in Microsoft PowerPoint format.

The path for these conditions is as follows:

<Folder of the global library>\UserFiles\UserDocumentation\fr-FR\Library Types\commande de moteur.pptx

Creating user-defined documentation as CHM file

To provide user-defined documentation in CHM format, follow these steps:

1. Create a folder in Windows Explorer for each object category for which you want to create user-defined documentation. Use the English designation for the object category.
2. Create an HTML file for each object for which you want to provide user-defined documentation. Name the HTML file identically to the object for which you want to call the user-defined documentation. If you want to provide user-defined documentation for a library type, for example, name the HTML file identically to the type.
3. Store the HTML files in the corresponding folders of the respective object category.
4. Use the Microsoft HTML Help Workshop to create the CHM file. Use the prepared folder structure with the HTML files.
5. Copy the CHM file to one of the following storage locations:
   - Project folder under "UserFiles\UserDocumentation\<Folder for the respective language>"
   - Directory of a global library under "UserFiles\UserDocumentation\<Folder for the respective language>"
   - Central directory on the hard drive or a network drive:
     <Central directory for user-defined documentation>\<Folder for the respective language>

   If the respective language folder does not exist yet, create the language folder before you copy the CHM file.

Creating a homepage (Page 431)

Conventions for the creation (Page 432)

Using libraries

9

9.1 Library basics

Introduction

You can store library elements you want to reuse in libraries. For each project there is a project library that is connected to the project. In addition to the project library, you can create any number of global libraries that can be used over several projects. Since the libraries are compatible with each other, library elements can be copied and moved from one library to another. Libraries are used, for example, to create templates for blocks that you first paste into the project library and then further develop there. Finally, you copy the blocks from the project library to a global library. You make the global libraries available to other employees working on your project. The other employees continue to use the blocks and adapt them to their individual requirements as needed.

Both the project library and global libraries distinguish between two different types of library elements:

- Types
  Objects that are required to run user programs, for example, blocks, PLC data types (UDT), user-defined data types or faceplates are suitable as types. Types can be versioned and therefore support professional further development. Projects using the types can be updated as soon as new versions of the types are available.
- Master copies
  Almost every object can be saved as a master copy and pasted into the project again later. You can, for example, save entire devices with their contents or cover sheets for plant documentation as master copies.

Project library

Each project has its own library, the project library. In the project library, you store the objects you want to use more than once in the project. The project library is always opened, saved, and closed together with the current project.

Global libraries

In addition to the project library, you use global libraries if you want to use libraries over several projects. Global libraries exist in three versions:

- System libraries
  Siemens supplies global libraries for its own software products. These include off-the-peg functions and function blocks that you can use within your project. The supplied libraries cannot be changed. The supplied libraries are loaded automatically matching the project. If you edit the project in compatibility mode, only libraries that are compatible with the TIA Portal V14 are loaded.
- Corporate libraries
  Corporate libraries are made available centrally by your organization, for example, in a central folder on a network drive. The TIA Portal manages the corporate libraries automatically. As soon as a more recent version of an existing corporate library becomes available, you receive a prompt to update the corresponding corporate library to the more recent version.
- User libraries
  Global user libraries are independent of a specific project and can therefore be passed on to other users. Shared access to global user libraries is also possible, for example on a network drive, if all users open the global user library with write protection.
  Global user libraries from older versions of the TIA Portal that you created yourself can still be used. To continue using global user libraries from older versions of the TIA Portal, they must first be upgraded.

Comparing library elements

You can compare blocks and PLC data types (UDT) with the objects of a device. This allows you to determine, for example, whether certain blocks or PLC data types (UDT) have been used in a project and whether they have been modified.

See also

Overview of the "Libraries" task card (Page 443)

Overview of the library view (Page 447)

Overview of the library management (Page 451)

Basics on master copies (Page 472)

Basics on types (Page 476)

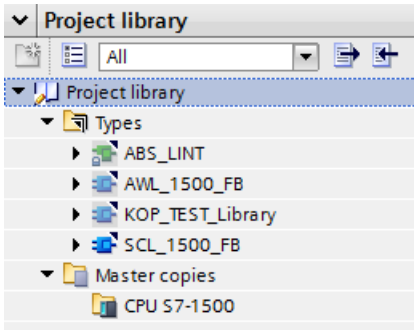
9.2 Using libraries in different TIA products

Description

You can use different TIA products (e.g. STEP 7 Professional, Safety, WinCC Advanced, etc.) within a TIA Portal version (e.g. V14 SP1). You can also open projects with project libraries and global libraries that you have created with one TIA product with a different TIA product at any time. However, the library elements can only be edited and used in the project if they are supported in the current project and when all necessary licenses and support packages are available. You cannot, for example, edit STL program blocks, with STEP 7 Basic.

If a master copy or a type or its versions are not supported, the block icon in the library and in the project tree is also marked with the icon for library elements that are not supported.

If a master copy or a type is marked as unsupported, the following functions are then available to you:

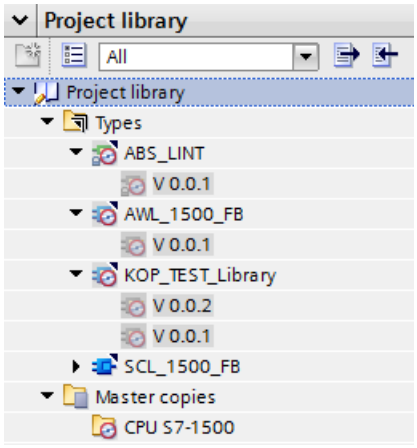


- rename
- delete
- move within the library
- copy to a different library, as long as this library also supports the library element

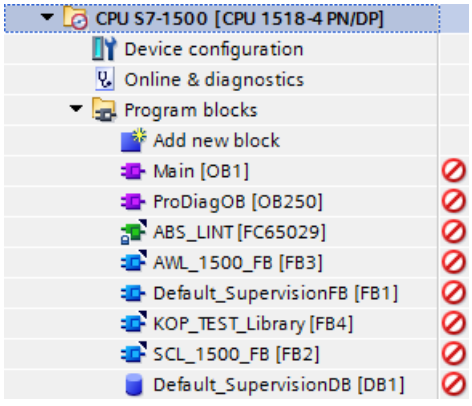
Even if a type is marked as unsupported, the following functions are also available to you:

- The "Go to type" function
- The library management
- "Clean up library" function
- Upgrade library as long as it does not contain a type version that is not supported
- Assign type version as long as it does not contain a type version that is not supported

Example



The example below shows you what it looks like when you open a project library from a more comprehensive product in a less comprehensive product:



The project library was created with STEP 7 Professional and includes types that are specific to Professional.

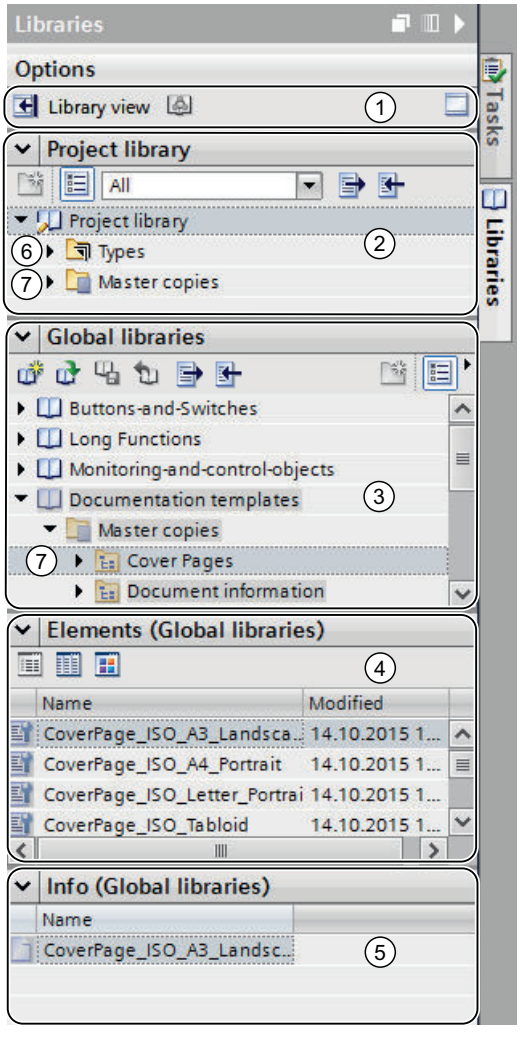
When you open the STEP 7 Professional project with STEP 7 Basic you will see a note that the contained libraries cannot be edited without restrictions.

- Representation in the project library:

- Representation in the project tree:

All STEP 7 Professional specific types are marked accordingly as not supported and can only be edited with restrictions.

9.3 Using the "Libraries" task card



9.3.1 Overview of the "Libraries" task card

Function of the "Libraries" task card

The "Libraries" task card enables you to work efficiently with the project library and the global libraries.

Layout of the "Libraries" task card

The "Libraries" task card consists of the following components:

① "Library view" and "Library management" buttons
② "Project library" pane

③ "Global libraries" pane
④ "Elements" pane
⑤ "Info" pane
⑥ "Types" folder
⑦ "Master copies" folder

"Library view" button

The "Library view" button is used to change to the library view. The "Libraries" task card and the project tree are hidden with this action.

See also: Using the library view (Page 447)

"Project library" pane

In the "Project library" pane, you can store the library elements that you want to use more than once in the project.

"Global libraries" pane

In the "Global libraries" pane, you manage the global libraries whose library elements you want to reuse over several projects.

The "Global libraries" pane also lists libraries that were shipped together with the products you purchased. These libraries provide you with ready-made functions and function blocks, for example. The supplied global libraries cannot be edited.

"Elements" pane

In this pane, you can display the contents of folders in the library. The "Elements" pane is not displayed by default. If you want to display the "Elements" pane, you have to enable it first. Three view modes are available in the "Elements" palette:

- Details mode
  The properties of folders, master copies and types are shown in table form in details mode.
- List mode
  In list mode, the contents of folders are listed.
- Overview mode
  In overview mode, the contents of folders are displayed with large symbols.

See also: Using the element view (Page 445)

"Info" pane

You can display the contents of the library elements in the "Info" pane. The individual versions of types and the last revision date of the version are also displayed.

"Types" folder

In the "Types" directories, you can manage types and type versions of library elements that you use as instances in the project.

See also: Using types (Page 476)

"Master copies" folder

In the "Master copies" directories, you can manage master copies of library elements that you can use as copies in the project.

See also: Using master copies (Page 472)

See also

Library basics (Page 439)

Comparing library elements (Page 520)

9.3.2 Using the element view

Introduction

When you open the "Libraries" task card the first time, the "Project library" and "Global libraries" palettes are opened and the "Info" palette is closed. You can display the "Elements" palette if needed.

The elements view shows the elements of the selected library. Three view modes are available in the elements view:

- Details
  The properties of folders, master copies and types are shown in table form in details mode.
- List
  In list mode, the contents of folders are listed.
- Overview
  In overview mode, the contents of folders are displayed with large symbols.

The "Info" palette shows the contents of the selected library element. If you select a type in the elements view, for example, the type versions are displayed in the "Info" palette.

Requirement

The "Libraries" task card is displayed.

Procedure

To use the element view, follow these steps:

1. Click "Open or close the element view" in the "Project library" or "Global libraries" pane.
2. To change the view mode from the details view to the list mode or overview mode, click the corresponding icon on the toolbar.

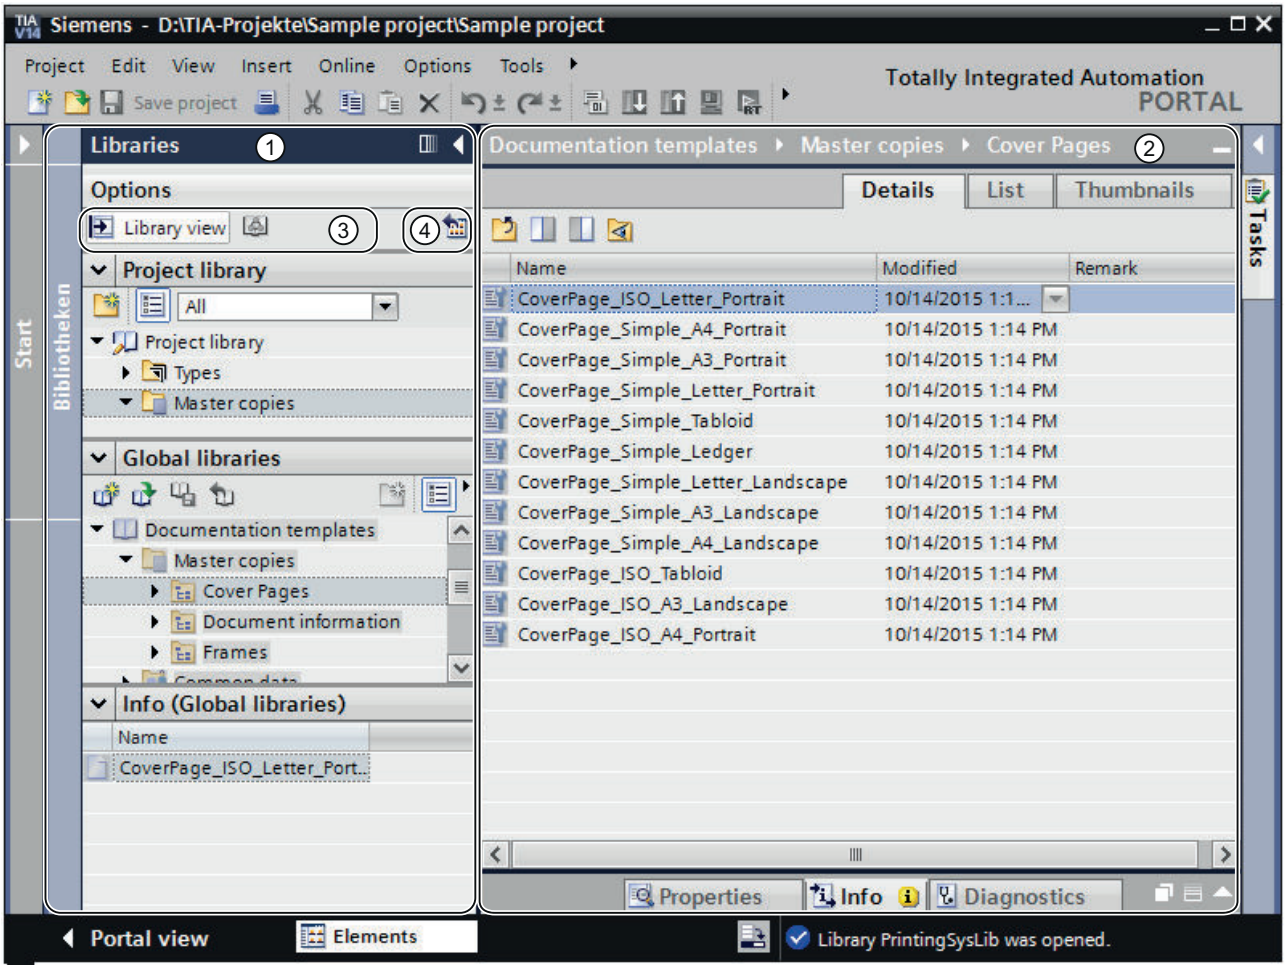
Comparing library elements (Page 520)

Using global libraries (Page 458)

9.4 Using the library view



9.4.1 Overview of the library view

Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

Layout of the library view

The following figure shows the components of the library view:

① Library tree
② Library overview
③ "Open/close the Library view" button and "Open library management"
④ "Open or close library overview" button

Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

See also: "Libraries" task card (Page 443)

Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views:

- Details view
  The objects are displayed in a list with additional information, such as the date of the last change.
- List view
  The objects are displayed in a simple list.
- Icon view
  The objects are displayed as icons according to category.

In addition, you can perform the following actions in the library overview:

- Renaming elements
- Deleting elements
- Copying elements
- Moving elements
- Editing type instances
- Versioning types
- WinCC only: Editing faceplates and HMI user data types

See also: Overview window (Page 262)

See also

Basics on master copies (Page 472)

Basics on types (Page 476)

Opening and closing the library view (Page 449)

Library basics (Page 439)

Comparing library elements (Page 520)

9.4.2 Opening and closing the library view

The library view is opened automatically in some cases, for example, when you edit the test instance of a type or when you edit faceplates and HMI user data types. You can also open the library view manually.

Opening the library view

To open the library view manually, follow these steps:

1. Open the "Libraries" task card.
2. Click the "Open/close library view" button in the "Libraries" task card.
   The library tree opens. The "Library" task card and the project tree are closed.
3. If the library overview is not displayed, click the "Maximizes/minimizes the elements" button in the library tree.
   The library overview opens.

Exit library view

To exit the library view, follow these steps:

1. Click the "Close/open library view" button in the library tree.
   The library tree closes. The "Libraries" task card and the project tree are opened.

See also

Overview of the library view (Page 447)

Library basics (Page 439)

Comparing library elements (Page 520)

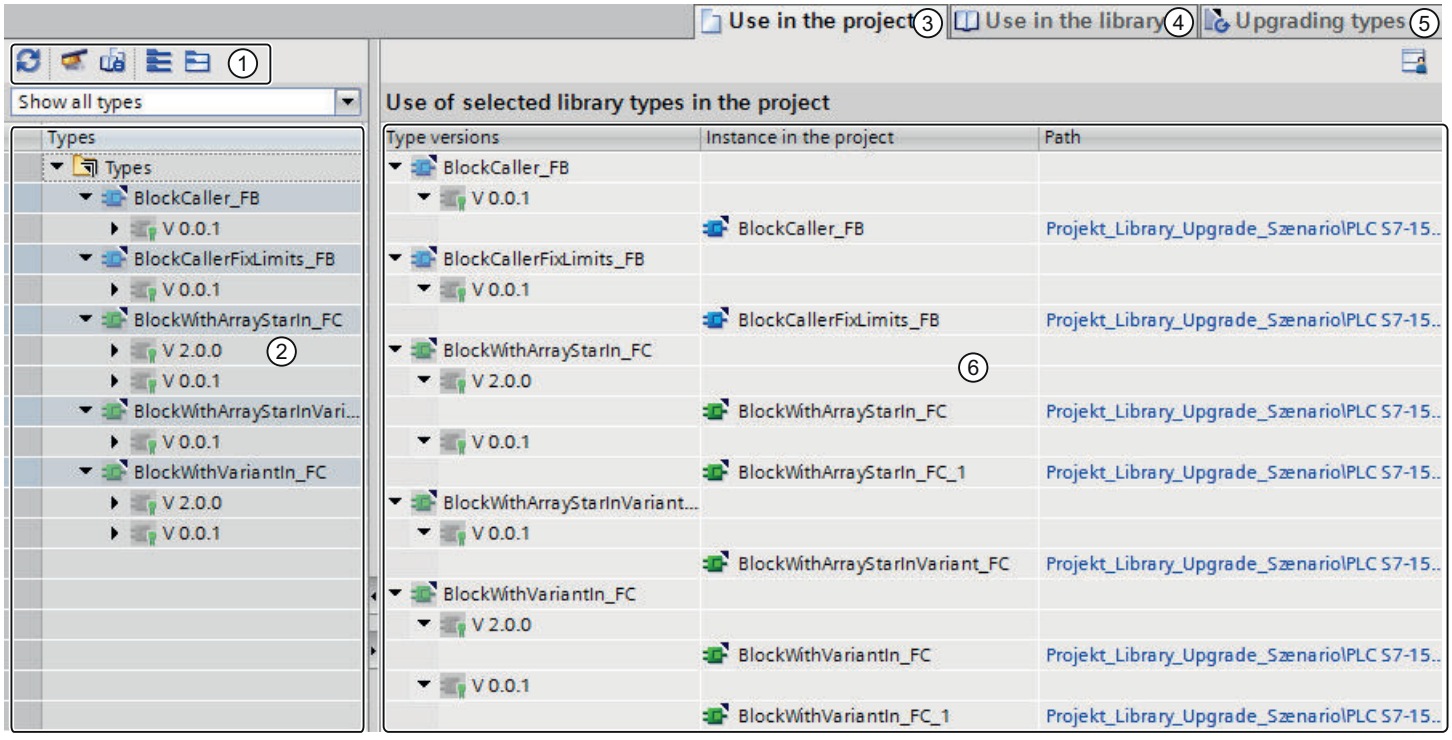
Using the "Libraries" task card (Page 443)

Using global libraries (Page 458)

9.5 Using library management

9.5.1 Overview of the library management

Function of the library management



Master copies and types with dependencies to other library elements are subject to some functional restrictions. They cannot be deleted, for example, as long as dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

The library management offers the following functions:

- Display of the correlations of types and master copies
  If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Upgrading types
- Using filters to narrow down the displayed types

Layout of the library management

The following figure shows the components of the library management:

① Toolbar of the library management
② "Types" area
③ "Use in the project" tab
④ "Use in the library" tab
⑤ "Upgrading types"
⑥ "Uses" window

Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update uses
  If the project was changed, you can update the view of the library management.
- Clean up library
  By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- Harmonize project
  By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.
- Collapse all
  Hides all subentries of the uppermost node in the "Types" area. The lower-level elements, such as types and individual type versions, are no longer displayed.
- Expand all
  Expands all lower-level elements in the "Types" area. The lower-level elements, such as types and type versions, are displayed in full.

"Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. For each type, the types that it references are displayed. You can expand or collapse all type nodes by using the buttons in the toolbar of the "Types" area.

You can also filter the view with the "Filter" drop-down list. You will find additional information on the specific filter settings here: Filtering the display of types (Page 454)

"Use in the project" tab

The "Use in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.

You can find additional information here:

Displaying cross references of an instance (Page 456)

Displaying instances in the project (Page 455)

"Use in the library" tab

The "Use in the library" tab is used to show all points within the library at which a type or a master copy is used.

You can find additional information here: Displaying relations to other library objects (Page 457)

"Upgrading types"

In the "Upgrading types" tab, you can identify all types, reference changed types, and upgrade.

You can find more information on upgrading projects here:

Upgrading types in an existing project (Page 506)

Example of the updating and upgrading of types (Page 509)

See also

Opening library management (Page 454)

Library basics (Page 439)

9.5.2 Opening library management

Procedure

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

Or:

1. Click the "Types" folder in the project library.
2. Select the "Library management" command from the shortcut menu.

Result

The library management opens and the types are displayed with their versions.

See also

Overview of the library management (Page 451)

9.5.3 Filtering the display of types

You can use filters to obtain a better overview of types in extensive libraries. A filter provides you with the option of limiting the displayed types. The following filters are available:

- Types with pending changes
  The filter displays all types that have a version "In test" or "In work".
- Released types
  The filter displays all released types that do not have versions "In test" or "In work".
- Types with multiple versions
  The filter displays all types that have more than one version.

- Types not used in the project
  The filter displays all types which have no instance in the project.
- Types with new versions for upgrading other types
  The filter displays all types that are relevant for upgrading other types. The types must also meet the following criteria:
  - The types have more than one version.
  - All versions of the respective type have been released.

Requirement

The library management is open.

Procedure

To filter the displayed types, follow these steps:

1. In the "Types" area, select the folder whose contents you want to filter.
2. Select the required filter from the drop-down list.
   In the "Types" area, types are displayed that correspond to the selected filter criteria.

9.5.4 Displaying instances in the project

In the library management, you can have the instances of all versions of a type or an individual type version displayed. You can jump directly to each instance in the project.

Requirement

The library management is open.

Procedure

To display the instances of a type or its versions, follow these steps:

1. In the "Types" area select the required folders, types or versions.
2. Open the "Use in the project" tab.
   The instances in the project are displayed for each type version. The "Path" column shows the path at which the respective instance is located in the project.
3. Click the path to jump directly to the respective instance in the project tree.
   The library management is hidden and the instance is selected in the project tree.

See also

Displaying cross references of an instance (Page 456)

Using types of the project library (Page 485)

Overview of the library management (Page 451)

Displaying relations to other library objects (Page 457)

9.5.5 Displaying cross references of an instance

You can display the cross references of an instance without exiting the library management.

Requirement

The library management is open.

Procedure

To display the cross references of an instance in the project, follow these steps:

1. In the "Types" area, select a type version whose instances you want to display.
2. Select the instance of the required type version in the "Uses in the project" tab.
3. Open the "Info > Cross-references" tab in the inspector window.
   The cross reference of the instance are displayed in the project.

See also

Using cross-references (Page 425)

Overview of the library management (Page 451)

Displaying instances in the project (Page 455)

9.5.6 Displaying relations to other library objects

You can display relations between individual library objects in the library management. The references of the individual type versions to the other library objects are automatically displayed in the "Types" area. In the "Uses in the library" tab, you can also view the other library objects in which the respective type version is referenced.

Requirement

The library management is open.

Procedure

To display the other library objects from which a type version is referenced, follow these steps:

1. In the "Types" area select the required folders, types or versions.
2. Open the "Uses in the library" tab.
   In the "Uses" window, you can now see which other library objects are referenced by the individual type versions.
3. To jump to the referenced library object, click on the respective path in the "Path" column.

See also

Referencing of objects within a block (Page 483)

9.6 Using global libraries

9.6.1 Creating a global library

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To create a new global library, follow these steps:

1. Click the "Create new global library" icon in the toolbar of the "Global libraries" palette or select the command "Global libraries > Create new library" in the "Options" menu.
   The "Create new global library" dialog opens.
2. Specify the name and the storage location for the new global library.
3. In the "Version" drop-down list, select the library in which you want to create the library version.
   If you select "V14", the library is compatible with the TIA Portal V14 without installed Service Pack 1.
4. Confirm your entries with "Create".

Result

The new global library is generated and pasted into the "Global libraries" palette. A folder with the name of the global library is created in the file system at the storage location of the global library. The actual library file is given the file name extension ".al14".

Closing a global library (Page 464)

Deleting a global library (Page 465)

9.6.2 Compatibility of global libraries

Libraries from the TIA Portal V13 or earlier

Global libraries that were created with TIA Portal V13 or earlier cannot be used in the current version of the TIA Portal. First, upgrade the libraries with version V13 SP1 of the TIA Portal to the current library version. You can then open the library and upgrade once again.

Libraries from the TIA Portal V13 SP1

You can use the TIA Portal to open global libraries that were created with TIA Portal V13 SP1. When you open the library, you are prompted to upgrade the library to the current version of the TIA Portal. Once the global library is upgraded, it cannot be opened with earlier versions of the TIA Portal.

Libraries from the TIA Portal V14

It is possible to open global libraries from the TIA Portal V14 in compatibility mode. The library remains compatible with the TIA Portal V14 until you save an element that can only be used with the TIA Portal V14 SP1. As soon as you save an element with functionality from the TIA Portal V14 SP1 in a global library with the library version V14, a prompt appears with the request to upgrade the library.

Backward compatibility of the current library version

Global libraries saved with the library format of the current TIA Portal product version are not backward compatible with older versions due to their enhanced functionality. Global libraries in the current library format can only be used in connection with TIA Portal V14 SP1 projects.

See also

Opening a global library (Page 459)

9.6.3 Opening a global library

Global libraries can be further developed centrally and used over several projects. Several persons can open a global library simultaneously from a central storage location, provided all users open the global library in write-protected mode.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To open a global library, follow these steps:

1. Click the "Open global library" icon in the toolbar of the "Global libraries" pane or select the command "Global libraries > Open library" in the "Options" menu.
   The "Open global library" dialog box opens.
2. Select the global library you want to open. Library files are identified by the file name extension ".al[version number]". This means that global libraries that were saved with the current TIA Portal product version have the file name extension ".al14".
3. Write protection is activated for the library. If you want to modify the global library, disable the "Open as read-only".
4. Click "Open".
   If the library is saved in the library version for TIA Portal V14 or V14SP1, the "Global library" is opened and pasted into the "Global libraries" pane. The "Upgrade global library" dialog opens if you have selected a global library from TIA Portal V13 SP1. Upgrade the library to the current version of the TIA Portal in this case.

Result

The global library is displayed in the "Global libraries" pane.

If the global library was opened write-protected, it and all its subfolders are grayed out.

Saving a global library (Page 463)

Closing a global library (Page 464)

Deleting a global library (Page 465)

9.6.4 Upgrading global libraries

Where necessary, global libraries in compatibility mode can be upgraded manually for TIA Portal V14.

Requirement

A global library is open in compatibility mode for TIA Portal V14.

Procedure

To manually upgrade global libraries to the current library version, follow these steps:

1. Right-click on the global library you want to upgrade.
2. Select the "Upgrade library" command in the shortcut menu.
   The "Upgrade" dialog opens.
3. Confirm with "Yes".
   The library is upgraded.

9.6.5 Defining library languages

You can define various library languages for global libraries and select an editing language for all comments from them. The selection of the library languages is valid for all library elements (types, type versions and master copies) within the global library.

The comments of the types and their type versions can be translated into multiple library languages and managed in the global library. The selected editing language specifies the languages in which the comments are displayed. The comments of a type can be edited at any time. As soon as the version of a type is released, it comments can no longer be edited and are displayed in ready-only mode.

If you change the editing language of a global library, the comments of all types are displayed in the newly selected editing language, provided translations are available.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To define the library languages of a global library, follow these steps:

1. Click the "Open global library" icon in the toolbar of the "Global libraries" pane or select the command "Global libraries > Open library" in the "Options" menu.
   The "Open global library" dialog box opens.
2. Select the global library you want to open.
3. Disable the write protection of the global library by removing the check mark for "Open write-protected".
   If you do not disable the "Open write-protected" option, you can see the selection of library languages in the global library, but you cannot change these.
4. Click "Open".
   The global library is displayed.
5. Open the "Languages & Resources" folder.
6. Double-click the "Library languages" entry or select "Open" from the shortcut menu.

Result

The library languages are displayed in the Library view.

9.6.6 Displaying properties of global libraries

Global libraries contain properties for describing the respective library in more detail. Properties include the following:

- General information about the library
  This includes the following information: creation time, author, file path, file size, copyright, etc. Many of the attributes can be changed.
- Library history
  The library history contains an overview of the migrations performed. Here you can also call the log file for the migrations. The library history also contains information on updates of the global library.
- Support packages in the library
  You can display an overview of additional software. The additional software is needed to process all devices of the project.
- Software products in the library
  You can display an overview of all installed software products needed for the project.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To display the properties of a global library, follow these steps:

1. Right-click the global library whose properties you want to display.
2. Select the "Properties" command in the shortcut menu.
   A dialog containing the properties of the global libraries opens.
3. Select the properties in the area navigation that you want to have displayed.

See also

Library basics (Page 439)
Creating a global library (Page 458)
Saving a global library (Page 463)
Closing a global library (Page 464)
Deleting a global library (Page 465)

9.6.7 Displaying logs of global libraries

Logs are created when you update or clean up global libraries or assign a shared version to several types. The logs list all changes you have made to the global library. The logs are stored together with the global library and are always available once you have opened the global library.

Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.
   The log opens in the work area.

See also

Updating library with the types of another library (Page 505)

9.6.8 Saving a global library

After you have changed a global library, you need to save it. You can save a global library under another name using the "Save library as" command.

Note

Backward compatibility with older versions of the TIA Portal

Note that global libraries can no longer be opened in older versions of the TIA Portal once they have been saved in the current version.

Requirement

The "Libraries" task card is displayed or the library view is open.

Saving changes

To save a global library, follow these steps:

1. Right-click on the global library you want to save.
2. Select the "Save library" command in the shortcut menu.

Saving a global library under another name

To save a global library under another name, follow these steps:

1. Right-click the global library that you want to save under a different name.
2. Select the "Save library as" command in the shortcut menu.
   The "Save global library as" dialog opens.
3. Select the storage location and enter the file name.
4. Confirm your entries with "Save".
   The library is saved in the specified location under the new name. The original library is retained.

Closing a global library (Page 464)

Deleting a global library (Page 465)

9.6.9 Closing a global library

Global libraries are independent of projects. This means that global libraries are not closed together with your project. You must therefore close global libraries explicitly.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To close a global library, follow these steps:

1. Right-click on the global library you want to close.
2. Select the "Close library" command in the shortcut menu.
   If you have made changes to the global library, select whether or not you want to save the changes.
   The global library is closed.

Library basics (Page 439)

Deleting a global library (Page 465)

9.6.10 Deleting a global library

If you no longer require a global library, you can delete it. Libraries supplied by Siemens cannot be deleted.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To delete a global library, follow these steps:

1. Right-click the global library you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Click "Yes" to confirm.

Result

The global library is removed from the "Global libraries" palette. The entire library for the global library is deleted from the file system.

Saving a global library (Page 463)

Closing a global library (Page 464)

9.6.11 Archiving and disabling global libraries

9.6.11.1 Working with archives of global libraries

If you want to back up global libraries on an external hard drive or send them via e-mail, for example, use the archiving function to reduce the storage space of the library.

Options for reducing the size of the project

There are two ways to reduce the space required to store global libraries:

- Creating a compressed archive of global libraries
  Archives of global libraries are compressed files, each containing an entire global library, including the entire folder structure of the library. Before the directory with the global library is compressed into the archive file, all files are reduced to their essential components to further decrease the storage space. Compressed archives of global libraries are therefore well suited for sending via e-mail.
  Compressed archives of global libraries of the current product version have the file extension ".zal14". Archives from the TIA Portal V13.x have the file extension ".zal13".
  To open a compressed archive of a global library, retrieve the archive. The archive file is extracted to a location you have selected with the entire folder structure and all files.
- Minimizing global libraries
  You can skip additional compression in an archive file, and instead create a copy of the global library directory. The included files can be reduced to the essential elements. This minimizes the required storage space. The full functionality of the global library is retained and the global library can be loaded as usual.
  Minimized global libraries are especially well suited for archiving, for example, on an external medium.

See also

Archiving global libraries (Page 466)

Retrieving global libraries (Page 467)

9.6.11.2 Archiving global libraries

You reduce the storage space of a global library by packing it into a compressed file. You can also reduce the storage space by saving the global library reduced to the essential elements. You can do both of these with the archiving function for global libraries.

Requirement

The global library is loaded.

Procedure

To archive a global library, follow these steps:

1. Select the global library that you want to archive.
2. Right-click the global library and select the "Archive" command from the shortcut menu. The "Archive global library as..." dialog opens.
3. Select the directory where you want to save the archive file or the new directory of the global library.
   The directory may not be located in a project directory or within the directory of a global library.
4. Select the file type from the "File type" drop-down list:
   - Global libraries archive, if you want to create a compressed file of the library.
   - Minimized global library, if you only want to create a copy of the library directory with minimal storage requirement.
5. Enter a file name in the "File name" field if you are creating an archive file. If you are creating a minimized global library, enter the name of the new library directory to be created in the "File name" box.
6. Click "Save".

Result

A compressed file with the extension ".zal14" is generated.

The file includes the complete directory of the global library. The individual files of the global library are also reduced to the essential components in order to save space.

If you have minimized the global library, only a copy of the original directory of the global library is created at the required location. The files contained within it were reduced to their essential components in order to save space.

See also

Working with archives of global libraries (Page 466)

Retrieving global libraries (Page 467)

9.6.11.3 Retrieving global libraries

Before you can use an archived global library, you have to retrieve it. The global library is extracted and then opened in the TIA Portal.

Procedure

To extract the archive of a global library, follow these steps:

1. Select the "Global libraries > Retrieve library" command in the "Options" menu. The "Retrieve archived global library" dialog opens.
2. Select the archive file.

3. Select the check box "Open read-only" if you want to load the global library write-protected.
4. Click "Open".
5. The "Find folder" dialog opens.
6. Select the target directory to which the archived global library should be extracted.
7. Click "OK".

Result

The global library is extracted to the selected directory and opened immediately.

Opening a global library (Page 459)
Compatibility of global libraries (Page 459)

9.6.12 Using global corporate libraries

9.6.12.1 Basics of corporate libraries

Introduction

Corporate libraries are global libraries made available by an administrator and assigned to the TIA Portal. The administrator can assign new libraries or change libraries at any time. New libraries are automatically loaded in the TIA Portal following your confirmation. As soon as more recent versions of corporate libraries are available, the existing corporate libraries are automatically updated to the more recent version, also following your confirmation.

The corporate libraries are located just like normal global libraries in the "Global libraries" palette of the "Libraries" task card.

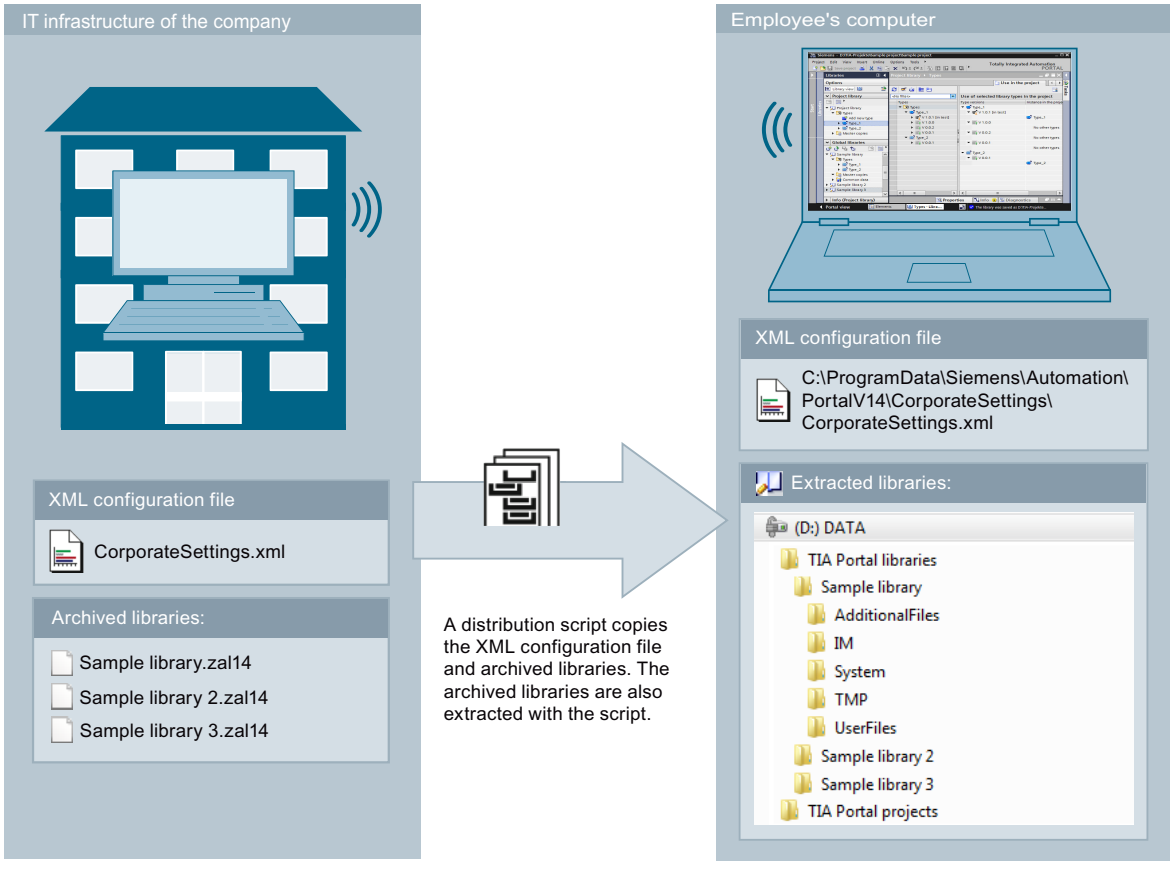
Providing corporate libraries

Corporate libraries can be saved in any directory on the hard drive of the computer or on a network drive. To include corporate libraries in the TIA Portal, use an XML file. The XML file includes the directories and names of the assigned corporate libraries. The XML file must be saved in the following directory on the hard drive of the computer:

`C:\ProgramData\Siemens\Automation\Portal V14\CorporateSettings\`

The XML file must be named "`CorporateSettings.xml`".

You either copy the configuration file yourself to the corresponding directory or the configuration file is assigned to you through the company network. The valid configuration is



automatically applied when the TIA Portal is started. When the TIA Portal is started, it continuously monitors the directory for configuration files. If the configuration file has changed, you receive a prompt to apply the new configuration. You can reject this prompt twice. You will always receive the next prompt three hours later. You must apply the new configuration at the third prompt. You receive a changed configuration file from the project administrator, for example, if corporate libraries have been added or deleted.

Options as project administrator

You can automatically assign the configuration file or the corporate libraries to the computers of the team members or distribute updates to the team members. This function is not part of the TIA Portal and requires a corresponding IT infrastructure in your company. If you want to administer the configuration file centrally, discuss this approach with the IT managers at your company.

The archive function for global libraries can be used to pass corporate libraries to employees of the project team. However, you must retrieve corporate libraries prior to their use in the TIA Portal.

The following figure shows an example of how you can distribute corporate libraries to individual employees within your organization:

See also

Working with archives of global libraries (Page 466)

Archiving global libraries (Page 466)

Retrieving global libraries (Page 467)

9.6.12.2 Creating a configuration file for corporate libraries

You use a configuration file in XML format to make the corporate libraries available in the TIA Portal. The configuration file includes the directories and file names of the libraries to be loaded. Below you will learn how you create the XML configuration file and where to save it.

Procedure

To provide a configuration file for corporate libraries, follow these steps:

1. Create an XML configuration file with the content listed below. Use the coding "UTF-8".
2. Replace the paths mentioned in the example in the "<CorporateLibraryPaths>" section below with the paths where your libraries are stored.
3. Save the XML file under the name "CorporateSettings.xml".
4. Save the file in the following directory on your computer:
   C:\ProgramData\Siemens\Automation\Portal V14\CorporateSettings\

Content of the XML configuration file

The XML configuration file must have the following content:

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
 <Settings.Settings ID="0">
  <ObjectList>
   <Settings.General ID="1" AggregationName="General">
    <AttributeList>
     <CorporateLibraryPaths>
     <!-- Example for two entries -->
     <Item>D:\CorporateLibraries\Corporate_Library_1.al14</Item>
     <Item>D:\CorporateLibraries\Corporate_Library_2.al14</Item>
     <!-- Here you enter additional global libraries, if any. -->
     </CorporateLibraryPaths>
    </AttributeList>
   </Settings.General>
  </ObjectList>
 </Settings.Settings>
</Document>
```

Result

As soon as you have saved the XML configuration file in the respective directory, you will receive a prompt in the TIA Portal to load the corporate libraries.

Specifying settings with an XML file (Page 429)

9.7 Using master copies

9.7.1 Basics on master copies

Master copies are used to create standardized copies of frequently used elements. You can create as many elements as needed and insert them into the project based on a master copy. The elements inherit the properties of the master copy.

You store master copies either in the project library or in a global library. Master copies in the project library can only be used within the project. When you create the master copy in a global library, it can be used in different projects.

The following elements can be created as master copies in the library, for example:

- Devices with their device configuration
- Tag tables or individual tags
- Instruction profiles
- Watch tables
- Elements from the documentation settings, for example, cover sheets and frames
- Blocks and groups containing multiple blocks
- PLC data types (UDTs) and groups which contain multiple PLC data types
- Text lists
- Alarm classes
- Technology objects

In many cases, the objects you add as master copy contain additional elements. A CPU, for example, can contain blocks. If the included elements are uses of a type version, the used versions of the types are automatically created in the library. The elements contained therein are then used as an instance and linked to the type.

See also

Adding master copies (Page 473)

Using master copies (Page 475)

Basics on types (Page 476)

Filtering master copies (Page 474)

9.7.2 Adding master copies

If you want to use objects multiple times, copy them as master copies in the project library or in a global library. You can choose from the following methods for creating master copies:

- You select one or more elements and create individual master copies from them
- You select multiple elements and create a single master copy from them that contains all selected elements.

Requirement

- The "Libraries" task card is displayed.
- If you add a device as a master copy, this device meets the following requirements:
  - The device is compiled and consistent.
  - The device contains no test instance of a type.
- If you add the master copy to a global library, the global library is opened with write permission.

Creating master copies from one or more elements

To create a master copy for one or more elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Select the desired elements.
3. Using a drag-and-drop operation, move the elements to the "Master copies" folder or any subfolder of "Master copies".

Alternative:

1. Select the desired elements.
2. Copy the elements to the clipboard and paste the elements at the required location. Each element is pasted in the library as a master copy. A type is created automatically in each case from any objects contained (such as referenced blocks).

Creating a single master copy from multiple elements

To create a single master copy for all elements from multiple elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Copy to the clipboard the elements that you want to create as master copies.
3. Right-click on the "Master copies" folder or any of its subfolders in the library.
4. In the shortcut menu, select "Paste as a single master copy" command.

Alternative:

1. Select the desired elements.
2. Using a drag-and-drop operation, move the elements to the "Master copies" folder or any subfolder of "Master copies". Meanwhile, keep the <Alt> key pressed.
   The elements are pasted in the library as a single master copy. The single master copy contains all selected elements. A type is created automatically in each case from any objects contained (such as referenced blocks).

Note

Avoiding complex structures of master copies

To prevent name conflicts and conflicts regarding the folder structure during subsequent use of master copies, avoid complex master copies. Complex master copies are, for example, master copies that consist of multiple elements and nested folders.

Basics on master copies (Page 472)

Using master copies (Page 475)

Library basics (Page 439)

Adding types to the project library (Page 481)

9.7.3 Filtering master copies

To make it easier to keep track of a large number of master copies, you can filter the display according to the type of master copy.

Requirement

The "Libraries" task card is displayed or the library view is open.

Procedure

To filter the view, follow these steps:

1. Open the "Master copies" folder in the project library or a global library.
2. In the drop-down list of the toolbar, select the type of objects you want to display under "Master copies".

Result

Only the selected type of master copies is displayed. You can set the filter to "All" to return to an unfiltered view.

See also

Library basics (Page 439)

Creating folders in a library (Page 515)

Basics on master copies (Page 472)

Using master copies (Page 475)

Using the element view (Page 445)

9.7.4 Using master copies

Master copies are contained either in the project library or in a global library. You can paste one or more master copies in the project at the same time. If you insert multiple master copies at the same time, ensure that all master copies are compatible with the desired point of use.

Requirement

The "Libraries" task card is displayed.

Procedure

To paste a master copy into the project, follow these steps:

1. In a library, open the "Master copies" folder or any subfolder of "Master copies".
2. Using a drag-and-drop operation, move the desired master copies or complete folders to the point of use.

Or:

1. Open the element view.
2. Using a drag-and-drop operation, move the desired master copies or whole folders from the "Elements" pane to the point of use.

Result

A copy of the master copies is inserted. If incompatible master copies were included in a multiple selection, these are omitted and a copy is not created in the project.

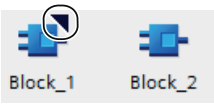
9.8 Using types and their versions

9.8.1 Basics on types

Using types



Types are elements that are required for the execution of user programs. Types can be versioned and further developed from a central location.

The following elements can be stored as type in the project library or the global library:

- Functions (FCs)
- Function blocks (FBs)
- PLC data types (UDTs)
- Faceplates
- Screens
- Styles
- User-defined functions

You can use the same version of a type only once within a CPU. If various versions of a type are available, these can also be used within a CPU. Depending on the number of CPUs used, any number of instances can be derived within a project. The instances are then connected with the version of the type in the library. If you are using types from a global library, the type is also created in the project library. If the type already exists in the project library, missing type versions are added if necessary. The instance is then linked only to the respective type version in the project library.

Types and their instances are marked with a black triangle. The following figure shows an instance, marked with a black triangle, and an ordinary program block:

Basics on versioning of types

Type versioning provides you with the means to develop types centrally and then roll out the most recent version to the individual projects as an update. In this way, error corrections and added functions can be easily integrated into existing projects. If you have created a new version of a global library, you can update existing projects in an automatic process. This minimizes errors and reduces the amount of maintenance work for large automation solutions that contain numerous individual projects.

Versioning allows you to trace the development process of individual types. Before you release a version, you can try it out in a test environment to determine whether changes made to a type integrate smoothly into an existing project. You only release a version for productive use after you have made sure that everything operates without errors. You can view the history of

individual instances in the project at any time and determine the version from which the instance was derived.

The TIA Portal also checks automatically whether there are associated objects with individual versions of a type. Associated objects can be, for example, PLC data types (UDTs) or other blocks referenced in a block. All associated objects are already taken into consideration during the creation of a type or during copying between libraries. Before being released, versions of types are checked for their consistency to ensure that no inconsistencies arise in the project.

Versions of types

Versions are assigned to each type. The version number is displayed in both the "Libraries" task card as well as the library view next to the respective type. You can also display the version of a type in the project tree next to the instances. To do this, select the "Version" column in the project tree. This allows you to see at all times which version of an instance is used in the project.

The version number consists of three numbers separated by periods. You can randomly assign the first two digits. Numbers from 1 to 999 are permitted as the first two numbers. The third digit is the build number. It is automatically incremented by one when you edit an instance related to the version. The build number is reset to 1 when you release the version.

The versions of types can have three states:

- In work (faceplates and HMI user data types)
- In test (all sorts of types except faceplates and HMI user data types)
- Released

The following figure shows a type with two versions. One version is "in test" and one version is released:

If you use functions (FCs) or function blocks (FBs) as types in the project library, observe the following when compiling the block if you use different instruction versions:

- You can recompile know-how-protected blocks without password if the interfaces of the block versions are identical.
- You can recompile blocks that are not know-how-protected if the supply is not lost for any actual parameters and if no new actual parameters that you need to supply are added by the new version.
- If it is not possible to compile the type with a different instruction version, a new version of the type is required that contains the required adjustments.

Adding types to the project library (Page 481)

Using types of the project library (Page 485)

Editing library elements (Page 516)

Duplicating types (Page 484)

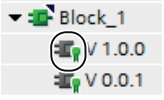
9.8.2 State of type versions

The versions of types can be in three different states. The states can be determined from the instance or in the library.

"In work" status

Only versions of faceplates and HMI user data types have the "In work" status. If a version is in progress, "In work" appears next to the version in the library.

When you create a new type or a new version of a released type, the type is assigned the status "In work".



Types with the status "In work" can be edited in the library view. A reference to an instance in the project does not have to exist. Upon release, the compatibility of the type is tested by a consistency check.

"In test" status

All types except for faceplates and HMI user data types can have the "in test" status. If a version is in test, "in test" appears next to the instance and in the library. A version in the test state is linked to a test instance in the project. This allows you try out the effects of your changes in a test environment including all online functions before you release a type for use in actual operations.

"Released" status

The "released" status is available for all types, regardless of the point of use. If a version has been released, the symbol of the version is marked with a seal in the library:

Released versions can be opened with write protection in their instance. If you want to edit a released version, you must first create a new "In work" or "In test" version.

Release versions (Page 491)
Assigning a version (Page 500)
Updating the project to the latest versions (Page 494)
Remove the link between instance and type (Page 495)
Filtering the display of types (Page 454)

9.8.3 Displaying a released type version

If you display a released version but do not want to edit it, open the instance with write protection. All types except faceplates and HMI user data types can be opened directly at the instance. Faceplates and HMI user data types can only be opened in the "Libraries" task card or in the library view.

Requirement

The released version has an instance in the project, except the type is a faceplate or an HMI user data type.

Opening a type version at an instance

To open a released version of a type with write protection starting from an instance, follow these steps:

1. Select the released version at the instance in the project tree.
2. To do this, right-click the instance and select the "Open" command from the shortcut menu. The instance is opened with write protection.

Opening a type version in the "Libraries" task card or library view

To open a released version of a type in the "Libraries" task card or in the library view, follow these steps:

1. Select the version.
2. To do this, right-click the version and select the "Open" command from the shortcut menu. If it is a faceplate or HMI user data type, it is opened directly in the library view. In this case, skip the remaining steps. If it is any other type, the "Open type" dialog opens.
3. Select the instance with the version that you want to display from the list of instances.
4. Click "OK" to confirm.
   The instance is opened with write protection.

9.8.4 Displaying properties of a type or version

You can display the properties of a type or version.

Procedure

To display the properties of a type or a version and to enter a comment, follow these steps:

1. Select a type or the version of a type in the "Libraries" task card or in the library view.
2. To do this, right-click on the type or one of its versions and select the "Properties" command from the shortcut menu.
   The "Properties" dialog box opens.
3. If needed, enter a comment on the type in the "Comment" field or edit an existing comment.

Visible and changeable properties

The following table shows the properties that you can see or change for a type or version:

Property	Description	Version	Types
Name	Name of the type	-	Visible and changeable
Version	Version number	Visible	-
Last change	If you create, release, duplicate or assign a version, this is recorded as a change to the type. The date and time of the change are entered in the "Last change" field.	Visible	-
Author	The creator of the version is indicated as the author.	Visible	-
Original library	The project and the library from which the current version of the type was generated are indicated. This information is important, for example, for finding the original of the type after it has been copied from another library.	Visible	-
Version GUID or Type GUID	The GUID is used to uniquely identify the type or the version of the type, even if, for example, there are types or versions with an identical name within the project library or the global library. The GUID cannot be changed and is assigned automatically.	Visible	Visible
Comment	Comments on the type or version	Visible and, for versions whose status is "in test" or "in work", changeable	Visible and changeable

9.8.5 Working with types in the project library

9.8.5.1 Adding types to the project library

Types for reuse in the project can be created in the project library for various elements. You can create the following elements as types, for example:

- Program blocks (FCs/FBs)
- PLC data types (UDTs)
- Faceplates
- HMI user data type
- Screens
- Styles

If you add an element as a type to the project library and this element has dependencies to other elements, the dependent elements are automatically created as a type as well.

After a type has been added to the project library, the type is linked to the added element from the project. The element from the project is thus the instance of the type.

Requirement

- The "Libraries" task card is displayed.
- The elements that you want to add as type are compiled.
- The elements are consistent.
- For blocks, all other requirements are met as described in section "Block requirements (Page 482)

Procedure

To add an existing element to the project library as a type, follow these steps:

1. Open the project library in the "Libraries" task card.
2. Drag-and-drop one or more elements into the "Types" folder or any subfolder of "Types".
   Alternative: Copy the elements in the project tree to the clipboard and add the elements in the desired project library folder.
   The "Generate type" dialog opens.
3. Enter the properties of the new type:
   - Enter a name for the new type in the "Name of the type" field.
   - Enter a version number for the new type in the "Version" field.
   - Enter the name of the editor who is responsible for the type in the "User" field.
   - Enter a comment on the type in the "Comment" field.
4. Click "OK" to confirm.
   The new type is generated with a released version. The version is linked to the element (instance) that has been added.

Basics on types (Page 476)

Duplicating types (Page 484)

Block requirements (Page 482)

Referencing of objects within a block (Page 483)

Library basics (Page 439)

Adding master copies (Page 473)

9.8.5.2 Block requirements

Permitted blocks for creating a type

You can create types of the following blocks in the project library:

- Function blocks (FBs)
- Functions (FCs)
- PLC data types (UDTs)

Consistency and compilation

To create a type from a block, the block must be consistent and compiled. When you create a type, the consistency of the block is checked automatically and the block is compiled if necessary.

Block requirements

To create a type from a block, the block must meet the following requirements:

- The block must match the type of CPU.
  A block which does not match a CPU can be identified by an incompatibility symbol to the right of the block in the project tree. The case occurs, for example, if you copy a block from a S7-1500 CPU to an S7-300 CPU. A block of an S7-1500 is not compatible with an S7-300 CPU and cannot be compiled. This means that you cannot create a type from the block.
- The block is not a system data block.
- The block does not include global data access or single instance call of an instance data block.
  This also applies, for example, to the call of a data block within an STL block with the "OPN" command.

Special aspects for know-how-protected blocks

You can also create types of know-how-protected blocks. However, keep in mind the following additional requirements for know-how-protected blocks:

- Release of the block for use as type
  Know-how-protected blocks must be released to be used in a library. You make the necessary settings in the block properties.
- The block does not include access to data blocks, PLC tags or PLC constants.
  Because you cannot create types from data blocks, PLC tags or PLC constants, you also cannot create a type from know-how-protected blocks with access to the objects listed above. The instance of a know-how-protected block does not work without the associated data blocks, PLC tags or PLC constants.

See also

Adding types to the project library (Page 481)

Referencing of objects within a block (Page 483)

9.8.5.3 Referencing of objects within a block

In many cases you reference other objects within a type. For example, call a tag or a data block within block. Accordingly, there is a dependence between the block and the referenced object. The block is only consistent if all dependent objects are also available.

Referencing other types

If you call other program blocks, faceplates, PLC data types (UDTs) or HMI user data types in a block these dependent objects are also stored automatically as type in the project library. When the referenced block is reused later as instance in the project, an instance of the referenced object is also created. The TIA Portal thus automatically ensures that the block state is consistent at all times and that the user program can be executed.

Referencing additional objects

Access to data blocks, PLC tags or PLC constants is permitted in blocks without know-how protection, Therefore, types can be created from the blocks. While function blocks referenced in a block, for example, are also automatically created as type in the project library, this is not the case for access to data blocks, PLC tags and PLC constants. If data blocks, PLC tags or PLC constants are referenced in a block, only the block itself is created as type. The referenced objects are not created as type. If you reference objects which are not stored as type, note the following:

- Use the block at a different point of use
  If you create an instance from the type at another point of use (such as a different CPU), the referenced objects are missing at the later point of use. This means that you should create referenced objects at the later point of use again (for example, data blocks or tag tables). Make sure that the referenced objects have the same name at the later point of use.
- Subsequent name changes to referenced objects
  If you subsequently change the name of the referenced objects, the block is no longer consistent. The referenced object (for example, a tag) is no longer found. In the case of already released versions of the type, you can no longer correct the call of the object. In this case create a new version of the type and correct the name of the called object. Then update all the instances of the type in the project to the latest version.

See also

Block requirements (Page 482)

Adding types to the project library (Page 481)

Performing a consistency check for a version (Page 490)

Updating the project to the latest versions (Page 494)

Displaying relations to other library objects (Page 457)

9.8.5.4 Duplicating types

Types in the project library can be duplicated. If you duplicate a type, the following applies to the duplicate:

- The duplicate is created in the same folder.
- The duplicate is created from the highest version of the type.
- The duplicate does not have an instance in the project.

Requirement

The type is released.

Procedure

To duplicate a type in the project library, follow these steps:

1. Right-click on a type.
2. Select the "Duplicate type" command in the shortcut menu.
   The "Duplicate type" dialog opens.
3. Enter the properties of the new type:
   - Enter a name for the new type in the "Name of the type" field.
   - Enter a version number for the new type in the "Version" field.
   - Enter the name of the editor who is responsible for the type in the "User" field.
   - Enter a comment on the type in the "Comment" field.
4. Click "OK" to confirm.
   The new type is generated with a released version.

See also

Adding types to the project library (Page 481)

Editing library elements (Page 516)

9.8.5.5 Using types of the project library

Types from the project library can be used any number of times within a project. The use of types is always linked to a version of the respective type in the project library. If the type contains dependent elements, these are also created as a type of use at a suitable point in the project. Examples of dependent elements are PLC data types referenced in a block.

You can only assign a version of the same type to a device. If necessary, you can create uses of several types at the same time.

Uses of a type are called instances in the project tree.

Possible points of use for type versions

To use a type, create an instance of a particular version of the type at a suitable point in the project. Suitable points of use are:

- Folder in the project tree
  An instance of a type can be created in a folder in the project tree. The folder must be suitable for the particular type. If the type is a user data type, for example, you can only create the instance in the "PLC data types" folder.
- Editor
  An instance can be created from a type in a suitable editor. For example, you can create an instance from the type of a function block in another block. The type of the function block is called from another block in this way.

Options for creating an instance

You have two options for creating type instances:

- Drag the required type version from the project library and drop it at the location where you want to use it.
  Instances of the types and their dependent elements are generated and pasted at the location where you want to use them. The instances are connected to the respective type version in the project library. If you have created the instances in an editor, instances of the types are also created at the appropriate points in the project tree. By default, the folder structure from the library is reproduced in the project tree. If you want to select a different folder in the project tree, you will find the instances in the same folders as in the library.
- Copying and pasting type instances
  You can copy type instances to the clipboard and paste them at another point. This way you create another instance of the type version. The instance is still connected to the same type version in the project library. When you copy the instance of a type to the clipboard and paste it in another project, all required type versions are accepted in the project library of the other project.

Requirement

- The desired versions have been released.
- A device which supports the category of desired type is already available in the project
- The device is not yet assigned any further instance of the same type.

Procedure

To create an instance of a type, follow these steps:

1. In the project library, select the versions from which you want to create an instance.
2. Using a drag-and-drop operation, move the versions from the project library to the point of use in the project tree or an editor.
   Alternative: To automatically use the newest version, move the types themselves from the project library to the point of use using a drag-and-drop operation.
   For example, use a drag-and-drop operation to move the type of a function block to the block folder of the CPU in the project tree. To call the type directly from another block, for example, move the type from the project library to the point of use in the program editor using a drag-and-drop operation.

Alternative:

1. Copy one or more instances to the clipboard.
2. Paste the instances at a suitable point in the same project or in a different project.

See also

Basics on types (Page 476)

State of type versions (Page 478)

Displaying types for an instance (Page 487)

Library basics (Page 439)

Using master copies (Page 475)

9.8.5.6 Displaying types for an instance

You can jump from the project tree to the type in the library that belongs to instance in the project tree.

Procedure

To jump to the type in the project library, follow these steps:

1. Right-click the instance of the type in the project tree.
2. Select the "Go to type" command from the shortcut menu.
   The referenced type version is displayed in the project library.

See also

Using types of the project library (Page 485)

9.8.5.7 Creating a test version of a type

Before you release a type for productive use, you need to test the type within a project and on the automation system. The test is conducted in a specific test environment. This test environment can be a CPU, for example.

Create a version with "in test" status for the test. The creation of a version "in test" is suitable for all sorts of types except for faceplates and HMI user data types. On the other hand, versions "In work" can be created from faceplates and HMI user data types.

There are two ways to create a test version of a type and define the test environment:

- In the "Libraries" task card or library view
  Generate the new version with "in test" status in the "Libraries" task card or in the library view. You can generate the new version either directly from the type or from a specific version of the type.
- At an instance in the project tree
  You can also create the test version directly at the instance in the project tree. Since the instance is always used in a specific version in the project, a new version of the type is generated from the version used at the instance.

You can also create test versions from several types at the same time.

The following rules apply to a version "in test":

- You can set only one version to "in test" for each type at a given time.
- A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "in test" status.

Requirement

- There is at least one instance of the type within the project in a given version.
- If you want to create the new version from a particular version of the type, the instance must be used in this version in the project.

Procedure

To generate a new test version of a type or the version of a type, follow these steps:

1. Select the type, a version of the type, or the instance.
   When you create the test version directly at the instance, you can select several elements or folders with multiple selection. You can skip steps 3 and 4 because the test environment is already defined by the selected instance.
2. Right-click the selected element and select the "Edit type" command from the shortcut menu.
   If you have started the editing in the "Libraries" task card or in the library view, the "Edit type" dialog opens. If you have started the editing at the instance in the project tree, the test instance is immediately opened for editing in the library view.
3. Select an instance of the type from the list in the project.
   If you have started editing at the type itself, the following applies:
   – The location at which the instance is used (for example, the CPU) is also used as test environment for the subsequent editing of the type.
   – Selecting the test instance also defines the version to be edited.

   The following applies to editing a specific version:
   If your starting point is a specific version, you can only select from the list instances that are used in the same version.
4. Click "OK" to confirm.

Result

A new version of the type is created. The new version is "in test" and is identified as such in the user interface.

See also

Basics on types (Page 476)

State of type versions (Page 478)

Library basics (Page 439)

9.8.5.8 Editing test version of a type

When you edit a version "in test", a new version is not created. You can start the editing of the test version at the instance in the project tree, in the "Libraries" task card or in the library view.

Note

Deleting and renaming interface parameters

You can add new parameters. However, if you rename or delete existing parameters, these parameters will not be supplied when the block is called.

Procedure

To edit the test version of a type, follow these steps:

1. Right-click the test version or the instance.
2. Select the "Edit type" command from the shortcut menu.
   The test instance is opened and can be edited.

Discarding versions (Page 490)

Release versions (Page 491)

9.8.5.9 Creating an editing version of a type

If you want to edit a type with faceplates or HMI user data types, create a new "In work" version of the type. The new version is edited in the library view. To check the compatibility of the changes, a consistency check is automatically performed for the type prior to the release.

Requirement

The project library is opened in the "Libraries" task card or in the library view.

Procedure

To create a new version of a type in work, follow these steps:

1. Right-click the type or the version of the type.
2. Select the "Edit type" command from the shortcut menu.
   A new "In work" version is created and opened for editing in the library view.

Basics on types (Page 476)

State of type versions (Page 478)

Library basics (Page 439)

9.8.5.10 Performing a consistency check for a version

A type version can unintentionally obtain an inconsistent state during editing. To notice errors in the development process in good time, you can regularly perform a consistency check. However, the consistency check always takes place automatically as soon as you release a version.

Details of how to start the consistency check manually for the version of a type are provided below.

Requirement

- The project library is opened in the "Libraries" task card or in the library view.
- The version is "In work" or "In test".

Procedure

To perform a consistency check for the version of a type, follow these steps:

1. Right-click on the version that you want to check for consistency.
2. Select the "Consistency check" command in the shortcut menu.
   The consistency check is carried out. You receive a message with the result of the consistency check.

Discarding versions (Page 490)

Editing test version of a type (Page 489)

Basics on types (Page 476)

State of type versions (Page 478)

Library basics (Page 439)

9.8.5.11 Discarding versions

Discard versions of a type "In test" or "In work" when you no longer need the version. You can also select several types or folders and discard all test or working versions contained therein. All uses of the deleted versions are reset to the last released status.

Requirement

- The version that you want to discard is in the state "In test" or "In work".
- Your are in the library view of the "Libraries" task card is open.

Procedure

To discard one version, follow these steps:

1. Right-click the version that you want to discard.
2. Select the "Discard changes and delete version" command from the shortcut menu.
   The version is deleted.

Alternative in the library view:

1. Click the "Discard changes and delete version" button in the toolbar while a version is opened for editing.
   The version is deleted.

See also

Basics on types (Page 476)

State of type versions (Page 478)

Library basics (Page 439)

Performing a consistency check for a version (Page 490)

9.8.5.12 Discarding all versions within a folder

You can discard all versions with the "In test" or "In work" status at the same time within a folder. All uses of the deleted version are reset to the last released status.

Requirement

Your are in the library view of the "Libraries" task card is open.

Discarding a version of a single type

To discard all versions within a folder, follow these steps:

1. Right-click the folder.
2. Select the "Discard all" command from the shortcut menu.
   All "In test" or "In work" versions are deleted.

9.8.5.13 Release versions

When you are finished editing a type version, release the version for productive use. Assign a version number for the release. You can also use a multiple selection to release several versions at the same time.

Requirement

- The "Libraries" task card is open or you are in the library view.
- The versions that you want to release are "In test" or "In work" status.
- The versions are consistent.
  A consistency check is performed as soon as you start the release. If errors that prevent a release occur during the consistency check, a message is displayed indicating how you can correct the errors.

Procedure

To release type versions, follow these steps:

1. Select the versions you want to release.
2. Right-click your selection.
3. Select the "Release version" command from the shortcut menu.
   The "Release type version" dialog box opens.
4. If necessary, change the properties of the version:
   - Enter a name for the type in the "Name" field. If you have selected several versions for release, the "Name" field cannot be changed.
   - In the "Version" field, define a main and an intermediate version number for the version to be released. If you have selected several versions for release, the "Version" field cannot be changed and the last version number is used for the release.
   - In the "Author" field, enter the editor of the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.
5. Optional: Select the "Delete unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or master copies are not deleted.
6. Click "OK" to confirm.

Alternative in the library view:

1. Click the "Release version" icon in the toolbar while a version is opened for editing.
2. Continue with steps 3 to 5 of the description above.

Result

The selected versions are released.

The properties are applied for the types themselves, the versions to be released, and for all future versions. Versions already released remain unaffected by the changes.

If needed, all instances with the same original version are updated to the most recent version and the unused versions of the type are deleted.

Updating the project to the latest versions (Page 494)

9.8.5.14 Releasing all versions within a folder

When you are finished editing all types within a folder, release all versions simultaneously.

Requirement

- Your are in the "Libraries" task card or in the library view.
- The folder includes versions "In test" or "In work" status.
- All versions "In test" or "In work" are consistent.
  A consistency check is performed as soon as you start the release. If errors that prevent release occur during the consistency check, a message is displayed indicating how to correct the errors.

Procedure

To release all type versions within a folder, follow these steps:

1. Right-click the required folder.
2. Select the "Release all" command from the shortcut menu.
   The "Release type version" dialog box opens.
3. If necessary, change the properties of the version:
   - In the "Author" field, enter the editor of the versions to be released.
   - In the "Comment" field, enter a comment on the versions to be released.
4. Select the "Delete unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or master copies are not deleted.
5. Click "OK" to confirm.

Result

All type versions "In test" or "In work" status within the selected folder are released.

The properties are applied for the versions to be released and for all future versions. Versions already released remain unaffected by the changes.

Versions of types not used in the project may be deleted.

See also

Release versions (Page 491)

9.8.5.15 Updating the project to the latest versions

After you have updated several types in the project library, update all instances in the project to the most recent version of the types from the project library. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

Each of the following elements can be selected as source for the update:

- The entire project library
- Individual folders within the project library
- Individual types
  You can select multiple types.

Requirement

Your are in the "Libraries" task card or in the library view.

Procedure

To update instances in a project with the contents from the project library, follow these steps:

1. Select the entire project library or elements from it.
2. Right-click the required elements and select the "Update > Project" command from the shortcut menu.
   The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.
4. Select the options for the update process:
   – The "Update instances in the project" check box is always selected during this process.
   – Select the "Delete all unused type versions from the library" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the project:

- All older versions are deleted from the project library as needed.
- All instances within the selected devices are updated to the most recent version of the linked type.
- If a CPU does not include block instances that are called in the user program, the block instances are removed from the CPU. The types still exist in the library and can be used in the project again as needed.
- You can find a log of the update process in the projection tree under "Common data".

State of type versions (Page 478)

9.8.5.16 Remove the link between instance and type

Instances of types are always connected to the version of the corresponding types. They cannot be edited like an ordinary object. If you edit the instance, a new version of the type is created automatically in the project library and the changes therefore affect the entire project.

If you remove the link between the instance and its type, you then edit the object like an ordinary object in the project tree.

Note

Disable "Terminate link to the type"

If you want to prevent instances of your types getting separated in the project, you can also deactivate the "Terminate link to the type" option.

Activate the option "Shortcut menu entry 'Terminate link to the type'" under "Options > Settings > General > Library settings".

Requirement

The instance must not be in the "in test" state.

Procedure

To remove the link between instances and their type versions, follow these steps:

1. Select one or more instances in the project tree.
2. Right-click the selection and select the "Terminate link to type" command from the shortcut menu.
3. The link to the corresponding type versions is removed.

9.8.6 Working with types in global libraries

9.8.6.1 Adding types to a global library

Global libraries are used as a central resource when working on multiple projects. Among the types, only the types in the project library can be edited directly. Therefore, use the project library if you want to work on types. When you are finished editing a type in the project library, you can add the type to a global library. Adding types from the project library corresponds to a normal copy process from the project library.

Requirement

- The "Libraries" task card is displayed or the library view is open.
- The global library to which you want to add types is opened and can be written to.

Procedure

To add types to a global library, follow these steps:

1. Open the required folder in the global library in the "Libraries" task card or in the library view.
2. Drag one or more types from the project library to the "Types" folder or any subfolder of the global library.

Alternative:

1. Copy the required types from the project library to the clipboard.
2. Open the required global library in the "Global library" pane of the "Libraries" task card.
3. Right-click the "Types" folder or any subfolder of "Types".
4. Select "Paste" in the shortcut menu.

Result

The types are inserted in the global library. Dependent types, such as types of HMI user data types or tags, are also copied to the global library, provided they do not already exist there. This ensures that all necessary elements for generating an instance are present in the global library.

If a type already exists in the global library, the described action corresponds to an update of the global library. In this case, the most recent released versions of the types are added to the global library.

Assigning a version (Page 500)

Updating the project to the latest type versions (Page 498)

Library basics (Page 439)

9.8.6.2 Using types from a global library

To use types from the global library, create an instance of a particular version of the type at a suitable point in the project. If necessary, you can create uses of several types at the same time. Uses of a type are called instances in the project tree.

Possible points of use for type versions

Suitable points of use for types from the global libraries are:

- Folder in the project tree
  An instance of a type can be created in a folder in the project tree. The folder must be suitable for the particular type. If the type is a user data type, for example, you can only create the instance in the "PLC data types" folder.
- Editor
  An instance can be created from a type in a suitable editor. For example, you can create an instance from the type of a function block in another block. The type of the function block is called from another block in this way.

Linking the instance with the project library

In the project, instances of types from a global library are not linked to the type in the global library. Instead, a copy of the type and its dependent elements is generated in the project library when an instance is created. Dependent elements, for example, can be PLC data types that are referenced in a block. In each case, the copy of the type and the dependent elements in the project library contains the version that you have linked to the instances. If the type or a dependent element already exists in the project library, only the missing version is added in the project library, if necessary.

The instance is finally linked to the copy of the type in the project library. You can only assign a type to a device once irrespective of the version.

Requirement

- A device which supports the category of the type is already available in the project.
- The device is not assigned to any further instances of the same type.

Procedure

To use the version of a type in the project, follow these steps:

1. In the global library, select the versions from which you want to create an instance.
2. Using a drag-and-drop operation, move the desired versions of the types to the point of use.
   Alternative: To automatically use the newest version, move the types themselves from the library to the point of use using a drag-and-drop operation.
   For example, use a drag-and-drop operation to move the type of a function block to the block folder of the CPU in the project tree. To call the type directly from another block, for example, move the type from the library to the point of use in the program editor using a drag-and-drop operation.

Result

Missing types or individual versions are added in the project library. If a type is not yet present in the project library, it is stored in the same folder as before in the global library. An instance is created from the types and their dependent elements and inserted at the point of use. The instances are connected to the respective type version in the project library.

If you have created the instances in an editor, instances of the types are also created at the appropriate points in the project tree. The folder structure from the library is reproduced in the project tree. You will therefore find the instances in the same folders as in the global library.

Library basics (Page 439)

Using the element view (Page 445)

9.8.6.3 Updating the project to the latest type versions

In large enterprises with numerous automation projects. the global libraries are frequently edited from a central location. The updated global libraries of the individual projects are made available after the completion of a new version. If you have received a more recent version of a global library, replace the outdated instances in your project with the most recent version. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

The project library is also updated with the new versions of the types in the global library during the updating of the project or individual devices.

The following elements can be selected as source for the updating:

- Individual folders within a global library
- Individual types
  You can select multiple types.

Requirement

- Your are in the "Libraries" task card or in the library view.
- The updated global library is open.

Procedure

To update instances in a project with the contents from a global library, follow these steps:

1. Select the updated global library or the individual elements from it.
2. Right-click the global library or the required elements and select the "Update > Project" command from the shortcut menu.
   The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.
4. Select the options for the update process:
   - The "Update instances in the project" check box is always selected during this process.
   - Select the "Delete all unused type versions from the library" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the project:

- The most recent version of the select types is present in the project library. All older versions were deleted if necessary.
- All instances within the selected devices were updated to the most recent version of the linked types.
- You can find a log of the update process in the projection tree under "Common data".

Basics on types (Page 476)

Library basics (Page 439)

Adding types to a global library (Page 496)

9.8.7 Assigning a version

A library is more clearly structured if types related by content have the same version number. The identical version number reflects the work progress. When you have completed the work on multiple associated types, you can assign the same version number to these types.

You have the following options to assign a common version to types:

- One or more folders in a library
- One or more types

Requirement

- The "Libraries" task card or the library view is open.
- Your selection must not contain types with "In test" or "In work" status.

Procedure

To assign several types the same version, follow these steps:

1. Select the types to which you want to assign a common version.
2. Select the "Assign version" command from the shortcut menu.
   The "Assign version" dialog box opens.
3. If necessary, change the properties of the version:
   - In the "Version" field, determine the new version number. The version number must be higher than the highest version number of all selected types.
   - In the "Author" field, enter the person responsible for the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.
4. Click "OK" to confirm.

Result

The selected type versions are changed as follows:

- A new version of all selected types is created with the specified version number.
- The properties are applied to all selected types, the new version and to all future versions. Lower versions remain unaffected by the changes. If you make no changes to the properties, the properties of the last released version of each type are applied.
- The build number of dependent types is incremented to the next free build number as long as the dependent types were not in your selection. If you had selected a dependent type as well, the version number you specified will be assigned.

A log of the changes is created. If you have versioned the types in the project library, you find the log in the project tree under "Common data > Logs". If you have versioned types in a global library, you find the log in the "Common data > Logs" folder in the level below the global library.

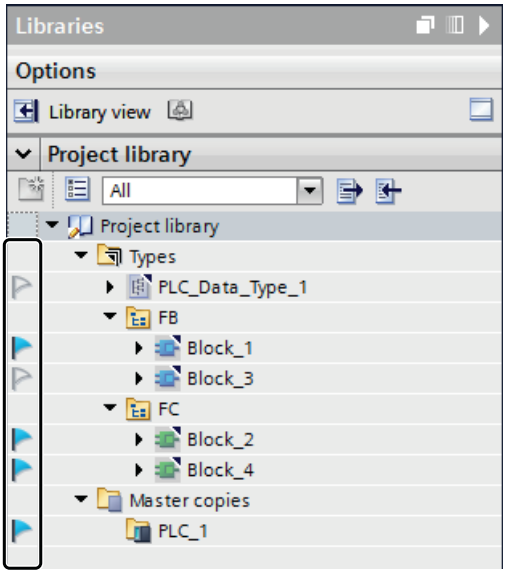
9.9 Multiuser Engineering in libraries

9.9.1 Multiuser Engineering with library elements

Library elements in the project library can be used in Multiuser Engineering.

More information on working with Multiuser Engineering can be found in section "Introduction to Multiuser Engineering (Page 6687)".



Markings for the check-in

Individual library elements within the project library are marked for Multiuser Engineering in the same way as in the project tree. You can mark library elements in the following areas of the TIA Portal:

- "Libraries" task card
- Library view
- Library management
- At the respective point of use, e.g. at type instances

Always mark the library elements manually.

The figure below shows the "Libraries" task card with the marking column and marked library elements for the multiuser function:

Library elements that can be marked

The following table shows which types can be marked for check-in in the project library and in the instance in the project:

	Type can be marked in the library	Instance can be marked
Function blocks (FB)	Yes	Yes
PLC Block Library Type (FC)	Yes	Yes
PLC data types (UDT)	Yes	Yes
HMI faceplates	Yes	By marking the screen in which the instance of the block is located
HMI user-defined data type (UDT)	Yes	By marking the object (e.g. screen or HMI tag), in which the UDT is used.
HMI style	Yes	No
HMI style sheet	Yes	Not available
HMI screen	Yes	Yes
HMI C script	Yes	Yes
HMI VB script	Yes	Yes

Deleting types in the local session

If you want to delete types in the local session, note the following:

- Release the type if a version is still being tested or edited.
- To delete the type in the assigned server project, mark the type in the local session before deletion.

Individual versions can be deleted in the local session, but these are retained in the server project. Because deleting is an administrative activity, you delete the types and their versions in the server project.

Updating the project

If you want to update the project, note the following:

- Mark the types before you update the project.
- Mark the HMI user data types at the point of use before you update the project.
- Changes to HMI styles are not applied in the local session when you update the project. Update the HMI style in the server project view.

See also

Introduction to Multiuser Engineering (Page 6687)

9.9.2 Checking in types and master copies

Check changes to types and master copies into the multiuser server project in the same way as all other objects within the local session. When you check in a type, all versions of the type are always checked in.

Update the server project

Types and master copies are identified and synchronized based on the unique GUID in the server project. When types and master copies are checked in, their changes from the local session are applied in the server project:

- The properties of the type or the master copy, e.g. the name, are applied in the server project
- Missing versions of types are added.
- The folder structure within the library is applied in the server project. However, empty folders are not deleted.

Conflicts can occur through updating the server project. Any conflicts are resolved as follows:

- Naming conflicts
  Two types with identical names cannot be checked in. The names of the respective types automatically receive an extension (<_1>, etc.).
  Two types instances with identical names are not permitted and result in an error when checking in.
- A type is "In test" or "In work" status.
  If a type is in one of these two states in the server project or in the local session, you cannot update the server project. First release all marked types before you update the server project.
- Version conflicts
  A message will notify you if both the server project and local session have versions with the identical version number but different content. Change the version numbers so that these exist only once.

More information on Multiuser Engineering can be found in section "Introduction to Multiuser Engineering (Page 6687)".

Introduction to Multiuser Engineering (Page 6687)

9.10 Updating and upgrading types of a library

9.10.1 Updating library with the types of another library

An existing library can be updated with the contents of another library. The following options are available for updating libraries:

- Updating a global library with types from another global library or from the project library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- The "Types" folder
- Individual folders within the "Types" folder
- Individual types
  You can select multiple types.

During the update, new versions are added to the types that already exist in the target library. Types that do not yet exist in the target library are copied together with all their versions to the target library.

Note

User-defined documentation when copying types

User-defined documentation is not copied together with a type to another library. You need to copy the user-defined documentation for types to the corresponding directory.

For additional help on using the user-defined documentation, refer to the section "Using user-defined documentation (Page 426)".

Requirement

If you want to update a global library, you have to open it with write permission.

Procedure

To update a library with the contents of a different library, follow these steps:

1. Select the "Types" folder or individual elements from this folder as source for the update.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.
3. Select the type of library you want to update:
   - Select "Update the project library" to update the project library with types from a global library.
   - Select "Update a global library" if you want to update a global library.
4. Optional: In the drop-down list, select the global library that you want to update, if you want to update a global library.

5. Select the options for the update:
   – The option "Update instances in the project" is always deactivated in this process.
   – Select the "Delete all unused type versions from the library" check box if you want to delete all versions of types from the library if these are not assigned to any instance in the project and if there are no dependencies to other types. This option cannot be selected for the update of a global library, since types of a global library never have a point of use in the project.
6. Click "OK" to confirm.
   The update is performed.

Result

The following changes were made to the target library:

- Types not yet available in the target library were copied together with all their type versions. More recent type versions were added to the types that already existed in the target library. If a more recent version of a type already existed in the target library, the latest version was nevertheless copied and automatically assigned a newer version number.
- If needed, all versions of types were deleted from the project library if these were not used in any instance in the project.
- A log listing all performed changes to the target library was created for the update process. If you have updated the project library, you can find the log in the project tree under "Common data > Logs".
  If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

Updating the project to the latest type versions (Page 498)

Displaying logs of global libraries (Page 463)

Library basics (Page 439)

Using user-defined documentation (Page 426)

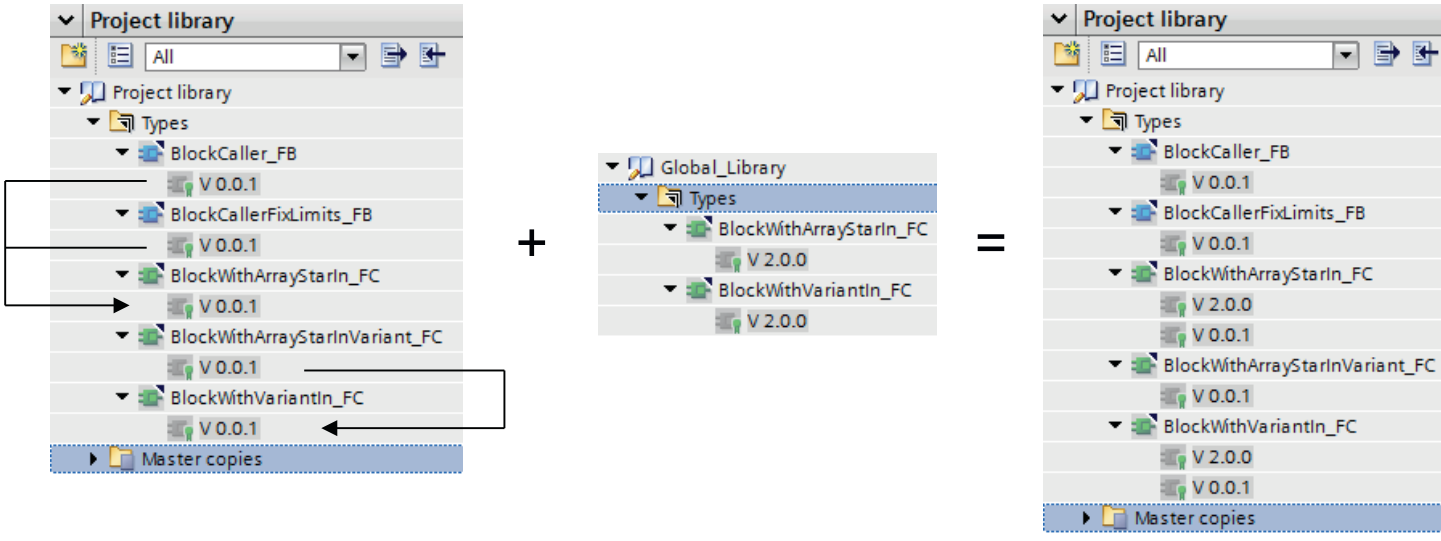
Conventions for the creation (Page 432)

9.10.2 Upgrading types in an existing project

Using the function "Upgrading types", you can upgrade the type dependencies to the latest available type versions in one step throughout the entire project.

If you edit a type that references another type within your project library and create a new type version, the referenced type is automatically set to the state "in test" or "in work". This ensures that all types within the project are up to date.

If you edit a type outside of the project and create a new type version, the referenced types are not automatically updated. To ensure that these dependencies to the individual referenced



types do not have to be manually upgraded, the "Upgrading of types" function is available in the library management.

Using this function you can identify all referenced types that are dependent on the changed type and automatically upgrade these types. The "in test" or "in work" extension is added to all upgraded types in the project library. After the upgrading you can see at a glance which types are also affected by the changes and can check these individually and release them once again.

Requirement

You have created a project that, for example, contains program blocks that call other program blocks or objects, such as PLC data types (UDTs). Dependencies thus exist between the individual objects.

You have created a project library and stored the types to be edited in a global library. The types were further developed outside of your project and are now to be re-integrated with the new type versions in your existing project library. Update the project library for this purpose.

To integrate the new type versions into the existing project library, follow these steps:

1. Open the global library without write protection.
   The types to edited have a higher type version than the types that are contained in the project library.
2. In the global library, click the folder "Types" and select "Update > Project" from the shortcut menu.
   The project library is updated and the new type versions are included.

Additional information on updating libraries is available here: Updating library with the types of another library (Page 505).

At this time the new type versions are only available in the project library, but not yet referenced in the project.

Procedure

To automatically reference new type versions in the project, these must be upgraded in the library management.

Proceed as follows:

1. In the project library, click the folder "Types" and open the library management.
2. In the "Types" area, select the entry "Types with new versions for upgrading other types" from the drop-down list.
   All types are displayed for which a new type version is available in the project library.
3. Right-click the "Types" folder and select the entry "Display upgradable types" from the shortcut menu.
   All referenced types are displayed in the "Upgrading of types" tab.
4. Select one of two entries in "Upgrading of types":
   - Only with test environment
     All types that reference an instance in the test environment are displayed.
   - Compatible with selected test environment
     All types that reference an instance in the test environment are displayed. However, the instance was not yet created at this time.
5. Select a test environment
   With the selection of a test environment, in which test environment the types are to be upgraded.
6. All types that have to be upgraded are now displayed.

   Note

   Display of types

   The display of types depends on which folder you selected in the library management and which settings you made in the "Upgrading types" tab.

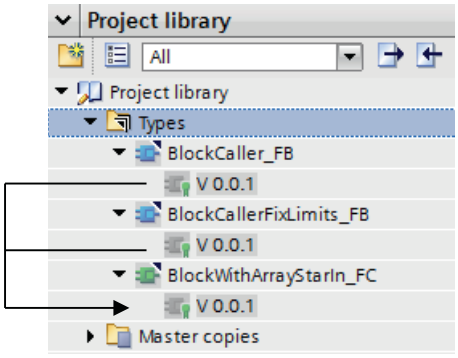
7. Click "Start".
   The "Upgrading of types" dialog opens after the successful upgrading.

   Note

   "Error" status

   You cannot start the upgrading of types if one the types to be upgraded has the "Error" status. You have two options:
   1. Correct the error and restart the upgrading.
   2. Refresh the view of the possible types to be upgraded, by selecting the required entry from the drop-down list under "Types to be upgraded".

   All referenced type are now in the project tree and in the "in test" state in the project library.
8. Check the types "in test" and then release them. You can also use the management library for this purpose.
9. To do so, select the "Types with pending changes" from the drop-down list and release all displayed types.



Result

All types within your project now reference the current type version.

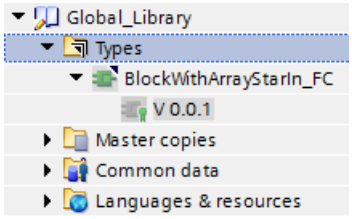
9.10.3 Example of the updating and upgrading of types

Description

You have a project library whose types reference one other in different ways.

The function "BlockWithArrayStarIn_FC" is called by each of the two function blocks.

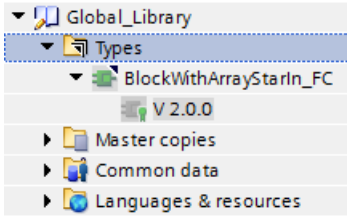
The function "BlockWithArrayStarIn_FC" should be further developed independently outside of the project library.



Requirement

You have created a project library with all relevant types.

Procedure



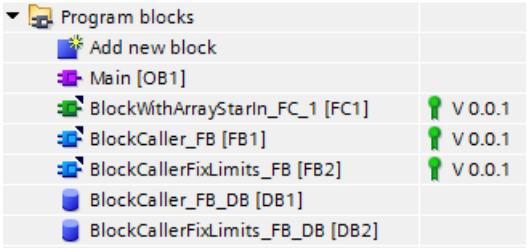
Proceed as follows to further develop the type "BlockWithArrayStarIn_FC" independently outside of the project:

1. Copy the type from the project library to a global library in order to be able to transfer it.

   You transfer version V0.0.1 for further development.

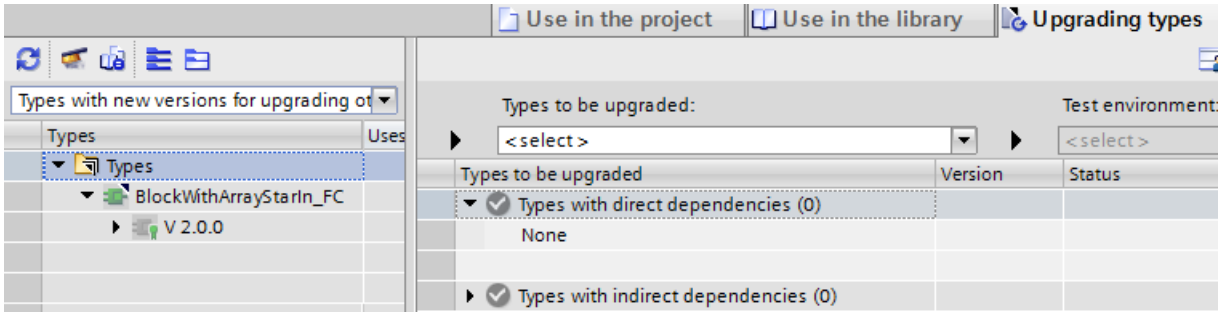
2. The type "BlockWithArrayStarIn_FC" was edited and released. The provider has created a new version V2.0.0 and returned the global library with the new type version:

To integrate the new versions of the function into your existing project library, follow these steps:



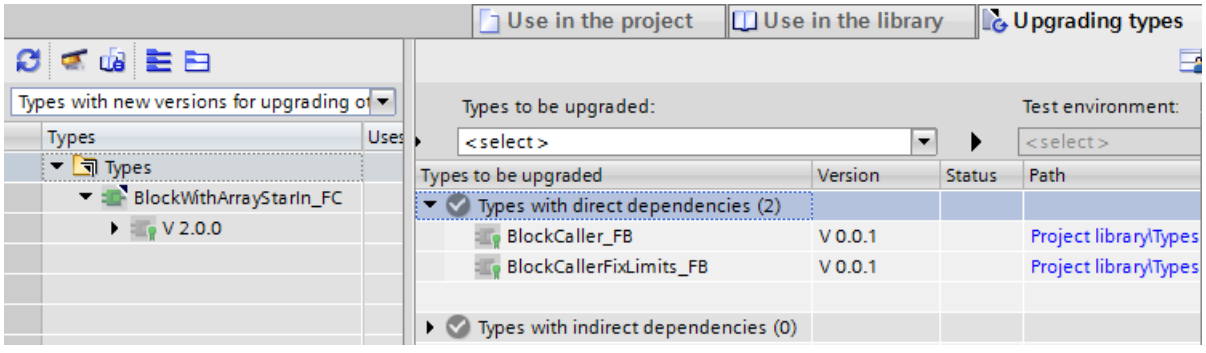
1. Click the "Types" folder of the global library "Global_Library".
2. Select the entry "Update > Project" from the shortcut menu.
   The "Update project" dialog box opens.
3. Click "OK".
   The new type version V2.0.0 has been integrated in the project library.

Note



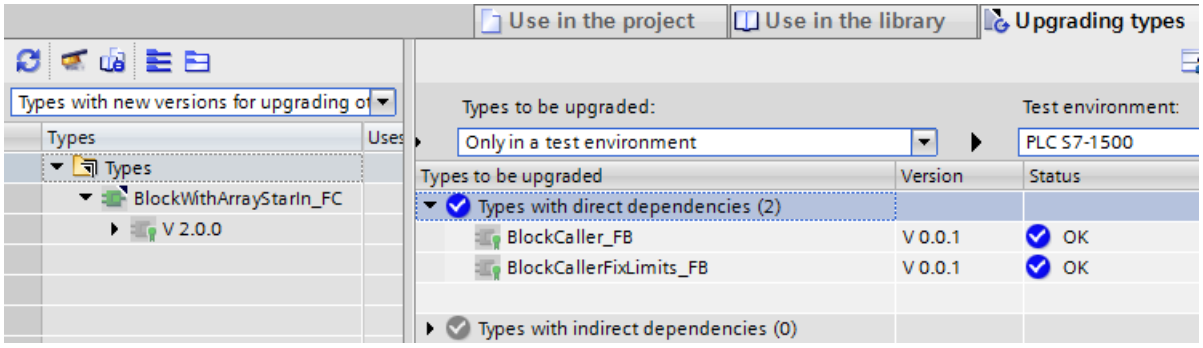
Referencing the latest type version

At this time the new type version is only available in the project library. The instances in the project tree still reference the obsolete type version V0.0.1.



To upgrade the instances in the project tree to the new type version in one step, follow these steps:

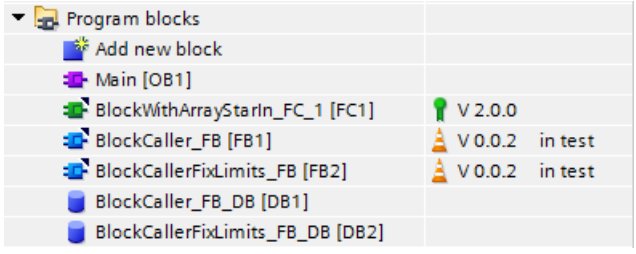
1. Click the "Types" folder in the project library and open the library management.
2. In the "Types" area, select the entry "Types with new versions for upgrading other types" from the drop-down list.
   The function that a new type version has that is not yet used in the project tree is displayed.



3. Click the "Types" folder and select the entry "Display upgradable type" from the shortcut menu.
   The "Upgrading types" tab opens and all types are displayed which have a direct dependency to the changed type.

4. To filter the upgraded types for a test environment, select the entry "Only with test environment" under "Types to be upgraded".

5. Select the test environment "PLC S7-1500".



All types that can be upgraded have the status "OK".
If one or more types have the status "Error", you cannot start the upgrading. First correct the error and then repeat the steps 1 - 5.

6. Click "Start".

Result

All referenced types are upgraded to a new version in the project library and in the project tree and the extension "in test" is added.

Check the new versions and then release these.

9.11 Defining the project languages in the project library

All defined project languages are also available in the project library.

You can define and change the project languages centrally for the entire project library. In this case, all changes to the project languages affect all existing and newly created types and master copies in the project library.

However, you can also change the project languages for individual type versions without affecting the rest of the project library.

Procedure

To define the project languages for the entire project library, follow these steps:

1. Open or edit a type or master copy.
2. Open the "Tasks" card.
3. Under "Languages & resources" either select another project language from the existing editing languages or click "Add new editing language".
4. If you click "Add new editing language", the list of all available project languages will be displayed.
5. Select the editing language you want to use.

Procedure

To define the project languages for an individual type version, follow these steps:

1. Select the appropriate type version from the project library.
2. Select the command "Tools > Project languages" from the menu bar.
   Shows the list of all available project languages.
3. Select the editing language you want to use.

Result

The project library or the type version has the requested project or editing languages.

9.12 Creating folders in a library

The library elements are stored in the libraries according to their type in the "Types" and "Master copies" folders. Create additional folders below "Types" and "Master copies" to further organize master copies and types.

Requirements

- The "Libraries" task card is displayed or the library view is open.
- If you want to create new folders within a global library, you have to open the global library with write permission.

Procedure

To create a new folder, follow these steps:

1. Right-click any folder within the library.
2. Select "Add folder" from the shortcut menu.
   A new folder is created.
3. Enter a name for the new folder.

See also

Filtering master copies (Page 474)

Working with types in the project library (Page 481)

9.13 Editing library elements

Types, master copies and folder can be cut, copied, pasted, moved, renamed or deleted in the usual way within the "Libraries" task card or the library view. Global libraries must be opened with write permission for each of the above-described processes.

Note

User-defined documentation for types and master copies

User-defined documentation is not affected by any of the operations within the library. If you move a master copy or a type to a different location, you also move the associated user-defined documentation in the file system to the corresponding location.

For additional help on using the user-defined documentation, refer to the chapter "Using user-defined documentation (Page 426)".

Copying types

The following rules apply when you copy types to the clipboard:

- Types are always copied to the clipboard with all associated versions. However, only versions that have previously been released are copied.
- Types are always copied to the clipboard with all dependent elements.
- Master copies are always copied to the clipboard with all type versions used in them.

Copying and pasting type versions

When you copy type versions to another library, the types must already exist in the target library.

Cutting elements

You can only paste previously cut library elements into the same library. In so doing, you can only paste master copies into the "Master copies" folder or any of its subfolders. Likewise, you can only paste types into the "Types" folder or any of its subfolders.

Pasting types

Pasting types in a different library corresponds to updating the target library.

The following rules apply when you have pasted a type into a different library:

- A type is always pasted with all its versions.
- If the type already exists in the target library, all versions that are not yet available are added to the corresponding types in the target library.
- If there is already a version with released status in the target library, this version is not pasted again.

- If the same version exists with "In test" or "In work" status in the target library, it is replaced by the released version.
- If a type needs other types, these are also added at the respective location.

Pasting master copies

When you paste master copies, all type versions contained in these copies are also pasted. If the corresponding types already exist in the library, only the missing versions are added to the individual types. If one of the types used does not yet exist, it is pasted at the highest level in the library. The type includes the type version that was used in the master copy.

Moving elements

When you move an element from one library to another, the element is copied and not moved. The same rules apply as described under "Pasting types" and "Pasting master copies".

Deleting of types and type versions

Note the following when you delete types or type versions:

- A type or a type version can only be deleted if there are no dependencies to other types.
- When you delete a type, all versions of the type are deleted.
- If you delete all versions of a type, the type is also deleted.
- If you delete a version that has instances in the project, the instances are also deleted from the project.
- If you delete a type that is also stored at the same time as a master copy, the master copy is also deleted.

Deleting instances

If you delete an instance that has dependencies to other instances, this instance is restored during the next compilation. The instance is then linked again to the original type version. This restores the consistency of the project.

See also

Library basics (Page 439)

Remove the link between instance and type (Page 495)

Updating library with the types of another library (Page 505)

Conventions for the creation (Page 432)

Using user-defined documentation (Page 426)

Duplicating types (Page 484)

9.14 Harmonizing names and path structure

You can harmonize the project with a library. This helps you correct the following items:

- Names of the instances:
  Instances can be created during the development phase of a library, the names of which are appended by "_1", "_2", etc. due to an automatic correction. This extension is used to prevent duplicate names in the project. During harmonization, the instances once again receive the names of their associated types.
- Path structure:
  The original path structure can be lost due to parallel development or copying of dependent instances. This affects the clarity of the project. During harmonization, the path structure within the project is adapted to the path structure of the library.

Procedure

To harmonize the names and the path structure, follow these steps:

1. Open the library management.
2. Click "Harmonize project" in the toolbar.
   The "Harmonize project" dialog box opens.
3. Select the device with which you wish to harmonize the library.
4. Select the "Harmonize paths between project and library" check box if you want to restore the path structure.
5. Select the "Harmonize names between project and library" check box if you want to have the names corrected.
6. Confirm your entries with "OK".

Result

Depending on your settings, the names and the path structure in the project are harmonized with the library.

The changes to the project are logged. The log is available under "Common data > Logs" in the project navigation.

See also

Library basics (Page 439)

Overview of the library view (Page 447)

Overview of the library management (Page 451)

9.15 Clean up library

You can clean up the project library and the global libraries to remove types or versions that are not connected to any instance in the project. This step provides more clarity within the libraries and decreases the size of the library.

Cleaning up the project library

To clean up the project library, follow these steps:

1. Open the library management.
2. Click on "Clean up library" in the toolbar.
   The "Clean up project library" dialog box opens.
3. Select the scope in which types or types versions are to be deleted:
   - To retain the version with the highest version number, even if this has no instance, select the option "Delete old type versions and retain the newest type version".
   - Select the option "Delete complete types" to delete the complete type if no version is connected to an instance.
4. Confirm your entry with "OK".
   Depending on your selection, either unused type versions or types are removed from the project library.
   The changes are logged. The log is available under "Common data > Logs" in the project navigation.

Clean up global library

To clean up a global library, follow these steps:

1. Open the global library in not write-protected mode.
2. Open the library management.
3. Click on "Clean up library" in the toolbar.
   The "Clean up global library" dialog box opens.
4. Click "OK".
   Unused type versions are deleted. The latest version of a type is always retained.
   The changes are logged. The log is available in the "Common data > Logs" folder in the level below the global library.

9.16 Comparing library elements

Introduction

You can compare devices from libraries with devices from both the current project as well as from the same or another libraries or reference projects. Note, however, that reference projects are write-protected. You can also compare instances in a device with their type version in a library. Not all actions are available for the comparison with types. You cannot, for example, overwrite an instance of a newer version with an older type version from the library.

When comparing library elements, you can always switch between automatic and manual comparison.

Procedure

To compare library elements with the device data of a project, follow these steps:

1. In the project tree, select the device whose data you want to compare to a library element and which allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The compare editor opens and the selected device is displayed in the left area.
3. Open the "Libraries" task card.
4. Select the library element that you want to compare to the device data.
5. Drag the library element into the right drop area of the compare editor.
   You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object properties and the corresponding object of the assigned device are clearly shown in the property comparison.
   You can drag other devices into the drop areas from the current project, a library or from a reference point at any time to start a new comparison. It does not matter which device you drag into the drop area.

9.17 Exporting library texts

Description

You can export library element texts for translation and then reimport them. The texts are exported to an Office Open XML file with the extension ".xlsx". This can be edited in Microsoft Excel or a number of other spreadsheet programs.

The following export options are available:

- Exporting texts of selected types and master copies
  You can select individual types or master copies, and use the shortcut menu to export only the texts of the selected object.
  Or you can select and export multiple or all types or master copies by making multiple selections.
- Exporting texts of all library elements of the project library or a global library
  You can use the buttons in the toolbar of the "Project library" or "Global libraries" pane to export all texts of a project library or a global library.

If multiple versions of one type exist, the texts of the latest version are exported.

Note

No exporting of library texts

If the current version of a type has not been released yet and has the extension "In test" or "In work", no library texts are exported.

Note

Row limit in Microsoft Excel

Note that spreadsheet programs may be able to process only a certain number of rows. Microsoft Excel 2003 supports a maximum of 65536 rows, for example. Later versions of Microsoft Excel support more rows.

Defining the source and target languages in a project library

The selection of possible source and target languages in the project library depends on the languages you have defined as project languages.

You can find additional information here: Select project languages (Page 409)

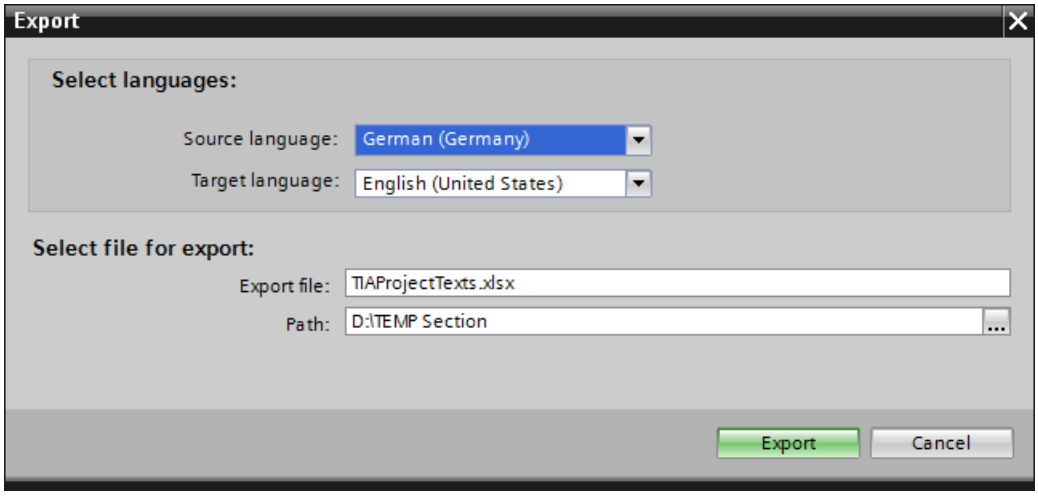
Defining the source and target languages in global libraries

In a global library you can define the library languages yourself unless the library has write protection.

You can display the selection of possible languages by double-clicking on the "Library languages" item in the "Languages & Resources" subfolder. For a write-protected library the library languages are displayed as read-only in the library view.

You can find additional information here: Defining library languages (Page 461)

Requirement



Activate the required target language:

- For a project library in the project languages
- For a global library in the library languages

Exporting texts of library elements

To export the texts of the selected library elements, follow these steps:

1. Select the required library elements (individual library element, multiple library elements, a folder or a complete library).
2. Either right-click and select "Export library texts" from the shortcut menu or click the "Export library texts" button in the toolbar.
   The "Export" dialog box opens.

3. Select the required source language and the required target language.
4. Give the export file the required name.
5. Set the required path to the storage location of the export file.
6. Click "Export".

Result

The export was successfully completed and the ".xlsx" file was created in the storage location.

	A	B	C	D	E	F
1	Category	ViewPath	Internal ID	Substitutions	de-DE*	en-US
2	<BlockCommentCategoryData>	Program blocks\	a5exBpTAQ6Af2xKwOQN99f		Start Motor	
3	<BlockCommentCategoryData>	Program blocks\	a5exBpTAQ6Af2xKwOQN99f		Stop Motor	

Write the English translations in the "en-US" column, in order to be able to then import them.

9.18 Importing library texts

Description

After external translation in a spreadsheet program, you import the texts into the TIA Portal. You can import the texts in the project library or a global library at the following locations:

- Using the "Import library texts" shortcut menu command
- Using the "Import library texts" button.

Regardless of how many library elements you have selected, all texts from the import file are imported for the entire library. The library elements from the import file must match the library elements of the library into which the texts are to be imported. The target languages you want to import must be enabled in the project or in the global library.

When you import texts for master copies, the existing texts are overwritten with the new texts. When you import texts for types, only the texts of the latest version are overwritten with the new texts.

Note

No import of library texts possible

No import of library texts possible if one of the following options applies:

- The library texts belong to a type instance which is contained in a master copy.
- A version of a type has not yet been released within the project library and has the extension "in test" or "in work".
- The global library is write-protected.
- It is a system library.

Note

Importing library texts for a multiuser project.

To also import library texts from objects that are not marked, the library texts in a multiuser project must be imported in the server project view.

Requirement

You have entered the translations in the target language in the export file.

	A	B	C	D	E	F
1	Category	ViewPath	Internal ID	Substitution	de-DE*	en-US
2	<BlockCommentCategoryData>	Program blo	a5exBpTAQ6Af2xKwOQN		Start Motor	Start the motor
3	<BlockCommentCategoryData>	Program blo	a5exBpTAQ6Af2xKwOQN		Stop Motor	Stop the motor

If you want to import library texts into a project library, the required target languages must be activated in the project languages.

If you want to import library texts into a global library, the required target languages must be activated in the global library.

Importing all texts of a project library or a global library

To import all translated library texts, follow these steps:

1. Select the project library or a global library.
2. Either right-click and select "Import library texts" from the shortcut menu or click the "Import library texts" button in the toolbar.
   The "Import" dialog box opens.
3. Select the file to be imported.
4. You have the option to also import the source language by enabling the option Import source language".
5. Click "Import".
   The "Import completed" dialog opens after the import.

Result

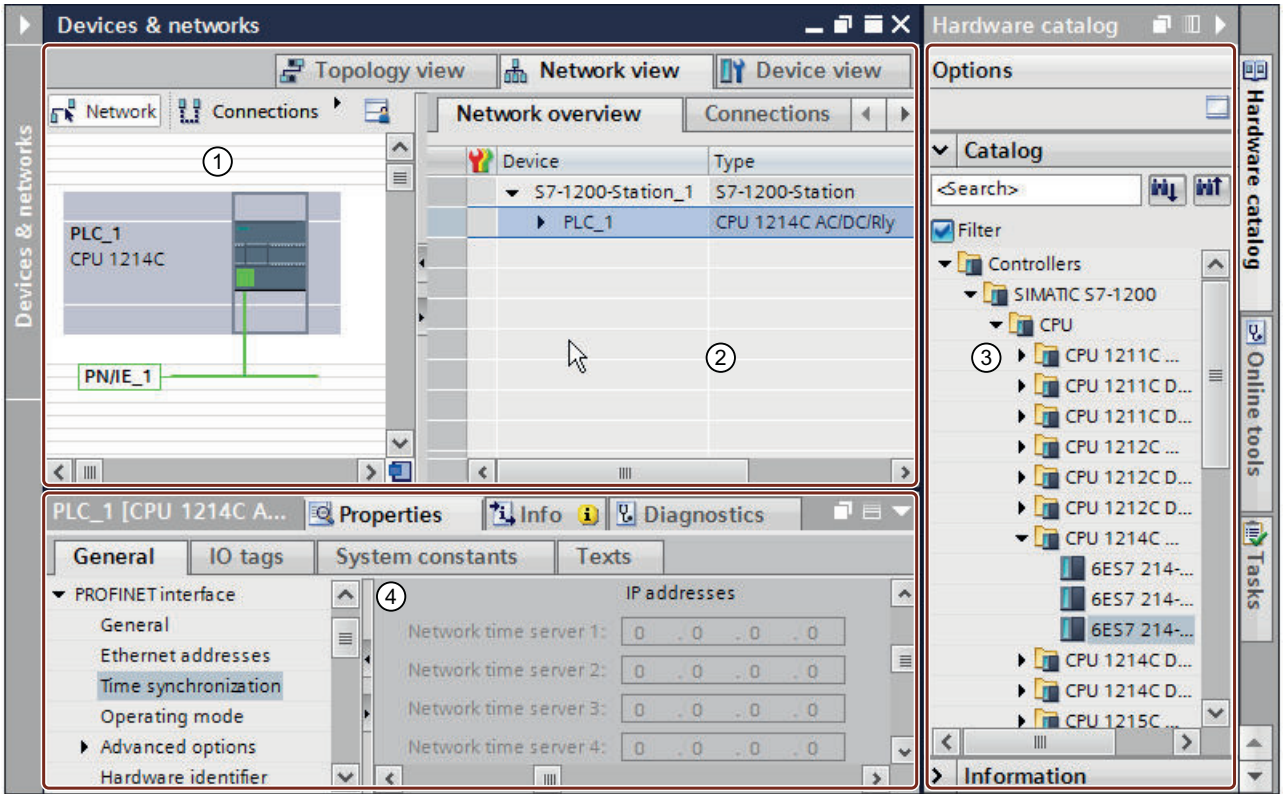
- Import successfully completed:
  The latest type version contains the translated texts after a successful import.
- Import completed with warnings:
  The reason for the error is either indicated directly in the dialog or you can click the link "Click here to view the log file" to view the causes of the error.
- Import failed:
  To find the log with the causes of the error, click the link "Click here to view the log file".

Editing devices and networks

10

10.1 Configuring devices and networks

10.1.1 Hardware and network editor



10.1.1.1 Overview of hardware and network editor

Function of the hardware and network editor

The hardware and network editor opens when you double-click on the "Devices and Networks" entry in the project tree. The hardware and network editor is the integrated development environment for configuring, networking and assigning parameters to devices and modules. It provides maximum support for the realization of the automation project.

Structure of the hardware and network editor

The hardware and network editor consists of the following components:

① Device view (Page 530), Network view (Page 527), Topology view (Page 536): Graphic area

② Device view (Page 530), Network view (Page 527), Topology view (Page 536): Table area

③ Hardware catalog (Page 544)

④ Inspector window (Page 539)

The hardware and network editor provides you with three views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device ot topology view.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

10.1.1.2 Overview of settings for hardware configuration

In "Options > Settings > Hardware configuration", you can make various settings relating to the hardware configuration.

Overview

The following table provides an overview of the settings for the hardware configuration:

Group	Setting	Description
Information on product support	Deactivated	Prevents access to the Siemens Industry Online Support
	Via Internet	Enables access to product information about individual devices in the hardware catalog via the Internet.
Topology overview	Temporarily assigning an IP address	Assigns a temporary IP address for topology discovery if a device does not have a valid IP address. Topology information (LLDP) cannot be read from a device without valid IP address.
	Show a warning if the option is activated	Shows a warning when a temporary IP address is assigned to a device during topology discovery.
Compiling and downloading	Download module comment	Transfers any existing comments in addition to the hardware configuration when loading the hardware configuration to the device. The comment is available after the device is loaded to a programming device.
	Download I&M data	This option must be enabled if you want to be able to also download I&M data to the actual hardware when downloading the hardware configuration, the software or both to a device.

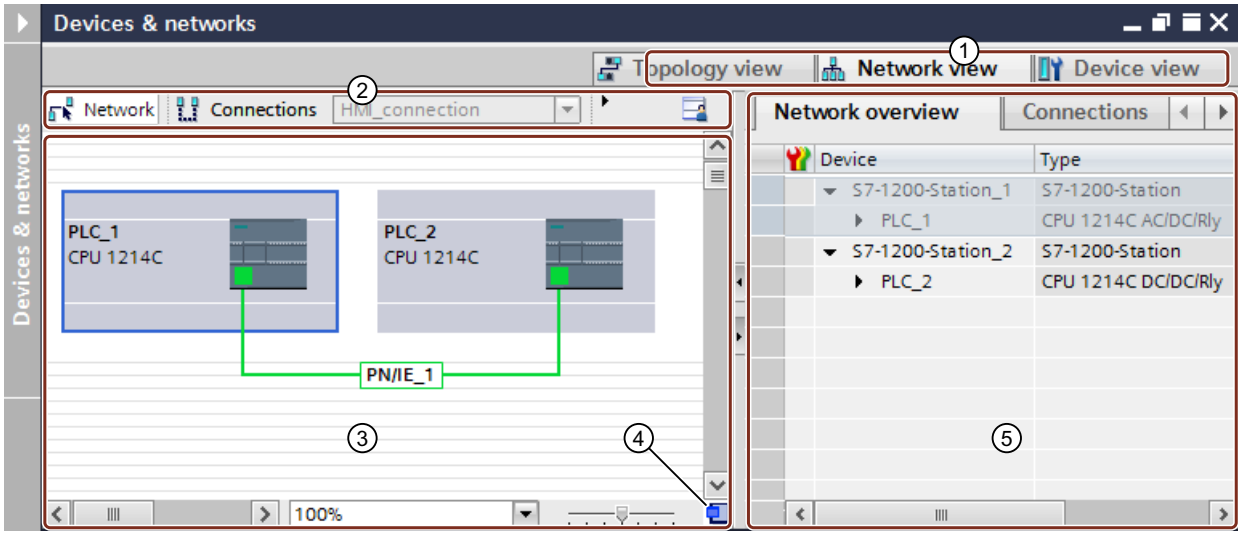
10.1.1.3 Network view



Introduction

The network view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Networking devices with one another
- Editing the device names

Structure

The following diagram shows the components of the network view:

① Changeover switch: device view / network view / topology view
② Toolbar of network view
③ Graphic area of network view
④ Overview navigation
⑤ Table area of network view

You can use your mouse to change the division between the graphic and table areas of the network view. The division can be changed between horizontal and vertical using a button in the toolbar. To change the position of the divider, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can use the adjacent drop-down list to set the connection type.
	Mode to create relations.
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Show interface addresses. You can edit the addresses for the MPI, PROFIBUS and Ethernet interfaces in the network view itself: Select the required address and then click on the selected address field or press [F2].
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.

Icon	Meaning
	You can zoom in (+) or zoom out (-) the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Changes the division of the graphical area and table area of the editor view between horizontal and vertical.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- Relations
- IO Communication
- VPN

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

See also

Adding a device to the hardware configuration (Page 556)

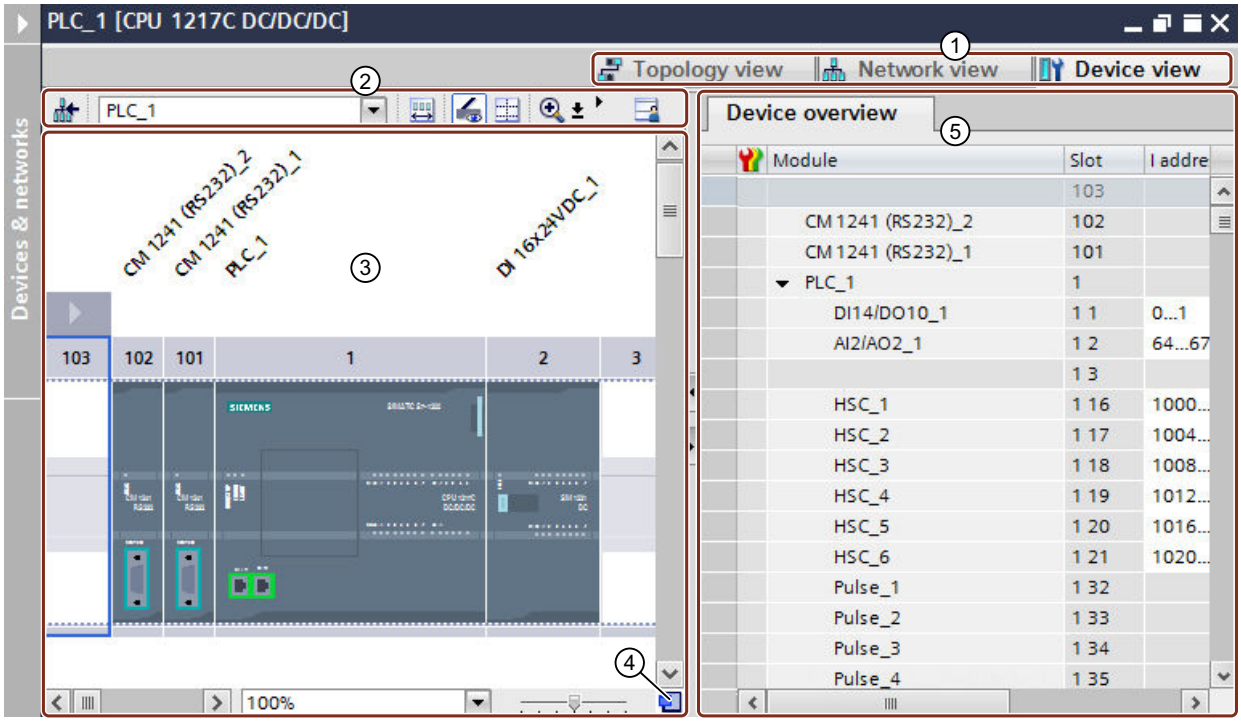
Tabular network overview (Page 589)

Layout of the user interface (Page 238)

10.1.1.4 Device view



Introduction

The device view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Configuring and assign module parameters
- Editing the names of devices and modules

Structure

The following diagram shows the components of the device view:

① Changeover switch: device view / network view / topology view
② Toolbar of device view
③ Graphic area of the device view
④ Overview navigation
⑤ Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view. The division can be changed between horizontal and vertical using a button in the toolbar. To change the position of the divider, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

You can switch between the devices in your project in the device view using the drop-down list in the toolbar. The following functions are also available for device selection in addition to the drop-down list:

Icon	Meaning
	Switches to the network view. The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Show module labels. You can edit the labeling in the device view itself: Select the required labeling and then click on the selected text field or press [F2].
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	You can use the Zoom icon to zoom in (+) or out (-) incrementally or to drag a frame around an area to be enlarged. With signal modules, you can recognize the address labels of the I/O channels from a zoom level of 200% or higher.
	Changes the division of the graphical area and table area of the editor view between horizontal and vertical.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

See also

Rack: Basics (Page 561)

Network view (Page 527)

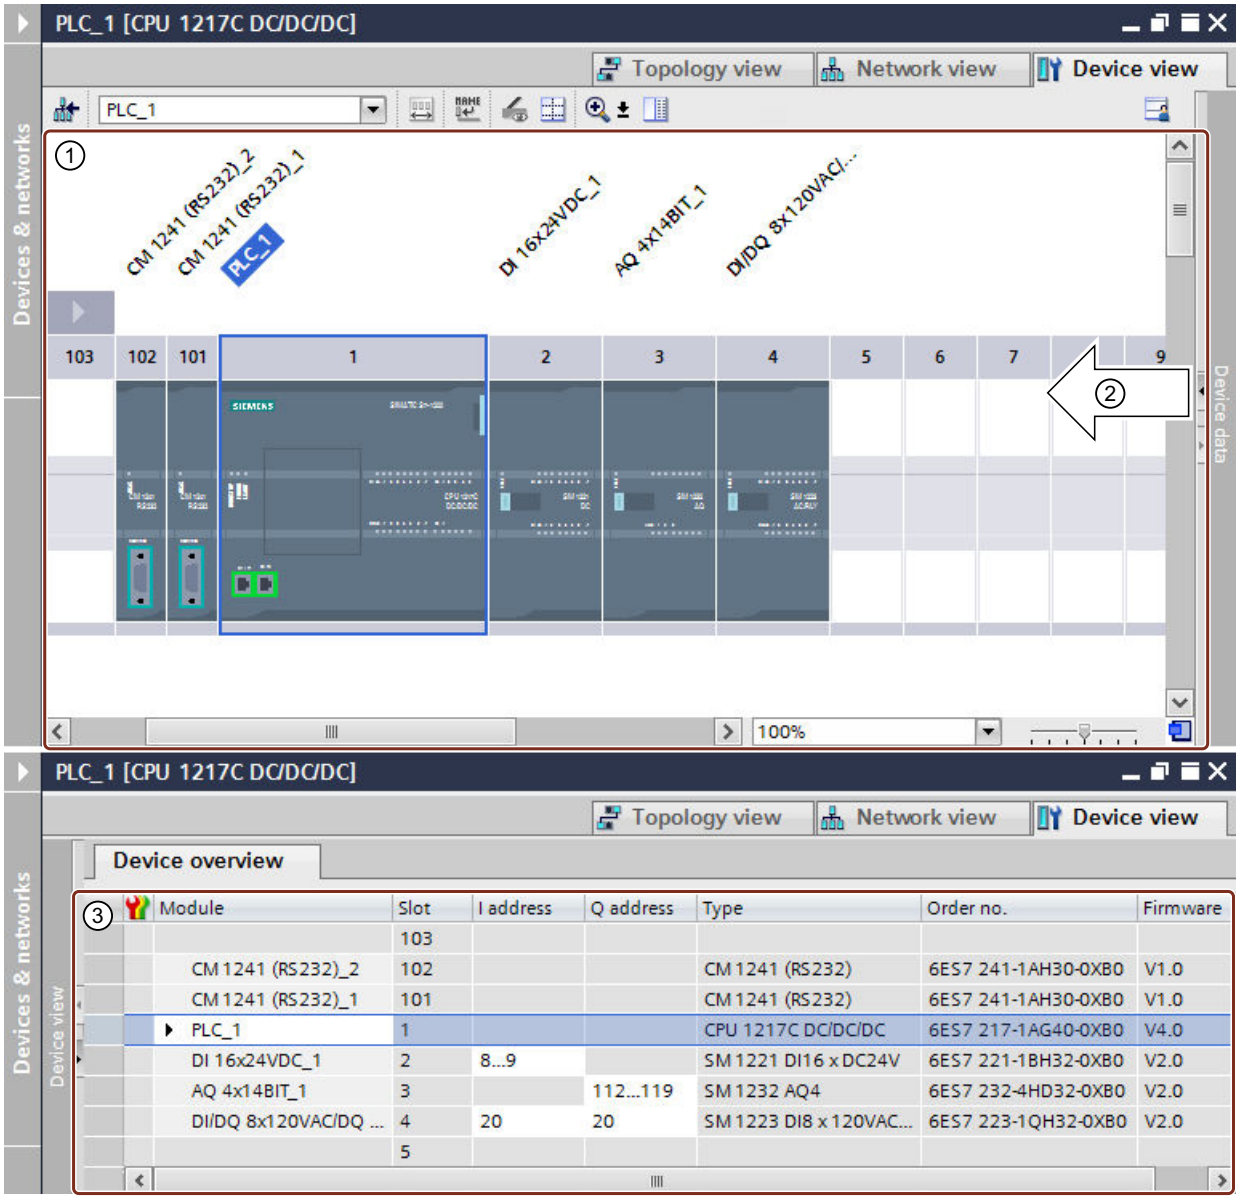
Device view: Area for unplugged modules (Page 535)

Rack: Inserting a module (Page 564)

Device view: Objects in the device view (Page 532)

Layout of the user interface (Page 238)

10.1.1.5 Device view: Objects in the device view



A graphic display of the rack and the devices plugged into it is shown in the left area of the device view. You can see the device overview in the right area of the device view. The device overview is a table showing you the most important information about the modules inserted in the rack. Both areas are displayed in a window. The size of both areas is adjusted using a divider. You can also use it to display one or the other area in full or to hide them.

Structure and content of device view

The offline configuration of the devices in the rack are displayed in the graphic device view. This is a symbolic representation of the configuration on the real rack.

The rack configuration is displayed as a table in the device view. Each line in the table contains the information for assigning a slot.

The following screenshot shows the device view with the configuration of a SIMATIC S7-1200 CPU.

① Graphic view of the allocation of the rack by the CPU and various modules in slots 1 to 4, as well as 101 and 102.

② You can use the divider to adjust the proportion of the device view between the left area (graphic view) and the right area (device overview). If you click on the arrows, you can quickly switch the division of the separate areas.

③ Device view with the tabular representation of the rack's slots and the inserted components. You can show additional columns and hide displayed columns using the shortcut menu of the column title.

Each line in the device overview represents one slot. The key information for each slot is displayed in the various columns:

Column	Meaning
Online status	Symbolic representation of the online status
Fail-safe	Symbolic representation for fail-safe module
Module	Name of module, can be edited in any way

Column	Meaning
Rack	Number of the rack
Slot	Slot number
I address	Input address area, can be edited in any way
Q address	Output address area, can be edited in any way
F-source address	F-source address when using fail-safe I/O
F-destination address	F-destination address when using fail-safe I/O
Type	Catalog name of module
Article no.	Article number of the module
Firmware	Firmware version of the module
Comment	Optional comment

Display in I/O channels

If you set the zoom level in the device view to at least 200%, you can see the individual I/O channels for I/O modules. If you have defined PLC tags for the channels, the names of the PLC tags are displayed.

The figure below shows the input channels of the digital input module with the two PLC tags "Test1" and "Test2" at a zoom level of 400 %.

You can select the individual I/O channels and have the following options for channels with PLC tags:

- You see the general properties of the selected PLC tag in the inspector window under "Properties".
- In the inspector window under "Info > Cross-references" you find the cross-reference information on the selected PLC tag. If you have selected the PLC tag, you can also open the cross-reference information using the shortcut menu.

See also

Device view (Page 530)

Overview of PLC tag tables (Page 4837)

10.1.1.6 Device view: Area for unplugged modules

In some cases, the modules for a hardware configuration are not assigned a slot for short periods. Such unplugged modules are moved to the area of unplugged modules, a special area in the device view.

Adding modules to the storage area

The modules that, for example, should be assigned to a device using a copy action but for which the corresponding rack does not have a free compatible slot, are moved automatically into the area of unplugged modules.

Under the following conditions, modules are automatically added to the area of unplugged modules:

- In the network view, a module is moved to a device but the rack does not have a compatible free slot.
- In the device view, a module is moved or copied from the rack, the hardware catalog or the project tree straight into the storage area.

CPs and FMs that occupy a network resource can be moved into the area of unplugged modules but will lose the network resources they have been assigned.

You can add modules to the area of unplugged modules by means of drag-and-drop, for example. To do this, the area must be opened.

Using the area of unplugged modules

Use the corresponding button to open the area of unplugged modules.

You can find the area of unplugged modules in the device view.

You open the area of unplugged modules with the respective icon in the toolbar of the device view (Page 530).

Icon	Meaning
	Open area of unplugged modules

Note

To free up slots, move modules from your configuration into the storage area and plug the modules you want from the storage area into the freed up slots.

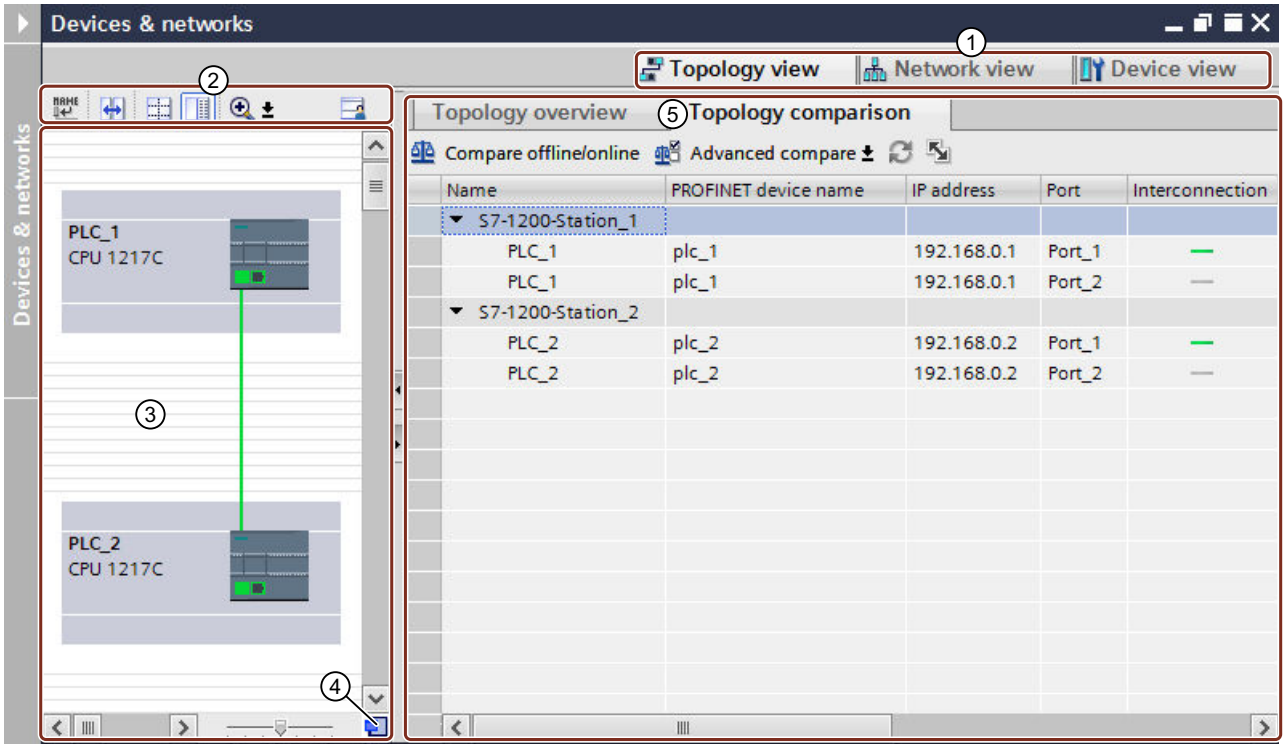
You can use this approach to temporarily move modules whose parameters have already been assigned out of the configuration without deleting them.

Treatment of modules in the storage area

The following rules apply to modules in the storage area:

- The modules appear in the project tree under the corresponding device in the "Local modules" folder.
- The modules retain all settings and parameters previously assigned.
- The modules are not taken into account during loading to a target system. This means that a consistency check is not undertaken for modules in the area of unplugged modules.
- Using the context menu, the modules can be copied, cut, or deleted, for example.

10.1.1.7 Topology view



Introduction

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identifying and minimizing differences between the desired and actual topology
- Editing the device names

Structure

The following figure provides an overview of the topology view.

① Changeover switch: device view / network view / topology view
② Topology view toolbar
③ Graphic area of the topology view
④ Overview navigation
⑤ Table area of the topology view (topology overview)

You can use your mouse to change the spacing between the graphic and table areas of the topology view. The division can be changed between horizontal and vertical using a button in the toolbar. To change the position of the divider, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Opens the dialog for manual name assignment for PROFINET devices. For this purpose the IO device must be inserted and connected online with the IO system.
	Changes the position of the devices in the topology view so that the new position is as close as possible to the position in the network view.
	Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.

Icon	Meaning
	You can zoom in (+) or zoom out (-) the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Changes the division of the graphical area and table area of the editor view between horizontal and vertical.
	Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port interconnections. Here you can add additional hardware objects with Ethernet interfaces. See: Adding a device to the hardware configuration (Page 556)

The operator controls for view control are located at the bottom edge of the graphic area:

- Select the zoom leveling using the drop-down list. You can also enter a value directly into the field of the drop-down list.
- You can also set the zoom level using the slider.
- You can re-focus the window of the graphic area using the icon in the bottom right corner.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate in the overview navigation to the desired objects and display them in the graphic area.

Table area

The table area consists of the following two tabs:

- "Topology overview" tab
- "Topology comparison" tab

The "Topology overview" tab displays the Ethernet or PROFINET modules, their ports and port interconnections in a table. This table corresponds to the network overview table in the network view.

In the "Topology comparison" tab, you identify and minimize differences between the desired and actual topology.

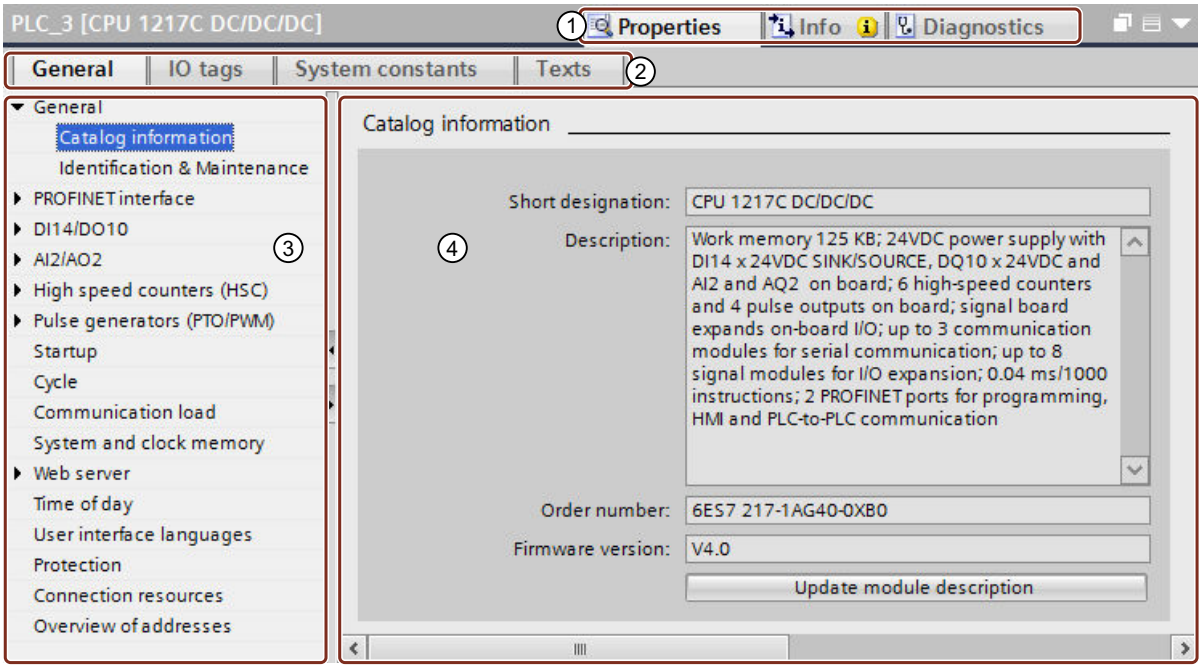
Overview of settings for hardware configuration (Page 526)



Layout of the user interface (Page 238)

10.1.1.8 Inspector window

The properties and parameters shown for the object selected can be edited in the Inspector window.

Structure

The Inspector window consists of the following components:

① Switch between various information and work areas

② Switch between various tabs of the information and work areas

③ Navigation between various pieces of information and parameters

④ Display showing the selected information and parameters

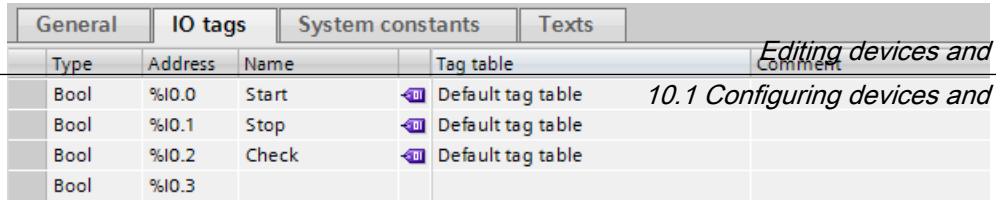
Description of functions

The information and parameters in the Inspector window are split into different types of information with different tabs:

- Properties
  This is where you can configure the device. You can make the settings for the hardware, edit tags and system constants and manage project texts. The following tabs are available here:
  - General (see Properties and parameters (Page 575))
  - IO tags (see Overview of PLC tag tables (Page 4837))
  - System constants (see Rules for global system constants (Page 4853))
  - Texts (see Project text basics (Page 407))
- Info
  In this area, you will find general information on the device in the project, a cross-reference list and messages and notes on compiling the device. The following tabs are available here:
  - General
  - Cross-reference list (see Cross-references in the Inspector window (Page 5172))
  - Compiling (see Information on compiling (Page 347))
- Diagnostics
  When you go online with the device, you will find the diagnostic information for the device and its connections here. The relevant diagnostic messages are also displayed. The following tabs are available here:
  - Device information (see Hardware diagnostics)
  - Connection information (see Connection diagnostics)
  - Message display (see Message display)

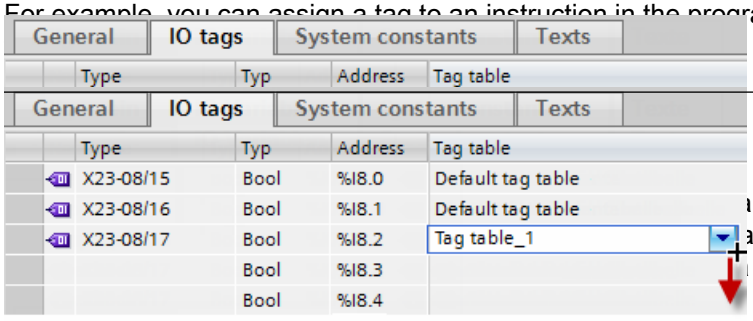
To display the corresponding information and parameters, click in the relevant area.

Display of device properties



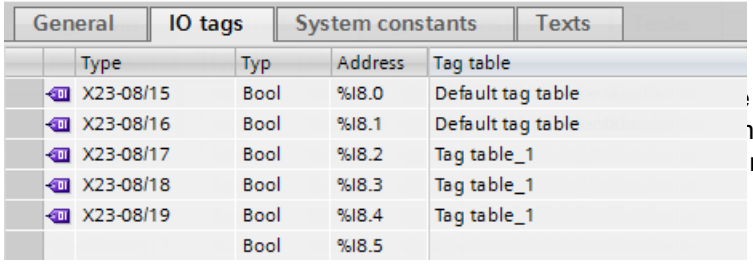
The "Properties" area is the most important one for configuring an automation system. The editing options for this area are therefore described in detail below. For information on the other areas, please see the links above to other sections of the information system.

"General" tab



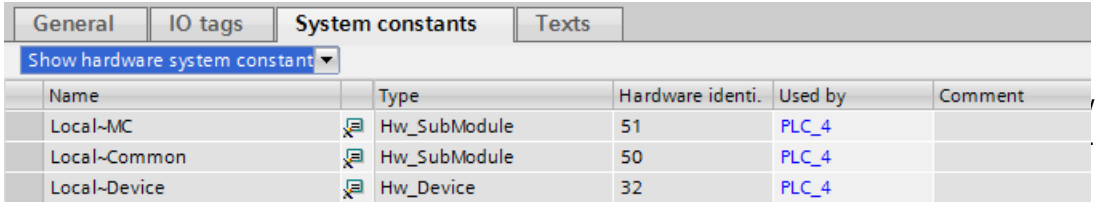
Display the properties and settings of the device or module. Here you can edit the settings and parameters. The left pane of the Inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the Inspector window and can be edited there too.

"IO tags" tab



Display the IO tags of the device, the PLC and the individual modules. You can assign names for the tags, assign the tags to the user-defined tag tables via a drop-down list, and enter comments for the tags. The IO tags are also shown in the PLC tag table.

You can click on the tag symbols in the table to drag and drop tags for use in other editors. For example, you can assign a tag to an instruction in the programming editor or copy a tag



lso click on the name of a tag
above or below. A new tag is
number is added to the name
a number, the number is

new tags for the tag table or
the drop-down list and drag
new tags in the corresponding

If existing tags are affected by these actions, a dialog appears to ask whether the affected tags should be overwritten or whether new tags should only be inserted in empty fields. In the latter case, this means that only three tags are added to an area with nine fields and six existing tags; the existing tags are not changed.

With I-slaves and I-devices, the system constants of the DP master or IO controller relating to the I-slave or I-device are also displayed.

If you click on the link in the column in which the use of the constant is displayed, the device view of the corresponding device opens. The system constants are also shown in the PLC tag table.

You can click on the constant symbols in the table to drag and drop system constants to use in other editors. For example, you can assign a system constant to an instruction in the programming editor or create a system constant as a user constant in another device.

"Texts" tab

Display the reference language and specify the text source for the project texts. Please see the rest of the information system.

See also

Overview of hardware and network editor (Page 525)

Translating project texts (Page 411)

Addressing modules (Page 1045)

Inspector window: Displaying UDTs (Page 542)

10.1.1.9 Inspector window: Displaying UDTs

Under "Properties > IO tags", the Inspector window displays self-defined data structures comprising multiple elements. These UDT (User Defined Structure) PLC data types are displayed differently from simple IO tags.

Display of UDTs in the I/O tag table

Structured PLC tags that occupy the address space of a module are displayed along with the data items they contain in combined columns. Occupied address areas are indicated by vertical lines and individual addresses by small diamonds.

The following symbols are used for display in line with IO module channel address assignment by the address area of the UDTs:

Symbol	Meaning
	Start of a data item address area covering several channels. The address area of the entire channel is used.
	Part of a data item address area covering several channels. The address area of the entire channel is used.
	End of a data item address area covering several channels. The address area of the entire channel is used.
	Complete address area of a data item over the address area of a channel used in full. Example: Only the input word of a channel is completely used for a data item.
	Start of a data item address area covering several channels. Only part of the address area of the channel is used.
	End of a data item address area covering several channels. Only part of the address area of the channel is used.
	Complete address area of a data item. Only the first part of the channel address is used. Example: Only the first byte of a word is assigned.
	Complete address area of a data item. Only the second part of the channel address is used. Example: Only the second byte of a word is assigned.
	Single address of a data item for a channel that only has one address. Example: Individual bit access to the channel address of a digital input.
	Single address of a data item for a channel that has multiple addresses. Example: Individual bit access to the channel address of an analog input.

Application example

The figure below shows a tag table with a UDT "Motor" PLC data type and its data items "Start", "Stop" and "Dummy":

	Name	Data type	Address
1	Start	Bool	%I2.0
2	Stop	Bool	%I2.1
3	ErrorCode	Byte	%IB3
4	Motor	"MotorUDT"	%I0.0
5	Dummy	Word	%IW0
6	Start	Bool	%I2.0
7	Stop	Bool	%I2.1
8	Status	Array[0..7] of B...	%I4.0
9	Status[0]	Bool	%I4.0
10	Status[1]	Bool	%I4.1

For a DI32 input module with input addresses I0.0 to I3.7, you see the combined column "Motor ("MotorUDT")" under the IO tags in the Inspector window. This combined column contains a column for the address area of the UDT "Motor" and a column for the data items contained in the UDT: "Motor.Dummy", "Motor.Start" and "Motor.Stop". The "Status" data item only starts at address I4.0 and is not displayed in the IO tags for this input module, because the address area of the 32 digital channels only runs from I0.0 to I3.7. The tag "ErrorCode (Byte)" is not part of the UDT. It is therefore not displayed in the combined column under UDT "Motor", but is instead shown in a separate column:

General | IO tags | System constants | Texts

Type	Address	Name	Tag table	Motor ("MotorUDT")		ErrorCode (Byte)
	Bool	%I0.0		Motor	Motor.Dummy	
	Bool	%I0.1				
	Bool	%I0.2				
	⋮	⋮		⋮	⋮	
	Bool	%I1.7				
Start	Bool	%I2.0	Default tag table		Motor.Start	
Stop	Bool	%I2.1	Default tag table		Motor.Stop	
	Bool	%I2.2				
	⋮	⋮		⋮		
	Bool	%I2.7				
	Bool	%I3.0				
	Bool	%I3.1				
	Bool	%I3.2				
	⋮	⋮		⋮		⋮
	Bool	%I3.7				

The UDT "Motor" in this module occupies an address area from I0.0 to I3.7. Within this address area, the "Dummy" tag occupies the address area from I0.0 to I1.7, and the two tags "Start"

and "Stop" occupy the single addresses I2.0 and I2.1. The "ErrorCode (Byte)" tag that is not part of the UDToccupies addresses I3.0 to I3.7 in its own column.

Note

The table of IO tags only shows the data in the address area of the selected device; in this case the address area of the input module DI32. If another input module with at least 16 channels is connected, the display of the address assignment is continued by the UDT with the extended address area: The address area of the UDT "Motor" runs to address I5.7, and the status data item it contains covers addresses I4.0 to I5.7. The "Status" data item occupies single addresses for individual status bits from I4.0 to I4.7. An additional column is added to the combined column of the UDT to display the status bits.

10.1.1.10 Hardware catalog

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

Structure

The "Hardware catalog" task card consists of the following panes:

① "Catalog" pane, search and filter function
② "Catalog" pane, component selection
③ "Information" pane

Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. After entering the search text, you can start a search in the upwards or downwards direction from the current catalog position.

You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions. Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

You can create hardware profiles with which the objects displayed in the hardware catalog are limited. For example, you could create a hardware profile in which only certain controllers can be seen and another profile in which only certain devices of the distributed I/O are included. You can switch between the created hardware profiles.

Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Article number
- Version number
- Description
- Type Identifier (only when activated)

Note

Type Identifier

You can activate the display of the "Type Identifier" attribute in the "Options > Settings > Hardware configuration" menu. If the Type Identifier is activated, hardware objects for use in external development environments can be uniquely identified. The Type Identifier is displayed in the "Information" pane in the hardware catalog.

Browsing the hardware catalog (Page 547)

Overview of hardware and network editor (Page 525)

10.1.1.11 Browsing the hardware catalog

Introduction

Use the "Hardware catalog" task card to select the hardware components you want for a hardware configuration. Use the hardware catalog to select the interconnectable hardware components in the network and topology view and to select the modules you want in the device view.

Context filter

You can use the "Filter" option of the hardware catalog to restrict the number of displayed hardware components and the number of hardware components that can be found by searching.

When you enable the filter, components available in the hardware catalog are displayed depending on the selected view and the selected device. If you switch between the various views, the view of the filter objects is adapted to the current context. If the filter is not enabled, the entire hardware catalog is displayed in all views.

Example: With the filter enabled in the device view of an S7-1200 CPU, only S7-1200 CPUs and matching modules are displayed in the hardware catalog.

Search options

You can use the search function to search for specific entries in the hardware catalog. Note the following rules when entering search terms:

- No distinction is made between upper and lower case text.
- Dashes and blanks are ignored during the search.
- The search function considers parts of a search term.
- Multiple search terms must be separated by a space.
- The asterisk "*" is used as a wildcard.

Note

Use of wildcards in the hardware catalog

In search queries, the asterisk "*" is used as a wildcard. A search for "1A**0", for example, also return hits with "1AD30" or "1AE40". The hardware catalog also contains modules with wildcards in their article numbers. The wildcards in the various article numbers can be either asterisks or the lowercase letters "x", "y" or "z". If you search for the specific article number "3RW4 422-1BC34", for example, your search will also return articles with the number "3RW4 422-*BC**" and "3RW4 4xx-1By3z".

You start the search from an object highlighted in the hardware catalog and either search upwards or downwards.

Icon	Meaning
	Search down
	Search up

Browsing the hardware catalog

If you want to browse the hardware catalog, proceed as follows:

1. Click in the entry field of the search function
2. Enter a search term. The search includes the following elements:
   - Name of device or module
   - Article number (MLFB)
   - Description in "Information" pane
3. Click on either the "Search down" or "Search up" button.

Note

To ensure the right search direction, note which point you have marked in the hardware catalog. To browse the entire catalog, click on the topmost object of the hardware catalog and start the search once you have entered the search term by clicking "Search down".

The first match with the search term found is displayed as the result. For more search results, again click on the "Search down" or "Search up" button.

Observe the context filter of the hardware catalog. If this is selected, the search in the hardware catalog is restricted to the displayed inserted hardware components.

10.1.1.12 Enabling product support

For each device in the hardware catalog, you have the option of displaying additional information that is stored in the Siemens Industry Online Support. By default, the function is disabled. Instructions for enabling the function are given below.

Requirement

The TIA Portal has access to the Internet.

Procedure

To enable access to Siemens Industry Online Support, follow these steps:

1. In the "Options" menu, select the "Settings" command.
2. Open the "Hardware configuration" group in the area navigation.
3. Select the "Via Internet" check box.

Result

You can access product support, FAQs and manuals in the hardware catalog via the shortcut menu for the module.

See also

Displaying product support for hardware components (Page 549)

Overview of settings for hardware configuration (Page 526)

10.1.1.13 Displaying product support for hardware components

In the hardware catalog, you have direct access to information that is stored for each module in Siemens Industry Online Support. You can jump directly to the following pages in Siemens Industry Online Support:

- Information on product support
- FAQs
- Manuals

Requirement

- You have access to the Internet.
- Access to Product Support is enabled in the settings of the TIA Portal.
  For information on how to enable the function, refer to section "Enabling product support (Page 548)".

Procedure

To display the information for a particular module in Siemens Industry Online Support, follow these steps:

1. Navigate to the required module in the hardware catalog.
2. Right-click the module.
3. Select one of the following entries in the shortcut menu:
   - Information on product support
   - FAQs
   - Manuals

Result

The default browser set in the operating system is opened and the relevant page in the Siemens Industry Online Support is loaded.

Enabling product support (Page 548)

Overview of settings for hardware configuration (Page 526)

10.1.1.14 Printing hardware and network configurations

Printout of hardware and network configurations

You can print out the following elements of the hardware and network view as part of the project documentation:

- Graphic network view
- Network overview table
- Graphic device view
- The device overview table
- The parameters of the object currently selected in the editor

Printout of editor content

If you start a printout within an opened editor and no module is selected, the content of the editor is always printed. This includes a graphic representation of the editor as well as the table for the editor. You can adapt the scope of the printout. You can specify whether only the graphic view, the table or both together are to be printed. Read section "Printing: Changing settings (Page 552)" for more on this.

If the graphic is larger than the page layout you have selected, the printout is continued on the next page. No content is lost this way. Alternatively, you can change the zoom level of the graphic representation to fit the printout on one page. The printout is always made in the currently selected zoom setting.

To check that all content fits on one page, you can either use the print preview or activate the page break preview. When page break preview is activated, dashed lines are displayed within the graphic editor at the location where the page break is later made.

Printing very large tables

If a table is larger than the print area and therefore cannot be fully printed, the content of the table is not printed as a table, but instead as pairs between value and key.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

Object A

Property 1: Value A1

Property 2: Value A2

Object B

Property 1: Value B1

Property 2: Value B2

You can also preset this as a template so that tables are always printed as pairs between the key and the value. Read section "Changing the print settings (Page 382)" for more on this.

Printing module parameters

Parameters of selected modules are printed out along with the current value settings in text form. All parameters from corresponding modules are also printed. For example, if you have selected a CPU, the parameters of an inserted signal board, if present, are printed as well.

You can determine the scope of the module parameters to be printed. In the "Print" dialog, select whether all properties and parameters of a module are to be printed or whether to use the compact printout. If you select the compact form, only the entries in the "General" area of the module properties are printed. Comments on modules, as well as the author and module description, are excluded. In compact mode, the following module parameters are therefore printed, for example:

- Module specifications
  Name, module slot, short description, article number, firmware version
- Name of the PROFINET interface
- Subnet specifications
  Name of the subnet, ID of the S7 subnet

Printing: Changing settings (Page 552)

Documentation settings (Page 380)

Creating a print preview (Page 394)

Printing project data (Page 397)

Printing: Enabling page break preview (Page 552)

10.1.1.15 Printing: Changing settings

Changing the scope of the printout

When printing from an editor, you can specify whether both graphics and tables are to be printed or just one of the two. Both are printed by default.

Procedure

To change the scope of the printout, proceed as follows:

1. In the "Options" menu, select the "Settings" command.
2. In the area navigation, open the "Print settings" parameter group under "General".
3. Scroll to the "Hardware configuration" group.
4. Select or clear the "Active graphic view" check box, depending on whether you want to print the graphics of the network and device view as well.
5. Select or clear the "Active table" check box, depending on whether you want to print the table for the editor as well.

See also

Printing hardware and network configurations (Page 550)

10.1.1.16 Printing: Enabling page break preview

You can activate the page break preview for the printout in the graphic editor. If this option is activated, dashed lines are shown within the graphic editor at the locations where page breaks are later made during printout.

Procedure

Proceed as follows to activate the page break preview:

1. Select the graphic area of the corresponding view.
2. Click on the "Show page break" symbol in the toolbar of the graphic editor.
   Dashed lines are displayed within the graphic editor at the location a page break is later made.
3. To modify the frame layout, select the "Print" command in the "Project" menu.
4. To disable page break preview, click again on the "Show page break" symbol in the toolbar of the graphic editor.

10.1.1.17 Keyboard operation: Navigation in the editor

You can use shortcut keys in the network and device view to navigate between the components of the hardware and network editor and its objects.

Navigating between elements and functions

Function	Shortcut keys
Switch to the next lower selection level You can for example, use <Return> to switch from a selected rack to the lower selection level of the devices and modules that are snapped onto it. If a device is selected, you can use <Return> to switch to the lower selection level of the interfaces that are displayed on the device.	<Return>
Switch to the next higher selection level You can use <Esc>, for example, to switch from a selected interface to the higher selection level of the devices and modules. If a device is selected, you can use <Esc> to switch to the higher selection level of the rack.	<Esc>
Navigation between objects in the current selection level You can use the arrow keys to switch between the objects within a current selection level. To change the selection level, use the <Return> or <Esc> keys.	<Up arrow> <Down arrow> <Right arrow> <Left arrow>
Switches to the device view	<Ctrl+Shift+D>
Switches to the network view	<Ctrl+Shift+N>
Switches to the topology view	<Ctrl+Shift+T>
Switch between editor elements Use the <Tab> key to switch from one editor element to the next element. Use <Shift +Tab> to switch to the previous element. You can switch, for example, between the graphical view, Speedy Splitter, table view or underlying tabs.	<Tab> <Shift+Tab>
Switch between tabs Use the <Ctrl+Tab> keys to switch from one tab to the next tab on the right. Use <Ctrl +Shift+Tab> to switch to the next tab to the left. You can use these keys, for example, to switch between the device view, the network view and the topology view.	<Ctrl+Tab> <Ctrl+Shift+Tab>

Opening elements and functions

Function	Shortcut keys
Opening the online and diagnostics view When a device is selected, <Ctrl+D> opens the online and diagnostics view for the selected device.	<Ctrl+D>
Opening the download to device dialog When a device is selected, <Ctrl+L> opens the advanced download dialog.	<Ctrl+L>
Add new device <Ctrl+N> opens the dialog for adding a new device.	<Ctrl+N>
Opens the "Hardware catalog" task card	<Ctrl+Shift+C>
Opens "Online Tools" task card	<Ctrl+Shift+O>

See also

Keyboard operation in the TIA Portal (Page 270)

10.1.1.18 Keyboard operation: Editing objects

You can execute some of the functions of the network and device view directly with a combination of keyboard and mouse in the hardware and network editor. The keyboard operation in tables (Page 270) corresponds to standard characteristics. Here you find the keyboard operation for the graphic work area of the network and device view.

General keyboard operation

Function	Shortcut keys
Zoom in on view in frame Drag a frame in the graphical view in order to correspondingly change the size of the view.	<Ctrl+Space> + pressed mouse button
Move view Move the mouse pointer in order to move the view.	<Space> + pressed mouse button
Cancel current operation	<Esc>
Separate connection Use <Esc> or a double-click to exit connection mode when dragging a connection.	<Esc> or double-click
Zoom in graphic view The enlargement or reduction depends on the direction of rotation.	<Ctrl> + turn mouse wheel

Selected objects

Function	Shortcut keys
Select object	Mouse click
Cut an object The selected object is copied to the clipboard and deleted from the graphical view.	<Ctrl+X>
Copy object The selected object is copied to the clipboard.	<Ctrl+C>
Paste object The object from the clipboard is inserted into the selection.	<Ctrl+V>
Delete selected object	<Del>
Select several objects 1 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected.	<Shift> + click
Select several objects 2 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected. When holding down the <Ctrl> key, you can use a mouse click to deselect selected objects.	<Ctrl> + click

Function	Shortcut keys
Move selection When the mouse button is pressed, you can drag devices or modules to allowed slots on a rack.	Mouse button pressed
Copy selection Using <Ctrl> + pressed mouse button you can drag devices and modules to allowed slots on a rack. This copies the devices or modules.	<Ctrl> + pressed mouse button

10.1.2 Configuring devices

10.1.2.1 Introduction to configuring hardware

To set up an automation system, you will need to configure, assign parameters and interlink the individual hardware components. The work needed for this is undertaken in the device and network view.

Configuring

"Configuring" is understood to mean arranging, positioning, and networking devices and modules within the device or network view. Racks are represented symbolically. Just like "real" racks, they allow you to plug in a defined number of modules.

An address is automatically assigned to each module. The addresses can be subsequently modified.

When the automation system is started, the CPU compares the configuration that is preset by the software with the actual configuration of the system. Possible errors can be detected and reported straight away.

Assigning parameters

"Assigning parameters" is understood to mean the setting of properties of the components used. Parameter assignment is carried out for hardware components and for data exchange settings:

- Properties of modules with assignable parameters
- Settings for data exchange between components

The parameters are loaded to the CPU and transferred to the corresponding modules when the CPU starts up. Modules can be replaced with ease since the assigned parameters are automatically loaded into the new module during startup.

Adjusting the hardware to the project requirements

You need to configure hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your configuration, connect them to existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset in such a way that in many cases there is no need for additional parameter assignment. Parameter assignment is however needed in the following cases:

- You want to change the default parameter settings of a module.
- You want to use special functions.
- You want to configure communication connections.

See also

Changing properties of the modules (Page 980)

10.1.2.2 Adding a device to the hardware configuration

Introduction

There are various ways of adding a connectable device from the hardware configuration in the network view and the topology view:

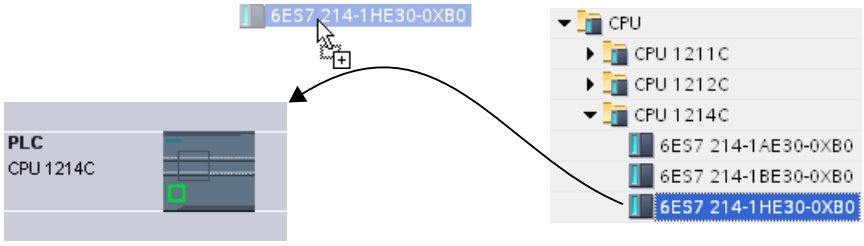
- Command "Add new device" in the project tree
- Double-click device in hardware catalog
- Drag-and-drop from the hardware catalog in network view or in topology view:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- "Add > Device" command from menu bar in network view or topology view
- Shortcut menu of a device in the hardware catalog for copying and pasting

A suitable rack is created along with the new device. The selected device is inserted at the first permitted slot of the rack.

Regardless of the method selected, the added device is visible in the project tree and the network view of the hardware and network editor.

Adding device using the project tree

To use the project tree to add a device to the hardware configuration, proceed as follows:



1. Click on the command "Add new device" in the project tree.
   The "Add new device" dialog box opens.
2. Display the required device in the tree structure:
   - Go to required device in the tree structure.
   - Enter a device name in the entry field.
3. Select the required device from the tree.
   More information about the device presently selected is displayed on the right-side of the dialog box.
4. If necessary, set the firmware version using the drop-down list in the dialog box.

5. Select the "Open device view" check box if you want to change to the device view immediately after adding the device.
   There you can immediately continue with device configuration and equipping the rack.
6. Click on "OK" to add the device selected.
   The dialog box closes.

Adding device from the hardware catalog

To add a device to the hardware configuration using the hardware catalog, proceed as follows:

1. Open the network view or the topology view.
2. Open the hardware catalog.
3. Go to the required device in the hardware catalog.
4. Click on the chosen device to select it.
5. If necessary, set the firmware version using the drop-down list in the hardware catalog.
6. Drag the device to the network view or the topology view.

You have now placed the device in the network view or in the topology view. The displayed rectangle (in other words "Station") symbolizes the plugged device together with its rack and any lower-level modules. Double-click on the device or station to open the device view and view the new rack and inserted device. In the next steps, you can configure the device in the device view and equip the rack with modules.

See also

Network view (Page 527)

Adding an unspecified CPU (Page 557)

Topology view (Page 536)

10.1.2.3 Adding an unspecified CPU

Introduction

If you have not yet selected a CPU but have already started programming or want to use an existing program, you have the option of using an unspecified CPU. You can also adjust some settings with unspecified CPUs. The setting options are restricted to parameters that all CPUs of the same CPU family have in common.

Adding an unspecified CPU in the portal view

To add an unspecified CPU in the portal view, follow these steps:

1. Now, click one of the following options:
   – "Devices & networks > Add new device"
   – "PLC programming" > "Device" button
2. For a device family, select an unspecified CPU from the tree structure of the "Add new device" dialog.
3. Click on "Add".

An unspecified CPU is added and the device view for this CPU is opened.

Further options for adding unspecified CPUs

In the project view, you can add unspecified CPUs like specified CPUs:

- Using the "Add new device" button in the project tree
- In the "Hardware catalog" task card

You can also use these methods to add multiple unspecified CPUs.

Specifying unspecified CPUs

You have two options for specifying unspecified CPUs:

- Use drag-and-drop to assign an existing CPU from the hardware catalog to an unspecified CPU by means of module replacement (Page 572).
- Select a selected, unspecified CPU and then the menu command "Online > Hardware detection" and assign a CPU identified online. For this purpose, you assign an IP address using the "Add address for PG/PC" button.

Note

If you want to go online after the hardware detection, you have to first download the detected configuration to your project; otherwise, an error may occur due to inconsistent configurations. After hardware detection, the article numbers of the CPU in the project and the actually existing CPU are identical, but their parameters are not. The parameters of the CPU in the project have the default values; the parameters of the actually existing CPU have the values set by you.

After module replacement, F-CPUs behave as a CPU without failsafe functionality. In contrast to F-CPUs from the hardware catalog, after module replacement with an unspecified CPU or a hardware recognition, the F capability is turned off and the protection level is set to "Full access (no protection)".

Selecting a CPU (Page 559)

Adding a device to the hardware configuration (Page 556)

10.1.2.4 Selecting a CPU

Introduction

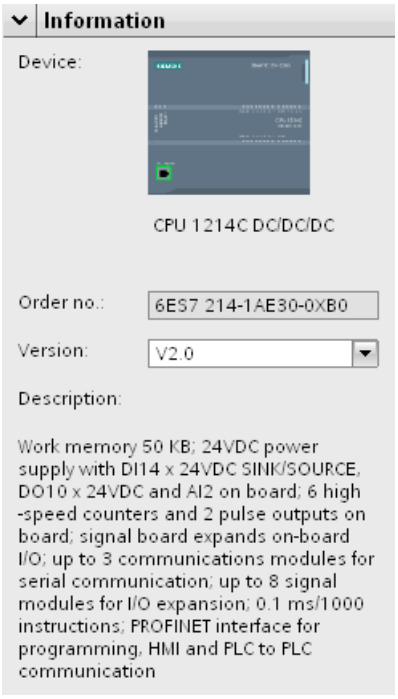
Select a CPU from the hardware catalog and place it, together with a rack, in the network view. On this device drag the desired modules from the hardware catalog; they are arranged automatically on the rack.

Selecting the components in the hardware catalog

Each hardware component is displayed as a folder in the hardware catalog. When you open this folder, you see the different versions of the selected hardware component with its respective article numbers.

There will be an example of how to set up a CPU with a rack in network view.

Requirement



- The hardware catalog is open.
- You must be in the network view.

Procedure

To select a CPU from the hardware catalog, proceed as follows:

1. In the hardware catalog navigate to the folder with the desired CPUs.
2. Open the folder with the desired CPU type; you will see all article numbers for the selected CPU type.

3. Click on a CPU article number to get information about the selected CPU in the "Information" pane.

4. Set up the CPU and a rack. You have the following options:
   - Use drag-and-drop to drag the CPU from the hardware catalog into network view.
   - Use Copy & Paste to copy the CPU to the network view.
   - Double-click the CPU entry in the hardware catalog.

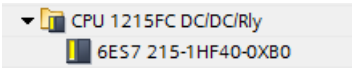
Rack: Basics (Page 561)

Adding an unspecified CPU (Page 557)

10.1.2.5 Selecting fail-safe modules

Introduction

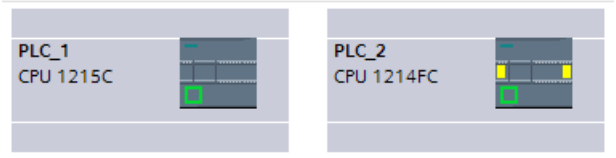


Fail-safe automation systems (F systems) are used to control processes with a safe state that can be achieved immediately on shutdown. F systems control processes that can be shut down immediately without endangering human beings or the environment.

Selecting the F components in the hardware catalog

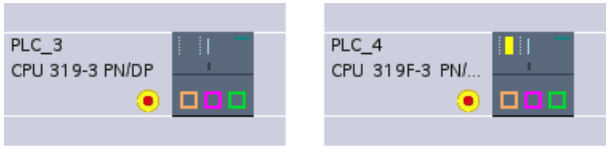
Each hardware component is displayed as a folder in the hardware catalog. Fail-safe hardware components are displayed with yellow symbols in the hardware catalog in contrast to the blue hardware components that are not fail-safe.

The following figure shows an excerpt from the hardware catalog with an F-CPU (yellow).



Based on this color coding, you can identify F components in the hardware catalog simply and quickly.

Display of the F components in the hardware and network editor



If you use fail-safe devices and "normal" devices in the graphic views of the hardware and network editor, you can recognize them simply by the yellow color-coding of the devices.

The following figure shows two CPUs. The F CPU is shown in yellow:

Fail-safe modules in racks or devices can also be recognized in the device view due to their yellow color coding. Since modules that are not capable of networking are not displayed in the network or topology view, devices with F components without networking capability are represented by a special symbol in the network and topology view.

The following figure shows a "normal" CPU and an F-CPU in the network view that both contain F components:

Based on the color coding of the fail-safe devices and modules, you can also identify the F components quickly in the graphic views of the hardware and network editor.

10.1.2.6 Rack: Basics

Introduction

To assign modules to a device, you need a rack, for example a mounting rail. Secure the modules on the rack and connect these via the backplane bus with the CPU, a power supply or other modules.

Creating a rack

If you insert a device in the network view, a station and a rack suitable for the device selected are created automatically. The rack and slots available are displayed in the device view. The number of slots available again depends on the type of device used.

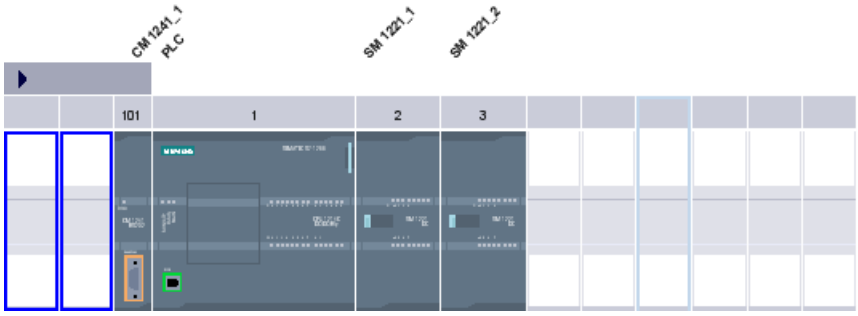
Rack structure

A rack always contains the device that has been inserted in the network view. The device is permanently assigned a slot which will depend on the type of device in question. There are additional slots on the right of the device and, if necessary, on left of the device; slot numbers are located above slots in which devices are plugged.

A corresponding short description is displayed above the plugged devices and modules. You show or hide this short description via the toolbar under "View" with the command "Display module titles" or the corresponding symbol in the toolbar of the device view (Page 530).

Symbol	Meaning
	Show module titles

When modules are selected in the hardware catalog, all the slots permitted for this module are marked. This allows you to see immediately the slot into which the selected module can be inserted.



In the following screenshot, a signal module has been selected in the hardware catalog for a partially filled S7-1200 rack:

Since slots 101-103 are reserved for communications modules, only the other free slots are shown as available slots.

You can expand and collapse the front group of slots using an arrow symbol above the expandable slot. When the group of slots is collapsed, the first and last of the group's slot numbers are displayed.

The following figure shows the expanded slot group:

Groups of slots into which modules have already been plugged cannot be collapsed.

Multiple selection of modules and slots

There are various ways of selecting several modules or slots:

- By pressing <Shift> or <Ctrl>, you can select several modules or slots at the same time.
- Click outside the rack and then hold the mouse button and drag a frame to include the modules or slots you want to select.

10.1.2.7 Rack: General slot rules

Introduction

Specific slot rules apply to each automation system and module.

If you select a module from the hardware catalog in the device view, all possible slots for the module selected are marked in the rack. You can only drag modules to marked slots.

If you insert, move or swap a module, the slot rules are also applied.

Consistency

Some slot rules depend on how the environment is configured. This means that you can sometimes plug modules into the rack although this would result in inconsistencies at the current time. If you change the configuration, for example by selecting different modules or module parameter settings, you can make the configuration consistent again.

In cases where inserting a module results in an inconsistency that can be corrected, this will be permitted. A consistency check is run when the configuration is compiled. Inconsistencies are displayed as alarms in the Inspector window under "Info". Based on the result of the consistency check, you can revise your configuration and make it consistent again.

Rules for arranging modules

The following rules apply generally to modules in racks:

- You can only plug modules into a rack.
- You can only plug interface modules into a module.
- You can only use modules of the same product or system family in one rack.

There are also other special rules for some modules:

- Can only be inserted in certain slots
- Insertion depends on other modules, CPUs or settings
- Limited number of uses in a rack

10.1.2.8 Rack: Inserting a module

Introduction

Once you have added devices from the hardware catalog to your configuration in network view, you can add modules to the devices. There are various ways of adding a module to a rack in the device view:

- If there is an available valid slot, double-click a module in the hardware catalog.
- Use drag-and-drop to move the module from the hardware catalog to an available valid slot in the graphic or table area:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- Select "Copy" in the shortcut menu for a module in the hardware catalog and then select "Paste" in the shortcut menu on an available valid slot in the graphic or table area.

To access the device view from the network view, double-click a device or station in the network view or select the Device view tab. The device view contains an illustration of the device selected within a rack. The graphic illustration of the rack in the software corresponds to the real structure, i.e. you can see the same number of slots as exist in the real structure.

Note

You can also move a module to a rack in the network view. The filter function for the hardware catalog must be deactivated in this instance. The module is automatically plugged into a free and permitted slot. If there are no slots available, the module will be moved to the area of unplugged modules (Page 535).

Equipping a rack

Arrange the modules on a rack according to the applicable slot rules.

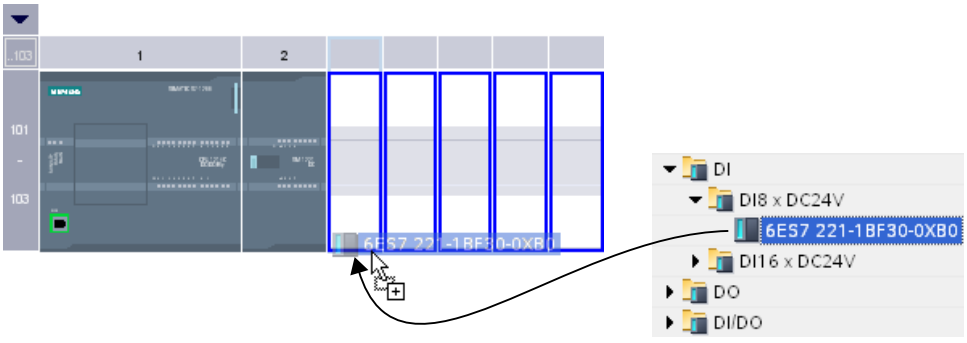
After a module has been inserted in a rack with an already inserted CPU, the address areas are checked automatically so that addresses are not assigned twice. After it has been inserted,

each module then has one valid address range. To do so, DP slaves and IO devices must be networked with a CPU via the corresponding DP master or IO system.

Requirements

- You are in the device view.
- The hardware catalog is open.

Adding module from the hardware catalog



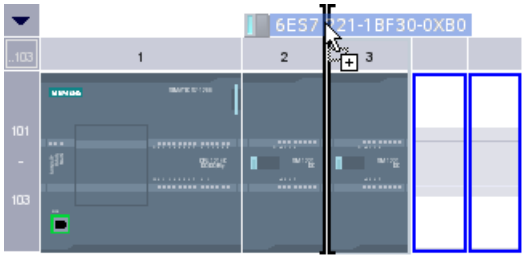
How to insert a module from the hardware catalog into a rack is illustrated based on the example of a signal module. To do this, follow these steps:

1. Go to the required module board in the hardware catalog.

   Note

   If you activate the filter function of the hardware catalog, only those modules which match the selected device type will be displayed.

2. Select the chosen module.
3. If necessary, set the firmware version using the drop-down list in the hardware catalog.
4. Drag the signal module to a free slot in the rack.



You have now inserted the digital signal module in a slot in the rack. Repeat these steps with the other modules.

The name of the module is displayed above the inserted modules. You can activate or deactivate module labeling in the menu bar with "View > Show module labels".

Inserting module

You can also drag modules and drop them between modules that have already been inserted. To do this, drag a module above and between the two existing modules while holding down the mouse button.

A mouse pointer appears. When you release the mouse button, all modules plugged to the right of the pointer are moved one slot to the right. Any redundant modules are moved to the area of unplugged modules. The new module is plugged at the point of the freed up slot.

Device view (Page 530)

Device view: Area for unplugged modules (Page 535)

Rack: General slot rules (Page 563)

10.1.2.9 Select hardware component

You can select hardware components and additional objects of the graphic views by clicking the left mouse button. You can also select multiple objects by dragging the mouse while keeping the left mouse button pressed or with the combination of left-click and the <Shift> or <Ctrl> keys.

You can select the following objects in the graphic views: Devices (with CPU, rack, modules), CPUs, CPs, modules, subnets, connections and nodes.

Rules

You can select objects in the graphic views as follows:

- Left-click on object: The object is selected.
- Left-click and <Ctrl> on an object: The object is added to the current selection.
- Left-click and <Shift> on an object: All objects between the currently selected object and the previously selected objects are added to the selection.
- Drag selection frame around multiple objects while pressing left mouse button: All objects completely enclosed by the frame are added to the selection.

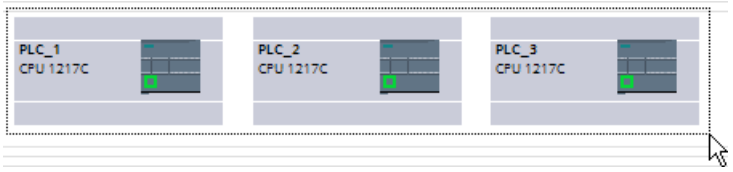
Multiple selection is only possible for objects of the same category:

- Category 1: Devices, subnets, connections, port interconnections
- Category 2: CPUs, CPs, interface modules / module
- Category 3: Interfaces, ports, nodes

Behavior for multiple selection with objects from different category:

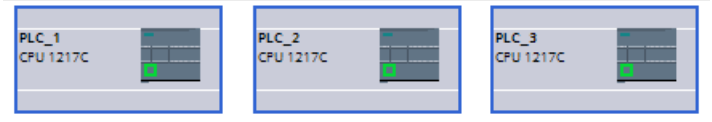
- Selection frame: Only objects of the respective highest category will become part of the multiple selection
- Left-click with <Shift> or <Ctrl>: The object of a new category that was selected last remains selected; the previously selected objects are dropped from the selection.

Note



Multiple selection of different types of objects

Only the same object categories can be selected in case of multiple selection. For example, multiple CPUs or multiple networks can be selected. However, it is not possible to first select a device in a multiple selection and then only add the CPU of a second device or the interface of a third device to the multiple selection.



Multiple selection of devices with the help of the selection frame

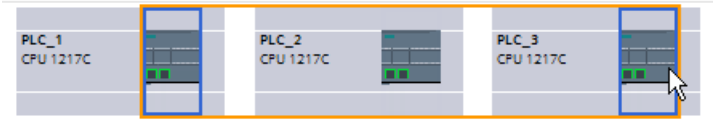
To select multiple devices in the network view by dragging a selection frame, follow these steps:

1. Press the left mouse button and draw a frame around all devices that you want to include in your selection:

2. Release the mouse button. All devices within the drawn frame are now part of the multiple selection.

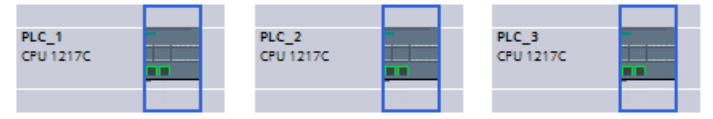
In the example above, the selection frame was drawn around entire devices. If you draw the frame so that it does not enclose entire devices but only the CPUs contained therein, only the CPUs and not the entire device is included in the multiple selection. If you draw the selection frame so that it partially encloses entire devices and partly only CPUs, the highest category of the selected objects is decisive and only the entire devices are added to the multiple selection.

Multiple selection of CPUs with the help of the <Shift> key



Instead of the multiple selection with a selection frame, you can also make the multiple selection with the <Shift> key. You select two objects with this key and all objects in between are included in the multiple selection.

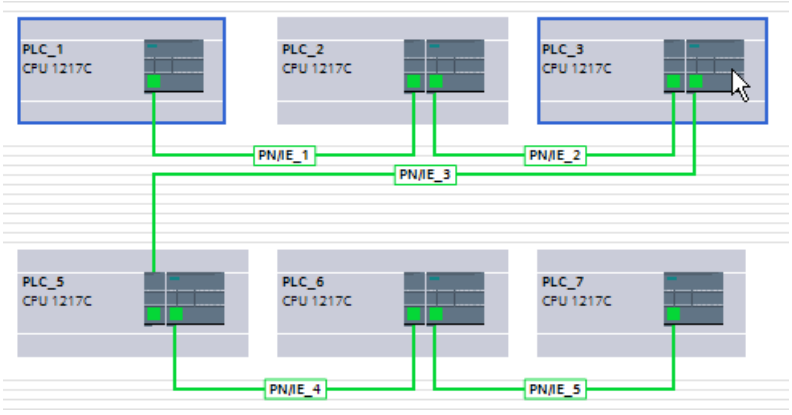
To select multiple CPUs in the topology view with the <Shift> key, follow these steps:



1. Select the first CPU of your multiple selection with the left mouse button:

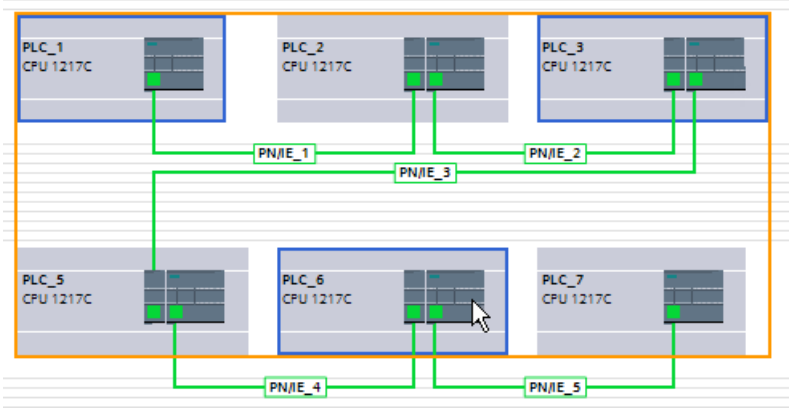
2. Select the last CPU of your multiple selection with the left mouse button while pressing the <Shift> key. The two selected CPUs behave like the margins of a selection frame indicated here by the orange line:

3. All CPUs between the first and the last CPU selected are included in the multiple selection:



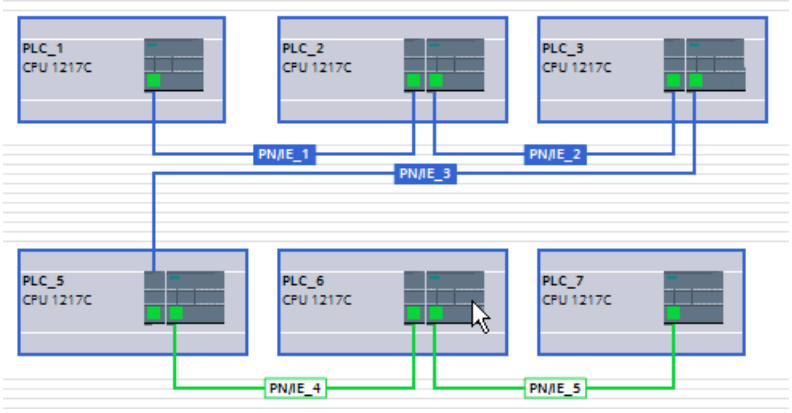
In the example above, only CPUs were selected. If you select entire devices instead, the devices between the first and the second device selected are included in the multiple selection. If you select an entire device as well as a CPU, the category of the object selected last is decisive for the category of all selected objects.

Multiple selection of devices with the help of the <Ctrl> and <Shift> keys



You can also make a multiple selection with the two keys <Ctrl> and <Shift>. You select multiple objects with a left mouse click and the <Ctrl> key. If you then select an object with a left mouse click and the <Shift> key, all objects between the previously selected objects and the last selected object are included in the multiple selection.

To select multiple devices in the device view with the <Shift> and <Ctrl> keys, follow these steps:



1. Use the left mouse button and press the <Ctrl> key to select multiple individual devices:

2. Select the last device of your multiple selection with the left mouse button while pressing the <Shift> key. The already selected devices behave like the margins of a selection frame indicated here by the orange line:

3. All devices of the virtual selection frame and the subnets in the selection frame are now included in the multiple selection.

Only the same object categories are selected. In the example above this includes the subnets in addition to the corresponding devices because they were located within the virtual selection

frame and belong to the same category as the devices. The subnets PN/IE_4 and PN/IE_5 were not located in the virtual selection frame and therefore are not part of the multiple selection.

10.1.2.10 Copying a hardware component

You can copy hardware components in the device or network view. Copied hardware components are stored on a clipboard and can be pasted at another point from this clipboard. Copied stations are pasted as new stations in the network view. Copied devices and modules can be pasted into existing racks in the network and device view.

Rules

- Single objects as well as several objects can be copied at the same time.
- Modules inserted in the rack and in the area of unplugged modules can be copied.
- You can only copy devices and modules to free and valid slots in keeping with the slot rules.
- Racks with a CPU inserted cannot be copied individually, but only as complete units along with all inserted hardware components.

Procedure

Proceed as follows to copy a hardware component:

1. Select the hardware components you want to copy.
   - Device view: Select the module in a rack or put it in the area of unplugged modules.
   - Network or topology view: Select the station or the relevant hardware component from the network view.
   - Project tree: Select the station or module.
2. Select "Copy" from the shortcut menu or press <Ctrl+C>.
   If the "Copy" menu item is unavailable, your selection contains at least one component that cannot be copied.
3. Select the location at which the content of the clipboard is to be pasted.
   - In the device view select a free slot in the rack or area of unplugged modules.
   - In the network or topology view select a station where you want to insert devices or modules.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.
   - If you paste the copied object without selection in the network or topology view with <Ctrl +V>, the copied object is pasted to the right of the original object.
   - If you paste the copied object without selection in the network or topology view using the shortcut menu, it is placed at the location of the mouse pointer.

   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The copied object is pasted at the chosen point.

If you have selected a station in the network or topology view to paste a module, the module is inserted into the first free and valid slot. If no free, valid slots are available, the object is inserted in the area of unplugged modules.

Note

You can also copy a module from one device to another:

To do so, copy a module in the hardware and network editor, select a different device in the network or topology view or the drop down list of the device view and insert the module.

You can insert the copied object directly in a slot or place it in the area of unplugged modules in the device view. If you add the copied object in the network view of a device or a station, it will be inserted in the first available slot.

If there is no slot available for the object, it is automatically placed in the area of unplugged modules (Page 535).

Note

You can use <Ctrl> and drag-and-drop to directly copy a selected hardware component.

See also

Keyboard operation: Editing objects (Page 554)

10.1.2.11 Moving a hardware component

You can move hardware components in the device or network view.

Rules

- You can move devices and modules from the rack and the area for unplugged modules taking the slot rules into consideration.
- CPs can be moved in the network view. The CP is plugged in a free and valid slot in the target device. If there are no free slots available, the CP to be inserted is moved to the area for unplugged modules.
- In the network view, CPU and slave head modules can be moved between the devices; depending on CPU type also within the rack.

Note

Moved CPs are disconnected from their network but keep their network parameters and address. If you reconnect the CP to the network and its address has been assigned, use a dialog to assign a new unique address to the CP.

Procedure

Proceed as follows to move a hardware component:

1. Select the hardware component you want to move.
   - Device view: Select the module in a rack or put it in the area of unplugged modules.
   - Network view: Select the hardware component of relevance to the network view.
2. Select "Cut" from the shortcut menu or press <Ctrl+X>.
   If the "Cut" menu item is unavailable, your selection contains at least one component that cannot be cut.
3. Select the location to which the cut object is to be moved.
   - Device view: Select a free slot in the rack or area of unplugged modules.
   - Network view: Select a station where you want to insert devices or modules.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.
   If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected hardware component is moved to the target. If the hardware component being moved is a networked object, it is disconnected from the network.

Note

You can use drag-and-drop to directly move a selected hardware component.

See also

Keyboard operation: Editing objects (Page 554)

10.1.2.12 Replacing a hardware component

You can replace hardware components with others. This, for example, allows you to replace unspecified CPUs (Page 557) with available CPUs from the hardware catalog.

Rules

You can only replace hardware components if they support module replacement and if the two components are compatible.

Procedure

To replace one module with another, proceed as follows:

1. Select the module you want to replace.
2. Open the shortcut menu:
   - If the "Replace device" entry is enabled, the module can be replaced.
   - If the "Replace device" entry is disabled, a module cannot be replaced.

3. Click on "Replace device" in the shortcut menu. The "Replace device" dialog box appears.
4. Under "New device" in the tree structure, select the module with which you want to replace your current module.
5. Click "OK".
6. Compile the hardware and software.

The existing module is replaced by the new one.

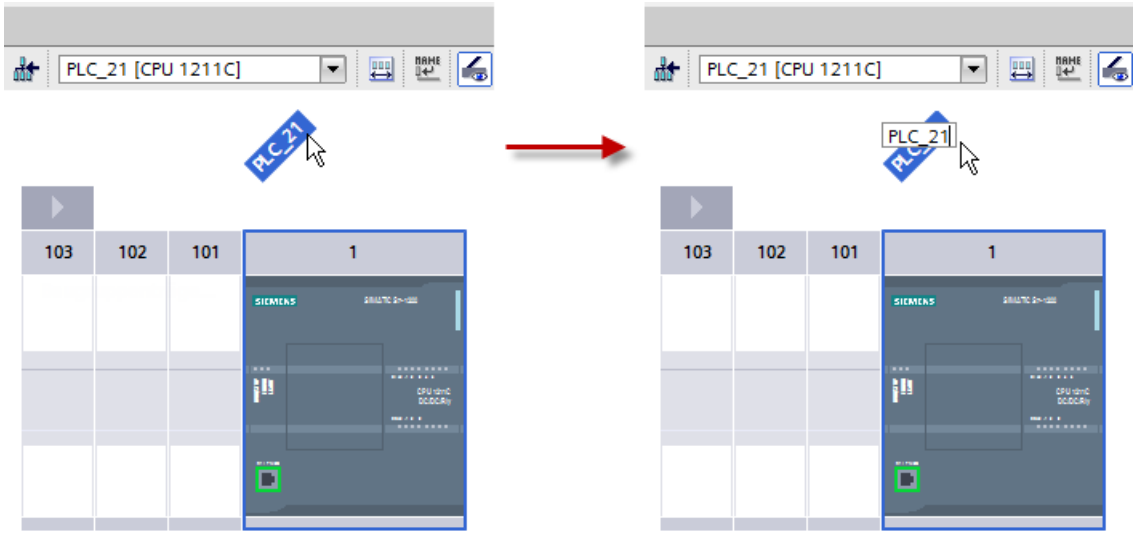
As an alternative, you can take a module by dragging it from the hardware catalog to the module you are replacing. If the module can be replaced by the selected module, this is indicated by the mouse pointer symbol.

10.1.2.13 Renaming hardware component

You can conveniently edit the names of hardware components in all three views (network view, device view, topology view) directly in the graphic area as well as in the corresponding table areas or in the Inspector window.

Rules

You can rename the hardware components as follows:



- In the graphic view after selection of the displayed name.
- In the table view in the table cell with the name that is to be changed.
- In the Inspector window under "Properties > General" for the selected hardware component.

Procedure

To rename a hardware component in the graphic area of a view, follow these steps:

For the device view:

1. Activate the display of the module names with the corresponding button in the toolbar.
2. Select the hardware component or its name.
3. You have two options:
   – Press <F2>.
   – Click on the previously selected name.
4. Edit the name.

For the network and topology view:

1. Select the hardware component or its name.
2. You have three options:
   - Press <F2>.
   - Click on the previously selected name.
   - Select "Rename" from the shortcut menu.

For editing names in the table area, select the cell with the name you want to edit in the table. Then click on the name once again so that you can edit the names directly in the cell.

For editing names in the Inspector window, select the hardware component whose name you want to edit in the graphic area. The relevant parameters are then displayed in the Inspector window. Now you can edit the names under "Properties > General".

See also

Network view (Page 527)

Device view (Page 530)

Topology view (Page 536)

Inspector window (Page 539)

10.1.2.14 Deleting a hardware component

There are various ways of deleting hardware components. Deleted hardware components are removed from the system and assigned addresses made available again.

Rules

- CPUs or modules from the rack and from the area of unplugged modules can be deleted.
- When a rack is deleted in the device view, the plugged hardware components are moved to the area of unplugged modules.

Procedure

Proceed as follows to delete a hardware component:

1. Select the hardware components you want to delete.
   - Network view: Select devices or network relevant hardware components in the graphic view or in the network view.
   - Device view: In the graphic view or device overview, select racks or modules in racks or in the area of unplugged components.
   - Topology view: Select devices or hardware components with Ethernet interfaces in the graphic view or in the topology view.
   - Project tree: Select devices or individual hardware components from the tree structure.
2. Select "Delete" from the shortcut menu or press <Del>.
   If the "Delete" menu item is unavailable, your selection contains at least one component that cannot be deleted.

The selected hardware components are deleted.

Note

Deleting hardware components may result in inconsistencies in the project, such as violation of slot rules. Inconsistencies are reported during the consistency check. Correct the inconsistencies by taking appropriate action, for example, ensuring compliance with the slot rules.

See also

Keyboard operation: Editing objects (Page 554)

10.1.2.15 Editing properties and parameters

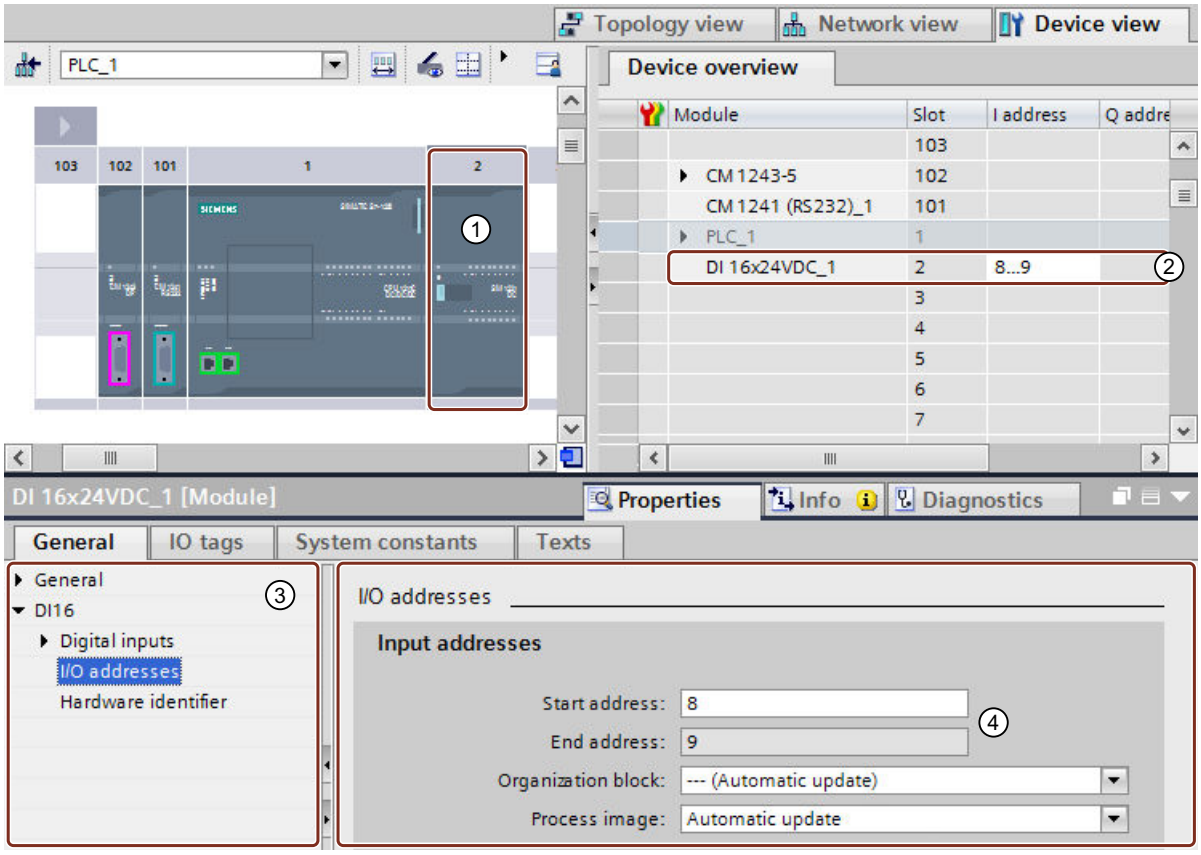
Once you have inserted hardware components in your rack, you can edit their default properties, such as names, parameters or addresses, in the network view, device view or topology view.

Requirement

You are in the network view, device view or topology view.

Note

You can edit the relevant properties and parameters in the different views in the graphic view as well as in the table view. It depends on the view which parameters you can edit. In the graphic network view, you have access to the network-related hardware components and the station. You can access modules and hardware components not displayed in the graphic network view using the table network view. In the topology view and in the device view, you have access to additional parameters regarding the topology or device access.



Procedure

To change the properties and parameters of the hardware components in the device view, follow these steps:

1. In the graphic view, select the CPU, module, rack or interface you want to edit.
2. Edit the settings for the selected object:
   - In the graphic area you can, for example, change the object names with activated module labeling.
   - Use the table area to edit addresses and names, for example.
   - In the Inspector window additional setting possibilities are available in "Properties".

Note that modules can only be fully parameterized if they are assigned to a CPU. Therefore, PROFIBUS or PROFINET interfaces modules must first be networked with the CPU or a centrally inserted communication module so that they form a master system or IO system. Only then is it possible, for example, to edit the addresses of the distributed components that are inserted.

Example of changing settings

① Selection of a module
② Editing option for addresses in the device overview
③ Selection options in the inspector window
④ Editing option for addresses in the inspector window

See also

Inspector window (Page 539)

10.1.2.16 Input and output addresses in the address overview

Introduction

The currently used input and output addresses can be displayed in the address overview in a table form. The address overview can be found in the Inspector window under "Properties" of the CPU.

Design of the address overview

With the different check boxes, you can set which objects should be displayed in the address overview:

- Inputs: Display of the input addresses
- Outputs: Display of the output addresses
- Address gaps: Display of open address spaces
- Slot: Display of the slot number

The following information is typically shown in the address overview:

Table header	Meaning
Type	Type of the address range. Indicates whether the area is an input address area or an output address area. • I = input address of module with input I/O address space (with length > 0) • I* = input or diagnostics address of modules without input I/O address space (with length = 0) No data (signal statuses or measured values) is exchanged via these addresses in the user program. Used for reporting diagnostics events of the operating system (e.g. in the start information of error OBs). • Q = output address
Addr. from	Start address of the address range. Indicates the first assigned address of the input or output.
Addr. to	End address in the address range. Indicates the last assigned address of the input or output.
Size	Address length of the address range occupied by the module for the input or output. Examples: • With a start address of 0 and an end address of 1, the address length is 2 bytes. • With a start address of 0 and an end address of 3, the address length is 4 bytes. • With a start address of 0.1 and an end address of 0.2, the address length is 2 bits. • If the start address and end address are identical, 0 bytes is displayed.
Module	Module using the address area.
Rack	Number of the rack on which the hardware component is inserted.
Slot	Number of the slot in the rack in which the hardware component is inserted.
Device name	Name and type of device in which the module is inserted. Examples: • The module is inserted in a PLC with the name "PLC_1" of the type CPU 1516-3 PN/DP, "PLC_1 [CPU 1516-3]" is displayed. • The module is inserted in a head module with the name "IO Device_1" of the type IM 151-3 PN; "IO Device_1 [IM 151-3 PN]" is displayed

Table header	Meaning
Device number	PROFINET device number or PROFIBUS address if the module is connected to a PLC via PROFINET or PROFIBUS. If the module is inserted directly in a PLC, "-" is displayed. Examples: • The module is inserted in a head module that is connected to a PLC via a PROFINET interface; the device number of the Ethernet address is displayed. • The module is inserted in a DP slave that is connected to a PLC via a PROFIBUS interface, the address parameter of the PROFIBUS address is displayed.
Master I/O system	Name of the DP master system or IO system via which the DP slave or IO device is connected to the PLC. The corresponding number of the DP master system or IO system is displayed in square brackets. If the module is inserted directly in a PLC, "-" is displayed. Examples: • The module is inserted in an IO device and is connected to a PLC via a PROFINET IO system with the name "PROFINET IO-System_1" and the number 100. "PROFINET IO-System_1 [100]" is displayed. • The module is inserted in a DP slave and is connected to a PLC via a PROFIBUS DP master system with the name "DP-Mastersystem" and the number 1. "DP-Mastersystem [1]" is displayed.
OB	Organization block that is assigned to the process image. The "Main" cycle OB always refers to the automatic update of the process image. This column is not available for every CPU.
PIP	Process image partition. Indicates whether the address is updated automatically via the cyclic process image or is located in a process image partition that must be triggered explicitly for an update. Refer to the further description of the "Process image partition PIP2" below.

Process image partition PIP

The "PIP" table column shows the assignment of the address to the cyclic process image or to a process image partition (PIP).

For S7-300/400:

- "OB1-PA": The address is assigned to the cyclic process image. The operating system updates this address automatically in each program cycle.
- "PIP x": The address is assigned to the process image partition x (for example PIP 1, no cyclic process image). The operating system updates this PIP when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update this PIP. You have the option to update the PIP yourself with the instructions "UPDAT_PI" and "UPDAT_PO" (for S7-400 and some S7-300 CPUs).

For S7-1200:

- "Automatic update": The address is assigned to the cyclic process image (PIP 0). The operating system updates this address automatically in each program cycle.
- "None": The address not assigned to any process image partition. You access this address directly in the user program (direct I/O access, no process image).

- "PIP x": The operating system updates this PIP when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update this PIP. You have the option to read inputs or write outputs in the user program via direct I/O access. The instructions "UPDAT_PI", "UPDAT_PO", "SYNC_PI" and "SYNC_PO" are not supported for S7-1200.
- "PIP OB servo": The process image partition "PIP OB Servo" is not assigned to an organization block (fixed setting for organization block: "---(None)"). The operating system does not update this PIP or any of the addresses contained in it: You access the addresses directly in the user program (direct I/O access).

For S7-1500:

- "Automatic update": The address is assigned to the cyclic process image (PIP 0). The operating system updates this address automatically in each program cycle.
- "None": The address not assigned to any process image partition. You access this address directly in the user program (direct I/O access, no process image).
- "PIP x" (PIP 1 to PIP 31): The operating system updates PIP x when the assigned OB is executed. If this PIP is not assigned to an OB, the operating system does not update PIP x. You have the option to update the PIP x in the user program with the instructions "UPDAT_PI" and "UPDAT_PO". If PIP x is assigned to an isochronous mode interrupt OB (OB 61 to OB 64), the operating system does not update PIP x. You have the option to update PIP x in your user program with the instructions "SYNC_PI" and "SYNC_PO".
- "PIP OB servo": The process image partition "PIP OB servo" is permanently assigned to the OB "MC-Servo". STEP 7 generates this OB automatically when you create a technology object in the Motion Control area. When the OB is executed, the PIP OB Servo is updated isochronously. All drives and encoders used by Motion Control are assigned to this process image partition.

10.1.2.17 Update module version

Explanation of terms

The terms "Module version" and "Firmware version" are explained in more detail in the following section.

- Module version: The specific version of the configuration software from which the module description stems.
  Example: V11.0.0.0
- Firmware version: The version of the firmware of the module whose parameters are assigned offline
  Example: V2.0

Requirement

- You have created a device configuration.
- You have installed an update or an optional package at a later date. As a result of this installation, the module version of at least one module type was updated in the hardware catalog, whereby the new version is incompatible with the previous version.
- You have used such modules in your device configuration and want to use the modified or added properties.

Procedure

Perform the following step for each affected module type.

1. Select the affected module in the device view.
2. In the Inspector window, go to "Properties > General > Catalog Information". Click the "Update module version" button there.
3. In the query that then appears, specify whether you want to update the module version only for the selected module or for all modules of this type in the current project.

Result

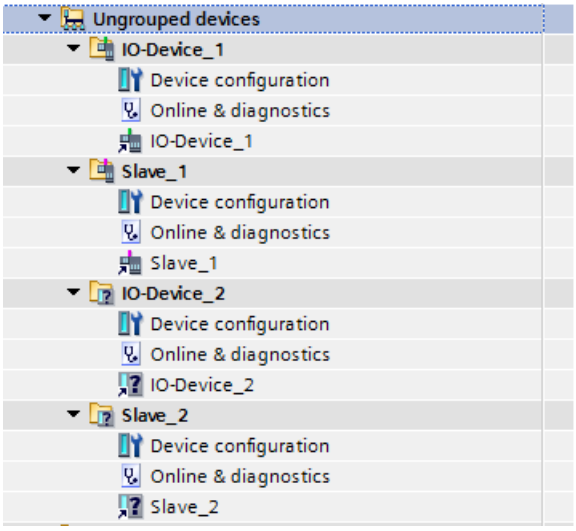
The selected modules are replaced by the same modules with updated module version in the current project.

In which cases is it unnecessary to update the module version?

An updating of the module version is not necessary in the following cases:

- You do not want to use the modified or added properties of the modules.
- When you open an existing project with a version of the configuration software that is more recent than the version with which you created the project, the system automatically performs a project conversion, for example, from TIA Portal V12 to V13. In this case, all older module versions are automatically adapted.

10.1.2.18 Distributed I/O in the project tree



Distributed I/O devices in the project tree shown in separate folders. Depending on whether a device was assigned to a PROFINET IO system, a DP master system or no system, the device is displayed as a node or link to the device in one of the folders described below.

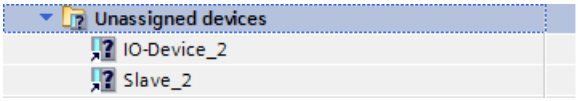
"Ungrouped devices" folder in the project

All distributed I/O devices in the project are collected in the "Ungrouped devices" folder.

The icons of the folders and links show the status "assigned" with colored identifiers: PROFINET IO devices are marked green, PROFIBUS DP slaves are marked magenta, other distributed I/O devices are not marked.

The icons of the folders and links show the status "not assigned" with question marks.

If you have established a connection to an IO device or a DP slave with the "Go online" function, the same diagnostics information (e.g. green check mark) is displayed for the link of a device as for the device itself in the project navigation. For more information, refer to the section "View in the online mode".



It is possible to copy or move distributed I/O devices from the "Ungrouped devices" folder, but not the folder itself, to another position in the project tree. Possible destinations are the project folder or device folder. You can also copy or move distributed I/O devices back to the "Ungrouped devices" folder.

By double-clicking on the link, you go to the device view and can configure the distributed I/O device.

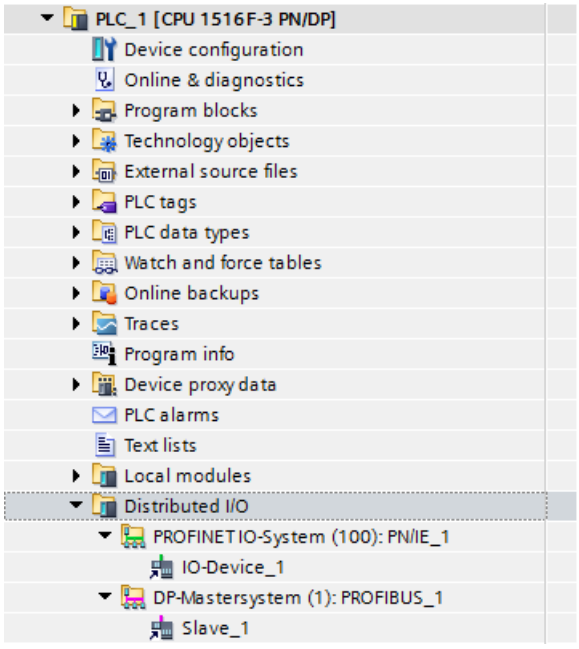
"Unassigned devices" folder in the project

Devices that are not assigned to a distributed I/O system appear as links in the "Unassigned devices" folder.

The icon for the folder and the link of the respective device in the project tree indicate with a question mark that they are not connected to a distributed I/O system. The link is marked by a small arrow.

The display of the project tree as a link allows IO devices or DP slaves to be selected individually, for example to select the destination of the link. It remains possible to select device groups.

By double-clicking on the link, you go to the device view and can configure the distributed I/O device.



"Distributed I/O" folder under a device

If you assign an IO device to a PROFINET IO system, this is displayed as a link below the node "Distributed I/O > PROFINET IO system".

Accordingly, a DP slave that is assigned to a DP master system is shown as a link below the node "Distributed I/O > DP master system".

The link references the corresponding IO device or the DP slave in the project tree.

The icon for the node and the link of the respective device in the project tree indicate whether the device is connected via PROFINET (green) or via PROFIBUS (magenta). The link is marked by a small arrow.

Gateways are shown as a link below the DP master/IO node to which they were assigned.

By double-clicking on the link, you go to the device view and can configure the distributed I/O device.

10.1.2.19 Comparing devices

Basics of device comparison

Function

You have the option of comparing the hardware components of two devices allowing you to identify any differences. You can perform an offline/offline comparison for this purpose. The devices to be compared can be from one project or different projects.

You can compare the central as well as the distributed I/O. The devices to be compared can be assigned either automatically or manually. The automatic assignment of central I/O is based

on the slot number. With the distributed I/O, the automatic assignment can be made according to the following criteria:

- Assignment using the address/HW ID: The assignment is made using the addresses or IDs of the devices. This criterion is suitable for comparing devices within a project.
- Assignment using the name: The assignment is made based on the device names. This criterion is suitable for comparing devices in different projects.

You can either specify the assignment yourself or let the system decide. In the latter case, the system selects the assignment itself depending on the context.

To compare the modules of the distributed I/O, start an offline/offline comparison for the affected distributed stations.

See also

Basics of project data comparison (Page 358)

Overview of the compare editor (Page 362)

Making a device comparison (Page 584)

Making a device comparison

Procedure

Follow the steps below to compare devices:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.
   The comparison editor opens and the selected device is displayed in the left area.
3. Open the "Hardware" tab.
4. Drag an additional device to the drop area in the right-hand pane.
   All existing objects of the selected devices are displayed depending on the settings of the comparison editor in the "Hardware" tab and an automatic comparison is made. You can identify the status of the comparison objects based on the symbols in the compare editor. For submodules, you can find detailed results in the "Property comparison" area.
5. If you want to change the matching criterion, click on the arrow of the "Available matching criteria" button in the toolbar. Then, select the matching criterion you want to use.
6. If you want to make a manual comparison, click the button for switching between automatic and manual comparison above the status area. Then select the objects you want to compare.
   The properties comparison is displayed. You can see the status of the objects based on the symbols.

10.1.3 Configure networks

10.1.3.1 Networking devices

Communication and networks

Communication between devices

The basis of all types of communication is always a previously configured network. The network configuration provides the necessary requirements for communication:

- All the devices in a network are provided with a unique address
- Communication of the devices with consistent transmission properties

Definition

Via the network, the various computers and end devices (PC, PG, PLC, AS) are connected together with interface modules, physical cables and suitable software. Networked devices can exchange data with each other. Networking can be implemented via wiring or a wireless network, e.g. via WLAN.

The subnet is part of a network whose parameters must be synchronized with the devices (e.g., with PROFIBUS). It includes the bus components and all connected devices. Subnets can also be linked by gateways to form a network. In practice, the terms "subnet" and "networked devices" are often used synonymously.

Network configuration

The following steps are necessary when configuring networks:

- Connect devices to subnet
- Specify the properties/parameters for each subnet
- Specify the device properties for every networked module
- Download configuration data to the devices to supply interfaces with the settings resulting from the network configuration
- Document the network configuration

For Open User Communication, creating and configuring a subnet is supported by the assignment of connection parameters.

Relation between network configuration and project

Within a project, subnets and their properties are managed. Properties result mainly from adjustable network parameters and the quantity and communication properties of the connected devices.

The devices to be networked must be in the same project.

Subnet name and subnet ID

Within the project, subnets are clearly identified by a subnet name and ID. The subnet ID is saved in all components along with interconnectable interfaces. Components can then be clearly assigned to a subnet even after uploading into a project.

Networking options

In the project, you can create and network devices with components capable of communication. The following basic options are available for networking the devices:

- You link the interfaces of the components capable of communication with one another. A new subnet is created suitable for the type of interface.
- You connect the interface of the devices capable of communication with a new or existing subnet.
- You create an Open User Communication connection. When you assign parameters to the connection for Open User Communication, a subnet is created automatically between the communication partners.
- You use the graphic connection configuration to configure connections; missing networks are hereby recognized and are created either automatically or via dialog.

Due to the different tasks of the devices or the span of the plant, you may need to use several subnets. These subnets are managed in a project.

Networking devices in the network view

Options

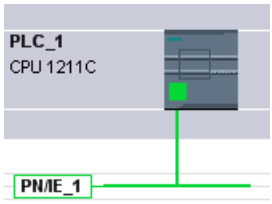
In the graphic network view, you have an overview of the subnets of the entire system in the project. You can use the tabular network overview for additional support.

Depending on the starting situation, there are various ways of undertaking configuration to network the interface for a component capable of communication. The procedures are described in the following section:

- Creating an individual subnet
- Creating several subnets at one time
- Connecting two target devices via a new subnet
- Connecting devices to existing subnet
- Selecting an existing subnet from a list
- Automatic networking during the configuration of the connection;
  See also: AUTOHOTSPOT

Possible starting situations are:

- A suitable subnet is not yet available.
- The subnet with which you want to connect the component already exists.



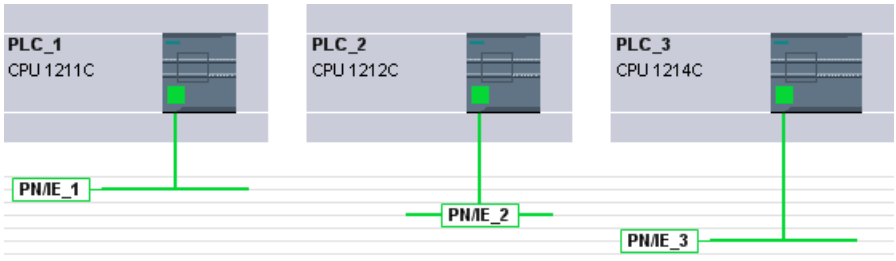
Procedure - creating a single subnet

To create a subnet and to connect it to an interface, proceed as follows:

1. Select the interface of a CPU / a CP.
2. Select the "Create subnet" command in the shortcut menu of the interface.

The selected interface is connected to a new subnet. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

The following schematic shows an interface with outgoing line connecting to a subnet:



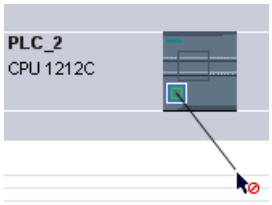
Procedure - creating several subnets at one time

To create several subnets at one time, proceed as follows:

1. Select several interfaces by clicking on them while pressing the <Ctrl> button.
2. Select the "Create subnet" command in the shortcut menu of the interface.

Each selected interface is connected to a new subnet. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

The following figure shows multiple subnets created by selecting multiple interfaces:

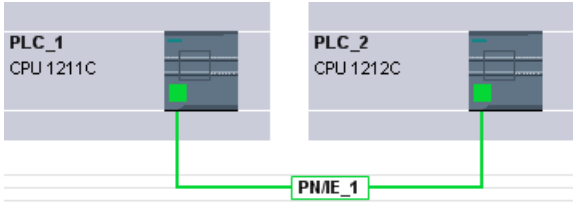


Procedure – Connecting two target devices via a new subnet

To connect an interface with another device via a subnet that does not yet exist, proceed as follows:

1. Position the mouse pointer over the interface for a component capable of communication requiring networking.
2. Click with the left mouse button and hold the button down.

3. Move the mouse pointer.
   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.



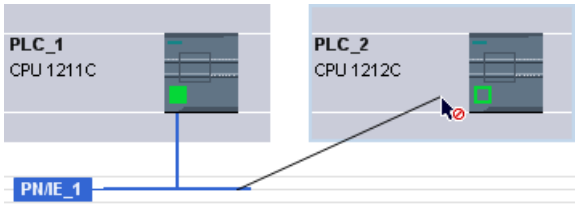
4. Now move the pointer in networking mode onto the interface of the target device. You can either keep the mouse button pressed or release it.
5. Now release the left mouse button or press it again (depending on your previous action).

Note

If you want to exit networking mode beforehand, press <Esc>, right-click or double-click in the background of the network view.

A new subnet is created. The interfaces are now connected via the new subnet. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

The following schematic shows two networked devices:



Procedure - Connecting devices to existing subnet

To connect an interface to an existing subnet, proceed as follows:

1. Position the mouse pointer on the interface of a communications-compliant component you want to network or on the existing subnet.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.
   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear once the pointer is moved to a valid target.

4. Now move the mouse pointer to the existing subnet or to the interface to be networked. You can either keep the mouse button pressed or release it.

5. Now release the left mouse button or press it again.
   If you want to exit networking mode beforehand, press <Esc> or right-click.

Result:

The interface and selected subnet are now connected. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

Procedure - selecting an existing subnet from a list

To link an interface with a subnet that has already been created, proceed as follows:

1. Select the interface of a CPU.
2. Select the "Assign to new subnet" command in the shortcut menu of the interface.
   A list box containing the available subnets appears.
3. Select a subnet from the list.

The interface and selected subnet are now connected. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

Tabular network overview

Table area of network view

The table area of the network view consists of several tables:

- Network overview: The table for the network overview supplements the graphical network view with the following functions:
  - You obtain detailed information on the structure and parameter settings of the devices.
  - Using the "Subnet" column, you can connect components capable of communication with created subnets.
- Connections: Communication connections are displayed in this table. Some aspects of the connections displayed here can be edited directly in the table. Selected connections are displayed in the Inspector window and can be edited there.
- Relations: Logical connections of the HMI client-server relation are displayed here.

- I/O communication: Device communication via PROFIBUS DP and PROFINET IO is configured and displayed in this table. In the I/O communication table, only those interfaces of a device are displayed that can be used for communication via PROFIBUS DP or PROFINET IO.
- VPN: Properties of the VPN user groups and their assigned security modules are displayed here.

Basic functions for tables

The network overview supports the following basic functions for editing a table:

- Displaying and hiding table columns
  Note: The columns relevant for configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

Networking devices in the device view

Networking in the device view

In the device view, you can check and set all the parameters of the components belonging to a device and the interfaces in detail. Here you can also assign the interfaces to the subnets created in the project.

Requirements

- The subnet with which you want to connect an interface has already been created.
- If the subnet has not yet been created, change to the network view and perform the networking.

Procedure - connecting to an existing subnet

To connect an interface to an existing subnet, proceed in the device view as follows:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. Select the subnet to be connected from the "Interface connected with" drop-down list.

The interface and selected subnet are now connected. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

Procedure - creating a new subnet

To create a subnet and to connect it to the interface, proceed as follows in the device view:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group belonging to the selected interface, for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. In "Interface connected with", click the "Add new subnet" button.

The interface is connected to a new subnet of the appropriate subnet type. The inconsistencies possibly resulting from the modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

Checking or changing network parameters and interface parameters

Introduction

Communication between networked devices requires the following parameters to be configured:

- Network parameters
  Network parameters identify the network within the system configuration, for example, using a name.
- Interface parameters
  Interface parameters define specific properties of a component capable of communication. Addresses and transmission characteristics are set automatically and are consistent with the network parameters.

Note

Network parameters and interface parameters are usually set during networking such that communication can take place for numerous applications without the parameters having to be changed. The inconsistencies possibly resulting from a modified configuration are clarified automatically or per query. In the case of consistency problems, the next free address is preferably used.

Procedure - checking or changing network parameters

Proceed as follows to check or change network parameters:

1. Enter the network view.
2. Select the subnet from the network view.
   You can see the network parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the network parameters in the relevant group of parameters.

Procedure - checking or changing interface parameters

You can check and modify interface parameters in the network and device view.

Proceed as follows to check or change interface parameters:

1. Enter the network view or device view.
2. Select the interface.
   You can see the interface parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the interface parameters in the relevant group of parameters.

Procedure - checking or changing interface addresses

You can edit the MPI, PROFIBUS and Ethernet addresses in the graphical network view itself.

Proceed as follows to edit MPI, PROFIBUS and Ethernet addresses in the network view:

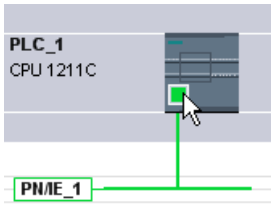
1. Enable the display of interface addresses in the network view.
2. Select an MPI, PROFIBUS or Ethernet address to be edited.
3. Click on the selected address field or press [F2] to edit the address in the network view.

Changing networkings

Introduction

You can cancel an interface's network connection or assign it to another subnet of the same subnet type.

Consequences



Depending on the version, a distinction should be made between:

- Canceling a network connection for an interface
  The configured parameters for the interface remain unchanged.
- Assigning a network connection to another subnet
  If the addresses in the assigned subnet are not unique, in other words, they already exist, they will be changed automatically to make them unique.

Procedure - disconnecting from a network

Proceed as follows to cancel the network connection for an interface:

1. Select the networked interface.

2. Select the "Disconnect from subnet" command in the shortcut menu of the interface.

The network connection is deleted, the interface addresses are, however, not changed.

Configured connections are retained; however these connections are marked red in the connection table because they are not networked. Specified connections remain specified.

See also

Networking devices in the network view (Page 586)

Copying, cutting or deleting subnets

Introduction

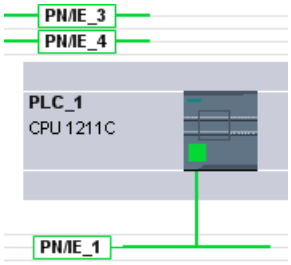
You can copy subnets as individual objects or copy them along with networked devices or other networks.

For example, you can create complex configurations to be used more than once in different variants within the project with no additional effort.

Effects on the copied subnet

Properties that have to be assigned explicitly within a project are re-assigned appropriately when the copied objects are copied.

For subnets, this means: The subnet ID and name are re-assigned to the copied subnet.



The configured properties are adopted in the copied subnet.

Procedure - copying a subnet

Proceed as follows to copy one or more subnets:

1. Select one or more subnets.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

The copied subnets are shown as "orphaned" subnets in the top part of the network view.

Procedure - copying a subnet with connected devices

To copy one or more subnets with networked devices, proceed as follows:

1. Select one or more subnets with the connected devices, for example by drawing a lasso around them.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

Complete copies of the subnets and connected devices are created.

Configured connections are adopted and remain within the copied devices. Connections to devices that have not been copied are interrupted and become unspecified.

MPI network configuration (S7-300, S7-400, PC)

Allocating MPI addresses

Note the following for devices with an MPI interface: All devices of a subnet must have a different device address.

CPUs with MPI address ship with the default MPI address 2. Since you can only use this address once in the MPI subnet, you will have to change the default address in all other CPUs.

The following applies to devices with the article no. 6ES7 3xx-xxxxx-0AB0:

When planning the MPI addresses for several CPUs, you have to fill "MPI address gaps" for FMs and CPs with separate MPI addresses to prevent addresses being assigned twice.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

Rules for assigning the MPI address

- Allocate the MPI addresses in ascending order.
- Reserve MPI address 0 for a programming device.
- You can link up to 126 (addressable) devices with one another in an MPI subnet; up to 8 devices at a transfer speed of 19.2 KB/s.
- All MPI addresses in an MPI subnet must be different.

You will find other rules relating to the structure of a network in the manuals for setting up automation systems.

PROFIBUS network configuration

PROFIBUS addresses

Rules for the network configuration

All the devices in a subnet must have a different PROFIBUS address.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

You can connect devices to the PROFIBUS subnet that communicate via configured connections or that belong to a PROFIBUS DP master system.

You can find more information on configuring a DP master system in the following sections.

Requirements

The 121xC CPU is PROFIBUS compatible as of firmware version 2.0.

Rules for assigning PROFIBUS addresses

- Allocate the PROFIBUS addresses in ascending order.
- Reserve the PROFIBUS address "0" for a programming device.
- Allocate a unique PROFIBUS address between 0 and 126 for each device on the PROFIBUS network and/or for each DP master and each DP slave in the PROFIBUS network.
- There are modules with which the smallest address that can be set has to be greater than 1.
- All PROFIBUS addresses of a PROFIBUS subnet must be different.

You will find additional rules relating to the structure of a network in the manuals for setting up automation systems, for example SIMATIC S7-1200.

Note

PROFIBUS address "0"

Reserve PROFIBUS address "0" for a programming device that you will briefly connect up to the PROFIBUS network at a later date for servicing.

See also

What you need to know about PROFIBUS bus parameters (Page 596)

What you need to know about PROFIBUS bus parameters

Matching parameters to one another

The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

Note

It may be possible for the bus parameters to be adjusted depending on the bus profile. If the bus parameters cannot be adjusted, they are grayed out. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

The parameters shown apply to the entire PROFIBUS subnet and are briefly explained below.

Activating cyclic distribution of the bus parameters

If the "Enable cyclic distribution of the bus parameters" check box is selected under "Bus parameters" while PROFIBUS subnet is selected in the Inspector window, the bus parameters are transferred cyclically during operation by the modules that support this function. This allows a programming device, for example, to be easily connected to the PROFIBUS in runtime.

You should deactivate this function:

- For a heterogeneous PROFIBUS subnet (or more accurately: when external devices are connected whose protocol uses the DSAP 63 for Multicast)
- When in constant bus cycle time mode (minimize bus cycle)

Bus parameters for the bus profile of PROFIBUS subnets

Bus parameter	Adjustable?	Limit values
Tslot_Init	Yes	Max. Tsdr + 15 <= Tslot_init <= 16.383 t_bit
Max. Tsdr	Yes	35 + 2*Tset + Tqui <= Max. Tsdr <= 1.023 t_bit
Min. Tsdr	Yes	11 t_bit <= Min. Tsdr <= MIN(255 t_bit, ... Max. Tsdr - 1, 34 + 2*Tset + Tqui)
Tset	Yes	1 t_bit <= Tset <= 494 t_bit
Tqui	Yes	0 t_bit <= Tqui <= MIN(31 t_bit, Min. Tsdr - 1)
GAP factor	Yes	1 <= GAP factor <= 100
Retry limit	Yes	1 <= Retry limit <= 15
Tslot	No	---
Tid2	No	Tid2 = Max. Tsdr
Trdy	No	Trdy = Min. Tsdr
Tid1	No	Tid1 = 35 + 2*Tset + Tqui
Ttr	Yes	256 t_bit <= Ttr <= 16.777.960 t_bit

Bus parameter	Adjustable?	Limit values
Ttr typical	No	This time is provided for information only and is not transferred to the nodes.
Response monitoring		10 ms <= response monitoring (watchdog) <= 650 s

If you want to create a customized bus profile, we recommend the following settings:

- Minimum target rotation time (Ttr) = 5000 x HSA (highest PROFIBUS address)
- Minimum response monitoring (watchdog) = 6250 x HSA

Recalculating

You can use the "Recalculate" button to recalculate the parameters.

See also

PROFIBUS addresses (Page 595)

Description of the bus parameters (Page 597)

Description of the bus parameters

Detailed description of PROFIBUS bus parameters

Bus parameter	Meaning
Tslot_Init	The wait-for-reception (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the line components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.
Max. Tsdr	The maximum protocol processing time defines the latest time by which the responding node should have replied.
Min. Tsdr	The minimum protocol processing time defines the earliest time by which the responding node may reply.
Tset	The trigger time is the time which may lapse between the reception of a data message frame and the response to it in the node.
Tqui	The modulator quiet time is the time which a sending node needs after the end of the message frame to switch from sending to receiving.
GAP factor	The GAP update factor defines the number of token rotations after which a newly added, active node can be added to the logical token ring.
Retry limit	This parameter defines the maximum number of attempts (message frame repeats) made to reach a node.
Tslot	The wait-for-reception time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the bus design components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.

Bus parameter	Meaning
Tid2	Idle time 2 defines the earliest time by which a sending node may send the next message frame after sending a message frame that has not been acknowledged.
Trdy	The ready time specifies the earliest time by which a sending node may receive a response message frame.
Tid1	Idle time 1 defines the earliest time by which a sending node may send the next message frame after receiving a response.
Ttr	The target rotation time is the maximum time made available for a token rotation. During this time, all active nodes (DP masters etc.) have the right to send (token) once. The difference between the target rotation time and the actual token holding time of a node determines how much time is left over for the other active nodes (programming device, other DP masters etc.) to send message frames.
Ttr typical	The typical data cycle time is the average response time on the bus if all configured slaves are exchanging data with the DP master. None of the slaves report diagnostics and there is no extra message frame traffic with programming devices or other active nodes etc. on the bus.
Response monitoring	The response monitoring time is only needed for PROFIBUS-DP bus systems. It defines the latest time by which a DP slave has to be addressed by its DP master with a new data message frame. If this does not happen, the DP slave assumes that the DP master has failed and resets its outputs to a secure mode.

What you need to know about PROFIBUS bus parameters (Page 596)

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values. For example, if both DP and FMS services are being used on a subnet, the "slower" sets of bus parameters must always be set for all devices, i.e. even the "Universal (DP/FMS)" profile for DP devices.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Standard	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Universal (DP-FMS)	9.6 19.2 93.75 187.5 500 1500
Customized	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal (DP/FMS)	Select the "Universal (DP/FMS)" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 (SIMATIC S7) • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.
Customized	The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. Select the "Customized" profile when none of the usual profiles "match" a PROFIBUS device and you need to adapt the bus parameters to your special structure. Information on this can be found in the documentation for the PROFIBUS device. You should only change the default values if you are familiar with how to configure the bus profile for PROFIBUS. Not all combinations that can be theoretically set can be used even with this bus profile. The PROFIBUS standard specifies several parameter limits that depend on other parameters. For example, a responder must not respond (Min Tsdr) before the initiator can receive the message frame (Trdy). These standard specifications are also checked in the "Customized" profile. Tip: The bus parameters last valid on the PROFIBUS subnet are always automatically set as customized. For example, if the "DP" bus profile was valid for the subnet, then the bus parameters for "DP" are set in the "Customized" bus profile. The parameters can be modified on this basis. The monitoring times are not automatically recalculated so that you do not put at risk the consistency of set values, for example with configurations in other configuration tools without realizing that you have done so. You can also have the Ttr monitoring times and target rotation time calculated on the basis of parameters you have set: Click here on the "Recalculate" button.

Note

Both mono-master mode and multi-master mode are possible with all PROFIBUS profiles.

What you need to know about PROFIBUS line configuration

Cable configuration and bus parameters

Information regarding the cable configuration can be taken into consideration when calculating the bus parameters. For this purpose, you must select the "Consider cable configuration" check box in the properties for the PROFIBUS subnet.

The remaining information then depends on the type of cable used; the following settings are available:

- Copper cable
- Fiber-optic cable/optical ring

PROFIBUS line configuration, optical ring

The calculation depends on the OLM types used. The selection is made by activating the check box (multiple activation is possible, at least one OLM type must be selected):

- OLM/P12
- OLM/G12
- OLM/G12-EEC
- OLM/G12-1300

The following bus parameter adjustments are made:

- Configuration of a node not present

  Note

  The following restrictions apply to optical rings, even for passive nodes (DP slaves for example):

  A maximum of HSA-1 nodes may be connected to the PROFIBUS network. With an HSA of 126, addresses 126 and 125 must not be used. A maximum of 125 nodes are possible on the bus (No. 0 to 124).

  If an HSA is less than or equal to 125, the addresses HSA and greater may not be used. The address HSA-1 may not be used.

- Increase the retry value to 3
- Setting of minimum slot time needed for ring mode

  Note

  Short slot time values are needed for OLM/P12, average ones for OLM/G12 and OLM/G12-EEC and long ones for OLM/G12-1300. This results in high performance for small network lengths and average to low performance for average to large network lengths.

PROFIBUS communication load

Communication load - allowing for additional network stations

The bus parameters depend on the volume of communication between the active network nodes. There are differences between cyclic communication (DP) and connection-based, acyclic communication (S7 communication, Send/Receive (FDL), FMS). Unlike DP, the volume and size of communication tasks (communication load) depends on the user program. For this reason, the communication load cannot always be calculated automatically.

To calculate the bus times you can define a network configuration in the "Additional network stations" parameter group that differs from the network configuration.

Taking the profile into account

The network configuration can be defined for the "Standard", "Universal (DP/FMS)", and "User-defined" profiles. Parameters cannot be entered in the "Additional network stations" parameter group for the "DP" profile.

Quantification of the communication load

The following settings are available in order to make allowance for the communication load.

- Information regarding the number of unconfigured network stations;
- Information on the communication load resulting from the user programs for FDL or S7 communication. Here you can selected from the following settings:
  - Low
    Typically used for DP, no great data communication apart from DP.
  - Medium
    Typically used for mixed operations featuring DP and other communication services (such as for S7 communication), when DP has strict time requirements and for average acyclic volumes of communication.
  - High
    For mixed operations featuring DP and other communication services (such as for S7 communication), when DP has loose time requirements and for high acyclic volumes of communication.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the module capable of communication supports the TCP/IP protocol. This is usually the case for all Ethernet modules.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of:

- Address of IP subnet
- Address of the device (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the device.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the device, i.e. 0.2.

It is generally true that:

- The network address results from AND logic operation of the IP address and subnet mask.
- The device address results from the AND NOT logic operation of the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D, etc). This is not recommended, however, because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of devices they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (for example IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All devices with addresses between 129.80.001.xxx and 129.80.127.xxx are on one IP subnet, all devices with addresses between 129.80.128.xxx and 129.80.255.xxx are on another IP subnet.

Router

The task of the routers is to connect the IP subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, you have to enter the address of the router for each device in the IP subnet.

The IP address of a device in the subnet and the IP address of the router can only differ at the points at which there is a "0" in the subnet mask.

Settings for interconnecting Ethernet devices (Page 603)

Settings for interconnecting Ethernet devices

The following paragraph describes the behavior of STEP 7 during interconnection of PROFINET devices and the effects of the port interconnection on the network view.

Relation between port interconnection and network view

Topology view

In the topology view, you specify the physical interconnection of Ethernet ports. You specifically determine which Ethernet port of a device is to be connected with a specific Ethernet port of another device by means of an Ethernet cable (preset topology).

Example:

You specify that port 1 of the PROFINET interface of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable. You also specify the interface for devices with several PROFINET interfaces.

Example:

You specify that port 1 of PROFINET interface X2 of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable. The Ethernet ports can be interconnected in a table or graphically.

Network view

In the network view, you specify which devices are to be connected with each other via an Ethernet subnet. You do not specify the Ethernet ports by which the devices are interconnected with each other (that is the task of the port interconnection).

The port interconnection has effects on the network view: When you interconnect Ethernet ports of devices with each other in the topology view, STEP 7 connects the interconnected PROFINET interfaces of the devices in the network view with an Ethernet subnet (green line). However, the course of the green line does not reflect the actual cable routing. You specify the actual wiring in the topology view.

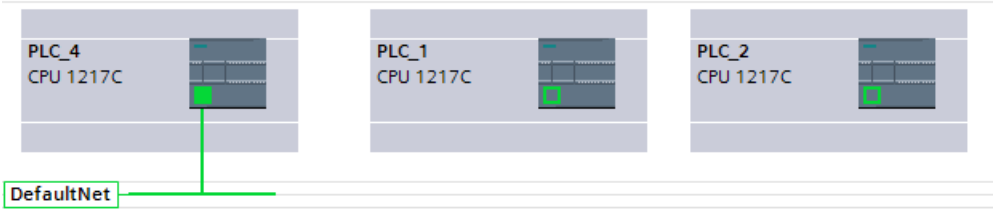
An Ethernet subnet always has a name and an S7 subnet ID. You can set these two values in the subnet properties.

Which Ethernet subnet is used to link interconnected devices?

STEP 7 distinguishes between the following cases:

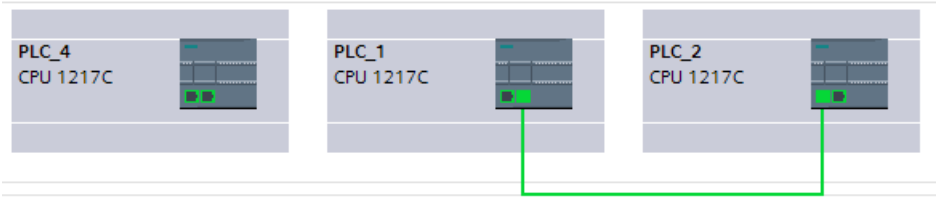
- Ethernet subnet specified (default subnet).
- No Ethernet subnet specified (no default subnet).

Ethernet subnet specified (default subnet)



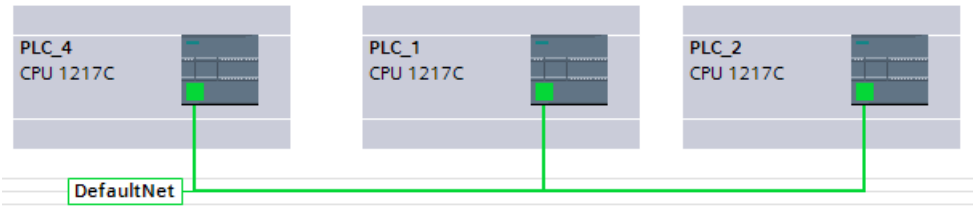
The option "Connect devices that are not linked with this subnet in case of port connection" is activated in the properties of an Ethernet subnet (default). This option can be activated for exactly one Ethernet subnet. Activate the option, if necessary, for the Ethernet subnet that is to be continued when interconnecting devices that are not linked. This subnet is referred to as "default subnet" below.

Response of STEP 7:



When you interconnect the ports of two devices that are not linked in the topology view, STEP 7 links these devices with the default subnet.

Example:



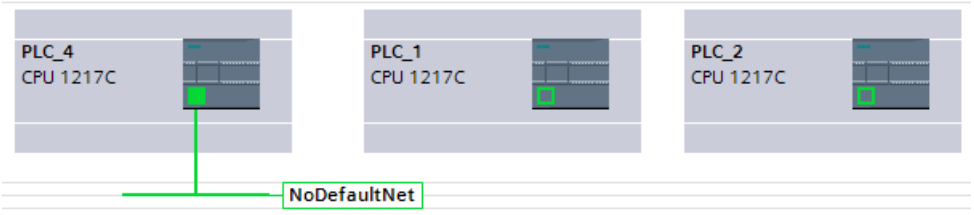
Step 1: Create a subnet in the network view at PLC_4, "Connect devices that are not linked with this subnet in case of port connection" option is **enabled**.

Step 2: Interconnect PLC_1 with PLC_2 (topology view).

Result: All PLCs are now connected to the same default subnet (network view).

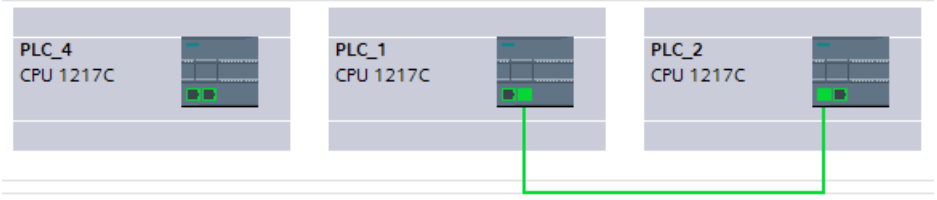
No Ethernet subnet specified (no default subnet).

This is the case when the following conditions are fulfilled:



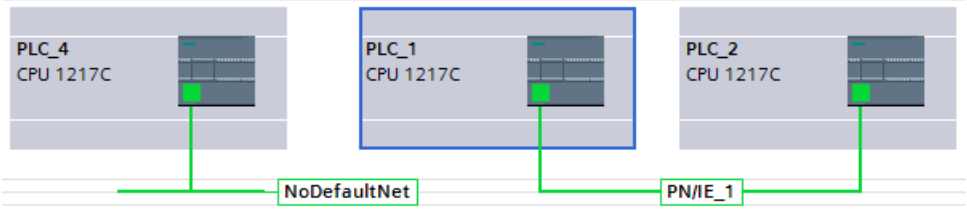
- A subnet has been added to a PROFINET interface (this interface is referred to as "Interface A" below).
- The option "Connect devices that are not linked with this subnet in case of port connection" is deactivated in the properties of this subnet (no default subnet).
- There is no other Ethernet subnet for which this option is activated.

Response of STEP 7:



- The Ethernet subnet of interface A is only continued when you interconnect a port of interface A with a port of another device.
- When you interconnect ports of other devices that are not linked with each other, STEP 7 creates a new Ethernet subnet.

Example:



Step 1: Create a subnet in the network view at PLC_4, "Connect devices that are not linked with this subnet in case of port connection" option is **disabled**.

Step 2: Interconnect PLC_1 with PLC_2 (topology view).

Result: PLC_1 and PLC_2 are connected to a new subnet (network view).

Manual adaptation of the IP addresses

It can occur that STEP 7 does not adapt the IP addresses of the interconnected devices in such a way that the resulting network can be correctly compiled, for example, for devices with multiple PROFINET interfaces. In these situations, you need to adapt the IP addresses of the devices manually.

The following rules apply:

- Devices that are to communicate with each other without a router cannot belong to different IP subnets.
- For devices with multiple PROFINET interfaces, the interfaces must be in different IP subnets.

To change the IP address of a PROFINET interface, perform the following steps:

1. Change to the network view (if not selected already).
2. Left-click on the icon of the PROFINET interface that is not to be part of the IP subnet.
3. Change the subnet part of the IP address in the properties of the PROFINET interface (in the "Ethernet addresses" area).

Example: Manual conversion of the IP subnet part for devices with multiple PROFINET interfaces in a subnet

The IP address is: "192.168.0.1".

The subnet mask is "255.255.255.0".

The first three numbers "192.168.0" form the IP subnet part of the IP address "192.168.0.1".

Change the IP subnet part, for example, to "192.168.1"

10.1.3.2 Communication via connections

Working with connections

Using Open User Communication (S7-1200, S7-1500)

Basics of Open User Communication (S7-1200, S7-1500)

Introduction

Open User Communication (OUC) is the name given to a program-controlled communication process for communicating via the integrated PN/IE interface of S7-1200/1500 and S7-300/400 CPUs. Different connection types are available for this communication process.

The main feature of Open User Communication is its high degree of flexibility in terms of the data structures transferred. This allows open data exchange with any communicating devices providing they support the connection types available here. Since this communication is controlled solely by instructions in the user program, event-driven connection establishment and termination is possible. Connections can also be modified by the user program during runtime.

For CPUs with an integrated PN/IE interface, the TCP, UDP, and ISO-on-TCP connection types are available for Open User Communication. The communication partners can be two SIMATIC PLCs or a SIMATIC PLC and a suitable third-party device.

Instructions for Open User Communication

To create the connections, you have various instructions available after opening in the program editor in the "Instructions > Communication > Open User Communication" task card:

- Compact instructions for sending or receiving data via the integrated functions for establishing and terminating the connection (S7-1200/1500 only):
  - TSEND_C (Page 4419) (connection establishment/termination, sending)
  - TRCV_C (Page 4432) (connection establishment/termination, receiving)
- Individual instructions for sending and receiving data or for establishing or terminating connections:
  - TCON (Page 4474) (connection establishment)
  - TDISCON (Page 4484) (connection termination)
  - TSEND (Page 4490) (TCP or ISO-on-TCP: Sending)
  - TRCV (Page 4493) (TCP or ISO-on-TCP: Receiving)
  - TUSEND (Page 4516) (UDP: Sending)
  - TURCV (Page 4520) (UDP: Receiving)

Connection establishment

For Open User Communication, instructions for establishing and terminating the connection must exist for both communication partners. One communication partner sends its data using TSEND, TUSEND or TSEND_C while the other communication partner receives the data using TRCV, TURCV or TRCV_C.

One of the communication partners starts the connection establishment as the active partner. The other communication partner reacts by starting its connection establishment as the passive partner. If both communication partners have initiated their connection establishment, the communication connection is fully established.

Connection configuration

You can specify establishment of the connection via a connection description DB with the TCON_Param, TCON_IP_v4, or TCON_IP_RFC structure by means of parameter assignment as follows:

- Manually create, assign parameters and write directly to the instruction.
- Supported by connection configuration.

Connection configuration supports the establishment of the connection and should, therefore, be given preference over the other methods.

You specify the following in the connection configuration:

- Connection partner
- Connection type
- Connection ID

- Connection description DB
- Address details according to selected connection type

In addition, you specify here which communication partner activates the connection establishment and which partner establishes a connection passively in response to a request from its communication partner.

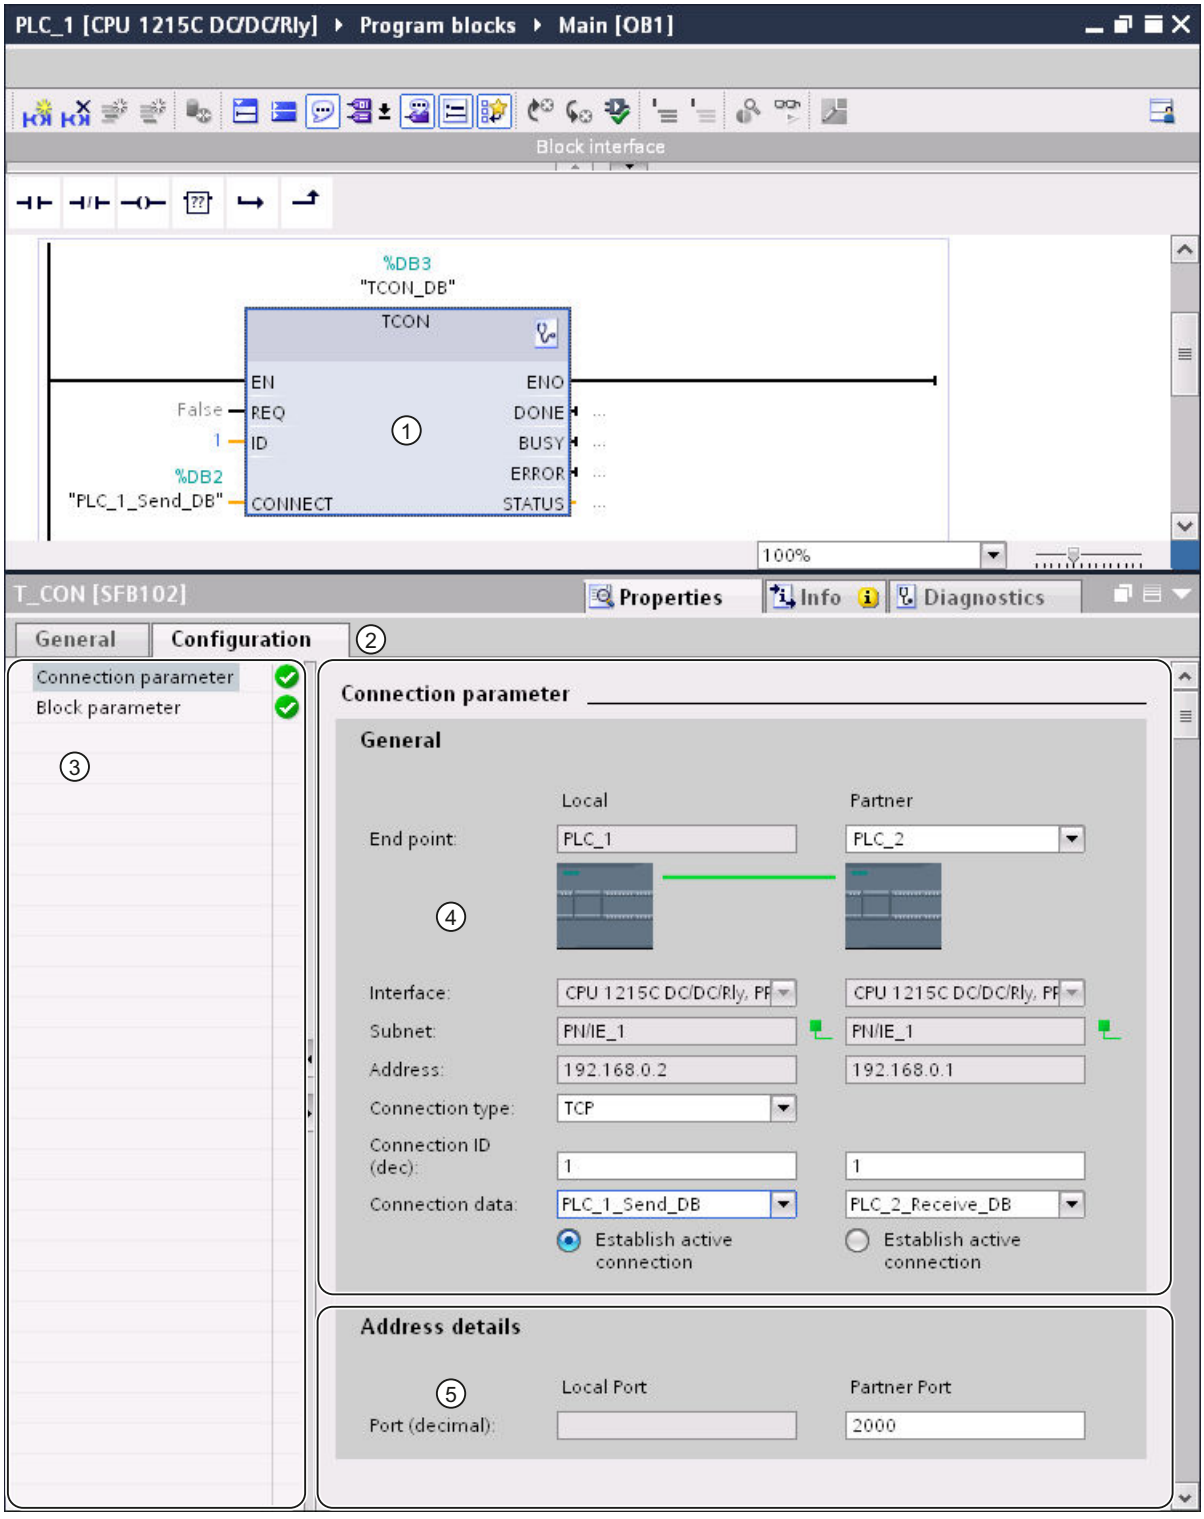
Principle of operation of connection-oriented protocols (Page 620)

Connection configuration (S7-1200, S7-1500)

Overview of connection configuration (S7-1200, S7-1500)



Introduction

You can find the connection configuration in the inspector window of the program editor if you want to program Open User Communication with the communication instructions TSEND_C, TRCV_C or TCON.

Connection configuration supports the flexible functionality of communication programming: The parameters entered for the connection configuration are stored in an automatically generated global DB derived from the TCON_Param, TCON_IP_v4 or TCON_IP_RFC structure. You can modify the connection parameters in this connection description DB.

Structure of the connection configuration

The connection configuration is made up of the following components:

① Communication instruction for TCON, TSEND_C or TRCV_C

② "Configuration" tab in the "Properties" tab
③ Area navigation of the "Configuration" tab
④ General properties of the connection parameters
⑤ Address details of the connection parameters (for selected connection DBs)

"Configuration" tab

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections and the address details with system support. Here, you also connect the CONNECT (TCON, TSEND_C, TRCV_C) or ID (TCON, TSEND, TRCV, TUSEND, TURCV) block parameters of the selected communication instructions.

When all the required parameters are assigned, a check mark is set in front of the "Connection parameters" group in the area navigation.

Note

The connection parameter assignment does not check whether the connection IDs and port numbers (TCP, UDP) or TSAPs (ISO-on-TCP, ISO) are unique. When you configure Open User Communication, you should, therefore, make sure that the parameter settings are unique within a device.

Description of the connection parameters (S7-1200, S7-1500)

Overview

The following table shows the general connection parameters:

Parameter	Description
End point	The names of the local end point and the partner end point are shown. The local end point is the CPU for which TCON, TSEND_C or TRCV_C is programmed. The local end point is, therefore, always known. The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. For S7-1500, broadcast can be selected as the partner end point (message to all subnet devices). For S7-1500 CPs/CMs, multicast can also be selected as the partner end point (message to a group within the subnet). The connection type is converted automatically to UDP in this case. As long as no connection partner is selected, all other parameters in the mask are disabled except for the "Connection data" parameter.
Interface	The interface of the local end point is displayed. If multiple interfaces are available, e.g., by means of CPs or CMs, the interface can be selected from the drop-down list. To display or select the partner interface, a specified partner end point must first be selected.
Subnet	The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected. If at least one of the two connection partners is not connected with a subnet, the two connection partners are connected with each other. A connection between partners in different subnets is only possible with IP routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.
Address	The IP address or the PROFIBUS address of the local end point is displayed, depending on the subnet used. The corresponding address of the partner is displayed only after the partner end point has been selected. If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you must specify a valid IP address/PROFIBUS address. The address type (IP or PROFIBUS) depends on the type of subnet that is set for the local partner. Broadcast (S7-1500 only): If "Broadcast" is set as the partner end point, a non-editable IP address with host address 255 is entered automatically for the connection partner. The network allocation corresponds to that of the sender. Example: Local IP address 192.168.0.1, partner IP address 192.168.0.255. Multicast (S7-1500 CPs/CMs only): If "Multicast" is set as the partner end point, the editable IP address 224.0.1.0 is entered automatically for the connection partner.
Connection type	Select the connection type you want to use from the "Connection type" drop-down list: • TCP • ISO-on-TCP • UDP With the S7-1500, you can also select the ISO connection type at the configuration type of the configured connections for TSEND_C and TRCV_C or TCON. The connection types can only be used for partners that support the corresponding protocol.

Parameter	Description
Connection type (for S7-1500 only)	With the S7-1500, two different configuration types can be set for TSEND_C and TRCV_C: • Programmed connections use program blocks for the connection description. • Configured connections are saved for the configuration and are only created after download to the device in runtime. You can also use the configured connection to select the connection type ISO. The specified configuration method depends on the selected connection type. If both configuration methods are possible, the programmed connection is preset. The same configuration method must be set for both connection partners.
Connection ID	Enter the connection ID in the input box. You can change the connection ID in the input boxes or enter it directly in TCON. Ensure that the connection ID assigned is unique within the device.
Connection data	The names of the connection description DBs for the connection description structured according to TCON_IP_v4, TCON_IP_RFC or TCON_Param are displayed in the drop-down lists. You can use the drop-down list to generate a new data block or to select an existing data block. This data block is filled automatically with the values from the connection configuration. The name of the selected data blocks is entered automatically in the CONNECT block parameter of the selected TSEND_C, TRCV_C or TCON instruction. From the drop-down list, you can also reference another valid data block. If a DB is referenced using the CONNECT input parameter of the TSEND_C, TRCV_C or TCON extended instructions and this does not correspond to the structure of a TCON_IP_v4, TCON_IP_RFC or TCON_Param, the drop-down list is shown with no content on a red background.
Connection name (for S7-1500 only)	If the connection type of the configured connections is set for TSEND_C and TRCV_C for the S7-1500, the "Connection data" parameter is replaced with the "Connection name" parameter. The name of the configured connection serves here as the connection data. The drop-down list is still empty after selection of a connection partner. You can use the drop-down list to generate a new connection or to select an existing connection. If needed, a data block is created and automatically filled with the values from the connection configuration. The name of the data block is entered automatically in the CONNECT block parameter of the TSEND_C or TRCV_C instruction. You can also reference an existing connection from the drop-down list.
Active connection establishment	Use the "Active connection establishment" check box to specify the active partner of the Open User Communication (only with TCP and ISO-on-TCP).
Port (only with TCP and UDP)	Address component for a TCP or UDP connection. The default after creating a new TCP connection is 2000. You can change the port numbers. The port numbers must be unique on the device!
TSAP (ISO-on-TCP only)	Address component for an ISO-on-TCP connection. The default value after creating a new ISO-on-TCP connection is E0.01.49.53.4F.6F.6E.54.43.50.2D.31 (S7-1200/1500) or E0.02.49.53.4F.6F.6E.54.43.50.2D.31 (S7-300/400). You can enter the TSAP-ID with an extension or as an ASCII TSAP. The TSAPs must be unique on the device!

Note

UDP connection for the "Broadcast" setting (S7-300/400/1200)

The parameters of the UDP connection for the "Broadcast" setting for the partner end point are stored in a connection description DB TCON_IP_v4 : With respect to UDP communication with TCON and TUSEND/TURCV , the TCON_IP_v4 is not filled with any partner parameters (value=0). However, the partner address and the partner port are necessary for sending the data and must be entered by the user in the TADDR_Param . The TADDR_Param for UDP communication is referenced by the TUSEND-/TURCV block parameter ADDR . The values for both parameters can be taken from the connection configuration.

The configuration must also be adapted for the other recipients of UDP communication. In order to receive broadcast frames, the partner port must be configured at the receiver end. For this purpose, the RemotePort parameter of the TADDR_Param must be filled at the ADDR block.

Note

Communication via TSEND_C and TRCV_C (S7-1500)

When TSEND_C and TRCV_C are used, a separate TSEND_C and TRCV_C block pair with a configured connection is required for each communication. Multiple TSEND_C and TRCV_C block pairs cannot simultaneously use the same configured connection for communication.

Additional connections for a TSEND_C or TRCV_C instruction can be created in the inspector window for the connection parameters using the appropriate button next to the connection data.

The connections configured using TSEND_C and TRCV_C are displayed in a connection table in the inspector window under "Properties > Configuration > Overview of configured connections" when the TSEND_C or TRCV_C block is selected.

The connection configuration for Open User Communication is enabled as soon as a TCON, TSEND_C or TRCV_C instruction for communication is selected in a program block.

Requirement

- Your project must contain at least one S7-CPU.
- The program editor is open.
- A network is available.

Procedure

To insert the extended instructions for Open User Communication, proceed as follows:

1. Open the task card, pane and folder "Instructions > Communication > Open User Communication".
2. Drag one of the following instructions to a network:
   - TSEND_C
   - TRCV_C
   - TCON

   The "Call options" dialog opens.
3. Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
   - Change the default name.
   - Select the "Manual" check box to assign your own number.
   - You can also execute the DB as a multi-instance for function blocks.
4. Click "OK" to complete your entry.

Result

A corresponding instance DB is created at a single instance for the inserted instruction TSEND_C, TRCV_C or TCON. In the case of a multi-instance, the instance DB of the function block is used.

With TSEND_C, TRCV_C or TCON selected, you will see the "Configuration" tab under "Properties" in the Inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

TCON: Establish communication connection (Page 4478)

Creating and assigning parameters to connections (S7-1200, S7-1500)

In the connection configuration for Open User Communication, you can create and configure connections of the TCP, UDP or ISO-on-TCP type.

Requirements

A CPU exists with a TCON, TSEND_C or TRCV_C communication instruction.

Procedure

To create a connection for Open User Communication, follow these steps:

1. Select a TCON, TSEND_C or TRCV_C block of Open User Communication in the program editor.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the drop-down lists for the partner end point and the local connection data are enabled. All other input options are disabled.
   The connection parameters already known are displayed:
   - Name of the local end point
   - Interface of the local end point
   - IP address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the local end point.
4. If you want to use an existing connection description DB, go to step 6. If you want to configure the connection with a new remote connection partner, continue here:
   In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communication partner. Certain connection parameters are then entered automatically.
   The following parameters are set:
   - Name of the partner end point
   - Interface of the partner end point
   - IP address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the partner end point.

   If the connection partners are networked, the name of the subnet is displayed.
5. With the S7-1500, in the "Configuration type" drop-down list, you choose between using program blocks or configured connections.

6. Select an existing connection description DB in the "Connection data" drop-down list or for configured connections select an existing connection under "Connection name". You can also create a new connection description DB or a new configured connection. When you select an existing connection description DB, the available configuration data is applied and entered in the connection description. Any data of a remote partner that was entered previously is overwritten. Later, you can still select other configured connections or change the names of the connection description DBs in order to create new data blocks:
   - You can also see the selected data block at the interconnection of the CONNECT input parameter of the selected TCON, TSEND_C or TRCV_C instruction.
   - If you have already specified a connection description DB for the connection partner using the CONNECT parameter of the TCON, TSEND_C or TRCV_C instruction, you can either use this DB or create a new DB.
   - If you edit the name of the displayed data block in the drop-down list, a new data block with the changed name but with the same structure and content is generated and used for the connection.
   - Changed names of a data block must be unique in the context of the communication partner.
   - A connection description DB must have the structure TCON_Param, TCON_IP_v4 or TCON_IP_RFC, depending on CPU type and connection.
   - A data block cannot be selected for an unspecified partner.

   Additional values are determined and entered after the selection or creation of the connection description DB or configured connection.
   The following is valid for specified connection partners:
   - ISO-on-TCP connection type
   - Connection ID with default of 1
   - Active connection establishment by local partner
   - TSAP ID
     for S7-1200/1500: E0.01.49.53.4F.6F.6E.54.43.50.2D.31
     for S7-300/400: E0.02.49.53.4F.6F.6E.54.43.50.2D.31

   The following is valid for unspecified connection partners:
   - TCP connection type
   - Partner port 2000

   The following applies for a configured connection with a specified connection partner:
   - TCP connection type
   - Connection ID with default of 257
   - Active connection establishment by local partner
   - Partner port 2000

   The following applies for a configured connection with an unspecified connection partner:
   - TCP connection type
   - Local port 2000

7. Enter a connection ID as needed for the connection partner. No connection ID can be assigned to an unspecified partner.

   Note

   You must enter a unique value for the connection ID at a known connection partner. The uniqueness of the connection ID is not be checked by the connection parameter settings and there is no default value entered for the connection ID when you create a new connection.

8. Select the desired connection type in the relevant drop-down list. Default values are set for the address details depending on the connection type. You can choose between the following:
   - TCP
   - ISO-on-TCP
   - UDP

   For configured connections with S7-1500, ISO applies in addition.
9. You can edit the input boxes in the address details. Depending on the selected protocol, you can edit the ports (for TCP and UDP) or the TSAPs (for ISO-on-TCP and ISO).
10. Use the "Active connection establishment" check box to set the connection establishment characteristics for TCP, ISO and ISO-on-TCP. You can decide which communication partner establishes the connection actively.

Changed values are checked immediately for input errors by the connection configuration and entered in the data block for the connection description.

Note

Open User Communication between two communication partners can only work when the program section for the partner end point has been downloaded to the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Deleting connections (S7-1200, S7-1500)

Introduction

The data of a created connection for Open User Communication is stored in a connection description DB. You can delete the connection by deleting the data block containing the connection description.

Requirement

You have created an Open User Communication connection.

Procedure

To delete a connection, follow these steps:

1. Select a communication partner for Open User Communication in the project tree.
2. Open the "Program blocks > System blocks > Program resources" folder below the selected communication partner.
3. Select the "Delete" command from the shortcut menu of the data block with the connection parameter assignment.

Note

If you are not certain which block to delete, open the extended instruction TCON, TSEND_C or TRCV_C. You will find the name of the data block as the CONNECT input parameter or in the connection parameter assignment as the "Connection data" parameter.

If you only delete the instance DBs of the extended instructions TCON, TSEND_C or TRCV_C, the assigned connections are not deleted as well.

Note

If the connection DB is still being used by other blocks of the extended instructions, then the corresponding calls, their instance DBs, and, if present, the combination blocks TSEND_C and TRCV_C must also be deleted from the block folder, provided they are not used elsewhere.

This action prevents the program from being inconsistent.

Result

You have deleted the connection.

Note

Insert an extended instruction TCON, TSEND_C, or TRCV_C again in order to reference an existing connection description with the TCON_Param, TCON_IP_v4, or TCON_IP_RFC structure again via the "Connection data" parameter.

Connection parameters (S7-1200, S7-1500)

Principle of operation of connection-oriented protocols (S7-1200, S7-1500)

Introduction

Connection-oriented protocols establish a logical connection to the communication partner before data transmission is started. After the data transmission is complete, they then terminate the connection, if necessary. Connection-oriented protocols are used especially when reliable data transmission is important. Several logical connections can exist over one physical line.

Open User Communication supports the following connection types:

- TCP
- ISO-on-TCP
- ISO (S7-1500 only)
- UDP

Both communication partners must support the same connection type for a connection. If a communication partner does not support a connection of the type ISO-on-TCP, for example, use the connection type TCP instead, if it is supported.

For communication partners that cannot be configured in the TIA Portal, such as third-party devices or PCs, enter "unspecified" for the partner end point during connection parameter assignment. The required connection type for unspecified devices is listed in the respective documentation.

Note

Connections with ISO

For S7-1500 CPUs, configured connections of the type ISO can be created using the TSEND_C and TRCV_C instructions. For additional information on these connection types, refer to the general connection descriptions.

Characteristics of TCP

TCP is a streaming protocol in which the length of the data stream is transmitted to the receiver so that it can receive the data stream as individual TCP segments. This means no information about the start and end of a message is transmitted during data transmission via a TCP connection. The receiver cannot determine by the received segments of the data stream where one message in the data stream ends and the next one begins. It is therefore recommended that the number bytes to be received (parameter LEN, instruction TRCV/TRCV_C) be assigned the same value as the number of bytes to be sent (parameter LEN, instruction TSEND/ TSEND_C).

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C): TRCV/TRCV_C copies the received data to the specified receive area (parameter DATA) only after the assigned length is reached. When the assigned length is reached, data of the subsequent job are already being received. As a result, the receive area contains data from two different send jobs. If you do not know the exact length of the first message, you are unable to recognize the end of the first message and the start of the second message.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C): TRCV/TRCV_C copies the number of bytes you specified in the LEN parameter to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the value of LEN. With each subsequent call, you receive a further block of the sent data.

A receive area with fixed data length can be specified in the TRCV/TRCV_C instructions with the protocol version of the Ad-hoc mode.

Characteristics of ISO-on-TCP

ISO-on-TCP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information regarding the length and the end of a message is included during data transmission via an ISO-on-TCP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C): TRCV/TRCV_C copies all the sent data to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND_C): TRCV/TRCV_C does not copy any data to the receive data area (parameter DATA), but instead supplies the following error information: ERROR=1, STATUS=W#16#8088 (destination buffer too small).

Characteristics of UDP

UDP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information on the length and the end of a message is included during data transmission via a UDP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) greater than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C): TURCV/TRCV_C copies all the sent data to the receive data area (DATA parameter). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV_C) less than length of data to be sent (parameter LEN, instruction TUSEND/TSEND_C): TRCV/TRCV_C copies as much data to the receive data area (parameter DATA) as the LEN parameter requests. No further error message is generated. In this case, the user has to call a T_URCV again in order to receive the remaining bytes.

Connection parameters with structure according to TCON_Param (S7-1200, S7-1500)

Data block for connection description

A connection description DB with a structure according to TCON_Param is used for some S7-1200 CPUs when it comes to the assignment of parameters for TCP, UDP and ISO-on-TCP communication connections. The fixed data structure of the TCON_Param contains all the parameters that are needed to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_Param

Byte	Parameter	Data type	Start value	Description
0 … 1	block_length	UINT	64	Length: 64 bytes (fixed)
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	USINT	17	Connection type: • 17: TCP (17 dec = 0x11 hex) • 18: ISO-on-TCP (18 dec = 0x12 hex) • 19: UDP (19 dec = 0x13 hex)
5	active_est	BOOL	TRUE	Identifier for the type of connection establishment. FALSE always applies to UDP, since data can be sent and received via local ID. The following is valid for TCP and ISO-on-TCP: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6	local_device_id	USINT	1	ID for the local PN/IE interface.
7	local_tsap_id_len	USINT	0	Length of parameter local_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the active side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 2, if connection type = 19 (UDP)
8	rem_subnet_id_len	USINT	0	This parameter is not used.
9	rem_staddr_len	USINT	4	Length of address of partner end point, in bytes: • 0: unspecified, in other words, parameter rem_staddr is irrelevant. • 4: valid IP address in the parameter rem_staddr (TCP and ISO-on-TCP only)
10	rem_tsap_id_len	USINT	2	Length of parameter rem_tsap_id used, in bytes; possible values: • 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the passive side. • 2 to 16, if connection type = 18 (ISO-on-TCP) • 0, if connection type = 19 (UDP)
11	next_staddr_len	USINT	0	This parameter is not used.

Byte	Parameter	Data type	Start value	Description
12 … 27	local_tsap_id	ARRAY [1..16] of BYTE	-	Local address component of connection: • TCP and UDP: local port no. (possible values: 1...49151; recommended values: 2000...5000); local_tsap_id[1] = high byte of port no. in hexadecimal notation; local_tsap_id[2] = low byte of port no. in hexadecimal notation; local_tsap_id[3-16] = irrelevant • ISO-on-TCP: local TSAP-ID: local_tsap_id[1] = B#16#E0; local_tsap_id[2] = rack and slot of local end points (bits 0 to 4: Slot number, bits 5 to 7: rack number); local_tsap_id[3-16] = TSAP extension, optional Note: Make sure that every value of local_tsap_id is unique within the CPU.
28 … 33	rem_subnet_id	ARRAY [1..6] of USINT	-	This parameter is not used.
34 … 39	rem_staddr	ARRAY [1..6] of USINT	-	TCP and ISO-on-TCP only: IP address of the partner end point, for example, for 192.168.002.003: • rem_staddr[1] = 192 • rem_staddr[2] = 168 • rem_staddr[3] = 002 • rem_staddr[4] = 003 • rem_staddr[5-6]= irrelevant
40 … 55	rem_tsap_id	ARRAY [1..16] of BYTE	-	Partner address component of connection • TCP: partner port no. (possible values: 1...49151; recommended values: 2000...5000); rem_tsap_id[1] = high byte of port no. in hexadecimal notation; rem_tsap_id[2] = low byte of port no. in hexadecimal notation; rem_tsap_id[3-16] = irrelevant • ISO-on-TCP: partner TSAP-ID: rem_tsap_id[1] = B#16#E0; rem_tsap_id[2] = rack and slot of partner end point (bits 0 to 4: Slot number, bits 5 to 7: rack number); rem_tsap_id[3-16] = TSAP extension, optional • UDP: This parameter is not used.
56 … 61	next_staddr	ARRAY [1..6] of BYTE	-	This parameter is not used.
62 … 63	spare	WORD	W#16#0000	Reserved.

Note

TCON_Param for S7-1500 CPU

The connection description DB with the structure according to TCON_Param is also supported by S7-1500 CPUs for migration reasons. However, we recommend that you use the new structures TCON_IP_v4 and TCON_IP_RFC.

Principle of operation of connection-oriented protocols (Page 620)

Description of the connection parameters (Page 612)

Ability to read back connection description parameters (Page 638)

Basic principles for programming of data blocks (Page 4795)

Overview of connection configuration (Page 609)

TSAP structure (Page 639)

Assignment of port numbers (Page 636)

Connection parameters with structure according to TCON_IP_v4 (S7-1200, S7-1500)

Data block for connection description

A connection description DB with a structure according to TCON_IP_v4 is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters for TCP and UDP communication connections. The fixed data structure of the TCON_IP_v4 contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_IP_v4

Byte	Parameter	Data type	Start value	Description
0 … 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.

Byte	Parameter	Data type	Start value	Description
4	connection_type	BYTE	11	Connection type: • 11: TCP (11 dec = 0x0B hex) • 19: UDP (19 dec = 0x13 hex) For compatibility and migration reasons, the CPU S7-1500 also allows the values of the connection description DB with a structure according to TCON_Param. For the connection type TCP, the entry 17 is therefore also valid (17 dec = 0x11 hex).
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6 … 9	remote_address	ARRAY [1..4] of BYTE	-	• IP address of the partner end point, for example, for 192.168.0.1: – addr[1] = 192 – addr[2] = 168 – addr[3] = 0 – addr[4] = 1 • Multicast address of an IPv4 multicast group (for S7-1500-CPUs as of firmware version V2.0 or V2.1 and higher when using TSEND_C/TRCV_C)
10 … 11	remote_port	UINT	2000	Port address of the remote connection partner (value range: 1 to 49151).
12 … 13	local_port	UINT	2000	Port address of the local connection partner (value range: 1 to 49151).

Connection parameters according to TCON_IP_V4_SEC (S7-1500)

Data block for connection description

To configure the communication connections for TCP over IPv4 with Secure Communication, use the following modules:

- S7-1500 as of firmware version V2.0
  With connection description DB with the structure of the SDT TCON_IP_V4_SEC
- Additionally optional: CP 1543-1 as of firmware version V2.0 or CP1543SP-1 as of firmware version V1.0

Note

Non-secure TCP or UDP connection over IPv4

You can also use SDT TCON_IP_V4_SEC for a non-secure TCP or UDP connection over IPv4.

The connection parameter CONNECT of the instance DBs for TCON contains a reference to the data block used.

Structure of the connection description according to TCON_IP_V4_SEC

Byte	Parameter	Data type	Start value	Description
0 … 15	ConnPara	TCON_IP_v4	-	SDT for the connection parameters Information about the interface_id: • If you leave the interface_id at the preset value of 0, the operating system of the CPU evaluates the remote IP address and the IP routes existing locally and then specifies an Industrial Ethernet interface of the CPU for establishing the secure OUC connection. In this case, the diagnostics data is always assigned to the first Industrial Ethernet interface of the CPU. • If you specify the hardware identifier of an Industrial Ethernet interface of the CPU or of a CP as interface_id, the secure OUC connection is established via the associated Industrial Ethernet interface.
16	ActivateSecure-Conn	BOOL	FALSE	Activation of Secure Communication for this connection If this parameter has the value FALSE, the subsequent security parameters are irrelevant, meaning that the connection is non-secure. You can set up a non-secure TCP or UDP connection in this case.
17	TLSServerReq-ClientCert	BOOL	FALSE	Only for the server side: Request for an X.509-V3 certificate from the TLS client

Byte	Parameter	Data type	Start value	Description
18 ... 19	ExtTLSCapabilities	WORD	16#0	• Bit 0: Only for the client side. A set bit means that the client validates the alternative name of the certificate subject (subjectAlternateName) in the X.509-V3 certificate of the server to check the identity of the server. The certificates are checked when the connection is established. • Bit 1 to 15: reserved for future upgrades
20 ... 23	TLSServerCertRef	UDINT	0	• Server side: ID of its own X.509-V3 certificate • Client side: ID of the X.509-V3 certificate (usually a CA certificate) that is used by the TLS client to validate the TLS server authentication. If this parameter is 0, the TLS client uses all the (CA) certificates currently loaded in the client certificate store to validate the server authentication.
24 … 27	TLSClientCertRef	UDINT	0	• Client side: ID of its own X.509-V3 certificate • Server side: ID of the X.509-V3 certificate (or a group of X.509-V3 certificates) that is used by the TLS server to validate the TLS client. If this parameter is 0, the TLS server uses all (CA) certificates currently loaded in the server certificate store to validate the client authentication.

Connection parameters with structure according to TCON_IP_v4 (Page 625)

Secure OUC between two S7-1500 CPUs (Page 942)

Connection parameters in accordance with TCON_QDN (S7-1500)

Data block for connection description

To configure the communication connections for TCP and UDP over the fully qualified domain name, use a connection description DB with a structure according to TCON_QDN for S7-1500 CPUs as of firmware version V2.0.

The connection parameter CONNECT of the instance DBs for TCON contains a reference to the data block used.

Note

TCON_DNS structure

TCON_QDN replaces TCON_DNS. Therefore use only connection description DBs with a structure according to TCON_QDN.

Structure of the connection description in accordance with TCON_QDN

Byte	Parameter	Data type	Start value	Description
0 … 1	interface_id	HW_ANY	0	irrelevant Note: The first Industrial Ethernet interface is always used in the firmware version V2.0 of the S7-1500 CPUs.
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TCON instruction under ID.
4	connection_type	BYTE	11	Connection type: • 11: TCP (11 dec = 0x0B hex) • 19: UDP (19 dec = 0x13 hex) For compatibility and migration reasons, the CPU S7-1500 also allows the values of the connection description DB with a structure according to TCON_Param. For the connection type TCP, the entry 17 is therefore also valid (17 dec = 0x11 hex).
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: • FALSE: Passive connection establishment • TRUE: Active connection establishment
6 … 261	remote_qdn	Array of STRING [1..254]	-	Fully qualified domain name of the partner end point, which must finish with "." Please note that in a SIMATIC network, the name including the concluding dot must not exceed 254 characters.
262 … 263	remote_port	UINT	2000	Port address of the remote connection partner (value range: 1 to 49151).
264 … 265	local_port	UINT	2000	Port address of the local connection partner (value range: 1 to 49151).

Connection parameters in accordance with TCON_QDN_SEC (S7-1500)

Data block for connection description

To configure the communication connections for TCP over the fully qualified domain name with secure communication, use a connection description DB with the structure of the SDT TCON_QDN_SEC for S7-1500 CPUs with firmware version V2.0 or higher.

Note

Non-secure TCP or UDP connection over the fully qualified domain name

You can also use the TCON_QDN_SEC SDT for a non-secure TCP or UDP connection over the fully qualified domain name.

The connection parameter CONNECT of the instance DBs for TCON contains a reference to the data block used.

Structure of the connection description according to TCON_QDN_SEC

Byte	Parameter	Data type	Start value	Description
0 … 271	ConnPara	TCON_QDN	-	Connection parameter
272	ActivateSecure-Conn	BOOL	FALSE	Activation of secure communication for this connection If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
273	TLSServerReq-ClientCert	BOOL	FALSE	Only for the server side: Request for an X.509-V3 certificate from the TLS client
274 .. . 275	ExtTLSCapabilities	WORD	16#0	• Bit 0: Only for the client side. A set bit means that the client validates the subjectAlternateName in the X.509-V3 certificate of the server to check the identity of the server. The certificates are checked when the connection is established. • Bit 1 to 15: reserved for future upgrades
276 .. . 279	TLSServerCertRef	UDINT	0	• Server side: ID of its own X.509-V3 certificate • Client side: ID of the X.509-V3 certificate (usually a CA certificate) that is used by the TLS client to validate the TLS server authentication. If this parameter is 0, the TLS client uses all (CA) certificates currently loaded in the client certificate store to validate the server authentication.
280 … 283	TLSClientCertRef	UDINT	0	• Client side: ID of its own X.509-V3 certificate • Server side: ID of the X.509-V3 certificate (or a group of X.509-V3 certificates) that is used by the TLS server to validate TLS client authentication. If this parameter is 0, the TLS server uses all (CA) certificates currently loaded in the server certificate store to validate the client authentication.

Connection parameters with structure according to TCON_IP_RFC (S7-1200, S7-1500)

Data block for connection description

A connection description DB with a structure according to TCON_IP_RFC is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters to ISO-on-TCP communication connections. The fixed data structure of the TCON_IP_RFC contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND_C, TRCV_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND_C, TRCV_C or TCON contains a reference to the data block used.

Structure of the connection description according to TCON_IP_RFC

Byte	Parameter	Data type	Start value	Description
0 … 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 … 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	BYTE	12	Connection type 12: ISO-on-TCP (12 dec = 0x0C hex) For compatibility and migration reasons, the CPU S7-1500 also allows the values of the connection description DB with a structure according to TCON_Param. For the connection type ISO-on-TCP, the entry 18 is therefore also valid (18 dec = 0x12 hex).
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: • FALSE: Passive connection establishment • TRUE: Active connection establishment
8 … 11	remote_address	ARRAY [1..4] of BYTE	-	IP address of the partner end point, for example, for 192.168.0.1: • addr[1] = 192 • addr[2] = 168 • addr[3] = 0 • addr[4] = 1
12 … 45	remote_tselector	TSelector	-	TSelector of the remote connection partner: • TSelLength = Value range 0 to 32 as UINT • TSel[1-32] = Value range each 0 to 255 in bytes
46 … 79	local_tselector	TSelector	-	TSelector of the local connection partner: • TSelLength = Value range 0 to 32 as UINT • TSel[1-32] = Value range each 0 to 255 in bytes

Overview of connection configuration (Page 609)

TSAP structure (Page 639)

Connection parameters to TCON_Phone (S7-1200, S7-1500)

System data types TCON_... for telecontrol connections

TCON_PHONE is used as a connection description for the following types of connection:

- In mobile wireless CPs of the S7-1200 for connections of Open User Communication to transfer SMS over TCON / TDISCON / TSEND or TSEND_C.
- With the CP 1242-7 for telecontrol connections to SMS clients with TC_CON

To configure establishment of a connection using one of the previously mentioned instructions, the CONNECT parameter of the instruction is used for the connection description.

The connection description is defined by the structure of the system data type (SDT) TCON_Phone. The structure of the relevant SDT contains the parameters necessary to establish the connection with the remote communications partner.

Creating a DB of the type TCON_Phone

You need to type in the data type of the DB with the keyboard. It is not displayed in a selection list. Upper or lower case is unimportant when entering the data type.

Follow these steps to create the DB:

1. Create a data block of the type "Global DB" with block access "Standard".
   To do so, deactivate the property "Optimized access" in the block properties (shortcut menu) in the "Attributes" tab.
2. Create an SDT in the parameter configuration table of the DB.
3. Enter the following name in the declaration table of the DB in the cell of the data type:
   TCON_Phone
   The SDT and its parameters are created (see below).
4. Configure the parameters described below.

Reserved bits are not displayed.

System data type TCON_Phone for SMS connections

Note

SMS text

- Programmed SMS texts for SMS messages to be sent are accessed using the DATA parameter of the TC_SEND instruction.
- The text of a received SMS message is assigned to the address area of the CPU by the DATA parameter of the TC_RECV instruction.

Table 10-1 Parameters of TCON_Phone

Byte	Parameter	Data type	Initial value	Description
0 ... 1	InterfaceId	HW_ANY		Reference to the local interface (telecontrol interface or Ethernet interface of the CP > "Hardware identifier")
2 ... 3	ID	CONN_OUC	1...07FF$_h$	Reference to the local mobile wireless connection. The ID is assigned and must be unique within the CPU. Note on telecontrol connections of the CP 1242-7: The same value as that of the parameter ID of the TC_CON instruction must be used here.
4	ConnectionType	Byte	W#16#0E	Protocol variant 14 (E$_h$): SMS connection
5	ActiveEstablished	Bool		Identifier for the type of connection establishment (not relevant for the CP 1242-7): • 0: Passive connection establishment (not relevant here) • 1: Active connection establishment
6...7	-	-	-	- reserviert -
8 ... 31	PhoneNumber	String[22]		Call number of the connection partner Permitted values: Plus character (+) and numbers Note the exact notation of the international dialing code of the relevant phone number assigned by the network provider ("+" character or zeros). Note on the telecontrol connections of the CP 1242-7: if the parameter PhoneNumber is not entered, no connection partner is specified and SMS messages can be received by all authorized connection partners. Without an entry, TC_RECV initially delivers the oldest received SMS messages during startup.

Connection parameters to TCON_FDL (S7-1200, S7-1500)

System data block (SDT) for FDL connection description

In order to parameterize an FDL connection for the CM 1542-5, a connection description DB with an SDT to TCON_FDL is used. The fixed data structure of the STD contains all parameters that are required to establish the connection. The connection description SDT has to be created in a created DB.

The connection parameter CONNECT of the instance DBs for TSEND_C or TRCV_C contains a reference to the data block used.

The following types of FDL connections can be established:

- **Configured FDL connections**
  These connection types are configured in the STEP 7 program editor, see AUTOHOTSPOT. TSEND_C and TRCV_C are used as blocks.
  - Specified connection
    Fully configured connection between two masters
  - Unspecified connection
    Configured connection with an unspecified partner
- **Programmed FDL connections**
  These connection types cannot be configured in the STEP 7 program editor. Instead these connection types require the calling the TCON instruction together with TSEND/TRCV or TUSEND/TURCV, respectively.
  - Unspecified Layer 2 connection
    Programmed FDL connection with an unspecified partner with free Layer 2 access
  - Broadcast connection
    Connection with all connected partners
  - Multicast connection
    Connection with several defined partners

If specific settings for the individual connection types are required, this is mentioned at the subsequent parameters of the SDT.

Structure of the connection description "TCON_FDL" for configured connections

The table below describes the connection parameters for the following configured FDL connections:

- Specified connection
- Unspecified connection

Byte	Parameter	Data type	Value range / Start value	Description
0 … 1	InterfaceId	HW_ANY	0 .. 65535	Hardware identifier of the local interface
2 … 3	ID	CONN_OUC	0 .. 4095	Reference to this connection in accordance with connection configuration
4	ConnectionType	Byte	15	Connection type: 0x15 (dec. 21) for FDL
5	ActiveEstablished	Bool	FALSE	ID for the manner in which the connection is established • FALSE: Passive connection establishment • TRUE: Active connection establishment The parameter value is not processed further.

Byte	Parameter	Data type	Value range / Start value	Description
5	ServiceId	Byte	0 .. 2	Identifier of the data transfer service • 0: Automatic default with selection of the service in accordance with the receiver configured in the connection description Only SDA is used in this setting for configured connections. • 1: Send Data Acknowledged (SDA) - for active connections between two masters Use this setting for unspecified connections. • 2: Send Data Non-Acknowledged (SDN) - for multicast / broadcast
6 … 9	RemotePBAddress	Byte	0 .. 126	PROFIBUS address of the connection partner • Is used for specified connections by the connection configuration. • Has to be stated explicitly for unspecified connections.
6 … 9	LocalPBAddress	Byte	0 .. 126	Own (local) PROFIBUS address Is assigned automatically by the interface configuration.
10 … 11	RemoteLSAP	Byte	2 .. 32	LSAP (link layer service access point) of the connection partner Has to be stated explicitly for configured connections.
12 … 13	LocalLSAP	Byte	2 .. 32	Own (local) LSAP Has to be stated explicitly for configured connections.

Structure of the connection description "TCON_FDL" for programmed connections

The table below describes the connection parameters for the following programmed FDL connections:

- Unspecified Layer 2 connection
- Broadcast connection
- Multicast connection

Byte	Parameter	Data type	Value range / Start value	Description
0 … 1	InterfaceId	HW_ANY	0 .. 65535	Hardware identifier of the local interface
2 … 3	ID	CONN_OUC	0 .. 4095	Reference to this connection Reference to the value of the ID generated by TCON. Specify the value for TSEND / TRCV or TUSEND / TURCV at the parameter ID.
4	ConnectionType	Byte	15	Connection type: 0x15 (dec. 21) for FDL
5	ActiveEstablished	Bool	FALSE	ID for the manner in which the connection is established • FALSE: Passive connection establishment • TRUE: Active connection establishment The parameter value is not processed further.

Byte	Parameter	Data type	Value range / Start value	Description
5	ServiceId	Byte	0 .. 2	Identifier of the data transfer service • 0: Automatic selection of the service. Not to be used for programmed connections. • 1: Send Data Acknowledged (SDA) - for active connections between two masters • 2: Send Data Non-Acknowledged (SDN) - for multicast / broadcast "1" or "2" has to be programmed for programmed connections.
6 … 9	RemotePBAddress	Byte	0 .. 127	PROFIBUS address of the connection partner Specify the address if TSEND or TUSEND is used. The value is set by the user program for TRCV or TURCV. • For broadcast / multicast: 127
6 … 9	LocalPBAddress	Byte	0 .. 126	Own (local) PROFIBUS address Is assigned automatically by the interface configuration.
10 … 11	RemoteLSAP	Byte	2 .. 32, 63	LSAP (link layer service access point) of the connection partner Specify the address if TSEND or TUSEND is used: • For unspecified Layer 2 connections: 2 .. 32 • For broadcast: 63 • For multicast: Use the same values as "LocalLSAP". The value is set by the user program for TRCV or TURCV.
12 … 13	LocalLSAP	Byte	2 .. 32	Own (local) LSAP Is to be assigned by the program.

Assignment of port numbers (S7-1200, S7-1500)

Introduction

When an Open User Communication is created, the value 2000 is automatically assigned as the port number.

Permissible values for port numbers are 1 to 49151. You can assign any port number within this range. However, because some ports may already be used depending on the system, port numbers within the range from 2000 to 5000 are recommended.

Note

Port numbers must be unique. The connection configuration or a corresponding block call is rejected with an error if the port numbers are assigned twice.

Overview of port numbers

The following table summarizes the system reactions to different port numbers.

Port no.	Description	System reaction
2000 … 5000	Recommended range	No warning, no error message on entry Port number is permitted and accepted
1 … 1999, 5001 … 49151	Can be used, but is outside the recommended range	Warning message on entry Port number is permitted and accepted
0, 20, 21, 25, 80, 102, 135, 161, 443, 465, 989, 990, 8080, 34962 … 34964	Can be used conditionally*	
53, 80, 102, 135, 161, 162, 443, 520, 9001, 34962 … 34964	Can be used conditionally**	

* Ports specified for specific functions ("well-known Ports"):
0: ANY - Port number is automatically assigned by S7-1500 CPU as value (>49151)
20: FTP data transmission
21: FTP control
25: SMTP (Simple Mail Transfer Protocol) / TMAIL_C
80: HTTP (Hypertext Transfer Protocol) / Web server
102: ISO-on-TCP (RFC1006)
135: DCE Endpoint Mapper for PROFINET
161: SNMP (Simple Network Management Protocol)
443: HTTPS (Hypertext Transfer Protocol Secure)
465: SMTPS (Simple Mail Transfer Protocol Secure)
989: FTPS data transfer
990: FTPS control
8080: HTTP alternative / internal Web
34962 ... 34964: PROFINET

Note

The user usually specifies the value 0 for the local port on the active connection end point for UDP/TCP. In this case, the CPU operating system selects the next available port above 49151. The partner port usually has the default 0 with the passive connection end point. The corresponding parameter is disabled in the connection configuration.

** These ports are disabled depending on the function scope of the CPU in use. The documentation of the respective CPUs provides the assignment of these ports.

Description of the connection parameters (Page 612)

Creating and assigning parameters to connections (Page 616)

Ability to read back connection description parameters (S7-1200, S7-1500)

Changing parameter values in the connection description

The connection description for exactly one connection of the Open User Communication is entered from the connection configuration in the connection description DB.

You can change the parameter values of the connection description DB outside of the connection configuration in the user program. Connection description DBs containing values you changed subsequently can be read back from the connection configuration. Under "Properties > Configuration > Connection parameters", the inspector window displays only the connection parameters stored in the connection description DB.

Note

You can only change the values in the running user program if the instructions TCON, TSEND_C or TRCV_C are not being processed and the referenced connection is not established.

The connection configuration does not support nested entries of connection descriptions in DB types that can only be found via offset referencing (for example, Global-DB).

The structure of the connection description cannot be changed.

Ability to read back individual connection parameters

For the "Address" parameter of the communication partner in a TCP or ISO-on-TCP connection, its IP address is displayed from the "rem_staddr" parameter of the connection description.

The following values can also be reloaded from the connection description:

- Connection type
- Local connection ID
- Active/passive connection establishment (only with UDP)
- Local TSAP (ISO-on-TCP only)
- Partner TSAP (ISO-on-TCP only)
- Local port (only with TCP and UDP)
- Partner port (only with TCP)

The values of the connection ID parameters of the communication partner, the connection data, as well as the connection establishment, are not included in the connection description in the local connection description DB. Consequently, these parameters cannot be displayed when the connection configuration is reopened. The connection establishment of the partner results from the local connection establishment and is therefore also displayed.

A new communication partner can be selected at any time in the "Partners" drop-down list box.

When a CPU recognized in the project is selected as a specified communication partner, the entry options for the connection ID and the connection data are shown again.

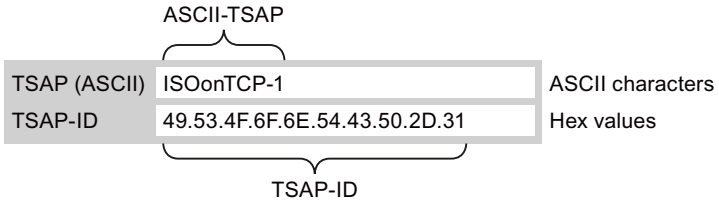
Connection parameters with structure according to TCON_Param (Page 622)

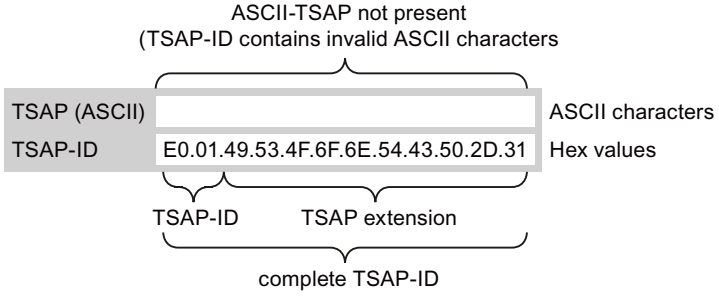
Description of the connection parameters (Page 612)



TSAP structure (S7-1200, S7-1500)

Introduction

For an ISO-on-TCP connection, Transport Service Access Points (TSAPs) must be assigned for both communication partners. TSAP IDs are assigned automatically after an ISO-on-TCP connection is created. To ensure the uniqueness of TSAP IDs within a device, you can change the preassigned TSAPs in the connection parameter assignment.



Structure of TSAPs

You must comply with certain rules when assigning TSAPs. A TSAP must contain a certain number of bytes, which are able to be displayed and entered as hexadecimal values (TSAP-ID) or as ASCII characters (ASCII-TSAP):

Entries or changes of the TSAP-ID or the ASCII-TSAP in the corresponding entry fields always take effect in the other display format as well.

If a TSAP contains no valid ASCII characters, the TSAP is displayed only as TSAP-ID and not as ASCII-TSAP. This is the case after a connection is created. The first two hex characters as TSAP-ID identify the communication type and the rack/slot. Because these characters are not valid ASCII characters for a CPU, the ASCII-TSAP is not displayed in this case.

In addition to the rules for length and structure of TSAPs, you must also ensure the uniqueness of the TSAP-ID. The assigned TSAPs are not automatically unique.

Length and content of TSAPs

Structure of the TSAP ID with TSAP extension:

- Valid for CPU S7-1200 firmware V1
  Length = 2 to 16 bytes
  x_tsap_id[0] = 0xE0 (Open User Communication)
  x_tsap_id[1] (bits 0 to 4) = slot number of CPU
  x_tsap_id[1] (bits 5 to 7) = rack number of CPU
  x_tsap_id[2...15] = any characters (TSAP extension, optional)
  (x = loc (local) or x = rem (partner))
- Valid for CPU S7-1500 and S7-1200 firmware as of V2
  Length = 2 to 16 bytes
  x_tsap_id[0] = 0xE0 (Open User Communication)
  x_tsap_id[1] = 0x00 to 0xFF
  x_tsap_id[2...15] = any characters (TSAP extension, optional)
  (x = loc (local) or x = rem (partner))

Structure of the TSAP ID as ASCII TSAP:

- Valid for CPU S7-1200 firmware V1
  Length = 3 to 16 bytes
  x_tsap_id[0...2] = 3 ASCII characters (0x20 to 0x7E)
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))
- Valid for CPU S7-1200 firmware as of V2
  Length = 3 to 16 bytes
  x_tsap_id[0...2] for active connection = 3 ASCII characters (0x00 to 0xFF) or any bit string*
  x_tsap_id[0...2] for passive connection = 3 ASCII characters (0x20 to 0x7E) or any bit string*
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))
- Valid for S7-1500 CPU
  Length = 3 to 16 bytes
  x_tsap_id[0...2] = 3 ASCII characters (0x00 to 0xFF) or any bit string*
  x_tsap_id[3...15] = any characters (optional)
  (x = loc (local) or x = rem (partner))

* ASCII character strings must not start with "SIMATIC-"

The following table shows the schematic structure of various TSAP IDs:

TSAP-ID	tsap_id_len	tsap_id[0]	tsap_id[1]	tsap_id[2]	tsap_id[3..15]
...with extension (CPU S7-1200 firmware V1)	2...16 bytes	0xE0	0x01 or 0x02 or 0x00*	Extension (optional)	Extension (optional)
...with extension (CPU S7-1500, S7-1200 firmware as of V2)	2...16 bytes	0xE0	0x00...0xFF	Extension (optional)	Extension (optional)
...as ASCII-TSAP (CPU S7-1200 firmware V1)	3...16 bytes	0x20...0x7E	0x20...0x7E	0x20...0x7	Any (optional)

*An S7-1200 CPU is normally inserted on rack 0 and slot 1, and an S7-300/400 CPU on rack 0 and slot 2. For this reason, hex value 01 or 02 is valid for the second position of the TSAP ID with extension. If the connection partner is an unspecified CPU, for example, a third-party device, the hex value 00 is also permissible for the slot address.

Note

For unspecified communication partners, the local TSAP-ID and the partner TSAP-ID can have a length of 0 to 16 bytes, in which all hex values from 00 to FF are permitted.

ASCII code table for entry of ASCII TSAPs

When entering ASCII TSAPs with the hexadecimal values from 20 to 7E, only the following characters are permitted:

Code	..0	..1	..2	..3	..4	..5	..6	..7	..8	..9	..A	..B	..C	..D	..E	..F
2..		!	"	#	$	%	&	’	(	)	*	+	,	-	.	/
3..	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4..	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5..	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6..	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7..	p	q	r	s	t	u	v	w	x	y	z	{	|	}	~

Examples of TSAP assignment (Page 641)

Description of the connection parameters (Page 612)

Creating and assigning parameters to connections (Page 616)

Examples of TSAP assignment (S7-1200, S7-1500)

The following examples show the processing of the TSAPs for CPUs of the S7-1200/1500 (CPU on slot 1) under various points of view:

- Example 1: Creating a new connection for PLC-PLC communication
- Example 2: Entry of a local ASCII-TSAP
- Example 3: Entry of a TSAP extension in the TSAP-ID
- Example 4: Incorrect editing of the TSAP-ID
- Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

Example 1: Creating a new connection for PLC-PLC communication

Once you have created a new connection with two PLCs for the Open User Communication, the TSAP extension "ISOonTCP-1" is assigned automatically.

This TSAP extension produces the TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31, which is entered automatically in the connection description DB and in the entry fields of the local and the partner TSAP. The entry fields of the ASCII-TSAPs remain empty:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

You can change the values in the entry fields of the TSAP-ID and the ASCII-TSAP at any time.

The entry field of the TSAP-ID shows the complete TSAP stored in the data block of the connection description. The TSAP-ID with TSAP extension, which is limited to 16 characters, is not displayed in the "TSAP (ASCII)" entry field because the character E0 does not represent a valid character for the ASCII-TSAP.

If the displayed TSAP-ID is a valid ASCII-TSAP, it is displayed in the "TSAP (ASCII)" entry field.

Changes in the entry fields for TSAP-ID and ASCII-TSAP affect the other field.

Example 2: Entry of a local ASCII-TSAP

If you have created a new connection and assigned an ASCII value for the local TSAP in the "TSAP (ASCII)" entry field, for example, "ISOonTCP-1", the resulting TSAP-ID is created automatically.

When you exit the "TSAP (ASCII)" entry field, the number of ASCII characters is checked automatically for compliance with the limit (3 to 16 characters) and the resulting TSAP-ID is entered into the corresponding entry field:

	Local TSAP	Partner TSAP
TSAP (ASCII)	ISOonTCP-1	
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Example 3: Entry of a TSAP extension in the TSAP-ID

If, following creation of a connection and entry of an ASCII-TSAP (see examples 1 and 2) in the entry field of the local TSAP-ID, you add the prefix "E0.01" to the TSAP value, the ASCII-TSAP will no longer be displayed when the entry field is exited.

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Once you have exited the entry field of the TSAP-ID, a check is performed automatically to determine whether the first character of the TSAP-ID is a valid ASCII character. Since the character "E0" now present in the TSAP-ID is not a valid character for the ASCII-TSAP, the "TSAP (ASCII)" entry field no longer displays an ASCII-TSAP.

If a valid ASCII character is used, the check for compliance with the length specification of 2 to 16 characters follows.

Example 4: Incorrect editing of the TSAP-ID

If you remove the hex value "E0" from a TSAP-ID beginning with "E0.01", the TSAP-ID now begins with "01" and therefore no longer complies with the rules and is invalid:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

After the entry field is exited, a message is output because the TSAP-ID is neither a valid ASCII-TSAP (this would have to have a hex value in the range from 20 to 7E as the first value) or a valid TSAP-ID (this would have to have the identifier "E0" as the first value).

Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

If you remove the value "01" in addition to the value "E0" from the incorrect TSAP-ID in example 4, the TSAP-ID begins with the hex value 49. This value is within the permissible range for ASCII-TSAPs:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

When you exit the entry field, the TSAP-ID is recognized as a valid ASCII-TSAP and the resulting ASCII-TSAP "ISOonTCP-1" is written to the "TSAP (ASCII)" entry field.

TSAP structure (Page 639)

Description of the connection parameters (Page 612)

Configuring HMI connections

Introduction to configuring connections

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (e.g., HMI connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an HMI connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A line in this connection table represents a configured connection, e.g., between an HMI device and PLC, along with its properties.

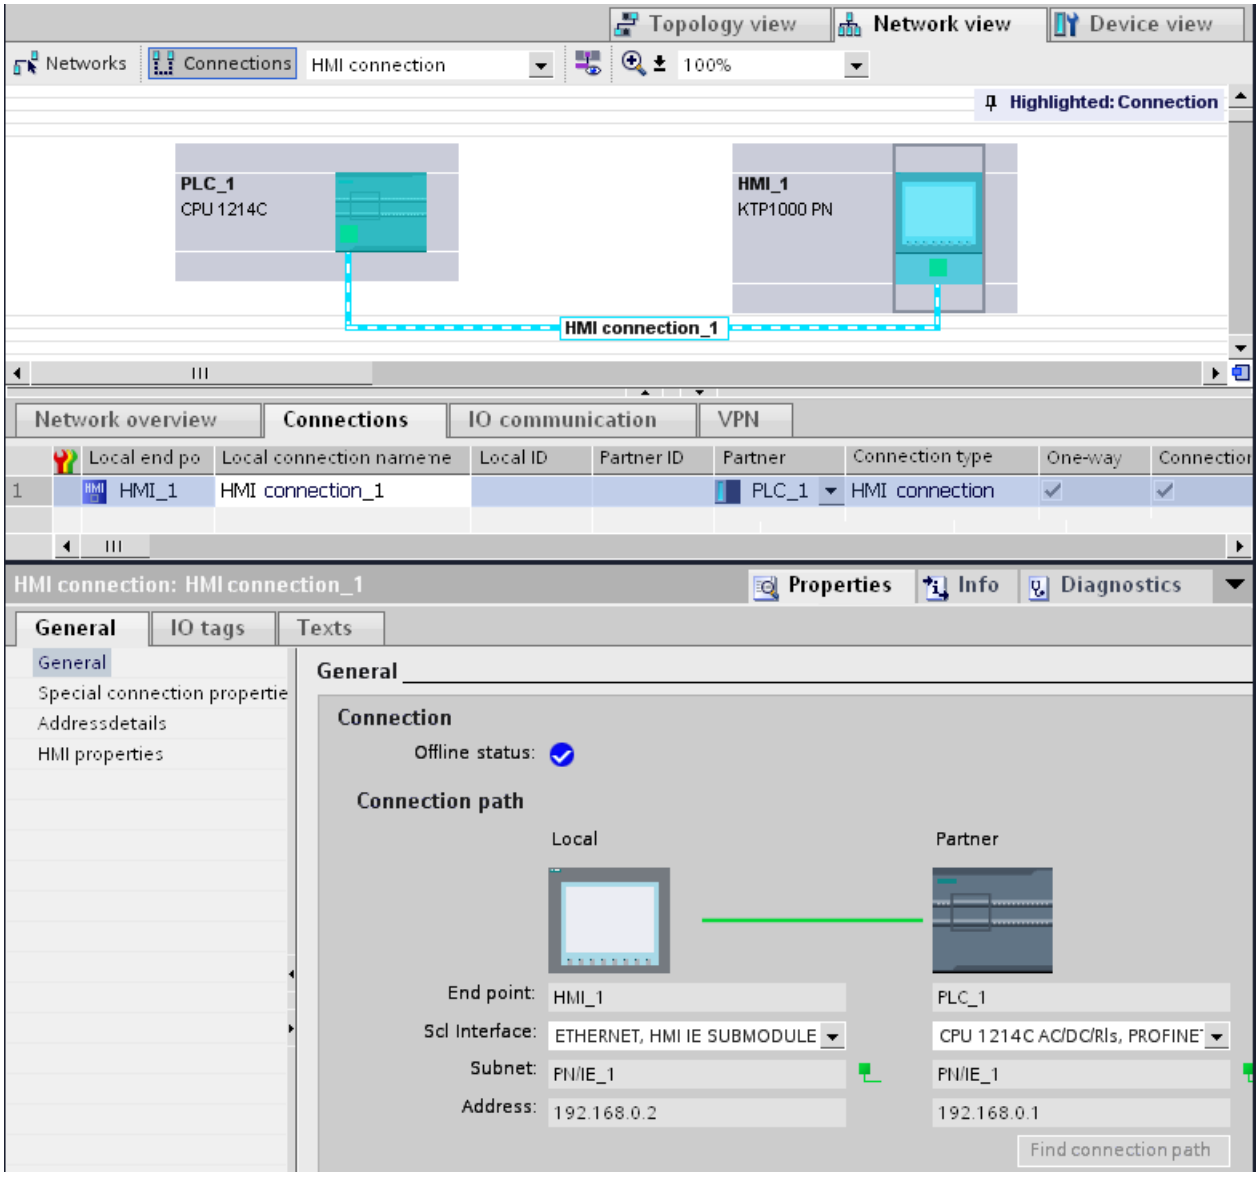
What you need to know about using connection resources

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

HMI connections



For HMI connections via the integrated PN interface, one connection resource for the endpoint per HMI connection is occupied for the HMI device.

One connection resource is also required for the connection partner (PLC).

Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - You will graphically see the connection path in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection

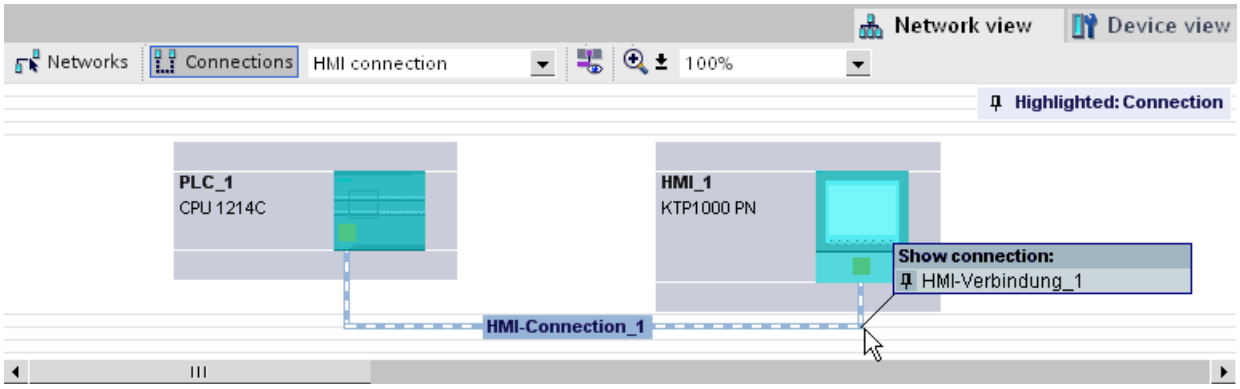
Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result



You have created the devices with CPUs and HMI devices between which you want to configure connections in the network view.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically into the connection table of the HMI device. A local connection name is assigned for this connection.

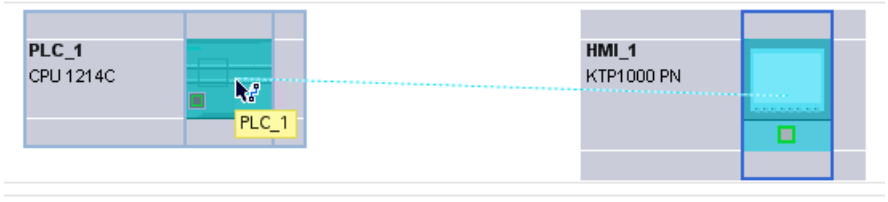
The following schematic shows a configured connection with a networked device:

Creating a new connection graphically

Graphically configuring connections

When using the graphic connection configuration, if necessary the system asks you to define the connection path. Select the devices to be connected in the current configuration.

Automatically determining connection path



To create a connection graphically, follow these steps:

1. Click the "Connections" button.

   The connection mode for the connection type you have selected is then activated.
   You will see this from the following:
   The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Interactively creating a new connection

Interactively configuring connections

Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Create new connection" command in the shortcut menu of a connection partner for which you want to create a connection.
   The "Create new connection" dialog is opened.
2. Select the partner endpoint.
   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To close the dialog, click "OK".
   To accept the configured connection and to configure additional connections to other endpoints, click "Apply".

Working in the network view

Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the "Highlight connection partners" command in the shortcut menu for the HMI device whose connection partners you want to display in the network view.
3. Select "All connection partners" in the following menu.
   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.

Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Creating a new connection graphically (Page 647)

Working with the connection table

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   - "Optimize column width" or
   - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit the parameters displayed in the connection table in some cases. To change the name of a connection, you do not have to navigate to the Inspector window.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

Result

The selected connection is removed completely.

Copying connections

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured (HMI devices), the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is only a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Errors when backing up data due to insufficient memory
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

If the connection cannot be repaired by opening the connection properties, changing them or undoing them in the configuration, then it may be necessary to delete the connection and re-create it.

HMI connection general settings

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can also assign the connection path and specify all aspects of the connection partner.

Special connection properties

Display of the connection properties (cannot be changed):

- Active connection establishment
  The connection establishment always starts from the HMI device. This option is selected by default if the address of the partner is specified.
- One-way
  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Sending operating mode messages
  Not relevant for HMI devices.

Address details

Displaying address details of the HMI connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

Miscellaneous

Display of the access points for the online connection between HMI device and connection partner.

Configuring S7 connections (S7-1200)

Introduction to configuring connections (S7-1200)

Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (for example, S7 connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an S7 connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A row in this connection table represents a

configured connection from the viewpoint of the local communication partner with its properties, for example, between two S7-1200 CPUs.

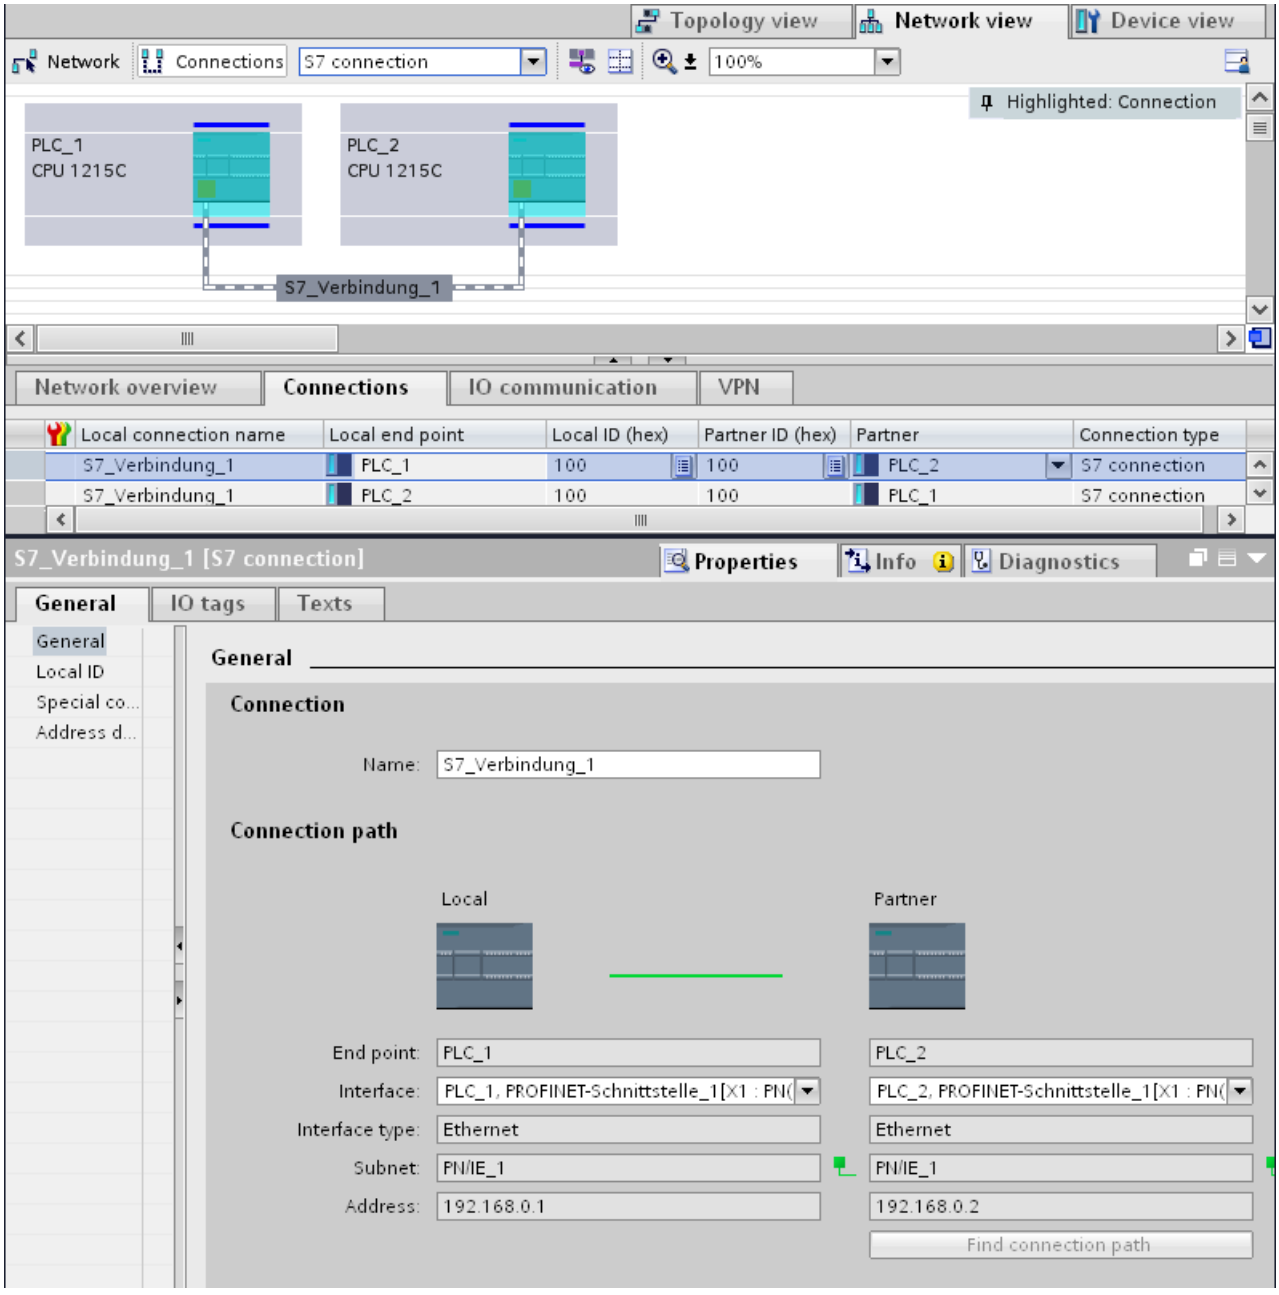
What you need to know about using connection resources (S7-1200)

Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

S7 connections



In the case of S7 connections via the PN interface, one connection resource per S7 connection is assigned for the endpoint for the S7-1200 CPU. One connection resource is also required for the connection partner.

You can find an overview of available and assigned connection resources for selected S7-1200 CPU in the Inspector window at "Properties > Connection Resources"

Views containing information about the configured connections (S7-1200)

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

Benefits

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - When connection mode is enabled, the connection path is highlighted in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

The connection table

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view (when connection mode is enabled)
- Changing of connection partners
- Display showing status information

"Properties" tab for a connection in the inspector window

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

Creating a new connection (S7-1200)

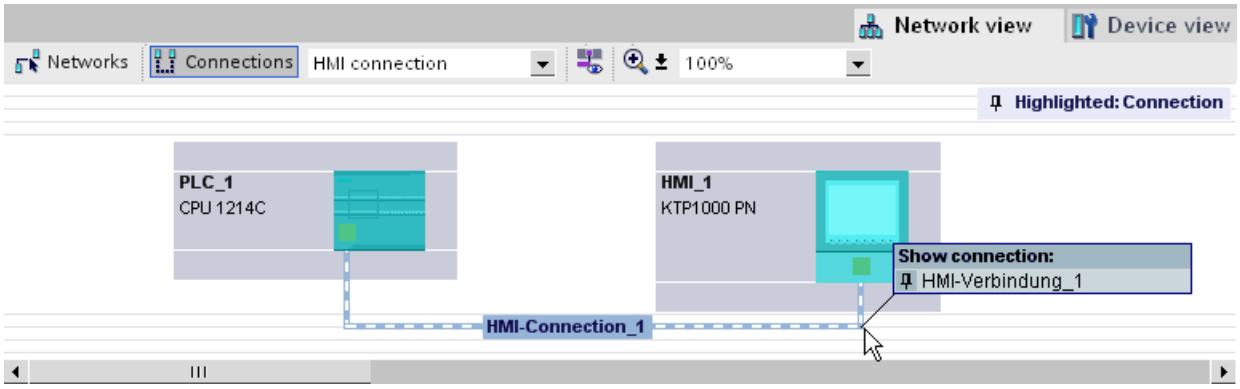
Creating a connection - alternatives

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

Requirement and result



In the network view, you have add devices between which the connections should be configured.

Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically in the connection table of the S7-1200 CPU. A local connection name is assigned for this connection.

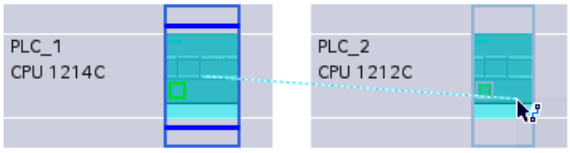
The following schematic shows a configured connection with a networked device:

Creating a new connection graphically (S7-1200)

Graphically configuring connections

In the case of graphic connection configuration, the connection path is automatically specified provided interfaces and resources are available. Select the devices to be connected in the current configuration.

Automatically determining connection path



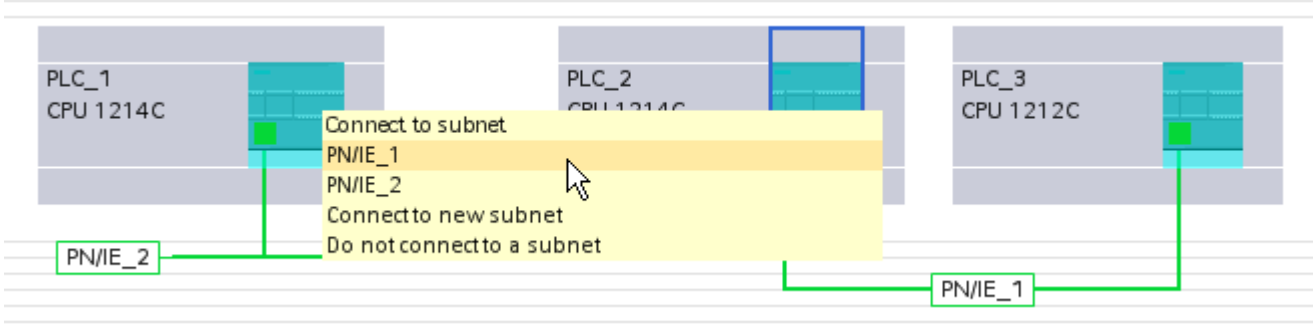
To create a connection graphically, follow these steps:

1. Click the "Connections" button.

   This step activates the connection mode: You can now select the connection type you want. You will see this from the following:
   The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.



Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

Configuring a connection when there is no or no clear network assignment

Any networking not in place will if possible be created automatically when a connection is created. A query will be made upon completion of connection configuration if unique network assignment is not possible. You will be able to choose from the existing subnets.

Example below: A query is made upon creation of a connection between stations PLC_1 and PLC_2, which are not yet networked.

Interactively creating a new connection (S7-1200)

Interactively configuring connections

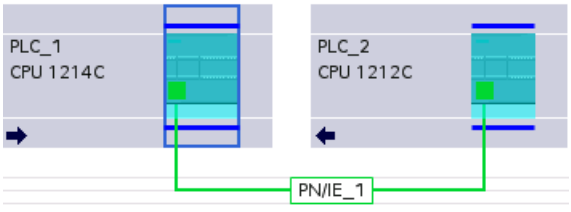
Define the local device and its connection partners.

Procedure

Proceed as follows to interactively create a connection:

1. Select the "Add new connection" command in the shortcut menu of a connection partner for which you want to create a connection.
   The "Create new connection" dialog appears.
2. Select the partner endpoint.
   In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To accept the configured connection and to configure additional connections to other endpoints, click "Add".
   To close the dialog, click "OK".

Working in the network view (S7-1200)



Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the S7-CPU for which you want to display the connection partners in the network view and then select the "Highlight connection partners" command in the shortcut menu.
3. Select "All connection partners" in the following menu.
   The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device. This additional function is useful in complex network configurations in which some devices are not visible.

Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

Working with the connection table (S7-1200)

Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
   - "Optimize column width" or
   - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

If you want to store the layout, width and visibility of the table columns, click on the "Remember layout" function in the top right-hand of the network view.

Symbol	Meaning
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

Changing properties of connection

You can directly edit some of the parameters displayed in the connection table. The name of the connection can, for example, only be changed in the connection table.

Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

Deleting connections (S7-1200)

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
   - In the network view: Select the connection to be deleted.
   - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

Result

The selected connection is removed completely.

Copying connections (S7-1200)

Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

Copying devices

If you copy devices for which connections have been configured, the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is merely a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

Inconsistent connections - connections without assignment (S7-1200)

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

Remedies

To assign a closed connection path to an existing open connection path, expand the device configuration in such a way that the interfaces required for the connection type are available for both partners. At "Properties > General > Interface" in the Inspector window, you can use the "Find connection path" button to create a connection to an existing partner.

S7 connection - general settings (S7-1200)

General connection parameters

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can assign the connection path and specify all aspects of the connection partner.

Local ID

The local ID of the module from which the connection is viewed is displayed here (local partner). You can change the local ID. You may need to do this if you have already programmed communication function blocks, and you want to use the local ID specified in those function blocks for the connection.

Special connection properties

Display of connection properties (can be modified depending on the components used):

- One-way
  One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Active connection establishment
  In the case of one-way connection, for example with a S7-1200 CPU (firmware version V1.0), a connection partner can only be provided for the active connection establishment. In the case of a two-way connection you can set which connection partner will assume the active role.
- Sending operating mode messages
  Indicates whether or not the local partner sends operating mode messages to the connection partner.

Address details

Displaying address details of the S7 connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

S7 connection - address details (S7-1200)

Meaning

The address details show the end points of the connection and can localize these via the specification of rack and slot.

When a connection is established, the connection-specific resources of a module are assigned permanently to this connection. This assignment requires that the connection resource can be addressed. The TSAP (Transport Service Access Point) is, as it were, the address of the resource that is formed with the help of the connection resource or, in the case of S7-1200 CPUs (firmware V2.0 or higher) with the SIMATIC-ACC (SIMATIC Application Controlled Communication).

Configuration of TSAP for S7-1200

- For S7-1200 CPU (firmare V2.0 or higher):
  "SIMATIC-ACC"<nnn><mm>
  nnn = Local ID
  mm = any value
- For S7-1200 CPU (firmare V1.0):
  <xx>.<yz>
  xx = Number of the connection resource
  y = Rack number
  z = Slot number

TSAP structure, dependent on partner

The configuration of the TSAP for S7-1200 CPUs is dependent on the respective firmware and on the remote connection partner. When a S7-1200 CPU is connected with a S7-300/400 CPU, a S7-1200 CPU also uses a TSAP configuration that includes the connection resource.

See the following examples of TSAPs of various connection configurations

- Connection between two S7-1200 CPUs (both with firmware V2.0):
  - S7-1200 CPU "A" with firmware V2.0 and local ID 100:
    TSAP: SIMATIC-ACC10001
  - S7-1200 CPU "B" with firmware V2.0 and local ID 5AE:
    TSAP: SIMATIC-ACC5AE01
- Connection between two S7-1200 CPUs (firmware V2.0 and V1.0):
  - S7-1200 CPU with firmware V2.0 and local ID 1FF:
    TSAP: SIMATIC-ACC1FF01
  - S7-1200 CPU with firmware V1.0 (rack 0, slot 1, connection resource 03):
    TSAP: 03.01
- Connection between S7-1200 CPUs (firmware V2.0) and S7-300/400 CPU:
  - S7-1200 CPU with firmware V2.0 (rack 0, slot 1, connection resource 12):
    TSAP: 12.01
  - S7-300/400 CPU (rack 0, slot 2, connection resource 11):
    TSAP: 11.02

S7 connections via CM/CP (S7-1200)

Introduction

S7-1200 CPUs with a firmware version of V2.0 or higher support one-way and two-way S7 connections via CM/CP interfaces. This increases the number of Ethernet ports and networks that can be used for S7 connections. Even though the connection is then guided via the CM/CP, the associated S7-1200 CPU is an end point of the connection. The other end point can be any other device in the case of two-way connections. This other device must also support S7 connections.

Data volumes and configuration limit

The number of communication connections which are supported by CM/CP can be found in the manual accompanying every CM/CP. The number of connections per device can be further increased by adding other CM/CPs.

If several CM/CPs are fitted in a device, an automatic switch is made to the next CM/CP when this limit is exceeded. Specifically assign the connections using the path selection as required.

Note

Data transfer > 240 byte transfer is supported by the current CPs.

CPs with an older product version support the transfer of data with a data length of up to 240 bytes.

For more information, refer to the details provided in the Ethernet CP equipment manual.

Tasks of the Ethernet CM/CP in online mode

During data transfer via a connection, the Ethernet CM/CP takes on the following tasks:

- Receiving
  Receiving data from the Ethernet and forwarding to the user data area in the CPU
- Sending
  Transferring data from the user data area of the CPU and sending data via the Ethernet

The connection is established automatically as soon as the partner can be reached.

S7 connections using PUT and GET instructions

Basic information on communication via the PUT/GET instruction

Basic information on PUT/GET instructions

Use PUT and GET instructions to exchange data between two CPUs via an S7 connection.

The GET instruction is used to read data from a partner CPU. The PUT instruction is used to control the writing of tags by the communication partner via the user program. Apart from the PUT and GET instructions, no additional communication functions are provided for reading and writing tags.

To simplify the use of the two instructions, specify all required parameters for the connection and all block parameters in the Inspector window of the program editor.

Requirement

To be able to use the PUT and GET instructions, the following requirements must be satisfied:

- At least one S7-1200/1500 CPU or S7-300/400 CPU must be created in the project. Firmware 2.0 or higher must be installed on an S7-1200 CPU. If you have not yet created a second CPU in the project, you can initially establish the connection to an unspecified partner.
- An S7 connection must exist between the two CPUs. If you have not yet established a connection between two CPUs, a connection is automatically established during the configuration of the instructions.
- For both instructions, an instance data block is required in which all data used by the instruction is stored. The instance data block is created automatically as soon as you drag a PUT or GET instruction to a network in the program editor. For the correct execution of the program, it is essential that the instance data blocks are not changed; consequently, these data blocks are know-how protected. You only have read access to the instance data blocks.

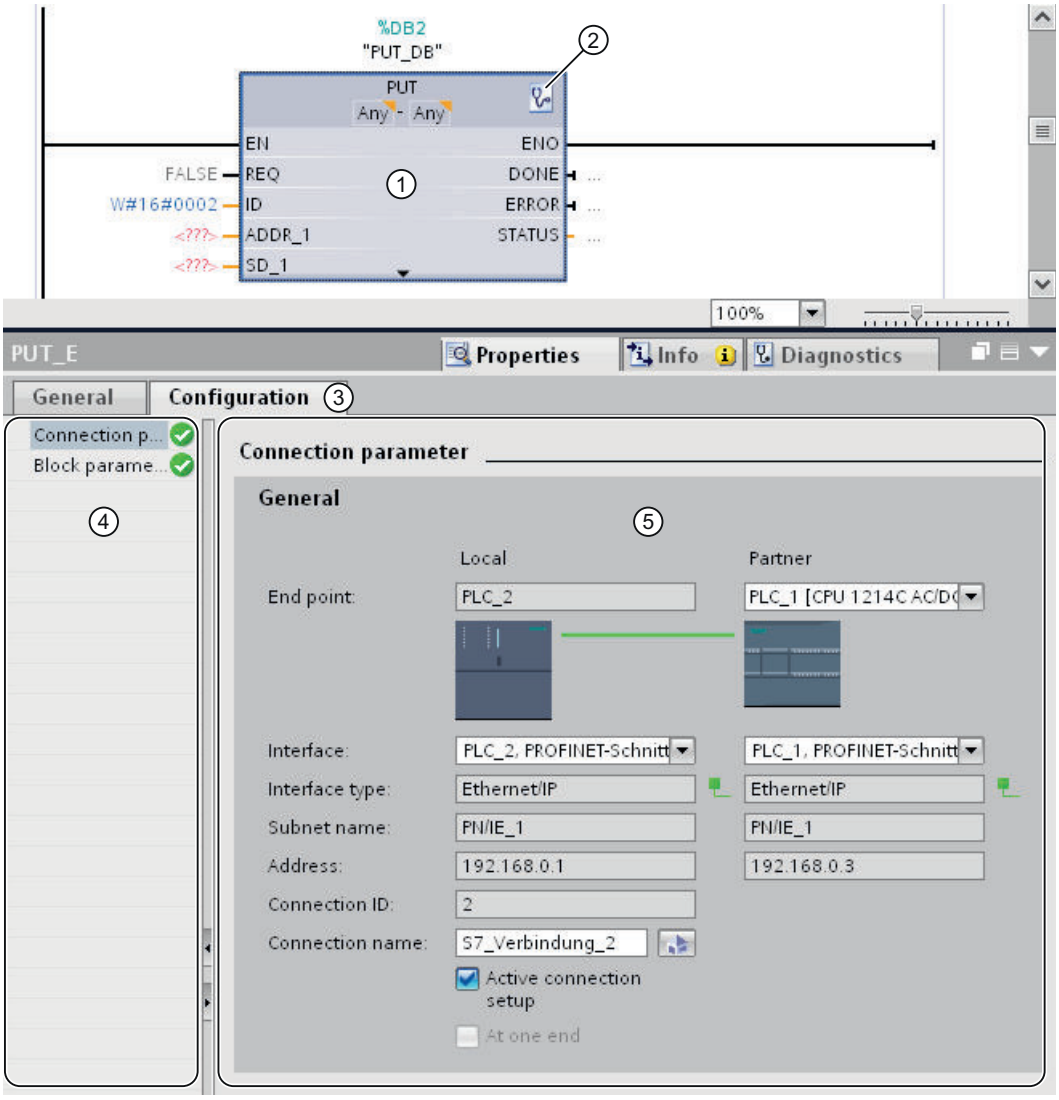
PUT: Set parameters for write and send area (Page 673)

GET: Set parameters for read and memory area (Page 674)

Connection configuration



Overview of connection configuration

Introduction

The connection parameters for the PUT and GET instructions are assigned in the inspector window of the program editor. All parameters are saved in the corresponding instance data block.

Structure of the connection configuration

The connection configuration is made up of the following components:

① Communication instruction for PUT or GET
② Call of online and diagnostic functions
③ "Configuration" tab in the "Properties" tab
④ Area navigation of the "Configuration" tab
⑤ General properties of the connection parameters

Display of online and diagnostic functions

If you click the icon for starting the online and diagnostic functions, the associated CPU goes online automatically. The connection table in the network view is opened. In addition, the "Diagnostics" tab and the connection information are displayed in the inspector window.

Entering the connection parameters

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections using system functions. When all the required parameters are assigned, a check mark is set behind the "Connection parameters" group in the area navigation.

Assigning parameters to start request (Page 672)

PUT: Set parameters for write and send area (Page 673)

GET: Set parameters for read and memory area (Page 674)

Description of the connection parameters

Overview

The following table shows the general connection parameters:

Parameter	Description
End point	The names of the local end point and the partner end point are shown. • Local end point The local end point is the CPU in which the PUT or GET instruction is programmed. • Partner end point The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. As long as no connection partner is set, all other parameters in the mask are disabled.
Interface	The interface of the partner CPU is displayed. The partner interface is not displayed until a specified partner CPU has been selected.
Interface type	The type of interface via which communication is handled is displayed.
Subnet name	The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected. If at least one of the two connection partners is not connected with a subnet, the two connection partners are automatically connected with each other. The partner which is not connected to a network is hereby connected to the same subnet via which the other partner is already connected to a network. A connection of connection partners to different subnets is only possible with IP or S7 routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.
Address	The IP address of the local end point is displayed. The IP address of the partner is displayed only after the partner end point has been selected. If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you will need to specify a valid IP address for the connection partner.
Connection ID	The currently set connection ID is displayed. You can change the connection ID in the connection table in the network view. You can also directly access the connection table while you are setting the connection parameters. To do this, click the "Create new connection" icon.

Parameter	Description
Connection name	The name of the connection which was automatically created when the PUT/GET instruction was inserted is displayed. You can change the name of the connection by entered a different name in the field. You can also create a new connection or edit existing connections by clicking the "Create new connection" icon.
Active connection establishment	Use the "Active connection establishment" option button to specify which partner starts the communication. When the connection is created, the local partner is initially specified by default for the establishment of the connection. If a device does not support active connection establishment, you have to activate active connection establishment on the other partner.
Configured at one end	If this check box is selected, the connection partner is the server for this connection. It cannot actively send or receive. This corresponds to the behavior of the PUT/GET instructions. In this case, other instructions are not possible. If the check box is not selected, other instructions can also be used for the communication.

Starting connection parameter assignment

You can assign the connection parameters for PUT and GET in the inspector window as soon as you have inserted and selected a PUT or GET instruction in a program block.

Procedure

To insert PUT/GET instructions, follow these steps:

1. Open the "Instructions" task card in the "Communication > S7 Communication" folder.
2. Drag a PUT or GET instruction to a network.
   The "Call options" dialog opens.
3. Optional: Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
   - Change the default name.
   - Select the "Manual" check box to assign your own number.
4. Click "OK".

Result

A corresponding instance data block is created for the inserted PUT or GET instruction. For S7-300 CPUs, a function block is also created in the program resources.

When PUT or GET instruction is selected, you will see the "Configuration" tab under "Properties" in the inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

Creating and assigning parameters to connections (Page 671)

Deleting connections (Page 672)

Creating and assigning parameters to connections

You can create S7 connections and assign the parameters for these in the connection parameter assignment of the PUT/GET instructions. Changed values are checked immediately by the connection parameter assignment for input errors.

Requirement

A CPU exists with a PUT or GET communication instruction.

Procedure

To configure an S7 connection using PUT/GET instructions, follow these steps:

1. In the program editor, select the call of the PUT or GET instruction.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.
   The connection parameters already known are displayed:
   - Name of the local end point
   - Interface of the local end point
   - IP address of the local end point
4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communications partner.
   The following parameters are automatically entered as soon as you have selected the connection partner:
   - Interface of the partner end point
   - Interface of the partner end point. If several interfaces are available, you can change the interface as required.
   - Interface type of the partner end point
   - Subnet name of both end points
   - IP address of the partner end point
   - Name of the connection which is used for the communication. If no connection exists yet, it is automatically established.
5. If required, change the connection name in the "Connection name" input box. If you want to create a new connection or edit an existing connection, click on the "Create new connection" icon.

Note

The PUT and GET instructions between two communication partners can only run if both the hardware configuration and the program part for the partner end point have been loaded into the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Deleting connections

A connection which was automatically created during the insertion of a PUT or GET instruction appears in the connection table of the network view like every standard connection. As a result, it can be deleted in the connection table.

Procedure

To delete a connection, follow these steps:

1. Open the connection table in the network view.
2. In the connection table, select the connection that you want to delete.
3. To do this, right-click the connection and select the "Delete" command from the shortcut menu.

Result

The connection is deleted. The PUT or GET instruction and the associated instance data blocks are retained and must be manually deleted if necessary.

To continue using the PUT or GET instruction, you must configure the connection again in the inspector window of the program editor, since all connection parameters were also deleted when the connection was deleted. In this case, specify a new communication partner and a suitable connection.

Block parameter assignment

Assigning parameters to start request

To start communication via the PUT or GET instruction, you have to specify an event which activates the instruction. This event is referred to as control parameter (REQ). The communication job is activated as soon as there is a positive edge at the control parameter REQ.

Please note that the control parameter REQ is assigned the default FALSE at first call.

Requirement

- The program editor is open.
- You have already inserted a PUT or GET instruction.
- A connection has been established between two communication partners.

Procedure

To define the REQ control parameter, follow these steps:

1. Select the PUT or GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.

3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "REQ" field, select a tag of the "BOOL" data type to initialize the execution of the instruction. Alternatively, you can also interconnect a previous instruction in the program editor.

See also

Data consistency (Page 4383)

PUT: Set parameters for write and send area (Page 673)

GET: Set parameters for read and memory area (Page 674)

PUT: Set parameters for write and send area

For communication via the PUT instruction, you must specify the memory area of the partner CPU to which the data should be written. In addition, you must specify the memory area of the local CPU from which the data is to be read.

Requirement

- The program editor is open.
- You have already inserted a PUT instruction.
- A connection has been established between two communication partners.

Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the PUT instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Write area (ADDR_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be written.
   Only absolute addressing is permitted.
   Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the write area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Send area (SD_1) > Start" field, select a pointer to the area in the local CPU which contains the data to be sent.
7. In the Length field, enter the length of the memory area to be read and select the data type from the drop-down list.
   Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.
   If the VARIANT pointer accesses a DB, the DB must always be specified (for example: P#DB10.DBX5.0 Byte 10).

See also

GET: Set parameters for read and memory area (Page 674)

GET: Set parameters for read and memory area

For communication via the GET instruction, you must specify the memory area of the local CPU to which the data should be written. In addition, you must specify the memory area of the partner CPU from which the data is to be read.

Requirement

- The program editor is open.
- You have already inserted a GET instruction.
- A connection has been established between two communication partners.

Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Read area (ADDR_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be read.
   Only absolute addressing is permitted.
   Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the read area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Memory area (RD_1) > Start" field, select a pointer to the area in the local CPU in which the read data is to be stored.
7. In the Length field, enter the length of the memory area and select the data type from the drop-down list.
   Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.

Connection resources

Configuration limits in the connection configuration

Connection resources

Some communications services require connections. During operation, communication connections utilize memory and program resources of the CPUs, CPs, and CMs involved in the communication path (e.g., memory areas in the CPU operating system). Within a controller (PLC), this applies, for example, to the CPU as connection end point and to the extensions with CPs as interfaces to the subnets. In most cases, one resource per CPU/CP/CM is assigned for a connection. In HMI communication, up to 3 connection resources are required for each HMI connection.

Available connection resources

The maximum configuration limit within the automation system is always defined by the CPU, either through the high system limit defined by the CPU (S7-1200/1500) or through the sum of usable resources of the CPU and CP (S7-300/400). In most cases, the available connection resources of a CPU/CP/CM are automatically distributed to their interfaces, as required.

Each CPU brings along reserved connection resources for programming device, HMI, and Web server communication in its configuration. In addition, there are available resources that can be used for any HMI, S7 and open communication (S7-1200/1500).

You can determine which resources are available to you based on the configuration of the devices as follows:

- Selection of the device type at connection end point (CPU)
- Number and type of additional communication modules (CP, CM)

The number of connection resources available differs for the various automation systems:

- S7-300: The used CPU defines the number of available resources for connections. The maximum number of resources for connections can be expanded by added CPs.
- S7-400: The used CPU defines the number of possible resources for S7 connections. The resources can also be used for other connection types, in which case the maximum number of resources for other connection types can be expanded by adding CPs.
- S7-1200: The used CPU defines the number of possible resources for S7 connections. This high limit can be extended by adding CPs or CMs.
- S7-1500: The CPU that is used defines the applicable high limit of the connection resources for the whole automation system. The CPU itself accounts for some of these connection resources, and additional resources are accrued via CPs and CMs. However, regardless of how many CPs and CMs are added, the total number of connection resources cannot exceed the high limit of connection resources defined by the CPU type.

Time of occupation of connection resources

Which resources are actually used in operation, depends on which communication functions are used at any specific time and which communication connections are enabled at any specific time. Therefore, only limited checks of compliance with specific configuration limits and available communication resources can be performed at the time of configuration. The connection configuration offers the greatest possible support for this.

Factors influencing the configuration limits

You determine the communication resources with the device configuration:

- Number of available S7 connection resources in the CPU (S7-300/400)
- Number of connection resources for S7 communication and open communication in the station (S7-1500)
- Number of protocol-specific connection resources in the CPs/CMs
- Number of available CPs/CMs
- Automatic, programmed, or configured connection setup

Behavior of the connection configuration

During input, the connection configuration checks the following circumstances and behaves as follows:

- During the creation of S7 connections
  Is the maximum number of available S7 connections assigned? If yes, it is not possible to configure another S7 connection via the selected interface.
  For the S7-300, it is possible to increase the configuration limit by adding CPs.
- During the creation of any connection types
  Is the maximum number of protocol-specific connection resources in the interface (CP) assigned? If yes, it is not possible to configure another connection of the selected type via the selected interface.
  For the S7-300/400, it is possible to increase the configuration limit by adding CPs.
- During the creation of any connection types with OPC (PC stations)
  In the case of connections with OPC as connection end point, more connections can generally be configured than can be operated at any one time in the CP used in the PC station. That is because the connection properties differentiate between "Maintain permanently" and "Set up on demand".

When the connection configuration is compiled, a warning or, in the case of a non-assignable interface, an error is output, if appropriate.

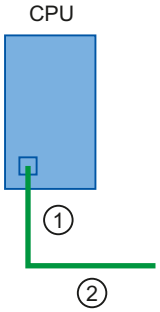
Note

S7 connection resources are exhausted

If the maximum number of S7 connection resources is reserved, no S7 connection resources additionally required for data transmission between CPU and CP are in operation or possibly available for connections. The corresponding communication jobs are then refused.

You should therefore make sure that there is a sufficient number of non-assigned S7 connection resources, depending on the total assigned communication functions.

You can find the number of reserved S7 connection resources for the selected S7-300 or S7-1200/1500 CPU in the area navigation under "Connection resources". For the S7-300, only the connection resources of the CPU are shown. For the S7-1200/1500, you also see the resources of the CPs and CMs.



Connection resources and communication type

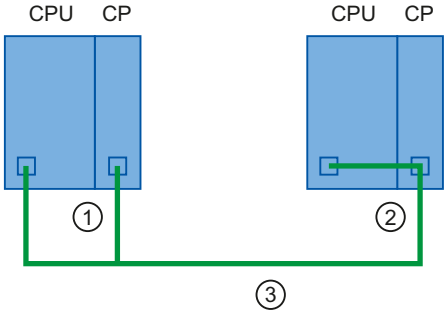
Every connection needs connection resources for the endpoint and transition point (e.g., CP, CM) on the devices involved. The number of available connection resources is CPU/CP/CM-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. Each type of communication is considered in detail below. Any number of combinations are possible however as long as the available connection resources are taken into account.

S7 connections via integrated interface

With S7 connections via the integrated MPI/PROFIBUS DP/PN interface, one connection resource is assigned for the endpoint on the CPU per S7 connection. This applies to all S7-300/400/1200/1500 CPUs.

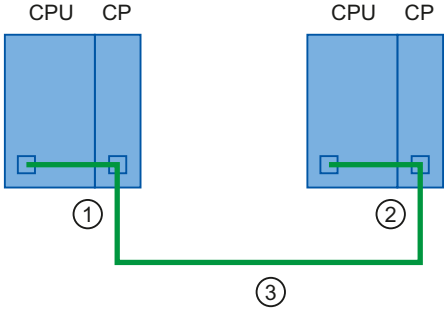
① Assigned S7 connection resource on the CPU



② Subnet (e.g., MPI, PROFIBUS-DP, or Industrial Ethernet/PROFINET)

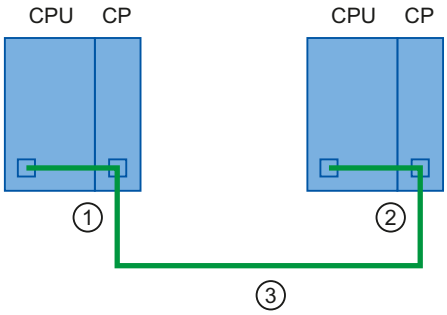
- S7-300/400 CPU: One S7 connection resource is assigned on the CPU.
- S7-1200/1500 CPU: One S7 connection resource is assigned on the CPU and thus also one S7 connection resource on the station.

S7 connections via external interfaces



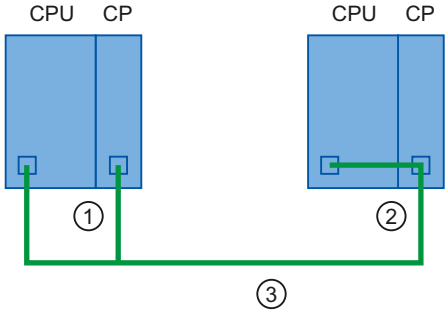
With S7 connections via an external CP interface, a distinction should be made between the following scenarios:

- S7-300 CPU
  - S7 connection configured at one end: One S7 connection resource is assigned on the CPU (for the endpoint) and one S7 connection resource on the CP (transition point) for each S7 connection.



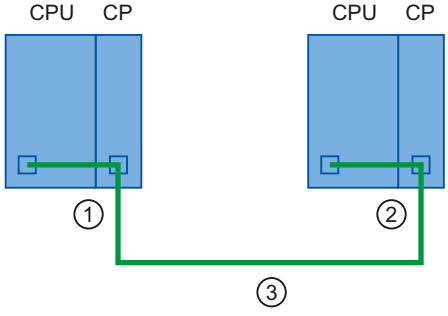
① One S7 connection resource in the CPU and one in the CP of the local end point
② Connection partner
③ Subnet, e.g., Industrial Ethernet

  - S7 connection configured at both ends: One S7 connection resource is assigned on the CP for each S7 connection.



① One S7 connection resource in the CP of the local end point
② Connection partner
③ Subnet, e.g., Industrial Ethernet

- S7-400 CPU
  One S7 connection resource is assigned on the CPU (for the endpoint) and one S7 connection resource on the CP (transition point) for each S7 connection.



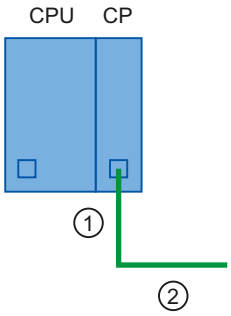
① One S7 connection resource in the CPU and one in the CP of the local end point
② Connection partner
③ Subnet, e.g., Industrial Ethernet

- S7-1200/1500 CPU
  - S7 connection configured at one end: One S7 connection resource is assigned on the CPU and thus also one S7 connection resource on the station for each S7 connection.

① One S7 connection resource in the CPU and one in the CP of the local end point
② Connection partner
③ Subnet, e.g., Industrial Ethernet

  - S7 connection configured at both ends: One S7 connection resource is assigned on the CPU and thus also one S7 connection resource on the station for each S7 connection.

① One S7 connection resource in the CP and, thus, also one in the station
② Connection partner
③ Subnet, e.g., Industrial Ethernet



Note

The number of reserved S7 connection resources for the selected CPU for certain CPU types of the S7-300, and for the selected CPU and its connected communication modules for the S7-1200/1500, can be seen in the area navigation under "Connection resources". S7 connection resources for OP/PG and S7 basic communication can be reserved here.

Connections for open communication services (SEND/RECEIVE interface)

Communication via the SEND/RECEIVE interface is solely via CPs. For this, one protocol-specific connection resource is allocated for the endpoint per connection (i.e., FDL, ISO transport ISO on TCP, UDP and TCP connection).

Here, no connection resources are required for the connection on the CPU.

① 1 assigned connection resource in the CP

② Subnet, e.g., Industrial Ethernet

Exception: on the S7-400 CPU, connections with the property "SPEED SEND/RECEIVE" require an additional S7 connection resource for each "SPEED SEND/RECEIVE" connection on the CPU.

Connection resources and connection type

Setting up the connection

Often, you can decide between a configured setup or a programmed setup. The programmed setup makes it easier to release connection resources following data transfer. With configured setup, you receive help in managing connection resources in STEP 7.

Table 10-2 Setting up the communication service

Communication service	Automatic setup	Programmed setup	Configured setup
PG communication	X	-	-
HMI communication	X	-	X
S7 communication	-	X	X
Open communication via TCP/IP	-	X	X

Communication service	Automatic setup	Programmed setup	Configured setup
Open communication via ISO-on-TCP	-	X	X
Open communication via UDP	-	X	X
Open communication via ISO	-	X	X
Open communication via e-mail	-	X	-
Open communication via FTP	-	X	-
Open communication via FDL	-	X	X
S7 routing	-	-	X

Assignment of connection resources according to the connection setup

Connection resources are assigned in different ways, depending on the type of connection setup:

- Configured setup
  In the case of configured connections, the connection resource is assigned as soon as the hardware configuration has been downloaded to the CPU. For OPC servers, the resources are assigned, as required.
- Programmed setup
  The call of the appropriate instructions for establishing the connection (using TSEND_C or T_CON) triggers assignment of a connection resource.
- Automatic setup
  As soon as you have connected the programming device or HMI device to a CPU physically and online, the connection resources will be assigned.

Connection resources for configured setup

You set up the connection in the network view of the hardware and network editor in the context of a CPU.

Following the data transfer, the connection is not terminated, i.e., the connection resources remain permanently assigned. To terminate the connection you must delete the connection configuration and download the modified configuration to the CPU.

OPC connections are automatically established and terminated as needed.

If you have **configured** the connections, compliance with the maximum possible number of connection resources in the automation system will be monitored.

Connection resources for programmed setup

You set up the connection in the program editor in the context of a CPU by parameter assignment of instructions for communication, e.g., TSEND_C.

Once the connection is established by the TCON or TSEND_C instruction, the connection will be terminated through appropriate parameter assignment of the TSEND_C instruction or by calling the TDISCON instruction after the data transfer. If the connection is terminated, the connection resources in the CPU/CP/CM are available again. If the connection is retained and

another data transfer is performed, the processing time of the instructions will be shorter because the connection does not have to be reestablished.

If the establishment and termination of connections are **programmed** in the user program, you are responsible for ensuring compliance with the automation system limits. If necessary, you will receive a communication error at the "STATUS" output parameter of the TSEND_C or T_CON instruction and can obtain more detailed information from the connection diagnostics.

Connection resources for automatic setup

The connection will be set up automatically (e.g., programming device or HMI connection) as soon as the PG/PC interface has been physically connected to an interface of the CPU and the assignment to the interface has been made in the "Go online" dialog.

For **automatically** set up connections, compliance with the connection resources reserved in the automation system for these connections is monitored.

S7-1200 connection resources: (S7-1200)

Display of connection resources (S7-1200)

Connection resources in the Inspector window

You will find an overview of the reserved and available connection resources of an S7-1200 automation system in the inspector window of the hardware and network editor under the CPU properties.

Overview of connection resources

The CPU supports at most the following number of simultaneous asynchronous communication connections for PROFINET and PROFIBUS. The maximum number of connection resources assigned to each category is predefined. You cannot modify the values. The 6 freely available connections can, however, be used to increase the number of connections in each category as required by your application.

The display of connection resources distinguishes between the offline and online view. The following figure shows you the offline display of the reserved and available connection resources of a CPU 1217C:

Connection resources

	① Station resources			② Module resources
	Reserved		Dynamic ⚠	PLC_11 [CPU 1217C DC/DC/DC]
Maximum number of resources:	62		6	68
	Maximum	Configured	Configured	Configured
PG communication:	4	-	-	-
HMI communication:	12	0	0	0
S7 communication:	8	0	0	0
Open user communication:	8	0	0	0
Web communication:	30	-	-	-
Other communication:	-	-	0	0
Total resources used:		0	0	0
Available resources:		62	6	68

① Station-specific connection resources

② Module-specific connection resources

Station-specific connection resources

The columns of the station-specific connection resources provide information about the reserved and dynamically available connection resources of the station. In the example, a maximum of 68 station-specific connection resources are available for the automation system.

- 62 connection resources are reserved for specific connection types
- 6 connection resources can be used freely for connection types

The warning triangle in the column of the dynamic station resources is displayed because the sum of the maximum available connection resources of the CPU has reached the station limit of 68.

Note

Exceeding the available connection resources

STEP 7 signals the reaching of the station-specific connection resources with a warning. If you require more connection resources, you either have to use a CPU with a higher maximum number of available station-specific connection resources or reduce the number of communications connections.

Module-specific connection resources

The columns of the module-specific connection resources provide information about the allocation of resources on the CPUs, CPs and CMs of an automation system: The display is per module and not per interface. In the example, the CPU provides a maximum of 68 connection resources.

Note

If you add CM/CP modules, the total number of S7-1200 communication resources is not increased.

Online view

If you are connected to the CPU online, you can also see how many resources are currently being used in the "Connection information" tab of the "Diagnostics" section in the Inspector window.

The online view of the "Connection resources" table not only displays the reserved and dynamic connection resources of the configured connections, but also includes columns containing the connection resources of the programmed and automatically set-up connections that are currently allocated in the station. Thus, the online view displays **all** the assigned connection resources in the automation system, regardless of how the connection was set up. The "Other communication" row displays connection resources assigned for communication with external devices and communication via data record routing.

The table is updated automatically. If there are inconsistencies between the configured hardware configuration and the hardware configuration available online, a corresponding message will be output.

Resource requirements of the connections

The communication connections of open user communication, S7 connection, HMI, programming device and Web server (HTTP) can utilize several connection resources on the basis of the functions used.

The following number of connections are available per device on the basis of the assigned connection resources:

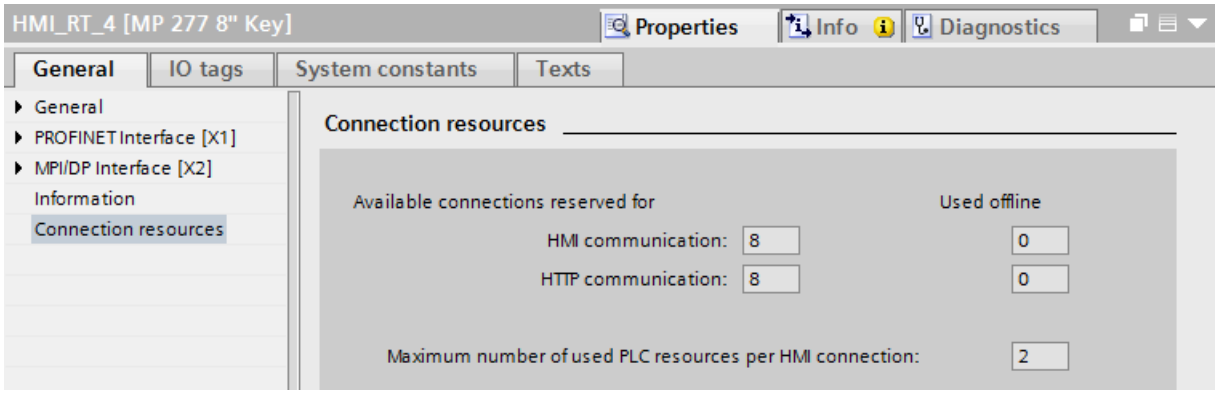
	Programming device (PG)	HMI devices	GET/PUT client/ server	Open user communication	Web browser
Maximum number of connection resources of a CPU 1217C	4 (guaranteed support of a programming device connection)	12 (guaranteed support of four HMI connections)	8	8	30 (guaranteed support of three HTTP connections)

Programming device communication

For example, four connection resources are available for programming device communication. Depending on the currently used programming device functions, the programming device occupies up to three connection resources for a connection. With the S7-1200, at least one programming device connection is guaranteed at all times.

HMI communication

A further example is the number of HMI devices as shown in the following figure. 12 connection resources are available for HMI devices. Depending on the type or model of your HMI device and the HMI functions used, the HMI device can require up to three connection resources for an HMI connection. For example, a Basic Panel requires up to two connection resources in the CPU for an HMI connection, while a Comfort Panel requires up to three connection resources in the CPU. Depending on the number of required connection resources, at least four HMI connections can be configured simultaneously.



An HMI device can use its available connection resources for the following functions:

- Reading
- Writing
- Interrupts and diagnostics

This is only an example. The actual number of connections can differ depending on the type and version of the HMI device.

Example	HMI 1	HMI 2	HMI 3	HMI 4	HMI 5	Total number of available connection resources
Used connection resources	2	2	2	3	3	12

Information regarding the availability and assignment of connection resources for HMI connections is available in the offline view in the HMI device context (under "Properties > General > Connection resources" in the Inspector window):

The following is displayed in the connection resources area:

- Number of available connections on the HMI reserved for HMI communication and HTTP communication
- Number of connection resources for HMI communication and HTTP communications used offline in the HMI
  If the maximum number of available connection resources for an HMI device is exceeded, a corresponding alarm is output by STEP 7.
- Maximum number of used PLC resources per HMI connection. This parameter is a factor that is to be multiplied by the number of HMI connections used offline. The product is the number of HMI resources occupied on the CPU.

If the maximum number of available connection resources for an HMI device is exceeded, a corresponding alarm is output.

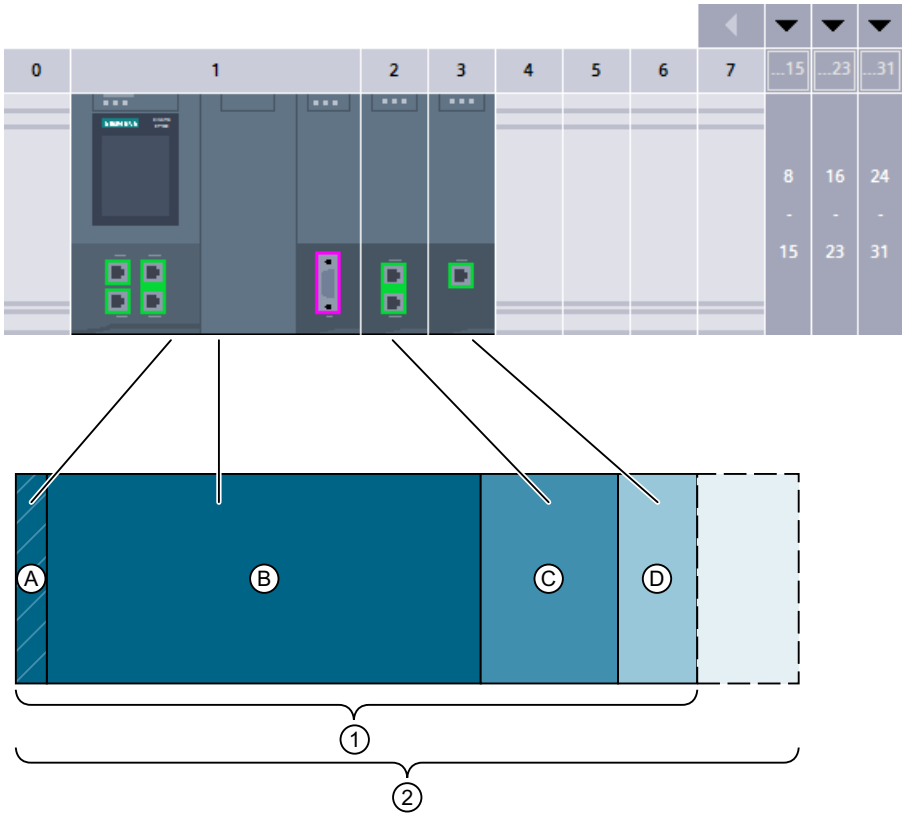
Web communication

The CPU offers Web server (HTTP) connections for several Web browsers. The number of browsers that can be supported simultaneously by the CPU depends on the number of connections that a Web browser requests/utilizes.

Connection resources S7-1500 (S7-1500)

Connection resources in the automation system (S7-1500)

Introduction



Some communications services require connections. Connections occupy resources in the automation system. The connection resources are made available by the CPUs, communications processors (CPs) and communications modules (CMs).

Connection resources of a station

The connection resources available depend on the CPUs, CPs and CMs and may not exceed a maximum number per station. The maximum number of resources of a station is determined by the CPU.

Each CPU has reserved connection resources for PG, HMI and Web server communication. This ensures, for example, that a PG can always establish at least one online connection with the CPU regardless of how many other communications services are already using connection resources. In addition, there are dynamic resources. The difference between the maximum number of connection resources and the number of reserved connection resources is the maximum number of dynamic connection resources. The communication services PG communication, HMI communication, S7 communication, Open User Communication, Web communication and other communication (such as OPC UA) use the dynamic connection resources from the pool.

The figure below shows an example of how individual components make connection resources available to an S7-1500 station.

① Available connection resources of the station, of which

- A Reserved connection resources of the station
- A + B Connection resources of CPU 1518
- C Connection resources of communications module CM 1542-1
- D Connection resources of communications processor CP 1543-1

② Maximum communications resources of the station using the example of a configuration from CPU 1518, CM 1542-1 and CP 1543-1

Number of connection resources of a station

The following table lists the maximum number of available connection resources for some CPU types:

Connection resources of a station	1511 1511C	1512C 1513	1515	1516	1517	1518
Maximum connection resources of the station	96	128	192	256	320	384
of which reserved	10					
of which dynamic	86	118	182	246	310	374
Connection resources of the CPU	64	88	108	128	160	192
Max. additionally usable connection resources by plugging in CMs/CPs	32	40	84	128	160	192

Connection resources of a station	1511 1511C	1512C 1513	1515	1516	1517	1518
Additional connection resources CM 1542-1	64					
Additional connection resources CP 1543-1	118					
Additional connection resources CM 1542-5	40					
Additional connection resources CP 1542-5	16					

The number of connection resources supported by a CPU or a communication module is described in the technical specifications section of the manuals.

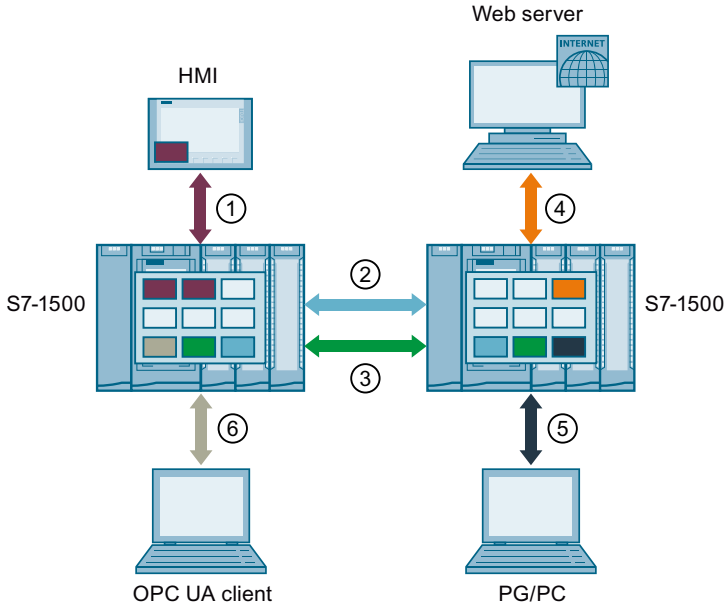
Example

You have configured a CPU 1518-4PN/DP with a communications module CM 1542-1 and a communications processor CP 1542-5.

- Maximum connection resources of the station: **384**
- Available connection resources:
  - CPU 1518-4 PN/DP: 192
  - CM 1542-1: 64
  - CP 1542-5: 16
  - Total: **272**

The setup provides 272 connection resources. By adding further communication modules the station can support a maximum of 112 additional connection resources.

Reserved connection resources



10 connection resources are reserved for stations with S7-1500 CPU, ET 200SP CPU and ET 200pro CPU based on S7-1500:

- 4 for PG communication required by STEP 7, for example, for test and diagnostics functions or downloading to the CPU
- 4 for HMI communication which are occupied by the first HMI connections configured in STEP 7
- 2 for communication with the Web server

Allocation of connection resources (S7-1500)

Overview - occupation of connection resources

The following figure shows how different connections occupy the resources of the S7-1500:

① HMI communication: See below.

② Open User Communication: Connections of Open User Communication occupy a connection resource in every end point.

③ S7 communication: Connections of S7 communication occupy a connection resource in every end point.

④ Web communication: The Web server connection occupies at least one connection resource in the station. The number of occupied connections depends on the browser.

⑤ PG communication: The PG connection occupies one connection resource in the station.

⑥ OPC UA communication: Each session that the OPC UA server of the CPU establishes with an OPC UA client usually occupies one connection resource (other communication) in the station.

Connection resource for HMI communication

Connection resource for Open User Communication

Connection resource for S7 communication

Connection resource for Web communication

Connection resource for PG communication

Connection resource for other communication (for example OPC UA)

Connection resources for HMI communication

With HMI communication, the occupation of connection resources in the station depends on the HMI device being used. The following table lists the maximum number of occupied connection resources for an HMI connection depending on the various HMI devices:

HMI device	Maximum number of allocated connection resources of the station for each HMI connection
Basic Panel	1
Comfort Panel	2[1]
RT Advanced	2[1]
RT Professional	3

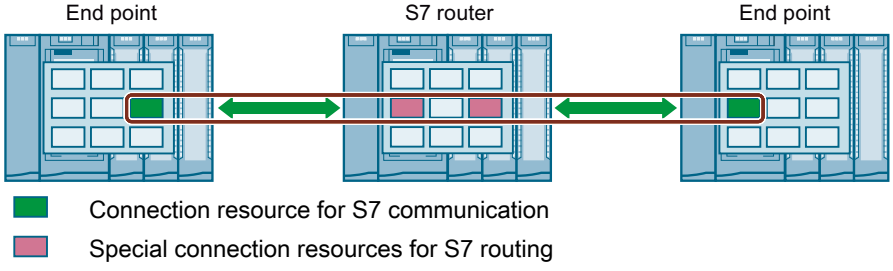
[1] If you do not use system diagnostics or alarm configuration, the station occupies only one connection resource per HMI connection.

Example: You have configured the following HMI connections for a CPU 1516-3 PN/DP:

- Two HMI connections to an HMI TP700 Comfort (2 connection resources each)
- One HMI connection to an HMI KTP1000 Basic (1 connection resource)

A total of 5 connection resources are allocated for HMI communication in the CPU.

Connection resources for routing



S7 connections beyond network boundaries (S7 routing)

To transfer data beyond S7 subnets ("S7 routing"), an S7 connection is established between two CPUs. The S7 subnets are connected via gateways known as S7 routers. The router is the transition point of an S7 connection and is capable of establishing S7 connections. CPUs, CMs and CPs in S7-1500 are S7 routers.

The following applies for a routed S7 connection:

- A routed connection occupies one connection resource each in both end points. STEP 7 shows these connection resources in the "Connection resources" table.
- On the S7 router, two special connection resources are occupied for S7 routing. STEP 7 does not display the special connection resources for S7 routing in the "Connection resources" table. The number of resources for S7 routing depends on the CPU. You will find the resources for S7 routing in the technical specifications of the CPU in "Number of S7 routing connections".

The following figure shows the allocation of the connection resources at S7 routing:

Data record routing

Data record routing also enables transfer of data beyond S7 subnets from an engineering station connected to PROFINET to various field devices via PROFIBUS.

With data record routing, as with S7 routing, two of the special connection resources for S7 routing are also occupied at the network transitions in every record router. At the end point of communication (CPU), connection resources for data record routing are displayed in the online view of the "Connection resources" table in the "Other communication" row.

Note

Connection resources with data record routing

With data record routing, on the data record router, two special connection resources for S7 routing are occupied. Neither the data record connection nor the allocated connection resources are displayed in the table of connection resources. You are responsible for observing the limits during configuration.

When are connection resources occupied?

The time for the occupation of connection resources depends on how the connection is set up.

- Programmed setup of a connection
  As soon as an instruction to establish a connection is called in the user program of the CPU (TSEND_C/TRCV_C or TCON), a connection resource is occupied. With suitable parameter assignment of the CONT parameter of the TSEND_C/TRCV_C instructions or by calling the TDISCON instruction, the connection can be terminated following data transfer and the connection resource is available again. If the connection is terminated, the connection resources on the CPU/CP/CM are available again.
- Configured connections (e.g. HMI connection)
  If you have configured a connection in STEP 7, the connection resource is occupied as soon as the hardware configuration is loaded to the CPU. After using a configured connection for data transfer, the connection is not terminated. The connection resource is permanently occupied. To release the connection resource again, you need to delete the configured connection in STEP 7 and download the modified configuration to the CPU.
- Programming device connection
  As soon as you have connected the programming device to a CPU online in STEP 7, connection resources are occupied.
- Web server
  As long as you have opened the Web server of the CPU in a browser, connection resources are occupied in the CPU.
- OPC UA server
  As long as a session exists between the OPC UA server of the CPU and an OPC UA client, a connection resource is occupied in the CPU.

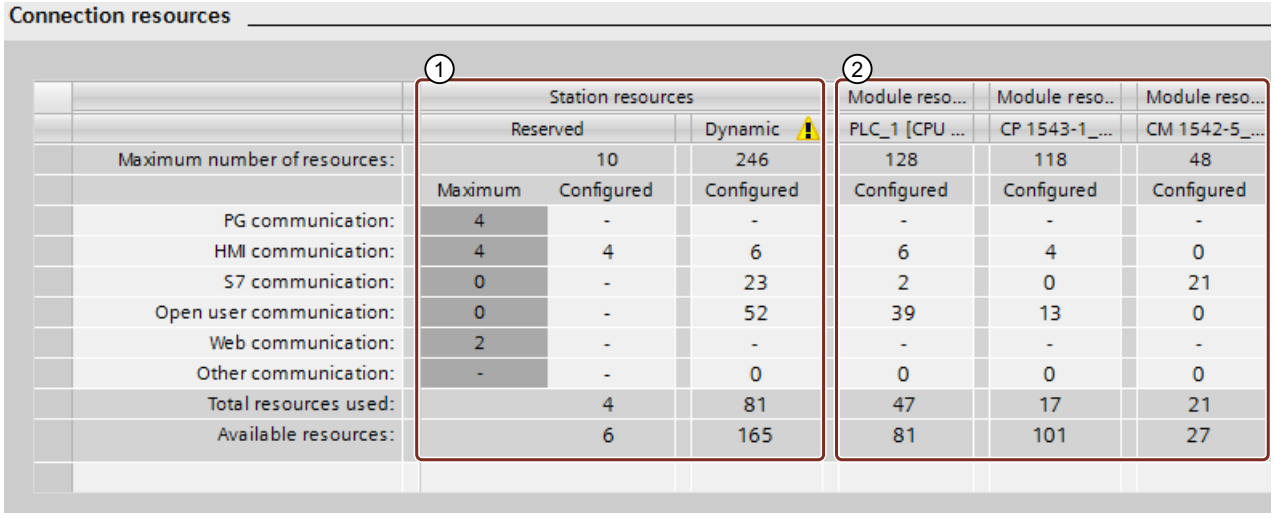
Monitoring the maximum possible number of connection resources

Offline

During configuration of connections, STEP 7 monitors the occupation of the connection resources. If the maximum possible number of connection resources is exceeded, STEP 7 signals this with a suitable warning.

Online

The CPU monitors the use of connection resources in the automation system. If you establish more connections in the user program than those provided by the automation system, the CPU acknowledges the instruction to establish the connection with an error.



Display of the connection resources (S7-1500)

Connection resources in the Inspector window

You will find an overview of the reserved available connection resources of an S7-1500 automation system in the Inspector window of the hardware and network editor under the CPU properties.

Display of the connection resources in STEP 7 (offline view)

The display of connection resources distinguishes between the offline and online view. The following figure shows you the offline display of the reserved and available connection resources of an S7-1500 CPU with a CP and a CM:

	Station resources			Module reso...	Module reso..	Module reso...
	Reserved		Dynamic	PLC_1 [CPU ...	CP 1543-1_...	CM 1542-5_...
Maximum number of resources:		10	246	128	118	48
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	6	6	4	0
S7 communication:	0	-	23	2	0	21
Open user communication:	0	-	52	39	13	0
Web communication:	2	-	-	-	-	-
Other communication:	-	-	0	0	0	0
Total resources used:		4	81	47	17	21
Available resources:		6	165	81	101	27

① Station-specific connection resources

② Module-specific connection resources

Station-specific connection resources

The columns of the station-specific connection resources provide information about the reserved and dynamically available connection resources of the station. In the example, a maximum of 256 station-specific connection resources are available for the automation system.

- 10 reserved connection resources, of which 4 are already in use and a further 6 still available.
  The occupied 4 resources are used for HMI communication.
- 246 dynamic connection resources, of which 81 are already in use and a further 165 still available.
  The configured resources are divided up as follows:
  - 6 resources for HMI communication
  - 23 resources for S7 communication
  - 52 resources for Open User Communication

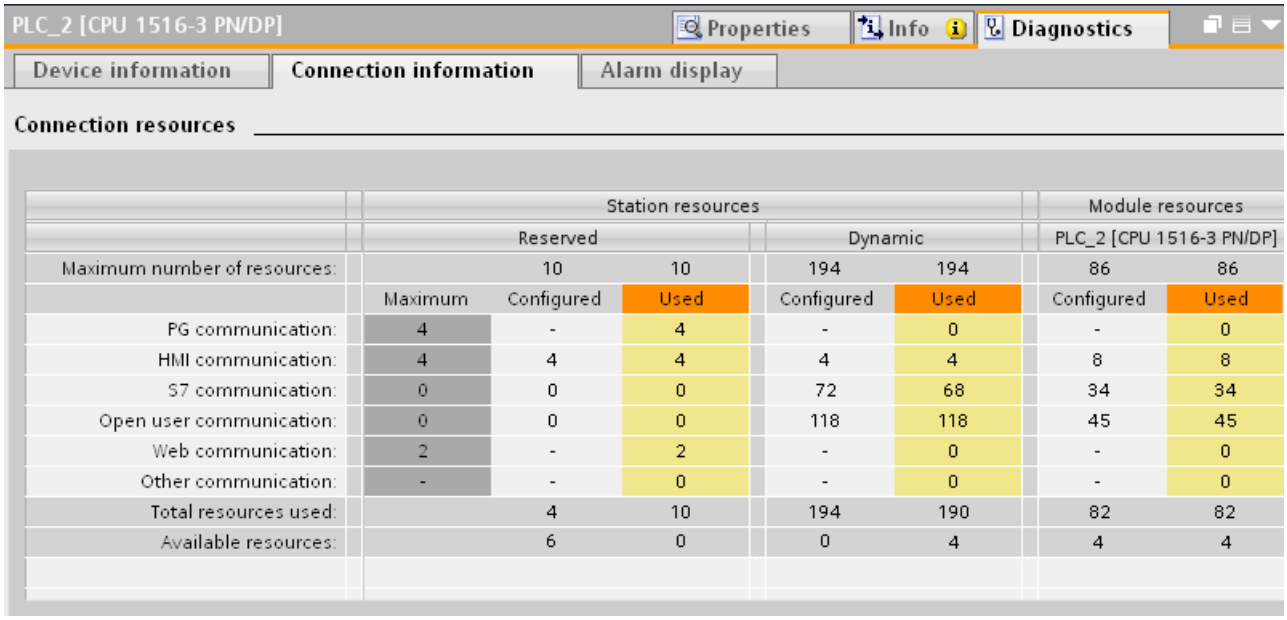
The warning triangle in the column of the dynamic station resources is therefore displayed because the sum of the maximum available connection resources of CPU, CP and CM (= 294 connection resources) exceeds the station limit of 256.

Note

Exceeding the available connection resources

STEP 7 signals the exceeding of the station-specific connection resources with a warning. To make full use of the connection resources from the CPU, CP and CM, either use a CPU with a higher maximum number of available station-specific connection resources or reduce the number of communications connections.

Module-specific connection resources



The columns of the module-specific connection resources provide information about the allocation of resources on the CPUs, CPs and CMs of an automation system: The display is per module and not per interface. In the example, the CPU makes a maximum of 128 connection resources available, of which 47 are already in use and a further 81 still available. The configured resources are divided up as follows:

- 6 resources for HMI communication
- 2 resources for S7 communication
- 39 resources for Open User Communication

The CP makes 118 resources and the CM 48 resources available, of which 17 resources and 21 resources respectively are used.

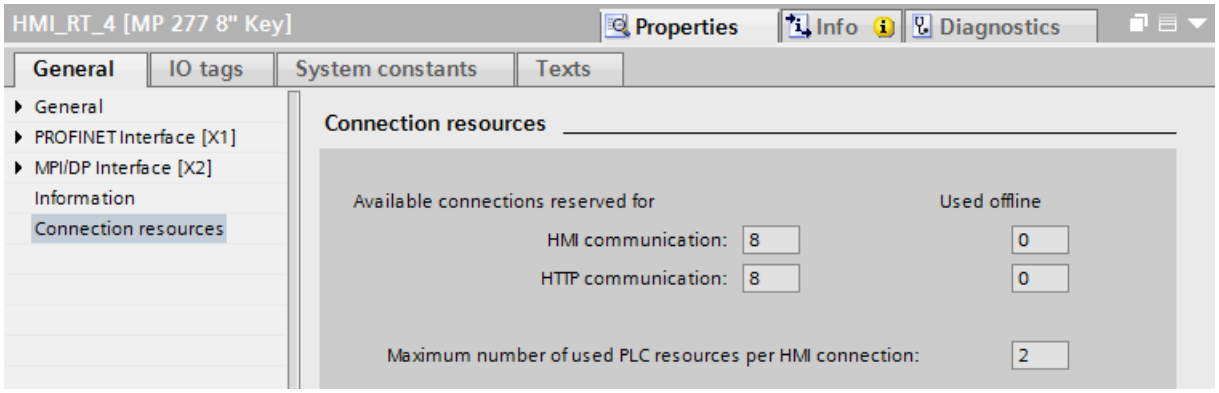
Display of the connection resources in STEP 7 (online view)

If you are connected to the CPU online, you can also see how many resources are currently being used in the "Connection information" tab of the "Diagnostics" section in the Inspector window. The following figure shows you the online display of the reserved, available and used connection resources of an S7-1500 CPU:

	Station resources					Module resources	
	Reserved			Dynamic		PLC_2 [CPU 1516-3 PN/DP]	
Maximum number of resources:		10	10	194	194	86	86
	Maximum	Configured	Used	Configured	Used	Configured	Used
PG communication:	4	-	4	-	0	-	0
HMI communication:	4	4	4	4	4	8	8
S7 communication:	0	0	0	72	68	34	34
Open user communication:	0	0	0	118	118	45	45
Web communication:	2	-	2	-	0	-	0
Other communication:	-	-	0	-	0	-	0
Total resources used:		4	10	194	190	82	82
Available resources:		6	0	0	4	4	4

The online view of the "Connection resources" table not only displays the reserved and dynamic connection resources of the configured connections, but also includes columns containing the connection resources of the programmed and automatically set-up connections that are currently allocated in the station. Thus, the online view displays **all** the assigned connection resources in the automation system, regardless of how the connection was set up. The "Other communication" row displays connection resources assigned for communication with external devices and communication via data record routing.

The table is updated automatically. If there are inconsistencies between the configured hardware configuration and the hardware configuration available online, a corresponding message will be output.



Note

If a routed S7 connection goes through a CPU, the required connection resources of the CPU do not appear in the table of connection resources!

Display of the connection resources for HMI

For HMI communication, connection resources in the CPU are assigned according to the HMI device used and the applications in which the HMI device is used. For example, a Basic Panel requires up to two connection resources in the CPU for an HMI connection, while a Comfort Panel requires up to three connection resources in the CPU.

Information regarding the availability and allocation of connection resources for HMI connections is available in the offline view in the HMI device context (under "Properties > General > Connection resources" in the Inspector window).

The following is displayed in the connection resources area:

- Number of available connections on the HMI reserved for HMI communication and HTTP communication
- Number of connection resources for HMI communication and HTTP communications used offline in the HMI
  If the maximum number of available connection resources for an HMI device is exceeded, a corresponding alarm is output by STEP 7.
- "Maximum number of used PLC resources per HMI connection". This parameter is a factor that is to be multiplied by the number of HMI connections used offline. The product is the number of HMI resources occupied on the CPU.

If the maximum number of available connection resources for an HMI device is exceeded, a corresponding alarm is output.

Displaying the connection resources in the Web server

You can display the connection resources not only in STEP 7, but also with a browser that displays the relevant page of the Web server. You will find information on displaying connection resources in the Web server in the function manual for the Web server.

Example for calculating the connection resources (S7-1500)

Introduction

This example for the table displaying connection resources shows you how the individual table entries are put together.

Requirement

- 2x CPU 1516-3 PN/DP with one CP 1543-1 and one CM 1542-1 each as connection partners for purposes of extending the configuration limit.
- 1x TFT display MP 377 12" Touch with WinAC MP 377 as a connection partner for HMI connections.
- The devices are networked together.

Creating the connections

Once the connection partners (CPUs, CPs, CMs, MP 377) have been created and networked in the network view of the hardware and network editor, follow these steps:

1. Switch to connection mode in the network view.
2. Create the following connections:
   - S7 connections: 2x via CPU, 21x via CM
   - TCP connections: 2x via CPU, 4x via CM
   - ISO connection: 6x via CP
   - ISO-on-TCP: 3x via CPU, 4x via CM
   - UDP connections: 4x via CPU, 106x via CP
   - HMI connections: 1x via CPU, 2x via CP

Result

The display of connection resources shows you not only the available resources but also the resources required for the created connections.

The available resources of devices and modules are highlighted in the following figure.

	Station resources			Module res...	Module res...	Module res...
	Reserved		Dynamic ③ ⚠	PLC_2 [CPU ..	CP 1543-1_...	CM 1542-5_...
Maximum number of resources:	① 10		246	② 128	118	118
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	5	3	6	0
S7 communication:	0	-	23	2	0	21
Open user communication:	0	-	129	9	112	8
Web communication:	2	-	-	-	-	-
Other communication:	-	-	-	-	-	-
Total resources used:		4	157	14	118	29
Available resources:		6	89	114	0	89

① Depending on the CPU, at most 256 connections are available for this station. Ten (10) resources are reserved for particular connection types and 246 resources are dynamically available.

② The CPU provides 128 connection resources, and the CP and CM each provide another 118 resources.

③ CPU, CP, and CM altogether provide 128 + 118 + 118 = 364 resources. Because more connection resources are provided via the devices and modules than the station can operate with its maximum limit of 256 connection resources, a warning icon is displayed.

The following figure highlights the resources utilized by the created connections:

	Station resources			Module res...	Module res...	Module res...
	Reserved		Dynamic	PLC_2 [CPU ..	CP 1543-1_...	CM 1542-5_..
Maximum number of resources:		10	246	128	118	118
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	5	3	6	0
S7 communication:	0	-	23	2	0	21
Open user communication:	0	-	129	9	112	8
Web communication:	2	-	-	-	-	-
Other communication:	-	-	-	-	-	-
Total resources used:		4	157	14	118	29
Available resources:		6	89	114	0	89

① These are the resources assigned via the HMI connections. In this example, one HMI connection utilizes 3 connection resources. For the whole station, 3 + 6 = 9 connection resources are required for the HMI communication.

② Four (4) resources are reserved for the HMI communication.

③ The 9 resources required for HMI communication are broken down as follows: For the first 4 resources, the resources already reserved for HMI communication will be used. The other 5 required resources will be taken from the dynamic resources.

④ These are the resources assigned via the S7 connections. An S7 connection occupies 1 connection resource. For the whole station, 2 + 21 = 23 connection resources are required.

⑤ For the S7 communication, there are no reserved resources. All 23 required resources come from the dynamically available resources.

⑥ These are the resources of the Open User Communication (for TCP, FDL, ISO, ISO-on-TCP, and UDP). For the whole station, 9 + 112 + 8 = 129 connection resources are required.

⑦ For the Open User Communication, there are no reserved resources. All 129 required resources come from the dynamically available resources.

Calculation of connection resources

Based on the available and utilized resources of individual devices and modules, the resources that are still free and the total resources used are calculated:

	Station resources			Module res...	Module res...	Module res...
	Reserved		Dynamic	PLC_2 [CPU ..	CP 1543-1_...	CM 1542-5_...
Maximum number of resources:	10		246	128	③ 118	118
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	5	3	6	0
S7 communication:	0	-	23	① 2	0	21
Open user communication:	0	-	129	9	112	8
Web communication:	2	-	-	-	-	-
Other communication:	-	-	-	-	-	-
Total resources used:		4	157	② 14	④ 118	29
Available resources:		6	89	114	⑤ 0	89

① All required resources for the respective communication types of the CPU are displayed here. Three (3) resources are required for HMI communication, 2 for S7 communication, and 9 for the connection types of the Open User Communication.

② The total number of resources required is listed below the required resources for the communication types. For the CPU, therefore, 3 + 2 + 9 = 14 resources are required.

③ The CP 1543-1 has 118 available connection resources. If these are utilized, no more connections can be created for the CP.

④ For the CP 1543-1, 118 connection resources are already utilized by the 2 HMI connections (3 resources each = 6 resources) and 112 resources by connections of the open communication.

⑤ The CP 1543-1 has no more free resources. No more connections can be created for the CP 1543-1.

The number of resources still available and the total number of resources used is also displayed for the whole station:

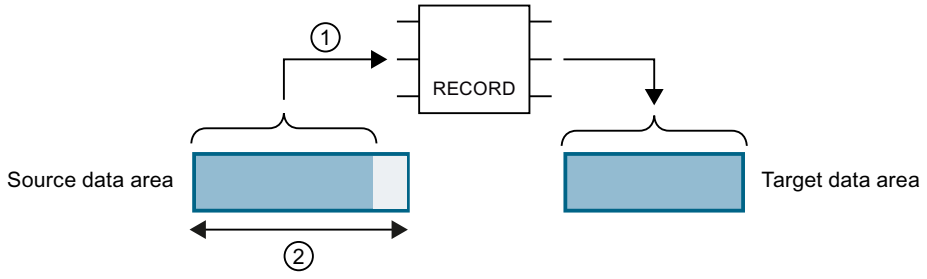
	Station resources			Module res...	Module res...	Module res...
	Reserved		Dynamic	PLC_2 [CPU ..	CP 1543-1_...	CM 1542-5_...
Maximum number of resources:	10		246	128	118	118
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	5	3	6	0
S7 communication:	0	① -	23	2	0	21
Open user communication:	0	-	129	9	112	8
Web communication:	2	-	-	-	-	-
Other communication:	-	-	-	-	-	-
Total resources used:		② 4	② 157	14	118	29
Available resources:		③ 6	89	114	0	89

① All connection resources used (configured), including both reserved and dynamic connection resources, for the individual communication types for the entire station. The values represent the sum of all resources utilized for devices and modules (CPU, CP, CM).

② All connection resources used (configured), including both reserved and dynamic connection resources, for all communication types for the entire station.

③ Total number of reserved and dynamic connection resources still available. The values are obtained by subtracting the number of resources used from the maximum number of resources that can be configured.

Data consistency (S7-1500)



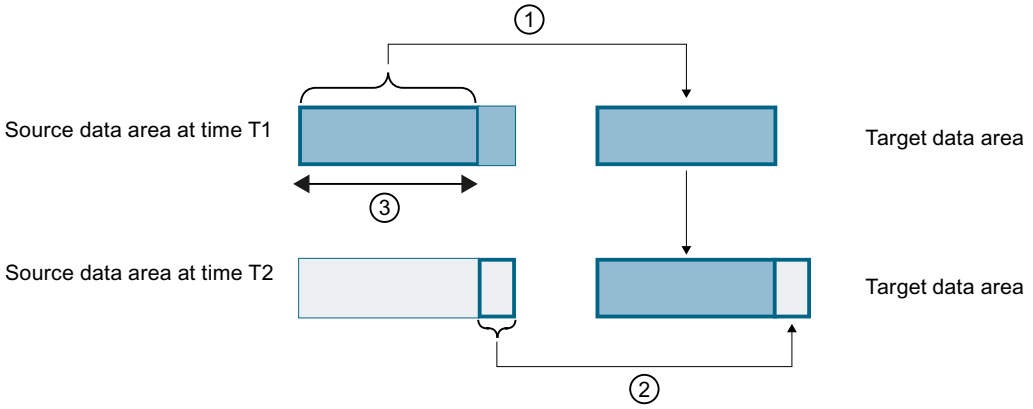
Definition

Data consistency is important for data transfer and you need to take this into account when configuring the communication task. Otherwise, malfunctions may occur.

A data area which cannot be modified by concurrent processes is called a consistent data area. This means that a data area which belongs together and which is larger than the maximum size of the consistent data area can consist in part of new and of old data at the same time.

An inconsistency can occur when an instruction for communication is interrupted, for example by a hardware interrupt OB with higher priority. This interrupts the transfer of the data area. If the user program in this OB now changes the data that has not yet been processed by the communication instruction, the transferred data originates from different times:

The following figure shows a data area that is smaller than the maximum size of the consistent data area. In this case, when transferring the data area, it is ensured that there is no interruption by the user program during data access so that the data is not changed.



① The source data area is smaller than the maximum size of the consistent data area (②). The instruction transfers the data together to the destination data area.

② Maximum size of the consistent data area

Figure 10-1 Consistent transfer of data

The following figure shows a data area that is larger than the maximum size of the consistent data area. In this case, the data can be changed during an interruption of the data transfer. An interruption also occurs if, for example, the data area needs to be transferred in several parts. If the data is changed during the interruption, the transferred data originates from different times.

① The source data area is larger than the maximum size of the consistent data area (③). At time T1, the instruction only transfers as much data from the source data area to the destination data area as fit in the consistent data area.

② At time T2, the instruction transfers the rest of the source data area to the destination data area. After the transfer, data from different points in time exist in the destination data area. If the data in the source data area has changed in the meantime, an inconsistency may result.

③ Maximum size of the consistent data area

Figure 10-2 Transfer of data larger than the maximum consistency area

Example of an inconsistency

The figure below shows an example of changing data during the transfer. The destination data area contains data from different points in time.

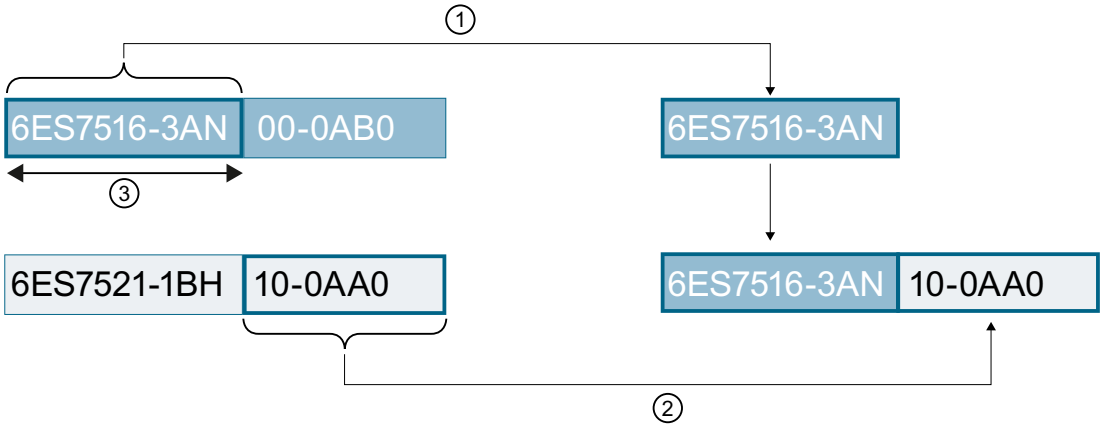


Figure 10-3 Example: Changing data during the transfer

System-specific maximum data consistency for S7-1500:

No inconsistency occurs if the system-specific maximum size of the consistent data is kept to. With an S7-1500, communication data is copied consistently into or out of the user memory in blocks of up to 512 bytes during the program cycle. Data consistency is not ensured for larger data areas. Where defined data consistency is required, the length of communication data in the user program of the CPU must not exceed 512 bytes. You can then access these data areas consistently, for example from an HMI device by reading/writing tags.

If more data than the system-specific maximum size needs to be transferred consistently, you yourself must ensure the data consistency with suitable measures in the user program.

Ensuring data consistency

Use of instructions for access to common data:

If the user program contains instructions for communication that access common data, for example TSEND/TRCV, you can coordinate access to this data area yourself, for example using the "DONE" parameter. The data consistency of the data areas that are transferred with an instruction for communication can therefore be ensured in the user program.

Note

Measures in the user program

To achieve data consistency, you can copy transferred data to a separate data area (for example global data block). While the user program continues to work with the original data, you can transfer the data saved in the separate data area consistently with the communication instruction.

For the copying, use uninterruptible instructions such as UMOVE_BLK or UFILL_BLK. These instructions ensure data consistency up to 16 KB.

Use of PUT/GET instructions or Write/Read via HMI communication:

In S7 communication with the PUT/GET instructions or Write/Read via HMI communication, you need to take into account the size of the consistent data areas during programming or configuration. In the user program of an S7-1500 as server, there is no instruction available that can coordinate the data transfer in the user program. The data exchanged using PUT/GET instructions updates the S7-1500 while the user program is running. There is no point in time within the processing of the cyclic user program at which the data is exchanged consistently. The length of the data area to be transferred should be smaller than 512 bytes.

Additional information

- You will also find the maximum amount of consistent data in the CPU, CM or CP manuals in the Technical Specifications.
- You will find further information on data consistency in the description of the instructions in the STEP 7 online help.

10.1.3.3 Displaying and configuring topology

Overview of the topology view

Functions of the topology view

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
  - Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports
  - Displaying interconnections between the ports
  - Displaying corresponding logical networks
  - Display diagnostic information of all ports
- Configuring the Ethernet topology
  - Creating, modifying and deleting interconnections of the ports
  - Renaming stations, devices, interfaces or ports
  - Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog
- Identifying and minimizing differences between the desired and actual topology
  - Running an offline/online comparison of Ethernet modules, ports and port interconnections
  - Adopting existing online topology information in the offline project

Note

Devices without valid IP address

Topology information (LLDP) cannot be read from a device without valid IP address.

To prevent devices from having an invalid IP address, specify in the settings of the TIA Portal for hardware configuration that devices without valid IP address are temporarily assigned an IP address.

Note

Subnet membership

Before the topology determination, you have to set for the local interface of your PG/PC the network address that the Ethernet components that are to be determined also have in the real plant. If you do not meet this requirement, no further topology information (information about ports and neighborhood relationships) can be determined.

Differences between network view and topology view

- The network view shows all the logical subnets of the project.
  The topology view shows all Ethernet components of the project. These include passive components such as switches, media converters and cables.

  Note

  Stations with non-Ethernet components are also displayed if the station has a least one Ethernet component.

- The position of a device in the network view and its position in the topology view are initially independent of one other; in other words, the same device generally appears at different locations in the two views.
  If you want to align the devices in the topology view as in the network view, click on the following icon in the toolbar of the topology view.

Icon	Meaning
	Changes the position of the devices in the topology view so that the new position is as close as possible to the position in the network view.

- If you open the hardware catalog in the topology view, you only see devices with an Ethernet interface.

Structure of the topology view

The topology view (Page 536) essentially consists of a graphic area (called the graphic view below) and a table area (called the table view below).

Which functions are there in the graphic view and which functions are there in the table view?

- Displaying the Ethernet topology

Function	Graphic view	Table view
Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports	yes	yes
Display interconnections between the ports (including type of medium)	yes	yes
Displaying corresponding logical networks	no	yes
Displaying properties of the cables between the ports	no	yes
Display diagnostic information of all ports	yes	yes

- Configuring the Ethernet topology

Function	Graphic view	Table view
Creating, modifying and deleting interconnections of the ports	• Create: yes • Modify: yes • Delete: yes	• Create: yes • Modify: yes • Delete: yes
Renaming stations, devices, interfaces or ports	no	yes
Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog	yes	no

- Identifying and minimizing differences between the desired and actual topology

Function	Graphic view	Table view
Running an offline/online comparison of Ethernet modules, ports and port interconnections	no	yes
Adopting existing online topology information in the offline project	no	yes

Structure of the table view

The table view consists of the following two tabs:

- "Topology overview" tab
- "Topology comparison" tab

The "Topology overview" tab provides the following functions:

- Display of the configured topology with hierarchical structures (from the station to the port)
- Configuration of the Ethernet topology
- The display of the diagnostics status of hardware components

The "Topology comparison" tab provides the following functions:

- Identifying and minimizing differences between the desired and actual topology

Starting the topology view

Requirement

The device or network view is open in the hardware and network editor.

Procedure

To start the topology view of your project, follow these steps:

1. Click on the "Topology view" tab.

Or:

1. Open the network view of the hardware editor.
2. Select a PROFINET device or a PROFINET module.
3. Select the "Go to topology view" command in the shortcut menu.

Result

The topology view is started. If you opened the topology view using the shortcut menu, the selected component remains selected after the change of view.

Displaying topology

Displaying the graphic view of the configured topology

What is shown?

The graphic view of the configured topology shows the following:

- Configured PROFINET devices and passive Ethernet components along with their ports
- Configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports

Type of display

The way in which the graphic view of the topology view and the network view are displayed is very similar:

- Compared with the device view, components are shown in a simplified form.
- The interconnections between ports are shown as horizontal and vertical lines. These are dashed when an interconnection between a tool changer port and its possible partner ports is involved.

Displaying the table view of the configured topology

Requirement

- The table view of the topology is open.
- You are in the "Topology overview" tab

What is shown?

The table view of the configured topology shows exactly the same content as the graphic view except for the logical PROFINET subnets:

- All the configured PROFINET devices and passive Ethernet components along with their ports
- All the configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports
  For each port with the "Alternating partner port" property, there are as many completed rows as there are potential partner ports plus one empty row.

Type of display

As the name implies, the table view of the topology view consists of a table, the topology overview table. It displays the configured topology with hierarchical structures (from the station to the port) It is structured like the network overview table. It consists of the following columns:

- Device / port
  This is the most important column of the table. The entries in this column have a hierarchical structure with the PROFINET ports being the last element in the hierarchy. You can expand and collapse the hierarchical entries. For a CPU, for example, an entry consists of the following elements:
  - Station name
  - Device name
  - Name of the PROFINET interface
  - Names of the ports

  Note: All the other columns only have entries in the rows containing the port names.
- Slot
  Indicates the number of the slot in a rack in which the relevant module is installed. For interfaces, the designation of the interface is also displayed.
- Index (by default, this column is not displayed)
  This column is only relevant for PC stations. The index is the virtual slot address of the component.
- Device type (by default, this column is not displayed)
  Shows what type of station, device or interface the table row relates to or whether it belongs to a port.
- Article no. (by default, this column is not displayed)
  Article no. of the device
- Subnet (as default, this column is not displayed)
  Configured subnet to which the interface belongs
- Master/IO system (as default, this column is not displayed)
  Shows whether or not the interface belongs to a PROFIBUS DP master system or a PROFINET IO system.

- IP address (by default, this column is not displayed)
  Configured address of the interface in the subnet
- Partner station
  Name of the station that contains the partner port
- Partner device
  Name of the device that contains the partner port
- Partner interface
  Interface to which the partner port belongs
- Partner port
- Cable data
  Contains the cable length and the signal delay of the cable connecting the ports

Basic functions for tables

The topology overview table supports the following basic functions for editing a table:

- Displaying and hiding table columns
  Note: The columns relevant for configuration cannot be hidden.
- Optimizing column width
- Saving current representation
- Displaying the meaning of a column, a row or cell using tooltips.

Displaying the diagnostics status of ports and cables in the graphic view

Requirements

The graphic view of the topology view is open.

Procedure

To determine the diagnostics status of the port, follow these steps:

1. Go online with the required component or components.

Result

The following icons are displayed:

- The corresponding diagnostics icon is displayed for each device.
- If there is an error in at least one lower-level component, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon.
- The corresponding diagnostics icon is displayed for each port.
- Every cable between two ports that are online has the color that matches its diagnostics status.

You will find the possible diagnostics icons for ports and the color coding of Ethernet cables in the description of hardware diagnostics. See: AUTOHOTSPOT

Showing the diagnostics status of hardware components in the table view

Requirement

- The table view of the topology view is open.
- You are in the "Topology overview" tab

Procedure

To obtain the diagnostics status of hardware components of the topology overview table, follow these steps:

1. Go online with the required components.

Result

The following icons are displayed at the left-hand edge of the topology overview table in each row that belongs to the component involved:

- The diagnostics icon belonging to the hardware component is displayed.
- If the hardware component has lower-level components and if there is an error in at least one of the lower-level components, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon of the hardware component.

For the possible diagnostics icons for hardware components, refer to the description of hardware diagnostics. See: AUTOHOTSPOT

Note

The display of the diagnostics status of hardware components in the topology overview table and the network overview table is identical.

Running an offline/online comparison and displaying the results

Requirements

- The table view of the topology view is open.
- You are in the "Topology comparison" tab
- There may be an online connection to one or more devices, but this is not actually necessary.

Procedure

To find the differences between the configured and the actual topology, follow these steps:

1. Click the "Compare offline/online" button in the toolbar.

Result

The actual topology is identified and compared with the configured topology.

Devices identified online are automatically assigned to configured devices as far as this is possible. See Automatic assignment of devices by offline/online comparison (Page 717)

The columns on the right-hand side of the table are filled or updated:

- Columns for the result of the offline/online comparison: "Status" and "Action"
- Columns for the topology identified online

Note

Stopping a running online/offline comparison

If you click the "Compare offline/online" button while topology discovery is active, the current topology discovery is stopped.

The following buttons are enabled in the toolbar of the table:

Button	Name	Meaning
	Update	The detection of the existing online topology is started again.
	Synchronize	• Adopting the port interconnections identified online in the project (Page 718) • Adopt the devices identified online in the project (Page 718)

Note

If you have not configured your own programming device or your own PC offline, the gray filled circle is displayed as a diagnostic symbol.

You can also configure a second and third programming device or a second and third PC offline.

Columns for the result of the offline/online comparison

The following columns are displayed:

- "Status"
  The result of the offline/online comparison is shown here in the form of diagnostics icons. The following icons are possible:

Diagnostics icon	Meaning
	Differing topology information in at least one lower-level component
	Identical topology information
	Topology information only available offline or device is disabled
	Topology information only exists online
	Differing topology information
	No port interconnection configured, no port interconnection discovered online
	If a device does not support topology functions, the "Status" column remains empty.

- "Action"
  The possible actions are shown here. The following actions are possible:
  - No action
  - Apply

Note

Separating columns

To separate the offline and online columns of the topology comparison table optically, there is a separating column to the left of the "Status" column and to the right of the "Action" column. The separating columns cannot be hidden and their width cannot be changed.

Columns for the topology identified online

The following columns are displayed:

- "PROFINET device name"
- "Article no." (by default, this column is not displayed)
- "Device family" (by default, this column is not displayed)
- "IP address" (by default, this column is not displayed)
- "Port"
- "Interconnection"
  - Green line if the port is interconnected
  - Gray line if the port is not interconnected
- "Partner port"
- "Partner IP address"
- "Partner PROFINET device name"

- "Partner article number" (by default, this column is not displayed)
- "Partner device family" (by default, this column is not displayed)

Basic functions for tables

The topology comparison table supports the following basic functions for editing a table:

- Displaying and hiding table columns
  Note: The columns relevant for configuration cannot be hidden.
- Optimizing column width
- Saving current representation
- Displaying the meaning of a column, a row or cell using tooltips.

Running an advanced offline/online comparison and displaying the results

Overview

With the standard offline/online comparison, a search method based on the DCP protocol is used.

With the advanced offline/online comparison, ICMP is also used to be able to detect devices that do not support DCP. These include, for example, PG/PC stations.

Requirement

- The table view of the topology view is open.
- You are in the "Topology comparison" tab
- The devices to be detected with ICMP are located in the same subnet as the network adapter of your PG/PC you are currently using.

Procedure

Follow these steps:

1. In the toolbar, click on the arrow in the "Advanced comparison" button.
2. With the input boxes "Start address" and "End address", select an IP address range in which accessible Ethernet nodes will be searched for with ICMP. Confirm this, for example by clicking the button with the green check mark.
3. Click on the icon in the left-hand part of the "Advanced comparison" button.

Result

The Ethernet nodes detectable with DCP and ICMP are discovered.

The columns on the right-hand side of the table are filled or updated:

Configuring topology

Interconnecting ports

Overview

Interconnecting ports in the topology view

In the topology view, you have the following options for interconnecting ports:

- in the graphic view (Page 713)
- in the graphic view of a tool changer (Page 715)
- in the table view (Page 714)
- in the table view of a tool changer (Page 715)
- by adopting port interconnections identified online (Page 718)

Note

Interconnecting an electric with an optical port

If you want to interconnect an electric and an optical port, you have to decide between RT and IRT communication:

- With RT communication, it is not necessary to configure a media converter.
- With IRT communication, you have to make the interconnection via a media converter.

What effects does the interconnection of ports have on the network view?

Note

In the properties of a subnet in the network view, you can specify that this subnet is used when a port interconnection is created between two devices that are not networked.

When you create an interconnection between two ports, the following effects are possible in the network view:

- If the corresponding interfaces are disconnected: If you have specified a default subnet, this is used. Otherwise a new subnet is created to connect the two interfaces.
- If one (and only one) of the two interfaces involved is networked: The non-networked interface is connected to the same subnet as the already networked interface.
- In all other cases: The corresponding interfaces are not connected to a logical subnet.

See also

Interconnecting ports (Page 1787)

Settings for interconnecting Ethernet devices (Page 603)

Interconnecting ports in the graphic view

Requirement

You are in the graphic view of the topology view.

Procedure – Creating a new interconnection between two ports

To interconnect a port of a device with a port of another device, follow these steps:

1. Place the mouse cursor on the port you want to interconnect.
2. Click with the left mouse button and hold it down.
3. Move the mouse pointer.
   The pointer now shows the networking symbol to indicate "Interconnect" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.
4. Now drag the mouse cursor to the target port. You can do this while holding down or after releasing the mouse button.
5. Now release the left mouse button or press it again (depending on your previous action).

Result: A new port interconnection is created.

Note

Creating a ring for S7-300, S7-400, and S7-1500 CPUs

If you create a ring using port interconnections for S7-300, S7-400, or S7-1500 CPUs, an MRP domain is created automatically.

Procedure – Changing an existing port interconnection without deleting it first

To do this, follow these steps:

1. Place the mouse cursor on the port of an existing interconnection that is to receive a new partner port.
2. Drag the port to the new partner port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

Alternative procedure:

1. Place the mouse cursor on a port without an interconnection that is to be connected with an already interconnected port.
2. Drag the port to the already interconnected port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

Procedure – Interconnecting two interconnected ports with each other without first deleting the two existing port interconnections

To do this, follow these steps:

1. Place the mouse cursor on the interconnected port that is to receive a new partner port.
2. Drag the port to the new partner port that has also already been interconnected.

Result: The two existing port interconnections are deleted. The new port interconnection is created.

Interconnecting ports in the table view

Which actions are possible with port interconnections in the table view?

The following actions are possible with port interconnections in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

Requirement

The row with the port whose interconnection you want to create, modify or delete is visible in the "Topology overview" tab.

Procedure

To create the interconnection of a port for the first time, to modify it or delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Any partner" entry (when deleting a port interconnection).

Result

The required action is performed. The new partner port (after creating or modifying a port interconnection) or the "Select port" entry (after deleting a port interconnection) is displayed in the "Partner port" column.

Interconnecting a port with more than one partner port in the graphic view

Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The graphic view of the topology view is open.

Procedure

1. Interconnect this port (referred to hereafter as source port) with one of the partner ports you have specified (referred to hereafter as target port).
2. Interconnect the source port with an additional target port.
   You can do this in several ways:
   - Drag the mouse pointer from a partner port that is already interconnected to a target port.
   - Drag the mouse pointer from an interconnection that has already been created to a target port.
   - Drag the mouse pointer from a target port to a partner port that is already interconnected.
   - Drag the mouse pointer from a target port to an already created interconnection.
3. If necessary, repeat the step above one or more times.

Result

An interconnection is created between the source port and the alternative partner ports. This is indicated by a dashed line.

Interconnecting a port with more than one partner port in the table view

Which actions are possible with port interconnections to several partner ports in the table view?

When working with a tool changer, the following actions can be performed with port interconnections to multiple partner ports in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The row with the port whose interconnection you want to create, modify or delete is visible in the "Topology overview" tab.

Procedure

To create the interconnection of a port to one or more partner ports for the first time, to modify it, or to delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Any partner" entry (when deleting a port interconnection).

Result

The required action is performed:

- If you are creating an interconnection, a new row is inserted in the topology overview table. The new partner port is displayed there in the "Partner port" column.
- If you change an interconnection, the new partner port is displayed in the "Partner port" column.
- If you delete an interconnection, the row with the previous port interconnection is deleted.

Note

With a tool changer, there are normally several rows for a port with port interconnections to more than one partner port. The last row is always an empty row. The first row can be edited, all other rows are read-only.

Renaming stations, devices, interfaces or ports

Rename a station, a device, an interface or a port

Requirement

- The table view of the topology view is open.
- You are in the "Topology overview" tab

Procedure

To rename a station, a device, an interface or a port, proceed as follows:

1. Click twice in the relevant field of the topology overview table (the second click starts the editing mode).
2. Enter the new name and then press the ENTER key (this closes editing mode).

Result

The object is renamed.

Offline/online comparison

Automatic assignment of devices by offline/online comparison

Overview

During the offline/online comparison, the configured topology is compared with the actual existing topology. Devices identified online are automatically assigned to configured devices as far as this is possible.

Start of availability detection

You start the availability detection the first time by clicking the "Compare offline/online" button in the toolbar of the "Topology comparison" tab.

You restart availability detection by clicking the "Update" button.

Note

The availability detection can take several seconds. During this time, no user input is possible.

Automatic assignment of a PNIO device

A PNIO device identified online is automatically assigned to a configured device if the following properties of the two devices match up:

- Article no.
- Device type or device family
- PROFINET device name

No automatic assignment

In the following situations, no automatic assignment is possible:

- No device can be identified online to match a configured device. (This means that the corresponding columns in the "Online topology" area of the topology comparison table are empty.)
  In this case, you should add the already configured device to your system or delete the configured device from the configuration.
- A device identified online can be assigned to a configured device, but there are differences in the port interconnections.
  In this case, you can apply the port interconnections identified online manually to the project (Page 718).
- A device identified online cannot be assigned to a configured device. (In this case, the corresponding columns in the "Offline topology" area of the topology comparison table are empty.)
  In this case, you can include the device identified online manually in the project (Page 718).

Apply the port interconnections identified online manually to the project

Requirement

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online was automatically assigned to a configured device, but that there are differences relating to the interconnection.

Procedure

To adopt one more port interconnections identified online in the project manually, follow these steps:

1. Select the row belonging to the port interconnection.
2. If applicable, select further roles using multi-selection.
3. Select "Apply" > "Use selected" in the shortcut menu.
   The content of the corresponding table cells in the "Action" column changes to "Apply".
4. If you have mistakenly prepared too many port interconnections to be included in the project:
   Select the rows that belong to the port interconnections you have mistakenly prepared for inclusion in the project using multi-selection.
   Select "Reset" > "Reset selected" in the shortcut menu.
   The content of the corresponding table cells in the "Action" column change to "No action".
5. Click the "Synchronize" button.

Result

The port interconnections identified online for the corresponding devices are included in the project. Successful adoption is indicated by the diagnostics icon "Identical topology information" for each port.

Note

If other port interconnections are recognized for a device identified online and these differ from those that exist in the project, adopting these in the project means that the port interconnections that were previously in the project are replaced by those identified online. If no port interconnections are detected for a device identified online, adopting in the project means that all the port interconnections of this device are deleted in the project.

Include the devices identified online manually in the project

Requirements

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online could not be assigned to any configured device.

Procedure

To adopt one more devices identified online in the project manually, follow these steps:

1. For a configured device without an online partner, move the mouse pointer to the "Device/ port" column of the online topology.
2. Select the device you want to assign to the configured device from the drop-down list of this box.
3. Repeat the previous steps if necessary for other configured devices without an online partner.

Result

The selected device that was identified online is moved up from the end of the table. Following this, it is in the row of the configured device to which you have just assigned it.

Automatic assignment of devices by advanced offline/online comparison

Overview

With the advanced offline/online comparison, ICMP is also used alongside DCP to be able to detect devices that do not support DCP.

Automatic assignment of devices detected by ICMP

With devices detected by ICMP, no type is available.

With passive devices, no article number is available. For this reason, passive devices can only be assigned automatically if you have not assigned an article number in the configured data and the offline and online IP addresses match.

With switches, automatic assignment is possible if the offline and online article number, IP address and PROFINET device name match.

10.1.3.4 Industrial Ethernet Security

Configuring security

General

Supported devices

Supported devices

The security functions described in this help section are supported y the following products;

- SCALANCE S:
  - S602 V2*/V3/V4
  - S612 V2*/V3/V4
  - S613 V2*
  - S623 V3/V4
  - S627-2M V4
- SOFTNET Security Client:
  - SOFTNET Security Client V4
- S7 CPs / TIM: CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 443-1 OPC UA, CP 1543-1, CP 1543SP-1, CP 1243-1 BX30, CP 1243-1 PCC, CP 1242-7 KX31, CP 1243-7 LTE, CP 1243-8 IRC, TIM 4R-IE, TIM 4R-IE DNP3, TIM 1531 IRC
- PC CP: CP 1628
- Mobile wireless router: SCALANCE M875

* SCALANCE S V2 devices cannot be inserted in a STEP 7 project. SCALANCE S V2 devices from projects of older STEP 7 versions are simply displayed with their properties. The properties of these devices can, however, not be changed. Downloading and compilation and diagnostics of SCALANCE S V2 devices is also not possible. All the functions described for SCALANCE S devices relate to the firmware versions as of V3.

When opening a STEP 7 project with existing SCALANCE S V2 devices global firewall rules can be created from the existing local firewall rules for the device.

General terminology "security module"

In this section of the information system the name "security module" is used instead of the product names named above. You will find the functional differences between the products in the Siemens Industry Mall.

Use of the terms "interface" and "port"

In this documentation, the ports of SCALANCE S modules are named as follows:

- "External interface": The external port of the SCALANCE S602 / S612 / S613 / S623 or an external port of the SCALANCE S627-2M (marked red)
- "Internal interface": The internal port of the SCALANCE S602 / S612 / S613 / S623 or an internal port of the SCALANCE S627-2M (marked green)
- "DMZ interface": The DMZ port of the SCALANCE S623 / S627-2M (marked yellow)

The term "port" itself is used when the focus of interest is a special port of an interface.

Structure of this section of the help system

Topics that are relevant to several module types can be found in the "General" section. Information that is only relevant to a certain module type can be found in the sections relating specifically to these module types.

Overview - Scope of performance and method of operation

General use of the term "STEP 7"

Configuration of security functions is supported as of STEP 7 V12. For this reason, in this section of the information system, the name "STEP 7" will be used for all versions of STEP 7 V12 or higher.

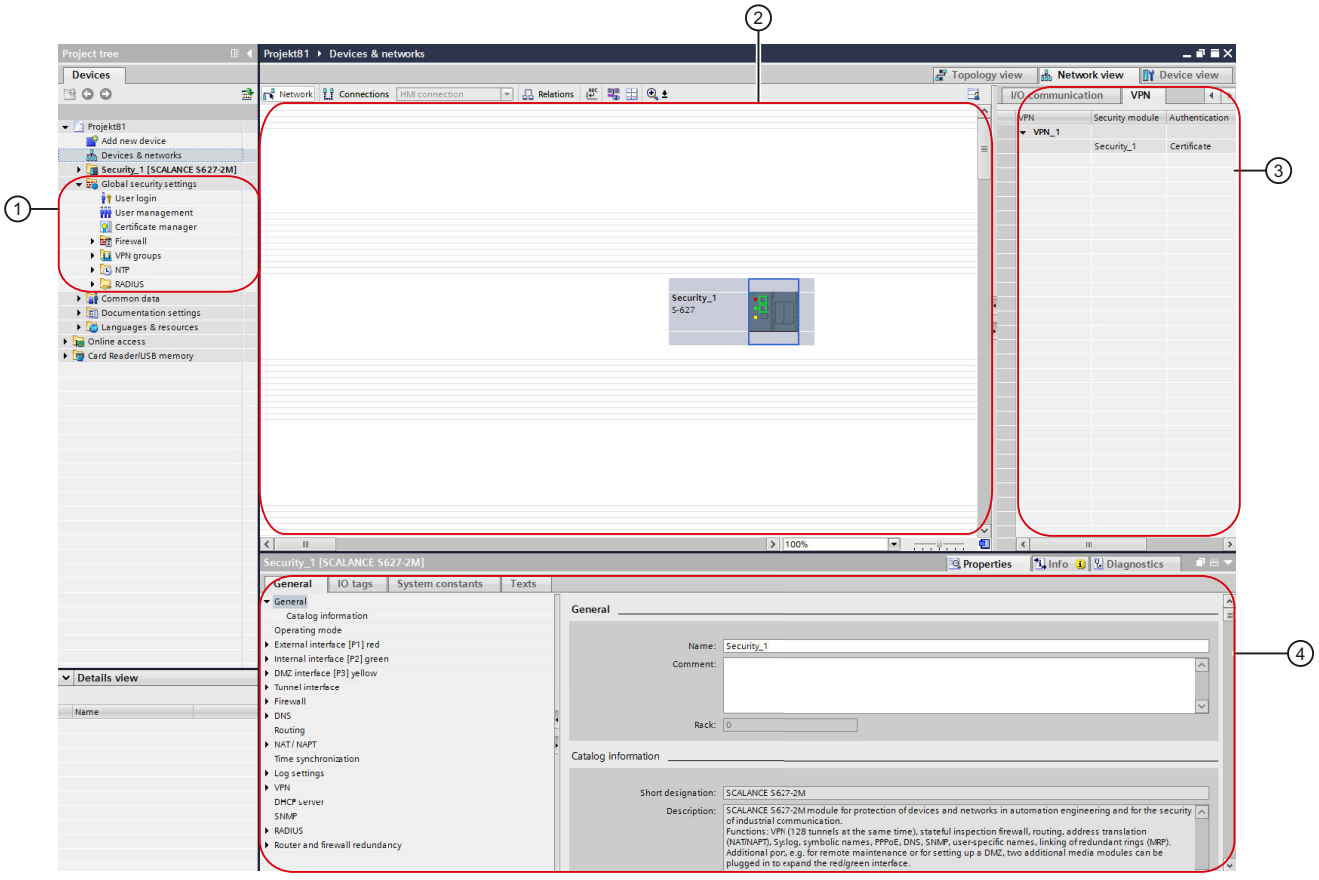
Scope of performance

You can use the following security functions in STEP 7:

- Configuration of the security modules
- Creating VPN configuration data for SOFTNET Security Client V4
- Creating VPN configuration data for SCALANCE M875
- Creating VPN configuration files for VPN devices from third-party manufacturers
- Test and diagnostics functions, status displays

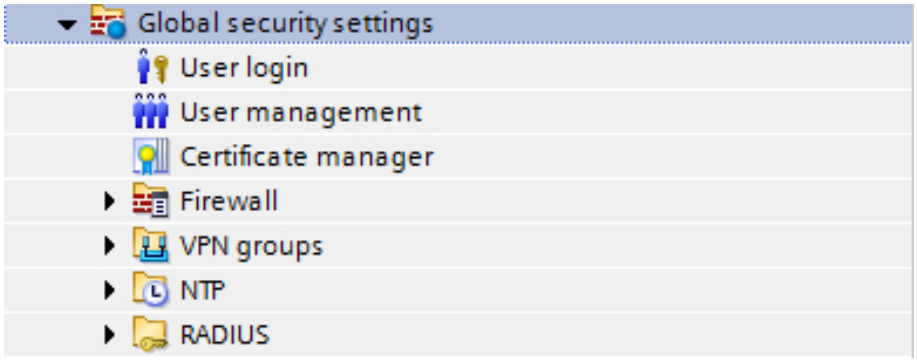
Offline configuration view and online diagnostics view

The security functions are configured in two views:



- Offline configuration view
  In the offline configuration view, you create the configuration data. Prior to downloading, there must already be a connection to the security modules.
- Online diagnostics view
  The online/diagnostics view is used for diagnostics of the security module and, among other things, allows you to run firmware updates.

How it works - security and consistency

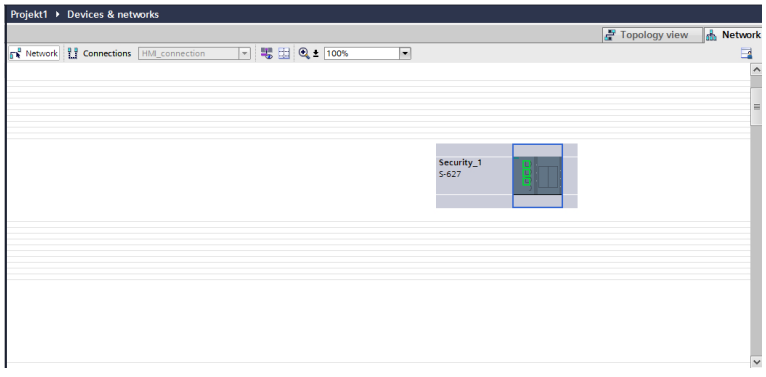


- Access only for authorized users
  The security functions of every project are protected from unauthorized access by assigning user names and passwords. With the help of password policies, project-specific rules for password assignment can be defined.
- Consistent project data
  Consistency checks are running even while you make the entries in the dialogs. In addition, cross-dialog, project-wide consistency checks are carried out.
  Only consistent project data can be downloaded to the security modules.
- Protecting project data by encryption
  The project and configuration data relevant to security are protected by encryption.
  Depending on the security module, data can be stored in the project and/or on the C-PLUG.

User interface - layout and menu commands

User interface for security functions in STEP 7

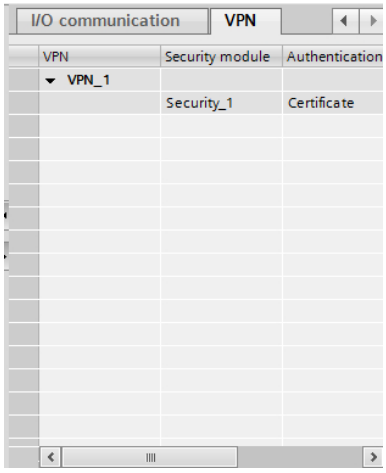
① Global security settings



The global security settings are located in the project navigation. These security settings can be configured independently of the module and subsequently assigned to individual security modules as required. Changes to the global security settings must be loaded on all security modules involved. This also applies to the settings of redundancy relationships.

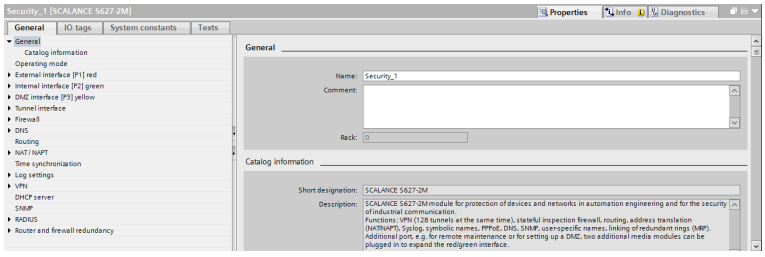
If the first security module to be configured is a CP, the global security settings are only displayed when the security functions have been enabled in the local security settings of the CP. If the first security module to be configured is

a SCALANCE S module, a SCALANCE M module or a security device the global security settings are displayed after logging in to the security project. The following main folders and entries are available in the global security settings:



- User login
  For the security configuration within a project, there is a separate user management. Log in to the security configuration using the "User login" entry. The first time that there is a login to the security configuration, a user with the system-defined role "Administrator" is created automatically. You can create further users in the security configuration in the user management.
- User administration
  In user administration, you can create users, define rights for roles and assign these roles to users.
- Certificate manager
  In the certificate manager, you see an overview of all the certificates used in the project. You can, for example, import new certificates as well as export, renew or replace existing certificates.
- Firewall
  Under the "Firewall" entry, you can define global IP and MAC firewall rule sets and user-specific IP rule sets (SCALANCE S modules only) and assign security modules. Global firewall rule sets can also be exported from STEP 7 and imported into STEP 7. IP and MAC service definitions are used to define the IP and MAC firewall rules compactly and clearly.
- VPN groups
  All created VPN groups are contained in this folder. You can create new VPN groups here and assign security modules to these VPN groups. You can also adapt VPN group properties of VPN groups that have already been created.
- NTP
  Here, you can create NTP servers and assign them to one or more security modules. This ensures that time synchronization is performed through the assigned NTP server. Unsecured NTP servers can only be configured in the local security settings.
- RADIUS
  Here, you can create RADIUS servers and assign them to one or more security modules. With this, you ensure that authentication queries from users who log on to the selected security module to activate user-specific IP rule sets are forwarded to the assigned RADIUS server.

② Work area



Once you have selected a SCALANCE M module or a security module in the work area, you can configure its local security settings in "Properties" > "General". If the selected object is in a VPN group, related information is displayed in the VPN tab.

③ VPN tab

This tab displays information about all the VPN groups to which the security module that was selected in the working area belongs. Information about the respective participants of a VPN group can be displayed and hidden.

④ Local security settings

Local security settings are configured for a specific security module / SCALANCE M module / security device. After one of these objects has been selected in the working area, its local security settings are available in the Inspector window under "Properties" > "General".

Note for CPs:

Before local security settings can be configured for CPs, these must first be enabled.

To do this, log in to your security project and then in the Inspector window, select the "Activate security features" check box in the "Properties" > "General" tab, "Security" entry. The local security settings are then displayed below the "Security" entry. When the check box is selected, the some of the CP settings (assuming they were enabled) are migrated automatically to the local security settings.

Depending on the particular security module, additional security functions are also available such as NTP (secure), SNMPv3, FTPS.

In addition, firewall rules that enable a connection to be established are created automatically for configured connections. Log settings are available to record blocked packets.

Secure and non-secure configuration areas

The user interface can be divided into secure and non-secure configuration areas.

The secure areas are areas in which configuration is possible only after logging in to the security configuration. These areas are encrypted and therefore only available to persons authorized in the user management even if the project is accessible to a wider circle of people.

Functions from the non-secure areas, on the other hand, can be configured without logging in to the security configuration. The correctness of the settings must be checked before downloading the project to the plant components if a wider circle of people can make modifications to the project.

Below, you will find a list of the configuration areas of the user interface showing which areas are secure and which are non-secure. To some extent, this depends on the security module for which the configuration is created.

- All settings from the global security settings are secure.
- Secure and non-secure configuration areas for SCALANCE S modules:
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - The settings under the entry "General" in the local security settings are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - The other settings are protected.
- Secure and non-secure configuration areas for CPs:
  - All settings outside the "Security" entry are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager, PROFINET settings, connections etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - All settings below the "Security" entry are secure.

Restrictions in the use of libraries

If a master copy is created in the global library for a security module, the configuration of this security module is lost in the master copy. You need to log in again if you use a master copy.

If a master copy is created in the project library for a security module, the configuration of this security module is retained, apart from the cross-module information for VPN and redundancy relationships.

IP addresses for configurable servers

When configuring servers, the (alias) IP addresses of the security module must not be used. For all configurable servers, there is a consistency check when the IP address is assigned.

Running a consistency check

Overview

The following consistency checks are available:

- Local consistency checks
- Project-wide consistency checks

In the individual dialog descriptions in this help system, the rules you need to take into account for your entries are listed under the keyword "Consistency check".

Local consistency checks

A consistency check is local when it can be performed directly within a dialog. With the following actions, local consistency checks are made:

- After exiting a box
- After exiting a row in a table
- When you confirm a dialog with OK.

Project-wide consistency checks

Project-wide consistency checks provide you with information indicating whether or not project data is correctly configured. With the following actions, there is a consistency check through the entire project:

- When compiling a configuration
- When downloading a configuration

Note

You can only download configured data to a security module if the project-wide consistency check for the security module was successful.

Replacing a security module

Module-specific function

Only SCALANCE S modules as of V3 can be replaced by SCALANCE S modules as of V3, refer to the section:
Replacing a security module (Page 838) in the section "SCALANCE S".

Managing certificates

Overview of certificates

Certificate management

The certificate manager in the global security settings contains an overview of all the certificates used in the project, for example, CA certificates with information about the certificate owner, issuer, validity, use and the existence of a private key.

A CA certificate is a certificate issued by a certificate authority from which the device certificates are derived. The device certificates include SSL certificates. SSL certificates are required for authentication during secure communication between a network node and a security module. Further device certificates include the VPN group certificates of security modules located in VPN groups and OPC UA client/server certificates of CP 443-1 OPC UA modules.
Certificate authorities can be:

- The STEP 7 project itself. If the "certificate owner" and "issuer" are the same, this is a self-signed certificate; in other words, issued by the STEP 7 project.
- A higher ranking (commercial) certificate authority. These third-party certificates are external to the project and are imported and stored in the certificate store of STEP 7.

Certificates created by one of the two certificate authorities always have a private key so that the device certificates can be derived from them.

Every certificate is assigned an ID via which the certificate can be referenced in the program blocks. The IDs are generated consecutively when certificates are created. Due to the system some IDs are not used.

Note

Downloading the configuration

After replacing or renewing certificates, the configuration must be downloaded to the relevant security modules.

After replacing or renewing CA certificates, the configuration must be downloaded to all security modules.

Note

Current date and current time of day on the security modules

When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

Note

Character set of certificates

Certificates are always stored in the ASCII character set. If a certificate contains characters that do not exist in the ASCII character set, the certificate is stored with the UTF-8 character set. This is not possible for SCALANCE S V2 modules.

Global certificate manager

The following functions are available in the certificate manager in the global security settings:

- Import of new certificates and certificate authorities.
- Import of SSL certificates (343-1 Adv. / CP 443-1 Adv. only), e.g. for FTP communication.
- Export of the certificates and certificate authorities used in the project.
- Renewal of expired certificates and certificate authorities.
- Replacing existing certificate authorities.
- Addition of trusted certificates and certificate authorities.
- Deleting manually imported certificates.

Double-click on the "Certificate manager" entry in the global security settings.

In the individual tabs, you have the following commands available in the shortcut menu:

Command	Meaning
Import / Export	Import / export of certificates. The following formats are permitted: *.cer (certificate only) *.crt (certificate only) *.pem (certificate only) *.p12 (certificate and corresponding private key)
Displays	Opens the certificate dialog of Windows where you see an overview of all certificate data. For the certificate to be displayed as valid, install it via the "Install certificate..." button of the "General" tab in the Windows certificate store. Appropriate Windows user rights are required to install the certificate.
Renew (only in the "CA" and "Device certificates" tabs)	Opens the "Renew certificate" dialog in which you can have a new certificate created by STEP 7 when necessary, for example with compromised certificates.
Replace (only in the "CA" tab)	Opens the "Replace certificate" dialog in which you can replace an existing certificate with a new one.
Delete	Deletes a certificate in the "Trusted certificates and root certification authorities" tab.

Local certificate manager

Certificates that were imported via the certificate manager in the global security settings are not automatically assigned to the corresponding modules. Imported certificates must be included in the list of trustworthy partner certificates manually via the entry "Certificate manager" in the local security settings. Certificates generated by STEP 7 such as SSL certificates or VPN group certificates are automatically assigned to the corresponding modules and do not need to be assigned using the local security settings.

Before certificates can be referenced in the program block for Secure Communication, these certificates must be assigned to the security module as device certificates via the local certificate manager. After selecting a table cell, you can either create a new certificate using the "Add" button or use an existing certificate of the project using the check mark symbol. For access to existing certificates of the project and for signing a new certificate by a certification authority, the check box "Use global security settings for the certificate manager" must be activated. To make the assigned certificate known to the partner module, this certificate must be entered in the list of trustworthy partner certificates after import.

Certificate authorities

"CA" tab

The following certification authorities are displayed

- CA certificates of a project: When you create a new project, CA certificates are generated for the project that use different hash algorithms for the certificate signature. CA certificates for projects are always loaded on the security modules belonging to them. The SSL certificates and OPC UA client/server certificates for the individual security modules are derived from the CA certificates.
- CA group certificates: When you create a new VPN group, a CA certificate is generated for the VPN group. The VPN group certificates of VPN group subscribers are derived from this certificate..

Device certificates

"Device certificates" tab

Display of the device-specific certificates generated by the certification authorities for modules. These include:

- SSL certificate of a module: An SSL certificate that is derived from a CA certificate of the project is generated for each module that you create. SSL certificates are used for authentication during secure communication between PG/PC and module when downloading the configuration.
- OPC UA client/server certificate of the module: Depending on the configured OPC UA client/server function of the CP 443-1 OPC UA, an OPC UA client/server certificate is generated that is used for authentication with the relevant communications partner.
- VPN group certificate of a module: A VPN group certificate is also generated for each module for each VPN group in which it is located.

Trusted certificates and root certification authorities

"Trusted root certification authorities" tab

Display of the third-party certificates imported into STEP 7. Server certificates can be imported for example from external FTP servers, project certificates from other STEP 7 projects and certificates required for the external services such as dyn.DNS.

After the import, certificates must be assigned to the corresponding modules using the local security settings. For further information, refer to the section Overview of certificates (Page 728).

Renewing certificates

Meaning

In this dialog, you renew CA certificates and device certificates.

How to access this function

1. Right-click on a list entry in the certificate manager.
2. Select the "Renew" entry in the shortcut menu.
3. Decide whether or not the new certificate will be self-signed or signed by a certificate authority.
4. If the certificate is to be signed by a certificate authority, select the certificate authority to be used with the "Select" button. Only certificate authorities stored in the certificate store of the current project can be selected.
5. Depending on the certificate, enter the following parameters in the corresponding input fields:

Parameter	Meaning
Common name of subject	Holder of the certificate. The common name of subject can contain no more than 35 characters. The displayed ID is not included in this count.
Signature	Algorithm used by the certification authority for signing the certificate. When a certificate with a SHA-256 signature from a V14 SP1 project is renewed in a V14 project, a certificate with an SHA-1 signature is always generated.
Valid from	The validity period of the certificate
Valid to	
Usage	Value that is entered in the "KeyUsage" and "ExtendedKeyUsage" extensions of the standard X.509 V3 for digital certificates.
Subject Alternative Name (SAN)	Depending on the certificate to be renewed, the alternative name of the certificate owner is displayed with an adaptable name type and value.

Replacing certificates

Meaning

In the "Replace certificate" dialog replace an existing certificate with a new one.

How to access this function

1. Right-click on the list entry of a certificate.
2. Select the "Replace" entry in the shortcut menu.
3. The "Replace certificate" dialog opens.

All certificates listed in the "Certificates involved" table are derived once again. This means that the CA group certificate of an already configured VPN group can be replaced in the project by the CA group certificate of a different project. The VPN group certificates for the VPN group members are therefore derived from the same CA group certificate in both projects.

After making changes in the certificate manager, download the configuration to all security modules affected.

Managing users and roles

Rules for user names, roles and passwords

Which rules apply to user names, role names and passwords?

When creating or modifying a user, a role or a password, remember the following rules:

Table 10-3 Rules for user management

Permitted characters	The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()*+,-./:;<=>?@ [\]_{|}~^
Characters not allowed	" ' `
Length of the user name (authentication method "password")	1 to 32 characters
Length of the user name (authentication method "RADIUS")	1 to 255 characters
Length of the password	8 to 32 characters
Length of the role name	1 to 32 characters
Maximum number of users per project	128

Maximum number of users on a security module (number of users that are assigned a role with module rights for the security module)	32 + 1 administrator when creating the project
Maximum number of roles per project	126
Maximum number of roles on a security module (number of roles that are assigned module rights for the security module and that are assigned to users)	37

Note

User names and passwords

As an important measure for increasing security, always make sure that user names and passwords are as long as possible and include special characters, upper and lowercase letters and numerals.

Using password policies, you can tighten the restrictions listed above for passwords even further. How to define password policies is described in the section:

Configuring password policies (Page 742)

Password strength

When a new password is entered, its password strength is checked. The following levels are distinguished for the password strength:

- Very weak
- Weak
- Medium
- Good
- Strong
- Very strong

Create users

Meaning

The security functions configured in STEP 7 are protected from unauthorized access by a separate user management. Before you can access the global and local security settings of security modules, you need to log in to the security configuration as a user.

Creating the first user in the project

After creating the first security module in the project, you first need to create a user. To do this, in the local security settings of the created security module, click the "User login" button under the "Security properties" entry and enter the login data of the user you want to create. You will then be logged in as the created user and the user is assigned the system-defined "Administrator" role. This role includes all configuration and module rights.

Upgrading a project to V14 SP1

If the STEP 7 project was created as a V14 project, the dialog for the user logon contains the check box "Upgrade project". If you select this check box, the project will be upgraded to V14 SP1 the next time a user logs on to the security configuration. V14 SP1 contains VPN settings with higher security, configurable VPN profiles and firewall settings for IP routing via the backplane bus. The user that upgrades the project to V14 SP1 by logging on to the security configuration must have the configuration right "Configure security". After upgrading, the project can no longer be opened with V14 and the check box can no longer be disabled. If a non-security relevant function is already being used in the project that is only available as of V14 SP1, the box "Upgrade project" is already enabled and cannot be disabled. The non-security relevant pert of the project was then already upgraded to V14 SP1. In this case, to be able to work on the security configuration the part of the project relevant for security must also be upgraded to V14 SP1. This requires a logon of a user with the configuration right "Configure security".

When adding the following modules available as of V14 SP1, the project must be upgraded to V14 SP1.

- CP 1543-1 V2.1
- CP 1243-1 BX30
- CP 1242-7 KX31
- CP 1243-7 LTE
- CP 1243-8 IRC
- TIM 1531 IRC
- TIM 3V-IE
- TIM 3V-IE Advanced
- TIM 3V-IE DNP3
- TIM 4R-IE
- TIM 4R-IE Standalone
- TIM 4R-IE DNP3
- TIM 4R-IE DNP3 Standalone

Creating users in the user management

When you are logged in as a user in the security configuration, you can create further users or delete users with the "User management" entry in the global security settings.

Note

Users with the "Administrator" role

There must always be at least one user with full configuration rights within a project. The administrator that is created automatically when you first enable the security functions in the project can only be deleted if at least one other user exists with the system-defined role "Administrator".

The following parameters are available in user management in the "User" tab:

Table 10-4 Information in the "User" tab

Parameter	Meaning
User name	Name of the user to be created. Click on the "Add new user" entry in the "User name" column to create a new user.
Password (only with the "Password" authentication method)	Entry of the password for the user. When it is entered, the password strength is checked. For more detailed information on password strength, refer to the following section: Rules for user names, roles and passwords (Page 732)
Authentication method	• **Password**: Use this authentication method for users that edit and download the STEP 7 Security project and that need to run diagnostics on the security module. The authentication of the user is performed by the security module when user-specific IP rule sets are activated. • **RADIUS** (only for SCALANCE S as of V4): The authentication of the user is performed by a RADIUS server when user-specific IP rule sets are activated. The password of the user is not configured in STEP 7 when using this authentication method but must be stored on the RADIUS server. Only use this authentication method for users that only need to log on to the Web page of a security module. A user with the "RADIUS" authentication method cannot log on to STEP 7 Security projects.
Role	Selecting a system-defined or user-defined role.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user logged on to the Web page for user-specific IP rule sets of SCALANCE S modules is automatically logged off. The time entered here starts after the logon and after renewing the session on the Web page of the security module. • Default setting: 30 minutes • Minimum value: 5 minutes • Maximum value: 480 minutes
Comment	Entry of optional comments.

Creating roles

Overview

You can assign a system-defined or a user-defined role to a user. Specify the module rights of a user-defined role for each security module.

System-defined roles

The system-defined roles listed below are predefined. Certain rights are assigned to the roles that are the same on all modules and that the administrator can neither change nor delete.

- Administrator
  Default role when creating a security configuration.
  Unlimited access rights to all configuration data and all security modules.
- Standard
  Role with restricted access rights.
- Diagnose
  - Read access to configurations.
  - Read access to the security module in the "Online" mode for testing and diagnostics.
- Remote-Access
  No rights except for logging on to the Web page for user-specific firewall rule sets.
- administrator (radius)
  Role that can be used to activate user-specific IP rule sets with authentication using a RADIUS server.
  Access rights to all configuration data except SNMP MIBs.
- radius
  Role that can be used to activate user-specific IP rule sets with authentication using a RADIUS server.
  Read-only access.

You will find a detailed list of the configuration and module rights assigned to the system-defined roles "Administrator", "Standard" and "Diagnostics" in tables 1-3 to 1-7 of the section Managing rights (Page 737).

For more detailed information on user-specific IP rule sets, refer to the following section: AUTOHOTSPOT

For more detailed information on authentication using a RADIUS server, refer to the following section: AUTOHOTSPOT

User-defined role

In addition to the system-defined roles, you can create user-defined roles. For a user-defined role, select the configuration or module rights and specify the appropriate module rights for every security module used in the project. You manually assign the user-defined roles to the relevant user.

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

Table 10-5 Information in the "Roles" tab

Parameter	Meaning
Role	Freely selectable role name. Double-click on the "Add new role" entry to create a new user-defined role. You can then set the rights for the created role.
Description	Specifying the system-defined role With user-defined roles, the "User-defined role" character string is displayed.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user with the assigned role is automatically logged off from the Web page for user-specific IP rule sets of SCALANCE S modules. The time entered here starts after the logon and after renewing the session on the Web page of the security module. • Default setting: 30 minutes • Minimum value: 5 minutes • Maximum value: 480 minutes
Comment	Entry of additional, optional comments.

Note

Deleting roles

A user-defined role can only be deleted when it is no longer assigned to any user. If necessary, assign the user a different role.

System-defined roles cannot be deleted.

Managing rights

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

Creating and assigning a user-defined role

1. Double-click on the "Add new role" entry.
2. Enter a name for the role and, if applicable, specify the maximum session time after which users with the assigned role are automatically logged off from the Web page for user-specific IP rule sets.

3. If necessary, select the system-defined role whose rights will be used as the template for the user-defined role from the drop-down list labeled "<Copy rights from>". User-defined roles cannot be selected from the drop-down list.
   Result: In the list of rights of the user roles, the rights are selected that are assigned to the selected system-defined role.
4. For each security module, enable or disable the rights to be assigned to the user-defined role.
5. Assign the role to a user in the "User" tab.

Configuration rights

Configuration rights are not module dependent and control the rights for configuration in STEP 7.

Depending on the user type, the following configuration rights are available for selection:

Table 10-6 Configuration rights

Configuration right	Administrator	Standard	Diagnose
Diagnose security	x	x	x
Configure security	x	x	-
Managing users and roles	x	-	-

Module rights

Module rights are configured per module. The "Service" column shows the service to which the particular right relates. With the "Copy rights" and "Paste rights" commands in the shortcut menu, you can transfer the rights from one module to another.

Depending on the user type, the following module rights are available for selection:

Table 10-7 Module rights CP 343-1 Advanced / CP 443-1 Advanced

Right within the service	Administrator	Standard	Diagnose	Service

* To be able to use the function, the module right "Web: Access Web diagnostics and CP file system" must be enabled as well.

** To be able to use the function, the module right "FTP: Read files from CP file system" must be enabled as well.

*** To be able to use the function, the module right "FTP: Write files to CP file system" must be enabled as well.

**** To use the function, the configuration right "Security diagnostics" must also be enabled.

Setting module rights before and after creating the security modules

Within a user-defined role, the module rights for each security module are defined separately. If a security module was created before this role was added and module rights within a role need to be set, STEP 7 presets the module rights for the security module according to the selected rights template. The preset module rights can then be adapted when adding the role. If a security module was created after adding a role, no rights are preset for this security module. In this case, you will need to edit an existing role and set all the module rights yourself for the security module.

You can also transfer existing module rights to another module by copying and, if necessary, adapting them there. To do this, select a module in the shortcut menu in the module rights and select the "Copy rights" or "Paste rights" menu command.

Configuring password policies

Meaning

Using the password policies, specifications can be defined that need to be taken into account when assigning passwords to new users.

How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Password policies" tab in User management.

After selecting a check box, the corresponding policy is active and can, if necessary, be adapted using the relevant input box.

The minimum number of numbers and special characters together must not be longer than the minimum password length.

Parameter	Meaning
Minimum password length	Minimum number of characters that passwords are required to contain. The corresponding check box is enabled as default and cannot be disabled. • Minimum value: 8 characters • Maximum value: 32 characters
Minimum number of digits	Minimum number of digits that passwords are required to contain. • Minimum value: 1 digit • Maximum value: 32 digits
Minimum number of special characters	Minimum number of special characters that passwords are required to contain. A special character is any character that is neither a letter nor digit. • Minimum value: 1 special character • Maximum value: 32 special characters

Parameter	Meaning
Number of user passwords blocked for re-use	Number of the most recently used passwords that are not available for use as a new password if the password is changed. • Minimum value: 1 password • Maximum value: 10 passwords
At least one uppercase and lowercase character	If you select this check box, passwords must contain at least one uppercase and one lowercase letter.

Authentication using a RADIUS server

Module-specific function

This function is available only for SCALANCE S V4 modules or higher, refer to:

AUTOHOTSPOT in the section "SCALANCE S".

Generating configuration data for SCALANCE M modules

Meaning

You can generate the VPN information for the assignment of parameters to a SCALANCE M using STEP 7. For this to be possible, the module must be in at least one VPN group with a security module or a SOFTNET Security Client. With the generated files, you can then configure the SCALANCE M using the Web Based Management of the device.

Generated files

The following file types are generated:

- Export file with the configuration data
  - File type: *.txt file in ASCII format
  - Contains the exported configuration information for the SCALANCE M including information on the additionally generated certificates.
- VPN group certificates of the module
  - File type of the private key: *.p12 file
  - The file contains the module certificate and the key material.
  - Access is password protected.
- CA certificates of VPN groups
  - File type: *.cer file

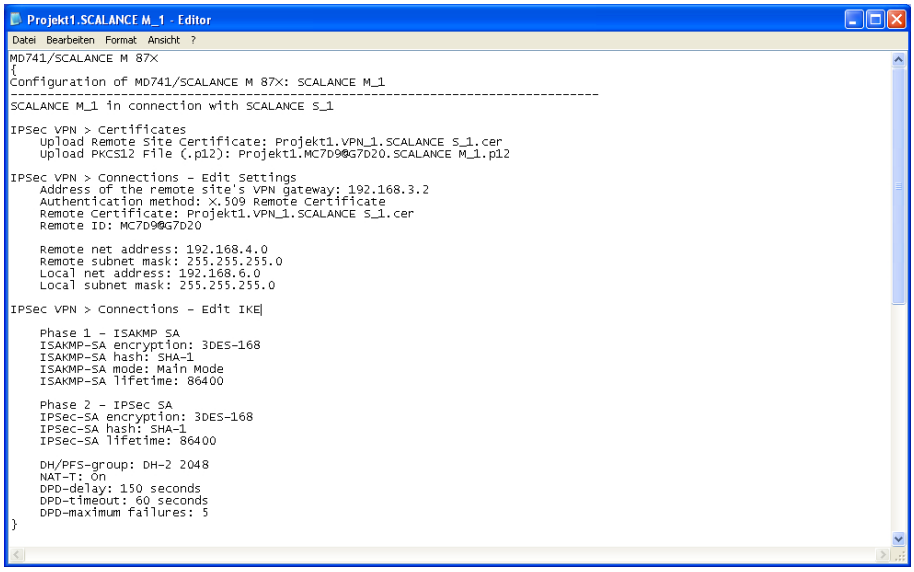

Figure 10-4 SCALANCE M configuration file

Note

No transfer to the SCALANCE M module

Configuration files are not transferred to the SCALANCE M module. An ASCII file is generated with which you can configure the VPN-relevant properties of the SCALANCE M. To allow this, the SCALANCE M must be located in at least one VPN group with another security module or a SOFTNET security client.

Note

Protecting exported configuration files from unauthorized access

Configuration files for SCALANCE M exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

Follow the steps below

1. Select the module of the type "SCALANCE M".
2. In the local security settings, select the entry "SCALANCE M configuration".
3. Select the "Generate SCALANCE M files" check box and select a storage location for the configuration files.
4. Specify a password for the encryption of the VPN group certificate by using the project name as the password or assigning a password of your own.
5. Compile the configuration of the SCALANCE M module.

Result: The files (.txt file and certificates) are stored in the folder you specify.

Generating configuration data for security devices

Meaning

A security device serves as substitute for a device from another manufacturer.

A security device can have the function of a VPN device that serves as substitute for a VPN device from another manufacturer. You can generate the VPN information for the assignment of parameters to a VPN device using STEP 7. For this to be possible, the VPN device must be in at least one VPN group with a security module. With the generated files, you can then configure the VPN device.

Note

Protecting exported configuration files from unauthorized access

Configuration files for VPN devices exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

Follow the steps below

1. Select the security device to be edited.
2. Select the "VPN device" entry in the local security settings.
3. Select the "Generate files of the VPN device" check box.
4. Select the mode of the VPN device from the "VPN mode" drop-down list. This selection is only possible when the VPN device is located in a VPN group.
   - VPN client: The VPN device can adopt the following role:
     Initiator The VPN device actively attempts to establish a VPN connection to the partner.
   - VPN server: The VPN device can adopt the following roles:
     Initiator/Responder: The VPN device actively attempts to establish a VPN connection to the partner. The receipt of requests for VPN connection establishment is also possible. This role is selected as default in the VPN connection properties.
     Responder: The receipt of requests for VPN connection establishment is possible.
   - NCP VPN client for Android (as of version 2.1): The VPN device with installed software NCP Secure VPN Client for Android actively attempts to establish a VPN connection to the partner.
5. Select a storage location for the configuration files.
6. Specify a password for the encryption of the VPN group certificate by using the project name as the password or assigning a password of your own.
7. If you have configured the VPN device as a VPN client:
   - Specify the corresponding file types in the "Exported certificates and keys" entry.

8. If you have configured the VPN device as a VPN server:
   - In the box "VPN server address (WAN IP address)" enter the WAN IP address at which the VPN server can be reached by the initiator of the VPN connection.
   - Specify the corresponding file types in the "Exported certificates and keys" entry.
   - In the entry "Subnets reachable through tunnel", enter the subnets and/or IP addresses for which tunnel communication will be released.
9. If you have configured the VPN device as an NCP secure VPN client:
   - In the entry "NCP Secure VPN client settings", enter the storage path on the NCP secure VPN client.

Note

Releasing subnets and subscribers with a VPN connection between NCP secure VPN client and SCALANCE S

The local internal subnet of SCALANCE S modules is released for tunnel communication as default. For this reason this is always entered as the first released subnet in the file generated for the NCP secure VPN client. Since NCP secure VPN client supports a maximum of 5 entries for released subnets / subscribers, as default the local internal network of the SCALANCE S module and the first 4 table entries from the entry "Nodes" in the NCP secure VPN client are released. To release other subnets and subscribers for tunnel communication, the file generated by STEP 7 must be suitably adapted.

Configuring interfaces for SCALANCE S modules

Overview

You will find information on configuration interfaces of SCALANCE S modules in AUTOHOTSPOT of the section "SCALANCE S". The information contained here deals with the following configuration options:

- Mode (bridge mode / routing mode / ghost mode (only for SCALANCE S602 as of V3.1)): Setting the operating mode (Page 841)
- IP address parameters: Configuring IP address parameters (Page 842)
- Port settings (only for SCALANCE S as of V3): Configuring port mode (Page 843)
- Settings for the Internet Service Provider (ISP) if one of the interfaces is operated using PPPoE (only for SCALANCE S as of V3): Configuring an Internet connection (Page 844)
- DNS (only for SCALANCE S as of V3): Configuring DNS (Page 846)
- Dynamic DNS (only for SCALANCE S as of V3): Configuring dynamic DNS (Page 846)
- LLDP (only for SCALANCE S as of V4 in routing mode): Configuring LLDP (Page 849)
- Media redundancy in ring topologies (e.g. MRP client), (only for SCALANCE S627-2M as of V4 in routing mode): AUTOHOTSPOT

For more information on special features of the Ghost mode, refer to the following section: Special features of the ghost mode (Page 852)

The configuration of the interfaces of CPs is described in the sections dealing with the CPs.

Setting up a firewall

Overview of the firewall

Meaning

The firewall functionality of the security modules is intended to protect networks and stations from third-party influence and interference. This means that only certain, previously specified communications relations are permitted. The firewall discards invalid frames without sending a response.

To filter the data traffic, IP addresses, IP subnets, services or MAC addresses can be used. You can also set a bandwidth limitation.

The firewall functionality can be configured for the following protocol levels:

- IP firewall with stateful packet inspection (layer 3 and 4)
- Firewall also for Ethernet "non-IP" frames according to IEEE 802.3 (layer 2)

With security modules capable of VPN, the firewall can also be used for the encrypted data traffic (IPsec tunnel). With the SCALANCE S602 Security module, the firewall can only be used for unencrypted data traffic.

Firewall rules

Firewall rules describe which packets in which direction are permitted or forbidden. IP rules affect all IP packets of layer 3 or higher. MAC rules only affect frames lower than layer 3.

Types of firewall rules

- Global firewall rule sets: Global firewall rule sets can be assigned to several security modules at the same time. Global firewall rule sets are configured in the global security settings.
- Local firewall rules: Local firewall rules are configured in the local security settings of a security module.
- User-specific IP rule sets (only for SCALANCE S as of V3): User-specific IP rule sets can be assigned to individual or several security modules at the same time. User-specific IP rule sets are configured in the global security settings and assigned there to one or more users.
  SCALANCE S as of V4 (RADIUS): User-specific IP rule sets can be assigned individual or multiple users as well as individual or multiple roles.

Service definitions

With the aid of service definitions, you can also define firewall rules clearly in a compact form. Service definitions are configured in the global security settings and can be used in the global, local and user-specific firewall rules.

Adapting standard rules for IP services

For SCALANCE S modules V3 or higher, you can adapt service-specific firewall rules that are set as default for the interfaces of the security modules. You will find information on configuring these firewall rules in Adapting standard rules for IP services (Page 868) of the section "SCALANCE S".

Automatically generated firewall rules for CP connections

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Which firewall rules are generated automatically is described in the following sections.

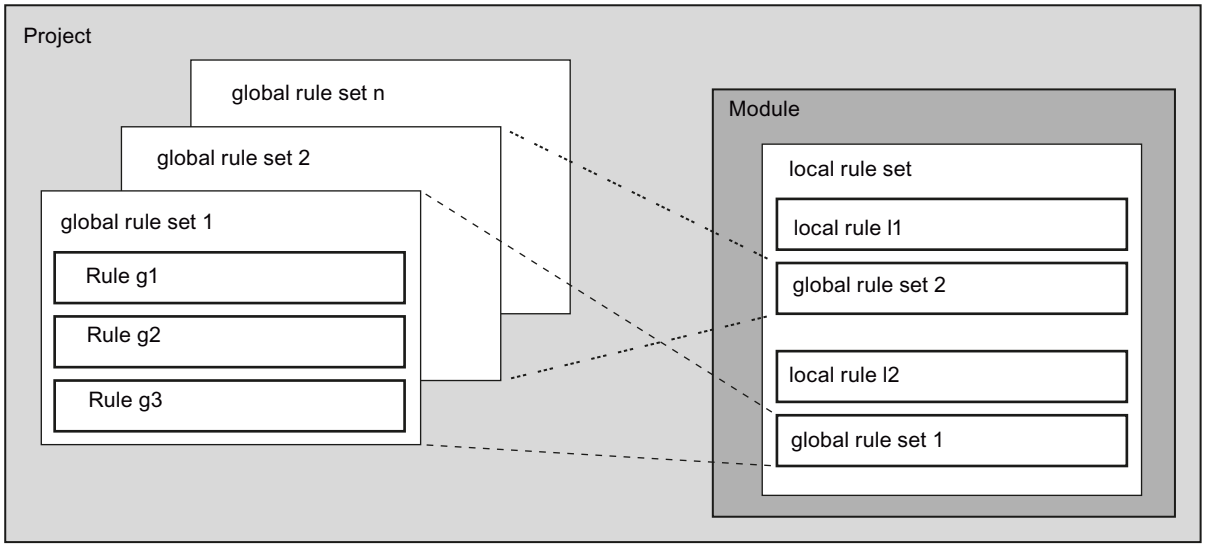
- For S7-300 CPs/S7-400 CPs/PC CPs: Connection-related automatic firewall rules (Page 900) in the section "Security for S7-300 / S7-400 / PC CPs".
- For S7-1200-/S7-1500-CPs: Connection-related automatic firewall rules (Page 913) in the section "Security for S7-1200 / S7-1500 CPs".

Enabling the firewall

Firewall functionality for a specific security module is controlled in the local security settings using the "Enable firewall" check box. If the check box is enabled, the firewall can be configured and is effective following the download. For a security module that is a member of a VPN group, the "Enable firewall" check box is activated by default and cannot be deactivated. After switching to advanced firewall mode, it is not possible to switch back to standard mode. For more information about the standard and advanced firewall modes, refer to the section:

Overview of local firewall rules (Page 770).

Global firewall rule sets



Application

Regardless of the module, global firewall rule sets are configured in the global security settings. A firewall rule set consists of one or more firewall rules and is assigned to the individual security modules.

In the global firewall rule sets, a distinction is made between the following:

- IP rule sets
- MAC rule sets

The following schematic illustrates the relationship between globally defined rule sets and locally used rule sets.

Configuring

When configuring global firewall rules, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network.

When are global IP and MAC firewall rules useful?

Global firewall rules are useful if you want to define identical filter criteria for communication with several security modules.

Note

Assigning firewall rule sets with incompatible firewall rules

For a security module, only the firewall rules from firewall rule sets are adopted correctly if the security module supports them. A firewall rule contained in a global firewall rule set with the direction "From: External" or "To: Any" is, for example not assigned to a CP 1628. The other firewall rules of the global firewall rule set are adopted if the CP 1628 supports them.

Global firewall rule sets - conventions

Global firewall rule sets are used locally

The following conventions apply when creating a global set of firewall rules and when assigning it to a module:

- Configuration view
  Global firewall rule sets are configured in the global security settings.
- Priority
  As default, locally defined rules have a higher priority than the global IP and MAC firewall rule sets. Newly assigned global IP and MAC firewall rule sets are therefore initially entered at the bottom of the local rule list.
  The priority can be changed by changing the position in the rule list.
- Entering, changing or deleting rule sets
  Global firewall rule sets cannot be edited in the local rule list of the firewall rules in the module properties. They can only be displayed there and positioned according to the required priority.
  It is not possible to delete a single rule from an assigned rule set in the local security settings. Only the entire rule set can be removed from the local list of rules. The firewall rule sets in the global security settings remain unaffected.

Creating global firewall rule sets

How to access this function

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "IP rule sets" or "MAC rule sets".
   Result: The previously created IP rule sets or MAC rule sets are displayed under the selected entry.
2. Double-click on the entry "Add new IP rule set" or "Add new MAC rule set".
   Result: The created firewall rule set is displayed with an automatically assigned number below the entry "IP rule sets" or "MAC rule sets".
3. Double-click on the created firewall rule set.
   Result: In the working area the assignment dialog for firewall rule sets is displayed. The selected firewall rule set is selected in the "Rule set" drop-down list. The required security modules can be assigned to this, see section Assigning global firewall rule sets (Page 751). In the local security settings, the configurable properties of the firewall rule set are displayed.

4. Enter the following data in the "General" entry in the local security settings:
   - Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
   - Description (optional): Enter a description of the global rule set.
5. In the local security settings in the entry "Firewall rule set" enter the firewall rules in the list.
   Note the parameter description in the following sections:
   For IP rule sets: Defining IP packet filter rules (Page 771)
   For MAC rule sets: Defining MAC packet filter rules (Page 775)
   To switch over to the local security settings of another firewall rule set, select this from the "Rule set" drop-down list of the assignment dialog or double-click on the corresponding entry in the global security settings.

Result

You have created the global firewall rule set and can now assign this to the required security modules.
Note the descriptions in the following section:

Assigning global firewall rule sets (Page 751)

Assigning global firewall rule sets

Requirement

You have enabled the advanced firewall mode for the security modules you want to assign to a firewall rule set.

Procedure

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "Assign module to a firewall rule set".
2. From the "Rule set" drop-down list, select the rule set to which you want to assign the security module.
   In the right-hand table, you will see the security modules that you can assign to the selected firewall rule set. In the left-hand table, you will see the security modules already assigned to the selected firewall rule set.
3. In the "Available modules" area, select the security modules you want to assign to the selected rule set.
4. Click the "<<" button to assign the selected modules to the selected rule set.

Result

The global rule set is used by the assigned security modules as a local rule set and appears automatically at the end of the list of firewall rules in the local security settings.

Exporting and importing global firewall rule sets

Meaning and function

Global IP rule sets and global MAC rule sets can be exported from STEP 7 in the XLSX format and imported into STEP 7. Per firewall rule set an XLSX file is created when you export.

The export and import provides the option of exchanging firewall rule sets between different STEP 7 projects. Exported firewall rule sets can also be edited in Microsoft Excel® and then imported into STEP 7 again. This simplifies the making of mass changes.

Firewall rule sets exported from STEP 7 are largely compatible with the Security Configuration Tool (SCT). Firewall rule sets exported from from the Security Configuration Tool are fully compatible with STEP 7.

Note

Restrictions when importing firewall rule sets from STEP 7 into the Security Configuration Tool

In SCT, IPv6 firewall rules and ICMPv6 services are not supported. During import firewall rules identified as IPv6 firewall rules and ICMPv6 services are ignored.

As the bandwidth limit a maximum of 100 Mbps are permitted in SCT. During import firewall rules with more than 100 Mbps are ignored.

Exporting firewall rule sets from STEP 7

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets".
2. Double-click on the "Overview" entry.
   Result: The IP rule sets and MAC rule sets that exist in STEP 7 are displayed in the working area.
3. If you do not want to export all firewall rule sets, enable the check box of the firewall rule sets to be exported.
4. Click the button.
5. In the "Export firewall rule sets" dialog, select whether all firewall rule sets, only the selected firewall rule sets or all firewall rule sets supported by SCT will be exported. With the third option firewall rule sets containing firewall rules containing communication directions not supported by SCT are excluded from the export.
6. Enter a path on which the firewall rule sets will be saved and click the "Export" button.
   Result: Per firewall rule set an XLSX file was created. The XLSX files were named with the name of the corresponding firewall rule set and according to the date and time of the export.

Importing firewall rule sets in STEP 7

Exported firewall rule sets can be edited prior to importing them. Refer to the information in the section "Requirements for firewall rule sets to be imported".

Follow the steps outlined below to import firewall rule sets in STEP 7:

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets".
2. Double-click on the "Overview" entry.
   Result: The IP rule sets and MAC rule sets that exist in STEP 7 are displayed in the working area.
3. Click the button.
4. If firewall rule sets of the same name are to be overwritten, select the "Overwrite existing firewall rule sets" check box.
   Note: For the comparison between the firewall rule sets existing in STEP 7 and the XLSX files, only the name of the firewall rule sets is used. The information about the date and time of the XLSX files is ignored.
5. Select the XLSX files to be imported. Multiple selection is possible.
6. Click the "Import" button.
   Result: The firewall rule sets of the selected XLSX files have been imported in STEP 7.

Structure of exported IP rule sets

For every IP rule set exported from STEP 7, an XLSX file is created with the following table sheets:

- IP Ruleset: Contains the IP packet filter rules of the IP rule set
- IP Services: Contains the IP services used in packet filter rules of the IP rule set. IP services in the IP service groups used are also displayed.
- ICMP Services: Contains the ICMP services used in packet filter rules of the IP rule set. ICMP services in the IP service groups used are also displayed.
- IP Service Groups: Contains the IP service groups used in IP packet filter rules of the IP rule set. The corresponding IP and ICMP services are displayed for every IP service group.

Structure of exported MAC rule sets

For every MAC rule set exported from STEP 7, an XLSX file is created with the following table sheets:

- MAC Ruleset: Contains the MAC packet filter rules of the MAC rule set
- MAC Services: Contains the MAC services used in MAC packet filter rules of the MAC rule set. MAC services in the MAC service groups used are also displayed.
- MAC Service Groups: Contains the MAC service groups used in MAC packet filter rules of the MAC rule set. The corresponding MAC services are displayed for every MAC service group.

Conventions for rule sets to be imported

The following conventions apply to firewall rule sets to be imported in STEP 7:

- The files have the file extension *.XLSX and the corresponding Office Open XML format.
- If the name of the XLSX file is longer than 128 characters, the rule set will be created in STEP 7 with a standard name.
- The names of the columns within the table sheets must not be changed, the order of the columns may, however, be changed.
- The names of the table sheets must not be changed, the order of the table sheets may, however, be changed.

Permitted parameter values for IP rule sets to be imported

The following values may be entered in the table columns of XLSX files for IP rule sets. Upper and lower case characters are not taken into account when the notation is checked.

Table 10-17 Permitted parameter values for table sheet "IP Ruleset"

Action	From	To	IPv6*	Source IP address	Destination IP Address	Service	Bandwidth	Logging	Stateful	Comment
• Allow • Drop	External	• Internal • DMZ • Tunnel • Any • Station • Backplane **	• True • False	[free text with max. 255 characters]	[free text with max. 255 characters]	[free text with max. 128 characters]	[Possible values: 0.001… 1000]	• True • False	• True • False	[free text with max. 255 characters]
	Internal	• External • Internal • DMZ • Tunnel • Any • Station								
	DMZ	• External • Internal • Tunnel • Any								
	Tunnel	• External • Internal • DMZ • Tunnel • Any • Station • Backplane **								

Action	From	To	IPv6*	Source IP address	Destination IP Address	Service	Bandwidth	Logging	Stateful	Comment
	Any	• External • Internal • DMZ • Backplane**								
	Station	• External • Internal • Tunnel • Backplane**								
	Backplane**	• Any • External • Station • Tunnel								

* This column is optional. If the column does not exist when importing into STEP 7, the default value "False" is used in STEP 7.

** Only possible with a V14, SP1 project

Table 10-18 Permitted parameter values for table sheet "IP Services"

Name	Protocol	Source Port	Destination Port
[free text with max. 128 characters]	• UDP • TCP • All	[free text with max. 32 characters]	[free text with max. 32 characters]

Table 10-19 Permitted parameter values for table sheet "ICMP Services"

Name	ICMPv6*	Type	Code
[free text with max. 128 characters]	True	• PacketToBig • EchoRequest • EchoReply • MulticastListenerQuery • MulticastListenerReport • V2MulticastListenerReport • MulticastListenerDone • RouterSolicitation • RouterAdvertisement • NeighbourSolicitation • NeighbourAdvertisement • RedirectMessage • InverseDiscoverySolicitation • InverseDiscoveryAdvertisement • HomeDiscoveryRequest • HomeDiscoveryReply • MobilePrefixSolicitation • MobilePrefixAdvertisement • CertificationPathSolicitation • CertificatePathAdvertisement • IcmpMessagesUtilizedBySeamoby • MulticastRouterAdvertisement • MulticastRouterSolicitation • MulticastRouterTermination • FmIpV6 • RplControl	NoCode
		RouterRenumbering	• RouterRenumberingCommand • RouterRenumberingResult • SequenceNumberReset
		IcmpNodeInformationQuery	• ContainsIpV6

IP services

Defining IP services

How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".

Procedure

Using the definition of IP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can also be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

Parameters for IP services

You define the IP services using the following parameters:

Table 10-24 IP services: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Name	Name for the service that is used as identification in the rule definition or in the group. The names of pre-defined services cannot be changed.	• Name must start with a letter. • Name must not contain any special characters. • Name must not be redundant.
Protocol	Selection of the protocol type	• TCP • UDP • TCP+UDP • All

Parameter	Meaning/comment	Available options / ranges of values
Source port	Filtering is based on the port number specified here; this defines the service access at the frame sender.	With the protocol selection "TCP+UDP", it is not possible to specify a port. Examples: *: Port is not checked 20 or 21: FTP service
Destination port	Filtering is based on the port number specified here; this defines the service access at the frame recipient.	With the protocol selection "TCP+UDP", it is not possible to specify a port. Examples: *: Port is not checked TCP 80: Web HTTP service TCP 102: S7 protocol

Defining ICMP services

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "ICMP" tab.

Procedure

Using the definition of ICMP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

Parameters for ICMP services

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group. The names of predefined ICMPv6 services cannot be modified.	• Name must start with a letter. • Name must not contain any special characters. • Name must not contain more than 20 characters. • Name must not occur more than once
ICMPv6	If you enable this check box, the ICMP service is declared as an ICMPv6 service and you can select an ICMPv6-specific type and code for the service. An ICMPv6 service can only be used in the firewall rule of a security module that supports IPv6.	• Enabled • Disabled (default)
Type	Type of the ICMPv4 or ICMPv6 message.	If the "ICMPv6" check box is deselected, ICMPv4-specific types can be selected. If the check box is selected, ICMPv6-specific types can be selected.
Code	Code of the ICMP type.	Values depend on the selected type.

Creating service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Service groups" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

Follow the steps below

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified IP services to the groups defined in this tab.

Managing service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Group management" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

MAC services

Define MAC services

How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".

Meaning

Using the definition of MAC services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the global or local packet filter rules, you use this name.

Parameters for MAC services

A MAC service definition is formed using protocol-specific MAC parameters:

Table 10-25 MAC services - parameters

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group.	• Name must start with a letter. • Name must not contain any special characters. • Name must not be redundant.
Protocol	Name of the protocol type: • ISO ISO identifies frames with the following properties: Lengthfield <= 05DC (hex), DSAP= userdefined SSAP= userdefined CTRL= userdefined • SNAP SNAP identifies frames with the following properties: Lengthfield <= 05DC (hex), DSAP=AA (hex), SSAP=AA (hex), CTRL=03 (hex), OUI=userdefined, OUI-Type=userdefined • PROFINET IO • As an alternative, a protocol number can be entered. The protocol entries 0800 (hex) and 0806 (hex) are not accepted since these values apply to IP or ARP frames.	• ISO • SNAP • PROFINET IO • 0x (entry of the protocol number)
DSAP	Destination Service Access Point: LLC recipient address	
SSAP	Source Service Access Point: LLC sender address	
CTRL	LLC control field	
OUI	Organizationally Unique Identifier (the first 3 bytes of the MAC address = vendor ID)	
OUI type	Protocol type/identification	

Note

Processing for S7-CPs

Only settings for ISO frames with DSAP=SSAP=FE (hex) are processed. Other frame types are not relevant for S7 CPs and are therefore discarded even before processing by the firewall.

Special settings for SIMATIC NET services

To filter special SIMATIC NET services, please use the following protocol settings:

- DCP:
  PROFINET IO
- SiClock :
  OUI= 08 00 06 (hex) , OUI-Type= 01 00 (hex)

Creating service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Service groups" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

Follow the steps below

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified MAC services to the groups defined in this tab.

Managing service groups

How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Group management" tab.

Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

Overview of local firewall rules

Meaning

Local firewall rules are configured in the local security settings of a security module and apply only to this security module. After enabling the firewall functionality you can either use predefined firewall rules or define firewall rules in the advanced firewall mode.

Using predefined firewall rules

Here, you use simple, predefined rules. You can only enable service-specific rules. The enabled services are allowed for all nodes in the specified direction. You can find detailed information on the definition of firewall rules in this dialog in the following module-specific sections:

- For SCALANCE S: AUTOHOTSPOT
- For S7-300/S7-400/PC CPs: AUTOHOTSPOT
- For S7-1200/S7-1500 CPs: AUTOHOTSPOT

The communication direction "Station" that can be configured for CPs, includes access to the CP and access to the CPU via the CP.

Defining firewall rules in advanced firewall mode

In advanced firewall mode, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network. You enable the advanced firewall mode using the "Activate firewall in advanced mode" check box. In the local security settings, the firewall rules can then be configured in "Firewall" > "IP rules" or "MAC rules". The configuration options available here are described individually in the following section:

For IP packet filter rules: Defining IP packet filter rules (Page 771)

For MAC packet filter rules: Defining MAC packet filter rules (Page 775)

Note

Deactivating the advanced firewall mode not possible

Once you have activated the advanced firewall mode, you can no longer deactivate it.

Adopting predefined firewall rules in the advanced firewall mode

When you switch over to the advanced firewall mode, enabled predefined firewall rules and logging settings are adopted. If, for example, the check box “Allow S7 protocol” is selected in the direction “From external to internal”, in the advanced firewall mode an allow rule with this communication direction and the service “S7” is created automatically.

If predefined logging settings exist for S7-1200 / S7-1500 CPs, in advanced mode these are not shown as firewall rules but under the entry “Firewall > Log settings” where they can be edited.

Configuration limits

Number of firewall rules (advanced firewall mode)	
SCALANCE S as of V3	Maximum of 256
S7-1200/S7-1500 CPs	Maximum of 256
CP 343-1 Adv. / 443-1 Adv.	Maximum of 226
CP 1628	Maximum of 226

Defining IP packet filter rules

Meaning

With IP packet filter rules, you filter according to IP frames, such as TCP, UDP and ICMP.

Within a packet filter rule, you can also fall back on the definitions of the IP services.

Entering IP packet filter rules

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 10-26 IP rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	• Allow Allow frames according to definition. • Drop Block frames according to definition. For firewall rules generated automatically as result of configuring a connection and subsequently adapted manually: • Allow* • Drop* If you change automatically created connection rules, when the "*" option is selected they are not recreated and overwritten by STEP 7.
From / To	Selection of the communications directions for which the rule will apply.	Described in separate sections. • For SCALANCE S modules: IP packet filter directions SCALANCE S (Page 867) • For S7-300/S7-400/PC CPs: IP packet filter directions S7-300-/S7-400-/PC-CPs (Page 898) • For S7-1200/S7-1500 CPs: IP packet filter directions S7-1200 / S7-1500 CPs (Page 911) The communication direction "Station" includes access to the CP and access to the CPU via the CP. The communication direction "Any" includes all the firewall directions supported by the security module at the time of loading. The communication directions "Station", "Backplane bus" (only for CP 1543-1 as of V2.1 with the option "IP routing between communications modules" is classified as trustworthy as default. For communication between trustworthy directions no firewall rules need to be configured.
IPv6	If this check box is selected, you can use a previously defined ICMPv6 service in the firewall rule. For some security CPs, after selecting the check box you can enter additional IPv6 addresses in the "Source IP address" and "Destination IP address" input boxes.	The check box can only be selected and deselected if there are no entries in the "Source IP address" and "Destination IP address" input boxes. If IPv6 is disabled in the local settings of a CP capable of IPv6, you cannot select the "IPv6" check box in the local security settings of the CP and therefore cannot use ICMPv6 services or IPv6 addresses in firewall rules. Existing firewall rules that use IPv6 are shown grayed out if IPv6 is disabled.

Parameter	Meaning/comment	Available options / ranges of values
Source IP address	The firewall rule is applied to the frames whose sender has the IP address specified here. If you do not specify an IP address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	You can find additional information about IP addresses in the IP addresses in IP packet filter rules (Page 777) section. **Configuration options in ghost mode (only for SCALANCE S S602 as of V3.1):** If ghost mode is activated, the IP address of the internal node is dynamically determined by the security module at runtime. Depending on the selected direction, you can select one of the following options in the column "Source IP address" (for direction "From internal to external) or in the column "Destination IP address" (for direction "From external to internal"): • IP address of the internal node: The IP address of the internal node is inserted in the firewall rule by the SCALANCE S. • Limited broadcast: The broadcast IP address 255.255.255.255 is inserted in the firewall rule by the SCALANCE S. • Directed broadcast: The broadcast IP address of the SCALANCE S network is inserted in the firewall rule by the SCALANCE S. A directed broadcast can also be forwarded into the destination network via routers. • Multicast: The multicast address band 224.0.0.0 /24 is inserted in the firewall rule by the SCALANCE S. After selecting this option, as an alternative a specific multicast IP address from the multicast address band can be specified.
Destination IP address	The firewall rule is applied to the frames whose recipient has the IP address specified here. If you do not specify an IP address, the firewall rules applies to all nodes in the communications direction you selected in the "To" column.	
Service	Selection of the IP/ICMP service or the service group to be used. Before you select an ICMPv6 service, you need to select the "IPv6" check box. Note: Before using a predefined service make sure that its predefined parameters meet your requirements. Pay particular attention to the predefined source and destination ports.	The drop-down list box displays the predefined and configured IP services and service groups you can select. These are displayed in the global security settings under "Firewall" > "Services" > "Define services for IP rules".
Bandwidth (Mbps)	Option for setting a bandwidth limitation Can only be entered if the "Allow" action is selected. A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP 343-1 Adv. / CP 443-1 Adv., S7-1200-/S7-1500-CPs: 0.001 ... 100 Mbps CP 1628 and SCALANCE S: 0.001 ... 1000 Mbps For global and user-specific rules: 0.001 ... 1000 Mbps For IP rules with the direction "Backplane bus": 0.001 ... 1 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the S7-1200/S7-1500 CPs, no bandwidth limitation can be specified. For CP 1543-1 V2.1 only one bandwidth limitation can be specified if "Any" is configured for one of the two directions. This does not apply to the combination of directions "Any" and "Station".
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	• Enabled • Disabled (default)

Parameter	Meaning/comment	Available options / ranges of values
Number	Automatically assigned number for the rule. The numbers are recalculated when rules are moved.	
Stateful	If this check box for an IP rule is disabled with the "Allow" action, no firewall states are generated by packets to which the allow rule applies. Firewall states automatically allow the responses to allowed packets. Can only be adapted if the "Allow" action is selected. Configuration of IP rules without firewall states is only possible for SCALANCE S modules as of firmware V3. If the responses to packets that have passed the firewall according to such IP rules should also be allowed, additional IP rules need to be configured for these responses.	For allow rules of SCALANCE S ≥ V3: • enabled (default) • disabled For allow rules of SCALANCE S < V3 and CPs: • enabled (default) Note: The check box is not present for CPs; however, the activated option is always used implicitly for allow rules of CPs. For drop rules: • Disabled (default)
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 10-27 Meaning of the entries in the shortcut menu

Entry in the shortcut menu	Meaning
Delete	This deletes the selected rule or the selected rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.
Move up	Use this button to move the selected rule or selected rule set up one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected rule set down one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with lower priority.
Define service for IP rules	This opens the dialog in which you can manage the IP services and service groups.

Defining MAC packet filter rules

Meaning

With the MAC packet filter rules, you filter according to MAC frames.

Within a packet filter rule, you can also fall back on the definitions of the MAC services.

Entering MAC packet filter rules

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 10-28 MAC rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	• Allow Allow frames according to definition. • Drop Block frames according to definition. For firewall rules generated automatically as result of configuring a connection and subsequently adapted manually: • Allow* • Drop* If you change automatically created connection rules, when the "*" option is selected they are not recreated and overwritten by STEP 7.
From / To	Selection of the communications directions for which the rule will apply.	Described in separate sections. • For SCALANCE S modules: MAC packet filter directions SCALANCE S (Page 867) • For S7-300/S7-400/PC CPs: MAC packet filter directions S7-300-/S7-400-/PC-CPs (Page 898) • For S7-1200/S7-1500 CPs: MAC packet filter directions S7-1200 / S7-1500 CPs (Page 912) The communication direction "Station" includes access to the CP and access to the CPU via the CP. As default, the communication directions "Station" and "Tunnel" are classified as being trustworthy. For communication between trustworthy directions no firewall rules need to be configured.

Parameter	Meaning/comment	Available options / ranges of values
Source MAC address	The firewall rule is applied to the frames whose sender has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	MAC address in the correct format
Destination MAC address	The firewall rule is applied to the frames whose recipient has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "To" column.	
Service	Selection of the MAC service or the service group to be used. Note: Before using a predefined service make sure that its predefined parameters meet your requirements.	The drop-down list box displays the predefined and configured services and service groups you can select. These are displayed in the global security settings under "Firewall" > "Services" > "Define services for MAC rules".
Bandwidth (Mbps)	Option for setting a bandwidth limitation. Can only be entered if the "Allow" action is selected. A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP 343-1 Adv. / CP 443-1 Adv., S7-1200-/S7-1500-CPs: 0.001 ... 100 Mbps CP 1628 and SCALANCE S: 0.001 ... 1000 Mbps For global rules: 0.001 ... 1000 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the S7-1200/S7-1500 CPs, no bandwidth limitation can be specified.
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	• Enabled • Disabled (default)
Number	Automatically assigned number for the rule. The numbers are recalculated when rules are moved.	
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 10-29 Meaning of the menu commands

Button	Meaning
Delete	This deletes the selected rule or the selected global rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.

Button	Meaning
Move up	Use this button to move the selected rule or selected global rule set up one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected global rule set down one position in the list. As an alternative, you can move the selected rule or the selected rule set by dragging it with the mouse. You can select multiple entries. The rule / rule set you moved is therefore handled with lower priority.
Define service for MAC rules	This opens the dialog in which you can manage the MAC services and service groups.

IP addresses in IP packet filter rules

Entering IP addresses in IP packet filter rules

In IP packet filter rules, you have the following options for entering IP addresses:

- Nothing specified
  The rule applies to all IP addresses.
- An IP address
  The rule applies specifically to the specified address.
- Address range
  The rule applies to all the IP addresses covered by the address range.
  An address range is defined by specifying the number of valid bit places in the IP address in the format: [IP address]/[number of bits to be taken into account]
  - [IP address]/24 therefore means that only the most significant 24 bits of the IP address are included in the filter rule. These are the first three octets of the IP address.
  - [IP address]/25 means that only the first three octets and the highest bit of the fourth octet of the IP address are included in the filter rule.
- Address area
  For the source IP address, an address range can be entered in the following format:
  [Start IP address]-[End IP address]

IPv4 addresses

An IPv4 address consists of 4 decimal numbers in the range from 0 to 255 separated from each other by a dot.

Table 10-30 Examples of address ranges in IPv4 addresses

Source IP address or destination IP address	Address range		Number of addresses*)
	from	to	
192.168.0.0**/16**	192.168.0.0	192.168.255.255	65.536
192.168.10.0**/24**	192.168.10.0	192.168.10.255	256
192.168.10.0**/25**	192.168.10.0	192.168.10.127	128

Source IP address or destination IP address	Address range		Number of addresses*)
	from	to	
192.168.10.0/**26**	192.168.10.0	192.168.10.63	64
192.168.10.0/**27**	192.168.10.0	192.168.10.31	32
192.168.10.0/**28**	192.168.10.0	192.168.10.15	16
192.168.10.0/**29**	192.168.10.0	192.168.10.7	8
192.168.10.0/**30**	192.168.10.0	192.168.10.3	4
*) Note: Note that the network address and the broadcast address are not available as IP addresses of network nodes in an address range.			

IPv6 addresses

IPv6 addresses consist of 8 fields each with four hexadecimal numbers (128 bits in total). The fields are separated by a colon.

Example: fd00:ffff:ffff:ffff:ffff:ffff:2f33:8f21

Rules / simplifications:

- Leading zeros within a field can be omitted.
  Example: Instead of 2001:0db8:2426:08d3:1457:8a2e:0070:7344 it is also possible to use the notation 2001:db8:2426:8d3:1457:8a2e:70:7344.
- If one or more fields have the value 0 (or 0000), a shortened notation is possible.
  Example: Instead of 2001:0db8:0:0:0:0:1428:57ab it is also possible to use the notation 2001:db8::1428:57ab.
  To ensure uniqueness, this shortened form can only be used once within the entire address.
- Decimal notation with periods
  The last 2 fields or 4 bytes can be written in the normal decimal notation with periods.
  Example: The IPv6 address fd00::ffff.125.1.0.1 is equivalent to fd00::ffff:7d01:1.
- Address range notation in IP packet filter rules: In the same way as IPv4 addresses, IPv6 addresses can also be noted in the form of address ranges.
  Example: The entry "2001:0db8:85a3:08d3:1319:8a2e:0:0/96" covers all IPv6 addresses from 2001:0db8:85a3:08d3:1319:8a2e:0:0 to 2001:0db8:85a3:08d3:1319:8a2e:ffff:ffff.

Carrying out module-specific log settings

Log settings - overview

Module-specific function

Some logging functions are only available for certain security modules.

Log settings in the configuration

The log settings made here are loaded on the module with the configuration and take effect when the security module starts up.

You can restrict the configured packet filter log settings in the online functions if necessary. For example, you can use the online functions to specify that merely IP logging is displayed if you have configured IP and MAC logging.

Logging procedures and event classes

Here, you can specify which data should be logged. As a result, you enable logging as soon as you download the configuration to the security module.

During configuration, you also select one or both of the possible logging procedures:

- Local logging
- Network Syslog

In both logging procedures, the security module recognizes the three following types of events:

- Packet filter events
- Audit events
- System events

Configuring local logging

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Local log memory" entry in the local security settings.

Configuring local logging

Table 10-31 Local logging - settings for log events

Log event	Meaning	Comments
Packet filter log (firewall)	The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible when logging is enabled for the packet filter rule. In the "Packets to be logged" drop-down list, you can specify the data packets to be logged: • "All packets": The data packets that are logged are those to which a configured firewall rule applies. In addition to this, all the response packets to such packets are recorded that have passed the firewall according to a configured allow rule. • "Status generating packets" (only for SCALANCE S as of V3): The only data packets that are logged are those to which a configured firewall rule (standard mode or advanced mode) applies and that initially generate a status in the firewall. Data packets that pass through the firewall by using this firewall status are not logged.	Packet filter log data is not retentive The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online & diagnostics" dialog in a file.
Audit log	The logging of audit events is always enabled. The logged information is always stored in the ring buffer. The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module.	Audit log data is retentive The data is stored in a retentive memory of the security module and is therefore still available after turning off the power supply. **Note for CPs:** The audit log files are not retentive on CPs. You should therefore use a Syslog server to backup this data.
System log	The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user. Select the "Log settings" > “System events" entry to configure the event filter and cable diagnostics functions.	System log data is not retentive The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online & diagnostics" dialog in a file.

Table 10-32 Local logging - storage of recorded data

Storage	Meaning
Ring buffer	At the end of the buffer, the recording continues at the start of the buffer and overwrites the oldest entries.
One-shot buffer	Recording stops when the buffer is full.

Configuring system events

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "System events" entry in the local security settings.

Filtering of the system events

In this dialog, you set a filter level for the system events. As default, the following values are set:

- SCALANCE S: Level 3 (Error)
- CP: Level 3 (Error)

The system events are recorded that have the same priority as the selected filter level and that have a higher priority than the selected filter level. The lower the value of the filter level, the higher its priority and therefore less events are recorded.

The priority of the selected filter level must be the same or lower than the severity set for the cable diagnostics; see the "Setting parameters for line diagnostics" table (not for CPs).

Recommendation: Select "Error" as the filter level or a filter level with a higher priority to prevent recording of general non-critical events.

Note for CP

For CPs, select only level 3 or level 6 since only events of these levels are generated for CPs.

- Level 0 to level 3 error messages are output if level 3 is selected.
- If you select level 6, the error messages of levels 0 to 6 are output.

Properties of the system events - line diagnostics (only for SCALANCE S)

Line diagnostics generates a special system event. A system event is generated when a selectable percentage of bad frames is reached. This system event is assigned the severity and facility set in this dialog.

Table 10-33 Setting parameters for line diagnostics

Function / option / parameter	Meaning
Enable	Enabling and disabling logging
Limit	Selectable percentage of faulty frames representing the limit at which a system event is triggered.
Facility	Select a facility from the drop-down list that identifies the system event to be logged.
Severity	Using the severity, you weight the system events of line diagnostics relative to the severity of the other system events.

Note

Severity of the system events of line diagnostics

The system events of the line diagnostics must not have a lower severity than you set for the filter. At a lower severity, these events cannot pass through the filter and will not be logged.

Configuring the network Syslog

How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Network Syslog" entry in the local security settings.

Configuring the network Syslog

Table 10-34 Network Syslog - basic settings

Option / parameter	
Enable network Syslog	Enables and disables the transfer of logging events to the Syslog server.
Syslog server	Here, enter the IP address of the Syslog server. As an alternative, an FQDN can be entered for SCALANCE S modules as of V4. The Syslog server must be accessible from the security module at the specified address and, if applicable, using the router configuration under the "Routing" entry of the local security settings. If the Syslog server cannot be accessed no Syslog messages are sent. You can recognize this operating state on the basis of corresponding system alarms. To activate the sending of the Syslog information again, you may have to update the routing information and initiate a restart of the security module.

Option / parameter	
Enabling event classes	Enable the classes of events to be transferred to the Syslog server. You can classify packet filter and audit events according to the Severity and using the Facility according to their origin.
Module name	The module name is displayed and cannot be changed at this point.

Note

Non-secure transfer of logging events

Logging events are transferred to Syslog servers in plain language. This should be taken into account when using Syslog servers.

Table 10-35 Network Syslog - settings for log events

Log event	Configuring	Comments
Packet filter events (firewall)	The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible if logging is activated for the packet filter rule. Syslog alarms can be classified according to their origin and their severity level by setting Facility and Severity. This assignment is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here depends on the evaluation in the Syslog server. If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
Audit events	The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module. Assignment of the severity and facility is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here for the severity and facility depends on the evaluation in the Syslog server. If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
System events	The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user.	Select the "Log settings" > “System events" entry in the local security settings to configure the event filter and cable diagnostics functions.

Security module as router

Overview of the routing settings

Meaning

If you operate the security module in routing mode, the networks connected to the internal and external interface are transformed into separate subnets. The DMZ interface (SCALANCE S623/S627-2M only) is connected in routing mode regardless of the mode. In routing mode, the frames intended for an existing IP address in the subnet are forwarded. The firewall rules for the direction of transmission also apply.

You have the following additional options:

- Setting specific routes - can be set in the local security settings under "Routing" (SCALANCE S only), see Specifying routes (Page 869) in the section "SCALANCE S".
- Use standard router - can be set in the local security settings with "External interface [P1] red", "Internal interface [P2] green" or "DMZ interface [P3] yellow" (SCALANCE S623/ S627-2M only) see Configuring IP address parameters (Page 842) in the section "SCALANCE S".
  A maximum of one standard router can be used per security module.
- NAT/NAPT routing - can be set in the local security settings in "NAT / NAPT" (only for SCALANCE S and CP 343-1 Adv. / CP 443-1 Adv.). To be able to use NAT/NAPT, the security module must be in routing mode.

Enabling routing mode (required for SCALANCE S modules only)

For this mode, you configure an internal IP address and an internal subnet mask for addressing the router in the internal subnet in the local security settings. All network requests that do not belong to a subnet are forwarded by the security module to a different subnet.

Note: In contrast to the bridge mode of the security module, VLAN tags are lost in routing mode.

1. Select the "Routing mode" option under "Mode" in the local security settings.
2. In the local security settings, enter an internal IP address and an internal subnet mask for addressing the router on the internal subnet in the input boxes under "Internal interface [P2] green" > Ethernet addresses".

Overview of NAT/NAPT

Requirements

- The security module is in routing mode or the DMZ interface is activated (SCALANCE S623 / S627-2M only).
- Since firewall rules that enable communication in the configured address translation direction are generated automatically for NAT / NAPT rules, the advanced firewall mode must be enabled for the security module. For more detailed information, refer to section Relationship between NAT/NAPT router and firewall (Page 792)

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "NAT / NAPT".
3. When required, enable address translation according to NAT (Network Address Translation) or NAPT (Network Address Port Translation).

Address translation with NAT (Network Address Translation)

NAT is a procedure for address translation between two address spaces.
The main task is to translate private addresses into public addresses; in other words into IP addresses that are used and even routed on the Internet. As a result, the IP addresses of the internal network are not known to the outside in the external network. The internal nodes are only visible to the external network by means of external IP address that is specified in the address translation list (NAT table). If the external IP address is not the address of the security module and if the internal IP address is unique, this is known as 1:1 NAT. With 1:1 NAT, the internal address is translated to this external address without port translation. Otherwise, n:1 NAT is being used.

Address translation with NAPT (Network Address Port Translation)

The address translation with NAPT changes the target address and the target port to a communication relation (port forwarding).

Frames coming from the external network or DMZ network and intended for the IP address of the security module are translated. If the destination port of the frame is identical to one of the values specified in the "Source port" column, the security module replaces the destination IP address and the destination port as specified in the corresponding row of the NAPT table. With the reply, the security module uses the values for the destination IP address and destination port as contained in the initial frame as the source IP address and the source port.

The difference to NAT is that with this protocol ports can also be translated. There is no 1:1 translation of the IP address. There is now only a public IP address that is translated to a series of private IP addresses with the addition of port numbers.

Address translation in VPN tunnels

Address translations with NAT/NAPT can also be performed for communications relations established via a VPN tunnel. This is supported for connection partners of the type SCALANCE S612 / S623 / S627-2M as of V4.

You will find further information on address translations in VPN tunnels in the following sections:

- NAT/NAPT routing (Page 786)
- Address translation with NAT/NAPT in VPN tunnels (Page 792)

Consistency check - these rules must be adhered to

Among other things, remember the following rules to obtain consistent entries:

- The IP address of the internal interface must not be used in the NAT / NAPT table.
- An IP address used in the NAT/NAPT address conversion list must not be a multicast or broadcast address.
- The external ports assigned for the NAPT translation are in the range > 0 and ≤ 65535. Port 443 (HTTPS), 161 (SNMP), 67+68 (DHCP) and 500+4500 (IPsec) are excluded if the relevant services are activated on the security module.
- The external IP address of the security module or the IP address of the DMZ interface may only be used in the NAT table for the action "Source NAT".
- Checking for duplicates in the NAT table
  An external IP address or an IP address in the DMZ network used in the direction "Destination NAT", "Source NAT +Destination NAT" or "Double NAT" may only be used once in each specified direction.
- Checking for duplicates in the NAPT table: A source port number may only be entered once for each interface.
- Internal NAPT ports can be in the range > 0 and ≤ 65535.

See also

Overview of the routing settings (Page 784)

NAT/NAPT routing

Enabling NAT

The input boxes for NAT are enabled. NAT address translations only take effect with the entries in the address translation list described below. After creating NAT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section:

Relationship between NAT/NAPT router and firewall (Page 792)

If PPPoE is activated for the external interface or the DMZ interface, the action "Destination NAT" cannot be configured. When configuring the action "Source NAT", the IP address cannot be entered in the "Source translation" input box because this is obtained dynamically during runtime.

Possible address translations for NAT

The following tables show the input options for address translation with NAT.

Action "Destination NAT" - "Redirect"

The action "Destination NAT" can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Destination NAT" can also be performed in the following directions:

- External to DMZ
- DMZ to internal
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Destination NAT" action can also be performed in the following directions:

- Tunnel to internal
- Tunnel to external
- Tunnel to DMZ (only if the DMZ interface is activated)

The following applies, for example for the direction "external to internal": The destination IP address of a frame coming from the external network is checked to see whether it matches the IP address specified in the "Destination IP address" input box. If it matches, the frame is forwarded into the internal network by replacing the destination IP address of the frame with the IP address specified in the "Destination translation" input box. Access from external to internal using the external address is possible.

The following table shows the input required for the action "Destination NAT".

Box	Possible entries	Meaning
Source IP address	Not relevant for this action.	-
Source translation	Not relevant for this action.	-
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed. The destination IP address must not match the IP address of the security module in the source network. If the destination IP address in a frame matches the address entered, the address is replaced by the corresponding IP address in the destination network. The specified destination IP address becomes the alias address. This means that the specified IP address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Action "Source NAT" - "Masquerading"

The action "Source NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Source NAT" action can also be performed in the following directions:

- Internal to tunnel
- External to tunnel
- DMZ to tunnel (only if the DMZ interface is activated)

The following applies, for example for the direction "internal to external": The source IP address of a frame coming from the internal network is checked to see whether it matches the IP address specified in the "Source IP address" input box. If it matches, the frame with the external IP address specified in the "Source translation" input box is forwarded to the external network as a new source IP address. In the external network, the external IP address is effective.

The following table shows the input required for the action "Source NAT".

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The source IP address of the specified node is replaced by the IP address specified in the "Source translation" input box.
	IP address range / IP address band in the source network	The IP addresses of the IP address range / IP address band are replaced by the IP address specified in the "Source translation" input box.
	*	The IP addresses of all nodes in the source network are replaced by the IP address specified in the "Source translation" input box.
Source translation	IP address in the destination network	Entry of the IP address that will be used as the new source IP address. If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination IP address	Not relevant for this action.	-
Destination translation	Not relevant for this action.	-
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Note

You can configure an address translation to the module IP address in the destination network for all frames going from a source network to a destination network. The security module also assigns a port number for each frame. This is an n:1 NAT address translation in which multiple IP addresses of the source network are translated to one IP address of the destination network.

Enter, for example, the following parameters for the direction "internal to external":

- Action: "Source NAT"
- From: "Internal"
- To "External"
- Source IP address: "*"
- Source translation: External IP address of the security module

Action "Source NAT + Destination NAT" - "1:1-NAT"

The action "Source NAT + Destination NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT + Destination" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the "Source-NAT + Destination-NAT" action can also be performed in the following directions:

- External to tunnel
- Internal to tunnel
- DMZ to tunnel (only if the DMZ interface is activated)

The following applies, for example for the direction "internal to external": When accessing from internal to external, the action "Source NAT" is performed. When accessing from external to internal, the action "Destination NAT" is performed.

The following table shows the input required for the action "Source NAT + Destination NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The configuration is always specified in the source NAT direction. The IP addresses of the destination NAT direction are then inserted automatically by STEP 7.
Source translation	IP address in the destination network	
Destination IP address	Not relevant for this action.	
Destination translation	Not relevant for this action.	
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rules generated by STEP 7 for the NAT rule.

Action "Double NAT"

The action "Double NAT" can be performed for SCALANCE S modules in the following directions:

- Internal to external
- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Double NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to internal
- DMZ to external

In every direction, Source and Destination NAT always take place at the same time.
The following applies, for example for the direction "external to internal": When accessing from external to internal, the source IP address of the external node is replaced (Source NAT). Access to the internal network also uses the external IP address specified in the "Destination IP address" input box (Destination NAT).

You can, for example, use this action if a standard router other than the security module is entered for a device to be accessed using Destination NAT. Response frames from this device are then not sent to the entered standard router but to the corresponding interface of the security module.

The following table shows the input required for the action "Double NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	IP address of the node in the source network
Source translation	-	The Source NAT address translation is always to the IP address of the security module in the destination network. For this reason, the "Source translation" input box cannot be configured.

Box	Possible entries	Meaning
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed. If the destination IP address in a frame matches the IP address entered, the IP address is replaced by the IP address specified in the "Destination translation" input box. If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network. The alias IP addresses of a security module are displayed under the entry "Alias IP addresses" of the relevant interface.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Enabling NAPT

The input boxes for NAPT are enabled. NAPT translations only take effect with the entries in the list described below. After creating NAPT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section:
Relationship between NAT/NAPT router and firewall (Page 792)

The IP address translation with NAPT can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the IP address translation with NAPT can also be performed in the following directions:

- External to DMZ
- DMZ to internal
- DMZ to external

If the SCALANCE S module (only SCALANCE S612/S623/S627-2M as of V4) is in a VPN group and the tunnel interface is enabled, the IP address translation with NAPT can also be performed in the following directions:

- Tunnel to internal
- Tunnel to external
- Tunnel to DMZ (only if the DMZ interface is activated)

The following applies, for example for the direction "external to internal": Frames intended for the external IP address of the security module and for the port entered in the "Source port" column are forwarded to the specified destination IP address in the internal network and to the specified destination port.

The IP address from which the frames of forwarded into the target network is displayed in the column "Virtual IP address". With a direction from external this is the external IP address of the security module and with a direction from DMZ the IP address of the DMZ interface of the security module.

The following table shows the input required for address translation with NAPT:

Box	Possible entries	Meaning
Source port	TCP/UDP port or port range Example of entering a port range: 78:99	A node in the source network can send a frame to a node in the destination network by using this port number.
Destination IP address	IP address in the destination network	Frames intended for the IP address of the security module in the source network and the TCP/UDP port specified in the "Source port" box are forwarded to the IP address specified here.
Destination port	TCP/UDP port	Port number to which the frames coming from the source network are forwarded.
Protocol	• TCP+UDP • TCP • UDP	Selection of the protocol family for the specified port numbers
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAPT rule.

Address translation with NAT/NAPT in VPN tunnels

Module-specific function

Address translation with NAT/NAPT in VPN tunnels is only available for SCALANCE S612/ S623/S627-2M modules as of V4, refer to the section:
Address translation with NAT/NAPT in VPN tunnels (Page 870)

Relationship between NAT/NAPT router and firewall

Meaning

After creating NAT/NAPT rules, STEP 7 automatically generates firewall rules that enable communication in the configured address translation direction. The generated firewall rules are visible in advanced firewall mode and can, if necessary, be moved and expanded (additional IP address / IP address range / IP address band, services, bandwidth). In addition to this, the automatically generated firewall rules should be checked in terms of their priority and their position. If there are also manually configured firewall rules in the rule list that have higher priority than the automatically generated firewall rules, under certain circumstances no NAT / NAPT will be performed.

If there are several identical NAT / firewall pairs of rules, the priority in the firewall rule list decides which rule is used.

Firewall parameters generated by STEP 7 cannot be adapted. After deactivating NAT/NAPT, the firewall rules generated by STEP 7 are disabled.

To clarify the relationship between the NAT/NAPT rules and the corresponding firewall rules, they are identified by corresponding, consecutive numbers.

In firewall rules that were generated automatically for NAT/NAPT rules, the “Stateful” check box cannot be disabled.

The following table shows the system behind the firewall rules generated for NAT rules for SCALANCE S modules.

Table 10-36 NAT address translation and corresponding firewall rules for SCALANCE S modules

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Destination NAT	Allow	Source network	Destination network	-	IP address specified in the "Destination IP address" input box
Source NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
Source NAT + Destination NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
	Allow	Destination network	Source network	-	IP address that was inserted in the "Destination IP address" input box by STEP 7
Double NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	IP address specified in the "Destination IP address" input box
	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	IP address of the node specified in the "Destination translation" input box

The following table shows the system behind the firewall rules generated for NAT rules for CP 343-1 Adv. / CP 443-1 Adv.

Table 10-37 NAT address translation and corresponding firewall rules for CP 343-1 Adv. / CP 443-1 Adv.

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Destination NAT	Drop	External	Station	-	IP address of the security module in the external network
	Allow	External	Any	-	IP address of the node specified in the "Destination translation" input box
Source NAT	Allow	Any	External	IP address specified in the "Source translation" input box	-
Source NAT + Destination NAT	Allow	Any	External	IP address specified in the "Source translation" input box	-
	Drop	External	Station	-	IP address of the security module in the external network
	Allow	External	Any	-	IP address of the node that was inserted in the "Destination translation" input box by STEP 7

The following table shows the system behind the firewall rules generated for NAT rules for SCALANCE S modules.

Table 10-38 NAPT translation and firewall rules created for SCALANCE S modules

Created firewall rule					
Action	From	To	Source IP address	Destination IP address	Service
Allow	Source network	Destination network	-	IP address of the security module in the source network	[Service_NAPT_rule]

The following table shows the system behind the firewall rules generated for NAPT rules for CP 343-1 Adv. / CP 443-1 Adv.

Table 10-39 NAPT translations and created firewall rules for CP 343-1 Adv. / CP 443-1 Adv.

Created firewall rules					
Action	**From**	**To**	**Source IP address**	**Destination IP address**	**Service**
Drop	External	Station	-	IP address of the security module in the external network	[Service_NAPT_rule]
Allow	External	Any	-	IP address of the security module in the external network	[Service_NAPT_rule]

Stateful packet inspection

The firewall and NAT/NAPT router supports the "Stateful Packet Inspection" mechanism. As a result, reply frames can pass through the NAT/NAPT router and firewall without it being necessary for their addresses to be included extra in the firewall rule and the NAT/NAPT address translation.

Relationship between NAT/NAPT router and user-specific firewall

Module-specific function

The configuration of NAT/NAPT rules in the user-specific firewall is only available for SCALANCE S modules as of V3, refer to the section:

Relationship between NAT/NAPT router and user-specific firewall (Page 872)

Configuring time-of-day synchronization

Procedure for time-of-day synchronization

Meaning

For the time synchronization of the transfer of productive data, the date and time are maintained on the security module to verify the validity (time) of a certificate and for time stamping log entries. For the Security functions the time of day of the security modules of a project must be synchronized.

Note

Configuring the firewall for communication with NTP servers

If the NTP server cannot be reached by the security module, you will need to allow the frames from the NTP server explicitly in the firewall (UDP, port 123).

Note

Time-of-day synchronization relates solely to the security module and cannot be used to synchronize devices in the internal network of the security module.

Some CPs can forward the time of day to other module of the station.

The CP 443-1 OPC UA can only receive the time-of-day in the SIMATIC mode from the station but cannot forward it.

Note

Before the security functions of a CP (time-of-day slave) are used, the CP must receive a valid time-of-day frame from the time master.

Configuring time-of-day synchronization for a security module

How to access this function

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the "Activate time-of-day synchronization" check box.

Procedure for time-of-day synchronization

Depending on the security module being used, the following methods can be configured:

Procedure	Meaning
Set time with each download	The module time is set automatically to the PC time when a configuration is downloaded.
SIMATIC	Time-of-day synchronization by received MMS time-of-day messages (MMS = Manufacturing Message Specification) For the CP select whether the CP is to adopt or forward the time of day. The CP 1628 always forwards the time of day. The CP 443-1 OPC UA uses the SIMATIC mode if no time-of-day synchronization using NTP is configured. It can only receive the time-of-day from the station but cannot forward it. Available directions: • Automatic The CP receives the time from the station or from the LAN and forwards it to the station or to the LAN. If several CPUs are being operated in the station, the default setting can lead to collisions. To avoid this, you should specifically define the forwarding direction. • From station The CP forwards the time of day to the LAN. • From LAN The CP forwards the time of day from the LAN to the station. If forwarding of the time of day is enabled, you can use the "Use corrected time" check box to specify whether or not a correction factor included in the time-of-day frame is used. For the CP 1628, this option is is the default and it cannot be disabled.

Procedure	Meaning
Time of day from partner	The time is obtained from the relevant communications partner. Synchronization cycle: Specifies the cycle for time-of-day synchronization. For the synchronization cycle of the CP, and individual hour or minute interval can be specified.
NTP / NTP (secure)	Time-of-day synchronization by an NTP server / NTP server of the type "NTP (secure)". • Time zone: In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. This corresponds to GMT (Greenwich Mean Time). The time offset from UTC can be set by configuring the local time zone. • Update interval in seconds: Specifies the interval between the time queries in seconds. For SCALANCE S as of V3, the time interval for querying the NTP server is specified automatically. If the "Enable security functions" check box is enabled in the local security settings of a CP, the setting for the update interval is transferred from the CP's local settings into the CP's local security settings. • Time synchronization on the full minute: With this option, you specify that the time of day is forwarded to the communications bus on the full minute. This option is required for certain special applications. • Accept time from non-synchronized NTP servers Here you can specify whether the security module also accepts the time-of-day from non-synchronized NTP servers. • Forward time of day to station: Disable this option if the CPU requests the time separately from an NTP server. This prevents the time on the CPU obtained directly from the NTP server from being overwritten by the time detected in the CP. The accuracy may be reduced slightly due to forwarding via the CP. • NTP server: Creating NTP servers in the local security settings is described in the section Configuring NTP servers (Page 799).

Configuring NTP servers

Creating NTP servers of the type "NTP (secure)" in the global security settings

In the global security settings only NTP servers of the type "NTP (secure)" can be created and assigned to CPs or SCALANCE S modules as of V4.

1. In the global security settings, select the entry "NTP".
   Result: The previously created NTP servers (secure) are displayed under the selected entry.
2. Double-click on the "Add new NTP server" entry.
   Result: The created NTP server (secure) is displayed with an automatically assigned number below the entry "NTP".
3. Double-click on the created NTP server (secure).
   Result: In the working area the assignment dialog for NTP servers (secure) is displayed. The selected NTP server (secure) is selected in the "NTP server" drop-down list. The required security modules can be assigned to this, see section Assigning the security module to an NTP server (secure) (Page 800). In the local security settings, the configurable properties of the NTP server (secure) are displayed.
4. Enter the following data in the "General" entry in the local security settings:
   - Name: A maximum of 25 characters can be used for the name of the NTP server (secure).
   - IP address / FQDN: Address of the NTP server (secure).
5. Enter the following encryption parameters in the "NTP key" entry in the local security settings:

Property	Meaning
Key ID	Numeric value between 1 and 65534.
Authentication	Select the authentication algorithm.
Hex/ASCII	Select the format for the NTP key.
Key	Enter the NTP key with the following lengths: Hex: 22 ... 40 characters ASCII: 5 ... 20 characters

To switch over to the local security settings of another NTP server (secure), select this from the "NTP server" drop-down list of the assignment dialog or double-click on the corresponding entry in the global security settings.

Result

You have created the NTP server (secure) and can now assign this to the required security modules.
Note the descriptions in the following section:

Creating non-secure NTP servers in the local security settings

Non-secure NTP servers for SCALANCE S modules below V4 and CPs need to be created in the local security settings.

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the synchronization method..
4. Enter a name and the IP address of the NTP server. A maximum of 25 characters can be used for the name. If you have selected the "NTP (secure)" synchronization mode, you can select an NTP server (secure) that you created in the global security settings in the "Name" column.

Configuration limits for NTP servers

You can assign a maximum of 4 NTP servers to one security module.

Conventions for names of NTP servers

The characters 0-9, a-z, A-Z, -._ can be used for the names of NTP servers. A name must start with a letter and end with a letter or number. Before the '.' character only letters and numbers are permitted, after the '.' character only letters. Before the '_' or '-* character only letters and numbers are permitted.

Importing/exporting NTP servers (secure)

Using the "Import" or "Export" commands in the shortcut menu, you can export the key list of the currently selected NTP server (secure) and import the file into an NTP server (secure) or vice versa.

Assigning the security module to an NTP server (secure)

Requirement

- You have defined an NTP server (secure) in the global security settings.
- "NTP" or "NTP (secure)" is selected as the time-of-day synchronization mode in the local security settings of the security module that you want to assign to an NTP server (secure).

Procedure

1. Double-click the "NTP" entry in the global security settings.
2. Double-click the entry "Assign module to an NTP server".
3. From the "NTP Server" drop-down list, select the NTP server (secure) to which you want to assign a security module.

4. In the "Available modules" section, select the security module that you want to assign to the selected NTP server (secure).
5. Click the "<<" button to assign the selected security module to the selected NTP server (secure).

Result

You have assigned the security module to the NTP server (secure). The NTP server (secure) is displayed automatically in the local security settings in the list of NTP servers.

Security module as DHCP server

Module-specific function

The use of the security module as a DHCP server is only possible with SCALANCE S modules, see subsection:
AUTOHOTSPOT in the section "SCALANCE S".

Configuring SNMP

Overview of SNMP

What is SNMP?

The security module supports the transfer of management information using the Simple Network Management Protocol (SNMP). For this purpose, an SNMP agent that receives and responds to SNMP requests is installed on the security module. The information on the properties of SNMPcompliant devices is entered in MIB files (MIB = Management Information Base) for which the user must have the required rights.

In SNMPv1, the "community string" is also sent. The "community string" is like a password that is transmitted along with the SNMP request. If the community string is correct, the security module replies with the required information. If the string is incorrect, the security module discards the query and does not reply. The community string is transmitted via SNMPv1 without encryption.

SNMPv3 lets you transmit encrypted data.

Configuring SNMP - "SNMP" entry

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "SNMP".
3. Activate the "Activate SNMP" check box.

4. Select one of the following SNMP protocol versions:

   Note
   Encrypted data transmission with SNMPv3
   You should use SNMPv3 to transmit data in encrypted form in order to enhance security.

   – SNMPv1
     The security module uses the following default values for the community strings to control the access rights in the SNMP agent. These default values should be adapted to increase security.
     For read access: public
     For read and write access: private
     To enable write access using SNMP, select the "Allow write access" option.
   – SNMPv3
     Select either only an authentication algorithm or an authentication algorithm and an encryption algorithm.
     Authentication algorithm: none, MD5, SHA-1
     Encryption algorithm: none, AES-128, DES

     Note
     Preventing the use of DES
     DES is an insecure encryption algorithm. Therefore, it should only be used for reasons of down compatibility.

     Note
     When using SNMPv3 no RADIUS authentication is possible.

5. If SNMPv3 is to be used, assign a user a role with corresponding activated SNMP rights to enable access to the module via SNMP. An overview of SNMP rights is available in the section:
   Managing rights (Page 737).
6. In the "Advanced settings" area, for SCALANCE S modules configure module-specific information about the author, location and e-mail address overwriting the information from the project properties.
   The following applies to values written to the security module by an SNMP tool using an SNMP-SET command:
   If you select the "Keep values written by SNMP set" check box, the values are not overwritten when there is another download of a STEP 7 configuration to the security module.

Configuring proxy ARP

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Configuring proxy ARP (Page 876)

Activate Web server on security module

Module-specific function

This function is only available for CP 343-1 Advanced / CP 443-1 Advanced and CP 443-1 OPC UA see section:
Activating Web server on security module (Page 902)in the section "Security for S7-300 / S7-400 / PC CPs".

IPsec tunnel: Creating and assigning VPN groups

How to create an IPsec tunnel with VPN groups

Requirement

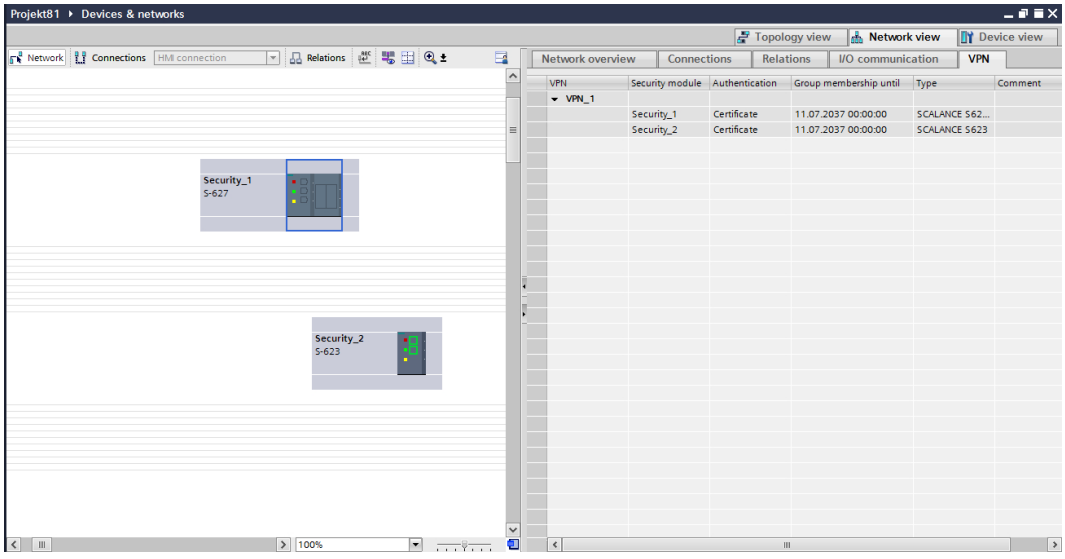
Note

Current date and current time of day on the security modules

When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

Creating a VPN group

The security of the default settings of VPN groups was increased in V14 SP1. If in a V14 project a new VPN group should be given these default settings, the project needs to be upgraded to V14 SP1 when this VPN group is created. If the project is not upgraded the VPN group will be created with the default settings of V14. For further information on upgrading, refer to section Create users (Page 733)



1. In the global security settings, select the entry "VPN groups".
   Result: The previously created VPN groups are displayed under the selected entry.
2. Double-click on the "Add new VPN group" entry.
   Result: The created VPN group is displayed with an automatically assigned number below the entry "VPN groups".
   As an alternative, in the network view you can right click on an interface of a module with VPN capability and create a VPN group with the shortcut menu command "Add new VPN group" (not possible for SOFTNET Security Client). The selected security module is automatically assigned to the created VPN group.
3. Double-click on the created VPN group.
   Result: In the working area the assignment dialog for VPN groups sets is displayed. The selected VPN group is selected in the "VPN" drop-down list. Security modules can be assigned to this in the relevant assignment dialog, see section Assigning a security module to a VPN group (Page 805). In the local security settings, the VPN group properties of the selected VPN group can be adapted, see section Configuring VPN group properties (Page 808).

Conventions for names of VPN groups

The characters 0-9, a-z, A-Z, -._ can be used for the names of VPN groups. A name must start with a letter and end with a letter or number. Before the '.' character only letters and numbers are permitted, after the '.' character only letters. Before the '_' or '-* character only letters and numbers are permitted.

Display of the VPN groups with their properties

If you select a security module that is in one or more VPN group(s), the properties of the VPN group(s) of which the security module is a member are shown in the "Network data" area.

The following properties of the VPN groups are displayed in columns in the "VPN" tab of the "Network data" area:

Property/column	Meaning
VPN	Names of the VPN groups of which the selected security module is member
Security module	Names of the assigned security modules
Authentication	Type of authentication: Pre-shared key or certificate
Group membership until	Date and time up to which the VPN group certificate of the security module is valid
Type	Model numbers of the assigned security modules
Comment	Comment

Setting the life of certificates

Open the dialog in which you can set the expiry date of the certificate as follows:

1. Select the VPN group you want to edit in the "VPN" tab.
2. In the "Properties" > "General" tab of the Inspector window, select the entry "Authentication".

Note

Expiry of a certificate

Communication through the VPN tunnel continues after the certificate has expired until the tunnel is terminated or the SA lifetime expires. For more information on certificates, refer to section:
AUTOHOTSPOT.

Configuration limits

Number of the VPN tunnel	
SCALANCE S612 V3/V4	Maximum of 128
SCALANCE S623 V3/V4	Maximum of 128
SCALANCE S627-2M V4	Maximum of 128
CP 343-1 Advanced / CP 443-1 Advanced	Maximum of 32
CP 1628	Maximum of 64
S7-1200/S7-1500 CPs	Maximum of 16

For the number of communications relations between subnets of the security module and subnets of other security modules that can be reached via VPN tunnel the following configuration limits apply:

Number of subnet relations	
SCALANCE S612 V3/V4	Maximum of 128
SCALANCE S623 V3/V4	Maximum of 128
SCALANCE S627-2M V4	Maximum of 128
CP 343-1 Advanced / CP 443-1 Advanced	Maximum of 32
CP 1628	Maximum of 64
S7-1200 / S7-1500 CPs	Maximum of 8

Assigning a security module to a VPN group

Requirement

You have created a VPN group in the global security settings. Before assigning security modules to VPN groups, note the rules for this in the section Modes of VPN groups (Page 815).

Procedure

1. Double-click on the "VPN groups" entry in the global security settings.
2. Double-click on the “Assign module to a VPN group" entry.
3. From the "VPN" drop-down list, select the VPN group to which you want to assign a security module.
4. In the "Available modules" section, select the security module that you want to assign to the selected VPN group.
5. Click the "<<" button to assign the selected security module to the selected VPN group.
   If the security module doe not support one or more properties of the VPN group box, the module symbol in the area of the assigned modules is displayed with an error symbol .
   As an alternative to the procedure , in the network view you can assign a security module to an existing VPN group by right clicking on an interface of a module with VPN capability and assign this to the VPN group using the shortcut menu "Assign module to a VPN group" (not possible for SOFTNET Security Client).

Result

You have assigned the security module to the VPN group.

Authentication methods

The following methods are available:

The authentication method is specified per VPN group and decides the type of authentication used.

The following key-based or certificate-based authentication methods are supported:

- Pre-shared key
  Authentication is achieved using a previously specified character string that is distributed to all modules in the group.
  Enter a pre-shared key in the "Key" field under "Authentication" > "General" in the VPN group properties dialog. If you click the "Renew preshared key" button, STEP 7 renews the pre-shared key to be used.
- Certificate
  Certificate-based authentication "Certificate" is the default setting. The procedure is as follows:
  - When a group is created, a CA certificate is generated as a root certificate.
  - Each security module that is a member of the VPN group also receives a group certificate signed with the key of the CA certificate.

  If you click the "Renew certificate " button, STEP 7 renews the CA certificate of the VPN group.
  All certificates are based on the ITU standard X.509v3 (ITU, International Telecommunications Union).
  The certificates are generated by a certificate authority contained in STEP 7.

Note

Restriction in VLAN operation

No VLAN tagging is transmitted in IP frames via the VPN tunnel of the security module. The VLAN tags included in IP frames are lost when they pass through the security modules because IPsec is used to transfer the IP frames.

As default, no IP broadcast or IP multicast frames can be transferred with IPsec through a layer 3 VPN tunnel. Through a layer 2 VPN tunnel of the security module, IP broadcast or IP multicast frames are packaged just like MAC packets including the Ethernet header in UDP and transferred. With these packets, the VLAN tagging is therefore retained.

VPN group properties

VPN connection establishment by Known Peers and Unknown Peers

The properties of a VPN group are made up of the selected authentication method and the configured parameters for IKE phase 1 and 2 and during loading are transferred to all VPN group nodes. On the responder the IP addresses of the security modules that may initiate the VPN connection establishment with the configured properties of the VPN group are stored in addition. When a security module attempts to establish a VPN connection to the responder, this first checks whether the IP address of the initiator is known to it. If this is the case, the initiator is a Known Peer. If the VPN group properties proposed by this Known Peer match those stored on the responder for the Known Peer, the responder allows the VPN connection establishment. In addition to the properties of a VPN group, fallback VPN profiles can be assigned to a VPN group. VPN profiles contain predefined properties for the authentication method, IKE phase 1 and 2. Fallback VPN profiles can be used as alternative configurations for VPN connection establishment. These come into play when VPN properties of the initiator do not match the VPN properties of the responder. In such cases, fallback VPN profiles ensure the VPN connection establishment. The configured fallback VPN profiles just as the properties of the VPN group are transferred to all VPN group nodes. The priority for the use of the fallback VPN profiles is specified by their order in the configuration. The fallback VPN profiles and the properties of the VPN group must not differ in the authentication method.

If the IP address of the initiator is not known to the responder because the initiator in productive mode for example is connected via a NAT translation, the initiator is an Unknown Peer (Road Warrior). As default the responder allows connection establishment by Unknown Peers. In the module-specific VPN properties of the responder you can specify whether and with which VPN group properties connection establishment by Unknown Peers is allowed by the responder, see section Configuring module- and connection-specific VPN settings (Page 819).

The configuration of fallback VPN profiles and responder setting for Road Warrior connections is only possible in V14 SP1 projects. For information on upgrading projects, refer to section Create users (Page 733)

Configuring VPN group properties

VPN group properties

Note

Knowledge of IPsec necessary

To be able to set these parameters, you require IPsec experience. If you do not make or modify any settings, the defaults apply.

The following settings can be configured in the properties of a VPN group:

- Authentication method (entry: "General")
- IKE settings (entry: "Advanced settings phase 1")
- IPsec settings (entry: "Advanced settings phase 2")
- Fallback VPN profiles

The configuration of all available settings of phase 1 and phase 2 and the configuration of fallback VPN profiles is only possible in V14 SP1 projects. For information on upgrading projects, refer to section Create users (Page 733).

If the VPN group properties you have configured are less secure than the recommended properties, STEP 7 makes this known to you with an appropriate message text.

How to access this function

1. In the global security settings select the VPN group whose properties you want to configure under the entry "VPN groups".
2. Select "Open" in the shortcut menu of this entry.
   Result: The VPN group properties appear in the area of the local security settings.
3. In the "Authentication" entry, select whether to use a pre-shared key or certificate for authentication. For more detailed information, refer to section:
   Authentication methods (Page 806).

Advanced settings phase 1

Phase 1: IKE negotiation of the Security Association (SA) for phase 2:

Here you set the parameters for negotiating the security parameters to be used in phase 2:

Parameter	Description
IKE mode	• Main (default setting) • Aggressive* Selection of the mode IKE phase 1. In Main mode, the connection partners exchange their identities encrypted, in Aggressive mode unencrypted. In Aggressive mode KE phase 1 runs faster but is less secure than in the alternative Main mode.
DH group	Groups selectable for the Diffie-Hellman Key exchange: • Group 15 • Group 14 (default setting) • Group 5* • Group 2* • Group 1*
SA lifetime type	Phase 1 Security Association (SA): • Time: Time limit in minutes The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated.
SA lifetime	Numeric value: Range of values for time: 1440 … 2500000 minutes (default setting: 2879)

Parameter	Description
Encryption	Encryption algorithm: • AES-256 (default setting), 192, 128: Advanced Encryption Standard (256 bit, 192 bit or 128 bit key length, mode CBC) • 3DES-168*: Triple DES (168-bit key length, mode CBC) • DES*: Data Encryption Standard (56 bit key length, mode CBC)
Authentication	Authentication algorithm: • SHA-512: Secure Hash Algorithm 512 • SHA-384: Secure Hash Algorithm 384 • SHA-256 (default setting): Secure Hash Algorithm 256 • SHA-1*: Secure Hash Algorithm 1 • MD5*: Message Digest Algorithm 5

* The setting is classified as less secure. It is recommended when possible that you use a more secure setting.

Advanced settings phase 2

Phase 2: IKE negotiation of the Security Association (SA) for IPsec data exchange:

Here, you set the parameters for negotiating the security parameters used for the IPsec data exchange with ESP (Encapsulating Security Payload) and AH (Authentication Header). Communication in phase 2 is already encrypted.

Parameter	Description
SA lifetime type	Phase 2 Security Association (SA): • Time (default setting): Time limit in minutes. The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated. • Limit: Limitation of the data volume in MB
SA lifetime	Numeric value: • Range of values for time: 60 … 16666666 minutes (default setting: 2879) • Range of values for limit: 2000 ... 500000 MB (default setting: 4000)
Encryption	Encryption algorithm: • AES-128 (default setting): Advanced Encryption Standard (128-bit key length, mode CBC) • 3DES-168*: Triple DES (168-bit key length, mode CBC) • DES*: Data Encryption Standard (56 bit key length, mode CBC)

Parameter	Description
Authentication	Authentication algorithm: • SHA-512: Secure Hash Algorithm 512 • SHA-384: Secure Hash Algorithm 384 • SHA-256 (default setting): Secure Hash Algorithm 256 • SHA-1*: Secure Hash Algorithm 1 • MD5*: Message Digest Algorithm 5
Perfect Forward Secrecy	• ON (default setting): Diffie Hellmann public key values are exchanged for recalculation of the keys. • OFF*: The values already exchanged in phase 1 are used for recalculation of the keys.

* The setting is classified as less secure. It is recommended when possible that you use a more secure setting.

Configuring fallback VPN profiles

The configuration of fallback VPN profiles is only possible in V14 SP1 projects. For information on upgrading projects, refer to section Create users (Page 733).

In addition to the properties of a VPN group, fallback VPN profiles can be assigned to a VPN group. VPN profiles contain predefined properties for the authentication method, IKE phase 1 and 2. Fallback VPN profiles can be used as alternative configurations for VPN connection establishment. These come into play when VPN properties of the initiator do not match the VPN properties of the responder. In such cases, fallback VPN profiles ensure the VPN connection establishment. The configured fallback VPN profiles just as the properties of the VPN group are transferred to all VPN group members. The priority for the use of the fallback VPN profiles is specified by their order in the configuration. The fallback VPN profiles and the properties of the VPN group must not differ in the authentication method.

The following fallback VPN profiles are available:

Table 10-40 VPN profile 1

Parameter	Setting
Authentication method	Certificate
IKE mode	Main
Phase 1 DH group	Group 14
Phase 1 encryption	AES-256
Phase 1 SA lifetime	SA lifetime proposed by the initiator: 480 minutes Range permitted by the responder for the SA lifetime: 480 … 2880 minutes
Phase 1 authentication	SHA-1
Phase 2 SA lifetime type	Time
Phase 2 encryption	AES-128
Phase 2 SA lifetime	SA lifetime proposed by the initiator: 240 minutes Range permitted by the responder for the SA lifetime: 60 … 2880 minutes

Parameter	Setting
Phase 2 authentication	SHA-1
Perfect Forward Secrecy	OFF

Table 10-41 VPN profile 2

Parameter	Setting
Authentication method	Certificate
IKE mode	Main
Phase 1 DH group	Group 2
Phase 1 encryption	AES-256
Phase 1 SA lifetime	SA lifetime proposed by the initiator: 480 minutes Range permitted by the responder for the SA lifetime: 480 … 2880 minutes
Phase 1 authentication	SHA-1
Phase 2 SA lifetime type	Time
Phase 2 encryption	3DES-168
Phase 2 SA lifetime	SA lifetime proposed by the initiator: 2880 minutes Range permitted by the responder for the SA lifetime: 60 … 2880 minutes
Phase 2 authentication	SHA-1
Perfect Forward Secrecy	OFF

Table 10-42 VPN profile 3

Parameter	Setting
Authentication method	Certificate
IKE mode	Main
Phase 1 DH group	Group 2
Phase 1 encryption	3DES-168
Phase 1 SA lifetime	SA lifetime proposed by the initiator: 480 minutes Range permitted by the responder for the SA lifetime: 480 … 2880 minutes
Phase 1 authentication	SHA-1
Phase 2 SA lifetime type	Time
Phase 2 encryption	3DES-168
Phase 2 SA lifetime	SA lifetime proposed by the initiator: 2880 minutes Range permitted by the responder for the SA lifetime: 60 … 2880 minutes
Phase 2 authentication	SHA-1
Perfect Forward Secrecy	OFF

Table 10-43 VPN profile 4

Parameter	Setting
Authentication method	Certificate
IKE mode	Main
Phase 1 DH group	Group 2
Phase 1 encryption	DES
Phase 1 SA lifetime	SA lifetime proposed by the initiator: 480 minutes Range permitted by the responder for the SA lifetime: 480 … 2880 minutes
Phase 1 authentication	MD5
Phase 2 SA lifetime type	Time
Phase 2 encryption	3DES-168
Phase 2 SA lifetime	SA lifetime proposed by the initiator: 2880 minutes Range permitted by the responder for the SA lifetime: 60 … 2880 minutes
Phase 2 authentication	SHA-1
Perfect Forward Secrecy	OFF

Table 10-44 VPN profile 5

Parameter	Setting
Authentication method	Pre-shared key
IKE mode	Main
Phase 1 DH group	Group 2
Phase 1 encryption	3DES-168
Phase 1 SA lifetime	SA lifetime proposed by the initiator: 480 minutes Range permitted by the responder for the SA lifetime: 480 … 2880 minutes
Phase 1 authentication	SHA-1
Phase 2 SA lifetime type	Time
Phase 2 encryption	3DES-168
Phase 2 SA lifetime	SA lifetime proposed by the initiator: 2880 minutes Range permitted by the responder for the SA lifetime: 60 … 2880 minutes
Phase 2 authentication	SHA-1
Perfect Forward Secrecy	OFF

After opening a STEP 7 project, that was last stored with an older version than V14 SP1, all existing VPN groups with the authentication method "Certificate" are assigned the predefined fallback VPN profile 2 - 5 as default.

Special features for the SOFTNET Security Client and SCALANCE M

Configured fallback VPN profiles are not included in the configuration files for the Road Warrior modules SOFTNET Security Client and SCALANCE M For the SOFTNET Security Client and SCALANCE M modules the following applies:

- Select the VPN profile to be used for VPN connections of SOFTNET Security Client / SCALANCE M modules to SCALANCE S / CPs in the responder settings, see section Configuring module- and connection-specific VPN settings (Page 819).
- For VPN connections from SCALANCE M modules to SCALANCE M modules, the configured VPN group settings are used.
- For VPN connections from SOFTNET Security Client to SCALANCE M modules the settings of VPN profile 3 are always used.

Unsupported VPN group properties

The following VPN group properties are not supported by the individual modules:

Module	Phase 1					Phase 2			
	IKE mode	DH group	SA lifetime	Encryption	Authentication	SA lifetime type	SA lifetime	Encryption	Authentication
CP 1543-1 as of V2.1	-	-	Minutes outside the range 1440-2500000	-	SHA-384 SHA-512	-	Limit: MB outside the range 2000-500000	-	SHA-384 SHA-512
SOFTNET Security Client (Windows XP)	Aggressive	Group 1 Group 5 Group 14 Group 15	Minutes outside the range 1440-2879	AES-128 AES-192 AES-256	SHA-256 SHA-384 SHA-512	Limit	Time: Minutes outside the range 60-2879	AES-128	MD5 SHA-256 SHA-384 SHA-512
SOFTNET Security Client (Windows 7)	Aggressive	Group 1 Group 5 Group 14 Group 15	Minutes outside the range 1440-2879	-	SHA-256 SHA-384 SHA-512	Limit	Time: Minutes outside the range 60-2879	-	MD5 SHA-256 SHA-384 SHA-512

Module	Phase 1					Phase 2			
	IKE mode	DH group	SA lifetime	Encryption	Authentication	SA lifetime type	SA lifetime	Encryption	Authentication
SCALANCE M875	Aggressive	Group 1 Group 5 Group 14 Group 15	Minutes outside the range 1-2147483647	AES-128 AES-192 AES-256 DES	MD5 SHA-256 SHA-384 SHA-512	Limit	Time: Minutes outside the range 1-2147483647	AES-128 DES	MD5 SHA-256 SHA-384 SHA-512
Security device	-	Group 1	Minutes outside the range 1-2500000	-	-	-	Limit: MB outside the range 0-500000 Time: Minutes outside the range 1-16666666	-	-

- No restriction

The following applies to the other security modules: VPN group properties with a DH group higher than group 14 and/or authentication higher than SHA-1 are not supported.

Modes of VPN groups

VPN modes

Depending on the mode of the security modules that were added to a VPN group, different modes of VPN groups are distinguished. The mode of a VPN group provides information about the security modules and their modes that can be added to the VPN group.

Rules for forming groups

Remember the following rules if you want to create VPN groups:

- For SCALANCE S612 / S613 / S623 / S627-2M / SCALANCE M / VPN device
  The first module assigned in a VPN group decides which other modules can be added to it.
  If the first SCALANCE S module to be added is in routing mode or if the first module is a SCALANCE M module or a VPN device, only additional SCALANCE S modules with routing activated or SCALANCE M modules cor VPN devices an be added because SCALANCE M modules and VPN devices always operate in routing mode. If the first SCALANCE S module added is in bridge mode, you can only add other SCALANCE S modules in bridge mode. If you want to change the mode of a VPN group, you have to remove all the modules contained in the group and add them again. A CP and an SSC can be added to a group with a SCALANCE S in bridge or routing mode.
- For CP / SSC
  If a CP / SSC is the first module in a VPN group, security modules can be added in any mode. The next module that decides the mode then also decides the mode of the VPN group. A CP / SSC can be assigned to several VPN groups at the same time and use different modes. The CP / SSC is then operated in mixed mode.
- It is not possible to add a SCALANCE M module to a VPN group that contains a module in bridge mode.

Refer to the following table to see which modules can grouped together in a VPN group:

Table 10-45 Security modules and VPN modes

Module	Can be included in a VPN group in...	
	Bridge mode	Routing mode
SCALANCE S612 / S613 / S623 / S627-2M in bridge mode	x	-*
SCALANCE S612 / S613 / S623 / S627-2M in routing mode	-	x
CP 343-1 Adv. / CP 443-1 Adv.	x	x
S7-1200/S7-1500 CPs	x	x
CP 1628	x	x
SOFTNET Security Client V4.0	x	x
SCALANCE M875 / VPN device	-	x

* SCALANCE S623/S627-2M modules in bridge mode can be inserted in a VPN group in routing mode if their DMZ interface is activated (not at the same time).

Including security module in configured VPN group

The configured VPN group properties are adopted for security modules added to in an existing VPN group.

Procedure after including a security module in a configured VPN group

Depending on whether or not you have changed the VPN group properties since the last download, you must make a distinction between the following:

- **Case a:** If you have not changed the VPN group properties and the module to be added actively establishes the connection to modules of the type SCALANCE S, CP 343-1 Adv. / CP 443-1 Adv. or CP 1628:

1. Add the new security module to the VPN group.
2. Download the configuration to the new module.

- **Case b:** If you have changed the VPN group properties or the module being added does not actively establish the connection to the already configured modules:

1. Add the new security module to the VPN group.
2. Download the configuration to all modules that belong to the VPN group.

In case a, it is not necessary to reconfigure and load the already commissioned security modules. Active communication is not influenced or interrupted.

Procedure after removing an active member from a VPN group

If you remove an active node from an existing VPN group, this can still establish a connection to the group members even if you have downloaded the project to all members of the VPN group again.

If you do not want the removed active node to be able to establish the connection any longer, renew the CA group certificate and download the project again to the members of the VPN group. The certificate can be renewed in the group properties of the VPN group or in the "CA" tab of Certificate Manager.

Configuring network nodes reachable through a tunnel

Overview

Configuring network nodes reachable through a tunnel

Each security module must know the network nodes reachable via a VPN tunnel to be able to recognize the authenticity of a frame.

The security module must know both its own nodes as well as the nodes of the security modules in the same VPN group. This information is used on a security module to decide which data packet will be transferred in which tunnel.

By adding a security module to a VPN group, the local internal nodes/subnets of the security module are automatically made known to the security module. To allow communication via the VPN tunnel with other subnets or nodes of another subnet (routed internal network; DMZ network when the VPN tunnel is on the external interface and vice versa), these subnets or nodes must be enabled for VPN tunnel communication in the configuration.

SCALANCE S modules allow network nodes to be learned automatically or configured statically. The mode of the security module also decides the options available for learning internal network nodes.

SCALANCE S in bridge mode

In bridge mode, you can configure the IP/MAC nodes and the subnets or alternatively can allow automatic learning of nodes by the SCALANCE S.

SCALANCE S in routing mode

In routing mode there is no automatic learning mode available. Instead, enter entire subnets here that need to be released for tunnel communication.

CP 343-1 Advanced / CP 443-1 Advanced and CP 1628

- CP 343-1 Advanced / CP 443-1 Advanced
  Decide whether or not tunnel communication to the CP (Gbit interface) and/or to the internal subnet (PROFINET subnet) is permitted for VPN connection partners in routing mode (SCALANCE S / M).
- CP 1628
  Enter the NDIS nodes you want to be reachable through the tunnel of VPN connection partners in routing mode (SCALANCE S / M).

CP 1543-1 as of V2.1 with activated IP routing between communications modules

Enter the subnets or IP addresses reachable via the backplane bus of the station and that need to be released for tunnel communication.

Automatic learning of internal network nodes

Module-specific function

SCALANCE S modules in bridge mode provide a learning mode with which the internal network nodes can be learned automatically during operation. For more detailed information, refer to subsection:
Using the learning mode to learn internal nodes (Page 877) in the section "SCALANCE S".

Configuring IP network nodes manually for SCALANCE S

Module-specific function

How to configure IP network nodes for SCALANCE S modules manually is explained in:
Configuring IP network nodes manually (Page 878) in the section "SCALANCE S".

Configuring MAC network nodes manually for SCALANCE S

Module-specific function

How to configure MAC network nodes for SCALANCE S modules manually is explained in Configuring MAC network nodes manually (Page 879) in the section "SCALANCE S".

Configuring internal subnets for SCALANCE S manually

Module-specific function

How to configure the internal subnets for SCALANCE S modules is explained in Configuring internal subnets manually (Page 879) in the section "SCALANCE S".

Allow access to S7-300 / S7-400 CPs for VPN connection partners

Module-specific function

How to allow access to S7-300 / S7-400 CPs for VPN connection partners is explained in Allow access to S7-300 / S7-400 CPs for VPN connection partners (Page 903) in the section "Security for S7-300 /S7-400 /PC CPs".

Configuring NDIS nodes for PC CPs that can be reached through the tunnel

Module-specific function

How you configure NDIS nodes for PC CPs that can be reached through the tunnel is explained in
Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel (Page 903) in the section "Security for S7-300 / S7-400 / PC CPs".

Configuring subnets reachable via the backplane bus for CP 1543-1

Module-specific function

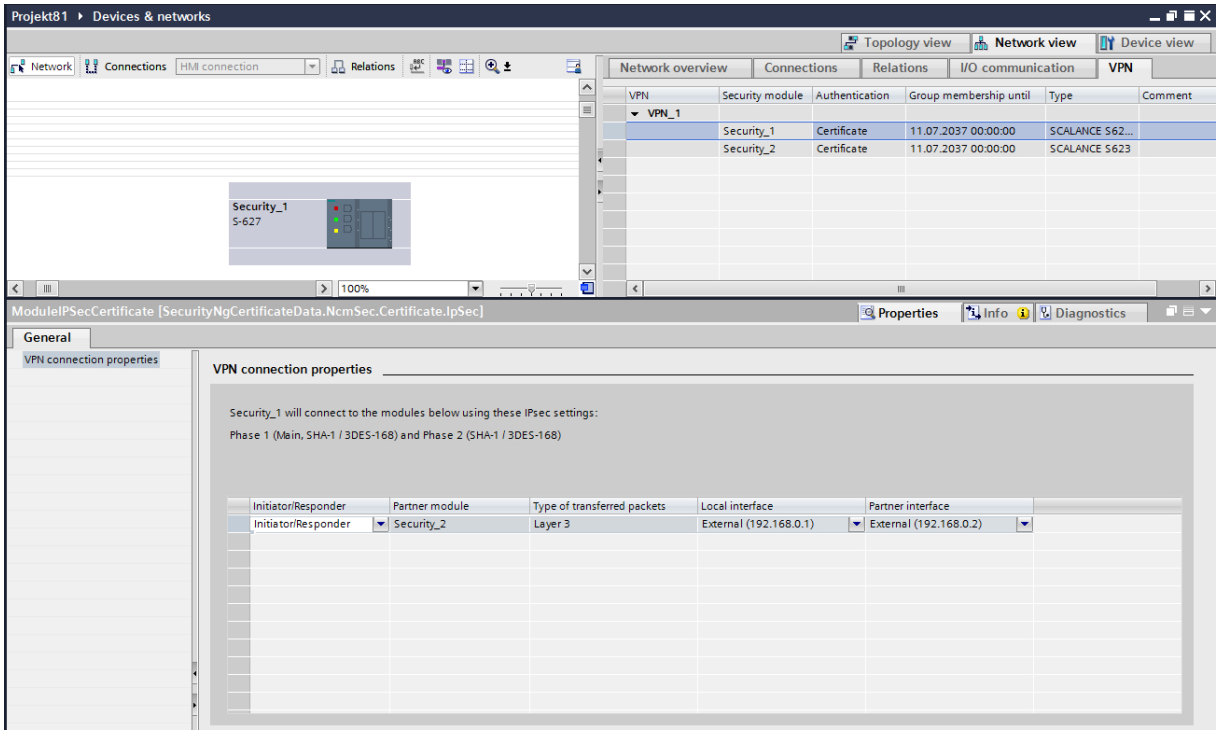
For information on how to configure subnets and network nodes reachable via the backplane bus of the station for CP 1543-1 as of V2.1, see section
Configuring subnets reachable via the backplane bus for CP 1543-1 (Page 914).

Configuring module- and connection-specific VPN settings

Requirement

The module is a member of a VPN group.

Module- and connection-specific settings



With module- and connection-specific settings, you can configure specific VPN settings. Module-specific settings are configured specifically for a security module while connection-specific settings are configured specifically for a security module in a certain VPN group.

You can configure the following **module-specific** properties in the local security settings with the "VPN" entry:

- Dead peer detection
- Permission to initiate connection establishment
- Public address (IP address / FQDN) for communication via Internet gateways
- Responder settings for Road Warrior connections
- Nodes that need to be enabled for tunnel communication

If you select a security module in the list of VPN groups in the "Network data" area, the following **connection-specific** VPN settings can be seen and can be configured:

- Permission to initiate connection establishment
- Partner modules to which tunnel connections exist
- Type of transferred packets
- Selection of the local interface of the selected security module that will serve as the tunnel endpoint
- Selection of the partner interface that will serve as the tunnel endpoint

Dead peer detection (DPD)

As default, DPD is enabled.

When DPD is enabled, the modules exchange additional messages at selectable intervals if no communication occurs at these points in time. This means that it is possible to recognize whether the IPsec connection is still valid or possibly needs to be re-established. If there is no longer a connection, the security associations (SA) of phase 2 are terminated prematurely. If DPD is disabled, the SA is ended only after the SA lifetime has expired. For information on setting the SA lifetime, see section
Configuring VPN group properties (Page 808).

Permission to initiate connection establishment

You can restrict the permission for initiating the VPN connection establishment to certain modules in the VPN.

The decisive factor for the setting of the parameter described is the assignment of the address for the gateway of the module you are configuring. If a static IP address is assigned, the module can be found by the partner. If the IP address is assigned dynamically and therefore changes constantly, the partner cannot establish a connection as things stand.

Mode	Meaning
Start connection to partner (initiator/responder) (default)	If this option is selected, the module is "active", in other words, it attempts to establish a connection to the partner with a fixed IP address. The reception of requests for VPN connection establishment is also possible. This option is recommended when you obtain a dynamic IP address from the provider for the gateway of the security module you are configuring. The partner is addressed using its configured WAN IP address, its configured external module IP address or the configured DNS name.
Wait for partner (responder)	If this option is selected, the module is "passive", in other words, it waits for the partner to initiate the connection. This option is recommended when you have been assigned a static IP address by the provider for the gateway of the security module you are configuring. It means attempts to establish a connection can only be initiated by the partner. This partner can, for example, have a dynamic WAN IP address.

Note

Make sure that you do not set all the modules in a VPN group to "Wait for connection from remote VPN gateway" otherwise no connection is established.

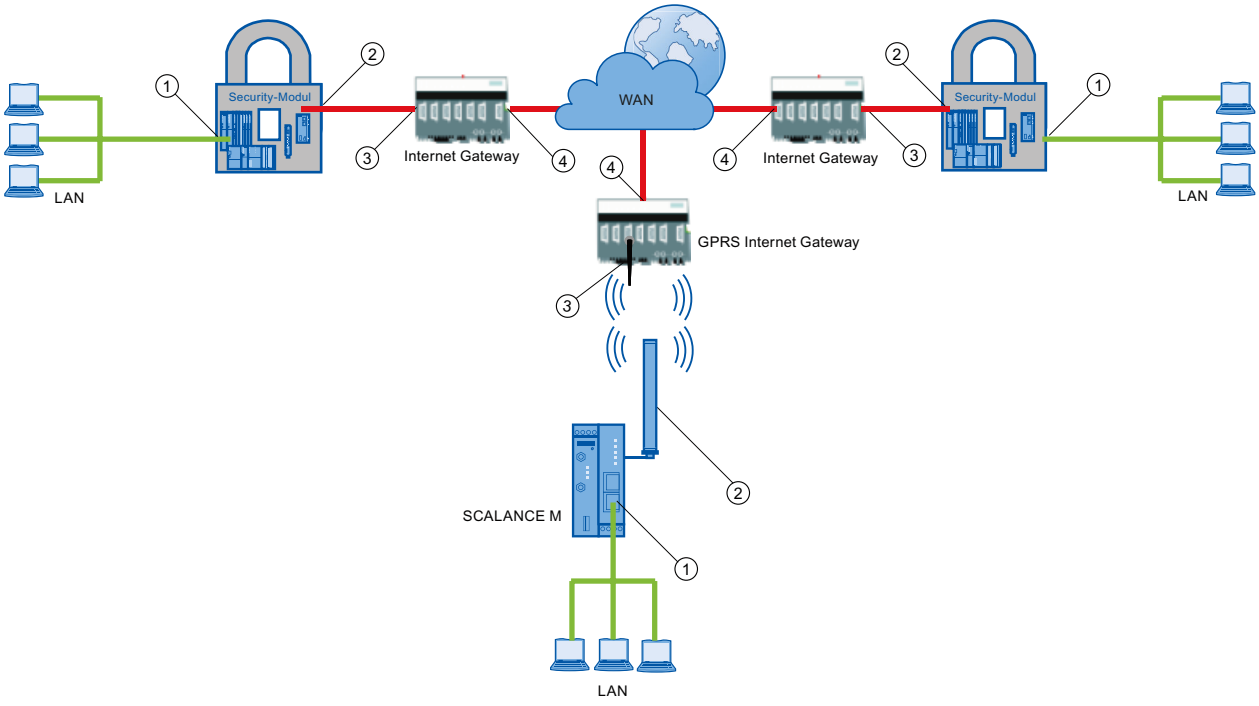
WAN IP address / FQDN - addresses of the modules and gateways in a VPN over Internet

When operating a VPN with IPsec tunnel over the Internet, additional IP addresses are generally required for the Internet gateways such as DSL routers. The individual security or SCALANCE M modules must know the external IP addresses of the partner modules in the VPN.

Note

To use a WAN as an external public network, enter the IP address that you received from the provider as the external IP address, through which the security module is then reachable in the WAN (Internet). To allow the security module to send packets via the WAN, you need to enter your DSL router as "Standard router".

If you use a DSL router as Internet gateway, the following ports (at least) must be opened on it as described in the relevant documentation:



- Port 500 (ISAKMP)
- Port 4500 (NAT-T)

To allow this, in the module-specific VPN settings, you have the option of assigning an IP address as a "WAN IP address". When you download the module configuration, the group members are then informed of the WAN IP addresses of the partner modules. As an alternative to a WAN IP address, you can also enter an FQDN. Depending on the existing addresses, VPN endpoints are used as default according to the following priorities:

1. WAN address
2. FQDN of the primary dynamic DNS service
3. FQDN of the secondary dynamic DNS service
4. External IP address / DMZ IP address of the security module

Note: After removing an existing WAN address, the external IP address / DMZ IP address is always used.

In the interface selection of the connection-specific VPN settings, you yourself can decide which address the partner will be informed of. In these settings, you can also specify the interface to be used for communication by the nodes of a VPN group and the security module that is authorized to set up connections.

① Internal IP address - of a module
② External IP address - of a module
③ IP address of an Internet gateway (for example, GPRS gateway)
④ IP address (WAN IP address) of an Internet gateway (for example, DSL router)

Responder settings for Road Warrior connections

The configuration of responder setting for Road Warrior connections is only possible in V14 SP1 projects. For information on upgrading projects, refer to section Create users (Page 733).

The VPN connection establishment by Unknown Peers (Road Warriors) is allowed by the responder as default with the secure VPN properties of VPN profile 1. You can allow or block

the VPN connection establishment by Unknown Peers and the properties used by selecting a VPN group profile and by selecting VPN profiles.

Operator control element	Meaning
Allow VPN connection establishment by Road Warriors	The responder allows VPN connection establishment by Unknown Peers.
VPN profile 1 - 5 in the selection dialog for VPN profiles	The responder allows VPN connection establishment by unknown peers with the properties of the predefined VPN profiles 1 - 5. The properties of these VPN profiles correspond to the properties of the fallback VPN profiles that you can select for VPN groups, see section Configuring VPN group properties (Page 808).
VPN group profiles in the selection dialog for VPN profiles	The responder allows VPN connection establishment by Unknown Peers with the properties of the VPN group selected in the selection dialog for VPN profiles with a check mark. The VPN groups can be selected in which the responder is located. A maximum of one VPN group can be selected and used as a VPN group profile. With the "Add" button, new VPN groups can be created to which the responder is automatically assigned. These VPN groups can then be selected for the formation of a VPN group profile. If VPN connection establishment by Unknown Peers with the properties of the VPN group in which the responder and the Unknown Peers are located is to be allowed, this VPN group must be selected in the selection dialog.

After opening a STEP 7 project last saved with a version older than V14 SP1, the check box "Allow VPN connection establishment by Road Warriors" is activated s default. In addition to this, the responder is assigned the predefined VPN profiles 2 - 5.

For VPN connections from SOFTNET Security Client / SCALANCE M-800 modules to SCALANCE S / CPs the selected VPN profile with the highest priority is always used and read out. The authentication method of the selected VPN profile must match the authentication method of the corresponding VPN group. The priority of the VPN profiles is as follows:

1 Selected VPN group profile
2. VPN profile 1
3. VPN profile 2
4. VPN profile 3
5. VPN profile 4
6. VPN profile 5

For VPN connections from SCALANCE M875 modules to SCALANCE S / CPs, VPN profile 3 must be selected if the authentication method of the corresponding VPN group is "Certificate". If the authentication method of the corresponding VPN group is "Preshared key", VPN profile 5 must be selected.

Configuring internal network nodes

The configuration of internal network nodes is described in the following section:
AUTOHOTSPOT

How to create an IPsec tunnel with VPN groups (Page 803)

Configuring router and firewall redundancy

Module-specific function

This function is available only for SCALANCE S623/S627-2M as of V4, see section AUTOHOTSPOT.

Online functions - diagnostics and logging

Overview of diagnostics and logging in

For test and monitoring purposes, the security module has diagnostic and logging functions.

- Diagnostic functions
  These include various system and status functions that you can use for an existing network connection to the security module.
- Logging functions
  This involves the logging of system and security events and data packets.

Recording events with logging functions

You select the events to be logged in the log settings for the relevant security module.

You can configure the following variants for logging:

- Local logging
  In this variant, you log events in the local buffer of the security module. You can then access these logs, display them and archive them on the service station in the "Online & diagnostics" dialog. The evaluation of the buffer areas of the security module is only possible if there is a network connection to the selected security module.
- Network Syslog
  With Network Syslog, you use a Syslog server that exists in the network. This logs the events according to the configuration in the log settings for the relevant security module.

Archiving log data and reading in from a file

You can save the logged events for archiving in a log file and open this later even without a network connection to the security module. For more detailed information, refer to section AUTOHOTSPOT.

Diagnostics in ghost mode (only for SCALANCE S S602 as of V3.1)

When you operate the security module in ghost mode, the external interface of the security module takes over the IP address of the internal node at runtime. Before you can run diagnostics of a security module in ghost mode, you need to establish the connection to the security module via the IP address that the security module obtained from the internal node at runtime.

To find out which IP address the security module currently has, you can search for accessible nodes in STEP 7 using the "Online" > "Accessible devices".

Protecting exported log files from unauthorized access

Log files exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

Function overview online dialog

Functions of the "Online & diagnostics" dialog

In STEP 7, the security module provides the following functions in the "Online & diagnostics" dialog:

Entry in the online dialog	Function
Status	Display of status information about the selected security module, such as the current IP addresses of the interfaces and the current time and date.
Interface settings	Overview of the settings of the individual interfaces.
Dynamic DNS	Overview of the settings for dynamic DNS.
System log	Display of logged system events, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
Audit log	Display of logged security events, starting and stopping reading out of log data from the local buffer of the security module.
Packet filter log	Display of logged data packets, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
ARP table	Display of the ARP table of the security module.
Logged-on users	Shows the users logged in to the Internet page for user-specific IP rule sets.
Communications status	Display of status information about VPN tunnel connections and members of VPN groups to which the selected security module belongs.
Internal nodes	Display of the learned or configured internal network nodes of the security module.
Dynamically updated firewall rules	Display of the IP addresses that were released dynamically over HTTP or HTTPS, or loaded by a user.
Firewall blacklist	Display of the IP addresses that were entered in the blacklist of the firewall.
Ghost mode	Dialog for the ghost mode of the SCALANCE S602 with information on the address parameters of the internal node (identical to the external IP address of the security module) and on IP address changes of the internal node.
Log files (offline view)	
• System log	Display of logged system events as well as starting and stopping the display.
• Audit log	Display of logged security events as well as starting and stopping the display.
• Packet filter log	Display of logged data packets as well as starting and stopping the display.
Date and time of day	Date and time setting.
Firmware update	Updating the firmware.

Requirements for access

The following requirements must be met to use the online functions of a security module:

- There is a network connection to the selected module
- The project with which the module was configured is open
- a user with the required rights must be logged in to the project
- For CPs the diagnostics access must be opened in the firewall (CP 343-1 Adv. / 443-1 Adv. and CP 1628: TCP 443; S7-1200/S7-1500 CPs: TCP 8448)

Note

Requirement for online diagnostics in ghost mode (only for SCALANCE S S602 as of V3.1)

Online diagnostics is only available in ghost mode if the security module has learned the IP address of the internal node and has adopted this for its external interface. After this, the security module can be reached via the IP address of the external interface.

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. If there is no online connection established to the security module, click the "Connect online" button in the "Diagnostics" entry.

Online settings are not saved in the configuration

Settings that you make in online mode (for example settings for the logging memory) are not stored in the configuration on the security module. This is why the configuration settings are always applied at the restart of the module.

Functions of the online diagnostics

Status information of the security module - "Status" entry

Meaning

Display of the status of the security module selected in the project.

Table 10-46 Online & diagnostics: - "Status" entry

System and status functions	Meaning
Overview	
Hardware type	The type of the security module.

System and status functions	Meaning
External IP address	The external IP address of the security module. For S7-1200/S7-1500 CPs, CP 1628: The IP address of the Industrial Ethernet interface. For CP 343-1 Adv. / 443-1 Adv.: The IP address of the Gbit interface.
Internal IP address	The internal IP address of the security module. For CP 1628: The IP address of the NDIS interface. If there is more than one NDIS address, only one is displayed. For CP 343-1 Adv. / 443-1 Adv.: The IP address of the PROFINET interface.
DMZ IP address (SCALANCE S623 / S627-2M only)	The DMZ IP address of the security module.
Tunnel IP address (only SCALANCE S612/S623/ S627-2M as of V4)	The first alias internal IP address of the security module in the VPN tunnel.
Serial number	The serial number of the security module.
Article number	The article number of the security module that is used when ordering.
Firmware version	The firmware version of the security module.
Operating mode	Mode of the security module (bridge mode / routing mode)
External MAC address	The external MAC address of the security module. For S7-1200/S7-1500 CPs, CP 1628: The MAC address of the Industrial Ethernet interface. For CP 343-1 Adv. / 443-1 Adv.: The MAC address of the gigabit interface.
Internal MAC address	The internal MAC address of the security module. For CP 1628: The MAC address of the NDIS interface. For CP 343-1 Adv. / 443-1 Adv.: The MAC address of the PROFINET interface.
DMZ MAC address (SCALANCE S623 / S627-2M only)	The DMZ MAC address of the security module
Hardware release	The hardware product version of the security module.
C-PLUG	Shows whether or not a C-PLUG is inserted.
Alias IP addresses (only for SCALANCE S as of V4)	
IP address	Alias IP address that was registered on an interface of the security module by a NAT rule.
Corresponding Interface	Interface of the security module on which the alias IP address was registered.
Local time	

System and status functions	Meaning
Current time	Date and time that is displayed on the security module. Format for "German" user interface language: dd.mm.yyyy (date) hh:mm:ss (time) Format for "English" user interface language: mm/dd/yyyy (date) hh:mm:ss AM/PM (time) Format for "French", "Italian" and "Spanish" user interface language: dd/mm/yyyy (date) hh:mm:ss (time) Format for "Chinese" user interface language: yyyy/mm/dd (date) hh:mm:ss **Note (not for CPs)** You set the local time on the SCALANCE S module in "Functions" > "Date and time".
Operating time	Time since the last restart of the security module. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dddd.hh:mm:ss
Time-of-day source	The source from which the date and time are obtained.
Configuration	
Created	Date and time when the project was first created. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dd.mm.yyyy (date) hh:mm:ss (time)
Name	File name of the project last loaded.
Author	Name of the user who created the project. Is adopted from the project properties.
Compiled	Date and time when the project was last compiled. Format with the user interface language "German", "English", "French", "Italian", "Spanish" and "Chinese": dd.mm.yyyy (date) hh:mm:ss (time)
Storage location	Specifies the location (e.g. town) that was entered in the properties of an SCT project.
File system (not for CPs)	
RAM	Indicates how much RAM and flash is occupied in the file system.
Flash	

Overview of the individual interfaces - "Interface settings" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the individual interfaces - "Interface settings" entry (Page 885)

Overview of the Dyn. DNS settings - "Dynamic DNS" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the Dyn. DNS settings - "Dynamic DNS" entry (Page 886)

Display of the ARP table - "ARP table" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Display of the ARP table - "ARP table" entry (Page 888)

Users logged in to the Web page - "Logged in users" entry

Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Users logged in to the Web page - "Logged in users" entry (Page 888)

VPN connections of the security module - "Communication status" entry

Meaning

Display of the communication status of the following network components:

- Other security modules of the VPN group to which the selected security module belongs
- Internal network nodes of these security modules

Table 10-47 Online & diagnostics: "Communication Status" entry

System and status functions	Meaning
Known security devices or modules	Display of the nodes with which the selected security module is in a VPN group. This also shows whether the tunnel status is active or passive. To obtain additional information on one of the nodes, select this in the list. **Note:** Configured, inactive tunnels are indicated for CPs only.
Endpoints	Display of information on the internal network nodes of the security module that you selected in the "Known security devices or modules" table. For each internal network node, this shows whether it was learned or configured. It also shows the subnet in which the internal network node is located. With SCALANCE S modules, the subnet of network nodes is only displayed in bridge mode.
Tunnel properties	Display of properties of the VPN tunnel established to the security module that you selected in the "Known security devices or modules" table.

Found internal network nodes - "Internal nodes" entry

Meaning

Display of all learned and configured network nodes. This also displays whether or not the learning mode of the security module is enabled.

Updated firewall rules - "Dynamically updated firewall rules" entry

Module-specific function

This function is only available for CP 343-1 Adv. / 443-1 Adv., see section: AUTOHOTSPOTin the section "Security for S7-300 / S7-400 / PC CPs".

See also

Updated firewall rules - "Dynamically updated firewall rules" entry (Page 903)

Display of the firewall blacklist - "Firewall blacklist" entry

Module-specific function

This function is available only for SCALANCE S V4 modules or higher, see section Display of the firewall blacklist - "Firewall blacklist" entry (Page 888).

Setting the date and time - "Date and Time" entry

Module-specific function

This function is available only for SCALANCE S, see section Setting the date and time - "Date and time" entry (Page 889).

Diagnostics in ghost mode - "Ghost mode" entry

Module-specific function

This function is available only for SCALANCE S602 as of V3.1, see section Diagnostics in ghost mode - "Ghost mode" entry (Page 889).

Logging functions

Logging system events - "System log" entry

Meaning

Display of logged system events and starting and stopping reading system events from the local memory of the security module.

The system log automatically logs successive system events, for example the start of a process. The logging can be scaled based on event classes.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops recording of system events. The method and the event classes that are logged are configured in the local security settings.
Start/stop reading	Starts/stops reading of system events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening saved system events in log files, refer to section Evaluating system events in offline mode - "System log" entry (offline view) (Page 834).

Logging security events - "Audit log" entry

Meaning

Display of logged security events and starting and stopping reading of security events from the local memory of the security module.

The audit log automatically logs successive security-relevant events. This includes, for example, user actions such as enabling and disabling packet logging.

System and status functions	Meaning
Start/stop reading	Starts/stops reading of security events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening security events stored in log files, refer to section Evaluating security events in offline mode - "Audit log" entry (offline view) (Page 835).

Logging data packets - "Packet filter log" entry

Meaning

Display of logged data packets and starting and stopping reading of packet filter events.

The packet filter log records certain packets of the data traffic. Data packets are only logged if they match a configured packet filter rule (firewall) or to which the basic protection reacts (corrupt or invalid packets). This is only possible when logging is enabled for the packet filter rule.

For information about activation of the logging, refer to section AUTOHOTSPOT.

As well as reading the log data from the buffer and transferring it to the display, it can also be saved in a file for archiving.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops logging of data packets. The method with which the data is logged is configured in the local security settings.
Start/stop reading	Starts/stops reading out of logged data packets from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. **Note** If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.
Log category	Select the data packets for which the logging will be displayed. The selection depends on the settings you configured offline in the local security settings. Only the data packets for which logging was enabled are logged. If you select a category for which logging was not enabled, no data will be logged for this category.

For information on opening the stored packet filter log data, refer to section Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view) (Page 835).

Evaluating log files in offline mode

Evaluating system events in offline mode - "System log" entry (offline view)

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "System log".

Meaning

Opens logged system events that you saved as a file in the online view.

For more information, refer to chapter Logging system events - "System log" entry (Page 832).

Evaluating security events in offline mode - "Audit log" entry (offline view)

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Audit log".

Meaning

Opens logged security events that you saved as a file in the online view.

For more detailed information, refer to section Logging security events - "Audit log" entry (Page 833).

Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view)

How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Packet filter log".

Meaning

Opens logged data packets that you saved as a file in the online view.

For more detailed information, refer to section Logging data packets - "Packet filter log" entry (Page 833).

Download functions

Special features when downloading security configurations

Security configurations can influence the reachability of the security module for the configuration PC. This, for example, is the case if there is a tunnel connection configured for one security module to another security module in a configuration and this configuration is downloaded from the configuration PC to the security module. After the download by the configuration PC, the security module can no longer be reached and the reachability test performed as default by STEP 7 following the download of the configuration fails. The error message output by STEP 7 relates solely to the reachability test; the actual download of the configuration is ensured if the project data is consistent and the IP address relationship between the security module and the configuration PC is correct.

Special features when downloading configurations and firmware to SCALANCE S modules are described in the following subsection of the section "SCALANCE S": AUTOHOTSPOT

Uploading configurations to the engineering station

Uploading a configuration from a SCALANCE S module or from the CP 1628 to an engineering station is not possible.

Uploading a configuration from an S7 CP that supports security to an engineering station is also possible if security features were included in the configuration. Configured security functions are not, however, transferred to the engineering station. In the transferred configuration on the engineering station, the "Activate security features" check box is also deselected.

SOFTNET Security Client

Using the SOFTNET Security Client

Area of application - access over VPN

With the SOFTNET Security Client (SSC) PC software, secure remote access is possible from PGs/PCs to automation systems protected by a security module via public networks. You require SOFTNET Security Client V4.0 HF1 for S7-300/S7-400 CPs and for the PC CP 1628. These CPs are not approved for operation with SOFTNET Security Client ≤ V4.0. The SOFTNET Security Client has not been released for other CPs.

With the SOFTNET Security Client, a PG/PC is configured automatically so that it can establish a secure IPsec tunnel communication in the VPN (Virtual Private Network) with one or more security modules.

This IPsec tunnel communication makes it possible for PG/PC applications such as NCM diagnostics to securely access devices or networks that are located in an internal network protected by the security module.

How does the SOFTNET Security Client work?

The SOFTNET Security Client reads the configuration that was created by STEP 7 and, if necessary, determines from the file which certificates are to be imported.

The CA certificate and the private key are imported when applicable and stored on the local PG/PC.

Following this, security settings are made based on the data from the configuration so that applications can access IP addresses downstream from the security modules.

If the learning mode is enabled for the internal nodes or programmable controllers, a security policy is first set for secure access to security modules. Then, the SOFTNET Security Client addresses the security modules in order to obtain the IP addresses of the relevant internal nodes.

The SOFTNET Security Client enters these IP addresses in special filter lists belonging to this security policy. Applications can then communicate with the programmable controllers via VPN.

Note

Additional security measures when using the SOFTNET Security Client

The SOFTNET Security Client provides a solution for secure communication with automation cells via VPN. For self-protection of the PC/PG and the corresponding automation cell, it is advisable to use additional measures such as a virus scanner and the Windows firewall.

In Windows 7, the firewall of the operating system must be enabled so that VPN tunnel establishment works.

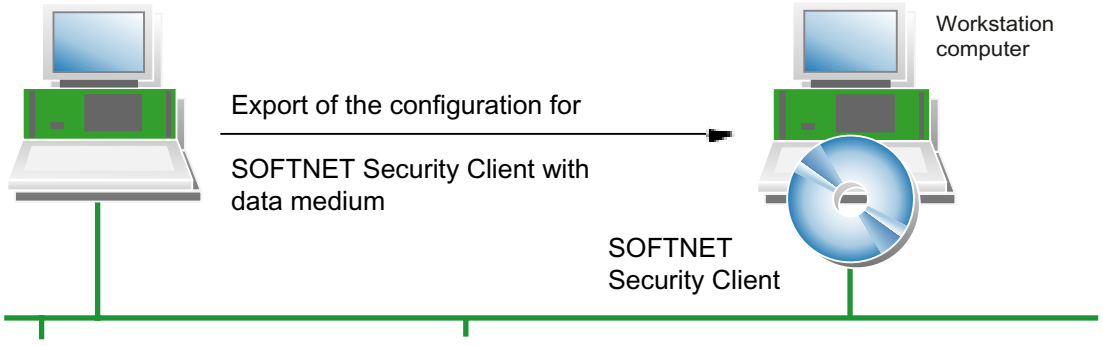
Creating a configuration file in STEP 7

Configuring a SOFTNET Security Client module in the project

The SOFTNET security client is created as a module in the project. In contrast to the other security modules, you do not need to configure any further properties.

Assign the SSC module to the VPN group or groups at which an IPsec tunnel to the PG/PC is to be set up.

Note



Refer to the information on parameters in section
Including security module in configured VPN group (Page 816).

Note

If you create several SOFTNET Security Clients within a group, no tunnels are set up between these clients but only from the relevant client to the security modules.

Configuration files for the SOFTNET Security Client

The interface between STEP 7 as configuration tool and the SOFTNET Security Client is controlled by configuration files.

The configuration is stored in the file types "*.dat", "*.p12" and "*.cer".

Procedure

To generate the configuration files, perform the following steps in STEP 7:

1. In the "Devices & networks" view, select the "Topology view" or the "Network view" tab.
2. Insert a PC system of the type "SOFTNET Security Client" in the selected tab from the hardware catalog.
3. Assign the SOFTNET Security Client to the VPN groups in which the PG/PC will communicate over IPsec tunnels.
4. Make sure that the "Generate SSC files" check box is selected under the "Configuration of the SOFTNET Security Client" entry in the local security settings of the SOFTNET Security Client.
5. Select the storage location for the configuration files.
6. Compile the configuration of the SOFTNET Security client to export the configuration file.
7. If you selected certificate as the authentication method, specify a password for the certificate of the VPN configuration. If you do not assign a password, the project name (not the project password) is used as the password.
   Result: Export of the configuration files is completed.
8. Adopt the files of the type *.dat, *.p12, *.cer on the PG/PC on which you want to operate the SOFTNET Security Client.

Note

Protecting exported configuration files from unauthorized access

Configuration files for SOFTNET Security Client exported from STEP 7 can contain security related information. You should therefore make sure that these files are protected from unauthorized access. This is particularly important when passing on the files.

SCALANCE S

Replacing a security module

Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

Requirement

To be able to replace security modules, their module descriptions must be up to date. To update the module description of security modules, follow the steps below:

1. Select the security module to be edited.
2. In the local security settings, click on the entry "General" > "Catalog information".
3. Click the "Update module description" button.

How to access this function

1. Select the security module to be edited in the topology or network view.
2. Right-click on the security module and select the shortcut menu command "Change device...".
   Based on the following table, you can see which security modules you can replace without data loss and which could involve a possible data loss.

Initial module	Possible module replacement									
	S602 V3	S602 V3.1	S602 V4	S612 V3	S612 V4	S623 V3	S623 V4	S623 V4.0.1	S627-2 M V4	S627-2 M V4.0.1
S602 V3	-	x	x	x	x	x	x	x	x	x
S602 V3.1	!	-	x	!	!	!	!	!	!	!
S602 V4	!	!	-	!	!	!	!	!	!	!
S612 V3	!	!	!	-	x	x	x	x	x	x
S612 V4	!	!	!	!	-	!	x	x	x	x
S623 V3	!	!	!	!	!	-	x	x	x	x
S623 V4	!	!	!	!	!	!	-	x	x	x
S623 V4.0.1	!	!	!	!	!	!	!	-	!	x
S627-2M V4	!	!	!	!	!	!	!	!	-	x
S627-2M V4.0.1	!	!	!	!	!	!	!	!	!	-

x Without losses

! Possibly with losses

- The module type and the firmware version are not changed.

Configuring interfaces for SCALANCE S modules

Overview

Configuring the mode

With the mode you specify how interface routing is handled (external/internal). The DMZ interface of the security module (SCALANCE S623/S627-2M only) is always connected in routing mode. For more detailed information, refer to the section
Configuring IP address parameters (Page 842)

Configuring the interfaces

If the external interface, the DMZ interface (SCALANCE S623/S627-2M only) or the tunnel interface (only SCALANCE S612/S623/S627-2M as of V4 in VPN group(s)) of a security module needs to be configured, it must be activated using the "Activate interface" check box. Set the IP address information for each interface and settings for the individual ports. The following options are available with which you can assign an IP address for the external interface and for the DMZ interface in the "General" entry (SCALANCE S623/S627-2M only):

- Static IP address with subnet mask. For more detailed information, refer to the section Configuring IP address parameters (Page 842)
- Address assignment using PPPoE. For more detailed information, refer to the section Configuring an Internet connection (Page 844)
  The internal interface and the tunnel interface can only be configured using a static IP address.

If alias IP addresses were registered on the interfaces of the security module due to configuring NAT rules, these are displayed in the "Alias IP addresses" entry.

Note

External interface and DMZ interface as Internet access

The simultaneous operation of PPPoE on the external interface and on the DMZ interface (dual ISP) is not possible.

Point to Point Protocol over Ethernet (PPPoE)

To allow Internet/WAN access directly via a DSL modem, the IP address on the external interface or on the DMZ interface is assigned using PPPoE. PPPoE is a dial-in protocol for obtaining IP addresses from an Internet service provider (ISP). SCALANCE S is operated here in routing mode.

To use this IP address assignment mode, specify the ISP in the "PPPoE" entry. The IP address, the subnet mask, the standard router and the DNS server of the interface are specified by the ISP.

Note

A configured standard router is not taken into account when using PPPoE. This is assigned dynamically to the module by the ISP.

Note

No network components between SCALANCE S and DSL modem

If the interface of a SCALANCE S module is operated using PPPoE, there must be no other network components between this interface and the connected DSL modem, otherwise the dial-in data of the Internet Service Provider may be transferred unencrypted over this link. When using the "CHAP" authentication protocol, the data is transferred encrypted.

Configuring media modules

In addition to the functions of the SCALANCE S623, the S627-2M has two media module slots in which an electrical or optical media module with two ports can be inserted. This expands both the external and internal interface by up to two ports. In routing mode, the additional ports of the security module can be used to link the external and internal interface to ring topologies.

To integrate media modules in the SCALANCE S627-2M, select the security module and change to the device view. Then select the required media modules from the hardware catalog.

For ports with the port type "Copper", you can set the transmission speed and the duplex method manually using the port mode. For ports with the port type "Optical", the port mode is fixed by the media module used or by the SFP transceiver used and cannot be adapted.

You will find information on connecting the media module ports to MRP rings in the following section:
AUTOHOTSPOT

Setting the operating mode

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Mode".

Operating mode - possible selections

You can change the operating mode in this dialog if the security module is not included in a VPN group. If the security module is in a VPN group, the mode cannot be changed.

The selection applies to interface routing between the external and internal interface. The DMZ interface (SCALANCE S623 and S627-2M only) is always connected in routing mode.

Bridge mode	For operation in flat networks. External and internal interface are in the same IP subnet. For S623 / S627-2M: External and internal interface are in the same IP subnet, the DMZ interface is in a different IP subnet or is deactivated.
Routing mode	All interfaces are in different IP subnets. If you have activated the routing mode, you must configure an internal IP address and subnet mask for the internal interface of the security module. **Note** If you have enabled the routing mode for the SCALANCE S module, no MAC firewall rules can be defined.
Ghost mode (only for SCALANCE S S602 as of V3.1)	In operation, the security module adopts the IP address of the node connected to the internal interface of the security module for the external interface. The IP address data specified for the external interface is only used for downloading the configuration prior to operation in ghost mode.

Configuring IP address parameters

Meaning

Specify network parameters such as the IP address and subnet mask for the interface(s) of the security module.

How to access this function

1. Select the module to be edited.
2. Select "External interface [P1] red" or "DMZ interface [P3] yellow" in the local security settings. The virtual tunnel interface can only be configured when the security module (only SCALANCE S612/S623/S627-2M as of V4) is in at least one VPN group, refer to the section "Meaning of the tunnel IP address".

   Note

   Configuration of the internal interface in routing mode

   If you have selected the "Routing" mode for the security module, you must also configure an internal IP address and subnet mask for the internal interface of the security module. You can access this function in the local security settings under "Internal interface [P2] green" > Ethernet addresses".
3. If applicable, enable the interface using the "Activate interface" check box.
4. Select the "Ethernet addresses" entry.
5. Complete the settings specified in the following table.

Parameter	Meaning
IP address	IP address for the external interface. The IP address consists of four decimal numbers from 0 to 255, with each number being separated by a period, for example, 141.80.0.16.
Subnet mask	The subnet mask consists of four decimal numbers that are separated by period, for example, 255.255.0.0
Use router (not possible for the tunnel interface)	Select this check box if you want to use a standard router and enter its IP address in the "Router address" input box.

Note

Networking the physical interfaces

Network the physical interfaces of the security module with suitable subnets to avoid IP address conflicts.

Meaning of the tunnel IP address

If you use the function "NAT/NAPT in the VPN tunnel" for a SCALANCE S612/S623/S627-2M module as of V4, you need to assign a tunnel IP address for the security module. This ensures the reachability of the security module via the VPN tunnel and provides a configuration and diagnostics option. The configured tunnel IP address can be expanded with alias tunnel IP addresses using suitable NAT / NAPT rules. The subnet mask is fixed at 32 bits for the tunnel IP address and cannot be changed by the configuration. The tunnel IP address can only be configured if the security module is in at least one VPN group.

You will find further information on address translation with NAT/NAPT in VPN tunnels in the following section:
Address translation with NAT/NAPT in VPN tunnels (Page 870)

Special features with a standard router

- If the IP assignment configured is via "PPPoE", a configured standard router is ignored because the standard route is always automatically via the PPPoE interface.
- If the address assignment configured is with "Static address" and if the security module is connected to the Internet via a DSL (NAPT) router, the DSL router must be entered as the standard router.
- For security modules in ghost mode (SCALANCE S602 as of V3.1 only), no standard routers can be configured since these are identified during runtime. Specific routes cannot be configured for security modules in ghost mode.

Configuring port mode

Meaning

The port mode specifies the transmission speed and the duplex method. The same parameters should be set for the ports involved in communication.

Configurable port modes

For SCALANCE S V3 and higher, the following port modes can be configured for the permanently installed ports:

Port mode	Meaning
Autonegotiation	The transmission speed and the duplex setting are selected automatically. **Note** A transmission speed of 1000 Mbps and the autocrossing function are supported only if autonegotiation is selected.
10 Mbps, half and full duplex	Transmission speed of 10 Mbps
100 Mbps, half and full duplex	Transmission speed of 100 Mbps

Deactivating a port is possible only for external ports and for the DMZ port of SCALANCE S623/ S627-2M. The port modes for media module ports are configured in the device view and are based on the range of functions of the media module in question.

Configuring an Internet connection

Requirement

The "PPPoE" entry is only displayed in the local security settings if the IP assignment method "PPPoE" is configured for one of the interfaces.

How to access this function

1. Select the security module to be edited
2. In the local security settings, select the entry "PPPoE".

Meaning

In this entry, you make settings related to the Internet Service Provider (ISP) if a connection using PPPoE is set for one of the interfaces of the security module.

Table 10-48 Settings for the ISP account

Function	Description
Authentication protocol	Select none or one of the following authentication protocols: • PAP (Password Authentication Protocol) • CHAP (Challenge Handshake Authentication Protocol) **Note** Both communications partners have to use the same authentication method otherwise no connection can be established.
User name	Enter the name for logging in with the ISP account.

Function	Description
Password	Enter the password for logging in with the ISP account.
Repeat password	Enter the password for logging in with the ISP account again.

Table 10-49 Rules for user names and passwords

Permitted characters	The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()"*'+`,-./:;<=>?@ [\]_{|}~^
Length of the user name	1 to 255 characters
Length of the password	1 to 31 characters

Table 10-50 Settings for the connection

Function	Description
Permanent connection	Permanent Internet connection. After the connection has been terminated by the provider, the connection is automatically restored even if there are currently no packets to be sent.
On-demand connection	The Internet connection is established automatically if packets need to be sent to the Internet. In this setting, delays in the sending of packets are possible.
Maximum idle time (only with the setting "on-demand connection")	If no packets are sent during a certain time, the Internet connection is automatically terminated. In the "Maximum idle time" box, enter the time in seconds after which the connection will be terminated. • Default setting: 300 • Minimum value: 10 • Maximum value: 3600
Forced disconnection (only with the "Permanent connection" setting)	Select the check box to be able to adapt the time of the forced disconnection by the security module.
Forced disconnection time (only with the "Permanent connection" setting)	The provider terminates the Internet connection automatically after a certain period. If you enter a time of day in this box, the security module terminates the Internet connection itself at this time. This allows disconnection of the Internet connection by the provider to be delayed under certain circumstances. A self-initiated forced disconnection is only possible with an existing permanent connection. • Default setting: 00.00 • Permitted entries: 00:00 ... 23:59

Configuring DNS

Module-specific function

DNS servers for resolving FQDNs specified in the entry "Dynamic DNS" can be used by SCALANCE S modules as of V3. DNS servers for all other functions can be used by SCALANCE S modules as of V4.

DNS

To address network notes using FQDNs the security module must know the IP address of a DNS server that converts the DNS queries to the corresponding IP addresses of the network nodes.

Setting up DNS - Follow the steps below:

1. Select the security module to be edited.
2. In the local security settings, select the entry "DNS".

Option	Meaning
Obtain DNS server address automatically	The address of the DNS server can be obtained automatically using PPPoE if the security module is connected to the Internet via a DSL modem. Can only be set for the external interface and the DMZ interface.
Use the following DNS server address:	Enter the address of the preferred and of the alternative DNS server manually.

Configuring dynamic DNS

Dynamic DNS

With dynamic DNS, you can access a constantly changing IP address with a permanently defined name (FQDN). This is necessary, for example, if you want to access a server that can be reached via a public IP address that changes.

The security module signals the current WAN IP address via which the security module can be reached to a provider for dynamic DNS (for example DynDNS.org, no-ip.com). The provider ensures that DNS queries sent to the FQDN of the security module are replied to with the current WAN IP address of the security module.

Dynamic DNS is permitted on the following interfaces:

- External interface
- DMZ interface

Requirement

An account has been created with a provides of dynamic DNS and an FQDN has been registered.

Setting up dynamic DNS - Follow the steps below:

1. Select the security module to be edited.
2. Select the "Dynamic DNS" entry in the local security settings.

3. Activate the "Activate service" check box in the "Primary dynamic DNS service" area and make the following settings:

Setting	Meaning
Provider	Choose the provider with which you have set up an account for dynamic DNS. With the predefined providers (DynDNS.org and No-IP.com), the provider update URL and the check IP service URL are already completed. If you select the option "User defined" you can specify the two URLs manually.
Service type	Select whether the HTTP or HTTPS protocol will be used for the provider update URL of the predefined provider.
FQDN	Enter the host name (e.g. mysecuritymodule) and the domain name (e.g. dyndns.org) that is registered with the provider separated by a period. The FQDN can function as a VPN endpoint and differ from the FQDN in the "VPN" entry. You can configure which VPN endpoint the VPN partner is informed of in the connection-specific VPN settings. The syntax of an FQDN must comply with DNS. Maximum number of characters: 99
Ignore errors when checking the server certificate	To protect the authentication data the certificate of the update server is checked. If the certificate check fails, the HTTPS connection is terminated as default and the account data is not transferred. If you activate the check box, the HTTPS connection is not terminated if the check fails (e.g. with an expired certificate) and the account data is transferred. You are advised not to ignore the check and not to select the check box. The check box can only be activated if the service type "DDNS-HTTPS" was selected.
User	Enter the user name that you specified when you created the account. The syntax of a user name must comply with DNS. Maximum number of characters: 24
Password	Enter the password that you specified when you created the account. The syntax of the password must comply with DNS. Maximum number of characters: 24
Monitor IP address change on DSL router	If the security module is connected to the Internet via a DSL router, enabling this function activates the function of the Check IP service. The security module periodically sends queries to determine the current IP address of the DSL router and to detect an IP address change on the DSL router. The IP address specified in this way is sent to the provider with each change ID.

Setting	Meaning
Period	Specify the interval at which the Check IP service is called. • Default setting: 20 minutes • Minimum value: 10 minutes • Maximum value: 1440 minutes
Provider update URL	Enter the URL with which the security module reports the public IP address to the provider. The placeholder texts <FQDN> and <CurrentWanIP> need to be placed at the correct positions in the URL. The syntax of the URL must comply with DNS. Maximum number of characters: 127
Check IP service URL	Enter the URL that the security module will use to determine its public IP address. The syntax of the URL must comply with DNS. Maximum number of characters: 127

4. In case the primary provider fails, create a second provider in the "Secondary dynamic DNS service" area (optional setting).

Configuring LLDP

Module-specific function

This function is available only for SCALANCE S V4 modules or higher.

Requirement

The security module is in routing mode.

Meaning

LLDP (Link Layer Discovery Protocol) is a protocol used to discover network topologies. A device capable of LLDP can send information about itself to neighboring devices at regular intervals and at the same time receive information from neighboring devices. The received information is stored on every device with LLDP capability in an LLDP MIB file. Network management systems can access these LLDP MIB files using SNMP and therefore recreate the existing network topology.

Configurable parameters

The degree of activity of the security module in terms of LLDP can be configured under the "LLDP mode" entry of the relevant interface.

Parameter	Description
Name	Name of the port for which the setting is configured.
LLDP mode	Configured LLDP mode: • RxTx: LLDP frames can be sent and received • Off: No LLDP frames can be sent or received

Media redundancy in ring topologies

Media redundancy with MRP

Module-specific function

This function is available only for SCALANCE S627-2M modules.

Meaning

The term "media redundancy" groups together various methods for increasing availability in Industrial Ethernet networks in which devices can be reached over different paths. This might be achieved by meshing networks, arranging parallel transmission paths or by closing a linear bus topology to form a ring.

Media redundancy method MRP

Media redundancy within a ring topology is available with SIMATIC NET products among other things with the MRP method (Media Redundancy Protocol).

With this method, one of the nodes is configured as the redundancy manager. The other nodes are redundancy clients. SCALANCE S627-2M modules can only adopt the role of an MRP client. Using test frames, the redundancy manager checks the ring to make sure it is not interrupted. The redundancy clients forward the test frames. If the test frames of the redundancy manager no longer arrive at the other ring port of the redundancy manager due to an interruption, the redundancy manager switches through its two ring ports and informs the redundancy clients of the change immediately.

The time the SCALANCE X switches need to switch through their ring ports as redundancy manager is 200 ms.

Note on the use of MRP

- MRP is supported in ring topologies with up to 100 devices. Exceeding this number of devices can lead to a loss of data traffic.
- It is recommended that you set the ring ports involved to full duplex and 100 Mbps. Otherwise there may be a loss of data traffic.

Possible uses of MRP on media module ports

MRP is supported only on the media module ports of the SCALANCE S627-2M. The following table shows the possible uses of MRP on the media module ports of a SCALANCE S627-2M:

Ring ports	Media module 1		Media module 2	
	P4	P5	P6	P7
MRP Client	-	-	-	-
	Ring 1	Ring 1	-	-
	-	-	Ring 2	Ring 2
	Ring 1	Ring 1	Ring 2	Ring 2

With two lower-layer rings per SCALANCE S module, layer 3 communication is possible between the rings.

Configuring MRP for the security module

Requirement

- The security module is in routing mode.
- Media modules are configured for the interfaces to be connected to MRP rings.
- The interfaces of the security module to be connected to rings are networked with the relevant ring managers.

How to access this function

1. Select the security module to be edited.
2. In the settings of the required interface, select the "Media Redundancy" entry.

Configurable parameters

Parameter	Meaning	Possible selections
MRP domain (only if the "MRP client" media redundancy role is selected)	The members of an MRP ring are specified with the help of MRP domains. The same MRP domain must be selected for the interfaces of all modules to be connected to the same MRP ring.	Display of the MRP domain used for the interface.
Media redundancy role	Selection of the media redundancy protocol or disabling of media redundancy for the interface.	• Not a node in the ring • MRP Client
Ring port 1 (only when the media redundancy role "MRP client" is selected)	Name of the first ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-

Parameter	Meaning	Possible selections
Ring port 2 (only when the media redundancy role "MRP client" is selected)	Name of the second ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-
Domain settings	Using the domain settings, you can add new MRP domains, edit the names of existing MRP domains and delete existing MRP domains.	-
Alternative media redundancy protocol	Select this check box to enable the interface of the security module for other media redundancy protocols.	• Enable interface for other media redundancy protocols • Disable interface for other media redundancy protocols (default setting)
Passive listening	Enable this check box if the selected interface will be connected to third-party networks in which STP/RSTP (Spanning Tree Protocol/ Rapid Spanning Tree Protocol) is used.	• Activate passive listening (default) • Deactivate passive listening

Special features of the ghost mode

Module-specific function

This function is available only for SCALANCE S602 as of V3.1.

Meaning

In ghost mode, the security module has no IP address of its own, neither on the internal nor on the external interface. Instead, the security module obtains the IP address for its external interface during runtime from a node connected to the internal interface of the security module whose IP address parameters may be unknown at the time of configuration. It is possible to change an IP address of the internal node and a corresponding IP address at the external interface. Since the internal node is identified based on its MAC address, IP address changes are made only for the learned MAC address. No IP address is configured or obtained at the internal interface of the security module.

As regards the MAC addresses, the security module replaces the MAC address of the internal node with the MAC address of the security module in all outgoing packets on the external interface (responses from the internal node).

Activating ghost mode

1. Select the module to be edited.
2. In the local security settings, select the entry "Mode".
3. Select the "Ghost mode" option.

Configurable module properties

In ghost mode, the following module properties can be configured in the local security settings:

- External interface [P1] red
- Firewall
- Time-of-day synchronization
- Log settings
- SNMP

Since no DNS servers can be configured in ghost mode, no FQDN resolution is possible.

Requirement for identifying an internal node

The security module can only obtain the IP address of the internal node if the internal node initiates data communication with a communications partner of the external network.
In addition to this, the security module does not provide any server services while obtaining the IP address. The security module can only reply to queries from external after data packets have been sent to the security module by the internal node.

Port assignment for incoming and outgoing data connections

Since the external interface of the security module and the internal node have the same IP address, the network components must be addressed explicitly via the TCP/UDP ports. For this reason, the ports are either assigned to the security module or the internal node. The assignments of the ports to the relevant devices are shown in the following tables for incoming and outgoing data connections:

Table 10-51 Port assignment for incoming connections (from external to security module)

Service	Port	Protocol	Comment
Web services, configuration and diagnostics access	443	TCP	The HTTPS port is permanently activated for configuration and diagnostics access using STEP 7 and cannot be changed.
SNMP	161	TCP UDP	Once SNMP is activated in STEP 7, incoming SNMP queries are transmitted via UDP port 161. Transfer via TCP port 161 is also possible, for example, to be able to reach the internal node. **Note** After activating SNMP, the SNMP port is permanently assigned to the security module. If SNMP is not activated, the internal node can be accessed using SNMP with the aid of a firewall rule.

Table 10-52 Port assignment for outgoing connections (from security module to external)

Service	Port	Protocol	Comment
Syslog	514	UDP	If the Syslog service is activated in STEP 7, Syslog messages are transferred via UDP port 514 by the security module. This port assignment cannot be changed.
NTP	123	UDP	If NTP servers are used for time-of-day synchronization, NTP queries are transferred via UDP port 123. This port assignment cannot be changed.

Recognizable IP addresses and subnet masks

The security module only recognizes internal nodes with IP addresses in the network class ranges A, B or C. The subnet mask is identified by the security module based on the network class (refer to the table "Network classes and corresponding subnet masks"). To allow the subnet mask to be determined correctly, a standard router must be entered for the internal node.

Nodes with IP addresses in the network classes D and E are rejected by the security module.

Network class	IP addresses		Subnet mask
	Low limit	High limit	
A	0.0.0.0	127.255.255.255	255.0.0.0
B	128.0.0.0	191.255.255.255	255.255.0.0
C	192.0.0.0	223.255.255.255	255.255.255.0
D	224.0.0.0	239.255.255.255	Rejected by the security module
E	240.0.0.0	255.255.255.255	Rejected by the security module

Configuration limits

A maximum of one internal node is recognized by the security module. If several internal nodes exist, the security module reacts as follows:

- The first device the security module recognizes in the internal network obtains access to the external network segment if the firewall is suitably configured.
- The data traffic of any additional nodes in the internal network area is blocked in the outgoing direction at level 2 (MAC layer) based on the sender address.

Loading configurations and diagnostics after commissioning

After obtaining an IP address from the internal node, the security module has an IP address on the external interface that can differ from the IP address with which the security module was initially configured. To load a configuration or to run diagnostics, in STEP 7 you need to specify the IP address for the connection to the external interface that the security module obtained from the internal node during runtime. This is possible in the local security settings or directly in the "Advanced download" or "Connect online" dialogs. For more detailed information on establishing online connections, refer to the section: Downloading a configuration (Page 890)

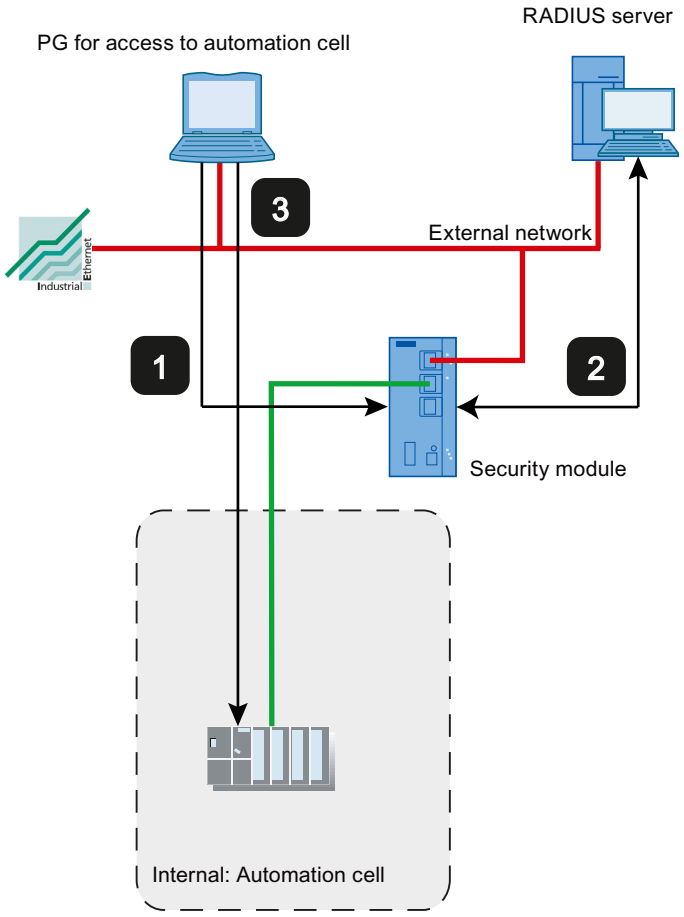
Routing information for hierarchical networks on the external interface

If there are hierarchical networks with subnet transitions on the external interface of the security module, the security module needs to obtain the relevant routing information from the internal node. To achieve this, the internal node must respond to ICMP queries sent to it. Responding to ICMP broadcasts is not necessary.

Authentication using a RADIUS server

Overview

Module-specific function



This function is available only for SCALANCE S V4 modules or higher.

Meaning

RADIUS (Remote Authentication Dial-In User Service) is a protocol for authenticating users by servers on which user data can be stored centrally. The use of RADIUS servers can increase the protection of user names, assigned roles and passwords.

Scenario for the use of RADIUS servers

Authentication by RADIUS servers can be performed when activating user-specific IP rule sets.

1 Entry of the user data on the Web page of the security module

2 Authentication by RADIUS server and activation of the user-specific IP rule set

3 Access to an automation cell

The network setup shown above is simply an example. The RADIUS server can also be located in the internal network or in the DMZ network of the security module.

For the configuration options described below, it is assumed that a RADIUS server is configured in STEP 7 and was assigned to the relevant security module. In addition to this, one user or role must be configured with the "RADIUS" authentication method. For more detailed information, refer to the following sections:

- Defining a RADIUS server (Page 859)
- Assigning a RADIUS server to a security module (Page 860)
- Create users (Page 733)
- Creating roles (Page 736)

For general information on user-specific IP rule sets, refer to the following section:

- AUTOHOTSPOT

Configuration options

To authenticate the user using a RADIUS server, there are two configuration options available:

- The user and the user's role are known on the security module, only the password management for the user is performed on the RADIUS server. The user and the password are configured on the RADIUS server.
  - A user with the "RADIUS" authentication method is configured.
  - The user is assigned to the user-specific IP rule set.

  Result:
  - When a user logs on to the Web page of the security module, the authentication query is forwarded to the RADIUS server.
  - The RADIUS server runs a password check and signals the result back to the security module.
  - If the password check is passed successfully, the user-specific IP rule set is activated.
- The role is known on the security module, user management is via the RADIUS server. The user and the password are configured on the RADIUS server.
  - A user-defined role or a system-defined role is assigned to the user-specific IP rule set.
  - Under the entry "RADIUS" > "RADIUS settings" in the local security settings of the security module, the check box "Allow RADIUS authentication of unconfigured users" and the check box "Filter ID is required for authentication" are enabled.

  Result:
  - When a user logs on to the Web page of the security module, the authentication and authorization query is forwarded to the RADIUS server.
  - The RADIUS server runs a password check and signals the result back to the security module.
  - Case a: If, in addition to this, the role name is configured on the RADIUS server:
    The RADIUS server returns the role name assigned to the user to the security module.
  - Case b: If the role name is not configured on the RADIUS server:
    The security module assigns the user the system-defined role "radius".
  - If the password check is passed successfully, the user-specific IP rule set is activated.

Conventions for RADIUS servers

- The RADIUS servers can be in any network connected to the security module.
- A maximum of two RADIUS servers can be configured per security module. During operation only one of the RADIUS servers is active.
- When defining a RADIUS server, an FQDN can also be used instead of IP an address.
- A maximum of 25 characters can be used for the name of a RADIUS server.

Defining a RADIUS server

Meaning

Before authentication by a RADIUS server is possible, this first needs to be stored in the STEP 7 project. Following this, you assign the defined RADIUS server to the security module for which the RADIUS server will handle user authentication.

Procedure

1. In the global security settings, select the entry "RADIUS".
   Result: The previously created RADIUS servers are displayed under the selected entry.
2. Double-click on the "Add new RADIUS server" entry.
   Result: The created RADIUS server is displayed with an automatically assigned number below the entry "RADIUS".
3. Double-click on the created RADIUS server.
   Result: In the working area the assignment dialog for RADIUS servers is displayed. The selected RADIUS server is selected in the "RADIUS server" drop-down list. The required security modules can be assigned to this, see section Assigning a RADIUS server to a security module (Page 860). In the local security settings, the configurable properties of the RADIUS server are displayed.
4. Enter the following data in the "General" entry in the local security settings:

Parameter	Meaning
Name	Name of the RADIUS server. The name can consist of a maximum of 25 characters. The characters 0-9, a-z, A-Z, -._ can be used. A name must start with a letter and end with a letter or number. Before the '.' character only letters and numbers are permitted, after the '.' character only letters. Before the '_' or '-* character only letters and numbers are permitted.
IP address / FQDN	IP address or FQDN of the RADIUS server.
Port	UDP port via which the RADIUS server can be reached. As default, authentication data is received at port 1812.
Shared secret	Entry of the password that will be used when transferring the logon data between the RADIUS server and security modules for encryption. The following characters from the ANSI X 3.4-1986 character set are permitted: 0123456789 A...Z a...z !#$%&()"*'+`,-./:;<=>?@ [\]_{|}~^ Length of the shared secret: 1 to 32 characters
Repeat shared secret	Confirmation of the password
Authentication method	Display of the method used to check the user data. Only the "PAP" method (Password Authentication Protocol) is supported.
Comment	Entry of freely selectable, optional comments.

Result

You have defined a RADIUS server and can now assign this to the required security modules.
Note the descriptions in the section below:
Assigning a RADIUS server to a security module (Page 860)

Assigning a RADIUS server to a security module

Requirement

You have defined a RADIUS server.

Procedure

1. Select the module to be edited.
2. Select the "RADIUS" entry in the local security settings.
3. Select the "Enable RADIUS authentication" check box.

   Note
   Changing the method of authentication with the Web server on the security module

   If RADIUS authentication is enabled on the security module, the method for authentication with the Web server is changed from "Digest Access Authentication" to "Basic Access Authentication".

4. In the "RADIUS timeout" input box, enter the maximum time in seconds that the security module will wait for a response from the RADIUS server.
5. In the "RADIUS repetitions" input box, enter the number of connection establishment attempts with the RADIUS server.
6. Select the "Allow RADIUS authentication of unconfigured users" check box if the user-specific IP rule to be activated was assigned a role instead of a user.
7. Select the "Filter ID is required for authentication" check box if the assigned role is a user-defined role.
8. Under the entry "RADIUS server", select the RADIUS server you want to assign to the security module from the "Name" drop-down list.
   As an alternative, you can assign security modules for which RADIUS authentication is enabled to RADIUS servers in the global security settings. You will find general information on authentication by the RADIUS server in the following section:
   AUTOHOTSPOT

Setting up a firewall

Local firewall rules for SCALANCE S modules

Configuring a firewall with predefined firewall rules

Configuring a firewall using predefined firewall rules

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section
Overview of local firewall rules (Page 770)

Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default. This means that only encrypted IPsec data transfer is permitted via the external interface or via the DMZ interface. Only HTTPS access to the module (TCP port 443) remains allowed untunneled.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Table 10-53 Available firewall rules and directions

Service	From internal to external	From external to internal	From internal to DMZ	From DMZ to internal	Enabled ports	Meaning
Allow IP communication	x	x	x	x	-	IP communication for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.

Service	From internal to external	From external to internal	From internal to DMZ	From DMZ to internal	Enabled ports	Meaning
Allow FTP/ FTPS (explicit mode)	x	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	x	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	x	x	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	x	x	x	UDP port 123	For synchronization of the time of day.
Allow DHCP	x	x	x	x	UDP port 67 UDP port 68	Only in bridge mode Communication connection with a DHCP server is permitted.

Table 10-54 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming IP packets that are discarded are logged.
Log blocked outgoing packets	All outgoing IP packets that are discarded are logged.

You can view the logged packets at the "Packet filter log" entry in the "Online & Diagnostics" dialog. For more detailed information, refer to the section Logging data packets - "Packet filter log" entry (Page 833).

Configuring a firewall with predefined MAC rules

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section Overview of local firewall rules (Page 770).

Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Available MAC rules and directions

Service	From internal to external	From external to internal	Meaning
Allow MAC communication	x	x	MAC traffic for the selected communication directions is allowed.
Allow ISO protocol	x	x	ISO traffic for the selected communication directions is allowed.
Allow SiClock	x	x	SiClock time-of-day frames for the selected communication directions are allowed.
Allow DCP	x	x	DCP traffic for assignment of IP addresses is allowed for the selected communications directions.

Table 10-55 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.

User-specific IP rule sets

Overview

Meaning

Initially, individual or multiple users are assigned to user-specific IP rule sets. The user-specific IP rule sets are then assigned to individual or multiple security modules. This makes it possible, to allow user-specific access. If, for example all access to the networks downstream from a security module is blocked, certain nodes can be allowed for a user based on their IP addresses. This means that access is allowed for this user but access remains blocked for other users.

User logon via the Internet

The user can log in to the external interface or the DMZ interface via the Web page of the security module. If authentication is successful, the IP rule set defined for the user for the IP address of the device from which the login is made is enabled.

The connection to the Web page of the security module is via HTTPS using the IP address of the connected port and taking into account the valid routing rules:

Example:

External interface: 192.168.10.1

Call up of the login page with: https://192.168.10.1/

Users can log on with every role as long as the user or the role is assigned to a user-specific firewall rule set.

Options for authenticating the user

Depending on the authentication method selected when the user who will log in to the security module was created, the authentication is handled by different instances:

- Authentication method "Password": Authentication is handled by the security module.
- Authentication method "RADIUS": Authentication is handled by a RADIUS server (SCALANCE S as of V4 only).

Assignment of roles to user-specific IP rule sets

On SCALANCE S modules as of V4, it is also possible to assign user-specific IP rule sets that are assigned to roles. This makes it possible to enable a group of users for access to certain IP addresses.

If a RADIUS server is used for user authentication and a role is assigned to the user-specific IP rule set, users can also be authenticated by the RADIUS server although they are not configured on the security module. These users must be stored on the RADIUS server or on a separate database where they need to be assigned to the role assigned to the user-specific IP rule set in STEP 7. This procedure has the advantage that all user data is stored exclusively on the RADIUS server.

You will find more information on authentication by the RADIUS server in the following section:

AUTOHOTSPOT

User-specific IP rule sets are used locally - conventions

The same conventions as described in the following section apply:
Global firewall rule sets - conventions (Page 750)

Creating and assigning user-specific IP rule sets

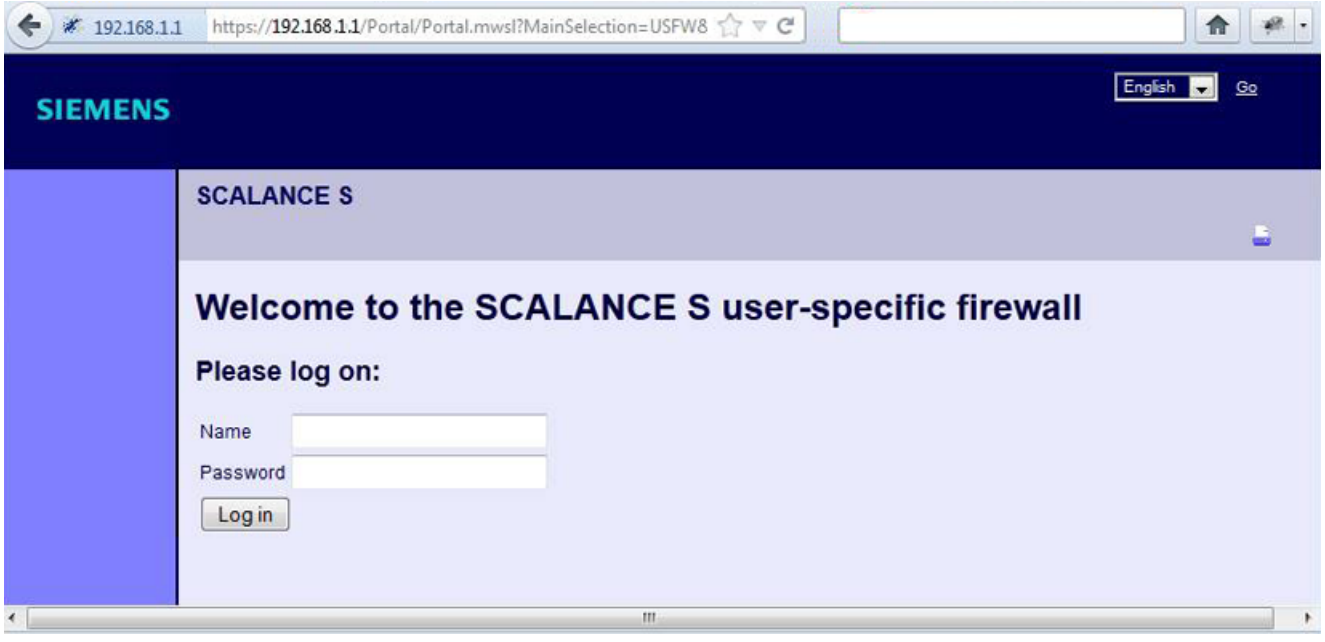
Creating user-specific IP rule sets

1. In the global security settings, select the entry "Firewall" > "User-specific IP rule sets" > "IP rule sets".
2. Double-click on the "Add new IP rule set" entry to create a user-specific IP rule set.
   Result: The created user-specific IP rule set is shown in the entry.
3. Double-click on the created user-specific IP rule set.
   Result: In the "Properties" > "General" tab of the Inspector window, the configurable properties of the user-specific IP rules set are displayed.
4. In the Inspector window, click on the "General" entry and enter the following data:
   - Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
   - Description (optional): Enter a description of the user-specific IP rule set.
5. Click on the "IP rules" entry and enter the firewall rules one after the other in the list.
   No IP address can be entered in the “Source IP address” box. This is entered automatically when the node logs on to the security module.
   The “Stateful” check box cannot be disabled for IP rules of user-specific IP rule sets
   Note the parameter description in the following sections:
   Defining IP packet filter rules (Page 771)
   Note the special features of firewall rules generated automatically by STEP 7 for NAT/NAPT rules:
   Relationship between NAT/NAPT router and user-specific firewall (Page 872)

Assigning user-specific IP rule sets

1. Click on the "Users and roles" entry in the Inspector window.
2. In the "Available users and roles" area, select the users you want to assign to the user-specific rule set.

3. Click the "<<" button to assign the selected users or roles to the user-specific rule set. The assignment of roles to user-specific IP rule sets is possible only for SCALANCE S modules as of V4.
4. Assign the created user-specific IP rule set to the required security modules using the entry "Assign user-specific IP rule set" in the global security settings. For this, advanced firewall mode must be enabled for the security modules.



Note

Assignment of user-specific IP rule sets

- A security module can only be assigned one user-specific rule set per user.
- Due to the assignment, the right to log in to the security module is activated implicitly for all users and roles assigned to the IP rule set.

Result

- The user-specific rule set is used by the assigned security modules as a local rule set and automatically appears in the local list of firewall rules.
- The user can log on with the security module. Authentication of the user is performed depending on the selected authentication method either by the security module or a RADIUS server.

Range of values for the maximum session time

The time after which the user is automatically logged out can be specified when creating or editing a user; the default is 30 minutes. On the Web page of the security module, the session time can be extended to the value assigned to the user.

You will find more information creating users in the following section:

Create users (Page 733)

IP packet filter directions SCALANCE S

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		
From	**To**	**S602**	**S61x**	**S623 / S627-2M**
Internal	External	**x**	**x**	**x**
	Tunnel	-	**x**	**x**
	Any	-	**x**	**x**
	DMZ	-	-	**x**
	Internal	**x**	**x**	**x**
External	Internal	**x**	**x**	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**
	DMZ	-	-	**x**
Tunnel	Internal	-	**x**	**x**
	External	-	**x**	**x**
	DMZ	-	-	**x**
Any	Internal	-	**x**	**x**
	External	-	-	**x**
	DMZ	-	-	**x**
DMZ	Internal	-	-	**x**
	External	-	-	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**

x = communication direction is configurable

- = communication direction is not configurable

MAC packet filter directions SCALANCE S

Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		
From	**To**	**S602**	**S61x**	**S623 / S627-2M**
Internal	External	**x**	**x**	**x**
	Tunnel	-	**x**	**x**
	Any	-	**x**	**x**
External	Internal	**x**	**x**	**x**
	Any	-	-	**x**
	Tunnel	-	-	**x**
Tunnel	Internal	-	**x**	**x**
	External	-	**x**	**x**
Any	Internal	-	**x**	**x**
	External	-	-	**x**

x = communication direction is configurable

- = communication direction is not configurable

Adapting standard rules for IP services

Requirement

This function is available only in advanced firewall mode.

How to access this function

1. Select the security module to be edited.
2. In the local security settings, select the entry "Firewall" > "Standard rules for IP services".

Meaning of the advanced settings

Parameter	Meaning when activated
Use advanced status options	The permitted number of connections and firewall statuses per time unit is limited. If a network node exceeds this limit, its IP address is entered in the IP blacklist of the security module. The node can then no longer communicate via the security module. The IP blacklist of the security module can be viewed in online mode.
Log all activated rules	Packets that are allowed according to the default rules for IP services are logged.
Enable ICMP test for interfaces	Ping queries coming in on an interface of the security module can be forwarded to other interfaces. This means that, for example, ping queries can be made from the external network to the internal interface of the security module.

Default firewall rules for SCALANCE S

The following table lists the default firewall rules for SCALANCE S modules. In some cases, the firewall rules are only set if the relevant service is used by the security module (e.g. SNMP).

Service	Direction	X1 interface (red)	Interface X2 (green)	Interface X3 (yellow) (only for S623, S627-2M)	Tunnel interface* (not for S602)
Interface rerouting	outgoing	-	x	-	-
HTTPS		x	x*	x	x
ICMP	incoming	-	x	-	x
ICMP pathfinder (only for SCALANCE S S602 as of V3.1 in ghost mode)	outgoing	-	x	-	-
SNMP	incoming	x	x	x	x
Syslog	outgoing	x	x	x	x
NTP	outgoing	x	x	x	x
DNS	outgoing	x	x	x	x
HTTP	outgoing	x	-	x	-
VPN (IKE)		x	-	x	-
VPN (NAT Traversal)		x	-	x	-
BootP Server	incoming	-	x	x	-
BootP Client	outgoing	-	x	x	-
RADIUS	outgoing	x	x	x	x
CARP (only for SCALANCE S62x as of V4)	outgoing	x*	x*	-	-
Pfsync (only for SCALANCE S62x as of V4)	outgoing	-	-	x*	-

x enabled as default

- disabled as default

* cannot be adapted

SCALANCE S module as router

Specifying routes

Meaning

Specifies routes for addressing subnets that cannot be reached directly via the security module.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the "Routing" entry.
3. Double-click "Add new" in the table to add a route.
4. Enter the following values:

Parameter	Function	Example of a value
Network ID	Requests to nodes of the subnet with the network ID and the subnet mask specified here are forwarded to the subnet via the specified router IP address. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. The specified network ID must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router that connects to the subnet. As an alternative, an FQDN can be entered for SCALANCE S modules as of V4. The specified router IP address must be in the same subnet as the IP address of the security module.	192.168.10.2
Activate rerouting (only for SCALANCE S as of V3)	Select this check box if the frames of the entered route will enter and leave on the same interface of the security module (rerouting). Rerouting is only supported on the internal interface of the security module.	

Address translation with NAT/NAPT in VPN tunnels

Module-specific function

Address translation with NAT/NAPT in VPN tunnels is only available for SCALANCE S612/ S623/S627-2M modules as of V4.

Meaning

Address translations with NAT/NAPT can also be performed for communications relations established via a VPN tunnel.

Requirements

The following requirements apply generally to a SCALANCE S module that will perform an address translation with NAT/NAPT in a VPN tunnel:

- The SCALANCE S module is in a VPN group.
- The SCALANCE S module is in routing mode and/or the DMZ interface of the SCALANCE S module is activated.

- The tunnel interface is enabled.
- The advanced firewall mode is enabled.

Supported address translation directions

The address translation directions described in the following section are supported:
NAT/NAPT routing (Page 786)

Supported address translation actions

With tunneled communications relations, the following address translation actions are supported:

- Destination NAT ("Redirect")
- Source NAT ("Masquerading")
- Source and Destination NAT ("1:1-NAT")
- NAPT ("Port forwarding")

You will find basic information on these address translation actions in the following section:
NAT/NAPT routing (Page 786)

Supported VPN links

In conjunction with NAT/NAPT, the following VPN links are supported:

VPN link		VPN link is initiated by	Address translation is performed by
SCALANCE S (a)	SCALANCE S (b)	SCALANCE S (a) or SCALANCE S (b)	SCALANCE S (a) and/or SCALANCE S (b)
SCALANCE S	CP 343-1 Adv. / 443-1 Adv. / PC-CP	SCALANCE S or CP 343-1 Adv. / 443-1 Adv. / PC-CP	SCALANCE S
SCALANCE S	SCALANCE M	SCALANCE M	SCALANCE S and/or SCALANCE M*
SOFTNET Security Client	SCALANCE S	SOFTNET Security Client	SCALANCE S

* Only 1:1 NAT is supported.

SCALANCE S modules of the type SCALANCE S623 V4 and SCALANCE S627-2M V4 that have a VPN endpoint on the external interface and on the DMZ interface can perform address translations on both interfaces at the same time.

Address translation characteristics when involved in several VPN groups

If a SCALANCE S module is a member of several VPN groups, the address translation rules configured for the tunnel interface of the SCALANCE S module apply for all VPN connections of this SCALANCE S module.

Please note: Once you have configured a NAT address translation to or from the direction of the tunnel, only the IP addresses involved in the NAT address translation rules can be reached via the VPN tunnel.

Relationship between NAT/NAPT router and user-specific firewall

Module-specific function

The configuration of NAT/NAPT rules in the user-specific firewall is only available for SCALANCE S modules as of V3.

Meaning

After creating NAT/NAPT rules, STEP 7 automatically generates a user-specific IP rule set in the user-specific firewall that enables communication in the configured address translation direction. You can then assign this user-specific IP rule set to individual or multiple users and/or individual or multiple roles (only for SCALANCE S modules as of V4).

The generated firewall rules can, if necessary, be moved and expanded (additional IP address, services, bandwidth). Firewall parameters generated by STEP 7 cannot be adapted. If the user-specific IP rule set is assigned to a security module with NAT/NAPT deactivated, the NAT/NAPT rules from the user-specific firewall are also applied to this security module.

Note

The address translation actions "Source-NAT + Destination-NAT" and "Double-NAT" are not supported in conjunction with the user-specific firewall.

How to access this function

"NAT" or "NAPT" entry in the editor for user-specific IP rules sets, refer to the following section: Creating and assigning user-specific IP rule sets (Page 865)

Supported address translation directions for the action "Source NAT"

The action "Source NAT" can be performed in the following directions:

- External to DMZ
- DMZ to external

No IP address can be entered in the "Source IP address" box. This is entered automatically when the node logs on to the security module.

Supported address translation directions for the action "Destination NAT"

The action "Destination NAT" can be performed in the following directions:

- External to internal
- External to DMZ
- DMZ to internal
- DMZ to external
- Tunnel to internal (only SCALANCE S612/S623/S627-2M as of V4)

- Tunnel to external (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to DMZ (only SCALANCE S612/S623/S627-2M as of V4)

Supported address translation directions for NAPT

The address translation with NAPT can be performed in the following directions:

- External to internal
- External to DMZ
- DMZ to internal
- DMZ to external
- Tunnel to internal (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to external (only SCALANCE S612/S623/S627-2M as of V4)
- Tunnel to DMZ (only SCALANCE S612/S623/S627-2M as of V4)

NAT/NAPT address translation and corresponding user-specific IP rule sets

In the firewall rules for user-specific IP rule sets generated based on NAT/NAPT rules, no IP address can be entered in the "Source IP address" box. This is entered automatically when the node logs on to the security module. The remaining properties generated locally for individual security modules are identical. Refer to the section
Relationship between NAT/NAPT router and firewall (Page 792)

Security module as DHCP server

Overview DHCP server

Overview

You can operate the SCALANCE S module on the internal network and on the DMZ network as DHCP server (DHCP = Dynamic Host Configuration Protocol). This allows IP addresses to be assigned automatically to the devices connected to the internal network or the DMZ network.

Simultaneous DHCP server operation on both interfaces is possible (SCALANCE S623/ S627-2M only).

The IP addresses are either distributed dynamically from an address range you have specified or you can select a specific IP address and assign it to a particular device. If devices on the internal interface or on the DMZ interface should always be assigned the same IP address for firewall configuration, the address assignment must only be static based on the MAC address or based on the client ID.

Requirements

You configure the devices on the internal network or on the DMZ network so that they obtain the IP address from a DHCP server.

Depending on the mode, the security module sends an IP address of the standard router to the nodes in the relevant subnet or you need to inform the nodes in the subnet of a router IP address.

- Router IP address will be transferred
  In the following situations, the DHCP protocol of the security module will inform the nodes of the router IP address:
  - The node is connected to the DMZ interface (SCALANCE S623/S627-2M only)
    In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is configured for router mode
    In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is not configured for router mode, there is, however, a standard router specified in the configuration of the security module.
    In this case, the security module transfers the IP address of the standard router as the router IP address.
- Router IP address will not be transferred
  In the following situations, enter the router IP address manually on the node:
  - The node is connected to the internal interface and the security module is not configured for router mode. There is also no standard router specified in the configuration of the security module.

Configuring a DHCP server (Page 874)

Configuring a DHCP server

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "DHCP server".

3. Select the interface for which you want to make the DHCP settings.
4. Make the address assignment. You have the following configuration options:
   - Static address assignment
     Devices with a specific MAC address or client ID are assigned the specified IP addresses. You specify these addresses by entering the devices in the address list in the "Static address assignment" group box.
   - Dynamic address assignment
     Devices whose MAC address or whose client ID was not specified specifically, are assigned a random IP address from the specified address range. For this purpose, activate the "Dynamic IP address pool" check box. Set the address range in the "Dynamic IP address pool" input area.

Note

Dynamic address assignment - reaction after interrupting the power supply

Please note that dynamically assigned IP addresses are not saved if the power supply is interrupted. On return of the power, you must therefore make sure that the nodes request an IP address again.

You should therefore only use dynamic address assignment for the following nodes:

- Nodes that are used temporarily in the subnet (such as service devices).
- Nodes that have been assigned an IP address and send this as the "preferred address" the next time they request an address from the DHCP server (for example PC stations).

For permanent nodes you should preferably use static address assignment by specifying a client ID or the MAC address.

Consistency check - these rules must be adhered to

Remember the following rules when making the entries.

- The IP addresses assigned in the address list in the "Static address assignments" group box must not be in the range of the dynamic IP addresses.
- IP addresses, MAC addresses and client IDs may only occur once in the "Static address assignment" table (related to the security module).
- For the statically assigned IP addresses, you must specify either the MAC address or the client ID (computer name).
- The client ID is a string with a maximum of 63 characters. Only the following characters may be used: a-z, A-Z, 0-9 and - (dash).
  Note
  In SIMATIC S7, a client ID can be assigned to the devices on the Ethernet interface to allow them to obtain an IP address using DHCP.
  With PCs, the procedure depends on the operating system being used; it is advisable to use the MAC address here for the assignment.
- For the statically assigned IP addresses, you must specify the IP address.

- The following IP addresses must not be in the range of the free IP address range (dynamic IP addresses):
  - All router IP addresses in the "Routing" entry
  - Syslog server
  - Standard router
  - Security module address(es)
- DHCP is supported by the security module on the interface to the internal subnet and on the interface to the DMZ network. The following additional requirements for IP addresses in the range of the dynamic address assignments result from this operational behavior of the security module:
  - Bridge mode
    The range must be within the network defined by the security module.
  - Routing mode
    The range must be within the internal subnet defined by the security module.
    Note
    The DMZ network always represents a separate subnet. When using DHCP on the DMZ interface, make sure that the free IP address range (dynamic IP addresses) is within the DMZ subnet.
- The free IP address range must be fully specified by entering the start address and the end address. This end address must be higher than the start address.
- The IP addresses you enter in the address list in the "Static address assignments" input area must be in the address range of the internal subnet or in the DMZ subnet of the security module.

Running a consistency check (Page 727)

Configuring proxy ARP

Overview

Proxy ARP allows routers to respond to ARP queries for hosts. The hosts are in networks separated by routers but use the same IP address range.

If PC1 sends an ARP request to PC2, it receives an ARP response and the hardware address of the interface (MAC address of the port of the security module) on which the query was received from the security module located in between and not from PC2. The querying PC1 then sends its data to the security module that then forwards it to PC2.

How to access this function

This function is only available for the internal interface of a security module that is a member of a VPN group and is in bridge mode.

1. Select the security module to be edited.
2. In the local security settings, select the entry "Proxy ARP".
3. If the security module is to respond to an ARP query from its own LAN as a substitute for the specific connection partner, enter the corresponding IP address.

IPsec tunnel: Creating and assigning groups

Configuring internal network nodes

Using the learning mode to learn internal nodes

Finding nodes for tunnel communication automatically

One great advantage when configuring and operating tunnel communication is that SCALANCE S modules in bridge mode can find the nodes on the internal interface automatically. New nodes are detected by the security module during operation. The detected nodes are signaled to the security modules belonging to the same VPN group. This allows data exchange within the tunnels of a group in both directions at any time.

Detectable nodes

The following nodes are detected:

- Network nodes with IP capability
  Network nodes with IP capability are found when they transmit an ICMP response to the ICMP subnet broadcast.
  IP nodes downstream from routers can be found if the routers pass on ICMP broadcasts.
- ISO network nodes
  You can also teach-in network nodes without IP capability that can be addressed by means of ISO protocols.
  This is only possible if they reply to XID or TEST packets. TEST and XID (Exchange Identification) are auxiliary protocols for exchanging information on layer 2. By sending these packets with a broadcast address, these network nodes can be located.
- PROFINET nodes
  Using DCP (Discovery and basic Configuration Protocol), it is possible to find PROFINET nodes.

Network nodes that do not meet these conditions must be configured manually.

Subnets located on the other side of internal routers also need to be configured manually.

How to access the function

1. Select the module.
2. In the local security settings, select the entry "VPN" > "Nodes".

Enabling/disabling the learning mode

The learning function is enabled in the configuration as default for every security module.

Learning can also be disabled completely for SCALANCE S. In this case, you will need to configure all internal network nodes participating in the tunnel communication manually.

When is it useful to disable the automatic learning mode?

The default settings for the security module assume that internal networks are always secure; in other words, in a normal situation, no network node is connected to the internal network if it is not trustworthy.

Disabling the learning mode can be useful if the internal network is static; in other words, when the number of internal nodes and their addresses do not change.

If the learning mode is disabled, this reduces the load on the medium and the nodes in the internal network resulting from the learning packets. The performance of the security module is also slightly improved since it does not need to process the learning packets.

Note: In the learning mode, all nodes in the internal network are detected. The information relating to VPN configuration limits relates only to nodes that communicate over VPN in the internal network.

Note

If more than 128 internal nodes are being operated, the permitted configuration limits are exceeded and an illegal operating status results. Due to the dynamics in the network traffic, this causes internal nodes that have already been learned to be replaced by new previously unknown internal nodes.

See also

Configuring internal subnets manually (Page 879)

Configuring IP network nodes manually

Meaning

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal IP nodes" entry and in doing so enable them for VPN tunnel communication. The MAC address of a network node can be specified as an option.

Requirement

- The security module is in bridge mode.
- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal IP nodes".

Configuring MAC network nodes manually

Meaning

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal MAC nodes" entry and in doing so enable them for VPN tunnel communication.

Requirement

- The security module is in bridge mode.
- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal MAC nodes".

Configuring internal subnets manually

Requirement

- The security module is a member of a VPN group.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal subnets".

Security module in bridge mode - "Internal subnets" entry

To be able to enable internal subnets for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. Must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router via which the subnet you are allowing is reached. Must be located in the same subnet as the IP address of the security module.	192.168.10.2

Security module in routing mode - "Subnets reachable through tunnel" entry

In routing mode, entire subnets are always tunneled. To be able to enable internal subnets reachable via routers, the external subnet or the DMZ subnet for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Comment	Entry of additional, optional comments.	

Router and firewall redundancy

Overview

Meaning

Failures of the security modules SCALANCE S623 as of V4 and SCALANCE S627-2M as of V4 can be automatically compensated by routers and firewall redundancy during operation. To do this, group two security modules of the type SCALANCE S623 or SCALANCE S627-2M in a redundancy relationship by activating routers and firewall redundancy for both security modules. Following this, you decide which security module of the redundancy relationship is passive in normal mode (secondary module). You make this setting for the security module of the redundancy relationship that is active in normal operation (primary module). If the primary module fails during operation, the secondary module automatically adopts the function as firewall and (NAT/NAPT) router. To ensure the identical configuration of both security modules, these are connected together via their DMZ interfaces and their configurations are synchronized during operation. In this case, the DMZ interfaces of the security modules involved cannot be used for other purposes.

Address redundancy

In addition to their module IP addresses, the two security modules share a common IP address on the external and on the internal interface so that if one of the security modules fails, the IP addresses do not need to be changed. To do this, you need to configure an IP address for the external and for the internal interface of the redundancy relationship.

Effects of redundancy relationships on security modules

When you create redundancy relationships between security modules, some properties of these security modules are automatically adapted to establish compatibility with the redundancy relationship. The following properties are affected by this adaptation:

Module property	Effect on the module property
Operating mode	Where necessary, the mode is changed to the "Routing mode" option.
Membership of VPN groups	Where necessary, the security module is removed from VPN groups.
Interface configuration	Where necessary, the external interface and the DMZ interface of the security module are enabled. Where necessary, the IP assignment method "Static address" is configured for all interfaces.

Configuration of security modules in redundancy relationships

After router and firewall redundancy have been enabled and the primary module of the redundancy relationship selected, some of the module properties are configured only using the primary module. The properties configured for the primary module then apply to the redundancy relationship and cannot be configured for the secondary module. The following properties can be configured for the redundancy relationship:

- Basic settings of the redundancy relationship (secondary module, network parameters)
- Firewall (standard rules for IP services are configured separately for the individual security modules).
- Routing
- NAT/NAPT routing (not 1:1 NAT)

The values of the properties listed above are initially adopted from the primary module for the redundancy relationship.

The settings listed below remain active for the individual security modules even after including them in a redundancy relationship. Configuring these properties for the primary module therefore has no effect on the secondary module.

- Interface configuration (disabling interfaces and changing the VIP assignment method "Static address" is not possible).
- Standard rules for IP services (firewall)
- DDNS
- Time-of-day synchronization
- Log settings
- SNMP
- RADIUS

Note

Loading a configuration on security modules of a redundancy relationship (only SCALANCE S623/S627-2M as of V4)

The properties of a redundancy relationship configured for the primary module must be loaded both on the primary module and on the secondary module. To load the configuration, the physical IP address via which your engineering station can reach the security module must be used. The virtual IP addresses of the redundancy relationship cannot be used for loading.

Note

Configuring routing when using routers and firewall redundaancy

In a redundancy relationship the only routing information that is synchronized between the primary and secondary module is that that was configured statically in the local security settings of the primary module in the “Routing” entry. Routing entries resulting dynamically due to using standard routers are not synchronized. When using routers and firewall redundancy it is therefore recommended that you configure all known routers statically.

Creating redundancy relationships between security modules

Requirement

The security modules SCALANCE S623/S627-2M as of V4 are not assigned to any other redundancy relationship.

Procedure

1. Select the security module that will be the active security module in normal operation (primary module).
2. In the local security settings, select the entry "Router and firewall redundancy".
3. Select the "Router and firewall redundancy" check box.
4. In the "Secondary module" drop-down list, select the security module that will be the passive security module in normal operation.

Result: You have created a redundancy relationship between the security modules.

Configuring redundancy relationships

How to access this function

1. Select the primary module of the redundancy relationship.
2. In the local security settings, select the entry "Router and firewall redundancy".

Configuring network parameters of the redundancy relationship

Configurable parameter	Meaning
IP address	IP address of the virtual external or internal interface of the redundancy relationship. The IP address must be located in the external or internal subnet of the primary module.
Subnet mask	Subnet mask of the virtual external or internal interface of the redundancy relationship
MAC address (adaptable only for SCALANCE S623/ S627-2M as of V4.0.1)	MAC address of the virtual external or internal interface of the redundancy relationship

For general information on configuring network parameters, refer to the following section:
Configuring IP address parameters (Page 842)

Configuring the firewall

IP packet filter rules for redundancy relationships are configured on the primary module. The communications directions "From external to internal" and "From internal to external" are available.

For general information on configuring IP packet filter rules in advanced firewall mode, refer to the following section:
Defining IP packet filter rules (Page 771)

Configuring address translation with NAT/NAPT

Address translation with NAT/NAPT for the redundancy relationship is configured on the primary module. For redundancy relationships, only Source NAT and NAPT can be configured. With Source NAT, source IP addresses in the internal subnet can only be replaced with the virtual external IP address of the redundancy relationship. No alias IP addresses can be registered on the external interface of the redundancy relationship. With NAPT, only the "External to internal" address translation direction can be configured.

For general information on configuring address translations with NAT/NAPT, refer to the following section:
Overview of NAT/NAPT (Page 784)

Configuring routing

Routes for the redundancy relationship are configured on the primary module. Standard routers must be specified in the "External interface [P1] red" or "Internal interface [P2] green" entry and must be identical per interface.

For general information on configuring routing, refer to the following section:
Specifying routes (Page 869)

Online functions - diagnostics and logging

Overview of the individual interfaces - "Interface settings" entry

Meaning

Table 10-56 Online diagnostics: "Interface settings" entry

System and status functions	Meaning
Interfaces	Table above: General overview of the interfaces of the security module. Table below: Information on the interface operated via PPPoE. • Status: Indicates whether or not a connection was established to the Internet Service Provider (ISP). • Current IP address: Current IP address of the interface • Gateway: IP address of the gateway • Primary dynamic DNS service: IP address of the primary dynamic DNS service • Secondary dynamic DNS service: IP address of the secondary dynamic DNS service • Error code (numeric): Error information if no connection could be established to the ISP.
CARP (only SCALANCE S623/S627-2M as of V4)	• CARP interface: Display of the virtual CARP interface • Physical interface: Physical interface on which the virtual CARP interface is operated (external / internal). • Status: Displays which of the modules of the redundancy relationship is active. • MAC address: MAC address of the virtual CARP interface • Preferred: Displays which of the modules of the redundancy relationship is configured as the primary module.

System and status functions	Meaning
Media redundancy (SCALANCE S627-2M only)	• Interface: Interface connected to the MRP ring. • Protocol: Protocol used (MRP) • Ring port 1: Name of the first media module port of the interface connected to the MRP ring. • Ring port 2: Name of the second media module port of the interface connected to the MRP ring. • Domain name: Name of the MRP domain. • Discrepancy: Display whether the domain of the client differs from that of the redundancy manager. • Domain UUID: UUID of the MRP domain.
Media modules (SCALANCE S627-2M only)	• Port: Port ID(s) of the media module port(s) • Name: Name of the media module • MLFB: MLFB of the media module • Revision: Version of the media module • Discrepancy: Displays whether there are differences between the configuration data in STEP 7 and the media modules.

Overview of the Dyn. DNS settings - "Dynamic DNS" entry

Meaning

Table 10-57 Online diagnostics: "Dynamic DNS"

System and status functions	Meaning
Client status	Indicates whether or not a connection was established to a dyn. DNS server.
Current IP address	WAN IP address via which the security module can currently be reached.
Defined IP address	IP address currently assigned to the FQDN.
Current time	The current time-of-day.
Force update	The security module obtains the current IP address of its Internet access and sends an update query to the configured update server(s). This publishes the current IP address on the Internet. The status is displayed in the primary or secondary dynamic DNS service fields. This means, for example that it is possible to check whether configured data such as the user name and password of the dynamic DNS account are correct.
Cancel suspension	Cancels the suspension (blocking of IP address updates from the dynamic DNS provider on the security module), for example after the dynamic DNS provider password has been corrected or an error has been eliminated.
Primary and secondary dynamic DNS service	
FQDN	Fully Qualified Domain Name registered with the provider.
Server IP Address	IP address of the update server used.
Successful update	Successful update in the dynamic DNS update service.
Last update attempt	Last update attempt for DynDNS update service.

System and status functions	Meaning
Last failed update	Last update error in the dynamic DNS update service.
Error code	Error status of the last unsuccessful update attempt during a dynamic DNS update.

What is the meaning of the messages?

The messages of the last DDNS update attempt have the following meaning:

Message	Meaning
Success	
DDNS_OK	The update query was successful.
Connection-related status messages	
DDNS_E_CON_UDP_SRV_RESOLV_ERR	DNS name of the update server unknown, FQDN cannot be resolved using the known DNS server.
DDNS_E_CON_UDP_SRV_UNREACHABLE	Update server unreachable ("Timeout").
Security-related status messages (errors)	
DDNS_E_CERT_SUBJECT_INVALID	The common name of the subject in the certificate does not match the domain name of the update server or its IP address.
DDNS_E_CERT_UNABLE_TO_GET_ISSUER_CERT	Issuer certificate not found. The certificate chain could not be followed back to the root CA because an issuer certificate was not found. The trust chain is incomplete.
DDNS_E_CERT_SIGNATURE_INVALID	The signature of a certificate could not be read or is invalid.
DDNS_E_CERT_NO_TRUST	A certificate in the trust chain is invalid, in other words: • Not yet valid or ready expired • V3 extensions invalid • Critical V3 extension is not supported
DDNS_E_CERT_DEPTH_ZERO_SELFSIGNED_CERT	The update server has supplied a self-signed certificate and the certificate is not in the certificate store for trustworthy root CA certificates.
DDNS_E_CERT_SELF_SIGNED_CERT_IN_CHAIN	The certificate chain could be established using non trustworthy certificates but no suitable root CA certificate was found in the certificate store for trustworthy certificates.
DDNS_E_CERT_CHAIN_TOO_LONG	The certificate chain exceeds the maximum supported verification depth.
DDNS_E_CERT_INVALID_CA	A CA certificate is invalid, in other words expired, not yet valid or the V3 extensions are not suitable for the intended purpose (for example CA not set to TRUE for CA certificates).
DDNS_E_CERT_KEYUSAGE_UNSUITED	The V3 extensions key usage or extended key usage set in a certificate of the trust chain are not suitable for the use of the certificate.
DDNS_E_CERT_EXTENSION_UNSUPPORTED	A certificate in the trust chain used an extension marked as critical that is not supported.

Message	Meaning
Agent-related status messages (errors)	
DDNS_E_AGT_BAD_AGENT	• The update request does not correspond to the structure required by cRSP, for example URL parameters missing. • The update request was sent to an illegal URL on the update server. • The configured update string contains errors.

Display of the ARP table - "ARP table" entry

Meaning

Display of the ARP table of the security module.

Table 10-58 Online diagnostics: "ARP table" tab

System and status functions	Meaning
ARP table	Display of the static (proxy ARP) and dynamic entries of the ARP table on the security module. The "Publication type" tab specifies whether the entry is configured statically or learnt.

Users logged in to the Web page - "Logged in users" entry

Meaning

Shows the users logged in to the Internet page for user-specific IP rule sets.

System and status functions	Meaning
User name	Name of the logged on user.
Source IP address	IP address with which the user logged on.
Time remaining	Remaining time before the user is automatically logged off.
Maximum time of the session	Configured total time of the session.
Log off	The selected user is logged off.

Display of the firewall blacklist - "Firewall blacklist" entry

Meaning

Displays the IP addresses of nodes that have exceeded the permitted number of connections and firewall statuses per time unit. These nodes are entered in the IP blacklist of the firewall.

The number of connections and firewall statuses per time unit is only limited if the "Use extended status options" check box is selected in the "Standard rules for IP services" entry in the local security settings.

If you click the "Delete all" button, the displayed IP addresses are removed from the firewall blacklist of the security module. The IP addresses are also no longer displayed.

Setting the date and time - "Date and time" entry

How to access this function

1. Select the security module whose time and date you want to check or set.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. In online diagnostics, select the "Functions" > "Date and time" entry.

Setting the local time on the security module

In this area, you can read out and set the time and date of the security module. When you click the "Apply" button, the security module is assigned the time and date currently entered in the "Date" and "Time" input boxes.

Setting the local time on PC

This area shows the current time and current date of the PC on which STEP 7 is installed. If you click the "Adopt for module" button, the security module is assigned the current time and current date of the PC.

Diagnostics in ghost mode - "Ghost mode" entry

Module-specific function

This function is available only for SCALANCE S602 as of V3.1.

Meaning

Display of address information as well as information on IP address changes of the internal node.

System and status functions	Meaning
Status of SCALANCE S602	Display of the status of the security module in relation to operation in ghost mode.
IP address	IP address of the internal node (identical to the external IP address of the security module).
Subnet mask	Subnet mask of the security module.
MAC address	MAC address of the internal node.

System and status functions	Meaning
Node found on	Displays when the internal node was recognized by the security module or when an IP address change was made on the internal node.
Number of IP address changes	Number of IP address changes detected by the security module.
IP address	IP address in the external network for which the security module requires route information.
Standard router	Standard router for the IP address in the external network.

Download functions

Downloading a configuration

Downloading the configuration / establishing an online connection

1. From the "PG/PC interface" drop-down list of the "Advanced download" dialog or "Connect online", select the network adapter via which you can reach the module.
2. If the module is in the factory settings status, follow the steps below:
   - From the "Connection to interface/subnet" drop-down list, with which your engineering station is connected and for which the IP address to be assigned is configured in the local security settings.
   - Select the "Display all compatible nodes" from the drop-down list.
   - Click the "Start search" button.
   - Result: The module is displayed in the "Select target device" table with its detected MAC address.
   - Select the module entry in the table and click the "Assign IP address" button.
   - Result: The module is assigned the IP address configured in the local security settings for the selected interface.
3. If the module is not in the factory settings status, follow the steps below:
   - From the "Connection with interface/subnet", select the interface / the FQDN address / WAN address of the module via which your engineering station can reach the module. STEP 7 then uses the address configured in the local security settings for the selected component for access to the module.
   - If you select the option "Display devices with the same address" from the drop down list, the nodes will be displayed whose address matches the selected component. If you select the entry "Show all compatible devices", the devices whose module type matches that of the selected module are shown.
   - Click the "Start search" button.
   - Result: The "Address" column of the "Compatible devices in the target subnet" displays the detected IP address / FQDN address of the module.
   - Select the address entry in the table and click the "Load" or "Go online" button.

Ideally, you should configure the modules of a group via the common external network of these modules (interface X1). If the engineering station is located in an internal network, you will need to enable the IP addresses of the other modules of the group explicitly in the firewall of this SCALANCE S and configure this module first.

Note

Downloading the configuration when operating in ghost mode (only SCALANCE S602 as of V3.1)

When you operate the security module in ghost mode, the external interface of the security module takes over the IP address of the internal node at runtime. Before you can download a new configuration via the external interface to the security module, you need to specify the IP address for downloading a configuration that the security module obtained from the internal node during runtime.
To find out the current IP address of the security module, you can search for reachable nodes in STEP 7 with the menu command "Online" > "Accessible devices".

Note

Loading a configuration on security modules of a redundancy relationship (only SCALANCE S623/S627-2M as of V4)

The properties of a redundancy relationship configured for the primary module must be loaded both on the primary module and on the secondary module. To load the configuration, the physical IP address via which your engineering station can reach the security module must be used. The virtual IP addresses of the redundancy relationship cannot be used for loading.

Specifying a different address

In the "Compatible devices in target subnet" dialog area, you have the option of specifying an IP address / an FQDN address that differs from the IP address / FQDN address in the local security settings. To do this, enter the IP address / FQDN address of the module in the editable cell in the "Address" table column. After loading, the security module is reachable via the IP address / the FQDN address from the local security settings.

Firmware version

The configuration of a SCALANCE S module can also be downloaded to a SCALANCE S module whose firmware version is higher than the firmware version of the SCALANCE S module in STEP 7.

Operating mode

Configurations can be downloaded while the SCALANCE S modules are operating. Restart the SCALANCE S module to activate your configuration changes.

Note

Special characteristics

- As long as a module has not yet set IP parameters (in other words, prior to the first configuration), there must be no router between the module and the configuration computer.
- If you swap a PC from the internal to the external interface of the SCALANCE S, access from this PC to the SCALANCE S is blocked for approximately 20 minutes.

Configuration status

Prior to each download, the existing configuration on the security module is checked and compared with the configuration to be downloaded from the STEP 7 project. If the configuration of the module originates from the STEP 7 project currently to be downloaded and there are differences between these configurations, it is possible to download only files with differences between the module and project configuration to the security module. In some situations, this can speed up the download.

Transferring firmware

This needs to be taken into consideration before transferring new firmware

To transfer new firmware to a security module, the following conditions must be met:

- You have the rights required to transfer firmware; refer to section AUTOHOTSPOT.
- The security module is configured with an IP address.

The transfer is secure

The firmware is transferred over a secure connection and can therefore also be transferred from the unprotected network.

The firmware itself is signed and encrypted. This ensures that only authentic firmware can be downloaded to the SCALANCE S module.

Restart necessary following transfer

Newly downloaded firmware only becomes active after the SCALANCE S module has been restarted. If the transfer is disturbed and aborted, the module starts up again with the old firmware version.

Security for S7-300 /S7-400 / PC CPs

Setting up a firewall

Local firewall rules for S7-300 /S7-400 / PC CPs

Overview S7-300 CPs / S7-400 CPs /PC CPs

Enabling packet filter rules

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

Firewall configuration with VPN

If the security module is added to a VPN group, the firewall is enabled by default. In addition, the "Tunnel communication only" check box is enabled. This means that only encrypted IPsec data transfer is permitted via the external interface. External data traffic is blocked.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

Configuring a firewall with predefined firewall rules - CP 343-1 Adv. / 443-1 Adv.

Configuring a firewall with predefined IP rules - CP 343-1 Adv. / 443-1 Adv.

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-59 Available services and directions

Service	From station/ internal to external	External to internal	From external to station	Enabled ports	Meaning
Allow IP communication	x	x	x	All	IP traffic for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/ FTPS (explicit mode)	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	-	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	-	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	x	-	UDP port 123	For synchronization of the time of day.

Table 10-60 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP 343-1 Adv. / 443-1 Adv.

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-61 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC communication	x	x	The MAC traffic from station to external and vice versa is allowed.
Allow ISO protocol	x	x	The ISO traffic from station to external and vice versa is allowed.

Table 10-62 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined firewall rules - CP 1628

Configuring a firewall with predefined IP rules - CP 1628

How to access this function

1. Select the module to be edited.
2. Select the "Security" > "Firewall" > "Predefined IP rules" entry.

Table 10-63 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	UDP port 123	For synchronization of the time of day.

Table 10-64 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules - CP 1628

How to access this function

1. Select the module to be edited.
2. Select the entry "Security" > "Firewall" > "MAC rules".

Table 10-65 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC level communication	x	x	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO communication	x	x	ISO traffic from external to the station and vice versa is allowed.
Allow SiClock	x	x	SiClock time-of-day frames from external to the station and vice versa are allowed.

Table 10-66 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

IP packet filter directions S7-300-/S7-400-/PC-CPs

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		Meaning
From	To	CP 343-1 Adv. / 443-1 Adv.	CP 1628	
Internal	Station	x	-	Access from the internal network to the station.
	Any	x	-	Access from internal to the external network, VPN tunnel partner and the station.
External	Station	x	x	Access from the external network to the station.
	Any	x	-	Access from external to the internal network and the station.
Station	Internal	x	-	Access from the station to the internal network.
	External	x	x	Access from the station to the external network.
	Tunnel	x	x	Access from the station to the VPN tunnel partner.
Tunnel	Station	x	x	Access via the VPN tunnel partner to the station.
	Any	x	-	Access from VPN tunnel partners to the internal network and the station.
Any	External	x	-	Access from the internal network and the station to the external network.

MAC packet filter directions S7-300-/S7-400-/PC-CPs

Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Security module		Meaning
From	**To**	**CP 343-1 Adv. / 443-1 Adv.**	**CP 1628**	
External	Station	**x**	**x**	Access from the external network to the station.
Station	External	**x**	**x**	Access from the station to the external network.
	Tunnel	**x**	**x**	Access from the station to the VPN tunnel partner.
Tunnel	Station	**x**	**x**	Access via the VPN tunnel partner to the station.

Configuring the access list

Module-specific function

This function is not available for the CP 1628.

Meaning

You set access protection for certain IP addresses using the IP access lists. List entries that have already been created and the corresponding rights are displayed in the local settings of the CP in the entry "Firewall" > "IP rules" (advanced firewall mode).

Note

Changed behavior after activation of security

- Once you have activated the security function for a CP, access protection will only apply to the external interface. You can apply access protection to the internal interface as well, by configuring suitable firewall rules in advanced firewall mode.
- The CP also responds to ARP requests from IP addresses that have not been released (layer 2).
- If the IP access list of a CP contains no entries and you activate security for the CP, the firewall will be activated and prevent access to the CP from external locations. Configure the corresponding firewall rules in advanced firewall mode so that the CP can be reached.

Effect of IP access list entries at activation of security

If security is enabled in the local settings of a CP, the corresponding rules are created in the advanced firewall mode. A firewall rule "Allow" > "External" > "Station" is created for an IP address you specified in the address list. The IP address from the IP access list is used accordingly as source IP address. IP addresses from a defined IP address range are also integrated into corresponding firewall rules.

Requirements for editing

Before you can edit created firewall rules, the following condition must be met:

- for editing using STEP 7: "Configure security" configuration right
- for editing using a Web server: Module right "Web: Expand IP access control list"

The requirements for editing the IP access lists outside the local security settings are described in the sections on the specific CPs.

Connection-related automatic firewall rules

Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Note

Releasing UDP multicast connections manually

No automatic firewall rules are created for UDP multicast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the security module is in a VPN group, the direction "External" changes to "Tunnel". This applies only to CPs that support VPN.

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Allow	Station	External
	Drop	External	Station
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

CP->internal	Action	From	To
active	Allow	Station	Internal
	Drop	Internal	Station
passive	Drop	Station	Internal
	Allow	Internal	Station
active and passive	Allow	Internal	Station
	Allow	Station	Internal

For level 2 connections, "Allow" rules are created for both directions. If the security module is in a VPN group, the direction "External" changes to "Tunnel".

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

Note

Changing the connection configuration

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

Conventions for automatically created firewall rules

- Priority
  The rules have highest priority and are therefore inserted at the top in the local rule list.
- Deleting rules
  The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- Changing the action
  If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow*" or "Drop*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow*" or "Drop*". If the configured connection is deleted, the corresponding rules are removed from the list.

Security module in VPN group

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with network nodes to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.
- If it is not clear whether connection should bypass or run through the VPN tunnel, the connection is assigned to the VPN tunnel and a message to this effect is displayed. The assignment can be adapted in advanced firewall mode, for example, by changing the "From" direction "Tunnel" to "External". To avoid this adaptation being overwritten by the next system synchronization, the "Allow*" or "Drop*" action must be selected.

Note

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode, for example, for internal nodes or NDIS addresses.

To allow only tunneled communication for a CP, add a rule with the following settings:

- "Action": "Drop"
- "From": "Any"
- "To": "External"

For the CP 1628, add a rule with the following settings:

- "Action": "Drop"
- "From": "Station"
- "To": "External"

In addition to this, you need to remove existing firewall rules that allow untunneled communication.

Activating Web server on security module

Module-specific function

This function is only available for CP 343-1 Adv. / 443-1 Adv. and CP 443-1 OPC UA:

Meaning

After activating the Web server, you have access to the Web pages of the module. In the local security settings, you can restrict access to these Web pages for the CP 343-1 Adv. / 443-1 Adv.to the HTTPS protocol. This access is controlled using the "Allow access only using HTTPS" check box. In addition, you must configure the firewall accordingly. For the CP 443-1 OPC UA access to the Web server is only permitted using HTTPS.

IPsec tunnel: Creating and assigning groups

Configuring internal network nodes - "Nodes" entry

Allow access to S7-300 / S7-400 CPs for VPN connection partners

Possible selections

Decide whether or not the VPN connection partner can have access to the CP and/or the internal subnet of the CP in routing mode (SCALANCE S / M).

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Node".
3. Configure access for the VPN connection partner of the CP in routing mode (SCALANCE S / M):
   - Allow connection to the CP (Gbit interface)
   - Allow connection to the internal subnet (PROFINET subnet)

Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel

Configuring NDIS nodes that can be reached through the tunnel

The internal nodes are learned and assigned to the routes dynamically. This concerns the NDIS IP addresses of the Windows PC.

Follow the steps below

1. Select the module to be edited.
2. In the local security settings, select the entry "Nodes" > "NDIS nodes reachable via tunnel".
3. Enter the NDIS IP addresses.

Online functions - Debug / Diagnostics and Logging

Updated firewall rules - "Dynamically updated firewall rules" entry

Module-specific function

This function is only available for CP 343-1 Adv. / 443-1 Adv.

Meaning

Display of the IP addresses or IP address ranges that were enabled dynamically using HTTP or HTTPS, or loaded by a user. The rights assigned for accessing the S7 CP are displayed for the enabled IP addresses. An update of the IP addresses in this tab can only be triggered by the following events:

- Extension/modification of the IP access control list
- Update of firewall rules
- Dynamic extensions transmitted to the CP at runtime, for example, PROFINET IO devices

Since only the dynamically updated firewall rules are displayed here, you also need to take into account the firewall rules that were configured offline and downloaded to the station for a full picture of the current firewall status of the module.

Security for S7-1200-/S7-1500-CPs

Setting up a firewall

Local firewall rules for S7-1200 / S7-1500 CPs

Overview of the local firewall rules for S7-1200 / S7-1500 CPs

Enabling packet filter rules

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

Note

Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

Configuring a firewall with predefined firewall rules - CP 1543-1 / CP 1543SP-1

Configuring a firewall using predefined IP rules

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-67 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS* (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow security diagnostics	x	TCP port 8448	Allow security diagnostics.

*not available for CP 1543SP-1

Table 10-68 IP routing via backplane bus (only for the CP 1543-1 as of V2.1)

Service	Enabled ports	Meaning
Allow IP communication via backplane bus	All	IPv4 traffic is allowed via the backplane bus. If the option "IP routing between communications modules" is activated group, this check box is enabled and cannot be deselected. If the option is deactvated, this check box is deactivated and cannot be activated.

Table 10-69 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall using predefined IPv6 rules

Meaning

With the predefined IPv6 rules, you have the option of configuring the firewall for services in which IPv6 is used. By enabling a predefined IPv6 rule in the local security settings of the CP 1543-1 V1.1, the system-defined ICMPv6 services that can be seen in the global security settings in the "ICMP" tab in "Firewall" > "Services" > "Define services for IP rules"are also enabled in the firewall. The firewall of the CP 1543-1 V1.0 allows ICMPv6 packets through even without enabling a predefined IPv6 rule.

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" > "Pre-defined IPv6 rules" item in the local security settings.

Table 10-70 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS* (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.

*not available for CP 1543SP-1

Table 10-71 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings made in "Predefined IPv6 rules" have no effect on firewall rules that were automatically generated as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-72 Available services and directions

Service	From station to external	From external to station	Enabled ports	Meaning
Allow MAC communication	x	x	-	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO protocol*	x	x	-	ISO traffic from external to the station and vice versa is allowed.
Allow DCP	x	x	-	DCP traffic from external to the station and vice versa is allowed.
Allow LLDP*	x	x	-	LLDP traffic from external to the station and vice versa is allowed.

*not available for CP 1543SP-1

Table 10-73 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station

Option	Action when activated	Relevant firewall rule		
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined firewall rules - S7-1200 CPs

Configuring a firewall using predefined IP rules

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 10-74 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow security diagnostics	x	TCP port 8448	Allow security diagnostics.

Table 10-75 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall using predefined IPv6 rules

Meaning

With the predefined IPv6 rules, you have the option of configuring the firewall for services in which IPv6 is used. By enabling a predefined IPv6 rule in the local security settings of of an S7-1200 CP capable of IPv6, the system-defined ICMPv6 services that can be seen in the global security settings in the "ICMP" tab in "Firewall" > "Services" > "Define services for IP rules" are also enabled in the firewall.

How to access this function

1. Select the module to be edited.
2. Select the "Firewall" > "Predefined IPv6 rules" item in the local security settings.

Table 10-76 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.

Table 10-77 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		**Action**	**From**	**To**
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

Note

Relationship between log settings in default mode and firewall rules

Log settings made in "Predefined IPv6 rules" have no effect on firewall rules that were automatically generated as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

Configuring a firewall with predefined MAC rules

How to access this function

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 10-78 Available services and directions

Service	From station to external	From external to station	Enabled ports	Meaning
Allow MAC communication	x	x	-	The MAC traffic from external to the station and vice versa is allowed.
Allow DCP	x	x	-	DCP traffic from external to the station and vice versa is allowed.

Table 10-79 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		**Action**	**From**	**To**
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station

Option	Action when activated	Relevant firewall rule		
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

Note

Relationship between log settings in default mode and firewall rules

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

IP packet filter directions S7-1200 / S7-1500 CPs

Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	To	
External	Station	Access from the external network to the station.
	Backplane bus*	Access from the external network to the backplane bus of the station.
	Any**	Access from the external for all supported directions.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to the VPN tunnel partner.
	Backplane bus*	Access from the station to its backplane bus.
	Any**	Access from the station to all supported directions.
Tunnel	Station	Access by VPN tunnel partners to the station.
	Backplane bus*	Access from VPN tunnel partners to the backplane bus of the station.
	Any**	Access from NPN tunnel partners to all supported directions.

Available options / ranges of values		Meaning
Backplane bus*	External	Access from backplane bus of the station to the external network.
	Tunnel	Access from backplane bus of the station to NPN tunnel partners.
	Station	Access from the backplane bus to the station.
	Any**	Access from the backplane bus to all supported directions.
Any**	External	Access from all supported directions to the external network.
	Tunnel	Access from all supported directions to VPN tunnel partners.
	Station	Access from all supported directions to the station.
	Backplane bus*	Access from all supported directions to the backplane bus of the station.

* only for CP 1543-1 as of V2.1 with IPv4 communication. if the option "IP routing between communications modules" is activated, IP routing via the backplane bus an be allowed / blocked via this direction.

* Only for CP 1543-1 as of V2.1

MAC packet filter directions S7-1200 / S7-1500 CPs

Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	To	
External	Station	Access from the external network to the station.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to the VPN tunnel partner.
Tunnel	Station	Access by VPN tunnel partners to the station.

Connection-related automatic firewall rules

Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/ passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Note

Enabling UDP multicast and UDP broadcast connections manually

No automatic firewall rules are created for UDP multicast and UDP broadcast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the CP is in a VPN group, the direction "External" changes to "Tunnel".

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Drop	External	Station
	Allow	Station	External
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

For level 2 connections, "Allow" rules are created for both directions. If the CP is in a VPN group, the direction "External" changes to "Tunnel".

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

Note

Changing the connection configuration

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

Conventions for automatically created firewall rules

- Priority
  The rules have highest priority and are therefore inserted at the top in the local rule list.
- Deleting rules
  The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- Changing the action
  If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow*" or "Drop*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow*" or "Drop*". If the configured connection is deleted, the corresponding rules are removed from the list.

Security module in VPN group

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with devices to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.

Note

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode.

To allow only tunneled communication for a CP, add a rule with the following settings:

- "Action": "Drop"
- "From": "Station"
- "To": "External"

In addition to this, you need to remove existing firewall rules that allow untunneled communication.

Configuring subnets reachable via the backplane bus for CP 1543-1

Requirement

- The security module CP 1543-1 as of V2.1 is a member of a VPN group and the option "IP routing between communications modules" is activated

How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" " Subnets reachable through tunnel".

Configuring subnets reachable via the backplane bus

VPN communication with network nodes and subnets reachable via the backplane bus of a station is only possible if this is released for VPN communication. In the entry "Subnets reachable through tunnel" a maximum of 16 addresses or subnets can be specified. IP addresses must be specified with a 32 bit subnet mask, subnets with a permitted subnet mask in the range 1... 31 bits. Broadcast addresses must not be specified.

10.1.3.5 Secure Communication (S7-1500)

Basics of Secure Communication (S7-1500)

Basics of Secure Communication (S7-1500)

For STEP 7 (TIA Portal) as of V14 and for S7-1500 CPUs as of firmware V2.0, the options for secure communication have been broadened considerably.

"S7-1500 CPUs" also refers to CPU versions S7-1500F, S7-1500T, S7-1500C as well as S7-1500pro CPUs and ET200SP CPUs.

Introduction

The attribute "secure" is used for the identification of communication mechanisms that are based on a Public Key Infrastructure (PKI) (for example RFC 5280 for Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List Profile). A Public Key Infrastructure (PKI) is a system that can issue, distribute and check digital certificates. The digital certificates issued are used within the PKI to secure computer-based communication. If a PKI uses asymmetric key cryptography, the messages in a network can be digitally signed and encrypted.

Components that you have configured in STEP 7 (TIA Portal) for secure communication use an asymmetric key encryption scheme with a public key (Public Key) and a private key (Private Key). TLS (Transport Layer Security) is used as the encryption protocol. TLS is the successor for the SSL (Secure Sockets Layer) protocol.

Objectives of secure communication

Secure communication is used to achieve the following objectives:

- Confidentiality
  i.e. the data is secret/cannot by read by eavesdroppers.
- Integrity
  i.e. the message that reaches the recipient is the same message, unchanged, that the sender sent. The message has not been altered on the way.
- End point authentication
  i.e. the end point communication partner is exactly who it claims to be and the party who is to be reached. The identity of the partner is verified.

In the past, these objectives were primarily relevant to IT and networked computers. Today, industrial machinery and control systems with sensitive data are at equally high risk, as they are also networked, and consequently pose high security requirements for data exchange.

Protection of the automation cell by means of the cell protection concept through firewall, or via connection through VPN, for example with the security module, was common in the past and remains so.

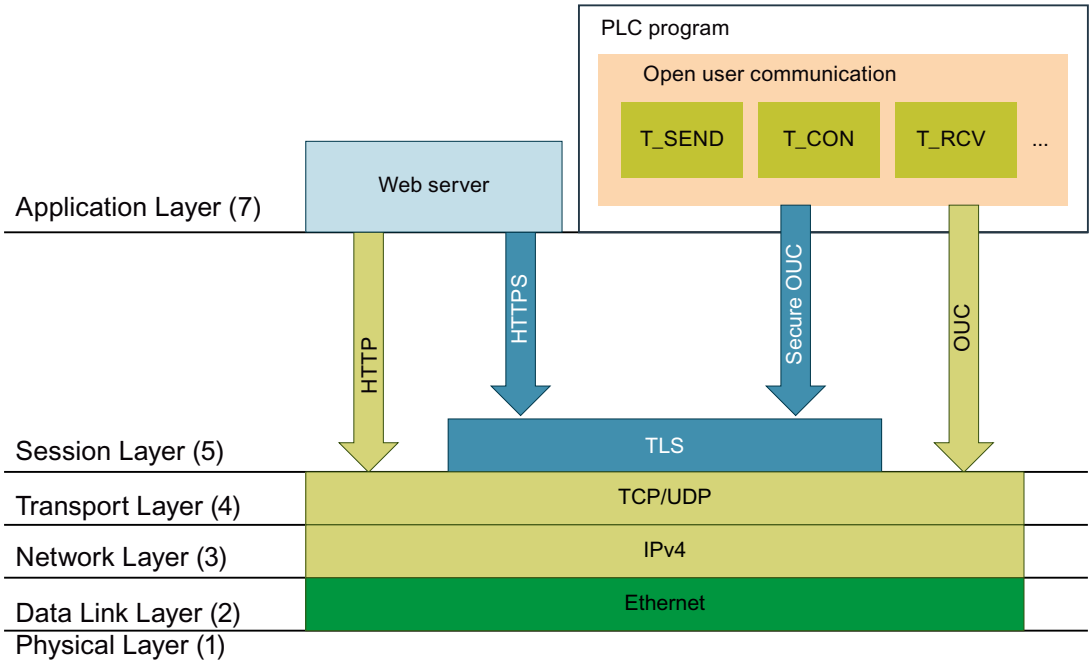
However, it is becoming increasingly necessary to also transfer data to external computers in encrypted form via Intranet or public networks.

Common principles of secure communication

Independent of the context, secure communication is based on the Public Key Infrastructure (PKI) concept and contains the following components:

- An asymmetric encryption scheme. This scheme allows the following:
  - Encryption or decryption of the messages using public or private keys.
  - The verification of signatures in messages and certificates.
    The messages / certificates are signed by the sender / certificate owner with their private key. The recipient / verifier checks the signature with the public key of the sender / certificate owner.
- Transport and storage of the public key using X.509 certificates.
  - X.509 certificates are digitally signed data that allow public key authentication in terms of the bound identity.
  - X.509 certificates can also contain information that describes in more detail or restricts use of the public key. For example the effective date of a public key in a certificate and when it expires.
  - X.509 certificates also contain information on the issuer of the certificate in secure form.

The following paragraphs give an overview of these basic concepts which are required for managing certificates in STEP 7 (TIA Portal), for example, and for programming the communication instructions for secure Open User Communication (sOUC).



Secure communication in STEP 7

STEP 7 as of V14 provides the required PKI for the configuration and operation of secure communication.

Examples:

- The Hypertext Transfer Protokoll (HTTP) becomes Hypertext Transfer Protokoll Secure (HTTPS) by means of the TLS (Transport Layer Security) protocol. Since HTTPS is a combination of HTTP and TLS, it is called "HTTP over TLS" in the corresponding RFC. You can see in the browser that HTTPS is being used. This is indicated by the URL scheme "https://" instead of "http://" in the address bar of the browser. Most browsers highlight such secure connections.
- Open User Communication becomes secure Open User Communication. The underlying protocol is also TLS.
- E-mail providers also offer access over the "Secure SMTP over TLS" protocol to increase the security of e-mail communication.

The figure below shows the TLS protocol in the context of communication layers.

Secure communication with OPC UA

An OPC UA server is implemented in S7-1500 CPUs as of firmware V2.0. OPC UA Security also covers authentication, encryption and data integrity with digital X.509 certificates and also uses a Public Key Infrastructure (PKI). Depending on the requirements of the application you can select various security levels for the end point security. The description of the OPC UA server functionality is covered in a separate section.

Confidentiality through encryption (S7-1500)

Message encryption is an important element of data security. When encrypted messages are intercepted by third parties during communication, these potential eavesdroppers cannot access the information they contain.

There is a wide range of mathematical processes (algorithms) for encrypting messages.

All algorithms process a "key" parameter to encrypt and decrypt messages.

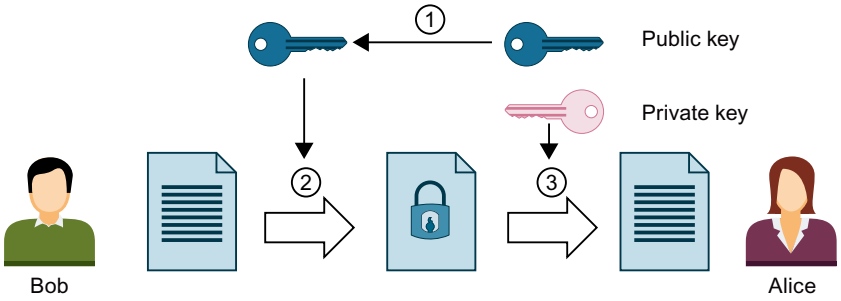
- Algorithm + key + message => encrypted message
- Encrypted message + key + algorithm => (decrypted) message

Symmetric encryption

The central aspect of symmetric encryption is that both communication partners use the same key for message encryption and decryption, as shown in the figure below. Bob uses the same key for encryption as Alice uses for decryption. In general, we also say that the two sides share a secret, the secret key, with which they encrypt or decrypt a message.

① Bob encrypts his message with the symmetric key
② Alice decrypts the encrypted message with the symmetric key

The process can be compared to a briefcase to which the sender and recipient have the same key, which both locks and opens the case.



- Advantage: Symmetric encryption algorithms (for example AES, Advanced Encryption Algorithm) are fast.
- Disadvantages: How can the key be sent to a recipient without getting into the wrong hands? This is a key distribution problem. If enough messages are received, the key can also be worked out and must therefore be changed regularly.

If there is a large number of communication partners, there is also a large number of keys to distribute.

Asymmetric encryption

Asymmetric encryption works with a pair of keys consisting of one public key and one private key. In connection with a PKI it is also called a Public Key process or only PKI process: A communication partner, Alice in the figure below, has a private key and a public key. The public key is provided to the public, in other words any potential communication partner. Anyone with the public key can encrypt messages for Alice. In the figure below, this is Bob.

Alice's private key, which she must not disclose, is used by Alice to decrypt an encrypted message addressed to her.

① Alice provides Bob with her public key. No precautionary measures are required to this purpose: Anyone can use the public key for messages to Alice if they are sure that it is actually Alice's public key.

② Bob encrypts his message with Alice's public key.

③ Alice decrypts the encrypted message from Bob with her private key. As only Alice has the private key and never discloses it, only she can decrypt the message. With her private key, she can decrypt any message encrypted with her public key - not only messages from Bob.

The system can be compared to a mailbox into which anyone can put a message, but from which only the person with the key can remove messages.

- Advantages: A message encrypted with a public key can only be decrypted by the owner of the private key. As another (private) key is required for decryption, it is also much harder to work out the decryption key on the basis of large numbers of encrypted messages. This means that the public key does not have to be kept strictly confidential, unlike with symmetric keys.
  Another advantage is easier distribution of public keys. No specially secured channel is required in asymmetric cryptography to transfer the public key from the recipient to the sender encrypting the messages. Less effort is thus required in the management of the keys than with the symmetric encryption process.
- Disadvantages: Complex algorithm (e.g. RSA, named after the three mathematicians Rivest, Shamir and Adleman), and therefore poorer performance than with symmetric encryption.

Encryption processes in practice

In practice, for example with a CPU Web server and Secure Open User Communication, the TLS protocol is used below the relevant application layer. Application layers are HTTP or SMTP, for example, as detailed above.

TLS (Transport Layer Security) uses a combination of asymmetric encryption and symmetric encryption (hybrid encryption) for secure data transfer, for example, over the Internet, and uses the following subprotocols:

- TLS Handshake Protocol, responsible for authentication of communication partners and negotiation of the algorithms and keys to be used for subsequent data transfer on the basis of asymmetric encryption
- TLS Record Protocol, responsible for encryption of user data with symmetric encryption and data exchange.

Both asymmetric and symmetric encryption are considered secure encryption schemes - there is basically no difference in security between the two procedures. The degree of security depends on parameters such as the selected key length.

Improper use of encryption

You cannot tell what identity is assigned to a public key from the bit string. A fraud could provide their public key and claim to be someone else. If a third party then uses this key thinking that they are addressing their required communication partner, confidential information could end up with the fraud. The fraud then uses their private key to decrypt the message that was not intended for them, and sensitive information falls into the wrong hands.

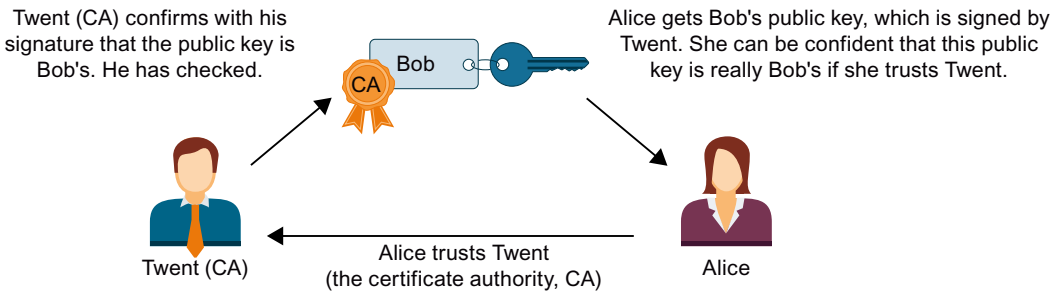
To prevent this type of abuse, the communication partners must be confident that they are dealing with the right communication partner. This trust is established by using digital certificates in a PKI.

Authenticity and integrity through signatures (S7-1500)

Attacks from programs that intercept communication between the server and client and act as if they themselves were client or server, are called man-in-the-middle attacks. If the false identity of these programs is not detected, they can, for example, obtain important information via the S7 program or set values in the CPU and attack a machine or plants. Digital certificates are used to avoid such attacks.

Secure communication uses digital certificates that meet the standard X.509 of the International Telecommunication Union (ITU). This allows the identity of a program, a computer or an organization to be checked (authenticated).

How certificates establish trust



The main role of X.509 certificates is to bind an identity with the data of a certificate subject (for example e-mail address or computer name) to the public key of the identity. Identities can be people, computers or machines.

Certificates are issued by certificate authorities (Certificate Authority, CA) or by the owner of a certificate itself. PKI systems specify how users can trust the certificate authorities and the certificates that they issue.

The certificate process:

1. Anyone wishing to own a certificate submits a certificate application to a registration authority linked to the certificate authority.
2. The certificate authority assesses the application and applicant on the basis of set criteria.
3. If the identity of the applicant can be clearly established, the certificate authority confirms that identity by issuing a signed certificate. The applicant has now become the certificate holder.

The figure below is a simplified overview of the process. It does not show how Alice can check the digital signature.

Self-signed certificates

Self-signed certificates are certificates whose signature comes from the certificate owner and not from an independent certificate authority.

Examples:

- You can create and sign a certificate yourself, for example, to encrypt messages to a communication partner. In the example above, Bob (instead of Twent) could himself sign his certificate with his private key. Alice can use Bob's public key to check that the signature and public key from Bob match. This procedure is sufficient for simple internal plant communication that is to be encrypted.
- A root certificate is, for example, a self-signed certificate, signed by the certificate authority (CA), that contains the public key of the issuer.

Features of self-signed certificates

The attributes "CN" (Common Name of Subject) for the certificate holder and "Issuer" (issuer) of the self-signed certificates are identical: You have signed your certificate yourself. The field "CA" (Certificate Autority) for the certificate authority must be set to "False"; the self-signed certificate should, after all, not be used to sign other certificates.

Self-signed certificates are not embedded in a PKI hierarchy.

Certificate content

A certificate to the X.509 V3 standard, the same standard that is used by STEP 7 and the S7-1500 CPUs, consists primarily of the following elements:

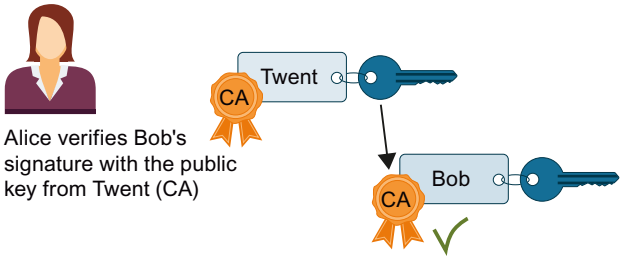
- Public key
- Details of the certificate holder (meaning the holder of the key). This is, for example, the Common Name (CN) of Subject
- Attributes such as serial number and validity period
- Digital signature from the certificate authority (CA) confirming that the information is correct.

There are also extensions, for example:

- Specification of what the public key may be used for (Key Usage), for example, signing or key encryption.
  When you create a new certificate with STEP 7, for example in the context of Secure Open User Communication, select the correct entry from the list of possible usages, e.g. "TLS".
- Specification of a "Subject Alternative Name" ("SAN"), which is used in secure communication with Web servers (HTTP over TLS), for example, to ensure that the certificate in the address bar of the Web browser also belongs to the Web server specified in the URL.

How signatures are generated and verified

Asymmetric key usage ensures that certificates can be verified: The example of the certificate "MyCert" illustrates the "Sign" and "Verify signature" processes.



Generating a signature:

1. The issuer of the "MyCert" certificate generates a hash value from the certificate data using a specific hash function (for example SHA-1, Secure Hash Algorithm).
   The hash value is a bit string of a constant length. The advantage of the constant length of the hash value is that it always takes the same amount of time to sign.
2. Using the hash value generated in this way and the private key, the issuer of the certificate then generates a digital signature. The RSA signature scheme is often used.
3. The digital signature is saved in the certificate. The certificate is now signed.

Verifying a signature:

1. The authenticator of the "MyCert" certificate obtains the certificate of the certificate issuer and thus also the public key.
2. A new hash value is formed from the certificate data with the same hash algorithm that was used for signing (for example SHA-1).
3. This hash value is then compared with the hash value that was determined by means of the public key of the certificate issuer and the signature algorithm to verify the signature on the certificate.
4. If the signature verification supplies a positive result, both the identity of the certificate holder as well as the integrity, meaning the authenticity and genuineness of the certificate contents, is proven. Anyone who has the public key, meaning the certificate from the certificate authority, can check the signature and thus prove that the certificate was actually signed by the certificate authority.

The figure below shows how Alice uses the public key in the certificate from Twent (who represents the certificate authority, CA) to verify the signature on Bob's public key. All that is required for verification is therefore the availability of the certificate from the certificate authority at the time of verification. The validation itself is executed automatically in the TLS session.

Signing messages

The method described above for signing and verifying also uses the TLS session for signing and verifying messages:

If a hash value is generated by a message and this hash value is signed with the private key of the sender and attached to the original message, the recipient of the message is able to check the integrity of the message. The recipient decrypts the hash value with the public key of the sender, puts together the hash value from the message received and compares the two values. If the values are not the same, the message has been tampered with on the way.

Chain of certificates to root certificate

The certificates of a PKI are often organized hierarchically: The top of the hierarchy is formed by root certificates. These are certificates that are not signed by a higher-level certificate authority. The certificate holder and certificate issuer of root certificates are identical. Root certificates enjoy absolute trust. They are the "anchor" of the trust and must therefore be known at the receiver as absolute certificates. They are stored in an area provided for trusted certificates.

The function of root certificates is to sign certificates from lower-level certificate authorities, so-called intermediate certificates. This transfers the trust from the root certificate to the intermediate certificate. An intermediate certificate can sign a certificate just like a root certificate; both are therefore referred to as "CA certificates".

This hierarchy can be continued over multiple intermediate certificates until the end-entity certificate. The end-entity certificate is the certificate of the user who is to be identified.

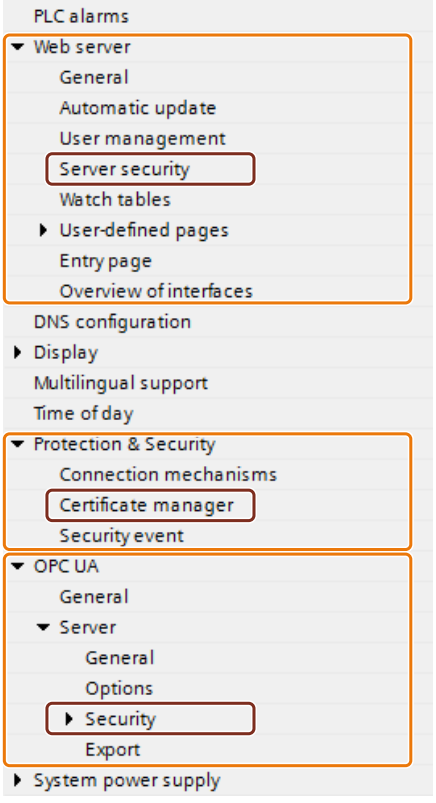
The validation process runs through the hierarchy in the opposite direction: As described above, the certificate issuer is established and the signature checked with the issuer's public key, then the certificate of the higher-level certificate issuer is established along the entire chain of trust to the root certificate.

Conclusion: The chain of intermediate certificates to the root certificate, the certificate path, must be available in every device that is to validate an end-entity certificate of the communication partner, irrespective of the type of secure communication that you configure.

Managing certificates with STEP 7 (S7-1500)

STEP 7 as of version V14 together with the S7-1500-CPUs as of FW version 2.0 support the Internet PKI (RFC 5280) in as far as an S7-1500 CPU is able to communicate with devices that similarly support the Internet PKI.

The use of X.509 certificates, for example to verify certificates as described in the preceding sections, is a result of this.



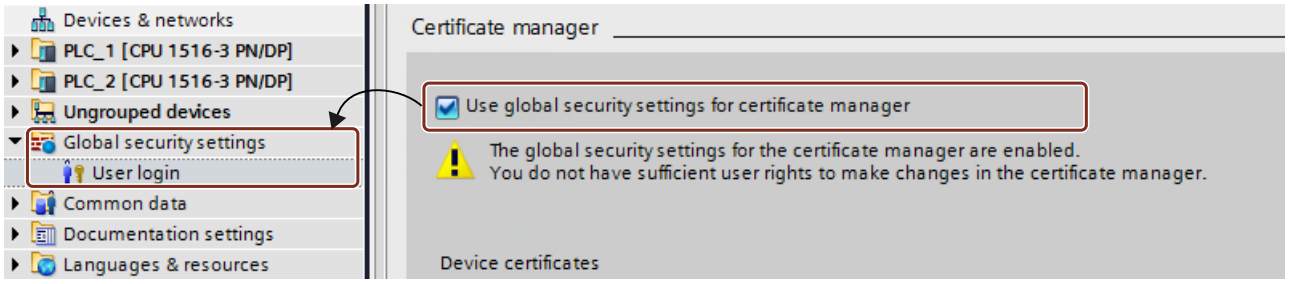
STEP 7 as of V14 uses a PKI similar to the Internet PKI. Certificate Revocation Lists (CRLs), for example, are not supported.

Create or assign certificates

For devices with security properties, such as an S7-1500 CPU as of firmware V2.0, you create certificates in STEP 7 for various applications.

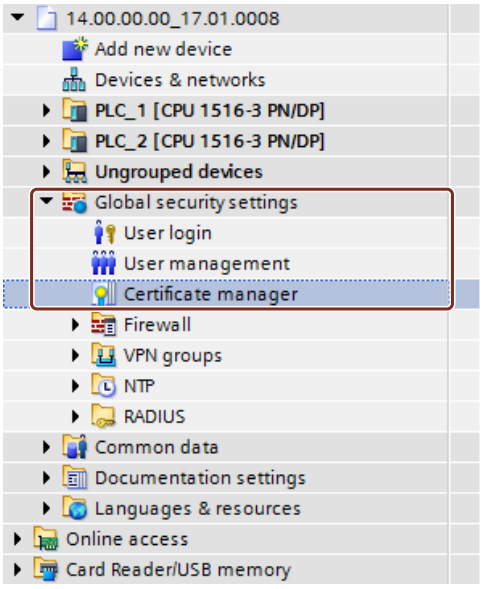
The following areas in the Inspector window of the CPU allow the creation of new certificates or the selection of existing ones:

- "Protection & Security > Certificate manager" - for the generation or assignment of all types of certificates. The default setting for the creation of certificates is TLS certificates for Secure Open User Communication.
- "Web server > Security" - for the generation and assignment of Web server certificates.
- "OPC UA > Server > Security" - for the generation or assignment of OPC UA certificates



Special feature of the area "Protection & security > Certificate manager"

Only in this area of the Inspector window do you switch between the global, meaning the project-wide, certificate manager and the local, meaning the device-specific, certificate manager (option "Use global security settings for certificate manager"). The option decides whether you have access to all the certificates in the project or not.



- If you do **not** use the certificate manager in the global security settings, you only have access to the local certificate memory of the CPU. You do not have any access, for example, to imported certificates or root certificates. Without these certificates only limited functionality is available. You can, for example, only create self-signed certificates.
- If you do not use the certificate manager in the global security settings and you are logged on as an administrator, you have access to the global, project-wide certificate memory. You can, for example, assign imported certificates to the CPU or create certificates that are issued and signed by the project CA (certification authority of the project).

The figure below shows how the "Global security settings" are displayed in the project tree after activation of the option "Use global security settings for certificate manager" in the Inspector window of the CPU.

When you double-click "User login" in the project tree below the global security settings and log in, a line "Certificate manager" is displayed there among other things.

With a double-click on the "Certificate manager" line you receive access to all the certificates in the project, divided into the tabs "CA" (certificate authorities), "Device certificates" and "Trusted certificates and root certification authorities".

Private keys

STEP 7 generates private keys when generating device certificates or server certificates (end-entity certificates). It depends on the use of the global security settings for the certificate manager where the private key is stored encrypted:

- If you use global security settings, the private key is stored encrypted in the global (project-wide) certificate memory.
- If you do not use global security settings, the private key is stored encrypted in the local (CPU-specific) certificate memory.

The existence of the private key that is required, for example, to decrypt data, is displayed in the "Private key" column in the "Device certificates" tab of the certificate manager in the global security settings.

When the hardware configuration is downloaded, the device certificate, the public key as well as the private key are downloaded to the CPU.

NOTICE
The option "Use global security settings for certificate manager" influences the previously used private keys: If you have already created certificates without using the certificate manager in the global security settings and then change the option to the use of the certificate manager, the private keys are lost and the certificate ID can change. A warning draws your attention to this fact. Therefore specify at the beginning of the configuration which option is required for the certificate management.

Examples for the management of certificates (S7-1500)

As explained in the preceding sections, certificates are required for every type of secure communication. The following section shows as an example how you handle the certificates with STEP 7 so that the requirements for Secure Open User Communication are met.

In the following section a distinction is made as to which devices the participating communication partners are. The respective steps for supplying the communication participants with the required certificates are described for each. An S7-1500 CPU or an S7-1500 software controller as of firmware version 2.0 is required.

The following generally applies:

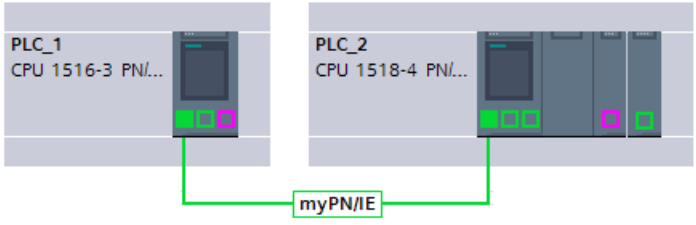
During the establishment of a secure connection ("handshake") the communication partners as a rule only transfer their end-entity certificates (device certificates).

Therefore the CA certificates required to verify the transferred device certificate must be located in the certificate memory of the respective communication partner.

Note

The current date/time must be set in the CPU.

When using secure communication (for example, HTTPS, secure OUC, OPC UA), make sure that the corresponding modules have the current time of day and the current date. Otherwise, the modules evaluate the used certificates as invalid and the secure communication does not work.



Secure Open User Communication between two S7-1500 CPUs

Two S7-1500 CPUs PLC_1 and PLC_2 should interchange data over Secure Open User Communication.

You generate the required device certificates with STEP 7 and assign them to the CPUs as described below.

STEP 7 project certification authorities (CA of the project) are used to sign the device certificates.

The certificates are to be referenced by their certificate ID in the user program (TCON communication instruction in combination with the associated system data type, for example TCON_IPV4_SEC). STEP 7 assigns the certificate ID automatically when generating or creating certificates.

Procedure

STEP 7 automatically downloads the required CA certificates together with the hardware configuration to the participating CPUs so that the requirements for certificate verification exist for both CPUs. You therefore only have to generate the device certificates for the respective CPU - everything else is done by STEP 7 for you.

1. Select PLC_1 and activate the "Use global security settings for certificate manager" option in the "Protection & Security" area.
2. Log in as a user in the project tree in the "Global security settings" area. The "Administrator" role is the default for the first login to a new project.
3. Return to the PLC 1 in the "Protection & Security" section. Click in an empty line in the "Certificate holder" column in the "Device certificates" table to add a new certificate.
4. Click the "Add" button in the drop-down list to select a certificate.
   The "Generate new certificate" dialog opens.
5. Leave the default settings in this dialog. They are tailored to the usage of Secure Open User Communication (usage: TLS).
   Tip: Extend the preset name of the certificate holder - in this case the CPU name. In order to differentiate better, leave the default CPU name in case you have to manage a large number of device certificates.
   Example: PLC_1/TLS becomes PLC_1-SecOUC-Chassis17FactoryState.
6. Compile the configuration.
   The device certificate and the CA certificate are part of the configuration.
7. Repeat the steps described for PLC_2.

In the next step you have to create the user programs for the data exchange and download the configurations together with the program.

Use self-signed certificates instead of CA certificates

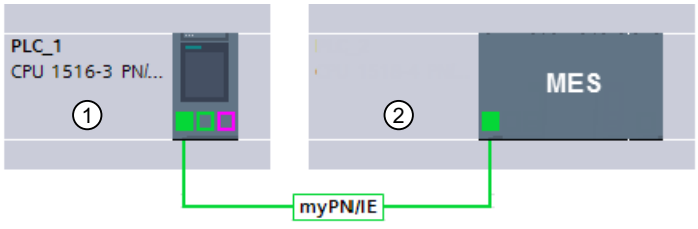
When creating device certificates you can select the "Self-signed" option. You can create self-signed certificates without having to be logged in for the global security settings. This procedure is not recommended because the certificates created by this method do not exist in the global certificate memory and can therefore not be assigned directly to a partner CPU.

As described above you should select the name of the certificate holder with care so that the right certificate can be assigned to a device without any doubt.

A verification with the CA certificates of the STEP 7 project is not possible with self-signed certificates. To ensure that self-signed certificates can be verified, you have to include the self-signed certificate of the communication partner in the list of trusted partner devices for each CPU. To do so, you must have activated the option "Use global security settings for certificate manager" and be logged in as a user in the global security settings.

Proceed as follows to add the self-signed certificate of the communication partner of the CPU:

1. Select PLC_1 and navigate to the table "Certificates of partner devices" in the "Protection & Security" area.
2. Click in an empty line of the "Certificate holder" column to open the drop-down list for adding or selecting certificates.
3. From the drop-down list select the self-signed certificate of the communication partner and confirm the selection.



In the next step you have to create the user programs for the data exchange and download the configurations together with the program.

Secure Open User Communication between an S7-1500 CPU as a TLS client and an external device as a TLS server

Two devices are to interchange data via a TLS connection or TLS session, for example to exchange recipes, production data or quality data:

- An S7-1500 CPU (PLC_1) as the TLS client; the CPU uses Secure Open User Communication
- An external device (such as a Manufacturing Execution System (MES)) as the TLS server

As the TLS client the S7-1500 CPU establishes the TLS connection / session to the MES system.

① TLS client
② TLS server

In order to authenticate the TLS server, the S7-1500 CPU requires the CA certificates of the MES system: The root certificate and if appropriate the intermediate certificates for verifying the certificate path.

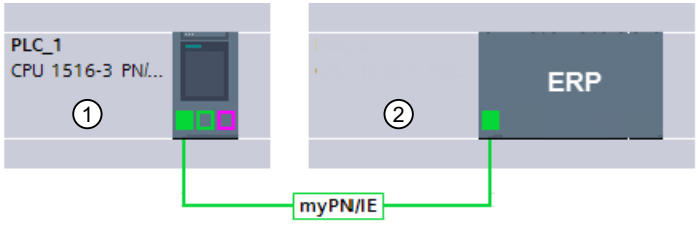
You have to import these certificates into the global certificate memory of the S7-1500 CPU.

Proceed as follows to import certificates of the communication partner:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (trusted certificates of root certification authorities) for the certificate to be imported.
3. Right-click in the table to open the shortcut menu. Click "Import" and import the required certificate or the required CA certificates.
   Through the import the certificate receives a certificate ID and can be assigned to a module in the next step.

4. Select PLC_1 and navigate to the table "Certificates of partner devices" in the "Protection & Security" area.
5. Click in an empty line of the "Certificate holder" column to add the imported certificates.
6. From the drop-down list select the required CA certificates of the communication partner and confirm the selection.

Optionally the MES system can also request a device certificate of the CPU to authenticate the CPU (meaning the TLS client). In this case the CA certificates of the CPU must be available to the MES system. Prerequisite for importing the certificates into the MES system is a preceding export of the CA certificates from the STEP 7 project of the CPU. Proceed as follows:



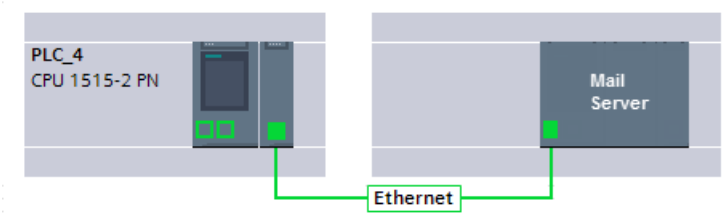
1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates) for the certificate to be exported.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Export".
5. Select the export format of the certificate.

In the next step you have to create the user programs for the data exchange and download the configurations together with the program.

Secure Open User Communication between an S7-1500 CPU as TLS server and an external device as TLS client

If the S7-1500 CPU acts as a TLS server and the external device, for example an ERP system (Enterprise Resource Planning System), establishes the TLS connection / session, you require the following certificates:

- For the S7-1500 CPU you generate a device certificate (server certificate) with a private key and download it with the hardware configuration. When generating the server certificate you use the option "Signed by certificate authority".
  The private key is required for the key exchange as explained in the figure for the example "HTTP over TLS".
- For the ERP system you have to export the CA certificate of the STEP 7 project and import / download it to the ERP system. With the CA certificate, the ERP system checks the server certificate of the S7-1500 that was transmitted from the CPU to the ERP system during the establishment of the TLS connection/session.



① TLS server
② TLS client

The description of the required actions is provided in the preceding sections.

Secure Open User Communication via S7-1543-1 CP as an e-mail client (SMTP over TLS)

An S7-1500 CPU can establish a secure connection to an e-mail server via the CP 1543-1 with the communication instruction TMAIL-C.

The system data types TMail_V4_SEC, TMail_V6_SEC and TMail_QDN_SEC allow you to specify the partner port of the e-mail server and thus to reach the e-mail server via "SMTP over TLS".

Prerequisite for a secure e-mail connection is an import of the root certificate and of the intermediate certificates from the e-mail server (provider) into the global certificate memory of the STEP 7 project. When these certificates have been assigned to the CP, the CP can check the server certificate of the e-mail server that is sent by the e-mail server during the establishment of the TLS connection / session by means of this certificate.

Follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (trusted certificates of root certification authorities) for the certificate to be imported.
3. Right-click in the table to open the shortcut menu. Click "Import" and import the required certificate or the required CA certificates.
   Through the import the certificate receives a certificate ID and can be assigned to the CP in the next step.
4. Select the CP 1543-1 and navigate to the table "Certificates of partner devices" in the "Security" section.
5. Click in an empty line of the "Certificate holder" column to add the imported certificates.
6. From the drop-down list select the required CA certificates of the e-mail server and confirm the selection.

In the next step you have to create the user programs for the e-mail client function of the CPU and download the configurations together with the program.

Secure OUC via e-mail (Page 955)

Secure OUC via CP interface (Page 951)

Example: HTTP over TLS (S7-1500)

The following paragraphs show how the mechanisms described are used to create secure communication between a Web browser and the Web server of an S7-1500 CPU.

First the changes for the option "Permit access only through HTTPS" in STEP 7 are described. As of STEP 7 V14 you have the option of influencing the server certificate of the Web server of an S7-1500 CPU as of firmware V2.0: The server certificate is generated with STEP 7 as of this version.

In addition the processes that are implemented when a website of the Web server of the CPU is called up with a Web browser of a PC via an encrypted HTTPS connection are displayed.

Using Web server certificates for S7-1500 CPUs as of FW V2.0

For S7-1500 CPUs with a firmware version before V2.0, you were able to set "Permit access only with HTTPS" when setting the Web server properties, without specific requirements applying.

You did not have anything to do with the handling of certificates for these CPUs; the CPU automatically generates the certificates required for the Web server.

For S7-1500 CPUs as of firmware V2.0, STEP 7 generates the server certificate (end-entity certificate) for the CPU. You assign a server certificate to the Web server in the properties of the CPU (Web server > Server security).

Since a server certificate name is always preset, nothing changes in the simple configuration of the Web server: You activate the Web server and activate the option "Permit access only with HTTPS" - STEP 7 generates a server certificate with the preset name during compiling.

Irrespective of whether you use the certificate manager in the global security settings or not: STEP 7 has all the information needed to generate the server certificate.

In addition you have the option of determining the properties of the server certificate, for example, the name or the duration of validity.

Note

The current date/time must be set in the CPU.

When using secure communication (for example, HTTPS, secure OUC, OPC UA), make sure that the corresponding modules have the current time of day and the current date. Otherwise, the modules evaluate the used certificates as invalid and the secure communication does not work.

Downloading the Web server certificate

The server certificate generated by STEP 7 is automatically also loaded when the hardware configuration is downloaded to the CPU.

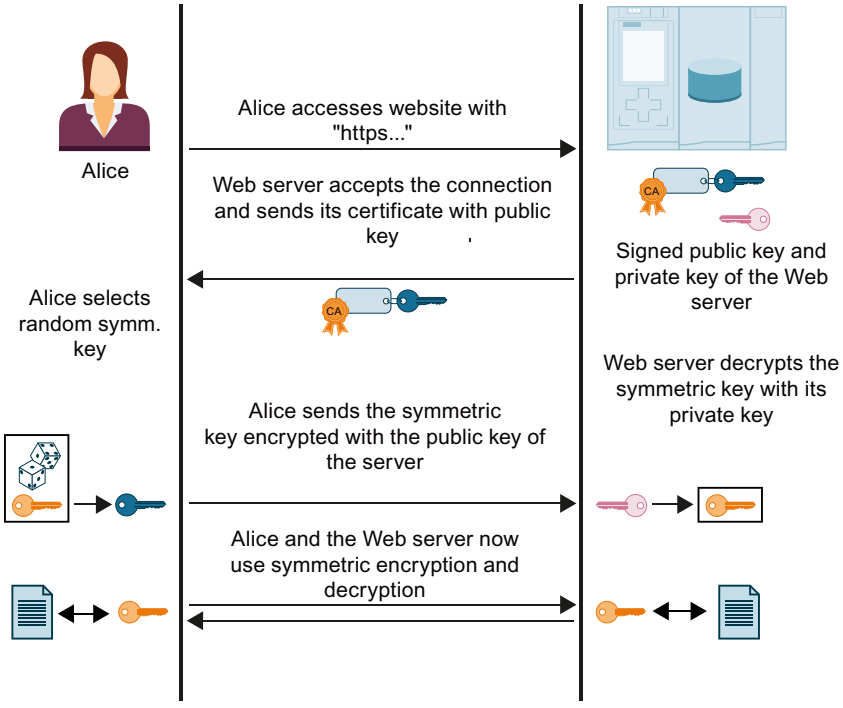
- If you use the certificate manager in the global security settings, the certificate authority of the project (CA certificate) signs the server certificate of the Web server. When downloading the CA certificate of the project is automatically loaded as well.
- If you do not use the certificate manager in the global security settings, STEP 7 generates the server certificate as a self-signed certificate.

When you address the Web server of the CPU via the IP address of the CPU, a new server certificate (end-entity certificate) must be generated and loaded with each change of the IP address of an Ethernet interface of the CPU. This is necessary because the identity of the CPU changes with the IP address – and the identity requires a signature in accordance with the PKI rules.

You can avoid this problem by addressing the CPU with a domain name instead of its IP address, e.g. "myconveyer-cpu.room13.myfactory.com". To do so, you need to manage the domain names of your CPUs over a DNS server.

Supplying a Web browser with a CA certificate of the Web server

In the Web browser, the user who accesses the websites of the CPU through HTTPS should install the CA certificate of the CPU. If no certificate is installed, a warning is output recommending that you do not use the page. To view this page, you must explicitly "Add an exception".



The user receives the valid root certificate (Certification Authority) for download from the "Intro" web page of the CPU Web server under "Download certificate".

STEP 7 offers a different possibility: Export the CA certificate of the project with the certificate manager into the global security settings in STEP 7. Subsequently import the CA certificate into the browser.

Course of Secure Communication

The figure below shows, in simplified terms, how communication is established ("handshake"), focusing on the negotiation of keys used for data exchange (here via HTTP over TLS).

However, the course can theoretically be applied to all communication options that are based on the use of TLS, i.e. also for Secure Open User Communication (see Basics of secure communication).

The figure does not show the measures taken at Alice's end (browser) to verify the certificate sent by the Web server. Whether Alice can trust the transferred Web server certificate and thus the identity of the Web server and allow the data exchange depends on a positive outcome of the verification.

The steps for verifying the authenticity of the Web server are:

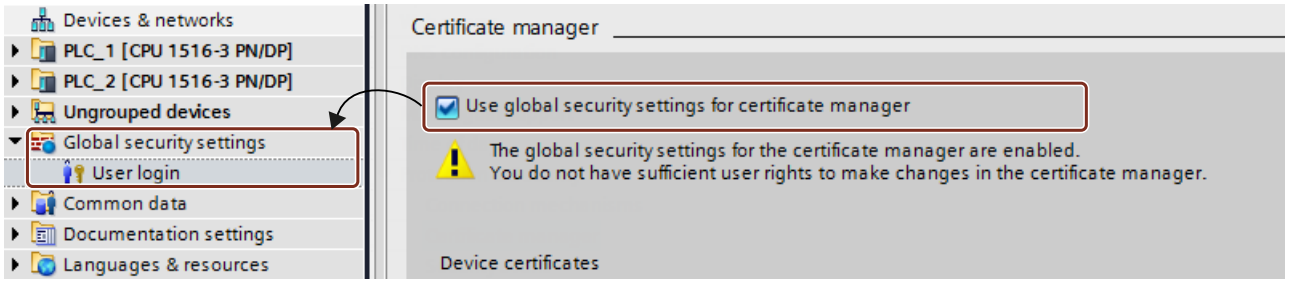
1. Alice must know the public keys of all relevant certificate authorities, i.e. she requires the complete certificate chain to be able to verify the Web server certificate (i.e. the end-entity certificate of the Web server).
   Alice will generally have the required root certificate in her certificate memory. When a Web browser is installed, a whole range of trusted root certificates is also installed. If she does not have the root certificate, she has to download it from the certificate authority and install it in the certificate memory of the browser. The certificate authority can also be the device on which the Web server is located.
   You have the following options for obtaining the intermediate certificates:
   - The server itself sends the required intermediate certificates along with its end-entity certificate to Alice – in the form of a signed message so that Alice can check the integrity of the certificate chain.
   - The certificates often contain the URLs of the certificate issuer. Alice can load the required intermediate certificates from these URLs.

   When you handle certificates in STEP 7, it is always assumed that you have imported the required intermediate certificates and the root certificate into the project and have assigned them to the module.
2. Alice validates the signatures in the certificate chain with the public keys of the certificates.

3. The symmetric key has to have been generated and transferred to the Web server.
4. If the Web server is addressed by its domain name, Alice verifies the identity of the Web server in accordance with the PKI rules defined in RFC 2818. She is able to do this because the URL, in this case the "Fully Qualified Domain Name (FQDN) of the Web server, is saved in the end-entity certificate of the Web server. If the certificate entry in the "Subject Alternative Name" field corresponds to the entry in the address bar of the browser, everything is fine.

The process continues with the exchange of data with the symmetric key, as shown in the figure above.

Global security settings (S7-1500)



Global security certificate manager (S7-1500)

Introduction

In the global certificate manager, you have an overview of all the certificates, for example, CA certificates, used in the project with information about the certificate holder, issuer, validity, use and the existence of a private key. With the corresponding authorization you can also manage certificates for the project there.

Activation of the global security settings

The global security settings are not visible until they have been activated in the project for at last one device. The "Use global security settings for certificate manager" check box is available to this end in the local CPU-specific certificate manager:

The check box is located in the Inspector window in the general settings of a device with security functions under "Protection & Security > Certificate manager".

Principle

The CA certificate is issued by a certificate authority from which the device certificates are derived.

Certificate authorities can be:

- STEP 7: If the "certificate holder" and "issuer" are the same, this is a self-signed certificate; in other words a certificate issued by STEP 7.
- Higher-level certificate authority: These external certificates are external to the project and are imported and stored in the certificate memory of STEP 7.

Certificates created by one of the two certificate authorities always have a private key so that the device certificates can be derived from them.

Functions of the global security certificate manager

The following functions are available for selection in the global security certificate manager:

- Import of new certificates and certificate authorities.
- Import of SSL certificates (only CP x43-1 Adv.), for example, for FTP communication.
- Export of the certificates and certificate authorities used in the project.
- Renewal of expired certificates and certificate authorities.
- Replacement of existing certificate authorities.
- Adding trusted certificates and certification authorities.

Deleting manually imported certificates.

Note

Downloading the configuration

After replacing or renewing certificates the configuration has to be downloaded to the corresponding devices. After replacing or renewing CA certificates the configuration has to be downloaded to the corresponding devices.

Note

Current date and current time of day on the security modules

When using secure communication (for example, HTTPS), make sure that the corresponding devices have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

Managing users and roles (S7-1500)

Introduction

After you have activated the global security settings for the certificate manager, you have to log in to the global security settings or you require administrator rights. Otherwise you do not have sufficient user rights to edit the global certificates. You cannot access the global certificate manager without a login or if you do not have sufficient rights.

Roles and rights

You can configure the security settings if the predefined roles "Administrator" or "Standard" are assigned to you or if a different defined role with the associated authorization is assigned. You can view the roles in the project tree under "Global security settings > User administration > Roles" or, if you have corresponding rights, edit them.

Assigned role	Diagnosing	Configuring	Managing users and roles
Administrator	Yes	Yes	Yes
Standard	Yes	Yes	No
Diagnostics	Yes	No	No

You can create new roles and users as an administrator and assign users and roles to each other in the user administration.

Requirement

You have to be logged in as an administrator via the user login to the global security settings.

Procedure

Proceed as follows to edit users and roles:

1. In the project navigator go to user administration in the global security settings.
2. Select the role to be changed or create a new role.
3. Edit the rights of the selected role in the rights list.

Importing and exporting certificates (S7-1500)

Introduction

You can import and export certificates and the associated private keys. Certificates can only be imported with the global certificate manager. Certificates can also be exported via the local CPU-specific certificate manager.

You can import or export the certificates into the following file types:

- Certificates without private key to CER, DER, CRT or PEM
- Certificates with their private key to P12 (PKCS12).

Requirement

During import of certificates with private key you may require a password for access.

Importing certificates

To import a certificate follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates, device certificates, trusted certificates of root certification authorities) for the certificate to be imported.
3. Right-click in the table to open the shortcut menu.
4. Click "Import".
5. Select the import format of the certificate:
   - CER, DER, CRT or PEM for certificates without private keys.
   - P12 (PKCS12 archive) for certificates with private key.
6. Click "Open" to import the certificate.

The imported certificate has to be assigned manually to the desired device or module.

Exporting certificates

To export a certificate, follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates, device certificates, trusted certificates of root certification authorities) for the certificate to be exported.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Export".
5. Select the export format of the certificate:
   - CER, DER, CRT or PEM for certificates without private keys.
   - CRL for certificate block list encoded to DER
   - P12 (PKCS12 archive) for certificates with private key.
6. Click "Save" to export the certificate.

You can also export certificates directly from the local CPU-specific certificate manager.

Selectable file formats

X.509 certificates to the certificate standard X.509 V3 from the RFC 5280 can be imported or exported in various formats with different file name extensions:

File name extension	**PEM**
File type	Privacy Enhanced Mail Security Certificate
Usage	Base64-encoded certificate
MIME type	application/x-pem-file

File name extension	PEM
Meaning	Certificate in PEM/X509 format (PEM = Privacy-Enhanced Mail) with an encoding in ASCII (Base64). Format of the certificate authorities often used for the certificate transfer via e-mail to the applicant of the certificate. Instead of the file name extension PEM, a Base64-enoded certificate can also have the extensions CER or CRT.
Usage	In TIA Portal the import and export is supported with PEM encoding. An export with PEM encoding can be effected in the file format PEM or CRT.

File name extension	DER
File type	DER Encoded X509 Certificate
Usage	Binary encoded certificate
MIME type	application/x-x509-ca-cert, application/pkix-cert
Meaning	Certificate in DER/X.509 format (DER = Distinguished Encoding Rules) with binary encoding. The binary DER format is the basis for the ASCII-encoded PEM format. The DER format is used in particular in the Microsoft Windows environment and on Java platforms. Instead of the file name extension DER a binary-encoded certificate can also have the extensions CER or CRT.
Usage	In TIA Portal the import and export is supported with DER encoding. An export with DER encoding can be effected in the file format DER or CER.

File name extension	CER
File type	Internet Security Certificate File
Usage	After PEM or DER encoded certificate
MIME type	application/x-x509-ca-cert, application/pkix-cert, application/keychain_access
Meaning	Alternative file name extension CER (Canonical Encoding Rules) for a binary encoded certificate in the DER format or for a Base64/ASCII-encoded certificate in PEM format.
Usage	In TIA Portal the import and export is supported in the file format CER. When importing a certificate in the file format CER the encoding can be to PEM or DER. The DER encoding is used for export in the file format CER.

File name extension	CRT
File type	Internet Security Certificate File
Usage	After PEM or DER encoded certificate
MIME type	application/x-x509-ca-cert, application/pkix-cert, application/keychain_access
Meaning	Alternative file name extension CRT for a binary encoded certificate in the DER format or for a Base64/ASCII-encoded certificate in PEM format.
Usage	In TIA Portal the import and export is supported in the file format CRT. When importing a certificate in the file format CRT the encoding can be to PEM or DER. The PEM encoding is used for export in the file format CRT.

File name extension	CRL
File type	Certificate Revocation List
Usage	Certificate block list encoded to DER
MIME type	application/pkix-crl, application/x-pkcs7-crl
Meaning	The CRL (Certificate Revocation List) is an X.509 V3 extension and contains the list of blocked or revoked certificates for a specific root certificate. Certificate authorities use the option to revoke the authorization of certificates already issued. This is the case when certificates are compromised or if their content turns out to be faulty. Blocked certificates can be unblocked again with the CRL, for example, when the certificate turns out not to be compromised after all or if the content was correct after all. Revoked certificates remain invalid forever and cannot be authorized again. The certificate authority updates its CRLs as soon as their validity has expired or the content has changed. The source of supply of a CRL is entered in the respective certificate.
Usage	The TIA Portal does not support a certificate revocation via CRL. Since some external clients must have certificate block lists for the validation of the certificates, an export of the CRL is however supported. But the list is empty and solely serves the purpose of making the validation of an output certificate by certain external clients possible.

File name extension	P12
File type	Personal Information Exchange File
Usage	As PKCS12-archive encoded certificates, optionally with private key
MIME type	application/keychain_access, application/x-pkcs12
Meaning	File types in the format P12 can also contain the private key in addition to the server certificate and intermediate certificates. A password can be assigned when storing.
Usage	In TIA Portal the import and export is supported in the file format P12. The option for exporting into a PKCS12 archive only exists if the certificate disposes of a private key. During export a password can be assigned for the PKCS12 archive. Analog to the password assignment during exporting, the entry of a password may be required to access the certificate during importing.

Renewing certificates (S7-1500)

Introduction

You can renew certificates, for example, to update a compromised certificate by an imported or new certificate.

Procedure

To renew a certificate, follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates, device certificates) for the certificate to be renewed.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Renew".

5. You can edit the data of the selected certificate in the dialog for new certificates.
6. When you click "OK", the certificate is renewed with the changed values.

When you renew a certificate, the old certificate is replaced by the certificate with the new values. Through the renewal of certificates no signature query to a certificate authority is generated.

Replacing certificates (S7-1500)

Introduction

You can replace an existing certificate by a different certificate.

Procedure

To replace a certificate, follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates, device certificates, trusted certificates of root certification authorities) for the certificate to be replaced.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Replace".
5. In the dialog for changing the certificate authority you replace the existing CA certificate of the project or the CA group certificate with a new one.

All certificates listed in the "Certificates involved" table are derived once again.

Displaying certificates (S7-1500)

Introduction

You can have an overview of all the certificate data displayed via the Windows certificate dialog

Procedure

Proceed as follows to display the certificate data:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (CA certificates, device certificates, trusted certificates of root certification authorities) for the certificate to be displayed.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Display".

Result

Different information about the selected certificate is displayed in a window:

- General information about the certificate
- Detailed information about the certificate
- Information about the certification path

Deleting certificates (S7-1500)

Introduction

You can delete certificates that are no longer required or are compromised.

Procedure

To delete a certificate, follow these steps:

1. Open the certificate manager in the global security settings in the project tree.
2. Select the matching table (device certificates, trusted certificates of root certification authorities) for the certificate to be deleted.
3. Right-click to open the shortcut menu for the selected certificate.
4. Click "Delete".

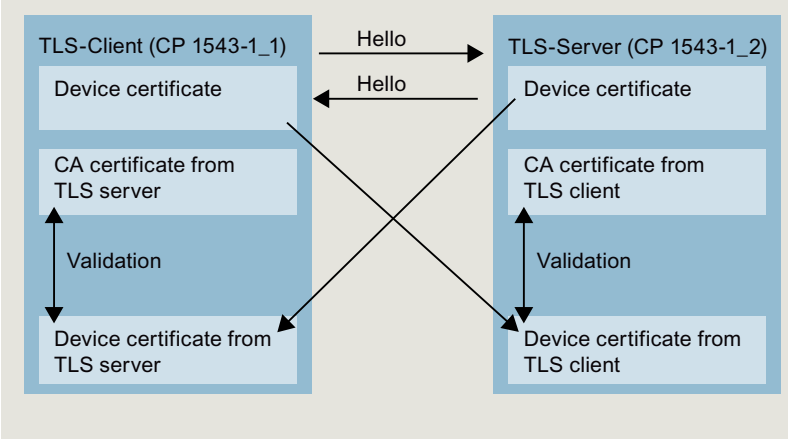
Note

CA certificates reserved for the project and certificates that are assigned automatically to a CP cannot be deleted.

You can also delete certificates directly in the local CPU-specific certificate manager. The certificate then remains in the global security manager for the project, but is no longer used for the device.

Secure Open User Communication (S7-1500)

Secure OUC between two S7-1500 CPUs (S7-1500)



The following section describes how you can set up a Secure Open User Communication over TCP between two S7-1500 CPUs In the process one S7-1500 CPU acts as a TLS client (active connection establishment) and the other S7-1500 CPU as a TLS server (passive connection establishment).

Setting up a secure TCP connection between two S7-1500 CPUs

In order to establish secure TCP communication between two S7-1500 CPUs you have to create a data block with the system data type TCON_IPv4_SEC in each CPU, carry out the parameter assignment and call it directly at the instruction. The TCON instruction supports the system data type TCON_QDN_SEC.

Requirements:

- Both S7-1500 CPUs have a minimum firmware version of V2.0
- TLS client and TLS server have all the required certificates.

Settings at the TLS client

To set up a secure TCP connection in the TLS client, follow these steps:

1. Create a global data block in the project tree.
2. Define a tag of the data type TCON_IP_4_SEC in the global data block. To do so, enter the string "TCON_IP_V4_SEC" in the "Data type" field.
   The example below shows the global data block "Data_block_1" in which the tag "SEC connection 1 TLS Client" of the data type TCON_IP_V4_SEC is defined.

Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	SEC connection 1 TLS-Client	TCON_IP_V4_SEC		
3	ConnPara	TCON_IP_v4		parameter of the TCP connection
4	InterfaceId	HW_ANY	72	HW-identifier of IE-interface submodule
5	ID	CONN_OUC	10	connection reference / identifier
6	ConnectionType	Byte	11	type of connetion: 11=TCP/IP, 19=UDP (17=TCP/IP)
7	ActiveEstablished	Bool	true	active/passive connection establishment
8	RemoteAddress	IP_V4		remote IP address (IPv4)
9	ADDR	Array[1..4] of Byte		IPv4 address
10	ADDR[1]	Byte	192	IPv4 address
11	ADDR[2]	Byte	168	IPv4 address
12	ADDR[3]	Byte	1	IPv4 address
13	ADDR[4]	Byte	100	IPv4 address
14	RemotePort	UInt	4711	remote UDP/TCP port number
15	LocalPort	UInt	4711	local UDP/TCP port number
16	ActivateSecureConn	Bool	true	activate the security functionality of that connection in general
17	TLSServerReqClientCert	Bool	false	Just for server side: The TLS server requests a client certificate
18	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 address against th
19	TLSServerCertRef	UDInt	1	for Server side: Reference to own X.509 V3 server certificate; fo
20	TLSClientCertRef	UDInt	5	for Client side: add id of own X.509 V3 client certificate; for Ser

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the IPv4 address of the TLS server for "RemoteAddress".
4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerCertRef": ID of the own X.509-V3 certificate.
   - "TLSClientCertRef": Enter, for example, the value 1. This references the CA certificate of the TIA Portal project (SHA1).
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_IP_V4_SEC.

Settings at the TLS server

To set up a secure TCP connection in the TLS server, follow these steps:

1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TCON_IP_V4_SEC.
   The example below shows the global data block "Data_block_1" in which the tag "SEC connection 1 TLS Server" of the data type TCON_IP_V4_SEC is defined.

Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	SEC connection 1 TLS-Server	TCON_IP_V4_SEC		
3	ConnPara	TCON_IP_v4		parameter of the TCP connection
4	InterfaceId	HW_ANY	120	HW-identifier of IE-interface submodule
5	ID	CONN_OUC	10	connection reference / identifier
6	ConnectionType	Byte	11	type of connetion: 11=TCP/IP, 19=UDP (17=TCP/IP)
7	ActiveEstablished	Bool	false	active/passive connection establishment
8	RemoteAddress	IP_V4		remote IP address (IPv4)
9	ADDR	Array[1..4] of Byte		IPv4 address
10	ADDR[1]	Byte	192	IPv4 address
11	ADDR[2]	Byte	168	IPv4 address
12	ADDR[3]	Byte	1	IPv4 address
13	ADDR[4]	Byte	10	IPv4 address
14	RemotePort	UInt	4711	remote UDP/TCP port number
15	LocalPort	UInt	4711	local UDP/TCP port number
16	ActivateSecureConn	Bool	true	activate the security functionality of that connection in general
17	TLSServerReqClientCert	Bool	true	Just for server side: The TLS server requests a client certificate
18	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 address against the
19	TLSServerCertRef	UDInt	6	for Server side: Reference to own X.509 V3 server certificate; fo
20	TLSClientCertRef	UDInt	1	for Client side: add id of own X.509 V3 client certificate; for Serv

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the IPv4 address of the TLS client for "RemoteAddress".
4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerReqClientCert ": Request for an X.509-V3 certificate from the TLS client Enter the value "true".
   - "TLSServerCertRef": ID of the own X.509-V3 certificate.
   - "TLSClientCertRef": Enter, for example, the value 1. This references the CA certificate of the TIA Portal project (SHA1).
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_IP_V4_SEC.

Secure OUC from an S7-1500 CPU as a TLS client to an external PLC (TLS server) (S7-1500)

The following section describes how you can set up a Secure Open User Communication over TCP from an S7-1500 CPU as TLS client to a TLS server.

Setting up a secure TCP connection from an S7-1500 CPU as TLS client to a TLS server

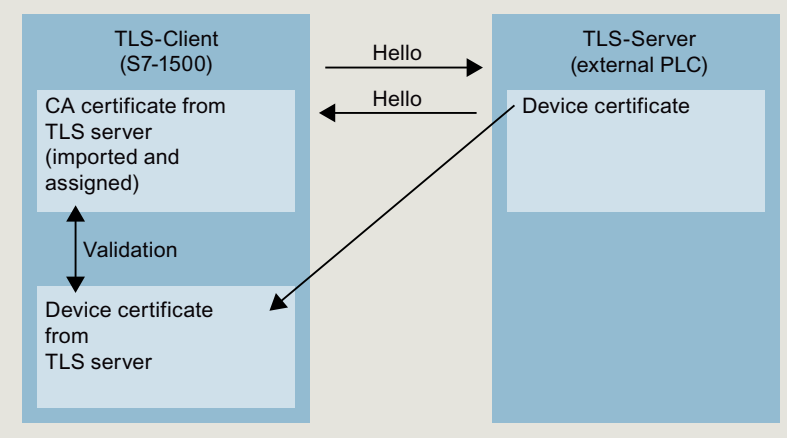
S7-1500 CPUs as of firmware version V2 support Secure Communication with addressing via a Domain Name System (DNS).

In order to establish secure TCP communication via the domain name you have to create a data block yourself with the system data type TCON_QDN_SEC, carry out the parameter assignment and call it directly at the instruction. The TCON instruction supports the system data type TCON_QDN_SEC.

Requirements:

- At least one DNS server exists in your network.
- You have configured at least one DNS server for the S7-1500 CPU.
- TLS client and TLS server have all the required certificates.

To set up a secure TCP connection to a TLS server, follow these steps:



1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TCON_QDN_SEC.
   The example below shows the global data block "Data_block_1" in which the tag "DNS ConnectionSEC" of the data type TCON_QDN_SEC is defined.

Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	DNS Connection SEC	TCON_QDN_SEC		
3	ConnPara	TCON_QDN		parameter of the TCP connection
4	InterfaceId	HW_ANY	0	not relevant
5	ID	CONN_OUC	5	connection reference / identifier
6	ConnectionType	Byte	11	type of connection: 16#0B=11=TCP/IP, 16#13
7	ActiveEstablished	Bool	true	active/passive connection establishment
8	RemoteQDN	String[254]	'plc_1.factory127.'	fully or partially qualified domain name of rem
9	RemotePort	UInt	4000	remote UDP / TCP port number
10	LocalPort	UInt	0	local UDP / TCP port number
11	ActivateSecureConn	Bool	true	activate the security functionality of that conn
12	TLSServerReqClientCert	Bool	false	Just for server side: The TLS server requests a
13	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 a
14	TLSServerCertRef	UDInt	7	for Server side: Reference to own X.509 V3 se
15	TLSClientCertRef	UDInt	0	for Client side: add id of own X.509 V3 client c

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the fully qualified domain name (FQDN) of the TLS server for "RemoteQDN".

4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "ExtTLSCapabilities": When you enter the value 1, the client validates the subjectAlternateName in the X.509-V3 certificate of the server to check the identity of the server. The certificates are checked when the connection is established.
   - "TLSServerCertRef": ID of the X.509-V3 certificate (usually a CA certificate) that is used by the TLS client to validate the TLS server authentication. If this parameter is 0, the TLS client uses all (CA) certificates currently loaded in the client certificate store to validate the server authentication. The certificate ID of the CA certificate is entered in the TLS server.

   - "TLSClientCertRef": ID of the own X.509-V3 certificate.
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_QDN_SEC.
   In the example below, the CONNECT parameter of the TCON instruction is interconnected with the tag "DNS connectionSEC" (data type TCON_QDN_SEC).

Connection parameters in accordance with TCON_QDN_SEC (Page 629)

TCON: Establish communication connection (Page 4478)

Examples for the management of certificates (Page 926)

Secure OUC from an S7-1500 CPU as TLS server to an external PLC (TLS client) (S7-1500)

The following section describes how you can set up a Secure Open User Communication over TCP from one S7-1500 CPU as TLS server to a TLS client.

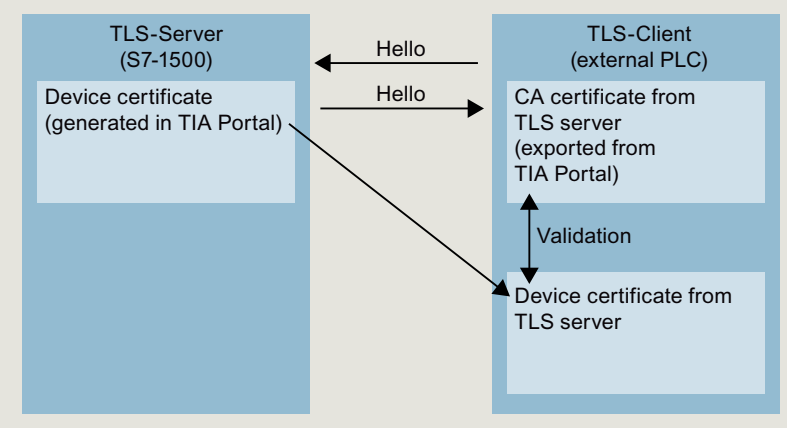
Setting up a secure TCP connection via the domain name of the communication partner

S7-1500 CPUs as of firmware version V2 support Secure Communication with addressing via a Domain Name System (DNS).

In order to establish secure TCP communication via the domain name you have to create a data block yourself with the system data type TCON_QDN_SEC, carry out the parameter assignment and call it directly at the instruction. The TCON instruction supports the system data type TCON_QDN_SEC.

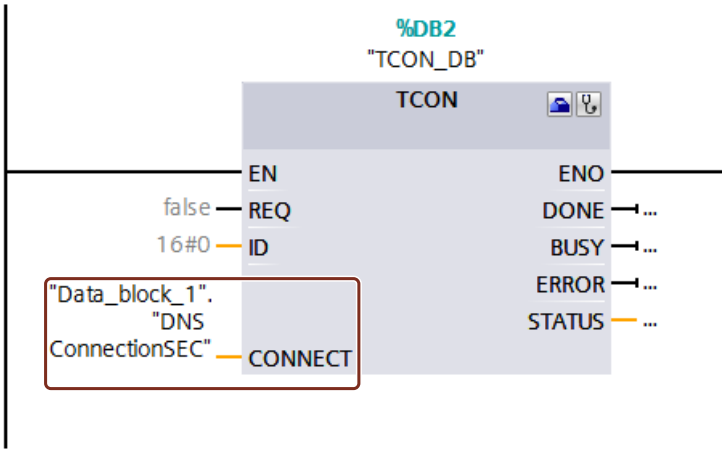
Requirements:

- At least one DNS server exists in your network.
- You have configured at least one DNS server for the S7-1500 CPU.
- TLS client and TLS server have all the required certificates.



To set up a secure TCP connection to a TLS client, follow these steps:

1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TCON_QDN_SEC.
   The example below shows the global data block "Data_block_1" in which the tag "DNS ConnectionSEC" of the data type TCON_QDN_SEC is defined.



Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	DNS Connection SEC2	TCON_QDN_SEC		
3	ConnPara	TCON_QDN		parameter of the TCP connection
4	InterfaceId	HW_ANY	0	not relevant
5	ID	CONN_OUC	8	connection reference / identifier
6	ConnectionType	Byte	11	type of connection: 16#0B=11=TCP/IP, 16#13
7	ActiveEstablished	Bool	false	active/passive connection establishment
8	RemoteQDN	String[254]	''	fully or partially qualified domain name of rem
9	RemotePort	UInt	0	remote UDP / TCP port number
10	LocalPort	UInt	2010	local UDP / TCP port number
11	ActivateSecureConn	Bool	true	activate the security functionality of that conn
12	TLSServerReqClientCert	Bool	false	Just for server side: The TLS server requests a
13	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 a
14	TLSServerCertRef	UDInt	5	for Server side: Reference to own X.509 V3 se
15	TLSClientCertRef	UDInt	0	for Client side: add id of own X.509 V3 client c

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the local ID of the TCP connection in "ID".
4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerReqClientCert": Request for an X.509-V3 certificate from the TLS client
   - "TLSServerCertRef": ID of the own X.509-V3 certificate.

   - "TLSClientCertRef": ID of the X.509-V3 certificate (or a group of X.509-V3 certificates) that is used by the TLS server to validate TLS client authentication. If this parameter is 0, the TLS server uses all (CA) certificates currently loaded in the server certificate store to validate the client authentication.
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_QDN_SEC.
   In the example below, the CONNECT parameter of the TCON instruction is interconnected with the tag "DNS connectionSEC" (data type TCON_QDN_SEC).

Connection parameters in accordance with TCON_QDN_SEC (Page 629)

TCON: Establish communication connection (Page 4478)

Examples for the management of certificates (Page 926)

Secure OUC via CP interface (S7-1500)

The following sections describes the particular points to be taken into consideration in the case of Secure Open User Communication via a CP interface. At least one station is an S7-1500 station with the following modules:

- S7-1500 CPU as of firmware version V2.0 (with the exception of S7-1500 Software Controller)
- CP 1543-1 as of firmware version V2.0 or CP 1543SP-1 as firmware version V1.0

The CP acts in an S7-1500 station as a TLS client (active connection establishment) or a TLS server (passive connection establishment).

The fundamental procedure and the concept for using secure communication via a CP interface is similar to that of secure communication via the interfaces of the S7-1500 CPUs. Essentially, you have to assign the certificates to the CPU in the role of a TLS server or TLS client and not to the CPU. Other rules and procedures therefore apply. These are described below.

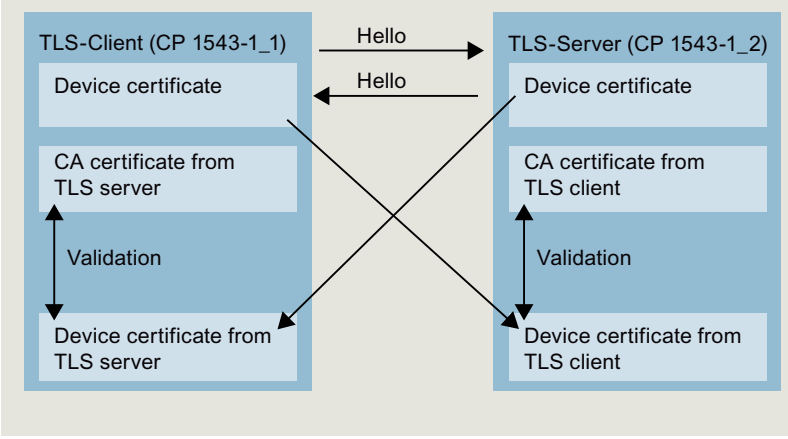
Handling certificates for CPs

The following applies in general: You have to be logged on at the certificate manager in the global security settings. The generation of self-signed certificates also requires logon for the global security settings. You have to have sufficient rights as a user (administrator or user with the "Standard" role with the right to "Configure security").

The starting point for the generation or assignment of certificates at the CP is the section "Security > Security properties". In this section, you log on for the global security settings.

Procedure:

1. In the network view of STEP 7, mark the CP and select the section "Security > Security properties" in the Inspector window.
2. Click on the "User logon" button.
3. Log on using your user name and password.
4. Enable the "Activate security functions" option.
   The security properties are initialized.
5. Click in the first line of the "Device certificates" table to generate a new certificate or select an existing device certificate.
6. If the communication partner is also an S7-1500 station, you also have to assign a device certificate to the communication partner with STEP 7 as described here or for the S7-1500 CPU.



Example: Setting up a secure TCP connection between two S7-1500 CPUs via CP interfaces

In order to establish secure TCP communication between two S7-1500 CPs, you have to create a data block with the system data type TCON_IPv4_SEC in each CPU, carry out the parameter assignment and call it directly at the instruction.

Requirements:

- Both S7 1500 CPUs have at least firmware version V2.0. If you use the CP 1543SP-1: Firmware version as of V1.0.
- Both CPs (for example CP 1543-1) must have at least firmware version V2.0
- TLS client and TLS server have all the required certificates.
  - A device certificate (end-entity certificate) for the CP must be generated and be located in the certificate memory of the CP. If a communication partner is an external device (for example an MES or ERP system), a device certificate also has to exist for this device.
  - The root certificate (CA certificate) with which the device certificate of the communication partner is signed must also be located in the certificate memory of the CP or in the certificate memory of the external device. If you use intermediate certificates, you have to ensure that the complete certificate path exists in the validating device. A device uses these certificates to validate the device certificate of the communication partner.
- The communication partner must always be addressed via its IPv4 address, not via its domain name.

The following figure shows the different certificates in the devices for the case that both communication partners communicate via a CP 1543-1. In addition, the figure shows the transfer of the device certificates during establishment of the connection ("Hello").

To set up a secure TCP connection in the **TLS client**, follow these steps:

1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TCON_IP_V4_SEC. To do so, enter the string "TCON_IP_V4_SEC" in the "Data type" field.
   The example below shows the global data block "Data_block_1" in which the tag "SEC connection 1 TLS Client" of the data type TCON_IP_V4_SEC is defined.
   The Interface ID has the value of the HW identifier of the IE interface of the local CP (TLS client).

Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	SEC connection 1 TLS-Client	TCON_IP_V4_SEC		
3	ConnPara	TCON_IP_v4		parameter of the TCP connection
4	InterfaceId	HW_ANY	258	HW-identifier of IE-interface submodule
5	ID	CONN_OUC	10	connection reference / identifier
6	ConnectionType	Byte	11	type of connetion: 11=TCP/IP, 19=UDP (17=TCP/IP)
7	ActiveEstablished	Bool	true	active/passive connection establishment
8	RemoteAddress	IP_V4		remote IP address (IPv4)
9	ADDR	Array[1..4] of Byte		IPv4 address
10	ADDR[1]	Byte	192	IPv4 address
11	ADDR[2]	Byte	168	IPv4 address
12	ADDR[3]	Byte	1	IPv4 address
13	ADDR[4]	Byte	100	IPv4 address
14	RemotePort	UInt	4711	remote UDP/TCP port number
15	LocalPort	UInt	4711	local UDP/TCP port number
16	ActivateSecureConn	Bool	true	activate the security functionality of that connection in general
17	TLSServerReqClientCert	Bool	false	Just for server side: The TLS server requests a client certificate
18	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 address against th
19	TLSServerCertRef	UDInt	1	for Server side: Reference to own X.509 V3 server certificate; fo
20	TLSClientCertRef	UDInt	5	for Client side: add id of own X.509 V3 client certificate; for Sen

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the IPv4 address of the TLS server for "RemoteAddress".
4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerCertRef": Enter the value 2 (reference to the CA certificate of the TIA Portal project (SHA256) or the value 1 (reference to the CA certificate of the TIA Portal project (SHA1)).
   - "TLSClientCertRef": ID of the own X.509-V3 certificate.
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_IP_V4_SEC.

Settings at the TLS server

To set up a secure TCP connection in the **TLS server**, follow these steps:

1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TCON_IP_V4_SEC.
   The example below shows the global data block "Data_block_1" in which the tag "SEC connection 1 TLS Server" of the data type TCON_IP_V4_SEC is defined.
   The interface ID has the value of the HW identifier of the IE interface of the local CP (TLS server).

Data_block_1

	Name	Data type	Start value	Comment
1	Static			
2	SEC connection 1 TLS-Server	TCON_IP_V4_SEC		
3	ConnPara	TCON_IP_v4		parameter of the TCP connection
4	InterfaceId	HW_ANY	260	HW-identifier of IE-interface submodule
5	ID	CONN_OUC	10	connection reference / identifier
6	ConnectionType	Byte	11	type of connetion: 11=TCP/IP, 19=UDP (17=TCP/IP)
7	ActiveEstablished	Bool	false	active/passive connection establishment
8	RemoteAddress	IP_V4		remote IP address (IPv4)
9	ADDR	Array[1..4] of Byte		IPv4 address
10	ADDR[1]	Byte	192	IPv4 address
11	ADDR[2]	Byte	168	IPv4 address
12	ADDR[3]	Byte	1	IPv4 address
13	ADDR[4]	Byte	10	IPv4 address
14	RemotePort	UInt	4711	remote UDP/TCP port number
15	LocalPort	UInt	4711	local UDP/TCP port number
16	ActivateSecureConn	Bool	true	activate the security functionality of that connection in general
17	TLSServerReqClientCert	Bool	true	Just for server side: The TLS server requests a client certificate
18	ExtTLSCapabilities	Word	16#0	Bit 0: Just for client side: validate given IPv4 address against the
19	TLSServerCertRef	UDInt	6	for Server side: Reference to own X.509 V3 server certificate; fo
20	TLSClientCertRef	UDInt	1	for Client side: add id of own X.509 V3 client certificate; for Serv

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the IPv4 address of the TLS client for "RemoteAddress".
4. Set the parameters for Secure Communication in the "Start value" column.
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerReqClientCert ": Request for an X.509-V3 certificate from the TLS client Enter the value "true".
   - "TLSServerCertRef": ID of the own X.509-V3 certificate.
   - "TLSClientCertRef": Enter the value 2 (reference to the CA certificate of the TIA Portal project (SHA256) or the value 1 (reference to the CA certificate of the TIA Portal project (SHA1)).
5. Create a TCON instruction in the program editor.
6. Interconnect the CONNECT parameter of the TCON instruction with the tag of the data type TCON_IP_V4_SEC.

Upload device as new station

When you upload a configuration with certificates and configured secure Open User Communication as a new station into your STEP 7 project, the certificates of the CP are not uploaded, in contrast to the certificates of the CPU. After the device has been loaded as a new station, no more certificates are contained in the corresponding tables of the CPs for the device certificates.

You have to perform configuration of certificates again after the upload. Otherwise, renewed loading of the configuration results in the certificates that originally exist in the CP being deleted so that secure communication does not function.

Secure OUC connections via CPU and CP interfaces - similarities

- Connection resources:
  No differences between OUC and secure OUC. A programmed secure OUC connection uses a connection resource just like an OUC connection, irrespective of which IE/ PROFINET interface communicates with the station.
- Connection diagnostics:
  No differences between OUC and secure OUC connection diagnostics.
- Loading of projects with secure OUC connections into the CPU:
  Only possible in STOP of the CPU, if certificates are loaded as well.
  Recommendation: Load to device > Hardware and software. Reason: Ensuring the consistency between the program with secure OUC, hardware configuration and certificates.
  Certificates are loaded with the hardware configuration - therefore loading requires a stop of the CPU. The reloading of blocks that utilize further secure OUC connections is only possible in RUN if the certificates required for this purpose are already located on the module.

Examples for the management of certificates (Page 926)

Secure OUC via e-mail (S7-1500)

The following section describes how to establish a secure connection (SNMP over TLS) to a mail server with the communication instruction TMAIL_C.

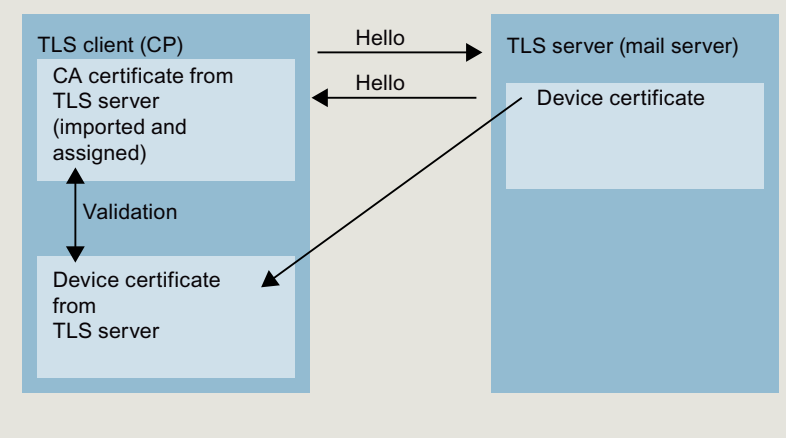
Setting up a secure connection to a mail server

In order to establish a secure communication to a mail server you have to create a data block yourself with one of the system data types TMAIL_V4_SEC, TMAIL_V6_SEC or TMAIL_QDN_SEC, carry out the parameter assignment and call it directly at the TMAIL_C instruction.

Requirements:

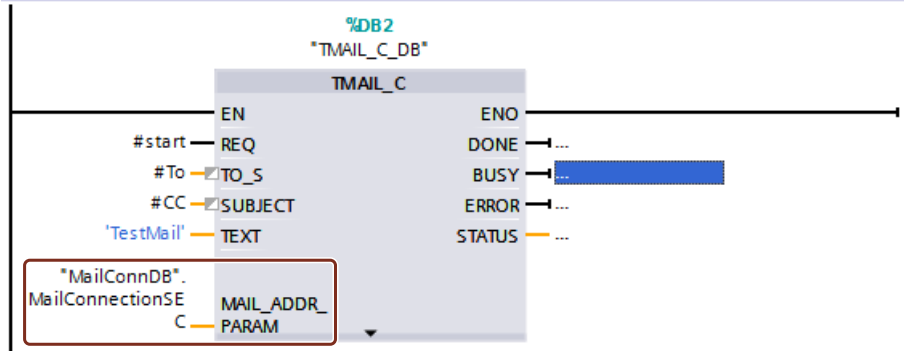
- S7-1500 CPU as of firmware version V2.0 with communication module CP 1543-1 as of firmware version V2.0
- ET 200SP CPU as of firmware version V2.0 with communication module CP 1542SP-1 (IRC) as of firmware version V1.0
- You have assigned all CA certificates of the mail server (TLS server) to the CP (TLS client) and have downloaded the configuration to the CPU.

To set up a secure mail server connection via the IPv4 address of the mail server, follow these steps:



1. Create a global data block in the project tree.
2. In the global data block, define a tag of the data type TMAIL_V4_SEC.
   The example below shows the global data block "MailConnDB" in which the tag "MailConnectionSEC" of the data type TMAIL_V4_SEC is defined.

MailConnDB



Name	Data type	Start value	Comment
Static			
MailConnectionSEC	TMail_V4_SEC		
InterfaceId	HW_ANY	"Local~CP_1543-1_1~Ethernet-Schnittstelle_1"	Use HW-identifier of the IE-interface to specify th
ID	CONN_OUC	100	connection reference / identifier
ConnectionType	Byte	16#20	type of connection 16#20=32=TMail_V4 or TMai
ActiveEstablished	Bool	true	active / passive connection establishment
WatchDogTime	Time	T#5000ms	watchdog time to monitor SMTP server associat
MailServerAddress	IP_V4		IPv4 address of mail server
ADDR	Array[1..4] of Byte		IPv4 address
ADDR[1]	Byte	144	IPv4 address
ADDR[2]	Byte	145	IPv4 address
ADDR[3]	Byte	2	IPv4 address
ADDR[4]	Byte	20	IPv4 address
UserName	String[254]	'myName'	user name which is necessary to login into the
PassWord	String[254]	'myPW'	user password which is necessary to login into
From	EMAIL_ADDR		source mail address
LocalPartPlusAt...	String[64]	'Mustermann@'	local part of e-mail address plus "@" sign
FullQualifiedD...	String[254]	'siemens.com'	full qualified domain name part of e-mail addre
RemotePort	UInt	587	remote TCP port number
ActivateSecureConn	Bool	TRUE	activate the security functionality of that conne
ExtTLSCapabilities	Byte	16#0	for further capability extensions of the TLS hand
TLSServerCertRef	UDInt	7	Reference to the X.509 V3 (CA-) certificate of the

3. Set the connection parameters of the TCP connection in the "Start value" column. For example, enter the IPv4 address of the mail server in "MailServerAddress".

4. Set the parameters for Secure Communication in the "Start value" column. For example, enter the certificate ID of the CA certificate of the communication partner in "TLSServerCertRef".
   - "ActivateSecureConn": Activation of secure communication for this connection. If this parameter has the value FALSE, the subsequent security parameters are irrelevant. You can set up a non-secure TCP or UDP connection in this case.
   - "TLSServerCertRef": Reference to the X.509 V3 (CA) certificate of the mail server which is used by the TLS client to validate the authentication of the mail server.

5. Create a TMAIL_C instruction in the program editor.
6. Interconnect the MAIL_ADDR_PARAM parameter of the TMAIL_C instruction with the tag of the data type TMAIL_V4_SEC.
   In the following example the MAIL_ADDR_PARAM parameter of the TMAIL_C instruction is interconnected with the "MAILConnectionSEC" tag (data type TMAIL_V4_SEC).

10.1.4 Creating configurations

10.1.4.1 Configuring automation systems (S7-1200)

Functional description of S7-1200 CPUs (S7-1200)

Operating modes (S7-1200)

Principles of the operating modes of S7-CPUs (S7-1200)

Introduction

Operating modes describe the behavior of the CPU. The following operating modes are possible:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate via the PN/IE interface, for example.

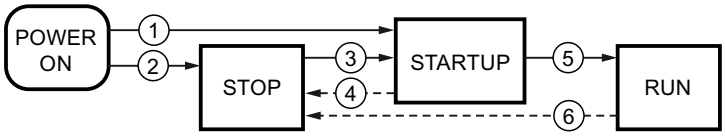
Other operating modes

If the CPU is not ready for operation, it is in one of following two operating modes:

- Deenergized, i.e. the supply voltage is switched off.
- Defective, which means an internal error has occurred.
  If the "Defective" status is caused by a firmware error, this state is indicated by the status LEDs of the CPU (refer to the description of the CPU). To find out the cause, follow these steps:
  - Turn the power supply switch off and on again.
  - Read out the diagnostics buffer when the CPU starts up and send the data for analysis to Customer Support.

  If the CPU does not start up, replace it.

See also



STOP mode (Page 963)

RUN mode (Page 963)

Operating mode transitions (S7-1200)

Overview

The following figure shows the operating modes and the operating mode transitions of S7-1200 CPUs:

The following table shows the conditions under which the operating modes will change:

No.	Operating mode transition	Conditions
①	POWER ON → STARTUP	After switching on, the CPU goes to "STARTUP" mode if: • "Warm restart" startup type is set, and • the hardware configuration and the program blocks are consistent. Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
②	POWER ON → STOP	When startup type "No startup" is set, the CPU goes to "STOP" mode after the supply voltage is switched on. Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: • CPU is set to "RUN" from the programming device, and • the hardware configuration and the program blocks are consistent.
④	STARTUP → STOP	The CPU returns to the "STOP" mode in the following situations: • Error detected during startup. • The CPU is set to "STOP" from the programming device. • A STOP command is processed in the STARTUP OB.
⑤	STARTUP → RUN	If the STARTUP is successful, the CPU switches to "RUN".
⑥	RUN → STOP	The CPU returns to the "STOP" mode in the following situations: • An error is detected that prevents continued processing. • The CPU is set to "STOP" from the programming device. • A STOP command is processed in the user program.

"STARTUP" operating mode (S7-1200)

Principles of the STARTUP mode (S7-1200)

Function

After turning on the CPU, it executes a startup program before starting to execute the cyclic user program.

By suitably programming startup OBs, you can specify certain initialization variables for your cyclic program in the startup program. There is no rule in terms of the number of startup OBs. That is, you can set up one or several startup OBs in your program, or none at all.

Parameter settings for startup characteristics

You can specify whether the CPU remains in STOP mode or whether a warm restart is run. Over and above this, you can set the response during startup (RUN or previous mode) in the "Startup" group of the CPU properties.

Special characteristics

Note the following points regarding the "STARTUP" mode:

- The startup OBs are executed. All startup OBs you have programmed are executed, regardless of the selected startup mode.
- No time-based program execution can be performed.
- Interrupt controlled program execution limited to:
  - OB 82 (diagnostics interrupt)
- The outputs on the modules are disabled.
- The process image is not updated; direct I/O access to inputs is possible.

Editing properties and parameters (Page 575)

Principles of the operating modes of S7-CPUs (Page 958)

Startup OBs (Page 1021)

Warm restart (Page 960)

Warm restart (S7-1200)

Function

During a warm restart, all non-retentive bit memory is deleted and non-retentive DB contents are reset to the initial values from load memory. Retentive bit memory and retentive DB contents are retained.

Program execution begins at the call of the first startup OB.

Triggering a warm restart

You can trigger a "Warm restart" using a corresponding menu command on your programming device in the following situations:

- The CPU must be in "STOP" mode.
- After a memory reset
- After downloading a consistent program and a consistent hardware configuration in the "STOP" mode of the CPU.

"POWER ON" triggers a "warm restart" if you have set the following parameters for the startup response:

- Startup type "warm restart - RUN" (regardless of the CPU operating mode prior to POWER OFF).
- "Warm restart - mode prior to POWER OFF" (depending on the CPU operating mode prior to POWER OFF. The CPU must have been in RUN mode prior to this.)

See also

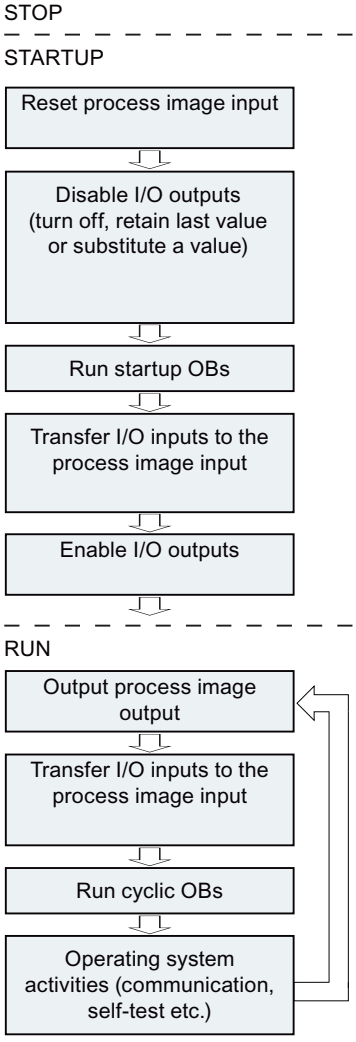
Retentive memory areas (Page 968)

Startup activities (S7-1200)

Overview

The following table shows which activities the CPU performs at STARTUP:

Activities in execution sequence	At warm restart
Clear non-retentive bit memories	Yes
Clear all bit memories	No
Clear the process image output	Yes
Processing startup OBs	Yes
Update the process image input	Yes
Enable outputs after changing to "RUN" mode	Yes



Sequence

The following figure shows the activities of the CPU in "STOP", "STARTUP", and "RUN" modes.

You can use the following measures to specify the state of the I/O outputs in the first cycle of the user program:

- Use assignable output modules to be able to output substitute values or to retain the last value.
- Set default values for outputs in startup OBs.

During the startup, all interrupt events are entered in a queue so that they can be processed later during RUN mode. In RUN mode, hardware interrupts can be processed at any time.

Special features during startup (S7-1200)

Response when expected and actual configurations do not match

The expected configuration is represented by the engineering configuration loaded on the CPU. The actual configuration is the actual configuration of the automation system.

If the expected configuration and actual configuration differ, the CPU nevertheless initially changes to RUN.

Canceling a STARTUP

If errors occur during startup, the startup is canceled and the CPU remains in "STOP" mode.

Under the following conditions, a startup will not be performed or will be canceled:

- If an invalid SD card is inserted.
- If no hardware configuration has been downloaded.

See also

Overview of the CPU properties (Page 982)

RUN mode (S7-1200)

Function

In "RUN" mode the cyclic, time-driven, and interrupt-driven program sections execute:

- The process image output is read out.
- The process image input table is read.
- The user program is executed.

Active data exchange between S7-1200 CPUs by means of Open User Communication is only possible in "RUN" mode.

Running the user program

Once the CPU has read the inputs, the cyclic program runs from the first to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is up even if the user program is completed sooner.

A maximum cycle time is set which you can adjust according to your requirements. This ensures that the cyclic program is completed within a specified time. The system will respond with a time error if the cyclic program is not completed within this time.

Other events such as hardware and diagnostic interrupts can interrupt the cyclic program flow and prolong the cycle time.

See also

Principles of the operating modes of S7-CPUs (Page 958)

Events and OBs (Page 973)

STOP mode (S7-1200)

Function

In "STOP" mode, the user program is not executed. All outputs are disabled or react according to the parameter settings: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe status.

The CPU checks the following points:

- Hardware, for example whether are all modules are available
- Whether the default settings for the CPU are applicable or parameter sets are present
- Whether the general conditions for the programmed startup behavior are correct

See also

Principles of the operating modes of S7-CPUs (Page 958)

Basics of a memory reset (S7-1200)

Function

A memory reset on the CPU is possible only in STOP mode.

When memory is reset, the CPU is changed to an "initial status". This means:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data are deleted.
- The diagnostic buffer, the time, the IP address, the hardware configuration, and active force jobs are retained.
- The load memory (code and data blocks) is then copied to work memory. As a result, the data blocks no longer have current values but their configured initial values.

Memory areas (S7-1200)

What you need to know about SIMATIC memory cards (S7-1200)

Function of the SIMATIC memory card

The SIMATIC memory card for an S7-1200 is an SD memory card, preformatted by Siemens for the CPU user program, that is compatible with the Windows operating system.

NOTICE
Formatting the SIMATIC memory card You may only delete files and folders. If you format the SIMATIC memory card with Windows tools, for example with a commercially available card reader, you will render the memory card unusable as a storage medium for an S7 CPU.

Setting the card type

You can use the SIMATIC memory card as a transfer card, a program card or a firmware update card.

To set the card type, insert the SIMATIC memory card into the card reader of the programming device and select the "Card reader/USB memory" folder from the project tree. In the properties of the selected memory card, designate the card type:

- Program
  If the SIMATIC memory card is used as a program card, you can load the user program to the card. In this case, the internal load memory of the device is replaced by the SIMATIC memory card and the internal load memory is erased. The user program is then fully executable from the SIMATIC memory card. If the SIMATIC memory card with the user program is removed, there is then no program.
- Transfer
  If the SIMATIC memory card is used as a transfer card, you can transfer the user program from the card to the internal load memory of the CPU. You can then remove the SIMATIC memory card.
- Firmware card
  Firmware for the S7-1200 modules can be stored on a SIMATIC memory card. It is therefore possible to perform a firmware update with the help of a specifically prepared SIMATIC memory card. A backup copy of firmware for a module can also be stored on the SIMATIC memory card.

Transferring objects from the project to a SIMATIC memory card

When the SIMATIC memory card is inserted in the programming device or in an external card reader, you can transfer the following objects from the project tree to the SIMATIC memory card:

- Individual blocks (multiple selection possible)
  In this case a consistent transfer is available, as the dependencies of the blocks to each other is taken into account with block selection.
- PLC
  In this case, all objects relevant to processing, such as blocks and the hardware configuration, are transferred to the SIMATIC memory card, just as with downloading.

To perform the transfer, you can move the objects with drag-and-drop or use the command "Card reader/USB memory > Write to memory card" in the "Project" menu.

Transferring objects from the SIMATIC memory card to the project

You can transfer Individual blocks (multiple selection is possible) by dragging them to the project. A hardware configuration cannot be transferred from the SIMATIC memory card to the project.

Updating firmware with a SIMATIC memory card

You can get the latest firmware data on the Internet from the Service & Support pages:

http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/34143537)

Save the firmware files on the hard disk and plug the SIMATIC Memory Card into the card reader of your programming device.

To store the file on the SIMATIC memory card, select the SIMATIC memory card in the "Card Reader/USB memory" folder in the project tree. Select the shortcut menu "Card Reader/USB memory > Create firmware update memory card".

Then follow the instructions in the Service & Support portal for performing a firmware update with your CPU.

Updating the firmware changes the CPU firmware status. If you have used the CPU in the project, you will have to update the CPU already configured to the CPU with the new firmware status by changing devices offline, and adapt and then load the program or configuration.

Load memory (S7-1200)

Function

Each CPU has an internal load memory. The size of this internal load memory depends on the CPU used.

This internal load memory can be replaced by using external memory cards. If there is no memory card inserted, the CPU uses the internal load memory; if a memory card is inserted, the CPU uses the memory card as load memory.

See also

Using memory cards (Page 421)

Work memory (S7-1200)

Function

Work memory is a non-retentive memory area for storing elements of the user program that are relevant for program execution. The user program is executed exclusively in work memory and system memory.

System memory (S7-1200)

System memory areas (S7-1200)

Function

System memory contains the memory elements that each CPU makes available to the user program, such as the process image and bit memory.

By using appropriate operations in your user program, you address the data directly in the relevant operand area.

The following table shows the operand areas of the system memory:

Operand area	Description	Access via units of the following size:	S7 notation
Process image output	The CPU writes the values from the process image output table to the output modules at the start of the cycle.	Output (bit)	Q
		Output byte	QB
		Output word	QW
		Output double word	QD
Process image input	The CPU reads the inputs from the input modules and saves the values to the process image input table at the start of the cycle.	Input (bit)	I
		Input byte	IB
		Input word	IW
		Input double word	ID
Bit memory	This area provides storage for intermediate results calculated in the program.	Bit memory (bit)	M
		Memory byte	MB
		Memory word	MW
		Memory double word	MD
Data block	Data blocks store information for the program. They can either be defined so that all code blocks can access them (global DBs) or assigned to a specific FB or SFB (instance DB). Requirement: The block attribute "Optimized block access" is not enabled.	Data bit	DBX
		Data byte	DBB
		Data word	DBW
		Data double word	DBD

Operand area	Description	Access via units of the following size:	S7 notation
Local data	This area contains the temporary data of a block while the block is being processed. Requirement: The block attribute "Optimized block access" is not enabled. Recommendation: Access local data (temp) symbolically.	Local data bit	L
		Local data byte	LB
		Local data word	LW
		Local data double word	LD
I/O input area	The I/O input and output areas permit direct access to central and distributed input and output modules.	I/O input bit	<tag>:P
		I/O input byte	
		I/O input word	
		I/O input double word	
I/O output area		I/O output bit	
		I/O output byte	
		I/O output word	
		I/O output double word

Overview of the block interface (Page 4764)

Access to the I/O addresses (Page 971)

Retentive memory areas (S7-1200)

Retentive memory areas

Data loss after power failure can be avoided by marking certain data as retentive. This data is stored in a retentive memory area. A retentive memory area is an area that retains its content following a warm restart, in other words, after cycling the power when the CPU changes from STOP to RUN.

The following data can be assigned retentivity:

- Bit memory: The precise width of the memory can be defined for bit memory in the PLC tag table or in the assignment list.
- Tags of a function block (FB): You can define individual tags as retentive in the interface of an FB if you have enabled optimized block access. Retentivity settings can be defined only in the assigned instance data block if optimized block access has not been activated for the FB.
- Tags of a global data block: You can define retentivity either for individual or for all tags of a global data block depending on the settings for access.
  - Block with optimized access: retentivity can be set for each individual tag.
  - Block with standard access: The retentivity setting applies to all tags of the DB; either all tags are retentive or no tag is retentive.

See also

Warm restart (Page 960)

Setting the retentivity of PLC tags (Page 4848)

process image input/output (S7-1200)

Basic principles of process images (S7-1200)

Function

When the user program addresses the input (I) and output (O) operand areas, it does not query or change the signal states on the digital signal modules. Instead, it accesses a memory area in the system memory of the CPU. This memory area is referred to as the process image.

Advantages of the process image

Compared with direct access to input and output modules, the main advantage of accessing the process image is that the CPU has a consistent image of the process signals for the duration of one program cycle. If a signal state on an input module changes during program execution, the signal state in the process image is retained until the process image is updated again in the next cycle. The process of repeatedly scanning an input signal within a user program ensures that consistent input information is always available.

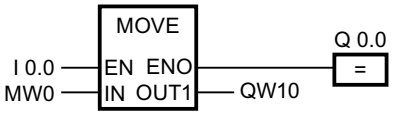
Access to the process image also requires far less time than direct access to the signal modules since the process image is located in the internal memory of the CPU.

Updating the process images (S7-1200)

Sequence

The operating system updates the process images at cyclic intervals unless defined otherwise in your configuration. The process image input/output is updated in the following order:

1. The internal tasks of the operating system are performed.
2. The process image output (PIQ) table is written to the outputs of the module.
3. The status of inputs is read to the process image input (PII) table.
4. The user program is executed with all the blocks that are called in it.



The operating system automatically controls the writing of the process image output to the outputs of the modules and the reading of the process image input.

Special characteristics

You have the option of accessing inputs or outputs directly using direct I/O access.

- If an instruction accesses an output directly and the output address is located in the process image output, the process image of the relevant output is updated.
- If an instruction accesses an output directly and the output address is **not** located in the process image output, the process image of the relevant output is **not** updated.

Example of normal I/O access by way of the process image

Update QW10 in the I/O output area with the value from MW0.

I/O access error during process image updating

If an error occurs during process image updating (I/O access error), the CPU reacts with the default system reaction "Ignore".

See also

Start address of a module (Page 971)

Access to the I/O addresses (Page 971)

Startup activities (Page 961)

Diagnostics buffer (S7-1200)

Function

The diagnostics buffer is part of the system memory of the CPU. It contains the errors detected by the CPU or modules with diagnostics capability. It includes the following events:

- Every mode change of the CPU (for example, POWER UP, change to STOP mode, change to RUN mode)
- Every diagnostics interrupt

The diagnostics buffer of the S7-1200-CPU has a capacity of 50 entries of which the last (most recent) 10 entries are retained following power cycling.

Those entries can only be cleared by restoring the CPU to factory defaults.

You can read the content of the diagnostics buffer with the help of the Online and Diagnostics view.

I/O data area (S7-1200)

Start address of a module (S7-1200)

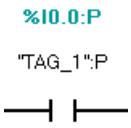
Definition

The start address is the lowest byte address of a module. It acts as the initial address of the module user data area.

Configuring module start addresses

The addresses used in the user program and the module start addresses are coordinated when the modules are configured.

In the module properties ("I/O addresses" group), you can change the start addresses that were assigned automatically after the modules were inserted.



You can also make a setting that decides whether or not the addresses are located in the process image.

Access to the I/O addresses (S7-1200)

I/O addresses

If you insert a module in the device view, its user data is located in the process image of the S7-1200 CPU (default). The CPU handles the data exchange between the module and the process image area automatically during the update of the process images.

Append the suffix ":P" to the I/O address if you want the program to access the module directly instead of using the process image.

This could be necessary, for example, during execution of a time-sensitive program which also has to control the outputs within the same cycle.

Basics of program execution (S7-1200)

English designation of the OB types (S7-1200)

English designation of the OB types

When an OB is created in the "Add new block" dialog, the OB types can only be displayed in English for technical reasons – irrespective of the set user interface language. In order to facilitate handling, the following table lists the English terms and their corresponding designations in the set user interface language.

English designation of the OB type in the "Add new block" dialog.	Designation in the information system
Program cycle	Cycle OB, OB for cyclic program processing, cyclic program
Startup	Startup OB
Time delay interrupt	Time-delay interrupt OB
Cyclic interrupt	Cyclic interrupt OB
Hardware interrupt	Hardware interrupt OB
Time error interrupt	Time error OB
Diagnostic error interrupt	Diagnostic interrupt OB
Pull or plug of modules	Pull/plug interrupt OB
Rack or station failure	Rack failure OB
Time of day	Time-of-day interrupt OB
Status	Status interrupt OB
Update	Update interrupt OB
Profile	OB for vendor or profile-specific interrupt
MC-Interpolator	MC-Interpolator OB
MC-Servo	MC-Servo OB
MC-PreServo	MC-PreServo OB
MC-PostServo	MC-PostServo OB

Events and OBs (S7-1200)

Events and OBs

The operating system of S7-1200-CPUs is based on events. There are two types of events:

- Events which can start an OB
- Events which cannot start an OB

An event which can start an OB triggers the following reaction:

- It calls the OB you possibly assigned to this event. The event is entered in a queue according to its priority if it is currently not possible to call this OB.
- The default system reaction is triggered if you did not assign an OB to this event.

An event which cannot start an OB triggers the default system reaction for the associated event class.

The user program cycle is therefore based on events, the assignment of OBs to those events, and on the code which is either contained in the OB, or called in the OB.

The following table provides an overview of the events which can start an OB, including the associated event classes and OBs. The table is sorted based on the default OB priority. Priority class 1 is the lowest.

Event class	OB no.	Number of OBs	Start event	OB priority (default)
Cyclic program	1, >= 123	>= 1	Starting or end of the last program cycle OB	1
Startup	100, >= 123	>=0	STOP to RUN transition	1
Time-of-day interrupt	>= 10	Max. 2	Start time has been reached	2
Time-delay interrupt	>= 20	Max. 4	Delay time expired	3
Cyclic interrupt	>= 30		Constant bus cycle time expired	8
Hardware interrupt	>= 40	Max. 50 (more can be used with DETACH and ATTACH)	• Positive edge (max. 16) • Negative edge (max. 16)	18
			• HSC: Count value = reference value (max. 6) • HSC: Count direction changed (max. 6) • HSC: External reset (max. 6)	18
Status interrupt	55	0 or 1	CPU has received status interrupt	4
Update interrupt	56	0 or 1	CPU has received update interrupt	4
Manufacturer- or profile-specific interrupt	57	0 or 1	CPU has received manufacturer-specific or profile-specific interrupt	4
Diagnostic error interrupt	82	0 or 1	Module has detected an error	5
Pull/plug interrupt	83	0 or 1	Removal/insertion of modules of distributed I/O	6

Event class	OB no.	Number of OBs	Start event	OB priority (default)
Rack error	86	0 or 1	Error in the I/O system of the distributed I/O	6
Time error	80	0 or 1	• Maximum cycle time exceeded • Called OB is still being executed • Time-of-day interrupt missed • Time-of-day interrupt missed during STOP • Queue overflow • Interrupt loss due to high interrupt load	22

The following table describes events which do not trigger an OB start, including the corresponding reaction of the operating system. The table is sorted based on event priority.

Event class	Event	Event priority	System reaction
Insert/remove central modules	Insert/remove a module	21	STOP
I/O access error during process image update	I/O access error during process image update	22	Ignore
Programming error	Programming error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	23	RUN
I/O access error	I/O access error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	24	RUN
Maximum cycle time exceeded twice	Maximum cycle time exceeded twice	27	STOP

Assignment between OBs and events

With the exception of the cyclic program and startup program and event can only be assigned to one OB. However, in certain event classes such as hardware interrupts one and the same OB can be assigned to several events.

The assignment between OBs and events is defined in the hardware configuration. Defined assignments can be changed at runtime by means of ATTACH and DETACH instructions.

OB priority and runtime behavior

S7-1200-CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

OBs are always executed on a priority basis: The OBs with the highest priority are executed first. Events of the same priority are processed in order of occurrence.

As of firmware version V4.0 of the S7-1200 CPUs you can specify in the device configuration, under properties of the CPU, if the OBs are interruptible or not. This parameter assignment has an effect on all OBs with exception of the cycle OBs which are always interruptible.

The following applies to S7-1200 CPUs with firmware version < V4.0:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event of priority group 2 to 25. This rule also applies to events of a priority higher than that of the currently active OB. Such events are processed later.
- A time error (priority 26) will interrupt any other OB.

The following applies to S7-1200 CPUs as of firmware version V4.0:

If you do not configure the OBs as interruptible, an OB is always processed completely even if an event of a higher priority occurs during its runtime. Specifically, this means:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event. This rule also applies to events of a priority higher than that of the currently active OB, which also includes a time error. Such events are processed later.

If you do configure the OBs as interruptible and an event of a higher priority occurs during the runtime of an OB, the running OB is interrupted and the OB associated with the occurring event is processed. Once this OB has been completed, processing of the interrupted OB continues. Specifically, this means:

- Any OB with priority >= 2 will interrupt cyclic program execution.
- An OB of priority 2 to 25 can be interrupted by any event whose priority is higher than that of the running OB. This is also true for time errors: A time error (priority 26) will interrupt any OB.

OB start information

Certain OBs have start information, while others do not. This is explained in greater detail in the description of the relevant OB.

ATTACH: Attach an OB to an interrupt event (Page 3795)

DETACH: Detach an OB from an interrupt event (Page 3799)

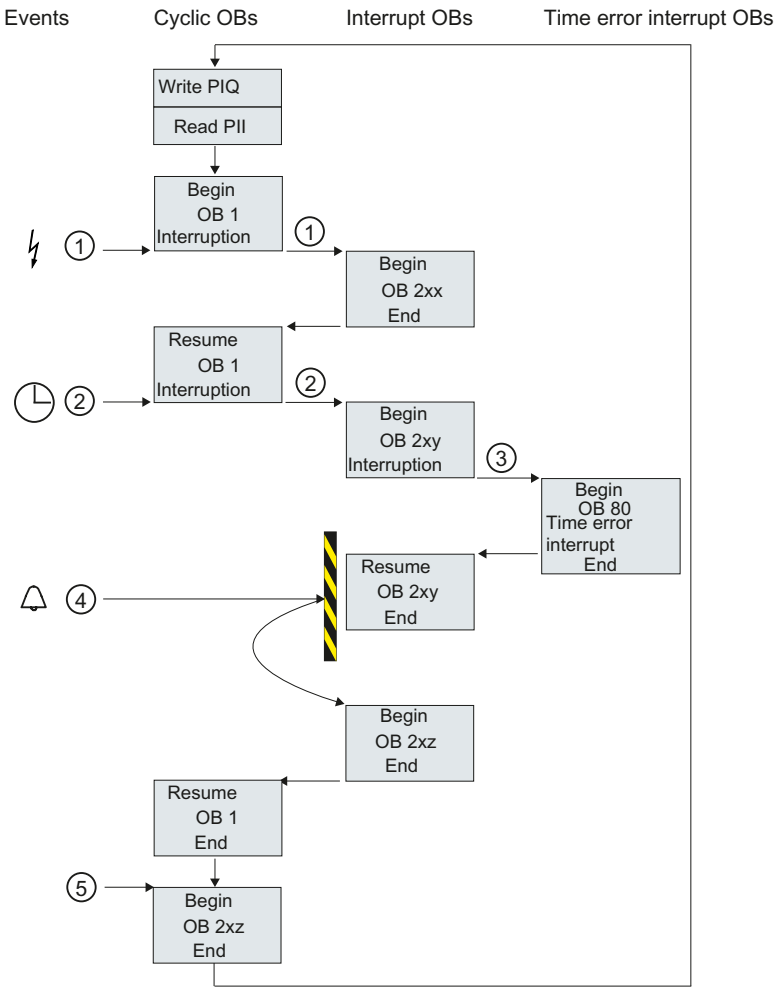
Event-based program execution (S7-1200)

OB priority and runtime behavior

S7-1200-CPUs support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

Interrupt OBs can only be interrupted by time error interrupts. This rule also applies to events of a priority higher than that of the currently active OB. That is, only one interrupt OB can be active, with exception of the time error interrupt OB.

Any further event of generated while an interrupt OB is being executed is added to a queue in accordance with its priority. Start events within a queue are processed later based on the chronological order of their occurrence.



Program execution on the CPU

Cyclic OBs are interrupted by interrupt OBs.

Reactions to events which start an interrupt OB:

- For CPUs up to firmware version V3: Interrupt OBs can only be interrupted by time error interrupt OBs.
- For CPUs as of firmware version V4: Interrupt OBs can be interrupted by interrupt OBs of a higher priority.

The figure below shows the basic procedure in case interrupt OBs cannot be interrupted (behavior up to firmware version V3):

① and ② An event (e.g. a hardware interrupt) calls its associated OB.

A called OB is executed without interruption, including all of its nested blocks. Execution of the cyclic OB is resumed on completion of interrupt processing, provided the queue does not contain any events which trigger an OB start.

③ An interrupt OB can only be interrupted by a time error interrupt OB (OB 80).

④ An new alarm-triggering event occurs during interrupt processing.

Reaction for CPUs up to and including firmware version V3:

This new event is added to a queue. The queued events successively call their corresponding OBs only after execution of the current interrupt OBs was completed and according to the following rules:

- Events are processed in the order of their priority (starting at the highest priority).
- Events of the same priority are processed in chronological order.

Reaction for CPUs as of firmware version V4:

You use a CPU parameter to set the interruptibility for CPUs as of firmware version V4. Default behavior: OBs are interruptible. In this case: If the new event has a higher priority than the currently running OB, the OB started by the new event interrupts the currently running OB.

If you disable the option, the interrupt OBs cannot be interrupted.

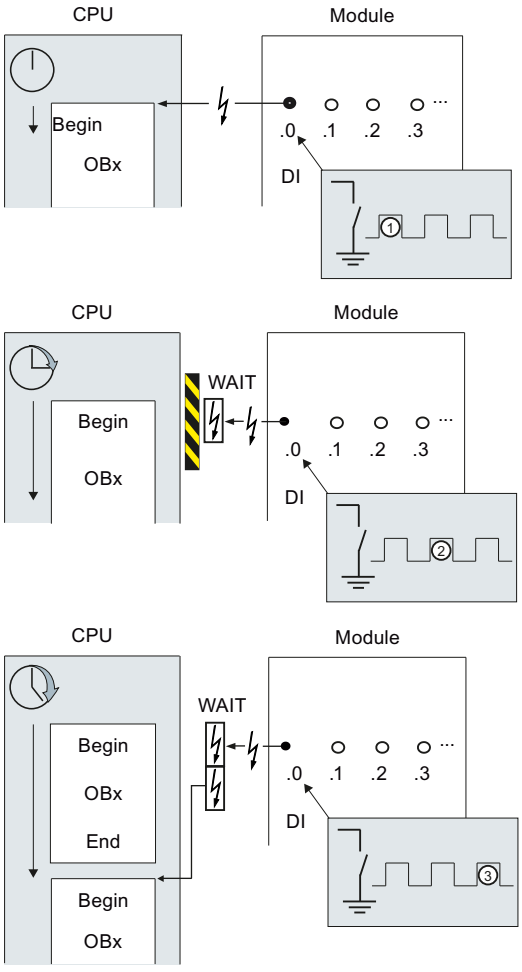
⑤ The cyclic OBs are processed one after the other.

Notes on queues

- Every priority class (OBs of the same priority to be called) is assigned a separate queue. The size of those queues is set by default.
- Any new event leading to the overflow of a queue is discarded and therefore lost. A "time error interrupt event" is generated simultaneously. Information identifying the OB that caused the error is included in the start information of the time error interrupt OB (OB 80). A corresponding reaction such as an alarm trigger can be programmed in the time error interrupt OB.

Example of a hardware interrupt event (S7-1200)

The function principle of event-oriented program execution in the S7-1200 CPU is described based on the example of a hardware interrupt-triggering module.



Process events and their priority

Process events are triggered by the I/O (e.g. at a digital input) and initiate a call of the assigned OB in the S7-1200 CPU. OBs assigned to a process event are called hardware interrupt OBs.

Examples of process events and their priority:

- Process events "rising edge" or "falling edge" at an interrupt-triggering module: The hardware interrupt OB started by such an event is always assigned priority 5.
- Process events from a high-speed counter
  - Count value corresponds to the reference value
  - Change count direction
  - External reset of the high-speed counter
    The hardware interrupt OB started by this event is always assigned priority 6.

The figure below shows the chronological sequence of hardware interrupt execution: In the case of two hardware interrupt events in immediate succession, the second hardware interrupt triggering event is held back in the queue until the first OBx has been processed. The next hardware interrupt triggering event can only start the associated OBx when the OBx has been processed. Additional hardware interrupt triggering events are lined up in the queue according to this principle.

Hardware interrupt execution

① A hardware interrupt-triggering event such as a rising edge at the input calls the OB to which it is assigned.

② If a new event occurs that triggers a hardware interrupt while the OB is executing, this event is entered in a queue.

③ The new event that triggers a hardware interrupt starts the hardware interrupt OB assigned to the event.

Assigning the interrupt-triggering event

The interrupt-triggering event is assigned to an OB in the input properties of the device view.

- An interrupt-triggering event can only be assigned to a single OB.
- OBs, however, can be assigned to several interrupt-triggering events.
  This means, for example, that you can assign both the rising and the falling edge to the same interrupt OB in order to trigger the same reaction to any change of the input signal.

- The started OB can interrupt a cycle OB at every instruction. Consistent data access is secured up to dword size.
- You can parameterize module-specific interrupt-triggering events such as a rising and the falling edge at the input.
- Assign the interrupt-triggering event and the OB to be started in the configuration of the interrupt-triggering module. However, within the started hardware interrupt OB you can override this assignment using the DETACH instruction, or assign the same event to a different OB using the ATTACH instruction. This functionality allows a flexible reaction to external process signals.

Setting the operating behavior (S7-1200)

Changing properties of the modules (S7-1200)

Default settings

When they leave the factory, all hardware components with parameters have default settings suitable for standard applications. These default values allow the hardware components to be used immediately without making any additional settings.

You can, however, modify the behavior and the properties of the hardware components to suit the requirements and circumstances of your application. Hardware components with settable parameters include, for example, communications modules and several analog and digital modules.

Setting and loading parameters

When you have selected a hardware component in the device or network view, you can set the properties in the Inspector window. When you save a device configuration with its parameters, data is generated that needs to be loaded on the CPU. This data is transferred to the relevant modules during startup.

Properties of the CPUs

The properties of the CPUs have special significance for system behavior. For example for a CPU you can set:

- Interfaces
- Inputs and outputs
- High-speed counters
- Pulse generators
- Startup behavior
- Time-of-day
- Protection level
- Bit memory for system and clock

- Cycle time
- Communications load

The entry possibilities specify what is adjustable and in which value ranges. Fields that cannot be edited are disabled or are not shown in the properties window.

Requirement

You have already arranged the hardware components for which you want to change properties on a rack.

Procedure

To change the properties and parameters of the hardware components, follow these steps:

1. In the device or network view, select the hardware component or interface that you want to edit.
2. Edit the settings for the selected object:
   - For example in the device view you can edit addresses and names.
   - In the Inspector window additional setting possibilities are available.

You do not need to confirm your entries, the changed values will be applied immediately.

Introduction to loading a configuration (Page 1815)

CPU properties (S7-1200)

Overview of the CPU properties (S7-1200)

Overview

The following table provides you with an overview of the CPU properties:

Group	Properties	Description
General	Project information	General information to describe the inserted CPU. Except for the slot number, you can change this information.
	Catalog information	Read-only information from the hardware catalog for this CPU.
	Identification & Maintenance	For saving application-specific information such as the name of the plant and the installation location.
	Checksums	To check the identity or integrity of PLC programs. Blocks in the block folder and text lists are automatically marked with unique checksums when they are compiled. You can easily establish whether the program currently running on the CPU is the same program that you loaded a long time ago or whether the program has been changed in the meantime. The "GetChecksum" instruction is available to read out the checksum while the program is running. See: Comparison of PLC programs based on checksums (Page 5086)
PROFINET interface	General	Name and comment for this PROFINET interface. The name is limited to 110 characters.
	Ethernet addresses	Select whether the PROFINET interface is networked. If subnets have already been created in the project, they are available for selection in the drop-down list. If not, you can create a new subnet with the "Add new subnet" button. Information on the IP address, subnet mask and IP router usage in the subnet is available in the IP protocol. If an IP router is used, the information about the IP address of the IP router is necessary. See: Assigning addresses and names for PROFINET devices (Page 1767)
	Advanced options	Name, comment and additional setting options of the Ethernet interface port.
	Time synchronization	Settings for time synchronization in the NTP time format. The NTP (network time protocol) is a general mechanism for synchronizing system clocks in local and global area networks. In NTP mode, the interface of the CPU sends time queries (in client mode) at regular intervals to NTP servers on the subnet (LAN) and the addresses must be set in the parameters here. Based on the replies from the server, the most reliable and most accurate time is calculated and synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. The accuracy depends on the quality of the NTP server being used.

Group	Properties	Description
DI#/DO#	General	Name of and comment on the integrated digital inputs of the CPU.
	Digital inputs	Input delays can be set for digital inputs. The input delays can be set in groups (in each case for 4 inputs). The detection of a positive and a negative edge can be enabled for each digital input. A name and a hardware interrupt can be assigned to this event. Depending on the CPU, pulse catches can be activated at various inputs. When the pulse catch is activated, even pulse edges that are shorter than the cycle time of the program are detected.
	Digital outputs	The reaction to a mode change from RUN to STOP can be set for all digital outputs: The state can either be frozen (corresponds to retain last value) or you set a substitute value ("0" or "1")
	I/O addresses	The address space of the input and output addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.
AI#	General	Name of and comment on the integrated analog inputs of the CPU.
	Analog inputs	During noise reduction, the specified integration time suppresses interference frequencies at the specified frequency (in Hz). The channel address, measurement type, voltage range, smoothing and overflow diagnostics must be specified in the "Channel #" group. The measurement type and voltage range are set permanently to voltage, 0 to 10 V. Smoothing analog values provides a stable analog signal for further processing. Smoothing analog values can be useful with slow measured value changes, for example, in temperature measurement. The measured values are smoothed with digital filtering. Smoothing is achieved by the module forming mean values from a specified number of converted (digitalized) analog values. The selected level (slight, medium, strong) decides the number of analog signals used to create the mean value. If overflow diagnostics is enabled, a diagnostics event is generated if an overflow occurs.
	I/O addresses	The address space of the input addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.
High-speed counter (HSC)	High-speed counter (HSC)#	High-speed counters are typically used to drive counting mechanisms. See: Configuring high-speed counters (Page 995)

Group	Properties	Description
Pulse generators (PTO/PWM)	PTO#/PWM#	A pulse generator is activated and can be initialized with project information. For the configuration of an activated pulse generator, specify the usage as PWM (Pulse Width Modulation) or as PTO (Pulse Train Output). Specify the output source, time base, pulse width format, cycle time and initial pulse width for PWM. A pulse output is specified as the hardware output. The PWM output is controlled by the CTRL_PWM instruction, see CTRL_PWM (Page 3991). Specify the output source for PTO. A pulse output and a direction output are specified as the hardware outputs. A PTO is operated together with a high-speed counter in the "axis of motion" count mode and controlled by the Motion Control technology object (see keyword "Motion Control S7-1200") . The hardware ID is displayed in the I/O-diagnostics addresses and, if the PWM function is selected, the address space of the output addresses and the process image can be selected.

Group	Properties	Description
Startup	Startup after POWER ON	Setting the startup characteristics after cycling power. See: Principles of the STARTUP mode (Page 960)
	Comparison of preset configuration and actual configuration	Specifies the startup characteristics of the CPU for situations in which the actual configuration of the S7-1200 station does not correspond to the preset configuration: • Startup of the CPU only if compatible • Startup of the CPU even if there are differences With the "Startup CPU only if compatible" setting, a module in a configured slot must be compatible with the configured module. Compatible means that the module that is present matches the number of inputs and outputs and must match with respect to its electrical and functional properties. A compatible module must be able to completely replace a configured module; it may be more capable, but not less capable. Example for the "Startup CPU only if compatible" setting: A CPU can be a compatible replacement for a CPU of the same type with a lower firmware version. An input module with 32 digital inputs can be a compatible replacement for a signal module with 16 digital inputs. The CPU starts up when the configured module or a compatible module is plugged in. The CPU does not start up if an incompatible module is inserted. Example of the "Startup CPU even if mismatch" setting: Instead of a configured digital input module, an analog output module is plugged in or no module is present in this slot. Although the configured inputs cannot be accessed, the CPU starts up. Note in this case that the user program cannot function correctly and take the appropriate measures.
	Configuration time for central and distributed I/O	Specifies a maximum period (standard: 60000 ms) in which the central I/O and distributed I/O must start up. (The CMs and CPs are supplied with voltage and communication parameters during the CPU startup. This configuration time provides a time period during which I/O modules connected to the CM or CP must start up.) The CPU switches to RUN as soon as the central I/O and the distributed I/O has started and is ready for operation, regardless of the "Parameter assignment time for central and distributed I/O" parameter. If the central I/O and distributed I/O has not started up during this period, the CPU switches to RUN without the central I/O and distributed I/O.
Cycle	Maximum cycle time and minimum cycle time.	Specification of a maximum cycle time or a fixed minimum cycle time. If the cycle time exceeds the maximum cycle time, the CPU goes to STOP mode. See: Cycle time and maximum cycle time (Page 988)
Communication load	Maximum allocation of the cycle for communication (as a percentage)	Controls the duration of communication processes that always also extend the cycle time, within certain limits. Examples of communication processes include: Transferring data to another CPU or loading blocks (initiated via the PC). See: Cycle loading by communications (Page 989)

Group	Properties	Description
System and clock memory	System memory bits and clock memory bits	You use system memory bits for the following scans: • Is the current cycle the first since cycling power? • Have there been any diagnostics state changes compared with the previous cycle? • Scan for "1" (high) • Scan for "0" (low) Clock memory bits change their values at specified periodic intervals. See: Enabling system memory (Page 1006) See: Using clock memory (Page 1006)
Web server	-	Enables and configures the Web server function. See: Enabling the Web server
	Automatic update	Sends the requested web page with current CPU data periodically to the web browser. Enter the period duration under "Update interval". Automatic update can only be activated if the web server is enabled. See: AUTOHOTSPOT
	User Management	You enter the user names with their access rights here. • Everyone: pre-defined user whose access rights you assign using a drop-down list. The "Everyone" user is a user who does not log on with a password for Web access. • User#: Editable name for a user for whom you assign access rights and a password. As soon as you click in a line below "Everyone", a preset name is displayed that you can change. Each user can be assigned different access rights via a drop-down list. There are access rights that are connected to each other. Example: When you activate the access right "Perform firmware update", the access rights "Change operating mode" and "... query diagnostics" are activated automatically. These two rights are required to perform a firmware update from the Web server. See: User list
	Watch tables	Allows you to create watch tables and defines access to those tables.
	User-defined web pages	Allows access to freely-designed web pages of the CPU via a web browser. See: AUTOHOTSPOT
	Entry page	Allows you to select the entry page.
	Overview of interfaces	Table of all modules with their Ethernet interfaces providing Web server functionality for this device. Here, you can permit or deny access to the Web server over the interface for each Ethernet interface of the device (CPU, CP or CM).

Group	Properties	Description
User interface languages	-	If you want to use translations of project texts for the Web server, you need to assign the project language to the languages for the Web server (number depends on the CPU). This specifies the project languages that are displayed when the Web server is accessed. Example: You assign the project language "German (Luxembourg)" to the Web server language "German" by selecting it from the drop-down list. Enable the project language under "Languages & resources > Project languages" in the project tree to make it available for selection in the drop-down list.
Time	Local time and daylight saving time	Setting of the time zone in which the CPU is operated and setting of the daylight-saving/standard time changeover.
Protection & Security	Protection and password for read/write access	Setting the read/write protection and the password for access to the CPU. See: Setting options for the protection level (FW V1 to V3) (Page 1007) See: Setting options for the protection (FW as of V4) (Page 1008)
	Connection mechanisms	Enabling access over PUT/GET communication.
	Security event	Enabling group alarms for security events and specifying a monitoring time (interval).
	External load memory	Disables copying from the internal to the external load memory.
Configuration control	-	Enables configuration control. Allows a configuration change in the user program within certain limits. See: Configuration control (Page 1085)
Connection resources	-	Provides an overview of the assigned reserved and dynamic resources for the CPU connections. The resources currently used are also displayed in the online view. See: Use of connection resources (Page 677)
Address overview	-	Tabular representation of all addresses used by the CPU for integrated inputs/outputs as well as for the inserted modules. Addresses that are not used by any module are represented as gaps. The view can be filtered according to • Input addresses • Output addresses • Address gaps

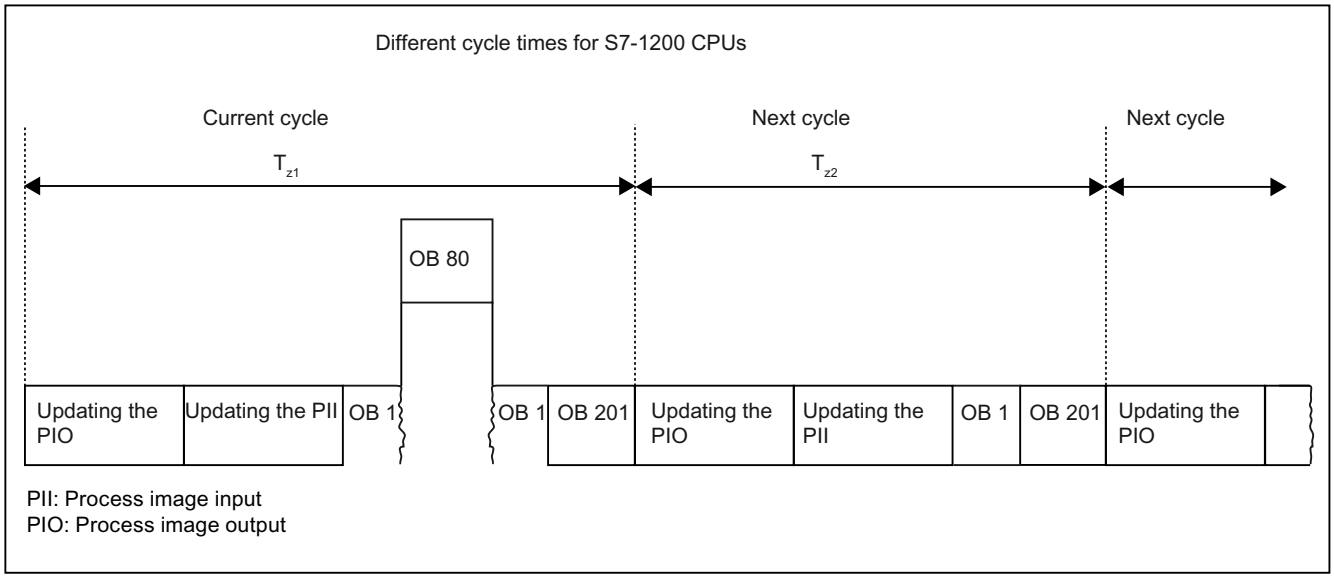
Cycle time and maximum cycle time (S7-1200)



Function

The cycle time is the time that the operating system requires to execute the cyclic program and all the program sections that interrupt this cycle. The program execution can be interrupted by:

- Time errors and 2xMaxCycleTime errors
- System activities, e.g., process image updating

The cycle time (Tcyc) is therefore not the same for every cycle.

The following schematic shows an example of different cycle times (TZ1 ≠ TZ2) for S7-1200 CPUs:

In the current cycle, the cyclic OB used here (e.g. OB 1) will be interrupted by a time error (e.g. OB 80). Following the cyclic OB, the next cycle OB 201 is processed.

Maximum cycle time

The operating system monitors the execution time of the cyclic program for a configurable upper limit known as the maximum cycle time. You can restart this time monitoring at any point in your program by calling the RE_TRIGR instruction.

If the cyclic program exceeds the maximum cycle time, the operating system will attempt to start the time error OB (OB 80). If the OB is not available, the S7-1200 CPU reacts as follows:

- CPUs with firmware version V1.x to V3.x: The CPU remains in RUN mode.
- CPUs with firmware version as of V4.x: The CPU changes to STOP mode

In addition to monitoring the runtime for overshooting of the maximum cycle time, adherence to a minimum cycle time is guaranteed. To do this, the operating system delays the start of

the new cycle until the minimum cycle time has been reached. During this waiting time, new events and operating system services are processed.

If the maximum cycle time is exceeded a second time, for example while the time error OB is being processed (2xMaxCycleTime error), the CPU changes to STOP mode.

See also

Time error OB (Page 1032)

Cycle loading by communications (S7-1200)

Function

The cycle time of the CPU can be extended due to communications processes. These communications processes include for example:

- Transferring data to another CPU
- Loading of blocks initiated by a programming device

You can control the duration of these communications processes to some extent using the CPU parameter "Cycle load due to communication".

In addition to communications processes, test functions also extend the cycle time. The "Cycle load due to communication" parameter can be used to influence the duration.

How the parameter works

You use the "Cycle load due to communication" parameter to enter the percentage of the overall CPU processing capacity that can be available for communications processes. This CPU processing capacity is now available at all times for communication. This processing capacity can be used for program execution when not required for communication.

Effect on the actual cycle time

The "Cycle load due to communication" parameter can be used to extend the cycle time of the cyclic organization block (e.g., OB 1) by a factor calculated according to the following formula:

$$\frac{100}{100 - \text{"Cycle load due to communication"}}$$

The formula does not take into account the effect of asynchronous events such as hardware interrupts or cyclic interrupts on the cycle time.

If the cycle time is extended due to communication processes, more asynchronous events may occur within the cycle time of the cyclic organization block. This extends the cycle still further. The extension depends on how many events occur and how long it takes to process them.

Example 1 – no additional asynchronous events:

If the "Cycle load due to communication" parameter is set to 50%, this can cause the cycle time of the cyclic organization block to increase by up to a factor of 2.

Example 2 – additional asynchronous events:

For a pure cycle time of 500 ms, a communication load of 50% can result in an actual cycle time of up to 1000 ms, provided that the CPU always has enough communications jobs to process. If, parallel to this, a cyclic interrupt with 20 ms processing time is executed every 100 ms, this cyclic interrupt would extend the cycle by a total of 5*20 ms = 100 ms without communication load. That is, the actual cycle time would be 600 ms. Because a cyclic interrupt also interrupts communications, it affects the cycle time by adding 10 * 20 ms at 50 % communication load. That is, in this case, the actual cycle time amounts to 1200 ms instead of 1000 ms.

Note

Observe the following:

- Check the effects of changing the value of the "Cycle load due to communication" parameter while the system is running.
- You must always consider the communication load when setting the minimum cycle time as time errors will otherwise occur.

Recommendations

- Increase this value only if the CPU is used primarily for communication purposes and the user program is not time critical.
- In all other situations you should only reduce this value.

Time-of-day functions (S7-1200)

Basic principles of time of day functions (S7-1200)

All S7-1200 CPUs are equipped with an internal clock. The backup supports the display of the correct time for up to 10 hours if the power supply is interrupted.

Time-of-day format

The clock always shows the time of day with a resolution of 1 millisecond and the date including the day of the week. The time adjustment for daylight-saving time is also taken into account.

Setting and reading the time of day (S7-1200)

Setting and reading the time with instructions

You can set, start and read the time-of-day and date on the CPU clock with the following instructions in the user program:

- Set the time-of-day: "WR_SYS_T"
- Read time of day "RD_SYS_T"
- Read local time "RD_LOC_T"
- Set time zone "SET_TIMEZONE"

Manual setting

You can also read and set the time-of-day manually in the online and diagnostics view under "Functions > Set time-of-day".

See also

WR_SYS_T: Set time-of-day (Page 3467)

RD_SYS_T: Read time-of-day (Page 3469)

RD_LOC_T: Read local time (Page 3471)

SET_TIMEZONE: Set time zone (Page 3476)

Assigning the clock parameters (S7-1200)

Clock parameters

The clock parameters allow you to make the following settings:

- Enable time synchronization via NTP server
  Select this check box if you want the internal clock to be synchronized using the NTP synchronization mode.
- Network time server
  The IP addresses of up to four NTP servers need to be configured.
- Update interval
  The update interval defines the interval between time queries.

High-speed counters (S7-1200)

General information on high-speed counters (S7-1200)

Introduction

High-speed counters are typically used to drive counting mechanisms in which a shaft turning at a constant speed is equipped with an incremental step encoder. The incremental step encoder ensures a certain number of count values per rotation and a reset pulse once per rotation. The clock memory bit(s) and the reset pulse of the incremental step encoder supply the inputs for the high-speed counter.

The various S7-1200 CPUs have differing numbers of high-speed counters available:

S7-1200 CPU	Number of HSCs	HSC designation
CPU 1211C	3 (with digital signal board 4)*	HSC1…3 (and HSC5)*
CPU 1212C	4 (with digital signal board 5)*	HSC1…4 (and HSC5)*
CPU 1214C CPU 1215C CPU 1217C	6	HSC1…6

* with DI2/DO2 signal board

How it works

The first of several default values is loaded on the high-speed counter. The required outputs are enabled for the time during which the current value of the counter is lower than the default value. The counter is set up so that an interrupt occurs if the current value of the counter is equal to the default value or when the counter is reset.

If the current value is equal to the default value and an interrupt event results, a new default value is loaded and the next signal state is set for the outputs. If an interrupt event occurs because the counter is reset, the first default value and the first signal states of the outputs are set and the cycle repeated.

Since the interrupts occur much less frequently than the high-speed counter counts, a precise control of the fast operations can be implemented with only a slight influence on the overall cycle of the automation system. Since you can assign specific interrupt programs to interrupts, each new default can be loaded in a separate interrupt program allowing simple control of the state.

Note

You can also process all interrupt events in a single interrupt program.

Count algorithms of the various counters

All counters work in the same way, however some high-speed counters do not support all count algorithms. There are four basic count algorithms:

- Single-phase counter with internal direction control
- Single-phase counter with external direction control
- 2-phase counter with 2 clock inputs
- A/B counter

Each high-speed counter can be used with or without a reset input. If the reset input is activated, this resets the current value. The current value remains reset until the reset input is deactivated.

See also

Configuring high-speed counters (Page 995)

Interdependency of the counter mode and counter inputs (Page 993)

Interdependency of the counter mode and counter inputs (S7-1200)

General information on counter mode and counter inputs

You can assign not only the counter modes and counter inputs to the high-speed counters but also functions such as clock pulse generator, direction control, and reset. The following rules apply:

- An input cannot be used for two different functions.
- If an input is not required by the current counter mode of the defined high-speed counter, it can be used other purposes.

If, for example, you set HSC1 to counter mode 1, in which inputs I0.0 and I0.3 are required, you can use I0.1 for edge interrupts or for HSC2.

If, for example, you set HSC1 and HSC5, inputs I0.0 (HSC1) and I1.0 (HSC5) are always used with the counting and frequency counter modes. As a result, these two inputs are not available for any other functions when counters are operated.

You have additional inputs available if you use a digital signal board.

Overview of the interdependency of counter mode and counter inputs

Counter mode	Description	Inputs		
	HSC1	I0.0 (CPU) I4.0 (signal board)	I0.1 (CPU) I4.1 (signal board)	I0.3 (CPU) I4.3 (signal board)
	HSC2	I0.2 (CPU) I4.2 (signal board)	I0.3 (CPU) I4.3 (signal board)	I0.1 (CPU) I4.1 (signal board)
	HSC3*	I0.4 (CPU)	I0.5 (CPU)	I0.7 (CPU)
	HSC4 (CPU 1212/14/15/17C only)	I0.6 (CPU)	I0.7 (CPU)	I0.5 (CPU)
	HSC5 (CPU 1214/15/17C only)**	I1.0 (CPU) I4.0 (signal board)	I1.1 (CPU) I4.1 (signal board)	I1.2 (CPU) I4.3 (signal board)
	HSC6 (CPU 1214/15/17C only)**	I1.3 (CPU)	I1.4 (CPU)	I1.5 (CPU)
Counting / frequency	Single-phase counter with internal direction control	Clock pulse generator	-	-
Counting				Resetting
Counting / frequency	Single-phase counter with external direction control	Clock pulse generator	Direction	-
Counting				Resetting
Counting / frequency	2-phase counter with 2 clock inputs	Clock pulse generator forwards	Clock pulse generator backwards	-
Counting				Resetting
Counting / frequency	A/B counter	Clock pulse generator A	Clock pulse generator B	-
Counting				Resetting
Motion axis	Pulse generators PWM/PTO	HSC1 and HSC2 support the motion axis count mode for the PTO1 and PTO2 pulse generators: • For PTO1, HSC1 evaluates the Q0.0 outputs for the number of pulses. • For PTO2, HSC2 evaluates the Q0.2 outputs for the number of pulses. Q0.1 is used as the output for the motion direction.		

* HSC3 can only be used for CPU 1211 without a reset input

** HSC5 can be also be used for CPU 1211/12 if a DI2/DO2 signal board is used

General information on high-speed counters (Page 992)

Configuring high-speed counters (Page 995)

Configuring high-speed counters (S7-1200)

Requirement

An S7-1200 CPU has been inserted in the hardware configuration.

Procedure

To configure a high-speed counter, follow these steps:

1. Select an S7-1200 CPU in the device or network view.
2. Click on the required high-speed counter under "Properties > High-speed counter (HSC)" in the Inspector window:
   - CPU 1211C: HSC1 to HSC3 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1212C: HSC1 to HSC4 (also HSC5 with a DI2/DO2 signal board)
   - CPU 1214C / 1215C / 1217C: HSC1 to HSC6
3. Enable the high-speed counter in the "General" parameter group using the relevant check box.

Note

If you use a CPU 1211C or CPU 1212C with a DI2/DO2 signal board, you can also enable the high-speed counter HSC5.

Note

When you activate the pulse generators and operate them as PTO (to control stepper motors), high-speed counters are required.

With firmware versions as of V3.0, the CPU uses internal (additional) HSCs.

With firmware versions lower than V3.0, the CPU uses HSC1 for PTO1 and HSC2 for PTO2. The counters are then no longer available for other counting tasks.

In "Project information" you can enter a name and a comment for the counter.

4. Define the functionality of the counter in the "Function" parameter group:
   - Count mode: Select one of the following functions of the counter from the drop-down list:
     - Counting (decides the number of pulses)
     - Period (measurement of the period of pulses)
     - Frequency (measurement of the frequency of pulses)
     - Motion Control (use counter for motion control).
   - Operating phase: Select from the drop-down list how the counter will be operated:
     - Single phase (one clock input for counting, up and down can be set via the direction input)
     - Two-phase (one clock input for counting up, one clock input for counting down)
     - A/B counter (two clock inputs with phase-shifted pulses, single count value)
     -A/B counter fourfold (two clock inputs with phase-shifted pulses, quadruple count value)
   - Input source (only in firmware versions lower than 4.0): As the input source for the count pulses, select a CPU input or an input of a signal board.
   - Count direction is specified by: If the operating phase "Single phase" is set, you can choose whether the user program decides the count direction (instruction CTRL_HSC, parameters DIR and NEW_DIR) or a digital input.
   - Initial count direction: If the user program is set as the direction control for the count direction, you can select the count direction at the start of counting.
   - Frequency meter period: If frequency or period is set as the count mode, you can select the duration of the frequency measurement periods in the drop-down list.
5. Specify the initial values and reset condition of the counter in the "Reset to initial values" parameter group:
   - Initial counter value: Enter a start value for the counter.
   - Initial reference value: Enter a reference value.
     The current count is compared with this reference value: When the current counter value is equal to the reference value, an event is triggered (if enabled in "Event configuration").

   Here, you can also set whether the counter uses a reset input and the counter resets the current count at a high or low level at the reset input.
6. The following events can be enabled in the "Event configuration" parameter group:
   - Counter value equal to reference value
   - External reset
   - Direction change

   You can assign a hardware interrupt OB to each of these events under "Hardware interrupt". Alternatively, assign a hardware interrupt OB to every event in the user program ("ATTACH" instruction).
   Result: When an event is triggered, the CPU executes the assigned hardware interrupt OB (according to the configured priority).
   The names of the events and the hardware interrupts can be changed.

7. In the parameter group "Hardware inputs", hardware inputs are already entered. You can accept these. Alternatively, click the "..." button beside "Clock generator up", "Clock generator down" or "Reset input" and select an input.
   Note: With earlier firmware versions (lower than V4.0), the hardware inputs were preset and could not be changed.
8. In the "I/O addresses" area, the following parameters can be set:
   - Start address: The CPU writes the counter status to the address area with the set start address (data type DInt).
   - Organization block: Assignment of this address area to an organization block.
   - Process image: Assignment of the address area to a process image partition (PIP). The default setting is automatic update (PIP0).

Result

You have now adapted the parameters of the high-speed counter to the requirements of your project.

Interdependency of the counter mode and counter inputs (Page 993)

Point-to-point communication (S7-1200)

Overview of point-to-point communication (S7-1200)

PtP communication is communication via a serial interface that uses standardized UART data transmission (Universal Asynchronous Receiver/Transmitter). The S7-1200 uses communications modules with an RS-232 or RS-485 interface to establish PtP communication.

Functions of point-to-point communication

Point-to-point communication (PtP) allows numerous applications:

- Direct transmission of information to an external device, for example a printer or a barcode reader
- Reception of information from external devices such as barcode readers, RFID readers, cameras and third-party optical systems as well as many other devices.
- Exchange of information with third-party devices, for example GPS devices, radio modems and many others

The Freeport protocol

The S7-1200 supports the Freeport protocol for character-based serial communication. Using Freeport communication, the data transmission protocol can be configured entirely by the user program.

Siemens provides libraries with Freeport communication functions that you can use in your user program:

- USS Drive protocol
- Modbus RTU Master protocol
- Modbus RTU Slave protocol

Configuring a communications port (Page 998)

Using RS-232 and RS-485 communications modules (S7-1200)

Communications modules with RS-232 and RS-485 interfaces

In an S7-1200 CPU, you can use two different communications modules:

- RS-232 communications module
- RS-485 communications module

The communications modules can be connected to the S7-1200 CPU via the I/O channel on the left. You can plug in up to three different modules.

Properties of the communications modules

The communications modules have the following features:

- Support of the Freeport protocol
- Configuration by the user program with the aid of expanded instructions and library functions

Configuring a communications port (S7-1200)

Configuring a communications port

After you have inserted a communications module with an RS-232 or RS-485 interface, you then set the interface parameters. You set the parameters for the interface either in the properties of the interface or you control the interface parameters from the user program using the PORT_CFG instruction. The following description relates to the graphic configuration.

Note

If you use the user program to change the port setting, the settings of the graphic configuration are overwritten.

You should also keep in mind that the settings made by the user program are not retained if there is a power down.

Requirement

- A communications module is already plugged in.
- You are in the device view.

Procedure

To configure the communications port, proceed as follows:

1. Select the interface in the graphic representation in the device view.
   The properties of the interface are displayed in the Inspector window.
2. Select the "Port configuration" group in the area navigation of the Inspector window.
   The settings of the port are displayed.
3. From the "Transmission speed" drop-down list, select the speed for the data transmission.
   With user-programmed communication, remember the influence of the transmission speed on the changeover time.
4. From the "Parity" drop-down list, select the type of detection of bad information words.
5. Using the "Data bits" drop-down list, decide whether a character consists of eight or seven bits.
6. From the "Stop bit" drop-down list, select how many bits will identify the end of a transmitted word.
7. From the "Flow control" drop-down list, select the method for ensuring a trouble-free data stream between sender and receiver. This parameter can only be set for the RS-232 interface.
   - Enter a HEX value in the "XON character" box that will cause the transmission of the message to be continued when it is detected. This parameter can only be set for software-controlled data flow control.
   - Enter a HEX value in the "XOFF character" box that will cause the transmission of the message to be suspended for the set wait time. This parameter can only be set for software-controlled data flow control.
8. In the "Wait time" box, enter a wait time in ms that must be kept to after the end of the message before the next transmission can start.

Note

You can configure the interface in the network view as well. To do so, you must first select the communication module in the tabular network view and then select the interface in the Inspector window. Then you can continue as described above.

Setting data flow control (Page 1000)

Setting data flow control (S7-1200)

Data flow control

Data flow control is a method that ensures a balanced send and receive behavior. In the ideal situation, the intelligent control does not allow data to be lost. It ensures that a device does not send more information than the receiving partner can process.

There are two methods of data flow control:

- Hardware-controlled data flow control
- Software-controlled data flow control

With both methods, the DSR signals of the communications partners must be active at the beginning of transmission. If the DSR signals are inactive, the transmission is not started.

The RS-232 communications module can handle both methods. The RS-485 communications module does not support data flow control.

Hardware-controlled data flow control

Hardware-controlled data flow control uses the request to send (RTS) and clear to send (CTS) signals. With the RS-232 communications module, the RTS signal is transmitted via the output by pin 7. The CTS signal is received via pin 8.

If hardware-controlled data flow control is enabled, the RTS signal is then always set to activated when data is sent. At the same time, the CTS signal is monitored to check whether the receiving device can accept data. If the CTS signal is active, the module can transfer data until the CTS signal becomes inactive. If the CTS signal is inactive, the data transfer must be suspended for the set wait time. If the CTS signal is still inactive after the set wait time, the data transfer is aborted and an error is signaled back to the user program.

Data flow control using hardware handshaking

If data flow control is controlled by hardware handshaking, the sending device sets the RTS signal to active as default. A device such as a modem can then transfer data at any time. It does not wait for the CTS signal of the receiver. The sending device itself monitors it own transmission by sending only a limited number of frames (characters), for example to prevent overflow of the receive buffer. If there is nevertheless an overflow, the transferring device must hold back the message and signal an error back to the user program.

Software-controlled data flow control

Software-controlled data flow control uses certain characters within the messages and these control the transfer. These characters are ASCII characters selected for XON and XOFF.

XOFF indicates when a transmission must be suspended. XON indicates when a transmission can be continued.

If the sending device receives the XOFF character, it must suspend sending for the selected wait time. If the XON character is sent after the selected wait time, the transfer is continued. If no XON character is received after the wait time, an error is signaled back to the user program.

Software data flow control requires full duplex communication because the receiving partner needs to send the XON character during the ongoing transfer.

Configuring a communications port (Page 998)

Configuration of message transfer (S7-1200)

User-programmed communication

You can control the data traffic between a communications module and a device connected externally via the serial interface using your own mechanisms. If you want to do this, you will need to define a communications protocol yourself. In freely programmable communication, ASCII and binary protocols are supported for message transfer.

Within the communications protocol, you will need to specify the criteria by which the start and end of a transferred message can be recognized in the data stream.

User-programmed communication can only be activated in RUN mode. If there is a change to STOP mode, the user-programmed communication is stopped.

Specifying the communications protocol

You can specify the communications protocol as follows:

- With the user program
  - The behavior when sending data is controlled by the SEND_CFG instruction.
  - The behavior when receiving data is controlled by the RCV_CFG instruction.
- Using parameter settings set graphically in the Inspector window

Note

If you change the communications protocol from the user program, the settings of the graphic configuration are overwritten.

You should keep in mind that the settings made by the user program are not retained if there is a power down.

Specifying the end of the message (Page 1005)

User-programmed communication with RS-232 devices (S7-1200)

RS-232/PIP multi-master cable and user-programmed communication with RS-232 devices

Using the RS-232/PIP multi-master cable and user-programmed communication, you can connect a wide variety of RS-232-compliant devices to the communications modules of the S7-1200. The cable must, however, be set to the "PIP/user-programmed communication" mode.

Settings on the cable

The switches on the cable must be set as follows:

- Switch 5 must be set to 0
- Switch 6 sets either the local mode (DCE) or the remote mode (DTE):
  - Switch set to 0 for the local mode
  - Switch set to 1 for the remote mode

Changing over between send and receive mode

The RS-232/PIP multi-master cable is in send mode when data is sent from the RS-232 interface to the RS-485 interface. The cable is in receive mode when it is idle or when data is sent from the RS-485 interface to the RS-232 interface. The cable changes from receive to send mode immediately when it detects characters on the RS-232 send line.

Supported transmission speeds

The RS-232/PIP multi-master cable supports transmission rates between 1200 baud and 115.2 kbaud. The RS-232/PIP multi-master cable can be set to the required transmission rate using the DIP switch on the PC/PIP cable.

The following table shows the switch settings for the various transmission speeds:

Transmission speed	Switchover time	Settings (1 = up)
115200 bps	0.15 ms	110
57600 bps	0.3 ms	111
38400 bps	0.5 ms	000
19200 bps	1.0 ms	001
9600 bps	2.0 ms	010
4800 bps	4.0 ms	011
2400 bps	7.0 ms	100
1200 bps	14.0 ms	101

The cable returns to receive mode when the RS-232 send line is idle for a certain time that is defined as the changeover time of the cable. The set transmission speed influences the changeover time as shown in the table.

Influence of the changeover time

When working with an RS-232/PIP multi-master cable in a system in which user-programmed communication is used, the program must take into account the changeover time for the following reasons:

- The communications module reacts to messages sent by the RS-232 device.
  Once the communications module has received a request from the RS-232 device, it must delay the reaction message for a period that is equal to or longer than the changeover time of the cable.
- The RS-232 device reacts to messages sent by the communications module.
  Once the communications module has received a reaction message from the RS-232 device, it must delay the next request message for a period that is equal to or longer than the changeover time of the cable.

In both situations, the RS-232-PIP multi-master cable has enough time to change from send to receive mode so that the data can be sent from the RS-485 interface to the RS-232 interface.

Configuration of message transfer (Page 1001)

Making the settings for sending (Page 1003)

Specifying the start of the message (Page 1004)

Specifying the end of the message (Page 1005)

Making the settings for sending (S7-1200)

Sending messages

You can program pauses between individual messages.

The following table shows which pauses can be set:

Parameter	Definition
RTS ON delay	You can set the time that must elapse after the send request RTS (request to send) before the actual data transfer starts.
RTS OFF delay	You can set the time that must elapse after the complete transfer before RTS signal is deactivated.
Send pause at the start of the message	You can specify that a pause is sent at the start of every message transfer when the RTS ON delay has elapsed. The pause is specified in bit times.
Send Idle Line after a pause	You can make a setting so that following a selected pause at the start of the message, the "Idle Line" signal is output to signal that the line is not in use. To enable the parameter, "Send pause at message start" must be set. The duration of the "Idle Line" signal is specified in bit times.

See also

Specifying the start of the message (Page 1004)

Specifying the end of the message (Page 1005)

User-programmed communication with RS-232 devices (Page 1002)

Specifying the start of the message (S7-1200)

Recognizing the start of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

If a criterion is met that indicates the start of a message, the receiver starts searching the data stream for criteria that mean the end of the message.

There are two different methods for identifying the start of a message:

- Starting with any character:
  Any character can defined the start of a message. This is the default method.
- Starting with a specific condition:
  The start of a message is identified based on selected conditions.

Conditions for detecting the start of a message

The following table shows the various options for defining the start of a message:

Parameter	Definition
Recognize start of message by line break	The receiver recognizes a line break when the received data stream is interrupted for longer than one character. If this is the case, the start of the message is identified by the line break.
Recognize start of message by idle line	The start of a message is recognized when the send transmission line is in the idle state for a certain time (specified in bit times) followed by an event such as reception of a character.
Recognize start of message with individual characters	The start of a message is recognized when a certain character occurs. You can enter the character as a HEX value.
Recognize start of message by a character string	The start of a message is detected when one of the specified character sequences arrives in the data stream. You can specify up to four character sequences each with up to five characters.

The individual conditions can be logically linked in any way.

See also

Making the settings for sending (Page 1003)

User-programmed communication with RS-232 devices (Page 1002)

Specifying the end of the message (S7-1200)

Recognizing the end of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

In total, there are six different methods of recognizing the end of a message and these can all be logically linked in any way. The following table shows the various possible setting options:

Parameter	Definition
Recognize end of message by message timeout	The end of a message is recognized automatically when a selected maximum duration for a message is exceeded. Values from 0 to 65535 ms can be set.
Recognize end of message by reply timeout	The end of a message is recognized when there is no reply within a set time after transferring data. Values from 0 to 65535 ms can be set.
Recognize end of message by timeout between characters	The end of a message is detected when the time between two characters specified in bit times is exceeded. Values from 0 to 2500 bit times can be set. The S7-1200 CPU only accepts a maximum time of eight seconds even if the value that is set results in a duration of more than eight seconds.
Recognize end of message by maximum length	The end of a message is recognized when the maximum length of a message is exceeded. Values from 1 to 1023 characters can be set.
Read message length from message	The message itself contains information about the length of the message. The end of a message is reached when the value taken from the message is reached. Which characters are used for the evaluation of the message length is specified with the following parameters: • Offset of the length field in the message The value decides the position of the character in the message that will be used to indicate the message length. Values from 1 to 1022 characters can be set. • Size of the length field This value specifies how many characters starting at the first evaluation position will be used to indicate the message length. Values of 0, 1, 2 and 4 characters can be set. • The data following the length field (does not belong to the message length) The value specifies the number of bytes after the length field that must be ignored in the evaluation of the message length. Values from 0 to 255 characters can be set.
Recognize message end with a character sequence	The end of a message is detected when the specified character sequence arrives in the data stream. You can define up to five characters in the character string that are to be checked. If the specified characters appear at the correct location in the message, the message end is recognized. To recognize the message end when character 1 and character 3 have a certain value, for example, you have to activate the check box for character 1 and character 3 and enter a character value.

Making the settings for sending (Page 1003)

User-programmed communication with RS-232 devices (Page 1002)

Enabling system memory (S7-1200)

System memory

A system memory is a bit memory with defined values.

You decide which memory byte of the CPU will become the system memory byte when assigning the system memory parameters.

Benefits

You can use system memory in the user program, for example to run program segments in only the first program cycle after start-up. Two system memory bits are constant 1 or constant 0.

Bits of the system memory bytes

The following table shows the meaning of the system memory:

Bit of the system memory bytes	7	6	5	4	3	2	1	0
Meaning	Reserved (=0)	Reserved (=0)	Reserved (=0)	Reserved (=0)	=0	=1	=1 with change to the diagnosis status	=1 in first program cycle after startup, otherwise 0

Note

The selected memory byte cannot be used for intermediate storage of data.

Using clock memory (S7-1200)

Clock memory

A clock memory is a bit memory that changes its binary status periodically in the pulse-no-pulse ratio of 1:1.

You decide which memory byte of the CPU will become the clock memory byte when assigning the clock memory parameters.

Benefits

You can use clock memory, for example, to activate flashing indicator lamps or to initiate periodically recurring operations such as recording of actual values.

Available frequencies

Each bit of the clock bit memory byte is assigned a frequency. The following table shows the assignment:

Bit of the clock memory byte	7	6	5	4	3	2	1	0
Period (s)	2.0	1.6	1.0	0.8	0.5	0.4	0.2	0.1
Frequency (Hz)	0.5	0.625	1	1.25	2	2.5	5	10

Note

Clock memory runs asynchronously to the CPU cycle, i.e. the status of the clock memory can change several times during a long cycle.

The selected memory byte cannot be used for intermediate storage of data.

Protection (S7-1200)

Setting options for the protection level (FW V1 to V3) (S7-1200)

Protection level

The following section describes how to use the various protection levels of the S7-1200 CPUs V1 to V3.

Effects of the protection level setting

You can choose between the following protection levels:

- No protection: This corresponds to the default behavior. You cannot enter a password. Read and write access is always permitted.
- Write protection: Only read-only access is possible. You cannot change any data on the CPU and cannot load any blocks or a configuration. HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.
- Write/read protection: No write or read access is possible in the "Accessible devices" area or in the project for devices that are switched online. Only the CPU type and the identification data can be displayed in the project tree under "Accessible devices". Display of online information or blocks under "Accessible devices", or in the project for devices interconnected online, is possible.
  HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.

Behavior of a password-protected CPU during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was assigned write protection and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on with a password.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights". Access authorization will also expire when the project is closed.

Note

You cannot restrict functions for process control, monitoring, and communications.

However, some functions are protected due to their use as online data. RUN/STOP in the "Online tools" task card or "Set time of day" in the online and diagnostics view are therefore write-protected.

Setting options for the protection (FW as of V4) (S7-1200)

Protection level

The following section describes how to use the various access levels of the S7-1200 CPUs as of V4.

S7-1200 CPUs provide various access levels to limit the access to specific functions.

The parameters for the access levels are assigned in a table. The green checkmarks in the columns to the right of the respective access level specify which operations are possible without knowing the password of this access level. If you want to use the functions of check boxes that are not selected, a password has to be entered.

NOTICE
Configuring an access level does not replace know-how protection Configuring access levels prevents unauthorized changes to the CPU by restricting download privileges. However, blocks on the memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the memory card.

Default characteristics

The default access level is "Full access (no protection)". Every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

The access levels in detail

With an S7-1200 CPU, you can configure the following access levels:

- Full access (no protection): The hardware configuration and the blocks can be read and changed by all users.
- Read access: With this access level, only read access to the hardware configuration and the blocks is possible without entering a password - meaning that you can load the hardware configuration and blocks into the programming device. In addition, HMI access and access to diagnostics data is possible.
  You cannot load blocks or a hardware configuration into the CPU without entering the password. Moreover, writing test functions and firmware updates are **not** possible without a password.
- HMI access: With this access level, only HMI access and access to diagnostics data is possible without entering the password.
  Without entering the password, you can neither load blocks and hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. In addition, the following is **not** possible without a password: Writing test functions, changing the operating state (RUN/STOP) and firmware updates.
- No access (complete protection): When the CPU is completely protected, no read or write access to the hardware configuration and the blocks is possible. HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed).
  Authorization with the password again provides you full access to the CPU.

Behavior of a password-protected module during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was configured with read access and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights".

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

Configuring access levels (S7-1200)

The following section describes how to configure an access level and enter passwords for an S7-1200 CPU as of V4.

For an S7-1200 CPU, you can enter multiple passwords and thereby set up different access rights for individual user groups.

The passwords are entered in a table in such a way that exactly one access level is assigned to each password.

The effect of the password is given in the "Access level" column.

Example

You select the "No access (complete protection)" access level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each of the access levels that lie above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the set passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (Full access (no protection)) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (read access) allows access as if the CPU were write-protected. Users who know this password have read-only access to the CPU.
- The password in row 3 (HMI access) allows access as if the CPU were write-protected and read-protected so that only HMI access is possible for users who know this password.

Procedure

To configure the access levels of an S7-1200 CPU, follow these steps:

1. Open the properties of the module in the inspector window.
2. Open the "Protection" entry in the area navigation.
   A table with the possible access levels appears in the inspector window.

Protection level	Access			Access permission	
Protection	HMI	Read	Write	Password	Confirmation
Full access (no protection)	✓	✓	✓		
Read access	✓	✓			
HMI access	✓				
No access (complete protection)					

3. Activate the required access level in the first column of the table. The green checkmarks in the columns to the right of the respective protection level show you which operations are still available without entering the password.
4. In the "Password" column, specify a password for full access in the first row. In the "Confirmation" column, enter the selected password again to protect against incorrect entries.
   Ensure that the password is sufficiently secure, in other words, that is does not follow a machine-recognizable pattern!
   You must enter a password in the first row "Full access (no protection)". This enables unrestricted access to the CPU for those who know the password, regardless of the selected protection level.
5. Assign additional passwords as needed to other access levels if the selected protection level allows you to do so.
6. Download the hardware configuration so that the access level takes effect.

Result

The hardware configuration and the blocks are protected against unauthorized access according to the set access level. If an operation cannot be executed without a password due to the set access level, a dialog for entering a password is displayed.

Restriction of communication services (S7-1200)

Introduction

The CPU can be the server for a number of communication services. This means that other communication participants can access CPU data even if you have not configured and programmed connections for the CPU.

The local CPU as a server thus does not have the possibility to control communication to the clients.

The parameter "Connection mechanisms" in the "Protection" area of the CPU parameters is used to specify whether this type of communication is permitted or not for the local CPU during operation.

Permit access with PUT/GET communication from remote partners

By default, the "Permit access with PUT/GET communication from remote partners (...)" option is disabled. In this case, read and write access to CPU data is only possible for communication connections that require configuration or programming both for the local CPU and for the communication partner. Access through BSEND/BRCV instructions is possible, for example.

Connections for which the local CPU is only a server (meaning that no configuration/ programming of the communication with the communication partner exists at the local CPU), are therefore not possible during operation of the CPU, for example,

- For PUT/GET, FETCH/WRITE or FTP access via communication modules
- For PUT/GET access from other S7 CPUs
- For HMI access that is realized via PUT/GET communication

If you want to allow access to CPU data from the client side, meaning that you do not want to restrict the communication services of the CPU, activate the "Permit access with PUT/GET communication from remote partners" option.

Group alarms for security events (S7-1200)

What you should know about group alarms for security events

Security events in the diagnostics buffer

The CPU stores information on important actions and events in the diagnostics buffer.

The following security events (event types) lead to an entry in the diagnostics buffer of the S7-1200:

- Going online with the correct or incorrect password.
- Manipulated communications data detected.
- Manipulated data detected on memory card.
- Manipulated firmware update file detected.
- Changed protection level (access protection) downloaded to the CPU.
- Password legitimization restricted or enabled (by instruction or CPU display).
- Online access denied due to the possible number of simultaneous access attempts being exceeded.
- Timeout when an existing online connection is inactive.
- Logging in to the Web server with the correct or incorrect password.
- Creating a backup of the CPU.

- Restoring the CPU configuration.
- During startup:
  - Project on the SIMATIC memory card has changed (the SIMATIC memory card remains the same)
  - SIMATIC memory card was replaced

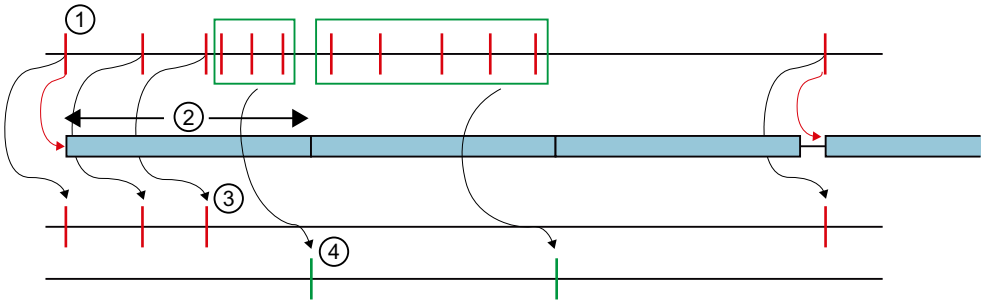
Group alarm for security events

To prevent the diagnostics buffer being "swamped" by large numbers of identical security events, as of STEP 7 V13 service pack 1, you can set parameters so that these events are entered in the diagnostics buffer as a group alarm. Per interval (monitoring time), the CPU then only generates one group alarm per event type.

Example: Brute-Force attacks

With Brute-Force attacks, attackers attempt to gain access to the CPU by systematically trying out a large number of the possible password combinations. As a result, the CPU receives a large number of login requests within seconds and the inrush of identical single entries in the diagnostics buffer leads to the loss of important diagnostics information. Group alarms help here.

Principle of operation of group alarms



The CPU enters the first three events of an event type in the diagnostics buffer. It then ignores all subsequent security events of this type.

At the end of the monitoring time (interval), the CPU generates a group alarm in which it enters the event type and the frequency of the event during the elapsed interval.

If these security events also occur in the intervals that follow, the CPU only generates one group alarm per interval.

An attack leaves the following pattern in the diagnostics buffer: Three individual alarms followed by a series of group alarms. This series can consist of two, three or more group alarms depending on the selected monitoring time and duration of the attack.

Since the alarms in the diagnostics buffer have a time stamp, the duration of the attack can be determined.

① Security events of one type, for example login attempts with an invalid password.

② Interval (monitoring time): When a security event of a particular type occurs the first time (or reoccurs), the monitoring time is started (or restarted).

③ Single alarms: The first three security events of a type are entered in the diagnostics buffer immediately. As of the fourth security event of this type, the CPU only creates group alarms.

If a security event of this type occurs after a pause of at least one interval, the CPU enters a single alarm in the diagnostics buffer and restarts the monitoring time.

④ Group alarms: After three security events, the CPU only generates a group alarm as a summary of all other security events in this interval. If these security events also occur in the intervals that follow, the CPU only generates one group alarm per interval.

Configuring a group alarm for security events (S7-1200)

Requirements

- STEP 7 V14
- S7-1200-CPU as of firmware V4.2

Procedure

To configure group alarms for security events, follow these steps:

1. Click on the CPU symbol in the network view.
   The properties of the CPU are displayed in the Inspector window.
2. Go to the "Protection" > "Security event" area.
3. Click on "Security event".
4. Select the option "Summarize security events in case of high message volume" to enable group alarms for security events.
5. Set the duration of an interval (monitoring time); the default is 20 seconds.

What you should know about group alarms for security events (Page 1012)

Deactivating SNMP (S7-1200)

The network management protocol SNMP (Simple Network Management Protocol) is a protocol that uses various services and tools for detection and diagnostics of the network topology. SNMP uses the transport protocol UDP. SNMP recognizes two network components, the SNMP manager and the SNMP client. The SNMP manager monitors the network nodes: The SNMP clients collect the various network-specific information in the individual network nodes and store it in a structured form in the MIB (Management Information Base). Various services and tools can run detailed network diagnostics with the help of this data.

Under certain conditions, it may be useful to disable SNMP. Examples:

- The security guidelines in your network do not allow the use of SNMP.
- You use your own SNMP solution, e.g. with your own communications instructions.

If you disable SNMP for a device, various options for diagnostics of the network topology (e.g. using the PRONETA tool or the Web server of the CPU) are no longer available to you.

Requirements

- CPU S7-1200 V4.1 and higher
- CPU S7-1500 V1.8 and higher

Disabling SNMP

To disable SNMP, follow these steps:

1. In STEP 7, create a data block that contains the structure of data record $F003_H$. The following table shows the structure of the data record $F003_H$.

Byte	Element	Code	Explanation
0-1	BlockID	$F003_H$	Header
2-3	BlockLength	8	The data record length is counted starting at byte 4 "Version".
4	Version	01_H	
5	Subversion	00_H	
6-7	Reserved	-	-
8-11	SNMP controller	Disable/enable SNMP	If you want to disable SNMP, enter the value 0. If you want to enable SNMP, enter the value 1.

2. Transfer the data record $F003_H$ in the startup OB (OB100) to the CPU with the WRREC instruction (write data record). Use an integrated interface of the CPU as the hardware ID.

Deactivating SNMP - complete example (S7-1200)

Introduction

The example applies to S7-1500 and S7-1200.

Follow these steps to apply the program code to your project:

1. Copy the entire program code to the clipboard.
2. Open a text editor (e.g. "Editor").
3. Paste the content of the clipboard to the text editor with Ctrl+V. Save the document as scl file, for example, SNMP_DEACT.scl.
4. Open your project in STEP 7.
5. Import the scl file as an external source.
6. Generate the startup OB and the data blocks.
7. Right-click the scl file and select "Generate block from source" in the shortcut menu.

Example program with WRREC call in OB 100

Symbolic and numerical names of instructions (S7-1200)

Description

The instructions from the task card are comprised of functions (FC), function blocks (FB), system functions (SFC) and system function blocks (SFB) that are identified internally by numbers.

The following tables show the assignment of numerical and symbolic names.

Function blocks (FBs)

Numerical name	Symbolic name
FB 105	TC_CONFIG
FB 110	Port_Config
FB 111	Send_Config
FB 112	Receive_Config
FB 113	Send_P2P
FB 114	Receive_P2P
FB 115	Receive_Reset
FB 116	Signal_Get
FB 117	Get_Features
FB 118	Set_Features
FB 163	TC_SEND
FB 164	TC_RECV
FB 165	TC_CON
FB 166	TC_DISCON
FB 804	SET_TIMEZONE

Numerical name	Symbolic name
FB 1030	TSEND_C
FB 1031	TRCV_S
FB 1071	USS_DRIVE
FB 1080	MB_COMM_LOAD
FB 1081	MB_MASTER
FB 1082	MB_SLAVE
FB 1084	MB_CLIENT

Organization blocks (S7-1200)

Startup OBs (S7-1200)

Description

You can determine the boundary conditions for the startup characteristics of your CPU, for example, the initialization values for "RUN". To do this, write a startup program. The startup program consists of one or more startup OBs (OB numbers 100 or >= 123).

The startup program is executed once during the transition from "STOP" mode to "RUN" mode. Current values from the process image of the inputs are not available for startup program, nor can these values be set.

After the complete execution of the startup OBs, the process image of the inputs is read in and the cyclic program is started.

There is no time limit for executing the startup routine. Therefore the scan cycle monitoring time is not active. Time-driven or interrupt-driven organization blocks cannot be used.

Start information

A startup OB has the following start information:

Tag	Data type	Description
LostRetentive	BOOL	= 1, if retentive data storage areas have been lost
LostRTC	BOOL	= 1, if realtime clock has been lost

See also

Events and OBs (Page 973)

Cyclic OBs (S7-1200)

Introduction

For the program execution to start, at least one program cycle OB must be present in the project. The operating system calls this program cycle OB once in each cycle and thereby starts the execution of the user program. You can use multiple OBs (OB numbers >= 123). When multiple program cycle OBs are used, these are called in one after the other in the order of their OB numbers. The program cycle OB with the lowest OB number is called first.

The program cycle OBs have the priority class 1. This corresponds to the lowest priority of all OBs. The cyclic program can be interrupted by events of any other event class.

Programming cyclic program execution

You program cyclic program execution by writing your user program in the cycle OBs and the blocks that they call.

The first cyclic program execution begins as soon as the startup program has ended without errors. The cycle restarts after the end of each cyclic program execution.

Sequence of cyclic program execution

One cycle of the program execution encompasses the following steps:

1. The operating system starts the maximum cycle time.
2. The operating system writes the values from the process image output to the output modules.
3. The operating system reads out the state of the inputs of the input modules and updates the process image input.
4. The operating system processes the user program and executes the operations contained in the program.
5. At the end of a cycle, the operating system executes any tasks that are pending, for example, loading and deleting blocks or calling other cycle OBs.
6. Finally, the CPU returns to the start of the cycle and restarts the scan cycle monitoring time.

See also: AUTOHOTSPOT

Options for interrupting

Cyclic program execution can be interrupted by the following events:

- Interrupt
- A STOP command, triggered by
  - Operation of the programming device
  - "STP" instruction
- Supply voltage failure
- Occurrence of a device fault or program error

Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB: • Transition from STOP or HOLD to RUN • After reloading
retentivity	BOOL	= TRUE, if retentive data are available

Events and OBs (Page 973)

Organization blocks for interrupt-driven program execution (S7-1200)

Time-of-day interrupt OBs (S7-1200)

Function

Organization blocks for time-of-day interrupt (OB number >=123) can be processed as follows:

- One time to a preset time (date with time of day)
- Periodically with preset start time and the following intervals:
  - Every minute
  - Hourly
  - Daily
  - Weekly
  - Monthly
  - Yearly
  - End of month

Time-of-day interrupt-OBs are therefore used to run parts of the user program on a time-controlled basis.

Status for time-of-day interrupt

The following table contains the possible status of a time-of-day interrupt as well as it's meaning.

Status	Meaning
Cancelled	The one-time processing has already taken place, or the start event of an not yet processed time-of-day interrupt has been deleted with the extended instruction CAN_TINT.
Set	You have scheduled the time or start time for processing.
Activated	You have scheduled whether processing takes place one time or periodically, and in the case of periodic processing, you have scheduled the interval.

Rules for time-of-day interrupts

The following rules apply to the use of time-of-day interrupts:

- A time-of-day interrupt can only be processed if it is set and activated, and a corresponding organization block exists in the user program.
- The start times of periodic time-of-day interrupts must correspond to a real date. For example, it is not possible to repeat an organization block monthly which first occurs on January 31st. In this case, on OB will only be started in the months that have 31 days.
- A time-of-day interrupt activated during startup by extended instruction call ACT_TINTwill not be executed until the startup is complete.
- After each CPU startup, you must reactivate previously set time-of-day interrupts

Setting and activating a time-of-day interrupt OB

Before a time-of-day interrupt can be deleted and the corresponding time-of-day interrupt OB can be processed from the operating system, you must set and activate the interrupt. You have the following options:

Set time-of-day interrupt	Activate time-of-day interrupt
Means of configuring	Means of configuring
Means of configuring	By extended instruction call ACT_TINT
By extended instruction call SET_TINTL	By extended instruction call ACT_TINT

Note

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed once, the start time must not be in the past (relative to the real-time clock of the CPU).

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed periodically, but the start time is in the past, then the time-of-day interrupt will be processed the next time it is due.

Time-of-day interrupt status query

In order to query the status of the time-of-day interrupt, call the extended instruction QRY_TINT.

Cancelling a time-of-day interrupt

You can cancel a time-of-day interrupt which has not yet been processed with the extended instruction CAN_TINT.

You can reset cancelled time-of-day interrupts with the extended instruction SET_TINTL and activate them with the extended instruction ACT_TINT.

Conditions that effect the time-of-day interrupt OBs

Since a time-of-day interrupt occurs only at specific intervals, certain conditions can affect the function of the associated OBs during execution of your program. The following table shows some of these conditions and describes how these affect the processing of a time-of-day interrupt OB.

Condition	Result
The extended instruction CAN_TINT is called in the user program.	The operating system deletes the start event (date and time) of the time-of-day interrupt. You must reset and reactivate the time-of-day interrupt if you are going to call the corresponding time-of-day interrupt OB again.
By synchronizing or correcting the CPU system clock, the time of day will be set ahead. With this, the start time for a time-of-day interrupt OB will be bypassed.	The operating system calls the time error interrupt OB (OB 80) and records the start event, the number, and the priority of the first bypassed time-of-day interrupt OB in its start information. After completion of the OB 80, the operating system processes the bypassed time-of-day interrupt OB only once.
By synchronizing or correcting the CPU system clock, the time of day will be set back. The corrected clock time is before the start time of an already processed time-of-day interrupt OB.	The time-of-day interrupt OB is repeated.
A time-of-day interrupt OB is still being processed when the start event for its next execution occurs.	The operating system then calls time error interrupt OB 80. The requested OB is processed only after the processing and further execution of the current time-of-day interrupt OB has completed.

Start information

A time-of-day interrupt OB has the following start information:

Tag	Data type	Description
CaughtUp	BOOL	=1, if the OB call is executed because clock time is turned ahead.
SecondTime	BOOL	=1 if the OB is called a second time because clock time is turned back (more exactly, if the planned time of the current OB processing is earlier than or the same time as the planned time for the previous OB processing). Note: SecondTime is only set once.

Status interrupt OB (S7-1200)

Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the status interrupt OB from a DP master or IO controller. This may be the case if a module of a slave changes its operating mode, for example, from "RUN" to "STOP". For more detailed information on events that trigger a status interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The status-interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 973)

Update interrupt OB (S7-1200)

Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the update interrupt OB from a DP master or IO controller. This may be the case if you changed a parameter on a slot of a slave or device. For more detailed information on events that trigger an update interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The update interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 973)

OB for vendor- or profile-specific interrupts (S7-1200)

Description

When it receives a manufacturer-specific or profile-specific interrupt from a DP master or IO controller, the operating system of the S7-1200 CPU calls OB 57. For more detailed information on events that trigger this type of interrupt, refer to the documentation of the slave or device manufacturer.

Structure of the start information

The OB for manufacturer-specific and profile-specific interrupts has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

See also

Events and OBs (Page 973)

Time-delay interrupt OBs (S7-1200)

Description

A time-delay interrupt OB is started after a configurable time delay of the operating system. The delay time starts after the SRT_DINT instruction is called.

You can use up to four time-delay interrupt OBs or cyclic OBs (OB numbers >= 123) in your program. If, for example, you are already using two cyclic interrupt OBs, you can insert a maximum of two further time-delay interrupt OBs in your program.

You can use the CAN_DINT instruction to prevent the execution of a time-delay interrupt that has not yet started.

Function of time-delay interrupt OBs

The operating system starts the corresponding OB after the delay time, which you have transferred with an OB number and an identifier to the SRT_DINT instruction.

To use a time-delay interrupt OB, you must execute the following tasks:

- You must call the instruction SRT_DINT.
- You must download the time-delay interrupt OB to the CPU as part of your program.

The delay time is measured with a precision of 1 ms. A delay time can immediately start again after it expires.

Time delay interrupt OBs are executed only when the CPU is in the "RUN" mode. A warm restart clears all start events of time-delay interrupt OBs.

The operating system calls the time-delay interrupt OB if one of the following events occurs:

- If the operating system attempts to start an OB that is not loaded and you specified its number when calling the SRT_DINT instruction.
- If the next start event for a time-delay interrupt occurs before the time delay OB has completely executed.

You can disable and re-enable time-delay interrupts using the DIS_AIRT and EN_AIRT instructions.

Note

If you disable an interrupt with DIS_AIRT after executing SRT_DINT, this interrupt executes only after it has been enabled with EN_AIRT. The delay time is extended accordingly.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
sign	WORD	User ID: Input parameter SIGN from the call of the "SRT_DINT" instruction

Note

"sign" tag

The "sign" tag exists only since firmware version V4.1 of the S7-1200 CPUs. See Useful information on CPU firmware versions and STEP 7 versions (Page 1043)

See also

SRT_DINT: Start time-delay interrupt (Page 3830)

Events and OBs (Page 973)

Cyclic interrupt OBs (S7-1200)

Description

Cyclic interrupt OBs serve to start program in periodic time intervals independently of the cyclic program execution. The start times of a cyclic interrupt OB are specified using the time base and the phase offset.

The time base defines the intervals at which the cyclic interrupt OB is started and is an integer multiple of the basic clock cycle of 1 ms. The phase offset is the time by which the start time is offset compared with the basic clock cycle. If several cyclic interrupt OBs are being used, you can use this offset to prevent a simultaneous start time if the time bases of the cyclic interrupt OBs have common multiples.

You can specify a time period between 1 ms and 60000 ms as the time base.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 123) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

The execution time of each cyclic interrupt OB must be noticeably smaller than its time base. If a cyclic interrupt OB has not been completely executed but execution is again pending because the cycle clock has expired, the time error OB is started. The cyclic interrupt that caused the error is executed later or discarded.

Example of the use of phase offset

You have inserted two cyclic interrupt OBs in your program:

- Cyclic interrupt OB1
- Cyclic interrupt OB2

For cyclic interrupt OB1, you have set a time base of 20 ms and for cyclic interrupt OB2 a time base of 100 ms. After expiration of the time base of 100 ms, the cyclic interrupt OB1 reaches the start time for the fifth time, cyclic interrupt OB2 for the first time. To nevertheless execute the cyclic interrupt OBs offset, enter a phase offset for one of the two cyclic interrupt OBs.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB • At the transition from STOP or HOLD to RUN • After reloading
event_count	INT	Number of lost start events since the last start of this OB

See also

Assigning parameters to cyclic interrupt OBs (Page 1040)

Events and OBs (Page 973)

Hardware interrupt OBs (S7-1200)

Description

You can use hardware interrupt OBs to react to specific events. You can assign an event that triggers an alarm to precisely one hardware interrupt OB. A hardware interrupt OB in contrast can be assigned to several events.

Hardware interrupts can be triggered by high-speed counters and input channels. For each high-speed counter and input channel that should trigger a hardware interrupt, the following properties need to be configured:

- The process event that should trigger the hardware interrupt (for example, the change of a count direction of a high-speed counter)
- The number of the hardware interrupt OB which is assigned to this process event

You can use up to 50 hardware interrupt OBs (OB numbers >= 123) that are independent of each other in your program.

Functionality of a hardware interrupt OB

After triggering a hardware interrupt, the operating system identifies the channel of the input or the high-speed counter and determines the assigned hardware interrupt OB.

If no other interrupt OB is active, the determined hardware interrupt OB is called. If a different interrupt OB is already being executed, the hardware interrupt is placed in the queue of its priority class. The hardware interrupt is acknowledged after the completion of the assigned hardware interrupt OB.

If another event that triggers a hardware interrupt occurs on the same module during the time between identification and acknowledgement of a hardware interrupt, the following applies:

- If the event occurs on the channel that previously triggered the hardware interrupt, then no additional hardware interrupt is triggered. Another hardware interrupt can only be triggered if the current hardware interrupt is acknowledged.
- If the event occurs on a different channel, a hardware interrupt is triggered.

Hardware interrupt OBs are called only in the CPU's "RUN" mode.

Start information

- None
- Optimized start information:

Name	Data type	Meaning
Laddr	HW_IO	Hardware identifier of the module that triggers the hardware interrupt
USI	WORD	Identifier for future extensions (not user-relevant)
IChannel	USINT	Number of the channel that triggered the hardware interrupt
EventType	BYTE	Identifier for the event type associated with the event triggering the interrupt (e.g., positive edge) This identifier can be found in the description of the respective module.

Events and OBs (Page 973)

Time error OB (S7-1200)

Description

The operating system calls the time error OB (OB 80) if one of the following events occurs:

- The cyclic program exceeds the maximum cycle time.
- The OB called is currently still being executed (possible for time-delay interrupt OBs and cyclic interrupt OBs).
- A time-of-day interrupt was missed because the clock time was set forward by more than 20 seconds.
- A time-of-day interrupt was missed during a STOP.
- An overflow has occurred in an interrupt OB queue.
- An interrupt was lost due to the excessive interrupt load.

If you have programmed no time error OB, the S7-1200 CPU reacts as follows:

- CPUs with firmware version V1.x to V3.x: The CPU remains in RUN mode.
- CPUs with firmware version as of V4.x:
  - The CPUs goes to STOP mode when the maximum cycle time is exceeded.
  - With all other start events of the time error OB, the CPU remains in RUN mode.

Violation of the maximum cycle time twice does not lead to the calling of an OB, but to the STOP of the CPU. You can avoid the second violation by restarting the cycle monitoring of the CPU with the RE_TRIGR instruction.

You can use only one time error OB in your program.

Start information

The time error OB has the following start information:

Tag	Data type	Description
fault_id	BYTE	• 0x01: Maximum cycle time exceeded • 0x02: Called OB is still being executed • 0x05: Expired time-of-day interrupt due to time jump • 0x06: Expired time-of-day interrupt on return to RUN mode • 0x07: Queue overflow • 0x09: Interrupt loss due to high interrupt load
csg_OBnr	OB_ANY	Number of the OB being executed at the time of the error
csg_prio	UINT	Priority of the OB being executed at the time of the error

Events and OBs (Page 973)

Cycle time and maximum cycle time (Page 988)

Diagnostic interrupt OB (S7-1200)

Description

You can enable the diagnostic error interrupt for diagnostics-capable modules so that the module detects changes in the I/O status. As a result, the module triggers a diagnostic error interrupt in the following cases:

- A fault is present (incoming event)
- A fault is no longer present (outgoing event)

If no other interrupt OB is active, then the diagnostic interrupt OB (OB 82) is called. If another interrupt OB is already being executed, the diagnostic error interrupt is placed in the queue of its priority group.

You can use only one diagnostic interrupt OB in your program.

Start information

The diagnostic interrupt OB has the following start information:

Tag	Data type	Description
IO_state	WORD	Contains the I/O status of the diagnostics-capable module.
laddr	HW_ANY	HW-ID
Channel	UINT	Channel number
multi_error	BOOL	= 1, if there is more than one error

IO_state tag

The following table shows the possible I/O states that the IO_state tag can contain:

IO_state	Description
Bit 0	Configuration correct: = 1, if the configuration is correct = 0, if the configuration is no longer correct
Bit 4	Error: = 1, if an error is present, e.g., a wire break = 0, if the error is no longer present
Bit 5	Configuration not correct: = 1, if the configuration is not correct = 0, if the configuration is correct again
Bit 7	I/O cannot be accessed: = 1, if an I/O access error has occurred In this case, laddr contains the hardware identifier of the I/O with the access error. = 0, if the I/O can be accessed again
Bits 8 to 15	Reserved (always 0)

Events and OBs (Page 973)

Pull/plug interrupt OB (S7-1200)

Description

The S7-1200 CPU operating system calls the pull/plug interrupt OB (OB 83) if a configured and non-disabled distributed I/O module or submodule (PROFIBUS, PROFINET, AS-i) is removed or inserted.

Note

The removal or insertion of a central module leads to the STOP of the CPU.

Start information

The pull/plug interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the affected module or submodule
Event_Class	BYTE	• B#16#38: (Sub)module plugged • B#16#39: (Sub)module pulled or not responding
Fault_ID	BYTE	Error code (possible values: B#16#51, B#16#54, B#16#55, B#16#56, B#16#57, B#16#58)

The following table shows which event caused the start of the pull/plug interrupt OB.

ev_class (B#16# ...)	fault_id (B#16# ...)	Meaning
39	51	Module pulled
39	54	Submodule pulled
38	54	Submodule plugged, which conforms to the parameterized submodule
38	55	Submodule inserted, which does not conform to the submodule parameter assignment
38	56	Submodule inserted, but error in module parameter assignment
38	57	Submodule or module inserted, but with a fault or maintenance
38	58	Submodule access error remedied

Events and OBs (Page 973)

Rack error OB (S7-1200)

Description

The S7-1200 CPU operating system calls the OB 86 in the following cases:

- The failure of a DP master system or of a PROFINET IO system is detected (in the case of either an incoming or an outgoing event).
- The failure of a DP slave or of an IO device is detected (in the case of either an incoming or an outgoing event).
- Failure of some of the submodules of a PROFINET I-device is detected.

Structure of the start information

The rack fault OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the defective hardware object
Event_Class	BYTE	• B#16#32: Activation of a DP slaves or an IO device • B#16#33: Deactivation of a DP slaves or an IO device • B#16#38: outgoing event • B#16#39: incoming event
Fault_ID	BYTE	Error code (possible values: B#16#C3, B#16#C4, B#16#C5, B#16#C6, B#16#C7, B#16#C8, B#16#C9, B#16#CA, B#16#CB, B#16#CC, B#16#CD, B#16#CE, B#16#CF, B#16#F8, B#16#F9)

The following table shows which event caused the start of OB 86.

Ev_class B#16# ...	Fault_id B#16# ...	Meaning
39	C3	Failure of a DP master system
39/38	C4	Failure/return of a DP slave
38	C5	Return of a DP slave; however, slave is faulty
38	C6	Expansion unit return, but error in module parameter assignment
38	C7	Return of a DP device, but there is error in module configuration
38	C8	Return of a DP device, but discrepancy between preset/actual configuration
32/33	C9	Activation/deactivation of a DP slave with the "D_ACT_DP" instruction
39	CA	Failure of a PROFINET IO system
39/38	CB	Failure/return of a PROFINET IO device
38	CC	Return of a PROFINET IO device with fault or maintenance
38	CD	Return of a PROFINET IO device, deviation between preset/actual configuration
38	CE	Return of a PROFINET IO device, error in module configuration
32/33	CF	Activation/deactivation of an IO device with the "D_ACT_DP" instruction
39/38	F8	Failure/return of some of the submodules of a PROFINET I-device
38	F9	Return of some of the submodules of a PROFINET I-device with a device configuration difference

Events and OBs (Page 973)

MC-servo OB (S7-1200)

Description

When you create a technology object with drive connection using MC-Servo [OB91]/create an analog output, the organization block PROFIdrive is created automatically. The Motion Control functionality of the technology objects creates its own execution level, and is called according to the Motion Control application cycle.

The MC-Servo OB is write-protected. The content cannot be changed.

The position control algorithms of all technology objects configured for motion control on the CPU are calculated within the MC-Servo OB.

You can set the application cycle and the priority of the organization block in accordance with your requirements for control quality and system load.

Application cycle

You can set the application cycle in which the MC-Servo OB is called in the properties of the organization block.

The MC-Servo OB is called cyclically with the specified application cycle.

The selected application cycle must be long enough to allow all the technology objects to be processed in one cycle. If the processing time of the technology objects is longer than the application cycle, overflows will occur.

To avoid disruptions in the program execution on the CPU, set the application cycle depending on the number of axes used as follows:

Application cycle = number of axes x 2 ms

The following table shows the resulting application cycle as an example according to the number of axes:

Number of axes	Application cycle
1	2 ms
2	4 ms
4	8 ms
8	16 ms

The SINAMICS G120 drive updates the drive process image every 4 ms. To improve control, set the application cycle of the MC-Servo OB to 4 ms or to a multiple of 4 ms.

MC-PostServo OB (Page 1037)

MC-interpolator OB (Page 1038)

Assigning the MC-Servo OB parameters (Page 1043)

MC-PreServo OB (S7-1200)

Description

The organization block MC-PreServo [OB67] can be programmed and is called in the application cycle configured at the MC-Servo OB (Page 1036). MC-PreServo [OB67] is called directly before MC-Servo [OB91].

Via the organization block, you can read out the configured application cycle (information in µs).

Structure of the start information

Optimized start information:

Name	Data type	Meaning
Initial_Call	BOOL	=TRUE in the first call of this OB during transition from STOP to RUN
PIP_Input	BOOL	TRUE: The associated process image input is up-to-date
PIP_Output	BOOL	TRUE: The associated process image output was transferred to the outputs in good time after the last cycle
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	• = n: Number of lost cycles • = -1: An unknown number of cycles has been lost (e.g., because cycle has changed).
Synchronous	BOOL	Reserved
CycleTime	UDINT	Display of the application cycle configured for the MC-Servo OB in µs

MC-PostServo OB (S7-1200)

Description

The organization block MC-PostServo [OB95] can be programmed and is called in the application cycle configured for the MC-Servo OB (Page 1036). MC-PostServo [OB95] is called directly after MC-Servo [OB91].

Via the organization block, you can read out the configured application cycle (information in µs).

Structure of the start information

Optimized start information:

Name	Data type	Meaning
Initial_Call	BOOL	=TRUE in the first call of this OB during transition from STOP to RUN
PIP_Input	BOOL	TRUE: The associated process image input is up-to-date
PIP_Output	BOOL	TRUE: The associated process image output was transferred to the outputs in good time after the last cycle
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	• = n: Number of lost cycles • = -1: An unknown number of cycles has been lost (e.g., because cycle has changed).
Synchronous	BOOL	Reserved
CycleTime	UDINT	Display of the application cycle configured for the MC-Servo OB in µs

MC-interpolator OB (S7-1200)

Description

When you create a technology object with drive connection using MC-Interpolator [OB91]/ create an analog output, the organization block PROFIdrive is created automatically. The Motion Control functionality of the technology objects creates its own execution level, and is called according to the Motion Control application cycle of the MC-Servo OB (Page 1036).

The MC-Interpolator OB is write-protected. The content cannot be changed.

The evaluation of the motion control instructions as well as the monitoring and the setpoint generation for all technology objects configured on the CPU (motion control) is performed within the MC-Interpolator OB.

The MC-Interpolator OB is called at the end of processing of the MC-Servo OB. The clock ratio between MC-Interpolator OB and MC-Servo OB is always 1:1.

Process response

You must select the application cycle of the MC-Servo OB long enough to allow all the technology objects for motion control to be processed in one application cycle. If the application cycle is not observed, overflows occur. Note the following response to overflows:

- The CPU tolerates a maximum of three consecutive overflows of the MC-Interpolator OB.
- The processing of an MC-Interpolator OB can be interrupted by the calling of the MC Servo OB, at most.

Block parameters of organization blocks (S7-1200)

Basics of block parameters (S7-1200)

Introduction

Several organization blocks (OBs) have properties with which you can control their behavior or their assignment to specific events. You can influence these properties by assigning parameters.

Overview

You can assign parameters to the properties for the following organization blocks:

- Time-of-day interrupt OBs
- Cyclic interrupt OBs
- Hardware interrupt OBs
- MC-Servo OB

See also

Assigning parameters to hardware interrupt OBs (Page 1041)

Assigning parameters to cyclic interrupt OBs (Page 1040)

Parameter assignment for time-of-day interrupt OBs (S7-1200)

Procedure for setting the parameters

To set the parameters of a time-of-day interrupt OB, proceed as follows:

1. Open the "Properties" dialog belonging to the time-of-day interrupt OB in question.
2. Click the "Time-of-day interrupt" group in the area navigation.

Overview of the parameters that can be set

You can set the following parameters:

- Execution
- Start date and time-of-day
- Option buttons "Local time" and "System time"

"Execution" parameter

Use the drop-down list "Execution" to define the periods at which the time-of-day interrupt OB is to be executed. The time intervals relate to the settings for "Start date" and "Time-of-day".

The following values are possible for "Execution":

- Never
- Once
- Every minute
- Hourly
- Daily
- Weekly
- Monthly
- Yearly
- End of month

Note

With the value "End of month", the value specified under "Start date" is irrelevant.

"Start date" and "Time-of-day" parameter

Here, you specify the time at which the time-of-day interrupt is to be executed for the first time.

Example: Start date = 07/05/2013, time =11:16

Depending on the value of the "Execution" parameter, the CPU generates additional time-of-day interrupts periodically. Depending on the setting, the start time relates either to the local time or to the coordinated universal timeUTC.

Note

If you set the "Execution" parameter to "Monthly", the start date cannot be set to the 29th, the 30th, or the 31st. If you want the time-of-day interrupt OB to start at the end of the month, you should set the parameter "Execution" to "End of month".

"Local time" or "System time"

Here, you decide which time the start time of the time-of-day interrupt OB relates to:

- "Local time": The start time relates to the time zone set for the CPU.
- "System time": The start time relates to the coordinated universal time UTC (Universal Time Coordinated).

Assigning parameters to cyclic interrupt OBs (S7-1200)

Introduction

You can use cyclic interrupt OBs to start programs at regular time intervals. To do so you must enter a scan time and a phase shift for each cyclic interrupt OB used.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers >= 200) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

Note

If you assign multiple cyclic OBs, make sure that you assign a different cycle time or phase offset to each cyclic interrupt OB to avoid them executing at the same time or having to queue. When you create a cyclic interrupt OB, the cycle time 100 and the phase offset 0 are entered as start value.

Procedure

To enter a scan time and a phase shift for a cyclic interrupt OB, proceed as follows:

1. Open the "Program blocks" folder in the project tree.
2. Right-click on an existing cyclic interrupt OB.
3. Select the "Properties" command in the shortcut menu.
   The "<Name of the cyclic interrupt OB>" dialog box opens.
4. Click the "Cyclic interrupt" group in the area navigation.
   The text boxes for the scan time and the phase shift are displayed.
5. Enter the scan time and the phase shift.
6. Confirm your entries with "OK".

Basics of block parameters (Page 1039)

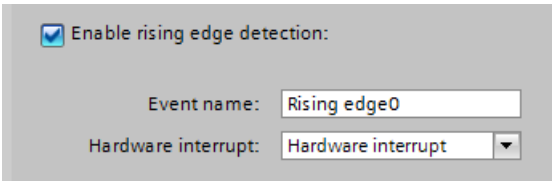
Cyclic interrupt OBs (Page 1029)

Assigning parameters to hardware interrupt OBs (S7-1200)

Introduction

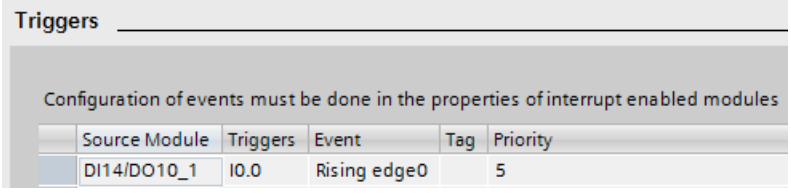
You must select the corresponding event and assign the following parameters for every input channel and high-speed counter that should trigger a hardware interrupt:

- Event name
- Number of the hardware interrupt OB that is assigned to this process event



The parameters of the hardware interrupt are assigned in the properties of the corresponding device. You can assign parameters for up to 50 hardware interrupt OBs.

You can create the hardware interrupt OB to be assigned parameters either before or during activation of an event.



Procedure

To configure a hardware interrupt event, follow these steps:

1. Double-click the "Devices & Networks" command in the project tree.
   The hardware and network editor opens in the network view.
2. Change to the device view.
3. If the Inspector window closed in the device view, select the "Inspector window" check box in the "View" menu.
   The Inspector window opens.
4. Click the "Properties" tab.
5. In the device view, select the module for which you want to a assign a hardware interrupt.
6. Select the corresponding event that will trigger a hardware interrupt, e.g., a positive edge.

7. Enter an event name.
8. Select an existing hardware interrupt OB from the "Hardware interrupt" drop-down list or create a new hardware interrupt OB. If you have not previously created any hardware interrupt OBs, you can click the "Add new block" button in the drop-down list.
   The start information of the corresponding hardware interrupt OB, including all specifications for the interrupt-triggering event, is updated.

9. If you want to assign further hardware interrupts, repeat steps 5 to 8.

A system constant of data type Event_HwInt is created automatically for the event identified by the explicit event name. The system constants are displayed in the standard tag table.

Basics of block parameters (Page 1039)

Hardware interrupt OBs (Page 1030)

Events and OBs (Page 973)

Assigning the MC-Servo OB parameters (S7-1200)

Procedure for setting the parameters

To assign the parameters of an MC-Servo OB, follow these steps:

1. Open the "Properties" dialog associated with the MC-Servo OB in question.
2. Click on the "Cycle time " group in the area navigation.

Overview of the parameters that can be set

In the "Cycle time" group, select the application cycle with which the MC-Servo OB will be called cyclically in the execution system of the SIMATIC S7-1200

You set the cycle in which the MC-Servo OB is called in the "Application cycle" field.

Basics of block parameters (Page 1039)

MC-servo OB (Page 1036)

Useful information on CPU firmware versions and STEP 7 versions (S7-1200)

CPUs and engineering software for configuring the CPUs is constantly developed further to improve performance and security. New versions that have some special features with respect to the interaction of the components are created in this way. The sections below describe the special features of the S7-1200 CPUs with firmware version V4 as compared to firmware versions V1 to V3.

For a detailed comparison of the range of functions, read the S7-1200 System Manual (description of new instructions, new organization blocks and advanced configuration options).

Required engineering software

S7-1200 CPUs V4 can be configured with STEP 7 as of V13.

Compatibility between memory card content and firmware version of the CPU

Memory cards (transfer cards or program cards) with configuration and program for an S7-1200 CPU V1, V2 or V3 do not work with an S7-1200 CPU V4.
Memory cards with configuration and program for an S7-1200 CPU V4 do not work with an S7-1200 CPU V1, V2 or V3.

You must change an S7-1200 CPU V1 to V3 configuration to an S7-1200 CPU V4 configuration (device replacement) and then download it to the CPU. A gradual device replacement is required for an S7-1200 CPU V1-V2 (see below).

When you insert the memory card into a CPU with an incompatible firmware version, the CPU does not start up. When you insert a memory card for a CPU V1, V2 or V3 into an S7-1200 CPU V4, this CPU outputs a version error.

Going online and loading

When you have configured an S7-1200 CPU with firmware version V1, V2 or V3 with STEP 7, the CPU to which you want to go online or which you want to download must have one of these firmware versions. You cannot go online to an S7-1200 CPU V4 with a configured S7-1200 CPU V1, V2 or V3.

On the other hand, you cannot go online to an S7-1200 CPU V1, V2 or V3 with a configured S7-1200 CPU V4 or download this CPU.

Replacing an existing CPU

You can replace a configured S7-1200-CPU V1, V2 or V3 with a new CPU with a firmware version greater than or equal to 4. In case of an existing S7-1200 CPU V1 or V2, you must start by replacing the device with an S7-1200 CPU V3: It is not possible to directly replace it with an S7-1200 CPU V4.

1. S7-1200 CPU V1 (V2) > S7-1200 CPU V3
2. S7-1200 CPU V3 > S7-1200 CPU V4

As long as you do not download the configuration, you can undo the device replacement ("Undo" command in the "Edit" menu). When you download the configuration for the new CPU firmware version ("V4 configuration") to the CPU, you can no longer return to version V3.

This means you should save the existing project, for example, with a V3 configuration as project archive so that you can access it later.

Special notes for device replacement (V3 > V4):

- The interrupt behavior of interrupt OBs remains the same; they are not configured as interruptible. This is also the default behavior of S7-1200 CPUs V1-V3. The interrupt behavior of the interrupt OB can be configured for S7-1200 V4 CPUs. If you drag an S7-1200 CPU V4 directly from the hardware catalog into the network view, this option is activated (interrupt OBs are interruptible).
- The behavior for PUT/GET access of remote partners remains the same; access is permitted. This is also the default behavior of S7-1200 CPUs V1-V3. The access via PUT/GET communication by means of remote partners can be configured for S7-1200 V4 CPUs ("Protection" area of CPU parameters). If you drag an S7-1200 CPU V4 directly from the hardware catalog into the network view, access is not permitted and must be explicitly enabled.
- The wording for the protection levels changes but the effect of the settings remains the same. You can also select the access level "No access (complete protection)".
- The web server settings for activation of the web server and HTTP/HTTPS settings are applied. You also have the option to create users and assign them specific rights (Web server area > User management of CPU parameters). Web server users only have access to standard websites when you do not configure users. An S7-1200 CPU V4 no longer supports the user "admin" and his/her password.
- For reasons of compatibility, the interfaces of used OBs are not changed by the device replacement. You can therefore continue to use used OBs. If you want to use OB properties that have been added or changed in the new firmware version of the S7-1200 CPU, you will need to recreate the corresponding OB.

Communication with HMI devices

When you connect an HMI device to an S7-1200 CPU V4, make sure that you use the appropriate Runtime software version of the HMI device.

You may have to transfer the latest HMI Runtime version by means of the WinCC engineering software.

You must compile the HMI configuration once again and download it to the HMI device for the CPU-HMI communication to work.

Addressing modules (S7-1200)

Addressing modules (S7-1200)

Introduction

In the device overview, you see the addresses or address ranges of the modules in the I address and Q address columns. There are other addresses as well, which are explained below.

I/O address

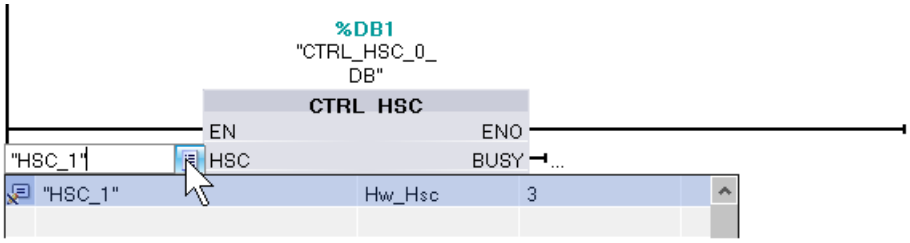
I/O addresses (input/output addresses) are required to read inputs and set outputs in the user program.

Input and output addresses are assigned automatically when modules are inserted in the rack. The address of the first channel is the start address of a module. The addresses of the other channels are derived from this start address. The address end is obtained from the module-specific address length.

Device address (e.g., Ethernet address)

Device addresses are addresses of programmable modules (Industrial Ethernet addresses). They are required to address the different stations of a subnet, for example, to download a user program to a CPU.

Hardware identifier for identifying modules and submodules



In addition to the I addresses and Q addresses, a hardware identifier (HW ID) is assigned automatically and is used to address and identify the module. Submodules (units of a module), such as an integrated counter, also receive such a hardware identifier.

The hardware identifier consists of an integer and is output by the system with diagnostics alarms to allow the faulty module or the faulty submodule to be localized.

In addition, the hardware identifier is used for a number of instructions to address the corresponding module.

The hardware identifier cannot be changed.

Example: Identifying high-speed counters of the S7-1200 CPU

The hardware identifier is assigned automatically when components are inserted in the device or network view and in the PLC tags. A name is also assigned automatically for the hardware identifier. The system constants of the PLC tags cannot be changed either.

Specifying input and output addresses (Page 1046)

Assigning addresses to a location in the program (Page 1047)

Introduction to loading a configuration (Page 1815)

Inspector window (Page 539)

Specifying input and output addresses (S7-1200)

Default input and output addresses are set automatically. You can, however, change the address assignment later.

All addresses of modules are located in the process image area. The process image is automatically updated cyclically.

Requirement

You are in the device view.

Procedure

To change the preset address range proceed as follows:

1. In the device view, click on the module for which you want to set the start address.
2. Go to "I/O addresses" in "Properties" in the inspector window.
3. Under "Start address" enter the required start address.
4. Press <Return> or click on any object to accept a modified value.

If you have entered an invalid address, a message indicating the next available address is displayed.

Note

You can also change the addresses directly in the device overview.

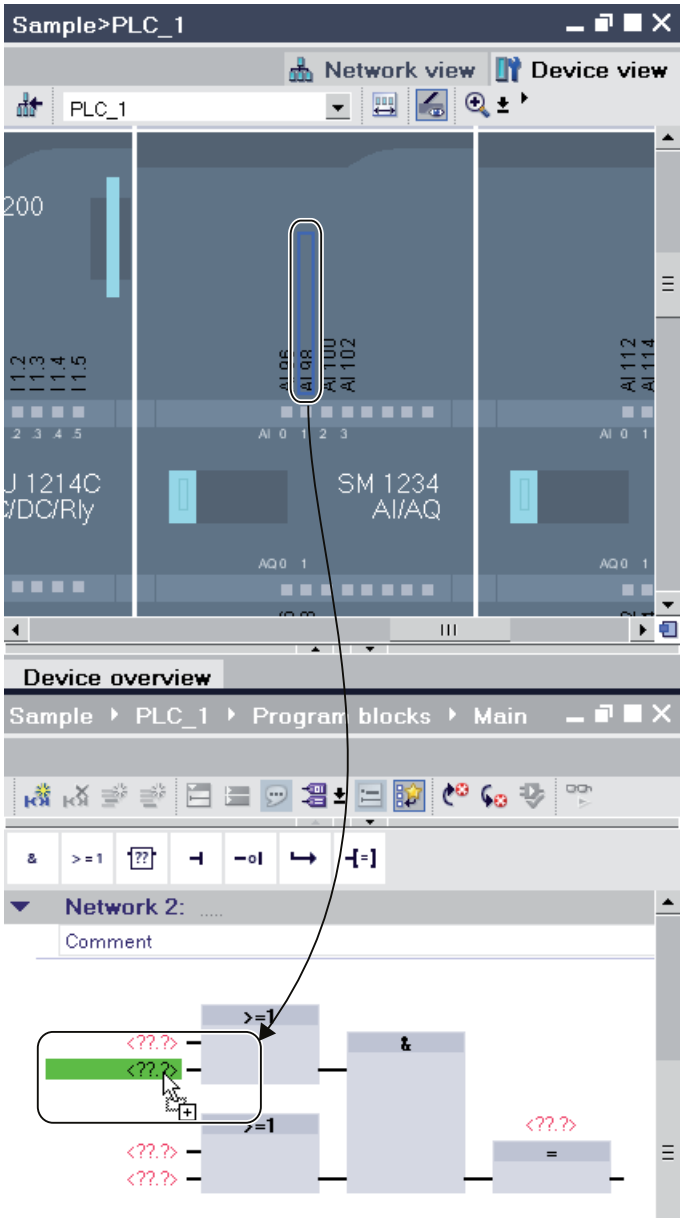
See also

Editing properties and parameters (Page 575)

Input and output addresses in the address overview (Page 577)

Assigning addresses to a location in the program (S7-1200)

You can assign addresses of the I/O channels of modules directly to the points of use in the program or to a tag table.



Requirement

- The device view of the hardware and network editor is open.
- The zoom level in the device view must be set to at least 200% to allow you to see the individual I/O channels.
- The instruction window of the programming editor or a tag table is open.

Procedure

To assign I/O channels of modules to the points of use in the program or to a tag table, follow these steps:

1. In the device view, navigate to the module with the desired I/O channel.
2. Click and hold down the mouse button to drag the desired I/O address to the corresponding point of use of the block or to the tag table.

The address of the module is assigned to the point of use in the program or entered as a tag in the tag table.

Note

The tag for an input or output of a block can also be dragged to the input or output of a module in order to link the tag to the I/O channel of the module.

Overview of PLC tag tables (Page 4837)

Signal board (S7-1200)

Inserting a signal board in a CPU (S7-1200)

Introduction

Signal boards allows you to increase the number of the S7-1200 CPU's own inputs and outputs. Just like all other hardware components, you will find signal boards in the hardware catalog. However, you do not insert signal boards in the rack like other modules but directly in a slot of the CPU itself.

Note the following points when using a signal board:

- Each CPU can have only one signal board inserted in it.
- A signal board can only be inserted when the slot in the CPU is free.

There are various ways of inserting a signal board in a CPU:

- Double click on a signal board in the hardware catalog when there is a free slot in the CPU
- Drag from the hardware catalog to a free slot in the CPU
- Shortcut menu of a signal board in the hardware catalog for copying and pasting

Requirement

- The hardware catalog is open.
- The S7-1200 CPU has a free slot for the signal board.

Inserting a signal board in a CPU

To insert a signal board in a CPU, proceed as follows:

1. Go to the required signal board in the hardware catalog.
2. Select the signal board you want to use.
3. Drag the signal board to the free slot in the CPU.

You have now inserted a signal board in the slot of the CPU.

If you are in the network view, you can also drag a signal board to a device. If the CPU has a an empty slot for a signal board, the signal board is inserted automatically into this slot.

Configurations for Web server (S7-1200)

Information about the web server (S7-1200)

Introduction

The Web server allows you to monitor the CPU via the Internet or the intranet of your company. This permits evaluation and diagnostics over long distances.

Alarms and status information are visualized on HTML pages.

Web browser

You need a web browser to access the HTML pages of the CPU.

The information with which Web browsers and Web browser versions the Web server was tested is available in the corresponding manual (http://support.automation.siemens.com/WW/view/en/36932465).

Reading information via the Web server

The following information can be read from the CPU. The availability of the respective web pages depends on the CPU and its firmware version.

As of firmware version 4 the web pages are available in several languages.

Page/information	Description
Introduction	Entry page for the standard web pages
Start page with general CPU information	The start page provides an overview of general information on the CPU, the name of the CPU, the type of CPU and basic information on the current operating state.
Diagnostics	Display of the detailed information about the CPU including the serial number, article number and version numbers. Displays the content of the diagnostics buffer with the most recent entries first.
Module information	Display of the identification information whether the centrally inserted components of a station are OK, whether there are maintenance requirements or components cannot be reached, for example. As of firmware version 4 a firmware update is possible via this Web page.
Communication	Displays the communication connections during open communication (OUC); displays resources and address parameters.
Diagnostic buffer	Display of the diagnostic buffer content
Tags	Displays the status of operands of the user program to monitor and change the values.
File browser (as of firmware version 4)	Data logs in CSV format to transfer to the hard disk of the programming device. The data logs are created with data log instructions in the user program and filled with data. As of firmware version 4 you have access to files of the internal load memory and of the external load memory (Memory Card) via this web page, for example, to the content of the directories "DataLogs" and "Recipes".
Login	Login as a user or logoff.
User pages (if user-defined web pages have been configured and loaded)	The user web pages deliver a list of web pages with customer-specific web applications.

Web access to the CPU via PG/PC

Proceed as follows to access the Web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.
   Enter the IP address of the CPU in the "Address" field of the Web browser in the format http://ww.xx.yy.zz (example: http://192.168.3.141).
   The start page of the CPU is opened. From the start page, you can navigate to further information.

Standard web pages (S7-1200)

Requirements for web access (S7-1200)

The requirements for access to standard CPU web pages are explained in the following, as well as the effects of missing or existing configuration information.

Requirement

The web server must be started.

The web server only starts when it has been activated in the properties of the CPU in the "Web server" section.

Note the following:

The web pages are normally transmitted via an non-secure connection and are not secured against hacker attacks. If you want to transfer the web pages in encrypted form to the browser, use the URL https://, followed by the IP address of the CPU.

Logon

No logon is required to access the standard web pages read-only. A user must be logged on to execute certain actions like changing the operating mode of the CPU or for write access.

For S7-1200 CPUs up to FW version V3:

You must be logged on as "admin" for the actions listed above. The logon input boxes are on the top left of each standard web page.

If you log on as "admin", you must enter the user name and password there.

Name: admin.

Password: configured CPU password (for password-protected CPU).

For S7-1200 CPUs as of FW version 4:

You can freely select the names of users and the passwords (CPU parameter "Web server", area "User management").

You assign rights to the users, for example the right to query diagnostics or to update the firmware.

JavaScript and cookies

The standard web pages use JavaScript and cookies. You must enable both in your web browser.

If JavaScript is not enabled, the following limitations apply:

- Data from standard web pages is not automatically updated.
- You cannot log on as user.
- Fields cannot be sorted (module information)

If cookies are not enabled, you cannot log on.

See also

Access for HTTPS (Page 1054)

Settings for operation (S7-1200)

Settings for operation

To be able to use the web server of an S7-1200-CPU, you must select the CPU in the network view or the device view and make the following settings in the inspector window under "Properties > General > Web server":

- Enable the web server
- Restricting access to the CPU to HTTPS transmission protocol (encrypted transmission) Access via port 80 is then blocked. Communication is only possible via port 443.

- Enabling automatic update of web pages
  The update interval is set by default and cannot be changed. The CPU updates web pages with changing content ((for example, status information or diagnostics information) at regular intervals.
- Creating and managing users
  Users are exclusively entitled to options that are assigned to the access rights. Depending on the CPU and firmware used, you can assign different user rights. Rights that your CPU does not support cannot be activated. A user called "Everybody" with minimal access rights, that you can, however, extend, is set by default in the user list. A user who uses the Web server without entering a password has "Everybody" user rights.
  You have the possibility of configuring further users with different access rights. These users have to log on with the configured user name and password.

WARNING

Unauthorized access to the CPU by means of the Web server

Unauthorized access to the CPU or the changing of PLC variables to invalid values can result in interruptions of the processes controlled by the CPU and cause death, serious bodily harm or material damage!

Since the activation of the Web server allows authorized persons for example to change operating modes, to write-access CPU data or to update the firmware, we recommend that the following security measures be taken:

- If possible limit access to the HTTPS protocol.
- Create users with secure passwords. An example of a secure password is one which is only used for a single application, is more than 8 characters long, and consists of lower- and upper-case letters as well as symbols and numbers (?!+%$1234...). In addition, passwords based on common keyboard sequences or words from the dictionary should be avoided.
  Change the password at regular intervals.
- Do not extend the rights of the "Everybody" user.
- Check the PLC variables in the user program and limit the range of values to permissible ranges since users can set invalid values via the Web server.

Access for HTTPS (S7-1200)

Access via HTTPS

HTTPS is used for encrypting and authentication of communication between the browser and web server.

To transfer data between the browser and the CPU using the HTTPS protocol, enter the URL as https://ww.xx.yy.zz in the address line of your browser, whereby ww.xx.yy.zz stands for the IP address of the CPU.

You require a valid, installed certificate for error-free HTTPS access to the CPU.

If no certificate is installed a warning is displayed with a recommendation not to use this page. To view the page you must explicitly "Add exception".

You can receive a valid certificate (Certification Authority) "SIMATIC CONTROLLER" as a download from the "Intro" web page under "Download certificate". The help function for your respective web browser provides information on how to install a certificate.

Accessing data of the CPU memory (S7-1200)

You can access data in the internal or external CPU load memory by means of a standard web page.

- Use the web page "Data logs" for S7-1200 CPUs up to and including FW version 3. From this web page, you transfer the data logs from the CPU to a drive on your PC.
- Use the web page "File Browser" for S7-1200 CPUs as of FW version 4. From this web page, you transfer data from the folders "Data logs" or "Recipes", for example, to a drive on your PC.

Depending on the file type and the access permissions you have configured for the web server user, you can download, delete, rename or upload the files. The actual directories can only be created, deleted or renamed.

Example: Data logs

To open a data log, click on the link of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Special note: Data logs are saved in U.S. American CSV format. You can only open the file directly using the U.S. version of Microsoft Excel. If you are using another national version of Microsoft Excel, you must import the file, selecting "comma" in the import assistant as the delimiter.

Downloading a data log

To download a data log, click on the download icon of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Downloading and clearing or deleting a data log

For a CPU with FW version up to V3.0:

To download and delete the current entries of the data log, you must be logged on. To do this, click on the "Download and delete" icon of the required data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

For a CPU as of FW version V4.0:

To reset the data log, follow these steps:

1. Open the CSV file, for example with Excel.
2. Delete the rows between the headline and the row with the entry "//END", if this row exists.

3. Save the file to a drive on your PC.
4. On the web page "File Browser", delete the data log (which means the CSV file) and load the prepared CSV file to the CPU with the "Upload file" button of the "File Browser" web page.

Additional information is available in the S7-1500 CPU system manual.

Data logging - Overview (Page 4011)

Creating and loading user pages (S7-1200)

What you need to know about user pages (S7-1200)

Concept

The concept of user pages or of user-defined web pages allows you to access freely-designed web pages of the CPU with a web browser. The Web server of the CPU provides this function.

You are not dependent on special tools for the design and functionality of the user-defined web pages. You can adapt the pages in the layout with CSS, provide dynamic content with JavaScript or use any framework to produce web pages.

The totality of files processed by the Web server is also referred to as the "web application".

Web application and user program

Using HTML code in user-defined web pages (AWP commands), you can also transmit data via a web browser to the user program of the CPU for further processing and can display data from the operand area of the CPU in the web browser.

You can use script instructions (such as Javascript) to optimize your web pages, for example to dynamically change contents or validate user entries.

To synchronize between the user program and the Web server, but also to initialize, you must call the WWW (SFC 99) instruction in the user program.

- If no interaction is required between the web application and the user program, for example, if a web page only provides static information, only initialization in the user program is required.
- If a simple data exchange is necessary between PLC tags and tags in web applications, to display the contents of PLC tags or write a value in a PLC tag for example, the syntax for reading and writing tags has to be observed. In this case only an initialization is required in the user program, for example in the startup OB.
- If a further interaction is required between the web application and the user program, you must handle status and control information from the Web Control DB in addition to the synchronization between Web server and user program. This is the case, for example, when user entries are transmitted via the web browser to the Web server for evaluation by the CPU. Unlike simple data exchange, the user program directly influences the time at which the requested web page is relayed back to the web browser. In this case, you must be acquainted with the concept of manual fragments and the structure of the Web Control DB.

Initialization

User-defined web pages are "packaged" in data blocks for processing by the CPU. You must generate appropriate data blocks from the source data (HTML files, images, JavaScript files, etc.) during configuration to be able to download the web application into the CPU. The Web Control DB takes on a special role (default: DB 333). It contains status and control information as well as links to additional data blocks with coded web pages. Data blocks that contain coded web pages are termed "Fragment DBs".

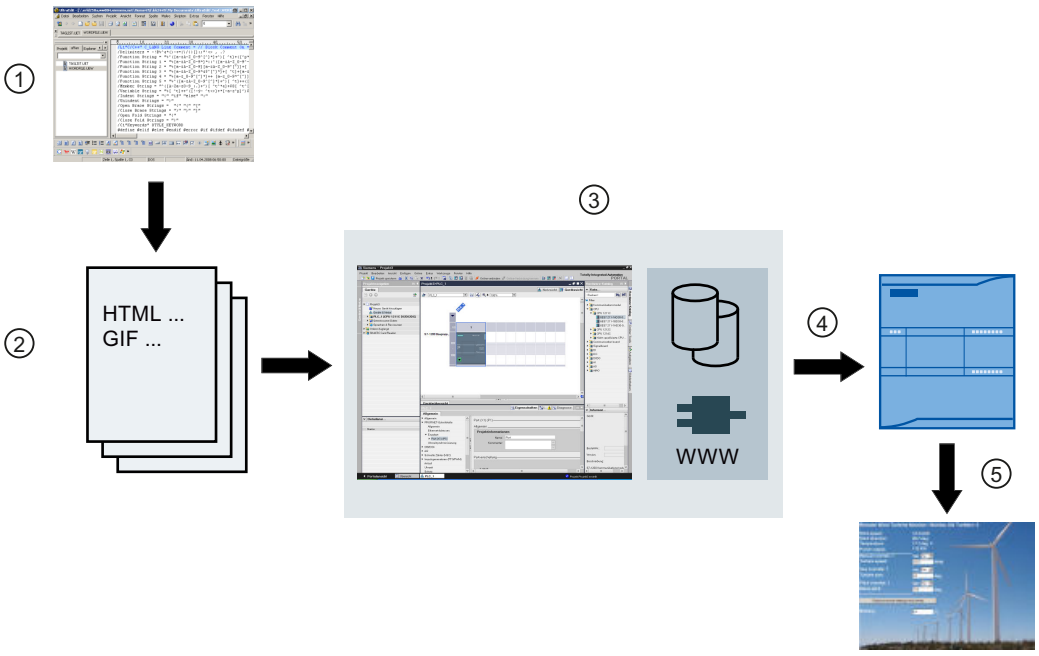
When the data block is downloaded into the CPU, the CPU does not "know" that user-defined web pages are coded inside it. The "WWW" (SFC 99) instruction, for example, in the Startup OB informs the CPU which DB is the Web Control DB. The user-defined web pages can be accessed via a web browser after this initialization.

Synchronization

If the user program is to exchange data with the user-defined web pages, the WWW (SFC 99) instruction must be used in the cyclic program section.

Examples of interaction between user program and web page:

- Check received data
- Assemble and send back data to the web browser making the request



In this case, the status information must be able to be evaluated and control information must be transmitted to the Web server, for example, to release a requested web page.

Procedural overview (S7-1200)

Basic information

This section provides a step-by-step explanation of the basic procedure used to create and download custom web pages and to use them in the operating phase.

The following graphic provides a simplified representation of the process used in creating and displaying custom web pages:

① Programming a web application (using suitable tools when required and AWP commands for dynamic pages when applicable).

② The web application is comprised of single source files, for example, *.html, *.gif, *.js, etc.

③ Using STEP 7:

- Generate the data blocks (Web Control DB and fragment DBs) from source files. The DBs contain meta information and the complete web application, including the images and the dynamic and static parts of the web application. The DBs are stored under "System blocks" in the project tree.
- Call the "WWW" instruction in the user program. This instruction initializes the web server of the CPU for a web application.
- If required, complete final programming for interaction between the web server and user program

④ Downloading the blocks to the CPU.

⑤ Call the web page in the browser. The web pages of the CPU are called by entering the IP address of the CPU.

Additional information

You can find additional information and examples relating to the S7-1200 web server on the Internet (http://support.automation.siemens.com/WW/view/en/36932465).

Creating web pages (S7-1200)

Web design tools from various companies can be used to create user-defined web pages. As a rule, the web pages should be programmed and designed compliant to the conventions of the W3C (World Wide Web Consortium). No check is made for compliance to W3C criteria in the web server of the CPU.

Rules

- The tool must be able to directly edit the HTML code so that the AWP command can be inserted into the HTML page.
  Only the AWP commands are parsed in the CPU and, for example, replaced by values from the user program/process image of the CPU.
- Files containing AWP commands must be coded in UTF-8. In the metadata of the HTML page, therefore, set the attribute charset to UTF-8 and save the file UTF-8 coded.
- Files containing AWP commands must not contain the following sequence:]]
- Files containing AWP commands must not contain the following sequence outside of the "Tag read ranges" (:=<Tag name>:): :=
  Tip: Replace the first character of a prohibited sequence with its character coding; for the colon, for example, :.

A small example for a custom web page should make clear the basic design.

Requirement

- The CPU must have a web server and the web server of the CPU must be activated.
- To be able to access PLC tags with write access as a user, you must be logged on as "admin".
- For the example below, PLC tags must be defined for those PLC tags that are to be shown on the web page. This is shown here for the first tab used, "Tank_below_max".

	Name	Data type	Address
1	Tank_below_max	Bool	%I0.0

Creating user-defined web pages

The following code for an example web page reads values from the process image and provides them in a table.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN" "http://www.w3.org/
TR/html4/strict.dtd">
<html>
  <head>
   <meta http-equiv="Content-Type" content="text/html;
charset=utf-8">
```

```
   <title>Mix</title>
  </head>
   <body>
    <h1>Mix</h1>
    <h2> Actual State </h2>
    <table border="1">
     <tr>
      <th>Variable</th>
      <th>State</th>
     </tr>
     <tr>
      <td>Tank below max</td>
      <td>:="Tank_below_max":</td>
     </tr>
     <tr>
      <td>Tank above min</td>
      <td>:="Tank_above_min":</td>
     </tr>
    </table>
   </body>
</html>
```

AWP commands for controlling Web pages (S7-1200)

Using AWP commands in Web pages (S7-1200)

With AWP (Automation Web Programming) commands, you declare the interface between your user pages (Web application, e.g. a simple HTML page) and the CPU data.

To develop user pages or Web applications, you need only observe the restrictions of the Web browser. In one of the programming languages of STEP 7, control with the user program in the CPU which CPU data is displayed at what time in the Web browser of the viewer.

Use AWP commands, which you comment within the HTML page, to declare data to be used for intentional interaction between the Web application and the user program.

You insert AWP commands as HTML comments with a special syntax into HTML pages. Using AWP commands, the following features can be implemented:

- Read PLC tags
- Write PLC tag
- Read special tags
- Write special tags
- Define enum types
- Assign tags to enum types
- Defining fragments
- Import fragments

Syntax of AWP commands

An AWP command begins with "<!-- AWP_" and ends with " -->". In JavaScript files, the commands should also be enclosed by JavaScript comments ("/*...*/").

Notation rules for PLC tag names within an AWP command

The AWP commands "AWP_In_Variable" and "AWP_Out_Variable" contain a name attribute and optionally a use attribute. A PLC tag name is assigned to these attributes, by means of which the PLC tags in the browser are written or read. The following rules apply to handling PLC tag names in HTML code:

- PLC tags must be enclosed in quotation marks (" ... ").
- PLC tags used in AWP commands must also be enclosed by single quotation marks ('" ... "') or with quotation marks masked by a backslash ("\" ... \"").
- If the PLC tag name contains the character \ (backslash) or * (star), this character must be designated with the escape sequence \\ as standard character of the PLC tag name. See below for examples.
- If the PLC tag name in the AWP command is also enclosed by single quotation marks and the single quotation mark (') occurs within the name, it must also be designed as normal character by the escape sequence \'.
- If an absolute address (input, output, bit memory) is used in AWP command, it is enclosed by single quotation marks.

PLC tag	PLC tag in HTML code
"Velocity"	<!-- AWP_In_Variable Name='"Velocity"' -->
	<!-- AWP_In_Variable Name="\"Velocity\"" -->
"abc\de"	<!-- AWP_In_Variable Name='"abc\\de"' -->
"abc'de"	<!-- AWP_In_Variable Name='"abc\'de"' -->
"abc'de"	<!-- AWP_In_Variable Name="abcde" Use'"abc\'de"' -->
"DB name".tag	<!-- AWP_In_Variable Name='"DB name".tag' -->
"DB name"."ta.g"	<!-- AWP_In_Variable Name='"DB name"."ta.g"' -->
-	<!-- AWP_Out_Variable Name=’flag1’ Use='M0.0' -->

See also

Reading tags (Page 1061)

Writing tags (Page 1064)

Special tags (Page 1065)

Reading tags (S7-1200)

User-defined web pages can read PLC tags.

The PLC tag must be specified by a PLC tag name.

These OUT variables (direction of output as viewed from the controller) are inserted at any location within the HTML text with the syntax described in the following.

Syntax

```
:=<varname>:
```

These references are replaced when the Web server is in operation by the current values of the PLC tag in each case.

<varname> can be a simple, global PLC tag but also a complete tag path to a structural element.

Notation rules for PLC tag names

- PLC tags in HTML code are enclosed by quotation marks ("), if they are defined in the tag table. In the case of data block tags, the name of the data block is enclosed by quotation marks. If special characters are used in the structure elements of the data block, for example the dot (.) or blank, this part must also be enclosed by quotation marks.
- Quotation marks are not used for absolute addresses of inputs, outputs or bit memories.

PLC tag	PLC tag in HTML code
"DB_name".var_name	:="DB_name".var_name:
"DB_name"."var.name"	:="DB_name"."var.name":
"memory"	:="memory":
-	:=I0.0:
	:=Q0.0:
	:=MW100:
	:=%MW100:
"My_Data_Block".flag1	<!-- AWP_Out_Variable Name='flag1' Use='"My_Data_Block".flag1' -->
	...
	:=flag1:

- If the PLC tag name contains the character : (colon) or \ (backslash), this character must be designated with the escape sequence \: or \\ as standard character of the PLC tag name.

PLC tag	PLC tag in HTML code
"abc:de"	:="abc\:de":
"abc\de"	:="abc\\de":

- Special characters "<, &, >"
  Display problems can occur if these characters are contained in the tag name (for example, "a<b").
  Avoid expressions such as :="a<b": in the HTML page.
  To prevent display problems from occurring, use e.g. an AWP command with a use expression according to the pattern depicted below. The use attribute defines the PLC tag with the problematic character, the name attribute defines the name without problematic character, as it is used in the HTML page.

PLC tag	PLC tag in HTML code
"a<b"	<!-- AWP_Out_Variable Name='simplename' Use='"a<b"' --> ... :=simplename:

Reading tags of the type String and Character

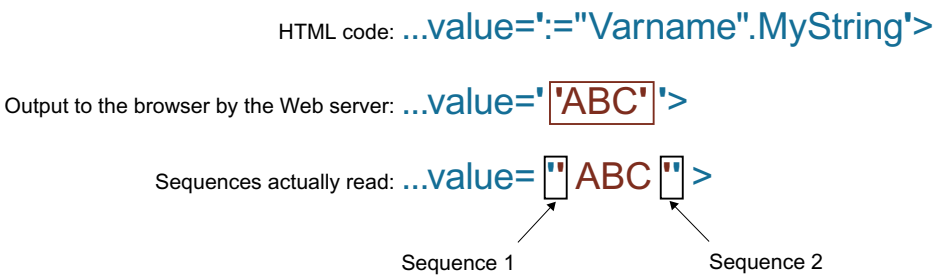
Below, these types of quotation marks are used in the explanation: single quotes ('), double quotes (").

As of firmware V1.6, with the "Read PLC tags" function, an S7-1500 CPU outputs tags of the type String or Character enclosed in single quotes to the browser.
Example:

- String tag "Varname".MyString with the content ABC
- You read the tag in HTML using the function :="Varname".MyString:
- The Web server outputs the character string 'ABC' to the browser

Using String or Character tags in expressions

On your HTML page, you use an expression in which the character string for reading a tag is enclosed in quotes, for example in forms.



Possible HTML code used:
```
<input type="text" name="appfield" value="myvalue">
```

If you read the displayed value for the "value" attribute from a PLC tag in this expression, the HTML code appears as follows:
```
<input type="text" name="appfield" value=":="Varname".MyString:">
```

By reading the PLC tag, the Web server outputs the value 'ABC'. In HTML, the code is then represented as follows:
```
<input type="text" name="appfield" value=" 'ABC' ">
```

If you have used single quotes instead of double quotes in your HTML code to enclose the attributes, the Web server passes on the content of the tags enclosed in two single quotes to the browser. As a result of this, the browser does not output the content of the String or Character tag, since two consecutive single quotes each form a closed sequence. The values to be read are located between these sequences and are not output by the browser.

In this context, note in particular that the character string with double quotes is not identical to two single quotes even if they appear to be identical, as shown in the following figure.

See also

Using AWP commands in Web pages (Page 1060)

Writing tags (S7-1200)

Custom web pages can write data into the CPU.

This requires an AWP command that identifies the PLC tag to be written.

The PLC tag must also be specified by a PLC tag name.

The IN tags (direction of input as viewed from the controller) are placed on the browser page. This can be done, for example, in a form.

The tags are either set in the HTTP header (by cookie or POST method) or in the URL (GET method) by the browser and are then written by the Web server into the respective PLC tag.

Syntax

To allow the IN tags to be written to the CPU, the tags must first be defined by an explicit AWP instruction:

```
<!-- AWP_In_Variable Name='<PLC_Varname1>' Name='<PLC_Varname2>'
Name='<PLC_Varname3>' -->
```

Several tags can be defined in an instruction - such as that shown above.

The specific PLC tag name is hereby written in double quotation marks; for example <PLC_Varname1> = "myVar".

In cases where the name of the tag that you use for the web application is not identical to the name of the PLC tag, the "Use" parameter can be used to assign to a PLC tag:

```
<!-- AWP_In_Variable Name='<Webapp_Varname>' Use='<PLC_Varname>'
```

Example

The "AWP_In_Variable" AWP command is indispensable when handling forms.

```
<form method='post' action='/awp/appl/x.html'>
 <p>
  <input name='"var1"' type='text'>
  <input value='set' name='Button1' type='submit'>
 </p>
</form>
```

In the form defined above, the HTTP request method "post" is used to transfer the tag "var1" to the Web server. The user places the "var1" tag in the form field. The tag 'Button1' has the value 'set', but is not required for the CPU. To allow the "var1" tag to be written to the CPU, the following instruction must be included in the same fragment:

```
<!-- AWP_In_Variable Name='"var1"' -->
```

Since PLC tags are enclosed in double quotation marks ("), the name in the AWP command must be enclosed in single quotation marks (') or in masked quotation marks (\"). To avoid the numerous escape sequences, we recommend the use of single quotation marks.

```
<!-- AWP_In_Variable Name='"Info".par1' -->
<!-- AWP_In_Variable Name="\"Info".par1\"" -->
```

Conditions for write access during operation

The following requirement has to be met in order for a user to be able to write to PLC tags from a user-defined web page:

The user must have rights to change tags. The Web server ignores the commands if the user has no change rights.

This rules applies to all writing access to web pages on a CPU.

Requirements for web access (Page 1052)

Using AWP commands in Web pages (Page 1060)

Special tags (S7-1200)

Special tags are mainly HTTP tags set in the definition of the World Wide Web Consortium (W3C) . Special tags are also used for cookies and server tags.

The AWP command to read and write special tags differ only in that they have additional parameters than the AWP command used to read and write normal tags.

Reading a special tag

The Web server can read PLC tags and transfer these to special tags in the HTTP Response Header. You can, for example, read a URL for a diversion to another web page and transfer to the special tag HEADER:Location using the special tag HEADER:Location.

The following special tags can be read:

Name	Description
COOKIE_VALUE:name	Value of cookie with name: "name"
COOKIE_EXPIRES:name	Execution time of cookie with name: "name" in seconds (must be set beforehand).
HEADER:Status	HTTP status code (if no other value has been set, status code 302 is returned).
HEADER:Location	Path for forwarding to another page. Status code 302 must be set.

Name	Description
HEADER:Retry-After	Anticipated time in which the service is not available. Status code 503 must be set.
HEADER: …	All other header tags can also be forwarded in this way.

Use the AWP command "AWP_Out_Variable" to specify which PLC tags are to be transferred in the HTTP header to the web browser.

Basic structure:

```
<!-- AWP_Out_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description

- Name: Type and name of special tag
- Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, parameter "Use" can be used to assign to a PLC tag.

Example:

```
<!-- AWP_Out_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

Writing a special tag

In principle, all HTTP tags written in the HTTP header by the web browser can be evaluated by the user program of the CPU. Examples of tag types:

Name	Description
HEADER:Accept-Language	Accepted or preferred language
HEADER:Authorization	Proof of authorization for a requested resource
HEADER:Host	Host and port of the requested resource
HEADER:User-Agent	Information on the browser
HEADER: …	All other header tags can also be forwarded in this way
SERVER:current_user_id	Indicates whether a user is logged on (current_user_id=0: no user logged on)
SERVER:current_user_name	User name of the user logged on
SERVER:GET	Request method is GET
SERVER:POST	Request method is POST
COOKIE_VALUE:name	Value of cookie with name: "name"

The AWP command "AWP_In_Variable" is used to define which special tags are to be evaluated in the user program of the CPU.

Basic structure:

```
<!-- AWP_In_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description:

Name: Type and name of special tag

Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, the parameter Use can be used to assign to a PLC tag.

Examples:

```
<!-- AWP_In_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use . The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='COOKIE_VALUE:siemens' Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use. The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='"COOKIE_VALUE:siemens"' -->
```

The HTTP-header variable is written in the same-name PLC variable.

Using AWP commands in Web pages (Page 1060)

Enumeration types (S7-1200)

Enumeration types (enums)

Numerical values from the PLC program can be converted into text and vice versa using enums. The numerical values can also be assigned for several languages.

Creating enums

Enter an AWP command using the following syntax at the start of the HTML file:

```
<!-- AWP_Enum_Def Name="<Name of the enum type>"
Values='0:"<Text_1>", 1:"<Text_2>", ... , x:"<Text_x>"' -->
```

For example, for German values to be saved as an HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"an", 1:"aus", 2:"Störung"' -->
```

For example, for English values, to be saved as an HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -->
```

Assigning enums

Tags are assigned from the user program to the individual enum texts using a special AWP command:

```
<!-- AWP_Enum_Ref Name="<VarName>" Enum="<EnumTypeName>" -->
```

<VarName> is thereby the symbolic name from the user program and <EnumTypeName> is the previously set name of the enum type.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned by the appropriate AWP command of the enum type name.

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage because this import can result in the enum assignment lying in a different fragment than the enum usage.

Example

Enum type "state" is defined with values "0" and "1". "0" means "off", "1" means "on":

```
<!-- AWP_Enum_Def Name="state" Values='0:"off", 1:"on"' -->
```

The following code is contained in the HTML code of the web page to be output:

```
<!-- AWP_Enum_Ref Name="operating state" Enum="state" -->
:=operating state:
```

Depending on the value of the "operating state" tag, the ´result displayed is no longer "0" or "1", but "off" or "on".

Simplified use of enumeration types (S7-1200)

At S7-1200 CPUs as of firmware version 4 it is possible to use enumerations directly in AWP commands to read and write PLC variables.

You create enums as described in the previous section, and you can then utilize the values with user program read and write commands.

Creating enums

```
<!-- AWP_Enum_Def Name="<Name des Enum Typs>" Values='0:"<Text_1>",
1:"<Text_2>", ... , x:"<Text_x>"' -->
```

Utilizing enums in the user program read and write commands

```
<!-- AWP_In_Variable Name='<Varname>' Enum="<EnumType>" -->
<!-- AWP_Out_Variable Name='<Varname>' Enum="<EnumType>" -->
```

Example of reading PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is
full", 2:"Tank is empty"' --><!-- AWP_Out_Variable Name='"Alarm"'
Enum="AlarmEnum" -->...<p>The current value of "Alarm"
is :="Alarm":</p>
```

If the value of "Alarm" in the CPU is "2", the following text will be displayed on the HTML page:

'The current value of "Alarm" is Tank is empty' because the enum definition assigns the string "Tank is empty" to the numerical value 2.

Example of writing PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is
full", 2:"Tank is empty"' --><!-- AWP_In_Variable Name='"Alarm"'
Enum='AlarmEnum' -->...
<form method="POST">
<p><input type="hidden" name='"Alarm"' value="Tank is full" /></p>
<p><input type="submit" value='Set Tank is full' /></p>
</form>
```

Because the enum definition assigns the string "Tank is full" to the numerical value "1", the value "1" is written to the PLC tag "Alarm".

Definition of fragments (S7-1200)

Fragments

Fragments are "logical sections" of a web page to be processed by the CPU individually.

Fragments are usually complete pages but can also be individual elements such as files (for example, images) or complete documents.

Defining fragments

```
<!-- AWP_Start_Fragment Name="<Name>" [Type="<Type>"] [ID="<Id>"]
[Mode=<Mode>]-->
```

The start of a fragment is specified by this command. A fragment runs to the start of the next fragment or to the end of the file.

- <Name> Indicates the name of the fragment.
  The name must start with a letter [a-zA-Z] or an underscore (_). Letters, underscores or numbers [0-9] can follow after this first character.
- <Type> Indicates the type of the fragment.
  - "manual" The user program is informed of the request for a fragment; the web page to be returned can be changed by the user program.
  - "automatic" The page is automatically processed (default).
- <id> A numeric ID can be stipulated for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual) , the fragment can be addressed in the user program of the CPU by this ID.

  Note

  Keep the ID low because the highest ID influences the size of the Web Control DB.

- <Mode> Fragments support the visible and hidden modes.
  - "visible" The fragment is a part of the web page. This mode is preset and can also be omitted.
  - "hidden" The fragment is not part of the web page. However, the fragment will be saved in the Web DB and is available to the user program for inserting in a requested web page. You use an exchange of the fragment ID (Web-Control-DB.fragment_index tag) to insert a "hidden" fragment in the requested web page.

The input document is completely divided into fragments by the "AWP_Start_Fragment" command. "AWP_End_Fragment" is therefore unnecessary.

Without a start fragment command, a file is mapped as a fragment; the fragment name is derived from the file name. If a file is divided into several fragments (by "AWP_Start_Fragment"), the file must begin with the "AWP_Start_Fragment" command.

Importing fragments (S7-1200)

You can declare a fragment in an HTML page and import this fragment into other web pages.

Example

A company logo is to be displayed on all web pages of a web application.

There is only one instance of the HTML code for the fragment that displays the company logo. You can import the fragment as often and into as many HTML files as required.

Syntax

```
<!-- AWP_Import_Fragment Name = "<name>"-->
```

- <name> is the name of the fragment to be imported.

Example

HTML code within a web page that declares a fragment:

```
<!-- AWP_Start_Fragment Name = "My_Company_Logo" -->
<p><img src = "compay_logo.jpg"></p>
```

Example

HTML code within another web page that imports the declared fragment:

```
<!-- AWP_Import_Fragment Name = "My_Company_Logo" -->
```

Creating and loading a data block (S7-1200)

Requirement

- All source files required for the web application (*.html, *.js, *.png, ...) have been created.
- The source files are located in one folder, but only those source files that are required for the web application. No other files may be located in this folder.

Note

Length of file names and tag names

If you have a comprehensive web application with many files and directories, the generation of the web data blocks may possibly fail. If this happens, the generation is aborted with the message "Text list overflow...". The cause is system-internal size limitations for management information saved in the web data block.

Remedy: Use short file names and short tag names.

Procedure

To create data blocks from the source files for user-defined web pages in STEP 7, proceed as follows:

1. Select the CPU, for example, in the device configuration.
2. Select the properties for user-defined web pages in the inspector window under "Properties > General > Web server".
3. As "HTML source", select the folder that contains the source files for the web application.
4. Enter the HTMP page to be opened on starting the web application as the start HTML page.
5. Enter a name for the application if required.
6. You can supplement a range of file name extensions as "Files with dynamic content" if necessary. Only enter those file name extensions that also contain AWP commands.
7. The number for the Web Control DB and for the fragment DB start number can be kept as long as they are not already being used by your user program.
8. Click on the "Generate" button to create DBs from the source files.
   The generated data blocks are saved in the project navigation in the "System block" folder (in the "Web server" subfolder).
9. In the CPU, select the network view to be loaded and then select the "Download to device" command in the "Online" menu to download the blocks. Compilation of the blocks is implicitly initiated before downloading.
   If errors are reported during this process, you must correct these errors before you can download the configuration.

Creating and loading a data block (S7-1200)

Requirement

- All source files required for the web application (*.html, *.js, *.png, ...) have been created.
- The source files are located in one folder, but only those source files that are required for the web application. No other files may be located in this folder.

Note

Length of file names and tag names

If you have a comprehensive web application with many files and directories, the generation of the web data blocks may possibly fail. If this happens, the generation is aborted with the message "Text list overflow...". The cause is system-internal size limitations for management information saved in the web data block.

Remedy: Use short file names and short tag names.

Procedure

To create data blocks from the source files for user-defined web pages in STEP 7, proceed as follows:

1. Select the CPU, for example, in the device configuration.
2. Select the properties for user-defined web pages in the inspector window under "Properties > General > Web server".
3. As "HTML source", select the folder that contains the source files for the web application.
4. Enter the HTMP page to be opened on starting the web application as the start HTML page.
5. Enter a name for the application if required.
6. You can supplement a range of file name extensions as "Files with dynamic content" if necessary. Only enter those file name extensions that also contain AWP commands.
7. The number for the Web Control DB and for the fragment DB start number can be kept as long as they are not already being used by your user program.
8. Click on the "Generate" button to create DBs from the source files.
   The generated data blocks are saved in the project navigation in the "System block" folder (in the "Web server" subfolder).
9. In the CPU, select the network view to be loaded and then select the "Download to device" command in the "Online" menu to download the blocks. Compilation of the blocks is implicitly initiated before downloading.
   If errors are reported during this process, you must correct these errors before you can download the configuration.

Structure of the PLC program (S7-1200)

Your user program must call the " WWW" instruction to even allow the web application, for example, the user-defined web pages, to be available to the CPU on the standard web pages and to allow them to be called up there.

The Web Control DB you have created from the source files is the input parameter (CTRL_DB) for the "WWW" instruction. The Web Control DB references the content of the user-defined web pages coded in the fragment DB and then receives status and control information.

Calling the "WWW" instruction in the startup program

If you do not want the user program to influence requested web pages, it is sufficient to only call the "WWW" instruction once in a startup OB. This instruction initializes communication between the web server and the CPU.

Calling the "WWW" instruction in the cyclic program

The "WWW" instruction can also be called in an OB processed in cycles (for example, OB 1). This has the advantage of being able to respond to web server requests from within the user program. Manual fragments must be used for this.

In this case, you must evaluate information from the Web Control DB in order to identify the requested web page or the requested fragment. On the other hand, you must set a bit in the user program in order to explicitly release the web page to be returned by the web server after processing the web page request.

The structure of the Web Control DB is described in the following section.

Web Control DB (S7-1200)

The Web Control DB (DB 333 by default) is created by STEP 7 and contains information on the structure of user pages, the status of communication and any errors that occur.

Additional fragment DBs are also created as well as the Web Control DB. These fragment DBs (there may also only be one fragment DB) are referenced in the Web Control DB. The fragment DBs contain the web pages and media data coded in fragments, for example, images. The content of the fragment DB cannot be changed by the user program. It is created automatically and is only for data management.

The status and control tags of the Web Control DB are accessed via symbols.

The following lists the tags of the Web Control DB required for status evaluation and to control interaction.

The Web Control DB provides two types of information:

- Global status information: Not bound to a concrete web page request.
- Request status and control information: Information about queued requests.

Global status information

"WEB-Control_DB".commandstate.init	Activates and initializes the web application.
"WEB-Control_DB".commandstate.deactivate	Deactivates the web application.
"WEB-Control_DB".commandstate.inititializing	The web application is initialized (read Web Control DB, etc.).
"WEB-Control_DB".commandstate.error	Web application could not be initialized. The reason is coded in "WEB-Control_DB".commandstate.last_error .
"WEB-Control_DB".commandstate.deactivating	The web application is closed.

"WEB-Control_DB".commandstate.initialized	The web application has been initialized and is ready.
"WEB-Control_DB".commandstate.last_error	Refer to the next table for a value table of possible errors.

Last_error	Description
1	Fragment DB is inconsistent (does not match the Web Control DB).
2	A web application already exists with this name.
3	Memory problem initializing in the web server.
4	Inconsistent data in the Web Control DB.
5	A fragment DB is not available (not loaded).
6	No AWP ID for a fragment DB.
7	The enum fragment is not available (contains the texts and information on the enum types).
8	An action requested via the command flag in the Web Control DB is prohibited in the current state.
9	Web application is not initialized (if there is no reinitializing after disabling).
10	Web server is disabled.
...	Last_error is reset once the web application has been successfully initialized.

Request status information

Request status information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].idle	Nothing need be done.
"WEB-Control_DB".requesttab[x].waiting	The user program must react to a request from a manual fragment and explicitly initiate further processing in the web browser.
"WEB-Control_DB".requesttab[x].sending	The web server is occupied with processing the request/fragment.
"WEB-Control_DB".requesttab[x].aborting	The TCP connection is closed by the web server.

Request control information

Request control information is bound to one of four possible requests, x = [1 … 4].

"WEB-Control_DB".requesttab[x].continue	Releases the fragment being processed for transmission. Processing of the next fragment is initiated.
"WEB-Control_DB".requesttab[x].repeat	Releases the fragment being processed for transmission. The fragment is then processed again.

"WEB-Control_DB".requesttab[x].abort	Closes the TCP connection.
"WEB-Control_DB".requesttab[x].finish	Releases the fragment being processed for transmission. Stops further processing of requests (terminates the request).

Example:

The tag for the DB is: "WEB-Control_DB". Whether errors have occurred during initialization of the web application can be determined by requesting bit "WEB-Control_DB".commandstate.error in the user program.

If an error has occurred you can analyze it using the "WEB-Control_DB".commandstate.last_error value.

Interaction with the user program (S7-1200)

With the help of manual fragments, you can make sure that the user program reacts synchronously to browser entries so that the returned website can be prepared by the user program.

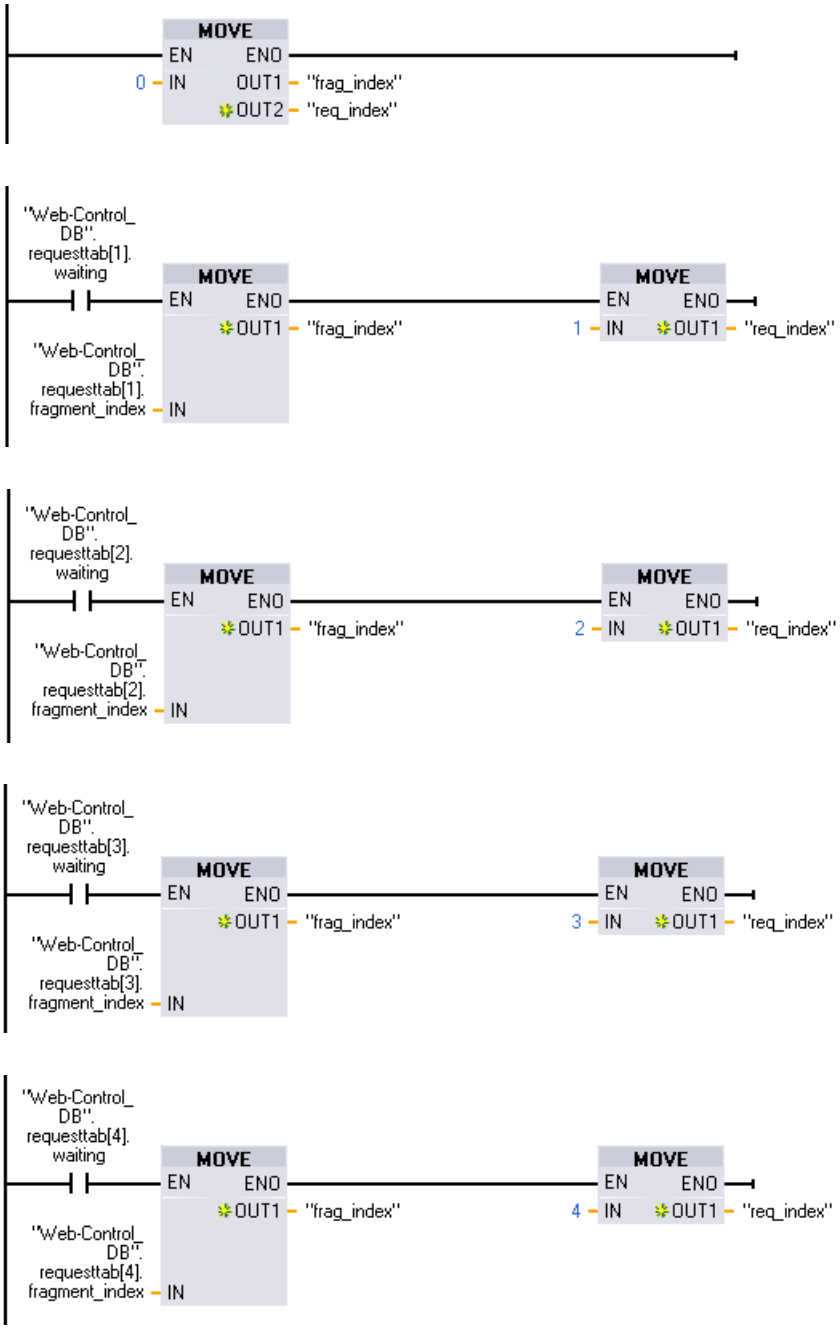
Fragment type

To react to the received data in the user program the "manual" fragment type must be used for the fragment writing the data (for "manual pages"):

```
<!-- AWP_Start_Fragment Name="testfrag" ID="1" Type="manual" -->
```

The values are always transferred to the Web server of the CPU for automatic and manual pages in the same way:

Example:



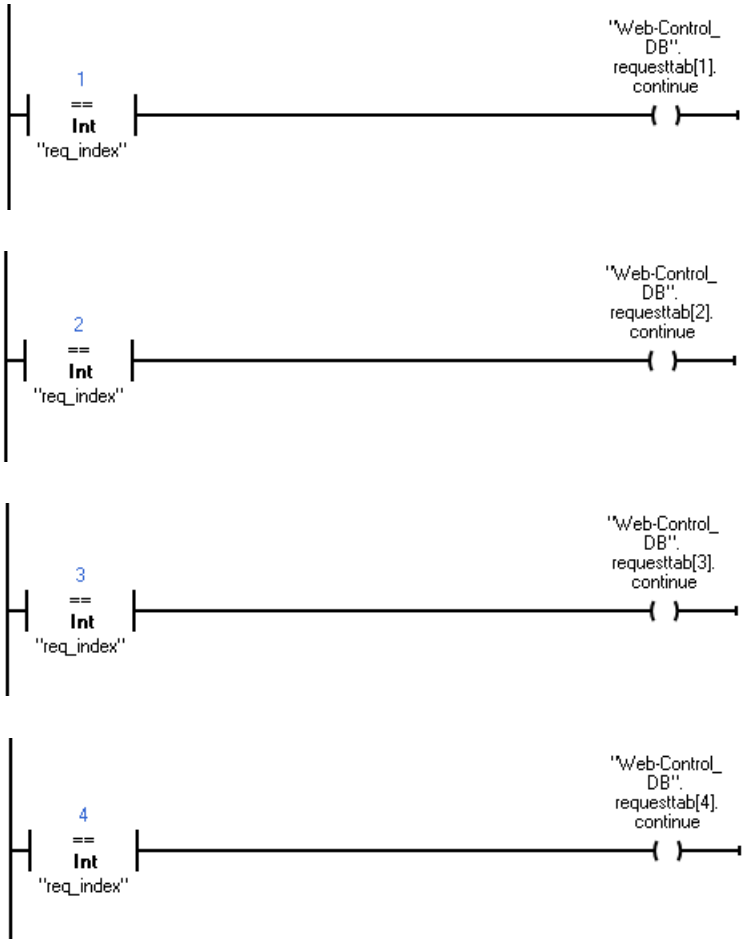
```
<form method="POST" action="">
 <p>
  <input type="submit" value="Set new value">
  <input type="text" name='"Velocity"' size="20">
 </p>
</form>
```

User program for manual fragments

When using manual pages, the "WWW" instruction must be called in cycles in the user program of the CPU.

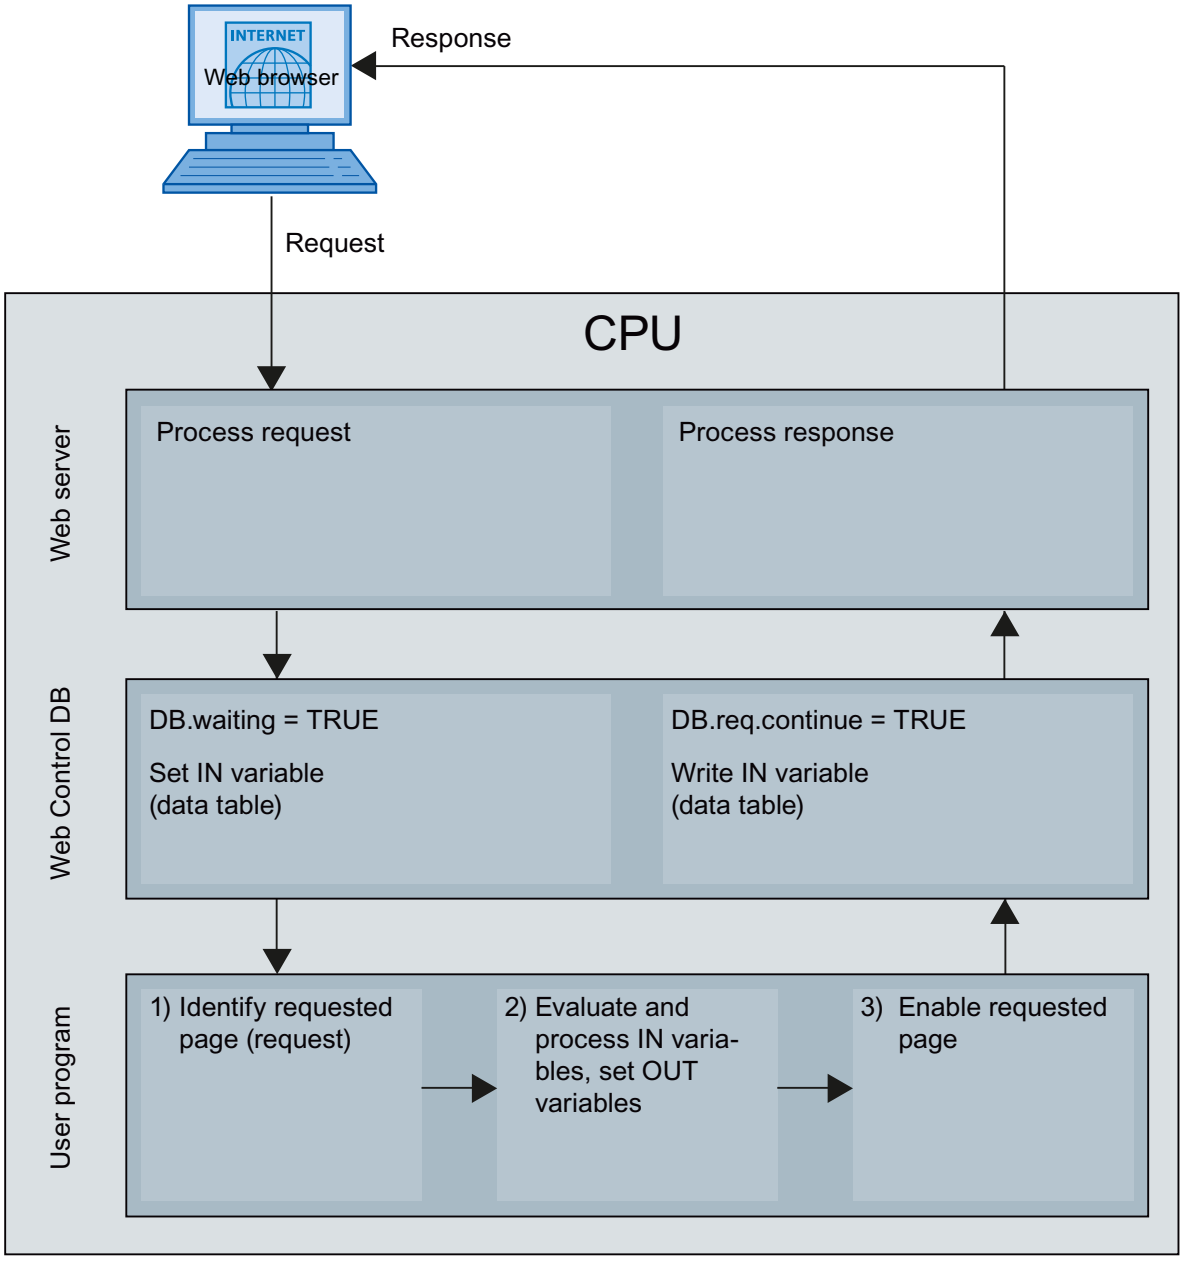
To react to values entered in the browser, the request - which is made by the manual page to the Web server - must first be evaluated in the user program. The web-control-DB (for example, DB 333) must investigate pending requests to do this. The array that manages four requests is contained in the "requesttab" section of the Web Control DB. Each element of the array contains information about the respective request in a structure.

A simple programming example shows how queued requests are checked based on the tags of the Web Control DB.



In cases where a request has been made, this program section writes the fragment ID in the #frag_index tag and the request no. (value range 1-4) in the #req_index tag.

Using the information from this, the information transferred in the request can now be processed separately for each fragment ID in the program (for example, plausibility check).



Once processing of the request has been completed by the program, the request must be answered and the appropriate entry is once more reset under"requesttab" of the Web Control DB (for example, DB 333).

A simple programming example for replying to requests:

Principle sequence of a browser request with interaction from the user program

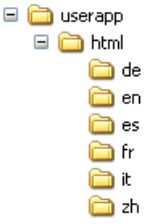
The following figure shows the simplified, principle sequence of the web browser request on the effects of Web Control DB content and the actions required from the user program until the processed web page is returned (response).

Displaying custom web pages in the browser (S7-1200)

Display web pages in browser

Web pages are called from the standard web pages of the web browser.

In addition to the other links in the navigation bar, the standard web pages also have a link to "user pages".



Click on the "user pages" link to open the web browser you have configured as the default HTML page.

Creating custom web pages in several languages (S7-1200)

You can make each of your custom web pages available in various languages.

Requirements

The language-dependent HTML; pages must be stored in a folder structure containing folders with the respective language abbreviations:

Specified language abbreviations

Language abbreviations "de", "en", "fr", "es", "it" and "zh" are fixed. Additional language folders or other designated language folders are not supported.

Additional folders within the same folder hierarchy for other files can be created as required; for example, an "img" folder for images and a "script" folder for JavaScript files.

Selecting an entry page (S7-1200)

Defining the user page as the start page

In addition to the default intro page, you can also define the start page of your user pages as the start page of the Web server.

Follow these steps to define the user pages in STEP 7 as the start page of the Web server:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. Select the entry "AWP1" in the area "Entry page" under "Select entry page".

If you now enter the IP address of the CPU in the browser, a connection to your user pages is automatically established.

If you want to access the Web pages of your CPU again, link the Web pages from your user pages, e.g. via the URL "http://a.b.c.d./Portal/Portal.mwsl?PriNav=Start" or "https://a.b.c.d/

Portal/Portal.mwsl?PriNav=Start". In this case, the information "a.b.c.d" represents, as an example, the IP address of the configured CPU.

Example of the link in HTML:

```
<a href="/Portal/Portal.mwsl?PriNav=Start">SIMATIC Web pages</a>
```

Note

If you define your user page as start page of the Web server, all direct access to the Web pages of the CPU is blocked. This applies also to the bookmarks you saved for the Web pages of the CPU as well as the page for reading out the service data.

Reading out service data

If you define your user page as the start page of the Web server, all direct access to the Web pages for reading out the service data is also blocked.
If you want to continue to read out service data via the Web server in a service situation, here is how you can link the service data page directly to your user page.
Just as for the web pages of the CPU, link the service data page e.g. via the URL "http://a.b.c.d/save_service_data" or "https://a.b.c.d/save_service_data"; the "a.b.c.d" here is an example of the IP address of the configured CPU.

Example of the link in HTML:

```
<a href="/save_service_data">Service data</a>
```

Language switching for custom web pages (S7-1200)

Requirements

The HTML pages are contained in the predefined language folders, for example, HTML pages with German text are in the "de" folder, HTML pages with English text are in the "en" folder.

Language switching concept

Language switching is based on a predefined cookie named "siemens_automation_language". If the cookie is set to value "de", at the next web page request or web page update, the web server switches to the web page from the "de" folder.

Similarly, the web server switches to the web page from the "en" folder when the cookie is set to "en".

Example of language switching (S7-1200)

The example is structured as follows:

- The language-dependent HTML files with the same name, for example, "langswitch.html" are located in both language folders "de" and "en". The text to be displayed within the two files are German or English, corresponding to the name of the folder.
- There is an additional "script" folder in the folder structure containing the JavaScript file "lang.js". Functions required for language switching are stored in this file .

Structure of the "langswitch.html" file ("de" folder)

Meta data "content language", charset and path to JavaScript file are set in the file header.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="de">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Switch language to German page</title>
<script type="text/javascript" src="script/lang.js" ></script>
<head>
```

Language selection is implemented in the body of the file by the "select" HTML element. The select element initiates a list box and contains the "de" option, labeled as "German" and "en", labeled as "English"; "de" is the default.

The "DoLocalLanguageChange(this)" function is called using the "onchange" event handler. The "this" parameter transmits the select object with the selected option to this function. "onchange" calls the function each time the option is changed.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
         <!-- change language immediately on change of the selection
-->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" selected >Deutsch</option>
                <option value="en" >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of the "langswitch.html" file ("en" folder)

The header of the HTML file with English text is structured similarly to the HTML file with German text.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="en">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Language switching english page</title>
<script type="text/javascript" src="script/lang.js" ></script>
```

Language selection is also implemented in the body of the file by the "select" HTML element. In contrast to the German HTML file, the English option is already selected as a default and the test or the labels are in English.

```
<!-- Language Selection -->
<table>
    <tr>
        <td align="right" valign="top" nowrap>
```

```
         <!-- change language immediately on change of the selection
-->
          <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
                <option value="de" >German</option>
                <option value="en" selected >English</option>
            </select>
        </td>
     </tr>
</table>
<!-- Language Selection End-->
```

Structure of "lang.js" file (in the "script" folder)

The " DoLocalLanguageChange" function is defined in the Java script file and calls the "SetLangCookie" function with the language selection value. SetLangCookie combines the cookie name and cookie value and then sets the cookie by means of the corresponding document.cookie property. The web page must then be reloaded (top.window.location.reload) to allow the web server to react to the setting of the cookie by displaying the required language.

```
function DoLocalLanguageChange(oSelect) {
        SetLangCookie(oSelect.value);
        top.window.location.reload();
    }

 function SetLangCookie(value) {
        var strval = "siemens_automation_language=";
            // this is the cookie by which the web server
            // detects the desired language
            // this name is required by the web server
        strval = strval + value;
        strval = strval + "; path=/ ;";
            // set path to the application, since otherwise
            // path would be set to the requesting page
            // would not get the cookie.
            // The path for user defined applications follows this
sample:
            // path=/awp/<application name>/<pagename>
            // example: path=/awp/myapp/myappstartpage.htm
            //(where myapp is the name of the web application
            // entered in the web server properties of the cpu)
            /*
            use expiration if this cookie should live longer
            than the current browser session
            var now      = new Date();
            var endttime = new Date(now.getTime() + expiration);
            strval = strval + "; expires=" + endttime.toGMTString()
+ ";";
            */
        document.cookie = strval;
    }
```

Additional examples (S7-1200)

Filling bottles with different drinks

This example describes a bottling plant (http://support.automation.siemens.com/WW/view/en/94681612) that can be monitored and controlled via a user-defined Web page.

It is possible to decide the type of drinks to be bottled using a recipe.

For the control and visualization of the plant, no panel (HMI) is necessary.

A Web browser serves to display the Web page.

The Web page is regularly supplied with current process values.

This is done with an invisible inline frame (iframe) that is re-sent regularly by the Web server. Current process values reach the browser with the inline frame. Using JavaScript, the process values are read from the inline frame and inserted in the main page.

In addition to this, users can call functions on the CPU via the Web page, for example starting or stopping bottling or importing or exporting recipes (refer to the link Bottling plant application (http://support.automation.siemens.com/WW/view/en/94681612)).

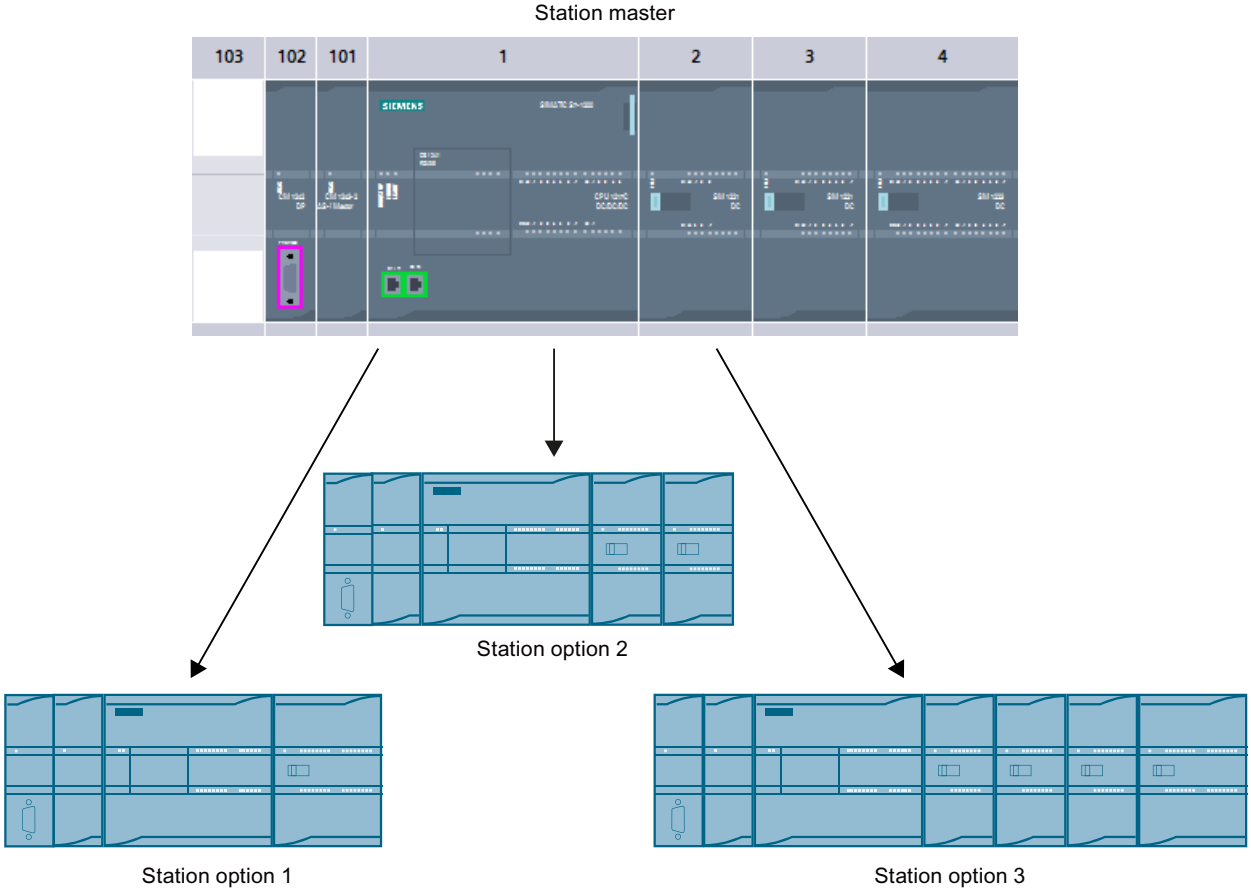
Filling and emptying a tank

This example describes a tank for liquids (http://support.automation.siemens.com/WW/view/en/58862931) that can be monitored and controlled via a user-defined Web page. Using buttons, the user controls the inflow into the tank and the outflow from the tank.

The current fill level is displayed along with the last ten fill levels with time information

The pages "Overview" and "Data" read in the current process values at fixed intervals whereby the Web server sends the pages completely new to the browser.

The "DataOpti" page, on the other hand, uses an inline frame simply to receive the current fill levels of the tank from the Web server (see Tank simulation application (http://support.automation.siemens.com/WW/view/en/58862931)).



Configuration control (option handling) for devices (S7-1200)

Important information regarding configuration control (option handling) (S7-1200)

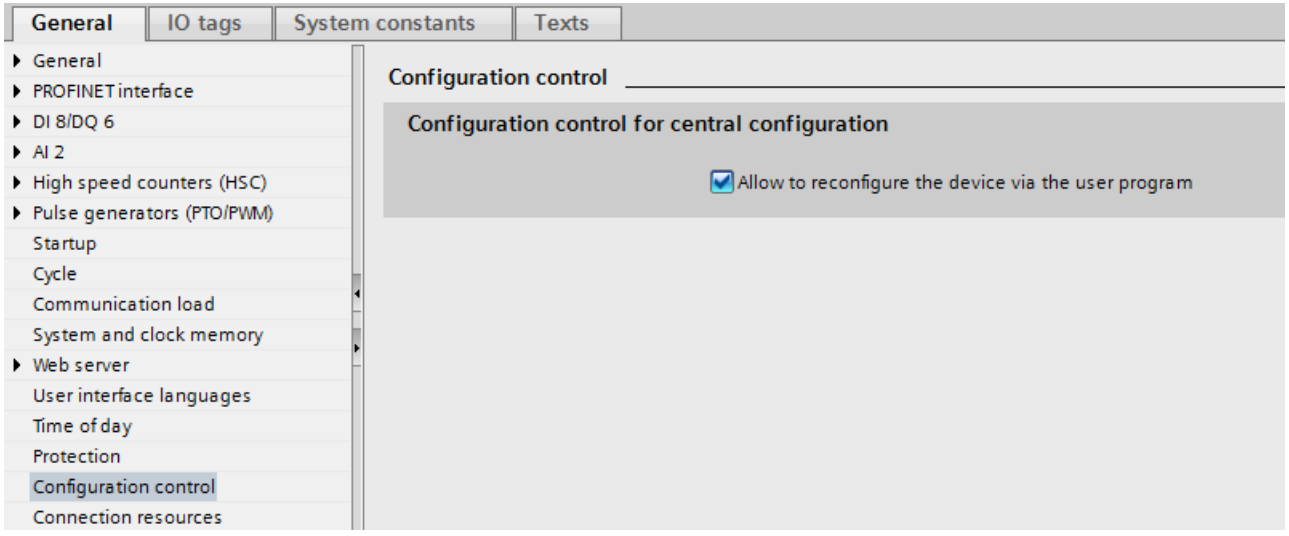
Operating principle

With S7-1200 Firmware Version 4.1 or higher, the configuration control enables you to configure the structure of a control system and to work with variants (options) that differ from this configuration.

- All modules that are needed in a set of similar plant units or machines are configured in a master project with a maximum configuration (station master).
- Provision is made in the user program of the master project for various station options for various plant units or machines as well as the selection of a station option. A station option uses, for example, only some of the configured modules and these modules are inserted in varying order.
- An operator selects a station option for a specific plant on-site. The operator does not have to modify the project and thus also does not have to download a modified configuration for this.

A control data record you have programmed in the startup program notifies the CPU as to which modules are missing or located in different slots as compared to the preset configuration. The configuration control has no effect on the parameter assignment of the modules.

Configuration control gives you the flexibility to vary the central installation as long as the real configuration can be derived from a preset maximum configuration.



Below you will find a description of how to activate configuration control (CPU parameter assignment) and how to structure the required data record.

Requirements

- STEP 7 Version V13 SP1 or higher
- CPU S7-12XX Firmware Version V4.1 or higher Modules that support the "Configuration control" function also have the "Configuration control" entry in the description (info text) of the hardware catalog.
- Recommendation: Before you load a new program with a modified control data record, perform a memory reset. This action will prevent inconsistent states that may result from the presence of incompatible control data records.
- The startup parameter "Compare preset to actual configuration" is set to "Startup CPU even if mismatch" (default setting).

Required steps

1. Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU ("Configuration control" area).

2. Create a control data record (e.g., in a data block) according to the current configuration based on the sample described below for the control data record. The control data record has the number 196. If you want to transfer the control data record as a whole block to the WRREC instruction (input parameter RECORD), note that you must first create a PLC data type containing the structure of the control data record and base the data block on this PLC data type.

ConfDB

	Name	Data type	Start value	...	...	...	...	Comment
1	Static							
2	ConfigControl	Struct			☑	☑		
3	Block_length	USInt	9		☑	☑		Length of control data record, including header
4	Block_ID	USInt	196		☑	☑		Data record number
5	Version	USInt	5		☑	☑		
6	Subversion	USInt	0		☑	☑		
7	Slot_1	USInt	16#FF		☑	☑		Assignment for CPU annex card/Actual annex card
8	Slot_2	USInt	16#FF		☑	☑		Configured slot 2/ Assigned "real" slot
9	Slot_3	USInt	16#FF		☑	☑		Configured slot 3 / Assigned "real" slot
10	Slot_4	USInt	16#FF		☑	☑		Configured slot 4 / Assigned "real" slot

10	Slot_103	USInt	16#FF		☑	☑		Configured slot 103 / Assigned "real" slot

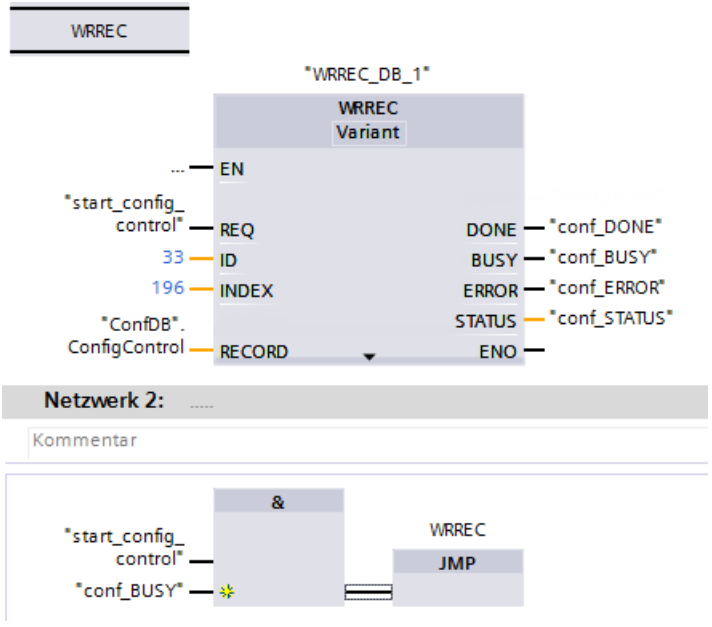
3. Transfer the control data record to the CPU in the startup program.
The configuration control for the centrally inserted modules takes effect only after an operating mode change of the CPU from STOP to RUN. For this reason, call the extended WRREC (Write data record) instruction in the startup OB, and transfer the created control data record to the CPU; see next section.

If a valid control data record is not transferred in the startup OB, the control is not ready for operation. The CPU returns from startup to STOP in this case.

Transferring a control data record in the startup program

The CPU processes the WRREC instruction for asynchronous transfer of the control data record. For this reason, you must call WRREC in the startup OB repeatedly in a loop until the output parameter "BUSY" or "DONE" indicate that the data record has been transferred.

Tip: Use the SCL programming language (Page 4991) with the REPEAT ... UNTIL instruction for programming the loop.



```
REPEAT
    "WRREC_DB"(REQ := "start_config_control",
               ID := 33,
               INDEX := 196,
               LEN := "conf_LEN",
               DONE => "conf_DONE",
               BUSY => "conf_BUSY",
               ERROR => "conf_ERROR",
               RECORD := "ConfDB".ConfigControl,
               STATUS => "conf_STATUS");
UNTIL NOT "conf_BUSY"
END_REPEAT;
```

Below, you will find explanations for individual block parameters that you must supply with specific values in the configuration control context. For the remaining block parameters, see also WRREC (Page 3596):

Parameter	Explanation
ID	HW identifier; is always 33 (decimal) for configuration control for centrally arranged modules.
INDEX	Data record number; is always 196 (decimal) for configuration control for centrally arranged modules.
RECORD	Control data record to be transferred. See the section "Control data record" for the structure of the control data record. Tip: The "RECORD" block parameter of the WRREC instruction (V1.1 and higher) is of the "VARIANT" data type and therefore requires a tag with data type. If you store the control data record in a data block, this data block must thus have a data type. The data block created must not be of the "Global-DB" type. Rather, it must be derived from a user data type. Proceed as follows: 1. First, create a new PLC data type (user data type) with the structure of the control data record and name it, for example, "ConfDB". 2. Create a new data block. Select the newly created user data type, for example, "ConfDB", as type for this data block.

In graphical programming languages, you realize the loop using instructions for program control.

Example in FBD: Use the LABEL (jump label) and JMP (jump at RLO=1) instructions to program a loop.

Arrangement of the modules

The following table shows the slot number assignment:

Slot	Modules	Note
1	Signal board, communication board, battery board	Slot on front of the CPU
2 - 9	Signal modules	Slots to the right of the CPU
101 - 103	Communications modules	Slots to the left of the CPU

Control data record

A control data record 196 containing a slot assignment is defined for configuration control.

The following codes apply:

0	Module is included in the hardware configuration but is not used in the current configuration.
1 to 9, 101 to 103	Current slot of the module
16#FF (255)	A module is not located in this slot in the hardware configuration.

Byte	Element	Code	Explanation
0	Block length	4 + number of slots	Header
1	Block ID	196	
2	Version	5 (for central I/O)	
3	Subversion	0	
4	Assignment of the CPU expansion board	Expansion board, 0 or 16#FF	Control element Describes in each element which real slot in the device is assigned to the configured slot. The structure of a control element is described in the following section.
5	Assignment of configured slot 2	Real slot, 0 or 16#FF	
...	...	...	
12	Assignment of configured slot 9	Real slot, 0 or 16#FF	
13	Assignment of configured slot 101	Real slot or 16#FF	In contrast to signal modules, the real slot of the communications modules must correspond to the configured slot.
14	Assignment of configured slot 102	Real slot or 16#FF	
15	Assignment of configured slot 103	Real slot or 16#FF	

Structure of a control element

A control element contains the information on which module is inserted in which slot.

The byte numbers represent the configured slots in ascending order (see above):

- Byte 4 stands for the configured slot of the expansion board
- Byte 5 to byte 9 stand for the configured slots 2 to 9
- Byte 13 to byte 15 stand for the configured slots 101 to 103

The value that you need to enter in the corresponding byte depends on the following rule:

- If the module is present in the real configuration, enter the real slot number of the module.
  - Example 1: The module configured in slot 2 is located in slot 2.
    Enter value 2 (= actual slot) in byte 5 (= configured slot 2).
  - Example 2: The module configured in slot 3 is located in slot 2.
    Enter value 2 (= actual slot) in byte 6 (= configured slot 3).
- If the module is configured but is missing in the real structure, enter 0 in the byte for the configured slot.
- If a module is not located in this slot in the hardware configuration, enter 16#FF (255) in the byte for the configured slot.

Rules

Observe the following rules:

- The configuration control does not support the repositioning of communications modules. The slot entries in the control data record for slots 101 to 103 must correspond to the real positions of the modules or be defined as not present in the hardware configuration by entering 16#FF (255).
- Slot gaps in the configuration are not allowed. For example, if a signal module is inserted in slot 4 in the real configuration, slots 2 and 3 of the real configuration must also be occupied. The same applies to the slots 101 to 103. If a communications module is inserted in slot 102 in the real configuration, slot 101 must also have a communications module inserted in the real configuration.
- If you have enabled configuration control, the CPU is not ready for operation without a control data record. The CPU returns from startup to STOP if a valid control data record is not transferred in the startup OB. The central I/O is not initialized in this case. The cause for the STOP mode is entered in the diagnostics buffer.
- For addressing the WRREC instruction, use the HW identifier 33 (decimal, for the ID block parameter) to write the control data record.
- The control data record is saved retentively in the CPU, which means that it is not necessary to write the control data record 196 again at a restart if the configuration is unchanged. Prior to commissioning, we recommend that a memory reset be performed for the CPU in order to delete any control data record that is present.
- Slot entries in the control data record outside the configured preset configuration are ignored by the CPU.
- Each real slot may only be present once in the control data record.
- A real slot may only be assigned to one configured slot.

Note

Modified configuration

The writing of a control data record with a modified configuration triggers the following automatic reaction by the CPU:

Memory reset with subsequent startup with this modified configuration.

As a result of this reaction, the retentively saved original data record 196 is deleted and the new data record 196 is saved retentively.

Behavior during operation

Effect of the discrepancy between the configured configuration and real configuration:

- For the online display and for the display in the diagnostics buffer (module OK or module faulty), the hardware configuration is always used and not the differing real configuration. Example: A module supplies diagnostic information. This module is configured in slot 4, but is really inserted in slot 3 (missing module; see example in the next section). In the online view, a configured slot 4 is indicated as faulty. In the real configuration, the module in slot 3 indicates an error via an LED display.

If modules are entered as missing in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK
- Direct write access to the outputs or write access to the process image of outputs that are not present: Remains without effect; no access error is signaled.
- Direct read access to the inputs or read access to the process image of inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: An error is signaled because a valid data record cannot be returned.

Error messages

The following error messages are returned if an error occurs during writing of the control data record:

Table 10-80 Error messages

Error code	Meaning
16#80B1	Invalid length; the length information in data record 196 is not correct.
16#80B5	Configuration control parameters not assigned.
16#80E2	Data record was transferred in the wrong OB context. The data record must be transferred in the startup program.
16#80B8	Parameter error; module signals invalid parameters.

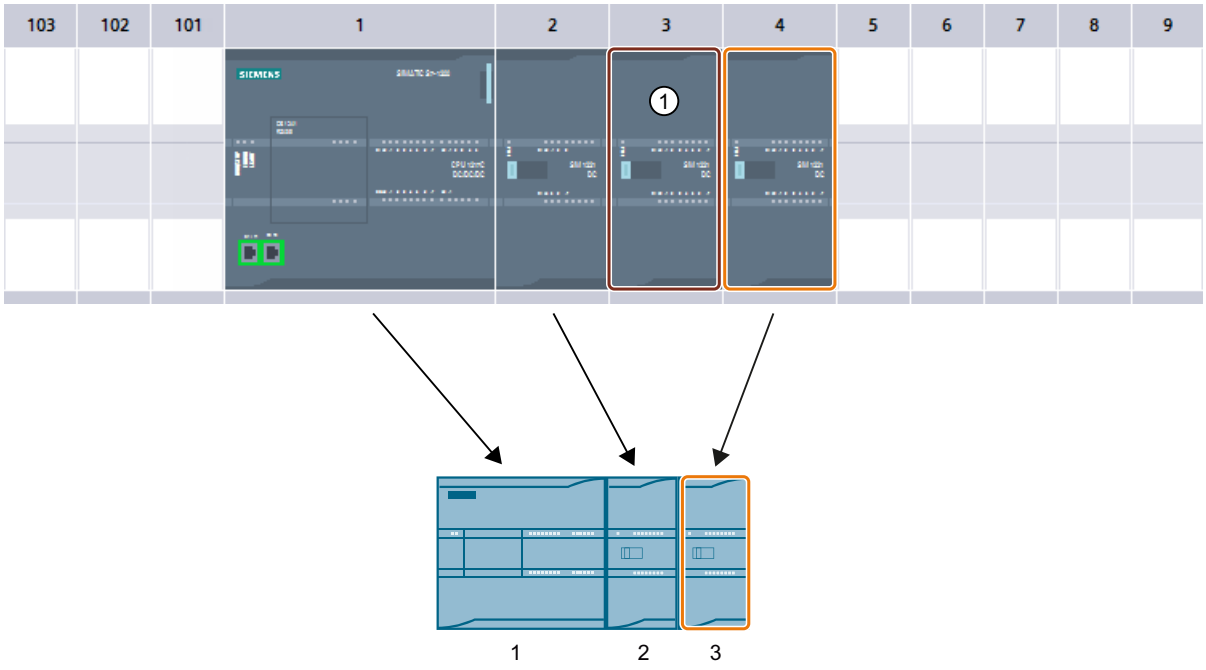
S7-1200 System Manual (http://support.automation.siemens.com/WW/view/en/89851659)

Example of a configuration control (S7-1200)

A configuration consisting of a CPU and 3 signal modules is configured in the following.



The module at slot 3 is not present in the first configuration expansion and is "hidden" by the configuration control.

In the second configuration expansion, the module that was initially hidden is located in the last slot. The added slot is made known to the CPU by a modified control data record.

Actual configuration with missing module

The specified configuration contains all modules that can be present in a final expansion stage.

The module that is inserted in slot 3 in the specified configuration is missing in the real expanded configuration. For this reason, slot 3 must be coded in the control data record accordingly with "FF_H" (= not present).

ControlDataRecord

18		Slot_103	USInt	255	Configured slot 103 / Assigned "real" slot

① Module is missing in the real configuration

Actual configuration with subsequently added module

The module present in slot 3 in the specified configuration is added to the back of the real configuration by inserting it as the last module in slot 4.

The control data record is adapted accordingly.

Additional configurations (S7-1200)

Configuring additional functions

The S7-1200 automation system has numerous additional functions that are useful as integrated CPU functions or available via plug-in modules (for example, communication modules). You can find the description via the following links.

10.1.4.2 Configuring PC systems

Overview

Important information about PC systems and PC stations

Definition of PC systems

PC systems are available in a wide range of designs, which can flexibly be expanded with software and hardware components. In this case, we are describing PC systems with a software controller that makes a PC (e.g. IPC) into a controller - similar to a modular controller such as a CPU S7-300/400 or a CPU S7-1500.

PC Station and possibly other components are installed in a PC system.

Definition of PC Station

PC Station is a software component that manages SIMATIC software products and the use of interfaces on a PC. In addition, it controls communication among the SIMATIC products on a PC.

PC Station is required by the SIMATIC software products SIMATIC NET PC software, WinAC RT or the SIMATIC S7-1500 software controllers and installed on the target PC.

SIMATIC HMI products such as WinCC Advanced RTX can work with different versions of PC Station.

As of version V2.x, PC Station can also be installed without the software controller.

Selecting the version of PC Station

During configuration, the version of your PC Station is automatically adapted by the software components configured in the PC system.

The following scenario is an example of a version change for PC Station:

- You have selected an IPC from the hardware catalog that conforms to PC Station V2.x:
  - In the initial state of the IPC, PC Station V1.0 is the default.
  - PC Station V1.0 remains installed as long as components that are compatible with PC Station V1.0 are inserted in the PC system.
  - The version of the PC Station only adjusts automatically to V2.x when the S7-1500 version of the software controller is inserted in an IPC.
  - If you **only** insert WinCC Runtime, the display changes from "PC Station" to "not installed". No installation of PC Station is required on the PC.
  - If you insert WinCC Runtime and a software controller is already inserted, the version of PC Station remains unchanged.

Note

When you include incompatible software products in the PC system, you receive an error message when trying to compile the station.

The properties of PC Station indicate which version of PC Station is installed: For the selected PC Station, you can find the settings in the Inspector window in the "PC Station" area.

Reference

You can find more information on operating a software controller with a PC Station in the SIMATIC ET 200SP Open Controller CPU 1515SP PC (https://support.industry.siemens.com/cs/de/en/view/109248384) manual, in the SIMATIC S7-1500 CPU 150xS (https://support.industry.siemens.com/cs/de/en/view/109249299) operating manual and in the SIMATIC NET PC software Commissioning PC Stations (https://support.industry.siemens.com/cs/de/en/view/109488960) configuration manual.

Software components of a PC station

A PC station contains a range of configurable software components, which are applied during loading to the PC station. There are different applications which have different effects on the generation and handling of the configuration data.

- PC station V2.x:
  - WinCC RT Advanced, as of V13 SP1
  - S7-1500 Software Controller
- PC station V1.0:
  - Standard application
  - OPC server as a central communication service provider
  - WinCC RT Advanced
  - WinCC RT Professional
  - WinCC V7
  - WinAC RTX
  - Communications processors
- Not installed:
  - WinCC RT Advanced
  - WinCC RT Professional
  - WinCC Client

You configure the specific properties of these components according to the utilized services.

WinCC RT Advanced

WinCC RT Advanced is a PC-based HMI solution for single-user systems directly at the machine level. The WinCC RT software is integrated in the SIMATIC HMI devices (e.g. Basic/ Comfort/Mobile Panel) and permits data exchange over HMI connections.

If you want to set up several HMI connections to a CPU, use for example:

- The PROFINET and PROFIBUS DP interfaces of the PC station
- CPs and CMs with the relevant interfaces

Other communication options:

- OPC UA client or as server (all HMI versions)
- Communication between HMI systems over the Intranet/Internet
  - Read and write access to tags

S7-1500 Software Controller

The SIMATIC S7-1500 Software Controller is a PC-based controller.

- It offers the same functionality as CPUs of the SIMATIC S7-1500 automation system.
- Software Controllers offer the functionality of a programmable logic controller (PLC) in a PC-based real-time environment.
- In order to develop your user program, use the same programming languages, program structure, and programming interface (STEP 7) with the PC-based controller as those used for hardware controllers.
- For the SIMATIC S7-1500 Software Controller, you can use the same user program as for a hardware controller. The Software Controller CPU has a display application that runs on the PC. The CPU's operating mode can be shown with the display application. With the display application - similar to the display of a hardware CPU - you can execute diagnostics and commissioning tasks.
- The Software Controller makes use of the interfaces of the PC for PROFINET and PROFIBUS.
  Windows-independent use of PROFINET or PROFIBUS for operating distributed I/O.
  Depending on the interface hardware used, the following functions are possible:
  - PROFINET IO RT
  - PROFIenergy
  - I-device
  - PROFIBUS DP master
- Communication (SIMATIC communication, Open User Communication) with Windows applications or external devices via the Windows interfaces of the PC.
  The communications services are based on the module in use.

The Software Controller based on S7-1500 is available in the following versions:

- As SIMATIC ET 200SP Open Controller CPU 1515SP PC and as CPU 1515SP PC including HMI in ET 200SP design, with pre-installed and pre-configured SIMATIC S7-1500 Software Controller. Can be centrally expanded using ET 200SP I/O modules.
- As Software Controller CPU 1507S for PC-based automation. The SIMATIC S7-1500 Software Controller provides the benefits of the standard SIMATIC S7-1500 controller on high-performance industrial PCs.

Standard application

With standard applications, you communicate with other applications and devices via your PC module.

You can configure the following communication services depending on the PC module in use:

- S7 connections
- DP services

OPC server as central communication service provider

OPC clients use the interface to an OPC server to communicate with an automation device (such as a SIMATIC S7-1500).

Configure its properties to adapt the OPC server. The set or changed parameters take effect after the configuration data is downloaded to the PC station and the OPC server is started.

You can use the following communication services depending on the PC module in use:

- All connection types
- DP services (DPV0)

WinAC RTX

The SIMATIC WinAC (Windows Automation Center) is a PC-based controller and provides the same functionality as SIMATIC S7-300/400 CPUs (hardware controllers). WinAC RTX is used as a solution for typical PC applications (for example, MS Office and user programs) and automation tasks in a system.

Distributed I/O is controlled via:

- PROFIBUS
  - The connection of I/Os via PROFIBUS DP takes place over the integrated DP interface of the SIMATIC PCs or over a communications processor.
- PROFINET
  - The connection of I/O devices via PROFINET takes place over an integrated Ethernet interface of the SIMATIC IPC or over a communications processor.

Optimum access to the data, e.g. for image processing, measured value acquisition, etc., takes place via the WinAC option Open Development Kit (ODK).

You can use the following communication services depending on the PC module in use:

- PG/OP communication
- S7 communication
- Open User Communication (OUC)
- Process data access via OPC

Communications processors

Connecting the SIMATIC controllers via communications processors enables direct integration of controllers in industrial networks.

You can use the following communication services depending on the PC module in use:

- OPC UA client or as server
- Open communication (TCP/IP and UDP): Multicast with UDP
- PG/OP communication: cross-network via S7 routing
- S7 communication (client, server)
- IT communication (HTTP(S), e-mail)

- PROFINET IO controller with real-time properties (RT and IRT)
- IP address assignment via DCP
- Shared device
- PROFIBUS DP
- PG/OP communication

WinCC RT Professional

WinCC RT Professional is a PC-based control and monitoring system for visualizing and operating processes, production flows, machines and plants – from simple single-user systems to multi-user systems and multi-site solutions with Web clients.

The WinCC RT software is integrated in the SIMATIC HMI devices (e.g. Basic/Comfort/Mobile Panel) and permits data exchange over HMI connections.

If you want to set up several HMI connections to a CPU, use for example:

- The PROFINET and PROFIBUS DP interfaces of the PC station
- CPs and CMs with the relevant interfaces

Other communication options:

- OPC server
- OLE DB server
- WinCC WebNavigator
- WinCC DataMonitor

WinCC Client

Depending on requirements, a WinCC single-user system can be expanded into a high-performance client/server system. In this way, several coordinated HMI stations can be operated in a single group with networked automation systems.

Reference

You can find more information on WinCC RT in the WinCC online help.

You can find additional information on the S7-1500 Software Controller and WinAC RTX in the section What you need to know about PC systems (Page 1096).

You can find additional information about the meaning and handling of PC applications and the OPC server in the SIMATIC NET - Industrial Communication (https://support.industry.siemens.com/cs/de/en/view/https://support.industry.siemens.com/cs/de/de/view/61630799) configuration manual and the SIMATIC NET - Commissioning PC Stations (https://support.industry.siemens.com/cs/de/en/view/109488960) configuration manual.

You can find more information on communication processors on theService&Support (http://w3.siemens.com/mcms/industrial-communication/en/ie/system-interfacing/advanced-controller/Pages/CPs-fuer-advanced-controller.aspx) Web pages.

You can find application examples for changing to the new Software Controller generation in the Guide for Migrating PC-based Controllers: from SIMATIC WinAC RTX to the SIMATIC S7-1500 Software Controller and TIA Portal (https://support.industry.siemens.com/cs/document/109478804/guide-for-migrating-pc-based-controllers%3A-from-simatic-winac-rtx-to-the-simatic-s7-1500-software-controller-and-tia-portal?dti=0&lc=en-WW).

Improvements of PC Station V2.x compared to PC Station V1.0

The common features and improvements of the two PC Stations are listed briefly below.

Common features of PC Station V2.x and V1.0

PC Station V2.x and PC Station V1.0 have the following common features:

- Simple installation of all required software components via a setup (for example, S7-1500 Software Controller, WinCC Advanced RT, etc.)
- PC systems with pre-installed software controller or pre-installed Runtime Advanced can also be ordered.

Improvements of PC Station V2.2 compared to PC Station V2.1

PC Station V2.2 offers the following improvements compared to PC Station V2.1:

- Loading project data in a configuration file (Page 1113)

Improvements of PC Station V2.1 compared to PC Station V2.0

PC Station V2.1 offers the following improvements compared to PC Station V2.0:

- Access possible via a Web server (Page 1118)

Improvements of PC Station V2.0 compared to PC Station V1.0

Compared to PC Station V1.0, PC Station V2.x provides the following improvements:

- Loading the PC Station configuration is easy, similar to a modular S7-1500 controller; no prior configuration of the PC system setup is needed on the IPC.
- Integrated PC hardware diagnostics is integrated into the system diagnostics, for example, to diagnose the state of PC components such as fan or hard disk.

Rules for the configuration

Rules and special features for configuring a PC system

Due to the numerous possible combinations of software and interface cards with various IPC versions, there are complex dependencies.

We recommend simply configuring PC Station according to your requirements and then compiling. STEP 7 performs most of the required adjustments, such as setting the station type.

If a combination cannot be compiled, an error message indicates that a rule has been violated and you receive information about how to rectify the error.

The following sections provide information on the basic rules:

- If an IPC is suitable for an S7-1500 Software Controller, it can also be inserted in a WinAC RTX. Applies to most IPCs.
- The following components are suitable or not suitable for the S7-1500 controller software:
  - The open controller (CPU 1515SP PC) is not suitable for the S7-1500 Software Controller.
  - The IPC2x7D and Embedded Controller (S7-mEC 31) are not suitable for the S7-1500 controller software.
- Device replacement between S7-1500 Software Controller and WinAC RTX is not possible.
- You can only insert one software controller in a PC system in each case.
- Neither an OPC server nor an application (user application) can be used in combination with an S7-1500 Software Controller. An installed PC Station V2.x prevents installation of the OPC server or the application on an IPC.
  Both components are used for a PC Station V1.0.
- Assigning interfaces: Assigning "None, or a different Windows setting" to an interface is only practical for onboard interfaces. The interfaces of the configured CPs/CMs are initially assigned to the PC station, because they are normally used by the configured components of the PC station.
- The graphic view of a PC Station in STEP 7 is identical in the network view and the device view.
  The "slots" on which the components of a PC system are located are not numbered. When you insert components by dragging them from the hardware catalog, STEP 7 places them automatically: The hardware components (e.g. CPs) are on the left side, the software components (e.g. a software controller) are on the right.
  Detailed information, for example, about the order number (i.e. the localization information similar to a slot in the PC system) is available only in the device overview table of the device view.
  - In the device overview table, index 125 is permanently assigned for the PC station (it is also referred as the "Station Manager" for PC Station V1.0). This index is displayed in the first row of the device overview table.
  - For the open controller CPU 1515SP PC, there are the columns "Rack", "Slot" and "I address" and "Q address" in addition to the "Index" column. These columns contain the corresponding information for inserted ET 200SP modules.
  - Inserted software components and CPs obtain their index in the order in which they are inserted in the device view. You can force a specific index only by dragging it from the hardware catalog to the corresponding row in the device overview table. This has no impact on the representation in the graphic device view.
  - You can find onboard interfaces to which no software components have been assigned starting at index 100. As soon as you have assigned an onboard interface, it is assigned the next free index, for example 4. In this way, assigned interfaces always appear at the start of the device overview table.

IPCs, CPs and software components for PC Station V2.x

The following IPCs are suitable for PC Station V2.x:

- IPC227E, IPC277E
- IPC427D, IPC477D
- IPC427E, IPC477E
- as of IPC547G (without CPU 1505SP software controller)
- IPC627D, IPC647D, IPC677D
- IPC827D, IPC847D

The following CPs are suitable for PC Station V2.x (can only be used as an interface of the S7-1500 Software Controller, CPU 1507S):

- IE general
- CP5622
- CP5623

The following software components are suitable for PC Station V2.x:

- CPU S7-1507S Software Controller
- WinCC RT as of V13 SP1

Procedure for configuring a PC system

Introduction

The following section describes how to select a PC system from the hardware catalog in the network view. Drag the required modules from the hardware catalog to this PC system; they will be arranged automatically.

Selecting the components in the hardware catalog

Each component is displayed as a folder in the hardware catalog. When you open this folder, you see the different versions of the selected component with their respective article numbers.

The following provides an example of how to create a PC system in the network view.

Requirement

- The hardware catalog is open.
- You are in the network view.

Procedure

To configure a PC system with a required software controller, follow these steps:

1. Navigate to the "PC Systems" folder in the hardware catalog.
2. Open the folder with the required industrial PC type. You will see all types of the selected IPC type.
3. Click the chosen IPC type to select it.
4. Drag the IPC from the hardware catalog and drop it into the network view.
5. Navigate to the "SIMATIC Controller Application" folder in the hardware catalog.
6. Select the desired software controller:
   - CPU 1507S
   - SIMATIC WinAC RTX
7. Drag the desired software controller and drop it onto this PC system.
8. Configure the properties of the PC system and the Software Controller.

Note

Requirements for loading

In order to load the hardware configuration, the software controller or PC station must be assigned to an interface.

Refer the following sections to learn how to assign interfaces: Important information about assigning interfaces (Page 1139) and Assigning interfaces for the communication (Page 1141).

Installation requirements depending on configured components

The configured components of a PC system in STEP 7 determine which installation requirements apply to the target system, for example, to an IPC. These installation requirements must be met in order to successfully load the configuration and enable you to access the PC system with STEP 7 online. STEP 7 shows the applicable (minimum) installation requirements for a selected PC system in the "PC System" area of the Inspector window.

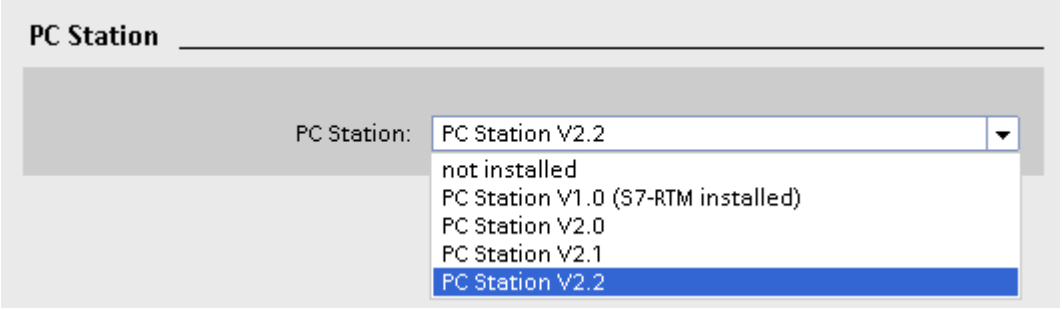
Example: Only WinCC RT configured

If only WinCC RT is configured, "not installed" must be shown in the PC system in the sense of "no PC Station installed".

Therefore, STEP 7 displays "not installed".

Example: WinAC RTX configured

If the WinAC RTX Software Controller is configured, SIMATIC WinAC RTX 2010 must be installed (referred to as "PC Station V1.0" below) on the PC system. SIMATIC WinAC RTX 2010 includes PC Station or S7-RTM, referred to as "PC Station V1.0" in the following, as an installation component.



STEP 7 automatically sets this version of PC Station once a WinAC RTX has been configured.

Example: CPU 1507S Software Controller configured

If the CPU 1507S Software Controller is configured, the SIMATIC S7-1500 Software Controller must be installed on the PC system. This includes PC Station installation component, referred to as "PC Station V2.x" below.

STEP 7 automatically sets this version of PC Station once a SIMATIC S7-1500 software controller has been configured.

- PC Station V2.2 (for Software Controller V2.x as of TIA Portal V14 SP1)
- PC Station V2.1 (for Software Controller V2.0 as of TIA Portal V14)
- PC Station V2.0 (for Software Controller V1.x as of TIA Portal V13 SP1)

Reference

You can find additional information about the installation requirements of the relevant PC Station version in the section Loading with STEP 7 (Page 1108).

Special features of the diagnostics in the PC System V2.x

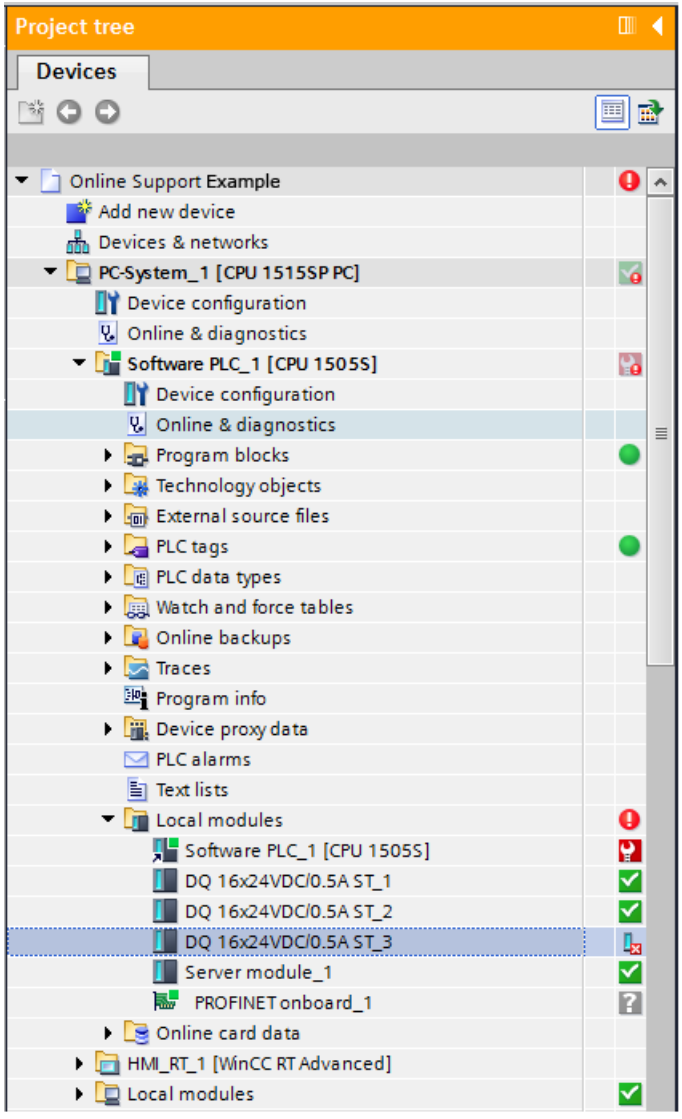
Special features of the diagnostics in the PC System V2.x

The diagnostics concept for a PC System V2.x has the same hierarchical structure as that of a modular CPU. You can see at a glance whether the station is free from faults or if, for example, an underlying component has a fault.

There is only one difference: They have one hierarchical level more than modular CPUs; the PC system is on a level higher than the Software Controller. The PC system has its own hardware status (separate diagnostics).

The following figure shows the diagnostics of the complete PC system in the project tree. The PC station itself is OK (green check mark), but has an underlying component with a fault (exclamation mark in a green check mark). The symbol provides preliminary information about disrupted or missing modules in the underlying structure.

To obtain a more detailed description of the error, double-click on the "Online & Diagnostics" entry in the project tree.



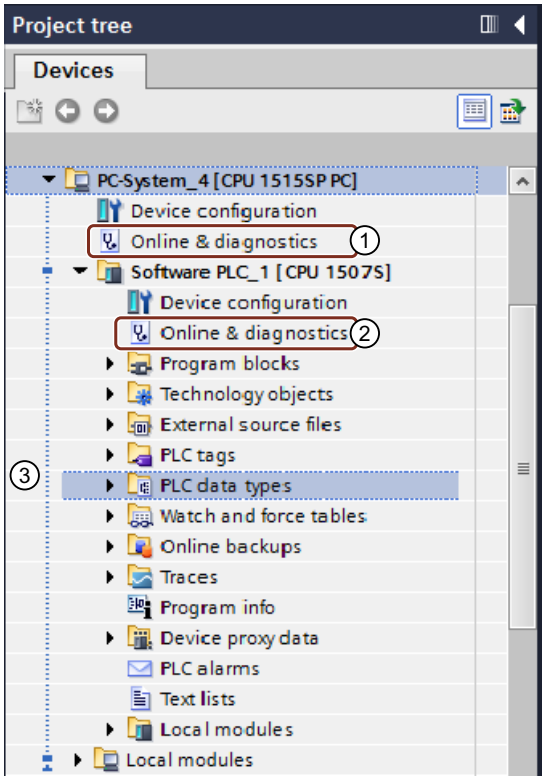


Figure 10-5 Displaying faults in the project tree

The following figure shows the two entries in the project tree for starting the online and diagnostics view of the PC system. For details, refer to the figure's legend.

① Hardware diagnostics of the PC system (for example, fans, temperatures, voltages for IPCs)
② Standard diagnostics (as for S7-1500 CPU)
② Visual brackets for the components of the PC station

Figure 10-6 "Online & Diagnostics" project navigation

Additional information

You can find additional information on "Diagnostics" and the legend with the meaning of each symbol in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

Loading with STEP 7

Loading PC station V2.x with STEP 7

The special features for loading a PC System V2.x with STEP 7 are listed below.

Requirement

- The corresponding software components are installed on the PC system (e.g. SIMATIC S7-1500 CPU 1507S).
- If needed, also install the corresponding version of the Setup DVD for SIMATIC WinCC Runtime Advanced on the PC system.

- The SIMATIC IPC hardware component is physically connected via Ethernet to the PC on which STEP 7 is installed.
- The Software Controller is started.

Other settings on the PC station are not required, because PC System V2.x is fully configured by loading the project.

Note

Recommended interfaces for download

- Use a "PN/IE" interface to load a SIMATIC IPC, which is not to be assigned to the Software Controller as a PROFINET interface.
  The "X1" interface is recommended.
- Use the "X2" interface to load a CPU 1515SP PC.

Procedure

To download the STEP 7 project, follow these steps:

1. Select the PC system in the device view.
2. Select the "Download to device" shortcut menu command.
   The "Extended download to device" dialog opens.
3. Configure the settings for the interface.
4. Click the "Download" button to start the download.
   If the PC system is not executed in the "Extended download to device" dialog, this may be due to the lack of an interface assignment.

Result

The project is downloaded step-by-step. A dialog shows the download progress.

- If you have made changes to the PC system configuration (for example, interface assignment, LED, NVRAM or index), then the PC system configuration is downloaded first. If a restart is required after this, STEP 7 displays a corresponding message. You can stop the download at this point, for example, to first configure the Software Controller and then perform the download later. Configurations already loaded are only reloaded if they have changed.
- If you wait instead of stopping the download after the download of the PC system configuration, the PC system reboots and automatically loads the remaining components, such as the configuration of the Software Controller and WinCC Advanced.

Checking the result of the download

After successful completion of the download, the CPU link appears in the Windows Start menu with the name you have assigned in the CPU settings in STEP 7.

The name assigned in STEP 7 is also visible in the CPU display.

Loading PC station V1.0 with STEP 7

The special features for loading a PC System V1.0 with STEP 7 are listed below.

Requirement

- The SIMATIC WinAC RTX DVD is installed on the PC system.
- Each device to which you want to load is accessible via online access.
- The PC station (runtime PC) is linked to the configuration station over a network. The PC station can be reached as communication station, for example, by setting the parameters in the initial configuration.
- An existing connection is checked, for example, with the "Accessible devices" function.
- The target PC station must be configured with the Station Configuration Editor.

Transfer of the configuration

You have the following options for transferring a created configuration to the PC station:

- Online operation
  - Networked (engineering station networked with Runtime PC); access point: "S7ONLINE (STEP 7)"
  - Local (configuration station same as PC station); access point: "PC internal (local)"
- Offline operation (separate engineering station and runtime PC) - Create and import XDB file and WinAC program file (*.wld)

Online operation

Online operation enables direct loading of the configuration data:

- Loading over a PC station connected to a network (MPI, PROFIBUS or Ethernet)
- Loading to the local PC station that is also used as configuration station

Procedure: Online operation - networked

1. Select the station to be loaded in STEP 7.
2. Load the configuration data with "Online" > "Download to device".

Note

For programming device operation

Make sure that you set the correct interface with "Set PG/PC Interface" (access point "S7ONLINE (STEP 7)").

Procedure: Online operation - local

The configuration data is transferred over an internal PC connection in this case.

1. Select the station to be loaded in STEP 7.
2. Load the configuration data with "Online" > "Download to device".

Offline mode

A file of the type XDB is required for data transfer in this operating mode. The configuration system generates an XDB file for each configured PC station.

The storage location of the configuration file is available in the properties of the "PC Station" object in the configuration system. This file can be imported with the "Station Configuration Editor" on the PC station.

You can find more information on offline information in section "Loading PC station V1.0 via storage medium (Page 1111)".

Reference

Additional information can be found in the "NET PC software Commissioning PC Stations - Manual and Quick Start (https://support.industry.siemens.com/cs/de/en/view/109488960)".

Load via file

Load PC Station V1.0 via file

The particularities of loading a PC Station V1.0 via storage medium are listed below.

To load the complete configuration, you have two options:

- Option 1: Create and import a configuration using an XDB file (Page 1111)
- Option 2: Create the program with the help of the memory card and load it to the Software Controller (Page 1112)

Create and import a configuration using an XDB file

Note

WinAC RTX cannot be installed.

Procedure

Follow these steps to configure a PC station offline using an XDB file and then importing it:

1. Drag a device for a PC station into the network view from the hardware catalog under "PC systems".
2. Select the PC station.
3. Change the name of the PC station to suit your needs under "Properties > General" in the Inspector window.

4. Drag-and-drop the additional components required into the PC station from the hardware catalog. An added component is inserted on a new index.

   Note

   You can change the index of a selected component in the Inspector window under "Properties > General > Position number". There may be gaps in index numbering for this reason. These gaps are not displayed in the graphic representation of the device view. However, gaps are displayed in the tabular area of the device view.

5. Select the PC station.
6. Under "Properties > XDB configuration" in the Inspector window, select the "Generate XDB file" check box.
   The connection data and addresses for CPs and applications are saved in the XDB file.
7. Specify the storage path under "XDB file path".
8. Select the PC station.
9. Select the shortcut menu command "Compile > ...".
   When the configuration of a PC station is saved and compiled, system data and the XDB configuration file are generated. This can then be loaded into the target system or be installed.

   Note

   The location of the configuration file is set on the target PC station via the program "Set PG-PC interface" (in the "STEP 7 Configuration" tab).

10. Copy the XDB file to a storage medium that can be accessed by the target station.
11. Import the XDB file to your target PC station with the Station Configuration Editor.

Create the program with the help of the memory card and load it to the Software Controller

Procedure

The configuration data, the current values of the DBs and the STEP 7 user program can be archived, reused and passed on in wld files. The log file (*.wld) does not save the configuration of the PC station in the Station Configuration Editor.

The controller must be in STOP mode for this to take place.

To create a log file, follow these steps:

1. Select the "New..." command in the "Project > Memory card file" menu.
   A dialog opens.
2. Select the directory in which you want to create the file.
3. Enter the file name and the path.
4. Confirm with "Create".

   Note

   You can also create a log file in WinAC with the menu command "File > Archive from CPU".

5. Select the "Open..." command in the "Project > Memory card file" menu to display the created log file in the project tree.
6. Select the directory in which the log file with the file extension (*.wld) is located.
7. The log file is displayed in the project tree under "Card Reader/USB memory".
8. Copy the wld file to a storage medium that can be accessed by the target station.
9. To restore the log file, select the menu command "File > Download to CPU**".**
10. Select the log file with the extension *.wld that you want to restore.
11. Click "OK" to confirm. The STEP 7 user program and the configuration for the Software Controller are loaded again.

Load PC Station V2.x via file

The possibility to save and transport the system configuration of the PC system in a configuration file, offers the following advantages:

- Update of large plants without the TIA Portal
- Simple provision of program and configuration updates
- Plant-level update no longer necessary
- No special software required

Create configuration file

Create configuration file

The entire configuration of your PC station is saved in a configuration file from the TIA Portal. The data may be re-used and distributed. The configuration file has the extension *.psc.

To create a configuration file, follow these steps:

1. Select the menu command "Project > PC Station configuration file > New > PC Station configuration file".
2. Enter the file name in the "Create memory card file" dialog that opens. Make sure your entries here are correct to avoid error messages:
   - Use short, unique name
   - Name can have a maximum of 255 characters
   - Name may not contain spaces
   - Use only permitted characters; permitted characters are letters and numbers, and the special characters '-' and '_'.
3. Select the desired directory in which you want to create the file. In this case too, make sure your entries under point 2 are correct to avoid error messages.
4. Confirm with "Create".

NOTICE
Secure data against access by third parties
The customer is fully responsible for the secure transport of data.

Result

The "Memory card file" folder is created in the project tree under "Card Reader/USB memory" with the following structure:

- PC system configuration file
  This file contains the PC system configuration file. The information indicates the file name and path information, for example: Drive:\PC-SystemConfiguration01.psc
  - Icon "Display PC system info"
    With a double-click on the icon, you can display all information relating to the project, device and module in an editor via the loaded configuration. If additional data is loaded, the user can view the latest metadata using the "Update" button.
  - Folder with station name already assigned in the project navigation, for example, PC-System_1.
    This folder contains the configuration of the PC system.

Loading project data to configuration file

To load data into the PC system configuration file, you have the following options:

- Load project data to a memory card using Drag&Drop or Copy&Paste
- Write project data to a memory card

Requirement

A PC system with PC Station V2.2 or later is configured in the TIA project.

A *.psc file is created and opened in the project tree.

If you use a CPU1515SP PC, Microbox, Nanobox "E", or IPC IPC547G or IPC xxxD in your configuration, then this is only possible in conjunction with a PC Station version ≥ V2.2.

Note

Note the following versions:

- Loading is not possible if you use a CPU1515SP PC F and a CPU 1507S F in your configuration.
- It is not possible to copy a single software CPU in the *.psc file!

Loading the project data on a memory card

To load project data to a memory card file, follow these steps:

1. Drag the project data that you want to load from the project tree to the memory card.
   If necessary, the project data is compiled.
2. Then, the "Load preview" dialog opens. This dialog displays messages and recommends actions necessary for loading.
3. Check the messages and enable the actions in the "Action" column if necessary. As soon as loading is possible, the "Load" button is enabled.
4. Click the "Load" button.
   The loading is performed.

or:

1. Select the "PC system" folder in the project tree.
2. Right-click on the selection and select the "Copy" command from the shortcut menu. Alternatively, you can also use the shortcut <Ctrl+V>.
3. Right-click on the "*.psc" file level or "PC system" folder in the memory card file and select the "Paste" shortcut menu command. Alternatively, you can also use the shortcut <Ctrl+V>. All other levels are locked. If necessary, the project data is compiled.
4. Then, the "Load preview" dialog opens. This dialog displays messages and recommends actions necessary for loading.
5. Check the messages and enable the actions in the "Action" column if necessary. As soon as loading is possible, the "Load" button is enabled.
6. Click the "Load" button.
   The loading is performed.

or:

1. Select the "PC system" folder in the project tree.
2. In the "Project" menu, select the command "Card Reader / USB memory > Write to memory card".
   The "Select memory card Select" dialog opens.
3. Select a memory card.
   A button with a green check mark is enabled in the lower part of the dialog.
4. Click on the button with the green check mark.
   If necessary, the project data is compiled.
5. Then, the "Load preview" dialog opens. This dialog displays messages and recommends actions necessary for loading.
6. Check the messages and enable the actions in the "Action" column if necessary. As soon as loading is possible, the "Load" button is enabled.
7. Click the "Load" button.
   The loading is performed.

Result

The psc file contains the configuration for all components in corresponding subfolders. The name of the folder is changed to the current PC system name.

Note

Check that file is complete

Ensure that the psc file in your TIA Portal is complete, because outside the TIA Portal it cannot be edited.

Open existing configuration files

Open configuration file

To view a configuration file in the project tree, follow these steps:

1. Select the menu command "Project > PC Station configuration file > Open > PC Station configuration file".
2. Select the directory containing the psc file.

The memory card file appears with the mentioned content under "Card Reader / USB memory" in the project tree.

Import configuration file on the target system

The following lists the tools with which you can commission the target system without TIA Portal:

- Command line tool
- PC Station display in the information area (Page 1127)

Requirement

You have administrator rights.

PC Station ≥ V2.2 is installed.

The open controller CPU 1515 Open SP PC (F) and/or an IPC can be accessed.

The psc file is located in a local directory or on a medium such as a USB flash drive.

Overview of the supported command line commands

The following table provides an overview of the supported command line commands:

Command	Explanation
PCSystem_Control.exe /Help	Displays the help text in the command line editor.
PCSystem_Control.exe /HelpExitCode	Displays the help text for the error codes in the command line editor.

Command	Explanation
PCSystem_Control.exe /PrintConfig <file.psc*>	Displays the information about the components; output format: Standard
PCSystem_Control.exe /PrintConfig <file.psc*> /xml	Displays the information about the components; output format: XML format
PCSystem_Control.exe /ImportConfig <file.psc*>	The call starts the full import of the psc file.
PCSystem_Control.exe /GetStatus /ImportConfig	Displays the current status of all the components, the import process; output format: XML format
PCSystem_Control.exe /GetStatus /SimaticComponents	Displays information on all installed Simatic components; output format: XML format

* The <file.psc > parameter stands for the full path and file name, for example, C:\Data\Test.psc

Result

The data is imported in the background.

If a restart is configured, this is performed automatically once the import is completed. If software CPU is contained in the imported configuration, it remains in STOP after the restart.

Procedure for error messages

If an error occurs with a command, you can determine the bit number of the error and to obtain an accurate description of it.

Proceed as follows:

1. To obtain the error code, enter the command "echo% errorlevel%" in the command line tool.
2. This command gives you the following result:
   - If the error code = 0, there is no error
   - If the error code > 0, there is an error and it is output as a decimal number
3. The decimal number must be converted into a binary number.
4. To get an overview of the bit number describing the error, enter the command line command "HelpExitCode".

Example

Here is an example for a conversion and a bit number associated with the corresponding error description:

- Decimal number: 288
- Binary number:100100000

Result: You can read the error at bit number 5 "Err_Net_45_Full=1" and bit number 8 "Err_IIS_Running=1".

Web server

Settings of the Web server on the target system

The Web server functionality is available as of PC Station V2.1. Below you will find the settings and special features for using the Web server.

Requirement

The following software requirements are necessary to use the full range of functions offered by the Web server:

- Windows 7 Embedded is installed
- Windows Ultimate 7 including the Internet Information Services (IIS) ≥ V7.0 is installed (see section Installing the Internet Information Service (Page 1119))
- .NET version ≥ 4.5 is installed

Note

The software must be installed BEFORE installing the PC station.

Principle

The Web server is a Web application and part of the Microsoft Internet Information Server installation. During installation, the Web server integrates itself into the standard website under the pre-installed IIS with access via port 80.
The Web server is used when the URL address contains /simatic or /simatic/.

Example

Examples of how to reach the Web server:

- http://IP address/simatic/ or http://IP address/simatic
- http://computer name/simatic/ or http://computer name/simatic

Reference

You can find additional information on the Web server in the Web server function manual (https://support.industry.siemens.com/cs/de/en/view/59193560).

Enabling the Internet Information Services (IIS)

Below we will show you how to enable the Internet Information Services (IIS) and the required settings.

Note

The additional installation of the IIS is only necessary when Windows 7 Ultimate is installed on your computer.

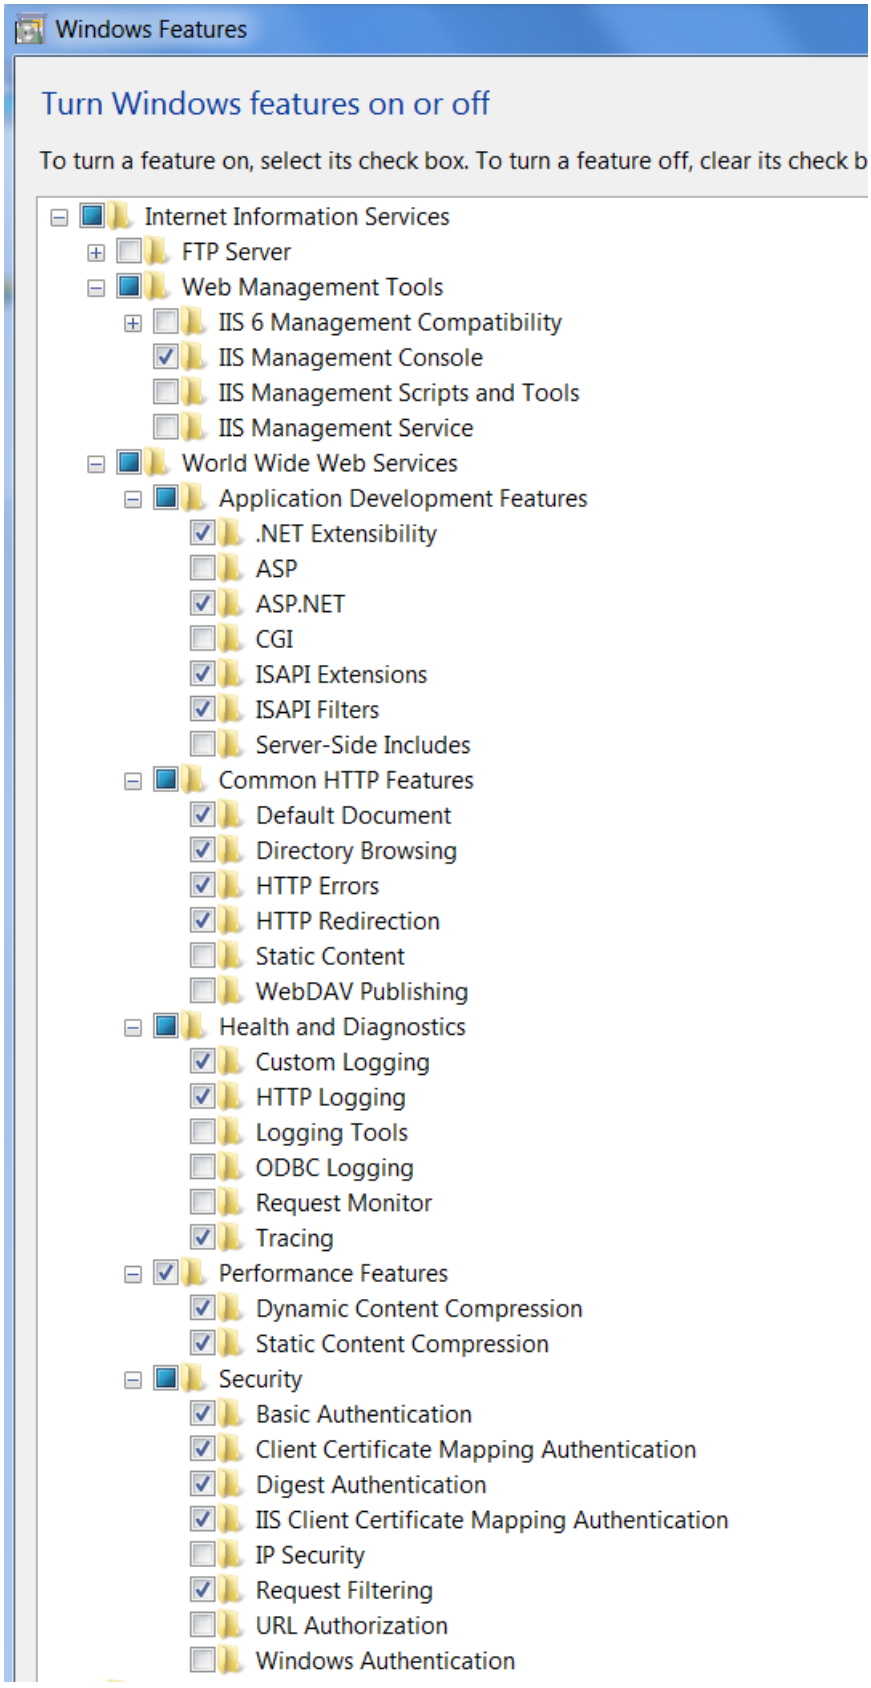
Requirement

Windows 7 Ultimate is installed.

Procedure

Follow these steps to enable the Internet Information Services (IIS):

1. Click on the button "Start > System Control > Programs and Features > Turn Windows features on or off".
2. Confirm the message for user account control with "Yes".
3. Navigate to the menu command: "Internet Information Services" and make the following settings:



Windows Features
Turn Windows features on or off
To turn a feature on, select its check box. To turn a feature off, clear its check b

Figure 10-7 Settings for Internet Information Services

Problems when accessing the Web server

You can find possible causes and their remedies here:

- Internet Information Services were enabled after installation of .NET
- A 64-bit version of Windows is run on the computer

To remedy the problem, you must register a .NET version afterwards in the Internet Information Services (IIS). To do so, execute the following command in the Windows CMD window: C:\Windows\Microsoft.NET\Framework64\v4.0.30319>aspnet_regiis.exe –ir

Configuration of the Web server in the TIA Portal

The procedure for configuring the Web server in the TIA Portal is described below.

Procedure

To use the Web server, follow these steps:

1. Select the desired PC system.
2. Select the following settings in the Inspector window under "Properties > General > Web server":
   - Activate web server on this module
   - Enable automatic update
   - Create and manage users

Reference

You can find additional information on the Web server in the Web server function manual (https://support.industry.siemens.com/cs/de/en/view/59193560).

Setting up the Web server using command line commands

The following command line tool is installed when installing the PC system: PCSystem_Control.exe.

The tool enables you to query information over the Web server and perform the following tasks:

- Query and check the Web server registration
- Register a Web server
- Revoke Web server registration
- Subsequently change the Web server settings

Requirement

The user has administrator rights.

Overview of the supported command line commands

The following table provides an overview of the supported command line commands:

Command	Explanation
PCSystem_Control.exe/Help	Displays the help text in the command line editor.
PCSystem_Control.exe /HelpExitCode	Displays the help text for the error codes in the command line editor.
PCSystem_Control.exe/Help/RegWebserver	Displays the help text for this call.
PCSystem_Control.exe/Help/UnregWebserver	
PCSystem_Control.exe/Help/VerifyWebserver	
PCSystem_Control.exe/RegWebserver/	The Dispatcher Web server registers itself in the Internet Information Services (IIS).
PCSystem_Control.exe/RegWebserver/HTTP	The call expects an existing connection for the HTTP protocol to the standard port "80".
PCSystem_Control.exe/RegWebserver/HTTPS	The call expects an existing connection for the HTTPS protocol to the standard port "443".
PCSystem_Control.exe/RegWebserver/HTTP/HTTPS	The call expects an existing connection for the HTTP protocol to the standard port "80" and for the HTTPS protocol to the standard port "443".
PCSystem_Control.exe/RegWebserver/Sitename"..."	The call expects an existing website in the IIS with the transferred name.
PCSystem_Control.exe/UnregWebserver	The registration of the Web server in the IIS is undone.
PCSystem_Control.exe/VerifyWebserver	Displays whether the user can register the Web server in the IIS or if prerequisites have to be met.

Procedure for error messages

If an error occurs with a command, you can determine the bit number of the error and obtain an accurate description of it.

Proceed as follows:

1. To obtain the error code, enter the command "echo% errorlevel%" in the command line tool.
2. This command gives you the following result:
   - If the error code = 0, there is no error
   - If the error code > 0, there is an error and it is output as a decimal number
3. The decimal number must be converted into a binary number.
4. To get an overview of the bit number describing the error, enter the command line command "HelpExitCode".

Example

Here is an example for a conversion and a bit number associated with the corresponding error description:

- Decimal number: 288
- Binary number:100100000

Result: You can read the error at bit number 5 "Err_Net_45_Full=1" and bit number 8 "Err_IIS_Running=1".

Access via HTTPS

Requirements

The requirements for error-free HTTPS access are as follows:

- The current time-of-day is set.
- The firewall is configured appropriately.
- A valid certificate is installed.
  - If no certificate is installed, a recommendation is displayed that you should not use the page. You also have the option of creating your own certificate.

Input and example

To access the Web pages with the HTTPS protocol, enter the URL in the following format:

- https://ww.xx.yy.zz, where ww.xx.yy.zz
  Example input: https://192.168.3.141

You can recognize an encrypted connection by a lock symbol in the status bar of the Web page.

Reference

You can find additional information on how to create your own certificate in the section Creating your own certificate (Page 1123).

Creating your own certificate

If your company does not have a Certification Authority (CA), you can use the procedure described in this section. The key files are created with the "OpenSSL" program. If you have not yet installed OpenSSL on your PC, you can download and install the program for free from the following website: http://openssl.org/ (http://openssl.org/)

Procedure

To create your own certificate, follow these steps:

1. Open the "Internet Information Services manager" application.
2. Click on the computer name.
3. Double-click "Server Certificates" in the "Features" view.
   The "Server Certificates" directory opens.
4. Click "Create Self-Signed Certificate" in the "Actions" area.
5. On the "Create Self-Signed Certificate" page, enter a display name for the certificate in the "Specify a friendly name for the certificate" field.
6. Click "OK".
   The new certificate is displayed in the "Certificate Server" overview.
7. Switch back to the "Internet Information Services Manager".
8. In the "Pages" directory, select the website in which the new HTTPS connection shall be created.
9. On the right side, click on "Edit Page > Binding".
   The dialog box with the available Web pages opens.
10. Select the connection type "https" and click "Add new".
    The dialog with the connection properties opens.
11. Select the protocol type "HTTPS" and the port number 443; insert the certificate you created in the "SSL Certificates" selection box.
12. Click "OK" to create a new connection.

Integrating IPCs into the TIA Portal

In addition to control and visualization tasks, PC systems can also be used for the following applications:

- Data gateway to higher-level MES
- Plant-level data server
- Hardware platform for SCADA systems
- Industrial workstations (for example, at test stations)
- Process & data analysis on site

Integrating SIMATIC IPCs in TIA Portal

Integrating the SIMATIC PC station (IPC in TIA Portal) integrates a PC system in a plant configuration (TIA project), with the following advantages:

- Fast configuration
  - Configuration via drag-and-drop from the hardware catalog
  - Detailed display of all interfaces – suitable for configuration of SIMATIC IPC
  - Network-spanning view including display of IP addresses
  - Fine-grained status diagnostic network topology
- Simplified commissioning
  - Central overview of all IP addresses
    Excludes conflicts due to duplicate assignments
    Easy to find SIMATIC IPC (including host name and IP address) via "Accessible devices"
  - Status diagnostics within the TIA Portal
    Diagnostics of the Ethernet/PROFINET connection to the SIMATIC IPC from the configuration
    Simple and fast error localization, for example, topology errors in the network, inaccessible devices
    Port-granular diagnostics (including the ports assigned in the topology on the SCALANCE switch)
  - Overview of the entire network
    Comprehensive information on topology, structures and hierarchies
- Integration of hardware diagnostics for IPCs in the TIA Portal
  - Fine-grained status diagnostics of the network topology, for example, topology errors in the network, inaccessible devices
  - Preventive maintenance, for example, of hard disks or fans
  - Early reaction to violation of high/low limit of the permitted operating temperature
  - Central overview of all SIMATIC IPCs in a plant
  - Display of hardware diagnostics in the WinCC Diagnostic Viewer
    Display of PC diagnostics in the running plant
    Preventive maintenance

System requirements

To install a PC station in an IPC, the following requirements must be met:

Requirements

- You have administrator rights on your computer.
- A minimum of 400 MB space is available.

Hardware requirements

The following IPCs are supported:

- SIMATIC IPC4x7D
- SIMATIC IPC2x7E
- SIMATIC IPC547G
- SIMATIC IPC6x7D
- SIMATIC IPC8x7D

Note

Make sure that the IPCs you use in your configuration are compatible.

If you ignore the error message about your configuration, diagnostics errors in TIA Portal can result.

Always select the appropriate IPC for your configuration.

Software requirements

- The SIMATIC IPC software can be used with the following operating systems:
  - Windows Embedded Standard 7 E/P SP1 32-bit
  - Windows Embedded Standard 7 E/P SP1 64-bit
  - Windows 7 SP1 32-bit
  - Windows 7 SP1 64-bit
- The following diagnostic software is installed:
  - DiagBase >= V1.5.0 or
  - DiagMonitor >= V4.5.0

Restrictions

- The following filters are disabled:
  - EWF
  - FBWF
- The following components may not be installed:
  - PC Station classic (S7-RTM)
  - CPU 150xS
  - SIMATIC NET
  - WinAC RTX

Installation

Storage media for the installation

Setup can be installed from the following media:

- USB stick
- DVD
- Hard disk
- Network drive

Installation

Setup is started by running "start.exe" in the Setup folder.

Proceed as follows for this:

1. Double-click on "start.exe".
2. Select the desired product properties for the installation.
3. Follow the instructions on the screen during the installation.

Result

After a successful installation, the following components have been installed:

- PC Station V2.x
- S7 device drivers
- SIMATIC NET CP Manager Plus
- PC Station Web server

In addition, an icon for the PC Station service is also displayed in the notification area of the Windows task bar during operation of the CPU.

Reference

You can find more information on the PC Station display in the section PC Station display in the notification area (Page 1127).

PC station display in the notification area

An icon for the PC Station service is also displayed in the notification area of the Windows task bar during operation of the CPU. Among other things the icon indicates the current state of the PC Station service, and provides you with the opportunity to do configurations.
Right clicking the icon in the notification area opens the PC Station shortcut menu.

States of the notification area icon

The state of the icon for the PC Station service in the notification area of the task bar changes as soon as the mode of the PC station changes.
The notification area icon can display the following states:

RUN	STOP
	

Configuration options using the "Station Manager" service's icon

The icon for the PC Station service in the task bar's notification area gives you the following configuration options via the shortcut menu:

- Import > Import Configuration
  This shortcut menu command opens and displays the metadata of a selected PC system configuration file. The user also starts the import of the psc file with this. The feature is not supported for F-CPUs.
- Configuration
  - Delete existing configuration
    Administrative rights are required for this configuration option.
    This shortcut menu command causes the configuration to be deleted.
    This function is disabled by default in an F-CPU. The "Failsafe Operators" user group must be added explicitly authorized in order to provide them with permission on an individual basis. Furthermore, the configured passwords for an F-CPU are retained after the configuration is deleted. These passwords are required later again for downloading. To reset the password, load a project without passwords.
  - Change the storage path of configuration data
    Administrative rights are required for this configuration option.
    If you are protecting a partition with an enhanced write filter (EWF), for example, the configuration and diagnostic data is also thereby write-protected.
    Save the diagnostic data in an area of the hard disk that is not write-protected. You can also save the configuration data containing the configuration in a section of the hard disk that is not write-protected.
- Restart all of the PC Station services
  Administrative rights are required for this configuration option.
  This shortcut menu command causes all of the PC Station services to be restarted.
- Exit
  This shortcut menu command causes the PC Station panel to be closed. The icon for the PC Station service in the notification area of the task bar is hidden. Restart the PC Station panel using the following entry in the Windows Start menu: **Siemens Automation > SIMATIC > PC Station > "PC Station"**

Repairing/uninstalling

You have the option to repair or uninstall the installed program.

Repairing

To repair the program, proceed as follows:

1. Navigate to the path where your Setup is installed.
2. Double-click on "start.exe".
3. Select "TIA integration for SIMATIC IPC" by placing a check mark and click "Next".
4. Select the "Repair" button.
5. Click "Next" and follow the instructions on the screen.

Uninstalling

To uninstall the program, you have two options.

Via the Control Panel

1. In the Windows taskbar, select **Start > Control Panel > Run Advertised Programs**
2. Select the program "TIA integration for SIMATIC IPC".
3. Click "Uninstall".
4. Follow the on-screen instructions during the uninstall process.

Via "start.exe":

1. Navigate to the path where your Setup is installed.
2. Double-click on "start.exe".
3. Select "TIA integration for SIMATIC IPC" by placing a check mark and click "Next".
4. Select the "Uninstall" button.
5. Click "Next" and follow the instructions on the screen.

Restrictions for cancellation

When the setup is aborted, all installation steps must be carried out again.

Basic configuration of the Open Controller

Creating the configuration

You have created a new project in the TIA Portal.

To create the configuration in the TIA Portal, follow these steps:

1. Double-click "Add new device" in the project tree.
2. Select "CPU 1515SP PC (+HMI)" under "PC Systems > Open Controller".
3. Select the appropriate version.
   The configured Open Controller is displayed in the device view.

4. The following components can be seen in the Open Controller:
   – Onboard interface X2 (GB Ethernet Windows interface) that is assigned directly to the PC station (1 port)
   – Exchangeable BusAdapter X1 that is assigned directly to the Software Controller (2 ports)
   – On the right side (behind the plugged modules in the rack): the configured CPU 1505S Software Controller and WinCC Runtime Advanced.
5. Insert the server module.
   The server module at the right end of the configuration forms the termination of the CPU with the I/O modules.

Setting the IP addresses:

In the Inspector window under "Properties":

- Onboard interface X2: The configured, preset IP address is identical to the Windows IP address that is set on the Open Controller during initial commissioning.
- BusAdapter X1: The configured, preset IP address is identical to the IP address that was set in the panel of the Software Controller (display application) during initial commissioning.

Important properties of the Software Controller

If necessary, you can change the properties in the Inspector window under "Properties".

- Selecting startup type
- System diagnostics
- Setting the storage location for retentive data
- Setting up copy protection
- Using the LEDs of the hardware
- Configuring the Web server
- Assigning interfaces for the communication

Establish HMI connection

1. Right-click the WinCC RT Advanced in the device view.
2. Start the HMI device wizard.
3. Apply all default settings.
   The wizard creates system images for you with the corresponding navigation.
4. Switch to the connection view in the network view.
5. Click on WinCC RT Advanced.
6. Draw a line from the WinCC RT Advanced software to the S7-1500 Software Controller (e.g. CPU 1505SP) while keeping the mouse button pressed.
   A network connection is established between the two devices.

Downloading the project to the target system

The complete PC station is downloaded the first time you download the configuration.

1. Select the complete PC system in the device view.
2. Click the "Download" button.
3. Make the following settings:
   - Type of connection
   - Specify the interface of the programming device
   - Specify the X2 interface on the Open Controller

Note

The first TIA Portal download **must** take place over the "X2" interface.

Only ASCII characters are permitted in the name of the interface X2 PN/IE (LAN) in the TIA Portal, e.g. PROFINET_2.

Download and compile the project. The hardware configuration and the first download are now completed.

WinCC RT Advanced

WinCC Runtime Advanced contains all the essential functions for operator control and monitoring of machinery or plants.

Reference

You can find additional information on configuration and downloading in the ET 200SP Open Controller CPU 1515SP PC (https://support.industry.siemens.com/cs/de/en/view/109248384) manual.

You can find more information on WinCC RT Advanced in the WinCC Advanced V13.0 SP1 (https://support.industry.siemens.com/cs/de/en/view/109091876) system manual.

Parameter assignment

Booting of PC (startup parameters)

Configuration of the startup type of the CPU

With a CPU 150xS, you have the option of assigning parameters for the startup characteristics in addition to the standard startup parameters, for example "Startup after POWER ON". The CPU can be started (POWER ON) in two different ways:

- Manual start via the "Power" button on the CPU display
- Automatic start during PC start (recommended)

Using the "Automatic start after booting the PC" option in the properties of the software controller, you determine how the CPU starts.

We recommend you enable the option "Automatic start after booting the PC", otherwise the software controller does not automatically boot after the PC system starts. A software controller can be only loaded after it has started.

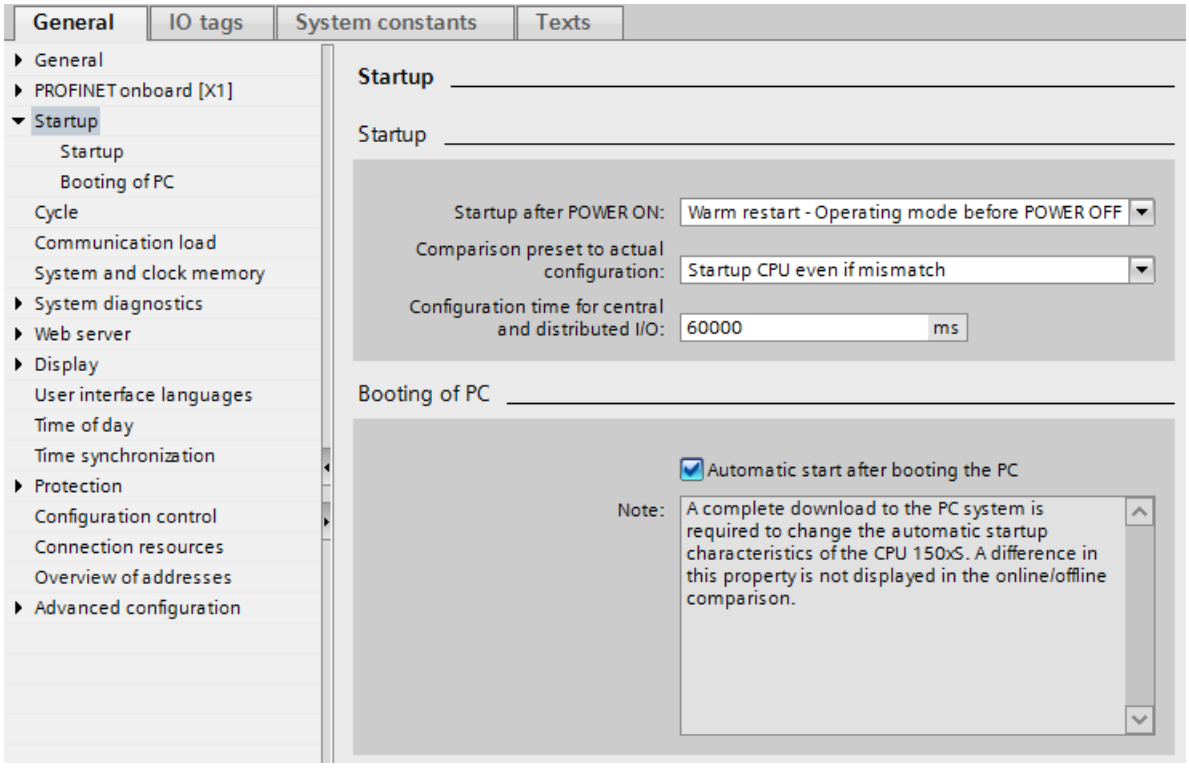
If this option is disabled, you must start the CPU manually before a download procedure via the CPU display.

Note

BIOS memory test on SIMATIC IPCs

PCs provide the option of a memory test. Some hardware tests, such as the memory test, are disabled by default in the BIOS setup program and are skipped during startup of the PC. Booting is accelerated as a result.

If you are using the CPU on a SIMATIC IPC or CPU 1515SP PC, the BIOS memory test must not be enabled.



The default startup parameters are no different from the startup parameters of S7-1500 CPUs.

Setting the startup type

To set the startup type, follow these steps:

1. Start STEP 7.
2. Open your project.
3. Change to the project view.
4. Open the device view.
5. Select the CPU.
6. On the "Properties" > "General" tab of the Inspector window, select the "Startup" area.

7. Configure the startup characteristics of your CPU.

8. Download the project to the CPU, by selecting the PC system before you start the download.

Result

If, in addition to the settings for the startup type, you also change the "Automatic start after booting the PC" option, the CPU is stopped automatically before the download. At the beginning of the download, the CPU starts again in STOP mode.

The project is downloaded. The new settings for the startup type are active.

Special features in the parameter assignment of the access protection

Assigning access protection parameters in STEP 7

The access protection parameters are assigned using the properties of the PC system in which the software controller is inserted.

The access levels are read-only in the properties of the CPU. To access the properties of the PC system, click the arrow. Here you can define the access levels of the PC system and overwrite them for the entire application.

Note

Assigning access protection parameters for the entire PC system

Unlike for a hardware CPU, parameter assignment for access protection is not done directly in the CPU's properties. This ensures that consistent protection level passwords are configured for all of a PC system's components.

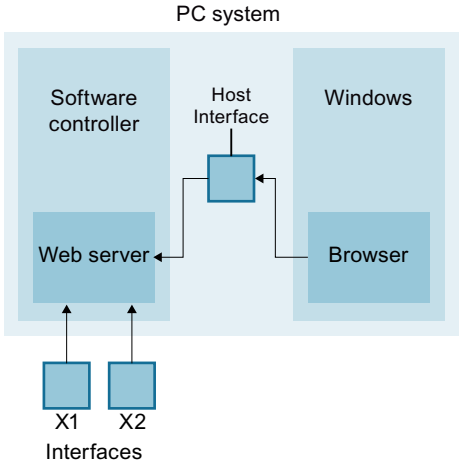
Unlike a hardware CPU of the S7-1500 automation system, a separate display password cannot protect the CPU against unauthorized access . Because the CPU can also be controlled by remote access, it uses the access protection passwords from STEP 7 to ensure access protection for the display.

Reference

For additional information on the protection concept in conjunction with display access, refer to theSIMATIC S7-1500 CPU 150xS (https://support.industry.siemens.com/cs/de/en/view/109249299) operating manual.

Advanced configuration for PC systems

If you select an S7-150xS software controller in the device view or network view, click on the "Advanced configuration" area in the Inspector window. The parameters under "Advanced configuration" are explained below or you can find references to explanations for these parameters.



Host interface

The host interface offers access, for example, to an office network via a Windows-controlled interface independent of a PROFIBUS or PROFINET subnet. Your user program uses this interface to communicate with other devices or fetch information via the web server of the software controller:

Accessing the web server

Similar to the hardware interface, you also need to enable access via the host interface to be able to access the web server of the controller software through this interface.

The following figure shows the web server access from the web browser of the PC system via the host interface.

Communication via Open User Communication (OUC)

You can also use Ethernet interfaces on the PC via the host interface.
Basically, only the name of the host interface and the hardware ID is displayed for the configuration.
In the properties of a communication instruction (e.g. TSEND_C), you can access the properties of the host interface and use the "Connection data" area to access the address parameters for the programmed OUC communication. The hardware ID of the host interface is entered in the connection data.

Index

The index of a component in the PC system corresponds to the position of the component (for example, a hardware resource as an interface). It is a sort of "slot address on the PC-internal subnet" (Softbus).

The index of a software or hardware component is not displayed in the graphical view.

When a software controller is selected in the network view or device view, you can read or change the index in the properties of the software controller under "Advanced configuration". You can also change the index in the device overview table in the device view.

Reference

You can find information on using the hardware LEDs here (Page 1137).

You can find information about setting the storage location for retentive data here (Page 1136).

Setting the storage location for retentive data

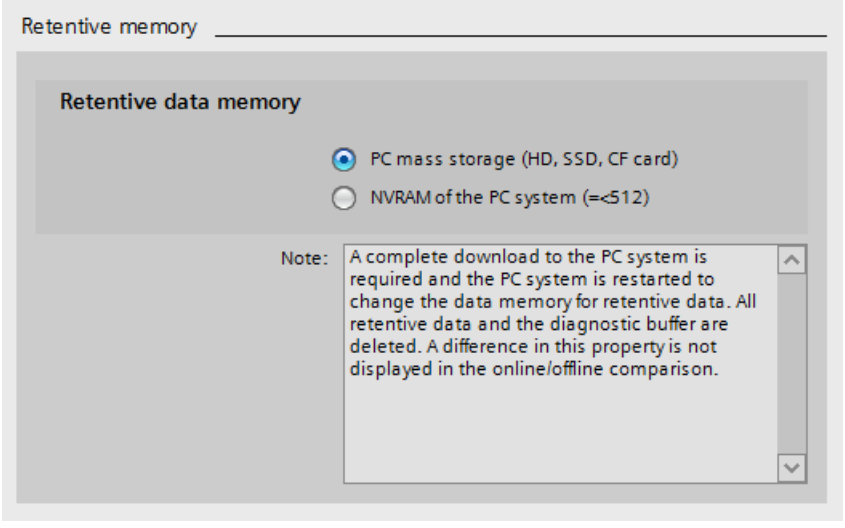
The S7-1500 Software Controller (CPU) provides the option of storing data retentively in the PC mass storage or in the integrated NVRAM when the CPU is stopped or a power failure occurs. You set the type of data storage in the CPU properties.

Note

Data loss when changing the storage type

When you change the storage type, the current retentive data and the contents of the diagnostic buffer are deleted when the changed configuration is loaded.

Requirement



The project view is open.

The device view is open.

Procedure

To configure the type of storage, follow these steps:

1. Select the CPU.
2. Select the "Advanced configuration" area on the "Properties" tab of the Inspector window.
   - Select the "PC mass storage" option button to store the retentive data in the mass storage of your PC.
   - Select the "NVRAM of PC platform" option button to save the retentive data in the integrated NVRAM of your PC.

3. To change the type of data storage in STEP 7 at a later time, download the project to the PC system again.

Note

Downloading the change of configuration

When you change the storage type for storage of retentive data in STEP 7, you must download the entire PC system for this configuration change. When you change the storage type, the CPU reboots during the download process. Without a reboot the storage type is not changed despite the download process.

To ensure the required restart of the CPU, you have to load the PC and then restart it.

See also

Advanced configuration for PC systems (Page 1134)

Using the LEDs of the hardware

The S7-1500 Software Controller (CPU) can display its status on the LEDs of the hardware platform on which it is installed. You set this functionality in the CPU properties in STEP 7.

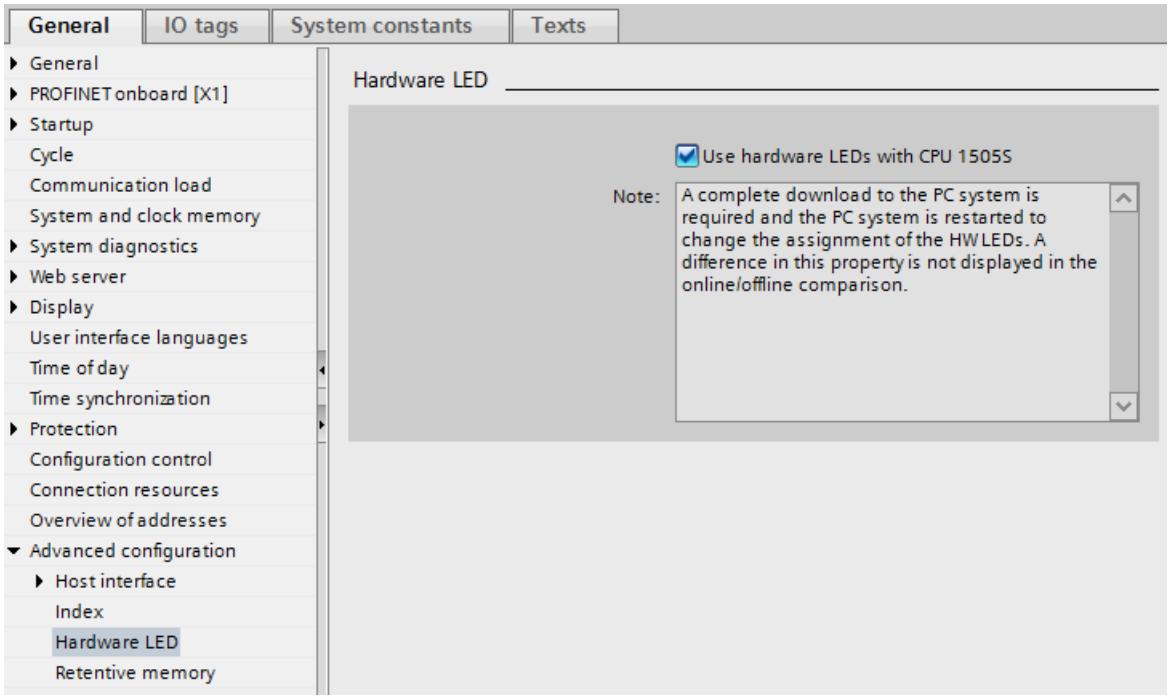
Note

Simultaneous access by multiple components

Take care that multiple competing components (for example DiagBase and CPU) do not make simultaneous access to the hardware LED.

Requirement

Your project is open.



You are in the project view.

Procedure

To use the LEDs of the hardware platform for the CPU, follow these steps:

1. Open the network view or device view.
2. Select the CPU.

3. Select the "Advanced configuration > Hardware LED" area on the "Properties" tab of the Inspector window.

4. Select the "Use hardware LEDs with CPU 150xS" option.

   As described in the note below the option, you then have to fully download the PC system and reboot it.

Result

The PC is shut down and the CPU is stopped. The project is downloaded.

The PC is restarted automatically. The CPU starts in STOP mode. The download is continued. After completion of the download, the CPU is put into RUN mode.

Special feature

If there is an online/offline difference with regard to the "Use hardware LEDs" property, this difference is not shown in the online/offline comparison.

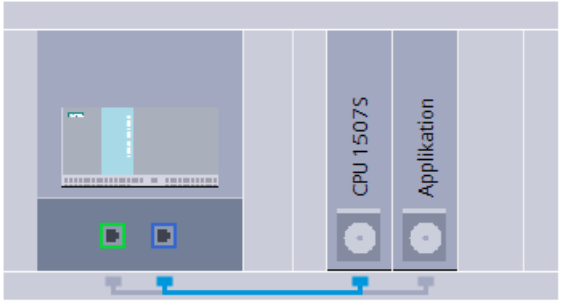
Advanced configuration for PC systems (Page 1134)

Important information about assigning interfaces

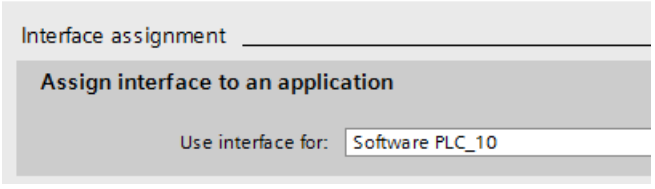
As of STEP 7 V13 SP1, relationships between a software component, such as a Software Controller, and its interfaces to the outside world, e.g. a PROFINET interface, are represented by reference lines.

Representation of relationships

If nothing was selected, all interfaces and the software components are connected by a gray line. The lines have a square connector at the end. These lines show the relationship between software components (e.g. S7-1500 Software Controller, WinCC RTX or OPC server) and interfaces (PROFINET, PROFIBUS, ...).



When you select an interface, the assigned software components can be recognized by the blue line that is clearly distinguishable from the gray lines.

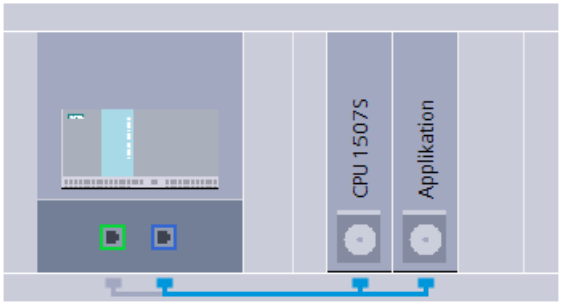


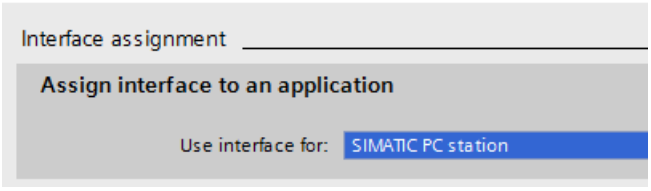
Interfaces without relation lines or with gray reference lines are not assigned.

Example 1: Assigning an interface to the Software Controller (CPU)

A blue reference line between a selected interface and an S7-1500 Software Controller means that the interface is assigned to the S7-1500 Software Controller and can only be used by it. In this case, the Software Controller, as IO controller, can operate a PROFINET IO system on this interface.

Only with this type of interface assignment is it possible to configure the IP address and the device name of the PROFINET interface and load it in the PC system.

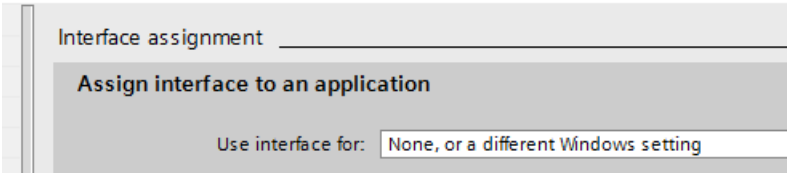




Example 2: Assigning the interface to the SIMATIC PC station

A blue reference line from a selected onboard interface to several software components means that this interface is assigned to the PC station and can therefore be used by all software components. Programming device communication, for example, can be performed through this interface.

Although you can edit the IP address of the interface with this type of interface assignment, this setting is not loaded in the PC system. The IP address must be set in Windows on the PC system. It still makes sense to synchronize IP addresses, for example, to be offered exactly this PC station in the "Extended download" dialog (filter function).



Example 3: None, or a different Windows setting

If you assign the "None, or a different Windows setting" option to an onboard interface, no relation to the inserted software components is possible and therefore also not visible. Only Windows applications can use this interface; however, they are not visible in the configuration. The IP address of the interface is not visible in the configuration as well.

Displaying the position of the interface

The position of the interface is displayed below the "Interface assignment" area in the Inspector window. Depending on the assignment to the PC station or to the Software Controller, the index or the hardware resource/interface type is displayed.

Assigning interfaces for communication of the PC Station V2.x

Interface types

The PC station uses the Ethernet interfaces on the PC for communication. The following communication services are available through these Ethernet interfaces:

- Engineering access to the PC station and the installed components, for example, the S7-1500 Software Controller or WinCC RT Advanced
- HMI connections to the PC station or to the Software Controller
- Data communication (S7 communication of the Software Controller)
- HMI connections, for example, between WinCC RT Advanced and external controllers
- S7 connections routed through the PC

Communication between devices

To enable configured communication between components on the PC and other SIMATIC devices, you need to assign the interface to the PC station. The following Ethernet interfaces can be assigned to PC Station V2.x:

- On-board Ethernet interfaces, for example, X1 and X2, of the SIMATIC IPC (not: on-board CP 1616)
- On-board X2 interface of CPU 1515SP PC

A maximum of 2 on-board interfaces can be assigned.

Engineering functions are possible with all Ethernet interfaces of the PC as long as they are operated under Windows, even if they are not assigned to the PC station.
However, for simplified commissioning, at least one interface must be assigned:

- SIMATIC PC: X1 interface
- CPU 1515SP PC: X2 interface
- No use of external CPs

Note

Interfaces for exclusive use can also be assigned to the S7-1500 Software Controller. These are then not available for the PC station.

Procedure

To assign the interfaces for the communication to the PC station, follow these steps:

1. Select the PC system.
2. Select the desired integrated interface in the device view.
3. In the Inspector window, select the area "General > Interface assignment".
4. Assign the interface to the "SIMATIC PC station".

5. Compile the project with "Edit > Compile".
6. Download the hardware configuration of the PC system to the target device.

Result

After downloading, the interfaces can be used for configured communication services.

Reference

You can find more information on the special aspects of configuring interfaces with the S7-1500 Software Controller in the SIMATIC S7-1500 CPU 150xS operating manual (https://support.industry.siemens.com/cs/de/en/view/109249299).

SIMATIC NET version

Information on the SIMATIC Net version is available at Service&Support under the Entry ID: 63098071 (https://support.industry.siemens.com/cs/document/63098071?lc=en-WW).

SIMATIC NET version for onboard interfaces

The SIMATIC NET version of the onboard interfaces can be found as follows:

1. Select the onboard interface.
2. In the Inspector window, select the area "General > Catalog information".
   - The displayed version is 2.2 for PC Station V2.2
   - The displayed version is 2.1 for a PC System V2.1.
   - The displayed version is 2.0 for a PC System V2.0.
   - For a PC System V1.0, the latest version of the SIMATIC NET CD from the hardware catalog is displayed, for example V8.2, see the description text. STEP 7 does not know the SIMATIC NET version actually used because you are installing and configuring PC System V1.0 with S7-RTM (Station Manager) from the SIMATIC NET CD.

SIMATIC NET version for PC Station

If you select a PC system in the network view and select the "PC Station" area in the Inspector window, the various PC system versions can be selected in the drop-down list.

- Select "PC System V1.0" option: **No** SIMATIC NET version displayed because STEP 7 does not know the SIMATIC NET version actually used, see above.
- Select the "PC-System V2.x" option: The SIMATIC NET version that is loaded and installed along with the PC system configuration is displayed.

Special features of the S7 Modular Embedded Controller

Special features of the S7 Modular Embedded Controller

Recommendation

For new projects we recommend switching to the new product generation with S7-1500 Software Controllers.

Reference

You can find additional information on the S7-modular Embedded Controller in the SIMATIC Embedded Automation S7 Modular Embedded Controller (https://support.industry.siemens.com/cs/de/en/view/37971572) operating instructions.

Introduction and basic procedure

Introduction

S7-modular Embedded Controllers (S7-mEC) are PCs in S7-300 design with preinstalled and preconfigured software:

- Windows Embedded Standard operating system
- WinAC RTX (F)
- SIMATIC NET
- WinCC Runtime (only with EC31-HMI/RTX)

Ethernet interfaces of the S7-modular Embedded Controller

An S7-modular Embedded Controller has two integrated Industrial Ethernet interfaces:

- The X1 PN LAN P1 / X1 PN LAN P2 interface can be configured as a PROFINET interface.
- The X2 P1 PN/IE LAN interface is assigned to the PC station in index 3 at IE General and is preconfigured for Industrial Ethernet communication.

Note

If accessing S7-mEC via Remote Desktop Protocol, ensure that S7-mEC and the Engineering PC/programming device are connected to the same Ethernet subnet.

To access S7-mEC via Remote Desktop protocol, you have to use the IE General network connection (usually X2 P1 PN/IE LAN interface).

Basic configuration and programming of the S7-mEC

Since an S7-mEC is a preconfigured system, follow these steps:

1. Create a project.
2. Insert a PC station.
3. Configure the hardware.
4. Create an S7 program.
5. Configure visualization in WinCC for the EC31-HMI/RTX.
6. Download the configuration data to the WinLC RTX EC.

EC31-HMI/RTX: Configuring visualization

For EC31-HMI/RTX only

Create the visualization project for the EC31-HMI/RTX on the engineering PC, using SIMATIC WinCC.

Requirement

- WinCC is installed on the engineering PC.
- A WinCC RT object had been inserted in the PC station.

Procedure

In order to create a visualization project for EC31-HMI/RTX, follow these steps:

1. Open the device view of the PC station of the EC31-HMI/RTX.
2. Select WinCC RT object.
3. Select the "Open object" command.
   WinCC is started.
4. Create and configure the necessary elements: Pictures, alarms, tags, etc., using the WinCC editors.
5. Save and test the visualization.
6. Transfer the project to the EC31-HMI/RTX target system.

Downloading the configuration data to the target system

Download options

You can download the following configuration data from STEP 7 to the embedded controller:

- The entire PC station (including, for example, IE General)
- Only the configuration data of the WinLC RTX / WinLC RTX F
- Only the S7 program of the WinLC RTX / WinLC RTX F

For an EC31-HMI/RTX, you will need to transfer the configuration data from WinCC.

Requirement

- The enhanced write filter (EWF) must be deactivated on the Embedded Controller if the entire PC station is to be downloaded.
- The embedded controller is connected to the programming device / PC via Industrial Ethernet. The PG/PC interface must be set to TCP/IP.
- **EC31-HMI/RTX only:** The visualization project has been created in WinCC.
- Before the following functions become available, the embedded controller must be connected to the engineering system via a port of the X1 PN LAN interface:
  - Assign PROFINET IO device names
  - PROFINET CBA: Interconnection download and online functions

Procedure

1. Deactivate EWF on the EC31-RTX / EC31-RTX F / EC31-HMI/RTX (if not already deactivated). After EWF has been deactivated, turn off and restart the embedded controller.
2. Start WinLC.
3. Activate the PC station in the Station Configuration Editor ("Enable station" button).
4. Change the embedded controller to STOP mode.
5. Download the hardware configuration, the S7 program and the configuration data to the target system.

Making ready for operation

To make the EC31-RTX / EC31-HMI/RTX ready for operation, follow these steps:

1. Set the enhanced write filter for drive C:\ to the "activated" state.

NOTICE
Flash memory failure If you leave the enhanced write filter in "deactivated" state, you risk an early failure of your flash memory due to the persistent write access of the operating system. When the enhanced write filter is activated, the number of write accesses to the operating system partition is minimized, thereby increasing the life of the flash memory.

2. Record all special settings (such as changes to the IP addresses) made in the course of application development. Store them along with your project.
3. Create a backup copy of your settings.

10.1.4.3 Configuring AS-i devices

Digital addresses

Bit assignment

The bit assignment is determined from the IO code (I/O configuration) of the configured AS-i slave. The following table shows the bit assignment.

IO code	Offset of the input bits				Offset of the output bits			
	0.0	0.1	0.2	0.3	0.0	0.1	0.2	0.3
0 (EEEE)	IN1	IN2	IN3	IN4	-	-	-	-
1 (EEE-)	IN1	IN2	IN3	-	-	-	-	-
2 (EEEE)	IN1	IN2	IN3	IN4	-	-	-	-
3 (EEA-)	IN1	IN2	-	-	-	-	OUT1	-
4 (EEBE)	IN1	IN2	IN3	IN4	-	-	OUT1	-
5 (EAAA)	IN1	-	-	-	-	OUT1	OUT2	OUT3
6 (BBBB)	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4
7 (BBBB)	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4
8 (AAAA)	-	-	-	-	OUT1	OUT2	OUT3	OUT4
9 (AAAE)	-	-	-	IN1	OUT1	OUT2	OUT3	-
A (AAAB)	-	-	-	IN1	OUT1	OUT2	OUT3	OUT4
B (AAEE)	-	-	IN1	IN2	OUT1	OUT2	-	-
C (AABB)	-	-	IN1	IN2	OUT1	OUT2	OUT3	OUT4
D (AEEE)	-	IN1	IN2	IN3	OUT1	-	-	-
E (ABBB)	-	IN1	IN2	IN3	OUT1	OUT2	OUT3	OUT4

IN1 = first input of the AS-i slave, IN2 = second input of the AS-i slave, etc.

OUT1 = first output of the AS-i slave, OUT2 = second output of the AS-i slave, etc.

Note

The labeling of the inputs and outputs on the AS-i slaves may differ from this illustration.

For A/B slaves (with ID code = A), output bit offset 0.3 is not occupied. Exception: An A/B slave with 4 inputs and 4 outputs (IO code = 7, ID code = A) occupies all output bits.

The actual address of the bit is calculated from the input and/or output address plus that of the offset given in this table.

Example

Input address 100.0 and output address 200.4 have been set. The IO code of the slave has been set to "3 (EEA-)". The AS-i slave data then lies in the process image on input and/or output bits E100.0, E100.1 and A200.6.

Network configuration of AS interface

AS-Interface consists of an AS-i master and AS-i slaves connected to each other over an AS-i subnet.

Rules for AS interface network configuration

All the nodes in an AS-i subnet must have a different AS-i node address.

You should only load the settings over the network when all the modules in a subnet have different addresses and when the actual structure matches that of the network configuration you have created.

One AS-i master and up to 62 AS-i slaves can be operated on an AS-i subnet.

For more information on configuring an AS-Interface with an AS-i master and AS-i slaves, refer to the section on AS-Interface and the documentation of the AS-i master modules.

I/O range

Input and output ranges

The CM AS-i Master ST module has an I/O range (process image for inputs and outputs) for transferring the AS-i slave input and output data to the CPU of the PLC.

The permissible length of the I/O range, as well as the assignment of I/O addresses to AS-i slaves, is dependent on the configuration used. The input and output ranges have the same length.

The length of data configured is always transferred, although data not used by slaves is filled with substitute values.

If a configured slave is not present (e.g. in the event of slave failure), the allocated input range is populated with substitute values.

In the event of a slave failure, no I/O area access error is generated because the entire I/O range is transferred, filled with either process values or substitute values.

In order to achieve the best possible performance, select the length of the I/O range based on the volume of data used by the slaves.

If the length is set to > 32 bytes, the module in the ET 200SP slot uses time division multiplexing to internally transfer data with a block size of 32 bytes.

Properties of the I/O range for different configurations

CM AS-i Master ST, FW version V1.0

Length of I/O range: 32 bytes

The digital inputs and outputs of the AS-i slaves are assigned to the addresses in the I/O range according to a defined format. See the table below for more details.

The analog inputs and outputs of the AS-i slaves can be transferred via data record communication.

The following table shows the assignment of the digital I/O address to the AS-i slave address:

Byte	Bit 7 … 4	Bit 3 … 0
n+0	Reserved	Slave 1 or 1A
n+1	Slave 2 or 2A	Slave 3 or 3A
n+2	Slave 4 or 4A	Slave 5 or 5A
n+3	Slave 6 or 6A	Slave 7 or 7A
n+4	Slave 8 or 8A	Slave 9 or 9A
n+5	Slave 10 or 10A	Slave 11 or 11A
n+6	Slave 12 or 12A	Slave 13 or 13A
n+7	Slave 14 or 14A	Slave 15 or 15A
n+8	Slave 16 or 16A	Slave 17 or 17A
n+9	Slave 18 or 18A	Slave 19 or 19A
n+10	Slave 20 or 20A	Slave 21 or 21A
n+11	Slave 22 or 22A	Slave 23 or 23A
n+12	Slave 24 or 24A	Slave 25 or 25A
n+13	Slave 26 or 26A	Slave 27 or 27A
n+14	Slave 28 or 28A	Slave 29 or 29A
n+15	Slave 30 or 30A	Slave 31 or 31A
n+16	Status data	Slave 1B
n+17	Slave 2B	Slave 3B
n+18	Slave 4B	Slave 5B
n+19	Slave 6B	Slave 7B
n+20	Slave 8B	Slave 9B
n+21	Slave 10B	Slave 11B
n+22	Slave 12B	Slave 13B
n+23	Slave 14B	Slave 15B
n+24	Slave 16B	Slave 17B
n+25	Slave 18B	Slave 19B

n+26	Slave 20B	Slave 21B
n+27	Slave 22B	Slave 23B
n+28	Slave 24B	Slave 25B
n+29	Slave 26B	Slave 27B
n+30	Slave 28B	Slave 29B
n+31	Slave 30B	Slave 31B

n = Start address

Status data only possible with CM AS-i Master ST from FW version V1.1 onwards, otherwise these 4 bits are not used (reserved).

CM AS-i Master ST, from FW version V1.1 with configuration via acceptance of ACTUAL configuration, e.g. via SET button

Note

No configuration of AS-i slaves in STEP 7 and/or configuration via GSD

Switchable I/O range length: 16 bytes or 32 bytes

The digital inputs and outputs of the AS-i slaves are assigned to the addresses in the I/O range according to a defined format. See above table.

The analog inputs and outputs of the AS-i slaves can be transferred via data record communication.

When the length is set to 16 bytes, the digital I/Os of the AS-i slaves with B addresses are not transferred.

When the length is set to 32 bytes, 4 bits of status data can be additionally transferred.

CM AS-i Master ST, from FW version V1.1 with configuration of AS-i slaves in STEP 7 (i.e. selection of AS-i slaves from hardware catalog)

Settable I/O range length: 4 ... 288 bytes

Possible settings: 4, 8, 12, 16, 20, 24, 28, 32, 64, 96, 128, 160, 192, 224, 256, 288 bytes

The digital and analog inputs and outputs of the AS-i slaves can be freely assigned within the I/O range.

The digital and analog inputs and outputs of the AS-i slaves can also be transferred via data record communication.

Further factors affecting the length of the I/O range:

Length of I/O range: 4 ... 256 bytes for configurations with IM 155-6 PN ST from FW V3.1 onwards
Length of I/O range: 4 ... 32 bytes for configurations with IM 155-6 PN ST < FW V3.1
Restriction when operating under CPU S7-300 FW version < V3 - length of I/O range: max. 224 bytes

Length of I/O range: 4 ... 32 bytes for configurations with IM 155-6 DP HF

I/O configuration for AS-i slaves

I/O configuration

The I/O configuration is assigned as follows on the basis of the I/O code standard:

Table 10-81 AS-i standard slave

I/O code	I/O configuration			
	D0	D1	D2	D3
0	I	I	I	I
1	I	I	I	O
2	I	I	I	B
3	I	I	O	O
4	I	I	B	B
5	I	O	O	O
6	B	B	B	B
7	B	B	B	B
8	O	O	O	O
9	O	O	O	I
A	O	O	O	B
B	O	O	I	I
C	O	O	B	B
D	O	I	I	I
E	O	B	B	B
F	F	F	F	F

Key: I=Input; O=Output; B=Bidirectional (input/output); F=TriState

Table 10-82 AS-i A/B slave

I/O code	I/O configuration			
	D0	D1	D2	D3
0	I	I	I	I
1	I	I	I	-
2	I	I	I	I
3	I	I	O	-
4	I	I	B	I
5	I	O	O	-
6	B	B	B	I
7	B	B	B	I
8	O	O	O	-
9	O	O	O	I
A	O	O	O	I
B	O	O	I	I

E	O	B	B	I
F	F	F	F	F

Key: I=Input; O=Output; B=Bidirectional (input/output); F=TriState

Operating principle of the safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe AS-i input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

For the function of a safe AS-i output, you need the following components:

- A control unit
- An evaluation unit

Control unit

The control unit outputs safety-related IN or OUT control commands to the AS-i bus. The control unit is integrated in the F-CM AS-i Safety ST module. The control unit assumes an active position in the communication. It acts like an AS-i slave and has an AS-i address that must be called by the AS-i master. The values in the output data of the AS-i master are not relevant in this case. The F-CM AS-i Safety ST module inserts the safety-related control data into the communication data.

Besides controlling the OFF state according to specification, a control unit can control up to four different output switching states: F-OUT 1, F-OUT 2, F-OUT 3, and F-OUT 4. The F-CM AS-i Safety ST module, however, makes available only the output switching state F-OUT 1, i.e., The OFF and ON states are controlled.

In addition to the switching states, a control unit can send out two different auxiliary signals: AUX1 and AUX2. You can use these auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, the AUX1 and AUX2 signals are mapped in the safe process image output. The auxiliary signals are not safety-related signals, however. During control by the safety program, the F-CM AS-i Safety ST module sends a sequence from each auxiliary signal one after the other on the AS-i bus. Up to 16 different control units can be activated in the F-CM AS-i Safety ST module. The control units are managed in the F-CM AS-i Safety ST module as switching group 0 to switching group 15.

If you want to use more than 16 different control units, you can plug two F-CM AS-i Safety ST modules into the ET 200SP station.

Observe the information on the bus configuration in Section AUTOHOTSPOT.

NOTICE
Uniqueness of the AS-i address on the AS-i bus Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Evaluation unit

The evaluation unit reads the safety-related control commands ON or OFF on the AS-i bus and passes corresponding switching commands, e.g., to switching contacts. In case of error, e.g., communication error on the AS-i bus, the evaluation unit switches off. The evaluation unit is integrated in the safe AS-i output module to which, for example, drive contactor coils are connected. The evaluation unit behaves as a passive unit in the AS-i communication. The master does not detect the evaluation unit and does not call it. The evaluation unit monitors the communication of the AS-i address of the control unit and reacts to its safety-related control signals.

You set the AS-i address (see Section "Control unit") the evaluation unit is to monitor.

You can set multiple evaluation units to the same address so that a control unit can control multiple safe output modules simultaneously.

NOTICE
Bus cycle time for safe AS-i outputs An evaluation unit requires a minimum AS-i bus cycle time. Ensure that at least 5 AS-i addresses are present on the AS-i bus. Otherwise, the control unit goes to error state. When A/B slaves are used, at least 5 different numerical AS-i addresses must be present. That is, a combination of slave addresses 1A and 1B count as 1 numerical address. The F-CM AS-i Safety ST module does not have a monitoring function for this configuration rule.

Teaching ASIsafe code sequences

Operating principle of code sequences of safe AS-i slaves

Function of the code sequences

To monitor safety-related AS-i input slaves, they must be declared to the system. To do this, the F-CM AS-i Safety module requires information about the code sequences sent by the slaves. To prevent mix-ups of the AS-i input slaves on an AS-i bus, each slave must use a different code sequence. The code sequences are permanently stored in the input slave.

The recording, checking, and storing of these code sequences in the F-CM is referred to as "teaching code sequences”.

Once the F-CM detects a new code sequence, the teaching of the code sequences starts automatically. The user must confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i components.

The F-CM module checks each code sequence for correctness of data content and then sets the safe input image depending on the evaluation.

Initial commissioning

During initial commissioning, the code sequences are taught at the F-CM from the safe AS-i input slaves that exist on the AS-i bus and then transferred into the non-volatile memory. Both the slaves for which input monitoring is activated as well as the other safe input slaves are detected.

Replacement of a safe input slave

After replacement of a safe input slave, the new code sequence must be taught and saved.

Transferring code sequences

In the non-volatile memory, you can transfer the code sequences in one of the following ways:

- Click the "Transfer taught code sequences" button
- Press the "Transfer taught code sequences" button
- Via the user program, see F-CM AS-i Safety ST Manual

Replacement of the F-CM module

The non-volatile memory is located in the BaseUnit, which means that code tables that are transferred after the F-CM module is replaced are retained.

Unsaved code sequences

For safe input slaves having code sequences that are not saved or do not correspond to the saved code sequence, the input channel is passivated and assigned the substitute value 0.

Safety-related communication for safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

"Learn ASIsafe code sequences" dialog

Description of the “Learn ASIsafe code sequences” dialog

The dialog displays an overview of the existing code sequences of the safety-oriented AS-i slaves. For this purpose, code sequences read in at the AS-i bus can be transferred to the F-CM AS-i Safety ST module memory.

Code sequences can be read in by activating the dialog under "Functions" in "Online & Diagnostics" of the F-CM.

See also: Operating principle of code sequences of safe AS-i slaves (Page 1152)

The dialog can only be opened if there is an online connection to the controller or F-CM.

Before the teaching of the code sequences, load the hardware configuration into the controller modules so that the online configuration of the F-CM agrees with the offline configuration.

The "ASIsafe code sequences" dialog does not make any changes to the module configuration and can also be opened for information during operation.

The displayed information is obtained online from the F-CM module. There is no comparison with the offline configuration in this case.

The dialog displays the following information for each AS-i address within the "AS-i addresses 0…15" and "AS-i addresses 16…31":

Slave status (Page 1154)

Code sequence (Page 1155)

F-IN 1…2 (Page 1155)

F-OUT 1…4 (Page 1156)

Information on the slave status is displayed in the TIA Portal for the AS-i address 0.

Under this information, you will find the Transfer taught code sequences (Page 1157) button and the progress display for the teaching process (Page 1156).

You can exit the dialog at any time without having to make changes to the data. Code sequences can also be only partially transferred.

Description of the “Slave Status” column

Slave status

The "Slave status" column displays information about the AS-i address via a color code:

Gray: The AS-i slave is neither configured nor detected on the AS-i network.

Green (without checkmark): The address is present on the AS-i bus but is not activated in the configuration of the F-CM (input monitoring/output control deactivated). The slave on the AS-i bus is a safe slave or a standard slave. It is available for use by the AS-i master or another module.

Green with checkmark: The address is present on the AS-i bus and corresponds to the configuration of the F-CM (input monitoring or output control is activated).

Yellow: Error detected: The address is present on the AS-i bus but does not correspond to the configuration of the F-CM (input monitoring or output control is activated). Check the slave, replace the slave with the required slave or change the configuration.

Red: Error detected: The address is not present on the AS-i bus but is required in the configuration of the F-CM (input monitoring or output control is activated). Check whether the slave exists on the bus and was included in the communication by the AS-i master. Check whether the slave is contained in the configuration of the AS-i master and correct the bus configuration as required.

Description of the “Code sequence" column

The "Code sequence" column shows information about the AS-i address via a color code:

Gray: No code sequence is needed for the address

Green (without checkmark): A new code sequence was taught but not transferred to the memory. The transfer is possible via the "Transfer taught code sequences" button.

Green with checkmark: The code sequence was transferred to the non-volatile memory.

Note: The status is also displayed when the output control is activated for this address. The code sequences for safe outputs are automatically pre-defined in the F-CM and are not transferred into the non-volatile memory of the code sequences.

Yellow: Error detected: A code sequence was taught that is already being used by another slave. Safe operation is not possible. Replace the slave with a different slave.

Red: Warning or error: The address is sending an incomplete or invalid code sequence. Check whether the ON signal is assigned to both inputs of the safe input slave. If required, actuate the associated safety contacts (contacts must be closed). Check whether there is a cross circuit at the inputs and correct the wiring of the inputs as needed.

Description of the "F-IN 1...2" column

The states of the safety-related AS-i input channels are displayed in the F-IN1 and F-IN2 columns via a color code.

Meanings of the color codes for F-IN 1...2

Red: Error, e.g. code sequence error. The status of the input channel cannot be read in. The substitute value 0 is used.

Yellow: The input channel shows the value 0 (OFF state) or is not present.

Note

Condition monitoring

The status indication is unambiguous once the code sequence has been taught for a safe input slave (ON signal assigned to both inputs), or when an ON signal has been read in for externally controlled safe output slaves.

Green: Signal=1: Contact F-IN closed

White: Signal=0: Contact F-IN open

Gray: The input channel is not present. A safe input slave was not detected at the address.

Description of the "F-OUT 1...4" column

The states of the safety-related AS-i output channels are displayed in the columns F-OUT1 to F-OUT4 via a color code.

Meanings of the color codes for F-OUT 1...4

Red: Error, e.g. code sequence error. The status of the output channel cannot be read in.

Yellow: The output channel shows the value 0 (OFF state) or is not present.

Note

Condition monitoring

The status indication is unambiguous once the code sequence has been taught for a safe input slave (ON signal assigned to both inputs), or when an ON signal has been read in for externally controlled safe output slaves.

Green: Signal=1: Channel On (ON status)

White: Signal=0: Channel Off (OFF status)

Gray: The output channel is not present. A safe output slave was not detected at the address.

Display of teaching progress

Progress bar "Teaching in progress"

If at least one safe slave whose code sequence has not yet been taught is detected on the AS-i bus, an active progress bar is displayed. Check the displays in the "Code sequence" column and ensure that the safe slaves send their code sequences.

Trained slaves

The "Trained slaves" output field shows the number of code sequences that has already been applied in relation to the number of code sequences that can still be applied. The number ratio of the output field "Taught slaves" is also displayed as a percentage. If the display reads 100%, all of the code sequences of the existing safe AS-i slaves are transferred into the non-volatile memory.

"Transfer taught code sequences" dialog

Description of the "Transfer taught code sequences" dialog

After the "Transfer taught code sequences" button is actuated, a dialog opens with a prompt asking if the code sequences should be transferred. You must confirm that you are addressing the correct module. As a check, the green LED "ADDR" on the front panel of the F-CM module flashes.

- You can cancel the prompt using the "No" button without transferring the code sequences.
- If you click "Yes", the taught code sequences are transferred into the non-volatile memory. Next, the input data of the safe AS-i input slaves is evaluated, allowing reintegration in the safety program.

WARNING

Plant components can be switched on

Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before the transfer, ensure that no personnel injuries or property damage can occur. After transferring, check the safety equipment for proper functioning.

The "Transfer taught code sequences" button is deactivated when all taught code sequences have already been transferred to the non-volatile memory.

10.1.4.4 S7-1200 CM/CP

Telecontrol modules

Telecontrol CPs and TIM

CP identification

Reference

CPs using the "TeleControl Basic" protocol.

"CP identification" parameter group

One project number for the entire STEP 7 project

If you change the project number for a CP in the "CP identification" parameter group, this parameter is changed for all CPs in the entire STEP 7 project using the "TeleControl Basic" protocol.

TCSB evaluates project numbers from 1 ... 2000.

Configuration of the station number

You need to configure a unique station number for each station in the STEP 7 project that uses a CP using the "TeleControl Basic" protocol.

TCSB evaluates station numbers from 1 ... 8000.

Access ID

The access ID displayed in the "CP identification" parameter group is made up of the hexadecimal values of the project number, station number and slot. The parameter of the type DWORD is allocated as follows:

- Bits 0 - 7: Slot
- Bits 8 to 20: Station number
- Bits 21 to 31: Project number

Parameter groups

Communication types

In this parameter group, you enable the communication types you want to use for the particular module.

To minimize the risk of unauthorized access to the station via Ethernet, you need to enable the communications services that the module will execute individually. You can leave all options disabled if you do not need them. However, at least one option should be enabled in a telecontrol CP.

"Communication types" parameter group

- **Activate online functions**
  In the module enables access to the CPU for the online functions (diagnostics, loading project data etc.). If the function is enabled, the engineering station can access the CPU via the module.
  If the option is disabled, you have no access to the CPU via the module with the online functions. Online diagnostics of the CPU with a direct connection to the interface of the CPU however remains possible.
- **Enabling S7 communication**
  Enables the functions of S7 communication with a SIMATIC S7 and S7 routing.
  If you configure S7 connections to the relevant station, and these run via the module, you will need to enable this option.
- **Enable telecontrol communication**
  In the module, enables the telecontrol communication. Depending on the module type, the following protocols can be used:
  - ST7
    Enables communication with a control system that supports the ST7 protocol.
  - TeleControl Basic
    Enables communication with the telecontrol server.
  - DNP3
    Enables communication with up to four DNP3 masters.
  - IEC 60870-5-104
    Enables communication with up to four IEC masters.

Note

Full telecontrol functionality only enabled Security functions

For the following functions, you need to enable the Security functions:

- Send messages (e-mails / SMS) via the telecontrol functionality
- Use of the "TeleControl Basic" (general) protocol
- Use of the DNP3 Security functions
- Use of certificates

Note

Loss of configuration data when changing the telecontrol protocol

If you change the protocol on a configured module, protocol-specific configuration data is lost, for example, the data point configuration, the partner configuration and the messages (e-mails).

Ethernet interface

Time-of-day synchronization

Time-of-day synchronization with S7-1200

Note

Recommendation: Time-of-day synchronization only by 1 module

Only have the time of day of the station from an external time source synchronized by a single module so that a consistent time of day is maintained within the station.

When the CPU takes the time from the CP, disable time-of-day synchronization of the CPU.

Module and synchronization method

When using an external time source, the S7-1200 station can obtain the current time of day both via the CPU as well as via a CP.

With the S7-1200 there is no forwarding of the time of day from the station to the subnet.

Time-of-day synchronization of the CPU

As the synchronization method, with the CPU only NTP can be selected.

For the options for setting the CPU time via a telecontrol CP see below.

Time-of-day synchronization of telecontrol CPs

The following synchronization methods are available:

- **NTP**
  NTP can only be used when the telecontrol communication is disabled. In this case, the telecontrol CP is used as an extended PROFINET interface.
- **Time from partner**
  When telecontrol communication is enabled, the CP automatically takes the time-of-day from the communications partner.
- **Time from the CPU**
  All CMs/CPs of the station are synchronized by the time of the CPU.

Note

Forwarding the time to the CPU

Depending on the firmware version of the modules involved, the time-of-day of the CP is forwarded to the CPU in different ways:

- Optional forwarding of the CP time to the CPU using a PLC tag
- Obligatory forwarding of the CP time to the CPU via the backplane bus

Forwarding the time from the CP to the CPU

The forwarding of the CP time to the CPU depends on the firmware version of the CP and the CPU. Note the following behaviour.

- **CP firmware ≤ V2.1.5**
  With this firmware version the CP can make the time-of-day available to the CPU as an option via a PLC tag. When this PLC tag is read cyclically by the CPU, the CPU adopts the CP time.
  For TLC tags, see parameter group "Communication with the CPU" of the CP.
- **CP firmware ≥ V2.1.7 and CPU firmware ≥ V4.2**
  If both modules in the station have one of the named firmware versions, the time of day of the CP is automatically forwarded to the CPU. Since the CPU automatically adopts the CP time, you no longer require the forwarding option using the PLC tag.
  If for the CPU the option "CPU synchronizes the modules of the device" is enabled in "PROFINET interface > Time synchronization", all smart modules of the station are synchronized with the CPU time.

Time-of-day synchronization with NTP

NTP mode

In NTP mode, the CP sends time-of-day queries at regular intervals to one or more NTP servers. From the responses of the servers, the module selects the most accurate time of day.

The advantage of this mode is that it allows the time to be synchronized across subnets.

NTP generally uses UTC (Universal Time Coordinated). This corresponds to GMT (Greenwich Mean Time).

NTP server and synchronization interval

The IP address of at least one NTP server must be configured.

The synchronization interval specifies the cycle of the time-of-day queries to the NTP server. Depending on the selected module, the cycle can be selected from a drop down list or configured within a range of values between 10 seconds and 1 day (86400 seconds).

"Accept time of day from non-synchronized NTP servers" option

If the option is supported by the selected module the following behavior applies:

- Enabled
  The module also accepts the time-of-day from non-synchronized NTP servers with stratum ≥ 15.
- Disabled
