

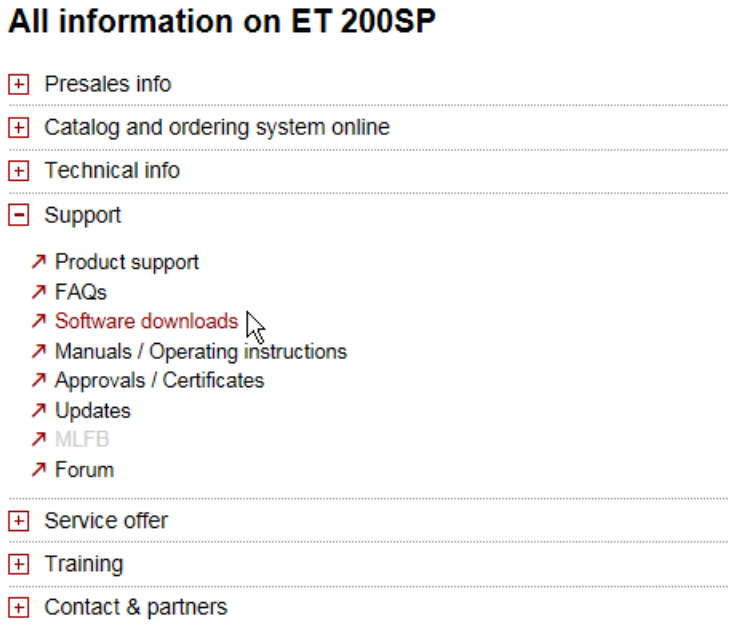

Figure 1-437 Selecting the software downloads

- Before installing the firmware update, make sure that the modules are not being used.

NOTICE
Firmware update for fail-safe motor starters In the case of fail-safe motor starters, the firmware update is permissible only if the motor starter is the only module on a rack. Make sure before a firmware downgrade of fail-safe motor starters with a F-DI BaseUnit (MS5-MS10) that the associated F-DI is on 1-signal (=value of "1"). Also make sure that the motor starter is only connected to the device on which the firmware is being updated (e.g. PG/PC or CPU).

NOTICE
Loss of the safety function after an incorrect firmware update The safety functions can be lost if you inadvertently install a firmware update on a motor starter for which the update was not intended. Make sure that the PG/PC or the CPU is exclusively connected to the motor starter on which the firmware is being updated.

NOTE

Securing the supply voltage

On starting, and during the firmware update, the 24 V DC supply voltage must be applied at the header module and the motor starter.

NOTE

Interrupted firmware update

If a firmware update has been interrupted, remove and reconnect the affected module before a renewed firmware update.

⚠ WARNING

Risk of impermissible system states

The CPU switches to STOP mode or the interface module to "station failure" as a result of the firmware update being installed. STOP or station failure due to a firmware update can cause an unpredictable motor starter state. After completion of the update, the current PIO and the input actions take effect again.

Unexpected operation of a process or a machine can lead to fatal or severe injuries and/or to property damage.

Before installing the firmware update, ensure that the motor starter, the CPU and the interface module are not executing an active process.

More options for the firmware update

The following options are available for updating firmware:

- Online via PROFINET IO/PROFIBUS DP (with STEP 7), see below
- Via the integrated Web server (possible for CPU as well as centralized and distributed I/O modules), see below
- With the TIA Portal:
  - Non-fail-safe ET 200SP motor starter, SIMATIC STEP 7 V13 SP1 or higher with installed HSP
  - Fail-safe ET 200SP motor starter, SIMATIC STEP 7 V14 or higher with installed HSP
- Via a SIMATIC memory card, see below
- With SIMATIC STEP 7 Version V5.5 SP4 or higher

Procedure using STEP 7

Proceed as follows to perform an online firmware update with STEP 7:

1. Select the module in the device view.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select the "Firmware update" group in the "Functions" folder.
4. Click the "Browse" button to select the path to the firmware update files in the "Firmware update" area.
5. Select the suitable firmware file. The table in the firmware update area lists all modules for which an update is possible with the selected firmware file.
6. Click the "Run update" button. If the module can interpret the selected file, the file is downloaded to the module.

NOTE

If a firmware update is interrupted, you need to remove and insert the module before starting the firmware update again.

Procedure using a SIMATIC memory card
Proceed as follows to perform a firmware update via the SIMATIC memory card:

1. Insert a SIMATIC memory card into the SD card reader of your programming device / computer.
2. To save the update file on the SIMATIC memory card, mark the SIMATIC memory card in the project navigator under "Card reader/USB memory".
3. In the "Project" menu, select the command "Card Reader/USB memory → Create firmware update memory card".
4. Use a file selection dialog to navigate to the firmware update file. In a further step you can decide whether you want to delete the content of the SIMATIC memory card or whether you want to add the firmware update files to the SIMATIC memory card.
5. Insert the SIMATIC memory card containing the firmware update files in the CPU.

Procedure using the Web server
The procedure is described in the Function Manual Web server (http://support.automation.siemens.com/WW/view/en/59193560).

Behavior during the firmware update

Note the following behavior during the firmware update of the motor starter:

- The LEDs flash as described in chapter "Status and error displays (Page 115)".
- The motor starter powers up again after completion of the firmware update. Diagnoses are reset. The firmware update does not affect the thermal motor type and the cooling time.
- The sensor supply of the DI module remains active.

Behavior after the firmware update

After the firmware update, check the firmware version of the updated module. A successfully loaded firmware update is activated immediately.

If a fail-safe motor starter is in "Manual local" mode during the firmware update, the motor starter switches to Commissioning mode (Page 100) after the successful firmware update operation. You must first confirm ATEX parameters before you can perform manual local control (see Configuring ATEX operation (Page 107)).

Online help for STEP 7

You can find more information on the procedure in the STEP 7 online help.

Parameters/address space

8

8.1 Parameter assignment

When configuring an ET 200SP motor starter, the full parameterization scope is set and automatically transferred to the motor starter. When parameterizing in the user program, the parameters are transferred to the module via the data sets with the statement "WRREC". If the CPU initiates a new parameter assignment, e.g. if communication breaks down, the parameterization is overwritten by the system parameterization via the user program.

The modules of the ET 200SP distributed I/O system support the full parameterization scope of the ET 200SP motor starters.

NOTE

List of supported ET 200SP header modules

You will find a list of the compatible ET 200SP header modules in the Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/109485777).

NOTE

Reduction to default parameters

In the following cases, the full scope of parameterization is reduced by the configuring software to the standard parameters (DS201) for system reasons:

- Activated DPV0 alarm mode (in the case of PROFIBUS IMs)
- Activated option handling (in the case of PROFIBUS IMs)
- When configuring using a GSD (for parameters, see Read/write DS201 device parameter 1 (Page 139))

NOTE

Trip RESET

When you send valid parameters to the motor starter, a trip RESET is triggered. Acknowledgeable active faults are deleted.

Parameters for ET 200SP motor starter

The effective range of the adjustable parameters depends on the type of configuration. The following configurations are possible:

- Centralized operation with an ET 200SP CPU and the ET 200SP Open Controller
- Distributed operation on the PROFINET IO in an ET 200SP system
- Distributed operation on the PROFIBUS IO in an ET 200SP system

When you assign parameters in the user program, transfer the parameters to the module via the data sets with the "WRREC" statement.

The parameters that can be set can be found in the Appendix in Read/write DS201 device parameter 1 (Page 139) and Read/write DS202 device parameter 2 (Page 141).

You will find an explanation of the parameters in Chapter Declaration of parameters (Page 103).

NOTE
Changing the parameters during operation
If parameters are modified during operation, they will be overwritten by the parameters configured in the hardware configuration during a restart of the control system.
If this is not desired, a command must be issued to disable parameterization.

You set the parameter block in theDS93 Write command (Page 136).

8.2 Commissioning mode

Commissioning mode is available for fail-safe ET 200SP motor starters.

When setting up a system, you can test the wiring without the functioning PROFINET or PROFIBUS connection. Perform the test in commissioning mode.

The motor starter switches to commissioning mode in the following cases:

- After the power supply has been activated, the motor starter does not receive any parameterization via the backplane bus.
- The DI module's "Local Control" switch is activated.
  As soon as Local Control is active, the parameterization saved last is used when the power supply is activated. Control via the DI module is possible after confirmation via the TEST/RESET button.

To switch to commissioning mode in the case of fail-safe motor starters, confirm the change with the blue button. During ATEX operation, additionally confirm the current parameters, as described in chapter "Configuring ATEX operation (Page 107)".

If the motor starter receives valid parameterization via the backplane bus in commissioning mode, the parameterization is placed in intermediate storage. The parameterization becomes active when "Local Control" is terminated (motor OFF). The commissioning mode is exited.

Inputs for commissioning
To ensure operation of a motor in the unparameterized state of the ET 200SP motor starter with the aid of the 3DI/LC module, the input parameters in data record 201 are permanently assigned the following values by default:

- DI1: Motor CW
- DI2: Motor CCW
- DI3: Cold start (fail-safe motor starters as of V1.2.0)

This pre-parameterization is overwritten when the ET 200SP motor starter is parameterized.

8.3 Parameterization using a GSD file

For the ET 200SP-IM155 interface module of the ET 200SP system, there are two different GSD files, one for operation with PROFINET and one for operation with PROFIBUS. The GSD and GSDML files can be used with STEP 7 V5.5 SP4 and higher, and TIA Portal V13 SP1 and higher.

If you configure the ET 200SP motor starter in the PROFIBUS environment with GSD, and the standard values in data set 202 have to be changed, then you create data set 202 via the user program on initial commissioning of the starter. Transfer the data set to the PLC.

Parameterization with the PROFINET GSDML file

The ET 200SP motor starter can be fully configured with all parameters with the GSDML file for PROFINET.

Parameterization with the PROFIBUS GSD file

Two parameter data sets (DS201 and DS202) are used for configuring the ET 200SP motor starter. Only data set DS 201 is ever transferred as the startup data set when using a PROFIBUS GSD.

8.4 Slot rules

You can find further information on the structure of a system with an ET 200SP motor starter in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

8.5 Data plausibility check

Check of the incoming parameters in the "Automatic" and "Manual bus" modes

The motor starter checks all incoming parameters for validity and plausibility, provided manual local mode is not active. The valid parameters are stored in data set 203 and 204.

In the case of incorrect parameters during startup (after power ON):

- The diagnoses "Group fault" and "Invalid parameter value" are set in the DS92 Read device diagnostics (Page 133).
- The motor remains shut down.
- An "Invalid parameter value" logbook entry (object number 365) is created in DS73 logbook - Read triggering operations (Page 131).
- The currently valid parameter values are retained and can be read via the Read DS203 device parameter 1 (Page 142). Incorrect parameters can be read back and verified in the Read/write DS201 device parameter 1 (Page 139).

In the case of incorrect parameters from the user program and when the motor is switched off:

- The "Group warning" and "Invalid parameter value" diagnoses are set and the number of the invalid parameter is entered in DS92 Read device diagnostics (Page 133).
- A logbook entry is created in the DS75 logbook - Read events (Page 132).
- The currently valid parameter values are retained and can be read via the Read DS203 device parameter 1 (Page 142). Incorrect parameters can be read back and verified in data set 201.

For parameters when the motor is running:

- The parameters are not accepted by the starter.
- The "Parameters cannot be changed in ON state" maintenance alarm is set if the maintenance alarm is enabled in the current parameterization.
- The "Group warning" and "Invalid parameter value" entries are set in DS92 Read device diagnostics (Page 133) and the number of the invalid parameter is entered.
- The motor is not switched off.
- A logbook entry is created in the DS75 logbook - Read events (Page 132).
- The currently valid parameter values are retained and can be read via the Read DS203 device parameter 1 (Page 142). Incorrect parameters can be read back and verified in the Read/write DS201 device parameter 1 (Page 139).

Checking incoming parameters in "Manual local" mode

The incoming parameters are checked as follows in "Manual local" mode:

- When the motor is switched off:

  The motor starter saves the parameter and accepts it only when the motor starter has switched over to "Automatic" mode again. Only after changing to "Automatic" are the parameters checked.
- When the motor is running:
  - The parameters are not accepted by the motor starter, even if the motor starter changes later to "Automatic" mode.
  - The diagnosis "Parameters cannot be changed in ON state" is set in the DS75 logbook - Read events (Page 132).
  - The diagnosis "Group warning" is set.
  - The motor is not switched off.
  - A logbook entry is created
  - The currently valid parameter values are retained.

Checking incoming parameters in "Manual bus" mode

The incoming parameters are not accepted and saved in "Manual bus" mode.

8.6 Declaration of parameters

Trip class

The trip class (CLASS) specifies the maximum time within which a protective device must trip from a cold state at 7.2x the setting current (motor protection to IEC 60947).

For more information, see Chapter Overload protection (Page 55).

Rated operational current I_e

This is where you can enter the rated operational current that the branch (switchgear and motor) can carry without interruption. The setting range depends on the relevant device's rating class.

For more information, see Chapter Rated operational current (Page 48).

Blocking current

If the blocking current is overshot, the motor starter detects stalling.

For more information, see Chapter Blocking time and blocking current (Page 70).

Blocking time

The blocking time is the time a motor block can be permitted without tripping the motor. If the blocking time expires and the system is still stalled, the motor starter switches off.

For more information, see Chapter Blocking time and blocking current (Page 70).

Diagnosis Electronics supply voltage too low

With this device parameter, you define whether a message is to be displayed if the supply voltage is too low (as of firmware V1.2.0).

Input n action

Different actions can be triggered when an input signal is present.

You can find out which actions you can parameterize depending on "Input n level", "Input n signal" and "Mode" in chapter Inputs (Page 76).

Input n level

You use this device parameter to specify the input logic.

For more information, see Chapter Inputs (Page 76).

Input n signal

You use this device parameter to determine whether or not the input level of the digital inputs is to be saved.

For more information, see Chapter Inputs (Page 76).

Load type

Here, you can specify whether the motor starter must protect a 1-phase load (direct-on-line starters only) or a 3-phase load.

For more information, see Chapter Load type (Page 49).

Upper/lower current limit

You can enter a lower and/or an upper current limit value.

NOTE
The current limits are not activated for startup override until the CLASS time expires, e.g. after 10 seconds for CLASS 10.

For more information, see Chapter Upper/lower current limit (Page 69).

Upper/lower current warning limit

You can enter a lower and/or an upper current warning limit value.

NOTE
The current limits are not activated for startup override until the CLASS time expires, e.g. after 10 seconds for CLASS 10.

For more information, see Chapter Upper/lower current warning limit (Page 69).

Group error diagnostics

You use this parameter to determine whether diagnostics via PROFINET or PROFIBUS DP (fault type) are enabled or disabled.

For more information, see Chapter Group fault diagnostics/group warning diagnostics (Page 76).

General warning diagnostics

You use this device parameter to determine whether or not a maintenance alarm is forwarded to the higher-level CPU.

For more information, see Chapter Group fault diagnostics/group warning diagnostics (Page 76).

Thermal motor model (response to overload)

You use this device parameter to determine how the motor starter is to respond to overload.

For more information, see Chapter Overload protection (Page 55).

Response to CPU/master STOP

Determines the module's response to CPU STOP.

For more information, see Chapter Response to CPU/master STOP (Page 76).

Response to residual current detection

You use this device parameter to specify how the motor starter is to respond to residual current detection.

For more information, see Chapter Response to residual current detection (Page 65).

Response to asymmetry

You use this device parameter to determine how the motor starter is to behave in the event of asymmetry.

For more information, see Chapter Asymmetry monitoring (Page 73).

Warning limit motor heating

The motor starter displays a warning if the motor heating limit is overshot. You use this parameter to preset a motor heating value in percent as a warning limit. At a warning limit of 0 %, the function is deactivated.

For more information, see Chapter Overload protection (Page 55).

8.7 Assigning fail-safe motor starter parameters

8.7.1 Explanation of safety-related parameters

Ex motor

The motor starter can switch and protect loads in an EX protection zone (see Ex motor application (Page 75)).

Response to safety-related tripping

The motor starter can send a warning to the CPU if tripping has been triggered through the fail-safe input (see Response to safety-related tripping (Page 74)).

8.7.2 Setting safety-related parameters

Fail-safe motor starters possess the following safety-related parameters:

- Ex motor
- Rated operational current
- Trip class

Response to modified safety-related parameters

If modified safety-related parameters are received during run-up, the parameters are displayed. Confirm the modified parameters by pressing the Reset button twice before continuing work.

If modified safety-related parameters are received after run-up has been completed, the motor starter responds as follows depending on its status:

- Motor OFF in automatic mode

  The motor starter accepts the new parameters. The parameters are indicated by the LEDs' flashing sequence. To activate the parameters, confirm them with the blue button. The motor cannot be switched on before the parameters are activated.
- Motor ON in automatic mode and in manual local mode

  The motor starter rejects the parameters. The "Parameter changes not allowed in motor ON state" message is issued. As communication is not secure, the motor starter does not respond to the modified parameters. Depending on the parameterization, entries in data set "DS92" or diagnostic interrupts are generated. The entries in data set "DS92" are deleted as soon as the modified parameters are active.
- Manual local mode

  The motor starter accepts the new parameters and saves them. As soon as manual local mode is ended, the parameters are activated and indicated by means of the LEDs' flashing sequence. Confirm the parameters with the blue button. The motor cannot be switched on before the parameters are activated.
- Manual bus mode

  The motor starter accepts the new parameters. The parameters are indicated by the LEDs' flashing sequence. To activate the parameters, confirm them with the blue button. The motor cannot be switched on before the parameters are activated.

The motor starter remains in the safe state (STO) until you have confirmed the parameters. Before you have confirmed the parameters, they can already be read out in data set "DS203". Data set "DS201" is accepted. A group warning in the DS92 Read device diagnostics (Page 133) and in the process image input is triggered. Moreover, a maintenance alarm, "New safety-related parameters received" (0x1036), can be generated.

Response to invalid parameterization

If inconsistent or invalid parameterization is detected, the applicable parameters are discarded. Entries in data set "DS92" or diagnostic interrupts are generated. To narrow down the invalid parameterization, compare the parameter values from the data sets "DS201" and "DS203" or "DS202" and "DS204".

Reading back the data sets "DS201" and "DS202" returns the last correctly transferred data set, even if it is rejected later due to inadmissible content.

Data sets with incorrect lengths are rejected and discarded. The starter continues to operate with the last valid parameter.

8.7.3 Configuring ATEX operation

ET 200SP fail-safe motor starters protect motors in an ATEX environment. The following parameters are considered to be safety-related in ATEX operation:

- Rated operational current (I_e)
- Trip class

You set the parameters via the data sets or using the engineering software.

Before the new safety-related parameters are accepted, however, check and confirm the new parameters. The parameter settings are indicated by means of a flashing sequence of the LEDs on the fail-safe motor starter. As soon as you have ensured with the aid of the LEDs that all parameters are correctly set, confirm the new parameters on the device by means of the blue button. The parameters are not accepted until you have confirmed and the motor starter is "Ready for motor ON". Changes to parameters that are not safety-related do not require confirmation.

LED flashing sequence

The following graphic shows the order in which the LEDs flash:

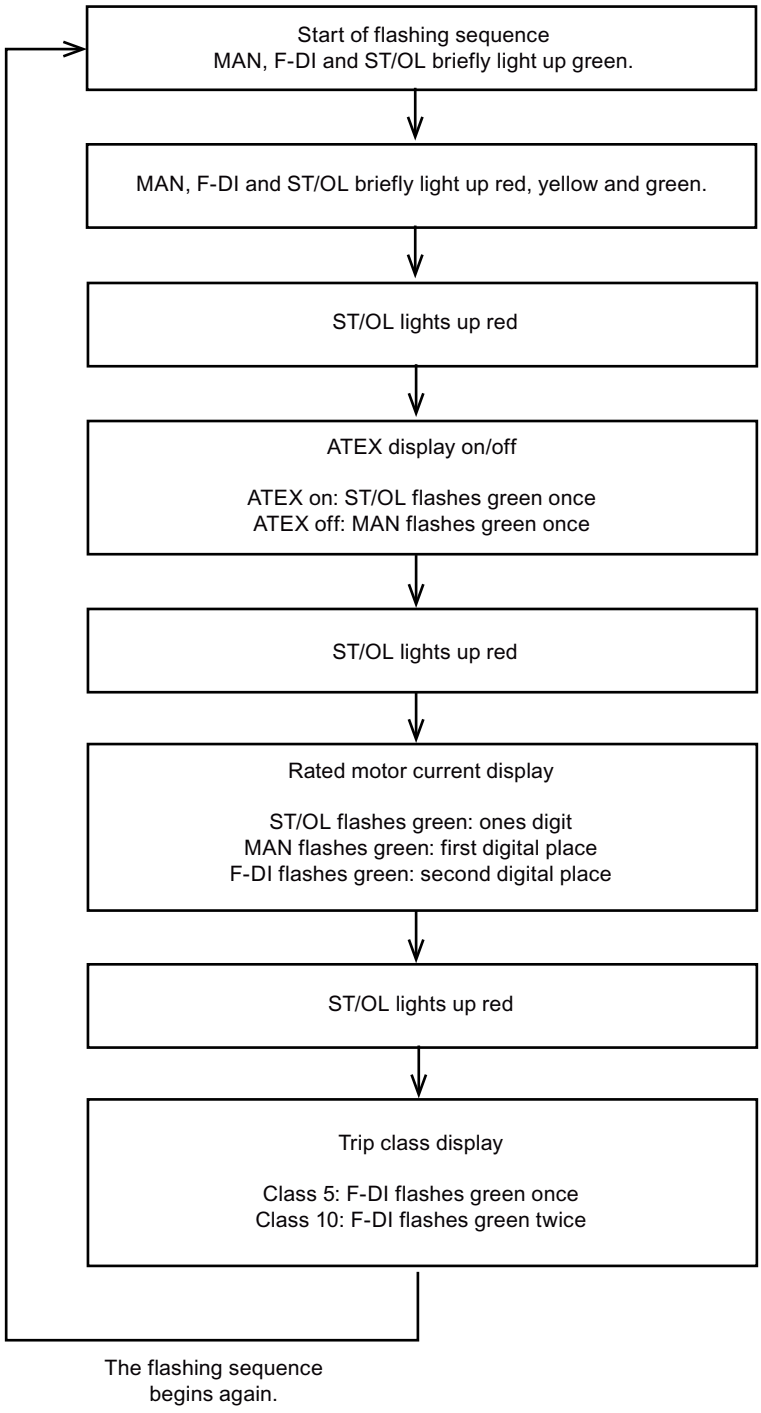

Figure 1-438 Flashing sequence during ATEX operation

The start of the flashing sequence is indicated by the "MAN", "F-DI" and "ST/OL" LEDs, which light up briefly in green all at the same time. The multi-colored LEDs then light up in red and yellow. Lighting up also serves to verify that all LEDs are functioning correctly.

To signal display of the next parameter, the "ST/OL" LED briefly lights up in red between every flashing signal for a set parameter.

The flashing sequence ends as soon as you press the blue button twice and confirm the set parameters.

NOTE

Receiving several parameter assignments

If safety-related parameters are received during a flashing sequence, conform the first parameters (or reject them) first. Only then are the parameters that have been sent last indicated. The motor cannot be started until the parameters last sent are valid and you have confirmed them.

NOTE

ATEX operation is not possible in connection with an activated parameter block

If the parameter block is activated and an ATEX parameter assignment is received, the device fault 461 and the diagnostic interrupt 0x1095 are output.

Disable the parameter block of the corresponding motor starter before you send ATEX parameters.

Rejecting ATEX parameterization

Proceed as follows if you want to reject the set parameterization:

1. Press the blue button for longer than five seconds.

   A group fault is output and the "Invalid parameter value" diagnostic message in data set 92 is set. A logbook entry is also created in data set 73. The diagnostic interrupt 0x1095 is also triggered if group fault diagnostics is enabled. In this state you cannot trigger any of the other functions.
2. Send the correct parameterization via the data set "DS201".
3. Confirm the correct parameterization.

Displaying ATEX parameters

To display the safety-related parameter settings during normal operation, press the TEST/RESET button for at least five seconds.

8.7.4 Examples of LED flashing sequences

Below you see a few examples of the LED flashing sequence.

Example of I_e = 5 A and CLASS 10

The following figure shows the LED flashing sequence with a fail-safe motor starter that has trip class I_e = 5 A and CLASS 10:

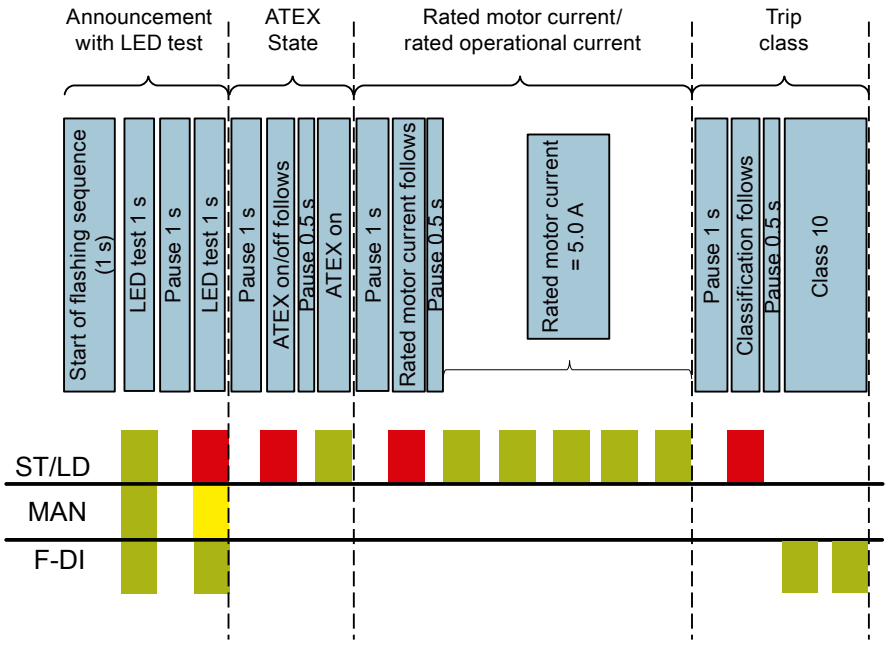

Figure 1-439 Display example I_e = 5.0 A CLASS 10

Example of I_e = 0.34 A and CLASS 5

The following figure shows the LED flashing sequence with a fail-safe motor starter that has trip class I_e = 0.34 A and CLASS 5:

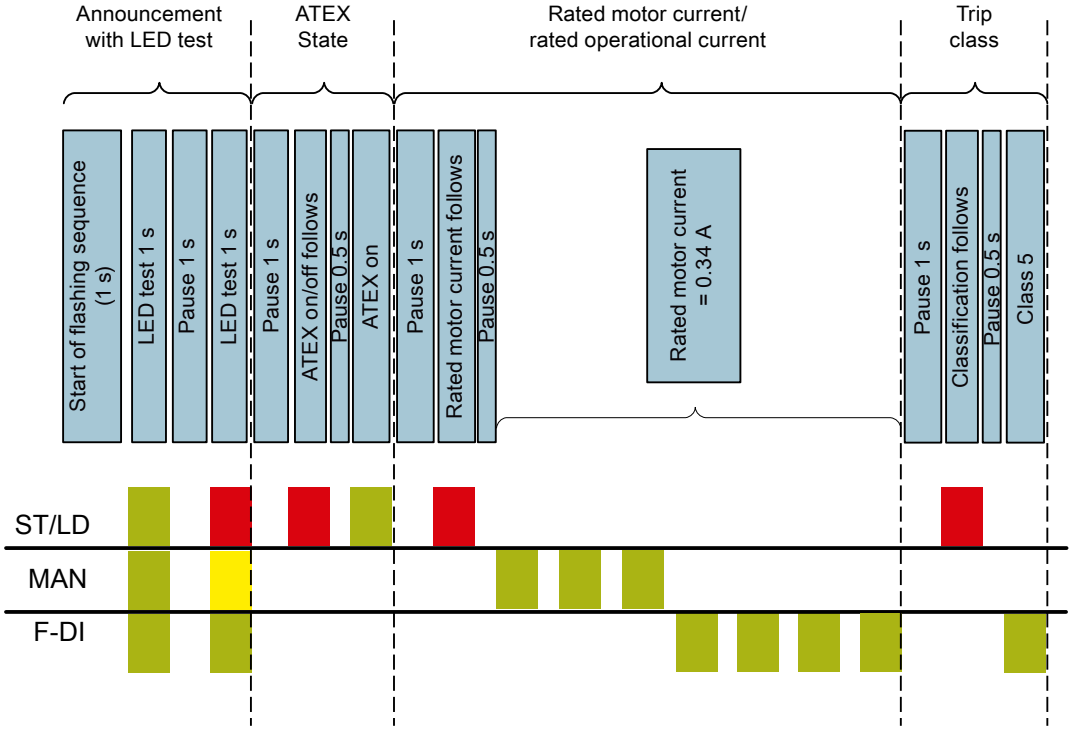

Figure 1-440 Display example I_e = 0.34 A CLASS 5

Example of I_e = 11.4 A and CLASS 5

The following figure shows the LED flashing sequence with a fail-safe motor starter that has trip class I_e = 11.4 A and CLASS 5:

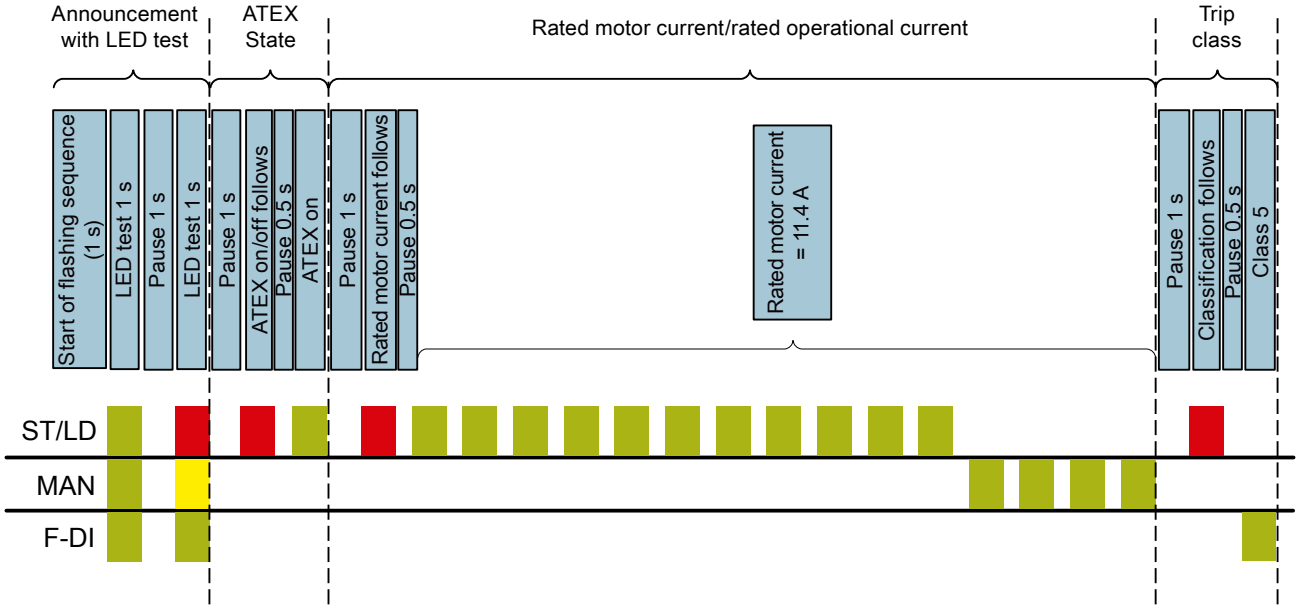

Figure 1-441 Display example 11.4 A CLASS 5

Example of I_e = 3.75 A and CLASS 5

The following figure shows the LED flashing sequence with a fail-safe motor starter that has trip class I_e = 3.75 A and CLASS 5:

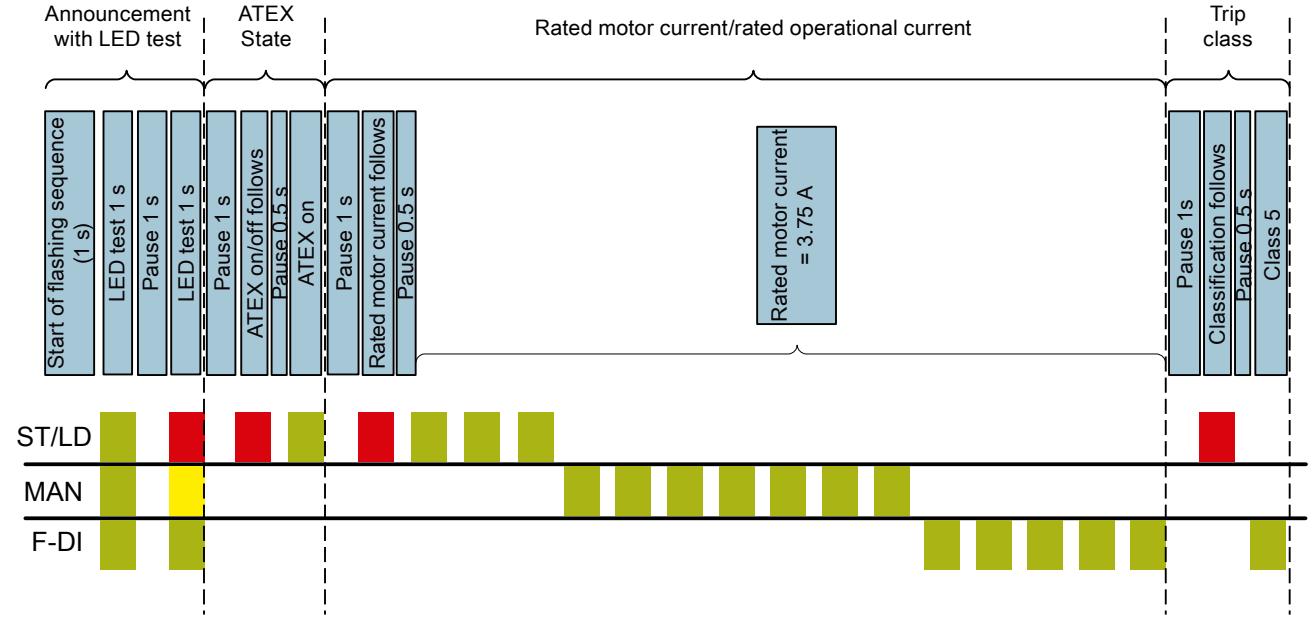

Figure 1-442 Display example Ie = 3.75 A CLASS 5

ATEX off display

The following figure shows the LED flashing sequence when ATEX operation for a fail-safe motor starter is deactivated:

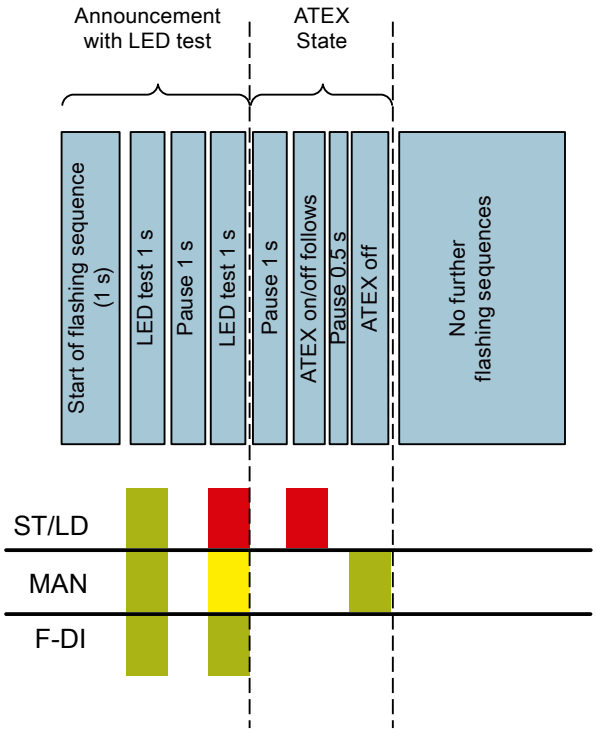

Figure 1-443 ATEX off display

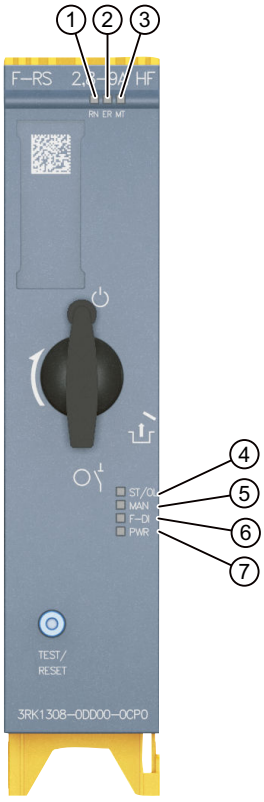
9.1 Status and error displays

LED display



The figure below shows the LED display on the ET 200SP motor starter:

①	RN	(green)	- Run
②	ER	(red)	- Error
③	MT	(yellow)	- Maintenance
④	ST/OL	(red/green)	- State/overload
⑤	MAN	(yellow)	- Manual (manual local mode)
⑥	PWR	(green)	- Power

Figure 1-444 LED display on the ET 200SP motor starter

The figure below shows the LED display on the fail-safe ET 200SP motor starter:

①	RN	(green)	- Run
②	ER	(red)	- Error
③	MT	(yellow)	- Maintenance
④	ST/OL	(red/green)	- State/overload
⑤	MAN	(yellow)	- Manual (manual local mode)
⑥	F-DI	(green)	- Fail-safe digital input
⑦	PWR	(green)	- Power

Figure 1-445 LED display on the ET 200SP Failsafe motor starter

Meaning of the LEDs

The tables below give the meanings of the status and fault displays:

RN/ER/MT LED

Table 1-793 RN/ER/MT status and error displays

LEDs			Meaning	Explanation
RN (RUN)	ER (ERROR)	MT (MAINT)		
■ On	Not relevant	Not relevant	Operating state "RUN", the ET 200SP motor starter is in a "normal" application and executes the control commands. The current operating mode is not relevant.	-
☼ Flashes	Not relevant	Not relevant	Startup (Cfg + Par.) Self-test Module deactivated Parameterization error	System operating state "System startup" A parameterization fault during startup prevents exiting of this state. The SIMATIC ET 200SP motor starter reports a fault.
				Wait until the ET 200SP motor starter is ready.
				Firmware update
				The module has been deconfigured.
Not relevant	Not relevant	■ On	Maintenance demanded (warning)	Group warning At least one Maintenance demanded alarm has been transferred to the controller. Possible causes: • Motor model has exceeded warning limit • Current value has exceeded or undershot warning limit • Start disabled, ET 200SP motor starter too warm (without ON command)
Not relevant	☼ Flashes at ≥ 2 Hz	Not relevant	Error	Group fault At least one Error alarm has been transferred to the controller. Possible causes: • Electronics supply voltage too low or too high • Motor protection disconnection • Thermal overload of the ET 200SP motor starter • Missing load voltage, phase failure/missing load • The mechanical rotary interlock is not in the READY position.
■ On	OFF	☼ Flashes	PROFIenergy active	-
☼ Flashes	OFF	☼ Flashes	Action required	Ex motor (ATEX): New safety-related parameters are available for release.

ST/OL (STATE/OVERLOAD) LED

Table 1-794 Status display ST/OL

ST/OL LED	Motor operating state	Meaning
■ On	Operation	ON command for motor active
□ Off	STOP	The motor is switched off. It is not known whether the motor is still rotating or not.
☼ Flashes at 0.5 Hz	Overload	The thermal motor model or device protection model has tripped.

MAN (MANUAL) LED

Table 1-795 Status display MAN

MAN LED	Meaning	Remedy
□ Off	Manual local mode deactivated	-
■ On	Manual local mode activated	-
☼ Flashes at 1 Hz	Connection abort in manual bus mode	-

PWR (POWER) LED

Table 1-796 Status display PWR

PWR LED	Meaning	Remedy
□ Off	Supply voltage not present or too low	Check the supply voltage.
■ On	Supply voltage present	-

LED F-DI for fail-safe motor starters

Table 1-797 Status display F-DI

LED F-DI	Meaning	Remedy
□ Off	LOW level at the fail-safe digital input on the BaseUnit in the case of a fail-safe motor starter.	-
■ On	HIGH level at the fail-safe digital input on the BaseUnit in the case of a fail-safe motor starter.	-

LED combinations

Table 1-798 Status displays ST/OL/MAN/PWR

LEDs			Meaning	Explanation
ST/OL (State/Over-load)	MAN (Manual)	PWR (Power)		
Lights up for 4 s	Lights up for 4 s	Lights up for 4 s	LED/fan test	All LEDs are switched on for 4 s (triggered by pressing the blue button).
Flashes	Flashes	Lights up	Firmware update active or canceled	-
OFF	OFF	OFF	No supply voltage	No supply voltage available A detected undervoltage (in the case of still functioning electronics) is not reported as power OFF, but as a fault.
Flashes at 1 Hz	Flashes	Lights up	Device fault	Non-correctable fault detected following self-diagnostics (contactor contacts, switching element, etc.). Remedy: Check the wiring and, if necessary, replace the device.

9.2 TEST/RESET button

The RESET button has the following functions:

Designation	Tripping	Description
LED/fan test	Press of a button for less than two seconds	The LED/fan test is activated. All LEDs (ST/OL, MAN, PWR) light up and the fan is switched on for 4 s. An LED/fan test is not possible in the case of fail-safe motor starters with F-DI deactivated (safety-related shutdown by low level).
RESET function	Press of a button	If a group fault is active, you can acknowledge this fault using the blue button. You can acknowledge device faults in principle only via ON/OFF of the control voltage. Note: If a fault is active, you cannot execute the LED/fan test.

Additional functions in the case of fail-safe motor starters

Confirming ATEX parameters	Press of a button	You confirm display of the parameters via an LED flashing sequence by pressing the RESET button twice.
Discarding ATEX parameterization	Press of a button for longer than five seconds.	By pressing the button for longer than five seconds, you discard newly set ATEX parameters and you return to the original parameterization.
Displaying ATEX parameterization	Press of a button for longer than five seconds.	By pressing the button for longer than five seconds, you can display the currently set ATEX parameters during operation.
Switching to commissioning mode	Press of a button	In "Manual local" mode, confirm the change to commissioning mode by the fail-safe motor starter by pressing the button.

9.3 Interrupts

The ET 200SP motor starter supports diagnostic interrupts and maintenance. You can read out the diagnoses of the motor starter in the following data sets:

- DS72 logbook - Read device error (Page 128)
- DS73 logbook - Read triggering operations (Page 131)
- DS75 logbook - Read events (Page 132)
- DS92 Read device diagnostics (Page 133)

A diagnostic message is output for each diagnostics event and the ER LED flashes on the module when group fault diagnostics are enabled. You can read out the diagnostic messages in the diagnostics buffer of the CPU, for example. You can evaluate the error codes via the user program. The following table shows the individual diagnostic messages:

Error type channel diagnostics	Fault text	Generated at data record object number	Remedial measures
0003_h (3_{dec})	Overvoltage	1407	Cause: The supply voltage is above the tolerance limit. Remedy: Change the power supply.
1000_h (4096_{dec})	Zero current after ON command	338	No current flow is detected in the motor feeder after an ON command. Possible cause: main circuit interrupted (energy supply missing, internal fuse defective, load missing)
1021_h (4129_{dec})	Phase unbalance	340, 341	The limit value for phase unbalance has been exceeded. Phase unbalance can cause an overload. Possible causes: Failure of the phase, fault in the motor windings Remedy: Check the motor feeder and the motor.
1022_h (4130_{dec})	Thermal motor model overload	327, 328	The motor feeder has been overloaded. The motor temperature rise has exceeded a limit. Remedy: Please check the motor and the applications that are being driven by the motor. After a trip, you can switch the motor on again after the cooling time has expired, or after the thermal motor model has been deleted.
1036_n (4150_{dec})	Parameters for EX motor protection received	1537	Parameters for the EX motor protection have been received. Remedy: Remedy: Confirm the correctness of the parameters directly on the device.
1040_h (4160_{dec})	Threshold I exceeded	334, 1541	The current has exceeded a limit. Remedy: Please check the application that is being driven by the motor.
1041_h (4161_{dec})	Threshold I undershot	335, 1542	The current has undershot a limit. Remedy: Please check the application that is being driven by the motor.
1093_h (4243_{dec})	Sensor supply overload	354	The output driver for the sensor supply is overloaded. Remedy: Check the cabling and the sensor.
$104C_h$ (4172_{dec})	Motor blocking	339	The maximum motor current has exceeded a limit for blocking protection. Possible cause: The motor is blocked. Remedy: Please check the application that is being driven by the motor.

Error type channel diagnostics	Fault text	Generated at data record object number	Remedial measures
1080_h (4224_{dec})	Device fault	308, 338, 381,456, 458, 460, 476, 480, 490, 1414, 1417, 1466, 1467, 1482, 20010, 20011, 20012, 20013, 20015, 20018, 20017 (up to V1.2.0)	Non-correctable fault detected following self-diagnostics (contactor contacts, switching element, etc.). Remedy: Check the logbook entries. Check the wiring and, if necessary, replace the device.
1083_h (4227_{dec})	Switching element overload	309, 1580	Switching element (switching contact, power semiconductor) too hot. Check the ambient conditions linked to cooling. You might have to take derating into consideration. Check the number of switching operations. Also check whether the fan is working properly.
1084_h (4228_{dec})	Electronics supply voltage too low	317	The supply voltage is below the permissible value. Remedy: Check the power supply (load measurement, voltage range)
1088_h (4232_{dec})	No switching element supply voltage	333	No supply voltage has been detected or the mechanical rotary interlock is not in the READY position. Remedy: Check the power supply to the switching elements and the cabling or turn the mechanical rotary interlock to the READY position.
1095_h (4245_{dec})	Parameter error	365, 366, 384, 461	The module is not yet parameterized or is incorrectly parameterized or the safety-related parameters have been rejected. Remedy: Correct the parameterization.
1096_h (4246_{dec})	Process image error	355	The process image output (PIQ) contains invalid control bit combinations (e.g. control bits for clockwise and counter-clockwise set simultaneously). Remedy: Check and correct the process image output (PIQ).
$10A5_h$ (4261_{dec})	Residual current	337, 338	No current flow is detected in the motor feeder after an ON command. Possible causes: Phase failure, fault in the motor winding, fuse in the device defective Remedy: Check the motor feeder (main circuit) and the motor. Clear the short-circuit in the system and replace the device.
$100A_h$ (4106_{dec})	Test mode current flow	1406	Current is flowing in the motor feeder although the motor feeder is in test mode or the test position. Possible causes: The main circuit is not interrupted in test operation. The cold start function of the ET 200SP motor starter is activated. Remedy: Check the wiring or deactivate the cold start function
$109D_h$ (4253_{dec})	Input Action	348, 351	A warning or trip signal is active on at least one input. Remedy: Check the application.
$109E_h$ (4254_{dec})	Emergency end position CW	349	The "CW" emergency end position has been passed. Remedy: Check the end position of the drive.
$001F_h$ (31_{dec})	Channel temporarily unavailable		Wait until the firmware update is completed.

Error type channel diagnostics	Fault text	Generated at data record object number	Remedial measures
$109F_h$ (4255_{dec})	Emergency trip end position CCW	350	The "CCW" emergency end position has been passed. Remedy: Check the end position of the drive.
$134B_h$ (4939_{dec})	Trip Reset not possible		Trip reset is currently not possible (e.g. because the cooling phase is in progress). Remedy: Repeat the action later (e.g. after the cooling time has elapsed).
1080_h		20013, 1466, 1417, 20010, 1467 (as of V1.2.2)	When the error occurs for the 1st to 4th time. On the 5th occurrence, error type channel diagnostics 1080_h is reported again.

9.4 Maintenance

A maintenance alarm is output for each group warning and the MT LED lights up on the module when group warning diagnostics are enabled. You can read out the diagnostic messages in the diagnostics buffer of the CPU, for example. You read the maintenance alarms in data set 75 (Page 132) of the motor starter.

Extended maintenance

You will find general information on extended maintenance in "Diagnostics" in the SIMATIC PROFINET Function Manual
(https://support.industry.siemens.com/cs/de/de/view/49948856/en).

The PROFINET interfaces of the interface module support the diagnostics concept and maintenance concept in PROFINET according to the standard IEC 61158-6-10. The aim is early detection and correction of potential faults. The motor starter's full functionality (maintenance) is available with firmware version V3.3 of the interface module.

The maintenance information is generated in STEP 7 with the following system messages:

- Maintenance request - symbolized by a yellow screwdriver.
- Faults - symbolized by a red screwdriver

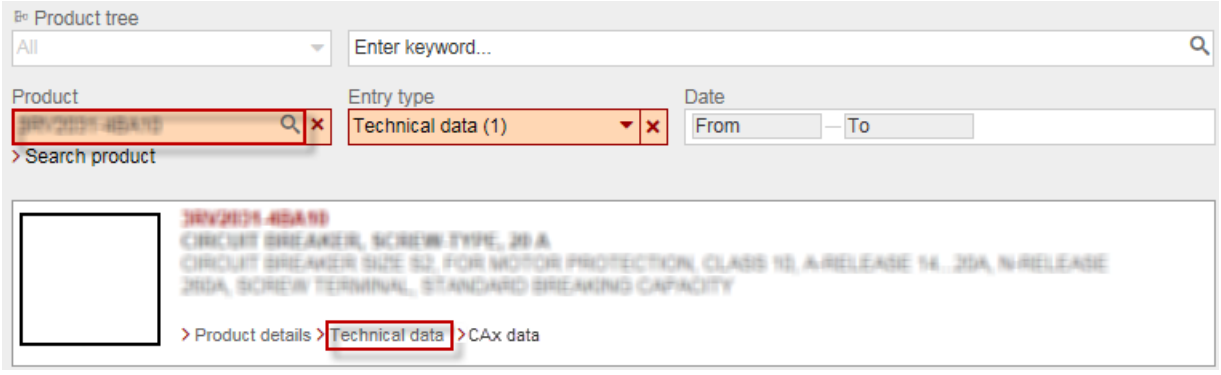
Technical data



10

10.1 Technical data in Siemens Industry Online Support

Technical data sheet

You can also find the technical data of the product at Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/).

1. Enter the full article number of the desired device in the "Product" field, and confirm with the Enter key.
2. Click the "Technical data" link.

10.2 Final conditions for safety-related parameters

Safety-related parameters

The safety-related parameters in the data sheet have been determined on the basis of the following final conditions:

- Side-by-side mounting at rated current I_n
- 100% ON period of electronics
- 40 °C ambient temperature
- DIN EN 60721-3-7 noxious gas environment: class 3C2

B10d value

NOTICE
Consider the B10d value stated for the motor starter in your application. The maximum number of operating cycles (B10d) may not be exceeded within the mission time T1. If the expected number of operating cycles exceeds the B10d value during the device's service life, you must set correspondingly shorter replacement intervals.

You can calculate the maximum service life of the device as follows: T10D = B10d / nop;
nop: Operating cycles/year

Validity of safety engineering data

The safety engineering data specified in the data sheet is valid under the following prerequisites:

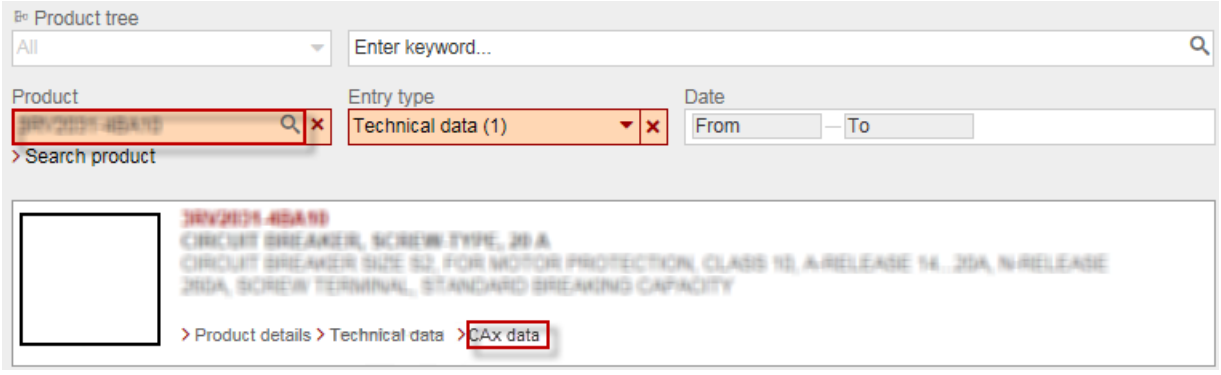
The specified PFH/PFD value is valid until the electrical endurance (B10) or the mission time has been reached. Replace the device if either the electrical endurance or the mission time has been exceeded. The application is outside of the specification if the maximum number of starting operations is exceeded.

NOTE

Definition of "number of starting operations"

The "number of starting operations" stands for the frequency of switching of the main conducting path switching elements, i.e. switching on and off of the connected motor and not requesting of STO via the power supply or the fail-safe digital input.

NOTICE
Use of ET 200SP motor starters at installation altitudes higher than 2000 m above sea level Refer to the current product information for use at an altitude higher than 2000 m above sea level (Extension of the application range for fail-safe SIMATIC ET 200SP motor starters up to an installation altitude of 4000 m (https://support.industry.siemens.com/cs/ww/en/view/109778836)).



CAx data

11

11.1 CAx data

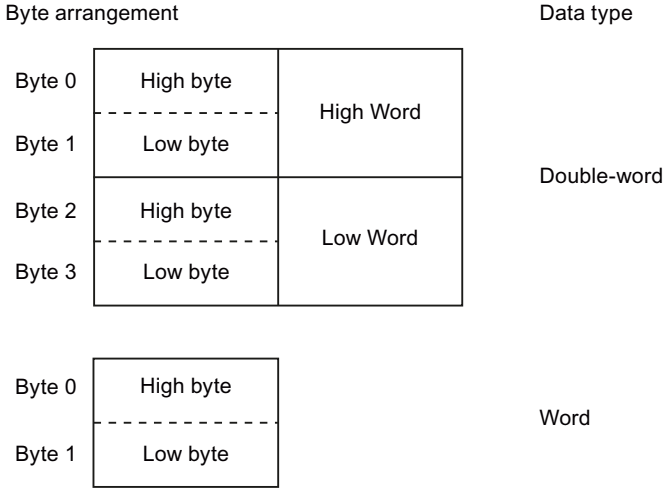
You can find the CAx data in the Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/).

1. Enter the full article number of the desired device in the "Product" field, and confirm with the Enter key.
2. Click the "CAx data link.

Data sets

A

A.1 Reading and writing of data records



You can access the data sets of the motor starter from STEP 7:

- Writing data sets by calling SFB 53 "WRREC"
- Reading data sets by calling SFB 52 "RDREC"

You will find further information about the SFB in the STEP 7 online help.

A.2 Byte arrangements

When data longer than one byte is stored, the bytes are arranged as follows ("big endian"):

A.3 DS68 Read/write process image output

NOTE

Please note that data set 68 is overwritten by the cyclic process image in automatic mode!

Byte	Content	Value / value range	Meaning
0	Coordination	0x21	Write via acyclic bus channel (PLC)
1	Reserved	0x00	-
2	Reserved	0x00	-
3	Reserved	0x00	-

Byte	Content	Value / value range	Meaning
Process image of the outputs			
4	Process data	DQ 0.0 to DQ 0.7	See table below
5	Process data	DQ 1.0 to DQ 1.7	See table below

Table 1-799 Content of process image of the outputs (in bytes 4 and 5)

Byte.Bit	Encoding	Process data	Meaning	Relevant for
4.0	Bit (1 = active)	DQ 0.0	Motor CW	All
4.1		DQ 0.1	Motor CCW	Reversing starters only
4.2		DQ 0.2	-	-
4.3		DQ 0.3	Trip reset	All
4.4		DQ 0.4	Emergency start	All [1]
4.5		DQ 0.5	-	-
4.6		DQ 0.6	-	-
4.7		DQ 0.7	Cold start	All [2]
5.0	Bit (1 = active)	DQ 1.0	-	-
5.1		DQ 1.1	-	-
5.2		DQ 1.2	-	-
5.3		DQ 1.3	-	-
5.4		DQ 1.4	-	-
5.5		DQ 1.5	-	-
5.6		DQ 1.6	-	-
5.7		DQ 1.7	Disable quick stop	All

1) Not for EX motor

2) F starter as of FW V 1.2.0

A.4 DS69 Read process image input

Byte	Content	Value / value range	Meaning
0	Process data	DI 0.0 to DI 0.7	See table below
1	Process data	DI 1.0 to DI 1.7	See table below
2	Process data	DI 2.0 to DI 2.7	See table below
3	Process data	DI 3.0 to DI 3.7	See table below

Table 1-800 Process image input (in bytes 0 and 3)

Byte.Bit	Encoding	Process data	Meaning	Relevant for
0.0	Bit (1 = active)	DI 0.0	Ready (automatic)	All
0.1		DI 0.1	Motor ON	All
0.2		DI 0.2	Group fault	All
0.3		DI 0.3	Group warning	All
0.4		DI 0.4	Input 1	All
0.5		DI 0.5	Input 2	All
0.6		DI 0.6	Input 3	All

Byte.Bit	Encoding	Process data	Meaning	Relevant for
0.7	Bit (1 = active)	DI 0.7	Input 4	All
1.0	Bit (1 = active)	DI 1.0	Motor current I_{act}-bit0	All
1.1		DI 1.1	Motor current I_{act}-bit1	All
1.2		DI 1.2	Motor current I_{act}-bit2	All
1.3		DI 1.3	Motor current I_{act}-bit3	All
1.4		DI 1.4	Motor current I_{act}-bit4	All
1.5		DI 1.5	Motor current I_{act}-bit5	All
1.6		DI 1.6	Manual local mode	All
1.7		DI 1.7	-	-
2.0	Bit (1 = active)	DI 2.0	Ready to start for motor ON	All
2.1		DI 2.1	Motor CW	All
2.2		DI 2.2	Motor CCW	Reversing starters only
2.3		DI 2.3	Quick stop active	All
2.4		DI 2.4	Energy saving mode active	All
2.5		DI 2.5	DI module inserted	All
2.6		DI 2.6	Ex motor active	F starters only
2.7		DI 2.7	Parameters disabled CPU/master active	All
3.0	Bit (1 = active)	DI 3.0	Thermal model overload	All
3.1		DI 3.1	-	-
3.2		DI 3.2	I_e current limit tripping	All
3.3		DI 3.3	F-DI status	F starters only
3.4		DI 3.4	Residual current detected	All
3.5		DI 3.5	Asymmetry detected	All
3.6		DI 3.6	Overtemperature	All
3.7		DI 3.7	-	-

A.5 DS72 logbook - Read device error

Byte	Data type	Meaning	Range of values	Increment
Entry 1 (= latest entry)				
0 ... 3	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
4 ... 5	Signed 16	Object number	0 ... ±32767	1
Entry 2 (= second-latest entry)				
6 ... 9	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
10 - 11	Signed 16	Object number	0 ... ±32767	1
... ...				
Entry 21 (last, oldest entry)				
120 ... 123	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
124 ... 125	Signed 16	Object number	0 ... ±32767	1

The data set call "Logbook device fault" returns the operating hour of the event that has occurred and an associated object number for each entry. This data set can accommodate 21 entries. When all locations have been overwritten, the oldest entry is overwritten again.

Following a retentive device fault (fail-safe motor starter defective), new entries are no longer entered into the logbook as soon as the 24 V supply voltage has been interrupted (e.g. pulling/plugging in the device).

NOTE

The latest entry is entered at the first location of the data set. The remaining entries are moved one entry down. You cannot delete logbooks yourself.

The supported object numbers and their meanings are shown in the table below: In the case of HF motor starters, you can acknowledge faults by switching off the supply voltage and by switching it on again. Replace the motor starter if the fault occurs again.

NOTE

In the case of fail-safe motor starters, there are some faults that you cannot acknowledge. If the relevant message in the "Fail-safe motor starter defective" column is marked with an "x", you can reset this error a maximum of 5 times. After that, the motor starter must be replaced.

Table 1-801 Assignment of error types to device faults

Object No.	Device fault messages	Fail-safe motor starter defective	5-life Error	F	Unit	Comment
308	Switching element defective	x	-	x	x	-
417	Stack overflow	-	-	x	x	These messages are used for the exact analysis of the cause of the error, in DS92 all are mapped to object number 381 "Error during self-test". The failure type defined there also applies.
418	Stack underflow	-	-	x	x	
423	Invalid command	-	-	x	x	
434	Error in system software	-	-	x	x	
437	Watchdog overflow	-	-	x	x	
456	EEPROM: memory defective	x	-	x	x	
458	EEPROM: CRC error "Device parameter"	x	-	x	x	
460	EEPROM: Contains invalid data	x	-	x	x	
462	EEPROM: Invalid pointer for device parameter buffer	x	-	x	x	
464	ROM error	x	-	x	x	
465	RAM error	x	-	x	x	
476	Current measuring defective	x	-	x	x	These messages are used for the exact analysis of the cause of the error, in DS92 all are mapped to object number 308 "Switching element defective". The failure type defined there also applies.
478	Bypass element does not close	-	-	x	x	
479	Bypass element does not open	x	-	x	x	
480	Bypass element protection has opened unintentionally during operation	- [2)]	-	x	x	

Object No.	Device fault messages	Fail-safe motor starter defective	5-life Error	F	Unit	Comment
486	Program execution check: Sequential program execution error	-	-	x	x	These messages are used for the exact analysis of the cause of the error, in DS92 all are mapped to object number 381 "Error during self-test". The failure type defined there also applies.
487	Program execution check: Logical programming error	-	-	x	x	
490	Incorrect power section detected	x	-	x	x	-
1414	Switching element short-circuited	x	-	x	x	-
1417	Bypass element defective	- [1) 4)]	**x**	x	x	-
1466	Contact 1 failed	- [4)]	**x**	x	x	These messages are used for the exact analysis of the cause of the error, in DS92 all are mapped to object number 308 "Switching element defective". The failure type defined there also applies.
1467	Contact 2 failed	- [4)]	**x**	x	x	
381	Error during self-test		-	x	x	-
1407	Electronics supply voltage too high	-	-	x	x	Previously in D73
1482	Current measuring range overshot	x [3)]	-	x	x	Previously in D73
20010	Direct-on-line or reversing relay defective	- [4)]	**x**	x	-	These messages are used for the exact analysis of the cause of the error, in DS92 all are mapped to object number 308 "Switching element defective". The failure type defined there also applies.
20011	12 V supply defective	x	-	x	-	
20012	F-DI defective	x	-	x	-	
20013	Hard switching of relays	- [4)]	**x**	x	-	
20015	Relay control defective feedback message	x	-	x	-	
20018	Bypass relay hard switched in the permissible current range (< 1 A at 0.4 A, < 3 A at 1 A MS and 3 A MS, < 8 A at 9 A MS and 12 A MS)	-	-	x	-	

[1)] Defective fail-safe ET200 SP motor starters up to V1.0.1 with error code 1417 can be reset once to V1.0.2 by means of a firmware update.

[2)] The error is present if the bypass relay could no longer be closed during the on/off routine of the fail-safe motor starter.

[3)] In case of error 1482, the last measured current value is stored in data set 95 as object number 608 as of firmware version V1.2.0.

[4)] **Defective fail-safe ET200 SP motor starters as of V1.0.1 can be reset to V1.2.2 by means of a firmware update. These errors are now tolerated 4 times.**

A.6 DS73 logbook - Read triggering operations

Byte	Data type	Meaning	Range of values	Increment
Entry 1 (latest entry)				
0 ... 3	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
4 ... 5	Signed 16	Object number	0 ... ±32767	
Entry 2 (second-latest entry)				
6 ... 9	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
10 ... 11	Signed 16	Object number	0 ... ±32767	
... ...				
Entry 21 (last, oldest entry)				
120 ... 123	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
124 ... 125	Signed 16	Object number	0 ... ±32767	

The data set call "Logbook trips" returns the operating hour of the event that has occurred and an associated object number for each entry. This data set can accommodate 21 entries. When all locations have been overwritten, the oldest entry is overwritten again.

NOTE

The latest entry is entered at the first location of the data set. The remaining entries are moved one entry down. You cannot delete the logbook.
Following a retentive device fault (fail-safe motor starter defective), new entries are no longer entered into the logbook as soon as the 24 V supply voltage has been interrupted (e.g. pulling/plugging in the device).

The supported object numbers and their meaning are shown in the table below:

Table 1-802 Assignment of object number to trips message

Object No.	Trips message	Comment
305	Safety-related tripping	Fail-safe motor starters only
309	Switching element overload	-
317	Electronics supply voltage too low	-
328	Motor overload trip	Tripping of the thermal motor model
333	Mechanical rotary interlock is not in the READY position	-
334	I_e upper limit violation	-
335	I_e lower limit violation	-
338	Residual current tripping	-
339	Tripping due to motor blocking	-
341	Asymmetry tripping	-
348	Input tripping	-
349	Input trip CW	-
350	Input trip CCW	-
354	Sensor supply overload	
355	Process image error	-
365	Invalid parameter value	Group fault only on startup

Object No.	Trips message	Comment
384	No external startup parameters received	-
1406	Cold start tripping	For all motor starters
20016	Insufficient temperature	-

A.7 DS75 logbook - Read events

Byte	Data type	Meaning	Range of values	Increment
User data (technology data)				
Entry 1 (latest entry)				
0 ... 3	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
4 ... 5	Signed 16	Object number	0 ... ±32767	
Entry 2 (second-latest entry)				
6 ... 9	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
10 ... 11	Signed 16	Object number	0 ... ±32767	
... ...				
Entry 21 (oldest entry)				
120 ... 123	Unsigned 32	Operating hours - device	0 ... 2^{32}-1	1 s
124 ... 125	Signed 16	Object number	0 ... ±32767	

The data set call "Logbook events" returns the operating hour of the event that has occurred and an associated object number for each entry. This data set can accommodate 21 entries. When all locations have been overwritten, the oldest entry is overwritten again.

NOTE

The latest entry is entered at the first location of the data set. The remaining entries are moved one entry down. You cannot delete the logbook.
Following a retentive device fault (fail-safe motor starter defective), new entries are no longer entered into the logbook as soon as the 24 V supply voltage has been interrupted (e.g. pulling/plugging in the device).

The supported object numbers and their meaning are shown in the table below:

Table 1-803 Assignment of object number to event message

Object No.	Event messages	Comment
Warnings		
327	Thermal motor model overload	In the case of a group fault, the message "Motor overload trip" is also queued.
337	Residual current detected	-
340	± Asymmetry detected	-
351	Input warning	-
365	Invalid parameter value	Not in the case of startup since it is a group fault
366	Parameters cannot be changed in ON state	-
1541	± I_e warning threshold exceeded	-

±: Event is entered as "incoming" (+) and "outgoing" (-) event. Other messages are entered only as "incoming" messages

Object No.	Event messages	Comment
1542	± I_e warning threshold undershot	-
	Actions	
310	± Emergency start active	-
357	Automatic mode	Enter at the time of changeover
358	Manual bus mode	Enter at the time of changeover
359	Manual local mode	Enter at the time of changeover
360	Manual bus mode	Connection abort
368	± Parameters block CPU/master active	-
376	Firmware update successful	-
378	Firmware update has errors	-
454	Internal communication fault	-
1520	± Energy-saving mode active	-
1580	Switching element hot	-

±: Event is entered as "incoming" (+) and "outgoing" (-) event. Other messages are entered only as "incoming" messages

A.8 DS92 Read device diagnostics

Object number	Byte.Bit	Meaning	Relevant for
		User data (technology data) Switching/controlling	
301	0.0	Ready (automatic) The device is ready for operation via the controller. There is no connection to the mechanical rotary interlock.	All
306	0.1	Motor CW	All
307	0.2	Motor CCW	Reversing starter
309	0.3	Switching element overload	All
308	0.4	Switching element defective	All
310	0.5	Emergency start active	All
302	0.6	Group fault	All
304	0.7	Group warning	All

1) As of Firmware version V1.2.0. If the starting current exceeds the maximum current measuring range (see technical data sheet), this bit is set and the measured value is stored in data set 95.

A.9 DS93 Write command

Write structure of data set 93 command

Byte	Content	Value / value range	Meaning
0	Coordination	0x21	Write via acyclic bus channel
1	Reserved	0x00	-
2	Reserved	0x00	-
3	Reserved	0x00	-
Command			
4	Number of commands	0 ... 1	Number of subsequent valid commands
5	Command 1	Command number	Optional; for meaning see the following table
6	Reserved	Reserved	Reserved
7	Reserved	Reserved	Reserved
8	Reserved	Reserved	Reserved
9	Reserved	Reserved	Reserved

Assignment of command to command number and their meaning (byte 5 to 9)

Object number	Command number	Command	Meaning
0	0	Reserved	No function
703	1	Trip reset	Resets and acknowledges error messages
709	4	Automatic mode	Transition to automatic mode (control by DP master)

Object number	Command number	Command	Meaning
711	5	Manual bus mode	Transition to manual mode. The motor starter switches to manual bus mode depending on the interface via which the command is received.
707	10	Parameters disabled CPU/master ON	Parameterization by parameterizing master not possible, or its parameters are ignored
708	11	Parameters disabled CPU/master OFF	Parameterization by parameterizing master is possible

A.10 DS94 Read measured values

-	12 ... 27	0x00	Reserved	-	-
513	28 ... 31	Signed 32	Phase current $I_{L1(rms)}$	±0 ... 20,000 A	0.01 A
514	32 ... 35	Signed 32	Phase current $I_{L2(rms)}$	±0 ... 20,000 A	0.01 A
515	36 ... 39	Signed 32	Phase current $I_{L3(rms)}$	±0 ... 20,000 A	0.01 A
516	40 ... 41	Unsigned 16	Electronics supply voltage	0 ... 1,500 V	0.1 V
-	42 ... 43	0x00	Reserved	-	-
531	44 ... 47	Signed 32	I_{max} current motor switch-on cycle	±0 ... 20,000 A	0.01 A (as of V.1.2.1)
-	48 ... 63	0x00	Reserved	-	-

A.11 DS95 Read statistics

Object number	Byte.Bit	Coding	Meaning	Range of values	Increment
	User data (technology data)				
-	0	0	Reserved	-	-
-	1.0-5	0	Reserved	-	-
-	1.6-7	11_B	Bit 6 operating hours resolution 1 second Bit 7 operating hours selection 1 operating hour - device	11 (fixed)	1
-	2 ... 3	0x00	Reserved	-	-
682	4 ... 7	Unsigned 32	Device operating hours in seconds	0 ... (2^{32}-1)	1 s

Object number	Byte.Bit	Coding	Meaning	Range of values	Increment
603	8 ... 11	Unsigned 32	Number of motor CW starts	0 ... (2^{32}-1)	1
604	12 ... 15	Unsigned 32	Number of starts motor CCW	0 ... (2^{32}-1)	1
605	16 ... 17	Unsigned 16	Number of motor overload trips Is incremented on tripping by: • Blocking current monitoring • Overload protection	0 ... (2^{16}-1)	1
20051	18	Unsigned 8	Number of chatter monitoring errors	0 ... (2^{8} - 1)	1 [1)]
-	18 ... 19	0x00	Reserved	-	-
609 [2)]	20 ... 23	Signed 32	Motor current $I_{max\ (rms)}$	±0 ... 20 000	0.01 A
608 [3)]	24 ... 27	Signed 32	Last tripping current $I_{A\ (rms)}$	±0 ... 20 000	0.01 A
602	28 ... 31	Unsigned 32	Motor operating hours in seconds	0 ... (2^{32}-1)	1 s
615	32 ... 49	0x00	Reserved	-	-
616	50 ... 51	Unsigned 16	Number of switching element overload trips	0 ... (2^{16}-1)	1
2013 [4)]	52 ... 53	Unsigned 16	Number of hard switching operations of the relay	0 ... (2^{16}-1)	1
-	54 ... 89	0x00	Reserved	-	-
20050	54	Unsigned 8	Number of 5 life errors	0 ... 5	1 [1)]

[1)] As of firmware version V1.2.2

[2)]The motor current $I_{max\ (rms)}$ shows the maximum rms value present in a phase over the operating period (min/max pointer function). It is calculated every 10 ms. Excluded are the first 20 ms after start (inrush current).

[3)] The last tripping current $I_{A\ (rms)}$ is updated for each trip, irrespective of the magnitude of the current that was present there beforehand (no min/max pointer function).

[4)] Previously, the object number could only contain a maximum of "1". Now the motor starter can be reset for values from "1" to "4". The starter should only be replaced at "5"

Up to firmware version V1.2.0 the value is entered if

- the motor is blocked,
- the maximum value of the motor model is exceeded,
- the maximum value of the device or relay model is exceeded.

As of firmware version V1.2.0, an additional entry is made if a measured value is exceeded or if hard switching occurs with the fail-safe motor starter.

NOTE

Operating hours counter

The operating hours counter runs as soon as the motor starter is supplied with 24 V.

A.12 Read/write DS201 device parameter 1

DS201 contains the second part of the device parameters.

If incorrect parameters are sent to the motor starter in DS201, these incorrect parameters will also be reported back when reading DS201. In the case of incorrect parameters, the object number of the first incorrect parameter is output in WORD 10 of DS92.

The defaults for factory settings of the motor starter appear in italics in the Value range column. In the engineering system, a distinction is made between the default values of the input actions and the current range of the defaults of the motor starter.

A.16 I&M data

A.16.1 I&M data

The following I&M data (Identification & Maintenance function) are supported by all ET 200SP motor starters:

Number	Name	Comment
I&M 0	Device identification	This is stored in the device on initialization
I&M 1	Equipment identifier	These are entered in the engineering system.
I&M 2	Installation	
I&M 3	Description	

NOTE

With PROFINET, the I&M data can be accessed via data sets 0xAFF0 - 0xAFF3 (PNO).
With PROFIBUS, the I&M data can be accessed via data set 255.

A.16.2 I&M 0: Read device identification

The following data are saved:

Byte	Data type	Content	Meaning
I&M header			
0 ... 1	Unsigned16	0x0020	Block type
2 ... 3	Unsigned16	0x0038	Block length = 56
4 ... 5	Unsigned16	0x0100	Block version = 1.0
I&M0 data block 0			
6 ... 7	Unsigned16	MANUFACTURER_ID	42 = Manufacturer ID SIEMENS
8 ... 27	Char[20]	ORDER_ID	Article number (MLFB)
28 ... 43	Char[16]	SERIAL_NUMBER	Serial number
44 ... 45	Unsigned16	HARDWARE REVISION	Hardware revision or product version
46 ... 49	Char	SOFTWARE_REVISION	Firmware version
50 ... 51	Unsigned16	REV_COUNTER	Provides information about the parameterized changes on the module. The "REV_ COUNTER" is incremented after each change.
52 ... 53	Unsigned16	PROFILE_ID	Gives information about the PROFIBUS profile supported by the device and the line of products belonging to the device.
54 ... 55	Unsigned16	PROFILE_SPECIFIC_TYPE	Used to supplement the object "PROFILE_ID" and contains further information on the profile.
56 ... 57	Unsigned16	IM_VERSION	Provides information about the version of the identification data (01 01hex = Version 1.1).
58 ... 59	Unsigned16	IM_SUPPORTED	Provides information about the available identification data (Index 2 to 4).

A.16.3 I&M 1: Read/write equipment identifier

The following data are saved:

Byte	Length	Content	Meaning

Circuit examples

B

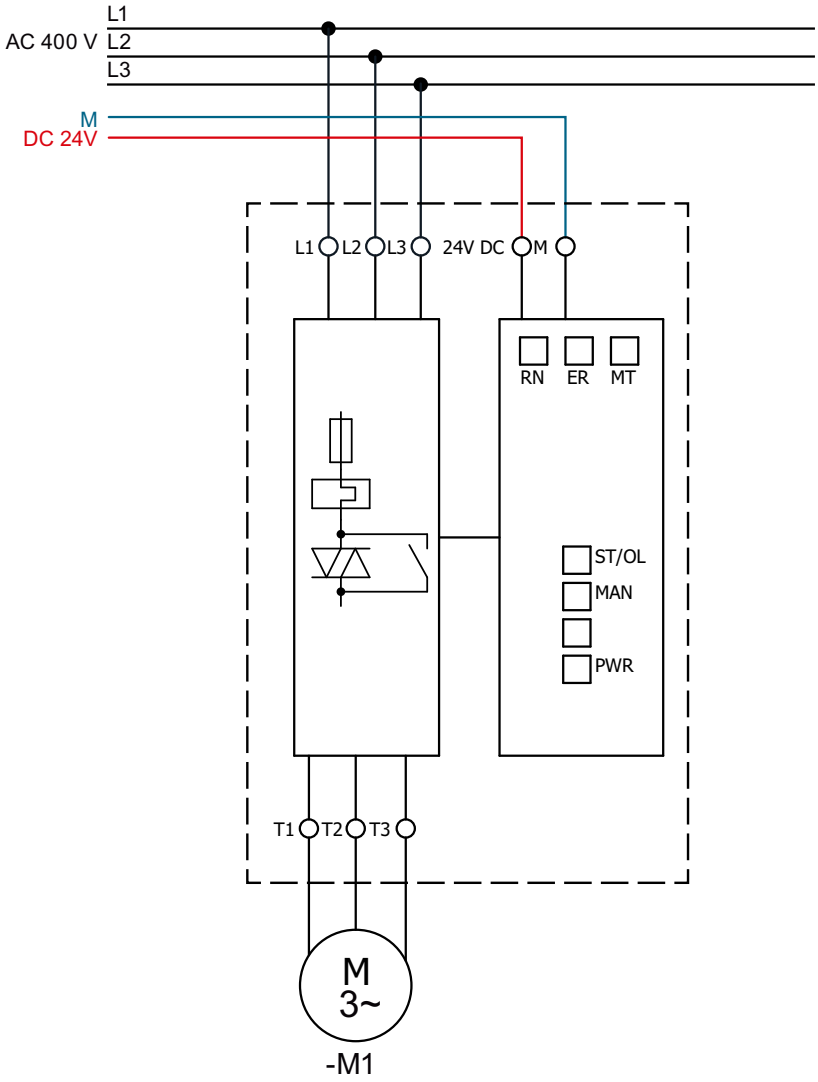
B.1 Connection examples for motor starters

B.1.1 Connecting and operating motor brakes

See Chapter Operating motor starters (Page 33).

B.1.2 Example of the correct engineering of a motor starter

See Chapter Operating motor starters (Page 33).



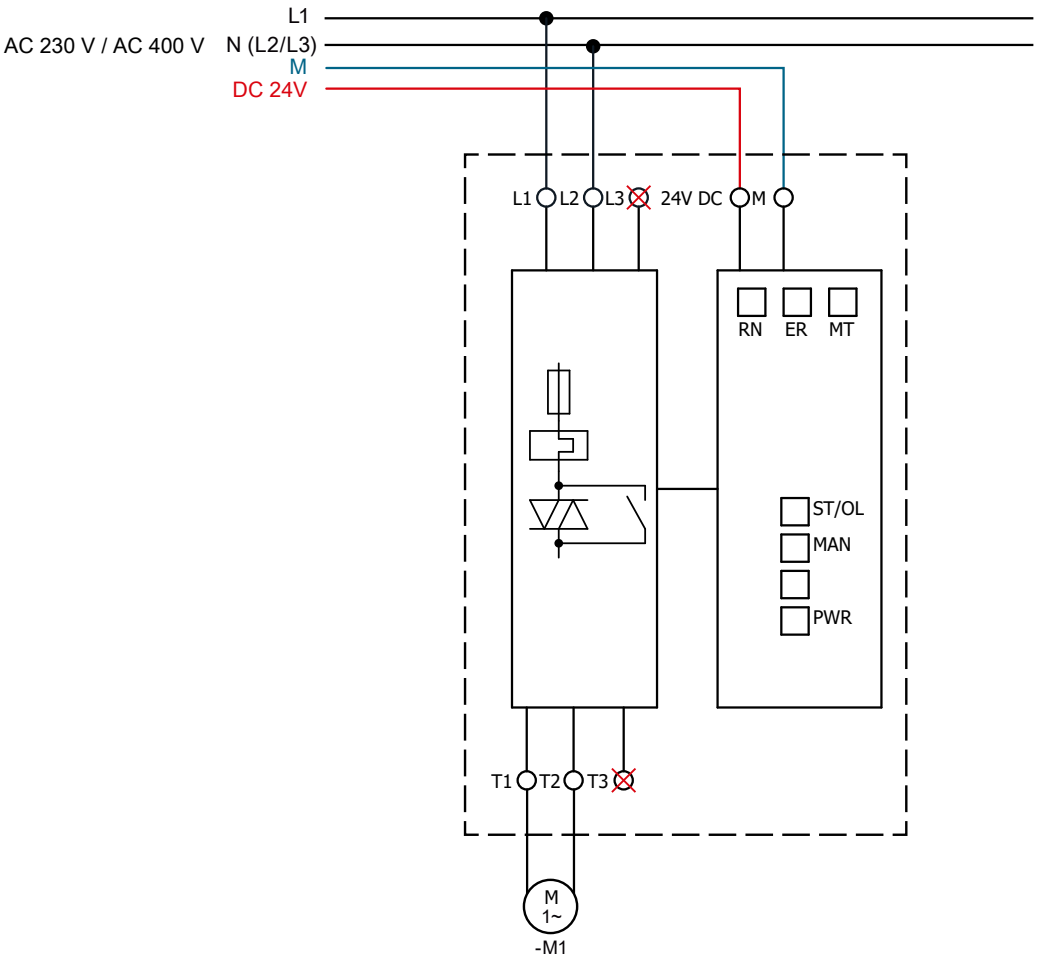
B.1.3 Induction machine

Direct-on-line starter
Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starter: 3RK1308-0A*00-0CP0

Reversing starter
Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starter: 3RK1308-0B*00-0CP0



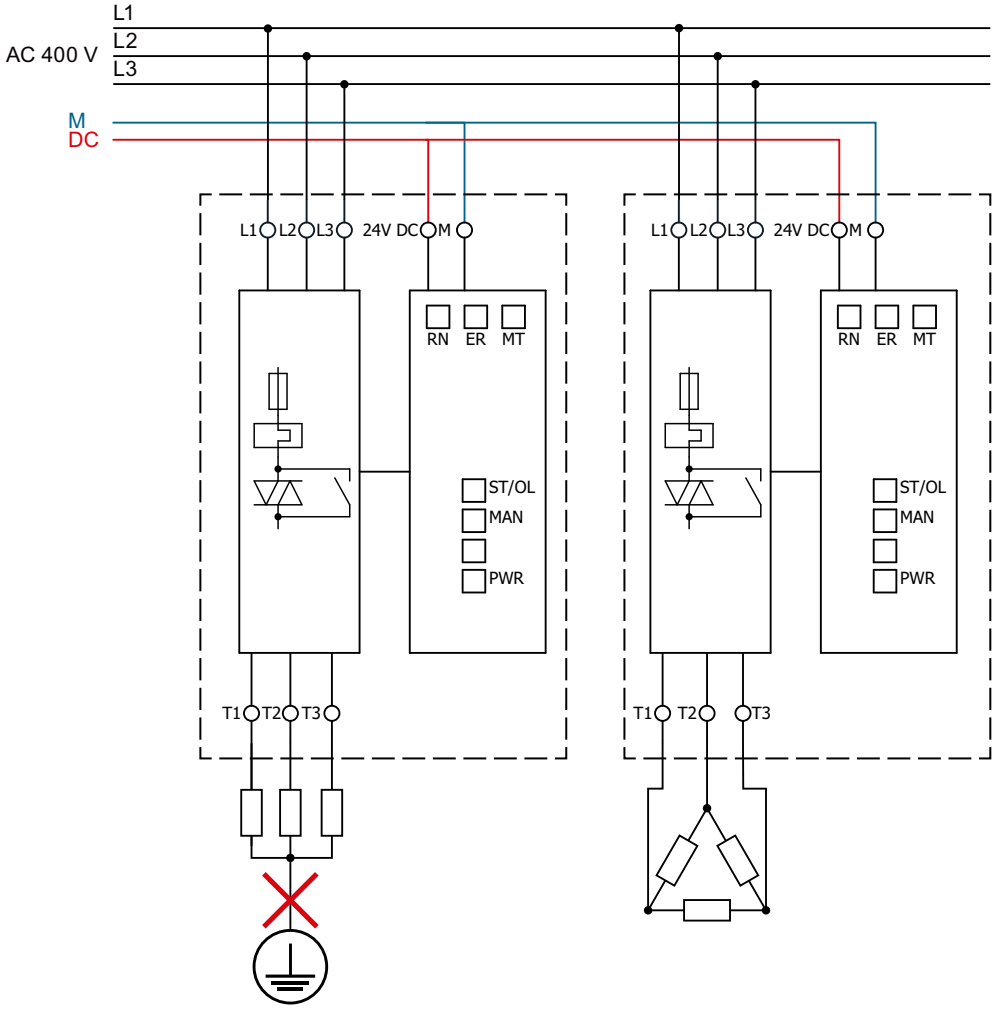
In the multi-pole representation, the N and PE conductors are not shown separately.
Do not connect PE or N to the neutral point.

B.1.4 Single-phase motor

Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starters: 3RK1308-0A*00-0CP0.
- Alternatively, this wiring can also be performed using a fail-safe 3RK1308-0C*00-0CP0 direct starter.

In the multi-pole representation, the PE conductor is not shown separately.



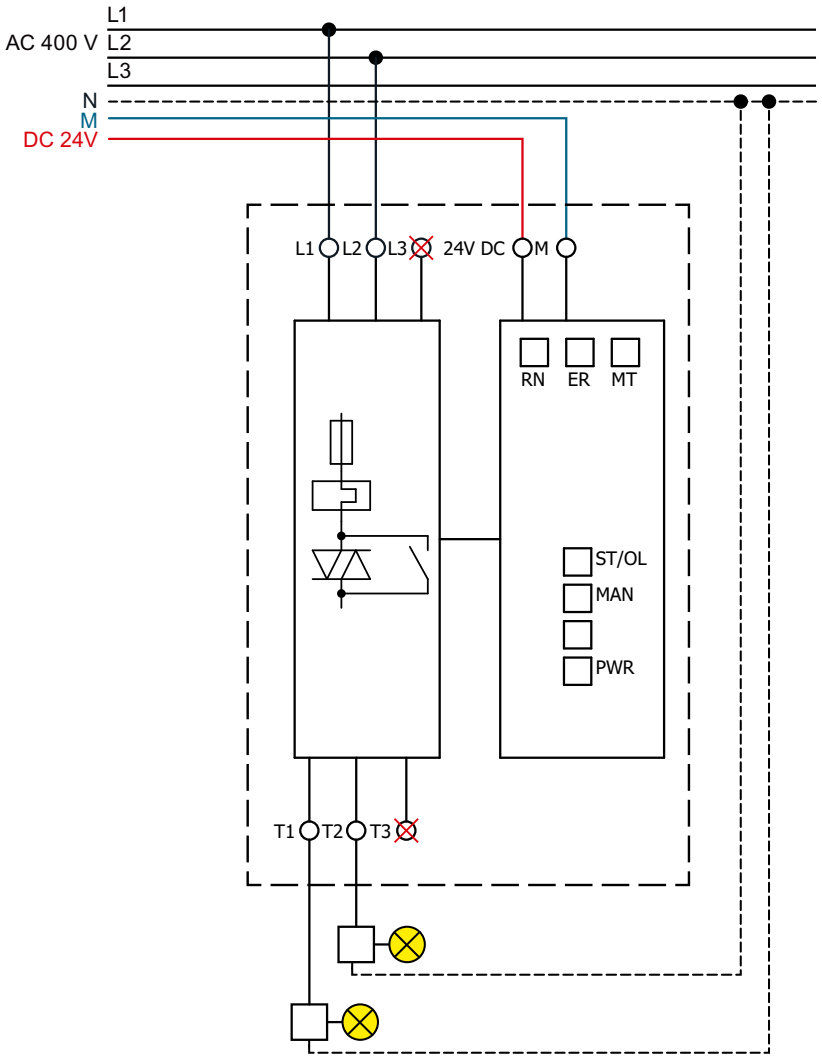
B.1.5 Resistive load

Star connection
Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starters: 3RK1308-0A*00-0CP0

Delta connection:
Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starters: 3RK1308-0A*00-0CP0



Do not connect PE or N to the neutral point.
In the multi-pole representation, the N and PE conductors are not shown separately.

B.1.6 Gas discharge lamps

Article numbers:

- BaseUnit: 3RK1908-0AP00-0AP0
- Motor starters: 3RK1308-0A*00-0CP0

In the multi-pole representation, the PE conductor is not shown separately.

NOTE

Motor model und response to overload of the gas discharge lamp

Observe the set motor model and the overload response of the gas discharge lamp for the parameterization of the motor starter.

B.2 Connection examples for fail-safe motor starters

B.2.1 General information

Shutdown options
The safe tripping of the ET 200SP motor starter can take place in various ways, e.g.

- With a 3SK safety relay
- With a fail-safe ET 200SP F-DQ digital output module
- With a fail-safe ET 200SP F-PM E power module

Documentation and sample projects
You will find an entry Safe shutdown of ET 200SP motor starters (https://support.industry.siemens.com/cs/ww/en/view/109748128) in the Industry Online Support. This entry describes methods of switching off one or more ET 200SP F motor starters in a safety-oriented manner.

The attached documentation "Power module F PM-E" contains a decision-making matrix, which illustrates the various switch-off variants.

Shutdown principle ET 200SP F motor starter		Application example with SK safety relay	Application example with fail-safe digital output F-DQ	Application example with fail-safe power module F-PM-E
Hardware variety	Suitable for group shutdown	Yes	Yes	Yes
	Suitable for single shutdown	Yes	Yes	No
Use in cyclically requested safety functions (e.g. protective door, light curtain)		Yes	Yes	No
Use in acyclically requested safety functions (e.g. emergency stop)		Yes	Yes	Yes
Motor starter can still be addressed by CPU after fail-safe shutdown		Yes	Yes	No
Suitable for immediate recovery		Yes	Yes	No (recovery time ≥ 2.2 s)
External wiring effort		Yes	Yes	No
Standard and safety engineering		Separate	Integrated into a device	Integrated into a device

Further information
See"SIRIUS Safety Integrated" Application Manual (https://support.industry.siemens.com/cs/ww/en/view/83150405).

B.2.2 Safety-related shutdown

Single shutdown

With the BaseUnits BU30-MS5 to BU30-MS6, a single shutdown can be implemented with the aid of the F-DI. Single shutdown in SIL3 Cat. 4 PL e is possible here with fail-safe control modules with pp-switching or pm-switching.

For the single use of the BU30-MS7 and BU30-MS10, a fail-safe control module with pp-switching is basically to be used.

			1)	2)	3)	4)	5)	6)	7)	8)	9)
BU30-MS1	BU with 24 V and 500 V infeed	3RK1908-0AP00-0AP0	x	-	x	x	-	x	-	-	-
BU30-MS2	BU with 500 V infeed	3RK1908-0AP00-0CP0	-	x	x	x	-	x	-	-	-
BU30-MS3	BU with 24 V infeed	3RK1908-0AP00-0BP0	x	-	x	-	x	x	-	-	-
BU30-MS4	BU without infeed	3RK1908-0AP00-0DP0	-	x	x	-	x	x	-	-	-
BU30-MS5	BU F-DI (without forwarding) with 500 V infeed	3RK1908-0AP00-0EP0	-	x	x	x	-	x	x	-	-
BU30-MS6	BU F-DI (without forwarding) without infeed	3RK1908-0AP00-0FP0	-	x	x	-	x	x	x	-	-
BU30-MS7	BU F-DI infeed with 500 V infeed	3RK1908-0AP00-0GP0	-	x	x	x	-	x	x	-	x
BU30-MS8	BU F-DI forwarding with 500 V infeed	3RK1908-0AP00-0HP0	-	x	x	x	-	x	-	x	x
BU30-MS9	BU F-DI forwarding without infeed	3RK1908-0AP00-0JP0	-	x	x	-	x	x	-	x	x
BU30-MS10	BU F-DI infeed without 500 V infeed	3RK1908-0AP00-0KP0	-	x	x	-	x	x	x	-	x

1) 24 V infeed
2) 24 V import from left module
3) 24 V forwarding
4) 500 V infeed
5) 500 V import from left
6) 500 V forwarding
7) F-DI infeed
8) F-DI import from left
9) F-DI forwarding

Group shutdown

With the BaseUnits BU30-MS7 to BU30-MS10, a group shutdown can be implemented with the aid of the F-DI.

The group shutdown in SIL3 Cat 4 PL e is only possible with fail-safe control modules with pp-switching. A group shutdown is also possible by a fail-safe shutdown of the supply voltage with all motor starter BaseUnits.

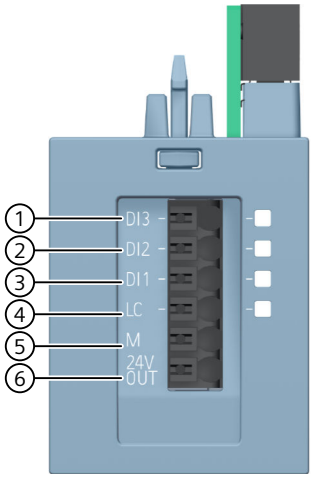
⚠ WARNING

Safety-related shutdown using the F-DI

Depending on the I/O used, the shutdown takes place via one or two output channels (terminals):

- PM-switching: The shutdown takes place via two output channels.
- PP-switching: The shutdown takes place via one output channel.

Shutdown via one output channel (PP switching) achieves SILCL 3 according to EN 62061, PL e/Cat. 4 according to EN ISO 13849-1 if steps are taken to ensure that the cables are installed in such a way that they are protected against a cross-circuit/line-to-line fault.



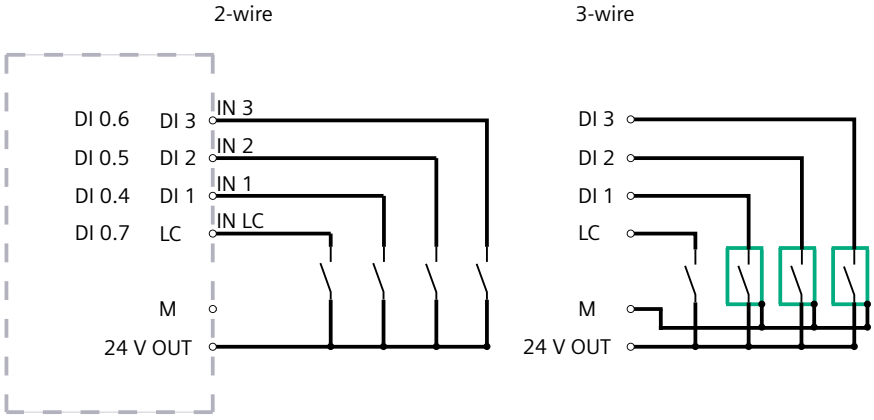
For the BU-30-MS7 to BU-30-MS10 F-DI forwarding BaseUnits, only PP switching is possible.

For the single F-DI BaseUnits BU-30-MS5 and BU-30-MS6, PM and PP switching are possible.

B.2.3 Connecting the 3DI/LC module for the motor starter

Procedure

The figure below shows the connections of the 3DI/LC module:



① Digital input 3
② Digital input 2
③ Digital input 1
④ Local control (manual local)
⑤ Ground
⑥ 24 V DC/ 100 mA output

NOTE

The digital inputs (1 to 4) are not isolated. The reference potential is M (5). Control the digital inputs only via a unit supplied from the 24 V DC output (6).
Connect only cables of maximum 30 m to the 3DI/LC module.
The supply (5 and 6) is protected against short circuits.

Terminal sketch of the 3DI/LC module

The following diagram shows a terminal sketch of the 3DI/LC module:

DI 1.4 to DI 1.7: Bit in PII

Figure 1-446 Connection example of inputs

⚠ WARNING

The digital inputs (1 to 4) are not isolated. The reference potential is M (5), and therefore SELV/PELV. Only supply the inputs with the 24 V DC output (6).
Do not connect any temperature sensors for winding control of motors if they do not have protective separation. Otherwise, in the event of a fault, a dangerous voltage may be transmitted to the sensor cables and thus to the SELV/PELV circuits. If these cables are then touched, it can lead to death, serious injury and enormous material damage.

Introduction

1

Purpose of the documentation

This documentation provides important information on configuring, installing, wiring and commissioning the S7-1500 automation system/ET 200MP distributed I/O system.

Basic knowledge required

General knowledge in the field of automation engineering is required to understand this documentation.

Validity of the documentation

This documentation applies to all products of the SIMATIC S7-1500 and SIMATIC ET 200MP product families.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

NOTE

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

ID link for the digital nameplate

The ID link is a globally unique identifier according to IEC 61406-1, which you will find in the future as a QR code on your product.

The figure shows an example of an ID link for the digital output module DQ 16x24VDC/0.5A BA.

You can recognize the ID link by the frame with a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call the ID link.

In the digital nameplate, you will find product data, manuals, declarations of conformity, certificates and other helpful information about your product.

Special information

NOTE

Important note for maintaining the operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we inform you in personal notifications about product developments and features that are (or could be) relevant to the operation of systems from a safety perspective.

You need to subscribe to the corresponding notifications to ensure that you always remain up-to-date and are able to make any necessary changes to your plant regarding operational safety should the need arise.

Log into Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

- SIMATIC S7-300/S7-300F (https://support.industry.siemens.com/cs/ww/en/ps/13751)
- SIMATIC S7-400/S7-400H/S7-400F/FH (https://support.industry.siemens.com/cs/ww/en/ps/13828)
- SIMATIC WinAC RTX (F) (https://support.industry.siemens.com/cs/ww/en/ps/13915)
- SIMATIC S7-1500/SIMATIC S7-1500F (https://support.industry.siemens.com/cs/ww/en/ps/13716)
- SIMATIC S7-1200/SIMATIC S7-1200F (https://support.industry.siemens.com/cs/ww/en/ps/13683)
- Distributed I/O (https://support.industry.siemens.com/cs/ww/en/ps/14029)
- STEP 7 (TIA Portal) (https://support.industry.siemens.com/cs/ww/en/ps/14667)

NOTE

Increased safety measures

Anywhere that errors can cause injury or property damage, special standards must be applied to the safety of the entire plant. Special, plant-specific rules exist for this purpose, which must also be taken into account by the owner when setting up the controller.

For electronic controllers with safety responsibility, the measures that must be taken to prevent or control errors are based on the risk posed by the plant. For this, the owner must ensure implementation of additional measures for the plant, for example, use of safety-related controllers such as the S7-1500 F fail-safe automation system.

NOTE
When using F-CPUs in safety mode and fail-safe modules, note the description of the fail-safe system SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126).

1.1 SiePortal

You can find current information on the following topics quickly and easily here:

- **Catalog and ordering system**
  Ordering system for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).
- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySiePortal**
  Your personal work area in the SiePortal for notifications, support requests, and configurable documents.

This information is provided by SiePortal on the Internet (https://sieportal.siemens.com/).

1.2 S7-1500/ET 200MP documentation guide

1.2.1 Information classes S7-1500/ET 200MP

1.2.1.1 S7-1500/ET 200MP documentation guide

The documentation for the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require. Changes and supplements to the manuals are documented in a Product Information.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742691).

Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- Getting Started S7-1500
- S7-1500/ET 200MP System Manual
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules
- Equipment Manuals Power Supply Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC S7-1500 and ET 200MPsystems.

Examples:

- Function Manual Diagnostics
- Function Manual Communication
- Function Manual Motion Control
- Function Manual Web Server
- Function Manual Cycle and Response Times
- PROFINET Function Manual
- PROFIBUS Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the S7-1500 and ET 200MP systems on the Internet (https://support.industry.siemens.com/cs/ww/en/view/68052815).

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/86140384)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

SIMATIC S7-1500 comparison list for programming languages

The comparison list contains an overview of which instructions and functions you can use for which controller families.

You can find the comparison list on the Internet
(https://support.industry.siemens.com/cs/ww/en/view/86630375).

1.2.2 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)

     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:

     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Safety information

2

2.1 Warnings in this document

You can find explanations of the warnings used in this document in the "Legal information" section.

2.2 Safety-related symbols

2.2.1 Devices without explosion protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
 CABLE SPEC.	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	Note that the device must be constructed and connected in accordance with EMC regulations.
 230V MODULES	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2

Symbol	Meaning
	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-DB Symbol 5180
	Be aware that the device is only approved for the industrial field and only for indoor use.
	Note that an enclosure is required for installing the device. Enclosures are considered: • Standing control cabinet • Serial control cabinet • Terminal boxes • Wall enclosure

2.2.2 Devices with explosion protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
	The assigned safety symbols apply to devices **with Ex approval**. You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
	Observe the mechanical rating of the device.
	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
	Note that the device must be constructed and connected in accordance with EMC regulations.
	When the device is under voltage, note that it may not be installed or removed, or plugged or pulled.
	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2

Symbol	Meaning
 24V MODULES	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-DB Symbol 5180
 INDOOR USE ONLY INDUSTRIAL USE ONLY	Be aware that the device is only approved for the industrial field and only for indoor use.
 ZONE 2 INSIDE CABINET IP54	For Zone 2 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP54.
 ZONE 22 INSIDE CABINET IP6x	For Zone 22 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP6x.

2.3 Intended use

The system is used to control machines and plants.

Intended use also includes observance of this documentation, in particular the safety instructions and conditions of use. See Technical specifications (Page 382) section.

2.4 Changes to the device and spare parts

Modifications to the device can impair the safety and function of the device:

- Do not make any changes or modifications to the device.
- Do not remove or paste over safety instructions on the device.
- Do not tape over, cover or install ventilation slots.
- Only use original spare parts and accessories.
- Only use the software provided by Siemens.

2.5 Knowledge and personnel qualification

All persons working with this device require the following knowledge:

- Contents of this document as well as contents of the enclosed documents.
- Handling the device (after instruction)
- Relevant standards and regulations
- Accident prevention regulations

The following activities are reserved for specially qualified personnel:

Working on electrical parts
Work on electrical parts may only be performed by the following persons:

- Qualified electricians
- Persons trained in electrical engineering under the direction and supervision of qualified personnel.

Commissioning and configuration
Commissioning and configuration requires general knowledge in the field of automation technology.

2.6 Personal protective equipment

The personal protective equipment depends on the activity and is determined by the operator.

To avoid material damage during packing, unpacking and installation activities we recommend:

- ESD wrist strap
- ESD shoes

2.7 Open Source Software

This product, solution or service ("Product") contains third-party software components. These are either open source software licensed under a license recognized by the Open Source Initiative (https://opensource.com/) or a license defined by Siemens as comparable ("OSS") and/or commercial software or freeware. With respect to the OSS components, the applicable OSS license conditions prevail over any other terms and conditions covering the Product. The OSS portions of this Product are provided royalty-free and can be used at no charge.

If SIEMENS has combined or linked certain components of the Product with/to OSS components licensed under the GNU LGPL version 2 or later as per the definition of the applicable license, and if use of the corresponding object file is not unrestricted ("LGPL Licensed Module", whereas the LGPL Licensed Module and the components that the LGPL Licensed Module is combined with or linked to is the "Combined Product"), the following additional rights apply, if the relevant LGPL license criteria are met: (i) you are entitled to modify the Combined Product for your own use, including but not limited to the right to modify the Combined Product to relink modified versions of the LGPL Licensed Module, and (ii) you may reverse-engineer the Combined Product, but only to debug your modifications. The modification right does not include the right to distribute such modifications and you shall maintain in confidence any information resulting from such reverse-engineering of a Combined Product.

Certain OSS licenses require SIEMENS to make source code available, for example, the GNU General Public License, the GNU Lesser General Public License and the Mozilla Public License. If such licenses are applicable and this Product is not shipped with the required source code, a copy of this source code can be obtained by anyone in receipt of this information during the period required by the applicable OSS licenses by contacting the following address:

Siemens Aktiengesellschaft
LC DI FA SL
Werner-von-Siemens Str. 60
91052 Erlangen
Germany

Keyword: Open Source Request (please specify Product name and version, if applicable)

SIEMENS may charge a handling fee of up to 5 EUR to fulfil the request.

Warranty regarding further use of the Open Source Software

SIEMENS' warranty obligations are set forth in your agreement with SIEMENS. If you modify the product or the OSS components or use them in a way other than that specified by SIEMENS, the warranty will be voided and no technical support will be provided. The following license terms may contain limitations of liability that apply between you and the respective licensor. For the avoidance of doubt, SIEMENS does not make any warranty commitment on behalf of or binding upon any third-party licensor. The Open Source Software used in the product and the license agreements concerning this software can be found in the Readme_OSS.

2.8 Safe working

2.8.1 Working on electrical parts

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualification (Page 20)).
- Always observe the country-specific safety rules.
- Notify all those who will be affected by the procedure.
- Follow the 5 safety rules according to DIN EN 50110-1 (VDE 0105-1):

1. Disconnect
2. Secure to prevent reconnection
3. Verify safe isolation from the supply (all poles)
4. Ground and short-circuit
5. Erect barriers around or cover adjacent live parts

The 5 safety rules must be applied in the above order prior to starting work on an electrical system. After completing the work, proceed in the reverse order.

It is assumed that every electrician is familiar with the 5 rules.

2.9 Residual risks

Despite all the technical and procedural risk reductions that have been carried out, not all dangers can be avoided.

The following sections describe these residual risks and measures to avoid them.

2.9.1 Live parts

Electrocution on contact with live parts leads to life-threatening injuries (death).

Operation

- Do not open the device.
- Never use damaged devices.
- Pull the plug and not the cable.

Installation and connection

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualification (Page 20)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 22))
- Fuse the connection cables according to the current-carrying capacity of the cable used, taking into account the applicable standards.
- Install the device in a control cabinet. The enclosures, cabinets or electrical equipment rooms must guarantee protection against electric shock and spread of fire.
- Ground the device in compliance with the applicable regulations.
- For the 24 V DC supply (SELV/PELV), only use power supply units that provide safe electrical extra-low voltage in accordance with IEC 61131-2 or IEC 61010-2-201.

Maintenance

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualification (Page 20)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 22))

2.9.2 External power supply to modules

Even if the main supply to the plant is disconnected, externally supplied modules can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.

For special SIMATICmodules, e.g. relay modules, you can connect or switch voltages larger than 24 V DC, e.g. 230 V AC. In some applications, these modules are supplied with voltages from outside the system (external power supply). In the event of an external power supply, a dangerous voltage may still be present on these modules even if the system is disconnected.

Maintenance

Ensure the following points before starting work:

- The plant is completely disconnected from the power supply.
- All externally supplied plant units are disconnected from the power supply

2.9.3 Voltage dangerous to touch due to permissible electric potential difference

Due to the permissible electric potential difference, a dangerous voltage may be present at the inputs of modules. An electric shock on contact with live parts can lead to death or serious injury.

Special SIMATIC modules, such as analog input modules, have isolated channels. In this case, there is no connection between the potential of the sensor and the potential of the module. If a dangerous voltage within the permissible electric potential difference occurs at the sensor, this voltage may also be present at the measurement channel of the module.

You can find the permissible electric potential differences in the technical specifications section of the modules' Equipment Manuals.

Maintenance

Ensure the following points before starting work:

- The plant is completely disconnected from the power supply.
- All externally supplied plant units are disconnected from the power supply

2.9.4 Conductive pollution

Electrocution during transmission of electrical energy via conductive contamination to the body leads to life-threatening injuries (death).

- Install the device in a control cabinet.
- Keep the control cabinet free of conductive contamination.

2.9.5 Overheating

Smoke development and fire due to overheating of the device and lines lead to burns and life-threatening injuries (death).

To avoid overheating:

- Ensure the correct installation position.
- Ensure sufficient air supply (for example, do not mask or cover ventilation slots, maintain mounting clearances).
- Only use undamaged cables.

Installation and connection

- Follow the instructions for the mounting position.
- Adhere to the specified ventilation clearances.
- Fuse the connecting cables according to the cable cross-section.

Maintenance

- Check plug-in connections and cables regularly for damage.

2.9.6 Uncontrolled movements

Uncontrolled movements of driven machine or system parts during commissioning, operation, maintenance and repair.

- Follow the safety instructions described in the function manuals.

2.9.7 Unsafe operating states

Unsafe operating states may result in personal injury of unknown extent.
The following factors can be triggers:

- Manipulation of the software, e.g. viruses, trojans or worms.

Manipulation of the software, e.g. viruses, trojans or worms.

- Adhere to the protective measures against tampering with the software (see section Industrial cybersecurity (Page 40)).
- Perform available updates in a timely manner.
- Protect files stored on removable media from malware with appropriate protective measures, e.g. virus scanner.
- Set up access protection for the CPU.

2.10 Behavior in case of emergency

- Force EMERGENCY OFF.

When the safe operating state has been restored:

- Unlock the EMERGENCY OFF mechanism.
- The person responsible for the system ensures that the system starts up in a controlled and defined manner.

2.11 Material damage

2.11.1 Transport and storage

- Only pack, store, transport and ship electronic components, modules or devices in the original product packaging or in other suitable materials, e.g. conductive foam rubber or aluminum foil.
- Observe the limits during transport and storage. See Technical specifications (Page 382) section.

2.11.2 Installation and connection

- We recommend touching components, modules and devices only if they are grounded by one of the following measures:
  - With an ESD wrist strap.
  - With ESD shoes or ESD grounding strips in ESD areas with conductive flooring.
- Place electronic components, modules and devices only on conductive surfaces (e.g. tables with ESD coating, conducting ESD plastic foam, ESD packing bags, ESD transport containers).
- Ensure that there is sufficient overvoltage protection.
- Do not install/remove the following elements when the power is on:
  - Front connectors
  - I/O modules
  - CPU

New properties/functions

3

What's new in the S7-1500, ET 200MP System Manual, Edition 11/2025 compared to Edition 11/2024?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Backup and restore configuration of the CPU from the central user	As of FW version V4.1 of a CPU, a central user can also back up and restore the configuration. Read about the rules you need to follow when backing up and restoring.	Section Backing up and restoring the CPU configuration (Page 326)
	Integrated safety		
	Temporary account lock for local user accounts	As of STEP 7 V21, you can set up a temporary account lock for local user accounts for CPUs as of FW version V4.1. The temporary account lock provides protection against brute force attacks.	Section Temporary account lock in case of brute force attacks (Page 269)
	SIMATIC S7 data	This appendix in the S7-1500/ET 200MP System Manual provides you with an overview of the data that the SIMATIC S7-1500 automation system generates and makes available to you.	Appendix SIMATIC data (Page 420)
	Communication of the CPU		
	New function for OPC UA	Enables cross-vendor communication.	Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual
	Activating IP forwarding through data record transfer	For CPUs as of FW version V4.1, you can also activate/deactivate the "IP forwarding" function for local interfaces of the CPU via data record transfer.	
	Configuring SNMP and DCP	As of STEP 7 V20, you can centrally configure the SNMP settings for an entire PROFINET IO system. IO devices that support the SNMP automatically synchronize the SNMP settings of the PROFINET interface of your higher-lever IO controller. If the IO controller and IO devices support the DCP protocol, the write-protected mode is activated by default for DCP. Easier configuration of the SNMP settings through central default at the CPU for the connected PROFINET IO system.	PROFINET (https://support.industry.siemens.com/cs/ww/en/view/49948856) Function Manual
	Technology functions of the CPU		
	General functions	Distribution of the processing of motion jobs across multiple cores Improved performance	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
	Axis functions (S7-1500T only)	Specification of the motion setpoints of a superimposing axis in addition to the basic motion of the axis Extended scope of functions	Axis functions (https://support.industry.siemens.

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Axis functions (S7-1500T only)	Cam can be used as a time-based position profile Extended scope of functions	com/cs/us/en/view/109817884) Function Manual
	Synchronous operation functions (S7-1500T only)	Range scaling on a cam before or during active camming Extended scope of functions	Synchronous operation functions (https://support.industry.siemens.com/cs/us/en/view/109817888) Function Manual
		Cross-PLC synchronous operation with communication via isochronous I-device Extended scope of functions	
	Kinematics functions (S7-1500T only)	New predefined kinematics type "6-axis articulated arm with offset wrist" available Extended scope of functions	Kinematics functions (https://support.industry.siemens.com/cs/us/en/view/109817886) Function Manual
		As of firmware version V4.1, the following CPUs support the motion control package "S7-1500T Motion Control Kinplus" V10.0: • CPU 1516T/TF-3 PN • CPU 1517T/TF-3 PN	
	Interpreter functions (S7-1500T only)	Value of a tag can be changed at a breakpoint in debug program mode Extended scope of functions	Interpreter functions (https://support.industry.siemens.com/cs/us/en/view/109817891) Function Manual
	Trace functionality of the CPU		
	Creating a long-term trace configuration from a long-term trace measurement	Extended scope of functions	Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual
	Recording, display and analysis of events in the TIA Portal	Diagnostics of Motion Control jobs Extended scope of functions	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
	PID control		
	New version V2.0 of PID_Temp controller	Use for cooling-only applications	PID control (https://support.industry.siemens.com/cs/ww/en/view/108210036) Function Manual
		Temporary shutdown of the heating	
		Manual stopping of the integral-action component	
		Active limiting of the integral-action component and change of output value limits in automatic mode	
		Improved anti-windup behavior in the cascade	

What's new in the S7-1500, ET 200MP System Manual, Edition 11/2024 since the previous version 11/2023?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Extension of the CPU portfolio	The following CPUs have been added to the CPU portfolio: • 1517(F)-3 PN • 1518(F)-3 PN • 1516T(F)-3 PN • 1517T(F)-3 PN • 1518T(F)-3 PN The CPUs mentioned above have 2 ports at the PROFINET interface X2 and the same PROFINET functionalities as at the PROFINET interface X1. In addition, these CPUs provide higher performance and make more data work memory available.	As of section System overview (Page 74)
	Performance boost through configurable environmental conditions	In the case of the following CPUs, you can specify the ambient conditions at the operating location in the hardware configuration and thus optimize the program processing of the CPU: • 1518(F)-3 PN • 1518T(F)-3 PN	Cycle and response times (https://support.industry.siemens.com/cs/us/en/view/59193558) Function Manual
	Integrated safety		
	Central user management	System-wide, central management of users and user groups outside TIA Portal via UMC server. User management for comprehensive automation solutions with multiple projects, users, and user groups can work in all projects in which they are activated and the appropriate rights have been assigned to them. During operation, users can be added to or removed from a group or their passwords can be changed – all without the CPU configuration having to be changed or loaded.	Section Central user management (Page 271)
	Retentive memory area for syslog messages	S7-1500 CPUs store Syslog messages retentively as of FW Version V4.0. This means that events that require a restart of the CPU also remain in the syslog storage.	Section Industrial cybersecurity (Page 40)
	Programming the CPU		
	SIMATIC Controller Profiling	You start or stop the profiling of an S7-1500 CPU as of firmware version V4.0 using the new "Profiling" instruction. When starting the profiling, specify the configuration with which the profiling data is to be recorded.	STEP 7 online help

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Programming the CPU	For S7-1500 CPUs as of firmware version V4.0, the nesting depth has been extended for the following elements: • PLC data types • Tags of the STRUCT data type • Tags of the ARRAY of STRUCT / ARRAY of UDT data type Previously, the maximum nesting depth was eight elements. You can now nest up to 26 elements inside each other. An ARRAY of STRUCT/UDT requires three hierarchy levels in each case. If you use these data types, the maximum nesting depth is reduced accordingly.	STEP 7 online help
	Communication of the CPU		
	New function for OPC UA	Enables cross-vendor communication.	Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual
	Configuring SNMP and DCP	As of STEP 7 V20, you can centrally configure the SNMP settings for an entire PROFINET IO system. IO devices that support SNMP automatically synchronize the SNMP settings of the PROFINET interface of your higher-lever IO controller. If IO controllers and IO devices support the DCP protocol, the write-protected mode is activated by default for DCP. Easier configuration of the SNMP settings through central default at the CPU for the connected PROFINET IO system.	PROFINET (https://support.industry.siemens.com/cs/ww/en/view/49948856) Function Manual
	Web server of the CPU		
	System web pages	Introduction of the system web pages with new design and functionality for: • Overview • Diagnostics • User program • Messages and DataLogs • Maintenance	Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) Function Manual
	New Web API methods	The Web API has been expanded to include the following functions: • Reading out basic information of the CPU • Reading out API session information • Reading out technology objects and their values • Configuring the HTTP response header • Further options for configuring web applications The extended scope of functions of the Web API offers additional access options. The configuration of the HTTP header also extends access to the web server via HMI Unified Panels.	
	Technology functions of the CPU		
	Axis functions	Defining the motion transition Extended scope of functions	Axis functions (https://support.industry.

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Axis functions	Stopping the basic motion Extended scope of functions	siemens.com/cs/us/en/view/109817884) Function Manual
	Synchronous operation functions (T-CPU only)	New cyclic cam types with larger definition ranges Extended scope of functions	Synchronous operation functions (https://support.industry.siemens.com/cs/us/en/view/109817888) Function Manual
		Directly set a following axis synchronously at a specified leading value position in camming. New synchronization mode of the following axis in camming: • Direct synchronous setting at the specified leading value position Extended scope of functions	
		New synchronization modes of the following axis in gearing: • Subsequent synchronization using leading value distance starting from current leading value position with calculated synchronous position • Subsequent synchronization using leading value distance with calculated synchronous position Extended scope of functions	
		Reversal tolerance of the leading value adjustable in gearing and camming. Synchronization and desynchronization are not aborted with a fluctuating leading value.	
		Cross-PLC synchronous operation with communication via PN/PN coupler Extended scope of functions	
		Cross-PLC synchronous operation across multiple projects Use of externally supplied projects possible.	
	Kinematics functions (T-CPU only)	Extension of the kinematics control panel Improved commissioning	Kinematics functions (https://support.industry.siemens.com/cs/us/en/view/109817886) Function Manual
		Display of effective dynamic limits Extension of the kinematics control panel	
	Interpreter functions (T-CPU only)	"Debug" program mode The execution of the Interpreter program can be tested.	Interpreter functions (https://support.industry.siemens.com/cs/us/en/view/109817891) Function Manual
	Trace functionality of the CPU		
	Named value data types in Traces	"Named values" are values that are assigned a unique name. In TIA Portal, you declare named values within "named value data types". They contain a set of values to which a unique set of names is assigned.	Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual

What's new?		What are the customer benefits?	Where can I find the information?
New contents		Named values are easily referenced throughout the program and increase the readability and maintainability of the program. This makes it easy to monitor/analyze the named value data types in the trace.	Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual
	Recording as binary file for long-term trace and long-term project trace	Recording as binary file instead of a CSV file and saving in a DAT file. This makes it possible to monitor/analyze long-term traces and long-term project traces directly in TIA Portal.	
	Acquiring events from technology objects in the Trace recording	Detecting events in the Trace recording, which occur at a Motion Control technology object as of V9.0 during recording. Monitoring/analyzing of the correct sequence and parameterization of Motion Control jobs in complex applications.	
	Cross-project Trace	Recording of values from multiple projects with a PN/PN coupler. Monitoring/analyzing of signals and events from multiple projects.	

What's new in the S7-1500, ET 200MP System Manual, Edition 11/2023 since the previous version 01/2023?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	"Industrial cybersecurity" section	Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities. The section contains the following information: • Basic information on the subject of industrial cybersecurity • Measures to protect individual components and the entire system against manipulation and unwanted access.	Section Industrial cybersecurity (Page 40)
	Syslog messages	As of TIA Portal version V19 and FW version V3.1, you can forward the syslog messages of an S7-1500 CPU to a syslog server.	
	CPU 1511(F)-1 PN	Expansion of the code work memory: 300 KB (standard CPU), 450 KB (F-CPU).	Section System overview (Page 74)
	Compact CPUs	Expansion of the work memory: • Code work memory: 300 KB (CPU 1511C-1 PN), 400 KB (CPU 1512C-1 PN) • Data work memory: 1.5 MB (CPU 1511C-1 PN), 2 MB (CPU 1512C-1 PN)	

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Local user management	As of TIA Portal version V19 and FW version V3.1, S7-1500 CPUs have improved management of users, roles, and CPU function rights (User Management & Access Control, UMAC). As of the above-mentioned version, you manage all project users with their rights (for example, access rights) for all CPUs in the project. Management is performed in the editor for users and roles in the TIA Portal.	Section Local user management (Page 259)
	"Random" instruction	The "Random" instruction is supported as of FW version V3.1: You can use this instruction to generate a 32-bit random number.	STEP 7 online help
	SIMATIC Controller Profiling	With SIMATIC Controller Profiling you can analyze and evaluate the runtime behavior of your user program on an S7-1500 CPU as of FW Version V3.1. All the relevant information can be displayed graphically and evaluated in a web browser.	Application example SIMATIC Controller Profiling (https://support.industry.siemens.com/cs/us/en/view/109750245)
	Appendix "Use over 2,000 m above sea level and extended temperature range"	The previously permissible ambient temperature range has been extended for many modules. The permissible installation heights have been extended to installation heights of up to 5000 m, depending on the module.	Appendix Use over 2 000 m above sea level and extended temperature range (Page 410)

What's new in the S7-1500, ET 200MP System Manual, Edition 01/2023 since the previous version 11/2022?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	General safety instructions	This section contains a compilation of general safety instructions for the SIMATIC S7-1500/ET 200MP automation system.	Section General safety instructions

What's new in the S7-1500, ET 200MP System Manual, Edition 11/2022 since the previous version 05/2021?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	S7-1500 Motion Control KinPlus	The "S7-1500T Motion Control KinPlus" software enables control of kinematics with 5 or 6 interpolating axes.	S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manuals
	Technology and standard CPUs	Expansion of the work memory	Section Technical specifications of CPUs (Page 100)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Increase in the number of simultaneously active jobs for asynchronous instructions (OUC and S7 communication)	The CPU can process a larger number of asynchronous instructions in parallel with the cyclic user program.	Section Asynchronous instructions (Page 246)
	Management of web server certificates during CPU runtime	You can load or update web server certificates not only in STOP mode but also in RUN mode.	Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) Function Manual
	New Web API methods	Many new API methods extend your access options to the CPU via the Web API.	

What's new in the S7-1500, ET 200MP System Manual, Edition 05/2021 since the previous version 11/2019?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Active backplane bus	The active backplane bus is used in applications with high availability requirements. Applications in which even short plant downtimes would result in significant economic damage. The active backplane bus provides you with the following advantages: • Reaction-free pulling and plugging of I/O modules during operation • Reserve capacity (= gaps in system configuration) for later use	Section Components (Page 91) Active backplane bus (https://support.industry.siemens.com/cs/de/de/view/109778694/en) Equipment Manual
	CPU 1518(F)-4 PN/DP MFP	A Linux-based operating system (SIMATIC Industrial OS) is pre-installed on the CPUs 1518(F)-4 PN/DP MFP (multifunctional platform) to allow you to use Linux-based apps and software, for example.	Starting from section System overview (Page 74)
	CPU 1518(F)-4 PN/DP	Expansion of work memory and motion control resources: • Code work memory: 6 MB (standard CPU), 9 MB (F-CPU) • Data work memory: 60 MB • Motion control resources: 15360 This expansion allows you to implement larger and more extensive applications with the CPUs.	Starting from section System overview (Page 74)
	CPU 1518T-4 PN/DP	Extension of the CPU portfolio with the CPU 1518T-4 PN/DP: CPU 1518T-4 PN/DP offers a very large program and data memory for demanding usage in applications that contain central I/O in addition to distributed automation structures. CPU 1518T-4 PN/DP features high-performance, extended motion control functions, for example: • Synchronous operation functions • Kinematics functions	Starting from section System overview (Page 74)

What's new?		What are the customer benefits?	Where can I find the information?
New contents		Important technical specifications: • Code work memory: 9 MB • Data work memory: 60 MB • Motion control resources: 15360 • Extended motion control resources: 512	
	CPU 1518TF-4 PN/DP	Extension of the CPU portfolio with the CPU 1518TF-4 PN/DP: CPU 1518TF-4 PN/DP offers a very large program and data memory for demanding usage in applications that contain central I/O in addition to distributed automation structures. The CPU can also be used for safety functions according to IEC 61508 up to SIL-3 and ISO 13849 up to PLe for safety applications. CPU 1518TF-4 PN/DP features high-performance, extended motion control functions, for example: • Synchronous operation functions • Kinematics functions Important technical specifications: • Code work memory: 9 MB • Data work memory: 60 MB • Motion control resources: 15360 • Extended motion control resources: 512	Starting from section System overview (Page 74)
	New motion control technology functions for the following tasks: • Desynchronization of gearing or camming • Following value shift in gearing or camming • Simulation of the kinematic motions • Copying the calculated cam elements	Extended areas of application	Motion Control (Page 133) section
Changed contents	With the introduction of DHCP (Dynamic Host Configuration Protocol), NTP servers can also be obtained via DHCP. This changes the configuration, in order to define where the NTP server obtains its configuration from: • via the hardware configuration of the CPU • via DHCP • via the block T_CONFIG	More assignment options from NTP servers to the CPU.	Section Time synchronization (Page 330)

What's new in the S7-1500, ET 200MP System Manual, Edition 11/2019 since the previous version 12/2017?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	DIN rail adapter	You can install the SIMATIC S7-1500/ET 200MP automation system on a standard 35 mm DIN rail using the DIN rail adapter.	Sec. Installing the DIN rail adapter (Page 177)
	Communication module IO-Link Master	With the IO-Link master, you can do the following during operation: • Changing parameters for the production and processing of product variants and batches down to sensor/actuator level • Specify remote diagnostics or detailed diagnostics up to the sensor/actuator	Section Communication module IO-Link Master (Page 131)
	Communications processor CP 1545-1	Communication processors connect the SIMATIC S7-1500 automation system securely with networks. With the integrated security functions, communication processors protect the S7-1500 automation system and lower-level networks from unauthorized access. Communication processors use encryption to protect data transfer against manipulation and espionage.	Section CM communication modules / CP communications processors (Page 129)
	Technology module TM NPU	With the TM NPU technology module, you can: • Process large amounts of data via neural networks • Perform visual quality check • Control robot systems via screen • Using pick-and-place applications	Section Technology Module TM NPU (Page 145)
	Basic analog input module	The new, simple and inexpensive analog input module provides data for temperature measurement with RTD via 8 channels.	Section Analog input modules (Page 122)

What's new in the S7-1500, ET 200MP System Manual, Edition 12/2017 since the previous version 09/2016?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Technology CPUs	• Extension of the technology CPU portfolio by the CPUs 1516T(F)-3 PN/DP • All technology CPUs feature the new technology object TO_Kinematics. With the TO_Kinematics, you can implement complex Motion Control applications for controlling 2D, 3D and 4D kinematics.	Starting from section System overview (Page 74)
	CPU1518(F)-4 PN/DP MFP	• Extension of the CPU portfolio by the CPUs 1518(F)-4 PN/DP MFP (multifunctional platform) • The CPU can execute STEP 7 blocks of the "usual" user program as well as blocks and applications programmed with C/C++.	Starting from section System overview (Page 74)

What's new?		What are the customer benefits?	Where can I find the information?
New contents		• The multifunctional platform offers you the option of running C/C++ code synchronously in the CPU cycle (via the CPU function library). In addition, the multifunctional platform can run C/C++ applications as separate applications in parallel to CPU runtime. • With C/C++ applications, you can implement parallel processes for the STEP 7 user program, for example, for preprocessing or sending data via Industrial Ethernet. A CPU can perform several tasks at the same time, the complexity of functions is reduced and the time required for implementation is reduced. • You can re-use existing technological know-how in C/C++ code synchronously and asynchronously to the STEP 7 user program.	
	Password provider	As an alternative to manual password entry, you can link a password provider to STEP 7. A password provider offers you the following advantages: • More convenient handling of passwords. STEP 7 automatically imports the password for the blocks. This saves you time • Optimum block protection as the users do not know the password themselves	Section Know-how protection (Page 284)
	GetSMCinfo instruction	With the help of the GetSMCinfo instruction you can respond to information provided by the memory card in the user program and if required, replace the memory card as a precautionary measure. This process makes sense if you write to the card often in your application, for example if you use data logs.	STEP 7 online help
	Testing with breakpoints	When testing with breakpoints, you execute a program from one breakpoint to another. Testing with breakpoints provides you with the following advantages: • Testing SCL and STL program code with the help of breakpoints • Localization of logic errors step by step • Simple and quick analysis of complex programs prior to actual commissioning • Recording of current values within individual executed loops • Use of breakpoints for program validation also possible in SCL/STL networks within LAD/FBD blocks	Section Test functions (Page 374)
Changed contents	PS 60W 24/48/60VDC HF system power supply	The PS 60W 24/48/60VDC HF enables extended retentivity of the CPU's data work memory. In the event of failure of the supply voltage, the PS 60W 24/48/60VDC HF supplies sufficient power for the CPU to back up the entire data work memory (without retentive data) to the SIMATIC Memory Card.	Section Use of system power supplies (Page 160)

What's new?		What are the customer benefits?	Where can I find the information?
Changed contents	Time synchronization	For all applications that require the exact time, you update the CPU time using the NTP method. This also automatically sets the CPU time beyond subnet limits.	Section Time synchronization (Page 330)
	Reading out the identification and maintenance data using the Get_IM_Data instruction	With the Get_IM_Data instruction you can read out the identification and maintenance data of the modules without much programming work. With the Get_IM_Data instruction you can access identification and maintenance data (I&M) of a module in the user program. I&M data is information saved in a module. This allows you to • Check the system configurations • React to hardware changes • React to hardware faults in the user program. Finding and elimination of hardware errors is easier.	Section Reading out and entering I&M data (Page 334)

What's new in the S7-1500, ET 200MP System Manual, Edition 09/2016 since the previous version 12/2014?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Compact CPUs	You can use compact CPUs for smaller to medium-sized applications. The compact CPUs have integrated analog and digital on-board I/O as well as integrated technology functions.	Starting from section System overview (Page 74)
	Technology CPUs	You can use technology CPUs for demanding applications. Technology CPUs are equipped with expanded motion control functions.	Starting from section System overview (Page 74)
	Fail-safe modules	With fail-safe modules, you replace the conventional safety engineering technical setup. For example, this involves replacement of switching devices for EMERGENCY OFF, protective door monitoring and two-hand operation.	Starting from section System overview (Page 74)
	Formatting, erasing or converting a SIMATIC Memory Card via the display	Your SIMATIC Memory Card is formatted, erased or converted to a program card directly via the display without having to use STEP 7. You save time.	Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101) Function Manual
Changed contents	Asynchronous instructions	You are given an overview of the resource consumption of asynchronous instructions. This ensures adequate resources in the CPU.	Section Asynchronous instructions (Page 246)

What's new?		What are the customer benefits?	Where can I find the information?
Changed contents	Configuration control	Configuration control provides you with the following advantages: • Different configuration levels of a standard machine can be handled in a single project. • No changes to the hardware configuration or user program are needed. • Centralized/distributed configuration of a system is flexibly variable • Easy handling during maintenance, versioning and upgrades. • Hardware savings: You only use the I/O modules that you currently need. • Potential savings when building, commissioning and creating documentation for standard machines.	Section Configuration control (Page 291)
	Wiring rules for the power supply elements	You are given information on proper connection of the power supply elements.	Section Wiring rules (Page 203)
	Connecting the CPU/interface module to the load current supply	You are given information on proper connection of the CPU/interface module to the load current supply.	Section. Connecting the CPU/interface module to the load current supply (Page 210)
	Firmware update via accessible devices	You are given information on fast firmware updates via accessible devices in the network.	Section Firmware update (Page 359)

Industrial cybersecurity

4

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

In the first part of this section you will find basic information on the subject of industrial cybersecurity. Subsequent sections describe recommended measures for protecting the entire system and the individual components from manipulation and unwanted access.

NOTE

Security-relevant changes to software or devices are documented in the section New properties/functions (Page 27).

4.1 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

4.2 Security update notification

Read the special information on maintaining the operational safety of your plant in the Introduction (Page 11) section.

Set up notification of security updates

To receive notifications about security updates, proceed as follows:

1. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home).
2. Enter the keyword "Security" in the search engine.
3. Choose the "Search in Knowledge base" option.
4. Enter the name or article number of the product in the product search.
5. Select the "Other types" option from the filter menu for "Type," and choose "Download" and "Product note".
6. For the document you want to be informed about, select "Add to my favorites" using the 3 dots on the right.

   For example, if you would like to be informed about all firmware versions of the CPUs, select the entry "Firmware update S7-1500 CPUs incl. displays and ET 200 CPUs (ET 200SP, ET 200pro)".
7. In the following dialog, enter the name of the favorite, select the storage location, and select the "Notify me" option. Then click the "+ Add to my favorites" button.

Result: You will be notified by email each time the document is changed.

Under "mySiePortal" > "Lists & notifications" > "My notifications", you can display your notifications and delete them if necessary.

4.3 Basic information on industrial cybersecurity

4.3.1 Definition of industrial cybersecurity

Industrial cybersecurity is generally understood to mean all measures to protect against the following threats:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability (for example, due to the destruction of data or denial of service (DoS))

4.3.2 Objectives of industrial cybersecurity

The objectives of industrial cybersecurity are:

- Ensuring trouble-free operation of industrial plants and production processes
- Preventing threats to people and production from cybersecurity attacks
- Protection of industrial plants against espionage and manipulation
- Protection of industrial automation systems and components against unauthorized access and data loss
- Provision of a practical and cost-effective concept for securing existing plants and devices that do not have their own security functions

- Use of existing, open, and proven industrial cybersecurity standards
- Compliance with legal requirements

An optimized and adapted security concept applies to automation and drive technology. The security measures must not impede or endanger production.

4.4 Integrated security concept and security strategies

4.4.1 Comprehensive security concept "Defense in Depth"

With Defense in Depth, Siemens provides a multi-layer security concept that offers industrial plants comprehensive and far-reaching protection in accordance with the recommendations of the IEC 62443 international standard.

Productivity and know-how are protected on 3 levels:

Plant security
Plant security uses various methods to safeguard critical components from physical access by people. This starts with classic building access and extends to securing sensitive areas using access control (for example, code card, iris scan, fingerprint or access code).

Network security
Automation networks must be protected against unauthorized access. This is achieved through security measures on the product, but also those in the product-related environment.

System integrity
Targeted measures must be taken to protect existing know-how or to prevent unauthorized access to automation processes. The measures protect against unauthorized configuration changes, and highlight attempts at manipulation.

You can find more information on the topics of Defense in Depth, plant security, network security, and system integrity on the SIEMENS Industrial cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) Web page.

You can also visit the download center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) to obtain more information on the topic of industrial cybersecurity. The "Operational Guidelines", for example, provide recommendations on basic security measures for secure machine and plant operation in an industrial environment.

4.4.2 Security management

The ISO 27001 and IEC 62443 standards call for a comprehensive approach in information technology (IT) and operational technology (OT) to protect against cyber attacks.

Responsibility for cybersecurity and IT security

Every operator of machinery and equipment is responsible for:

- Defining cybersecurity and IT security as an important criterion in the procurement and selection of machines and software applications
- Use of suitable measures to protect production resources, data, and communication from manipulation and theft
- Providing all necessary resources and training to employees to fully support these goals

For this purpose, suitable measures must be selected after a risk assessment and a cost-benefit analysis in order to protect material and intellectual property and prevent damage from occurring. These measures should be integrated into corporate processes and procedures, evaluated regularly, and firmly anchored in the corporate culture. In addition to protecting intellectual property, the protection of personal data must be ensured at all organizational units and levels.

Siemens will provide you with information and support. Subscribe to the Security feeds (https://www.siemens.com/cert) for information on vulnerabilities. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home) and create filters to be notified when important information is published. The procedure is described in the section Notification of security updates (Page 41). Consider using Siemens Cybersecurity Services.

Responsibility in the digital supply chain

Cybersecurity should play a critical role in the evaluation and procurement process. The entire life cycle of a product should be considered to ensure protection against current and future risks. These include, for example, security updates throughout the product life cycle, including guidelines for secure disposal of the product.

Siemens plans and announces the provision of security updates, as well as total discontinuation of products, as part of product support.

Employee awareness

Regular training in cybersecurity and continuous testing of training success are essential so that cybersecurity measures are internalized in processes and work instructions. This involves general training in the use of software and IT hardware for company communication and as work equipment, for example:

- Secure handling of USB devices
- Encrypted communication
- Use of VPN
- Rules for passwords and use of access
- Setting up two-factor authentication
- Educating employees about the dangers posed by malware, phishing, social engineering and other factors

Furthermore, if applicable, production equipment and software training should always include the topic of cybersecurity.

Maintaining the security concept through updates

Keeping software up-to-date is essential, for example, to benefit from the following measures:

- Implementation of new security strategies, protocols and techniques
- Closing of security vulnerabilities
- Elimination of security vulnerabilities

To this end, it is necessary to keep a constant eye on the further development of protective measures and, if necessary, the expansion of requirements.

Recommendations:

- Set up notifications for (security) updates
- Subscribe to information on vulnerabilities
- Monitor and implement the further development of the technology, especially in the area of cybersecurity

Always keep technology and knowledge up to date.

Consideration of the risks posed by cyber attacks in the Threat and Risk Assessment (TRA)

Make an inventory of all software, hardware, and infrastructure devices, in order to identify risks to the location or organization. Incident response procedures must be incorporated into all IT and manufacturing processes. The choice of risk mitigation measures should be based on a cost-benefit analysis and classification of risks. This is followed by the introduction of cybersecurity rules and procedures and the training of personnel.

Living the concept

Technical solutions alone are not sufficient to effectively counter threats.

Cybersecurity must be part of the corporate culture and process landscape and must be internalized and lived by all employees.

Continuously monitoring the security situation

You have the following options to monitor the cybersecurity situation continuously:

- Setting anomaly references and creating allow and deny lists based on normal network communication and production machine behavior. The SINEC software family offers you reliable security tools (https://www.siemens.com/global/en/products/automation/industrial-communication/sinec-network-software/cybersecurity.html) to detect potential vulnerabilities in OT networks, quickly initiate suitable measures and resolve security vulnerabilities in a targeted manner.
- Establishment of an intrusion detection system (IDS) that generates alarms when unusual behavior occurs in the network

- Introduction of a Security Information and Event Management (SIEM) system to collect, analyze, and evaluate events in real time to enable early countermeasures
- Measures regarding network security: for example, network segmentation, firewalls, VPN, DMZ (demilitarized zones)

4.5 Operational application environment and security assumptions

4.5.1 Intended use

SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.

The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

Operational reliability and intended use

Read the "Special information" in the Introduction (Page 11) section.

Area of application

Observe the section Areas of application SIMATIC S7-1500 and ET 200MP (Page 77).

4.5.2 Requirements for the operational application environment and security assumptions

Siemens recommends the following security measures:

- Threat and Risk Assessments (as part of security management)
- Network security concepts
  - Network segmentation
  - Asset and network management
  - Network protection
  - Remote access
- Access control concepts (utilizing access control systems)
  - Physical protection
  - Physical corporate security
  - Physical product security

Threat and Risk Assessment

Vulnerabilities and risks are identified, and countermeasures are proposed to ensure the security of the system, networks, and data.

Network security concepts

You can find information on network security in the whitepaper "Industrial Network Security Architecture", available at the Download Center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) on the Industrial Cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) website.

Access control concepts

Physical protection
In addition to closing off and/or monitoring entire production facilities, it may be necessary to physically secure cabinets or even individual components such as circuit breakers.

Physical corporate security
You can ensure physical corporate security by the following measures, among others:

- Closed off and monitored company premises
- Access control, locks/card readers, and/or security personnel
- Accompaniment of non-employees by company personnel
- Employees are trained on and embrace security processes within the company

Physical production security
You can ensure the physical production security by, among others, the following measures:

- Separate access control for critical areas, such as production zones.
- Installation of critical components in lockable cabinets/control rooms with monitoring and alarm capabilities. The cabinets/control rooms must be secured with a cylinder lock. Do not use simple locks, such as universal, triangular/square, or double-bit locks.
- Radio field planning to limit WLAN coverage areas, preventing them from extending beyond defined zones (e.g. factory floor).
- Guidelines that prohibit the use of external data storage media (such as USB flash drives) and IT devices (such as laptops) classified as unsafe on systems.

4.6 Security properties of the devices

The security properties of the individual devices are listed in the Equipment Manuals.

4.7 Secure operation of the system

This section describes measures recommended by Siemens to protect your system from manipulation and unauthorized access.

4.7.1 Hardening measures

System hardening, also simply referred to as hardening, is the secure configuration of products or systems. The aim is to close security gaps and take various measures to reduce the attack surfaces for cyberattacks.

Measures for system hardening include, for example:

- Secure configuration in which only necessary software components and services are installed or activated for proper operation.
- Access control, by which a restrictive user and rights management system is implemented.

4.7.2 Secure configuration

Secure configuration involves control over all software components, along with their interfaces, ports, and services.

Activated services and ports pose a risk, for example of unauthorized access to the network and to programs.

To minimize the risk, activate solely the required services at all the automation components. Take all activated services (especially Web servers, FTP, remote maintenance etc.) into account in the security concept. Consider the default states of ports and services in your security concept.

You can find an overview of all ports and services used in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.7.3 Access control

In addition to physical protection, also establish logical safeguards to control access to your system:

- Use a restrictive user and rights management system, for example, for accessing the CPUs and TIA Portal.
- Refer to the information about password management in the section Protection (Page 256) and in the STEP 7 online help (TIA Portal).

4.7.4 Handling of sensitive data

Data protection information

Siemens Aktiengesellschaft observes the applicable data protection laws, including the General Data Protection Regulation (GDPR), in particular the rules of data minimization and data-protection-friendly default settings (privacy by design, privacy by default).

This means for the products in this system:

Products with user management save user names and passwords to manage access rights. User names are also saved in logging alarms. These logging alarms are provided with a time stamp and stored in the internal cache of the CPU. They can be forwarded to a central syslog server. You can find more information in the section Syslog messages (Page 61).

In addition, the products do not store any personal data.

If you establish a reference to an identifiable person by linking these data with other data (such as shift schedules), or if you store personal data on the same medium (such as a hard disk), you must yourself ensure that the data protection regulations are observed.

Information on the secure removal of data from the CPU, interface module and SIMATIC Memory Card is provided in the section Secure decommissioning (Page 50).

Storage of security-relevant data

When storing your security-relevant data on your PC, independently ensure secure data storage.

Also observe the section Sensitive data (Page 58).

4.7.5 Regular firmware updates

NOTE

Outdated firmware versions might not be monitored for security vulnerabilities.

- Always keep your plant/products up to date to benefit from troubleshooting and to minimize potential risks.
- Use email notifications to be automatically informed about firmware updates.

You can find more information in the following:

- The section Firmware update (Page 359)
- The section Notification of security updates (Page 41)

4.7.6 Notifications about security vulnerabilities (Siemens Security Advisories)

A vulnerability is a security vulnerability in information security. A vulnerability can pose a threat as it provides intruders with the opportunity to access system resources and manipulate or steal data. Many vulnerabilities allow availability to be impaired.

Siemens ProductCERT

If Siemens identifies or fixes Security Vulnerabilities in the products, this will be published in the Security Advisories.

You can find the documents for SIMATIC on the following website of the Siemens Aktiengesellschaft: Siemens ProductCERT and Siemens CERT (https://new.siemens.com/global/en/products/services/cert.html?s=SIMATIC#SecurityPublications)

"Search Security Advisories" is the default entry in the "SIMATIC" search field. You can also enter other product names or other terms in the search field and search for them.

On this page, you will also find all the required information on how to deal with vulnerabilities:

- Contact persons for matters related to vulnerabilities
- Options for automated notifications regarding vulnerabilities
- Notifications are also possible in CSAF format
- Option to subscribe to RSS feeds and newsletters
- List of all current vulnerabilities and detailed information such as:
  - Description
  - Classification according to Common Vulnerability Scoring System (CVSS)
  - Measures
  - Availability
  - Etc.

Set up Security feeds (https://www.siemens.com/cert) to receive notifications about security-related topics.

If you suspect or have discovered a vulnerability in a Siemens product, please let us know immediately. To do this, press the "Contact" button on the CERT Services page (https://www.siemens.com/cert) and follow the instructions.

4.7.7 Data backup

Secure your configuration and parameter settings so that you can quickly restore this data if needed.

4.7.8 Security checks

Security checks for data, files, and archives serve to ensure data integrity at the storage location and during file transmission, protecting against manipulation and transmission errors. This is often achieved using digital checksums that are provided alongside the data. Tools (such as SHA-256 or SHA-512) for calculating and verifying these checksums are provided in many systems and named according to their respective calculation methods.

File Integrity Guidelines describe the prescribed procedure for integrity checks.

Integrity protection is a protection function for engineering data and firmware files.

Communication integrity means protecting communication against unauthorized manipulations to ensure high system availability. A central element in this regard is, for example, the use of digital checksums when accessing controllers. (Source: Industrial Cybersecurity website (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html))

4.7.9 Secure decommissioning

In the following section, you will find information on how to properly decommission individual components of your automation system. Decommissioning is necessary when the component has reached the end of its service life.

Decommissioning includes environmentally sound disposal and secure removal of all digital data of electronic components with storage medium.

4.7.9.1 Securely removing data

Before disposing of components of your automation system, you should securely delete all data from the storage media of these components. How to securely delete data from the devices so that it cannot be recovered is described below.

NOTICE
Data misuse resulting from non-secure deletion of data Incomplete or non-secure deletion of data from data memories can result in data misuse by third parties. For this reason, ensure secure deletion of data from all storage media used before disposing of the product.

Secure erasure of data from the CPU and SIMATIC Memory Card

To delete all data from the data memories of the CPU, reset the CPU to factory settings. The function deletes all information that was saved internally on the module.

For secure deletion of the data, follow these steps in the order given:

1. Format the SIMATIC Memory Card.

   The formatting deletes all contents from the SIMATIC Memory Card.

   Formatting with STEP 7:

   – Establish an online connection.
   – Open the online and diagnostics view of the CPU (either from the project context or via "Accessible devices").
   – In the dialog window, select "Functions > Format memory card" and then click the "Format" button.

   Formatting using the display of a CPU:

   – In the display of the CPU, select the menu "Settings" > "Card functions" > "Format card" and confirm with OK.

2. Restore the factory settings of the CPU.
   We recommend resetting the CPU in STEP 7. When you reset a CPU to factory settings, select the options shown in the figure before the reset.

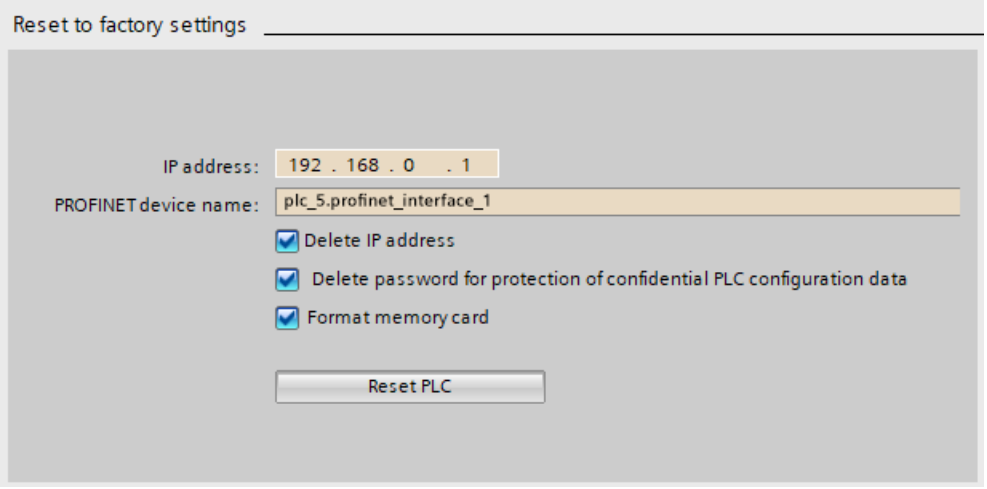

Figure 1-447 Resetting the CPU to factory settings

NOTE
If you reset the CPU using STEP 7 and you have selected the "Format memory card" option, you can skip step 1 of the described sequence of steps.

Result: All data that was still contained in the data memories of the modules and the SIMATIC Memory Card has been deleted. You can now dispose of the components.

For more information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 365).

NOTE
If you no longer plan to use the SIMATIC Memory Card after formatting it, destroy it before disposing of it.
A secure destruction method is to shred the card to such a degree that it cannot be reconstructed. For this, you can also use a waste disposal service that specializes in data storage medium destruction.

Secure erasure of data from the interface module

With the following tools, you can securely erase the data from the interface module:

- STEP 7 < V19
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Follow these steps in the order given:

1. Establish an online connection.
2. Open the Online and Diagnostics view of the IM (either from the project context or via "Accessible devices").
3. In the dialog box "Functions > Reset to factory settings", select the option "Delete I&M data" and then the "Reset" button.

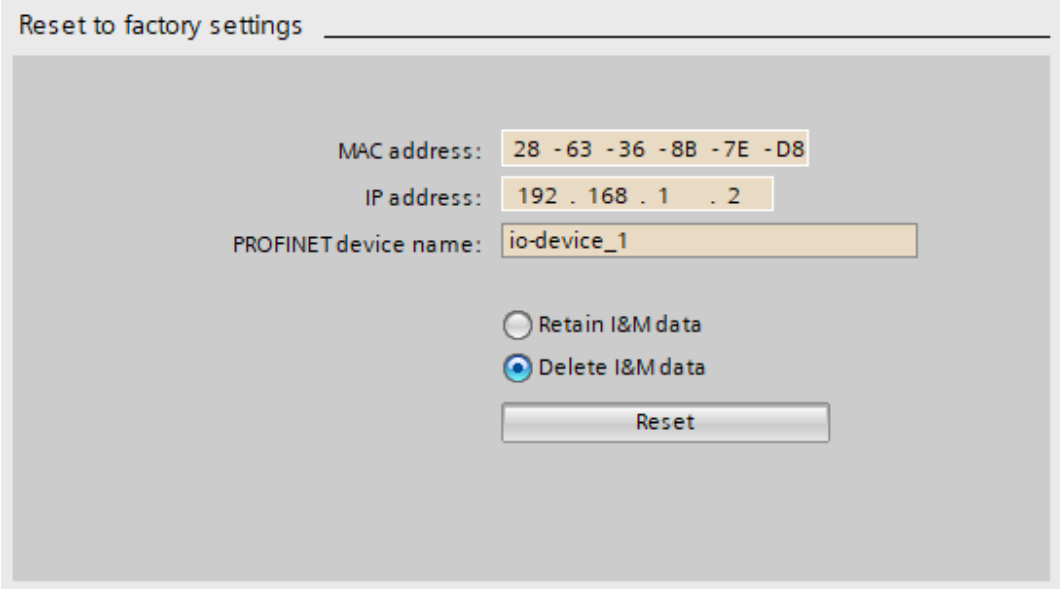

Figure 1-448 Resetting an interface module to factory settings

Result: All the data that was still in the data memories of the interface module was deleted. You can now dispose of the components.

For more information on resetting the interface module to factory settings, refer to the section Resetting an interface module to factory settings (Page 370).

NOTE

STEP 7 ≥ V19

Only the communication parameters will be securely deleted on "Reset to factory settings" with the "Delete I&M data" option enabled when you use STEP 7 ≥ V19.

Deleted communication parameters:

- IP address
- Device name
- PROFINET configuration data

If you want to securely remove all data, use one of the tools listed above for this purpose.

4.7.9.2 Recycling and disposal

For environmentally sustainable recycling and disposal of your old equipment, contact a certified electronic waste disposal service and dispose of the equipment according to the applicable regulations in your country.

NOTE

Recycler Guides

Disassembly of electronic devices may only be carried out by specialists trained in the recycling of electronic products.

The Siemens Recycler Guides provide step-by-step disassembly instructions and material composition information of the products. This information helps recyclers direct specific materials to specialized recyclers and thus maximize the recovery of resources.

You can find the Recycler Guides in the SiePortal (https://sieportal.siemens.com/en-ww/home) in the "Support" area by using the search term "Recycler Guide".

4.8 Secure operation of the engineering software

For more information on secure operation of the engineering software, refer to the TIA Portal online help.

4.9 Secure operation of CPUs

This section describes measures recommended by Siemens to protect your device from manipulation and unauthorized access.

4.9.1 Secure configuration

Information about ports, services, and default states can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and the Equipment Manual.

4.9.2 User management and access control

4.9.2.1 Administration of user accounts

Creating and managing user accounts with appropriate usage rights is an important measure, as every active user represents a potential security risk.

Take the following security measures:

- Train your personnel in understanding their rights and password assignment
- Regularly check the user accounts

You can find information on creating and managing user accounts in the Protection (Page 256) section under "User management" and in the online help for STEP 7 (TIA Portal).

4.9.2.2 Assigning secure passwords

Using non-secure passwords can easily lead to data misuse. Non-secure passwords can be easily guessed or decrypted.

- Therefore, always change the default passwords during commissioning and use different passwords for different users, functions and devices.
- When changing the password, do not use passwords (or parts of passwords) that were used in the past.
- Also, change passwords for functions you don't personally use to prevent misuse of such unused functions.
- Always keep your passwords confidential and ensure that only authorized individuals have access to the respective passwords.
- Go over the required minimum password length and use a mixture of lower- and upper-case letters, numbers and characters.

The STEP 7 online help (TIA Portal) provides information on creating secure passwords.

Overview of all components and functions with password protection

Components and functions with password protection	Comment
SIMATIC S7 app	See section SIMATIC S7 app (Page 154)
Syslog (with certificate protection)	See section Syslog messages (Page 61)
CPU	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
OPC UA	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section OPC UA communication
SNMP Community-String (similar to a password)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section SNMP
Secure communication (with certificate protection)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
Web server	See the Web server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59193560)

4.9.2.3 Password management

- You can find comprehensive recommendations for creating secure passwords in the Industrial security Configuration Manual (https://support.industry.siemens.com/cs/us/en/view/108862708).
- Establish guidelines for assigning passwords and intervals for password changes.
- Settings for checking password policies when passwords are assigned or changed can be configured in the TIA Portal. For more information, please refer to the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

- Modify and reset the password for protecting confidential configuration data.
  You can find information on the following topics in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925):
  - Description of how to change the password
  - Description of how to delete or reset the password
  - Description of how to assign the password via a SIMATIC Memory Card
- Access to a password-protected CPU can be configured through the display, if the CPU has a display; see section Using the display to set additional password protection (Page 283).
- For user management and access control, use the Local/central user management (Page 259).
- Using a password provider: In STEP 7, you can set up a password provider; see section Know-how protection (Page 284).
- In addition, you can use commercially available password management programs.

Setting password protection without engineering system

You can change your password for a user account in the user management via the web server of the CPU:

- API method Api.ChangePassword: Changing a password in runtime

You can find more information about the available methods of the web server's Web API in the Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) Function Manual.

4.9.2.4 Setting protection levels

For detailed information about setting up protection levels for the CPU and assigning user authorizations, refer to the section Configuring access protection for the CPU (Page 280) and the STEP 7 online help (TIA Portal).

4.9.2.5 Certificate management

You can create, assign and manage certificates with TIA Portal for the following functions of the CPUs:

- Secure Open User Communication
- OPC UA communication
- Secure PG/HMI communication
- Web server

You can find all relevant information about "Certificate management" in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.9.3 Protection functions

Integrated protection functions of the CPU protect against unauthorized access.

You can find an overview of the protective functions supported by your CPU in the respective Equipment Manual.

A description of the protection functions and their activation can be found in the section Protection (Page 256).

4.9.4 Signed firmware update for CPUs

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Principle of the signed firmware updates for CPUs

Firmware updates for CPUs contain a digital signature.

The digitally signed firmware update files are available for download on the Siemens Support Web page (https://support.industry.siemens.com/cs/de/en/view/109478459).

The CPU verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the CPU can detect a manipulated or corrupted firmware update file and reject it.

Note that the CPU performs the verification only after the complete firmware download has taken place.

The procedure for carrying out firmware updates for CPUs is described in the section Firmware update (Page 359).

Diagnostics alarms and remedy

The success/failure of the signed firmware update is reported:

- In the diagnostics buffer of the CPU
- On the display of the CPU if the CPU has a display
- In the Syslog storage of the CPU

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support Web page.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109483101).

4.9.5 Secure Boot for CPUs

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Principle of "Secure Boot" for CPUs

CPUs as of article number 6ES751x-xxx03-0AB0 and as of 6ES751x-xxx10-0AB0 verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before their startup.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to the signed firmware update for CPUs (Page 56), Secure Boot prevents a manipulation of the firmware by a physical intervention into the CPU.

Secure Boot is integrated in the CPU and cannot be deactivated for security reasons.

4.9.6 Web server

The CPUs have an integrated web server.

It comes with built-in security features:

- Activation for specific interfaces
- Access via the secure transmission protocol "HTTPS" using the CA-signed or self-signed web server certificate
- Authentication via local or central user management
- Changing the password of local users during runtime via Web API

The functions are described in detail in the Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) Function Manual.

4.9.7 Secure communication/OPC UA

Additional protection is provided by the protection functions of the secure communication and OPC UA protocols.

Information about the protocols Secure Communication and OPC UA can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.9.8 Sensitive data

Security-relevant and sensitive data can be protected through appropriate measures such as passwords and protection functions.
For certain data, protection is already essential and implemented within the system (e.g. certificate management in the TIA Portal).

Sensitive data	Comment	Where can I find more information?
Confidential configuration data (private keys, passwords/access data)	Protection by using a strong password	Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Protection of confidential configuration data
User management data	-	Protection (Page 256) section STEP 7 online help
Configuration of CPUs and interface modules	Protection through PROFINET Security Class 1	Function manual PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856)
Blocks (data blocks, logic blocks)	Know-how protection, copy protection, write protection	Protection (Page 256) section
Data deemed sensitive by the operator	Backups, other configuration data, analysis data	Backing up and restoring the CPU configuration (Page 326) section

4.9.9 Backups and data backups

Regular data backups after successful installation should be part of a successful security concept. Whether for restoring a project if required, if the changes made do not yield the desired results, or for saving an installation in an emergency.

Backup of a STEP 7 project:

- Project backup via the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300)
- Project backup via TIA Portal, see FAQ What options are there in STEP 7 (TIA Portal) for backing up projects and what is the significance of the backup files of the projects? (https://support.industry.siemens.com/cs/us/en/view/92561565)

You can find more information in the section Backing up and restoring the CPU configuration (Page 326).

4.9.10 Additional protective measures for network security

To secure a CPU via further measures, the following options are available:

- Use of the CP 1543-1 or CP 1545-1 with security functions

  The use of an Ethernet CP provides you with additional access protection through a firewall and possibilities to establish secure VPN connections. See also operating instructions SIMATIC NET: S7-1500 - Industrial Ethernet CP 1543-1 (https://support.industry.siemens.com/cs/us/en/view/67700710) and S7-1500 - Industrial Ethernet SIMATIC CP 1545-1 (https://support.industry.siemens.com/cs/us/en/view/109771664).

- Various measures increase protection against unauthorized access to functions and data of the CPU from external sources and via the network. For information on the protection functions, refer to the Overview of protective functions (Page 256) section, under Further measures for protection of the CPU.
- You can find information on network security and network components for protection against unauthorized access in the Network security section of the PROFINET Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).

4.9.11 Remote access to CPU

4.9.11.1 Using a Web server

When using Web servers, traditional firewalls are no longer sufficient to protect modern networks.

Information about potential risks when using Web servers can be found in the Web server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59193560).

4.9.11.2 Remote access via Internet

Communication via SINEMA Remote Connect (SINEMA RC)

The "SINEMA Remote Connect" (SINEMA RC) application is available for remote maintenance purposes. SINEMA RC uses OpenVPN to encrypt the data. The center of communication is the SINEMA RC server, which is used for communication between the devices and manages the configuration of the communication system.

You can use the CP 1543-1 communication processor for remote maintenance via SINEMA RC.

More information on communication via SINEMA RC can be found in the Operating instructions S7-1500 - Industrial Ethernet SIMATIC CP 1543-1 (https://support.industry.siemens.com/cs/de/de/view/109986722/en) and on the Internet.

4.9.11.3 Remote access via TIA Portal

Communication via TIA Portal Cloud Connector

The TIA Portal Cloud Connector enables you to access the local PG/PC interface and the SIMATIC hardware connected to it from a TIA Portal Engineering in a cloud environment.

Use the "TIA Portal Cloud Connector" via a VPN solution (for example, SINEMA RC).

More information on communication via TIA Portal Cloud Connector in the STEP 7 (TIA Portal) online help. You can find details on working with the TIA Portal Cloud Connector in this application example (https://support.industry.siemens.com/cs/de/de/view/109747305/en).

4.9.12 Recording Security events

Syslog storage

Syslog stands for "System Logging Protocol," a standard for transmitting log messages triggered by security events. Predefined events in a network device are collected as security events in the device (syslog client) and stored as syslog messages in the local cache.

A syslog server collects and categorizes syslog messages, which can then be analyzed and filtered and displayed in various ways. Additionally, notifications for critical events can be configured.

The following security events, for example, are collected in the CPU diagnostic buffer:

- Going online with the correct or incorrect password
- Manipulated communication data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (via an instruction or, if applicable, the CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive
- Logging on to the Web server with the correct or incorrect password
- Creating a backup of the CPU
- Restoring the CPU configuration (Restore)

The above-listed security events are also stored as syslog messages in the local cache of a CPU as of firmware version V3.1. You can find an overview of all syslog messages in the following Entry (https://support.industry.siemens.com/cs/ww/en/view/109823696).
The content of a syslog message is based on IEC 62443-3-3.

You can find more information in the section Syslog messages (Page 61).

Connection to a SIEM system

A SIEM system (Security Information and Event Management) analyzes security events in real time and can be installed, for example, on the syslog server.

4.9.13 Syslog messages

Using syslog messages

International standards and national regulations for the IT security of automation components require, for example, the ability to log safety-related events.
Syslog (System Logging) is an IETF standard protocol (RFC 5424) for the transfer of recorded events and meets this requirement. A CPU records the following events, for example:

- Security events
- Firmware updates
- Changes to the user program
- Changes to the configuration
- Changes to the operating mode

The collecting of security-relevant events cannot be deactivated. Each CPU as of FW version saves V3.1 syslog messages in a local cache. By querying this cache, you can view the syslog messages and identify potential security risks.

For CPUs as of FW version V4.0, the local cache is located in the retentive memory area. As a result, syslog messages are retained after a POWER OFF/POWER ON transition or when the CPU is switched off. As a result, events that require one or more CPU restarts are also retained in syslog storage, such as restoring the CPU configuration.

The cache of a CPU is organized as a ring buffer. If the storage limit of the cache is reached and additional security events occur, the oldest messages in the cache are overwritten.

You have the option of transferring the events collected by the CPU to a syslog server in the network.

NOTE

Deleting the retentive syslog storage

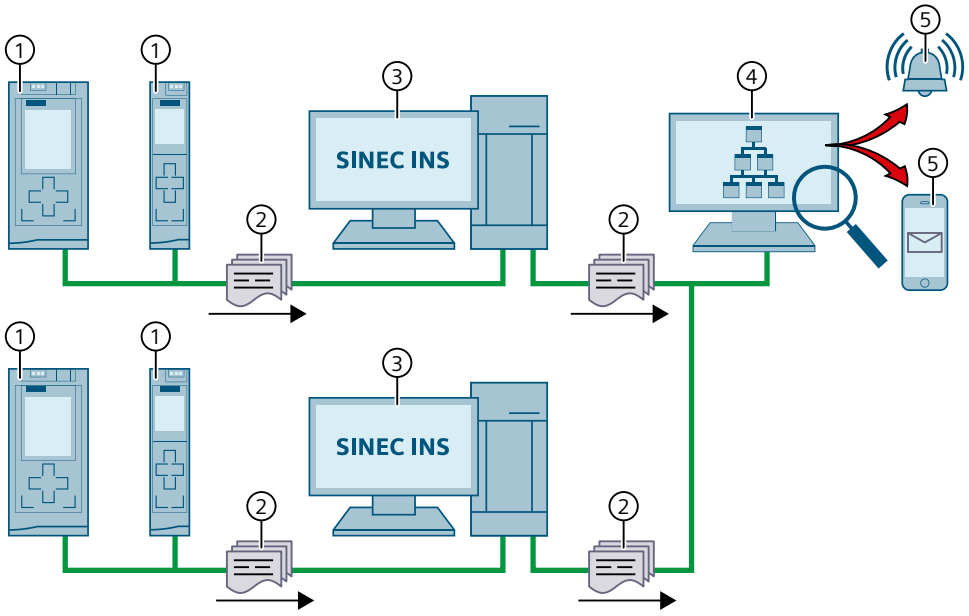
If you want to expand or store a CPU as of FW version V4.0, the syslog messages are retained in the syslog storage of the CPU. To prevent unwanted transmission of saved syslog messages, return the CPU to factory settings (reset to factory settings) before removing or storing.

After a successful reset, the syslog storage only contains one boot up entry, which provides information about the reset to factory settings.

Forwarding to a syslog server

From STEP 7 V19 and a CPU as of FW version V3.1, it is possible to transfer syslog messages to a server, for example, SINEC INS. The syslog messages are transferred to the syslog server via the syslog protocol. The syslog server saves all syslog messages from its connected devices. Messages of system and network events are stored centrally in a storage location in the syslog server. At the syslog server interface, you can view the collected syslog messages and thereby determine the source of potential security risks or problems.

If you want S7-1500 CPUs to transfer their syslog messages to a syslog server, configure either a TLS or UDP connection. Syslog messages are sent to the syslog server via port 514 (UDP) or port 6514 (TLS over TCP) by default.



Use solely a TLS connection in productive operation. TLS ensures that all syslog messages from the CPU are securely transferred to the syslog server.

You can also use a UDP connection for commissioning and testing scenarios. A UDP connection is not secured. A UDP connection also does not guarantee transfer of all syslog messages to the configured syslog server.

Processing in a Security Information and Event Management system (SIEM system)

In order to be able to accept and process the incoming syslog messages, a SIEM system must "understand" the syslog protocol according to RFC 5424.

The SIEM system breaks down the incoming syslog messages into individual elements. These elements are assigned to their own event within the SIEM system. Within this event, it is analyzed whether there are connections between the individual syslog messages. In this way, the SIEM system detects possible attack vectors and, if necessary, informs the user, for example, in the event of multiple attacks at several points in the system.

① CPUs
② Syslog messages

Figure 1-449 Forwarding and processing of syslog messages

More information

More information on network management with SINEC INS is available in the "SIMATIC NET: Network management SINEC INS V1.0 SP2" (https://support.industry.siemens.com/cs/us/en/view/109781023) manual.

You can find information on the structure of syslog messages in the Structure of the Syslog messages (Page 65) section.

4.9.13.1 Transfer the syslog messages to a syslog server

A CPU can send syslog messages to a syslog server via a TLS or UDP connection.

Recommendation: Use solely a TLS connection for the productive operation. You can also use a UDP connection for commissioning or testing scenarios.

Transmitting syslog messages via a TLS connection

A TLS connection ensures that all syslog messages from a CPU are securely transmitted to the syslog server. If the TLS connection is interrupted, the syslog messages are cached in the CPU cache. The CPU only sends the cached syslog messages when the TLS connection to the syslog server is established again.

Each syslog message is transferred to a syslog server only once. If you address another syslog server in the settings for the syslog server, syslog messages that have already been transferred are not transferred to a newly configured syslog server.

Since the cache of a CPU is organized as a ring buffer, the oldest messages are overwritten as soon as the memory limit is reached and further security events occur. Overwriting syslog messages that have not yet been transferred to a syslog server is reported as a security event (overflow event) in syslog storage. If syslog messages are overwritten over a long period of time, the overflow event is repeated regularly. As soon as the first message is sent back to the syslog server, another security event is generated. This security event confirms that syslog messages are being transferred back to the syslog server.

Message in the diagnostics buffer of the CPU

If a syslog server is configured in the CPU properties, the CPU also records overwriting of non-transmitted syslog messages in the diagnostics buffer.

As soon as a non-transmitted syslog message is overwritten, the CPU reports maintenance demanded as an incoming event in the diagnostics buffer. In addition, the MAINT LED of the CPU also signals incoming maintenance demanded.

As soon as the syslog messages are sent back to the syslog server, the CPU reports maintenance demanded as an outgoing event in the diagnostics buffer. If the CPU does not report any further maintenance demanded, the MAINT LED also turns off again.

Information on the status and error display of the CPU can be found in the respective device manuals.

Requirements

If you want to transfer the syslog messages of a CPU to a syslog server, the following requirements must be met:

- STEP 7 as of version V19
- CPU as of FW version V3.1
- A project has been created in STEP 7
- The device or network view of STEP 7 is open

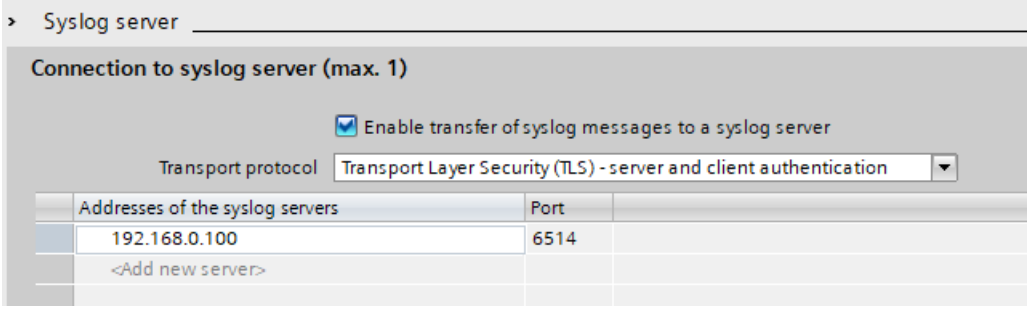
Procedure

To configure the CPU to transfer syslog messages to a syslog server, following these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Syslog server".
3. In the "Connection to syslog server" area, select the "Enable transfer of syslog messages to a syslog server" option. The selection options below become editable.
4. Select one of the following options from the "Transport protocol" drop-down list:
   - "Transport Layer Security (TLS) - server and client authentication": Encrypted data transfer, syslog server and client (CPU) must authenticate themselves.
   - "Transport Layer Security (TLS) - only server authentication": Encrypted data transfer, only the syslog server needs to authenticate itself.
   - "UDP": Unencrypted data transfer, syslog server and client (CPU) do not need to authenticate themselves.

   In the next sections you can read how to select the certificates for authentication (logon) depending on the settings specified.
5. In the "Addresses of the syslog servers" column, enter a valid server address.
6. In the "Port" column, enter a valid port number.
   By default, STEP 7 uses the following port numbers:
   - Standard TCP port for TLS: 6514
   - Standard UDP port: 514

Result: You have configured the transfer of syslog messages to a syslog server.



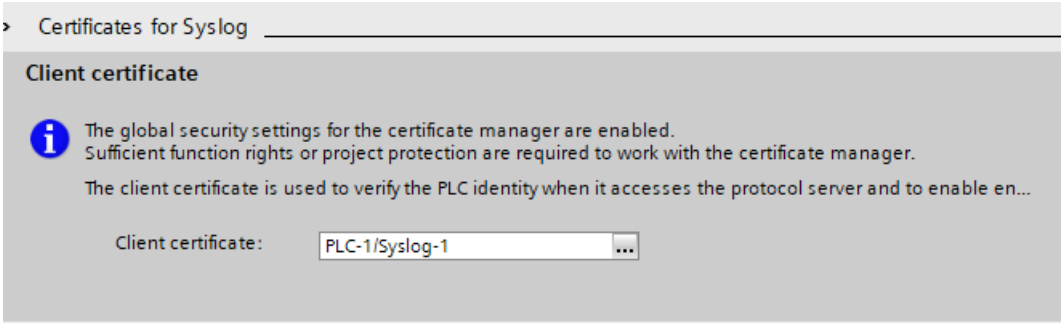


Figure 1-450 Transfer of syslog messages to a syslog server configured

Selecting the client certificate

STEP 7 provides the required client certificate for a CPU for the TLS transport protocol. If the certificate is managed within the CPU, you can either choose an existing certificate or create a new certificate. To do so, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".

3. Select the appropriate certificate in the "Client certificate" field.

Selecting the server authentication

After selecting the TLS transport protocol, the configured syslog server must authenticate itself. This ensures that the CPU only connects to a trusted server. If you want to waive server authentication, activate the automatic acceptance of server certificates during runtime. To configure these settings, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".
3. In the "Trusted servers" area, specify whether the connected syslog server is to be authenticated. In this case, it is necessary to complete the following information:
   - Add trusted server: Add a valid server certificate in the "Common name of subject" column.
   - Automatically accept certificates during runtime: Activate the "Automatically accept server certificates during runtime" option. Editing in the table is then not possible.

NOTE

No authentication with automatically accepted server certificates

If you enable the "Automatically accept server certificates during runtime" option, a server does not need to authenticate itself. This means that the CPU can also connect to unknown servers that could represent a security risk.

Only select this option during commissioning or in a protected environment.

4.9.13.2 Structure of the Syslog messages

A CPU collects syslog messages in a local cache. These syslog messages are structured according to the syslog protocol (RFC 5424) and consist of the following elements:

- HEADER
- STRUCTURED-DATA
- MSG (Message)

The following sections describe the structure and parameters of the individual elements.

Structure of the HEADER element

The header contains all the data required for further processing of the syslog message. A space separates the individual parts of the header (exception: No space between PRI and VERSION). A CPU transmits the following header in syslog messages, for example:

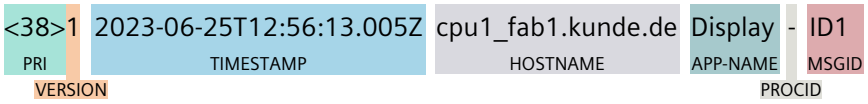

Figure 1-451 Example: HEADER of the syslog message of a CPU

The following table describes the parameters in the prescribed order.

Parameter	Description
PRI	PRI encodes the priority of the syslog message, divided into Severity (severity of the message) and Facility (origin of the message). The PRI value is formed as follows: • PRI = Facility x 8 + Severity Possible values: • Severity – 0 = Emergency: system is unusable – 1 = Alert: action must be taken immediately – 2 = Critical: critical conditions – 3 = Error: error conditions – 4 = Warning: warning conditions – 5 = Notice: normal but significant condition – 6 = Informational: informational messages – 7 = Debug: debug-level messages • Facility – 1 = User-level messages – 2 = Mail system – 3 = System daemons – 4 = Security/authorization messages – 5 = Messages generated internally by syslog – 6 = Line printer subsystem – 7 = Network news subsystem – 8 = UUCP subsystem – 9 = Clock daemon – 10 = Security/authorization messages – 11 = FTP daemon – 12 = NTP subsystem – 13 = Log audit – 14 = Log alert A CPU does not use all of the listed severity/facility values.
VERSION	Version number of the syslog specification.
TIMESTAMP	The device sends the time stamp in the format "2023-06-25T12:56:13.005Z" as UTC time without time zone and correction for daylight-saving/standard time.
HOSTNAME	Contains the name or the IP address (PROFINET interface X1) of the device or system from which the syslog message has been sent. IPv4 address according to RFC1035: Bytes in decimal representation: XXX.XXX.XXX.XXX IPv6 address according to RFC4291 Section 2.2 "-" is output if information is missing.
APP-NAME	Contains the component (device part or application) from which the message has been generated. "-" is output if information is missing.
PROCID	The process ID serves to clearly identify the individual processes, for example during analysis and troubleshooting. "-" is output if information is missing.
MSGID	ID to identify the message. "-" is output if information is missing.

Structure of the STRUCTURED-DATA element

STRUCTURED-DATA provides information in an interpretable and decomposable data format. The following applications are possible, for example:

- More information about the syslog message
- Application specific information

STRUCTURED-DATA can contain one or more elements (SD-ELEMENT). Each SD element must be enclosed in square brackets. If STRUCTURED-DATA consists of multiple SD elements, the individual SD elements are separated by a space.

Each SD-ELEMENT consists of its name (SD-ID) and one or more name-value pairs (SD-PARAM). Each name-value pair consists of a parameter name (PARAM-NAME) and the associated value (PARAM-VALUE). A space separates the individual components (SD-ID and SD-PARAM) within an SD element.

A CPU transmits the following SD ELEMENT in a syslog message, for example:

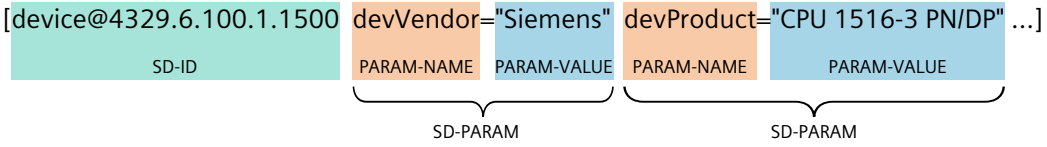

Figure 1-452 Example: SD ELEMENT of the syslog message of a CPU

Structure of the MSG element

In the MSG (MESSAGE) element, a CPU transmits the simplified name of the event in English. The following table shows what the content of a message of the MESSAGE element can look like.

MESSAGE	Description
SE_LOCAL_SUCCESSFUL_LOGON	The local logon has been successful (e.g. on the operator display of the CPU).

More information

You can read more information about the structure and transmission of syslog messages in the following RFCs (Request for Comments):

- The syslog protocol (RFC 5424) (https://tools.ietf.org/html/rfc5424)
- Transferring syslog messages via Transport Layer Security (RFC 5425) (https://tools.ietf.org/html/rfc5425)
- Transferring syslog messages via UDP (RFC 5426) (https://tools.ietf.org/html/rfc5426)

4.10 Secure operation of interface modules

Device-specific security information and instructions for interface modules can be found in the respective Equipment Manual.

4.10.1 Data integrity for interface modules

Data integrity refers to the completeness and correctness (integrity) of data, which is an essential prerequisite for the proper functioning of systems.

Measures for data privacy, data consistency, and data security ensure that data used within devices cannot be damaged, altered (manipulated), or deleted during processing or transmission, and at the very least, any changes to the data are detected.

Data integrity for interface modules

To detect intentional or accidental changes to data within an interface module and its associated modules, the possibility of dynamic integrity checking is introduced for PROFINET interface modules.

The ability to detect integrity breaches enhances the resilience of the distributed I/O system.

Data integrity within a distributed I/O system is entirely covered within the interface module and does not pertain to other components of the automation system.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as parameter settings, IP address, device name, MAC address and I&M data. The interface module stores the checksums in the I&M4 data area.

A CRC (Cyclic Redundancy Check) is always the same for specific, unchanged memory content. When the memory content changes, the interface module (IM) calculates a different checksum for this content by reading and comparing the I&M4 data. By comparing with the initial CRC, you can determine whether the data in the memory has been modified or not:

- CRC stayed the same: No change in the data within this memory area of the interface module IM
- CRC changed: The data within this memory area of the IM was modified

Only you, as the user, know whether changes to the data of an interface module were intentional or not. If changes were not intentional, you can detect that the data of the interface module has been compromised through changed CRCs and respond accordingly.

I&M data

PROFINET devices provide Identification and Maintenance data (I&M data), which is a set of predefined data structures containing the internal module status. With this data, a module can be identified, its serial number can be determined, etc.

The CRC checksums are mapped in the maintenance data **I&M4** of the interface module.

NOTE

Requirements for calculating the CRCs

The CRCs via the memory contents of the interface module are calculated only when you request to read the I&M4 data.

The CRCs cover not only the interface module itself but can also take into consideration combined checksums from associated modules (refer to the section on the structure of the data record for I&M data). Process data is not included in the calculation of CRCs.

Example:

- You put your distributed I/O system into operation and read the CRC CHK_OVERALL with the value "0x55AAA678" ("16#55AAA678") from the interface module via the I&M4 data.
- As long as no changes have been made to the data of the interface module or the associated modules, each subsequent read will give the value "0x55AAA678" or "16#55AAA678".
- Once you read a different CRC CHK_OVERALL, for example, "0xCC9876FF", you will realize that there must have been changes to the data of the interface module or the associated modules.

The quality of the statement regarding the data integrity of the distributed I/O system improves with each module associated with the interface module that supports I&M4 data. Refer to the Equipment Manual of the respective module to find out if and from which firmware version the module supports I&M4 data.

The structure of the I&M data 0 to 4 is described in the section Record structure for I&M data (Page 336).

Spare parts scenario

The spare parts scenario is ensured. This means that you can replace interface modules with the same article number. For the "new" interface module, the static data such as the serial number and MAC addresses will change. Note that this is why the replacement is reflected in the changed identification data CHK_STATIC_LOCAL and consequently also in CHK_OVERALL.

More information on the spare parts scenario and compatibility can be found in the Equipment Manual of the interface module.

4.10.2 Signed firmware update for interface modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Information on whether your interface module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of the signed firmware update for interface modules

Firmware updates for interface modules may include a digital signature. The digitally signed firmware update files are available for download on the Siemens Support Web page.

The interface module verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the interface module can detect a manipulated or corrupted firmware update file and reject it.

Note that the interface module performs the verification only after the complete firmware download has taken place.

Subsequently, a notification is sent to the firmware update tool regarding the success or failure of the signature verification.

You still have all the options for firmware updates, as described in the Firmware update (Page 359) section, when performing signed firmware updates for modules. If the firmware update was not successful, the module will continue to run with the previous firmware.

Diagnostics alarms and remedy

When performing a firmware update for a module with an established connection between the IM and CPU, the following options for notifications are available in the CPU's diagnostic buffer:

- Successful integrity check of the firmware for the module
- Rejection of non-secure firmware for the module

You can find more information in the section on diagnostics alarms in the equipment manual for the respective module.

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support website.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/de/de/view/109483101/en).

4.10.3 Secure Boot for interface modules

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Information on whether your interface module supports Secure Boot is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of "Secure Boot" for interface modules

Interface modules verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before being executed.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to signed firmware updates for interface modules, Secure Boot also prevents manipulation of the firmware through physical intervention in the interface module.

Secure Boot is integrated into the interface module and cannot be deactivated for security reasons.

NOTE

Longer startup duration of the interface module
The signature verification of Secure Boot significantly extends the startup time of the interface module. You can find time specifications in the Equipment Manual of the interface module, in the Technical specifications section.

LED display on the interface module

If the Secure Boot verification results in an invalid signature, the LEDs RUN, ERROR, and MAINT on the interface module will flash. In this case, you need to replace the interface module.

4.11 Secure operation of I/O modules

Device-specific security information and instructions for I/O modules can be found in the respective Equipment Manual.

4.11.1 Data integrity for I/O modules

Data integrity for I/O modules

In order to detect intentional or accidental changes to the data of an interface module and the assigned modules, the dynamic integrity check for I/O modules is introduced. Information on whether your I/O module supports the data integrity check is available in the Technical specifications section of the corresponding Equipment Manual.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as serial numbers, parameter settings, calibration data and I&M data of I/O modules. The interface module stores the checksums in the I&M4 data area.

You can find more information on the principle of data integrity and I&M4 data in the section Data integrity for interface modules (Page 68).

Spare parts scenario

The spare parts scenario is still ensured. This means that you can replace I/O modules with the same article number. For the "new" I/O module, the static data such as the serial number will change. Note that the replacement is therefore reflected in the following modified I&M4 data of the interface module:

- CHK_STATIC_SUBS
- CHK_OVERALL_SUBS
- CHK_OVERALL

You can find the structure of I&M data in the section Record structure for I&M data (Page 336).

4.11.2 Signed firmware update for I/O modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Signed firmware update for I/O modules

Firmware updates for I/O modules can contain a digital signature. Information on whether your I/O module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms, and remedies

The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 70) applies.

4.12 Secure operation of power supply modules

Device-specific security information and instructions for the power supply modules can be found in the respective Equipment Manual.

4.12.1 Signed firmware update for system power supplies (PS)

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Signed firmware update for system power supplies (PS)

Firmware updates for system power supplies (PS) can contain a digital signature. Information on whether your power supply module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms, and remedies

The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 70) applies.

System overview

5

5.1 Overview of the SIMATIC S7-1500 automation system

5.1.1 The SIMATIC automation systems

You need optimum solutions for every application in order to automate your machines and plants economically and flexibly.

The SIMATIC controller portfolio includes a variety of systems:

- The SIMATIC S7-1200 Basic Controller is the intelligent choice for compact automation solutions with integrated communication and technology functions.
- If plant complexity and system performance are priorities, the SIMATIC S7-1500 automation system is the right choice for you. The SIMATIC S7-1500 controller builds on the more simple functionality of the SIMATIC S7-1200 Basic Controller and fulfills the highest demands on performance, flexibility and networking capability.
- The SIMATIC ET 200SP Distributed Controller combines the advantages of the S7-1500 and the very compact design of the ET 200SP with high channel density. By using distributed intelligence, you save costs and space in the control cabinet.
- For use outside the cabinet, the CPU 1513pro-2 PN and CPU 1516pro-2 PN offer you SIMATIC S7-1500 functionality in the design of the ET 200pro in the degree of protection IP65/IP67.
- If you require PC-based automation, use the SIMATIC S7-1500 software controller. The PC-based controller is autonomous from the operating system during operation.
- If you want to increase the availability of your system, use the redundant system S7-1500R/H. In the system, two CPUs (primary and backup CPU) process the user program in parallel and permanently synchronize all relevant data. In the event of failure of the primary CPU, the backup CPU takes over control of the process at the point of interruption.

The SIMATIC controllers are integrated into the Totally Integrated Automation Portal and offer consistent data management and a uniform operating concept. With its integrated functions, engineering in the TIA Portal ensures consistent functionality.

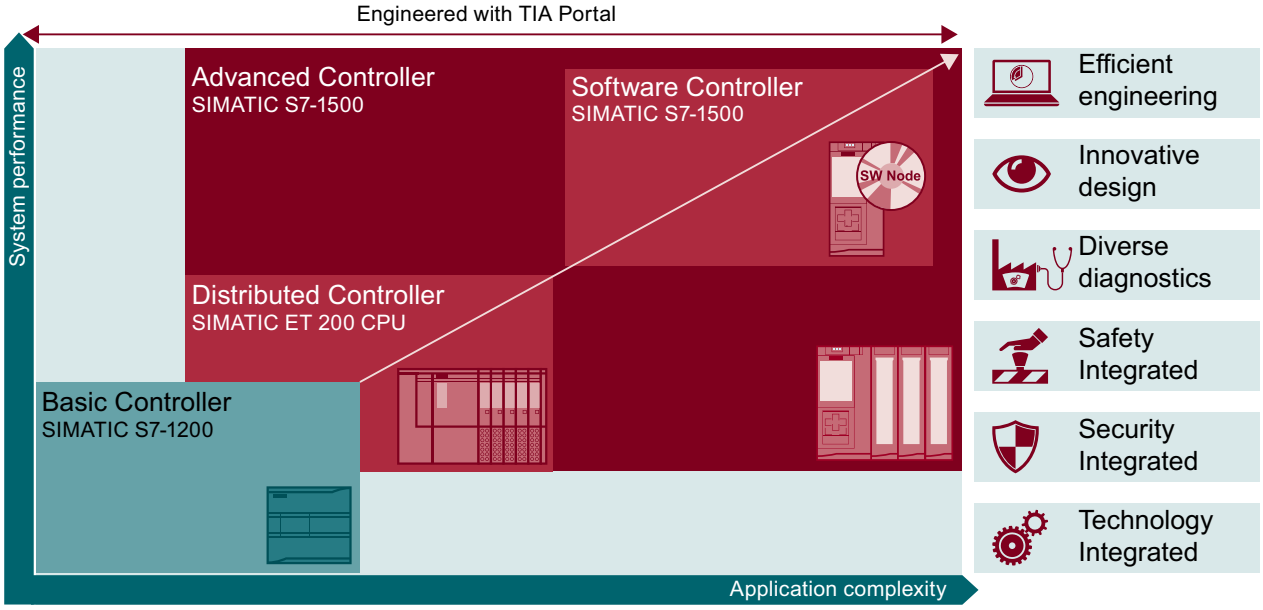

Figure 1-453 Overview of SIMATIC automation systems

The SIMATIC S7-1500 automation system supports all conventional communication standards.

All the SIMATIC S7-1500 CPUs offer integrated motion control functions. Technology CPUs are available for extended motion control functions.

The SIMATIC S7-1500 CPUs are also available as fail-safe controllers.

Diagnostic functions across all components simplify troubleshooting. Changes to the parameter assignment can be implemented quickly and easily with the integrated display.

Integrated security functions help against:

- Manipulation
- Theft of know-how

Integrated security functions offer additional security mechanisms for the configuration of secured networks.

5.1.2 Comparison of SIMATIC automation systems

The tables below compare the main technical specifications of the SIMATIC systems.

	Basic Controller	**Controller**	
	SIMATIC S7-1200	**SIMATIC ET 200SP CPU**	**SIMATIC ET 200SP Open Controller CPU 1515SP PC2**

5.1.3 Areas of application SIMATIC S7-1500 and ET 200MP

Area of application SIMATIC S7-1500

The SIMATIC S7-1500 automation system offers you the required flexibility and performance for a wide range of controller applications in machine and plant engineering. The scalable configuration makes it possible for you to adapt your PLC onsite to the local conditions.

As well as the standard motion control and technology functions available in the S7-1500, SIMATIC S7-1500 technology CPUs offer you additional features such as enhanced synchronous operation and kinematics functions.

The SIMATIC S7-1500 automation system conforms with IP20 degree of protection and is intended for use in a dry environment and installation in a control cabinet.

SIMATIC S7-1500R/H CPUs (redundant or fault-tolerant CPUs) offer you the option to increase the availability of your system. In order to be able to switch from the primary CPU to the backup CPU in case of need, the user program is processed synchronously on two CPUs.

Area of application Distributed I/O system ET 200MP

SIMATIC ET 200MP is a modular, scalable and universally usable distributed I/O system. SIMATIC ET 200MP offers the same system benefits as the SIMATIC S7-1500. A central controller accesses the I/O modules of the ET 200MP as central I/O modules via PROFINET or PROFIBUS.

SIMATIC ET 200MP convinces with its high performance:

- For shortest response times
- For large configuration limits
- For fastest applications

This is also accompanied by the high-speed backplane bus, special input/output modules and the consistent use of PROFINET mechanisms.

Area of application F-system SIMATIC Safety with S7-1500 and ET 200MP

By using fail-safe SIMATIC S7-1500 CPUs and modules, you can implement applications for safety engineering. This enables you to achieve almost seamless integration of machine safety into the SIMATIC S7-1500 and ET 200MP. You use one system at the same time for both your standard and fail-safe automation. This provides you with economic benefits, reliability as well as potential savings on hardware, engineering tasks and storage costs.

5.1.4 Plant components and automation levels

The Advanced Controllers SIMATIC S7-1500 are used for complete production automation and in applications for medium-sized and high-end machines. The combination of the individual SIMATIC components offers powerful and flexible automation solutions that cover all ranges of control applications:

- The process signals are connected to the central controller via fieldbus
- All modules are located directly in the automation system or in the distributed I/O system
- F-CPUs with integrated safety functionality ensure fail-safe processes
- SIMATIC S7-1500 is intended for installation in the control cabinet with IP20 degree of protection

The SIMATIC S7-1500 is integrated across all communication standards consistently in the various automation levels.

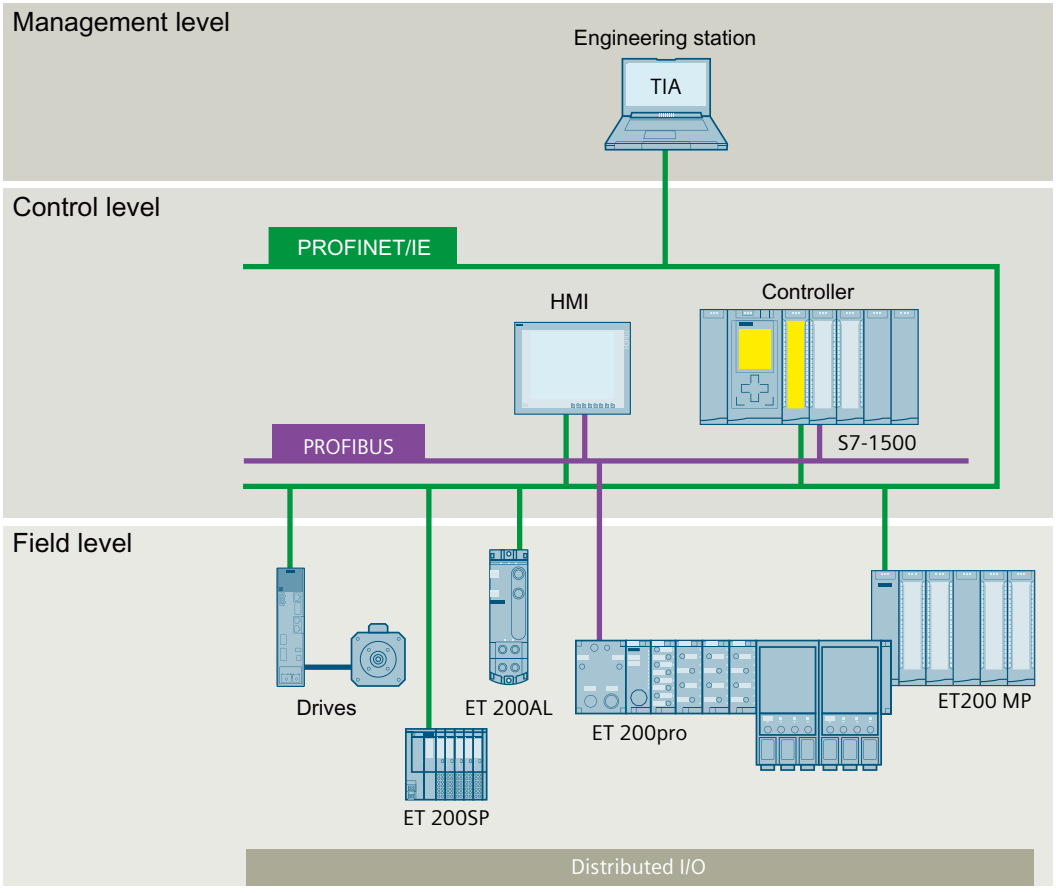

Figure 1-454 Basic structure: SIMATIC S7-1500 at management, control and field level

You can also find an overview of the SIMATIC S7-1500 automation system on the Internet (https://www.siemens.com/global/en/products/automation/systems/industrial/plc/simatic-s7-1500.html).

5.1.5 Scalability

In order to suit the requirements of your plant planning, the SIMATIC S7-1500 controllers can be scaled in their processing speed and configuration limits. They also offer networking facilities via different communications standards.

Safety Integrated, Motion Control, and other technology functions can be used for all plant sizes.

Different example applications with different SIMATIC S7-1500 CPUs are shown in the following:

SIMATIC S7-1500 with integrated I/O

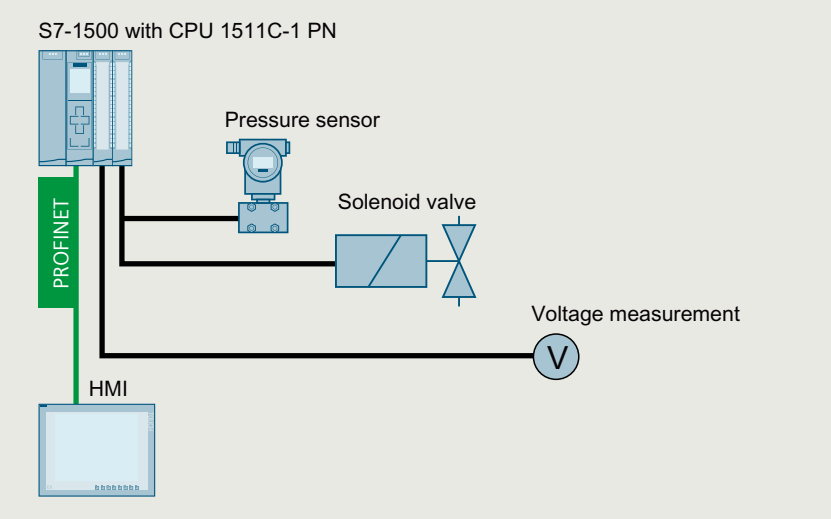

Figure 1-455 Example: Plant configuration with SIMATIC S7-1500 with integrated I/O

SIMATIC S7-1500 with I/O, ET 200MP and HMI device

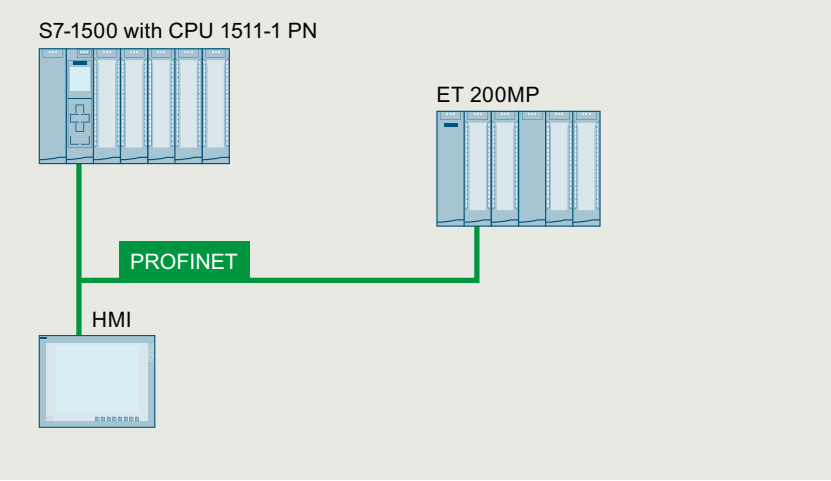

Figure 1-456 Example: Plant configuration with SIMATIC S7-1500 with I/O, ET 200MP and HMI device

SIMATIC S7-1500 with Motion Control, distributed I/O and IO-Link devices

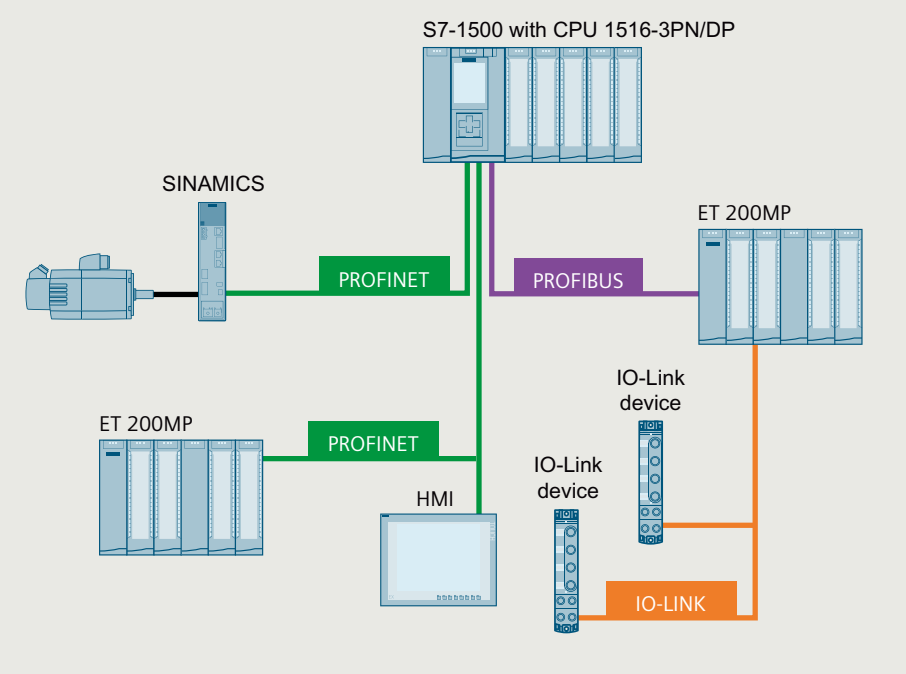

Figure 1-457 Example: Plant configuration with SIMATIC S7-1500, Motion Control, distributed I/O and IO-Link devices

SIMATIC S7-1500 with safety und WLAN integration

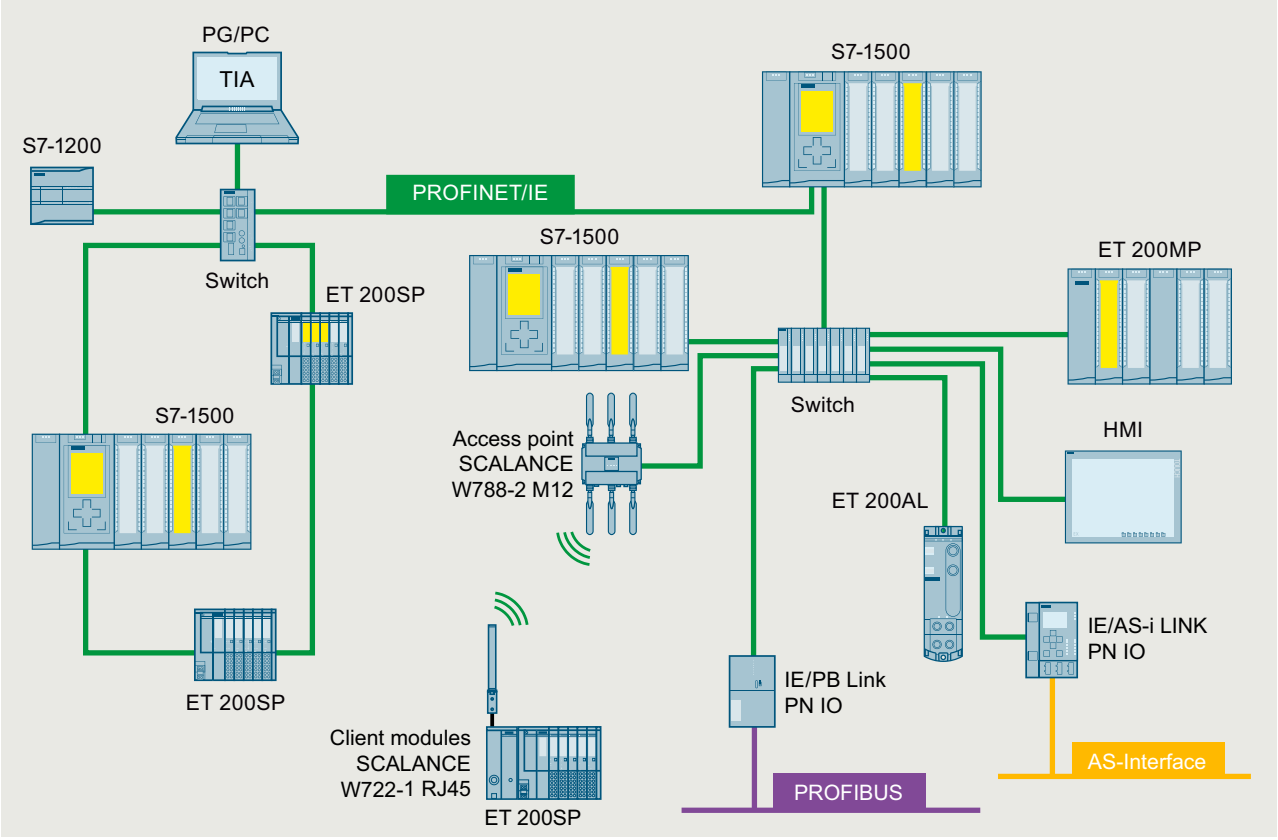

Figure 1-458 Example: Plant configuration with SIMATIC S7-1500 and Safety on PROFINET

SIMATIC S7-1500 with redundant IO modules

You can use the "LRedlo" instructions to connect and monitor IO modules redundantly to a SIMATIC S7-1500. You can find an application example with a user program at the following link (https://support.industry.siemens.com/cs/ww/de/view/109767576/en) .

5.1.6 Overview of features

Automation system SIMATIC S7-1500

Through the integration of numerous new performance features, the S7-1500 automation system offers you excellent operability and the highest performance.

Important properties and functions

Easy to use

- Uniform front connectors
- Pre-wiring position enables easy connecting and reconnecting
- Integrated shield for high signal measurement quality

High performance

- Fast signal processing for faster reaction times and high productivity
- Fast backplane bus for high baud rate and efficient transmission protocol
- Location-independent information acquisition thanks to integrated web server
- High number of connections and PROFINET ports
- Variety of networking options in systems (IO controller, I-device, shared device)

Wide range of diagnostics

- Integrated system diagnostics for uniform display concept without additional programming effort
- User-defined interrupts
- Evaluate system errors using system blocks

Innovative design

- Onboard display for diagnostics and first commissioning
- High degree of variability through scalability up to 30 I/O modules per rack
- Innovative labeling system maximizes organization in very limited spaces
- Compact CPUs with integrated analog and digital on-board I/O and integrated technology functions

Communication standards

- PROFINET IO
- PROFIBUS DP
- Point-to-point (RS232, RS485)

Efficient engineering

- STEP 7 language innovations while maintaining proven functions
- Support of different programming languages (STL, LAD, FBD, SCL, CFC, GRAPH)
- Consistency check by STEP 7 instead of in the CPU

Safety Integrated

- Easy integration of fail-safe CPUs (F-CPUs) and fail-safe modules (F-modules)
- One F-CPU for fail-safe and non-fail-safe applications
- Setting of all F parameters via software

Security Integrated

- Protection level concept for greater access protection
- Know-how protection against unauthorized access and modifications
- Copy protection on the SIMATIC Memory Card against copying of user programs

Technology Integrated

- Motion control functionality supports the connection of PROFIdrive-capable drives
- Technology CPUs with advanced motion control functions
- Easy programming of motion sequences with PLCopen motion control blocks
- Temperature controller
- PID control for continuous and discrete closed-loop control processes with autotuning for easy commissioning and optimal control performance
- Seamless integration into TIA Portal for synchronous configuration and uniform operating concept
- TRACE support for effective commissioning, diagnostics and fast optimization of drives and closed-loop controls

Figure 1-459 SIMATIC S7-1500 automation system - Properties and functions

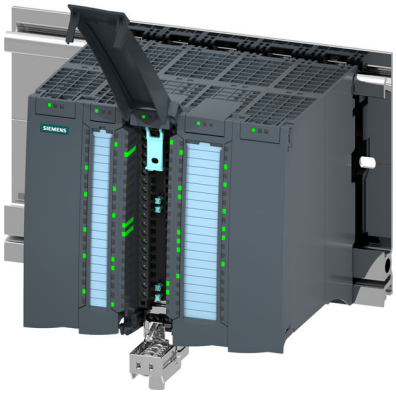
Distributed I/O system ET 200MP

The ET 200MP distributed I/O system is a scalable and flexible system for connecting the process signals to a CPU via a fieldbus.

The modules have a very high channel density and a low variety of parts. This simplifies ordering, logistics and spare parts handling significantly.

Important properties and functions

Innovative design



- High channel density (e.g. 32 channels on 25 mm wide I/O module)
- High degree of variability through scalability up to 30 I/O modules per station
- Innovative labeling system maximizes organization in very limited spaces

Safety Integrated

- Easy integration of fail-safe modules (F-modules)
- Setting of all F parameters via software

Easy to use

- With I/O modules of the S7-1500 automation system
- Screw-type or push-in terminal connections
- Configuration adjustment for future configuration levels through integrated configuration control
- Uniform front connectors
- Pre-wiring position enables easy connecting and reconnecting

Interface modules

- IO device with PROFINET IO interface (2 ports)
- DP device with PROFIBUS DP interface

High performance

- Isochronous PROFINET IO with send clocks as fast as 250 µs

Powerful technology

- Technology modules for counting, position detection, and time-based IO functionality

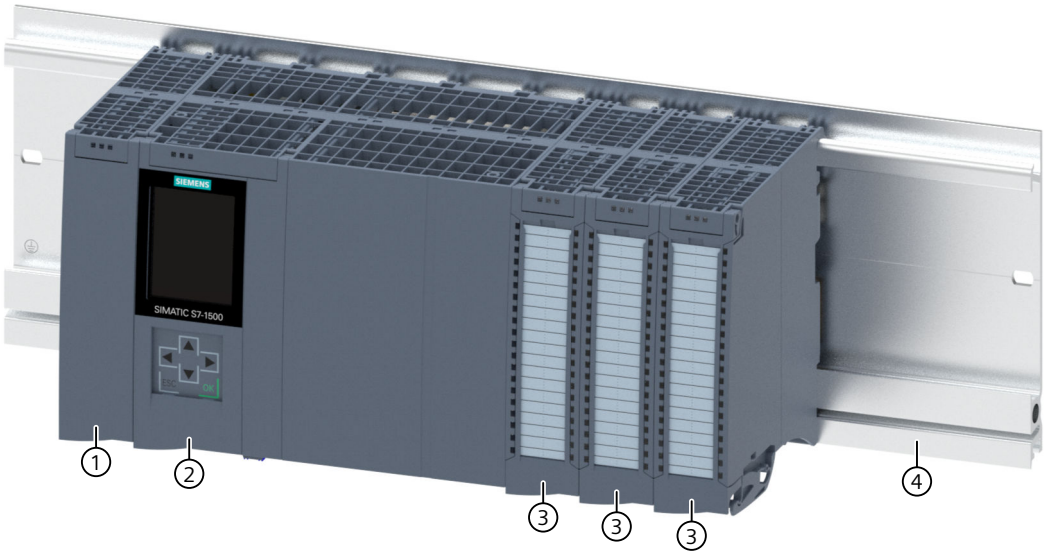
Communication standards

- PROFINET IO
- PROFIBUS DP
- Point-to-point (RS232, RS485)

Figure 1-460 SIMATIC ET 200MP distributed I/O system - Properties and functions

5.2 Configuration

5.2.1 Configuration of the SIMATIC S7-1500 Automation System



Configuration

The SIMATIC S7-1500 automation system is made up of the following components:

- CPU (standard, fail-safe, compact or technology CPU)
- Digital and analog I/O modules
- Communications modules (PROFINET/Ethernet, PROFIBUS, point-to-point)
- Technology modules (counting, position detection, time-based IO)
- Load current supply
- System power supply (optional)

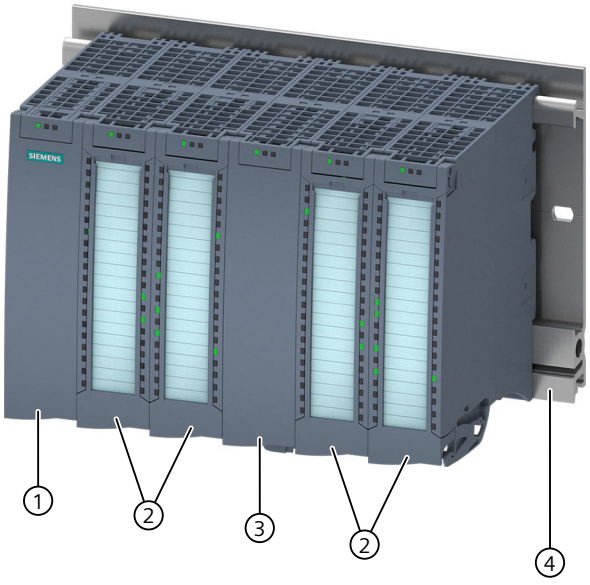
You install the S7-1500 automation system on a mounting rail. You can install up to 32 modules (CPU, system power supply and 30 I/O modules) on the mounting rail. You connect the modules to each other with U connectors.

Configuration example

① System power supply
② CPU
③ I/O modules
④ Mounting rail with integrated DIN rail profile

Figure 1-461 Example configuration of an S7-1500 automation system

5.2.2 Configuration of the distributed I/O system SIMATIC ET 200MP

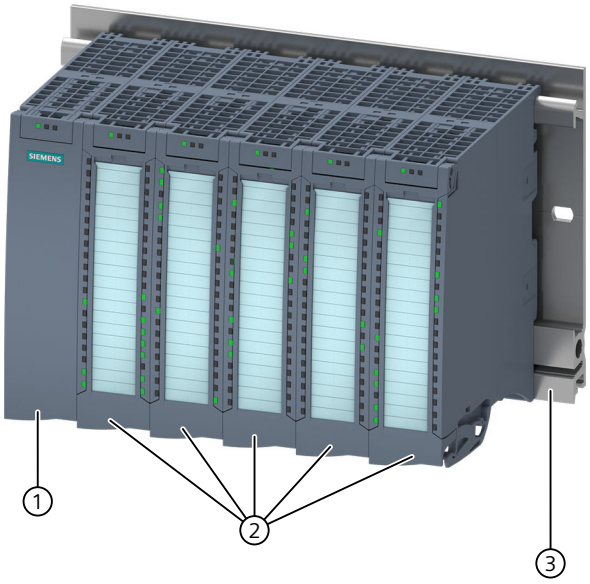


Configuration

The SIMATIC ET 200MP distributed I/O system is made up of the following components:

- Interface module (PROFINET or PROFIBUS)
- Digital and analog I/O modules
- Communications modules (point-to-point)
- Technology modules (counting, position detection, time-based IO)
- System power supply (optional)

The ET 200MP distributed I/O system is installed on a mounting rail like the S7-1500 automation system.
The I/O modules of the SIMATIC ET 200MP distributed I/O system can be used in a decentralized configuration (with an ET 200MP interface module) or in a centralized configuration (with an S7-1500 CPU).



Example of a configuration with the IM 155-5 PN ST interface module

① Interface module
② I/O modules
③ System power supply
④ Mounting rail with integrated DIN rail profile

Figure 1-462 Example of a configuration of the ET 200MP with IM 155-5 PN ST

Example of a configuration with the IM 155-5 DP ST interface module

① Interface module
② I/O modules
③ Mounting rail with integrated DIN rail profile

Figure 1-463 Example of a configuration of the ET 200MP with IM 155-5 DP ST

5.2.3 Configuration of a fail-safe system with SIMATIC S7-1500

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher safety requirements. F-systems control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Safety Integrated

Safety Integrated is the integrated safety concept for automation and drive technology from Siemens.

Proven technologies and systems from automation technology, such as SIMATIC S7-1500 in this case, are used for safety systems. Safety Integrated includes the complete safety sequence, ranging from sensor, actuator and fail-safe modules right through to the controller, including safety-related communication via standard fieldbuses. Drives and controllers handle safety tasks in addition to their actual functions.

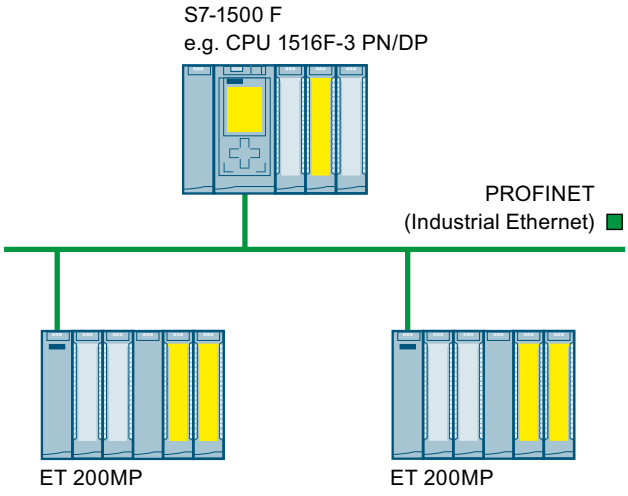
SIMATIC Safety F-system with S7-1500 and ET 200MP

The figure below contains an example of an F-system SIMATIC Safety with S7-1500, ET 200MP, and PROFINET IO.

You can combine fail-safe I/O modules and non-fail-safe I/O modules in a can be combined in a S7-1500/ET 200MPconfiguration.

The fail-safe IO controller (F-CPU) exchanges:

- Safety-related data with fail-safe modules.
- Non-safety-related data with non-fail-safe modules.



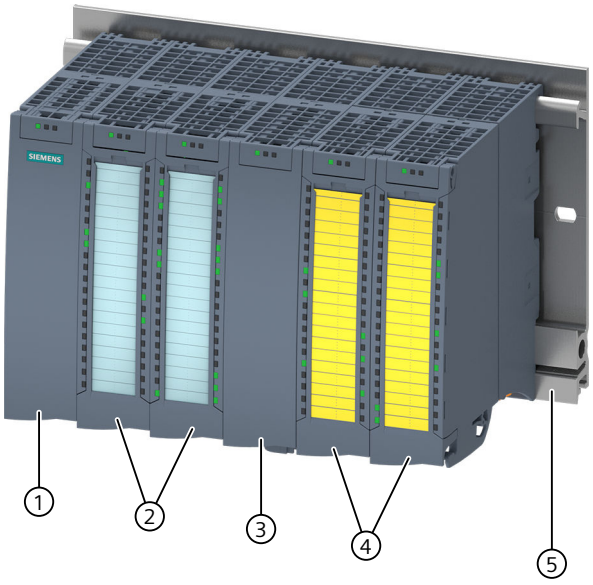


Figure 1-464 Fail-safe automation system SIMATIC Safety (example)

Fail-safe I/O modules S7-1500/ET 200MP

The following fail-safe I/O modules are available for S7-1500/ET 200MP:

- Fail-safe digital input modules detect the signal states of safety-related sensors and send the relevant safety frames to the F-CPU.
- Fail-safe digital output modules control actuators for safety-oriented tasks.

Configuration example of the ET 200MP with fail-safe I/O modules

① Interface module
② I/O modules
③ Power supply (optional)
④ Fail-safe I/O modules
⑤ Mounting rail with integrated DIN rail profile

Figure 1-465 Configuration example of the ET 200MP with fail-safe I/O modules

Hardware and software requirements

You use the S7-1500/ET 200MP fail-safe I/O modules:

- In S7-1500 with S7-1500 F-CPUs as of firmware version V1.7
- Distributed in ET 200MP with S7-1500 F-CPUs as of firmware version V1.5 and all F-CPUs that can be selected in the hardware catalog of the TIA Portal

Fail-safe I/O modules in ET 200MP require the following interface modules:

- IM 155-5 PN BA, as of firmware version V4.3
- IM 155-5 PN ST, as of firmware version V3.0.0
- IM 155-5 PN HF, as of firmware version V3.0.0
- IM 155-5 DP ST, as of firmware version V3.0.0

To configure and program fail-safe I/O modules S7-1500/ET 200MP , you need:

- STEP 7, V13 SP1 or higher
- Option package STEP 7 Safety Advanced as of V13 SP1 + HSP0086

Use in safety mode only

You can only use the S7-1500/ET 200MP fail-safe I/O modules in safety mode. They cannot be used in non-fail-safe mode, i.e. standard mode.

Achievable safety classes

Fail-safe I/O modules are equipped with integrated safety functions for safety mode.

You can achieve the safety classes of the table below:

- By corresponding parameter assignment of the safety functions in STEP 7
- With a specific combination of fail-safe and non-fail-safe I/O modules as well as
- With a special arrangement and wiring of the sensors and actuators

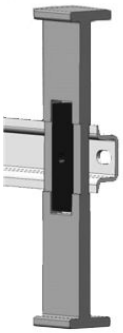
Table 1-804 Safety classes that can be achieved with S7-1500/ET 200MP in safety mode

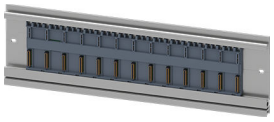
Safety class in safety mode		
According to IEC 61508:2010	**According to ISO 13849-1:2015**	
SIL3	Category 3	(PL) Performance Level d
SIL3	Category 4	(PL) Performance Level e

More information

An overview of the technical specifications of the fail-safe I/O modules can be found in section Fail-safe digital modules (Page 121).

The applications and wiring for the particular safety class are described in the manuals of the fail-safe I/O modules.





5.3 Components

Components of the S7-1500 automation system/ET 200MP distributed I/O system

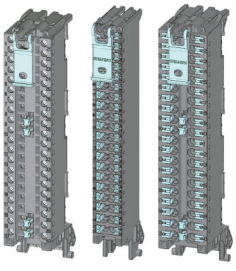


Table 1-805 Components S7-1500/ET 200MP

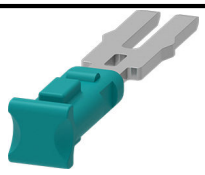
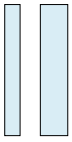
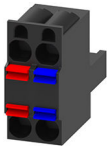
Component	Function	Diagram
Mounting rail	The mounting rail is the module rack of the SIMATIC S7-1500/ET 200MP automation system. You can use the entire length of the mounting rail (rimless assembly). The mounting rails can be ordered as Accessories/spare parts (Page 406) accessories.	







* Additionally the PS 60W 24/48/60V DC HF keeps the complete work memory of the CPU retentive.

Component	Function	Diagram
DIN rail adapter	The SIMATIC S7-1500/ET 200MP automation system is installed on a standard 35 mm DIN rail using the DIN-rail adapter. The DIN-rail adapter can be ordered as an accessory/spare part (Page 406).	
Active backplane bus	Properties of the active backplane bus: • Reaction-free pulling and plugging of I/O modules during operation • Reserve capacity for later use The active backplane bus can be used with the following interface modules: • IM 155-5 PN HF (6ES7155-5AA00-0AC0 as of firmware version V4.4) • IM 155-5 MF HF (6ES7155-5MU00-0CN0 as of firmware version V5.0) You can find more information on the active backplane bus (for example, installing, configuring, technical specifications) in the Active backplane bus (https://support.industry.siemens.com/cs/de/de/view/109778694/en) Equipment Manual. The active backplane bus can be ordered as an accessory/spare part (Page 406).	
PE connection element for mounting rail	The set of screws is threaded into the mounting rail's T-profile groove, and is required for grounding the mounting rail. The set of screws is contained in the scope of delivery of the mounting rails in the standard lengths (160 to 830 mm) and can be ordered as Accessories/spare parts (Page 406).	
CPU (standard, fail-safe, compact or technology CPU)	The CPU runs the user program. The integrated system power supply of the CPU supplies the modules used via the backplane bus. Additional features and functions of the CPU: • Communication via Ethernet • Communication via PROFIBUS/PROFINET • HMI communication • Integrated web server • OPC UA server • OPC UA client • Integrated technology (for example, motion control functions, trace functionality) • Integrated system diagnostics • Integrated protection functions (access, know-how and copy protection) • Safety mode (when using fail-safe CPUs)	 

* Additionally the PS 60W 24/48/60V DC HF keeps the complete work memory of the CPU retentive.

Component	Function	Diagram
Interface module for PROFINET IO	The interface module: • Is used as an IO device on PROFINET IO. • Links the ET 200MP distributed I/O system with the IO controller. • Exchanges data with the I/O modules via the backplane bus. • Can be used with the BusAdapters of the ET 200SP (only IM 155-5 MF HF).	
Interface module for PROFIBUS DP	The interface module: • Is used as a DP Device on PROFIBUS DP. • Links the ET 200MP distributed I/O system with the DP master. • Exchanges data with the I/O modules via the backplane bus.	
I/O module/ fail-safe I/O module	The I/O modules form the interface between the controller and the process. The controller detects the current process state via the connected sensors and actuators, and triggers the corresponding reactions. I/O modules are divided into the following module types: • Digital input (DI, F-DI) • Digital output (DQ, F-DQ) • Digital input/digital output (DI/DQ) • Analog input (AI) • Analog output (AQ) • Analog input/analog output (AI/AQ) • Technology module (TM) • Communication module (CM) • Communication processor (CP) A U connector is included in the scope of delivery for each I/O module. For fail-safe I/O modules, an additional electronic coding element for saving the PROFIsafe address is included in the scope of delivery and can be ordered as spare part Accessories/spare parts (Page 406).	
U connector	The individual modules are connected to one another with the U connector. The U connector provides the mechanical and electrical connection between the modules. The U connector is included in the scope of delivery of all modules (exceptions: CPU, interface module) and can be ordered as Accessories/spare parts (Page 406).	
Front connectors	The front connectors are used to wire the I/O modules. The front connectors for technology and analog modules must be supplemented with a shielding bracket, power supply element, and shield connection clamp. The components are included in the scope of delivery of the technology modules, analog modules and compact CPUs (for onboard I/O) and can be ordered as Accessories/spare parts (Page 406) accessories. There are front connectors with screw terminals and push-in terminals for 35 mm modules, and with push-in terminals for 25 mm modules. The front connectors for 25 mm modules are included in the scope of delivery of the I/O modules and compact CPUs (for onboard I/O). Four potential bridges and one cable tie are included in the scope of delivery of the front connectors for 35 mm modules. The front connectors for 25 mm modules have no potential bridges due to the compact module design.	

* Additionally the PS 60W 24/48/60V DC HF keeps the complete work memory of the CPU retentive.

Component	Function	Diagram
Potential bridges for front connector	You jumper two terminals with potential bridges. The potential bridges are included in the scope of delivery of the front connector and can be ordered as Accessories/spare parts (Page 406). The front connectors for 25 mm modules have no potential bridges. Therefore, you should also observe the information in the product manual for the respective digital or analog module.	
Shielding bracket	The shielding bracket is an insertable bracket for modules with EMC-critical signals (for example, analog modules, technology modules), and, together with the shield connection clamp, permits the low impedance application of shielding with minimal installation times. The shielding bracket is included in the scope of delivery of the analog modules, technology modules, and compact CPUs (for onboard I/O) and can be ordered as Accessories/spare parts (Page 406).	
Shield clamp	The shield connection clamps are used to attach cable shielding to the shielding bracket. The shield connection clamp is included in the scope of delivery of the analog modules, technology modules, and compact CPUs (for onboard I/O) and can be ordered as Accessories/spare parts (Page 406).	
Power supply element	The power supply element is inserted in the front cable connector, and serves to supply power to modules with EMC-critical signals (analog modules, technology modules). The power supply element (connection technology: screw terminal) is included in the scope of delivery of the analog and technology modules and can be ordered as Accessories/spare parts (Page 406).	
Labeling strips for the exterior of the front cover of the I/O modules	The labeling strips are used to label the modules for specific plants. You can label the labeling strips using a machine. The labeling strips are available in different colors: • Al gray: Non-fail-safe modules • Yellow: Fail-safe modules The labeling strips are included in the scope of delivery of the I/O modules and compact CPUs (for onboard I/O). Additional labeling strips can be ordered as Accessories/spare parts (Page 406).	
4-pole connection plug for supply voltage of the CPU/interface module	The supply voltage is supplied by means of the 4-pole connection plug.	
Display module	The display module is a plug-in display module.	
Display	The display is the front cover with integrated display module and operator controls for local diagnostics, display and operation.	

Component	Function	Diagram
System power supply (PS)	The system power supply is a diagnostics-capable power supply module, that can be connected with the backplane bus using a U connector. A system power supply is required when the power fed from the CPU/interface module into the backplane bus is not sufficient to supply the connected modules with power. System power supplies are available in various models: • PS 25 W 24 V DC • PS 60 W 24/48/60 V DC • PS 60W 24/48/60V DC HF* • PS 60 W 120/230 V AC/DC A power cable connector with coding element and U-connector is included in the scope of delivery for the system power supply and can be ordered as spare part.	
Load current supply (PM)	The load current supply (PM) supplies the system power (PS), central modules (CPU), interface module and input and output circuits of the I/O modules with 24 V DC. If you are using load current supplies, we recommend the devices from the SIMATIC series. These devices can be mounted on the mounting rail. Load current supplies are available in various models: • PM 70 W 120/230 V AC • PM 190 W 120/230 V AC As an alternative to the SIMATIC load power supplies (PM), you can also use SITOP smart power supplies. Use of a SITOP smart power supply is recommended in these cases, among others: • Higher power requirement • Redundancy • Uninterruptible power supply For more information on the SITOP modules, refer to an FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/96998532).	

* Additionally the PS 60W 24/48/60V DC HF keeps the complete work memory of the CPU retentive.

Reference

You can find more information on the different function classes (for example, basic, standard) of the interface and I/O modules in an FAQ on the Internet (https://support.industry.siemens.com/cs/de/de/view/109476914/en).

5.4 CPUs

Figure 1-466 Controller

SIMATIC S7-1500 controllers are characterized by maximum performance capability thanks to a high-performance backplane bus, very short terminal-to-terminal response time and extremely fast signal processing.

The controller (CPU) executes the user program. The integrated system power supply of the controller provides power to the modules used through the backplane bus.

A fail-safe version is available for each SIMATIC S7-1500 controller (except compact CPUs and the redundant CPU 1513R-1 PN and CPU 1515R-2 PN). To use the safety functions in the TIA Portal, you need the "STEP 7 Safety Advanced" option package.

During commissioning of the plant you can, for example, change the IP address of the CPU directly via the display, thus saving time and costs. In the event of a service call, the plant downtimes are minimized by quick access to diagnostics alarms.

For effective commissioning and fast optimization of drives and controls, the SIMATIC S7-1500 supports extensive trace functions for all CPU tags.

A SIMATIC S7-1500 controller also offers additional functions:

- Communication via Ethernet/PROFINET
- Communication via PROFIBUS
- HMI communication
- Communication via OPC UA
- Web server, technology functions, system diagnostics, protection functions integrated
- When using an F-CPU: Safety mode
- When using a S7-1500 R/H CPU: Redundancy
- When using a T-CPU: Extended motion control functions

5.4.1 What can you do with the CPU?

SIMATIC S7-1500 provides you with a variety of CPUs that can be integrated. You can expand each CPU with I/O, communications and technology modules.

Example: The performance of a CPU 1511-1 PN with 1.5 MB data work memory is sufficient for your application. If you require additional communication interfaces, you can extend the CPU with communication modules for Industrial Ethernet, PROFINET and PROFIBUS. Modules for serial communication are also available.

The following overview supports you in selecting the CPU and shows the respective maximum size of the data work memory:

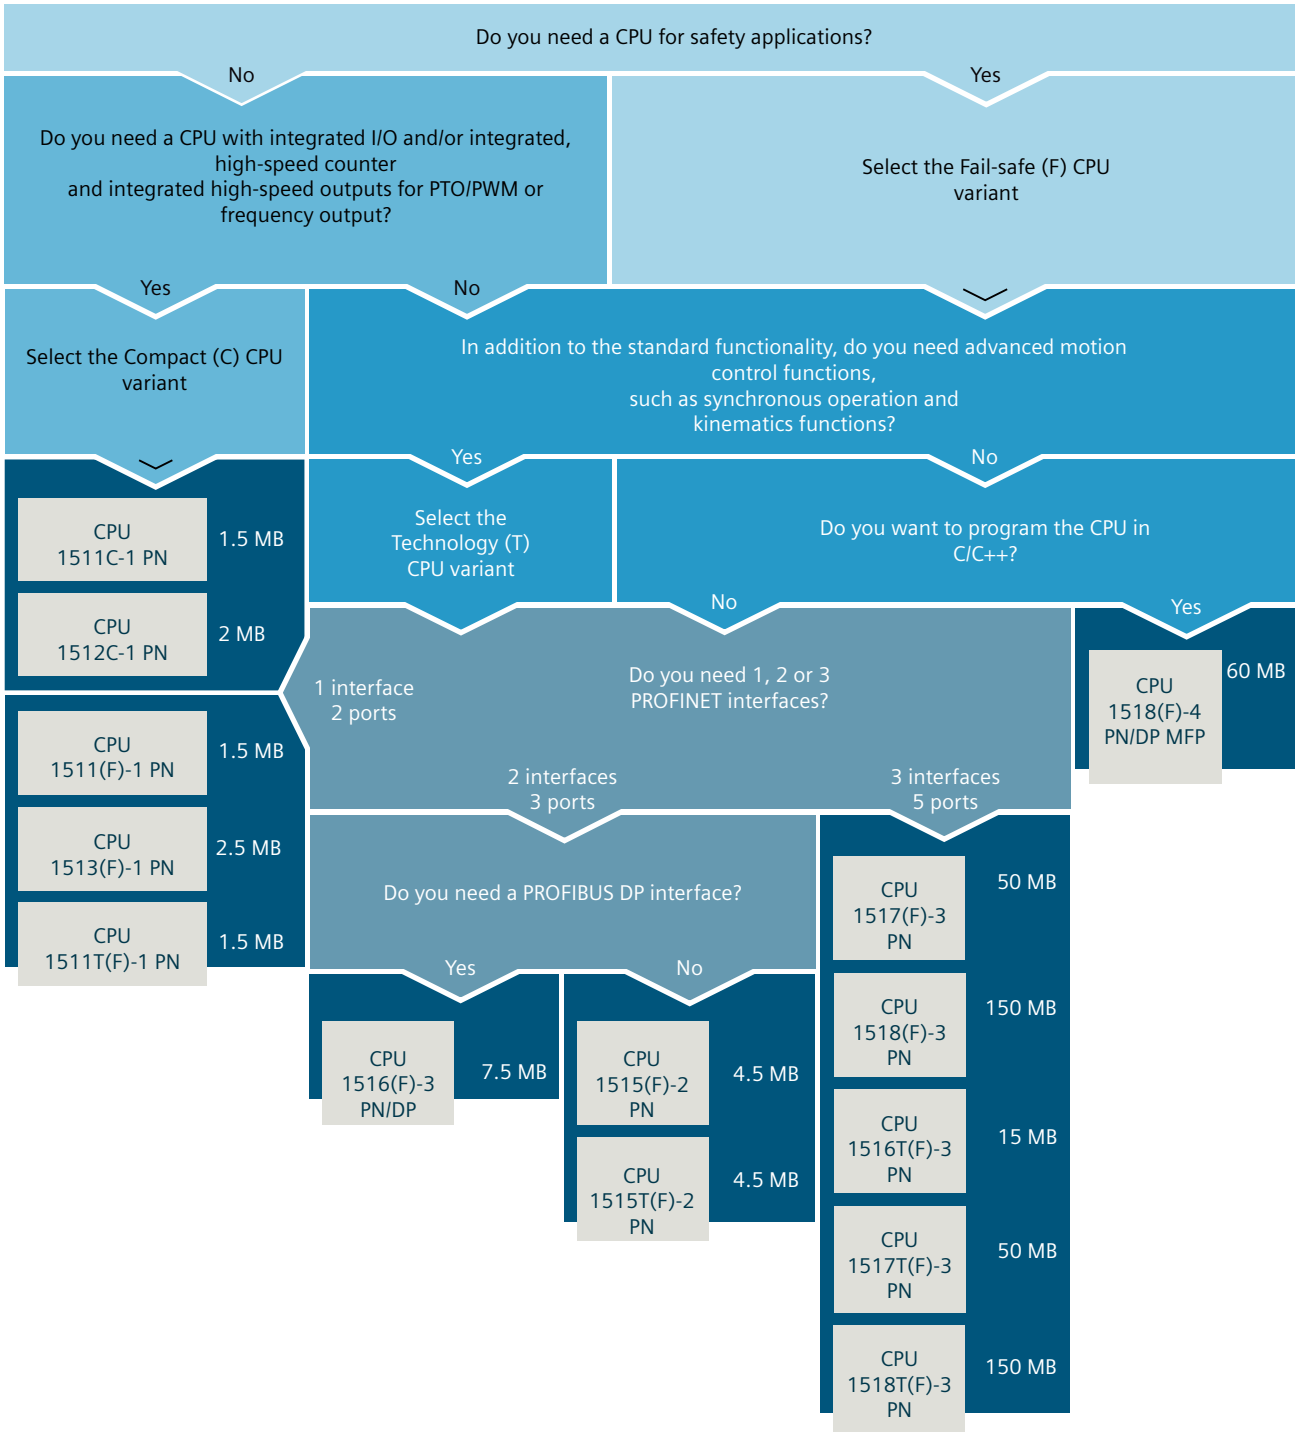


Figure 1-467 Selection guide for CPUs

5.4.3 Web server

The SIMATIC S7-1500 CPUs have an integrated web server.

You can display the CPU status without additional software installation via a web browser and control it to a limited extent. Graphically visualized process variables and user-defined websites facilitate information acquisition and diagnostics of plant states.

Figure 1-468 Home page web server

Example: Web server simplifies maintenance of treatment plants

Automation task:

Implementation of a user interface for fault management of a treatment plant.

Feature:

Treatment plants operate fully automatically, they are not manned. The operator optionally receives an SMS if a fault occurs. For diagnostics, the operator directly accesses the corresponding web sites.

Solution:

Creation of user sites for the web server of a SIMATIC S7-1500 CPU. The customer can make changes to the web sites himself, e.g. the mobile number for the SMS messages, settings in the CPU or the message texts.

Benefits

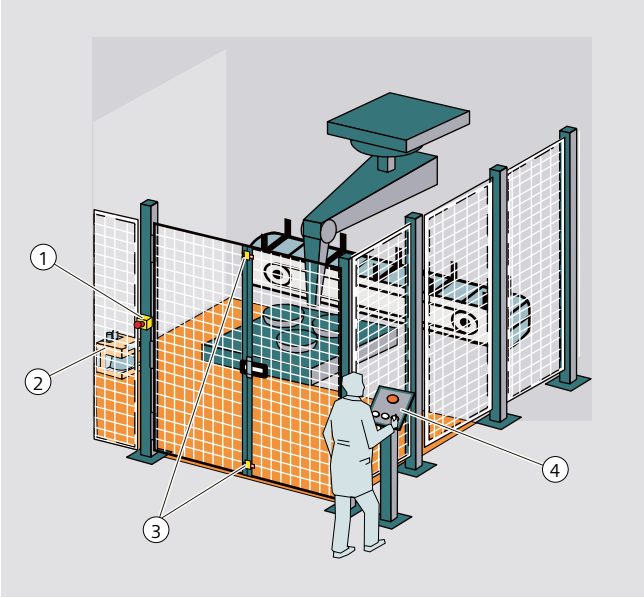
The web server provides you with the following advantages:

- Access via web browsers to a SIMATIC S7-1500 with plant-relevant operating data
- Display of service and diagnostics information over large distances
- Access restrictions for unauthorized users

Additional information

A detailed description of handling the web server can be found in the Function Manual "SIMATIC S7-1500 web server" SIMATIC S7-1500 Web server (https://support.industry.siemens.com/cs/de/en/view/59193560).

5.4.4 Safety



For fail-safe operation of your plant, program the F-CPUs of the SIMATIC S7-1500. Use the "STEP 7 Safety Advanced" option package of the TIA Portal for this purpose. In combination with the TIA Portal, the F-CPUs offer optimal integration of fail-safe systems into your engineering environment; one controller, one communication system, and one engineering platform for standard and fail-safe automation:

- Integration of safety technology
- Instructions approved by German Technical Inspectorate for frequently required safety applications
- Integration of safety-related functions up to SIL 3 according to IEC 61508 or PL e and Category 4 according to ISO 13849-1 or EN ISO 13849-1
- Uniform engineering for standard and safety automation
- Simple documentation of safety-related changes via the F-change history in STEP 7 Safety
- Support in the acceptance of the safety program and no renewed acceptance of the safety program after changes in the standard program

Example: Production cell with access protection

Automation task:

A laser scanner monitors access to a production area. The maintenance area is secured by a protective door. Entering the production area or opening the protective door, just like an emergency stop, results in the shutdown or stopping of the production cell.

① Emergency stop
② Laser scanner
③ Protective door
④ Control panel with start and acknowledgment key

Figure 1-469 Production cell with access protection

Feature:

Start-up of the system is only possible with unlocked emergency stop, closed protective door and free protection area of the laser scanner. After activating the emergency stop, opening the protective door or addressing the protection area, a user acknowledgement is required to restart production operations again. Access protection to the F-CPU and the safety program is essential for productive operation.

Solution:

Use of a SIMATIC S7-1500 F-CPU with fail-safe modules in the distributed I/O system ET 200SP on the PROFINET IO.

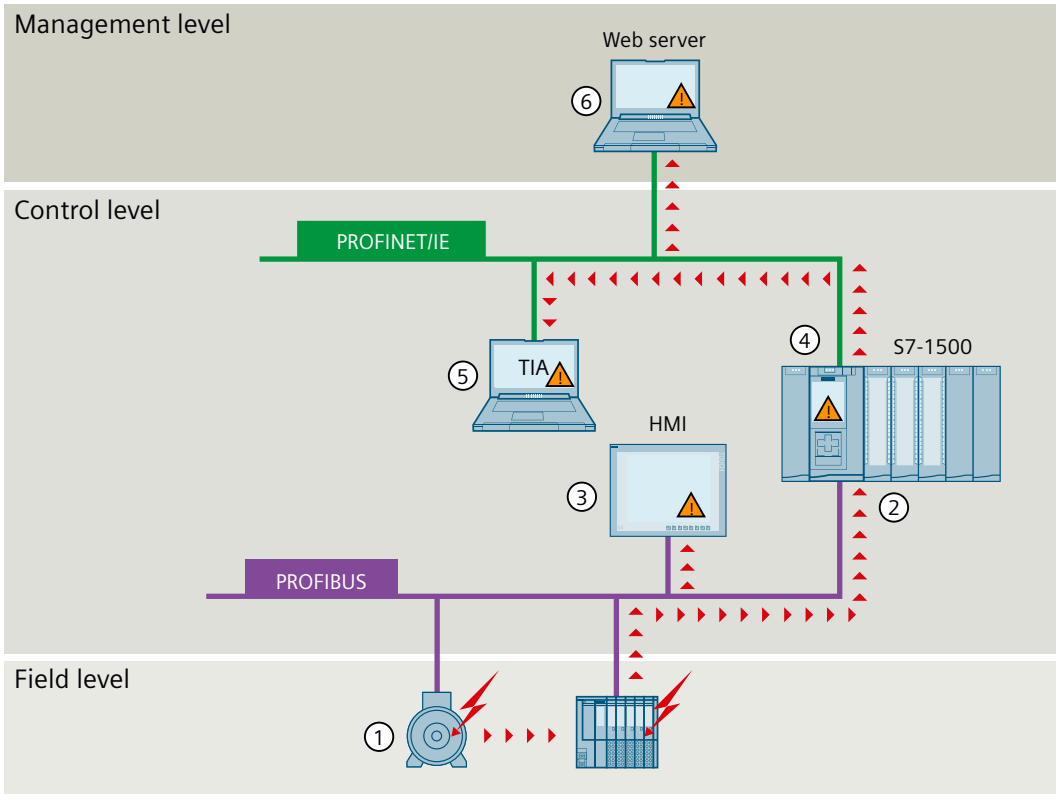
The F modules ET 200SP take over the connections for emergency stop, monitoring of the protective door, monitoring of the access area, the motor and the user acknowledgment. Perform the relevant programming in STEP 7. The safety program runs in the CPU.

Benefits

SIMATIC Safety Integrated provides you with the following advantages:

- Engineering with SIMATIC STEP 7 Safety Advanced in the TIA Portal, same engineering and operating concept for standard and fail-safe automation task
- Use of instructions approved by the German Technical Inspectorate from the system library Safety in the safety program, e.g. for protective door, emergency stop, monitored feedback loop circuit and user acknowledgment, saves time and reduces the error rate
- Simple connections of PROFIsafe devices via PROFINET and PROFIBUS
- Additional password protection for F-CPU and safety program is set up for IT security.
- Integration in integrated system diagnostics

Additional information



A detailed description of the topic "Safety Integrated" is available in the programming and operating manual SIMATIC Safety - Configuring and Programming SIMATIC Safety - Configuration and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

5.4.5 Diagnostics

Integrated diagnostics across all levels of the automation is incorporated in the SIMATIC S7-1500 automation system. All SIMATIC products have integrated diagnostic functions which you can use to analyze and localize faults and errors efficiently. This reduces the commissioning periods required and minimizes standstill times in production.

A uniform display concept ensures that error messages in the STEP 7, on the HMI, the Web server and in the display of the CPU are visualized identically as plain text information.

You can optionally configure machine and plant diagnostics. This means that the logic of these process diagnostic messages or monitoring depends directly on the state of the plant and is defined by you.

① Monitoring functions are integrated in the hardware as standard.
② Diagnostics is implemented system-wide across bus limits.
③ Output of the cause of the error in plain text, archiving and logging of alarms
④ Automatic localization of the error source
⑤ Configurability of alarms
⑥ Plant-wide, uniform display of system status

Figure 1-470 *Display of diagnostic information*

Faults in the plant are immediately detected and reported on the display devices, even in STOP mode. As a result, system diagnostics is always consistent with the actual state of the plant.

Advantages and customer benefits

Integrated system diagnostics offers the following advantages:

- Diagnostics is always consistent with the actual state of the plant. The system diagnostics also works in the STOP mode of the CPU.
- The uniform display concept enables efficient error analysis.
- The immediate identification of the error source in the event of an error speeds up commissioning and minimizes production downtimes.
- By configuring diagnostics events, you tailor the diagnostics to the requirements of your automation task.

5.4.6 Trace

for effective commissioning and optimization of drives and closed-loop controls, the SIMATIC S7-1500 CPUs feature integrated trace functionality. The trace function records the CPU tags, depending on the settable trigger conditions. Tags are, for example, drive parameters or system and user tags of a CPU. You can display and evaluate the saved recordings with STEP 7.

By visualizing the entire process with real-time trace, you identify, for example, sporadic events in the system during commissioning and service.

The event recording adds the recording of status changes to Motion Control jobs as well as coming and going program and technology alarms to the signal recording with the trace.

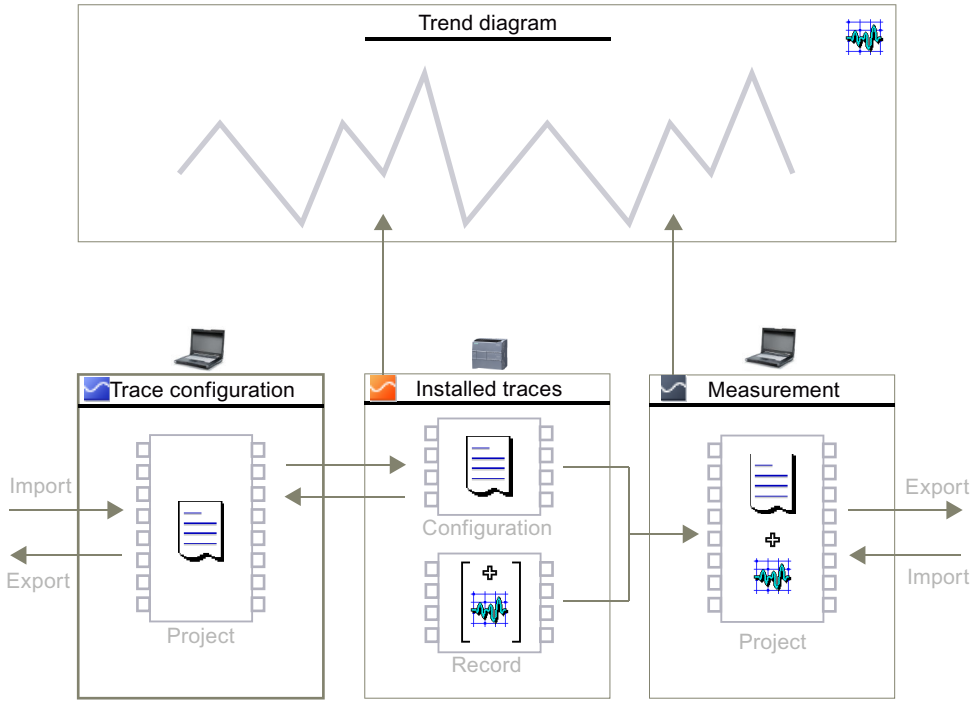


Figure 1-471 Schematic overview

Example: Trace optimizes the commissioning of packaging machines

Automation task:

At what speed does a plant reach its maximum productivity? How do you quickly determine the optimum settings?

The packaging machine ensures quick and reliable packaging of ECG electrodes on a rotary table which is loaded and unloaded by a conveyor belt.

Feature:

After filling is the correct time for further transport of the packaged electrodes. Light barriers trace the position of the electrodes for this.

Solution:

The Trace function of a SIMATIC S7-1500 CPU visualizes the exact sequence of selected signals over a short period of time. It supports the start-up engineer in finding the exact light barrier positions and the optimum speed for belts and the rotary table.

The trace recordings are supplied to the customer as part of the plant project. In the event of a fault, the customer recognizes whether changes to the basic settings have caused the fault.

In addition, the trace recordings are stored as a "measurement" on the SIMATIC memory card, up to 999 trace recordings are available for evaluation.

Advantages and customer benefits

The Trace function provides you with the following advantages:

- Cost-effective and easy evaluation as the signals are available in the CPU
- Monitoring of highly dynamic processes
- Up to 8 independent trace jobs simultaneously
- Recordings of individual cycles for up to 64 different tags in a .csv file over a longer period (e.g. hours, days) → Long-term trace.
- recording in separate CPU memory area for easy localization of sporadic errors
- Various trigger options
- Various zoom and cursor measuring functions
- Recording of status changes to motion control jobs
- Recording of incoming and outgoing program and technology alarms
- Saving trace recordings on the SIMATIC memory card
- export of measurements, e.g. for user-specific processing

Project trace

A project trace includes trace configurations of multiple devices and records the signals across devices.

Synchronization takes place via a global trigger that can be triggered by any device. After receiving the global trigger, the devices with valid project trace configuration start the recording.

More information

You can find a detailed description of the "Trace" function in the Function Manual SIMATIC/SINAMICS Using the trace and logic analyzer function SIMATIC/SINAMICS Trace and logic analyzer function (https://support.industry.siemens.com/cs/ww/en/view/64897128).

5.5 Interface modules for SIMATIC S7-1500 I/O devices

An interface module connects the SIMATIC S7-1500 I/O devices as ET 200MP distributed I/O system via PROFINET or PROFIBUS with the controller. The interface module exchanges the data between the higher-level controller and the I/O modules.

5.6 Input and output modules

The I/O modules form the interface between the controller and the process. The controller detects the current process state via the connected sensors and actuators, and triggers the corresponding reactions.

Digital and analog modules provide the inputs/outputs that are required for the respective task.

The input/output modules are divided into function classes.

Function classes of input/output modules

The table below shows selected properties and technical specifications of different function classes of input/output modules.

Function class		
High Speed (HS)	Special modules for extremely fast applications Shortest input delays Shortest conversion times Isochronous mode	
High Feature (HF)	Flexible use Even for complex applications Parameters for each channel Diagnostics for each channel Add-on functions	With analog modules • Highest accuracy (< 0.1%) • High common mode voltage (e. g. 60 V DC / 30 V AC), with single-channel electrical isolation if required
Standard (ST)	Medium price range Parameter per load group / module Diagnostics per load group / module	With analog modules • Universal modules • Accuracy ≥ 0.3% • Common-mode voltage approx. 10 V to 20 V
Basic (BA)	Inexpensive, simple modules No parameters No diagnostics	

5.6.1 Which I/O devices are the correct ones?

SIMATIC S7-1500 offers a wide range of I/O modules. Depending on the complexity of your plant and the technical and functional requirements, you perform your planning flexibly and in a modular manner with SIMATIC components.

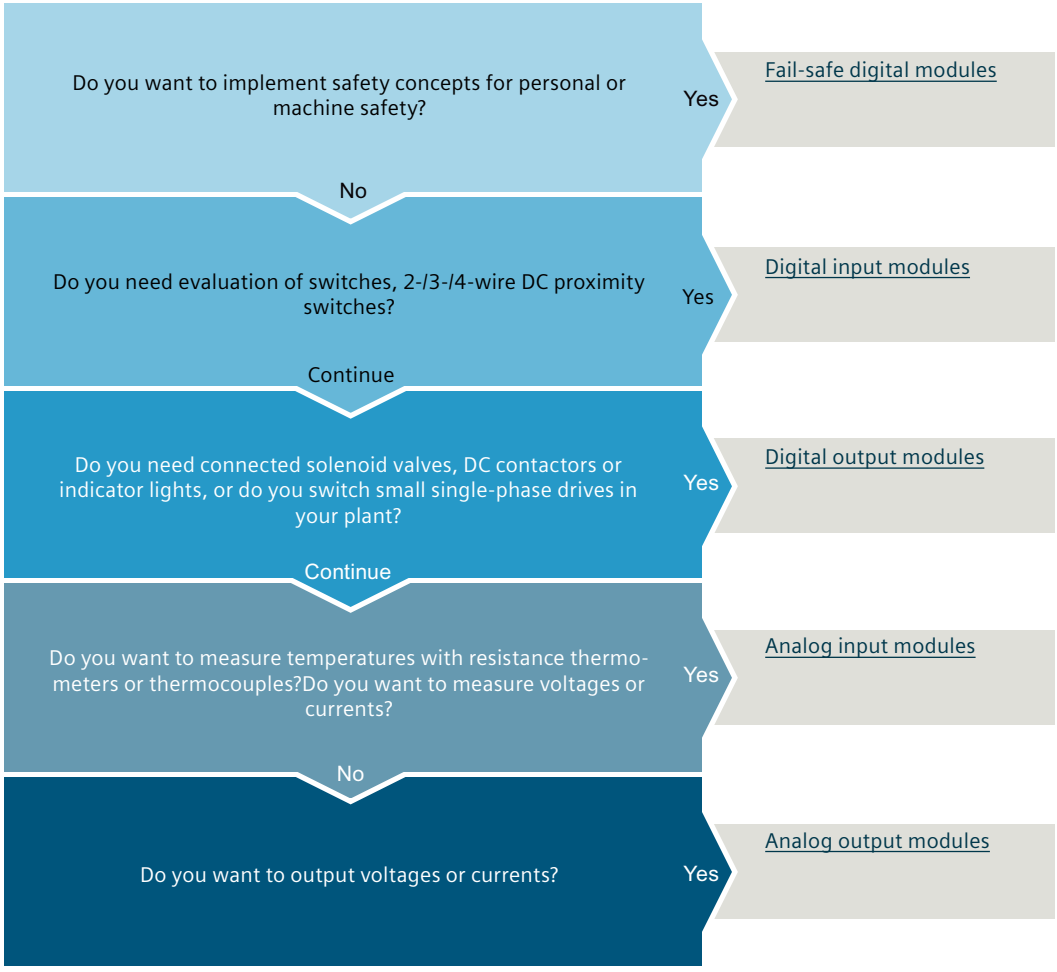

Figure 1-472 Selection guide for input/output modules

Advantages

The digital input modules provide you with the following advantages:

- High channel density with low variety of parts, therefore less effort for ordering, logistics and storage of spare parts
- Modules in 25 mm size without parameter assignment and diagnostics, therefore simple commissioning
- Front connector in screw-type connection system or in push-in system for 25 mm and 35 mm modules
- Same mechanical design, same handling and same accessories for all modules
- Same pin assignment for wiring, which means that circuit diagrams and wiring plans can be universally used
- Any combination of narrow and wide modules
- Can be used centrally in SIMATIC S7-1500 and in the ET 200MP distributed I/O system

- Cost-effective implementation of simple counting tasks with two counter inputs each of the following modules:
  - DI 16x24V DC HF
  - DI 32x24V DC HF
  - DI 16xNAMUR HF
  - DI 16xUC HF
  - DI 16x24VDC HS

Advantages

The digital output modules provide you with the following advantages:

- High channel density with low variety of parts, therefore less effort for ordering, logistics and storage of spare parts
- Modules in 25 mm size without parameter assignment and diagnostics, therefore simple commissioning
- Front connector in screw-type connection system or in push-in system for 25 mm and 35 mm modules
- Same mechanical design, same handling and same accessories for all modules
- Switching cycle counter for planning maintenance cycles
- Same pin assignment for wiring, which means that circuit diagrams and wiring plans can be universally used
- Any combination of narrow and wide modules
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system
- High feature module DQ 8x24VDC/2A HF: You can use pulse width modulation (PWM) to easily generate periodic pulses with a constant rated voltage and a variable pulse duration.

  Typical use:

  – Control of proportional valves and way valves (for example, energy savings by reducing the holding current)
  – Heating control, for example via an external additional power unit
- High-current module DQ 8 HS:
  – 5 A per channel
  – 8 A per channel group

5.6.4 Fail-safe digital modules

Fail-safe digital modules

Fail-safe digital modules are available for implementing safety concepts in the area of equipment and personnel safety (for example, for emergency stop devices in the operation of processing machines).

The fail-safe modules ensure safe processing of field information (sensors: e.g., EMERGENCY OFF buttons, light barriers; actuators, e.g. motor control). You are provided with all the hardware and software components required for safe processing, according to the required safety class. The following table shows the available fail-safe modules.

Short designation	F-DI 16x 24VDC PROFIsafe	F-DQ 8x24VDC/2A PPM

Diagnostic interrupt	X	X
Hardware interrupt	---	---
Input delay	0.4 ms to 20 ms (configurable by channel)	---

Benefits

The fail-safe input and output modules S7-1500 provide you with the following advantages:

- High-channel, fail-safe inputs and outputs
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system
- processing of standard and safety programs
- Uniform engineering for standard and safety automation in the TIA Portal
- Integration of safety-related functions up to SIL 3 according to IEC 61508:2010 or PL e and category 4 according to ISO 13849-1:2015 or according to EN ISO 13849-1:2015

Advantages

Analog input modules detect process signals, for example, pressure or temperature and pass the process signals on in digitalized form (16 bit format) to the CPU. You use the analog input modules to measure current (2-wire and 4-wire transducer), voltages, resistances (resistance thermometer) and temperatures (thermoelements). The measurement types depend on the module used.

The analog input modules provide you with the following advantages:

- Front connector in screw-type connection system or in push-in system for 25 mm and 35 mm modules
- Same mechanical design, same handling and same accessories for all modules
- Components required for shielding are included in the scope of delivery and allow simple and quick installation without the use of tools
- Same pin assignment for wiring, which means that circuit diagrams and wiring plans can be universally used
- Any combination of narrow and wide modules
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system

Overview of functions

In the following you will find a brief overview of special functions of the modules. You can find a detailed description of the functions in the equipment manual of the module.

Measuring range adjustment of the analog input module AI 8xU/I HF

The function adjusts the measuring range to the sensor. You can increase the resolution for a configurable part of the measuring range in S7 format. The measured signal is resolved precisely to more decimal places around a specific operating point.

Scaling of the measured values of the analog input module AI 8xU/I HF

With measured value scaling, you display the user data of the module in REAL format (32-bit floating point) instead of S7 format. You can thus directly assign a technological variable to the analog value of the module. The conversion is made directly in the module, which saves power and cycle time in the CPU.

You can combine the measured value scaling with the measuring range adjustment. In this case, the measuring range is adjusted first and then the representation of the measured value is scaled.

Calibration in runtime

The following analog modules offer you the calibration function at runtime:

- AI 4xU/I/RTD/TC ST
- AI 8xU/I/RTD BA
- AI 8xU/I/RTD/TC ST
- AI 8xU/I HS
- AI 8xU/I HF
- AI 8xHART HF
- AI 8xU/R/RTD/TC HF
- AI 16xU BA
- AI 16xI BA
- AI 24xCVM HF
- AI 4xU/I/RTD/TC / AQ 2xU/I ST

The calibration compensates for influences on the measuring result by cables and/or temperature. A calibration checks the process values output by the analog input module, determines the deviation from the actual values and compensates for measuring errors.

Typical use:

- For plants in which sensors detect relatively small voltages or currents
- For applications which require regular calibration for all components in a measuring circuit.

Oversampling of the AI 8xU/I HS analog input module

Oversampling divides a PROFINET bus cycle into equidistant bus sub-cycles. This requires isochronous mode.

Oversampling acquires data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles. Use for quality-monitoring measurements, for example when recording pressure trends during the blowing process of PET bottle production.

Advantages

Analog output modules convert a 16-bit digital value into current or voltage and output it at the process. With the analog output modules you control, for example, proportional valves or small servo drives.

The analog output modules provide you with the following advantages:

- Front connector in screw-type connection system or in push-in system for 25 mm and 35 mm modules
- Same mechanical design, same handling and same accessories for all modules
- Components required for shielding are included in the scope of delivery and allow simple and quick installation without the use of tools
- Same pin assignment for wiring, which means that circuit diagrams and wiring plans can be universally used
- Any combination of narrow and wide modules
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system

Overview of functions

In the following you will find a brief overview of special functions of the modules. A detailed description of the functions is available in the device manual of the module.

Calibration in runtime

The following analog modules offer you the calibration function at runtime:

- AQ 2xU/I ST
- AQ 4xU/I ST
- AQ 4xU/I HF
- AQ 8xU/I HS
- AQ 8xHART HF
- AI 4xU/I/RTD/TC / AQ 2xU/I ST

The calibration compensates for influences on the measuring result by cables and/or temperature. A calibration checks the process values output by the analog output module, determines the deviation from the actual values and compensates for output errors.

Typical use:

- For plants in which sensors process relatively small voltages or currents.
- For applications which require regular calibration for all components in a measuring circuit.

Oversampling of the AQ 8xU/I HS analog output module

Oversampling divides a PROFINET bus cycle into equidistant bus sub-cycles. This requires isochronous mode.

Oversampling acquires data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles. Used, for example, for controlling a feed valve, the output data is controlled exactly at the current position of the machine.

5.7 Communication

5.7.1 Interfaces for communications

Interfaces for communication via PROFINET and PROFIBUS DP (as of CPU 1516) are already integrated in the CPUs. Additional communication modules enhance the communication capabilities of the SIMATIC S7-1500 with additional functions or interfaces, e.g. 8xIO-Link. The following communications options are available for your automation task:

Communication options	PN/IE	DP	Serial
PG communication for commissioning, testing, diagnostics	X	X	---
HMI communication for operator control and monitoring	X	X	---
Open User Communication	X	---	---
Secure Open User Communication	X	---	---
Data exchange via OPC UA as server	X	---	---
Data exchange via OPC UA as client	X	---	---
Direct data exchange between IO controllers	X	---	---

Communication options	PN/IE	DP	Serial
Communication via Modbus TCP	X	---	---
Communication via UDP Multicast	X	---	---
Sending process alarms via e-mail	X	---	---
File management and file access via FTP (File Transfer Protocol); CP may be the FTP client and FTP server	X	---	---
S7 communication	X	X	---
Serial point-to-point or multi-point connection Data exchange via point-to-point with Freeport, 3964 (R), USS or Modbus protocol	---	---	X
Web server Data exchange via HTTP(S), for example for diagnostics	X	---	---
SNMP (Simple Network Management Protocol)	X	---	---
Time synchronization	X	X	---

5.7.2 CM communication modules / CP communications processors

For special requirements of your plant, use communications processors (CPs) for security functions to secure Industrial Ethernet networks.

If your system requires additional interfaces, communication modules (CM) expand your S7-1500 CPU with other interfaces of an interface type such as PROFINET, PROFIBUS or point-to-point connection. The CMs for point-to-point connection allow, for example, Freeport or Modbus communication via their RS232, RS422 and RS485 interfaces.

Benefits

The communication modules point-to-point connection S7-1500 provide you with the following advantages:

- Connection of legacy and external systems possible
- Connection of data readers or special sensors
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system
- Variety of physical interfaces, e.g. RS232 and RS422 or RS485
- Predefined protocols, e.g. 3964(R), Modbus RTU or USS
- Application-specific protocols based on Freeport (ASCII)
- Uniform programming interface for all modules
- Diagnostic interrupt for simple fault rectification

5.7.3 Communication module IO-Link Master

Communication module IO-Link Master

An 8-port IO-link master module CM 8xIO-link is available for the S7-1500 automation system/ET 200MP distributed I/O system.

IO-Link is a point-to-point connection between a master and a device. Both conventional and intelligent sensors/actuators can be used as devices at the IO link via unshielded standard cables using proven 3-wire technology.

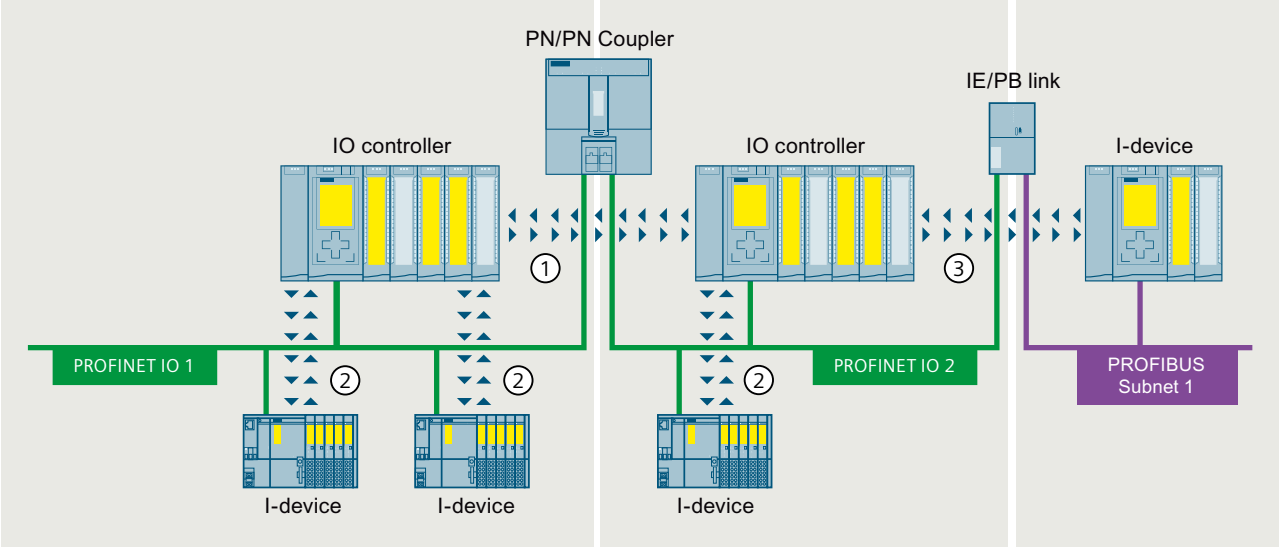
You can use the 8-port IO link master as follows:

- Central, directly behind a S7-1500 CPU (a total of 30 I/O modules, plug-in type)
- Distributed with ET 200MP to PROFINET and PROFIBUS

With the IO link, you can easily change the parameters for the production and processing of different product variants and batches up to sensor/actuator level during CPU runtime. A

considerably more detailed diagnostics up to sensor or actuator or a remote diagnostics is possible.

Table 1-808 Communication module IO-Link Master



Short designation	**CM 8x IO-Link**
Article number	6ES7547-1JF00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7547-1JF00-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109763143)
Bus system	IO-Link
Interface	8 ports
Data transmission rate	COM1 (4.8 kbaud), COM2 (38.4 kbaud), COM3 (230.4 kbaud)
Functionality and protocols	IO-Link Protocol 1.0 IO-Link Protocol 1.1
Diagnostic interrupt	X
Hardware interrupt	---
Isochronous mode	---

Benefits:

- Simplified and reduced wiring, engineering and commissioning
- Time savings
- Higher availability due to pre-assembled cable
- Avoidance of plant downtimes through preventive maintenance
- High diagnostics capability
- Configurable diagnostics can be set for each channel

5.7.4 Safety-related communication via fail-safe modules

The figure below provides an overview of the possibilities of safety-related communication via PROFINET IO in SIMATIC Safety fail-safe systems with S7-1500 F-CPUs.

1. Safety-related IO controller - IO controller communication
2. Safety-related IO controller - I-device communication
3. Safety-related IO controller-I-device communication (via IE/PB link to PROFIBUS)

Figure 1-473 Example of safety-related communication

5.8 Technology functions

5.8.1 Motion control

You use the integrated Motion Control functionality of SIMATIC S7-1500 for positioning and moving axes. Depending on the CPU, the SIMATIC S7-1500 automation system supports different configuration limits for motion control technology objects.

With Motion Control instructions according to PLCopen, you control PROFIdrive-capable drives and drives with analog setpoint interface.

Drives with a stepper motor interface are connected using telegram 3 and with the help of PTO (Pulse Train Output) pulse generators. Use the following modules to control the stepper motors:

- TM PTO 2x24V / TM PTO 4
- SIMATIC MICRO-Drive F-TM StepDrive

SIMATIC S7-1500T CPUs

The Technology CPUs extend the Motion Control functions available in all SIMATIC S7-1500 controllers for demanding solutions to include gearing and camming and kinematics.

The S7-1500 T-CPUs are also suitable for safety applications, so that you only need one CPU for standard, safety and comprehensive Motion Control automation tasks.

Motion control technology objects

The table below shows the technology objects that are supported by the SIMATIC S7-1500 and S7-1500T. * They occupy Motion Control resources or Extended Motion Control resources in the CPU.

Technology objects	SIMATIC S7-1500	SIMATIC S7-1500T	Resource requirements per technology object
Speed-controlled axis	X	X	40
Positioning axis	X	X	80
Synchronous axis	X	X	160
External encoder	X	X	80
Measuring input	X	X	40
Output cam	X	X	20
Cam track	X	X	160
Cam of type "TO_Cam"	---	X	2*
Cam of type "TO_Cam_10k"	---	X	20*
Cam of the type "TO_Cam_600Seg"	---	X	2*
Cam of the type "TO_Cam_6kSeg"	---	X	20*
Kinematics	---	X	30*
Interpreter	---	X	60*
Interpreter program	---	X	0
Interpreter mapping	---	X	0
Leading axis proxy	---	X	3*

* They occupy Extended Motion Control resources in the CPU.

Motion control technology functions

The table below shows the technology functions offered by both SIMATIC S7-1500 and S7-1500T and the extended Motion Control functions of the technology CPUs.

Technology functions	SIMATIC S7-1500	SIMATIC S7-1500T
Enable, disable technology objects	X	X
Acknowledge alarms, restart technology object	X	X
Reference technology objects, set reference point	X	X
Pause axis	X	X
Position axis absolutely	X	X
Position axis relatively	X	X
Move axis at set velocity/speed	X	X
Move axis via a time-based position profile	---	X

Technology functions	SIMATIC S7-1500	SIMATIC S7-1500T
Move axis in jog mode	X	X
Positioning axis overlapping	X	X
Pause superimposed motions on the axis	X	X
Set alternative encoder as operationally active encoder	---	X
Hold and disable axis	X	X
Controlling bits of control word 1 and 2	X	X
Write parameter	X	X
Save absolute encoder adjustment for device replacement	X	X
Start one-time measuring	X	X
Start cyclic measuring	X	X
Abort active measuring	X	X
Activate/deactivate output cam	X	X
Activate/deactivate cam track	X	X
Start gearing	X	X
Start gearing with specified synchronous positions	---	X
Start velocity synchronous operation	---	X
Absolute shift of master value on the following axis	---	X
Relative shift of master value on the following axis	---	X
Relative shift of following value on the following axis	---	X
Absolute shift of following value on the following axis	---	X
Start camming	---	X
Simulate synchronous operation	---	X
Desynchronize gearing	---	x
Desynchronize camming	---	x
Specify additive master value	---	X
Interpolate cam	---	X
Read master value of a cam	---	X
Read out slave value of a cam	---	X
Cyclically read out following value of a cam	---	X
Copy calculated cam elements	---	X
Specify motion setpoints	---	X
Specify superimposed motion setpoints	---	X
Activate and deactivate force/torque limiting / fixed stop detection	X	X
Specify additive torque	X	X
Specify upper and lower torque limits	X	X
Interrupt motion control of kinematics	---	X
Continue motion control of kinematics	---	X
Stop motion of kinematics	---	X
Position kinematics with linear motion	---	X
Position kinematics relatively with linear motion	---	X
Position kinematics with circular motion	---	X
Position kinematics relatively with circular motion	---	X
Move kinematics with synchronous "point-to-point" motion, absolute	---	X
Move kinematics with synchronous "point-to-point" motion, relative	---	X

Technology functions	SIMATIC S7-1500	SIMATIC S7-1500T
Start conveyor tracking	---	X
Set kinematics to simulation mode	---	X
Define workspace zone	---	X
Define kinematics zone	---	X
Activate workspace zone	---	X
Deactivate workspace zone	---	X
Activate kinematics zone	---	X
Deactivate kinematics zone	---	X
Re-define tool	---	X
Change active tool	---	X
Redefine object coordinates system	---	X
Transform axis coordinates into cartesian coordinates	---	X
Transforming Cartesian coordinates into axis coordinates	---	X
Load/unload the Interpreter program	---	X
Start execution of the Interpreter program	---	X
Stop execution of the Interpreter program	---	X

Motion Control configuration example

The SINAMICS Startdrive engineering tool is available in the TIA Portal for easy commissioning and optimization of SINAMICS drives. SINAMICS Startdrive enables efficient commissioning by means of the integrated axis control panel and extensive diagnostic functions.

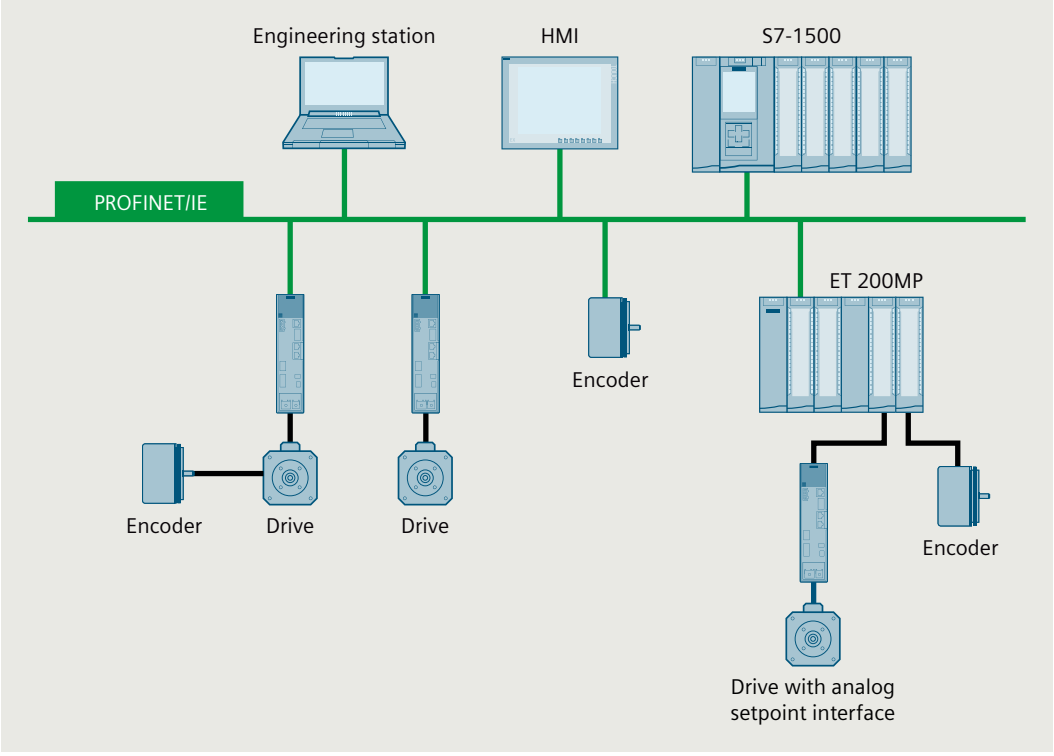


Figure 1-474 Example of a Motion Control configuration

Example: Quick and flexible packaging of luxury goods thanks to the CPU SIMATIC S7-1500T

Automation task:

Development of a modular, automatic packaging machine with a speed of up to 50 packages per minute.

Feature:

The packaging machine enables the outer packaging of individual products as well as containers at medium to high speeds (more than 40 products per minute). The possibility of quick changeover to new products is a condition. Scalability and cost efficiency is paramount in the automation solution.

Solution:

A SIMATIC S7-1500 TIME-CPU controls several axes in parallel with its technology functions gearing and camming.

The SINAMICS V90 drive communicates with the CPU via PROFINET IO with IRT. You assign parameters to the technology functions via technology objects with STEP 7.

Advantages

Motion Control with SIMATIC S7-1500T CPUs provide you with the following advantages:

- Rugged and stable motion control platform with easy extensibility to include additional axes
- Automatic alignment of the technological variables between controller and drive by means of technology objects; reduced engineering, commissioning and service times
- Simple setup and commissioning of the technology functions in the TIA Portal, no specialist knowledge required
- Inclusion in the integrated system diagnostics and trace function, thus reducing maintenance times and downtimes
- Numerous options for using synchronized axes in gearing with specification of the synchronous position, in camming and in velocity synchronous operation
- Configuration limits can be expanded through cross-PLC synchronous operation
- Graphical and tabular configuration and optimization and diagnostics of cams with integrated cam editor saves time and reduces the error rate
- Adaptation and calculation of the cam disks in the user program during operation, e.g. for quick product changeover
- Control of kinematics for handling tasks such as pick-and-place, assembly and palletizing

S7-1500 Motion Control KinPlus

The "S7-1500T Motion Control KinPlus" software extends the S7-1500T kinematics functions. The "S7-1500T Motion Control KinPlus" software enables control of kinematics with 5 or 6 interpolating axes.

More information

More information can be found in the function manuals S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109751049)

5.8.2 PID Control

PID controllers are integrated as standard in all S7-1500 CPUs. PID controllers measure the actual value of a physical variable, for example, temperature or pressure, and compare the actual value with the setpoint. Based on the resulting system deviation, the controller calculates a manipulated variable that causes the actual value to reach the setpoint as quickly and stably as possible.

You can choose from three different PID technology objects:

PID technology object	Description
PID_Compact	The PID_Compact technology object provides a PID controller with integrated tuning for actuators with proportional action behavior. Different operating modes are possible with PID_Compact, such as: • Pretuning • Fine tuning • Automatic mode • Manual mode
PID_3Step	The PID_3Step technology object provides a PID controller with tuning for valves or actuators with integrating behavior. You can configure the following controllers: • Three-point stepping controller with position feedback • Three-point stepping controller without position feedback • Valve controller with analog output value
PID_Temp	The PID_Temp technology object provides a continuous PID controller with integrated tuning. PID_Temp is specially designed for closed-loop temperature control and is suitable for heating, cooling or heating/cooling applications. Two outputs are available, one for heating and one for cooling. You can also use PID_Temp for other control tasks. PID_Temp can be cascaded. You can use PID_Temp in manual or automatic mode.

Example: PID Control optimizes the drying process

Automation task: Development of a temperature control for drying panes of glass in the production of mirrors**.**

Feature: The drying process is a critical phase in silvering mirrors. It is decisive for optimum product quality. During the silvering process, the glass panes are treated with chemical solutions and then dried in a pre-heated oven. Temperature control plays a key role in the drying process.

Solution: A PID controller controls the temperature in the drying oven. The filament of each infrared lamp in the oven is controlled separately and remotely. Control was previously only possible manually.

Benefits

The integrated controller PID Control of the SIMATIC S7-1500 CPUs offer you the following advantages:

- High-quality end product due to optimum control performance
- High flexibility in the drying oven
- Time savings thanks to automatic control parameter optimization for optimum control performance and simple commissioning

More information

A detailed description of PID Control in SIMATIC S7-1500 can be found in the Function Manual "SIMATIC S7-1200, S7-1500 PID Control" SIMATIC S7-1200, S7-1500 PID control (https://support.industry.siemens.com/cs/ww/en/view/108210036).

5.8.3 Technology functions of the compact CPUs

Technology functions are integrated into the SIMATIC S7-1500 compact CPUs.

Function	Value	Description
Six high-speed counters	Up to 100 kHz	For pulse and incremental encoders
Frequency measurement	0.04 Hz - 400 kHz	
Period duration measurement	2.5 µs - 25 s	
Velocity measurement		Dependent on measurement interval and signal evaluation Unit can be defined by user
Pulse width modulation (PWM output)	Max. 4 (up to 100 kHz)	Output of a signal with defined period duration and variable on-load factor at DQ
Pulse Train Output (PTO output)	Max. 4 (up to 100 kHz)	Output of position information, e. g. for activation of stepper motor drives or simulation of an incremental encoder
Frequency output	Up to 100 kHz	Precise assignment of a frequency value with high frequencies

Benefits

Compared with the other SIMATIC S7-1500 CPUs, the compact CPUs offer added value in a small space:

- The CPU with display and inputs/outputs in one enclosure
- Compact size with high performance
- Important technology functions such as counting, measuring and positioning are integrated
- Cost effective compared to modular systems with CPU and modules
- Space saving design
- Can be expanded by SIMATIC S7-1500 input and output modules

5.8.4 Technology modules for counting, measuring and position detection

For technological tasks, powerful technology modules are available that perform these tasks largely autonomously and reduce the load on the CPU. Use the technology objects "Counting and measuring" or "Motion Control" for easy configuration and operation of the operating modes.

The table below shows the available technology modules for counting, measuring and position detection.

Short designation	**TM Count 2x24V**	**TM PosInput 2**
Article number	6ES7550-1AA01-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES75-50-1AA01-0AB0)	6ES7551-1AB01-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES75-51-1AB01-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109783960)	↓ (https://support.industry.siemens.com/cs/ww/en/view/109813005)
Connectable encoders	Incremental encoder for signals, 24 V asymmetrical, Pulse encoders with/without direction signal, Pulse encoders up/down	Incremental encoders for signals according to RS422 (5 V differential signal) or 5 V asymmetrical, Pulse encoders with/without direction signal, Pulse encoders up/down, Absolute encoders (SSI)
Max. count frequency	200 kHz 800 kHz with four-fold pulse	1 MHz 4 MHz with four-fold pulse
Integrated DI	3 DIs per counter channel for • Start • Stop • Capture • Synchronization	2 DIs per counter channel for • Start • Stop • Capture • Synchronization
Integrated DQ	2 DQs for comparators and limit values	2 DQs for comparators and limit values
Counting functions	• 32 bits up/down • Adjustable counting range • Comparator • Incremental position detection for motion control	• 32 bits up/down • Adjustable counting range • Comparator • Incremental and absolute position detection for motion control
Measuring functions	Frequency Period duration Velocity	Frequency Period duration Velocity
Diagnostic interrupt	X	X
Hardware interrupt	X	X
Isochronous mode	X	X

Benefits

Technology modules for counting, measuring and position detection offer you the following advantages:

- Fast and timely detection of events with fine resolution for high productivity and product quality
- Hardware-level signal processing for rapid counting, measurement and position detection for a variety of transducers
- Simple setup and commissioning of the technology functions in STEP 7
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system
- Quick response thanks to different hardware interrupts

5.8.5 Technology module for time-based IO

Time-based IO modules enable you to achieve maximum precision and speed - regardless of the performance of the controller and the fieldbus. The time-based IO modules output signals with a precisely defined response time. The I/O signals are processed on a time basis.

The table below shows the most important features of the technology modules for time-based IO. In conjunction with the "Cam" and "Cam track" technology objects, the TM Timer DIDQ modules ensure highly accurate cam output. In conjunction with the "Measuring input" technology object, the TM Timer DIDQ module ensure highly accurate detection of passing products.

Short designation	**TM Timer DIDQ 24x24V**
Article number	6ES7552-1AA01-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7552-1AA01-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109974309)
Connectable encoders	24 V incremental encoder with signals A and B 24 V pulse encoder with a signal
Max. count frequency	200 kHz with fourfold evaluation
Integrated DI	8 DI with the following functions: • Up to 2 time stamps per cycle (resolution 1 µs) • 32x oversampling • Counting function up to 50 kHz • Incremental encoder acquisition with 2 phase-shifted tracks • Configurable input filter to suppress interference
Integrated DQ	16 DQs with the following functions: • Up to 2 time stamps per cycle (resolution 1 µs) • 32x oversampling • Pulse-width modulated output • Configurable substitute values per DQ
Diagnostic interrupt	X
Hardware interrupt	---
Isochronous mode	X (required for the time stamp and oversampling functions)

Benefits

The technology modules for time-based IO offers you the following advantages:

- Meets stringent requirements for precision and speed, independent of the CPU and fieldbus
- Signals are read in and output precisely, to within 1 microsecond
- Exact definition of response times, independent of the application cycle
- Typical use: cam control, length measurement, time measurement, as a probe, for dosing fluid quantities

5.8.6 Technology module TM PTO 4

You can use the TM PTO 4 technology module to connect up to four stepper motor axes to an S7-1500 system. The module is connected to the technology objects "speed axis", "positioning axis" or "synchronous axis" via a conversion of the PROFIdrive telegram 3 and forms the interface to the drive. The number of steps output is returned as position actual value.

The table below shows the main features of the technology module TM PTO 4.

Short designation	**TM PTO 4**
Article number	6ES7553-1AA01-0AB0 (https://mall.industry.siemens.com/mall/en/ww/Catalog/Product?mlfb=6ES7553-1AA01-0AB0&SiepCountryCode=de)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109974308)
Number of axes	4
Available signals per axis	2x RS422 2x DQ (24 V DC) 2x DI (24 V DC) 1x DIQ (24 V DC)
Parameterizable functions	PTO (Pulse Train Output) signal interface: • 24 V asymmetric • RS 422 symmetrical • TTL (5 V) asymmetrical PTO (Pulse Train Output) signal type: • Pulse and direction • Count up/down • Incremental encoder Digital inputs/outputs: • Drive enable • Reference switch • Measuring input • Drive ready
Diagnostic interrupt	X
Hardware interrupt	---
Isochronous mode	X

Advantages

- Direct control of the axes via pulse signals.
- High-frequency pulse signals for precise positioning and fast motion of the connected axes.
- Precise and dynamic axis control through isochronous processing.

5.8.7 Technology module TM FAST

The TM FAST technology module provides you the opportunity to control particularly fast processes with short response times in the micro- and nanosecond range. You can define the hardware functionality of the module through application-specific programming. Supplementary software components and related information can be found in the following Internet entry (https://support.industry.siemens.com/cs/ww/en/view/109817062).

The table below shows the main features of the technology module TM FAST.

Short designation	TM FAST
Article number	6ES7554-1AA00-0AB0 (https://mall.industry.siemens.com/mall/en/ww/Catalog/Product?mlfb=6ES7554--1AA00-0AB0&SiepCountryCode=de)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109816087)
Available signals	8x RS485 (can also be used as 5 V asymmetrical) 8x DI (24 V DC) 8x DQ (24 V DC) 4x DIQ (24 V DC)
Diagnostic interrupt	X
Hardware interrupt	---
Isochronous mode	X

Advantages

Application-specific programming of the FPGA (Field-Programmable Gate Array) in the module, e.g. for the following applications:

- Individual communication protocols
- Individual cam functions
- Controlling laser mirrors
- Precise evaluation of incremental encoders with very high frequencies
- Precise measurement of pulse durations in the micro- and nanosecond range
- Short response times in the micro- and nanosecond range

5.8.8 Technology module for weighing technology

The technology modules SIWAREX WP521 and SIWAREX WP522 are used for the acquisition and processing of signals from weighing or force transducers. You can connect one scale (WP521) or two separate scales (WP522) respectively to the modules. The SIWAREX modules offer high accuracy.

The table below shows the main features of the technology modules for weighing technology.

Short designation	**TM electronic weighing system SIWAREX WP 521 ST**	**TM electronic weighing system SIWAREX WP 522 ST**
Article number	7MH4980-1AA01 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/7MH4-980-1AA01)	7MH4980-2AA01 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/7MH4-980-2AA01)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109742780)	
Weighing channel	1 channel	2 channels
Interfaces	RS 485 with Modbus RTU or for connecting the remote display (per channel) Ethernet interface with SIWATOOL protocol and Modbus TCP/IP (1 for both channels)	
Integrated digital inputs	DI 3x24VDC	
Integrated digital outputs	DQ 4x24VDC	
Load cell connection	DMS load cells in 6- or 4-wire technology (per channel), 1 to 4 mV/V	
Functions	• Adjust the scale with weights or automatically • 3 limits • Tare • Set to zero • Trace • Commission with SIWATOOL (service tool for PC)	
Diagnostic interrupt	---	
Hardware interrupt	X (configurable)	

Benefits

The weighing modules SIWAREX for SIMATIC S7-1500 offer you the following advantages:

- Seamless integration of simple weighing applications such as platform and hopper scales in SIMATIC S7-1500
- Use for level monitoring, e.g. silos and bunkers
- Can be used centrally in SIMATIC S7-1500 and in ET 200MP distributed I/O system
- SIWAREX WP521 ST for the setup of one scale
- SIWAREX WP522 ST for the setup of two separate scales, with the same space requirements as WP521 ST
- Free sample application on the Internet for the quick implementation of customer or industry-specific solutions

5.8.9 Technology Module TM NPU

Technology Module TM NPU

Applications based on artificial intelligence can be implemented using the TM NPU technology module. The technology module TM NPU is used in the S7-1500 automation system / ET 200MP distributed I/O system.

The integrated AI processor (AI - Artificial Intelligence) enables the processing of large amounts of data from connected sensors, as well as data from the user program of the CPU. Connect the sensor technology via the integrated USB interface of the TM NPU, e.g.: Cameras or microphones. For TM NPU with V1.0.0, use the USB camera from Intel, type RealSense D435.

The supplied data is processed at high speed in the TM NPU over neural networks. The TM NPU transmits the processing result via the backplane bus to the CP. The CPU then evaluates the data in the user program.

Typical areas of application:

- Visual quality check in production plants
- Pick-and-place applications
- Image-guided robotic systems

Table 1-809 Technology Module TM NPU

Short designation	**TM NPU**
Article number	6ES7556-1AA00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7556-1AA00-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/109765877)
Interfaces	Ethernet (1 port) USB 3.1 (1 Port) SD card slot
Interrupts/diagnostics/status information	
Status display	Yes
Interrupts	No
Diagnostic functions	Yes
Product function	
Artificial intelligence / Processing of neural networks	Yes

Benefits:

- Design of flexible and precise production processes
- Reduction of time required for configuration, programming and commissioning

5.8.10 Technology module TM MFP

Technology module TM MFP

The TM MFP (technology module multifunctional platform) is a module for IT applications that are not included in the control tasks of the CPU. The technology module processes, for example, the data of connected cameras or robot systems and the data from the user program of the CPU.

The Linux-based operating system SIMATIC Industrial OS (IndOS) has been pre-installed on the TM MFP. The Graphics Processing Unit (GPU) of the built-in processor is able to run and accelerate AI routines. This enables fast and efficient processing of large amounts of data and optimization of processes.

The technology module supports Docker software (not pre-installed by default) for loading software and algorithms, for example, into the TM MFP in the form of bins.

Typical areas of application:

- Edge computing for SIMATIC controllers
- Data processing of connected sensors, e.g. cameras
- Execution and acceleration of AI routines

Table 1-810 Technology module TM MFP

Short designation	**TM MFP**
Article number	6ES7558-1AA00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7558-1AA00-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/us/en/view/109820481)
Interfaces	2x Ethernet (1 port each) 2x USB 3.0 DisplayPort
Interrupts/diagnostics/status information	
Status display	No
Interrupts	No
Diagnostic functions	No
Product function	
Execution of IT applications	Yes

Advantages

- Supports applications in high-level languages, e.g. C, C++ or Python
- Fast and efficient processing of large amounts of data

5.9 Power supply

The power supply of an automation system to be dimensioned according to plant size. The SIMATIC S7-1500 CPUs are supplied via a load power supply or a system power supply. A system power supply that supplies the backplane bus is integrated in the CPUs. Depending on the system configuration, you can expand the integrated system power supply with up to two additional system power supply modules. If your plant has high power requirements, e.g. I/O load groups, you can connect additional load power supplies.

The table below shows the main differences between the two power supplies for the SIMATIC S7-1500 automation system:

Power supply	Description
Load current supply (PM)	Supplies 24 V DC to the S7-1500 system components such as CPU, system power supply (PS), input/output circuits of the I/O modules and any sensors and actuators. You can install the load power supply directly to the left of the CPU (without connection to the backplane bus). If you supply the voltage for the backplane bus via a system power supply, then the supply of the CPU or the interface module with DC 24 V is optional.
System power supply (PS)	Supplies only internally required system voltage. Supplies parts of the module electronics and the LEDs. Additionally the PS 60W 24/48/60V DC HF keeps the complete work memory of the CPU retentive.

Configuration example of a system with load power supply and system power supply

The following figure shows a system configuration with load power supply and additional system power supply.

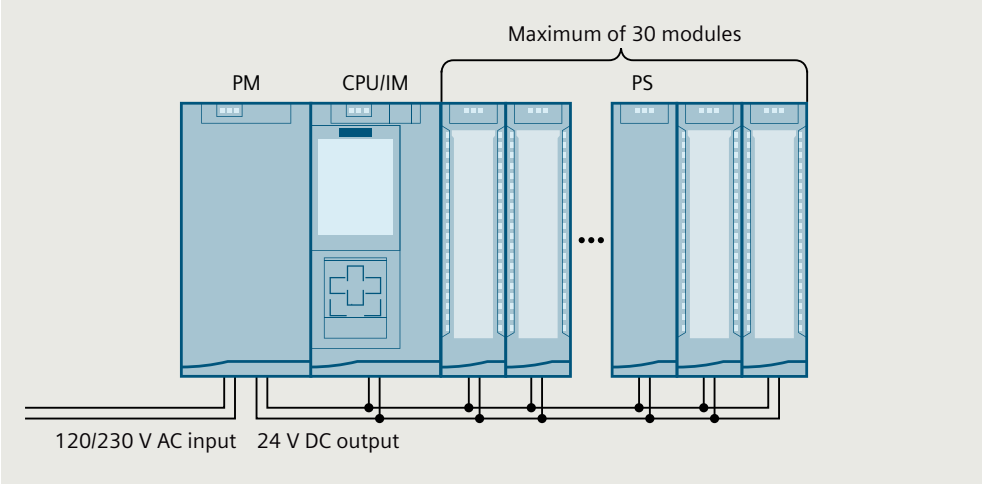

Figure 1-475 Overall configuration of power supply

In order to ensure the supply of the modules from the backplane bus, the incoming power is compared with the required power in the TIA Portal engineering system or in the TIA Selection Tool.

As early as in the planning stages, make sure that the power fed into the backplane bus is always greater than or equivalent to the power drawn.

System power supply modules

System power supplies supply the internal electronics of the S7-1500 modules with power via the backplane bus. The table below shows the available system power supply modules:

Short designation	PS 25 W 24 V DC	PS 60 W 24/48/60 V DC	PS 60 W 24/48/60 V DC HF	PS 60 W 120/230 V AC/DC
Article number	6ES7505-0KA01-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7505-0KA00-0AB0)	6ES7505-0RA00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7505-0RA00-0AB0)	6ES7505-0RB00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7505-0RB00-0AB0)	6ES7507-0RA00-0AB0 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6ES7507-0RA00-0AB0)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/59193552)	↓ (https://support.industry.siemens.com/cs/ww/en/view/59192919)	↓ (https://support.industry.siemens.com/cs/ww/en/view/109746400)	↓ (https://support.industry.siemens.com/cs/ww/en/view/59193004)
Rated input voltage	24 V DC	24 VDC, 48 VDC, 60 VDC	24 VDC, 48 VDC, 60 VDC	120 V AC, 230 V AC 120 V DC, 230 V DC
Output power	25 W	60 W	60 W	60 W
Electrical isolation from the backplane bus	X	X	X	X
Diagnostic interrupt	X	X	X	X
Energy buffering for data backup in the CPU	---	---	Up to 20 MB retentive	---

Load power supply modules

The load power supply modules with automatic range selection of the input voltage are optimally adapted in design and functionality to the SIMATIC S7-1500 controller. The table below shows the available load power supply modules:

Short designation	PM 70 W 120/230 V AC	PM 190 W 120/230 V AC
Article number	6EP1332-4BA00 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6EP1332-4BA00)	6EP1333-4BA00 (https://mall.industry.siemens.com/mall/en/WW/Catalog/Product/6EP1333-4BA00)
Equipment Manual	↓ (https://support.industry.siemens.com/cs/ww/en/view/68036174)	↓ (https://support.industry.siemens.com/cs/ww/en/view/68022506)
Rated input voltage	120/230 V AC, with automatic switchover	120/230 V AC with automatic switchover
Output voltage	24 V DC	24 V DC
Rated output current	3 A	8 A
Power consumption	84 W	213 W

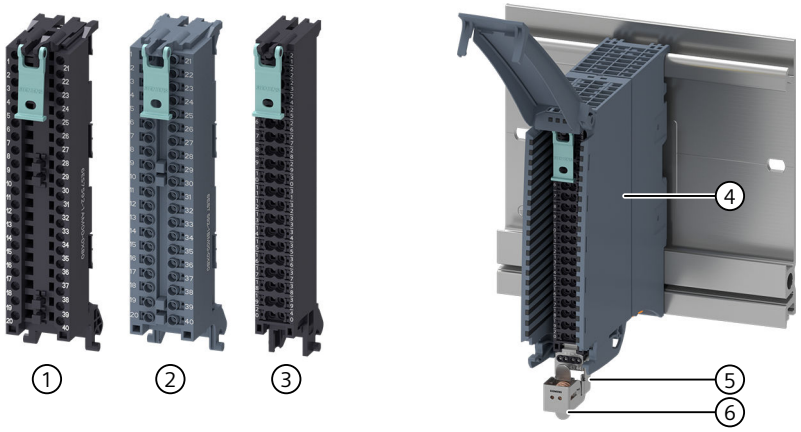
Using a SITOP power supply as an alternative to a load power supply

Alternatively, an external 24 V power supply from the SITOP range (https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10008864) (SITOP smart or SITOP modular) can be used:

- For higher output currents and 1-phase or 3-phase infeed
- With redundant installation (https://support.industry.siemens.com/cs/ww/de/view/109768676/en) of the 24 V power supply as protection against failure of a power supply unit
- With buffering of the 24 V power supply (e.g. with DC UPS) as protection against power failure
- With selective monitoring of 24 V loads as protection against overload or short-circuit

5.10 Connection elements and system cabling

Front connector and shield contact



The front connectors are used to wire the I/O modules. For modules with EMC-critical signals, such as analog modules and technology modules, the front connectors also need a shield contact.

The front connectors are available for 35 mm modules optionally with screw terminals and push-in terminals and for 25 mm modules with push-in terminals. The front connectors for 25 mm modules are included in the scope of delivery of the I/O modules.

24 V DC is supplied, for example, via a plug-in infeed element for analog modules.

The shield contact consists of shield bracket and shield terminal. Together with the shield terminal, the shield bracket allows the low-impedance, module-level connection of cable shields with minimum installation times. The shielding takes place without tools.

The components (infeed element, shielding bracket and shield clamp) are included in the scope of delivery of the modules.

1. Front connector 35 mm with screw terminals
2. Front connector 35 mm with push-in terminals
3. Front connector 25 mm with push-in terminals
4. Front connector
5. Shield bracket
6. Shield clamp

Figure 1-476 Versions of the front connector with and without shield

U connector

The individual modules are connected to one another with the U connector. The U connector establishes the mechanical and electrical connection between the modules. The U connectors are included in the scope of delivery of the I/O modules.

System cabling SIMATIC TOP connect

Figure 1-477 Example: System cabling with SIMATIC TOP connect

For 35 mm modules, the system cabling SIMATIC TOP connect with prefabricated connection elements is available in two versions:

- Fully modular connection consisting of front connector module, connection cables and connection modules for connecting sensors and actuators from the field
- Flexible connection, consisting of front connector with single cores for wiring within the cabinet

You can find more information in the SIMATIC TOP connect for S7-1500 and ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/95924607) manual.

5.11 Software

5.11.1 TIA Portal

The SIMATIC controllers are integrated into the Totally Integrated Automation Portal. Engineering with TIA Portal offers:

- Configuration and programming
- Shared data management
- A uniform operating concept for control, visualization and drives

The TIA Portal simplifies the integrated engineering in all configuration phases of a plant.

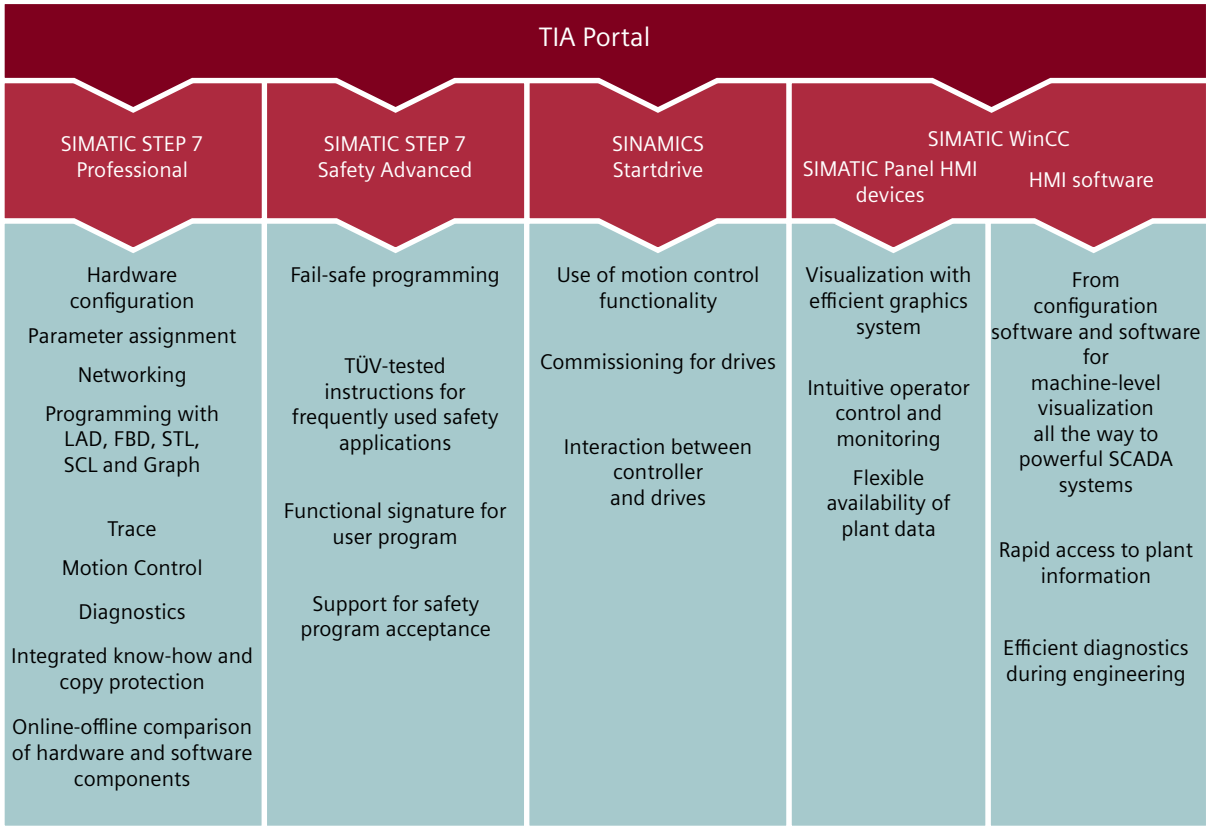


Figure 1-478 TIA Portal overview

5.11.2 TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://new.siemens.com/global/en/products/automation/topic-areas/tia/tia-selection-tool.html).

5.11.3 SIMATIC Automation Tool

You use the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal. The SIMATIC Automation Tool provides you with a multitude of functions:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Downloading of addresses (IP, subnet, gateway) to a device
- Downloading the PROFINET name (station name) to a device
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your PG/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- Performing a CPU memory reset
- Resetting devices to factory settings
- Downloading a firmware update to a device
- Documentation and backup of the configuration in
  - Standard .csv text file
  - Encrypted and password-protected .sat file
- Advanced functions:
  - Up to 10 concurrent connections
  - Scheduler for scheduling device operations at a time and frequency of your choosing
  - Ability to insert multiple devices in a single operation
  - Support for devices behind a NAT router
  - Archiving of SAT projects and related file data
  - Card browser for working with files and folders on SIMATIC Memory Cards in your CPUs

These functions can be executed as bulk operation, that is, simultaneously on various S7 stations and other devices.

The SIMATIC Automation Tool additionally has a Software Development Kit (SDK) version. With the SIMATIC Automation Tool SDK (Software Development Kit), you can create applications based on the SIMATIC Automation Tool API (Application Programming Interface). To deal with a large number of device automation tasks efficiently, these user-specific applications can be distributed to third parties including the API software. You do not need any license keys to use the user-specific applications.

5.11.4 SINETPLAN

SINETPLAN (https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html), the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. Thus, you prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through import and simulation of existing STEP7 projects
- Efficiency through securing existing investment in the long term and optimal exploitation of resources

5.11.5 PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

SIEMENS PRONETA (https://support.industry.siemens.com/cs/ww/en/view/67460624) is available for free on the Internet.

5.11.6 SIMATIC S7 app

With the SIMATIC S7 app (https://www.siemens.com/global/en/products/software/mobile-apps/simatic2go.html), you can establish a secure connection via WLAN to SIMATIC S7-1500 and ET 200SP with, for example, the following functions:

- Detect up to 50 networked CPUs via HTTPS and establish a connection
- Change CPU operating mode (RUN/STOP)
- Read out CPU diagnostics information and send via e-mail
- Monitor and modify variables and tags
- High security through encrypted communication and encrypted profile data; password to start app and establish the connection

Application planning

6

6.1 Hardware configuration

Introduction

The S7-1500 automation system/ET 200MP distributed I/O system consists of a single-row configuration in which all modules are installed on one mounting rail. The modules are connected by means of U connectors, and thus form a self-assembling backplane bus.

You can configure the S7-1500 automation system/ET 200MP distributed I/O system with fail-safe and non-fail-safe modules.

6.1.1 Hardware configuration of the S7-1500 automation system

Maximum configuration

- The integrated system power supply of the CPU supplies 10 W or 12 W (depending on CPU type) to the backplane bus. The power budget calculation determines the exact number of modules (without optional PS) that can be operated with the CPU. The operating principle is described in section Power balance calculation (Page 167).
- A maximum of three system power supplies (PS) is possible. one system power supply (PS) can be inserted to the left of the CPU and two system power supplies (PS) can be inserted to the right of the CPU.
- If you use a system power supply (PS) left next to the CPU, a maximum configuration of 32 modules is possible. The modules occupy slots 0 to 31. If further system power supplies (PS) are required to the right of the CPU, they also occupy a slot.

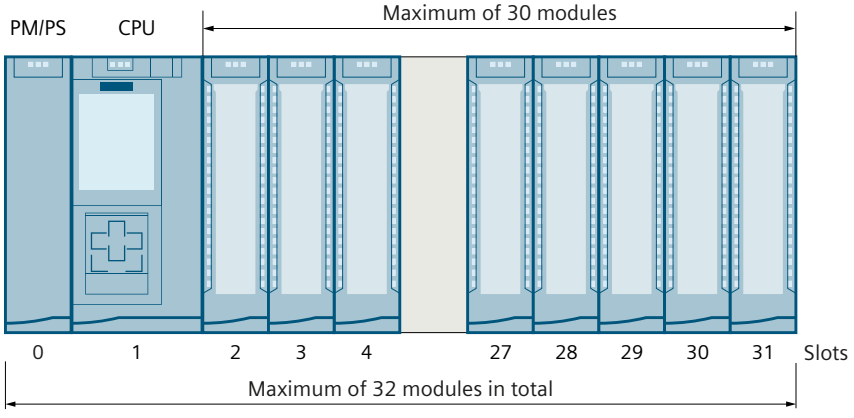

Figure 1-479 S7-1500 maximum configuration

Applicable modules

The following table shows which modules may be used in the various slots:

Table 1-811 Assignment of slot numbers

Module type		Permissible slots	Maximum number of modules
Load current supply (PM)*		0**	Unlimited / only 1 PM can be configured in STEP 7
System power supply (PS)		0; 2 - 31	3
PS 60W 24/48/60VDC HF system power supply		0	1***
CPU		1	1
Analog and digital I/O modules		2 - 31	30
Communication modules			
• Point-to-point		2 - 31	30
• PROFINET/Ethernet, PROFIBUS			
	When using a CPU 1511-1(F) PN, CPU 1511C-1 PN, CPU 1511T(F)-1 PN	2 - 31	4
	When using a CPU 1512C-1 PN	2 - 31	6
	When using a CPU 1513(F)-1 PN	2 - 31	6
	When using a CPU 1515(F)-2 PN, CPU 1515T(F)-2 PN	2 - 31	6
	When using a CPU 1516(F)-3 PN/DP, CPU 1516T(F)-3 PN/DP, CPU 1516T(F)-3 PN	2 - 31	8
	When using a CPU 1517(F)-3 PN/DP, CPU 1517(F)-3 PN, CPU 1517T(F)-3 PN/DP, CPU 1517T(F)-3 PN	2 - 31	8
	When using a CPU 1518(F)-4 PN/DP, CPU 1518T(F)-4 PN/DP, CPU 1518(F)-4 PN/DP MFP, CPU 1518(F)-3 PN, CPU 1518T(F)-3 PN	2 - 31	8
Technology modules		2 - 31	30

* No connection to the backplane bus.

** When slot 0 is occupied by a load current supply (PM) in STEP 7, this slot can no longer be used for a system power supply (PS) in STEP 7. You do not have to configure a load current supply (PM) in STEP 7.

When you occupy slot "0" with the system power supply (PS), you can plug in a load current supply (PM) in the TIA Portal to the left of the PS in slot 100.

***The PS 60W 24/48/60VDC HF must only be inserted to the left of the CPU. Use a different system power supply (PS) for other power segments in the configuration to the right of the CPU.

6.1.2 Hardware configuration of the ET 200MP distributed I/O system with PROFINET interface module

Maximum configuration

- The integrated system power supply of the interface module feeds 14 W into the backplane bus. The power budget calculation determines the exact number of I/O modules that can be operated with the interface module (without optional PS). The operating principle is described in section Power balance calculation (Page 167).
- You use the integrated power supply for the IM 155-5 PN BA interface module. No 'additional system power supplies (PS) must be used. You can insert a maximum of 12 modules to the right of an interface module.

- The interface modules IM 155-5 MF HF and IM 155-5 PN HF also support the configuration with an active backplane bus. You can find information on the active backplane bus (e.g. installing, configuring, technical specifications) in the Active backplane bus (https://support.industry.siemens.com/cs/us/en/view/109778694) Equipment Manual.
- The following applies to the interface modules IM 155-5 PN ST and IM 155-5 PN HF: A maximum of three system power supplies (PS) is possible. You can insert one system power supply (PS) to the left of the interface module and two system power supplies (PS) to the right of the interface module.
  If you insert a system power supply (PS) to the left of the interface module, this yields a possible maximum configuration of a total of 32 modules (up to 30 modules to the right of the interface module). If further system power supplies (PS) are required to the right of the interface module, they also occupy a slot.

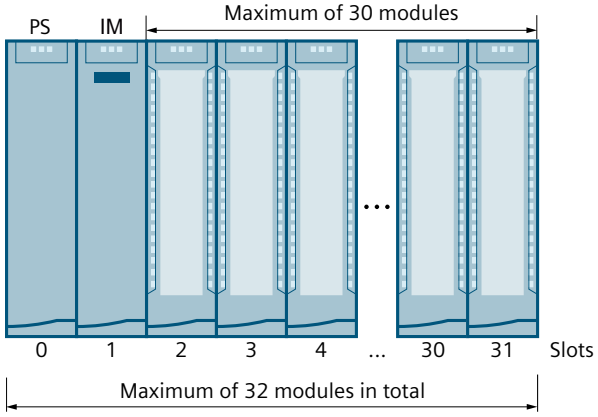

Figure 1-480 Maximum configuration ET 200MP with IM 155-5 PN ST or IM 155-5 PN HF

Applicable modules

The following table shows which modules may be used in the various slots:

Table 1-812 Assignment of slot numbers

Module type	Permissible slots IM 155-5 PN BA	Permissible slots IM 155-5 PN ST, IM 155-5 PN HF	Maximum number of modules
Load current supply (PM)*	-	0**	Unlimited / only 1 PM can be configured in STEP 7
System power supply (PS)	-	0; 2 - 31	3
PS 60W 24/48/60VDC HF system power supply	-	0	1***
Interface module	1	1	1
Analog and digital I/O modules	2 - 13	2 - 31	12 or 30
Communication modules			
• Point-to-point	2 - 13	2 - 31	12 or 30
Technology modules	2 - 13	2 - 31	12 or 30

* No connection to the backplane bus.

** When slot 0 is occupied by a load current supply (PM) in STEP 7, this slot can no longer be used for a system power supply (PS) in STEP 7. You do not have to configure a load current supply (PM) in STEP 7.

***The PS 60W 24/48/60VDC HF must only be inserted to the left of the interface module. Use a different system power supply (PS) for other power segments in the configuration to the right of the interface module.

6.1.3 Hardware configuration of the ET 200MP distributed I/O system with PROFIBUS interface module

Maximum configuration

The integrated system power supply of the interface module feeds 14 W into the backplane bus. You can insert a maximum of 12 modules to the right of an interface module. The power budget calculation determines the exact number of I/O modules that can be operated with the interface module. The operating principle is described in section Power balance calculation (Page 167).

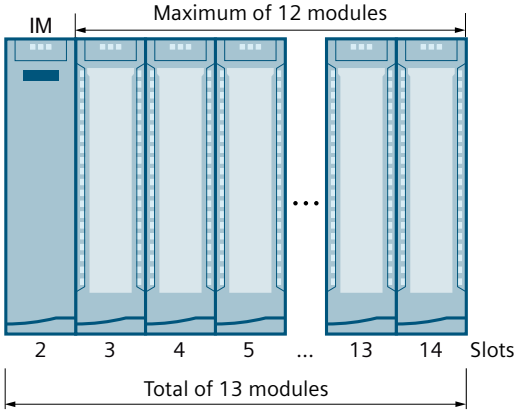

Figure 1-481 Maximum configuration ET 200MP with IM 155-5 DP

Applicable modules

The following table shows which modules may be used in the various slots:

Table 1-813 Assignment of slot numbers

Module type	Permissible slots	Maximum number of modules
Interface module	2	1
Analog and digital I/O modules	3 - 14	12
Communications modules		
Point-to-point	3 - 14	12
Technology modules	3 - 14	12

6.2 System and load power supply

Types of power supplies

The S7-1500 automation system/ET 200MP distributed I/O system distinguishes between two types of power supply:

- System power supply (PS)
- Load current supply (PM)

System power supply (PS)

The system power supply has a connection to the backplane bus (U connector) and supplies solely the internally required system voltage. This system voltage supplies parts of the module electronics and the LEDs. A system power supply can also supply CPUs or interface modules if these are not connected to a 24 VDC load current supply.

Load current supply (PM)

The load current supply feeds the input/output circuits of the modules, as well as the sensors and actuators of the plant, if installed. If you supply the voltage for the backplane bus via a system power supply, then the supply of the CPU/interface module with 24 V DC is optional.

Special characteristic of the load current supply

Load current supplies are mounted on the "S7-1500 mounting rail" and do not have a connection to the backplane bus.

Total configuration with power supplies

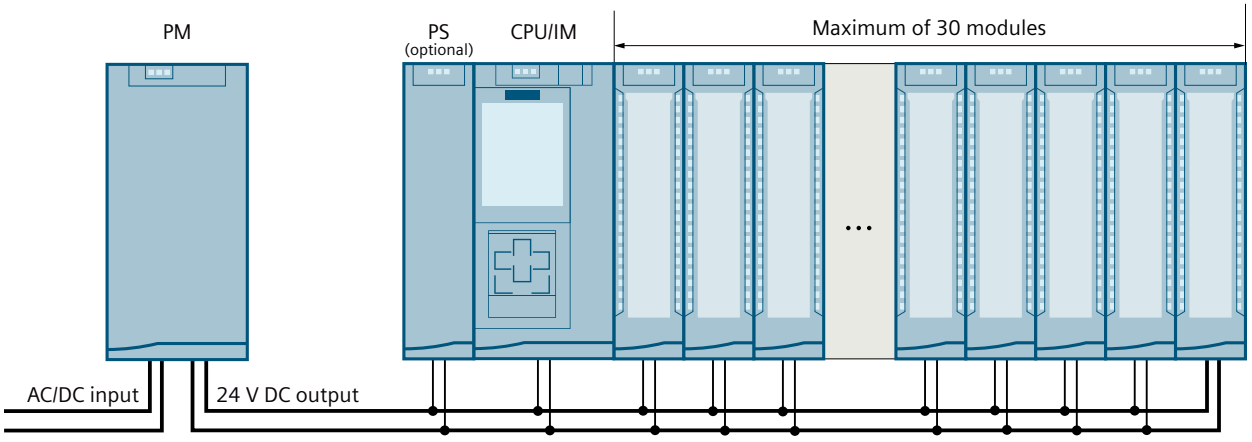

Figure 1-482 Total configuration with load current supply (PM) and system power supply (PS)

Optionally, you can insert up to two system power supplies (PS) in the slots to the right of the CPU/interface module.

The number of load current supplies is unlimited.

Observe the installation rules and specified installation distances in the manuals of the load current supplies.

System power supplies

- PS 25W 24VDC: Supply voltage with 24 V DC and infeed power to the backplane bus of 25 W
- PS 60W 24/48/60VDC: Supply voltage with 24/48/60 V DC and infeed power to the backplane bus of 60 W

- PS 60W 24/48/60VDC HF:
  - Supply voltage with 24/48/60 V DC and infeed power to the backplane bus of 60 W
  - Extended retentive memory for CPUs as of FW V2.1.0 (see section Special requirements when using a system power supply PS 60W 24/48/60VDC HF (Page 164)).
- PS 60W 120/230V AC/DC: Supply voltage with 120/230 V AC and infeed power to the backplane bus of 60 W

Load current supplies

The load current supplies listed below have been technically adapted especially to the S7-1500 automation system/ET 200MP distributed I/O system. Use of the listed load current supplies is not imperative because you can use a SITOP module, for example, as an alternative.

- PM 70W 120/230VAC: Supply voltage with 120/230 V AC
- PM 190W 120/230VAC: Supply voltage with 120/230 V AC

Also note the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/96998532) in connection with load current supply units.

6.2.1 Use of system power supplies

Introduction

You can use system power supplies with the CPUs and the interface modules IM 155-5 PN ST and IM 155-5 PN HF.

If the power fed from the CPU/interface module into the backplane bus is not sufficient to supply all connected modules with power, system power supplies (PS) are required.

Whether or not you need a system power supply depends on the power consumption of the modules used. The power supplied by the CPU/interface module and the system power supplies must be greater than the power required by the I/O modules.

During configuration, STEP 7 compares the supplied power and the power required by the modules. If the required power is too high, you receive a corresponding message from STEP 7.

In addition, the system power supply PS 60W 24/48/60V DC HF buffers the power in the event of power failures and therefore enables the retentivity of the data of a CPU – without a battery and therefore maintenance-free.

Slots for system power supplies

The following slots may be used for system power supplies:

- A system power supply in slot 0 to the left of the CPU/interface module
- Up to 2 system power supplies in the slots to the right of the CPU/interface module (power segments) A power segment consists of a power supply module and the modules supplied by it.

NOTE

The system power supply PS 60W 24/48/60V DC HF can only be inserted in slot 0.

Power segment

The following applies for the CPUs and interface modules M 155-5 PN ST and IM 155-5 PN HF: If you are using system power supplies to the right of the CPU/interface module, divide the configuration into power segments.

Configuration variant with power segments

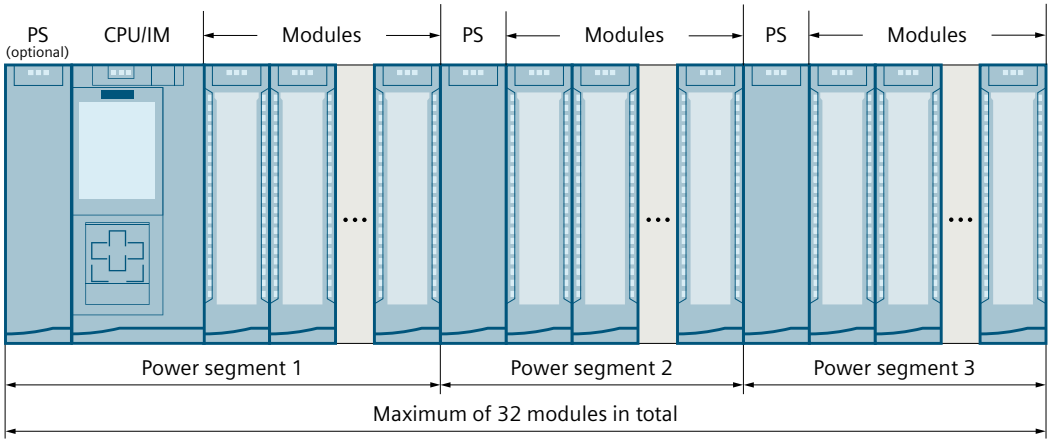

Figure 1-483 Configuration variants with 3 power segments

NOTE

When you configure with STEP 7, STEP 7 automatically checks configuration for consistency and tells you from which module you must open a new power segment.

Overload in the power segment

If an overload occurs in a power segment, the red SF LED flashes on the system power supply (PS). All I/O modules to the right of the PS in the power segment will be switched off.

Remedy:

1. Correct the configuration in the power segment of the overloaded PS.
2. Switch the supply voltage power off and on again via the on-off switch on the PS.
3. Switch the CPU from STOP to RUN mode.

Reference

Information about the required power is available in the section Power balance calculation (Page 167).

Additional information on the performance values (power feed, power consumption) of the CPU, interface module, system power supply, and I/O modules can be found in the manuals (https://support.automation.siemens.com/WW/view/en/57251228) of the respective modules.

6.2.2 Special considerations for the use of a system power supply in the first power segment

Infeed options

There are three options for the infeed of the required system voltage in the backplane bus:

- Infeed via CPU/interface module
- Infeed via CPU/interface module and system power supply
- Infeed only via system power supply in slot 0

Infeed via CPU/interface module

Infeed via the CPU/interface module generally suffices for small and medium hardware configurations. The power consumption of the connected modules must not exceed the power supplied by the CPU/interface module.

In this configuration variant, supply the CPU/interface module with 24 V DC from a load current supply.

Procedure

To set up the supply by means of the CPU/interface module, follow these steps:

1. Open the "Properties" tab of the CPU/interface module in STEP 7 and select the "System power supply" in the navigation.
2. Select the option "Connection to supply voltage L+".

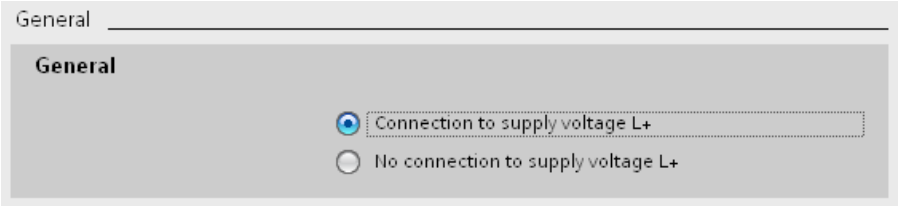

Figure 1-484 Supply voltage via CPU/interface module only

Infeed via CPU/interface module and system power supply

For larger hardware configurations, infeed into the backplane bus by the CPU/interface module alone no longer suffices. If the modules consume more power in total than the power supplied by the CPU/interface module, you must insert an additional system power supply.

Supply the system power supply with the permissible supply voltage and the CPU/interface module with 24 V DC.

Both the system power supply and the CPU/interface module feed current into the backplane bus. The supplied power is summed.

Power addition: "Infeed power of the system power supply" + "Infeed power of the CPU/interface module"

Procedure

To set up the supply by means of the CPU/interface module and system power supply, follow these steps:

1. Open the "Properties" tab of the CPU/interface module in STEP 7 and select the "System power supply" in the navigation.
2. Select the option "Connection to supply voltage L+".

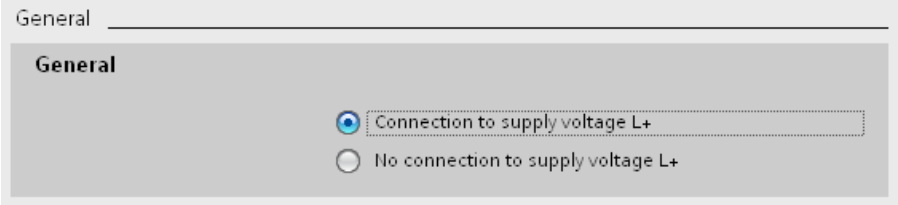

Figure 1-485 Supply voltage via the CPU/interface module and system power supply

Infeed via system power supply only

As a further possibility you can supply the required power to the backplane bus using only a system power supply (in slot 0). In this case, the CPU/interface module is not supplied with 24 V DC, and draws its supply from the backplane bus. The system power supply must be inserted to the left of the CPU/interface module for this.

In general, you can use system power supplies with AC or DC infeed for the configuration.

If no supply voltage with 24 V DC is present (and e.g. only CMs/CPs are inserted next to the CPU), you can use a system power supply with 230 V AC because the CMs/CPs are supplied via the backplane bus.

Procedure

To set up infeed only via the system power supply, follow these steps:

1. Open the "Properties" tab of the CPU/interface module in STEP 7 and select the "System power supply" in the navigation.
2. Select the option "No connection to supply voltage L+".

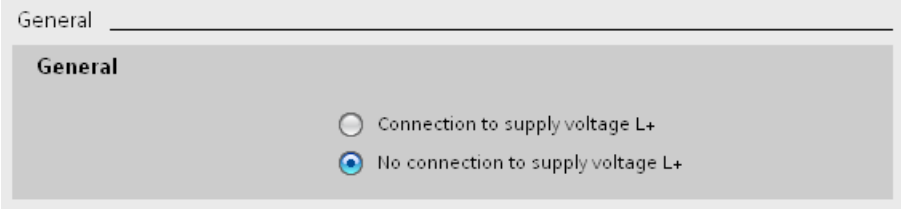

Figure 1-486 No infeed into the backplane bus by means of the CPU/interface module

6.2.3 Special requirements when using the power supply PS 60W 24/48/60VDC HF

S7-1500 - Extended retentive memory for CPUs as of FW V2.1.0

When you use the PS 60W 24/48/60VDC HF system power supply, the entire data area can be used as retentive memory for CPUs as of firmware version V2.1.0 and higher.

The PS 60W 24/48/60VDC HF supplies enough energy in case of a POWER OFF that the CPU can save the entire data area retentively.

Requirements

- STEP 7 V14 SP1 or higher
- PS 60W 24/48/60VDC HF system power supply
- CPU with firmware version as of V2.1.0, see table below

Applicable CPUs

The size of the retentive memory depends on the size of the work memory for data of the CPU used. The table below shows the applicable CPUs with the required hardware function versions.

CPU with firmware version V2.1.0 or higher	Hardware function version	Article number	Max. retentive memory
CPU 1511-1 PN	FS01 or higher	6ES7511-1AK01-0AB0 6ES7511-1AK02-0AB0	1 MB
		6ES7511-1AL03-0AB0	1.5 MB
CPU 1511F-1 PN	FS01 or higher	6ES7511-1FK01-0AB0 6ES7511-1FK02-0AB0	1 MB
		6ES7511-1FL03-0AB0	1.5 MB
CPU 1511T-1 PN	FS01 or higher	6ES7511-1TK01-0AB0	1 MB
		6ES7511-1TL03-0AB0	1.5 MB
CPU 1511TF-1 PN	FS01 or higher	6ES7511-1UK01-0AB0	1 MB
		6ES7511-1UL03-0AB0	1.5 MB

Connection, structure and configuration of an S7-1500 with PS 60W 24/48/60VDC HF

- You must insert the system power supply PS 60W 24/48/60VDC HF in slot 0.

Figure 1-487 Slot PS 60W 24/48/60VDC HF

- If you are using the PS 60W 24/48/60VDC HF, the 24 V supply of the CPU is not taken into account in the power budget calculation.

NOTE
You may only connect the 24 V DC supply voltage directly to the system power supply and not to the CPU.

You must set the "System power supply" parameter to the option "No connection to supply voltage L+" during configuration of the CPU. STEP 7 checks the setting when compiling the configuration.

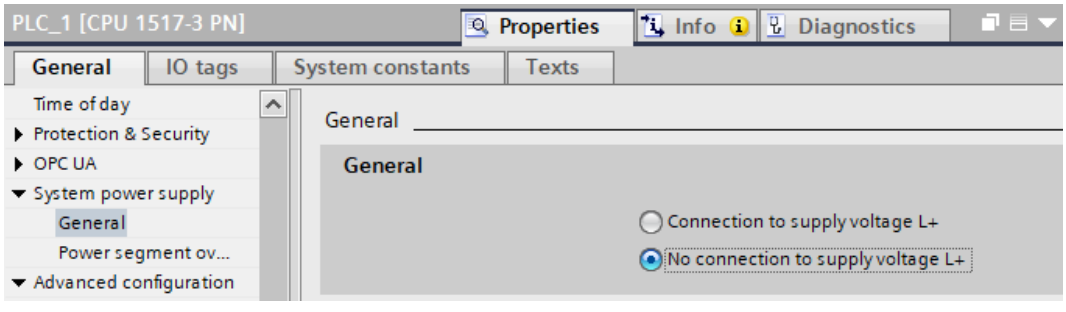

Figure 1-488 Connecting PS 60W 24/48/60VDC HF

- The parameter "Startup > Comparison preset to actual module" must be set to the value "Startup CPU only if compatible" during configuration of the PS 60W 24/48/60VDC HF. Reason: The retentivity of the entire CPU work memory (data) is only guaranteed when the PS 60W 24/48/60VDC HF is inserted.

  When you insert the PS 60W 24/48/60VDC HF, STEP 7 automatically sets the parameter.

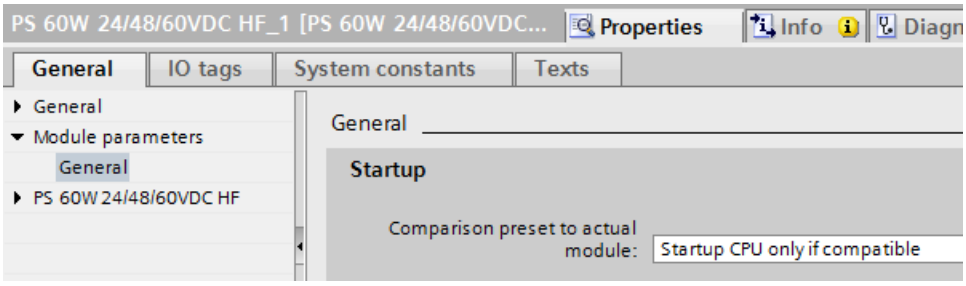

Figure 1-489 Startup of PS 60W 24/48/60VDC HF

NOTE

Other power segments in the configuration

The PS 60W 24/48/60VDC HF must only be inserted to the left of the CPU / interface module. Use a different system power supply (PS) for other power segments in the configuration to the right of the CPU / interface module.

Missing diagnostics for the PS 60W 24/48/60VDC HF

In case of POWER OFF, saving the extended retentive data is most important. The CPU as of FW V2.1.0 and higher does **no longer** output the following diagnostics of the PS 60W 24/48/60VDC HF:

- Supply voltage fault
- Switch position Off

6.3 Power balance calculation

Principle of power balance calculation

In order to ensure the supply of the modules from the backplane bus, the power balance calculation compares the infed power with the required power for the modules. The supplied power of all system power supplies including the CPU/interface module must be greater than or equal to the power taken from the modules.

In order to operate the configuration with its used modules, the power balance must be positive for each power segment in use.

This means that the power fed into the power segment is greater than the power consumed by the modules.

Take care even during planning, that the power fed into the backplane bus is always greater than or equal to the power drawn. The TIA Selection Tool (https://new.siemens.com/global/en/products/automation/topic-areas/tia/tia-selection-tool.html) aids you during planning.

The power fed into the backplane bus by the CPU/interface module and system power supply is listed in the technical specifications of the CPU/interface module in the corresponding manuals.

The power consumed from the backplane bus by an I/O module or the CPU/interface module can be found in the technical specifications in the corresponding manuals.

The power balance calculation is performed:

- When configuring with STEP 7
- During operation by the CPU

Power balance calculation when configuring with STEP 7

STEP 7 checks compliance with the power balance during the configuration.

Proceed as follows to evaluate the power balance calculation:

1. Perform the configuration of the S7-1500/ET 200MP with all the required modules.
2. In the network view, select the CPU/interface module or the system power supply.
3. Open the "Properties" tab in the inspector window.
4. Select the "System power supply" entry in the area navigation.
5. Check the "Power segment overview" table, so see whether the power balance is positive. If the power balance is negative, STEP 7 marks the underpowered modules in red.

Power segment overview

	Module	Slot	Power consumption
	PS 25W 24VDC_1	0	25.00W
	PLC_1	1	12.00W
	DI 32x24VDC HF_1	2	-1.10W
	DQ 8x230VAC/5A ST_1	3	-0.80W
	AI 8xU/I/RTD/TC ST_1	4	-0.70W
	AQ 4xU/I ST_1	5	-0.60W
		Summary	33.80W

Figure 1-490 Example of a power balance calculation with STEP 7

Power balance calculation check for overload by the CPU/interface module

The CPU / the interface module monitors compliance with a positive power balance:

- At every POWER ON
- At every change of the installed hardware

Causes for overload

An overload can still occur despite a positive power balance during planning. The cause for overload can be a hardware configuration that does not correspond to the configuration in STEP 7, for example:

- More I/O modules inserted in the actual configuration than in the STEP 7 project.
- A supply voltage L+ (24 V DC) that is necessary for operation is not connected when system voltage infeed via the CPU/interface module is specified during parameter assignment (see section Special considerations for the use of a system power supply in the first power segment (Page 162)).
- A system power supply that is necessary for operation is not inserted.
- A system power supply that is necessary for operation is not switched on (power connection plug or on/off switch).
- A system power supply that is necessary for operation has no U connector inserted.

Response of the CPU to negative power balance or failure of system power supplies

As soon as the CPU detects a negative power balance/overload, the following actions are executed:

- The CPU stores the retentive data.
- The CPU enters the event in the diagnostics buffer.
- The CPU carries out a restart and repeats this until the cause of the negative power balance is resolved.

Response of the interface module to negative power balance or failure of system power supplies

As a result of the overload, the interface module switches off all power segments. The I/O controller or DP master can no longer access the I/O modules. The interface module provides diagnostic information and periodically checks the connection to the backplane bus and re-establishes the connection.

Exception: In the case of a voltage drop or a hardware fault in power segment 2 or 3, the corresponding system power supply module switches off its power segment (and possibly the following segments), and generates a diagnostic alarm, if possible.

More information on the behavior of the system power supply (PS) in the event of a fault can be found in the manuals for the system power supplies.

6.4 Use of load power supplies

Introduction

The load current supply (PM) supplies the system power (PS), central modules (CPU), interface module and input and output circuits of the I/O modules with DC 24 V.

Load current supplies can be mounted on the mounting rail but do not have a connection to the backplane bus.

Observe the installation rules and specified installation distances in the manuals of the load current supplies.

Use of multiple load current supplies

Several load current supplies (PM) can be used as follows for higher output currents:

Every load current supply feeds independent 24 V DC load lines.

Alternatively you can use an external 24 V power supply, e.g. from the SITOP line.

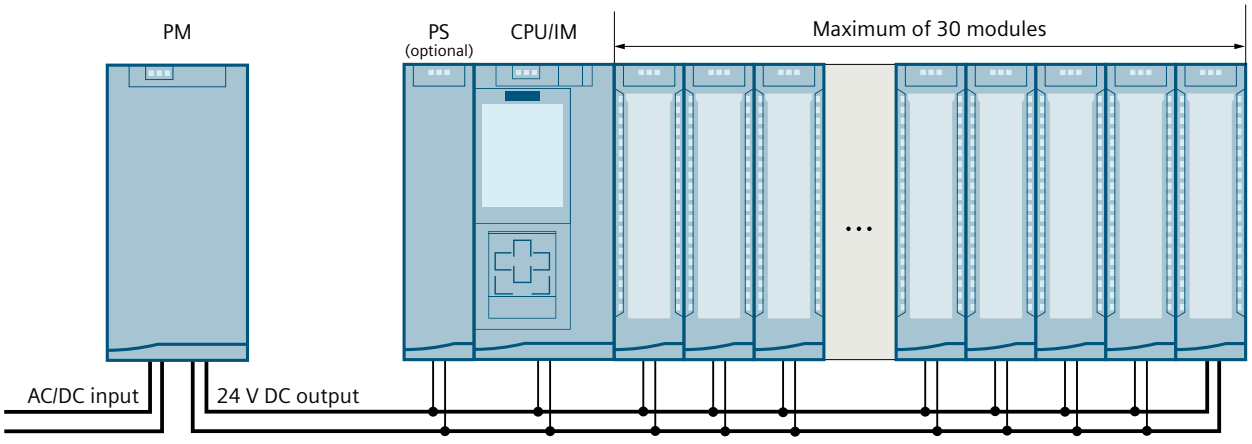

Figure 1-491 Supply of the modules from 24 V DC load current suppl

NOTE

Alternative 24 V supply of the modules from the control cabinet

If safe electrical separation (SELV/PELV according to IEC 61131-2 and IEC 61010-2-201) is guaranteed, you can alternatively supply the modules with 24 V DC from the control cabinet.

Reference

More information on load current supplies can be found on the Internet (https://mall.industry.siemens.com) in the online catalog and in the online ordering system.

Installation 7

7.1 Basics

Introduction

All modules of the S7-1500 automation system/ET 200MP distributed I/O system are open equipment. This means that you may only install this system in housings, cabinets or electrical operating rooms that are located indoors. The housings, cabinets and electrical operating rooms must guarantee protection against electric shock and spread of fire. The requirements for mechanical strength must also be met. The housings, cabinets, and electrical operating rooms must not be accessible without a key or tool. Personnel with access must have been trained or authorized.

Installation position

The S7-1500 automation system / ET 200MP distributed I/O system is designed for the following mounting positions:

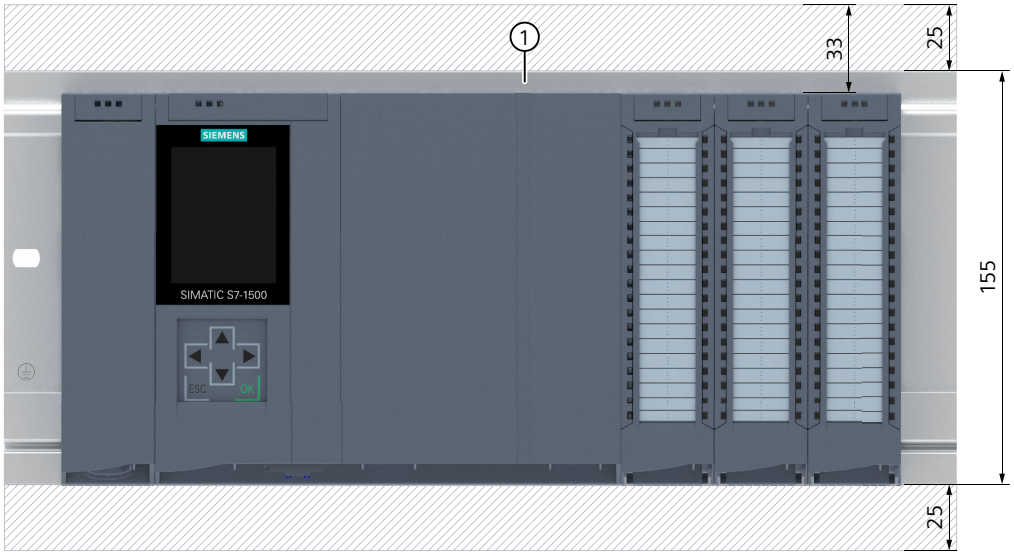
- Horizontal mounting position for ambient temperatures up to 60 °C
- Vertical mounting position (CPU is down) for ambient temperatures up to 40 °C

More information can be found in chapter Mechanical and climatic ambient conditions (Page 395).

Mounting rail

You can mount the following components on the mounting rails alongside the S7-1500/ET 200MP modules:

- Modules from the S7-1200 and ET 200SP range
- Terminals
- Circuit breakers
- Small contactors
- Similar components



These components can influence the installation dimensions for the cable duct.

Modules can be mounted right to the outer edge of the mounting rail.

The mounting rails are available in various lengths. You order the mounting rails using the online catalog or the online ordering system. You can find the available lengths and article numbers in the section Accessories/spare parts (Page 406).

Minimum clearances

The modules can be mounted to the outer edge of the mounting rail. Maintain the following minimum clearances at the top and bottom when installing or removing the S7-1500 automation system / ET 200MP distributed I/O system:

① Upper edge of the mounting rail

Figure 1-492 Minimum clearances in the control cabinet

Installation rules

- The installation starts on the left with a CPU/interface module or a system power supply/load current supply.
- You connect the modules to each other with U connectors.
- Note that no U connector protrudes from the first and last module.

NOTE

Only remove and insert modules when the power to the system is switched off.

⚠ WARNING

Protection from conductive contamination

Protect the devices against conductive contamination. At the same time, note the ambient conditions.

Protection from conductive contamination can, for example, be achieved by installing the devices in a control cabinet with the appropriate degree of protection.

7.2 Installing the mounting rail

Lengths and drill holes

The mounting rails are delivered in six lengths:

- 160 mm
- 245 mm
- 482.6 mm (19 inches)
- 530 mm
- 830 mm
- 2 000 mm

You can find the article numbers in the appendix Accessories/spare parts (Page 406).

The mounting rails (from 160 to 830 mm) come with two drill holes for fixing screws. A set of screws for grounding the mounting rail is provided.

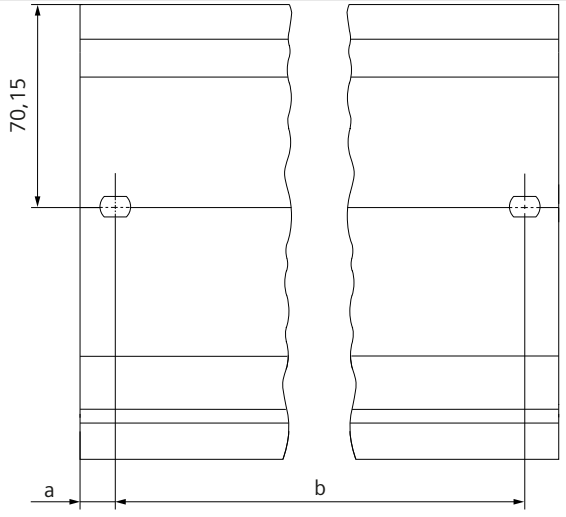
The 2 000 mm mounting rail is designed for assemblies with special lengths and does not have holes for fixing screws. No set of screws for grounding is enclosed with the mounting rail (can be ordered as Accessories/spare parts (Page 406)).

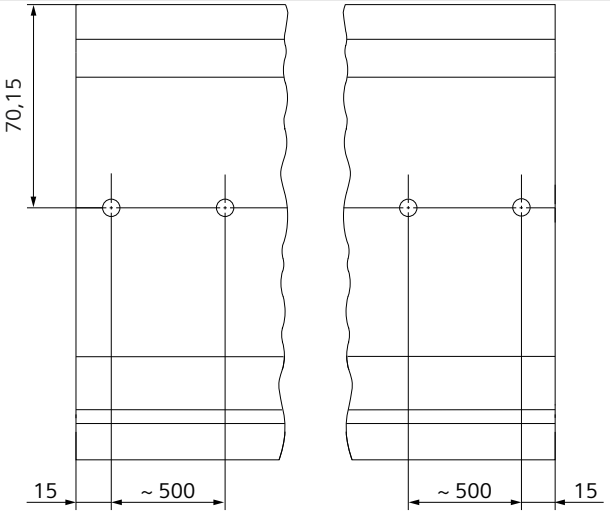
The specifications of the maximum offsets between two drill holes can be found in the table, "Dimensions for the drill holes".

Tools required

- Commercially available hacksaw
- Drill ∅ 6.5 mm
- Screwdriver
- Size 10 adjustable screw-wrench or socket wrench for grounding cable connection
- Adjustable screw-wrench, matching the selected fixing screws
- Stripping tool and crimp tool for the grounding cable

Required accessories





Use the following screw types for fastening the mounting rails:

Table 1-814 Required accessories

For ...	you can use ...	Explanation
• Outer fixing screws • Additional fixing screws (for mounting rails > 482.6 mm)	M6 socket cap screw	Choose a suitable screw length for your assembly. You also need washers for cylinder head screws with an internal diameter of 6.4 mm and an external diameter of 11 mm.
	M6 hex screw	

Dimensions for the drill holes

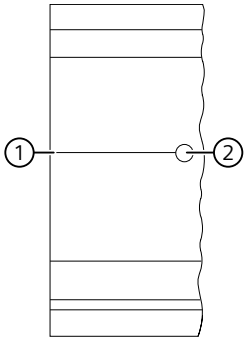
Table 1-815 Dimensions for the drill holes

"Standard" mounting rails	"Longer" mounting rails
	

Length of the mounting rail	Distance a	Distance b
160 mm	10 mm	140 mm
245 mm	10 mm	225 mm
482.6 mm	8.3 mm	466 mm
530 mm	15 mm	500 mm
830 mm	15 mm	800 mm

Additional fixing screws (for mounting rails > 530 mm)

For mounting rails longer than 530 mm, we recommend using additional fixing screws at intervals of >482 mm on the identification groove.



Preparing the 2 000 mm mounting rail for installation

To prepare the 2 000 mm mounting rail for installation, proceed as follows:

1. Cut the 2 000 mm mounting rail to the required length.
2. Mark the holes. The necessary dimensions can be found in the table "Dimensions for the drill holes":
   - Two drill holes at the beginning and end of the mounting rail
   - Additional drill holes at equal intervals of 500 mm maximum, along the identification groove
3. Drill the marked holes according to the selected type of fastening.
4. Ensure that there are no burrs or shavings on the mounting rail.

NOTE

To ensure secure installation of the modules, make sure you position the drill holes centered on the identification groove and only use screws of the maximum size.

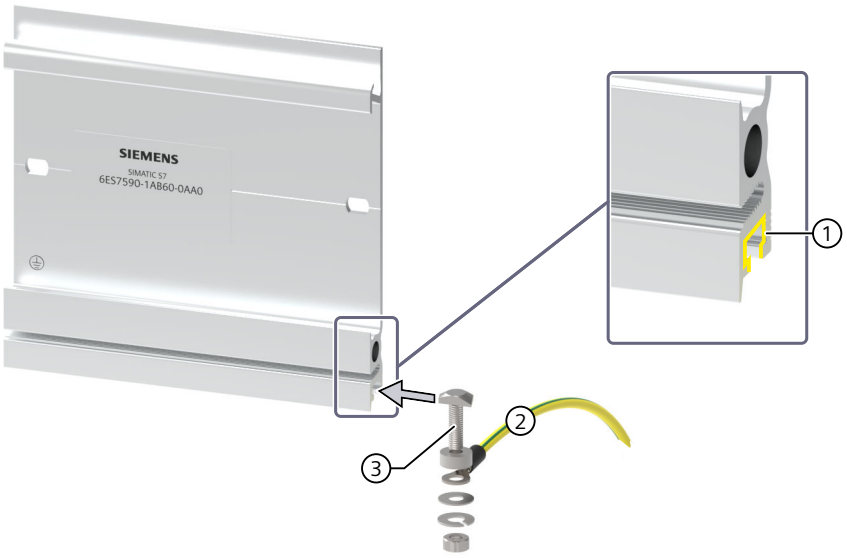
① Identification groove for additional drill holes
② Additional drill hole

Figure 1-493 Preparing the 2 000 mm mounting rail for installation

Installing the mounting rail

Place the mounting rail such that sufficient space remains for installation of and heat dissipation from the modules. Note the figure Minimum clearances in the control cabinet.

Screw the rail onto the mounting surface.



Attaching the protective conductor

The S7-1500 automation system/ ET 200MP distributed I/O system has to be connected to the protective conductor system of the electrical system to ensure electrical safety.

Proceed as follows to connect the protective conductor:

1. Strip the ground conductor with a minimum diameter of 10 mm^2. Attach a ring cable lug for M6 bolts with the crimping pliers.
2. Slide the enclosed bolt into the T profile groove.
3. Insert the spacer, ring terminal with the grounding connector, flat washer, and lock washer onto the bolt (in that order). Thread on the hexagon nut. Fasten the components in place with the nut (tightening torque 4 Nm).

4. Connect the opposite end of the grounding cable to the central grounding point/protective conductor busbar (PE).

① T-profile groove
② Protective conductor (PE)
③ PE connection element for mounting rail

Figure 1-494 Attaching the protective conductor (protective earth)

NOTE

Alternative grounding of the mounting rail

Grounding with the grounding screw is not required if the following requirements are met: The mounting rails must be permanently connected to the protective circuit using an equivalent fitting that complies with the applicable standards, for example by permanent attachment to a grounded control cabinet wall.

Note

You can find more information on the exact dimensions of the mounting rails in the appendix Dimension drawings of the mounting rails (Page 399).

7.3 Installing the standard rail adapter

Introduction

The DIN rail adapter allows you to mount the SIMATIC S7-1500/ET 200MP automation system on the standard 35 mm mounting rails.

You order the DIN rail adapter as separate accessories.

NOTE

Note the following reduced technical specifications regarding mechanical load when you install the S7-1500/ET 200MP modules on the 35 mm DIN rail using the DIN rail adapter:

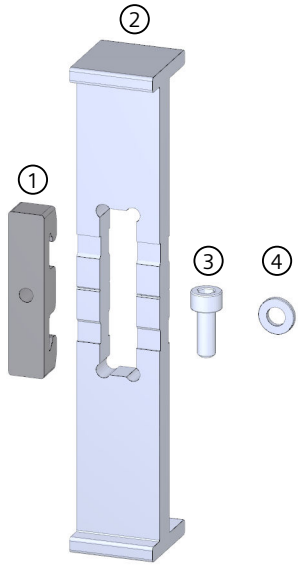
Vibration test acc. to IEC 60068-2-6 (sinusoidal)

- 5 Hz ≤ f ≤ 8.4 Hz, constant amplitude **3.5 mm**
- 8.4 Hz ≤ f ≤ 150 Hz, constant acceleration **1 g**

Duration of vibration: 10 frequency sweeps per axis in each of three perpendicular axes

Shock, tested according to IEC 60068-2-27

- Type of shock: Half-sine
- Shock intensity: **150 m/s**^{2} peak value, **11 ms** duration
- Direction of shock: **3** shocks each in (+/-) direction, along each of the 3 mutually perpendicular axes

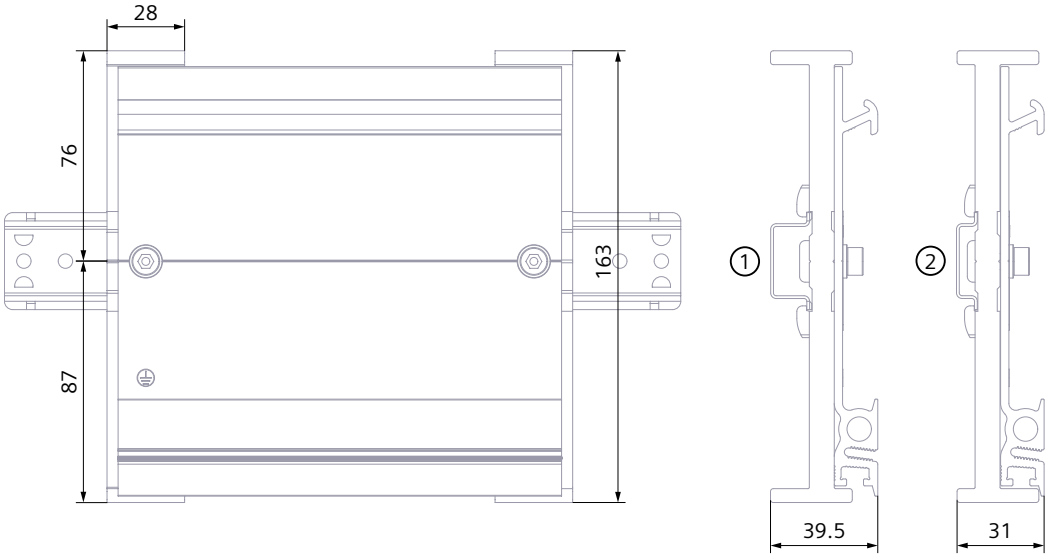


Article number

6ES7590-6AA00-0AA0

The scope of delivery consists of ten adapters, ten hexagon socket-head screws and ten washers.

View



The DIN rail adapter consists of a clamp, an adapter frame and a hexagon socket-head screw with washer.

① Clamp
② Adapter frame
③ Hexagon socket-head screw
④ Washer

Figure 1-495 Parts of the DIN rail adapter

Dimensional drawing

① Position of the adapter frame during mounting to the standard DIN rail 35 mm x 7.5 mm
② Position of the adapter frame during mounting to the standard DIN rail 35 mm x 15 mm

Figure 1-496 Dimensional drawing

Tools required

Wrench matching the hexagon socket head cap screw M6 according to EN ISO 4762 (DIN 912).

Properties

- The DIN rail adapter makes it possible to mount the S7-1500/ET 200MP mounting rail on standard 35 mm DIN rails.
- The DIN rail adapter allows the use of prefabricated control cabinet and terminal box systems.
- The total length of the S7-1500/ET 200MP mounting rail can be used again completely as before.
- To ensure optimal stability, the clearance between the two DIN rail adapters must be no more than 250 mm or less.

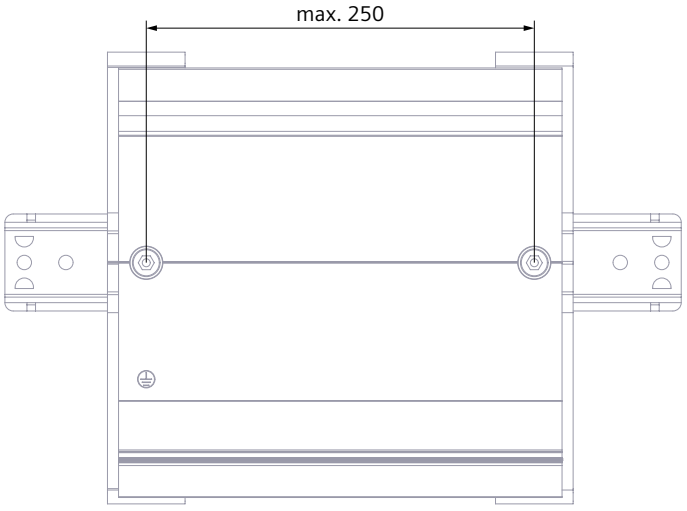


Figure 1-497 Distance between two DIN rail adapters

NOTE

Note that, depending on the mounting rail width, the mounting rail adapter can protrude up to 4 mm on each side due to the drill holes.
You can find an overview of the protrusion dimensions for the various DIN rails in the table below.

Table 1-816 Additional lateral space required

Mounting rail	Article number	Additional space required with adapter
• 160.0 mm (with drill holes)	6ES7590-1AB60-0AA0	4 mm
• 245.0 mm (with drill holes)	6ES7590-1AC40-0AA0	4 mm
• 482.6 mm (with drill holes)	6ES7590-1AE80-0AA0	8 mm
• 530.0 mm	6ES7590-1AF30-0AA0	0 mm
• 830.0 mm (with drill holes)	6ES7590-1AJ30-0AA0	0 mm

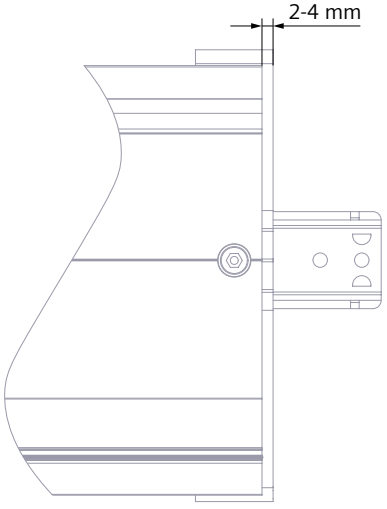

Figure 1-498 DIN rail adapter protrusion

Procedure

Mounting on the standard DIN rail 35 mm x 7.5 mm
To install DIN rail adapter on the standard DIN rail 35 mm x 7.5 mm, follow these steps:

1. Set the clamp onto the standard DIN rail.
2. The **shorter** transverse edge of the adapter frame points towards the cabinet or box wall (2).
3. Place the S7-1500/ET 200MP mounting rail on the adapter frame so that the groove in the S7-1500/ET 200MP mounting rail matches the groove in the adapter frame.
   Place the S7-1500/ET 200MP mounting rail with the adapter frame on the clamp (4).
4. Use screws to fasten the S7-1500/ET 200MP mounting rail to the DIN rail adapter and the standard mounting rail (tightening torque 5 Nm to 6 Nm).

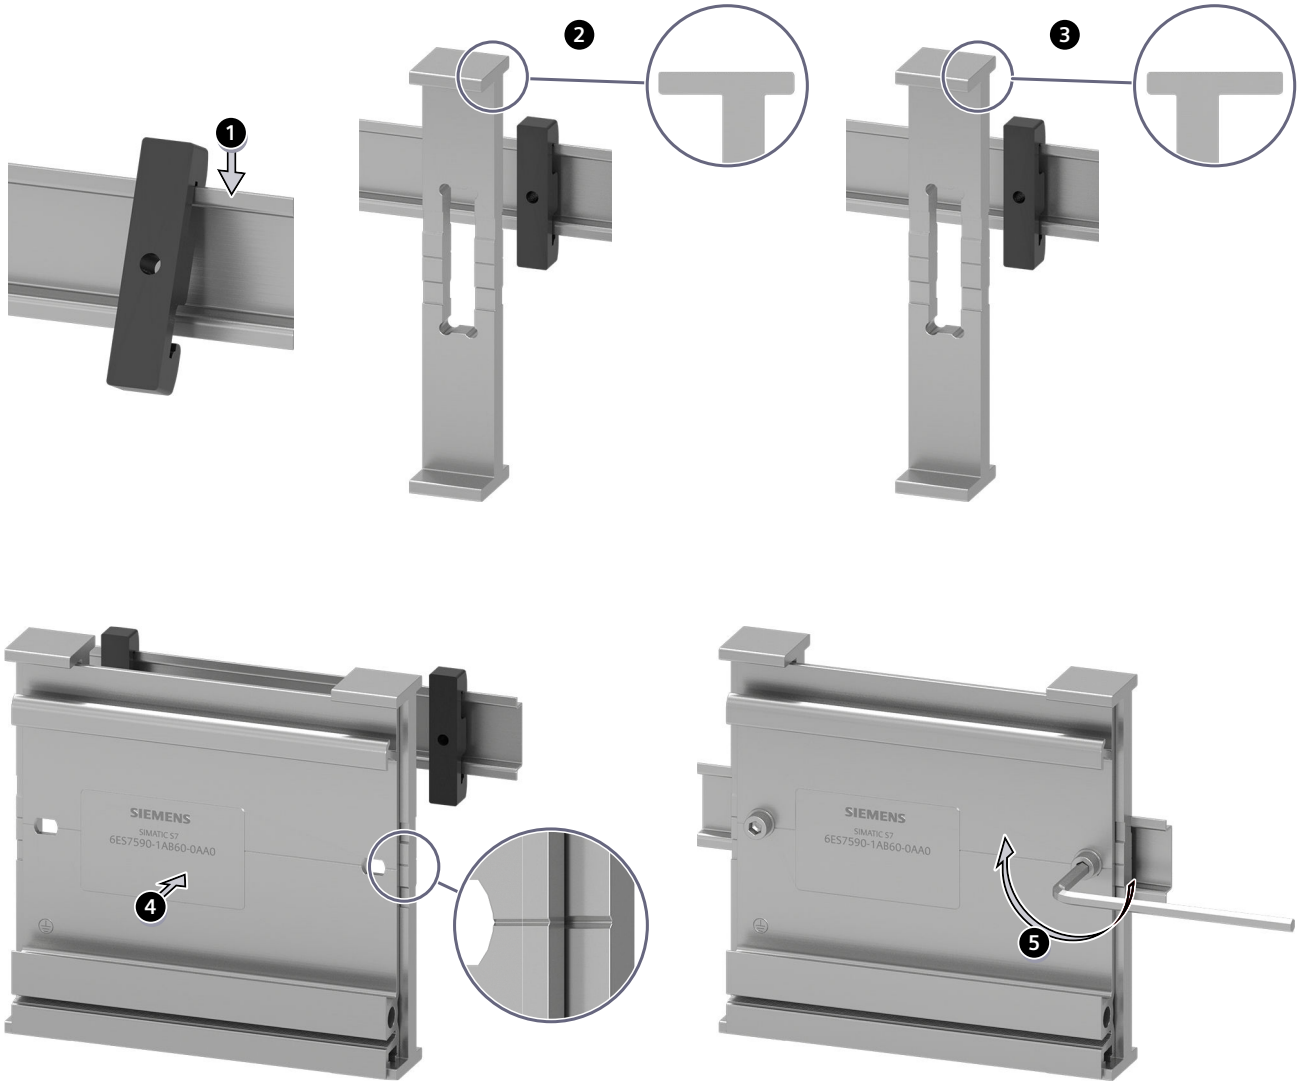

Figure 1-499 Mounting sequence of the DIN rail adapter to the DIN rail 35 mm x 7.5 mm or 35 mm x 15 mm

Mounting to the standard DIN rail 35 mm x 15 mm
To install DIN rail adapter on the standard DIN rail 35 mm x 15 mm, follow these steps:

1. Set the clamp onto the standard DIN rail.
2. The **longer** transverse edge of the adapter frame points toward the cabinet or box wall (3).
3. Place the S7-1500/ET 200MP mounting rail on the adapter frame so that the groove in the S7-1500/ET 200MP mounting rail fits into the groove in the adapter frame.
   Place the S7-1500/ET 200MP mounting rail with the adapter frame onto the clamp (4).
4. Use screws to fasten the S7-1500/ET 200MP mounting rail to the standard rail adapter and the standard mounting rail (tightening torque 5 Nm to 6 Nm).

7.4 Installing a system power supply

Introduction

The system power supply has a connection to the backplane bus and supplies the connected modules with the internal supply voltage.

Requirements

The mounting rail is installed.

Tools required

Screwdriver with 4.5 mm blade

Installing a system power supply

To install the system power supply, follow these steps:

1. Insert the U-connector into the back of the system power supply.
2. Hang the system power supply on the mounting rail.
3. Swivel the system power supply to the rear.

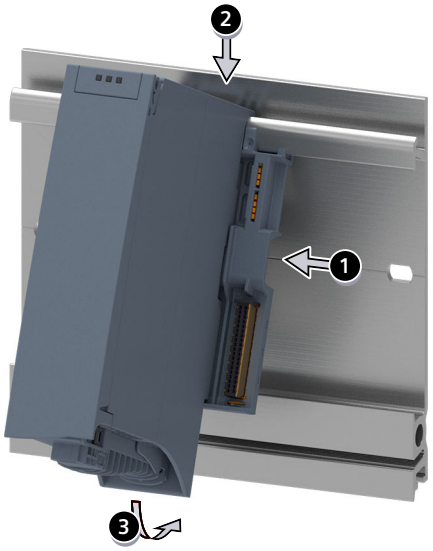

Figure 1-500 Installing a system power supply

4. Open the front cover.
5. Disconnect the power cable connector from the system power supply.
6. Screw the system power supply tight (tightening torque 1.5 Nm).
7. Insert the already wired-up power cable connector into the system power supply.

Information about wiring of the power cable connector is available in the section Connecting system power supply and load current supply (Page 209).

Uninstalling a system power supply

The system power supply is wired up.

To uninstall the system power supply, follow these steps:

1. Open the front cover.
2. Shut down the system power supply.
3. Switch off the supplied supply voltage.
4. Disconnect the power cable connector, and remove the connector from the system power supply.
5. Unscrew the fixing screw.
6. Swivel the system power supply out of the mounting rail.

Reference

Additional information can be found in the manuals for the system power supplies.

7.5 Installing a load current supply

Introduction

Load current supplies do not have a connection to the backplane bus of the S7-1500 automation systems/ET 200MP distributed I/O system and also do not occupy a slot on the backplane bus. The load current supply (PM) supplies the system power (PS), CPU, interface module and input and output circuits of the I/O modules with DC 24 V.

Requirements

The mounting rail is installed.

Tools required

Screwdriver with 4.5 mm blade

Installing a load current supply

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/78027451)

To install a load current supply, follow these steps:

1. Hook the load current supply on the mounting rail.
2. Swivel the load current supply to the rear.

Figure 1-501 Installing a load current supply

3. Open the front cover.
4. Disconnect the power cable connector from the load current supply.
5. Screw the load power supply tight (tightening torque 1.5 Nm).
6. Insert the already wired-up power cable connector into the load current supply.

For a description on how to wire the power cable connector, refer to the section Connecting system power supply and load current supply (Page 209).

NOTE
Load current supplies can only be mounted on the left or right side outside the S7-1500 automation system/ET 200MP distributed I/O system. If you mount a load current supply on the right of the configured setup, the heat development of the load current supply may make a gap to the configured setup necessary. For additional information, refer to the relevant manuals. The number of load current supplies that can be used is unlimited.

Uninstalling the load current supply

The load current supply is wired up.

To uninstall a load current supply, follow these steps:

1. Open the front cover.
2. Shut down the load current supply.
3. Turn off the feed supply voltage.
4. Disconnect the power cable connector, and remove the connector from the load current supply.
5. Unscrew the fixing screw.
6. Swivel the load current supply out of the mounting rail.

Reference

Additional information can be found in the manuals for the load current supplies.

7.6 Installing the CPU

Introduction

The CPU executes the user program and supplies the electronics of the modules with power via the backplane bus.

Requirements

The mounting rail is installed.

In a system power supply located on the left next to the CPU, a U connector is inserted on the back right.

NOTE

Protective film

Please note that the CPU is supplied with a removable protective film on the display. You can remove the protective film as required.

Tools required

Screwdriver with 4.5 mm blade

Installing the CPU

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/78027451)

To install a CPU, follow these steps:

1. Insert a U-connector into the back right on the CPU.
2. Install the CPU to the mounting rail. Also push the CPU to the left system power supply if necessary.
3. Ensure that the U-connector is inserted at the system power supply. Swivel the CPU in to the rear.

4. Screw the CPU tight (tightening torque 1.5 Nm).

Figure 1-502 Installing the CPU

Uninstalling the CPU

The CPU is wired, and is followed by additional modules.

To uninstall a CPU, follow these steps:

1. Open the front cover.
2. Switch the CPU into STOP mode.
3. Turn off the feed supply voltage.
4. Pull off the connector for the supply voltage.
5. Loosen the bus connectors for PROFIBUS/PROFINET with the screwdriver.
6. Disconnect the bus connector from the CPU.
7. Undo the CPU fixing screws.
8. Pivot the CPU out of the mounting rail.

Device damage caused by electrical fields or electrostatic discharge

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that can be damaged by electrostatic fields or electrostatic discharge.

NOTICE
Device damage caused by electrical fields or electrostatic discharge Electrical fields or electrostatic discharge can cause function failures that result from damaged individual components, integrated circuits, modules or devices. • Pack, store, transport and send electronic components, modules or devices only in the original product packaging or in other suitable materials, e.g. conducting foam rubber or aluminum foil. • Only touch components, modules and devices when you have grounded yourself with one of the following measures: – Wear an ESD wrist strap – Wear ESD shoes or ESD grounding strips in ESD areas with a conducting floor • Place electronic components, modules and devices only on conducting surfaces (table with ESD coating, conducting ESD plastic foam, ESD packing bag, ESD transport container).

7.7 Installing the interface module

Introduction

The interface module connects the ET 200MP with the PROFINET IO/PROFIBUS DP.

The interface module exchanges data between the higher-level controller and the I/O modules.

Requirements

The mounting rail is installed.

For a system power supply located to the left of the interface module, a U connector is inserted on the back left.

Tools required

Screwdriver with 4.5 mm blade

Installing the interface module

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/67462859)

To install an interface module, proceed as follows:

1. Mount the U-connector on the back right-hand side of the interface module.
2. Hook the interface module on the rail.

3. Pivot the interface module towards the back.
4. Tighten the interface module (tightening torque 1.5 Nm).

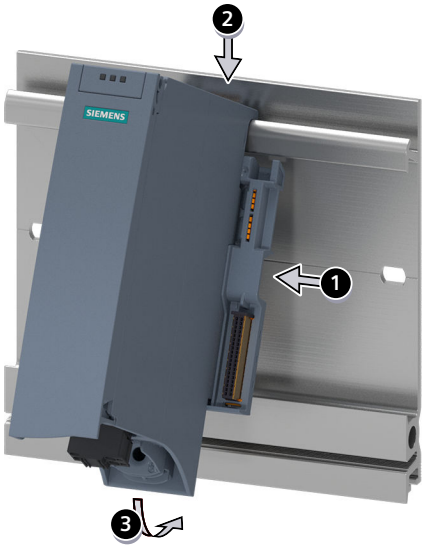

Figure 1-503 Installing the interface module

Uninstalling the interface module

The interface module is wired and is followed by additional modules.

To uninstall the interface module, follow these steps:

1. Switch off the supply voltage for the interface module.
2. Open the front cover.
3. Loosen the bus connector and the connector for the supply voltage with the screwdriver.
4. Remove the plug from the interface module.
5. Loosen the fixing screw of the interface module.
6. Pivot the interface module out of the mounting rail.

7.8 Installing I/O modules

Introduction

The I/O modules are then mounted to the right of the CPU/interface module. I/O modules form the interface between the controller and the process. The controller detects the current process state via the connected sensors and actuators, and triggers the corresponding reactions.

Requirements

The mounting rail is installed.

The CPU/interface module is installed.

In the module/CPU/interface module located to the left of the I/O module, a U-connector is inserted on the back right.

Tools required

Screwdriver with 4.5 mm blade

Installing I/O modules

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/78027451)

Proceed as follows to install an I/O module:

1. Insert a U connector into the back right on the I/O module.
   Exception: the last I/O module in the assembly
2. Install the I/O module on the mounting rail. Push the I/O module up to the left module.
3. Pivot the I/O module towards the back.
4. Tighten the I/O module (tightening torque 1.5 Nm).

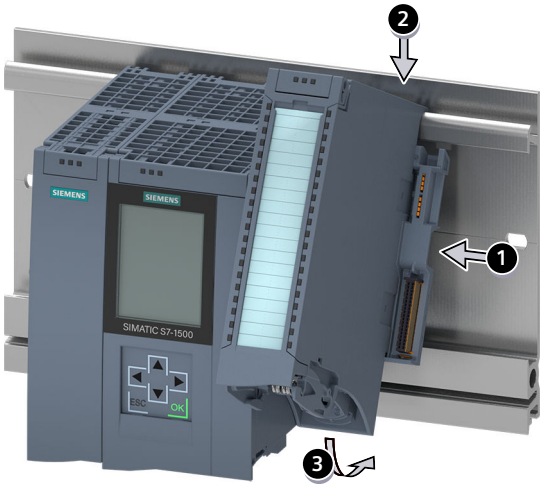

Figure 1-504 Installing I/O module

Uninstalling I/O modules

The I/O module is wired.

Proceed as follows to dismantle an I/O module:

1. Turn off all feed supply voltages.
2. Open the front cover.
3. For communications modules: Loosen and remove the connector from the module.
4. At I/O modules: Pull the front connector out of the I/O module using the unlocking strap. Swivel the front connector downward. Remove the front connector from the guide grooves.

5. Loosen the fixing screw of the I/O module.
6. Pivot the I/O module out of the mounting rail.

Wiring

8

8.1 Rules and regulations for operation

Introduction

The S7-1500 automation system / ET 200MP distributed I/O system is a component of plants or systems. Special rules and regulations must be adhered to in line with the area of application.

This section provides an overview of the most important rules that must be observed for the integration of the S7-1500 automation system/ ET 200MP distributed I/O system in a plant or system. Please follow these rules when connecting the S7-1500 automation system/ ET 200MP distributed I/O system.

Specific application

Observe the safety and accident prevention regulations that are applicable to specific applications (for example Machinery Directive).

EMERGENCY-STOP devices

EMERGENCY OFF equipment to IEC 60204 (corresponds to DIN VDE 0113) must remain effective in all operating modes of the plant or system.

Excluding hazardous plant states

Hazardous operating states must not occur when

- The plant restarts after a voltage dip or power failure.
- Bus communication is reestablished following a fault.

If a hazardous operating state occurs, force an EMERGENCY STOP.

After the EMERGENCY-STOP device has been unlocked, the S7-1500 automation system / ET 200MP distributed I/O system must not started uncontrolled or undefined.

External fuses/switches

Install the external fuses/switches in the proximity of the S7-1500 automation system/ET 200MP distributed I/O system.

Line voltage

The points to note for line voltage are set out below.

- For fixed plants or systems without multipole circuit breaker, a mains disconnection device (multipole) must be available in the building installation.
- For load current supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the S7-1500 automation system/ET 200MP distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

You can find additional information in the section Information on insulation tests, protection class, degree of protection and rated voltage (Page 397).

24 V DC supply

The following describes what you must pay attention to in terms of the 24 V DC supply:

- Power supply units for the 24 V DC supply (SELV/PELV) must supply a safe extra-low voltage according to IEC 61131-2 or IEC 61010-2-201.
- To protect the S7-1500 automation system/ET 200MP distributed I/O system from lightning and overvoltages, use overvoltage arresters.

  Suitable components for the lightning and overvoltage protection are specified in the Defining interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) function manual.

Requirements for power supplies in the event of voltage interruption

NOTE

To ensure adherence to IEC 61131-2, only use power packs/power supply units (e.g. 230/400 V AC → 24 V DC) with a mains buffering time of at least 10 ms. Observe the relevant requirements in your application (e.g. product standard for "burners" 30 ms according to EN 298 or 20 ms according to NAMUR recommendation NE 21) with respect to possible voltage interruptions. The latest up-to-date information on PS components is available on the Internet (https://mall.industry.siemens.com).

Of course, these requirements also apply to power packs/power supply units not constructed using S7-1500 or ET 200SP/S7-300-/S7-400 technology.

Protection against electrical shock

As protection against electric shock you must connect the mounting rail and if necessary, all other existing protective conductor connections of the S7-1500 automation system / ET 200MP distributed I/O system conductively with the protective conductor.

You may only use conductors in the colors yellow-green for connections to protective conductor connections.

Protection against external electrical influences

To protect against electrical effects or faults, observe the following rules:

- The system for discharging electromagnetic interference must be connected to a protective conductor with a sufficient cross-section for all plants with an S7-1500 automation system / ET 200MP distributed I/O system.
- You must ensure that all supply, signal and bus cables are correctly routed and installed.
- For signal and bus lines, a cable break, wire break or a cross circuit must not lead to undefined states in the plant or system.

Reference

Additional information can be found in the function manual, Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566).

8.2 Additional rules and regulations for operation of the S7-1500/ET 200MP with fail-safe modules

8.2.1 Safety extra-low voltage (SELV, PELV) for failsafe modules

Key statement

⚠ WARNING

The failsafe modules must be operated with safety extra-low voltage (SELV, PELV).
You can find more information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.
The fail-safe modules operate at a rated voltage of 24 V DC. The tolerance range is 19.2 V DC to 28.8 V DC.
The fail-safe motor starters operate with the 24 V DC rated voltage. The tolerance range is 20.4 V DC to 28.8 V DC.
Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.
Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g., use of a surge protection device.
All system components that can supply electrical energy in any form whatsoever must fulfill this condition.
Each additional circuit (24 V DC) used in the system must have a safety extra low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.
Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module must not exceed a fault voltage U_m in the event of a fault.

⚠ WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.
An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which could cause the fault voltage U_m to be exceeded.

8.2.2 Requirements of sensors and actuators for fail-safe modules

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have a service life of 20 years as defined in IEC 61508:2010 without considerable loss of safety.
The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".
To achieve the respective safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat. 3/PLd, it is sufficient that a sensor has a single-channel connection. However, to achieve SIL3/Cat. 3/PLd with a single-channel connected sensor, the sensor itself must be SIL3/Cat. 3/PLd-capable. Otherwise, this safety level can only be achieved through two-channel connection of sensors.

To achieve Cat.4, sensors must be connected by two channels.

⚠ WARNING

In the case of fail-safe input modules, a "0" value is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.
Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the respective actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Duration requirements for sensor signals

⚠ WARNING

Observe the following requirements for sensor signals:

- In order to ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- In order for pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Safe detection of inputs through F-modules

The minimum duration of sensor signals for fail-safe modules with inputs is dependent:

- On the parameters assigned for input delay
- On the parameters of the short-circuit test of sensor supplies.
- On the configured discrepancy behavior with 1oo2 (2v2) evaluation.

The duration of the signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in section "Response times" of the respective F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, briefly switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

High-speed actuators may briefly drop out or be activated during this test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g. 230 V AC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (acc. to standard IEC 60664-1).
This is generally the case with relays and contactors and you must pay particular attention to this with semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

8.2.3 Capacitive crosstalk of digital input/output signals

Readback errors may occur on the F-DQ modules if the fail-safe digital output signals and fail-safe digital input signals are routed through a single cable.

Cause: Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers due to the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short circuit and performs a safety-related shutdown.

Solution:

- Separate cables for fail-safe DI modules and fail-safe DQ modules / non-fail-safe DQ modules
- Coupling relay or diodes in the outputs
- Disable the short-circuit test of the sensor supply if safety class requirements allow it.

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

Solution:

- Spatially disconnect the inductive loads or shield against the magnetic field.
- Configure the "Max. readback time dark test" to 50 ms or higher.

8.3 Operation on grounded infeed

Introduction

Information is provided below on the overall configuration of an S7-1500 automation system/ET 200MP distributed I/O system on a grounded infeed (TN-S system). The specific subjects discussed are:

- Shut-off devices, short circuit and overload protection in accordance with
  - IEC 60364, corresponds to DIN VDE 0100
  - IEC 60204, corresponds to DIN VDE 0113
- Load current supplies and load circuits

Grounded infeed

In the case of grounding incoming supplies (TN-S system) the neutral conductor (N) and the protective conductor (PE) are each grounded. Both conductors form a part of the overvoltage concept. When a plant is in operation, the current flows across the neutral conductor. When a fault occurs, for example a single ground fault between a live conductor and ground, the current flows through the protective conductor.

Safe electrical isolation (SELV in accordance with IEC 61131-2 or IEC 61010-2-201)

System power/load current supplies with 24 V DC output voltage feature safe electrical separation and a voltage limit (extra-low voltage). Load power supplies/system power supplies with a 24 V DC output voltage are not connected to the protective conductor.
In accordance with IEC 61131-2 / IEC 61010-2-201, this protection is referred to as SELV (Safety Extra Low Voltage).

Either the wiring of SELV circuits must be safely isolated from the wiring of other circuits that are not SELV, or the insulation of all wires must be dimensioned for the higher voltage.

Protective extra-low voltage (PELV in accordance with IEC 61131-2 or IEC 61010-2-201)

Load current supplies with grounded 24 V DC output voltage require a safe connection to the protective conductor and a voltage limit (extra-low voltage).

In accordance with IEC 61131-2 / IEC 61010-2-201, this protection is referred to as PELV (Protective Extra Low Voltage).

Either the wiring of PELV circuits must be safely isolated from the wiring of other circuits that are not PELV, or the insulation of all wires must be dimensioned for the higher voltage.

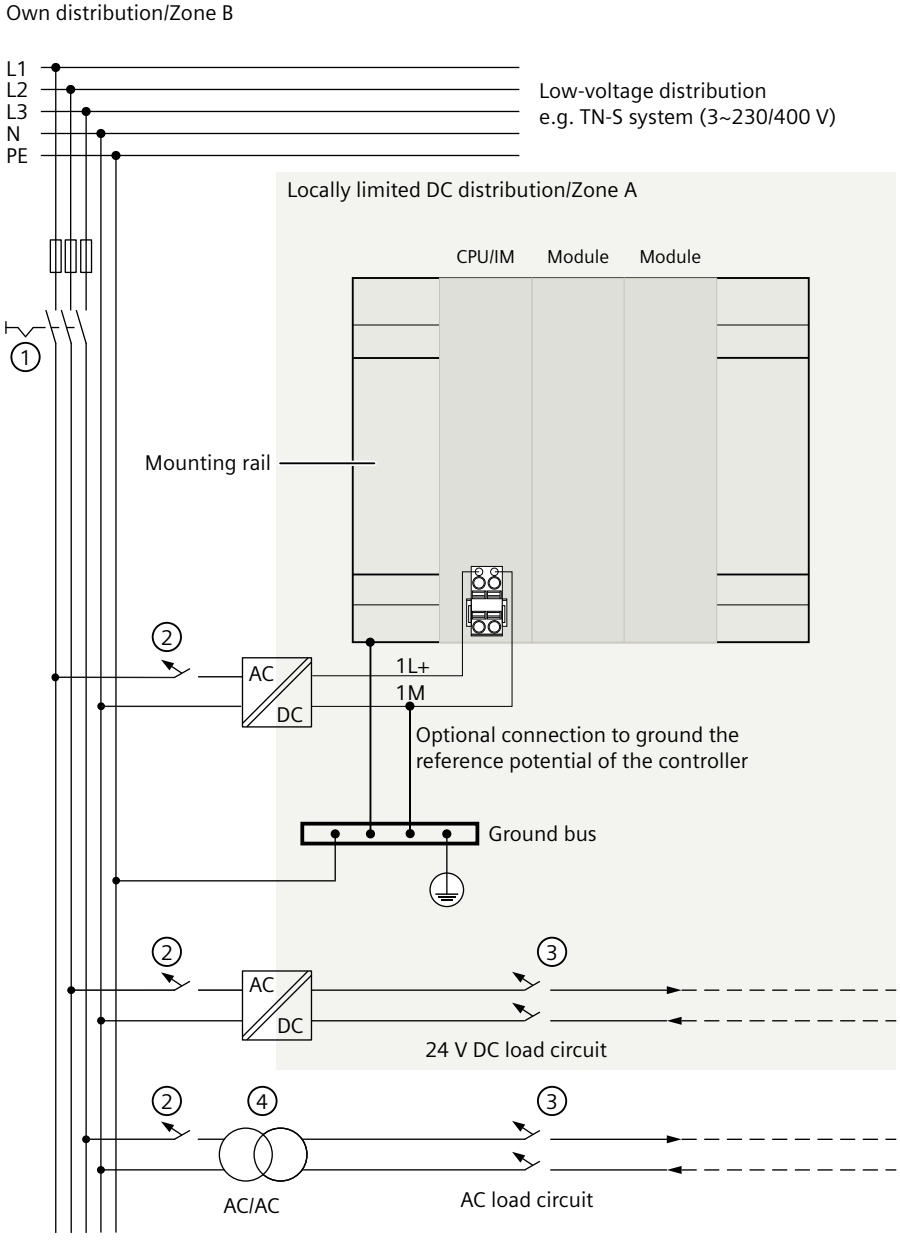
Reference potential of the controller

The reference potential of the S7-1500 automation system/ ET 200MP distributed I/O system is connected with the mounting rail through a high-resistance RC combination in the CPU/interface module. In this way, high-frequency interference currents are conducted and electrostatic charges are avoided. Despite the grounded mounting rail, the reference potential of the S7-1500 automation system / ET 200MP distributed I/O system has to be considered as ungrounded due to the high-resistance connection.

If you want to configure the S7-1500 automation system/ET 200MP distributed I/O system with grounded reference potential, connect the M connection of the CPU/interface module galvanically with the protective conductor.

You can find a simplified representation of the potential relationships in section Electrical configuration (Page 201).

Short-circuit and overload protection



Various measures as protection against short-circuits and overloads are required for setting up a full installation. The nature of the components and the degree to which the required measures are binding depends on the IEC (DIN VDE) regulation applicable to your plant configuration. The table refers to the following figure and compares the IEC (DIN VDE) regulations.

Table 1-817 Components and required measures

	Reference to following figure	**IEC 60364 (DIN VDE 0100)**	**IEC 60204 (DIN VDE 0113)**
Shut-off device for control system, sensors, and actuators	①	Main switch	Disconnector
Short-circuit and overload protection: In groups for sensors and actuators	② ③	Single-pole protection of circuits	• With grounded secondary circuit: fuse **unipolar** • Otherwise: fuse **all poles**
Load power supply for AC load circuits with more than five items of electromagnetic equipment	④	Galvanic isolation by transformer **recommended**	Galvanic isolation by transformer **recommended**

S7-1500/ET 200MP in the overall configuration

The figure below shows the overall configuration of the S7-1500/ET 200MP (load current supply and grounding concept) with infeed from a TN-S system.

① Main switch
② Short-circuit and overload protection on the primary side
③ Short-circuit and overload protection on the secondary side
④ Optional for galvanic isolation

Figure 1-505 Operating the S7-1500/ET 200MP with grounded reference potential

NOTE

In general, you must connect all modules with DC supply of the automation system S7-1500/distributed I/O system ET 200MP to their own distribution (or batteries) by means of an upstream local power supply unit. If you connect the modules with DC supply directly to their own distribution, you need to provide additional protective measures against overvoltages.

8.4 Electrical configuration

Galvanic isolation

With the S7-1500 automation system/ET 200MP distributed I/O system, there is galvanic isolation between:

- The primary side of the system power supply (PS) and all other circuit components
- The (PROFIBUS/PROFINET) communication interfaces of the CPU/interface module and all other circuit components
- The load circuits/process electronics and all other circuit parts of the S7-1500/ET 200MP components

High-frequency interference currents are conducted and electrostatic charges are avoided through integrated RC combinations or integrated capacitors.

S7-1500 potential relationships

The following figure shows a simplified representation of the potential relationships of the S7-1500 automation system.

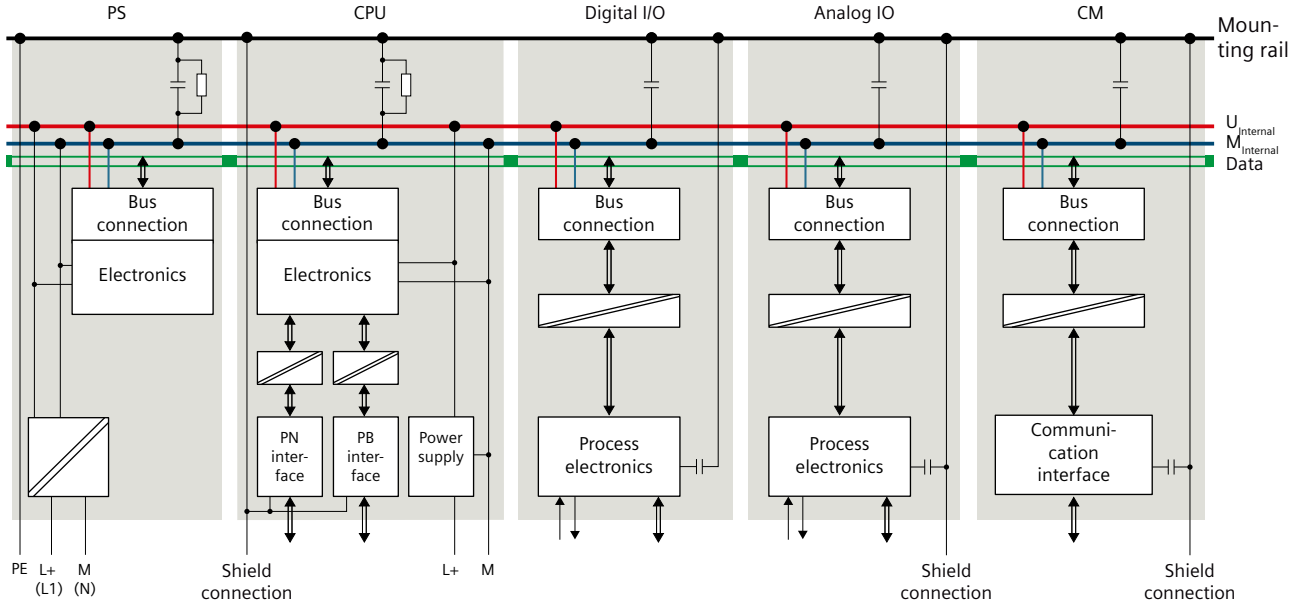


Figure 1-506 Potential relationships for S7-1500 using CPU 1516-3 PN/DP as an example

Potential relationships ET 200MP on PROFINET IO

The following figure shows a simplified representation of the potential relationships of the ET 200MP distributed I/O system on PROFINET IO.

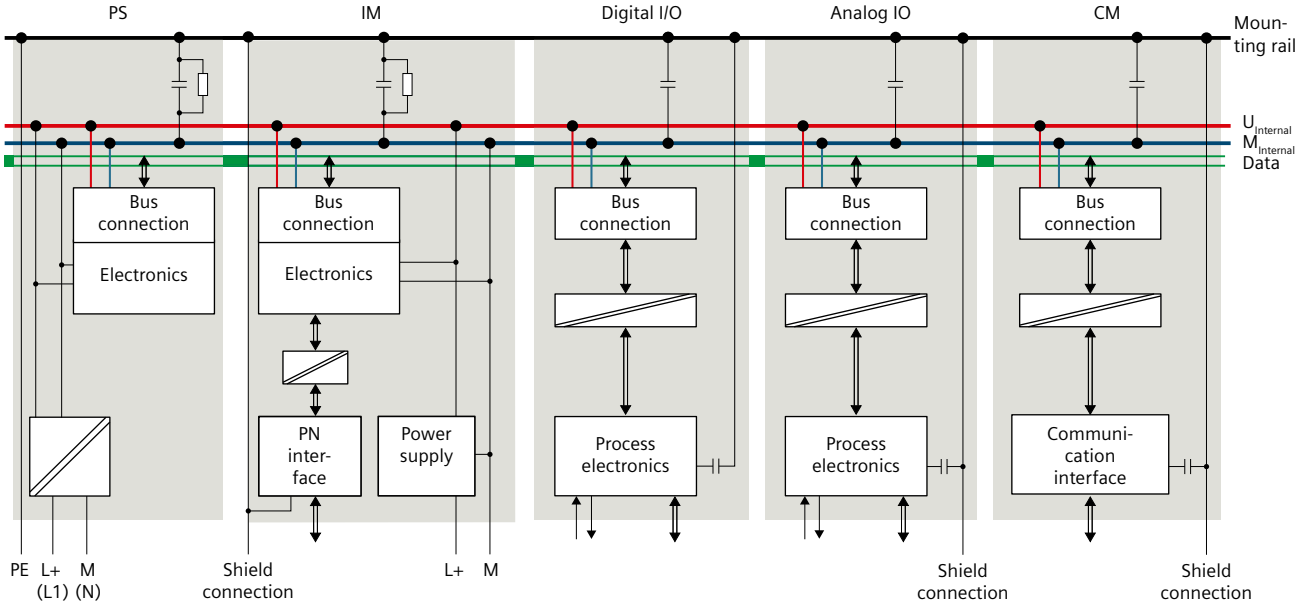

Figure 1-507 Potential relationships for ET 200MP using an IM 155-5 PN HF interface module as an example

Potential relationships ET 200MP on PROFIBUS DP

The following figure shows a simplified representation of the potential relationships of the ET 200MP distributed I/O system on PROFIBUS DP.

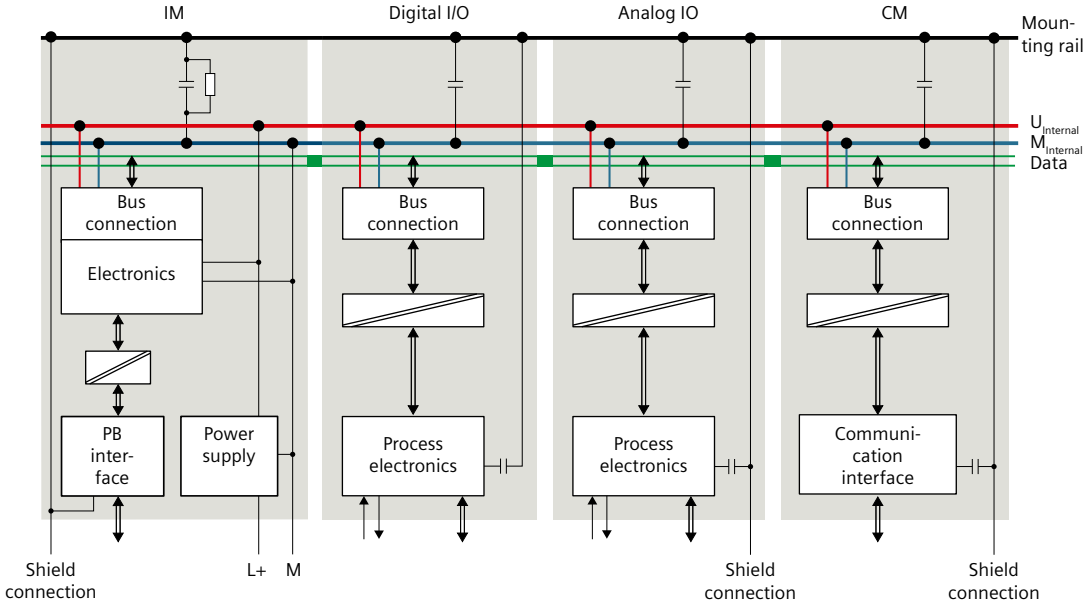

Figure 1-508 Potential relationships for ET 200MP using an IM 155-5 DP ST interface module as an example

8.5 Wiring rules

Introduction

Use suitable cables for connecting the S7-1500 automation system/ET 200MP distributed I/O system. Also select the cable insulation corresponding to the applied voltage. The following tables present the wiring rules for the CPU, interface module, system power supply, load current supply, front connector and power supply elements.

CAUTION

Use copper cables on connectors with terminal connections.
Use only copper cables (Cu) for all signal and supply lines that are connected to the device via terminals, for example, 24 V DC power supply cable to the 24 V DC power supply connections.

CPU, interface module, system power supply and load current supply

Table 1-818 Wiring rules for CPU, interface module, system power supply and load current supply

Permissible cable temperature

NOTE

Permissible cable temperature

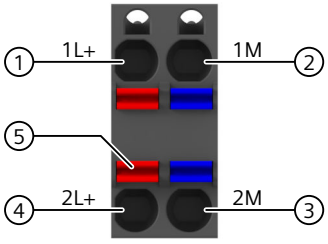
When choosing a cable, remember that the cable temperature in operation can be up to 30 °C higher than the ambient temperature of the S7-1500/ET 00MP system.

Example: If you use the system in a switchgear cabinet at an ambient temperature of 30 °C, you must use a connecting conductor with a temperature range of at least 60 °C.

With terminals that carry a current load of ≥ 8 A during operation, you must expect a cable temperature of up to 65 °C above the ambient temperature.

You can determine the required cable temperature more precisely for each application. To do so, measure the cable temperature in the system at a load corresponding to the maximum possible power and ambient temperature values.

You should specify other connection types and material requirements based on the electrical characteristics of the circuits you use and the installation environment.



8.6 Connecting the supply voltage

Introduction

The supply voltage of the CPU/interface module is supplied by means of a 4-pole connection plug, which is located on the front or below on the CPU / interface module.

Connection for supply voltage (X80)

The connections of the 4-pole connector have the following meaning:

① +24 V DC of the supply voltage (current limited to 10 A)
② Ground of the supply voltage (current limited to 10 A)
③ Ground of the supply voltage for loop-through
④ +24 V DC of the supply voltage for loop-through
⑤ Spring opener (one spring opener per terminal)

Figure 1-509 Connection for supply voltage

The cable connector offers you the option of looping the supply voltage uninterrupted, even when it is unplugged.

For the maximum wire cross-sections, observe the information in the tables of the Wiring rules (Page 203).

Requirements

- Only wire the cable connector when the supply voltage is turned off.
- Observe the Wiring rules (Page 203).

Tools required

3 to 3.5 mm screwdriver

Tool-free connection of cables: multi-wire (stranded), with end sleeve or ultrasonic compressed

To connect a wire without tools, follow these steps:

1. Strip 8 to 11 mm of the wires.
2. Seal or crimp the wire with end sleeves.
3. Insert the wire into the push-in terminal as far as it will go.
4. Push the wired connector into the socket of the CPU/interface module.

Connection of wires: multi-wire (stranded), without end sleeve, unprocessed

To connect a wire without end sleeve, follow these steps:

1. Strip 8 to 11 mm of the wires.
2. Using a screwdriver, press the spring release and insert the wire into the push-in terminal as far as it will go.
3. Pull the screwdriver out of the spring release.
4. Push the wired connector into the socket of the CPU/interface module.

Loosening a wire

Push with the screwdriver as far as it will go into the spring release. Remove the wire from the push-in terminal.

Uninstalling the connection plug

To uninstall the connection plug, you need a screwdriver. With the screwdriver, pry the connection plug out of the CPU/interface module.

8.7 Connecting system power supply and load current supply

Introduction

In the delivery condition of the system power supplies/load current supplies, power connectors are inserted. The modules and the associated power connectors are coded. There are two parts to the coding element. One coding element is located in the module, and the other in the power connector. The system power supplies/load current supplies use identical power connectors for the voltage connection.

The coding element prevents the insertion of a power connector into a different type of system power supply/load current supply.

Tools required

3 to 3.5 mm screwdriver

Connecting the supply voltage to a system power supply/load current supply

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/78027451)

To connect the supply voltage, follow these steps:

1. Swing the front cover of the module up until the front cover latches.
2. Press down the unlocking button of the power cable connector (Figure 1). Remove the power cable connector from the front of the module.
3. Loosen the screw on the front of the connector. This loosens the housing latch and the cable relief. With a tightened screw the connector's cover can't be removed (Figure 2).
4. Pry off the connector cover using a suitable tool (Figure 3).

Figure 1-510 Connecting the supply voltage to a system power supply/load current supply (1)

5. Strip the cable jacket to a length of 35 mm and the conductors to a length of 7 to 8 mm. Attach the end sleeves.
6. Connect the wires in the connector according to the connection diagram (Figure 4).
7. Close the cover (Figure 5).

8. Retighten the screw (Figure 6). This effects a strain relief on the lines.

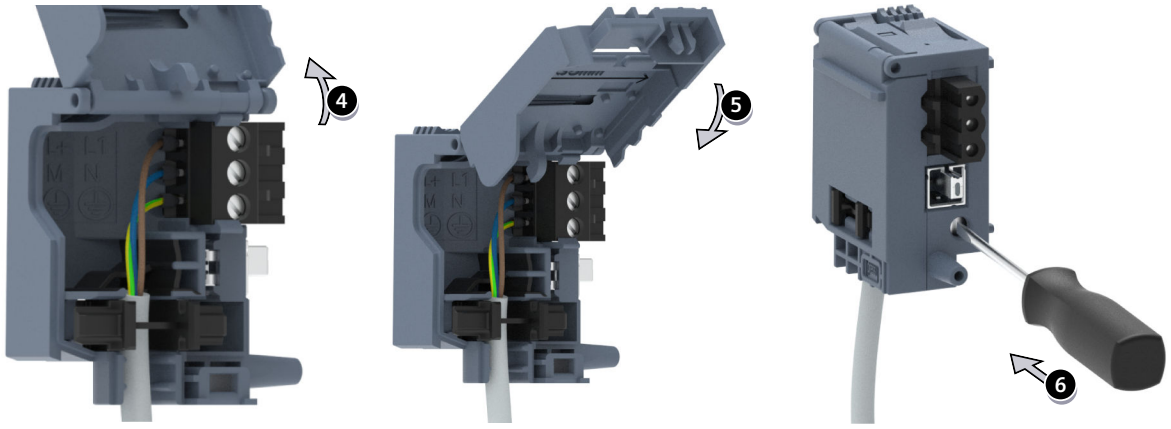


Figure 1-511 Connecting the supply voltage to a system power supply/load current supply (2)

9. Insert the power connector into the module, until the latch engages.

Reference

You can find more information on connecting the 24 V DC output voltage of the load power supply (PM) in the manuals for the relevant modules.

For more information on configuring system power supplies, refer to the System and load current supply (Page 158) section.

8.8 Connecting the CPU/interface module to the load current supply

Introduction

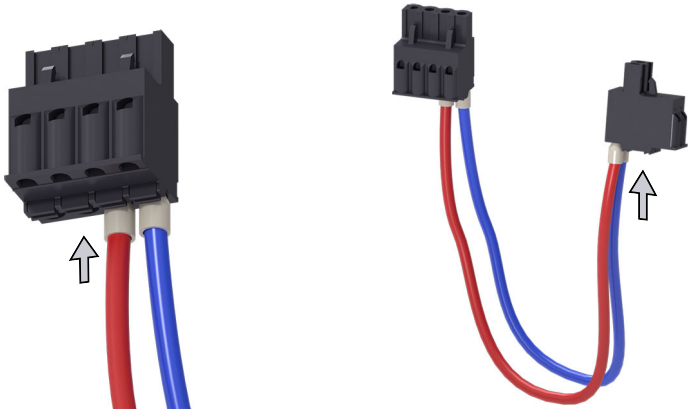
The load current supply is fitted with a plug-in 24 V DC output terminal (behind the front cover at the bottom). You connect the cables for the supply voltage to the CPU/interface module at this terminal.

Requirements

- Only wire the connection plug when the supply voltage is turned off.
- The connection plug for connecting the supply voltage to the CPU/interface module is already mounted.

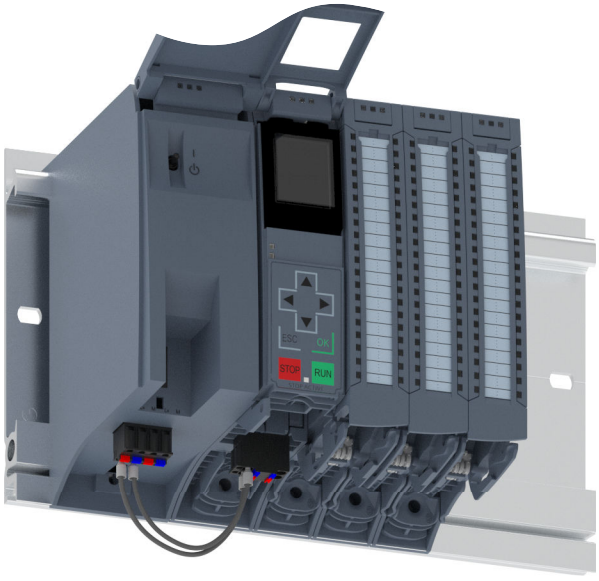
You can find additional information in the section Connecting the supply voltage (Page 207).

Tools required



3 to 3.5 mm screwdriver

Connecting the CPU/interface module to a load current supply



Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/78027451)

To connect the supply voltage, follow these steps:

1. Open the front cover of the load power supply. Pull the 24 V DC output terminal downwards.
2. Connect the 24 V DC output terminal to the wires of the 4-pole connection plug of the CPU/interface module.

3. Connecting the load current supply to the CPU/interface module.

NOTE

Position of the connection socket at the CPU

The connection socket for the 4-pole connection plug is located on the underside of the device for the following CPUs/interface modules:

- Standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0
- Interface modules IM 155-5 PN BA as of article number 6ES7155-5AA00-0AA0 and IM 155-5 PN ST as of article number 6ES7155-5AA01-0AB0

In the case of all CPUs with older article numbers, the connection socket is located on the front of the device under the front flap.

Additional information can be found in the associated manuals for the CPUs/interface modules.

8.9 Connecting interfaces for communication

Connecting interfaces for communication

Connect the communication interfaces of the CPU/interface module using standardized plug connectors.

Use prefabricated connecting cables for the connection. If you want to prepare communication cables yourself, the interface assignment is specified in the manuals of the corresponding modules. Observe the mounting instructions for the connectors.

Special consideration: Unlock connectors Industrial Ethernet FastConnect RJ45 plug 180 2x 2 or Industrial Ethernet FastConnect RJ45 plug 180 4x 2 and disconnect from PROFINET interface of CPU/IM

Tools required

- Industrial Ethernet FastConnect RJ45 Plug 180 2x 2 (6K1901-1BB10-2Ax0): **2.5 mm screwdriver**
- Industrial Ethernet FastConnect RJ45 Plug 180 4x 2 (6GK1901-1BB12-2Ax0): **3.0 mm screwdriver**

Procedure

1. Press the screwdriver parallel to the connector into the unlocking.
2. Disconnect the connector from the PROFINET interface.

NOTE

Do not unlock the connector under tension!

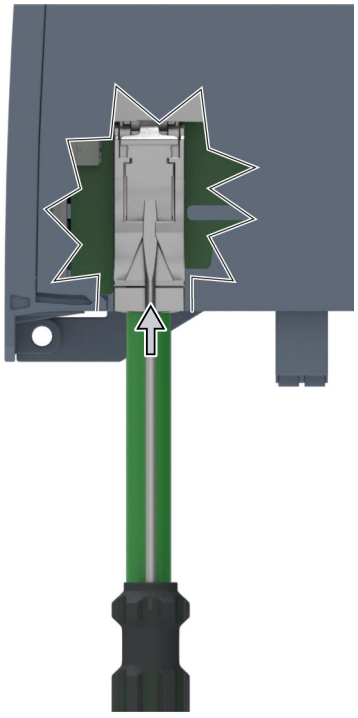


Figure 1-512 Unlocking the FastConnect connector

8.10 Front connector for the I/O modules

Introduction

The sensors and actuators of your plant are connected to the automation system by means of front connectors. Wire the sensors and actuators to the front connector. Plug the front connector with the wired sensors and actuators onto the I/O module.

You can wire the front connector as follows:

- In the "pre-wiring position", which allows a convenient wiring
- Completely, before you insert it into the I/O module.

You can remove the front connector easily from the I/O module with the wiring attached. This means it is not necessary to loosen the wiring when you replace the module.

Device versions of the front connector

① ② ③

① Front connector 35 mm with screw terminals
② Front connector 25 mm with push-in terminals
③ Front connector 35 mm with push-in terminals

Figure 1-513 Device versions of the front connector

Properties of the front connectors

The three different front connectors are characterized as follows:

- 40 clamping points each
- Connection system: Screw terminal (for 35 mm modules only) or push-in terminal
- Module width: 35 mm or 25 mm

- If you want to supply load groups with the same potential (non-isolated), use the potential bridges supplied for the front connector (with 35 mm width) for digital I/O modules. The bridges are used to connect the terminals 9 and 29, 10 and 30, 19 and 39 as well as 20 and 40 facing each other. Advantage: Reduction of the wiring effort.

  NOTE

  Use of potential bridges

  The use of potential bridges depends on the relevant module used.

  It is not permitted to use potential bridges for 230 V modules. Use the potential bridges only with a maximum supply voltage of 24 V DC. The current capacity per potential bridge is 8 A maximum.

  Because of the different assignment, you may not use the potential bridges with analog I/O modules.

  The front connectors for 25 mm modules have no potential bridges.

  Observe the instructions and wiring rules in the product manual of the respective I/O module when using potential bridges.

- In the delivery state a coding element is located in the module. When the front connector is first inserted into the I/O module, a part of the coding element clips onto the front connector. When the front connector is removed from the I/O module, one part of the coding element remains in the front connector, and the other part remains in the I/O module. The insertion of a front connector that is not suited to the module is thereby mechanically prevented. This ensures, for example, that the front connector with the coding element for a digital module cannot be inserted into an analog module.

Properties of the front connectors on fail-safe modules

In as-delivered condition, a fail-safe module not only has a mechanical coding element but also an electronic coding element. The electronic coding key is a rewritable memory for the PROFIsafe address. When the front connector is inserted in the F-module, the electronic coding element engages completely in the front connector. If you remove the front connector from the F-module, the memory with the PROFIsafe address of the fail-safe module remains in the front connector (see section Replacing a front connector (Page 356)).

Reference

You can find additional information on the coding element in the section Coding element on the I/O module and on the front connector (Page 352).

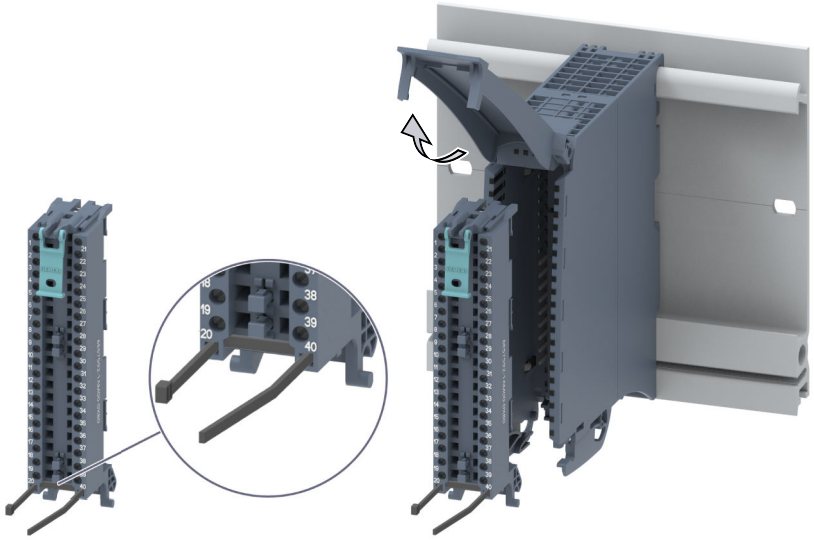
Additional information on the use of the potential bridges can be found in the product manual for the respective I/O module.

8.10.1 Wiring front connectors for I/O modules without shield contact element

Requirements

- The I/O modules are installed on the mounting rail.
- The supply voltages are turned off.
- The cables are prepared according to the clamping technology used; take the Wiring rules (Page 203) into account for this purpose.

Tools required



- Stripping tool
- 3 to 3.5 mm screwdriver

Preparing and wiring front connectors for I/O modules without shield contact element

Proceed as follows to wire the front connector:

1. Shut down the load current supply.
2. Place the included cable strain relief (cable tie) for the cable harness into the front connector (Figure 1).
3. Swing the front cover of the wired I/O module up until the front cover latches (Figure 2). Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/67462859)
4. Bring the front connector into the pre-wiring position. To do this, hook the front connector into the bottom of the I/O module and swivel the front connector upward until the front connector latches (Figure 3).

   Result: In this position, the front connector still protrudes from the I/O module (Figure 4). However, front connector and I/O module are not yet electrically connected. By means of the pre-wiring position, you can easily wire the front connector.

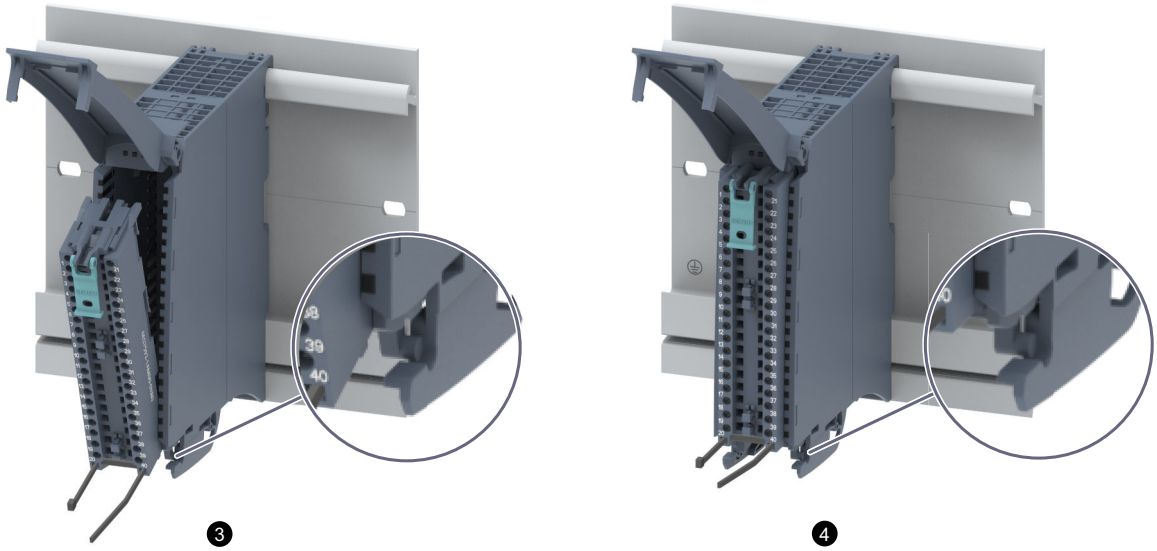


Figure 1-514 Wiring front connectors for I/O modules without shield contact element

5. Begin to completely wire the front connector.
6. Put the strain relief around the cable harness, and pull the strain relief for the cable harness tight.

Use of the potential bridges on 35 mm digital modules

With the delivered potential bridges, for digital modules with a maximum rated voltage of 24 V DC, you can bridge the terminals for the voltage supply and thus reduce the wiring effort. The bridges are used to connect the following pairs of opposing terminals: 9 and 29, 10 and 30, 19 and 39 as well as 20 and 40.

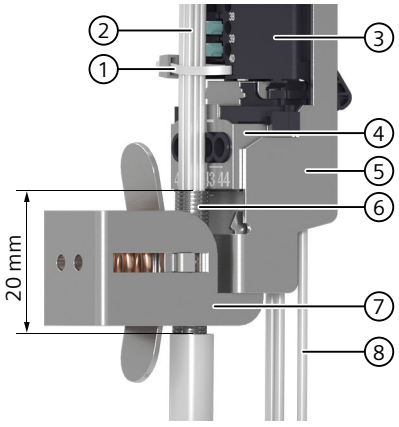
Reference

Additional information on wiring the inputs and outputs can be found in the manuals for the I/O modules.

8.10.2 Wiring front connectors for I/O modules with shield contact element

Requirements

- The I/O modules are installed on the mounting rail.
- The supply voltages are turned off.
- The wires are prepared according to the clamping technology used. To do this, follow the Wiring rules (Page 203).



Tools required

- Stripping tool
- 3 to 3.5 mm screwdriver
- Flat pliers

Details view

The shielding bracket, the power supply element, and the shielding clamp are included in the scope of delivery for the analog and technology modules.

The following figure shows the details view of a front connector with shield connection element:

①	Shield clamp	⑥	Power supply element
②	Cable sheathing removed (approx. 20 mm)	⑦	Shielding bracket
③	Strain relief (cable tie)	⑧	Supply lines
④	Signal cables	①+⑦	Shield contact
⑤	Front connectors		

Figure 1-515 Details view for front connectors with shield connection elements

Preparing front connectors for I/O modules with shield contact element

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/67462859)

To prepare the front connector for wiring, follow these steps:

1. Remove the connection separator from the lower part of the connector (Figure 1).
2. Insert the power supply element (Figure 2).
3. Insert the shielding bracket from below into the guiding groove of the front connector until the shielding bracket latches into place (Figure 3).

4. Place the included cable strain relief (cable tie) for the cable harness into the front connector (Figure 4).

Figure 1-516 Preparing front connectors for I/O modules with shield contact element (1)

5. Swing the front cover up until the front cover latches (Figure 5).

6. Bring the front connector into the pre-wiring position. To do this, hook the front connector into the bottom of the I/O module and swivel it upwards until the front connector latches (Figure 6).

   Result: In this position, the front connector still protrudes from the I/O module (Figure 7). However, front connector and I/O module are not yet electrically connected.

Figure 1-517 Preparing front connectors for I/O modules with shield contact element (2)

7. Wire the power supply element (Figure 8).
   Terminals 41/42 and 43/44 are galvanically connected to each other. If you connect the supply voltage to 41 (L+) and 44 (M), you can then loop-through the potential to the next module (max. 8 A) with terminals 42 (L+) and 43 (M).

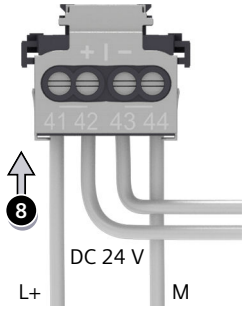


Figure 1-518 Preparing front connectors for I/O modules with shield connection element (3)

Wiring front connectors for I/O modules with shield contact element

To wire a front connector, follow these steps:

1. Strip the cable shielding.
2. Begin to completely wire the front connector (Figure 1).

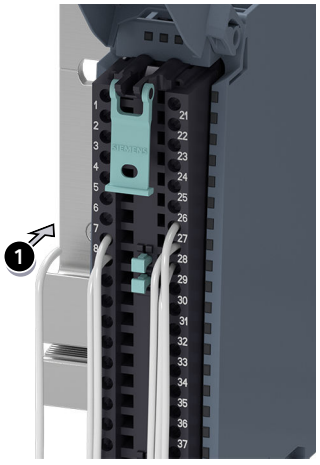

Figure 1-519 Wiring front connectors for I/O modules with shield connection element (1)

3. Put the strain relief (cable tie) around the cable harness, and pull the strain relief for the cable harness tight (Figure 2).

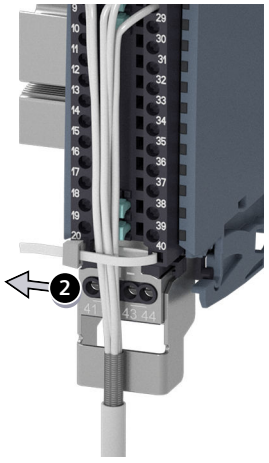

Figure 1-520 Wiring front connectors for I/O modules with shield connection element (2)

4. Insert the shield clamp from below into the shielding bracket in order to connect the cable shielding (Figure 3).

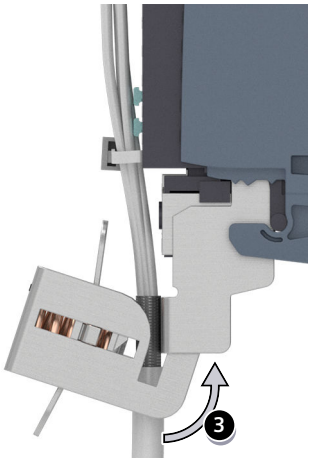

Figure 1-521 Wiring front connectors for I/O modules with shield connection element (3)

Functions of the shield contact

The shield contact:

- Is needed to apply cable shields (e.g., for analog modules)
- Interference currents on cable shields are diverted from the shield connection to ground via the mounting rail. The shielding connection is not required at cable entry into the switchboard.
- The shield support has a cable storage area of 18 mm x 15 mm.

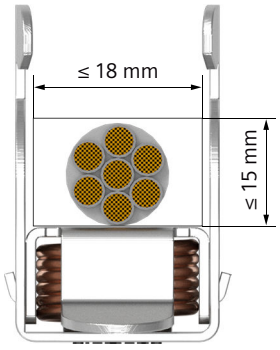

Figure 1-522 Shield clamp

Reference

Additional information on wiring the inputs and outputs can be found in the manuals for the I/O modules.

8.10.3 Bringing the front connector into final position

Bring the front connector from the pre-wiring position into final position

Proceed as follows to bring the front connector from the pre-wiring position into final position:

1. Grip the front connector by the unlocking strap.
2. Pull on the strap until the front connector is released from its latched position.
3. Tilt the top section of the front connector and raise it slightly. The front connector slides over the guide channel into its final position.

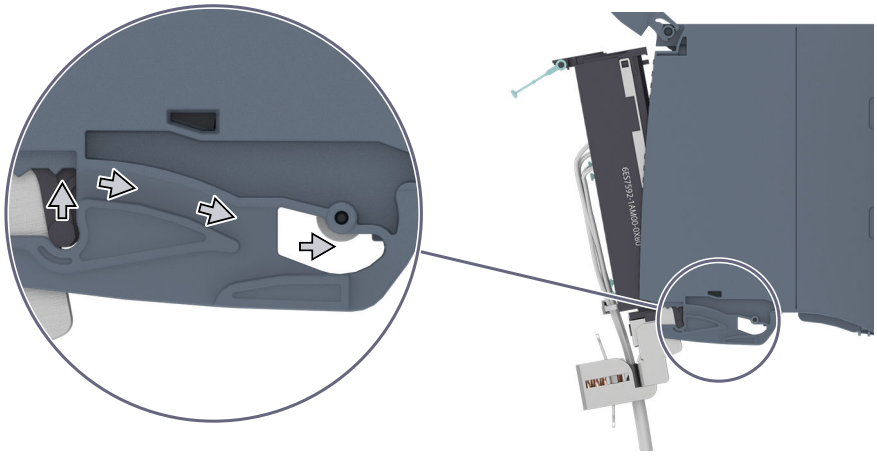

Figure 1-523 Bring the front connector from the pre-wiring position into final position

4. Push the front connector back into the I/O module until it latches. The front connector is now electrically connected with the I/O module.
5. Swivel the front cover down into place. Various latch positions are possible depending on the space requirement of the cable harness so that the required cable storage space can grow as needed.

Bringing the front connector directly into final position

Proceed as follows to bring the front connector directly into final position:

1. Grip the front connector by the unlocking strap.
2. Push the guide pin of the front connector into the guide channel that has been displaced downwards. The front connector slides over the guide channel into its final position.

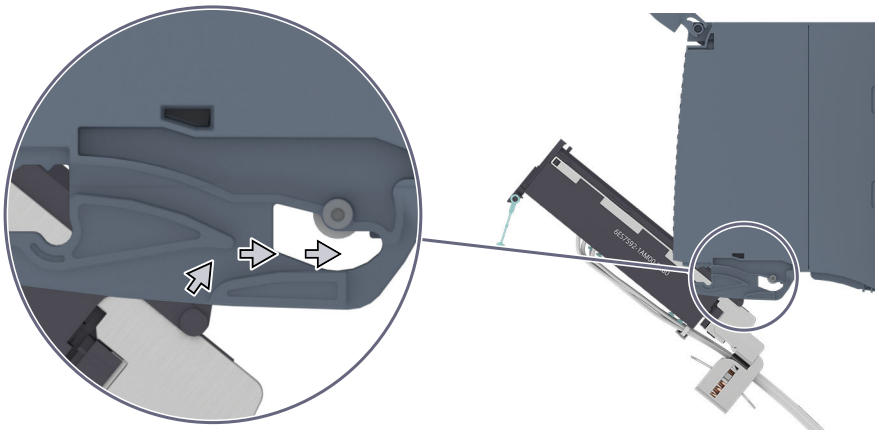

Figure 1-524 Bringing the front connector directly into final position

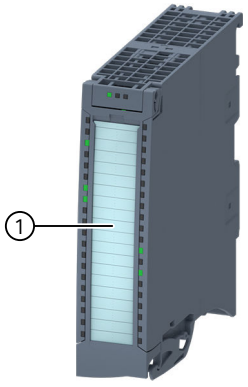
3. Tilt the front connector and press it into the I/O module until it latches. The front connector is now electrically connected with the I/O module.
4. Swivel the front cover down into place. Various latch positions are possible depending on the space requirement of the cable harness so that the required cable storage space can grow as needed.

8.11 Marking the I/O modules

8.11.1 Labeling strips

Introduction

Mark the pin assignment of the I/O modules using labeling strips. You can label the labeling strips as desired and slide them into the outside of the front cover.



The labeling strips are available in the following models:

- Pre-prepared strips that are included with the I/O module as delivered.
- DIN A4 sheets, pre-perforated strips for machine printing; see section Accessories/spare parts (Page 406)

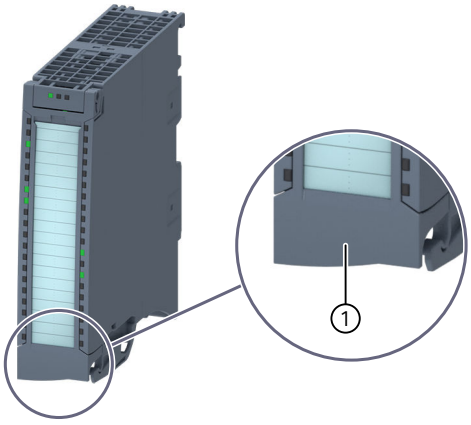
Preparing and installing the labeling strip

Proceed as follows to prepare and install the labeling strips:

1. Label the labeling strip.
   You can print labeling strips for the modules in your project with STEP 7. The labeling strips are exported to Microsoft Word DOCX files and printed from the text editing program. You can find more information in the online help.
2. With a pre-perforated strip: Separate the labeling strip from the sheet.
3. Slide the labeling strip into the outside of the front cover.

① Labeling strips

Figure 1-525 Marking with labeling strips



8.11.2 Optional marking

Introduction

The I/O modules have a free area on the front cover. You can label or mark the free area yourself.

Optional marking

The front cover provides about 30 mm x 10 mm of space in its lower part for an optional identifier label.

① Free space, for example for equipment identifiers

Figure 1-526 Optional marking

Configuring

9

Introduction

By configuring the individual hardware components, assigning their parameters, and connecting them, you communicate to the S7-1500 automation system/ET 200MP distributed I/O system its preset configuration and operating principle. You perform the work needed for this in the device and network views in STEP 7.

"**Configuring**" is understood to mean the arranging, setup and networking of devices and modules within the device view or network view of STEP 7. STEP 7 graphically represents modules and racks. Just like "real" module racks, the device view allows the insertion of a defined number of modules.

When the modules are inserted, STEP 7 automatically assigns the addresses and a unique hardware identifier (HW identifier). You can change the addresses later. The HW identifiers cannot be changed.

At startup, the system components compare the configured preset configuration with the actual configuration of the system. By means of parameter assignment, you can specify the response of the CPU to errors in the hardware configuration.

"**Assigning parameters**" is understood to mean setting the properties of the components used (CPU, modules).

STEP 7 compiles the hardware configuration (the result of "configuring" and "assigning parameters") and downloads it to the CPU. The CPU then connects to the configured components and transfers their configuration and parameters. Modules can be replaced very easily because when a new module is inserted, STEP 7 transfers its configuration and parameters again.

9.1 Configuring the CPU

Requirements for configuration of the CPU

Configuration software	Installation information
STEP 7 as of V12.0 [1)]	STEP 7 online help

1) The following CPUs can be configured as of V12: CPU 1511-1 PN, CPU 1513-1 PN, CPU 1516-3 PN/DP
Note that all other CPUs can be configured only as of a later version (for example, V12 SP1). Refer to the manual for the CPU to find out whether the version of the CPU you are using is configurable in STEP 7.

Spare parts compatibility for CPUs with article numbers ≥ 6ES751x-xxx03-0AB0

The following applies to the CPUs as of article number 6ES751x-xxx**10**-0AB0:
The CPUs have 2 ports at the PROFINET interface X2, but do not have a PROFIBUS DP interface. Therefore, these CPUs are not compatible with the CPUs with article numbers 6ES751x-xxx**0**x-0AB0 with regard to spare parts.

The following applies to the CPUs as of the article numbers 6ES751x-xxx0**3**-0AB0:
The CPUs are compatible for use with CPUs with article numbers ≥ 6ES751x-xxx0**1**-0AB0 with regard to spare parts.

You cannot download STEP 7 projects that have a hardware configuration with CPU article number 6ES751x-xxx0**0**-0AB0 to a CPU with article number 6ES751x-xxx0**3**-0AB0.

Solution: When replacing a CPU 6ES751x-xxx0**0**-0AB0 with a successor type 6ES751x-xxx0**3**-0AB0, you must upgrade the STEP 7 project to ≥ 6ES751x-xxx01-0AB0. For the upgrade, use STEP 7 ≥ V13 SP1 Update 3.

Replace CPUs with article numbers ≥ 6ES751x-xxx10-0AB0 in STEP 7

S7-1500 CPUs as of article numbers 6ES751x-xxx10-0AB0 have 2 ports at the PROFINET interface X2, but do not have a PROFIBUS DP interface. If, for example, you replace a CPU 1517-3 PN/DP by a CPU 1517-3 PN (article number: 6ES7517-3AQ**10**-0AB0), use the function "Change device" for the exchange in STEP 7. More information on this function is available in the STEP 7 online help.

Configuring CPUs with article numbers < 6ES751x-xxx03-0AB0 in older STEP 7 versions

CPUs with article numbers < 6ES751x-xxx0**3**-0AB0 are compatible with their predecessor version in terms of spare parts. Manipulation protection, particularly with respect to the SIMATIC Memory Card and RUN/STOP function, is retained.

When replacing a CPU (for example, 6ES7515-2AM01-0AB0) with a compatible successor type (for example, 6ES7515-2AM02-0AB0), the STEP 7 project does not have to be changed, nor is it necessary to upgrade the STEP 7 project.

You can still configure modules with new article numbers in STEP 7 as the predecessor version (for example, 6ES7515-2AM01-0AB0). Because the new article number (for example, 6ES7515-2AN03-0AB0) is not yet contained in previous STEP 7 versions, you can also configure the CPU as a predecessor version, i.e. with the predecessor article number (for example, 6ES7515-2AM01-0AB0).

References

- If you want to configure new CPUs whose article numbers are not yet included in the hardware catalog of STEP 7, please refer to the following FAQ in the Internet (https://support.industry.siemens.com/cs/ww/en/view/109760846).
- If you want to load project data, but the firmware version installed in the CPU cannot be selected in STEP 7, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109744163).
- If the supplied module has an article number different to the one which was ordered, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/de/view/109763472).

- If you are searching for the successor product for a totally discontinued module and information on its compatibility, take the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/de/view/109826566/en) into account.
- You can find an overview of the most important documents and links to STEP 7 in the following FAQ on the Internet (https://support.industry.siemens.com/cs/de/de/view/65601780/en).

9.1.1 Reading out the configuration

Introduction

When there is a connection to an existing CPU that is being installed, you can load the configuration of this CPU, including centrally present modules, from the device into your project using the "Hardware detection" function. You do not need to manually configure the CPU and the centrally present modules, as the physical configuration is read out automatically.

If you have already configured a CPU and the centrally present modules and you want to load the current configuration and parameters in a new project, it is advisable to use the "Upload device as new station" function. For additional information about this function, refer to section Backing up and restoring the CPU configuration (Page 326).

Procedure for reading out an existing configuration

1. Create a new project and configure an "Unspecified CPU 1500".

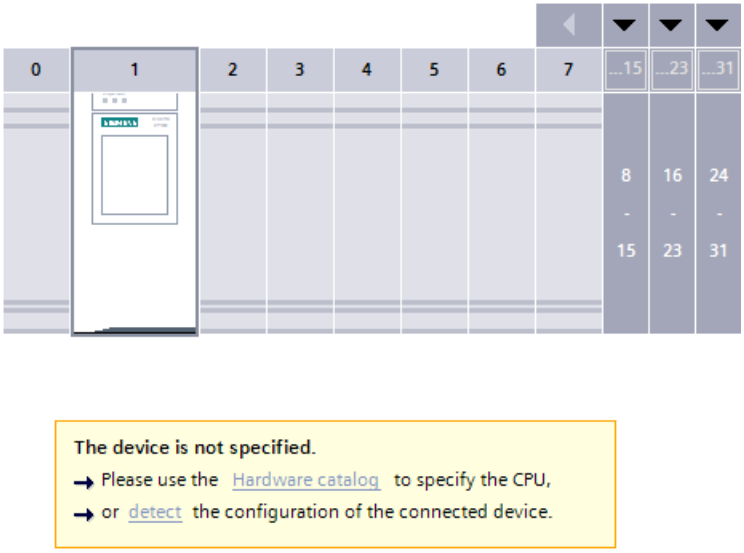


Figure 1-527 Unspecified S7-1500 CPU in the device view

NOTE

To open the "Hardware detection for PLC_x" dialog, click the "Detect" link. An example can be found in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/de/view/41885693/en).
An alternative procedure is described in step 2 and step 3.

2. In the device view (or network view), select the "Hardware detection" command in the "Online" menu.

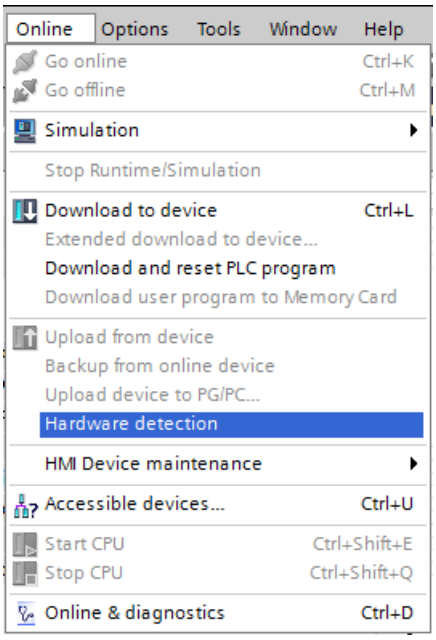

Figure 1-528 Hardware detection in the Online menu

STEP 7 opens the "Hardware detection for PLC_x" dialog box.

3. In the "Hardware detection for PLC_x" dialog, click "Refresh". Then, select the CPU and click "Detect".

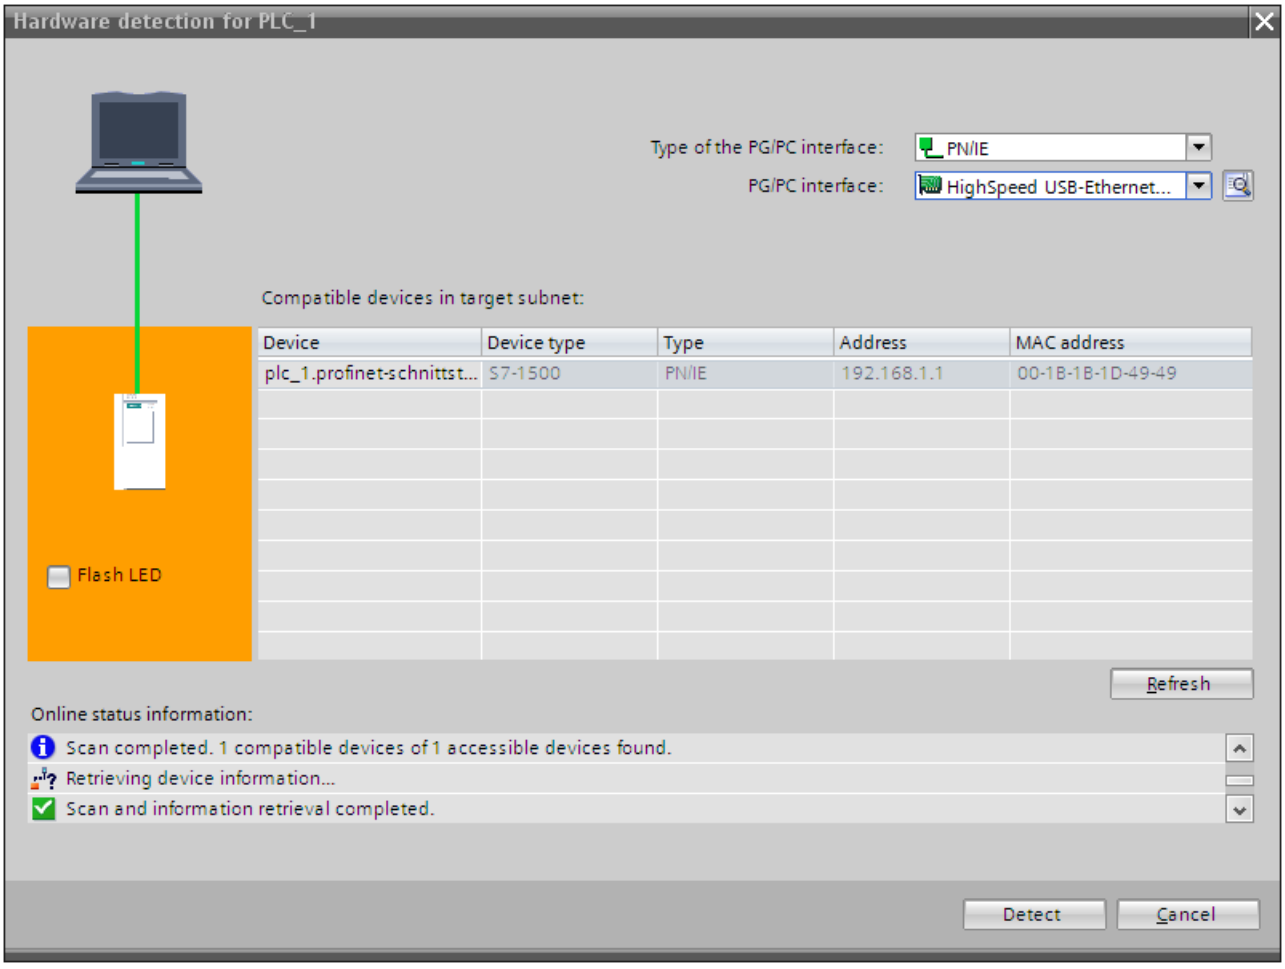

Figure 1-529 Hardware detection dialog box

Result of the hardware detection

STEP 7 has read out the hardware configuration and the modules and transferred them to your project. STEP 7 assigns a valid default parameter assignments for all modules. You can change the parameter assignment subsequently.

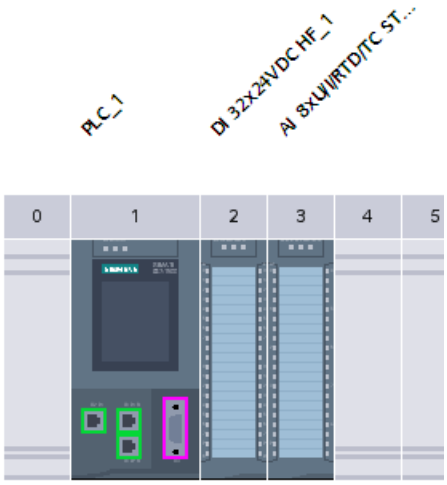

Figure 1-530 Result of the hardware detection in the device view

NOTE

If you want to go online after the hardware detection, you have to first download the detected configuration to the CPU; otherwise, an error may occur due to inconsistent configurations.
You can find an example of downloading a project to the CPU with STEP 7 in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/de/view/42637263/en).

Properties of the CPUs

The properties of the CPUs have special significance for system behavior. For a CPU you can make the following settings in STEP 7, for example:

- Startup characteristics
- Parameter assignment of the interfaces, for example, IP address, subnet mask
- Web server, e.g., activation, user administration, and languages
- OPC UA server
- Global Security Certificate Manager
- Cycle times, e.g., maximum cycle time
- Properties for the operation of the display
- System and clock memory
- Protection level for access protection with assigned password parameter
- Time and day settings (daylight saving/standard). For additional information, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/de/view/43566349/en).

The properties that can be set and the corresponding value ranges are specified by STEP 7. Fields that cannot be edited are grayed out.

Reference

Information about the individual settings can be found in the STEP 7 online help and in the manuals of the relevant CPUs.

9.1.2 Address assignment

9.1.2.1 Addressing - overview

Introduction

In order to address the automation components or modules, they must have unique addresses. The following section explains the various address areas.

I/O address

I/O addresses (input/output addresses) are required in the user program to read inputs and set outputs.

STEP 7 automatically assigns input and output addresses when modules are configured. Each module uses a continuous range of input and/or output addresses corresponding to its volume of input and output data.

Module	Rack	Slot	I address	Q address	Type	Article no.
	0	100				
PS 25W 24VDC_1	0	0			PS 25W 24VDC	6ES7 505-0KA00-0AB0
▸ PLC_1	0	1			CPU 1518-4 PN/DP	6ES7 518-4AP00-0AB0
DI 32x24VDC HF_1	0	2	0...3		DI 32x24VDC HF	6ES7 521-1BL00-0AB0
DQ 8x230VAC/5A ST_1	0	3		0	DQ 8x230VAC/5A ST	6ES7 522-5HF00-0AB0
AI 8xU/I/RTD/TC ST_1	0	4	4...19		AI 8xU/I/RTD/TC ST	6ES7 531-7KF00-0AB0
AQ 4xU/I ST_1	0	5		1...8	AQ 4xU/I ST	6ES7 532-5HD00-0AB0

Figure 1-531 Example with input / output addresses from STEP 7

STEP 7 assigns the address areas of the modules by default to the process image partition 0 ("Automatic updating"). This process image partition is updated in the main cycle of the CPU.

Device address (e.g., Ethernet address)

Device addresses are addresses of modules with interfaces to a subnet (e.g., IP address or PROFIBUS address). They are required to address the various devices on a subnet, for example, to download a user program.

Hardware identifier

STEP 7 automatically assigns a hardware identifier (HW identifier) for identification and addressing of modules and submodules. The HW identifier is used, for example, for diagnostics alarms or for instructions, to identify the faulty module or the addressed module.

The "System constants" tab contains all hardware identifiers and their symbolic names (of HW identifier) for the selected module.

The HW identifiers and names of all modules of a device are also available in the default tag table on the "System constants" tab.

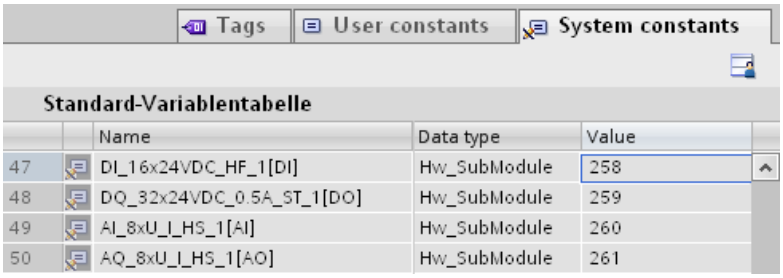

Figure 1-532 Example of a default tag table from STEP 7

9.1.2.2 Addressing digital modules

Introduction

The following section describes the addressing of the digital modules. In your user program, you require the addresses of the channels of the digital module.

Digital module addresses

The address of a digital module's input or output is composed of the byte address and the bit address. The channels of the digital module are assigned bit addresses.

Example: **I 1.2**

The example consists of:

I	Input	-
1	Byte address	The byte address depends on the module start address
2	Bit address	You read the bit address from the module

When you insert a digital module into a free slot, STEP 7 assigns a default address. You can change the proposed default address in STEP 7.

Example for the assignment of channel addresses (digital module)

The following figure shows how the addresses of the individual channels of the digital input module are determined.

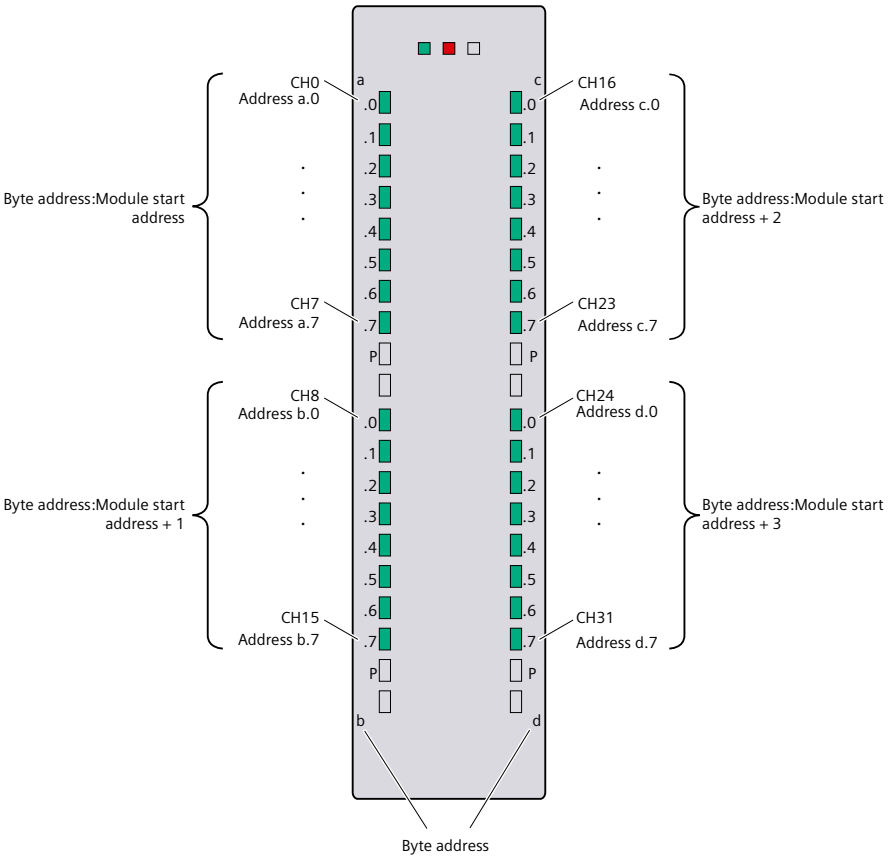

Figure 1-533 Example for the assignment of channel addresses (digital module)

NOTE

You can assign symbolic names to the addresses at the following locations in STEP 7:

- PLC tag table
- Properties of the module in the "IO Tags" tab.

Value status

The value status is additional binary information of a digital input or output signal. It is entered simultaneously with the process signal in the process image input and provides information about the validity of the input or output signal.

The value status of a module informs you whether the value of the corresponding channel can be read or output. You can respond to this information with simple binary operations in the user program without having to evaluate the diagnostics information of the module for this. Configured diagnostics in STEP 7 is not necessary for output of the value status.

If you enable the value status for a digital module, then additional bytes are allocated in the input address area. Each bit in the value status is assigned to a channel and provides

information about the validity of the process value. You can find the assignment in the product manual for the respective I/O module.

The value status is influenced by all diagnostics that might falsify the process value, e.g. wire break, short-circuit.

- 1_B: A valid process value is being output or read for the channel.
- 0_B: A substitute value is being output for the channel, or the channel is deactivated, faulty or inaccessible.

You can find more information on evaluation and processing of the value status for fail-safe digital modules in the SIMATIC Safety – Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126) manual.

Reference

More information on addressing and address allocation with value status can be found in the manuals of the digital modules, and in the online help for STEP 7. An example of the evaluation of the value status in the user program is available in the function manual Diagnostics (https://support.automation.siemens.com/WW/view/en/59192926).

9.1.2.3 Addressing analog modules

Introduction

The following section describes the addressing of the analog modules. In your user program, you require the addresses of the channels of the analog module.

Analog module addresses

The address of an analog channel is always a word address. The channel address depends on the module start address. STEP 7 automatically assigns the channel addresses during configuration. Based on the module start addresses, STEP 7 assigns the channel addresses in increasing sequence (in the following figure, the module start address is 256).

When you insert an analog module into a free slot, STEP 7 assigns a default address. You can change the assigned default address in STEP 7.

Example for the assignment of channel addresses (analog module)

The following figure shows how the addresses of the individual channels of an analog input module are determined when the module has the start address 256.

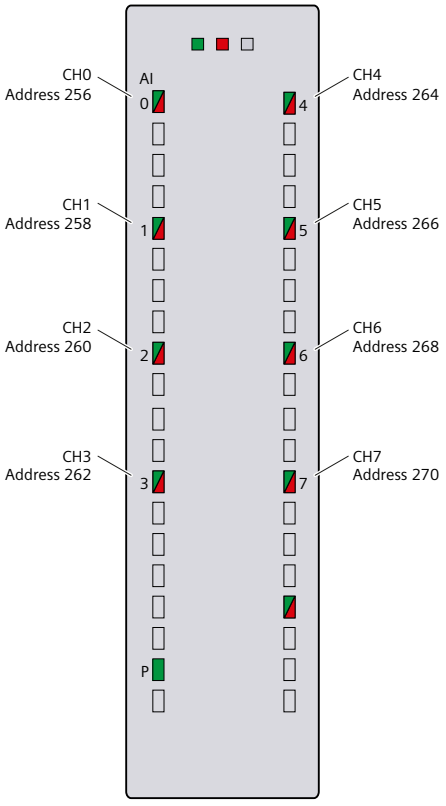

Figure 1-534 Example for the assignment of channel addresses (analog module)

NOTE

You can assign symbolic names to the addresses at the following locations in STEP 7:

- PLC tag table
- Properties of the module in the "IO Tags" tab.

Value status

The value status is additional binary information of an analog input or output value. It is entered simultaneously with the process value in the process image input and provides information about the validity of the analog value.

The value status of a module informs you whether the value of the corresponding channel can be read or output. You can respond to this information with simple binary operations in the user program without having to evaluate the diagnostics information of the module for this. Configured diagnostics in STEP 7 is not necessary for output of the value status.

If you enable the value status for an analog module, then additional bytes are allocated in the input address area. Each bit in the value status is assigned to a channel and provides information about the validity of the process value. You can find the assignment in the product manual for the respective I/O module.

The value status is influenced by all diagnostics that might falsify the process value, e.g. wire break, short-circuit.

- 1_B: A valid process value is being output or read for the channel.
- 0_B: A substitute value is being output for the channel, or the channel is deactivated, faulty or inaccessible.

Reference

More information on addressing and address allocation with value status can be found in the manuals of the analog modules, and in the online help for STEP 7. A detailed description of the value status for analog modules is available in the function manual Analog value processing (https://support.automation.siemens.com/WW/view/en/67989094). An example of the evaluation of the value status in the user program is available in the function manual Diagnostics (https://support.automation.siemens.com/WW/view/en/59192926).

9.1.3 Process images and process image partitions

9.1.3.1 Process image - overview

Process image of the inputs and outputs

The process image of the inputs and outputs is an image of the signal states. The CPU transfers the values from the input and output modules to the process image in this memory area. At the start of the cyclic program, the CPU transfers the process image output as a signal state to the output modules. The CPU then transfers the signal states of the input modules to the process image inputs.

Advantages of the process image

A process image accesses a consistent image of the process signals during cyclic program execution. If a signal state at an input module changes during program processing, the signal state is retained in the process image. The CPU does not update the process image until the next cycle.

Consistency of the process image

When the process image is updated, the S7-1500 accesses the data of each submodule as consistent data. The maximum data width that is accessed as consistent data for each submodule is dependent on the IO system. For PROFINET IO, for example, this data width is 1024 bytes.

32 process image partitions

By means of process image partitions, the CPU synchronizes the updated inputs/outputs of particular modules with defined user program sections.

In the S7-1500 automation system, the overall process image is subdivided into up to 32 process image partitions (PIP).

The CPU automatically updates PIP 0 (automatic update) in each program cycle and assigns it to OB 1.

You can assign the process image partitions PIP 1 to PIP 31 to the other OBs during configuration of the input/output modules.

The CPU always reads the process image partition of the inputs (PIPI) before processing the associated OB. The CPU outputs the process image of the outputs (PIPQ) at the end of the OB.

The figure below illustrates the updating of a process image partition.

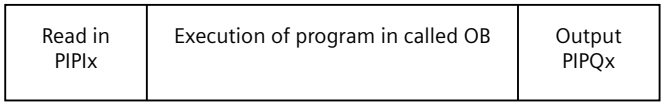

Figure 1-535 process image

9.1.3.2 Update process image partitions in the user program

Requirements

Alternatively, you can also use the following instructions to update process images:

- Instruction "UPDAT_PI"
- Instruction "UPDAT_PO"

You will find the instructions in STEP 7 in the "Instructions" task card under "Extended instructions". The instructions can be called from any point in the program.

Requirements for updating process image partitions with the "UPDAT_PI" and "UPDAT_PO" instructions:

- The process image partitions must not be assigned to any OB. This means the process image partitions are not automatically updated.

NOTE

Update of PPI 0

PIP 0 (automatic update) cannot be updated with the "UPDAT_PI" and "UPDAT_PO" instructions.

UPDAT_PI: Update process image partition of the inputs

With this instruction you read the signal states from the input modules into the process image partition of the inputs (PIPI).

UPDAT_PO: Update process image partition of the outputs

With this instruction you transmit the process image partition of the outputs to the output modules.

Isochronous mode interrupt OBs

In the isochronous mode interrupt OBs you use the instructions "SYNC_PI" and "SYNC_PO" to update the process image partitions. Additional information on isochronous mode interrupt OBs is available in the STEP 7 online help.

Direct I/O access to the inputs and outputs of the module

You also have direct read and write access to the I/O, as an alternative to access via the process image, should direct access be required for programming reasons. A direct (write) I/O access also writes the process image. This prevents the situation where a subsequent output of the process image overwrites the value written via direct access again.

Reference

Additional information on process image partitions is available found in the function manual, Cycle and response times (https://support.automation.siemens.com/WW/view/en/59193558).

9.2 Configuring ET 200MP distributed I/O system

Introduction

You configure and assign parameters to the ET 200MP (interface module and I/O modules) with STEP 7 or in the configuration software of another manufacturer.

Requirements

Table 1-821 Requirements for installation

Configuration software	Requirements	Installation information
STEP 7 as of V13 [1]	• IM 155-5 PN ST and IM 155-5 DP ST: as of firmware version V2.0.0 • IM 155-5 PN HF: as of firmware version V1.0.0 • IM 155-5 MF HF: Firmware version V5.0.0 or higher • PROFINET: PROFINET GSD files (https://support.industry.siemens.com/cs/ww/de/view/68189683/en?dl=en) • PROFIBUS: PROFIBUS GSD files (https://support.industry.siemens.com/cs/de/de/view/80206700/en?dl=en)	• The TIA Portal supports the following GSDML specifications: – TIA Portal V11: V2.3 – TIA Portal V12SP1: V2.31 – TIA Portal V14: V2.32 – TIA Portal V15: V2.34 • The GSDML versions are largely downwards compatible. • The ET 200MP is already delivered with a GSD file based on specification V2.3. The GSD file can be installed and used in the TIA Portal. STEP 7 online help
STEP 7 V5.5 SP4 HF1 or higher	• PROFINET: PROFINET GSD files (https://support.automation.siemens.com/WW/view/en/19698639/13000-0) • PROFIBUS: PROFIBUS GSD files (https://support.automation.siemens.com/WW/view/en/10805317/13330-0)	STEP 7 online help
Software of another manufacturer		Manufacturer documentation

[1] STEP 7 does not support all the PROFINET features contained in the GSDML specifications. Non-supported features cannot be used with GSD devices.

Reference

You can find an overview of the most important documents and links to STEP 7 in the following FAQ on the Internet (https://support.industry.siemens.com/cs/de/de/view/65601780/en).

Configuring operation on PROFIBUS DP using a GSD file

If you want to configure the operation on the PROFIBUS DP with GSD file, you need to note the following additional requirements:

Table 1-822 Requirements for PROFIBUS DP with GSD file

I/O modules	Required firmware version IM 155-5 DP ST as of ...	Required firmware version I/O modules as of ...
Input/output modules 35 mm	V1.0.0	V2.0
Input/output modules 25 mm	V2.0.0	V1.0
Technology modules (TM)	V2.0.0	V1.1
Communications modules CM PtP	V1.0.0	V1.0.1

9.3 Assigning PROFIsafe address to fail-safe modules with SIMATIC Safety

The PROFIsafe address is saved permanently on the electronic coding element of the S7-1500/ET 200MP fail-safe modules. You can find additional information on the electronic coding element in the section Replacing the coding element at the power connector of the system power supply and load current supply (Page 358).

NOTE

The supply voltage L+ must be applied to the F-module during the assignment of the PROFIsafe address (F-destination address together with F-source address).

For additional information on assigning the PROFIsafe address (F-destination address together with the F-source address), refer to the SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126) programming and operating manual and the online help.

Basics of program execution

10

10.1 Events and OBs

Triggers

The table below gives an overview of the possible event sources for start events and their OBs.

Table 1-823 Triggers

Event sources	Possible priorities (default priority)	Possible OB numbers	Default system reaction [1]	Number of OBs
Startup [2]	1	100, ≥ 123	Ignore	0 to 100
Cyclic program [2]	1	1, ≥ 123	Ignore	0 to 100
Time-of-day interrupt [2]	2 to 24 (2)	10 to 17, ≥ 123	Not applicable	0 to 20
Time-delay interrupt [2]	2 to 24 (3)	20 to 23, ≥ 123	Not applicable	0 to 20
Cyclic interrupt [2]	2 to 24 (8 to 17, frequency dependent)	30 to 38, ≥ 123	Not applicable	0 to 20
Hardware interrupt [2]	2 to 26 (16)	40 to 47, ≥ 123	Ignore	0 to 50
Status interrupt	2 to 24 (4)	55	Ignore	0 or 1
Update interrupt	2 to 24 (4)	56	Ignore	0 or 1
Manufacturer-specific or profile-specific interrupt	2 to 24 (4)	57	Ignore	0 or 1
Isochronous mode interrupt	16 to 26 (21)	61 to 64, ≥ 123	Ignore	0 to 2
Time error [3]	22	80	Ignore	0 or 1
Maximum cycle time exceeded once			STOP	
Diagnostic interrupt	2 to 26 (5)	82	Ignore	0 or 1
Removal/insertion of modules	2 to 26 (6)	83	Ignore	0 or 1
Rack error	2 to 26 (6)	86	Ignore	0 or 1
MC_Servo [4]	17 to 26 (26)	91	Not applicable	0 or 1
MC_PreServo [4]	corresponds to MC_Servo priority	67	Not applicable	0 or 1
MC_PostServo [4]	corresponds to MC_Servo priority	95	Not applicable	0 or 1
MC_Interpolator [4]	16 to 26 (24)	92	Not applicable	0 or 1
MC_PreInterpolator [4]	corresponds to MC_Interpolator priority	68	Not applicable	0 or 1
MC_LookAhead [4]	15 to 16 (15)	97	Not applicable	0 or 1

Event sources	Possible priorities (default priority)	Possible OB numbers	Default system reaction [1]	Number of OBs
MC_Transformation [4]	17 to 25 (25)	98	Not applicable	0 or 1
Programming error (only for global error handling)	2 to 26 (7)	121	STOP	0 or 1
I/O access error (only for global error handling)	2 to 26 (7)	122	Ignore	0 or 1

1) If you have not configured the OB.

2) For these event sources, apart from the permanently assigned OB numbers (see column: possible OB numbers), you can also assign OB numbers from the range ≥ 123 in STEP 7.

3) If the maximum cycle time has been exceeded twice within a cycle, the CPU always switches to STOP regardless of whether you have configured OB80.

4) For more information about these event sources and the runtime behavior, see the S7-1500/S7-1500T Motion Control Function Manuals.

Response to start events

The occurrence of a start event results in the following reaction:

- If the event comes from an event source to which you have assigned an OB, this event triggers the execution of the assigned OB. The event enters the queue according to its priority.
- If the event comes from an event source to which you have not assigned an OB, the CPU executes the default system reaction.

NOTE

Some event sources, such as startup, pull/plug, exist even if you do not configure them.

Assignment between event source and OBs

The type of OB determines where you assign OB to event source:

- For hardware interrupts and isochronous mode interrupts: The assignment is made during the configuration of the hardware or when the OB is created.
- With MC_Servo, MC_PreServo, MC_PostServo, MC_Interpolator and MC_PreInterpolator: Automatic assignment of OBs 91/92 by STEP 7 as soon as you add a technology object.
- For all other OB types: Assignment when the OB is created, where applicable after you have configured the event source.

For hardware interrupts, you can change an assignment which has already been made during runtime with the instructions ATTACH and DETACH. In this case, only the actually effective assignment changes, and not the configured assignment. The configured assignment takes effect after loading, and upon each startup.

The CPU ignores hardware interrupts to which you did not assign an OB in your configuration or which occur after the DETACH instruction. The CPU does not check whether an OB is assigned to this event when an event arrives, but only prior to the actual processing of the hardware interrupt.

OB priority and runtime behavior

If you have assigned an OB to the event, the OB has the priority of the event. S7-1500 CPUs support the priority classes 1 (lowest) to 26 (highest). The following items are essential to the execution of an event:

- Call and execution of the assigned OB
- The update of the process image partition of the assigned OB

The user program processes the OBs exclusively on a priority basis. This means the program processes the OB with the highest priority first when multiple OB requests occur at the same time. If an event occurs that has a higher priority than the currently active OB, this OB is interrupted. The user program processes events of the same priority in order of occurrence.

NOTE

Communication

The communication (for example, test functions with the PG) always works with priority 15. To avoid unnecessarily prolonging the program runtime in the case of time-critical applications, make sure that these OBs are not interrupted or delayed by the communication. Assign a priority > 15 for these OBs.

Programming guideline and programming style guide

The programming guideline contains many recommendations and tips for optimal programming of the S7-1500 automation system.

The programming guidelines described in the programming style guide help you to create a uniform program code. You can better maintain and reuse the uniform program code. This allows you to detect or avoid errors early on, for example, through compilers.

You can find the programming guideline and programming style guide on the Internet (https://support.industry.siemens.com/cs/us/en/view/81318674).

Reference

More information on organization blocks is available in the STEP 7 online help.

10.2 Asynchronous instructions

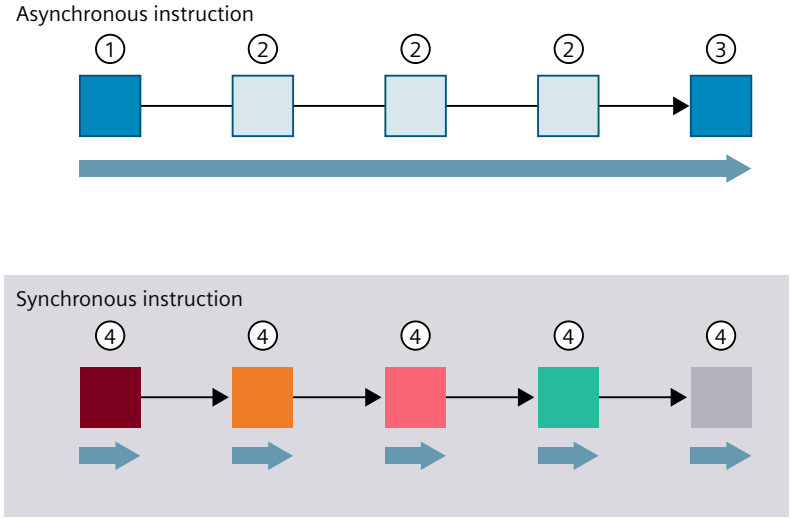
Introduction

Program execution makes a distinction between synchronous and asynchronous instructions.

The "synchronous" and "asynchronous" properties relate to the temporal relationship between the call and execution of the instruction.

The following applies to synchronous instructions: When the call of a synchronous instruction is complete, execution of the instruction is also complete.

This is different in the case of asynchronous instructions: When the call of an asynchronous instruction is complete, execution of the asynchronous instruction is not necessarily complete yet. This means the execution of an asynchronous instruction can extend over multiple calls.



The CPU processes asynchronous instructions in parallel with the cyclic user program. Asynchronous instructions generate jobs in the CPU for their processing.

Asynchronous instructions are usually instructions for transferring data, for example data records for modules, communication data, or diagnostics data.

Difference between synchronous/asynchronous instructions

The figure below shows the difference between the processing of an asynchronous instruction and a synchronous instruction. In this figure the CPU calls the asynchronous instruction five times before its execution is complete, for example, a data record has been completely transferred.

In the case of a synchronous instruction, this is completely executed with each call.

① First call of the asynchronous instruction, start of execution
② Intermediate call of the asynchronous instruction, execution continues.
③ Last call of the asynchronous instruction, completion of execution
④ A job is fully processed by a synchronous instruction with each call.
➡ Duration of a fully processed job

Figure 1-536 Difference between asynchronous and synchronous instructions

Parallel processing of asynchronous instruction jobs

A CPU can process several asynchronous instruction jobs in parallel. The CPU processes the jobs in parallel under the following conditions:

- Jobs for an asynchronous instruction are started while other jobs for that instruction are still running.
- The maximum number of simultaneously running jobs for the instruction is not exceeded.

The figure below shows the parallel processing of two jobs of the WRREC instruction. The two instructions are executed simultaneously for a certain duration.

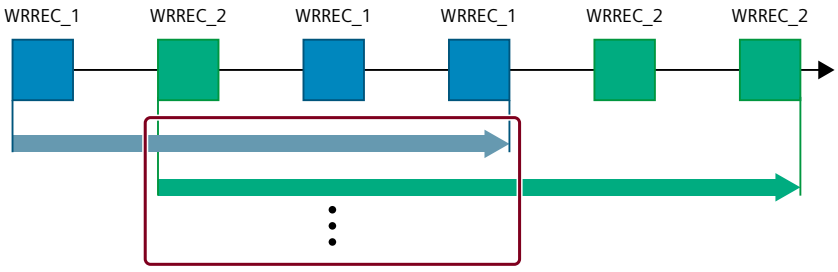


Figure 1-537 Parallel processing of the asynchronous instruction WRREC

NOTE

Dependencies between asynchronous instructions

The call sequence in the user program may differ from the processing sequence of the asynchronous instructions. This can lead to problems with dependencies between asynchronous instructions.

Solution: To ensure correct timing of processing, use the status outputs of the asynchronous instructions in a sequencer. The next asynchronous instruction should only start when an asynchronous instruction is completed and this is acknowledged via the parameter DONE.

Example: For the RecipeImport and RecipeExport recipe phases, you need a CSV file for the recipe data. If you use the same CSV file for import and export, then the two asynchronous instructions are interdependent. In a sequencer, link the status of the DONE parameter of the RecipeImport instruction in the transition to the next step where the RecipeExport is executed. The link thus ensures correct processing.

Assigning calls of an instruction to a job

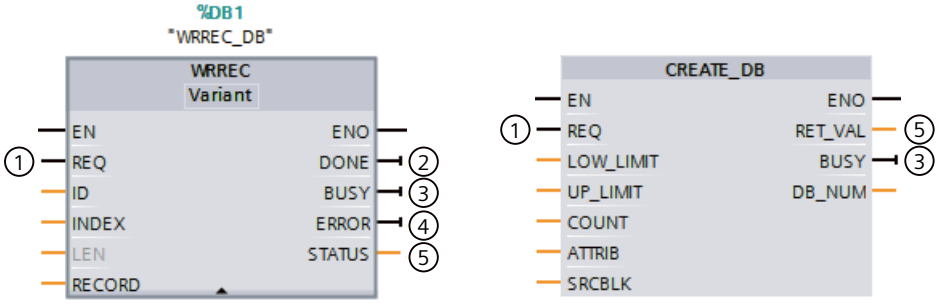
To execute an instruction over multiple calls, the CPU must be able to uniquely relate a subsequent call to a running job of the instruction.

To relate a call to a job, the CPU uses one of the following two mechanisms, depending on the type of the instruction:

- Using the instance data block of the instruction (for "SFB" type)
- Using job-identifying input parameters of the instruction. These input parameters must match in each call during processing of the asynchronous instruction.
  Example: A job of the "Create_DB" instruction is identified by input parameters LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB and SRCBLK.

  The following table shows which input parameters you use to identify which instruction.

Table 1-824 Identifying input parameters for asynchronous instructions



Instruction	Job is identified by
DPSYC_FR	LADDR, GROUP, MODE
D_ACT_DP	LADDR
DPNRM_DG	LADDR
WR_DPARM	LADDR, RECNUM
WR_REC	LADDR, RECNUM

Instruction	Job is identified by
RD_REC	LADDR, RECNUM
CREATE_DB	LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB, SRCBLK
READ_DBL	SRCBLK, DSTBLK
WRIT_DBL	SRCBLK, DSTBLK
RD_DPARA	LADDR, RECNUM
DP_TOPOL	DP_ID

Status of an asynchronous instruction

An asynchronous instruction shows its status via the block parameters STATUS/RET_VAL and BUSY. Many asynchronous instructions also use the block parameters DONE and ERROR.

The figure below shows the two asynchronous instructions WRREC and CREATE_DB.

① The input parameter REQ starts the job to execute the asynchronous instruction.
② The output parameter DONE indicates that the job was completed without error.
③ The output parameter BUSY indicates whether the job is currently being executed. When BUSY=1, a resource is allocated for the asynchronous instruction. When BUSY= 0, the resource is free.
④ The output parameter ERROR indicates that an error has occurred.
⑤ The output parameter STATUS/RET_VAL provides information on the status of the job execution. The output parameter STATUS/RET_VAL receives the error information after the occurrence of an error.

Figure 1-538 Block parameters of asynchronous instructions using the instructions WRREC and CREATE_DB as examples.

Summary

The table below provides you with an overview of the relationships described above. It shows in particular the possible values of the output parameters if execution of the instruction is not complete after a call.

NOTE

You must evaluate the relevant output parameters in your program after each call

Table 1-825 Relationship between REQ, STATUS/RET_VAL, BUSY and DONE during a "running" job.

Seq. no. of the call	Type of call	REQ	STATUS/RET_VAL	BUSY	DONE	ERROR
-	Idle	0	W#16#7000	0	0	0
1	First call	1	W#16#7001	1	0	0
			Error code (for example, W#16#80C3 for lack of resources)	0	0	1
2 to (n - 1)	Intermediate call	Not relevant	W#16#7002	1	0	0
n	Last call	Not relevant	W#16#0000, if no errors have occurred.	0	1	0
			Error code if errors occurred.	0	0	1

Use of resources

Asynchronous instructions use resources in the CPU during their execution. The resources are limited depending on the type of CPU and instruction. The CPU can only simultaneously process a set maximum number of asynchronous instruction jobs. The resources are available again after a job has been processed successfully or with errors.

Example: For the RDREC instruction, an S7-1500 CPU can process up to 20 jobs in parallel.

If the maximum number of concurrent jobs for an instruction is exceeded, the following occurs:

- The instruction returns the error code 80C3 (lack of resources) in the block parameter STATUS.
- The CPU stops execution of the job until a resource becomes free again.

NOTE

Lower-level asynchronous instructions

Some asynchronous instructions use one or more lower-level asynchronous instructions for their processing. This dependence is shown in the tables below.

Please note that each lower-level instruction typically occupies one resource in the instruction's resource pool.

Extended instructions: maximum number of simultaneously running jobs

Table 1-826 Maximum number of simultaneous jobs for asynchronous extended instructions and lower-level instructions used

Maximum number of simultaneously running jobs for asynchronous instructions for OPC UA.

The maximum number of simultaneously running jobs for asynchronous instructions for OPC UA can be found in the respective equipment manual in the technical specifications section or on the Internet (https://sieportal.siemens.com/su/blVMV).

For the OPC UA instructions for session management or data access, you need the following values from the technical specifications to calculate the maximum number of jobs running at the same time:

- Number of connections, max.
- Number of simultaneous calls of the client instructions for session management, per connection, max.
- Number of simultaneous calls of the client instructions for data access, per connection, max.

In addition to the OPC UA instructions, the following table shows the use and calculation of the maximum number of jobs running at the same time.

OPC UA instruction	Use	Calculation
OPC_UA_Connect	Session management	"Number of connections, max." multiplied by "Number of simultaneous calls of the client instructions for session management, per connection, max."
OPC_UA_NamespaceGetIndexList		
OPC_UA_NodeGetHandleList		
OPC_UA_MethodGetHandleList		
OPC_UA_TranslatePathList		
OPC_UA_NodeReleaseHandleList		
OPC_UA_MethodReleaseHandleL-ist		
OPC_UA_Disconnect		
OPC_UA_ConnectionGetStatus		
OPC_UA_ReadList	Data access	"Number of connections, max." multiplied by "Number of simultaneous calls of the client instructions for data access, per connection, max."
OPC_UA_WriteList		
OPC_UA_MethodCall		The value can be taken directly from the technical specifications.

Technology: maximum number of simultaneously running jobs

Protection

11

11.1 Overview of the protection functions

Advantages and customer benefits of protection functions

The protection functions listed protect your investments from unauthorized access and manipulation, helping to secure plant availability.

Protection functions

To set up secure networks, the SIMATIC S7-1500 automation system offers an integrated security concept:

Table 1-833 Overview of protection functions

Protection function	Description	S7-1500	ET 200MP
Integrity protection	The CPUs come with integrity protection functions as standard. These help detect any manipulations: • In the engineering data on the SIMATIC Memory Card; see also information on the integrity protection of the SIMATIC Memory Card as of CPU FW version V3.1 in the next section • In the engineering data during data transfer between TIA Portal and CPU • In the engineering data during data transfer between HMI system and CPU • In the encrypted firmware	✓	---
Protection of confidential configuration data	Protection of confidential CPU configuration data	✓	---
Central user management (as of FW version V4.0)	Connection of a central server (UMC server) that is responsible for the administration and authentication of users. The central user management UMC (User Management Component) allows management of user groups and users independently of TIA Portal for extensive automation solutions.	✓	---
Local user management (as of FW version V3.1)	Improved management of users, roles, and CPU function rights (User Management & Access Control, UMAC). You can use the local user management in the editor to manage all project users along with their rights (e. g. access rights) for project users and roles in the TIA Portal.	✓	---
Access protection (up to FW version V3.0)	Protection against unauthorized configuration changes using authorization levels	✓	---

Protection function	Description	S7-1500	ET 200MP
Know-how protection	Protection against unauthorized access and modifications to algorithms with password protection	✓	---
Copy protection	Protection against duplication of programs by linking individual blocks to the serial number of the original memory card on the SIMATIC Memory Card	✓	---
Protection by locking the CPU/interface module	Protection against unauthorized access by locking the front cover with a seal or a lock	✓	✓

You can find more information about security mechanisms of the SIMATIC automation systems in the Security with SIMATIC S7 controllers (https://support.industry.siemens.com/cs/ww/en/view/77431846) document and in the Communication (https://support.industry.siemens.com/cs/us/en/view/59192925) Function Manual.

Integrity protection of the SIMATIC Memory Card, as of CPU FW version V3.1 or higher

With CPUs as of FW version V3.1, the integrity protection of the SIMATIC Memory Card depends on the password for protecting confidential configuration data that you assigned during the configuration of the CPU. This results in the following changes when using SIMATIC Memory Cards:

- To transfer a CPU to a card reader/USB memory device via drag and drop:
  For CPUs as of FW version V3.1, you need to enter the password of the CPU you want to use with the SIMATIC Memory Card. If you enter an incorrect password, the CPU does not start booting after power on and reports the content of the SIMATIC Memory Card as faulty.
- To insert a CPU from a card reader/USB memory device:
  In order to be able to verify the integrity of the included configuration in STEP 7, you must enter the password of the CPU from which the project was loaded. In this case, STEP 7 checks the data on the SIMATIC Memory Card and reports potential damage.
  Entering the password is optional. If you do not want to use the integrity check, you do not need to enter the password (restore project).

For CPUs as of FW version V4.1, you can select whether you also want to protect the entire configuration of the CPU in addition to protecting the configuration data. The data is stored encrypted in the SIMATIC.S7S folder on the SIMATIC Memory Card and can only be decrypted with the password for protection of confidential configuration data.
If you revoke or add the setting for protection of all data, the contents of the SIMATIC.S7S folder on the SIMATIC Memory Card will be deleted at the next download to the CPU. Other files, such as recipes or backup files on the SIMATIC Memory Card, are not deleted. After the deletion, the CPU performs a restart.

You can find more information about the folder structure on the SIMATIC Memory Card in the "Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101)" Function Manual.

Secure communication

There is an increasing need to transfer data to external computers in encrypted form via Intranet or public networks.

SIMATIC S7-1500 CPUs and ET 200 CPUs with firmware version 2.0 or higher support the Internet PKI (RFC 5280) with STEP 7 as of V14. This makes the configuration and the operation of secure communication possible, for example:

- Hypertext Transfer Protocol Secure (HTTPS)
- Secure Open User Communication
- Secure communication with OPC UA

A public key infrastructure (PKI) can issue, distribute and check digital certificates. For S7-1500 CPUs, you create certificates for various applications in the CPU properties in STEP 7, for example: TLS certificates for Secure Open User Communication, web server certificates, OPC UA certificates.

SIMATIC S7-1500 CPUs and ET 200 CPUs from firmware version 2.9 support with STEP 7 and WinCC as of Version 17 innovated and standardized secure PG/PC and HMI communication – referred to as Secure PG/HMI communication for short.

Further measures for protecting the CPU

The following measures additionally increase the protection against unauthorized access to functions and data of the S7-1500 CPU from external sources and via the network:

- Deactivation of the Web server
- Disabling the OPC UA server (you can find more information on the security mechanisms for OPC UA server in the Communication (https://support.industry.siemens.com/cs/us/en/view/59192925) Function Manual)
- Deactivation of the time synchronization via an NTP Server
- Deactivation of the PUT/GET communication
- Deactivation of SNMP

When you use the Web server, protect your S7-1500 automation system against unauthorized access:

- By setting password-protected access rights for specific users in the user administration.
- By using the pre-set option "Permit access only via HTTPS".
  The option allows access to the web server only with the secure hypertext transmission protocol HTTPS.

When you use the OPC UA server, protect your S7-1500 automation system against unauthorized access:

- By not setting up OPC UA server access for the "Anonymous" user.
- By disabling the "Automatically accept client certificates during runtime" option.

Security functions in communications processors

Communications processors support security functions, such as access protection using a firewall, protection against data manipulation using VPN, FTPS, HTTPS, SNMPv3, and secure NTP.

More information

You can find more information on the protection functions described in the STEP 7 online help.

Siemens products and solutions are only one element of a comprehensive industrial security concept. Observe the additional information on Industrial Security (http://www.siemens.com/industrialsecurity).

11.2 Protection of confidential configuration data

As of STEP 7 V17, you have the option of assigning a password for protecting confidential configuration data of the respective CPU. This refers to data such as private keys that are required for the proper functioning of certificate-based protocols.

You can find detailed information on protecting confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual.

11.3 Local user management

11.3.1 Useful information on the local user administration and access control

As of TIA Portal version V19 and CPU firmware version V3.1, S7-1500 CPUs feature improved management of users, roles, and CPU function rights (User Management & Access Control, UMAC).

For HMI devices, authentication is not possible via either local or central users (TIA Portal V19/V20).

From the versions mentioned above onwards, you manage all project users along with their rights (for example, access rights) for all CPUs in the project in the editor for users and roles of the project in the TIA Portal:

- To manage users along with their rights, for example to control access rights, navigate to the "Security settings > Users and roles" area in the project tree.

TIA Portal saves the assignment of the function rights of a CPU to user-defined roles and the assignment of these roles to users for each CPU. There are no system-defined roles with predefined function rights for CPUs.

After loading the configuration, the user management becomes effective in the respective CPUs. After loading, every CPU "knows" who may access which service and execute certain functions.

This new feature is also called "local user management and access control" below.

NOTE

Support of central users and groups for CPU function rights

UMC (User Management Component) can also be used to manage users centrally in TIA Portal. With this component, you can manage central users and groups on connected UMC servers, e.g. by connecting an MS Active Directory. The authentication is then implemented via UMC. The central user management for CPU-specific function rights via UMC is supported as of TIA Portal V20 and CPU FW version V4.0 (see Useful information on central user management and access control (Page 271)).

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution - however, only if you ensure the confidentiality of the user-relevant information.

In addition, the rules for industrial cybersecurity must be observed, for example regarding the "Defense in Depth" security concept, in particular the remarks on plant security and hardening measures.

You can find detailed information in the Industrial cybersecurity (Page 40) section.

Users, roles and function rights

Users and roles were already being managed in the predecessor version by TIA Portal under "Security settings > Users and roles". In addition to the existing user management options, e.g. for HMI devices, you can also manage all CPU function rights in this editor starting from TIA Portal Version V19.

The CPU function rights are valid during runtime. Therefore, these rights are located in the "Runtime rights" tab in the editor for users and roles. For each CPU in the project, there is a section with all CPU function rights to choose from – listed according to CPU services such as PG/HMI communication (engineering access, access levels), web server, and OPC UA.

Besides the user management for projects, additional user management possibilities were available for the web server and OPC UA server in the CPU properties (static user management for CPUs up to FW version V3.0):

- Users for the OPC UA server (authentication)
- User for the web server (authentication and access control)

These additional user management options have been integrated in the local user management in the project tree as of TIA Portal V19 and CPU FW version V3.1.

Introduction to the local user management and access control

For S7-1500 CPUs up to firmware version V3.0, users were managed under the respective CPU properties, separated according to services such as "Web server" and "OPC UA". Web server users were managed in the "Web server" area, OPC UA users in the "OPC UA" area.

To restrict the PG/HMI access to the CPU at different levels, you configured passwords for the corresponding access levels. With this approach, for example, HMI access could be permitted without restriction, but write access could be made dependent on the knowledge of a password. You assigned the passwords for the different access levels in the "Protection & Security" area of the CPU properties. The access protection therefore always related to groups that have the appropriate passwords - not to individual users.

With the introduction of local user management and access control in TIA Portal version V19, you use the "Security settings > Users and roles" area in the project tree in TIA Portal to manage all users, together with their roles and function rights, of a CPU. The same holds for the access protection for engineering/HMI access, which as of TIA Portal version V19 no longer relies on access levels with password protection by default but instead on the user management.

More information on the new access protection is available here (Page 265).

As already introduced, e.g. for engineering rights, you use role assignments for combining individual function rights. In a further step, you assign the roles to individual users. All the function rights which were assigned to a user via roles and which the user can exercise for the corresponding CPU are listed In the "Assigned rights" tab.

The following figure shows an example of the available and activated function rights of a CPU. At least one user must have full access to the CPU. Otherwise, the configuration cannot be compiled. A role with full access to the CPU must be created for this.

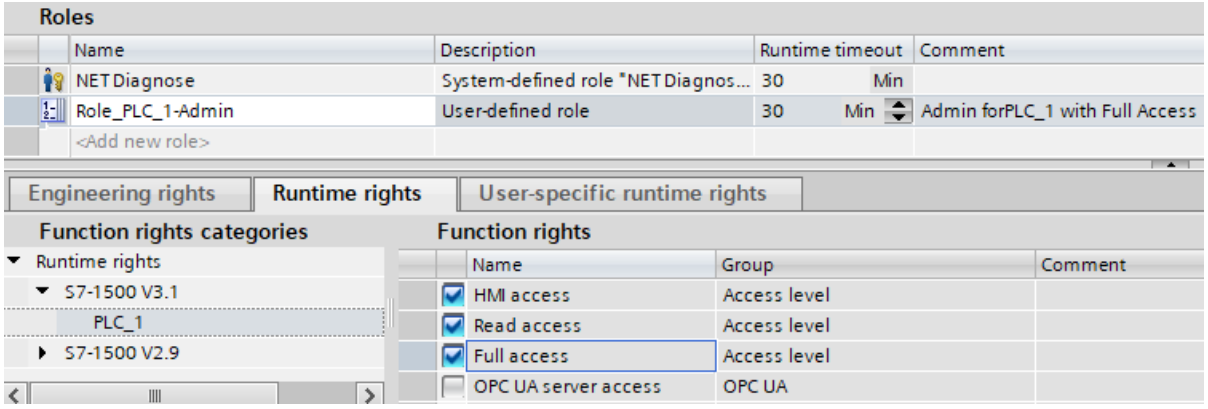

Figure 1-539 Assigning function rights of a CPU to a role

The following figure shows the assignment of the role with full access to a user ("Admin").

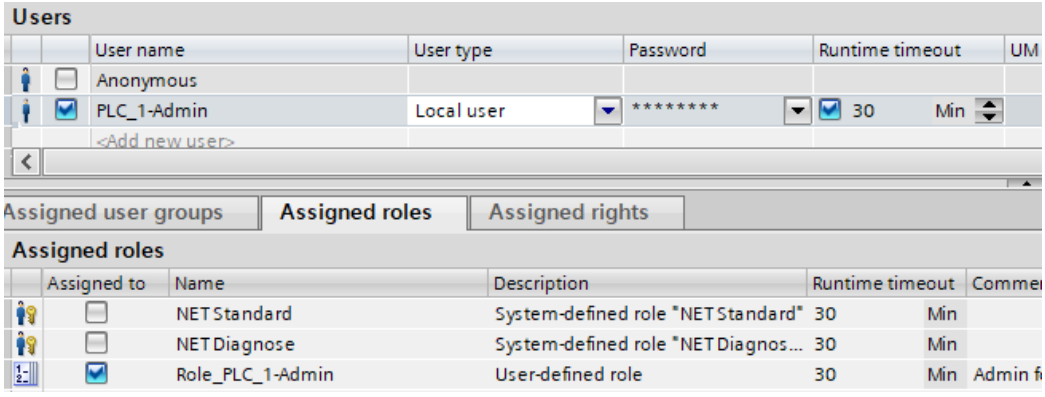

Figure 1-540 Assigning a role to a user

Requirement

CPU parameterization: To make use of users, roles and function rights for a CPU, the "Enable access control" option must be selected in the "Protection & Security > Access control" area.

In the "Configuration of user management" area, the "Local user management" option is preset, whereby the users are loaded to the CPU.

If you select the "Central user management" option, you have to add additional parameters such as the UMC server address and server ID (see Useful information on central user management and access control (Page 271)).

No project protection is required for user management.

Default characteristics

The "Activate access control" option is preset for the access control. Users can be configured with their assigned passwords and their roles and function rights.

Downloading to device

If you want to download changes to the user configuration in RUN mode, the hardware configuration in the CPU and in the STEP 7 project must be unchanged. Otherwise, a transition to STOP is required to download the user configuration together with the changed hardware configuration.

Save your STEP 7 project and then configure only the desired changes in the user configuration. Load your project into the CPU.

Changes to the access rights for the "Anonymous" user can only be loaded in STOP mode.

A fail-safe S7-1500 CPU may only load a user to whom the runtime right "Full access including fail-safe" is assigned. Otherwise, STEP 7 displays an error message when loading the configuration.

Explanations of the options for the user management download (Load preview):

- If you select the option "Keep online user management data", the local user management is not downloaded to the CPU.
- If you select the option "Download all user management data (reset to project)", all passwords changed online via WebAPI are deleted. After the download, the configured local user data is valid.
- If you select the option "Update user management data, but keep online passwords" and have not changed existing user names, the passwords changed online via WebAPI are retained. Only changes to function rights and/or roles take effect. Newly configured users are downloaded with their settings and deleted users are no longer available after the download to the CPU.
  If you have changed a user name in the project and assigned a password to this user in the project, this setting becomes valid after the download. The previously valid user name with the password changed online is deleted during the download.

Runtime timeout

You can set a runtime timeout for both the role and the user in 'Security Settings > Users and Roles'.

For an S7-1500 CPU, these settings are taken into account by the various services as follows:

- By means of the Web API you can, for example, create a web page or application that takes the settings for the runtime timeout into account. Standard web pages do not take the settings for runtime timeout into account and use the default value.
- The other services (PG/HMI communication and OPC UA server) do not use the runtime timeout; the logged-in user is not logged out after the set time.

11.3.2 Advantages of the local user administration and access control

The advantages of the new local user management for S7-1500 CPUs and the changes associated with it are described in the following.

Quick activation/deactivation of local user management

The options for user administration are located in the "Protection & Security > Access control" tab:

- Access control deactivated: Every user has full access to all functions with the exception of the GDS Push function for the online transfer of certificates.

  ⚠ WARNING

  Disabled access control carries the risk of unauthorized access and thus the risk of personal injury and property damage.
  Only use this setting in a protected environment, such as during commissioning.

- Access control enabled: The configured users with their assigned roles and concomitant linked function rights become effective after loading.

Access protection for PG/HMI accesses, now with user authentication

While it was possible to assign passwords for access levels for S7-1500 CPUs with firmware versions <V3.1, you can configure users with corresponding function rights for the current CPUs. This means that the authentication options for PG/HMI access correspond to the options offered by OPC UA or web server accesses.

All in one place

Irrespective of the service for which you configure users, roles and rights for a CPU: You have to manage the data at the same location.

All users, no matter if you manage their engineering rights for the project or their local runtime rights for each CPU in the project, can be found in the editor for users and roles in the project tree.

Powerful password functions

- Support for compliance with complexity rules for password creation:
  Already at the password creation stage, you can have the TIA Portal check for compliance with complexity rules, such as rules on password length, uppercase/lowercase letters (project tree, "Security settings > Settings" area).
  The complexity rules are also saved in the CPU when the user management is loaded. When the password is changed online, the CPU determines and considers these rules. This prevents a user from overriding the complexity rules set by the configuration engineer and assigning a non-secure password.

- The period of validity of passwords is adjustable:
  To ensure that a user does not have access to the CPU with a compromised password for an unlimited time, you can parameterize a period of validity. Before the period of validity expires, the remaining time is then displayed on login so that each user has the possibility to change their password in time.

Loading the user management during operation

As of firmware version V3.1, you can load certain security-relevant configuration data both in STOP mode and in RUN mode. This means that loading the hardware configuration does not necessarily lead to a CPU STOP.

You can make the following changes in STOP mode as well as in RUN mode (Download to device > Hardware configuration):

- Local user management extended/changed
- TIA Portal-configured certificates modified
- Syslog configuration changed

If you made additional changes to the hardware configuration (for example, modules added, parameters reassigned, etc.), then the CPU automatically requests the STOP state before loading the configuration.

So if you, for example, load just one user with modified roles/function rights to the CPU, this process does not require the CPU to be in STOP state.

The preview dialog for loading contains a security area so that you can determine when loading how the CPU should deal with user data that has changed in the meantime (not when loading for the first time). This allows changes to user data (e.g. password changes during runtime) to be retained.

Loading the device as a new station - with user data

If you load a previously configured CPU into a new project, for example, because you do not have the original project, the user data is also loaded into the project and is available for further editing of the CPU settings.

Changing of passwords during operation

You can use the web server API to write an application with which each user can change their password at runtime, provided that the original password was entered correctly and the new password corresponds to the set password guideline.

Requirement: You have enabled access control for the CPU.

A user can change their own password at any time, even if the password has expired. If the password has expired, the user must change the password. Login will not be possible with an expired password.

API methods used:

- Api.ChangePassword
- Api.GetPasswordPolicy

You can find more information about the API methods in the Web server Function Manual (https://support.industry.siemens.com/cs/de/en/view/59193560).

NOTE

Passwords changed at runtime take priority over loaded passwords

If you have changed your password during running operation and subsequently load your project, the password assigned during runtime takes precedence over the password set in the project (default setting).

If you want to overwrite the passwords changed during runtime by loading the project, you have to select the option "Load all user management data (reset to project data)". In this case, **all** passwords changed during runtime will be lost.

11.3.3 From the access level to the function right of users

The following section shows how to implement access protection with the new local user management for CPUs.

Access levels as function rights

With S7-1500 CPUs up to FW version V3.0, access could only be controlled via passwords. With CPUs as of FW version V3.1, you can create the appropriate users and roles with the necessary function rights for access control. The assignment between access level and the associated function right results from the already known access levels:

- Users who are to have full access must have a role with the function right "Full access", or "Full access incl. failsafe" for F-CPUs.

  A CPU configuration can only be compiled and loaded if at least one user has the function right "Full access" or "Full access incl. failsafe".
- Users who are to have read access must have a role with the function right "Read access".
- Users who are to have HMI access must have a role with the function right "HMI access".

If a user does not have any of these specified function rights, that user also has no access to the CPU.

The hierarchical organization of the access levels also remains the same for the corresponding function rights:

- A user with full access also has the function rights "Read access" and "HMI access".
- A user with read access also has the function right "HMI access".

NOTE

Compatibility of the "ENDIS_PW" instruction

The "ENDIS_PW" instruction can only be used to disable or enable passwords for access levels. The "ENDIS_PW" instruction has no effect on assigned rights for users or roles.

Continuing to use access levels

Even though the new local user management replaces the usual access protection via corresponding function rights of individual users, there is still the possibility to continue to use this familiar access protection. This is required, for example, for HMI devices which only support access levels and which do not benefit yet from possibilities of the new user management.

If you require the configuration of an access level, for example, to ensure an HMI device access even without user or password access, you have to activate the "Use legacy access control via access levels" option in the CPU properties.

NOTE

Users for OPC UA and for the web server

Independent of the access protection, you always have to configure the users for the web server and OPC UA server in the project tree ("Security settings > Users and roles" area).

Restrictions on continued use of the access levels

When using the "Legacy access control" option, you cannot select the access level directly in the table for setting the access levels. This selection can only be set for the new local user management in one way: Via the access protection function rights of the "Anonymous" user.

The local user "Anonymous" is created in a project by the system by default. With the help of this user, you determine the behavior of the CPUs in the project for someone who logs in without a user name and password. For security reasons, the anonymous user is deactivated and needs to be activated before use.

The area where you set the access levels leads you via a link to the editor for the required settings for the "Anonymous" user.

Examples:

- If the "Anonymous" user is deactivated or if the "Anonymous" user is activated and no function rights have been assigned to that user, then nobody can log in without a user name and password (corresponds to the access level "No access (complete protection")).
- If the "Anonymous" user is activated and the "Full access" function right for a CPU is assigned to that user via a corresponding role, the result of this setting is "No protection". You can achieve the same effect with regard to access protection by setting "No access protection" in the "Protection & Security" area of the CPU properties.

Procedure

To activate the "Legacy access control" and set the required access level, follow these steps:

1. In the CPU properties, go to "Protection & Security > Access control".
2. Select the option "Activate access control" and, in addition, select the check box "Use legacy access control via access levels" check box.

   The access level selection cannot be used in this setting. You have to set the access level via the "Anonymous" user of the CPU.

   The "Anonymous" user is deactivated by default. This means that the resulting access level for users without a password is "No access (complete protection)" (default setting).
3. Go to "Security Settings > Users and roles" in the project tree.

4. Activate the "Anonymous" user, if you want to set a different access level than "No access (complete protection)". You can assign a role with function rights that grants access to the CPU without password input, only to the activated "Anonymous" user.
5. You cannot assign function rights for a CPU directly to a user. You must first assign a role: Therefore switch to the "Roles" tab and add a new role. Assign a meaningful name, e.g. "PLC1-Read-Access-Role". If you assign this role to a user, this user should have read access to PLC1 during operation.
6. Assign the required function right for the access to the CPU with the name "PLC1" to the role "PLC1-Read-Access-Role" - in this case "Read access".
7. Switch to the "User" tab and assign the "PLC1-Read-Access-Role" role to the activated "Anonymous" user.

   Result: The "Anonymous" user has read access for PLC1. This means that the access level tables of the CPU "PLC1" in the project are preset to "Read access" (cannot be changed) and users who are not logged in only have read access.

   For full access, or full access including fail-safe, you have to configure a password for the full access in the table for the access protection. Users who need full access to the CPU during runtime via an action, e.g. because a project is to be loaded onto the CPU, must legitimize themselves for this action with this password.

Tip

To make the user rights transparent, use meaningful names for the respective roles. You create users and roles for the entire project; you must select the function rights of a role individually for each CPU in the project. With a descriptive name you can, for example, immediately see which CPUs have read access and which CPUs are fully protected.

11.3.4 Information about compatibility

In the following sections, you will find information on the behavior of the CPUs with the local user administration, e.g. when replacing modules in STEP 7 and for further use of projects and programs without local user administration.

Replacement part scenario

If you replace a CPU with a firmware version < V3.1 with a CPU with a firmware version V3.1 or higher, the program stored on the memory card runs like the original CPU. The behavior with regard to the configured access levels, the users for the OPC UA server and the web server corresponds to the behavior of the previous CPU.

In this case, the "Change password function" via the web server API is not accepted by the CPU because the CPU has been configured for firmware version < V3.1 and has no local user administration.

Replace CPU (upgrade)

If you replace a CPU (FW < V3.1) with a current CPU (FW V3.1 or higher) in the TIA Portal, this has the following effects on the configured user data:

- The user data from the OPC UA server and web server is transferred to the "Users and roles" editor in the project navigation.

NOTICE
Passwords are lost when replacing the CPU Before replacing the CPU, make sure that the passwords are available. They must be entered again in the "Users and roles" editor. Otherwise, you have to assign new passwords and inform the users.

- A corresponding role is created for each web server user in the "Users and roles" editor; the name of the role contains the CPU name, the "Web" string and the already configured web server user name. In this way, by assigning these roles in the "Users and roles" editor, you can easily restore the original rights for each CPU.
- The "OPC UA server access" role is created for each OPC UA server user.
- OPC UA guest access and the web server "Everybody" are migrated to the "Anonymous" user.
- Each OPC UA user and each web server user is listed in the "User" column in the editor for users and roles. If the names are the same (web server and OPC UA user), only one user is created.
- With a protected project, you can select which action the CPU performs:
  - Migrate user (requirement: You are logged in as a user with the right to manage users and roles and the right to edit the project/configuration)
  - Remove user
  - Cancel
- The "Legacy access control via access levels" option is set for access protection.

Replace CPU (downgrade)

If you replace a CPU (as of FW V3.1) with a previous CPU (< FW V3.1) in the TIA Portal, this has the following effects on the configured user data:

- The local user administration is no longer available.
- Users with function rights for the web server are not transferred.
- Users of the OPC UA server remain with their user rights in the "Users and roles" editor. No users are moved to the "OPC UA" area of the CPU parameters.
- It is no longer possible for users to change passwords during runtime (via web server API).

11.4 Temporary account lock in case of brute force attacks

Useful information about brute force attacks

In a brute force attack, combinations of credentials (for example, user name and password) are systematically tried out with the aim of gaining access to a user account. Trying all options requires a lot of computing effort and time until a correct combination of user name and password is found.

Brute force attacks are particularly effective with weak or simple passwords.

Protecting a CPU from brute force attacks

As of STEP 7 V19, you can define password policies in the project tree under "Security settings" and thus ensure that strong passwords are assigned.

As of STEP 7 V21, there is the additional option of setting up a temporary account lock for CPUs as of FW version V4.1. You can only configure the temporary account lock for local user accounts. For central user accounts, protection against brute force attacks is configured directly on the UMC server.

You specify a maximum number of failed login attempts per time unit (monitoring time). If the specified number of failed login attempts is reached within the monitoring time, the period of the account lock (lockout duration) begins. During this time period, every login attempt is unsuccessful, regardless of whether the login data is correct or incorrect.

The indicator for hits ("correct password") is masked. The attacker does not receive any feedback about the temporary lock.

Configuring the locking of the local user account in STEP 7

To configure the locking of the local user account, follow these steps:

1. Place the required CPU from the hardware catalog in the network view.
2. Select the CPU in the network view.
3. In the Inspector window, navigate to "Properties > General > Protection & Security > Lockout of user account at runtime".
4. Select the "Lockout of the user account after failed login attempts" check box.
   The fields below become editable.
5. Edit the other fields according to the following options:
   - Max. failed login attempts:
     Determine the number of incorrect login attempts accepted by the CPU for a user account. If this number is reached within the monitoring time, the affected user account will be locked.
     Default: 5 failed login attempts
   - Monitoring time:
     Determine the time period between failed login attempts for a user account. The time period starts again after each failed login. If a valid login attempt is made within the time period, the time is reset.
     Default: 2 minutes

– Lockout duration:
  Determine the time period for which the user account should be locked. The time period starts when the set number of failed login attempts for a user account is reached within the monitoring time. During the lockout duration, the CPU rejects all login attempts. If an unsuccessful login attempt is made during the lockout duration, the set lockout duration starts again.
  Default: 2 minutes

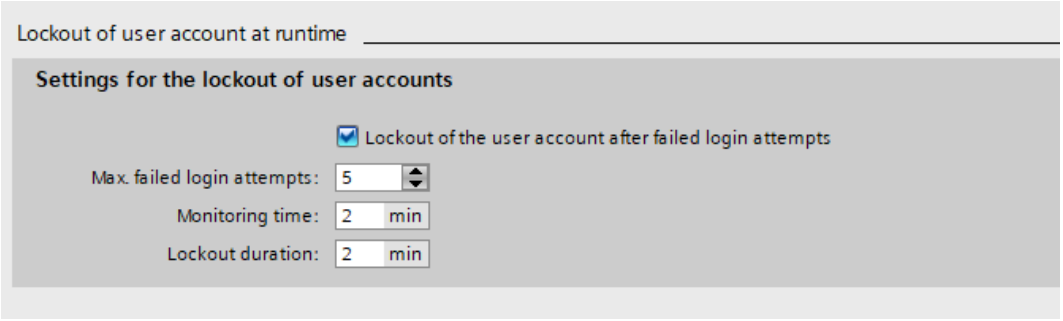

Figure 1-541 Configure the locking of the user account during runtime

6. Load the configuration into the CPU.

Result: You have configured the settings for locking user accounts and loaded them into the CPU.

The following figure shows an example of the procedure for locking a user account. A maximum number of 4 incorrect login attempts was set here.

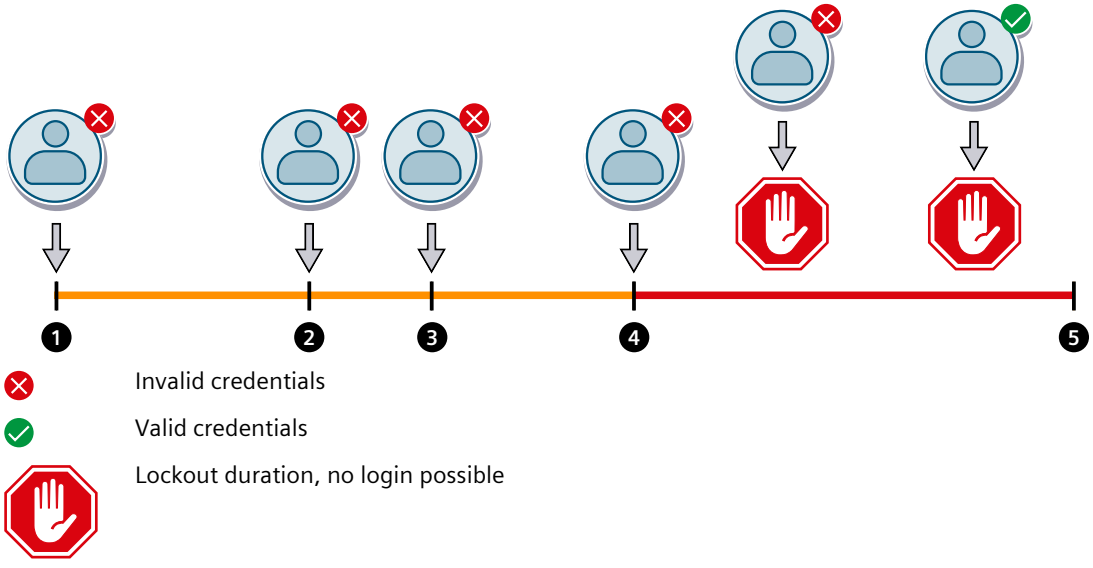

Figure 1-542 Procedure in the event of incorrect login attempts to a CPU

1. Failed login attempt no. 1:
   The set monitoring time starts. The counter for the number of failed login attempts is set to 1.
2. Failed login attempt no. 2 within the monitoring time:
   The set monitoring time starts again. The counter for the number of failed login attempts is incremented by 1.

3. Failed login attempt no. 3 within the monitoring time:
   The set monitoring time starts again. The counter for the number of failed login attempts is incremented by 1.
4. Failed login attempt no. 4 within the monitoring time:
   The set number of failed login attempts within the monitoring time has been reached. The set lockout duration starts.
   As long as the lockout duration is running, the CPU responds to each login as if it were an incorrect login attempt (no login possible). A login attempt with incorrect credentials during the lockout duration leads to a restart of the lockout duration.
5. After lockout duration elapses:
   Login attempts are again accepted by the CPU. The counter for the number of failed login attempts is reset to 0.

Influence of events on the temporary account lock

The following states and events belong to the temporary account lock:

- Incorrect login attempt detected
- Ongoing monitoring time
- Current lockout duration

The following events reset all states of the temporary account lock for all local users:

- Transition from POWER-ON to POWER-OFF
- Download to CPU
- System state transition from RUN-Solo to RUN-Redundant (S7-1500R/H systems)

The following events have **no** influence on the temporary account lock:

- Changing the password of local users during runtime via Web API.
- System state transition from RUN-Redundant to RUN-Solo (S7-1500R/H systems)

11.5 Central user management

11.5.1 Useful information on central user management and access control

As of TIA Portal version V20 and CPU firmware version V4.0, S7-1500 CPUs have a feature whereby authentication of users can be left to a central UMC server.

As of the versions specified above, you manage users centrally and combine multiple users with the same roles/function rights into one group.

The central authentication service is performed in this case by the UMC (User Management Component).

You set up linking between user/group and assigned roles and function rights in the editor "Users and roles" in TIA Portal - as with the local user management.

For HMI devices, the authentication is not possible via either local or central users (TIA Portal V19/V20).

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution - however, only if you ensure the confidentiality of the user-relevant information.

In addition, the rules for industrial cybersecurity must be observed, for example regarding the "Defense in Depth" security concept, in particular the remarks on plant security and hardening measures.

You can find detailed information in the Industrial cybersecurity (Page 40) section.

Advantages of central user management

Central user management allows management of users and user groups independently of TIA Portal. This enables the user management to be scaled from a few users and CPUs in a single project (local user management) up to extensive automation solutions with multiple projects, users and user groups (central user management) – without increased workload.

If you use the central user management (UMC), you can, for example, configure user groups on the UMC server set up for this purpose. The users of a group then have the same roles and function rights on the CPU.

During operation, users can be added to or removed from a group or passwords can be changed on the UMC server. The CPU configurations do not need to be changed and reloaded.

⚠ WARNING

Decoupling the user management from the CPU involves risks

When central user management is used, the CPU or TIA project has no way of checking the central user administration. UMC administrators must carefully check the effect of their changes with regard to modified roles and function rights.

Changes to central users at the time of the change do not affect the existing connection to the CPU at this time. These include, for example, the following changes:

- Delete a user on the UMC server
- Users are moved to other groups on the UMC server and thus get other roles and rights.

The changed user configuration will only take effect when you log in again.

Requirements

The configuration in the editor for users and roles (TIA Portal) provides you with a wide scope of usage scenarios in connection with UMC:

- Programming device with TIA Portal is connected to a UMC domain. In this case, the users and groups can be synchronized in the editor for users and roles.
- Programming device with TIA Portal is not connected to a UMC domain but the names of the user groups/central users used in operation are known and can be added without contact to the UMC server.

  The names of the user groups/central users can also be entered without connection to the UMC domain and synchronized with the UMC domain later.

  The synchronization is not necessary for authentication of CPU users via a UMC server. The group names or user names only have to match to make use of the authentication service.

A CPU which needs to authenticate the querying users (for example, via web, PG/HMI communication, or OPC UA) for diverse online functions requires the following information for accessing the authentication service:

- The UMC server address
  Example: https://central.umc.testnet:443/ra
  (443 = Port for https, ra = remote authentication)
- A server ID (fingerprint of the server certificate).
  You can determine the fingerprint of a certificate through Windows (open the certificate, "Details" tab, "Fingerprint" field).

As an alternative to the server ID, you can configure a list of CA certificates. These certificates are used by the CPU to verify the certificate returned by the UMC server when a connection is established. In order for the verification to be successful, the entire certificate chain down to the root certificate must have been loaded. The verification does not work for end-entity certificates or for intermediate certificates without a certificate chain to the root certificate.

Further requirements for operation (Runtime):

- User groups and users have been set up on the UMC server.
- A connection can be established between the CPU and UMC server via the configured UMC server address.
- CPU time is current. As with local user management, central users are informed about the remaining validity of their password. CPU and UMC server must have the same date and time settings.

NOTE

No logon possible if the UMC server is not available or the CPU time is reset

- If you use only UMC users and UMC user groups to access the CPU during operation and the UMC server becomes unreachable, for example, due to connection abort, then no one can log on anymore.
  - To enable access to the CPU in this case, configure at least one local user with the required roles/function rights.
- If you use UMC user groups or UMC users to access the CPU during operation, the CPU time must be up-to-ate.
  If the CPU time has been reset, for example, by restoring the factory settings, and no NTP time synchronization has been configured, it is also not possible to log on via the central user management. Authentication of the UMC server using certificates requires an up-to-date CPU time.
  - To enable access to the CPU in this case, configure at least one local user with the required roles/function rights to set the time (for example, from the "Web server – Maintenance" group).
  - Alternatively, you can synchronize the CPU time using NTP servers (for information on configuration; see section Time synchronization (Page 330)).

Basic procedure for using the User Management Component (UMC)

The following basic steps are required to use the User Management Component (UMC):

1. Installation of UMC on one or more computers in the system.
2. Assigning a corresponding UMC version as a UMC ring server or UMC server. This creates a UMC system consisting of one or multiple UMC computers.
3. Creating users and user groups in UMC. These can exist only in UMC or can be imported from a Microsoft Active Directory.
4. Connection of the UMC agent that is installed on the computer with the TIA Portal installation. The connection can be established with the TIA Administrator or with the Windows command line.
5. Use of UMC users and UMC user groups, for example, in the context of the TIA Portal project creation.
6. Authentication of UMC users after logging on via UMC.

NOTE

Enabled "Anonymous" user is always loaded
An enabled "Anonymous" user with its configured roles/function rights is loaded even if you only enabled the central user management. Local user management does not have to be additionally enabled for the "Anonymous" user to take effect.

Additional information on the UMC server

More information on setting up (installing, configuring) a UMC server as well as creating central users and groups can be found here (https://support.industry.siemens.com/cs/us/en/view/109780337).

11.5.2 Configuring central user management in the editor for users and roles

The procedure for configuring the central user management in TIA Portal version V20 with an S7-1500 CPU is described below (firmware version as of V4.0).

We distinguish between the following use cases:

- The project is configured in the environment that has access to the UMC server.
- The project is created in an environment that has no access to the UMC server.
  This is, for example, the case for a machine that is configured independently of the later place of installation and environment. The parameters for the user management must still be modified at the installation location.

Requirements - TIA Portal has access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is an online connection to the UMC server.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click the "Add new UMC user group" button.

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the user groups, select the user groups to be imported into the editor.
6. Assign the desired roles to the groups.

Procedure - Creating a new central user

To create a new central user, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User" tab.
3. Click "Add user".

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the central users, select the users to be imported into the editor.
6. Assign the desired roles to the users.

Requirements - TIA Portal has no access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is no online connection to the UMC server at the time in which user management is configured.

NOTE

Case sensitivity of user name

Although the UMC server does not differentiate between upper and lower case of the user name/group name when logging on, deviations in case prevent the user from logging on for users/groups configured offline or unsynchronized in the TIA Portal.

Recommendation:

- Before login, synchronize users and user groups in the TIA Portal and download this configuration to the CPU. In this case, the case of the user name is not relevant during logon.
- If possible, import users/groups as described above.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click in the <Add new user group> field in the "Name" column.
   The TIA Portal enters a default name.
4. Modify the default name - this name will be used in the target environment of UMC.
   The name can also be modified in the target environment during commissioning.

Result: The groups are set up but not synchronized, i.e. no UM domain ID is assigned.

When a connection to the UMC server exists in the target environment, the following process takes place when a central user logs on:

- The CPU forwards the authentication request to the UMC server.
- After a successful check, the UMC server returns a list of groups to which the logged-on user belongs.
- The CPU determines the assigned roles and function rights for the user based on the group names.

Procedure - Creating a new central user

To create a new central user, follow these steps:

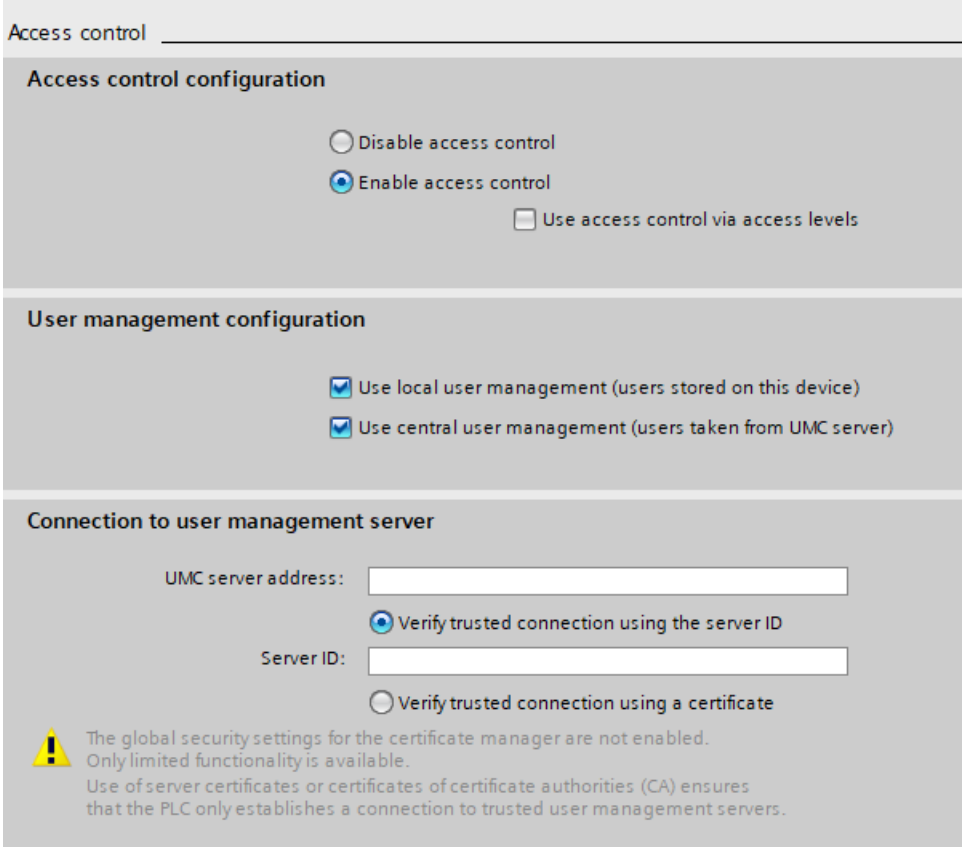
1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Click in the <Add new user> field in the "User name" column.
   The user type "Local user" is preset.
3. Modify the default user name - this name will be used in the target environment of UMC.
4. In the column "User type" change the entry to "Central user".

Result: The central user has been set up but not yet synchronized, meaning that no UM domain ID is assigned.

In the target environment with a connection to a UMC server, you can still adjust the provisional group and central user names using the TIA Portal.

Changing the user type - Effects

- When you change the user type (central user > local user), the data for the connection to the UMC server is lost (UM domains ID).
- When the user type is changed from local user to a central user, the configured password and the comment are lost.



11.5.3 Configuring central user management for an S7-1500 CPU

The procedure for configuring the S7-1500 CPU is described below (firmware version as of V4.0).

Procedure - CPU configuration for central user management

To configure the central user management for an S7-1500 CPU, follow these steps:

1. Place the CPU and navigate to the area "Protection & Security > Access control".
2. Ensure that access control has been enabled (access control via protection levels may be enabled or disabled).
3. Activate the option "Use central user management (users taken from UMC server)".
   In addition, the local user management can also be activated in order to still be able to access the CPU if the connection to the UMC server fails, for example.
4. Add the specifications to the UMC server address and server ID for authentication of the UMC server.
   As an alternative to the server ID, you can also add the CA certificate or intermediate certificate for authentication. The CPU must have the entire certificate chain for verification of the server certificate including root certificate.

Changing the connection data for the UMC server

A user with a role that grants full access to the CPU can download modified connection data (UMC server address and server ID) in both STOP and RUN modes of the CPU.

11.5.4 Logon of central users

The processes for the logon of central users are described below from the perspective of different applications.

Requirements

- A UMC server is connected to the CPU (firmware version V4.0 or higher) and is accessible.
- The required central users and groups have been set up for the UMC server.
- The CPUs are configured accordingly for the central user management (roles and function rights) and the configuration is loaded.

Logging onto a protected CPU

If you access a CPU online and the operation requires function rights from users, a dialog appears, as with the local user management, which queries the user type. As of TIA Portal version V20, you can log on as a central user.

Causes of a failed logon of a central user

Besides known causes, such as a wrong user name (not configured) or wrong password, the logon may, for example, fail due to network problems (UMC server not reachable) or an oversized response frame.

Tip

To handle such cases, set up a local user who can read the diagnostic buffer in the event of a failed logon and determine the exact cause.

In the diagnostic buffer, the causes are represented by an error code that you can interpret using the following table.

Each entry in the diagnostic buffer also leads to a corresponding syslog message so that connected evaluation systems can record the processes.

Table 1-834 Error codes for failed login

Error code	Meaning
#8000 0001	Missing configuration. The UMC server endpoint is not specified.
#8000 1000	Unspecified UMC system error.
#8000 1001	No DNS address configured.
#8000 1002	The DNS server is not reachable, for example, because it was shut down as the remote port is not reachable due to firewall settings.
#8000 1003	During data exchange with the UMC server: The interface is currently receiving new parameters.

Error code	Meaning
#8000 1004	The UMC server is not reachable. The UMC server does not respond to the ARP frame or there are problems with the TCP handshake to establish a connection.
#8000 1005	The IP address of the UMC server is not reachable due to missing routing information.
#8000 1006	The UMC server refuses to establish the connection. Connection was closed unexpectedly.
#8000 2xxx	Internal, unrecoverable TLS error.
#8000 3001	Validation of the UMC server certificate failed. Possible causes: Verification against the chain of trust not possible. Certificate not valid or expired. Verification of Identity failed (subject alternative name, FQDN, IPv4 check). Server ID verification failed (fingerprint).
#8000 4001	UMC server does not respond (timeout).
#8000 4002	HTTP response frame too long (system limit exceeded).
#8000 4003	Invalid HTTP response.
#8000 5xxx	Encoded HTTP status code of the HTTP request. Example of an encoding of Status Code 500 (#1F4) = Internal Server Error: Coding: #8000 5000 + #1F4 (=500) = #8000 51F4
#8000 6001	Syntax error in JSON response frame from UMC server.
#8000 6002	JSON response frame from the UMC server too long (system limit exceeded).
#8000 6003	Unexpected JSON format. The message has a valid JSON format, but it is not a valid UMC authentication response from the UMC server.
#8000 7xxx	Login failed (unknown error).

Logging on as an OPC UA client or as a web client

When an OPC UA client logs on to the OPC UA server of the S7-1500 CPU, the user name and password are transferred via the UserNameIdentityToken.

The user name and password are also queried for web clients if you want to use the full functionality of the web server of the S7-1500 CPU. See also the Web server function manual, section "Authentication". The following process applies to OPC UA clients and web clients:

- For central users, the CPU forwards the authentication query to the UMC server.
- If the authentication is successful, the UMC server returns the assigned groups to which the user belongs.
- The CPU generates the corresponding session context and grants the authorizations (function rights from the determined roles).
- The client can then execute the access in the context of the session in accordance with the granted function rights.

How does the CPU (OPC UA server or the website of the web server) detect whether the user is a local or central user?

You have the freedom to configure a user both as a local user and as a central user. This results in an ambiguity about which service is responsible for the authentication and which user ultimately gains access. Since access permission for the user depends solely on the password in this case, you should use strong passwords, for example, created by a password generator.

The following rules apply to ensure unambiguousness for the responsible authentication service (local or central user management):

- For logon of a local user, add the prefix "L:" (uppercase or lowercase) in front of the user name.
  Example: L:username

  If you do not use a prefix for the user names, central user management is automatically responsible (when central and local user management are used at the same time). If you use only one type of user management, access is unambiguous even without a prefix.
- A user name must not begin with the string "L:" (uppercase or lowercase).

11.6 Configuring access protection for the CPU

Introduction

The following section describes how to use the various access levels of the CPUs. The description applies to S7-1500 CPUs up to firmware version V3.0.

In later firmware versions, use the local user management (Page 259) in the editor for users and roles in the project tree. The access levels are represented there by function rights of the same name which you assign to individual users via roles.

The CPU provides you with various access levels to limit access to specific functions.

By setting up access levels and passwords, you limit the functions and memory areas that are accessible without a password. The individual access levels as well as their associated passwords are specified in the object properties of the CPU.

Rules for passwords

Ensure that passwords are sufficiently secure. Passwords must not follow a machine-recognizable pattern.

Apply the following rules:

- Assign a password that is at least 8 characters long.
- Use different cases and characters: uppercase/lowercase, numbers and special characters.

Access levels of the CPU

Table 1-835 Access levels and access restrictions

Access levels	Access restrictions
Full access including fail-safe (no protection)	Users of STEP 7 and HMI applications have access to all standard and fail-safe functions. A password is not required.
Complete access (no protection)	Users of STEP 7 have access to standard functions. HMI applications can access all functions (fail-safe and standard). **Required password:** For additional access to the fail-safe functions, the user must enter the password for "Full access incl. fail-safe" in STEP 7.
Read access	In this access level, only read access to the hardware configuration and the blocks is possible without a password. HMI access and access to diagnostics data is also possible. Neither blocks nor the hardware configuration can be downloaded to the CPUs without the password. Additionally, the following is not possible without the password: Writing test functions and firmware update (online).
HMI access	The access restrictions that apply to read access also apply to HMI access. Additionally, the following is **not** possible without the password: Test functions, changing the operating mode (RUN/STOP), firmware update and display of online/offline comparison status.
No access (complete protection)	When the CPU has complete protection, no read or write access to the hardware configuration and the blocks is possible (without access authorization in the form of a password). HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed). Authentication with the password will again provide you full access to the CPU.

Reference

An enumeration of which functions are available in the different access levels is available in the "Setting options for the protection" entry in the STEP 7 online help.

Properties of the access levels

Each access level allows unrestricted access to certain functions without entering a password, e.g. identification using the "Accessible devices" function.

The default of the CPUs is "No access (complete protection)". In the default access level, the user may neither read nor change the hardware configuration and the blocks. To obtain access to the CPUs, use an alternative parameter assignment in the properties of the CPU:

- A password for the protection level "No access (complete protection)"
- A different protection level, e.g. "Full access (no protection)"

Communication between the CPUs (via the communication functions in the blocks) is not restricted by the access level of the CPU, unless PUT/GET communication is deactivated in the "No access" (complete protection) access level.

Entry of the right password allows access to all the functions that are allowed in the corresponding level.

NOTE

Configuring an access level does not replace know-how protection

Configuring access levels offers a high degree of protection against unauthorized changes on the CPU via network access. Access levels are used to restrict the rights to download the hardware and software configuration to the CPU. However, blocks on the SIMATIC Memory Card are not write-protected or read-protected. Use know-how protection to protect the code of blocks on the SIMATIC Memory Card.

Behavior of functions with different access levels

The STEP 7 online help contains a tabular list of the online functions that are possible in the various access levels.

Configuring access levels

To configure the access levels for an S7-1500 CPU up to FW version V3.0, follow these steps:

1. Open the properties of the S7-1500 CPU in the Inspector window.
2. Open the "Protection & Security" entry in the area navigation.
   A table with the possible access levels appears in the Inspector window.

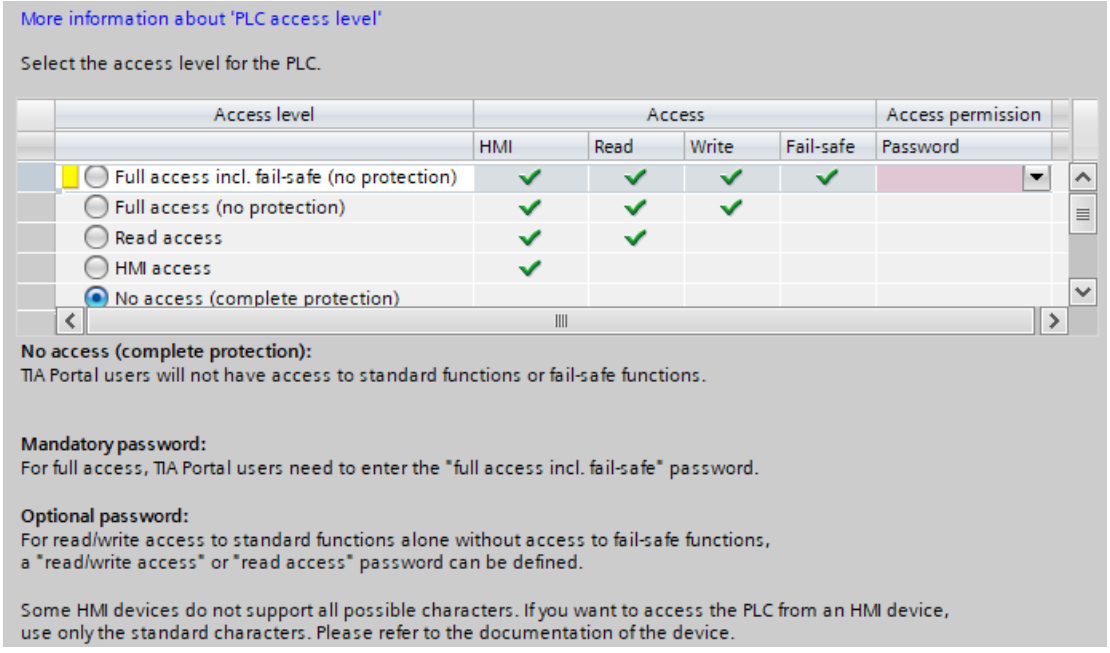


Figure 1-543 Possible access levels of an S7-1500 CPU up to FW version V3.0

3. Activate the desired protection level in the first column of the table. The green check marks in the columns to the right of the respective access level show you which operations are still available without entering the password. In the example (Figure: Possible access levels), access is not possible without a password.
4. In the "Enter password" column, specify a password for the access level "Full access" in the first row. In the "Confirm password" column, enter the selected password again to guard against incorrect entries.
5. Assign additional passwords as required for other access levels.
6. Download the hardware configuration for the access level to take effect.

The CPU logs the following actions with an entry in the diagnostic buffer:

- Input of the correct or, possibly, wrong password
- Changes to access level configuration

Behavior of a password-protected CPU during operation

Protection of an S7-1500 CPU up to FW version V3.0 takes effect for an online connection after you have downloaded the settings to the CPU. If you set a higher access level and download it to the CPU, all other online connections will be interrupted. You must then establish a new online connection.

Before an online function is executed, STEP 7 checks the necessary permission and, if necessary, prompts the user to enter a password. The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Logon authorization to the protected data applies for the duration of the online connection or for as long as you have STEP 7 open. The menu command "Online > Delete access rights" cancels the access authorization.

You can limit access to a password-protected CPU in RUN locally on the display. This prevents access even with the password.

Access level for F-CPUs

For the fail-safe CPUs up to FW version V3.0, there is an additional access level in addition to the four described access levels. For more information on this access level, refer to the description of the fail-safe system SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126).

11.7 Using the display to set additional password protection

Blocking access to a password-protected CPU

On the display of an S7-1500 CPU, you can block access to a password-protected CPU (local block of the password). If the mode selector is set to RUN, the block is effective.
The access block requires a configured protection level in STEP 7 and works independently of the password protection. This means that even if someone accesses the CPU via a connected programming device and has entered the correct password, access to the CPU remains

disabled.
The access block can be set separately for each access level on the display. Then, for example, the read access is allowed locally, but the writing access is not allowed locally.

Procedure

If you want to block access to the CPU via the display, you need to configure an access level with a password in STEP 7.

When you set the local access protection for an S7-1500 CPU on the display, proceed as follows:

1. On the display, select Settings > Protection menu.
2. Confirm the selection using "OK", and configure for each access level, whether access at the RUN mode selector switch is allowed or not:
   - Allow: Access to the CPU is possible with the corresponding password in STEP 7.
   - Deactivated in RUN: If the mode selector is set to RUN, no additional logon to the CPU is possible with the rights of this access level. Access is denied despite the fact that the user knows the password. Access with the password is enabled again in the STOP operating state.

Access protection for the display

Configure a password for the display in STEP 7 in the properties of the CPU. This protects local access protection with a local password.

11.8 Using the user program to set additional access protection

Access protection by means of the user program

In addition to access protection via the display, you have another option. You can also restrict access to a password-protected CPU using the ENDIS_PW instruction in STEP 7.

You can find more information on this instruction in the STEP 7 online help under "ENDIS_PW: Limit and enable password legitimation ".

11.9 Know-how protection

Application

You can use know-how protection to protect one or more OB, FB or FC blocks as well as global data blocks in your program from unauthorized access. Enter a password to restrict access to a block. The password offers high-level protection against unauthorized reading or manipulation of the block. Know-how protection does not involve the CPU (offline access in STEP 7).

Password provider

As an alternative to manual password input, you can assign a password provider to STEP 7. When using a password provider, you select a password from a list of available passwords. When a protected block is opened, STEP 7 connects to the password provider and retrieves the corresponding password.

To connect a password provider you have to install and activate it. A settings file in which you define the use of a password provider is also required.

A password provider offers you the following advantages:

- The password provider defines and manages the passwords. When know-how protected blocks are opened, you work with symbolic names for passwords. For example, a password is marked with the symbolic name "Machine_1" n the password provider. The actual password behind "Machine1" remains hidden from you.
  A password provider therefore offers optimum block protection as the users do not know the password themselves.
- STEP 7 automatically opens know-how protected blocks without the direct entry of a password. This saves you time.

You can find more information on connecting a password provider in the STEP 7 online help.

Readable data

If a block is know-how protected, only the following data is readable without the correct password:

- Block title, comments and block properties
- Block parameters (INPUT, OUTPUT, IN, OUT, RETURN)
- Call structure of the program
- Global tags without information on the point of use

Further actions

Further actions that can be carried out with a know-how protected block:

- Copying and deleting
- Calling within a program
- Online/offline comparison
- Load

Global data blocks and array data blocks

You protect global data blocks (global DBs) from unauthorized access with know-how protection. If you do not have the valid password, you can read the global data block but not change it.

Know-how protection is not available for array data blocks (array DBs).

Setting up block know-how protection

To set up block know-how protection, follow these steps:

1. Open the properties of the respective block.
2. Select the "Protection" option under "General".

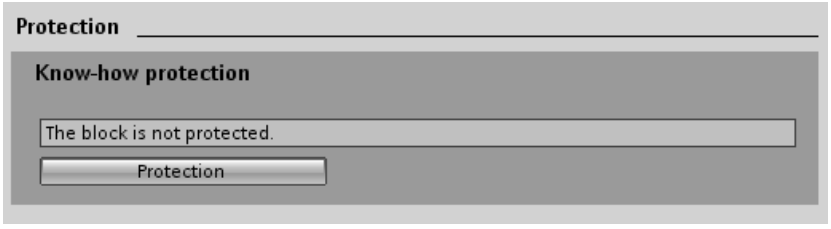

Figure 1-544 Setting up block know-how protection (1)

3. Click the "Protection" button to display the "Define protection" dialog.

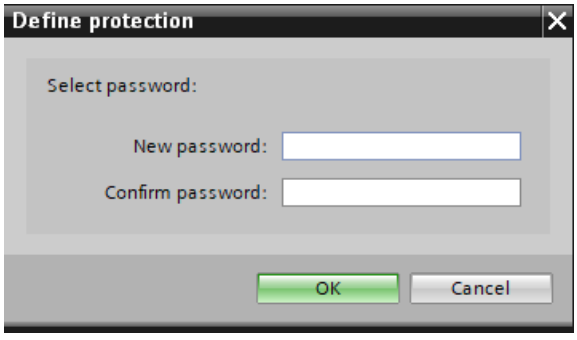

Figure 1-545 Setting up block know-how protection (2)

4. Enter the new password in the "New password" field. Enter the same password in the "Confirm password" field.
5. Click "OK" to confirm your entry.
6. Close the "Know-how protection" dialog by clicking "OK".

Result: The blocks selected will be know-how-protected. Know-how protected blocks are marked with a lock symbol in the project tree. The password entered applies to all blocks selected.

NOTE

Password provider
Alternatively, you can set up know-how protection for blocks with a password provider.

Opening know-how protected blocks

To open a know-how protected block, follow these steps:

1. Double-click the block to open the "Access protection" dialog.
2. Enter the password for the know-how protected block.
3. Click "OK" to confirm your entry.

Result: The know-how-protected blockopens.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or STEP 7 is open. You need to enter the password again the next time you open the block. If you close the "Access protection" dialog with "Cancel", the block will open but the block code will not be displayed. You will not be able to edit the block.

If you copy the block or add it to a library, for example, this does not cancel the know-how protection of the block. The copies will also be know-how-protected.

Changing know-how protection for blocks

To change the know-how protection for blocks, follow these steps:

1. Select the block for which you want to change the know-how protection. The protected block must not be open in the program editor.
2. To open the "Change protection" dialog, select the "Know-how protection" command in the "Edit" menu.
3. To change the password for the know-how protection, enter the current password under "Old password".
4. Then enter a new password under "New password" and confirm the password under "Confirm password".
5. Click "OK" to confirm your entry.

Result: The password for the know-how protection of the selected block has been changed.

Removing know-how protection for blocks

To remove block know-how protection, follow these steps:

1. Select the block from which you want to remove know-how protection. The protected block must not be open in the program editor.
2. Select the "Know-how protection" command in the "Edit" menu.

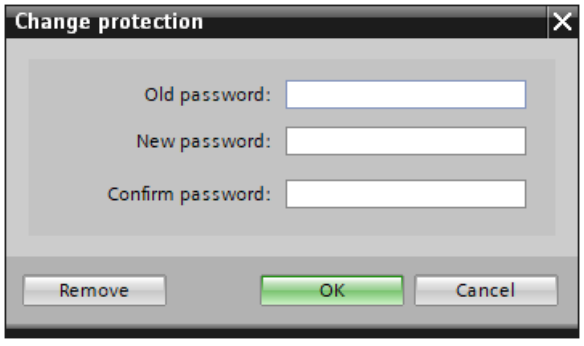

Figure 1-546 Removing know-how protection for blocks

3. To remove the block protection, enter the current password under "Old password". Leave the fields for the new password empty.
4. Click "Remove" to confirm your entry.

Result: Know-how protection for the selected block has been canceled.

11.10 Copy protection

Application

The copy protection allows you to protect your program against unauthorized duplication. With copy protection you associate the blocks with a specific SIMATIC memory card or CPU. The link to the serial number means that you can only use the block in conjunction with the corresponding SIMATIC memory card or CPU.

Copy and know-how protection

Recommendation: To prevent an unauthorized reset of the copy protection, provide a copy-protected block with additional know-how protection. First set up the copy protection for the block and after this the know-how protection. You can find additional information on setting up know-how protection in the section Know-how protection (Page 284).

Setting up copy protection

To set up copy protection, follow these steps:

1. Open the properties of the respective block.
2. Select the "Protection" option under "General".
3. In the "Copy protection" area, select either the "Bind to serial number of the CPU" entry or the "Bind to serial number of the memory card" entry from the drop-down list.

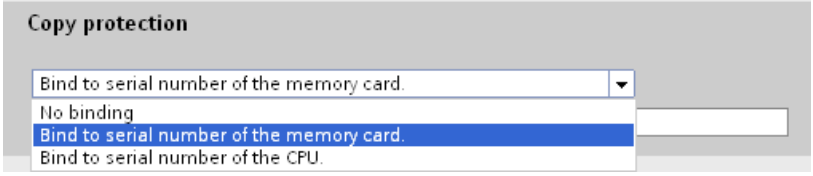

Figure 1-547 Setting up copy protection

4. Activate the option "Serial number is inserted when downloading to a device or a memory card" if STEP 7 is to automatically insert the serial number during the uploading process (dynamic binding). Assign a password using the "Define password" button to link the use of a block additionally to the input of a password.
   If you want to manually bind the serial number of the CPU or the SIMATIC memory card to a block (static binding), activate the "Enter serial number" option.
5. You can now set up the know-how protection for the block in the "Know-how protection" area.

NOTE

If you download a copy-protected block to a device that does not match the specified serial number, the entire download operation is not possible. This means that you also cannot download blocks without copy protection.

Removing copy protection

To remove copy protection, follow these steps:

1. Remove the Know-how protection (Page 284), if it is set.
2. Open the properties of the respective block.
3. Select the "Protection" option under "General".
4. In the "Copy protection" area, select the "No binding" entry from the drop-down list.

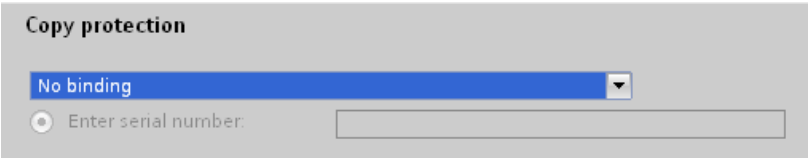

Figure 1-548 Removing copy protection

11.11 Protection by locking the CPU/interface module

Locking options

Provide additional protection for your CPU/Ihr interface module from unauthorized access (for example to the SIMATIC memory card) by using a secure front cover.

You have e.g. the following options:

- Attach a seal
- Secure the front cover with a lock (shackle diameter: 3 mm)

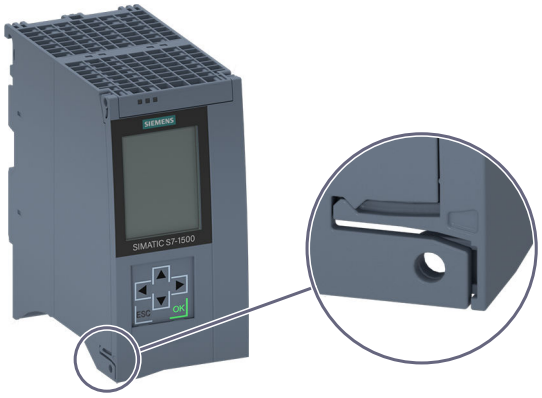

Figure 1-549 Locking latch on a CPU

Flexible automation concepts 12

12.1 Standard machine projects

Introduction

Standard machine projects are STEP 7 projects that use a set of innovative functions allowing simple configuration and commissioning of flexible automation solutions for standard machines or for machines with a modular structure.

A hardware configuration consisting of an S7-1500 CPU as the IO controller and any connected IO devices represents a "PROFINET IO system master". This master is configured with a maximum configuration based on which various options can be derived for different standard machines, for example with different configuration variants of the IO system.

Greater flexibility at all levels

Standard machine projects have the following central characteristics:

- From one project (IO system master) with an engineered maximum configuration, different variants of a standard machine can be loaded (IO system options). The standard machine project covers all variants (options) of the IO system.
- An IO system option can be integrated in an existing network locally using simple tools.

Flexibility is provided in more ways than one:

- With suitable configuration, adaptation of the IP address parameters of the IO controller is possible locally using simple tools. This allows a standard machine to be integrated in different plants with little effort or to be included in a network several times.
  IO systems with this property are known as **multiple use IO systems**.
- With suitable configuration and programming, different setups of IO system options can be operated locally that differ in terms of the selection of IO devices used or in terms of the arrangement of the IO devices.
  Since the specific configuration of the IO system is controlled by the user program, this is known as **configuration control for IO systems**.
- Independently of the functions described above, with suitable configuration and programming, you can use different station options of central devices or distributed I/O devices in one project. The devices can be different in terms of the selection and arrangement of the modules.
  Since the concrete configuration of the station is controlled by the user program, this is also known as **configuration control**.

Additional information

You can find additional information on configuration control in the section Configuration control (option handling) (Page 291).

You can find additional information on multiple-use IO systems and on configuration control for IO systems in the PROFINET with STEP 7 (https://support.automation.siemens.com/WW/view/en/49948856) function manual.

12.2 Configuration control (option handling)

Introduction

With configuration control (option handling), you handle various standard machine configuration levels in one project. You do not need to change the hardware configuration or the user program.

Operating principle of configuration control

Configuration control enables you to operate different configuration levels of a standard machine with a single configuration of the S7-1500 automation system/ET 200MP distributed I/O system.

- A station master (maximum configuration) is configured in a project. The station master comprises all modules needed for all possible equipment components of a modular standard machine.
- Provision is made in the user program of the project for various station options for the different configuration levels of the standard machine and for selection of a station option. A station option uses, for example, only some of the modules of the station master and these modules are not inserted in the configured order.
- Manufacturers of standard machines select a station option for a configuration level of the standard machine and does not have to change the project or load a changed configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. The configuration control has no effect on the parameter assignment of the modules.

The configuration control allows you to flexibly vary the centralized/distributed configuration. As a precondition for this, the station option must be able to be derived from the station master.

The following figure shows three configuration levels of a standard machine with the corresponding station options of the S7-1500 automation system.

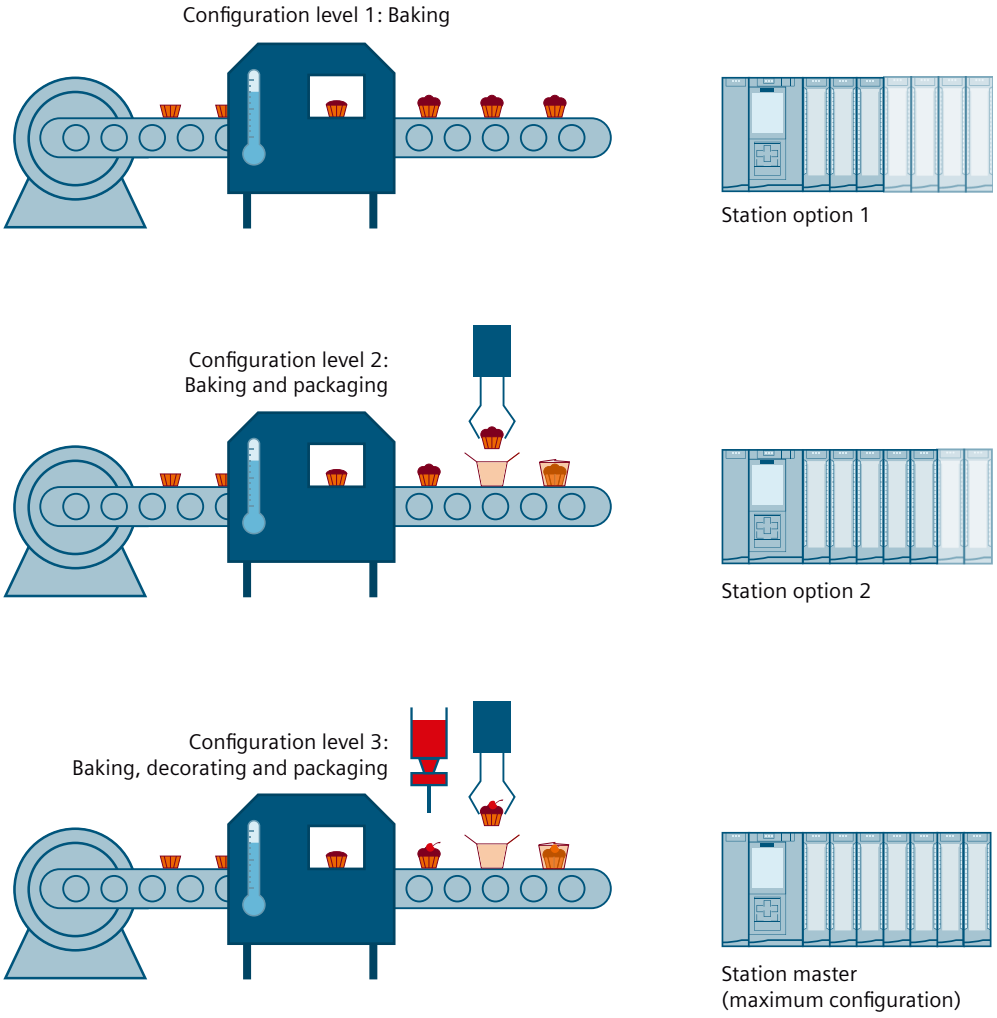

Figure 1-550 Various configuration levels of a standard machine with the corresponding station options of the S7-1500 automation system

Benefits

- Easy project handling and commissioning through use of a single STEP 7 project for all station options.
- Easy handling during maintenance, versioning and upgrades.
- Hardware savings: I/O modules are installed that are necessary for the current station option of the machine.
- Potential savings when building, commissioning and creating documentation for standard machines.

Procedure

To set up the configuration control, proceed as follows:

Table 1-836 Procedure for commissioning the SIMATIC S7-1500

Step	Procedure	See...
1	Enable configuration control in STEP 7	Section Configuring (Page 293)
2	Create control data record	Section Creating the control data record (Page 294)
3	Transfer control data record	Section Transferring the control data record in the startup program of the CPU (Page 304)

Library for configuration control

A library for configuration control is available for download (https://support.industry.siemens.com/cs/ww/en/view/29430270) on the internet. The library contains data types with the structure of the control data records for the S7-1500/ET 200MP automation system. You can implement the configuration control for your flexible automation solution economically using these data types.

12.2.1 Configuring

Requirements

In the case of the S7-1500, configuration control is possible both with centrally inserted modules and with the ET 200MP distributed I/O system via PROFINET IO.

For S7-1500 automation system:

- STEP 7 Professional as of Version V13
- CPU S7-15XX as of firmware version V1.5
- The startup parameter "Comparison preset to actual configuration" is set to "Startup CPU even if mismatch" (default setting).
  You can find the "Comparison preset to actual configuration" parameter in the Inspector window of the CPU properties under "General">"Startup".

For ET 200MP distributed I/O system:

- STEP 7 Professional as of Version V13
- IM 155-5 PN ST/HF
- You have assigned the interface module to an IO controller/DP master in STEP 7
- The startup parameter "Comparison preset to actual module" is set to "Startup CPU even if mismatch" (default setting).
  You can find the "Comparison preset to actual module" parameter in the Inspector window of the interface module properties in the "Startup" field under "General">"Module parameters".

Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU/interface module.

- For an S7-1500 CPU, you can find the "Allow to reconfigure the device via the user program" parameter in the "Configuration control" area.
- For an IM 155-5 PN interface module, you can find the "Allow to reconfigure the device via the user program" parameter in the "Configuration control" field under "General">"Module parameters".

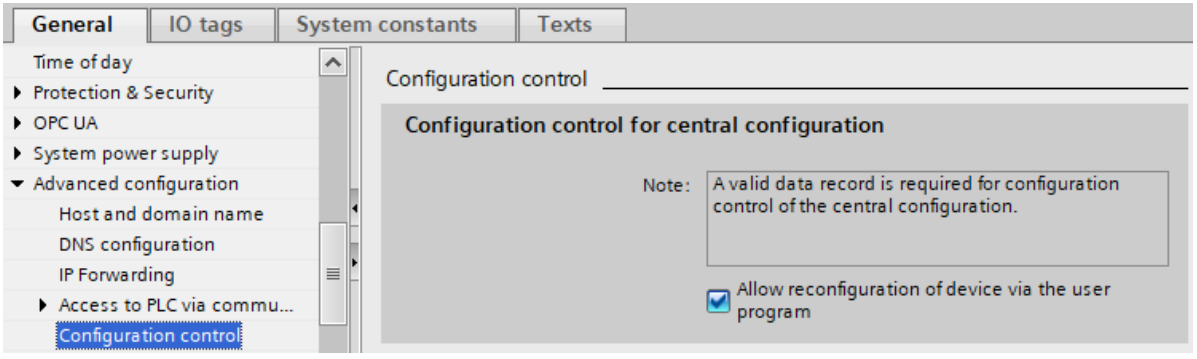

Figure 1-551 Enabling configuration control using an S7-1500 CPU as an example

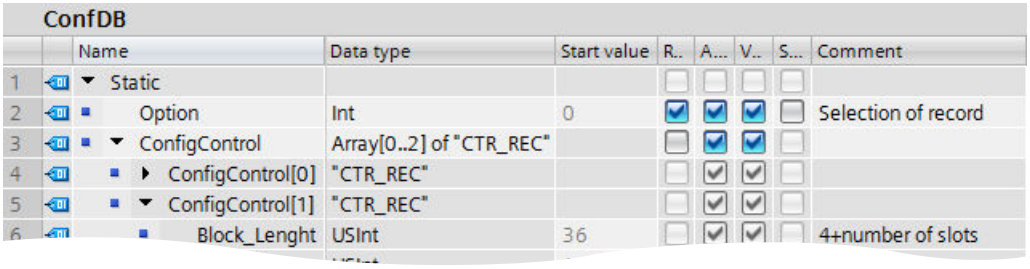
12.2.2 Creating the control data record

Required steps

To create a control data record for the configuration control, follow these steps:



1. Create a PLC data type that contains the structure of the control data record.
   You can find the structure of the control data record:
   - For the S7-1500 automation system in section Control data record for the S7-1500 Automation System (Page 296).
   - For the ET 200MP distributed I/O system in section Control data record for the ET 200MP distributed I/O system (Page 297).

CTR_REC

14	Slot 5	USInt	5	☐	☑	☑	☑	assigned "real" slot

Figure 1-554 Assigning slots

Rules

Observe the following rules:

- The CPU/interface module ignores slot entries in the control data record outside the station master.
- The control data record must contain the entries up to the last slot of the station option.
- Each slot of a station option may only be present once in the control data record.
- Each slot of a station option may only be assigned to one slot in the station master.

- System power supplies (PS) can also be subject to configuration control.

NOTE
Configuration control for system power supplies
In the case of a configuration (station option) loaded using a data record, STEP 7 does not automatically check compliance with the power budget.
Ensure that the power supplied in each power segment of the station option is greater than or equal to the power drawn.
You can find more information in the section Power balance calculation (Page 167).

Using communication modules

- Point-to-point communication modules:
  Point-to-point communication modules can be used without any restrictions for the configuration control.
- PROFINET/Ethernet and PROFIBUS communication modules:
  CPUs as of firmware version V1.7 support configuration control when using PROFINET/Ethernet or PROFIBUS communication modules. If communication modules for PROFINET/Ethernet or PROFIBUS, such as a CM 1542-5 (DP master or DP slave), are inserted in the central configuration, these communication modules cannot be influenced by the configuration control. You must therefore leave these modules in the slots preassigned in the station master and enter the slot numbers from the station master in the control data record ("Station option slot = Station master slot"). In a station option, all slots up to the communication module furthest from the CPU must be present in the control data record. Maximum flexibility is achieved by inserting the communication modules directly to the right of the CPU.

12.2.2.1 Control data record for the S7-1500 Automation System

Slot assignment

The following table shows the slot assignment of the modules for the S7-1500 automation system:

Table 1-837 Slot assignment

Slot	Modules	Comment
0	System power supply (optional)	Upstream of CPU
1	CPU	Slot 1 is always the CPU
2 - 31	I/O modules/system power supplies, depending on the station option	Downstream of CPU

Control data record

For configuration control of the S7-1500 automation system, you define a control data record 196 V4.0, which contains a slot assignment. The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-838 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + number of slots	Header
1	Block ID	196	
2	Version	4	
3	Version	0	
4	Slot 0 of the station master	Slot assignment in the station option	**Control element** Contains information on which module is inserted in which slot. The following rule determines which value you must enter in the respective byte: • If the module is included in the station option, enter the slot number of the module. • If the module is not included in the station option, enter 255.
5	Slot 1 of the station master	Slot assignment 1 in the station option (always 1, because the CPU is always in slot 1)	
6	Slot 2 of the station master	Slot assignment in the station option	
7	Slot 3 of the station master	Slot assignment in the station option	
:	:	:	
4 + (max. slot number)	Maximum slot of the station master	Slot assignment in the station option	

12.2.2.2 Control data record for the ET 200MP distributed I/O system

Slot assignment

The following table shows the slot assignment of the modules for the ET 200MP distributed I/O system:

Table 1-839 Slot assignment

Slot	Modules	Comment
0	System power supply (optional)	Upstream from interface module
1	Interface module	Interface module (slot 1) is not an element of the configuration control, but instead controls the configuration control.
2 - 31	I/O modules/system power supplies, depending on the station option	Downstream from the interface module

Control data record

For configuration control of the ET 200MP distributed I/O system, you define a control data record 196 V3.0, which contains a slot assignment. The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-840 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + number of slots	Header
1	Block ID	196	
2	Version	3	
3	Version	0	
4	Slot 0 of the station master	Slot assignment in the station option	**Control element** Contains information on which module is inserted in which slot. The following rule determines which value you must enter in the respective byte: • If the module is included in the station option, enter the slot number of the module. • If the module is not included in the station option, enter 127.
5	Slot 2 of the station master	Slot assignment in the station option	
6	Slot 3 of the station master	Slot assignment in the station option	
:	:	:	
4 + (max. slot no. - 1)	Maximum slot of the station master	Slot assignment in the station option	

12.2.2.3 Feedback data record of the ET 200MP distributed I/O system

Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0.

Slot assignment

The feedback data record exists only when configuration control is configured and always refers to the maximum quantity framework **without interface module**, i.e., 31 slots.

The following table shows the slot assignment of the modules:

Table 1-841 Slot assignment

Slot	Modules	Comment
0	System power supply (optional)	Upstream from interface module
2 - 31	I/O modules/system power supplies, depending on the station option	Downstream from the interface module

Partial reading of the feedback data record is possible.

Feedback data record

Table 1-842 Feedback data record

Byte	Element	Code	Explanation
0	Block length	66	Header
1	Block ID	197	
2	Version	2	
3		0	
4	Status slot 0	0/1	Status = 1: • Module from station master is inserted in the station option • Slot is marked as not available in the control data record Status = 0: • Module pulled • Incorrect module inserted in the station option*
5	Reserved	0	
6	Status slot 2	0/1	
7	Reserved	0	
:	:	:	
64	Slot n status	Maximum slot	
65	Reserved	0	

* Not possible if the slot is marked as not available.

NOTE

The data in the feedback data record is always mapped for all modules. In a Shared Device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record was sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

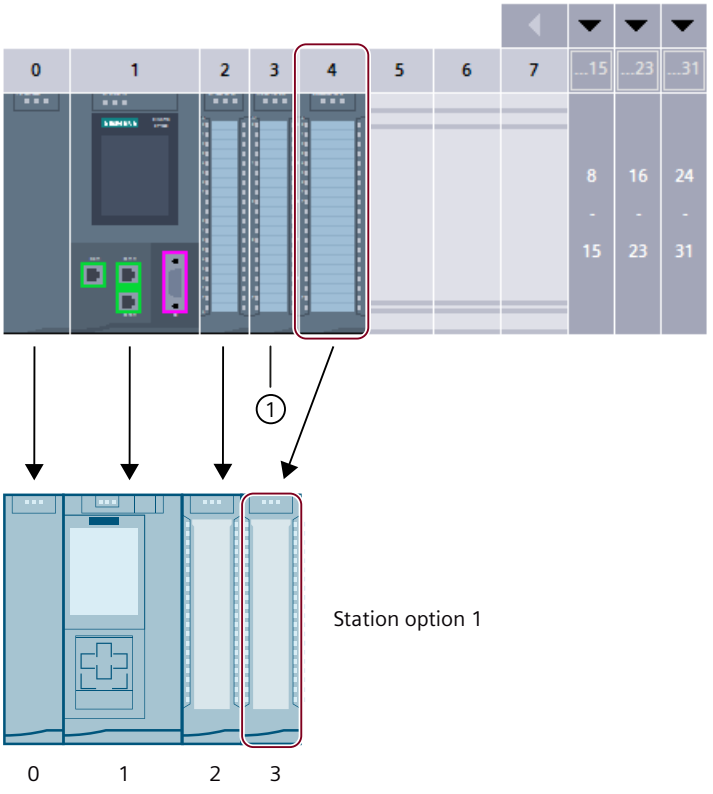
Error messages

In the case of an error when reading the feedback data record, the RDREC instruction returns the following error messages via the STATUS block parameter:

Table 1-843 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 197 is not correct.
$80B5_H$	Configuration control not configured
$80B8_H$	Parameter error The following events cause a parameter error: • Incorrect block ID in the header (not equal to 197) • Invalid version identifier in the header • A reserved bit was set • Multiple slots in the station master are assigned to the same slot in the station option

12.2.2.4 Examples of configuration control



A station master consisting of a system power supply, CPU, and three I/O modules is configured in STEP 7 in the following section.

The module at slot 3 is not present in the station option 1 and is "hidden" by the configuration control.

In station option 2, the order of the modules in slots 3 and 4 is interchanged. The modified order of the modules is made known to the CPU by a modified control data record.

Station option 1 with module that is not present

The module that is located in slot 3 in the station master is not present in the station option 1. Slot 3 must be designated in the control data record accordingly with 255 (= not present).

Figure 1-556 Example: Hardware configuration of station option 2 with the associated control data record in STEP 7

Detailed application example

You can find a detailed application example for the configuration control in S7-1500 in here (https://support.industry.siemens.com/cs/ww/en/view/29430270) under "Application example for ET 200SP (PROFINET) and S7-1500 by using the library".

12.2.3 Transferring the control data record in the startup program of the CPU

Required steps

Transfer the created control data record 196 to the CPU/interface module using the WRREC (Write data record) instruction.

Parameters of the WRREC instruction

Below, you will find explanations of individual parameters of the WRREC instruction which you must supply with specific values in the configuration control context. You can find additional information on the WRREC instruction in the STEP 7 online help.

ID	Hardware identifier • For configuration control for centrally arranged modules, use the HW identifier for the CPU. If you have selected the CPU in the network view or device view, you can find the HW identifier on the **System constants** tab of the Inspector window. Use the value of the system constant "Local Configuration". • For configuration control for distributed I/O, use the HW identifier of the interface module. If you have selected the interface module in the network view or device view, you can find the HW identifier on the **System constants** tab of the Inspector window. Use the value of the system constant "<Name_of_interface_module> Head".
INDEX	Data record number: 196 (decimal)
RECORD	Control data record to be transferred. For the structure of the control data record, see section Creating the control data record (Page 294).

Error messages

In case of error, the WRREC instruction returns the following error messages via the STATUS block parameter:

Table 1-844 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 196 is not correct.
$80B5_H$	Configuration control parameters not assigned.
$80E2_H$	Data record was transferred in the wrong OB context. The data record must be transferred in the startup program.

Error code	Meaning
$80B8_H$	Parameter error Reasons for a parameter error are: • Incorrect block ID in the header (not equal to 196) • Invalid version identifier in the header • A reserved bit was set • A station master slot was assigned an invalid slot in the station option • Multiple slots in the station master are assigned to the same slot in the station option • For shared device on submodule level: violation of defined restrictions

Special requirements relating to the transfer of the control data record to the CPU

- If you have enabled configuration control, the CPU is not ready for operation without a control data record. The CPU returns from startup to STOP if a valid control data record is not transferred in the startup OB (for example, OB 100). The central I/O is not initialized in this case. The cause for STOP mode is entered in the diagnostics buffer.

  NOTE
  If an incorrect control data record is transferred to the CPU in the startup OB, the startup of the CPU may be prevented.
  In this case, perform a reset to factory settings of the CPU and then transfer a correct control data record.

- The CPU processes the WRREC instruction for transferring the control data record asynchronously. For this reason, you must call WRREC in the startup OB (for example, OB 100) repeatedly in a loop until the output parameters "BUSY" and "DONE" indicate that the data record has been transferred.
  - Tip: To program the loop, use the SCL programming language with the REPEAT ... UNTIL instruction.

```
REPEAT
 "WRREC_DB"(REQ := "start_config_control",
            ID := "Local Configuration",
            INDEX := 196,
            LEN := "conf_LEN",
            DONE => "conf_DONE",
            BUSY => "conf_BUSY",
            RECORD := "ConfDB".ConfigControl["ConfDB".Option],
//Selection of control data record*
            ERROR => "conf_ERROR",
            STATUS => "conf_STATUS");
UNTIL NOT "conf_BUSY"
END_REPEAT;
```

  *Selection of the station option in the user program: In order for the CPU to know which station option you want to operate, you must set up a possibility to select between the various control data records in the user program. You can implement the

selection, for example, via an Int tag that references an array element. Please note that the variable used to select the control data record must be stored in the retentive memory area. If the tag is not retentive, it will be initialized during startup of the CPU and will thus be unavailable for selection of the station option.

– In the graphical programming languages, you implement the loop using instructions for program control.

  Example in FBD: Use the LABEL (jump label) and JMP (jump at RLO=1) instructions to program a loop.

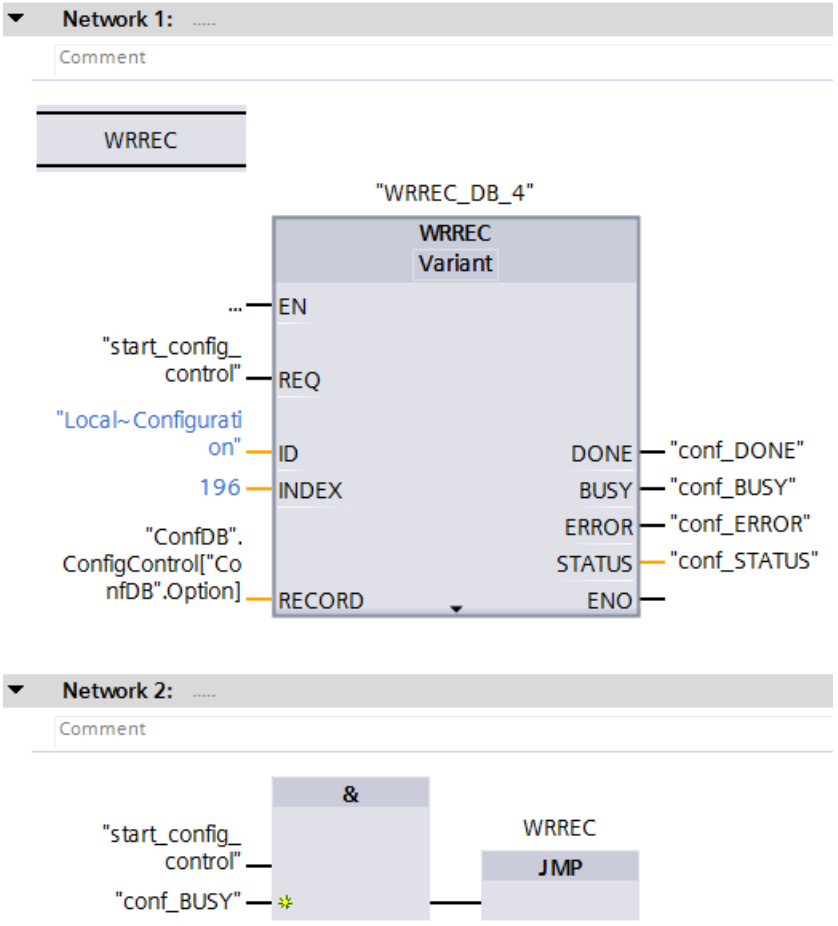

Figure 1-557 WRREC

- The control data record is stored retentively in the CPU. Note:
  – The retentivity of the control data record is independent of the retentivity settings in the STEP 7-memory area. The memory area in which the control data record is configured does then not have to be configured as retentive for this purpose.
  – If you write a control data record with modified configuration, the original data record 196 is deleted and the new data record 196 is saved retentively. The CPU will then restart with the modified configuration.

Special requirements relating to the transfer of the control data record to the interface module

- If you have enabled configuration control, the ET 200MP station is not ready for operation without a control data record. As long as no valid control data record has been transferred, the I/O modules are considered as failed by the CPU and exhibit substitute value behavior. The interface module continues to exchange data.
- The control data record is stored retentively in the interface module. Note:
  - If the configuration is unchanged, you do not have to rewrite the control data record 196 during restart.
  - If you write a control data record with modified configuration, this will result in a station failure in the distributed I/O system. The original data record196 is deleted and the new data record 196 is saved retentively. The station will then restart with the modified configuration.

12.2.4 Behavior during operation

Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module outputs diagnostics data. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows an incorrect module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

Response to modules that are not present

If modules are entered as not present in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct writing access to the outputs that are not present or writing access to the process image of outputs that are not present: Remains without effect; no access error is signaled.
- Direct reading access to the inputs that are not present or reading access to the process image of inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: The output parameter STATUS of the instruction RDREC supplies the value $80A3_H$ "General CM error".

Commissioning 13

13.1 Overview

Introduction

This section includes information on the following topics:

- Check before powering on for the first time
- Procedure for commissioning the S7-1500 automation system
  - Removing/inserting the SIMATIC memory card
  - First power-on of the CPU
- Procedure for commissioning the S7-1500 distributed I/O system
  - First power-on of the ET 200MP on PROFINET IO
  - First power-on of the ET 200MP on PROFIBUS DP
- Operating modes of the CPU STARTUP, STOP, RUN and operating mode transitions
- CPU memory reset: Automatic and manual
- Backing up and restoring the CPU configuration
- Time synchronization
- Identification and maintenance data
- Shared commissioning of projects

Commissioning requirements

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

NOTE

Check coding element in the I/O module

Make sure that the coding element is present in the I/O module before you plug in the front connector for the first time. This reduces the risk of plugging a wired front connector into the wrong type of module when replacing a module.

Software tools for commissioning

The following software tools support you during commissioning:

- SIEMENS PRONETA in commissioning PROFINET systems.
- SIMATIC automation tool in commissioning the S7-1500 automation system / ET 200MP distributed I/O system.

You can find more information on SIEMENS PRONETA and the SIMATIC Automation Tool in the section Software (Page 152).

13.2 Check before powering on for the first time

Before the first power-on, check the installation and the wiring of the S7-1500 automation system/ET 200MP distributed I/O system.

Questions for the check

The following questions provide instructions for checking your system in the form of a checklist.

Racks

- Are the mounting rails firmly installed on the wall, in the framework, or in the cabinet?
- Are the cable ducts correctly installed?
- Have the minimum clearances been observed?

Grounding and chassis concept

- Is the mounting rail connected to the protective conductor?
- If applicable, are all further protective conductor connection points on the S7-1500 automation system / ET 200MP distributed I/O system connected to the protective conductor? Has the protective conductor been tested?
- Has the connection between reference ground and ground been correctly made on all mounting rails?
- Are the required equipotential bonding cables connected with low impedance to the affected plant units?

Module installation and wiring

- Are all the modules inserted / installed in accordance with the mounting plan and corresponding to the configuration with STEP 7 and screwed firmly to the mounting rail?
- Are the coding elements present in the I/O modules?
- Are all the front connectors wired according to the circuit diagram, in the final position, and inserted on the correct module?
- Are the correct modules installed and connected to each other with U connectors?
- Are U connectors projecting either at the left-hand or right-hand over the outer modules on the S7-1500 automation system/ET 200MP distributed I/O system?

System power supply or load current supply

- Are all system power supplies and load current supplies switched off?
- Is the power cable connector correctly wired?
- Has the connection to line voltage been made?

13.3 Procedure for commissioning the S7-1500 automation system

Requirements

- The CPU is in the "Factory settings" state or has been reset to factory settings. You can find more information in the section Resetting the CPU to factory settings (Page 365).
- The SIMATIC memory card is as delivered or has been formatted.

Commissioning procedure

For the first commissioning of an S7-1500 automation system, we recommend the following procedure:

Table 1-845 Procedure for commissioning the SIMATIC S7-1500

Step	Procedure	See...
1	Configure hardware in STEP 7 and perform power balance calculation (see also "Requirements: CPU as bus device")	Section Power balance calculation (Page 167)
2	Create user program	STEP 7 online help
3	Insert required modules	Section Installation (Page 171)
4	Wiring and checking the assembly (system power supplies, front connectors, etc.)	Section Wiring (Page 192)
5	Insert SIMATIC memory card in the CPU	Section Removing/inserting a SIMATIC memory card on the CPU (Page 311)
6	Switch on the CPU and system power supply	Section First power-on of the CPU (Page 313)
7	Check LEDs	The meaning of the LEDs can be found in the manuals of the modules.
8	Evaluate information on the CPU's display	Section CPU display (Page 341)
9	Load hardware configuration and user program to the CPU	Online and diagnostics functions in STEP 7
10	Test inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, modifying the outputs in STOP mode. Section Test and service functions (Page 374)

Requirements: CPU as bus device

Note the following requirements for operation of a CPU as bus device:

- PROFIBUS interface
  - The integrated PROFIBUS interface of the CPU is configured using STEP 7 (device address and bus parameters configured).
  - The CPU is connected to the subnet.
  - The terminating resistors at the segment boundaries are switched on.

  You can find more information in the PROFIBUS function manual (https://support.industry.siemens.com/cs/ww/en/view/59193579)

- PROFINET interface
  - The integrated PROFINET interface of the CPU is configured using STEP 7 (IP address and device name configured).
  - The CPU is connected to the subnet.

  You can find more information in the PROFINET function manual (https://support.automation.siemens.com/WW/view/en/49948856)

Procedure for commissioning a SIMATIC Safety F-system

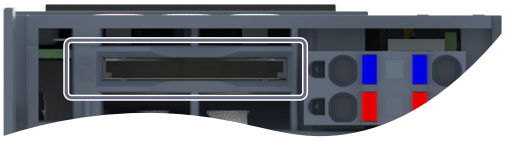
The procedure for commissioning an F-system is essentially the same as for commissioning a standard system. You use the Safety Administration Editor to commission SIMATIC Safety and activate the safety mode. The Safety Administration Editor is assigned to the fail-safe CPU in the STEP 7 project tree.

You can find more information on commissioning a SIMATIC Safety F-system and the Safety Administration Editor in the programming and operating manual SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

13.3.1 Removing/inserting a SIMATIC memory card on the CPU

Requirements

The CPU only supports pre-formatted SIMATIC memory cards. If applicable, delete all previously stored data before using the SIMATIC memory card. More information about deleting the contents of the SIMATIC memory card can be found in the Function Manual Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101).



In order to work with the SIMATIC memory card, first ensure that the SIMATIC memory card is not write-protected. For this purpose, slide the slider on the SIMATIC memory card out of the lock position.

If the inserted SIMATIC memory card is write-protected, the CPU display outputs the symbol ⚠ in the menu "Memory card" > "Overview". In addition, the display shows a message in the lower level of the menu.

Inserting the SIMATIC memory card

To insert a SIMATIC memory card, follow these steps:

1. Open the front cover of the CPU.
2. Ensure that the CPU is either switched off, or in the STOP mode.
3. Insert the SIMATIC memory card, as depicted on the CPU, into the slot for the SIMATIC memory card.

① Standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0: The slot for the SIMATIC memory card is located on the bottom of the CPU.

Figure 1-558 Slot for the SIMATIC memory card

4. Insert the SIMATIC memory card with light pressure into the CPU, until the SIMATIC memory card latches.

Removing the SIMATIC memory card

To remove a SIMATIC memory card, follow these steps:

1. Open the front cover.
2. Switch the CPU into STOP mode.
3. Press the SIMATIC memory card into the CPU with light pressure. Once it has clicked into place, remove the SIMATIC memory card.

Only remove the SIMATIC Memory Card in POWER OFF or STOP mode of the CPU. Ensure that:

- No writing functions are active in STOP . Writing functions are online functions with the PG/PC, for example loading/deleting a block and test functions.
- No writing functions were active before POWER OFF.

If you remove the SIMATIC memory card during a write process, the following problems can occur:

- The data content of a file is incomplete.
- The file is no longer readable, or no longer exists.
- The entire content of the card is corrupted.

Please also note the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/59457183) for removal of the SIMATIC memory card.

Reactions after removing/inserting the SIMATIC memory card

Inserting and removing the SIMATIC memory card in STOP mode triggers a re-evaluation of the SIMATIC memory card. The CPU hereby compares the content of the configuration on the SIMATIC memory card with the backed-up retentive data. If the backed-up retentive data matches the data of the configuration on the SIMATIC memory card, the retentive data is retained. If the data differs, the CPU automatically performs a memory reset. The retentive data is deleted and CPU then goes to STOP.

The CPU evaluates the SIMATIC memory card and indicates this by flashing the RUN/STOP LED.

NOTE

Using the SIMATIC memory card as a firmware update card

If you use the SIMATIC memory card as a firmware update card, removing and inserting the card will not result in the loss of retentive data.

Reference

You can find more information on the SIMATIC memory card in the Function Manual Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101).

13.3.2 First power-on of the CPU

Requirements

- An S7-1500 automation system has been installed.
- The system has been wired.
- The SIMATIC Memory Card is inserted in the CPU.

Procedure

Proceed as follows to commission the CPU:

- Switch on the system power supply and load current supply.

Result:

- The CPU executes a flash test:
  - All LEDs flash at 2 Hz
  - RUN/STOP LED flashes alternately yellow/green
  - ERROR LED flashes red
  - MAINT LED flashes yellow
- The CPU performs the system initialization and evaluates the SIMATIC Memory Card:
  - RUN/STOP LED flashes yellow at 2 Hz
- After the system initialization has been completed, the CPU goes to STOP mode:
  - The RUN/STOP LED lights up yellow

13.4 Procedure for commissioning the ET 200MP distributed I/O system

13.4.1 Commissioning the ET 200MP for PROFINET IO

Introduction

The commissioning of your automation system depends on the plant configuration.

Commissioning procedure

To commission the ET 200MP as IO device for PROFINET IO, proceed as follows:

Table 1-846 Procedure for commissioning the ET 200MP as an IO device for PROFINET IO

Step	Procedure	See...
1	Install ET 200MP	Section Installation (Page 171)
2	Connect ET 200MP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 192)
4	Configure IO controller	CPU manual or documentation of the IO controller
5	Switch on supply voltages for the IO controller	CPU manual or documentation of the IO controller
6	Switch on supply voltages for IO devices	Interface module (https://support.automation.siemens.com/WW/view/en/67295970/1-33300) manual
7	Download configuration to the IO controller	STEP 7 online help
8	Switch IO controller to RUN mode	CPU manual or documentation of the IO controller
9	Check LEDs	Interface module (https://support.automation.siemens.com/WW/view/en/67295970/1-33300) manual
10	Test inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, modifying the outputs. See section Test and service functions (Page 374)

NOTE

The operating mode transitions for the IO controller from RUN to STOP or from STOP to RUN can take several milliseconds, until the mode transition for the inputs and outputs of all I/O modules for the ET 200MP station is completed. This delay also applies to isochronous mode.

13.4.2 Commissioning the ET 200MP for PROFIBUS DP

Introduction

The commissioning of your automation system depends on the plant configuration.

Commissioning procedure

To commission the ET 200MP as a DP device on PROFIBUS DP, follow these steps:

Step	Procedure	See...
1	Install the ET 200MP (with IM 155-5 DP ST)	Section Installation (Page 171)
2	Set the PROFIBUS address on the interface module	Manual for the interface module (https://support.automation.siemens.com/WW/view/en/77910801/133300)
3	Connect the ET 200MP • Supply voltages • PROFIBUS DP • Sensors and actuators	Section Wiring (Page 192)
4	Configure DP master (including PROFIBUS address)	Documentation of the DP master
5	Switch on supply voltages for DP master	Documentation of the DP master
6	Switch on supply voltages for DP devices	Interface module (https://support.automation.siemens.com/WW/view/en/77910801/133300) manual
7	Download configuration to the DP master	STEP 7 online help
8	Switch DP master to RUN	Documentation of the DP master
9	Check LEDs	Interface module (https://support.automation.siemens.com/WW/view/en/77910801/133300) manual
10	Test inputs and outputs	The following functions are helpful: Monitoring and modifying tags, testing with program status, forcing, modifying the outputs. Section Test and service functions (Page 374)

NOTE

During operating mode transitions of the DP master from RUN to STOP or from STOP to RUN, it can take several milliseconds until the mode transition is complete for the inputs and outputs of all the I/O modules of the ET 200MP.

13.5 Operating modes

Introduction

Operating states describe the behavior of the CPU at a specific time. The following operating states are possible via the mode selector:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate, for example, via the PROFINET IO interface (X1).

The status LEDs on the front side of the CPU indicate the current operating mode.

13.5.1 STARTUP mode

Response

Before the CPU starts to execute the cyclic user program, a start-up routine is executed.

By suitably programming startup OBs, you can specify initialization tags for your cyclic program in the start-up routine. That is, you can set up one or several startup OBs in your program, or none at all.

Points to note

- The CPU resets the process image input.
- All outputs are disabled or react according to the parameter settings for the respective module: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe operating mode.
- Before processing the start-up routine, the CPU transfers the I/O inputs to the process image input.
- After processing the start-up routine, the CPU releases the peripheral outputs.

NOTE

To read the current state of inputs during STARTUP, you can access inputs via the process image or via direct I/O access.
To initialize outputs during STARTUP, you can write values via the process image or via direct I/O access. The values are output at the outputs during the transition to the RUN mode.

- The CPU always starts up in a warm restart.
  - The non-retentive bit memories, timers and counters are initialized.
  - The non-retentive tags in data blocks are initialized.
- During startup, no cycle time monitoring is running yet.
- The CPU processes the startup OBs in the order of the startup OB numbers. The CPU processes all programmed startup OBs, regardless of the selected startup mode (figure "Setting the startup behavior").

- If a corresponding event occurs, the CPU can start the following OBs in startup:
  - OB 82: Diagnostics interrupt
  - OB 83: Removal/insertion of modules
  - OB 86: Rack error
  - OB 121: Programming error (only for global error handling)
  - OB 122: Time-out (for global error handling only)
    You can find a description of how to use global and local error handling in the STEP 7 online help.

  The CPU does not start all other OBs until the transition to RUN mode.

Response when expected and actual configurations do not match

The configuration downloaded to the CPU represents the expected configuration. The actual configuration is the actual configuration of the automation system. If the expected configuration and actual configuration deviate from one another, the CPU's behavior is specified by the setting of the hardware compatibility. For more information about the hardware compatibility, see section Operating mode transitions (Page 321).

Cancellation of the startup

If errors occur during startup, the CPU cancels the startup and returns to STOP mode.

The CPU does not perform startup or interrupts the startup under the following conditions:

- You have not inserted a SIMATIC memory card or an invalid one is inserted.
- You have not downloaded a hardware configuration to the CPU.

Configuring startup behavior

You configure the behavior of the CPU in the Startup group of the CPU properties.

Setting the startup behavior

To set the startup behavior, follow these steps:

1. Select the CPU in the device view of the STEP 7 hardware network editor.
2. In the properties under "General" select the "Startup" area.

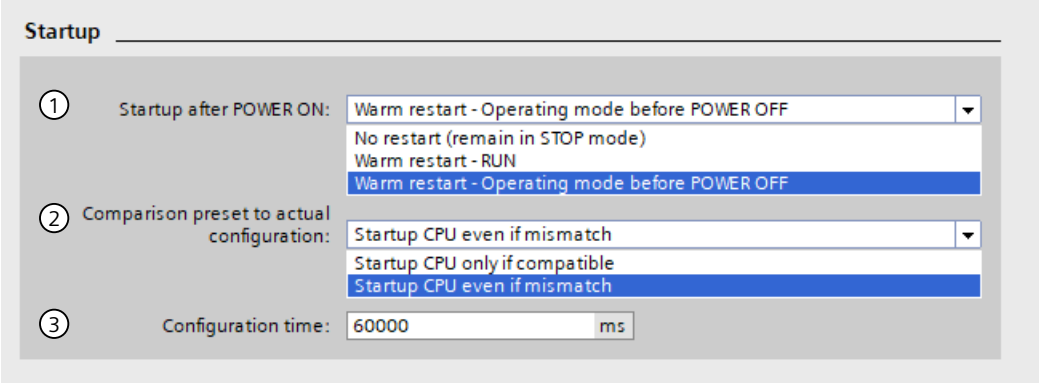


Figure 1-559 Setting the startup behavior

① Sets the startup type after POWER ON

② Defines the startup behavior for the case where a module in a slot does not correspond to the configured module. This parameter applies to the CPU and to all the modules for which no other setting was selected.

- Startup CPU only if compatible: In this setting a module on a configured slot has to be compatible with the configured module. Compatible means that the module matches the number of inputs and output and must match with respect to its electrical and functional properties.
- Startup CPU even if mismatch: At this setting the CPU starts up irrespective of the type of module plugged.

For locally used modules you can configure the hardware compatibility in the parameter "Comparison preset to actual module" individually for each slot. When you change the setting of the hardware compatibility for a module, the setting made at the CPU does not apply for this module.

③ Specifies a maximum period (default: 60000 ms) in which the central and distributed I/O must be ready for operation. The communications modules (CM/CP) are supplied with voltage and communication parameters during the CPU startup. This parameter assignment time grants a period within which the I/O modules connected to the communication module (CM/CP) must be operationally ready.
The CPU goes into RUN mode when the central and the distributed I/O is operationally ready within the parameter assignment time.

If the central and distributed I/O is not ready for operation within the configuration time, the startup characteristics of the CPU depends on the setting of the hardware compatibility.

Example for the "Comparison preset to actual configuration" parameter

"Startup CPU only if compatible"

The DI 32x24VDC HF input module with 32 digital inputs can be a compatible replacement for a DI 16x24VDC HF input module with 16 digital inputs. The pin assignment and all electrical and functional properties are identical.

"Startup CPU even if mismatch"

Instead of a configured digital input module, you insert an analog output module or no module is present in this slot and thus in all subsequent slots. Although the configured inputs cannot be accessed, the CPU starts up.

Note that the user program cannot function correctly in this case. Therefore, take appropriate measures!

13.5.2 STOP mode

Response

The CPU does not execute the user program in STOP mode.

All outputs are disabled or react according to the parameter settings for the respective module: They provide a substitute value as set in the parameters or retain the last value output and thus hold the controlled process in a safe operating mode.

13.5.3 RUN mode

Response

In "RUN" mode the cyclic, time-driven, and interrupt-driven program execution is performed. Addresses that are in the "Automatic Update" process image are automatically updated in each program cycle. For more information, see section Process images and process image partitions (Page 239).

Execution of the user program

Once the CPU has written the outputs and read the inputs, it runs through the cyclic program from the first instruction to the last instruction. Events with higher priority, such as hardware interrupts, diagnostic interrupts and communication, can interrupt the cyclic program flow and prolong the cycle time.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time has expired, even if the user program is completed sooner.

The operating system monitors the execution time of the cyclic program for a configurable upper limit known as the maximum cycle time. You can restart this time monitoring at any point in your program by calling the RE_TRIGR instruction.

If the cyclic program exceeds the maximum cycle time, the operating system starts the time error OB (OB 80). If the OB is not available, the CPU goes to STOP mode. If the cycle monitoring time is exceeded a second time, e.g. while the time error OB is being processed, the CPU goes to STOP mode.

Causes for loss of RUN mode

The following table provides a summary of causes that result in a loss of the RUN mode.

Cause	Reason	Comments
Triggering the STOP mode	Time error without calling OB 80	Maximum cycle time was exceeded.
	Time error when calling OB 80	The cycle time was exceeded twice in the same cycle.
	Programming error (without OB 121)	-
	Programming error in OB 121	-
	For motion control: Overflow of events	MC_Interpolator (OB 92)
		MC_Servo (OB 91)
	For motion control: Temperature monitor tripped	After a warning, the system switches to STOP mode
	For F-CPUs: Error responses occurred	75D1 / 75DC: Safety program: Internal CPU error
		75D2: Safety program: Maximum cycle time exceeded
		75D6: Safety program: Data corruption before output to F-I/O
		75D7: Safety program: Data corruption before output to partner F-CPU/other F-runtime group
		75D9: Safety program: Permissible time in deactivated safety mode exceeded
		75DF: Safety program: Data corruption before output to OPC UA SafetyConsumer instance
		75E6: Safety program: Inconsistent
		75EE: Safety program: Modifying jobs on F-I/O not completed
	Central module for S7-1500 unplugged/plugged	-
	Switched to STOP mode	Via STP instruction, mode selector switch/button, display, STEP 7, HMI, web server or SAT tool
CPU failure	CPU defective	-
	Power supply failed	-
	Negative power segment overview occurred	-
	SIMATIC Memory Card unplugged	-
Interrupting the RUN mode	Set breakpoint reached	-

Reference

More information about cycle and response times is available in the Function Manual Cycle and response times (https://support.automation.siemens.com/WW/view/en/59193558).

13.5.4 Operating mode transitions

Operating modes and operating mode transitions

The following figure shows the operating modes and the operating mode transitions:

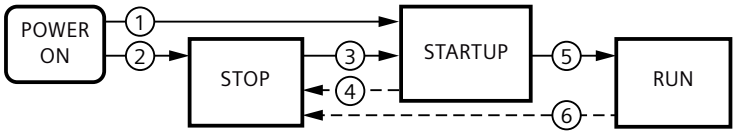

Figure 1-560 Operating modes and operating mode transitions

The table below shows the effects of the operating mode transitions:

Table 1-847 Operating mode transitions

No.	Operating mode transitions		Effects
①	POWER ON → STARTUP	After switching on, the CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • The preceding "POWER OFF" was triggered by an interruption in the power supply. • Startup type "Warm restart - RUN" is set. or • Startup type "Warm restart mode before POWER OFF" is set and the CPU was in RUN mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
②	POWER ON → STOP	After switching on, the CPU goes to "STOP" mode if: • The hardware configuration and program blocks are inconsistent. or • Startup type "No restart" is set. or • Startup type "Warm restart mode before POWER OFF" is set and the CPU was in STOP mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • You set the CPU to "RUN" mode via the programming device or the display and the mode switch in is RUN position. or • You set the mode selector from STOP to RUN or press the operating mode button RUN.[1)]	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
④	STARTUP → STOP	In the following cases the CPU returns from "STARTUP" to "STOP" mode when: • The CPU detects an error during startup. • You set the CPU to "STOP" via the programming device, display or mode selector switch / keys.[1)] • The CPU executes a STOP command in the Startup OB.	These operating mode transitions have no effect on data.
⑤	STARTUP → RUN	In the following cases, the CPU goes from "STARTUP" to "RUN" mode when: • The CPU has initialized the PLC tags. • The CPU has executed the startup blocks successfully.	

[1)] Standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0: You switch the mode using keys (RUN and STOP).

No.	Operating mode transitions		Effects
⑥	RUN → STOP	In the following cases, the CPU goes from "RUN" mode back to "STOP" mode: • The CPU detects an error that prevents it from continuing to operate. • You have inserted CMs/CPs that have not yet been configured. • The CPU processes a STOP command in the user program. • You set the CPU to "STOP" via the programming device, display or mode selector switch / operating mode button.[1)]	These operating mode transitions have no effect on data.

1) Standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0: You switch the mode using keys (RUN and STOP).

NOTE

RUN → STOP in configurations with centrally inserted communication modules (CM) and/or communications processors (CPs)

Centrally inserted communications modules (CMs) and/or communications processors (CPs) that have not yet been configured and downloaded to the CPU can cause a transition from "RUN" mode back to "STOP" mode.

Remove unconfigured CMs/CPs or configure and download the configuration of these CMs to the CPU before you set the CPU to "RUN" mode.

13.6 CPU memory reset

Basics of a memory reset

The CPU must be in STOP mode for a memory reset.

A memory reset returns the CPU to its "initial state".

Memory reset means:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data are deleted (with manual memory reset).
- The diagnostics buffer, time of day, and IP address are retained.
- Subsequently the CPU is initialized with the loaded project data (hardware configuration, code and data blocks, force jobs). The CPU copies this data from the load memory to the work memory.

  Result:

  – If you set an IP address in the hardware configuration ("Set IP address in the project" option) and a SIMATIC memory card with the project is in the CPU, this IP address is valid after the memory reset.
  – Data blocks no longer have current values but rather their configured start values.
  – Force jobs remain active.

Detecting a CPU memory reset

The RUN/STOP LED flashes yellow at 2 Hz. After completion, the CPU switches to STOP. The RUN/STOP LED is on (constant yellow light).

Result after memory reset

The following table provides an overview of the contents of the memory objects after memory reset.

Table 1-848 Memory objects after memory reset

Memory object	Contents
Actual values of the data blocks, instance data blocks	Initialized
Bit memories, timers and counters	Initialized
Retentive tags of technology objects (e.g. adjustment values of absolute encoders)	Retained
Diagnostics buffer entries	Retained
IP address	Retained
Device name	Retained
Counter readings of the runtime meters	Retained
Time of day	Retained
CPU operating state: RUN/STOP	The CPUs retain the STOP state.

NOTE

Password for protection of confidential configuration data

The password for protection of confidential configuration data is retained after a memory reset of the CPU. The password is only deleted when the "Delete password for protection of confidential PLC configuration data" option is set.

You can find more information on the password for protection of confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) Function Manual.

13.6.1 Automatic memory reset

Possible causes of automatic memory reset

The CPU executes an automatic memory reset if an error occurs that prevents normal further processing.

Examples of such errors:

- User program is too large and cannot be loaded to the work memory in full.
- The project data on the SIMATIC memory card are damaged, for example because a file was deleted.
- You remove or insert the SIMATIC memory card. The backed-up retentive data differs in structure from the data in the configuration on the SIMATIC memory card.

13.6.2 Manual memory reset

Reason for manual memory reset

Memory reset is required to reset the CPU to the "original state".

CPU memory reset

Three options are available for performing a CPU memory reset:

- Via the operating mode keys/mode switches
- Using the display
- Using STEP 7

Procedure via the mode selector keys (standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0)

NOTE

Memory reset ↔ Reset to factory settings

The procedure described below also corresponds to the procedure for resetting to factory settings:

- Key operation with inserted SIMATIC memory card: CPU executes a memory reset
- Key operation without inserted SIMATIC memory card: CPU executes reset to factory settings

To perform a memory reset of the CPU using the mode selector keys, follow these steps:

1. Press the STOP mode selector key.
   Result: The STOP ACTIVE and RUN/STOP LED light up yellow.
2. Press the STOP operating mode button until the RUN/STOP LED lights up for the 2nd time and remains continuously lit after 3 seconds. After this, release the button.
3. Press the STOP mode button again within the next 3 seconds.

Result: The CPU executes memory reset.

For information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 365).

Procedure using the mode selector

NOTE

Memory reset ↔ Reset to factory settings

The procedure described below also corresponds to the procedure for resetting to factory settings:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

To perform a memory reset of the CPU using the mode selector, follow these steps:

1. Set the mode selector to the STOP position.
   Result: The RUN/STOP LED lights up yellow.
2. Set the mode selector to the MRES position. Hold the switch in this position until the RUN/STOP LED lights up for the second time and remains continuously lit after three seconds. After this, release the selector.
3. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes memory reset.

For information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 365).

Procedure using the display

To navigate to the desired "Memory reset" menu command, select the following sequence of menu commands and confirm after each selection with "OK".

- Settings → Reset → Memory reset

Result: The CPU executes memory reset.

Procedure using STEP 7

To perform a memory reset of the CPU via STEP 7, follow these steps:

1. Open the "Online Tools" task card of the CPU.
2. Click the "MRES" button in the "CPU control panel" pane.
3. Click "OK" in response to the confirmation prompt.

Result: The CPU is set to STOP mode and performs memory reset.

13.7 Backing up and restoring the CPU configuration

Backup from online device
You may make changes in the operation of your plant. For example, you may add new devices, replace existing ones or adapt the user program. If these changes result in undesirable behavior, you can restore the plant to an earlier state. Before you download a changed configuration to the CPU, first use the option "Backup from online device" to create a complete backup of the current device state. If you have assigned a password to protect confidential PLC configuration data, then this password is not saved.

When restoring a backup with a set password to protect confidential configuration data, the following applies:
The password in the CPU must match the password in the backup.
Transfer the password to the CPU before restoring the backup. You can transfer the password either via a SIMATIC Memory Card or online in STEP 7 via "Online & Diagnostics". If the password in the CPU does not match the password entered in STEP 7, the SIMATIC Memory Card will be rejected when restoring. The CPU generates an entry in the diagnostics buffer.

You can find more information in the Protection of confidential configuration data (Page 259) section and in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) Function Manual.

Upload from device (software)
With the option "Upload from device (software)", you load the software project data from the CPU to an existing CPU in the project.

Upload device as new station
If you are operating a new PG/PC in the plant, the STEP 7 project that was used to create the plant configuration might not be available. In this case, you can use the option "Upload device as new station" to load the data to a project in your PG/PC.

Snapshot of the monitor values
To allow you to restore the actual values at a later date, back up the actual values of the data blocks using the option "Snapshot of the observed values".

Overview of backup types

The table below shows the backup of CPU data depending on the selected type of backup and its specific characteristics:

Table 1-849 Types of backup

	Backup from online device	Upload from device (software)	Upload device as new station	Snapshot of the monitor values
Current values of all DBs (global and instance data blocks) [1]	✓	✓	✓	✓
Blocks of the type OB, FC, FB and DB	✓	✓	✓	--
PLC tags (tag names and constant names)	✓	✓	✓	--
Technology objects	✓	✓	✓	--
Hardware configuration	✓	--	✓	--
Actual values (bit memories, timers and counters)[1]	✓	--	--	--

1 Only the values of the tags that are set as retentive are saved.

2 Contents of the DataLogs, Recipes and UserFiles folders

	Backup from online device	Upload from device (software)	Upload device as new station	Snapshot of the monitor values
Content of the SIMATIC memory card	✓	--	✓[2]	--
Archives, recipes	✓	--	--	--
Entries in the diagnostics buffer	--	--	--	--
Current time	--	--	--	--
Properties of the type of backup				
Backup possible for fail-safe CPUs	✓	✓	✓	✓
Backup can be edited	--	✓	✓	✓
Backup possible in operating mode	STOP	RUN, STOP	RUN, STOP	RUN, STOP

1 Only the values of the tags that are set as retentive are saved.

2 Contents of the DataLogs, Recipes and UserFiles folders

Example: Backup from online device

The following example shows how to carry out a complete backup of the current device state of the CPU in STEP 7. The S7-1500 automation system is in RUN mode. Before the backup, the CPU goes into STOP mode.

To start the backup, proceed as follows:

1. Right-click to select the CPU in the project tree.
2. Select the "Backup from online device" command from the shortcut menu.
   The "Upload preview" dialog window sets out the key information on the backup process to be run. For a backup you have to switch the CPU to the STOP mode.
3. In the "Action" column, select the "Stop module" command from the drop-down menu.
4. Click "Upload from device". The CPU changes to STOP mode. The backup of the CPU data starts. The backup is saved in the project tree in the folder of the CPU under "Online backups".

Example: Restoring a backup of an online device

If you have saved the CPU data beforehand, you can transfer the backup back to the device. The saved backup is then restored to the CPU.

The S7-1500 automation system is in RUN mode. Before the restoration, the CPU goes into STOP mode.

To start the backup restore, proceed as follows:

1. Open the CPU's folder in the project navigator. The lower-level objects are displayed.
2. Open the "Online backups" folder.
3. Select the backup you want to restore.
4. In the "Online" menu, select the "Download to device" command.
5. The "Load preview" dialog window sets out the key information on the restore process to be run. For a restoration you have to switch the CPU to the STOP mode.
6. In the "Action" column, select the "Overwrite" command from the drop-down menu.

7. Click "Download". The CPU changes to STOP mode. The backup is transferred to the CPU and restored. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary (no action, start modules).
8. Click "Finish".

Rules for backup and restore

Observe the following rules when backing up/restoring:

- Complete the process quickly and without interruptions.
- The CPU and the programming device must be located in a protected network.
- Decide in advance whether you want to back up/restore the data of a CPU in STEP 7 or via the web server of the CPU.
  If you start the process in STEP 7, you must also finish the process in STEP 7. The same applies to the procedure via the web server.
  - To perform the operation in STEP 7, the user requires either the "PLC administrator" role or a role with the "Full access" function right.
  - The user requires a role with the "Create a backup of the CPU" or "Restore the CPU using a backup file" function right to carry out the procedure via the web server of the CPU.
- The user who starts the process must also complete the process.
- If a user cancels the process or the CPU cancels the process due to an error, only the user who canceled the process can resume the process. To do so, the following intermediate steps are required:
  - Reset to factory settings
  - Start a new backup/restore

Reference

You can find additional information on the different backup methods in the STEP 7 online help.

Emergency address (Emergency IP)

The emergency address (emergency IP address) of a CPU is intended for diagnostic and download functions, for example, when the CPU is no longer accessible via the IP protocol after a wrong project is downloaded. For information on the emergency address, please refer to the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) function manual.

Storage of multilingual project texts

When you configure a CPU, texts of different categories result, for example:

- Object names (names of blocks, modules, tags, etc.)
- Comments (for blocks, networks, watch tables, etc.)
- Messages and diagnostic texts

Texts are provided by the system, for example texts in the diagnostics buffer, or they are created during configuration, for example messages.

Texts exist in the project in one language or, after a translation process, in multiple languages. You can maintain project texts in all languages available to you in the project tree (Languages & resources > Project texts). The texts produced when configuring can be downloaded to the CPU.

The following texts are downloaded in the selected languages with the project data to the CPU and are also used by the Web server/CPU display:

- Diagnostics buffer texts (cannot be changed)
- Status texts for the module status (cannot be changed)
- Message texts with associated text lists
- Tag comments and step comments for S7 GRAPH and PLC Code Viewer
- Comments in watch tables

The following texts are also downloaded in the selected languages with the project languages to the CPU but are not used by the Web server/CPU display:

- Comments in tag tables (for tags and constants)
- Comments in global data blocks
- Comments of elements in block interfaces of FBs, FCs, DBs and UDTs
- Network titles in blocks written in LAD, FBD or STL
- Block comments
- Network comments
- Comments of LAD and FBD elements

The S7-1500 CPUs support the storage of multilingual project texts in up to three different project languages. If the project texts for a project language nevertheless exceed the memory space reserved for them, the project cannot be downloaded to the CPU. The download is aborted with a notice that not enough memory space is available. In such a case, take measures to reduce the required storage space, for example by shortening comments.

You will find information on parameterization of multilingual project texts in STEP 7 in the STEP 7 online help.

Size of files and size of the SIMATIC Memory Card

NOTE

SIMATIC Memory Card

Make sure that there is enough available storage space on your SIMATIC Memory Card for downloading projects.

To download and back up projects, the project size and the size of the files on the SIMATIC Memory Card must be less than 2 GB.

Do not manipulate any contents in the OMSSTORE folder on the SIMATIC Memory Card.

You can find information on reading out the memory usage of the CPU and the SIMATIC memory card in the Structure and Use of the CPU Memory (https://support.industry.siemens.com/cs/de/de/view/59193101/en) Function Manual.

13.8 Time synchronization

Introduction

All CPUs are equipped with an internal clock. The clock shows:

- The time of day with a resolution of 1 millisecond
- The date and the day of the week

The CPU take into account the time change caused by daylight saving time.

You can synchronize the time of the CPUs with an NTP server in NTP mode.

Principle of operation

In NTP mode, the device sends time queries at regular intervals (in client mode) to the NTP server in the subnet (LAN). Based on the replies from the server, the most reliable and most accurate time is calculated and the time of day on the CPU is synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. You can synchronize the time of day of up to a maximum of four NTP servers. You address a communications processor or an HMI device, for example, as sources for time synchronization via the IP addresses.

The update interval defines the interval between the time queries (in seconds). The value of the interval ranges between 10 seconds and one day. In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. UTC corresponds to GMT (Greenwich Mean Time).

NTP server for the CPU S7-1500

You can assign up to 4 NTP servers to a CPU S7-1500.

You have the following options to reset the IP addresses of the NTP servers:

- Configure IP addresses of the NTP servers in STEP 7.
- Set IP addresses of the NTP servers with the "T_CONFIG" instruction.
- Obtain IP addresses of the NTP servers via DHCP.
  As of firmware version V2.9, the CPU can also obtain the NTP servers via DHCP. You can find more information on the procedure and the DHCP communication protocol in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) function manual.

Configuring IP addresses of the NTP servers in STEP 7

To configure the IP addresses of the NTP servers in STEP 7, follow these steps:

1. Select the S7-1500 CPU in STEP 7.
2. Configure the time synchronization in the "Properties > General > Time" parameter group.
3. Set the "Set NTP server in the project" value at the "Time synchronization" parameter.
4. Enter the IP addresses of up to four NTP servers for "NTP Server 1" to "NTP Server 4".
5. Set the time interval of time queries for "Update interval". Set the update interval to between 10 s and 86400 s.

Setting the IP addresses of the NTP servers with the "T_CONFIG" instruction

Requirement:

- You selected the option "Set NTP server directly on the device (e.g. PLC program, display)" in the "Time synchronization" drop-down list in STEP 7.

Proceed as follows to set the IP addresses of the NTP servers with the T_CONFIG instruction:

1. Enter the IP addresses of up to four NTP servers in a tag of the data type IF_CONF_NTP.
2. Connect the tag of the data type IF_CONF_NTP to the block parameter CONF_DATA of the instruction T_CONFIG.
3. Call the T_CONFIG instruction in the user program.

Result: The CPU adopts the addresses of the NTP servers from the T_CONFIG instruction.

If necessary, you can change the addresses of the NTP servers several times with T_CONFIG.

Reference

For more information on time-of-day synchronization - time synchronization in automation, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/de/en/view/86535497).

13.8.1 Example: Configuring the IP address of the NTP server in STEP 7 or setting it in the user program

Automation task

You are using your own NTP server in your network with the IP address 192.168.1.15. Your own server provides you with the following advantages:

- Protection against unauthorized accesses from outside
- Every device that you synchronize with your own NTP server uses the same time.

You want to synchronize the S7-1500 CPU with this NTP server.

The following sections describe how to configure the IP address of the NTP server in STEP 7 or set it in the user program.

Configuring the IP address of the NTP server in STEP 7

Procedure

1. Select the S7-1500 CPU in STEP 7.
2. Configure the time synchronization in the "Properties > General > Time" parameter group.
3. Set the "Set NTP server in the project" value at the "Time synchronization" parameter.
4. For "NTP Server 1", enter the IP address of the NTP server: 192.168.1.15.
5. Download the hardware configuration to the CPU.

Result

The S7-1500 synchronizes the time with the NTP server 192.168.1.15.

Set IP addresses of the NTP server with the "T_CONFIG" instruction

Requirement:

- You selected the option "Set NTP server directly on the device (e.g. PLC program, display)" in the "Time synchronization" drop-down list in STEP 7.

To set the IP address for the NTP server, use the following block parameters of the "T_CONFIG" instruction:

- Req: A positive edge at the block parameter "Req" starts a job of the "T_CONFIG" instruction.
- Interface: Enter the HW ID of the PROFINET interface 1 of the CPU at the block parameter "Interface". In this example, the HW ID is "64".
- Conf_Data: Area in which you save the IP addresses of the NTP server. Use the data type "IF_CONF_NTP" for this purpose.

Procedure

Proceed as follows to set the IP address of the NTP server in the user program to "192.168.1.15":

1. Create a global data block in the project tree under "Program blocks > Add new block". Name the global data block "NTP".
2. Create an "NTP_Server" tag of the data type "IF_CONF_NTP" in the global data block "NTP".

NTP

	Name	Data type	Start value	Comment
1	Static			
2	NTP_Server	IF_CONF_NTP		
3	Id	UInt	17	
4	Length	UInt	22	
5	Mode	UInt	0	
6	NTP_IP	Array[1..4] of IP_V4		
7	NTP_IP[1]	IP_V4		
8	ADDR	Array[1..4] of Byte		IPv4 address
9	ADDR[1]	Byte	192	IPv4 address
10	ADDR[2]	Byte	168	IPv4 address
11	ADDR[3]	Byte	1	IPv4 address
12	ADDR[4]	Byte	10	IPv4 address
13	NTP_IP[2]	IP_V4		
14	NTP_IP[3]	IP_V4		
15	NTP_IP[4]	IP_V4		
16	change_NTP-Server	Bool	false	
17	done	Bool	false	
18	busy	Bool	false	
19	error	Bool	false	
20	status	DWord	16#0	
21	err_loc	DWord	16#0	

Figure 1-561 Example data block with IF_CONF_NTP

3. Create a "T_CONFIG" instruction in the user program.
4. Connect the "T_CONFIG" instruction as follows.

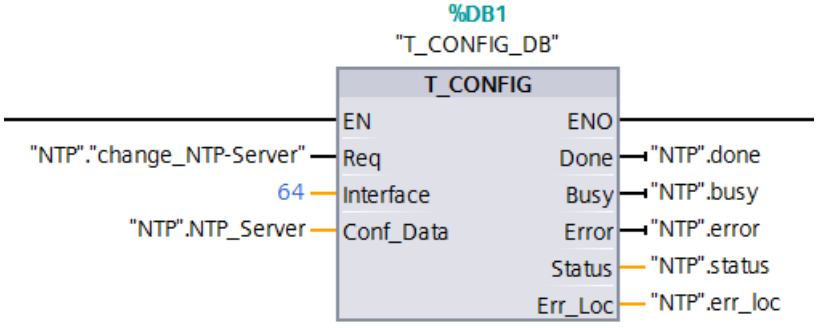

Figure 1-562 Example T_CONFIG: Setting the NTP server

5. In the user program, assign the IP address 192.168.1.15 to the data type "IF_CONF_NTP":
```
"NTP".NTP_Server.NTP_IP[1].ADDR[1] := 192;
"NTP".NTP_Server.NTP_IP[1].ADDR[2] := 168;
"NTP".NTP_Server.NTP_IP[1].ADDR[3] := 1;
"NTP".NTP_Server.NTP_IP[1].ADDR[4] := 15;
```
6. Generate a positive edge for the tag "change_NTP-Server" in the user program:
```
"NTP"."change_NTP-Server" := true;
```

Result
The S7-1500 synchronizes the time with the NTP server 192.168.1.15.

13.9 Identification and maintenance data

13.9.1 Reading out and entering I&M data

I&M data

Identification and maintenance data (I&M data) is information saved on the module. The data is:

- Read-only (I data) or
- Readable/writable (M data)

Identification data (I&M0): Manufacturer information about the module that can only be read. Some identification data is also printed on the housing of the module, for example article number and serial number.
Maintenance data (I&M1, 2, 3): Plant-specific information, for example installation location. Maintenance data for the S7-1500/ET 200MP is created during configuration and downloaded to the automation system/distributed I/O system.

All modules of the S7-1500/ET 200MP support identification data I&M0 through I&M3.

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a plant
- Correcting errors in a plant

Modules can be clearly identified online using the I&M identification data.

Maintenance data (I&M4): Storage of a CRC test value for IM 155-5 MF HF interface modules to ensure data integrity of data used by the interface module.

Options for reading out I&M data

- Via the user program
- Using the display of the CPU
- Via STEP 7 or HMI devices
- Via the CPU web server

Reading I&M data via the user program

You have the following options for reading module I&M data in the user program:

- Using the RDREC instruction
  The data record structure for centrally inserted modules as well as for distributed modules that are accessible via PROFINET IO/PROFIBUS DP is described in the section Record structure for I&M data (Page 336).
- Using the Get_IM_Data instruction

Reference

The description of the instructions can be found in the STEP 7 online help.

Reading I&M data from displays

To read the I&M data "Plant designation" or "Location identifier" of the CPU via the display, follow these steps:

1. Navigate to the "Overview/PLC" menu on the display of the CPU.
2. Select "Plant designation" or "Location identifier" and confirm with "OK".

To read the I&M data "Plant designation" or "Location identifier" of a centrally used module, follow these steps:

1. Navigate to the "Modules" menu on the display of the CPU.
2. Select the menu command "Local modules" and confirm with "OK".
3. Select the slot of the module (e.g., slot 3: DI 32 x 24VDC HF) and confirm with "OK".
4. Select the "Status" and confirm with OK.
5. Select "Plant designation" or "Location identifier" and confirm with "OK".

To read the I&M data "Plant designation" or "Location identifier" of a module used in distributed mode, follow these steps:

1. Navigate to the "Modules" menu on the display of the CPU.
2. Select the corresponding distributed I/O system (for example PROFINET IO system) and confirm with "OK".
3. Select the corresponding device (for example ET 200SP-Station_1) and confirm with "OK".
4. Select the slot of the module (e.g., slot 1: DI 16 x DC24V ST_1) and confirm with "OK".
5. Select the "Status" and confirm with OK.
6. Select "Plant designation" or "Location identifier" and confirm with "OK".

Reading I&M data via STEP 7

Requirement: There must be an online connection to the CPU/interface module.

To read I&M data using STEP 7, follow these steps:

1. In the project tree, select the CPU/the interface module.
2. Go to "Online & diagnostics".
3. In the "Diagnostics" folder, select the "General" area.

Enter maintenance data via STEP 7

STEP 7 assigns a default module name. You can enter the following information:

- Plant designation (I&M 1)
- Location identifier (I&M 1)
- Installation date (I&M 2)
- Additional information (I&M 3)

To enter maintenance data via STEP 7, follow these steps:

1. In the device view of STEP 7, select the CPU/interface module or a module.
2. Go to properties, "General", and select the "Identification & Maintenance" area
3. Enter the data.

During the loading of the hardware configuration, the maintenance data (I&M 1, 2, 3) are also loaded.

Procedure for reading I&M data via the Web server

The procedure is described in detail in the Web server Function Manual (https://support.automation.siemens.com/WW/view/en/59193560).

13.9.2 Record structure for I&M data

Reading I&M records via user program (centrally and distributed via PROFINET IO)

Use **Read data record** ("RDREC" instruction) to access specific identification data. Under the associated record index you obtain the corresponding part of the identification data.

The records are structured as follows:

Table 1-850 Basic structure of data records with I&M identification data

Contents	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H I&M4: 0024_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H I&M4: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	I&M0/Index $AFF0_H$: 54 I&M1/Index $AFF1_H$: 54 I&M2/Index $AFF2_H$: 16 I&M3/Index $AFF3_H$: 54 I&M4/Index $AFF4_H$: 54	- - - - -

Table 1-851 Record structure for I&M identification data

Identification data	Access	Default setting	Explanation
Identification data 0: (record index AFF0$_H$)			
VendorIDHigh	read (1 bytes)	00$_H$	Name of the manufacturer (42$_D$ = Siemens AG)
VendorIDLow	read (1 bytes)	2A$_H$	
Order_ID	read (20 bytes)	6ES7155-5MU00-0CN0	Article number of module (e.g. IM 155-5 MF HF)
IM_SERIAL_NUMBER	read (16 bytes)	-	Serial number (device-specific)
IM_HARDWARE_REVISION	read (2 bytes)	1	Corresponding to hardware version
IM_SOFTWARE_REVISION	read	Firmware version	Provides information about the firmware version of the module
• SWRevisionPrefix	(1 byte)	V	
• IM_SWRevision_Functional_Enhancement	(1 byte)	00$_H$ - FF$_H$	
• IM_SWRevision_Bug_Fix	(1 byte)	00$_H$ - FF$_H$	
• IM_SWRevision_Internal_Change	(1 byte)	00$_H$ - FF$_H$	
IM_REVISION_COUNTER	read (2 bytes)	0000$_H$	Provides information about parameter changes on the module (not used)
IM_PROFILE_ID	read (2 bytes)	0000$_H$	Generic Device
IM_PROFILE_SPECIFIC_TYPE	read (2 bytes)	0001$_H$	CPU
		0003$_H$	I/O modules
IM_VERSION	read	0101$_H$	Provides information on the ID data version (0101$_H$ = Version 1.1)
• IM_Version_Major	(1 byte)		
• IM_Version_Minor	(1 byte)		
IM_SUPPORTED	read (2 bytes)	000E$_H$	Provides information about the available identification data and maintenance data (I&M1 to I&M3)
Maintenance data 1: (Record index AFF1$_H$)			
IM_TAG_FUNCTION	read/write (32 bytes)	-	Enter an identifier for the module here, that is unique plant-wide.
IM_TAG_LOCATION	read/write (22 bytes)	-	Enter the installation location of the module here.
Maintenance data 2: (Record index AFF2$_H$)			
IM_DATE	read/write (16 bytes)	YYYY-MM-DD HH:MM	Enter the installation date of the module here.
Maintenance data 3: (Record index AFF3$_H$)			
IM_DESCRIPTOR	read/write (54 bytes)	-	Enter a comment about the module here.
Maintenance data 4: (Record index AFF4$_H$)			
USI	Read (4 bytes)	0x63726331	UserstructureIdentifier: Internal, fixed value
CHK_OVERALL	Read (4 bytes)	-	Overall CRC via all individual CRCs
CHK_OVERALL_SUBS	Read (4 bytes)	0 or value*	Overall CRC via all assigned modules of the IM
CHK_STATIC_LOCAL	Read (4 bytes)	-	CRC via static data of the IM

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the associated modules support I&M4 data.

Identification data	Access	Default setting	Explanation
CHK_STATIC_SUBS	Read (4 bytes)	0 or value*	CRC via all static data of the modules of the IM
CHK_OVERALL_SETUP	Read (4 bytes)	-	Overall CRC via all setup data of the IM and modules of the IM
CHK_REMANENT_LOCAL	Read (4 bytes)	-	CRC via retentive data of the IM
CHK_REMANENT_SUBS	Read (4 bytes)	0 or value*	CRC via all retentive data of the modules of the IM
CHK_WORKING_LOCAL	Read (4 bytes)	-	CRC via the parameters in STEP 7 for the IM
CHK_WORKING_SUBS	Read (4 bytes)	0 or value*	CRC via all parameters in STEP 7 for the modules of the IM
NOT USED	Read (14 bytes)	0	14 reserved bytes

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the associated modules support I&M4 data.

Reading I&M records with record 255 (distributed configuration via PROFIBUS)

Use **Read data record** ("RDREC" instruction) to access specific identification data.

The modules support standardized access to identification data using DR 255 (index 65000 to 65003). For more information on the DR 255 data structure, refer to the specifications of the Profile Guidelines Part 1: Identification & Maintenance Functions - Order no.: 3.502, Version 1.2, October 2009.

The specifications are available, for example, on the PROFIBUS & PROFINET International (PI) website on the Internet (https://www.profibus.com/).

13.9.3 Example: Read out firmware version of the CPU with Get_IM_Data

Automation task

You want to check whether the modules in your automation system have the current firmware. The firmware version of the modules can be found in the I&M0 data. The I&M0 data is the basic information for a device. The I&M0 data contains information, for example:

- Manufacturer ID
- Article number and serial number
- Hardware and firmware version.

To read out the I&M0 data, use the "Get_IM_Data" instruction. You read the I&M0 data of all modules in the user program of the CPU with "Get_IM_Data" instructions and store the I&M data in a data block.

Conditions and parameters

To read out the I&M data of the CPU, use the following block parameters of the "Get_IM_Data" instruction:

- LADDR: Enter the HW ID of the module at the block parameter "LADDR".
- IM_TYPE: Enter the I&M data number (e.g. "0" for I&M 0 data) at the block parameter "IM_TYPE".
- DATA: Area for storing the read I&M data (for example. in a global data block). Store the I&M 0 data in an area of the data type "IM0_Data".

This example shows how to read out the I&M 0 data of a CPU 1511-1 PN. To read out the I&M 0 data of a different module, simply use the HW ID of the module at the parameter LADDR.

Solution

To read out the I&M 0 data of the CPU, follow these steps:

1. Create a global data block to store the I&M 0 data.
2. Create a structure of the data type "IM0_Data" in the global data block. You can assign any name to the structure ("imData") in this case.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value
1	Static		
2	imData	IM0_Data	
3	done	Bool	false
4	busy	Bool	false
5	error	Bool	false
6	status	Word	16#0

Figure 1-563 Example: Data block for I&M data

3. Create the Insert the "Get_IM_Data" instruction in the user program, e.g. in OB 1.
4. Connect the "Get_IM_Data" instruction as follows:

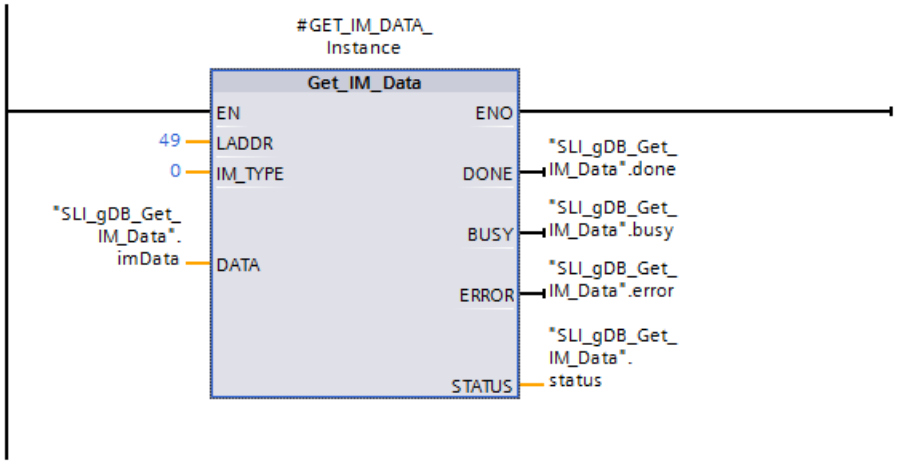

Figure 1-564 Example: Reading out I&M0 data

5. Call the "Get_IM_Data" instruction in the user program.

Result

The "Get_IM_Data" instruction has stored the I&M0 data in the data block.

You can view the I&M0-Daten online in STEP 7, for example, in the data block with the "Monitor all" button. The CPU in the example is a CPU 1511-1 PN (6ES7511-...) with firmware version V1.5.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value	Monitor value
1	Static			
2	imData	IM0_Data		
3	Manufacturer_ID	UInt	0	42
4	Order_ID	String[20]	''	'6ES7 511-...'
5	Serial_Number	String[16]	''	'S C-DOS710132013'
6	Hardware_Revision	UInt	0	3
7	Software_Revision	IM0_Version		
8	Type	Char	' '	'V'
9	Functional	USInt	0	1
10	Bugfix	USInt	0	5

12	Revision_Counter	UInt	0	0
13	Profile_ID	UInt	0	0
14	Profile_Specific_Ty...	UInt	0	0
15	IM_Version	Word	16#0	16#0101
16	IM_Supported	Word	16#0	16#001E
17	done	Bool	false	TRUE
18	busy	Bool	false	FALSE
19	error	Bool	false	FALSE
20	status	Word	16#0	16#0000

Figure 1-565 Example: I&M0 data of an S7-1500 CPU

13.10 Shared commissioning of projects

Team Engineering

In Team Engineering, several users from various engineering systems work on a project at the same time and access one S7-1500 CPU.

The users can edit separate parts of a master project independently of one another at the same time. The CPU show the changes of the other editors in a synchronization dialog during the loading of the configuration into the CPU and synchronizes the changes automatically, if possible.

Certain online functions can also be executed in parallel from several engineering systems on a shared CPU, such as:

- Monitoring blocks on the CPU
- Modifying blocks on the CPU
- Trace functions

You can find detailed information on the topic of Team Engineering in the STEP 7 online help.

CPU display

14

Introduction

The section below gives an overview of the mode of operation of the CPU display. Detailed information on the individual options, a training course and a simulation of the selectable menu items is available in the SIMATIC S7-1500 Display Simulator (https://support.industry.siemens.com/cs/ww/en/view/109761758).

Display

The S7-1500 CPU has a display and operating keys. The display of the CPU shows you the control and status information in different menus. You use operating keys to navigate through the menus and make a variety of settings in the process.

Advantages

The display of the CPU offers the following advantages:

- Reduced downtimes through diagnostic messages in plain text
- Time savings during commissioning, maintenance and downtime of the plant by changing the interface settings (e.g. IP address) of CPU and connected CMs/CPs. No programming device is required.
- Shorter downtimes due to read/write access to force tables and read/write access to watch tables.
  This allows the current values of the individual tags of a user program or a CPU to be monitored and changed by the monitoring and force tables. You can find more information on the watch and force tables in section Test functions and fault correction (Page 374) and in the STEP 7 online help.
- On site, an image (backup copy) of the functioning plant can be
  - Backed up on the SIMATIC Memory Card of the CPU
  - Restored from the SIMATIC Memory Card of the CPU

You do not require an additional PG/PC.

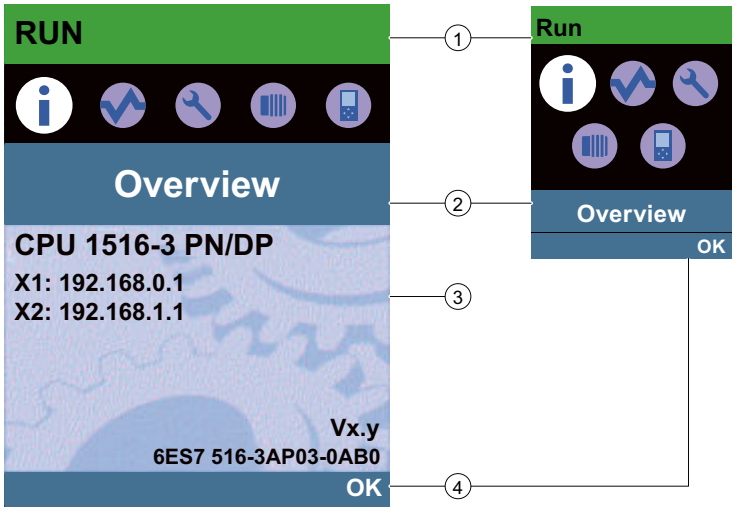
- For F-CPUs: Overview of status of safety mode and of F-parameters of F-CPU and F-I/O.

Password protection for the display

In the properties of the CPU, configure a password in STEP 7 for the display operation. Local access protection is thus protected via a local password.

Operating temperature for the display

To increase the service life of the display, the display switches off when the permitted operating temperature is exceeded. When the display has cooled down again, it switches on automatically again. When the display is switched off, the LEDs continue to show the status of the CPU.



Information about the temperatures at which the display switches off and back on again is available in the technical data of the manuals of the CPUs.

NOTE

The S7-1500 CPU has no internal temperature measurement. Reading out the internal temperature of the S7-1500 CPU is not supported.

Display

The following figures show an example of a CPU with large display (left: for example, CPU 1516-3 PN/DP) and a CPU with small display (right: for example, CPU 1511-1 PN).

① CPU status information
② Names of the menus
③ Data display field
④ Navigation aid, e.g. OK/ESC or the page number

Figure 1-566 Example views of the displays

Regarding ①: CPU status information

The following table shows the CPU status information that can be retrieved via the display.

Table 1-852 CPU status information

Color and icons for the status data	Meaning
Green	RUN
Orange	• STOP • STOP - firmware update
Red	FAULT
White	• Connection established between CPU and display.
	• Access protection configured. • Incorrectly displayed with the following configuration: You have not configured access control and the "Anonymous" user does not have full access rights (e.g. read-only access) to the CPU.
	• At least one interrupt is active in the CPU. • No SIMATIC Memory Card inserted in the CPU. • The serial number to which a know-how-protected block is bound does not match the serial number of the CPU or the SIMATIC Memory Card. • No user program loaded.
	Force job is active in the CPU.
	F-capability activated. Safety operation active (for fail-safe CPUs) The symbol is grayed out when safety mode is deactivated.
	Fail-safe CPU (for fail-safe CPUs).

Regarding ②: Names of the menus

The following table shows the available menus of the display.

Table 1-853 Names of the menus

Main menu items	Meaning	Description
	Overview	The "Overview" menu contains information about: • The properties of the CPU • The properties of the inserted SIMATIC Memory Card • Whether a know-how protection or a linking of the serial number exists. The following information is displayed for F-CPUs: • The status of the safety mode • The collective signature • The date of the last changes
	Diagnostics	The "Diagnostics" menu includes: • The display of diagnostic messages. • Read/write access to force and watch tables. • Display of cycle time. • Display of CPU memory utilization. • Display of interrupts.
	Settings	In the "Settings" menu you: • Assign the IP addresses and the PROFINET device name of the CPU. • Set the network properties of each CPU interface. • Set the date, time, time zones, operating modes (RUN/STOP) and protection levels. • Disable/enable display with display password • Perform a CPU memory reset. • Perform a reset to factory settings. • Format the SIMATIC Memory Card. • Delete the user program. • Back up/restore the CPU configuration to/from the SIMATIC Memory Card.

Main menu items	Meaning	Description
		• View the status of the firmware update. • Convert the SIMATIC Memory Card to a program card
	Modules	The "Modules" menu contains information about the central and distributed modules that are used in your configuration. Peripherally deployed modules are connected to the CPU via PROFINET and/or PROFIBUS. You can set the IP addresses for the CPU or a CP/CM here. Fail-safe parameters are displayed for F-modules.
	Display	In the "Display" menu you can configure settings related to the display, such as language setting, brightness and energy-saving mode. The energy-saving mode dims the display. The standby mode selectors the display off.

Menu icons

The following table shows the icons that are displayed in the menus.

Table 1-854 Menu icons

Icon	Meaning
	Editable menu item.
	Select the desired language here.
	A message is available in the next lower level page.
	There is an error in the next lower level page.
	The marked module is not accessible.
	Navigate to the next lower level page.
	In edit mode you make the selection using two arrow keys: • Down/up: jumps to the selection or is used to select the desired digits/options.
	In edit mode you make the selection using four arrow keys: • Down/up: jumps to the selection or is used to select the desired digits. • Left/right: jumps one spot forward or backward.
	The alarm is not yet acknowledged.
	The alarm is acknowledged.

Control keys

You operate the display using the following keys:

- Four arrow keys: "up", "down", "left", "right"
  If you press and hold an arrow key for 2 seconds, this generates an automatic scroll function.
- One ESC key

- One OK key

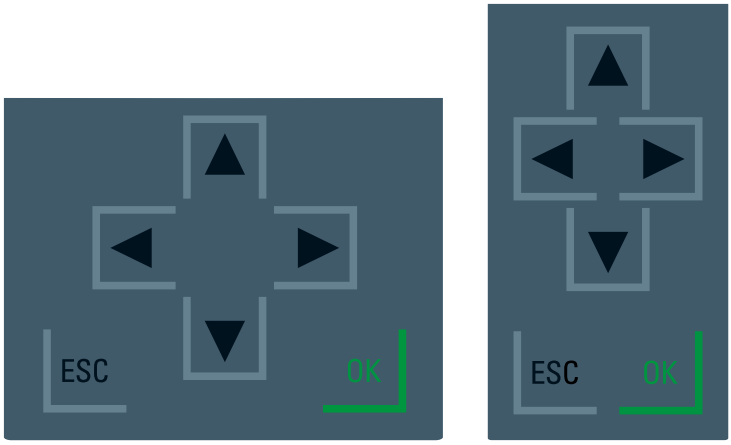


Figure 1-567 Control keys

NOTE
If the display is in energy-saving mode or in standby mode, you can exit this mode by pressing any key.

Functions of the "OK" and "ESC" keys

- For menu commands in which an entry can be made:
  - OK → valid access to the menu command, confirmation of input, and exit from the edit mode
  - ESC → Restore original content (changes are not saved) and exit edit mode
- For menu commands in which no entry can be made:
  - OK → to next submenu command
  - ESC → back to previous menu command

Hold ESC for about 3 seconds on any screen of the display. Result: You automatically return to the home page.

Tooltips

Some of the values shown on the display can exceed the available display width. The values in question include:

- Station name
- Plant designation
- Location identifier
- PROFINET device name

The available display width is frequently exceeded on CPUs with small displays.

If you focus on the relevant value on the display and press the "Left" arrow key, a tooltip appears. The tooltip shows the name of the value in complete length. To hide the tooltip again, press the "Left" arrow key again or the "ESC" key.

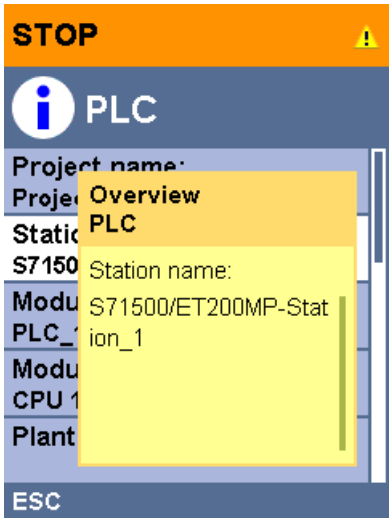

Figure 1-568 Tooltip function

Uploading image to the display via STEP 7

In the STEP 7 device view, you download an image from your file system to the CPU display with the "Display > User-defined logo" function.

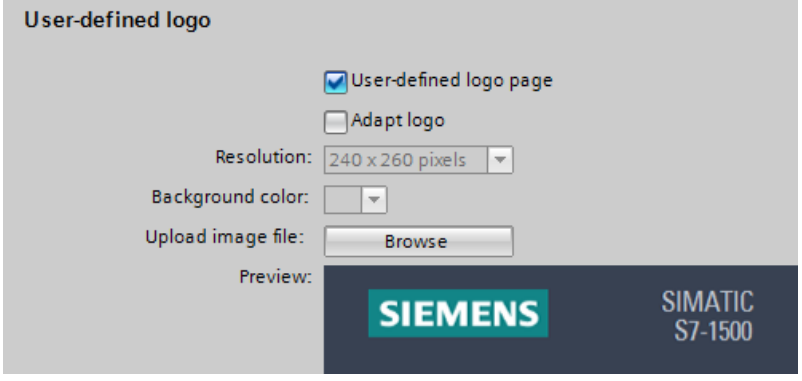

Figure 1-569 Uploading image to CPU

To display the uploaded image in the correct aspect ratio, use images with the following dimensions depending on the CPU.

Table 1-855 Dimensions

CPU	Dimensions	Supported formats
CPU 1511(F)-1 PN CPU 1511C-1 PN CPU 1511T(F)-1 PN	128 x 120 pixels	Bitmap, JPEG, GIF, PNG
CPU 1512C-1 PN	128 x 120 pixels	Bitmap, JPEG, GIF, PNG
CPU 1513(F)-1 PN	128 x 120 pixels	Bitmap, JPEG, GIF, PNG

CPU	Dimensions	Supported formats
CPU 1515(F)-2 PN CPU 1515T(F)-2 PN	240 x 260 pixels	Bitmap, JPEG, GIF, PNG
CPU 1516T(F)-3 PN CPU 1516(F)-3 PN/DP CPU 1516T(F)-3 PN/DP	240 x 260 pixels	Bitmap, JPEG, GIF, PNG
CPU 1517(F)-3 PN CPU 1517(F)-3 PN/DP CPU 1517T(F)-3 PN CPU 1517T(F)-3 PN/DP	240 x 260 pixels	Bitmap, JPEG, GIF, PNG
CPU 1518(F)-3 PN CPU 1518(F)-4 PN/DP CPU 1518T(F)-3 PN CPU 1518T(F)-4 PN/DP CPU 1518(F)-4 PN/DP MFP	240 x 260 pixels	Bitmap, JPEG, GIF, PNG

If the uploaded image exceeds the specified dimensions, the display shows only part of the image. The "Adapt logo" option in STEP 7 allows you to reduce the image to the specified dimensions. However, note that the original aspect ratio of the image is not retained in such cases.

Displaying image on the display

To display the uploaded image on the display of the CPU, press the ESC key in the main screen of the display. When you upload an image and are in the main screen, the display automatically shows the image after 60 seconds. To hide the image again, press any key on the display.

Available language settings

You can set the following languages separately for menu and message texts:

- Chinese
- German
- English
- French
- Italian
- Japanese
- Korean
- Portuguese (Brazil)
- Russian
- Spanish
- Turkish

You select the required language directly on the display in the "Display" menu or in STEP 7 in the hardware configuration of the CPU under "User interface languages".

To display message texts on the display, follow these steps:

1. Download the message texts to the CPU as a software component.
   - To do so, select the "Consistent download" option under "Text libraries" in the "Load preview" dialog.
2. You set the project language you would like to be displayed as the interface language by means of parameter assignment.
   - To do so, select a CPU and navigate to the "Multiple languages" area ("Properties > General > Multilingual support") in the Inspector window.
   - Assign the required project languages to the interface languages.

Reference

Important information/special requirements for the display of F-CPUs can be found in Product Information F-CPUs S7-1500
(https://support.industry.siemens.com/cs/ww/de/view/109478599/en)

Maintenance 15

15.1 Removing and inserting I/O modules

Requirement

Remove or insert front connectors and I/O modules only when the voltage is switched off.

NOTICE
Physical damage can occur If you install or uninstall front connectors and/or I/O modules with switched-on voltage, this can lead to undefined conditions in your plant. The S7-1500 automation system/ET 200MP distributed I/O system may be damaged as a result. Therefore only install/uninstall front connectors and/or I/O modules with switched-off voltage. Therefore during the planning of a plant always make sure to comply with the necessary, pertinent standards and safety guidelines.

Replacement part scenario

Replacing the CPU in a replacement part scenario has an impact on the password for protection of confidential configuration data. When you replace the CPU, observe the rules for the replacement part scenario in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

If you replace an existing CPU with a higher-grade CPU, you must also make the change in your STEP 7 project accordingly. You can only replace CPUs with CPUs of the same family. Then load the customized STEP 7 project into the CPU.

15.2 Replacing the display/front cover

Replacing display (Standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0)

The display is pluggable. You can remove or replace the display during operation (RUN). Removing or replacing of the display does not have any influence on the running CPU.

To remove the display from the CPU, follow these steps:

1. Flip the front cover up.
2. Press with a 3.5 mm screwdriver from the front into the unlatching mechanism of the display. This is found in the middle directly above the display.
3. Press the screwdriver lightly from above and lever out the display from the support.

4. Remove the display in an upward direction.
5. You have removed the display.
6. Place the new display in the CPU and press the display firmly in the top area until it audibly engages.
7. Flip the front cover down into place.

The figure below shows an example of the operation at the CPU 1511-1 PN.

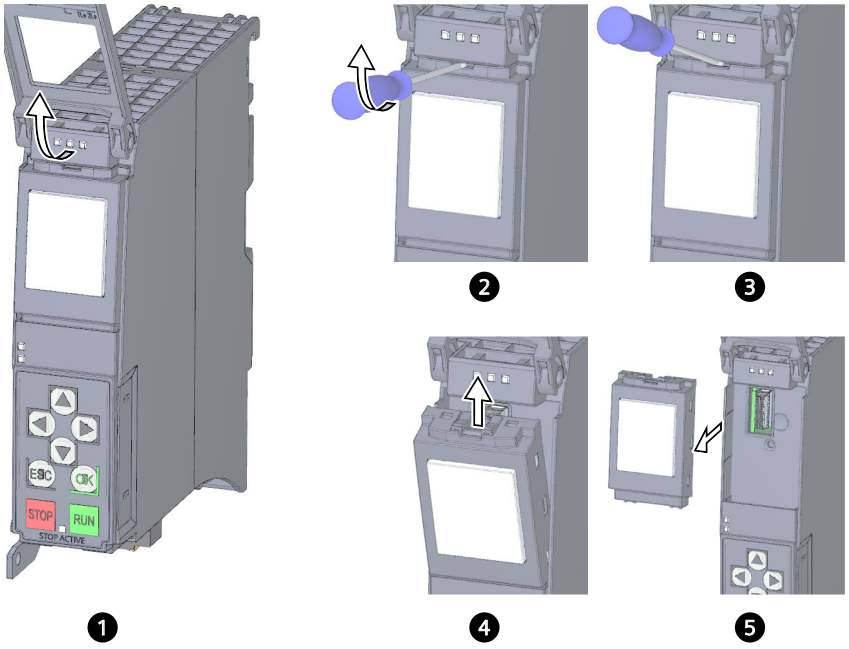

Figure 1-570 Remove display

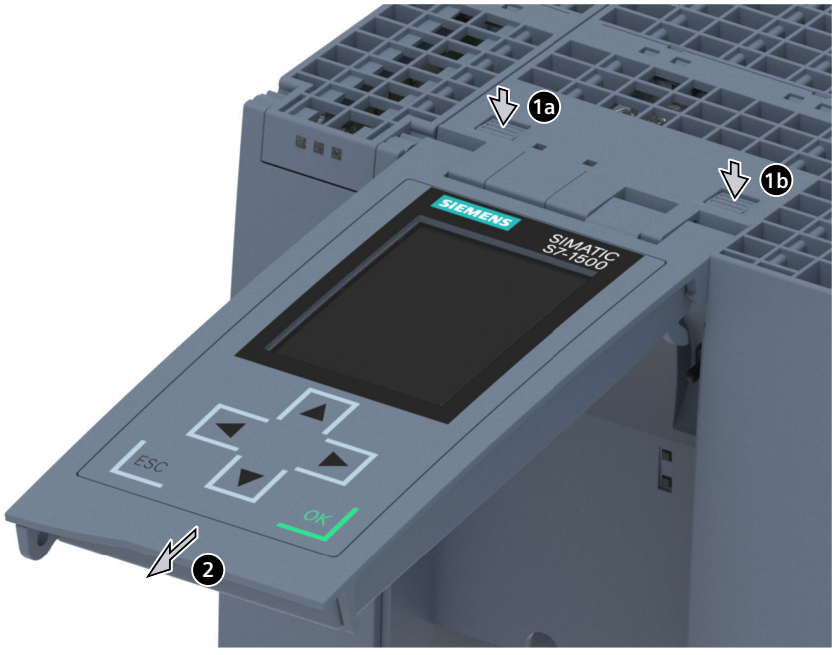
WARNING

Personal injury or material damage can occur in zone 2 hazardous areas
In Zone 2 hazardous areas, personal injury or damage to property can occur if you pull or plug the display of an S7-1500 automation system during operation.
Before you remove or fit the display, always switch off the power supply to the S7-1500 automation system in hazardous area zone 2.



Exchanging the front cover

The front cover is pluggable. If necessary, you can take off the front cover or replace the front cover during runtime (RUN). Removing or replacing the front cover does not affect the CPU in operation.

To remove the front cover from the CPU, follow these steps:

1. Flip up the front cover until the front cover stands at a 90° angle to the front of the module.
2. In the upper area of the front cover, simultaneously press on the anchor(s). At the same time, pull the front cover forward and away.
3. Insert the new front panel (at a 90° angle to the module) from the front into the anchor(s) until they audibly engage.
4. Flip the front cover down into place.

The figure below shows an example view of the CPU 1516-3 PN/DP, article number: 6ES7516-3AN01-0AB0.

① Fasteners for removing and fitting the front panel
② Pull the front cover off towards the front

Figure 1-571 Removing and fitting the front panel

⚠ WARNING

Personal injury or material damage can occur in zone 2 hazardous areas
If you pull or plug the front panel of an S7-1500 automation system during operation, personal injury or damage to property can occur in zone 2 hazardous areas.
Before you remove or fit the front panel, always switch off the power supply to the S7-1500 automation system in hazardous area zone 2.

15.3 Replacement of I/O modules and front connectors

15.3.1 Coding element on the I/O module and on the front connector

Function

All front connectors for the I/O modules of the S7-1500 automation system/ET 200MP distributed I/O system are identical. The coding element prevents a front connector from being inserted on a module with a different electrical pin assignment.

Delivery state of the I/O module

In the delivery state, the coding element is located in the I/O module.

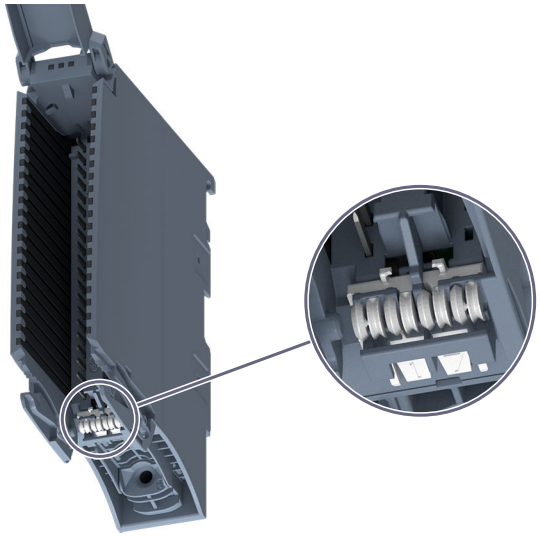


Figure 1-572 Coding element in the I/O module (delivery condition)

Coding element in the front connector

When the front connector is inserted into the I/O module for the first time, one half of the coding element latches into the front connector. When you remove the front connector from the I/O module, this half of the coding element remains in the front connector, while the other half remains in the I/O module.

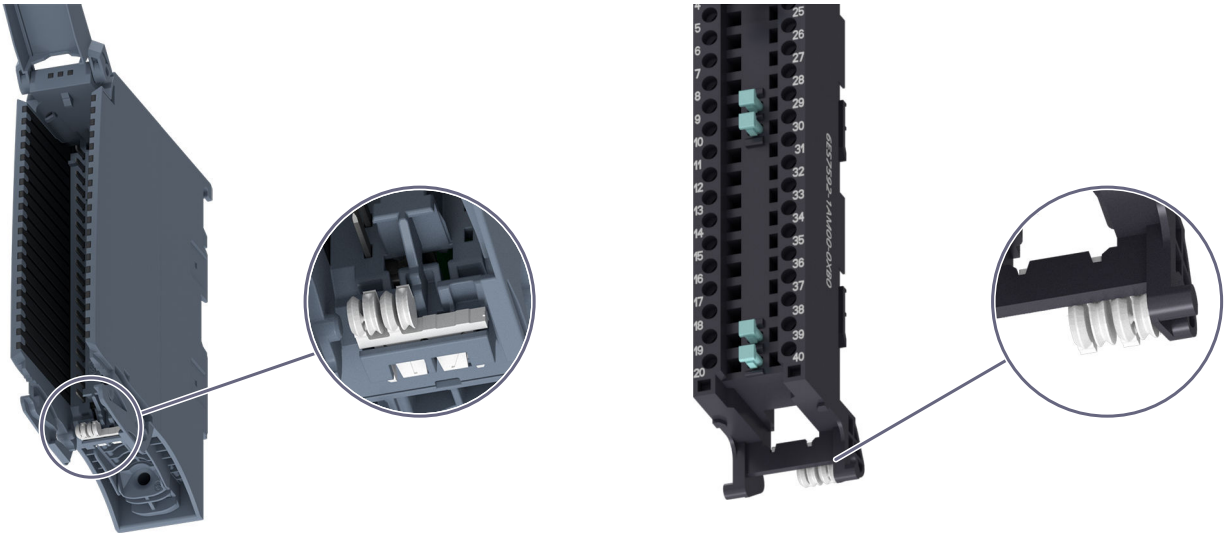

Figure 1-573 Coding element in the I/O module/front connector

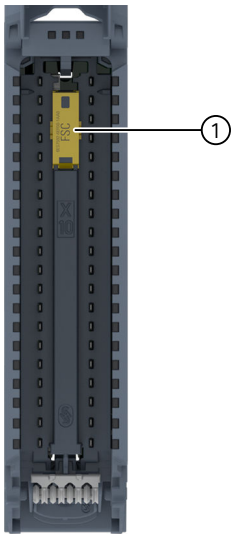
You can insert a coded front connector on modules with the same electrical pin assignment.
Refer to section Application planning (Page 155).

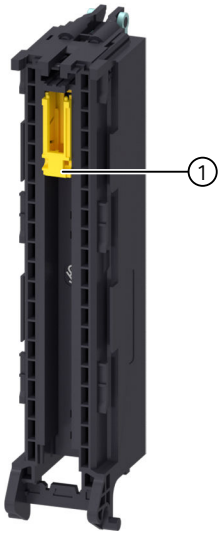


NOTICE
Physical damage can occur If the coding element is changed or removed, it will be possible to insert the front connector on modules in which the electrical connection is not properly wired. This can destroy the module and/or the connected sensors and actuators. Even hazardous plant states are possible. Do not change the coding element unless you want to use the front connector on a different module and you change the process wiring accordingly.

Use cases for replacing the coding element

- Replacing an I/O module, for example, due to a defect or incorrect configuration
- Replacing a front connector

Additional electronic coding element for fail-safe modules



In as-delivered condition, a fail-safe module not only has a mechanical coding element but also an electronic rewritable memory for the PROFIsafe address.

① Electronic coding element

Figure 1-574 F-module with electronic coding element (as delivered)

When the front connector is inserted in the F-module, the electronic coding element engages completely in the front connector. If you remove the front connector from the F-module, the memory with the PROFIsafe address of the fail-safe module remains in the front connector.

① Electronic coding element

Figure 1-575 Front connector with electronic coding element

15.3.2 Replacing an I/O module

Introduction

- When the front connector is first inserted into the I/O module, a part of the coding element clips onto the front connector.
- In the case of fail-safe modules, the electronic coding element with the PROFIsafe address of the F-module also engages completely in the front connector.

When you replace an I/O module with the same type of module, the correct coding element or coding elements in the case of F-modules are already present in the front connector.

Result: Before inserting the previous front connector, you must remove the coding element or coding elements from the new I/O module.

Procedure

To replace the I/O module, follow these steps:

The I/O module to be replaced is uninstalled.
You can find information on removing the I/O module in section Installing I/O modules (Page 189).

1. For a new I/O module, use a screwdriver to break out the half of the mechanical coding element that is designated for the front connector.

   NOTE

   The arrangement of the mechanical coding element depends on the module type: First, check the position of the coding element on the front connector before you break out the matching half from the I/O module.

   For a new fail-safe module you must also remove the electronic coding element from the F-module.

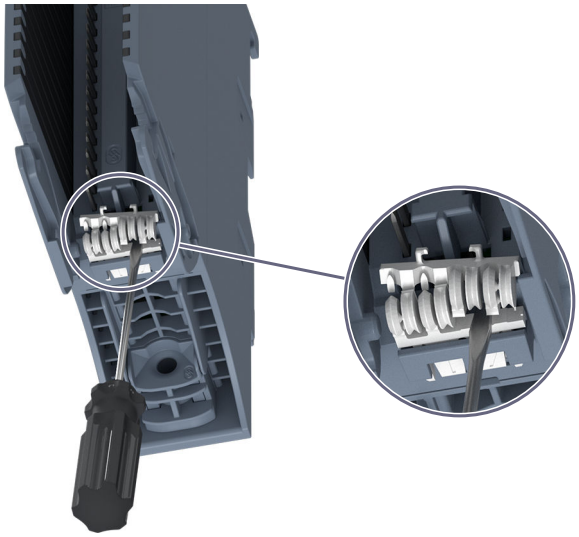


Figure 1-576 Breaking the coding element out of the I/O module

2. Insert the existing front connector into the new I/O module (same module type) until your hear it click into place.

15.3.3 Replacing a front connector

Introduction

- When the front connector is first inserted into the I/O module, a part of the mechanical coding element engages on the front connector.
- In the case of fail-safe modules, the electronic coding element with the PROFIsafe address of the F-module also engages completely in the front connector.

When you replace a defective front connector with a new front connector, you must transfer the coding element(s) to the new front connector.

Procedure

You have already removed the front connector from the module and loosened the wiring. If you are using the front connector for an analog module, you also need to remove the power supply element and shield element. Proceed as follows to replace the front connector:

1. Carefully remove the mechanical coding element from the front connector. Take care not to damage the coding element.

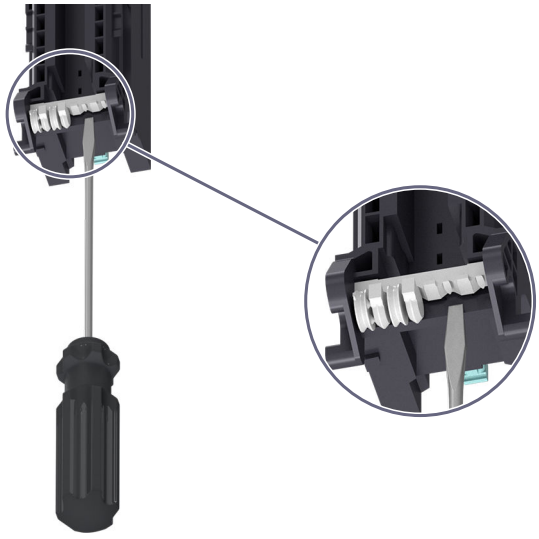

Figure 1-577 Removing the mechanical coding element from the front connector

NOTE

The coding elements are dependent on the module type.

2. Insert the removed mechanical coding element into the new front connector.

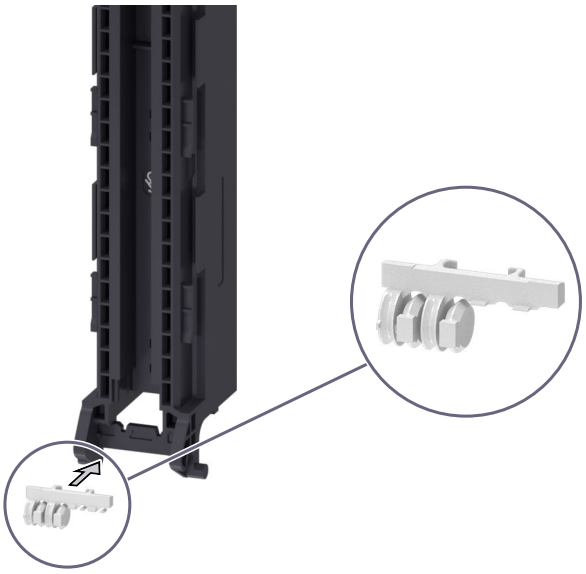

Figure 1-578 Inserting the mechanical coding element into a new front connector

3. Additionally for F-modules:
   - Carefully remove the electronic coding element from the front connector. Take care not to damage the coding element.
   - Insert the removed electronic coding element into the new front connector.

Figure 1-579 Removing the electronic coding element from the front connector and inserting it into a new front connector

4. Insert the new front connector into the existing I/O module, until your hear it click into place.
5. Wire the new front connector.

15.4 Replacing the coding element at the power connector of the system power supply and load current supply

Introduction

The coding consists of a 2-part coding element.

Ex factory a part of the coding element is inserted into the back side of the power connector. The other part is firmly inserted in the system power supply or load power supply.

This prevents the insertion of a power connector of a system power supply or load power supply into a module of a different type.

⚠ DANGER

Do not manipulate the coding element, or leave it off

- Changing or replacing the coding element can result in dangerous system states.
- To avoid damage, do not change or replace the coding element.
- You must not remove the coding element.

Replacement parts scenario

Insertion of the coding element into a new power connector in the case of a replacement part.

⚠ DANGER

Dangerous voltage

When installing the coding element, you must take into account the supply voltage of the system power supply and load power supply: 24 V DC, 24/48/60 V DC or 120/230 V AC/DC

Only install the coding element with switched-off voltage.

You must insert the coding element in such a way that the power connector matches the power supply module in terms of voltage.

Procedure

To replace the coding element on the power connector of the system power supply and load current supply, follow these steps:

1. Orient yourself using the labeling on the power cable connection.

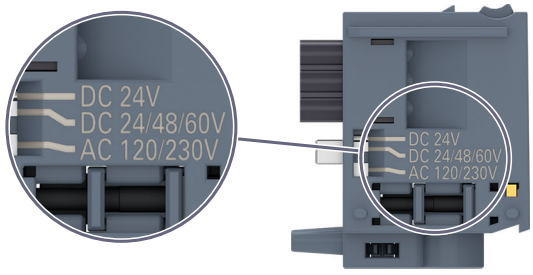

Figure 1-580 Labeling on the power connector

2. Orient yourself using the red marking on the coding element.
3. The coding element has 3 red markings. Turn the coding element in such a way that one of the 3 red markings corresponds to the voltage indicated on the connector.
4. Insert the coding element into the back side of the power cable connector, until you hear it click into place. The figure below shows you how to insert a coding element into a power cable connector for 24 V DC.

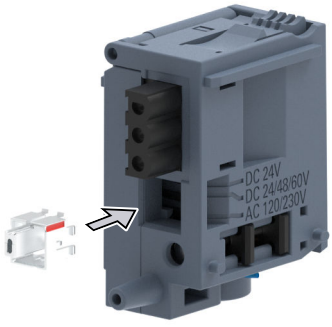

Figure 1-581 Inserting a coding element into a power connector

15.5 Firmware update

Introduction

Update the firmware of the CPU/interface module, display and the I/O modules using firmware files. The retentive data is retained after the execution of the firmware update.

We recommend that you always update to the latest firmware version available for the respective article number. The previous versions of the firmware are only intended as a backup to enable you to downgrade to the original version.

A firmware update has no effects on the user program of the CPU on which the update was performed. However, a downgrade can have effects on the user program if you use new functions in the user program which were not yet supported by the firmware of the CPU.

NOTE

Possible older firmware versions for CPU with firmware version as of V3.0

You can load a CPU with firmware version as of V3.0 with a STEP 7 project based on an earlier firmware version:

- For CPUs with article numbers 6ES751x-xxx03-0AB0: Firmware versions V2.9 to V1.8
- For CPUs with article number 6ES751x-xRx03-0AB0: Firmware versions V2.9 to V2.6
- For all other article numbers of the CPUs (firmware version lower than 4.0): Firmware versions V2.9 to V1.5

The CPU with firmware version as of V3.0 then responds like the CPU with the previous firmware version and supports only the functionality of this earlier version. This also applies to the configuration limits.

The following entry (https://support.industry.siemens.com/cs/de/en/view/109478459) lists all firmware versions for the S7-1500 CPUs including displays. You will also find a description of the new functions of the respective firmware versions.

Requirement

- You have downloaded the data/files for the firmware update from Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps).
  On this web site, select:
  - For the S7-1500 automation system: Automation Technology > Automation Systems > Industrial Automation Systems SIMATIC > Controllers > SIMATIC S7 Advanced Controller > SIMATIC S7-1500.
  - For the ET 200MP distributed I/O system: Automation Technology > Automation Systems > Industrial Automation Systems SIMATIC > SIMATIC ET 200 I/O systems > ET 200 systems for the cabinet > ET 200MP.

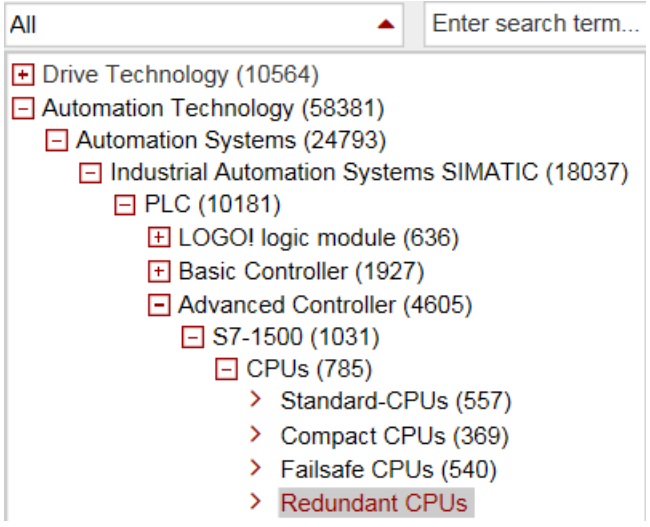

Figure 1-582 Product tree using the S7-1500 as an example:

From this position, navigate to the specific type of module that you want to update. To continue, click on the "Software downloads" link under "Support". Save the desired firmware update files.

Before installing the firmware update, make sure that the modules are not being used.

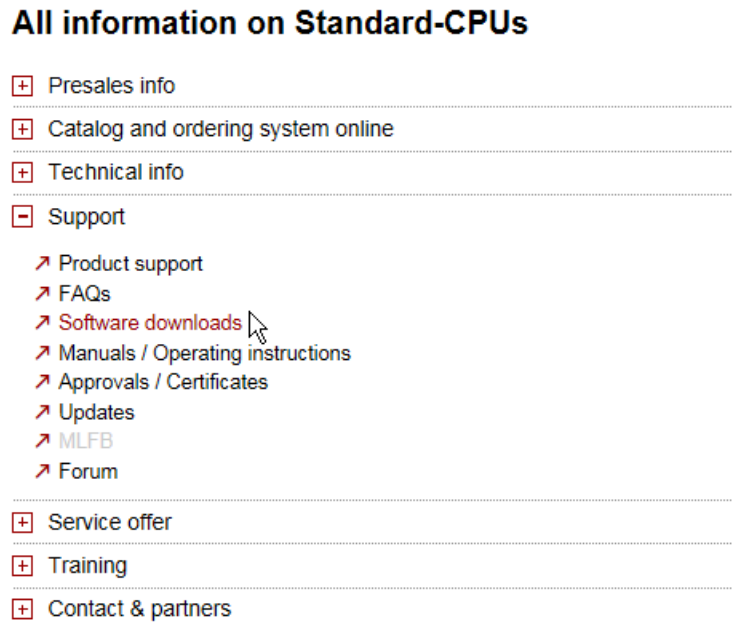

Figure 1-583 Selecting the software downloads

Additional requirement for fail-safe modules

WARNING

Check the firmware version for F-approval

When using a new firmware version, always check that the version is approved for use in the respective module.

The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify which firmware version is approved.

Special feature when updating the firmware of CPUs with Linux-based operating system

For the 1518(F)-4 PN/DP MFP CPUs, also observe the procedure for firmware updates from the CPU 1518-4 PN/DP MFP (https://support.industry.siemens.com/cs/ww/en/view/109749061) manual.

Options for the firmware update

The firmware update has to be carried out manually. There are the following options for performing a firmware update:

- Online in STEP 7 via Online & Diagnostics
- Online in STEP 7 via accessible devices (PROFINET)
- Via SIMATIC memory card: for CPU, display, and all centrally inserted modules
- Via the integrated Web server
- Online via the SIMATIC Automation Tool

The table below gives an overview of the various options for a firmware update.

Table 1-856 Overview of firmware update options

Firmware update	CPU	Central I/O module	Interface module	Distributed I/O module
STEP 7 (V12 or higher)	✓	✓	✓	✓
Accessible devices	✓	✓	✓	✓
SIMATIC memory card	✓	✓	--	--
Web server of the CPU	✓	✓	✓	✓
SIMATIC Automation Tool	✓	✓	✓	✓

Downtime during the firmware update

When you start a firmware update, for example online in STEP 7 via "Online & Diagnostics", the CPU goes into STOP mode and executes the firmware update. The time from start of the firmware update until RUN of the CPU with the new firmware takes a few minutes (typically < 3 minutes).

Installation of the firmware update

⚠ WARNING

Impermissible plant states possible
Installation of the firmware update causes the CPU to carry out a restart and go into STOP mode. The interface module changes into the station failure state. STOP or station failure can have an adverse effect on the operation of an online process or a machine.
Unexpected operation of a process or a machine can lead to fatal or severe injuries and/or to material damages.
Ensure before installing the firmware update that the CPU is not controlling any active process.

Procedure: online in STEP 7 via Online & diagnostics

Requirement: There is an online connection between the CPU/module and PG/PC.

Proceed as follows to perform an online firmware update via STEP 7:

1. Select the module in the device view.
2. Select the "Online & diagnostics" menu command from the shortcut menu.
3. In the "Functions" folder, select the "Firmware update" group.
   For a CPU, you can select whether you want to update the CPU or the CPU's display.
4. Click the "Browse" button to select the firmware update files in the "Firmware update" area.
5. Select the matching firmware file. The table in the firmware update area lists all modules for which an update is possible with the selected firmware file.
6. Click the "Run update" button. If the module can interpret the selected file, the file is downloaded to the module. If you must change the CPU mode, STEP 7 prompts you to do so with dialogs.

Updating the firmware

The "Run firmware after update" check box is always selected.

After a successful loading process the CPU includes imports the firmware and subsequently operates with the new firmware.

NOTE

If a firmware update is interrupted, you need to remove and insert the module before starting the firmware update again.

Procedure: online in STEP 7 via accessible devices

To perform a firmware update online via accessible devices, follow these steps:

1. From the "Online" menu, select the "Accessible devices" menu item.
2. In the Accessible devices dialog, search for the accessible devices for the selected PROFINET interface.
3. To go to a device in the project tree, select the desired device from the list of accessible devices and click the "Show" button.
4. In the project tree, select the "Online & diagnostics" option of the relevant device and perform the firmware update under the category Functions/Firmware Update (CPU, Display, Local modules).

You can find information on how to perform a firmware update when your project has no connection to a CPU in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109779881).

Procedure via the SIMATIC memory card

Proceed as follows perform a firmware update via the SIMATIC memory card:

1. Insert a SIMATIC memory card into the SD card reader of your PG/PC.
2. To store the update file on the SIMATIC Memory Card, select the SIMATIC Memory Card in the "Card Reader/USB memory" folder in the project tree.

3. Select the "Card Reader/USB memory > Create firmware update memory card" command in the "Project" menu.
4. Use a file selection dialog to navigate to the firmware update file. In a further step you can decide whether you are deleting the content of the SIMATIC memory card or adding the firmware update files to the SIMATIC memory card.
5. Insert the SIMATIC memory card with the firmware update files into the CPU.

   The firmware update begins shortly after the SIMATIC memory card has been plugged.

   The display indicates that the CPU is in STOP mode, and that a firmware update is being executed: "STOP - FW UPDATE". The display shows the progress of the firmware update. The CPU shows any errors that occur during the firmware update on the display.

   The display shows a results screen after the completion of the firmware update.
6. Remove the SIMATIC Memory Card after the firmware update is complete.
   The RUN LED on the CPU lights up in yellow and the MAINT LED flashes yellow.
   If you subsequently wish to use the SIMATIC Memory Card as a program card, leave the SIMATIC Memory Card in the CPU. To do so, after completion of the firmware update, select the "Convert memory card" menu item on the display.

   Alternatively, you can convert the SIMATIC memory card to a program card via STEP 7.

NOTE

If your hardware configuration contains several modules, the CPU updates all affected module in the slot sequence, i.e. in ascending order of the module position in the STEP 7. device configuration.

NOTE

Memory size of the SIMATIC memory card

If you perform a firmware update via the SIMATIC memory card, you must use a large enough card based on the CPU used and the associated I/O modules.

Check the specified file sizes of the update files when downloading them from Siemens Industry Online Support. The file size information is especially important when you perform the firmware update not only for the CPU but also, e.g., for the associated I/O modules, communication modules. The total size of the update files must not exceed the available memory size of your SIMATIC memory card.

You can find more information on the capacity of SIMATIC Memory Cards in the section Accessories/spare parts (Page 406) and in the function manual Structure and use of the CPU memory (https://support.industry.siemens.com/cs/de/en/view/59193101).

Procedure: via the integrated Web server

The procedure is described in the Web server (https://support.automation.siemens.com/WW/view/en/59193560) Function Manual.

Procedure: online via the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Special feature at a firmware update of analog modules

When you carry out a firmware update for analog modules, you have to supply 24 V DC load supply to the module through the infeed element.

Behavior after the firmware update

After the firmware update, check the firmware version of the updated module.

Possibilities for verifying the firmware update:

- Online via STEP 7 (e.g. Signature), SIMATIC Automation Tool or web server
- Offline via LED display, I&M0 data or display (if existing)

Reference

For more information on the topic of firmware update, refer to the STEP 7 online help and the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/89257657).

15.6 Reset to factory settings

15.6.1 Resetting the CPU to factory settings

Introduction

"Reset to factory settings" restores the CPU to its delivery state. The function deletes all information that was stored internally on the CPU.

Recommendation:

Switch the CPU to its as-delivered condition if:

- You remove a CPU and use it elsewhere with a different program.
- You store the CPU.

NOTE

Standard and F-CPUs with article number 6ES751x-xxx02-0AB0, compact CPUs with article number 6ES751x-xxx01-0AB0

"Reset to factory settings" restores the status of the operating mode button to the factory setting, i.e. the CPU remains in STOP mode. To set the CPU to RUN mode, local operation via the RUN button is required.

It does not matter here whether you perform the "Reset to factory settings" via the operating mode button, the display or STEP 7.

Options for resetting a CPU to factory settings

To reset the CPU to its delivery state, follow these steps:

- Via the operating mode keys/mode switches
- Using the display
- Using STEP 7
- Using the SIMATIC Automation Tool

Procedure via the mode selector keys (standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0)

Make sure that the CPU is in STOP mode (the CPU display shows STOP mode or RUN/STOP LED lights up yellow).

NOTE

Reset to factory settings ↔ Memory reset

The procedure described below also corresponds to the procedure for a memory reset:

- Key operation with inserted SIMATIC memory card: CPU executes a memory reset
- Key operation without inserted SIMATIC memory card: CPU executes reset to factory settings

Perform a reset to factory settings as follows:

1. Press the STOP mode selector key.
   Result: The STOP-ACTIVE and RUN/STOP LED light up yellow.
2. Remove the SIMATIC Memory Card from the CPU. Wait until the RUN/STOP LED stops flashing.
3. Press the STOP operating mode button until the RUN/STOP LED lights up for the 2nd time and remains continuously lit (after 3 seconds). After this, release the button.
4. Press the STOP mode selector key again within the next three seconds.

Result: The CPU executes a "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the STOP-ACTIVE and RUN/STOP LED light up yellow, then the CPU has been reset to factory settings, and is in STOP mode. The "Reset to factory settings" event is entered into the diagnostics buffer.

NOTE

The IP address of the CPU is also deleted when the CPU is reset to the factory settings using the mode selector keys.

Procedure using the mode selector

Make sure that the CPU is in STOP operating state: The CPU display indicates the STOP operating mode. The RUN/STOP LED lights up yellow.

NOTE

Reset to factory settings ↔ Memory reset

The procedure described below corresponds to the procedure for a memory reset:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

Restore the factory settings of the CPU as follows:

1. Set the mode selector to the STOP position.
   Result: The RUN/STOP LED lights up yellow.
2. Remove the SIMATIC Memory Card from the CPU. Wait until the RUN/STOP LED stops flashing.
3. Set the mode selector to the MRES position. Hold the mode selector in this position until the RUN/STOP LED lights up for the second time and remains lit (this takes three seconds). After this, release the selector.
4. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes a "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, then the CPU has been reset to factory settings, and is in the STOP mode. The "Reset to factory settings" event is entered into the diagnostics buffer.

NOTE

The IP address of the CPU is also deleted when the CPU is reset to the factory settings through the mode selector.

Procedure using the display

Make sure that the CPU is in STOP operating state: The CPU indicates STOP mode. The RUN/STOP LED lights up yellow.

To reach the desired menu command, "Factory setting", select the following sequence of menu commands. Confirm with "OK" after each selection.

- Settings → Reset → Factory settings

Result: The CPU executes a "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, then the CPU has been reset to factory settings, and is in STOP mode. The "Reset to factory settings" event is entered into the diagnostics buffer.

NOTE

Resetting the CPU to factory settings via the display also deletes the IP-address of the CPU and the password for protecting confidential PLC configuration data.

Procedure using STEP 7

To reset a CPU to factory settings via STEP 7, follow these steps:

Make sure that there is an online connection to the CPU.

1. Open the Online and Diagnostics view of the CPU.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. If you want to keep the IP address, select the "Keep IP address" option button. If you want to delete the IP address, select the "Delete IP address" option button.

NOTE

"Delete IP address" deletes all IP addresses, regardless of how you established the online connection.

If a SIMATIC Memory Card is inserted, selecting the "Delete IP address" option has the following effect:

- The IP addresses are deleted and the CPU is reset to factory settings.
- The existing configuration (including IP address) on the SIMATIC Memory Card is then loaded into the CPU. If no configuration is stored (for example, after the SIMATIC Memory Card has been erased or formatted), no new IP address is assigned.

4. Click the "Reset" button.
5. Click "OK" in response to the confirmation prompts.

Result: The CPU executes a "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up in yellow, the CPU has been reset to factory settings and is in STOP mode. The "Reset to factory settings" event is entered into the diagnostics buffer.

Procedure using the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Result after resetting to factory settings

The following table provides an overview of the contents of the memory objects after the reset to factory settings.

Table 1-857 Result after resetting to factory settings

Memory object	Contents
Actual values of the data blocks, instance data blocks	Initialized
Bit memories, timers and counters	Initialized
Retentive tags of technology objects (for example, adjustment values of absolute encoders)	Initialized
Entries in the diagnostics buffer	Are initialized, including a startup entry, that informs about the resetting to factory settings.

1) Only for standard, F-CPUs with article number 6ES751x-xxx02-0AB0, compact CPUs with article number 6ES751x-xxx01-0AB0

Memory object	Contents
Entries in the syslog storage	Now only contains a startup entry that informs about the reset to factory settings.
IP address	Depends on the procedure: • Using mode switch: is deleted • Using display: is deleted • Using STEP 7: Depends on the setting of the "Retain IP-address"/"Delete IP-address" option button.
Device name	Set to "CPU"
Counter readings of the runtime meters	Initialized
Time of day	Is set to "00:00:00, 01.01.2012"
CPU operating mode	The CPU is set to STOP.
Operating mode of the CPU	"STOP Active" is activated [1)]
Deleting passwords for protecting confidential PLC configuration data	Depends on the procedure: • Using the mode selector / mode selector keys: Retained • Using the display: is deleted • Using STEP 7: Depends on the setting of the "Delete password for the protection of confidential PLC configuration data" option button

1) Only for standard, F-CPUs with article number 6ES751x-xxx02-0AB0, compact CPUs with article number 6ES751x-xxx01-0AB0

If there was a SIMATIC Memory Card inserted in the CPU prior to the reset to factory settings, the CPU loads the configuration contained on the SIMATIC Memory Card (hardware and software):

- A configured IP address is then valid again.
- If you have backed up adjustment values of absolute encoders on the SIMATIC Memory Card with the "MC_SaveAbsoluteEncoderData" instruction, these become valid after the reset to factory settings with SIMATIC Memory Card inserted in the CPU.

NOTE

Password for protecting confidential configuration data after resetting the CPU to factory settings

- **Via the mode switch / mode selector keys (SIMATIC Memory Card is not inserted):** The password for protection of confidential configuration data is retained.
- **Using the display:** The password for protection of confidential configuration data is deleted.
- **Using STEP 7:** The password for protection of confidential configuration data is retained. The password is only deleted when the "Delete password for protection of confidential PLC configuration data" option is set.

You can find more information on the password for protection of confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) Function Manual.

Reference

More information on "Reset to factory settings" can be found in the Function Manual Structure and use of the CPU memory (https://support.automation.siemens.com/WW/view/en/59193101) in the section on memory areas and retentivity, and in the online help for STEP 7. For information on the memory reset of the CPU, refer to the section CPU memory reset (Page 322).

15.6.2 Resetting interface module (PROFINET IO) to factory settings

Introduction

The interface module can be reset to its factory state using "Reset to factory settings".

Method of resetting an interface module to factory settings

- Via STEP 7 (online via PROFINET IO)

Procedure using STEP 7

To reset an interface module to factory settings via STEP 7, follow these steps:
Make sure that an online connection to the interface module exists.

1. Open the online and diagnostics view of the interface module.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Click the "Reset" button.
4. Click "OK" in response to the confirmation prompts.

Result: The interface module then performs a "Reset to factory settings".

Result after resetting to factory settings

Table 1-858 Properties of the interface module when shipped

Properties	Value
Parameter	Default setting
IP address	Not present
Device name	Not present
MAC address	Present
I&M data	Identification data (I&M0) present Maintenance data (I&M1, 2, 3) reset
Firmware version	Present

NOTE

Failure of downstream stations is possible

Stations downstream from the interface module can fail when the factory settings are restored on an interface module.

NOTE

Substitute value behavior of the installed I/O modules during reset to factory settings
The I/O modules in the station do not have the configured status after a "reset to factory settings". The interface module does not acquire any input data and does not output any output data.

Reference

You will find more information on the procedure in the STEP 7 online help.

15.7 Fault reactions with fail-safe modules

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

NOTE

For fail-safe input and output modules, this safe state is the value "0".

Fault reactions and startup of the F-system

The safety function requires that substitute values (safe state) be output instead of process values for a fail-safe module (**passivation of the fail-safe module**) in the following cases:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If fail-safe I/O faults or channel faults are detected (e.g., wire break, discrepancy error)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. When the system is powered down and then restarted, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

⚠ WARNING

Channel faults do not trigger any diagnostic reactions or error handling for channels that have been set to "deactivated" in STEP 7, even if this channel is affected indirectly by a channel group fault (channel parameter "activated/deactivated").

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnostic and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Fail-safe value output for F-modules

In the case of F-modules with inputs, if there is passivation, the F-system provides substitute values (0) for the safety program instead of the process data pending at the fail-safe inputs.

In the case of F-modules with outputs, if there is passivation, the F-system transfers substitute values (0) to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized. This also applies when the F-CPU goes into STOP mode. The parameter assignment of fail-safe values is not possible.

Substitute values are used either for the relevant channel only or for all channels of the relevant fail-safe module, depending on:

- The F-system used
- The type of fault that occurred (fail-safe I/O fault, channel fault or communication error)
- The parameter assignment of the F-module

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs is made available to the safety program again
- In the case of an F-module with outputs, the output values provided in the safety program are transferred to the fail-safe outputs again

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126) manual.

Reaction of the F-module with inputs to communication errors

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

15.8 Maintenance and repair

The components of the S7-1500 automation system/ET 200MP distributed I/O system are maintenance-free.

NOTE

Repairs to the components of the S7-1500 automation system/ET 200MP distributed I/O system may only be carried out by the manufacturer.

Test and service functions 16

16.1 Test functions

Introduction

You can test the operation of your user program on the CPU. You monitor signal states and values of tags, and preassign tags with values so that you can simulate specific situations for program execution.

NOTE

Using test functions

Using test functions affects the program execution time and thus the cycle and response times of the controller to a slight extent (a few milliseconds).

Requirements

- There is an online connection to the relevant CPU.
- An executable user program is available in the CPU.

Test options

- Testing with program status
- Testing with breakpoints
- Testing with a watch table
- Testing with a force table
- Testing with a PLC tag table
- Testing with a data block editor
- Testing with the LED flash test
- Testing with a trace function

Testing with program status

The program status allows you to monitor the execution of the program. You can hereby display the values of operands and the results of logic operations (RLO). This allows you to detect and fix logical errors in your program.

NOTE

Restrictions with the "Program status" function

Monitoring loops can significantly increase the cycle time. The increase in cycle time depends on the following factors:

- The number of tags to be monitored
- The actual numbers of loops run through

⚠ WARNING

Testing with program status

A test with the "Program status" function can cause serious damage to property or injury to persons if there are functional disturbances or program errors.

Make sure that you take appropriate measures to exclude the risk of hazardous conditions occurring before running a test with the "Program status" function!

Testing with breakpoints

With this test option, you set breakpoints in your program, establish an online connection, and enable the breakpoints on the CPU. You then execute a program from one breakpoint to another.

Requirements:

- Setting breakpoints is possible in the programming language SCL or STL.
- You can only set breakpoints in the startup OB (OB 100) when the CPU is in STOP mode.

Testing with breakpoints provides you with the following advantages:

- Localization of logic errors step by step
- Simple and quick analysis of complex programs prior to actual commissioning
- Recording of current values within individual executed loops
- Use of breakpoints for program validation also possible in SCL/STL networks within LAD/FBD blocks

NOTE

Restriction during testing with breakpoints

- When you test with breakpoints, there is a risk of overwriting the cycle time of the CPU.
- If you are using technology objects and test them with breakpoints, the CPU switches to STOP mode.

NOTE

F-System SIMATIC Safety

Setting breakpoints in the standard user program results in errors in the safety program:

- Sequence of F cycle time monitoring
- Error in communication with the F-I/O
- Error during safety-oriented CPU-CPU communication
- Internal CPU error

If you nevertheless want to use breakpoints for testing, you must disable safety mode. This will result in the following errors:

- Error in communication with the F-I/O
- Error during safety-oriented CPU-CPU communication

Testing with watch tables

The following functions are available in the watch table:

- Monitoring of tags

  You can use the watch tables to monitor the current values of the individual tags of a user program or a CPU on the programming device/PC, on the display of the CPU, and on the web server. A symbolic name for the tags must be specified in the "Name" column of the watch table to allow the display of the CPU and the web server to show the value of the tags.

  You monitor the following operand areas:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs
  – Timers and counters

- Modifying tags

  Use this function to assign fixed values to the individual tags of a user program or CPU on the PG/PC. Modifying is also possible with Test with program status.

  The following operand areas are modifiable:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs (for example, %I0.0:P, %Q0.0:P)
  – Timers and counters

- "Enable peripheral outputs" and "Modify now"

  These two functions enable you to assign fixed values to individual peripheral outputs of a CPU in the STOP mode. You can also use them to check your wiring.

Testing with a force table

The following functions are available in the force table:

- Monitoring of tags

  Force tables are used to monitor the actual values of the individual tags of a CPU user program or a CPU
  - On the PG/PC
  - On the display of the CPU
  - On the web server

  You monitor the table with or without a trigger condition.

  A symbolic name for the tags must be specified in the "Name" column of the force table in order that the display of the CPU and the web server can display the value of the tags.

  You monitor the following tags:
  - Bit memory
  - Contents of data blocks
  - Peripheral inputs
- Modifying tags

  You use this function to assign fixed values to individual tags of a user program or a CPU on the programming device/PC or on the display of the CPU. Modifying is also possible with Test with program status.

  The following tags are modifiable:
  - Bit memory
  - Contents of data blocks
  - Peripheral inputs (e.g. %I0.0:P)
- Forcing of peripheral inputs and peripheral outputs

  You can force individual peripheral inputs or peripheral outputs.
  - Peripheral inputs: Forcing of peripheral inputs (for example %I0.0:P) is a "bypassing" of sensors / inputs by the specification of fixed values to the program. The program receives the force value instead of the actual input value (via process image or via direct access).
  - Peripheral outputs: Forcing of peripheral outputs (for example %Q0.0:P) is a "bypassing" of the complete program by the specification of fixed values to the actuators.

With the force table you can simulate different test environments and also overwrite tags in the CPU with a fixed value. This enables you to intervene in the running process in a regulating way.

Difference between modifying and forcing

The fundamental difference between the modifying and forcing functions consists in the storage behavior:

- Modifying: Modifying of tags is an online function and is not stored in the CPU. You can end modifying of tags in the watch table or force table or by terminating the online connection.
- Forcing: A force job is written to the SIMATIC memory card and is retained after a POWER OFF. The S7-1500 CPU displays an active force job with a corresponding symbol. You can only end the forcing of peripheral inputs and peripheral outputs in the force table.

Testing with a PLC tag table

You can monitor the current data values of tags in the CPU directly in the PLC tag table. To do so, open the PLC tag table and start the monitoring.

You also have the option of copying PLC tags to a watch table or force table so that you can monitor, control or force them in the table.

Testing with a data block editor

The data block editor offers different options for monitoring and modifying tags. These functions directly access the actual values of the tags in the online program. Actual values are the current values of tags in the CPU work memory at any moment during program execution. The following functions for monitoring and modifying are available in the database editor.

- Monitor tags online
- Modify individual actual values
- Create a snapshot of the actual values
- Overwrite actual values with a snapshot

NOTE

Setting data values during commissioning

During plant commissioning, you often need to adjust data values to adapt the program to local conditions.

To this end, the declaration table offers a few functions for data blocks.

Testing with the LED flash test

In many online dialogs, you can perform an LED flash test. This feature is useful if you are not sure which device in the hardware configuration corresponds to the device currently selected in the software.

If you click on the "Flash LED" button in STEP 7 under Online & diagnostics (online access), an LED flashes on the device currently selected. The RUN/STOP, ERROR, and MAINT LEDs flash on the CPU. The LEDs flash until you cancel the flash test.

Testing with a trace function

The trace function is used to record the CPU tags, depending on the settable trigger conditions. Tags are, for example, drive parameters or system and user tags of a CPU. The CPU saves the recordings. If necessary, you can display the recordings with STEP 7 and evaluate them.

Procedure: The trace function can be called from the CPU's folder in the project tree, under the name "Traces".

In connection with trace functions, please also note the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/102781176).

Simulation

With STEP 7 you can run and test the hardware and software of the project in a simulated environment. Start the simulation using the menu command "Online" > "Simulation" > "Start".

Reference

More information on the test functions can be found in the STEP 7 online help.

More information about testing with trace functions is available in the Function Manual Using the trace and logic analyzer function (https://support.automation.siemens.com/WW/view/en/64897128).

16.2 Reading out/saving service data

Service data

In addition to the contents of the diagnostics buffer, the service data contains a great deal more information about the internal status of the CPU or IM. If a problem occurs with the CPU or IM that you cannot resolve with other methods, send the service data to the Industry Online Support via a Service Request. For more information on how to create a support request, see the following entry on the Internet (https://support.industry.siemens.com/cs/ww/en/view/18194667). The service data allows Industry Online Support to quickly analyze problems that have occurred.

NOTE

You cannot execute a download to the device while reading out the service data of the CPU.

Methods of reading service data of a CPU

You have the following options for reading out the service data:

- Web server
- STEP 7
- SIMATIC Memory Card

Methods of reading service data in interface modules

You have the following options for reading out the service data:

- STEP 7
- MFCT (MultiFieldbus Configuration Tool)

Procedure using the Web server

To read service data using the Web server, follow these steps:

1. Open a web browser that is suitable for communication with the CPU.
2. Enter the following address in the address bar of the web browser:
   https://<CPU IP address>/save_service_data, for example,
   https://172.23.15.3/save_service_data
3. The service data page will appear on your screen, with a button for saving the service data.

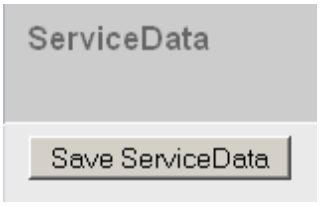

Figure 1-584 Saving service data via the Web server

4. Save the service data locally on your PC/programming device, by clicking "Save ServiceData".

Result: The data is saved in a .dmp file with the following naming convention: "<Article number> <Serial number> <Time stamp>.dmp". You can change the file name.

NOTE

If you have defined your user page as the home page of the Web server, direct access to the service data by inputting the IP address of the CPU is not possible. For more information on reading out service data via a user-defined page, refer to the Web server (https://support.automation.siemens.com/WW/view/en/59193560) function manual.

Procedure using STEP 7

You can find more information on saving service data of the CPU (and interface module) with the keyword "Saving service data" in the STEP 7 online help.

Procedure with the SIMATIC Memory Card

If no communication with the CPU is possible via Ethernet, use the SIMATIC memory card to read out the service data. In all other cases, read and back up the service data via the web server or STEP 7.
The procedure via the SIMATIC memory card is more complex than the other options. You must also ensure before backing up that there is sufficient memory space on the SIMATIC memory card.

To back up service data using the SIMATIC memory card, follow these steps:

1. Insert the SIMATIC memory card into the card reader of your PC / programming device.
2. Open the job file S7_JOB.S7S in an editor.
3. Overwrite the entry PROGRAM with the string DUMP in the editor.
   To ensure that the file size is exactly 4 bytes, do not use any spaces/line breaks/quotation marks.
4. Save the file under the existing file name.
5. Ensure that the SIMATIC Memory Card is not write-protected and insert the SIMATIC Memory Card in the card slot of the CPU. Up to CPU 1516 you need a card ≥ 32 MB and from CPU 1517 a card ≥ 2 GB.

Result: The CPU writes the service data file DUMP.S7S to the SIMATIC memory card and remains in STOP mode.

Service data transfer is complete when the STOP LED stops flashing and is lit continuously. If service data transfer has been successful, only the STOP LED lights up.

In the event of errors in transfer, the STOP LED is lit continuously and the ERROR LED flashes. In addition, the CPU creates a text file containing information about the error in the DUMP.S7S folder.

Technical specifications 17

Introduction

This chapter lists the technical specifications of the system:

- The standards and test values which the modules of the S7-1500 automation system/ET 200MP distributed I/O system comply with and fulfill.
- The test criteria according to which the S7-1500 automation system/ET 200MP distributed I/O system was tested.

Technical specifications for the modules

The technical specifications of the individual modules can be found in the manuals of the modules themselves. In the event of deviations between the statements in this document and the manuals, the statements in the manuals take priority.

17.1 Standards, approvals and safety instructions

Currently valid markings and approvals

NOTE

Details on the components of the S7-1500 automation system/ET 200MP distributed I/O system

The currently valid markings and approvals are printed on the components of the S7-1500 automation system/ET 200MP distributed I/O system.

Safety information

⚠ WARNING

Personal injury and damage to property may occur

In hazardous areas, injury to persons and material damage may occur if you disconnect plug-in connections during operation of an S7-1500 automation system/ET 200MP distributed I/O system.

Always switch off the power to the S7-1500 automation system/ET 200MP distributed I/O system when disconnecting plug-in connections in hazardous atmospheres.

⚠ WARNING
Explosion hazard If you replace components, compliance with Class I, DIV 2 may become invalid.

⚠ WARNING
Deployment requirements This device is only suitable for use in Class I, Div. 2, Group A, B, C, D, or in non-hazardous areas.

Safety of the plant or the system

NOTICE
Safety is the responsibility of the assembler The safety of any plant or system incorporating the equipment is the responsibility of the assembler of the plant or system.

CE marking

CE

The S7-1500 automation system/ET 200MP distributed I/O system complies with the harmonized European standards (EN) for programmable logic controllers published in the official journals of the European Union. The S7-1500 automation system/ET 200MP distributed I/O system meets the requirements and protection targets of the following directives:

- 2014/35/EU Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits; OJ L 96, 29/3/2014, pp. 357-374
- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
  Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the member states relating to electromagnetic compatibility; Official Journal of the European Union L96, 29/03/2014, pp. 79-106
- 2014/34/EU Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to equipment and protective systems intended for use in potentially explosive atmospheres; Official Journal of the European Union L96, 29/03/2014, pp. 309–356

- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment, Official Journal of the European Union L174, 01/07/2011, pp 88-110
- 2006/42/EC "Machinery Directive and Supplementary Directive 95/16/EC" (Machinery Directive) for F-modules S7-1500/ET 200MP
  Directive of the European Parliament and of the Council of 17 May 2006 on machinery and amending Directive 95/16/EC (recast); Official Journal of the EU L157, 9/06/2006, pp. 24-87

EU Declarations of Conformity for the respective authorities are available from the following address:

The EU declarations of conformity are also available for download from the Siemens Industry Online Support website, under the keyword "Declaration of Conformity".

UKCA marking

The S7-1500 automation system / ET 200MP distributed I/O system complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The S7-1500 automation system / ET 200MP distributed I/O system meets the requirements and protection targets of the following regulations and related amendments:

- Electrical Equipment (Safety) Regulations 2016 (S.I. 2016 No. 1101), and related amendments
- Electromagnetic Compatibility Regulations 2016 (S.I. 2016 No. 1091), and related amendments
- Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations 2016 (S.I. 2016 No.1107), and related amendments
- Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012 (S.I. 2012 No. 3032), and related amendments
- Supply of Machinery (Safety) Regulations 2008 (S.I. 2008 No. 1597), and related amendments

- Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 119 V.

CCCEx approval

In accordance with GB/T 3836.3 (Explosive atmospheres - Part 3: Equipment protection by type of protection "e"), GB/T 3836.1 (Explosive atmospheres - Part 1: Equipment - General requirements).

Ex ec IIC T4 Gc

Special conditions in hazardous areas:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in GB/T 16935.1.
- The equipment must be installed in a suitable enclosure providing a degree of protection not less than IP54 in accordance with GB/T 3836.1. The ambient conditions must be taken into consideration for use.
- It must be ensured that the transient protection is set to a value which does not exceed 140% of the rated peak voltage value at the supply terminals of the device.

RCM Declaration of conformity for Australia/New Zealand

The S7-1500 automation system/ET 200MP distributed I/O system fulfills the requirements of the standard IEC 61000-6-4.

Korea Certification

Please note that this device corresponds to limit value class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

Marking for the Eurasian Customs Union

EAC (Eurasian Conformity)

Customs Union of Russia, Belarus and Kazakhstan

Declaration of conformity with the technical requirements of the Customs Union (TR CU).

IEC 61131-2

The S7-1500 automation system/ET 200MP distributed I/O system meets the requirements and criteria of the standard IEC 61131-2

(Programmable logic controllers, Part 2: Equipment requirements and tests) and the EMC requirements for use in Zone B.

IEC 61010-2-201

The S7-1500 automation system/ET 200MP distributed I/O system meets the requirements and criteria of the standard IEC 61010-2-201

(Safety regulations for electrical equipment for measurement, control, and laboratory use Part 2-201: Particular requirements for control equipment).

PROFINET standard

The PROFINET interfaces of the S7-1500 automation system/ET 200MP distributed I/O system are based on the standard IEC 61158 Type 10.

PROFIBUS standard

The PROFIBUS interfaces of the S7-1500 automation system/ET 200MP distributed I/O system are based on the standard IEC 61158 Type 3.

Marine approval

Classification societies:

- ABS (American Bureau of Shipping)
- BV (Bureau Veritas)
- DNV (Det Norske Veritas)
- LRS (Lloyds Register of Shipping)
- Class NK (Nippon Kaiji Kyokai)
- KR (Korean Register of Shipping)
- CCS (China Classification Society)
- RINA (Registro Italiano Navale)

Industrial use

The S7-1500 automation system ET 200MP / distributed I/O system is designed for the industrial field. It meets the following standards for this type of use:

- Requirements for interference emission EN IEC 61000-6-4
- Requirements for immunity EN IEC 61000-6-2

Use in mixed areas

Under certain conditions you can use the S7-1500 automation system ET 200MP / distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact on residents.

If you use the S7-1500 automation system / ET 200MP distributed I/O system in a mixed area, you must comply with the radio frequency interference limits of the generic standard EN IEC 61000-6-3. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the S7-1500 automation system / ET 200MP I/O system in grounded control cabinets
- Use of noise filters in the supply lines

An additional individual acceptance test is also required.

Use in residential areas

NOTE

S7-1500 automation system / ET 200MP I/O system not intended for use in residential areas

The S7-1500 automation system ET 200MP / distributed I/O system is not intended for use in residential areas. If you use the S7-1500 automation system / ET 200MP distributed I/O system in residential areas, this may have an impact on radio/TV reception.

Environmental Product Declaration (EPD)

Siemens is committed to the development and production of environmentally compatible and sustainably produced equipment.

With the help of an Environmental Product Declaration (EPD), you can obtain information on the "ecological footprint" of your Siemens product.

The EPD is based on the ISO 14021 "Environmental labels and declarations – Self declared environmental claims – Type II" international standard.

EPDs are based on independently verified data from life cycle assessments, life cycle inventory analyses, or information modules which comply with the ISO 14040 series of standards. The EPD contains comprehensive data relating to ingredients and substances (REACH, RoHS), fire load, energy consumption, packaging, and disposal information for your Siemens product.

Importer addresses

In the following table you can find the importer addresses for specific countries:

Countries	Address
United Kingdom (UK)	Siemens plc. Manchester M20 2UR
Türkiye (TR)	Siemens San. ve Tic. A.Ş. Yakacık Cad. No:111 34870 Kartal/İstanbul

Reference

With SiePortal in the Internet (https://www.siemens.com/automation/service&support), you will find:

- The current Environmental Product Declarations (EPDs) for Siemens products, with a search using the keyword "Environmental Product Declaration"
- Certificates for markings and approvals

17.2 Electromagnetic compatibility

Definition

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

The S7-1500 automation system/ET 200MP distributed I/O system also meets the requirements of the EMC legislation for the European single market. The prerequisite for this is that the S7-1500/ET 200MP system complies with the requirements and guidelines relating to electrical equipment.

EMC in accordance with NE21

The S7-1500 automation system/ET 200MP distributed I/O system meets the EMC specifications of the NAMUR guideline NE21.

Pulse-shaped disturbances

The following table shows the electromagnetic compatibility of the S7-1500 automation system/ET 200MP distributed I/O system with regard to pulse-shaped disturbances.

Table 1-859 Pulse-shaped disturbances

Pulse-shaped disturbance	Tested with	Corresponds to degree of severity
Electrostatic discharge in accordance with IEC 61000-4-2 *)	Air discharge: ±8 kV Contact discharge: ±6 kV	3 3
Burst pulses (fast transient disturbances) in accordance with IEC 61000-4-4 *)	±2 kV (power supply line) ±2 kV (signal cable >30 m) ±1 kV (signal cable <30 m)	3 4 3
High-energy single pulse (surge) in accordance with IEC 61000-4-5 **)		
• Asymmetric coupling (phase-ground) ***)	±1 kV (24 V DC supply cable)	2
	±1 kV (24 V DC signal/data line only > 30 m)	2
	2 kV (230 V AC supply cable)	3
• Symmetric coupling (phase-phase) ***)	±0.5 kV (24 V DC supply cable)	2
	±1 kV (230 V AC supply cable)	3
*) The maximum short-term influence of analog modules during the duration of the EMC tests can be ±10% of the full-scale value. **) Analog value deviation beyond the limits of the nominal range and diagnostics possible.		

Pulse-shaped disturbance	Tested with	Corresponds to degree of severity
***) If higher phase-ground or phase-phase values are required, you will need an additional external protective circuit (see Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) Function Manual).		

Sinusoidal disturbances

The following table shows the electromagnetic compatibility of the S7-1500 automation system/ET 200MP distributed I/O system with regard to sinusoidal disturbances (RF radiation).

Table 1-860 Sinusoidal disturbances with RF radiation

RF radiation in accordance with IEC 61000-4-3/NAMUR 21 Electromagnetic RF field, amplitude-modulated		Corresponds to degree of severity
80 MHz to 2.7 GHz	10 V/m	3
2.7 GHz to 6 GHz	3 V/m	2
80 % AM (1 kHz)		

The maximum short-term influence on analog modules during the duration of the EMC tests can be ±1% of the full-scale value.

The following table shows the electromagnetic compatibility of the S7-1500 automation system/ET 200MP distributed I/O system with regard to sinusoidal disturbances (RF coupling).

Table 1-861 Sinusoidal disturbances with RF coupling

RF coupling in accordance with IEC 61000-4-6	Corresponds to degree of severity
from 10 kHz	3
10 V_{rms}	
80 % AM (1 kHz)	
150 Ω source impedance	

The maximum short-term influence on analog modules during the duration of the EMC tests can be ±1% of the full-scale value.

Emission of radio interference

Interference emission of electromagnetic fields in accordance with EN IEC 61000-6-4/EN 55016-2-3.

Table 1-862 Interference emission of electromagnetic fields

Frequency	Interference emission	Measuring distance
30 MHz to 230 MHz	< 40 dB (µV/m) QP	10 m
230 MHz to 1000 MHz	< 47 dB (µV/m) QP	10 m
From 1 GHz to 3 GHz	< 76 dB (µV/m) P	3 m
From 3 GHz to 6 GHz	< 80 dB (µV/m) P	3 m

Conducted emission

Interference emission via the AC power supply in accordance with EN IEC 61000-6-4/EN 55016-2-1.

Table 1-863 Interference emission via the AC power supply

Frequency	Interference emission
0.15 ... 0.5 MHz	< 89 dB (µV) Q < 76 dB (µV) M
0.5 ... 30 MHz	< 83 dB (µV) Q < 70 dB (µV) M

17.3 Electromagnetic compatibility of fail-safe modules

Pulse-shaped disturbances

The fail-safe I/O modules S7-1500/ET 200MP **without** external protective circuit meet the severity level 2 for the high-energy individual pulse (surge) according to IEC 61000-4-5.

Protecting S7-1500/ET 200MP against overvoltages with fail-safe modules

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the fail-safe modules to ensure surge immunity for the S7-1500 automation system/ET 200MP distributed I/O system with fail-safe modules.

NOTE
Lightning protection measures always require a case-by-case examination of the entire system. An almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.
If you want detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

You can find more information on protection from overvoltage in the Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) function manual.

17.4 Shipping and storage conditions

Introduction

The S7-1500 automation system / ET 200MP I/O system meet the specifications regarding transport and storage conditions pursuant to IEC 61131-2. The following information applies to modules that are shipped and/or stored in their original packaging.

Shipping and storage conditions for modules

The S7-1500 automation system/ET 200MP distributed I/O system exceeds the requirements of IEC 61131-2 regarding transport and storage conditions. The following table shows the conditions that apply to modules transported or stored in their original packaging.

- Transport condition class: TTH4
- Storage condition class: STH4

Table 1-864 Shipping and storage conditions

Type of condition	Permissible range
Free fall (in shipping package)	≤ 1 m
Temperature	From -40 °C to +70 °C
Barometric pressure	From 1 140 to 540 hPa (corresponds to an altitude of -1000 to +5000 m)
Relative humidity	5% to 95%, without condensation
Sinusoidal vibrations in accordance with IEC 60068-2-6	5 to 9 Hz: 3.5 mm 9 to 500 Hz: 9.8 m/s^2
Shock in accordance with IEC 60068-2-27	250 m/s^2, 6 ms, 1 000 shocks

17.5 Mechanical and climatic ambient conditions

Operating conditions

The S7-1500 automation system/ET 200MP distributed I/O system is suitable for use in weather-proof, fixed locations. The operating conditions are based on the requirements of IEC 61131-2.

- OTH4 (S7-1500 CPUs: For the minimum ambient temperature, see the Climatic ambient temperatures table)

Test of mechanical ambient conditions

The table below provides important information with respect to the type and scope of the test of ambient mechanical conditions.

Table 1-865 Test of mechanical ambient conditions

Condition tested	Test Standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (Sinus)	Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute. 5 Hz ≤ f ≤ 8.4 Hz, constant amplitude 7 mm 8.4 Hz ≤ f ≤ 150 Hz, constant acceleration 2 g Duration of vibration: 10 frequency sweeps per axis, along each of the 3 mutually perpendicular axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 15 g peak value, 11 ms duration Direction of shock: 3 shocks each in +/- direction, along each of the 3 perpendicular axes
Continuous shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 25 g peak value, 6 ms duration Direction of shock: 1 000 shocks each in +/- direction, along each of the 3 mutually perpendicular axes

Reduction of vibrations

If your S7-1500 automation system/ET 200MP distributed I/O system is exposed to severe shock or vibration, take appropriate measures to reduce the acceleration or the amplitude.

We recommend installing the S7-1500 automation system/ET 200MP distributed I/O system on damping materials (for example, rubber-bonded metal mounting).

Climatic ambient conditions

The following table shows the permissible climatic ambient conditions for the S7-1500 automation system/ET 200MP distributed I/O system during operation.

Table 1-866 Climatic ambient conditions

Ambient conditions	Permissible range	Comments
Temperature: Horizontal and vertical mounting	See product data sheets for the respective module on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/td)	The lower permissible ambient temperature was extended for the S7-1500 automation system/ET 200MP distributed I/O system to -30 °C. Differences may exist for specific modules and depending on the mounting position and, if applicable, load. You must check the lower permissible ambient temperature for each module in the product data sheets. The product data sheets with daily updated technical specifications can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/td) at Industry Online Support. Enter the article number or the short description of the desired module on the website.
		To increase the service life of the display, the display switches off when the permitted operating temperature is exceeded. At certain temperatures, the display switches off an on again. You can find more information in the technical specifications in the CPU manuals.
Temperature variation	10 K/h	-
Relative humidity	from 10 % to 95 %	Without condensation
Barometric pressure	From 1140 to 795 hPa	Corresponds to an altitude of -1 000 m to 2 000 m. See below under "Using the S7-1500 automation system/ET 200MP distributed I/O system over 2 000 m above sea level".
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

Using the S7-1500 automation system/ET 200MP distributed I/O system over 2 000 m above sea level

This information is available in the Use above 2 000 m above sea level and extended temperature range (Page 410) section.

17.6 Information on insulation tests, protection class, degree of protection and rated voltage

Insulation

The insulation is designed in accordance with the requirements of EN 61010-2-201.

NOTE
In the case of modules with 24 V DC (SELV/PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Pollution degree/overvoltage category in accordance with EN 61131-2 and IEC 61010-2-201

- Pollution degree: 2 (macro environment)
- Overvoltage category: II

Protection class according to IEC 61131-2 and IEC 61010-2-201

The S7-1500 automation system/ET 200MP distributed I/O system meets protection class I and contains parts of protection classes II and III.

Degree of protection IP20

Degree of protection IP20 in accordance with IEC 60529 for all modules of the S7-1500 automation system/ET 200MP distributed I/O system:

- Protection against contact with standard test fingers
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

Rated voltage for operation

The S7-1500 automation system/ET 200MP distributed I/O system works with the rated voltages and corresponding tolerances listed in the following table.

Note the supply voltage of each module when selecting the rated voltage.

Table 1-867 Rated voltage of all modules of the S7-1500 automation system/ET 200MP distributed I/O system for operation

rated voltage	Tolerance range
24 V DC	19.2 V DC to 28.8 V DC [1]
48 V DC	40.8 to 57.6 V DC

[1] Static value: Generation as protective extra-low voltage with safe electrical isolation in accordance with IEC 61131-2 or IEC 61010-2-201.

rated voltage	Tolerance range
60 V DC	51.0 to 72.0 V DC
120 V AC	93 V AC to 132 V AC
230 V AC	187 V AC to 264 V AC

[1] Static value: Generation as protective extra-low voltage with safe electrical isolation in accordance with IEC 61131-2 or IEC 61010-2-201.

17.7 Use of the S7-1500/ET 200MP in zone 2 hazardous areas

Reference

You can find more information in the product information Use of modules in a Zone 2 Hazardous Area (https://support.automation.siemens.com/WW/view/en/19692172).

A.9 Dimension drawing of test probe for measurement tap

To perform measurements on the front connector of the S7-1500/ET 200MP automation system, you need a test probe with the following properties:

- Maximum diameter at measuring tip: 1 mm
- Length of measuring tip: ≥ 10 mm

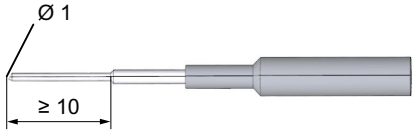

Figure 1-599 Dimension drawing of test probe for measurement tap

Corresponding test probes are available from electrical retailers.

Accessories/spare parts

B

Accessories for the S7-1500 automation system/ET 200MP distributed I/O system

Table 1-868 General accessories

Designation	Article number
Mounting rail	
• Mounting rail, 160 mm (with drill holes)	6ES7590-1AB60-0AA0
• Mounting rail, 245 mm (with drill holes)	6ES7590-1AC40-0AA0
• Mounting rail, 482 mm (with drill holes)	6ES7590-1AE80-0AA0
• Mounting rail, 530 mm (with drill holes)	6ES7590-1AF30-0AA0
• Mounting rail, 830 mm (with drill holes)	6ES7590-1AJ30-0AA0
• Mounting rail, 2 000 mm (without drill holes) for cutting to length	6ES7590-1BC00-0AA0
DIN-rail adapter, 10 adapters, 10 hexagon socket screws and 10 washers	6ES7590-6AA00-0AA0
Active backplane bus	
• For one interface module and 12 I/O modules (ST 1+12)	6ES7590--0BL00-0AA0
• For one interface module and 8 I/O modules (ST 1+8)	6ES7590-0BH00-0AA0
• For one interface module and 4 I/O modules (ST 1+4)	6ES7590-0BD00-0AA0
PE connection element for mounting rail, 2 000 mm (spare part), 20 units	6ES7590-5AA00-0AA0
Front connector (incl. four potential bridges, cable tie, and individual labeling strip) for 35 mm modules	
• Screw-type terminals, 40-pin	6ES7592-1AM00-0XB0
Front connector (incl. four potential bridges, cable tie, and individual labeling strip) for 35 mm modules	
• Push-in terminal (40-pin)	6ES7592-1BM00-0XB0
Front connector (incl. cable tie and individual labeling strip) for 25 mm modules	
• Push-in terminal (40-pin)	6ES7592-1BM00-0XA0
4-pole connection plug for supply voltage (spare part), 10 units	6ES7193-4JB00-0AA0
DIN A4 labeling sheet (10 x for labeling the 35 mm I/O modules)	
• Pre-perforated, Al gray	6ES7592-2AX00-0AA0
DIN A4 labeling sheet (10 x for labeling the 25 mm I/O modules)	
• Pre-perforated, Al gray	6ES7592-1AX00-0AA0
U connector (spare part), 5 units	6ES7590-0AA00-0AA0
I/O shielding set for 35 mm modules (consists of: Power supply element, shielding bracket, and shield connection clamp), (spare part), 5 units	6ES7590-5CA00-0AA0
I/O shielding set for 25 mm modules (consists of: Power supply element, shielding bracket, and shield connection clamp), (spare part), 4 units	6ES7590-5CA10-0XA0

[*] The PROFIBUS FastConnect bus connector 0BB70 is supplied with the IM 155-5 DP ST interface module and can also be ordered as a spare part.

Designation	Article number
Shield clamp (spare part), 10 units	6ES7590-5BA00-0AA0
Display 35 mm (spare part) for standard and F technology, TF-CPUs up to article number 6ES751x-xxx01-0AB0, compact CPUs with article number 6ES751x-xxx00-0AB0	6ES7591-1AA01-0AA0
Display module 35 mm (spare part) for standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0	6ES7591-1AB00-0AA0
Display module 35 mm (spare part) for standard and F-CPUs, technology, TF-CPUs, compact CPUs as of article number 6ES751x-xxx03-0AB0	6ES7591-1AB10-0AA0
Protective cover 35 mm (spare part) with cutout for display and display keys for standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, compact CPUs as of article number 6ES751x-xxx01-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0, 5 units	6ES7591-4AB00-0AA0
Display 70 mm (spare part) for standard and F-technology, TF-CPUs up to article number 6ES751x-xxx01-0AB0	6ES7591-1BA02-0AA0
Display module 70 mm (spare part) for standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0	6ES7591-1BB00-0AA0
Protective cover 70 mm (spare part) with cutout for display and display keys for standard, F-CPUs as of article number 6ES751x-xxx02-0AB0, technology, TF-CPUs as of article number 6ES751x-xxx03-0AB0, 5 units	6ES7591-4BB00-0AA0
Power cable connector with coding element for power supplies (spare part), 10 units	6ES7590-8AA00-0AA0
Potential bridges for front connector (spare part), 20 units	6ES7592-3AA00-0AA0
Universal front cover for 35 mm I/O modules (spare part), 5 units	6ES7528-0AA00-7AA0 Consists of: • 5 x front cover • 5 x front labeling strip (per module - article number) • 5 x wiring diagram (per module article number)
Universal front cover for 25 mm I/O modules (spare part), 5 units	6ES7528-0AA00-0AA0 Consists of: • 5 x front cover • 5 x front labeling strip (per module - article number) • 5 x wiring diagram (per module article number)
Universal front cover for interface module (spare part), 5 units	6ES7528-0AA70-7AA0 Consists of: • 5 x front cover
Industrial Ethernet FastConnect RJ45 plug 180 degrees, 1 unit	6GK1901-1BB10-2AA0
Industrial Ethernet FastConnect RJ45 plug 180 degrees, 10 units	6GK1901-1BB10-2AB0
Industrial Ethernet FastConnect RJ45 plug 90 degrees, 1 unit	6GK1901-1BB20-2AA0
Industrial Ethernet FastConnect RJ45 plug 90 degrees, 10 units	6GK1901-1BB20-2AB0
PROFIBUS-FastConnect bus connector without programming device socket, up to 12 MBaud, 1 unit	6ES7972-0BA70-0XA0

[*] The PROFIBUS FastConnect bus connector 0BB70 is supplied with the IM 155-5 DP ST interface module and can also be ordered as a spare part.

Electronic coding element with rewritable memory for fail-safe modules (spare part), 5 units	6ES7592-6EF00-1AA0
Front cover for 35 mm F-I/O modules (spare part), 5 units	6ES7528-0AA10-7AA0 Consists of: • 5 x front cover • 5 x front labeling strip (per module - article number) • 5 x wiring diagram (per module article number)

Designation	Article number
DIN A4 labeling sheet (10 x for labeling the fail-safe I/O modules), pre-perforated, yellow	6ES7592-2CX00-0AA0

Use over 2000 m above sea level and extended temperature range

C

C.1 Ambient temperature and installation altitude

Extension of the temperature range and the installation altitude

The previously permissible range of ambient temperatures of **0 °C** to 60 °C for the horizontal mounting position has been extended for a large number of modules to a range of ambient temperatures of **-30 °C** to 60 °C or **-25 °C** to 60 °C (in each case without condensation or icing). In addition, depending on the module, the permitted installation altitudes has been extended to installation height of up to 5,000 meters.

The accessory components offered for S7-1500/ET 200MP (labeling strips, shield terminals, mounting rails, front connectors, etc.) can also be used down to -30 °C and for altitudes up to 5 000 m.

The following tables show an overview of the current climatic ambient conditions for ambient temperature and installation altitude of modules of the S7-1500, ET 200MP product families.

Reference

The current status of the respective modules can be found in the online published technical specifications.

In general, the module-dependent extended climatic operating conditions are described in the "Technical specifications" section of the respective modules in the equipment manuals.

PFDavg and PFH values for F-CPUs for operating altitudes up to 3 000 m or 5 000 m.

Below you will find the probability of failure values (PFDavg and PFH values) for the fail-safe CPUs mentioned in the table with a service life of 20 years and with a repair time of 100 hours:

Operation in low demand mode in accordance with IEC 61508:2010: PFDavg = Average probability of a dangerous failure on demand	Operation in high demand or continuous mode in accordance with IEC 61508:2010: PFH = Average frequency of a dangerous failure [h-1]
< 2E-05	< 1E-09 at an installation altitude ≤ 3 000 m < 2E-09 at an installation altitude > 3 000 m to 5 000 m

Information on PFDavg, PFH values for fail-safe S7-1500 I/O modules

PFDavg and PFH values for fail-safe S7-1500 I/O modules for operating altitudes up to 5 000 m.

The safety parameters (PFDavg, PFH values) specified in the Equipment Manual for the fail-safe S7-1500 I/O modules already reflect the influence of higher cosmic radiation (soft error rate) for operation up to 5 000 m above sea level.

Active backplane bus 4 slots	6ES7590-0BD00-0AA0	-30 to +60	FS 01	5,000	FS 01
Active backplane bus 8 slots	6ES7590-0BH00-0AA0				
Active backplane bus 12 slots	6ES7590-0BL00-0AA0				

C.5 Restrictions

Restrictions of the max. ambient temperature specified with regard to the installation altitude

Installation altitude	Derating factor for ambient temperature [1]
-1,000 to 2,000 m	1.0
2,000 to 3,000 m	0.9
3,000 to 4,000 m	0.8
4,000 to 5,000 meters	0.7

[1] Base value for the application of the derating factor is the maximum permissible ambient temperature in °C for 2,000 m

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air in higher altitudes due to lower density.
- Note the mounting position of the respective module in the technical specifications. The basis is the standard IEC 61131-2.
- Make sure that the power supplies you use are also rated for altitudes > 2 000 m.
- The displays of the S7-1500 CPUs are designed for an altitude of ≤ 3,000 m. When operating the device at altitudes > 3,000 m, you might experience problems with the CPU display in rare cases; however, these do not affect the mode of operation of the CPU.
- The function "Fail-safe shutdown of standard modules", as described in the Internet (https://support.industry.siemens.com/cs/us/en/view/39198632), is only released up to a maximum of 2,000 m.

Effects on availability

The higher cosmic radiation present during operation at altitudes above 2,000 m will also start to have an effect on the failure rate of electronic components (the so-called soft error rate). In rare cases this can result in a transition of the module into the safe state, especially for safety modules. However, the functional safety of the module is fully retained.

NOTE

Information on the components of the S7-1500 automation system

The markings and approvals printed on the components of the S7-1500 automation system are currently based on operation at an altitude of up to 2 000 m. The fail-safe components are certified for operation in safety mode up to the specified maximum altitudes (according to "Z10 067803 0020" certificate (https://support.industry.siemens.com/cs/ww/de/view/57141281/en)).

Reference

You can find more information in the Mechanical and climatic ambient conditions (Page 395) section.

SIMATIC S7-1500 data

D

The EU Data Act, a key component of the European data strategy, entered into force on 11 January 2024.

The following information provides an overview of the data that is generated by the SIMATIC S7-1500 automation system and accessible to you.

D.1 Data of the CPUs

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and program data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, system and security events, service data	Time formats, string formats, CSV, binary formats	Depending on application Several hundred bytes per event
Operating data (runtimes, cycle times, CPU utilization)	Numeric formats, time formats, JSON	Depending on application
Log data	Time formats, string formats, CSV	Depending on application

Continuous and real-time data generation

The SIMATIC S7-1500 is able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The CPU operates with defined cycle times in which process data is acquired and processed.

Data storage and storage duration

Local data storage

The SIMATIC S7-1500 stores data in integrated memory areas of the CPU and on the SIMATIC Memory Card.

Local data storage	Storage capacity	Storage duration
Load memory (via SIMATIC Memory Card)	4 MB to 32 GB, depending on SIMATIC Memory Card	Permanent
Code work memory	300 KB to 18 MB, depending on CPU	During operation of the CPU
Data work memory	1.5 MB to 150 MB	During operation of the CPU
Retentive memory	Up to 4.5 MB, depending on CPU	Permanent

More information
You can find more information on memory areas, retentive memory, and memory usage in the Structure and use of the CPU memory Function Manual (https://support.industry.siemens.com/cs/de/de/view/59193101/en).

Remote data storage
Data can be transmitted to external systems via various communication interfaces of the SIMATIC S7-1500, such as PROFINET, Industrial Ethernet.

The SIMATIC S7-1500 can send data to various remote systems, including SCADA systems, SQL databases, cloud platforms (for example, Insights Hub), and file servers.

The SIMATIC S7-1500 can send logging data to a SIEM system in the form of syslog messages.

The storage duration on external systems depends on the configuration of the respective system.

The SIMATIC S7-1500 CPU can be integrated as a data source into the Siemens Industrial Edge concept.

Data access/retrieval, terms of use and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	TIA Portal Web server OPC UA HMI/SCADA systems CPU display	User management Authentication Certificates	Prioritization of control tasks over data access Data throughput rates up to 1 Gbps via PROFINET Encrypted data transmission available (HTTPS, TLS)
Configuration and program data	TIA Portal Web server SIMATIC Memory Card	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Diagnostics data, system and security events, service data	TIA Portal SIMATIC Automation Tool Web server CPU display	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Operating data (runtimes, cycle times, CPU utilization)	TIA Portal Web server HMI/SCADA systems SIMATIC controller profiling	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Log data	TIA Portal Trace and logic analyzer function	User management Authentication	Encrypted data transmission available (HTTPS, TLS)

* "Quality of service" refers to the ability of the SIMATIC S7-1500 to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from CPUs

To delete all data from the data memories of the CPU, the "Reset to factory settings" function is available.

A reset of the CPU to factory settings can be implemented using any of the following:

- Mode selector keys/switches of the CPU
- CPU display
- TIA Portal
- SIMATIC Automation Tool

More information
You can find more information on deleting data in the SIMATIC S7-1500, ET 200MP System Manual (https://support.industry.siemens.com/cs/ww/en/view/59191792), "Securely removing data" and "Reset to factory settings" sections.

D.2 Data of the interface, power supply, and I/O modules

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and parameter data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, service data	Binary formats	Depending on application Less than 100 bytes per diagnostic event; several kilobytes of service data
Fieldbus* metadata: I&M data, log data, statistics data	Binary formats, string formats	Approximately 100 bytes per read-out data record

* PROFIBUS, PROFINET, EtherNet/IP, Modbus TCP (only for interface modules as MultiFieldbus devices)

Continuous and real-time data generation

The interface, power supply, and I/O modules are able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The cycle time is specified by the higher-level CPU.

Data storage and storage duration

Local data storage

The interface, power supply, and I/O modules store data in integrated memory areas.

Local data storage	Storage capacity	Storage duration
Retentive memory (for I&M data, configuration and parameter data*, service data)	Up to 16 MB for interface modules 1 to 4 MB for power supply and I/O modules	Permanent
Work memory (for process data, diagnostics data, fieldbus metadata, configuration and parameter data, service data)	Up to 1 MB for interface modules Several hundred KB for power supply and I/O modules	During operation of the module

* only interface modules as MultiFieldbus devices and IO-Link masters

Data access/retrieval, terms of use and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for supported modules)	Via fieldbus without authentication Via CPU (Page 420)	Prioritization of control tasks over data access Standard fieldbus transmission mechanisms Data throughput rates up to 1 Gbps via PROFINET
Configuration and parameter data (upload to programming device/PC)	TIA Portal (via CPU) S7-PCT (for IO-Link masters) MFCT (for supported modules)	Via fieldbus without authentication Via CPU (Page 420)	Standard fieldbus transmission mechanisms
Diagnostics data, service data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for supported modules)	Via fieldbus without authentication Via CPU (Page 420)	Standard fieldbus transmission mechanisms
Fieldbus metadata: I&M data, log data, statistics data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for supported modules)	Via fieldbus without authentication Via CPU (Page 420)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the interface, power supply, and I/O modules to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from interface, power supply, and I/O modules

Interface modules
To delete all data from the data memories of the interface module, the "Reset to factory settings" function is available.

The IM can be reset to factory settings using any of the following:

- TIA Portal
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Power supply modules
No delete function is available for power supply modules.

I/O modules
The data of an IO-Link master can be deleted using S7-PCT by executing the "Reset to factory settings" function.

For all other I/O modules, no delete function is available.

More information
You can find more information on deleting data in the SIMATIC S7-1500, ET 200MP System Manual (https://support.industry.siemens.com/cs/ww/en/view/59191792), "Securely removing data" and "Reset to factory settings" sections.

SIEMENS

Product information on the system manuals

Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://new.siemens.com/cert.

General amendments to the documentation

This product information contains amendments to the system manuals. The product information is part of the product supplied. Consider the statements provided in it as more up-to-date than other documentation if uncertainties arise.
This product information is valid for all products which reference this product information.

Operation of a system in an environment with low relative humidity

You have the possibility to operate the products in an environment with low relative humidity (calculated values: Dew point temperature -60 °C, 100 % humidity).
To do this, follow the following points in this product information.

Shock, vibrations
In the chapter "Mechanical and climatic environmental conditions" of the system manuals the "Tests for mechanical environmental conditions" table is replaced by the following table:

Table 1 Tests of mechanical environmental conditions

Condition tested	Test standard	Comment
Vibrations	Vibration test according to IEC 60068-2-6 (sinusoidal)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each one of the three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

ESD
Comply with the requirements of the table "Pulse-shaped disturbance variables" in the chapter "Electromagnetic compatibility" of the system manuals.

⚠ WARNING

Loss of the safety function, personal injury, property damage and destruction of the modules
When operating the system in an environment with low relative humidity (RH) < 10 % expect a rise of the electrostatic charge.
Take appropriate measures to ensure that the test levels specified in the "Pulse-shaped disturbance variables" table are not exceeded during this use.

Amendments to documentation S7-1500/ET 200MP

Standard/compact/technology CPUs Equipment Manuals, Edition 11/2024

Sections Product overview, New functions

New functions for FW version 4.1	Applications	Customer benefits
Backup and restore of the configuration of the CPU by a central user	As of FW version V4.1 of a CPU, a central user can also back up and restore the configuration.	Rules you need to follow for backup and restore. More information is available in the SIMATIC S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/59191792) System Manual, in the section Backing up and restoring the CPU configuration.
Integrated security		
Temporary account lockout for local user accounts	Starting from STEP 7 V21, you can set up a temporary account lockout for local user accounts in the case of CPUs as of FW version V4.1.	The temporary account lockout provides protection against brute force attacks.
SIMATIC S7-1500 data	This appendix provides you with an overview of the data that the CPU generates and makes available to you.	More information is available in the SIMATIC S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/59191792) System Manual, in the appendix SIMATIC S7-1500 data.
Communication of the CPU		
New function for OPC UA	Enables cross-vendor communication.	For more information, please refer to the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual
Activating IP forwarding through a data record transfer	For CPUs as of FW version V4.1, you can also activate/deactivate the "IP forwarding" function for local interfaces of the CPU through data record transfer.	
Technology functions of the CPU		
General functions	Distribution of motion job processing over several cores Improved performance	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
Axis functions (only S7-1500T)	Specification of the motion setpoints of a superimposing axis in addition to the basic motion of the axis Extended range of functions	Axis functions (https://support.industry.siemens.com/cs/us/en/view/109817884) Function Manual
Synchronous operation functions (only S7-1500T)	Cam usable as time-based position profile Extended range of functions	Synchronous operation functions (https://support.industry.siemens.com/cs/us/en/view/109817888) Function Manual
	Area scaling at a cam before or during active camming Extended range of functions	
	Cross-PLC synchronous operation with communication via isochronous I-device Extended range of functions	

New functions for FW version 4.1	Applications	Customer benefits
Kinematics functions (only S7-1500T)	New predefined kinematics type "6-axis articulated arm with offset wrist" available Extended range of functions	Kinematics functions (https://support.industry.siemens.com/cs/us/en/view/109817886) Function Manual
	As of firmware version V4.1, the following CPUs support the Motion Control package "S7-1500T Motion Control KinPlus" V10.0: • CPU 1516T/TF-3 PN • CPU 1517T/TF-3 PN	
Interpreter functions (only S7-1500T)	Value of a tag at a breakpoint can be changed in Debug program mode Extended range of functions	Interpreter functions (https://support.industry.siemens.com/cs/us/en/view/109817891) Function Manual
Trace functionality of the CPU		
Creating a long-term trace configuration from a long-term trace measurement	Extended range of functions	Trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual
Recording, display and analysis of events in TIA Portal	Diagnostics of Motion Control jobs Extended range of functions	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
PID control		
New version V2.0 of PID_Temp controller	Use for cooling-only applications	PID control (https://support.industry.siemens.com/cs/ww/en/view/108210036) Function Manual
	Temporary shutdown of the heating	
	Manual stopping of the integral-action component	
	Active limiting of the integral-action component and change of output value limits in automatic mode	
	Improved anti-windup behavior in the cascade

ET 200MP with IM 155-5 MF HF - MF Shared Device in the sections Ethernet/IP and Modbus TCP
Equipment Manual IM 155-5 MF HF (6ES7155-5MU00-0CN0), Edition 11/2025
Four ARs are available; these are shared by the fieldbuses. For EtherNet/IP and Modbus TCP, only one AR is reserved in each case, regardless of the number of controller connections used.
The maximum amount of I/O data must comply with the rules of the following table:

Number of fieldbus connections			Maximum I/O data per connection[1]		Max. download size with MFCT [1]	
PROFINET	**EtherNet/IP**	**Modbus TCP**	**Inputs**	**Outputs**	**Inputs**	**Outputs**
0	1 to 2	1 to 10	500	246	1440	1440
1	1 to 2	0	EtherNet/IP: 500 Modbus TCP: 500 PROFINET: 1440	EtherNet/IP: 246 Modbus TCP: 246 PROFINET: 1440	Download size[2]: 1440	Download size[2]: 1440
1	0	1 to 10				
1	1 to 2	1 to 10	EtherNet/IP: 500 Modbus TCP: 500 PROFINET: 1440	EtherNet/IP: 246 Modbus TCP: 246 PROFINET: 1440	Download size[2]: 1440	Download size[2]: 1440
2	1 to 2	0				
2	0	1 to 10				
2	1 to 2	1 to 10				

1 Including PROFINET payload qualifier or data status byte for signaling the data validity

2 PROFINET data + download size as displayed in MFCT ≤ 5760

The total size of all input data (PROFINET ARs) + the size of all output data across all PROFINET ARs + the download size should be less than 5760 bytes.

NOTE

The intensive use of Shared Device (multiple fieldbus connections with very large I/O configuration limits) and other functions such as Virtual Module affect the performance of the interface module.
To avoid temporarily exceeding the I/O configuration limits, you must proceed as follows in the case of a reconfiguration that results in changed I/O lengths:

1. Reduce the amount of I/O data in one configuration and download it to the MF device/CPU.
2. Increase the amount of I/O data in the other configuration and download it to the MF device/CPU.

Communication Function Manual, Edition 11/2025

Communications services, Secure Communication, Protection of confidential configuration data
If you connect to the CPU online, the user management loaded onto the CPU applies. A user with the required function rights can start loading from the CPU without needing to enter the password for the protection of confidential configuration data. Recommendation: Always load user management onto your CPU. Otherwise, everyone who can connect to the CPU online has full access to all CPU data.

Enabling/disabling routing, IP forwarding via data record transfer: Example for a CPU 1516-3 PN/DP
You can enable/disable IP forwarding for CPUs as of FW version V4.1 via the user program, regardless of which STEP 7 version is installed.

Connecting inductances to quenching elements
Function Manual Designing interference-free controllers, Edition 06/2014
In contrast to the specifications in section 6 "Special measures for interference-free operation", the following applies to wiring with quenching elements:
The inductances controlled by SIMATIC modules (for example, contactor or relay coils) require wiring with external quenching elements since **no** quenching elements are integrated in the modules.
The wiring examples with quenching elements in section 6 of the Function Manual still apply.

S7-1500/ET 200MP – digital output module DQ 8x24VDC/2A HF
Equipment Manual DQ 8x24VDC/2A HF**, Edition 06/2018, Technical specifications section**

Maximum permitted switching frequency of inductive loads
The following trends show the maximum permissible switching frequency of inductive loads as a function of the inductance and channel current. The maximum switching frequency applies to a pulse-pause ratio of 50%. The channel contributes 500 mA to the total current of the module, even if the actual channel current is smaller.
If you do not know the inductance of the actuator, assume a maximum inductance of 1.152 H for DC-13 loads (IEC 60947-5-1).

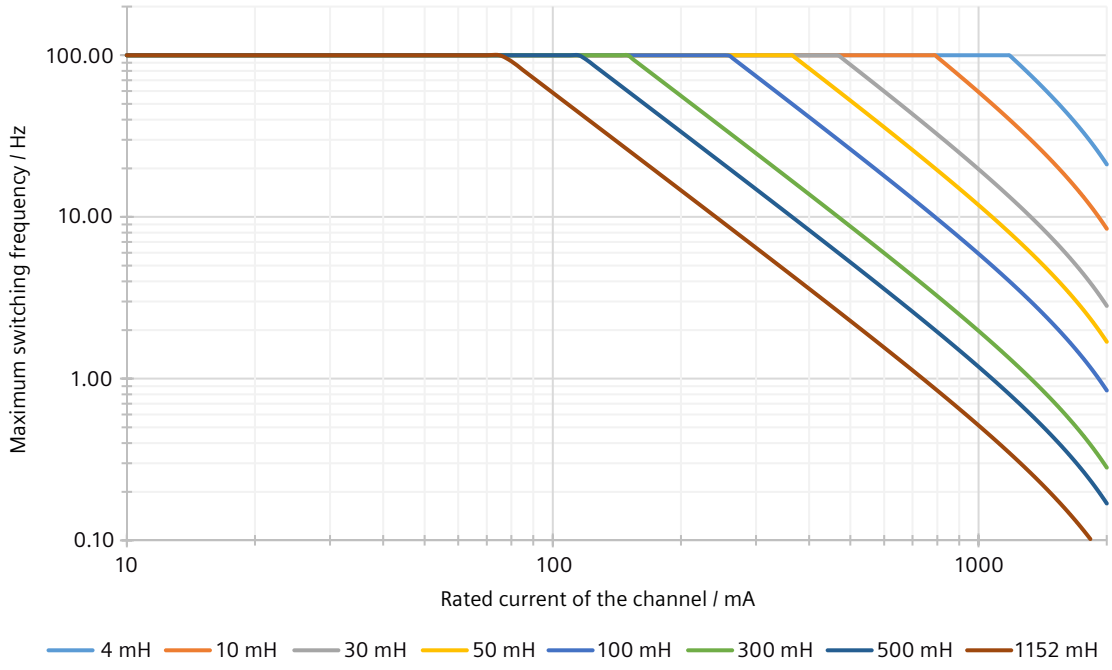

Figure 1 Maximum switching frequency

SIMATIC memory card – Overview
Structure and use of the CPU memory Function Manual 11/2023 edition

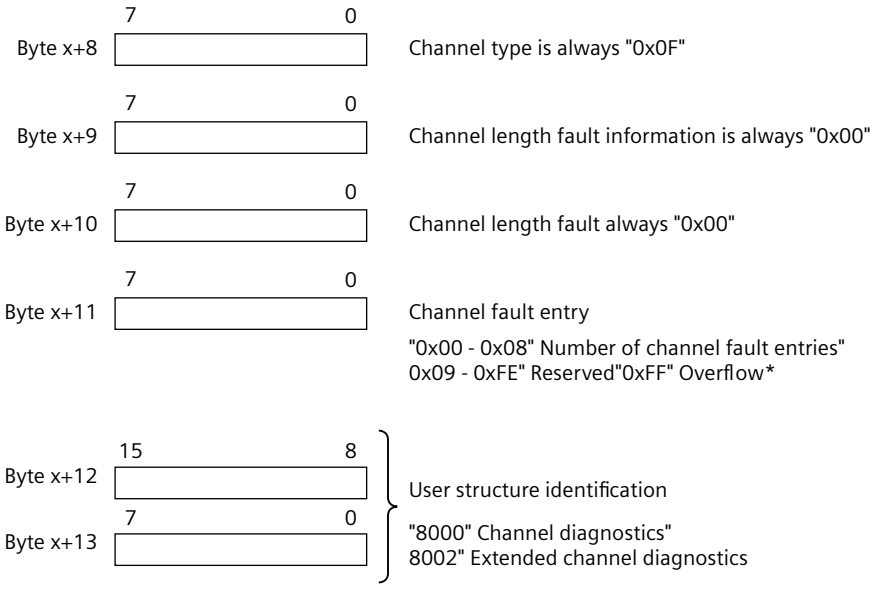
NOTE

Supported file/directory names and hierarchy levels on the SIMATIC Memory Card
The following rules apply to file names, directory names and hierarchy levels on the SIMATIC Memory Card:

- Do not use any umlauts (ö, ä, ü, Ö, Ä, Ü) in file and/or directory names.
- Use a maximum of 60 characters for file and/or directory names.
- Use a maximum of 6 hierarchy levels for the directory structure of the SIMATIC memory card (for example: /mountpoint/1/2/3/4/5/6/file.txt).
  The operating system of the CPU guarantees directories of no more than 8 levels, where one level is reserved for the mount point and one for the actual file.

ET 200MP with IM 155-5 PN ST - Channel diagnostics, MSI/MSO
Equipment Manual IM 155-5 PN ST interface module, Edition 11/2017

Channel diagnostics
In contrast to the order specified in the manual, the User Structure Identifiers (USI) are structured as follows:



- USI data block
- Reserved bytes
- Manufacturer-specific diagnostics

ET 200MP with IM 155-5 DP ST – Operation on a WIN AC RTX
When operating the ET 200MP (PROFIBUS) on a WIN AC RTX, configuration is only possible via a GSD file (selection in the hardware catalog under "Additional field devices"). Configuration on the basis of a support package is not supported in TIA Portal for this device arrangement.

ET 200MP with IM 155-5 DP ST - operation on Y-Link, interrupts, technical specifications Equipment Manual IM 155-5 DP ST interface module, Edition 08/2013

Operation on Y-Link
As of firmware version V2.0.0, it is possible to operate the IM 155-5 DP ST interface module as a DP slave after the Y-Link.

Interrupts
The bytes x+8 to x+19 of the diagnostic interrupt are assigned as follows:

* The number of existing channel faults is greater than 8.

Figure 2 Structure starting at byte x+8

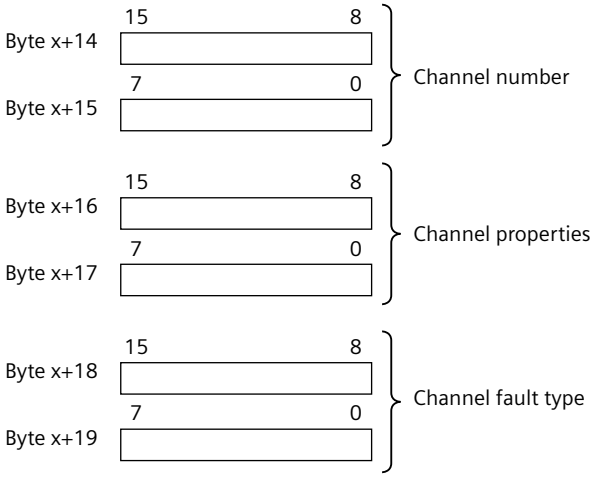


Figure 3 Structure starting at byte x+14

Technical specifications
For the IM 155-5 DP ST, it is possible to assign a maximum of 64 bytes of inputs and a maximum of 64 bytes of outputs to the address space per module.

S7-1500/ET 200MP - Substitute value behavior in shared device mode
Observe the following special characteristics for substitute value behavior in shared device mode with the modules/configurations in the following table:

NOTE

Substitute value behavior in shared device mode
If the system is in shared device mode and one of the IO controllers involved goes into STOP or fails due to a communication breakdown, for example, all submodules of the output module perform the configured substitute value reaction (e.g. shutdown).
This means that even when only one IO controller fails, that the other IO controllers associated with the shared device no longer control the assigned submodule of the output module.

Module/module name	Configuration	Article no.:
DQ 32x24VDC/0.5A BA	4 x 8-channel without value status	6ES7522-1BL10-0AA0
DQ 16x24VDC/0.5A BA	2 x 8-channel without value status	6ES7522-1BH10-0AA0

S7-1500/ET 200MP - Modules with isochronous mode
The following configurations rule out isochronous mode of the module:
- Module-internal shared input (MSI)
- Module-internal shared output (MSO)
- Submodules for shared device

S7-1500/ET 200MP - Calibration of analog modules
Requirements: The module is integrated in the hardware catalog of STEP 7 (TIA Portal) (no GSD file).
The "Calibration" function (calibration in RUN) is only possible with the following configurations.

Module/module name	Configuration	Article no.:
AI 8xU/I/RTD/TC ST QI	1 x 8-channel with value status	6ES7531-7KF00-0AB0
AI 8xU/I/RTD/TC ST	1 x 8-channel without value status	
AI 8xU/I HS QI	1 x 8-channel with value status	6ES7531-7NF10-0AB0
AI 8xU/I HS	1 x 8-channel without value status	
AQ 8xU/I HS QI	1 x 8-channel with value status	6ES7532-5HF00-0AB0
AQ 8xU/I HS	1 x 8-channel without value status	
AQ 4xU/I ST QI	1 x 4-channel with value status	6ES7532-5HD00-0AB0
AQ 4xU/I ST	1 x 4-channel without value status	
AQ 4xU/I HF QI	1 x 4-channel with value status	6ES7532-5ND00-0AB0
AQ 4xU/I HF	1 x 4-channel without value status	
AI 4xU/I/RTD/TC/ AQ 2xU/I ST QI	1 x 6-channel with value status	6ES7534-7QE00-0AB0
AI 4xU/I/RTD/TC/ AQ 2xU/I ST	1 x 6-channel without value status	
AI 4xU/I/RTD/TC ST QI	1 x 4-channel with value status	6ES7531-7QD00-0AB0
AI 4xU/I/RTD/TC ST	1 x 4-channel without value status	
AQ 2xU/I ST QI	1 x 2-channel with value status	6ES7532-5NB00-0AB0
AQ 2xU/I ST	1 x 2-channel without value status	

S7-1500/ET 200MP - Technical specifications

Equipment Manual AI 8xU/I HS (6ES7531-7NF10-0AB0), Edition 12/2016

Equipment Manual AI 4xU/I/RTD/TC ST (6ES7531-7QD00-0AB0), Edition 09/2016

Equipment Manual AI 4xU/I/RTD/TC / AQ 2xU/I ST (6ES7534-7QE00-0AB0), Edition 09/2016
Contrary to the information given in the manuals, the following statements apply:

24 V encoder supply	
Short-circuit protection	Yes
Output current, max.	20 mA; max. 47 mA per channel for a duration < 10 s

The "encoder supply" depends on the module and is described in the technical specifications of the respective device manual. You can find the data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/td). Enter the article number or the short designation of the desired module on the website.

S7-1500/ET 200MP - Analog Output Module AQ 8xU/I HS
Equipment Manual AQ 8xU/I HS (6ES7532-5HF00-0AB0), Edition 09/2016, Technical specifications section
Derating depending on mounting position, ambient temperature and output type (per module):
Deviating from the information in the equipment manual, the following statement applies:
The trends illustrated in the equipment manual show the number of channels (CHx) that can be **simultaneously activated** in horizontal and vertical installation of the S7-1500 automation system / ET 200MP distributed I/O system depending on the ambient temperature.

Shared device
Shared device is not possible with the HSP0318 in the combination of active backplane bus and S7-300/400 CPUs as IO controller.
This combination is possible with GSD file (in STEP 7 as of V5.5 and in STEP 7 (TIA Portal)).
Shared device with active backplane bus and S7-1500 CPUs as IO controller is possible with the HSP0318 and with GSD file.

S7-1500/ET 200MP - Digital Input Module DI 16xNAMUR HF
Equipment Manual DI 16xNAMUR HF (6ES7521-7TH00-0AB0), Edition 07/2021, Technical specifications section

Tolerances of the programmable input delay
Deviating from the tolerance range for input delay 0.05 ms specified in the Equipment Manual, the following values apply:

Input delay	**Tolerance range**
0.05 ms	14 µs to 22 µs

This modified tolerance range applies to all operating modes of the module.
The difference in tolerance range from that of other S7-1500 digital input modules is due to the extended counting frequency of the module of up to 20 kHz.

Integrated counting functions
You can optionally parameterize up to 4 inputs as counters with 2 x 20 kHz and 2 x 10 kHz or 4 x 10 kHz.

S7-1500/ET 200MP - Digital output module DQ 8x230VAC/2A ST Triac
Equipment Manual DQ 8x230VAC/2A ST Triac (6ES7522-5FF00-0AB0), Edition 12/2021, Address space section

Table 1 Configuration options

Configuration	Short designation / module name in the GSD file	Configuration software, e.g., STEP 7 (TIA Portal)	
		Integrated in hardware catalog STEP 7 (TIA Portal)	GSD file in STEP 7 (TIA Portal) V12 or higher or STEP 7 V5.5 SP3 or higher
1 x 8-channel without value status	DQ 8x230VAC/2A ST	X	X
1 x 8-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 8x230VAC/2A ST MSO	V13 Update 3 or higher (PROFINET IO only)	X (PROFINET IO only)
1 x 8-channel with value status	DQ 8x230VAC/2A ST QI		

S7-1500/ET 200MP - Digital output module DQ 16x230VAC/1A ST Triac
Equipment Manual DQ 16x230VAC/1A ST Triac (6ES7522-5FH00-0AB0), Edition 12/2021, Address space section

Table 2 Configuration options

Configuration	Short designation / module name in the GSD file	Configuration software, e.g., STEP 7	
		Integrated in hardware catalog STEP 7 V13, SP1 or higher with HSP 0119	GSD file in STEP 7 V12 or higher or STEP 7 V5.5 SP3 or higher
1 x 16-channel without value status	DQ 16x230VAC/1A ST	X	X
2 x 8-channel without value status	DQ 16x230VAC/1A ST S	X (PROFINET IO only)	X (PROFINET IO only)
1 x 16-channel with value status for module-internal Shared Output with up to 4 submodules	DQ 16x230VAC/1A ST MSO		
1 x 16-channel with value status	DQ 16x230VAC/1A ST QI		
2 x 8-channel with value status	DQ 16x230VAC/1A ST S QI		

S7-1500/ET 200MP - Digital output module DQ 8x24VDC/2A HF
Equipment Manual DQ 8x24VDC/2A HF (6ES7522-1BF00-0AB0), Edition 06/2018

Minimum pulse duration
The minimum pulse duration of 300 µs applies for a duty cycle > 0.
The following table shows the duty cycles and the values output for a duty cycle of 2 ms:

Duty cycle as a %	Pulse duration
0	0 µs
0.1	300 µs
10.0	300 µs
15.0	300 µs
15.1	302 µs
20.0	400 µs

Example for energy saving by reducing the holding current
The `PWM_Out` tag applies for the outputs QB x+2/3 for Channel 0 or QB x+4/5 for Channel 4.

The following special points apply for the duty cycle and the minimum pulse duration:

- At a duty cycle of 0 no PWM output is active
- At an on-load factor < 300 µs no signal is output

Address space operating mode pulse width modulation
If you have set "Pulse width modulation" mode for Channel 0 and Channel 4 in the operating mode parameter, Bit 0 and Bit 4 are not evaluated. Actuation of the PWM channels is effected via the duty cycle (QB x+2/3 and/or QB x+4/5).

Assignment in the process image output (PIQ)

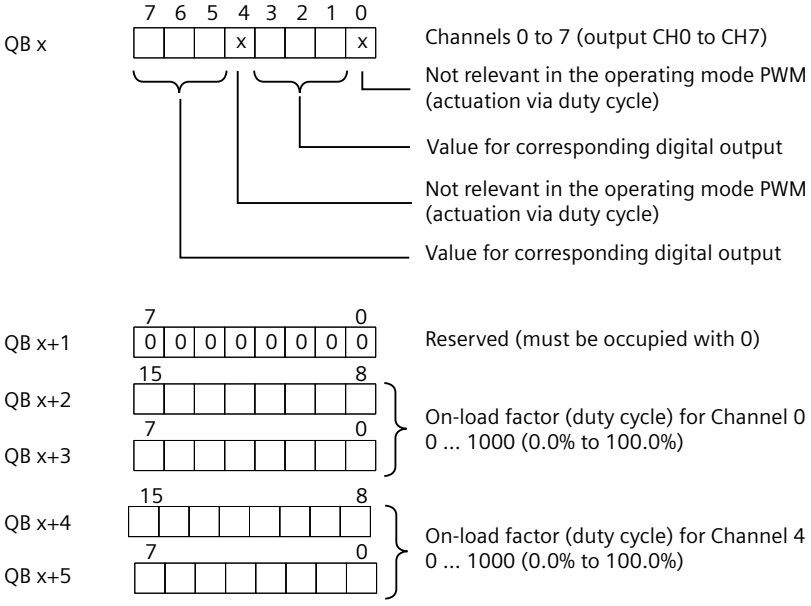

Figure 4 Allocation in the process image output

Transport protocols for syslog messages

Using a TLS or UDP connection
If you want S7-1500 CPUs to transfer their syslog messages to a syslog server, configure either a TLS or UDP connection. Use solely a TLS connection in productive operation. TLS ensures that all syslog messages from the CPU are securely transferred to the syslog server.
You can also use a UDP connection for commissioning and testing scenarios. A UDP connection is not secured. A UDP connection does not even guarantee transferring of all syslog messages to the configured syslog server.

Supplements to the "Protection" section

The following paragraphs supplement the contents in the "Protection" section, Edition 11/2025.

Overview of the protective functions
The link to the document "Security with SIMATIC S7 controllers" in the section is no longer valid.

Recommendation: Several protective functions for increased protection of your system
Use as many of the listed protective functions as possible. These protective functions protect your investments against unauthorized access and manipulation and thus contribute to reliable system availability.

Central user management

Useful information on central user management and access control
Additional information on the warning "Decoupling the user management from the CPU involves risks":
Changes to central users do not affect the existing connection to the CPU at the time the changes are made. In addition to the listed changes, the changes also include deleting a user from the project.

Configuring central user management in the editor for users and roles
Recommendation: It is best to create user groups in your project rather than individual central users.
If you use user groups, the user data only has to be maintained on the connected UMC server. In the case of individual central users, the user data must be maintained in the project in addition and loaded onto the CPU.

Backing up and restoring the CPU configuration

The following paragraphs supplement the contents in the section Commissioning, Backing up and restoring the CPU configuration, Edition 11/2025.

Recommendation: Use password protection for confidential configuration data
Protect the configuration data of a CPU by assigning the password for the protection of confidential configuration data. You thus achieve the best possible protection for the configuration data of a CPU. If possible, manage the password in a password manager.
Also protect the backup files of a CPU against unauthorized access to prevent the manipulation of the backup files.

Information regarding compatibility
In order to use all backup possibilities, use a CPU as of the configured FW version V4.1 and STEP 7 as of V21. Backup files which were generated by a CPU with a configured FW version V4.1 can only be restored on CPUs with a FW version as of V4.1.

Rules for backup and restore
If a user cancels the operation or the CPU cancels the operation due to an error, only the user who canceled the operation can resume it. The intermediate steps "Reset to factory settings" and "Start a new backup/restore" are required for this purpose. The intermediate step "Download from STEP 7" is not required.

Supplements to the "CPU display" section

The following paragraphs supplement the contents in the "CPU display" section, Edition 11/2026.

Advantages
You can save an image (backup copy) of the CPU data to the SIMATIC Memory Card of the CPU locally via the CPU display. Saving an image affects the memory capacity remaining on the SIMATIC Memory Card for the user program.
Consequence: The remaining memory capacity may no longer be sufficient for data that the user program writes to the SIMATIC Memory Card.
Recommendation: Plan in advance for a SIMATIC Memory Card with sufficient memory.

Password protection for the display
The password for the display forms part of the S7-1500 CPU security concept. If possible, manage the password in a password manager. When entering the password, make sure that nobody is able to observe you or read the password.

Other OPC UA functions

Maximum number of simultaneously running jobs for asynchronous instructions for OPC UA
The following table supplements the contents in the section Basics of program editing, Asynchronous instructions, Edition 11/2025
The maximum number of simultaneously running jobs for asynchronous instructions for OPC UA can be found in the respective Equipment Manual in the section Technical specifications section or on the Internet (https://sieportal.siemens.com/su/blVMV).
In the OPC UA instructions for session management or for data access, you require the following values from the technical specifications to be able to calculate the maximum number of jobs running simultaneously:

- Number of connections, max.
- Number of simultaneous calls of the client instructions for session management, per connection, max.
- Number of simultaneous calls of the client instructions for data access, per connection, max.

In addition to the OPC UA instructions, the following table shows the use and calculation of the maximum number of jobs running simultaneously.

OPC UA instruction	Usage	Calculation
OPC_UA_Connect	Session management	"Number of connections, max." multiplied by "Number of simultaneous calls of the client instructions for session management, per connection, max."
OPC_UA_NamespaceGetIndexList		
OPC_UA_NodeGetHandleList		
OPC_UA_MethodGetHandleList		
OPC_UA_TranslatePathList		
OPC_UA_NodeReleaseHandleList		
OPC_UA_MethodReleaseHandleLis		
OPC_UA_Disconnect		
OPC_UA_ConnectionGetStatus		
OPC_UA_ReadList	Data access	"Number of connections, max." multiplied by "Number of simultaneous calls of the client instructions for data access, per connection, max."
OPC_UA_WriteList		
OPC_UA_MethodCall		The value can be taken directly from the technical specifications.

Communication Function Manual, Edition 11/2025

OPC UA communication, Security at OPC UA, Role-based security in OPC UA
A role in the project that you want to use for OPC UA user roles cannot be named "- - -". Otherwise, it will not be possible to map the role in the project to OPC UA user roles. The role is loaded onto the CPU, but has no authorizations.

Communication Function Manual, Edition 11/2024

OPC UA - Global Discovery Push (GDS Push) function: Update problem with downloaded certificates
Under certain conditions, the CPU does not register a downloaded certificate (e.g. a new OPC UA server certificate, or an updated web server certificate). A certificate error may be signaled during a connection attempt in this case.
The update problem occurs only when the CPU still manages certificates that were provided during runtime (GDS Push) and when certificates are then transferred by loading the hardware configuration to the CPU. The certificates loaded via the hardware configuration are not registered by the CPU under these conditions.
Examples:

- You have initially enabled the GDS Push function and selected the option "... use certificates provided during runtime" for the certificate settings and loaded this configuration. The required server certificate as well as the trust lists/CRLs are provided exclusively via GDS Push methods in this case.
- You then change the hardware configuration by adding new certificates or changing existing certificates (e.g. web server certificates or certificates for secure PG/HMI communication). During loading, you have **not** deleted existing certificates provided during runtime so that you can use them later.
  Result: The newly loaded server certificates (e.g. web server certificates or certificates for secure PG/HMI communication) are not registered by the CPU.
- The problem also occurs when you have disabled the GDS Push function and selected the option "... use configured and downloaded certificates" for the certificate settings and loaded this configuration. During loading, you have **not** deleted existing certificates provided during runtime so that you can use them later.
  Result: The newly loaded OPC UA server certificate is not registered by the CPU.

Solution:
When the CPU still has certificates that were provided during runtime and you want to transfer new/changed certificates by loading the hardware configuration to the CPU, proceed as outlined below:

- After loading the configuration, perform a "Memory reset" or restart the CPU (POWER OFF > POWER ON). After performing these measures, the CPU reorganizes the loaded configuration and uses the current certificates.

OPC UA server: Change in behavior when using multi-dimensional arrays in a UDT
From firmware version V2.9.4 onwards, S7-1500 CPUs code multi-dimensional arrays within structures according to OPC UA specification V1.04.
CPUs with older firmware versions code the corresponding structures in another form. If you have used multi-dimensional arrays in structures for CPUs with older firmware versions and are upgrading to the latest firmware version, then you must modify your client programs accordingly.

Amendments to SIMATIC S7-1500R/H documentation

R/H CPUs Equipment Manuals, Edition 11/2024

Sections Product overview, New functions

New functions for FW version 4.1	Applications	Customer benefits
System modification during redundant operation (CiR)	The configuration changes are possible in the PROFINET network of the R/H system. CiR is supported in a ring, line or combined topology.	You can make configuration changes with CiR during running redundant operation. • Add IO device • Reconfigure I/O module

New functions for FW version 4.1	Applications	Customer benefits
OB 83 (pull/plug OB)	As of FW version V4.1, OB 83 (Pull/plug interrupt OB) supports additional events for system modification during redundant operation (CiR).	Additional events: • In the RUN-Redundant system state of an S7-1500R/H system, the re-parameterization of a configured I/O module was started via CiR. • In the RUN-Redundant system state of an S7-1500R/H system, the re-parameterization of a configured I/O module via CiR was successfully completed. • In the RUN-Redundant system state of an S7-1500R/H system, the re-parameterization of a configured I/O module could not be carried out (IO device refuses the new configuration).
Technology object TO_Ident	As of FW version V4.1, the R/H system supports the TO_Ident technology object, the technology object for SIMATIC Ident products.	"TO_Ident" enables the simple parameterization of an Ident system in TIA Portal. It creates an easy-to-parameterize interface between the configured hardware and the function blocks in the "SIMATIC Ident" library.
Number of IO devices that can be used on the H CPUs	As of FW version V4.1, the CPUs 1517H-4 PN/1518HF-4 PN support 512 IO devices in the PROFINET network.	More information is available in the SIMATIC S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual, as of the section System overview.
Switching the system IP address	As of FW version V4.1 of the R/H CPUs, switching the system IP address is also possible when the OPC UA server is activated.	
Firmware update	As of FW version V4.1, the firmware update is supported via accessible nodes.	More information is available in the SIMATIC S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual in the section Firmware update.
Backup and restore configuration of the R/H CPUs from the central user	As of FW version V4.1 of an R/H CPU, a central user can also back up and restore the configuration.	Rules you need to follow for backup and restore. More information is available in the SIMATIC S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual, in the section Backing up and restoring the CPU configuration.
Integrated security		
Temporary account lockout for local user accounts	Starting from STEP 7 V21, you can set up a temporary account lockout for local user accounts in the case of CPUs as of FW version V4.1.	The temporary account lockout provides protection against brute force attacks.
SIMATIC S7-1500R/H data	This appendix provides you with an overview of the data that the CPU generates and makes available to you.	More information is available in the SIMATIC S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual, in the appendix SIMATIC S7-1500R/H data.
Communication of the CPU		
New function for OPC UA	Enables cross-vendor communication.	For more information, please refer to the

New functions for FW version 4.1	Applications	Customer benefits
Activating IP forwarding through a data record transfer	For CPUs as of FW version V4.1, you can also activate/deactivate the "IP forwarding" function for local interfaces of the CPU through data record transfer.	Communication (https://support.industry.siemens.com/cs/en/de/view/59192925) Function Manual.
GDS (certification management in runtime)	As of FW version V4.1, you can use the OPC UA server on R/H CPUs to transfer certificates during runtime.	The certificate, the trust lists and certificate revocation lists (CRLs) of the OPC UA server and the certificate of the web server can be updated automatically using GDS push management functions.
Configuration limits for OPC UA	As of FW version V4.1, the following configuration limits for OPC UA have been increased: • Maximum number of jobs running simultaneously for asynchronous instructions • OPC UA server methods • Monitored items • Nodes in user-defined interfaces	More information is available in the SIMATIC S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual in the section Asynchronous instructions.
Web server of the R/H CPUs		
System web pages	Introduction of system web pages with functionality for: • Overview • Diagnostics • User program • Messages and DataLogs • Maintenance	You can find more information in the Web server (https://support.industry.siemens.com/cs/en/de/view/109977246) Function Manual.
System IP address	As of FW version V4.1, you can access the web server of the R/H CPUs via the system IP address.	
Trace functionality of the CPU		
Creating a long-term trace configuration from a long-term trace measurement	Extended range of functions	Trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual
PID control		
New version V2.0 of PID_Temp controller	Use for cooling-only applications	PID control (https://support.industry.siemens.com/cs/ww/en/view/108210036) Function Manual
	Temporary shutdown of the heating	
	Manual stopping of the integral-action component	
	Active limiting of the integral-action component and change of output value limits in automatic mode	
	Improved anti-windup behavior in the cascade	

Technical specifications section

Equipment Manual	Technical specifications for firmware version V4.1
CPU 1513R-1 PN (6ES7513-1RM03-0AB0)	↓ (https://support.industry.siemens.com/cs/ww/en/pv/6ES7513-1RM03-0AB0/td?dl=de)
CPU 1515R-2 PN (6ES7515-2RN03-0AB0)	↓ (https://support.industry.siemens.com/cs/ww/en/pv/6ES7515-2RN03-0AB0/td?dl=de)
CPU 1517H-4 PN (6ES7517-4HQ10-0AB0)	↓ (https://support.industry.siemens.com/cs/ww/en/pv/6ES7517-4HQ10-0AB0/td?dl=de)
CPU 1518HF-4 PN (6ES7518-4JT10-0AB0)	↓ (https://support.industry.siemens.com/cs/ww/en/pv/6ES7518-4JT10-0AB0/td?dl=de)

Prerequisite for CiR (Configuration in Run): STEP 7 V21 Update 1 and firmware version V4.1.2

System Manual S7-1500R/H redundant system, Edition 11/2025

Sections Maintenance, System modification during runtime (CiR), Requirements

NOTE

If you use CiR with S7-1500R/H, at least STEP 7 V21 Update 1 and a firmware version greater than V4.1.0 is required for the R/H CPUs.
Perform updates for STEP 7 and the R/H CPUs!

CiR with S1 devices of the ET 200S/ET 200M type or GSD devices that only support IEC V2.2 LLDP mode

System Manual S7-1500R/H redundant system, Edition 11/2025

Sections Maintenance, System modification during runtime (CiR), Restrictions/Special features
If you plan to add S1 devices of the type ET 200S/ET 200M with CiR, you need to activate the "Use IEC V2.2 LLDP mode" parameter beforehand. To do this, select the corresponding check box in the properties of the PROFINET interface of the R/H CPU in the area "PROFINET interface > Advanced options > Interface options". The same applies to GSD devices that only support IEC V2.2 LLDP mode.
The parameter can only be activated in the STOP system state of the R/H system. Activation with CiR is not possible.

Display of the source address in multicast packages

Communication Function Manual, Edition 11/2025
If an S7-1500 R/H CPU sends UDP multicast messages via a system IP address, the device IP address of the CPU is entered as the source address in the multicast packages instead of the system IP address. Take this behavior into consideration for filters and firewalls.
In case of a reply to the multicast sender, use the system IP address as target.

Configure FTP or Secure FTP in the S7-1500R/H redundant system

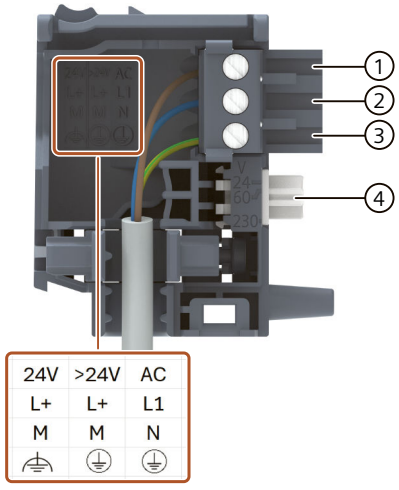
Communication Function Manual, Edition 11/2025
The S7-1500R/H redundant system supports the use of CP 1543-1 communications processors as of FW version V3.1. If you use the CP 1543-1 communications processors on the S7-1500R/H redundant system, you can also set up communication via FTP or secure FTP.
You configure the FTP server functionality in the properties of the respective CP. In the FTP configuration of each CP, always assign the R/H CPU to mounting rail_0. Only this R/H CPU can be selected in the selection list. The same applies to CPs that are plugged onto mounting rail_1.

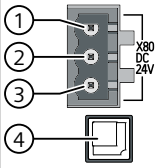
Configuring VPN on the S7-1500R/H redundant system

Communication Function Manual, Edition 11/2025
If you are using the CP 1543-1 communications processors on the S7-1500R/H redundant system, you can also set up communication over a VPN. You can configure a VPN in one of the following ways:

- Both CPs in the same slot of the primary and backup CPU are in the same VPN
- Each CP in the same slot of the primary and backup CPU is located in a specific VPN

Communication over a VPN is only possible via the physical interfaces of the CPs. The virtual interface W1 of the CPUs does not support communication over a VPN.



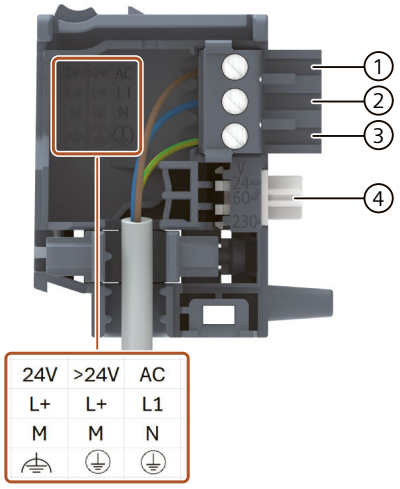


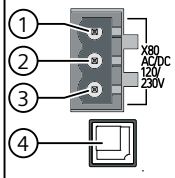
Using the firewall of the CPs
You also configure the access to the CPUs via the device and system IP address of the virtual interfaces W1 in the firewall settings of the CPs.

Supplements to the documentation on power supply modules PS

Supplements relating to the connection plug PS 25W 24VDC

Equipment Manual PS 25W 24VDC (6ES7505-0KA00-0AB0), Edition 11/2020, section Wiring
The following paragraph supplements the Equipment Manual PS 25W 24VDC (6ES7505-0KA00-0AB0) and takes precedence over the Equipment Manual PS 25W 24VDC (6ES7505-0KA00-0AB0).





Connection plug
The connection plug for the power supply is plugged in when the power supply module ships from the factory.
The following figure shows the assignment of the connection plug:

Connector	PS connection	Name
		① L ② M ③ Functional earthing conductor ④ Coding element

Supplements relating to the connection plug PS 60W 230VAC

Equipment Manual PS 60W 230VAC (6ES7507-0RA00-0AB0), Edition 11/2020, section Wiring
The following paragraph supplements the Equipment Manual PS 60W 230VAC (6ES7507-0RA00-0AB0) and takes precedence over the Equipment Manual PS 60W 230VAC (6ES7507-0RA00-0AB0).

Connection plug
The connection plug for the power supply is plugged in when the power supply module ships from the factory.
The following figure shows the assignment of the connection plug:

		① L ② N ③ Protective conductor ④ Coding element

SIEMENS
SIMATIC

S7-1500/ET 200MP automation system
Compact Operating Instructions
Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity
- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/13716/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/13716/cert?ct=444&ci=5596).
- You can find the EU Declaration of Conformity for SIPLUS and SIPLUS RAIL here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/18119/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity for SIPLUS and SIPLUS RAIL here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/18119/cert?ct=444&ci=5596).

Firmware
You will find the latest firmware versions (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/search?t=all&search=et%20200mp%20S7-1500&type=Download&lc=en-WW).

Documentation
The complete documentation consists of product information, the system manual, equipment and function manuals. You can find these in the Manual Collection (https://support.industry.siemens.com/cs/ww/en/view/86140384) on the Internet.

Retention of the documentation
Retain this documentation for later use.
1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.
1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Only install products with IP20 degree of protection according to IEC 60529 in enclosures, cabinets, or electrical equipment rooms suitable for the end use that meet at least this degree of protection.

⚠ WARNING

Electric shock due to externally supplied plant units
Even if the main supply to the plant is disconnected, externally supplied plant units can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.
Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Electric shock due to permissible electric potential difference

Due to the permissible electric potential difference, a dangerous voltage may be present at the inputs of modules. An electric shock on contact with live parts can lead to death or serious injury.

Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Safety functional extra low voltage

The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384) of the fail-safe I/O and in the data sheets of the power supplies to be used.

Use a power supply unit with output voltage that does not exceed 36 V DC even in the event of a fault.

Follow the notes and warnings in the respective manual.

⚠ CAUTION

The synchronization module contains a laser system and is classified as a "CLASS 1 LASER PRODUCT" in accordance with IEC 60825-1.

Can cause personal injury.

Avoid eye contact with the laser beam. Do not open the housing. Read the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384).

⚠ WARNING

Personal injury due to uncontrolled movement

When using Motion Control, uncontrolled movements can occur which result in personal injury of unknown extent.

Follow the safety instructions described in the Motion Control function manuals (https://support.industry.siemens.com/cs/ww/en/view/86140384).

Electromagnetic Compatibility

The product is intended for operation in the Industrial EMC environment class.

Ensure that your automation system is installed in compliance with EMC requirements, as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384) for the product.

NOTICE

Interference emission / Interference immunity

Operation of the product can cause radio interference in residential areas.

If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

ATEX-/UKEX device intended for use in hazardous area
If the product is intended for use in a potentially explosive atmosphere (gas/air or gas/dust mixture), observe the special information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384). The intended use (e.g. ATEX zone, degree of protection, temperature class) is indicated on the product (in the declaration of conformity and usually also on the nameplate).

NOTE

As a rule, country-specific requirements for the operator also apply when a product is used in a potentially explosive atmosphere (e.g. Directive 1999/92/EC for the EU).

Safety in potentially hazardous atmospheres
SIMATIC systems are suitable for use in zones with occasional presence of hazardous gas atmospheres (equipment group II, Cat. 3, gases, vapors, mists). You can find information, restrictions and special conditions in the respective system manuals. To avoid damage, determine a suitable installation location and select suitable products. It is mandatory to define the following points before planning your automation system:

- Hazardous plant areas
- Potentially existing atmosphere
- Relevant requirements for the products

⚠ WARNING

Explosion hazard
If work in areas with potentially hazardous atmospheres is not carried out correctly, an explosion may occur. Explosions can lead to serious personal injury or damage to the plant.
Only suitably qualified specialists are allowed to plan and perform activities in areas with potentially hazardous atmospheres. In hazardous areas, always de-energize the SIMATIC system before starting activities.

⚠ WARNING

Pulling or plugging a module is prohibited in the hazardous area.
When you pull or plug a module or plug-in connector during operation, there is a risk of sparking. Sparks can cause an explosion in the hazardous area; death or serious physical injury as well as damage to property can result.
Do not pull or plug the module or the plug-in connectors until one of the following two conditions is met: The area is no longer hazardous or the device and its plug-in connectors are de-energized.

Cleaning
If you need to clean the product, use dry ESD cleaning cloths (observing the protective measures for ESD).
Requirement: All supply voltages present on the device are switched off. Observe the five safety rules for working in and on electrical installations.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384).

Functional safety

⚠ WARNING

Danger to humans and the environment
To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components. For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation (https://support.industry.siemens.com/cs/ww/en/view/86140384).

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether it is approved for the respective device.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product

versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Preface

Purpose of the documentation

This manual supplements the system manual S7-1500 Automation System. You can find information on the functions that apply generally to the S7-1500 automation system and the ET 200MP distributed I/O system in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

The information provided in this manual and the system manual enables you to commission the S7-1500 automation system and ET 200MP distributed I/O system.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe the notes identified as follows:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which particular attention should be paid.

Important note for maintaining the operational safety of your system

NOTE

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators by means of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Log in to Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Open Source Software

Open-source software is used in the firmware of the product described. Open Source Software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information relating to this in the appendix.

Documentation guide

1

1.1 Guide to documentation S7-1500 / ET 200MP

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information
The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information
Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information
The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-controllers/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet.

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/86140384).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet.

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

2.1 Properties

Order number

6ES7526-1BH00-0AB0

View of the module

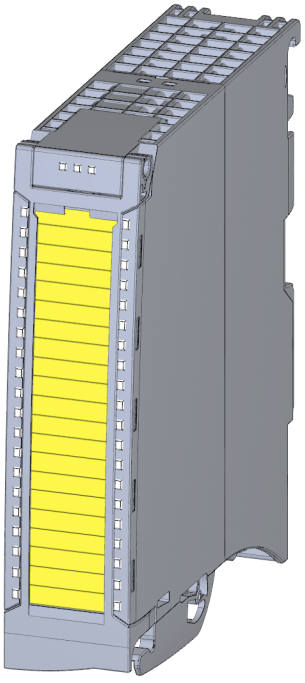

Figure 1-604 View of the F-DI 16x24VDC module

Properties

- Technical properties
  - Fail-safe digital module for use in the S7-1500 automation system and in the ET 200MP distributed I/O system.
  - PROFIsafe
  - PROFIsafe address type 2
  - Supports the RIOforFA-Safety profile (on S7-1500 F-CPUs)
  - 16 inputs (SIL3/Category 3/PLd) or 8 inputs (SIL3/Category 4/PLe)
  - 4 outputs for sensor supply

  - Use of various interconnection types are possible (1oo1 & 1oo2)
  - Supply voltage L+
  - Sink input (P-reading)
  - Suitable for connection of 3/4-wire sensors according to IEC 61131:2007, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Internal short-circuit-proof sensor supplies for each channel group
  - External sensor supply possible
  - Status display RUN (green LED)
  - Status display module diagnostics (red LED)
  - Status display channel status/channel diagnostics per input (green/red LED)
  - Status display supply voltage (green LED)
  - Diagnostics, e.g., short-circuit, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or module-wide passivation
- Supported functions
  - Firmware update
  - I&M identification data

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, switch off the supply voltage of the affected module before 100 hours expires.
Follow the repair procedure described in section Diagnostic alarms (Page 49).

Accessories

The following accessories are supplied with the module and can also be ordered as spare part:

- Labeling strips
- U-connector
- Universal front cover
- Electronic coding element

Additional components

The following component is to be ordered separately:

- Front connector incl. potential bridges and cable ties

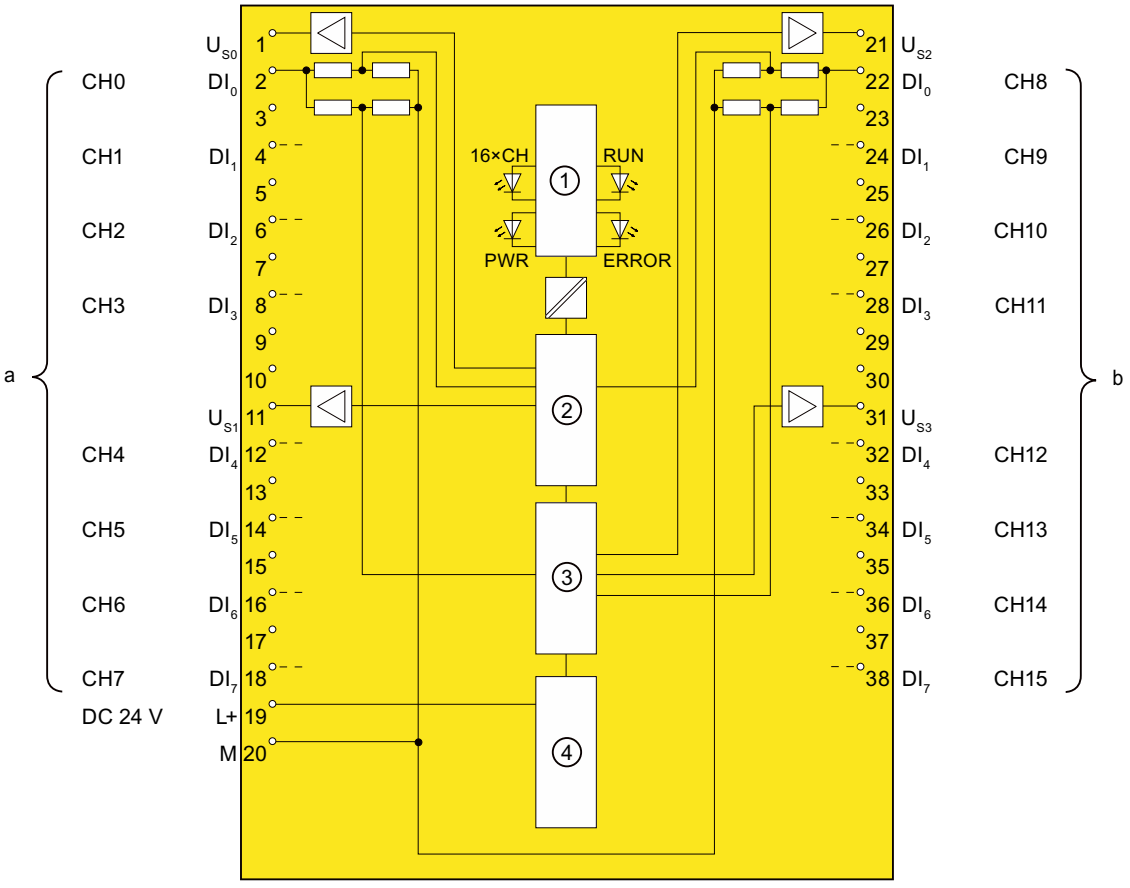
You can find additional information on accessories in the S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

Connecting

3

3.1 Block diagram

This section includes the block diagram with the general pin assignment of the F-module.



For information on parameter assignment of the F-module, refer to "Parameters/address space (Page 14)".

Information on different connection options is available in the section Applications of the F-I/O module (Page 27).

You can find information on wiring the front connectors and creating the cable shielding, etc., in the Wiring section of the system manual Automation System S7-1500 (http://support.automation.siemens.com/WW/view/en/59191792).

Block diagram

The following figure shows the assignment of channels to addresses (input byte a and input byte b).

①	Backplane bus interface	L+	Supply voltage 24 V DC
②	Microcontroller 1	M	Chassis ground
③	Microcontroller 2	CH	Channel or LED channel status, channel diagnostics (green, red)
④	Reverse polarity protection	PWR	LED supply voltage (green)
U_{Sn}	Internal sensor supply n	RUN	RUN LED (green)
DI_n	Input bit n	ERROR	LED module diagnostics (red)

Figure 1-605 Block diagram of the F-DI 16x24VDC

Parameters/address space

4

4.1 Parameters

Parameters

WARNING

Diagnostic functions must be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 27).

Table 1-873 Parameters for F-DI 16x24VDC

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of F-monitoring time	• Disable • Enable	No	Module
F-monitoring time	1 to 65535 ms	No	Module
F-source address	1 to 65534	No	Module
F-destination address	1 to 65534	No	Module
F-parameter signature (without address)	0 to 65535	No	Module
Behavior after channel fault	• Passivate channel • Passivate the entire module	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	No	Module
F-I/O DB manual number assignment	• Disable • Enable	No	Module
F-I/O DB-number	—	No	Module
F-I/O DB name	—	No	Module
DI parameters:			
Sensor supply			
Supplied channels	Sensor supply 0: • No channels • Channels [0..3] • Channels [0..7] • Channels [0..15] Sensor supply 1: • No channels • Channels [4..7] Sensor supply 2: • No channels • Channels [8..11] • Channels [8..15]	No	Channel group

Parameter	Value range	Parameter reassignment in RUN	Scope
	Sensor supply 3: • No channels • Channels [12..15]		
Short-circuit test activated	• Disable • Enable	No	Channel
Time for short-circuit test	0.9 ms to 2 s	No	Channel
Startup time of sensors after short-circuit test	0.9 ms to 2 s	No	Channel
Channel parameters			
Channel n, n+8			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent	No	Channel pair
Discrepancy behavior	• Supply value 0 • Supply last valid value	No	Channel pair
Discrepancy time	5 ms to 30 s	No	Channel pair
Reintegration after discrepancy error	• Test 0-signal not necessary • Test 0-signal necessary	No	Channel pair
Channel n			
Channel activated	• Enable • Disable	No	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20.0 ms The provided value range depends on the parameter assignment of the employed sensor supply.	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	No	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	No	Channel
Chatter monitoring	• Disable • Enable	No	Channel
Number of signal changes	2 to 31	No	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	No	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Basis for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address) and the F I/O DB in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

4.2.1.1 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

4.2.1.2 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use in S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use in S7-1500 F-CPUs
When using the fail-safe module in S7-1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.2.2 Parameters of the sensor supply

4.2.2.1 Supplied channels

With this parameter, you specify whether and which internal sensor supply supplies which channel groups. The choice taken applies to the entire channel group (CH0-3, 4-7, 8-11, 12-15).

The following options are available, for example:

Parameter assignment:		**Meaning**	**Parameter assignment:**	
Left-hand module side			**Right-hand module side**	
Sensor supply 0 supplies channels ...	**Sensor supply 1 supplies channels ...**		**Sensor supply 2 supplies channels ...**	**Sensor supply 3 supplies channels ...**
0 to 3	4 to 7	Each channel group is supplied by its own internal sensor supply.	8 to 11	12 to 15
0 to 7	-	The channel groups of the left-hand module side are supplied by the internal sensor supply V_{S0}.	8 to 11	12 to 15
0 to 3	4 to 7	The channel groups of the right-hand module side are supplied by the internal sensor supply V_{S2}.	8 to 15	-
0 to 7	-	The channel groups of the left-hand module side are supplied by the internal sensor supply V_{S0}; the channel groups of the right-hand module side are supplied by the internal sensor supply V_{S2}.	8 to 15	-
0 to 15	-	All the channels of the module are supplied by the internal sensor supply V_{S0}.	-	-

You can also supply the sensors by means of an external sensor supply (parameter "None").

The selection of an internal sensor supply is required for using the short-circuit test.

See also

Short-circuit test activated (Page 17)
Connecting (Page 12)

4.2.2.2 Short-circuit test activated

Here you enable the short-circuit detection for the channels of the F-module for which one of the internal sensor supplies is set ("Supplied channels").

The short-circuit test is always possible when you are using simple switches that do not have their own power supply. For switches with their own power supply, for example, 3/4-wire proximity switches or optical sensors with OSSD (Output Signal Switching Device) outputs, you must adapt the "Startup time of sensors after short-circuit test" parameter to match the sensor in use.

The short-circuit detection switches off the internal sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

NOTE

During the execution time of the short-circuit test (Time for short-circuit test + Startup time of sensors after short-circuit test), the last valid value of the input before the start of the short-circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.2.3 Time for short-circuit test

Function

When the short-circuit test is enabled, the corresponding internal sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the configured time, a diagnostics alarm is generated.

Note the following during parameter assignment:

- If the channel is passivated, this may be due to excessively high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance is not discharged within the configured time, you need to adjust the "Time for short-circuit test" parameter.

  NOTE

  During the execution time of the short-circuit test (Time for short-circuit test + Startup time of sensors after short-circuit test), the last valid value of the input before the start of the short-circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

- The "Time for short-circuit test" has to be 0.5 ms greater than the set input delay.

4.2.2.4 Startup time of sensors after short-circuit test

Function

In addition to the switch-off time ("Time for short-circuit test"), a startup time must be specified for performing the short-circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after turning on the internal sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

Note the following during parameter assignment:

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The "Startup time of sensors after short-circuit test" must
  - be set to a value greater than the set input delay
  - be at least 1% of the "time for short-circuit test"
  - be 0.5 ms greater than the set input delay.

Requirement

The short-circuit test is enabled.

4.2.3 Parameters of the channel pairs

4.2.3.1 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Evaluation of the sensors" parameter:

- 1oo1 evaluation
- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo1 evaluation

With a 1oo1 evaluation, the sensor occupies only one input channel.

1oo2 evaluation, equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- a two-channel equivalent/non-equivalent sensor
- Two single-channel sensors

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly. The evaluation result is provided in the bit of the lower-order channel of the channel pair (channel n).

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

Discrepancy analysis for equivalence or non-equivalence is used for fail-safe inputs to detect errors caused by the time characteristic of two signals with the same functionality. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same level). A check is made to determine whether the difference in levels (when testing for non equivalence: the same level) has disappeared after an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error.

4.2.3.2 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.3.3 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

- Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.3.4 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-Signal necessary"
- "Test 0-Signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Test 0-Signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non-equivalent", the result of the channel pair must provide a 0-Signal again.

"Test 0-Signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4 Parameters of the channels

4.2.4.1 Channel activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.4.2 Input delay

Function

To suppress injected interference, you can set an input delay for a channel or a channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are not visible in the process image input (PII).

A high input delay suppresses longer interference pulses, but results in a longer response time.

The set value for the input delay has to be smaller than the configured "Startup time of sensors after short-circuit test" and smaller than the configured "Time for short-circuit test".

With 1oo2 evaluation, the input delay of the lower-order channel (channel n) automatically applies to the higher-order channel (channel n+8).

NOTE

If there is an input delay < 3.2 ms, you have to use shielded cables.

NOTE

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792)).
If the interference pulses occur with a short-circuit test, the fail-safe digital inputs are passivated. Increase the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the internal sensor supply.

See also

Response times (Page 57)
Technical specifications (Page 54)

4.2.4.3 Channel failure acknowledge

Use in S7-1500 F-CPUs

This parameter is only relevant if the fail-safe module is operated on an S7-1500 F-CPU, and can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel should react to a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. There you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.4.4 Pulse extension

Function

Pulse extension is a function to extend a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

The pulse extension can only be configured with 1oo1 evaluation.

4.2.4.5 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

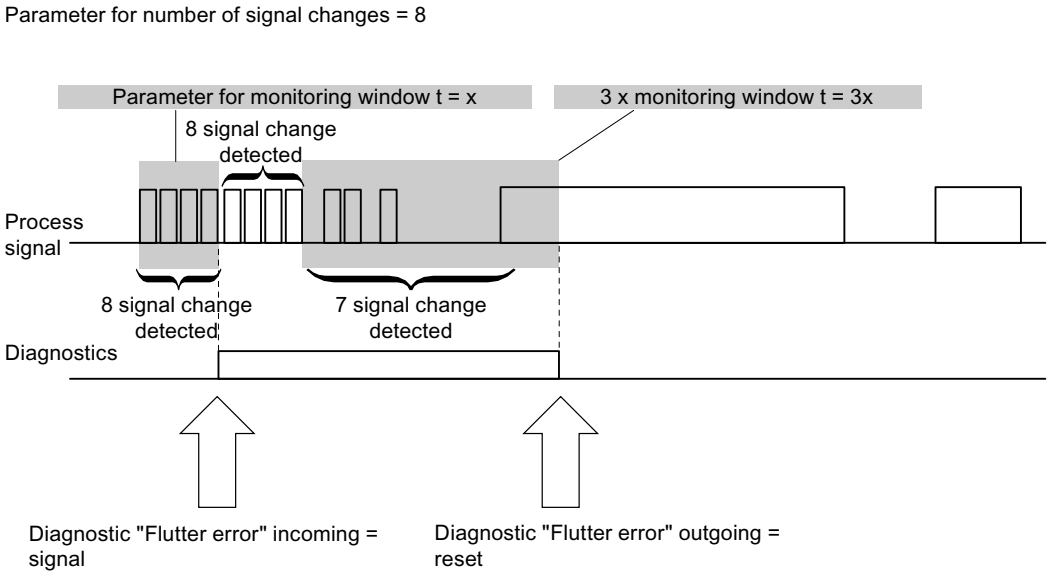


Figure 1-606 Figure chatter monitoring

4.2.4.6 Number of signal changes

Sets the number of signal changes after which a chatter error should be reported (value range: 2 to 31).

4.2.4.7 Monitoring window

Sets the time for the monitoring window of flutter monitoring.
You can set times of 1 s to 100 s in whole seconds for the monitoring window.
Enter 0 to configure a monitoring window of 0.5 s.

4.3 Address space

Address assignment of the digital input module F-DI 16x24VDC

The digital input module F-DI 16x24VDC occupies the following address areas in the F-CPU:

Table 1-874 Address assignment in the F-CPU

	Occupied bytes in the F-CPU:	
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 7	QB x + 0 to x + 3
S7-1500 F-CPUs	IB x + 0 to x + 8	QB x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 16x24VDC

The user data occupies the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 16x24VDC:

Table 1-875 Address assignment through user data

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0 Channel group a	DI_7 (CH7)	DI_6 (CH6)	DI_5 (CH5)	DI_4 (CH4)	DI_3 (CH3)	DI_2 (CH2)	DI_1 (CH1)	DI_0 (CH0)
IB x + 1 Channel group b	DI_7 (CH15)	DI_6 (CH14)	DI_5 (CH13)	DI_4 (CH12)	DI_3 (CH11)	DI_2 (CH10)	DI_1 (CH9)	DI_0 (CH8)
IB x + 2 Channel group a	Value status for DI_7 (CH7)	Value status for DI_6 (CH6)	Value status for DI_5 (CH5)	Value status for DI_4 (CH4)	Value status for DI_3 (CH3)	Value status for DI_2 (CH2)	Value status for DI_1 (CH1)	Value status for DI_0 (CH0)
IB x + 3 Channel group b	Value status for DI_7 (CH15)	Value status for DI_6 (CH14)	Value status for DI_5 (CH13)	Value status for DI_4 (CH12)	Value status for DI_3 (CH11)	Value status for DI_2 (CH10)	Value status for DI_1 (CH9)	Value status for DI_0 (CH8)

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels, e.g. CH0 (input bit DI_0 in channel group a) with CH8 (input bit DI_0 in channel group b). With 1oo2 evaluation of the sensors, you may only access the input bit from channel group a in the safety program, in this example CH0.

Additional information

For detailed information about F-I/O access and for evaluation and processing of the value status, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

5.1 Applications of the F-DI 16x24VDC

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

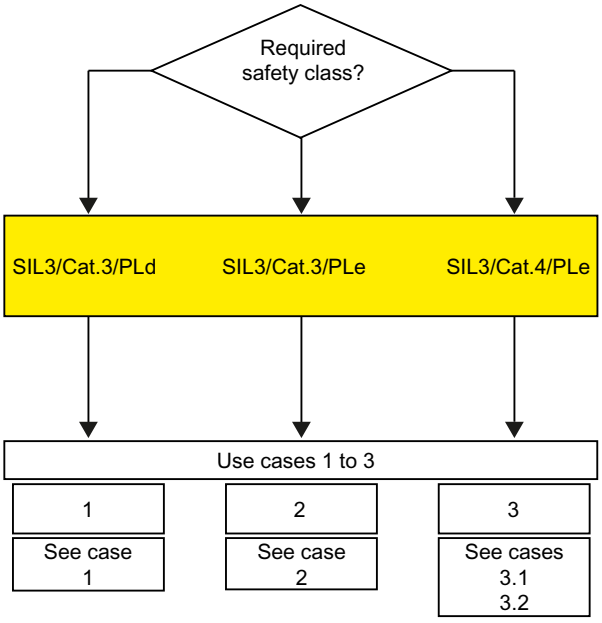

Figure 1-607 Selecting the application – digital input module F-DI 16x24VDC

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the mission time in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 1-876 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short-circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short-circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External or internal, with short-circuit test	

NOTE
You can operate the various inputs of an F-DI module simultaneously in SIL3/Cat.3/PLd **and** in SIL3/Cat.3 or Cat.4/PLe. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on the safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules of the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

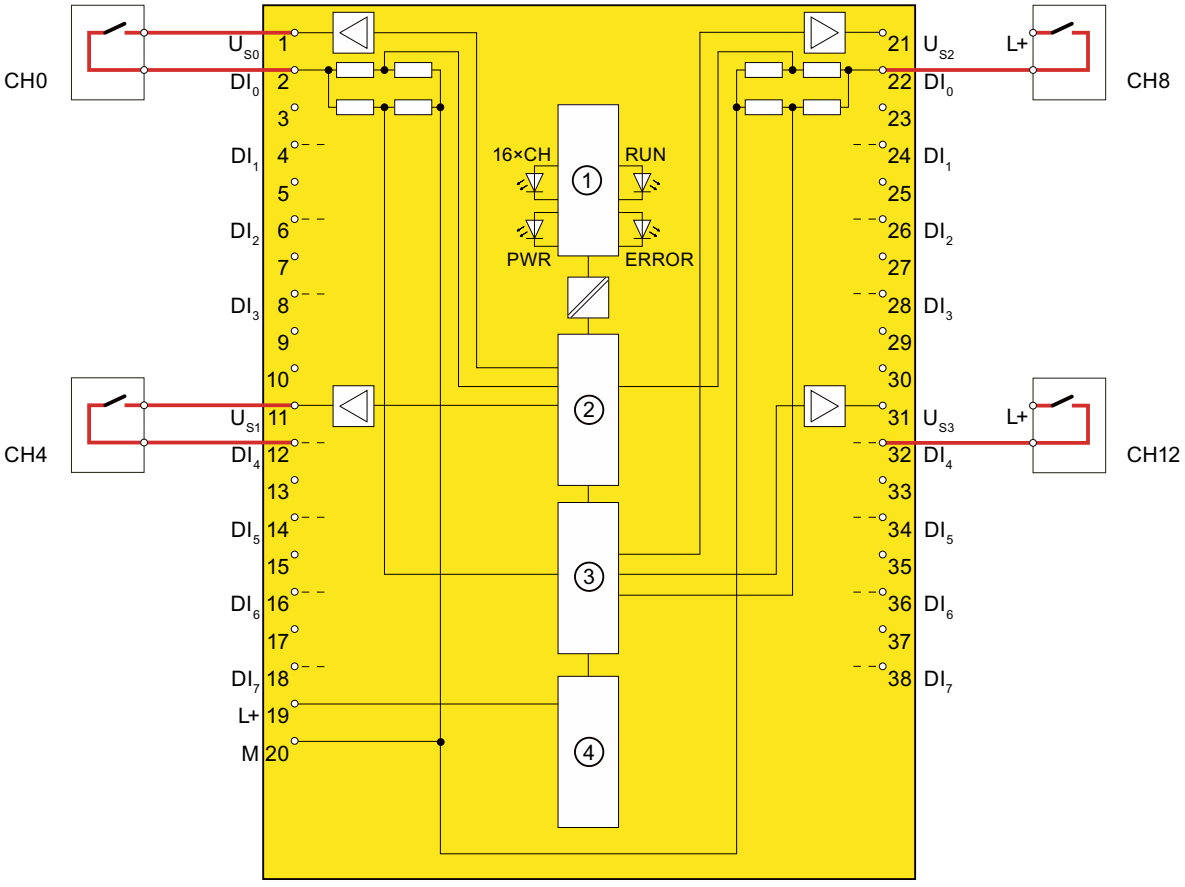
5.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

Sensor supply

The sensor supply can be powered internally or externally.



Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal.

The assignment of the input to an internal sensor supply of the module must take place according to the parameter assignment "Supplied channels" (see section Supplied channels (Page 17)).

You can also supply the sensor by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with one-channel connection of a sensor.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

Figure 1-608 One sensor connected via one channel, internal sensor supply (left) or external sensor supply (right)

WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-877 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Supplied channels	Channels [x...y]	None
Short-circuit test activated	• Disable • Enable*	Disable

*) optional. The selection of an internal sensor supply, however, is required for using the short-circuit test.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-878 Fault detection

Fault	Fault detection		
	Internal sensor supply and short-circuit test activated	**Internal sensor supply and short-circuit test deactivated**	**External sensor supply**
Short-circuit of the input with other channels or other sensor supplies (short-circuit with other channels is detected only if they use a different sensor supply)	Yes*	No	No
Short-circuit between the input and associated sensor supply	No	No	No
Short-circuit with L+ to DI_n	Yes	No	No
Short-circuit with M to DI_n	No	No	No
Discrepancy error	—	—	—
Short-circuit with L+ to U_{Sn}	Yes	No	—
Short-circuit with M to U_{Sn} or defective	Yes	Yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

WARNING

If the short-circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the cable must be routed short-circuit proof.

Connecting (Page 12)

5.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The digital input module F-DI 16x24VDC has 16 fail-safe inputs, DI_0 to DI_{15} (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 and DI_8
- DI_1 and DI_9
- DI_2 and DI_{10}
- DI_3 and DI_{11}
- DI_4 and DI_{12}
- DI_5 and DI_{13}
- DI_6 and DI_{14}
- DI_7 and DI_{15}

The process signals are provided by channels DI_0, DI_1, DI_2, DI_3, DI_4, DI_5, DI_6 and DI_7.

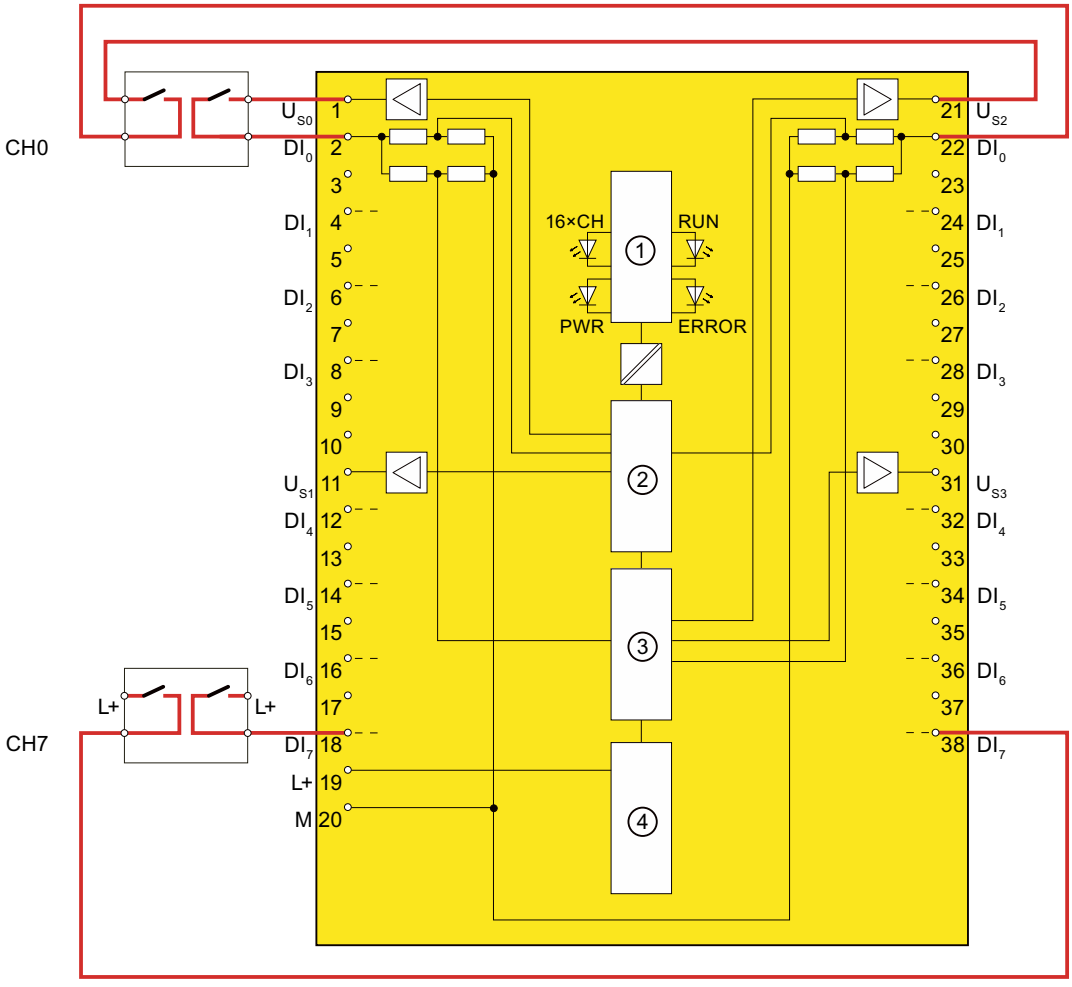
NOTE

You can mix 1oo1 evaluation and 1oo2 evaluation in an F-DI module. You must interconnect and parameterize the inputs according to the fail-safe requirements (SIL3/Cat.3/PLd and SIL3/Cat.3 or Cat.4/PLe).

Wiring

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

Sensor supply



The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor equivalent

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

You can also supply one or both sensor switches by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with equivalent connection of a two-channel sensor.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

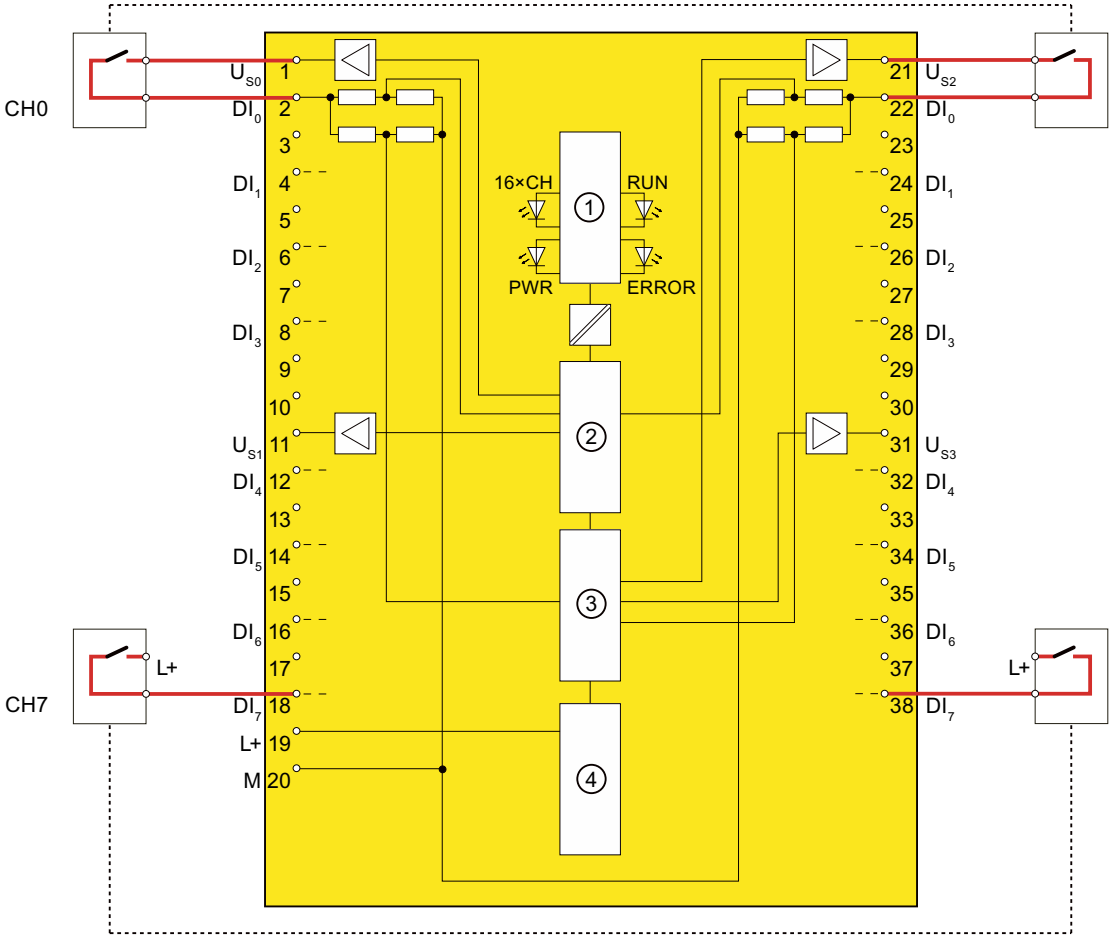


Figure 1-609 One two-channel sensor connected equivalently, internal sensor supply (top) or external sensor supply (bottom)

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

You can also supply the sensors by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with two-channel connection of two single-channel sensors.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

Figure 1-610 Two single-channel sensors connected via two channels, internal sensor supply (top) or external sensor supply (bottom)

⚠ WARNING

To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-879 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Supplied channels	Channels [x...y]	None
Short-circuit test activated	Disable	

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-880 Fault detection

Fault	Fault detection	
	Internal sensor supply and short-circuit test deactivated	External sensor supply
Short-circuit within the channel pair	No	No
Short-circuit with other channels or other sensor supplies	Yes*	Yes
Short-circuit with L+ to DI_n	Yes*	Yes*
Short-circuit with M to DI_n	Yes*	Yes*
Discrepancy error	Yes	Yes
Short-circuit with L+ to U_{Sn}	No	No
Short-circuit with M to U_{Sn} or defective	Yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Connecting (Page 12)

5.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The digital input module F-DI 16x24VDC has 16 fail-safe inputs, DI_0 to DI_{15} (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 and DI_8
- DI_1 and DI_9
- DI_2 and DI_{10}
- DI_3 and DI_{11}
- DI_4 and DI_{12}
- DI_5 and DI_{13}
- DI_6 and DI_{14}
- DI_7 and DI_{15}

The process signals are provided by channels DI_0,DI_1,DI_2, DI_3,DI_4, DI_5, DI_6 and DI_7.

Wiring

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

Sensor supply

The sensor must be supplied internally by at least one channel group for application 3.1.

The sensor can be supplied internally or externally for application 3.2.

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed with state-of-the-art engineering and standards to prevent short-circuits.
- The sensors must be wired as shown in sections Application 3.1 (SIL3/Cat.4/PLe) (Page 40) or Use case 3.2 (SIL3/Cat.4/PLe) (Page 42). You only need to detect **one** short-circuit because 2 faults are required to generate it. This means both signal cables in short-circuit have an isolation fault. A multiple short-circuit analysis is not required.

Procedures for locating all short-circuits are also permitted if single short-circuits are not located. One of the two conditions must be met for this purpose:

- Short-circuits may not corrupt the read signals compared to the sensor signals.
- Short-circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

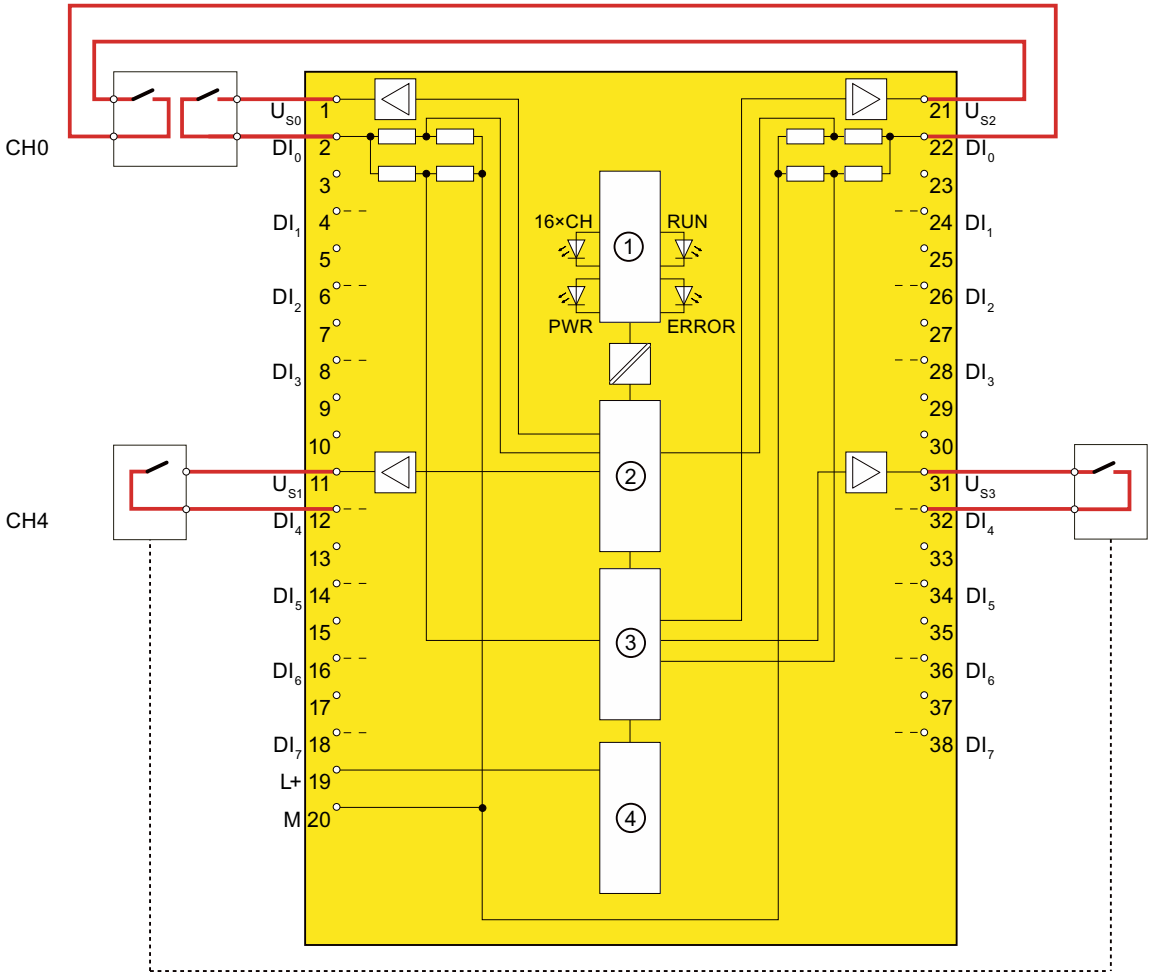
Connecting (Page 12)

5.4.1 Application 3.1 (SIL3/Cat.4/PLe)



Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation).

Supply the sensors from two different internal sensor supplies.

Alternatively, two single-channel sensors can be connected via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with two-channel connection of one two-channel sensor or two single-channel sensors.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

Figure 1-611 One two-channel sensor connected via two channels (top) or two single-channel sensors connected via two channels (bottom); internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-881 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	1oo2 evaluation, equivalent
Supplied channels	Channels [x...y]
Short-circuit test activated	Enable

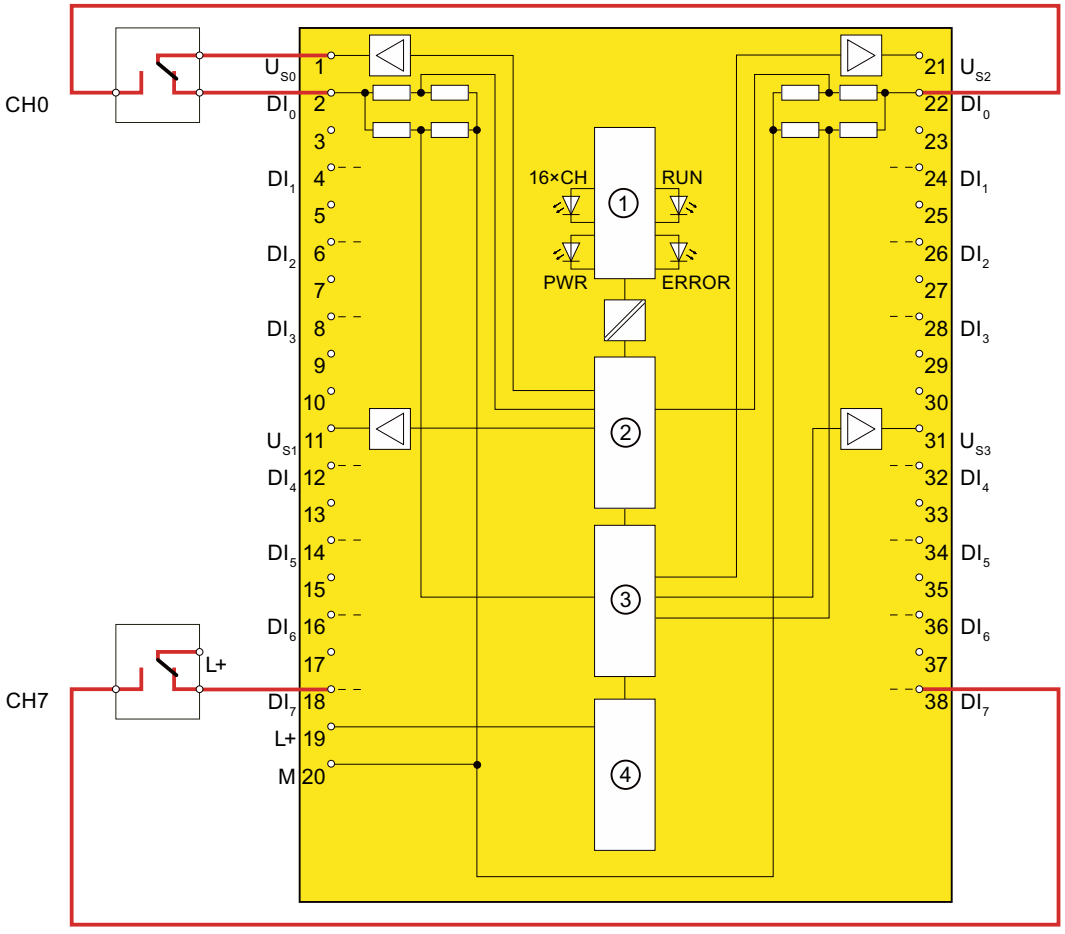
Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-882 Fault detection

Fault	Fault detection
	Internal sensor supply and short-circuit test activated
Short-circuit within the channel pair	No
Short-circuit with other channels or other sensor supplies	Yes*
Short-circuit with L+ to DI_n	Yes* / Yes (for channel whose short-circuit test is activated)
Short-circuit with M to DI_n	Yes*
Discrepancy error	Yes
Short-circuit with L+ to U_{Sn}	Yes
Short-circuit with M to U_{Sn} or defective	Yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.



5.4.2 Use case 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a non-equivalent sensor

A non-equivalent sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation, non-equivalent).

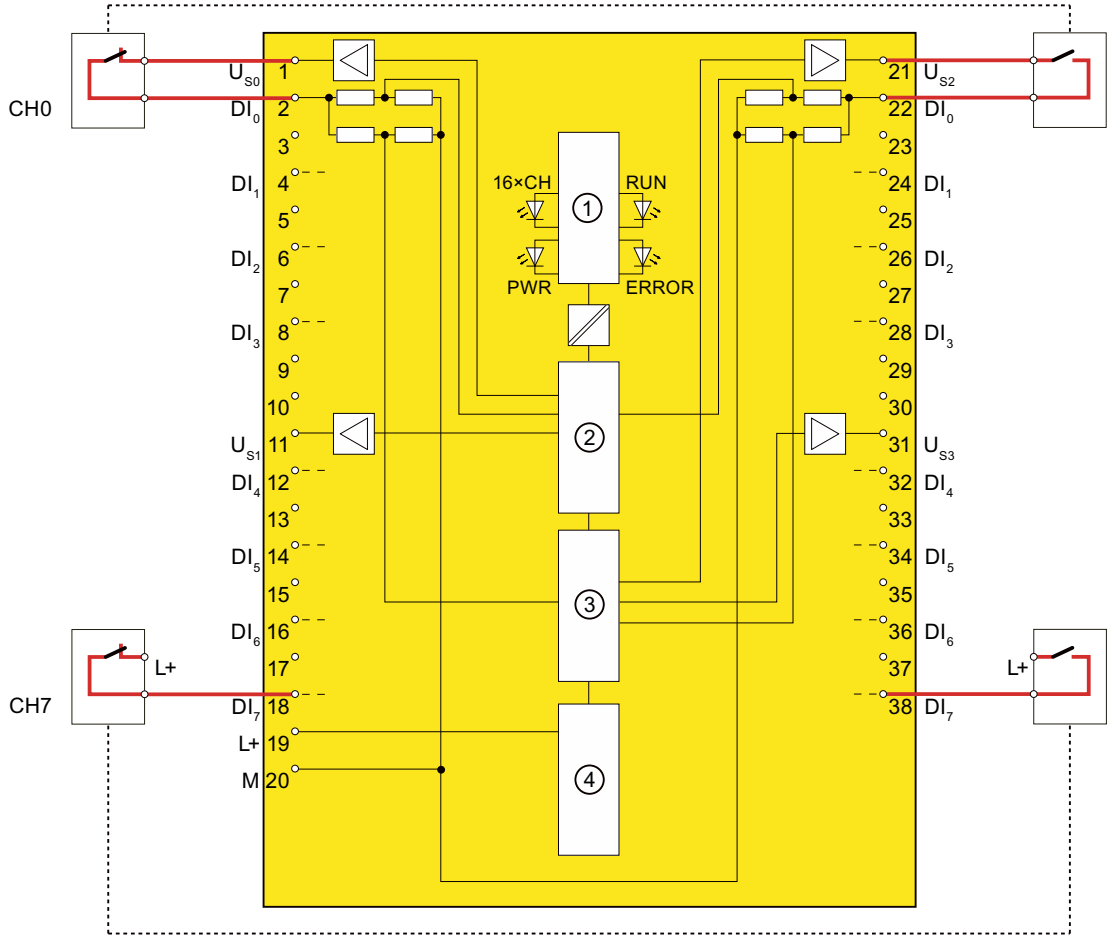
You can also supply the sensor by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with connection of a non-equivalent sensor.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

Figure 1-612 One non-equivalent sensor connected, internal sensor supply (top) or external sensor supply (bottom)

⚠ WARNING



To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors non-equivalent

Two single-channel sensors are connected non-equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

You can also supply one or both sensors by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe digital input module F-DI 16x24VDC with non-equivalent connection of two single-channel sensors.

① Backplane bus interface
② Microcontroller 1
③ Microcontroller 2
④ Reverse polarity protection

Figure 1-613 Two single-channel sensors connected non-equivalently, internal sensor supply (top) or external sensor supply (bottom)

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-883 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, non-equivalent	
Supplied channels	Channels [x...y]	None
Short-circuit test activated	• Disable • Enable*	Disable

*) optional. The selection of an internal sensor supply, however, is required for using the short-circuit test.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-884 Fault detection

Fault	Fault detection
Short-circuit within the channel pair, with other channels or other sensor supplies	Yes
Short-circuit with L+ to DI_n	yes* / yes (for channel whose short-circuit test is activated)
Short-circuit with M to DI_n	Yes*
Discrepancy error	Yes
Short-circuit with L+ to U_{Sn}	Yes, if internal sensor supply is used and short-circuit test activated
Short-circuit with M to U_{Sn} or defective	Yes, if internal sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Interrupts/diagnostic messages

6

6.1 Status and error displays

LED displays

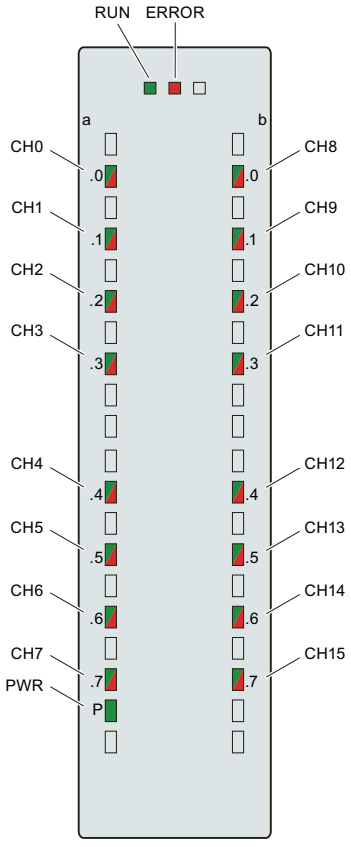


Figure 1-614 LED displays of the F-DI 16x24VDC module

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic alarms can be found in section Diagnostic alarms (Page 49).

WARNING

The RUN, ERROR LEDs and channel status/channel diagnostics LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

RUN and ERROR LEDs

Table 1-885 RUN and ERROR status and error displays

LED		Meaning	Remedy
RUN	ERROR		
Off	Off	Missing or insufficient voltage on the backplane bus	• Switch on the CPU and/or the system power supply modules. • Check whether the module is correctly plugged into the U-connector. • Check whether too many modules are plugged in.
Flashing	Off	Module starts up and flashes up to the valid parameter assignment.	---
On	Off	Module parameters are assigned and module addressed.	
Off	Flashing	Firmware is being updated.	
On	Flashing	Indicates diagnostic interrupts: • Module fault (for example, supply voltage too high) • Channel fault (for example, frequency too high). • PROFIsafe communication error Operation in S7-1500 F-CPUs: At least one channel is waiting for user acknowledgment.	Evaluate the diagnostics and eliminate or acknowledge the error. It may be necessary to remove and re-insert the module.
Flashing	Flashing	Hardware defective.	Replace the module.
Alternately flashing		• Operation in S7-1500 F-CPUs: The F-module expects user acknowledgment after a module error. • Operation in S7-300/400 F-CPUs: At least one channel is waiting for user acknowledgment.	Acknowledge the error (see manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)).

PWR LED

Table 1-886 PWR status display

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

CHx LED

Table 1-887 Display channel status/channel diagnostics

Status CHx	Diagnostics CHx	Meaning
Off	Off	Process signal = 0 and no channel diagnostics*
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

* Operation in S7-300/400 F-CPUs only: If necessary, wait for user acknowledgment, if an additional channel is also waiting for user acknowledgment due to an error that occurred later.

CHx/Error LED with PROFIsafe address assignment

Table 1-888 Channel status/channel diagnostics/Error display with PROFIsafe address assignment

Status CHx	Diagnostics CHx	ERROR	Meaning
Off	All on	Flashing	The PROFIsafe address does not match the configured PROFIsafe address
All are flashing	Off	Flashing	Identification of the F-module when assigning the PROFIsafe address

CHx/RUN/ERROR LED if supply voltage error occurs

Table 1-889 Channel status/channel diagnostics/RUN/ERROR display if supply voltage error occurs

CHx status	Diagnostics CHx	RUN	ERROR	Meaning
Off	On	On	Flashing	Supply voltage too high or too low. • Operation in S7-1500 F-CPUs: Module is waiting for user acknowledgment. • Operation in S7-300/400 F-CPUs: Module is automatically reintegrated after the correction of the error.

6.2 Interrupts

Introduction

The F-DI 16x24VDC fail-safe digital input module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic alarm described in section Diagnostic alarms (Page 49).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

Table 1-890 Diagnostic interrupts of the F-DI 16x24VDC

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	1, 2, 3	F-module	No
Parameter error	16_D			
Supply voltage missing	17_D			
Mismatch of safety destination address (F_Dest_Add)	64_D			
Safety destination address not valid (F_Dest_Add)	65_D			
Safety source address not valid (F_Source_Add)	66_D			
Safety watchdog time value is 0 ms (F_WD_Time)	67_D			
Parameter F_SIL exceeds SIL from specific device application	68_D			
Parameter F_CRC_Length does not match the generated values	69_D			
Version of F-parameter set incorrectly	70_D			
CRC1 fault	71_D			
Save iParameter watchdog time exceeded	73_D			
Restore iParameter watchdog time exceeded	74_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Transmission error: Inconsistent data (CRC error)	77_D			
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D			
Module is defective	256_D			
Watchdog tripped	259_D			
Invalid/inconsistent firmware present	283_D			
Discrepancy failure, channel state 0/0	768_D	2, 3	Channel	
Discrepancy failure, channel state 0/1	769_D			
Discrepancy failure, channel state 1/0	770_D			
Discrepancy failure, channel state 1/1	771_D			
Input signal not recorded unique	773_D	1, 2, 3		
Internal sensor supply short-circuit to P	774_D			Yes
Overload or internal sensor supply short-circuit to ground	775_D			
Channel failure acknowledgment	779_D			
F-address memory not accessible	781_D		F-module	No
Sensor signal flutters	784_D	1	Channel	Yes

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Frequency too high	785_D		Channel	No
Undertemperature	786_D		F-module	
Input shorted to P	796_D		Channel	Yes
Supply voltage too high	801_D		F-module	No
Supply voltage too low	802_D			

6.3 Diagnostic alarms

Diagnostic alarms

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 1-891 Diagnostic alarms of the F-DI 16x24VDC

Diagnostic alarm	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 54)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Parameter error	16_D	Parameter errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at the front connector • Check the front connector

Diagnostic alarm	Fault code	Meaning	Remedy
Mismatch of safety destination address (F_Dest_Add)	64_D	The firmware of the F-module has detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	65_D	The firmware of the F-module has detected an illegal different F-destination address.	
Safety source address not valid (F_Source_Add)	66_D	The firmware of the F-module has detected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	67_D	The firmware of the F-module has detected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	68_D	The firmware of the F-module has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	69_D	The firmware of the F-module has detected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	70_D	The firmware of the F-module has detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	71_D	The firmware of the F-module has detected inconsistent F-parameters.	
Save iParameter watchdog time exceeded	73_D	iPar server does not respond to "save IPar" within 4.4 minutes.	Check the parameter assignment of the iPar server.
Restore iParameter watchdog time exceeded	74_D	iPar server does not respond to "restore IPar" within 4.4 minutes.	Check the parameter assignment of the iPar server.
Inconsistent iParameters (iParCRC error)	75_D	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The firmware of the F-module has detected an incorrect F_block_ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	77_D	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Module is defective	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.

Diagnostic alarm	Fault code	Meaning	Remedy
Watchdog tripped	259_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Invalid/inconsistent firmware present	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Discrepancy failure, channel state 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short-circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy failure, channel state 0/1	769_D		
Discrepancy failure, channel state 1/0	770_D		
Discrepancy failure, channel state 1/1	771_D		
Input signal not recorded unique	773_D	An error occurred during the plausibility check of the input signal between the processors. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short-circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Internal sensor supply short-circuit to P	774_D	Possible causes: • There is a short-circuit of the internal sensor supply with L+. • There is a short-circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short-circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.
Overload or internal sensor supply short-circuit to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short-circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.

Diagnostic alarm	Fault code	Meaning	Remedy
Channel failure acknowledgment	779_D	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
F-address memory not accessible	781_D	The F-source address and F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Sensor signal flutters	784_D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short-circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor/switch is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Frequency too high	785_D	The switching frequency of the encoder is too high.	Reduce the switching frequency of the sensor.
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 54))
Input shorted to P	796_D	The input signal is short-circuited to L+.	Eliminate the short-circuit.
Supply voltage too high	801_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	802_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the ERROR LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute, see Technical specifications (Page 54)), the ERROR LED stops flashing. The module remains passivated and waits for user acknowledgment.

Behavior in case of cross circuit/short-circuit to the sensor supply

When internal sensor supply is configured and short-circuit test is deactivated, short-circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is configured and short-circuit test is enabled, short-circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short-circuit test and the sensor power supply. For this reason, tables on fault detection for the applications are presented under Applications of the F-I/O module (Page 27).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all F-modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

7

Technical specifications of F-DI 16x24VDC

	6ES7526-1BH00-0AB0
General information	
Product type designation	F-DI 16x24VDC
Firmware version	
FW update possible	Yes
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1 with HSP0086
Operating mode	
DI	Yes
Supply voltage	
Rated value (DC)	24 V
Low limit of permitted range (DC)	19.2 V
High limit of permitted range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	50 mA
Sensor supply	
Number of outputs	4
Short-circuit protection	Yes; electronic (response threshold 0.7 A to 1.8 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short-circuit protection	Yes
Output current, max.	300 mA; max. 100 mA with vertical mounting position
Power	
Power consumption from the backplane bus	0.9 W
Power loss	
Power loss, typ.	4.6 W
Address range	
Address space per module	
Address space per module, max.	9 bytes
Digital inputs	
Number of inputs	16
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes

	6ES7526-1BH00-0AB0
Input voltage	
Rated value (DC)	24 V
For "0" signal	-30 ... +5 V
For "1" signal	+15 ... +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
Configurable	Yes
For "0" to "1", min.	0.4 ms
For "0" to "1", max.	20 ms
For "1" to "0", min.	0.4 ms
For "1" to "0", max.	20 ms
Cable length	
shielded, max.	1000 m
unshielded, max.	500 m
Interrupts/diagnostics/status information	
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	No
Short-circuit	Yes
Group error	Yes
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; red LED
Electrical isolation	
Electrical isolation, channels	
Between channels and backplane bus	Yes
Permitted potential difference	
Between different circuits	75 V DC/60 V AC (basic insulation)
Insulation	
Insulation test voltage	707 VDC (type test)
Standards, approvals, certificates	
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
SIL according to IEC 61508	SIL 3
Low demand mode: PFDavg according to SIL3	< 5.00E-05
High demand/continuous mode: PFH according to SIL3	< 1.00E-09 1/h

	6ES7526-1BH00-0AB0
Environmental conditions	
Ambient temperature in operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	40 °C
Dimensions	
Width	35 mm
Height	147 mm
Depth	129 mm
Weights	
Weight, approx.	280 g

Dimension drawing

See system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

Response times

A

Introduction

The next section shows the response times of the digital input module F-DI 16x24VDC. The response times of the digital input module F-DI 16x24VDC are included in the calculation of the F-system response time.

Definition of cycle time for fail-safe digital inputs

The cycle time indicates the time between the occurrence of an event and the transfer to the backplane bus.

Times required for the calculation

- Max. cycle time: T_{cycle} = 5 ms
- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 10 ms

The maximum response time in the case of fault (One Fault Delay Time, OFDT) is equivalent to the maximum response time with no faults (Worst Case Delay Time, WCDT).

Maximum response time with no faults (Worst Case Delay Time, WCDT) during 1oo1 evaluation

The following formula applies to a sensor supply without short-circuit test:

t <= 2 * cycle time + input delay

The following formula applies to a sensor supply with short-circuit test:

t <= 2 * cycle time + input delay + T1 + T2

T1	Time for short-circuit test
T2	Startup time of sensors after the short-circuit test

Maximum response time with no faults (Worst Case Delay Time, WCDT) during 1oo2 evaluation

The following formula applies to a sensor supply without short-circuit test:

t <= 2 * cycle time + input delay+ discrepancy time*

* Obsolete with discrepancy behavior "Supply value 0"

The following formula applies to a sensor supply with short-circuit test:

t <= 2 * cycle time + input delay+ max (T1p + T2p, T1s + T2s) + discrepancy time*

* Obsolete with discrepancy behavior "Supply value 0"

T1p Test time for the sensor supply of sensor 1
T2p Startup time of sensor after the short-circuit test (sensor 1)
T1s Test time for the sensor supply of sensor 2
T2s Startup time of sensor after the short-circuit test (sensor 2)

Maximum response time to external short-circuits

t <= max (120 ms, 2 * (n × cycle time) + sum [x=0...3](T1x + T2x)) + cycle time

T1x Time for the sensor test
T2x Startup time of sensors after the short-circuit test
n Number of sensor supplies with activated short-circuit test
x Sensor supply

Maximum response time to discrepancy errors during 1oo2 evaluation

t <= 2 * cycle time + input delay + discrepancy time + 2 * max (T1p + T2p, T1s + T2s)

n Number of sensor supplies with activated short-circuit test
T1x Time for the sensor test
T2x Startup time of sensors after the short-circuit test
T1p Test time for the sensor supply of sensor 1
T2p Startup time of sensor after the short-circuit test (sensor 1)
T1s Test time for the sensor supply of sensor 2
T2s Startup time of sensor after the short-circuit test (sensor 2)
x Sensor supply

Open Source Software

B

For Resellers: In order to avoid infringements of the license conditions by the reseller or the buyer these instructions and license conditions and accompanying CD – if applicable - have to be forwarded to the buyers.

1) Siemens License Conditions

General License Conditions for Software Products for Automation and Drives

(2011-08-01)

1. Supply of Software to Licensee and Granting of Rights to use the Software

1.1 These General License Conditions shall exclusively apply to the delivery of Software for Automation and Drives to the Licensee. General terms and conditions of the Licensee shall apply only where expressly accepted in writing by us. The scope of delivery of the Software shall be determined by the congruent mutual written declarations of both parties. We shall grant the Licensee rights to use the software specified in the Confirmation of Order or, if the Licensee does not receive a Confirmation of Order, the software specified in the Certificate of License or that specified in the Software Product Sheet, if the Licensee is instead submitted a Software Product Sheet (hereinafter referred to as "SW"). The Certificate of License and the Software Product Sheet shall be collectively referred to as "CoL" hereinafter. The Licensee shall be submitted the CoL when the SW is supplied or in conjunction with the delivery bill. The way in which the SW is supplied is also derived directly from the Confirmation of Order or from the SW purchase order number contained in the Confirmation of Order, in conjunction with the associated order data of our catalog valid at the time of the Confirmation of Order (hereinafter collectively referred to as "Order Data"), or from the CoL. If the Licensee does not receive a data medium, it shall be authorized to copy the SW already available to it to the extent necessary to exercise the rights to use the SW granted to it. The aforesaid shall apply, mutatis mutandis, to electronic supply of the software (downloading). Where reference is made to the Order Data or the CoL in these General License Conditions, the reference to the CoL is of significance if the Licensee has not received a Confirmation of Order. In any case, the data contained in the Order Data is also contained in the CoL.

1.2 The Documentation relating to the SW (hereinafter referred to as "Documentation") shall be purchased separately, unless either the Order Data or CoL contains a stipulation stating that it belongs to the scope of delivery. If the Licensee is authorized to copy the SW in accordance with Clause 1.1, this shall also apply to the Documentation provided that it is included in the scope of delivery.

1.3 In the event that we submit a License Key to the Licensee, which unlocks the SW (hereinafter referred to as "License Key"), this License Key must also be installed.

1.4 The rights granted to the Licensee with respect to the SW are based on the License Type (see Section 2) and the Software Type (see Section 3). The license and Software Types are detailed in the Order Data or CoL. If the SW is supplied electronically or if copying rights are granted for it, the rights and duties specified in these General License Conditions shall apply to the legitimately generated copies.

1.5 If the Licensee is legitimately in possession of a previous SW version/release (hereinafter referred to as "Previous Version"), the Licensee shall be authorized to exercise the rights to use the SW granted to it either with respect to the SW or - if this is intended from a technical point of view - to the Previous Version, at its own discretion (downgrading). If the SW is an Upgrade or PowerPack in accordance with Section 4, Section 4 shall apply additionally.

1.6 If Previous Versions are listed in the Readme file of the SW under the category " parallel use", the Licensee has the right to exercise, alternatively to the user rights granted to him for the SW, the user rights for the listed Previous Versions in one (1) Instance. If the "Type of use" named in the Order Data or the CoL is: "Installation" or "User", the Licensee is entitled to the previously described right additionally to and at the same time as the Previous Versions listed in one Instance. An "Instance" in the context of these General License Conditions is either an instance in a physical operating system environment or an instance in a virtual operating system environment. The transferability of the user rights onto Previous Versions is only permissible in conjunction with the user rights for the SW in accordance with Clause 5.3.

1.7 In case the Licensee obtains only the data media but no license as per the Order Data or the CoL, any use of the SW by the Licensee is subject to the acquisition of a license according to Section 2. Up to the acquisition of the license, the Licensee is not entitled to supply the SW to third parties.

1.8 In case the SW contains Open Source Software or any similar software of a third party (hereinafter referred to as "OSS") the OSS is listed in the Readme_OSS-file of the SW. The Licensee is entitled to use the OSS in accordance with the respective license conditions of the OSS. The license conditions are provided on the same data carrier as the SW. The license conditions of the respective OSS shall prevail over these General License Conditions with respect to the OSS. If the license conditions of the OSS require the distribution of the source code of such OSS we shall provide such source code on request against payment of the shipping and handling charges.

1.9 The SW may be or contain licensed software other than OSS, i.e. software which has not been developed by us itself but which has been licensed to us by a third party (hereinafter referred to as the "Licensor"), e.g. Microsoft Licensing Inc. If the Licensee receives the terms and conditions stipulated by the relevant Licensor together with the SW in the Readme_OSS file in this case, such terms and conditions shall apply with respect to the Licensor's liability vis-à-vis the Licensee. Our own liability vis-à-vis the Licensee shall be governed in any case by these General License Conditions.

2. License Type

Depending on the License Type, the Licensee shall be granted the following rights to the SW:

2.1 Single License (One Off License, Copy License)
The term "One Off License" or "Copy License" which may be used in the Software Product Sheet corresponds to the term "Single License". The following regulation shall apply to the full scope of the One Off License / Copy License. The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and valid for an unlimited period of time, to install the SW in one (1) Instance and to utilize the SW thus installed in the manner specified in the Order Data or CoL (see "Type of Use").

2.2 Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and valid for an unlimited period of time, to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use).

2.3 Rental License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or CoL (see "Type of Use"), to install and use the SW in one (1) Instance. If the period of use is specified in hours, the usage decisive for the calculation of the time limit commences with the software start-up and finishes with its shut-down. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.4 Rental Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use) as well. If the period of use is specified in hours, the usage decisive for the calculation of the time limit commences with the software start-up and finishes with its shut-down. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.5 Demo License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW in one (1) Instance and to use it for validation purposes. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.6 Demo Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use) as well. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.7 Trial License
The Licensee shall be granted the non-exclusive and non-transferable right to install the SW in one (1) Instance and to use it for validation purposes in the manner specified in the Order Data or CoL (see "Type of Use"). The period of usage is limited to 14 days and commences with the SW start-up, unless a different period of usage is specified in the Order Data or CoL.

3. Software Type
If the Software Type is not specified in the Order Data or CoL, the rights specified in Clause 3.2 (Runtime Software) shall apply to the SW.

3.1 Engineering Software (hereinafter referred to as "E-SW")
In the event that the Licensee uses E-SW to generate its own programs or data containing parts of the E-SW, the Licensee shall have the right, without having to pay any license fee, to copy and to use these parts of the E-SW as a part of its own programs or data, or to supply them to third parties for use. In the event that such parts are supplied to third parties for use, these parties shall be bound in writing to comply with stipulations corresponding to those in Clauses 5.1 and 5.2 with respect to the above parts of the E-SW.

3.2 Runtime Software (hereinafter referred to as "R-SW")
If the Licensee incorporates R-SW or any parts thereof into its own programs or data, it shall purchase a license with respect to the R-SW each time it installs or copies - depending on what is done first - its own programs or data containing R-SW or parts thereof, in accordance with the relevant intended Type of Use and on the basis of the Siemens catalog valid at that time. In the event that the Licensee supplies the specified programs or data to third parties for their use, these parties shall be bound in writing to adhere to stipulations corresponding to those in Section 5, with respect to the R-SW parts contained therein. The aforesaid shall not affect the Licensee's obligation to purchase a license for the R-SW if the R-SW original is copied. If the R-SW contains tools for parameterization/configuration and extended rights have been granted in this regard, this will be detailed in the readme file of the R-SW.

4. Upgrade and PowerPack
If it is apparent from the Order Data or CoL, e.g. by the addition "Upgrade" or " PowerPack" after the SW product name, that the SW is an upgrade for another software item (hereinafter referred to as "Source License"), the rights originally granted to the Licensee to use the Source License end in conjunction with the upgrade measure. The rights of use in accordance with Clause 1.6 remain unaffected by this. However, the Licensee is entitled to undo the upgrading (downgrading) - if this is intended from a technical point of view - and to exercise the rights to use the SW granted to it with respect to the Source Version in accordance with Clause 1.5.

5. Further Rights and Duties of the Licensee
5.1 Unless a stipulation to the contrary relating to a specific number of copies is contained on the data medium or in the readme file of the SW, the Licensee may generate an appropriate number of copies of every item of SW which it is authorized to use in accordance with these General License Conditions, where such copies shall be used exclusively for data backup purposes. Furthermore the Licensee may only copy the SW if and insofar as it has been granted copying rights by us in writing.

5.2 The Licensee shall not be entitled to modify, decompile or reverse engineer the SW. Nor may it extract any individual parts unless this is permitted by mandatory copyright law. Furthermore, the Licensee shall not be entitled to remove any alphanumeric identifiers, trademarks or copyright notices from the SW or the data medium and, insofar as it is entitled to make copies of the SW, shall copy them without alteration. The aforementioned regulation shall apply accordingly to the Documentation supplied in accordance with Section 1.

5.3 The Licensee shall be entitled to completely transfer the right to use the SW granted to it to a third party, provided that it concludes a written agreement with the third party in conformance with all of the conditions contained in this Section 5 and on the proviso that it does not retain any copies of the SW. If the Licensee has received a License Key for the SW, this key shall be supplied to the third party together with the SW. Furthermore, the third party shall be submitted the CoL together with these General License Conditions. The Licensee shall submit the CoL received for the SW to us at any time, if requested.

5.4 If the SW is a PowerPack or an Upgrade, the Licensee shall keep the CoL of the Source License and submit it to us at any time, if requested, together with the CoL for the SW. In the event that the Licensee transfers its right to use the PowerPack SW or Upgrade SW in accordance with Clause 5.3, it shall also submit the CoL of the Source License to the third party.

5.5 If the Licensee receives a data medium which, in addition to the SW, contains further software products which are released for use, then it shall have the right to use these released software products exclusively for validation purposes, for a limited period of time and free of charge. The period of use shall be limited to 14 days, commencing with the first start-up of the relevant software program unless a different period is specified e.g. in the readme file of the relevant software product. These software products supplied exclusively for validation purposes shall be governed, mutatis mutandis, by the stipulations contained in these General License Conditions. The Licensee shall not be authorized to pass on these software products separately, i.e. without the SW, to a third party.

The conditions of the purchase contract apply if not otherwise stipulated hereafter for the Open Source Software.

2) License Conditions and Disclaimers for Open Source Software and other Licensed Software

In the product "S7-1500 F-SM - V1.0", Copyright Siemens AG, 2015 (hereinafter "Product"), the following Open Source Software is used either unchanged or in a form that we have modified, and additionally the other License Software noted below:

Liability for Open Source Software

Open Source Software is provided free of charge. We are liable for the Product including Open Source Software contained in accordance with the license conditions applicable to the Product. Any liability for use of Open Source Software beyond the program flow intended for the Product is explicitly excluded. Furthermore, any liability for defects resulting from modifications to the Open Source Software by you or third parties is excluded.

We do not provide any technical support for the Product if it has been modified.

Please note the following license conditions and copyright notices applicable to Open Source Software and other License Software:

Component	Open Source Software [Yes/No]	Acknow-ledgements	Copyright Information / File
Dinkumware C/C++ Library - 5.01	NO		LICENSE AND COPYRIGHT INFORMATION FOR COMPONENT DINKUMWARE C/C++ LIBRARY - 5.01

SIEMENS

SIMATIC
S7-1500/ET 200MP
Product information for documentation of the digital input module F-DI 16x24VDC (6ES7526-1BH00-0AB0)

Product Information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

General amendments to the documentation

Content
This Product Information contains additional information and corrections relating to the documentation on the digital input module F-DI 16x24VDC (6ES7526-1BH00-0AB0).
The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

Technical specifications

The information on "Permitted potential difference between different circuits" is no longer part of the technical specifications.

Response times

Definition of response time for fail-safe digital inputs
The response time of the considered channel represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Maximum response time with external short-circuits
Max. response time = Input delay + T1 + 158 ms + 2 * Sum[x=0..3](T1x + T2x * corr)

T1 = Short-circuit test time for the considered channel
x = activated sensor supply
T1x = Time for the short-circuit test
T2x = Startup time of the sensor after the short-circuit test
corr = correction factor = 1.03
Sum term = sum [x=0..3](T1x + T2x * corr): Sum of all short-circuit tests and startup times of the active sensor supplies

Examples
Below you will find an example for the calculation of the maximum response time of the F-DI 16x24VDC with default parameter assignment.

Channel	Input delay [ms]	Short-circuit test	T1 [ms]	T2 [ms]	Sensor supply	Sum term [ms]	max. response time [ms]
0 to 3	3.2	enabled	4.2	4.2	0	34.1	233.6
4 to 7	3.2	enabled	4.2	4.2	1		233.6
8 to 11	3.2	enabled	4.2	4.2	2		233.6
12 to 15	3.2	enabled	4.2	4.2	3		233.6

Sample calculation: Sum term = (4.2 ms + 4.2 ms * 1.03) + (4.2 ms + 4.2 ms * 1.03) + (4.2 ms + 4.2 ms * 1.03) + (4.2 ms + 4.2 ms * 1.03) = 34.1 ms

Below you will find an example for the calculation of the maximum response time of the F-DI 16x24VDC depending on the parameter assignment.

Channel	Input delay [ms]	Short-circuit test	T1 [ms]	T2 [ms]	Sensor supply	Sum term [ms]	max. response time [ms]
0	0.4	enable	3.7	3.7	0	4188.1	8538.3
1	0.4						8538.3
2	3.2						8541.1
3	3.2						8541.1
4	6.4	enable	100	20	1		8640.6
5	10						8644.2
6	12.8						8647.0
7	12.8						8647.0
8	20	enable	2000	2000	2		10554.2
9	20						10554.2
10	20						10554.2
11	20						10554.2
12	0.4	disable	-	-	3		- *)

*) With short-circuit test deactivated, external short-circuits are not detected.

13	1.6	disable	-	-	3	4188.1	- *)
14	10						- *)
15	20						- *)

*) With short-circuit test deactivated, external short-circuits are not detected.

Sample calculation: Sum term = (3.7 ms + 3.7 ms * 1.03) + (100 ms + 20 ms * 1.03) + (2000 ms + 2000 ms * 1.03) = 4188.1 ms

Chan-nel	**Input delay [ms]**	**Short-circuit test**	**T1 [ms]**	**T2 [ms]**	**Sensor supply**	**Sum term [ms]**	**max. response time [ms]**
0	0.4	enable	20	20	0	1055.6	2289.6
1	0.4						2289.6
2	3.2						2292.4
3	3.2						2292.4
4	6.4						2295.6
5	10						2299.2
6	12.8						2302.0
7	12.8						2302.0
8	20	enable	500	500	2		2789.2
9	20						2789.2
10	20						2789.2
11	20						2789.2
12	0.4						2769.6
13	1.6						2770.8
14	10						2779.2
15	20						2789.2

Sample calculation: Sum term = (20 ms + 20 ms * 1.03) + (500 ms + 500 ms * 1.03) = 1055.6 ms

Introduction

1

Purpose of the documentation

This manual supplements the system manual S7-1500 Automation System. You can find information on the functions that apply generally to the S7-1500 automation system and the ET 200MP distributed I/O system in the system manual S7-1500 Automation System (https://support.industry.siemens.com/cs/ww/en/view/59191792).

The information provided in this manual and the system manual enables you to commission the S7-1500 automation system and ET 200MP distributed I/O system.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the "STEP 7 (TIA Portal)" configuration and programming software.

Please also observe the notes identified as follows:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which particular attention should be paid.

Important note for maintaining the operational safety of your system

NOTE

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators by means of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Log in to Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

- SIMATIC S7-1500/SIMATIC S7-1500F (https://support.industry.siemens.com/cs/products?pnid=13716&lc=en-WW)
- SIMATIC S7-1200/SIMATIC S7-1200F (https://support.industry.siemens.com/cs/products?pnid=13683&lc=en-WW)
- Distributed I/O (https://support.industry.siemens.com/cs/products?pnid=14029&lc=en-WW)
- STEP 7 (TIA Portal) (https://support.industry.siemens.com/cs/ww/en/ps/24471)

Open source software

Open source software is used in the firmware of the product described. The open source software is provided free of charge. We are liable for the product described, including the open source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Read the information on this on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109823569).

SIMATIC S7-FCT

Failsafe Configuration Tool (FCT) enables you to GSD configure the following devices in third-party engineering systems:

- Selected, functionally fail-safe SIMATIC I/O devices
- Functionally fail-safe SIRIUS ACT PROFINET interfaces

The engineering system must meet the following requirements for this:

- Support of the CPD system integration acc. to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO"
- TCI implementation to Conformance Class C3

Additional information on S7-FCT can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

1.1 S7-1500/ET 200MP Documentation Guide

1.1.1 S7-1500/ET 200MP documentation guide

The documentation for the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require. Changes and supplements to the manuals are documented in a Product Information.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742691).

Basic information

The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- Getting Started S7-1500
- S7-1500/ET 200MP System Manual
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules
- Equipment Manuals Power Supply Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC S7-1500 and ET 200MPsystems.

Examples:

- Function Manual Diagnostics
- Function Manual Communication
- Function Manual Motion Control
- Function Manual Web Server
- Function Manual Cycle and Response Times
- PROFINET Function Manual
- PROFIBUS Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the S7-1500 and ET 200MP systems on the Internet (https://support.industry.siemens.com/cs/de/en/view/68052815).

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/86140384)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.

SIMATIC S7-1500 comparison list for programming languages

The comparison list contains an overview of which instructions and functions you can use for which controller families.

You can find the comparison list on the Internet (https://support.industry.siemens.com/cs/ww/en/view/86630375).

1.1.2 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)
     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:
     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.1.3 Tool support

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

Industrial cybersecurity 2

2.1 Introduction to industrial cybersecurity

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

You can find general information and measures relating to industrial cybersecurity in the system manual (https://support.industry.siemens.com/cs/ww/en/view/59191792).

This section provides an overview of security-related information about your SIEMENS device.

NOTE

Security-related changes to software or devices are documented in the "New functions" section.

2.2 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Product overview

3

3.1 Properties

Article number

6ES7536-1MF00-0AB0

View of the module

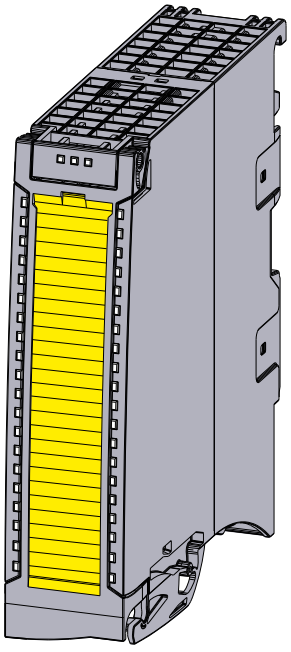

Figure 1-615 View of the F-AI 8xI 0(4)..20mA module

Properties

The module has the following technical properties:

- Fail-safe analog module for use in the S7-1500 automation system and in the ET 200MP distributed I/O system.
- PROFIsafe profile V2.6.1
- PROFIsafe address type 2
- Supports the profile RIOforFA-Safety (on F-CPUs S7-1200 and S7-1500)
- Measurement type current adjustable per channel
  - 0 to 20 mA
  - 4 to 20 mA
- Interference frequency suppression: 50/60 Hz
- 8 analog inputs (SIL3/Cat.3/PLd) or 4 inputs (SIL3/Cat.4/PLe)
- Use of various interconnection types are possible (1oo1 & 1oo2)
- External sensor supply possible
- Internal short-circuit-proof sensor supplies for each channel
- Electrical isolation
  - From backplane bus
  - In groups of 4 channels (AI_0 ... AI_3, AI_4 ... AI_7)
- Status display RUN (green LED)
- Status display module diagnostics (red LED)
- Status display channel status (green LED)
- Status display power supply (green LED)
- Channel diagnostics per input (red LED)
- Resolution 16 bits including sign
- Channel-specific or module-wide passivation

Supported functions:

- Firmware update
- I&M identification data
- Service data
- Value status
- HART communication (Rev. 5 to Rev. 7; is supported as of firmware V2.0)
- Up to 3 additional submodules can be configured as module-internal shared input (MSI) or as HART variables (supported as of firmware V2.0)

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, switch off the power supply of the affected module before 100 hours expires.
Follow the repair procedure described in section Diagnostic alarms (Page 72).

Accessories

The following accessories are supplied with the module and can also be ordered as spare part:

- Labeling strips
- U-connector
- Universal front cover
- Electronic coding element
- Shielding bracket
- Shield terminal
- Power supply element

Additional components

The following component must be ordered separately:

- Front connector and cable tie

You can find more information on accessories in the S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/59191792) system manual.

3.2 F-CPU and Engineering

Requirement

- F-CPU 15xxF as of firmware V2.0
- F-CPU 12xxF as of firmware V4.2
- Safety system version as of V2.5
- PROFIsafe driver profile V2.6.1
- As of TIA Portal V18 SP1 with HSP0394 (firmware V1.0)
- As of TIA Portal V19 with HSP0451 (firmware V2.0)

Connecting

4

4.1 Block diagram

This section includes the block diagram with the general pin assignment of the F-module.

You can find more information on the parameter assignment of the F-module in the section Parameters/address space (Page 34).

You can find more information on the various connection options in the section Applications of the F-I/O module (Page 59).

You can find information on wiring the front connectors and providing the cable shielding, etc., in the Wiring section of the Automation System S7-1500 (https://support.industry.siemens.com/cs/ww/en/view/59191792) System Manual.

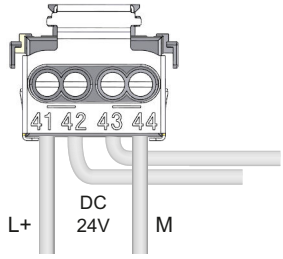
Abbreviations used

In the following images, the abbreviations used mean:

I_n+/I_n-	Analog input channel n (current only)
L+	Connection to power supply
M	Connection to ground
U_{Sn}	Sensor supply

Pin assignment for the power supply element

The power supply element is plugged onto the front connector and serves as the shield connection. For this, you must connect the power supply to terminal 41 (L+) and terminal 44 (M).



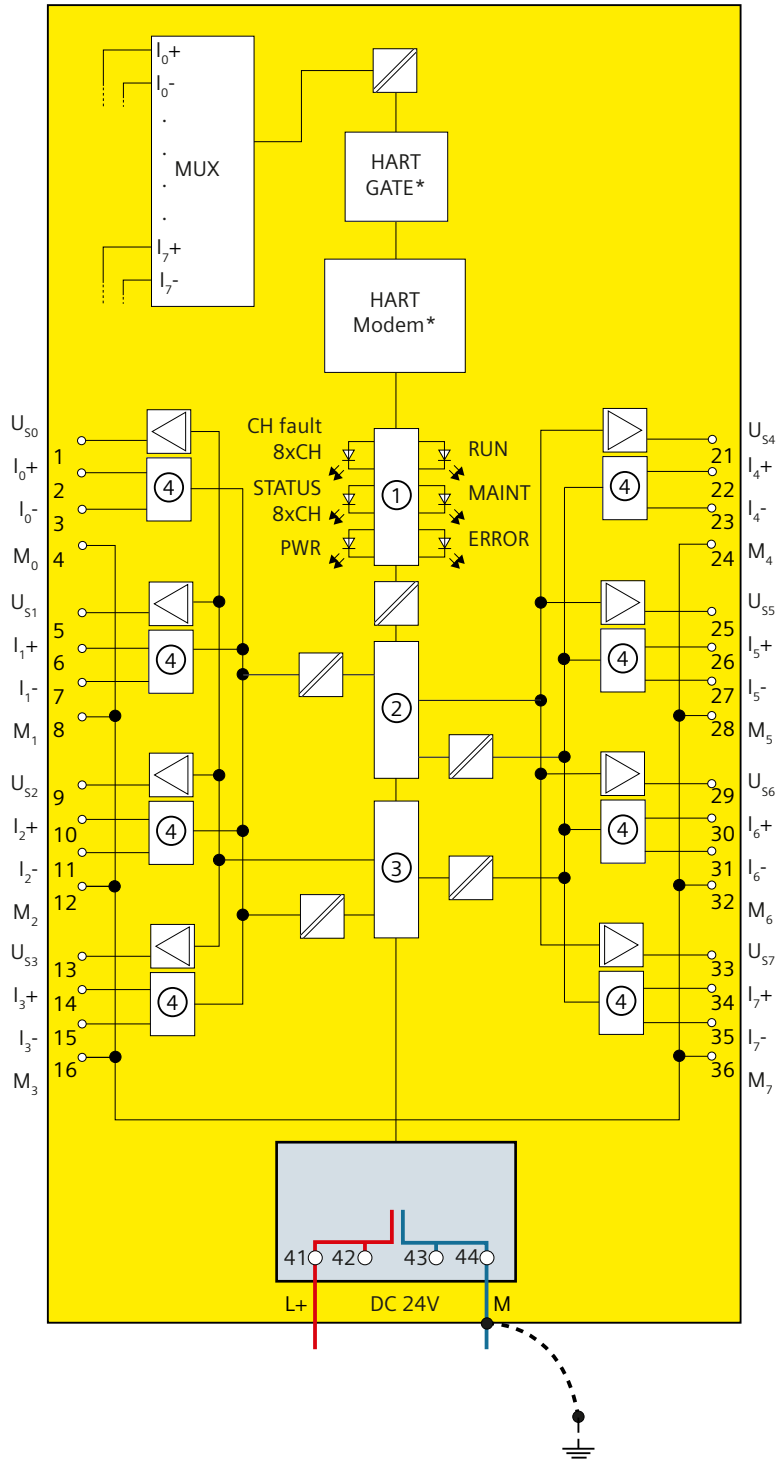


Figure 1-616 Connection of power supply element

Block diagram

The following figure shows the assignment of channels to addresses (input word).

①	Backplane bus interface	RUN	LED status display (green)
②	Microcontroller 1	ERROR	LED for fault display (red)

③	Microcontroller 2	PWR	LED for power supply (green)
④	Signal evaluation	MAINT	LED for MAINT ALARM (yellow)
		CH fault	LED for channel fault (red)
		STATUS	LED for channel status (green)
		*	The function is supported as of firmware V2.0.

Figure 1-617 Block diagram

Sensor supply

⚠ WARNING

Voltage dips and voltage fluctuations of the power supply are not buffered by the F-module and therefore affect the sensor supply.
This can cause the measured value to be falsified and must be taken into account when determining the safety function.
To ensure that the sensor functions without problems, we recommend one of the following options:

- You can avoid voltage dips by using a voltage supply according to the NAMUR recommendation NE 21.

or

- Use a transmitter with an appropriate battery backup or diagnostics.

Recommendation: Internal sensor supply

You are strongly advised to use the short-circuit-proof internal sensor supply of the F-module. This internal sensor supply is monitored and its status is indicated by the Fn LED. The input is also protected in the event of short-circuits in the wiring or at the sensor.

NOTE

The internal sensor supply is switched off in case of a short-circuit to ground or during power-up in the event of short-circuit to L+.
The sensor supply is also switched off at input currents > 35 mA.
A check is made approximately 1 minute later to determine if the error has gone.

NOTE

Behavior of process values and diagnostics evaluation

Sensor startup during module startup:

After the internal sensor supply is activated, the evaluation of wire break and underflow diagnostics is suppressed for 3 seconds. During this time, the module makes the secure process value 0 available at all channels. This suppresses a possible wire break or underflow diagnostics caused by the sensor startup. If the sensor startup is not yet complete after the 3 seconds have elapsed, it is possible that the module might detect wire break or underflow and passivate the affected channel. In this case, the channel fault must be acknowledged during startup.

Sensor startup during operation:

If a sensor startup takes place during operation, e.g. the sensor supply is reactivated after a short-circuit, all analog values are invalid and wire break or underflow diagnostics can occur on the sensors connected to the internal sensor supply.

External/internal sensor supply

The figures in section Applications of the F-I/O module (Page 59) show how you can supply power to the sensors via an external sensor supply (for example, from another module).

⚠ WARNING

A short-circuit from L+ to I_n+ might destroy the input resistors, depending on the selected interconnection type.

You can avoid this problem through proper wiring and use of the internal sensor supply. When an external sensor supply is used, other suitable measures are necessary to protect the input resistors (e.g. external quick-response 50 mA fuse in the input circuit of the F-module).

⚠ WARNING

External sensor supply

If you use an external sensor supply, you need to take into consideration the voltage dips and voltage fluctuations when determining the safety function.

To ensure that the sensor functions without problems, we recommend one of the following options:

- Use a transmitter with an appropriate battery backup or diagnostics.
  or
- Use a **redundant** external sensor supply
  or
- **Monitor** the external sensor supply for undervoltage/overvoltage, including shutdown of the sensor supply in the event of a fault (1-channel for SIL2; 2-channel for SIL3).

HART function

5

5.1 Usage of HART

Definition

"HART" stands for "Highway Addressable Remote Transducer" = Remote-controlled field devices (sensors or transmitters) that can be addressed via communication.

Using the HART functionality, you can also use the analog input module F-AI 8xI 0(4)..20mA to exchange data with the connected field devices. The HART protocol is generally accepted as a standard protocol for communication with intelligent field devices: HART is a registered trademark of the HART Communication Foundation (HCF), which owns all the rights to the HART protocol. You can find detailed information about HART in the HART specification.

NOTE

HART communication (Rev. 5 to Rev. 7) is supported as of firmware V2.0.

Advantages of HART

Using the analog input module F-AI 8xI 0(4)..20mA offers the following advantages:

- Additional digital communication using the HART protocol
- Numerous field devices with HART functions are in use
- Analog input module F-AI 8xI 0(4)..20mA is used to integrate HART into the S7 system.

Use in the system

Analog input module F-AI 8xI 0(4)..20mA is used in the central I/O as well as in the distributed structure, which is connected to PROFIBUS DP or PROFINET IO.

You can connect a field device to any channel: The analog input module F-AI 8xI 0(4)..20mA operates as a HART master, monodrop; field devices as HART devices.

Typical applications

The following applications are typical:

- Commissioning of field devices (centralized parameter assignment)
- Field device parameters can be changed online
- Information, maintenance, and diagnostics displays for the field devices
- Integration of configuration tools for field devices via the HART interface

⚠ WARNING

The HART protocol is not a safety-related protocol.

Use of HART communication with marine applications

NOTE

Power supply requirements with marine applications

To meet the requirements of the marine approvals specified in the S7-1500 automation system (https://support.industry.siemens.com/cs/ww/en/view/59191792) System Manual, you must install the F-AI 8xI 0(4)..20mA analog input module and the associated power supply unit in the same control cabinet if HART communication is enabled. Only F-AI 8xI 0(4)..20mA analog input modules may be supplied with the power supply unit.
If HART communication is disabled, these restrictions do not apply.

5.2 HART operating principle

Introduction

The HART protocol describes the physical form of the transfer: transfer procedures, message structure, data formats and commands.

HART signal

The figure below shows the analog signal with the modulated HART signal (FSK method), which consists of sine waves of 1200 Hz and 2200 Hz and has a mean value of 0. It can be filtered out using an input filter so that the original analog signal is available again.

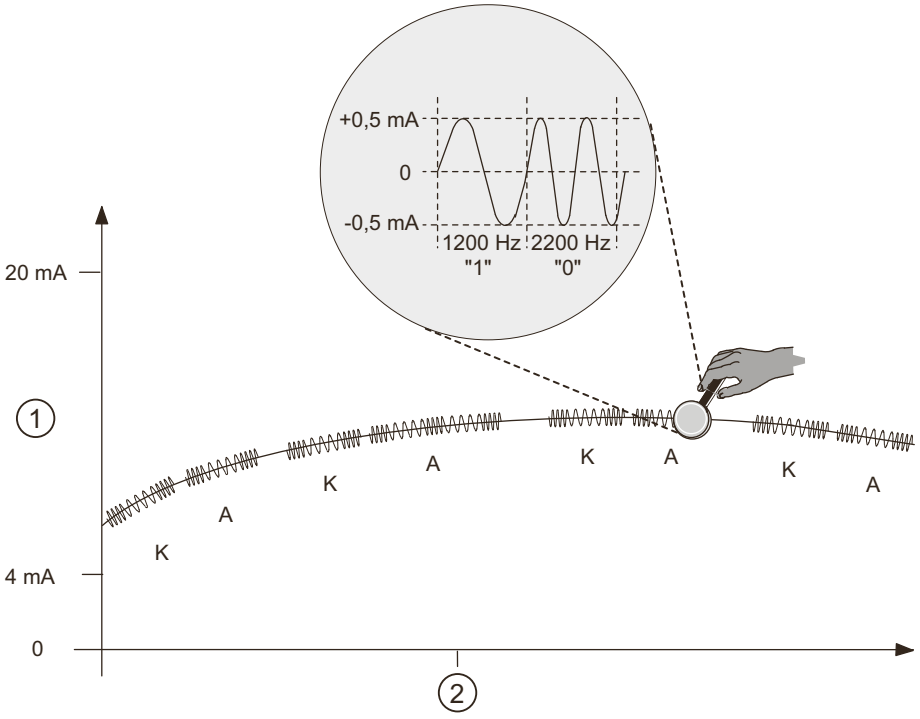

Figure 1-618 The HART signal

①	Analog signal
②	Time (seconds)
K	Command
A	Response

HART communication

The analog input module F-AI 8xI 0(4)..20mA processes the HART communication sequentially in multiplex mode, i.e. channel-by-channel one after the other. HART commands of the individual channels therefore influence the speed of HART processing of the other channels.

When HART mode is enabled, the analog module independently sends HART commands to the connected field devices. This always takes place on a channel-specific basis, alternating with any pending external HART commands that arrive via the module's command interface, see HART command interface (Page 29).

Commissioning a HART field device

Only HART field devices that are set to the short frame address 0 can be operated. If a HART field device with a different short frame address is connected or a connected field device is reconfigured to a short frame address other than 0 during operation, the module starts a scan of all possible short frame addresses at the next re-establishment of HART communication (command 0 with short frame addresses 1...63). As soon as the connected field device responds, it is converted to the short frame address 0 (HART command 6) by the module. During the scan, the module reports a HART communication error.

HART commands

The assignable properties of the HART field devices (HART parameters) can be set with HART commands and read by means of HART replies. The HART commands and their parameters are divided into 3 groups with the following properties:

- Universal
- Common practice
- Device-specific

Universal commands must be supported by all manufacturers of HART field devices and common practice commands should be supported. There are also device-specific commands that apply only to the particular field device.

Examples of HART commands

The following two tables show examples of HART commands:

Table 1-892 Examples of universal commands

Command	Function
0	Read manufacturer and device type - only with this command 0 can field devices be addressed by means of a short frame address
11	Read manufacturer and device type
1	Read primary variable and unit
2	Read current output and percent of range, digitally as floating-point number (IEEE 754)
3	Read up to four pre-defined dynamic variables (primary variables, secondary variables, etc.)
13, 18	Read or write tag, descriptor and date (data included in transmission)

Table 1-893 Examples of common practice commands

Command	Function
36	Set upper range value
37	Set lower range value
41	Perform self-test
43	Set the primary variable to zero
109	Switch burst mode on or off

Structure of the HART protocol

Each HART frame (request frame) sent from the analog module to the connected field device and each HART frame (response frame) received by the field device has the following basic structure.

PREAMBLE	STRT	ADDR	COM	BCNT	STATUS	DATA	CHK

PREAMBLE: Bytes (0xFF) for synchronization.
5 to 20 bytes depending on parameter assignment

STRT: Start character (start delimiter)

ADDR: Address of the field device (1 byte; short address or 5 bytes; long address)

COM: HART command number

BCNT: Byte count, number of bytes to follow without checksum

STATUS: HART device status (1st and 2nd status byte). Only present for a response frame. For structure of HART device status, see below.

DATA: Transferred user data / parameters, quantity depending on command (0...230 bytes)

CHK: Checksum

With the exception of the preamble bytes, this structure is contained in the communication data of the HART command interface. See section HART request and response data records (DS 80 to DS 95) (Page 90).

HART replies always contain data. Status information (HART device status; 1st and 2nd status bytes) is always sent together with a HART response. You should evaluate these to make sure the response is correct.

Structure of HART device status (1st and 2nd status bytes).

Table 1-894 1st status byte

When Bit 7 = 1: "Communication error"	
Bit 6 = 1	Parity error
Bit 5 = 1	Overflow
Bit 4 = 1	Framing error
Bit 3 = 1	Checksum error
Bit 2 = 0	Reserved
Bit 1 = 1	Overflow in the receive buffer
Bit 0 = 0	Reserved

When bit 7 = 0: "Specific in line with response frame"

Table 1-895 2nd status byte

Bit 7 = 1	Device fault
Bit 6 = 1	Configuration changed
Bit 5 = 1	Startup (cold start)
Bit 4 = 1	Additional status information available
Bit 3 = 1	Fixed analog output current setting
Bit 2 = 1	Analog output current saturated
Bit 1 = 1	Non primary variable outside the limits
Bit 0 = 1	Primary variable outside the range

HART Fast Mode

The analog input module F-AI 8xI 0(4)..20mA supports processing of HART commands as SHC sequence ("Successive HART Command").
When a HART command with a set SHC bit for a channel is detected by the analog module, the complete HART command processing is reserved on the analog module for that channel for about 2 seconds. For all other channels of the analog module, no HART frame processing occurs during this time, see section HART command interface (Page 29)

NOTE

- While a HART channel of the HART module of the analog input module F-AI 8xI 0(4)..20mA processes an SHC sequence, i.e. the HART processing for this channel is reserved, the HART variables of all HART channels are no longer updated. They remain unchanged in the value and quality code.
- HART requests for other channels of the HART module are not processed and acknowledged accordingly.

Burst mode

Analog input module F-AI 8xI 0(4)..20mA does not support burst mode. HART commands with set burst bit are ignored and are not forwarded to the connected field device.

5.3 Using HART

System environment for the use of HART

To use an intelligent field device with HART functionality, you require the following system environment:

- Current loop 4 to 20 mA
  Connection of the transmitters to the analog input module F-AI 8xI 0(4)..20mA

- HART configuration tool "Client":
  You can assign the HART parameters using an external hand-held operating device (HART handheld) or a HART configuration tool (PDM). Both assume the function of a "client":
  The configuration tool accesses through the analog input module F-AI 8xI 0(4)..20mA while the HART handheld is connected directly in parallel to the field device.
  PDM (Process Device Manager) is available as a stand-alone unit or integrated in *STEP 7 HW Config*.
- HART system integration:
  The analog input module F-AI 8xI 0(4)..20mA assumes the function of a "master" by receiving the commands from the HART configuration tool or programmed from an S7 user program, passing them on to the intelligent field device and then returning the replies. The interface of the analog input module F-AI 8xI 0(4)..20mA is represented by data records that are transferred via the S7-1500 I/O bus. The data records must be created and interpreted by the client.

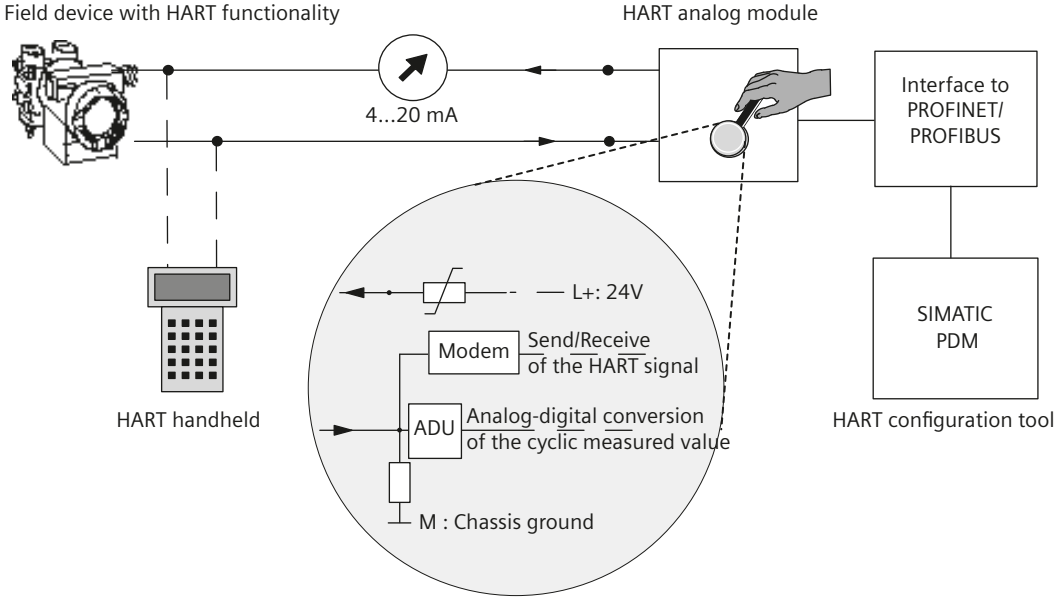

Figure 1-619 System environment for the use of HART

Error management

The two HART status bytes (HART device status), which are transmitted with each response from the field device, contain error messages about the HART communication, HART command and device status.

Among other things, these are evaluated by the analog input module F-AI 8xI 0(4)..20mA and made available in the system via the S7 diagnostic alarms.

Configuration/commissioning

You configure the analog input module F-AI 8xI 0(4)..20mA in the SIMATIC system with STEP 7 or the TIA Portal. You configure the individual channels with respect to the actual analog value acquisition and the use of the HART variables in the input address space of the additional submodules of the module.

You can configure one field device per channel. By means of this configured field device, the configuration/parameter assignment of the connected field device is then carried out using PDM or the EDD for the S7-1500/ET 200MP. You will find the current EDD for download in Siemens Industry Online Support under entry ID 109822354 (https://support.industry.siemens.com/cs/ww/en/view/109822354).

With PROFINET IO, analog input module F-AI 8xI 0(4)..20mA can be configured via a GSD file. However, in this case, direct configuration / parameter assignment of the connected field devices is not possible.

Parameter reassignment of the field devices

The analog input module F-AI 8xI 0(4)..20mA generally accepts triggered parameter reassignment for field devices. Access rights can only be allocated in the configuration tool.

For parameter reassignment of the field devices connected to analog input module F-AI 8xI 0(4)..20mA, proceed as follows:

1. You trigger parameter reassignment of a field device with a HART command entered using the SIMATIC PDM configuration tool or programmed via the STEP 7 user program.
2. The corresponding bit is set in the HART device status of the connected field device (in the 2nd status byte) after you have reassigned the parameters of a HART field device.
3. The parameter reassignment of the field device causes the analog input module F-AI 8xI 0(4)..20mA to trigger a "HART configuration changed" diagnostic interrupt, if this is enabled. See Diagnostic alarms (Page 72). This diagnostic interrupt is to be regarded as information and not as an error and is automatically deleted again by the analog module after approximately 1 minute.

A diagnostic interrupt can also be triggered, if enabled, when parameters are reassigned with the handheld.

⚠ WARNING

An external operating device (e.g. HART handheld or HART modem) may only be used if one of the following requirements is met:

- The input signals (i.e. process values or user data in the input range in section Address space (Page 53)) are checked for plausibility. For example, by comparison in the fail-safe user program with the equivalent value of another F-I/O module.
- Your system is in a state in which parameter reassignment of a HART field device is possible without risk.

See also

Block diagram (Page 16)

5.4 HART for safety-related applications

Overview

- "HART gate" parameter
  You use the "HART gate" parameter to switch on the HART function (HART communication) for the I/O module. The "HART gate" parameter acts as a fail-safe "main switch" for the complete module.
- "HART function" parameter
  You use the "HART function" parameter to enable or disable HART communication with the HART field device for the relevant channel of the I/O module.
  The parameter is not safety-related. In other words, this parameter cannot be used for fail-safe shutdown of HART communication.

⚠ WARNING

Write protection of the connected HART field devices should always be enabled as soon as the "HART gate" is switched on.
This measure guarantees both protection from unauthorized access or manipulation of the HART sensors and compliance with the requirements for using HART field devices in safety-related applications.
If write protection is not enabled and the "HART gate" is switched on, one of the following conditions must be met:

- The input signals (i.e. input values or user data in the input range in the section Address space (Page 53)) are checked for plausibility. For example, by comparison in the fail-safe user program with the equivalent value of another F-I/O module.
- Your system is in a state in which parameter reassignment of a HART field device is possible without risk.

⚠ WARNING

If the "HART gate" is switched on, the additional error of the input signal (i.e. input values or user data in the input range in section Address space (Page 53)) specified in the Technical specifications (Page 78) of the F-I/O module must be taken into account by the HART signal modulated on the input signal depending on the configured interference frequency suppression.

⚠ WARNING

An external operating device (e.g. HART handheld or HART modem) may only be used if one of the following requirements is met:

- The input signals (i.e. input values or user data in the input range in the section Address space (Page 53)) are checked for plausibility. For example, by comparison in the fail-safe user program with the equivalent value of another F-I/O module.
- Your system is in a state in which parameter reassignment of a HART field device is possible without risk.

5.5 HART command interface

Data records

The HART commands are sent as "external" HART requests from the client (e.g. PDM or the STEP 7 user program) via data records to the connected field device. The response from the field device is then made available in the system via data records.

HART communication may be controlled by only one client (e.g. PDM) per channel. If a channel is handled by several clients, the response made available by the module cannot be allocated to one client with certainty. Analog input module F-AI 8xI 0(4)..20mA does not support client management.

Fixed data records are assigned to each client/channel:

Table 1-896 Structure of the data records

Channel	Data record number	
	Request to the field device	Response from the field device
0	80	81
1	82	83
2	84	85
3	86	87
4	88	89
5	90	91
6	92	93
7	94	95

The corresponding data records are transferred to the module with the "WRREC" instruction and read by the module with the "RDREC" instruction.

Errors during the transfer are indicated at output parameter STATUS.

Errors during interpretation of the request data record are signaled in the corresponding response data record. The faulty request can be read back again using the request data record.

Rules

- After having written a request data record, a client must read the response data record before it may write another request data record.
- The client can evaluate the "processing status" in the response data record: If the "processing status" indicates "successful" or "error," the response data record contains current response data or error displays.
- The response data record must always be read completely because the analog module may modify the data record after the initial reading with "successful" or "error" status. If the processing status in the response data record indicates "successful" or "error", the data record contains current response data or error displays.
- The client may only write a request data record to the module again when it has read the response to the previously written request data record via the corresponding response data record. Otherwise, the response from the module is overwritten.
- The STATUS component in the response frame (HART device status in the response data) provides information on whether errors have occurred and, if so, which errors.

Each request is stored on a channel-specific basis, and the corresponding request data record is disabled. Another writing of the same request data record is thus not possible and is acknowledged with BUSY.
The disable of the request data record is reset after the termination or completion of the requested HART command.

SHC sequence

If a HART command is sent to the module with the SHC bit set, this channel is reserved for external HART commands for 2 seconds.

For each additional HART command with the SHC bit set, the module reserves this channel again for a further 2 seconds for HART commands. If a HART command without a set SHC bit is detected for this channel or if no further command is received for this channel within 2 seconds of the previous HART command, command 3 or 9 is sent cyclically again for this channel to read the HART variables to the field device.

5.6 HART variables

Introduction

Numerous HART field devices provide additional measured quantities (e.g. sensor temperature).

For each channel with activated HART functionality, a maximum of 4 HART variables supported by the connected field device are read cyclically. The HART variables are read automatically via HART command 3 (for field devices with HART Rev. 5 and 6) or via command 9 (for field devices from HART Rev. 7).

These 4 HART variables per channel are always stored in the HART variable data record 121 and can be read at any time. See section HART variable data record (DS 121) (Page 88).

In addition, a maximum of 8 HART variables can be configured directly in the input address space of the additional submodules of the analog input module F-AI 8xI 0(4)..20mA. See section Additional submodules (Page 49). You assign the respective HART variables to a channel in the "HART variables configuration" properties dialog of the module. Parameter

assignment is performed via parameter data record 140. See section Parameter assignment and structure of the HART mapping parameters (DS 140) (Page 97). This enables you to easily process measured values directly from the field device as input data in the automation device.

Evaluating the multiHART area

You can select the multiHART area via the parameter assignment dialog.

The multiHART area occupies 1 byte in the output range (command) and 6 bytes in the input range (1 byte acknowledgment + 5 bytes HART variable).

You can read all HART variables available in the module using the multiHART area. To do this, you must request a HART variable from the module using the command byte in the output range.

The command byte identifies the requested HART variable (HART variable reference):

HART variable reference	
Bit 4 ... 7: Channel number 0 ... 7	Bit 0 ... 3: Variable identification 1 = PV (Primary Variable) 2 = SV (Secondary Variable) 3 = TV (Tertiary Variable) 4 = QV (Quaternary Variable)

The command is confirmed via the acknowledgment byte in the input range. As soon as the HART variable reference requested using the command can be read, the requested HART variable can be evaluated.

If an invalid HART variable reference is requested, this is also acknowledged accordingly. The value of the corresponding HART variable is then zero, and the quality code is signaled with $0x37_H$ (initialization value from analog module).

Example:
The primary variable of channel 6 is to be read.

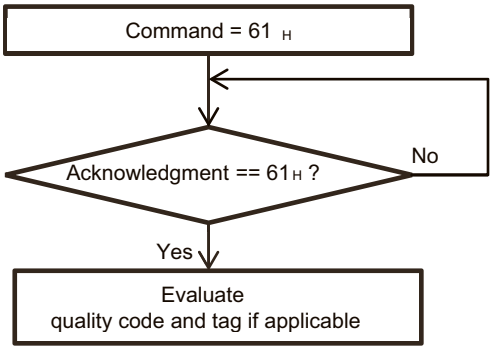

Figure 1-620 Command = 0x61

Address assignment

You can configure up to three additional submodules and access the HART variables in the input address space of these additional submodules (see section Additional submodules (Page 49)).

You can find the address assignment in section Address space of additional submodules (Page 55).

Configuration of HART variables

You can configure up to 4 HART variables for each channel:

- PV (Primary Variable)
- SV (Secondary Variable)
- TV (Tertiary Variable)
- QV (Quaternary Variable)

When HART mode is activated, the analog input module F-AI 8xI 0(4)..20mA automatically reads the variables supplied by the connected field devices cyclically and makes them available in the input address space of the module's additional submodules in accordance with the configuration.

Each HART variable consists of a 4-byte value and a 1-byte quality code.

Quality code

The quality code describes the process status of the corresponding HART variable.

Basic structure of the quality code

Bit	7 ... 6	5 ... 2	1 ... 0
	Quality 0 0: Bad 0 1: Uncertain 1 0: Good 1 1: Good	Sub-status Coded according to "PROFIBUS PA Profile for Process Control Devices"	Limits 0 0: OK 0 1: Low limit 1 0: High limit 1 1: Constant

The quality codes generated by the analog input module F-AI 8xI 0(4)..20mA depend on the HART revision of the field device used.

For field devices with HART Revision 5 and 6

The quality code is formed exclusively from the 1st and 2nd Status byte (HART device status) of the response frames (HART command 3).

Quality code	Meaning (process status)	
80_H	Value is okay	Also applies if the following bits are set in the 2nd status byte of the HART response frame: • Configuration changed • Startup (cold start) • Fixed analog output current setting
78_H	Value is uncertain	Also applies if the following bits are set in the 2nd status byte of the HART response frame: • Additional status information available • Analog output current saturated • Non primary variable outside the limits • Primary variable outside the range

Quality code	Meaning (process status)	
84_H	Response code RC8: Update error	
24_H	Response code RC16: Access restricted	Request from field device refused
23_H	Communication error or HART variable not present in the field device	
37_H	Initialization value from analog module	• After module startup • After incorrect operation of the multiHART interface
00_H	Initialization value from S7 system	

For field devices from HART Revision 7

The quality code is formed from the 1st status byte (HART device status) and from the "Device variable status" (DVS) of the response frames (HART command 9).

Quality code	Meaning (process status)	
80_H	Value is okay	
28_H ... $2B_H$	"Bad"	Process status, formed from the "Device variable status" (DVS) of the response frames with corresponding limits (see above)
68_H ... $6B_H$	"Poor accuracy"	
78_H ... $7B_H$	"Manual" or "Fixed" (manually controlled or fixed value)	
88_H	"More device variable state available" (additional status information available)	
89_H	"Good" with "Low limit"	
$8A_H$	"Good" with "High limit"	
$8B_H$	"More device variable state available" (additional status information available)	
84_H	Response code RC8: Update error	
24_H	Response code RC16: Access restricted	Request from field device refused
23_H	Communication error or HART variable not present in the field device	
37_H	Initialization value from analog module	• After module startup • After incorrect operation of the multiHART interface
40_H	Alternatively read via command 3	
00_H	Initialization value from S7 system	

Parameters/address space

6

6.1 Measurement types and measuring ranges

The following table shows the measurement types and the respective measuring range.

Table 1-897 Measurement types and measuring ranges

Measurement type	Measuring range	Resolution
Current	0 to 20 mA (2- and 3-/4-wire transducer) 4 to 20 mA (2- and 3-/4-wire transducer)	16 bits including sign 16 bits including sign

You can find the tables of the measuring ranges as well as overflow, overrange, etc. in the Appendix Representation of analog values (Page 84).

6.2 Parameters

Parameters for F-AI 8xI 0(4)..20mA

WARNING

Diagnostic functions must be activated or deactivated in accordance with the application; see section Applications of the F-I/O module (Page 59).

The following parameters are possible:

Table 1-898 Configurable parameters

Parameter	Value range	Default	Configuration in RUN	Scope
F-parameters:				
Manual assignment of F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Dependent on parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Suggested by F-system	No	Module
F-parameter signature (without addresses)	0 to 65535	Calculated by F-system	No	Module
Behavior after channel fault	• Passivate the entire module • Passivate channel	Passivate channel	No	Module

*) See formula in the section "Parameter assignment of discrepancy analysis for 1oo2 evaluation"

Parameter	Value range	Default	Configuration in RUN	Scope
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	All channels manually	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB-number	Value range depending on parameter assignment of the F-CPU	Suggested by F-system	No	Module
F-I/O DB-name	—	Suggested by F-system	No	Module
AI parameters:				
HART gate	• On • Off • Switchable	Off	No	Module
Interference frequency suppression	• 50 Hz • 60 Hz	50 Hz	No	Module
Channel parameters				
Channel n, n+4				
Sensor evaluation	• 1oo1 evaluation (max. SIL3/Cat.3/PLd) • 1oo2 evaluation (max. SIL3/Cat.4/PLe)	1oo2 evaluation (max. SIL3/Cat.4/PLe)	No	Channel
Unit value	• MIN • MAX	MIN	No	Channel
Discrepancy time *	100 to 30000 ms	100 ms	No	Channel
Tolerance window abs.	0.3 to 20.0%	2.5%	No	Channel
Tolerance window rel.	0.3 to 20.0%	2.5%	No	Channel
Channel n				
Activated	• Disable • Enable	Enable	No	Channel
Channel fault acknowledge	• Manual • Automatic	Manual	No	Channel
Measuring range	• 0...20 mA • 4...20 mA	4...20 mA	No	Channel
Diagnosis: Wire break **	• Disable • Enable	Enable	No	Channel
Smoothing	• 1 • 2 • 4 • 8 • 16 • 32 • 64	1	No	Channel

*) See formula in the section "Parameter assignment of discrepancy analysis for 1oo2 evaluation"

Table 1-899 HART/MSI/HART variables parameter

Parameter	Value range	Default	Configuration in RUN	Scope
Module parameters:				
AI configuration				
Number of additional submodules (for MSI / HART variables)				
Additional submodules	• None • 1 • 2 • 3	None	No	Module
HART:				
Channel n				
HART function	• Disable • Enable	Disable	Yes	Channel
HART preamble bytes	5 to 20	5	Yes	Channel
HART repetitions	1 to 10	5	Yes	Channel
HART diagnostics	• Disable • Enable	Disable	Yes	Channel
HART variables configuration				
HART variables	• None • 4 HART • 8 HART • 1 multiHART	None	No	Module
Submodule_n: *				
Submodule type				
Submodule type	• MSI • HART variables	MSI	No	Module

*) Only present if the "Additional submodules" parameter is configured with 1, 2 or 3

6.3 Explanation of parameters

6.3.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Basis for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address) and the F I/O DB in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

6.3.1.1 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

6.3.1.2 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

6.3.1.3 HART gate

Definition

This parameter is used to enable the HART communication for the I/O module.

The "HART gate" parameter acts as a fail-safe "main switch" for the complete module.

The following parameter assignments are possible:

- "On": HART communication is enabled.
- "Off": HART communication is disabled.
- "Switchable": If the module is in RUN, HART communication can be switched on and off from the safety program via the process output byte QB x + 0. This means that the HART communication with HART field devices can be activated and deactivated during operation of the F-CPU (e.g. for maintenance purposes). You can find more information about the address assignment in the section Address space (Page 53).

HART communication is then activated on a channel-specific basis with the "HART function" parameter.

You can find more information on this parameter in the section "HART for safety-related applications (Page 28)".

6.3.1.4 Interference frequency suppression

Here you set the interference frequency suppression for the line frequency:

- 50 Hz
- 60 Hz

You can find more information on this in the Analog value processing function manual (https://support.industry.siemens.com/cs/ww/en/view/67989094).

6.3.2 Parameters of the channels

6.3.2.1 Evaluation of the sensors

Overview

Here you select the type of sensor evaluation:

- "1oo1 evaluation (max. SIL3/Cat.3/PLd)"
- "1oo2 evaluation (max. SIL3/Cat.4/PLe)"

If you do not want to measure with a channel or channel pair, disable the channel or the channel pair.

1oo1 evaluation (max. SIL3/Cat.3/PLd)

With the 1oo1 evaluation, there is one sensor, and it is connected to the F-module via a single channel.

1oo2 evaluation (max. SIL3/Cat.4/PLe)

With the 1oo2 evaluation, two input channels are occupied by:

- Two single-channel sensors
- One two-channel sensor

Note that in 1oo2 evaluation, two channels are combined into a channel pair.

Achievable safety class

Depending on the selected sensor evaluation, you achieve the following safety classes with a sensor that is qualified accordingly:

- SIL3/Cat.3/PLd for "1oo1 evaluation" or
- SIL3/Cat.4/PLe for "1oo2 evaluation"

6.3.2.2 Unit value

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can choose for each input channel pair which of the two F-CPU values is provided.

- "MIN": the lesser of the two values.
- "MAX": the greater of the two values.

During a discrepancy between the two input channels, the last valid unit value prior to the occurrence of the discrepancy is made available to the F-CPU.

6.3.2.3 Discrepancy time

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the discrepancy time for each channel pair here in milliseconds.

The discrepancy time does not start until the unit value is outside the assigned tolerance window (relative or absolute). If the two redundant input channels of the channel pair differ by more than the specified tolerance and for longer than the specified discrepancy time but no longer than the duration of the maximum response time, the F-module detects a discrepancy error and triggers a diagnostic interrupt. If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.

For more information regarding configuring the discrepancy analysis refer to Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 40).

A discrepancy error is handled by the safety program in the same way as a channel fault. More information is available in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

6.3.2.4 Tolerance window abs.

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for the channel pair. You specify the tolerance window as a percentage of the full-scale value. The reference value is the full-scale value, i.e. 20 mA. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

You can find more information on setting the tolerance window under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 40).

Example

You have assigned the following:

- "Tolerance window abs." at 10%
- The measuring range of 0...20 mA
- A discrepancy time of 100 ms

The input channels may differ from the configured discrepancy time (100 ms) up to the max. reaction time for a time window with a difference of more than 2 mA.

See also

Discrepancy time (Page 39)

6.3.2.5 Tolerance window rel.

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for each channel pair. You specify the tolerance window as a percentage of the assigned unit value. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

The two parameters "Tolerance window abs." and "Tolerance window rel." are combined. The "Tolerance window abs." parameter is decisive in the case of low process values.

You can find more information on setting the tolerance window under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 40).

Example

You have assigned the following:

- "Tolerance window rel." at 10%
- The measuring range of 0...20 mA
- A discrepancy time of 200 ms
- The unit value to MIN

With a measured value of 20 mA a difference of more than 2 mA from the configured discrepancy time (200 ms) up to the max. response time may occur.

Discrepancy time (Page 39)

6.3.2.6 Parameter assignment of discrepancy analysis for 1oo2 evaluation

Operating principle of discrepancy analysis

A discrepancy analysis is performed with a configured 1oo2 evaluation. **Smoothed** process values are used for the discrepancy analysis.

An assignable tolerance window is formed around the process value that represents the instantaneous unit value (value that is signaled to the F-CPU).

The tolerance window is formed relative to the process value or as an absolute value relative to the measuring range end value. Relative and absolute tolerance windows are combined.

If the process value does not represent the unit value at an instant and is within the tolerance window, **no** discrepancy exists.

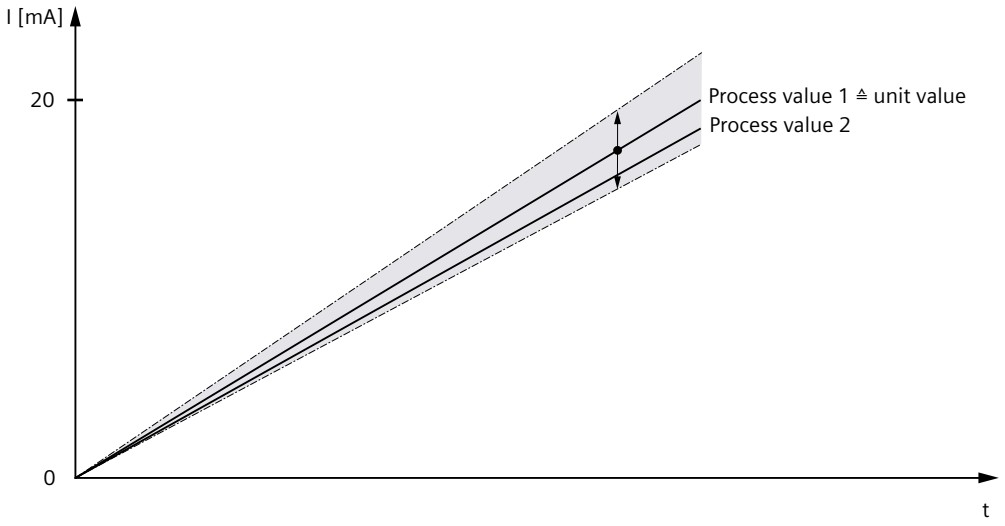

Figure 1-621 Example of a relative tolerance window *without* discrepancy (parameter assignment: unit value = MAX)

If the process value does not represent the unit value at an instant but is outside the tolerance window, a discrepancy exists.

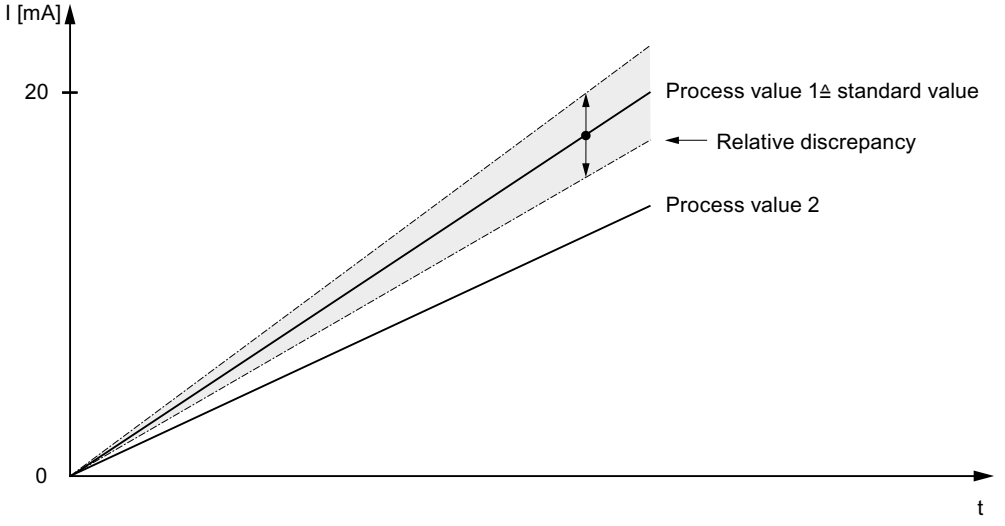

Figure 1-622 Example of a relative tolerance window *with* discrepancy (parameter assignment: unit value = MAX)

The assigned discrepancy time starts as soon as a discrepancy is detected. The discrepancy time runs as long as the discrepancy exists.

- During a discrepancy between the two input channels, the last valid unit value prior to occurrence of the discrepancy is signaled to the F-CPU.

  If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.
- There is no valid old value after startup. If the discrepancy is detected during this time, 0 is output and the discrepancy time is started.

  If there is no longer a discrepancy between the input channels when the discrepancy time expires, the unit value is output.

If the discrepancy time expires, an error is signaled and the process value is set to 0. In the PII, the substitute value 0 is set for the safety program.

A discrepancy error is handled by the safety program in the same way as a channel fault. More information is available in the STEP 7 Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Configuring the discrepancy analysis parameters

The following four parameters for the discrepancy analysis are assigned for each channel pair:

- Discrepancy time
- Unit value
- Tolerance window abs.
- Tolerance window rel.

"Discrepancy time" parameter

If the following is true, the F-module detects a discrepancy error:

- The process value that does not represent the unit value is outside the configured tolerance window.
- Lasts longer than the configured discrepancy time.
- Lasts at maximum the duration of the maximum response time.

In the case of a discrepancy error, the F-module triggers a diagnostic interrupt and sets the process value to 0. The discrepancy time is reset if the unit value lies within the tolerance window again.

In the PII, the substitute value 0 is set for the safety program.

You calculate the maximum discrepancy time that is permitted in the respective application using the following formula:

Discrepancy time = Maximum response time (in case of discrepancy error) – 2 × Conversion cycle time × Smoothing – 2 × Conversion cycle time

NOTE

You calculate the discrepancy time by using the values from the appendix Response times (Page 82) in the above equation.

You can assign the discrepancy time for each channel pair.

"Unit value" parameter

You can select which of the two values is to be signaled to the F-CPU for each input channel pair. During a discrepancy between the two input channels, the last valid unit value prior to occurrence of the discrepancy is signaled to the F-CPU.

- "MIN": The lower of the two values is signaled to the F-CPU as the unit value.
- "MAX": The higher of the two values is signaled to the F-CPU as the unit value.

"Tolerance window abs." parameter

You can calculate the absolute tolerance window using the following formula:

$$T_{abs} = \frac{|\Delta I_{abs}|}{I_{ME} - I_{MA}} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta I_{abs} = \pm \frac{(I_{ME} - I_{MA}) \times T_{abs}}{100} \ [\text{mA}]$$

With

- I_{ME} = 20 mA (full-scale value)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA (start-of-scale value)
- I_{MA} = 4 mA for measuring range 4 ... 20 mA (start-of-scale value)
- T_{abs} = Tolerance in %
- ΔI_{abs} = Maximum deviation of current (+/-)

You can assign a value of 0.3 to 20.0% for the "Tolerance window abs." parameter for each channel pair.

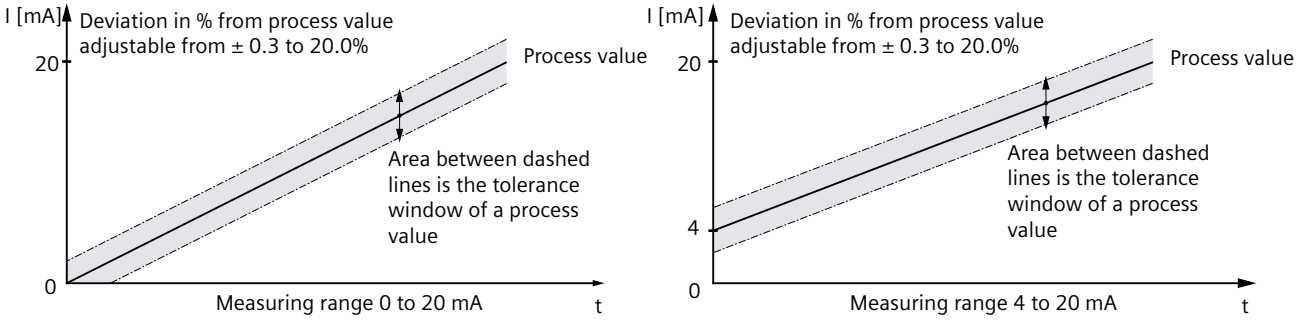

Figure 1-623 Absolute deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

"Tolerance window rel." parameter

The tolerance window is calculated as a percentage of the **smoothed** process value that represents the MIN or MAX value (depending on the parameter assignment of the unit value) in this instant.

You can calculate the relative tolerance window using the following formula:

$$\mathbf{T}_{rel} = \frac{|\Delta \mathbf{I}_{rel}|}{|\mathbf{I}_{EW} - \mathbf{I}_{MA}|} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta \mathbf{I}_{rel} = \pm \frac{|\mathbf{I}_{EW} - \mathbf{I}_{MA}| \times \mathbf{T}_{rel}}{100} \ [\text{mA}]$$

With

- I_{EW} = Process unit value (min./max.)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA
- I_{MA} = 4 mA for measuring range 4 ... 20 mA
- T_{rel} = Tolerance in %
- ΔI_{rel} = Maximum deviation of current (+/-)

You can assign a value of 0.3 to 20.0% for the "Tolerance window rel." parameter for each channel pair.

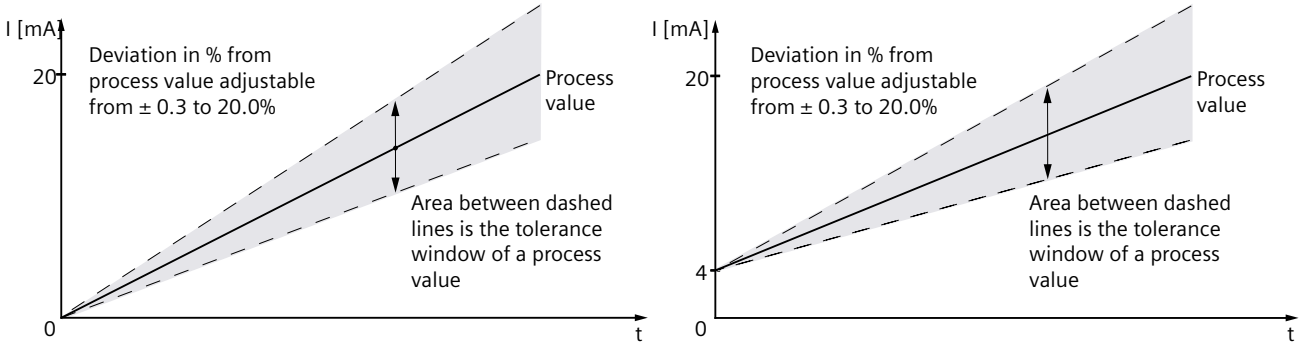

Figure 1-624 Relative deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

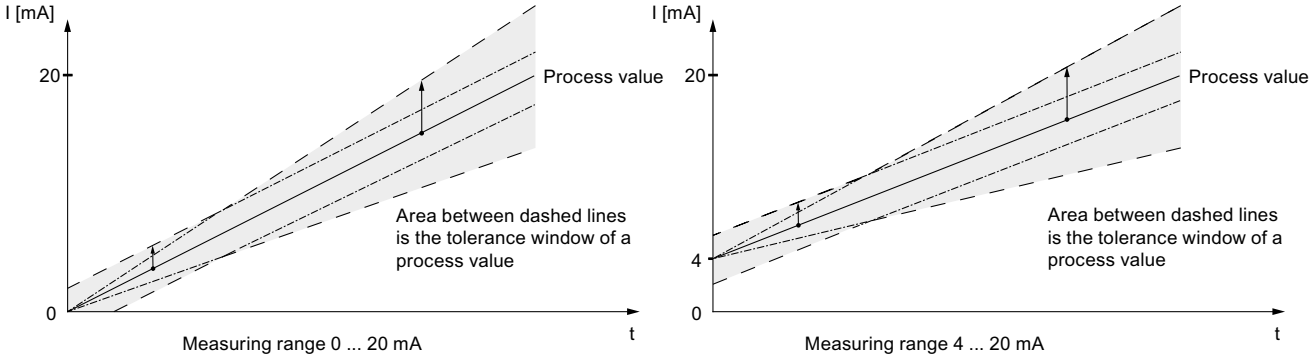
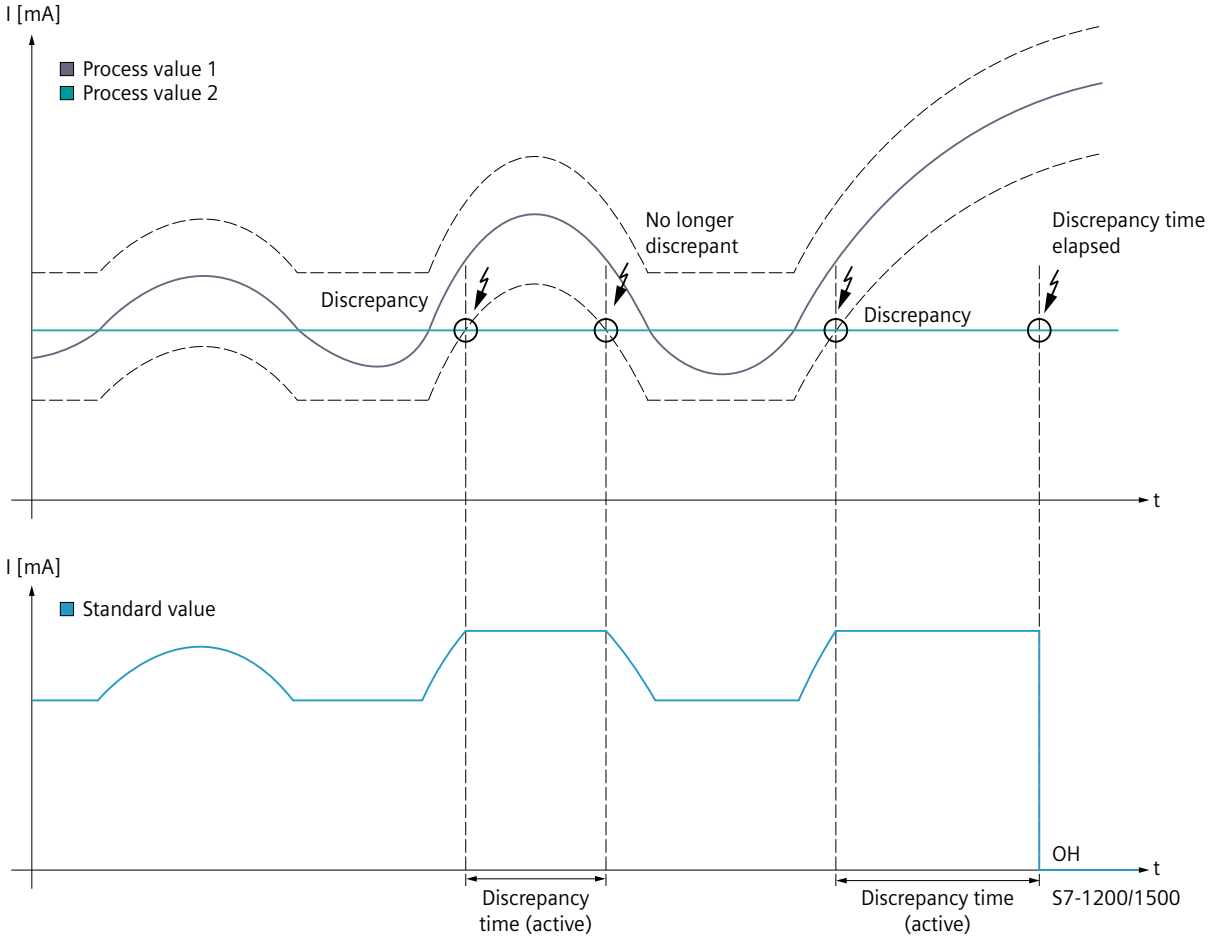
Combination of the "Tolerance window abs." and "Tolerance window rel." parameters



You can combine the "Tolerance window abs." and "Tolerance window rel." parameters as needed. The combined tolerance window (shown in gray in the figure below) is the maximum of T_{rel} and T_{abs}.

$T = MAX \{ T_{rel}, T_{abs} \}$

$\Delta I = MAX \{ \Delta I_{rel}, \Delta I_{abs} \}$



With

- T = Tolerance, in %
- ΔI = Maximum deviation of current (+/-)

Example

The following diagrams show you the behavior of the discrepancy evaluation when unit value = MAX.

The upper of the two diagrams shows you the characteristic curve of the two process values. The dashed line represents the absolute tolerance range configured in this example.

The lower of the two diagrams shows you the unit value signaled to the F-CPU.

In this example, on the first occurrence of a discrepancy, process value 1 is **within** the tolerance range again **before** expiration of the discrepancy time. This means the discrepancy error is not signaled.

In this example, on the second occurrence of a discrepancy, process value 1 is **outside** the tolerance range when the discrepancy time expires. As a result, a discrepancy error is signaled after expiration of the discrepancy time. In the PII, the substitute value 0 is set for the safety program.

6.3.2.7 Activated

If you select this check box, the corresponding channel is enabled for signal processing.

You can deactivate an unused channel with this parameter.

If you deactivate unused channels, the response time of the F-module is reduced.

You can find more information on the response times of the F-module in the appendix Response times (Page 82).

6.3.2.8 Channel failure acknowledge

The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

SIMATIC Safety - Configuring and Programming
(https://support.industry.siemens.com/cs/ww/en/view/54110126)

6.3.2.9 Measuring range

You select the measuring range for the channel with this parameter:

- 0...20 mA
- 4...20 mA

6.3.2.10 Diagnosis: Wire break

Function

Here you activate wire break detection for a configured measuring range of 4 to 20 mA.

With an assigned measuring range of 4 to 20 mA:

- With assigned wire break diagnostics and currents < 3.6 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.
- Without configured wire break and currents diagnostics < 0.4444 mA detects "underflow" and triggers a diagnostic interrupt in the F-CPU.

With an assigned measuring range of 0 to 20 mA, the wire break diagnostics is permanently set by default. With currents < 0.4442 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.

If you do not need a channel, deactivate the channel. Then, a wire break is not detected.

6.3.2.11 Smoothing

Using smoothing

Smoothing of analog values provides a stabilized analog signal for further processing. Smoothed values are always used for discrepancy analysis.

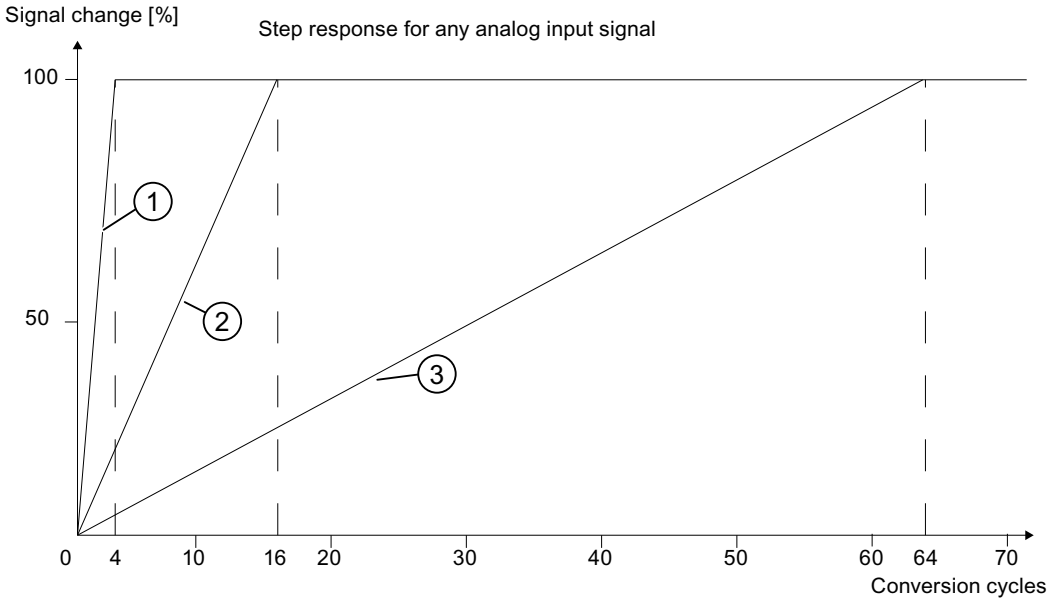
⚠ WARNING

The smoothing takes place as a result of averaging over the selected number of most recently converted analog values of a channel, e.g. 64.
The mean value generation causes a discrepancy to be delayed with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)". You can find an example below.

Smoothing principle

The measured values are smoothed by a digital filter. Smoothing is achieved by the F-module forming the mean of a number of converted (digitized) analog values determined by the "Smoothing" parameter.

You assign smoothing in 7 levels (1, 2, 4, 8, 16, 32, 64 conversion cycles). The level determines the number of analog signals that are averaged. If smoothing = 1 is configured, the smoothing is deactivated.



A higher smoothing provides a more stable analog value, and prolongs the time it takes to apply a smoothed analog signal following a unit step. You can find an example below.

NOTE

Smoothing is reset after startup, short-circuit, wire break or another channel fault. If, for example, smoothing with 16 conversion cycles is assigned and all channels are active, it takes up to 1600 ms until the process value is signaled with a configured interference frequency suppression of 50 Hz.
Until the first valid process value, the F-module reports the process value 0 for the channel.
If a discrepancy occurs, measuring and smoothing continues and is not restarted.

Example

The figure below shows the number of conversion cycles, depending on the smoothing setting, after which the analog value is completely smoothed and available in the case of a unit step. The figure applies to all signal changes at the analog input.

① Smoothing - 4 conversion cycles
② Smoothing - 16 conversion cycles
③ Smoothing - 64 conversion cycles

Example: Effect of smoothing on the maximum response time for a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)" in case of error

If an error (One Fault Delay Time, OFDT) occurred with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you calculate the maximum response time according to the following formula:

Maximum response time (in case of discrepancy error) = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time

For example, one channel pair connected and configured (activated), interference frequency 50 Hz, smoothing = 16 conversion cycles, discrepancy time = 2000 ms, conversion cycle time calculated with the formula from the appendix Response times (Page 82):

Max. response time (in case of discrepancy error) = 2 × 31 ms × 16 + 2000 ms + 2 × 31 ms = 3054 ms

If a discrepancy exists between the two input channels, it can take 4380 ms until the F-module signals a discrepancy error to the F-CPU.

If the discrepancy time expires, an error is signaled and the process value is set to 0. In the PII, the substitute value 0 is set for the safety program.

6.3.3 AI configuration

6.3.3.1 Additional submodules

In addition to the basic submodule, you can create up to 3 additional submodules. You can find more information about the address assignment in the section Address space of the additional submodules (Page 55).

Use this parameter to specify the number of additional submodules:

- None
- 1
- 2
- 3

The additional submodules are only available when the module is used in a distributed setup that is connected to PROFINET.

When using the module in a Shared Device, you can assign the additional submodules to up to 3 IO controllers (fail-safe or non-fail-safe). Each IO controller has read access to the same data. The number of IO controllers depends on the interface module used. Follow the instructions in the respective manual for the interface module.

The additional submodules are preset to module-internal shared input (MSI). Channels 0 to 7 are copied to the additional submodules. Channels 0 to 7 are then available with identical input values in all submodules configured as MSI. Alternatively, you can copy the HART variables (8 HART, 4 HART or 1 multiHART) into the additional submodules; see section HART variables (Page 30). The change from MSI (default setting) to the HART variables is possible in TIA Portal within the additional submodules.

You can use MSI and HART variables simultaneously in up to three additional submodules. For example, MSI in the 1st additional submodule and HART variables in the 2nd and 3rd additional submodule. The HART variables used in the up to 3 additional submodules are defined once and are therefore identical in all additional submodules (i.e. 8 HART, 4 HART or 1 multiHART).

You can find the assignment of the address space of the additional submodules in the section Address space of the additional submodules (Page 55).

⚠ WARNING

All values in the additional submodules are not safety-related and must therefore not be used for safety-related activities.

NOTE

Procedure when assigning the PROFIsafe address

Assignment of the PROFIsafe address in TIA Portal is only possible when the value "None" is set for the "Additional submodules" parameter.

If you want to use 1, 2 or 3 additional submodules, we recommend that you proceed as follows:

1. Set "Additional submodules" to "None" initially.
2. Assign the PROFIsafe address.
3. Set the desired number of additional submodules (1, 2 or 3).
4. Configure the set additional submodules.

NOTE

Displaying diagnostics alarms

If you have set the "Additional submodules" parameter to 1, 2 or 3 in the settings, diagnostics with the F-module scope are not displayed correctly in the TIA Portal (see sections Interrupts (Page 70) and Diagnostics alarms (Page 72)). Instead, only a PROFIsafe communication error (channel diagnostics) is shown. You can refer to the diagnostics buffer of the F-CPU for the correct diagnostics alarm in this case.

6.3.4 HART

6.3.4.1 HART function

Use this parameter to enable HART communication for the relevant channel.

This parameter can only be configured if the "HART gate" parameter is configured as "On" or "Switchable" and measuring range "4...20 mA" is set.

This parameter is not safety-related, i.e. it cannot be used for fail-safe shutdown of HART communication.

6.3.4.2 HART preamble bytes

Use this parameter to specify the number of preamble bytes sent.

6.3.4.3 HART repetitions

Use this parameter to specify the number of HART frame repetitions. If the analog input module F-AI 8xI 0(4)..20mA receives no response or a response with errors to a HART frame sent to the field device, the frame is repeated. It is therefore sent again to the field device.

Because HART communication of the individual channels uses multiplex mode, HART frames with errors affect the other channels when the number of HART repetitions is high. In other words, the other channels are processed less frequently.

6.3.4.4 HART diagnostics

Enabling the diagnostics of the HART frame specific monitoring and the status information supplied by the connected field device in the HART frame (HART device status).

The parameter is only relevant if the "HART function" parameter is activated.

The HART diagnostics are reported as maintenance events.

6.3.4.5 HART variables

Use this parameter to specify which HART variables can be copied to the additional submodules:

- None
- 8 HART
- 4 HART
- 1 multiHART

This parameter is only relevant if at least one additional submodule with "HART variables" is configured with the "Submodule type" parameter.

You can find information on the additional submodules in the section Additional submodules (Page 49).

⚠ WARNING

The HART variables are not safety-related and must therefore not be used for safety-related activities.

Use of "1 multiHART"

If you have configured the value "HART variables" as the "Submodule type" for more than one additional submodule and set the "HART variables" parameter to "1 multiHART", all these additional submodules read and write to the same multiHART area in the module.

By evaluating the acknowledgment byte in the input range of the submodule, you can determine if the HART variable requested by the respective submodule is available in the input range. See example under "Evaluating the multiHART area" in the section HART variables (Page 30). To ensure data consistency, read the acknowledgment byte and the HART variable from the input range of the submodule at the same time.

6.3.4.6 HART mapping

A maximum of 8 HART variables can be configured (mapped) in the address space of the additional submodules via the HART mapping parameters.

Each HART variable occupies 5 bytes of input data. Depending on the configuration, the addresses are assigned for 4 variables (20 bytes) or 8 variables (40 bytes).

You can find the assignment of the address space in section Address space of additional submodules (Page 55).

If required, this can be changed via data record 140; see section Parameter assignment and structure of the HART mapping parameters (DS 140) (Page 97).

Parameters

Table 1-900 Configurable HART mapping parameters

Parameter		Value range	Default	Configuration in RUN
Variable 1	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 2	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 3	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 4	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
The following variables only apply to a configuration with 8 HART variables:				
Variable 5	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 6	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 7	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes
Variable 8	Channel	0 ... 7	0	Yes
	Type	• None • PV (Primary Variable) • SV (Secondary Variable) • TV (Tertiary Variable) • QV (Quaternary Variable)	None	Yes

See also

Address space (Page 53)

6.3.5 Submodule type

Use this parameter to specify whether module-internal shared input (MSI) is available in the additional Submodule_n or the HART variables are copied into the additional Submodule_n.

The parameter is only present if the "Additional submodules" parameter is configured with 1, 2 or 3.

6.4 Address space

Address assignment of the analog input module F-AI 8xI 0(4)..20mA

The analog input module F-AI 8xI 0(4)..20mA occupies the following address ranges in the F-CPU:

Table 1-901 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In the input range**	**In the output range**
F-CPUs S7-1200 and S7-1500	IB x + 0 to x + 22	QB x + 0 to x + 5

x = Module start address

Address assignment of the user data and the value status of the analog input module F-AI 8xI 0(4)..20mA

The user data and the value status occupy the following addresses in the F-CPU out of all the assigned addresses of the analog input module F-AI 8xI 0(4)..20mA:

Table 1-902 Address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 0	Input value at channel 0 (Result of the 1oo2 evaluation channel 0/4)							
IB x + 1								
IB x + 2	Input value at channel 1 (Result of the 1oo2 evaluation channel 1/5)							
IB x + 3								
IB x + 4	Input value at channel 2 (Result of the 1oo2 evaluation channel 2/6)							
IB x + 5								
IB x + 6	Input value at channel 3 (Result of the 1oo2 evaluation channel 3/7)							
IB x + 7								
IB x + 8	Input value at channel 4							
IB x + 9								
IB x + 10	Input value at channel 5							
IB x + 11								
IB x + 12	Input value at channel 6							
IB x + 13								

x = Module start address

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 14	Input value at channel 7							
IB x + 15								
IB x + 16	Value status for AI_7	Value status for AI_6	Value status for AI_5	Value status for AI_4	Value status for AI_3	Value status for AI_2	Value status for AI_1	Value status for AI_0
IB x + 17	-	-	-	-	-	-	-	Value status for HART gate

x = Module start address

NOTE

You only have read access to the addresses occupied by user data and value status.
The other address ranges occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.
With 1oo2 evaluation of the sensors, two channels are combined, e.g. channel 0 (input word AI_0) with channel 4 (input word AI_4). In this example, you may only access the input bit AI_0 in the safety program with 1oo2 evaluation of the sensors.

Table 1-903 Address assignment in the output range

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
QB x + 0								HART gate*

* The function is supported as of firmware V2.0. Only evaluated if HART gate is configured as "Switchable".

x = Module start address

More information

For detailed information about F-I/O access and for evaluation and processing of the value status, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

6.5 Address space of additional submodules

⚠ WARNING

All values in the additional submodules are not safety-related and must therefore not be used for safety-related activities.

Address assignment of the additional submodule for configuration MSI

The following table shows the allocation of the address space:

Table 1-904 Address assignment in the input range of the additional submodule

Byte	Assigned bits per F-module							
	7	6	5	4	3	2	1	0
IB a + 0	Input value at channel 0 (Result of the 1oo2 evaluation channel 0/4)							
IB a + 1								
IB a + 2	Input value at channel 1 (Result of the 1oo2 evaluation channel 1/5)							
IB a + 3								
IB a + 4	Input value at channel 2 (Result of the 1oo2 evaluation channel 2/6)							
IB a + 5								
IB a + 6	Input value at channel 3 (Result of the 1oo2 evaluation channel 3/7)							
IB a + 7

IB a + 9								
IB a + 10	Input value at channel 5							
IB a + 11								
IB a + 12	Input value at channel 6							
IB a + 13								
IB a + 14	Input value at channel 7							
IB a + 15								
IB a + 16	Value status for AI_7	Value status for AI_6	Value status for AI_5	Value status for AI_4	Value status for AI_3	Value status for AI_2	Value status for AI_1	Value status for AI_0
IB a + 17	-	-	-	-	-	-	-	Value status for HART gate

a = Start address of the additional submodule

Reference

You can find information on the Shared Input/Output (MSI/MSO) functionality in the PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) Function Manual in the Module-internal shared input/shared output (MSI/MSO) section.

NOTE

If the module is in the reintegration state (ACK_REQ = true), the following scenario can occur: The input values and value status of the channels can have the value 0 in the basic submodule (see section Address space (Page 53)). At the same time, the input values and value status of the channels in the additional submodule configured with MSI can have a value not equal to 0.
In this case, the substitute values are output instead of the input values in the basic submodule. By contrast, the valid input values are already present in the additional submodule configured with MSI.

Address assignment of the additional submodule for HART configuration with 8 variables

The following table shows the allocation of the address space:

Table 1-905 Address assignment in the input range of the additional submodule

Byte	Assigned bits per F-module							
	7	6	5	4	3	2	1	0
IB a + 0	HART variable 1

Applications of the F-I/O module

7

7.1 Application cases of the F-AI 8xI 0(4)..20mA

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

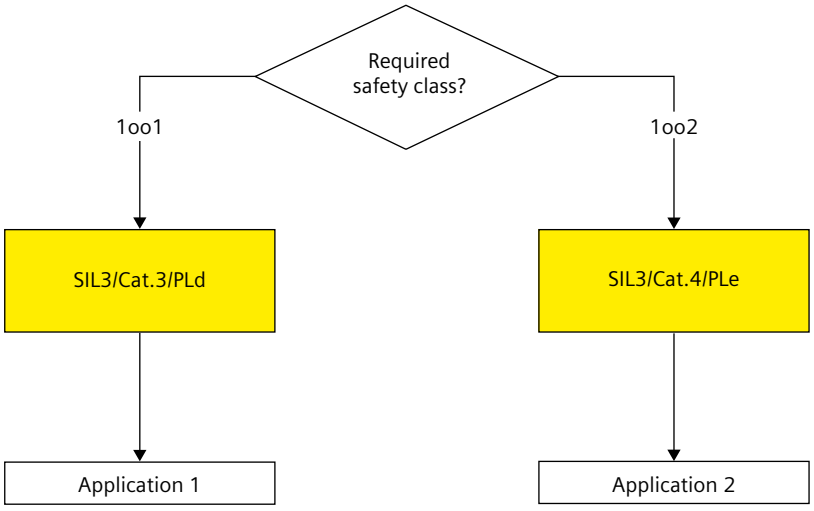

Figure 1-625 Select application case - Analog input module F-AI 8xI 0(4)..20mA

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the mission time in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 1-909 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Achievable SIL/Cat./PL
1	1oo1	3/3/d
2	1oo2	3/4/e

NOTE
You can operate the various inputs of an F-AI module simultaneously in SIL3/Cat.3/PLd **and** in SIL3/Cat.4/PLe. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on the safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules of the system manual S7-1500 Automation System (https://support.industry.siemens.com/cs/ww/en/view/59191792).

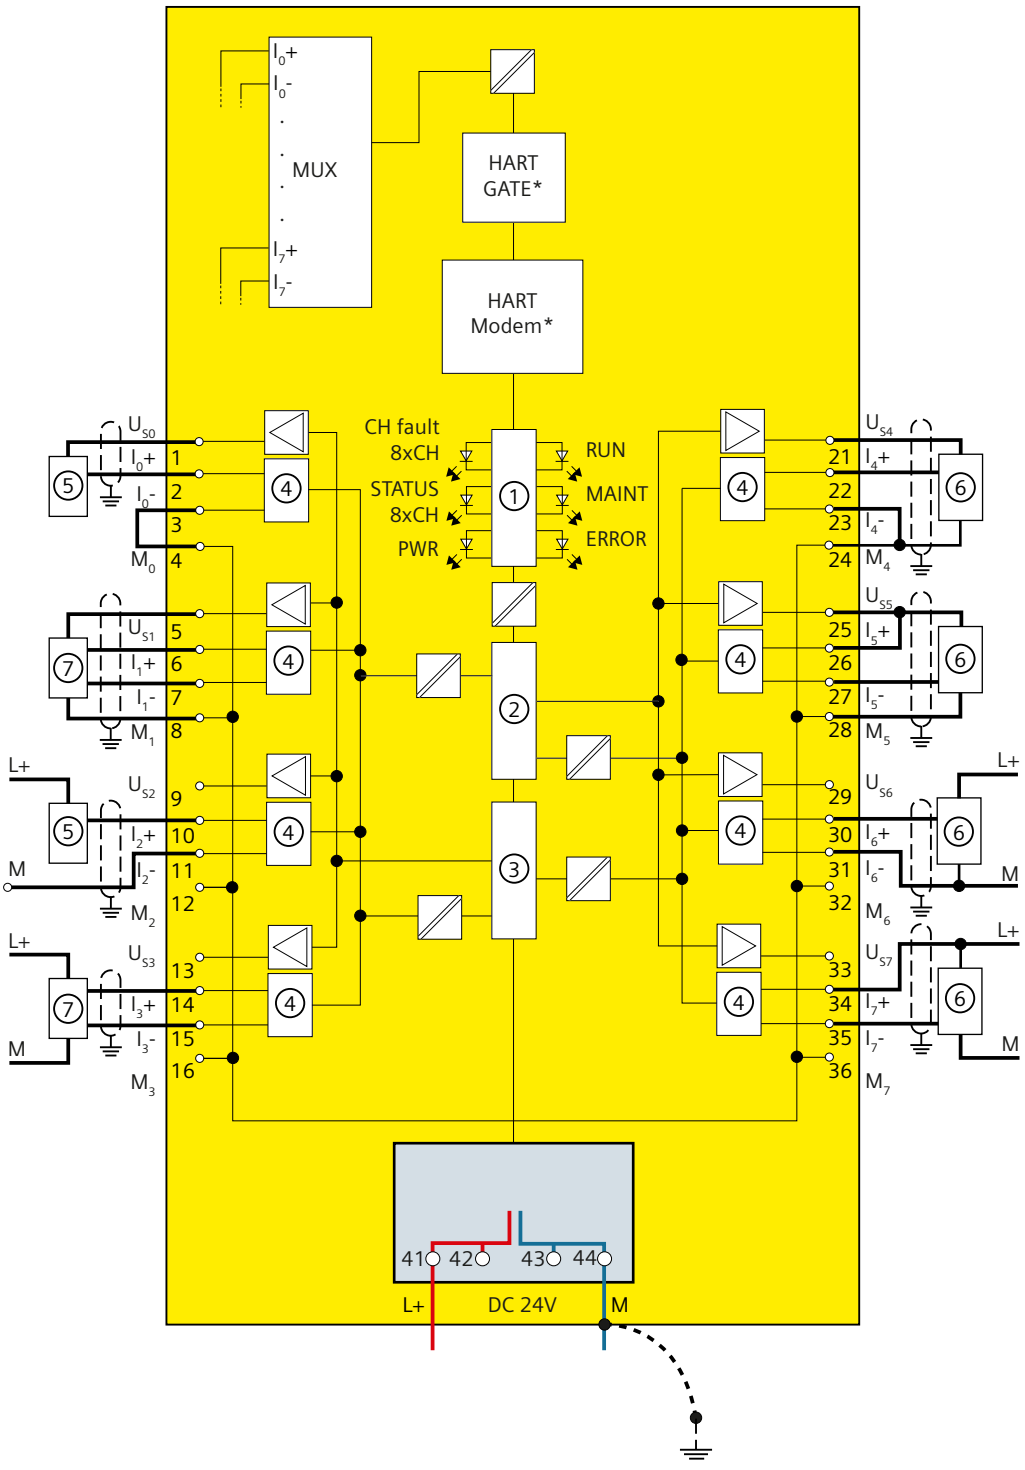
7.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (https://support.industry.siemens.com/cs/ww/en/view/59191792) system manual.

Sensor supply

The sensor supply can be powered internally or externally.



Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal.

The assignment of the sensor supply is defined by the terminals. There is one fused sensor supply per channel.

You can also supply the sensors by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe analog input module F-AI 8xI 0(4)..20mA for connecting 1-channel sensors.

①	Backplane bus interface	RUN	LED status display (green)
②	Microcontroller 1	ERROR	LED for fault display (red)
③	Microcontroller 2	PWR	LED for power supply (green)
④	Signal evaluation	MAINT	LED for MAINT ALARM (yellow)

⑤	2-wire transducer	CH fault	LED for channel fault (red)
⑥	3-wire transducer	STATUS	LED for channel status (green)
⑦	4-wire transducer	*	The function is supported as of firmware V2.0.

Figure 1-626 One sensor connected via one channel

⚠ WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

⚠ WARNING

With 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

Assignable parameters for application 1

Table 1-910 Parameters for application case 1 of F-AI 8xI 0(4)..20mA

Parameter	Value range in safety mode
Behavior after channel faults	• Passivate the entire module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo1 evaluation (max. SIL3/Cat.3/PLd)
Measuring range	• 0...20 mA • 4...20 mA
Diagnosis: Wire break	(in measuring range 4...20 mA) • Disable • Enable
Smoothing	1/2/4/8/16/32/64 conversion cycles

7.3 Application 2: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The analog input module F-AI 8xI 0(4)..20mA has 8 fail-safe inputs AI_0 to AI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- AI_0 and AI_4
- AI_1 and AI_5
- AI_2 and AI_6
- AI_3 and AI_7

The process signals are provided by channels AI_0, AI_1, AI_2 and AI_3.

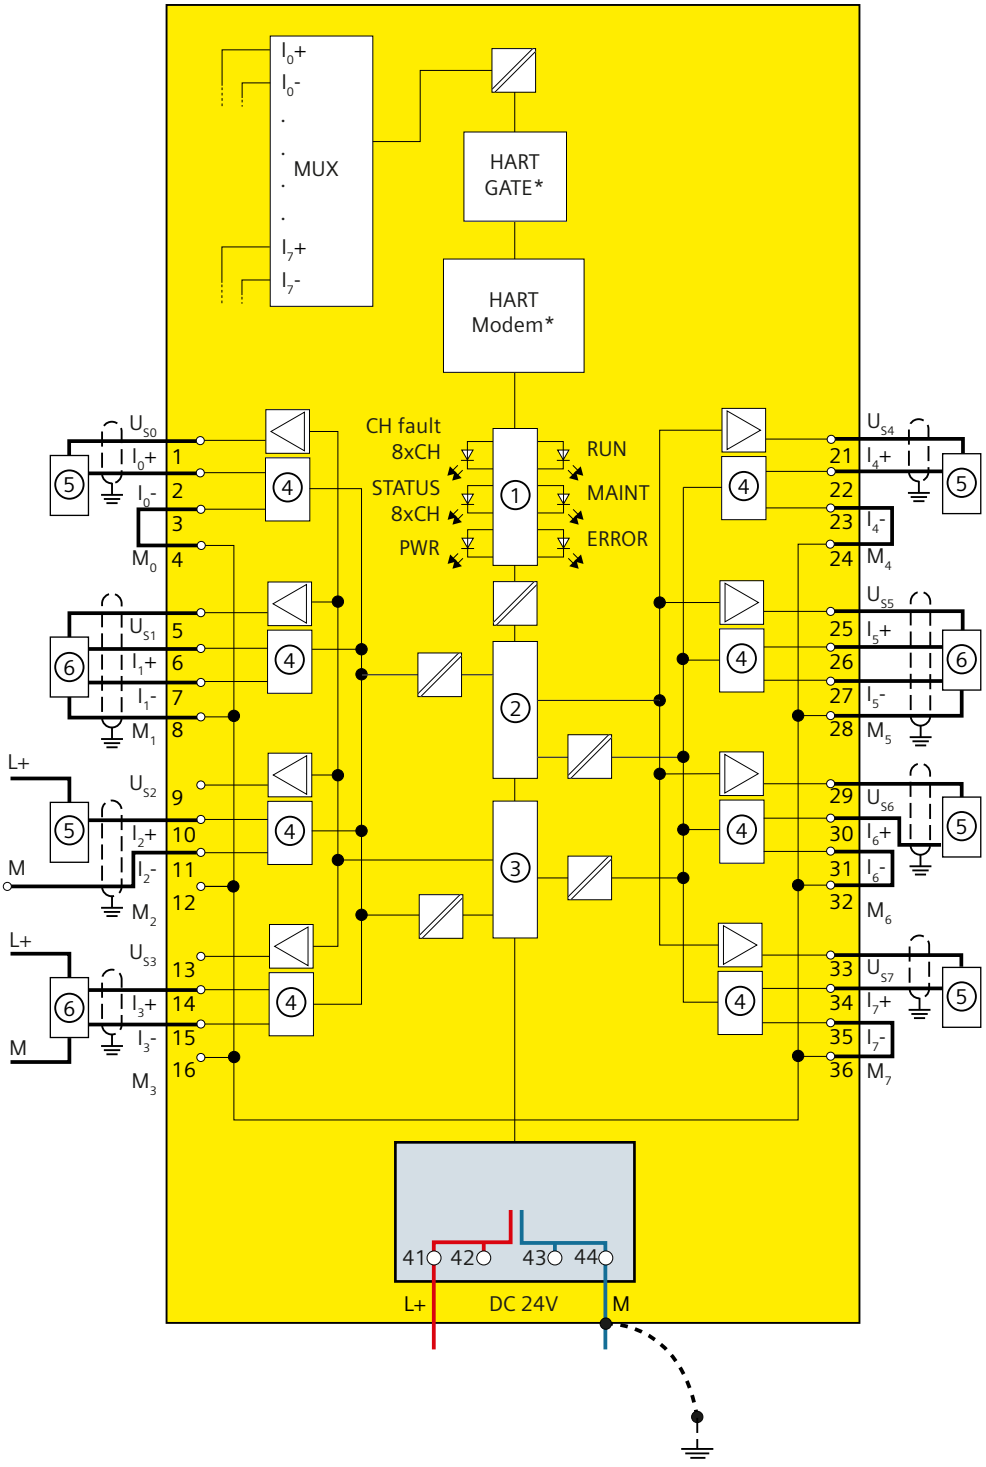
NOTE

You can mix 1oo1 evaluation and 1oo2 evaluation in an F-AI module. You must interconnect and configure the inputs according to the fail-safe requirements (SIL3/Cat.3/PLd and SIL3/Cat.4/PLe).

Wiring

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (https://support.industry.siemens.com/cs/ww/en/view/59191792) system manual.

Sensor supply



The sensor supply can be powered internally or externally.

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

You can also supply the sensors by means of an external sensor supply.

The figure below shows an example of the pin assignment of the fail-safe analog input module F-AI 8xI 0(4)..20mA for connecting 2-channel sensors.

①	Backplane bus interface	RUN	LED status display (green)
②	Microcontroller 1	ERROR	LED for fault display (red)
③	Microcontroller 2	PWR	LED for power supply (green)
④	Signal evaluation	MAINT	LED for MAINT ALARM (yellow)
⑤	2-wire transducer	CH fault	LED for channel fault (red)
⑥	4-wire transducer	STATUS	LED for channel status (green)
		*	The function is supported as of firmware V2.0.

Figure 1-627 Two single-channel sensors connected via 2 channels

⚠ WARNING

To achieve SIL3/Cat.4/PLe with this wiring, you must use suitably qualified sensors.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

Assignable parameters for application 2

Table 1-911 Parameters for application case 2 of F-AI 8xI 0(4)..20mA

Parameter	Value range in safety mode
Unit value	• MIN • MAX
Discrepancy time	100 to 30000 ms
Tolerance window abs.	0.3 to 20.0%
Tolerance window rel.	0.3 to 20.0%
Behavior after channel faults	• Passivate the entire module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo2 evaluation (max. SIL3/Cat.4/PLe)
Measuring range	• 0...20 mA • 4...20 mA
Diagnosis: Wire break	(in measuring range 4...20 mA) • Disable • Enable
Smoothing	1/2/4/8/16/32/64 conversion cycles

Interrupts/diagnostic messages

8

8.1 Status and error displays

LED displays

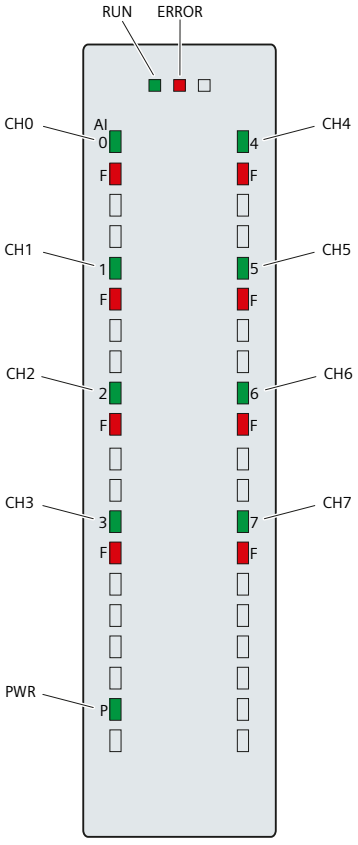


Figure 1-628 **LED displays of the F-AI 8xI 0(4)..20mA** module

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic alarms can be found in section Diagnostic alarms (Page 72).

WARNING

The RUN, ERROR LEDs and channel status/channel diagnostics LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

RUN and ERROR LEDs

Table 1-912 RUN and ERROR status and error displays

LED		Meaning	Remedy
RUN	ERROR		
Off	Off	Missing or insufficient voltage on the backplane bus	• Switch on the CPU and/or the system power supply modules. • Check whether the module is correctly plugged into the U-connector. • Check whether too many modules are plugged in.
Flashing	Off	Module starts up and flashes up to the valid parameter assignment.	---
On	Off	Module parameters are assigned and module addressed.	
Off	Flashing	Firmware is being updated.	
On	Flashing	Indicates diagnostic interrupts: • Module fault (for example, supply voltage too high) • Channel fault (e.g. wire break) • PROFIsafe communication fault • At least one channel is waiting for user acknowledgment.	Evaluate the diagnostics and eliminate or acknowledge the error. It may be necessary to remove and re-insert the module.
Flashing	Flashing	Hardware defective.	Replace the module.
Alternately flashing		The F-module expects user acknowledgment after a module fault.	Acknowledge the error (see manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126)).

PWR LED

Table 1-913 PWR status display

PWR LED	Meaning
Off	Power supply L+ missing
On	Power supply L+ available

CHx LED

Table 1-914 Display channel status/channel diagnostics

Status CHx	Diagnostics CHx	Meaning
Off	Off	Channel deactivated or power supply L+ missing.
On	Off	Channel activated and no channel diagnostics

Status CHx	Diagnostics CHx	Meaning
Off	On	Channel activated and channel diagnostics
On	On	Channel activated and diagnostics with HART protocol
Alternately flashing		Channel waiting for user acknowledgment

CHx/Error LED with PROFIsafe address assignment

Table 1-915 Channel status/channel diagnostics/Error display with PROFIsafe address assignment

Status CHx	Diagnostics CHx	ERROR	Meaning
Off	All on	Flashing	The PROFIsafe address does not match the configured PROFIsafe address
All are flashing	Off	Flashing	Identification of the F-module when assigning the PROFIsafe address

CHx/RUN/ERROR LED if power supply error occurs

Table 1-916 Channel status/channel diagnostics/RUN/ERROR display if power supply error occurs

CHx status	Diagnostics CHx	RUN	ERROR	Meaning
Off	On	On	Flashing	• Supply voltage too high or too low. • Module is waiting for user acknowledgment.

8.2 Interrupts

Introduction

The fail-safe analog input module F-AI 8xI 0(4)..20mA supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic alarm described in section Diagnostic alarms (Page 72).

The table below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Diagnostics Short-circuit
Before acknowledging the short-circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the troubleshooting procedure described in section Diagnostic alarms (Page 72)

Table 1-917 Diagnostic interrupts of the F-AI 8xI 0(4)..20mA

Diagnostic interrupt	Fault code	Signaled in application case	Scope of diagnostic interrupt	Configurable
Overtemperature	5_H	1, 2	F-module	No
Wire break	6_H		Channel	Yes
High limit exceeded	7_H			No
Low limit violated	8_H			
Parameter error	10_H		F-module	
Supply voltage missing	11_H			
Communication fault	13_H			
Channel/component temporarily not available	$1F_H$			
Mismatch of safety destination address (F_Dest_Add)	40_H			
Safety destination address not valid (F_Dest_Add)	41_H			
Safety source address not valid (F_Source_Add)	42_H			
Safety watchdog time value is 0 ms (F_WD_Time)	43_H			
Parameter F_SIL exceeds SIL from specific device application	44_H			
Parameter F_CRC_Length does not match the generated values	45_H			
Version of F parameter set incorrect	46_H			
CRC1 fault	47_H			
Device-specific diagnostics information, see manual	48_H			
Save iParameter watchdog time exceeded	49_H			
Restore iParameter watchdog time exceeded	$4A_H$			
Inconsistent iParameters (iParCRC error)	$4B_H$			
F_Block_ID not supported	$4C_H$			
Transmission error: Inconsistent data (CRC error)	$4D_H$			
Transmission error: Timeout (watchdog time 1 or 2 expired)	$4E_H$			

Diagnostic interrupt	Fault code	Signaled in application case	Scope of diagnostic interrupt	Configurable
Acknowledge required to enable channel(s) - as channel error(s) are remedied.	$4F_H$	1, 2	F-module	No
Watchdog tripped	103_H			
Internal supply voltage fault	104_H			
Invalid/inconsistent firmware present	$11B_H$			
Diagnostics queue overflow	$13E_H$			
HART parameter error	140_H		Channel	Yes
HART communication error	141_H			
HART primary variable out of range	142_H			
HART analog output current saturated	143_H			
HART output current of the field device fixed	144_H			
HART - more status available	145_H			
HART configuration changed	146_H			
HART field device malfunction	147_H			
HART - non primary variable out of limits	149_H			
Analog input signal not recorded unique	304_H		Channel	No
Internal sensor supply short-circuit to P	306_H		Channel	No
Overload or internal sensor supply short-circuit to ground	307_H		Channel	No
Channel failure acknowledgment	$30B_H$		Channel	No
F-address memory not accessible	$30D_H$		F-module	No
No valid F-address available	$30E_H$			
Undertemperature	312_H			
Discrepancy failure	314_H		Channel	No
Supply voltage too high	321_H		F-module	No
Supply voltage too low	322_H			
Safety related HART shutoff defective	$32A_H$			
F module error (0x032F)	$32F_H$			
ADC failure	331_H		Channel	No
Failure in the test circuit	332_H			

8.3 Diagnostic alarms

Diagnostic alarms

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For more information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Table 1-918 Diagnostic alarms of the F-AI 8xI 0(4)..20mA

Diagnostic alarm	Fault code	Meaning	Remedy
Overtemperature	5_H	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 78)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Wire break	6_H	Possible causes: • A cable to the sensor is broken. • Fault at the external circuit • Defective sensor • Wrong sensor type set in the parameters • Input channel not used • Measurement resistance too high	Check the possible causes and eliminate the fault.
High limit exceeded	7_H	The measured value exceeds the measuring range.	Check the interaction between the module and the sensor.
Low limit violated	8_H	The measured input value is below a measuring range.	Check the interaction between the module and the sensor.
Parameter error	10_H	Parameter errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient power supply L+	• Check power supply L+ at the front connector • Check the front connector
Communication fault	13_H	The module is defective.	Replace the module.
Channel/component temporarily not available	$1F_H$	Possible causes: • Internal fault in the F-module • Firmware update error	• Replace the F-module. • Repeat the firmware update.

Diagnostic alarm	Fault code	Meaning	Remedy
Mismatch of safety destination address (F_Dest_Add)	40_H	The firmware of the F-module has detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	41_H	The firmware of the F-module has detected an illegal different F-destination address.	
Safety source address not valid (F_Source_Add)	42_H	The firmware of the F-module has detected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	43_H	The firmware of the F-module has detected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	44_H	The firmware of the F-module has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The firmware of the F-module has detected a discrepancy in the CRC length.	
Version of F parameter set incorrect	46_H	The firmware of the F-module has detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	47_H	The firmware of the F-module has detected inconsistent F-parameters.	
Device-specific diagnostics information, see manual	48_H	The PROFIsafe driver has received inconsistent fail-safe parameters.	Check the parameter assignment of the PROFIsafe driver.
Save iParameter watchdog time exceeded	49_H	iPar server does not respond to "save IPar" within 4.4 minutes.	Check the parameter assignment of the iPar server.
Restore iParameter watchdog time exceeded	$4A_H$	iPar server does not respond to "restore IPar" within 4.4 minutes.	Check the parameter assignment of the iPar server.
Inconsistent iParameters (iParCRC error)	$4B_H$	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	$4C_H$	The firmware of the F-module has detected an incorrect F_block_ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	$4D_H$	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Transmission error: Timeout (watchdog time 1 or 2 expired)	$4E_H$	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Acknowledge required to enable channel(s) - as channel error(s) are remedied.	$4F_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.

Diagnostic alarm	Fault code	Meaning	Remedy
Watchdog tripped	103_H	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Internal supply voltage fault	104_H	Internal voltage is too low.	Replace the F-module.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Diagnostics queue overflow	$13E_H$	Overflow of the diagnostics memory. It was not possible to send all pending diagnostics. This error can lead to deactivation of the F-module and even to switch off/on of the power supply.	Remedy the cause of the diagnostics surge.
HART parameter error	140_H	The module has detected an error in a HART parameter data record.	Check and correct the HART-specific parameters.
HART communication error	141_H	• HART field device does not reply • Timing error • HART field device did not understand the command that was sent (1st status byte)	• Check the process wiring • Correct the parameter assignment • Set output current ≥4 mA • Increase number of configured repetitions
HART primary variable out of range	142_H	• Incorrect parameters in the HART field device • HART field device is set to "Primary variable out of limits" in simulation mode • Incorrect measuring point • Assigned primary variable is outside the limits	• Check the parameter assignment of the HART device • Correct the simulation • Check whether the correct measuring transducer is connected
HART analog output current saturated	143_H	The output current of the HART field device is saturated: • Incorrect parameters in the HART field device • HART field device is set to a measured value that is too high in simulation mode • Incorrect measuring point	
HART output current of the field device fixed	144_H	The output current of the HART field device is permanently set: • Incorrect parameters in the HART field device • HART field device is set to a measured value that is too high in simulation mode • Incorrect measuring point	
HART - more status available	145_H	The HART field device identifier for "Additional status information available" has been set in the HART device status (in the 2nd status byte).	Read out status with HART command 48 and clear error/cause if necessary

Diagnostic alarm	Fault code	Meaning	Remedy
HART configuration changed	146_H	The identifier for "re-parameterization" of the HART field device has been set in the HART device status (in the 2nd status byte).	If a diagnostic interrupt is not to be triggered for the re-parameterization, the diagnostic interrupt must not be enabled.
HART field device malfunction	147_H	In the HART device status (in the 2nd status byte), the field device reports a malfunction.	• Read out status with HART command 48 and clear error/cause if necessary • Replace field device
HART - non primary variable out of limits	149_H	• Incorrect parameters in the HART field device • HART field device is set to "Non primary variable out of limits" in simulation mode • Incorrect measuring point • Assigned non primary variable is outside the limits	• Check the parameter assignment of the HART device • Correct the simulation • Check whether the correct measuring transducer is connected
Analog input signal not recorded unique	304_H	Measured values from the sensor are not plausible. Possible causes: • Increased EMC • F-module defective	Check the interaction between the F-module and the sensor.
Internal sensor supply short-circuit to P	306_H	Possible causes: • There is a short-circuit of the internal sensor supply with L+. • There is a short-circuit of two sensor supplies. • The sensor is defective.	• Eliminate the short-circuit in the process wiring. • Replace the sensor.
Overload or internal sensor supply short-circuit to ground	307_H	• The internal sensor supply is overloaded. • Missing or insufficient power supply L+.	• Eliminate the short-circuit in the process wiring.
Channel failure acknowledgment	$30B_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
F-address memory not accessible	$30D_H$	The F-source address and F-destination address stored in the electronic coding element cannot be accessed.	Verify that the coding element is present. Replace the coding element, if necessary.
No valid F-address available	$30E_H$	No valid PROFIsafe address is saved in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between target and actual configuration of the plant.	• In the case of initial commissioning or deliberate parameter change, assign the PROFIsafe address. • Check the consistency of the target and actual configuration.
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 78))
Discrepancy failure	314_H	The discrepancy time set for 1oo2 operation has been exceeded. Possible causes of the discrepancy failure: • Incorrect parameter assignment • Wire break in the sensor's supply cable	Check the discrepancy time, the sensors and the cabling.
Supply voltage too high	321_H	The power supply is too high.	Check the power supply.
Supply voltage too low	322_H	The power supply is too low.	Check the power supply.

Diagnostic alarm	Fault code	Meaning	Remedy
Safety related HART shutoff defective	$32A_H$	The signal module has a malfunction in the safety-related HART shutoff. Cause: Fault in the F-module	Replace the F-module.
F module error (0x032F)	$32F_H$	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• The internal diagnostics has detected an error. The module must be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
ADC failure	331_H	Internal error during analog-digital conversion. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Failure in the test circuit	332_H	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.

NOTE

HART diagnostics for PROFIBUS IM with GSD file

For PROFIBUS IM with GSD file, the HART diagnostics are represented by "External error".

NOTE

HART diagnostics

HART diagnostics are generated in parallel and additionally in the event of wire break and over/underflow.

Power supply outside the nominal range

If the power supply L+ is outside the specified value range, the ERROR LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute, see Technical specifications (Page 78)), the ERROR LED stops flashing. The module remains passivated and waits for user acknowledgment.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all F-modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

See also

Applications of the F-I/O module (Page 59)

8.4 Value status

Properties

In addition to the diagnostic messages and the status and fault display, the F-module provides information about the validity of each analog input signal – the value status. The value status is entered in the process image along with the input signal.

Value status for analog input and output modules

The value status is the binary additional information of an analog input signal. The value status is entered in the process image of the inputs at the same time as the process value. It provides information about the validity of the analog input signal.

The value status is affected by all faults.

- 1_B: A valid process value is output for the channel.
- 0_B: A substitute value is output for the channel, or the channel is deactivated.

NOTE

You may only access the addresses occupied by user data and value status.
The other address ranges occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.
1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors, you can only access the low order channel in the safety program, e.g. channel 0.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image inputs. You can find the assignment in section Address space (Page 53).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Product type designation	F-AI 8xI 0(4) ... 20 mA
Firmware version	
• FW update possible	Yes
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated from version	V18 with HSP0394 (FW V1.0) / V19 with HSP0451 (FW V2.0)
• PROFINET from GSD version/GSD revision	V2.42 / -
Operating mode	
• MSI	Yes; firmware V2.0 or higher
CiR - Configuration in RUN	
Reparameterization possible in RUN	No
Calibration possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA
Current consumption, max.	2.5 A; All channels are supplied from the encoder supply
Encoder supply	
Number of outputs	8
Short-circuit protection	Yes
24 V encoder supply	
• 24 V	Yes; min. L+ (-1.5 V)
• Short-circuit protection	Yes
• Output current per channel, max.	300 mA
Power	
Power available from the backplane bus	0.5 W
Power loss	
Power loss, typ.	2.5 W

Article number	6ES7536-1MF00-0AB0
Address area	
Address space per module	
• Inputs	23 byte
• Outputs	6 byte
Hardware configuration	
Automatic encoding	Yes
Analog inputs	
Number of analog inputs	8
permissible input current for current input (destruction limit), max.	35 mA
Input ranges (rated values), currents	
• 0 to 20 mA	Yes
– Input resistance (0 to 20 mA)	150 Ω
• 4 mA to 20 mA	Yes
– Input resistance (4 mA to 20 mA)	150 Ω
Cable length	
• shielded, max.	1 000 m
Analog value generation for the inputs	
Measurement principle	Sigma Delta
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Integration time (ms)	20 / 16,667
• Interference voltage suppression for interference frequency f1 in Hz	50 / 60 Hz
Smoothing of measured values	
• Number of smoothing levels	7
• parameterizable	Yes
• Step: None	Yes; 1x conversion time
• Step: low	Yes; 2x / 4x conversion cycle time
• Step: Medium	Yes; 8x / 16x conversion cycle time
• Step: High	Yes; 32x / 64x conversion cycle time
Encoder	
Connection of signal encoders	
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.05 %
Temperature error (relative to input range), (+/-)	0.005 %/K
Crosstalk between the inputs, max.	-70 dB

Article number	6ES7536-1MF00-0AB0
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.05 %
Operational error limit in overall temperature range	
• Current, relative to input range, (+/-)	0.3 %; without HART communication
Basic error limit (operational limit at 25 °C)	
• Current, relative to input range, (+/-)	0.05 %; without HART communication
Influence of a HART signal modulated on the input signal in relation to input range	
• error occurred at interference frequency suppression: 60 Hz	0.12 %
• error occurred at interference frequency suppression: 50 Hz	0.12 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	40 dB
• Common mode voltage, max.	60 V DC/30 V AC
• Common mode interference, min.	70 dB
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	No
Diagnoses	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• Overflow/underflow	Yes
Diagnostics indication LED	
• RUN LED	Yes; green LED
• ERROR LED	Yes; red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; green LED
• for channel diagnostics	Yes; red LED
Potential separation	
Potential separation analog inputs	
• between the channels	No
• between the channels, in groups of	4
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	60 V DC/30 V AC

Article number	6ES7536-1MF00-0AB0
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 4.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	40 °C
Dimensions	
Width	35 mm
Height	147 mm
Depth	129 mm
Weights	
Weight, approx.	290 g

Operational error limit in overall temperature range

⚠ WARNING

When designing the safety function, you must take into account the "Operational error limit in overall temperature range" information for the entire mission time.

Dimension drawing

See S7-1500 Automation System (https://support.industry.siemens.com/cs/ww/en/view/59191792) System Manual.

Response times

A

Introduction

The next section shows the response times of the analog input module F-AI 8xI 0(4)..20mA. The response times of F-AI 8xI 0(4)..20mA analog input module are included in the calculation of the F-system response time.

Definition of cycle time for fail-safe analog inputs

The response time results from the number of channels/channel pairs, the response time per channel/channel pair, the basic response time and the configured smoothing.

Times required for the calculation

- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 25 ms
- Basic response time: 8 ms
- Response time per channel pair
  - At 50 Hz: 23 ms
  - At 60 Hz: 20 ms

Conversion cycle time = Basic response time + (N × Response time per channel pair)

(N = Number of active channel pairs)

The conversion cycle time is the time in which all activated channels are processed/converted once.

Channel pairs are: 0-4, 1-5, 2-6, 3-7

If you use only one channel of the channel pair, the channel pair is considered used.

Example:

Activated channels: 0, 4, 1, 5 => N = 2

Activated channels: 0, 4, 1, 2 => N = 3

Typical response time

You can calculate the typical response time of F-AI 8xI 0(4)..20mA using the following formula:

Typical response time = Conversion cycle time × Smoothing

Maximum response time with no faults (Worst Case Delay Time, WCDT)

You can calculate the maximum response time of F-AI 8xI 0(4)..20mA (Worst Case Delay Time, WCDT) using the following formula:

Max. response time = 2 × Conversion cycle time × Smoothing

Response time in the case of a fault (one fault delay time, OFDT)

You calculate the response time of the F-AI 8xI 0(4)..20mA (One Fault Delay Time, OFDT):

- According to the following formula if a discrepancy error is present:

  Typical response time = Conversion cycle time × Smoothing + Discrepancy time + Conversion cycle time

  Maximum response time = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time
- According to the following formula if a channel fault is present:

  Typical response time = Conversion cycle time

  Max. response time = 2 × Conversion cycle time

This means that, for OFDT, the time on occurrence of a discrepancy error should be taken with parameter assignment "1oo2 evaluation (max. SIL3/Cat.4/PLe)" and the time on occurrence of a channel fault should be taken with parameter assignment "1oo1 evaluation (max. SIL3/Cat.3/PLd)".

Representation of analog values

B

This section shows the analog values for all measuring ranges that you can use with the F-AI 8xI 0(4)..20mA analog input module.

Measured value resolution

The analog values are shown as fixed-point number in two's complement.

The resolutions shown here are 16 bits including sign.

Table 1-919 Resolution of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of analog values

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table 1-920 Current measuring range 0 to 20 mA

Values		Current measuring range	Range
Dec.	Hex.	0 to 20 mA	
32512	$7F00_H$	> 23.518 mA	Overflow
32511 . . 27649	$7EFF_H$ . . $6C01_H$	23.518 mA . . 20.0007 mA	Overrange
27648 . . 614	$6C00_H$ . . 266_H	20 mA . . 0.4442 mA	Nominal range
613 . . 1 0	265_H . . 1_H 0_H	< 0.4442 mA . . 723.4 nA 0 mA	Wire break

Table 1-921 Current measuring range 4 to 20 mA

Values		Current measuring range	Range	
Dec.	Hex.	4 to 20 mA	Diagnostics wire break: No	Diagnostics wire break: Yes
32512	$7F00_H$	> 22.814 mA	Overflow	Overflow
32511 . . 27649	$7EFF_H$ . . $6C01_H$	22.814 mA . . 20.0006 mA	Overrange	Overrange

Values		**Current measuring range**	**Range**	
27648 . . 1 0	$6C00_H$ . . 1_H 0_H	20 mA . . 4 mA + 578.7 nA 4 mA	Nominal range	Nominal range
-1 . . -691	$FFFF_H$ . . $FD4D_H$	3.9994 mA . . 3.6 mA	Underrange	Underrange
-692 . . -6144	$FD4C_H$ . . $E800_H$	< 3.6 mA . . 0.4444 mA		Wire break
-6145	$E7FF_H$	< 0.4444 mA	Underflow	

HART operating data records

C

C.1 HART operating data records

Read/write data in RUN

HART operating data records are transferred to the module with the "WRREC" instruction and read from the module with the "RDREC" instruction.

Errors during transmission are indicated at the output parameter STATUS of the "WRREC" or "RDREC".

The following HART operating data records are available:

Data record number	Description	Length (bytes)	Writable	Readable
80	HART request Channel 0	240	Yes	Yes
81	HART response Channel 0	240	No	Yes
82	HART request Channel 1	240	Yes	Yes
83	HART response Channel 1	240	No	Yes
84	HART request Channel 2	240	Yes	Yes
85	HART response Channel 2	240	No	Yes
86	HART request Channel 3	240	Yes	Yes
87	HART response Channel 3	240	No	Yes
88	HART request Channel 4	240	Yes	Yes
89	HART response Channel 4	240	No	Yes
90	HART request Channel 5	240	Yes	Yes
91	HART response Channel 5	240	No	Yes
92	HART request Channel 6	240	Yes	Yes
93	HART response Channel 6	240	No	Yes
94	HART request Channel 7	240	Yes	Yes
95	HART response Channel 7	240	No	Yes
121	HART variables	160	No	Yes
131	HART parameters Channel 0	8	Yes	Yes
132	HART parameters Channel 1	8	Yes	Yes
133	HART parameters Channel 2	8	Yes	Yes
134	HART parameters Channel 3	8	Yes	Yes
135	HART parameters Channel 4	8	Yes	Yes
136	HART parameters Channel 5	8	Yes	Yes
137	HART parameters Channel 6	8	Yes	Yes
138	HART parameters Channel 7	8	Yes	Yes
140	HART mapping parameters	12 or 20	Yes	Yes
148	HART directory	25	No	Yes
149	HART feature data	3	No	Yes

C.2 HART directory (DS 148)

Structure of the HART directory

Byte	Meaning	Comment
0	Profile Revision Number	= 2, 0 (Revision 2.0)
1		
2	Index of Client Management	= 255 (not relevant)
3	Number of Clients	= 1
4	Number of Channels	= 8
5	Write Read Index Offset	= 1 (The response to a request data record is made with the data record number of the request data record + 1)
6	Index of HMD Feature Parameter	= 149
7	Index of HMD Module Parameter	= 255 (not relevant)
8	Start Index of Burst Buffer Area	= 255 (not relevant)
9+n	Index of HMD Channel Parameter (Channel n)	= 131+n
9+n+4	Index of HART Client Channel Message Data	= 80+(2*n) The HART request data records are not configurable. Data records starting from data record number 80 (80, 82, 84, 86, 88, 90, 92, 94) are always used.

C.3 HART feature data (DS 149)

Structure of the HART feature data

Byte	Meaning	Comment
0	Byte 0	= 0x62 Bit 1 = 1: "Parameter check result is given with a read response" Bit5 = 1: “compact format is supported”
1	Byte 1	= 0
2	Max Length Data Unit	= 230 (maximum length of the HART request data)

C.4 HART variable data record (DS 121)

The analog module F-AI 8xI 0(4)..20mA supports a maximum of 4 HART variables per channel. Provided they are supported by the connected field device, these variables are read cyclically.

These 32 HART variables are made available as readable variables in HART variable data record 121.

Each HART variable consists of a 4-byte real value and a 1-byte quality code.

Structure of the HART variable data record

Byte	Meaning	
Channel 0		
0 ... 3	Value	PV (Primary Variable)
4	Quality code	
5 ... 8	Value	SV (Secondary Variable)
9	Quality code	
10 ... 13	Value	TV (Tertiary Variable)
14	Quality code	
15 ... 18	Value	QV (Quaternary Variable)
19	Quality code	
Channel 1		
20 ... 39	HART variables same as for channel 0	
Channel 2		
40 ... 59	HART variables same as for channel 0	
Channel 3		
60 ... 79	HART variables same as for channel 0	
Channel 4		
80 ... 99	HART variables same as for channel 0	
Channel 5		
100 ... 119	HART variables same as for channel 0	
Channel 6		
120 ... 139	HART variables same as for channel 0	
Channel 7		
140 ... 159	HART variables same as for channel 0	

If HART is not enabled or the respective HART variable is not supplied from the connected field device, the corresponding variable = 0 and the QC = 0x37 (initialization value from the analog module).

C.5 HART-specific settings (DS 131 to DS 138)

HART communication is available via the standard configuration (see Parameters (Page 34)).

Additional HART-specific settings can be specified channel-specifically via data records 131 to 138.

The parameters assigned with STEP 7 are not changed permanently in the CPU, which means the parameters assigned with STEP 7 are valid again after a restart.

Channel	Data record number
0	131
1	132
2	133
3	134
4	135
5	136
6	137
7	138

Structure of the HART-specific settings

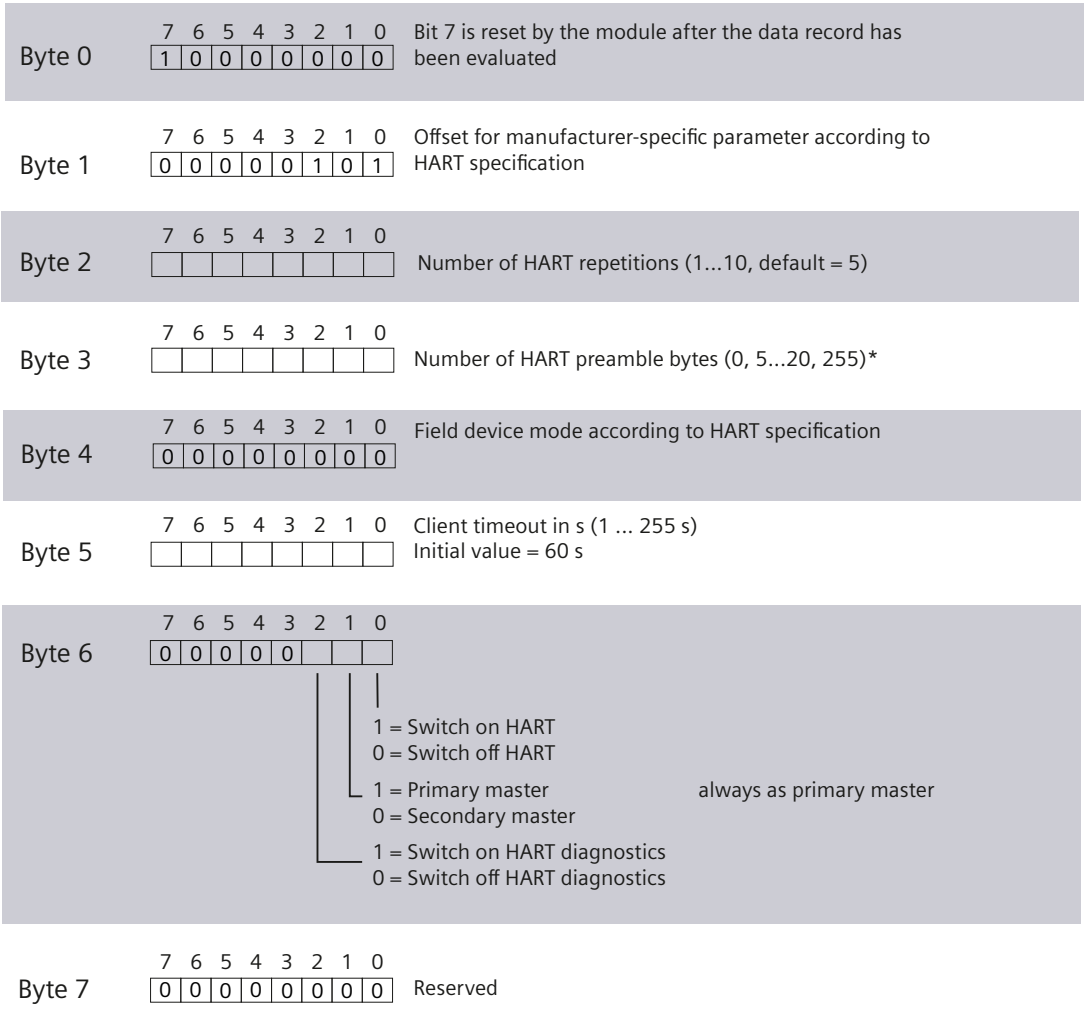

Figure 1-629 Settings

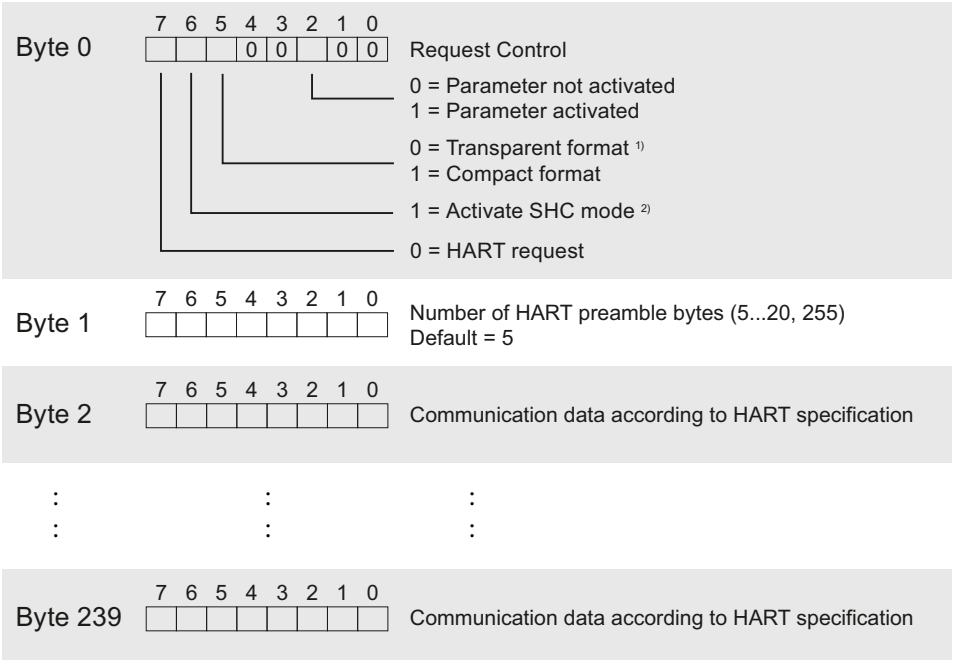
* If the number of HART preamble bytes = 0, the number of preamble bytes required by the connected field device is used, but at least 5.

If the number of HART preamble bytes = 255, 20 preamble bytes are used.



C.6 HART request and response data records (DS 80 to DS 95)

HART commands are processed channel-specifically via a separate command interface, each with a request data record and a response data record.

Channel	Data record number	
	Request to the field device	Response from the field device
0	80	81
1	82	83
2	84	85
3	86	87

Channel	Data record number	
	Request to the field device	Response from the field device
4	88	89
5	90	91
6	92	93
7	94	95

Structure of the request data records 80, 82, 84, 86, 88, 90, 92, 94

1) HART commands are processed by the analog module in transparent message format and in compact message format. However, the response data from the module is always made available in transparent message format.

2) When a sequence of HART commands in the form of an SHC sequence is processed, this affects all other channels with activated HART. See HART command interface (Page 29) SHC sequence.

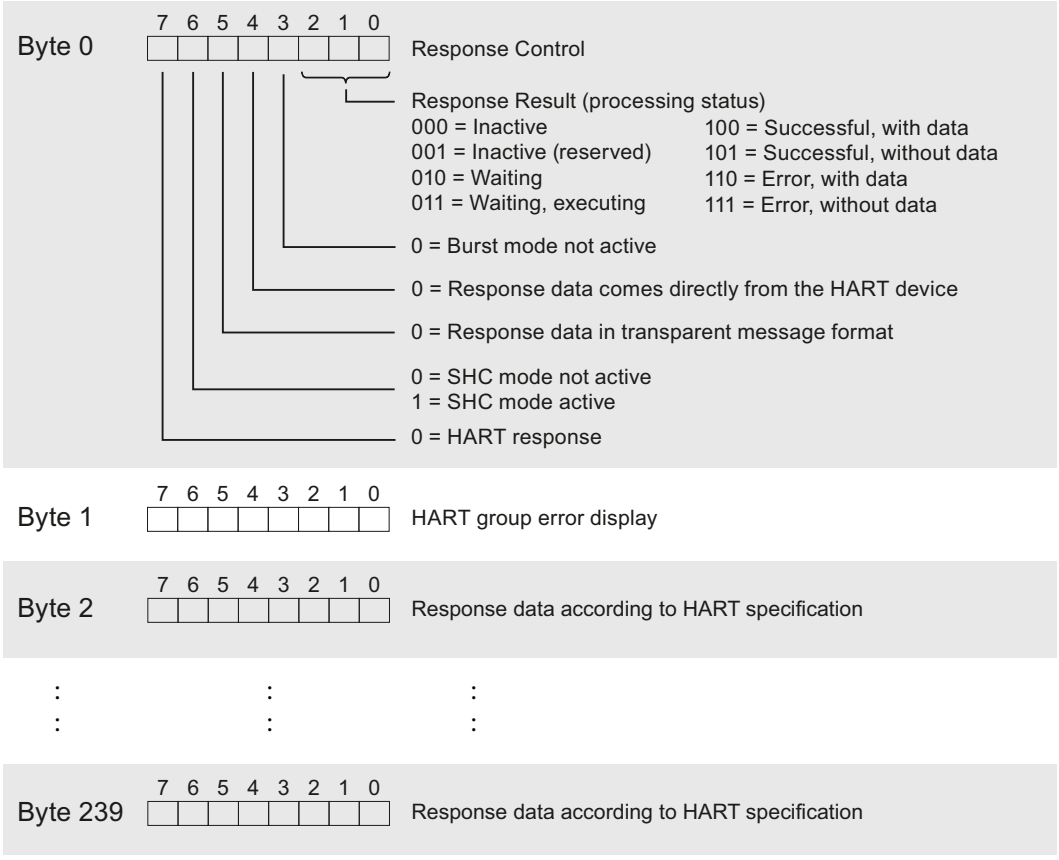
Figure 1-630 Request data record

NOTE

If "Number of HART preamble bytes" = 255, the number of preambles set via the parameters is used. 5 are set by default. You can change the configured number of preamble bytes via the parameters as well as via the HART-specific settings (see HART-specific settings (DS 131 to DS 138) (Page 89)).

Structure of the response data records 81, 83, 85, 87, 89, 91, 93, 95

In case of successful response



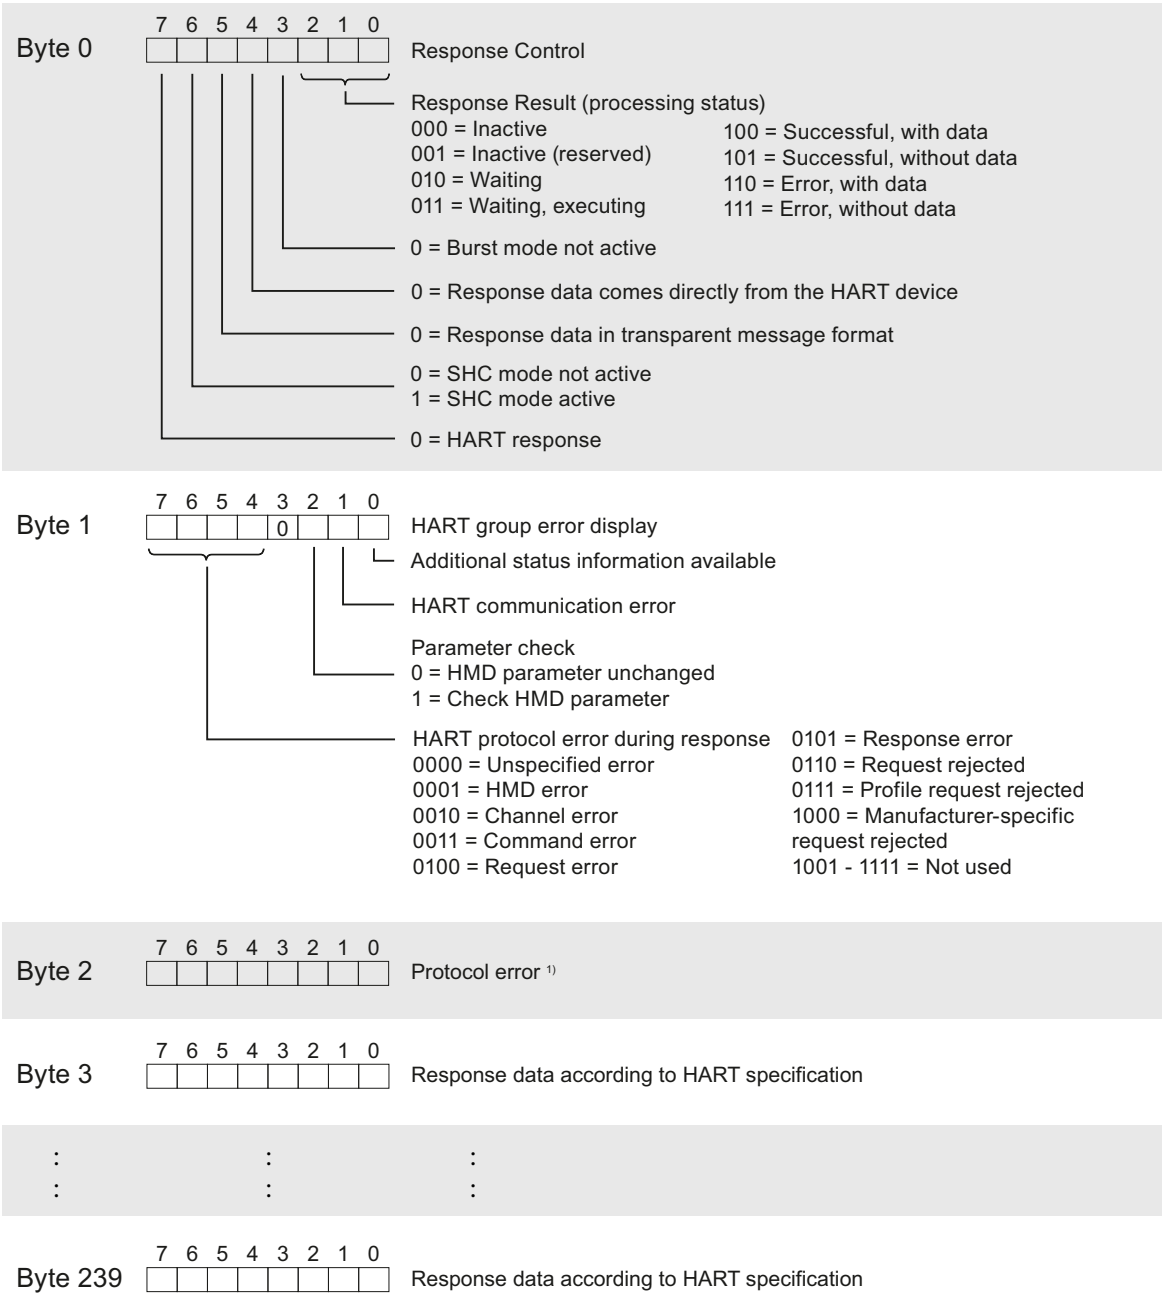


Figure 1-631 Response data record in case of successful response

In case of response error

1) See table: "HART protocol error during response" coding

Figure 1-632 Response data record in case of response error

Table 1-922 "HART protocol error during response" coding

HART protocol error with response	Meaning	Explanation
0	Unspecified error	Always 0
1	HMD error	0: Not specified 1: Internal communication error 2: Parameter assignment error 3: HW fault 4: Wait time expired 5: HART timer expired 6 ... 127: Reserved 128 ... 255: Manufacturer-specific
2	Channel error	0: Not specified 1: Line fault 2: Short-circuit 3: Open line 4: Low current output 5: Parameter assignment error 6 ... 127: Reserved 128 ... 255: Manufacturer-specific
3	Command error	0-127: HART protocol, Bit 7 = Always 0
4	Query error	Bit 0 = 0: Reserved Bit 1 = 1: Receive buffer overflow Bit 2 = 0: Reserved Bit 3 = 1: Checksum error Bit 4 = 1: Framing error Bit 5 = 1: Overflow error Bit 6 = 1: Parity error Bit 7 = 1: Reserved
5	Response error	Bit 0 = 1: GAP timeout Bit 1 = 1: Receive buffer overflow Bit 2 = 1: Timeout Bit 3 = 1: Checksum error Bit 4 = 1: Framing error Bit 5 = 1: Overflow error Bit 6 = 1: Parity error Bit 7 = 1: Reserved
6	Query rejected	0: Unspecified 1: Compact format not supported 2: SHC not supported 3: Impermissible command 4: No resources 5 ... 127: Reserved 128 ... 255: Manufacturer-specific
7	Profile query rejected	0: Not specified (not supported)
8	Manufacturer-specific query rejected	0: Not specified (not supported)

Example of HART programming (HART command interface)

For HART channel 0, command 01 is to be sent in Transparent Message Format to the HART field device with the address "2A 2F 00 59 D3".

A positive edge at input 4.0 of a digital input module causes the HART command to be written.

The following assumptions are made:

- The identification number of the hardware component of the analog module F-AI 8xI 0(4)..20mA is 266 ($10A_H$).
- The data record is stored in DB80: starting from address 0.0, length of 11 bytes.
- In this example, DB80 (request data record for channel 0) consists of 11 bytes.

Symbol	Address	Data type	Comment
T_DS80	I 4.0	Bool	Button of DS80
M_PF_WR	M 104.0	Bool	Positive edges auxiliary flag WRREC
M_WR_Done	M 51.0	Bool	Flag =1 : Data record was transferred
M_WR_Busy	M 51.1	Bool	Flag =1 : Writing has not yet finished
M_WR_Error	M 51.2	Bool	Flag =1 : An error occurred when writing.
MD_WR_Sta-tus	MD 93	DWord	WRREC block status or error information
DB80	DB80	DB80	The data record is stored in DB80

```
SCL                                 Explanation
"R_TRIG_DB"(CLK:="T_DS80",
  Q=>"M_PF_WR");
WHILE "M_PF_WR" DO
  "WRREC_DB"(REQ := TRUE,
    ID := 266,                      Identification number of the hardware component
    INDEX := 80,                    Data record number 80
    LEN := 11,                      Data record length 11 bytes
    DONE => "M_WR_Done",            Done= True: Data record was transferred
    BUSY => "M_WR_Busy",            BUSY= True: Writing has not yet finished
    ERROR => "M_WR_Error",          ERROR = True: An error occurred when writing.
    STATUS => "MD_WR_Status",       Block status or error information
    RECORD := P#DB80.DBX0.0 BYTE    Data record with length of 11 bytes (must corres-
11                                  pond to the exact length that is to be transferred)
  );
  IF ("M_WR_Done"                   Exit loop immediately if data record was trans-
OR "M_WR_Error") THEN               ferred or an error occurred.
    EXIT;
    ;
  END_IF;
  ;
END_WHILE;
```

Table 1-923 DB80: Transparent message format

Byte	Initial value (hex)	Comment (Hex)
0	00	Req_Control (00 = Transparent message format. 40 = Transparent message format with SHC sequence)
1	05	Number of preamble bytes (05-14)
2	82	Start character (02 = Short Frame with command 0) (82 = Long Frame with other commands)
3	2A	Address (with command 0, the address is exactly 1 byte long and has the value 0.)
4	2F	
5	00	
6	59	
7	D3	
8	01	Command (CMD)
9	00	Length in bytes
10	0D	Checksum (CHK) (calculated starting from byte 2 "Start character" up to the next to last byte)

A HART command can also be sent in Compact Message Format. In this case, the data transmitted via DB 80 is reduced to 4 bytes.

Table 1-924 DB80: Compact message format

Byte	Initial value (hex)	Comment (Hex)
0	20	Req_Control (20 = Compact message format. 60 = Compact message format with SHC sequence)
1	05	Number of preamble bytes (05-14)
2	01	Command (CMD)
3	00	Length in bytes

You can learn when the response from the field device was received by cyclically reading data record DS81 for HART channel 0. The response is always supplied in transparent message format.

  IF ("M_RD_Done"                   Exit loop immediately if data record was trans-
OR "M_RD_Error") THEN               ferred or an error occurred.
    EXIT;
    ;
  END_IF;
  ;
END_WHILE;
```

As long as "0x03" is in byte 0 of DB81, the response has not been received from the field device. As soon as bit 2 = 1 in byte 0, there is positive response data from the field device that you can evaluate.
In the event of incorrect response data, see the tables "HART group error display" in byte 1 or "HART protocol error on response" in byte 2 of the response from the field device.

C.7 Parameter assignment and structure of the HART mapping parameters (DS 140)

Structure of data record 140

Data record 140 has a length of 20 bytes.

You can use the parameters of data record 140 to configure/map up to 8 HART variables in the additional submodules of the module, provided the corresponding configuration is selected, see "HART mapping (Page 51)".

Data record 140 is then only evaluated by the module if 4 HART or 8 HART variables are configured.

Header information

The figure below shows the structure of the header information.

	7 6 5 4 3 2 1 0	
Byte 0		Version = 0
Byte 1		Block length = 19 bytes
Byte 2		Block type = 75
Byte 3		Reserved = 0

Preface

Purpose of the documentation

This manual supplements the system manual S7-1500 Automation System. You can find information on the functions that apply generally to the S7-1500 automation system and the ET 200MP distributed I/O system in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

The information provided in this manual and the system manual enables you to commission the S7-1500 automation system and ET 200MP distributed I/O system.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe the notes identified as follows:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which particular attention should be paid.

Important note for maintaining the operational safety of your system

NOTE

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators by means of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Log in to Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Open Source Software

Open-source software is used in the firmware of the product described. Open Source Software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information relating to this in the appendix.

Documentation guide

1

1.1 Guide to documentation S7-1500 / ET 200MP

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information
The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information
Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information
The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-controllers/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet.

Manual Collection S7-1500/ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/86140384).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet.

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

2.1 Properties

Order number

6ES7526-2BF00-0AB0

View of the module

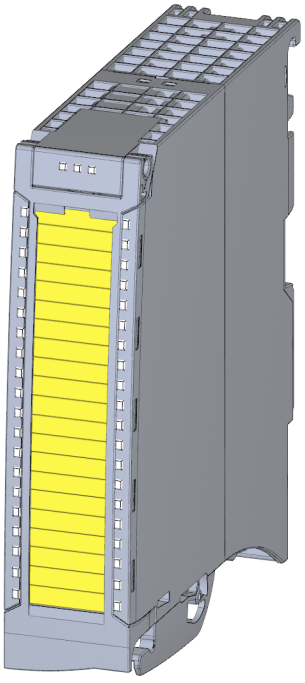

Figure 1-635 View of the F-DQ 8x24VDC/2A PPM module

Properties

- Technical properties
  - Fail-safe digital module for use in the S7-1500 automation system and in the ET 200MP distributed I/O system.
  - PROFIsafe
  - PROFIsafe address type 2
  - Supports the RIOforFA-Safety profile (on S7-1500 F-CPUs)
  - 8 output PM-switching or PP-switching in 2 channel groups (SIL3/Cat.4/PLe)
  - Supply voltage L+

  - Output current per output 2 A
  - Source output (PM/PP-switching)
  - Suitable for solenoid valves, DC contactors and signal lamps
  - Status display RUN (green LED)
  - Status display module diagnostics (red LED)
  - Status display channel status/channel diagnostics per output (green/red LED)
  - Status display supply voltage (green LED)
  - Diagnostics, e.g., short-circuit/wire break/load voltage missing, channel-specific
  - Channel-specific or module-wide passivation
- Supported functions
  - Firmware update
  - I&M identification data

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, switch off the supply voltage of the affected module before 100 hours expires. The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic alarms (Page 43).

Accessories

The following accessories are supplied with the module and can also be ordered as spare part:

- Labeling strips
- U-connector
- Universal front cover
- Electronic coding element

Additional components

The following component is to be ordered separately:

- Front connector incl. potential bridges and cable ties

You can find additional information on accessories in the S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs
If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.
Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.
One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.
The required measures are standardized for plants with product standards.
For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting

3

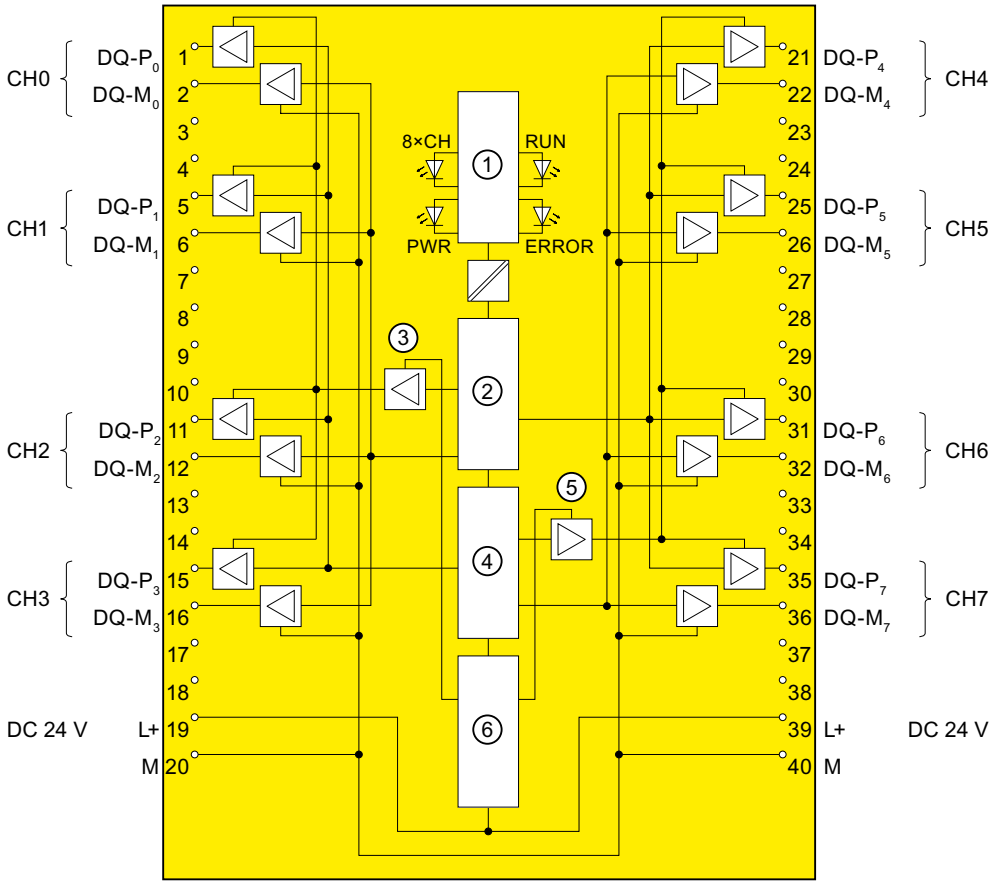
3.1 Block diagram

This section includes:

- The block diagram with the general pin assignment of the F-module.
- An example for switching of loads with ground.

For information on parameter assignment of the F-module, refer to "Parameters/address space (Page 16)".

Information on different connection options is available in the section Applications of the F-I/O module (Page 28).



You can find information on wiring the front connectors and creating the cable shielding, etc., in the Wiring section of the system manual Automation System S7-1500 (http://support.automation.siemens.com/WW/view/en/59191792).

WARNING

To protect the F-module, always install an external fuse with the following properties for the load circuit: Circuit-breaker 24 V DC/16 A, tripping characteristic type B.

Block diagram

The following figure shows the assignment of channels to addresses.

①	Backplane bus interface	$DQ\text{-}M_n$	Ground for output bit n, channel n, M-switching
②	Microcontroller 1	L+	Supply voltage 24 V DC
③	P1 switch for channel groups 0 to 3	M	Chassis ground
④	Microcontroller 2	CH	Channel or LED channel status, channel diagnostics (green, red)
⑤	P1 switch for channel groups 4 to 7	PWR	LED supply voltage (green)
⑥	Reverse polarity protection	RUN	RUN LED (green)
$DQ\text{-}P_n$	Output bit n, channel n, P-switching	ERROR	LED module diagnostics (red)

Note:
- In PP operation, the DQ M channels are not used.
- Terminal 19 and 39 (L+) bridged internally
- Terminal 20 and 40 (M) bridged internally
  Note the maximum permissible cable cross-sections and use both terminals, if necessary.

Figure 1-636 Block diagram of the F-DQ 8x24VDC/2A PPM

Switching of loads with ground if the F-module is configured PM-switching

If the following two conditions are met, F-DQ 8x24VDC/2A PPM detects a short-circuit:

- If loads that have a connection between chassis and ground are switched by the F-DQ 8x24VDC/2A PPM (for example, to improve the EMC properties).
- If chassis and ground are connected at the power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection (refer to the diagram below for an example).

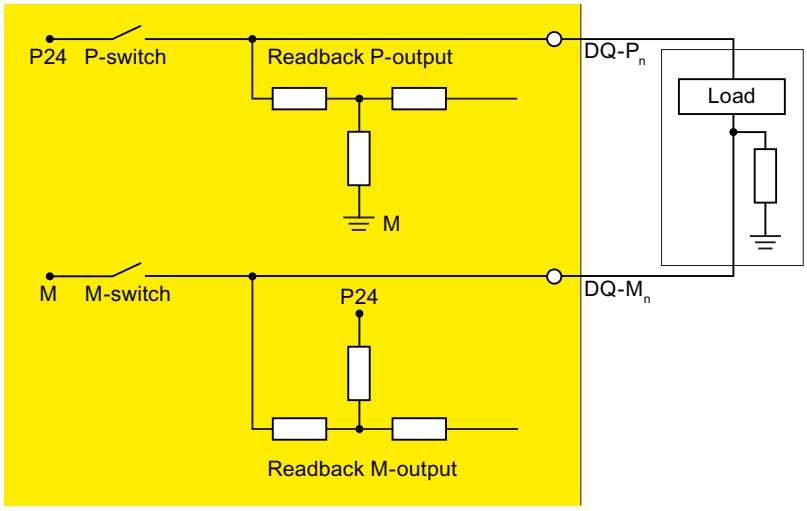


Figure 1-637 Switching of grounded loads (resistance between chassis and ground)

Remedy:

- Increase the parameters "Max. readback time dark test" and "Max. readback time switch-on test".
- Increase the value of the resistance between chassis and ground at the load end to more than 100 kΩ.

Or:

- Use the F-DQ 8x24VDC/2A PPM configured as a PP-switching module.

Parameters/address space

4

4.1 Parameters

Parameters

WARNING

Diagnostic functions must be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 28).

Table 1-925 Parameters for F-DQ 8x24VDC/2A PPM

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of F-monitoring time	• Disable • Enable	No	Module
F-monitoring time	1 to 65535 ms	No	Module
F-source address	1 to 65534	No	Module
F-destination address	1 to 65534	No	Module
F-parameter signature (without address)	0 to 65535	No	Module
Behavior after channel fault	• Passivate channel • Passivate the entire module	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	No	Module
F-I/O DB manual number assignment	• Disable • Enable	No	Module
F-I/O DB-number	—	No	Module
F-I/O DB name	—	No	Module
DQ parameters:			
Maximum test period	• 100 s • 1000 s	No	Module
Operating mode of the output	• PM-switching mode • PP switching	No	Module
Channel parameters in operating mode PM-switching:			
Channel n			
Diagnostics: Wire break	• Disable • Enable	No	Channel
Channel activated	• Disable • Enable	No	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	No	Channel
Max. readback time dark test	0.8 to 400.0 ms	No	Channel
Disable dark test for 48 hours	• Disable • Enable	No	Channel
Max. readback time switch on test	0.8 to 5.0 ms	No	Channel
Activated light test	• Disable • Enable	No	Channel
Channel parameters in operating mode PP-switching:			
Channel n			
Diagnostics: Wire break	• Disable • Enable	No	Channel
Channel activated	• Disable • Enable	No	Channel 1…7 (Channel 0 always enabled)
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	No	Channel
Max. readback time dark test	0.8 to 400.0 ms	No	Module (Channel 0)
Disable dark test for 48 hours	Disable	No	Module
Max. readback time switch on test	0.8 to 5.0 ms	No	Module (Channel 0)
Activated light test	Enable	No	Module

4.2 Explanation of parameters

4.2.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Basis for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address) and the F I/O DB in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

4.2.1.1 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

4.2.1.2 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use in S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use in S7-1500 F-CPUs
When using the fail-safe module in S7-1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.2.2 DQ parameters

4.2.2.1 Maximum test period

With this parameter, you specify the time within which the light, dark and switch on tests should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test time is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

The "Maximum test period" parameter is a module parameter, which means the test cycle for the entire fail-safe output module is performed within the configured maximum test time. If the bit pattern test is not performed within the configured time (or the shortened test time of 60 seconds in case of an error), the module goes into the error state.

4.2.2.2 Operating mode of the output

Chooses between PM and PP switching mode for the outputs.

After re-parameterization of the operating mode, the power supply of the F-module must be switched OFF and ON.

4.2.3 Parameters of the channels

4.2.3.1 Diagnostics: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

You also have to activate the light test to detect a wire break with an output signal "0".

⚠ WARNING

The diagnostics for wire break of the outputs is not designed for safety-related functions and can therefore not be evaluated for safety-related activities.

4.2.3.2 Channel activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

You can deactivate an unused channel with this parameter.

4.2.3.3 Channel failure acknowledge

Use in S7-1500 F-CPUs

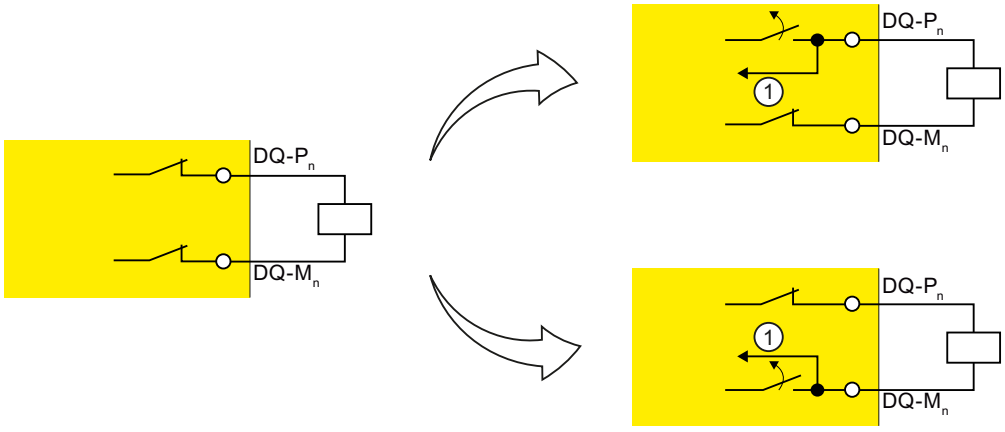
This parameter is only relevant if the fail-safe module is operated on an S7-1500 F-CPU, and can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel should react to a channel fault:

- Manual: A channel is not reintegrated until after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs

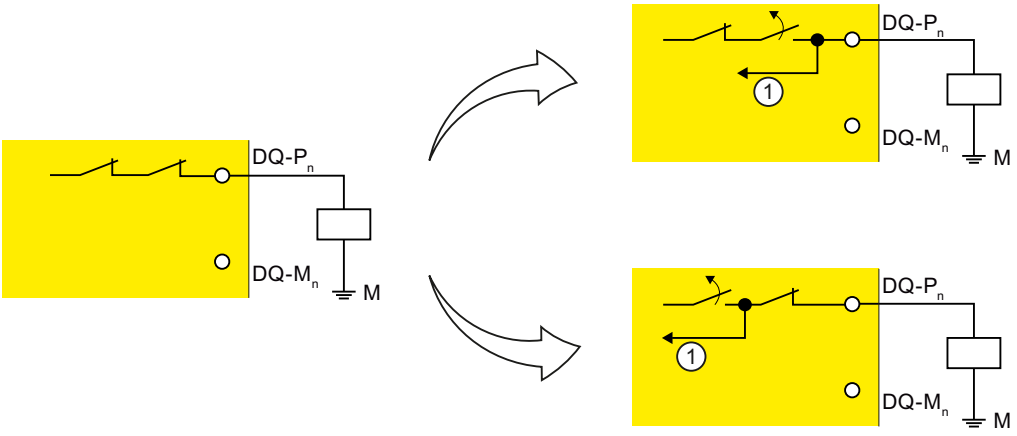
The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. There you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.



For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.3.4 Max. readback time dark test

Function



Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). The output channel is then switched off briefly (= "dark period") and read back (for **PM operation**, P- and M-readback, for **PP operation** only PP-readback). A sufficiently slow actuator does not respond to this and remains switched on.

① Readback (P-switch and M-switch do not switch simultaneously.)

Figure 1-638 Functional principle of the dark test (PM switching)

① Readback (The two P-switches do not switch simultaneously.)

Figure 1-639 Functional principle of the dark test (PP switching)

This parameter allows you to set the time for the readback.

If the expected signals could not be read back correctly after expiration of the readback time, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short-circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).
Short-circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short-circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

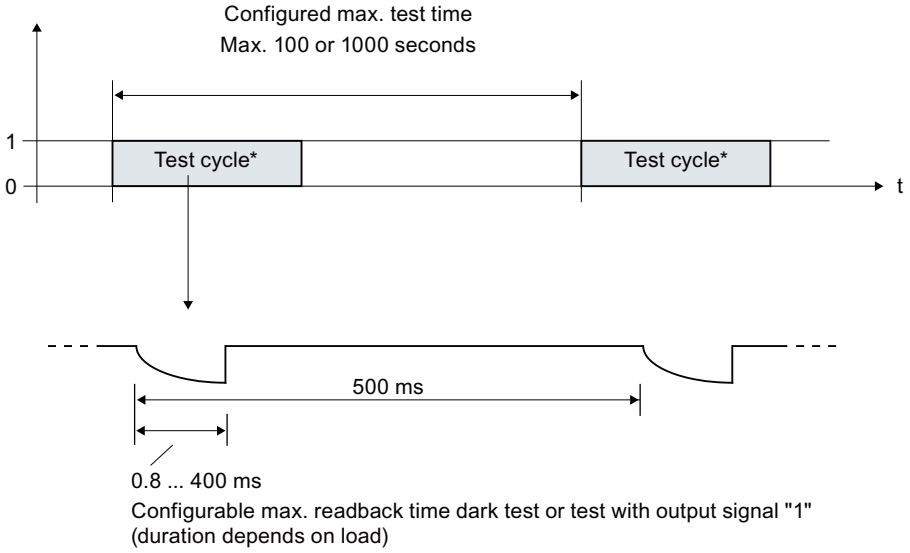
Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test as low as possible, but high enough that the output channel is not passivated.

In case of the "Connecting a load per digital output, PP switching" (Page 34) application, see the warnings and notes in the section describing the application.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads (Page 52).

Setting readback time dark test with unknown actuator capacity

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time dark test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.



Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use the process value "1" with a minimum duration that corresponds to the "maximum test time" parameter.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

To increase availability, we recommend that you maintain an interval to the determined limit for the times.

Test pulses of the dark test

* Output of test pulses only during test cycle.

Figure 1-640 Test pulses of the dark test

The interval between two test pulses is 500 ms.

4.2.3.5 Disable dark test for 48 hours

NOTE

Can only be configured for **PM operation**.

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, one dark test pulse is applied at the channel once this time has expired.

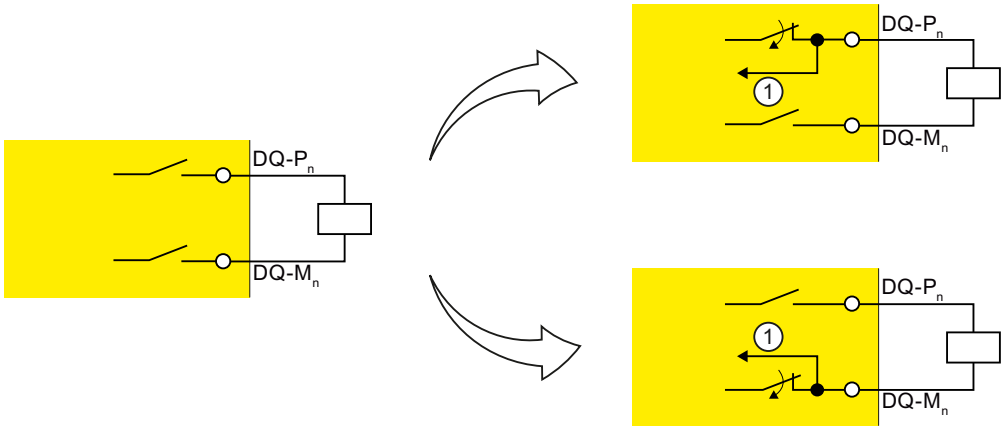
You must ensure the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. This also applies to the operating time if the operating time is < 48 hours. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING

When you use the function "Disable dark test for 48 hours", cross-circuits and other errors are not detected.



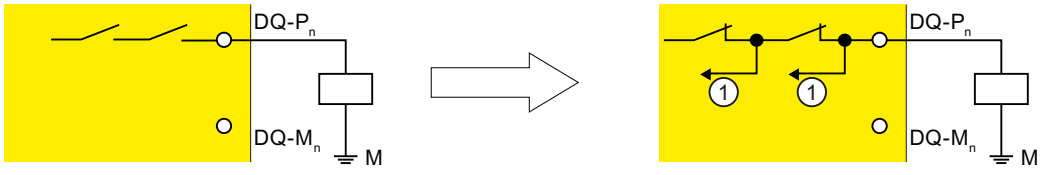
Also take into consideration the respective requirements of your product standards regarding error detection time.

4.2.3.6 Max. readback time switch-on test

Function

The switch on test is part of the bit pattern test.

PM operation
During the switch-on test in PM operation, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 1-641 Functional principle of the switch on test (PM switching)

WARNING

In case of an error, the bit pattern test can apply voltage to the load up to a duration that was configured with the "Maximum readback time switch on test" parameter.
For capacitive loads, it can happen that these are not actively discharged in the event of an error.
Therefore, always configure a maximum readback time that cannot activate the load under any circumstances.

PP operation
The M-switch is meaningless during the switch-on test in PP operation. The switch-on test corresponds to the light test and current flows through the load. The light test is always activated in PP operation.

① Readback

Figure 1-642 Functional principle of the switch on test (PP switching)

This parameter allows you to set the time for the readback.

If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short-circuit to L+ with output signal "0"
- Short-circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short-circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).
Short-circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time switch on test

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time as low as possible, but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads (Page 52).

Setting readback time switch on test with unknown actuator capacity

If the capacitance of the actuator is not known, you may have to determine the required value for the readback time switch-on test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

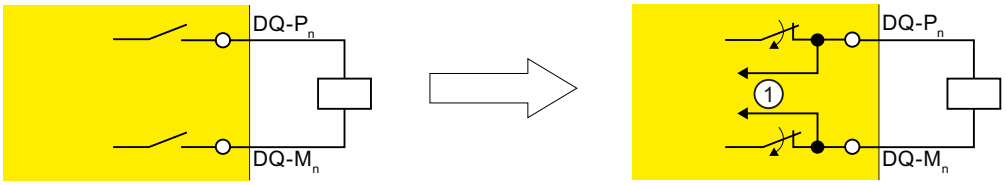
Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use the process value "0" with a minimum duration that corresponds to the "maximum test time" parameter. If you have not configured a light test, continue by changing the process value to "1" after the verification.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time is too small for a connected capacitive load. The charge of the capacitive load cannot take place during the configured readback time. Increase the readback time.

If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

To increase availability, we recommend that you maintain an interval to the determined limit for the times.

4.2.3.7 Activated light test



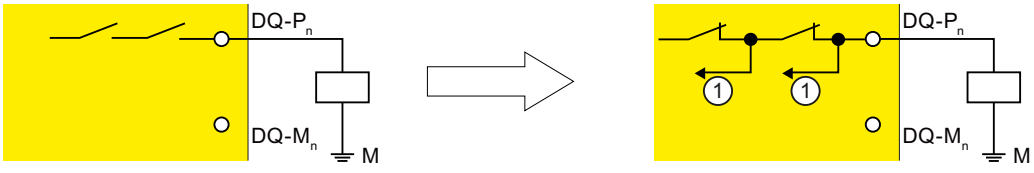
Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, a test signal is switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.

PM operation

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.



① Readback

Figure 1-643 Functional principle of the light test (PM switching)

PP operation

The M-switch is meaningless during the light test in PP operation. The light test corresponds to the switch-on test and current flows through the load. The light test is always activated in PP operation.

① Readback

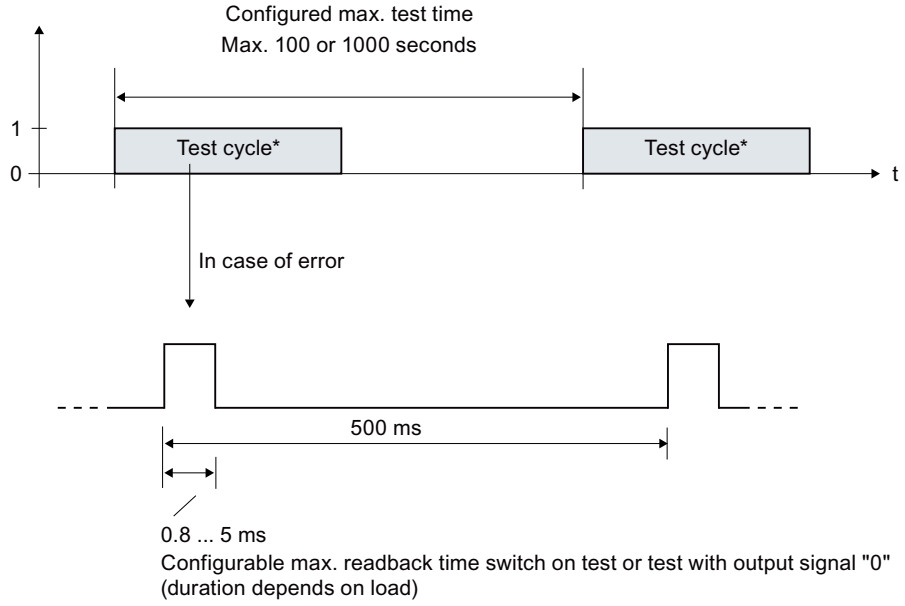


Figure 1-644 Functional principle of the light test (PP switching)

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

* Output of test pulses only during test cycle. The module cycle is 5 ms.

Figure 1-645 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test time per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 500 ms. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.3 Address space

Address assignment of the digital output module F-DQ 8x24VDC/2A PPM

The digital output module F-DQ 8x24VDC/2A PPM occupies the following address areas in the F-CPU:

Table 1-926 Address assignment in the F-CPU

	Occupied bytes in the F-CPU:	
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	x + 0 to x + 4	x + 0 to x + 4
S7-1500 F-CPUs	x + 0 to x + 5	x + 0 to x + 5

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 8x24VDC/2A PPM

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 8x24VDC/2A PPM:

Table 1-927 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Value status DQ_7 (CH7)	Value status DQ_6 (CH6)	Value status DQ_5 (CH5)	Value status DQ_4 (CH4)	Value status DQ_3 (CH3)	Value status DQ_2 (CH2)	Value status DQ_1 (CH1)	Value status DQ_0 (CH0)

x = Module start address

Table 1-928 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
QB x + 0	DQ_7 (CH7)	DQ_6 (CH6)	DQ_5 (CH5)	DQ_4 (CH4)	DQ_3 (CH3)	DQ_2 (CH2)	DQ_1 (CH1)	DQ_0 (CH0)

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access and for evaluation and processing of the value status, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

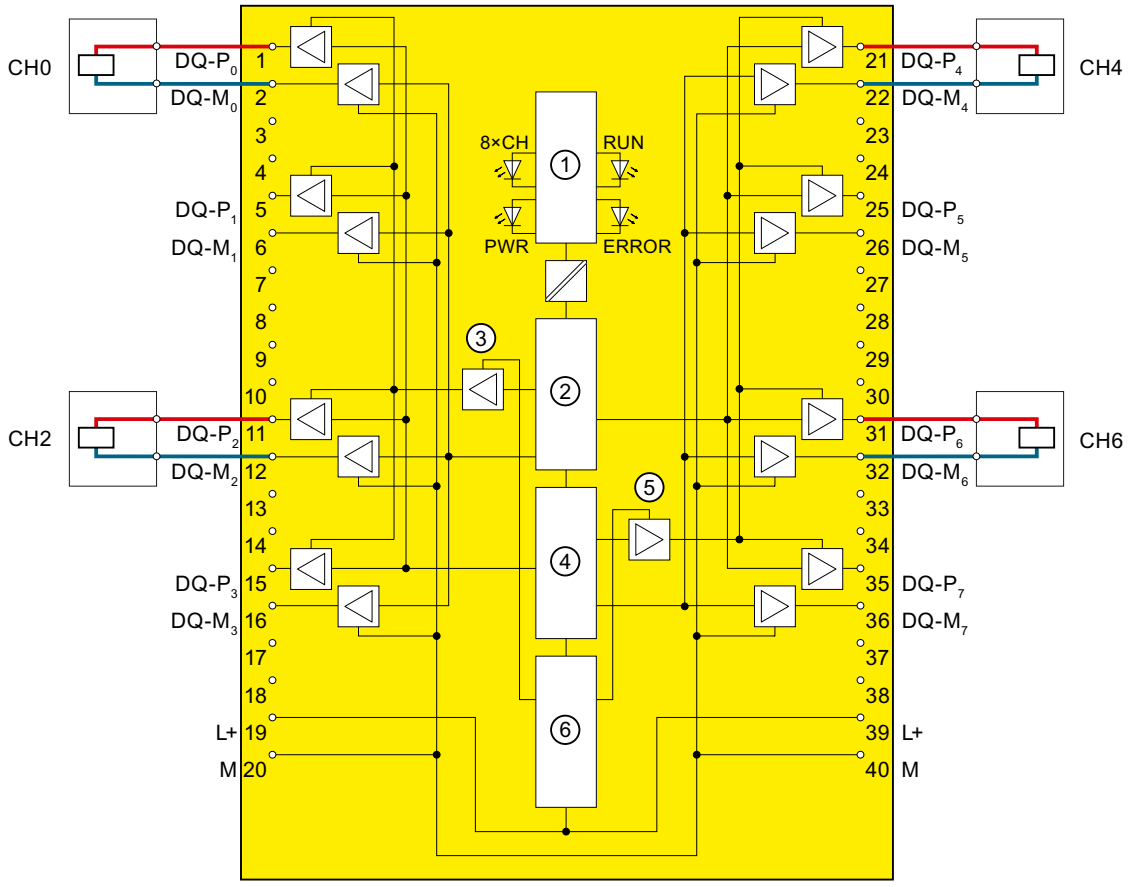
5.1 Applications for the F-DQ 8x24VDC/2A PPM

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is carried out on the front connector of the module. Refer to the "Wiring" section in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

See also

Connecting (Page 13)



5.2 Application: Connecting a load per digital output, PM switching

Each of the 8 fail-safe digital outputs consists of a P-switch DQ-P_n and an M-switch DQ-M_n. You connect the load between the P-switch and the M-switch. The two switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

The figure below shows an example of the pin assignment of the fail-safe digital output module F-DQ 8x24VDC/2A PPM with connection of one load per digital output, PM switching.

WARNING

To protect the F-module, always install an external fuse with the following properties for the load circuit: Circuit-breaker 24 V DC/16 A, tripping characteristic type B.

① Backplane bus interface
② Microcontroller 1
③ P1 switch for channel groups 0 to 3
④ Microcontroller 2
⑤ P1 switch for channel groups 4 to 7
⑥ Reverse polarity protection

Figure 1-646 Wiring diagram for 1 relay to 1 F-DQ of the digital output module F-DQ 8x24VDC/2A PPM, PM-switching mode

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

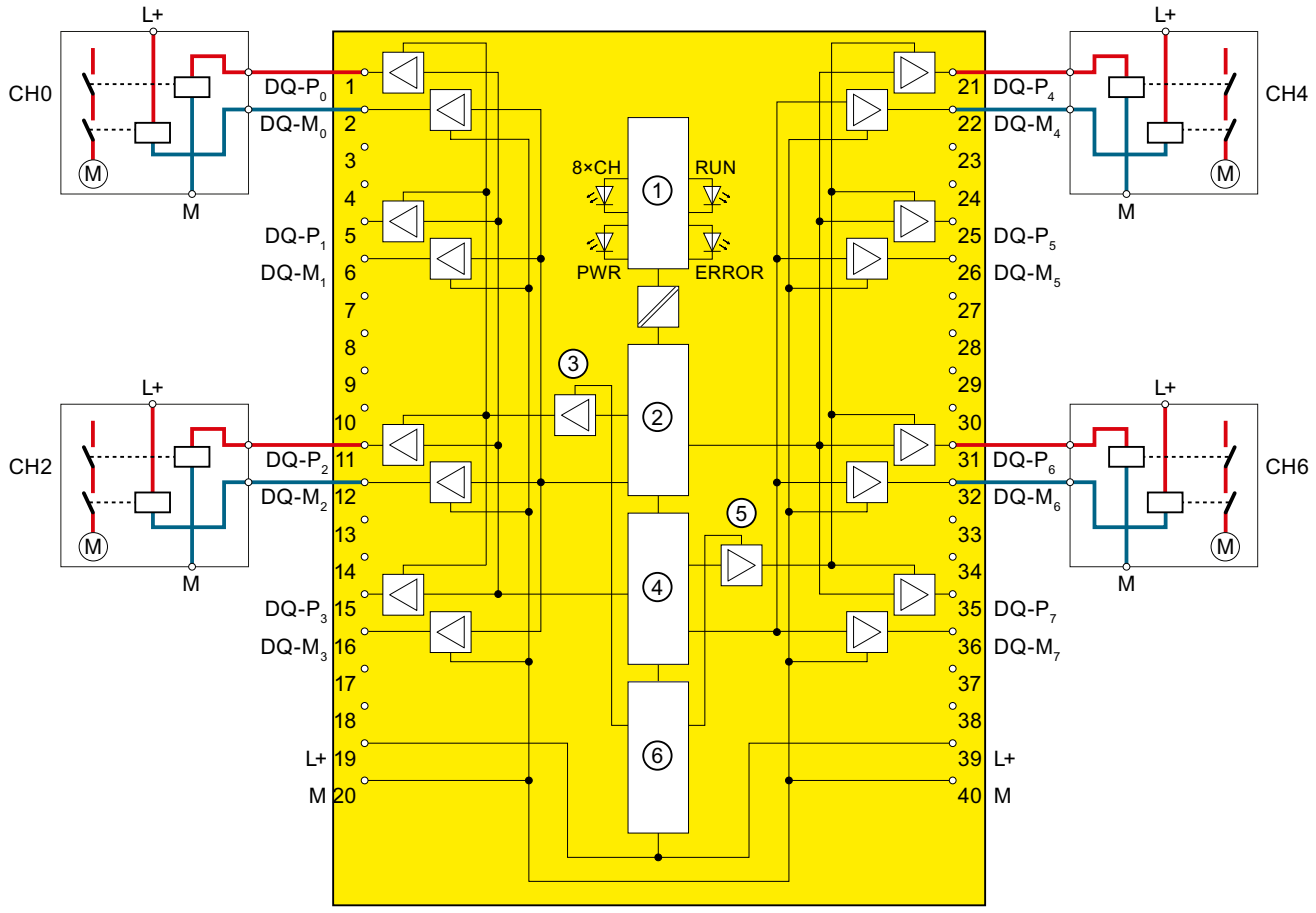
Assign the following parameter for the corresponding channel group:

Table 1-929 Parameter

Parameter	
Operating mode of the output	PM-switching mode

5.3 Application: Connection of loads per digital output to L+ and M, PM-switching mode

You can connect two relays using one fail-safe digital output. The following conditions should be kept in mind:



- Same reference potential
- The normally open contacts of the two relays must be connected in series.

This configuration achieves SIL3/Cat.4/PLe (process status readback required).

The figure below shows an example of the pin assignment of the fail-safe digital output module F-DQ 8x24VDC/2A PPM with connection of loads per digital output to L+ and M, PM-switching mode.

⚠ WARNING

To protect the F-module, always install an external fuse with the following properties for the load circuit: Circuit-breaker 24 V DC/16 A, tripping characteristic type B.

① Backplane bus interface
② Microcontroller 1
③ P1 switch for channel groups 0 to 3
④ Microcontroller 2
⑤ P1 switch for channel groups 4 to 7
⑥ Reverse polarity protection

Figure 1-647 Wiring diagram for 2 relay to 1 F-DQ of the digital output module F-DQ 8x24VDC/2A PPM, PM-switching mode

WARNING

When two relays are connected to one digital output, as shown in the figure above, the "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).

WARNING

With a cross circuit between P-switch and M-switch of the output, the module detects the fault and switches off the output. But the actuator is still supplied with power due to the external fault.
To avoid cross circuits between the P and M-switches of a fail-safe digital output, you should always wire the relay connection to the P and M-switches separately, in order to prevent any cross circuits. For example, as separately sheathed cables or in separate cable ducts.

NOTE

The digital output module F-DQ 8x24VDC/2A PPM performs a bit pattern test depending on the parameter assignment. For this, the module outputs up to 5 ms pulses depending on the parameter assignment. This test (switch-on test) is run with a time offset between the P-switch and M-switch to prevent the actuator from being activated. This pulse may cause the corresponding relay to operated, which may reduce its mission time.

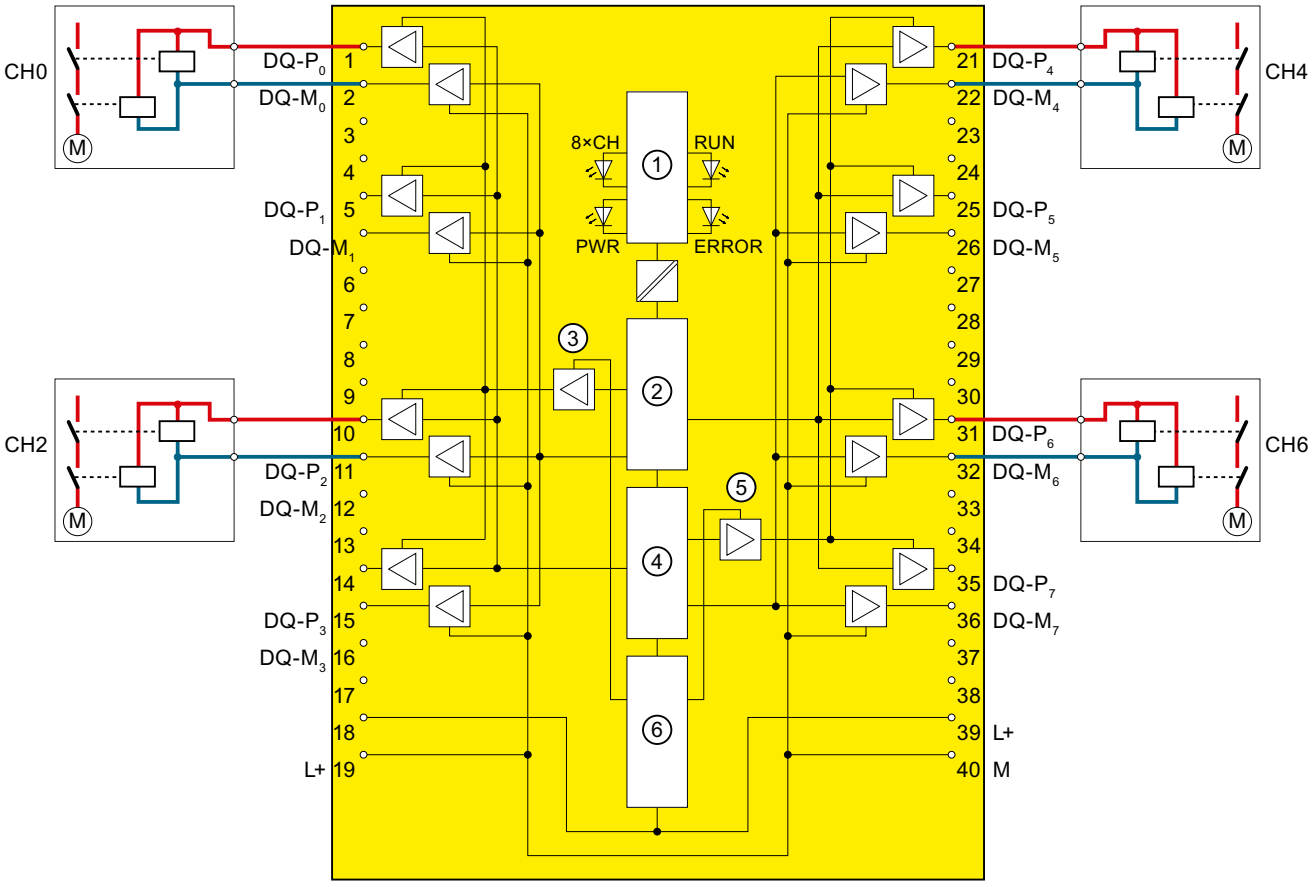
We therefore recommend adhering to the wiring scheme described below. See section Application: Connecting 2 loads in parallel per digital output, PM-switching mode (Page 32).

Parameter assignment

Assign the following parameter for the corresponding channel group:

Table 1-930 Parameter

Parameter	
Operating mode of the output	PM-switching mode



5.4 Application: Connecting 2 loads in parallel per digital output, PM-switching mode

To protect against cross-circuits between P-switch and M-switch in fail-safe digital outputs, we recommend the following wiring scheme. This circuit achieves SIL3/Cat.4/PLe.

The figure below shows an example of the pin assignment of the fail-safe digital output module F-DQ 8x24VDC/2A PPM with connection of two parallel loads per digital output, PM-switching mode.

⚠ WARNING

To protect the F-module, always install an external fuse with the following properties for the load circuit: Circuit-breaker 24 V DC/16 A, tripping characteristic type B.

① Backplane bus interface
② Microcontroller 1
③ P1 switch for channel groups 0 to 3
④ Microcontroller 2
⑤ P1 switch for channel groups 4 to 7
⑥ Reverse polarity protection

Figure 1-648 Wiring diagram for 2 relays in parallel to 1 F-DQ of the digital output module F-DQ 8x24VDC/2A PPM, PM-switching mode

NOTE

With a parallel connection of two relays on one digital output (as shown above) the "wire break" fault is only detected if the wire break disconnects both relays from P or M. This diagnostics is not safety-related.

NOTE

You can connect several actuators per output.

If several actuators are connected to an output, the diagnostics of each actuator affects the other ones.

This means:

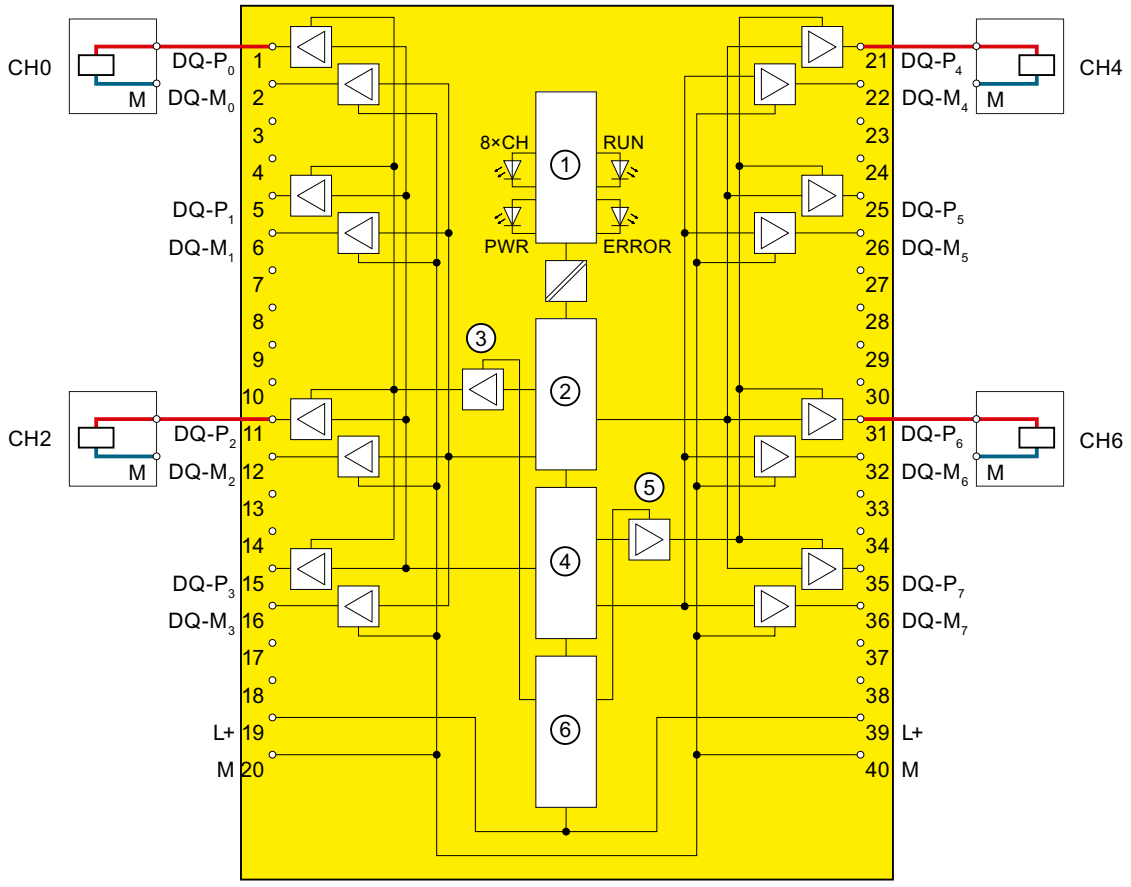
- A wire break is only signaled when several actuators are affected.
- A single short-circuit affects multiple actuators.

Parameter assignment

Assign the following parameter for the corresponding channel group:

Table 1-931 Parameter

Parameter	
Operating mode of the output	PM-switching mode



5.5 Application: Connecting a load per digital output, PP switching

You connect the load between the P-switch DQ-P_n and chassis ground in this application. This circuit achieves SIL3/Cat.4/PLe.

The figure below shows an example of the pin assignment of the fail-safe digital output module F-DQ 8x24VDC/2A PPM with connection of one load per digital output, PP switching.

⚠ WARNING

To protect the F-module, always install an external fuse with the following properties for the load circuit: Circuit-breaker 24 V DC/16 A, tripping characteristic type B.

①	Backplane bus interface	④	Microcontroller 2
②	Microcontroller 1	⑤	P1 switch for channel groups 4 to 7
③	P1 switch for channel groups 0 to 3	⑥	Reverse polarity protection

Figure 1-649 Wiring diagram for 1 relay to 1 F-DQ of the digital output module F-DQ 8x24VDC/2A PPM, PP switching

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

⚠ WARNING

In PP operation, the actuator can no longer be shut down if a cross circuit has developed between a positive potential (e.g. L+) and DQ. To prevent cross circuits between a positive potential (e.g. L+) and DQ, you must route the cables used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).

⚠ WARNING

In this application, you have to connect two ground terminals for safety reasons. Otherwise, the maximum residual current at signal "0" (specified in the technical specifications) cannot be maintained if a single ground line is interrupted.

⚠ WARNING

PP operation
In the event of an error at a non-passivated, non-activated output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + max. readback time dark test (Trb).

Parameter assignment

Assign the following parameter for the corresponding channel group:

Table 1-932 Parameter

Parameter	
Operating mode of the output	PP switching

6 Interrupts/diagnostic messages

6.1 Status and error displays

LED displays

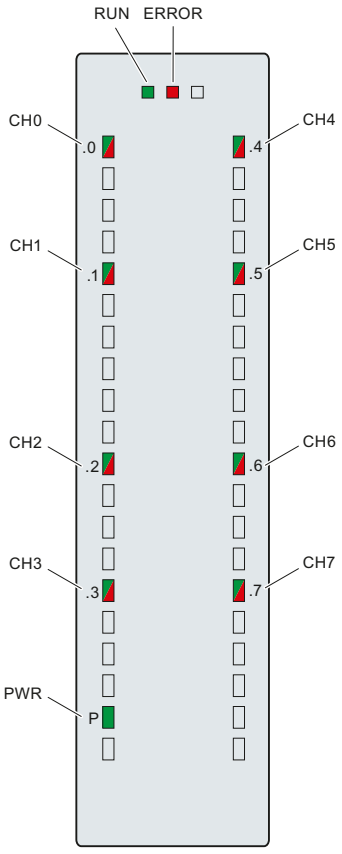


Figure 1-650 LED displays of the F-DQ 8x24VDC/2A PPM

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic alarms can be found in section Diagnostic alarms (Page 43).

WARNING

The RUN, ERROR LEDs and channel status/channel diagnostics LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

RUN and ERROR LEDs

Table 1-933 RUN/ERROR status and error displays

LED		Meaning	Remedy
RUN	ERROR		
Off	Off	Missing or insufficient voltage on the backplane bus	• Switch on the CPU and/or the system power supply modules. • Check whether the module is correctly plugged into the U-connector. • Check whether too many modules are plugged in.
Flashing	Off	Module starts up and flashes up to the valid parameter assignment.	---
On	Off	Module parameters are assigned and module addressed.	
Off	Flashing	Firmware is being updated.	
On	Flashing	Indicates diagnostic interrupts: • Module fault (for example, supply voltage too high) • Channel fault (for example, frequency too high). • PROFIsafe communication error Operation in S7-1500 F-CPUs: At least one channel is waiting for user acknowledgment.	Evaluate the diagnostics and eliminate or acknowledge the error. It may be necessary to remove and re-insert the module.
Flashing	Flashing	Hardware defective.	Replace the module.
Alternately flashing		• Operation in S7-1500 F-CPUs: The F-module expects user acknowledgment after a module error. • Operation in S7-300/400 F-CPUs: At least one channel is waiting for user acknowledgment.	Acknowledge the error (see manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)).

PWR LED

Table 1-934 PWR status display

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

CHx LED

Table 1-935 Display channel status/channel diagnostics

Status CHx	Diagnostics CHx	Meaning
Off	Off	Process signal = 0 and no channel diagnostics*
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

* Operation in S7-300/400 F-CPUs only: If necessary, wait for user acknowledgment, if an additional channel is also waiting for user acknowledgment due to an error that occurred later.

CHx/ERROR LED with PROFIsafe address assignment

Table 1-936 Channel status/channel diagnostics/ERROR display with PROFIsafe address assignment

Status CHx	Diagnostics CHx	ERROR	Meaning
Off	All on	Flashing	The PROFIsafe address does not match the configured PROFIsafe address
All are flashing	Off	Flashing	Identification of the F-module when assigning the PROFIsafe address

LED CHx/RUN/ERROR if supply voltage error occurs

Table 1-937 Channel status/channel diagnostics/RUN/ERROR display if supply voltage error occurs

CHx status	Diagnostics CHx	RUN	ERROR	Meaning
Off	On	On	Flashing	Supply voltage too high or too low. • Operation in S7-1500 F-CPUs: Module is waiting for user acknowledgment. • Operation in S7-300/400 F-CPUs: Module is automatically reintegrated after the correction of the error.

6.2 Interrupts

Introduction

The F-DQ 8x24VDC/2A PPM fail-safe digital output module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic alarm described in section Diagnostic alarms (Page 43).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short-circuit diagnostic alarm, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic alarms (Page 43).

Table 1-938 Diagnostic interrupts of the F-DQ 8x24VDC/2A PPM

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	F-module	No
Wire break	6_D		
Parameter error	16_D		
Supply voltage missing	17_D		
Safety event	25_D		
Mismatch of safety destination address (F_Dest_Add)	64_D		
Safety destination address not valid (F_Dest_Add)	65_D		
Safety source address not valid (F_Source_Add)	66_D		
Safety watchdog time value is 0 ms (F_WD_Time)	67_D		
Parameter F_SIL exceeds SIL from specific device application	68_D		
Parameter F_CRC_Length does not match the generated values	69_D		
Version of F-parameter set incorrectly	70_D		
CRC1 fault	71_D		
Save iParameter watchdog time exceeded	73_D		
Restore iParameter watchdog time exceeded	74_D		
Inconsistent iParameters (iParCRC error)	75_D		
F_Block_ID not supported	76_D		
Transmission error: Inconsistent data (CRC error)	77_D		
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D		
Module is defective	256_D		
Watchdog tripped	259_D		
Short-circuit to L+	261_D	Channel	Yes
Short-circuit to ground	262_D		

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Invalid/inconsistent firmware present	283_D	F-module	No
Channel failure acknowledgment	779_D	Channel	
F-address memory not accessible	781_D	F-module	
Frequency too high	785_D	Channel	
Undertemperature	786_D	F-module	
Output defective	797_D	Channel	No
Read back failure	798_D	Channel	
Overload	800_D	Channel	
Supply voltage too high	801_D	F-module	
Supply voltage too low	802_D	F-module	

6.3 Diagnostic alarms

Diagnostic alarms

Module faults are indicated as diagnostics (module status).

NOTE

You can connect several actuators per output.
If several actuators are connected to an output, the diagnostics of each actuator affects the other ones.
This means:

- A wire break is only signaled when several actuators are affected.
- A single short-circuit affects multiple actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 1-939 Diagnostic alarms of the F-DQ 8x24VDC/2A PPM

Diagnostic alarm	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 47)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • A short-circuit exists.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short-circuit.
Parameter error	16_D	Parameter errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at the front connector • Check the front connector
Safety event	25_D	For safety purposes, channel was switched off due to an error on another channel. Possible causes: • A short-circuit exists. • The capacitive load is too high (PP-switching operation).	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).

Diagnostic alarm	Fault code	Meaning	Remedy
Mismatch of safety destination address (F_Dest_Add)	64_D	The firmware of the F-module has detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	65_D	The firmware of the F-module has detected an illegal different F-destination address.	
Safety source address not valid (F_Source_Add)	66_D	The firmware of the F-module has detected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	67_D	The firmware of the F-module has detected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	68_D	The firmware of the F-module has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	69_D	The firmware of the F-module has detected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	70_D	The firmware of the F-module has detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	71_D	The firmware of the F-module has detected inconsistent F-parameters.	
Save iParameter watchdog time exceeded	73_D	iPar server does not respond to "save IPar" within 4.4 minutes.	Check the configuration/parameter assignment of the iPar server.
Restore iParameter watchdog time exceeded	74_D	iPar server does not respond to "restore IPar" within 4.4 minutes.	Check the configuration/parameter assignment of the iPar server.
Inconsistent iParameters (iParCRC error)	75_D	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The firmware of the F-module has detected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	77_D	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Module is defective	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.

Diagnostic alarm	Fault code	Meaning	Remedy
Watchdog tripped	259_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Short-circuit to L+	261_D	Short-circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load between the channels is too high (for example, due to cable length) You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Short-circuit to ground	262_D	Short-circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • There is a short-circuit between two output channels. • The capacitive load is too high. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Invalid/inconsistent firmware present	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Channel failure acknowledgment	779_D	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
F-address memory not accessible	781_D	The F-source address and F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency (see Technical specifications (Page 47))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 47))

Diagnostic alarm	Fault code	Meaning	Remedy
Output defective	797_D	The F-module has detected an internal error. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible. Possible causes: • The capacitive load is too high. • Short-circuit to L+ or M • The F-module has detected an internal error and has reacted in a safety-related manner.	• Increase the test times (dark, light, switch-on tests). • Check the wiring. • Consider replacing the F-module.
Read back failure	798_D	The F-module has detected an internal error. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible. Possible causes: • Impermissibly high electromagnetic interference is present. • The capacitive load is too high. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Increase the test times (dark, light, switch-on tests). • If the error continues, consider replacing the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible. Possible causes: • A short-circuit exists. • The connected load is too high.	• Check the process wiring. • Reduce the load or the load current.
Supply voltage too high	801_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	802_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the ERROR LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute, see Technical specifications (Page 47)), the ERROR LED stops flashing. The module remains passivated and waits for user acknowledgment.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications of F-DQ 8x24VDC/2A PPM

	6ES7526-2BF00-0AB0
General information	
Product type designation	F-DQ 8x24VDC/2A PPM
Firmware version	
FW update possible	Yes
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1 with HSP0086
Operating mode	
DQ	Yes
Supply voltage	
Rated value (DC)	24 V
Low limit of permitted range (DC)	19.2 V
High limit of permitted range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	110 mA; without load
Output voltage	
Rated value (DC)	24 V
Power	
Power consumption from the backplane bus	0.8 W
Power loss	
Power loss, typ.	11 W
Address range	
Address space per module	
Address space per module, max.	6 byte
Digital outputs	
Number of outputs	8
M switching	Yes
P switching	Yes
Short-circuit protection	Yes
Wire break detection	Yes
Response threshold, typ.	8 mA
Overload protection	Yes
Response threshold, typ.	2.9 A
Voltage induced on current interruption limited to	PM switching: -24 V + (-47 V), PP switching: -24 V
Switching capacity of outputs	

	6ES7526-2BF00-0AB0
With resistive load, max.	2 A
With lamp load, max.	10 W
Load resistance range	
Low limit	12 Ω
High limit	2000 Ω
Output voltage	
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	2 A
For "0" signal, residual current, max.	0.5 mA; PP switching or separate P and M-switch, PM-switching: max. 1 mA
Switching frequency	
With resistive load, max.	30 Hz
With inductive load, max.	0.1 Hz
With lamp load, max.	10 Hz
Total current of outputs	
Max. current per channel	2 A
Total current of the outputs (per module)	
Horizontal mounting position	
Up to 40 ℃, max.	16 A
Up to 60 ℃, max.	8 A
Vertical mounting position	
Up to 40 ℃, max.	8 A
Cable length	
shielded, max.	1000 m
unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Diagnostic alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	Yes
Short-circuit	Yes
Group error	Yes
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of the supply voltage (PWR-LED)	Yes
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; red LED
Electrical isolation	
Electrical isolation, channels	
Between channels	No

	6ES7526-2BF00-0AB0
Between channels and backplane bus	Yes
Insulation	
Insulation test voltage	707 VDC (type test)
Standards, approvals, certificates	
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
SIL according to IEC 61508	SIL 3
Low demand mode: PFDavg according to SIL3	< 6.00E-05
High demand/continuous mode: PFH according to SIL3	< 2.00E-09 1/h
Environmental conditions	
Ambient temperature in operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	40 °C
Dimensions	
Width	35 mm
Height	147 mm
Depth	129 mm
Weights	
Weight, approx.	300 g

NOTE

To reach the maximum cable length, it may be necessary to increase the settings for maximum readback time switch on test or maximum read-back time dark test.
We also recommend a more detailed consideration of the boundary conditions, such as EMC, cables used, cable guide, etc.

Dimension drawing

See system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

Response times

A

Introduction

The next section shows the response times of the digital output module F-DQ 8×24VDC/2A PPM. The response times of digital output module F-DQ 8×24VDC/2A PPM are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

- Max. cycle time: T_{cycle} = 5 ms
- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 10 ms

The maximum response time in the case of fault (One Fault Delay Time, OFDT) is equivalent to the maximum response time with no faults (Worst Case Delay Time, WCDT).

Assign the parameters for maximum readback time dark test (Maximum Readback Time, T_{rb}) and a maximum readback time switch-on test (Maximum Readback Time Switch-On Test, T_{rb_swon}) in STEP 7.

Maximum response time with no faults (Worst Case Delay Time, WCDT)

t <= 3 * cycle time + max (T_{rb}, T_{rb_swon})

Maximum response time with detection of a channel fault by readback

t <= 4 * cycle time + 2 * max (T_{rb}, T_{rb_swon})

Maximum response time with detection of a channel fault by bit pattern test

t <= 2 * cycle time + maximum test time

Maximum response time with detection of a wire break at "1" signal

t <= 3 * cycle time + 1000 ms (wire break detection) + max (T_{rb}, T_{rb_swon})

Maximum response time with detection of an overload at "1" signal

t <= 4 * cycle time + max (T_{rb}, T_{rb_swon})

Maximum response time with detection of an overload or wire break at "0" signal and light test activated.

t <= 2 * cycle time + maximum test time

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 8x24VDC/2A PPM digital output module is interconnected with loads that require little current and have capacitance, this can lead to detection of a short-circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trends shown in the two figures below represent the correlation between load impedance and maximum switched load capacitance at a supply voltage of 24 V DC.

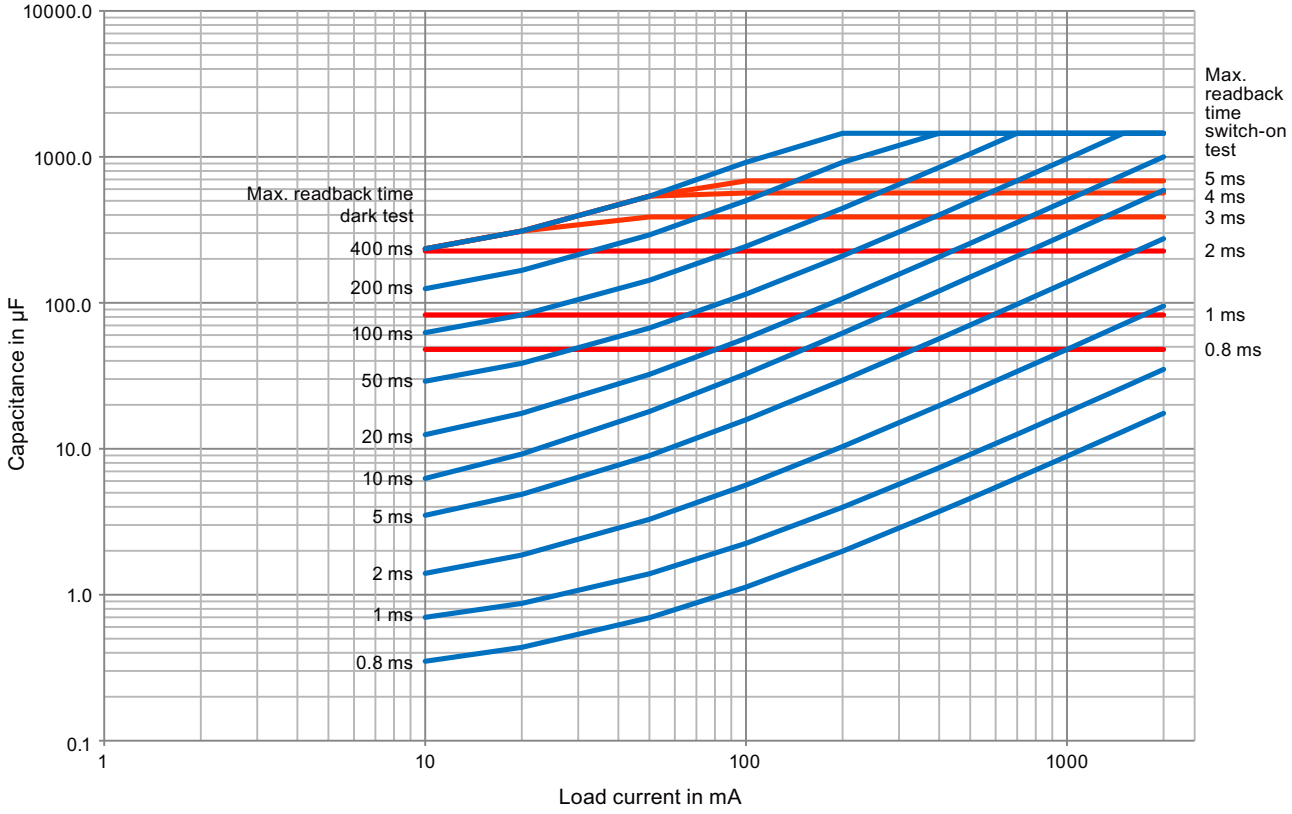

Figure 1-651 Switching of capacitive loads for the F-DQ 8x24VDC/2A PPM digital output module in PM-switching mode depending on the configured dark and light test times

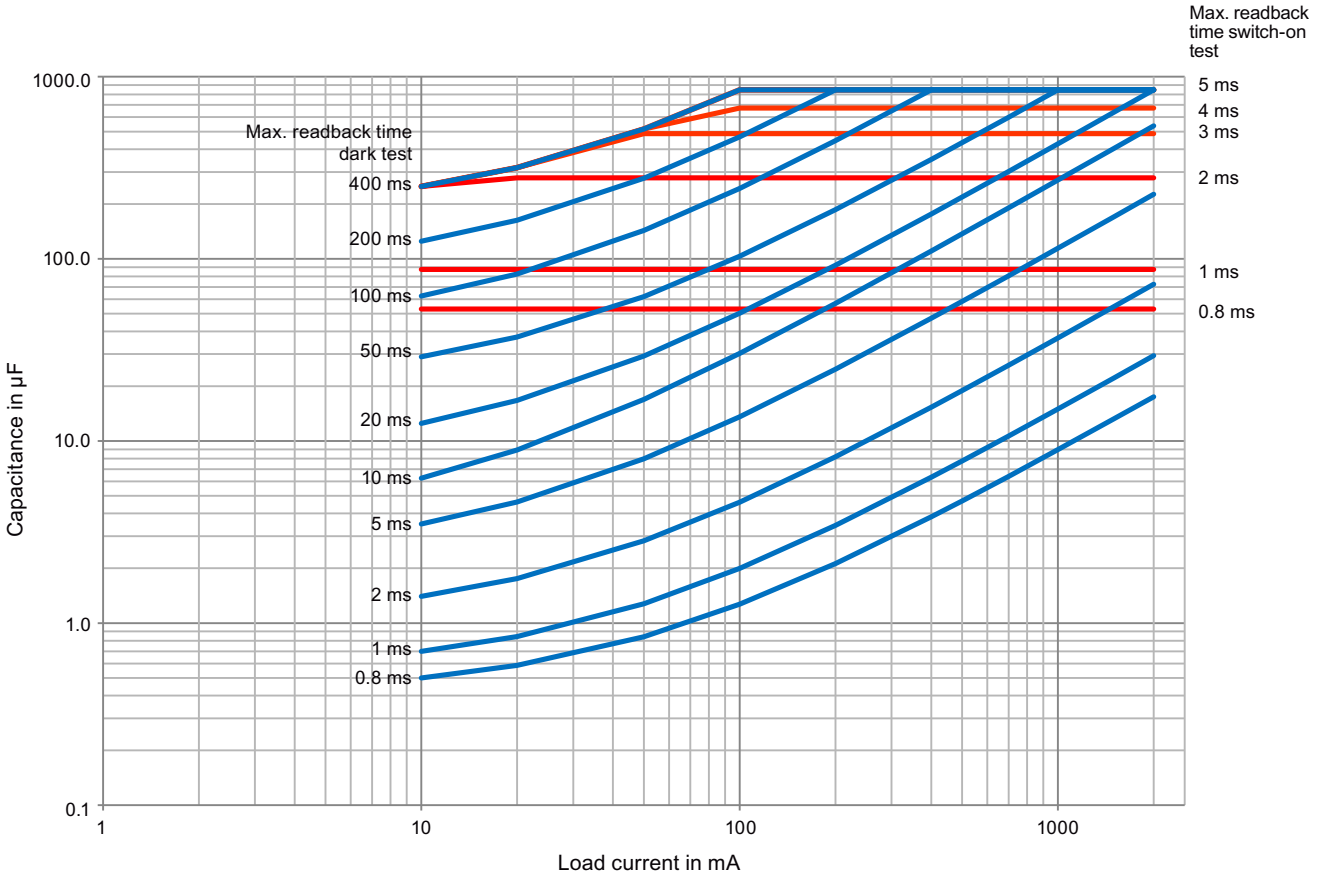

Figure 1-652 Switching of capacitive loads for the F-DQ 8x24VDC/2A PPM digital output module in PP-switching mode depending on the configured dark and light test times

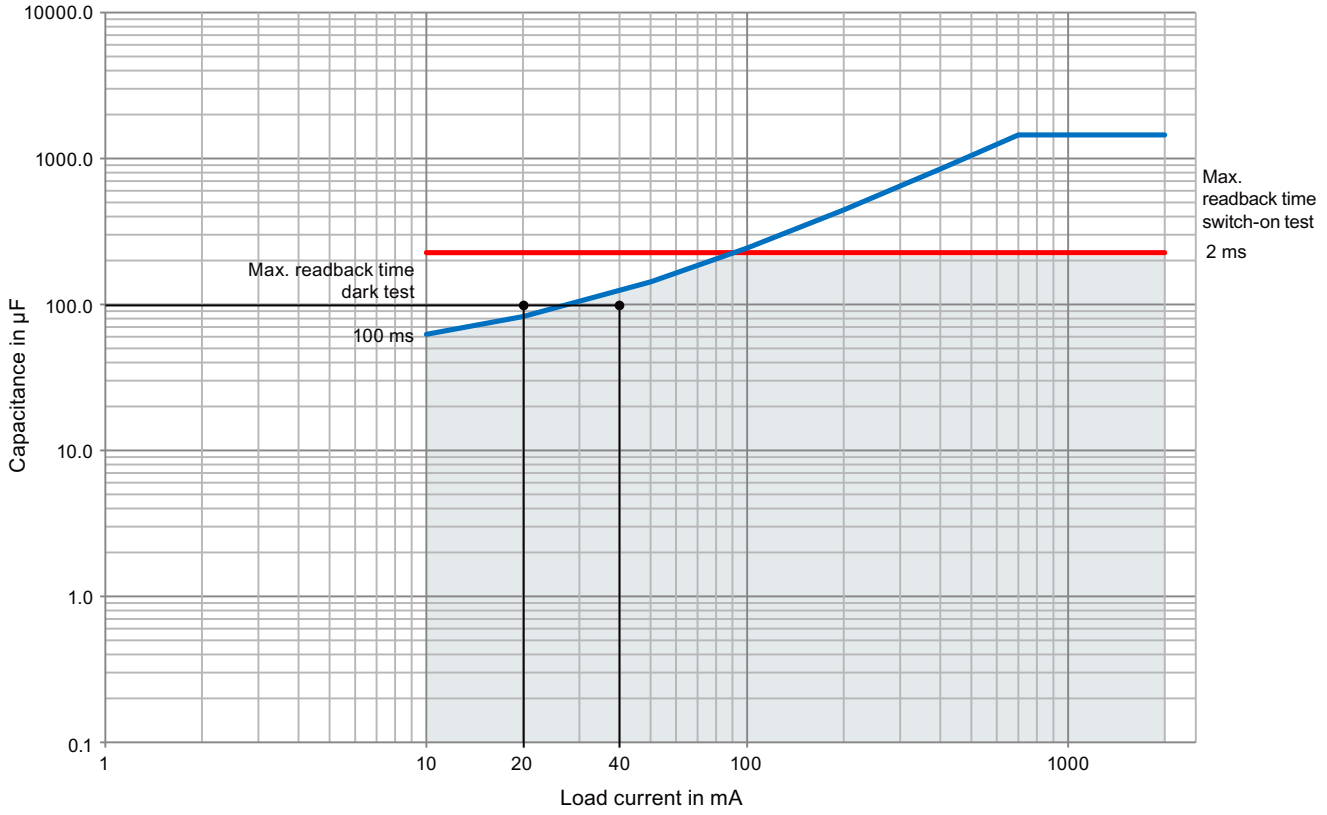
The trends shown were plotted using a SIMATIC PS 307 10A power supply unit with a cable length of 25 m (cable cross-section of 1.5 mm^2) between the output of the F-DQ 8x24VDC/2A PPM output module and the load.

NOTE

The maximum readback time switch on test is only relevant if the light test is activated.



Remedy for detecting a short-circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the trend, select an actuator with higher current consumption so that the new operating point is below the curve.

Example

You have set a dark test time of 100 ms, a light test time of 2 ms and the PM-switching mode. You have set the load current to 20 mA and the capacity to 100 µF. The operating point is thus outside the range defined by the two trends (gray background).

Solution: Select an actuator with higher current consumption. In this example, 40 mA. Alternatively, you can configure the parameter "Max. readback time dark test" with 200 ms.

B.2 Switching of inductive loads

Switching of inductive loads

Use the switchgear for control and auxiliary circuits according to the utilization category DC-13 in accordance with IEC 60947-5-1:2014.

Open Source Software

C

For Resellers: In order to avoid infringements of the license conditions by the reseller or the buyer these instructions and license conditions and accompanying CD – if applicable - have to be forwarded to the buyers.

1) Siemens License Conditions

General License Conditions for Software Products for Automation and Drives

(2011-08-01)

1. Supply of Software to Licensee and Granting of Rights to use the Software

1.1 These General License Conditions shall exclusively apply to the delivery of Software for Automation and Drives to the Licensee. General terms and conditions of the Licensee shall apply only where expressly accepted in writing by us. The scope of delivery of the Software shall be determined by the congruent mutual written declarations of both parties. We shall grant the Licensee rights to use the software specified in the Confirmation of Order or, if the Licensee does not receive a Confirmation of Order, the software specified in the Certificate of License or that specified in the Software Product Sheet, if the Licensee is instead submitted a Software Product Sheet (hereinafter referred to as "SW"). The Certificate of License and the Software Product Sheet shall be collectively referred to as "CoL" hereinafter. The Licensee shall be submitted the CoL when the SW is supplied or in conjunction with the delivery bill. The way in which the SW is supplied is also derived directly from the Confirmation of Order or from the SW purchase order number contained in the Confirmation of Order, in conjunction with the associated order data of our catalog valid at the time of the Confirmation of Order (hereinafter collectively referred to as "Order Data"), or from the CoL. If the Licensee does not receive a data medium, it shall be authorized to copy the SW already available to it to the extent necessary to exercise the rights to use the SW granted to it. The aforesaid shall apply, mutatis mutandis, to electronic supply of the software (downloading). Where reference is made to the Order Data or the CoL in these General License Conditions, the reference to the CoL is of significance if the Licensee has not received a Confirmation of Order. In any case, the data contained in the Order Data is also contained in the CoL.

1.2 The Documentation relating to the SW (hereinafter referred to as "Documentation") shall be purchased separately, unless either the Order Data or CoL contains a stipulation stating that it belongs to the scope of delivery. If the Licensee is authorized to copy the SW in accordance with Clause 1.1, this shall also apply to the Documentation provided that it is included in the scope of delivery.

1.3 In the event that we submit a License Key to the Licensee, which unlocks the SW (hereinafter referred to as "License Key"), this License Key must also be installed.

1.4 The rights granted to the Licensee with respect to the SW are based on the License Type (see Section 2) and the Software Type (see Section 3). The license and Software Types are detailed in the Order Data or CoL. If the SW is supplied electronically or if copying rights are granted for it, the rights and duties specified in these General License Conditions shall apply to the legitimately generated copies.

1.5 If the Licensee is legitimately in possession of a previous SW version/release (hereinafter referred to as "Previous Version"), the Licensee shall be authorized to exercise the rights to use the SW granted to it either with respect to the SW or - if this is intended from a technical point of view - to the Previous Version, at its own discretion (downgrading). If the SW is an Upgrade or PowerPack in accordance with Section 4, Section 4 shall apply additionally.

1.6 If Previous Versions are listed in the Readme file of the SW under the category " parallel use", the Licensee has the right to exercise, alternatively to the user rights granted to him for the SW, the user rights for the listed Previous Versions in one (1) Instance. If the "Type of use" named in the Order Data or the CoL is: "Installation" or "User", the Licensee is entitled to the previously described right additionally to and at the same time as the Previous Versions listed in one Instance. An "Instance" in the context of these General License Conditions is either an instance in a physical operating system environment or an instance in a virtual operating system environment. The transferability of the user rights onto Previous Versions is only permissible in conjunction with the user rights for the SW in accordance with Clause 5.3.

1.7 In case the Licensee obtains only the data media but no license as per the Order Data or the CoL, any use of the SW by the Licensee is subject to the acquisition of a license according to Section 2. Up to the acquisition of the license, the Licensee is not entitled to supply the SW to third parties.

1.8 In case the SW contains Open Source Software or any similar software of a third party (hereinafter referred to as "OSS") the OSS is listed in the Readme_OSS-file of the SW. The Licensee is entitled to use the OSS in accordance with the respective license conditions of the OSS. The license conditions are provided on the same data carrier as the SW. The license conditions of the respective OSS shall prevail over these General License Conditions with respect to the OSS. If the license conditions of the OSS require the distribution of the source code of such OSS we shall provide such source code on request against payment of the shipping and handling charges.

1.9 The SW may be or contain licensed software other than OSS, i.e. software which has not been developed by us itself but which has been licensed to us by a third party (hereinafter referred to as the "Licensor"), e.g. Microsoft Licensing Inc. If the Licensee receives the terms and conditions stipulated by the relevant Licensor together with the SW in the Readme_OSS file in this case, such terms and conditions shall apply with respect to the Licensor's liability vis-à-vis the Licensee. Our own liability vis-à-vis the Licensee shall be governed in any case by these General License Conditions.

2. License Type

Depending on the License Type, the Licensee shall be granted the following rights to the SW:

2.1 Single License (One Off License, Copy License)
The term "One Off License" or "Copy License" which may be used in the Software Product Sheet corresponds to the term "Single License". The following regulation shall apply to the full scope of the One Off License / Copy License. The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and valid for an unlimited period of time, to install the SW in one (1) Instance and to utilize the SW thus installed in the manner specified in the Order Data or CoL (see "Type of Use").

2.2 Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and valid for an unlimited period of time, to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use).

2.3 Rental License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or CoL (see "Type of Use"), to install and use the SW in one (1) Instance. If the period of use is specified in hours, the usage decisive for the calculation of the time limit commences with the software start-up and finishes with its shut-down. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.4 Rental Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use) as well. If the period of use is specified in hours, the usage decisive for the calculation of the time limit commences with the software start-up and finishes with its shut-down. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.5 Demo License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW in one (1) Instance and to use it for validation purposes. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.6 Demo Floating License
The Licensee shall be granted the non-exclusive right, transferable in accordance with Clause 5.3 and limited in time as stipulated in the Order Data or the CoL (s. " Type of use"), to install the SW on any desired number of the Licensee's hardware devices. The number of objects (for example, users or devices) permitted to utilize the SW at the same time can be derived from the Order Data or CoL (see "Type of Use) as well. If the period of usage is specified in days, weeks or months, the specified period, which commences in conjunction with the first SW start-up, shall apply independently of the actual time of usage. If the period of use is specified with a date, the right of use ends on this date – regardless of the actual period of use.

2.7 Trial License
The Licensee shall be granted the non-exclusive and non-transferable right to install the SW in one (1) Instance and to use it for validation purposes in the manner specified in the Order Data or CoL (see "Type of Use"). The period of usage is limited to 14 days and commences with the SW start-up, unless a different period of usage is specified in the Order Data or CoL.

3. Software Type
If the Software Type is not specified in the Order Data or CoL, the rights specified in Clause 3.2 (Runtime Software) shall apply to the SW.

3.1 Engineering Software (hereinafter referred to as "E-SW")
In the event that the Licensee uses E-SW to generate its own programs or data containing parts of the E-SW, the Licensee shall have the right, without having to pay any license fee, to copy and to use these parts of the E-SW as a part of its own programs or data, or to supply them to third parties for use. In the event that such parts are supplied to third parties for use, these parties shall be bound in writing to comply with stipulations corresponding to those in Clauses 5.1 and 5.2 with respect to the above parts of the E-SW.

3.2 Runtime Software (hereinafter referred to as "R-SW")
If the Licensee incorporates R-SW or any parts thereof into its own programs or data, it shall purchase a license with respect to the R-SW each time it installs or copies - depending on what is done first - its own programs or data containing R-SW or parts thereof, in accordance with the relevant intended Type of Use and on the basis of the Siemens catalog valid at that time. In the event that the Licensee supplies the specified programs or data to third parties for their use, these parties shall be bound in writing to adhere to stipulations corresponding to those in Section 5, with respect to the R-SW parts contained therein. The aforesaid shall not affect the Licensee's obligation to purchase a license for the R-SW if the R-SW original is copied. If the R-SW contains tools for parameterization/configuration and extended rights have been granted in this regard, this will be detailed in the readme file of the R-SW.

4. Upgrade and PowerPack
If it is apparent from the Order Data or CoL, e.g. by the addition "Upgrade" or " PowerPack" after the SW product name, that the SW is an upgrade for another software item (hereinafter referred to as "Source License"), the rights originally granted to the Licensee to use the Source License end in conjunction with the upgrade measure. The rights of use in accordance with Clause 1.6 remain unaffected by this. However, the Licensee is entitled to undo the upgrading (downgrading) - if this is intended from a technical point of view - and to exercise the rights to use the SW granted to it with respect to the Source Version in accordance with Clause 1.5.

5. Further Rights and Duties of the Licensee
5.1 Unless a stipulation to the contrary relating to a specific number of copies is contained on the data medium or in the readme file of the SW, the Licensee may generate an appropriate number of copies of every item of SW which it is authorized to use in accordance with these General License Conditions, where such copies shall be used exclusively for data backup purposes. Furthermore the Licensee may only copy the SW if and insofar as it has been granted copying rights by us in writing.

5.2 The Licensee shall not be entitled to modify, decompile or reverse engineer the SW. Nor may it extract any individual parts unless this is permitted by mandatory copyright law. Furthermore, the Licensee shall not be entitled to remove any alphanumeric identifiers, trademarks or copyright notices from the SW or the data medium and, insofar as it is entitled to make copies of the SW, shall copy them without alteration. The aforementioned regulation shall apply accordingly to the Documentation supplied in accordance with Section 1.

5.3 The Licensee shall be entitled to completely transfer the right to use the SW granted to it to a third party, provided that it concludes a written agreement with the third party in conformance with all of the conditions contained in this Section 5 and on the proviso that it does not retain any copies of the SW. If the Licensee has received a License Key for the SW, this key shall be supplied to the third party together with the SW. Furthermore, the third party shall be submitted the CoL together with these General License Conditions. The Licensee shall submit the CoL received for the SW to us at any time, if requested.

5.4 If the SW is a PowerPack or an Upgrade, the Licensee shall keep the CoL of the Source License and submit it to us at any time, if requested, together with the CoL for the SW. In the event that the Licensee transfers its right to use the PowerPack SW or Upgrade SW in accordance with Clause 5.3, it shall also submit the CoL of the Source License to the third party.

5.5 If the Licensee receives a data medium which, in addition to the SW, contains further software products which are released for use, then it shall have the right to use these released software products exclusively for validation purposes, for a limited period of time and free of charge. The period of use shall be limited to 14 days, commencing with the first start-up of the relevant software program unless a different period is specified e.g. in the readme file of the relevant software product. These software products supplied exclusively for validation purposes shall be governed, mutatis mutandis, by the stipulations contained in these General License Conditions. The Licensee shall not be authorized to pass on these software products separately, i.e. without the SW, to a third party.

The conditions of the purchase contract apply if not otherwise stipulated hereafter for the Open Source Software.

2) License Conditions and Disclaimers for Open Source Software and other Licensed Software

In the product "S7-1500 F-SM - V1.0", Copyright Siemens AG, 2015 (hereinafter "Product"), the following Open Source Software is used either unchanged or in a form that we have modified, and additionally the other License Software noted below:

Liability for Open Source Software

Open Source Software is provided free of charge. We are liable for the Product including Open Source Software contained in accordance with the license conditions applicable to the Product. Any liability for use of Open Source Software beyond the program flow intended for the Product is explicitly excluded. Furthermore, any liability for defects resulting from modifications to the Open Source Software by you or third parties is excluded.

We do not provide any technical support for the Product if it has been modified.

Please note the following license conditions and copyright notices applicable to Open Source Software and other License Software:

SIEMENS

SIMATIC
S7-1500/ET 200MP
Product information for the digital output module F-DQ 8x24VDC/2A PPM (6ES7526-2BF00-0AB0)

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.
Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.
Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Content

This product information contains **important information on the digital output module F-DQ 8x24VDC/2A PPM (6ES7526-2BF00-0AB0)**. The product information is part of the product supplied. The information in this Product Information should be considered more up-to-date than other documentation if uncertainties arise.

Addition to the section "Max. readback time dark test"

⚠ WARNING
You can configure the parameter "Max. readback time dark test" with a maximum of 100 ms for F-modules with firmware version 1.0.0.

Addition to the section "Operating mode of the output"

⚠ WARNING
If the F-module with firmware version 1.0.0 has been configured with PP-switching mode, you need to change the "Behavior after channel fault" parameter from "Passivate channel" to "Passivate the entire module".

© Siemens 2016. All rights reserved

Correction in the section "Application: Connection of one load per digital output, PP-switching"

WARNING

In PP operation, a cross-circuit between a positive potential (e.g. L+ or other signal lines) and DQ is detected by the module and it switches the output off. However, the connected actuator is still supplied with power due to the external fault.
To prevent cross-circuits between a positive potential (e.g. L+ or other signal lines) and DQ, you must route the lines used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).

Correction in the section "Connecting capacitive loads"

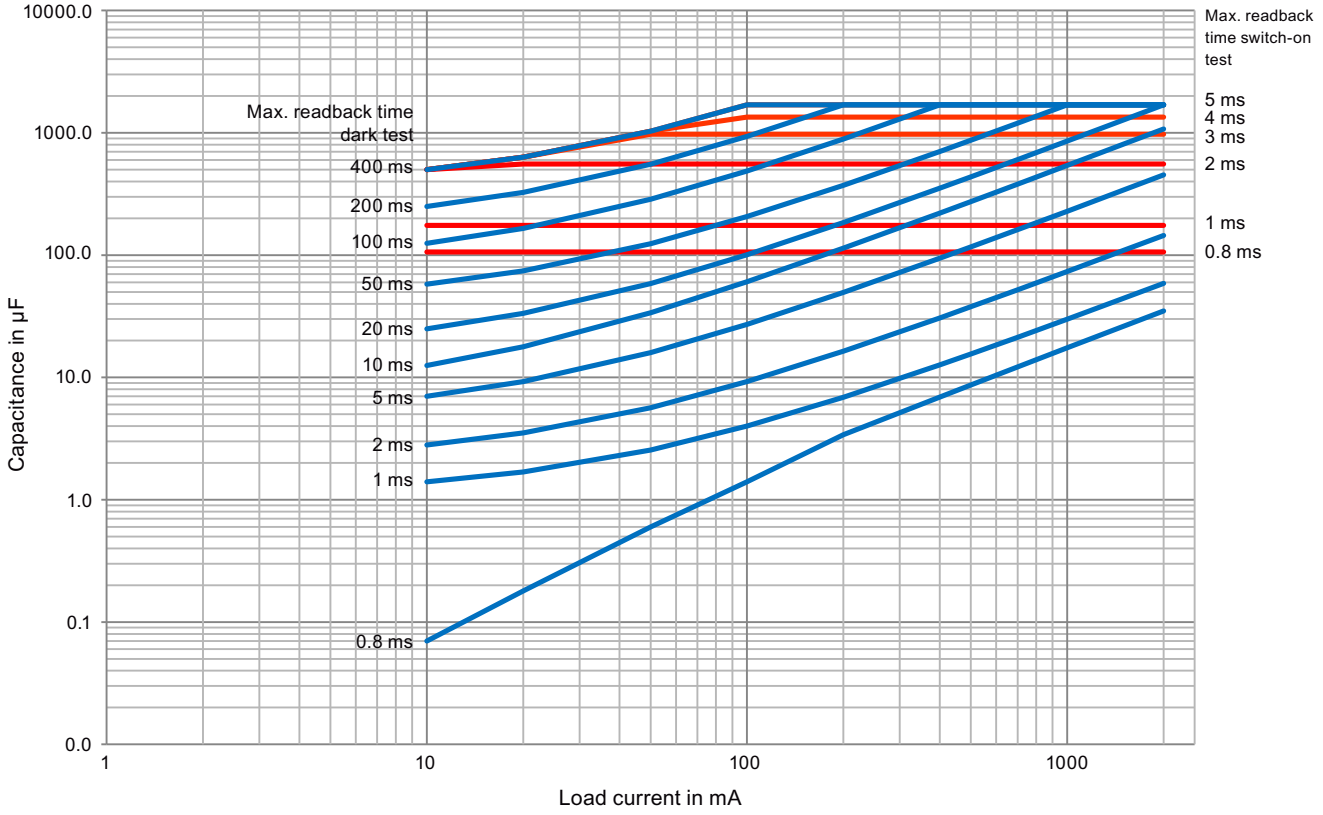

Figure 1 Switching of capacitive loads for the F-DQ 8x24VDC/2A PPM digital output module in PP-switching mode depending on the configured dark and light test times

Introduction

1

Purpose of the documentation

This documentation provides you with important information on how to configure, install, wire and commission the SIMATIC ET 200AL distributed I/O system.

Basic knowledge required

A basic knowledge of automation technology is required to understand the documentation.

Scope of the documentation

This documentation is valid for the SIMATIC ET 200AL distributed I/O system.

Conventions

Observe the notes labeled as follows:

NOTE

A note contains important information on the product described in the documentation and on the handling of the product to which particular attention should be paid.

Standards

You can find a dated reference to the respective standards or the EC Declaration of Conformity on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14245/cert?ct=444&ci=526).

Special information

NOTE

Important note for maintaining the operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we inform you in personal notifications about product developments and features that are (or could be) relevant to the operation of plants from a safety perspective.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

NOTE

When using F-CPUs in safety mode and fail-safe modules, note the description of the fail-safe system SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/de/view/54110126/en).

ID Link for the digital nameplate

Figure 1-654 ID Link example DI 16x24VDC 8xM12

The ID Link is a globally unique identifier according to IEC 61406, which you will find in the future as a QR code on your product.

The figure shows an example of an ID Link for the I/O device digital inputs DI 16x24VDC 8xM12.

You can recognize the ID Link by the frame with a black corner at the bottom right. The ID Link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner or reader app. Call the ID Link.

In the digital nameplate, you will find product data, manuals, Declarations of Conformity, certificates, and other useful information about your product.

1.1 SiePortal

You can find current information on the following topics quickly and easily here:

- **Catalog and ordering system**
  Ordering system for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).
- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySiePortal**
  Your personal work area in the SiePortal for notifications, support requests, and configurable documents.

This information is provided by SiePortal on the Internet (https://sieportal.siemens.com/).

1.2 ET 200AL Documentation Guide

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet. (https://support.industry.siemens.com/cs/ww/en/view/109742667)

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200AL System Manual
- STEP 7 Professional
- Product information

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Communications Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200AL distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- Function Manual IO-Link system

Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/95242965)

1.3 MultiFieldbus Configuration Tool (MFCT)

MultiFieldbus Configuration Tool

MultiFieldbus Configuration Tool (MFCT) is a PC-based software and supports the configuration of MultiFieldbus- and DALI-devices. In addition, the MFCT offers convenient options for mass firmware updates of ET 200 devices with MultiFieldbus- support and reading service data for many other Siemens devices.

Functional scope of the MFCT

- MultiFieldbus configuration:
  Engineering, configuration and diagnostics of MultiFieldbus-devices, provision of the required project files (project, UDT-, CSV- and EDS-file), transfer/export of the files to device and/or data memory.
- DALI configuration:
  Device selection and online configuration of DALI devices.

- TM FAST:
  Generation and download of FPGA-UPD- and FPGA-DB-files.
- Maintenance:
  Topology scan of a Ethernet network, reading of service data, parameter assignment and firmware update.
- Settings:
  Language switching German / English, network scanner speed, setting of the network adapter, installation of GSDML-and EDS-files.

System/installation requirements for MFCT

The MFCT runs under Microsoft Windows and does not require installation or administrator rights.

For MFCT you must also install the following software:

- Microsoft .NET Framework 4.8 (You can find an Offline Installer on the Internet. (https://support.microsoft.com/en-us/topic/microsoft-net-framework-4-8-offline-installer-for-windows-9d23f658-3b97-68ab-d013-aa3c3e7495e0))
- NPcap from directory "Misc"
- PG/PC interface from directory "Misc"
- Microsoft C++ Redistributable for x86-systems (you can find the installation data for download on the Internet. (https://aka.ms/vs/15/release/vc_redist.x86.exe))

The download of the tool and further information as well as documentation on the individual functions of the MFCT can be found on the Internet.
(https://support.industry.siemens.com/cs/de/en/view/109773881)

1.4 S7 Port Configuration Tool (S7-PCT)

SIMATIC S7-PCT

The Port Configuration Tool (PCT) is a PC-based software for the parameter assignment of Siemens IO-Link Master modules and IO-Link devices from any manufacturer.

You integrate IO-Link-devices using the standardized device description "IODD", which you get from the respective device manufacturer. S7-PCT supports version 1.0 and V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link Master from STEP 7. When STEP 7 is not used or the IO-Link Master is not operated on a SIMATIC controller, "standalone"-operation is also possible.

You can find additional information on IO-Link on the Internet (https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html).

1.5 S7 Failsafe Configuration Tool (S7-FCT)

SIMATIC S7-FCT

Failsafe Configuration Tool (FCT) enables you to GSD configure the following devices in third-party engineering systems:

- Selected, functionally fail-safe SIMATIC I/O devices
- Functionally fail-safe SIRIUS ACT PROFINET interfaces

The engineering system must meet the following requirements for this:

- Support of the CPD system integration acc. to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO"
- TCI implementation to Conformance Class C3

Additional information on S7-FCT can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

1.6 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)
     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:
     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Safety instructions

2

2.1 Warnings in this document

You can find explanations of the warnings used in this document in the "Legal information" section.

2.2 Safety-related symbols for IP65/IP67 modules

The following table contains an explanation of the symbols located on your IP65/IP67 modules, their packaging or in the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must read the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
	The assigned safety symbols apply to devices **with Ex approval**. You must read the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by an electrically skilled person. IEC 60417 No. 6182
	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
	Note that the device must be constructed and connected in accordance with EMC regulations.

Symbol	Meaning
 230V MODULES	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2
 24V MODULES	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-DB Symbol 5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	Be aware that the device is only approved for the industrial field and only for indoor use.

2.3 Intended use

The system is used to control machines and plants.

Intended use also includes observance of this documentation, in particular the safety instructions and conditions of use. See section Technical specifications (Page 116).

2.4 Changes to the device and spare parts

Modifications to the module may affect the safety and the function of the module:

- Do not make any changes or attachments to the module.
- Do not remove or paste over safety instructions on the module.
- Only use original spare parts and accessories.

2.5 Target group and personnel qualifications

All persons working with this module require the following knowledge:

- Contents of this document as well as contents of the enclosed documents.
- Handling the module (after instruction)
- Relevant standards and regulations
- Accident prevention regulations

The following activities are reserved for specially qualified personnel:

Working on electrical parts
Work on electrical parts may only be performed by the following persons:

- Qualified electricians
- Persons trained in electrical engineering under the direction and supervision of qualified personnel.

Commissioning and configuration
Commissioning and configuration requires general knowledge in the field of automation technology.

2.6 Personal protective equipment

The personal protective equipment depends on the activity and is determined by the operator. To avoid material damage during packing, unpacking and installation activities we recommend:

- ESD wrist strap
- ESD shoes

2.7 Working on electrical parts

Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 17)).

- Always observe the country-specific safety rules.
- Notify all those who will be affected by the procedure.
- Follow the 5 safety rules according to DIN EN 50110-1 (VDE 0105-1):

1. Disconnect
2. Secure to prevent reconnection
3. Verify safe isolation from the supply (all poles)
4. Ground and short-circuit
5. Erect barriers around or cover adjacent live parts

After completing work:

- Restore operational readiness in reverse order.

2.8 Residual risks

Despite all the technical and procedural risk reductions that have been carried out, not all dangers can be avoided. The following sections describe these residual risks and measures to avoid them.

2.8.1 Live parts

Electrocution on contact with live parts leads to life-threatening injuries (death).

Operation

- Do not open the module.
- Do not use damaged modules.
- Pull the plug and not the cable.

Installation and connection

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 17)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 18))
- Fuse the connection cables according to the current-carrying capacity of the cable used, taking into account the applicable standards.
- Ground the module according to regulations.
- For the 24 V DC supply (SELV/PELV), only use power supply units that provide safe electrical extra-low voltage in accordance with IEC 61131-2 or IEC 61010-2-201.

Maintenance

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 17)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 18)).

2.8.2 Conductive pollution

Electrocution during transmission of electrical energy via conductive contamination to the body leads to life-threatening injuries (death).

- Seal unused connections with a suitable and approved sealing cap.
- Keep the module free from conductive pollution.

2.8.3 Overheating

Smoke development and fire due to overheating of module and cables result in burns and life-threatening injuries (death).

To avoid overheating:

- Ensure the correct installation position.
- Ensure sufficient air supply (e.g. maintain mounting clearances).
- Only use undamaged cables.

Installation and connection

- Follow the instructions for the mounting position.
- Adhere to the specified ventilation clearances.
- Fuse the connecting cables according to the cable cross-section.

Maintenance

- Check plug-in connections and cables regularly for damage.

2.8.4 Uncontrolled movements

Uncontrolled movements of driven machine or system parts during commissioning, operation, maintenance and repair.

- Follow the safety instructions described in the function manuals.

2.8.5 Unsafe operating states

Unsafe operating states may result in personal injury of unknown extent.
The following factors can be triggers:

- Manipulation of the software, e.g. viruses, trojans or worms.

Manipulation of the software, e.g. viruses, trojans or worms.

- Adhere to the protective measures against tampering with the software (see section Industrial cybersecurity (Page 128)).
- Perform available updates in a timely manner.
- Protect files stored on removable media from malware with appropriate protective measures, e.g. virus scanner.
- Set up access protection for the CPU.

2.9 Behavior in case of emergency

- Force EMERGENCY OFF

When the safe operating state has been restored:

- Unlock the EMERGENCY OFF mechanism.
- The person responsible for the system ensures that the system starts up in a controlled and defined manner.

2.10 Material damage

2.10.1 Transport and storage

- Only pack, store, transport and ship electronic components, modules or devices in the original product packaging or in other suitable materials, e.g. conductive foam rubber or aluminum foil.
- Observe the limits during transport and storage. See Technical specifications (Page 116) section.

2.10.2 Installation and connection

- We recommend touching components, modules and devices only if they are grounded by one of the following measures:
  - With an ESD wrist strap.
  - With ESD shoes or ESD grounding strips in ESD areas with conductive flooring.
- Place electronic components, modules and devices only on conductive surfaces (e.g. tables with ESD coating, conductive ESD plastic foam, ESD packing bags, ESD transport containers).
- Ensure that there is sufficient overvoltage protection.

Installation/disassembly with voltage switched on

- Refer to section Mounting (Page 36)
- Refer to section Replacing modules (Page 108)

New properties/functions

3

What's new in the ET 200AL System Manual, Edition 08/2025 compared to Edition 03/2025?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	ID Link	Here you will find a description of the ID Link	Section Introduction (Page 8)
	The module "Communications module CM 4xIO-Link 4xM12" has been added	In various sections contents on the module "Communications module CM 4xIO-Link 4xM12" have been added.	Section Marks and approvals (Page 116) Section Safety-related shutdown of ET200AL standard modules (Page 145)
	The module "Communications module CM 8xIO-Link + DIQ 6x24VDC/-0.5A 8xM12" has been added	In various sections contents on the module "Communications module CM 8xIO-Link + DIQ 6x24VDC/0.5A 8xM12" have been added.	
	The module "Voltage distributor PD 24VDC" has been added	In various sections, content has been added to the module "Voltage distributor PD 24VDC".	Section Components (Page 28) Section Connecting (Page 41) Section Marks and approvals (Page 116) Section Safety-related shutdown of ET200AL standard modules (Page 145)
	Accessories for power supply M12-L	M12-L cables for voltage supply are now also included in the section	Section Accessories/spare parts (Page 150)
	Importer addresses	You can find the importer addresses for specific countries here.	Standards and requirements (Page 119) section
	SIMATIC ET 200AL data	This section provides an overview of the data that is generated by the SIMATIC ET 200AL automation system and accessible to you.	SIMATIC ET 200AL Data (Page 166) section
Changed contents	Technical specifications	Various specifications have been adapted in the "Technical specifications" section	Section Technical specifications (Page 116)
	"Industrial Cybersecurity" section	The content of the "Industrial Cybersecurity" section has been updated	Section Industrial cybersecurity (Page 128)
	Ambient conditions	The operating conditions and storage conditions have been adapted.	Section Transport and storage conditions (Page 123) Section Mechanical and climatic ambient conditions (Page 124)

What's new in the ET 200AL System Manual, Edition 03/2025 compared to Edition 10/2024?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	The "Digital input/digital output module DIQ 8x24VDC/0.5A 8xM8" has been added.	In various sections, content has been added to the module "Digital input/digital output module DIQ 8x24VDC/0.5A 8xM8".	Section Marks and approvals (Page 116) Section Mechanical and climatic ambient conditions (Page 124)
Changed contents	"Industrial Cybersecurity" section	The content of the "Industrial Cybersecurity" section has been updated	Section Industrial cybersecurity (Page 128)

What's new in the ET 200AL System Manual, Edition 10/2024 compared to Edition 12/2023?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	"Industrial Cybersecurity" section	These sections have been added to the "Industrial Cybersecurity" section: • Secure Boot • Secure operation of I/O modules	Section Secure Boot (Page 142) Section Safe operation of I/O modules (Page 143)
	Use above 2000 m is possible.	Information and this table have been added to the section "Mechanical and climatic environmental conditions": Derating factor of installation altitude and ambient temperature for use above 2000 m above sea level.	Section Mechanical and climatic ambient conditions (Page 124)
Changed contents	"Introduction" section	The contents have been updated in the "Introduction" section	Section Introduction (Page 8)
	"Configuring" section	The "Configuring" section has been newly structured	Section Configuring (Page 69)
	Update of the section	Various values have been added and updated in the "Technical specifications" section	Section Technical specifications (Page 116)

What's new in Edition 12/2023 of the ET 200AL System Manual compared with Edition 12/2022?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	General security instructions	The section contains a compilation of general security instructions for the ET 200AL distributed I/O system.	Section Safety instructions (Page 16)
	"Industrial Cybersecurity" section	Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities. The section contains the following information: • Basic information on the subject of industrial cybersecurity • Measures to protect individual components and the entire system against manipulation and unwanted access.	Section Industrial cybersecurity (Page 128)
	Supplement IM 157-1 MF module	The MultiFieldbus interface module IM 157-1 MF	Starting with section System overview (Page 24)

What's new in Edition 12/2022 of the ET 200AL System Manual compared with Edition 08/2021?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Technical specifications of the plug	The technical specifications of the plug-in connections are listed in the section.	Starting with section Connectors (Page 162)
Changed contents	Update of the section	The UKCA approval has been added.	Section Marks and approvals (Page 116)
	Update of the section	The table "Pulse-shaped disturbance variables" has been revised.	Section Electromagnetic compatibility (Page 121)

System overview

4

4.1 What is the SIMATIC ET 200AL distributed I/O system?

SIMATIC ET 200AL

The SIMATIC ET 200AL distributed I/O system is a scalable and highly flexible, distributed I/O system for connecting process signals to a higher-level control system with a field bus.

Customer benefits of the system

Compact design

- High IO configuration limits for module widths of 30 mm or 45 mm and up to 32 modules for each ET 200AL
- High degree of protection IP65/IP67
- Adequate for temperatures from -30 °C/-25 °C to +55 °C and accelera-tions up to 10g

Easy to use

- Easy wiring thanks to color-coded connectors
- CAx compliant labeling of all interfaces
- Fast, convenient configuration and commissioning with STEP 7 (TIA Portal)
- Configuration customizing for future extension through integrated configurationcontrol

Flexible mounting

- Easy mounting in all mounting positions - even in small spaces
- Spatially separated mounting of the modules by means of a backplane bus designed as a cable(= ET Connection)
- Flexible connection to MultiFieldbus, PROFIBUS or integration in SIMATIC ET 200SP
- Integration of sensors and actuators through M8 and M12 connection technology

Energy efficiency

- PROFIenergy as integrated function

Communication standards

- PROFINET IO
- EtherNet/IP
- Modbus TCP
- PROFIBUS DP
- IO-Link
- PROFIsafe

Powerful technology

- Module with counting function
- Fail-safe modules

Figure 1-655 ET 200AL benefits

Area of application

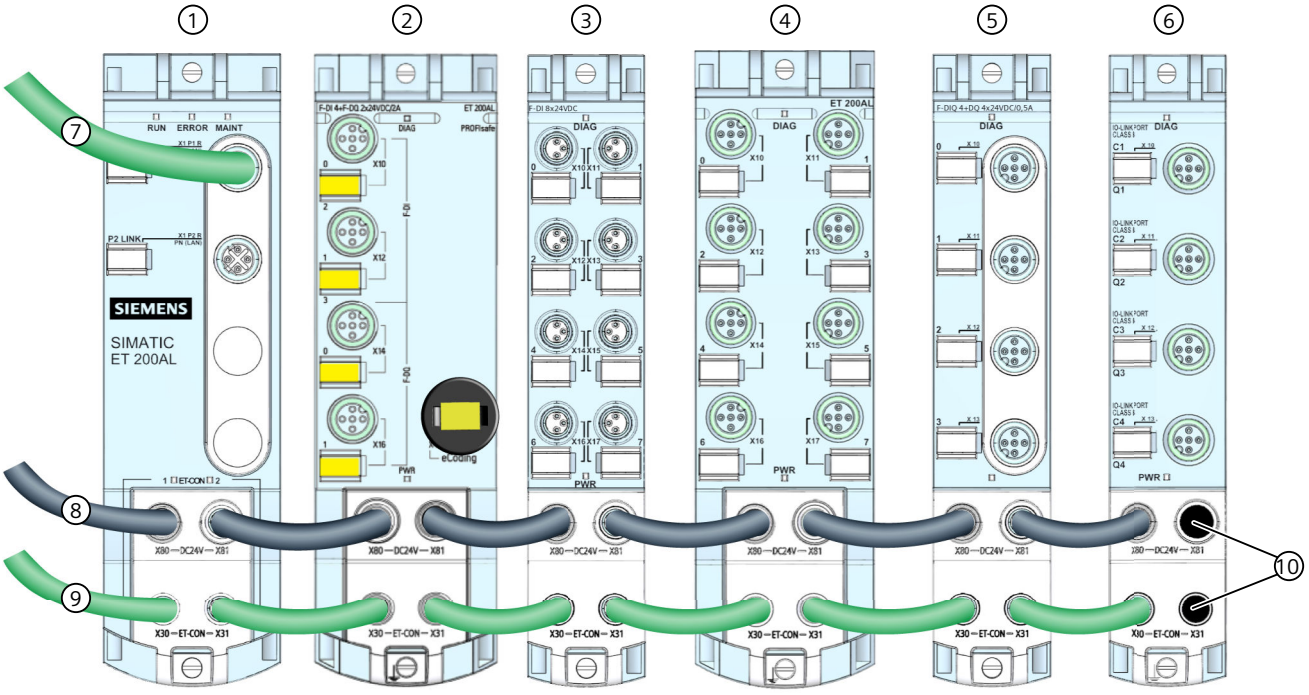
The SIMATIC ET 200AL distributed I/O system is especially well suited for use in tight spaces, moving applications and for assembly and handling technology. Thanks to its scalable construction, you have the option to precisely customize its configuration to your on site needs.

The SIMATIC ET 200AL distributed I/O system features degree of protection IP65/IP67. The I/O modules are suitable for distributed use indoors on a machine or assembly line.

Setup

The SIMATIC ET 200AL distributed I/O system is made up of the following components:

- Interface modules (MultiFieldbus/PROFINET/PROFIBUS)
- Digital and analog I/O modules
- Communications modules
- Fail-safe modules



After an interface module you can configure 2 lines (ET-Connection), each with 16 modules.

Alternatively, you can configure a line with 16 I/O modules on the SIMATIC ET 200SP distributed I/O system with BaseUnit BU-Send and the BusAdapter BA-Send 1xFC.

The ET-Connection backplane bus is designed as a cable. This allows you to create spatial distances of up to 15 m between the modules.

Configuration example

The figure below shows a configuration example of the SIMATIC ET 200AL distributed I/O system with a PROFINET interface module.

① Interface module (PROFINET)
② Fail-safe digital input / digital output module
③ Digital input/output module
④ Digital output module
⑤ Analog input module
⑥ Communication module
⑦ PROFINET cable
⑧ Power supply cable
⑨ ET-Connection cable
⑩ Sealing caps

Figure 1-656 Configuration example of the ET 200AL

4.2 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems are mainly used in applications where failure could have consequences for the safety of people and/or the environment. Fail-safe systems are therefore intended to reduce hazards or failures that could cause physical damage. Their purpose is to ensure a tolerable level of risk.

F-systems are used to control processes and provide a safe operating state when faults are detected. Fault detection is ensured by a very high level of diagnostic coverage. When a fault is detected, appropriate actions are initiated to bring the affected application to a safe state.

F-systems offer improved fault detection and fault localization through detailed diagnostics and diagnostic messages. This is the most important difference between fail-safe systems and standard systems. The use of fail-safe systems should be considered for applications where hazards are inherent and can cause physical damage.

Safety Integrated

Safety Integrated is the integrated safety concept for automation and drive technology from Siemens.

Proven technologies and systems from automation technology are used for safety systems. Safety Integrated includes the complete safety sequence, ranging from sensor, actuator and fail-safe modules right through to the controller, including safety-related communication via standard fieldbuses. Drives and controllers handle safety tasks in addition to their actual functions.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard modules is that they have an internal two-channel design. This means the two integrated processors monitor each other, automatically test the input and output circuits, and switch the fail-safe module to a safe state in the event of a fault.

The F-CPU communicates with a fail-safe module via the safety-related PROFIsafe bus profile.

Possible uses of ET 200AL with fail-safe modules

The use of ET 200AL with fail-safe modules makes it possible to replace conventional mounting technology in safety technology with PLC components. This also includes the replacement of switchgear for EMERGENCY STOP, safety door monitoring, ambidextrous operation, etc.

Fail-safe modules for ET 200AL are supported together with the STEP 7 Safety Advanced V17 or higher option package.

F-modules for ET 200AL can be used either with an ET 200AL PROFINET interface module (IM), a direct ET connection to an ET 200SP F-CPU or a direct ET connection to an ET 200SP IM (mixed configuration).

Use in SIMATIC Safety F-systems

The fail-safe ET 200AL modules can be used with STEP 7 Safety Advanced from V17 with PROFINET and direct ET connection configurations together with an F-CPU.

The fail-safe modules can only be used in safety mode. Fault safe and non-fault safe modules can be combined within one ET 200AL ET connection.

Achievable safety classes

The fail-safe modules are equipped with integrated safety functions for safety mode.
You can achieve the safety classes of the table below:

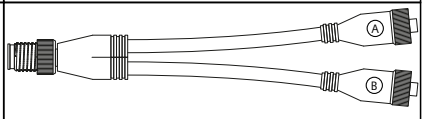
- With the appropriate parameter assignment of the safety functions in STEP 7
- With a specific combination of fail-safe and non-fail-safe I/O modules
- With a special arrangement and wiring of the sensors and actuators

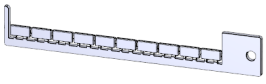
Table 1-940 Safety classes that can be achieved with ET 200AL in safety mode

Safety class in safety mode		
According to IEC 61508	**According to ISO 13849-1**	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

⚠ WARNING

The safety performance of your installation depends on the design and ongoing maintenance of the individual complete safety function.
SIMATIC fail-safe CPUs and ET 200AL fail-safe modules have logic processing components with certified safety integrity levels, provided they are operated in accordance with classifications, specifications, and instructions.
Failure to adhere to this may cause damage or unpredictable operation, resulting in fatal or serious injury and/or property damage.
To achieve the level of safety you require, you need to select all components of your plant and construct and maintain them in accordance with accepted safety standards and practices.





4.3 Components

Components of the ET 200AL distributed I/O system

The following table shows and explains the function of the most important components of the ET 200AL distributed I/O system.

Table 1-941 Components of the ET 200AL distributed I/O system

Components	Function	View
Interface module for MultiFieldbus	• The interface module connects the distributed I/O system ET 200AL with one or more I/O controllers, scanners, Modbus clients • Exchanges data with the I/O modules via ET-Connection	

Components	Function	View
Interface module for PROFINET IO	• The interface module connects the ET 200AL distributed I/O system with the IO controller • Exchanges data with the I/O modules via ET-Connection	
Interface module for PROFIBUS DP	• The interface module connects the ET 200AL distributed I/O system with the DP master • Exchanges data with the I/O modules via ET-Connection	
I/O modules	• The I/O modules form the interface to the process • Recording and controlling the current process status via the connected sensors and actuators	
Voltage distributor	• The voltage distributor distributes the voltage 24 V DC to the I/O modules • 1 input M12-L connector • 4 outputs M8 socket with electronic fusing of 4 A per output for 1L+ and 2L+	
eCoding plug connector	Electronic coding element with an overwritable electronic memory for module-specific fail-safe address data (for example, the F-destination address)	
Y-cable	Y-cable connects multiple actuators or sensors to inputs or outputs. There are two types: • Y-cable: Connects inputs or outputs of the module to several actuators or sensors. • Inverted Y-cable: Connects several fail-safe inputs or outputs of the F-module with one or more sensors and actuators	
Identification labels	• The identification labels come with the module and can be machine printed • Can be ordered separately in white or yellow for fail-safe modules	

Components	Function	View
Bus cable and M8 connector for ET-Connection	The bus cable creates the bus connection between the modules	
Power cable and M8 connector for power supply	The power cable provides power to the modules	
Stripping tool ET-Connection	The stripping tool is used to strip the ET-Connection bus cable	

Application planning

5

5.1 Hardware configuration

Mechanical maximum configuration

The following tables show the rules of the mechanical configuration. As soon as one of the following rules applies, the maximum configuration has been reached.

Table 1-942 Maximum mechanical configuration - on ET 200AL interface module

Properties	Rule (max.)	
	Interface modules as of firmware version V1.0.0	Interface modules as of firmware version V1.0.1
Number of ET 200AL I/O modules in the configuration	32	
Number of ET-Connection outlets	2	
Number of I/O modules per ET-Connection outlet	16	
Spatial extension per ET-Connection line	160 m	240 m
Cable length between the modules	10 m	15 m

Table 1-943 Maximum mechanical configuration - on ET 200SP with interface module

Properties	Rule (max.)	
	Interface modules as of firmware version V3.0.0	Interface modules as of firmware version V3.3.0
Number of ET 200AL I/O modules in the configuration	16	
Number of ET-Connection outlets	1	
Spatial extension ET-Connection line	160 m	240 m
Cable length between the modules	10 m	15 m

Table 1-944 Maximum mechanical configuration - on ET 200SP with CPU

Properties	Rule (max.)
	CPUs with firmware version as of V2.0.0
Number of ET 200AL I/O modules in the configuration	16
Number of ET-Connection outlets	1
Spatial extension ET-Connection line	240 m
Cable length between the modules	15 m

Electrical maximum configuration

The number of usable I/O modules of a potential group is limited by the following points:

- Power requirements of the I/O modules
- Power requirements of the components supplied via these I/O modules

The maximum infeed current of the I/O modules is 4 A with 1L+ supply voltage (non-switched) and 2L+ load voltage (switched). When the maximum infeed current has been reached, you must open a new potential group.

Reference

You will find more information in the section Wiring rules for the interface module and I/O modules (Page 60).

5.2 Configuration variants with ET-Connection

5.2.1 ET 200AL with ET-Connection

Every ET 200AL interface module has 2 ET-Connection I/Os.

From every ET-Connection, you have the option to set up a line with a maximum of 16 ET 200AL I/O modules.

ET-Connection1

The figure below shows a configuration in the IP65/IP67 environment with one ET-Connection line.

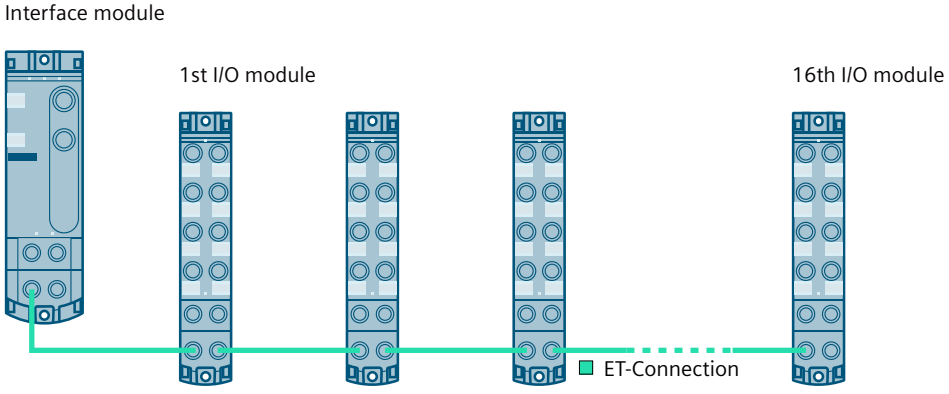


Figure 1-657 ET 200AL with ET-Connection1

ET-Connection1 and ET-Connection2

The figure below shows a configuration in the IP65/IP67 environment with two ET-Connection lines

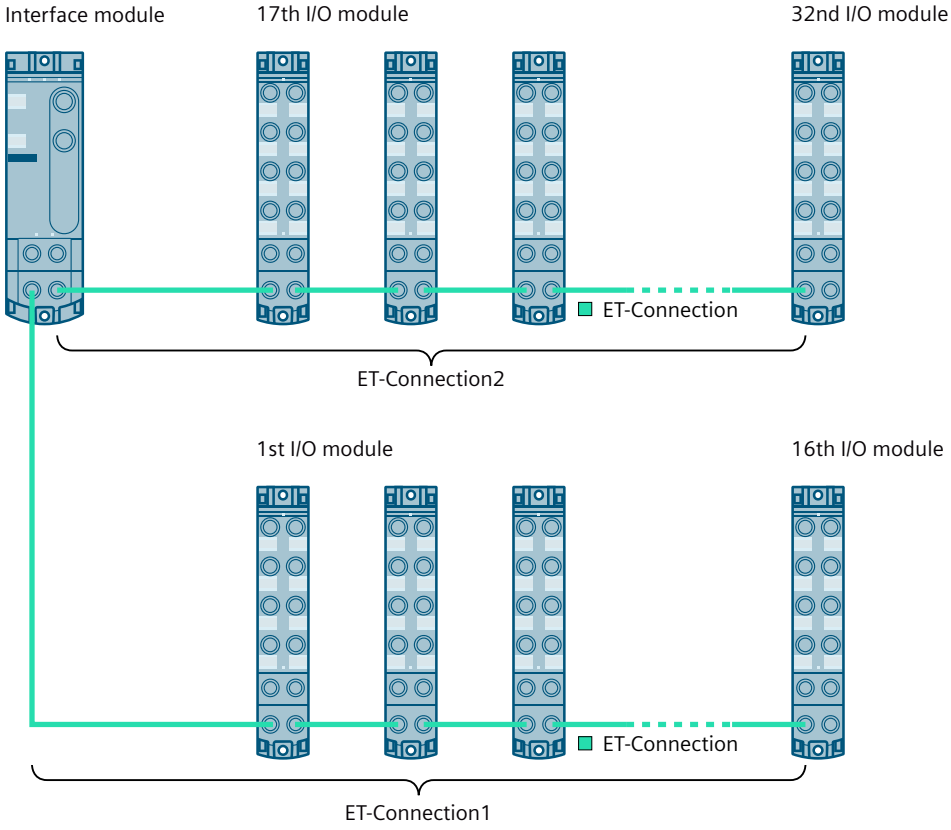

Figure 1-658 ET 200AL with ET-Connection1 and ET-Connection2

5.2.2 Hybrid configuration ET 200AL/ET 200SP with ET-Connection

Hybrid configuration ET 200AL and ET 200SP

You have the possibility to integrate standard and fail-safe I/O modules of the distributed I/O systems ET 200AL (IP65/IP67) into a configuration of the distributed I/O system ET 200SP (IP20). Fail-safe and non-fail-safe modules may be combined at will in the ET 200AL distributed I/O system.

The figure below shows a combination of the modules of the ET 200AL and ET 200SP distributed I/O systems.

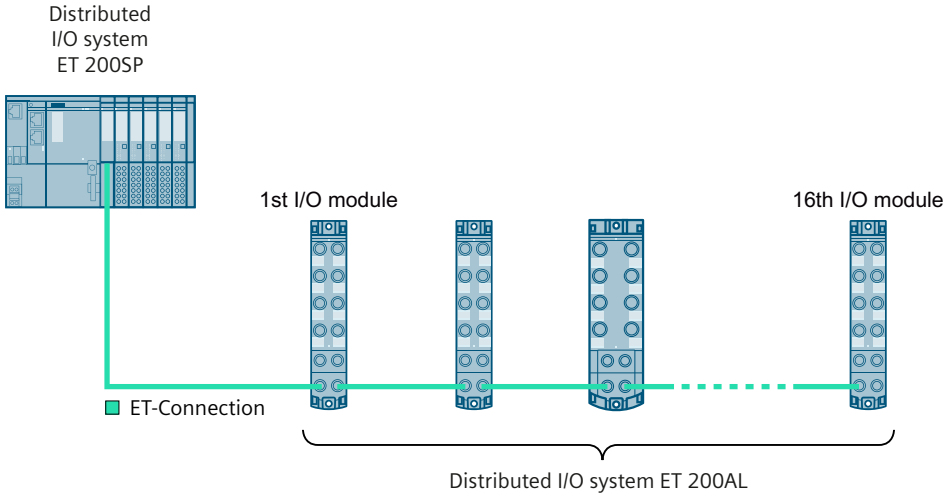

Figure 1-659 Hybrid configuration ET 200SP and ET 200AL with ET-Connection

Requirement

For a hybrid configuration, you need at least the following components:

- Interface module or CPU

NOTE

Use of a F-CPU with F-modules

A fail-safe CPU must also be used when using a fail-safe module in the ET 200AL.

- BaseUnit BU-Send with BusAdapter BA-Send 1xFC
- ET-Connection cable pre-assembled on one side
- Power cable pre-assembled on one side

Rules

When putting together a hybrid configuration, you must observe the following rules:

- The bus length of the ET 200SP distributed I/O system is a maximum of 1 m (excluding interface module/CPU, including BU-Send, BA-Send 1×FC and server module).
- A maximum of 16 ET 200AL I/O modules can be connected to ET-Connection.
- The maximum length of the bus cable for ET-Connection between two modules is 15 m.

Rules

The following table shows a rough overview of the functions of the ET 200AL I/O modules in combination with the ET 200SP.

Function	Hybrid configuration		
	ET 200SP		ET 200AL I/O modules on ET connection
	IM	CPU	
Isochronous mode	●	--	--
Configuration control	●	●	●
Shared device	●	●	●
PROFIenergy	●[1]	--	●[1]
System redundancy S2	●[2]	--	●[2]

1) PROFIenergy is not supported by fail-safe I/O module F-DI 4+F-DQ 2x24VDC/2A, 4xM12

2) With IM 155-6 PN/3 HF and IM 155-6 PN/2 HF as of V4.2

Details on the hybrid configuration are available here (https://support.industry.siemens.com/cs/de/en/view/100300517).

Procedure

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/95886672)

Proceed as follows to put together a multi-tier configuration:

1. Mount the BaseUnit BU-Send directly to the right of the ET 200SP interface module or the ET 200SP CPU.
2. Then install the other BaseUnits/I/O modules for the ET 200SP distributed I/O system and the server module.
3. Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1×FC and install it on the BaseUnit BU-Send.
4. Fasten the BusAdapter BA-Send 1×FC with the BaseUnit BU-Send (1 screw with tightening torque of 0.2 Nm). Use a screwdriver with a 3 to 3.5 mm blade to do this.
5. Connect the other end of the bus cable for ET-Connection (with M8 plug) to the first ET 200AL I/O module (socket X30 ET-Connection IN).
6. Connect the supply voltage (24 V DC) to the ET 200AL I/O modules (X80 plug).

Mounting

6

6.1 Basics

Introduction

All the modules of the ET 200AL distributed I/O system are designed for the degree of protection IP65/IP67. This means that you can directly mount this system in your plant.

Installation position

You can mount the ET 200AL distributed I/O system in any position.

Minimum clearances

At ambient temperatures of >50 °C or higher, ensure that the module is mounted at a distance of least 1 cm from an adjacent module or other device.

With the voltage distributor PD 24VDC (6ES7194-2CA00-0AA0), maintain a minimum clearance of 1 cm from adjacent modules or other devices when mounting.

Mounting rules

When mounting the modules, you do not need to following any special rules.

NOTE

Mounting of the modules
Mount the ET 200AL distributed I/O system only with disconnected supply voltages.

NOTICE
Mounting of the interface modules When mounting the interface modules of the ET 200AL, ensure that the rear of the module is protected against mechanical damage.

6.2 Mounting modules

Introduction

The modules of the ET 200AL distributed I/O system are designed for installation on a level, firm surface.

Thanks to the axisymmetrical drill holes in the modules, you have the option to fasten the modules on an aluminum profile using tee nuts.

The following images shows the aluminum profile on which you can mount the modules.

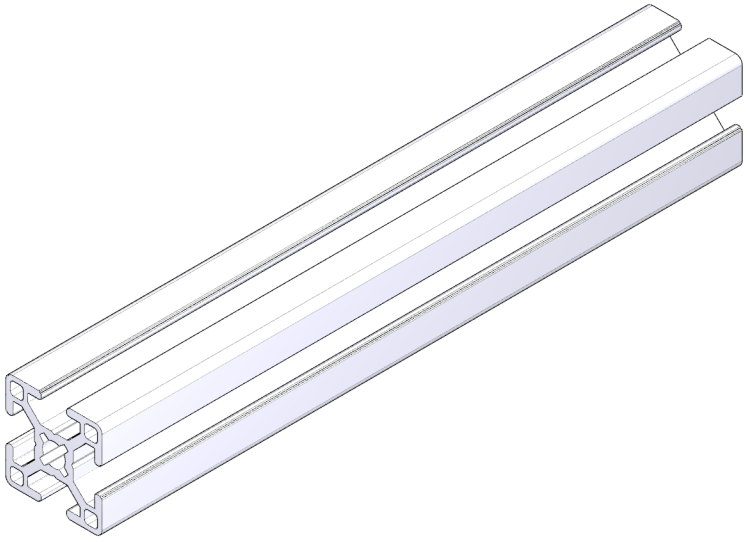

Figure 1-660 Aluminum profile

Required tools

For installation, you need a screwdriver or an Allen wrench.

Required screws

The following table shows and explains the screw types required to mount the modules.

Table 1-945 Recommended screws

Screw type	Explanation
Socket head cap screw M4 according to DIN EN ISO 1207 / DIN EN ISO 1580	The screw length must be at least 30 mm. If you need washers, use DIN EN ISO 7089/DIN EN ISO 7090 washers.
Hexagon socket head cap screw M4 according to DIN EN ISO 4762	

Drill holes of the modules

All modules of the ET 200AL distributed I/O system feature a uniform drill pattern.

- All module housings are axisymmetrical.
- The distance between the top and bottom drill hole is identical for all modules.

Mounting interface module and 45 mm I/O modules (front)

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/95886672)

The interface modules and the 45 mm I/O modules have an attachment point on top and on the bottom.

To mount an interface module or 45 mm I/O module, follow these steps:

1. Drill 2 fastening holes with 4.5 mm diameter at a distance of 149.6 mm.
2. Fasten the interface module or the 45 mm I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening the IM 157-1 PN interface module and the DQ 8x24VDC/2A 8xM12 45 mm I/O module.

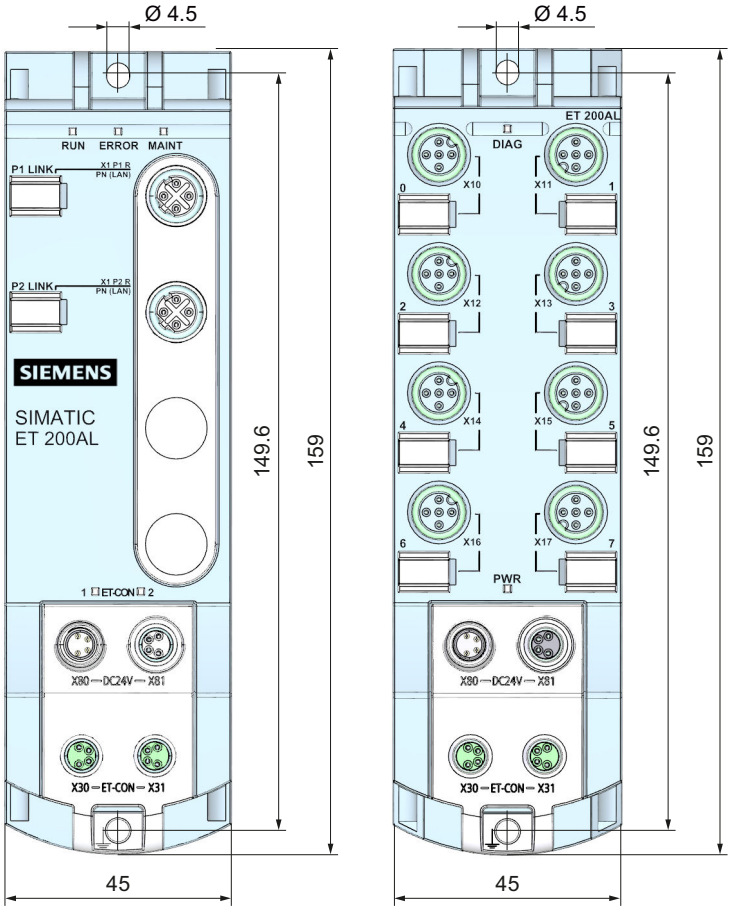

Figure 1-661 Dimensions for mounting interface modules and 45 mm I/O modules

Mounting 30 mm I/O modules (front or side)

Watch video sequence (https://support.industry.siemens.com/cs/ww/en/view/95886672)

The 30 mm I/O modules have an attachment point on top and on the bottom. You also have the option of fastening the 30 mm I/O modules at the side. When fastening them at the side, you must use the supplied spacers.

To mount a 30 mm I/O module, follow these steps:

1. Drill 2 fastening holes with 4.5 mm diameter at a distance of 149.6 mm.
2. Use the supplied spacers for side fastening of the I/O module on the top and bottom (on one side adjacent to the fastening surface).
3. Fasten the I/O module with the screws to both fastening points (tightening torque 1.2 Nm).

The figure below shows the dimensions for fastening the 30 mm I/O modules using the example of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 I/O module.

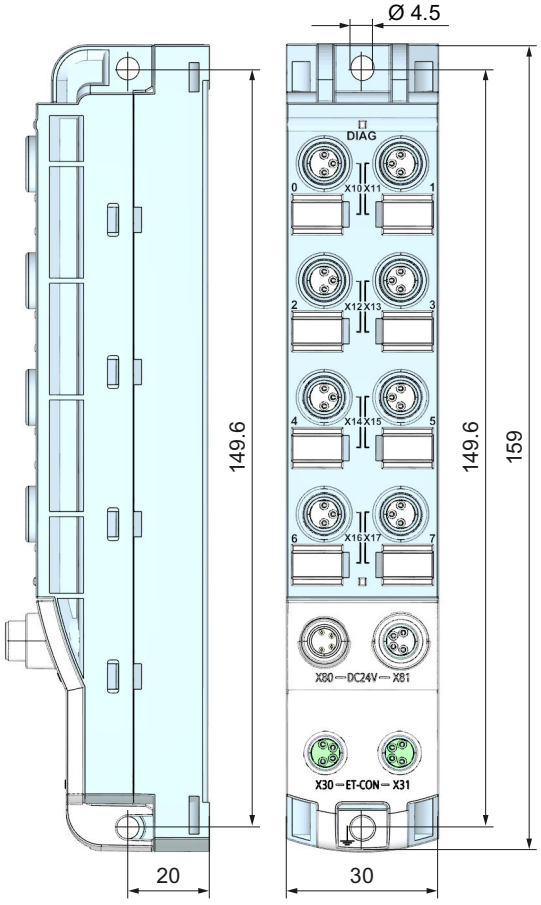

Figure 1-662 Dimensions for mounting 30 mm I/O modules

Fastening for cable ties

All module of the ET 200AL distributed I/O system have an integrated attachment point for cable ties. The attachment points are found on all four corners of the modules.

The figure below shows the top left attachment point for 2.5 mm wide cable ties for fastening the cables.

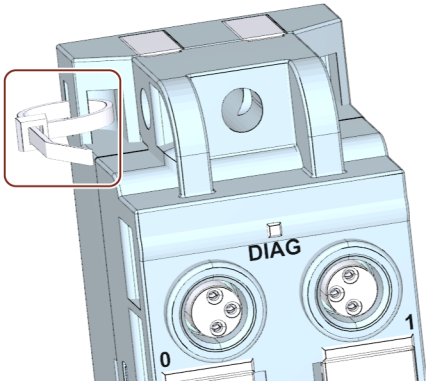

Figure 1-663 Top left attachment point for cable ties

Connecting 7

7.1 Rules and regulations for operation

Introduction

Depending on the area of application, the ET 200AL distributed I/O system, as a component of plants and systems, requires that special rules and specifications be observed.

This section gives an overview of the most important rules to be followed for integration of the ET 200AL distributed I/O system in a plant or in a system.

Specific application

Follow the safety and accident prevention regulations applicable to specific applications, e.g. the machinery directive.

EMERGENCY-STOP device

EMERGENCY-STOP devices according to IEC 60204 (corresponds to DIN VDE 113) must remain in effect in all operating modes of the plant or system.

Excluding hazardous system conditions

Hazardous plant states must not occur.

Ensure that dangerous system conditions are excluded, even in the following situations:

- In the event of a voltage dip or power outage
- When the plant restarts after a voltage dip or power outage
- When the ET 200AL distributed I/O system restarts after interruption of PROFINET communication

If necessary, force the EMERGENCY OFF.

An uncontrolled or undefined startup is not permitted after the "EMERGENCY STOP" is unlocked.

Cables and wires

The cables and lines used including the connector must fulfill the following requirements:

- Designed for at least the supply voltage used
- Designed for continuous cable temperature of at least 20 K above the ambient air temperature of the ET 200AL modules.
- Conductor cross-section suitable for the application and fusing.

An example for the line voltage drop at the used cables and lines is available in the section "Connecting cables for ET 200AL (Page 60)".

External fuses/switches

External fuses and switches must be installed so that they meet the standards for cable and device protection applicable to your application.

Line voltage of the SELV/PELV power supply

The following section describes what you need to pay attention to with respect to the line voltage (you will find additional information in the section Information on insulation, protection class, degree of protection, and rated voltage (Page 126)):

- For stationary plants or systems without an all-pole line disconnector, there must be a disconnector unit (all-pole) fitted in the building installation.
- For load current supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the ET 200AL distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

24 V DC supply

Below there is a description of what you need to pay attention to with 24 V DC supply:

- For buildings:
  If there is a danger due to overvoltages, you must take lightning protection measures for external lightning protection (e.g. lighting protection elements).
- With 24 V DC supply lines and signal lines:
  If there is a danger due to overvoltages, you must take lightning protection measures for internal lightning protection (e.g. lightning protection elements. You will find additional information in the Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566) function manual).

- For 24 V DC supply:
  Ensure that there is safe (electrical) separation of low voltage (SELV/PELV) according to IEC 61010-2-201 or IEC 60950-1.
  Use a UL/IEC-approved fuse for the infeed supply voltages.
  - For interface modules and I/O modules: 28.8 V DC/4 A fuse (type B or type C tripping characteristic). Ensure that the fuse used blows within 120 s at a current of 8.33 A.

    NOTE

    The 4 A fuse is not required if you use the voltage distributor PD 24VDC for the voltage supply.

  - For voltage distributor PD 24VDC:

    For UL approval usage: 28.8 V DC/10 A or 28.8 V DC/15 A (tripping characteristic type T according to UL 248-15), depending on the cable cross-section used.

    For IEC usage: 28.8 V DC/10 A or 28.8 V DC/16 A (tripping characteristic type B or type C), depending on the cable cross-section used.
- Continuous operation of fail-safe modules with more than 28.8 V DC can result in personal injury and equipment damage.

⚠ WARNING

Continuous operation of fail-safe modules with more than 28.8 V DC can result in personal injury and equipment damage.
Certain transients from certain source impedances (for example according to EN 61000-4-2, 61000- 4-4 and 61000-4- 5), as specified in the "Electromagnetic compatibility" section, can act on this voltage without interrupting operation or causing damage.
Operate the fail-safe module within the voltage parameters specified in the technical specifications. This will avoid unacceptable temperature increases and heat damage that will cause the module to lose its functionality.

Requirements for power supplies in the event of a power interruption

To ensure compliance with IEC 61131-2, use only power supply units/power supplies with a power failure bridging time of at least 20 ms. Observe the relevant requirement in your product standards (e.g. 30 ms for "burners" according to EN 298) with regard to possible voltage interruptions. You can find the latest information on power supply components on the Internet.

Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- For all plants or systems in which the ET 200AL distributed I/O system is integrated, you must ensure that the equipment or system is functionally grounded to discharge electromagnetic interference.
- For supply, signal and bus cables, you must ensure that the cable routing and installation is correct.
- For signal and bus cables, you must ensure that a wire/cable breakage or a cross-wire does not lead to undefined states of the plant or system.

Reference

Additional information can be found in the function manual Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566).

7.2 Additional rules and regulations for the operation of the ET 200AL with fail-safe modules

7.2.1 Safety extra-low-voltage (SELV, PELV) for fail-safe modules

⚠ WARNING

The fail-safe modules must be operated with a safe extra-low voltage (SELV, PELV).
You can find additional information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.
The fail-safe modules operate at a rated voltage of 24 V DC. The tolerance range is 20.4 V DC to 28.8 V DC.
Within the overvoltage range from 28.8 V DC to 35 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages higher than 35 V DC, the F-modules are permanently de-energized.
Use a power supply unit that does not exceed U_m = 35 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g. use of an overvoltage protector.
All system components that can supply electrical energy in any form whatsoever must fulfill this condition.
Each additional circuit (24 V DC) used in the system must have a safety extra-low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.
Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module must not exceed a fault voltage U_m in the event of a fault.

⚠ WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.
An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage U_m to be exceeded.

Immunity to surge voltages

To meet the product standard for burner controls (EN 298), the wiring must be equipped with external protection against coupled surge voltages caused by lightning. Further information on this can be found in the function manual Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566).

7.2.2 Requirements for sensors and actuators for fail-safe modules

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Remember, too, that sensors and actuators do not generally withstand proof-test intervals of 20 years as defined in IEC 61508 without considerable loss of safety.
The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".
To achieve the required safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat. 3/PLe, a single-channel sensor is adequate. However, to achieve SIL3/Cat. 3/PLe with a single-channel sensor, the sensor itself must be SIL3/Cat. 3/PLe-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat. 4/PLe, sensors must be connected by two channels.

⚠ WARNING

In the case of fail-safe input modules, the value "0" is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.
Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Duration requirements for sensor signals

⚠ WARNING

Observe the following requirements for sensor signals:

- To ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in the section "Response times" of the relevant F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

Fast reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g. 230 V AC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (in accordance with IEC 60664-1).
This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

7.2.3 Crosstalk of digital input/output signals

Readback errors may occur on the F-DQ channels if the fail-safe digital output signals and fail-safe digital input signals are routed through a single cable.

Cause: capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. A cross circuit/short-circuit is detected, which leads to safety-related tripping.

Remedy:

- Separate cables for fail-safe DQ modules and non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it.

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

Remedy:

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

7.3 Operation of the ET 200AL on grounded/non-grounded infeed

Introduction

Information is provided below on the overall configuration of an ET 200AL distributed I/O system on a grounded incoming supply (TN-S network). The specific subjects discussed are:

- Disconnecting devices, short-circuit and overload protection to IEC 60364 (corresponding to DIN VDE 0100) and IEC 60204 (corresponding to DIN VDE 0113)
- Load current supplies and load circuits
- Supply voltages of the ET 200AL distributed I/O system

Grounded infeed

In grounded incoming supplies, the neutral conductor of the supply system is grounded. A simple ground fault between a live conductor and ground or a grounded section of the plant causes the protective devices to trip.

Supply voltages

Provide the ET 200AL distributed I/O devices with a SELV/PELV supply voltage for 1L+.
The supplied SELV/PELV load voltage for 2L+ can be switched, depending on the application.

- 1L+: Supply voltage (non-switched)
- 2L+: Load voltage (switched)

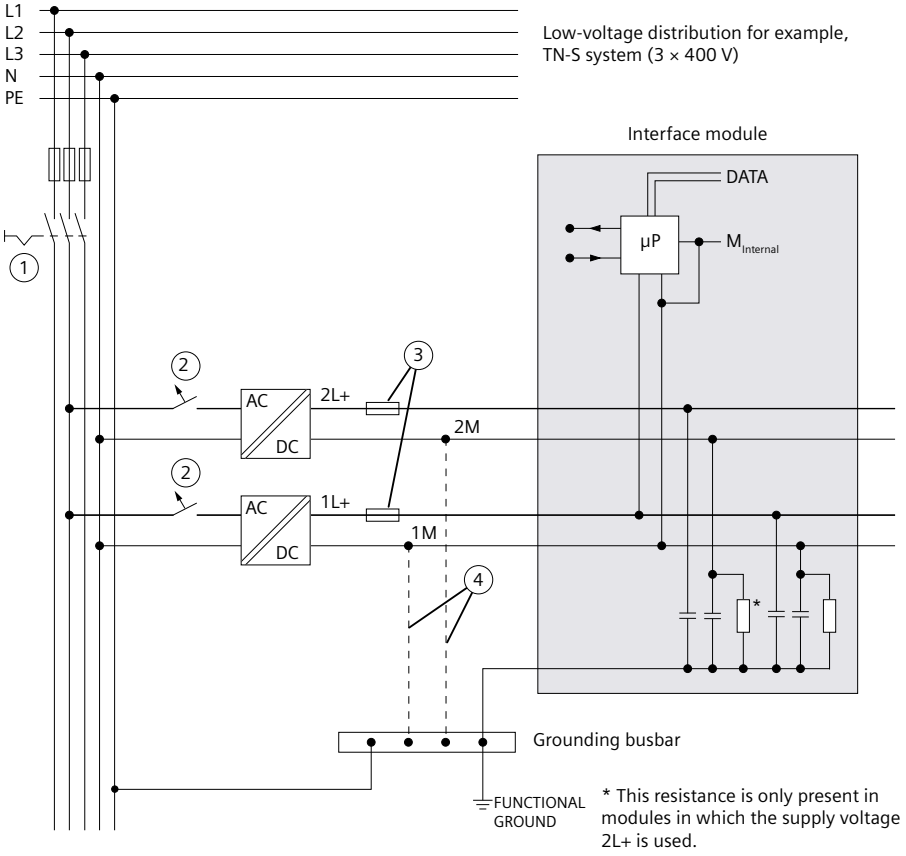
Safe electrical separation (SELV/PELV)

For operating the ET 200AL distributed I/O system, mains devices/power supply modules with safe electrical separation SELV/PELV are required. These power supplies/power supply modules must comply with IEC 61010-2-201.

The wiring of SELV/PELV circuits must be separated from the wiring of non-SELV/PELV circuits. Alternatively, the insulation of all conductors must be dimensioned for the higher voltage.

NOTICE
Operation in damp/wet environments When operating in a damp/wet environment, other voltage limits apply for SELV/PELV according to IEC 61010-2-201.

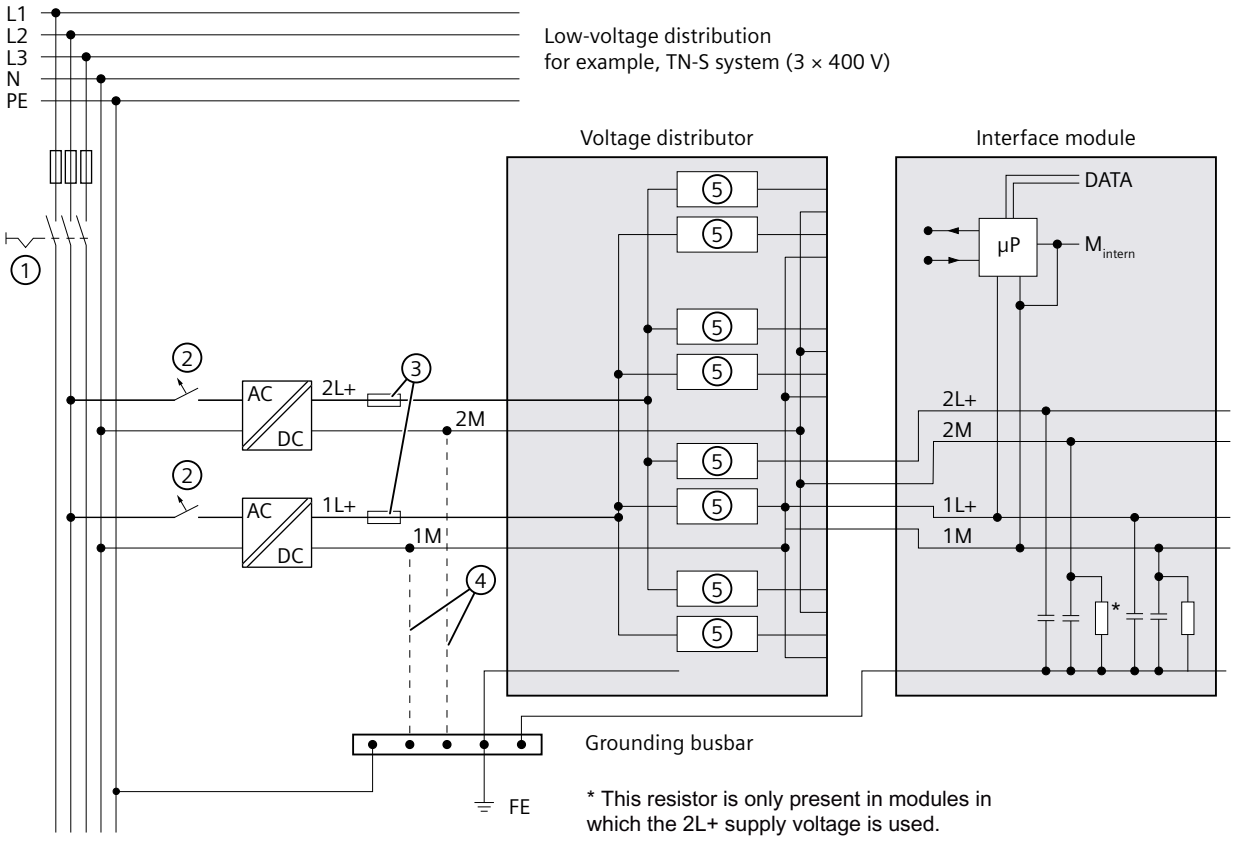
Configuring ET 200AL with grounded reference potential



When configuring the ET 200AL distributed I/O system with grounded reference potential, occurring interference currents are discharged into functional ground. The connections must be externally connected (connection between 1M and functional ground).

Configuring ET 200AL with ungrounded reference potential

When configuring the ET 200AL distributed I/O system with non-grounded reference potential, occurring interference currents are discharged via an internal RC network to functional ground (no external connection between 1M and functional ground).



ET 200AL in the overall configuration

The figures below show the ET 200AL distributed I/O system in the complete electrical configuration using an interface module with and without voltage distributor as the example.

① Main switch
② Short-circuit and overvoltage protection
③ Fuses for cable protection (fuse for 4 A)
④ When configuring the ET 200AL distributed I/O system with non-grounded reference potential, no connection is made between 1M, 2M and functional ground

Figure 1-664 Electrical configuration

① Main switch
② Short-circuit and overvoltage protection
③ Fuses for cable protection (see Rules and regulations for operation (Page 41))
④ When configuring the ET 200AL distributed I/O system with non-grounded reference potential, no connection is made between 1M, 2M and functional ground
⑤ Integrated short-circuit protection electronic 4 A

Figure 1-665 Electrical configuration with voltage distributor

Components and protective measures

Various components and protective measures are stipulated for setting up a complete plant. The types of components and the degree to which the protective measures are mandatory depend on the IEC regulation that applies to your plant setup.

The following table shows the components of the electrical configuration with reference to the previous figure and compares the IEC regulations.

Table 1-946 Components of electrical configuration

	Reference to illustration	IEC 60364 (DIN VDE 0100)	IEC 60204 (DIN VDE 0113)
Disconnection element for controller, sensors, and actuators	①	Main switch	Disconnector
Short-circuit / overload protection	②	Single-pole protection of circuits Secure all incoming supply cables with a circuit breaker. (See Rules and regulations for operation (Page 41))	Secure single pole for a grounded secondary circuit
Cable protection	③	Protection of cables and wires against overcurrent	-

Insulation monitoring

In the following situations, you must provide insulation monitoring:

- When configuring the ET 200AL distributed I/O system with non-grounded reference potential
- When hazardous system conditions may occur due to errors

7.4 Electrical configuration of the ET 200AL distributed I/O system

Electrical isolation

When electrically configuring the ET 200AL distributed I/O system, there is electrical isolation between:

- Load voltage 2L+ and all other switching parts
- Communication interfaces (PROFINET/PROFIBUS) of the interface modules and all other switching parts
- ET-Connection and all other switching parts

The following images show the potential conditions of the modules of the ET 200AL distributed I/O system.

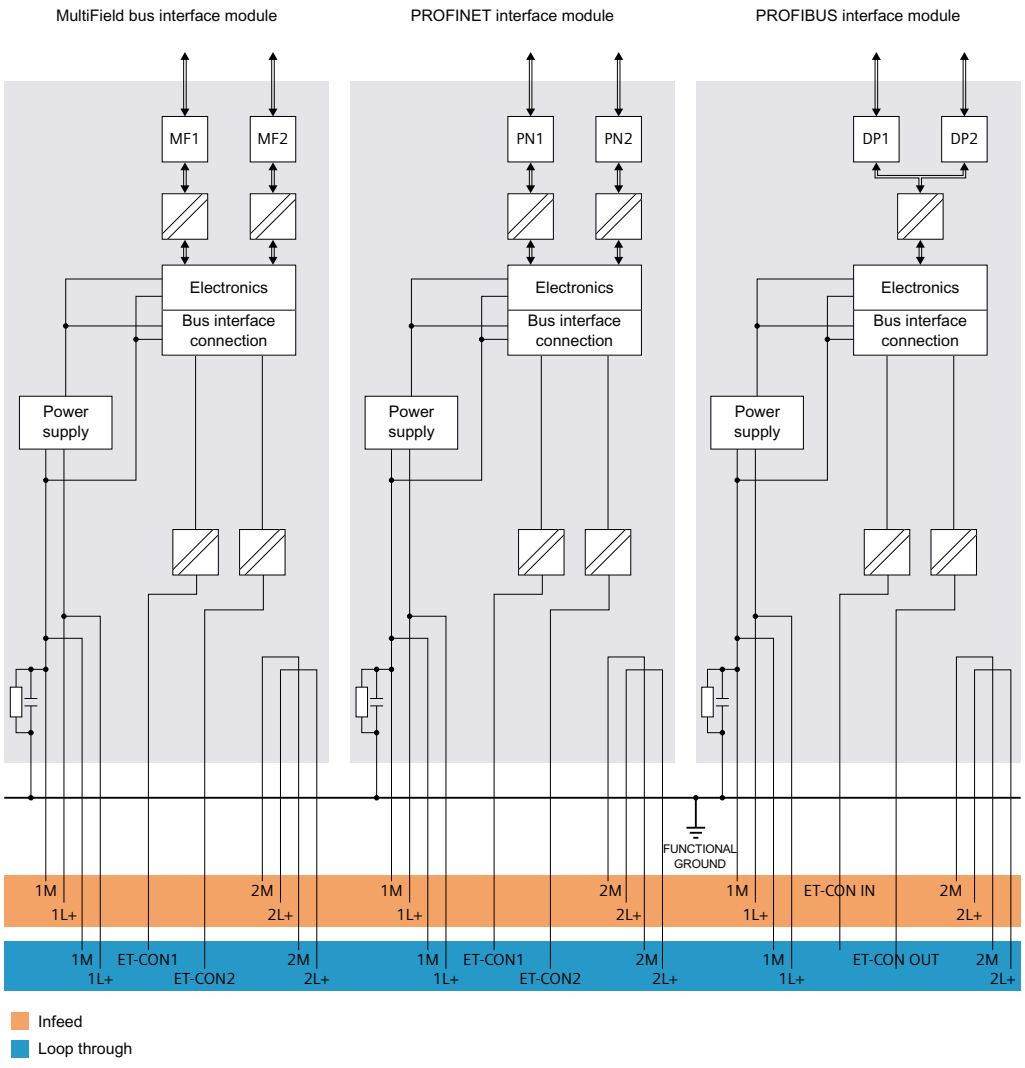


Figure 1-666 Potential conditions of the ET 200AL distributed I/O system (Part 1)

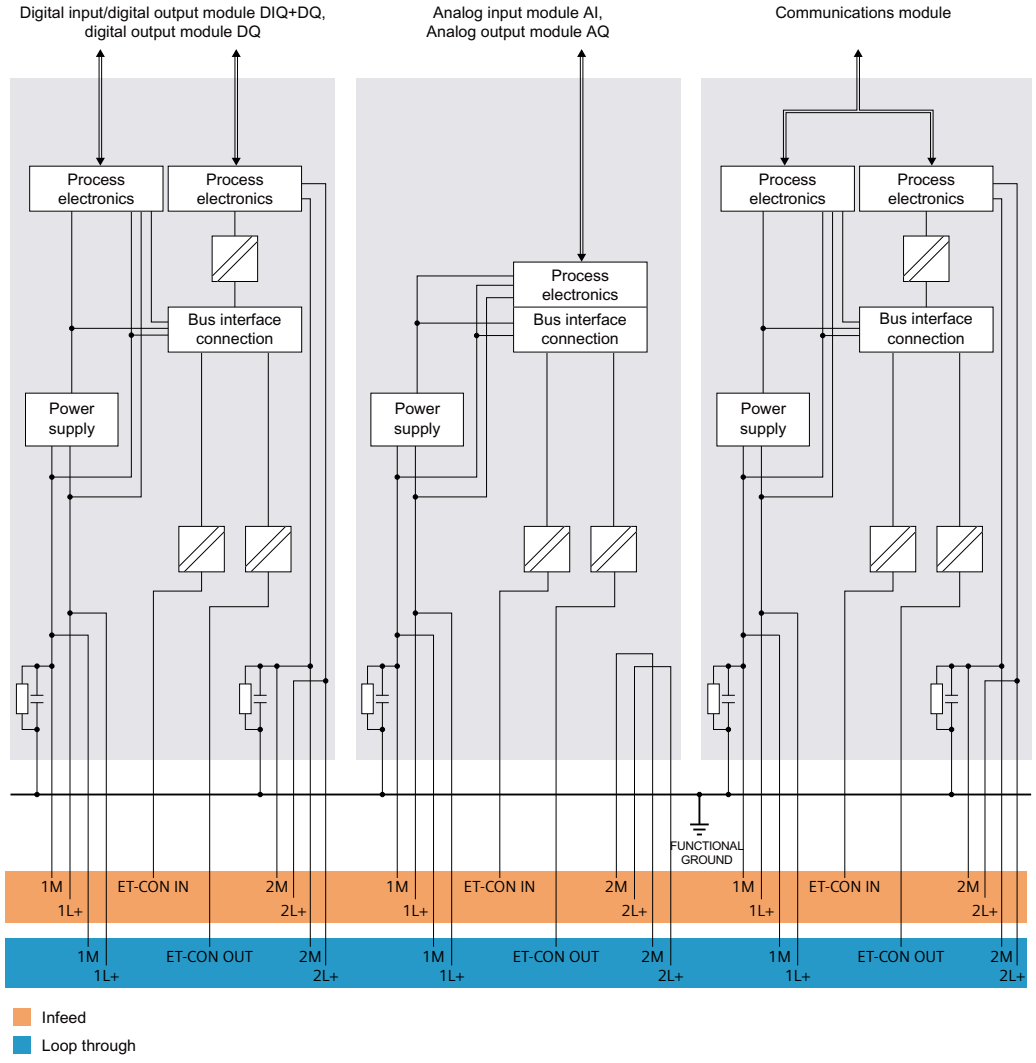

Figure 1-667 Potential conditions of the ET 200AL distributed I/O system (Part 2)

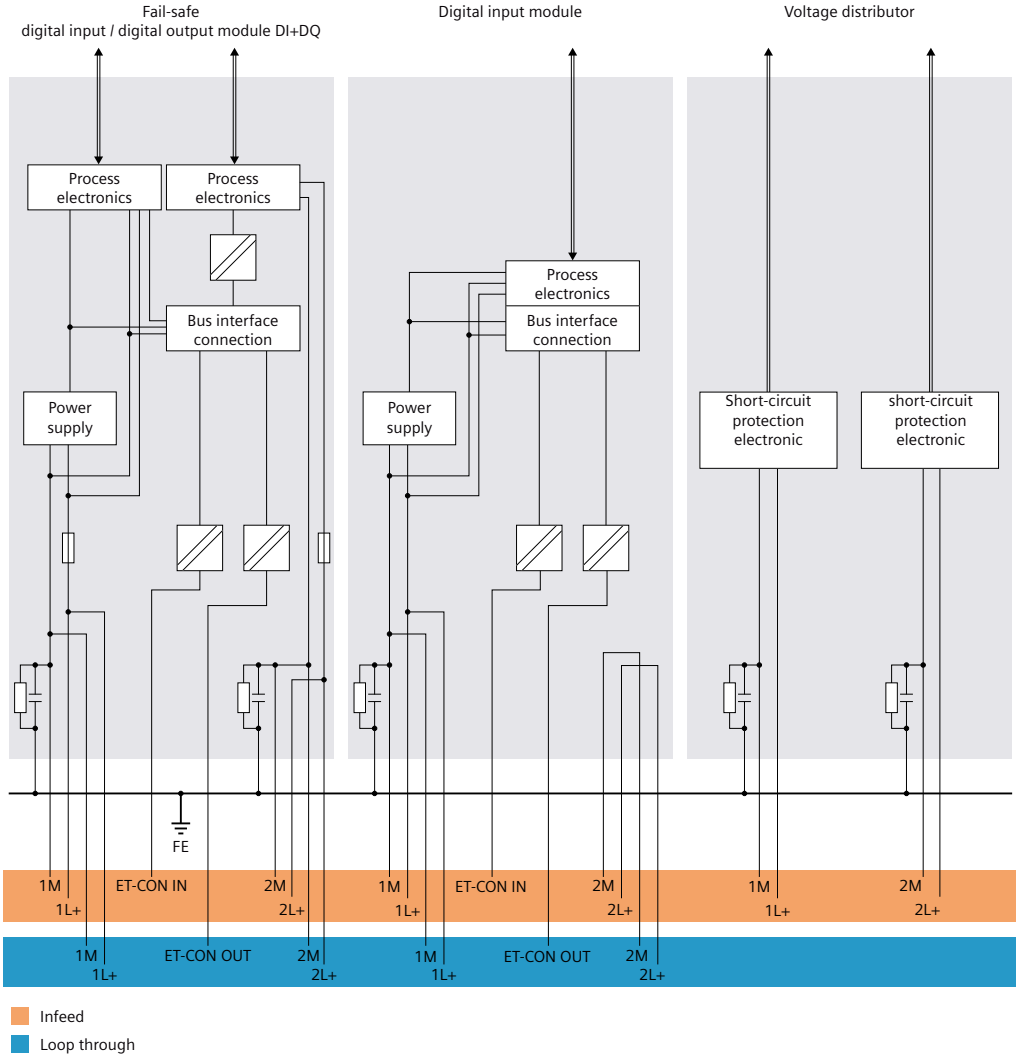

Figure 1-668 Potential conditions of the ET 200AL distributed I/O system (Part 3)

Connection of a digital output with a digital input

NOTICE
Pay attention to the potential group When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M may then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+. The possible compensating currents can destroy the digital module.

⚠ WARNING

Note potential groups for safety-related shutdown
When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M may then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+.
Safety-related shutdown is not permitted if electrical isolation has been eliminated.

Cable protection

According to IEC 60364, cable protection is required. Secure the supply cables externally.

Information about the fuses can be found in the section "Rules and regulations for operation (Page 41)" under "24 V DC supply".

Power supply of the configuration

Two voltage groups are available for the distributed I/O system ET 200AL: 1L+ (supply voltage) and 2L+ (load voltage).

A second infeed may be needed to supply all the modules of a configuration with the required voltage. Renewed voltage supply of 1L+ and 2L+ can be necessary to configure different potential groups or because the voltage is not sufficient for all modules due to the voltage drop. Create a power balance for the selection of the infeed point of the voltage.

NOTE

Turning 1L+ and 2L+ on and off
In contrast to the load voltage 2L+, the operational switching on and off of the supply voltage 1L+ results in a restart of the module.

The figure below shows a configuration with a new voltage infeed for the modules. The different potential groups have a gray background.

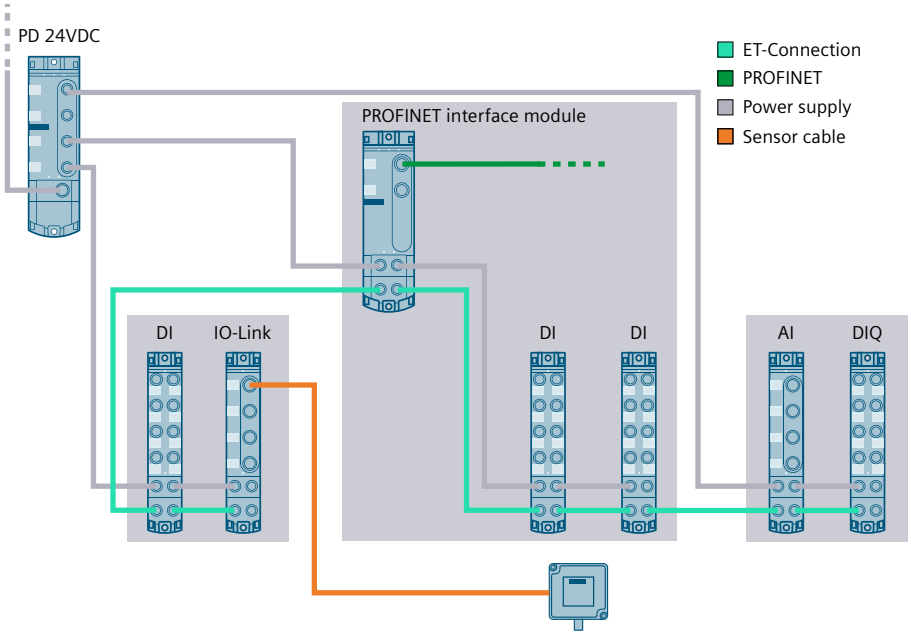

Figure 1-669 Wiring of the power supply

Reference

You will find additional information on electrical configuration and the voltage drop in the section Connecting cables for ET 200AL (Page 60).

7.5 Connecting ET 200AL to functional earth

Introduction

You must connect the distributed I/O system ET 200AL to functional earth (FE)

What is functional earth?

All ET 200AL modules feature a functional earth connection. This connection is used to suppress interference sensitivity, but not for protection purposes. With the functional earth connection, you create an electrical connection directly to a point of your system or shielding. This discharges the EMC interference directly into the earth. By discharging the EMC interference, the interference safety of the entire module is increased.

The figure below shows the symbol with which the functional earth connection is identified on the ET 200AL modules.

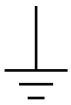

Figure 1-670 Functional earth

7.5.1 Mounting ET 200AL modules on conductive substrate

Requirement

Conductive substrate for mounting of the module

Required tools

To connect to functional earth, you need the following tools:

- Screwdriver

Required accessories:

To connect to functional earth, you need the following accessories:

- 2 x M4 fastening screws.

Mounting

To connect modules of the ET 200AL distributed I/O system to functional earth with a conductive mounting substrate, proceed as follows:

1. Drill two fastening holes.
2. Screw the module with the M4 fastening screws using a torque of 1.2 Nm.

NOTE

Earthing with conductive mounting substrate

When you fasten a module of the ET 200AL distributed I/O system on a conductive, grounded substrate, the bottom fastening screw provides a conductive connection to the ground potential.

Ensure that there is a low-impedance connection between the module and conductive underground as well as between the conductive underground and functional earth.

Reference

You will find more information on installing the modules in the section Mounting modules (Page 37).

7.5.2 Mounting ET 200AL modules on non-conductive substrate

Requirement

Conductive substrate for mounting of the module

Required tools

To connect to functional earth, you need the following tools:

- Screwdriver
- Stripping tool
- Crimp tool

Required accessories:

To connect to functional earth on a non-conductive fastening substrate, you need the following accessories:

- 2 x M4 fastening screws.
- Cable lug suitable for M4 screws
- Grounding cable (braided copper cable) with a minimum cross section of 4 mm^2

Mounting

To connect modules of the ET 200AL distributed I/O system to functional earth, proceed as follows:

1. Drill two fastening holes.
2. Strip the grounding cable.
3. Fasten the cable lug to the grounding cable.
4. Screw the module and the cable lug with the M4 fastening screws using a torque of 1.2 Nm.

The figure below shows how to connect functional earth using the example of the IM 157-1 PN interface module.

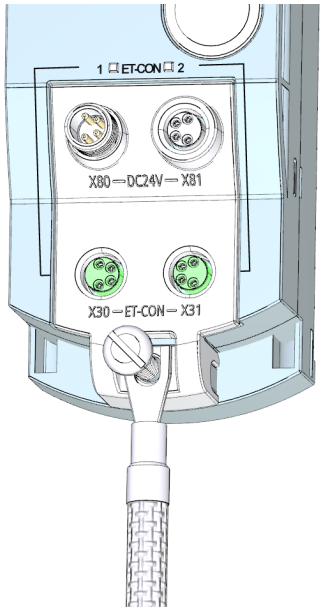

Figure 1-671 Connecting the functional earth

NOTE

Earthing with non-conductive mounting substrate

Make sure there is a low-impedance connection between the module and the functional earth.

Reference

You will find more information on installing the modules in the section Mounting modules (Page 37).

7.6 Connecting cables for ET 200AL

7.6.1 Wiring rules for the interface module and I/O modules

Impact of cable length on the supply voltage

When you wire your configuration, you must take into account the impact of the cable length on the supply voltage of the ET 200AL distributed I/O system.

CAUTION

Pay attention to maximum incoming currents
For interface modules and I/O modules, you may feed a maximum of 4 A per power supply (1L+, 2L+).
Comply with the maximum infeed currents and the required cable cross-sections. If you do not comply with the specifications, then an increased infeed current can lead to overheating of the cable insulation and the contacts. This could result in damage to the modules.

The figure below shows the voltage drop depending on the cable length for 4 current strengths, using the example of a copper cable with ∅ 0.5 mm².

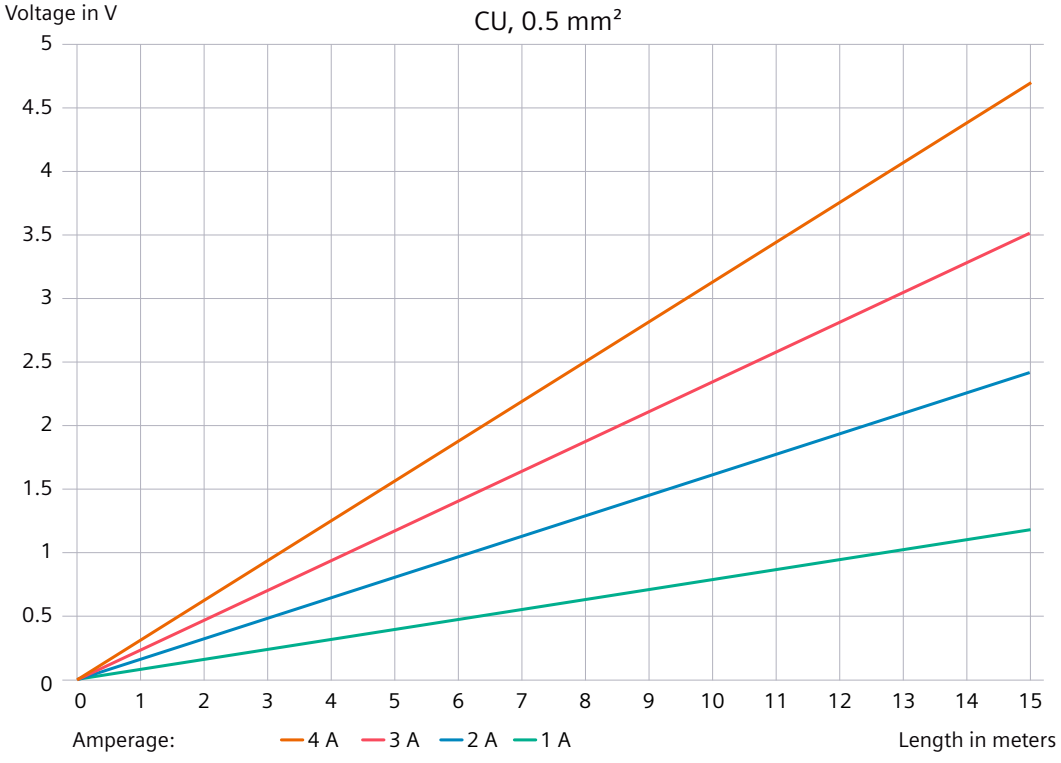

Figure 1-672 Voltage drop with a cable cross-section of 0.5 mm²

To estimate the voltage drop in your ET 200AL distributed I/O system, you must add the voltage drops of the different cables. For every module used, you must add an additional voltage drop of around 0.1 V.

Example

If you have a 7 m power supply cable with ∅ 0.5 mm², the voltage drop is around 1.5 V with a load of 3 A.

7.6.2 Connecting cables for voltage distributor PD 24VDC

Impact of cable length on the supply voltage

When you wire your configuration, you must take into account the impact of the cable length on the supply voltage of the ET 200AL distributed I/O system.

⚠ CAUTION

Pay attention to maximum incoming currents
For each power supply (1L+, 2L+), you can feed in a maximum of 15 A.
Comply with the maximum infeed currents and the required cable cross-sections. If you do not comply with the specifications, then an increased infeed current can lead to overheating of the cable insulation and the contacts. This could result in damage to the modules.

To estimate the voltage drop in your ET 200AL distributed I/O system, you must add the voltage drops of the different cables.

Voltage drop for copper cable with ∅ 2.5 mm²

The figure below shows the voltage drop depending on the cable length for 4 current strengths, using the example of a copper cable with ∅ 2.5 mm².

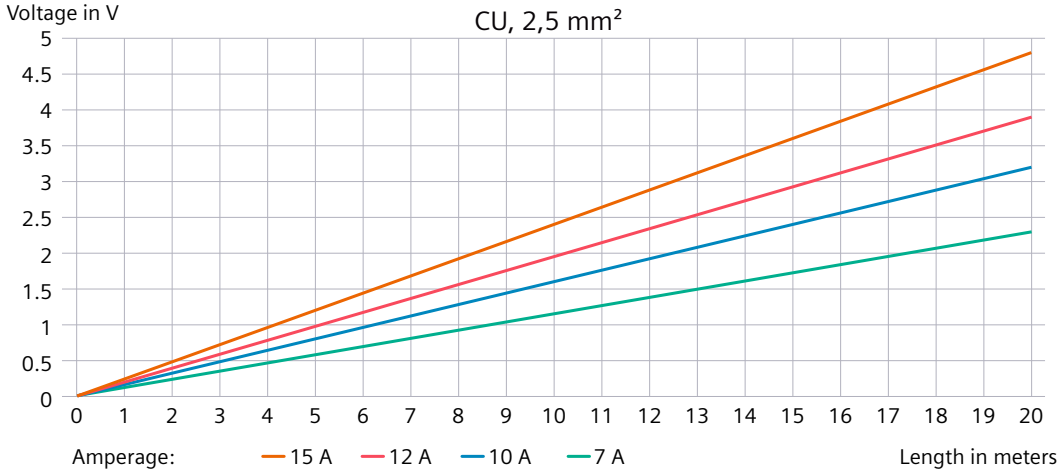

Figure 1-673 Voltage drop with a cable cross-section of 2.5 mm²

Example

If you have a 15 m power supply cable with ∅ 2.5 mm², the voltage drop is around 2.4 V with a load of 10 A.

7.7 Wiring

Connection

Connect all cables to the front side of the modules:

- Supply voltage and ET-Connection to the 4-pin M8 round sockets and M8 round connectors
- Signal lines to the 3-pin M8 or 4/5-pin M12 round sockets
- Fieldbus lines to the 4/5 pole M12 round sockets and M12 round connectors

NOTE

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

Requirement

Wire the modules with the supply voltage off.

Required tools

If you are not using pre-assembled cables, you need the following tools:

- Stripping tool
- Screwdriver to wire the connection plugs
- Stripping Tool for ET-Connection

Required accessories when connecting the supply voltage

You need the following accessories:

- Cables
  - Pre-assembled power cable, M8, 4-pin, or
  - Flexible 4-wire copper cable (wire cross section: 0.25 to 0.5 mm^2)
- 4-pin M8 connection plug

Accessories required for the connection of ET-Connection

You need the following accessories:

- ET-Connection cables
- 4-pin M8 connection plug

NOTE

ET-Connection cables
When connecting ET-Connection **use only** the offered cables.

Connecting M8 plugs

To connect M8 plugs, proceed as follows:

1. Insert the connector in the appropriate round socket on the module.
   Make sure that there is proper locking between the connector and socket.
2. Tighten the connector using the knurled screw with a torque of 0.4 Nm.

The figure below shows the connection of the M8 plugs, using the example of the DIQ 4+DQ 4x24VDC/0.5A 8xM8 digital input / digital output module.

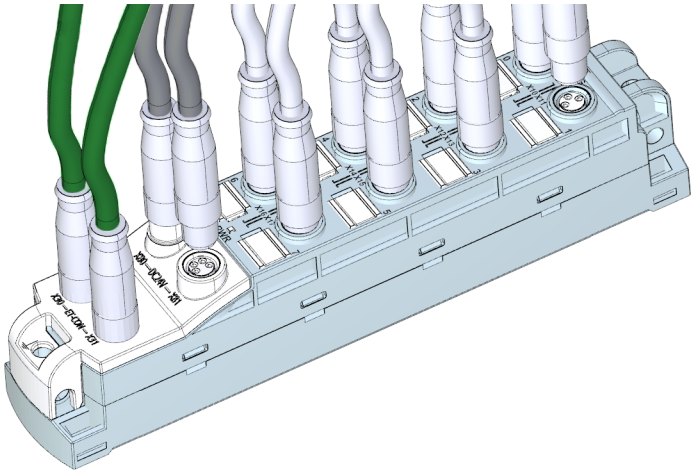

Figure 1-674 Connecting M8 plugs

Connecting M12 plugs

To connect M12 plugs, proceed as follows:

1. Insert the connector in the appropriate round socket on the module.
   Make sure that there is proper locking between the connector and socket (nut and spring).
2. Tighten the connector using the knurled screw with a torque of 1 Nm.

The figure below shows the connection of the M12 plugs, using the example of the analog input module AI 4xU/I/RTD 4xM12.

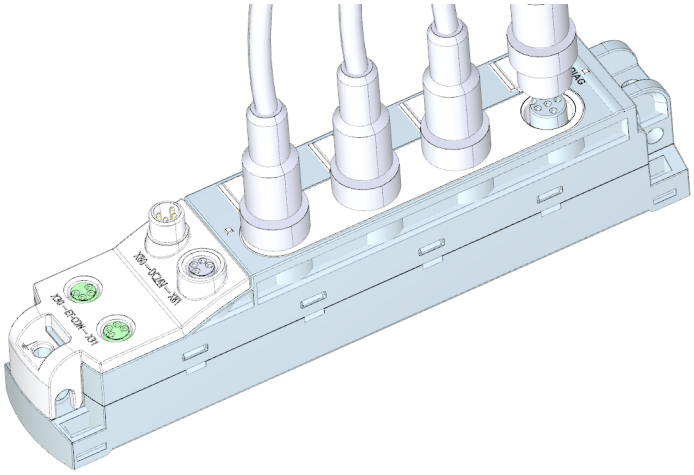

Figure 1-675 Connecting M12 plugs

Pin assignment of the sockets

The pin assignment of the sockets can be found in the manuals for the interface modules (https://support.industry.siemens.com/cs/ww/en/ps/14246/man) and I/O modules (https://support.industry.siemens.com/cs/ww/en/ps/14247/man) in the section on pin assignment and on the side surface of the module.

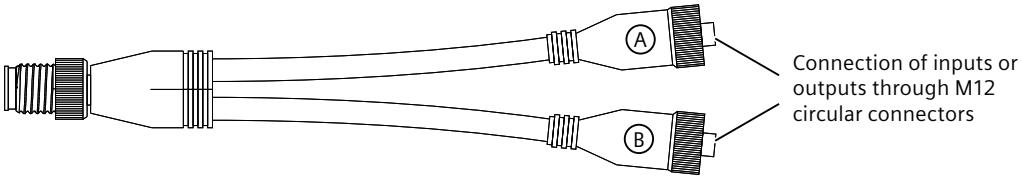
Y-cable

The Y-cable allows you to connect two actuators or sensors to the inputs or outputs.

The use of a Y-cable is particularly recommended when two channels are occupied for each socket of an I/O device. The Y-cable distributes the channels to two circular connectors.

- Y-cable (6ES7194-6KA00-0XA0) for connecting 2 actuators or sensors for double connection of inputs (also fail-safe inputs) or double connection of outputs with one cable
- Y-cable (6ES7194-6KB00-0XA0) for connecting 2 sensors for double connection F-DI with one cable. Only suitable for use with the F-DI module.

You can find details about connection in the respective user manual of the product.



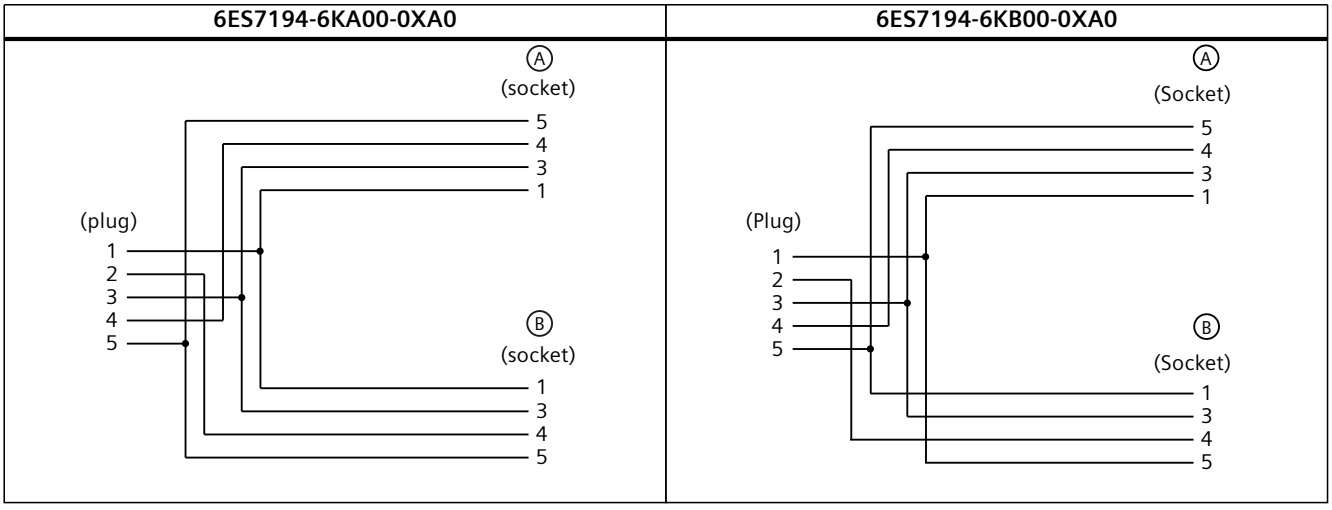


Figure 1-676 Y-cable

The following figure shows the wiring of the Y-cables.

Inverted Y-cable

The inverted Y-cable enables the connection of fail-safe inputs and a fail-safe output to an I/O device (for example a Siemens SIRIUS safety position switch with interlock) with only one cable.

You can find details about connection in the respective user manual of the product.

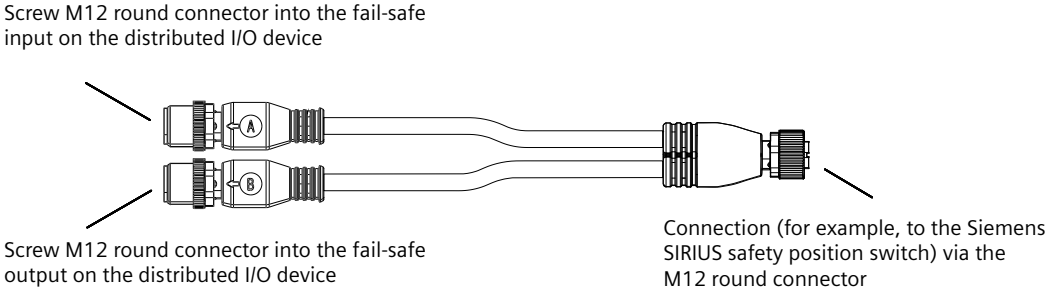

Figure 1-677 Inverted Y-cable

The following figure shows the wiring of the Y-cables.

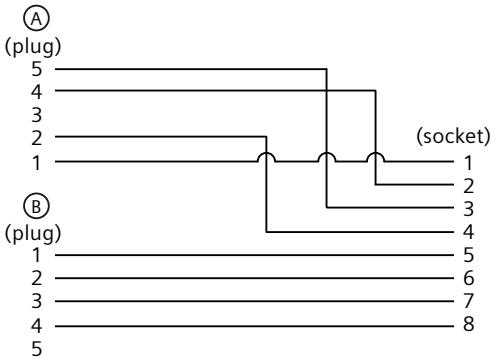

Figure 1-678 Y-cable 6ES7194-6KC00-0XA0

Sealing of unused sockets

To ensure IP65 or IP67 degree of protection, seal off all unused sockets with sealing caps.

Article numbers for accessories/spare parts.

You will find the article numbers in the Appendix in section Accessories/spare parts (Page 150).

7.8 ET 200AL marking

7.8.1 Factory markings

Introduction

For better orientation, the ET 200AL distributed I/O system is identified using various markings which will help you when configuring and connecting the modules.

Marking of the interfaces

The interfaces of the modules are factory-labeled.

The table below shows the labeling of the interfaces.

Table 1-947 Interface labeling

interface	Labeling
PROFINET IO interfaces MultiFieldbus interfaces	X1 P1R and X1 P2R
PROFIBUS DP interfaces	X1 DP1 and X1 DP2
I/O input and output interfaces	X10 to X17
ET-Connection interfaces (interface modules)	X30 (ET-CON1) and X31 (ET-CON2)
ET-Connection interfaces (I/O modules)	X30 (ET-CON IN) and X31 (ET-CON OUT)
Power supply interfaces	X80 (IN) and X81, X82, X83, X84 (OUT)

NOTE

Color coding

The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

NOTICE

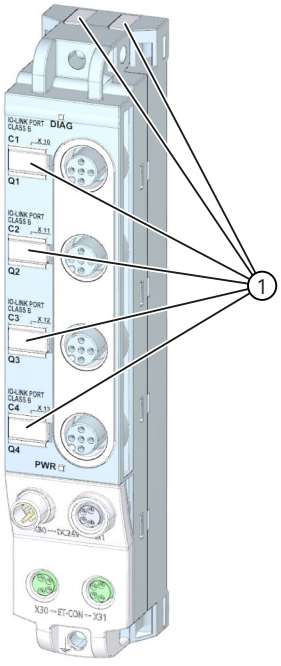
ET-Connection/supply voltage

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage. Mixing up the ET-Connection connectors and the connectors for the supply voltage can destroy the module.

Pin assignment

The pin assignments of the various interfaces are lasered at the factory, on the side of every module.

7.8.2 Optional markings



Introduction

In addition to the factory markings, there are also optional possibilities for labeling and/or identifying interfaces and modules on the ET 200AL distributed I/O system.

Identification label

The identification labels come with each module as strips and can be machine-printed. A strip has 10 identification labels measuring 10 x 5 mm in the color RAL9016. The identification labels can be inserted into every module at the points provided. The identification labels are used for channel, module and slot labeling.

The figure below shows all points where you can use the identification labels using the example of the IO-Link Master CM 4xIO-Link 4xM12 communication module.

① Identification labels

Figure 1-679 Optional marking

7.8.3 Mounting identification labels

Introduction

This section describes how to mount or remove identification labels.

Required tools

You need a screwdriver with 3 mm blade width (only to remove identification labels).

Mounting procedure

To mount an identification label, proceed as follows:

1. Print the identification label using commercially available marking systems.
2. Press the identification label out of its holder.
3. Stick the identification labels into the cutouts provided, as shown in the figure Optional marking (Page 67).

Mounting the identification labels is the same for all modules.

Removal procedure

To remove an identification label, proceed as follows:

1. Carefully use a screwdriver to pull out the identification label.

Removing identification labels is the same for all modules.

Configuring

8

8.1 Introduction

You configure and assign parameters for the ET 200AL distributed I/O system (interface modules and I/O modules) using STEP 7 or the configuration software of another manufacturer.

8.2 Requirements

Configuration software and requirements

The following table shows the configuration software that can be used and the associated requirements.

Table 1-948 Configuration software and requirements

Configuration software	Requirements	Installation information
STEP 7 (TIA Portal) as of V19 for modules: • IM 157-1 MF • CM 8xIO-Link + DIQ 6x24VDC/0.5A 8xM12 • CM 4xIO-Link 4xM12	As of Support Package HSP 0419	STEP 7 online help
STEP 7 Safety (TIA Portal) as of V17 for modules: • F-DI 4+F-DQ 2x24VDC/2A 4xM12	• PROFINET-compliant F-CPU (with CP expansion modules) • PROFIsafe-compliant F-PLC controller, 2.6.X (RIOforFA safety profile) or PROFIsafe 2.4	
STEP 7 (TIA Portal) as of V16 for modules: • AI 4xRTD/TC 4xM12	As of Support Package HSP 0313	
STEP 7 (TIA Portal) as of V14 for modules: • DIQ 16x24VDC/0.5A 8xM12 • AQ 4XU/I, 4XM12	As of Support Package HSP 0194	
STEP 7 (TIA Portal) V13 SP1 or higher for modules: • DI 8x24VDC 4xM12 • DI 16x24VDC 8xM12	As of Support Package HSP 0155	
STEP 7 (TIA Portal) V13 SP1 or higher for modules: • DIQ 4+DQ 4x24VDC/0.5A 4xM12 • DQ 8x24VDC/2A 8xM12	As of Support Package HSP 0156	
STEP 7 (TIA Portal) V13 SP1 or higher for modules: • IM 157-1 PN • IM 157-1 DP • DI 8x24VDC 8xM8 • DIQ 4+DQ 4x24VDC/0.5A 8xM8 • AI 4xU/I/RTD 4xM12 • CM 4xIO-Link 4xM12	None, integrated in STEP 7	
STEP 7 as of V5.5 SP4 for modules: • IM 157-1 PN • IM 157-1 DP	• PROFINET IO: As of Support Package HSP 0259 • PROFIBUS DP: as of Support Package HSP 0258	
STEP 7 as of V5.5 SP4 for all IO modules	As of Support Package HSP 0260

Software of third-party manufacturer		Manufacturer documentation

Configuring the ET 200AL distributed I/O system

See the STEP 7 online help or the documentation of the configuration software manufacturer.

8.3 Configuration

8.3.1 MultiFieldbus maximum configuration

MultiFieldbus configuration

Each of the connections for ET-Connection occupies a slot in the configuration. The slots for ET-Connection1 and ET-Connection2 are pre-defined statically in the GSD file.
ET-Connection1 is always at slot 1 and ET-Connection2 at slot 18.

The fixed slot assignment of ET-Connection1 and ET-Connection2 offers you the following advantages:

- You can expand ET-Connection1 and ET-Connection2 without a high workload
- Transparency in configuration control
- Simplification of diagnostics alarms and troubleshooting

The figure below shows the maximum configuration with modules of the ET 200AL distributed I/O system.

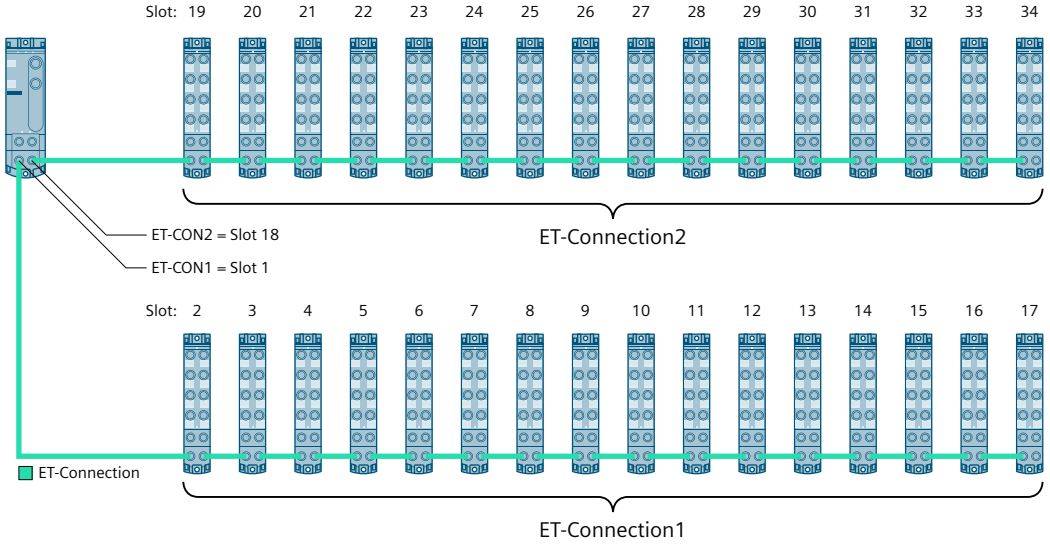

Figure 1-680 MultiFieldbus maximum configuration

Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 76).

8.3.2 PROFINET maximum configuration

PROFINET configuration

Each of the connections for ET-Connection occupies a slot in the configuration. The slots for ET-Connection1 and ET-Connection2 are specified statically in the PROFINET GSD file. ET-Connection1 is permanently on slot 1 and ET-Connection2 on slot 18.

The fixed slot assignment of ET-Connection1 and ET-Connection2 offers you the following advantages:

- You can expand ET-Connection1 and ET-Connection2 without a high workload
- Transparency in configuration control
- Simplification of diagnostics alarms and troubleshooting

The figure below shows the maximum configuration with modules of the ET 200AL distributed I/O system.

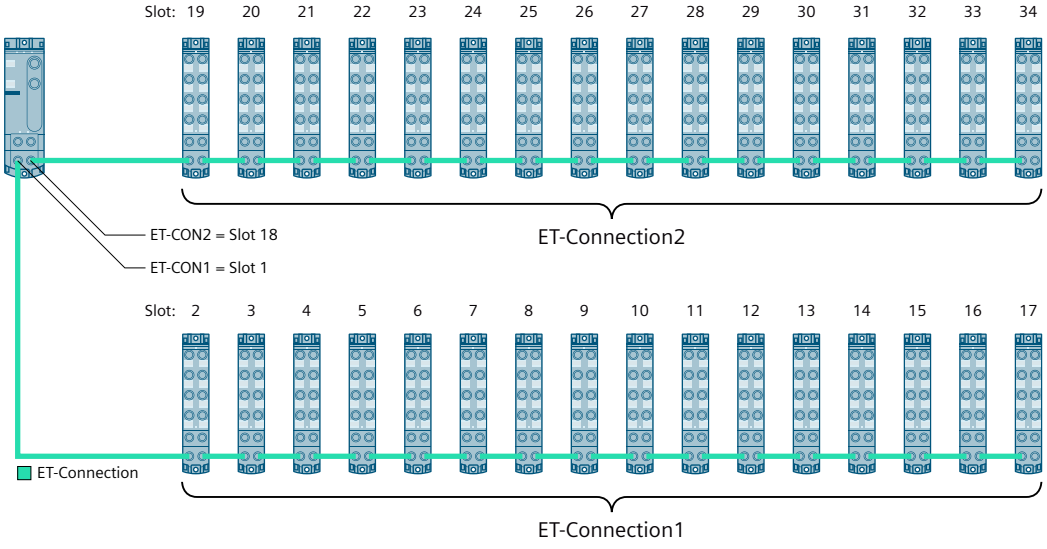

Figure 1-681 PROFINET maximum configuration

Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 76).

8.3.3 PROFIBUS maximum configuration

PROFIBUS configuration

Each of the connections for ET-Connection occupies a slot in the configuration. The slot for ET-Connection1 is statically defined in the PROFIBUS GSD file. ET-Connection1 is always permanently installed in slot 1. Always place the topology module for ET-Connection2 on slot 18. You do not need to fill slots in the configuration for ET-Connection1 with dummy modules.

The fixed slot assignment of ET-Connection1 and ET-Connetion2 offers you the following advantages:

- You can expand ET-Connection1 and ET-Connection2 without a high workload; for ET-Connection1 you need to remove the placeholder, the I/O module is placeable (no placeholders are needed for ET-Connection2)
- You cannot configure more modules on ET-Connection1 or ET-Connection2 than are allowed.
- Transparency in configuration control
- Simplification of diagnostics alarms and troubleshooting

The figure below shows the maximum configuration with modules of the ET 200AL distributed I/O system.

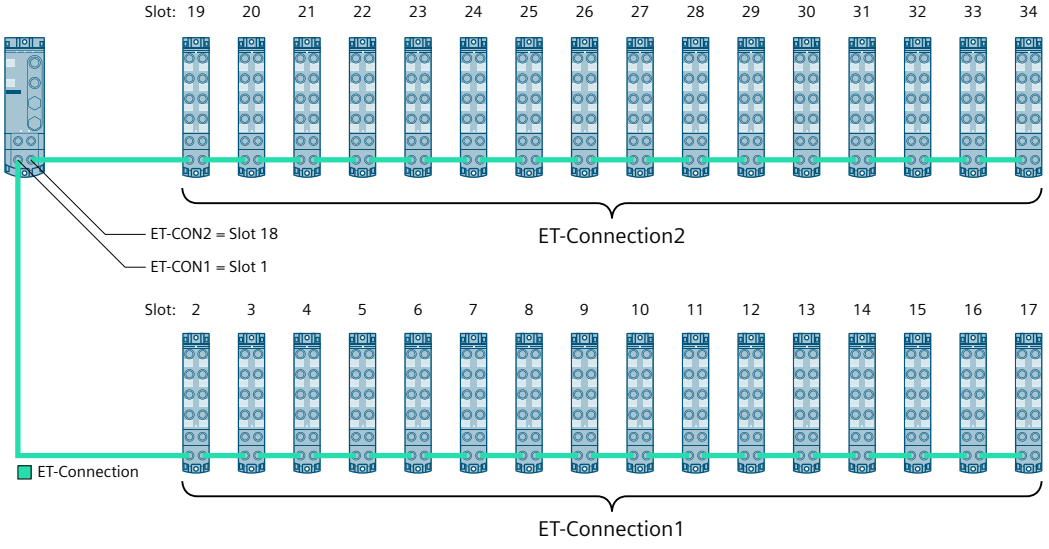

Figure 1-682 PROFIBUS maximum configuration

Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 76).

8.4 Assigning the PROFIsafe addresses

The F-destination address is permanently stored in the eCoding plug connector of the fail-safe ET 200AL I/O modules.

NOTE

When assigning the PROFIsafe addresses, the F-modules must be supplied with voltage 1L+.

NOTE

Follow these points in conjunction with the configuration control:
Before you can use the configuration control together with F-modules, the PROFIsafe addresses must be assigned to the F-modules in the designated slots.
For this, each F-module must be plugged into the slot configured for it. The actual configuration may differ from the set configuration.

You can find additional information about the assignment of the PROFIsafe addresses in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Reference

You can find additional information on this topic in section Configuration control (option handling) (Page 76).

Configuration control (option handling) 9

9.1 Configuration control

Introduction

With configuration control (option handling), you handle various standard machine configuration levels in one project without having to change the hardware configuration or user program.

Operating principle of configuration control

You can use configuration control to operate different standard machine configurations with a single configuration of the ET 200AL distributed I/O system.

- A station master (maximum configuration) is configured in a project. The station master comprises all modules needed for all possible equipment components of a modular standard machine.
- Provision is made in the user program of the project for various station options for the different configuration levels of the standard machine and for selection of a station option. A station option uses, for example, only some of the modules of the station master and these modules are not inserted in the configured order.
- Manufacturers of standard machines select a station option for a configuration level of the standard machine. They do not have change the project or download the modified configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. If a module with the configuration control is moved to another slot, it retains its parameter assignment.

The configuration control allows you to flexibly vary the centralized/distributed configuration. As a precondition for this, the station option must be able to be derived from the station master.

The following figure shows 3 configurations of a standard machine with the corresponding station options of the ET 200AL distributed I/O system.

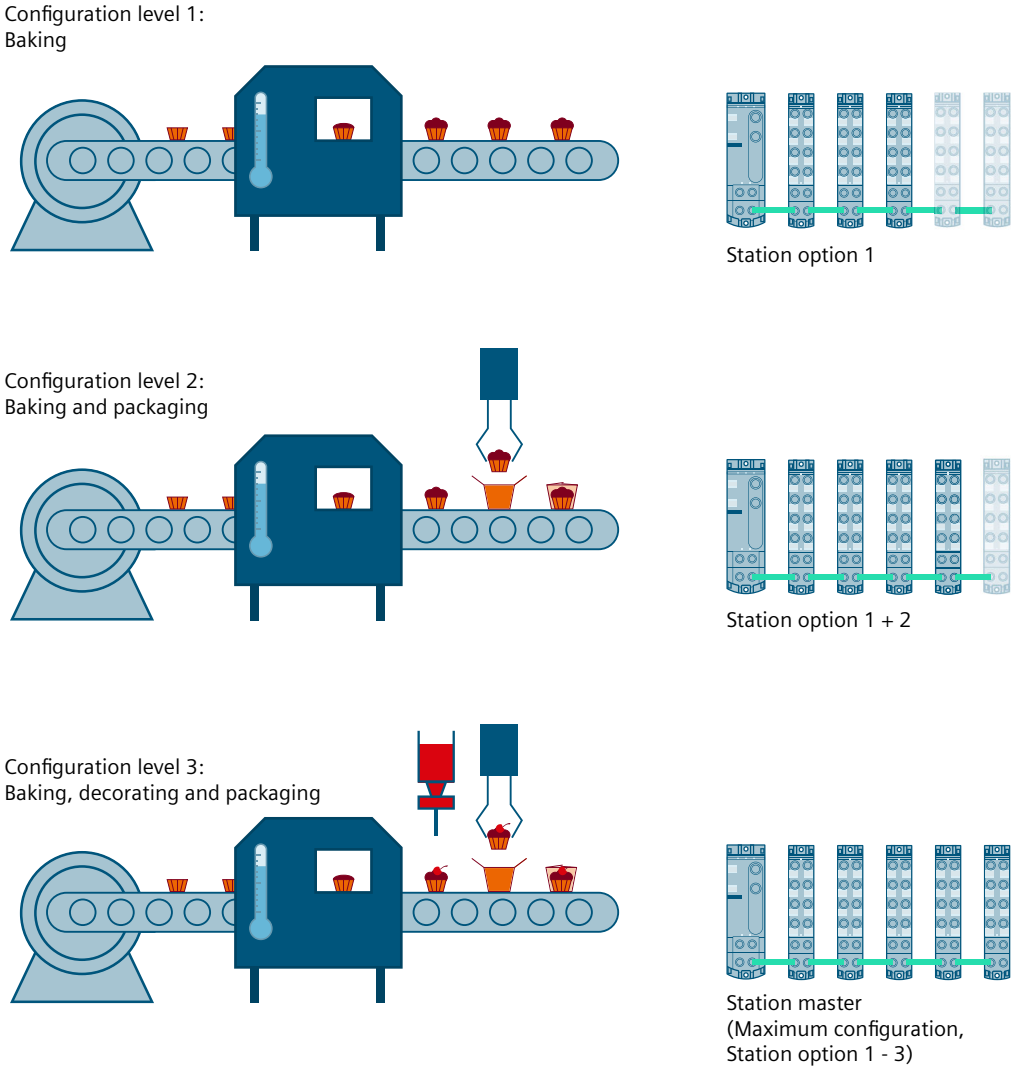

Figure 1-683 Various configuration levels of a standard machine with the corresponding station options of the ET 200AL distributed I/O system.

Benefits

- Easy project handling and commissioning through use of a single STEP 7 project for all station options.
- Easy handling during maintenance, versioning and upgrades.
- Hardware savings: Only the I/O modules needed for the current station option of the machine are installed.
- Potential savings when building, commissioning and creating documentation for standard machines.

Procedure

To set up the configuration control, follow these steps in the order given:

Step	Procedure	See...
1	Enable configuration control in STEP 7	Section Configuring (Page 78)
2	Create control data record	Section Creating the control data record (Page 80)
3	Transfer control data record	Section Transferring the control data record in the user program of the CPU (Page 88)

Library for configuration control

A library for configuration control is available for download (https://support.industry.siemens.com/cs/ww/en/view/29430270) on the internet. The library contains data types with the structure of the control data records for the ET 200AL distributed I/O system. You can implement your flexible automation solution economically with the help of these data types.

9.2 Configuring

Requirements

Via PROFINET IO:

- Configuration software, for example STEP 7 Professional as of V13
- IM 157-1 PN or IM 157-1 MF
- You have assigned the interface module to an IO controller in STEP 7

Via PROFIBUS DP:

- Configuration software, for example STEP 7 Professional as of V13
- IM 157-1 DP
- You have assigned the interface module to a DP master in STEP 7

- The parameter "Operation if preset configuration does not match actual configuration" is activated.
  The parameter "Operation if preset configuration does not match actual configuration" is located in STEP 7 in the properties of the interface module under "Module parameters" > "Start-up".

NOTE

Disabled parameter "Startup if preset configuration does not match actual configuration"
If an I/O module is missing or an incorrect or additional I/O module is plugged in and the "Startup if preset configuration does not match actual configuration" parameter is disabled, the ET 200AL distributed I/O system does not start up.
The diagnostic "Slot x no module" or "Slot x wrong module" is generated.
If the IM 157-1 DP interface module does not start up in this status, the RUN and ERROR LEDs on the interface module flash red. The DIAG LEDs flash green on all I/O modules as well.

NOTE

Follow these points in conjunction with the configuration control:
Before you can use the configuration control together with F-modules, the PROFIsafe addresses must be assigned to the F-modules in the designated slots.
For this, each F-module must be plugged into the slot configured for it. The actual configuration may differ from the set configuration.

Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the interface module.

- The parameter "Enable reconfiguration of device via user program" is located in the properties of the interface module under "Module parameters" > "Configuration control".

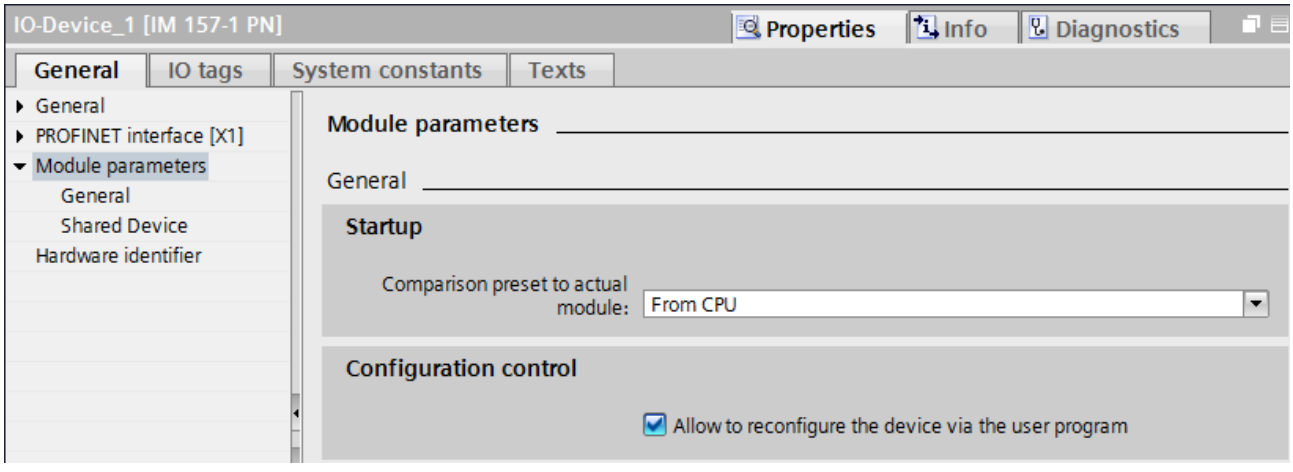

Figure 1-684 Enabling configuration control using the IM 157-1 PN as an example

9.3 Creating the control data record

9.3.1 Introduction

Required steps

The following description shows as an example how you can create a control data record for the configuration control in STEP 7 (TIA Portal).

To create a control data record for the configuration control, follow these steps:

1. Create a PLC data type that contains the structure of the control data record for an ET 200AL interface module.

   You can find the structure of the control data record in section Control data record for the ET 200AL distributed I/O system (Page 82)

CTR_REC

Figure 1-685 Creating control data record 196

2. Create a global data block.
3. Create an array of the data type of the above created PLC data type in the data block.

   The following figure shows a data block containing the control data records for an ET200AL interface module. In this example the data block contains three control data records.

Figure 1-686 Data block for configuration control

4. In the "Start value" column of the control data records, enter which module is located at which slot.

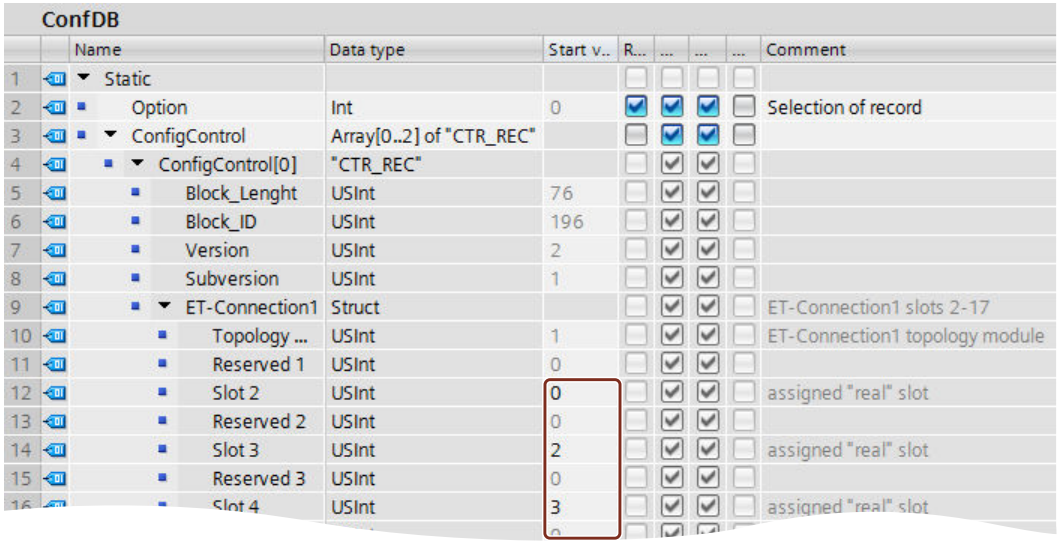

Figure 1-687 Assigning slots

Rules

Observe the following rules:

- Slot entries in the control data record outside the station master are ignored by the interface module.
- The control data record must contain the entries up to the last slot of the station option.
- Each slot of a station option may only be present once in the control data record.
- Each slot of a station option may only be assigned to one slot in the station master.
- The interface module (slot 0) is not an element of the configuration control, but instead controls this.
- The topology modules always have to exist in the data record:
  - The topology module ET-Connection 1 is always located on Slot 1.
  - The topology module ET-Connection 2 is always located on Slot 18.

9.3.2 Control data record for the ET 200AL distributed I/O system

Slot assignment

NOTE

Topology modules ET-Connetion1 and ET-Connection2
Both topology modules ET-Connection1 and ET-Connection2 should be treated like real modules during configuration control.
Restriction: ET-Connetion1 is always placed in Slot 1 and ET-Connection2 is always placed in Plot 18.

The following table shows the possible slots for the various modules for an ET 200AL interface module:

Table 1-949 Slot assignment

Modules	Possible slots	Comment
Topology ET-Connection1	1	The topology module ET-Connection 1 is always located on Slot 1.
I/O modules ET-Connection1	2-17	-
Topology module ET-Connection2	18	The topology module ET-Connection2 is always located on Slot 18.
I/O modules ET-Connection2	19-34	-

Control data record

For configuration control of the ET 200AL distributed I/O system, you define a control data record 196 V2.1, which contains a slot assignment for the modules. The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-950 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots x 2)	Header
1	Block ID	196	
2	Version	2	
3	Subversion	1	

Byte	Element	Code	Explanation
4	Slot topology module ET-Connection1	1 The topology module ET-Connection 1 is always located on Slot 1.	**Control element** Contains information on which module is inserted in which slot. The following rule determines which value you must enter in the respective byte: • If the module is included in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
5	Reserved		
6	Slot 2 of the station master	Slot assignment in the station option	
7	Reserved		
:	:	:	
38	Slot topology module ET-Connection2	18 The topology module ET-Connection2 is always located on Slot 18	
39	Reserved		
40	Slot 19 of the station master	Slot assignment in the station option	
41	Reserved		
:	:	:	
4 + ((max. slot - 1) x 2))	Maximum slot of the station master	Slot assignment in the station option	
5 + ((max. slot - 1) x 2))	Reserved		

Combination of configuration control and shared device (for PROFINET)

The configuration control function in a shared device is therefore only for the I/O modules of the IO controller to which the interface module has subscribed. I/O modules that are assigned to no controller or a different controller behave like a station without activated configuration control.

In the control data record change the slots only for those modules that are assigned to the IO-Controller.

In the control data record do not move modules to slots that are assigned to a different IO controller or no IO controller. The interface module does not check whether a control data record 196 exists for these slots. The interface module assumes a 1-to-1 assignment for these slots.

Combination of configuration control and PROFIenergy (at PROFINET)

You can use configuration control together with PROFIenergy for the ET 200AL distributed I/O system.

Ensure that you use the slots of the used station option when creating Data record 3. Do not use the slots configured in the station master.

Example: You want to set up PROFIenergy for a DQ module of an IM 157-1 PN that works with configuration control. You have configured the DQ module to Slot 5 in the station master. You have moved the DQ module to Slot 2 in the station option. In order to set up PROFIenergy for this module use Slot 2 in Data record 3.

You can find more information about PROFIenergy in the Interface module IM 157-1 PN (https://support.industry.siemens.com/cs/ww/en/view/89254863) Equipment Manual.

9.3.3 Feedback data record at the ET200AL distributed I/O system

Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0.

Feedback data record

The feedback data record exists only when configuration control is configured and always refers to the maximum configuration limits **without interface module**, i.e., 34 slots. Partial reading of the feedback data record is possible.

Table 1-951 Feedback data record

Byte	Element	Code	Explanation
0	Block length	66	Header
1	Block ID	197	
2	Version	2	
3		0	
4	Slot 1 status	0/1	Status = 1: • Module from station master is inserted in the station option • Slot is marked as not available in the control data record Status = 0: • Module pulled • Incorrect module inserted in the station option*
5	Reserved	0	
6	Status slot 2	0/1	
7	Reserved	0	
:	:	:	
70	Status Slot 34	0/1	
71	Reserved	0	

* Not possible if the slot is marked as not available.

NOTE

The data in the feedback data record is always mapped for all modules. In a Shared Device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record was sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

Error messages

In the case of an error when reading the feedback data record, the RDREC instruction returns the following error messages via the STATUS block parameter:

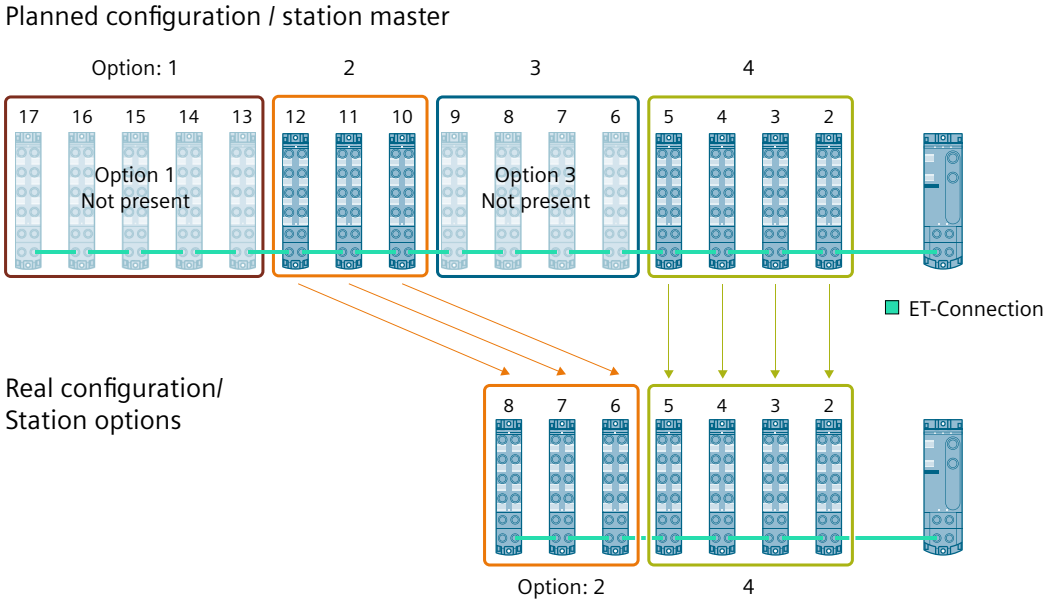
Table 1-952 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 197 is not correct.
$80B5_H$	Configuration control not configured

Error code	Meaning
$80B8_H$	Parameter error The following events cause a parameter error: • Incorrect block ID in the header (not equal to 197) • Invalid version identifier in the header • A reserved bit was set • Multiple slots in the station master are assigned to the same slot in the station option

9.3.4 Example of a configuration control

Introduction



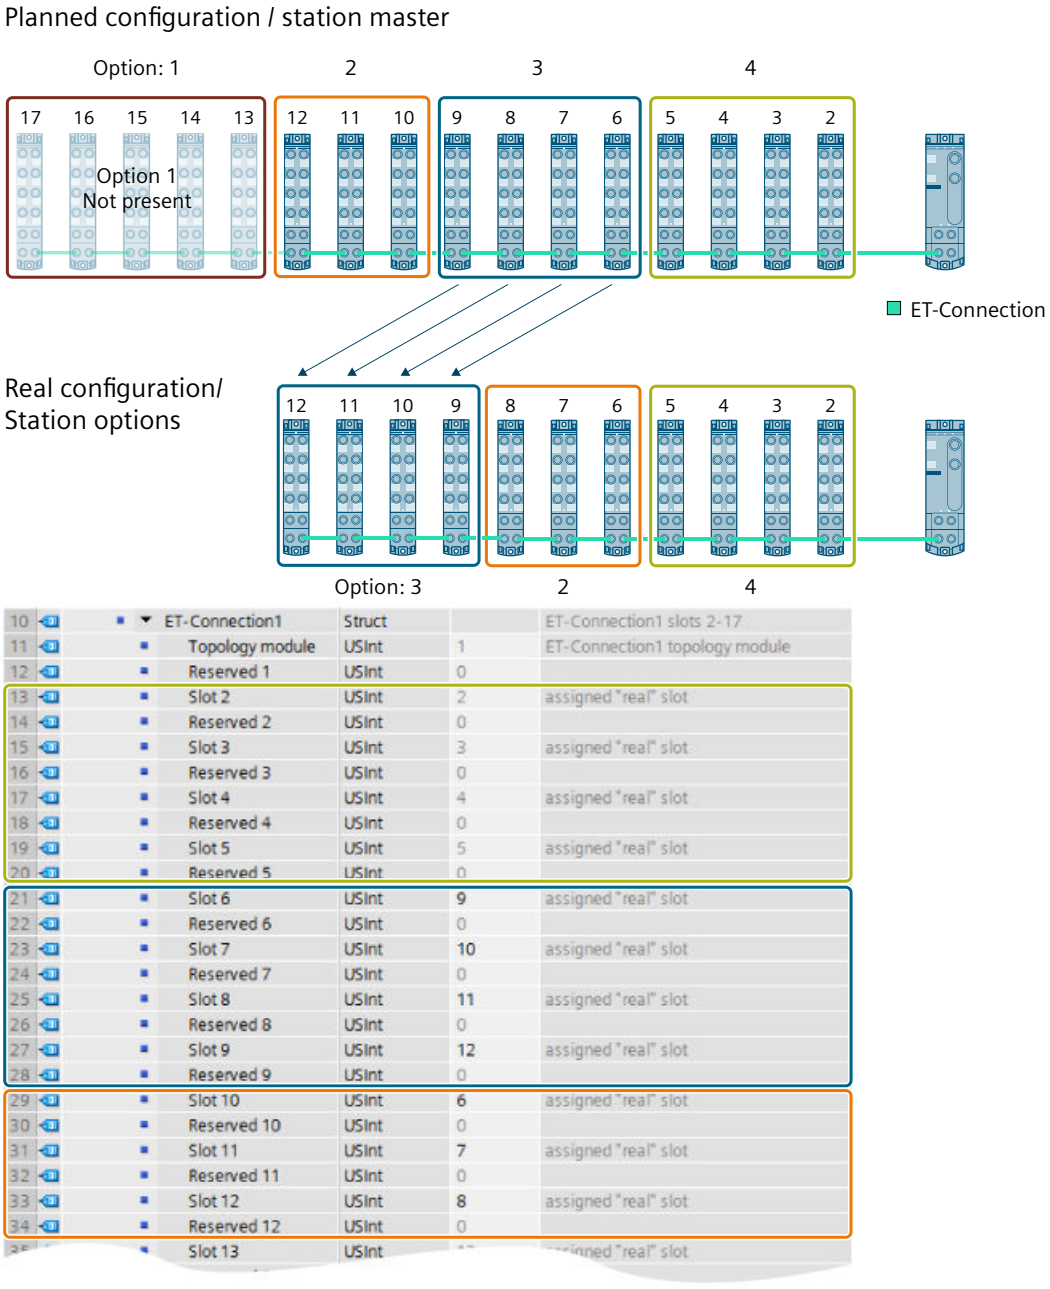
Several options/functional variations often exist for machines designed as series products. Or you have a plant that can operate in different modes.
Combine the modules that are needed for a function. With configuration control (option handling), you have the option to switch these functions on and off or expand their configuration.

The following examples show how you can form the control data record for a station option. The station master consists of an interface module IM 157-1 PN and 15 I/O modules in this case.

Station option with associated control data record

The configuration with the station options 2 and 4 differ from the station master as follows:

- The modules for options 1 and 3 do not exist.



9		ET-Connection1	Struct		ET-Connection1 slots 2-17
10		Topology ...	USInt	1	ET-Connection1 topology module
11		Reserved 1	USInt	0	
12		Slot 2	USInt	2	assigned "real" slot
13		Reserved 2	USInt	0	
14		Slot 3	USInt	3	assigned "real" slot
15		Reserved 3	USInt	0	
16		Slot 4	USInt	4	assigned "real" slot
17		Reserved 4	USInt	0	
18		Slot 5	USInt	5	assigned "real" slot
19		Reserved 5	USInt	0	
20		Slot 6	USInt	0	assigned "real" slot
21		Reserved 6	USInt	0	
22		Slot 7	USInt	0	assigned "real" slot
23		Reserved 7	USInt	0	
24		Slot 8	USInt	0	assigned "real" slot
25		Reserved 8	USInt	0	
26		Slot 9	USInt	0	assigned "real" slot
27		Reserved 9	USInt	0	
28		Slot 10	USInt	6	assigned "real" slot
29		Reserved 10	USInt	0	
30		Slot 11	USInt	7	assigned "real" slot
31		Reserved 11	USInt	0	
32		Slot 12	USInt	8	assigned "real" slot
33		Reserved 12	USInt	0	
34		Slot 13	USInt	0	assigned "real" slot
35		Reserved 13	USInt	0	
36		Slot 14	USInt	0	assigned "real" slot
37		Reserved 14	USInt	0	
38		Slot 15	USInt	0	assigned "real" slot
39		Reserved 15	USInt	0	
40		Slot 16	USInt	0	assigned "real" slot
41		Reserved 16	USInt	0	
42		Slot 17	USInt	0	assigned "real" slot
43		Reserved 17	USInt	0	

Figure 1-688 Example: Hardware configuration of Station option 2 and 4 with the associated control data record in STEP 7

Extension by a station option

The following figure shows the configuration with the Station options 2 and 4 that has subsequently been extended by the Station option 3.
The modules of option 3 are added to the modules already existing.

10	ET-Connection1	Struct		ET-Connection1 slots 2-17
11	Topology module	USInt	1	ET-Connection1 topology module
12	Reserved 1	USInt	0	
13	Slot 2	USInt	2	assigned "real" slot
14	Reserved 2	USInt	0	
15	Slot 3	USInt	3	assigned "real" slot
16	Reserved 3	USInt	0	
17	Slot 4	USInt	4	assigned "real" slot
18	Reserved 4	USInt	0	
19	Slot 5	USInt	5	assigned "real" slot
20	Reserved 5	USInt	0	
21	Slot 6	USInt	9	assigned "real" slot
22	Reserved 6	USInt	0	
23	Slot 7	USInt	10	assigned "real" slot

25	Slot 8	USInt	11	assigned "real" slot
26	Reserved 8	USInt	0	
27	Slot 9	USInt	12	assigned "real" slot
28	Reserved 9	USInt	0	
29	Slot 10	USInt	6	assigned "real" slot
30	Reserved 10	USInt	0	
31	Slot 11	USInt	7	assigned "real" slot
32	Reserved 11	USInt	0	
33	Slot 12	USInt	8	assigned "real" slot
34	Reserved 12	USInt	0	
	Slot 13	USInt		assigned "real" slot

Figure 1-689 Example: Hardware configuration of station option 2 to 4 with the associated control data record in STEP 7

Detailed application example

You can find a detailed application example for the configuration control in S7-1500 in here under the keyword "Application example for ET 200SP (PROFINET) and S7-1500 based on the library" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/29430270).

9.4 Transferring the control data record in the user program of the CPU

Required steps

Transfer the created control data record 196 to the interface module using the WRREC (Write data record) instruction.

Parameters of the WRREC instruction

Below, you will find explanations of individual parameters of the WRREC instruction which you must supply with specific values in the configuration control context. You can find additional information on the WRREC instruction in the STEP 7 online help.

ID	HW identifier of the interface module. If you have selected the interface module in the network view or device view, the HW identifier is available in the **System constants** tab of the Inspector window. Use the value of the system constant "<Name_of_interface_module> Head".
INDEX	Data record number: 196 (decimal)
RECORD	Control data record to be transferred. You can find the structure of the control data record in section Control data record for the ET 200AL distributed I/O system (Page 82).

Selection of the station option in the user program

In order for the CPU to know which station option you want to operate, you must set up a possibility to select between the various control data records in the user program. You can implement the selection, for example, via an Int tag that references an array element. Note that the tag used to select the control data record must be stored in the retentive memory area. If the tag is not retentive, it will be initialized during startup of the CPU and will thus be unavailable for selection of the station option.

Special requirements relating to the transfer of the control data record to the interface module

- If you have enabled configuration control, the ET 200AL station is not ready for operation without a control data record. As long as no valid control data record has been transferred, the I/O modules are considered as failed by the CPU and exhibit substitute value behavior. The interface module continues to exchange data.
- The control data record is stored retentively in the interface module. Note:
  - If the configuration is unchanged, you do not have to rewrite the control data record 196 during restart.
  - If you write a control data record with modified configuration, this will result in a station failure in the distributed I/O system. The original data record 196 is deleted and the new data record 196 is saved retentively. The station will then restart with the modified configuration.

Error messages

In case of error, the WRREC instruction returns the following error messages via the STATUS block parameter:

Table 1-953 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 196 is not correct.
$80B2_H$	Invalid slot: The configured slot is not assigned
$80B5_H$	Configuration control parameters not assigned.
$80B8_H$	Parameter error Reasons for a parameter error are: • Incorrect block ID in the header (not equal to 196) • Invalid version identifier in the header • A reserved bit was set • A station master slot was assigned an invalid slot in the station option • Multiple slots in the station master are assigned to the same slot in the station option • For shared device on submodule level: violation of defined restrictions
$80C5_H$	DP slave or module not available. Indicates that a data record has not been acknowledged due to the system.

If you receive the error code $80A2_H$, $80B2_H$ or $80C5_H$ when writing to control data record 196, check whether the required configuration was accepted despite the error code.

9.5 Behavior during operation

Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module outputs diagnostics data. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows an incorrect module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

Response to modules that are not present

If modules are entered as not present in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct writing access to the outputs that are not present or writing access to the process image of outputs that are not present: Remains without effect; no access error is signaled.
- Direct reading access to the inputs that are not present or reading access to the process image of inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: The output parameter STATUS of the instruction RDREC supplies the value $80A3_H$ "General CM error".

Commissioning 10

10.1 PROFINET IO

10.1.1 Commissioning ET 200AL on PROFINET IO

Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on an IO controller.

Requirements for the ET 200AL distributed I/O system on PROFINET IO

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also plan the tests to include any possible foreseeable errors. This will allow you to prevent people or plants from being placed in danger during operation.

Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 1-954 Requirements for the ET 200AL distributed I/O system on PROFINET IO

Step	Procedure	See...
1	Mounting the ET 200AL interface module	Section Mounting (Page 36)
2	Wiring the ET 200AL interface module	Section Connecting (Page 41)
3	Configuring the ET 200AL interface module	Section Configuring (Page 69)
4	Turning on the supply voltage for the ET 200AL interface module	Equipment Manual • IM 157-1 PN interface module (https://support.industry.siemens.com/cs/ww/en/view/89254863) • IM 157-1 MF interface module (https://support.industry.siemens.com/cs/ww/en/view/109824723)
5	ET 200AL interface module automatically switches to RUN mode	-

Reference

You can find additional information on assigning the PROFINET IO parameters in the PROFINET with STEP 7 V14 (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

10.1.2 Startup on PROFINET IO

Principle of operation

The figure below schematically shows the startup of the ET 200AL distributed I/O system on the PROFINET IO (= IO device) as a flow chart.

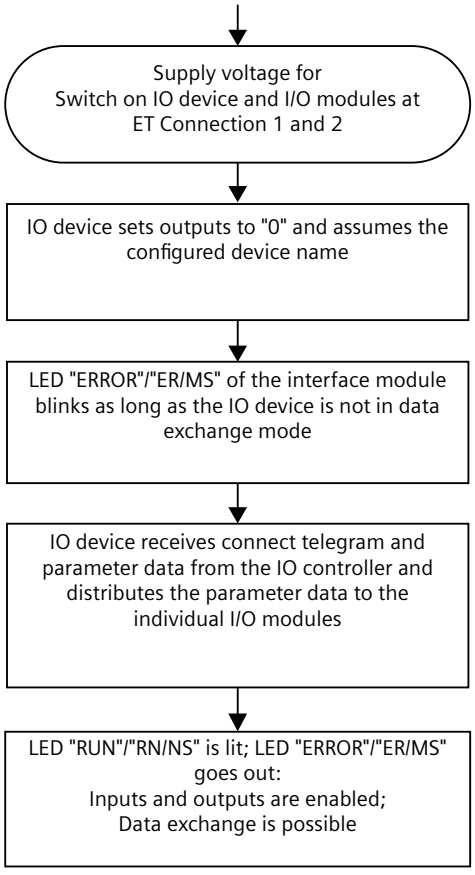

Figure 1-690 Startup of the ET 200AL distributed I/O system on the PROFINET IO

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL PROFINET interface module.

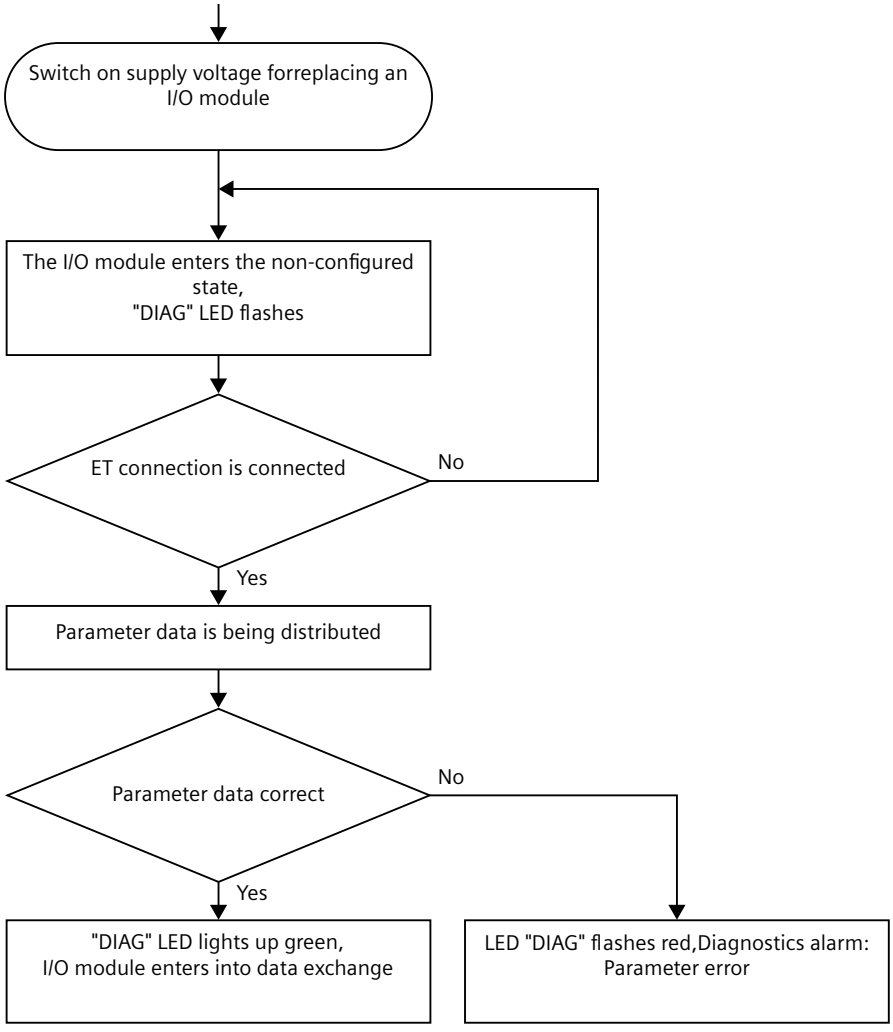

Figure 1-691 Startup of the ET 200AL I/O module

10.1.3 PROFIenergy

NOTE

PROFIenergy is not supported by fail-safe I/O module F-DI 4+F-DQ 2x24VDC/2A, 4xM12.

PROFIenergy (for PROFINET) makes it possible to reduce the energy consumption of the device using the PROFIenergy command during production downtime.

Additional information

You will find more information on the Internet (https://www.profibus.com) under Common Application Profile PROFIenergy; Technical Specification for PROFINET; as well as in the following documentation:

- IM 157-1 PN interface module (https://support.industry.siemens.com/cs/ww/en/view/89254863) manual
- I/O modules (https://support.industry.siemens.com/cs/ww/en/ps/14247/man) manuals

- Saving energy with SIMATIC S7 (STEP 7 as of V5.5) (https://support.industry.siemens.com/cs/ww/en/view/41986454)
- Saving energy with SIMATIC S7 and SIMATIC HMI (TIA Portal) (https://support.industry.siemens.com/cs/ww/en/view/58235225)
- SIMATIC S7 library for simple configuration of PROFIenergy. (https://support.industry.siemens.com/cs/ww/en/view/109478388)
- You can find additional information on the PROFIenergy FBs ("PE_START_END" - FB 815, "PE_CMD" - FB 816) in the online help for STEP 7 V5.5 as of SP2, Help on system functions/function blocks.

10.2 EtherNet/IP

10.2.1 Commissioning the ET 200AL on EtherNet/IP

Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on an scanner.

Requirements for the ET 200AL distributed I/O system on EtherNet/IP

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also plan the tests to include any possible foreseeable errors. This will allow you to prevent people or plants from being placed in danger during operation.

Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 1-955 Requirements for the ET 200AL distributed I/O system on EtherNet/IP

Step	Procedure	See...
1	Mounting the ET 200AL interface module	Section Mounting (Page 36)
2	Wiring the ET 200AL interface module	Section Connecting (Page 41)
3	Configuring the ET 200AL interface module	Section Configuring (Page 69)
4	Turning on the supply voltage for the ET 200AL interface module	Equipment manual IM 157-1 MF interface module (https://support.industry.siemens.com/cs/ww/en/view/109824723)
5	ET 200AL interface module automatically switches to RUN mode	-

Reference

You can find additional information about the configuration of EtherNet/IP parameters in the MultiFieldbus function manual (https://support.industry.siemens.com/cs/ww/en/view/109773209).

10.2.2 Startup on EtherNet/IP

Principle of operation

The following figure shows a schematic flow chart of the startup of the ET 200AL distributed I/O system on EtherNet/IP. The interface module is in the network of the EtherNet/IP adapter and communicates with the scanner.

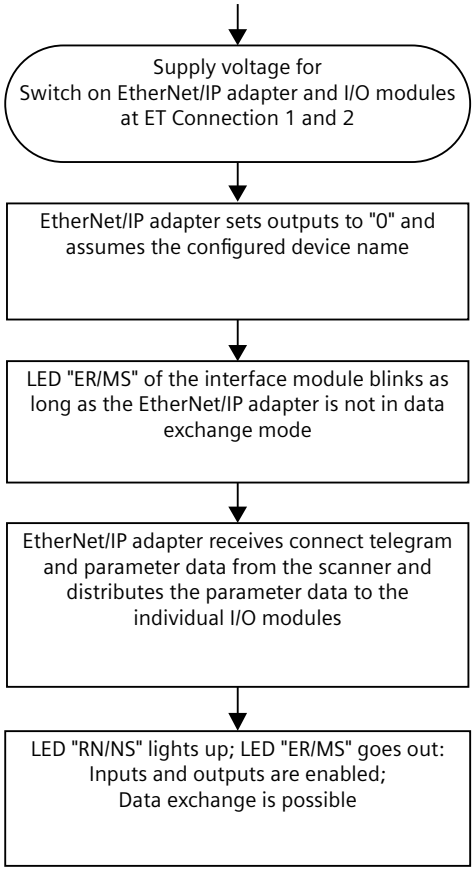

Figure 1-692 Startup of the ET 200AL distributed I/O system on EtherNet/IP

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL EtherNet/IP interface module as a flow chart.

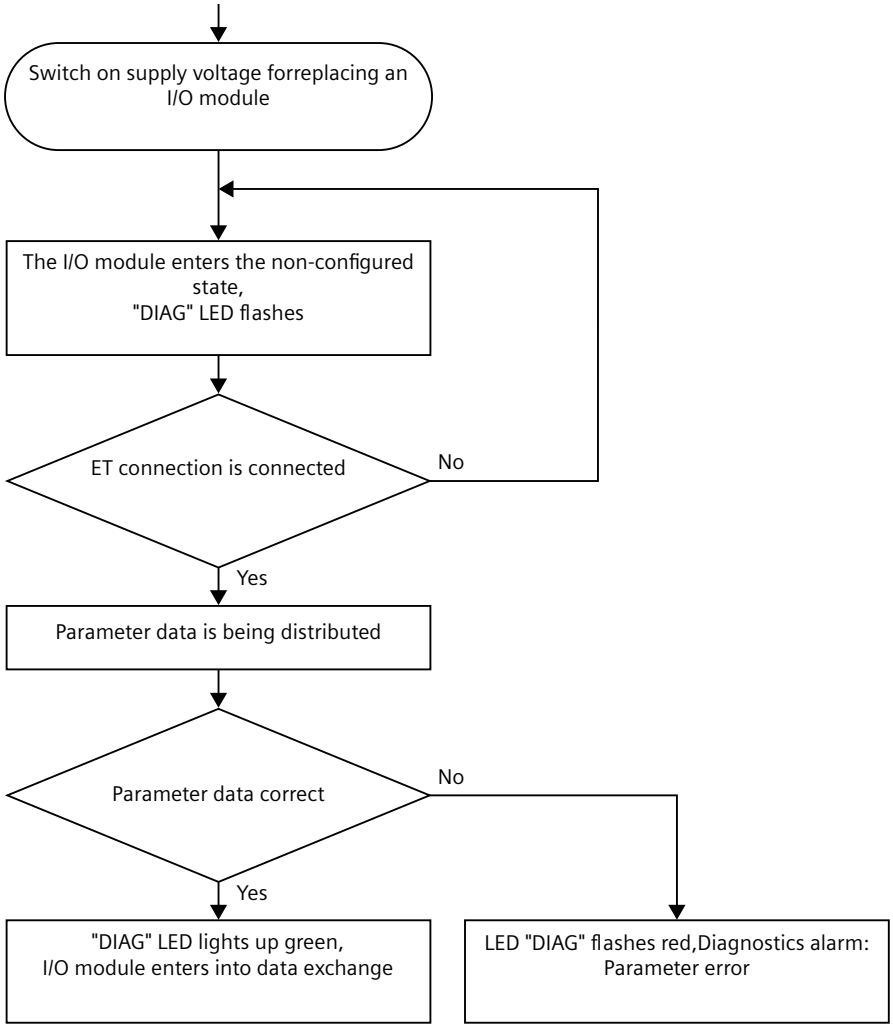

Figure 1-693 Startup of an ET 200AL I/O module

10.3 Modbus TCP

10.3.1 Commissioning the ET 200AL on Modbus TCP

Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on a Modbus client.

Requirements for the ET 200AL distributed I/O system on Modbus TCP

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also plan the tests to include any possible foreseeable errors. This will allow you to prevent people or plants from being placed in danger during operation.

Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 1-956 Requirements for the ET 200AL distributed I/O system on Modbus TCP

Step	Procedure	See...
1	Mounting the ET 200AL interface module	Section Mounting (Page 36)
2	Wiring the ET 200AL interface module	Section Connecting (Page 41)
3	Configuring the ET 200AL interface module	Section Configuring (Page 69)
4	Turning on the supply voltage for the ET 200AL interface module	Equipment manual IM 157-1 MF interface module (https://support.industry.siemens.com/cs/ww/en/view/109824723)
5	ET 200AL interface module automatically switches to RUN mode	-

Reference

You can find additional information about configuring the parameters of Modbus TCP in the MultiFieldbus function manual (https://support.industry.siemens.com/cs/ww/en/view/109773209).

10.3.2 Startup on Modbus TCP

Principle of operation

The following figure shows as flow chart schematically the start-up of the ET 200AL distributed I/O system on Modbus TCP. The interface module is the Modbus TCP server in the network and communicates with the client.

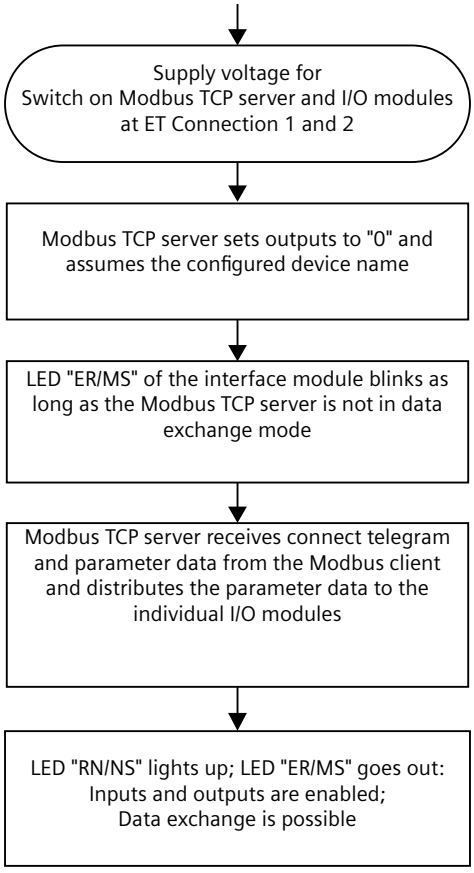

Figure 1-694 Startup of the ET 200AL distributed I/O system on Modubus TCP

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL Modubus TCP interface module as a flow chart.

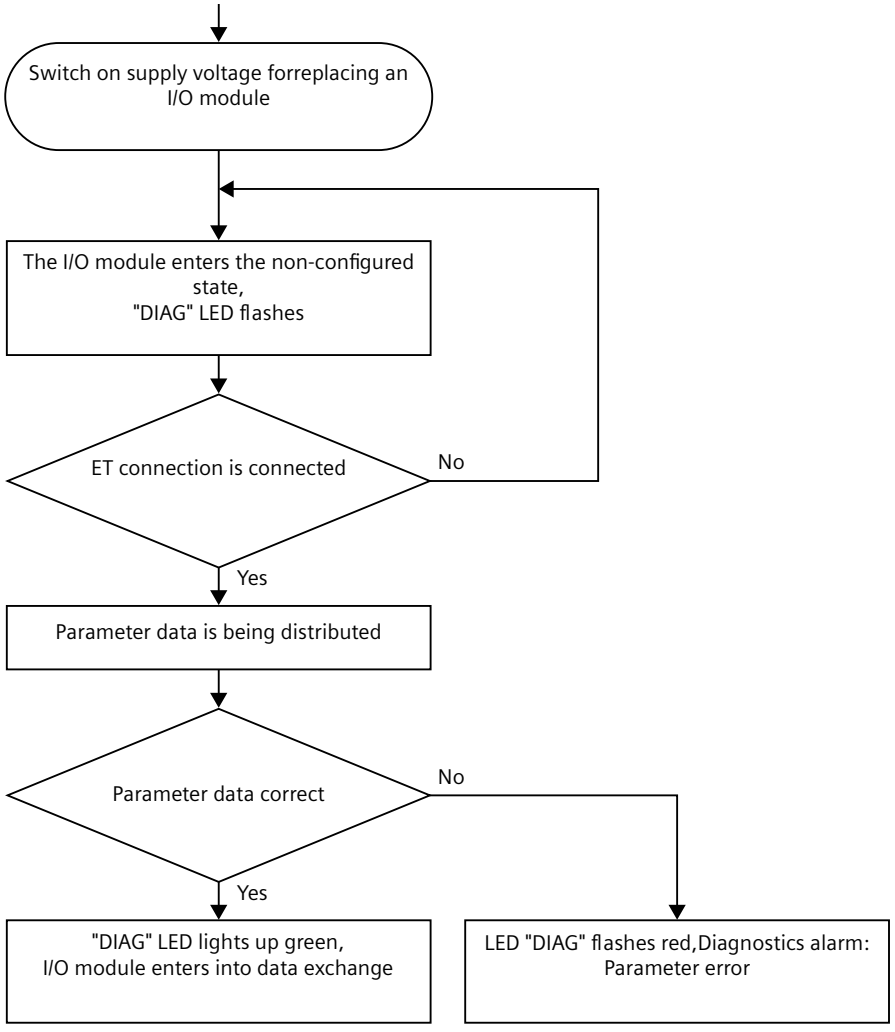

Figure 1-695 Startup of the ET 200AL I/O module

10.4 PROFIBUS DP

10.4.1 Commissioning ET 200AL on PROFIBUS DP

Introduction

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200AL distributed I/O system on a DP master.

Requirements for the ET 200AL distributed I/O system on a PROFIBUS DP

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also plan the tests to include any possible foreseeable errors. This helps to avoid endangering persons or equipment during operation.

Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 1-957 Requirements for the ET 200AL distributed I/O system on a PROFIBUS DP

Step	Procedure	See...
1	Mounting the ET 200AL interface module	Section Mounting (Page 36)
2	Setting the PROFIBUS DP address on the ET 200AL PROFIBUS interface module	IM 157-1 DP interface module (https://support.industry.siemens.com/cs/ww/en/view/89255073) manual, section Setting the PROFIBUS DP address and terminating resistor
3	Wiring the ET 200AL interface module	Section Connecting (Page 41)
4	Configuring the ET 200AL interface module	Section Configuring (Page 69)
5	Switching on the supply voltage for the ET 200AL interface module	IM 157-1 DP interface module (https://support.industry.siemens.com/cs/ww/en/view/89255073) manual

10.4.2 Startup on PROFIBUS DP

Principle of operation

The figure below schematically shows the startup of the ET 200AL distributed I/O system on the PROFIBUS DP (= DP slave) as a flow chart.

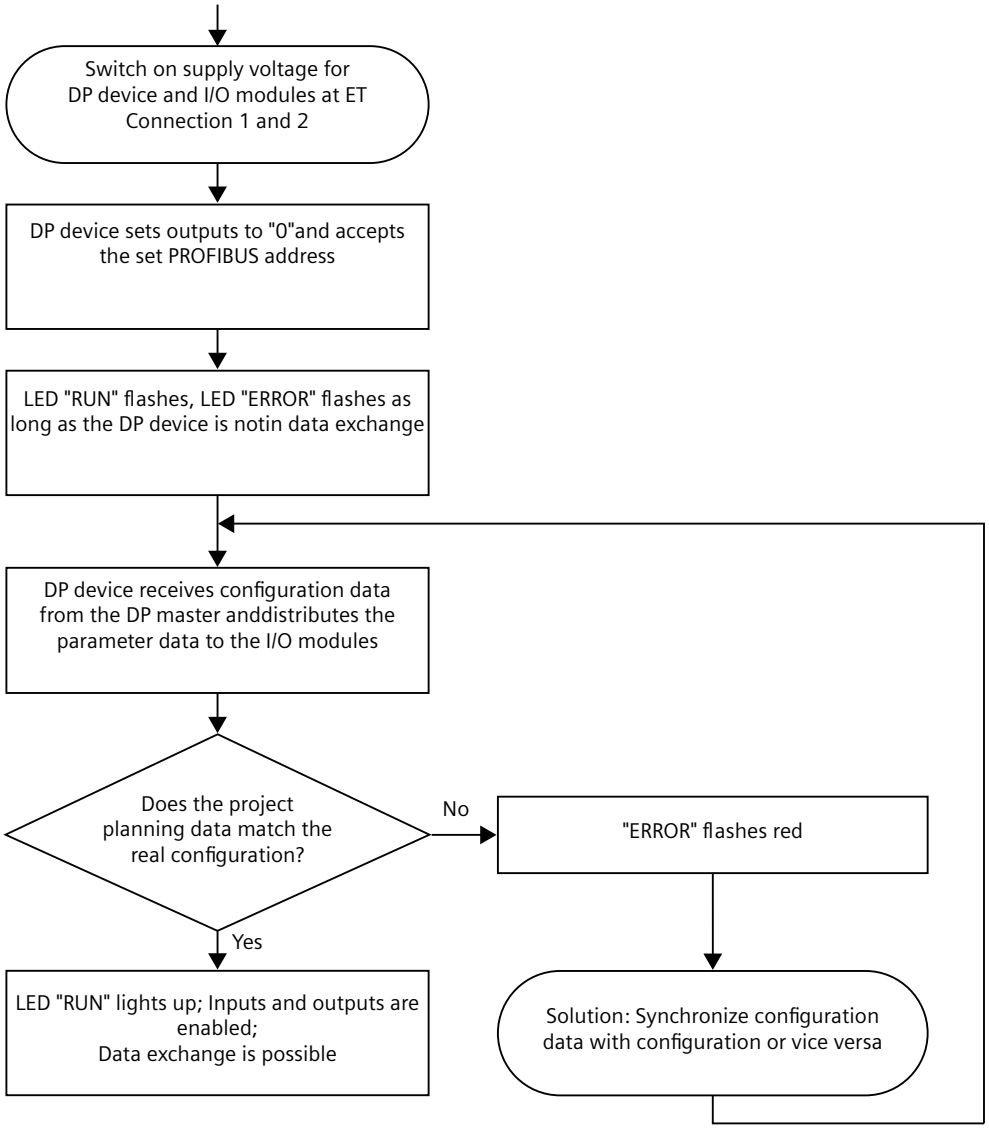

Figure 1-696 Startup of the ET 200AL distributed I/O system on PROFIBUS DP

The figure below schematically shows the startup of an ET 200AL I/O module after an ET 200AL PROFIBUS interface module as flow chart.

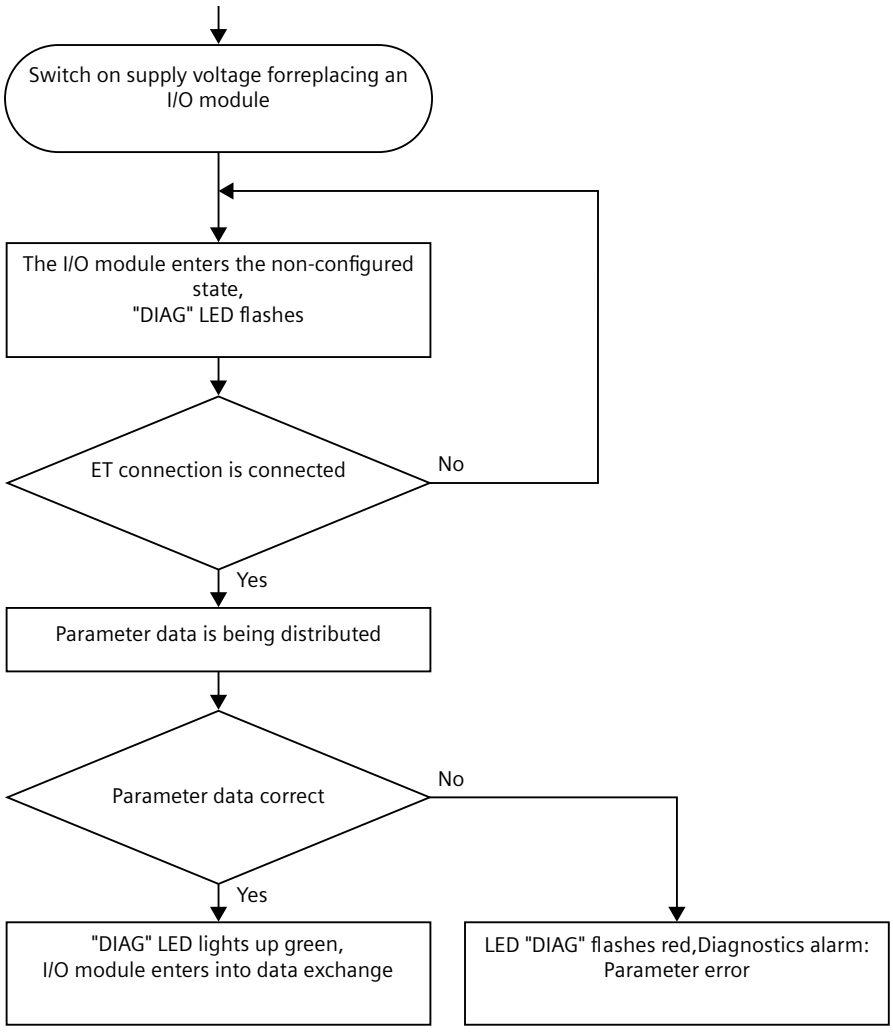

Figure 1-697 Startup of an ET 200AL I/O module

10.5 Identification and maintenance data

10.5.1 Reading out and entering I&M data

Introduction

Identification data I&M is information that is saved either as read-only (I data) or read/write (M data) on the interface module.

Identification data (I&M0): Manufacturer information on the module that is read-only and in some cases is also printed on the module housing, for example, article number, serial number and firmware version.

Maintenance data (I&M1, 2, 3): Plant-dependent information, e.g. installation location. Maintenance data is created during configuration and written to the module.

All modules of the ET 200AL distributed I/O system support identification data (I&M0 to I&M3).

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a system
- Correcting errors in a system

With the I&M identification data, you have the option of clearly identifying modules online.

Maintenance data (I&M4): Storage of a CRC test value for interface modules IM 157-1 PN and IM 157-1 MF and to ensure data integrity of data used by the interface module.

In STEP 7, the identification data is displayed in the "Module status - IM 157" and "Properties..." tabs (see STEP 7 online help).

Options for reading out I&M data

You have the following options for reading the I&M data:

- Via the user program
- Via STEP 7 or HMI devices

Procedure for reading I&M data by means of the user program

To read the I&M data of the interface module in the user program, use the instruction "RDREC".

Procedure for reading the I&M data using STEP 7

Requirement: There must be an online connection to the interface module.

1. In the project navigation, under "Distributed I/O", select the I/O device or the DP slave, e.g. "IM 157-1 PN".
2. Select: **IO device/DP slave > Online & Diagnostics > Identification & Maintenance**.

Procedure for input of maintenance data using STEP 7

The default module name is assigned by STEP 7. You have the option to enter the following data:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)
- Signature (I&M4), only for PROFINET

To enter the data, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the interface module, for example.
2. In the properties under "General", select the "Identification & Maintenance" area and enter the data.

During the loading of the hardware configuration, the I&M data are also loaded.

Reference

You can find additional information on I&M data of the ET 200SP (mixed configuration) in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

10.5.2 Data record structure for I&M data

Reading I&M data records (distributed via PROFINET IO)

You can directly access specific identification data by selecting **Read data record** ("RDREC" instruction). You obtain the corresponding part of the identification data under the associated data record index.

The following table shows the principle behind the structure of data records.

Table 1-958 Basic structure of data records with I&M identification data

Contents	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H I&M4: 0024_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H I&M4: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	54 54 16 54 54	I&M0/Index $AFF0_H$ I&M1/Index $AFF1_H$ I&M2/Index $AFF2_H$ I&M3/Index $AFF3_H$ I&M4/Index $AFF4_H$

The following table shows the structure of data records for I&M identification data.

Table 1-959 Data record structure for I&M identification data

Identification data	Access	Default	Explanation
Identification data 0: (data record index AFF0 hex)			
VendorIDHigh	read (1 byte)	00_H	This is where the name of the manufacturer is stored (42_D = SIEMENS AG).
VendorIDLow	read (1 byte)	$2A_H$	
Order_ID	read (20 bytes)	6ES7157-1MA00-0AB0	Article number of module (e.g. IM 157-1 MF)
IM_SERIAL_NUMBER	read (16 bytes)	-	Serial number (device-specific)
IM_HARDWARE_REVISION	read (2 bytes)	1	Corresponding hardware version
IM_SOFTWARE_REVISION	read	Firmware version	Provides information about the firmware version of the module
• SWRevisionPrefix	(1 byte)	V	
• IM_SWRevision_Functional_Enhancement	(1 byte)	00 - FF_H	
• IM_SWRevision_Bug_Fix	(1 byte)	00 - FF_H	
• IM_SWRevision_Internal_Change	(1 byte)	00 - FF_H	
IM_REVISION_COUNTER	read (2 bytes)	0000_H	provides information about configured changes on the module (not used)
IM_PROFILE_ID	read (2 bytes)	0000_H	Generic device
IM_PROFILE_SPECIFIC_TYPE	read (2 bytes)	0005_H	Interface modules
IM_VERSION	read	0101_H	provides information about the version of the identification data (0101_H = Version 1.1)
• IM_Version_Major	(1 byte)		
• IM_Version_Minor	(1 byte)		
IM_SUPPORTED	read (2 bytes)	$001E_H$	provides information about the existing identification data (I&M1 though I&M4)
Maintenance data 1: (data record index AFF1 hex)			
IM_TAG_FUNCTION	Read/write (32 bytes)	-	Enter an identifier for the module here, that is unique plant-wide.
IM_TAG_LOCATION	Read/write (22 bytes)	-	Enter the installation location of the module here.
Maintenance data 2: (data record index AFF2 hex)			
IM_DATE	Read/write (16 bytes)	YYYY-MM-DD HH:MM	Enter the installation date of the module here.
Maintenance data 3: (data record index AFF3 hex)			
IM_DESCRIPTOR	Read/write (54 bytes)	-	Enter a comment describing the module.
Maintenance data 4: (data record index AFF4 hex)			
USI	Read (4 bytes)	0x63726331	UserstructureIdentifier: Internal, fixed value
CHK_OVERALL	Read (4 bytes)	-	Overall CRC via all individual CRCs
CHK_OVERALL_SUBS	Read (4 bytes)	0 or value*	Overall CRC via all assigned modules of the IM
CHK_STATIC_LOCAL	Read (4 bytes)	-	CRC via static data of the IM

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the associated modules support I&M4 data.

Identification data	Access	Default	Explanation
CHK_STATIC_SUBS	Read (4 bytes)	0 or value*	CRC via all static data of the modules of the IM
CHK_OVERALL_SETUP	Read (4 bytes)	-	Overall CRC via all setup data of the IM and modules of the IM
CHK_REMANENT_LOCAL	Read (4 bytes)	-	CRC via retentive data of the IM
CHK_REMANENT_SUBS	Read (4 bytes)	0 or value*	CRC via all retentive data of the modules of the IM
CHK_WORKING_LOCAL	Read (4 bytes)	-	CRC via the parameters in STEP 7 for the IM
CHK_WORKING_SUBS	Read (4 bytes)	0 or value*	CRC via all parameters in STEP 7 for the modules of the IM
NOT USED	Read (14 bytes)	0	14 reserved bytes

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the associated modules support I&M4 data.

Reading I&M data records with data record 255 (distributed via PROFIBUS DP)

The modules support standardized access to identification data using DR 255 (index 65000 to 65003). For additional information on the DR 255 data structure, refer to the specifications of the Profile Guideline - Order No. 3.502.

Maintenance 11

11.1 Replacing modules

Replacing modules

Replacing a module is not permitted during ongoing operation.

⚠ WARNING

Material damage can occur
If you remove/insert modules with the power connected, this can lead to undefined states in your system.
Material damage to the ET 200AL distributed I/O system may occur as a result.
Only remove or replace modules when the power is disconnected.
Always comply with the required standards and safety guidelines when configuring a system.

⚠ WARNING

Mixing up ET-Connection1 and ET-Connection2
When connecting the modules, always ensure that they are properly connected.
If you mix up the lines for ET-Connection1 and ET-Connection2 when connecting the modules, this can lead to undefined states in your system.

Behavior of ET-Connection

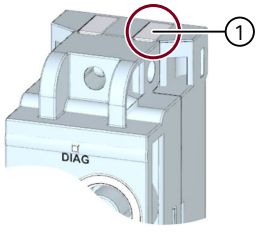
During ongoing operation, a module replacement may be necessary, e.g. because the module is defective. If an I/O module fails in an ET-Connection line, the line remains active up to the failed I/O module. After replacing the I/O module, the ET-Connection line starts up by itself.

Procedure

To replace a module, proceed as follows:

1. Disconnect the supply voltage to the module to be replaced.
2. Completely remove all cables connected to the module.
3. Completely remove the fixing screws of the module

4. Replace the module.



NOTE
"New" module
The removed module may only be replaced by a module of the same type.

5. Fasten the module with a torque of 1.2 Nm.
6. Connect all cables.
7. Turn the supply voltage on.

⚠ WARNING

Pay attention to the slot number of the module
If you mix up the ET 200AL I/O modules when connecting them, this can cause personal injury and damage to the machine.
The ET 200AL distributed I/O system cannot distinguish between modules of the same type during the actual/target comparison.
We recommend that you clearly label the ET 200AL I/O modules with the slot number.

The figure below shows a recommendation for labeling the ET 200AL I/O modules with the slot number.

① Recommendation for labeling the slot number

Figure 1-698 Slot number

Result

The disconnected I/O module and all downstream I/O modules start up again by themselves.

11.2 Firmware update

Introduction

During operation, it can become necessary to update the firmware (e.g. for function extensions).

Firmware updates are used to update the firmware of the interface module and I/O modules.

NOTE

Temporary bus interruption

When you perform a firmware update of an ET 200AL I/O module, then the ET-Connection is temporarily interrupted due to the restart of I/O module. All downstream ET 200AL I/O modules report a pull/plug interrupt.

Options for the firmware update

You have the following options to running a firmware update:

- Online via STEP 7, as of V5.5[1]
- Online with STEP 7, TIA Portal V13 or higher
- Embedded web server running on a SIMATIC CPU[1] or a SIMATIC F-CPU with fail-safe modules
- SIMATIC Automation Tool (SAT)
- Online via MultiFieldbus Configuration Tool (MFCT)

[1)] Not for use with fail-safe ET 200AL I/O modules

NOTE

MultiFieldbus interface module remains in configured fieldbus mode

After a firmware update, the MultiFieldbus interface module remains in the bus protocol in which the update was installed.

If there is an update via EtherNet/IP, for example, the MultiFieldbus interface module remains in EtherNet/IP mode.

Reference

11.3 Resetting interface module to factory settings

This section applies to interface modules with one or more of these communication protocols:

- PROFINET
- EtherNet/IP
- Modbus TCP

Introduction

When you "Reset to factory settings", the interface module is reset to the delivery state settings. This means that all information that was saved internally on the interface module is deleted.

Result after resetting to factory settings

The following table shows an overview of the contents of the memory objects after resetting to factory settings.

Table 1-960 Result after resetting to factory settings

Memory object	Contents
IP address	• Deleted • Can be configured with TIA Portal for a reset: "Retain IP address"/"Delete IP address"
Device name	Deleted
MAC address	Is not deleted
Identification data (I&M0)	Is not deleted
Maintenance data (I&M1, 2, 3, 4)	Are deleted (optional)
Firmware version	Is not deleted

NOTE

Failure of downstream stations is possible
Resetting an interface module to factory settings can lead to failure of downstream stations in a line.

NOTE

Substitute value behavior of I/O modules when resetting to factory settings
When "Resetting to factory settings", the I/O modules in the station take on the non-configured state, which means input data are not entered and output data are not output.

Reset options

You have the following options to reset an interface module device to the factory settings:

- Online with STEP 7 (TIA Portal)
- Online with STEP 7, V5.5 or higher
- SIMATIC Automation Tool (SAT)
- Online via PRONETA
- Online via MultiFieldbus Configuration Tool (MFCT)

Requirement

You need an online connection to reset an interface module to factory settings.

Procedure with STEP 7 (TIA Portal)

Connect the PG/PC to the PROFINET IO interface of the ET 200AL distributed I/O system.

Make sure that there is an online connection to the interface module which is to be reset to factory settings.

1. Open the online and diagnostics view of the interface module.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Select the "Retain IP address" option button if you want to retain the IP address, or the "Reset IP address" option button if you want to delete the IP address.
4. Click the "Reset" button.
5. Answer the security prompts with "OK".

Result: The interface module performs the "Reset to factory settings" while the RUN LED flashes yellow. When the RUN LED is lit yellow, the interface module has been reset to factory settings and is in the STOP operating mode. The event "Reset to factory settings" is entered in the diagnostics buffer.

Procedure with STEP 7 V5.5 or higher

Connect the PG/PC to the PROFINET IO interface of the ET 200AL distributed I/O system.

Make sure that there is an online connection to the interface module which is to be reset to factory settings.

1. Open the SIMATIC Manager.
2. Select accessible devices.
3. Select the interface module.
4. Navigate through "Menu > Options > Edit Ethernet devices > Reset to factor settings > Reset".

Result: The interface module performs the "Reset to factory settings" while the RUN LED flashes yellow. When the RUN LED is lit yellow, the interface module has been reset to factory settings and is in the STOP operating mode. The event "Reset to factory settings" is entered in the diagnostics buffer.

Procedure using the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) equipment manual (included in the SIMATIC Automation Tool).

Procedure using PRONETA

You can carry out these steps with PRONETA:

- Delete or reassign the device name and IP address
- Reset I&M data
- Remove module from the network and reintegrate

You can find information on this in the "PRONETA user manual (https://support.industry.siemens.com/cs/ww/en/view/109815137)"

Procedure using MFCT

You can find information on the procedure via MFCT under "MultiFieldbus function manual (https://support.industry.siemens.com/cs/ww/en/view/109773209)" in the "Resetting the MF device" section.

Reference

You will find more information on the procedure in the STEP 7 online help.

11.4 Reactions to errors of the F module

Safe state (safety concept)

The basic principle behind the safety concept is the presence of a safe state for all process tags.

NOTE

For digital F-modules, the safe state is "0". The safe state applies to sensors and actuators.

Error reactions and startup of the F-system

In the following situations, the values of the safe state must be connected to the fail-safe channel/channels instead of the process values (passivation of the fail-safe module) due to the safety function:

- When the F-system is started
- When errors are detected in the safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- When errors of the F-I/O or channel errors (e.g. wire break or discrepancy error) are detected

Detected errors are written to the diagnostic buffer of the F-CPU and reported to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. If the system is switched off and then restarted, any pending errors are detected again at startup. However, you can save errors in your safety program.

⚠ WARNING

If channels are set to "disabled", there are no diagnostic or error handling reactions.
For channels that are set to "disabled" in STEP 7, no diagnostic message or error handling is triggered when a channel error occurs. Not even if this channel is indirectly affected by a channel group error ("Channel activated/deactivated" parameter).

Troubleshooting in the F-system

To correct errors in your F-system, proceed as described in IEC 61508-1: Section 7.15.2.4 and IEC 61508-2: Section 7.6.2.1 e.

Perform the following steps:

1. Rung diagnostics and correct the error
2. Revalidate the safety function
3. Record in the service report

Fail-safe values for F-modules

For F-modules with inputs, the F-system provides fail-safe values (0) for the safety program when passivated. The fail-safe values are used instead of the process data at the F-DI.

For F-modules with outputs, the F-system transfers the fail-safe values (0) to the fail-safe outputs during passivation. The fail-safe values are used instead of the output values of the safety program. The fail-safe outputs are de-energized. this process is performed even if the F-CPU goes to the STOP operating state.

It is not possible to set the parameters of fail-safe values.

The fail-safe values are used in the following dependencies for the channel involved or all channels of the I/O module involved:

- F-system used
- Type of error occurred
  - Error in the F-I/O
  - Channel fault
  - Communication error

Re-integration of a fail-safe module or channel

The F-system changes from fail-safe values to process values automatically or after acknowledgment in the safety program by the user. A detailed list of errors can be found in the device manual of the F-module or in the STEP 7 online help.

Procedure after re-integration:

- For an F-module with inputs, the process data pending at the F-DI is provided again to the safety program.
- For an F-module with outputs, the output values provided by the safety program are transferred again to the F-DQs.

Additional information on passivation and re-integration

For additional information on passivation and reintegration of F-I/O modules, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Reaction of the F-module with inputs to communication errors

F-modules with inputs react differently to communication errors than to other errors.

When a communication error is detected, the current process values at the inputs of the F-module remain set. No channels are passivated. The current process values are passivated in the F-CPU.

11.5 Cleaning modules

When wired, ET 200AL modules comply with degree of protection IP65/IP67 and do not require any cleaning. If you do have to clean the modules, then use a dry or damp cloth. Please take care to comply with degree of protection IP65/67 when cleaning with liquids.

Technical specifications

12

12.1 Marks and approvals

Marks and approvals on the nameplate

The following overview provides information about the possible marks and approvals. Only the marks and approvals specified on the nameplate apply to the module.

You can find the associated certificates for download on the Internet. See also: ET 200AL approvals (https://support.industry.siemens.com/cs/ww/en/ps/14245/cert)

CE marking

CE

The ET 200AL distributed I/O system fulfills the requirements and protection targets of the following directives and complies with the harmonized European standards (ES) which have been promulgated for programmable logic controllers in the official gazettes of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)

  Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the member states relating to electromagnetic compatibility; OJ L 96, 29.3.2014, p. 79–106
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment; OJ L 174, 1.7.2011, p. 88–110

The fail-safe modules of the ET 200AL distributed I/O system meet the safety requirements and safety objectives of the following EU directives and comply with the harmonized EU standards (EN) for programmable controllers as specified in the official journals of the European Union.

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)

  Directive of the European Parliament and of the Council of February 26, 2014 on the harmonization of the laws of the member states relating to electromagnetic compatibility; official journal of the EU L96, 29/03/2014, pages 79–106
- 2006/42/EC "Machinery Directive and Supplementary Directive 95/16/EC"

  Directive of the European Parliament and of the Council of 17 May, 2006 on machinery, and amending Directive 95/16/EC (revised); official journal of the EU, L157, 09/06/2006, pages 24–87
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment, official journal of the EU L174, 01/07/2011, pages 88–110

The EC Declarations of Conformity are available for the responsible authorities and are kept at the following address:

Siemens Aktiengesellschaft
Digital Industries
DI FA TI COS TT
P.O. Box 1963
D-92209 Amberg, Germany

UKCA mark

The ET 200AL distributed I/O system complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The ET 200ALdistributed I/O system meets the requirements and protection targets of the following regulations and associated supplements:

- Electromagnetic Compatibility Regulations 2016 (S.I. 2016 No. 1091), and related amendments
- Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012 (S.I. 2012 No. 3032), and related amendments
- Supply of Machinery (Safety) Regulations 2008 (S.I. 2008 No. 1597), and related amendments

UK Declarations of Conformity are available to the relevant authorities at the following address:

Siemens Aktiengesellschaft

EAC (Eurasian Conformity)

The code EAC (Eurasian Conformity) confirms the conformity with the guidelines (TR) of the Eurasian Economic Union.

WEEE mark (European Union)

Disposal information, observe the local regulations and section "Secure decommissioning (Page 137)".

12.2 Certificates

Shipbuilding certificates

The following shipbuilding certificates are intended for the device:

- ABS (American Bureau of Shipping)
- Bureau Veritas (French marine classification society)
- CCS (China Classification Society)
- Class NK (Nippon Kaiji Kyokai)
- DNV (Det Norske Veritas)
- KR (Korean Register of Shipping)
- LRS (Lloyds Register of Shipping)
- RINA (Registro Italiano Navale)

After a successful approval you can find the certificates with the certified article numbers in the Internet. See also: ET 200AL Marine/Shipbuilding (https://support.industry.siemens.com/cs/ww/en/ps/14245/cert?ct=446)

NOTE

The fail-safe module F DI 4+F DQ 2x24VDC/2A, 4xM12 of the ET 200AL distributed I/O system does not support the specified marine approvals due to the increased supply voltage requirements.

12.3 Standards and requirements

IEC 61131-2

The ET 200AL distributed I/O system fulfills the requirements and criteria of IEC 61131-2 (Programmable controllers, Part 2: Equipment requirements and tests) and the EMC requirements for use in Zone B.

IEC 61010-2-201

The ET 200AL distributed I/O system fulfills the requirements and criteria of standard IEC 61010-2-201.

PROFINET standard

The PROFINET interfaces of the ET 200AL distributed I/O system are based on the standard IEC 61158 Type 10.

PROFIBUS standard

The PROFIBUS interfaces of the ET 200AL distributed I/O system are based on IEC 61158 Type 3.

IO-Link standard

The IO-Link interfaces of the ET 200AL distributed I/O system are based on the standard IEC 61131-9.

Use in industrial environments

The ET 200AL distributed I/O devices are designed for the industrial field. It meets the following standards for this type of use:

- Requirements for interference emission EN IEC 61000-6-4
- Requirements for immunity EN IEC 61000-6-2

Use in residential areas

The ET 200AL distributed I/O system is not intended for use in residential areas. Using the ET 200AL distributed I/O system in residential areas can affect radio or television reception.

Use in mixed areas

Under certain circumstances, you can use the ET 200AL distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact on residents.

If you want to use the ET 200AL distributed I/O system in mixed areas, you must ensure that its radio frequency interference emission complies with the limit classes of the EN 61000-6-3 generic standard. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the ET 200AL distributed I/O system in grounded control cabinets/control boxes
- Use of noise filters in the supply cables

An individual acceptance test is also required.

EtherNet/IP requirement

The EtherNet/IP interfaces of the ET 200AL distributed I/O system are based on the requirements of the CIP network library CIP Networks Library Volume 2 EtherNet/IP Adaptation of CIP.

Modbus TCP requirement

The Modbus TCP interfaces of the ET 200AL distributed I/O system are based on the requirements of the Modbus TCP application protocol specification V1.1b3.

Use in industrial burner and firing environments.

The fail-safe module F-DI 4+F-DQ 2x24VDC/2A, 4xM12 of the ET 200AL distributed I/O system meets the requirements and criteria of the following standards:

- EN 298 (Automatic burner control systems for burners and appliances burning gaseous or liquid fuels)
- EN 50156-1 (Electrical equipment for furnaces and ancillary equipment)
- EN 50156-2 (Electrical equipment for furnaces and ancillary equipment)

Importer addresses

The following table shows the importer addresses for specific countries:

Countries	Address
United Kingdom (UK)	Siemens plc. Manchester M20 2UR
Türkiye (TR)	Siemens San. ve Tic. A.Ş. Yakacık Cad. No:111 34870 Kartal/İstanbul

12.4 Electromagnetic compatibility

Definition

Electromagnetic compatibility is the ability of an electrical apparatus to function in a satisfactory manner in its electromagnetic environment without affecting this environment.

An I/O device of the ET 200AL distributed I/O system fulfills the requirements of the EMC law of the European Union. The requirement for this is that an I/O device of the ET 200AL distributed I/O system meets the specifications and guidelines for electrical configuration.

Pulse-shaped disturbance variables

The table below shows the electromagnetic compatibility of the distributed I/O systems compared to pulse-shaped disturbance variables.

Table 1-963 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	Tested with	Conforms to degree of severity
Electrostatic discharge according to IEC 61000-4-2.[1]	Air discharge: ±8 kV	3
	Contact discharge: ±4 kV	2
Burst pulses (fast transient disturbance variables) according to IEC 61000-4-4.[1]	±2 kV (power supply cable)	3
	±2 kV (PROFIBUS/PROFINET/MultiFieldbus line)	4
	±1 kV (signal line <30 m)	3
	±1 kV (ET-Connection)	3
High-energy single pulse (surge) to IEC 61000-4-5 [2] Signal line < 30 m and only installation within buildings		

Pulse-shaped disturbance variable	Tested with	Conforms to degree of severity
• Asymmetric coupling (phase-ground)[3]	±1 kV (24 V DC supply cable) without protective element	2
	±2 kV (PROFIBUS/PROFINET/MultiFieldbus line)	3
• Symmetric coupling (phase-phase)[3]	±0.5 kV (24 V DC supply cable) without protective element	2

[1] The maximum short-term influencing of analog devices during the duration of the EMC tests can amount to ±10 % of the full-scale value.
[2] Analog value deviation beyond the limits of the nominal range and diagnostics possible.
[3] If greater phase to ground or phase to phase values are required, you will need an additional external protective circuit (see function manual Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566)).

Sinusoidal disturbance variables

The following tables show the electromagnetic compatibility of the distributed I/O systems to sinusoidal disturbance variables.

Table 1-964 RF radiation

RF radiation according to IEC 61000-4-3 Electromagnetic RF field, amplitude modulated		Conforms to degree of severity
80 ... 1000 MHz	10 V/m	3
1.4 ... 6 GHz	3 V/m	2
80% AM (1 kHz)		

Table 1-965 RF coupling (signal and supply cables)

RF coupling according to IEC 61000-4-6.	Conforms to degree of severity
0.15 ... 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

The maximum short-term influencing of analog modules during the duration of the EMC tests can amount to ±1% of the full-scale value.

Emission of radio frequency interference

The following table shows the interference emission of electromagnetic fields according to EN IEC 61000-6-4/EN 55016-2-3.

Table 1-966 Interference emission of electromagnetic fields

Frequency	Interference emission	Measuring distance
30 ... 230 MHz	<40 dB (µV/m) Q	10 m
230 ... 1000 MHz	<47 dB (µV/m) Q	10 m
1 ... 3 GHz	<76 dB (µV/m) P	3 m
3 ... 6 GHz	<80 dB (µV/m) P	3 m

Conducted emission

The following table shows the limit values for the power supply connections according to EN IEC 61000-6-4/EN 55016-2-1.

Table 1-967 Interference emission from the power supply

Frequency	Interference emission
0.15 ... 0.5 MHz	< 89 dB (µV) Q < 76 dB (µV) M
0.5 ... 30 MHz	< 83 dB (µV) Q < 70 dB (µV) M

12.5 Transport and storage conditions

Transport and storage conditions

The modules of the ET 200AL distributed I/O system exceed the specifications regarding transport and storage conditions pursuant to IEC 61131-2. The following table shows the conditions that apply to modules transported or stored in their original packaging.

- Transport condition class: TTH4
- Storage condition class: STH4

Table 1-968 Transport and storage conditions

Type of condition	Permitted range
Free fall	≤0.3 m
Temperature	-40 °C ... +70 °C
Temperature variation	20 K/h
Barometric pressure	1140 ... 540 hPa (Corresponds to an altitude of -1000 m to 5000 m)
Relative humidity	5... 95 %; no condensation

12.6 Mechanical and climatic ambient conditions

Operating conditions

The ET 200AL distributed I/O system is suitable for use in weather-proof, fixed locations.

- The conditions of use exceed the requirements pursuant to IEC 61131-2
  - Class OTH3

You can find the values for the operating conditions in the technical specifications of the manuals or on the Internet (https://support.industry.siemens.com/cs/de/en/view/109742718).

Tests of mechanical ambient conditions

The following table shows the type and scope of the tests on mechanical ambient conditions.

Table 1-969 Tests of mechanical ambient conditions

Condition tested	Test standard	Values
Vibrations	Vibration test according to IEC 60068-2-6.	Type of oscillation: Frequency sweeps with a rate of change of 1 octave/minute. 5 Hz to 12.9 Hz, constant amplitude 15 mm 12.9 Hz to 150 Hz, constant acceleration 10 g Duration of oscillation: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 30g peak value, 18 ms duration Direction of shock: 3 shocks each in ± direction in each of the 3 axes vertical to one another

Climatic ambient conditions

The following table shows the type and scope of the tests on climatic ambient conditions.

Table 1-970 Climatic ambient conditions

Ambient conditions	Fields of application	Comments
Temperature	-25 °C ... 55 °C	All installation positions
Temperature variation	10 K/h	-
Relative humidity	5 ... 100%	With condensation and sealing caps installed
Barometric pressure	1140 ... 540 hPa	Corresponds to an elevation of -1000 to 5000 m
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

The following table shows the modules with functional versions which are permitted to -30 °C.

Table 1-971 Extended temperature range to -30 °C

Description	Article number	As of functional version
Interface modules		
IM 157-1 DP	6ES7157-1AA00-0AB0	FS02
IM 157-1 MF	6ES7157-1MA00-0AB0	FS01
Digital modules		
DI 8 x DC24V 8xM8	6ES7141-5BF00-0BA0	FS03
DI 8 x DC24V 4xM12	6ES7141-5AF00-0BA0	FS03
DI 16 x DC24V 8xM12	6ES7141-5AH00-0BA0	FS03
DIQ 4+DQ 4x24VDC/0.5A 8xM8	6ES7143-5BF00-0BA0	FS03
DIQ 4+DQ 4x24VDC/0.5A 4xM12	6ES7143-5AF00-0BA0	FS03
DIQ 8x24VDC/0.5A 8xM8	6ES7143-5BF50-0BA0	FS01
DIQ 16x24VDC/0.5A 8xM12	6ES7143-5AH00-0BA0	FS03
DQ 8x24VDC/2A 8xM12	6ES7142-5AF00-0BA0	FS03
Analog modules		
AI 4xU/I/RTD 4xM12	6ES7144-5KD00-0BA0	FS04
AI 4xRTD/TC 4xM12	6ES7144-5KD50-0BA0	FS01
AQ 4XU/I, 4XM12	6ES7145-5ND00-0BA0	FS03
Communications modules		
CM 4xIO-Link 4xM12	6ES7147-5JD00-0BA0	FS05
CM 4xIO-Link 4xM12	6ES7147-5JD01-0BA0	FS01
CM 8xIO-Link+DIQ 6x24VDC/0.5A 8xM12	6ES7147-5JJ00-0BA0	FS01
Fail-safe modules		
F-DI 4+F-DQ 2x24VDC/2A, 4xM12	6ES7146-5FF00-0BA0	FS01
Voltage distributor		
PD 24VDC	6ES7194-2CA00-0AA0	FS01

Use above 2000 m is possible.

The following constraints apply to the maximum specified ambient temperature:

Table 1-972 **Derating factor of installation altitude and ambient temperature**

Installation altitude	Derating factor for ambient temperature [1]
-1000 ... 2000 m	1.0
2000 ... 3000 m	0.9
3000 ... 4000 m	0.8
4000 ... 5000 m	0.7

[1] Base value for application of the derating factor is the maximum permissible ambient temperature in °C for 2000 m.

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air at higher elevations due to lower density.
- Make sure that the power supplies used are suitable for altitudes > 2000 m.

NOTE

All markings and certifications are currently based on an elevation of up to 2000 m.

12.7 Details on insulation, protection class, degree of protection and rated voltage

Insulation

The insulation is designed in compliance with the requirements of IEC 61010-2-201.

NOTE

Galvanic isolation with 707 V DC (Type Test) is tested for modules with 24 V DC supply voltage (SELV/PELV).

Pollution class according to IEC 61010-2-201

- Protection class III

Severity for voltage interruption

The I/O devices of the distributed I/O system ET 200AL meet and exceed the severity class PS1 for voltage interruptions with a value of 5 ms.

Pollution degree / overvoltage category pursuant to IEC 61010-2-201

Connected according to the specifications in the "Wiring (Page 62)" section:

- Pollution degree: 3 (macro environment)
- Overvoltage category: II

In delivery state, with one or more open connections:

- Pollution degree: 2 (micro environment)
- Overvoltage category: II

Degree of protection IP65 and IP67

Degree of protection IP65 and IP67 according to IEC 60529 for all modules of the ET 200AL distributed I/O system:

- 1. Code number: Dust-proof and complete protection from contact
- 2. Code number: Protection from water
  - IP65: Protection from water jets from any angle
    (The water may not have any damaging effect)
  - IP67: Protection against temporary submersion
    (The water must not enter the enclosure in harmful quantities)

Rated voltage for operation

The following table shows the nominal voltage and the corresponding tolerance with which the ET 200AL distributed I/O system operates.

Table 1-973 Rated voltage for operation

Rated voltage (SELV/PELV)	Tolerance range
24 V DC	20.4 ... 28.8 V DC

Industrial cybersecurity 13

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

In the first part of this section you will find basic information on the subject of industrial cybersecurity. Subsequent sections describe recommended measures for protecting the entire system and individual components from manipulation and unwanted access.

NOTE

Security-relevant changes to software or devices are documented in the section New properties/functions (Page 22).

13.1 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

13.2 Security update notification

Read the special information on maintaining the operational safety of your plant in the Introduction (Page 8) section.

Set up notification of security updates

To receive notifications about security updates, proceed as follows:

1. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home).
2. Enter the keyword "Security" in the search engine.
3. Choose the "Search in Knowledge base" option.
4. In the "Product tree" filter menu, select your product or your product group, for example "Automation Technology" > "Automation Systems" > "Industrial Automation Systems SIMATIC" > "I/O systems" > "SIMATIC ET 200 systems without control cabinet" > "ET 200AL".
5. Select the "Other types" option from the filter menu for "Type," and then choose "Download" and "Product note".
6. Select the document about which you want to receive notifications using the 3 points on the right "Add to my favorites".
7. In the following dialog, select the name, the storage location and the "Notify me" option for the favorite. Then click on the "+ Add to my favorites" button.

Result: You will be notified by email each time the document is changed.

Under "mySiePortal" > "Lists & notifications" > "My notifications", you can display your notifications and delete them if necessary.

13.3 Basic information on industrial cybersecurity

13.3.1 Definition of industrial cybersecurity

Industrial cybersecurity is generally understood to mean all measures to protect against the following threats:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability (e.g. due to the destruction of data or denial of service (DoS))

13.3.2 Objectives of industrial cybersecurity

The objectives of industrial cybersecurity are:

- Ensuring trouble-free operation of industrial systems and production processes
- Preventing threats to people and production from cybersecurity attacks
- Protection of industrial plants against espionage and manipulation
- Protection of industrial automation systems and components against unauthorized access and data loss
- Provision of a practical and cost-effective concept for securing existing plants and devices without their own security functions

- Use of existing, open and proven industrial cybersecurity standards
- Compliance with legal requirements

An optimized and adapted security concept applies to automation and drive technology. The security measures must not impede or endanger production.

13.4 Integrated security concept and security strategies

13.4.1 Comprehensive security concept "Defense in Depth"

With Defense in Depth, Siemens provides a multi-layer security concept that offers industrial plants comprehensive and far-reaching protection in accordance with the recommendations of the IEC 62443 international standard.

Productivity and know-how are protected on 3 levels:

Plant security
Plant security uses various methods to secure the physical access of people to critical components. This starts with classic building access and extends to securing sensitive areas using access control (for example, code card, iris scan, fingerprint or access code).

Network security
Automation networks must be protected against unauthorized access. This is achieved through security measures on the product, but also those in the product-related environment.

System integrity
Targeted measures must be taken to protect existing know-how or to prevent unauthorized access to automation processes. The measures protect against unauthorized configuration changes and highlight attempts at manipulation.

You can find more information on the topics of Defense in Depth, plant security, network security, and system integrity on the SIEMENS Industrial cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) Web page.

You can also visit the download center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) to obtain more information on the topic of industrial cybersecurity. The "Operational Guidelines", for example, provide recommendations on basic security measures for secure machine and plant operation in an industrial environment.

13.4.2 Security management

The ISO 27001 and IEC 62443 standards call for a comprehensive approach in information technology (IT) and operational technology (OT) to protect against cyber attacks.

Responsibility for cybersecurity and IT security

Every operator of machinery and equipment is responsible for:

- Defining cybersecurity and IT security as an important criterion in the procurement and selection of machines and software applications.
- Use of suitable measures to protect production resources, data, and communication from manipulation and theft
- Providing all necessary resources and training to employees to fully support these goals

For this purpose, suitable measures must be selected after a risk assessment and a cost-benefit analysis in order to protect material and intellectual property and prevent damage from occurring. These measures should be integrated into corporate processes and procedures, evaluated regularly, and firmly anchored in the corporate culture. In addition to protecting intellectual property, the protection of personal data must be ensured at all organizational units and levels.

Siemens will provide you with information and support. Subscribe to the Security feeds (https://www.siemens.com/cert) for information on vulnerabilities. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home) and create filters to be notified when important information is published. The procedure is described in the section Notification of security updates (Page 129). Consider using Siemens Cybersecurity Services.

Responsibility in the digital supply chain

Cybersecurity should play a critical role in the evaluation and procurement process. The entire life cycle of a product should be considered to ensure protection against current and future risks. These include, for example, security updates throughout the product life cycle, including guidelines for secure disposal of the product.

Siemens plans and announces the provision of security updates, as well as total discontinuation of products, as part of product support.

Employee awareness

Regular training in cybersecurity and continuous testing of training success are essential so that cybersecurity measures are internalized in processes and work instructions. This involves general training in the use of software and IT hardware for company communication and as work equipment e.g.:

- Secure handling of USB devices
- Encrypted communication
- Use of VPN
- Rules for passwords and use of access
- Setting up two-factor authentication
- Educating employees about the dangers posed by malware, phishing, social engineering and other factors

Furthermore, if applicable, production equipment and software training should always include the topic of cybersecurity.

Maintaining the security concept through updates

Keeping software up-to-date is essential, for example, to benefit from the following measures:

- Implementation of new security strategies, protocols and techniques
- Closing of security vulnerabilities
- Elimination of security vulnerabilities

To this end, it is necessary to keep a constant eye on the further development of protective measures and, if necessary, the expansion of requirements.

Recommendations:

- Set up notifications for (security) updates
- Subscribe to information on vulnerabilities
- Monitor and implement the further development of the technology, especially in the area of cybersecurity

Always keep technology and knowledge up to date.

Consideration of the risks posed by cyber attacks in the Threat and Risk Assessment (TRA)

Make an inventory of all software, hardware, and infrastructure devices, in order to identify risks to the location or organization. Incident response procedures must be incorporated into all IT and manufacturing processes. The choice of risk mitigation measures should be based on a cost-benefit analysis and classification of risks. This is followed by the introduction of cybersecurity rules and procedures and the training of personnel.

Living the concept

Technical solutions alone are not sufficient to effectively counter threats.

Cybersecurity must be part of the corporate culture and process landscape and must be internalized and lived by all employees.

Continuously monitoring the security situation

You have the following options for continuously monitoring the cybersecurity situation:

- Setting anomaly references and creating allow and deny lists based on normal network communication and production machine behavior. The SINEC software family offers you reliable security tools (https://www.siemens.com/global/en/products/automation/industrial-communication/sinec-network-software/cybersecurity.html) to detect potential vulnerabilities in OT networks, quickly initiate suitable measures and effectively resolve security vulnerabilities.
- Establishment of an intrusion detection system (IDS) that generates alarms when unusual behavior occurs in the network

- Introduction of a Security Information and Event Management (SIEM) system to collect, analyze, and evaluate events in real time to enable early countermeasures
- Measures regarding network security: for example network segmentation, firewalls, VPN, DMZ (demilitarized zones)

13.5 Operational application environment and security assumptions

13.5.1 Intended use

SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.

The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

Operational reliability and intended use

Read the "Special information" in the Introduction (Page 8) section.

Area of application

Refer to the "Application area" section in the System overview (Page 24) chapter.

13.5.2 Requirements for the operational application environment and security assumptions

Siemens recommends the following security measures:

- Threat and risk assessment (as part of security management)
- Network security concepts
  - Network segmentation
  - Asset and network management
  - Network protection
  - Remote access
- Access control concepts (utilizing access control systems)
  - Physical protection
  - Physical corporate security
  - Physical product security

Threat and Risk Assessment

Vulnerabilities and risks are identified, and countermeasures are proposed to ensure the security of the system, networks, and data.

Network security concepts

You can find information on network security in the whitepaper "Industrial Network Security Architecture", available at the Download Center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) on the Industrial Cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) website.

Access control concepts

Physical protection
In addition to closing off and/or monitoring entire production facilities, it may be necessary to physically secure cabinets or even individual components such as circuit breakers.

Physical corporate security
You can ensure the physical security of the company by taking the following measures:

- Closed off and monitored company premises
- Access control, locks/card readers, and/or security personnel
- Accompaniment of non-employees by company personnel
- Employees are trained on and embrace security processes within the company

Physical production security
You can ensure physical production safety by taking the following measures, among others:

- Separate access control for critical areas, such as production zones.
- Installation of critical components in lockable cabinets/control rooms with monitoring and alarm capabilities. The cabinets/control rooms must be secured with a cylinder lock. Do not use simple locks, such as universal, triangular/square, or double-bit locks.
- Radio field planning to limit WLAN coverage areas, preventing them from extending beyond defined zones (e.g. factory floor).
- Guidelines that prohibit the use of external data storage media (such as USB flash drives) and IT devices (such as laptops) classified as unsafe on systems.

13.6 Security properties of the devices

The security properties of the individual devices are listed in the Equipment Manuals.

13.7 Secure operation of the system

This section describes measures recommended by Siemens to protect your system from manipulation and unauthorized access.

13.7.1 Hardening measures

System hardening, simplify referred to as hardening, is the secure configuration of products or systems. The aim is to close security gaps and take various measures to reduce the attack surfaces for cyberattacks.

Measures for system hardening include, for example:

- Secure configuration in which only necessary software components and services are installed or activated for proper operation.
- Access control, by which restrictive user and rights management system is implemented.

13.7.2 Secure configuration

Secure configuration involves control over all software components, along with their interfaces, ports, and services.

Activated services and ports pose a risk, e.g. of unauthorized access to the network and programs.

To minimize risks, only activate the necessary services for all automation components. Take all activated services (especially Web servers, FTP, remote maintenance etc.) into account in the security concept. Consider the default states of ports and services in your security concept.

You can find an overview of all ports and services used in the Communication function manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

13.7.3 Handling of sensitive data

Data protection information

Siemens Aktiengesellschaft observes the applicable data protection laws, including the General Data Protection Regulation (GDPR), in particular the rules of data minimization and data protection-friendly default settings (privacy by design, privacy by default).

The products do not store any personal data.

If you establish a reference to an identifiable person by linking this functional data with other data (such as shift schedules) or if you store personal data on the same medium (such as a hard disk), you are responsible for ensuring that the data protection regulations are observed.

Information on the secure removal of data is provided in the section Secure decommissioning (Page 137).

Storage of security-related data

When storing your security-relevant data on your PC, independently ensure secure data storage.

13.7.4 Regular firmware updates

NOTE

Outdated firmware versions might not be monitored for security vulnerabilities.

- Always keep your plant/products up to date to benefit from troubleshooting and to minimize potential risks.
- Use email notifications to be automatically informed about firmware updates.

You can find more information in:

- Section Firmware update (Page 110)
- Section Notification of security updates (Page 129)

13.7.5 Notifications about security vulnerabilities (Siemens Security Advisories)

A vulnerability is a security vulnerability in information security. It can pose a threat as it provides intruders with the opportunity to access system resources and manipulate or steal data. Many vulnerabilities allow availability to be impaired.

Siemens ProductCERT

If Siemens identifies or fixes security gaps (Vulnerabilities) in the products, this will be published in the Security Advisories.

You can find the documents for SIMATIC on the following Siemens Aktiengesellschaft web page: Siemens ProductCERT and Siemens CERT (https://www.siemens.com/global/en/products/services/cert.html?s=SIMATIC&_originalHost=new.siemens.com#SecurityPublications)

"SIMATIC" is preset in the "Search Security Advisories" search field. You can also enter other product names or other terms in the search field and search for them.

On this page, you will also find all the required information on how to deal with vulnerabilities:

- Contact persons for matters related to vulnerabilities
- Options for automated notifications regarding vulnerabilities
- Notifications are also possible in CSAF format
- Option to subscribe to RSS feeds and newsletters
- List of all current vulnerabilities and detailed information such as:
  - Description
  - Classification according to Common Vulnerability Scoring System (CVSS)
  - Measures
  - Availability
  - Etc.

Set up Security feeds (https://www.siemens.com/cert) to receive notifications about security-related topics.

If you suspect or have discovered a vulnerability in a Siemens product, please inform us immediately. To do this, press the "Contact" button on the CERT Services page (https://www.siemens.com/cert) and follow the instructions.

13.7.6 Data backup

Secure your configuration and parameter settings so that you can quickly restore this data if needed.

13.7.7 Security checks

Security checks for data, files, and archives serve to ensure data integrity at the storage location and during file transmission, protecting against manipulation and transmission errors. This is often achieved using digital checksums that are provided alongside the data. Tools (such as SHA-256 or SHA-512) for calculating and verifying these checksums are provided in many systems and named according to their respective calculation methods.

File Integrity Guidelines describe the prescribed procedure for integrity checks

Integrity protection is a protection function for engineering data and firmware files

Communication integrity means protecting communication against unauthorized manipulations to ensure high system availability. A central element in this regard is, for example, the use of digital checksums when accessing controllers. (Source: Industrial Cybersecurity website (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html))

13.7.8 Secure decommissioning

In the following section, you will find information on how to properly decommission individual components of your automation system. Decommissioning is necessary when the component has reached the end of its service life.

Decommissioning includes environmentally sound disposal and secure removal of all digital data of electronic components with storage medium.

13.7.8.1 Securely removing data

Before disposing of components of your automation system, you should securely delete all data from the storage media of these components. How to securely delete data from the devices so that it cannot be recovered is described below.

NOTICE
Data misuse resulting from non-secure deletion of data Incomplete or non-secure deletion of data from data memories can result in data misuse by third parties. For this reason, ensure secure deletion of data from all storage media used before disposing of the product.

Secure erasure of data from the interface module

With the following tools, you can securely erase the data from the interface module:

- STEP 7 < V19
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Follow these steps in the order given:

1. Establish an online connection.
2. Open the Online and Diagnostics view of the IM (either from the project context or via "Accessible devices").
3. In the dialog box "Functions > Reset to factory settings", select the option "Delete I&M data" and then the "Reset" button.

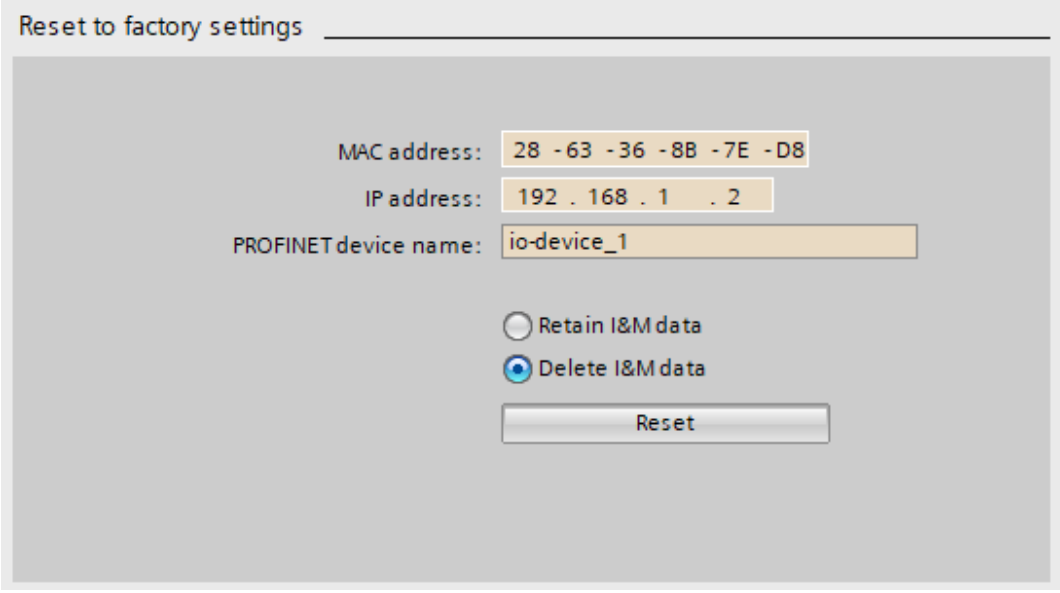

Figure 1-699 Resetting an interface module to factory settings

Result: All the data that was still in the data memories of the interface module was deleted. You can now dispose of the components.

For more information on resetting the interface module to factory settings, refer to the section Resetting an interface module to factory settings (Page 111).

NOTE

STEP 7 ≥ V19

Only the communication parameters will be securely deleted on "Reset to factory settings" with the "Delete I&M data" option enabled when you use STEP 7 ≥ V19.

Deleted communication parameters:

- IP address
- Device name
- PROFINET configuration data

If you want to securely remove all data, use one of the tools listed above for this purpose.

13.7.8.2 Recycling and disposal

For environmentally sustainable recycling and disposal of your old equipment, contact a certified electronic waste disposal service and dispose of the equipment according to the applicable regulations in your country.

13.8 Secure operation of the engineering software

For more information on secure operation of the engineering software, refer to the TIA Portal online help.

13.9 Secure operation of interface modules

Device-specific security information and instructions for interface modules can be found in the respective Equipment Manual.

13.9.1 Data integrity for interface modules

Data integrity refers to the completeness and correctness (integrity) of data, which is an essential prerequisite for the proper functioning of systems.

Measures for data privacy, data consistency, and data security ensure that data used within devices cannot be damaged, altered (manipulated), or deleted during processing or transmission, and at the very least, any changes to the data are detected.

Data integrity for interface modules

To detect intentional or accidental changes to data within an interface module and its associated modules, the possibility of dynamic integrity checking is introduced for PROFINET interface modules.

The ability to detect integrity breaches enhances the resilience of the distributed I/O system.

Data integrity within a distributed I/O system is entirely covered within the interface module and does not pertain to other components of the automation system.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as parameter settings, IP address, device name, MAC address and I&M data. The interface module stores the checksums in the I&M4 data area.

A CRC (Cyclic Redundancy Check) is always the same for a specific, unchanged memory content. When the memory content changes, the interface module (IM) calculates a different checksum for this content by reading and comparing the I&M4 data. By comparing with the initial CRC, you can determine whether the data in the memory has been modified or not:

- CRC stayed the same: No change in the data within this memory area of the interface module IM
- CRC changed: The data within this memory area of the IM was modified

Only you, as the user, know whether changes to the data of an interface module were intentional or not. If changes were not intentional, you can detect that the data of the interface module has been compromised through changed CRCs and respond accordingly.

I&M data

PROFINET devices provide Identification and Maintenance data (I&M data), which is a set of predefined data structures containing the internal module status. With this data, a module can be identified, its serial number can be determined, etc.

The CRC checksums are mapped in the maintenance data **I&M4** of the interface module.

NOTE

Requirements for calculating the CRCs

The CRCs via the memory contents of the interface module are calculated only when you request to read the I&M4 data.

The CRCs cover not only the interface module itself but can also take into consideration combined checksums from associated modules (refer to the section on the structure of the data record for I&M data). Process data is not included in the calculation of CRCs.

Example:

- You put your distributed I/O system into operation and read the CRC CHK_OVERALL with the value "0x55AAA678" ("16#55AAA678") from the interface module via the I&M4 data.
- As long as no changes have been made to the data of the interface module or the associated modules, each subsequent read will give the value "0x55AAA678" or "16#55AAA678".
- Once you read a different CRC CHK_OVERALL, for example, "0xCC9876FF", you will realize that there must have been changes to the data of the interface module or the associated modules.

The quality of the statement regarding the data integrity of the distributed I/O system improves with each module associated with the interface module that supports I&M4 data. Refer to the Equipment Manual of the respective module to find out if and from which firmware version the module supports I&M4 data.

You can find the structure of I&M data 0 to 4 in the section Record structure for I&M data (Page 105).

Spare parts scenario

The spare parts scenario is still ensured. This means that you can replace interface modules with the same article number. For the "new" interface module, the static data such as the serial number and MAC addresses will change. Note that this is why the replacement will be reflected in the changed identification data CHK_STATIC_LOCAL and consequently also in CHK_OVERALL.

More information on the spare parts scenario and compatibility can be found in the Equipment Manual of the interface module.

13.9.2 Signed firmware update for interface modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect internet source

Information on whether your interface module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of the signed firmware update for interface modules

Firmware updates for interface modules starting with article number 6ES7157-1MA00-0AB0 may include a digital signature. The digitally signed firmware update files are available for download on the Siemens Support Web page.

The interface module verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the interface module can detect a manipulated or corrupted firmware update file and reject it.

Note that the interface module performs the verification only after the complete firmware download has taken place.

Subsequently, a notification is sent to the firmware update tool regarding the success or failure of the signature verification.

You still have all the options for firmware updates, as described in the Firmware update (Page 110) section, when performing signed firmware updates for modules. If the firmware update was not successful, the module will continue to run with the previous firmware.

Diagnostics alarms and remedy

When performing a firmware update for a module with an established connection between the IM and CPU, the following options for notifications are available in the CPU's diagnostic buffer:

- Successful integrity check of the firmware for the module
- Rejection of non-secure firmware for the module

You can find more information in the section on diagnostics alarms in the equipment manual for the respective module.

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file you are using originates from a secure source and was downloaded unchanged. As a check, calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support website.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/de/de/view/109483101/en).

13.9.3 Secure Boot

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Information on whether your interface module supports Secure Boot is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of "Secure Boot" for interface modules

Interface modules verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before being executed.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to signed firmware updates for interface modules, Secure Boot also prevents manipulation of the firmware through physical intervention in the interface module.

Secure Boot is integrated into the interface module and cannot be deactivated for security reasons.

NOTE

Longer startup duration of the interface module
The signature verification of Secure Boot significantly extends the startup time of the interface module. You can find time specifications in the Equipment Manual of the interface module, in the Technical specifications section.

LED display on the interface module

If the Secure Boot verification results in an invalid signature, the LEDs RUN, ERROR, and MAINT on the interface module will flash. In this case, you need to replace the interface module.

13.10 Safe operation of I/O modules

Device-specific security information and instructions for I/O modules can be found in the respective Equipment Manual.

13.10.1 Data integrity for I/O modules

Data integrity for I/O modules

In order to detect intentional or accidental changes to the data of an interface module and the assigned modules, the dynamic integrity check for I/O modules is introduced as of firmware version V2.0. You can also find out whether your I/O module supports the data integrity check in the Technical specifications section of the corresponding equipment manual.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as serial numbers, parameter settings, calibration data and I&M data of I/O modules. The interface module stores the checksums in the I&M4 data area.

You can find more information on the principle of data integrity and I&M4 data in the section Data integrity for interface modules (Page 139).

Spare parts scenario

The spare parts scenario is still ensured. This means that you can replace I/O modules with the same article number. For the "new" I/O module, the static data such as the serial number will change. Note that the replacement is therefore reflected in the following modified I&M4 data of the interface module:

- CHK_STATIC_SUBS
- CHK_OVERALL_SUBS
- CHK_OVERALL

You can find the structure of I&M data in the section Record structure for I&M data (Page 105).

13.10.2 Signed firmware update for I/O modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect internet source

Signed firmware update for I/O modules

Firmware updates for I/O modules as of firmware version V2.0 contain a digital signature. The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms and remedies as for interface modules

The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 141) applies.

Safety-related shutdown of ET200AL standard modules

A

Introduction

The diagram below illustrates the fail-safe shutdown of ET 200AL standard modules.

In the configuration shown in the diagram below, all digital outputs that are operated with the 2L+ and 2M supply of the ET 200AL standard modules are switched to the safe OFF state. This step achieves the safety class SIL2/category 3/PLd.

Principle of operation

The higher-level safety relay (for example: 3SK1) disconnects the 2L+ and 2M supply. This switches all digital outputs operated with the 2L+ and 2M (switched) supply to the safe state. The digital outputs connected to the 1L+ and 1M (non-switched) supply are not intended for functional switching and therefore cannot be shut down safely.

There is no interaction between the outputs supplied by 1L+ and 2L+.

You can also integrate I/O modules that are operated solely at the supply 1L+ and 1M (non-switched) in the structure of your distributed I/O system. These I/O devices must be enabled as reaction-free modules. These I/O modules are not affected by a disconnection, they pass on the supply 2L+ and 2M (switched). The following figure shows this as an example using the DI, AI and AQ modules.

Schematic circuit diagram with 3SK1

The following figure shows a schematic circuit diagram with safety relay 3SK1.

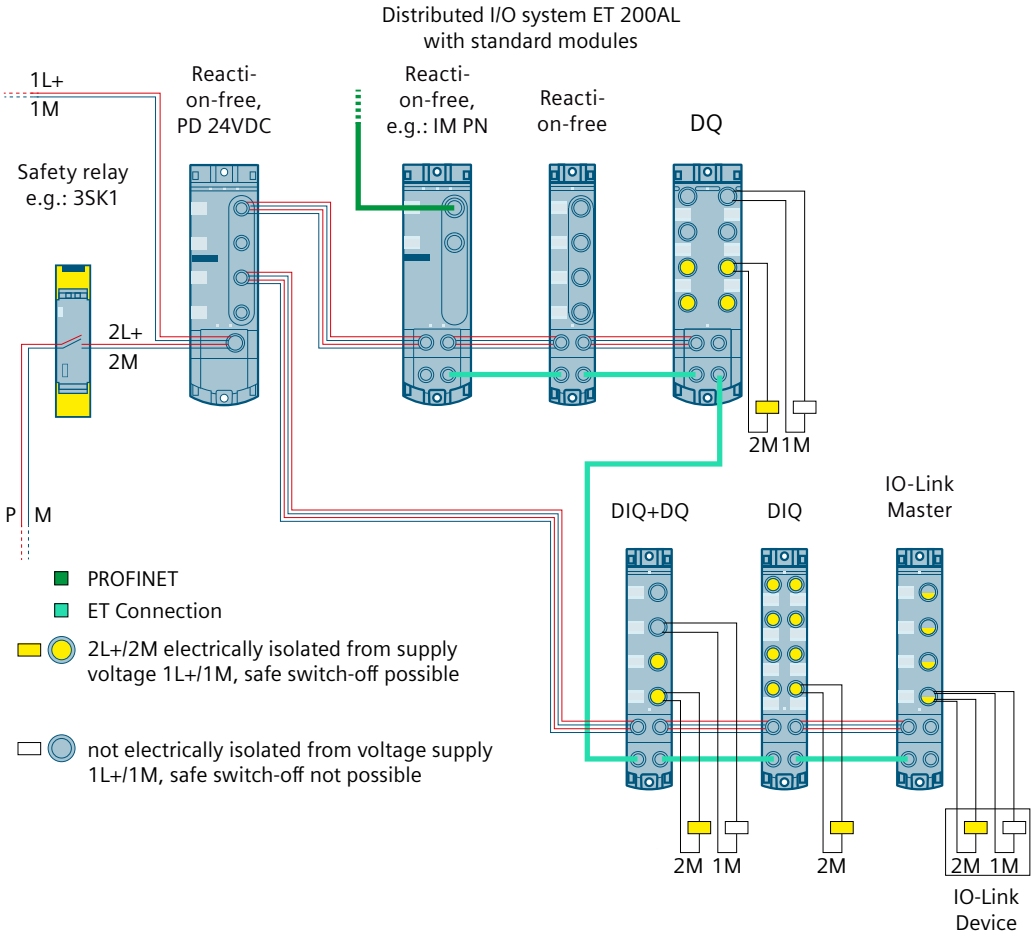

Figure 1-700 Higher-level safety circuit with safety relay

You can find an overview table with the article numbers of the I/O modules and other information in the FAQ on safety-related shutdown (https://support.industry.siemens.com/cs/us/en/view/39198632).

Planning

Note the following points when planning safety circuits.

WARNING

Note potential groups for safety-related shutdown
When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, which leads to elimination of the electrical isolation between 1L+ and 2L+.
The safety-related shutdown is not permitted if the electrical isolation is eliminated.

NOTE

Safe electrical isolation

Maintain safe galvanic isolation for voltages higher than SELV/PELV.

NOTE

Safety-related shutdown for the IO-Link master

For an IO-Link master with IO-Link Port Class B, safety-related shutdown is available for the additional supply (PIN 2 and PIN 5).

The other signals at the port are reaction-free.

Please note that the IO-Link device must have corresponding safety characteristics in order to use safety-oriented tripping.

Limits of the higher-level safety circuit

The ET 200AL standard modules do not fulfill any safety functions. The safety functions are executed by the safety relay in order to bring the system into a safe state.

Adjust the operation inspection interval of the safety switching device with a relay output to the safety class.

Take the following measures if energy that is not provided by the higher-level safety circuit is used to control the safety function.

Cover critical errors in the safety function that are not detected by the higher-level safety circuit (e.g. 3SK1) with suitable safety measures. The "diagnostics" must be performed indirectly via the controlled process.

Specifications for safety-relevant process data:

- Functionally safe
- Read via fail-safe inputs (e.g. F-DI)
- Fail-safe processing unit (e.g. F-CPU) for issuing commands
- Output through fail-safe outputs (e.g. F-DQ) to control the safety function

Requirements on the power supply

Operation requires a SELV/PELV power supply to limit overvoltages to L+ and M (24 V). This measure prevents possible errors from the power supply side at the same time.

Select the power supply according to the requirements of the respective operating instructions for the shutdown device and for the ET 200AL system.

You can find more information on safe SELV/PELV in the data sheets of the power supplies used.

FAQ

The information on the safety-related shutdown of standard modules refers to the status of the issue date. Read the up-to-date information on safety-related shutdown in this FAQ (https://support.industry.siemens.com/cs/us/en/view/39198632).

This FAQ specifies the SIMATIC standard modules that are suitable for a safety-related shutdown and a file with wiring examples.

Request German Technical Inspectorate report (Report no. SN89858T)

You can request copies of the German Technical Inspectorate report at the following address:

Siemens Aktiengesellschaft
Digital Industries
DI FA TI COS TT
P.O. Box 1963
D-92209 Amberg, Germany

Dimension drawings

B

2 module widths are available with the distributed I/O system.

The figure below shows the height and width of the modules. The depth of the modules ranges from 40 mm to 46 mm. Detailed information on the dimensions of the individual modules can be found in the manuals for the Interface modules (https://support.industry.siemens.com/cs/ww/en/ps/14246/man) and I/O modules (https://support.industry.siemens.com/cs/ww/en/ps/14247/man) in the section "Dimension drawing".

Online catalog

Other article numbers for the ET 200AL distributed I/O system can be found on the Internet (https://mall.industry.siemens.com) in the online catalog and the online order system.

C.2 UL-approved cables

In combination with the UL-approved cables for the power supply and the connection of inputs/outputs, the SIMATIC ET 200AL distributed I/O devices meet UL approval. Siemens has UL-approved cables for these applications in the product portfolio.

C.3 Cables

Cables for ET-Connection PVC cable and PUR cable

The cables for ET-Connection are available in the following versions and lengths:

- Bus cable (4-wire), pre-assembled on both sides with 2 M8 connectors, 4-pole, shielded
  - available lengths: 0.19 m, 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Bus cable (4-wire), pre-assembled on both sides with 2 M8 connectors, angled, 4-pole, shielded
  - available lengths: 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Bus cable (4-wire), pre-assembled on one side 1x M8 connector, 4-pole, shielded
  - available lengths: 2 m, 5 m, 10 m, 15 m

The following table shows the technical properties of the bus cable ET-Connection PVC cable.

Table 1-982 Cables for ET-Connection, PVC cable

General information	
Product type designation	BUS CABLE ET-CONNECTION
Function	To connect ET-CONNECTION devices with degree of protection IP65/IP67
Degree of protection and protection class	
IP65	Yes
IP67	Yes
Ambient conditions	
Ambient temperature during mounting	
minimum	-30 °C
maximum	80 °C

* = Applies to cable lengths up to 10 m.

General information	
Storage/transport temperature	
Ambient temperature during transport and storage	
minimum	-40 °C
maximum	80 °C
Cables	
Cable designation	2Y(ST)CY 1x4x0.5/1.0-100-GN
Number of electrical wires	4
Design of shielding	Overlapped aluminum-lined sheet, coated with shielding made of tin plated copper wires
Outside diameter of the inner conductor	0.5 mm
Outside diameter of the wire insulation	1.0 mm
Outside diameter of the cable sheath	5 mm
Number of bending cycles	1000000; Trailing-chain suitable for 1 million bending cycles with a bending radius of 100 mm, a velocity of 4 m/s and an acceleration of 4 m/s²
Permissible bending radius	
One time bending, min.	20 mm
Multiple bending, min.	40 mm
Constant bending	100 mm
Color of the cable sheath	Green
Color of the wire insulation of the data wires	White, yellow, blue, orange
Weight per length	34 kg/km
Mechanics/material	
Type of cable outlet	180° cable outlet 90° cable outlet (with angled connectors)
Number of connectors	1 or 2
Connector housing material	Metal/plastic
Wire insulation material	PE
Cable sheath material	PVC
Material property halogen free	No
Material property silicon free	Yes

* = Applies to cable lengths up to 10 m.

The following table shows the technical properties of the bus cable ET-Connection, PUR cable.

Table 1-983 Cables for ET-Connection, PUR cable

General information	
Product type designation	BUS CABLE ET-CONNECTION, PUR CABLE
Function	To connect ET-CONNECTION devices with degree of protection IP65/IP67
Degree of protection and protection class	
IP65	Yes
IP67	Yes
Ambient conditions	
Ambient temperature during mounting	
minimum	-30 °C

* = Applies to cable lengths up to 10 m.

General information	
maximum	80 °C
Storage/transport temperature	
Ambient temperature during transport and storage	
minimum	-40 °C
maximum	80 °C
Cables	
Cable designation	2Y(ST)C11Y 2x2x0.5/1.0-100-GN
Number of electrical wires	4
Design of shielding	Overlapped aluminum-lined sheet, coated with shielding made of tin plated copper wires
Outside diameter of the inner conductor	0.5 mm
Outside diameter of the wire insulation	1.0 mm
Outside diameter of the cable sheath	5 mm
Number of bending cycles	1000000*; trailing-chain suitable for 1 million bending cycles with a bending radius of 100 mm, a velocity of 4 m/s and an acceleration of 4 m/s²
Permissible bending radius	
One time bending, min.	20 mm
Multiple bending, min.	40 mm
Constant bending	100 mm
Color of the cable sheath	Green
Color of the wire insulation of the data wires	White, yellow, blue, orange
Weight per length	34 kg/km
Mechanics/material	
Type of cable outlet	180° cable outlet 90° cable outlet (with angled connectors)
Number of connectors	1 or 2
Connector housing material	Metal/plastic
Wire insulation material	PE
Cable sheath material	PUR
Material property halogen free	Yes
Material property silicon free	Yes

* = Applies to cable lengths up to 10 m.

Connection cable for ET-Connection PVC cable and PUR cable

You can use the connection cable between two cables for ET-Connection.

Typical applications for using connection cable for ET-Connection are:

- Combination of individual cable lengths by joining multiple pre-assembled cables for ET-Connection.
- Selective installation of disconnection points of cables for ET-Connection (for simple changing of cables and cable sections, e.g. with trailing-cable applications).

You can use a maximum of two connection cables between the two modules.
The length of the cables for ET-Connection is limited to maximum 10 m when connection cables are used.

The connection cable for ET-Connection is available in the following design:

- Connection cable for bus cable ET-Connection M8, both ends assembled with 2x M8 socket, 4-pole, shielded, length 0.2 m

The following table shows the technical properties of the connection cable for ET-Connection PVC cable.

Table 1-984 Connection cables for ET-Connection, PVC cable

General information	
Product type designation	Connection cable for bus cable ET-CONNECTION, cable 0.2 M
Function	To connect two bus cables ET-CONNECTION
Degree of protection and protection class	
IP65	Yes
IP67	Yes
Ambient conditions	
Ambient temperature during mounting	
minimum	-30 °C
maximum	80 °C
Storage/transport temperature	
Ambient temperature during transport and storage	
minimum	-40 °C
maximum	80 °C
Cables	
Cable designation	2Y(ST)CY 1x4x0.5/1.0-100-GN
Number of electrical wires	4

Cables for voltage supply PVC cable and PUR cable

The cables for the power supply are available in the following versions and lengths:

- Power cable (4-wire), pre-assembled on both sides with a 4-pole M8 pin connector/socket connector
  - available lengths: 0.19 m, 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Power cable (4-wire), pre-assembled on both sides with a 4-pole M8 pin connector/socket connector, angled
  - available lengths: 0.3 m, 1 m, 2 m, 5 m, 10 m, 15 m
- Power cable (4-wire), pre-assembled on one side with 1x M8 socket connector
  - available lengths: 2 m, 5 m, 10 m, 15 m

The following table shows the technical properties of the power supply line PVC cable

Table 1-986 Cables for power supply, PVC cable

General information	
Product type designation	POWER CABLE M8
Function	For connection of ET 200AL for 24 V DC power supply
Degree of protection and protection class	
IP65	Yes
IP67	Yes
Ambient conditions	
Ambient temperature during mounting	
minimum	-30 °C
maximum	80 °C
Storage/transport temperature	
Ambient temperature during transport and storage	
minimum	-40 °C
maximum	80 °C
Cables	
Cable designation	4 Li9Y 0.50 mm² Y
Number of electrical wires	4
Outside diameter of the inner conductor	0.8 mm
Outside diameter of the wire insulation	1.46 mm
Outside diameter of the cable sheath	5.2 mm
Number of bending cycles	2500000; Trailing-chain suitable for 2.5 million bending cycles with a bending radius of 52 mm, a speed of 3 m/s² and an acceleration of 10 m/s²
Permissible bending radius	
One time bending, min.	26 mm
Multiple bending, min.	52 mm
Constant bending	52 mm
Color of the cable sheath	Gray
Color of the wire insulation of the power wires	White, brown, blue black
Weight per length	44 kg/km
Mechanics/material	

General information	
Type of cable outlet	180° cable outlet 90° cable outlet (with angled connectors)
Number of connectors	1 or 2
Connector housing material	Plastic
Wire insulation material	PP
Cable sheath material	PVC
Material property halogen free	No
Material property silicon free	Yes

The following table shows the technical properties of the power supply, PUR cable

Table 1-987 Cables for power supply, PUR cable

General information	
Product type designation	POWER CABLE M8, PUR CABLE
Function	For connection of ET 200AL for 24 V DC power supply
Degree of protection and protection class	
IP65	Yes
IP67	Yes
Ambient conditions	
Ambient temperature during mounting	
minimum	-30 °C
maximum	80 °C
Storage/transport temperature	
Ambient temperature during transport and storage	
minimum	-40 °C
maximum	80 °C
Cables	
Cable designation	LIF9Y11YFHF 4x0.50 mm²
Number of electrical wires	4
Outside diameter of the inner conductor	1 mm
Outside diameter of the wire insulation	1.46 mm
Outside diameter of the cable sheath	5.1 mm
Number of bending cycles	2000000; trailing-chain suitable for 2 million bending cycles with a bending radius of 51 mm, a velocity of 5 m/s and an acceleration of 5 m/s²
Permissible bending radius	
One time bending, min.	26 mm
Multiple bending, min.	51 mm
Constant bending	51 mm
Color of the cable sheath	Gray
Color of the wire insulation of the power wires	White, brown, blue black
Weight per length	44 kg/km
Mechanics/material	
Type of cable outlet	180° cable outlet 90° cable outlet (with angled connectors)
Number of connectors	1 or 2

General information	
Connector housing material	Plastic
Wire insulation material	PP
Cable sheath material	PE-PUR
Material property halogen free	Yes
Material property silicon free	Yes

C.4 Connectors

The following table shows the technical specifications of the user-configurable connectors.

The following table shows the technical specifications of the connection plug for the ET-CONNECTION connection.

Article number	6ES7194-2AB00-0AA0
General information	
Product type designation	Connection plug
Product description	M8 plug connector with high degree of protection, 4-pin, metal version
Suitability for use	for connecting ET-CONNECTION nodes (e.g. SIMATIC ET 200AL) in degree of protection IP65 / 67
Degree and class of protection	
IP degree of protection	IP65/67
Ambient conditions	
Ambient temperature during assembly, min.	-30 °C
Ambient temperature during assembly, max.	80 °C
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	80 °C
Mechanics/material	
Outgoing feeder type	180° cable outlet
Material of housing	metal
Dimensions	
Width	14 mm
Depth	47 mm

The following table shows the technical specifications of the power connector with female contact insert for the 24 V DC power supply.

Article number	6ES7194-2AC00-0AA0
General information	
Product type designation	Power connector
Product description	M8 plug connector with high degree of protection, socket insert, 4-pin, plastic version
Suitability for use	For connection to ET 200AL for 24 V DC power supply
Degree and class of protection	
IP degree of protection	IP65/67
Ambient conditions	
Ambient temperature during assembly, min.	-30 °C
Ambient temperature during assembly, max.	85 °C
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	85 °C

Article number	6ES7194-2AC00-0AA0
connection method / header	
Connector type	M8, 4-pole
Type of electrical connection for mains supply line	Screw terminals
• connectable cable cross-section for mains supply line, min.	0.14 mm²
• connectable cable cross-section for mains supply line, max.	0.5 mm²
• Connectable conductor cross-section for AWG cables, min.	26
• Connectable conductor cross-section for AWG cables, max.	20
Suitable for cable diameter, min.	4 mm
usable for cable diameter, max.	5.5 mm
Mechanics/material	
Outgoing feeder type	180° cable outlet
Material of housing	plastic
Dimensions	
Width	14 mm
Depth	47 mm

The following table shows the technical specifications of the power connector with male contact insert for the 24 V DC power supply.

Article number	6ES7194-2AA00-0AA0
General information	
Product type designation	Power connector
Product description	M8 plug connector with high degree of protection, 4-pin, plastic version
Suitability for use	For connection to ET 200AL for 24 V DC power supply
Degree and class of protection	
IP degree of protection	IP65/67
Ambient conditions	
Ambient temperature during assembly, min.	-30 °C
Ambient temperature during assembly, max.	85 °C
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	85 °C
connection method / header	
Connector type	M8, 4-pole
Type of electrical connection for mains supply line	Screw terminals
• connectable cable cross-section for mains supply line, min.	0.14 mm²
• connectable cable cross-section for mains supply line, max.	0.5 mm²
• Connectable conductor cross-section for AWG cables, min.	26

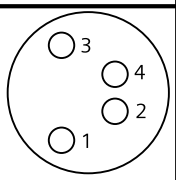
Article number	6ES7194-2AA00-0AA0
• Connectable conductor cross-section for AWG cables, max.	20
Suitable for cable diameter, min.	4 mm
usable for cable diameter, max.	5.5 mm
Mechanics/material	
Outgoing feeder type	180° cable outlet
Material of housing	plastic
Dimensions	
Width	14 mm
Depth	47 mm

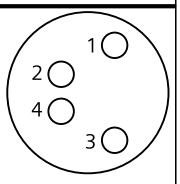
C.5 Pin assignment and core color

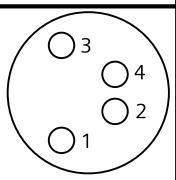
Pin assignment of the sockets for ET-Connection

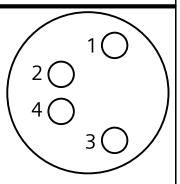
The tables below shows the pin assignments of the 2 sockets for the connection of ET-Connection.

Table 1-988 Pin assignment for ET-Connection (interface modules)









Pin	Assignment		Assignment of the core color of the bus cable for ET-Connection	Front view of the sockets	
	X30 socket (ET-Connection1)	X31 socket (ET-Connection2)		X30	X31
1	RXP	RXP	yellow		
2	TXP	TXP	white		
3	TXN	TXN	blue		
4	RXN	RXN	orange		
Shield-ing	Functional earth FE		-		

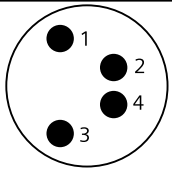


Table 1-989 Pin assignment for ET-Connection (I/O modules)

Pin	Assignment		Assignment of the core color of the bus cable for ET-Connection	Front view of the sockets	
	X30 socket (ET-Connection IN)	X31 socket (ET-Connection OUT)		X30	X31
1	TXP	RXP	yellow		
2	RXP	TXP	white		
3	RXN	TXN	blue		
4	TXN	RXN	orange		
Shield-ing	Functional earth FE		-		

Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment for infeed of the supply voltage.

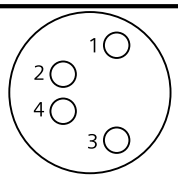

Table 1-990 Pin assignment of the supply voltage connector

Pin	Assignment **X80 connector (power input)**	Assignment of the core color of the power cable	Front view of the connector
1	Supply voltage 1L+ (non-switched)	brown	
2	Ground 2M (switched)	white	
3	Ground 1M (non-switched)	blue	
4	Load voltage 2L+ (switched)	black	

Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment for loop-through of the supply voltage.

Table 1-991 Pin assignment of the supply voltage socket

Pin	Assignment **X81 Socket (power output)**	Assignment of the core color of the power cable	Front view of the socket
1	Supply voltage 1L+ (non-switched)	brown	
2	Ground 2M (switched)	white	
3	Ground 1M (non-switched)	blue	
4	Load voltage 2L+ (switched)	black	

SIMATIC ET 200AL data

D

The EU Data Act, a key component of the European data strategy, entered into force on 11 January 2024.

The following information provides an overview of the data that is generated by the SIMATIC ET 200AL automation system and accessible to you.

D.1 Data of the interface and I/O modules

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and parameter data (upload to PG/PC)	Binary formats, string formats	Depending on application
Diagnostics data, service data	Binary formats	Depending on application Less than 100 bytes per diagnostic event; several kilobytes of service data
Fieldbus* metadata: I&M data, log data, statistics data	Binary formats, string formats	Approximately 100 bytes per read-out data record

* PROFIBUS, PROFINET, EtherNet/IP, Modbus TCP (only for interface modules as MultiFieldbus devices)

Continuous and real-time data generation

The interface and I/O modules are able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The cycle time is specified by the higher-level CPU.

Data storage and storage duration

Local data storage

The interface and I/O modules store data in integrated memory areas.

Local data storage	Storage capacity	Storage duration
Retentive memory (for I&M data, configuration and parameter data*, service data)	Up to 16 MB for interface modules 1 to 2 MB for I/O modules	Permanent
Work memory (for process data, diagnostics data, fieldbus metadata, configuration and parameter data, service data)	Up to 1 MB for interface modules Several 100 KB for I/O modules	During operation of the module

* only interface modules as MultiFieldbus devices and IO-Link masters

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Prioritization of control tasks over data access Standard fieldbus transmission mechanisms Data throughput rates up to 1 Gbps via PROFINET
Configuration and parameter data (upload to PG/PC)	TIA Portal (via CPU) S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms
Diagnostics data, service data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms
Fieldbus metadata: I&M data, log data, statistics data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the interface, power supply, and I/O modules to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from interface and I/O modules

Interface modules

To delete all data from the data memories of the interface module, the "Reset to factory settings" function is available.

The IM can be reset to factory settings using any of the following:

- TIA Portal
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

I/O modules

The data of an IO-Link master can be deleted using S7-PCT by executing the "Reset to factory settings" function.

For all other I/O modules, no delete function is available.

More information

You can find more information on deleting data in the "Securely removing data (Page 137)" and "Restoring the factory settings (Page 111)" sections.

SIEMENS
SIMATIC

Distributed I/O system ET 200AL

Compact Operating Instructions
Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity

- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14245/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14245/cert?ct=444&ci=5596).

Firmware
You will find the latest firmware versions (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/search?t=all&search=et%20200al&type=Download&lc=en-WW).

Documentation
The complete documentation consists of product information, the system manual, equipment and function manuals. You can find these in the Manual Collection (https://support.industry.siemens.com/cs/ww/en/view/95242965) on the Internet.

Retention of the documentation
Retain this documentation for later use.

1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Install products with degree of protection IP65/67 according to IEC 60529 weatherproof and stationary indoors.

⚠ WARNING

Safety functional extra low voltage
The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965) of the fail-safe I/O and in the data sheets of the power supplies to be used.
Use a power supply unit with output voltage that does not exceed 35 V DC even in the event of a fault.
Follow the notes and warnings in the respective manual.

Electromagnetic Compatibility
The I/O system is intended for operation in the EMC environment class Industry.
Ensure an EMC-compliant design of your automation system as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965) for the I/O system.

NOTICE
Interference emission / Interference immunity The operation of the I/O system can cause radio interference in residential areas. If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

Cleaning
When wired, the product complies with degree of protection IP65/IP67 and does not require any cleaning.
If you do have to clean the product, then use a dry or damp cloth. Take care to comply with the conditions of degree of protection IP65/IP67 when cleaning with liquids.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965).

Functional safety

⚠ WARNING
Danger to humans and the environment To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components. For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/95242965) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation.

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether the firmware version is approved for the respective fail-safe I/O.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

2 Use of radio devices and cell phones

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Preface

Purpose of the documentation

This manual supplements the *ET 200AL distributed I/O system system manual* (https://support.industry.siemens.com/cs/ww/en/view/89254965). Functions that are generally applicable to the ET 200AL distributed I/O system are described there.

The information provided in the present manual, the system manual and the function manuals enables you to commission the ET 200AL distributed I/O system.

⚠ WARNING

The *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* in the current version is the authoritative source for functional safety-related information concerning configuring and programming.

Siemens identifies the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* as the authoritative and/or original source in the case of discrepancies between the manuals.

All warnings in the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* have to be observed. You can find the current version of the manual on the Internet (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Conventions

Please observe notes marked as follows:

NOTE

Indicates important product information to which particular attention should be paid.

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are

available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

Documentation guide

1

The documentation for the SIMATIC ET 200AL distributed I/O system is arranged into three areas.

Basic information

The *System Manual* and *Getting Started* describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200AL distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200AL distributed I/O system, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742667).

Manual Collection ET 200AL

The Manual Collection contains the complete documentation on the SIMATIC ET 200AL distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/95242965).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/cs/ww/en/my).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://support.industry.siemens.com/cs/us/en/view/109767888).

Safety technology support

Siemens provides the following online comprehensive support for your use of safety technology:

- Safety Evaluation Tool - assists you in determining required safety levels
- Functional Examples - guides you in your safety applications
- Siemens training (SITRAIN) classes - offers training in safety standards and products
- SIMATIC STEP 7 Safety Advance F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times Excel file (RT_calculator) - assists you in calculating your maximum system response time

You can find the Safety Evaluation Tool on the Internet (http://www.siemens.com/safety-evaluation-tool).

You can find Functional Examples on the Internet (http://www.siemens.com/safety-functional-examples).

You can find SITRAIN classes on the Internet (http://www.siemens.com/sitrain-safetyintegrated).

You can find the RT_calculator on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100).

2.1 Properties

Article Number

6ES7146-5FF00-0BA0

View of the Module

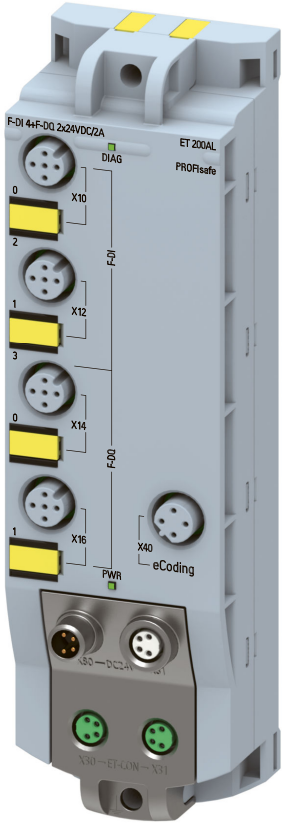

Figure 1-702 View of the F-DI 4+F-DQ 2x24VDC/2A, 4xM12 Fail-Safe I/O module

Properties

The module has the following technical properties:

- Four fail-safe digital inputs and two fail-safe digital outputs (M12 sockets for connection of sensors and actuators)
- One eCoding connection (M12 socket for eCoding plug)
- Two power ports, infeed and loop-through, which contain both logic and input power (1L+) and output power (2L+) (M8 module supply voltage ports)
- Two ET-Connection communication ports (M8 sockets)
- Fail-safe digital inputs:
  - 24 V DC rated
  - Two short-circuit proof sensor supplies
  - External sensor supply possible
  - Configurable diagnostics can be set for each channel
  - Configurable input delay
  - Suitable for switches and 3/4-wire proximity switches
- Fail-safe digital outputs:
  - Rated load voltage 24 V DC
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Output current per output 2.0 A
  - Configurable diagnostics can be set for each channel
- Dimensions 45 x 159 mm

The module supports the following functions:

- Firmware update
- Identification and maintenance data I&M0 to I&M3
- Value status (Quality Information)

The module has the following maximum achievable safety class in safety mode:

Maximum achievable safety class in safety mode	**1-channel input**	**2-channel input**	**Output channel**
Performance level according to EN ISO 13849-1	Cat. 3, PL d	Cat. 4, PL e	Cat. 4, PL e
SIL according to IEC 61508	SIL 2	SIL 3	SIL 3

Accessories

The following components are included in the module package:

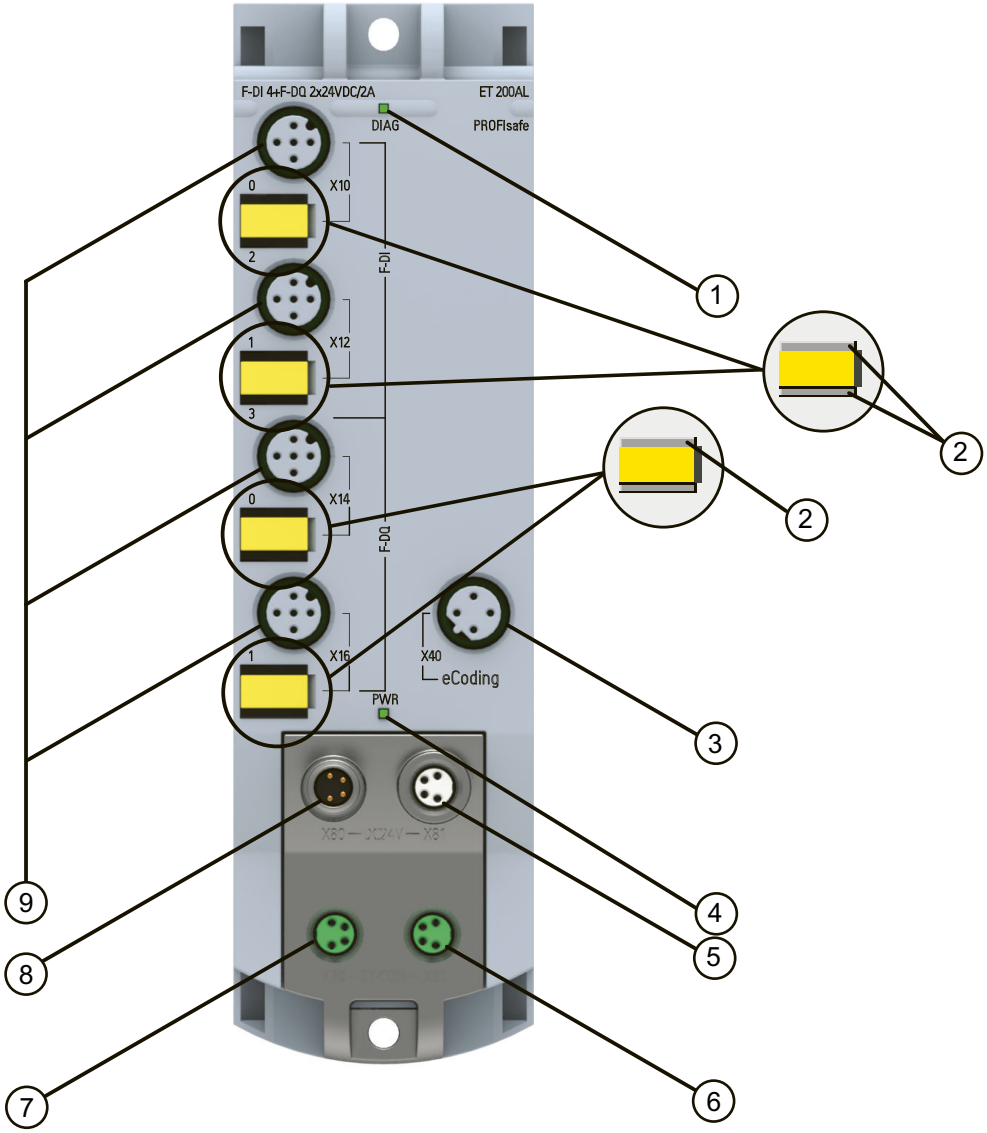
- Identification labels (Yellow)
- eCoding plug (Used to store the application's PROFIsafe addresses)

Other components

The following components can be ordered as a spare part:

- Identification labels (Yellow)
- eCoding plug

The following components can be ordered as accessories:



- Connectors
- Cables
- Stripping Tool for ET-Connection
- M8 sealing cap
- M12 sealing cap

See also

You can find more information on accessories in "Accessories/spare parts" in the *ET 200AL distributed I/O system system manual* (https://support.industry.siemens.com/cs/ww/en/view/89254965).

2.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the F-DI 4/F-DQ 2 Fail-Safe module:

① DIAG: LED display for the diagnostic status
② LED displays for the channel status
③ X40: eCoding plug connection
④ PWR: LED display for load voltage 2L+
⑤ X81: Socket for loop-through of the supply voltage (POWER output)
⑥ X31: Socket for ET-Connection OUT
⑦ X30: Socket for ET-Connection IN
⑧ X80: Connector for infeed of the supply voltage (POWER input)
⑨ X10 to X16: Sockets for the input/output signals

Figure 1-703 Operator controls and display elements

2.3 Fail-safe digital inputs

The digital inputs of the F-DI 4/F-DQ 2 Fail-Safe module are rated for connection to 24 V DC sensors/switches and 3/4-wire proximity switches (for example, BEROs: Siemens line of no-touch sensors) and have an EN 61131-2 type 1 input rating.

The fail-safe module has two 0.5 A sensor supply outputs that can power external sensors (inputs). All 1oo1 and 1oo2 application modes, except the "1oo2, 2 channel 3-wire nonequivalent" application mode, use the V_{S1} sensor supply to provide power for channels 0 and 1, and the V_{S2} sensor supply to provide power for channels 2 and 3. The "1oo2, 2 channel 3-wire nonequivalent" application mode uses the V_{S1} sensor supply to provide power for all four inputs and does not use the V_{S2} sensor supply.

Inputs and test circuit

The fail-safe digital inputs consist of four input channels (F-DI x.0 to x.3). You can configure these channels as four one-out-of-one (1oo1) inputs (SIL 2/Cat. 3/PL d), two one-out-of-two (1oo2) inputs (SIL 3/Cat. 3 or Cat. 4/PL e), or combinations of 1oo1 and 1oo2 inputs.

Connections	Input channel pairs
X10	0 and 2
X12	1 and 3

The fail-safe digital inputs use two microcontrollers to implement the safety function. One microcontroller monitors inputs 0 and 1, and the other microcontroller monitors inputs 2 and 3. The corresponding channels (0, 2) and (1, 3) form a 1oo2 channel group. The lower numbered channel of the group is called the primary input and the other channel is called the secondary input. The first of the two inputs in the channel group conveys the signal in a 1oo2 configuration. For example, if you wire F-DI 0.0 and F-DI 0.2 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal state is reported at only the F-DI 0.0 input when you close or open the circuit for both.

When you configure a channel group as 1oo2, the two microcontrollers must sense the same input change within a configured time. Otherwise, the two microcontrollers detect a discrepancy error.

You can enable short-circuit testing if you use a sensor supply output to provide power to a sensor. The short-circuit test checks for shorts to 24 V DC by periodically pulsing the sensor output off and verifying that the associated input is off.

This short-circuit test also checks for shorts to the other circuit in "1oo2, 2 channel equivalent" and "1oo2, 2 channel 4-wire nonequivalent" application modes because the test pulses the two sensor outputs off at different times.

The microcontrollers provide internal test pulses to each other's process input circuits to verify that sensing electronics are responsive to both "1" and "0" inputs.

See also

Accessories for the ET200AL distributed I/O system (https://support.industry.siemens.com/cs/us/en/view/89254965)

2.4 Fail-safe digital outputs

The digital outputs of the F-DI 4/F-DQ 2 Fail-Safe module are for use in fail-safe applications and are suitable for various actuators such as the following:

- Solenoid valves
- DC contactors
- Indicator lights

The two digital outputs each have P- and M-switches that are rated to connect 24 V DC actuators with up to a 2.0 A rating. The two digital outputs use the load voltage 2L+ with a maximum current of 4.0 A. This means that the total current usage by the two digital outputs cannot exceed 3.96 A because the 2L+ supply uses about 40 mA.

Outputs

The fail-safe digital outputs consist of two output channels (F-DQ x.0 to x.1). You can use each output for SIL 3 applications.

Connections	Output channel
X14	0
X16	1

Each output consists of two switches:

- A P-switch connects 24 V DC positive (L+) to the load.
- An M-switch connects the load to M or 24 V DC return.

Both switches must be ON for current to flow to the load.

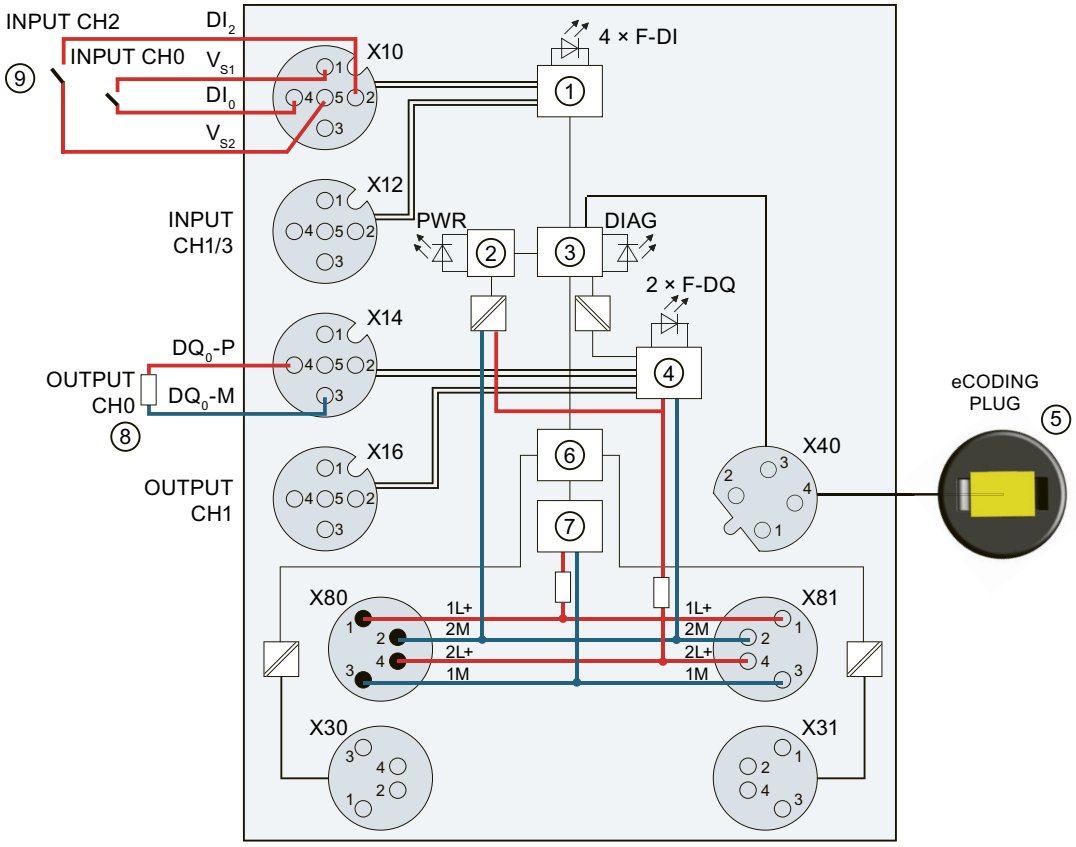
The fail-safe digital outputs use two microcontrollers to implement the safety function. One microcontroller controls the P-switch while the other microcontroller controls the M-switch. Status of the P-switch is fed back to the other microcontroller (the one that controls the M-switch). Likewise, status of the M-switch is fed back to the other microcontroller (the one that controls the P-switch). The microcontrollers use the feedback to verify that the output switches are operating properly and in the commanded state.

You must configure a "Maximum readback time" that specifies the allowed delay for the output voltage to respond to the switch change.

The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. Your configured "Maximum readback time" also sets the duration of the "OFF" test pulse. You must configure a "Maximum readback time switch on test" which sets the duration of the "ON" test pulse. Choose these durations short enough to not affect your load.

The module can detect a broken wire or missing load when the output PV is OFF. If the broken wire diagnostic is enabled, then the load must be wired in the PM configuration or a broken wire diagnostic will occur (see applications 1, 3 or 4 in section 5.2 Digital output applications (Page 48)).

Wiring



3

WARNING

You can come into contact with live electrical wires connected to the main power supply.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
Shut off the supply and load voltage before you wire the fail-safe module.

3.1 Terminal and block diagram

The following figure shows an example of the pin assignment of signal inputs with 4-wire connection as well as signal outputs:

①	F-DI circuit (1L+)	X40	eCoding socket
②	Diagnostic monitoring	X80	Infeed of supply voltages
③	Microcontrollers	X81	Loop-through of supply voltages
④	F-DQ circuit (2L+)	V_{Sn}	24 V sensor supplies
⑤	eCoding plug	1L+	Supply voltage 1L+

⑥	ET-Connection interface	1M	Ground 1M
⑦	Internal supply voltage	2L+	Load voltage 2L+
⑧	Outputs	2M	Ground 2M
⑨	Inputs: Configured as 1oo1 sensor using internal sensor supply	DI_n	Input signal
X10, X12	F-DI input channels	DQ_n-P	Output signal, P-switch
X14, X16	F-DQ output channels	DQ_n-M	Output signal, M-switch
X30	Infeed of the ET-Connection	DIAG	LED diagnostic status (red/green)
X31	Loop-through of the ET-Connection	PWR	LED load voltage 2L+ status (green)

Figure 1-704 Terminal and block diagram

3.2 Pin assignment

NOTE

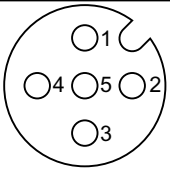
Color coding

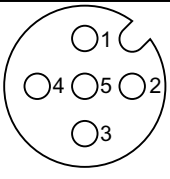
The sockets for ET-Connection and the power supply of the modules are color-coded. These colors correspond to the colors of the offered cables.

Pin assignment of the sockets for fail-safe digital inputs/outputs

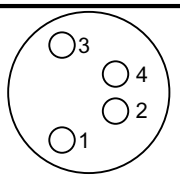
The tables below show the pin assignments of the four sockets for connection of the fail-safe digital inputs/outputs:

Table 1-992 Pin assignment for fail-safe digital input sockets





Pin	Assignment	Front view of the sockets
	X10 and X12 - sockets for fail-safe digital inputs	**X10, X12**
1	24 V DC sensor supply V_{S1}	
2	Input signal DI_2: Connector X10 Input signal DI_3: Connector X12	
3	Sensor supply ground 1M	
4	Input signal DI_0: Connector X10 Input signal DI_1: Connector X12	
5	24 V DC sensor supply V_{S2}	



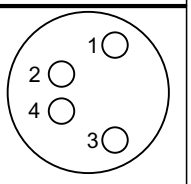


Table 1-993 Pin assignment for fail-safe digital output sockets

Pin	Assignment	Front view of the sockets
	X14 and X16 - sockets for fail-safe digital outputs	**X14, X16**
1	Unassigned	
2	Unassigned	
3	Output signal DQ_0-M: Connector X14 Output signal DQ_1-M: Connector X16	
4	Output signal DQ_0-P: Connector X14 Output signal DQ_1-P: Connector X16	
5	Functional earth FE	

Pin assignment of the sockets for ET-Connection

The table below shows the pin assignments of the two sockets for the connection of ET-Connection:

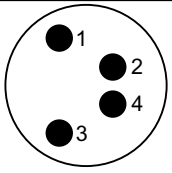

Table 1-994 Pin assignment for ET-Connection

Pin	Assignment		Assignment of the wire color of the bus cable for ET-Connection	Front view of the sockets	
	X30 socket (ET-Connection IN)	X31 socket (ET-Connection OUT)		X30	X31
1	TXP	RXP	Yellow		
2	RXP	TXP	White		
3	RXN	TXN	Blue		
4	TXN	RXN	Orange		
Shielding	Functional earth FE		-		

Pin assignment of the connector for infeed of the supply voltage

The table below shows the pin assignment of the connector for infeed of the supply voltage:

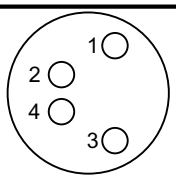

Table 1-995 Pin assignment of the supply voltage connector

Pin	Assignment	Assignment of the wire color of the power line cable	Front view of the connector
	X80 connector (POWER input)		
1	Supply voltage 1L+	Brown	
2	Ground 2M	White	
3	Ground 1M	Blue	
4	Load voltage 2L+	Black	

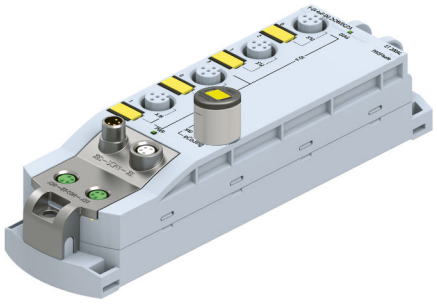
Pin assignment of the socket for loop-through of the supply voltage

The table below shows the pin assignment of the socket for loop-through of the supply voltage:

Table 1-996 Pin assignment of the supply voltage socket

Pin	Assignment X81 socket (POWER output)	Assignment of the wire color of the power line cable	Front view of the socket
1	Supply voltage 1L+	Brown	
2	Ground 2M	White	
3	Ground 1M	Blue	
4	Load voltage 2L+	Black	

NOTE



ET-Connection/supply voltage

Installing a supply voltage cable in an ET-connection socket or an ET-connection cable in the supply voltage loop-through socket can destroy the module.

Observe the correct wiring of the M8 sockets for ET-Connection and the supply voltage.

3.3 Connecting the M12 eCoding plug

The eCoding plug (6ES7194-6KB01-0AA0) stores the PROFIsafe addresses that you assign to the F-DI 4/F-DQ 2 Fail-Safe module:

eCoding Plug (side view)	F-DI 4/F-DQ 2 with eCoding Plug Attached (front view)	F-DI 4/F-DQ 2 with eCoding Plug Attached (side view)
		

The eCoding plug stores the following information:

- PROFIsafe source address
- PROFIsafe destination address
- Address validity information

The eCoding plug occupies the X40 M12 socket, utilizing a B-coded plug. You use the eCoding plug to facilitate module replacement.

The eCoding plug stores assigned PROFIsafe source and destination addresses. The "Assign PROFIsafe address option" is selected in STEP 7 during the F-DI 4/F-DQ 2 Fail-Safe module set-up. The module checks the PROFIsafe addresses stored in the eCoding plug against the PROFIsafe reference addresses provided to the module during start-up parameterization.

Protection mechanisms prevent you from damaging the eCoding plug or an I/O channel due to attempted plugging of the eCoding plug into an I/O M12 socket or plugging of an I/O M12 cable into the X40 socket.

Install the eCoding plug into the M12 socket at X40 with a torque of 1 Nm. Do not overtighten the eCoding plug as it could damage the threading.

⚠ WARNING

If you remove/insert the eCoding plug with the power connected, this can lead to undefined states in your system.

Death or serious personal injury and damage to the fail-safe module and associated machines/equipment may result if proper precautions are not taken.

Only remove or replace the eCoding plug when the power is disconnected. Always comply with the required standards and safety guidelines when configuring a system.

NOTE

When replacing the F-DI 4/F-DQ 2 Fail-Safe module, transfer the eCoding plug of the failed module to the replacement module to retain the PROFIsafe addresses stored in the eCoding plug. Otherwise, use STEP 7 to configure the PROFIsafe address in the replacement module. Ensure that the eCoding plug is not accidentally inserted in a module other than the intended F-DI 4/F-DQ 2 Fail-Safe module.

4 Parameters/address space

All connected fail-safe I/O must have their operating properties configured by the STEP 7 Safety configuration software. You have the responsibility to ensure that no unconfigured modules are connected in a fail-safe automation system.

F-Parameters

You must assign the PROFIsafe addresses (F-destination address together with F-source address) to the F-module before you put it into operation as follows:

- You define the F-source address using the "Central F-source addresses" parameter in the F-CPU.
- An F-destination address unique throughout the project's hardware configuration is automatically assigned for each F-module. You can manually change the F-destination addresses assigned in the hardware configuration.

You can find further information on F-parameters such as the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address), F-parameter signature (with or without addresses) and the F-I/O DB in the *SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* on the Internet (https://support.industry.siemens.com/cs/ww/en/view/54110126).

4.1 Configuring module I/O properties

To configure fail-safe module I/O properties, follow these steps:

1. Select the image of a fail-safe I/O device (on the Device view or Device overview) and view the module's "Properties" tab.
2. On the "Properties" view, select the "General" tab.
3. Select a property category in the left-side property tree and then set values in the right-side property fields.
4. A successful compile and download of your hardware configuration to one of the following CPUs automatically puts your new configuration settings in the I/O modules:
   - ET 200pro F
   - ET 200SP F
   - S7-1200 F
   - S7-1500 F
   - Prior generation S7-300 F and S7-400 F

4.2 Parameters

The following table shows the parameters for the F-DI 4/F-DQ 2 Fail-Safe module:

Channel	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters				
Manual assignment of F-monitoring time	• disable • enable	disable	no	Module
F-monitoring time	1 to 65535 ms	150 ms	no	Module
F-source address	1 to 65534	1 (always disabled)	no	Module
F-destination address	1 to 65534	65534 (always enabled)	no	Module
F-parameter signature (with addresses)	0 to 65535	always disabled	no	Module
F-parameter signature (without addresses)	0 to 65535	always disabled	no	Module
Behavior after channel fault	• Passivate channel • Passivate entire module	Passivate channel (always enabled)	no	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	All channels manually (always enabled)	no	Module
F-I/O DB manual number assignment	• disable • enable	disable	no	Module
F-I/O DB number	• Fixed value, if DB manual number assignment is disabled • Value can be edited by user, if DB manual number assignment is enabled	Fixed value	no	Module
F-I/O DB name	-	always disabled	no	Module
DI parameters				
Sensor supply				
Short-circuit test	• disable • enable	enable	no	Channel
Interval for short-circuit test	• 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms	25.6 ms	no	Channel
Duration of short-circuit test	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms	1.6 ms	no	Channel

Channel	Value range	Default	Parameter reassignment in RUN	Scope
Channel n, n+2				
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation: – 2 channel equivalent – 2 channel - 3 wire non-equivalent – 2 channel - 4 wire non-equivalent	1oo2 evaluation, 2 channel equivalent	no	Channel
Discrepancy behavior	• Supply value 0 • Supply last valid value	Supply value 0	no	Channel
Discrepancy time	5 ms to 30 s	5 ms	no	Channel
Reintegration after discrepancy error	• Test 0-Signal not necessary • Test 0-Signal necessary	Test 0-Signal not necessary	no	Channel
Channel n				
Activated	• disable • enable	enable	no	Channel
Input filters	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms	6.4 ms	no	Channel
Channel failure acknowledge	• Automatic • Manual	Manual	no	Channel
Sensor supply	• Internal • External	Internal	no	Channel
DQ parameters				
Maximum test period	• 100 s • 1000 s	1000 s	no	Channel
Channel n				
Wire break	• disable • enable	disable	no	Channel
Activated	• disable • enable	enable	no	Channel
Channel failure acknowledge	• Automatic • Manual	Manual	no	Channel
Maximum readback time	1.0 ms to 400.0 ms	2.0 ms	no	Channel
Maximum readback time switch on test	0.5 ms to 5.0 ms	1.0 ms	no	Channel
Disable dark test (max. SIL 2, Cat. 3, PL d)	• dark test is disabled • dark test is enabled	dark test is enabled	no	Channel

4.3 Explanation of parameters

4.3.1 F-parameters

Information on F-parameters is available in the *SIMATIC Safety – Configuring and Programming* manual (https://support.industry.siemens.com/cs/us/en/view/54110126).

Behavior after channel fault

Use this parameter to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use in S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7- 300/400 F-CPUs. You make the required setting in the F-I/O DB of the fail-safe module.

Use in ET 200pro, ET 200SP and S7-1200/1500 F-CPUs
When using the fail-safe module in ET 200pro, ET 200SP and S7-1200/1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.3.2 DI parameters

Short-circuit test

You can enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with a power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit test switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Duration of short-circuit test".

If a short-circuit is detected, the fault is reported to the F-CPU and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input to another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, nonequivalent) which also detects the cross circuits using discrepancy.

During the execution time (duration of short-circuit test + startup time of sensor after the short-circuit test) of the short-circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

Discrepancy time variation with short-circuit test
If your process input changes near when a short-circuit test is in progress, a discrepancy is detected in less time than your configured discrepancy time.

Elements of discrepancy time variations are defined as follows:

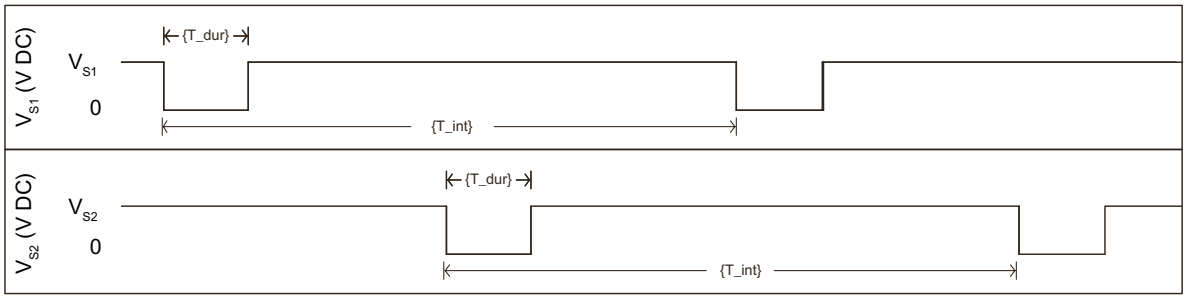
- **Tdisc** = configured discrepancy time
- **Tsct** = configured short circuit test duration
- **Tfilter** = configured input filter time
- **Tda** = actual discrepancy time, time between process signal changes that can be detected as a fault

The range of detected discrepancy time is as follows:

- **If Tfilter < Tsct**: {Tdisc - (Tfilter + Tsct)} <= Tda <= Tdisc
- **If Tfilter >= Tsct**: {Tdisc - (2 x Tsct)} <= Tda <= Tdisc

Your configured discrepancy time should account for this variation to avoid unexpected passivations.

Interval for short-circuit test



You can specify how often the short-circuit test is executed (Interval) when the "Short-circuit test" check box is selected. The interval defines the period of time between two consecutive sensor supply OFF test pulses.

This value is the time between the OFF pulses of the sensor supply.

NOTE

The interval between pulses must be a minimum of eight times the duration of a pulse.

Short-circuit testing is performed on V_{S1} and V_{S2} independently, allowing module circuitry to detect shorts between the two sensor supplies as follows:

V_{Sn} V_{S1} or V_{S2} sensor supplies (V DC)
T_int Short-circuit test interval (time period) between the OFF pulses of the sensor supply (ms)
T_dur Short-circuit test OFF pulse time duration (ms)

Duration of short-circuit test

You can specify the duration of the test pulse applied to the sensor supply when the "Short-circuit test" check box is selected.

This value is the time that the power supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs.

Sensor evaluation

You can assign whether “channel n” input operates individually (1oo1) or is paired with its companion channel "n+2" input (1oo2).

Defines signal evaluation and wiring definitions. These selections correspond with the various application mode wiring examples.

1oo1 evaluation: One sensor is connected to the module on a single channel.

1oo2 evaluation: Two input channels are occupied by either:

- **2 channel equivalent** (with equivalent signals): One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair.
- **2 channel - 3 wire nonequivalent**: One two-channel nonequivalent sensor is connected to the two channels, in a channel pair.
- **2 channel - 4 wire nonequivalent** One two-channel nonequivalent sensor or two single-channel nonequivalent sensors are connected to the two channels, in a channel pair.

If 1oo2 is selected, you must assign the discrepancy properties.

Refer to "Digital input applications (Page 35)" for illustrations of connection modes.

When you select the channel group as 1oo2, STEP 7 (TIA Portal) enables the parameters in the first channel of the group and completely disables the parameters in the second channel of the group. The second channel derives its parameter values from the first channel's parameter values. When you select the channel group as 1oo1, STEP 7 (TIA Portal) enables all of the parameters in both channels.

NOTE

Safety program access to 1oo2 input data
For 1oo2 evaluation, two paired input channels (for example, F-DI 0 and F-DI 2) are connected to one or two sensors. The F-DI performs the discrepancy analysis and sends the result to the safety program, at the input address of the low-numbered channel of the pair (F-DI 0, in the example).

Discrepancy behavior

A 1oo2 input configuration allows a logical difference between the two signals, without error, for the configured discrepancy time. You assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

NOTE

Sensor-actuator response time is increased when you add more input discrepancy time
The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0" but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0' and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides reliable normal operation. Refer to "Response times (Page 76)" for further information.

Discrepancy time

The two signals in a 1oo2 input configuration will not change exactly at the same time, due to differences in sensors, contacts, and wiring. You can configure a maximum expected duration for a mismatch between signals during transition.

Reintegration after discrepancy error

You can assign whether a zero state must be detected on both 1oo2 inputs before a previously declared discrepancy can be cleared.

"Test 0-signal necessary"
If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels for a duration of at least 100 ms.

If you are using nonequivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, nonequivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"
If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists between the two relevant input channels.

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel. Whenever you disable all output channels, you do not have to power 2L+ and 2L+ undervoltage reporting is suspended.

Input filters

The module filters the digital inputs to remove contact bounce and short duration noise. This parameter assigns the duration of the filter time.

Channel failure acknowledge

Controls whether the channel is automatically reintegrated after a fault clears or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults (Page 57)" for the reintegration procedure.

NOTE

The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can determine your ability to modify the "Channel failure acknowledge" parameter's selection.

Sensor supply

You can assign whether to supply 24 V DC power to sensors from the module's integrated sensor supply (internal) or from an external power supply (external).

Short-circuit tests are not performed for any channel where external power is selected.

4.3.3 DQ parameters

Maximum test period

You can assign the time interval between bit pattern tests for F-DQ DC output faults to a value of either 100 seconds or 1000 seconds.

Functional bit pattern tests are applied to the output switches. These tests detect faulted P- or M- output switches and wiring faults. Short circuits to other signals or power rails can be detected. Open circuits between the wiring terminals and the load are not detected.

If an error is detected on a channel, the test interval is shortened to 60 seconds. If an error is no longer detected on any output channel, the configured test interval is used again.

A persistent fault is reported to the fail-safe CPU and the affected channels are passivated.

Wire break

You can enable or disable wire break testing. Wire break is only detected when the channel is in the OFF state (process value is "0").

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

NOTE

Whenever you disable all output channels, you do not have to power 2L+ and 2L+ undervoltage reporting is suspended.

Channel failure acknowledge

Controls whether the channel is automatically reintegrated after a fault clears or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults (Page 57)" for the reintegration procedure.

NOTE

The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can determine your ability to modify the "Channel failure acknowledge" parameter's selection.

Maximum readback time

The maximum readback time is a user-configured parameter that assigns the maximum time allowed for an output to reach the new state (ON or OFF) due to a process value change without generating an error. Also, this is the maximum width of a diagnostic test pulse applied during the bit pattern test to verify that an output can be turned OFF while it is in the ON state. The time of the OFF pulse should be as long as possible, but short enough so that the actuator cannot react.

The "Maximum readback time" parameter allows you to set the maximum time for verification that the channel's output switch states are as expected after a process value change.

If the expected output switch states (as reported by P-readback and M-readback signals) are not reached upon expiration of the "Maximum readback time", the output channel is passivated.

No new process values are switched to the output channels while a test pattern is applied to the outputs. This means that a higher "Maximum readback time" increases the response time of the F-module.

⚠ WARNING

Short-circuit (cross-circuit) detection may not be possible for high frequency signals
Through the configured "Maximum readback time", short-circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured "Maximum readback time") Hz cannot be detected (50:50 sampling ratio).
You must take this into consideration for your application and respective requirements of your product standards.
Short-circuits (cross-circuits) to an output of the same module are recognized regardless of the frequency of the output channel.
You can adjust the maximum readback time to change the frequency of the signal that can be detected.

The parameter also effects the short-circuit detection (cross-circuit) with a "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting the parameter "Maximum readback time"

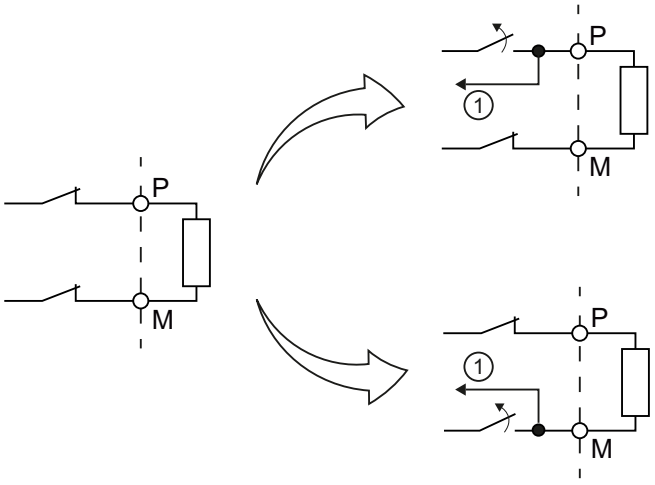
Because the fault response time is extended by the configured maximum readback time, we recommend that you set the "Maximum readback time" as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in "Connecting capacitive loads (Page 79)".

If the capacitance of the actuator is not known, it may be necessary for you to determine the value for the "Maximum readback time" by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the "Maximum readback time" so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification, use the process value "0" with a minimum duration that corresponds to the "maximum test period" parameter. Execute a process value change from "1" to "0".
- If the output channel is passivated, the "Maximum readback time" is too small for the connected capacitive load. The discharge cannot take place within the configured "Maximum readback time". Increase the "Maximum readback time".



If you have set the "Maximum readback time" to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacitance is outside the permitted range.

Dark test

Dark tests are switch-off tests which occur during an output bit-pattern test sequence.

When dark test is disabled on an output channel, the parameter "Maximum readback time" is only relevant for the process value change.

For a dark test, one of the output channel's switches is briefly turned OFF while the output channel is active (output signal "1"). As a result, current flow through the output is interrupted for a short time. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1-705 Functional principle of the dark test (PM switching)

Test pulses of the dark test

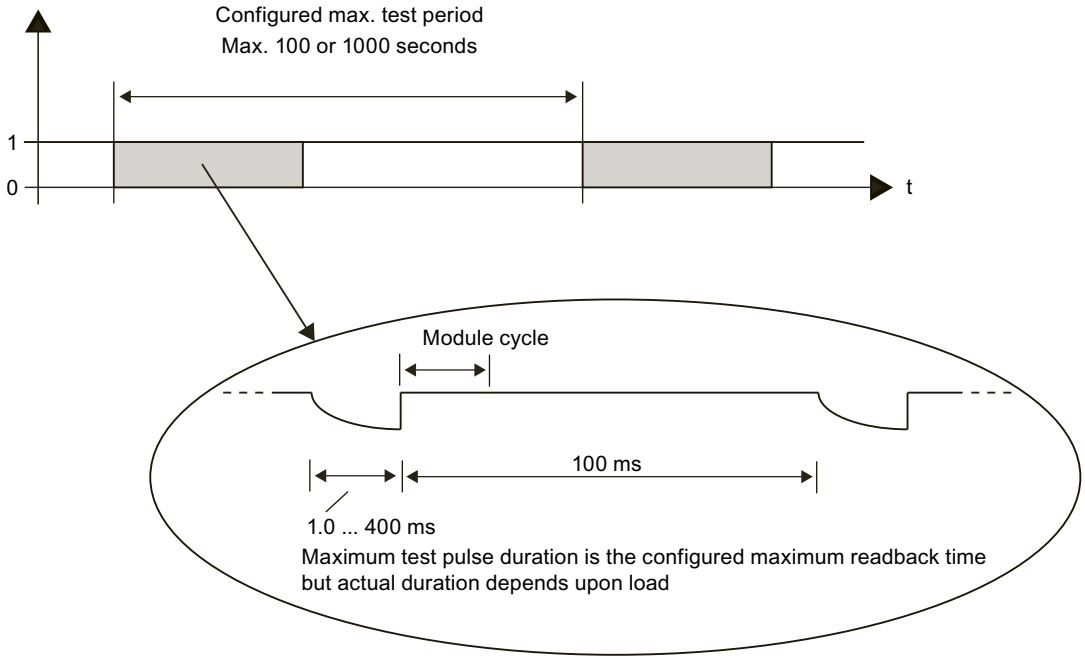


Figure 1-706 Test pulses of the dark test

You configure the time between output bit pattern test sequences to either 100 or 1000 seconds. Each output bit pattern test sequence includes multiple test pulses. The interval between two test pulses is at least 100 ms.

Maximum readback time switch on test

You can configure the maximum readback time switch on test parameter to assign the maximum time for which the P-switch or the M-switch of a channel that is currently in OFF state can be switched ON during a bit pattern test step. This action tests the P- and M-switches on a channel such that only one switch is turned on at a time. Unless there is a fault in the system (for example, actuator shorted to ground), the actuator is not energized during either the P- or M-switch on tests. Under single fault conditions (either internal or external to the module), test pulses applied to either the P- or the M-switch of channels in the OFF state can repeatedly energize the actuator. You must select the parameter so that the duration of such pulses is too short to cause the actuator to react and, therefore, cannot have a hazardous effect on the equipment under control.

Disable dark test (max. SIL 2, Cat. 3, PL d)

You can select the check box to disable channel dark testing.

To prevent an unwanted reaction of the actuator to a dark test, you can disable the dark test at the F-module output. An unwanted reaction can be for example, the brief de-energizing of a magnetic drive.

A capacitive load that does not meet the load curve (see "Switching of loads (Page 79)") can result in a passivation of the output in case of a process value change or switch-on test, even if the dark test is disabled.

You can only reach up to SIL 2/Cat. 3/PL d with the dark test disabled.

⚠ WARNING

Loss of SIL 2/Cat. 3/PL d rating, loss of output control due to potential undetected faults
With the dark test disabled, an output that is turned on for more than 1 year may not be able to be turned off.
SIL 2/Cat. 3/PL d requires that there is a signal change from "1" to "0" at the corresponding output at least once a year.
Ensure the "0" signal has a duration of at least 2 seconds. It is not enough to simply turn off the supply or load voltage of the F-module and turn it on again.

⚠ WARNING

Loss of cross-circuit detection between channels
When you use the function "Disable dark test", cross-circuits between channels with "1" signal are not detected.
You must take this into consideration for your application and respective requirements of your product standards.
You must also take into consideration the respective requirements of your product standards regarding error detection time.

4.4 Address space

NOTE

The F-DI 4/F-DQ 2 Fail-Safe module uses more I and Q memory than required for the physical number of inputs and outputs on the module. The extra bytes carry the PROFIsafe safety status and data integrity information. The number of input (I) bytes and output (Q) bytes that the F-DI 4/F-DQ 2 Fail-Safe module requires depends upon which PROFIsafe profile your fail-safe CPU uses.

Module	PROFIsafe profile	Input (I) bytes required	Output (Q) bytes required
F-DI 4+F-DQ 2x24VDC/2A, 4xM12	V2.4 (with S7-300/S7-400)	7	5
	V2.6 (with ET 200pro, ET 200SP and S7-1200/1500)	8	6

The figure below shows the assignment of the address space for the F-DI 4/F-DQ 2 Fail-Safe module with value status (Quality Information (QI)).

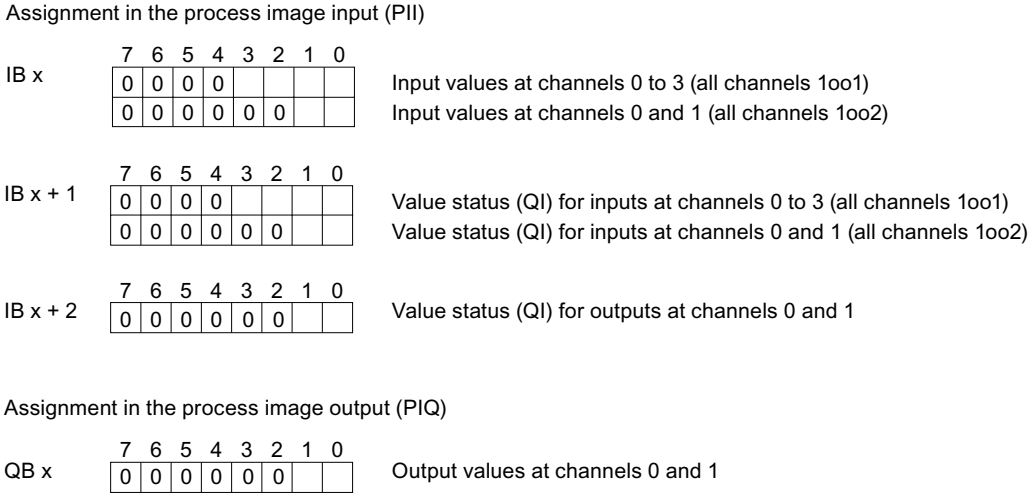

Figure 1-707 Address space

Evaluating the value status

The value status bits provide information regarding the validity of the digital values or channel status:

- Bit = 1: Corresponding process value is valid
- Bit = 0: Channel is passivated

Applications of the F-I/O module

5

The PLC system has an extremely low failure rate and therefore contributes only a small part of the total probability of dangerous failure of an automated system. The probability of dangerous failures of the sensors and actuators is typically far larger than the probability of dangerous failure per hour (PFH)/probability of dangerous failure on demand (PFD) of the PLC system. Estimates for quantitative safety properties like PFD and PFH are calculated using the following methods:

- standard data tables
- calculation methods according to international standards which include the following standards:
  - IEC 61508
  - ISO 13849
  - IEC 61131-6

The values are based on the following assumptions:

- continuous full nominal load
- nominal voltage
- equipment ambient temperature of 55 °C

Faults in the wiring system can also be a substantial contributor to failures.

To achieve a targeted level of safety performance for each safety function, perform these actions:

- Choose an appropriate architecture.
- Choose sensors and actuators that are appropriately rated.
- Provide a safety program that meets the requirements of the safety function.
- Provide diagnostics and proof-tests to maintain the ratings of the sensors and actuators.
- Use wiring installation practices, diagnostics, and proof-tests to assure wiring integrity.
- Generate and control operating and maintenance procedures for the lifetime of the installation.

The ET 200AL, ET 200pro, ET 200SP, and S7-1200/1500 Fail-Safe systems provide a high level of internal diagnostic coverage. Diagnostic coverage of your external circuits, sensors, and actuators depends on your design choices using features of the PLC system and other measures.

The PFH/PFD of each fail-safe PLC component is stated assuming there is no field proof-test within the lifetime of the product. Sensors and actuators typically require regular proof-tests to maintain an expected level of safety performance.

The reaction time of each safety function depends on the reaction time of each component, including the sensor, the PLC system, and the actuator. "Maximum response time (Page 76)" gives further information on delay times through the PLC components. You must choose PLC parameters and external component reaction times to achieve a total safety reaction time goal.

In addition to the total delay from the safety demand input to the safe actuator response, you must consider these additional time-related factors. Refer to "Maximum response time (Page 76)" for exact information:

- To be assured of a safety response, a safety demand signal from the input sensor lasts long enough to be seen by the safety program. Your configured filter time, discrepancy resolution time, and short-circuit test duration all contribute to determining the required signal duration.
- The F-DI 4/F-DQ 2 Fail-Safe module digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. The OFF test pulse duration can be as long as your configured "Maximum readback time". The ON test pulse duration can be as long as your configured "Maximum readback time switch on test". For a given output, the ON test pulse is only provided to one of the P- or M-switches at a time, but in the presence of single fault this could apply energy to your load. Your actuator should not respond to an OFF signal up to the "Maximum readback time" duration, or to an ON signal up to the "Maximum readback time switch on test" duration.
- The F-DI 4/F-DQ 2 Fail-Safe module digital outputs expect to complete and confirm any commanded transition from the ON to OFF output state. After your program changes the process output value from "1" to "0", do not change the "0" back to a "1" until the output's configured "Maximum readback time" has elapsed. The affected output passivates on commanded "0" states that are too short to confirm.

⚠ WARNING

The safety performance of your installation depends on your design and continued maintenance of each complete safety function.
The ET 200pro, ET 200SP and S7-1200/1500 Fail-Safe CPUs and F-DI 4/F-DQ 2 Fail-Safe module provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions.
Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.
You must choose all components of your installation and complete your design and maintenance according to accepted safety standards and practices to achieve your required level of safety.

5.1 Digital input applications

You should consider the application modes presented here along with the features of the F-DI 4/F-DQ 2 Fail-Safe module as described in the overview. Refer to "Fail-safe digital inputs (Page 13)".

The main features of the F-DI 4/F-DQ 2 Fail-Safe module digital inputs include the following items:

- Inputs are 24 V DC rated inputs that meet the requirements of IEC 61131-2 as Type 1 inputs.
- Configure each channel as 1oo1 or part of a 1oo2 channel group. The corresponding channels (x.0, x.2) and (x.1, x.3) form a 1oo2 channel group. The lower numbered channel of the group is called the primary input and the other channel is called the secondary input. Within this restriction, you can assign 1oo1 and 1oo2 in any order.

- Short-circuit testing requires use of the internal sensor supply. For all evaluation and sensor interconnections except for 1oo2, 2 channel - 3 wire nonequivalent, use V_{S1} with inputs x.0 to x.1 and V_{S2} with inputs x.2 to x.3. For evaluation and sensor interconnection for 1oo2, 2 channel - 3 wire nonequivalent, use V_{S1} with inputs x.0 to x.3, and do not use V_{S2}.
- If you enable the short-circuit test, you configure both V_{S1} and V_{S2} with the same parameters. All channels that you configure for internal sensor supply are subject to the same short-circuit test. You configure a test duration (length of dark time) and test interval (time between the start of the dark tests).
- The module performs these short-circuit functions for F-DI channels:
  - Monitors the sensor supply to detect short-circuit or overload.
  - Cycles the sensor supply once on each power up to assure control and readback are working. This ensures operational integrity of the sensor supply at power up even when disabled.
  - Monitors the readback during input short-circuit tests.
- Configure a discrepancy time to identify unacceptable differences between 1oo2 inputs.
- Configure a filter time for each channel or each 1oo2 pair.

You can achieve Cat. 3 in 1oo1 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof-testing of conductors:

- Each F-DI input includes sufficient diagnostics and redundant components such that no single internal fault can cause a dangerous failure.
- An appropriately-rated, single sensor can reach Cat. 3 by internal fault tolerance.
- The external wiring of a single sensor to a single input is vulnerable to single fault dangerous failures unless you apply additional measures.

You can achieve Cat. 4 in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof-testing of conductors:

- With 1oo2 evaluation, a pair of F-DI inputs is not subject to dangerous internal failure within a reasonable number of accumulated internal faults.
- Appropriately-rated, external-paired sensors or equivalent redundancy can achieve Cat. 4.
- The duplicated external wiring of two sensors to two input points is vulnerable to accumulated fault dangerous failure unless you apply additional measures.

The fail-safe digital inputs are certified for SIL 3/PL e only when you select 1oo2 evaluation.

Input architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

The following are the minimum conditions which must be met for achieving the corresponding safety requirements:

Table 1-997 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Sensor supply [1]	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
1	Internal	1oo1 evaluation	Single input	1 channel	2/3/d	
2	External					
3	Internal	1oo2 evaluation	Two inputs	2 channel equivalent	3/3/e	3/4/e
4	External				3/3/e	
5	Internal			2 channel - 3 wire nonequivalent	3/3/e	3/4/e
6	External				3/3/e	
7	Internal			2 channel - 4 wire nonequivalent	3/3/e	3/4/e
8	External				3/3/e	

[1] The F-DI 4/F-DQ 2 Fail-Safe module uses M12 I/Oconnections and is intended for use outside a cabinet in IP67 applications (everything sealed). If you require the use of an external supply, cut the M12 cable and make the connection inside a sealed cabinet or inside a sealed sensor. For external supplies, do not connect the pin 1 wire (V_{S1}) or the pin 5 wire (V_{S2}) in the M12 cable. This action prevents the sensor supply (which may be ON due to a different channel being configured as internal) from being shorted to the external 24 V DC. In addition, make the external 24 V DC connection inside a sealed cabinet or inside a sealed sensor.

Refer to "Pin assignment" (Page 16) for further information on connector pin assignments.

5.1.1 Applications 1 and 2: 1oo1 evaluation of single-channel sensors

F-DI application mode 1

This application mode uses single-channel sensors with a 1oo1 evaluation as shown in the following illustrations. When you use an internal sensor supply, you can successfully perform short-circuit detection.

NOTE

To incorporate F-DI application mode 1 into a SIL 2-rated application, ensure the sensors are appropriately qualified devices.

Figure 1-708 F-DI application mode 1: Internal sensor supply (1oo1 evaluation of a single-channel sensor shown)

Use Y cable (6ES7194-6KB00-0XA0) for F-DI application mode 1 to connect two single-channel sensors in 1oo1 evaluation as follows:

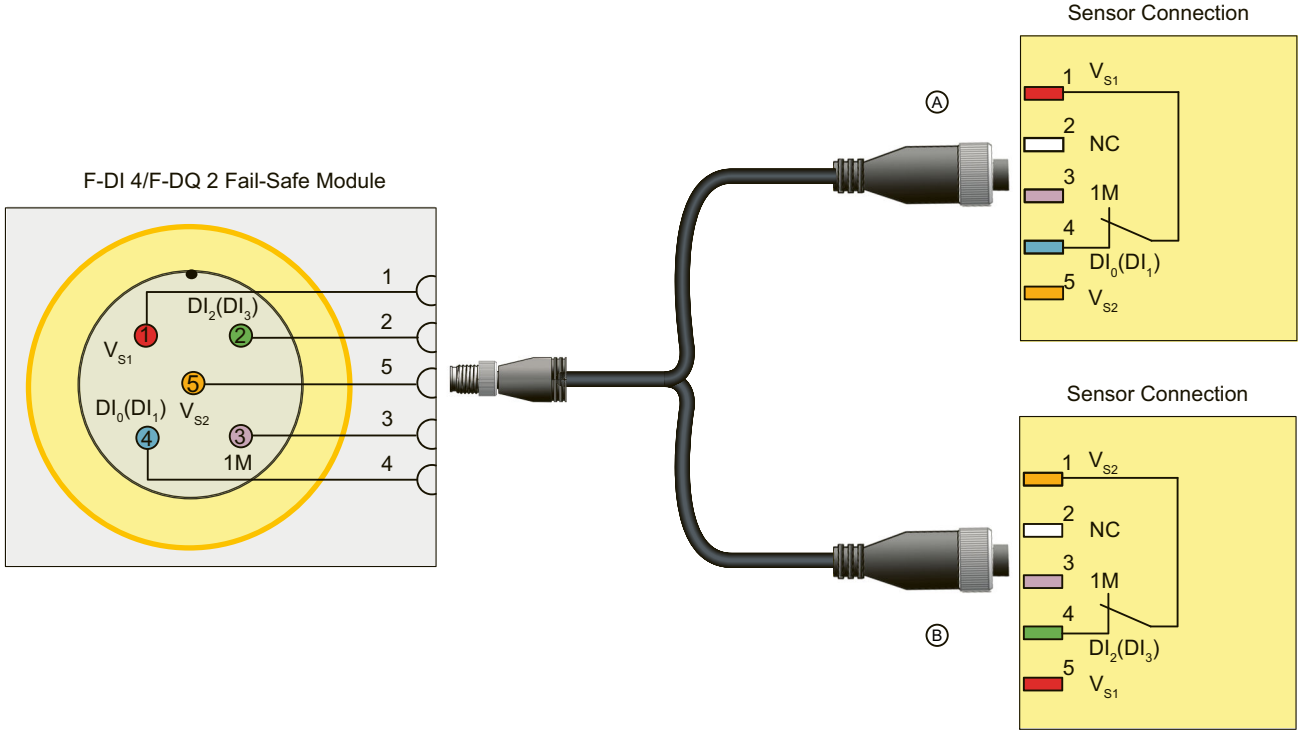

Figure 1-709 F-DI application mode 1: Internal sensor supply (1oo1 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 2

This application mode uses single-channel sensors with a 1oo1 evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing.

NOTE

To incorporate F-DI application mode 2 into a SIL 2-rated application, ensure the sensors are appropriately qualified devices.

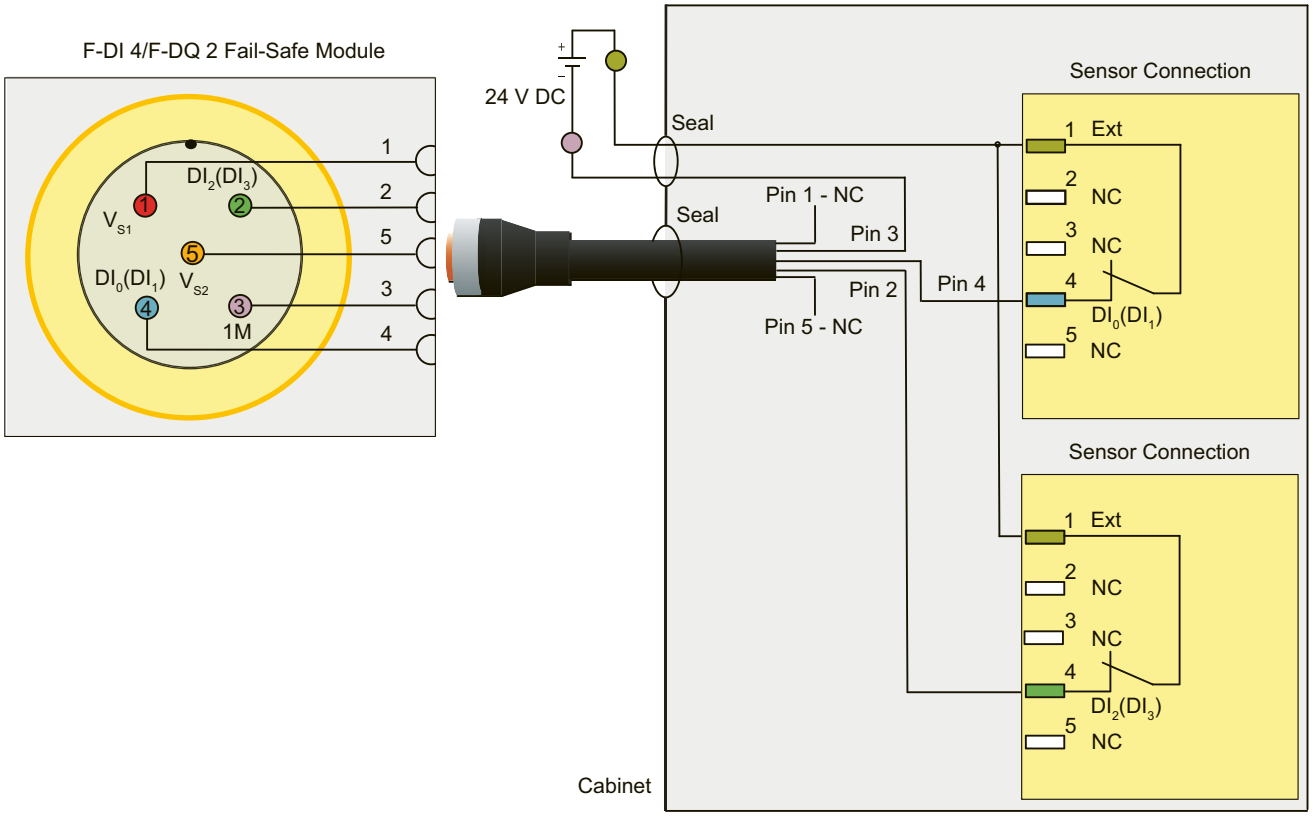

Figure 1-710 F-DI application mode 2: External sensor supply (1oo1 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	External

5.1.2 Applications 3 and 4: 1oo2 evaluation of equivalent sensors

F-DI application mode 3

This application mode uses a two-channel sensor or two single-channel sensors in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection.

NOTE

To incorporate F-DI application mode 3 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

Figure 1-711 F-DI application mode 3: Internal sensor supply (1oo2 evaluation of two-channel sensor shown)

Use Y cable (6ES7194-6KB00-0XA0) for F-DI application mode 3 as follows:

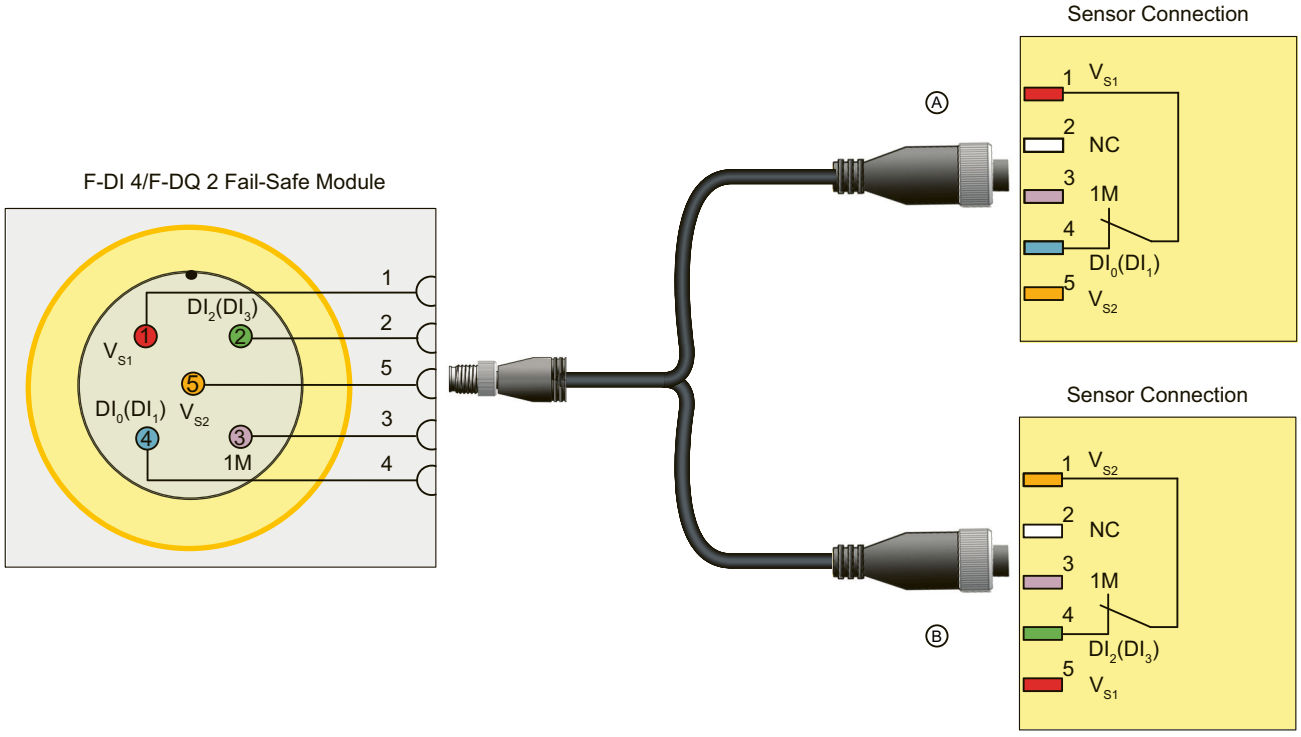

Figure 1-712 F-DI application mode 3: Internal sensor supply (1oo2 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel equivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 4

This application mode uses a two-channel sensor or two single-channel sensors in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing.

NOTE

To incorporate F-DI application mode 4 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

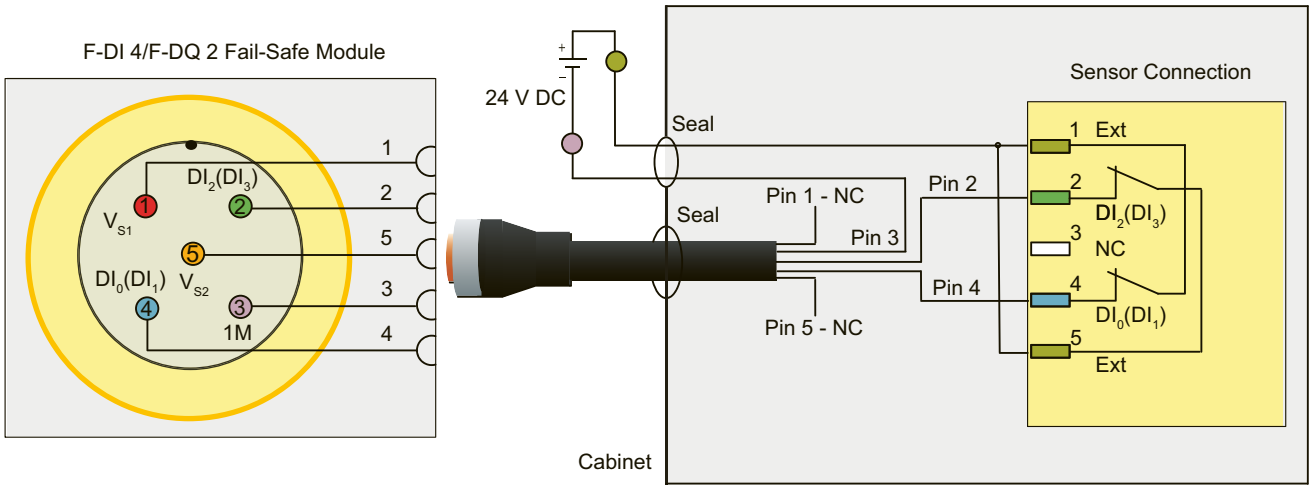

Figure 1-713 F-DI application mode 4: External sensor supply (1oo2 evaluation of two-channel sensor shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel equivalent
Sensor supply	External

5.1.3 Applications 5 and 6: 1oo2 evaluation of a 3-wire, nonequivalent sensor circuit

F-DI application mode 5

This application mode uses a two-channel sensor or two single-channel sensors with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection. The application mode uses the following pins:

- Pin 2 (channels 2 and 3) is the inverted input of the nonequivalent configuration
- Pin 4 (channels 0 and 1) is the non-inverted input of the nonequivalent configuration

NOTE

To incorporate F-DI application mode 5 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

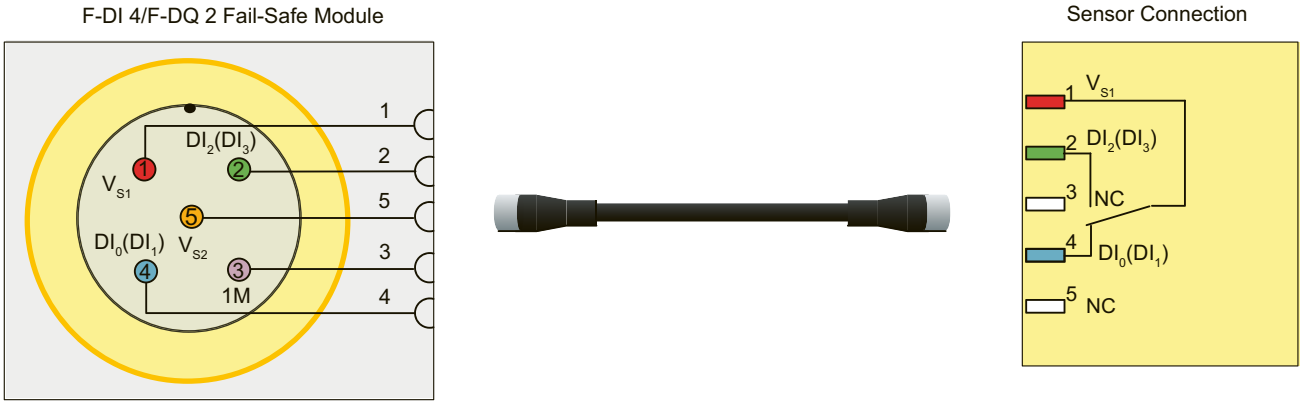

Figure 1-714 F-DI application mode 5: Internal sensor supply (1oo2 evaluation of two-channel sensor with nonequivalent outputs shown)

Use Y cable (6ES7194-6KA00-0XA0) for application mode 5 as follows:

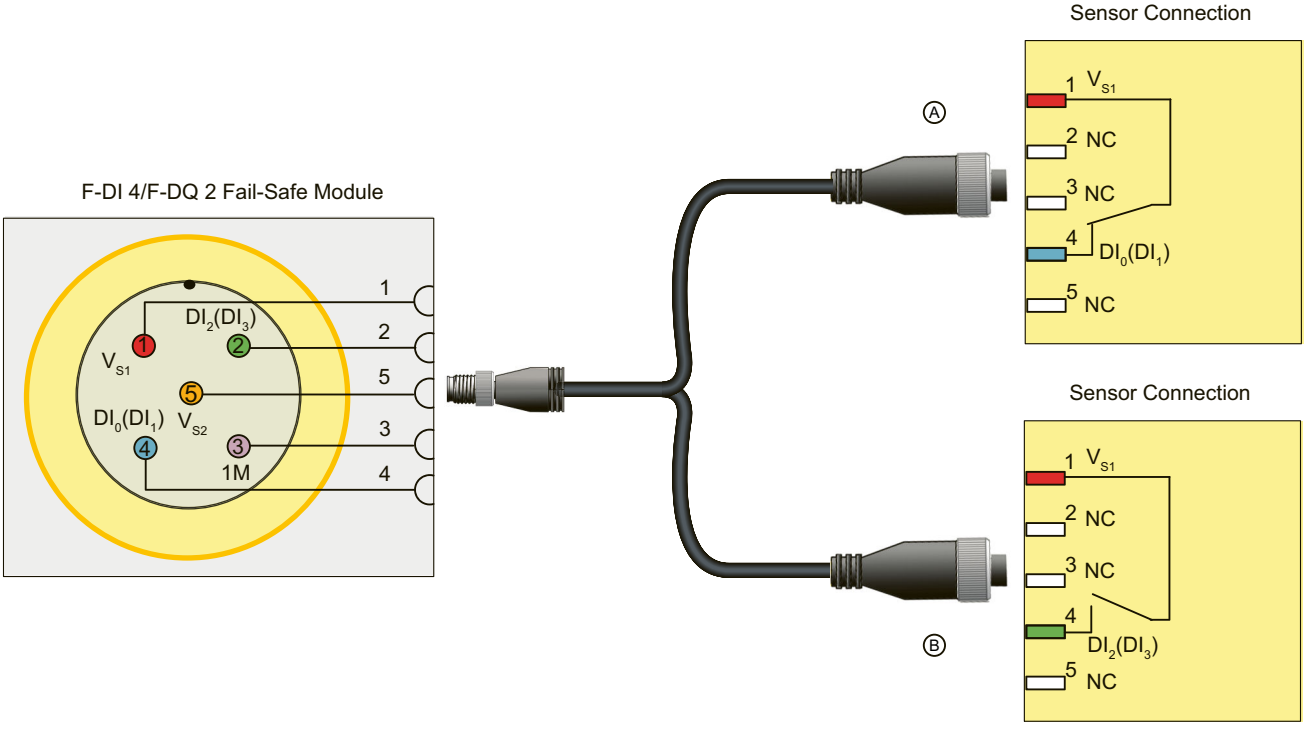

Figure 1-715 F-DI application mode 5: Internal sensor supply (1oo2 evaluation of two single-channel sensors with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire nonequivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 6

This application mode uses a two-channel sensor or two single-channel sensors with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing. The application mode uses the following pins:

- Pin 2 (channels 2 and 3) is the inverted input of the nonequivalent configuration
- Pin 4 (channels 0 and 1) is the non-inverted input of the nonequivalent configuration

NOTE

To incorporate F-DI application mode 6 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

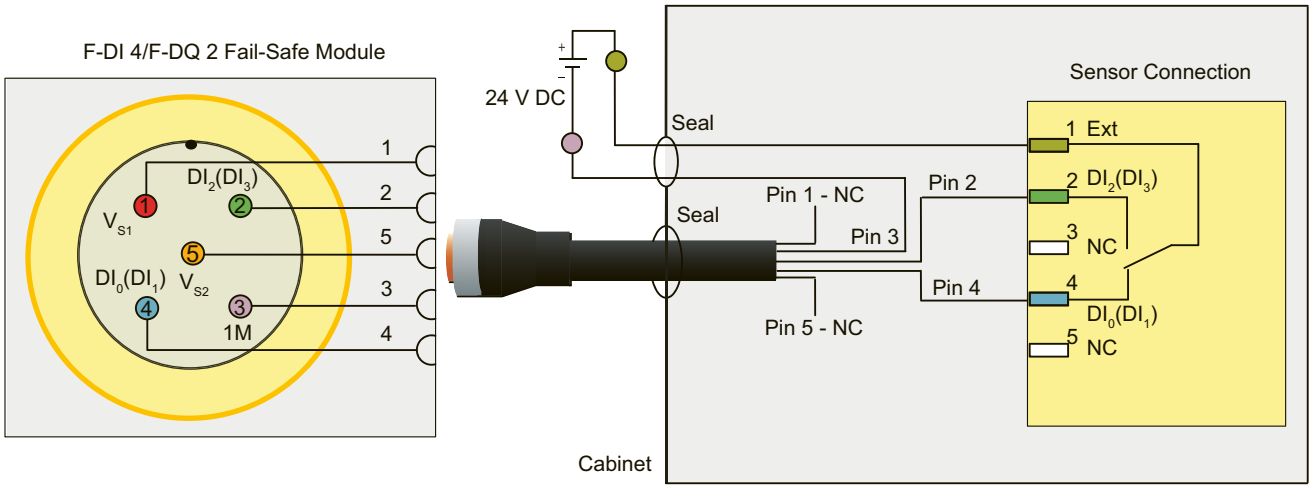

Figure 1-716 F-DI application mode 6: External sensor supply (1oo2 evaluation of two-channel sensor with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire nonequivalent
Sensor supply	External

5.1.4 Applications 7 and 8: 1oo2 evaluation of a 4-wire, nonequivalent sensor circuit

F-DI application mode 7

This application mode uses a two-channel sensor or two single-channel sensors in nonequivalent configuration (4-wire connection) in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection. The application mode uses the following pins:

- Pin 2 (channels 2 and 3) is the inverted input of the nonequivalent configuration
- Pin 4 (channels 0 and 1) is the non-inverted input of the nonequivalent configuration

NOTE

To incorporate F-DI application mode 7 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

Figure 1-717 F-DI application mode 7: Internal sensor supply (1oo2 evaluation of two-channel sensor with nonequivalent outputs shown)

Use Y cable (6ES7194-6KB00-0XA0) for application mode 7 as follows:

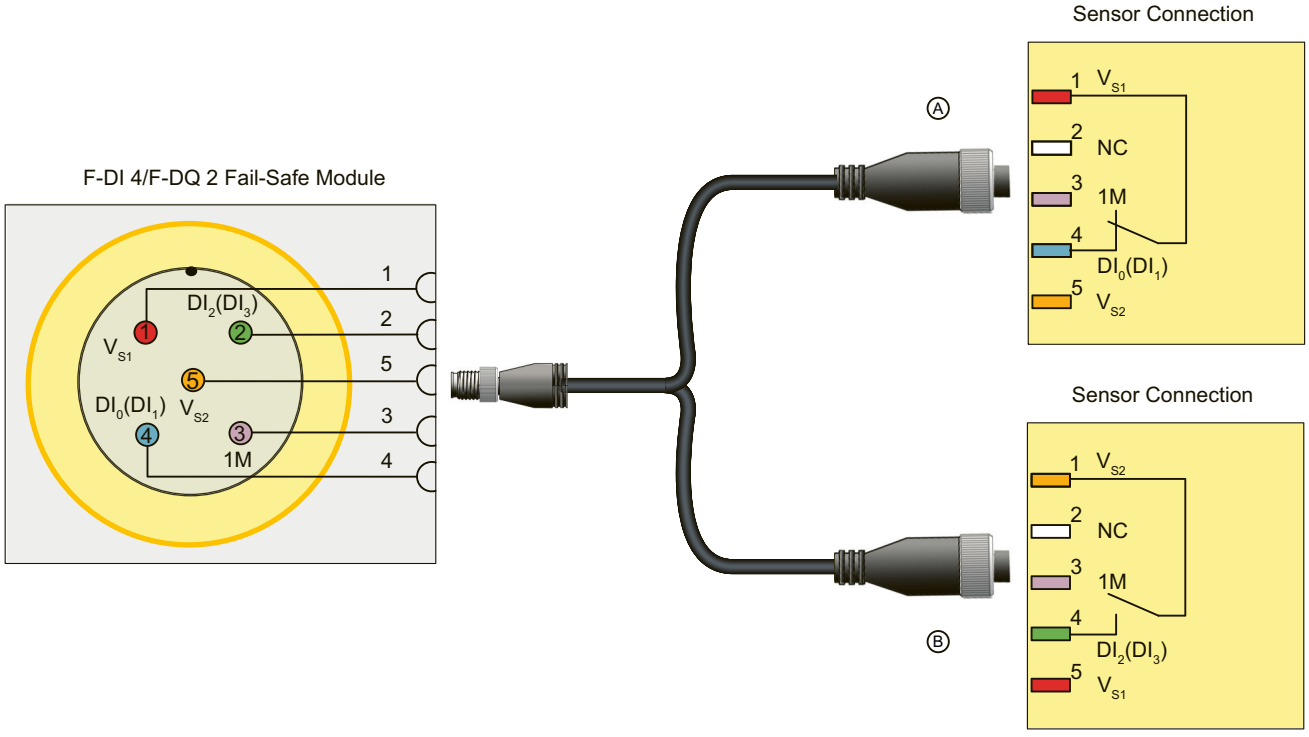

Figure 1-718 F-DI application mode 7: Internal sensor supply (1oo2 evaluation of two single-channel sensors with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire nonequivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 8

This application mode uses two single-channel sensors or a two-channel sensor with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing. The application mode uses the following pins:

- Pin 2 (channels 2 and 3) is the inverted input of the nonequivalent configuration
- Pin 4 (channels 0 and 1) is the non-inverted input of the nonequivalent configuration

NOTE

To incorporate F-DI application mode 8 into a SIL 3-rated application, ensure the sensors are appropriately qualified devices.

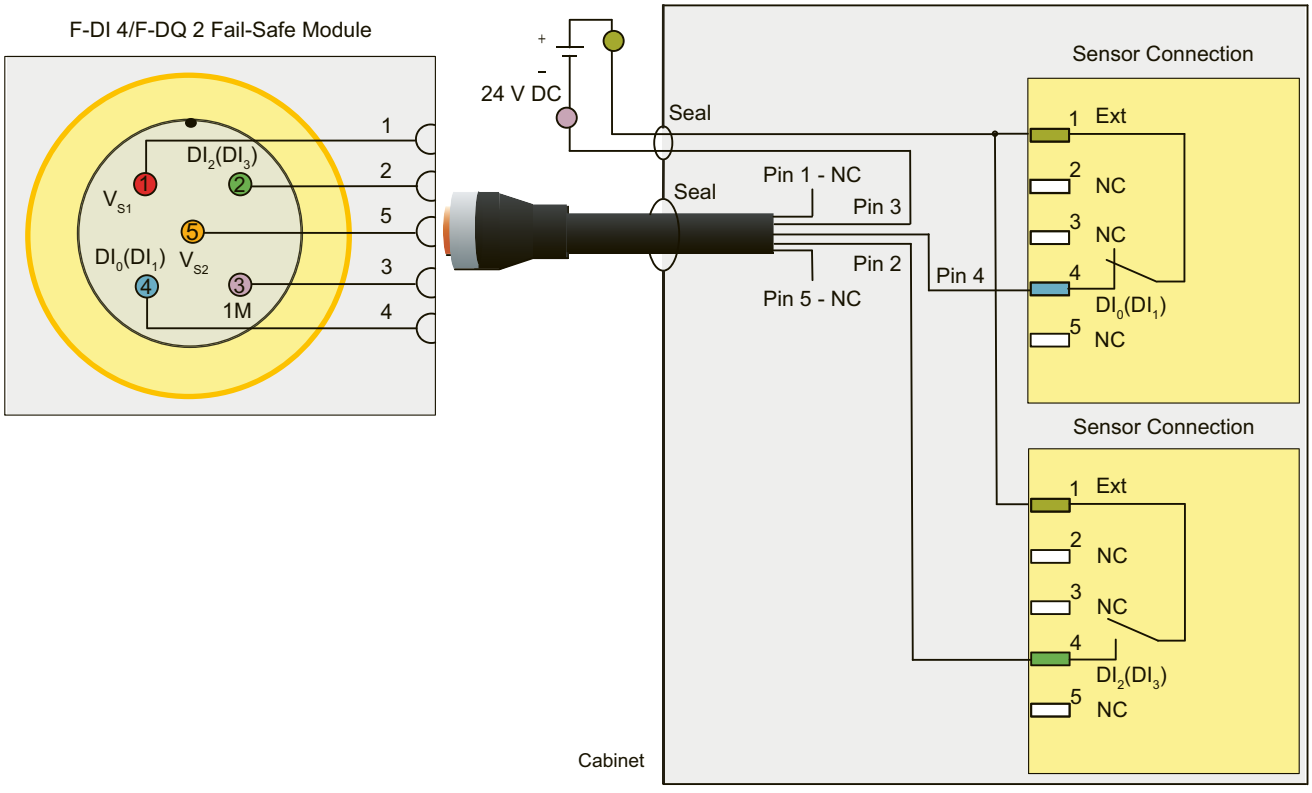

Figure 1-719 F-DI application mode 8: External sensor supply (1oo2 evaluation of two single channel sensors with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire nonequivalent
Sensor supply	External

5.2 Digital output applications

You should consider the application modes presented here along with the features of the F-DI 4/F-DQ 2 Fail-Safe module as described in the overview. Refer to "Fail-safe digital outputs (Page 14)".

The main features of the F-DI 4/F-DQ 2 Fail-Safe module digital outputs include the following items, which apply to each output channel:

- The fail-safe module separately controls current flow in the P output and M output.
- The voltage at the P and M outputs is read back to confirm proper state.
- The P and M outputs are regularly tested with short ON and OFF pulses to confirm control.

Ensure that the following steps are accomplished:

- Configure readback times that are sufficiently long to allow the channel's external voltages to respond to process value changes and applied test patterns from the bit pattern test. However, configuring readback times that are too long can cause your load to physically respond to applied test patterns during dark tests.
- Verify that internal current limiting as described in the data sheet is sufficient in combination with your 24 V DC supply. Consider whether additional current limits or fuses are necessary. Refer to "Specifications" and "Connecting" in the *ET 200AL distributed I/O system* system manual (https://support.industry.siemens.com/cs/ww/en/view/89254965).

The module controls all output channels as 1oo2 with cross-diagnostics.

All applications shown are capable of reaching SIL 3/Cat. 4/PL e unless you have dark testing disabled.

To reach Cat. 4, ensure that the following conditions are met:

- The dark testing is enabled.
- The external contactors are SIL-rated with sense contacts.
- The diagnostics are within limits when you read the sense contacts back and confirm the external contactor response in your program. Siemens recommends using an F-DI input for sense contact and other safety diagnostic inputs.

Output architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

The following are the minimum conditions which must be met for achieving the corresponding safety requirements:

Table 1-998 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Type of actuator connection	Achievable SIL/Category/PL	
		Dark test disabled	Dark test enabled
1	Directly-connected SIL-rated actuator	2/3/d	3/4/e
2	External contactors: Separate P and M controlled contactors	2/3/d	3/4/e
3	External contactors: Parallel-connected contactors between P and M	2/3/d	3/4/e
4	External contactors: Separate output channels for each contactor	2/3/d	3/4/e

Refer to "Pin assignment (Page 16)" for further information on connector pin assignments.

Refer to "Disable Dark Test (max. SIL 2, Cat. 3, PL d)" in "DQ parameters (Page 28)" for additional information on enabling and disabling dark testing.

5.2.1 Application 1: Wiring a directly-connected SIL-rated actuator

The module supports application mode 1, where there is a direct connection of a load between the P and M outputs of one channel. Both switches are opened when de-energizing the load.

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if neither channel is configured to disable the dark test.

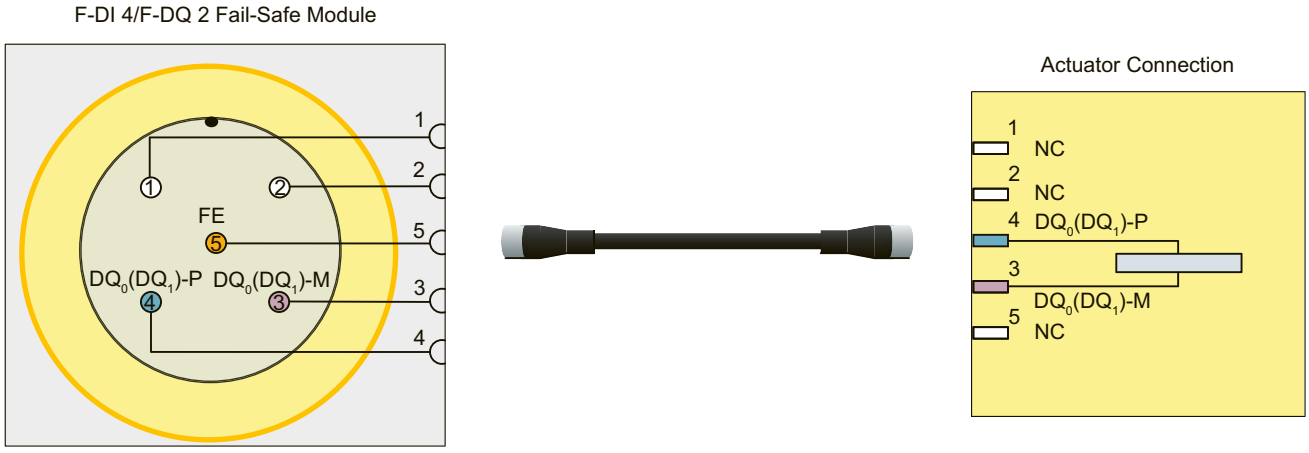

Figure 1-720 F-DQ application mode 1

5.2.2 Application 2: Wiring external contactors: Separate P and M controlled contactors

The module supports application mode 2, where the module controls the load using series-connected, normally-open contacts of two relays. The coil of one relay connects the P-output of a channel and M. The coil of the other relay connects the M-output of the same channel and L+.

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if you fulfill the following conditions:

- The CPU checks the relay status (feedback) using a separate digital input.
- You adequately protect the wiring against shorts from the P output to L+ and shorts from the M output to M. The CPU cannot switch off the actuator if both faults occur.
- You do not disable dark test for either output.

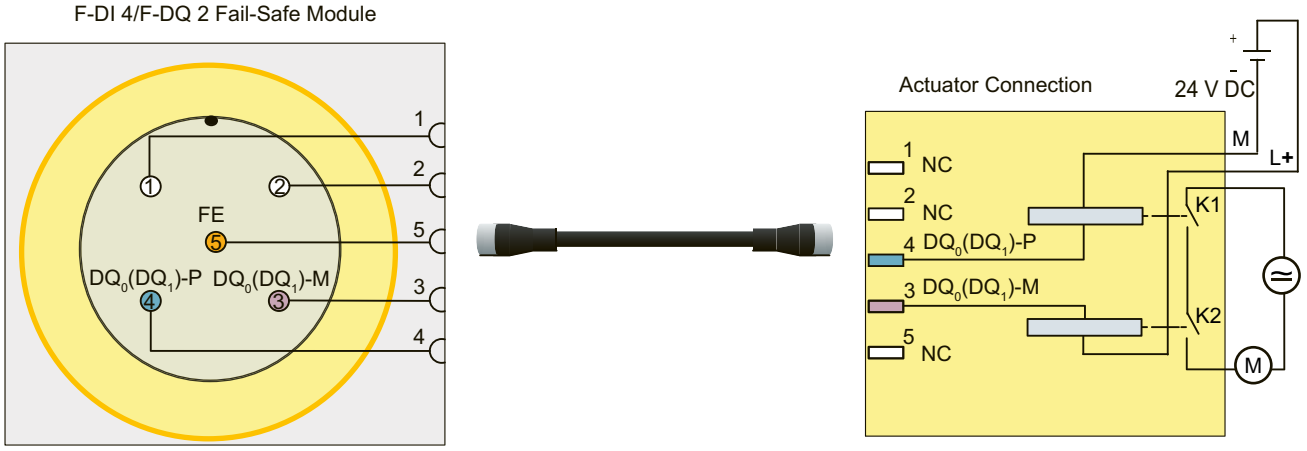

Figure 1-721 F-DQ application mode 2

5.2.3 Application 3: Wiring external contactors: Parallel-connected contactors between P and M

The module supports application mode 3, where the module controls the load using the series-connected, normally-open contacts of two relays. You connect the coils of both relays, in parallel, across the outputs of one channel.

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if the CPU checks the relay status (feedback) using a separate digital input and if neither channel is configured to disable the dark test. Application mode 3 is the preferred way of controlling an actuator using relays in a safety-related application. Application mode 3 avoids the problems mentioned for Application mode 2, regarding short-circuits of the P and M outputs.

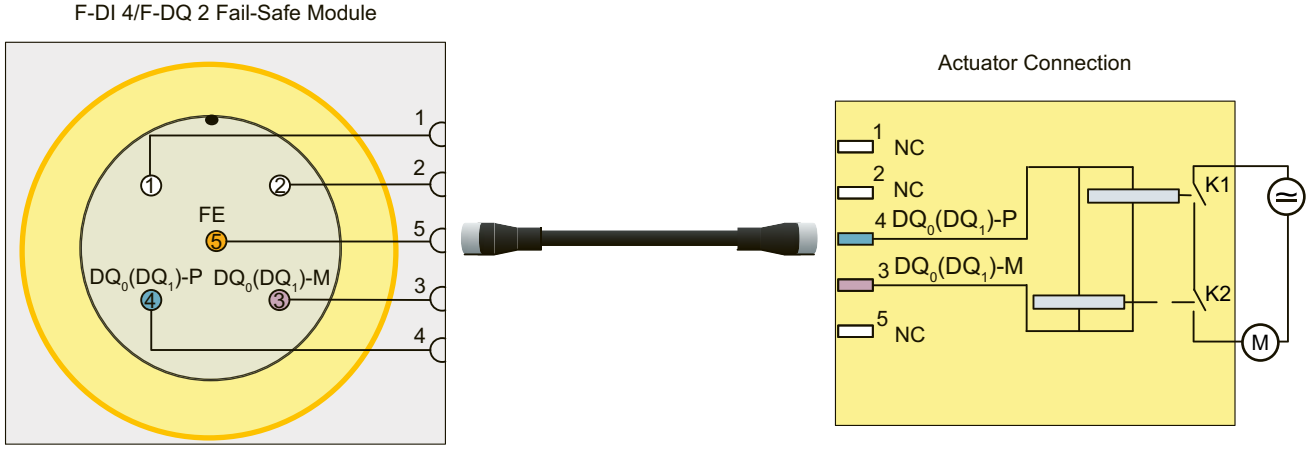

Figure 1-722 F-DQ application mode 3

5.2.4 Application 4: Wiring external contactors: Separate output channels for each contactor

The module supports application mode 4, where the module controls the load using the series-connected, normally-open contacts of two relays. Connect the coils of both relays across the outputs of two channels. In the safety program, write the same process value (ON or OFF) to both output channels.

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if the CPU checks the relay status (feedback) using a separate digital input and neither channel is configured to disable the dark test.

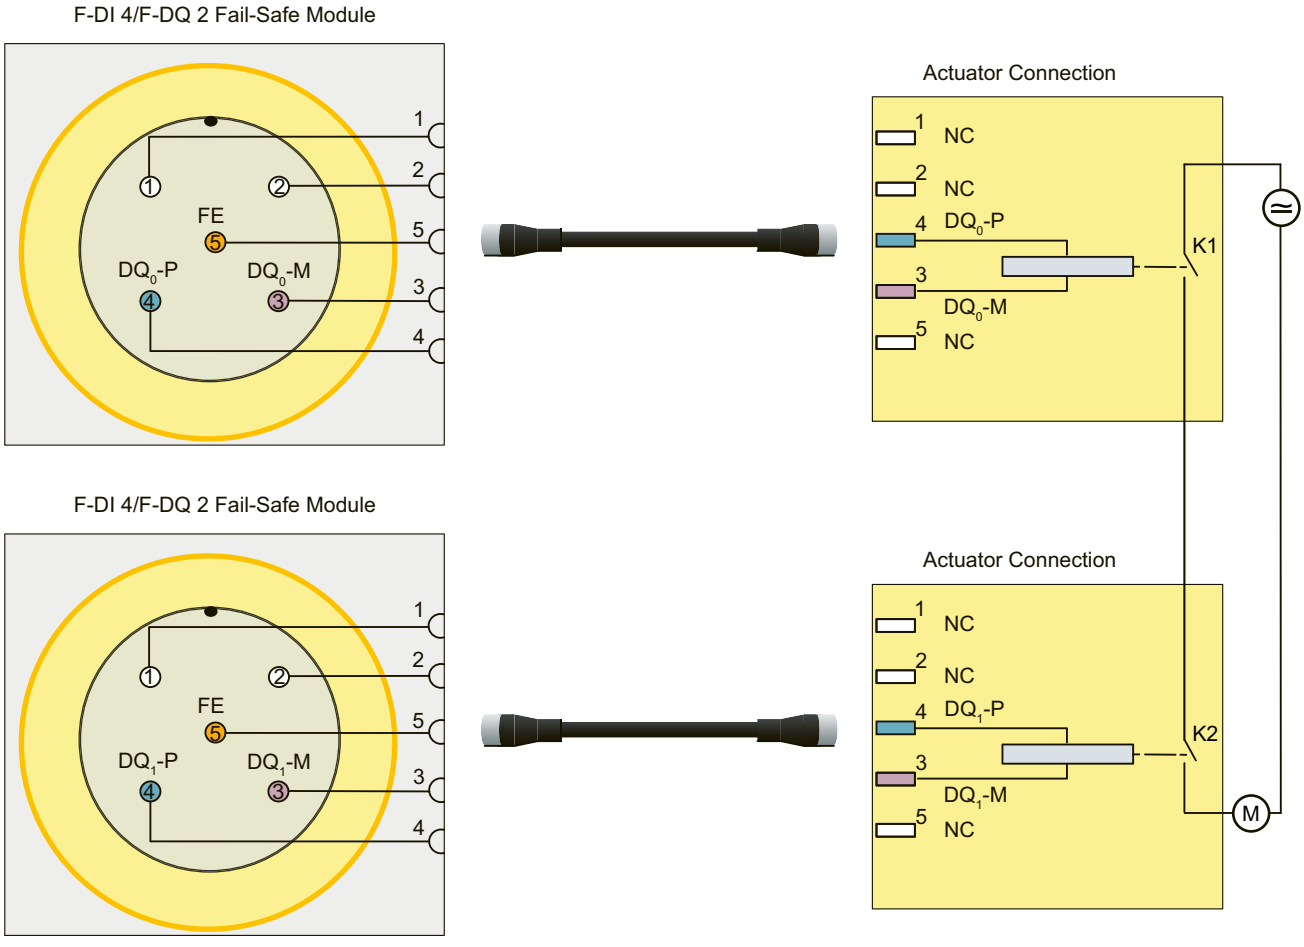

Figure 1-723 F-DQ application mode 4

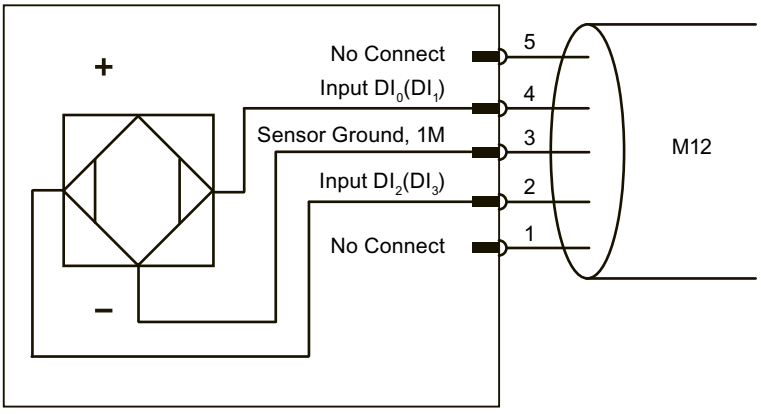


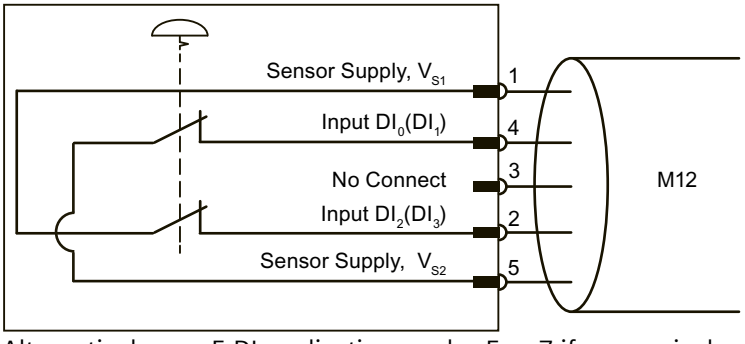
5.3 Examples of application modes for the F-DI 4/F-DQ 2 Fail-Safe module

You can connect field devices to the F-DI 4/F-DQ 2 Fail-Safe module as shown below.

Laser scanner (1oo2 evaluation)

For the output signal switching device (OSSD) sensors of a Laser Scanner, use F-DI application mode 4 to connect the Laser Scanner output signal switching device with 1oo2 evaluation to the F-DI 4/F-DQ 2 Fail-Safe module:

Laser Scanner (1oo2)

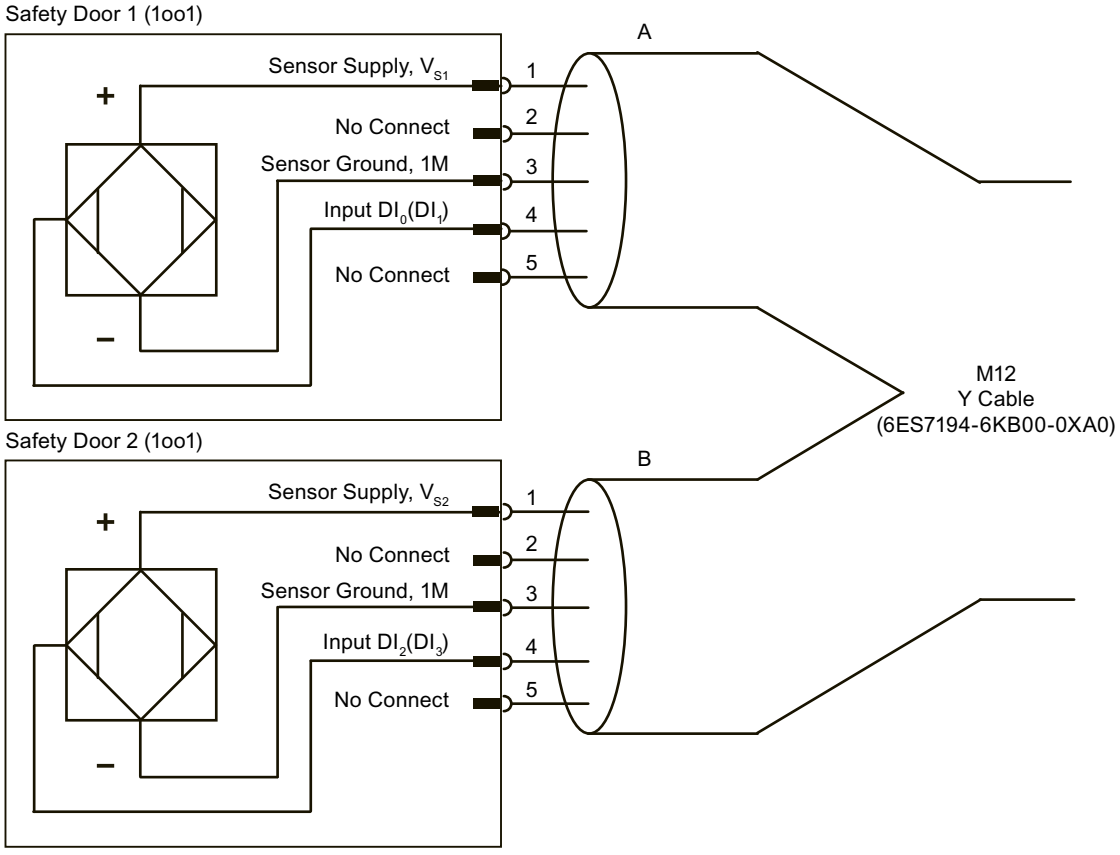


Alternatively, use F-DI application mode 3 and disable the parameter "Short-circuit test" for both sensor supplies.

ESTOP (Emergency Stop) (1oo2 evaluation)

For the ESTOP, use F-DI application mode 3 to connect an ESTOP device with 1oo2 evaluation to the F-DI 4/F-DQ 2 Fail-Safe module:

ESTOP (1oo2)



Alternatively, use F-DI application modes 5 or 7 if nonequivalent evaluation is required for your ESTOP device.

Safety doors (1oo1 or 1oo2 evaluation)

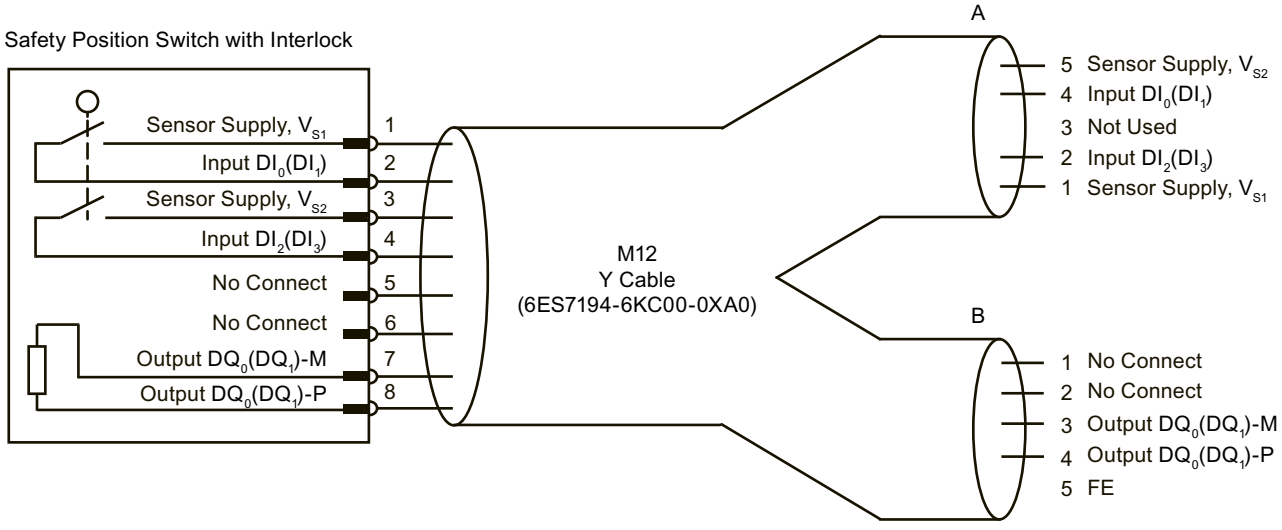
For the Safety Doors, you can do one of the following:

- Use F-DI application mode 1 with the fail-safe Y cable (6ES7194-6KB00-0XA0) to connect two single-channel sensors with 1oo1 evaluation to one input connection of the F-DI 4/F-DQ 2 Fail-Safe module.
- Use F-DI application mode 3 (1oo2 evaluation), using two single-channel sensors on the same safety door.

Alternatively, use F-DI application mode 5 with the fail-safe Y cable (6ES7194-6KA00-0XA0) to connect two nonequivalent single-channel sensors with 1oo2 evaluation on the same safety door.

Safety position switch with interlock (1oo2 evaluation)

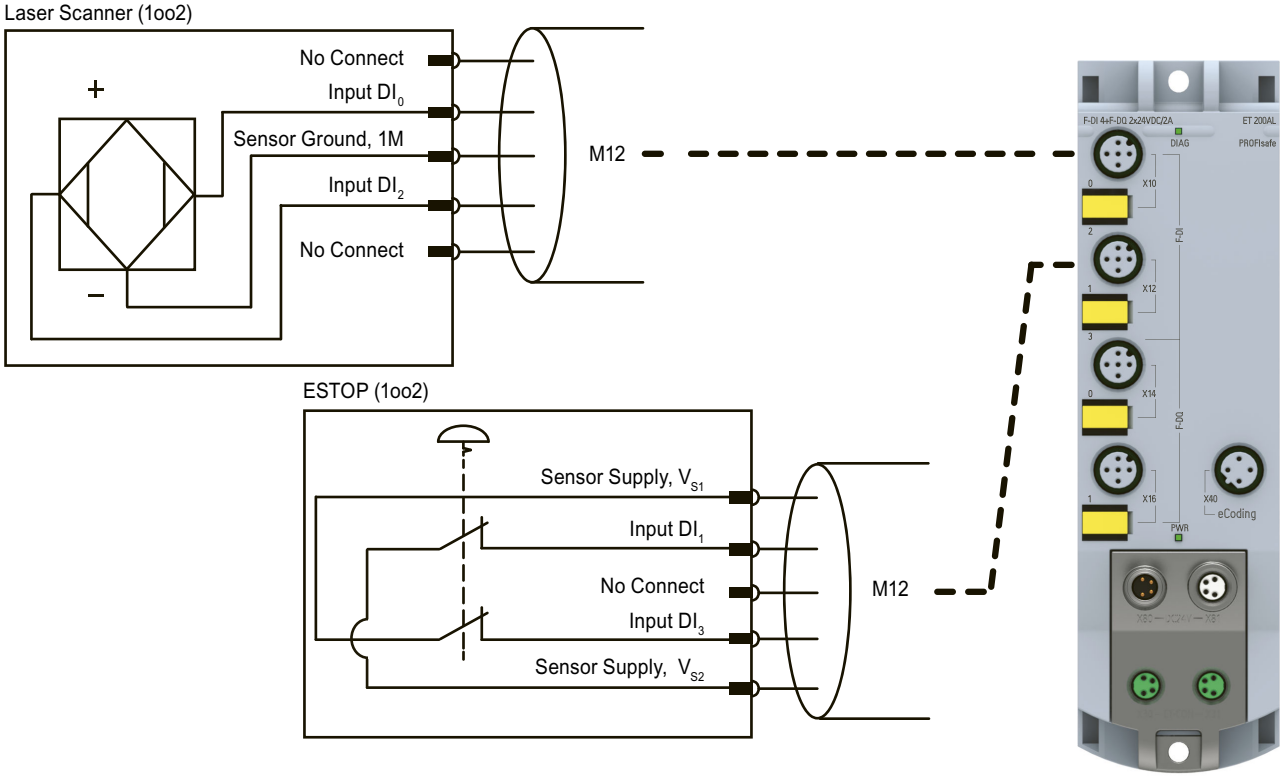
Use F-DI application mode 3 and F-DQ application mode 1 to connect the safety position switch with interlock to the F-DI 4/F-DQ 2 Fail-Safe module.



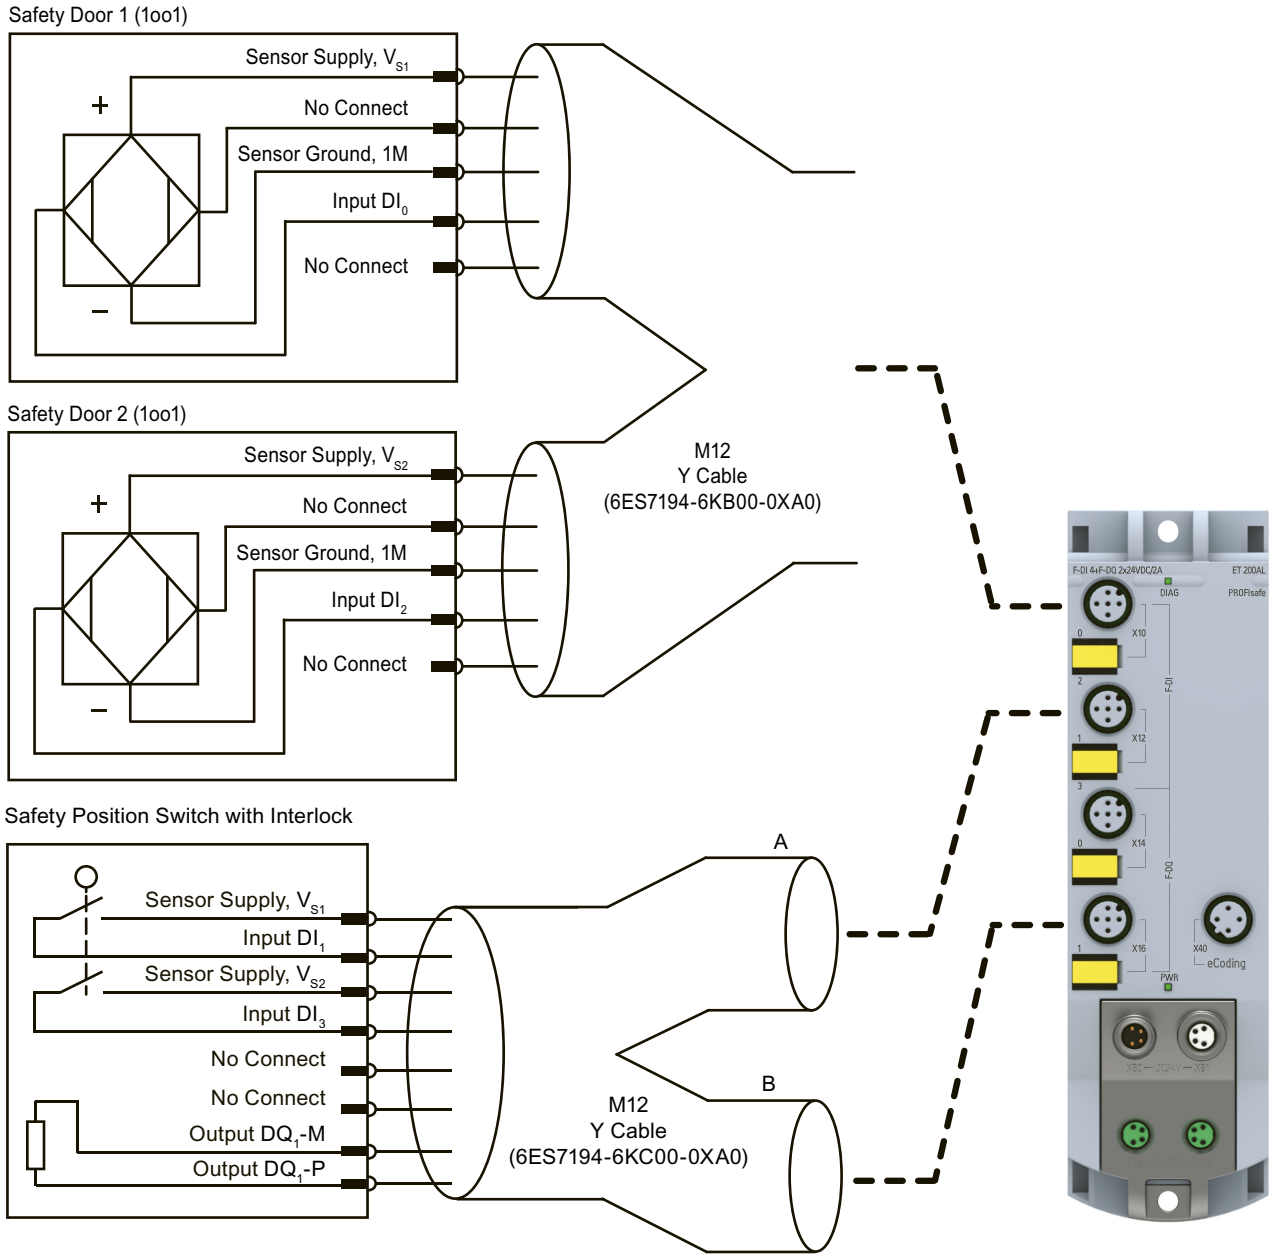
Use inverted Y cable (6ES7194-6KC00-0XA0) for a safety position switch with interlock. The inverted Y cable is designed to properly connect the fail-safe module F-inputs and F-output to the safety position switch.

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if neither output channel is configured to disable the dark test.



NOTE



To incorporate this application into a SIL 3-rated application, ensure the sensors are appropriately qualified devices: either SIL 3 or SIL 2 with the Systematic Capability rules defined in the SIRIUS documentation. For further information, refer to the *Industrial Controls, Detecting devices SIRIUS 3SE5/3SF1/3SE66/3SE67 position switches configuration manual* on the Internet (https://support.industry.siemens.com/cs/us/en/view/43920150).

Connect devices to F-DI 4/F-DQ 2 Fail-Safe module

Interrupts/diagnostic messages/diagnostics 6

6.1 Reactions to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. This applies to both sensors and actuators.

The safety function requires that safe state values be applied to the fail-safe channel(s) instead of process values (passivation of the fail-safe module or channel(s)) in the following situations:

- When the fail-safe system is started up
- If module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If module channel faults occur (for example, short-circuit and discrepancy errors)

The fail-safe CPU enters information about detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-safe modules do not remember errors upon power cycle. When the system is powered down and then restarted, the modules detect any faults still existing again. The exception to this is a permanent deactivation fault such as "sustained overvoltage".

Fail-Safe value for fail-safe modules

If digital input channels are passivated, the fail-safe system always provides safe state values ("0") for the safety program instead of the process values applied to the fail-safe inputs.

If digital output channels are passivated in the fail-safe module digital outputs, the fail-safe system always transfers safe state values "0" to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized.

The passivation safe state value and the output state value in CPU STOP mode are always "0", de-energized. You cannot select or program a default "ON" state for passivation or STOP mode.

Passivation is applied to individual channels when a channel-specific diagnostic failure is detected. Failures that can affect the entire module result in passivation of all channels.

NOTE

In the **F-DI 4/F-DQ 2 Properties** > **F-parameter**s > "Behavior after channel fault" field, if you select "Passivate the entire module", a single channel fault will result in passivation of all channels.

Timeout of the PROFIsafe message (F-monitoring time exceeded) passivates all module channels.

Table 1-999 Module signal type and passivation result

Module signal type	Passivation result
Fail-safe digital inputs	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective inputs. • If a channel fault occurs for a 1oo1 configuration, depending on your configuration, only the affected channel or all channels may be passivated. For a 1oo2, both inputs of the channel group in the 1oo2 configuration are passivated.
Fail-safe digital outputs	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective outputs. • Diagnostic evaluations are performed separately for each of the two switches of a channel. Depending on your configuration, failure detection for one switch may lead to passivation of only the affected channel or all channels.

Response to faults in the fail-safe system

You should prepare maintenance procedures for your system to assure that return to operation after a detected fault is controlled and documented.

Perform the following steps:

1. Diagnosis and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Reintegration of a fail-safe module

A channel or module can be reintegrated after diagnostics determine that a fault has cleared successfully.

You can configure reintegration as automatic or manual. You can make this selection on a per channel basis in the Device Configuration. Module wide errors such as PROFIsafe communication errors or supply voltage errors are always manually reintegrated. Fatal diagnostic errors require a power cycle with successful diagnostics to reintegrate.

Automatic

Channels that you select to be automatically reintegrated are immediately reintegrated when the fault has cleared.

Manual

Channels that you select to be manually reintegrated are acknowledged in your program after the fault has cleared.

The "ACK_REQ" bit for that module goes true to indicate that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Reintegration after high stress events

High temperature, high voltage, or excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Solid state switch outputs can be damaged by high currents prior to protective device activations. The PFD and PFH reliability calculations assume the fail-safe module is operated within its specified operating parameters. When a module has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future dangerous failure may be increased.

⚠ WARNING

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics.
Reintegration of a faulty system can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
After any reported fault, the steps outlined in this chapter and in safety standards applicable to your system should be followed to assure that the fault is completely understood and corrected before reintegration.

For an exact list of faults for the module, refer to "Fault types, causes, and corrective measures (Page 65)".

At reintegration, the following occurs:

- For a fail-safe module digital input, the process values pending at the fail-safe inputs are again provided for the safety program.
- For a fail-safe module digital output, the output values provided in the safety program are again transferred to the fail-safe outputs.

Safety repair time

The repair time used for PFH and PFD calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. You should respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

Deactivated fail-safe I/O are not being diagnosed and are subject to dangerous failure without warning.

If any error persists for 100 hours, the entire module is passivated and can only be recovered by power cycling.

If a repair within 100 hours is not possible, passivated fail-safe outputs should be taken out of service by physically disconnecting or opening circuits so that faults in the fail-safe module cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs are removed from any operating F-CPU Safety program logic that can result in activation of a safety function output.

Do not depend on channel or module passivation to maintain safe state for more than 100 hours.

Do not depend on deactivation or lack of configuration to maintain safe state in any circumstances.

⚠ WARNING

Unintentional activation of F-I/O module with fail-safe output
If a fail-safe output is passivated for a period longer than the safety repair time (> 100 hours) and the fault remains uncorrected, you need to be aware that an F-output could be activated unintentionally due to a second fault. This would place the F-system in a dangerous state. Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of a fail-safe output by using measures for the physical circuits or other organizational measures. One possibility is the shutdown of the power supply to the affected F-module. Required measures are often standardized for operations with defined design and risk reduction principles. For all other situations, necessary measures must be defined and approved.

Additional information on passivation and reintegration

For further information about fail-safe module access, refer to the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* on the Internet (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Diagnostic messages (Page %getreference)

6.2 Fault diagnostics overview

Diagnostics detect faults that can affect the integrity of safety-related I/O. The faults can be in the fail-safe module, communication with the CPU, or external circuits. Diagnostic information is assigned either to a single channel or to the entire fail-safe module.

Most diagnostics operate without user selection. You can configure the following diagnostic options:

- Short-circuit testing using the digital input sensor supply can be enabled. The interval and duration of short-circuit tests is configurable.
- The readback times for 24 V DC digital outputs are configurable.
- The timeout intervals for failures in the safety communication or failure of a safety program to run is configurable.
- Dark testing of the digital outputs can be disabled (max. SIL 2, Cat. 3, PL d).

Refer to "Parameters/address space (Page 20)" for a complete description of these options.

The safety-critical and validated action of the diagnostics is to passivate I/O when faults are detected. The reporting of status and diagnostic results through the LED displays and diagnostic messages is subject to single point failures in electronics or software. These reports are offered as maintenance and debugging aids. Observe and interpret the reports with caution.

In the presence of single faults, any or all LED indications can be wrong. You should not rely solely on the presence or absence of red or green LED indicators to make safety decisions.

In the presence of single faults, diagnostic messages may fail to be delivered, or the numerical event ID or text message can be wrong. You should not rely solely on the presence, absence, or content of diagnostic reports to make safety decisions.

⚠ WARNING

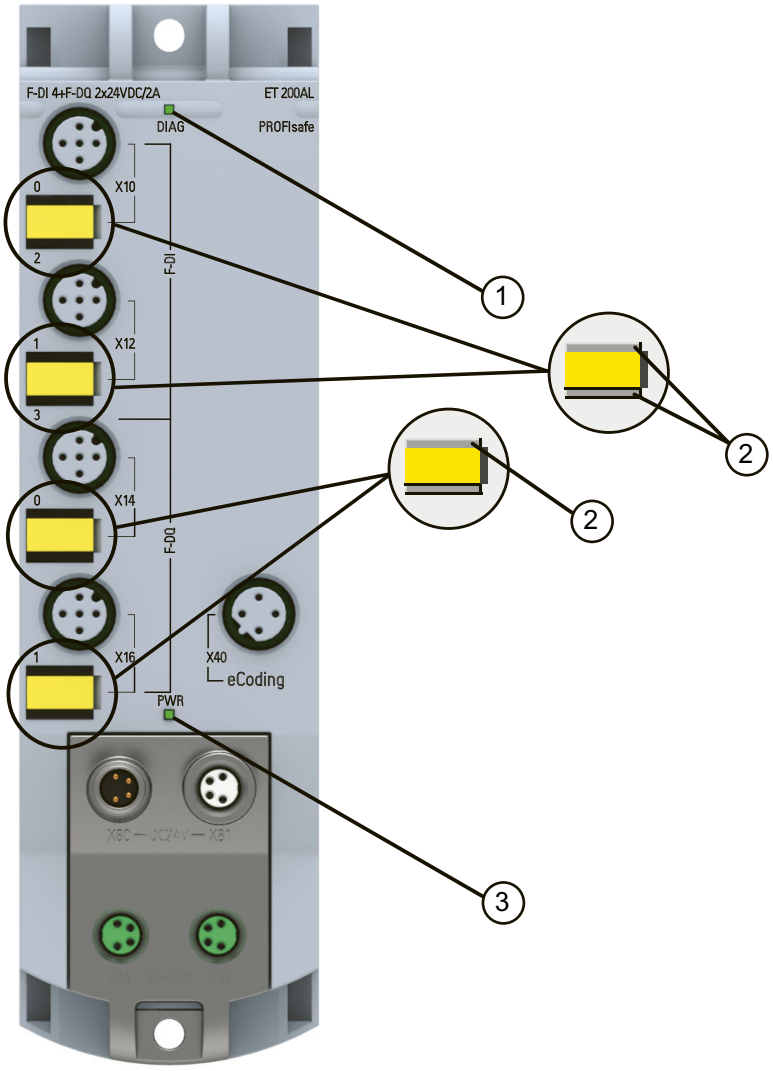
Diagnostic and status reports through LEDs and text messages are subject to single point failure errors.
Reliance on such reported information to determine that a system or I/O point is in a safely-controlled state can result in death, severe personal injury, or property damage.
If the integrity of your fail-safe system is in doubt, you should use additional measures such as restricted access or power removal to control hazards during maintenance and debug activities.

6.3 Diagnostics performed at startup

Each fail-safe module executes self-diagnostics at power-up to assure that the electronics and software meet testable expectations before allowing the module to participate in process control. If tests are not successful, the module passivates either individual or all channels.

In addition to internal tests, some tests create signal changes at the terminals.

The F-DI 4/F-DQ 2 Fail-Safe module executes tests for its digital outputs of the P- and M-switches as defined by your configured parameters for "Maximum readback time" and "Maximum readback time switch on test" after receiving configuration parameters from the fail-safe CPU at power-up. P- and M-switch ON tests are sequenced so that normally or in the presence of a single detected fault, there is no complete PM circuit to energize the load.



The F-DI 4/F-DQ 2 Fail-Safe module executes tests for its digital inputs of the sensor supply at power-up, including ON and OFF pulses, whether or not you have enabled the sensor supply or short-circuit testing in your configuration. If your configuration includes short-circuit testing, the module also executes a short-circuit test according to your configured parameters after receiving the parameters from the fail-safe CPU at power-up.

6.4 Diagnostics by LED display

6.4.1 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the F-DI 4/F-DQ 2 Fail-Safe module:

① Diagnostic status (DIAG (red/green))
② Channel status and channel error (red/green) for each channel (F-DI 0 - 3, F-DQ 0 and 1)
③ Load voltage 2L+ status (PWR (green))

Figure 1-724 LED displays

Meaning of the LEDs

The following tables set out the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in section Fault types, causes, and corrective measures (Page 65).

PWR LED

Table 1-1000 Meaning of the PWR LED

PWR	Meaning
Off	Load voltage 2L+ missing or supply voltage 1L+ is too low or not present
On green	Load voltage 2L+ available

DIAG LED

Table 1-1001 Meaning of the DIAG LED

DIAG LED	Meaning
Off	No supply voltage 1L+
Flashes green	Configuration/parameterization has not been received and no module diagnostics
Alternately Flashes red/green	Module-wide reintegratable faults such as the following are resolved and are awaiting reintegration: • Overvoltage • Undervoltage • PROFIsafe CRC error • PROFIsafe timeout error
On green	Module parameters assigned and no module or channel diagnostics
Flashes red	• Module diagnostic and/or one or more channel diagnostics • Module has inconsistent hardware and/or firmware versions

Channel LED for 1oo1 input channels

Table 1-1002 Meaning of the channel LED for 1oo1 input channels

DIAGInput LEDs	Meaning
Off	Process signal = 0
On green	Process signal = 1
On red	Channel fault or module fault affecting the channel
Alternately Flashes red/green	Fault resolved, awaiting reintegration

Channel LEDs for 1oo2 input channels

Table 1-1003 Meaning of the channel LEDs for 1oo2 input channels

Primary input LED	Secondary input LED	Meaning
Off	Off	Process signal = 0 (equivalent)
On green	On green	Process signal = 1 (equivalent)
Off	On green	Process signal = 0 (nonequivalent)
On green	Off	Process signal = 1 (nonequivalent)
On red	On red	Channel fault or module fault affecting the channel
Alternately Flashes red/green	Alternately Flashes red/green	Fault resolved, awaiting reintegration

Channel LED for output channels

Table 1-1004 Meaning of the channel LED for output channels

Output LED	Meaning
Off	Process signal = 0 or channel deactivated
On green	Process signal = 1
On red	Channel fault or module fault affecting the channel
Alternately Flashes red/green	Fault resolved, awaiting reintegration

6.5 Fault types, causes, and corrective measures

The "Fault types, causes, and corrective measures" table below lists the messages of the F-DI 4/F-DQ 2 Fail-Safe module. These messages are displayed in the TIA Portal under "Online & diagnostics" > "Diagnostics" > "Diagnostic buffer". When you highlight an individual text line in the diagnostic buffer, the Event ID for that text item is displayed, along with module identity and location that generated the message. You may need to expand the window to see all information.

Table 1-1005 Fault types, causes, and corrective measures

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0001	Short-circuit	F-DI 4/F-DQ 2 digital outputs	A channel problem has been detected where either the P terminal or M terminal is at an unexpected potential	• Short-circuit of the output • Short-circuit between channels with different signals • Output overload • "Maximum readback time switch on test" value is configured too small • Short-circuit of output to M • Defective output driver	• Eliminate the short-circuit • Eliminate the overload • Increase "Maximum readback time switch on test" if permissible • Replace the fail-safe module
16x0005	Overtemperature	Module	• Overtemperature at microcontoller • Overtemperature at I/O	Shutdown due to violation of high temperature limit value in the module case	Check the ambient temperature. Once the fault has been eliminated, switch the power off and on
16x0006	Wire break	Module	Wire break failure. The module can detect a wire break when all of the following are true: • The channel is wired using a PM load • The PV=0 • The wire break diagnostic is enabled	Output is activated: • No load is connected to the PM output • Output is wired in output application mode 2 • Too small of a load is detected	• Change the output load characteristics • Deactivate unused channels • Disable wire break diagnostic for the offending channels
16x0009	Hardware revision mismatch	Module	• The module detects hardware mismatch • DIAG LED is flashes red		Replace module

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0010	Parameterization failure (invalid parameters)	Module	When the module receives new parameters, the module checks for parameter failures. On detection of invalid parameters, the module stays in the configured state and signals the rejection of the faulty parameter to the fail-safe CPU. The module LEDs give an immediate indication of this fault.	• i-Parameter CRC error • Invalid i-parameters (for example, invalid selection, parameter out-of-range, unsupported feature selected, and wrong value of reserved field) • Any PROFIsafe parameterization problem detected by the PROFIsafe driver	Correct the parameter assignment
	Parameterization failure (address assignment failure)	Module	• On detection of an address assignment failure that indicates a hardware fault, the module enters the fatal error state. • The module performs this fault reaction if the address verification information provided by the F parameters is different than what has been previously assigned to the module	• Indicates assignment of an incorrect F address to one or more module(s) • Missing eCoding plug	• Reinsert the eCoding plug • Reassign the PROFIsafe F addresses using STEP 7 (TIA Portal) • Replace the eCoding plug
16x0040	Mismatch of safety destination address (F_Dest_Add)	Module	The PROFIsafe driver has detected a destination address mismatch. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective • Incorrect F-source address was downloaded as part of hardware configuration	• Reassign the PROFIsafe F addresses using STEP 7 (TIA Portal) • Replace the eCoding plug • Correct the F-destination address in hardware configuration and re-download
16x0041	Safety destination address not valid (F_Dest_Add)	Module	The PROFIsafe driver has detected an invalid destination address. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective	• Reassign the PROFIsafe F addresses using STEP 7 (TIA Portal) • Replace the eCoding plug

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0042	Safety source address not valid (F_Source_Add)	Module	The PROFIsafe driver has detected a source address mismatch or an invalid source address. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective • Incorrect F-source address was downloaded as part of hardware configuration	• Reassign the PROFIsafe F addresses using STEP 7 (TIA Portal) • Replace the eCoding plug • Correct the F-source address in hardware configuration and re-download
16x004B	Inconsistent iParameters (iParCRC error)	Module	The firmware of the F-module has detected a CRC error.	• Communication between the F-CPU and F-module is disturbed • Impermissibly high electromagnetic interference is present	• Check PROFINET communications between the F-module and F-CPU • Eliminate the electromagnetic interference • Power switched OFF and ON for station • Reassign the PROFIsafe F addresses using STEP 7 (TIA Portal)
16x004D	PROFIsafe communication error (CRC)	Module	Transmission error in data message frame: Data inconsistent (CRC (cyclic redundancy check) error). Checked after new output telegram received.	Communication interference between the fail-safe CPU and the fail-safe module (for example, due to electromagnetic interference in excess of limits or sign-of-life monitoring error)	• Check the communications connection • Eliminate the interference
16x004E	PROFIsafe communication failure (timeout)	Module	Monitoring time exceeded for data message frame (timeout). Checked after new output telegram received.	F-monitoring time exceeded. Transmission error: timeout (watchdog time 1 or 2 elapsed)	• Adjust F-monitoring time • Check Safety program and all other CPU activities for excessive execution or demands: – Interrupts – Ethernet communication – OB scheduling conflicts – Long program paths
16x004F	Channel failure acknowledgement	Module	Channel configured for manual acknowledgement is ready to reintegrate	Manual acknowledgement required	Manually acknowledge correction of channel fault so that reintegration can occur
16x0100	Module is defective	Module	Fatal internal error	Fail-safe module is defective	Replace the fail-safe module

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0103	Watchdog tripped	Module	The watchdog timer in the module communications processor timed out	Fail-safe module is defective	Replace the fail-safe module
16x0105	Short-circuit to L+	F-DI 4/F-DQ 2 digital outputs	Output shorted to P. The fail-safe module detects a channel problem where the P-terminal is unexpectedly at L+ potential.	• Short-circuit to L+ • Short-circuit between channels with different signals • Defective output driver • "Maximum readback time" value is configured too small	• Eliminate the short-circuit • Increase readback time • Replace the fail-safe module
16x0106	Short-circuit to ground	F-DI 4/F-DQ 2 digital outputs	The fail-safe module detects a channel problem where the M-switch output terminal is unexpectedly at M potential	• Short-circuit of output to M, ground, or another channel • Defective output driver • "Maximum readback time" value is configured too small	• Eliminate the short-circuit • Increase readback time • Replace the fail-safe module
16x011B	Invalid/ inconsistent firmware present	Module	Inconsistency between bus ASIC firmware and fail-safe controller firmware.	A firmware update operation was performed using an update file not suitable for the module (incorrect article number or hardware revision)	• The firmware update operation should be repeated with a suitable update file • Replace the fail-safe module
16x013E	Diagnostic event queue overflow	Module	Overflow of the diagnostic events queue has occurred. A newly-occurred diagnostic event could not be queued for transmission to the CPU because the buffer is full.	This can happen if channel errors come and go very quickly (for example, discrepancy errors)	Examine the Diagnostics buffer to see what errors are occurring, then address that issue

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0300	Discrepancy failure, channel state 0/0	F-DI 4/F-DQ 2 digital inputs	External discrepancy failure: Channel state 0/0 with 1oo2 nonequivalent configuration	• Process signal faulty, sensor may be defective • Configured discrepancy time too short • Short-circuit • Sensor mechanical activation or alignment out of tolerance	• Check the process signal, replace sensor if necessary • Check the configured discrepancy time • Check the wiring • Check that both sensors are mounted and aligned to be activated together
16x0301	Discrepancy failure, channel state 0/1	F-DI 4/F-DQ 2 digital inputs	External discrepancy failure: Channel state 0/1 with 1oo2 equivalent configuration		
16x0302	Discrepancy failure, channel state 1/0	F-DI 4/F-DQ 2 digital inputs	External discrepancy failure: Channel state 1/0 with 1oo2 equivalent configuration		
16x0303	Discrepancy failure, channel state 1/1	F-DI 4/F-DQ 2 digital inputs	External discrepancy failure: Channel state 1/1 with 1oo2 nonequivalent configuration		
16x0306	Internal sensor supply short-circuit to P	F-DI 4/F-DQ 2 digital inputs	Module-provided sensor supply voltage shorted to P	• Sensor supply shorted to P • Short-circuit test duration configured too short • Failed sensor supply	• Eliminate the short-circuit • Increase short-circuit test duration • Replace the fail-safe module
16x0307	Overload or internal sensor supply short-circuit to ground	F-DI 4/F-DQ 2 digital inputs	Internal sensor supply voltage shorted to M, ground, or excessive load on sensor supply	• Short-circuit • Excessive load on sensor supply • Failed sensor supply	• Eliminate the short-circuit • Reduce load on sensor supply • Replace the fail-safe module
16x030D	F-address memory not accessible	Module	The memory where the F-address is stored is not accessible	• eCoding plug is missing • eCoding plug is defective	• Install an eCoding plug into X40 of the module • Replace the defective eCoding plug
16x030E	No valid F-address available	Module	Fail-safe address is not valid (F-address and CRC inconsistent)	• eCoding plug has never been assigned a PROFIsafe address • eCoding plug is defective	• Assign the PROFIsafe Address • Replace the eCoding plug
16x0311	Frequency too high	F-DI 4/F-DQ 2 digital outputs	Switching frequency exceeded; readback not in time	Process value from safety program changing too rapidly for module to follow	Change Safety program logic to guarantee more time between output changes
16x0312	Undertemperature	Module	• Under-temperature at microcontrollers • Under-temperature at I/O	Shutdown due to violation of low temperature limit value in the module case	• Check the ambient temperature • Once the fault has been eliminated, switch the power off and on

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Event ID	Diagnostic message	F-DI 4/F-DQ 2 Fail-Safe module	Description	Possible causes	Corrective measures [1]
16x0313	Failure in the input circuit	F-DI 4/F-DQ 2 digital inputs	Internal fault at the read circuit/test circuit	• The module digital inputs detect a failure during bit pattern testing of inputs • EMI or module hardware fault	• If intermittent, it is probably due to interference; eliminate the interference • If persistent, or repeats after efforts to eliminate interference, replace the fail-safe module
16x031C	Input shorted to P	F-DI 4/F-DQ 2 digital inputs	Input shorted to P failure	• External wiring or sensor shorts input signal to L+ • Input configured for internal sensor supply with short-circuit detection enabled, but wired to external L+ • Input defective	• Check/correct external short-circuit • Make wiring and configuration agree • Replace the fail-safe module
16x031E	Read back failure	F-DI 4/F-DQ 2 digital outputs	The module has detected a channel problem where the expected terminal voltage(s) are not reached	• "Maximum readback time" or "Maximum readback time switch on test" configured value is too small • Output switch failure	• Increase readback time • Replace the fail-safe module if output does not respond
16x0320	Overload	F-DI 4/F-DQ 2 digital outputs	Overload condition at the output driver that leads to passivation of the channel	Overload at output	Eliminate overload
16x0321	Supply or load voltage too high	Module	Supply voltage (1L+) or load voltage (2L+) maximum exceeded	Supply or load voltage is set too high	Adjust supply or load voltage
16x0322	Supply or load voltage too low	Module	Supply voltage (1L+) or load voltage (2L+) minimum exceeded	Supply or load voltage is set too low	Adjust supply or load voltage

[1] Once the fault is eliminated, reintegrate the fail-safe module (return to normal state) from passivation into the safety program.

Electromagnetic interference and diagnostic reports

Electromagnetic interference can cause communication errors, disturb external and internal signal measurements, and cause processing errors. When error reports do not apparently relate to an identifiable device failure, wiring problem, programming, or configuration error, consider sources of electromagnetic interference and installation and wiring problems that might introduce electromagnetic interference in your installation. Typical problem sources include poor suppression of inductive loads and voltage dips due to excessive load inrush currents.

Technical specifications

7

7.1 Specifications

	6ES7146-5FF00-0BA0
General information	
Product type designation	F-DI 4+F-DQ 2x24VDC/2A, 4xM12
HW functional status	FS01
Firmware version	V1.0.x
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	Step 7 V17 or higher
Operating mode	
DI	Yes
DQ	Yes
Supply voltage	
Load voltage 1L+	
Rated value (DC)	24 V
permissible range, lower limit (DC)	20,4 V
permissible range, upper limit (DC)	28,8 V
Reverse polarity protection	Yes; against destruction
Load voltage2 L+	
Rated value (DC)	24 V
permissible range, lower limit (DC)	20,4 V
permissible range, upper limit (DC)	28,8 V
Reverse polarity protection	Yes; against destruction; outputs applied with reversed polarity for loads connected between M-switch and 2L+ will conduct
Input current	
Current consumption (rated value)	55 mA (1L+) / 40 mA (2L+); without load
from load voltage 1L+ (unswitched voltage)	4 A; Maximum value
from load voltage 2L+, max.	4 A; Maximum value
Encoder supply	
Number of outputs	2
24 V encoder supply	
Short-circuit protection	Yes; per load voltage, electronic (response threshold 0.7 A to 1.7 A)
Output current, max.	1 A; total current of all encoders, max. 0.5 A per load voltage; maximum of 2.0 V drop
Power loss	
Power loss, typ.	4,7 W

	6ES7146-5FF00-0BA0
Digital inputs	
Number of digital inputs	4
Input characteristic according to IEC 61131	Type 1
Number of simultaneously controllable inputs	
all mounting positions	
up to 55 °C, max.	4
Input voltage	
Rated value (DC)	24 V
for signal "0"	-30 to +5 V
for signal "1"	+15 to +30 V
Input current	
for signal "1", typ.	4,85 mA
Input delay (for rated value of input voltage)	
for standard inputs	
parameterizable	Yes
at "0" to "1", min.	0,8 ms
at "0" to "1", max.	12,8 ms
at "1" to "0", min.	0,8 ms
at "1" to "0", max.	12,8 ms
Cable length	
unshielded, max.	30 m
Digital outputs	
Number of digital outputs	2
in groups of	2
Short-circuit protection	Yes; per channel, electronic
Response threshold, typ.	10 A; measured at M-switch, threshold for P-switch is higher
Open-circuit detection	Yes; per channel, only detects when output is off
Overload protection	Yes
Response threshold, typ.	3,4 A; measured at P-switch
Limitation of inductive shutdown voltage to	P-switch: -26 V DC referenced to 2M, M-switch: +48 V DC referenced to 2M
Switching capacity of the outputs	
on lamp load, max.	10 W
Load resistance range	
lower limit	12 Ω
upper limit	2 kΩ
Output voltage	
for signal "1", min.	L + (-2.0 V), P-switch is L+ (-1.5 V), M-switch is 0.5 V
Output current	
for signal "1" rated value	2 A
for signal "0" residual current, max.	0,5 mA
Switching frequency	
with resistive load, max.	30 Hz
with inductive load, max.	0,1 Hz
on lamp load, max.	10 Hz

	6ES7146-5FF00-0BA0
Total current of the outputs	
Current per group, max.	4 A
Cable length	
unshielded, max.	30 m
Encoder	
Connectable encoders	
2-wire sensor	No
permissible quiescent current (2-wire sensor), max.	0.5 mA
Interrupts/diagnostics/status information	
Substitute values connectable	No
Alarms	
Diagnostic alarm	Yes; Parameterizable
Diagnoses	
Monitoring the supply voltage	Yes
Wire-break	Yes; outputs when off
Short-circuit	Yes; inputs, outputs, encoder supply
Diagnostics indication LED	
Channel status display	Yes; green LED
for channel diagnostics	Yes; red LED
for module diagnostics	Yes; green/red LED
For load voltage monitoring	Yes; green LED
Potential separation	
between the load voltages	Yes
Potential separation channels	
between the channels. in groups of	4 DI channels are isolated from 2 DQ channels
between the channels and backplane bus	Yes
between the channels and the power supply of the electronics	DI channels are not isolated from supply voltage 1L+ and DQ channels are isolated from supply voltage 1L+
Isolation	
Isolation tested with	707 V DC (type test)
Degree and class of protection	
IP degree of protection	IP65/67
Standards, approvals, certificates	
Highest safety class achievable in safety mode	
Performance level according to ISO 13849-1	PLd (DI single-channel), PLe (DI two-channel, DQ)
Category according to ISO 13849-1	Cat. 3 (DI single-channel), Cat. 4 (DI two-channel, DQ)
SIL acc. to IEC 61508	SIL 2 (DI single-channel), SIL 3 (DI two-channel, DQ)
Probability of failure (for service life of 20 years and repair time of 100 hours)	
Low demand mode: PFDavg in accordance with SIL2	< 1.0E-03 DI single-channel; < 1.0E-03 DQ with dark test disabled
Low demand mode: PFDavg in accordance with SIL3	< 1.0E-05 DI two-channel; < 2.0E-05 DQ with dark test enabled

	6ES7146-5FF00-0BA0
High demand/continuous mode: PFH in accordance with SIL2	< 1.0E-08 1/h DI single-channel; < 1.0E-07 1/h DQ with dark test disabled
High demand/continuous mode: PFH in accordance with SIL3	< 1.0E-09 1/h DI two-channel; < 1.0E-08 1/h DQ with dark test enabled
Ambient conditions	
Ambient temperature during operation	
min.	-30 °C
max.	55 °C
Connection method	
Design of electrical connection for the inputs and outputs	M12, 5-pin
Design of electrical connection for supply voltage	M8, 4-pin
ET-Connection	
ET-Connection	M8, 4-pin, shielded
Dimensions	
Width	45 mm
Height	159 mm
Depth	40 mm
Weights	
Weight, approx.	220 g

Dimension drawing

A

A.1 Dimension drawing

The figure below shows the dimension drawing of the F-DI 4/F-DQ 2 Fail-Safe module in front and side views. The dimensions are in mm.

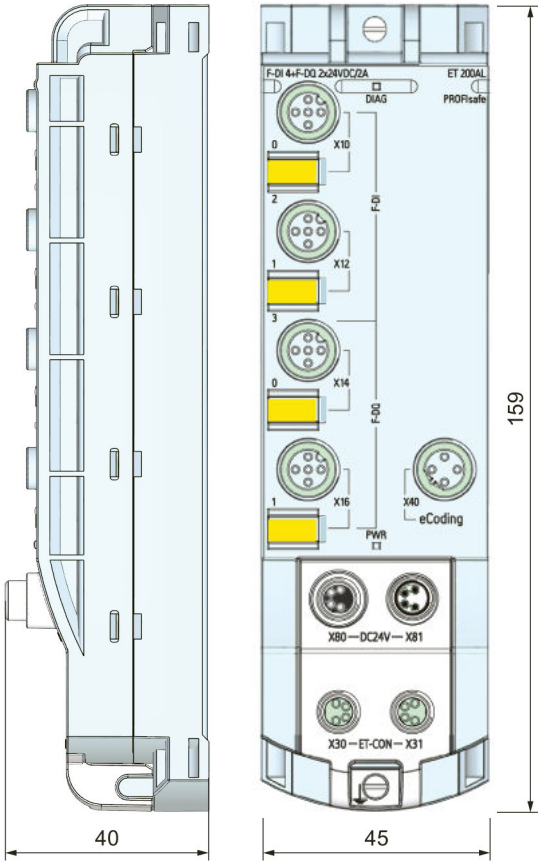


Figure 1-725 Dimension drawing

Response times

B

B.1 Maximum response time

This section shows the response times of the F-DI 4/F-DQ 2 Fail-Safe module. The response times are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the ET-Connection and the signal change at the digital output.

Times required for the calculation

Maximum cycle time: T_{cycle} = 23 ms

Maximum acknowledge time (Device Acknowledge Time): T_{dat} = 18 ms

You assign the "Maximum readback time" and "Maximum readback time switch on test" settings in STEP 7.

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times (http://support.automation.siemens.com/WW/view/en/49368678/133100)" Excel file (RT_calculator). Use your configured individual fail-safe module timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{cycle} parameter values given above include an allowance for the fail-safe module to acquire and deliver PROFIsafe messages in transactions with the PLC I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe module location and the fail-safe CPU. There are no separate transport delay parameters that you can include in your calculations.

B.2 Response time parameters for the F-DI 4/F-DQ 2 digital inputs

Maximum Device Acknowledge Response Time of the F-DI 4/F-DQ 2 Fail-Safe module digital inputs

1oo1 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle}$

$T_{OFDT_i} = T_{WCDT_i} + T_{scf}$

1oo2 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle}$

$T_{OFDT_i} = T_{WCDT_i} + MAX (T_{scf}, T_{dis})$

Where:

T_{cycle}	Internal cycle time of the fail-safe module
T_{dis}	Discrepancy time: • Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" • Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior You should include the expected discrepancy time between your sensor inputs in your external sensor delay. Your configured T_{dis} contributes to T_{OFDT_i} as the time delay for the fail-safe module's digital inputs to passivate the channel due to fault case extension of the discrepancy time. This parameter can be listed separately in the RT_calculator. Do not include T_{dis} in the value of T_{OFDT_i} that you enter into the RT_calculator if you enter T_{dis} as a separate item.
T_{filter}	Configured "Input filters" time for the channel
T_{OFDT_i}	One Fault Delay Time: Maximum response time for the fail-safe module's digital input to report a channel as passivated
T_{scf}	Time delay for short-circuit fault duration: • Configured "Interval for short-circuit test", when operating in high demand or continuous mode and depending on the short-circuit test to achieve your required level of safety integrity • "0" when not depending on the short-circuit test to achieve your required level of safety integrity
T_{sct}	Time delay for short-circuit test duration: • "0" if no short-circuit test configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in equation for T_{WCDT_i} if short-circuit test is configured.)
T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input to the reliable availability of the safety message frame available for the fail-safe CPU request

The term "2 x T_{cycle}" for "maximum response time of the fail-safe module" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

B.3 Response time parameters for the F-DI 4/F-DQ 2 digital outputs

Maximum response time of the F-DI 4/F-DQ 2 Fail-Safe module digital outputs

$T_{WCDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

$T_{OFDT_q} = T_{WCDT_q}$

When dark testing is disabled, a channel fault might not be detected until a process value change "1" to "0" takes place on the corresponding output. When dark testing is disabled and the process value is "1" for a given channel, the respective output switches are not manipulated by the various safety measures.

Where:

T_{cycle}	Internal cycle time of the fail-safe module
T_{OFDT_q}	One Fault Delay Time: Maximum response time for the module's digital outputs to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel
T_{WCDT_q}	Worst Case Delay Time: Maximum response time of the fail-safe module's digital output DC from the receipt of a safety message frame from the safety program in the fail-safe CPU to the signal transition at the digital output

The term "2 x T_{cycle}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

After the fail-safe module's digital outputs command the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Minimum permissible OFF time for F-DI 4/F-DQ 2 Fail-Safe module digital outputs

The fail-safe module's digital outputs expect to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than T_{WCDT_q} can cause the channel to passivate.

Switching of loads

C

C.1 Connecting capacitive loads

If an F-DI 4/F-DQ 2 Fail-Safe module is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

Load capacitance can delay the voltage response as seen at the P- and M-switches of the F-DI 4/F-DQ 2 Fail-Safe module digital outputs. For a capacitive load with capacitance C across P and M, and a parallel load resistance R, the "Maximum readback time" needs to be in the range of 2.0 to 2.5 time constant (R * C) of the load. This allows enough time for an appreciable voltage change to be seen when you briefly de-energize an energized load during bit pattern testing. If the resulting "Maximum readback time" is too long for your application, you can reduce this time constant by adding parallel resistance across the load to reduce the realized R * C time constant.

Alternatively, you can add a diode between the P-output and the load (capacitor and resistors) so that when you turn off the output, the voltage on the capacitor is not present at the P-output. Typically, power supplies with input capacitors that have reverse voltage protection have this diode built into the power supply. Using the added diode, you can greatly reduce the "Maximum readback time" to some portion of the hold-up time of the power supply/capacitor. This reduced "Maximum readback time" allows the load to operate normally (load stays ON) during the bit pattern tests.

Stray capacitance between the load circuit and ground, M, and P increases the time required for the "Maximum readback time switch on test". When module diagnostics switch "ON" a P- or M-switch to a de-energized load during bit pattern testing, both sides of the load are driven towards L+ or M, limited by stray capacitance. This effect is typically small.

Your "Maximum readback time switch on test" setting should be long enough for the load circuit voltage to react, but short enough that if one side of the load faults to P or M, testing of the opposite switch should not cause the load to mechanically react.

Capacitive loads (including power supplies with input capacitors) with low series resistance can have a large inrush current. If you have a large capacitive load, you should add series resistance to reduce the inrush current to reduce the risk of opened fuses or overcurrent fault detection on normal load switch ON events.

C.2 Switching of inductive loads

The diagram below shows the maximum permitted inductive load and switching frequency allowed using only the internal suppression circuits of the F-DI 4/F-DQ 2 Fail-Safe module digital outputs. You should equip larger or more frequently switched inductive loads with external suppression circuits to avoid early failure of the F-DI 4/F-DQ 2 Fail-Safe module digital output switch. External suppression conducts the load current at a voltage less than the internal suppression threshold to avoid overloading the internal suppression.

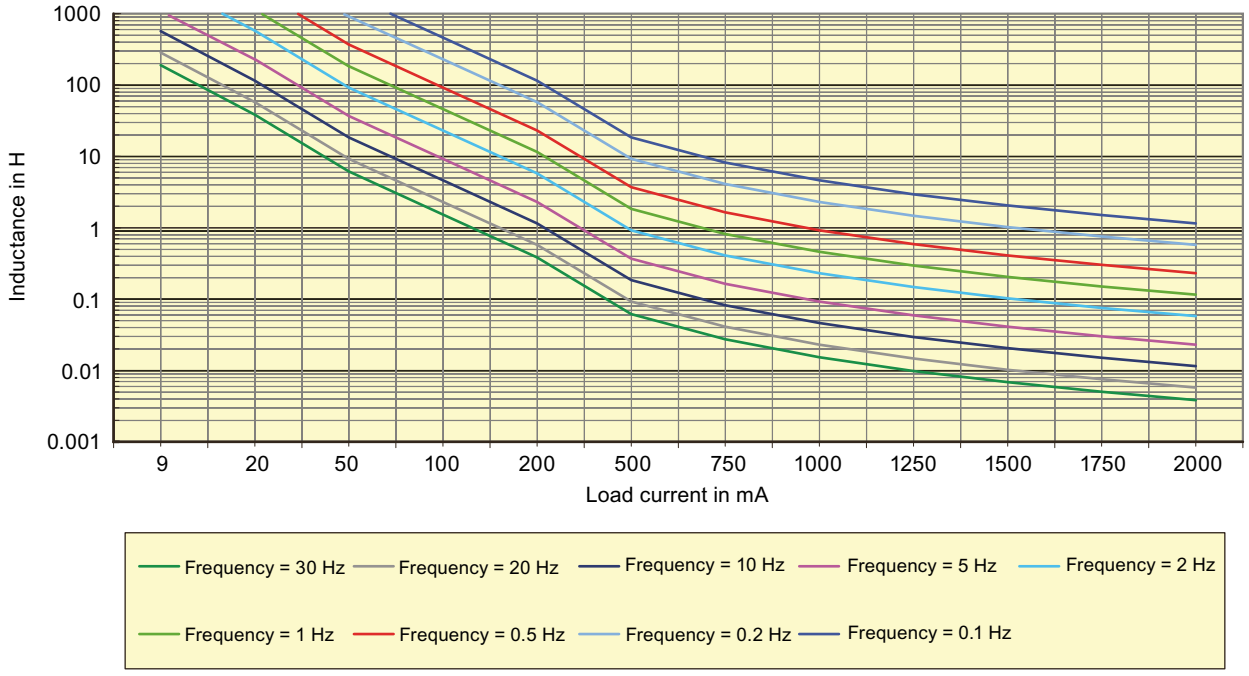

Figure 1-726 Switching of inductive loads for the F-DI 4/F-DQ 2 Fail-Safe module depending on the load current and switching frequency

⚠ WARNING

Unsuppressed inductive loads can lead to failures.
The following failures can result:

- Unsuppressed inductive loads can lead to early "stuck-on"' failures of the fail-safe module digital outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
You should use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads.

SIEMENS

SIMATIC
ET200
Update to the ET 200AL F-DI 4 + F-DQ 2x24 VDC/2A, 4xM12 Manual, edition 03/2022

Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Overview to Documentation Update for the ET 200AL F-DI 4 + F-DQ 2x24 VDC/2A, 4xM12

In spite of efforts to ensure the accuracy and clarity in the product documentation, some of the pages in the *ET 200AL System Manual* contain information that has been identified as being incomplete, incorrect or misleading.

Scope of the product information
This product information includes amendments and corrections to the documentation of the *ET 200AL System Manual*. The statements provided herein should be considered to be more up-to-date than other documentation if uncertainties arise.

This document contains the following updates

- Addition of statement for use of radio devices and cell phones in reading ID Link (Page 1)
- Update to statement for eCoding plug installation (Page 2)

© Siemens 2024. All rights reserved

Addition of statement for use of radio devices and cell phones in reading ID Link

The following Warning is applicable to the ET 200AL F-DI 4 + F-DQ 2x24 VDC/2A, 4xM12:

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones

Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.

If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.

Power off radio devices in the immediate proximity of the F-I/O.

Update to statement for eCoding plug installation

The text in Section 3.3, "Connecting the M12 eCoding plug", has been corrected as follows:
The statement "The eCoding plug must be installed before power is applied to the module." now precedes the statement "You use the eCoding plug to facilitate module replacement." Further, the statement "You use the eCoding plug to facilitate module replacement" now reads "You also use the eCoding plug to facilitate module replacement."

Description

Description
The firmware update V1.0.1 for the ET 200AL F-IO module is now available.

The firmware update includes the following features:

- Corrections for problems with the delivery of diagnostic messages. In some situations, diagnostic messages for resolved fault conditions were not successfully delivered by the module.

Refer to the ET 200AL System Manual (https://support.industry.siemens.com/cs/us/en/view/95242965) for more information about the ET 200AL product family. Refer to the the description on the Internet (https://support.industry.siemens.com/cs/us/en/view/109475743) of how to perform a firmware update for the SIMATIC ET 200AL.

NOTE

You cannot accomplish firmware update V1.0.1 by means of a SIMATIC Memory Card installed in a CPU. Please use one of the following approaches:

- Online via PROFINET (with STEP 7)
- Via the integrated web server of an F-CPU
- Via the SIMATIC Automation Tool

Table: Models affected by ET 200AL F-IO firmware update V1.0.1

Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity

- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=444&ci=5596).

Firmware
You will find the latest firmware versions (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/search?t=all&search=ET%20200eco%20PN&type=Download&lc=en-WW).

Documentation
The complete documentation consists of product information, the system manual, equipment and function manuals. You can find these in the Manual Collection (https://support.industry.siemens.com/cs/ww/en/view/109781058) on the Internet.

Retention of the documentation
Retain this documentation for later use.

1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Install products with degree of protection IP65/67 according to IEC 60529 weatherproof and stationary.

⚠ WARNING

Safety functional extra low voltage
The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058) of the fail-safe I/O and in the data sheets of the power supplies to be used.
Use a power supply unit with output voltage that does not exceed 35 V DC even in the event of a fault.
Follow the notes and warnings in the respective manual.

Electromagnetic Compatibility
The I/O system is intended for operation in the EMC environment class Industry.
Ensure an EMC-compliant design of your automation system as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058) for the I/O system.

NOTICE

Interference emission / Interference immunity
The operation of the I/O system can cause radio interference in residential areas.
If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

ATEX-/UKEX device intended for use in hazardous area
If the product is intended for use in a potentially explosive atmosphere (gas/air or gas/dust mixture), observe the special information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058). The intended use (e.g. ATEX zone, degree of protection, temperature class) is indicated on the product (in the declaration of conformity and usually also on the nameplate).

NOTE

As a rule, country-specific requirements for the operator also apply when a product is used in a potentially explosive atmosphere (e.g. Directive 1999/92/EC for the EU).

Safety in potentially hazardous atmospheres
SIMATIC systems are suitable for use in zones with occasional presence of hazardous gas atmospheres (equipment group II, Cat. 3, gases, vapors, mists). You can find information, restrictions and special conditions in the respective system manuals. To avoid damage, determine a suitable installation location and select suitable products. It is mandatory to define the following points before planning your automation system:

- Hazardous plant areas
- Potentially existing atmosphere
- Relevant requirements for the products

⚠ WARNING

Explosion hazard
If work in areas with potentially hazardous atmospheres is not carried out correctly, an explosion may occur. Explosions can lead to serious personal injury or damage to the plant.
Only suitably qualified specialists are allowed to plan and perform activities in areas with potentially hazardous atmospheres.
In hazardous areas, always de-energize the SIMATIC system before starting activities.

Cleaning
When wired, the product complies with degree of protection IP65/IP67 and does not require any cleaning.
If you do have to clean the product, then use a dry or damp cloth. Take care to comply with the conditions of degree of protection IP65/IP67 when cleaning with liquids.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058).

Functional safety

⚠ WARNING

Danger to humans and the environment
To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components. For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109781058).

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether the firmware version is approved for the respective fail-safe I/O.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

2 Use of radio devices and cell phones

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones

Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.

If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.

Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Introduction

1

Purpose of the documentation

This documentation provides you with important information on configuring, installing, wiring and commissioning the SIMATIC ET 200eco PN M12-L distributed I/O devices.

The ET 200eco PN M12-L I/O devices are the innovation of the proven product family ET 200eco PN. You can recognize the I/O devices of the new innovation level by the suffix **M12-L**.

Basic knowledge required

This manual requires general knowledge of automation engineering.

This manual contains a description of the components that were valid at the time the manual was published. We reserve the right to issue a Product Information which contains up-to-date information about new components and new versions of components.

Validity of the documentation

This documentation applies to the SIMATIC ET 200eco PN M12-L distributed I/O devices.

Safety of the plant or the system

Safety is the responsibility of the assembler
The safety of any plant or system incorporating the equipment is the responsibility of the assembler of the plant or system.

Conventions

Also observe notes marked as follows:

NOTE

A note contains important information:

- On the product described in the documentation
- On handling the product
- On the part of the documentation to which special attention is drawn, as this can result in damage.

Standards

You can find a dated reference to the respective standards or the EU Declaration of Conformity on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=444&ci=526).

ID Link for the digital nameplate

Figure 1-727 ID Link example DI 16x24VDC 8xM12

The ID Link is a globally unique identifier according to IEC 61406, which you will find in the future as a QR code on your product.

The figure shows an example of an ID Link for the I/O device digital inputs DI 16x24VDC 8xM12.

You can recognize the ID Link by the frame with a black frame corner at the bottom right. The ID Link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner or reader app. Call the ID Link.

In the digital nameplate, you will find product data, manuals, Declarations of Conformity, certificates, and other helpful information about your product.

Additional support

- The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/ps).
- You can find more information in section SiePortal (Page 7).

1.1 SiePortal

You can find current information on the following topics quickly and easily here:

- **Catalog and ordering system**
  Ordering system for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).
- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySiePortal**
  Your personal work area in the SiePortal for notifications, support requests, and configurable documents.

This information is provided by SiePortal on the Internet (https://sieportal.siemens.com/).

1.2 Guide to ET 200eco PN M12-L

1.2.1 Information classes ET 200eco PN M12-L

The documentation for the SIMATIC ET 200eco PN M12-L distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/de/en/view/109742718).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200eco PN M12-L distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200eco PN M12-L System Manual
- Online help in the TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- I/O Device Digital Inputs Equipment Manuals
- I/O Device Digital Inputs Equipment Manuals
- I/O Device Digital Inputs/Outputs Equipment Manuals
- IO-Link Master I/O Device Communication Module Equipment Manual
- I/O Device Analog Inputs Equipment Manual

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200eco PN M12-L distributed I/O system.

Examples:

- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- Function Manual Designing Interference-free Controllers
- IO-Link System Function Manual
- MultiFieldbus Function Manual

1.2.2 Basic tools

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer

- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/98161300)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

1.2.3 S7 Port Configuration Tool (S7-PCT)

SIMATIC S7-PCT

The Port Configuration Tool (PCT) is a PC-based software for the parameter assignment of Siemens IO-Link Master modules and IO-Link devices from any manufacturer.

You integrate IO-Link-devices using the standardized device description "IODD", which you get from the respective device manufacturer. S7-PCT supports version 1.0 and V1.1 of the IODD.

S7-PCT is called via the hardware configuration of the IO-Link Master from STEP 7. When STEP 7 is not used or the IO-Link Master is not operated on a SIMATIC controller, "standalone"-operation is also possible.

You can find additional information on IO-Link on the Internet (https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html).

1.2.4 MultiFieldbus Configuration Tool (MFCT)

MultiFieldbus Configuration Tool

MultiFieldbus Configuration Tool (MFCT) is a PC-based software and supports the configuration of MultiFieldbus- and DALI-devices. In addition, the MFCT offers convenient options for mass firmware updates of ET 200 devices with MultiFieldbus- support and reading service data for many other Siemens devices.

Functional scope of the MFCT

- MultiFieldbus configuration:
  Engineering, configuration and diagnostics of MultiFieldbus-devices, provision of the required project files (project, UDT-, CSV- and EDS-file), transfer/export of the files to device and/or data memory.
- DALI configuration:
  Device selection and online configuration of DALI devices.
- TM FAST:
  Generation and download of FPGA-UPD- and FPGA-DB-files.
- Maintenance:
  Topology scan of a Ethernet network, reading of service data, parameter assignment and firmware update.
- Settings:
  Language switching German / English, network scanner speed, setting of the network adapter, installation of GSDML-and EDS-files.

System/installation requirements for MFCT

The MFCT runs under Microsoft Windows and does not require installation or administrator rights.

For MFCT you must also install the following software:

- Microsoft .NET Framework 4.8 (You can find an Offline Installer on the Internet. (https://support.microsoft.com/en-us/topic/microsoft-net-framework-4-8-offline-installer-for-windows-9d23f658-3b97-68ab-d013-aa3c3e7495e0))
- NPcap from directory "Misc"
- PG/PC interface from directory "Misc"
- Microsoft C++ Redistributable for x86-systems (you can find the installation data for download on the Internet. (https://aka.ms/vs/15/release/vc_redist.x86.exe))

The download of the tool and further information as well as documentation on the individual functions of the MFCT can be found on the Internet.
(https://support.industry.siemens.com/cs/de/en/view/109773881)

1.2.5 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International
(https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)
     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:
     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.

Safety instructions

2

2.1 Warnings in this document

You can find explanations of the warnings used in this document in the "Legal information" section.

2.2 Safety related icons for ET 200eco PN M12-L

The following table explains the symbols located on the I/O device with the degree of protection IP65/IP67 and IP69K, on its packaging or in the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must follow the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
	The assigned safety symbols apply to devices with Ex approval. You must follow the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
	General warning sign **Hot surface** The surface of I/O modules with the marking 'Hot surface' can heat up significantly during operation.
	Read the information provided by the product documentation. ISO 7010 M002
	Be aware that the device is only approved for the industrial field and only for indoor use.
	Ensure the device is only installed by an electrically skilled person. IEC 60417 No. 6182

Symbol	Meaning
	Note that a device of Protection Class III can only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-DB symbol 5180 "Class III equipment"
	Note that the device must be constructed and connected in accordance with EMC regulations.
	Note that connected lines must be designed according to the expected minimum and maximum ambient temperature.

2.3 Intended use

The system is used to control machines and plants.

Intended use also includes observance of this documentation, in particular the safety instructions and conditions of use. See section Technical specifications (Page 84).

2.4 Changes to the device and spare parts

Modifications to the module may affect the safety and the function of the module:

- Do not make any changes or attachments to the module.
- Do not remove or paste over safety instructions on the module.
- Only use original spare parts and accessories.

2.5 Target group and personnel qualifications

All persons working with this module require the following knowledge:

- Contents of this document as well as contents of the enclosed documents.
- Handling the module (after instruction)
- Relevant standards and regulations
- Accident prevention regulations

The following activities are reserved for specially qualified personnel:

Working on electrical parts
Work on electrical parts may only be performed by the following persons:

- Qualified electricians
- Persons trained in electrical engineering under the direction and supervision of qualified personnel.

Commissioning and configuration
Commissioning and configuration requires general knowledge in the field of automation technology.

2.6 Working on electrical parts

Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 16)).

- Always observe the country-specific safety rules.
- Notify all those who will be affected by the procedure.
- Follow the 5 safety rules according to DIN EN 50110-1 (VDE 0105-1):

1. Disconnect
2. Secure to prevent reconnection
3. Verify safe isolation from the supply (all poles)
4. Ground and short-circuit
5. Erect barriers around or cover adjacent live parts

After completing work:

- Restore operational readiness in reverse order.

2.7 Residual risks

Despite all the technical and procedural risk reductions that have been carried out, not all dangers can be avoided. The following sections describe these residual risks and measures to avoid them.

2.7.1 Live parts

Operation

- Do not open the module.
- Do not use damaged modules.
- Pull the plug and not the cable.

Installation and connection

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 16)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 17))
- Fuse the connection cables according to the current-carrying capacity of the cable used, taking into account the applicable standards.
- Ground the module according to regulations.
- For the 24 V DC supply (SELV/PELV), only use power supply units that provide safe electrical extra-low voltage in accordance with IEC 61131-2 or IEC 61010-2-201.

Maintenance

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 16)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 17)).

2.7.2 Conductive pollution

Malfunctions may occur if electrical energy is transmitted via conductive soiling.
Seal unused connections with a suitable and approved sealing cap.

2.7.3 Overheating

Smoke development and fire due to overheating of module and cables may result in burns and life-threatening injuries (death).

To avoid overheating:

- Ensure the correct installation position.
- Ensure sufficient air supply (e.g. observe mounting clearances).
- Only use undamaged cables.
- Only use correctly dimensioned cables.
- Ensure that the cable protection is dimensioned correctly.

Installation and connection

- Follow the instructions for the mounting position.
- Adhere to the specified ventilation clearances.
- Fuse the connecting cables according to the cable cross-section.
- Ensure for the connection that the overvoltage protection is sufficient.

Maintenance

- Check plug-in connections and cables regularly for damage.

2.7.4 Unsafe operating states

Unsafe operating states may result in personal injury of unknown extent.
The following factors can be triggers:

- Manipulation of the software, e.g. viruses, trojans or worms.

Manipulation of the software, e.g. viruses, trojans or worms.

- Adhere to the protective measures against tampering with the software (see section Industrial cybersecurity (Page 100)).
- Perform available updates in a timely manner.
- Protect files stored on removable media from malware with appropriate protective measures, e.g. virus scanner.
- Set up access protection for the CPU.

2.8 Behavior in case of emergency

The safety of any plant or system incorporating the equipment is the responsibility of the assembler of the plant or system. If an emergency occurs in the plant or the system, follow the instructions of the assembler and operator.

When the safe operating state has been restored, the person responsible for the plant ensures that the system starts up in a controlled manner.

2.9 Material damage

2.9.1 Transport and storage

- Only pack, store, transport and ship electronic components, modules or devices in the original product packaging or in other suitable materials.
- Observe the limits during transport and storage. See section Technical specifications (Page 84).

2.9.2 Installation and connection

Ensure for the connection that the overvoltage protection is sufficient.

Installation/disassembly with voltage switched on

- Install the ET 200eco PN M12-L distributed I/O devices only with disconnected supply and load voltages.
  Refer to section Mounting (Page 29)
- If you connect or disconnect the I/O devices with the power connected, this can lead to undefined states in your system.
  As a result material damage may occur at the distributed I/O device ET 200eco PN M12-L.
  Only remove or replace the I/O device when the voltage is switched off. Always comply with the required standards and safety guidelines when configuring a system.

Refer to section Maintenance (Page 77)

- When disconnecting plug-in connections during running operation, personal injury and material damage may occur in potentially explosive atmospheres.
  In potentially explosive atmospheres, de-energize the ET 200eco PN M12-L I/O device before disconnecting plug connections.

  Observe the special conditions for hazardous areas in these sections:

  – Codes and approvals (Page 84)
  – Use of the ET 200eco PN M12-L in Zone 2/Zone 22 hazardous areas (Page 98)

New properties/functions

System overview

4

4.1 What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?

SIMATIC ET 200eco PN M12-L

The SIMATIC ET 200eco PN M12-L distributed I/O devices are part of a scalable and highly flexible, distributed I/O system for connecting the process signals to a higher-level controller via MultiFieldbus. MultiFieldbus supports the following communication protocols:

- PROFINET IO
- EtherNet/IP
- Modbus TCP

The connection interface is marked PN/MF.

Customer benefits of the system

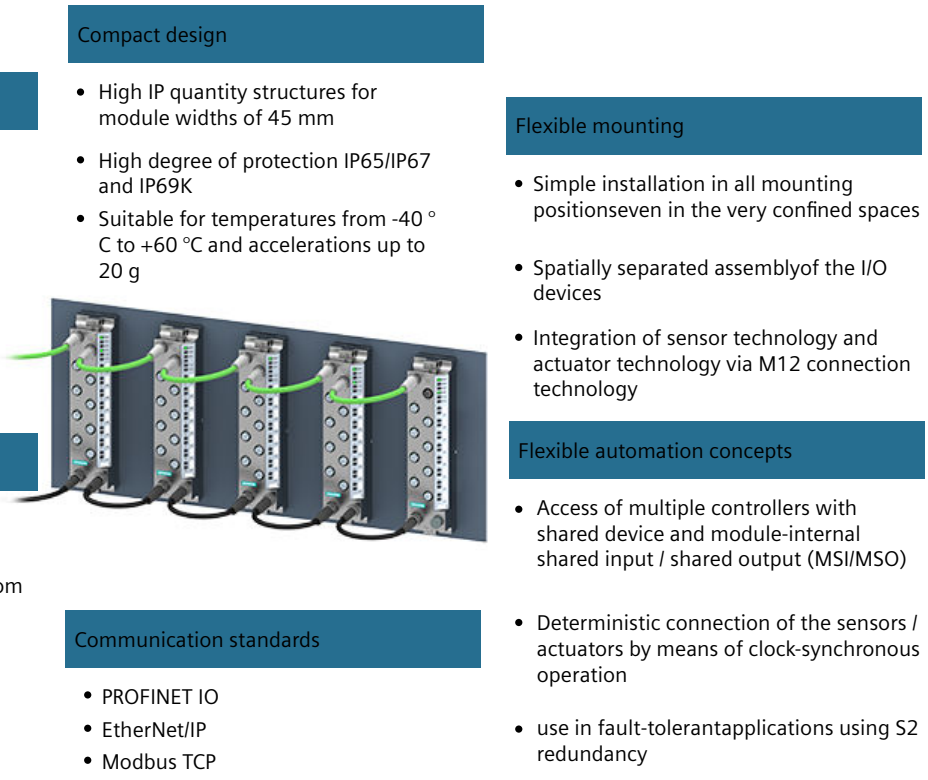

Figure 1-728 ET 200eco PN M12-L benefits

Area of application

The areas of application of the ET 200eco PN M12-L are derived from its special properties.

- A robust design and degrees of protection IP65/IP67 and IP69K make the ET 200eco PN M12-L distributed I/O device suitable for use in harsh industrial environments
- The distributed I/O ET 200eco PN M12-L with the IP54 degree of protection is suitable for use in Zone 2/Zone 22 hazardous areas.
- The compact design of the ET 200eco PN M12-L enables use in confined areas without control cabinets.
- The easy handling of ET 200eco PN M12-L facilitates fast commissioning and maintenance.

Configuration

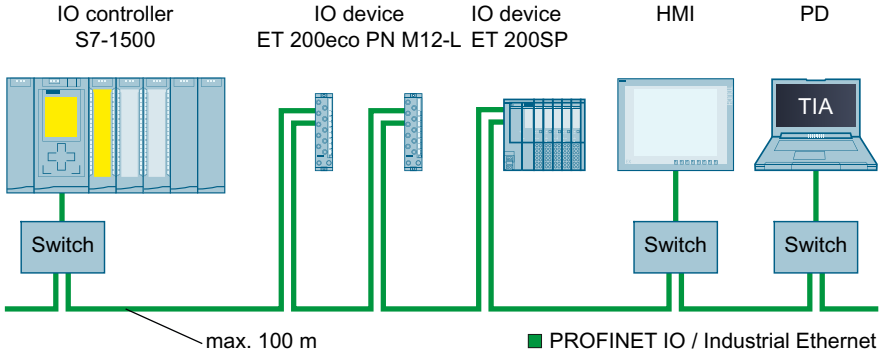
The SIMATIC ET 200eco PN M12-L distributed I/O system is made up of the following I/O devices:

- I/O device analog inputs
- I/O device digital inputs
- I/O device digital outputs
- Digital inputs/outputs of the I/O device
- I/O device IO-Link Master
- I/O device technology

The I/O devices of the ET 200eco PN M12-L are connected to an IO controller via MultiFieldbus.

Configuration example

The figure below shows an example configuration with the ET 200eco PN M12-L distributed I/O devices in a PROFINET IO network.



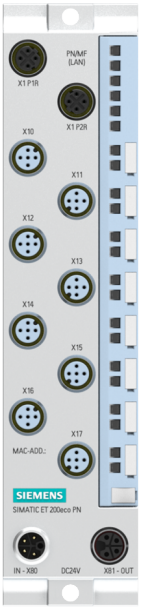


Figure 1-729 Configuration example of the ET 200eco PN M12-L

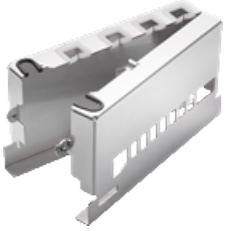
4.2 Components



Components of the ET 200eco PN M12-L distributed I/O system

The following table shows and explains the function of the most important components of the ET 200eco PN M12-L distributed I/O system.

Table 1-1006 Overview of components

Component	Function	Figure
I/O device	• The I/O device exchanges data with the IO controller via MultiFieldbus • The I/O device provides the interface to the process • Recording and controlling the current process status via the connected sensors and actuators	
Mounting rail	• Simple installation of several I/O devices next to one another. • Without drilling holes for I/O devices	
Profile screws for mounting rail	• Suitable screw for mounting the I/O device on the mounting rail.	

Component	Function	Figure
Identification labels	• The identification labels come with the module • They can be machine-printed • They can be ordered separately	
Sealing cap	• Caps for unused connections • IP protection class is maintained through use	
PROFINET IO cable and M12-D plug	• Connection to the MultiFieldbus	
Power connecting cable and M12-L plug / coupling	• Connection of supply and load voltages • Looping through of supply and load voltages to other devices	

Component	Function	Figure
Y cable	• Double connection of actuators or sensors to one socket • IP protection class is maintained when 2 actuators or sensors are connected to one socket	
Y-connector	• Double connection of actuators or sensors to one socket • IP protection class is maintained when 2 actuators or sensors are connected to one socket	
Plug cover	• For use in Zone 2 / Zone 22 hazardous area	

Mounting

5

5.1 Basics

Introduction

All ET 200eco PN M12-L distributed I/O devices are designed for IP65/IP67 and IP69K degrees of protection. This means that you can directly mount these I/O devices in your plant. Only use such accessories which are permitted for the required degree of protection.

Mounting position

You can mount the ET 200eco PN M12-L distributed I/O devices in any mounting position.

Minimum clearances

Ensure that the I/O devices are installed with a minimum clearance of 2 cm.

If the installation distance to other devices or objects is less than 2 cm, the ambient temperature must be reduced by 5 K (for example, 60 °C ⇒ 55 °C). This also applies to the derating diagrams in the equipment manuals.

The plug cover is an accessory for protecting the connected connectors on the I/O device. The plug cover may be necessary for use in hazardous areas. If you use the plug cover, the minimum distances from section Installing the plug cover (Page 33) apply.

Simple installation

The ET 200eco PN M12-L distributed I/O devices are designed for easy installation.

- The I/O device should be mounted on a level solid surface.
- The I/O device can be pre-wired.

Mounting rules

When mounting the I/O device, you do not need to following any special rules.

The plug cover is an accessory for protecting the connected connectors on the I/O device. The plug cover may be necessary for use in hazardous areas. If you use the plug cover, the installation rules from section Installing the plug cover (Page 33) apply.

NOTE

Mounting of the I/O devices

Install the ET 200eco PN M12-L distributed I/O devices only with disconnected supply and load voltages.

Configuration variants

There are two mounting variants:

- Without mounting rail
- With mounting rail

You can find additional information in the following sections.

5.2 Mounting without mounting rail

Introduction

The ET 200eco PN M12-L distributed I/O devices are designed for installation on a level, firm surface.

The axially symmetric drill holes allow you to fasten the I/O devices to an aluminum or carrier profile.

The following picture shows an aluminum mounting rail on which the I/O devices can be mounted.

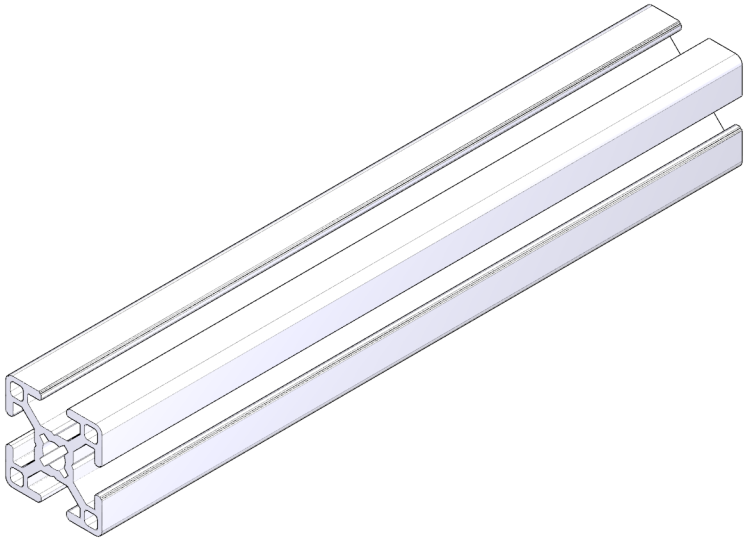


Figure 1-730 Aluminum profile

Required tools

For the installation you need a screwdriver, suitable for the screws used.

Required screws

For mounting, use screws with a diameter of 5 mm and a length of at least 35 mm.

Drill holes of the I/O device

All enclosures of the ET 200eco PN M12-L distributed I/O devices have a uniform hole pattern.

The housings of the I/O devices are axially symmetric. The distance between the drill holes is identical for all I/O devices.

Installing the I/O device

The I/O devices have an attachment point on top and on the bottom. You can also attach the I/O devices to the side.

To install the I/O device, follow these steps:

1. Drill two fixing holes at a distance of 191 mm.
   The drilling hole diameter depends on your chosen installation.
2. Fasten the I/O device with the screws at both fastening points to the flat base surface.
   The torque is 3 Nm

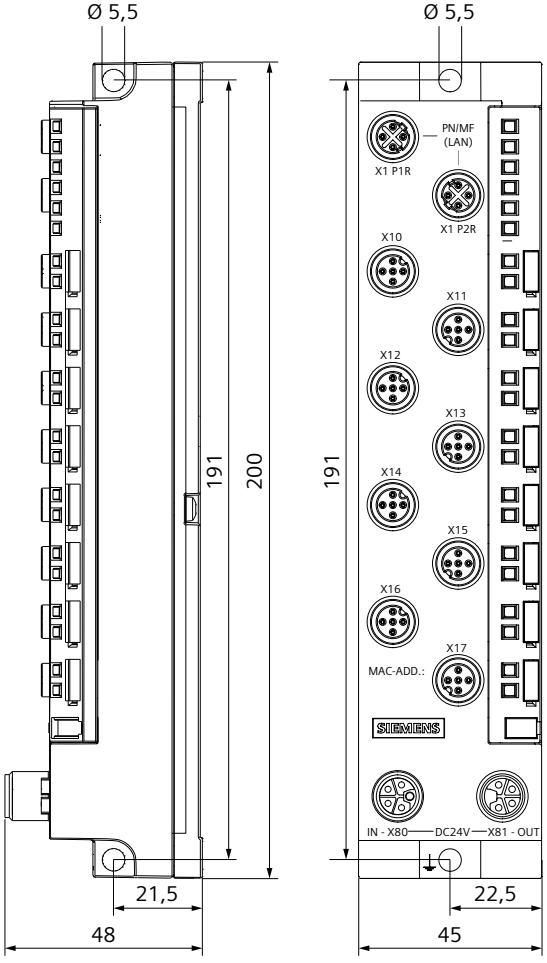

Figure 1-731 Mounting dimensions of the I/O device

5.3 Mounting with mounting rail

Introduction

A suitable mounting rail and profile screws are available as accessories for mounting the I/O devices.

Advantages of the mounting rail:

- Mounting rail can be cut to size for the application
- No drill holes required for the individual I/O devices
- I/O devices can be easily mounted on the mounting rail by simply screwing in the profile screws.

Required tools

For the installation you need a screwdriver, suitable for the screws used.

Required screws

For mounting rail
To mount the mounting rail, use screws with a diameter of 8 mm and a length of at least 20 mm.

For I/O devices on the mounting rail
To mount the I/O device on the mounting rail, use the mounting rail screws for the mounting rail ET 200eco PN M12-L**.**

Version

The mounting rail is available in a length of 500 mm.

Installing the mounting rail

The mounting rail with 500 mm length must be cut to length according to your requirements.

To install the mounting rail with 500 mm length, follow these steps:

1. Drill the mounting holes for screws with 8 mm diameter.
   We recommend that, after an initial distance of 12 mm, the mounting holes be provided at regular intervals of 182 mm.
2. Fasten the mounting rail with the screws.

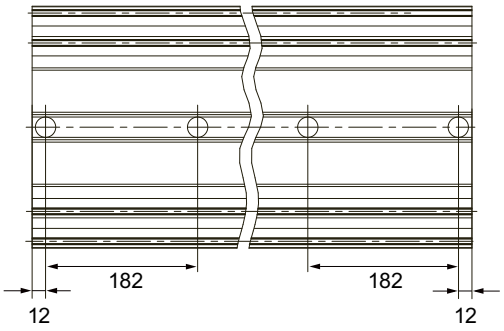

Figure 1-732 Installing the mounting rail

Installing the I/O device

The I/O devices have an attachment point at top and bottom for front mounting and side mounting.

The mounting rail has a groove at the top and bottom in which the profile screws are simply screwed in without drilling.

To install the I/O device, follow these steps:

1. Insert a profile screw through the mounting point of the I/O device and in a groove of the mounting rail.
2. Use the screwdriver to screw the I/O device to the mounting rail.
3. Align the I/O device on the mounting rail.
4. Insert a profile screw through the other mounting point of the I/O device and in the other groove of the mounting rail.
5. Screw the I/O device to the mounting rail. The tightening torque is 1.5 Nm.

Accessories

The accessories for mounting the distributed I/O device can be found in section Accessories/spare parts (Page 120).

5.4 Installing the plug cover

The plug cover is an accessory for protecting the connected connectors on the I/O device. The plug cover may be necessary for use in hazardous areas. Complete the following tasks before installing the plug cover:

- Mounting the I/O device
- Wiring of the I/O device
- Various tests on the system

Mounting rules

The use of the plug cover is possible with the following mounting rules:

- Cables with straight connection of the socket or plug
- Maximum outer diameter of socket/plug is 16 mm
- Maximum per cable holder
  - 3 cables
  - Maximum outer diameter is 7 mm
- Adherence to the minimum clearance
- Maximum 10 mounting and disassembly operations of the cables in the cable holders permitted

Minimum clearances

Maintain the following minimum clearances.

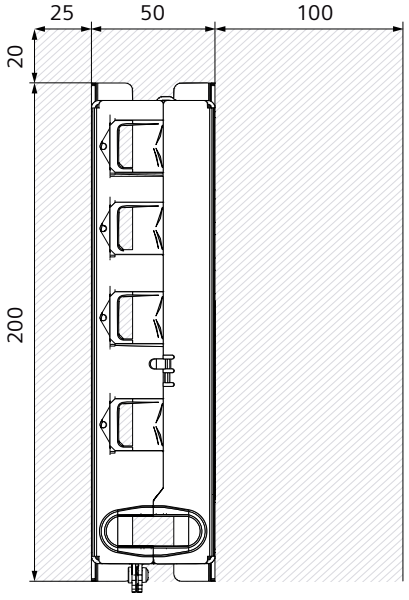

Figure 1-733 Minimum clearances

Dimensions of plug cover

The figure below shows the dimensions of the plug cover.

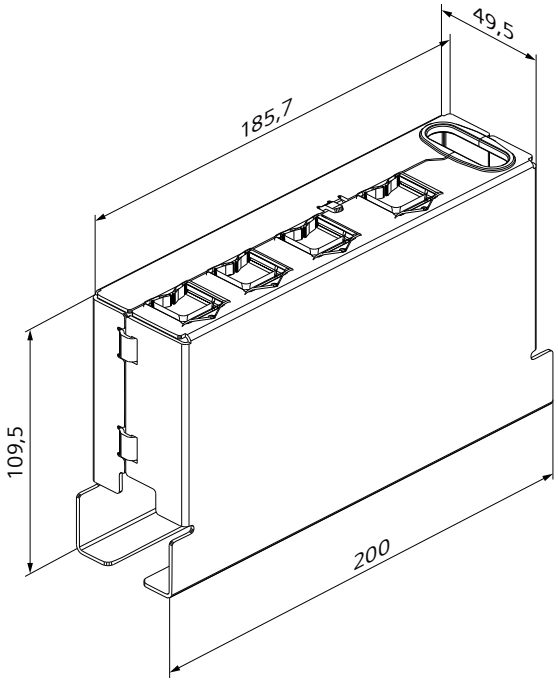

Figure 1-734 Dimensions of plug cover

Requirement

The mounting of the I/O module is prepared according to the description of these sections:

1. Basics (Page 29)
2. The planned mounting variant:
   - Mounting without mounting rail (Page 30)
   - Mounting with mounting rail (Page 32)

Required tools

For the mounting you will need:

- A screwdriver, suitable for the fixing screws used for the module.
- A TX 10 screwdriver for the plug cover

Installing the plug cover

For the installation, follow the steps below.

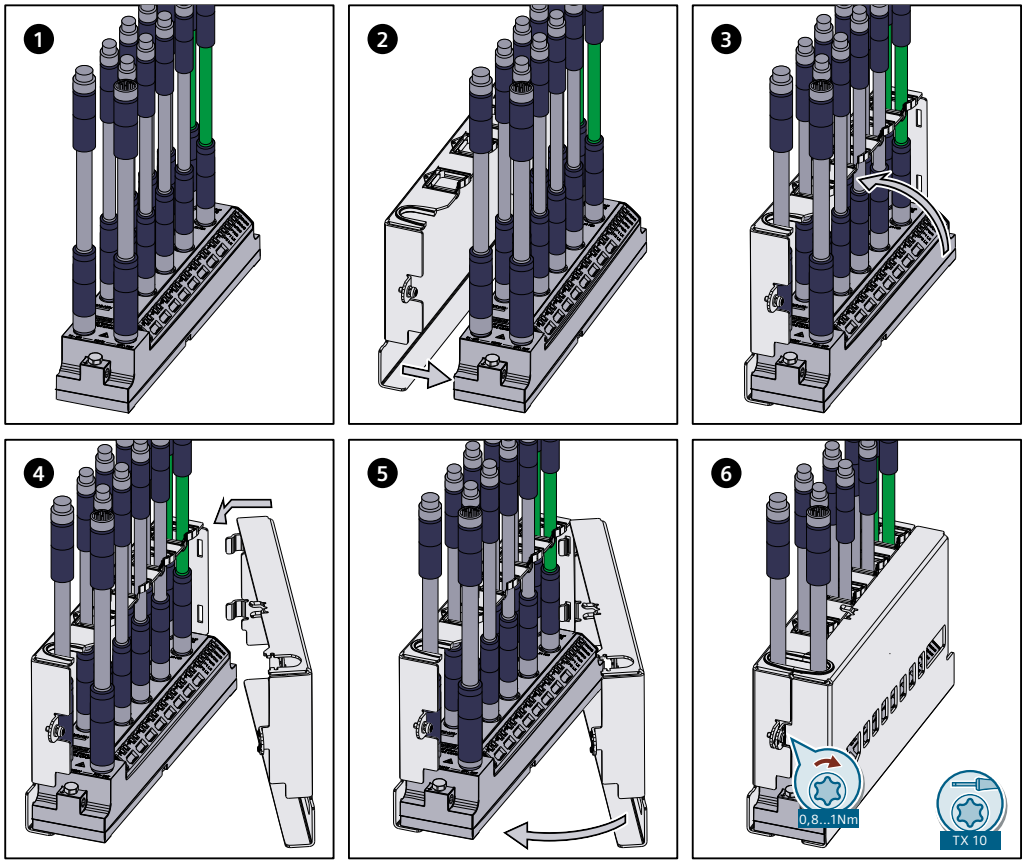

Figure 1-735 Installing the plug cover

1. Loosen the mounting screws of the I/O device
2. Slide the plug cover part with the cable cutouts under the I/O device.
3. Snap the connected cables into the provided cable holders
4. Hook the plug cover with the cutouts for the LED display into the plug cover with the cable cutouts.
5. Close the plug cover.
6. Close the plug cover with the connecting screw. Tightening torque: 0.8 to 1 Nm
7. Screw the cover into place on the I/O device, including the functional ground connection, with the fixing screws

Connecting

6

6.1 Rules and regulations for operation

Introduction

The ET 200eco PN M12-L distributed I/O devices are part of plants and systems. Depending on the area of application, follow the special rules and regulations.

This section provides an overview of the most important rules to be followed for integrating the ET 200eco PN M12-L distributed I/O devices into a plant or a system.

Specific application

Follow the safety and accident prevention regulations applicable to specific applications, e.g. the Machinery Directive.

EMERGENCY-STOP device

Emergency off devices according to IEC 60204-1 (corresponds to DIN VDE 0113-1) must remain effective in all operating modes of the plant or system.

Excluding hazardous system conditions

Hazardous plant states must not occur.

Ensure that dangerous system conditions are excluded, even in the following situations:

- In the event of a voltage dip / power outage
- When the plant restarts after a voltage dip or power outage.
- When the ET 200eco PN M12-L distributed I/O system restarts after interruption of MultiFieldbus communication

If necessary, force the EMERGENCY STOP.

An uncontrolled or undefined startup is not permitted after the "EMERGENCY STOP" is unlocked.

Cables and wires

The cables and lines used including plug must fulfill the following requirements:

- Designed for at least the supply voltage used.
- Conductor cross-section suitable for the application and fusing.
- Designed for a continuous ambient temperature of min. 20K (at 8 A) to 40K (at 12 A) above the ambient temperature of the ET 200eco PN M12-L. Please refer to the "Deratings of the input currents while maintaining the minimum clearance" table and the information enclosed with the cables.

External fuses/switches

External fuses and switches must be installed so that they meet the standards for cable and device protection applicable to your application.

Line voltage

The points to note for line voltage are set out below:

- For stationary plants or systems without an all-pole line disconnector, there must be a disconnector unit (all-pole) fitted in the building installation.
- For load current supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the ET 200eco PN M12-L distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

You can find more information in section Details on insulation, protection class, degree of protection and rated voltage (Page 96).

24 V supply

The points to note for 24 V power supply are set out below:

- For buildings:
  If there is a danger due to overvoltages, you must take lightning protection measures for external lightning protection (e.g. lightning protection elements).
- For 24 V DC supply lines and signal lines:
  In the event of danger through overvoltage, you must provide lightning protection measures for internal lightning protection (e.g. lightning protection elements). Additional information can be found in the function manual Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566).

- For 24 V DC supply:
  Ensure that there is a safe electrical separation of extra-low voltage (SELV/PELV) according to IEC 61010-2-201 or IEC 60950-1.
  Secure all feeding supply voltages with a UL/IEC approved fuse. This fuse must match the cable cross-section and must not exceed 24 V DC / 12 A.

NOTE

Wet environment
Other SELV/PELV values apply when using the I/O device in wet environments.

The specifications for a correct connection of the I/O device are listed in the System Manual and the device manuals. If you do not comply with the specifications, malfunctions, interferences, failure or destruction of the peripheral device or connected peripherals can result.

Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- To protect against electromagnetic faults, connect the I/O devices to functional earth.
- Ensure correct installation and wiring of the supply, signal lines and bus lines.
- Configure the plant/system in such a way that an error does not result in undefined states.
  - Line/wire break
  - Cross-circuit in the line

Reference

Additional information can be found in the function manual Designing interference-free controllers (https://support.industry.siemens.com/cs/ww/en/view/59193566).

6.2 Operation on grounded/non-grounded infeed

Introduction

Information is provided below on the overall configuration of an ET 200eco PN M12-L distributed I/O system on a grounded incoming supply (TN-S network). The specific subjects discussed are:

- Disconnecting devices, short-circuit and overload protection to IEC 60364 (corresponding to DIN VDE 0100) and IEC 60204 (corresponding to DIN VDE 0113)
- Load current supplies and load circuits
- Supply voltages of the ET 200eco PN M12-L distributed I/O system

Grounded infeed

In grounded incoming supplies, the neutral conductor of the supply system is grounded. A ground fault between a live conductor and ground or a grounded plant unit causes the protective devices to trip.

Supply voltages

Provide the ET 200eco PN M12-L distributed I/O devices with a SELV/PELV supply voltage for 1L+.
The supplied SELV/PELV load voltage for 2L+ can be switched, depending on the application.

- 1L+: Supply voltage (non-switched)
- 2L+: Load voltage (switched)

Safe electrical isolation (SELV/PELV)

Power packs/power supply modules with safe electrical isolation SELV/PELV are necessary for operating the ET 200eco PN M12-L distributed I/O devices. These power supplies/power supply modules must comply with IEC 61010-2-201 or IEC 60950-1.

The wiring of SELV/PELV circuits must be separated from the wiring of non-SELV/PELV circuits. The insulation of all conductors must be dimensioned for the higher voltage.

NOTICE
Operation in damp / wet environment When operating in a damp / wet environment, voltage limits apply for SELV/PELV andere according to IEC 61010-2-201.

Configuring ET 200eco PN M12-L with grounded reference potential (PELV)

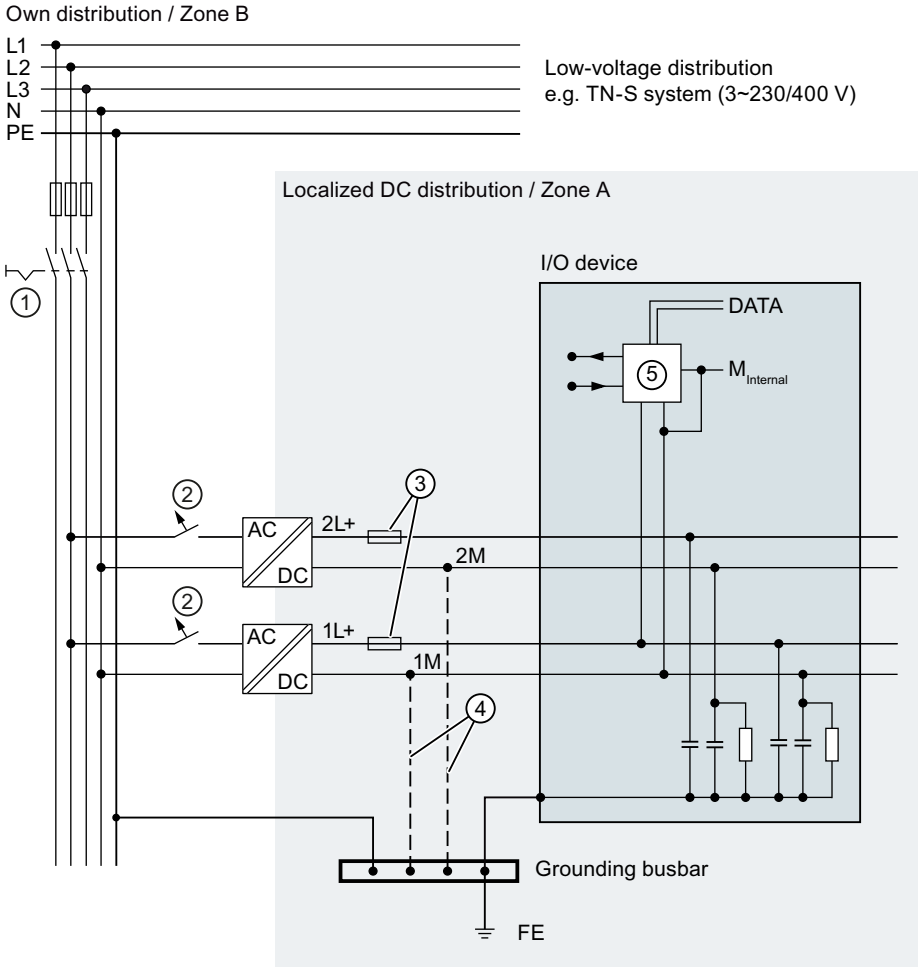
When configuring the ET 200eco PN M12-L distributed I/O devices with grounded reference potential, occurring interference currents are discharged into functional earth. The connections must be externally connected. Establish a connection between 1M or 2M and functional earth.

Configuring ET 200eco PN M12-L with non-grounded reference potential (SELV)

When configuring the ET 200eco PN M12-L distributed I/O devices with grounded reference potential, occurring interference currents are discharged into functional earth via an internal RC network. You do not need external connection between 1M, 2M and functional earth.

Components and protective measures

Various components and protective measures are stipulated for setting up a complete plant. The types of components and the degree to which the protective measures are mandatory depend on the IEC regulation that applies to your plant setup.



The following table shows the components of the electrical configuration with reference to the "Electrical configuration" figure below and compares the IEC regulations.

Table 1-1007 Components of electrical configuration

	Reference to illustration	**IEC 60364 DIN VDE 0100**	**IEC 60204 DIN VDE 0113**

Overall configuration of ET 200eco PN M12-L

The following figure shows a ET 200eco PN M12-L distributed I/O device with electrical overall configuration.

① Main switch
② Short-circuit and overvoltage protection
③ Fuses for cable protection
④ When configuring the ET 200eco PN M12-L distributed I/O devices with non-grounded reference potential, no connection is made between 1M, 2M and functional earth.
⑤ Circuit logic

Figure 1-736 Electrical configuration

NOTE

If you connect ET 200eco PN M12-L distributed I/O devices via upstream local power supplies to own distribution (or batteries), then you do not have to provide any additional protective measures against overvoltages.

Insulation monitoring

In the following situations, you must provide insulation monitoring:

- When setting up the ET 200eco PN M12-L distributed I/O devices with non-grounded reference potential
- If dangerous system states occur due to error

6.3 Electrical configuration of the ET 200eco PN M12-L

Electrical isolation

The electrical configuration of the ET 200eco PN M12-L features electrical isolation between:

- 1L+: Non-switched supply voltage (electronics/sensor/load supply):
  Isolated from MultiFieldbus and 2L+ (load voltage supply)
- 2L+: Switched supply voltage (load current supply):
  Electrical isolation from all other circuit components.
  Can be switched off without affecting the 1L+

- MultiFieldbus interface:
  Electrical isolation from all other circuit components.

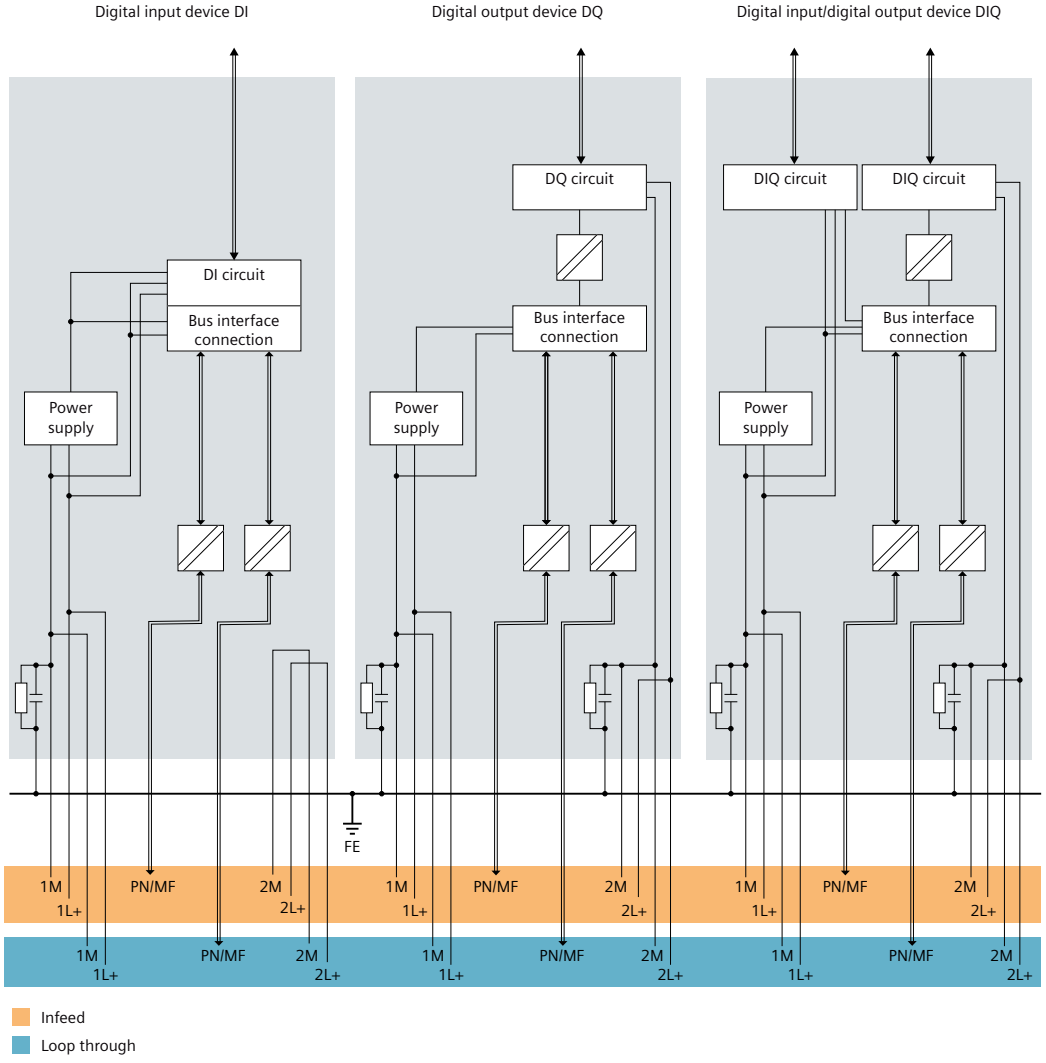

Figure 1-737 Electrical relationships

Connection of a digital output with a digital input

NOTICE
Pay attention to the potential groups When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+. The possible compensating currents can destroy the digital module.

⚠ WARNING

Note potential groups for safety-related shutdown
When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, which leads to elimination of the electrical isolation between 1L+ and 2L+.
The safety-related shutdown is not permitted if the electrical isolation is eliminated.

Cable protection

According to DIN VDE 0100, cable protection is required. Therefore, you must always protect the supply lines externally.

Protect the 24 V DC supply lines against short-circuits and overloads.

Select a protective device that meets the following criteria:

- 24 V DC supply voltage
- Suitable for cable cross-section and type of installation
- Suitable for other conditions, such as temperature

Power supply of the configuration

Two voltage groups are available for the ET 200eco PN M12-L distributed I/O devices.

- 1L+ (supply voltage / non-switched)
- 2L+ (load voltage / switched)

A renewed voltage supply of 1L+ and 2L+ may be necessary.

- To configure different potential groups
- Because of the voltage drop in long lines or several I/O devices

Create a supply/consumption balance for the selection of the infeed point of the supply voltages.

NOTE

Turning 1L+ and 2L+ on and off
In contrast to the load voltage 2L+, the operational switching on and off of the supply voltage 1L+ results in a restart of the I/O devices.

Reference

You will find more information on electrical configuration and the voltage drop in the section Connecting cables for ET 200eco PN M12-L (Page 50).

6.4 Connecting ET 200eco PN M12-L to the functional earth

Introduction

You must connect the ET 200eco PN M12-L distributed I/O devices to the functional earth.

What is functional earth?

All ET 200eco PN M12-L I/O devices feature a functional-earth connection. This connection is used to suppress interference sensitivity, but not for protection purposes. With the functional earth connection, you create an electrical connection to a point of your system or shielding. This discharges the EMC interference directly into the earth. By discharging the EMC interference, the interference immunity of the entire I/O device is increased.

The figure below shows the symbol with which the functional earth connection is identified on the ET 200eco PN M12-L I/O devices.

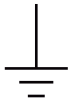

Figure 1-738 Functional earth

6.4.1 Mounting ET 200eco PN M12-L on conductive surface

Requirement

Conductive substrate for mounting of the I/O device.

Required tools

To connect to functional earth, you need the following tools:

- Screwdriver

Required accessories:

To connect to functional earth, you need the following accessories:

- 2 x 5 mm fixing screws

Mounting

Proceed as follows to connect ET 200eco PN M12-L distributed I/O devices to functional earth with a conductive mounting surface:

1. Drill two fastening holes. The dimensions of the I/O device can be found in the section Dimension drawing (Page 118).
2. Screw the module with the 5 mm fastening screws using a torque of 3 Nm.

NOTE

Earthing with conductive mounting substrate

If you attach a ET 200eco PN M12-L distributed I/O device to a conductive, grounded base, the two fixing screws establish a conductive connection to the ground potential.

Ensure that there is a low-impedance connection between the I/O device and conductive surface as well as between the conductive surface and the functional grounding.

Reference

You will find more information on installing the I/O devices in the section Mounting (Page 29).

6.4.2 Mounting ET 200eco PN M12-L on non-conductive surface

Requirement

Non-conductive substrate for mounting of the I/O device.

Required tools

To connect to functional earth, you need the following tools:

- Screwdriver
- Stripping tool
- Crimp tool

Required accessories:

To connect to functional earth on a non-conductive fastening substrate, you need the following accessories:

- 2 x 5 mm fixing screws
- Cable lug, suitable for 5 mm screws
- Spring lock washer
- Washer
- Grounding cable (braided copper cable) with a minimum cross section of 4 mm^2

Mounting

To connect ET 200eco PN M12-L distributed I/O devices to functional earth, proceed as follows:

1. Drill two fastening holes. The dimensions of the I/O device can be found in the section Dimension drawing I/O device (Page 118).
2. Strip the grounding cable.
3. Fasten the cable lug to the grounding cable.
4. Screw the I/O device and the cable lug with the 5 mm fastening screws using a torque of 3 Nm.

The figure below shows how to connect functional earth.

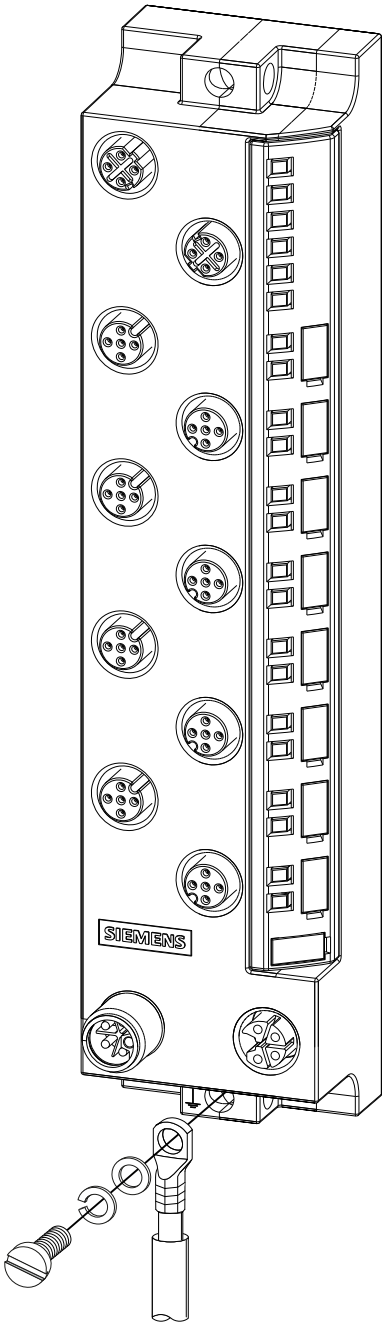

Figure 1-739 Connecting the functional earth

NOTE

Earthing with non-conductive mounting substrate

Make sure there is a low-impedance connection between the I/O device and the functional earth.

Reference

You will find more information on installing the I/O devices in the section Mounting (Page 29).

6.5 Connecting cables for ET 200eco PN M12-L

Impact of cable length on the supply voltage

When you wire your configuration, you must take into account the impact of the cable length on the supply voltage of the ET 200eco PN M12-L distributed I/O system.

⚠ CAUTION

Pay attention to maximum incoming currents

For each power supply (1L+, 2L+), you can feed in a maximum of 12 A.

If you exceed the maximum incoming currents and do not comply with the required cable cross sections, an increased incoming current could lead to overheating of the cable insulation and the contacts. This could result in damage to the I/O devices.

To estimate the voltage drop in your ET 200eco PN M12-L distributed I/O system, you must add the voltage drops of the different cables. For every I/O device used, you must factor in an additional voltage drop of around 0.1 V.

Example

When using a 10 m cable with Ø 1.5 mm^2, the voltage will drop by 2.5 V at a load of 10 A. This is equivalent to 0.25 V at a load of 1 A.

Derating of the input currents

The table below shows the maximum permissible input current of the distributed I/O systems depending on the ambient temperature.

Table 1-1008 Deratings of the input currents while maintaining the minimum clearance

Ambient temperature	Max. input current 1L+	Max. input current 2L+
40 °C	12 A	12 A
50 °C	10 A	10 A
60 °C	8 A	8 A

NOTE

Adherence to the minimum clearance

The I/O devices may be used at an installation distance of 2 cm up to max. 60 °C ambient temperature.

If the installation distance to other devices or objects is less than 2 cm, the ambient temperature must be reduced by 5 K (for example, 60 °C ⇒ 55 °C). This must also be taken into consideration for the derating diagrams of the Equipment Manuals.

6.6 Wiring

Wiring

Connect all cables to the front side of the I/O device:

- Supply voltage to the 4-pin M12-L coded round connectors and round sockets
- Signal lines to the 5-pin M12-A coded round sockets
- PROFINET IO/MultiFieldbus lines on the 4-pin M12-D coded round sockets
- Signal lines at the 8-pin M12 round sockets

Requirement

Wire the I/O devices with the supply voltage off.

Use in hazardous areas

The plug cover is an accessory for protecting the connected connectors on the I/O device. The plug cover may be necessary for use in hazardous areas. If you use the plug cover, the minimum distances specified in the Installing the plug cover (Page 33) section apply for installation.

Required tools

If you are not using pre-assembled cables, you need the following tools:

- Stripping tool
- Screwdriver to wire the connection plugs

Accessories required when connecting the supply voltage

You need the following accessories:

- Pre-assembled power cable 4-pin M12-L coded
  or
- Flexible 4-wire copper cable (wire cross section: 1.5 to 2.5 mm^2) and a connection plug 4-pin M12-L coded.

Accessories required for the connection of MultiFieldbus

You need the following accessories:

- Pre-assembled PROFINET M12 connecting cables with D-coded round connector
  or
- PROFINET cable and PROFINET M12 connector D-coded

Connecting the supply voltage, MultiFieldbus and sensor cable/actuator cable

To connect M12 plugs, proceed as follows:

1. Insert the plug into the respective round socket on the I/O device.
   Ensure the correct alignment of the coding between plug and socket.
2. Tighten the knurled screw of the connector with a torque of 1 Nm.

The figure below shows the connection of several I/O devices to the supply voltage and the MultiFieldbus as an example.

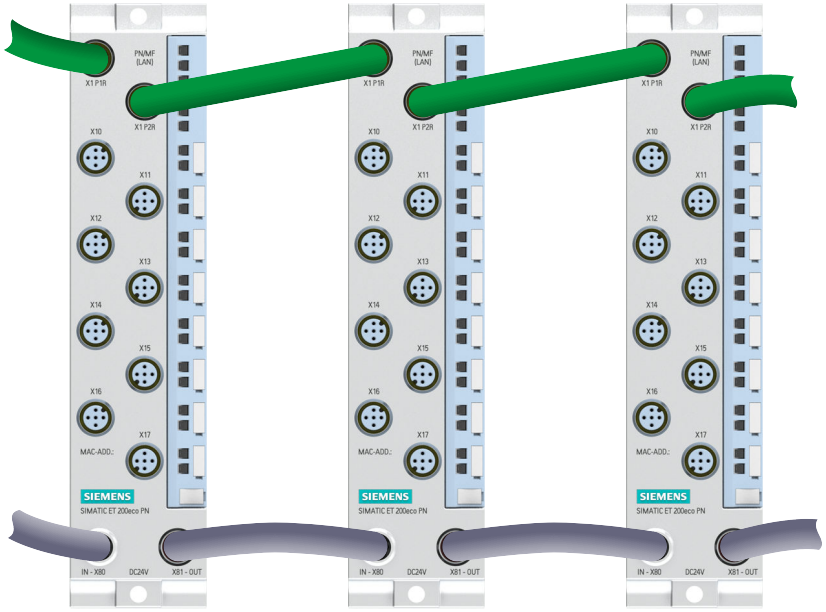

Figure 1-740 Connecting the supply voltage and MultiFieldbus

The figure below shows the connection of the sensor/actuator M12 plugs.

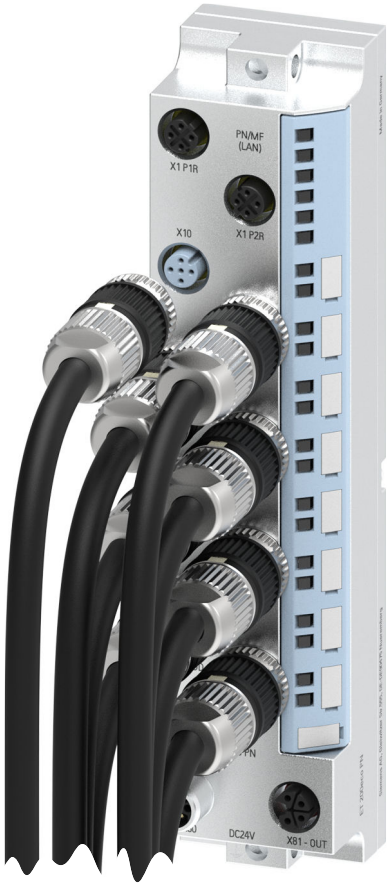

Figure 1-741 Connect sensor/actuator cable

Pin assignments of the sockets

You can find the pin assignment of the sockets in the Equipment Manuals of the I/O devices, in the section on pin assignment.

Y- connection

The Y-connection allows you to connect two actuators or sensors to the inputs or outputs of the I/O devices.

The use of a Y-cable or the Y-connector is particularly recommended when two channels are occupied for each socket of an I/O device. The Y-cable or the Y-connector distributes the two channels to two circular connectors.

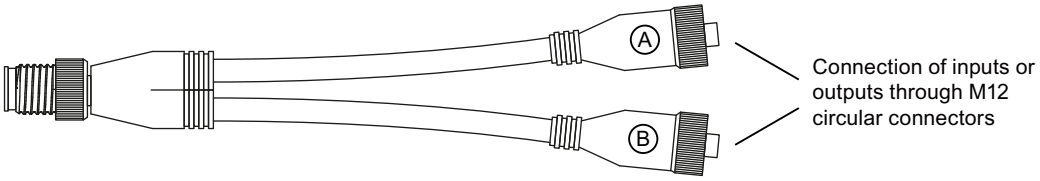

Figure 1-742 Y cable

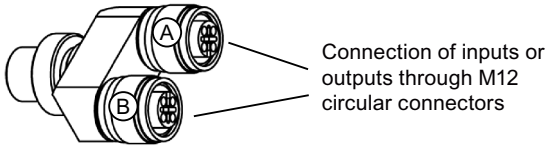

Figure 1-743 Y-connector

The figure below shows the wiring of the Y-connection.

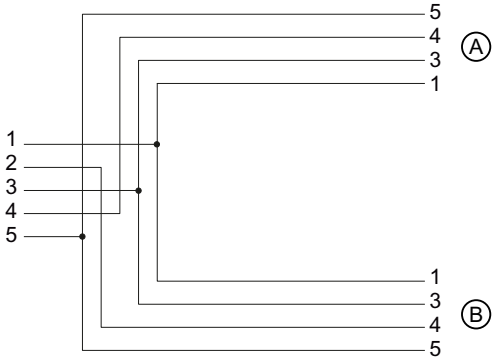

Figure 1-744 Wiring of the Y-connection

Sealing of unused sockets

To ensure IP65/IP67 or IP69K degree of protection, seal off all unused sockets with sealing caps. The sealing caps must be permitted for the required degree of protection.

Article numbers for accessories/spare parts

You will find the labels and article numbers in the Accessories/spare parts (Page 120) section.

6.7 Marking the ET 200eco PN M12-L

6.7.1 Factory markings

Introduction

For better orientation, the ET 200eco PN M12-L distributed I/O system is identified using various markings which will help you when configuring and connecting the I/O devices.

Marking of the interfaces

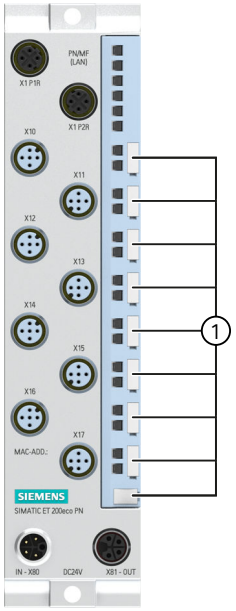
The interfaces of the I/O devices are factory-labeled.

The table below shows the labeling of the interfaces.

Table 1-1009 Interface labeling

interface	Labeling
MultiFieldbus interfaces	X1 P1R and X1 P2R
I/O input and output interfaces	X10 to X17
Power supply interfaces	X80 (IN) and X81 (OUT)

6.7.2 Optional markings



Introduction

In addition to the factory markings, there are also optional possibilities for labeling and/or identifying interfaces and I/O devices on the ET 200eco PN M12-L distributed I/O system.

Identification label

The identification labels come with each I/O device as strips and can be machine-printed. A strip has 10 identification labels measuring 10 x 5 mm in the color RAL9016. The identification labels can be inserted into every I/O device at the points provided. The identification labels are used for channel and I/O device labeling.

The figure below shows all points where you can attach the identification labels.

① Identification labels

Figure 1-745 Optional marking

6.7.3 Mounting identification labels

Introduction

This section describes how to mount or remove identification labels.

Required tools

You need a screwdriver with 3 mm blade width (only to remove identification labels).

Mounting procedure

To mount an identification label, proceed as follows:

1. Print the identification label using commercially available marking systems.
2. Press the identification label out of its holder.
3. Stick the identification labels into the cutouts provided, as shown in the figure Optional marking (Page 56).

Mounting the identification labels is the same for all I/O devices.

Removal procedure

To remove an identification label, proceed as follows:

1. Carefully use a screwdriver to pull out the identification label.

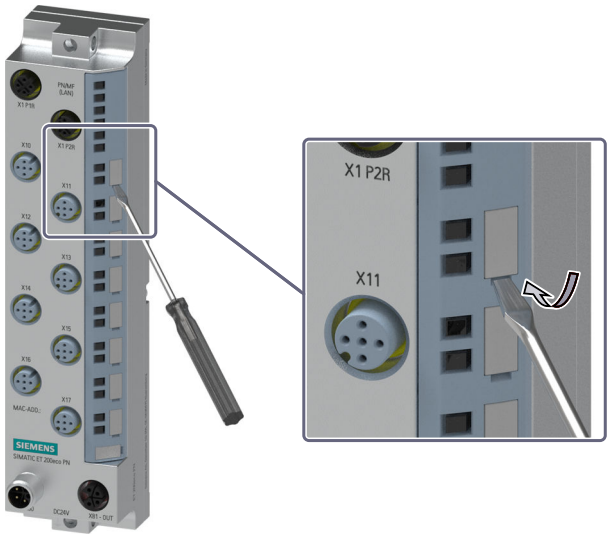


Figure 1-746 Replacing labels

Removing identification labels is the same for all I/O devices.

Configuring

7

7.1 MultiFieldbus engineering

MultiFieldbus Configuration Tool (MFCT)

You create and load the configuration and parameter assignment of the I/O modules with MFCT. The configuration and parameter assignment are retentively stored in the I/O module.

MFCT creates the following files and makes them available:

- User Defined Data Types (UDT) file (file extension *.l5x), enables structured access to I/O data with Ethernet/IP.
- Electronic Data Sheet (EDS) according to CIP specification Vol.1 for integration into EtherNet/IP configuration systems (the EDS file is also available for download)
- Comma Separated Values (CSV), contains the I/O data mapping of your configuration

You can find additional information on MFCT in the "MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209)" function manual.

7.2 Detect active fieldbus

For exclusive operation on a fieldbus (not MF Shared Device) you can recognize the active fieldbus by the number of green LEDs on the MF Device.

This requires that there are no errors and that the MF Device is in cyclic data exchange with a controller.

Active fieldbus:	RN/NS	ER/MS	MT/IO
PROFINET	■ Green	□ Off	□ Off
Modbus TCP	■ Green	■ Green	□ Off
EtherNet/IP	■ Green	■ Green	■ Green

7.3 PROFINET IO

Introduction

By configuring, parameterizing and connecting the individual hardware components of the ET 200eco PN M12-L distributed I/O devices, you determine their configuration (preset configuration) and their mode of operation. You perform the work needed for this in STEP 7 in *Devices & Networks*.

"**Configuring**" refers to the arranging, setup and networking of devices and modules within the *Devices & Networks* of STEP 7. STEP 7 graphically represents the I/O devices.

"**Assigning parameters**" refers to the setting of the properties of the I/O devices used.

STEP 7 compiles the hardware configuration (the result of "Configuring" and "Assigning parameters") and loads the configuration into the IO controller and/or into I/O devices of the plant.

7.3.1 Configuring the ET 200eco PN M12-L

Introduction

You configure and assign parameters to the ET 200eco PN M12-L distributed I/O device with STEP 7 or in the configuration software of another manufacturer.

Requirements

Table 1-1010 Requirements for installation

Configuration software	Requirements	Installation information
STEP 7 (TIA Portal) as of V16 with HSP 0299	PROFINET	STEP 7 online help
STEP 7 TIA Portal as of V14	PROFINET GSD file	The GSD versions are largely downward compatible.
STEP 7 V5.6 or higher	PROFINET GSD file	STEP 7 online help
Software of another manufacturer		Manufacturer documentation

Configuring the ET 200eco PN M12-L with STEP 7 TIA Portal

Information on the configuration can be obtained from the STEP 7 online help and in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) system manual.

Configuring the ET 200eco PN M12-L with STEP 7 Classic

The procedure for STEP 7 Classic can be found in the manual Programming with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/109751825).

Overview of PROFINET IO functions

The table below provides an overview of various PROFINET IO functions and the firmware version from when this function is supported.

Function	Firmware version
Isochronous real-time communication	FW 1.0.x or higher
Isochronous mode	FW 1.0.x or higher
Shared device	FW 1.0.x or higher
Module-internal shared input / shared output (MSI/MSO)	FW 1.0.x or higher
System redundancy S2	FW 1.1.x or higher

Function	Firmware version
Prioritized startup	FW 1.1.x or higher
Device replacement without programming device	FW 1.0.x or higher
Media redundancy	FW 1.0.x or higher

7.3.2 Isochronous real-time communication

Isochronous real-time communication

Synchronized communication protocol for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth is available within the send cycle for IRT I/O data. The reserved bandwidth ensures that the IRT data is also transmitted in time-synchronized intervals, unaffected by other high network loads (e.g. TCP/IP communication or additional real-time communication).

- IRT option:
  A topological configuration is required (STEP 7 V5.5 and higher).

NOTE

When an IO controller is used as sync master for IRT communication, the following must be observed:
Operate the IO controller also as a sync master when configuring IRT communication. Otherwise, IRT and RT configured IO devices can fail if the sync master fails.

Detailed information

You can find additional information on the topic of **isochronous real-time communication** in the STEP 7 online help and in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

7.3.3 Isochronous mode

Isochronous mode

The input and output data of distributed I/O modules in the system is simultaneously acquired and simultaneously output. For this purpose, the I/O data, the transmission cycle via PROFINET IO, and the user program are synchronized. The constant PROFINET IO cycle forms the corresponding clock generator. The I/O devices support isochronous mode of I/O data to the IO controllers starting at 250 µs. The I/O device can exchange isochronous process data with a maximum of one IO controller.

NOTE

Restriction with STEP 7 TIA Portal
The isochronous mode function is fully usable in STEP 7 TIA Portal from V16 Update 1. In the previous versions, it depended on the respective configuration whether and to what extent isochronous mode could be used. If an error occurs, the I/O device rejects the configuration with the alarm message "Parameter error".

For configuration with GSDML, select a configuration in the hardware catalog that provides the value status (QI) in order to use isochronous mode.

Detailed information

You can find additional information on the topic of **isochronous mode** in the STEP 7 online help and in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

7.3.4 Shared device

Shared device

IO device that makes its data available to up to two IO controllers.

If **there is no validity check of the shared device projects by the Engineering System**, note the following:

- Make sure the configurations are consistent. Assign each module or submodule to only one IO controller. Multiple assignment will result in an error as the module or submodule will only be available in the first controller.
- If you reconfigure shared device configurations without the validity check mentioned above, you have to commission the ET 200eco PN M12-L once again. This means you must download the projects of all involved IO controllers to the respective CPU again after reconfiguration. If necessary, perform a POWER OFF/POWER ON of the IO controller and the I/O device.

NOTE

In the case of a shared device application, make sure that all controllers work with the same send clock. If the controller does not have the same send clock, this may result in communication relationships not being set up.

If you set up all controllers in one project, the same send clock is ensured. Set the same send clock for engineering in separate projects.

Detailed information

You can find additional information on the topic of **shared device** in the STEP 7 online help and in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

7.3.5 Module-internal shared input / shared output (MSI/MSO)

Module-internal shared input / shared output (MSI/MSO)

The module-internal shared input function allows an input module to make its input data available to several IO controllers. Each controller has read access to the same channels.

The module-internal shared output function allows an output module to be operated by several IO controllers. One IO controller has write access. A second IO controller can have read access to the same channels.

Detailed information

You can find additional information on the topic of **Module-internal shared input / shared output (MSI/MSO)** in the STEP 7 online help and in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) function manual.

7.3.6 System redundancy S2

System redundancy S2

An IO device with S2 system redundancy supports redundant connections to 2 IO controllers (ARs).

In a redundant system, an IO device with system redundancy S2 has a redundant AR for each of the two CPUs (IO controllers). If one CPU fails, the IO device with S2 system redundancy remains accessible to the remaining IO controller via the AR.

The I/O devices support system redundancy S2 (as of FW V1.1.0) on S7-400H CPUs (as of FW V3.0) and on S7-1500R/H CPUs (as of FW V2.6).

Detailed information

You can find more information on the topic of **system redundancy S2** in the STEP 7 online help and in the Function Manual SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856).

7.3.7 Prioritized startup

Prioritized startup

Prioritized startup denotes the PROFINET functionality for accelerating the startup of IO devices operated on a PROFINET IO system with RT and IRT communication.

The function reduces the time that the correspondingly configured IO devices require to return to the cyclic user data exchange in the following cases:

- After the supply voltage has returned
- After station recovery
- After IO Devices have been activated

The prioritized startup function is supported by the ET 200eco PN M12-L I/O devices operated in a PROFINET IO system as of these FW versions.

- RT communication as of FW V1.0.0
- IRT communication as of FW V1.1.0

You recognize valid input values and output values from value status QI = 1. In the case of analog devices and IO-Link master communication modules, the determination of the analog value or the establishment of the IO-Link connection can take more time, for example. You receive invalid values with value status QI = 0 until then.

Detailed information

You can find more information in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) system manual.

7.3.8 Device replacement without programming device (PG)

Requirement

A topology must be created in the project.

Device replacement without programming device

IO devices with this function can be easily replaced:

- The device name does not have to be assigned with the programming device.

The replaced IO device receives the device name from the IO controller, no longer from the programming device. For this purpose, the IO controller uses the configured topology and the neighborhood relationships determined by the IO devices. The configured setpoint topology must agree with the actual topology.

If an I/O device was already in operation, reset it to factory settings before further use.

Detailed information

You can find more information in the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) system manual.

7.3.9 Media redundancy

Media redundancy

Function for ensuring the network and system availability. Redundant transmission links (ring topology) ensure that an alternative communication path is made available if a transmission link fails (STEP 7 V5.5 and higher).

For additional information, refer to the STEP 7 online help and the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856) manual.

7.4 EtherNet/IP

7.4.1 Introduction to configuring

Introduction

By configuring, parameterizing and connecting the individual hardware components of the ET 200eco PN M12-L distributed I/O devices, you determine their configuration (preset configuration) and their mode of operation. You perform the work needed for this in MFCT. The full range of functions is not ensured with other software.

"**Configuring**" refers to the arranging, setting up and networking of devices and modules in the MFCT or in another software.

"**Assigning parameters**" refers to the setting of the properties of the I/O devices used.

MFCT or another software compiles the hardware configuration (the result of "Configuring" and "Assigning parameters"). Then the configuration is loaded into I/O devices of the plant and the configuration files prepared for the controller.

NOTE

Temporary bus interruption

The ET 200eco PN M12-L I/O device starts again once the configuration is loaded. The reboot interrupts the MultiFieldbus for all downstream devices. The bus interruption is evaluated by the software used and the controller.

Detailed information

You can find more information in the "MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209)" function manual.

7.4.2 EtherNet/IP functions

The I/O modules can be configured with MFCT or another user program via EtherNet/IP.

The following table shows the supported EtherNet/IP functions with the configuration software MFCT V1.3 SP1 or higher:

Function	Firmware version
I/O communication with scanner	FW 5.1.x or higher
Reading diagnostics	FW 5.1.x or higher
Normative CIP objects	FW 5.1.x or higher
Hardware interrupt	FW 5.1.x or higher
Transfer data records	FW 5.1.x or higher
Resetting I/O module modules to factory setting	FW 5.1.x or higher
Diagnostics bit in data status of cyclic I/O data per submodule	FW 5.1.x or higher
Shared device	FW 5.1.x or higher
Module-internal shared input / shared output (MSI/MSO)	FW 5.1.x or higher

IP address

For the EtherNet/IP bus protocol, the IP address and the gateway address must not be identical.

NOTE

Setting the IP address
If there is an active connection to the controller and the IP address is set, an error message may be displayed in some configuration software.
Procedure:

1. Stop the connection to the controller.
2. Enter the IP address.

7.5 Modbus TCP

7.5.1 Introduction to configuring

Introduction

By configuring, parameterizing and connecting the individual hardware components of the ET 200eco PN M12-L distributed I/O devices, you determine their configuration (preset configuration) and their mode of operation. You perform the work needed for this in MFCT. The full range of functions is not ensured with other software.

"**Configuring**" refers to the arranging, setting up and networking of devices and modules in the MFCT or in another software.

"**Assigning parameters**" refers to the setting of the properties of the I/O devices used.

MFCT or another software compiles the hardware configuration (the result of "Configuring" and "Assigning parameters"). Then the configuration is loaded into I/O devices of the plant and the configuration files prepared for the controller.

NOTE

Temporary bus interruption
The ET 200eco PN M12-L I/O device starts again once the configuration is loaded. The reboot interrupts the MultiFieldbus for all downstream devices. The bus interruption is evaluated by the software used and the controller.

Detailed information

You can find more information in the "MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209)" function manual.

7.5.2 Modbus TCP functions

Modbus TCP functions

The following table shows the supported functions of the I/O modules in the Modbus TCP mode with the configuration software MFCT as of V1.3 SP1:

Function	Firmware version
I/O communication with scanner	FW 5.1.x or higher
Reading diagnostics	FW 5.1.x or higher
Hardware interrupt	FW 5.1.x or higher
Transfer data records	FW 5.1.x or higher
Resetting I/O module modules to factory setting	FW 5.1.x or higher
Diagnostics bit in data status of cyclic I/O data per submodule	FW 5.1.x or higher
Shared device	FW 5.1.x or higher
Module-internal shared input / shared output (MSI/MSO)	FW 5.1.x or higher

7.6 MF Shared Device

Number of connections via the MultiFieldbus

The distributed I/O devices support 2 simultaneous connections via the same connection type. A combination of various connection types is not possible.

The module objects are displayed in the MFCT or in other software during the selection.

Detailed information

You can find more information in the MF Shared Device section of the "MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209)" function manual.

Commissioning

8

8.1 Commissioning ET 200eco PN M12-L on MultiFieldbus

Introduction

The commissioning of your distributed I/O devices depends on the respective plant configuration. The following procedure describes how to commission the ET 200eco PN M12-L on an IO controller.

Requirements for commissioning on the MultiFieldbus

NOTE

Performing tests

You must ensure the safety of your plant. You need to run a complete functional test and perform the required safety checks before the commissioning of a plant.

Also allow for any possible foreseeable errors in the tests. This prevents you from putting persons or equipment at risk during operation.

Procedure

The following table shows the chapters/documents in which the required actions are described.

Table 1-1011 Requirements for the ET 200eco PN M12-L on the MultiFieldbus

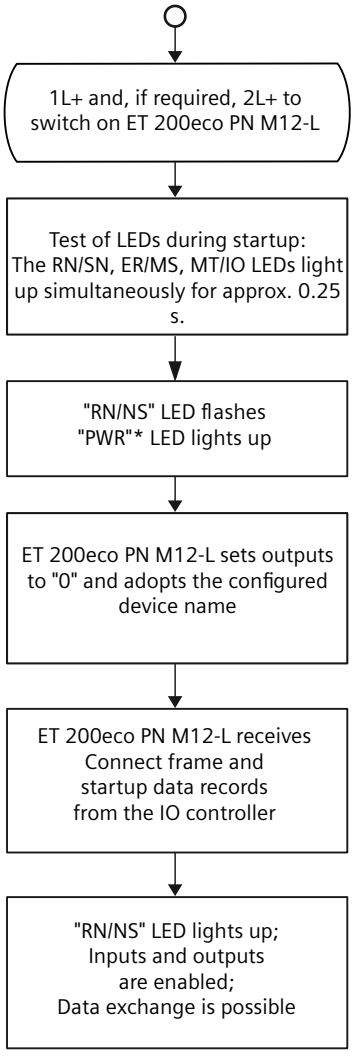
Step	Procedure	Reference
1	Mounting the ET 200eco PN M12-L	Section Mounting (Page 29)
2	Wiring the ET 200eco PN M12-L	Section Connecting (Page 37)
3	Configuring the ET 200eco PN M12-L	Section Configuring (Page 58)
4	Switching on supply voltage for the IO controller	IO controller manual
5	IO controller is in RUN mode	IO controller manual

Commissioning the ET 200eco PN M12-L

1. Switch on the supply voltage 1L+ non-switched for the ET 200eco PN M12-L.
2. Switch on the power supply 2L+, if necessary.

Reference

Additional information on the commissioning:



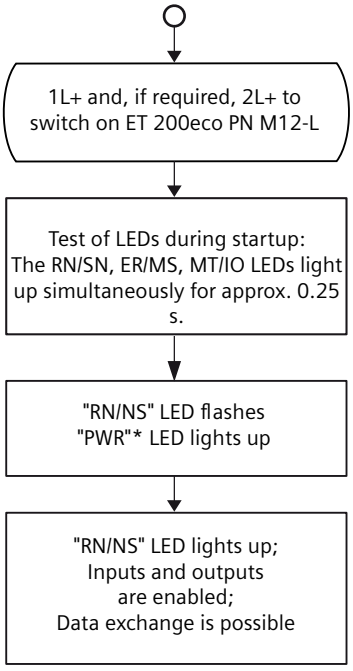
- STEP 7 online help
- In the manual SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856)
- In the MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209) function manual

8.2 Startup of the I/O device

8.2.1 Unconfigured on PROFINET IO

Startup without parameter assignment on PROFINET IO

The following schematic diagram shows the startup of the ET 200eco PN M12-L in factory setting, without PROFINET IO:

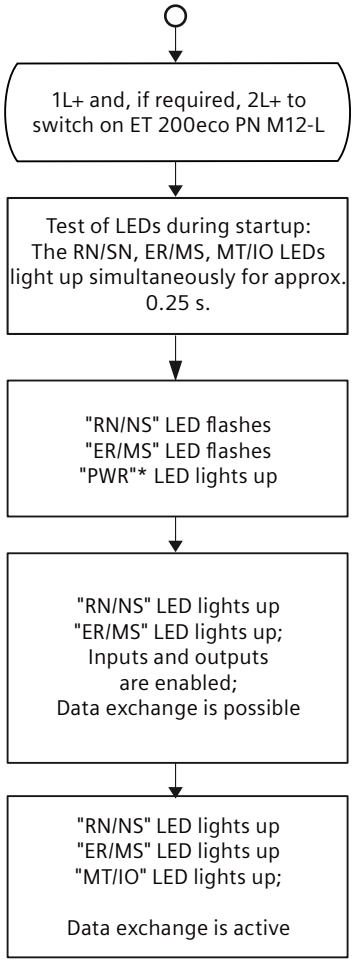


* "PWR" only for I/O devices that use 2L+ and when 2L+ is connected

8.2.2 Configured on PROFINET IO

Startup configured on PROFINET IO

The following schematic diagram shows the startup of the ET 200eco PN M12-L I/O device on PROFINET IO:

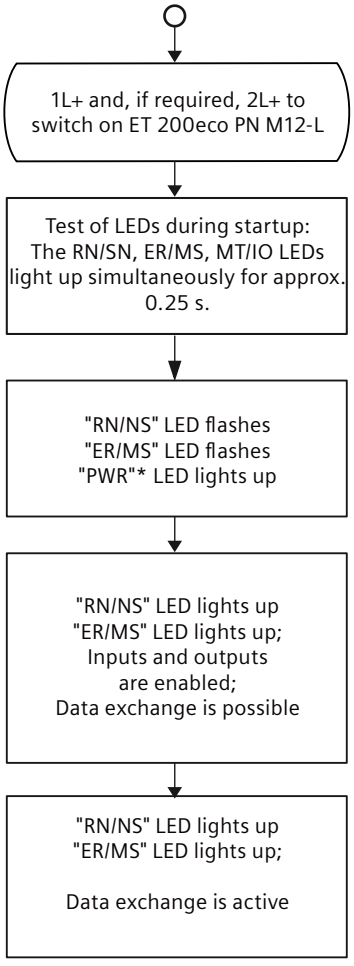


* "PWR" only for I/O devices that use 2L+ and when 2L+ is connected

8.2.3 Configured on EtherNet/IP

Startup configured on EtherNet/IP

The following schematic diagram shows the startup of the ET 200eco PN M12-L I/O device on EtherNet/IP:

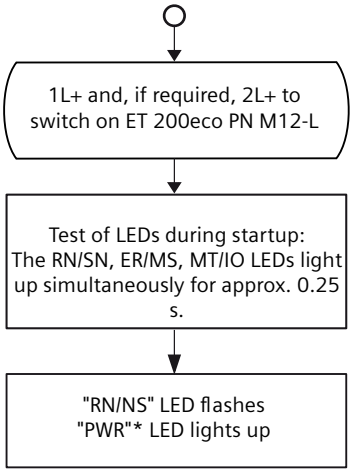


* "PWR" only for I/O devices that use 2L+ and when 2L+ is connected

8.2.4 Configured on Modbus TCP

Startup configured on Modbus TCP

The following schematic diagram shows the startup of the ET 200eco PN M12-L I/O device on Modbus TCP:



* "PWR" only for I/O devices that use 2L+ and when 2L+ is connected

8.2.5 Unconfigured without communication to fieldbus

Startup without parameter assignment, without communication to fieldbus

The following schematic diagram shows the startup of the ET 200eco PN M12-L with factory settings, displayed schematically without communication to the fieldbus:

* "PWR" only for I/O devices that use 2L+ and when 2L+ is connected

8.3 Identification and maintenance data

8.3.1 Reading out and entering I&M data

Introduction

I&M identification data is information which is stored on the I/O device either as read-only data (I-data) or read/write data (M-data).

Identification data (I&M0): Manufacturer information on the I/O device that is read-only and in some cases is also lasered on the I/O device housing, for example, article number, serial number and firmware version.

Maintenance data (I&M1, 2, 3): Plant-dependent information, e.g. installation location. Maintenance data is created during the configuration and written to the I/O device.

All modules of the ET 200eco PN M12-L distributed I/O system support identification data and maintenance data (I&M0 to I&M3).

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a system
- Correcting errors in a system

With the I&M identification data, you have the option of clearly identifying I/O devices online.

In STEP 7, the identification data is displayed in the "Module status" and "Properties..." tabs (see STEP 7 online help).

Options for reading out I&M data

You have the following options for reading the I&M data:

- Via the user program
- Via STEP 7 or HMI devices

Procedure for reading I&M data by means of the user program

To read the I&M data of the I/O devices in the user program, use the instruction "RDREC".

With third party software, the "read record" instruction may be named differently.

You can find more information in the "MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209)" function manual.

Procedure for reading the I&M data using STEP 7

Requirement: An online connection to the I/O device must be available.

1. Select the I/O device in project tree under "Distributed I/O".
2. Select: **IO device/DP slave > Online & Diagnostics > Identification & Maintenance**.

Procedure for input of maintenance data using STEP 7

The default module name is assigned by STEP 7. You have the option to enter the following data:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)

To enter the data, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the I/O device, for example.
2. In the properties under "General", select the "Identification & Maintenance" area and enter the data.

During the loading of the hardware configuration, the I&M data is also loaded.

8.3.2 Data record structure for I&M data

Reading I&M data records (distributed via PROFINET IO)

You can directly access specific identification data by selecting **Read data record** ("RDREC" instruction). You obtain the corresponding part of the identification data under the associated data record index.

The following table shows the principle behind the structure of data records.

Table 1-1012 Basic structure of data records with I&M identification data

Contents	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	54 54 16 54	I&M0/Index $AFF0_H$ I&M1/Index $AFF1_H$ I&M2/Index $AFF2_H$ I&M3/Index $AFF3_H$

The following table shows the structure of data records for I&M identification data.

Table 1-1013 Data record structure for I&M identification data

Identification data	Access	Default	Explanation
Identification data 0: (data record index AFF0 hex)			
VendorIDHigh	read (1 byte)	00_H	This is where the name of the manufacturer is stored (42_D = SIEMENS AG).
VendorIDLow	read (1 byte)	$2A_H$	
Order_ID	read (20 bytes)	6ES7141-6BG00-0BB0	Order number of the I/O device (e.g. of the digital input module)
IM_SERIAL_NUMBER	read (16 bytes)	-	Serial number (device-specific)
IM_HARDWARE_REVISION	read (2 bytes)	1	Corresponding hardware version
IM_SOFTWARE_REVISION	read	Firmware version	Provides information about the firmware version of the I/O device
• SWRevisionPrefix	(1 byte)	V	
• IM_SWRevision_Functional_Enhancement	(1 byte)	00 - FF_H	
• IM_SWRevision_Bug_Fix	(1 byte)	00 - FF_H	
• IM_SWRevision_Internal_Change	(1 byte)	00 - FF_H	
IM_REVISION_COUNTER	read (2 bytes)	0000_H	Provides information about configured changes on the I/O device (not used)
IM_PROFILE_ID	read (2 bytes)	0000_H	Generic device

Identification data	Access	Default	Explanation
IM_PROFILE_SPECIFIC_TYPE	read (2 bytes)	0005_H	Interface modules
IM_VERSION	read	0101_H	provides information about the version of the identification data (0101_H = Version 1.1)
• IM_Version_Major	(1 byte)		
• IM_Version_Minor	(1 byte)		
IM_SUPPORTED	read (2 bytes)	$000E_H$	Provides information about the available identification data (I&M1 to I&M3)
Maintenance data 1: (data record index AFF1 hex)			
IM_TAG_FUNCTION	Read/write (32 bytes)	-	For the I/O device, enter an identifier that is unique plant-wide here.
IM_TAG_LOCATION	Read/write (22 bytes)	-	Enter the installation location of the I/O device here.
Maintenance data 2: (data record index AFF2 hex)			
IM_DATE	Read/write (16 bytes)	YYYY-MM-DD HH:MM	Enter the installation date of the I/O device here.
Maintenance data 3: (data record index AFF3 hex)			
IM_DESCRIPTOR	Read/write (54 bytes)	-	Enter a comment about the I/O device here.

Maintenance

9

9.1 Replacing an I/O device

Replacing an I/O device

Replacing an I/O device is not permitted during ongoing operation.

NOTICE
Material damage can occur If you connect or disconnect the I/O devices with the power connected, this can lead to undefined states in your system. Material damage to the ET 200eco PN M12-L distributed I/O device can occur as a result. Only remove or replace I/O devices when the power is disconnected. Always comply with the required standards and safety guidelines when configuring a system.

Behavior of MultiFieldbus

When an I/O device fails in the MultiFieldbus line, the line remains active up to the failed I/O device. After the I/O device has been replaced, the following I/O devices of the line log in again automatically in MultiFieldbus.

NOTE

MRP ring with PROFINET

When set up as an MRP ring topology in the PROFINET bus protocol, only the affected I/O device fails.

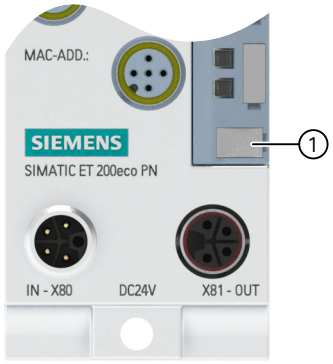
Procedure

To replace an I/O device, follow these steps:

1. Disconnect the supply voltage to the I/O device to be replaced.
2. Completely remove all cables connected to the I/O device.
3. Loosen the fixing screws of the I/O device completely.
4. Replace the I/O device.

NOTE

"New" I/O device



Replace the remote I/O device with an I/O device of the same type.

5. Fasten the I/O device with a torque of 3 Nm.
6. Connect all cables.
7. Turn the supply voltage on.

⚠ WARNING

Observe the connection sequence of I/O devices
If you mix up the ET 200eco PN M12-L I/O devices or lines when connecting them, this can cause personal injury and damage to the machine.
We recommend that you clearly label the ET 200eco PN M12-L I/O devices with the device number.

The figure below shows a recommendation for labeling the ET 200eco PN M12-L I/O devices with the device number.

① Recommendation for labeling the device number

Figure 1-747 Device number

Result

Topological configuration:

1. The new I/O device automatically receives the device name with PROFINET IO via the IO controller.

   NOTE
   New or factory setting
   The I/O device only obtains the device names automatically with PROFINET IO with:
   – New I/O device
   – Set to factory settings

2. The new I/O device receives the connect telegram and startup data record from the IO controller.
3. The new I/O device and all downstream I/O devices start up again by themselves.

No topological configuration:

1. The new I/O device must have the same name as the device name of the I/O device to be replaced.
2. The new I/O device receives the connect telegram and startup data record from the IO controller.
3. The new I/O device and all downstream I/O devices start up again by themselves.

Reference

You will find information on the device name in the STEP 7 online help or the MultiFieldbus (https://support.industry.siemens.com/cs/ww/en/view/109773209) function manual.

9.2 Firmware update

Introduction

During operation, it may become necessary to update the firmware (e.g. for function extensions).

Firmware updates are used to update the firmware of the I/O device.

NOTE

Temporary bus interruption

When you update the firmware of an ET 200eco PN M12-L I/O device, then the MultiFieldbus is briefly interrupted due to the reboot of the I/O device. This interruption generates an alarm in the controller for all downstream MultiFieldbus devices.

Options for the firmware update

You have the following options for installing a firmware update:

- Online with STEP 7, V5.6 or higher
- Online via STEP 7, TIA Portal
- Online via SIMATIC Automation Tool
- Online via MultiFieldbus Configuration Tool (MFCT)

NOTE

I/O device remains in configured fieldbus mode

After a firmware update, the I/O device remains in the bus protocol in which the update was installed.

For example, at an update via EtherNet/IP, the I/O device remains in EtherNet/IP mode.

9.3 Calibrating an analog I/O device

Introduction

Calibration checks the process values measured by the I/O device analog inputs, determines their deviation from the actual values and compensates the measuring errors.

Calibration

The analog inputs I/O device is calibrated before delivery. The I/O device has a high long-term stability, so that calibration during operation is not necessary. Certain directives require calibration for all components of a measuring circuit at regular intervals.
The calibration procedure is described in the Function Manual SIMATIC Analog Value Processing.

NOTE

Restriction during calibration

You cannot calibrate the I/O device with the following settings:

- Configured as 1 x 8-channel I/O device MSI.
- Configured as 2 x 4-channel I/O device

Reference

You can find information on the procedure in the Function Manual SIMATIC analog value processing (https://support.industry.siemens.com/cs/ww/en/view/67989094).

9.4 Resetting the I/O device to factory settings

Introduction

When you "Reset to factory settings", the I/O device is reset to the "delivery state". All information that was saved internally on the I/O device is deleted. The I/O device switches to PROFINET IO mode.

Result after resetting to factory settings

The following table shows an overview of the contents of the saved items after resetting to factory settings.

Table 1-1014 Result after resetting to factory settings

Memory object	Contents
IP address	Deleted (configurable when resetting: "Retain IP address"/ "Delete IP address")
Device name	Deleted
MAC address	Not deleted
Identification data (I&M0)	Not deleted
Maintenance data (I&M1, 2, 3):	Deleted
Firmware	Not deleted
Configuration	Deleted
Parameters	Deleted
MultiFieldbus	Switches to PROFINET IO

NOTE

Failure of downstream stations is possible

Resetting an I/O device to factory settings can lead to failure of downstream stations in a line.

NOTE

Substitute value behavior of I/O devices when resetting to factory settings

The I/O devices take on the unconfigured state after "Reset to factory settings". There is no I/O data exchange.

Reset options

You have the following options to reset an I/O device to the factory settings:

- Online with STEP 7 (TIA Portal)
- Online with STEP 7, V5.6 or higher
- Online via SIMATIC Automation Tool (SAT)
- Online via PRONETA
- Online via MultiFieldbus Configuration Tool (MFCT)

Requirement

You need an online connection to reset an I/O device to factory settings.

Procedure with STEP 7 (TIA Portal)

Connect the PG/PC to the MultiFieldbus interface of the ET 200eco PN M12-L distributed I/O system.

Make sure that there is an online connection to the I/O device which is to be reset to factory settings.

1. Open the Online and Diagnostics view of the I/O device.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Select the "Retain IP address" option button if you want to retain the IP address, or the "Reset IP address" option button if you want to delete the IP address.
4. Click the "Reset" button.
5. Click "OK" in response to the confirmation prompts.

Result: The I/O device executes "Reset to factory settings". The RN/NS, ER/MS and MT/IO LEDs light up simultaneously for approximately 2 s while "Reset to factory settings" is running.

Procedure with STEP 7 V5.6 or higher

Connect the PG/PC to the MultiFieldbus interface of the ET 200eco PN M12-L distributed I/O system.

Make sure that there is an online connection to the I/O device which is to be reset to factory settings.

1. Open the SIMATIC Manager.
2. Select accessible devices.
3. Select the I/O device.
4. Navigate through "Menu > Options > Edit Ethernet devices > Reset to factor settings > Reset".

Result: The I/O device executes "Reset to factory settings". The RN/NS, ER/MS and MT/IO LEDs light up simultaneously for approximately 2 s while "Reset to factory settings" is running.

Procedure using the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) Equipment Manual (included in the SIMATIC Automation Tool).

Procedure using PRONETA

With PRONETA you can follow these steps:

- Delete or reassign device name and IP address
- Resetting I&M data
- Remove the module from the network and reintegrate it

You can find information on this in the "PRONETA User Manual (https://support.industry.siemens.com/cs/ww/en/view/109815137)"

Procedure using MFCT

You can find information on the procedure via MFCT under "MultiFieldbus function manual (https://support.industry.siemens.com/cs/ww/en/view/109773209)" in the "Resetting the MF device" section.

Reference

You will find more information on the procedure in the STEP 7 online help.

9.5 Maintenance and repair

The components of the SIMATIC ET 200eco PN M12-L system are maintenance-free.

NOTE

Repairs to an ET 200eco PN M12-L I/O device may only be carried out by the manufacturer.

9.6 Cleaning the I/O device

The I/O devices do not require cleaning from the manufacturer perspective. When wired, ET 200eco PN M12-L I/O devices comply with the IP65/IP67 and IP69K degrees of protection and can be cleaned, if necessary.

Note the following points during cleaning:

- Observe the IP65/IP67 and IP69K degrees of protection.
- Use checked liquids only
  - Material compatibility test of the ECOLAB® company (Page 89)

Technical specifications

10

10.1 Codes and approvals

Codes and approvals on the type plate

The following overview provides information about the possible codes and approvals. Only the codes and approvals specified on the type plate apply for the device.

You can find the associated certificates for download on the Internet. See also: ET 200eco PN approvals (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert)

CE marking

CE

The ET 200eco PN M12-L distributed I/O devices meet the requirements and protection targets of the following directives. The distributed I/O devices comply with the harmonized European standards (EN) for programmable logic controllers published in the official gazettes of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)

  Directive of the European Parliament and of the Council of February 26, 2014 on the harmonization of the laws of the Member States relating to electromagnetic compatibility; OJ L 96, 29/3/2014, pp. 79–106
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)

  Directive of the European Parliament and of the Council of June 8, 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment; OJ L 174, 1/7/2011, pp. 88–110
- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (Explosion Protection Directive)

  Directive of the European Parliament and of the Council of February 26, 2014 on the harmonization of the laws of the Member States relating to equipment and protective systems intended for use in potentially explosive atmospheres; Official Journal of the European Union L96, 29/03/2014, pp. 309–356

For use in Zone 2/22, the devices must be installed in a suitable protective enclosure which fulfills the requirements of the impact resistance test according to GB/T 3836.1, e.g. connector cover 6ES7194-6JA00-0BB0.
The following additional conditions apply when using the devices in an area that requires EPL Gc:

- Only use the devices in an area with a degree of pollution 2 according to GB/T 16935.1.
- Provisions must be taken to prevent the rated operating voltage from being exceeded by transient disturbance voltages of more than 119 V.
- In the case of use in Zone 2/22, the I/O devices are approved for -20 °C to +60 °C and IP54.

More information
You can find the explosion protection with the approved ET 200eco PN M12-L I/O devices here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=441).
The multilingual product information "Use of the ET 200eco PN M12-L in Zone 2/Zone 22 hazardous areas" is available here on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109814099).

RCM Australia/New Zealand

The ET 200eco PN M12-L distributed I/O system meets the requirements of EN 61000-6-4 Generic standards – Emission standard for industrial environments.

Korea Certificate

Note that this device corresponds to limit class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.
이기기는업무용(A급) 전자파적합기기로서판매자또는사용자는이점을주의하시기바라며 가정외의지역에서사용하는것을목적으로합니다.

EAC (Eurasian Conformity)

The code EAC (Eurasian Conformity) confirms the conformity with the guidelines (TR) of the Eurasian Economic Union.

WEEE mark (European Union)

Disposal information, observe the local regulations and section "Recycling and disposal (Page 111)".

10.2 Certificates

Shipbuilding certificates

The following shipbuilding certificates are intended for the device:

- ABS (American Bureau of Shipping)
- Bureau Veritas (French marine classification society)
- CCS (China Classification Society)
- Class NK (Nippon Kaiji Kyokai)
- DNV (Det Norske Veritas)
- KR (Korean Register of Shipping)
- LRS (Lloyds Register of Shipping)
- RINA (Registro Italiano Navale)

After a successful approval you can find the certificates with the certified article numbers in the Internet. See also: ET 200eco PN Marine/Shipbuilding (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=446)

Material compatibility test

The distributed I/O devices ET 200eco PN M12-L have been tested by the ECOLAB® company with the following liquids.

- Topactive 200
- Topax MD3
- Topaz AC3
- Topaz AC4
- Topax 91
- Topax 990
- Topax 960
- Alcodes

The testimonial from the ECOLAB® company is available for downloading on the Internet. See also: ET 200eco PN M12-L Ecolab Testimonial (https://support.industry.siemens.com/cs/ww/en/view/109805757)

10.3 Standards and requirements

IEC 61131-2

The ET 200eco PN M12-L distributed I/O system fulfills the requirements and criteria of IEC 61131-2 (Programmable controllers, Part 2: Equipment requirements and tests) and the EMC requirements for use in Zone B.

IEC 61010-2-201

The ET 200eco PN M12-L distributed I/O system fulfills the requirements and criteria of standard IEC 61010-2-201.

PROFINET standard

The ET 200eco PN M12-L distributed I/O system is based on standard IEC 61158 Type 10.

EtherNet/IP requirement

The ET 200eco PN M12-L distributed I/O system is based on the requirements of the CIP network library CIP Networks Library Volume 2 EtherNet/IP Adaptation of CIP.

Modbus TCP requirement

The ET 200eco PN M12-L distributed I/O system is based on the requirements of the Modbus TCP Application Protocol Specification V1.1b3.

IO-Link standard

The ET 200eco PN M12-L distributed I/O system is based on standard IEC 61131-9.

Use in industrial environments

The ET 200eco PN M12-L distributed I/O devices are designed for the industrial field. It meets the following standards for this type of use:

- Requirements for interference emission EN 61000-6-4
- Requirements for immunity EN 61000-6-2

Use in mixed areas

Under certain circumstances, you can use the ET 200eco PN M12-L distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact on residents.

If you want to use the ET 200eco PN M12-L distributed I/O system in mixed areas, you must ensure that its radio frequency interference emission complies with the limit classes of the EN 61000-6-3 generic standard. Suitable measures for observing these limits for use in a mixed area are, for example:

- Use of noise filters in the supply cables

An individual acceptance test is also required.

Use in residential areas

The ET 200eco PN M12-L distributed I/O system is not intended for use in residential areas. Using the ET 200eco PN M12-L distributed I/O system in residential areas can affect radio or television reception.

Importer addresses

The following table shows the importer addresses for specific countries:

Countries	Address
United Kingdom (UK)	Siemens plc. Manchester M20 2UR
Türkiye (TR)	Siemens San. ve Tic. A.Ş. Yakacık Cad. No:111 34870 Kartal/İstanbul

10.4 Electromagnetic compatibility

Definition

Electromagnetic compatibility is the ability of an electrical apparatus to function in a satisfactory manner in its electromagnetic environment without affecting this environment.

An ET 200eco PN M12-L distributed I/O device fulfills the requirements of the EMC law of the European Union. The prerequisite for this is that the electrical configuration of the ET 200eco PN M12-L distributed I/O device complies with the specifications and guidelines for the electrical configuration.

Pulse-shaped disturbance variables

The table below shows the electromagnetic compatibility of the distributed I/O systems compared to pulse-shaped disturbance variables.

Table 1-1015 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	Tested with	Corresponds with degree of severity
Electrostatic discharge according to IEC 61000-4-2.[1]	Air discharge: ±8 kV	3
	Contact discharge: ±6 kV	3
Burst pulses (fast transient disturbance variables) according to IEC 61000-4-4.[1]	±2 kV (power supply cable)	3
	±2 kV (MultiFieldbus line)	4
	±2 kV (signal line)	4
High-energy single pulse (surge) to IEC 61000-4-5 [2] • For installation within buildings: – Signal line < 30 m • For installation outdoors – Signal line < 30 m – Use of shielded IP lines – Grounding of the shielding at both ends according to IEC 61000-4-5		

1 The maximum short-term influencing of analog devices during the duration of the EMC tests can amount to ±10 % of the full-scale value.

2 Analog value deviation beyond the limits of the nominal range and diagnostics possible.

Pulse-shaped disturbance variable	Tested with	Corresponds with degree of severity
• Asymmetric coupling	±1 kV (24 V DC supply cable) without protective element	2
	±1 kV (MultiFieldbus line) without protective element	2
• Symmetric coupling	±0.5 kV (24 V DC supply cable) without protective element	2

1 The maximum short-term influencing of analog devices during the duration of the EMC tests can amount to ±10 % of the full-scale value.

2 Analog value deviation beyond the limits of the nominal range and diagnostics possible.

Sinusoidal disturbance variables

The following tables show the electromagnetic compatibility of the distributed I/O systems to sinusoidal disturbance variables.

Table 1-1016 RF radiation

RF radiation according to IEC 61000-4-3 Electromagnetic RF field, amplitude modulated		Corresponds with degree of severity
80 ... 1000 MHz	10 V/m	3
1.4 ... 6 GHz	3 V/m	2
80% AM (1 kHz)		

Table 1-1017 RF coupling (signal and supply cables)

RF coupling according to IEC 61000-4-6.	Corresponds with degree of severity
0.15 ... 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

The maximum short-term influencing of analog modules during the duration of the EMC tests can amount to ±1 % of the full-scale value.

Emission of radio frequency interference

The following table shows the interference emission of electromagnetic fields according to EN IEC 61000-6-4/EN 55016-2-3.

Table 1-1018 Interference emission of electromagnetic fields

Frequency	Interference emission	Measuring distance
30 ... 230 MHz	< 40 dB (µV/m) Q	10 m
230 ... 1000 MHz	< 47 dB (µV/m) Q	10 m
1 ... 3 GHz	< 76 dB (µV/m) P	3 m
3 ... 6 GHz	< 80 dB (µV/m) P	3 m

Conducted emission

The following table shows the limits for power supply connections in accordance with EN IEC 61000-6-4/EN 55016-2-1.

Table 1-1019 Interference emission from the power supply

Frequency	Interference emission
0.15 ... 0.5 MHz	< 89 dB (µV) Q < 76 dB (µV) M
0.5 ... 30 MHz	< 83 dB (µV) Q < 70 dB (µV) M

10.5 Transport and storage conditions

Shipping and storage conditions

The I/O devices of the ET 200eco PN M12-L distributed I/O system exceed the specifications regarding transport and storage conditions pursuant to IEC 61131-2. The following table shows the conditions that apply to I/O devices transported or stored in their original packaging.

- Transport condition class: TTH4
- Storage condition class: STH4

Table 1-1020 Shipping and storage conditions

Type of condition	Permitted range
Free fall	≤0.3 m
Temperature	-40 °C ... +70 °C
Temperature variation	20 K/h
Barometric pressure	1140 ... 540 hPa (corresponds to an altitude of -1000 m to 5000 m)
Relative humidity	5 ... 95%; no condensation

10.6 Mechanical and climatic ambient conditions

Rated conditions

The ET 200eco PN M12-L distributed I/O system is suitable for use in weather-proof, fixed locations.

- The rated conditions exceed the requirements according to IEC 61131-2
  - Class OTH4

You can find the values for the rated conditions in the technical specifications of the Equipment Manuals or on the Internet (https://support.industry.siemens.com/cs/de/en/view/109742718).

Tests of mechanical ambient conditions

The following table shows the type and scope of the tests on mechanical ambient conditions.

Table 1-1021 Tests of mechanical ambient conditions

Condition tested	Test standard	Values
Sinusoidal vibrations, I/O device mounted without mounting rail[1]	Vibration test according to IEC 60068-2-6	Type of oscillation: Frequency sweeps at a rate of change of 1 octave/minute. 10 Hz ≤ f ≤ 58 Hz, constant amplitude 1.5 mm 58 Hz ≤ f ≤ 150 Hz, constant acceleration 20 g Period of oscillation: 10 frequency sweeps per axis at each of three vertically aligned axes
Sinusoidal vibrations, I/O device mounted on mounting rail		Type of oscillation: Frequency sweeps at a rate of change of 1 octave/minute. 5 ≤ f ≤ 9.1 Hz, constant amplitude 15 mm 9.1 ≤ f ≤ 150 Hz, constant acceleration 5 g Period of oscillation: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 30 g peak value, 18 ms duration Direction of shock: 3 shocks each in ± direction in each of the 3 axes vertical to one another

[1] When using the plug cover, use the "I/O device mounted on mounting rail" parameters for checking

Extended environmental conditions for use outdoors

The table below provides important information with respect to the type and scope of the test of extended ambient conditions for use in the outdoors. Consider further specifications and constraints for use in the outdoors.

Table 1-1022 Test of extended environmental conditions

Condition tested	Test standard	Conditions/remarks
Salt spray	IEC 60068-2-52	Degree of severity 1 for products that are used at sea or in the immediate vicinity of the sea: 4 cycles with each: • 2 h with 5 % NaCl at 35 °C • 6 days + 22 h at 40 °C/93 % relative humidity

Condition tested	Test standard	Conditions/remarks
200 h salt spray test	IEC 60068-2-11	5 % NaCl at 35 °C for 200 hours pH value: 6.5-7.2
UV resistance	IEC 61215-2	• Irradiance (E): 550 W/m² • Black standard temperature (BST): 55 °C
Condensed water alternating climate	EN ISO 6270-2	84 cycles with each: • 8 h at 40 °C with 100 % relative humidity (condensation) • 16 h at 18 °C to 28 °C with 100 % relative humidity
Temperature shock	IEC 60068-2-14	Temperature: -40 °C/+85 °C Duration: 250 cycles (250 h) Device in switched-off state
Icing	EN 60068-2-1	Check according to section 5.4
IP test	ISO 20653	IP69K (water and dust)

Climatic ambient conditions

The following table shows the type and scope of the tests on climatic ambient conditions.

Table 1-1023 Tests for climatic ambient conditions

Ambient conditions	Fields of application	Comments
Temperature	-40 ... 60 °C	All mounting positions*
Temperature variation	10 K/h	-
Relative humidity	5 ... 100%	With condensation and mounted covers
Barometric pressure	1140 ... 540 hPa	Corresponds to an elevation of -1000 to 5000 m
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

* Follow the instructions for the minimum distances in section Basics (Page 29).

Use above 2000 m is possible.

The following constraints apply to the maximum specified ambient temperature:

Table 1-1024 **Derating factor of installation elevation and ambient temperature**

Installation elevation	Derating factor for ambient temperature [1]
-1000 ... 2000 m	1.0
2000 ... 3000 m	0.9
3000 ... 4000 m	0.8
4000 ... 5000 m	0.7

[1] Base value for application of the derating factor is the maximum permissible ambient temperature in °C for 2000 m.

NOTE

- Linear interpolation between elevations is permissible.
- The derating factors compensate for the decreasing cooling effect of air at higher elevations due to lower density.
- Make sure that the power supplies you use are rated for elevations > 2000 m.

NOTE

All markings and certifications are currently based on an elevation of up to 2000 m.

10.7 Details on insulation, protection class, degree of protection and rated voltage

Insulation

The insulation is designed in compliance with the requirements of IEC 61010-2-201.

NOTE

In the case of I/O devices with 24 V DC (SELV/PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Pollution class according to IEC 61010-2-201

- Protection class III

Severity for voltage interruption

The I/O device of the distributed I/O system ET 200eco PN M12-L meet the severity class PS2 for voltage interruption (10 ms).

Pollution degree / overvoltage category according to IEC 61010-2-201

Connected according to the specifications in the "Wiring (Page 51)" section:

- Pollution degree: 3 (macro environment)
- Overvoltage category: II

In delivery state, with one or more open connections:

- Pollution degree: 2 (micro environment)
- Overvoltage category: II

Degree of protection IP65/67, IP69K

Degree of protection of the ET 200eco PN M12-L distributed I/O system:

IP65/IP67 according to IEC 60529

- 1. Code number IP6x: Dust-proof and complete protection from contact
- 2. Code number: Protection from water
  - IPx5: Protected against water jets (nozzle) from any angle
    Water directed as a jet against the housing from any direction must have no harmful effects.
  - IPx7: Protected against the effects of temporary immersion in water
    Water must not enter in a quantity to cause harmful effects when the enclosure is temporarily immersed in water under standardized pressure condition and time conditions.

IP69K in accordance with ISO 20653

- 1. Code number IP6x: Dust-proof
- 2. Code number IPx9K: Protected against water at high pressure/steam-jet cleaning
  Water directed as a jet against the housing from any direction must not have any harmful effects or affect the performance.

Rated voltage for operation

The following table shows the nominal voltage and the corresponding tolerance with which the ET 200eco PN M12-L distributed I/O system operates.

Table 1-1025 Rated voltage for operation

Rated voltage (SELV/PELV)	Tolerance range
24 V DC	DC 20.4 ... 28.8 V

10.8 Use of the ET 200eco PN M12-L in Zone 2/Zone 22 hazardous areas

Introduction

This section contains important notes on the ET 200eco PN M12-L distributed I/O device for installation in the Zone 2/Zone 22 hazardous areas.

The multilingual product information in different EU official languages is available here: Use of the ET 200eco PN M12-L in Zone 2/Zone 22 hazardous areas (https://support.industry.siemens.com/cs/ww/en/view/109814099)

Approved I/O devices ET 200eco PN M12-L

The I/O devices have these explosion approvals:

- ATEX approval
- UKEX approval
- IECEX approval
- CCCEx approval

You can find the explosion protection certificates with the approved ET 200eco PN M12-L I/O devices here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=441).

⚠ WARNING

Personal injury and material damage
When disconnecting plug-in connections during running operation, personal injury and material damage may occur in potentially explosive atmospheres.
In potentially explosive atmospheres, de-energize the ET 200eco PN M12-L I/O device before disconnecting plug connections.

Special conditions

- Set up the I/O devices so that the risk of mechanical danger is low.
- Adhere to the technical specifications for the I/O devices as specified in the EU -type examination certificate:
  - Supply voltage of the ET 200eco PN M12-L
  - Currents of inputs and outputs
  - Ambient temperatures
- All M12 connection plugs (for MultiFieldbus, supply voltage, encoders and actuators) must not be connected or disconnected under voltage.

NOTE

Prerequisites when using the plug cover

The plug cover is an accessory for protecting the connected connectors on the I/O device. If you use a plug cover, the cables with connectors must fulfill the following requirements:

- The cables have a straight plug outlet
- The maximum outer diameter of the connector is 16 mm

Plug cover

The figure below shows the plug cover. The plug cover is an accessory for protecting the connected connectors on the I/O device. The plug cover may be necessary for use in hazardous areas. You will find the article numbers in the Accessories/spare parts (Page 120) section.

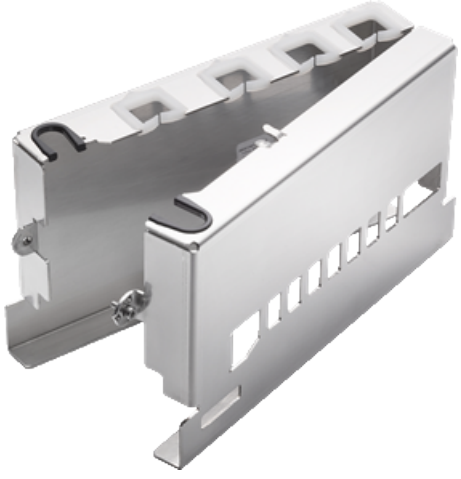

Figure 1-748 Plug cover

Industrial cybersecurity 11

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

In the first part of this section you will find basic information on the subject of industrial cybersecurity. Subsequent sections describe recommended measures for protecting the entire system and individual components from manipulation and unwanted access.

NOTE

Security-relevant changes to software or devices are documented in the section New properties/functions (Page 21).

11.1 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

11.2 Security update notification

Read the special information on maintaining the operational safety of your plant in the Introduction (Page 6) section.

Set up notification of security updates

To receive notifications about security updates, proceed as follows:

1. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home).
2. Enter the keyword "Security" in the search engine.
3. Choose the "Search in Knowledge base" option.
4. In the "Product tree" filter menu, select your product or your product group, for example "Automation technology" > "Automation systems" > " SIMATIC Industrial Automation Systems" > "I/O systems" > "SIMATIC ET 200 systems without control cabinet" > "ET 200eco PN".
5. Select the "Other types" option from the filter menu for "Type," and then choose "Download" and "Product note".
6. Select the document about which you want to receive notifications using the 3 points on the right "Add to my favorites".
7. In the following dialog, select the name, the storage location and the "Notify me" option for the favorite. Then click on the "+ Add to my favorites" button.

Result: You will be notified by email each time the document is changed.

Under "mySiePortal" > "Lists & notifications" > "My notifications", you can display your notifications and delete them if necessary.

11.3 Basic information on industrial cybersecurity

11.3.1 Definition of industrial cybersecurity

Industrial cybersecurity is generally understood to mean all measures to protect against the following threats:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability (e.g. due to the destruction of data or denial of service (DoS))

11.3.2 Objectives of industrial cybersecurity

The objectives of industrial cybersecurity are:

- Ensuring trouble-free operation of industrial plants and production processes
- Preventing threats to people and production from cybersecurity attacks
- Protection of industrial plants against espionage and manipulation
- Protection of industrial automation systems and components against unauthorized access and data loss
- Provision of a practical and cost-effective concept for securing existing plants and devices without their own security functions

- Use of existing, open, and proven industrial cybersecurity standards
- Compliance with legal requirements

An optimized and adapted security concept applies to automation and drive technology. The security measures must not impede or endanger production.

11.4 Integrated security concept and security strategies

11.4.1 Comprehensive security concept "Defense in Depth"

With Defense in Depth, Siemens provides a multi-layer security concept that offers industrial plants comprehensive and far-reaching protection in accordance with the recommendations of the IEC 62443 international standard.

Productivity and know-how are protected on 3 levels:

Plant security
Plant security uses various methods to safeguard critical components from physical access by people. This starts with classic building access and extends to securing sensitive areas using access control (for example, code card, iris scan, fingerprint or access code).

Network security
Automation networks must be protected against unauthorized access. This is achieved through security measures on the product, but also those in the product-related environment.

System integrity
Targeted measures must be taken to protect existing know-how or to prevent unauthorized access to automation processes. The measures protect against unauthorized configuration changes and highlight attempts at manipulation.

You can find more information on the topics of Defense in Depth, plant security, network security, and system integrity on the SIEMENS Industrial cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) Web page.

You can also visit the download center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) to obtain more information on the topic of industrial cybersecurity. The "Operational Guidelines", for example, provide recommendations on basic security measures for secure machine and plant operation in an industrial environment.

11.4.2 Security management

The ISO 27001 and IEC 62443 standards call for a comprehensive approach in information technology (IT) and operational technology (OT) to protect against cyber attacks.

Responsibility for cybersecurity and IT security

Every operator of machinery and equipment is responsible for:

- Defining cybersecurity and IT security as an important criterion in the procurement and selection of machines and software applications
- Use of suitable measures to protect production resources, data, and communication from manipulation and theft
- Providing all necessary resources and training to employees to fully support these goals

For this purpose, suitable measures must be selected after a risk assessment and a cost-benefit analysis in order to protect material and intellectual property and prevent damage from occurring. These measures should be integrated into corporate processes and procedures, evaluated regularly, and firmly anchored in the corporate culture. In addition to protecting intellectual property, the protection of personal data must be ensured at all organizational units and levels.

Siemens will provide you with information and support. Subscribe to the Security feeds (https://www.siemens.com/cert) for information on vulnerabilities. Register with mySiePortal (https://sieportal.siemens.com/en-ww/home) and create filters to be notified when important information is published. The procedure is described in the section Notification of security updates (Page 101). Consider using Siemens Cybersecurity Services.

Responsibility in the digital supply chain

Cybersecurity should play a critical role in the evaluation and procurement process. The entire life cycle of a product should be considered to ensure protection against current and future risks. These include, for example, security updates throughout the product life cycle, including guidelines for secure disposal of the product.

Siemens plans and announces the provision of security updates, as well as total discontinuation of products, as part of product support.

Employee awareness

Regular training in cybersecurity and continuous testing of training success are essential so that cybersecurity measures are internalized in processes and work instructions. This involves general training in the use of software and IT hardware for company communication and as work equipment, e.g.:

- secure handling of USB devices
- encrypted communication
- use of VPN
- rules for passwords and use of access
- setting up two-factor authentication
- Educating employees about the dangers posed by malware, phishing, social engineering and other factors

Furthermore, if applicable, production equipment and software training should always include the topic of cybersecurity.

Maintaining the security concept through updates

Keeping software up-to-date is essential, for example, to benefit from the following measures:

- Implementation of new security strategies, protocols and techniques
- Closing of security vulnerabilities
- Elimination of security vulnerabilities

To this end, it is necessary to keep a constant eye on the further development of protective measures and, if necessary, the expansion of requirements.

It is recommended to:

- Set up notifications for (security) updates
- Subscribe to information on vulnerabilities
- Monitor and implement the further development of the technology, especially in the area of cybersecurity

In short: Always keep technology and knowledge up to date.

Consideration of the risks posed by cyber attacks in the Threat and Risk Assessment (TRA)

Make an inventory of all software, hardware, and infrastructure devices, in order to identify risks to the location or organization. Incident response procedures must be incorporated into all IT and manufacturing processes. The choice of risk mitigation measures should be based on a cost-benefit analysis and classification of risks. This is followed by the introduction of cybersecurity rules and procedures and the training of personnel.

Living the concept

Technical solutions alone are not sufficient to effectively counter threats.

Cybersecurity must be part of the corporate culture and process landscape and must be internalized and lived by all employees.

Continuously monitoring the security situation

Continuous monitoring of the cybersecurity situation through:

- Setting anomaly references and creating allow and deny lists based on normal network communication and production machine behavior. The SINEC software family offers you reliable security tools (https://www.siemens.com/global/en/products/automation/industrial-communication/sinec-network-software/cybersecurity.html) to detect potential vulnerabilities in OT networks, quickly initiate suitable measures and effectively resolve security vulnerabilities.
- Establishment of an intrusion detection system (IDS) that generates alarms when unusual behavior occurs in the network

- Introduction of a Security Information and Event Management (SIEM) system to collect, analyze, and evaluate events in real time to enable early countermeasures
- Measures regarding network security: for example network segmentation, firewalls, VPN, DMZ (demilitarized zones)

11.5 Operational application environment and security assumptions

11.5.1 Intended use

SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.

The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

Operational reliability and intended use

Read the "Special information" in the Introduction (Page 6) section.

Area of application

Observe the "Area of application" section in System overview (Page 24) chapter.

11.5.2 Requirements for the operational application environment and security assumptions

Siemens recommends the following security measures:

- Conducting a threat and risk assessment (as part of security management)
- Network security concepts
  - Network segmentation
  - Asset and network management
  - Network protection
  - Remote access
- Access control concepts (utilizing access control systems)
  - Physical protection
  - Physical corporate security
  - Physical product security

Threat and Risk Assessment

Vulnerabilities and risks are identified, and countermeasures are proposed to ensure the security of the system, networks, and data.

Network security concepts

You can find information on network security in the whitepaper "Industrial Network Security Architecture", available at the Download Center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) on the Industrial Cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) website.

Access control concepts

Physical protection
In addition to closing off and/or monitoring entire production facilities, it may be necessary to physically secure cabinets or even individual components such as circuit breakers.

Physical corporate security
Physical enterprise security can be ensured by the following measures:

- Closed off and monitored company premises
- Access control, locks/card readers, and/or security personnel
- Accompaniment of non-employees by company personnel
- Employees are trained on and embrace security processes within the company

Physical production security
The following measures can be included in assuring physical production security:

- Separate access control for critical areas, such as production zones.
- Installation of critical components in lockable cabinets/control rooms with monitoring and alarm capabilities. The cabinets/control rooms must be secured with a cylinder lock. Do not use simple locks, such as universal, triangular/square, or double-bit locks.
- Radio field planning to limit WLAN coverage areas, preventing them from extending beyond defined zones (e.g. factory floor).
- Guidelines that prohibit the use of external data storage media (such as USB flash drives) and IT devices (such as laptops) classified as unsafe on systems.

11.6 Security properties of the devices

The security properties of the individual devices are listed in the Equipment Manuals.

11.7 Secure operation of the system

This section describes measures recommended by Siemens to protect your system from manipulation and unauthorized access.

11.7.1 Hardening measures

System hardening, also simply referred to as hardening, is the secure configuration of products or systems. The aim is to close security gaps and take various measures to reduce the attack surfaces for cyberattacks.

Measures for system hardening include, for example:

- Secure configuration in which only necessary software components and services are installed or activated for proper operation.
- Access control, by which a restrictive user and rights management system is implemented.

11.7.2 Secure configuration

Secure configuration involves control over all software components, along with their interfaces, ports, and services.
Activated services and ports pose a risk.

- One possible risk is unauthorized access to the network.
- Another risk is unauthorized access to programs.

To minimize risks, only the necessary services should be activated for all automation components.

- Take all activated services (especially Web servers, FTP, remote maintenance etc.) into account in the security concept.
- Consider the default states of ports and services in your security concept.

You can find an overview of all ports and services used in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

11.7.3 Handling of sensitive data

Data protection information

Siemens Aktiengesellschaft observes the applicable data protection laws, including the General Data Protection Regulation (GDPR), in particular the rules of data minimization and data protection-friendly default settings (privacy by design, privacy by default).

The products do not store any personal data.

If you establish a reference to an identifiable person by linking this functional data with other data (such as shift schedules) or if you store personal data on the same medium (such as a hard disk), you are responsible for ensuring that the data protection regulations are observed.

Information on the secure removal of data is provided in the section Secure decommissioning (Page 109).

Storage of security-related data

When storing your security-relevant data on your PC, independently ensure secure data storage.

11.7.4 Regular firmware updates

NOTE

Outdated firmware versions might not be monitored for security vulnerabilities.

- Always keep your plant/products up to date to benefit from troubleshooting and to minimize potential risks.
- Use email notifications to be automatically informed about firmware updates.

You can find more information in:

- Section Firmware update (Page 79)
- Section Notification of security updates (Page 101)

11.7.5 Notifications about security vulnerabilities (Siemens Security Advisories)

A vulnerability is a security vulnerability in information security. It can pose a threat as it provides intruders with the opportunity to access system resources and manipulate or steal data. Many vulnerabilities allow availability to be impaired.

Siemens ProductCERT

If Siemens identifies or fixes security gaps (Vulnerabilities) in the products, this will be published in the Security Advisories.

You can find the documents for SIMATIC on the following Siemens Aktiengesellschaft web page: Siemens ProductCERT and Siemens CERT (https://www.siemens.com/global/en/products/services/cert.html?s=SIMATIC&_originalHost=new.siemens.com#SecurityPublications)

"SIMATIC" is preset in the "Search Security Advisories" search field. You can also enter other product names or other terms in the search field and search for them.

On this page, you will also find all the required information on how to deal with vulnerabilities:

- Contact persons for matters related to vulnerabilities
- Options for automated notifications regarding vulnerabilities
- Notifications are also possible in CSAF format
- Option to subscribe to RSS feeds and newsletters

- List of all current vulnerabilities and detailed information such as:
  - Description
  - Classification according to Common Vulnerability Scoring System (CVSS)
  - Measures
  - Availability
  - Etc.

Set up Security feeds (https://www.siemens.com/cert) to receive notifications about security-related topics.

If you suspect or have discovered a vulnerability in a Siemens product, please inform us immediately. To do this, press the "Contact" button on the CERT Services page (https://www.siemens.com/cert) and follow the instructions.

11.7.6 Data backup

Secure your configuration and parameter settings so that you can quickly restore this data if needed.

11.7.7 Security checks

Security checks for data, files, and archives serve to ensure data integrity at the storage location and during file transmission, protecting against manipulation and transmission errors. This is often achieved using digital checksums that are provided alongside the data. Tools (such as SHA-256 or SHA-512) for calculating and verifying these checksums are provided in many systems and named according to their respective calculation methods.

- File Integrity Guidelines describe the prescribed procedure for integrity checks
- Integrity protection is a protection function for engineering data and firmware files
- Communication integrity means protecting communication against unauthorized manipulations to ensure high system availability. A central element in this regard is, for example, the use of digital checksums when accessing controllers. (Source: Industrial Cybersecurity website (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html))

11.7.8 Secure decommissioning

In the following section, you will find information on how to properly decommission individual components of your automation system. Decommissioning is necessary when the component has reached the end of its service life.

Decommissioning includes environmentally sound disposal and secure removal of all digital data of electronic components with storage medium.

11.7.8.1 Securely removing data

Before disposing of components of your automation system, you should securely delete all data from the storage media of these components. How to securely delete data from the devices so that it cannot be recovered is described below.

NOTICE
Data misuse resulting from non-secure deletion of data Incomplete or non-secure deletion of data from data memories can result in data misuse by third parties. For this reason, ensure secure deletion of data from all storage media used before disposing of the product.

Secure erasure of data from the I/O device

With the following tools, you can securely erase the data from the I/O device:

- STEP 7 < V19
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Follow these steps in the order given:

1. Establish an online connection.
2. Open the Online and Diagnostics view of the I/O device (either from the project context or via "Accessible devices").
3. In the dialog box "Functions > Reset to factory settings", select the option "Delete I&M data" and then the "Reset" button.

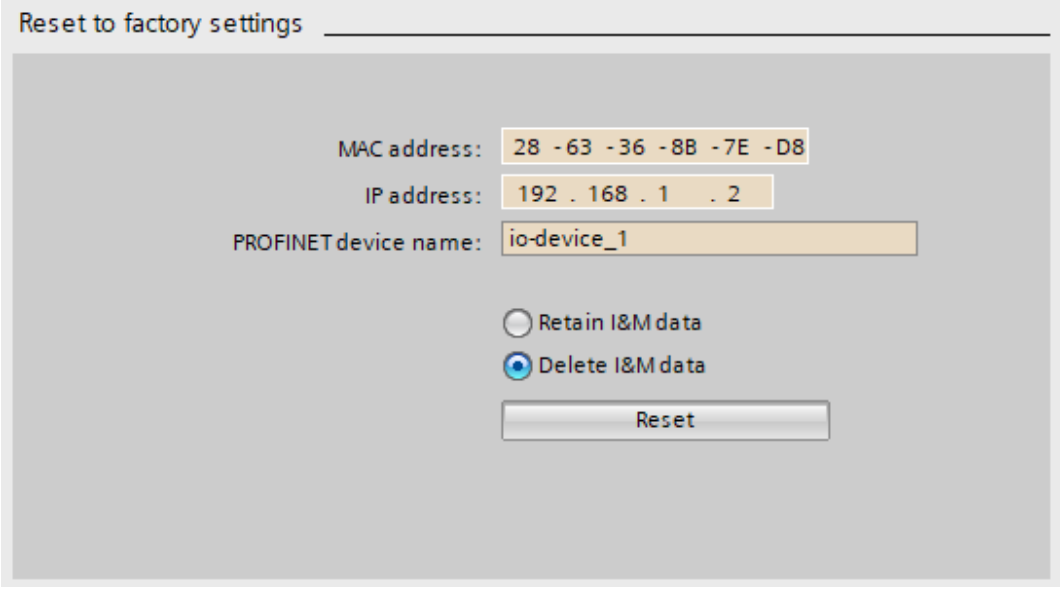

Figure 1-749 Resetting the I/O device to factory settings

Result: All the data that was still in the data memories of the I/O device was deleted. You can now dispose of the components.

For more information on resetting the I/O device to factory settings, refer to the section Resetting an interface module to factory settings (Page 81).

NOTE

STEP 7 ≥ V19

Only the communication parameters will be securely deleted on "Reset to factory settings" with the "Delete I&M data" option enabled when you use STEP 7 ≥ V19.

Deleted communication parameters:

- IP address
- Device name
- PROFINET configuration data

If you want to securely remove all data, use one of the tools listed above for this purpose.

11.7.8.2 Recycling and disposal

For environmentally sustainable recycling and disposal of your old equipment, contact a certified electronic waste disposal service and dispose of the equipment according to the applicable regulations in your country.

11.8 Secure operation of the engineering software

For more information on secure operation of the engineering software, refer to the TIA Portal online help.

11.9 Secure operation of I/O devices

11.9.1 Secure operation of I/O devices

Device-specific security information and notes on I/O devices can be found in the respective Equipment Manual.

11.9.2 Signed firmware update

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect internet source

Information on whether your I/O device supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of the signed firmware update for I/O device

Firmware updates of I/O devices may include a digital signature. The digitally signed firmware update files are available for download on the Siemens Support Web page.

The I/O device verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the I/O device can detect a manipulated or corrupted firmware update file and reject it.

Note that the I/O device performs the verification only after the complete firmware download has taken place.

Subsequently, a notification is sent to the firmware update tool regarding the success or failure of the signature verification.

You still have all the options for firmware updates, as described in the Firmware update section, when performing signed firmware updates for I/O devices. If the firmware update was not successful, the I/O device will continue to run with the previous firmware.

Diagnostics alarms and remedy

When performing a firmware update for an I/O device with an established connection between the I/O device and CPU, the following options for notifications are available in the CPU's diagnostic buffer:

- Successful integrity check of the firmware for the I/O device
- Rejection of non-secure firmware for the I/O device

For more information, refer to the Channel Diagnostics table in the Equipment Manual of the I/O device.

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file you are using originates from a secure source and was downloaded unchanged. As a check, calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support website.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/de/de/view/109483101/en).

Safety-related shutdown

A

A.1 Safety-related shutdown of ET 200eco PN M12-L

Introduction

The setup below describes how you shut down ET 200eco PN M12-L standard modules in a fail-safe manner.

With the illustrated setup (e.g. with safety relay 3SK1 or electronic module ET 200SP F-PM-E), all outputs that are connected to load voltage 2L+/2M (24 V switched) of the ET 200eco PN M12-L standard modules are switched to the safe OFF state. The ET 200eco PN M12-L standard modules are operated at supply voltage 1L+/1M. Supply voltage 1L+/1M is electrically isolated from load voltage 2L+/2M.

The maximum performance level achieved by the illustrated setup is SIL2/Category 3/PL d. The component with the lowest safety standard determines the maximum performance level a system achieves.

Principle of operation

A higher-level electromechanical safety relay (e.g. 3SK1) or an electronic fail-safe module (e.g. ET 200SP F-PM-E) isolates the load voltage 2L+/2M (24 V switched). The outputs of the ET 200eco PN M12-L standard modules operated at 2L+/2M (24 V switched) are switched to the safe state. The outputs connected to 1L+/1M (24 V non-switched) are not intended for functional switching and therefore cannot be shut down safely.

You can also integrate I/O devices that are operated exclusively at supply voltage 1L+/1M (non-switched) in the setup of your distributed I/O system. These I/O devices must be enabled as reaction-free modules. Reaction-free modules relay the load voltage 2L+/2M and are not affected by a shutdown. The following schematic circuit diagrams illustrate this.

Schematic circuit diagram with 3SK1

The following figure shows a schematic circuit diagram with safety relay 3SK1.

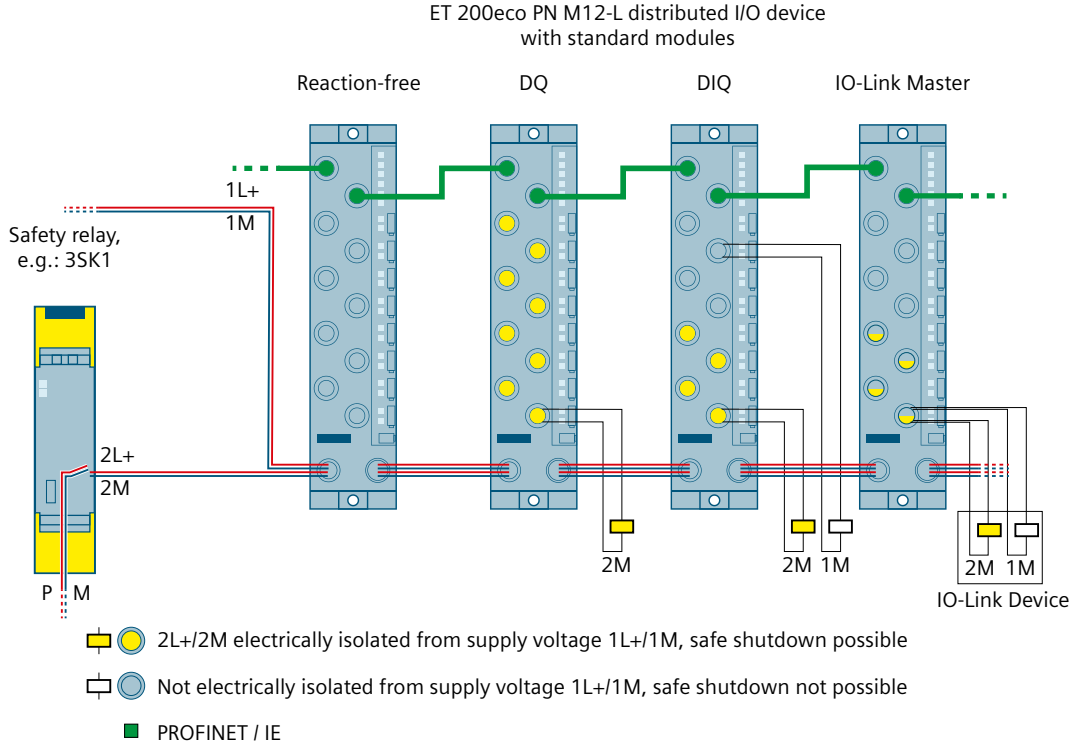

Figure 1-750 Higher-level safety circuit of the outputs

You can find an overview table with the article numbers of the I/O devices and other information in the FAQ on safety-related shutdown (https://support.industry.siemens.com/cs/ww/en/view/39198632).

Schematic circuit diagram with ET 200SP F-PM-E

The following figure shows a schematic circuit diagram with electronic module ET 200SP F-PM-E.

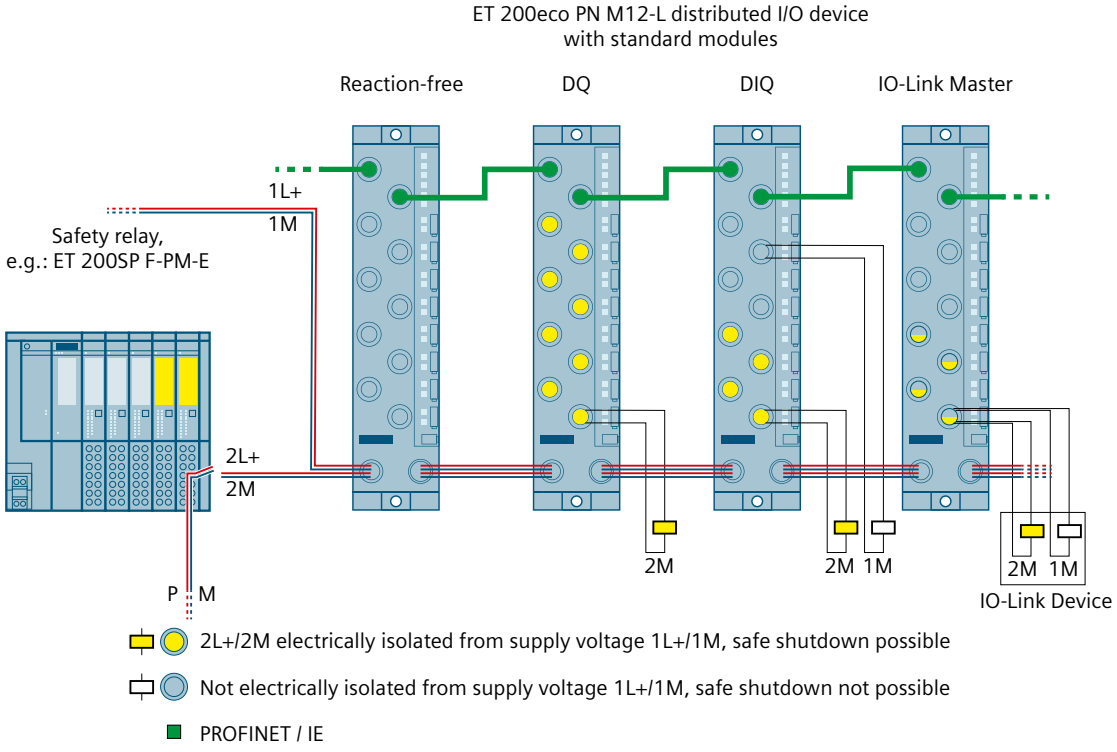

Figure 1-751 Higher-level safety circuit of the outputs

You can find an overview table with the article numbers of the I/O devices and other information in the FAQ on safety-related shutdown (https://support.industry.siemens.com/cs/ww/en/view/39198632).

Planning

Note the following points when planning safety circuits.

WARNING

Pay attention to potential groups for safety-related shutdown
When a digital output is connected to a digital input, pay attention to the potential groups. Depending on the configuration, 1M and 2M can then be connected, which leads to elimination of the electrical isolation between 1L+ and 2L+.
Safety-related shutdown is not permitted if electrical isolation has been eliminated.

⚠ WARNING

24 V encoder supply $2U_S$ for DIQ channels at 2L+/2M
Use only the 24 V encoder supply $2U_S$ provided by the I/O device for the encoder supply for DIQ channels.
If you use a different encoder supply, this eliminates the electrical isolation of the whole safety circuit. This prevents you from establishing a safe state in the entire system.

NOTE

Safe electrical isolation
Ensure protection by electrical separation for voltages greater than SELV/PELV.
If, for example, the actuators switch 230 V, there must be protection by electrical separation between the outputs and the 230 V components.

NOTE

Safety-related shutdown for the IO-Link master
For an IO-Link master with IO-Link Port Class B, safety-related shutdown is available for the additional supply (PIN 2 and PIN 5).
The other signals at the port are reaction-free if you ensure electrical isolation from PIN 2 and PIN 5 of the port.
Note that the IO-Link device must have corresponding safety characteristics in order to use the safety-related shutdown.

ET 200SP F-PM-E documents

If you use an electronic module ET 200SP F-PM-E for a safety circuit, observe the information in these documents:

- Manual for Power Module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/ww/en/view/78645796)
- Product information for Power Module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/ww/en/view/109761777)

Settings for ET 200SP F-PM-E

Consider the whole system when setting and planning. Here is a small excerpt of various settings.

- Operation only as a PM-switching module as shown in figure Safety-related shutdown of ET 200eco PN M12-L (Page 113)
- Disabling of dark test (max. SIL 2, Cat.3/PL d) since it causes outputs to drop out briefly
  Observe the information in Manual for Power Module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/ww/en/view/78645796) and Product information for Power Module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/ww/en/view/109761777)
- Switching of capacitive loads
  Observe the information in section "Connecting capacitive loads" in Manual for Power Module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/ww/en/view/78645796)

Limits of the higher-level safety circuit

The ET 200eco PN M12-L standard modules do not fulfill any safety functions. The safety functions are executed by the safety relay in order to bring the system into a safe state. Adjust the operation inspection interval of the safety relay according to the safety class. Use the operating instructions and related documents of the utilized safety relay for this.
Take the following measures if energy that is not provided by the higher-level safety circuit is used to control the safety function.

Prevent dangerous faults in the safety function that are not detected by the higher-level safety circuit (e.g. 3SK1 or ET 200SP F-PM-E) by adopting suitable safety measures. The "diagnostics" must be performed indirectly via the controlled process.

Requirements for safety-related process data:

- Functionally safe
- Read via fail-safe inputs (e.g. F-DI)
- Fail-safe processing unit (e.g. F-CPU) for output of commands
- Output through fail-safe outputs (e.g. F-DQ) for controlling the safety function

If these criteria are not met, bring the standard modules to the safe state through the higher-level safety circuit.

- Process error
- Faulty standard modules

Take the fault tolerant time interval (FTTI) of the process into account for this.

Requirements for the power supply

Operation requires a SELV/PELV power supply for limiting overvoltages on L+ and M (24 V). This measure prevents possible errors from the power supply side at the same time.

Select the power supply unit according to the requirements of the respective operating instructions for the shutdown device and for the ET 200eco PN M12-L system.

You can find more information on safe SELV/PELV in the data sheets of the utilized power supply units.

FAQ

The information on the safety-related shutdown of standard modules refers to the status of the issue date. Read the up-to-date information on safety-related shutdown in this FAQ (https://support.industry.siemens.com/cs/ww/en/view/39198632).

This FAQ specifies the SIMATIC standard modules that are suitable for a safety-related shutdown and a file with wiring examples.

Other article numbers for the ET 200eco PN M12-L distributed I/O system can be found on the Internet (http://www.siemens.com/automation/service&support) in the online catalog and the online order system.

C.2 UL-approved cables

In combination with the UL-approved cables for the power supply and the connection of inputs/outputs, the SIMATIC ET 200eco PN M12-L distributed I/O devices meet UL approval. Siemens has UL-approved cables for these applications in the product portfolio.

C.3 Plug cover for ET 200ecoPN M12-L

The following table shows the technical specifications for plug cover for ET 200ecoPN M12-L.

Article number	6ES7194-6JA00-0BB0
General information	
Product description	connector cover for ET200ecoPN M12-L
Degree and class of protection	
IP degree of protection	IP20
Ambient conditions	
Ambient temperature during assembly, min.	-40 °C
Ambient temperature during assembly, max.	80 °C
Ambient temperature during operation	
• min.	-40 °C
• max.	60 °C
Ambient temperature during storage/transportation	
• min.	-40 °C
• max.	80 °C
Mechanics/material	
Material of housing	stainless steel with plastic edge protection
Material property	
• Silicone-free	Yes

Article number	6ES7194-6JA00-0BB0
Dimensions	
Width	50 mm
Height	200 mm
Depth	110 mm
Weights	
Weight, approx.	710 g

SIMATIC ET 200eco PN M12-L data

D

The EU Data Act, a key component of the European data strategy, entered into force on 11 January 2024.

The following information provides an overview of the data that is generated by the SIMATIC ET 200eco PN M12-L automation system and accessible to you.

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and parameter data (upload to PG/PC)	Binary formats, string formats	Depending on application
Diagnostics data, service data	Binary formats	Depending on application Less than 100 bytes per diagnostic event; several kilobytes of service data
Fieldbus* metadata: I&M data, log data, statistics data	Binary formats, string formats	Approximately 100 bytes per read-out data record

* PROFINET, EtherNet/IP, Modbus TCP

Continuous and real-time data generation

The I/O devices are able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The cycle time is specified by the higher-level CPU.

Data storage and storage duration

Local data storage

The I/O devices store data in integrated memory areas.

Local data storage	Storage capacity	Storage duration
Retentive memory (for I&M data, configuration and parameter data, service data)	I/O devices up to 16 MB	Permanent
Work memory (for process data, diagnostics data, fieldbus metadata, configuration and parameter data, service data)	I/O devices up to 1 MB	During operation of the I/O device

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Prioritization of control tasks over data access Standard fieldbus transmission mechanisms Data throughputs up to 1 Gbps via PROFINET
Configuration and parameter data (upload to PG/PC)	TIA Portal (via CPU) S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms
Diagnostics data, service data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms
Fieldbus metadata: I&M data, log data, statistics data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Via fieldbus without authentication Via CPU (https://support.industry.siemens.com/cs/de/de/view/59193101-/en)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the I/O devices to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deleting data from I/O devices

To delete all data from the data memories of the I/O device, the "Reset to factory settings" function is available.

To reset the I/O device to factory settings, the following access options are available:

- TIA Portal
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

More information

You can find more information on deleting data in the "Securely removing data (Page 110)" and "Restoring the factory settings (Page 81)" sections.

Preface

Purpose of the manual

The information in this manual enables you to run the ET 200eco PN distributed I/O device on PROFINET IO as IO device.

Basic knowledge required

This manual presumes a general knowledge in the field of automation engineering.

The manual describes the components based on the data valid at the time of its release. SIEMENS reserves the right of including a product information for each new component, and for each component of a later version.

Scope of this manual

This manual applies to the ET 200eco PN distributed I/O device.

Changes compared to the previous version

Compared with the previous version, this manual includes the following changes/additions:

- Updates in section Standards and certifications (Page 88)

Standards and certifications

You can find information on the standards and approvals that are fulfilled by the ET 200eco PN distributed I/O device in the section Standards and certifications (Page 88).

Scope of information

In addition to this manual, you need:

- The manual for the IO Controller you are using
- The PROFINET System Description (https://support.industry.siemens.com/cs/ww/en/view/19292127) system manual,
- The From PROFIBUS DP to PROFINET IO (https://support.industry.siemens.com/cs/ww/en/view/19289930) programming manual.
- The IO-Link System (https://support.industry.siemens.com/cs/ww/en/view/65949252) function manual.

Guide

This manual describes the hardware of the ET 200eco PN distributed I/O device. It consists of instructive sections and reference sections (specifications).

Topics covered in this manual include

- Installation and wiring of the ET 200eco PN distributed I/O device
- Commissioning and diagnostics of the ET 200eco PN distributed I/O device
- Components of the ET 200eco PN distributed I/O system
- Article numbers
- Important terms are explained in the glossary.
- The index helps you to quickly find all texts relevant to your keyword.

Recycling and disposal

For ecologically compatible recycling and disposal of your old device, contact a certificated waste disposal service for electronic scrap. Dispose of the equipment according to the applicable regulations in your country.

Training Centers

Siemens offers corresponding courses to get you started with your ET 200eco PN distributed I/O device and the SIMATIC S7 automation system. Please contact your local training center.

Additional information can be found on the Internet (http://www.sitrain.com/index_en.html).

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet (https://support.industry.siemens.com/cs/ww/en/sc/2090).

Additional support

If you have any further questions about the use of products described in this manual, and do not find the right answers there, contact your local Siemens representative:

You can find your representative on the Internet (http://www.automation.siemens.com/partner/guiwelcome.asp?lang=en).

A guide to the technical documentation for the various SIMATIC products and systems is available on the Internet (https://support.industry.siemens.com).

The online catalog and ordering systems are available on the Internet (http://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Product overview

1

1.1 Distributed I/O device – Overview

Distributed I/O systems – application area

A plant configuration quite often features a process I/O configuration in a central automation system.

The wiring of process I/O components installed at a grated distance away from an automation system may soon may soon become highly complex and susceptible for electromagnetic interference.

Distributed I/O systems are are the perfect solution for such configurations.

- The controller CPU is located in a central rack.
- The I/O systems (inputs and outputs) are operated locally in a distributed configuration.

What is PROFINET IO?

PROFINET IO is an open transmission system with real-time functionality defined in accordance with the PROFINET standard. This standard defines a manufacturer-independent communication, automation and engineering model.

Industrial-strength connections are available for wiring the PROFINET components.

- PROFINET discards the hierarchical PROFIBUS master/slave concept. and deploys a provider/consumer principle instead. The IO Devices that will be subscribed to by an IO Controller are defined within the planning phase.
- The quantity structures are extended in accordance with the available quantities for PROFINET IO. Parameter limits are not exceeded during configuration.
- The transmission rate is 100 Mbps.
- The configuration interface for users is generally the same as that for PROFIBUS DP (the system is configured in **STEP 7 > HW Config**).

Structure of a PROFINET IO network

The figure below illustrates a typical PROFINET IO network structure. Existing PROFIBUS slaves can be integrated using an IE/PB Link.

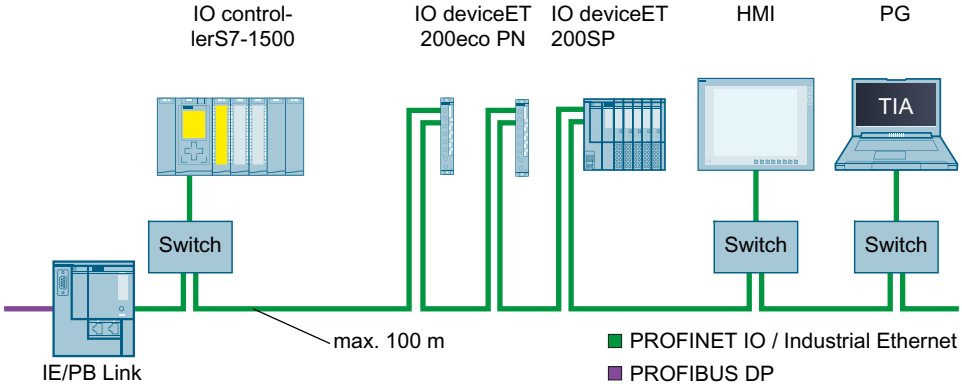

Figure 1-754 Typical structure of PROFINET IO

1.2 ET 200eco PN Distributed I/O Device

Definition

The ET 200eco PN distributed I/O device is a compact PROFINET IO device in degree of protection IP65/66 or IP67 and UL Enclosure Type 4x, Indoor use only.

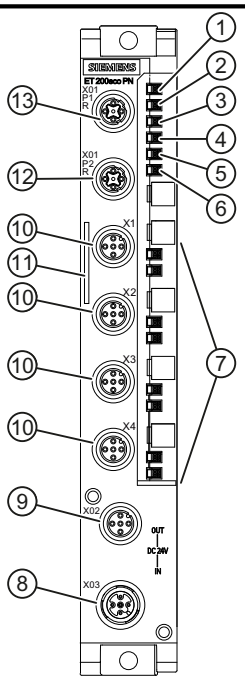
Field of application

The fields of application of the ET 200eco PN are derived from its special properties.

- A robust design and degree of protection IP65/66 or IP67 make the ET 200eco PN distributed I/O device suitable in particular for use in rugged industrial environments.
- The compact design of the ET 200eco PN is particularly favorable for applications in confined areas.
- The easy handling of ET 200eco PN facilitates efficient commissioning and maintenance.

Properties

The ET 200eco PN has the following properties:



- Integrated switch with 2 ports
- Supported Ethernet services:
  - ping
  - arp
  - Network diagnostics (SNMP)
  - LLDP
  - DCP

- Interrupts
  - Diagnostics interrupts
  - Maintenance interrupts
  - Hardware interrupts
- Port diagnostics
- Isochronous real-time communication
- Prioritized startup
- Device replacement without programming device
- Media redundancy

Components of ET 200eco PN

The tables below provide an overview of the most important components of ET 200eco PN:

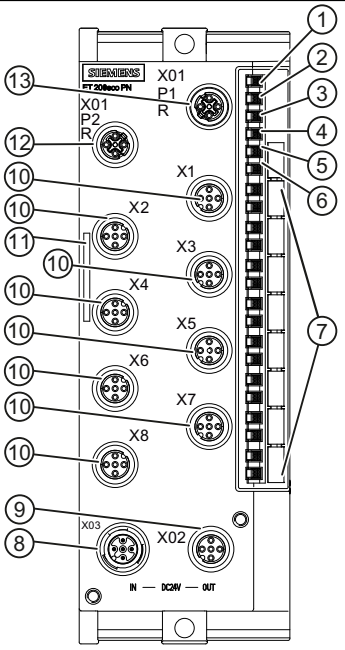


Table 1-1032 Components of ET 200eco PN (30 mm)

Component	Function	Figure

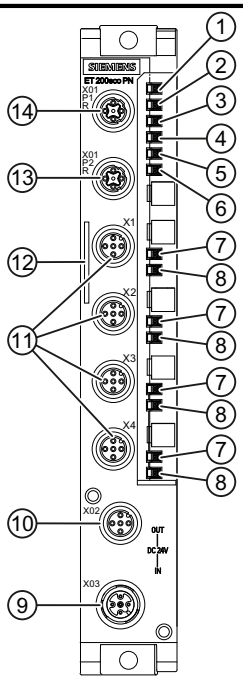
What is an IO-Link Master?

IO-Link is a point-to-point connection to conventional and intelligent sensors/actuators via unshielded standard cable in proven 3- or 5-conductor technology. IO-Link Masters are backwards compatible with all DI standard sensors. Switching state and data channel designed in proven 24 VDC technology.



Supports mixed operation of sensors/actuators in the IO-Link, digital input and digital output operating modes on all four ports of the IO-Link Master.

Table 1-1035 IO-Link Master (6ES7148-6JA00-0AB0)

LEDs

For information on the meaning of the LED displays, see section Diagnostics by means of LED display (Page 76).

Further components of ET 200eco PN

Table 1-1037 Further components of ET 200eco PN

Component	Function	Figure
Terminal block	You can connect up to 10 A per voltage to the terminal block for distribution to the I/O devices. A maximum of 4 A per voltage is available short-circuit protected for each I/O device.	
Voltage distributor	You can supply up to 8 A per voltage at the PD DC 24V 1×7/8" 4×M12 and distribute up to 4 A per voltage and connector short-circuit-protected through 4 connectors.	 ① LEDs for forwarding 1L/2L ② LEDs for forwarding 1L/2L ③ X05: Status of voltage supply ④ X01 ... X04: Loop through of the voltage
Mounting rail	You can install several I/O devices on the mounting rail.	

IO Controller

The ET 200eco PN can communicate with all IO controllers that conform to IEC 61158.

At least STEP 7 V5.4, SP4 is required to configure a ET 200eco PN.

The ET 200eco PN can be configured starting from a CPU with extended diagnostics, see FAQ (https://support.automation.siemens.com/WW/view/en/23678970).

For information on the individual PROFINET properties that are available for the respective versions of the ET 200eco PN, refer to theFAQ (https://support.automation.siemens.com/WW/view/en/44383954).

Installing

2

Two installation variants

There are two installation variants:

- With mounting rail
- Without mounting rail

For corresponding conditions, refer to the next chapters.

2.1 Installation without mounting rail

Simple installation

The ET 200eco PN distributed I/O device is designed for easy installation.

- The I/O device must be mounted on a solid base
- and can be prewired.

Requirements

Screw type	Explanation
Cylinder head screw M5 to ISO 1207/ISO 1580 (DIN 84/DIN85)	The minimum screw length amounts to 35 mm. Any washers you might need should conform to DIN 125.
Hexagon socket head cap screws M5 to DIN EN ISO 4762	

Tools required

Medium-sized screwdriver or 4 mm hex socket driver.

Procedure

1. Screw the I/O device onto a level surface.
   Screw the I/O device onto the panel at both mounting fixtures on the top and bottom of the front or side (torque: 3 N/m).

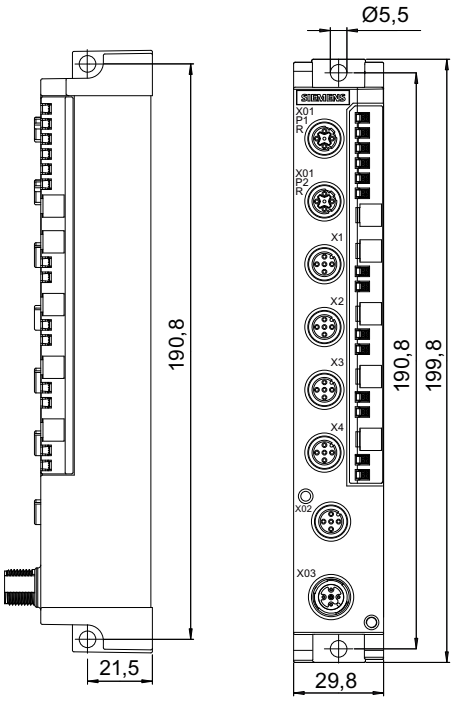

Figure 1-755 Mounting the I/O device on a panel (30 mm)

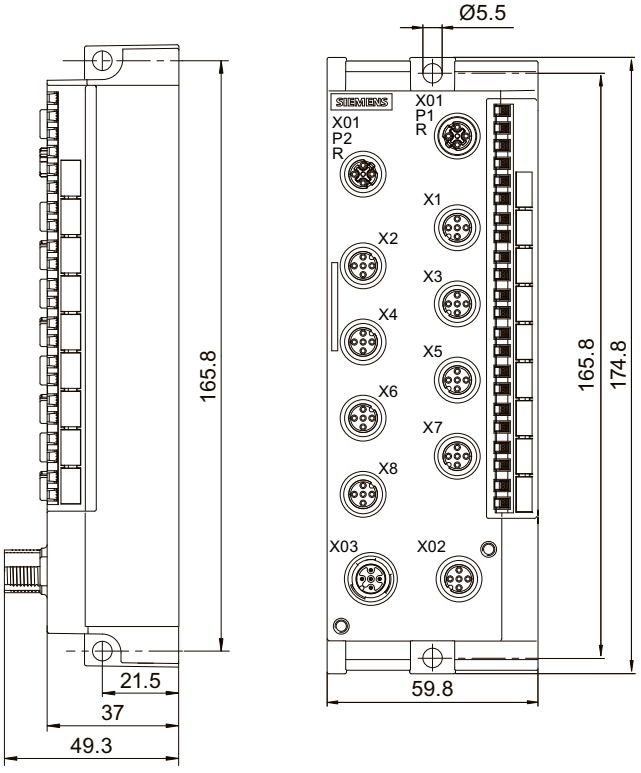

Figure 1-756 Mounting the I/O device on a panel (60 mm), for example 16 DO DC 24V/1,3A 8×M12

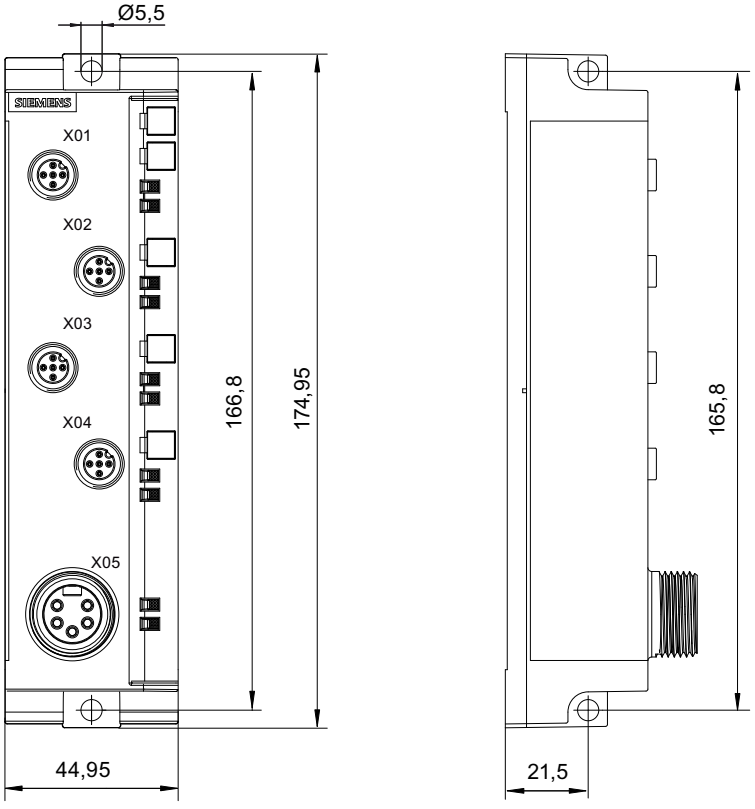

Figure 1-757 Mounting the PD DC 24V 1×7/8" 4×M12 on a panel (45 mm)

2.2 Installation with mounting rail

Version

The mounting rail is available with a length of 500 mm.

Installing the mounting rail

Cut the 500-mm rail to suit your requirements and drill mounting holes for the M8 screws. You should distribute the mounting holes evenly at a pitch of 182 mm on the rail, starting at a distance of 12 mm from the edge.

Use the rack screw to bolt the I/O devices onto the mounting rail.

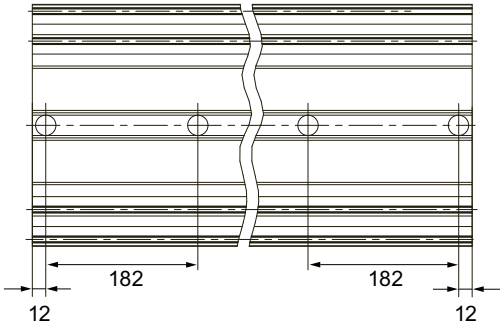

Figure 1-758 Installing the mounting rail

2.3 Mounting position, mounting dimensions

Mounting position

The ET 200eco PN can be mounted in any position.

Mounting and clearance dimensions

Table 1-1038 Mounting dimensions

	Dimensions	
	single width	**double width**
Mounting width	30 mm	60 mm
Mounting height	200 mm	175 mm
Mounting depth	49 mm	49 mm

2.4 Installing the terminal block

Properties

The terminal block connects the ET 200eco PN and supplies the I/O device with power.
The terminal block

- can be installed separately,
- or be screwed on to each I/O device.

Requirements

Note that you must wire the terminal block before you install it.

Tools required

Recessed head screwdriver, medium size

Installing the terminal block separately

You install the terminal block separately.
Remove the screws and then screw them in again at the bottom of the housing.

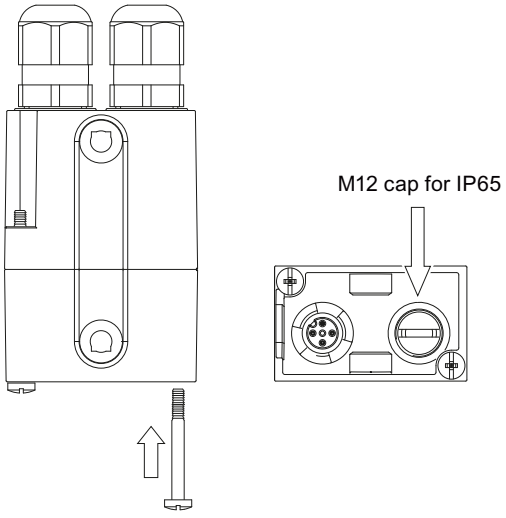

Figure 1-759 Installing the terminal block separately

Installing the terminal block on an I/O device

Install the terminal block vertically on a housing of 30 mm width, or horizontally on a housing of 60 mm width.

An M12 cap is attached to the bottom of the terminal block to implement the corresponding degree of protection. Make sure that the M12 cap is not attached to the terminal block connector and that it is mounted onto connector X02 of the I/O device. Bolt the terminal block onto the I/O device by tightening the screws.

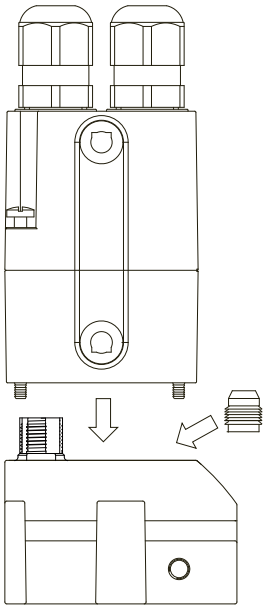

Figure 1-760 Installing the terminal block on an I/O device of 60 mm width

2.5 Replacing labels

Properties

You can identify the I/O device and the I/O connectors using the labels. The module is supplied with the labels already clipped into the holder.

- 1 for the I/O device
- 4 or 8 for the I/O connectors

Requirements

You can order replacement labels.

Tools required

2.5 to 4 mm slotted screwdriver

Replacing labels

1. Push the screwdriver into the small opening of the label at an angle and then lever it out.

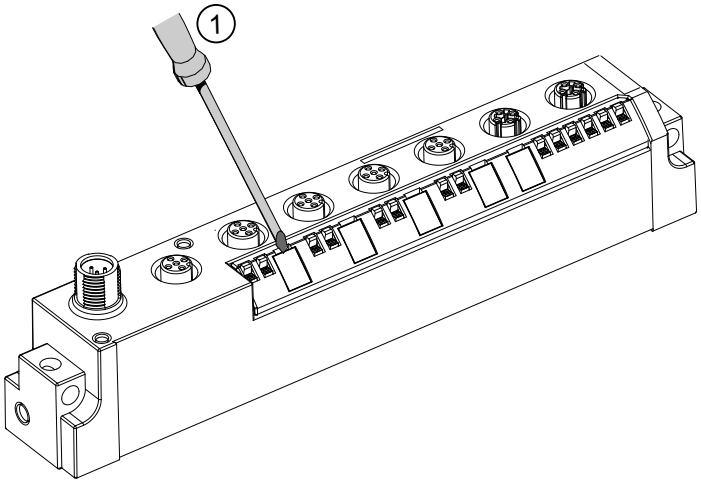

Figure 1-761 Removing labels

2. Push the new label into the holder on the device.

2.6 Removing ET 200eco PN

Procedure

The ET 200eco PN is wired up and operating.

1. Switch off the supply voltage to the ET 200eco PN.
2. Disconnect the wiring from the I/O device.
3. Remove the fixing screws from the I/O device.

NOTE

Observe the information in chapter Looping PROFINET and the supply voltage (Page 58) when replacing the I/O device.

3.1 General rules and regulations for operating an ET 200eco PN

Introduction

When installing the ET 200eco PN distributed I/O device as part of a plant or system, special rules and regulations need to be adhered to depending on the area of application.

This section provides an overview of the most important rules you have to observe when integrating the ET 200eco PN distributed I/O device in a plant or system.

EMERGENCY-STOP devices

EMERGENCY-STOP devices in accordance with IEC 204 (corresponds to DIN VDE 113) must remain effective in all operating modes of the plant or system.

System startup after certain events

The table below identifies situations you must pay attention to when the system starts up after the occurrence of certain events.

If ...	then ...
Startup follows a power dip / failure The ET 200eco PN is started up after bus communication has been interrupted	Dangerous states must not result. If necessary, EMERGENCY-STOP must be enforced!
Start-up follows unlocking of the emergency stop device	An uncontrolled or undefined start up must not occur.

External fuses/switches

External fuses and switches must be installed so that they meet the standards for cable and device protection applicable to your application.

24 V DC supply

The following table identifies requirements you must observe for the 24 V DC supply.

With ...	You must take into account...	
Buildings	External lightning protection	Take lightning protection measures (for example, lightning protection elements)
24 V DC supply lines, signal lines	Internal lightning protection	
24 V DC supply	Safe (electrical) isolation of the extra-low voltage (SELV/PELV)	
Looping-through of the supply voltage	Voltage drop in the case of loop-through (see Chapter Looping PROFINET and the supply voltage (Page 58))	

Protection against external electrical influences

The table below identifies to what you must pay attention when protecting against electrical influences or faults.

With ...	You must take into account...
all plants or systems in which the ET 200eco PN is installed	The plant or system is EMC-compatible and properly grounded for the discharge of electromagnetic interference.
Supply, signal and bus lines	The wiring arrangement and installation must be correct.
Signal and bus lines	A cable or wire break must not lead to undefined states of the plant or of the system.

3.2 Operating ET 200eco PN on grounded mains

Introduction

This section provides information about the overall configuration of an ET 200eco PN distributed I/O device with a grounded power system (TN-S system). The topics covered in this section are in particular: Disconnecting devices, short-circuit and overload protection in accordance with DIN VDE 0100 and DIN EN 60204-1.

Supply voltages of the ET 200eco PN

There are 2 voltage supplies:

- 1L+: Non-switched supply voltage (electronics/encoder/load voltage supply)
- 2L+: Switched voltage supply (load voltage supply)

Definition: Grounded power supply

For grounded power supplies the neutral conductor of the supply system is grounded. A short-circuit to ground of a live conductor, or of a grounded part of the system, trips the protective devices.

Safe electrical separation (SELV in accordance with IEC 61131-2 or IEC 61010-2-201)

Load power supplies/power supply modules with 24 V DC output voltage require safe electrical separation and voltage limiting (extra low voltage). Load power supplies/power supply modules with 24 V DC output voltage are not connected to the protective conductor. According to IEC 61131-2 and IEC 61010-2-201, this protection is referred to as SELV (Safety Extra Low Voltage).

The wiring of SELV circuits must be safely separated from the wiring of other circuits that are not SELV, or the insulation of all conductors must be dimensioned for the higher voltage.

Grounded extra-low voltage (PELV in accordance with IEC 61131-2 or IEC 61010-2-201)

Load power supplies/power supply modules with grounded 24 V DC output voltage require safe connection to the protective conductor and voltage limiting (extra low voltage).

According to IEC 61131-2 and IEC 61010-2-201, this protection is referred to as PELV (Protective Extra Low Voltage).

Either the wiring of PELV circuits must be safely isolated from the wiring of other circuits that are not PELV, or the insulation of all wires must be dimensioned for the higher voltage.

Components and protective measures

A number of components and protective measures are prescribed for plant installations. The type of components and the degree to which the protective measures are mandatory depend on which DIN VDE regulation applies to your system configuration. The following table refers to the figure below.

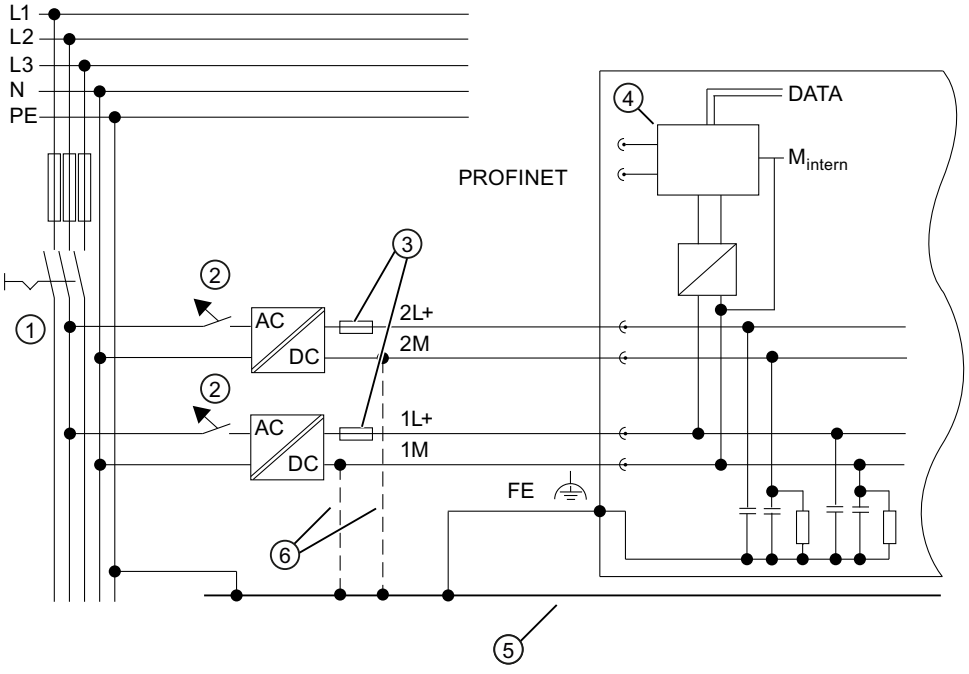
Comparison ...	**Reference to figure**	**DIN VDE 0100**	**DIN EN 60204**
Disconnecting device for controller, sensors, and actuators	(1) "Grounding concept for ET 200eco PN"	... Part 460: Main switch	... Part 1: Disconnector
Short-circuit / overload protection	(2) "Grounding concept for ET 200eco PN"	... Part 725: Single-pole protection of circuits	... Part 1: With grounded secondary circuit: **Single-pole** protection
Circuit breaker		... Part 430: Protection of cables and wires against overcurrent	-

Configuring ET 200eco PN with grounded reference potential

In the configuration of the ET 200eco PN with grounded reference potential, any interference currents that occur are discharged to functional ground. The terminals must be connected externally (see the figure "Grounding concept for ET 200eco PN": Connection between 1M and FE).

Configuring ET 200eco PN with ungrounded reference potential

In the configuration of the ET 200eco PN with ungrounded reference potential, any interference currents that occur are discharged to functional ground via an internal RC network (see in the figure "Grounding concept for ET 200eco PN": **No** connection between 1M and FE).



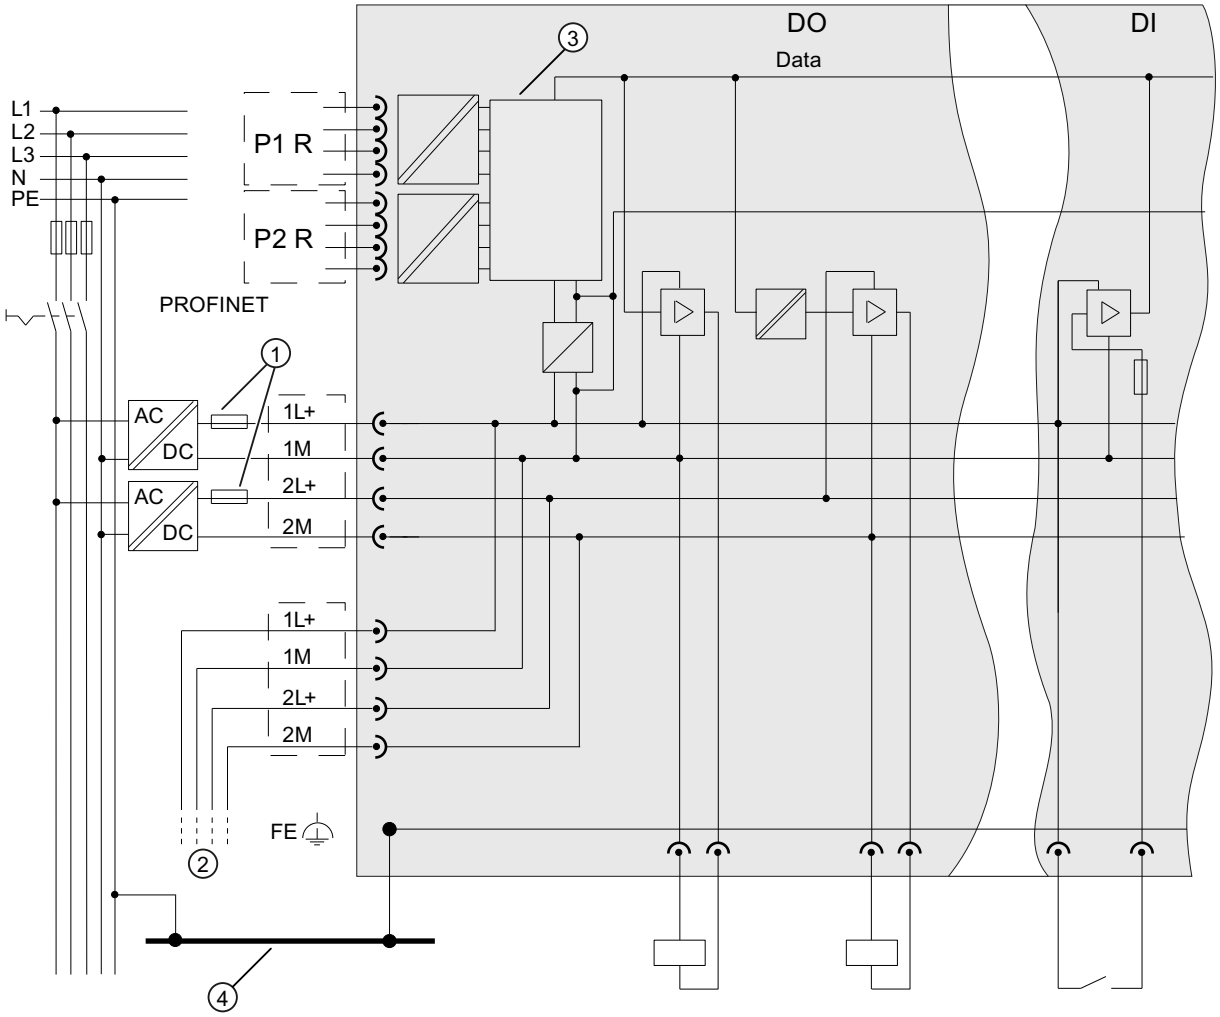
Insulation monitoring

Insulation monitoring must be provided in the following cases:

- When setting up the ET 200eco PN distributed I/O devices with non-grounded reference potential
- If dangerous system states occur due to error

ET 200eco PN in its overall configuration

The figure below shows the overall configuration of the ET 200eco PN distributed I/O device (load voltage supply and grounding concept) with supply from a TN-S system.



① Disconnecting device for controller, sensors, and actuators
② Short-circuit / overload protection
③ Fuses for line protection
④ Microprocessor and switch
⑤ Ground bus
⑥ When the ET 200eco PN is configured with ungrounded reference potential, the connection between 1M and FE and 2M and FE is not required

3.3 Electrical configuration of ET 200eco PN

Electrical isolation

The ET 200eco PN electrical configuration features electrical isolation between:

- 1L+ Non-switched supply voltage (electronic/sensor/load supply)
  Electrically isolated from PROFINET IO and 2L+ (load voltage supply)
- 2L+: Switched supply voltage (load voltage supply):
  Electrically isolated from all other circuit components.
  Can be shut down with influencing the 1L+.
- PROFINET IO interface:
  Electrically isolated from all other circuit components.

① Infeed of supply voltage
② Loop-through of supply voltage
③ Microprocessor and switch
④ Main ground line

Connection of a digital output to a digital input

⚠ WARNING

When a digital output is connected to a digital output, the respective potential groups have to be observed. Depending on the configuration, 1M and 2M may then be connected, resulting in elimination of the galvanic isolation between 1L+ and 2L+.

Line protection

Line protection is required in accordance with DIN VDE 0100, i.e., you must always provide external fusing.

The power supplies of the I/O device must be fused using a 24 V DC/4 A miniature circuit breaker with tripping characteristic type B or C.

The power supplies of the terminal block must be fused using a 24 V DC/10 A miniature circuit breaker with tripping characteristic type B or C.

The power supplies of the voltage distributor must be fused using a 24 VDC / 8 A miniature circuit breaker with tripping characteristic type B or C.

3.4 Technical specifications of the cables

Impact of the cable length on the supply voltage

- When you wire your configuration, you must take into account the impact of the cable length on the supply voltage of the ET 200eco PN.

  Example

  When using a 10 m cable with Ø 0.75 mm^2, the resistance is 0.5 Ω; this is equivalent to a 2 V voltage drop at 4 A.

NOTE

If you do not maintain the maximum feed current and the appropriate cable cross-sections, you will risk overheating of the cable insulation and contacts, and damage to the device.

3.5 Wiring the ET 200eco PN

3.5.1 Wiring the ET 200eco PN to functional earth (FE)

Introduction

You must connect the ET 200eco PN with the functional earth (FE).

What is functional ground?

All ET 200eco PN I/O devices have a functional earth connection. This connection is used to suppress interference but not for protective purposes. You establish a direction electrical connection to a point in your plant or a shield using the functional earth connection. EMC interference is discharged directly to earth through this connection. The interference immunity of the entire I/O device is increased by the discharge of the EMC interference.

Install ET 200eco PN I/O devices on conductive base

Requirements
Conductive base for installation of the I/O device.

Procedure
The procedure and further information about the required tools and accessories are described in the Section Installation without mounting rail (Page 19).

NOTE

Grounding with conductive base
When you fasten an I/O device of ET 200eco PN to a conductive, grounded base, the two module fixing screws create a conductive connection to the ground potential.
Make sure there is a low-impedance connection between the peripheral device and the conductive substrate and between the conductive substrate and the functional ground.

Install ET 200eco PN I/O devices on non-conductive base

Requirements
Non-conductive base for installation of the I/O device.

Tools required
You need the following tools to connect to the functional ground:

- Stripping tool
- Crimp tool
- Screwdriver

Required accessories
You need the following accessories to connect to the functional ground:

- M5 x 8 fixing screw and washers
- Grounding cable (copper braid cable) with a minimum cross-section of 4 mm^2
- Cable lug suitable for M5 screws

Installation
To connect ET 200eco PN I/O devices to functional earth with non-conductive base, follow these steps:

- Drill 2 fixing holes.
- Strip the grounding conductor and crimp on the cable lug.
- Screw the cable lug onto the I/O device and voltage distributor (M5 fixing screw) with a torque of 1.5 Nm.

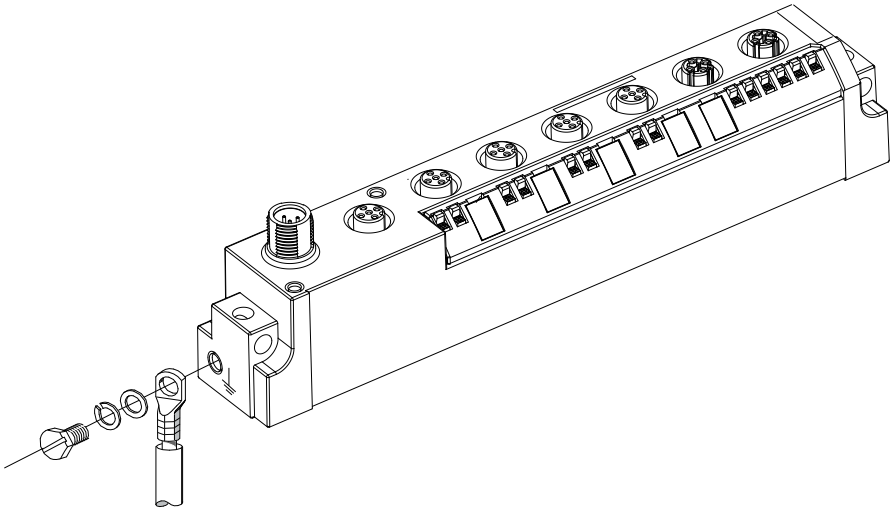


Figure 1-762 Wiring the I/O device to functional earth

Reference

For additional information on installing I/O devices, refer to the section Installing (Page 19).

3.5.2 Wiring I/O devices

Properties

Connect the sensors and actuators to the 5-pin M12 circular sockets (X1 to X4, or X1 to X8) on the front panel of the I/O device.

Requirements

Shut off the supply voltage before you wire the I/O devices.

Tools required

Stripping tool and screwdriver for wiring the M12 cable connector, if you do not use prefabricated cables.

Required accessories

- Prefabricated cable with 5-pin M12 cable connector
- or 3-, 4- or 5-wire copper cable, flexible and 5-pin M12 connector (see tables below)
- or a Y cable
- M12 sealing caps

You can find the article numbers in the appendixArticle numbers (Page 215).

Connecting the M12 connector

1. Plug the connector into the relevant circular socket connector on the I/O block. Make sure the connectors and sockets are properly interlocked (matched joint).
2. Secure the connector by tightening the knurled ring nut with a torque of 1.5 Nm.

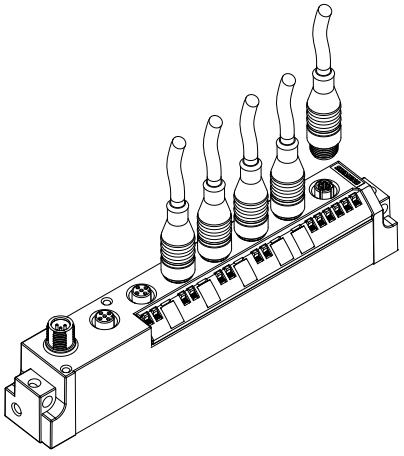

Figure 1-763 Connecting the M12 connector

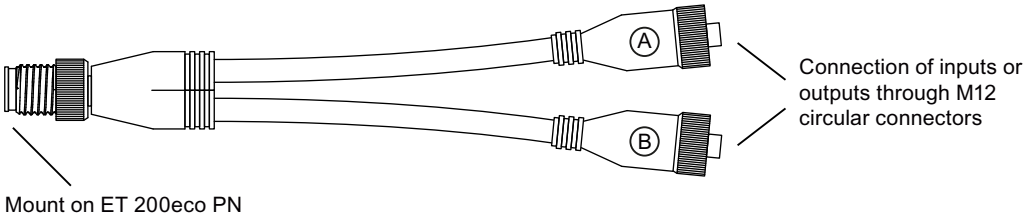
Y cable

The Y cable allows you to connect two actuators or sensors to the inputs or outputs of the ET 200eco PN.

The use of the Y cable is particularly recommended when two channels are occupied for each socket of an I/O device. The Y cable distributes the channels to two circular connectors (see figure below for pin assignment).

The wiring of the Y cable is shown below.



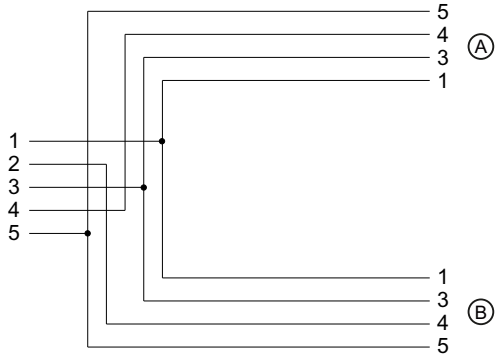


Figure 1-764 Y cable

Wiring jacks (DI/DQ) for Y cable

To connect digital inputs via a Y cable, you will need:

- A Y cable
- 2 M12 jacks
- A flexible 3-wire or 4-wire copper cable

The assignment of Pin 4 depends on which socket of the ET 200eco PN the Y cable is screwed to.

Pin assignment of the sockets for inputs/outputs

The pin assignment of the sockets for inputs/outputs can be found in the data for the individual I/O devices starting in sectionPin assignment of digital inputs (Page 38).

Wiring M12 jacks for analog inputs and analog outputs

For the connection of analog inputs and outputs, you will need:

- one 4-pin or 5-pin M12 jack
- a shielded 4-wire copper cable with a wire cross-section of ≤ 0.75 mm^2

Wire the jack according to the pin assignment of the sockets on the I/O device. You can find the pin assignment in the data for the individual I/O devices starting in Chapter Pin assignment for analog inputs (Page 47).

NOTE

Coupler plug for RTD measurement

For RTD measurements, use a coupler plug with gold-plated contacts. Other materials can create contact resistance that can result in incorrect measured values.

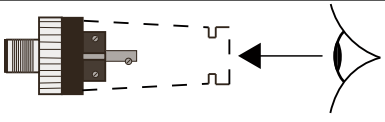
Sealing round sockets not in use

Always seal all unused round sockets using M12 sealing caps to achieve degree of protection IP65, IP66 or IP67.

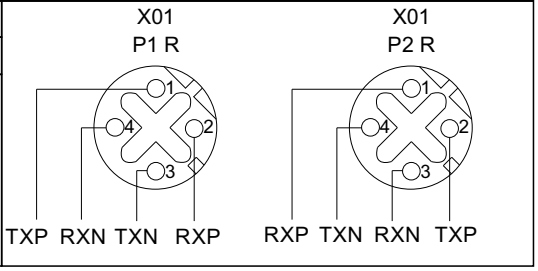
You can find the article numbers in the appendixArticle numbers (Page 215).

Pin assignment

The pin assignment of the I/O devices is specified in the following chapters.



3.6 Pin assignment of connectors



3.6.1 Pin assignment of the PROFINET connector

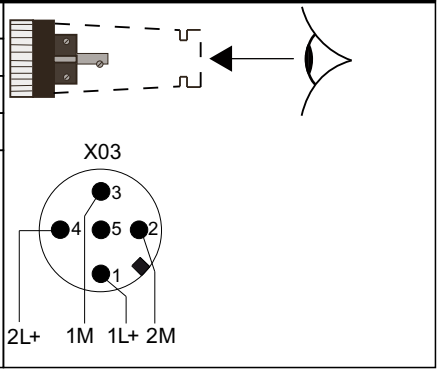
PROFINET connector, X01 connector, port 1 and port 2

The tables below list the pin assignment for the PROFINET connectors.

Table 1-1039 Pin assignment of the M12 cable connector for PROFINET connector, ports 1 and 2

Pin	Assignment	View of the cable connector (PROFINET), port 1 and port 2
	Assignment X01 P1 R	
1	TXP	
2	RXP	
3	TXN	
4	RXN	
Thread	Functional earth FE	
	Assignment X01 P2 R	
1	RXP	
2	TXP	

Pin	Assignment	View of the cable connector (PROFINET), port 1 and port 2
3	RXN	
4	TXN	
Thread	Functional earth FE	



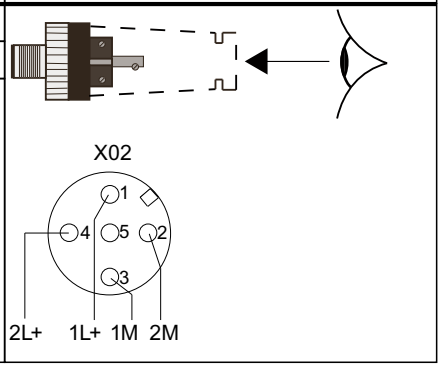
NOTE
When you deactivate the "Autonegotiation" function in *STEP 7* , you must observe the different assignment of the pins at X01 P1 R and X01 P2 R.

3.6.2 Pin assignment for feeding and looping the voltage

Cable connector for supply voltage infeed, X03 connector

The table below lists the pin assignment for the supply voltage infeed.

Table 1-1040 Pin assignment of the M12 cable connector for the supply voltage infeed



Pin	Assignment	View of the cable connector (wiring side)
1	Supply voltage 1L+ (non-switched)	
2	Ground 2M (switched)	
3	Ground 1M (non-switched)	
4	Supply voltage 2L+ (switched)	
5	Reserved	

Cable connector for loop-through of the supply voltage, X02 socket

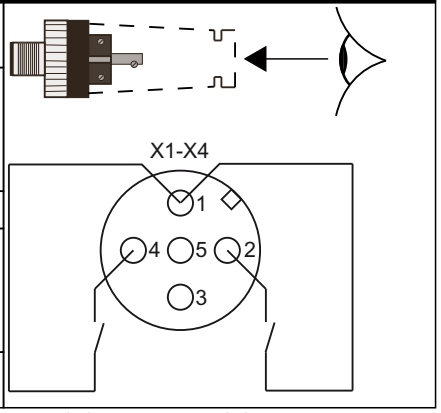
The following table lists the supply voltage for loop-through of the supply voltage.

Table 1-1041 Pin assignment of the M12 cable connector for loop-through of the voltage

Pin	Assignment	View of the cable connector (wiring side)
1	Supply voltage 1L+ (non-switched)	
2	Ground 2M (switched)	

Pin	Assignment	View of the cable connector (wiring side)
3	Ground 1M (non-switched)	
4	Supply voltage 2L+ (switched)	
5	Reserved	

NOTE
The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.



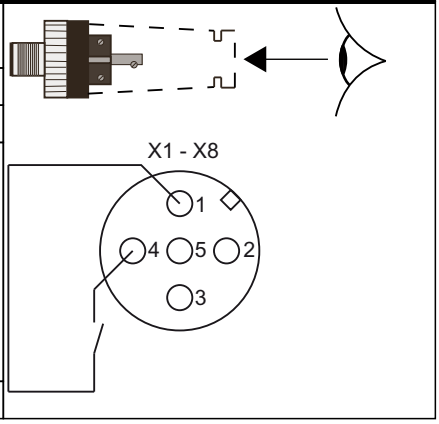
CAUTION
PROFINET IO
Modules with PROFINET interfaces may only be operated when all connected nodes are supplied with SELV/PELV voltages.

3.6.3 Pin assignment of digital inputs

I/O device 8 DI DC 24V 4×M12 (6ES7141-6BF00-0AB0)

You will find the pin assignment for the 8 DI DC 24V 4×M12 I/O device in the table below.

Table 1-1042 Pin assignment of the M12 cable connector for the 8 DI DC 24V 4×M12 I/O device



Pin	Assignment of X1 to X4	View of the cable connector (wiring side)
1	24 V sensor supply $1U_S$ (derived from 1L+ non-switched)

5	Functional earth FE	

When using the Y cable, pin 2 and pin 4 are assigned to pin 4 (A) and pin 4 (B).

NOTE
The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.

3.6.4 Pin assignment of digital outputs

I/O device 8 DO DC 24V/1,3A 4×M12 (6ES7142-6BF00-0AB0)

You will find the pin assignment for the 8 DO DC 24V/1,3A 4×M12 I/O device in the table below.

Table 1-1045 Pin assignment of the M12 cable connector for the 8 DO DC 24V/1,3A 4×M12 I/O device

5	Functional earth FE	

When using the Y cable, pin 2 and pin 4 are assigned to pin 4 (B) and pin 4 (A).

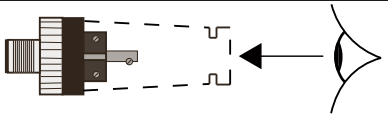
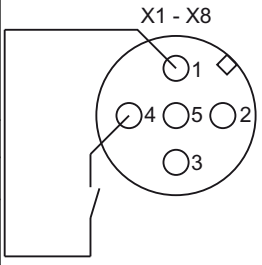
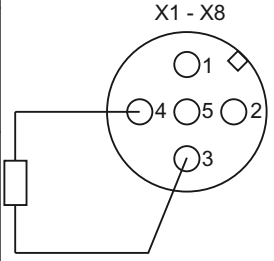
NOTE







The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.

3.6.5 Pin assignment for parameterizable digital input/digital output

I/O device 8 DIO DC 24V/1,3A 8×M12 (6ES7147-6BG00-0AB0)

You will find the pin assignment for the 8 DIO DC 24V/1,3A 8×M12 I/O device in the table below.

Table 1-1049 Pin assignment of the M12 cable connector for the 8 DIO DC 24V/1,3A 8×M12 I/O device

IO-Link Master 4 IO-L 4×M12 (6ES7148-6JD00-0AB0)

The following tables contain the pin assignments for the IO-Link Master 4 IO-L 4×M12.

Table 1-1053 Pin assignment for IO-Link Master

Pin	Assignment of X1 to X4	View of the cable connector (wiring side)
1	24 V sensor supply $1U_S$ (derived from 1L+ non-switched)	 Port Class A (type A)*  Port Class B (type B) 
2	24 V actuator supply $2U_A$	
3	Sensor supply ground 1M	
4	IO-Link master Port 1 (C/Q): Connector X1 Port 2 (C/Q): Connector X2 Port 3 (C/Q): Connector X3 Port 4 (C/Q): Connector X4	
5	Actuator supply ground 2M	

* If you use the sockets for IO-Link devices with Port Class A, do not place any signals on pins 2 and 5.

The M12 connectors are designed as Port Class B according to IO-Link specification. Pins 2 and 5 contain an additional power supply.

A non-interacting connection of devices of various port types (class A and class B) is possible using a 3-wire connecting cable (assignment of pins 1, 3 and 4).

NOTICE
24 V encoder supply $1U_S$ Only use the 24 V encoder supply $1U_S$ supplied by the IO-Link master to supply the devices.

3.6.7 Pin assignment for analog inputs

I/O device 8 AI 4 U/I + 4 RTD/TC 8×M12 (6ES7144-6KD00-0AB0)

You will find the pin assignment for the 8 AI 4 U/I + 4 RTD/TC 8×M12 I/O device in the table below.

Table 1-1054 Pin assignment for voltage and current for the 8 AI 4 U/I + 4 RTD/TC 8×M12 I/O device

3.7 Wiring the terminal block

Tools required

You need a Phillips screwdriver of medium size to attach the terminal block and a slotted screwdriver to connect the wires.

Use the following cables to this purpose:

- Wires: Cables with core cross-section of 0.25 to 1.5 mm²
- Cable gland: Cables with external diameters of 4.5 to 10 mm

Wiring the connectors

Prepare the wires for connection to the terminal block.

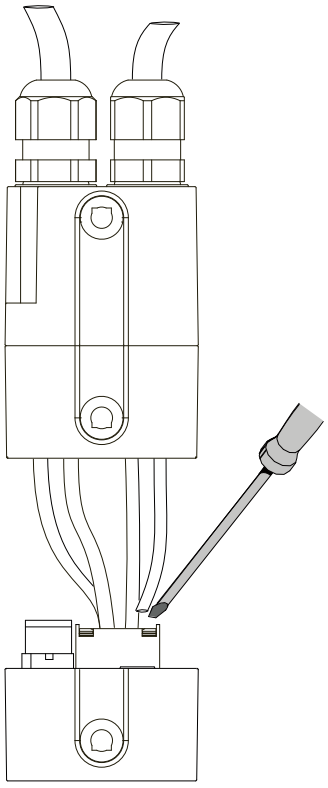

Figure 1-765 Wiring the terminal block

We'll show you an example of the separate installation of the terminal block and how to wire it to several I/O devices.

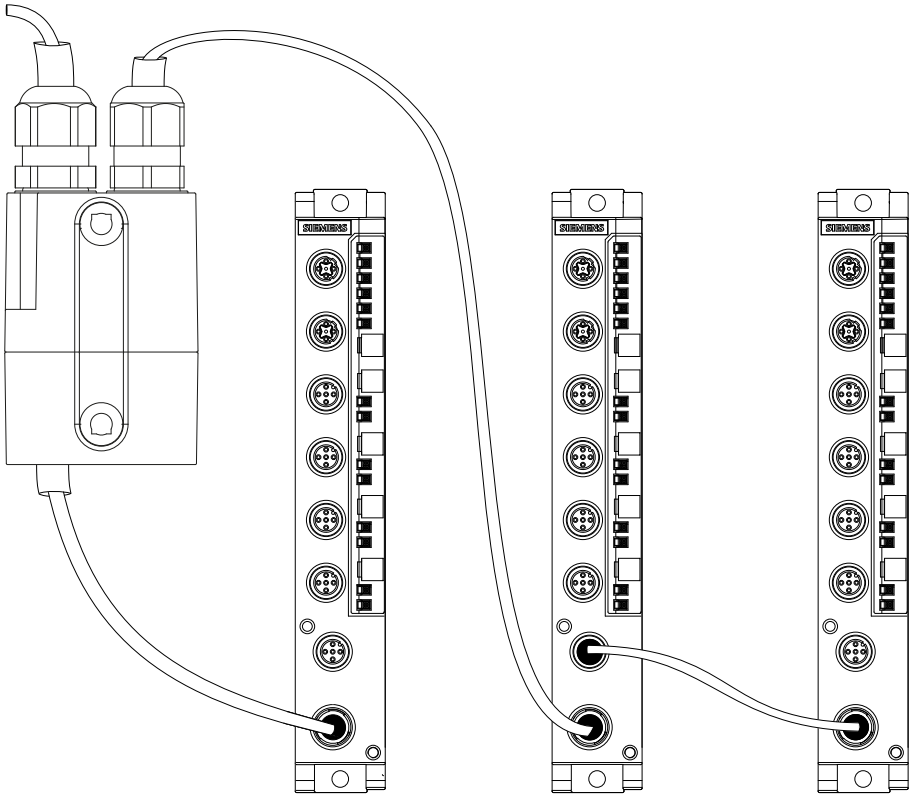

Figure 1-766 Wiring of the terminal block and of several I/O devices

You can tap a maximum load of 4 A from each supply voltage of the I/O device. You can loop-through the rest.

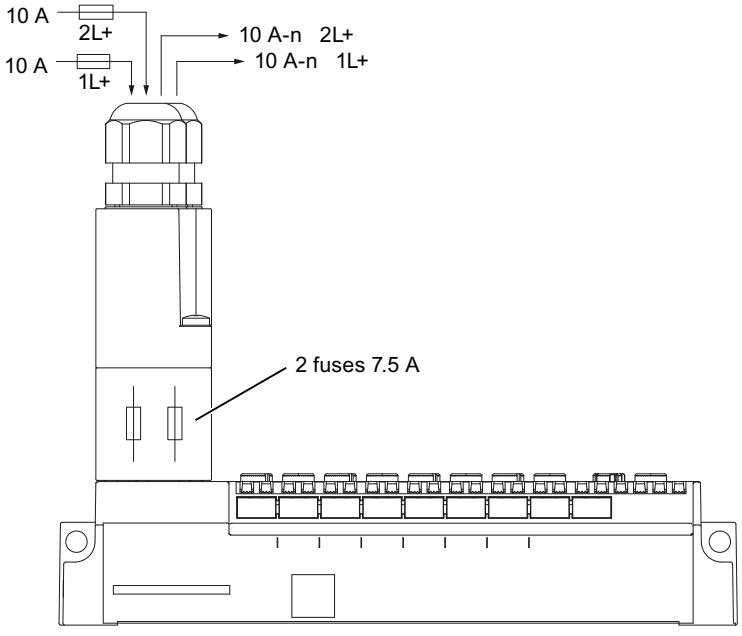

Figure 1-767 Principle of current distribution at the terminal block

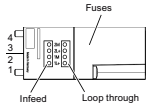
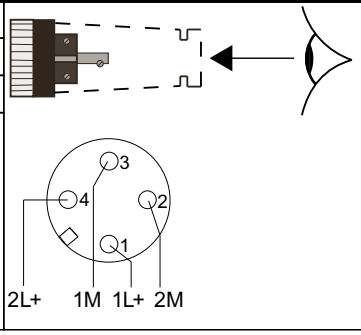
Pin assignment

The tables below show the pin assignments.

Table 1-1061 Pin assignment of the insulation displacement terminal block.





Pin	Assignment	View of the insulation displacement terminal block:
1	24 V (1L+ non-switched)	
2	Ground 1M (non-switched)	
3	24 V (2L+ switched)	
4	Ground 2M (switched)	

Table 1-1062 Pin assignment of the M12 connector

Pin	Assignment	View of the cable connector
1	24 V (1L+ non-switched)	
2	Ground 2M (switched)	
3	Ground 1M (non-switched)	
4	24 V (2L+ switched)	

Information on wiring

- If you are wiring your configuration, you must take into account the impact of cable length on the supply voltage to the ET 200eco PN (permitted tolerance).
- The maximum infeed current of the terminal block is 10 A for 1L+ non-switched and 10 A for 2L+ switched.

  Do not exceed these values.

CAUTION

Adhering to the maximum infeed currents and cable cross-sections
If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you will risk overheating the cable insulation and contacts resulting in damage to the device.

Installing the terminal block (Page 23)

3.8 Wiring the voltage distributor

Wiring the connectors

We use an example to show the configuration of the PD DC 24V 1×7/8" 4×M12 voltage distributor with connected I/O devices.

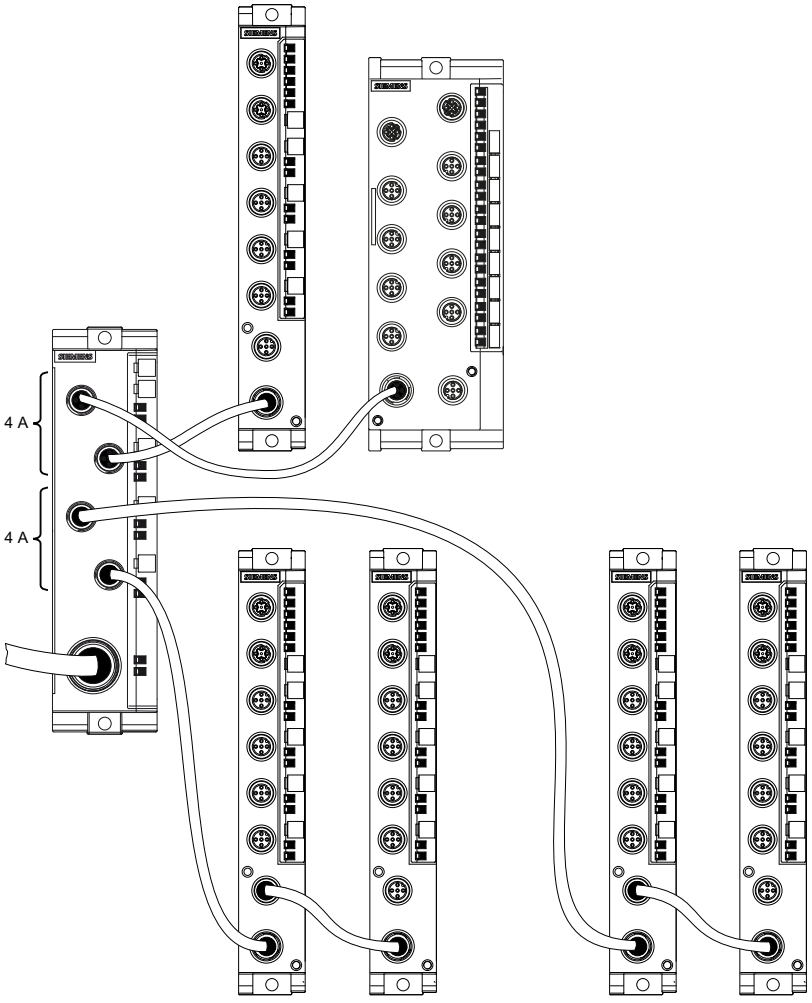

Figure 1-768 Wiring the voltage distributor

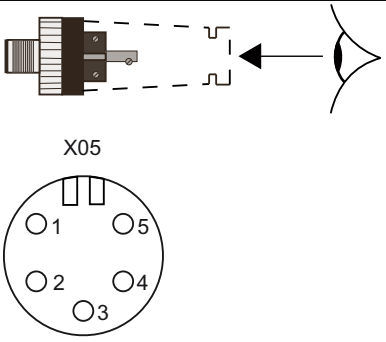
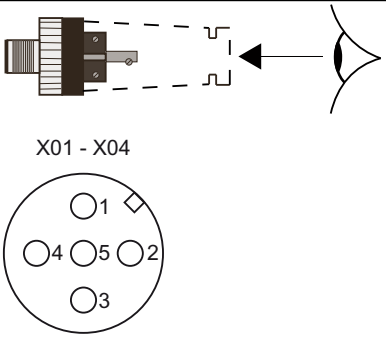
Pin assignment

The tables below show the pin assignments.

Table 1-1063 Pin assignment of the 7/8" connector at the current input of the voltage distributor

Pin	Assignment of X05	View of the 7/8" cable connector (24 V connection)
1	Ground 2M (switched)	
2	Ground 1M (non-switched)	





Pin	Assignment of X05	View of the 7/8" cable connector (24 V connection)
3	Functional earth FE	
4	24 V (1L+ non-switched)	
5	24 V (2L+ switched)	

Table 1-1064 Pin assignment of the M12 cable connector at the current output

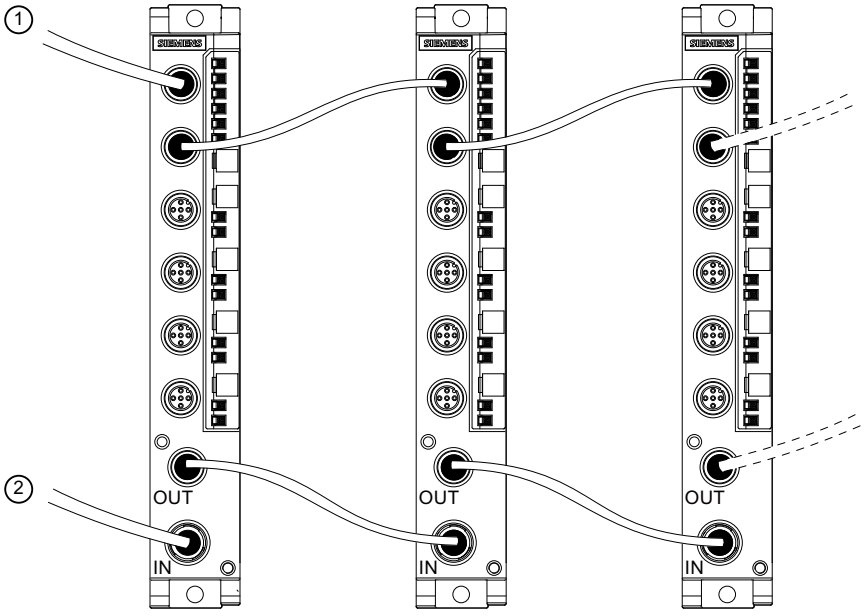
Pin	Assignment of X01 to X04	View of the M12 cable connector
1	24 V (1L+ non-switched)	
2	Ground 2M (switched)	
3	Ground 1M (non-switched)	
4	24 V (2L+ switched)	
5	Not used	

Information on wiring

- If you are wiring your configuration, you must take into account the impact of cable length on the supply voltage to the ET 200eco PN (permitted tolerance).
- The maximum input current of the voltage distributor is 8 A for 1L+ non-switched and 2L+ switched.

  Do not exceed these values.

⚠ CAUTION



Adhering to the maximum infeed currents and cable cross-sections
If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you will risk overheating the cable insulation and contacts resulting in damage to the device.

3.9 Looping PROFINET and the supply voltage

Properties

The I/O device is equipped with one connector for the infeed and one socket for loop-through of the supply voltage. The feed connector and the socket for loop-through are interconnected internally.

Two sockets for PROFINET IO are available on the I/O device. One socket for the infeed and one socket for loop-through of the PROFINET IO.

① PROFINET
② Supply voltage

Figure 1-769 PROFINET and loop-through of supply voltage for ET 200eco PN

Information on wiring

- Always make allowances for the influence of the cable length on the supply voltage at your ET 200eco PN (permitted tolerance) when you wire your configuration.
- The maximum infeed current of the I/O module is 4 A each for 1L+ non-switched and 2L+ switched.

  These values may not be exceeded.

⚠ CAUTION
Adhering to the maximum infeed currents and cable cross-sections If you do not maintain the maximum infeed currents and the appropriate cable cross-sections, you will risk overheating of the cable insulation and contacts, and damage to the device.

Configuring

4

4.1 Configuring ET 200eco PN

Requirements

You need STEP 7 as of version V5.4, SP4 and possibly HSP.

Introduction

ET 200eco PN is included in the hardware catalog of *HW Config* after the start of STEP 7.

Procedure

1. Start SIMATIC Manager.
2. Create a new project.
3. Configure the ET 200eco PN with *HW Config*.
4. Double-click on the technology module at slot 1 of the ET 200eco PN in the configuration table and set the parameters.
5. Save the configuration, or download it to the IO Controller.

Prerequisite for the GSD file

You will need a GSD file, available for download from the Internet (http://support.automation.siemens.com/WW/view/en/19698639/133100).

ET 200eco PN family:
gsdml-v2.2-siemens-et200eco"date format yyyymmdd".xml

Configuring ET 200eco PN on PROFINET IO using STEP 7

1. Start STEP 7 and call up the **Options > Install New GSD File** menu command in *HW Config*.
2. In the next dialog box, select the GSD file to install, and confirm with "OK". Result: ET 200eco PN is displayed in the hardware catalog, PROFINET IO folder.
3. The rest of the procedure is as described in the Programming with STEP 7 (http://support.automation.siemens.com/WW/view/en/18652056) manual.

See also

For further information, refer to the STEP 7 online help.

4.2 Configuring an IO-Link master

4.2.1 Configuring the IO-Link Master 6ES7148-6JA00-0AB0

Requirements

Configuration of the IO-Link Master takes place in two steps:

1. You need STEP 7 as of version V5.4 + SP5 + HSP188 for the IO-Link Master.
2. Configure the connected IO-Link Devices, encoders, and actuators with the Port Configurator tool (S7-PCT).

Configuring the IO-Link Master with HW Config

1. Start the SIMATIC Manager and configure the project as described in the STEP 7 online help.
2. Drag the IO-Link Master from the HW catalog **PROFINET IO > ET 200eco PN > IO Link > 4 IO-L + 8 DI + 4 DO DC24V/1.3A 8×M12 V6.1.**
   You can freely choose the address space in the **Properties > Addresses** field for each slot of the IO-Link Master. Additional information on possible configurations is available in the chapter I/O address space (Page 232).
3. Assign the IO-Link Master parameters. You can assign the parameters separately for each functional unit:
   – The PROFINET IO parameters are accessed by double-clicking Slot 0.
   – The IO-Link parameters are accessed by double-clicking Slot 1.
   – The 8 digital input and 4 digital output parameters are accessed by double-clicking Slot 2.

Configuring the IO-Link Devices using "Configure IO-Link"

1. Select Slot 1 "4 IO-L" from the configuration table of the I/O device IO-Link Master.
2. Right-click and select "Configure IO-Link" in the following shortcut menu.
   Result: S7-PCT is started.
3. Now start with the parameter assignment of the IO-Link Devices, sensors, and actuators.

You can find additional information in the S7-PCT online help.

Configuring the IO-Link Master with GSD file

1. Install the GSD file in HW Config. The GSD file is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/33291771).
2. Select the IO-Link Master I/O device in the hardware catalog of HW Config.
3. You can freely choose the address space in the **Properties > Addresses** field for each slot of the IO-Link Master. In contrast to HSP configuration, the address space on Slot 1 "4 IO-L" is set permanently to 32 byte inputs and outputs. Additional information on possible configurations is available in the chapter I/O address space (Page 232).

4. Assign the IO-Link Master parameters. You can assign the parameters separately for each functional unit:
   – The PROFINET IO parameters are accessed by double-clicking Slot 0.
   – The IO-Link parameters are accessed by double-clicking Slot 1.
   – The 8 digital input and 4 digital output parameters are accessed by double-clicking Slot 2.

Configuring the IO-Link device via S7-PCT

1. Select Slot 1 "4 IO-L" from the configuration table of the I/O device IO-Link Master.
2. Right-click and select "Start Device Tool" in the following shortcut menu.
   Result: S7-PCT is started.
3. Now start with the parameter assignment of the IO-Link Devices, sensors, and actuators.

You can find additional information in the S7-PCT online help.

Response of the IO-Link Master in unparameterized state and after "Resetting the IO-Link settings" via S7-PCT

- All ports of the IO-Link Master are deactivated.
- All user data are equal to 0.
- All bits of the value status are set to "invalid."
- The maintenance data 1 to 3 are deleted.

4.2.2 Configuring the IO-Link Master 6ES7148-6JD00-0AB0

Introduction

The IO-Link Master 6ES7148-6JD00-0AB0 is configured and parameters are assigned in the user interface of the selected configuration software.

"**Configuring**" is understood to mean arranging, setting and networking of devices and modules.

"**Assigning parameters**" is understood to mean setting the properties of the components used. The parameters of the hardware and the settings for the data exchange are assigned in the process.

Configuring the submodule of the IO-Link master

Requirements

- You have configured your automation system.
- In the device configuration of the 6ES7148-6JD00-0AB0 IO-Link Master, you have selected the IO-Link port that you want to configure.

Procedure

1. You configure the operating mode of the submodule. An overview of possible operating modes is available in the chapter Configuration (Page 201).
2. When you have configured the submodule and thus defined the operating mode, make the additional settings:

- Enable the Autostart parameter (without S7-PCT)

NOTE

Changes to the port configuration
If you have assigned the parameters for the IO-Link device via Autostart (without S7-PCT), or have configured the port as digital input, digital output or disabled, you can no longer change the port configuration via S7-PCT.

- Enabling the diagnostics (only in IO-Link mode)
- Enable the parameter assignment for the hardware interrupts (only in IO-Link mode)

Response after "Resetting the IO-Link settings" via S7-PCT

- Deleting the IO-Link device data in the backup memory or the IO-Link Master
- Resetting the parameters to factory state:
  - Resetting the inspection severity and the backup behavior

NOTE

Effects on the device configuration
If you have reset the IO-Link settings via S7-PCT, you have to reload the device configuration via S7-PCT.

4.3 Device names for ET 200eco PN

Introduction

Every PROFINET IO device is assigned a unique device ID (MAC address) before it leaves the factory.

Each ET 200eco PN IO Device is addressed based on its device name during configuration and in the user program.

You will find detailed information on addressing in PROFINET IO in the the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual.

Requirements

- An online PROFINET connection from the programming device to the IO Device is required for assigning the device name to the IO Device.
- The IO device is configured and an IP address assigned in *HW Config*.

Assigning device names

1. Switch on the supply voltages for the ET 200eco PN.
2. Open the "Properties - ET 200eco PN" window in *HW Config*. Enter the device name for the IO Device and confirm your entry with "OK".
3. Select **PLC > Ethernet > Assign Device Name** in *HW Config*.
4. Click on "Assign Name" in the "Assign Device Name" window.

Result

The device name is saved internally in the ET 200eco PN.

Node flash test

The "Assign device name" dialog box displays all IO Devices used. Compare the MAC address of the device with the MAC address displayed and then select the correct IO Device.

The identification of IO Devices in a plant is facilitated by a node flash test. The flash test is activated as follows:

1. Select one of the displayed IO Devices from the "Assign device name" dialog box.
2. Select the flashing period.
3. Click the "Flash on" button.

The LINK LEDs flash on the selected IO Device.

Detailed information

For additional information, refer to the *STEP 7* Online Help and the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual.

4.4 Ports of ET 200eco PN

Introduction

The ET 200eco PN can diagnose two ports: X01 P1 R and X01 P2 R:

Requirement

- The ports must be configured in *HW Config*.
- The port diagnostics must be enabled.

Configuring the ports in *HW Config*

In HW Config, configure the two ports in the "Properties of the ET 200eco PN" dialog:

- "Addresses" tab: Diagnostic address of the respective port.
- "Topology" tab
- "Options" tab:
  To enable the port diagnostics, select the following for "Connection" under "Transmission medium / Duplex": "(Monitor) automatic settings".

See also

See the *STEP 7* online help.

4.5 Isochronous real-time communication

Isochronous real-time communication

Synchronized communication protocol for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth is available within the send cycle for IRT IO data. The reserved bandwidth ensures that the IRT data are transmitted at reserved, synchronized intervals while remaining uninfluenced by another greater network load (for example, TCP/IP communication or additional realtime communication).

- "High performance" IRT option (not for 6ES7148-6JA00-0AB0 IO-Link Master):
  Topological configuration is required (STEP 7 V5.5 or higher).

NOTE

When using the IO controller as a Sync-Master for IRT communication with the "high performance" IRT option, the following must be observed:
Operate the IO controller as a Sync-Master if you configure the IRT communication with the "high performance" option.
Otherwise, IRT and RT configured IO devices may fail if the sync master fails.

NOTE

Using redundant Sync-Master

When using redundant Sync-Masters, a short-term failure of the 6ES7148-6JD00-0AB0 IO-Link Master can occur during the switching of the Sync-Master.

Detailed information

For additional information, refer to the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual and the Migration from PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) Programming Manual.

4.6 Prioritized startup

Prioritized startup

Prioritized startup denotes PROFINET functionality for accelerating the startup of IO Devices for RT and IRT communication within a PROFINET IO system.

The function reduces the time that the correspondingly configured IO Devices require to recover the cyclic exchange of user data in the following situations:

- After power has returned
- After station recovery
- After activation of IO Devices

Detailed information

For further information, see the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual and the Migration from PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) Programming Manual.

4.7 Device replacement without programming device

Device replacement without programming device

IO Devices having this function can be replaced easily:

- The device name does not have to be assigned using the programming device.

Instead of the programming device, the IO Controller now assigns the device name to the replacement IO Device. The IO Controller uses the configured topology and the correlations derived from the IO Devices. The configured target topology must agree with the actual topology.

IO Devices that have already been in operation must be reset to factory settings before before being put back into operation.

Detailed information

For further information, see the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual and the Migration from PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) Programming Manual.

4.8 Media redundancy

Media redundancy

Function for ensuring the network and system availability. Redundant transmission links (ring topology) ensures that an alternative communication path is made available if a transmission link fails (starting with STEP 7 V5.5) (not for 6ES7148-6JA00-0AB0 IO-Link Master up to firmware version 6.x).

For additional information, refer to the STEP 7 online help and the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) manual.

4.9 Reset to factory settings (PROFINET)

Reset to factory settings (PROFINET)

NOTE

The stations of a bus segment can fail during the reset to factory settings.

"Reset to factory settings" is only possible if the IO Device is not exchanging data with a controller.

SNMP parameters in non-volatile memory are reset to factory settings (*STEP 7* V5.3 SP 3 and higher) in the *HW Config* dialog **PLC > Ethernet > Edit Ethernet Nodes**, "Reset" button under "Reset to factory settings".

The following retentive data are retained during the reset:

- The MAC address,

  NOTE

  Deleting the device name

  The device name is deleted by means of the "Reset to factory settings" function.

- The I&M0 data,
- The settings configured with S7-PCT,
- The outputs take up the configured substitute value behavior.

4.10 SNMP

SNMP

The interface module supports the SNMP Ethernet service. MIB-2 (RFC1213) is supported. R/W objects can be edited using SNMP tools and are saved to module memory.

Following replacement with a brand new module, the R/W objects of the interface module are set to factory settings.

Commissioning

5

5.1 Commissioning ET 200eco PN

Introduction

Your automation system is commissioned depending on the current plant configuration. The section below describes the procedure for commissioning the ET 200eco PN on an IO Controller.

Requirements for commissioning the ET 200eco PN on the PROFINET IO

Actions	Reference
ET 200eco PN installed	Chapter Installing (Page 19)
ET 200eco PN wired	Chapter Wiring (Page 26)
The IO Device was assigned a device name	Chapter Configuring (Page 59)
ET 200eco PN configured	Chapter Configuring (Page 59)
Supply voltage for the IO Controller is switched on	IO Controller manual
IO Controller switched to RUN	IO Controller manual

Commissioning ET 200eco PN

1. Switch on the voltage supply 1L+ non-switched for the ET 200eco PN.
2. Switch on the supply voltage(s) 2L+ switched as required.

Startup of the ET 200eco PN on the PROFINET IO

The schematic diagram below illustrates the startup of the ET 200eco PN on the PROFINET IO:

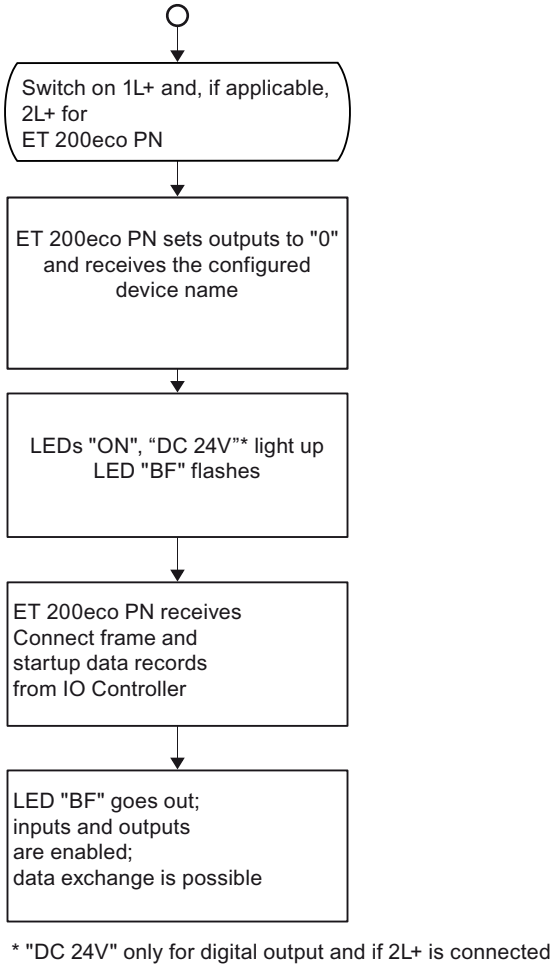

Figure 1-770 Startup of the ET 200eco PN on the PROFINET IO

Maintenance

6

6.1 Replacing the fuse

Introduction

The terminal block is equipped with replaceable fuses.
The figure below shows the fuses in the terminal block.

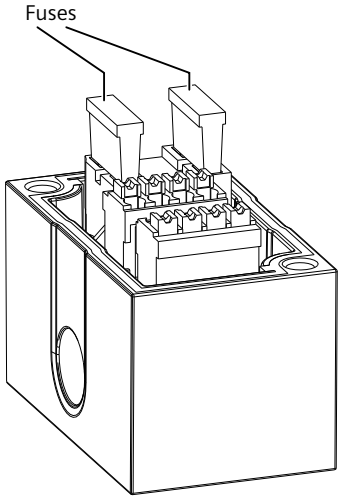

Figure 1-771 Fuses in the terminal block

Requirements

Switch off the supply voltage before you replace any fuses. Result: CPU stop of the ET 200eco PN.

Replacing a fuse of the terminal block

1. Remove the screws from the front panel of the terminal block using a crosstip screwdriver.
2. Remove the top section.
3. Remove the faulty fuse.
4. Press the new fuse (miniature copper flat fuse, type FK1, 7.5 A, fast-blow) into the fuse holder. The fuse is available as accessory.
5. Connect the terminal block and tighten the screws.
6. Switch on the supply voltage again.

6.2 Online firmware update by means of STEP 7 Manager

Introduction

To update the firmware of the ET 200eco PN including its I/O devices, you require the *.UPD files containing the current firmware version.

Requirements

- An online firmware update can be performed as of STEP 7 V5.4 + SP2.
- The I/O device of the station whose firmware is to be updated must be accessible online. The network card used must be set to "TCP/IP (Auto)" in the SIMATIC Manager under **Options > Set PG/PC Interface**.
- The files containing the current firmware versions must be available in the file system of your programming device or PC. A folder must contain the files of one firmware version only.

NOTE
The I/O device must be reset to the factory setting before the firmware update is carried out when special port parameter assignments have been carried out.

Performing a firmware update

1. Start STEP 7.
2. In the SIMATIC Manager select **PLC > Available stations**.
3. Select the I/O device.
4. Select the menu command **PLC > Update Firmware**. I/O devices without NameOfStation (NoS) are displayed with their MAC address.
   As of STEP 7 V5.4 SP5, Slot 0 must also be specified for the I/O devices. In previous versions of STEP 7 this setting is specified implicitly.
   With the ET 200eco PN, you can use the IO-Link Master 6ES7148-6JA00-0AB0 to perform the update of functional units:
   - Slot 0: PROFINET functional unit
   - Slot 1: IO-Link functional unit
   - Slot 2: 8 DI + 4 DQ functional unit
5. In the **Update Firmware** dialog, select the path to the firmware update files (*.UPD) using the "Browse" button.
6. After you have selected a file, the information in the bottom boxes of the "Update Firmware" dialog box indicates the I/O device for which the file is suitable and from which firmware version.
   If the firmware is to be loaded immediately after successful installation, select the check box "Activate firmware after download". If the check box is not selected, the firmware becomes active after the next Power Off/On.
7. Click "Run". The I/O device then automatically updates the firmware.

Result

You have updated your ET 200eco PN device online with a new firmware version.

Starting with version V6.0.0, if the ET 200eco PN I/O device was reset to the factory settings before the firmware update, the port parameter assignments are transmitted and activated again as a result of the neighborhood detection after the first connection is established between the controller and the ET 200eco PN I/O device. In previous versions, the device name had to be reassigned by selecting **PLC > Edit Ethernet Nodes ...** .

NOTE

You can also update the firmware using *HW Config*. You can find additional information in the STEP 7 online help.

6.3 Acyclic data exchange with the IO-Link library

Function blocks "LIOLink_Master" and "LIOLink_Device"

For acyclic data exchange, you can use the function blocks "LIOLink_Master" and "LIOLink_Device" for controllers of the S7-300, S7-400, S7-1200 and S7-1500 product lines.

The function blocks support the following tasks:

- Parameterization of an IO-Link device during operation
- Executing IO-Link port functions
- Diagnostics of IO-Link devices
- Backing up/restoring IO-Link device parameters

NOTE

Function blocks "LIOLink_Master" and "LIOLink_Device"

The function blocks "LIOLink_Master" and "LIOLink_Device" replace the functions of the previously available block "IOL_CALL".

The "LIOLink_Master" function block is used for all functions and accesses to the IO-Link master, and the "LIOLink_Device" function block is used for all accesses to the IO-Link devices.

Ensure for the IO-Link master 6ES7148-6JD00-0AB0 that the "LIOLink_Device" function block is only used for the configured submodules.

Reference

For an exact description of the procedure, refer to the IO-Link System functional manual on the Internet (https://support.industry.siemens.com/cs/ww/en/view/65949252).

The IO-Link block library is available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/82981502).

You can find additional application examples for IO-Link block library on the Internet (https://support.industry.siemens.com/cs/ww/en/view/90529409).

6.4 Exchange object

Exchange object

With *HW Config*, the I/O devices are exchanged, for example, an 8-channel I/O device is replaced by a 16-channel I/O device. The following takes place:

With the "Exchange object" function, the device name, IP-address, etc. are taken over. The module/channel parameters are set to the "default" values.

6.5 Maintenance and repair

The components of the SIMATIC ET 200eco PN system are maintenance-free.

NOTE

Repairs to an ET 200eco PN I/O device may only be carried out by the manufacturer.

6.6 Cleaning the I/O device

When wired, ET 200eco PN I/O devices comply with degree of protection IP65/IP67 and do not require any cleaning. If you do have to clean the I/O device, then use a dry or damp cloth. Take care to comply with the conditions of degree of protection IP65/67 when cleaning with liquids.

Interrupt, error, and system messages 7

7.1 Interrupts of ET 200eco PN

Introduction

The IO Device generates interrupts as a reaction to specific error events. Interrupts are evaluated depending on the IO Controller used.

Evaluating interrupts using an IO Controller

The ET 200eco PN supports the following interrupts:

- Diagnostics interrupts
- Maintenance interrupts

In the event of an interrupt, interrupt OBs are executed automatically in the CPU of the IO Controller (refer to the System Software for S7-300/400 System and Standard Functions (http://support.automation.siemens.com/WW/view/en/1214574) Manual, chapter "Program design").

Information on the cause and class of the error is already available based on the OB number and start information.

You can obtain detailed information on the error event in the error OB by calling SFB 54 RALRM (read supplementary interrupt information).

Triggering diagnostics interrupts

After having detected an incoming or outgoing event (e.g., wire break), the device triggers a diagnostic interrupt for "Group diagnostics", if enabled, and for "Diagnostics for the relevant channel".

The CPU interrupts the processing of the user program and processes the diagnostics block OB 82. The event which led to the triggering of the interrupt is entered in the start information of OB 82.

7.2 Maintenance interrupts

Introduction

The PROFINET interfaces of the ET 200eco PN support the diagnostics concept and maintenance concept in PROFINET as defined in IEC 61158-6-10. The objective is early detection and elimination of potential disturbances.

Maintenance interrupts

The following maintenance interrupts are available for the ET 200eco PN:

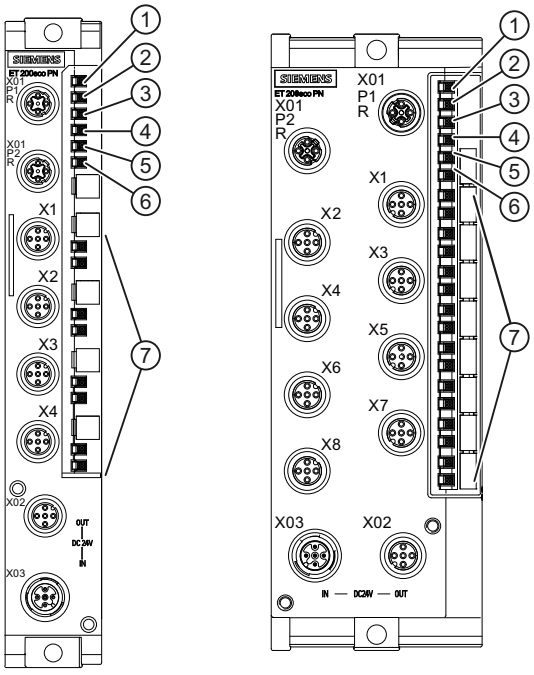
- Sync mismatch (no synchronization)
- Jitter out of Boundary (jitter too high)
- Frame dropped (frames are discarded)
- I/O error (with IO-Link devices)

System alarms in *STEP 7*

The maintenance information is generated in *STEP 7* with the following system alarms:

- Maintenance required, identified by a yellow wrench icon at the relevant port.

See also



For additional information, refer to the SIMATIC PROFINET system description (http://support.automation.siemens.com/WW/view/en/19292127) System Manual and the Migration from PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) Programming Manual.

7.3 Diagnostics by means of LED display

7.3.1 Diagnostics using the LED display on the I/O devices

LED display

The figure below shows the position and arrangement of the LED display on the ET 200eco PN I/O devices:

① SF/MT: Group fault/Maintenance (red/yellow LED)
② BF: Bus monitoring (red LED)
③ ON: Electronics/sensor/load voltage supply 1L+ non-switched (green LED)
④ DC 24V: Load voltage supply 2L+ switched (green LED); only for digital output device
⑤ P1 LK: Port1 Link (green LED)
⑥ P2 LK: Port2 Link (green LED)
⑦ Channel status, channel fault (green/red LED)

Status and error displays SF/MT, BF, ON

Table 1-1065 Status and error displays of the ET 200eco PN

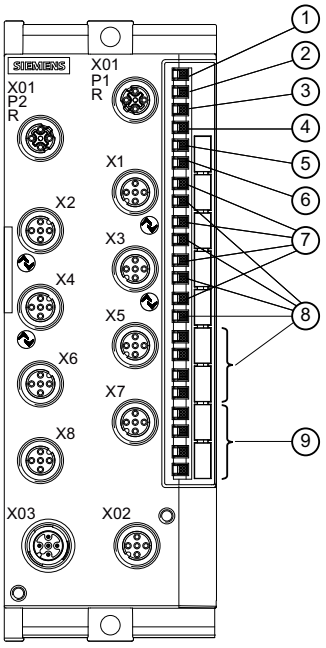
LEDs			Meaning	Remedy
SF/MT	BF	ON		
Off	Off	On	IO Device is currently exchanging data with the IO Controller without errors. The IO Device is supplied with power (electronic/sensor supply).	---
Off	Off	Off	Electronic/sensor voltage missing or too low at the I/O device.	Switch on the electronic/sensor/load supply for the IO Device.
			Hardware fault.	Replace the I/O device.

LEDs			Meaning	Remedy
SF/MT	**BF**	**ON**		
*	Flashing	On	Faulty or no connect message frame - no data exchange between the IO Controller and the distributed device (IO Device), although the device is physically connected to the switch. Causes: • Incorrect device name • Error in configuration • Parameterization errors	• Check the I/O device. • Check the configuration and parameter settings. • Check the device name. • Check the IO Controller.
*	On	On	• The IO Device is not connected to a switch.	• Connect to the IO Controller. • Assign a valid device name to the I/O device. • Check the bus installation. • Check whether the M12 cable connectors are properly installed. • Check whether the bus cable to the IO Controller is interrupted.
On (red)	*	On	Fault in peripheral circuit. Incoming diagnostics	Evaluate the diagnostics interrupt.
On (yellow)	*	*	Maintenance alarm	Analyze the maintenance alarm.
* irrelevant				

Status display of the port LEDs

Table 1-1066 Status display of the port LEDs

LED		Meaning	Remedy
P1 LK	**P2 LK**		
Off	Off	No connection to the switch/IO Controller.	Check the IE cable.
On	On	Connection to switch/IO Controller.	-



Status display DC 24V (only on I/O devices with digital outputs)

The DC 24V LED is lit in green color to indicate that you have connected the 2L+ switched load voltage supply. If the LED is not lit, check whether power is switched, or whether the fuse is okay.

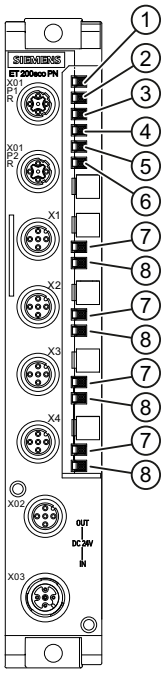
7.3.2 Diagnostics using LED display on the IO-Link masters

LED display IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12 (6ES7148-6JA00-0AB0)

The figure below shows the position and arrangement of the LED display on the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12.

① SF/MT: Group fault/Maintenance (red/yellow LED)
② BF: Bus monitoring (red LED)
③ ON: Electronics/sensor/load voltage supply 1L+ non-switched (green LED)
④ DC 24V: Load voltage supply 2L+ switched (green LED); digital output
⑤ P1 LK: Port1 Link (green LED)
⑥ P2 LK: Port2 Link (green LED)
⑦ IO-L: Status display / Communications OK (green LED)
⑧ Input: Channel status, channel fault (green/red LED)
⑨ Output: Channel status, channel fault (green/red LED)

Status display of the IO-L LEDs



The following table displays the possible status displays of the IO-L LEDs.

Table 1-1067 Status display of the IO-L LEDs

LED IO-L	Meaning
On	• DI/DQ operating mode: Status when input or output is activated • IO-Link operating mode: When communication is running.
flashes at 2 Hz	• during startup or continuously if no operational IO-Link device as found.

LED display IO-Link Master 4 IO-L 4×M12 (6ES7148-6JD00-0AB0)

The figure below shows the position and arrangement of the LED display on the IO-Link Master 4 IO-L 4×M12.

① SF/MT: Group fault/Maintenance (red/yellow LED)
② BF: Bus monitoring (red LED)
③ ON: Electronics/sensor/load voltage supply 1L+ non-switched (green LED)
④ DC 24V: Load voltage supply 2L+ switched (green LED)
⑤ P1 LK: Port1 Link (green LED)
⑥ P2 LK: Port2 Link (green LED)
⑦ Q 1-4: Status indicator SIO mode (Green LED)
⑧ IO-L 1-4: Status display IO-Link communication / channel error (green/red LED)

LEDs Q1 to Q4

Valid for an IO-Link port that is in SIO mode.

Table 1-1068 Status displays of LEDs Q1 to Q4

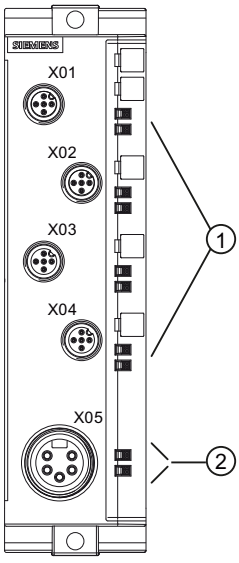
LEDs Q1 to Q4	Meaning	Remedy
On	Input or output value is 1.	---
Off	Input or output value is 0 or port is deactivated.	---

LEDs IO-L 1 to IO-L 4

Valid for an IO-Link port that is in IO-Link mode.

Table 1-1069 Status displays of LEDs IO-L 1 to IO-L 4

LEDs		Meaning	Remedy
SF	**IO-L 1 to IO-L 4**		
Off	Flashes (green)	Flashes device	Check the IO-Link device used.
On	Flashes (green)	No IO-Link communication (for example, when you have activated the port but no available IO-Link device can be found.)	Check the wiring.
Off	On (green)	IO-Link communication established, **no** pending device error.	---
On	On (red)	IO-Link communication established, pending device or channel error.	Check the IO-Link device used.
Off	Off	Port deactivated	---



Reference

For status and error displays see section Diagnostics using the LED display on the I/O devices (Page 76).

7.3.3 Diagnostics using the LED display at the voltage distributor

LED display

The figure below shows the position and arrangement of the LED display on the voltage distributor.

① Loop-through 1L/2L (green LED)
② Infeed voltage (green LED)

Figure 1-772 LED display at voltage distributor

Table 1-1070 Status displays on the voltage distributor

LED	**Meaning**
1L/2L	
Loop-through	
On	Voltage applied
Flashing	Overload
Off	Short-circuit
Infeed voltage	
On	Voltage applied
Off	Voltage not applied

7.4 Diagnostics messages of the I/O devices

Actions after a diagnostics message

Every diagnostics message triggers the following actions:

- The SF LED (red) of the I/O device lights up.
- Several simultaneous diagnostics messages are possible.
- Diagnostics data are reported as diagnostics interrupts and can be read from data records.

- Diagnostics messages are saved to the diagnostics buffer of the I/O controller.
- OB 82 is called. If there is no OB 82, the IO Controller goes to STOP.
- Acknowledgment of the diagnostics interrupt to enable new interrupts.

7.5 Diagnostics with STEP 7

7.5.1 Reading diagnostics data

Options for reading the diagnostics data

Table 1-1071 Reading diagnostics data in STEP 7

Automation system with IO Controller	Block or register in STEP 7	Application	See ...
SIMATIC S7	For example in *HW Config* by selecting **Station > Open Online**	Device diagnostics in plain text on the STEP 7 interface (in the Quick View, Diagnostics View or Module Status windows)	"Hardware diagnostics" in the STEP 7 online help
	SFB 52 "RDREC"	Reading data records from the IO Device	SFB, see STEP 7 online help (System functions/System function blocks)
	SFB 54 "RALRM"	Receiving interrupts from the IO Device	SFB, see STEP 7 online help (System functions/System function blocks)

7.5.2 Channel diagnostics

Additional information regarding the data records for PROFINET IO

For information on the structure of diagnostics data records, including programming examples, refer to the Migration from PROFIBUS DP to PROFINET IO (http://support.automation.siemens.com/WW/view/en/19289930) Programming Manual.

Structure of the manufacturer-specific diagnostics data records

The structure of the diagnostics data records is differentiated based on the BlockVersion. The following block versions apply to the ET 200eco PN:

ET 200eco PN	Article number	BlockVersion
8 DI DC 24V 4×M12	6ES7141-6BF00-0AB0	W#16#0101
8 DI DC 24V 8×M12	6ES7141-6BG00-0AB0	W#16#0101
16 DI DC 24V 8×M12	6ES7141-6BH00-0AB0	W#16#0101
8 DO DC 24V/1,3A 4×M12	6ES7142-6BF00-0AB0	W#16#0101
8 DO DC 24V/0,5A 4×M12	6ES7142-6BF50-0AB0	W#16#0101
8 DO DC 24V/1,3A 8×M12	6ES7142-6BG00-0AB0	W#16#0101

ET 200eco PN	Article number	BlockVersion
8 DO DC 24V/2,0A 8×M12	6ES7142-6BR00-0AB0	W#16#0101
16 DO DC 24V/1,3A 8×M12	6ES7142-6BH00-0AB0	W#16#0101
8 DIO DC 24V/1,3A 8×M12	6ES7147-6BG00-0AB0	W#16#0101
4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12	6ES7148-6JA00-0AB0	W#16#0101
4 IO-L 4×M12	6ES7148-6JD00-0AB0	W#16#0101
8 AI 4 U/I + 4 RTD/TC 8×M12	6ES7144-6KD00-0AB0	W#16#0101
8 AI RTD/TC 8×M12	6ES7144-6KD50-0AB0	W#16#0101
4 AO U/I 4×M12	6ES7145-6HD00-0AB0	W#16#0101

Manufacturer-specific diagnostics in the User Structure Identifier (USI)

- W#16#8000 channel diagnostics
- W#16#8002 extended channel diagnostics

7.5.3 Error classes for I/O devices

Error classes and remedies

The following tables show the error types for the I/O devices.

Error type for I/O devices, digital inputs/outputs, analog inputs/outputs

Table 1-1072 Overview Error types

Error class		Error text	Meaning	Remedy
00001_B	1_D	Short-circuit	• Short-circuit to M at the sensor supply line • Short-circuit at the output line • Load impedance too low	• Correct the process wiring • Check the sensor or actuator
00100_B	4_D	Thermal overload	• I/O device is overheating	• Check the process wiring • Check the ambient temperature
00110_B	6_D	Wire break	• Signal line to a sensor or actuator interrupted • Sensor or actuator failure • Load impedance too high	• Correct the process wiring • Replace the sensor or actuator • Use a sensor with lower impedance • Use an actuator with lower load impedance
00111_B	7_D	Violation of upper limit	• The value is above the overrange	• Correct the I/O device to sensor tuning • Modify measuring range by means of parameter assignment
01000_B	8_D	Violation of lower limit	• Value is below the underrange	• Correct the I/O device to sensor tuning • Modify measuring range by means of parameter assignment
01001_B	9_D	Error	• Internal I/O device error has occurred (diagnostic message on channel 0 applies to the whole I/O device).	• Replacement of I/O device

Error class		Error text	Meaning	Remedy
10000_B	16_D	Parameter assignment errors	• I/O device is incorrectly parameterized	• Correct the parameter assignment
10001_B	17_D	1L+ or 2L+ is missing	• Supply voltages missing or too low • Load voltage supply missing or too low	• Check the supply voltages • Check the load voltage supply • Correct the process wiring
10101_B	21_D	Reference channel fault	• Measurement cable for compensation interrupted • Data record DS2 incorrect • Timeout for "Dynamic ref. Temp."	• Correct the process wiring • Check the data record DS2. • Send DS2

Error classes for IO-Link Master (6ES7148-6JA00-0AB0), Slot 1

Table 1-1073 Overview Error types Slot 1

Error class		Error text	Meaning	IO-Link Master	IO-Link Device
00001_B	1_D	Short-circuit	Short circuit at the process cables of the IO-Link device (0x5151)		X
00010_B	2_D	Undervoltage	Supply voltage too low (0x5110 to 0x5119)		X
00100_B	4_D	Overload	Overload of the output stage of the IO-Link Devices (0x5410)		X
00101_B	5_D	Overtemperature	• Ambient temperature too high (0x4110) • IO-Link Device too hot (0x4210) • IO temperature exceeded (0x4310)		X
00110_B	6_D	Wire break	• No IO-Link Device connected • Incorrect IO-Link Device connected • Signal cable to IO-Link Device interrupted • Signal cable to IO-Link Device short-circuited • Short-circuit of supply voltage at sensor • IO-Link Device addressed with too short communication cycle time • IO-Link Device cannot communicate due to another error (0xFF10)	X	
00111_B	7_D	Overflow	• Process variable range exceeded (0x8C10) • Measuring range exceeded (0x8C20)		X
01000_B	8_D	Underflow	Process variable range too small (0x8C30)		X
01001_B	9_D	Error	All the IO-Link error codes not listed here will be mapped to this PROFINET IO error.		X
			Hardware error at IO-Link Master detected	X	
10000_B	16_D	Parameter assignment errors	IO-Link Master could not be parameterized	X	
			Event code of the IO-Link Device (0x6230 to 0x6340)		X
10010_B	18_D	Fuse defective	Event code of the IO-Link Device (0x5450 to 0x5459)		X
11010_B	26_D	External error	IO-Link Device cannot be set to desired mode	X	

Errors types IO-Link Master (6ES7148-6JD00-0AB0)

IO-Link devices diagnostics

The IO-Link master generates PROFINET channel diagnostics (CET, ECET) from the IO-Link events of an IO-Link devices according to the following mapping rules:

The IO-Link event codes of the area 0x0000 – $0x7FFF_H$ are displayed directly in the "IO-Link Device Diagnostics - Page 1" (CET $0x9500_H$):
$ECET_H$ = IO-Link Event $Code_H$

The IO-Link event codes of the area 0x8000 – $0xFFFF_H$ are displayed directly in the "IO-Link Device Diagnostics - Page 2" (CET $0x9501_H$) via the following rule:
$ECET_H$ = (IO-Link Event $Code_H$ – $0x8000_H$)

Table 1-1074 Overview Error types IO-Link Device Diagnostics

IO-Link Event Code	Error type (CET)	Expanded error type (ECET)	Error text	Meaning
0x0000 - $0x7FFF_H$	$0x9500_H$ (38144_D)	0x0000 - $0x7FFF_H$ (0 - 32767_D)	Error / Warning	See manual of the IO-Link devices or IODD file used.
0x8000 - $0xFFFF_H$	$0x9501_H$ (38134_D)	0x0000 - $0x7FFF_H$ (0 - 32767_D)	Error / Warning	See manual of the IO-Link devices or IODD file used.

Example of Display of IO-Link Event Codes:

An IO-Link device supports the event codes $0x4000_H$ and $0x8CA0_H$.
The channel diagnostics result from the event codes:

- CET: $0x9500_H$, ECET: $0x4000_H$
  Diagnostic alarm "IO-Link Device Diagnostics - Page 1, Temperature fault - Overload", generates Event Code $0x4000_H$ from the IO-Link.
- CET: $0x9501_H$, ECET: $0xCA0_H$
  Diagnostic alarm "IO-Link Device Diagnostics - Page 2, Ambient light interference, generates Event Code $0x8CA0_H$ from the IO-Link.

IO-Link Port Diagnostics

The IO-Link master generates channel diagnostics for each port. The port-specific channel diagnostics are display in the port diagnostics (CET $0x9502_H$).
The following table provides an overview of the possible diagnostics events and their meaning.

Table 1-1075 Overview Error types IO-Link Port Diagnostics

Error type (CET)	Expanded error type (ECET)	Error text	Meaning
$0x9502_H$ (38136_D)	$0x1883_H$ (6275_D)	S7-PCT configuration errors	Wrong or inconsistent parameter assignment
	$0x1888_H$ (6280_D)	Module defective	Replace module
	$0x7F22_H$ (32546_D)	Device not available	Communication aborted
	$0x1801_H$ (6145_D)	Parameter assignment error during startup	Check the parameterization
	$0x1802_H$ (6146_D)	Wrong device	Check device
	$0x1803_H$ (6147_D)	Nonconformance of process data	Check submodule configuration
	$0x1804_H$ (6148_D)	Short circuit at C/Q	Check port connection

Error type (CET)	Expanded error type (ECET)	Error text	Meaning
$0x9502_H$ (38136_D)	$0x1805_H$ (6149_D)	IO-Link PHY overtemperature	
	$0x1806_H$ (6150_D)	Short circuit at L+	Check port connection
	$0x1807_H$ (6151_D)	Undervoltage at L+	Check port connection
	$0x1808_H$ (6152_D)	Event overflow at device	
	$0x1809_H$ (6153_D)	Backup failed	Memory outside of the area 2k
	$0x180A_H$ (6154_D)	Backup inconsistent	Data storage index not available
	$0x180B_H$ (6155_D)	Backup invalid	Length of the data storage index is invalid
	$0x7F23_H$ (32547_D)	Backup invalid	Nonconformance in identification of data storage
	$0x7F25_H$ (32549_D)	Backup invalid	Access to data storage denied
	$0x180E_H$ (6158_D)	No P24 (Class B) or undervoltage	Check power supply (for example, 2L+)
	$0x180F_H$ (6159_D)	Short circuit at P24 (Class B)	Check port connection
	$0x6000_H$ (24576_D)	Invalid cycle time	Check cycle time
	$0x6001_H$ (24577_D)	Revision error	Incomplete protocol version
	$0x6002_H$ (24578_D)	Implausible device

7.5.4 STOP of the IO Controller and recovery of the IO Device

Diagnostics events triggered after a STOP of the IO Controller

Diagnostics frames received from the IO Device while the IO Controller is in STOP do not trigger the start of corresponding OBs after the restart of the IO Controller. You must explicitly read the diagnostics data from OB 100 to obtain an overview of the device state.

Diagnostics after recovery of the IO Device

You must explicitly read data record $E00C_H$ by calling SFB 52 after recovery of an IO Device. This record contains all diagnostics data for the device slots assigned to an IO Controller

General technical data

8

8.1 Standards and certifications

Introduction

The ET 200eco PN distributed I/O system satisfies the requirements and criteria of IEC 61131-2.

NOTE

Information on the nameplate
You will find the currently valid labels and approvals on the type plate of the respective product.

PROFINET IO

PROFINET IO is an open transmission protocol with real-time functionality defined in PROFINET.

CE marking

CE

Our products fulfill the requirements and safety objectives of the following EU Directives and comply with the harmonized European standards (EN) published for programmable logic controllers in the official journals of the European Union:

- 2014/30/EU "Electromagnetic compatibility" (EMC Guidelines)
- 2014/34/EU "Equipment and protective systems for use in hazardous areas" (Explosion protection directive)
- EU Directive 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic devices" (RoHS Directive)

The EU Declarations of Conformity are available to the relevant authorities at the following address:

Siemens AG

UKCA mark

The ET 200eco PN distributed I/O system complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The ET 200eco PN distributed I/O system meets the requirements and protection targets of the following regulations and related amendments:

- Electromagnetic Compatibility Regulations 2016 (EMC)
- Equipment and Protective Systems Intended for use in Potentially Explosive Atmospheres Regulations 2016 (Explosion Protection)
- The Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012 (RoHS).

UK declarations of conformity for the respective authorities are available from:

Siemens AG

Special conditions in hazardous areas:

Install the device so that there is a minimal risk of mechanical danger.

To prevent electrostatic charging, wipe the housing surface only with a wet cloth.

Use the device only in an environment that is protected from UV light.

The following additional conditions apply when using the devices in an area that requires EPL Gc:

- Only use the device in an area with a degree of pollution 2 according to EN 60664-1.
- Provisions must be taken to prevent the rated voltage from being exceeded by transient disturbance voltages of more than 119 V.

RCM (C-Tick) Declaration of conformity for Australia/New Zealand

The ET 200eco PN distributed I/O system fulfills the requirements of the standard EN 61000-6-4 Generic standards - Emission standard for industrial environments.

Korea Certificate KCC-REM-S49-ET200

Note that this device corresponds to limit class A in terms of the emission of radio frequency interference. This device can be used in all areas, except residential areas.

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

Marking for the Eurasian Customs Union

EAC (Eurasian Conformity)

Customs Union of Russia, Belarus and Kazakhstan

Declaration of conformity with the technical requirements of the Customs Union (TR CU).

cULus approval

Underwriters Laboratories Inc. in accordance with

- UL 508 (Industrial Control Equipment)
- UL50 Enclosure Type 4X, indoor use only, watertight
- CAN/CSA C22.2 No. 142 (Process Control Equipment)

NOTE

Class 2 power supply unit
The components must be supplied with a class 2 power supply unit.

Industrial applications

The ET 200eco PN distributed I/O system is designed for operation in industrial environments. It conforms to the following standards:

- Requirements for emissions EN 61000-6-4: 2007 + A1: 2011
- Requirements for immunity EN 61000-6-2: 2005

Usage in mixed-use zone
Under certain circumstances, you can use the ET 200eco PN distributed I/O system in a mixed-use zone. A mixed-use zone is used for housing and commercial operations that do not have a significant impact on residents.

When you use the ET 200eco PN distributed I/O system in a mixed-use zone, you must ensure that the limits of the generic standard EN 61000-6-3 regarding emission of radio frequency interference are observed. Suitable measures for achieving these limits for use in a mixed-use zone include:

- Installation of the ET 200eco PN distributed I/O system in grounded control cabinets / boxes.
- Use of noise filters in the supply lines

Individual acceptance is required.

Usage in residential area

NOTE

ET 200eco PN distributed I/O system not intended for use in residential area
The ET 200eco PN distributed I/O system is not intended for use in residential areas. Operation of the ET 200eco PN distributed I/O system in residential areas can have a negative influence on radio or TV reception.

Marine approval

Classification authorities:

- ABS (American Bureau of Shipping)
- BV (Bureau Veritas)
- CCS (China Classification Society)
- DNVGL (Det Norske Veritas / Germanischer Lloyd)
- KR (Korean Register of Shipping)
- LRS (Lloyds Register of Shipping)
- Class NK (Nippon Kaiji Kyokai)

The article numbers of the approved I/O devices for the respective classification society can be found here (https://support.industry.siemens.com/cs/ww/en/ps/14244/cert?ct=446).

8.2 EMC compatibility, shipping and storage conditions

Definition

Electromagnetic compatibility is the ability of an electrical device to function in its electromagnetic environment in a satisfactory manner without affecting this environment.

The ET 200eco PN distributed I/O device also meets the requirements of the EMC law of the European Single Market. Prerequisite is compliance of the electrical configuration of the ET 200eco PN distributed I/O device with specifications and directives.

Pulse-shaped disturbances

The table below shows the electromagnetic compatibility of the ET 200eco PN distributed I/O device with respect to pulse-shaped disturbances.

Pulse-shaped disturbance	Test voltage	corresponds with degree of severity
Electrostatic discharge to IEC 61000-4-2	8 kV 6 kV	3 (air discharge) 3 (contact discharge)
Burst pulses (high-speed transient disturbances) according to IEC 61000-4-4.	2 kV (power supply line) 2 kV (signal line)	3 4
High-energy single pulse (surge) according to IEC 61000-4-5 *		3
• Asymmetric coupling • Symmetric coupling	2 kV (power supply line) 2 kV (signal / data line) 1 kV (power supply line) 1 kV (signal / data line)	
* On DC 24 V supply only with protective element		

Sinusoidal disturbance variables

The table below shows the electromagnetic compatibility of the ET 200eco PN distributed I/O device with respect to sinusoidal disturbances.

HF radiation according to IEC 61000-4-3 Electromagnetic HF field	HF coupling according to IEC 61000-4-6
Amplitude modulated	
80 to 1000 MHz; 1.4 to 2 GHz	0.15 MHz to 80 MHz
10 V/m 80% AM (1 kHz)	10 V_{rms} unmodulated
2 to 2.7 GHz	80 % AM (1 kHz)
1 V/m at 80 % AM (1 kHz)	150 Ω source impedance

Emission of radio interference

Interference emission of electromagnetic fields in accordance with EN 61000-4-6: (measured at a distance of 10 m).

Frequency	Noise emission
30 MHz to 230 MHz	< 40 dB (µV/m)Q
230 MHz to 1000 MHz	<47 dB (µV/m) Q

Shipping and storage conditions

The ET 200eco PN distributed I/O device surpasses the requirements according to IEC 61131-2 for transport and storage conditions. The following information applies to modules transported or stored in their original packaging.

Type of condition	Permissible range
Free fall	≤ 0.3 m
Temperature	from -40 °C to +70 °C
Temperature change	20 K/h
Air pressure	From 1140 hPa to 660 hPa (corresponds with an altitude of -1000 m to 3500 m)
Relative humidity	From 5% to 95%, without condensation

8.3 Mechanical and climatic environmental conditions

Climatic environmental conditions

Applicable climatic environmental conditions:

Environmental conditions	Fields of application	Remarks
Temperature	from 0 °C to 55 °C	All mounting positions
Temperature change	10 K/h	-
Relative humidity	5 % to max. 100 %	With condensation
Air pressure	From 1140 hPa to 795 hPa	Corresponds to an altitude of -1000 m to 2000 m
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

Operating temperature range for the devices

The following devices can be used in different temperature ranges (indoor use only):

Designation	Article number	Fields of application			From product version
		-25 °C to 55 °C	-25 °C to 60 °C	-40 °C to 60 °C

Terminal block	6ES7194-6CA00-0AA0	X			1
Mounting rail	6ES7194-6GA00-0AA0	X	X	X	1

Mechanical environmental conditions

The table below shows the mechanical environmental conditions in the form of sinusoidal oscillation.

Devices	Frequency band	Continuous	Tested at ...
Without mounting rail	10 ≤ f ≤ 58 Hz	1.5 mm amplitude	3 mm amplitude
	58 ≤ f ≤ 150 Hz	20 g constant acceleration	40 g constant acceleration
With mounting rail	5 ≤ f ≤ 8 Hz	15 mm amplitude	-
	8 ≤ f ≤ 150 Hz	5 g constant acceleration	10 g constant acceleration

Compatibility test, mechanical environmental conditions

The table below provides information about the type and scope of the tests of mechanical environmental conditions.

Test ...	Test standard	Terminal and I/O devices	
Vibration	Vibration test according to IEC 60068-2-6	Without mounting rail With mounting rail	Type of vibration: Frequency sweeps at a rate of change of 1 octave/minute. 10 Hz ≤ f ≤ 58 Hz, constant amplitude 3 mm 58 Hz ≤ f ≤ 150 Hz, constant acceleration 40 g 5 Hz ≤ f ≤ 12 Hz, constant amplitude 15 mm 12 Hz ≤ f ≤ 150 Hz, constant acceleration 10 g Duration of vibration: 10 frequency sweeps per axis in each of three perpendicular axes
Shock	Shock, tested in accordance with IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 30 g peak value, 18 ms duration Direction of shock: 3 shocks in each +/- direction at each of the three vertically aligned axes	
Continuous shock		Type of shock: Half-sine Shock intensity: 25 g peak value, 6 ms duration Direction of shock: 1000 shocks in each +/- direction at each of the three vertically aligned axes	

Extended environmental conditions for outdoor use

The table below provides information about the type and scope of the tests for extended environmental conditions for outdoor use.

Test ...	Test standard	Conditions/Comments
Salt spray	IEC 60068-2-52	Severity level 1 for products used at sea or close to the ocean: 4 cycles each with: • 2 h with 5 % NaCl at 35 °C • 7 days at 40 °C/93 % rel. humidity
UV resistance		Chamber with glass: Sun test CPS plus Fa. Atlas Duration: 12 weeks • Irradiance (E): 550 W/m² • Black standard temperature (BST): 55 °C
Condensation changing climate	DIN EN ISO 6270-2	Condensation climate with alternating humidity and air temperature (AHT): 84 cycles each with: • 8 h at 40 °C +3 °C with 100% relative humidity (condensation) • 16 h at 18 °C to 28 °C with 100% relative humidity
Thermal shock test	IEC 60068-2-14 Na	Temperature: -40 °C/+125 °C Duration: 500 cycles (500 h) Device is switched off
Hot storage	IEC 60068-2-2 Bb	Temperature: 100 °C Duration: 1 year

Devices for operating range of extended environmental conditions in outdoor use

The following devices can be used for extended environmental conditions in outdoor use:

Designation	Article number	From product version
8 DI DC 24V 4×M12	6ES7141-6BF00-0AB0	4
8 DI DC 24V 8×M12	6ES7141-6BG00-0AB0	4

4 AO U/I 4×M12	6ES7145-6HD00-0AB0	4

8.4 Specification of dielectric tests, protection class, degree of protection, and rated voltage of ET 200eco PN

Insulation

The insulation is designed in accordance with the requirements of EN 61131-2: 2007.

NOTE
In the case of modules with supply voltage 24 V DC (SELV/PELV) electrical isolation with DC 707 V (type test) are tested.

Severity for voltage interruption

The distributed I/O devices of the ET 200eco PN meet the severity class PS1 for voltage interruptions (1 ms).

Degree of protection IP65

Degree of protection according to IEC 60529:

- Protection against the ingress of dust and full touch protection
- Water projected by a nozzle against the enclosure from any direction shall have no harmful effect.

Degree of protection IP66 and IP67

Degree of protection according to IEC 60529:

- Protection against the ingress of dust and full touch protection
- IP66: Protection against water from heavy seas or water projected in powerful jets (water must not enter the enclosure in harmful quantities)
- IP67: Protection against water when enclosure is immersed at specified pressures over a specified time period (water must not enter the enclosure in any harmful amount)

Rated voltage for operation

The ET 200eco PN distributed I/O device operates at the following rated voltage and corresponding tolerances.

Rated voltage	Tolerance range
DC 24 V	20.4 to 28.8 V DC

8.5 Safety-relevant symbols for the ET 200eco PN distributed I/O system

The following table contains a declaration of the systems than can be located on the modules of the ET 200ecoPN distributed I/O system, on their packaging or on the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must read the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
 ONLY EX MODULES	The assigned safety symbols apply to devices **with Ex approval**. You must read the product documentation. The product documentation contains information about the type of potential hazard and enables you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by an electrically skilled person. IEC 60417 No. 6182
 CABLE SPEC.	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	Note that the device must be constructed and connected in accordance with EMC regulations.
 230V MODULES	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2
 24V MODULES	Note that a device of Protection Class III must only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	If you use the ET 200ecoPN in accordance with the UL standard, take into account that the device is only approved for industrial field and only for the interior.

8.6 Use of the ET 200eco PN in zone 2/zone 22 hazardous areas

Approved ET 200eco PN distributed I/O devices
