Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified persons are those who, because of their training and experience, are familiar with the installation, assembly, commissioning, operation, decommissioning and disassembly of the product and can recognize risks and avoid possible hazards.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the application described in the catalog and the associated usage information. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens Aktiengesellschaft. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the manual

The S7-1200 series is a line of programmable logic controllers (PLCs) that can control a variety of automation applications. Compact design, low cost, and a powerful instruction set make the S7-1200 a perfect solution for controlling a wide variety of applications. The S7-1200 models and Windows-based programming tools give you the flexibility you need to solve your automation problems.

This manual provides information about using, installing, and programming the S7-1200 Fail-Safe PLCs and is designed for engineers, programmers, installers, and electricians who have a general knowledge of programmable logic controllers.

Required basic knowledge

To understand this manual, it is necessary to have a general knowledge of automation and programmable logic controllers.

Scope of the manual

STEP 7: In this documentation, STEP 7 is used as a synonym for all versions of the configuration and programming software STEP 7 (TIA Portal). This manual describes or references the following STEP 7 products:

- *STEP 7 Basic* with:
  - *STEP 7 Safety Basic*
- *STEP 7 Professional* with:
  - *STEP 7 Safety Basic*
  - *STEP 7 Safety Advanced*
- S7-1200 fail-safe CPU firmware release V4.6
- S7-1200 fail-safe signal modules (SM) firmware release V2.x

For a complete list of the S7-1200 products described in this manual, refer to the technical specifications article numbers for fail-safe CPUs (Page 183) and fail-safe SMs (Page 183).

⚠ WARNING

The "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" in the current version is the authoritative source for Functional Safety-related information concerning configuring and programming.
Siemens identifies the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) as the authoritative and/or original source in the case of discrepancies between the manuals.
All warnings in the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" have to be observed.

Certification, CE label, C-Tick, and other approvals

Refer to the technical specifications (Page 128) for more information.

Glossary

The definitions in the glossary are provided to give the reader an easy first reference for understanding the terms as used in this manual. Some terms have detailed formal definitions in IEC 61508, EN ISO 13849, IEC 61784-3-3, and associated standards, and must be understood in terms of broad safety concepts detailed in these standards.

Another reference for more exact definitions is the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

Service and support

In addition to our documentation, we offer our technical expertise on the Internet on the customer support web site (http://www.siemens.com/automation/).

Contact your Siemens distributor or sales office for assistance in answering any technical questions, for training, or for ordering S7 products. Because your sales representatives are technically trained and have specific knowledge about your operations, processes, and industry, as well as the individual Siemens products that you are using, they can provide the fastest and most efficient answers to any problems you might encounter.

Special information

NOTE

Important note for maintaining operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. Even suppliers are required to observe special measures during product monitoring. For this reason, we inform you in the form of personal notifications about product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

By subscribing to the appropriate notifications, you will ensure that you are always up-to-date and able to make changes to your system, when necessary.

Documentation and information

S7-1200 and STEP 7 provide a variety of documentation and other resources for finding the technical information that you require.

- The *S7-1200 Functional Safety Manual* presents an overview of the Siemens Safety software and fail-safe CPUs and signal modules (SMs) and a Getting Started configuration and programming example. However, the focus of the manual is the S7-1200 fail-safe SMs. SM installation, configuration, diagnostics, applications, and technical specifications are emphasized.

  The English version of the *S7-1200 Functional Safety Manual* is the authoritative (original) language for Functional Safety-related information. All translated manuals refer back to the English manual as the authoritative and/or original source. Siemens identifies the English manual as the authoritative and/or original source in the case of discrepancies between the translated manuals.
- The *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* provides information that enables you to configure and program SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance testing of a SIMATIC Safety fail-safe system. Before configuring and programming an actual live fail-safe operation, it is essential that you refer to this manual.

- The *S7-1200 Programmable Controller System Manual* provides specific information about the operation, programming, and the specifications for the complete S7-1200 product family. In addition to the system manual, the *S7-1200 Easy Book* provides a more general overview to the capabilities of the S7-1200 family.
- The *S7-1200 Functional Safety Manual; SIMATIC Safety - Configuring and Programming, Programming and Operating Manual; S7-1200 Programmable Controller System Manual*; and the *S7-1200 Easy Book* are available as electronic (PDF) manuals. You can download or view the electronic manuals from the Siemens Industry Online Support Web site (http://support.industry.siemens.com). These manuals are also available on the Documents Disk that ships with every S7-1200 CPU.
- The STEP 7 (TIA portal) online help information system provides immediate access to the conceptual information, specific instructions, and error code event IDs that describe the operation and functionality of the programming package and basic operation of SIMATIC CPUs.
- The Siemens Industry Online Support Web site (http://support.industry.siemens.com) provides access to the electronic (PDF) versions of the SIMATIC documentation set. Existing documents are available from the Product Support link. With this online documentation access, you can also drag and drop topics from various documents to create your own custom manual.

  You can access online documentation by clicking "mySupport" from the left side of the page and selecting "Documentation" from the navigation choices. To use the mySupport Documentation features, you must sign up as a registered user.
- Siemens also provides online comprehensive support for your use of safety technology. A Safety Evaluation Tool assists you in determining required safety levels, Functional Examples guide you in your safety applications, and Siemens training (SITRAIN) classes offer training in safety standards and products. Visit the following web sites to access these support activities:
  - Safety Evaluation Tool (http://www.siemens.com/safety-evaluation-tool)
  - Functional examples (http://www.siemens.com/safety-functional-examples)
  - SITRAIN (http://www.siemens.com/sitrain-safetyintegrated)
- The customer support web site also provides FAQs and other helpful documents for S7-1200 and STEP 7. Visit the following web sites to access the collection of podcasts:
  - STEP 7 Basic (http://www.industry.siemens.com/topics/global/en/tia-portal/controller-sw-tia-portal/simatic-step7-basic-tia-portal/Pages/Default.aspx)
  - STEP 7 Professional (http://w3.siemens.com/mcms/simatic-controller-software/en/step7/step7-professional/Pages/Default.aspx)
- You can also follow or join product discussions on the Service & Support technical forum (https://support.industry.siemens.com/tf/ww/en/?Language=en&siteid=csius&treeLang=en&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=34612486). These forums allow you to interact with various product experts.
  - Forum for S7-1200 (https://support.industry.siemens.com/tf/ww/en/threads/237?title=simatic-s7-1200&skip=0&take=10&orderBy=LastPostDate+desc)
  - Forum for STEP 7 Basic and Professional (https://support.industry.siemens.com/tf/ww/en/threads/243?title=step-7-tia-portal&skip=0&take=10&orderBy=LastPostDate+desc)

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

2.1.1 Instructional videos 26
2.1.2 Requirements for configuring and programming 27
2.1.3 Example structure and task definition 28
2.1.4 Procedure 28

2.2 Configuring 31
2.2.1 Introduction 31
2.2.2 Step 1: Configuring the S7-1200 CPU 1212FC, CPU 1214FC, or CPU 1215FC 32
2.2.3 Step 2: Configuring fail-safe CPU standard digital inputs for user acknowledgement, feedback circuit, and start pushbutton 34
2.2.4 Step 3: Configuring an SM1226 F-DI 16 x 24 V DC for connecting an emergency stop switch, position switches, and the laser scanner 35
2.2.5 Step 4: Configuring an SM 1226 F-DQ 4 x 24 V DC for connecting a motor 41
2.2.6 Summary: Configuring the Hardware 43

2.3 Programming 44
2.3.1 Introduction 44
2.3.2 Step 5: Specifying the centralized settings for the safety program 46
2.3.3 Step 6: Creating an F-FB 49
2.3.4 Step 7: Programming the safety door function 50
2.3.5 Step 8: Programming the emergency stop function 51
2.3.6 Step 9: Programming the feedback monitoring 53
2.3.7 Step 10: Programming the user acknowledgment for reintegration of the fail-safe SM 55
2.3.8 Step 11: Programming of the main safety block 57
2.3.9 Step 12: Compiling the safety program 58

2.3.10 Step 13: Downloading the complete safety program to the fail-safe CPU and activating safety mode . 59

3 Fail-Safe signal module (SM) applications ... 62

3.1 Digital input applications ... 63
3.1.1 Selecting the digital input application ... 64
3.1.2 Applications 1 and 2: 1oo1 evaluation of a single sensor ... 65
3.1.3 Applications 3 and 4: 1oo2 evaluation of a single sensor ... 65
3.1.4 Applications 5 and 6: 1oo2 evaluation of independent equivalent sensors ... 66
3.1.5 Applications 7 and 8: 1oo2 evaluation of 3-wire, non-equivalent sensor circuit ... 67
3.1.6 Applications 9 and 10: 1oo2 evaluation of 4-wire non-equivalent sensor circuit ... 67

3.2 Digital output applications ... 68
3.2.1 Selecting the digital output application ... 69
3.2.2 Application 1: Wiring a directly-connected SIL-rated actuator ... 69
3.2.3 Application 2: Wiring external contactors: Separate P and M controlled contactors ... 70
3.2.4 Application 3: Wiring external contactors: Parallel connected between P and M ... 70
3.2.5 Application 4: Wiring external contactors: Separate P and M output channels for each contactor . 71
3.2.6 Application 5: Separate circuits of a relay channel controlling external contactors ... 71
3.2.7 Application 6: Wiring a directly-connected SIL-rated actuator ... 72
3.2.8 Application 7: Wiring a directly-connected SIL-rated actuator, switching both load conductors . 72

4 Fail-Safe CPU and signal module (SM) installation ... 73

4.1 S7-1200 Fail-Safe modules installation and removal ... 73
4.1.1 Mounting dimensions for S7-1200 Fail-Safe modules ... 73
4.1.2 Guidelines for installing S7-1200 Fail-Safe devices ... 74
4.1.3 Installation and removal safety rules ... 76
4.1.4 Installing and removing an S7-1200 FC CPU ... 78
4.1.5 Installing and removing a signal module (SM) ... 79
4.1.6 Removing and reinstalling the S7-1200 terminal block connector ... 80

4.2 Fail-Safe system electrical design rules ... 81
4.2.1 Safe functional extra low voltage requirement (power supplies and other system components) . 81
4.2.2 Power budget ... 82
4.2.2.1 Connecting power to the S7-1200 system ... 82
4.2.2.2 Calculating a sample power requirement ... 84
4.2.2.3 Calculating your power requirement ... 86
4.2.3 Fail-Safe module electrical characteristics and terminal assignments ... 87

4.3 Control system wiring guidelines ... 87
4.3.1 Guidelines for grounding and wiring ... 87
4.3.2 Grounding an S7-1200 system ... 88
4.3.3 Wiring an S7-1200 system ... 89
4.3.4 Guidelines for lamp loads ... 90
4.3.5 Guidelines for inductive loads ... 90

4.4 Maintenance guidelines ... 92

5 Fail-Safe signal module (SM) I/O configuration 94
5.1 Configuring fail-safe SM I/O properties 94
5.2 Configuring common F-parameters 95
5.3 Configuring SM 1226 F-DI 16 x 24 V DC DI and channel parameters 96
5.4 Configuring SM 1226 F-DQ 4 x 24 V DC DQ and channel parameters 99
5.5 Configuring SM 1226 F-DQ 2 x Relay DQ and channel parameters 100

6 Fail-Safe signal module (SM) diagnostics 102

Product overview

1

1.1 Overview

SIMATIC Safety fail-safe system

The objective of safety engineering is to minimize danger to humans and the environment as much as possible through use of safety-oriented technical installations without restricting industrial production and the use of machines and chemical products any more than necessary. The SIMATIC Safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency stop (E-STOP) devices for machining and processing equipment).

What are fail-safe automation systems?

Fail-safe automation systems control processes that can achieve a safe state immediately as a result of an unexpected operation or failure. These are fail-safe control processes where an immediate shutdown to safe state does not endanger humans or the environment.

Fail-safe systems go beyond conventional safety engineering to enable far-reaching intelligent systems that extend all the way to the electrical drives and measuring systems. You use fail-safe systems in applications with advanced safety requirements. You can resume production quickly following a safety-related interruption, using the improved fault detection and localization provided in fail-safe systems through detailed diagnostic information.

Achievable safety requirements

SIMATIC Safety fail-safe systems can satisfy the following safety requirements:

- Safety class (Safety Integrity Level) SIL 1 to SIL 3 in accordance with IEC 61508:2010
- Category 2 to 4, Performance Level (PL) a to e in accordance with EN ISO 13849-1:2015

Principles of safety functions in SIMATIC Safety

You implement functional safety using the hardware and firmware of the fail-safe CPUs and signal modules (SM) in conjunction with the safety program downloaded by the software (ES). The SIMATIC Safety system executes the safety function to bring the system to a safe state or maintain a safe state in case of a dangerous event.

The fail-safe SMs ensure the safe processing of field information (for example, sensors for emergency OFF pushbuttons and light curtains and actuators for motor control). The fail-safe SMs have the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level (SIL).

You provide the safety function for the process through the application program that you create or by the reaction of the fail-safe system to a fault. In the event of an error, if the fail-

safe system can no longer execute its actual user safety function, it executes the fault reaction function (for example, the fail-safe system shuts down the associated outputs).

Example of user safety function

If an object interrupts the beam of a light curtain, the fail-safe system stops the motion in the area protected by the light curtain (user safety function):

- The light curtain provides a "1" signal, perhaps redundantly, to say the light beam is not broken or "0" to say the light beam is broken.
- The fail-safe digital input signal module (SM) acquires the signal from the light curtain and provides the state to the fail-safe CPU through a safe communication protocol. Redundant processors with mutual diagnostics in the fail-safe digital input SM provide a high assurance that a "1" is provided only when correct and faults result in a "0" being provided.
- The fail-safe CPU executes your user program for normal control of the motion and includes your programmed safety logic that says a "1" from the light curtain is required to enable the motion. Your programmed safety logic is encoded by the Engineering System in redundant logic steps that gives a high assurance that any fault in CPU execution results in an identified discrepancy and an output of "0". If the CPU fails to receive verifiable communication from the fail-safe digital input SM in a required time, the fail-safe CPU replaces the signal from the fail-safe digital input SM with "0".
- The fail-safe CPU delivers the results of the safety logic to the fail-safe digital output SM through the safe communication protocol. A "1" signal from your safety logic enables motion by turning an output channel ON, or a "0" turns the output channel OFF. Redundant processors with mutual diagnostics in the fail-safe digital output SM provide a high assurance that redundant output switches (series relay contacts or P/M 24 V DC solid state switches) are turned ON only when this is correct and at least one output switch turns OFF if a fault occurs. If the fail-safe digital output SM fails to receive verifiable communication from the fail-safe CPU in a required time, the fail-safe digital output SM replaces the signal from the fail-safe CPU with "0" and turns outputs OFF.

1.2 Hardware and software components

S7-1200 Fail-Safe CPUs and SMs

The following fail-safe V4.x CPUs and fail-safe signal modules (SM) are available with the STEP 7 Safety releases. You can use any of the listed S7-1200 fail-safe SMs centrally on any of the S7-1200 fail-safe CPUs:

- CPU 1212FC DC/DC/DC
- CPU 1212FC DC/DC/RLY
- CPU 1214FC DC/DC/DC
- CPU 1214FC DC/DC/RLY
- CPU 1215FC DC/DC/DC
- CPU 1215FC DC/DC/RLY
- SM 1226 F-DI 16 x 24 VDC
- SM 1226 F-DQ 4 x 24 VDC
- SM 1226 F-DQ 2 x Relay

An S7-1200 fail-safe system requires a fail-safe CPU and fail-safe SMs. The integrated I/O on the CPU is not fail-safe, but can be used to perform other control functions.

The S7-1200 standard signal modules (SM), communication modules (CM), and signal boards (SB) can be used in the same system with fail-safe SMs to perform your application control functions that do not require a rated Safety Integrity Level (SIL). Standard SMs that are supported for use with fail-safe SMs have the article numbers (6ES7--- ---32 0XB0) or later.

Hardware components for PROFINET IO

You can use the following fail-safe components in S7-1200 Fail-Safe on PROFINET IO:

- Fail-safe CPUs with built-in PROFINET interface
- Fail-safe inputs and outputs (F-I/O), such as:
  - ET 200SP fail-safe modules
  - ET 200eco PN fail-safe modules
  - ET 200AL fail-safe modules
  - ET 200MP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200M fail-safe modules
  - ET 200pro fail-safe modules
  - Fail-safe GSD-based, PROFIsafe-capable I/O devices (for example, a light curtain or laser scanner)

NOTE

You must use V4.2 or later S7-1200 Fail-Safe CPUs when configuring PROFINET IO fail-safe components.

Hardware components for PROFIBUS DP

You can use the following fail-safe components in S7-1200 Fail-Safe on PROFIBUS DP:

- Fail-safe CPUs with the CM 1243-5 (PROFIBUS DP master)
- Fail-safe inputs and outputs (F-I/O), such as:
  - ET 200SP fail-safe modules
  - ET 200MP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200M fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe GSD-based, PROFIsafe-capable DP slaves (for example, a light curtain or laser scanner)

NOTE

You must use V4.2 or later S7-1200 Fail-Safe CPUs when configuring PROFIBUS DP fail-safe components.

NOTE

You can only use PROFIBUS DP fail-safe modules that support PROFIsafe mode V2 with the S7-1200 CPU.

PROFINET shared device functionality

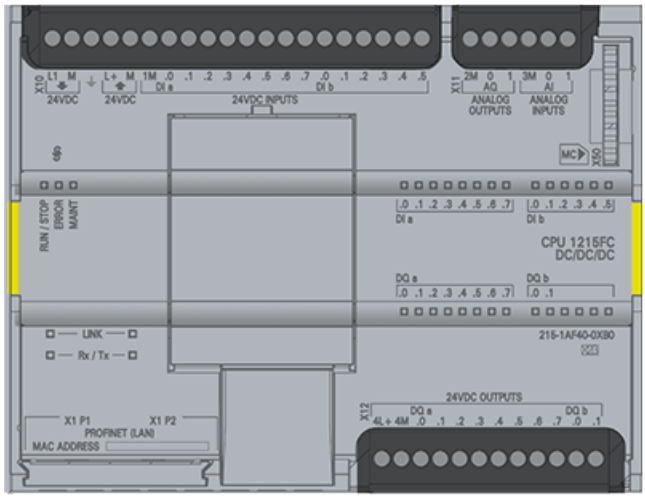
The "Shared Device" function allows the fail-safe and standard modules or submodules of an IO device to be shared by different IO controllers. One IO controller exclusively controls each module or submodule of the shared IO device.

Without the "Shared Device" function, you assign each I/O module or submodule of an IO device to the same IO controller. If you have sensors that are physically close to each other, but must provide data to different IO controllers, then you require several IO devices.

Refer to the S7-1200 Programmable Controller System Manual (https://support.industry.siemens.com/cs/ww/en/view/109478121) and the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for detailed information about PROFINET shared device configuration.

Required software components

You require one of the following software combinations:



- *STEP 7 Basic* with the *STEP 7 Safety Basic* optional package
- *STEP 7 Professional* with *STEP 7 Safety Basic* optional package
- *STEP 7 Professional* with *STEP 7 Safety Advanced* optional package

STEP 7 Safety Advanced and *STEP 7 Safety Basic* are the configuration and programming software packages for the SIMATIC Safety fail-safe system. In both software packages, you receive the following:

- Support for configuring the fail-safe CPUs and SMs in the hardware and network editor of the TIA portal
- Support for creating the safety program using LAD and FBD and integrating error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your safety program in LAD and FBD with special safety functions

1.3 S7-1200 Fail-Safe CPUs

The fail-safe CPU executes your safety program along with standard applications programs. Communication between the fail-safe CPU and the fail-safe signal modules is verified using the PROFIsafe protocol.

Safety program

You can create a safety program using the program editor. You can program fail-safe function blocks (FB) and functions (FC) in the Function Block Diagram (FBD) or Ladder Logic (LAD) programming languages and create fail-safe data blocks (DB).

The fail-safe system performs a dual execution using coded processing. The fail-safe system automatically performs safety checks and inserts additional fail-safe logic for error detection and error response when the safety program compilation occurs. This ensures the detection of failures and faults and appropriate execution of reactions to maintain the fail-safe system in the safe state or bring it to a safe state.

In addition to the safety program, you can run a standard user program on the fail-safe CPU. A standard program can coexist with a safety program in a fail-safe CPU. The fail-safe CPU protects the safety-related data of the safety program from the unintentional effects of the data of the standard user program.

⚠ WARNING

You cannot put an S7-1200 Fail-Safe system that provides safety-related functions into operation after installation or modification until after you successfully validate the safety-related functionality.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
An S7-1200 Fail-Safe system that provides both safety-related functions and standard (non safety-related) functions must not be put into operation in order to use the standard functions before you successfully validate the safety-related functions, even if all fail-safe signal modules go to the error state and thus remain safe.

You can exchange data between the safety program and the standard user program in the fail-safe CPU by means of bit memory or data of a standard DB.

1.3.1 Behavior differences between standard and fail-safe CPUs

1.3.1.1 Safety mode

Safety mode

In safety mode, the safety functions for fault detection and fault reaction are activated in the following:

- Safety program of the fail-safe CPU
- Fail-safe signal modules (SM)

Safety mode of safety program

The safety program runs in the fail-safe CPU in safety mode. The safety program activates all safety mechanisms for fault detection and fault reaction. You cannot modify the safety program during operation in safety mode.

You can deactivate and reactivate the safety mode of the safety program. "Deactivated safety mode" enables the safety program for online tests and changes as needed while the fail-safe CPU is in RUN mode.

For SIMATIC Safety, you can switch back to safety mode only after an operating mode change of the fail-safe CPU from RUN to STOP to RUN.

Safety message frame

In safety mode, the fail-safe CPU and fail-safe SMs consistently transmit data between them in a safety message frame. The safety message frame in accordance with PROFIsafe standards consists of the following:

- Process data (user data)
- Status byte/control byte (coordination data for safety mode)
- Virtual Monitoring Number (encoded in CRC signature, provides keep-alive mechanism and detection of out-of-sequence messages)
- CRC signature

1.3.1.2 Fault reactions

Safe state

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe signal modules (SM). This applies to both sensors and actuators.

Passivation

Passivation applies safe state values to the fail-safe SM or channel(s) instead of process values when the fail-safe system detects faults. The safety function requires passivation of the fail-safe SM or channel(s) in the following situations:

- When the fail-safe system starts up
- If the fail-safe system detects overall module faults, such as RAM or Processor failures
- If the fail-safe system detects errors during safety-related communication between the fail-safe CPU and the fail-safe SM through the PROFIsafe safety protocol (communication error)
- If fail-safe channel faults occur (for example, short-circuit and discrepancy errors or internal faults of fail-safe input or output channels)

When passivation occurs in a digital input fail-safe SM, SIMATIC Safety provides the safety program with safe state values (0) instead of the process data pending at the fail-safe inputs in the input process image.

When passivation occurs in a digital output fail-safe SM, the SM sets the passivated channel(s) to a value of (0).

Reintegration

Reintegration returns the process from passivation to a normal state after successful diagnostics determine that the fault has cleared. After reintegration of a fail-safe digital input, SIMATIC Safety again provides the process data pending at the inputs to the safety program. For a fail-safe digital output, SIMATIC Safety again transfers the output values provided by the safety program to the fail-safe outputs. Reintegration from safe state values to process data can be automatic or require acknowledgement by your safety program. See "Reactions to faults" (Page 102) for steps to reintegrate.

Detection and response to faults

SIMATIC Safety systems detect and respond to faults in several different conditions:

- Faults in the fail-safe CPU hardware and firmware
- Faults in the fail-safe user program
- PROFIsafe communication errors caused by conditions in either the fail-safe CPU or SMs
- Fail-safe SM-wide errors such as microprocessor errors or memory errors
- Fail-safe SM channel errors such as discrepancy errors, wiring shorts, or internal channel faults

Fail-safe CPU faults and fail-safe user program faults often result in the CPU operating mode being set to STOP. You can reintegrate PROFIsafe communication faults once communication is successfully restored. In most cases, you cannot reintegrate SM-wide faults because these faults require the fail-safe SM to be power-cycled. You can often reintegrate and return channel faults to proper operation by removing the fault and reintegrating the channel.

Virtual monitoring number, cyclic interrupt time, and F-monitoring time

The following parameters are integral to fault reactions:

- Virtual monitoring number: The PROFIsafe protocol provides time monitoring and detection of message sequence errors by means of a periodically-updated monitoring number.
- Cyclic interrupt time: The cyclic interrupt time is the interval by which the F-runtime group executes and determines how often the fail-safe CPU sends the PROFIsafe frame to the fail-safe SMs. When you add a fail-safe CPU to your project, STEP 7 creates Functional Safety Organization Block 1 (FOB_1) (OB123 by default). FOB_1 contains the cyclic time interrupt time, and you can configure the cyclic interrupt time (100ms by default).
- F-monitoring time: The F-monitoring time is the amount of time an SM or CPU waits for an error-free communication including a new Virtual Monitoring Number before passivating channels. You can configure the F-monitoring time. The fail-safe CPU and SMs must receive a valid, current safety message frame with a valid monitoring number within the configured F-monitoring time.

If the fail-safe system fails to detect a valid monitoring number within the F-monitoring time, the fail-safe system passivates the fail-safe SM. Expiration of an SM's F-monitoring time causes a transition to safe state for all F-inputs or F-outputs of the SM.

CRC (Cyclic Redundancy Check) signature

A CRC signature contained in the safety message frame protects the validity of the process data in the safety message frame, the accuracy of the assigned address references, and the safety-relevant parameters.

If a CRC signature error occurs during communication between the fail-safe CPU and fail-safe SMs, the fail-safe system passivates the fail-safe SMs.

1.3.1.3 Restart of fail-safe system

The operating modes of the SIMATIC Safety system differ from those of the standard system only in terms of the restart characteristics.

Restart characteristics

When you switch a fail-safe CPU from STOP to RUN mode, the standard user program restarts in the usual way. When you restart the safety program, the fail-safe system initializes all data blocks with the F-Attribute with values from load memory. This is comparable to a cold restart.

The fail-safe system attempts to reintegrate each fail-safe SM at restart. In contrast to the standard user program, you cannot use startup OBs in the safety program.

1.3.1.4 Firmware update

NOTE

Fail-safe SM firmware (FW) updates

If 24 V DC power to the fail-safe SM is interrupted during the FW update, then the FW update must be started again with a memory card.

You cannot complete re-started FW updates from a web server or the TIA Portal.

Refer to the S7-1200 Programmable Controller System Manual (https://support.industry.siemens.com/cs/ww/en/view/109478121) for firmware update procedures.

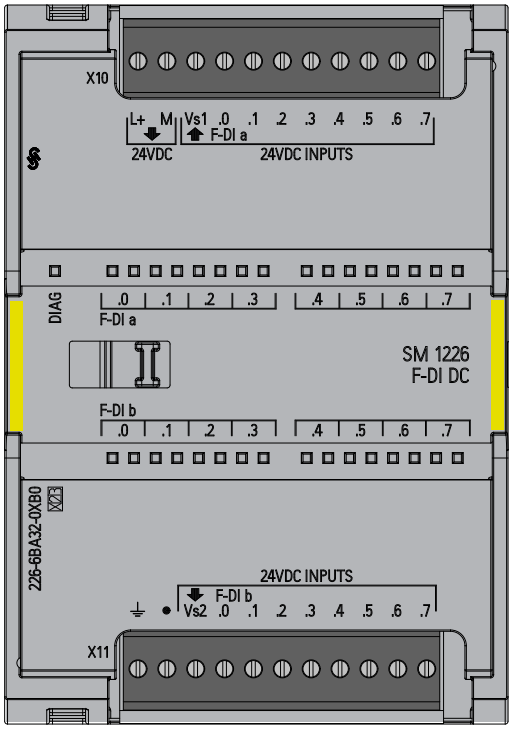
1.4 S7-1200 Fail-Safe signal modules (SM)

1.4.1 Overview

Siemens intends for the S7-1200 fail-safe products to be used to help solve functional safety in machine applications.

There are three fail-safe SMs in conjunction with the S7-1200 V4.x release:

- SM 1226 F-DI 16 x 24 V DC
- SM 1226 F-DQ 4 x 24 V DC
- SM 1226 F-DQ 2 x Relay



Redundant two-processor functional safety design

The major difference between S7-1200 fail-safe and standard SMs is that failsafe SMs use redundancy to achieve functional safety, including two processors that control fail-safe operation. Both processors monitor each other and verify that they are executing the same code at the same time, automatically test the I/O circuits, and set the fail-safe SMs to safe state in the event of a fault. Each processor monitors internal and external power supplies and module internal temperature and can passivate the module if an abnormal condition is detected.

Safety-related input and output signals form the interface to the process. This enables direct connection of single-channel and two-channel input signals from devices such as emergency STOP buttons or light curtains. The fail-safe SM redundantly combines the safety-related signals internally and passes the unified result on to the CPU in a fail-safe manner for further processing.

The fail-safe CPU sends the safety-related outputs from the CPU to the fail-safe SM for each individual output channel. Each output then sets two independent switches for each channel, a P and M solid-state switch, or two independent relays.

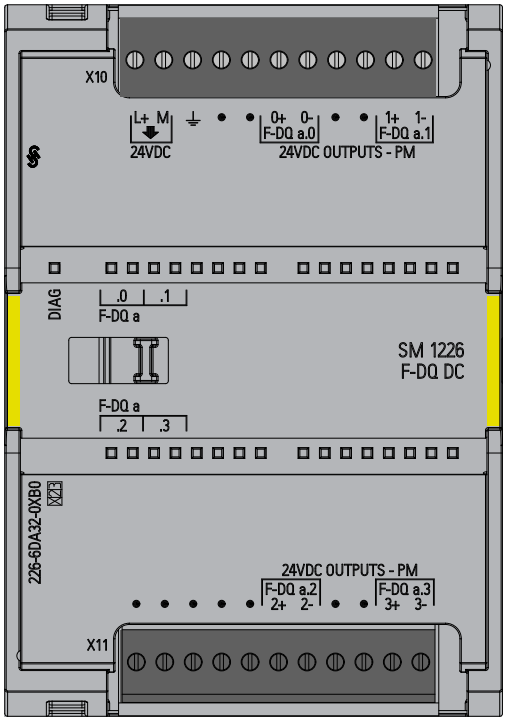
1.4.2 SM 1226 F-DI 16 x 24 V DC

The SM 1226 F-DI 16 x 24 V DC is an S7-1200 signal module (SM) for use in fail-safe applications. The inputs are rated for connection to 24 V DC sensors/switches and 3/4-wire proximity switches (for example, BEROs: Siemens line of no-touch sensors) and have an EN61131-2 type 1 input rating.

The module has two sensor supply outputs that can each power eight external sensors (inputs).

Inputs and test circuit

The F-DI consists of 16 input channels (F-DI a.0...a.7, F-DI b.0...b.7). You can configure these inputs as sixteen one-out-of-one (1oo1) inputs (SIL 2/Category 3/PL d), eight one-out-of-two (1oo2) inputs (SIL 3/Category 3 or Category 4/PL e), or combinations of 1oo1 and 1oo2 channels. One microcomputer monitors inputs a.0 to a.7, and the other microcomputer monitors inputs b.0 to b.7. The corresponding channels from a and b (a.0, b.0), (a.1, b.1)...(a.7, b.7) form a 1oo2 channel group. The "a" input, the first of the two inputs, conveys the signal in a 1oo2 configuration. For example, if you wire I8.0 and I9.0 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal appears at only the I8.0 input when you close or open the circuit for both.



When you configure a channel group as 1oo2, the two controllers must sense the same input change within a configured time. Otherwise, the two controllers detect a discrepancy error. The F-DI reports the 1oo2 input back to the fail-safe CPU as a single input.

If you use a sensor supply output to provide power to a sensor, you can enable short-circuit testing. The short-circuit test checks for shorts to plus voltage by periodically pulsing the sensor output off and verifying that the associated input is off. This short-circuit test also checks for shorts to the other circuit in a 1oo2 paired input because the test pulses the two sensor outputs off at different times. The short-circuit test does not detect shorts between inputs in the same sensor group.

The processors cooperate in providing internal test pulses to each others process input circuits, after the initial field interface, to verify that sensing electronics are responsive to "1" and "0" inputs.

You can achieve Category 4 in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards.

1.4.3 SM 1226 F-DQ 4 x 24 V DC

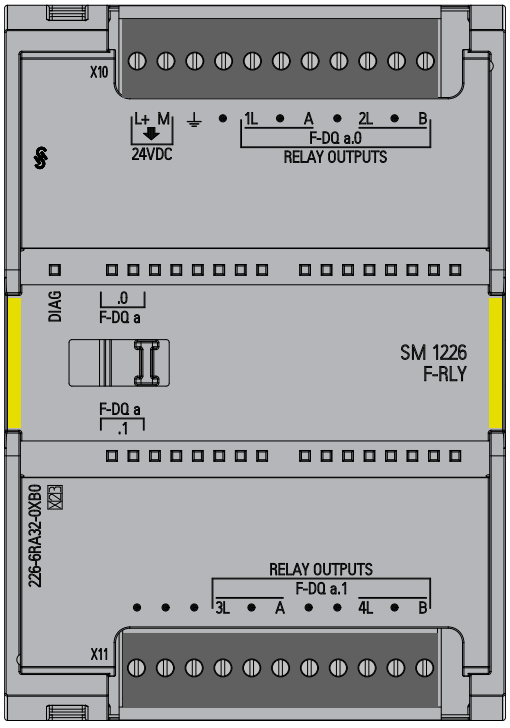
The SM 1226 F-DQ 4 x 24 V DC is an S7-1200 signal module (SM) for use in fail-safe applications and is suitable for solenoid valves, DC contactors, and indicator LEDs. It has four outputs with P- and M-switching that are rated for connection to 24 V DC actuators with up to a 2.0 A rating.

Outputs

The F-DQ DC consists of four output channels (F-DQ a.0...F-DQ a.3). You can use each output for SIL 3 applications. Each output consists of two switches:

- A P-switch connects 24V positive (L+) to the load.
- An M-switch connects the load to M or 24V return.

Both switches must be turned ON for current to flow to the load.



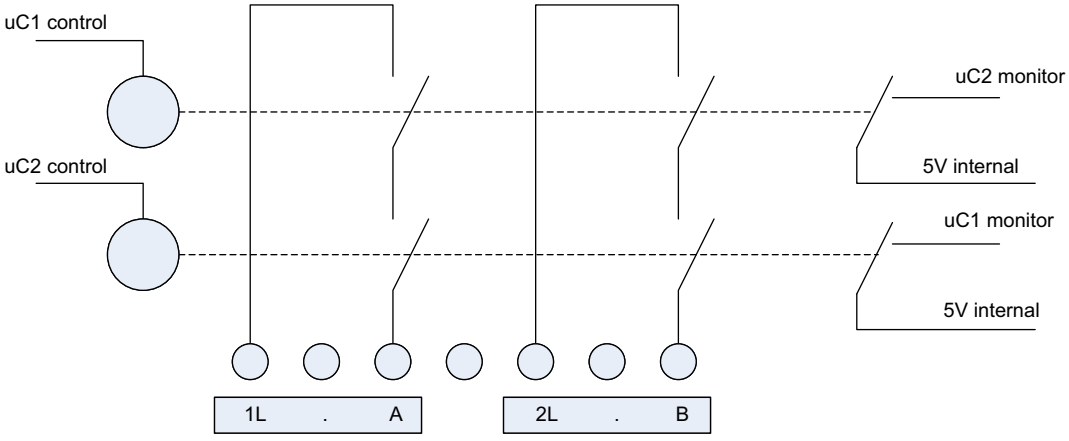
The F-DQ DC uses two microcomputers to implement the safety function. One microcomputer controls the P-switch while the other microcomputer controls the M-switch. There is feedback from the P-switch output to the other microcomputer that is controlling the M-switch. Likewise, there is feedback from the M-switch output to the other microcomputer

that is controlling the P-switch. The feedback verifies that the output switches are operating properly and in the commanded state.

You must configure a "Maximum readback time" that specifies the allowed delay for the output voltage to respond to the switch change.

The F-DQ DC regularly tests each "OFF" switch "ON" briefly, and each "ON" switch "OFF" briefly, to verify that each switch is still functional and under independent control. Your configured "Maximum readback time" also sets the duration of the "OFF" test pulse. You must configure a "Maximum readback time switch on test" which sets the duration of the "ON" test pulse. You should choose these durations short enough to not affect your load.

1.4.4 SM 1226 F-DQ 2 x Relay



The SM 1226 F-DQ 2 x Relay is an S7-1200 signal module (SM) for use in fail-safe applications. The F-RLY has two output channels (F-DQ a.0 and F-DQ a.1). Each channel includes two circuits that switch mechanically-linked contacts at the same time. Each circuit has two contacts in series controlled by independent relay coils.

Each circuit can directly control an actuator in SIL 3 applications. You can use the two circuits together to control redundant contactors or relays for SIL 3 applications with interposing relays.

The F-RLY uses two microcomputers to implement the safety function. Different microcomputers control the two series relay contacts in each circuit. Control of each relay coil by one microcomputer is verified by the other microcomputer monitoring the mechanically-linked sense contact.

The series contacts in each circuit are switched in sequence to avoid common mode failure by the welding of both contacts.

Output channel a.0: Two circuits controlled as one process output channel.
Refer to the isolation description in the SM 1226 F-DQ 2 x Relay (Page 176) Specifications, Digital outputs table.

Outputs

You can use each of the two relay output channels for SIL 3 applications.

NOTE

Relay contacts of the SM 1226 F-DQ 2 x Relay are designed to Overvoltage Category III. You can use them in AC mains circuits without further overvoltage protection.
Relay contact outputs and AC inputs for fail-safe S7-1200 CPUs and standard (non fail-safe) I/O modules do not meet requirements regarding Overvoltage Category III, as applicable to EN 50156-1 conforming equipment (burner applications).
When using the SM 1226 F-DQ 2 x Relay in safety critical circuits of burner applications, you can use the relay contact outputs and AC inputs for fail-safe S7-1200 CPUs and standard (non fail-safe) I/O modules, but only if used in one of the following:

- SELV/PELV circuits
- Circuits connected to the electrical mains with permanent, recognized protection that reduces transients to Overvoltage Category II

Otherwise, the CPU and I/O system, including the SM 1226 F-DQ 2 x Relay, will not meet the Overvoltage Category III requirement for burner applications.

⚠ WARNING

Adjacent relay contacts in the same channel of the SM 1226 F-DQ 2 x Relay are not rated to separate AC line from SELV / PELV.
Death or serious personal injury and damage to machines and equipment can result if SELV/PELV circuits are wired adjacent to high voltage circuits on this module.
The A and B circuits of each output must either be both AC line or both SELV.

Getting started

2

2.1 Introduction to example

2.1.1 Instructional videos

The "Getting Started" chapter contains eleven instructional videos. Nine instructional videos take you step-by-step through many of the configuring and programming tasks. These instructional videos show the completed task at the beginning of the video, with a fadeout to a step-by-step tutorial that demonstrates all of the required sub-tasks:

- "Procedure" (Page 28) (shows a wiring overview of the S7-1200 Fail-Safe application example)
- "Step 1: Configuring the S7-1200 CPU 1212FC, CPU 1214FC, or CPU 1215FC" (Page 32) (step-by-step tutorial)
- "Step 6: Creating an F-FB" (Page 49) (step-by-step tutorial)
- "Step 7: Programming the safety door function" (Page 50) (step-by-step tutorial)
- "Step 8: Programming the emergency stop function" (Page 51) (step-by-step tutorial)
- "Step 9: Programming the feedback monitoring" (Page 53) (step-by-step tutorial)
- "Step 10: Programming the user acknowledgment for reintegration of the fail-safe SM" (Page 55) (step-by-step tutorial)
- "Step 11: Programming of the main safety block" (Page 57) (step-by-step tutorial)
- "Step 12: Compiling the safety program" (Page 58) (step-by-step tutorial)
- "Step 13: Downloading the complete safety program to the fail-safe CPU and activating safety mode" (Page 59) (step-by-step tutorial)
- "Step 13: Downloading the complete safety program to the fail-safe CPU and activating safety mode" (Page 59) (second video; shows the end result of the LAD programming steps)

2.1.2 Requirements for configuring and programming

These instructions will guide you step-by-step through a specific example for configuring and programming with *STEP 7 Safety*.

You will become acquainted with the basic functions and special features of *STEP 7 Safety*.

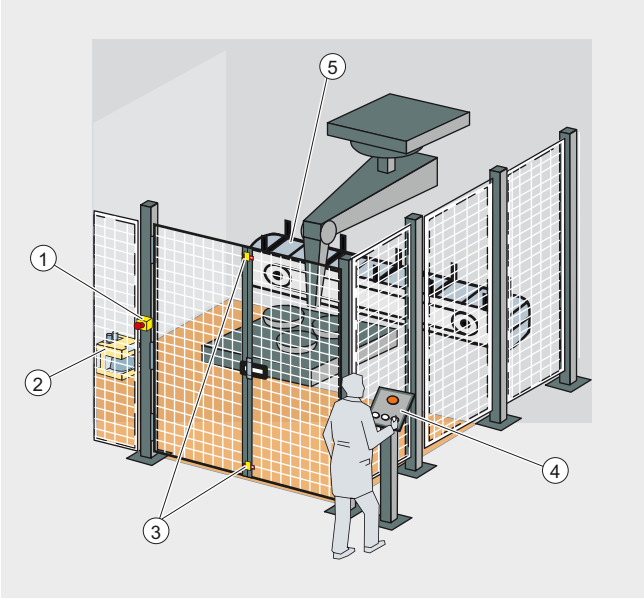
It should take one or two hours to work through this example, depending on your experience.

Requirements for the example

The following requirements must be met:

- In order to understand these Getting Started instructions, you need general knowledge of automation technology. You also need to be familiar with *STEP 7* and *STEP 7 Safety*.
- You need an S7-1200 station consisting of the following components:
  - Fail-safe CPU (CPU 1212FC, CPU 1214FC, or CPU 1215FC)
  - Fail-safe digital input signal module: SM 1226 F-DI 16 x 24 V DC
  - Fail-safe digital output signal module: SM 1226 F-DQ 4 x 24 V DC
- *STEP 7* and *STEP 7 Safety* must be correctly installed on your Windows-based programming device with an Ethernet interface.
- The programming device must be connected to the fail-safe CPU through the PROFINET interface.
- The CPU 1212FC, CPU 1214FC, or CPU 1215FC and other hardware must be fully installed and wired. Instructions for this can be found in the "S7-1200 Programmable Controller System Manual" (https://support.industry.siemens.com/cs/ww/en/view/109478121).

⚠ WARNING



As a component in plants and systems, the S7-1200 is subject to specific standards and regulations depending on the area of application. Please note the applicable safety and accident prevention regulations (for example, IEC 60204-1 (General Requirements for Safety of Machinery)).

The example in these Getting Started instructions serves as an introduction to configuring and programming of *STEP 7 Safety Advanced*. It does not lead to actual live operation in every case. Before you do this, it is essential that you refer to the current version of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en). The warnings and other notes contained in that manual must be heeded at all times even if they are not repeated in this document!

Serious injury and damage to machines and equipment may result if these regulations are ignored.

2.1.3 Example structure and task definition

Production cell with access protection

① Emergency stop (E-Stop)
② Laser scanner
③ Safety door
④ Control panel with start and acknowledgement pushbuttons
⑤ Conveyor motor

A laser scanner monitors the entry to the production area. A safety door secures the service area.

Entering the production area or opening the safety door results in a stop or shutdown of the production cell similar to an emergency stop.

The system can only be restarted when the emergency stop is cancelled, the safety door is closed, and the laser scanner detects no one in the protected area. The user must acknowledge that conditions have returned to a safe state before production can be restarted.

2.1.4 Procedure

The example in these Getting Started instructions consists of the following sections:

Configuring

For this example, you must configure the following S7-1200 fail-safe CPUs and SMs:

- Fail-safe CPU (CPU 1212FC, CPU 1214FC, or CPU 1215FC)
- Fail-safe CPU standard digital inputs for user acknowledgement, feedback loop, and start pushbutton
- SM 1226 F-DI 16 x 24 V DC for connecting an emergency stop switch, the position switches for monitoring a safety door, and the laser scanner for monitoring the entry area
- SM 1226 F-DQ 4 x 24 V DC for connecting a motor

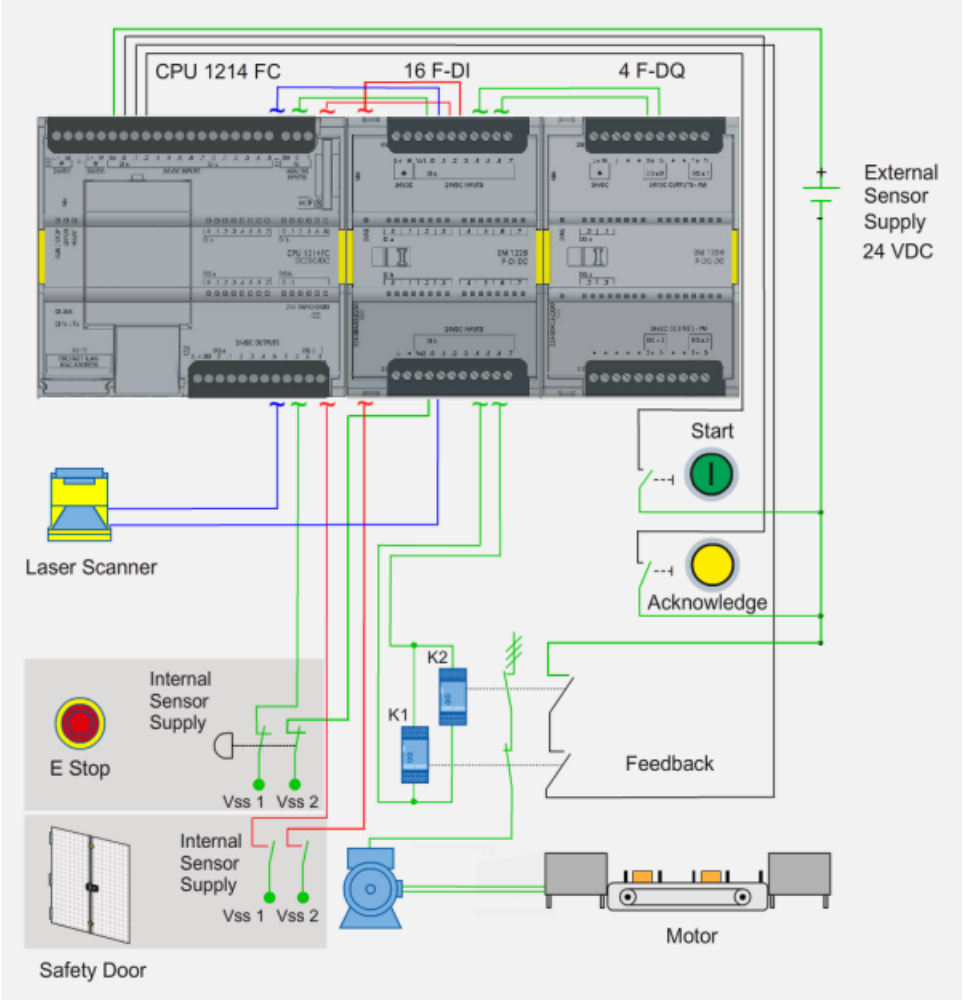
The configuration is described in the "Configuring" (Page 31) section.

Programming

Once the configuration is successfully completed, you can program your safety program.

In our example, a fail-safe block is programmed with an emergency stop, a safety door function, a feedback loop (as restart protection, when an incorrect load exists), and a user acknowledgement for reintegration. The block is then compiled to form a safety program.

The programming is described in the "Programming" (Page 44) section.



Operating the Getting Started example

This interactive graphic gives you the opportunity to become familiar with how the example functions in this Getting Started.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

The video switches the Laser Scanner, E-Stop, and Safety Door on and off to simulate unsafe conditions. Each device operates independently of the the other two devices. If you do activate a device, you must deactivate the device before continuing.

The video shows you that you must press the "Acknowledge" button to notify the system that you have returned to a safe state. Then, you can press the "Start" button to operate the system again.

The table below describes the steps and their actions:

Step	Action	Description
1	Activate the E-Stop. [1, 2]	This action prevents resumption of the operation.
2	Trigger the Laser Scanner. [1, 2]	This action prevents resumption of the operation.
3	Open the Safety Door. [1, 2]	This action prevents resumption of the operation.
4	Deactivate the Laser Scanner. [3]	The Laser Scanner deactivates.
5	Deactivate the E-Stop. [3]	The E-Stop deactivates.

[1] The activation of the E-STOP, trigger of the Laser Scanner, or opening of the Safety Door can be done in any order or individually to stop operations and bring the system to a safe state.

[2] To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device; 2. Press the Acknowledge button; 3. Press the Start button.

[3] This allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart operations.

Step	Action	Description
6	Close the Safety Door. [3]	The Safety Door closes.
7	Press the Acknowledge button.	The safety program requires acknowledgement.
8	Press the Start button.	Restart your operations.

[1] The activation of the E-STOP, trigger of the Laser Scanner, or opening of the Safety Door can be done in any order or individually to stop operations and bring the system to a safe state.

[2] To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device; 2. Press the Acknowledge button; 3. Press the Start button.

[3] This allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart operations.

2.2 Configuring

2.2.1 Introduction

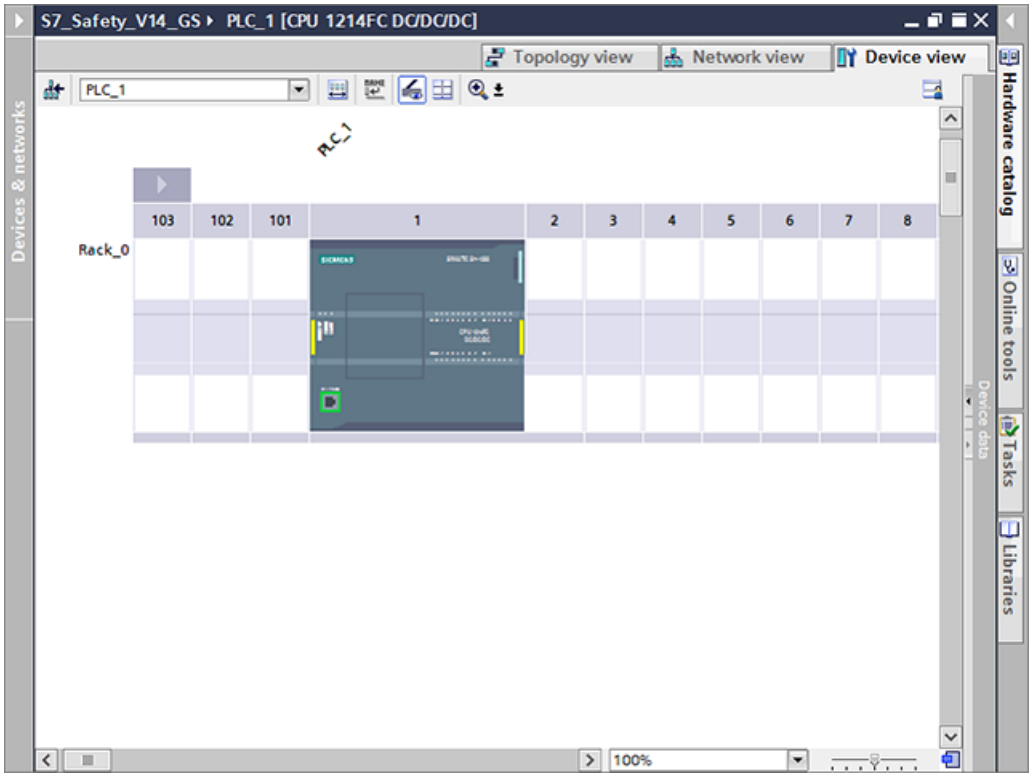
⚠ WARNING

You may come into contact with live electrical wires connected to the main power supply.
Only wire the S7-1200 fail-safe CPU control system when the input power is turned OFF.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.

The installation and wiring of the S7-1200 fail-safe CPU is described in the S7-1200 Programmable Controller System Manual (https://support.industry.siemens.com/cs/ww/en/view/109478121).

Configuring the Hardware

In STEP 7 Safety, you configure the following S7-1200 components:



- Fail-safe CPU
- Fail-safe CPU standard digital inputs for user acknowledgement, feedback loop, and start pushbutton
- Fail-safe digital input SM for connecting an emergency stop switch and position switches for monitoring a safety door and the laser scanner
- Fail-safe digital output SM for connecting a motor

2.2.2 Step 1: Configuring the S7-1200 CPU 1212FC, CPU 1214FC, or CPU 1215FC

In this step, you create a new project, add a fail-safe CPU, and assign parameters.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. In the portal view of STEP 7 Safety, create a new project named "S7_Safety_V14_GS"
2. Use "Add new device" to add a CPU 1214FC.

NOTE

Any of the six available fail-safe CPUs (1212FC DC/DC/DC, 1212FC DC/DC/Relay, 1214FC DC/DC/DC, 1214FC DC/DC/Relay, 1215FC DC/DC/DC, or 1215FC DC/DC/Relay) may be used in this example.

Result: The Device View containing the CPU 1214FC opens.

3. Locate the "Fail-safe: F-parameters" area.

   You can change the following parameters or accept the default setting:

   – "Low limit for F-destination addresses": Default value is suitable for a stand-alone fail-safe S7-1200 CPU with local fail-safe SMs.
   – "High limit for F-destination addresses": Default value is suitable for a stand-alone fail-safe S7-1200 CPU with local fail-safe SMs.
   – "Central F-source address": Default value is suitable for a stand-alone fail-safe S7-1200 CPU with local fail-safe SMs.

– "Default F-monitoring time for central F-I/O": A valid current safety message frame must be received from the fail-safe CPU to a fail-safe SM within the F-monitoring time. Otherwise, the fail-safe SM goes to safe state. The F-monitoring time must be set high enough so that message frame delays are tolerated and, at the same time, low enough that the process can react as quickly as possible when a fault occurs. By default, the F-monitoring time for each fail-safe SM is taken from the "Default F-monitoring time for central F-I/O" parameter of the fail-safe CPU. However, you can configure the F-monitoring time individually for each fail-safe SM. Refer to Section 5.2: "Configuring common F-parameters" (Page 95) for further information.

Leave the default values unchanged for this example.

4. Move to the "Protection" area.

   Select the "Protection" property to select the protection level and enter passwords. "Full access incl. fail-safe (no protection)" protection level with a fail-safe write protection password is the lowest level for a fail-safe CPU. Enter and confirm a password for the required protection. Passwords are case-sensitive.

When you download this configuration to the fail-safe CPU, the user has HMI access and can access HMI functions without a password. To read data, the user must enter the configured password for "Read access", the password for "Full access (no protection)", or the password for "Full access incl. fail-safe (no protection)". To write data, the user must enter the configured password for "Full access (no protection)" or the password for "Full access incl. fail-safe (no protection)".

Access protection for the fail-safe CPU

The fail-safe CPU provides five levels of security for restricting access to specific functions. When you configure the security level and password for a fail-safe CPU, you limit the functions and memory areas that can be accessed without entering a password.

Each level allows certain functions to be accessible without a password. The default condition for the fail-safe CPU is to have no restriction and no password-protection. To restrict access to a fail-safe CPU, you configure the properties of the fail-safe CPU, and enter and confirm the password.

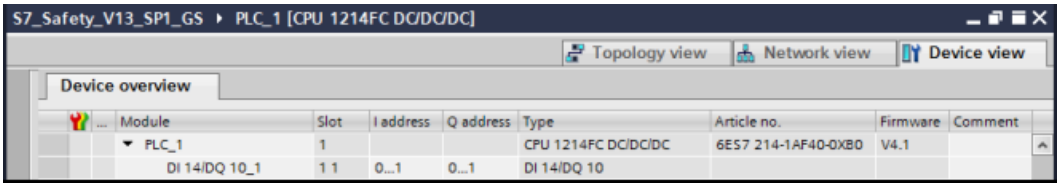
Table 1-1 Security levels for the CPU

Security level	Access restrictions
Full access incl. fail-safe (no protection)	Allows full access without password. This is the lowest level of protection for a fail-safe CPU.
Full access (no protection)	Allows full access, except write access to fail-safe blocks. Password is required for modifying (writing to) fail-safe blocks and for changing the CPU mode (RUN/STOP).

Security level	Access restrictions
Read access	Allows HMI access and all forms of PLC-to-PLC communications without password protection. Password is required for modifying (writing to) the CPU and for changing the CPU mode (RUN/STOP).
HMI access	Allows HMI access and all forms of PLC-to-PLC communications without password protection. Password is required for reading the data in the CPU, for modifying (writing to) the CPU, and for changing the CPU mode (RUN/STOP).
No access (complete protection)	Allows no access without password protection. Password is required for HMI access, reading the data in the CPU, for modifying (writing to) the CPU, and for changing the CPU mode (RUN/STOP)

Result

The new project has been created and the configuration of the fail-safe CPU is complete.



2.2.3 Step 2: Configuring fail-safe CPU standard digital inputs for user acknowledgement, feedback circuit, and start pushbutton

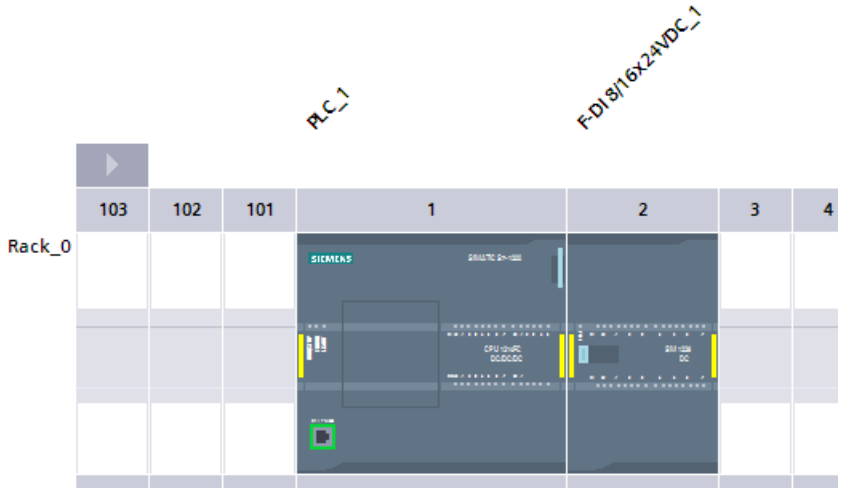
In this step, you assign parameters of fail-safe CPU standard digital inputs for the non-fail-safe signals (user acknowledgement, feedback loop, and start pushbutton).

Procedure

1. Assign the input address of the fail-safe CPU standard digital inputs to "0" for this example. Assign the output address of the fail-safe CPU standard digital outputs to "0" as well. You can assign these addresses in the CPU device configuration under "DI 14/DQ 10", "I/O addresses".

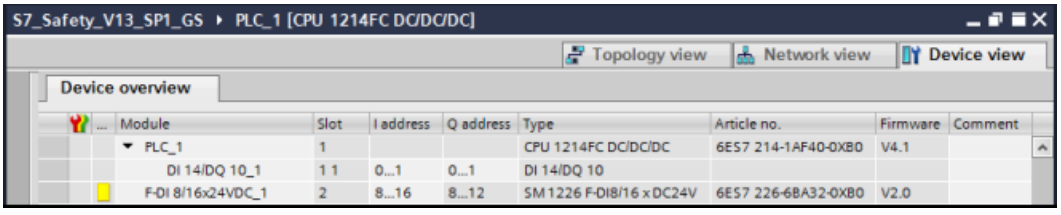
   Refer to the "CPU 1214FC Device view" information from the TIA Portal shown below:

Result



The configuration of the fail-safe CPU standard digital inputs is now complete.

2.2.4 Step 3: Configuring an SM1226 F-DI 16 x 24 V DC for connecting an emergency stop switch, position switches, and the laser scanner



In this step, you configure an F-DI for connecting an emergency stop switch, the position switches for monitoring a safety door, and the laser scanner for monitoring the entry area.

Procedure

1. In the Device View of the S7-1200, use drag-and-drop to add an F-DI 8/16x24VDC_1 digital electronic module from the hardware catalog to slot 2.

2. Open "Device data" to display the "Device overview" area. Here, you can change the starting addresses for the inputs and outputs of your fail-safe module. Use the module default I/O addresses of "8" and "8" for this example (inputs begin at byte 8, and outputs begin at byte 8).

NOTE

The fail-safe SMs each use both Is and Qs, even though they may physically only have input channels or only have output channels.

The F-DI can have 8 - 16 input channels; however, the SM requires 9 input (I) bytes and 5 output (Q) bytes.

3. Return to the "Device view" and select the F-DI 8/16x24VDC_1. Under the "Properties" tab, select the "IO tags" tab. This action displays the "Process value" and "Value status" bits for the fail-safe module. Here, you can define tags for each channel:

Name	Type	Address	Tag table	Comment
	Bool	%I8.0		
	Bool	%I8.1		
	Bool	%I8.2		
	Bool	%I8.3		
	Bool	%I8.4		
	Bool	%I8.5		
	Bool	%I8.6		
	Bool	%I8.7		
	Bool	%I9.0		
	Bool	%I9.1		
	Bool	%I9.2		
	Bool	%I9.3		
	Bool	%I9.4		
	Bool	%I9.5		
	Bool	%I9.6		
	Bool	%I9.7		
	Bool	%I10.0		
	Bool	%I10.1		
	Bool	%I10.2		
	Bool	%I10.3		
	Bool	%I10.4		
	Bool	%I10.5		
	Bool	%I10.6		
	Bool	%I10.7		
	Bool	%I11.0		
	Bool	%I11.1		
	Bool	%I11.2		
	Bool	%I11.3		
	Bool	%I11.4		
	Bool	%I11.5		
	Bool	%I11.6		
	Bool	%I11.7		

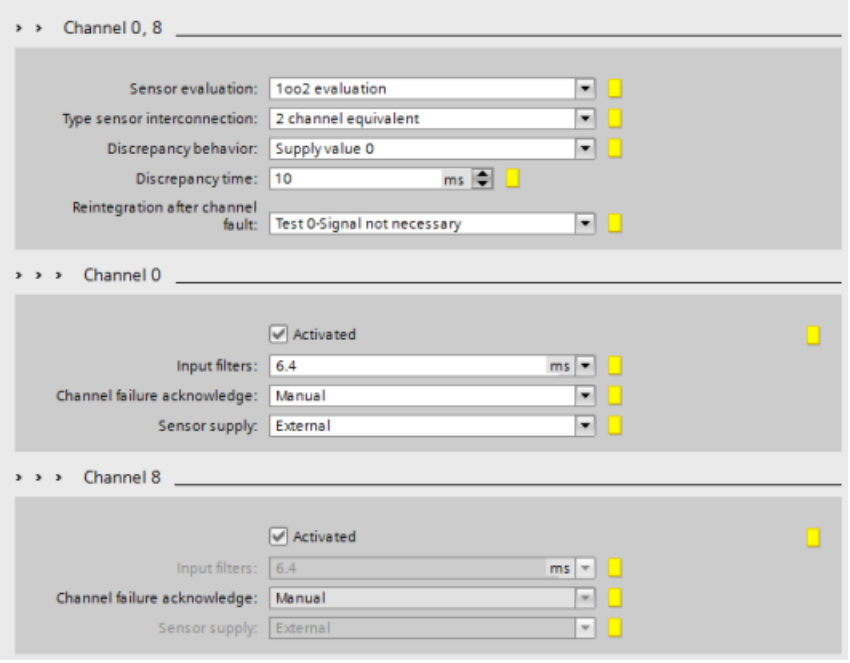
Each Process value bit has an associated Value status bit that reports whether the corresponding process value is valid or passivated. Value status bits are ON for valid data and OFF for data associated with passivated channels. If an entire module or a single channel is passivated, the associated Value status bits are OFF.

To check the Process value bits and the Value status bits, you must know where these bits are mapped in the module. For an F-DI 8/16x24VDC_1, the first two bytes of the input (I) image register are the Process value bits, and the next two bytes of the input (I) image register are the Value status bits. For example, if the module starting address is I8.0 and Q8.0 for the F-DI 8/16x24VDC_1 and you have a 1oo1 configuration, then the Process value bits and corresponding Value status bits are allocated as shown in the following table:

Process value	Value status bit
I8.0	I10.0
I8.1	I10.1
I8.2	I10.2
I8.3	I10.3
I8.4	I10.4
I8.5	I10.5
I8.6	I10.6
I8.7	I10.7
I9.0	I11.0
I9.1	I11.1
I9.2	I11.2
I9.3	I11.3
I9.4	I11.4
I9.5	I11.5
I9.6	I11.6
I9.7	I11.7

If you have a 1oo2 configuration, then the Process value bits and corresponding Value status bits are allocated as shown in the following table:

Process value	Value status bit
I8.0	I10.0
I8.1	I10.1
I8.2	I10.2
I8.3	I10.3
I8.4	I10.4
I8.5	I10.5
I8.6	I10.6
I8.7	I10.7
-	-
-	-
-	-
-	-
-	-
-	-
-	-
-	-



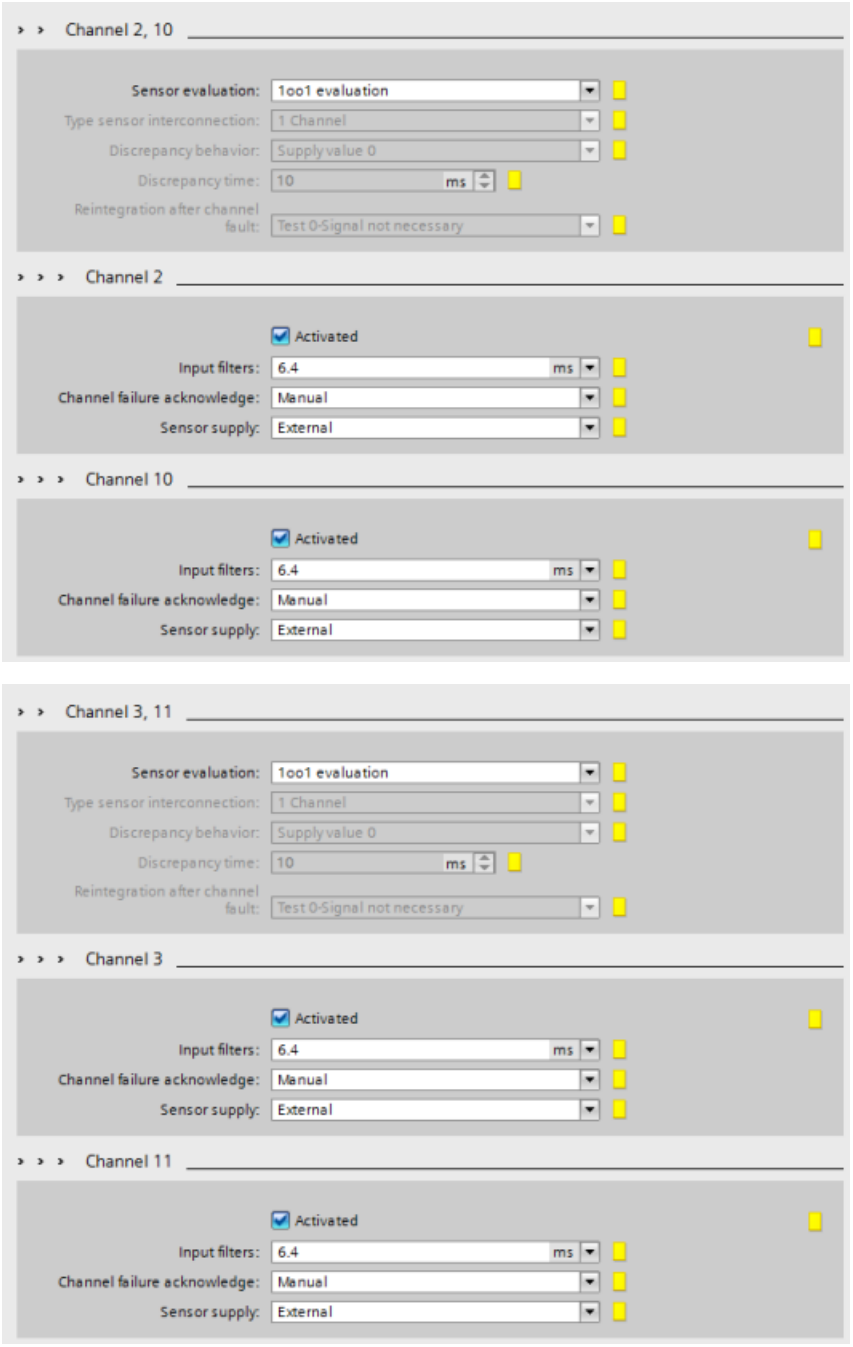
4. Under the "Properties" tab, select the "General" tab, and then select the "F-parameters" area. Here, you can change the following parameters or apply the default settings:
   – "F-monitoring time": A valid current safety message frame must be received from the fail-safe CPU to the F-DI within the F-monitoring time. Otherwise, the F-DI goes to safe state. The F-monitoring time must be set high enough so that message frame delays are tolerated and, at the same time, low enough that the process can react as quickly as possible when a fault occurs and run without impairment. By default, the F-DI's F-monitoring time is taken from the "Default F-monitoring time for central F-I/O" parameter of the fail-safe CPU.

     NOTE
     The "cyclic interrupt time" is a closely-related parameter to the F-monitoring time. The cyclic interrupt time is the interval by which the F-runtime group executes and determines how often the fail-safe CPU sends the PROFIsafe frame to the fail-safe SMs. When you add a fail-safe CPU to your project, STEP 7 creates Functional Safety Organization Block 1 (FOB_1) (OB123 by default). FOB_1 contains the cyclic interrupt time.

   – "F-destination address": A unique PROFIsafe address is critical for every F-IO used in a safety system (network and CPU-wide). Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for procedures to set and verify unique PROFIsafe addresses in networked systems.

   Leave the settings unchanged for the F-parameters for this example.
5. Select the "DI parameters" area.
   Deactivate (uncheck the box) the "Short-circuit test" parameter for this example.
6. In this example, a two-channel emergency stop switch (emergency stop) is connected to channels 0 and 8.
   In our example, these channels are wired to Process value bits I8.0 and I9.0. The first of the two inputs, I8.0, conveys the signal in this 1oo2 configuration. Expand "DI parameters" and "Channel parameters" and select "Channel 0, 8".

Enter the settings as shown in the following figure:



7. In this example, the laser scanner for monitoring the accessible entry area is connected to channels 1 and 9.

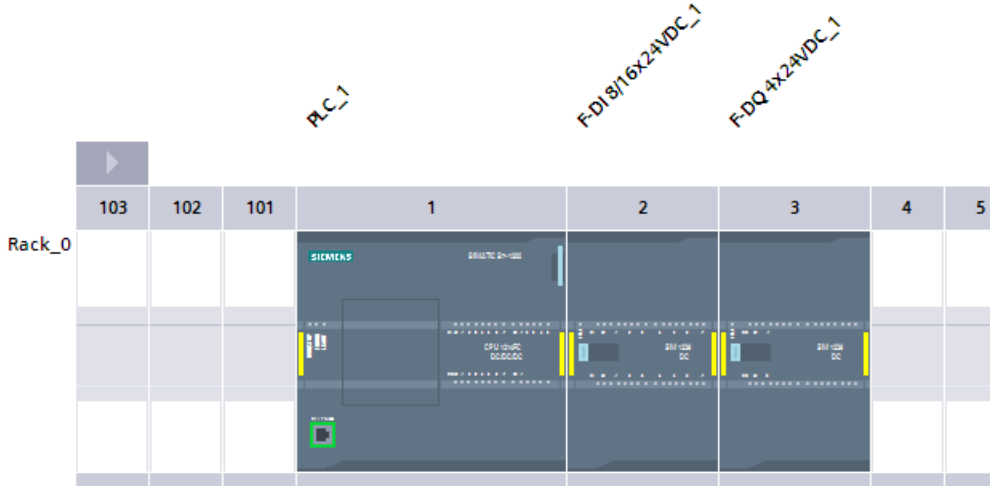
   Make the settings as shown in the following figure:

8. In this example, the position switches for monitoring a two-channel safety door are connected to channels 2 and 3.
   Make the settings as shown in the following figure:

9. Disable the following unused DI channels by clearing the "Activated" check box:

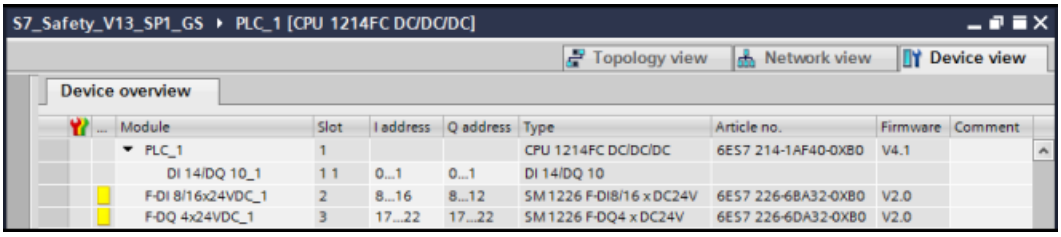
-
-
- 4
- 5
- 6
- 7
- 10
- 11
- 12
- 13
- 14
- 15

Result



The configuration of the F-DI is now complete.

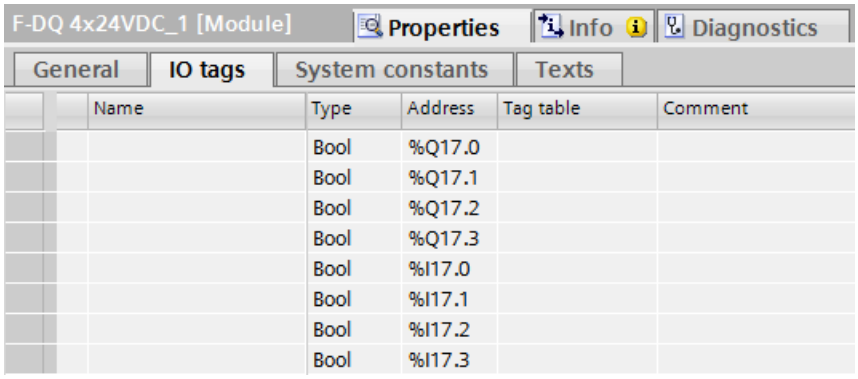
2.2.5 Step 4: Configuring an SM 1226 F-DQ 4 x 24 V DC for connecting a motor



In this step, you configure an F-DQ DC for indirect connection of a motor to channel 0, using 2 contactors.

Procedure

1. In the Device View of the S7-1200, use drag-and-drop to add an F-DQ 4x24VDC_1 digital electronic module from the hardware catalog to slot 3.

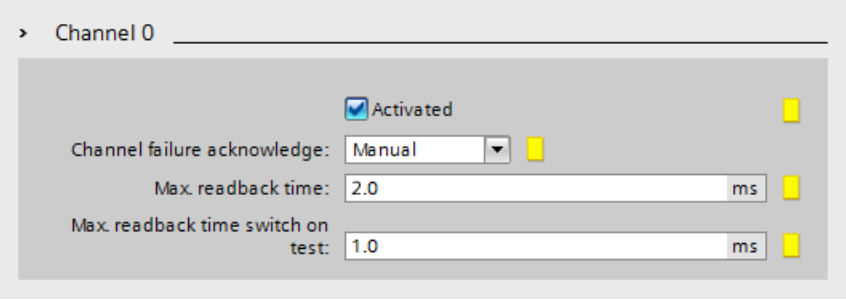


2. Open "Device data" to display the "Device overview" area. Here, you can change the start addresses for the inputs and outputs of your fail-safe module. Use the module default I/O addresses of "17" and "17" for this example (inputs begin at byte 17, and outputs begin at byte 17).

NOTE

The fail-safe SMs each use both Is and Qs, even though they may physically only have input channels or only have output channels.
The F-DQ DC has 4 output channels; however, the SM requires 6 input (I) bytes and 6 output (Q) bytes.

3. Return to the "Device view" and select the F-DQ 4x24VDC_1. Under the "Properties" tab, select the "IO tags" tab. This action displays the "Process value" and "Value status" bits for the fail-safe module. Here, you can define tags for each channel:



Each Process value bit has an associated Value status bit that reports whether the corresponding process value is good. Value status bits are ON for good quality and OFF for bad quality. If an entire module or channel is passivated, the associated Value status bits are OFF.

To check the Process value bits and the Value status bits, you must know where these bits are mapped in the module. For an F-DQ 4x24VDC_1, the first four bits of the output (Q) image register are the Process value bits, and the first four bits of the input (I) image register are the Value status bits. For example, if the module starting address is I17.0 and Q17.0 for the F-DQ 4x24VDC_1, then the Process value bits and corresponding Value status bits are allocated as shown in the following table:

Process value	Value status bit
Q17.0	I17.0
Q17.1	I17.1
Q17.2	I17.2
Q17.3	I17.3

4. Under the "Properties" tab, select the "General" tab, and then select the "F-parameters" area. Here, you can change the following parameters or accept the default settings:
   – "F-monitoring time": A valid current safety message frame must be received from the fail-safe CPU to the F-DQ DC within the F-monitoring time. Otherwise, the F-DQ DC goes to safe state. The F-monitoring time must be set high enough so that message frame delays are tolerated and, at the same time, low enough that the process can react as quickly as possible when a fault occurs and run without impairment. By default, the F-DQ DC's F-monitoring time is taken from the "Default F-monitoring time for central F-I/O" parameter of the fail-safe CPU.
   – "F-destination address": A unique PROFIsafe address is critical for every F-IO used in a safety system (network and CPU-wide). Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for procedures to set and verify unique PROFIsafe addresses in networked systems.

   Leave the settings unchanged for the F-parameters for this example.
5. Select the "DQ parameters" area. Here, you can change channel-specific parameters or apply the default settings.
   Enter the settings for the example as shown in the following figure:

6. Disable the unused DQ channels 1, 2, and 3 by clearing the "Activated" check box.

Result

The configuration of the F-DQ DC is now complete.

2.2.6 Summary: Configuring the Hardware

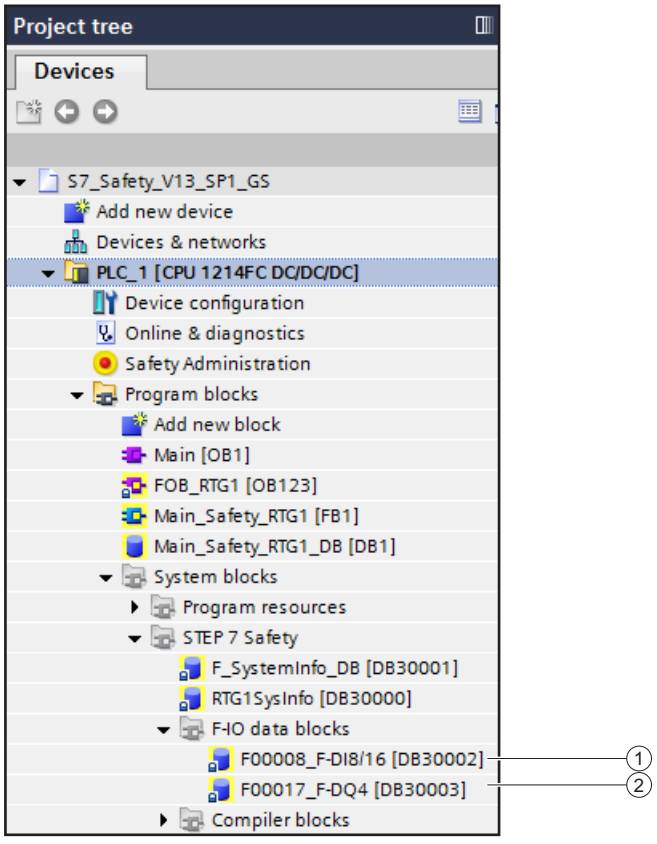
Summary

So far, you have configured the following S7-1200 components according to the task definition for the example:

- Fail-safe CPU
- Fail-safe CPU standard digital inputs for user acknowledgment, feedback loop, and start pushbutton:
  - Starting byte addresses of the input and output data areas: IB0 and QB0
  - Input channel (bit) 0 for re-integration acknowledgement (I0.0)
  - Input channel (bit) 1 for feedback (I0.1)
  - Input channel (bit) 2 for start (I0.2)

- Fail-safe digital input SM (F-DI 8/16x24VDC_1) for connecting an emergency stop switch, position switches for monitoring a safety door, and the laser scanner for monitoring the accessible production area:
  - Starting byte addresses of the input and output data areas: IB8 and QB8
  - Input channel (bits) 0 and 8 for the emergency stop (I8.0)
  - Input channel (bits) 1 and 9 for the laser scanner (I8.1)
  - Input channel (bit) 2 for one safety door position switch (I8.2)
  - Input channel (bit) 3 for other safety door position switch (I8.3)
- Fail-safe digital output SM (F-DQ 4x24VDC_1) for connecting a motor:
  - Starting byte addresses of the input and output data areas: IB17 and QB17
  - Output channel (bit) 0 for indirect switching of a motor using 2 contactors (Q17.0)

You can now continue with programming the safety program.



2.3 Programming

2.3.1 Introduction

In this example, a fail-safe function block (F-FB) will be programmed with a safety door function, an emergency stop function (safety circuit for switch-off in case of emergency stop, open safety door, or someone entering the protected area monitored by the laser scanner), a feedback circuit (as protection against reclosing in case of faulty load), a user acknowledgement for reintegration, and indirect switching of a motor using two contactors. The programmed F-FB will then be compiled to form a safety program and downloaded to the fail-safe CPU.

Fail-Safe SM data blocks (F-IO DBs)

An F-IO DB is automatically generated when you add a fail-safe SM to your configuration. The F-I/O DBs generated for the example I/O are located in the "Project tree" in the "Program blocks", "System blocks" folder:

① "F00008 F-DI16 [DB30002]": Fail-safe digital input SM 1226 F-DI 16 x 24 V DC data block (DB)

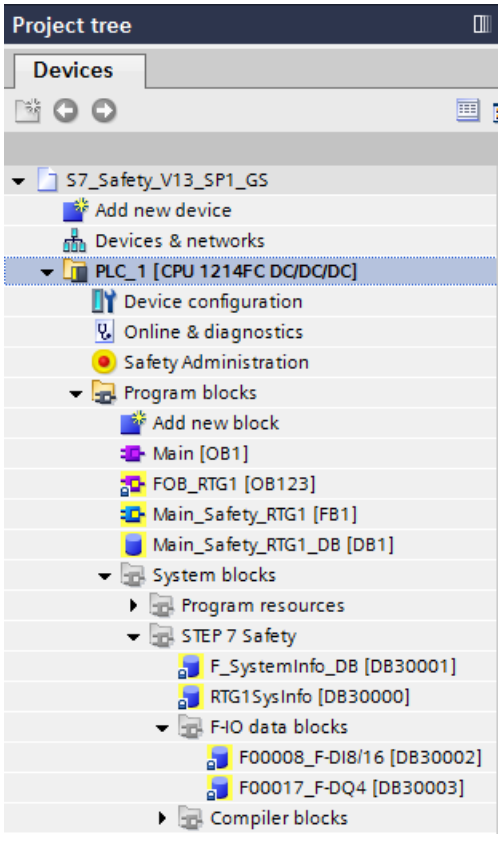
② "F000016 F-DQ4 [DB30003]": Fail-safe digital output SM 1226 F-DQ 4 x 24 V DC data block (DB)

The default name of the F-I/O DB is formed from the fixed prefix "F", the start input address of the fail-safe SM, and the names entered in the properties for the fail-safe SM in the hardware and network editor.

You can access the tags of the F-I/O DB with a fully qualified DB access (that is, by specifying the name of the F-I/O DB and the name of the tag).

Programming

You can program the safety program in LAD and FBD. In so doing, the instructions, data types, and operand areas you can use are subject to certain restrictions (see the "Programming" chapter, "Overview of programming" section of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en)).



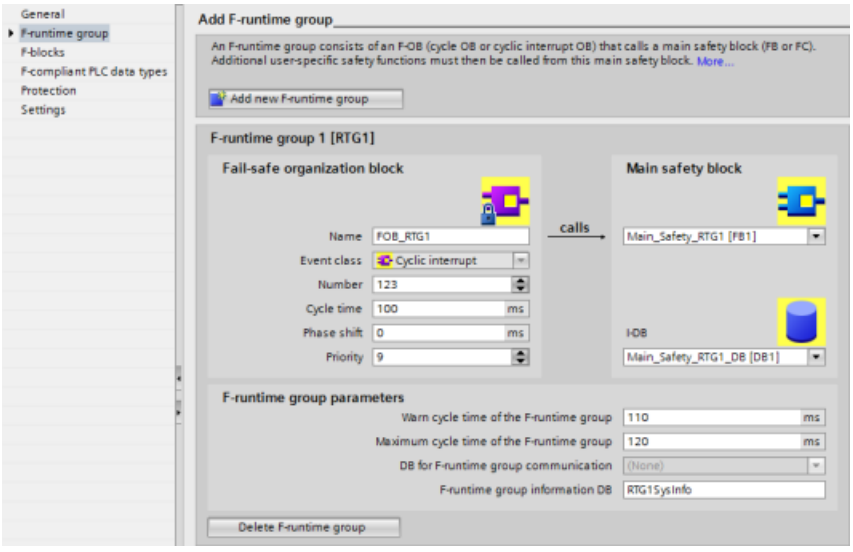
The FBD programming language is used in this example.

NOTE
Fail-safe signals are shown in yellow in the "LAD/FBD Editor".

NOTE
Note the rules for the program structure in the "Programming" chapter, "Defining F-runtime groups" section of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

2.3.2 Step 5: Specifying the centralized settings for the safety program

When the fail-safe CPU is inserted, an F-runtime group and the associated main safety block are created by default and assigned to the CPU. An F-runtime group consists of an F-OB (cyclic interrupt OB) that calls a main safety block FB. Additional user-specific safety functions must then be called from this main safety block:



The first step in programming of the safety program is the main safety block. The main safety block is an F-FB (with instance DB) that is called from the "Fail-Safe Organization Block" (F-OB) (cyclic interrupt OB) assigned in each F-runtime group. The F-OB has a higher priority than other standard OBs.

F-blocks created by the user are called from the main safety block. You can change the calling block and the called block at any time.

After the safety program is executed, the standard user program will resume.

Opening the Safety Administration editor

1. In the "Project tree" of the fail-safe CPU, double-click on "Safety Administration".
   Result: The "Safety Administration" editor opens.
   You make central settings for the safety program in the Safety Administration editor.
2. In the area navigation of the Safety Administration editor, click "Safety runtime group". The F-runtime group is created automatically when the fail-safe CPU is created and the associated main safety block is displayed:

The cyclic interrupt OB (FOB_1 [OB123]) calls the main safety block (Main_Safety [FB1]) by default. The F-blocks created by the user are called from the main safety block. You can change the calling block and the called block at any time.

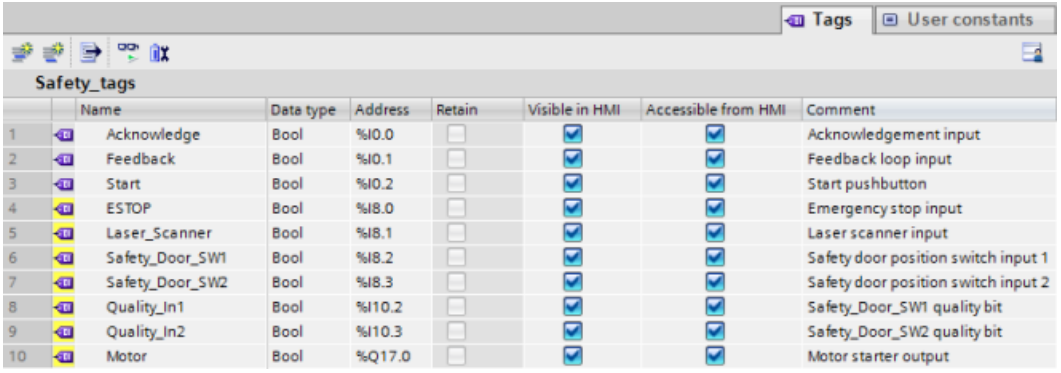
Leave the preset blocks for this example.

For additional information on the Safety Administration editor, refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

Numbering ranges of fail-safe system blocks

When the safety program is compiled, F-blocks are automatically added in order to generate an executable safety program.

By default, the system automatically manages the numbering range, which is displayed in the Safety Administration editor under "Settings".



Keep the pre-assigned settings for this example.

Specifying inputs and outputs for the safety program

After configuring the hardware as described in Steps 1 to 4, the following fail-safe CPU and SM DBs are available for programming the example:

Configured hardware	Start input address	Symbolic name
Fail-safe CPU standard digital inputs CPU 1214FC	IB0	PLC_1 [CPU 1214FC DC/DC/DC]
Fail-safe digital input module SM 1226 F-DI 16 x 24 V DC	IB8	F00008_SM 1226 F-DI 16 x 24 V DC
Fail-safe digital output module SM 1226 F-DQ 4 x 24 V DC	IB16	F00016_SM 1226 F-DQ 4 x 24 V DC

Assign the following symbolic names for the fail-safe inputs and outputs:

Tags | User constants

Safety_tags

	Name	Data type	Address	Retain	Visible in HMI	Accessible from HMI	Comment
1	Acknowledge	Bool	%I0.0		☑	☑	Acknowledgement input
2	Feedback	Bool	%I0.1		☑	☑	Feedback loop input
3	Start	Bool	%I0.2		☑	☑	Start pushbutton
4	ESTOP	Bool	%I8.0		☑	☑	Emergency stop input
5	Laser_Scanner	Bool	%I8.1		☑	☑	Laser scanner input
6	Safety_Door_SW1	Bool	%I8.2		☑	☑	Safety door position switch input 1
7	Safety_Door_SW2	Bool	%I8.3		☑	☑	Safety door position switch input 2
8	Quality_In1	Bool	%I10.2		☑	☑	Safety_Door_SW1 quality bit
9	Quality_In2	Bool	%I10.3		☑	☑	Safety_Door_SW2 quality bit
10	Motor	Bool	%Q17.0		☑	☑	Motor starter output

2.3.3 Step 6: Creating an F-FB

In this step, you create the F-FB where you will program the safety functions for this example.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

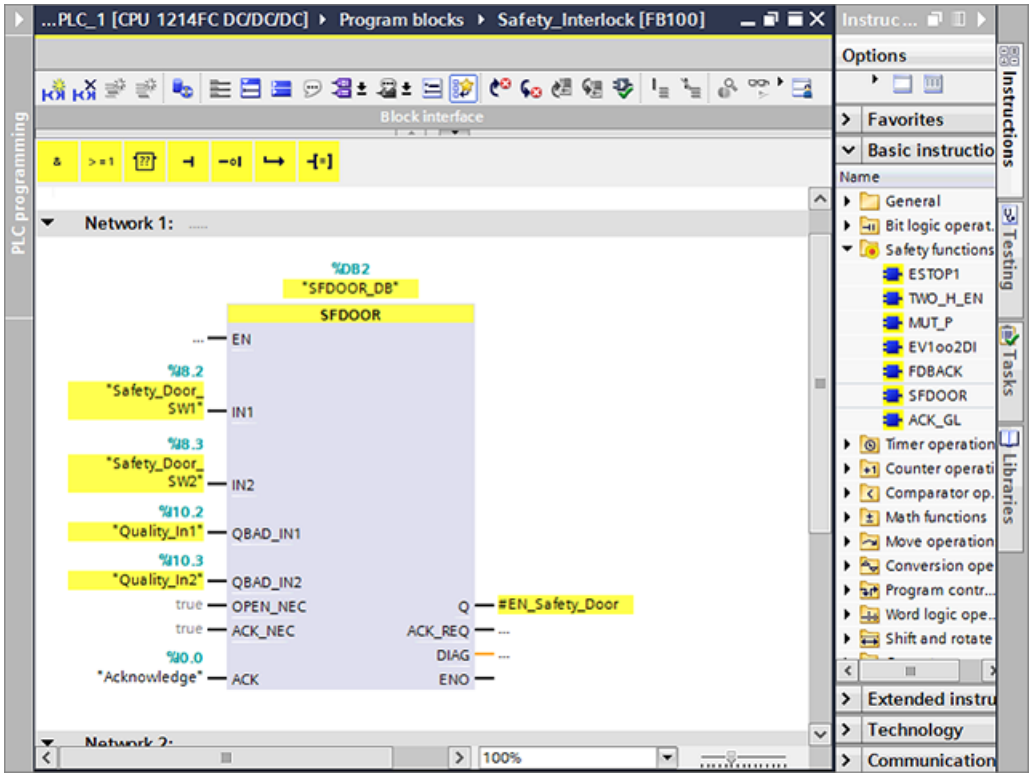
1. Insert an F-FB. Go to the "Program blocks" folder of the fail-safe CPU and double-click "Add new block".

   The "Add new block" dialog opens.
2. Under "Name" enter "Safety_Interlock" for the name of the F-FB.
3. Click the "Function block" button on the left.
4. Select "FBD" as the language for the F-FB.
5. Under "Number" choose the "Manual" option, and enter 100.
6. Ensure that you select the "Create F-block" check box so that a fail-safe function block is created.
7. Close the dialog box with "OK"

Result

The F-FB "Safety_Interlock" is created in the "Program blocks" folder and opens automatically in the "FBD Editor".

You can now continue with programming the safety functions in the next step.



2.3.4 Step 7: Programming the safety door function

In this step, you program the safety door function for this example.

The safety door secures the application's service area. Opening the safety door results in a stop or shutdown of the production cell similar to an emergency stop.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. In the interface of the "Safety_Interlock" F-FB, create a static tag of data type "Bool" named "EN_Safety_Door" (Enable safety door).
2. Insert the "SFDOOR" instruction from the "Safety functions" subfolder of the "Instructions" task card.
3. Click "OK" to confirm the "Call options" dialog.
4. Initialize the inputs and outputs with parameters as described in the table below.

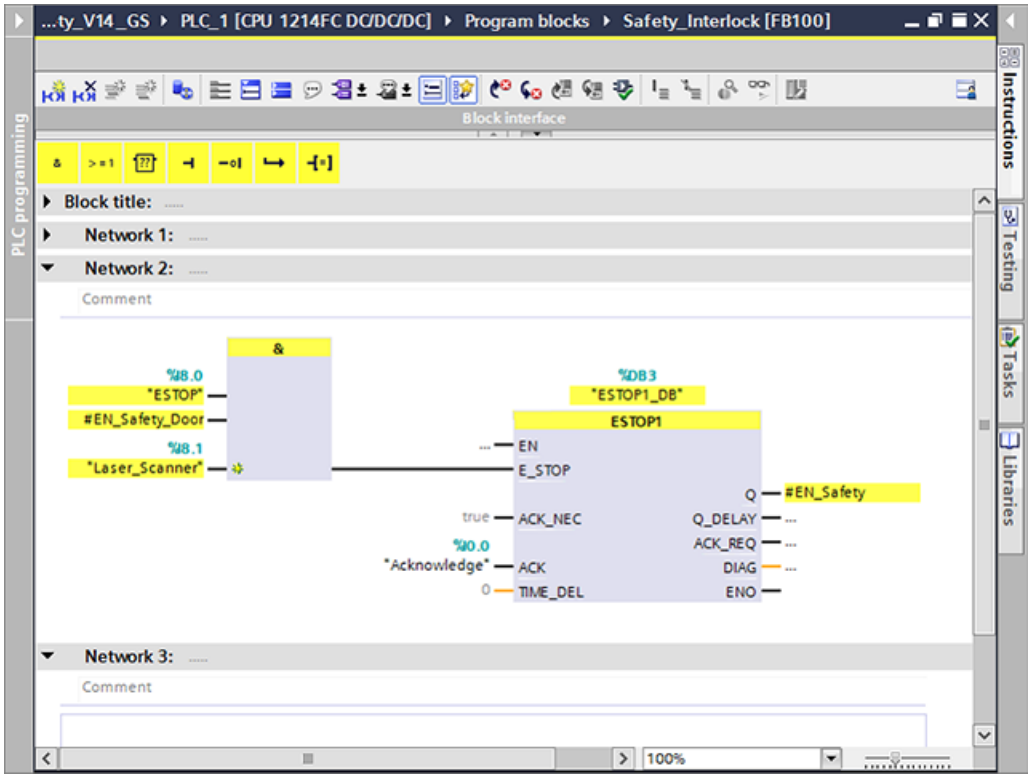
Result

The programming of the safety door function is now complete.

Parameter assignment of the "SFDOOR" instruction

Inputs/outputs	Parameter	Data type	Description	Default
"Safety_Door_SW1" (I8.2)	IN1	Bool	Input 1	FALSE
"Safety_Door_SW2" (I8.3)	IN2	Bool	Input 2	FALSE
"Value_status_In1" (I10.2)	QBAD_ IN1	Bool	Value status bit signal for input IN1 [1]	TRUE
"Value_status_In2" (I10.3)	QBAD_ IN2	Bool	Value status bit signal for input IN2 [1]	TRUE
TRUE	OPEN_NEC	Bool	TRUE = Opening required on startup	TRUE
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (Pushbutton)	FALSE
#EN_Safety_Door	Q	Bool	Output (Enable safety door)	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0

[1] The two inputs QBAD_ IN1 and QBAD_ IN2 must be interconnected. In this example, both safety door position switches are connected through the SFDOOR and ESTOP1 program logic with the QBAD signal of the F-I/O DB of the SM 1226 F-DQ 4 x 24 V DC in the FDBACK program logic.



2.3.5 Step 8: Programming the emergency stop function

In this step, you program the emergency stop function for this example.

Used for emergencies only, the emergency stop button is a safety measure to immediately shut down all machine functions. An emergency stop button must be highly visible in color and shape and must be easy to operate in emergency situations. In this example, the emergency stop is a manual push button attached next to the safety door entrance to the service area enclosure. The emergency stop function provides shutdown in the case of an emergency stop, an open safety door, or someone entering the protected area monitored by the laser scanner.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. In the interface of the "Safety_Interlock" F-FB, create a static tag of data type "Bool" named "EN_Safety" (Enable safety circuit).

   NOTE

   If the emergency stop is off, the safety door is closed, and the protected area laser scanner is not triggered, the inputs from the emergency stop, safety door, and the laser scanner are all true. All three inputs must be true, before the ESTOP1 instruction can power "EN_Safety". When "EN_Safety" is true, then the user knows that his operation is back to normal and that he can startup safely.

2. Insert a new network.
3. Insert the "AND logic operation" instruction from the "Bit logic operations" subfolder of the "Instructions" task card.
4. Insert a third input to the "AND logic operation" instruction and initialize the inputs of the instruction with parameters as described in the table below.
5. Insert the "ESTOP1" instruction from the "Safety functions" subfolder of the "Instructions" task card.
6. Click "OK" to confirm the "Call options" dialog.
7. Initialize the inputs and outputs of the instruction with parameters as described in the table below.
8. Connect the output of the "AND logic operation" instruction to the "ESTOP" input of the "ESTOP1" instruction.

Result

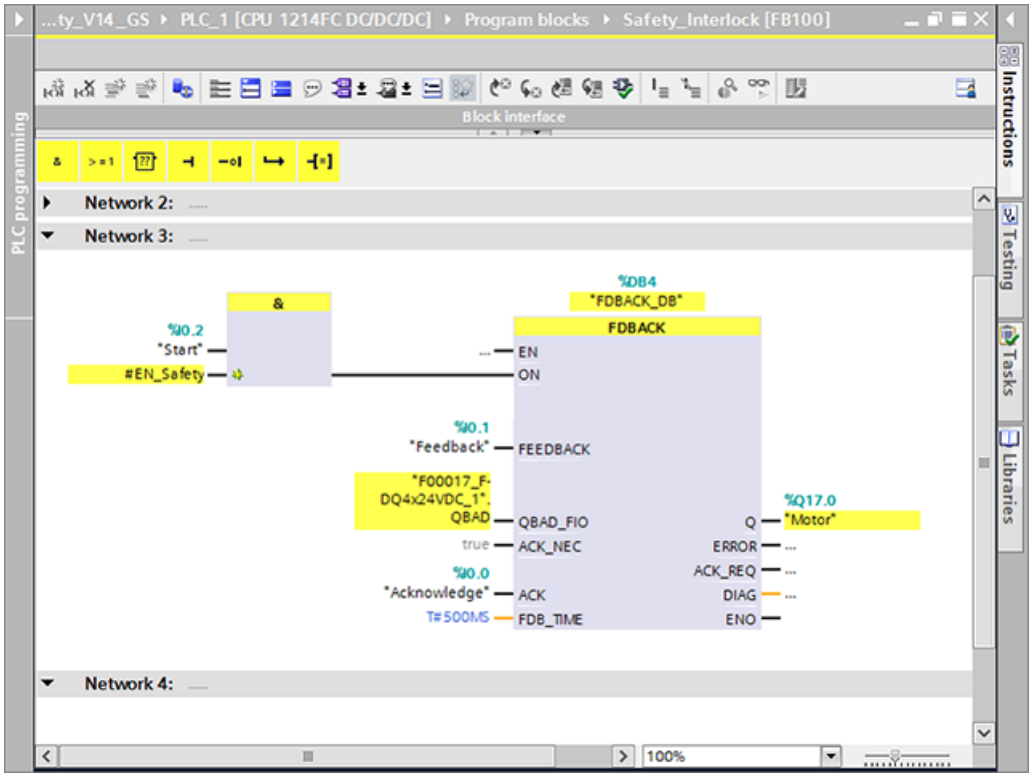
The programming of the emergency stop function is now complete.

Parameter assignment of the "AND logic operation" instruction

Inputs	Parameter	Data type	Description	Default
"ESTOP" (I8.0)	Input 1	Bool	Emergency STOP	FALSE
#EN_Safety_Door	Input 2	Bool	Enable safety door	FALSE
"Laser_scanner" (I8.1)	Input 3	Bool	Laser scanner	FALSE

Parameter assignment of the "ESTOP1" instruction

Inputs/outputs	Parameter	Data type	Description	Default
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (using a pushbutton)	FALSE
T#0MS	TIME_DEL	Time	Time delay	T#0MS
#EN_Safety	Q	Bool	Enable safety circuit	FALSE
—	Q_DELAY	Bool	Enable is OFF delayed	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0



2.3.6 Step 9: Programming the feedback monitoring

In this step, you program the feedback circuit monitoring for this example.

The feedback circuit provides protection against restarting normal operations while unsafe conditions still exist. The system can only be restarted when the emergency stop is cancelled, the safety door is closed, and the laser scanner detects no one in the protected area.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. Insert a new network.
2. Insert the "AND logic operation" instruction from the "Bit logic operations" subfolder of the "Instructions" task card.
3. Initialize the inputs of the instruction with parameters as described in the table below
4. Insert the "FDBACK" instruction from the "Safety functions" subfolder of the "Instructions" task card.
5. Click "OK" to confirm the "Call options" dialog.
6. Initialize the inputs and outputs of the instruction with parameters as described in the table below.
7. Connect the output of the "AND logic operation" instruction to the "ON" input of the "FDBACK" instruction.

Result

The programming of the feedback monitoring is now complete.

Parameter assignment of the "AND logic operation" instruction

Inputs	Parameter	Data type	Description	Default
"Start" (I0.2)	Input 1	Bool	TRUE = Switch on output	FALSE
#EN_Safety	Input 2	Bool	Enable safety circuit	FALSE

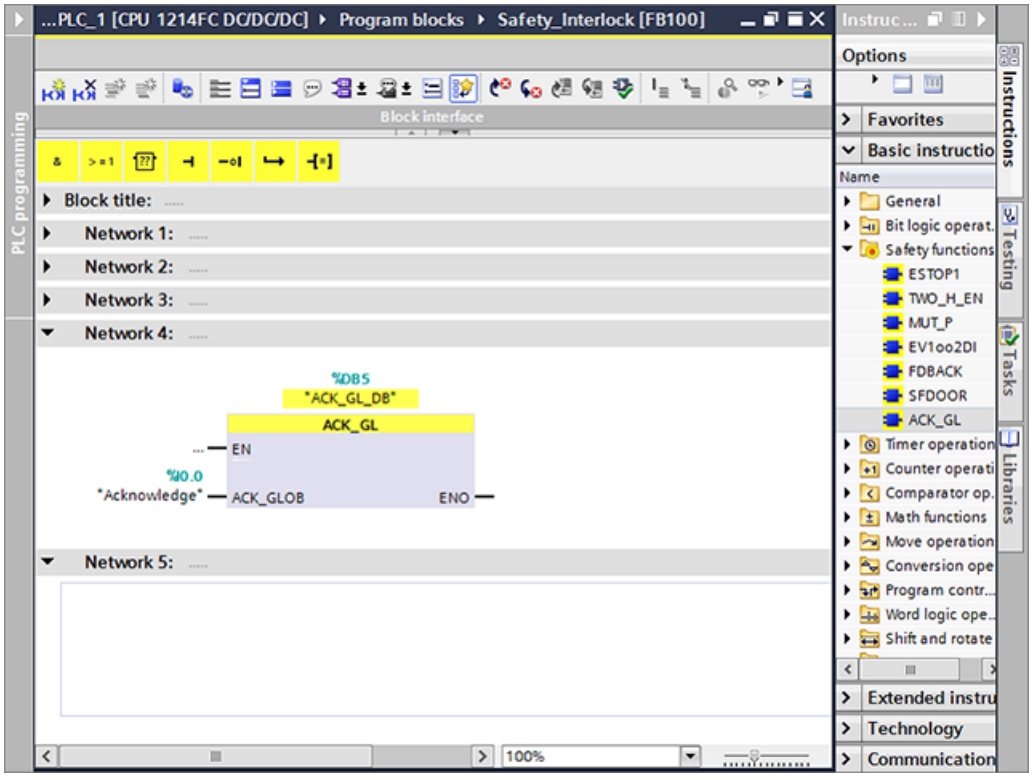
Parameter assignment of the "FDBACK" instruction

Inputs/outputs	Parameter	Data type	Description	Default
"Feedback" (I0.1)	FEEDBACK	Bool	Readback input	TRUE (No error detected)
"F00016_F-DQ4".QBAD	QBAD_FIO	Bool	QBAD signal from the fail-safe signal module DB of output Q [1]	FALSE (No error detected)
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (via pushbutton)	FALSE
T#500MS	FDB_TIME	Time	Readback time	T#0MS
"Motor" (Q16.0)	Q	Bool	Output	FALSE
—	ERROR	Bool	Readback error	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0

[1] In this example, this is the QBAD signal from the F-I/O DB of the SM 1226 F-DQ 4 x 24 V DC.

2.3.7 Step 10: Programming the user acknowledgment for reintegration of the fail-safe SM

In this step, you program the user acknowledgement for reintegration of the fail-safe signal module I/O for this example.



The user must acknowledge that conditions have returned to a safe state before production operations can be restarted.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

In your safety program, you must provide a user acknowledgment for the reintegration of the fail-safe signal module I/O. In order to acknowledge in the event of passivated F-I/O, the acknowledgement pushbutton is evaluated using a standard input. In this example, this is the "Acknowledge" input.

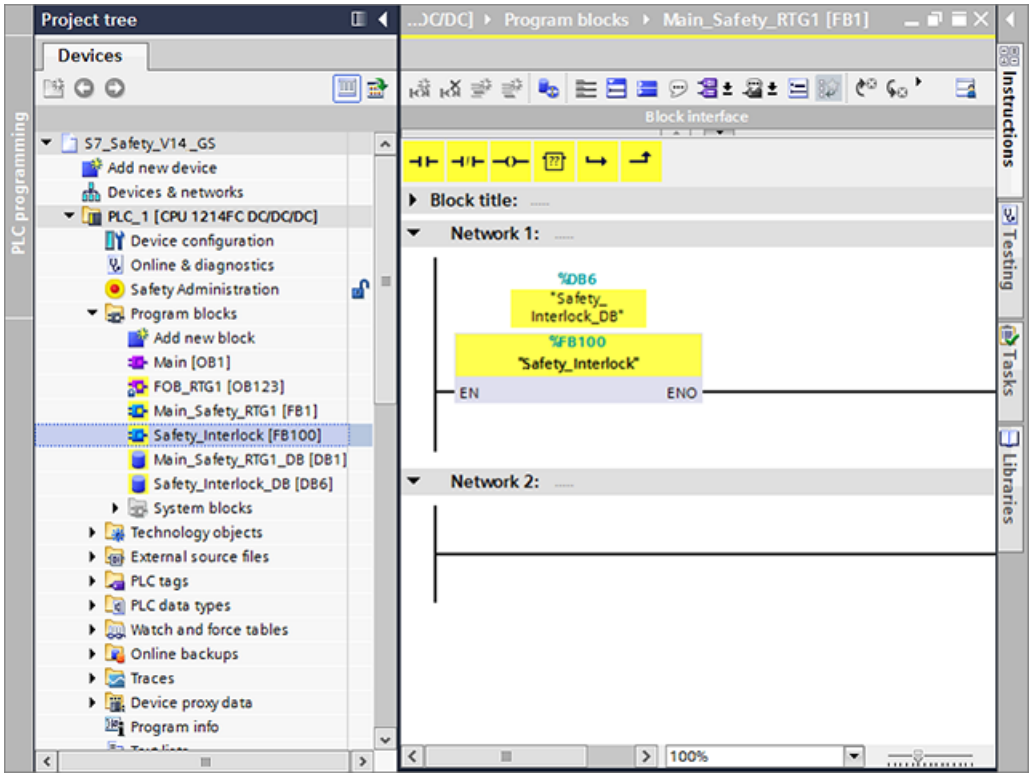
You can use the ACK_GL instruction to reintegrate all F-I/O of an F-runtime group.

1. Insert a new network.
2. Insert the "ACK_GL" instruction from the "Safety functions" subfolder of the "Instructions" task card.
3. Click "OK" to confirm the "Call options" dialog.
4. Initialize the input with parameters as described in the table below.

Result

The programming of the user acknowledgment is now complete.

Parameter assignment of the "ACK_GL" instruction



Input	Parameter	Data type	Description	Default
"Acknowledge" (I0.0)	ACK_GLOB	Bool	Acknowledgement for reintegration	FALSE

2.3.8 Step 11: Programming of the main safety block

In this step, you program the main safety block for this example.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

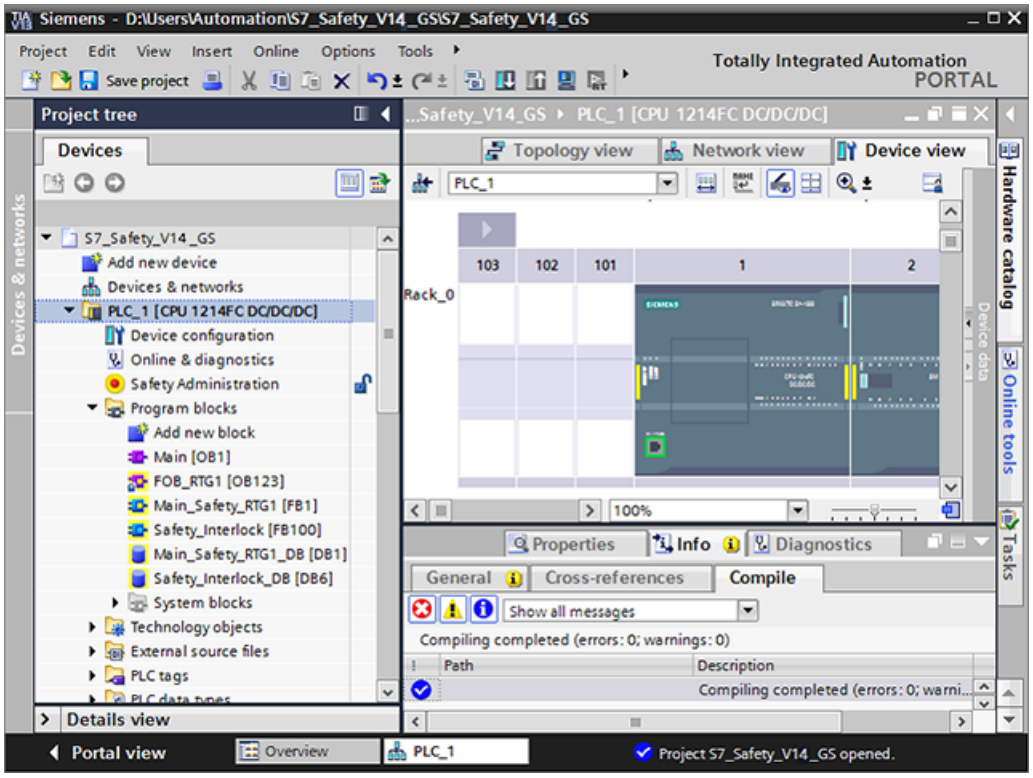
Procedure

1. Double-click in the project navigation to open the main safety block "Main_Safety".
2. Use drag-and-drop to insert the F-FB "Safety_Interlock" in Network 1 of the main safety block.
3. Click "OK" to confirm the "Call options" dialog.

Result

The F-FB "Safety_Interlock" will now be called cyclically by the main safety block.

You have now programmed the functionality according to the task definition of the example. You can now proceed with the next steps to compile the safety program, assign device names, and download the safety program along with the hardware configuration to the fail-safe CPU.



2.3.9 Step 12: Compiling the safety program

In this step, you compile the safety program and the hardware configuration.

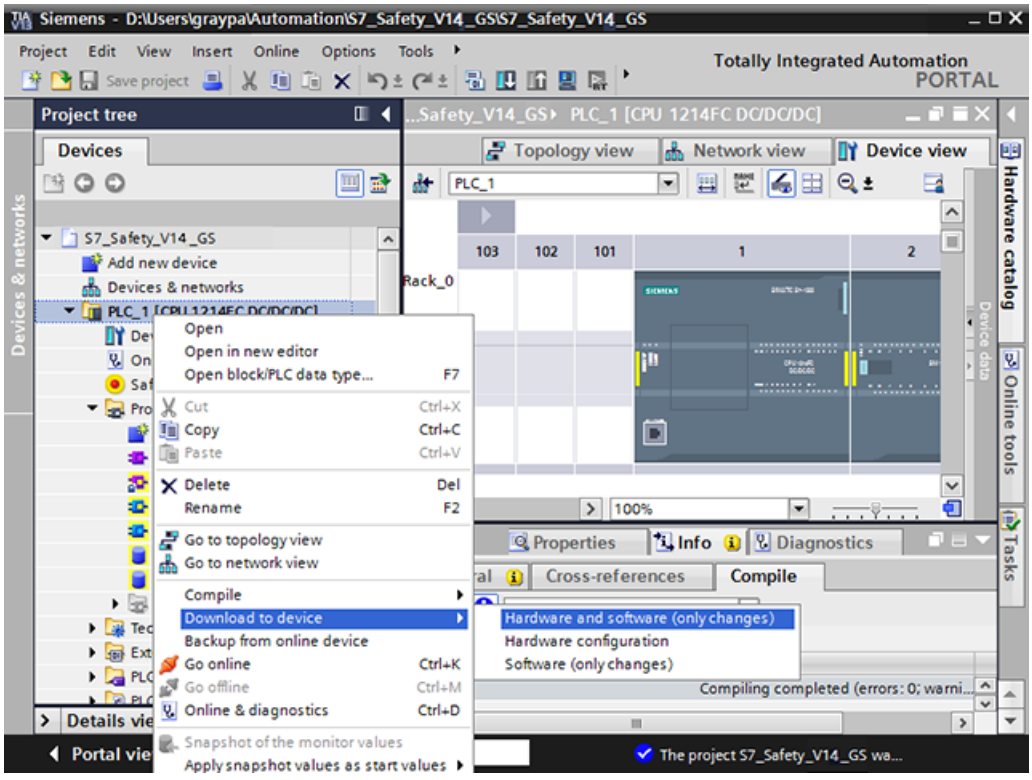
A consistency check is performed on the execution-relevant F-blocks when the safety program is compiled, that is, the safety program is checked for errors. Any error messages are output in an error window. After a successful consistency check, the additionally required F-blocks are generated automatically and added to the F-runtime group in order to generate an executable safety program.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. Select the fail-safe CPU in the project tree.
2. In the shortcut menu for the fail-safe CPU, select "Hardware and software (only changes)". The safety program is now compiled.

Result



If compilation is successful, the result is always a consistent and executable safety program comprising all F-blocks with F-attributes. You are notified of this with the message "Safety program is consistent".

2.3.10 Step 13: Downloading the complete safety program to the fail-safe CPU and activating safety mode

In this step, you download the hardware configuration and the safety program to the fail-safe CPU.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

Procedure

1. In the "Project tree", select the fail-safe CPU.
2. In the shortcut menu for the fail-safe CPU, select "Hardware and software (only changes)". If an online connection to the fail-safe CPU does not yet exist, you will be prompted to establish this connection.
3. Select "Consistent download" in the "Action" column in each case.

NOTE

To download the entire safety program, the fail-safe CPU must be in STOP mode.

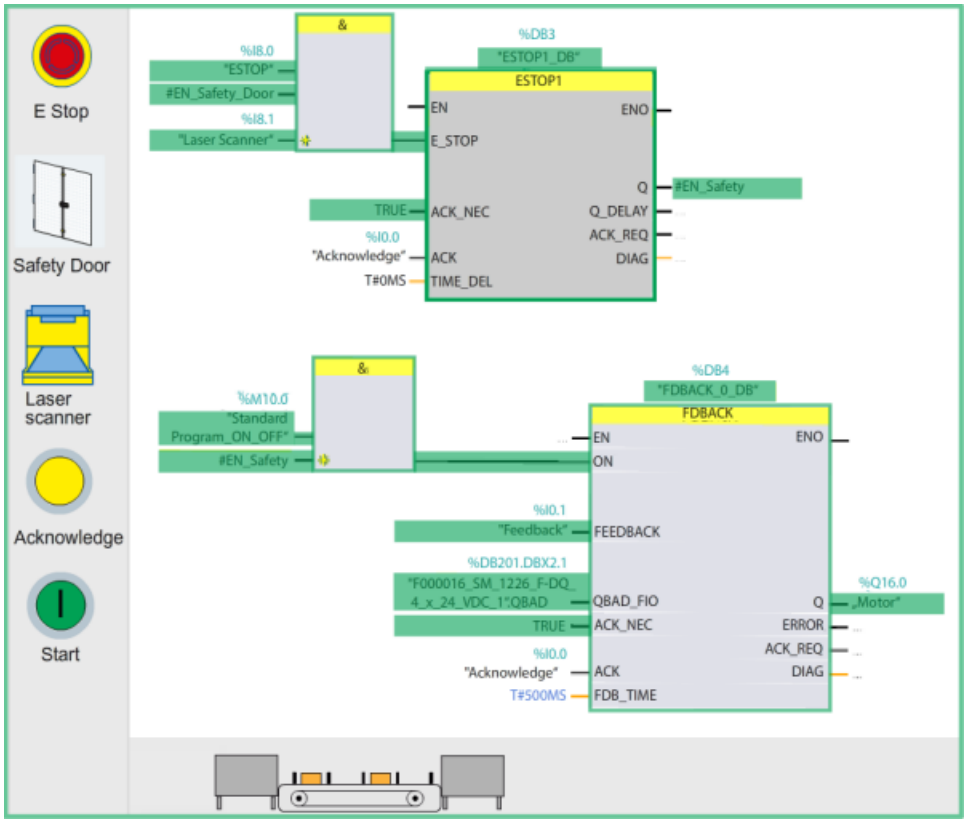
4. Click the "Load" button.
   Result: The "Load results" dialog is displayed.
5. Click the "Finish" button.
6. In the "Project tree", double-click "Safety Administration".

7. In the "Safety Administration" editor, check to see if the F-collective signatures of all F-blocks with F-attributes match online and offline to confirm whether your offline safety program blocks match what is in your connected CPU. You must be online in order to perform the signature comparison.
8. To activate safety mode, switch the fail-safe CPU from STOP to RUN mode.

   The Safety Administration editor displays the current safety mode status in the "General" area under "Safety Mode Status".

NOTE

Once a safety program has been created, you must perform a full function test according to your automation task (see SIMATIC Safety Configuring and Programming Manual (http://support.automation.siemens.com/WW/view/en/54110126/0/en)).



Result of programming

You have now finished creating the safety program according to the task definition of the example. In this interactive graphic, you can become familiar with the functions you just programmed.

When you move to this page, you activate the instructional video. Move your cursor over the image, and the video controls (rewind, pause, go back, or go forward) appear at the bottom of the video screen. Move to another page to deactivate the video.

The video switches the Laser Scanner, E-Stop, and Safety Door on and off to simulate unsafe conditions. Each device operates independently of the the other two devices. If you do activate a device, you must deactivate the device before continuing.

The video shows you that you must press the "Acknowledge" button to notify the system that you have returned to a safe state. Then, you can press the "Start" button to operate the system again.

The table below describes the steps and their actions:

Step	Action	Description
1	Activate the E-Stop. [1, 2]	This action prevents resumption of the operation.
2	Deactivate the E-Stop. [3]	The E-Stop deactivates.
3	Press the Acknowledge button.	The safety program requires acknowledgement.
4	Press the Start button.	Restart your operations.
5	Open the Safety Door. [1, 2]	This action prevents resumption of the operation.
6	Close the Safety Door. [3]	The Safety Door closes.
7	Press the Acknowledge button.	The safety program requires acknowledgement.
8	Press the Start button.	Restart your operations.
9	Trigger the Laser Scanner. [1, 2]	This action prevents resumption of the operation.
10	Deactivate the Laser Scanner. [3]	The Laser Scanner deactivates.
11	Press the Acknowledge button.	The safety program requires acknowledgement.
12	Press the Start button.	Restart your operations.

[1] The activation of the E-STOP, trigger of the Laser Scanner, or opening of the Safety Door can be done in any order or individually to stop operations and bring the system to a safe state.

[2] To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device; 2. Press the Acknowledge button; 3. Press the Start button.

[3] This allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart operations.

Fail-Safe signal module (SM) applications

3

This chapter presents typical application examples for connection of functional safety input and output channels, with a statement of the safety performance (SIL/Category/PL) that is possible for each example.

The PLC system typically contributes only a small part of the total probability of dangerous failure. The probability of dangerous failures of the sensors and actuators will typically be far larger than the PFH/PFD of the PLC system. Faults in the wiring system can also be a substantial contributor.

To achieve a targeted level of safety performance for each safety function, you must:

- Choose an appropriate architecture
- Choose sensors and actuators that are appropriately rated
- Provide a safety program that meets the requirements of the safety function
- Provide diagnostics and proof tests to maintain the ratings of the sensors and actuators
- Use wiring installation practices, diagnostics, and proof tests to assure wiring integrity
- Control operating and maintenance procedures for the lifetime of the installation

The S7-1200 Fail-Safe system provides a high level of internal diagnostic coverage. Diagnostic coverage of your external circuits, sensors, and actuators depends on your design choices using features of the PLC system and other measures.

The PFH/PFD of each S7-1200 fail-safe component is stated assuming no field proof test within the lifetime of the product. Sensors and actuators typically require regular proof tests to maintain an expected level of safety performance.

The reaction time of each safety function depends on the reaction time of each component, including the sensor, the PLC system, and the actuator. "Fail-Safe response times" (Page 186) gives further information on delay times through the PLC components. You must choose PLC parameters and external component reaction times to achieve a total safety reaction time goal.

In addition to total delay from safety demand input to safe actuator response, you must consider these additional time-related factors. Refer to "Fail-Safe response times" (Page 186) for exact information:

- To be assured of a safety response, a safety demand signal from the input sensor must last long enough to be seen by the safety program. Your configured filter time, discrepancy resolution time, short circuit test duration, and F-monitoring times all contribute to this time.
- The SM 1226 F-DQ 4 x 24 V DC provides ON test pulses to OFF switches, and OFF test pulses to ON switches, to test that the P and M switches respond. The OFF test pulse duration can be as long as your configured "Maximum readback time". The ON test pulse duration can be as long as your configured "Maximum readback time switch on test". The ON test pulse is only provided to one of the P or M switches at a time, but in the presence of single fault this could apply energy to your load. Your actuator should not respond to an OFF signal up to the "Maximum readback time" duration, or to an ON signal up to the "Maximum readback time switch on test" duration.

- Both the SM 1226 F-DQ 4 x 24 V DC and SM 1226 F-DQ 2 x Relay expect to complete and confirm any commanded transition from ON to OFF output state. After your program changes process output value from "1" to "0", you should not change the "0" back to a "1" until the F-DQ DC readback time or the F-RLY response time has completed. The affected output passivates on commanded "0" states that are too short to confirm.

⚠ WARNING

The safety performance of your installation depends on your design and continued maintenance of each complete safety function.
The S7-1200 fail-safe CPU and fail-safe signal modules provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions.
Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.
You must choose all components of your installation and complete your design and maintenance according to accepted safety standards and practices to achieve your required level of safety.

3.1 Digital input applications

You should consider the application modes presented here along with the features of the SM 1226 F-DI 16 x 24 V DC as described in the overview. Refer to "SM 1226 F-DI 16 x 24 V DC" (Page 22).

These are the main features to keep in mind:

- You configure each channel as a 1oo1 or part of a 1oo2 evaluation pair.
- The corresponding channels from input bytes "a" and "b" (a.0, b.0), (a.1, b.1)...(a.7, b.7) form a 1oo2 channel group.
- Within this restriction, you can assign 1oo1 and 1oo2 in any order.
- Short-circuit testing requires use of the internal sensor supply. VS1 must be used with inputs a.0...a.7, and VS2 must be used with inputs b.0...b.7.
- If you enable the short-circuit test, both Vs1 and Vs2 are configured with the same parameters. All channels you configured for internal sensor supply will be subject to the same short-circuit test. You configure a test duration (length of dark time) and test interval (time between dark tests).
- The sensor supply is monitored to detect short-circuit or overload. It is cycled once on each power up to assure control and readback are working, and the readback is monitored during input short circuit tests.
- You configure a discrepancy time to identify unacceptable differences between 1oo2 inputs.
- You configure a filter time for each channel or each 1oo2 pair.

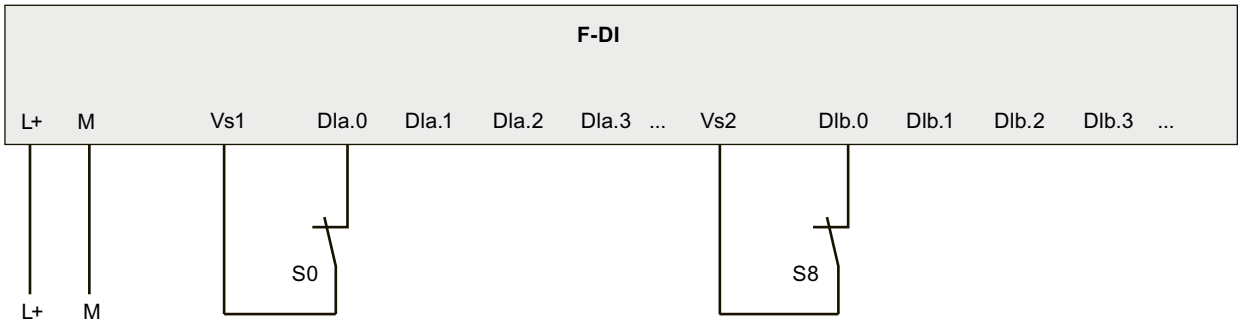
You can achieve Category 3 in 1oo1 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- Each F-DI input includes sufficient diagnostics and redundant components such that no single internal fault can cause a dangerous failure.
- An appropriately-rated, single sensor can reach Category 3 by internal fault tolerance.
- The external wiring of a single sensor to a single input is vulnerable to single fault dangerous failure unless additional measures are applied.

You can achieve Category 4 in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- With 1oo2 evaluation, a pair of F-DI inputs is not subject to dangerous internal failure within a reasonable number of accumulated internal faults.
- Appropriately-rated, external-paired sensors or equivalent redundancy can achieve Category 4.
- The duplicated external wiring of 2 sensors to 2 input points is vulnerable to accumulated fault dangerous failure unless additional measures are applied.

The F-DI is recommended for SIL 3/PL e only when 1oo2 evaluation is selected. A single high-integrity sensor can be rated up to SIL 3/PL e, but it should be wired and configured for 1oo2 evaluation for the channel to achieve SIL 3/PL e.



3.1.1 Selecting the digital input application

Input architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

Table 1-2 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Sensor supply	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
1 and 2	Internal or External	1oo1 evalution	Single input	1 channel	2/3/d	
3 and 4	Internal or External	1oo2 evaluation	Two inputs	2 channel equivalent	3/3/e	
5	Internal			2 channel equivalent	3/3/e	3/4/e
6	External				3/3/e	
7	Internal			2 channel - 3 wire non-equivalent	3/3/e	3/4/e
8	External				3/3/e	
9	Internal			2 channel - 4 wire non-equivalent	3/3/e	3/4/e
10	External				3/3/e	

3.1.2 Applications 1 and 2: 1oo1 evaluation of a single sensor

If short circuit detection is used, VS1 must be used with a.x inputs and VS2 must be used with b.x inputs.

Figure 1-1 F-DI Application mode 1: Internal sensor supply

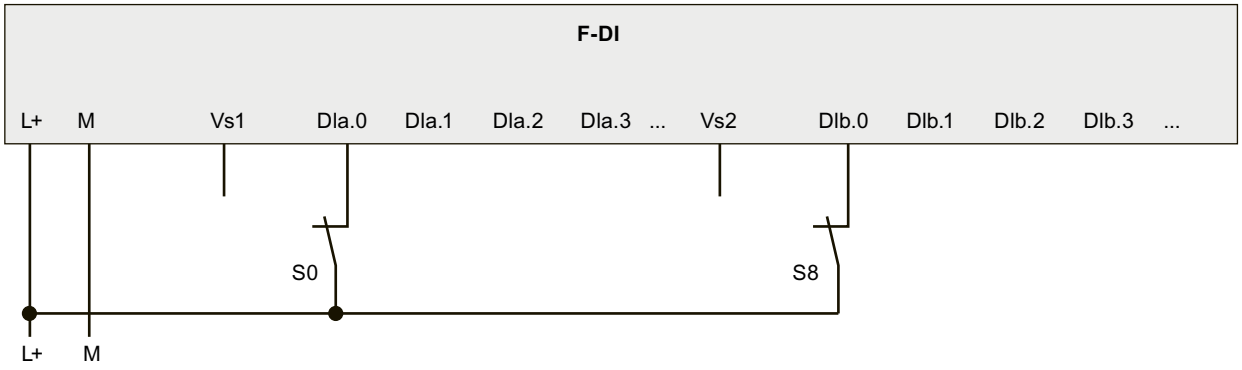


Figure 1-2 F-DI Application mode 2: External sensor supply

3.1.3 Applications 3 and 4: 1oo2 evaluation of a single sensor

You cannot configure short-circuit detection for this type of connection. Vs1 testing causes F-DI b.x inputs to fail.

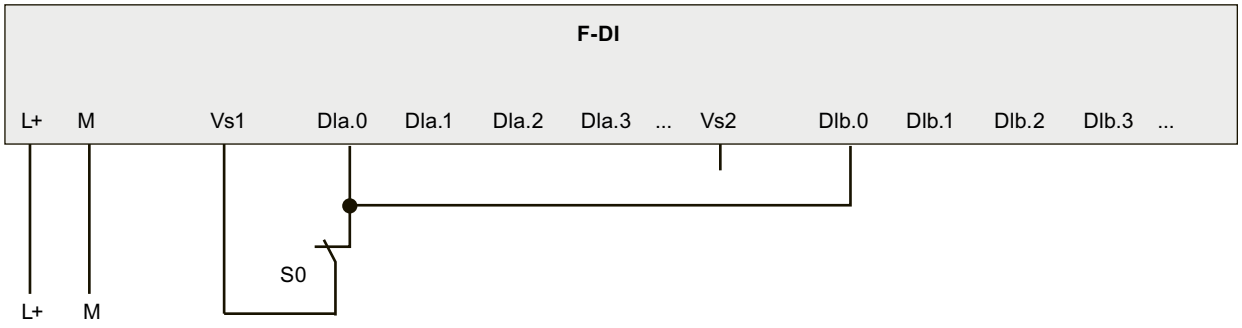

Figure 1-3 F-DI Application mode 3: Internal sensor supply

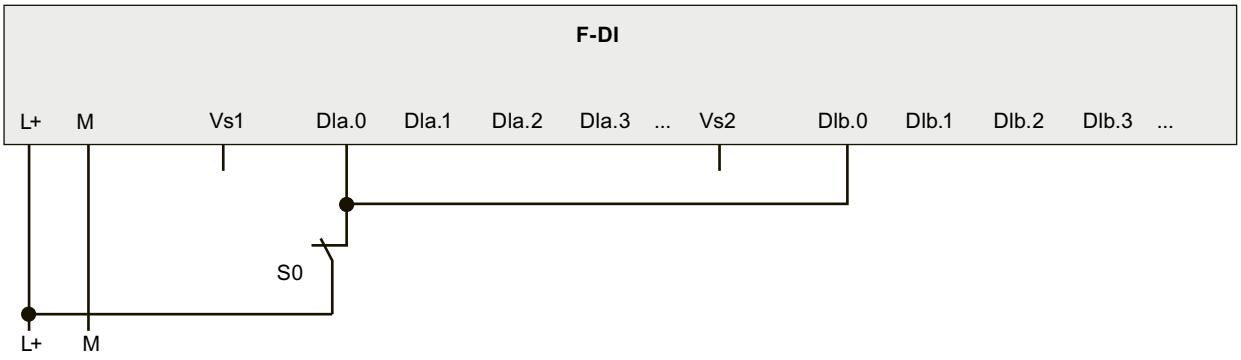

Figure 1-4 F-DI Application mode 4: External sensor supply

3.1.4 Applications 5 and 6: 1oo2 evaluation of independent equivalent sensors

S0 and S8 can be dual contacts of a single sensor.

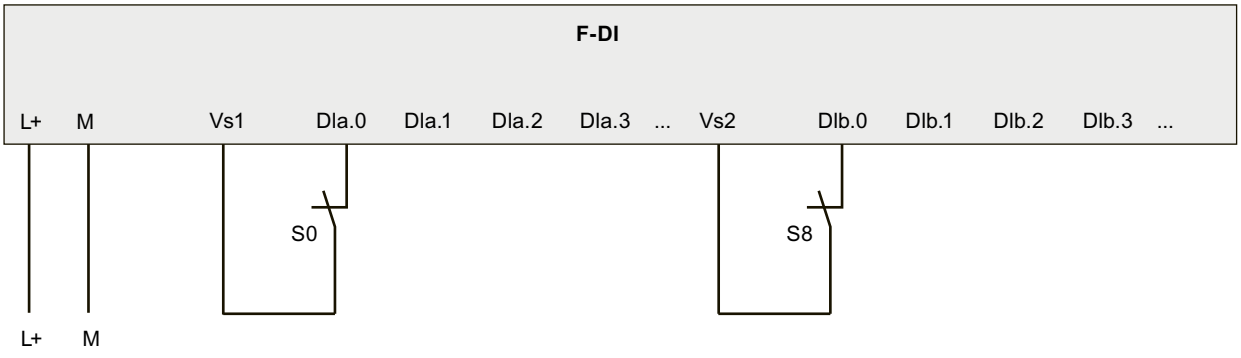

Figure 1-5 F-DI Application mode 5: Internal sensor supply

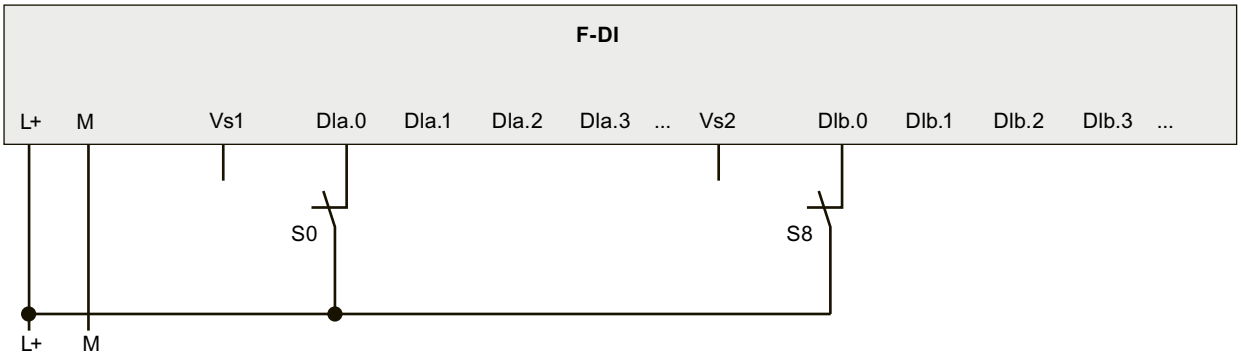

Figure 1-6 F-DI Application mode 6: External sensor supply

3.1.5 Applications 7 and 8: 1oo2 evaluation of 3-wire, non-equivalent sensor circuit

In non-equivalent mode, short-circuit testing can be enabled on a 3-wire circuit. The module expects that the logic "0" circuit will not change with the sensor dark test.

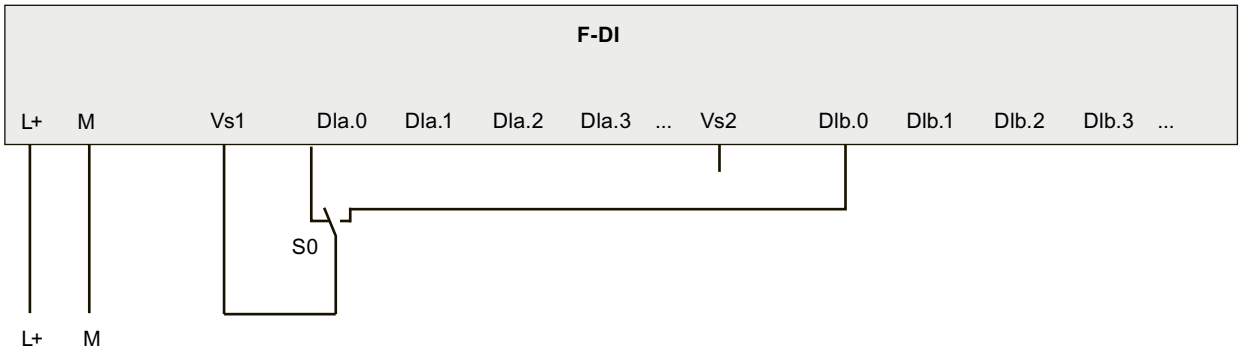

Figure 1-7 F-DI Application mode 7: Internal sensor supply

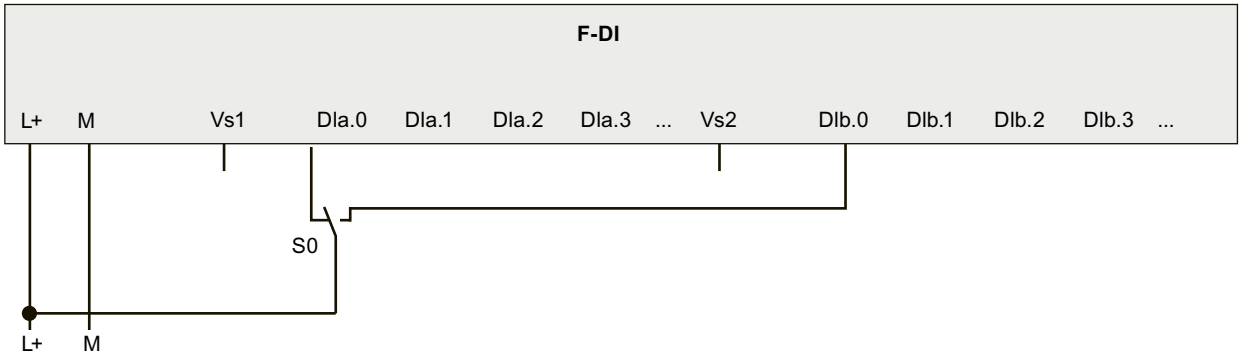

Figure 1-8 F-DI Application mode 8: External sensor supply

3.1.6 Applications 9 and 10: 1oo2 evaluation of 4-wire non-equivalent sensor circuit

S0 and S8 can be dual contacts of a single sensor.

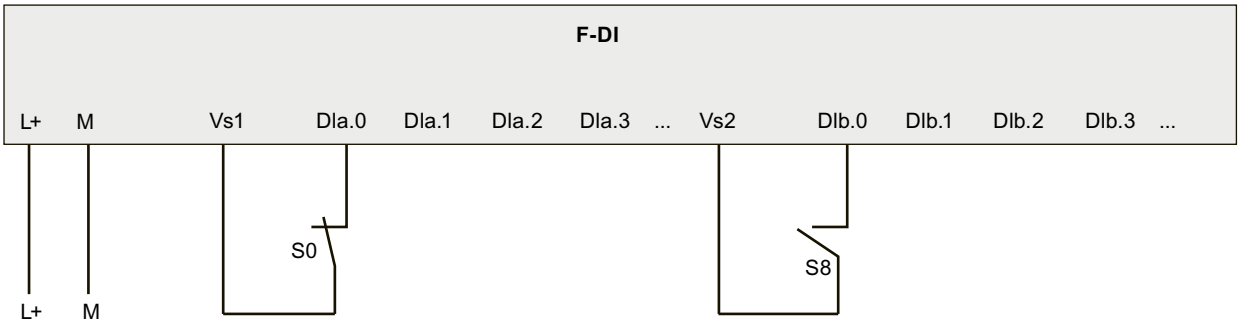

Figure 1-9 F-DI Application mode 9: Internal sensor supply

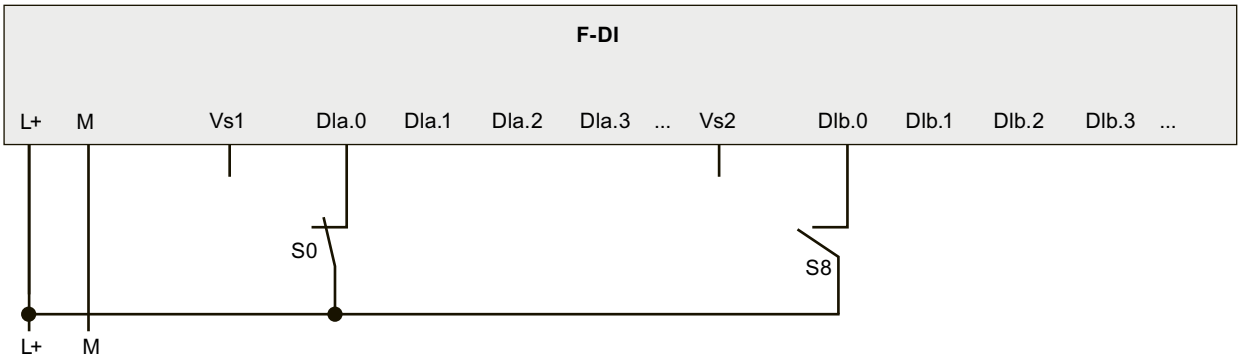

Figure 1-10 F-DI Application mode 10: External sensor supply

3.2 Digital output applications

You should consider the application modes presented here along with the features of the SM 1226 F-DQ 4 x 24 V DC and SM1226 F-DQ 2 x Relay as described in the overview. Refer to "SM 1226 F-DQ 4 x 24 V DC" (Page 23) and "SM 1226 F-DQ 2 x Relay" (Page 24).

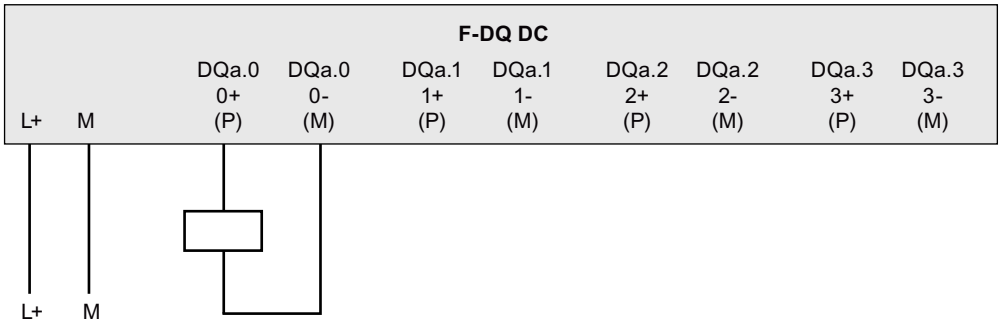
These are the main features to keep in mind for the SM1226 F-DQ 4 x 24 V DC:

- The F-DQ DC separately controls current flow in the P (24 V to load) and M (load to common) sides of the circuit.
- The voltage at P and M outputs is read back to confirm proper state.
- The P and M switches are regularly tested with short ON and OFF pulses to confirm control.
- You must configure readback times that allow the external voltage to respond but do not cause your load to physically respond.
- Internal current limiting as described in the data sheet may be sufficient in combination with your 24 V DC supply, but you must consider whether additional current limits or fuses are necessary. Refer to Appendix A.3.3.3: "Specifications" (Page 170) (SM1226 F-DQ 4 x 24 V DC).

These are the main features to keep in mind for the SM1226 F-DQ 2 x Relay:

- The F-RLY controls each circuit with two independently-controlled series contacts.
- The series contacts are sequenced to avoid welding as a common cause failure.
- All internal relays include mechanically-linked sense contacts with read back.
- You must configure a maximum ON time for each channel, effectively the time between tests that the channel can be turned OFF. For SIL 3 applications, this time must be 30 days or less.
- There are two complete circuits for each process channel.
- The two circuits on each channel must be the same voltage category: both SELV/PELV or both line voltage
- Each circuit must be protected by an external fuse as defined in the data sheet.

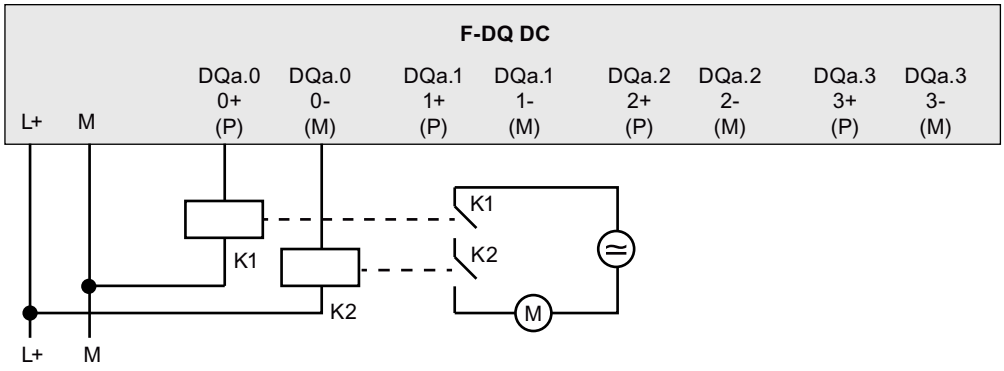
All output channels are controlled as 1oo2 with cross-diagnostics.



All applications shown are capable of reaching SIL 3/Category 4/PL e.

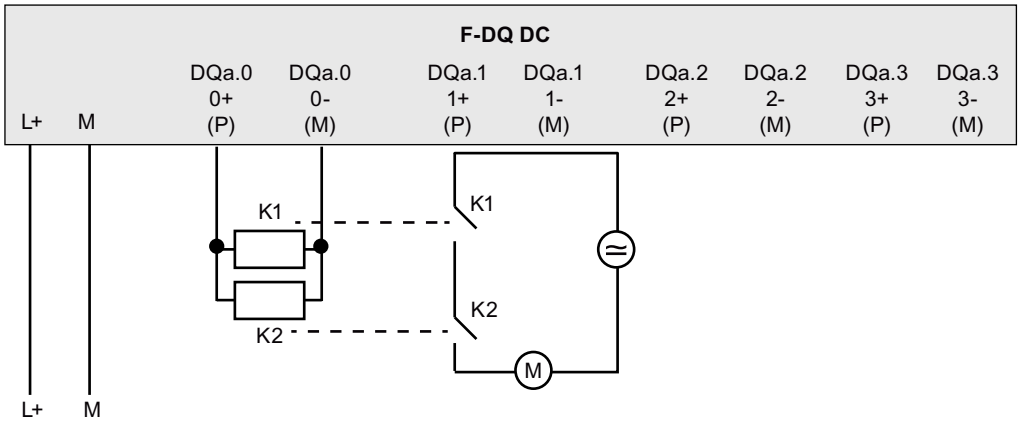
To reach Category 4, external contactors must be SIL-rated with sense contacts. You must read the sense contacts back and confirm the external contactor response in your program. Siemens recommends using an F-DI input for sense contact and other safety diagnostic inputs.

3.2.1 Selecting the digital output application

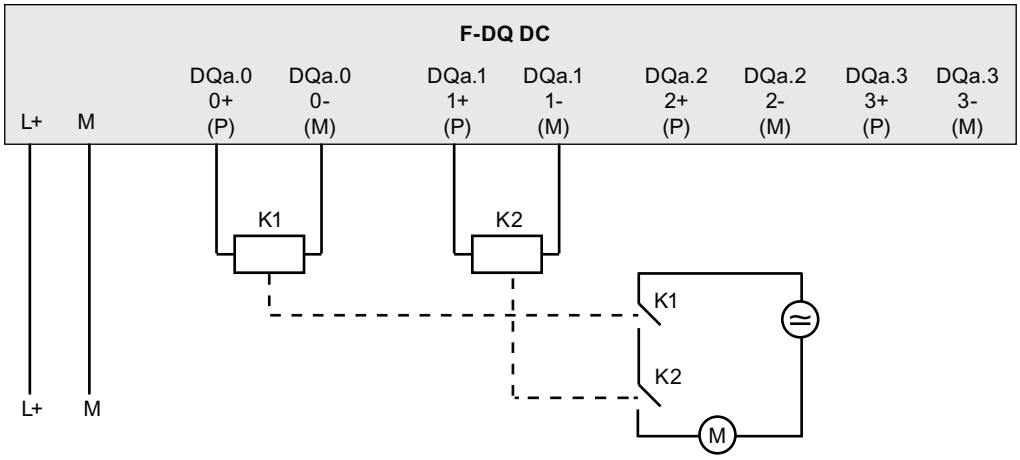


Application	Module	Description
1	DC	Directly-connected SIL-rated actuator
2	DC	External contactors: Separate P and M controlled contactors
3	DC	External contactors: Parallel connected between P and M
4	DC	External contactors: Separate output channels for each contactor
5	Relay	External contactors: Separate circuits of one output channel
6	Relay	Directly-connected SIL-rated actuator
7	Relay	Directly-connected SIL-rated actuator, switching both load conductors

3.2.2 Application 1: Wiring a directly-connected SIL-rated actuator

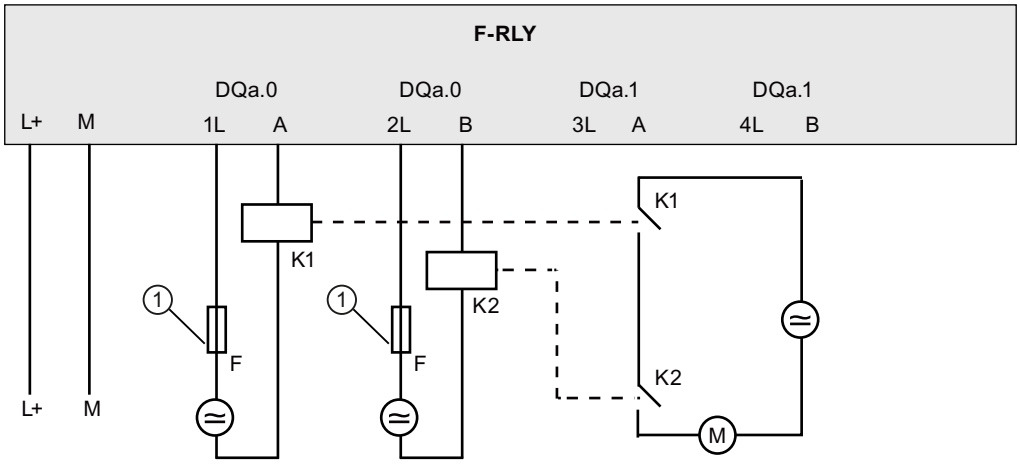


3.2.3 Application 2: Wiring external contactors: Separate P and M controlled contactors



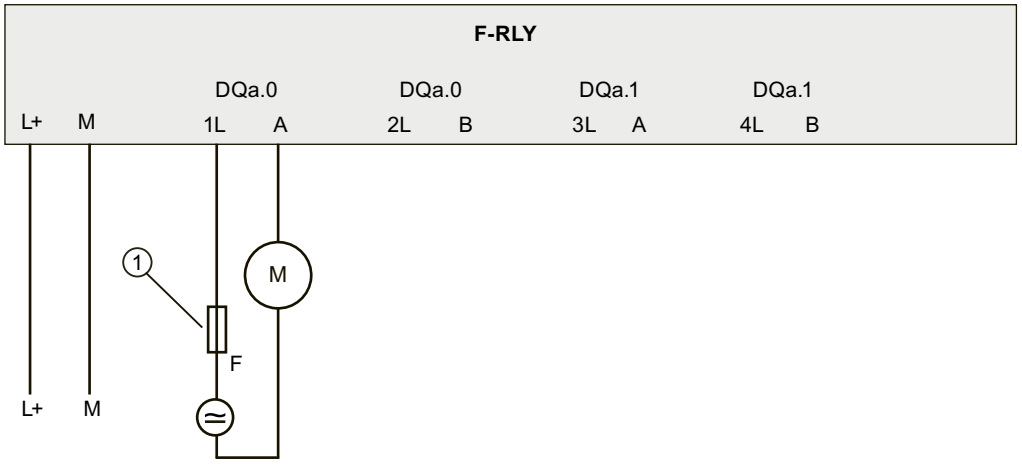
A short-circuit between the P and the M output can immediately lead to dangerous failure. You must prevent this failure mode by proper separation and protection of conductors.

3.2.4 Application 3: Wiring external contactors: Parallel connected between P and M



3.2.5 Application 4: Wiring external contactors: Separate P and M output channels for each contactor

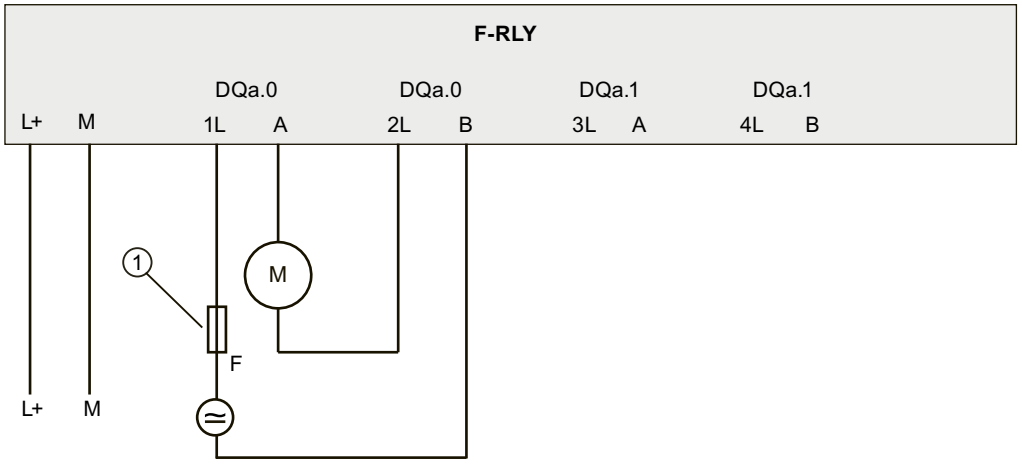
3.2.6 Application 5: Separate circuits of a relay channel controlling external contactors



Redundant external relays or contactors are controlled by independent electrical circuits that are switched as a single process variable channel.

① External fuse (Refer to F-DQ 2 x Relay "Specifications" (Page 176), "Digital outputs" table, "Short-circuit protection of output" for external fuse details.)

3.2.7 Application 6: Wiring a directly-connected SIL-rated actuator



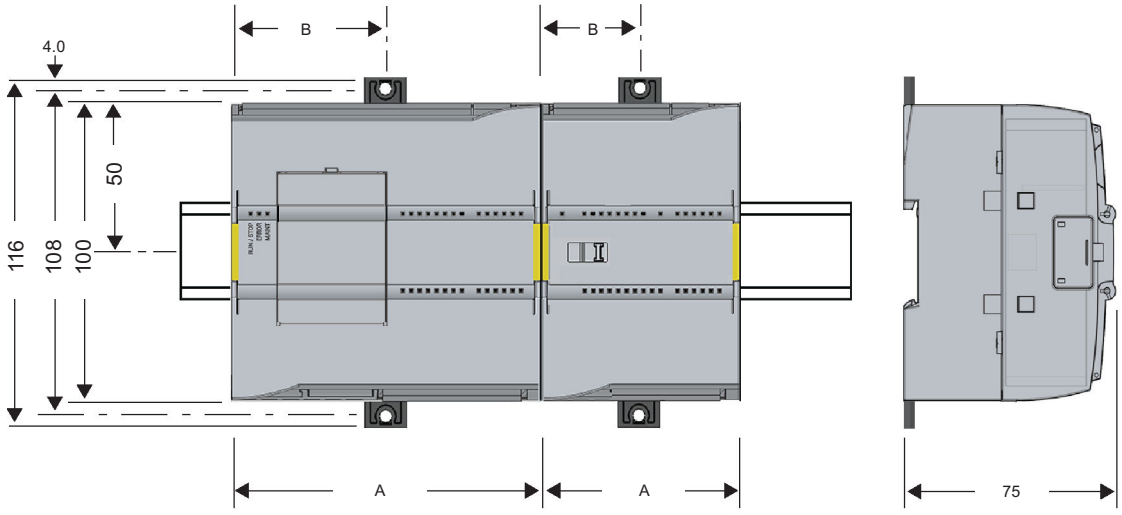
A short-circuit from 1L to A or equivalent fault can lead immediately to a dangerous failure. You must prevent this failure mode by proper separation and protection of conductors.

① External fuse (Refer to F-DQ 2 x Relay "Specifications" (Page 176), "Digital outputs" table, "Short-circuit protection of output" for external fuse details.)

3.2.8 Application 7: Wiring a directly-connected SIL-rated actuator, switching both load conductors

By switching both conductors to the load, this arrangement provides extra protection for faults to power or ground in the external wiring that might energize the load device.

① External fuse (Refer toF-DQ 2 x Relay "Specifications" (Page 176), "Digital outputs" table, "Short-circuit protection of output" for external fuse details.)



Fail-Safe CPU and signal module (SM) installation

4

4.1 S7-1200 Fail-Safe modules installation and removal

4.1.1 Mounting dimensions for S7-1200 Fail-Safe modules

CPU 1212FC, CPU 1214FC
(measurements in mm)

CPU 1215FC
(measurements in mm)

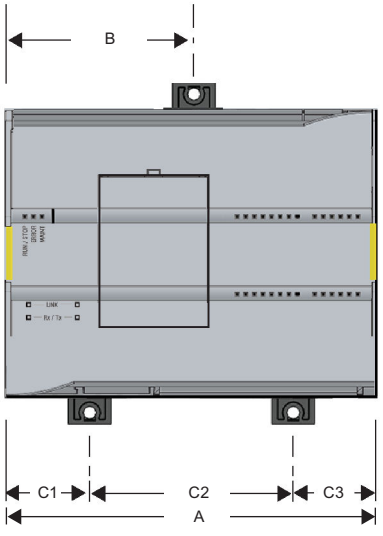


Table 1-3 Mounting dimensions (mm)

S7-1200 Fail-Safe devices		Width A (mm)	Width B (mm)	Width C (mm)
Fail-Safe CPU	CPU 1212FC	90	45	--
	CPU 1214FC	110	55	--
	CPU 1215FC	130	65 (top)	Bottom: C1: 32.5 C2: 65 C3: 32.5
Fail-Safe signal modules (SM)	SM 1226 F-DI 16 x 24 VDC SM 1226 F-DQ 4 x 24 VDC SM 1226 F-DQ 2 x Relay	70	35	--

Each fail-safe CPU and SM supports mounting on either a DIN rail or on a panel. Use the DIN rail clips on the module to secure the device on the rail. These clips also snap into an extended position to provide screw mounting positions to mount the unit directly on a panel. The interior dimension of the hole for the DIN clips on the device is 4.3 mm.

A 25 mm thermal zone must be provided above and below the unit for free air circulation.

4.1.2 Guidelines for installing S7-1200 Fail-Safe devices

The S7-1200 equipment is designed to be easy to install. You can install an S7-1200 either on a panel or on a standard rail. The S7-1200 assembly can be oriented either horizontally or vertically. The small size of the S7-1200 allows you to make efficient use of space.

Expansion module installation rules:

- Standard and fail-safe signal modules (SM) are installed on the right side of a CPU. Fail-safe CPUs allow a maximum of 8 signal modules, if the total of all expansion module CPU loads does not exceed the CPU's 5 V DC and 24 V DC power supply load limits. Fail-safe and standard modules may be intermixed on the right side of the CPU.
- Communication modules (CM) are installed on the left side of the CPU. Fail-safe CPU's allow a maximum of 3 communication modules, if the total of all expansion module loads does not exceed the CPU's 5 V DC and 24 V DC power load limits.
- Signal boards (SB), communications boards (CB), and battery boards (BB) are installed on top of the CPU. A maximum of 1 signal board, communication board, or battery board is allowed for any CPU.

The S7-1200 standard signal modules (SM), communication modules (CM), and signal boards (SB) can be used in the same system with fail-safe SMs to complete your application control functions that do not require a rated Safety Integrity Level (SIL). Standard SMs that are supported for use with fail-safe SMs have the MLFB numbers (6ES7--- ---32 0XB0).

The S7-1200 fail-safe CPUs support many of the PROFIBUS and PROFINET distributed fail-safe I/O. Refer to "Hardware and software components" (Page 15) for further information.

Electrical equipment standards classify the SIMATIC S7-1200 system as Open Equipment. You must install the S7-1200 in a housing, cabinet, or electric control room. You should limit entry to the housing, cabinet, or electric control room to authorized personnel.

The installation should provide a dry environment for the S7-1200. SELV/PELV circuits are considered to provide protection against electric shock in dry locations.

The installation should provide the appropriate mechanical strength, flammability protection, and stability protection that is approved for open equipment in your particular location category according to applicable electrical and building codes.

Conductive contamination due to dust, moisture, and airborne pollution can cause operational and electrical faults in the PLC.

If you locate the PLC in an area where conductive contamination may be present, the PLC must be protected by an enclosure with appropriate protection rating. IP54 is one rating that is generally used for electronic equipment enclosures in dirty environments and may be appropriate for your application.

⚠ WARNING

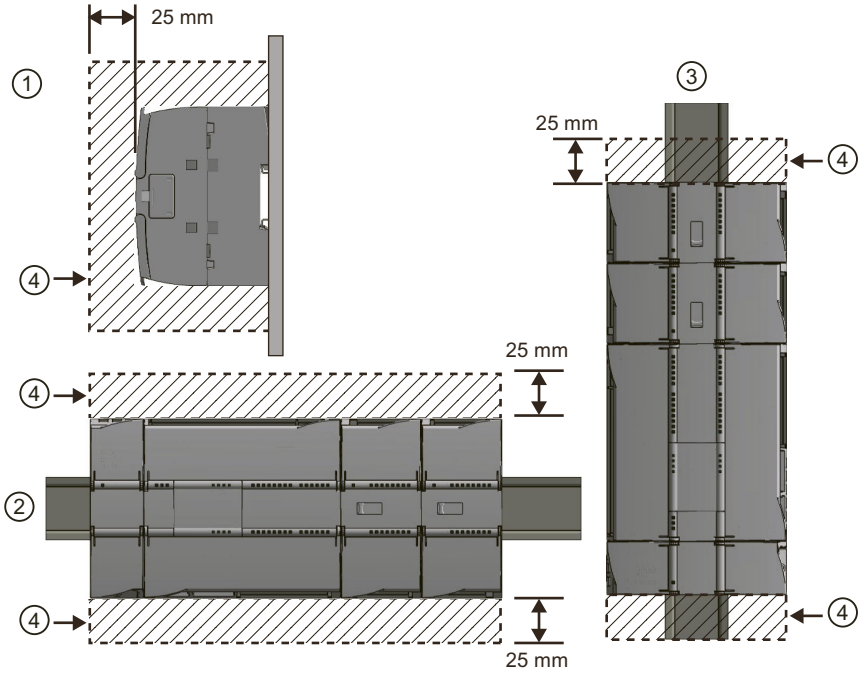
Improper installation of the S7-1200 can result in electrical faults or unexpected operation of machinery.
Electrical faults or unexpected machine operation can result in death, severe personal injury, and/or property damage.
All instructions for installation and maintenance of a proper operating environment must be followed to ensure the equipment operates safely.

Separate the S7-1200 devices from heat, high voltage, and electrical noise

As a general rule for laying out the devices of your system, always separate the devices that generate high voltage and high electrical noise from the low voltage, logic devices such as the S7-1200.

When designing the layout of an S7-1200 inside your panel, consider the heat generating devices and locate electronic devices in the cooler areas of your cabinet. Reducing the exposure to a high temperature environment extends the operating life of any electronic device.

Consider also the routing of the wiring for the devices in the panel. Do not place low voltage signal wires and communications cables in the same tray with AC power wiring and high energy, rapidly switched DC wiring.



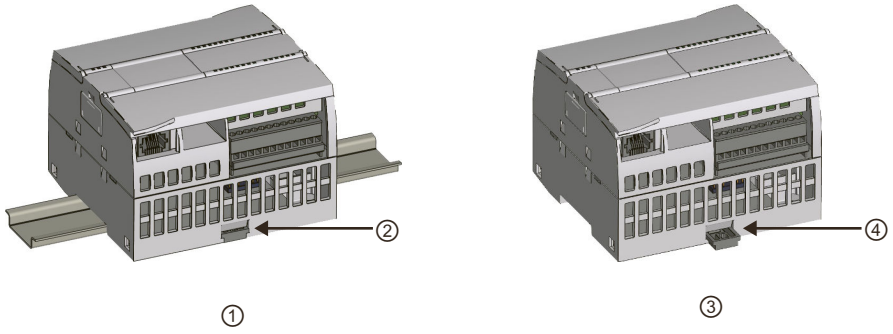
Provide adequate space for cooling and wiring

S7-1200 devices are designed for natural convection cooling. For proper cooling, you must provide a clearance of at least 25 mm above and below the devices. Also, allow at least 25 mm of space between the front of the modules and the inside of the enclosure.

⚠ CAUTION

For vertical mounting, the maximum allowable ambient temperature is reduced by 10 degrees C.
Orient a vertically mounted S7-1200 system as shown in the following figure.
Ensure that the S7-1200 system is mounted correctly.

When planning your layout for the S7-1200 system, allow enough clearance for the wiring and communications cable connections.



① Side view
② Horizontal installation
③ Vertical installation
④ Clearance area

4.1.3 Installation and removal safety rules

Installing and removing the S7-1200 devices

The CPU can be easily installed on a standard DIN rail or on a panel. DIN rail clips are provided to secure the device on the DIN rail. The clips also snap into an extended position to provide a screw mounting position for panel-mounting the unit.

① ③

① DIN rail installation
② DIN rail clip in latched position
③ Panel installation
④ Clip in extended position for panel mounting

Before you install or remove any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

⚠ WARNING

Installation or removal of S7-1200 or related equipment, with the power applied, could cause electric shock or unexpected operation of equipment.
Failure to disable all power to the S7-1200 and related equipment during installation or removal procedures could result in death, severe personal injury and property damage due to electric shock or unexpected equipment operation.
Always follow appropriate safety precautions and ensure that power to the S7-1200 is disabled before attempting to install or remove S7-1200 CPUs and related equipment.

Always ensure that whenever you replace or install an S7-1200 device you use the correct module or equivalent device.

⚠ WARNING

Incorrect installation of an S7-1200 module may cause the program in the S7-1200 to function unpredictably.
Failure to replace an S7-1200 device with the same model, orientation, or order could result in death, severe personal injury and property damage due to unexpected equipment operation.
Replace an S7-1200 device with the same model, and be sure to orient and position the module correctly.

⚠ WARNING

Do not disconnect equipment when a flammable or combustible atmosphere is present.
Disconnection of equipment when a flammable or combustible atmosphere is present may cause a fire or explosion which could result in death, serious injury and property damage.
Always follow appropriate safety precautions when a flammable or combustible atmosphere is present.

NOTE

Electrostatic discharge can damage the device or the receptacle on the CPU.
Make contact with a grounded conductive pad or wear a grounded wrist strap whenever you handle the device.

4.1.4 Installing and removing an S7-1200 FC CPU

You can install the CPU on a panel or on a DIN rail.

NOTE
Attach any communication modules to the CPU and install the assembly as a unit. Install signal modules separately after the CPU has been installed.

Set up the CPU rail clips:

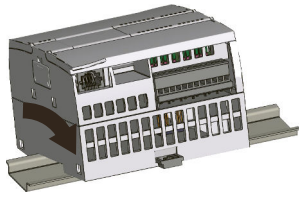
- **For DIN rail mounting**, make sure the upper DIN rail clip is in the latched (inner) position and lower DIN rail clip is in the unlatched (extended) position, for both CPU and attached CMs.
  - After installing the devices on the DIN rail, move the lower DIN rail clips to the latched position to lock the devices on the DIN rail.
- **For panel mounting**, make sure the DIN rail clips are pushed to the extended position.

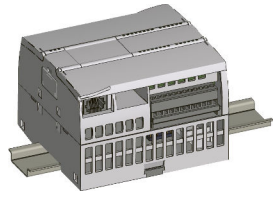
To install the CPU on a panel, follow these steps:

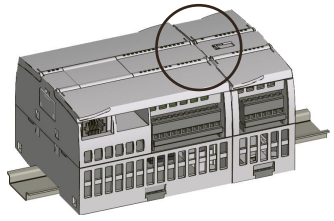
1. Locate, drill, and tap the mounting holes (M4), using the dimensions shown in the mounting dimensions table (Page 73).
2. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power.
3. Extend the mounting clips from the module. Make sure the DIN rail clips on the top and bottom of the CPU are in the extended position.
4. Secure the module to the panel, using a pan head M4 screw with spring and flat washer. Do not use a counter-sink screw with beveled head. Apply only enough torque to flatten the spring washer.

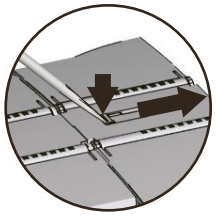
NOTE
If your system is subject to a high vibration environment or is mounted vertically, then panel mounting the S7-1200 is recommended.

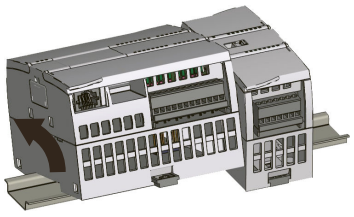
Table 1-4 Installing the CPU on a DIN rail











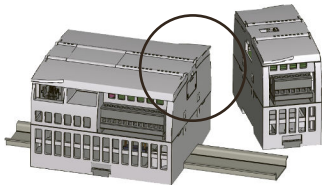
Task	Procedure
	1. Install the DIN rail. Secure the rail to the mounting panel every 75 mm. 2. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 3. Hook the CPU over the top of the DIN rail. 4. Pull out the DIN rail clip on the bottom of the CPU to allow the CPU to fit over the rail. 5. Rotate the CPU down into position on the rail. 6. Push in the clips to latch the CPU to the rail.
	

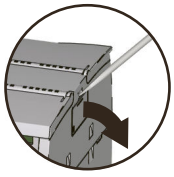
Table 1-5 Removing the CPU from a DIN rail

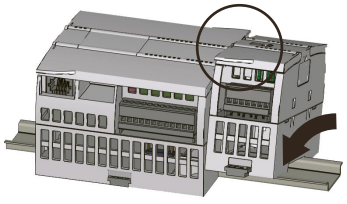
Task	Procedure
  	1. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 2. Disconnect the I/O connectors, wiring, and cables from the CPU. Refer to the terminal block removal instructions (Page 80). 3. Remove the CPU and any attached communication modules as a unit. All signal modules should remain installed. 4. If an SM is connected to the CPU, then retract the bus connector: – Place a screwdriver beside the tab on the top of the signal module. – Press down to disengage the connector from the CPU. – Slide the tab fully to the right. 5. Remove the CPU: – Pull out the DIN rail clip to release the CPU from the rail. – Rotate the CPU up and off the rail, and remove the CPU from the system.

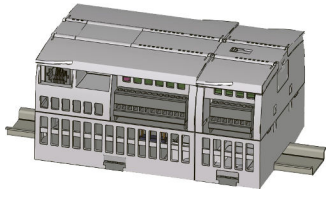
4.1.5 Installing and removing a signal module (SM)

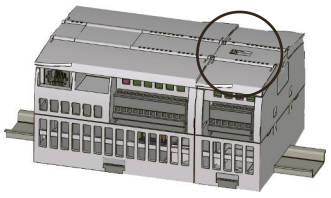
Table 1-6 Installing an SM

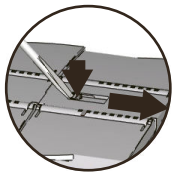


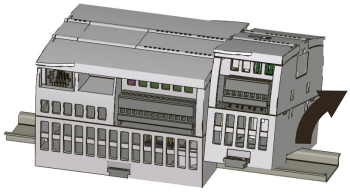












Task	Procedure	
		Install your SM after installing the CPU. 1. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 2. Remove the cover for the connector from the right side of the CPU. – Insert a screwdriver into the slot above the cover. – Gently pry the cover out at its top and remove the cover. Retain the cover for reuse.
	Connect the SM to the CPU: 1. Position the SM beside the CPU. 2. Hook the SM over the top of the DIN rail. 3. Pull out the bottom DIN rail clip to allow the SM to fit over the rail. 4. Rotate the SM down into position beside the CPU and push the bottom clip in to latch the SM onto the rail.	
		Extending the bus connector makes both mechanical and electrical connections for the SM. 1. Place a screwdriver beside the tab on the top of the SM. 2. Slide the tab fully to the left to extend the bus connector into the CPU. Follow the same procedure to install a signal module to another signal module.

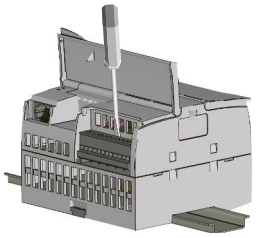
Table 1-7 Removing an SM

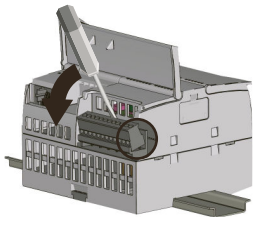
Task	Procedure
 	You can remove any SM without removing the CPU or other SMs in place. 1. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 2. Remove the I/O connectors and wiring from the SM. Refer to the terminal block removal instructions (Page 80). 3. Retract the bus connector. – Place a screwdriver beside the tab on the top of the SM. – Press down to disengage the connector from the CPU. – Slide the tab fully to the right. When another SM is connected on the right, repeat this procedure for that SM.
	Remove the SM: 1. Pull out the bottom DIN rail clip to release the SM from the rail. 2. Rotate the SM up and off the rail. Remove the SM from the system. 3. If required, cover the bus connector on the CPU to avoid contamination. Follow the same procedure to remove a signal module from a signal module.

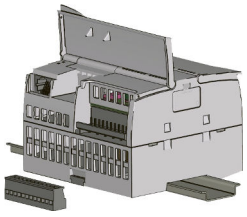
4.1.6 Removing and reinstalling the S7-1200 terminal block connector

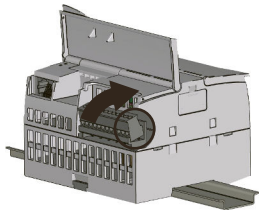
CPUs, signal boards (SB) and signal modules (SM) have removable connectors to make wiring easy.

Table 1-8 Removing terminal blocks (CPU example)









Task	Procedure
 	Prepare the system for terminal block connector removal by removing the power from the CPU and opening the cover above the connector. 1. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 2. Inspect the top of the connector and locate the slot for the tip of the screwdriver. 3. Insert a screwdriver into the slot. 4. Gently pry the top of the connector away from the CPU. The connector releases with a snap. 5. Grasp the connector and pull away from the CPU.

Table 1-9 Installing the connector

Task	Procedure
	Prepare the components for terminal block installation by removing power from the CPU and opening the cover for connector. 1. Ensure that the CPU and all S7-1200 equipment are disconnected from electrical power. 2. Align the connector with the pins on the unit. 3. Align the wiring edge of the connector inside the rim of the connector base. 4. Press firmly down and rotate until the connector snaps into place. Check carefully to ensure that the connector is properly aligned and fully engaged.
	

4.2 Fail-Safe system electrical design rules

4.2.1 Safe functional extra low voltage requirement (power supplies and other system components)

⚠ WARNING

Fail-safe modules must be operated with safe functional extra-low voltage (SELV, PELV) power sources.
To maintain safe S7-1200 low voltage circuits, external connections to communications ports, analog circuits, 24 V DC nominal power supplies, and I/O circuits must be powered from approved sources that meet the requirements of SELV, PELV, Class 2, Limited Voltage, or Limited Power according to various standards.
The external power supply should limit the maximum voltage to 35 V DC even under fault conditions. Please consult the manufacturer's data for the power supplies that you use.

Maximum applied voltage to S7-1200 Fail-Safe devices

- Operational voltage: The fail-safe CPU and fail-safe signal modules operational voltage is 20.4 V DC - 28.8 V DC, 35 V DC surge for 0.5 second. Operation of the unit to specifications is assured by design and testing. Defined transients from defined source impedances per EN 61000-4-2, 61000-4-4, 61000-4-6, as specified in the data sheet for each product, may be imposed on this voltage without disrupting operation or causing damage. Sustained operation in the range of 28.8 - 35 V DC can result in unacceptable temperature rise and thermal damage, causing the product to become inoperable.
- Absolute maximum rating regarding supply voltage: The absolute maximum rating to prevent module damage and to ensure the functional safety of the modules is 35 V DC. These power supplies must be specified by the manufacturer to limit the output voltage to 35 V DC or less under fault conditions. Otherwise, external protection must be supplied that will reliably open the circuit or limit the output voltage to less than 35 V DC to the CPU and signal modules.

- Surge immunity: Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. This protection must be sufficient to clamp surge voltages and/or open the supply circuit to assure the PLC system is not exposed to voltages greater than 35 V DC. One specification for evaluation of protection from lightning type surges is found in EN 61000-4-5, with operational limits established by EN 61000-6-2. S7-1200 DC fail-safe CPUs and fail-safe signal modules require external protection to maintain safe operation when subject to surge voltages defined by this standard. Refer to Appendix A.1.5.1: "Surge immunity (Page 123)" for further information.

Requirements for power supplies in the event of voltage interruption

To ensure adherence to IEC 61131-2 and NAMUR Recommendation NE 21, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirement in your product standards (for example, 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions. The latest information on PS components is available on the Internet.

⚠ WARNING

All power supply and fail-safe signal module circuits must be connected together to a common voltage reference or must be isolated SELV circuits.
The power supply M terminals on the fail-safe CPU and the fail-safe SMs must be connected together or isolated as SELV. Failure to do so can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
Connecting all M terminals together or isolating with approved SELV isolation prevents unwanted current flows in the event of a single fault in the CPU to SM isolation boundary.

4.2.2 Power budget

4.2.2.1 Connecting power to the S7-1200 system

Fail-safe CPUs require an external SELV/PELV 24 V DC power supply for the CPU's 24 V DC power input (the 24 V DC L+ and M terminals, with an **arrow pointing into** the CPU module). The external 24 V DC supply powers the CPU's internal 5 V DC supply that provides power for the CPU, signal modules (SM), signal board (SB), and communication modules (CM). 24 V DC power is available at the CPU's 24 V DC power output (the 24 V DC L+ and M terminals, with an **arrow pointing out of** the CPU module).

NOTE

Sensor supply connections for safety inputs
If you want to use a sensor supply source from the PLC for safety inputs, you should use the sensor supply provided on the fail-safe DI signal modules.

The purpose of a power budget calculation is to ensure that the power requirements of all CPU powered elements (fail-safe CPU, fail-safe SM, standard SM, and CM) do not exceed the available CPU power:

- You may not be able to connect the maximum number of signal modules and communication modules, if you exceed the CPU's 5 V DC power output capability.
- You may need to use external 24 V DC power for some system elements, if you exceed the CPU's 24 V DC power output capability.

NOTE

Power limits for 5 V DC and 24 V DC supplied from a fail-safe CPU.
Exceeding the power budget of the CPU may result in not being able to connect the allowed maximum number of add-on modules.

Refer to the technical specifications for information about power input requirements (CPUs, SMs, SBs, and CMs) and CPU power output limits (5 V DC and 24 V DC).

Refer to the "Calculating a power budget" (Page 84) to determine CPU power output capability.

Expansion module installation rules:

- Standard and fail-safe signal modules (SM) are installed on the right side of the CPU. Fail-safe CPUs allow a maximum of 8 signal modules, if the total of all add-on module CPU loads does not exceed the CPU's 5 V DC and 24 V DC power supply load limits. Fail-safe and standard modules may be intermixed on the right side of the CPU.
- Communication modules (CM), are installed on the left side of the CPU. A maximum of 3 communication modules is allowed for a Fail-safe CPU, if the total of all add-on module CPU loads does not exceed the CPU's 5 V DC and 24 V DC load limits.
- Signal boards (SB), communications boards (CB), and battery boards (BB) are installed on top of the CPU. A maximum of one signal board, communication board, or battery board is allowed for any CPU.

⚠ WARNING

Do not connect separate power supplies directly in parallel.
This can cause a conflict between the power supplies, as each supply tries to establish its preferred output voltage level.
The result of this conflict can be shortened lifetime or the immediate failure of one or both power supplies, with consequent unpredictable operation of the PLC system. Unpredictable operation could result in death, severe personal injury and property damage.
A CPU 24 V DC supply and any external power supply should provide power to different load points.

For improved electrical noise protection, the commons (M) of the different power supplies should be connected.

Some of the 24 V DC power inputs in an S7-1200 system are interconnected, with a common logic circuit connecting multiple M terminals. For example, the following circuits are interconnected when designated as "not isolated" in the technical specifications: the 24 V DC power supply of the CPU, the power input for the relay coil of an SM, or the power supply for a non-isolated analog input. All non-isolated M terminals must connect to the same external reference potential.

⚠ WARNING

Connecting non-isolated M terminals to different reference potentials will cause unintended current flows that may cause damage or unpredictable operation in the PLC and any connected equipment.
Failure to comply with this guideline could cause damage or unpredictable operation which could result in death or severe personal injury and property damage.
Always ensure that all non-isolated M terminals in an S7-1200 system are connected to the same reference potential.

4.2.2.2 Calculating a sample power requirement

CPU power budget calculation for example system

The following example shows the power requirements for a system that includes:

Quantity	Module	Module type
1	CPU 1214FC DC/DC/Relay	Fail-safe CPU with 14 standard (not fail-safe) digital inputs and 10 standard (not fail-safe) digital outputs
1	SB 1223 2 x 24 V DC Input/ 2 x 24 V DC Output	Standard I/O signal board with 2 digital inputs and 2 digital outputs
1	CM 1241 RS422/485	Communication module
1	SM 1226 F-DI 16 x 24 V DC	Fail-safe signal module with 16 digital inputs
1	SM 1226 F-DQ 4 x 24 V DC	Fail-safe signal module with 4 digital outputs
1	SM 1226 F-DQ 2 x Relay	Fail-safe signal module with 2 relay outputs
3	SM 1223 8 DC In/8 Relay Out	Standard signal module with 8 digital inputs and 8 relay outputs

This example system uses a total of 56 inputs and 42 outputs with a mix of standard and fail-safe I/O. If a digital input channel is disconnected and not used, then that input is excluded from the power calculation.

The current supply and consumption numbers are obtained from each module's technical specifications.

The example budget shows inadequate 24 V DC CPU power
An external 24 V DC power supply is necessary to supply a fail-safe CPU's L+ and M input terminals (with the arrow symbol pointing into the CPU). In the example, fail-safe SM 24 V DC loads are also connected to the external power supply. Other devices in your system may connect to the external 24 V DC supply. You must ensure that the external supply has sufficient power available. A total external power load calculation is not described in the example. The purpose of the example is to verify sufficient power is available for loads that are supplied directly from the CPU.

The fail-safe CPU in this example provides sufficient 5 V DC current for all add-on modules, but insufficient 24 V DC current for all of the standard digital inputs and outputs. The fail-safe

SMs connect to a 24 V DC external supply which moves their 24 V DC loads off of the CPU power budget calculation.

The example system requires 424 mA at 24 V DC from the fail-safe CPU, but the CPU can provide only 400 mA. This result requires moving at least 24 mA of the 24 V DC CPU load, to the external 24 V DC power supply. A solution would be to move the 24 V DC power connections for the 24 standard relay outputs, from the CPU to the external power supply. This action would reduce the CPU 24 V DC load by 264 mA.

NOTE

The power required to drive the fail-safe CPU's internal relay coils is already allocated. Do not include the internal relay power requirements in a power budget calculation.

Table 1-10 Sample power budget

	5 V DC distributed by internal bus when modules are installed	**24 V DC distributed by connection to fail-safe CPU terminals L+ and M, (identified by arrow pointing away from the fail-safe CPU)**	**24 V DC supplied by connection to external power supply (separate external supply power budget required)**
CPU 1214FC DC/DC/Relay maximum output current	1600 mA	400 mA	Obtain maximum current rating from the external power supply manufacturer
	Minus		
System components	**5 V DC CPU loads**	**24 V DC CPU loads**	**24 V DC external power supply loads**
CPU 1214FC, 14 X 24 V DC		14 standard inputs located on the CPU: 14 * 4 mA = 56 mA	
1 SB 1223, 2 X 24 V DC	50 mA	2 standard inputs located on a signal board: 2 * 4 mA = 8 mA	
1 CM 1241 RS422/485	220 mA		
1 SM 1226 F-DI 16 x 24 V DC	155 mA		Module plus 16 fail-safe inputs (8 paired channels): 130 mA + 16 * 6 mA = 226 mA
1 SM 1226 F-DQ 4X 24 V DC	125 mA		4 fail-safe digital outputs: 170 mA + load current for all 4 P-switches + Vs1/Vs2 load current
1 SM 1226 F-DQ 2 X relay	120 mA		2 fail-safe relay outputs: 300 mA
3 SM 1223 DI 8 x 24 V DC, DQ 8 x Relay	3 * 145 mA = 435 mA	24 standard digital inputs: 3 * 8 * 4 mA = 96 mA 24 standard relay outputs: 3 * 8 * 11 mA = 264 mA	
Total requirements	1105 mA	424 mA	
	Equals		
Current balance	**5 V DC CPU power**	**24 V DC CPU power**	**24 V DC external power**
Current balance total	495 mA	(24 mA)	

4.2.2.3 Calculating your power requirement

Form for calculating your power budget

Use the following table to determine how much power (current) is available from the fail-safe CPU and how much is needed by the central rack modules for your system. Refer to the technical specifications in this manual for the power ratings of your fail-safe CPU model (1212FC (Page 136), 1214FC (Page 145) ,or 1215FC (Page 155)) and the power requirements of the fail-safe digital input and output signal modules (SM 1226 F-DI 16 x 24 V DC (Page 166), SM 1226 F-DQ 4 x 24 V DC (Page 170), or SM 1226 F-DQ 2 x Relay (Page 176)). Refer to the technical specifications in the S7-1200 Programmable Controller System Manual (https://support.industry.siemens.com/cs/ww/en/view/109478121) for details about standard S7-1200 modules.

Table 1-11 CPU power budget

	5 V DC distributed by internal bus when modules are installed	**24 V DC distributed by connection to fail-safe CPU terminals L+ and M, (identified by arrow pointing away from the fail-safe CPU)**	**24 V DC supplied by connection to external power supply (separate external supply power budget required)**
		Minus

4.3 Control system wiring guidelines

4.3.1 Guidelines for grounding and wiring

Proper grounding and wiring of all electrical equipment is important to provide electrical noise protection for your application and the S7-1200. Refer to the technical specifications (Page 117) for the S7-1200 wiring diagrams.

Prerequisites

Before you ground or install wiring to any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

Ensure that you follow all applicable electrical codes when wiring the S7-1200 and related equipment. Install and operate all equipment according to all applicable national and local standards. Contact your local authorities to determine which codes and standards apply to your specific case.

⚠ WARNING

Installing or wiring the S7-1200 or related equipment with power applied could cause electric shock or unexpected operation of equipment.

Failure to disable all power to the S7-1200 and related equipment during installation or removal procedures could result in death, severe personal injury, and damage due to electric shock or unexpected equipment operation.

Always follow appropriate safety precautions and ensure that power to the S7-1200 is disabled before attempting to install or remove the S7-1200 or related equipment.

Always take safety into consideration as you design the grounding and wiring of your S7-1200 system. Electronic control devices, such as the S7-1200, can fail and cause unexpected operation of the equipment that is being controlled or monitored:

- On-board I/O on the fail-safe CPU and signal modules (SM) other than fail-safe SM: Single point dangerous failures of electronics or software can occur on these devices. You should never depend on these devices as the only protection against personal injury or unacceptable property damage.
- Fail-safe SM: Internal dangerous failures can occur on these devices with a probability as reflected in the SIL rating, PFD, and PFH as stated in this manual.
- Each control's installation: Common cause failure threats can occur such as overvoltage, over-temperature, electrical faults, EMC interference, and fire, water, or mechanical damage to the installation.

You must evaluate every control point for the threat level and consequences of failure. Your installation can require safeguards that are independent of the S7-1200 to achieve an appropriate level of risk for personal injury or equipment damage.

⚠ WARNING

Control devices can fail in an unsafe condition, resulting in unexpected operation of controlled equipment.
Such unexpected operations could result in death, severe personal injury, and property damage.
When using fail-safe I/O, design safety-related control functions to account for the probability of faults, including redundancy to achieve an appropriate level of risk for the consequences of failure.
When using standard I/O, always include an emergency stop function, electromechanical overrides, or other redundant safeguards when a failure could cause personal injury or significant property damage.

4.3.2 Grounding an S7-1200 system

Guidelines for grounding the S7-1200

The best way to ground your application is to ensure that all the common and ground connections of your S7-1200 and related equipment are grounded to a single point. This single point should be connected directly to the earth ground for your system.

All ground wires should be as short as possible and should use a large wire size, such as 2 mm^2 (14 AWG).

When locating grounds, consider safety-grounding requirements and the proper operation of protective interrupting devices.

4.3.3 Wiring an S7-1200 system

Guidelines for wiring the S7-1200 system

When designing the wiring for your S7-1200, provide a single disconnect switch that simultaneously removes power from the fail-safe CPU power supply, from all input circuits, and from all output circuits. Provide over-current protection, such as a fuse or circuit breaker, to limit fault currents on supply wiring. Consider providing additional protection by placing a fuse or other current limit in each output circuit.

Install appropriate surge suppression devices for any wiring that could be subject to lightning surges.

Do not place low voltage signal wires and communications cables in the same wire tray with AC wires and high energy, rapidly switched DC wires. Always route wires in pairs, with the neutral or common wire paired with the hot or signal-carrying wire.

NOTE

The standard I/O channels integrated in the S7-1200 fail-safe CPUs are not designed to be used for the fail-safe I/O function

In your project, you can use the integrated fail-safe CPU I/O with standard code blocks, but you must use the S7-1200 fail-safe DI and DQ signal modules as the fail-safe digital I/O channels with safety code blocks.

Use the shortest wire possible and ensure that the wire is sized properly to carry the required current. Refer to the "Wiring Rules for S7-1200 CPUs, SMs, and SBs" table below for further information.

Wire and cable should have a temperature rating 30 °C higher than the ambient temperature around the S7-1200 (for example, a minimum of 85 °C-rated conductors for 55 °C ambient temperature). You should determine other wiring type and material requirements from the specific electrical circuit ratings and your installation environment.

Use shielded wires for optimum protection against electrical noise. Typically, grounding the shield at the S7-1200 gives the best results. You should ground communication cable shields to S7-1200 communication connector shells using connectors that engage the cable shield, or by bonding the communication cable shields to a separate ground. You should ground other cable shields using clamps or copper tape around the shield to provide a high surface area connection to the grounding point.

When wiring input circuits that are powered by an external power supply, include an overcurrent protection device in that circuit. External protection is not necessary for circuits that are powered by the 24 V DC sensor supply from the S7-1200 because the sensor supply is already current-limited.

All S7-1200 modules have removable connectors for user wiring. To prevent loose connections, ensure that the connector is seated securely and that the wire is installed securely into the connector.

To help prevent unwanted current flows in your installation, the S7-1200 provides isolation boundaries at certain points. When you plan the wiring for your system, you should consider these isolation boundaries. Refer to the technical specifications (Page 117) for the amount of isolation provided and the location of the isolation boundaries. Circuits rated for AC line voltage include safety isolation to other circuits. Isolation boundaries between 24 V DC circuits are functional only, and you should not depend on these boundaries for safety.

A summary of wiring rules for the S7-1200 CPUs and SMs is shown below:

Table 1-12 Wiring rules for S7-1200 CPUs, SMs, and SBs

Wiring rules for...	CPU and SM connector	SB connector
Connectible conductor cross-sections for standard wires	2 mm^2 to 0.3 mm^2 (14 AWG to 22 AWG)	1.3 mm^2 to 0.3 mm^2 (16 AWG to 22 AWG)
Number of wires per connection	1 or combination of 2 wires up to 2 mm^2 (total)	1 or combination of 2 wires up to 1.3 mm^2 (total)
Wire strip length	6.4 mm	6.4 mm
Tightening torque* (maximum)	0.56 N-m (5 inch-pounds)	0.33 N-m (3 inch-pounds)
Tool	2.5 to 3.0 mm flathead screwdriver	2.0 to 2.5 mm flathead screwdriver

* To avoid damaging the connector, be careful that you do not over-tighten the screws.

NOTE

Ferrules or end sleeves on stranded conductors reduce the risk of stray strands causing short circuits. Ferrules longer than the recommended strip length should include an insulating collar such that the uninsulated portion of the ferrule is no longer than the maximum wire strip length. Cross-sectional area limits for bare conductors also apply to ferrules.

4.3.4 Guidelines for lamp loads

Guidelines for lamp loads

Lamp loads are damaging to relay contacts because of the high turn-on surge current. This surge current is 10 to 15 times the steady state current for a tungsten filament lamp. A replaceable interposing relay or surge limiter is recommended for lamp loads that are switched a large number of times during the lifetime of the application.

4.3.5 Guidelines for inductive loads

Guidelines for inductive loads

Use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off. Suppressor circuits protect your outputs from premature failure caused by the high voltage transient that occurs when current flow through an inductive load is interrupted.

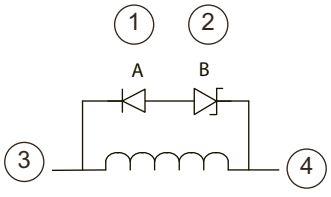
In addition, suppressor circuits limit the electrical noise generated when switching inductive loads. High frequency noise from poorly suppressed inductive loads can disrupt the operation of the PLC. Placing an external suppressor circuit so that it is electrically across the load and physically located near the load is the most effective way to reduce electrical noise.

S7-1200 DC outputs include internal suppressor circuits that are adequate for inductive loads in most applications. Since S7-1200 relay output contacts can be used to switch either a DC or an AC load, internal protection is not provided.

A good suppressor solution is to use contactors and other inductive loads for which the manufacturer provides suppressor circuits integrated in the load device, or as an optional accessory. However, some manufacturer provided suppressor circuits may be inadequate for

your application. An additional suppressor circuit may be necessary for optimal noise reduction and contact life.

For AC loads, a metal oxide varistor (MOV) or other voltage clamping device may be used with a parallel RC circuit, but is not as effective when used alone. An MOV suppressor with no parallel RC circuit often results in significant high frequency noise up to the clamp voltage.



A well-controlled turn-off transient will have a ring frequency of no more than 10KHz, with less than 1KHz preferred. Peak voltage for AC lines should be within +/- 1200 V of ground. The data sheets list voltage thresholds for the internal suppression circuits on DC outputs. (Refer to Appendix A: "Technical specifications" for further information.) External suppression should limit the transient to less than this threshold to ensure that the internal suppression circuit does not attempt to suppress an excessive load.

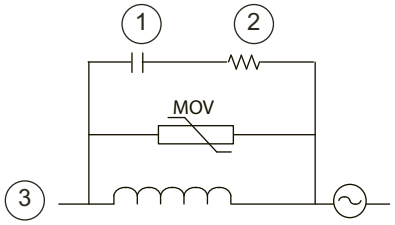
An external suppression circuit connected directly across the load also avoids the hazard of energizing the load if suppression circuit components fail short.

NOTE

The effectiveness of a suppressor circuit depends on the application and must be verified for your particular usage. Ensure that all components are correctly rated and use an oscilloscope to observe the turn-off transient.

Typical suppressor circuit for DC or relay outputs that switch DC inductive loads

① 1N4001 diode or equivalent



② 8.2 V Zener (DC outputs), 36 V Zener (Relay outputs)

③ Output channel F-DQ (P-switch) or standard DQ output

④ Output channel F-DQ (M-switch) or standard DQ common return

In most applications, the addition of a diode (A) across a DC inductive load is suitable, but if your application requires faster turn-off times, then the addition of a Zener diode (B) is recommended. Be sure to size your Zener diode properly for the amount of current in your output circuit.

Typical suppressor circuit for relay outputs that switch AC inductive loads

Ensure that the working voltage of the MOV is at least 20% greater than the nominal line voltage.

Choose pulse-rated, non-inductive resistors, and capacitors recommended for pulse applications (typically metal film). Verify the components meet

① See table for C value
② See table for R value
③ Output channel

average power, peak power, and peak voltage requirements.

If you design your own suppressor circuit, the following table suggests resistor and capacitor values for a range of AC loads. These values are based on calculations with ideal component parameters. "I rms" in the table refers to the steady-state current of the load when fully ON.

Table 1-13 AC suppressor circuit resistor and capacitor values

Inductive load			Suppressor values		
I rms	**230 V AC**	**120 V AC**	**Resistor**		**Capacitor**
Amps	VA	VA	Ω	W (power rating)	nF
.02	4.6	2.4	15000	.1	15
.05	11.5	6	5600	.25	47
.1	23	12	2700	.5	100
.2	46	24	1500	1	150
0.5	115	60	560	2.5	470
1	230	120	270	5	1000
2	460	240	150	10	1500

[2] **Conditions satisfied by the table values:**
Maximum turn-off transition step < 500 V
Resistor peak voltage < 500 V
Capacitor peak voltage < 1250 V
Suppressor current < 8% of load current (50 Hz)
Suppressor current < 11% of load current (60 Hz)
Capacitor dV/dt < 2 V/µs
Capacitor pulse dissipation : ∫(dv/dt) dt < 10000 V^2/µs
Resonant frequency < 300 Hz
Resistor power for 2Hz max switching frequency
Power factor of 0.3 assumed for typical inductive load

4.4 Maintenance guidelines

Each S7-1200 module and CPU is a factory-assembled unit that contains no user replaceable components or repairable components, except for removable terminal blocks and memory cards. Maintenance of an S7-1200 system consists of the following:

- Observation and response to diagnostic reports from the S7-1200
- Replacement of modules with identified failures
- Replacement of modules at 20 years of operating life
- Inspection and monitoring of the installation environment to ensure continued adherence to all specified operating conditions, to include the following:
  - S7-1200 and field wiring electrically and mechanically secure
  - Ventilation continued as designed for installation
  - Continued protection from moisture, dust, and conductive contamination
  - Voltage of connected circuits in proper range
  - Operating temperature of equipment in proper range

The fail-safe signal modules (SMs) monitor the 24 V DC power supplied at L+ and passivate the module on voltage out-of-range.

The fail-safe SMs monitor internal temperature and passivate the SM on temperature out-of-range.

You must assess your installation safety and determine if you require additional voltage and temperature monitoring.

NOTE

Associated equipment including sensors, actuators, circuit breakers, and surge protectors are subject to wear and typically require periodic inspections or proof tests according to manufacturer's instructions or standards to maintain a consistent level of safety integrity.

User cleaning or decontamination of an S7-1200:

- Only use vacuum or a dry cloth applied to the outside of the assembly.
- Turn the power off before cleaning.

NOTICE
Do not use high pressure forced air or wet/liquid cleaners for user cleaning or decontamination of an S7-1200. High pressure forced air can damage components or carry entrained contaminants. Wet/liquid cleaners of any kind can deposit conductive contamination onto the circuit boards.

Fail-Safe signal module (SM) I/O configuration 5

All connected fail-safe SM I/O must have their operating properties configured by the STEP 7 Safety configuration software. You have the responsibility to ensure that no unconfigured SMs are connected in a fail-safe automation system.

5.1 Configuring fail-safe SM I/O properties

To configure fail-safe SM I/O properties, follow these steps:

1. Select "Device configuration" in the project tree.
2. Place fail-safe I/O devices into your project's "Device view".

NOTE

The fail-safe SM's each use both I's and Q's, even though they may physically only have input channels or only have output channels. The extra bytes carry safety status and data integrity information.

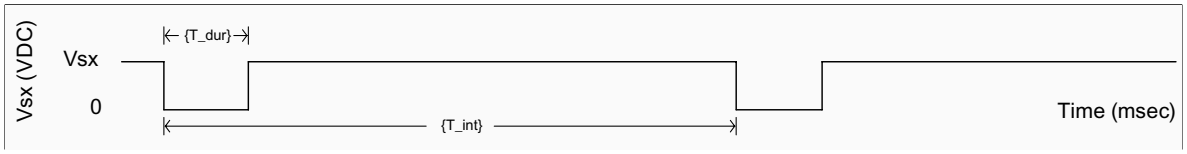
Module	Number of channels	Input (I) bytes required	Output (Q) bytes required
SM 1226 F-DI 16 x 24 V DC	8 - 16 (input)	9	5
SM 1226 F-DQ 4 x 24 V DC	4 (output)	6	6
SM 1226 F-DQ 2 x Relay	2 (output)	6	6

3. Select the image of a fail-safe I/O device (on the Device view or Device overview) and view the module's "Properties" tab.
4. On the **"Properties"** view, select the **"General"** tab.
5. Click on the module properties tree and expand the branches for an I/O module. You can select a module (for example, "F-DI16") and see all the properties. You can also select a module branch (for example, "F-parameters", "DI-parameters", or "Channel parameters") and see a subset of the properties.
6. Select a property in the left-side property tree and then set values in the right-side property fields.
7. A successful compile and download of your hardware configuration to an S7-1200 fail-safe CPU automatically puts your new configuration settings in the I/O modules.

5.2 Configuring common F-parameters

Table 1-14 Common F-parameters

F-parameters	Description	Default	Options
Manual assignment of F-monitoring time	You must select the check box to change F-monitoring time from the central value propagated by the fail-safe CPU.	Check box deselected	Check box: • Selected • Deselected
F-monitoring time [1]	Watchdog timer monitoring safety-related communication between the fail-safe CPU and fail-safe SM (PROFIsafe monitoring time)	150 ms	1 to 65535 ms
F-source address	Unique network-wide address for the fail-safe CPU	1	You can configure the F-source address using the fail-safe CPU parameter "Basis for PROFIsafe addresses".
F-destination address	CPU-wide unique address (usually in descending order, starting with 65534).	-	1 to 65534
Behavior after channel fault	Response by the fail-safe SM to channel faults such as a short-circuit, overload, or discrepancy error.	Passivate channel	Not configurable in the fail-safe SM
Reintegration after channel fault (not available for the SM 1226 F-DQ 2 x Relay)	You have two methods, manual and automatic, to reintegrate your fail-safe SM channels after a channel fault. You can choose to reintegrate in one of three ways: • All channels automatically (no acknowledgement necessary for reintegration) • All channels manually (acknowledgement necessary for reintegration) • Adjustable (channel-by-channel; some channels automatically reintegrated and some channels manually reintegrated)	Adjustable	• Adjustable • All channels automatically • All channels manually



[1] You set the "Default F-monitoring time for central F-IO" in the F-parameters of the fail-safe CPU. STEP 7 uses this number to set the F-monitoring time in each fail-safe SM unless you select the check box for "Manual Assignment of F-monitoring time" in that module configuration and assign a different time.

Refer to the SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for further F-parameter information.

5.3 Configuring SM 1226 F-DI 16 x 24 V DC DI and channel parameters

Table 1-15 SM 1226 F-DI 16 x 24 V DC DI parameters

DI parameters	Description	Default	Options
Short-circuit test	This test creates short duration OFF pulses on the sensor power supplies. Input circuits powered by Vs1 and Vs2 are expected to be OFF during the sensor OFF time. Failure to detect OFF when a sensor supply is OFF indicates a short-circuit to a power source or another fault that prevents the input from properly detecting a "0". Input channels which fail this test are passivated. During the test, the reported process value will not change, so the configured "Duration of short-circuit test" increases the response time. An actual process "0" occurring near the beginning of a test will not be reported to the user program until after the "Duration of short-circuit test" time has elapsed. The check box must be selected to activate the short-circuit test.	Check box deselected	Check box: • Selected • Deselected
Interval for short-circuit test (see T_int in figure below)	This value is the time between the OFF pulses of the sensor supply. Refer to the figure below for further information. Note: The interval must be a minimum of eight times the duration.	25.6 ms	• 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms
Duration of short-circuit test (see T_dur in figure below)	This value is the time that the power supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs. Refer to the figure below for further information. Note: The interval must be a minimum of eight times the duration.	1.6 ms	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms

Vsx Vs1 or Vs2 sensor supplies (VDC)

T_int Short-circuit test interval (time period) between the OFF pulses of the sensor supply

T_dur Short-circuit test OFF pulse time duration (msec)

Table 1-16 SM 1226 F-DI 16 x 24 V DC channel parameters

Channel parameters	Description	Default	Options
Activated	Select the check box to activate the channel. You must activate both required channels before selecting 1oo2. If channels are paired, you must change to 1oo1 and change individually. Deselect the check box and the unused channel is deactivated. If you deactivate a channel, you also deactivate its diagnostic function.	Check box selected	Check box: • Selected • Deselected
Input filters	Digital inputs are filtered to remove contact bounce and short duration noise. This parameter assigns the duration of the filter time.	6.4 ms	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms
Channel failure acknowledge	Controls whether the channel is automatically reintegrated after a fault clears, or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults" (Page 102) for the reintegration procedure.	Manual	• Automatic • Manual
Sensor supply	Assign whether 24 V power is supplied to sensors from a sensor supply output of the module (internal) or from an external power supply (external). Short-circuit tests are not performed for any channel where external power is selected.	External	• Internal • External
Sensor evaluation	Assigns whether channel x input operates individually or is paired with channel x+8 input. **1oo1 evaluation:** One sensor is connected to the module on a single channel. **1oo2 evaluation:** Two input channels are occupied by either: • Two 1-channel sensors • One 2-channel equivalent sensor • One 2-channel non-equivalent sensor If 1oo2 is selected, you must assign the digital input connection type and discrepancy properties.	1oo1 evaluation	• 1oo1 evaluation • 1oo2 evaluation
Type sensor connection	**1 channel**: One sensor is connected to one channel. For "1oo1 evaluation", the type of sensor connection is set read only to "1 channel". **2 channel equivalent** (with equivalent signals): One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair. **2 channel - 3 wire non-equivalent**: One two-channel non-equivalent sensor is connected to the two channels, in a channel pair. **2 channel - 4 wire non-equivalent** One two-channel non-equivalent sensor or two single-channel non-equivalent sensors are connected to the two channels, in a channel pair. Note: Refer to "Digital input applications" (Page 64) for illustrations of connection modes.	1 channel	• 1 channel • 2 channel equivalent • 2 channel - 3 wire non-equivalent • 2 channel - 4 wire non-equivalent

Channel parameters	Description	Default	Options
Discrepancy behavior	A logical difference between the two signals of a 1oo2 input configuration is allowed, without error, for the configured discrepancy time. You can choose whether the reported process value should be "0" or the last valid value during the configured discrepancy time while the signals do not match. If a logical difference in 1oo2 inputs persists for more than the configured discrepancy time, the channel will be passivated and the process value set to 0.	Supply value 0	• Supply value 0 • Supply last valid value
Discrepancy time	The two signals in a 1oo2 input configuration will not change exactly at the same time, due to differences in sensors, contacts, and wiring. The discrepancy time parameter allows you to configure a normally expected duration for a mismatch between signals during transition.	10 ms	5 to 30000 ms
Reintegration after discrepancy error	Assigns whether a zero state must be detected on both 1oo2 channels before a previously declared discrepancy can be cleared.	Test 0-signal not necessary	• Test 0-signal not necessary • Test 0-signal necessary Note: The test 0-signal must be applied for at least 100 ms.

NOTE

Safety program access to 1oo2 input data

For 1oo2 evaluation, two paired input channels (for example, F-DI a0.0 and F-DI b0.0) are connected to one or two sensors. The F-DI performs the discrepancy analysis and sends the result to the safety program, **at the input address of the low-numbered channel** (F-DI a0.0, in the example).

Sensor-actuator response time is increased when you add more input discrepancy time

The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0", but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0' and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides reliable normal operation. Refer to "Response time parameters for the SM 1226 F-DI 16 x 24 VDC" (Page 186) for further information.

Discrepancy time variation with short circuit test

If your process input changes near a short-circuit test, a discrepancy is detected in less time than your configured discrepancy time.

With:

Tdisc = configured discrepancy time

Tsct = configured short circuit test duration

Tfilter = configured input filter time

Tda = actual discrepancy time, time between process signal changes that can be detected as a fault

The range of detected discrepancy time is:

If Tfilter < Tsct: {Tdisc - (Tfilter + Tsct)} <= Tda <= Tdisc

If Tfilter >= Tsct: {Tdisc - (2 x Tsct)} <= Tda <= Tdisc

Your configured discrepancy time should account for this variation to avoid unexpected passivations.

5.4 Configuring SM 1226 F-DQ 4 x 24 V DC DQ and channel parameters

Table 1-17 SM 1226 F-DQ 4 x 24 V DC DQ parameters

DQ parameters	Description	Default	Options
Maximum test period	Assign the time interval between bit pattern tests for F-DQ DC output faults. Functional test bit patterns are applied to the output switches. These tests detect faulted P- or M- output switches and wiring faults that are detectable at the module terminals. Short circuits to other signals or power rails can be detected. Open circuits between the wiring terminals and the load are not detected. If an error is detected on a channel, the test interval is shortened to approx. 1 min. If an error is no longer detected, the configured test interval is used again. A persistent fault is reported to the fail-safe CPU and the affected channels are passivated.	1000 s	• 100 s • 1000 s

Table 1-18 SM 1226 F-DQ 4 x 24 V DC channel parameters

Channel parameters	Description	Default	Options
Activated	Select the check box to activate the channel. Deselect the check box and the unused channel is deactivated. If you deactivate a channel, you also deactivate its diagnostic function.	Check box selected	Check box: • Selected • Deselected
Channel failure acknowledge	Controls whether the channel is automatically reintegrated after a fault clears, or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults" (Page 102) for the reintegration procedure.	Manual	• Automatic • Manual
Maximum readback time	The maximum readback time is a user-configured parameter that assigns the maximum time allowed for an output to reach the new state (ON or OFF) due to a process value change without generating an error. Also, this is the maximum width of a diagnostic test pulse applied to verify that an output can be turned OFF while it is ON. The time of the OFF pulse should be as long as possible, but short enough so that the actuator cannot react.	2.0 ms	1 ms to 400 ms, in 0.1 ms increments
Maximum readback time switch on test	The maximum readback time switch on test is a user-configured parameter that assigns the maximum time for which the P-switch or the M-switch of a channel that is currently in OFF state can be switched ON during a bit pattern	1.0 ms	0.5 ms to 5 ms, in 0.1 ms increments

Channel parameters	Description	Default	Options
	test step. The F-DQ DC tests the P- and M-switches on a channel such that only one switch is turned on at a time. Unless there is a fault in the system (for example, actuator shorted to ground), the actuator is not energized during either the P- or M-switch on tests. Under single fault conditions (either internal or external to the SM), test pulses applied to either the P- or the M-switch of channels in the OFF state can repeatedly energize the actuator. You must select the parameter so that the duration of such pulses is too short to cause the actuator to react and, therefore, cannot have a hazardous effect on the equipment under control.		

⚠ WARNING

In the presence of a single fault, the bit pattern tests can apply energy to the load for a duration up to the configured "Maximum readback time switch on test".
If the load can respond dangerously within the configured readback time, it can respond to bit pattern tests in the presence of a single fault, resulting in death or serious injury to personnel and/or property damage.
Always choose a maximum readback configuration time that is guaranteed not to activate the load.

5.5 Configuring SM 1226 F-DQ 2 x Relay DQ and channel parameters

Table 1-19 SM 1226 F-DQ 2 x Relay DQ parameters

DQ parameters	Description	Default	Options
Relay continuous on time limit	Maximum number of days that the relay can remain continuously on before automatic passivation. Whenever the relay cycles from the de-energized to energized state, the number-of-days calculation begins again. Note: The 30-day default is the maximum test frequency for SIL 3/Category 4 applications. You can extend the test frequency for SIL 2/Category 3 applications for this product to as much as 366 days.	30	1 to 366 days

Table 1-20 SM 1226 F-DQ 2 x Relay channel parameters

Channel parameters	Description	Default	Options
Activated	Select the check box to activate the channel. Deselect the check box and the unused channel is deactivated. If you deactivate a channel, you also deactivate its diagnostic function.	Check box selected	Check box: • Selected • Deselected
Channel failure acknowledge	Controls whether the channel is automatically reintegrated after a fault clears, or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults" (Page 102) for the reintegration procedure.	Manual	Not configurable

Fail-Safe signal module (SM) diagnostics 6

6.1 Reactions to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe signal modules (SM). This applies to both sensors and actuators.

The safety function requires that safe state values be applied to the fail-safe signal module (SM) or channel(s) instead of process values (passivation of the fail-safe SM or channel(s)) in the following situations:

- When the fail-safe system is started up
- If SM module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe SM through the PROFIsafe safety protocol (communication error)
- If SM channel faults occur (for example, short-circuit and discrepancy errors)

The fail-safe CPU enters detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-Safe SMs do not remember errors upon power cycle. When the system is powered down and then restarted, any faults still existing are detected again.

Fail-Safe value for fail-safe signal modules

If channels are passivated in fail-safe DI SMs, the fail-safe system always provides safe state values ("0") for the safety program instead of the process values applied to the fail-safe inputs.

If channels are passivated in the F-DQ DC or F-RLY, the fail-safe system always transfers safe state values "0" to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized.

The passivation safe state value and the output state value in CPU STOP mode are always "0", de-energized. You cannot select or program a default "ON" state for passivation or STOP mode.

Passivation is applied to individual channels when a channel-specific diagnostic failure is detected. Failures that can affect the entire module result in passivation of all channels.

Time-out of the PROFIsafe message (F-monitoring time exceeded) passivates all module channels.

Table 1-21 Signal module type and passivation result

Signal module type	Passivation result
SM 1226 F-DI 16 x 24 V DC	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective inputs. • If a channel fault occurs for a 1oo1 configuration, only the affected channel is passivated. For a 1oo2, the channel group of two inputs in the 1oo2 configuration are passivated.
SM 1226 F-DQ 4 x 24 V DC	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective outputs. • Diagnostic evaluations are performed separately for each of the two switches of a channel. Failure detection for one switch leads to passivation of the channel.
SM 1226 F-DQ 2 x Relay	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective outputs. • Diagnostic evaluations are performed separately for each of the two relays of a channel. Failure detection for one relay leads to passivation of the channel.

Response to faults in the fail-safe system

You should prepare maintenance procedures for your system to assure that return to operation after a detected fault is controlled and documented.

The following steps must be performed:

1. Diagnosis and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Reintegration of a fail-safe signal module

A channel or module can be reintegrated after successful diagnostics determine that a fault has cleared.

You can configure reintegration as automatic or manual. You can make this selection on a per channel or module basis in the Device Configuration. Communication errors must always be manually acknowledged.

Channels that you select to be automatically reintegrated are immediately reintegrated when the fault has cleared.

Channels that you select to be manually reintegrated can be acknowledged in your program after the fault has cleared.

The "ACK_REQ" bit for that module goes true to signal that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Some fatal diagnostic errors require a power cycle with successful diagnostics to reintegrate.

Reintegration after high stress events

High temperature, high voltage, and excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Relays and solid state switch outputs can be damaged by high currents prior to protective device activations. The PFD and PFH reliability calculations assume the fail-safe SM is operated within its specified operating parameters. When an SM has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future dangerous failure may be increased.

⚠ WARNING

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics.
Reintegration of a faulty system can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
After any reported fault, the steps outlined in this chapter and in safety standards applicable to your system should be followed to assure that the fault is completely understood and corrected before reintegration.

For an exact list of faults for the SMs, refer to "Fault types, causes, and corrective measures" (Page 110).

At reintegration, the following occurs:

- For a fail-safe DI SM, the process values pending at the fail-safe inputs are provided for the safety program.
- For a fail-safe DQ SM, the output values provided in the safety program are again transferred to the fail-safe outputs.

Safety repair time

The repair time used for PFH and PFD calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. You should respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

Deactivated fail-safe I/O is not being diagnosed, and is subject to dangerous failure without warning.

If any channel passivation persists for 100 hours, the entire module is passivated and can only be recovered through power cycle.

If a repair within 100 hours is not possible, passivated fail-safe outputs should be taken out of service by physically disconnecting or opening circuits so that faults in the fail-safe SM cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs must be removed from any operating CPU Safety program logic that can result in activation of a safety function output.

Do not depend on channel or module passivation to maintain safe state for more than 100 hours.

Do not depend on deactivation or unconfiguration to maintain safe state in any circumstances.

Additional information on passivation and reintegration

For further information about fail-safe SM access, refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

6.2 Fault diagnostics

Diagnostics detect faults that can affect the integrity of safety-related I/O. The faults can be in the fail-safe SM, communication with the CPU, or external circuits. Diagnostic information is assigned either to a single channel or to the entire fail-safe SM.

Most diagnostics operate without user selection. You can configure the following diagnostic options:

- Short-circuit testing using the digital input sensor supply can be enabled. The interval and duration of short-circuit tests is configurable.
- The read-back times for 24 V DC digital outputs is configurable.
- The time-out intervals for failures in the safety communication or failure of a safety program to run is configurable.

  Refer to "Fail-Safe signal module (SM) I/O configuration" (Page 94) for a complete description of these options.

The safety-critical and validated action of the diagnostics is to passivate I/O when faults are detected. The reporting of status and diagnostic results through the LED displays and diagnostic messages is subject to single point failures in electronics or software. These reports are offered as maintenance and debugging aids, but must be observed and interpreted with caution.

In the presence of single faults, any or all LED indications can be wrong. You should not rely solely on the presence or absence of red or green LED indicators to make safety decisions.

In the presence of single faults, diagnostic messages may fail to be delivered, or the numerical event ID or text message can be wrong. You should not rely solely on the presence, absence, or content of diagnostic reports to make safety decisions.

⚠ WARNING

Diagnostic and status reports through LEDs and text messages are subject to single point failure errors.

Reliance on such reported information to determine that a system or I/O point is in a safely controlled state can result in death, severe personal injury, or property damage.

If the integrity of your fail-safe system is in doubt, you should use additional measures such as restricted access or power removal to control hazards during maintenance and debug activities.

6.2.1 Diagnostics performed at start-up

Each fail-safe SM executes self-diagnostics at power-up to assure that the electronics and software meet testable expectations before allowing the SM to participate in process control. If tests are not successful, the SM passivates individual channels or all channels.

In addition to internal tests, some tests create signal changes at the terminals.

The SM 1226 F-DQ 4 x 24 VDC executes tests of the P and M switches as defined by your configured parameters for "Maximum readback time" and "Maximum readback time switch on test" after receiving configuration parameters from the fail-safe CPU at power-up. P and M switch ON tests are sequenced so that normally or in the presence of a single detected fault there is no complete PM circuit to energize the load.

The SM 1226 F-DI 16 x 24 VDC executes tests of the sensor supply at power up, including ON and OFF pulses, whether or not you have enabled the sensor supply or short-circuit testing in your configuration. If your configuration includes short-circuit testing, the F-DI also executes a short-circuit test according to your configured parameters after receiving the parameters from the fail-safe CPU at power-up.

The SM 1226 F-DQ 2 x Relay executes tests of the relay coil control and the sense contact read circuit, but limits ON time of relay coil test pulses to much less than the normal pull-in time of the relay. In the absence of faults, the test does not close contacts of any relay. Relay coil tests are sequenced so that in the presence of a single detected fault no more than one of two series relay contacts closes and there is no energy supplied to the load.

6.2.2 Diagnostics by LED display

The fail-safe SMs have the following types of LEDs:

- **Module DIAG LED:**
  - Dual color (green / red) LED indicates the operating state and fault status of the module.
  - Only a single DIAG LED on each fail-safe SM
  - The DIAG LED is green ON if no fault is present and the fail-safe SM is configured.
  - The DIAG LED is flashing green if no fault is present and the fail-safe SM is not configured.
  - The DIAG LED is flashing red as soon as a diagnostic function is triggered by the fail-safe SM.
  - The DIAG LED alternates between flashing red and green when a reintegratable module fault has been cleared, but not yet acknowledged.
  - The DIAG LED continues to flash red when a reintegratable channel fault has been cleared, but not yet acknowledged.
  - The DIAG LED is green ON when all faults have been eliminated and acknowledged.
- **Input/Output Status LED**:
  - Green LED for each input shows the input/output state during normal operation**.**
- **Input/Output Fault LED**:
  - Red LED for each input/output indicates a channel error. If any channel error is present, the DIAG LED is flashing red.
  - The input/output LEDs alternate between flashing red and green when a reintegratable channel fault has been cleared, but not yet acknowledged.

SM 1226 F-DI 16 x 24 V DC

Table 1-22 Module DIAG and 1oo1 input channel LEDs

Description	DIAG LED	Input	
		Fault LED	Status LED
LED color	Green / red	Red	Green
I/O bus power off	○ Off	○ Off	○ Off
Module hardware fault [1]	✶ Flashing red	● On	○ Off
PROFIsafe error	✶ Flashing red	Unaffected	Unaffected
Inconsistent firmware versions between Bus-ASIC and F-µCs	✶ Flashing red	✶ Flashing	○ Off
24 V DC module supply voltage off	✶ Flashing red	○ Off	○ Off
24 V DC module supply voltage too high / too low	✶ Flashing red	● On	○ Off
Sensor supply fault: For inputs affected by the fault	✶ Flashing red	● On	○ Off
Sensor supply fault: For inputs not affected by the fault	✶ Flashing red	Unaffected	○ Input state 0

6.2.3 Fault types, causes, and corrective measures

The "Fault types, causes, and corrective measures" table below lists the messages of the S7-1200 fail-safe SMs. These messages are displayed in the TIA Portal under "Online & diagnostics" > "Diagnostics" > "Diagnostic buffer". When you highlight an individual text line in the diagnostic buffer, the Event ID for that text item is displayed, along with module identity and location that generated the message. You may need to expand the window to see all information.

Table 1-26 Fault types, causes, and corrective measures

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
0x0001	Short-circuit	SM 1226 F-DQ 4 x 24 V DC	A channel problem has been detected where either the P terminal or M terminal is at an unexpected potential.	Short-circuit of the output	Eliminate the short-circuit.
				Short-circuit between channels with different signals	Eliminate the short-circuit.

1 Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

2 Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
0x0001	Short-circuit	SM 1226 F-DQ 4 x 24 V DC	A channel problem has been detected where either the P terminal or M terminal is at an unexpected potential.	Output overload	Eliminate the overload.
				"Maximum readback time switch on test" value is configured too small	Increase "Maximum readback time switch on test" if permissible.
				Short-circuit of output to M	Eliminate the short-circuit.
				Defective output driver	Replace the fail-safe signal module (SM).
0x0005	Overtemperature	All	• Overtemperature at microcomputer • Overtemperature at I/O	Shutdown due to violation of high temperature limit value in the module case	Check the ambient temperature. Once the fault has been eliminated, the power must be switched off and on.
0x004D	PROFIsafe communication error (CRC)	All	Transmission error in data message frame: Data inconsistent (CRC (cyclic redundancy check) error)	Communication interference between the fail-safe CPU and the fail-safe signal module (SM) (for example, due to electromagnetic interference in excess of limits or sign-of-life monitoring error)	• Check the communications connection. • Eliminate the interference.
0x004E	PROFIsafe communication failure (timeout)	All	Monitoring time exceeded for data message frame (timeout)	F-monitoring time exceeded	• Adjust F-monitoring time. • Check Safety program and all other CPU activities for excessive execution or demands: – Interrupts – Ethernet communication – OB scheduling conflicts – Long program paths.
0x0100	Module is defective	All	Internal error	Fail-Safe SM is defective.	Replace the fail-safe SM. [2]
0x0103	Watchdog tripped	All	The watchdog timer in the SM communications processor timed out.	Fail-Safe SM is defective.	Replace the fail-safe SM.
0x0105	Short-circuit to L+	SM 1226 F-DQ 4	The fail-safe SM	Short-circuit to L+	Eliminate the short-circuit.

[1] Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

[2] Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
	Short-circuit to L+	x 24 V DC	detects a channel problem where the P-terminal is unexpectedly at L+ potential.	Short-circuit between channels with different signals	Eliminate the short-circuit.
				Defective output driver	Replace the fail-safe SM.
				"Maximum readback time" value is configured too small.	Increase readback time.
0x0106	Short-circuit to ground	SM 1226 F-DQ 4 x 24 V DC	The fail-safe SM detects a channel problem where the M-switch output terminal is unexpectedly at M potential.	Short-circuit of output to M, ground, or another channel.	Eliminate the short-circuit.
				Defective output driver	Replace the fail-safe SM.
				"Maximum readback time" value is configured too small.	Increase readback time.
0x0300	Discrepancy failure, channel state 0/0	SM 1226 F-DI 16 x 24 V DC	External discrepancy failure: Channel state 0/0 with 1oo2 non-equivalent configuration	• Process signal faulty, sensor may be defective. • Configured discrepancy time too short • Short-circuit • Sensor mechanical activation or alignment out of tolerance	• Check process signal, replace sensor if necessary. • Check the configured discrepancy time. • Check the wiring. • Check that both sensors are mounted and aligned to be activated together.
0x0301	Discrepancy failure, channel state 0/1	SM 1226 F-DI 16 x 24 V DC	External discrepancy failure: Channel state 0/1 with 1oo2 equivalent configuration		
0x0302	Discrepancy failure, channel state 1/0	SM 1226 F-DI 16 x 24 V DC	External discrepancy failure: Channel state 1/0 with 1oo2 equivalent configuration		
0x0303	Discrepancy failure, channel state 1/1	SM 1226 F-DI 16 x 24 V DC	External discrepancy failure: Channel state 1/1 with 1oo2 non-equivalent configuration		
0x0306	Internal sensor supply short-circuit to P	SM 1226 F-DI 16 x 24 V DC	SM provided sensor supply voltage shorted to P	Sensor supply shorted to P	• Eliminate the short-circuit. • Once the fault is eliminated, the power must be switched off and on.

[1] Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

[2] Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
0x0306	Internal sensor supply short-circuit to P	SM 1226 F-DI 16 x 24 V DC	SM provided sensor supply voltage shorted to P	Short-circuit test duration configured too short	Increase short-circuit test duration.
				Failed sensor supply	Replace the fail-safe SM.
0x0307	Overload or internal sensor supply shorted to ground	SM 1226 F-DI 16 x 24 V DC	Internal sensor supply voltage shorted to M, ground, or excessive load on sensor supply	Short-circuit	• Eliminate the short-circuit. • Once the fault has been eliminated, the power must be switched off and on.
				Excessive load on sensor supply	Reduce load on sensor supply.
				Failed sensor supply	Replace the fail-safe SM.
0x030B	Channel failure acknowledgement	All	Channel configured for manual acknowledgement is ready to reintegrate	Manual acknowledgement required	Manually acknowledge correction of channel fault so that reintegration can occur.
0x0311	Frequency too high	SM 1226 F-DQ 4 x 24 V DC SM 1226 F-DQ 2 x Relay	Switching frequency exceeded; readback not in time	Process value from safety program changing too rapidly for SM to follow	• Change Safety program logic to guarantee more time between output changes.
0x0312	Undertemperature	All	• Undertemperature at microcomputers • Undertemperature at I/O	Shutdown due to violation of low temperature limit value in the SM case	• Check the ambient temperature. • Once the fault has been eliminated, the power must be switched off and on.
0x0313	Failure in the input circuit	SM 1226 F-DI 16 x 24 V DC	Internal fault at the read circuit/test circuit	The input SM detects a failure during bit pattern testing of inputs. EMI or SM hardware fault.	• If intermittant, probably due to interference. Eliminate interference. • If persistent, or repeats after efforts to eliminate interference, replace the fail-safe SM.
0x0316	Relay cannot be turned on	SM 1226 F-DQ 2 x Relay	Relay activated, but remains deactivated	Relay is faulty. SM supply voltage too low.	• Check for supply voltage warning messages and supply voltage. • Replace the fail-safe SM.

1 Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

2 Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
0x0317	Relay cannot be turned off (contacts welded)	SM 1226 F-DQ 2 x Relay	Relay deactivated, but remains activated (Relay contact is welded)	Relay is faulty, due to normal wear, excessive load, or unsuppressed inductive load.	• Replace the fail-safe SM. • Check that load current, including inrush, is within specifications. • Check for adequate inductive load suppression and capacitive load inrush limiting. • Check for circuit faults creating excessive load.
0x031C	Input shorted to P	SM 1226 F-DI 16 x 24 V DC	Input shorted to P failure	External wiring or sensor shorts input signal to L+.	Check/correct external short-circuit.
				Input configured for short-circuit detection but wired to external L+	Make wiring and configuration agree.
				Input defective	Replace the fail-safe SM.
0x031D	Output defective	SM 1226 F-DQ 2 x Relay	Relay coil driver defective	Relay or relay driver faulty	Replace the fail-safe SM.
0x031E	Read back failure	SM 1226 F-DQ 4 x 24 V DC	The SM has detected a channel problem where the expected terminal voltage(s) are not reached.	"Maximum readback time" or "Maximum readback time switch on test" configured value is too small.	Increase readback time.
				Output switch failure	Replace the fail-safe SM if output does not respond.
		SM 1226 F-DQ 2 x Relay	Relay state does not agree with commanded value.	Relay faulty	Replace the fail-safe SM.
0x0320	Overload	SM 1226 F-DQ 4 x 24 V DC	Over load condition at the output driver that leads to passivation of the channel	Over load at output	Eliminate over load.

[1] Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

[2] Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Event ID	Diagnostic message	Fail-safe signal module	Description	Possible causes	Corrective measures [1]
0x0321	Supply voltage too high	All	Supply voltage maximum exceeded.	Supply voltage is set too high.	Adjust supply voltage.
0x0322	Supply voltage too low	All	Supply voltage minimum exceeded.	Supply voltage is set too low.	Adjust supply voltage.
0x032C	Failsafe error (0x032C)	SM 1226 F-DQ 2 x Relay	Maximum relay switch on time exceeded.	Safety program did not switch the relay within the configured "Relay continuous on time limit".	• Include in the safety program and process operations an opportunity to turn the relay "OFF" briefly, to allow the module to confirm that the relay is still under control. • Increase the "Relay continuous on time limit'. This value cannot exceed 30 days for SIL 3 applications.

1 Once the fault is eliminated, the fail-safe signal module must be reintegrated (returned to normal state) from passivation into the safety program.

2 Repeated external error conditions coming and going more rapidly than the system can process can lead to a module fatal error and a reported Event ID: 0x0100. One example is a rapidly changing 1oo2 input signal with repeated discrepancy errors. If the F-DI detects and reports errors coming and going more rapidly than the fail-safe CPU can process, the F-DI enters a fatal error state rather than continue to operate with unreported errors. Event ID: 0x0100 should be interpreted in view of other diagnostic reports which may suggest other corrective actions, including parameter adjustments, correction of external control system faults (within 100 hours), and suppression of electromagnetic interference. You must perform a power cycle of the module to recover from a fatal error as reported by Event ID: 0x0100 and some other Event IDs. Diagnostics performed at start-up provide a high level of assurance that any sustained fault is recognized again before process control is resumed.

Electromagnetic interference and diagnostic reports

Electromagnetic interference can cause communication errors, disturb external and internal signal measurements, and cause processing errors. When error reports do not apparently relate to an identifiable device failure, wiring problem, programming or configuration error, consider sources of electromagnetic interference and installation and wiring problems that might introduce electromagnetic interference in your installation. Typical problem sources include poor suppression of inductive loads and voltage dips due to excessive load in-rush currents.

Technical specifications

A

A.1 General technical specifications

A.1.1 Standards compliance

The S7-1200 Fail-Safe automation system design conforms to the following standards and test specifications. The test criteria for the S7-1200 automation system are based on these standards and test specifications.

Not all S7-1200 models may be certified to these standards, and certification status may change without notification. It is the user's responsibility to determine applicable certifications by referring to the ratings marked on the product. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

Siemens products will generally be in accordance with the latest released standards as of the time of product release. For European Norm (EN) standards, the effective version will be in accordance with listings in the official journal of the European Union. Product certifications including the CE declaration of conformity and certificates from listing agencies cite the exact standards applicable to each certification.

A.1.2 Fail-Safe standards and approvals

All S7-1200 fail-safe CPUs and fail-safe signal modules (SM) are certified by TÜV. The fail-safe CPUs and signal modules are certified to the IEC 61508, EN ISO 13849, and IEC 62061 standards and guidelines for functional safety. For further information, refer to the current Annex 1 of the report for the TÜV certifificate from the Internet.

TÜV certificates (http://support.automation.siemens.com/WW/view/en/49368678/134200)

A.1.3 PROFIsafe compatibility

- PROFIsafe address type 2
- Supports the RIOforFA-Safety profile

A.1.4 Standards and approvals

A.1.4.1 General certifications

CE approval

The S7-1200 Automation System satisfies requirements and safety related objectives according to the EC directives listed below, and conforms to the harmonized European standards (EN) for the programmable controllers listed in the Official Journals of the European Union.

- 2014/35/EU "Electrical equipment designed for use within certain voltage limits" (Low-Voltage Directive)
- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (Explosion Protection Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
- 2006/42/EC "Machinery Directive" for S7-1200 safety components (fail-safe modules)

NOTE

Not all S7-1200 products are suitable for potentially explosive atmosphere locations. Only S7-1200 products that are marked with the ATEX symbol are suitable for ATEX classified hazardous locations as marked.

EU declarations of conformity for the respective authorities are available from:

Siemens AG
Digital Industries
Factory Automation
P.O. Box 1963
D-92209 Amberg

The EU declarations of conformity are also available for download from the Siemens Industry Online Support website, under the keyword "Declaration of Conformity".

UK Conformity Assessed marking

The S7-1200 automation system complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The S7-1200 automation system meets the requirements and protection targets of the following regulations and related amendments:

- Electrical Equipment (Safety) Regulations 2016 (Low-Voltage)
- Electromagnetic Compatibility Regulations 2016 (EMC)
- Equipment and Protective Systems Intended for use in Potentially Explosive Atmospheres Regulations 2016 (Explosion Protection)
- Regulations on the restriction of the use of certain hazardous substances in electrical and electronic equipment 2012 (RoHS).
- Supply of Machinery (Safety) Regulations 2008 for S7-1200 safety components (fail-safe modules)

UK Declarations of Conformity for the respective authorities are available from:

Siemens AG
Digital Industries
Factory Automation
P.O. Box 1963
D-92209 Amberg

The UK Declaration of Conformity is also available for download from the Siemens Industry Online Support website under the keyword "Declaration of Conformity".

cULus approval

Underwriters Laboratories Inc. complying with:

- Underwriters Laboratories, Inc.: UL 508 Listed (Industrial Control Equipment)
- Canadian Standards Association: CSA C22.2 Number 142 (Process Control Equipment)

NOTE

The SIMATIC S7-1200 series meets the CSA standard.
The cULus logo indicates that the S7-1200 has been examined and certified by Underwriters Laboratories (UL) to standards UL 508 and CSA 22.2 No. 142.

cULus HAZ. LOC. approval

Underwriters Laboratories Inc. in accordance with:

- UL 508 (Industrial Control Equipment)
- CANCSA C22.2 No. 142 (Process Control Equipment)
- ANSI/ISA 12.12.01
- CAN/CSA C22.2 No. 213 (Hazardous Location) APPROVED for use in Class I, Division 2, Group A, B, C, D T3C; Class I, Zone 2, Group IIC T3 Installation Instructions for cULus haz.loc.
- WARNING – Explosion Hazard – Do not disconnect while circuit is live unless area is known to be non-hazardous.

- WARNING – Explosion Hazard – Substitution of components may impair suitability for Class I, Division 2 or Zone 2.
- This equipment is suitable for use in Class I, Division 2, Groups A, B, C, D; Class I, Zone 2, Group IIC; or non-hazardous locations.

IMPORTANT EXCEPTION: See Technical Specifications for the number of inputs or outputs allowed on simultaneously. Some models are de-rated for Ta = 55 °C.

FM approval

FM Approvals
Approval Standard Class Number 3600, 3611 (ANSI/UL 121201), 3810 (ANSI/UL 61010-1), CSA Standard C22.2 No. 0-10, C22.2 No. 213, C22.2 No. 61010-1
Approved for use in:
Class I, Division 2, Group A, B, C, D, Temperature Class T3C Ta = 55 °C [CA, US]
Class I, Zone 2, Group IIC, Temperature Class T3 Ta = 55 °C [US]
Canadian Class I, Zone 2 Installation per CEC 18-150 [CA]

⚠ WARNING

Substitution of components may impair the suitability for Class I, Division 2 and Zone 2.
Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.
Repair of units should only be performed by an authorized Siemens Service Center.

ATEX approval

According to EN 60079-7 (Electrical apparatus for potentially explosive atmospheres - Part 7: Increased safety "e") and EN IEC 60079-0 (Electrical apparatus for potentially explosive gas atmospheres - Part 0: General requirements).

II 3 G Ex ec IIC T3 Gc

UL 21 ATEX 2622X

Special conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in EN 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with EN IEC 60079-7.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

IECEx approval

According to IEC 60079-7 (Explosive atmospheres - Part 7: Equipment protection by increased safety "e") and IEC 60079-0 (Explosive atmospheres - Part 0: Equipment - General requirements).

Ex ec IIC T3 Gc

IECEx UL 21.0107X

Specific conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in IEC 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with IEC 60079-7.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

UKEX approval

According to EN 60079-7 (Explosive atmospheres – Part 7: Equipment protection by increased safety "e") and EN IEC 60079-0 (Explosive atmospheres - Part 0: Equipment - General requirements).

II 3 G Ex ec IIC T3 Gc

UL 21UKEX2277X

Specific conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in EN 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with EN 60079-7.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

CCCEx approval

According to GB 3836.3 (Explosive atmosphere - Part 3: Equipment protection by ignition protection type "e")

GB 3836.1 (Explosive atmosphere - Part 1: Equipment - General requirements)

Ex ec IIC T3 Gc

Specific conditions of safety use:

- The equipment shall only be used in an area of not more than polution degree 2, as defined in GB/T 16935.1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with GB 3836.3.
- Transient protection shall be provided that is set at a level not exceeding 140 % of the peak rated voltage value at the supply terminals to the equipment.

Australia and New Zealand - RCM Mark (Regulatory Compliance Mark)

The S7-1200 automation system satisfies requirements of standards to AS/NZS 61000.6.4 and IEC 61000-6-4 (Class A).

Korea Certification

The S7-1200 automation system satisfies the requirements of the Korean Certification (KC Mark). It has been defined as Class A Equipment and is intended for industrial applications and has not been considered for home use.

Eurasian Customs Union approval (Belarus, Kazakhstan, Russian Federation)

EAC (Eurasion Conformity): Declaration of Conformity according to Technical Regulation of Customs Union (TR CU)

Maritime approval

The S7-1200 products are periodically submitted for special agency approvals related to specific markets and applications. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

Classification societies:

- American Bureau of Shipping (ABS): U.S.A.
- Bureau Veritas (BV): France
- Det Norske Veritas (DNV): Norway
- Germanischer Lloyd (GL): German
- Lloyds Register of Shipping (LRS): England
- Nippon Kaiji Kyokai (Class NK): Japan
- Korean Register of Shipping (KR): Korea
- China Classification Society (CCS): China

A.1.4.2 Industrial environments

The S7-1200 automation system is designed for use in industrial environments.

Table 1-27 Industrial environments

Application field	Emission requirements	Immunity requirements
Industrial	EN 61000-6-4	EN 61000-6-2

A.1.5 Electromagnetic compatibility

Electromagnetic Compatibility (EMC) is the ability of an electrical device to operate as intended in an electromagnetic environment and to operate without emitting levels of electromagnetic interference (EMI) that may disturb other electrical devices in the vicinity.

For safety related functions, additional EMC requirements are applied according to IEC 61326-3-1 and IEC 61326-3-2.

Table 1-28 Immunity per EN 61000-6-2

Electromagnetic compatibility - Immunity per EN 61000-6-2	
EN 61000-4-2 Electrostatic discharge	8 kV air discharge to all surfaces 6 kV contact discharge to exposed conductive surfaces
EN 61000-4-3 Radiated, radio-frequency, electro-magnetic field immunity test	80 to 1000 MHz, 10 V/m, 80% AM at 1 kHz 1.4 to 6.0 GHz, 3 V/m, 80% AM at 1 kHz
EN 61000-4-4 Fast transient bursts	2 kV, 5 kHz with coupling network to AC and DC system power 2 kV, 5 kHz with coupling clamp to I/O
EN 61000-4-5 Surge immunity	AC systems - 2 kV common mode, 1kV differential mode DC systems - 2 kV common mode, 1kV differential mode For DC systems (I/O signals, DC power systems) external protection is required. Refer to "Safe functional extra low voltage requirement (power supplies and other system components)" (Page 81), "Surge immunity" for the recommended protection devices.
EN 61000-4-6 Conducted disturbances	150 kHz to 80 MHz, 10 V RMS, 80% AM at 1kHz
EN 61000-4-11 Voltage dips	AC systems 0% for 1 cycle, 40% for 12 cycles and 70% for 30 cycles at 60 Hz

Table 1-29 Conducted and radiated emissions per EN 61000-6-4

Electromagnetic compatibility - Conducted and radiated emissions per EN 61000-6-4		
Conducted Emissions EN 55016, Class A, Group 1	0.15 MHz to 0.5 MHz	< 79dB (µV) quasi-peak; <66 dB (µV) average
	0.5 MHz to 5 MHz	< 73dB (µV) quasi-peak; <60 dB (µV) average
	5 MHz to 30 MHz	< 73dB (µV) quasi-peak; <60 dB (µV) average
Radiated Emissions EN 55016, Class A, Group 1	30 MHz to 230 MHz	< 40dB (µV/m) quasi-peak; measured at 10 m
	230 MHz to 1 GHz	< 47dB (µV/m) quasi-peak; measured at 10 m
	1 GHz to 3 GHz	< 76dB (uV/m) quasi peak, measured at 10 m

A.1.5.1 Surge immunity

Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. One specification for evaluation of protection from lightning type surges is found in EN 61000-4-5, with operational limits established by EN 61000-6-2. S7-1200 DC CPUs and signal modules require external protection to maintain safe operation when subject to surge voltages defined by this standard.

Listed below are some devices that support the needed surge immunity protection. These devices only provide the protection if they are properly installed according to the manufacturer's recommendations. Devices manufactured by other vendors with the same or better specifications can also be used:

Table 1-30 Devices that support surge immunity protection

Sub-system	Protection device
+24 V DC power	BLITZDUCTOR VT, BVT AVD 24, Part Number 918 422
Industrial Ethernet	DEHNpatch DPA M CLE RJ45B 48, Part Number 929 121
+24 V DC digital inputs	DEHN, Inc., Type DCO SD2 E 24, Part Number 917 988
+24 V DC digital outputs and sensor supply	DEHN, Inc., Type DCO SD2 E 24, Part Number 917 988
Analog IO	DEHN, Inc., Type DCO SD2 E 12, Part Number 917 987
Relay outputs	None required
L - N	DEHNguard® DG M TNS 275 (952 400) DEHNguard® DG MOD 320 (952 013)

A.1.6 Transport and storage conditions

Table 1-31 Transport and storage

Environmental conditions - Transport and storage	
EN 60068-2-2, Test Bb, Dry heat and EN 60068-2-1, Test Ab, Cold	-40 °C to +70 °C
EN 60068-2-30, Test Db, Damp heat	25 °C to 55 °C, 95% humidity
EN 60068-2-14, Test Na, temperature shock	-40 °C to +70 °C, dwell time 3 hours, 5 cycles
EN 60068-2-32, Free fall	0.3 m, 5 times, product packaging
Atmospheric pressure	1140 hPa to 660 hPa (corresponding to an altitude of -1000 m to 3500 m)

A.1.7 Mechanical and climatic ambient conditions

A.1.7.1 Environmental conditions

Table 1-32 Operating conditions

Environmental conditions - Operating	
Ambient temperature range (Inlet Air 25 mm below unit)	0 °C to 55 °C horizontal mounting 0 °C to 45 °C vertical mounting 95% non-condensing humidity
Atmospheric pressure	1140 hPa to 795 hPa (corresponding to an altitude of -1000 m to 2000 m)
Concentration of contaminants	SO_2: < 0.5 ppm; H_2S: < 0.1 ppm; RH < 60% non-condensing
EN 60068-2-14, Test Nb, temperature change	5 °C to 55 °C, 3 K/minute
EN 60068-2-27 Mechanical shock	15 g, 11 ms pulse, 6 shocks in each of 3 axis
EN 60068-2-6 Sinusoidal vibration	DIN rail mount: 3.5 mm from 5 to 8.4 Hz, 1 G from 8.4 to 150 Hz Panel Mount: 7.0 mm from 5 to 8.4 Hz, 2 G from 8.4 to 150 Hz 10 sweeps each axis, 1 octave per minute

A.1.8 Information on protection class, degree of protection, and rated voltages

A.1.8.1 Contamination level and overvoltage category in accordance with IEC 61131-2

The following levels are provided:

- Pollution degree 2
- Overvoltage category: II, unless otherwise noted (See also the Overvoltage Category III section.)

A.1.8.2 Protection class in accordance with EN 61131-2

Protection Class II is provided according to EN 61131-2:

- S7-1200 is open equipment and must be enclosed in additional protection as described in Section 4.1.2: "Guidelines for installing S7-1200 Fail-Safe devices" (Page 74).
- S7-1200 systems including AC power supply or relays which can be connected to AC voltage achieve Class II when installed in a suitable enclosure.
- S7-1200 systems including only connections to SELV / PELV achieve Class III when installed in a suitable enclosure.
- The S7-1200 does not require a protective earth connection. A functional earth connection is provided and is used for non-safety purposes such as interference immunity improvement.

A.1.8.3 Degree of protection IP20

The degree of protection IP20 in accordance with IEC 60529 is provided for all modules of the S7-1200 automation system:

- Protection against contact with standard test finger
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

A.1.8.4 Rated voltages

Rated voltage	Tolerance	Notes
24 V DC	20.4 V DC to 28.8 V DC	Refer to "Safe functional extra low voltage requirement (power supplies and other system components)" (Page 81) for additional requirements of a 24 V DC power source.

When you suddenly apply 24 V DC power to the S7-1200 CPU or digital I/O signal modules (SM), including fail-safe SM, short-term current flows can occur which briefly mimic the effect of "1" signals at process outputs and inputs. Digital outputs can trigger to ON state for approximately 50 microseconds at power application. The SMs deliberately test functional safety P- and M-switch outputs ON at different times for up to the user-configurable "Maximum readback time switch on test" (500 microseconds to 5 ms) during the power up sequence and as a cyclic bit-pattern test. This test pulse can energize the load in the presence of a switch or wiring fault on the opposite side of the load circuit. Such short pulses are typically not a hazard for electromechanical loads, but you must consider the effect. High-speed electronic receiver circuits can detect short pulses and improperly interpret the short pulses as deliberate "1" signals.

⚠ WARNING

Short term current and voltage pulses can occur on 24 V DC I/O circuits near the time that power is applied.

Such short term pulses can cause unexpected activation or position changes in machinery, resulting in death or serious injury to personnel and/or property damage.

If your installation includes receivers which can be responsive to short pulses as described above, you should apply measures such as power sequencing or progressive removal of safety lockouts to assure that unexpected machine operations do not occur.

A.1.9 Reverse voltage protection

Reverse voltage protection circuitry is provided on each terminal pair of +24 V DC power or user input power for CPUs, signal modules (SM), and signal boards (SB). It is still possible to damage the system by wiring different terminal pairs in opposite polarities.

Some of the 24 V DC power input ports in the S7-1200 system are interconnected, with a common logic circuit connecting multiple M terminals. For example, the following circuits are interconnected when designated as "not isolated" in the data sheets: the 24 V DC power supply of the CPU, the power input for the relay coil of an SM, or the power supply for a non-isolated analog input. All non-isolated M terminals must connect to the same external reference potential.

⚠ WARNING

Connecting non-isolated M terminals to different reference potentials will cause unintended current flows that may cause damage or unpredictable operation in the PLC and any connected equipment.

Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.

Always ensure that all non-isolated M terminals in an S7-1200 system are connected to the same reference potential.

A.1.10 DC outputs

Short-circuit protection circuitry is not provided for DC outputs on CPUs, signal modules (SM) and signal boards (SB).

A.1.11 Relay electrical service life

The typical performance data estimated from sample tests is shown below. Actual performance may vary depending upon your specific application. An external protection circuit that is adapted to the load will enhance the service life of the contacts. N.C. contacts have a typical service life of about one-third that of the N.O. contact under inductive and lamp load conditions.

An external protective circuit will increase the service life of the contacts.

Table 1-33 Typical performance data

Data for selecting an actuator				
Continuous thermal current		2 A max.		
Switching capacity and life of the contacts				
	For ohmic load	Voltage	Current	Number of operating cycles (typical)
		24 V DC	2.0 A	0.1 million
		24 V DC	1.0 A	0.2 million
		24 V DC	0.5 A	1.0 million
		48 V AC	1.5 A	1.5 million
		60 V AC	1.5 A	1.5 million
		120 V AC	2.0 A	1.0 million
		120 V AC	1.0 A	1.5 million

Data for selecting an actuator				
	For ohmic load	120 V AC	0.5 A	2.0 million
		230 V AC	2.0 A	1.0 million
		230 V AC	1.0 A	1.5 million
		230 V AC	0.5 A	2.0 million
	For inductive load (according to IEC 947-5-1 DC13/AC15)	Voltage	Current	Number of operating cycles (typical)
		24 V DC	2.0 A	0.05 million
		24 V DC	1.0 A	0.1 million
		24 V DC	0.5 A	0.5 million
		24 V AC	1.5 A	1.0 million
		48 V AC	1.5 A	1.0 million
		60 V AC	1.5 A	1.0 million
		120 V AC	2.0 A	0.7 million
		120 V AC	1.0 A	1.0 million
		120 V AC	0.5 A	1.5 million
		230 V AC	2.0 A	0.7 million
		230 V AC	1.0 A	1.0 million
		230 V AC	0.5 A	1.5 million
Activating a digital input		Possible		
Switching frequency				
	Mechanical	Max. 10 Hz		
	At ohmic load	Max. 1 Hz		
	At inductive load (according to IEC 947-5-1 DC13/AC15)	Max. 0.5 Hz		
	At lamp load	Max. 1Hz		

A.1.12 Internal CPU memory retention

- Lifetime of retentive data and data log data: 10 years
- Power down retentive data, Write cycle endurance: 2 million cycles
- Data log data, up to 2 KB per data log entry, Write cycle endurance: 500 million data log entries

NOTE

Effect of data logs on internal CPU memory

Each data log write consumes at a minimum 2 KB of memory. If your program writes small amounts of data frequently, it is consuming at least 2 KB of memory on each write. A better implementation would be to accumulate the small data items in a data block (DB), and to write the data block to the data log at less frequent intervals.

If your program writes many data log entries at a high frequency, consider using a replaceable SD memory card.

A.1.13 Overvoltage Category III

Relay contacts of the SM 1226 F-DQ 2 x Relay are designed to Overvoltage Category III. You can use them in AC mains circuits without further overvoltage protection.

Relay contact outputs and AC inputs for fail-safe S7-1200 CPUs and standard (non fail-safe) I/O modules do not meet requirements regarding Overvoltage Category III, as applicable to EN 50156-1 conforming equipment (burner applications).

When using the SM 1226 F-DQ 2 x Relay in safety critical circuits of burner applications, you can use the relay contact outputs and AC inputs for fail-safe S7-1200 CPUs and standard (non fail-safe) I/O modules, but only if used in one of the following:

- SELV/PELV circuits
- Circuits connected to the electrical mains with permanent, recognized protection that reduces transients to Overvoltage Category II

Otherwise, the CPU and I/O system, including the SM 1226 F-DQ 2 x Relay, will not meet the Overvoltage Category III requirement for burner applications.

⚠ WARNING

Adjacent relay contacts in the same channel of the SM 1226 F-DQ 2 x Relay are not rated to separate AC line from SELV / PELV.
Death or serious personal injury and damage to machines and equipment can result if SELV/PELV circuits are wired adjacent to high voltage circuits on this module.
The A and B circuits of each output must either be both AC line or both SELV.

A.2 Fail-Safe CPU technical specifications

A.2.1 Fail-Safe CPU additions/exceptions

The following sections discuss exceptions and additions for the CPU 1212FC, CPU 1214FC, and CPU 1215FC that differentiates them from the standard CPU 1212C, CPU 1214C, and CPU 1215C.

A.2.1.1 Areas of application

The S7-1200 fail-safe CPUs are intended for applications including Functional Safety requirements. In addition to the safety program, you can also program standard applications.

A.2.1.2 Restrictions with "READ_DBL" and "WRIT_DBL"

If an F-DB is specified as the target address, a READ_DBL instruction execution fails when reading data from load memory into work memory.

If an F-DB is specified as the target address, a WRIT_DBL instruction execution fails when writing data from work memory to load memory.

A.2.1.3 Restrictions to configuring the retentive behavior of data blocks

The configuration of retentive data blocks is not supported for F-DBs.

This means that the current values of the F-DBs will not be retentive in the event of Power OFF/ON and Restart (STOP-RUN) of the fail-safe CPU. The F-DBs are always set to the initial values from the load memory.

In the F-DBs, for all tags the "Retain" check box is grayed out.

A.2.1.4 Probabilities of failure

Probability of failure values are estimated using standard data tables and calculation methods according to international standards, specifically for the purpose of calculating PFD and PFH values according to IEC 61508:2010 and related functional safety standards. The calculations assume products operated within specifications and repair of diagnosed faults within 100 hours:

	Operation in Low Demand Mode, Average probability of a dangerous failure on demand (PFD_avg)	**Operation in High Demand or Continuous Mode, Average frequency of a dangerous failure per hour (PFH)**	**Proof test interval (Mission time or Useful lifetime)**
S7-1200 fail-safe CPUs	< 2.00E-05	< 1.00E-09 1/h	20 years

A.2.1.5 Web server

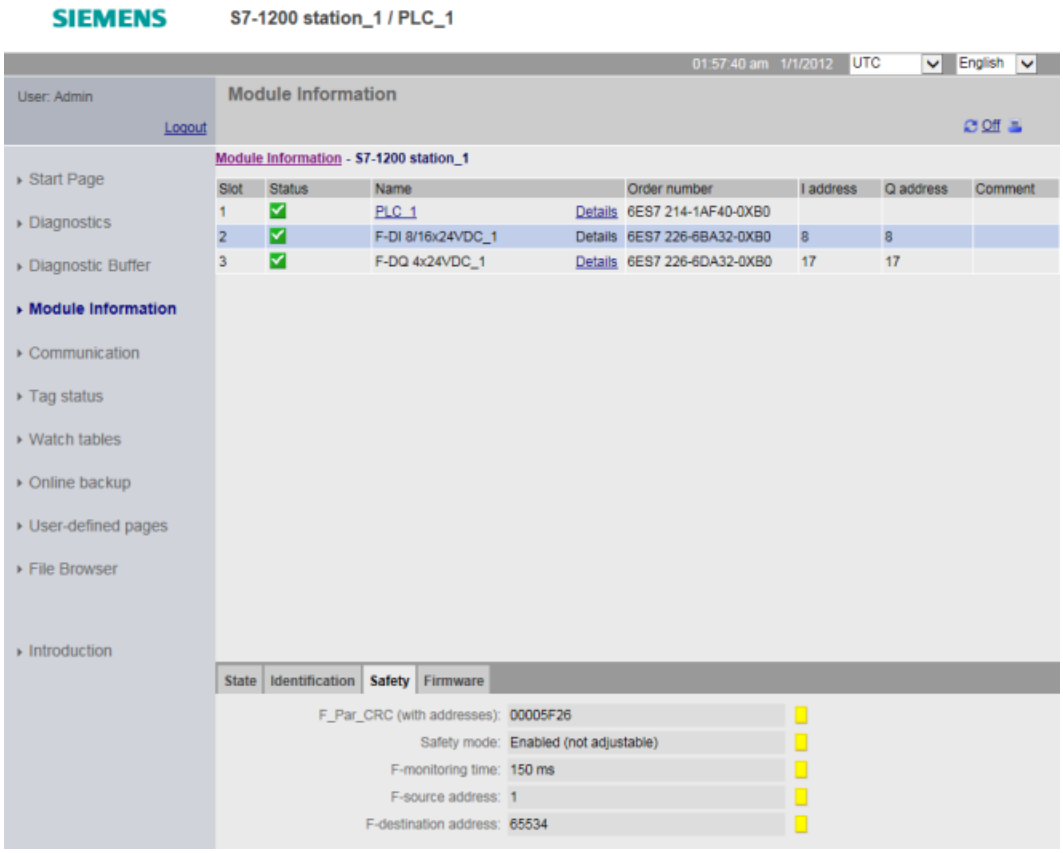
Start Page

The S7-1200 fail-safe CPUs display the following additional information on the "Start Page" of the web server:

- STEP 7 Safety version: Version of the TIA Portal Safety package used to download the project
- Safety mode (Enabled/Disabled): Indicates whether or not safety mechanisms for fault detection and fault reaction are activated in the project and safety-related communication using safety message frames is allowed
- Collective F-signature: Signature used to determine changes to any safety components in the project
- Last fail-safe modification: Date/time of last change to the safety components in the project

NOTE

The time displayed for "Last fail-safe modification" depends on the time being correctly set in the PLC when you load the program. Note that the time will not be correct in the PLC if you remove power from the PLC for an extended time before the program is loaded. The BB 1297 Battery Board allows a longer power down without loss of correct time.



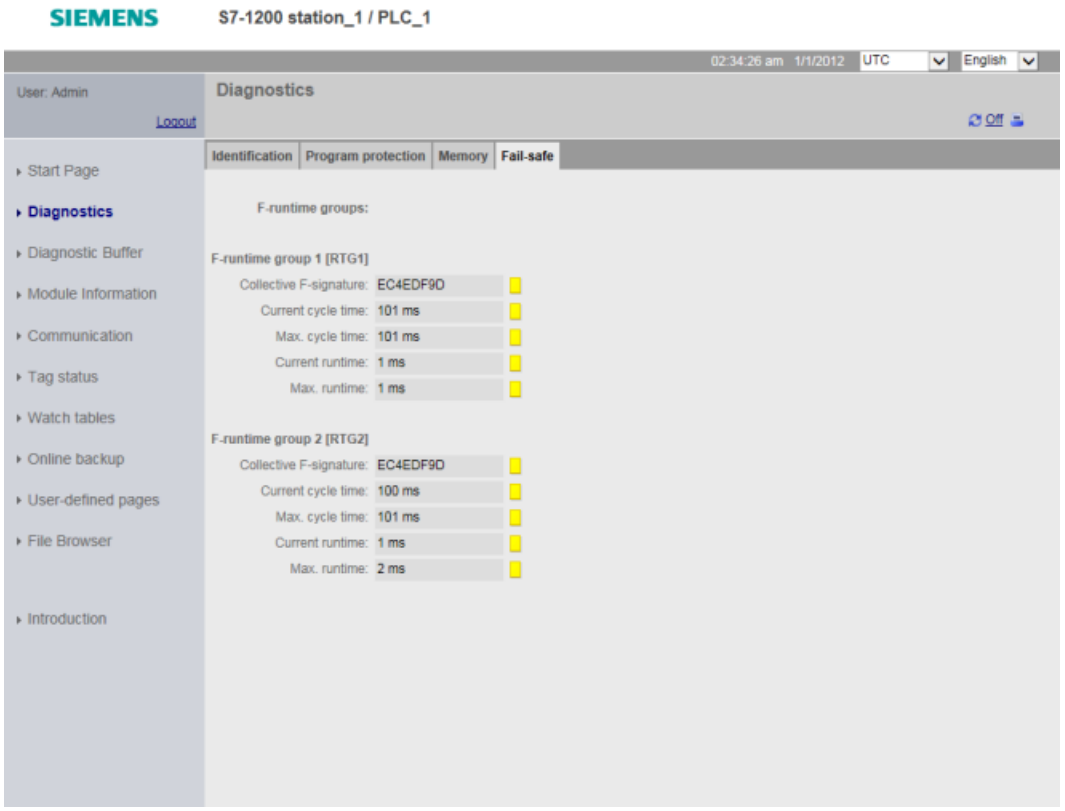
Module Information

Each F-I/O displays the following information on the "Module information" page in the "Safety" tab:

- F_Par_CRC (with addresses) (F-parameter signature): Cyclic redundancy checksum that confirms the integrity of the PROFIsafe message contents and sequence
- Safety mode: All safety mechanisms for fault detection and fault reaction are activated, and safety-related communication using safety message frames is allowed.
- F-monitoring time: The F-monitoring time is the amount of time an SM or CPU waits for a valid current safety message frame before passivating channels.
- F-source address: Unique network-wide address for the fail-safe CPU
- F-destination address: A CPU-wide unique PROFIsafe address for every F-IO used in a safety system

NOTE

If you click an F-I/O module and its "Details" link in the top section, then a "Safety" tab is displayed in the bottom section. In the Safety tab, you can see specific data related to the selected module.



NOTE
You do not have write access to F-blocks.

Diagnostics

F-runtime groups display the following information on the "Diagnostics" page in the "Fail-safe" tab:

- F-runtime group name: Name of group that consists of an F-OB (cycle OB or cyclic interrupt OB) that calls a main safety block (FB or FC). Additional user-specific safety functions must then be called from this main safety block.
- Collective F-signature: Signature used to determine changes to any safety components in the project
- Current cycle time: Time that the CPU requires to complete one PLC scan cycle
- Max. cycle time: Maximum recorded time that the CPU requires to complete one PLC scan cycle
- Current runtime: Time that the CPU requires to execute the user program once; duration of the last scan
- Max. runtime: Maximum recorded time that the CPU requires to execute the user program once

NOTE
If you download a standard program to an S7-1200 fail-safe CPU, the Fail-safe tab (to display runtime groups) is not displayed.

A.2.1.6 Using a memory card with the S7-1200 Fail-Safe CPU

The S7-1200 memory card used as a transfer card is a way to copy a program into the PLC Internal Load Memory (ILM) without a connected TIA Portal. You remove the transfer card after program installation, and subsequent power cycles use the program stored in the ILM.

A memory card used as a program card keeps the PLC program on the card. If you remove the memory card, the ILM is empty, and there is no program in the PLC.

Refer to the "S7-1200 Programmable Controller System Manual" (https://support.industry.siemens.com/cs/ww/en/view/109478121) for general instructions for creating and using transfer cards and memory cards. The S7-1200 fail-safe CPU behavior when using a memory card has some differences from the standard CPU:

- When the S7-1200 fail-safe CPU starts with no memory card and the ILM is empty, the fail-safe CPU's STOP and MAINT LEDs flash for three seconds. Power cycle the CPU. This provides a temporary visual indication that the ILM is empty. The TIA Portal or a memory card must be used to load a user program.
- When the fail-safe CPU starts with a program memory card installed and the ILM is not empty, the fail-safe CPU erases the ILM and then stops, flashing the STOP and MAINT LEDs. This is a visual indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. Continuation and subsequent power cycles load the program from the memory card.
- When the fail-safe CPU starts with an empty memory card installed and the ILM is not empty, the fail-safe CPU copies the program from the ILM to the memory card. The fail-safe CPU then erases the ILM and stops, flashing the STOP and MAINT LEDs. This is an indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. Continuation and subsequent power cycles load the program from the memory card.
- When the fail-safe CPU starts with a transfer memory card installed and the ILM is not empty, the fail-safe CPU erases the ILM and then stops, flashing the STOP and MAINT LEDs. This is a visual indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. Continuation copies the user program from the memory card to the ILM, and then the fail-safe CPU stops, with the STOP LED on and the MAINT LED flashing. At this point, you must remove the transfer memory card and then power cycle or command a memory reset in order to continue. Continuation and subsequent power cycles load the program from the ILM.

Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en), Section 10.4: "Function test of safety program and protection through program identification" for instructions on transferring programs.

⚠ WARNING

Loading an incorrect user program into a fail-safe CPU results in incorrect execution and total or partial loss of the safety function.

Loss of the safety function can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.

Follow the instructions as provided in the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* for properly identifying safety programs and controlling how you load programs into a fail-safe CPU.

NOTE

S7-1200 fail-safe CPU successful memory card format

Follow these steps:

1. Insert a memory card into an F-CPU (MAINT LED on F-CPU flashes yellow.)
2. Power cycle the F-CPU. (CPU comes up in STOP mode.)
3. Format the Memory Card from SAT (SAT reports operation completed succesfully. MAINT LED flashes yellow.)
4. Power cycle the F-CPU (CPU flashes RUN/STOP and MAINT yellow continuously. It does NOT stop after three seconds and go to STOP mode.)

A.2.1.7 Backing up and restoring a fail-safe CPU

You have the option of backing up an S7-1200 fail-safe CPU in the same way as a standard S7-1200 CPU. Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) and "S7-1200 Programmable Controller System Manual" (https://support.industry.siemens.com/cs/ww/en/view/109478121) for further information. You can also find information on backing up a CPU in the online help on STEP 7 under "Creating a backup of an S7 CPU".

A.2.1.8 Password for a fail-safe CPU

The password assigned in the fail-safe CPU hardware configuration ("Full access incl. fail-safe (no protection)" must be entered for the fail-safe CPU to perform the following functions:

- Download/delete F-blocks
- Change/delete the password for a fail-safe CPU
- Format the SIMATIC Memory Card in a fail-safe CPU with STEP 7
- Restore the factory settings with STEP 7
- Restore a backup of a fail-safe CPU

NOTE

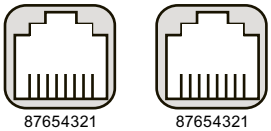
If neither the safety program nor the fail-safe CPU password is changed by the restore process, you are not prompted for the fail-safe CPU.

A.2.1.9 Configuration control (option handling)

When using fail-safe signal modules (SM) with option handling, configure the fail-safe SMs to reside in the slots closest to the fail-safe CPU. Place all standard SMs after all fail-safe SMs. The Option Handling record must not change the configuration of the fail-safe SMs.

A.2.2 PROFINET interface X1 port pinouts

The S7-1200 fail-safe CPU connects to the PROFINET network using a standard female RJ45 jack. The connector pinout depends on the CPU type.



Single-port CPUs

Single-port CPUs (CPU 1212FC and CPU 1214FC) have a standard Ethernet MDI pin configuration as follows:

Pin	Signal name	Description	RJ45 female jack pinout
1	TD+	Transmit data	 X1P1
2	TD-		
3	RD+	Receive data	
4	GND	Ground	
5	GND		
6	RD-	Receive data	
7	GND	Ground	
8	GND		

Dual-port CPUs

The ports of a dual-port CPU (CPU 1215FC) have a standard Ethernet MDI-X pin configuration as follows:

Pin	Signal name	Description	RJ45 female jack pinout
1	RD+	Receive data	 X1P1 X1P2
2	RD-		
3	TD+	Transmit data	
4	GND	Ground	
5	GND		
6	TD-	Transmit data	
7	GND	Ground	
8	GND		

Autonegotiation

If the port's configuration enables autonegotiation, the S7-1200 fail-safe CPU automatically detects the cable type and swaps the transmit/receive lines, if needed. If the port's configuration disables autonegotiation, the CPU also disables this automatic swap. You configure a port's autonegotiation setting in the TIA Portal's port options dialog. This is a port-specific advanced option for the PROFINET interface (X1) of the CPU's properties. Refer to "Configuring the PROFINET port" in Section 11.2.3.4: "Configuring an IP address for a CPU in your project" of the *S7-1200 Programmable Controller System Manual* for further information.

A.2.3 CPU 1212FC

A.2.3.1 General specifications and features

Table 1-34 General

Technical data	CPU 1212FC DC/DC/Relay	CPU 1212FC DC/DC/DC
Article number	6ES7212-1HF40-0XB0	6ES7212-1AF40-0XB0
Dimensions W x H x D (mm)	90 x 100 x 75	
Shipping weight	385 grams	370 grams
Power dissipation	9 W	
Current available (SM and CM bus)	1000 mA max. (5 V DC)	
Current available (24 V DC)	300 mA max. (sensor power)	
Digital input current consumption (24 V DC)	4 mA/input used	

Table 1-35 CPU features

Technical data		Description
User memory (Refer to "General technical specifications (Page 127)", "Internal CPU memory retention".)	Work	150 Kbytes
	Load	2 Mbyte internal, expandable up to SD card size
	Retentive	10 Kbytes
On-board digital I/O		8 inputs/6 outputs
On-board analog I/O		2 inputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		4096 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		2 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs: (Refer to the *S7-1200 System Manual*. for more information.) • 100/[1]80 kHz (Ia.0 to Ia.5) • 30 /[1]20 kHz (Ia.6 to Ia.7)
Pulse outputs[2]		Up to 4 configured to use any built-in or SB outputs: • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qa.5)
Pulse catch inputs		8
Time delay interrupts		4 total with 1 ms resolution
Cyclic interrupts		4 total with 1 ms resolution
Edge interrupts		8 rising and 8 falling (12 and 12 with optional signal board)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Technical data	Description
Memory card	SIMATIC Memory Card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table 1-36 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

NOTE
Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.2.3.2 Timers, counters, and code blocks supported by CPU 1212FC

Table 1-37 Blocks, timers and counters supported by CPU 1212FC

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	50 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupt	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1

Element		Description
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

Table 1-38 Communication

Technical data	Description
Number of ports	1
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 3 for server GET/PUT (CPU-to-CPU) S7 communication • 8 for client GET/PUT (CPU-to-CPU) S7 communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test) [1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface Hardware	
Number of ports	1
Integrated switch	No
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	No
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes

[1] Ethernet port isolation is designed to limit hazard during short-term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data		Description
IRT		No
MRP		No
PROFIenergy		No
Prioritized startup		Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.		16
Number of IO devices that you can connect for RT, max.		16
Of which are in line, max.		16
Number of IO devices that can be activated/ deactivated simultaneously, max.		8
Update times		The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT		
Send clock of 1 ms		1 ms to 512 ms
PROFINET IO device		
Services		
PG/OP communication		Yes
S7 routing		Yes
Isochronous mode		No
Open IE communication		Yes
IRT, supported		No
MRP, supported		No
PROFIenergy		Yes
Shared device		Yes
Number of IO controllers with shared device, max.		2
SIMATIC communication		
S7 communication, as server		Yes
S7 communication, as client		Yes
User data per job, max.		See online help (S7 communication, user data size)
Open IE communication		
TCP/IP:		Yes
	Data length, max.	8 KB
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short-term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table 1-39 Power supply

Technical data		**CPU 1212FC DC/DC/Relay**	**CPU 1212FC DC/DC/DC**
Voltage range		20.4 V DC to 28.8 V DC	
Line frequency		--	
Input current (max. load)	CPU only	400 mA at 24 V DC	
	CPU with all expansion accessories	1200 mA at 24 V DC	
Inrush current (max.)		12 A at 28.8 V DC	
I^2 t		0.5 A^2 s	
Isolation (input power to logic)		Not isolated	
Ground leakage, AC line to functional earth		--	
Hold up time (loss of power)		10 ms at 24 V DC	
Internal fuse, not user replaceable		3 A, 250 V, slow blow	

Table 1-40 Sensor power

Technical data	**CPU 1212FC DC/DC/Relay**	**CPU 1212FC DC/DC/DC**
Voltage range	L+ minus 4 V DC min.	
Output current rating (max.)	300 mA (short-circuit protected)	
Maximum ripple noise (<10 MHz)	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated	

A.2.3.3 Digital inputs and outputs

Table 1-41 Digital inputs

Technical data	**CPU 1212FC DC/DC/Relay**	**CPU 1212FC DC/DC/DC**
Number of inputs	8	
Type	Sink/Source (IEC Type 1 sink)	
Rated voltage	24 V DC at 4 mA, nominal	
Continuous permissible voltage	30 V DC, max.	
Surge voltage	35 V DC for 0.5 sec.	
Logic 1 signal (min.)	15 V DC at 2.5 mA	
Logic 0 signal (max.)	5 V DC at 1 mA	
Isolation (field side to logic)	707 V DC (type test)	
Isolation groups	1	
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0	
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30 /20 kHz (Ia.6 to Ia.7)	
Number of inputs on simultaneously	8 inputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs	

Table 1-42 Digital outputs

Technical data	CPU 1212FC DC/DC/Relay	CPU 1212FC DC/DC/DC
Number of outputs	6	
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	
Required external overload protection [1]	10 A maximum must be limited to any common	5 A maximum must be limited to any common
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC [2]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Switching delay (Qa.4 to Qa.5)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended [3]	100 kHz (Qa.0 to Qa.3) [4], 2 Hz min. 20 kHz (Qa.4 to Qa.5) [4]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	Last value or substitute value (default value 0)
Number of outputs on simultaneously	6 outputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 External overload protection is to limit fire hazard. Overload can damage relay or transistor output.

2 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

3 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

4 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.2.3.4 Analog inputs

Analog input specifications

Table 1-43 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU.
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / 0 to 55 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

Step response of built-in analog inputs of the CPU

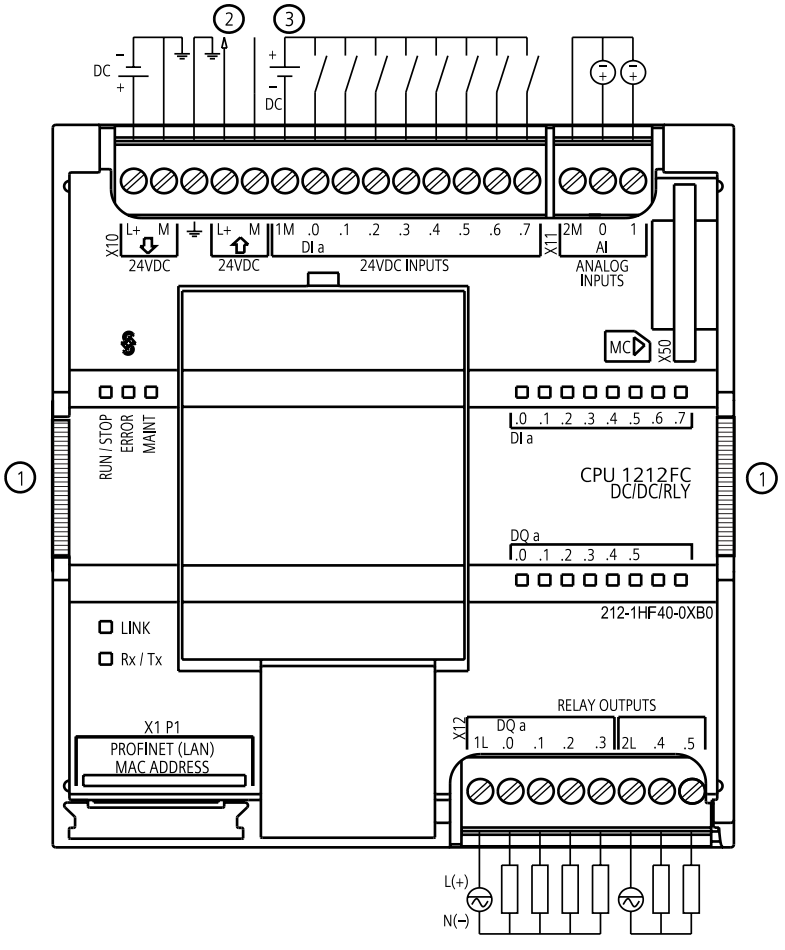
Table 1-44 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

Sample time for the built-in analog ports of the CPU

Table 1-45 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms



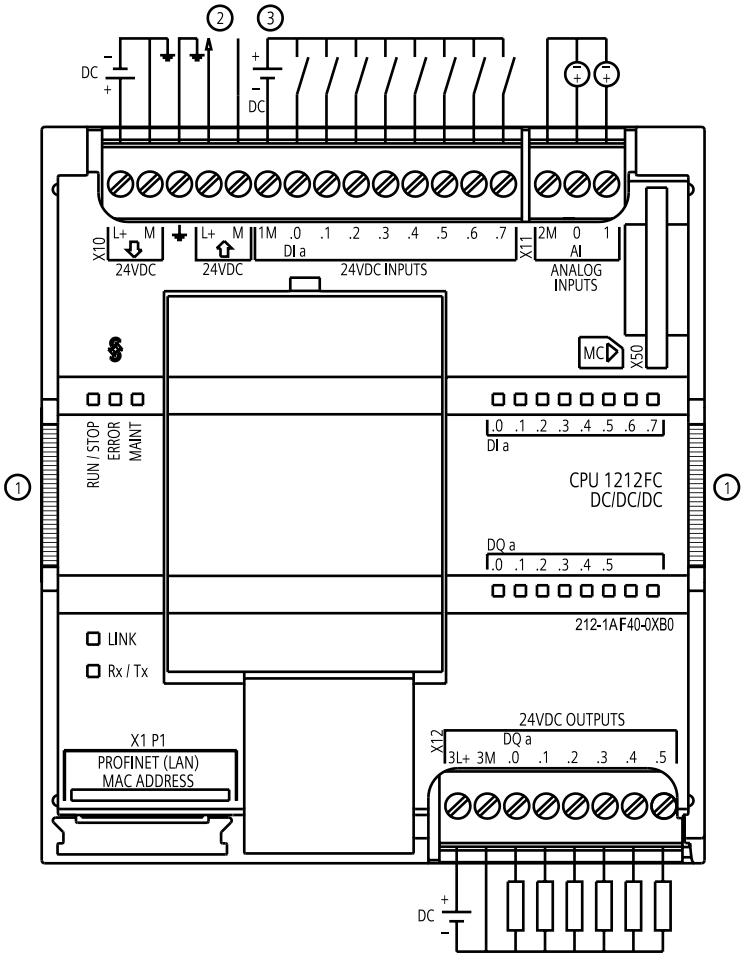
Measurement ranges of the analog inputs for voltage of the CPU

Table 1-46 Analog input representation for voltage of the CPU

System		Voltage Measuring Range	
Decimal	**Hexadecimal**	**0 to 10 V**	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.2.3.5 CPU 1212FC wiring diagrams

Table 1-47 CPU 1212FC DC/DC/Relay (6ES7212-1HF40-0XB0)



①	The two rectangular areas are yellow. These are only on the fail-safe CPUs.
②	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
③	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note: X11 connectors must be gold. See Appendix B, Spare Parts for article number.	

Table 1-48 Connector pin locations for CPU 1212FC DC/DC/Relay (6ES7212-1HF40-0XB0)

Pin	X10	X11 (gold)	X12
1	L+ / 24 V DC	2 M	1L
2	M / 24 V DC	AI 0	DQ a.0

Unused analog inputs should be shorted.

A.2.4 CPU 1214FC

A.2.4.1 General specifications and features

Table 1-51 General

Technical data	CPU 1214FC DC/DC/Relay	CPU 1214FC DC/DC/DC
Article number	6ES7214-1HF40-0XB0	6ES7214-1AF40-0XB0
Dimensions W x H x D (mm)	110 x 100 x 75	
Shipping weight	435 grams	415 grams
Power dissipation	12 W	
Current available (SM and CM bus)	1600 mA max. (5 V DC)	
Current available (24 V DC)	400 mA max. (sensor power)	
Digital input current consumption (24 V DC)	4 mA/input used	

Table 1-52 CPU features

Technical data		Description
User memory	Work	200 Kbytes
	Load	4 Mbytes internal, expandable up to SD card size

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Technical data		Description
(Refer to "General technical specifications (Page 127), "Internal CPU memory retention".)	Retentive	10 Kbytes
On-board digital I/O		14 inputs/10 outputs
On-board analog I/O		2 inputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		8192 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		8 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs: (Refer to the *S7-1200 System Manual*. for more information.) • 100/[1]80 kHz (Ia.0 to Ia.5) • 30/[1]20 kHz (Ia.6 to Ib.5)
Pulse outputs[2]		Up to 4 configured to use any built-in or SB outputs: • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qb.1)
Pulse catch inputs		14
Time delay interrupts		4 total with 1 ms resolution
Cyclic interrupts		4 total with 1 ms resolution
Edge interrupts		12 rising and 12 falling (16 and 16 with optional signal board)
Memory card		SIMATIC Memory Card (optional)
Real time clock accuracy		+/- 60 seconds/month
Real time clock retention time		20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table 1-53 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

NOTE

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.2.4.2 Timers, counters and code blocks supported

Table 1-54 Blocks, timers and counters supported by CPU 1214FC

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	64 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupts	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)

Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	

1 External overload protection is to limit fire hazard. Overload can damage relay or transistor output.

2 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

3 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

4 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

Technical data	CPU 1214FC DC/DC/Relay	CPU 1214FC DC/DC/DC
Required external overload protection [1]	10 A maximum must be limited to any common	5 A maximum must be limited to any common
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC [2]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Switching delay (Qa.4 to Qb.1)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended [3]	100 kHz (Qa.0 to Qa.3) [4], 2 Hz min. 20 kHz (Qa.4 to Qb.1) [4]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Number of outputs on simultaneously	10 outputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 External overload protection is to limit fire hazard. Overload can damage relay or transistor output.

2 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

3 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

4 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.2.4.4 Analog inputs

Table 1-60 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 152).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ

Technical data	Description
Isolation (field side to logic)	None
Accuracy (25 °C / 0 to 55 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

Step response of built-in analog inputs of the CPU

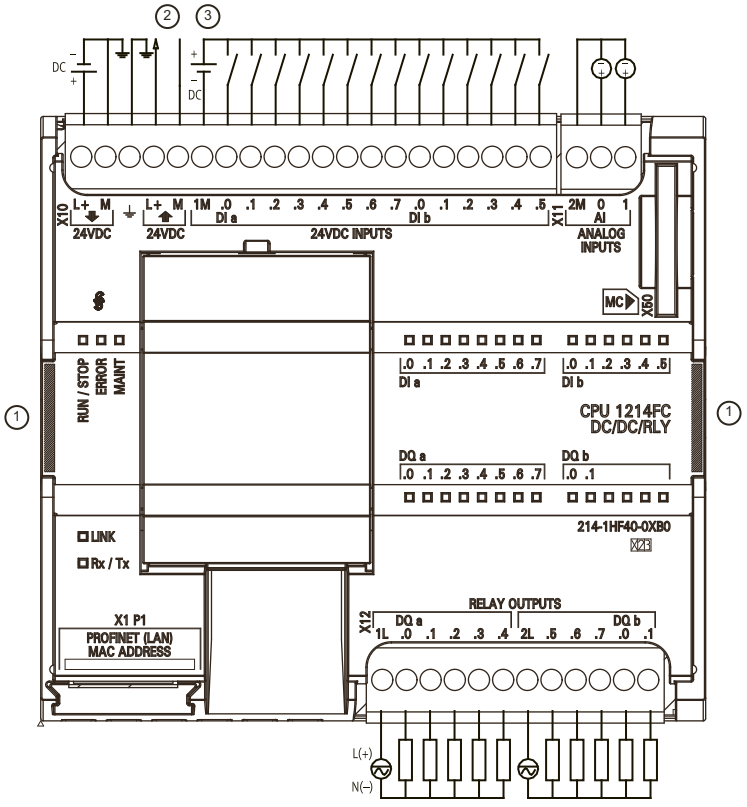
Table 1-61 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60 ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

Sample time for the built-in analog ports of the CPU

Table 1-62 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms



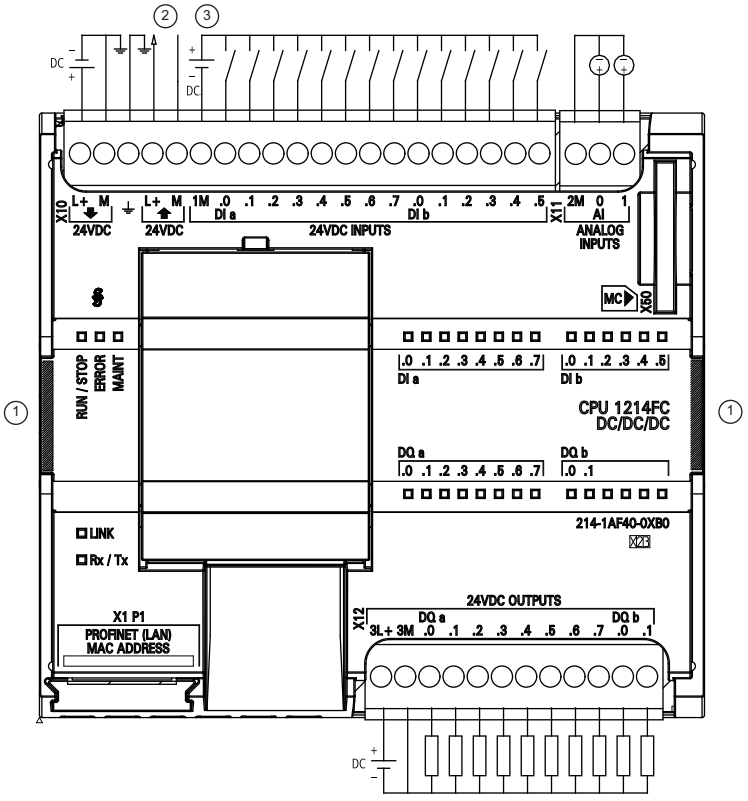
Measurement ranges of the analog inputs for voltage of the CPU

Table 1-63 Analog input representation for voltage of the CPU

System		Voltage Measuring Range	
Decimal	**Hexadecimal**	**0 to 10 V**	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.2.4.5 CPU 1214FC wiring diagrams

Table 1-64 CPU 1214FC DC/DC/Relay (6ES7214-1HF40-0XB0)



①	The two rectangular areas are yellow. These are only on the fail-safe CPUs.
②	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
③	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note: X11 connectors must be gold. See Appendix B, Spare Parts for article number.	

Table 1-65 Connector pin locations for CPU 1214FC DC/DC/Relay (6ES7214-1HF40-0XB0)

Pin	X10	X11 (gold)	X12

A.2.5 CPU 1215FC

A.2.5.1 General specifications and features

Table 1-68 General

Technical data	CPU 1215FC DC/DC/Relay	CPU 1215FC DC/DC/DC
Article number	6ES7215-1HF40-0XB0	6ES7215-1AF40-0XB0
Dimensions W x H x D (mm)	130 x 100 x 75	
Shipping weight	550 grams	520 grams
Power dissipation	12 W	
Current available (SM and CM bus)	1600 mA max. (5 V DC)	
Current available (24 V DC)	400 mA max. (sensor power)	
Digital input current consumption (24 V DC)	4 mA/input used	

Table 1-69 CPU features

Technical data		Description
User memory (Refer to "General technical specifications (Page 127), "Internal CPU memory retention".)	Work	250 Kbytes
	Load	4 Mbytes, internal, expandable up to SD card size
	Retentive	10 Kbytes
On-board digital I/O		14 inputs/10 outputs
On-board analog I/O		2 inputs/2 outputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		8192 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		8 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Technical data	Description
High-speed counters	Up to 6 configured to use any built-in or SB inputs. (Refer to the *S7-1200 System Manual* for more information.) • 100/[1]80 kHz (Ia.0 to Ia.5) • 30/[1]20 kHz (Ia.6 to Ib.5)
Pulse outputs[2]	Up to 4 configured to use any built-in or SB outputs • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qb.1)
Pulse catch inputs	14
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	12 rising and 12 falling (16 and 16 with optional signal board)
Memory card	SIMATIC Memory Card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table 1-70 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

NOTE
Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.2.5.2 Timers, counters and code blocks supported

Table 1-71 Blocks, timers and counters supported by CPU 1215FC

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	64 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupts	4 (1 per event)

Element		Description
OBs	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

Table 1-72 Communication

Technical data	Description
Number of ports	2
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 3 for server GET/PUT (CPU-to-CPU) S7 communication • 8 for client GET/PUT (CPU-to-CPU) S7 communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test) [1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface hardware	
Number of ports	2
Integrated switch	Yes
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes

[1] Ethernet port isolation is designed to limit hazard during short-term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	Yes
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT	No
MRP	Yes as MRP client
PROFIenergy	No
Prioritized startup	Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.	16
Number of IO devices that you can connect for RT, max.	16
Of which are in line, max.	16
Number of IO devices that can be activated/ deactivated simultaneously, max.	8
Update times	The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT	
Send clock of 1 ms	1 ms to 512 ms
PROFINET IO device	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT, supported	No
MRP, supported	Yes
PROFIenergy	Yes
Shared device	Yes
Number of IO controllers with shared device, max.	2
SIMATIC communication	
S7 communication, as server	Yes
S7 communication, as client	Yes
User data per job, max.	See online help (S7 communication, user data size)
Open IE communication	
TCP/IP:	Yes
Data length, max.	8 KB

[1] Ethernet port isolation is designed to limit hazard during short-term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data		Description
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP:		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short-term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table 1-73 Power supply

Technical data		CPU 1215FC DC/DC/Relay	CPU 1215FC DC/DC/DC
Voltage range		20.4 V DC to 28.8 V DC	
Line frequency		--	
Input current (max. load)	CPU only	500 mA at 24 V DC	
	CPU with all expansion accessories	1500 mA at 24 V DC	
Inrush current (max.)		12 A at 28.8 V DC	
$I^2 t$		0.5 $A^2 s$	
Isolation (input power to logic)		Not isolated	
Ground leakage, AC line to functional earth		-	
Hold up time (loss of power)		10 ms at 24 V DC	
Internal fuse, not user replaceable		3 A, 250 V, slow blow	

Table 1-74 Sensor power

Technical data	CPU 1215FC DC/DC/Relay	CPU 1215FC DC/DC/DC
Voltage range	L+ minus 4 V DC min.	
Output current rating (max.)	400 mA (short-circuit protected)	
Maximum ripple noise (<10 MHz)	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated	

A.2.5.3 Digital inputs and outputs

Table 1-75 Digital inputs

Technical data	CPU 1215FC DC/DC/Relay	CPU 1215FC DC/DC/DC
Number of inputs	14	
Type	Sink/Source (IEC Type 1 sink)	
Rated voltage	24 V DC at 4 mA, nominal	
Continuous permissible voltage	30 V DC, max.	
Surge voltage	35 V DC for 0.5 sec.	

Technical data	**CPU 1215FC DC/DC/Relay**	**CPU 1215FC DC/DC/DC**
Logic 1 signal (min.)	15 V DC at 2.5 mA	
Logic 0 signal (max.)	5 V DC at 1 mA	
Isolation (field side to logic)	707 V DC (type test)	
Isolation groups	1	
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0	
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30/20 kHz (Ia.6 to Ib.5)	
Number of inputs on simultaneously	14 inputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs	

Table 1-76 Digital outputs

Technical data	**CPU 1215FC DC/DC/Relay**	**CPU 1215FC DC/DC/DC**
Number of outputs	10	10
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	No
Required external overload protection [1]	10 A maximum must be limited to any common	5 A maximum must be limited to any common
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC [2]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Switching delay (Qa.4 to Qb.1)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended [3]	100 kHz (Qa.0 to Qa.3) [4], 2 Hz min. 20 kHz (Qa.4 to Qb.1) [4]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--

Technical data	CPU 1215FC DC/DC/Relay	CPU 1215FC DC/DC/DC
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Number of outputs on simultaneously	10 outputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 External overload protection is to limit fire hazard. Overload can damage relay or transistor output.

2 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

3 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

4 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.2.5.4 Analog inputs and outputs

Table 1-77 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 161).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / 0 to 55 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

Step response of built-in analog inputs of the CPU

Table 1-78 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60 ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

Sample time for the built-in analog ports of the CPU

Table 1-79 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms

Measurement ranges of the analog inputs for voltage of the CPU

Table 1-80 Analog input representation for voltage of the CPU

System		Voltage Measuring Range	
Decimal	**Hexadecimal**	**0 to 10 V**	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

Analog output specifications

Table 1-81 Analog outputs

Technical data	Description
Number of outputs	2
Type	Current
Full-scale range	0 to 20 mA
Full-scale range (data word)	0 to 27648
Overshoot range	20.01 to 23.52 mA
Overshoot range (data word)	27649 to 32511
Overflow range	see footnote [1]
Overflow range data word	32512 to 32767
Resolution	10 bits
Output drive impedance	≤500 Ω max.
Isolation (field side to logic)	None
Accuracy (25 °C / 0 to 55 °C)	3.0% / 3.5% of full-scale
Settling time	2 ms
Cable length (meters)	100 m, shielded twisted pair

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

Measurement ranges of the analog outputs for current of the CPU

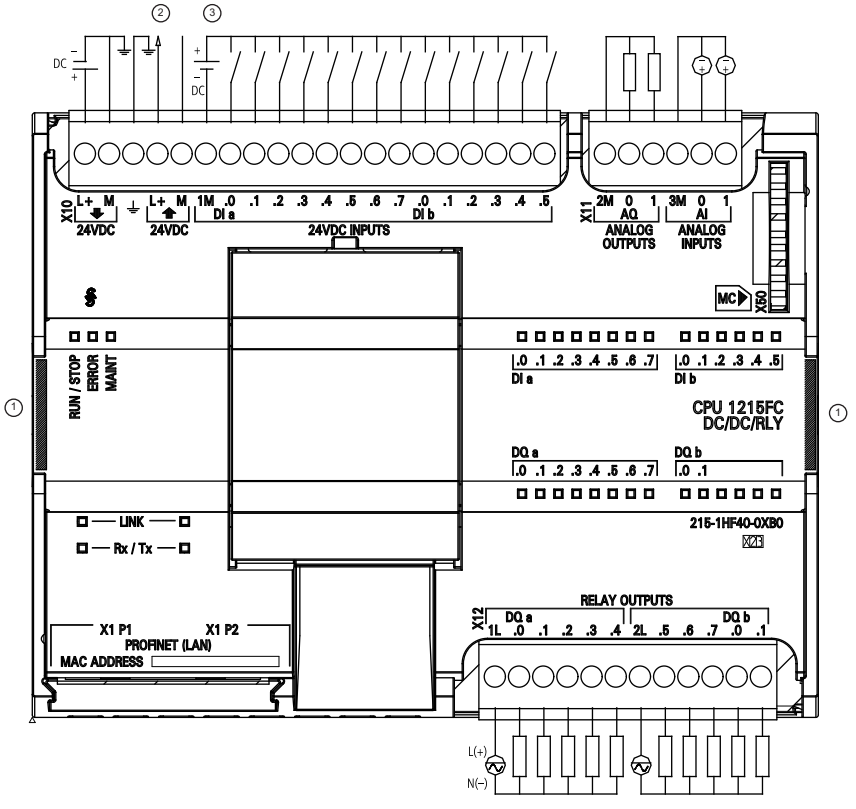

Table 1-82 Analog output representation for current of the CPU

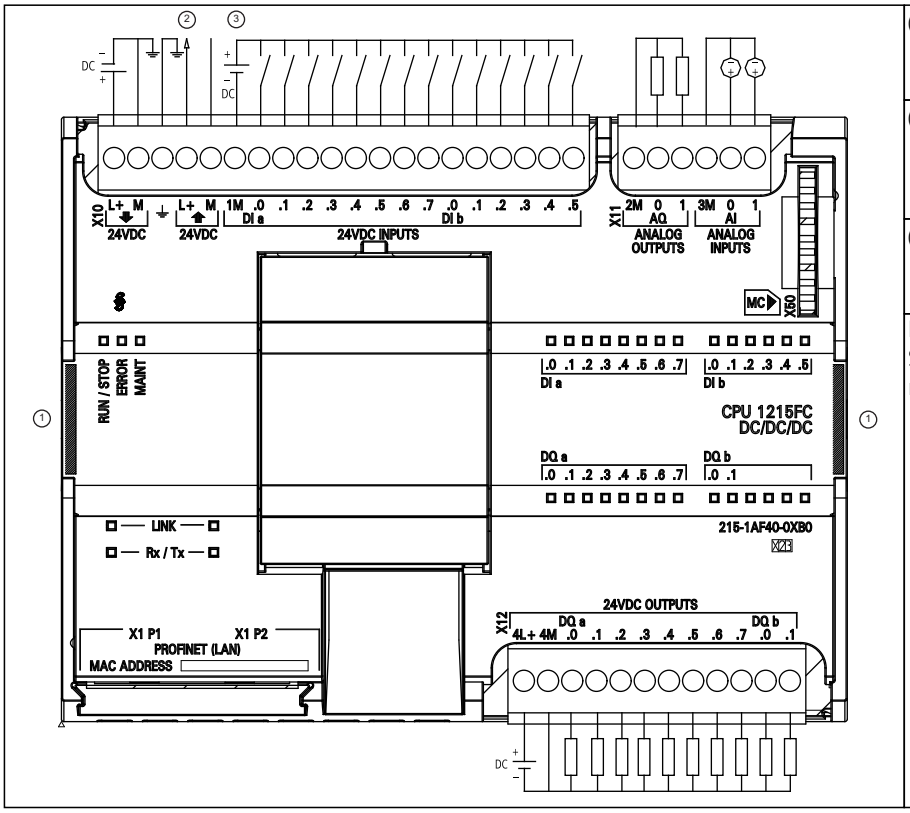
System		Current output range	
Decimal	**Hexadecimal**	**0 mA to 20 mA**	
32767	7FFF	See note 1	Overflow
32512	7F00	See note 1	
32511	7EFF	23.52 mA	Overshoot range
27649	6C01		
27648	6C00	20 mA	Rated range
20736	5100	15 mA	
34	22	0.0247 mA	
0	0	0 mA	
Negative values		Negative values are not supported	

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

A.2.5.5 CPU 1215FC wiring diagrams

Table 1-83 CPU 1215FC DC/DC/Relay (6ES7215-1HF40-0XB0)



①	The two rectangular areas are yellow. These are only on the fail-safe CPUs.
②	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
③	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note: X11 connectors must be gold. See Appendix B, Spare Parts for article number.	

Table 1-84 Connector pin locations for CPU 1215FC DC/DC/Relay (6ES7215-1HF40-0XB0)

Pin	X10	X11 (gold)	X12
1	L+ / 24 V DC	2M	1L
2	M / 24 V DC	AQ 0	DQ a.0
3	Functional Earth	AQ 1	DQ a.1
4	L+ / 24 V DC Sensor Out	3M	DQ a.2

A.3 Fail-Safe signal module (SM) technical specifications

A.3.1 Fail-Safe signal modules (SM)

Table 1-87 Fail-Safe signal modules

Signal module model	Digital inputs	Digital outputs	Removable connector
SM 1226 F-DI 16 x 24 V DC	8 x 24 V DC (1oo2), 16 x 24 V DC (1oo1), or a mix	-	Y
SM 1226 F-DQ 4 x 24 V DC	-	4 x 24 V DC	Y
SM 1226 F-DQ 2 x Relay	-	2 x Relay	Y

A.3.2 SM 1226 F-DI 16 x 24 V DC

A.3.2.1 Properties

Article number

6ES7226-6BA32-0XB0

Properties

The SM 1226 F-DI 16 x 24 V DC has the following features:

- 16 inputs (SIL 2/Category 3/PL d), 8 inputs (SIL 3/Category 3 or Category 4/PL e), or a mix
- 24 V DC-rated input voltage
- Suitable for switches and 3/4-wire proximity switches (BEROs)
- Two short circuit-proof sensor supplies, each one for eight inputs
- External sensor supply possible
- Module fault display (DIAG; green and red LED)
- Status display for each input (green LED)
- Fault display for each input (red LED)
- Assignable diagnostics
- Refer to "Fault diagnostics" (Page 105) for a description of LED and diagnostic message functions.

A.3.2.2 User data space

The SM 1226 F-DI 16 x 24 VDC user data space is two bytes (16 bits) of Process value input followed by two bytes of Value status bits.

This is the bit structure for an F-DI configured with input start address 8:

Input terminal	Process value bit	Value status bit
DI a.0	I8.0	I10.0
DI a.7	I8.7	I10.7
DI b.0	I9.0	I11.0
DI b.7	I9.7	I11.7

A.3.2.3 Specifications

Table 1-88 General specifications

Model	SM 1226 F-DI 16 x 24 V DC
Article number	6ES7226-6BA32-0XB0
Dimensions W x H x D (mm)	70 x 100 x 75
Weight	250 grams
Power dissipation	7 W
Current consumption (SM Bus, 5 V DC)	155 mA

Model		**SM 1226 F-DI 16 x 24 V DC**	
Current consumption (24 V DC)		130 mA + 6 mA / input used + any Vs1/Vs2 current used	
Isolation		• Signal terminals on this module are referenced to this module's M terminal and NOT ISOLATED from each other. • Signal terminals on this module are isolated to 707 V DC (type test) from S7-1200 system internal logic and Ground.	
Assigned address area	I/O area for inputs	9 bytes	
	I/O area for outputs	5 bytes	
Maximum achievable safety class	Number of channels	1-channel	2-channel
	In accordance with IEC 61508:2010	SIL 2	SIL 3
	In accordance with EN ISO 13849-1:2015	Category 3, PL d	Category 4, PL e
Fail-safe performance characteristics	Safety Integrity Level (SIL)	SIL 2	SIL 3
	Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg	5e-4	1e-5
	Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH	1e-8	1e-10
	Proof test interval (Mission time or Useful lifetime)	20 years	20 years
	Safety repair time	100 hours	100 hours
Inputs status display		Green LED / channel	
Inputs fault display		Red LED / channel	
Module fault display		Red / Green LED (DIAG)	
Diagnostic information can be displayed		Possible (TIA Portal, HMI, or Web page)	

Table 1-89 Performance

Model	**SM 1226 F-DI 16 x 24 V DC**
T_{cycle_i}: Internal cycle time	8 ms Note: Refer to "Response time parameters for the SM 1226 F-DI 16 x 24 VDC" (Page 186) for further information.

Table 1-90 Power supply (L+, M)

Model	**SM 1226 F-DI 16 x 24 V DC**
Voltage range	20.4 V DC to 28.8 V DC
Surge voltage	35 V DC for 0.5 s
Input current	• 130 mA with no current out of Vs1 and Vs2 • 730 mA with maximum current out of Vs1 and Vs2
Hold up time (loss of power)	1.0 ms at 20.4 V DC
Internal fuse, not user replaceable	2.5 A
Reverse polarity protection	Yes

Table 1-91 Sensor power (Vs1 / Vs2)

Model	**SM 1226 F-DI 16 x 24 V DC**
Number of outputs	2
Voltage range	L+ minus 2.0 V DC minimum

Model		**SM 1226 F-DI 16 x 24 V DC**
Output current rating (maximum)		300 mA
Permissible total current of outputs		600 mA
Short-circuit protection	Selection	Yes
	Operating value	0.7 A to 2.1 A

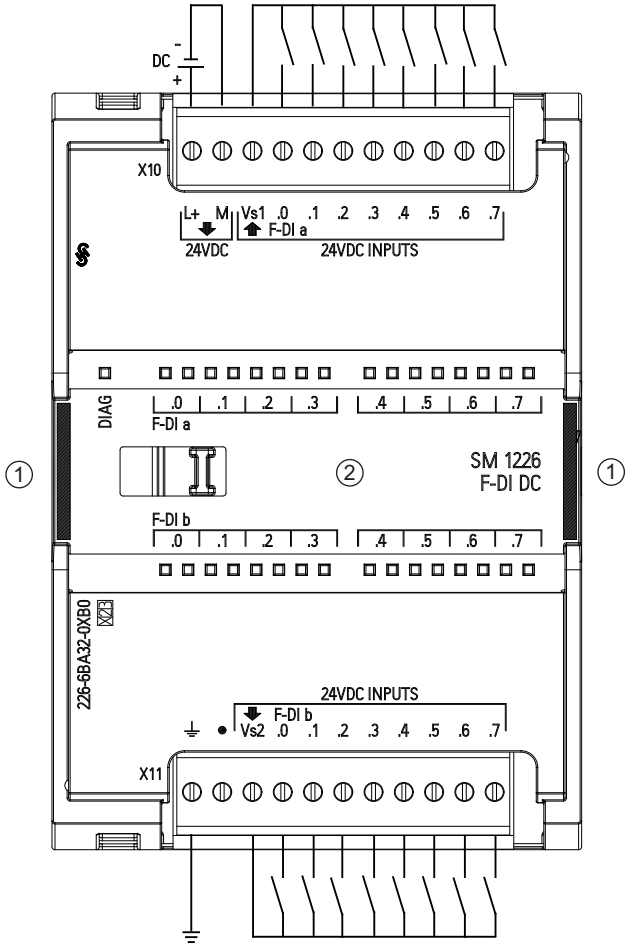

Table 1-92 Digital inputs

Model		**SM 1226 F-DI 16 x 24 V DC**	
Number of inputs	1oo1 evaluation	16 maximum	Note: You can individually assign each pair of inputs "a.x" and "b.x" as a single 1oo2 channel or as two separate 1oo1 channels.
	1oo2 evaluation	8 maximum	
Type		Sink (IEC 61131-2 Type 1)	
Rated voltage		24 V DC at 5 mA, nominal	
Surge voltage		35 V DC for 0.5 s	
Logic 1 signal		15 V DC at 3 mA to 30 V DC at 6 mA	
Logic 0 signal		-30 V DC to 5 V DC	
Connection of 2-wire proximity switch (BERO)	Selection	Not possible	
	Permissible quiescent current	0.5 mA maximum	
Filter times		• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms Note: Refer to "Response time parameters for the SM 1226 F-DI 16 x 24 VDC" (Page 186) for further information.	
Number of inputs on simultaneously		16 inputs at 55 °C horizontal or 45 °C vertical	
Cable length (meters)[1]		• 200 m unshielded with input filter time of 1.6 ms to 12.6 ms • 200 m shielded with input filter time of 0.8 ms to 12.6 s[1]	

[1] With an input delay of 0.8 ms, shielded cables must be used for the digital inputs and the sensor supply.

A.3.2.4 Wiring diagrams

Table 1-93 SM 1226 F-DI 16 x 24 V DC (6ES7226-6BA32-0XB0)

① The two rectangular areas are yellow. These are only on the fail-safe signal modules.
② Two LEDs per input:
- One for channel status: Green (on = input on, off = input off)
- One for channel faults: Red (on = problem/passivated, off = ok, blink = ready to reintegrate (activate))

Note: Refer to "Digital input applications" (Page 64) for alternate applications wiring.

Table 1-94 Connector pin locations for SM 1226 F-DI 16 x 24 V DC (6ES7226-6BA32-0XB0)

Pin	X10	X11
1	L+ / 24 V DC	Functional Earth
2	M / 24 V DC	No connection

A.3.3 SM 1226 F-DQ 4 x 24 V DC

A.3.3.1 Properties

Article number

6ES7226-6DA32-0XB0

Properties

The SM 1226 F-DQ 4 x 24 V DC has the following features:

- Four outputs, P- and M-switching
- 2 A output current
- Rated load voltage 24 V DC
- Suitable for solenoid valves, DC contactors, and indicator LEDs
- Module fault display (DIAG; green and red LED)
- Status display for each output (green LED)
- Fault display for each output (red LED)
- Safety class SIL 3 attainable
- Assignable diagnostics
- Refer to "Fault diagnostics" (Page 105) for a description of LED and diagnostic message functions.

A.3.3.2 User data space

The SM 1226 F-DQ 4 x 24 V DC user data space is four Process value output bits followed by four Value status bits.

This is the bit structure for an F-DQ DC module configured with input start address 8:

Terminal	Process value bit	Value status bit
F-DQ a.0	Q8.0	I8.0
F-DQ a.1	Q8.1	I8.1
F-DQ a.2	Q8.2	I8.2
F-DQ a.3	Q8.3	I8.3

A.3.3.3 Specifications

Table 1-95 General specifications

Model	SM 1226 F-DQ 4 x 24 V DC
Article number	6ES7226-6DA32-0XB0
Dimensions W x H x D (mm)	70 x 100 x 75
Weight	270 grams
Power dissipation	8 W
Current consumption (SM Bus, 5 V DC)	125 mA

Model		**SM 1226 F-DQ 4 x 24 V DC**
Current consumption (24 V DC)		170 mA + load current for all P-switch outputs
Isolation		• Signal terminals on this module are referenced to this module's M terminal and NOT ISOLATED from each other. • Signal terminals on this module are isolated to 707 V DC (type test) from S7-1200 system internal logic and Ground.
Assigned address area	I/O area for inputs	6 bytes
	I/O area for outputs	6 bytes
Maximum achievable safety class	In accordance with IEC 61508:2010	SIL 3
	In accordance with EN ISO 13849-1:2015	Category 4, PL e
Fail-safe performance characteristics	Safety Integrity Level (SIL)	SIL 3
	Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg	1e-5
	Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH	4e-9
	Proof test interval (Mission time or Useful lifetime)	20 years
	Safety repair time	100 hours
Outputs status display		Green LED / channel
Outputs fault display		Red LED / channel
Module fault display		Red / Green LED (DIAG)
Diagnostic information can be displayed		Possible (TIA Portal, HMI, or Web page)

Table 1-96 Performance

Model	**SM 1226 F-DQ 4 x 24 V DC**
T_{cycle_q}: Internal cycle time	8 ms Note: Refer to "Response time parameters for the SM 1226 F-DQ 4 x 24 VDC" (Page 187) for further information.

Table 1-97 Power supply (L+, M)

Model	**SM 1226 F-DQ 4 x 24 V DC**
Voltage range	20.4 V DC to 28.8 V DC
Surge voltage	35 V DC for 0.5 s
Input current	170 mA (does not include current in all P-switch loads)
Hold up time (loss of power)	• None for outputs • 1.0 ms at 20.4 V DC for internal power
Internal fuse, not replaceable	• 1 A for logic power • 7 A common for P-switch outputs F-DQ a.0 and F-DQ a.1 • 7 A common for P-switch outputs F-DQ a.2 and F-DQ a.3
Reverse polarity protection	Yes Note: Refer to "Reverse polarity protection" in the SM 1226 F-DQ 4 x 24 V DC "Digital outputs" table for more information.

Table 1-98 Digital outputs

Model		**SM 1226 F-DQ 4 x 24 V DC**
Number of outputs		4
Type		P- and M-switching
Logic 1 signal at maximum current		L+ minus 2.0 V DC (minimum): • P-switch: L+ minus 1.5 V DC (maximum) • M-switch: 0.5 V DC (maximum)
Logic 1 current		• 2 A nominal • 10 mA to 2.4 A
Lamp load		10 W (maximum)
Logic 0 current (residual)		• P-switch: 0.5 mA, maximum • M-switch: 0.5 mA, maximum
Wire break monitoring		None
Output overload protection: • M-switch • P-switch		Yes, electronic in addition to internal non-replaceable fuse. Threshold equal to or greater than 25 A turns off the switch (M- or P-) that sensed the current. Threshold of 2.4 A to 3.8 A, 400 ms time constant filter, measured at P-switch, turns both switches OFF. 7 A fuse can open for large faults.Note: Refer to "Fuse and electronic overload protection" (Page 172) for more information.
Current per common (maximum)		8 A
Inductive clamp voltage		• M-switch: + 48 V DC referenced to M • P-switch: - 26 V DC referenced to M
Behavior on RUN to STOP		Only 0 (OFF) is allowed
Number of outputs on simultaneously		4 at 55 °C horizontal or 45 °C vertical
Parallel connection of 2 outputs		Not possible
Control of a digital input		Not possible
Switching frequency	With resistive load	30 Hz symmetrical, maximum
	With inductive load in accordance with IEC 60947-5-1, DC13	0.1 Hz symmetrical, maximum
	With lamp load	10 Hz symmetrical, maximum
Cable length (meters)		• 200 m unshielded • 200 m shielded
Reverse polarity protection		Yes, except loads connected between M-switch and L+ will conduct if M and L+ are reversed. Note: Refer to Digital Output Application Mode 2 (Page 70) for more information.

A.3.3.4 Fuse and electronic overload protection

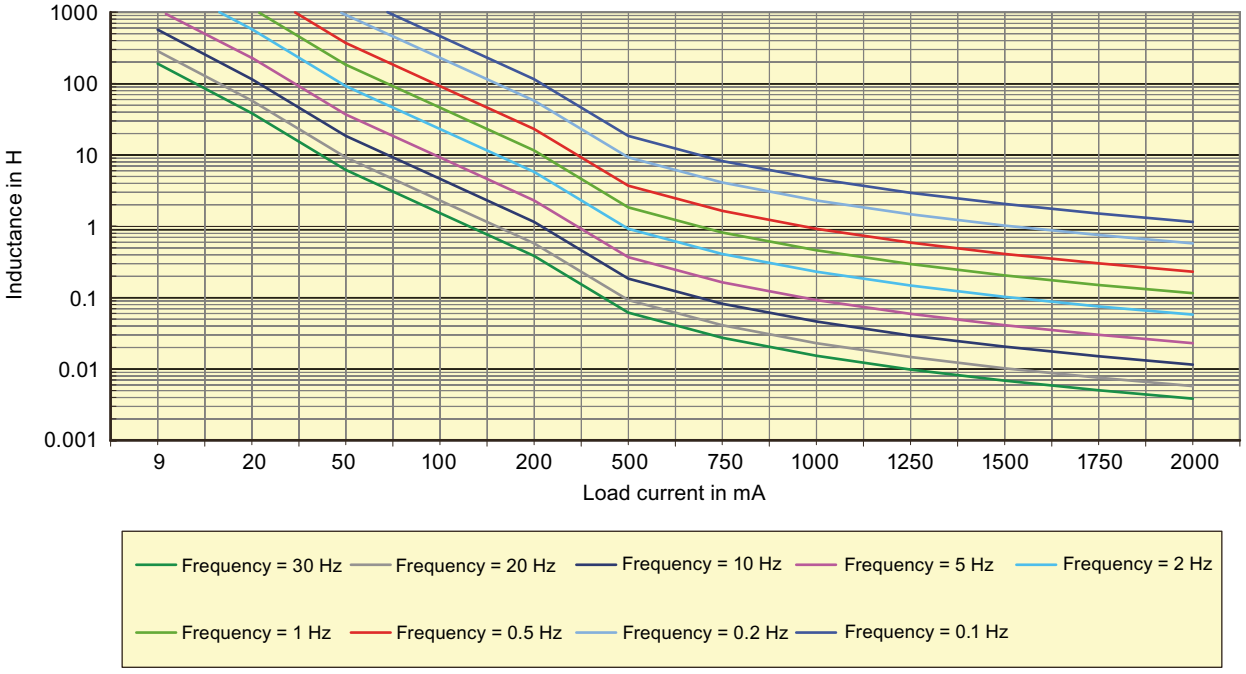
Overload protection attempts to protect the module from damage from moderate faults in the range of 2.4 A to 15 A at the P switch. Above 15 A on each P-switch fuse, the internal non-replaceable fuse can open. Supply your SM 1226 F-DQ 4 x 24 V DC from a source limited to less than 15 A, or use an external fuse or non-shorting load element to prevent opening of the internal fuse.

The internal electronic limiting causes the channel to passivate and reports as an overload. If no damage results, you can reintegrate the channel after removal of the external fault.

A.3.3.5 Switching of loads

Connecting capacitive loads

Load capacitance can delay the voltage response as seen at the P- and M- switches of the SM 1226 F-DQ 4 x 24 V DC. For a capacitive load with capacitance C across P and M, and a parallel load resistance R, the "Maximum readback time" needs to be longer than 1 time constant (R * C) of the load. This allows enough time for an appreciable voltage change to be seen when you briefly de-energize an energized load during bit pattern testing. If the resulting "Maximum readback time" is too long for your application, you can reduce this time constant by adding parallel resistance across the load to reduce the realized R * C time constant.



Stray capacitance between the load circuit and ground, M, and P increases the time required for the "Maximum readback time switch on test". When module diagnostics switch "ON" a P or M switch to a de-energized load during bit pattern testing, both sides of the load are driven towards L+ or M, limited by stray capacitance. This effect is typically small.

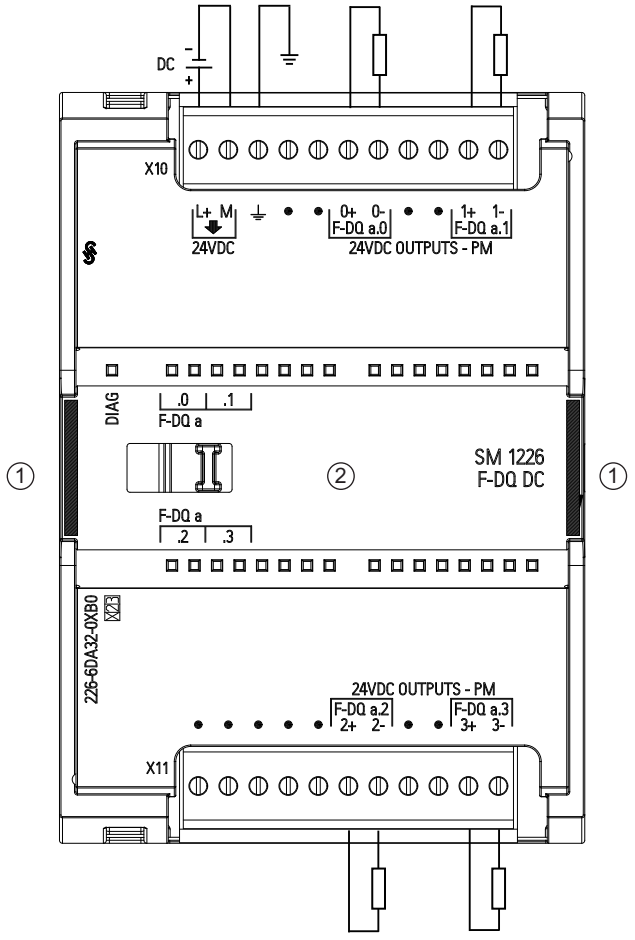
Your "Maximum readback time switch on test" should be long enough for the load circuit voltage to react, but short enough that if one side of the load faults to P or M, testing of the opposite switch should not cause the load to mechanically react.

Capacitive loads (including power supplies with input capacitors) with low series resistance can have a large inrush current. If you have a large capacitive load, you should add series resistance to reduce the inrush current to reduce the risk of opened fuses or overcurrent fault detection on normal load switch ON events.

Switching of inductive loads

The graph below shows the maximum permitted inductive load and switching frequency allowed using only the internal suppression circuits of the F-DQ DC outputs. You should equip larger or more frequently switched inductive loads with external suppression circuits to avoid early failure of the F-DQ DC output switch. The external suppression must conduct the load current at a voltage less than the internal suppression threshold to avoid overloading the internal suppression. Refer to "Guidelines for inductive loads" (Page 90) for more information:

WARNING



Unsuppressed inductive loads can lead to failures.
The following failures can result:

- Unsuppressed inductive loads can lead to early "stuck-on"' failures of F-DQ DC and F-RLY outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
You should use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads.

A.3.3.6 Wiring diagrams

Table 1-99 SM 1226 F-DQ 4 x 24 V DC (6ES7226-6DA32-0XB0)

① The two rectangular areas are yellow. These are only on the fail-safe signal modules.
② Two LEDs per output:
- One for channel status: Green (on = output on, off = output off)
- One for channel faults: Red (on = problem/passivated, off = ok, blink = ready to reintegrate (activate))

Note: Refer to "Digital output applications" (Page 69) for alternate applications wiring.

Table 1-100 Connector pin locations for SM 1226 F-DQ 4 x 24 V DC (6ES7226-6DA32-0XB0)

Pin	X10	X11
1	L+ / 24 V DC	No connection
2	M / 24 V DC	No connection
3	Functional Earth	No connection
4	No connection	No connection
5	No connection	No connection
6	F-DQ a.0+ / P-switch	F-DQ a.2+ / P-switch
7	F-DQ a.0- / M-switch	F-DQ a.2- / M-switch
8	No connection	No connection
9	No connection	No connection
10	F-DQ a.1+ (P-switch)	F-DQ a.3+ (P-switch)
11	F-DQ a.1- (M-switch)	F-DQ a.3- (M-switch)

A.3.4 SM 1226 F-DQ 2 x Relay

A.3.4.1 Properties

Article number

6ES7226-6RA32-0XB0

Properties

The SM 1226 F-DQ 2 x Relay has the following features:

- Two relay outputs (each output switches two circuits)
- 5 A output current
- Rated load voltage 24 V DC or 24 V AC to 230 V AC
- Module fault display (DIAG; green and red LED)
- Status display for each output (green LED)
- Fault display for each output (red LED)
- Safety class SIL3 attainable
- Assignable diagnostics
- Refer to "Fault diagnostics" (Page 105) for a description of LED and diagnostic message functions.

A.3.4.2 User data space

The SM 1226 F-DQ 2 x Relay user data space is two Process value output bits followed by two Value status bits.

This is the bit structure for an F-RLY module configured with input start address 8:

Terminal	Process value bit	Value status bit
F-DQ a.0	Q8.0	I8.0
F-DQ a.1	Q8.1	I8.1

A.3.4.3 Specifications

Table 1-101 General specifications

Model		SM 1226 F-DQ 2 x Relay
Article number		6ES7226-6RA32-0XB0
Dimensions W x H x D (mm)		70 x 100 x 75
Weight		340 grams
Power dissipation		10 W
Current consumption (SM Bus, 5 V DC)		120 mA
Current consumption (24 V DC)		300 mA
Assigned address area	I/O area for inputs	6 bytes
	I/O area for outputs	6 bytes

Model		**SM 1226 F-DQ 2 x Relay**
Maximum achievable safety class	In accordance with IEC 61508:2010	SIL 3
	In accordance with EN ISO 13849-1:2015	Category 4, PL e
Fail-safe performance characteristics	Safety Integrity Level (SIL)	SIL 3
	Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg	1e-5
	Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH	4e-9
	Proof test interval (Mission time or Useful lifetime)	20 years
	Safety repair time	100 hours
Outputs status display		Green LED / channel
Outputs fault display		Red LED / channel
Module fault display		Red / Green LED (DIAG)
Diagnostic information can be displayed		Possible (TIA Portal, HMI, or Web page)

Table 1-102 Performance

Model	**SM 1226 F-DQ 2 x Relay**
T_{cycle_r}: Internal cycle time	8 ms Note: Refer to "Response time parameters for the SM 1226 F-DQ 2 x Relay" (Page 188) for further information.

Table 1-103 Power supply (L+, M)

Model	**SM 1226 F-DQ 2 x Relay**
Voltage range	20.4 V DC to 28.8 V DC
Surge voltage	35 V DC for 0.5 s
Input current	300 mA
Isolation (L+, M to S7-1200 internal logic and Ground)	707 V DC (type test)
Hold up time (loss of power)	• None for outputs • 1.0 ms at 20.4 V DC for internal power with outputs off • 0.5 ms at 20.4 V DC with either output or both outputs on
Internal fuse, not user replaceable	1 A for internal power
Reverse polarity protection	Yes

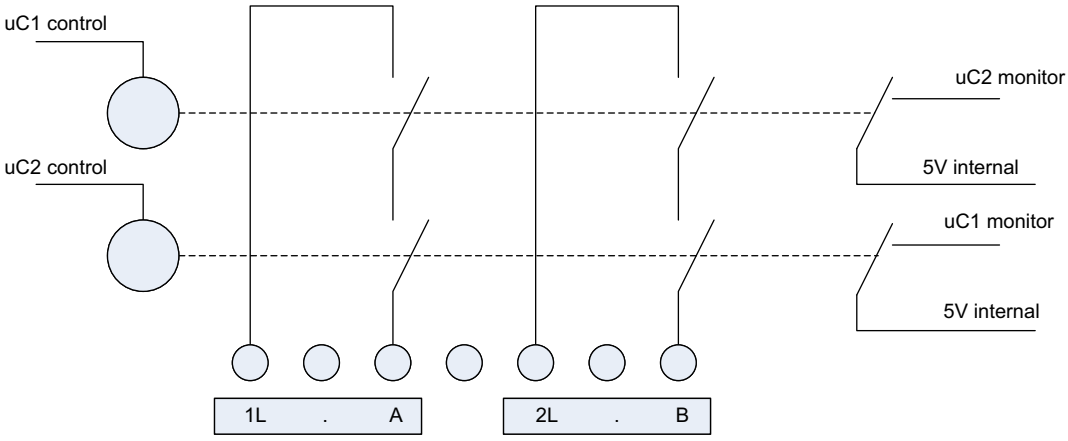


Table 1-104 Digital outputs

Model		**SM 1226 F-DQ 2 x Relay**
Number of outputs		2 (2 circuits per output)
Type		Relay, mechanically linked sense contact monitored internal to module
Voltage range		5 to 30 V DC or 5 to 250 V AC
Output current	Continuous thermal current	5 A maximum per circuit
	Minimum load current	5 mA
Current per common		5 A
Current per module (maximum) – all output circuits		10A at 55 °C horizontal or 45 °C vertical

Model		**SM 1226 F-DQ 2 x Relay**
ON state contact resistance		0.2 Ω maximum when new
Wire break monitoring		None
Short-circuit protection of output		None; external fuse or circuit breaker required. General purpose fuse type gG per IEC 60269, 5A maximum on each circuit. Some application standards require derating.
Overload protection of output		None
Isolation (output circuits to logic)		2200 V AC, rated for Overvoltage Category III
Isolation (output circuits to power supply)		2200 V AC, rated for Overvoltage Category III
Isolation (circuit to circuit on same output)		2200 V AC Note: Circuit-to-circuit isolation (A circuit to B circuit) on the same output is not rated to separate line voltage from SELV / PELV.
Isolation (output to output)		2200 V AC; rated for Overvoltage Category III, including Overvoltage Category III to SELV separation or different phase separation.
Isolation groups		4
Inductive clamp voltage		None; external protection required.
On delay time		Typically 20 ms to both series contacts closed, including 8 ms separation between commands to series contacts
Off delay time		Typically 16 ms to first series contact open, second contact opens approximately 40 ms later.
Behavior on RUN to STOP		Only 0 (OFF) is allowed.
Number of outputs on simultaneously		2
Parallel connection of 2 outputs		Allowed for redundant availability. Do not exceed single relay load rating.
Control of a digital input		With 24 V DC SELV supply
Switching frequency	With resistive load	2 Hz, maximum
	With inductive load in accordance with IEC 60947-5-1, DC13	0.1 Hz, maximum
	With inductive load in accordance with IEC 60947-5-1, AC15	2 Hz, maximum
	Inductive load in accordance with UL 508	Pilot Duty B300, R300
Cable length (meters)		• 200 m shielded • 200 m unshielded
Reverse polarity protection		No

A.3.4.4 Relay output circuits

The SM 1226 F DQ 2 x Relay has two output channels (F-DQ a.0 and F-DQ a.1). Each channel includes two circuits that switch mechanically-linked contacts at the same time. Each circuit has two contacts in series controlled by independent relay coils. Opening and closing of the series contacts in each circuit is sequenced to avoid common wear-out failures.

Output channel a.0: Two circuits controlled as one process output channel
Refer to the isolation description in the SM 1226 F-DQ 2 x Relay (Page 176) specifications, Digital outputs table.

⚠ WARNING

Adjacent relay contacts in the same channel of the SM 1226 F DQ 2 x Relay are not rated to separate AC line from SELV / PELV.
Death or serious personal injury and damage to machines and equipment may result if SELV/PELV circuits are wired adjacent to high voltage circuits on this module.
The A and B circuits of each output must either be both AC line or both SELV.

A.3.4.5 Switching performance and service life of contacts

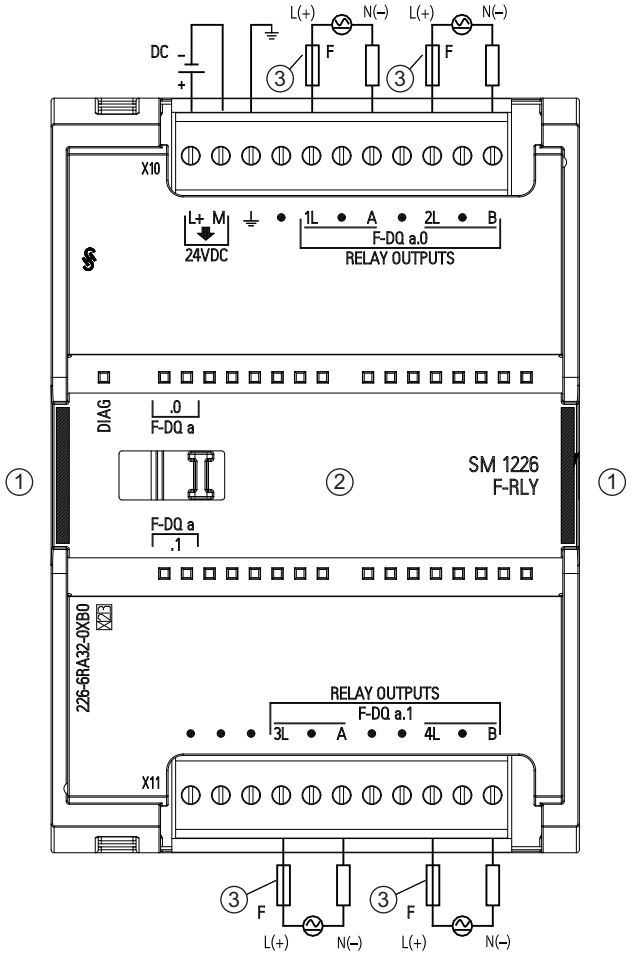
Note the "Switching performance and service life of contacts" table below. You should equip Inductive loads with suppression circuits to avoid shortened relay contact life and to avoid excessive switching noise. Refer to "Guidelines for inductive loads" (Page 90) for more information:

Table 1-105 Switching performance and service life of contacts

Resistive load	Voltage	Current	Duty cycle (typical) Normally-Open (NO) contact
For resistive load	24 V DC	5.0 A	0.35 million
		3.0 A	0.5 million
		2.0 A	0.75 million
		1.0 A	1.8 million
		0.5 A	4 million
	230 V AC	5.0 A	0.1 million
		3.0 A	0.15 million
		2.0 A	0.2 million

Resistive load	Voltage	Current	Duty cycle (typical) Normally-Open (NO) contact
For resistive load	230 V AC	1.0 A	0.4 million
		0.5 A	0.8 million
For inductive load to IEC 60947-5-1 DC13/AC15	24 V DC	1.0 A	0.1 million
		0.5 A	0.2 million
	230 V AC	1.0 A	0.2 million
		0.5 A	0.35 million

⚠ WARNING



Unsuppressed inductive loads can lead to failures.
The following failures can result from unsuppressed inductive loads:

- Unsuppressed inductive loads can lead to early "stuck-on'" failures of F-DQ and F-relay outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
You should use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads.

A.3.4.6 Wiring diagrams

Table 1-106 SM 1226 F-DQ 2 x Relay (6ES7226-6RA32-0XB0)

① The two rectangular areas are yellow. These are only on the fail-safe signal modules.
② Two LEDs per output:
- One for channel status: Green (on = output on, off = output off)
- One for channel faults: Red (on = problem/passivated, off = ok, blink = ready to reintegrate (activate))

③ External fuse
Note: Refer to "Digital output applications" (Page 69) for alternate applications wiring.

⚠ WARNING

External fuse or circuit breaker required
Use a general purpose fuse type gG per IEC 60269, 5A maximum on each circuit. Some application standards require derating to exclude contact welding as a fault.
Failure to follow these installation requirements could result in death, severe personal injury, and property damage.
Always follow these requirements when installing S7-1200 modules.

Table 1-107 Connector pin locations for SM 1226 F-DQ 2 x Relay (6ES7226-6RA32-0XB0)

Pin	X10	X11

A.4 Companion products

A.4.1 PM1207 power module

The PM1207 is a power supply module for the SIMATIC S7-1200. It provides the following features:

- Input: 120/230 V AC, output: 24 V DC/2.5 A
- Article number: 6ESP332-1SH71-4AA0

For more information about this product and for the product documentation, refer to the product catalog web site for the PM1207 (https://eb.automation.siemens.com/mall/en/de/Catalog/Product/6AG1332-1SH71-4AA0)

Fail-Safe response times

C

C.1 Maximum response time of the system

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced V14: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times" (http://support.automation.siemens.com/WW/view/en/49368678/133100).) Excel file (RT_calculator). Use your configured individual fail-safe SM timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{CYCLE} parameter values given below include an allowance for the fail-safe SM to acquire and deliver PROFIsafe messages in transactions with the S7-1200 I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe SM location and the fail-safe CPU. There are no separate transport delay parameters that you must include in your calculations.

C.2 Response time parameters for the SM 1226 F-DI 16 x 24 VDC

Maximum Device Acknowledge Time of the SM 1226 F-DI 16 x 24 VDC

T_{DAT_i} 9.44 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the F-DI to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

Maximum response time of the SM 1226 F-DI 16 x 24 VDC

1oo1 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle_i}$

$T_{OFDT_i} = T_{WCDT_i} + T_{scf}$

1oo2 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle_i}$

$T_{OFDT_i} = T_{WCDT_i} + T_{DIS}$

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time of the F-DI from a signal transition at the digital input to the reliable availability of the safety message frame available for the fail-safe CPU request.
T_{OFDT_i}	One Fault Delay Time: Maximum response time for the F-DI to report a channel as passivated.
T_{filter}	Configured "Input filters" time for the channel
T_{DIS}	Discrepancy time: • Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" • Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "0" for 1oo1 channels You should include the expected discrepancy time between your sensor inputs in your external sensor delay. Your configured T_{DIS} contributes to T_{OFDT} as the time delay for the F-DI to passivate the channel due to fault case extension of the discrepancy time. This parameter can be listed separately in the RT_calculator. Do not include T_{DIS} in the value of T_{OFDT} that you enter into the RT_calculator if you enter T_{DIS} as a separate item.
T_{sct}	Time delay for short-circuit test duration: • "0" if no short-circuit test configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in equation for T_{WCDT_i} if short-circuit test is configured.)
T_{scf}	Time delay for short-circuit fault detection: • Configured "Interval for short-circuit test", when operating in high demand or continuous mode and depending on the short-circuit test to achieve your required level of safety integrity • "0" when not depending on the short-circuit test to achieve your required level of safety integrity
T_{cycle_i} 8 ms	Internal cycle time of F-DI

The term "2 x T_{cycle_i}" allows for other input delays to complete just after the beginning of a cycle. The F-DI processes and reports the changed input data on the next cycle.

C.3 Response time parameters for the SM 1226 F-DQ 4 x 24 VDC

Maximum Device Acknowledge Time of the SM 1226 F-DQ 4 x 24 VDC

T_{DAT_q} 12.98 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the F-DQ DC to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

Maximum response time of the SM 1226 F-DQ 4 x 24 VDC

$T_{WCDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle_q}$

$T_{OFDT_q} = T_{WCDT_q}$

Where:

T_{WCDT_q}	Maximum response time of the F-DQ DC from the receipt of a safety message frame from the safety program in the fail-safe CPU to the signal transition at the digital output
T_{OFDT_q}	One Fault Delay Time: Maximum response time for the F-DQ DC to turn an output OFF upon detection of a channel or module fault.
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel
T_{cycle_q} 8 ms	Internal cycle time of F-DQ DC

The term "2 x T_{cycle_q}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The F-DQ DC processes the changed output request and applies new data to the output switches on the next cycle.

After the F-DQ DC commands the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Minimum permissible OFF time for SM 1226 F-DQ 4 x 24 VDC

The F-DQ DC expects to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than T_{WCDT_q} can cause the channel to passivate.

C.4 Response time parameters for the SM 1226 F-DQ 2 x Relay

Maximum Device Acknowledge Time of the SM 1226 F-DQ 2 x Relay

T_{DAT_r} 11.93 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the F-RLY to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

Maximum response time of the SM 1226 F-DQ 2 x Relay

T_{WCDT_r} **= 30 ms + 2 x** T_{cycle_r}	OFF to ON
T_{WCDT_r} **= 30 ms + 2 x** T_{cycle_r}	ON to OFF, normal transition with no fault
T_{WCDT_r} **= 70 ms + 2 x** T_{cycle_r}	ON to OFF, fault case, last-on/first-off relay in sequenced pair stuck ON

$T_{OFDT_r} = T_{WCDT_r}$

Where:

T_{WCDT_r}	Maximum response time of the F-RLY from the receipt of a safety message frame from the safety program in the fail-safe CPU to the relay contacts fully responding
T_{OFDT_r}	One Fault Delay Time: Maximum response time for the F-RLY to turn an output OFF upon detection of a channel or module fault.
T_{cycle_r} 8 ms	Internal cycle time of F-RLY

The term "2 x T_{cycle_r}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The F-RLY processes the change request and applies new data to the relay on the next cycle.

Minimum permissible OFF time for SM 1226 F-DQ 2 x Relay

The F-RLY expects to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than "T_{min_off}" can cause the channel to passivate.

$T_{min_off} = 2 \times T_{cycle_r} + 150$ ms

SIEMENS
SIMATIC

Automation system S7-1200
Compact Operating Instructions
Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity
- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/13683/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/13683/cert?ct=444&ci=5596).

Firmware
You will find the latest firmware versions for the automation system (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/search?t=all&search=S71200&type=Download&lc=zh-WW).

Documentation
The complete documentation for the automation system consists of product information documents, the system manual and the Easy Book. You will find these on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109744173).

Retention of the documentation
Retain this documentation for later use.
1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.
1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Only install products with IP20 degree of protection according to IEC 60529 in enclosures, cabinets, or electrical equipment rooms suitable for the end use that meet at least this degree of protection.

⚠ WARNING

Electric shock due to externally supplied plant units
Even if the main supply to the plant is disconnected, externally supplied plant units can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.
Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Electric shock due to permissible electric potential difference

Due to the permissible electric potential difference, a dangerous voltage may be present at the inputs of modules. An electric shock on contact with live parts can lead to death or serious injury.

Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Safety functional extra low voltage

The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173) of the fail-safe I/O and in the data sheets of the power supplies to be used.

Use a power supply unit with output voltage that does not exceed 35 V DC even in the event of a fault.

Observe the maximum permissible switching conditions specified in the equipment manual for F-RQ modules.

Follow the notes and warnings in the respective manual.

Electromagnetic Compatibility

The product is intended for operation in the Industrial EMC environment class.

Ensure that your automation system is installed in compliance with EMC requirements, as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173) for the product.

NOTICE

Interference emission / Interference immunity

Operation of the product can cause radio interference in residential areas.

If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

ATEX-/UKEX device intended for use in hazardous area

If the product is intended for use in a potentially explosive atmosphere (gas/air or gas/dust mixture), observe the special information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173). The intended use (e.g. ATEX zone, degree of protection, temperature class) is indicated on the product (in the declaration of conformity and usually also on the nameplate).

NOTE

As a rule, country-specific requirements for the operator also apply when a product is used in a potentially explosive atmosphere (e.g. Directive 1999/92/EC for the EU).

Safety in potentially hazardous atmospheres
SIMATIC systems are suitable for use in zones with occasional presence of hazardous gas atmospheres (equipment group II, Cat. 3, gases, vapors, mists). You can find information, restrictions and special conditions in the respective system manuals. To avoid damage, determine a suitable installation location and select suitable products. It is mandatory to define the following points before planning your automation system:

- Hazardous plant areas
- Potentially existing atmosphere
- Relevant requirements for the products

⚠ WARNING

Explosion hazard
If work in areas with potentially hazardous atmospheres is not carried out correctly, an explosion may occur. Explosions can lead to serious personal injury or damage to the plant.
Only suitably qualified specialists are allowed to plan and perform activities in areas with potentially hazardous atmospheres. In hazardous areas, always de-energize the SIMATIC system before starting activities.

Cleaning
If you need to clean the product, use dry ESD cleaning cloths (observing the protective measures for ESD).
Requirement: All supply voltages present on the device are switched off. Observe the five safety rules for working in and on electrical installations.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173).

Functional safety

⚠ WARNING

Danger to humans and the environment
To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components. For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109744173).

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether the firmware version is approved for the respective fail-safe I/O.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

2 Use of radio devices and cell phones

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

SIEMENS

SIMATIC
S7-1200
S7-1200 Firmware update V4.6
Product Information

Description

This firmware update provides the following feature improvements and functional changes:

- Increased work memory for S7-1200 CPUs:
  - CPU 1211C is now 75 Kbytes.
  - CPU 1212C is now 100 Kbytes.
  - CPU 1214C is now 150 Kbytes.
  - CPU 1215C is now 200 Kbytes.
  - CPU 1217C is now 250 Kbytes.
  - CPU 1212FC is now 150 Kbytes.
  - CPU 1214FC is now 200 Kbytes.
  - CPU 1215FC is now 250 Kbytes.
- The CPU disables SNMP by default.

Follow the links provided below for information on previous firmware update versions:

- V4.5.2 (https://support.industry.siemens.com/cs/ww/en/view/109806180)
- V4.5.1 (https://support.industry.siemens.com/cs/ww/en/view/109800925)
- V4.5.0 (https://support.industry.siemens.com/cs/ww/en/view/109797782)
- V4.4.1 (https://support.industry.siemens.com/cs/ww/en/view/109780308)
- V4.4.0 (https://support.industry.siemens.com/cs/ww/en/view/109773087)
- V4.3.1 (https://support.industry.siemens.com/cs/ww/en/view/109767000)
- V4.3.0 (https://support.industry.siemens.com/cs/ww/en/view/109764327)
- V4.2.3 (https://support.industry.siemens.com/cs/ww/en/view/109760967)
- V4.2.2 (https://support.industry.siemens.com/cs/ww/en/view/109756819)
- V4.2.1 (https://support.industry.siemens.com/cs/ww/en/view/109746398)
- V4.2.0 (https://support.industry.siemens.com/cs/ww/en/view/109741628)
- V4.1.3 (https://support.industry.siemens.com/cs/ww/en/view/109479125)
- V4.1.2 (https://support.industry.siemens.com/cs/ww/en/view/109478025)
- V4.1.1 (https://support.industry.siemens.com/cs/us/en/view/109550831)

Required user action

You can update the CPU firmware using one of the following methods:

- The Web server
- The Online & diagnostics functions of STEP 7
- The SIMATIC Automation Tool
- A SIMATIC Memory Card that contains the firmware update file from the Siemens Industry Online Support site

The S7-1200 System Manual and the SIMATIC Automation Tool User Guide document these methods.
After you apply the CPU firmware update, verify that your application operates as expected.

Introduction

1

Purpose of the documentation

The S7-1200 G2 programmable logic controllers (PLCs) can control a variety of automation applications. Compact design, affordable price, and a powerful instruction set make the S7-1200 G2 CPU and IO devices a perfect solution for controlling a wide variety of applications. Together with the TIA Portal configuration and programming tool, you have the flexibility you need to design your automation solutions.

This manual provides information about the S7-1200 G2 Fail-safe IO. It contains information for engineers, programmers, installers, and electricians.

Required basic knowledge

To understand this manual, you need a general knowledge of automation and programmable logic controllers.

Validity of the documentation

This manual describes the S7-1200 G2 Fail-safe IO.

Refer to the technical specifications for each IO device in the S7-1200 G2 Fail-safe family.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

NOTE

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

ID link for the digital nameplate

The ID link is a globally unique identifier according to IEC 61406-1, which you will find as a QR code on your product.

The figure shows an example of an ID link for the SM 1226 F-DI 4x, F-DQ 2x, DI 2x.

You can recognize the ID link by the frame with a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Access the ID link.

In the digital nameplate, you can find product data, manuals, declarations of conformity, certificates and other helpful information about your product.

⚠ WARNING

Risks when using a cellular phone in close proximity to an S7-1200 G2 system
Using a cellular phone in close proximity to an S7-1200 G2 system with cellular and Wi-Fi communications active can cause unpredictable behavior.
To reduce any influence of a cellular phone on the S7-1200 G2 system, and to ensure proper operation of your devices, place the phone in "Airplane mode" to disable cellular and Wi-Fi before bringing the phone into proximity (<10 cm) of the CPU.
Failure to comply with these guidelines can cause damage or unpredictable operation, which could result in death, severe personal injury, and/or property damage.

SiePortal Products & Services

The SiePortal Products & Services page provides the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://sieportal.siemens.com/en-us/products-services?tree=CatalogTree).

Certifications and approvals

Refer to the technical specifications for details on certifications and approvals.

Glossary

The definitions in the glossary provide an easy first reference for understanding the terms in this manual. Some terms have detailed formal definitions in IEC 61508, EN ISO 13849, IEC 61784-3-3, and associated standards. These terms refer to broad safety concepts, for which the standards provide specific details.

1.1 Documentation guide

In addition to this manual, Siemens offers technical information at Siemens Industry Online Support (https://support.industry.siemens.com/cs/start?lc=en-US). You can also find other resources online.

Contact your Siemens distributor or sales office for assistance in answering any technical questions, for training, or for ordering S7 products. Because your sales representatives are technically trained and have specific knowledge about your operations, processes, and industry, as well as the individual Siemens products that you are using, they can provide the fastest and most efficient answers to any problems you might encounter.

Maintaining operational safety of your plant

NOTE

Operators of plants with safety-related features must meet operational safety requirements. Suppliers must also take measures when monitoring products.
To stay up-to-date on the latest operational safety requirements, visit the Siemens Industry Online Support (https://support.industry.siemens.com/cs/start?lc=en-US) site and subscribe to email notifications:
Log onto Industry Online Support. Go to the following links and click "email on update":

- SIMATIC WinAC RTX (F) (https://support.industry.siemens.com/cs/products?mfn=ps&pnid=13917&lc=en-WW)
- SIMATIC S7-1500/SIMATIC S7-1500F (https://support.industry.siemens.com/cs/ww/en/ps/13716)
- SIMATIC S7-1200 G2/SIMATIC S7-1200 G2 F (https://support.industry.siemens.com/cs/us/en/ps/30068)
- Distributed I/O (https://support.industry.siemens.com/cs/ww/en/ps/14029)
- STEP 7 (TIA Portal) (https://support.industry.siemens.com/cs/ww/en/ps/14667)

NOTE

To reduce the risks associated with malicious or counterfeit CPUs and modules, use only official sales channels, such as the following:

- SiePortal Products & Services
- Official Siemens distributors
- Country-specific official Siemens sales and distribution channels

NOTE

To reduce the risks associated with compromised CPU or module firmware, only download firmware from the Siemens Industry Online Support website and verify the file integrity against the associated published SHA checksum.

NOTE
To reduce the risk of physical tampering with critical industrial equipment, implement the measures defined in the Operational guidelines (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity/downloads.html).

NOTE
For additional security, the CPU uses firmware encryption. While encryption provides confidentiality of the firmware, the main purpose is to enhance the secure boot process.

1.2 SIMATIC Technical Documentation

S7-1200 G2 and the TIA Portal provide a variety of documentation and other resources for finding the technical information that you require.

- The *S7-1200 G2 Programmable Logic Controller System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109997791) presents an overview of the Siemens Safety software and fail-safe CPUs. However, the focus of the *S7-1200 G2 F-IO Manual* is the S7-1200 G2 Fail-safe IO modules. IO configuration, diagnostics, applications, and technical specifications are emphasized.

  The English version of the *S7-1200 G2 F-IO Manual* is the authoritative (original) language for Functional Safety-related information. All translated manuals refer back to the English manual as the authoritative and/or original source. Siemens identifies the English manual as the authoritative and/or original source in the case of discrepancies between the translated manuals. The *S7-1200 G2 Programmable Logic Controller System Manual* provides specific information about the operation, programming, and the specifications for the complete S7-1200 G2 product family.
- The *S7-1200 G2 F-IO Manual; SIMATIC Safety - Configuring and Programming, Programming and Operating Manual;* and the *S7-1200 G2 Programmable Logic Controller System Manual* are available as electronic (PDF) manuals. You can download or view the electronic manuals from the Siemens Industry Online Support Web site (http://support.industry.siemens.com).
- The TIA Portal Information System provides immediate access to the conceptual information, specific instructions, and error code event IDs that describe the operation and functionality of the programming package and basic operation of SIMATIC CPUs and IO modules.
- The Siemens Industry Online Support Web site (http://support.industry.siemens.com) provides access to the SIMATIC documentation set. Existing documents are available from the Product Support link. With this online documentation access, you can also drag and drop topics from various documents to create your own custom manual.

  You can access online documentation by clicking "mySupport" from the left side of the page and selecting "Documentation" from the navigation choices. To use the mySupport Documentation features, you must sign up as a registered user.

- Siemens also provides online comprehensive support for your use of safety technology. A Safety Evaluation Tool assists you in determining required safety levels, functional examples guide you in your safety applications, and Siemens Training (SITRAIN) classes offer training in safety standards and products, while you can easily calculate your reaction times for fail-safe devices with the RT_calculator file. Visit the following web sites to access these supports:
  - Safety Evaluation Tool (http://www.siemens.com/safety-evaluation-tool)
  - Functional examples (http://www.siemens.com/safety-functional-examples)
  - SITRAIN (http://www.siemens.com/sitrain-safetyintegrated)
  - SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times Excel file (RT_calculator) (https://support.industry.siemens.com/cs/ww/en/view/58856512)

TIA Selection Tool

With the TIA Selection Tool (https://support.industry.siemens.com/cs/us/en/view/109767888), you can select, configure, and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

SINETPLAN

SINETPLAN (https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html), the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

Overview of the SIMATIC Technical Documentation

Here you will find links to technical support and to videos providing an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (http://support.industry.siemens.com)

Quick introduction to the technical documentation of automation products (https://support.industry.siemens.com/cs/ww/en/view/109742705)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://www.youtube.com/watch?v=TwLSxxRQQsA)

AI-powered online support chat

The "AskSUPport" function (https://support.industry.siemens.com/cs/ww/en/view/109974274) is an advanced AI-controlled platform that gives you access to the powerful knowledge base of the Siemens Support Portal (https://sieportal.siemens.com/en-ww/support). You do not just receive mechanical answers to your questions, but precise, interactive informational material. This allows you to effectively speed up your research and decision processes.

You can also access the entry by means of the "AI powered Online Support Chat" command in the "Help" menu in TIA Portal.

Industrial cybersecurity 2

2.1 Introduction to industrial cybersecurity

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

Refer to the SIMATIC S7-1200 G2 Programmable Logic Controller (https://support.industry.siemens.com/cs/ww/en/view/109997791) System Manual for general information and measures regarding industrial cybersecurity.

This section provides an overview of security-relevant information pertaining to your SIEMENS device.

2.2 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://www.siemens.com/cert.

2.3 Cybersecurity-relevant information

Observe all cybersecurity-relevant information.

Topics with cybersecurity-relevant information	Reference
Operational application environment and security assumptions	
Requirements for the operational application environment of the system and security assumptions	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
The security "Defense in Depth" strategy for the product to support installation, operation, and maintenance	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Guidelines for performing security hardening during installation and maintenance of the product	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Security properties of the product	
Access protection	Note the information on the topic of access protection in the "Protection" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Secure operation	
Recommendations for secure operation	Information on the secure operation of interface modules can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Corrective measures for known risks	Corrective measures for known risks are announced on the Siemens ProductCERT and Siemens CERT (https://siemens.com/productcert) web page. For more information on SIEMENS ProductCERT, refer to the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Security checks	Application-specific security measures such as cyclic checks of the configuration via checksums are described in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Secure decommissioning Products that contain security-relevant data must be securely decommissioned before disposal or resale.	Information on secure decommissioning can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Account management guidelines	You can find Information on access control, user rights, and default accounts in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Security update notifications	You can find Information on security patches for dependent components and operating systems and how to install them in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/109997791).

Topics with cybersecurity-relevant information	Reference
Integrity	
Integrity of documentation and other important files	You can find information on how to verify the integrity of documentation and file downloads like firmware updates using checksums on the SiePortal (https://support.industry.siemens.com/cs/ww/en/view/109483101) website.

Guide to S7-1200 G2 F-IO

3

3.1 Hardware and software components

Fail-safe CPUs

You can use any of the following fail-safe CPUs as of FW version V4.1.2 with the S7-1200 G2 F-IO:

- 1212FC
- 1214FC

A fail-safe system requires a fail-safe CPU with fail-safe local I/O and/or fail-safe distributed I/O.

Required software components

You require a STEP 7 V21 Basic / Professional license, which includes STEP 7 Safety Basic as an integral product.

STEP 7 V21 is the configuration and programming software for the SIMATIC Safety fail-safe system. STEP 7 V21 includes the following:

- Support for configuring the fail-safe CPUs and I/O in the hardware and network editor of the TIA Portal
- Support for creating the safety program using LAD and FBD to integrate error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD

You may require a Hardware Support Package (HSP) which corresponds with used devices and their firmware versions. To install an HSP from the TIA Portal, select "Options > Support packages". If downloading from the internet, click "Download from the internet" and enter the MLFB of the F-module to find and install the corresponding HSP.

3.2 Wiring

For information about wiring the S7-1200 G2 F-IO, refer to the *S7-1200 G2 Programmable Logic Controller System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109997791).

Wire temperature rating

Use wire and cable with a temperature rating that is 45 °C higher than the ambient temperature around the S7-1200 G2. Use the specific electrical circuit ratings and the installation environment to determine what other types of wiring and materials are needed.

3.2.1 Safety extra-low voltage requirement (power supplies and other system components)

⚠ WARNING

Operation of fail-safe modules with safe functional extra-low voltage (SELV, PELV) power sources

External connections to communications ports, analog circuits, 24 V DC nominal power supplies, and I/O circuits must be powered from approved sources that meet the requirements of SELV, PELV, Class 2, Limited Voltage, or Limited Power according to various standards. Failure to do so can result in the module's low voltage circuits becoming hazardous (for example, shock hazard).

The external power supply should limit the maximum voltage to 35 V DC even under fault conditions. Consult the manufacturer's data for the power supplies that you use.

Failure to use an appropriate external power supply can result in death, severe personal injury, and/or property damage.

Maximum applied voltage to S7-1200 G2 Fail-safe devices

- Operational voltage: The fail-safe CPU and fail-safe signal modules operational voltage is 20.4 V DC - 28.8 V DC. Design and testing assure operation of the unit to specifications. You can impose defined transients upon this voltage from defined source impedances per EN 61000-4-2, 61000-4-4, and 61000-4-6, as specified in the data sheet for each product, without disrupting operation or causing damage. Sustained operation in the range of 28.8 - 35 V DC can result in unacceptable temperature rise and thermal damage, causing the product to become inoperable.
- Absolute maximum rating regarding supply voltage: The absolute maximum rating to prevent module damage and to ensure the functional safety of the modules is 35 V DC. These power supplies must be specified by the manufacturer to limit the output voltage to 35 V DC or less under fault conditions. Otherwise, external protection must be supplied that will reliably open the circuit or limit the output voltage to less than 35 V DC to the CPU and signal modules.

Surge immunity

The S7-1200 G2 Fail-safe devices are equipped with internal protection for overloads coupled by surge voltage caused by lightning that meets the levels listed under "IEC 61000-4-5 Surge immunity" in the *S7-1200 G2 Programmable Logic Controller* (https://support.industry.siemens.com/cs/ww/en/view/109997791) System Manual. If you need higher limit values, then you need to use external protective circuits, for example a surge filter, between the voltage power supplies and the voltage input of the module to ensure surge immunity for the S7-1200 G2 Fail-safe device. Additionally, you need to use external protection between the I/O and the sensors/actuators to which the module is connected.

You can find more information in the function manual *Designing interference-free controllers* (https://support.industry.siemens.com/cs/ww/en/view/59193566).

Requirements for power supplies in the event of voltage interruption

To ensure adherence to IEC 61131-2, only use power packs/power supply units (https://support.industry.siemens.com/cs/ww/en/) with a main buffering time of at least 10 ms for DC power or 1/2 AC cycle. The port that powers the CPU meets IEC61131-2 rating of PS2 with an interruption time of 10 ms for DC power and 1/2 AC cycle for AC power. Observe the relevant requirement in your product standards (for example, 30 ms for Burner applications according to EN 298) regarding possible voltage interruptions. The latest

information on PS components is available on the Internet (https://support.industry.siemens.com/cs/ww/en/).

⚠ WARNING

Connection and isolation of power supplies and fail-safe module circuits
The power supply M terminals on the fail-safe CPU and the fail-safe SMs must be connected together or isolated as SELV. Failure to do so can result in unexpected operation.
Connecting all M terminals together or isolating with approved SELV isolation prevents unwanted current flows in the event of a single fault in the CPU to SM isolation boundary.
Unexpected operation can result in death, severe personal injury, and/or property damage.

3.3 Additional rules and regulations for the operation of the S7-1200 G2 with fail-safe modules

3.3.1 Requirements for sensors and actuators for fail-safe modules

When using sensors and actuators in safety-related applications, observe the following general requirements.

⚠ WARNING

Safety-related responsibility
Instrumentation with sensors and actuators bears a considerable safety responsibility. Also bear in mind that sensors and actuators generally require proof-test intervals that are more frequent than the service life of Siemens products, which is generally 20 years.
The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. You can find a listing of values achieved by each F-module in its respective technical specifications.
To achieve the required safety class, suitably qualified sensors and actuators are necessary.
Failure to use suitably qualified sensors and actuators can result in death, severe personal injury, and/or property damage.

Additional sensor requirements

Generally, to achieve SIL 3/Cat. 4/PL e, a single-channel sensor is adequate. However, with a single-channel sensor, the sensor itself must be SIL 3/Cat. 4/PL e capable. Otherwise, two sensors must be used. To achieve SIL 3/Cat. 4/PL e, sensors must be connected to the module using two input channels.

⚠ WARNING

Additional sensor requirements
In the case of fail-safe input modules, the value "0" is output to the F-CPU after detection of faults. You need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.
Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).
Failure to ensure that sensors are implemented to ensure reliable reaction of the safety program can result in death, severe personal injury, and/or property damage.

Duration requirements for sensor signals

⚠ WARNING

Duration requirements for sensor signals
To ensure the correct detection of the sensor signals by fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.
Failure to ensure that the sensor signals are output for a sufficient duration can result in death, severe personal injury, and/or property damage.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in "Fail-safe response times".

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly turns off outputs that are turned on and turns on particular switches of outputs that are turned off. You can assign the maximum duration of the test pulses (dark and switch-on period) with parameters.

Fast reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration of the switch-on or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

Additional requirements for actuators
If the actuators switch voltages greater than 24 V DC (for example, 230 V AC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (in accordance with IEC 60664-1).
This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.
Failure to provide proper electrical isolation can result in death, severe personal injury, and/or property damage.

Technical specifications of sensors and actuators

Refer to the technical specifications for each F-module to assist you in selecting sensors and actuators.

3.3.2 Crosstalk of digital input/output signals

Readback errors could occur on the F-DQ channels if the fail-safe digital output signals and fail-safe digital input signals are routed through a single cable.

Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply test of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line could result in crosstalk to other non-activated output or input channels. This could then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short-circuit, which leads to safety-related tripping.

To remedy this situation, do the following:

- Separate cables for fail-safe DQ modules and non-fail-safe DQ modules.
- Separate cables for F-DQ channels and F-DI channels.
- Couple relays or diodes in the outputs.
- Disable the sensor supply test if safety class requirements allow it.

Magnetic crosstalk

An inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

To remedy this situation, do the following:

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

SM 1226 F-DI 4x / F-DQ 2x 2A PPM / DI 2x, 24VDC

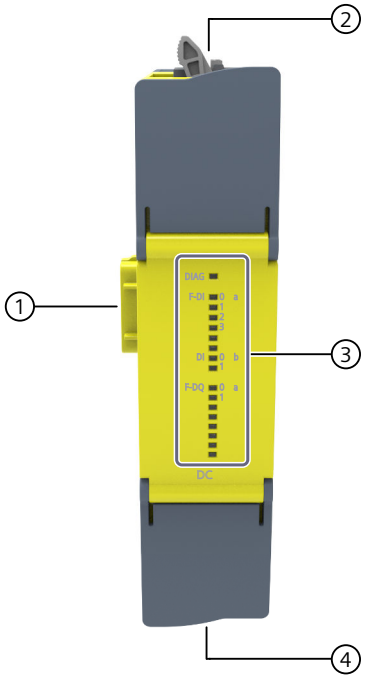
4.1 Properties

Article number

6ES7226-6ME50-0XB0

View of the module



Properties

The SM 1226 F-DI 4x, F-DQ 2x, DI 2x module has the following technical properties:

- Four 24 V DC fail-safe input channels, which can be configured as up to four fail-safe 1oo1 (1 out of 1) process inputs, up to two fail-safe 1oo2 (1 out of 2) process inputs, or as combinations thereof
- Two 24 V DC fail-safe output channels, which can be configured to operate in either PP or PM mode
- Two 24 V DC standard input channels

4.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the SM 1226 F-DI 4x, F-DQ 2x, DI 2x module:

① Bus connector
② F-DI / DI connectors
③ LED displays for channel status/fault/DIAG
④ F-DQ connectors

4.3 Functions

4.3.1 Module functions

4.3.1.1 Overview

The module supports the following functions:

Module

- Firmware update
- Identification and maintenance data I&M0

Fail-safe

- Fail-safe digital inputs
- Fail-safe digital outputs
- Embedded safety functions

Standard

- Standard digital inputs

4.3.2 Fail-safe functions

4.3.2.1 Fail-safe digital inputs

The fail-safe digital inputs are rated for connection to 24 V DC sensors/switches and have an IEC61131 Type 1 input rating.

The fail-safe module has four sensor supply outputs that can power external sensors (inputs). You can configure each fail-safe digital input to provide sensor supply or external power to any channel.

You can integrate these sensors directly as inputs into safety functions that are embedded within this F-module to control F-outputs. By configuring the F-inputs in this way, you can achieve faster reaction times when these sensors are used by the embedded Emergency Stop and/or Internal Evaluation safety functions.

Inputs and test circuit

The fail-safe digital inputs consist of four input channels (F-DI x.0 to x.3). You can configure these inputs as four 1oo1 inputs (SIL 2/Cat. 3/PL d), two 1oo2 inputs (SIL 3/Cat. 3 or Cat. 4/PL e), or combinations of 1oo1 and 1oo2 inputs.

Connections	Input channel pairs
X10	0 and 2, 1 and 3

One microcontroller monitors inputs 0 and 1, and the other microcontroller monitors inputs 2 and 3. The corresponding channels (0, 2) and (1, 3) each form a 1oo2 channel group. The first of the two fail-safe inputs conveys the signal in a 1oo2 configuration. For example, if you wire x.0 and x.2 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal appears at only the x.0 input when you close or open the circuit for both. This also applies to the channel quality.

When you configure a channel group as 1oo2, the two microcontrollers must sense an appropriate input change within a configured time. Otherwise, the module reports a discrepancy error.

If you use a sensor supply output to provide power to a sensor, you can enable short-circuit testing. The short-circuit test checks for shorts to 24 V DC on your inputs by periodically pulsing the sensor output off and verifying that the associated input is off. The sensor supply can also detect shorts to 24 V DC and ground on the sensor supply itself. The short-circuit test also detects cross-connected shorts between sensor supplies and inputs.

4.3.2.2 Fail-safe digital outputs

The fail-safe digital outputs are for use in fail-safe applications and are suitable for various actuators, including solenoid valves, DC contactors, and indicator LEDs. The two fail-safe digital outputs have PP- or PM-switching that are rated for connections to 24 V DC actuators with up to a 2.0 A rating. The fail-safe SM digital outputs use the supply voltage 2L+.

Outputs

The fail-safe digital outputs consist of two output channels (F-DQ x.0, x.1). You can use each output for SIL 3, Cat. 4, PL e applications (including dark test disabled for 48 hours).

Connections	Output channels
X11	0 and 1

Each output consists of three switches:

- Two P-switches (in series) connect 24 V DC positive (L+) through the load.
- An M-switch connects the load to M or to a 24 V DC return.

When the output is in PM mode, there are two connection points (wires). There is one wire for the P-switch and one wire for the M-switch. When the output is in PP mode, there is one connection point (wire). This single wire goes in the P-switch.

The fail-safe digital outputs use two microcontrollers to implement the safety function. One microcontroller controls one P-switch, while the other microcontroller controls the other P-switch and the M-switch. There is feedback from each of these switches to the opposite microcontroller. The feedback verifies that the output switches are operating properly and in the commanded state.

You can configure a "Max. readback time" in STEP 7 device configuration ("F-I/O parameters" > "Output parameters") that specifies the maximum amount of time that the output channel waits for the voltage to respond when the process value changes. The higher the capacitance of the connected load, the higher your set value for "Max. readback time" must be.

The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. Your configured "Max. readback time" sets the duration of the "OFF" test pulse. Your configured "Max. readback time switch on test" sets the duration of the "ON" test pulse. Choose short enough durations to not affect your load. You can disable the "OFF" test pulse with the "Disable dark test for 48 hours" parameter or with the "Disable dark test" parameter. If you select the "Disable dark test" parameter, you can only use the output for SIL 2, Cat. 3, PL d applications.

The module can detect a broken wire or missing load only when the output PV is "OFF" and the load is wired in PM mode.

4.3.2.3 Embedded safety functions (ESFs)

The fail-safe module can perform additional important safety functions with local I/O, such as Emergency Stop and Internal Evaluation. Additionally, you can chain these safety functions together by use of their internal logic results. When using the ESFs, you can achieve significantly faster reaction times.

The module provides two configurable Emergency Stop safety functions and two configurable Internal Evaluation safety functions.

When using ESFs, the module can override the process value from the F-CPU to "0" if the module invokes an ESF. Additionally, when the F-CPU sets the module's output(s) to "1" and the module clears the invocation of the ESF, the module stops overriding the output. This

allows the F-CPU to resume controlling the process value to the output(s). The following table explains this principle:

Table 1-115 ESF truth table

F-CPU PV	ESF State	ESF PV Override	Output State	Description
0	Invoked	Override to 0	0	The ESF is overriding the process value from the F-CPU to "0".
0	Not invoked	No override	0	The F-CPU is in full control of the output(s).
1	Invoked	Override to 0	0	The ESF is overriding the process value from the F-CPU to "0".
1	Not invoked	No override	1	The F-CPU is in full control of the output(s).

The ESFs provide significantly faster reaction times because the module no longer solely depends upon the F-CPU to set the output(s) to "0". This eliminates the F-CPU safety program overhead and communication overhead from the total reaction time (Page 94) to turn the output off.

NOTE

The numbered inputs for the ESFs, such as "Input #1" or "Emergency Stop 0", which are configurable in STEP 7 device configuration under "General > Safety Functions", do not correlate to the physical inputs of the fail-safe module.

Emergency Stop (Estop)

The module's Estop function is a safety measure used to de-energize the desired machine function(s). When activated in STEP 7 through Device configuration under "Safety Functions" > "Emergency Stop" and subsequently downloaded, the module begins to evaluate the configured Estop input to determine the state of the Estop button.

When the module detects that the Estop button is pressed, the module overrides the process value provided from the F-CPU to "0". The configured Estop output is de-energized in this state. If the Estop "Stop category" parameter is configured for delayed deactivation, the output remains energized from the configured Estop "Delay time" before the module overrides the process value to "0".

When the module detects that the Estop button has been reset, the user acknowledgement process is initiated if the Estop "Acknowledge necessary" is set to "Manually using rising edge". The module sets the "Acknowledge requested output" in the process image to "1", indicating that the Estop is ready to be acknowledged. You can then perform acknowledgement with the configured "Acknowledge input" by setting it from "0" to "1".

Once acknowledgement is complete, the module removes the override of the process value from the F-CPU.

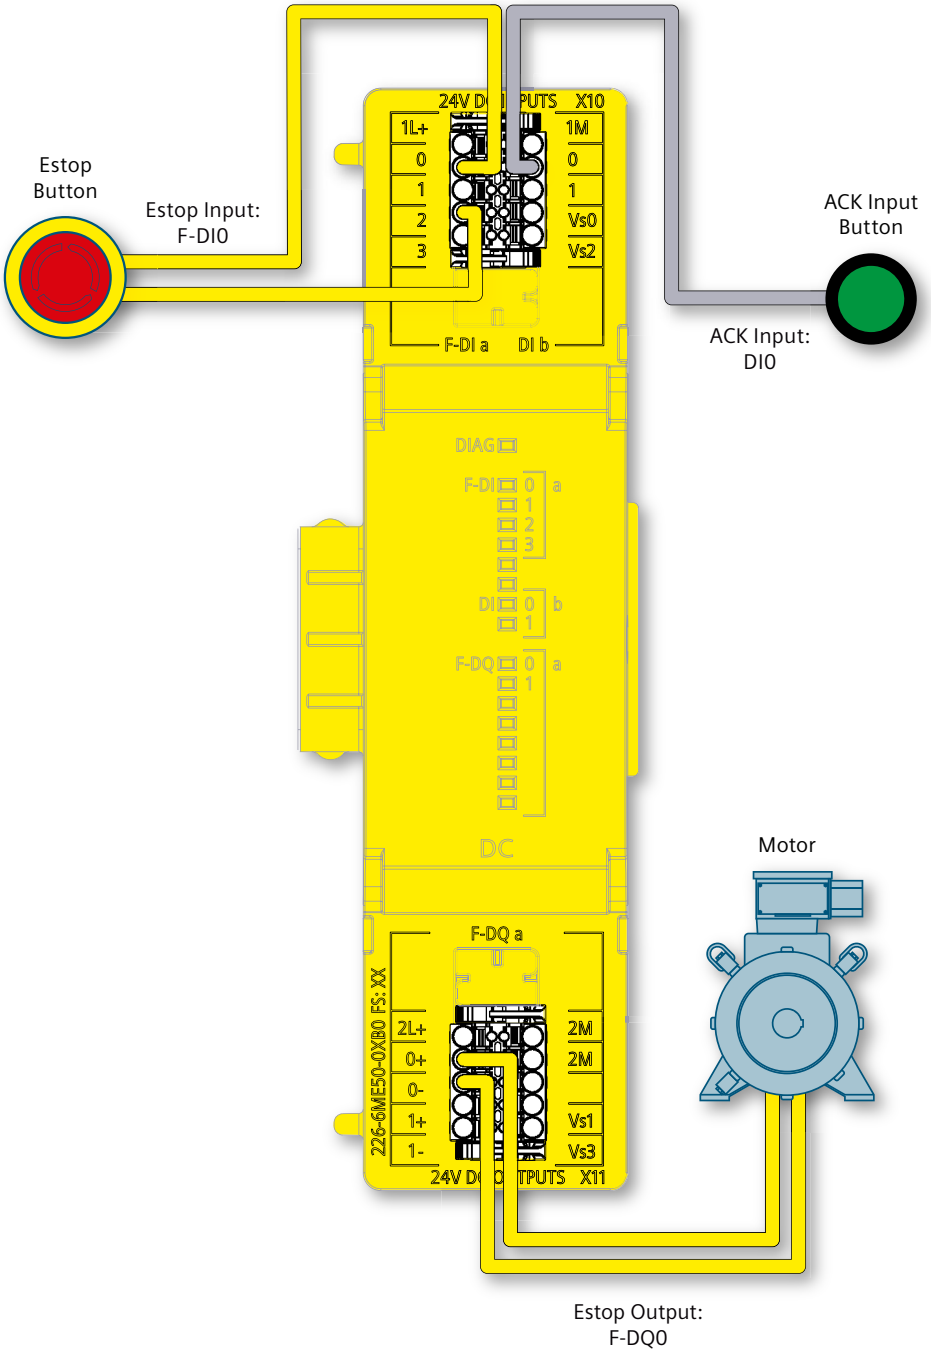


Figure 1-11 A motor controlled by the module's Estop with local I/O for acknowledgement process

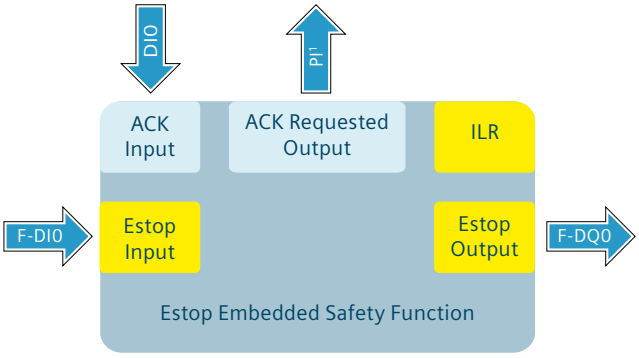

Figure 1-12 Visualization of module parameter assignment

[1]Process Image

Internal Evaluation (IE)

The module's IE function is a safety measure used to immediately de-energize the desired machine function(s). When activated in STEP 7 through Device configuration under "Safety Functions" > "Internal Evaluation" and subsequently downloaded, the module begins to evaluate the configured IE input(s) to determine the state of the connected sensor(s) and/or chained safety functions.

The IE safety function performs a Boolean "AND" operation on the configured input(s).

If the evaluation of the configured input(s) evaluates to "0", the module invokes the safety function and overrides the process value from the F-CPU to "0" to de-energize the configured output(s).

If the evaluation of the configured input(s) evaluates to "1", then the module does not override the configured output(s).

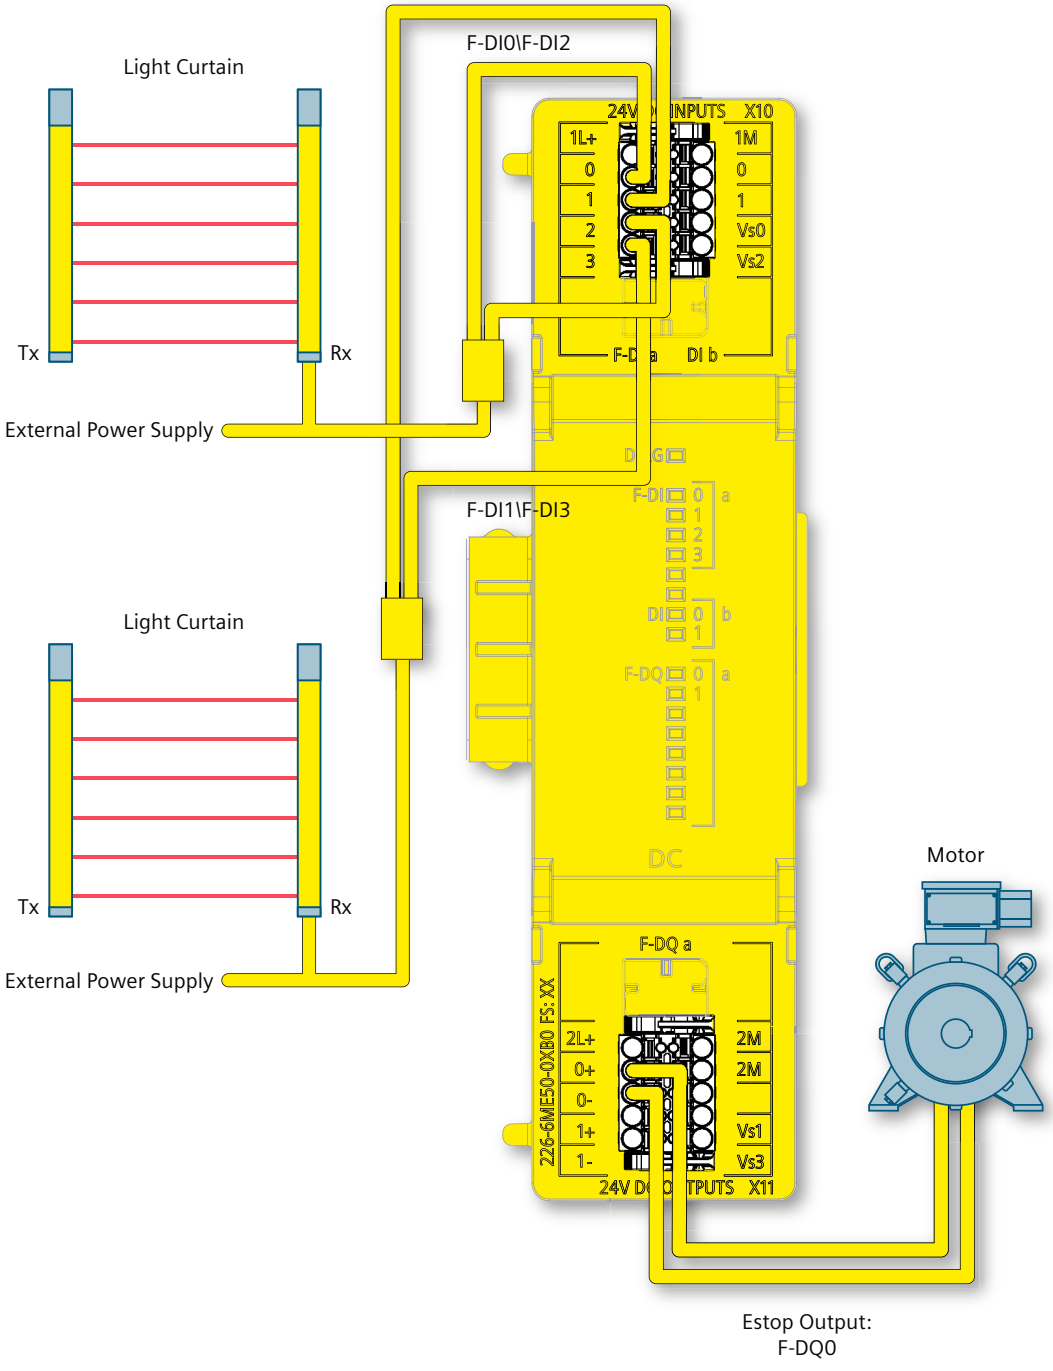

Figure 1-13 A motor controlled by the module's internal evaluation using light curtains

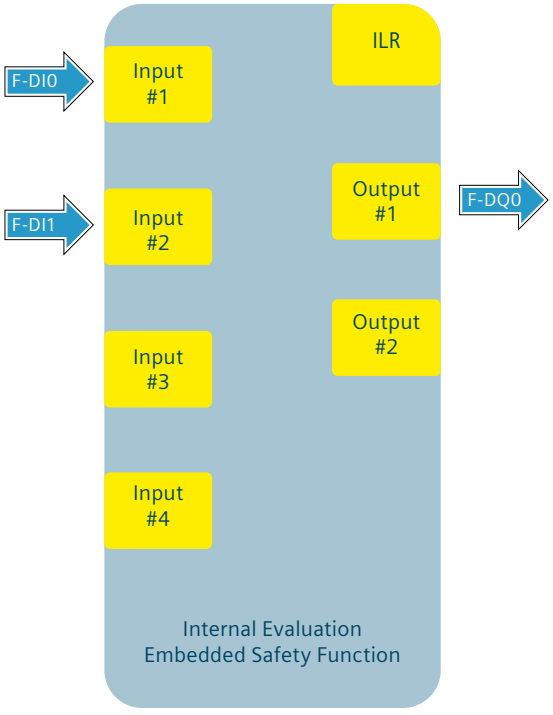

Figure 1-14 Visualization of module parameter assignment

Embedded safety function chaining

The module allows for chaining of embedded safety function outputs to safety function inputs.

In addition to applying the evaluation result of the ESFs to the configured output(s), each ESF provides the result of its evaluation as an Internal Logic Result (ILR). The ILR for each ESF is accessible at all times through the process image and as an input to another ESF.

You create an ESF chain by configuring the input(s) of an ESF to the ILR of another ESF. You can configure these ESF chains in different ways.

NOTE

You must not create a circular dependency within an ESF chain. A circular dependency occurs when the ILR of an ESF is used in another ESF that precedes it. If the module detects that you have configured a circular dependency, it generates a parameter error.

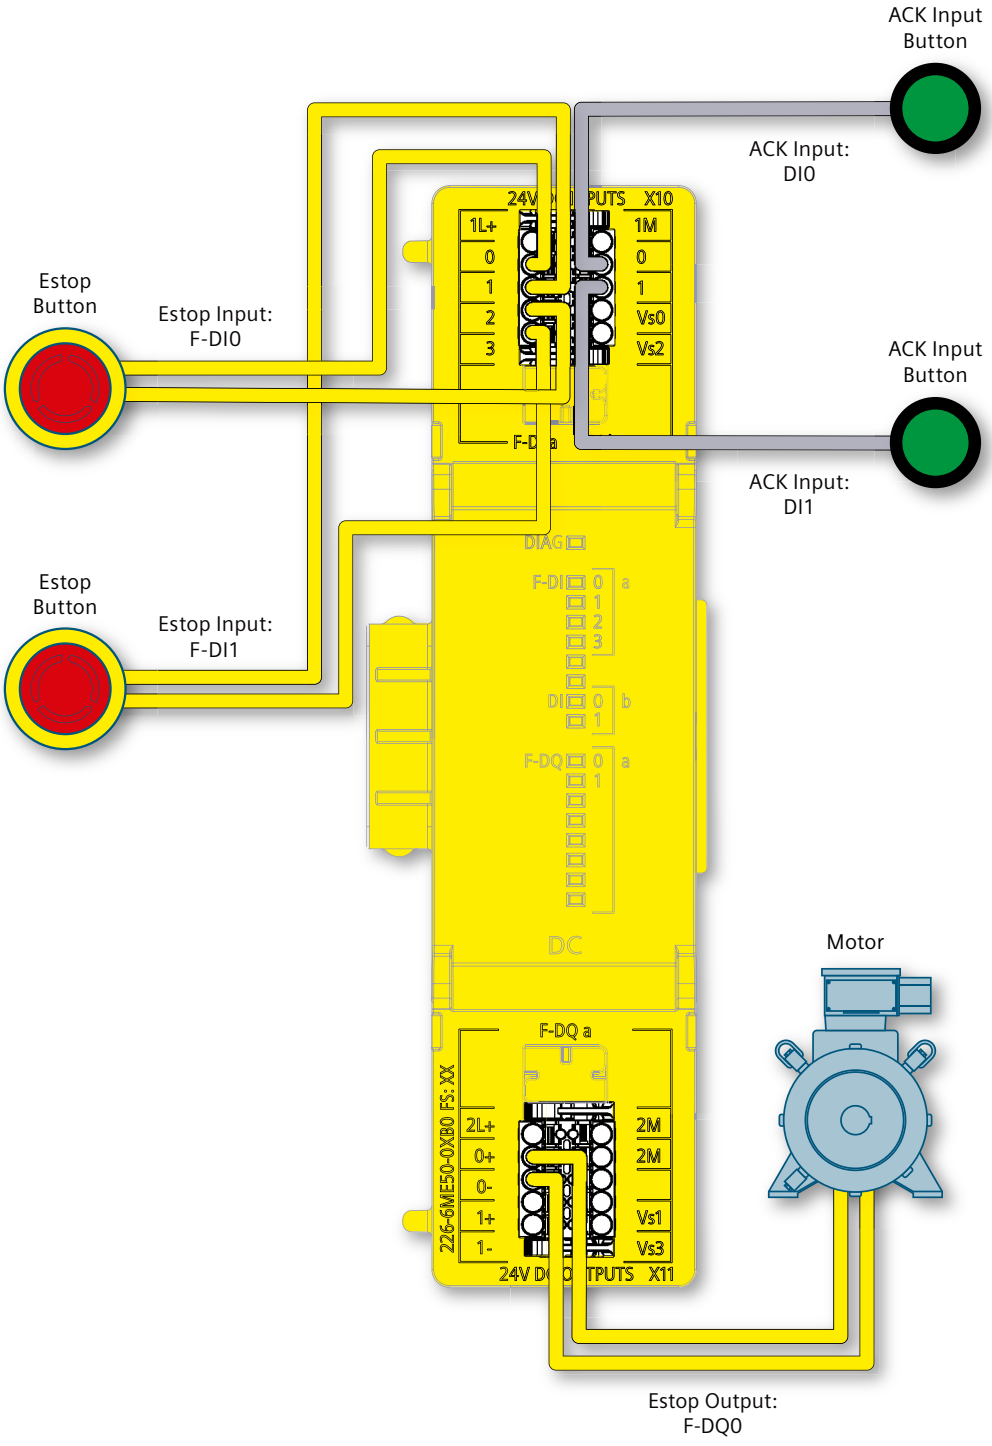

Figure 1-15 A motor controlled by the module's internal evaluation using two Estops

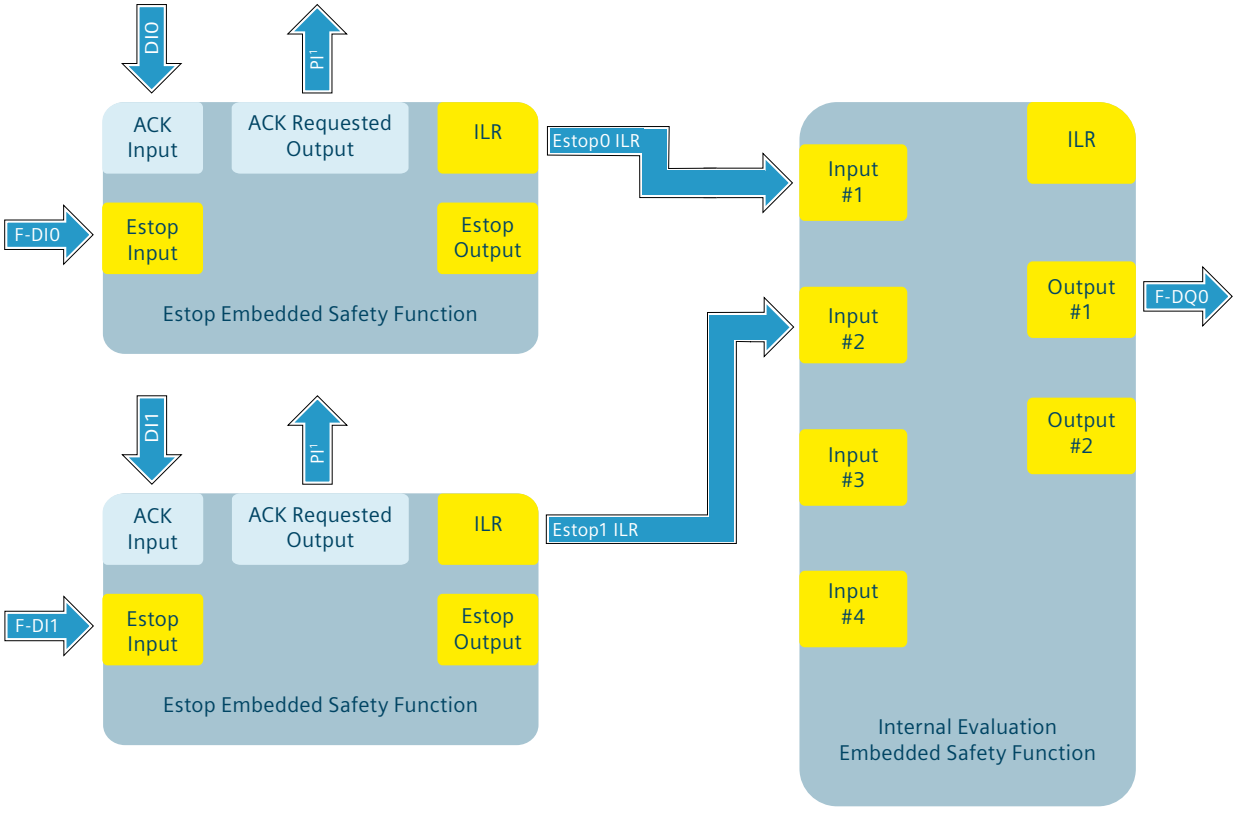

Figure 1-16 Visualization of module parameter assignment

[1] Process Image

4.3.3 Standard functions

4.3.3.1 Standard digital inputs

The standard digital inputs are rated for connection to 24 V DC sensors/switches and have an IEC 61131-2 Type 1 input rating.

Inputs and test circuit

The standard DI consists of two channels (DI x.0 and x.1).

Connectors	Input channel
X10	0 and 1

⚠ WARNING

Standard port safety ratings
Standard DI channels have no safety ratings and are not functionally safe. They should not be used in place of fail-safe I/O.
You must ensure that the appropriate I/O are used for your intended application.
Attempting to use standard I/O in place of fail-safe I/O in a safety related context could result in death, severe personal injury, and/or property damage.

4.4 Fail-safe IO

4.4.1 Parameters/address space

You use the STEP 7 Safety configuration software to configure the operating properties of all connected fail-safe SM I/O. You have the responsibility to ensure that no unconfigured SMs are connected in a fail-safe automation system.

⚠ WARNING

Configuring an F-System with mixed I/O
You cannot put an S7-1200 G2 Fail-safe system that provides safety-related functions into operation after installation or modification until after you successfully validate the safety-related functionality, as the fail-safe channels are potentially unsafe.
An S7-1200 G2 Fail-safe system that provides both safety-related functions and standard (non-safety-related) functions must not be put into operation in order to use the standard functions before you successfully validate the safety-related functions, even if all fail-safe signal modules go to the error state and thus, remain safe.
Failing to take proper precautions could result in death, severe personal injury, and/or property damage.

Configuring module I/O properties

To configure the fail-safe module's properties, follow these steps:

1. Select "Device configuration" for your module from the project tree.
2. Place the fail-safe module into your project's "Device view".

NOTE
The fail-safe module uses both I's and Q's. There are extra bytes allocated at the end of the address space that carry safety status and data integrity information.

Number of channels	Address (I/Q)	Bytes required
4 (fail-safe input) 2 (fail-safe output)	I Q	12 6

3. Select the image of the fail-safe module and view the module's "Properties" tab.
4. On the **"**Properties**"** view, select the **"**General**"** tab.
5. Click the module properties tree and expand the branches for the fail-safe module. You can select a module and see all the properties. You can also select a module branch (for example, "F-parameters", "DI-parameters", or "Channel parameters") and see a subset of the properties.
6. Select a property and set values in the appropriate fields.
7. A successful compile and download of your Device configuration to an S7-1200 G2 F-CPU automatically puts your new configuration settings in the I/O modules.

4.4.1.1 F-parameters

Parameters

You must configure the PROFIsafe addresses (F-destination address and F-source address) to the F-module before you put it into operation as follows:

- Configure the F-source address using the "Central F-source addresses" parameter in the Device configuration of the F-CPU.
- Configure the F-destination address using the "F-destination address" parameter in the Device configuration of each fail-safe module.
- Download the Device configuration to the F-CPU.

You can find further information on F-parameters such as the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address), F-parameter signature (with or without addresses) and the F-I/O DB in the *SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual*. (http://support.automation.siemens.com/WW/view/en/54110126/0/en)

The following table shows the F-parameters for the fail-safe module:

Table 1-116 Configurable F-parameters

Channel	Value range	Default	Scope
Manual assignment of F-monitoring time	• Unchecked • Checked	Unchecked	Module
F-monitoring time	16 to 65535	150 ms (disabled)	Module
F-source address	1 to 65534	1 (always disabled)	Module

Channel	Value range	Default	Scope
F-destination address	1 to 65534	65534	Module
F-parameter signature (with addresses)	0 to 65535	Always disabled	Module
F-parameter signature (without addresses)	0 to 65535	Always disabled	Module
Behavior after channel fault	• Passivate the entire module • Passivate channel	Passivate channel	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	All channels manually	Module
RIOforFA safety	-	Always disabled	Module
PROFIsafe mode	-	Always disabled	Module
PROFIsafe protocol version	-	Always disabled	Module
F-I/O DB manual number assignment	• Unchecked • Checked	Unchecked	Module
F-I/O DB number	• Fixed value, if DB manual number assignment is disabled • Value can be edited by user, if DB manual number assignment is enabled	Fixed value	Module
F-I/O DB name	-	Always disabled	Module

Explanation of the F-parameters

The following explanations describe parameters that you can set in STEP 7 Device configuration under "F-I/O parameters" > "F-parameters":

Behavior after channel fault

You can specify whether the entire F-module is passivated or only the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

Reintegration after channel fault

Use the "Reintegration after channel fault" parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Set this parameter in the STEP 7 dialog of the fail-safe module as follows:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". You can specify the reintegration type of the respective channel with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.4.1.2 F-DI

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "F-I/O parameters" > "DI parameters" for the F-DI of the module:

Table 1-117 Configurable F-DI parameters

Parameter	Value range	Default	Scope
Sensor supply			
Short-circuit test	• Unchecked • Checked	Checked	Module
Duration of short-circuit test	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms	3.2 ms	Module
Startup time of sensor after short-circuit test	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms	3.2 ms	Module
Channel Group Settings			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation: – 2 channel - 4 wire equivalent – 2 channel - 3 wire non-equivalent – 2 channel - 4 wire non-equivalent	1oo2 evaluation, 2 channel - 4 wire equivalent	Channel
Discrepancy behavior	• Supply last valid value • Supply value 0	Supply value 0	Channel
Discrepancy time	5 ms to 30000 ms in 1 ms steps	500 ms	Channel
Reintegration after discrepancy error	• Test 0-Signal not necessary • Test 0-Signal necessary	Test 0-Signal not necessary	Channel
Channel Settings			
Activated	• Unchecked • Checked	Checked	Channel
Input filter	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms	3.2 ms	Channel

Parameter	Value range	Default	Scope
Channel failure acknowledge	• Manual • Automatic	Manual	Channel
Sensor supply	• Sensor supply 0 • Sensor supply 1 • Sensor supply 2 • Sensor supply 3 • External sensor supply	• Sensor supply x (where "x" is the respective channel number)	Channel

Explanation of the F-DI parameters

The following explanations describe parameters that you can set in STEP 7 Device configuration under "F-I/O parameters" > "DI parameters":

Short-circuit test

You can enable the short-circuit detection for the sensor supplies and the fail-safe input channels configured to use a sensor supply. Short-circuit test only applies to one activated single sensor supply at a time.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply.

The short-circuit test switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Duration of short-circuit test". When the sensor supply is turned back on, the module waits to evaluate the sensor signal until the sensor has powered on and the sensor signal has stabilized. The length of the startup time for the sensor is equivalent to the configured "Startup time of sensor after short-circuit test" parameter.

If the module detects a short-circuit, the fault is reported to the F-CPU and the entire module can be passivated.

The following short-circuits are detectable:

- Short-circuit of input to L+
- Short-circuit of the input to another channel when it has a "1" signal
- Short-circuit of the sensor supply to L+
- Short-circuit of the sensor supply to ground
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If you disable the short-circuit test, you must make your wiring short-circuit and cross-circuit proof or select a sensor evaluation type (discrepancy, nonequivalent) which can detect the cross circuits using discrepancy.

During the execution time (duration of short-circuit test + startup time of sensor after short-circuit test + input filter) of the short-circuit test, the state of the input before the start of the short-circuit test is provided. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

Duration of short-circuit test

You can specify the duration of the test pulse applied to the sensor supply when you select the check box "Short-circuit test".

This value is the time that the sensor supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs.

Short-circuit evaluations are dependent upon customer-selected input filter times. The means that you must take care to ensure that input filter time selections are appropriately chosen. These must be faster that the selected duration of short-circuit test settings; otherwise, the module might not detect potential sensor supply and/or input short-circuit errors because of inappropriate filter times.

Startup time of sensor after short-circuit test

You can specify the startup time after the short-circuit test completes when you select the check box "Short-circuit test".

This value is the time that the module waits to evaluate the sensor signal after it has powered on and the sensor signal has stabilized. This duration must be long enough to allow your sensor time to power on.

Sensor evaluation

You can specify signal evaluation and wiring definitions. These selections correspond with the various application mode wiring examples.

You can assign whether “channel n” input operates individually (1oo1) or is paired with its companion channel "n+2" input (1oo2).

1oo1 evaluation: One sensor is connected to the module on a single channel.

1oo2 evaluation: Two input channels are occupied by either:

- **2 channel - 4 wire equivalent**: One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair.
- **2 channel - 3 wire non-equivalent**: One two-channel non-equivalent sensor is connected to the two channels, in a channel pair.
- **2 channel - 4 wire non-equivalent**: One two-channel non-equivalent sensor or two single-channel non-equivalent sensors are connected to the two channels, in a channel pair.

If you select a 1oo2 evaluation mode, you can assign the discrepancy properties.

When you select the channel group as 1oo2, STEP 7 enables the parameters in the first channel of the group and disables the parameters in the second channel of the group. The second channel derives its parameter values from the first channel's parameter values. When you select the channel group as 1oo1, STEP 7 enables all of the parameters in both channels.

NOTE

Safety program access to 1oo2 input data

For 1oo2 evaluation, two paired input channels (for example, F-DI 0 and F-DI 2) are connected to one or two sensors. The F-DI module performs the discrepancy analysis and sends the result to the safety program at the input address of the low-ordered channel of the pair (in the above example, F-DI 0).

Discrepancy behavior

A 1oo2 input configuration allows a logical difference between the two signals, without error, for the configured discrepancy time. You assign the value that is supplied during a discrepancy to the safety program in the F-CPU between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

NOTE

Sensor-actuator response time is increased when you add more input discrepancy time
The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0" but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0" and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides normal operation. Refer to "Maximum fault reaction time for 1oo2 fail-safe digital input discrepancy errors (Page 91)" for further information.

Discrepancy time

The two signals in a 1oo2 input configuration will not change at exactly the same time, due to differences in sensors, contacts, and wiring. You can configure a maximum expected duration for a mismatch between signals during transition.

Discrepancy evaluations and other diagnostic evaluations are dependent upon customer-selected input filter times. These evaluations occur using input samples generated after input filtering is complete. This means that you must take care to ensure that input filter time selections are appropriately chosen. These must be faster than selected discrepancy time evaluations; otherwise, the module might not detect potential 1oo2 input discrepancy differences because of inappropriate filter times.

Reintegration after discrepancy error

You can assign whether a zero state must be detected on both 1oo2 inputs before a previously declared discrepancy can be reintegrated.

"Test 0-signal necessary"
If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels for a duration of at least 100 ms.

If you are using non-equivalent sensors, which means you have set "Sensor evaluation" to a non-equivalent mode, a 0-signal must be present at the low-order channel of the channel pair, and a 1-signal must be present at the high-order channel of the channel pair for a duration of at least 100 ms.

"Test 0-signal not necessary"
If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists between the two relevant input channels.

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

Input filter

The module filters the digital inputs to remove contact bounce and noise. This parameter assigns the duration of the filter time. As the filter time increases, the reaction times of the digital inputs also increase.

Channel failure acknowledge

You can specify in the F-Parameters (Page 32) whether the channel is automatically reintegrated after a fault clears or requires a manual acknowledgement. Refer to "Reactions to faults" for the reintegration procedure.

Sensor supply

You can assign whether to supply 24 V DC power to sensors from the module's integrated sensor supply (internal) or from an external power supply (external).

Short-circuit tests are not performed for any channel where external power is selected.

4.4.1.3 F-DQ

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "F-I/O parameters" > "DQ parameters" for the F-DQ of the module:

Table 1-118 Configurable F-DQ parameters

Channel	Value range	Default	Scope
Maximum test period	• 100 s • 1000 s	1000 s	Module
Channel settings			
Activated	• Unchecked • Checked	Checked	Module
Operating mode of the output	• PM-switching mode • PP-switching mode	PM-switching mode	Module
Channel failure acknowledge	• Manual • Automatic	Manual	Module
Max. readback time	1.0 ms to 400.0 ms in 0.1 ms increments	2.0 ms	Module
Max. readback time switch on test	0.5 ms to 5.0 ms in 0.1 ms increments	1.0 ms	Module

Channel	Value range	Default	Scope
Diagnosis: Wire break	• Unchecked • Checked	Unchecked	Module
Disable dark test for 48 hours	• Unchecked • Checked	Unchecked	Module
Disable dark test (max. SIL2, CAT3, PLd)	• Unchecked • Checked	Unchecked	Module

Explanation of the F-DQ parameters

The following explanations describe parameters that you can set in STEP 7 Device configuration under "F-I/O parameters" > "DQ parameters":

Maximum test period

You can assign the time interval between bit pattern tests for F-DQ DC outputs to a value of either 100 seconds or 1000 seconds.

The module applies test pulses to the output switches. These tests detect faulted P- or M-output switches and wiring faults. Short circuits to other signals or power rails can be detected by the module.

If the module detects an error on a channel, the test interval shortens to 60 seconds. If an error is no longer detected on any output channel, the configured test interval is used again.

A detected fault is reported to the fail-safe CPU, and the affected channels or the module is passivated according to the configured selection of the "Behavior after channel fault" parameter.

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

NOTE

Suspension of 2L+ undervoltage

Whenever you disable all output channels, you do not need to power 2L+. Undervoltage reporting is suspended for 2L+.

Operating mode of the output

You can specify whether the output channel is wired and whether it operates as a PM or PP output.

Channel failure acknowledge

You can specify in the F-Parameters (Page 32) whether the channel is automatically reintegrated after a fault clears or requires a manual acknowledgement. Refer to "Reactions to faults" for the reintegration procedure.

Max. readback time

You can configure a "Max. readback time" that specifies the maximum amount of time that the output channel waits for the voltage to respond when the process value changes. If any P- or M-switch does not reach the expected voltage within the readback time, the module passivates the output channel.

Your configured "Max. readback time" also sets the duration of the "OFF" test pulse during the bit pattern test. Choose a short enough duration where your load will not be affected.

The module does not apply new process values to the output channels while a test pattern is being applied to the outputs. This means that a higher "Max. readback time" increases the response time of the fail-safe module.

⚠ WARNING

Short-circuit (cross-circuit) detection might not be possible for high frequency signals
Through the configured "Max. readback time", short-circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured "Max. readback time") Hz cannot be detected by the module (50:50 sampling ratio).
You must take this into consideration for your application and respective requirements of your product standards.
Short-circuits (cross-circuits) to an output of the same module are recognized regardless of the frequency of the output channel.
You can adjust the maximum readback time to change the frequency of the signal that can be detected.
Short-circuits of high frequency signals that are undetected can result in death, severe personal injury, and/or property damage.

The parameter also effects the short-circuit detection (cross-circuit) with a "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting the parameter "Max. readback time"

Siemens recommends that you set the "Max. readback time" as low as possible because the fault response time is extended by the configured value for this parameter; however, you must set this value to a high enough value where the module will not passivate the output channel as a result of your connected load.

You determine the readback time required for your actuator with the diagram in "Switching of loads (Page 96)".

If the capacitance of the actuator is not known, it might be necessary for you to determine the value for the "Max. readback time" by trial and error. This might also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the "Max. readback time" so that the output channel can be read back correctly, but your actuator does not respond during a bit-pattern test sequence.
- For verification, use the process value "0" with a minimum duration that corresponds to the "Maximum test period" parameter. Execute a process value change from "1" to "0".
- If the output channel is passivated, the "Max. readback time" is too small for the connected capacitive load. The discharge cannot take place within the configured "Max. readback time". Increase the "Max. readback time".

If you have set the "Max. readback time" to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacitance is outside the permitted range.

Max. readback time switch on test

You can configure the "Max. readback time switch on test", which specifies the duration of the "ON" test pulse for any P- or M-switch during the bit pattern test. You must choose a short enough duration that does not affect your load.

Any pulse during the bit pattern test does not generate a light pulse in the absence of faults.

Any pulse during the bit pattern test under fault conditions can result in a light pulse, which can energize the load if the "Max. readback time switch on test" is long enough to affect the load.

Wire break

You can enable or disable wire break testing. The module can detect a broken wire or missing load only when the output PV is "OFF" and the load is wired in PM mode.

Disable dark test for 48 hours

You can select the checkbox to disable dark testing for 48 hours for a channel.

When you deactivate a channel's bit pattern dark testing for 48 hours, its process value is monitored for signal changes. If the channel's process value is "1" for 48 consecutive hours, the channel is included in an immediate output pattern test. If the test is successful, the 48-hour timer restarts. If the channel's process value is "0" at any point during the 48-hour period, a complete output pattern test is performed including the respective channel and, upon successful completion, the 48-hour timer restarts. If an entire output pattern test including the respective channel does not complete successfully, the 48-hour timer does not restart.

A complete pattern test including dark testing for the respective channel(s) is required to establish proper SIL 3, Cat. 4, PL e behavior.

If you select the disable dark test for 48 hours for any channel(s) and a short-circuit or readback error is detected upon the demand of the safety function for any other channel, such as where a P- or M-switch controlling the load fails to open when commanded, a channel error is declared for each channel where you have enabled the disable dark test for 48 hours parameter.

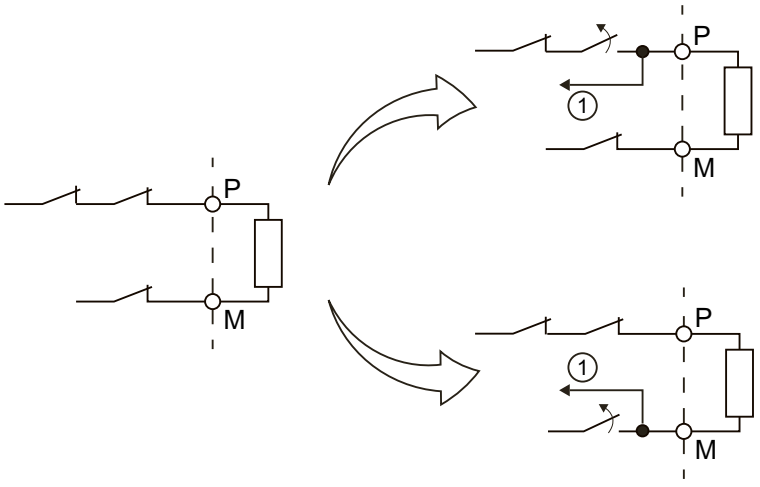
NOTE

Unused switches

The above requirement does not apply to unused switches, such as the M-switch in a PP output configuration, as they do not control the load. As a result, errors on unused switches do not result in channel passivation. Therefore, errors detected on unused switches do not result in any passivation of channels selected for disabling dark test for 48 hours.

If channel(s) that you configured for disabled dark testing for 48 hours are passivated by the module as a result of failures from other channels, reintegration can occur once you have resolved all relevant errors from the other channel(s). When all the other channel(s) become available for reintegration, all channel(s) configured for disabled dark testing for 48 hours also become available for reintegration.

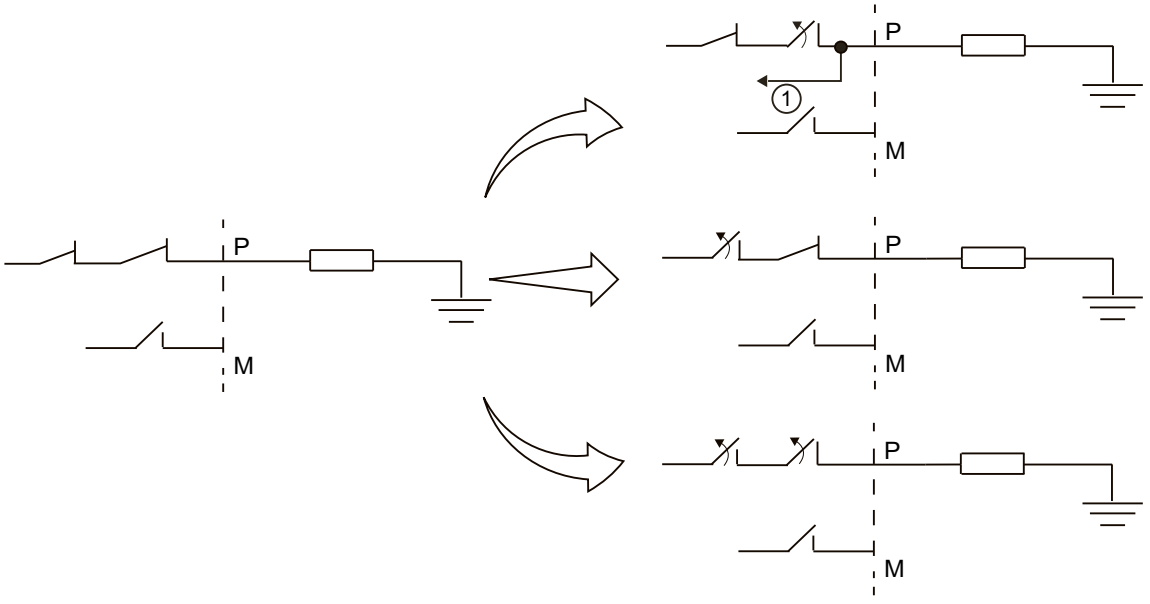
Disable dark test (max. SIL2, CAT3, PLd)



You can select the check box to disable dark testing for a channel.

Dark tests are switch-off tests which occur during an output bit-pattern test sequence.

For a dark test, one of the output channel's switches is briefly turned OFF while the output channel is active (output signal "1"). As a result, current flow through the output is interrupted for a short time. A sufficiently slow actuator does not respond to this and remains switched on.



When the dark test is disabled on an output channel, the parameter "Max. readback time" is only relevant for the process value change.

Dark testing of a channel operates in the same manner for both PM- and PP-switching.

① Readback

Figure 1-17 Functional principle of the dark test (PM-switching)

① Readback

Figure 1-18 Functional principle of the dark test (PP-switching)

Test pulses of the dark test

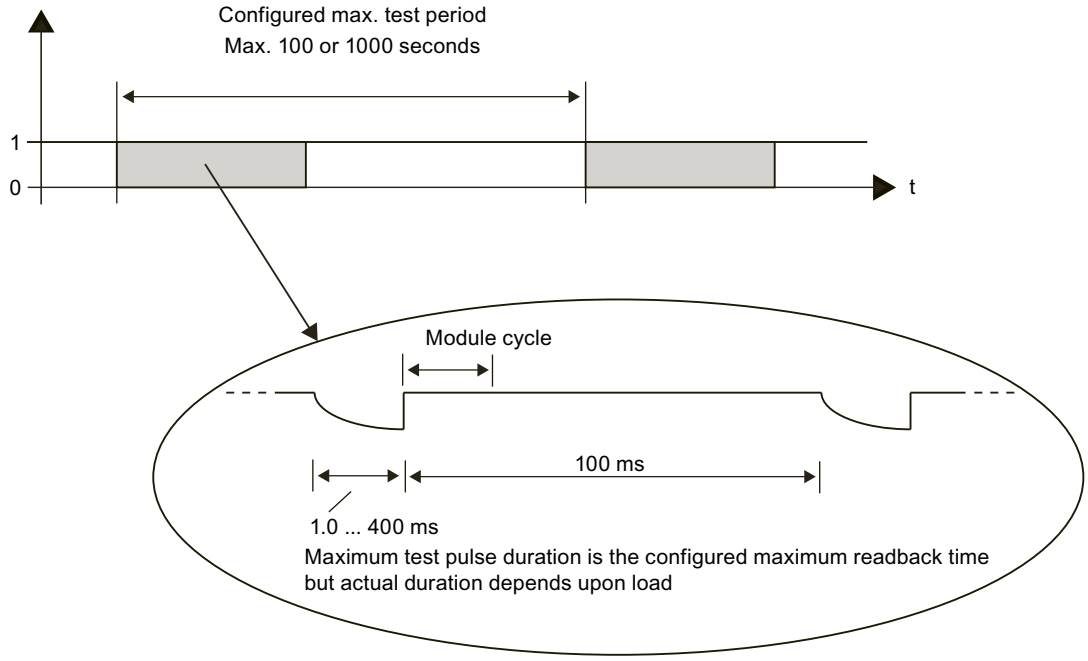


Figure 1-19 Test pulses of the dark test

You configure the time between output bit pattern test sequences to either 100 or 1000 seconds. Each output bit pattern test sequence includes multiple test pulses. The interval between two test pulses is at least 100 ms.

To prevent an unwanted reaction of the actuator to a dark test, you can also permanently disable the dark test individually for each F-output channel.

A capacitive load that does not meet the load curve (Page 96) can result in a passivation of the output in case of a process value change or switch-on test, even if the dark test is disabled.

With the dark test permanently disabled, you can only reach up to SIL 2/Cat. 3/PL d.

⚠ WARNING

Loss of SIL 2/Cat. 3/PL d rating, loss of output control due to potential undetected faults
SIL 2/Cat. 3/PL d requires that there is a signal change from "1" to "0" at the corresponding output at least once a year. With the dark test disabled, an output that is turned on for more than 1 year might not be able to be turned off. This could result in an accumulation of undetected faults.
Ensure the "0" signal has a duration of at least 2 seconds. It is not enough to simply turn off the supply or load voltage of the F-module and turn it on again.
If control of an output is lost due to potential undetected faults, death, severe personal injury, and/or property damage can result.

⚠ WARNING

Reduction of short-circuit detection
When you use the function "Disable dark test", cross-circuits between channels with "1" signal are not detected. An undetected accumulation of faults could result in unexpected operation.
You must take this into consideration for your application and respective requirements of your product standards.
You must also take into consideration the respective requirements of your product standards regarding error detection time.
Unexpected operation can result in death, severe personal injury, and/or property damage.

I/O address parameters

The following table shows the parameters that you can set to specify F-input and F-output starting image register addressing:

Table 1-119 Configurable I/O address parameters

Parameter	Value range	Default
Input addresses		
Start address	0 to 1023	Calculated
End address	N/A	Calculated
Organization block	"---"	"---"
Process image	"---"	"---"
Output addresses		
Start address	0 to 1023	Calculated
End address	N/A	Calculated
Organization block	"---"	"---"
Process image	"---"	"---"

4.4.1.4 Embedded Safety Functions (ESF)

Estop

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Emergency Stop" for the Estop of the module:

Table 1-120 Configurable Estop parameters

Channel	Value range	Default	Scope
Emergency Stop activated	• Checked • Unchecked	Unchecked	Module
Stop category	• 0 (Immediate deactivation) • 1 (Delayed deactivation)	0 (Immediate deactivation)	Module

Channel	Value range	Default	Scope
Emergency Stop input	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • "Emergency Stop x result" (where "x" is the Emergency Stop) • "Internal Evaluation #0 result" • "Internal Evaluation #1 result" • "None"	"None"	Module
Emergency Stop output	• F-DQ 0 • F-DQ 1 • "None"	"None"	Module
Delay time	500 ms to 7200000 ms (2 hours) in 1 ms steps	500 ms	Module
Acknowledge necessary	• "Manually using rising edge" • "Automatic"	"Manually using rising edge"	Module
Type of manual acknowledgement	• "Either process image or local I/O" • "Local I/O only" • "Process image only"	"Either process image or local I/O"	Module
Acknowledge input	• DI 0 • DI 1 • F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • "None"	"None"	Module

Explanation of the Estop parameters

The following explanations describe parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Emergency Stop":

Emergency Stop activated

You can enable or disable the Emergency Stop function.

Stop category

You can set the Estop to either deactivate the fail-safe output immediately, or after a configured delay time.

Emergency Stop input

You can select the F-input address that serves as the Estop input. You can also select the Internal Logic Result of another ESF as the input.

NOTE

Using the same input causes a compiler warning
Do not use the same input for both the "Emergency Stop input" and the "Acknowledge input". Doing so results in a compiler warning.

Emergency Stop output

You can select the F-output address that serves as the Estop output. When you configure this parameter, the Estop functions are able to override the respective F-CPU's output PV only to "0".

Delay time

If the Stop category is configured for "Delayed deactivation", you can configure the time delay for how long the module waits before turning the output off when the Emergency Stop function has been invoked.

Acknowledge necessary

You can select the acknowledgement type that returns the safety function to service, whether manual acknowledgement is required or acknowledgment is automatic.

Type of manual acknowledge

You can define the type of permissible manual acknowledgement from the following options:

- Either process image or local I/O: Performed using either approach
- Local I/O only: Performed using the acknowledge input specified by "Acknowledge Input"
- Process image only: Performed using the process image "ESTOP ACK" and "ACK REQ" bits

Acknowledge input

You can select the DI or F-input address that serves as the Acknowledge Input. You cannot, however, select an input already configured for Emergency Stop input.

NOTE

Using the same input causes a compiler warning
Do not use the same input for both the "Emergency Stop input" and the "Acknowledge input". Doing so results in a compiler warning.

Internal Evaluation (IE)

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Internal Evaluation" for the IE of the module:

Table 1-121 Configurable IE parameters

Channel	Value range	Default	Scope
Activated	• Checked • Unchecked	Unchecked	Module
Input #1	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DI 0 • DI 1 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation) • "None"	"None"	Module
Input #2	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DI 0 • DI 1 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation) • "None"	"None"	Module
Input #3	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DI 0 • DI 1 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation) • "None"	"None"	Module

Channel	Value range	Default	Scope
Input #4	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DI 0 • DI 1 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation) • "None"	"None"	Module
Output #1	• F-DQ 0 • F-DQ 1 • "None"	"None"	Module
Output #2	• F-DQ 0 • F-DQ 1 • "None"	"None"	Module

Explanation of the IE parameters

The following explanations describe parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Internal Evaluation":

Activated

You can either enable or disable the IE.

Input selection

You can select the standard DI addresses or F-input addresses which serve as the IE inputs. You can also select the Internal Logic Result of another ESF as the input.

NOTE

Using the same address causes a compiler warning

Do not select two inputs with the same address. Doing so results in a compiler warning.

NOTE

Fail-safe input requirement

When choosing inputs for the IE, at least one of the enabled inputs must be fail-safe. Failure to do so results in a compilation error.

When chaining together ESFs, all inputs must be fail-safe.

Output selection

You can select the F-output addresses which serve as the IE outputs.

NOTE

Using the same address causes a compiler warning

Do not select two outputs with the same address. Doing so results in a compiler warning.

4.4.1.5 Address space

The table below shows the number of I and Q bytes required for each available PROFIsafe profile:

PROFIsafe profile	Input (I) bytes required	Output (Q) bytes required
V2.4	11	5
V2.6.1	12	6

4.4.1.6 Control and feedback interfaces

Assignment of the control interface

Your safety program uses the control interface to influence the behavior of the module.

The following table shows the assignment of the control interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
QB x	0	0	ESTOP 1 ACK	ESTOP 0 ACK	0	0	F-DQ 0.1	F-DQ 0.0
QB x + 1-4 (PS)	PROFIsafe trailer (V2.4)							
QB x + 1-5 (PS)	PROFIsafe trailer (V2.6.1)							

Explanations of the control interface

Byte	Bit	Control bit/value	Explanation
QB x	0	F-DQ 0.0	The process value (PV) of fail-safe digital output channel 0.
	1	F-DQ 0.1	The process value (PV) of fail-safe digital output channel 1.
	4	ESTOP 0 ACK	The ESTOP 0 ACK bit is used to acknowledge the reset of the Emergency Stop. Not used when you configure Emergency Stop 0's "Type of manual acknowledgement" for "Local I/O only".
	5	ESTOP 1 ACK	The ESTOP 1 ACK bit is used to acknowledge the reset of the Emergency Stop. Not used when you configure Emergency Stop 1's "Type of manual acknowledgement" for "Local I/O only".
QB x + 1-4 (PS)	1-4	PROFIsafe trailer (V2.4)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.4.
QB x + 1-5 (PS)	1-5	PROFIsafe trailer (V2.6.1)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.6.1.

Assignment of the feedback interface

Your safety program receives current values and status information from the module by means of the feedback interface.

The following table shows the assignment of the feedback interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IB x	0	0	0	0	F-DI 0.3 or 0 (SIL 3)	F-DI 0.2 or 0 (SIL 3)	F-DI 0.1	F-DI 0.0
IB x +1	0	0	ESTOP 1 Internal Logic Result (ILR)	ESTOP 0 Internal Logic Result (ILR)	Int. Eval. 1 Internal Logic Result (ILR)	Int. Eval. 0 Internal Logic Result (ILR)	ESTOP 1 ACK REQ	ESTOP 0 ACK REQ
IB x +2	ESTOP #1 Status	ESTOP #1 Status	ESTOP #1 Status	ESTOP #1 Status	ESTOP #0 Status	ESTOP #0 Status	ESTOP #0 Status	ESTOP #0 Status
IB x +3	0	0	0	0	CQ F-DI 0.3 or 0 (SIL 3)	CQ F-DI 0.2 or 0 (SIL 3)	CQ F-DI 0.1	CQ F-DI 0.0
IB x +4	0	0	0	0	0	0	0	0
IB x +5	0	0	0	0	0	0	0	0
IB x +6	0	0	0	0	0	0	CQ F-DQ 0.1	CQ F-DQ 0.0
IB x +7-10 (PS)	PROFIsafe trailer (V2.4)							
IB x +7-11 (PS)	PROFIsafe trailer (V2.6.1)							

Explanations of the feedback interface

Byte	Bit	Control bit/value	Explanation
IB x	0	F-DI 0.0	The process value (PV) of fail-safe digital input channel 0.
	1	F-DI 0.1	The process value (PV) of fail-safe digital input channel 1.
	2	F-DI 0.2, or 0 (SIL 3)	The process value (PV) of fail-safe digital input channel 2. Not used when you configure the input channel pair for 1oo2 evaluation.
	3	F-DI 0.3, or 0 (SIL 3)	The process value (PV) of fail-safe digital input channel 3. Not used when you configured the input channel pair for 1oo2 evaluation.
IB x +1	0	ESTOP 0 ACK REQ	The Acknowledge Input state of Emergency Stop 0. Not used when you configure Emergency Stop 0's "Type of manual acknowledgement" for "Local I/O only".
	1	ESTOP 1 ACK REQ	The Acknowledge Input state of Emergency Stop 1. Not used when you configure Emergency Stop 1's "Type of manual acknowledgement" for "Local I/O only".
	2	Internal Eval. 0 Internal Logic Result (ILR)	The internal logic result from the execution of the Internal Evaluation 0 ESF.
	3	Internal Eval. 1 Internal Logic Result (ILR)	The internal logic result from the execution of the Internal Evaluation 1 ESF.
	4	ESTOP 0 Internal Logical Result (ILR)	The internal logic result from the execution of the Emergency Stop 0 ESF.
	5	ESTOP 1 Internal Logical Result (ILR)	The internal logic result from the execution of the Emergency Stop 1 ESF.
IB x +2	0	ESTOP #0 Status	The ESF reports one of the following status codes:
	1		
	2		

Byte	Bit	Control bit/value	Explanation
IB x +2	3	ESTOP #0 Status	• "1" - The module detects the acknowledge input as on when the Emergency Stop is not awaiting manual acknowledgement. • "2" - The module detected the acknowledge input as on when the Emergency Stop began awaiting manual acknowledgement; the module must detect a rising edge on the acknowledge input for acknowledgement to occur. • "3" - The module detects that the DIQ channel assigned as the Emergency Stop's acknowledge requested output has been incorrectly configured as an input channel; you must configure the DIQ channel as an output for the acknowledge requested output. More than one status code might be present at a given time; however, only one is represented in the process image. Therefore, the status code with the highest priority is returned. Any other status codes are retained such that if a higher priority status code is cleared, the lower priority status code is presented.
	4 5 6 7	ESTOP #1 Status	The ESF reports one of the following status codes: • "1" - The module detects the acknowledge input as on when the Emergency Stop is not awaiting manual acknowledgement. • "2" - The module detected the acknowledge input as on when the Emergency Stop began awaiting manual acknowledgement; the module must detect a rising edge on the acknowledge input for acknowledgement to occur. • "3" - The module detects that the DIQ channel assigned as the Emergency Stop's acknowledge requested output has been incorrectly configured as an input channel; you must configure the DIQ channel as an output for the acknowledge requested output. More than one status code might be present at a given time; however, only one is represented in the process image. Therefore, the status code with the highest priority is returned. Any other status codes are retained such that if a higher priority status code is cleared, the lower priority status code is presented.
IB x +3	0	CQ F-DI 0.0	The channel quality (value status) of fail-safe digital input channel 0. This represents the channel quality (value status) of input channel pair 0/2 when you configure the input channel pair for 1oo2 evaluation.
	1	CQ F-DI 0.1	The channel quality (value status) of fail-safe digital input channel 1. This represents the channel quality (value status) of input channel pair 1/3 when you configure the input channel pair for 1oo2 evaluation.
	2	CQ F-DI 0.2, or 0 (SIL 3)	The channel quality (value status) of fail-safe digital input channel 2. Not used when the input channel pair is configured for 1oo2 evaluation.
	3	CQ F-DI 0.3, or 0 (SIL 3)	The channel quality (value status) of fail-safe digital input channel 3. Not used when the input channel pair is configured for 1oo2 evaluation.
IB x +6	0	CQ F-DQ 0.0	The channel quality (value status) of fail-safe digital output channel 0.
	1	CQ F-DQ 0.1	The channel quality (value status) of fail-safe digital output channel 1.
IB x +7-10 (PS)	0-6	PROFIsafe trailer (V2.4)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.4.
IB x +7-11 (PS)	0-7	PROFIsafe trailer (V2.6.1)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.6.1.

Evaluating the value status

The channel quality (value status) bits provide information regarding the validity of the channel quality (value status):

- Bit = 1: Corresponding process value is valid.
- Bit = 0: Channel is passivated.

4.4.2 Interrupts/diagnostic alarms

4.4.2.1 Reactions to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. This applies to both sensors and actuators.

The safety function requires that safe state values be applied to the fail-safe channel(s) instead of process values. This results in passivation of the fail-safe module or channel(s) in the following situations:

- When the fail-safe system starts up
- If module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If channel faults occur (for example, short-circuit and discrepancy errors)

The fail-safe CPU enters detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-safe modules do not remember errors upon power cycle. When the system is powered down and then restarted, any faults still existing are detected again.

Fail-safe value for fail-safe modules

If digital input channels are passivated, the fail-safe system always provides safe state values ("0") for the safety program instead of the process values applied to the fail-safe inputs.

If digital output channels are passivated, the fail-safe system always transfers safe state values ("0") to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized.

The passivation safe state value and the output state value in CPU STOP mode are always "0", de-energized. You cannot select or program a default "ON" state for passivation or STOP mode.

Passivation is applied to individual channels when a channel-specific diagnostic failure is detected. Failures that can affect the entire module result in passivation of all channels.

NOTE
In the F-DI 4/F-DQ 2/DI 2 Properties > F-IO parameters > F-parameters > "Behavior after channel fault" field, if you select "Passivate the entire module", a single channel fault results in passivation of all channels.

Timeout of the PROFIsafe message (F-monitoring time exceeded) passivates the entire module.

Table 1-122 Module signal type and passivation result

Module signal type	Passivation of channel result	Passivation of module result
Fail-safe digital inputs	For a 1oo1 input channel: • The passivated channel reports a diagnostic. • The module reports the safe state value "0" for the affected channel's process and quality values. For a 1oo2 input channel pair: • The passivated channel, as well as the other input channel in the channel pair, report a diagnostic.[1] • The module reports the safe state value of "0" for the low-order input channel pair's process and quality values. The high-order input always reports "0".	For a 1oo1 input channel: • The passivated channel reports a diagnostic. • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels. For a 1oo2 input channel pair: • The passivated channel, as well as the other input channel in the channel pair, report a diagnostic.[1)] • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels.
Fail-safe digital outputs	• The passivated channel reports a diagnostic. • The F-CPU substitutes the safe state value "0" for the affected channel's process and quality values.	• The passivated channel reports a diagnostic. • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels.

[1] A discrepancy error between two inputs in a channel pair results in one diagnostic. The diagnostic's message indicates which type of discrepancy occurred (0/0, 0/1, 1/0, or 1/1).

Response to faults in the fail-safe system

Prepare maintenance procedures for your system to ensure that returning the safety function to operation after a detected fault is controlled and documented.

Perform the following steps:

1. Diagnosis and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Reintegration of a fail-safe module

A channel or module can be reintegrated into an operational state after diagnostics determine that a fault has cleared successfully.

You can configure reintegration as automatic or manual. You can make this selection on a per-channel basis in the Device configuration. Module-wide errors, such as PROFIsafe communication errors or supply voltage errors, are always manually reintegrated. Fatal diagnostic errors require a power cycle to reintegrate.

Automatic

Channels that you select to be automatically reintegrated immediately become operational when the fault has cleared.

Manual

Channels that you select to be manually reintegrated are acknowledged after the fault has cleared.

The "ACK_REQ" bit for the module goes true to indicate that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Fatal diagnostic errors require a power cycle with successful diagnostics to reintegrate.

Reintegration after high stress events

High temperature, high voltage, and excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Solid state switch outputs can be damaged by high currents prior to protective device activations. The PFD and PFH reliability calculations assume the fail-safe module is operated within its specified operating parameters. When a module has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future dangerous failure may be increased.

⚠ WARNING

Reintegration of a channel or module with an undetected fault

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics. Undetected faults can result in unexpected operation.

After any reported fault, follow the steps outlined in this chapter and in safety standards applicable to your system to assure that you understand the reason for the fault and how to take corrective action before reintegration.

Reintegration of a faulty system can result in unexpected operation, which can cause death, severe personal injury, and/or property damage.

For a list of faults for the module, refer to "Fault types, causes, and corrective measures".

After reintegration, the following occurs:

- For a fail-safe digital input, the process values pending at the fail-safe inputs are provided for the safety program.
- For a fail-safe digital output, the output values provided in the safety program are again transferred to the fail-safe outputs.

Safety repair time

The repair time used for PFH and PFD calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. Respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

Deactivated fail-safe I/O are not being diagnosed and are subject to dangerous failure without warning.

If any error persists for 100 hours, the module issues a fatal diagnostic error and can only be recovered by power cycling.

If a repair within 100 hours is not possible, take passivated fail-safe outputs out of service by physically disconnecting or opening circuits so that faults in the fail-safe module cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs must be removed from any operating CPU Safety program logic that can result in activation of a safety function output.

Do not depend upon channel or module passivation to maintain safe state for more than 100 hours.

Do not depend upon channel deactivation or removal of the module from Device configuration to maintain safe state in any circumstances.

⚠ WARNING

Unintentional activation of F-I/O module with fail-safe output

If a fail-safe output is passivated for a period longer than the safety repair time (> 100 hours) and the fault remains uncorrected, an F-output could be activated unintentionally due to a second fault, placing the F-system in a dangerous state.

Even though it is highly unlikely that such Device faults occur, you must prevent the unintentional activation of a fail-safe output by using measures for the physical circuits or other organizational measures. Some possibilities are the shutdown of the power supply to the affected F-module or taking the outputs out of service. Required measures are often standardized for operations with defined design and risk reduction principles. For all other situations, necessary measures must be defined and approved.

Unintentional activation of an F-output can result in death, severe personal injury, and/or property damage.

Additional information on passivation and reintegration

For further information about fail-safe module access, refer to the "*SIMATIC Safety - Configuring and Programming, Programming and Operating Manual*" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

4.4.2.2 Fault diagnostics

Diagnostics detect faults that can affect the integrity of safety-related I/O. The faults can be in the fail-safe module, in communication with the CPU, or in external circuits. Diagnostic information is assigned either to a single channel or to the entire fail-safe device.

Most diagnostics operate without user selection. You can configure the following diagnostic options in STEP 7 Device configuration under "F-I/O parameters":

- Short-circuit testing using the digital input sensor supplies, as well as the duration and startup time of the short-circuit tests for each sensor supply
- Discrepancy times for 1oo2 digital inputs
- The readback times for 24 V DC digital outputs
- The timeout intervals for failures in the safety communication or failure of a safety program to run
- Wire break testing when the output is wired in PM mode and the output is off
- Disabling of Dark testing of the digital outputs (max. SIL 2, Cat. 3, PL d)

The safety-critical and validated action of the diagnostics is to passivate I/O when faults are detected. The reporting of status and diagnostic results through the LED displays and diagnostic messages is subject to single point failures in electronics or software. These measures are offered as maintenance and debugging aids, but must be observed and interpreted with caution.

In the presence of single faults, any or all LED indications can be wrong. You should not rely solely on the presence or absence of red or green LED indicators to make safety decisions.

In the presence of single faults, diagnostic messages can fail to be delivered, or the numerical event ID or text message can be wrong. You should not rely solely on the presence, absence, or content of diagnostic reports to make safety decisions.

⚠ WARNING

Diagnostic and status reports and single point failure errors

Diagnostic and status reports through LEDs and text messages are subject to single point failure errors. These are not sufficient for determining a safety-controlled state.

If the integrity of your fail-safe system is in doubt, you should use additional measures such as restricted access or power removal to control hazards during maintenance and debug activities.

Relying solely upon such reported information to determine that a system or I/O point is in a safety-controlled state can result in death, severe personal injury, and/or property damage.

Diagnostics performed at start-up

Each fail-safe module executes self-diagnostics at power-up to ensure that the electronics and software operate as expected before allowing the module to participate in process control. If tests are not successful, the module passivates the affected channel or all channels.

In addition to internal tests, some tests create signal changes at the terminals.

The SM 1226 F-DI 4x, F-DQ 2x, DI 2x executes tests for its digital input sensor supplies at power-up, including ON and OFF pulses, whether or not you have enabled the sensor supply or short-circuit testing in your configuration. If your configuration includes short-circuit testing, the module also executes a short-circuit test according to your configured parameters after receiving the parameters from the fail-safe CPU at power-up.

The SM 1226 F-DI 4x, F-DQ 2x, DI 2x also executes tests for its digital outputs of the P- and M-switches as defined by your configured parameters for "Max. readback time" and "Max.

readback time switch on test" after receiving configuration parameters from the fail-safe CPU at power-up. P- and M-switch ON tests are sequenced so that there is no energy applied to the load in the absence of faults.

Diagnostics by LED display

Fail-safe modules have the following types of LEDs:

- **Module DIAG LED:**
  - The DIAG LED is green ON if no fault is present and the fail-safe module is configured.
  - The DIAG LED is flashing green if no fault is present and the fail-safe module is not configured.
  - The DIAG LED is flashing red as soon as a diagnostic function is triggered by the fail-safe module.

    NOTE

    The DIAG LED continues to flash red when a reintegratable channel fault has been cleared, but not yet acknowledged.

  - The DIAG LED alternates between flashing red and green when a reintegratable module fault has been cleared, but not yet acknowledged.
  - The DIAG LED is red ON when inconsistent hardware and/or firmware versions are present.
- **Input/Output Status LED**:
  - Green LED for each input shows the input/output state during normal operation**.** If the input is ON, the LED is green.
- **Input/Output Fault LED**:
  - Red LED for each input/output indicates a channel error. If any channel error is present, the DIAG LED is flashing red.

    The input/output LEDs alternate between flashing red and green when a reintegratable channel fault has been cleared, but not yet acknowledged.

LED states for module and channel behaviors

Table 1-123 Fail-safe module LEDs

Description	DIAG	F-Input channel		F-Output channel	
	Green / Red	Red	Green	Red	Green
Module / System Fault[2]	Blinking (red)[3]	On	Off	On	Off
Not configured, includes undervoltage, overvoltage of 1L+ and 2L+ when not configured[2]	Blinking (green)[3]	Off	Input state	Off	Off
States after you successfully configure the module					
Channel deactivated	N/A	Off	Input state	Off	Off
No channel faults	On (green)	Off	Input state	Off	Output state
Channel faults	Blinking (red)[3]	On	Off	On	Off
Awaiting manual reintegration after channel fault	Blinking (red)[3]	Blinking[1]	Blinking[1]	Blinking[1]	Blinking[1]
Awaiting manual reintegration of channels after 1L+/2L+ voltage too high or too low	Blinking (red/green)[1]	Blinking[1]	Blinking[1]	Blinking[1]	Blinking[1]

Description	DIAG	F-Input channel		F-Output channel	
	Green / Red	Red	Green	Red	Green
Awaiting reintegration after PROFIsafe communication error (detected by host)	Blinking (red/green)[1]	Off	Input state	Off	Off
1L+ module supply voltage too high/too low	Blinking (red)[3]	On	Off	On[4]	Off
2L+ module supply voltage too high/too low	Blinking (red)[3]	On	Off	On[4]	Off
PROFIsafe communication error (detected by module)	Blinking (red)[3]	Off	Input state	Off	Off
Identification of the F-module when assigning the PROFIsafe address	Off	Off	Blinking[3]	Off	Blinking[3]
PROFIsafe address does not match the configured PROFIsafe address	Off	On	Off	On	Off
Firmware Update	N/A	Off	Off	Off	Off
Inconsistent FW versions and/or HW revisions between TPS and uCs	Blinking (red)[3]	Blinking, all channels	Off	Blinking, all channels	Off

Table 1-124 LED states for 24V supply behaviors

Description	DIAG	F-Input channel		F-Output channel	
	Green / Red	Red	Green	Red	Green
24V module 1L+ off, 24V module 2L+ off	Off	Off	Off	Off	Off
24V module 1L+ on, 24V module 2L+ on	Off	Off	Off	Off	Off
24V module 1L+ on, 24V module 2L+ off	Blinking (red)[3 5]	On	Off	On[4]	Off
24V module 1L+ on, 24V module 2L+ on	Off	Off	Input state	Off	Output state

Table 1-125 LED states for sensor supply behaviors

Description	DIAG	F-Input channel	
	Green / Red	Red	Green
Sensor supply fault, for inputs affected by the fault	Blinking (red)[3]	On	Off
Sensor supply fault, for inputs not affected by the fault	Blinking (red)[3]	Off	Input state

Table 1-126 LED states for 1oo1 input channels

Description	DIAG	F-Input channel	
	Green / Red	Red	Green
Input state 0	N/A	Off	Off
Input state 1	N/A	Off	On
Channel fault	Blinking (red)[3]	On	Off
Channel fault resolved, awaiting integration	Blinking (red)[3]	Blinking[1]	Blinking[1]

Table 1-127 LED states for 1oo2 input channels

Description	DIAG	Primary input		Secondary input	
	Green / Red	Red	Green	Red	Green
Input state 0 (equivalent)	N/A	Off	Off	Off	Off
Input state 1 (equivalent)	N/A		On		On
Input state 0 (non-equivalent)	N/A		Off		On
Input state 1 (non-equivalent)	N/A		On		Off
Discrepancy error	Blinking (red)[3]	On	Off	On	Off
Discrepancy error resolved, awaiting reintegration	Blinking (red)[3]	Blinking[1]	Blinking[1]	Blinking[1]	Blinking[1]

[1] Alternating blinking of red and green LED, for channels awaiting reintegration (blinking frequency: 2 Hz)

[2] Desired behavior Deviations under certain conditions, due to technical constraints, are acceptable.

[3] Blinking frequency (2.0 Hz)

[4] Assuming channels are activated

[5] Unless all outputs are deactivated and 24V 2L+ is low

Fault types, causes, and corrective measures

The table below lists the messages of the S7-1200 G2 Fail-safe I/O modules. These messages are displayed in the TIA Portal under "Online & diagnostics" > "Diagnostics" > "Diagnostic buffer". When you highlight a diagnostic buffer entry, the Event ID for that text item is displayed, along with the module identity and location that generated the message. You might need to expand the window to see all of the information.

Table 1-128 Fault types, causes, and corrective measures

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0001	Short-circuit	Fail-safe digital outputs	Short-circuit on one of the switches in the output	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			"Max. readback time switch on test" value is configured too small.	Increase "Max. readback time switch on test" if permissible.
			Defective output driver	Replace the fail-safe module.
0x0005	Overtemperature	Module	Excessive heat within the module	Check the ambient temperature. Once the fault has been eliminated, the power must be switched off and on.
			Excessive heat within the environment surrounding the module	
0x0006	Wire break	Fail-safe digital outputs	No load is connected to the PM output.	Check the wiring between the affected output channel and the load.
			Output is configured as a PM output, but not wired as a PM output.	Check that the affected output channel is wired in PM mode.
			Too small of a load is detected.	Change the output load.
			There is a fault in the external circuitry.	Deactivate the "Wire break" diagnostic

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0006	Wire break	Fail-safe digital outputs	A PM output load with reverse voltage protection could cause a wire break diagnostic.	Provide a small reverse current path through the PM load.
0x0009	Error	Module	Hardware version of the module is set to "0" due to an internal error.	Replace module.
0x0010	Parameter error	Module	i-Parameter CRC error	Check the communications connection or eliminate any electrical interference.
			Invalid F-parameters, I-parameters, and/or parameter CRCs were configured and downloaded to the module.	Resolve the invalid parameters and perform another download.
			A different F-Source and/or F-Destination address has been downloaded and does not match what had been previously assigned to the module.	Assign consistent source and destination fail-safe addresses to the module.
0x004D	PROFIsafe communication error (CRC)	Module	Communication interference between the fail-safe CPU and the fail-safe module (for example, due to electromagnetic interference in excess of limits or sign-of-life monitoring error)	Check the communications connection.
				Eliminate the interference.
0x004E	PROFIsafe communication failure (timeout)	Module	F-monitoring time exceeded. Transmission error: timeout (watchdog time 1 or 2 elapsed)	Adjust F-monitoring time.
				Check Safety program and all other CPU activities for excessive execution or demands: • Interrupts • OB scheduling conflicts • Long program paths
0x004F	User acknowledgement request of channel failures	Module	Fail-safe module awaits an acknowledge of channel failures.	Acknowledge channel failures.
0x0100	Module is defective	Module	Fail-safe module is defective.	Replace the fail-safe module.
0x0103	Watchdog tripped	Module	Fail-safe module is defective.	Replace the fail-safe module.
0x0105	Short-circuit to L+	Fail-safe digital outputs	Short-circuit to L+	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			Defective output driver	Replace the fail-safe module.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0105	Short-circuit to L+	Fail-safe digital outputs	"Max. readback time" value is configured too small.	Increase readback time.
0x0106	Short-circuit to ground	Fail-safe digital outputs	Short-circuit to M	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			Defective output driver	Replace the fail-safe module.
			"Max. readback time" value is configured too small.	Increase readback time.
0x011B	Invalid/inconsistent firmware present	Module	Inconsistent firmware version may occur between Bus ASIC firmware and/or fail-safe microcontroller firmware if the firmware update was interrupted.	The firmware update operation should be repeated.
0x013E	Diagnostic event queue overflow	Module	This can happen if channel errors come and go quickly (for example, discrepancy errors when automatically acknowledged).	Examine the diagnostics buffer to see what errors are occurring, then address the relevant issues.
0x0300	Discrepancy failure, channel state 0/0	Fail-safe digital inputs	Process signal faulty, sensor may be defective Configured discrepancy time too short Short-circuit Sensor mechanical activation or alignment out of tolerance	Check process signal, replace sensor if necessary. Check the configured discrepancy time. Check the wiring. Check that both sensors are mounted and aligned to be activated together.
0x0301	Discrepancy failure, channel state 0/1	Fail-safe digital inputs		
0x0302	Discrepancy failure, channel state 1/0	Fail-safe digital inputs		
0x0303	Discrepancy failure, channel state 1/1	Fail-safe digital inputs		
0x0306	Sensor supply short-circuit to P	Fail-safe digital inputs	Sensor supply shorted to P	Eliminate the short-circuit.
			Short-circuit test duration configured too short	Increase short-circuit test duration.
			Failed sensor supply	Replace the fail-safe module.
0x0307	Sensor supply short-circuit to ground	Fail-safe digital inputs	Short-circuit	Eliminate the short-circuit.
			Excessive load on sensor supply	Reduce load on sensor supply.
			Failed sensor supply	Replace the fail-safe module.
0x0311	Frequency too high	Fail-safe digital outputs	Process value from safety program changing too rapidly for module to follow.	Change safety program logic to guarantee more time between output changes.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0312	Undertemperature	Module	The ambient temperature is too cold.	Check the ambient temperature. After the fault has been eliminated, the power must be cycled.
0x0313	Failure in the input circuit	Fail-safe digital inputs	The module has detected a failure in the input circuitry during diagnostic testing.	If intermittent, possibly due to interference. Eliminate interference. If persistent, or repeats after efforts to eliminate interference, replace the fail-safe module.
0x031C	Input shorted to P	Fail-safe digital inputs	External signal for input or sensor supply shorted to L+	Check/correct external short-circuit.
			Input configured for internal sensor supply with short-circuit detection enabled, but wired to external L+	Make wiring and configuration agree.
			Input defective	Replace the fail-safe module.
0x031E	Read back failure	Fail-safe digital outputs	"Max. readback time" or "Max. readback time switch on test" configured value is too small.	Increase readback time or readback switch on test time.
			Output switch failure	Replace the fail-safe module if output does not respond.
0x0320	Overload	Fail-safe digital outputs	Excessive load on output	Reduce the current demand on the output.
0x032F	Module is defective	Module	Fail-Safe module is defective.	Replace the fail-safe module.
0x0321	Supply too high	Module	Supply is set too high.	Adjust 1L+ and/or 2L+ voltage.
0x0322	Supply too low	Module	Supply is set too low.	Adjust 1L+ and/or 2L+ voltage.

Electromagnetic interference and diagnostic reports

Electromagnetic interference can cause communication errors, disturb external and internal signal measurements, and cause processing errors. When error reports do not apparently relate to an identifiable device failure, wiring problem, programming or configuration error, consider sources of electromagnetic interference and installation and wiring problems that might introduce electromagnetic interference in your installation. Typical problem sources include poor suppression of inductive loads and voltage dips due to excessive load in-rush currents.

4.5 Standard IO

4.5.1 Parameters/address space

4.5.1.1 DI

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "Input parameters" > "Digital inputs" for the standard DI of the module:

Table 1-129 Configurable standard DI parameters

Parameter	Value range	Default	Scope
Channel Settings			
Input filters	• 0.2 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms	6.4 ms	Channel

I/O address parameters

The following table shows the parameters that you can set for addressing of the standard DI of the module:

Table 1-130 Configurable standard DI address parameters

Parameter	Value range	Default	Scope
Start address	0 to 1023	Calculated	Channel
End address	N/A	Calculated	Channel
Organization block	• "--- (Automatic Update)" • List of available OBs	"--- (Automatic Update)"	Channel
Process image	• "Automatic Update" • List of available PIPs • "None"	"Automatic Update"	Channel

Explanation of DI parameters

The following explanation describes the parameter that you can set in STEP 7 Device configuration under "Input parameters" > "Digital inputs":

Input filters

You can parameterize the standard input filter setting which applies to both channels.

4.5.1.2 Address space

The table below shows the number of I and Q bytes required:

Input (I) bytes required	Output (Q) bytes required
1	0

4.5.1.3 Feedback interface

Assignment of the feedback interface

Your safety program receives current values and status information from the module by means of the feedback interface.

The following table shows the assignment of the feedback interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IB x	0	0	0	0	0	0	DI 0.1	DI 0.0

Explanations

Byte	Bit	Control bit/value	Explanation
IB x	0	DI 0.0	The process value (PV) of digital input channel 0.
	1	DI 0.1	The process value (PV) of digital input channel 1.

Applications

5

This chapter presents typical application examples for connection of fail-safe input channels and output channels, with a statement of the safety performance (SIL/Cat./PL) that is possible for each example.

The PLC system typically contributes only a small part of the total probability of dangerous failure. The probability of dangerous failures of the sensors and actuators will typically be far larger than the PFH/PFD of the PLC system. Faults in the wiring system can also be a substantial contributor.

To achieve a targeted level of safety performance for each safety function, you must do the following:

- Choose an appropriate architecture.
- Choose sensors and actuators that are appropriately rated.
- Provide a safety program that meets the requirements of the safety function.
- Provide diagnostics and proof tests to maintain the ratings of the sensors and actuators.
- Use wiring installation practices, diagnostics, and proof tests to assure wiring integrity.
- Control operating and maintenance procedures for the lifetime of the installation.

The S7-1200 G2 Fail-safe system provides a high level of internal diagnostic coverage. Diagnostic coverage of your external circuits, sensors, and actuators depends on your design choices using features of the PLC system and other measures.

The PFH/PFD of each S7-1200 G2 Fail-safe component is stated assuming no field proof test within the lifetime of the product. Sensors and actuators typically require regular proof tests to maintain an expected level of safety performance.

The reaction time of each safety function depends upon the reaction time of each component, including the sensor, the PLC system, and the actuator. "Fail-safe response times" gives further information on delay times through the PLC components. You must choose PLC parameters and external component reaction times to achieve a total safety reaction time goal.

In addition to total delay from safety demand input to safe actuator response, you must consider these additional time-related factors:

- To be assured of a safety response, a safety signal from the fail-safe input sensor must last long enough to be seen by the safety program, which varies based upon your configured input filter, the duration of short-circuit test, and startup after short-circuit test is completed times.
- The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is functional and under independent control. The OFF test pulse duration can be as long as your configured "Max. readback time". The ON test pulse duration can be as long as your configured "Max. readback time switch on test". For a given output, the ON test pulse is only provided to one of the P- or M- switches at a time, but in the presence of a single fault this could apply energy to your load. Make sure that your actuator does not respond to an OFF signal up to the "Max. readback time" or to an ON signal up to the "Max. readback time switch on test".

- The fail-safe digital outputs verify that any transition of the output process value reaches the expected state within the configured "Max. readback time". When an output process value transition occurs, your program must wait the configured "Max. readback time" before changing the output process value again. If the output does not reach the expected state in the configured "Max. readback time", the output channel passivates.

⚠ WARNING

Safety performance depends upon your design and continued maintenance
S7-1200 G2 F-CPUs and fail-safe signal modules provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions.
You must choose all components of your installation and complete your design and maintenance according to accepted safety standards and practices to achieve your required level of safety.
Failure to comply with these guidelines can result in death, severe personal injury, and/or property damage.

5.1 Digital input applications

Consider the application modes below along with the features of the fail-safe module as described in the product overview (Page 20).

You configure each channel as a 1oo1 or as part of a 1oo2 evaluation pair. The corresponding channels from input bytes "a" (a.0, a.2), (a.1, a.3) form 1oo2 channel groups. Within this restriction, you can assign 1oo1 and 1oo2 in any order.

Short-circuit testing requires use of the internal sensor supply. Each input can optionally have its own Vs supply. If you enable the short-circuit test, and your inputs are configured as 1oo2, sensors used with the 1oo2 pair are configured with the same parameters. All channels you configured for internal sensor supply will be subject to the same short-circuit test. You configure a test duration and sensor startup time.

The sensor supply is monitored to detect short-circuit or overload. It is cycled on each power up to assure control and readback are working, and the sensor supply continuously monitors the readback. You configure a discrepancy time to identify unacceptable differences between 1oo2 inputs. You configure a filter time for each channel or each 1oo2 pair.

Achieving SIL 2/Cat. 3/PL d in 1oo1 configuration

You can achieve SIL 2/Cat. 3/PL d in 1oo1 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- Each F-DI input includes sufficient diagnostics and redundant components such that no single internal fault can cause a dangerous failure.
- An appropriately-rated, single sensor can reach SIL 2/Cat. 3/PL d by internal fault tolerance.
- The external wiring of a single sensor to a single input is vulnerable to single fault dangerous failure, unless additional measures are applied.

Achieving SIL 3/Cat. 4/PL e in 1oo2 configuration

You can achieve SIL 3/Cat. 4/PL e in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- With 1oo2 evaluation, a pair of F-DI inputs is not subject to dangerous internal failure within a reasonable number of accumulated internal faults.
- Appropriately-rated, external-paired sensors or equivalent redundancy can achieve Cat. 4.
- The duplicated external wiring of 2 sensors to 2 input points is vulnerable to accumulated fault dangerous failure, unless additional measures are applied.

The F-DI is recommended for SIL 3/Cat. 4/PL e only when 1oo2 evaluation is selected. A single high-integrity sensor can be rated up to SIL 3/Cat. 4/PL e, but it should be wired and configured for 1oo2 evaluation for the channel to achieve SIL 3/Cat. 4/PL e.

5.1.1 Selecting the digital input application

Input architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

You can choose a digital input application based upon your functional and safety-related needs when wiring inputs. The applications and their achievable safety ratings are described in the table below:

Table 1-131 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Sensor supply	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
1	Internal	1oo1 evaluation	Single input	1 channel	2/3/d	
2	External					
3	Internal	1oo2 evaluation	Two inputs	2 channel equivalent	3/3/e	3/4/e
4	External				3/3/d	
5	Internal				3/3/e	3/4/e
6	External				3/3/e	
7	Internal			2 channel - 3 wire non-equivalent	3/3/e	3/4/e
8	External				3/3/e	
9	Internal			2 channel - 4 wire non-equivalent	3/3/e	3/4/e
10	External				3/3/e	

⚠ WARNING

Incorporation into SIL 2 and SIL 3 applications
To incorporate an Application Mode into a SIL 2 or SIL 3 rated application, the sensor must be an appropriately qualified device for that SIL level. Failure to use an appropriately qualified device can prevent your safety application from reaching a sufficient safety rating, which increases the probability of dangerous failures occurring.
Use sensors that are appropriately qualified devices: either SIL 3 or SIL 2 with Systematic Capability rules defined in IEC 61508-2:2010 observed (sufficient independence in design and application or SC3).
Dangerous failures could result in death, severe personal injury, and/or property damage.

5.1.2 F-DI Applications 1 and 2: 1oo1 evaluation of a single sensor

F-DI application mode 1

This Application Mode features a single one-channel sensor using 1oo1 evaluation and an internal sensor supply.

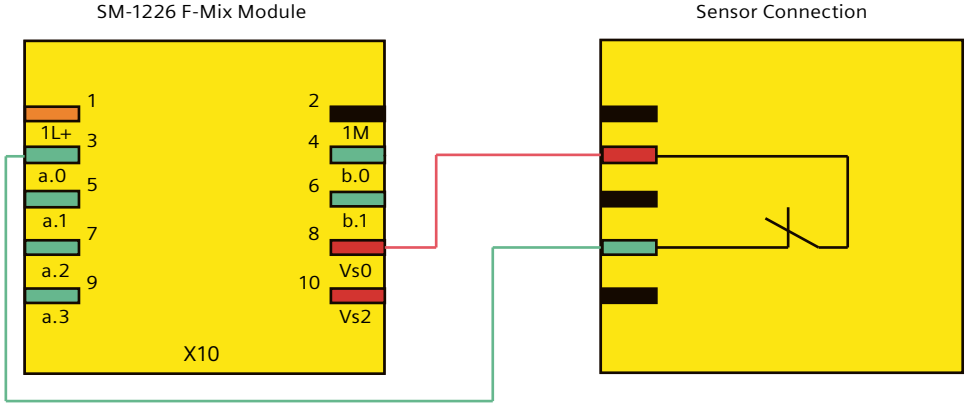

Figure 1-20 F-DI Application Mode 1

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	Assignable, sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 2

This Application Mode features a single one-channel sensor using 1oo1 evaluation and an external sensor supply.

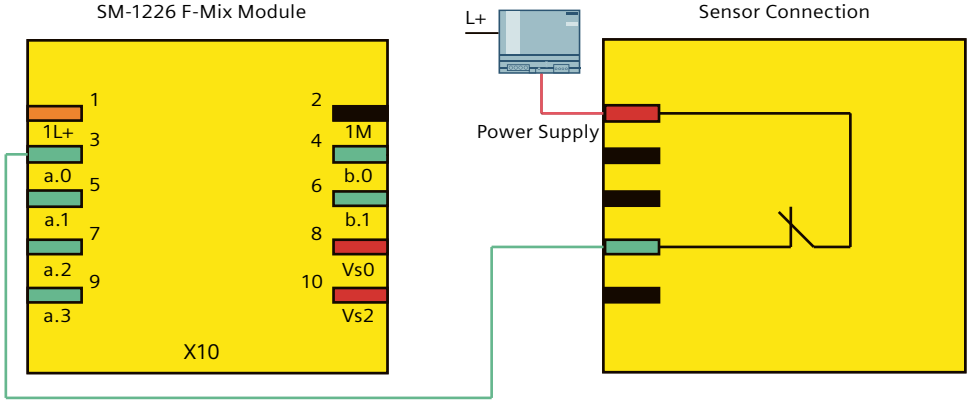

Figure 1-21 F-DI Application Mode 2

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	External

5.1.3 F-DI Applications 3 and 4: 1oo2 equivalent evaluation of a single sensor

F-DI application mode 3

This Application Mode features a single two-channel sensor using 1oo2 equivalent evaluation and an internal sensor supply.

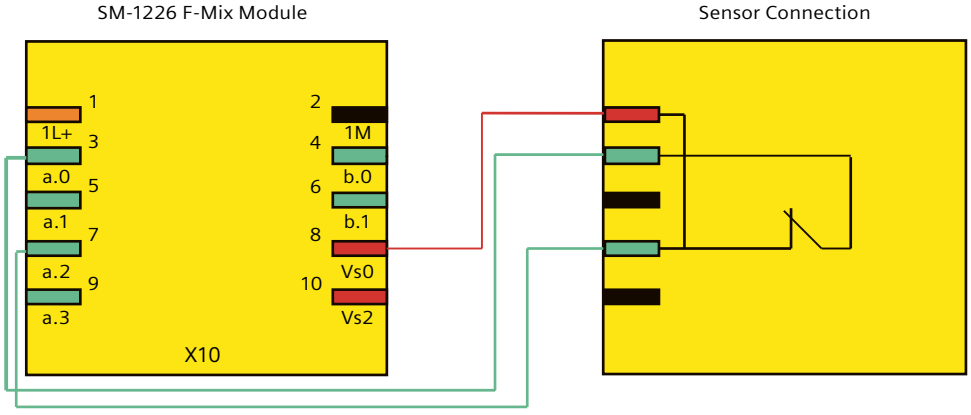

Figure 1-22 F-DI Application Mode 3

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire equivalent
Sensor supply	Assignable, sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 4

This Application Mode features a single two-channel sensor using 1oo2 equivalent evaluation and an external sensor supply.

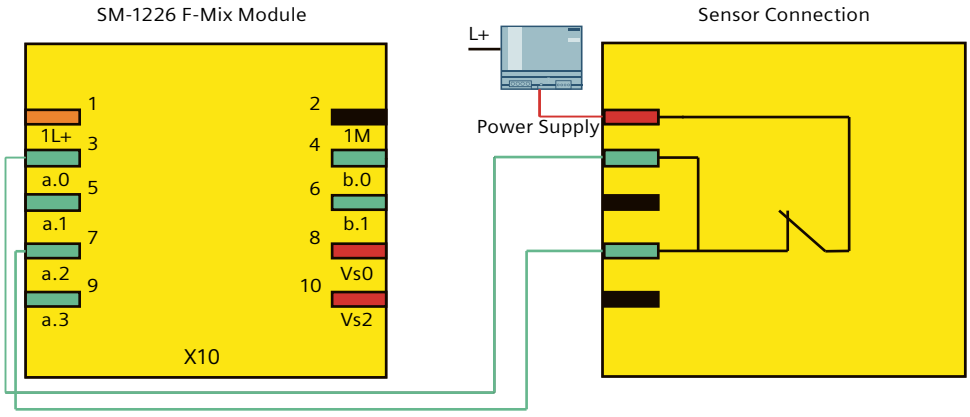

Figure 1-23 F-DI Application Mode 4

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire equivalent
Sensor supply	External

5.1.4 F-DI Applications 5 and 6: 1oo2 evaluation of a mechanically-coupled two-channel sensor

F-DI application mode 5

This Application Mode features a single two-channel sensor, with two mechanically-coupled contacts, using 1oo2 equivalent evaluation and internal sensor supplies.

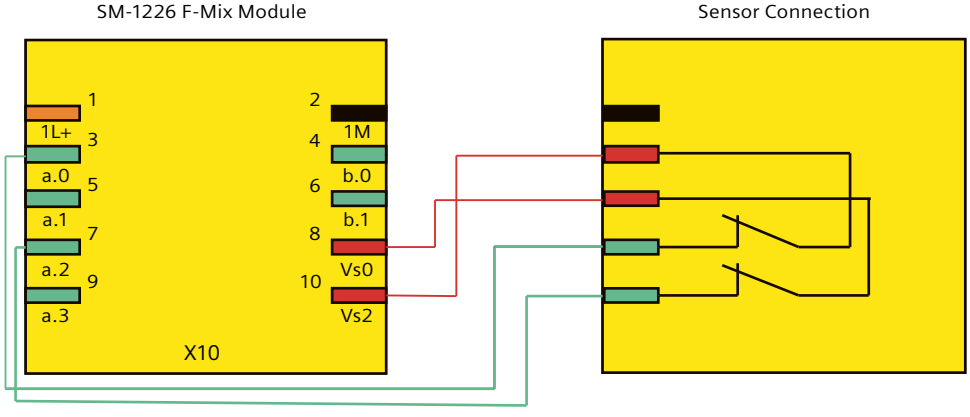

Figure 1-24 F-DI Application Mode 5

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire equivalent
Sensor supply	Assignable, sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 6

This Application Mode features a single two-channel sensor, with two mechanically-coupled contacts, using 1oo2 equivalent evaluation and external sensor supplies.

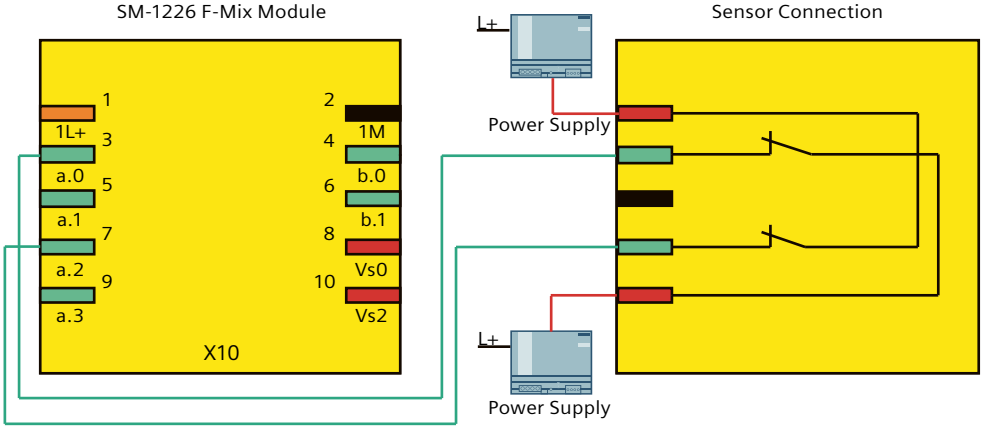

Figure 1-25 F-DI Application Mode 6

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire equivalent
Sensor supply	External

5.1.5 F-DI Applications 7 and 8: 1oo2 evaluation of a single 3 wire non-equivalent sensor

F-DI application mode 7

This Application Mode features a single two-channel sensor using 1oo2, 3-wire non-equivalent evaluation and an internal sensor supply.

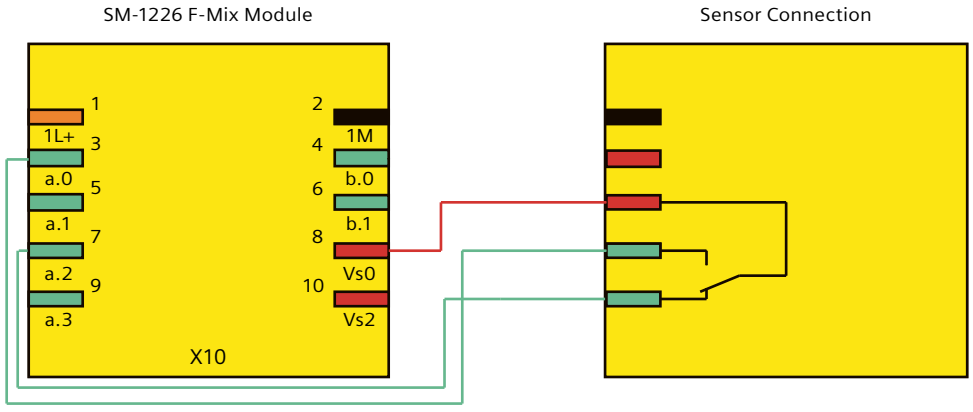

Figure 1-26 F-DI Application Mode 7

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 3-wire non-equivalent
Sensor supply	Assignable, sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 8

This Application Mode features a single two-channel sensor using 1oo2, 3-wire non-equivalent evaluation and an external sensor supply.

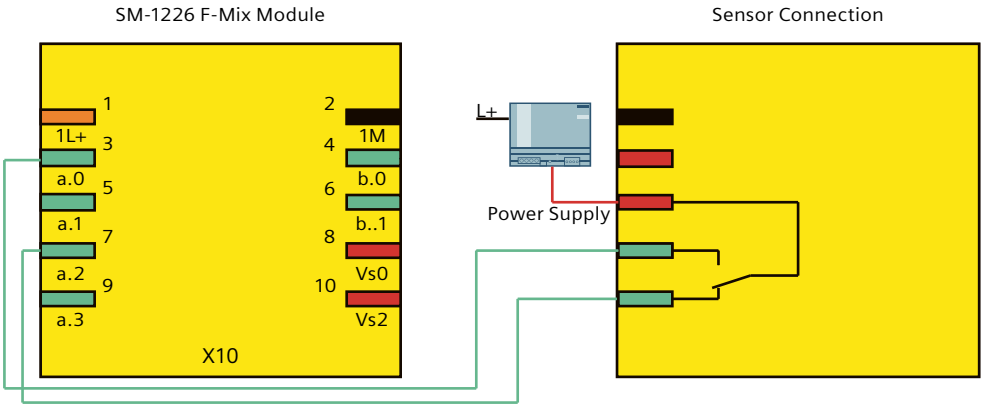

Figure 1-27 F-DI Application Mode 8

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 3-wire non-equivalent
Sensor supply	External

5.1.6 F-DI Applications 9 and 10: 1oo2 non-equivalent evaluation of a non-equivalent single channel sensor

F-DI Application Mode 9

This Application Mode features a single two-channel sensor using 1oo2, 4-wire non-equivalent evaluation and internal sensor supplies.

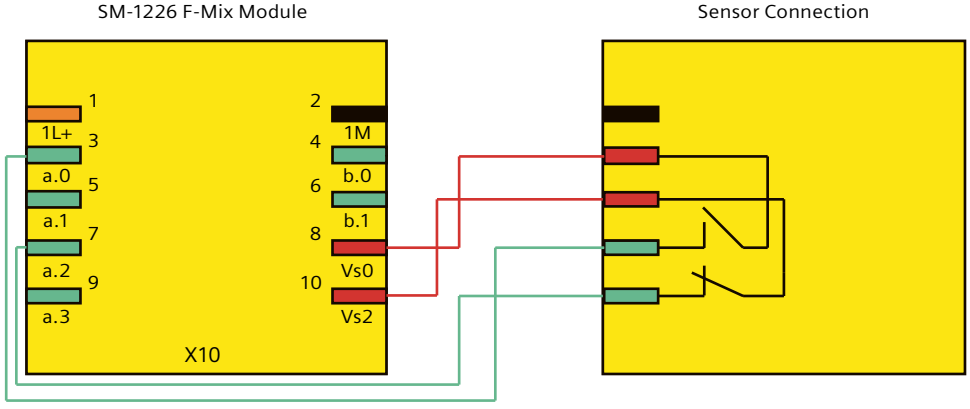

Figure 1-28 F-DI Application Mode 9

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire non-equivalent
Sensor supply	Assignable, sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI Application Mode 10

This Application Mode features a single two-channel sensor using 1oo2, 4-wire non-equivalent evaluation and external sensor supplies.

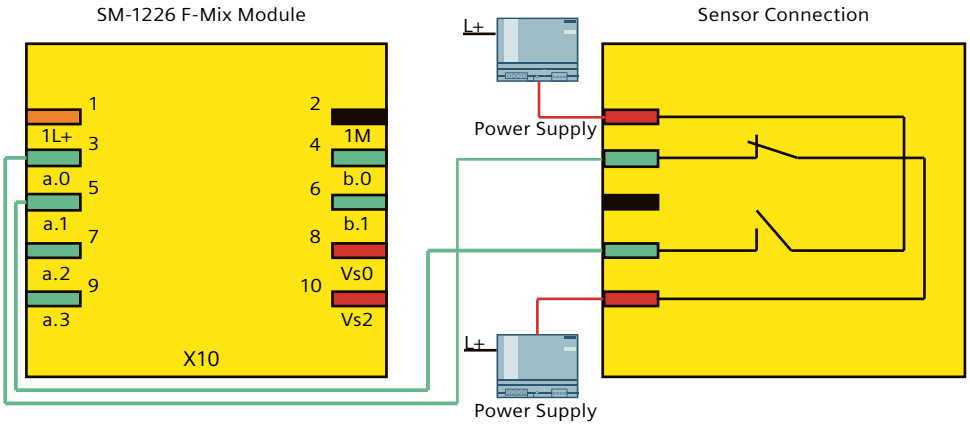

Figure 1-29 F-DI Application Mode 10

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2-channel 4-wire non-equivalent
Sensor supply	External

5.2 Digital output applications

Consider the application modes presented here along with the features of the fail-safe module as described in the product overview (Page 20).

The F-DQ DC separately controls current flow in the P (24 V to load) and M (load to common) sides of the circuit. The voltage at each P- and M- switch is read back to confirm proper state. The P- and M- switches are regularly tested with short ON and OFF pulses to confirm control. You must configure readback times that allow the external voltage to respond but do not cause your load to physically respond.

Internal current limiting as described in the data sheet may be sufficient in combination with your 24 V DC supply, but you must consider whether additional current limits or fuses are necessary. Refer to "Specifications".

All applications shown are capable of reaching SIL 3/Cat. 4/PL e (including dark test disable for 48 hours). To reach Category 4, external contactors must be SIL-rated with sense contacts. You must read the sense contacts back and confirm the external contactor response in your program. Siemens recommends using an F-DI input for sense contact and other safety diagnostic inputs, but external feedback inputs can also be standard inputs.

5.2.1 Selecting the digital output application

You can choose a digital output application based upon your functional and safety-related needs when wiring outputs. The table below describes these applications:

Application	Description
1	Wiring a load directly to a digital PM output
2	Wiring a load directly to a digital PP output
3	Using two relays to control an actuator, relays are connected between output and supply rail
4	Using two relays to control an actuator, relays are connected between output and supply rail
5	Using separate relays to control an actuator, relays are connected in parallel across two outputs

5.2.2 F-DQ Application 1: Wiring a load directly to a digital PM output

This Application Mode features directly connecting a load to the P- and M- outputs of one channel.

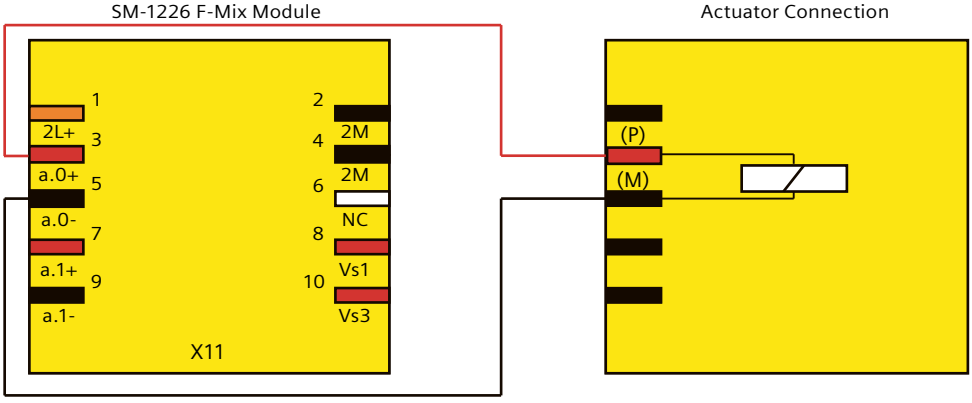

Figure 1-30 F-DQ Application Mode 1

5.2.3 F-DQ Application 2: Wiring a load directly to a digital PP output

This Application Mode features directly connecting a load to the P-output of one channel, which consists of two P-switches internally.

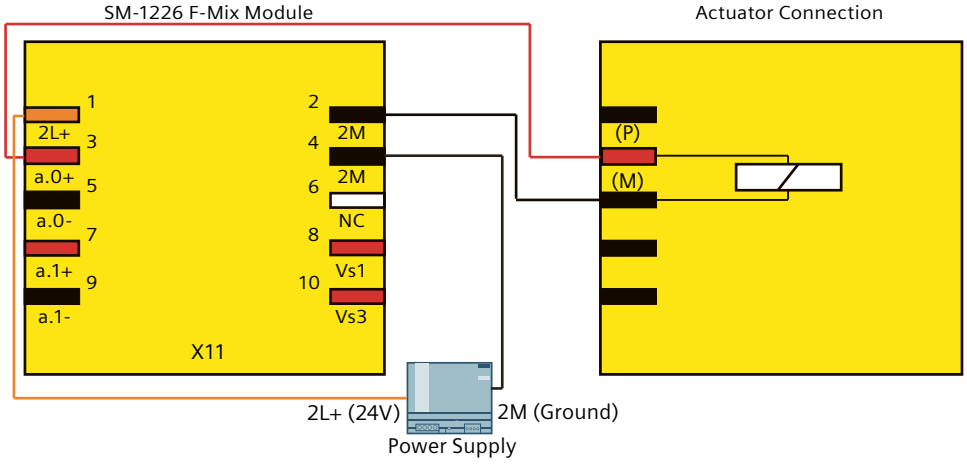

Figure 1-31 F-DQ Application Mode 2

The purpose of the additional wiring connection of the load back to the module's 2M terminal is potential fault mitigation. Without the additional connection, the module could be left in a floating condition with no reference to ground if a disruption to the first 2M (Ground) connection occurs. This disruption could cause the actuator to become energized by the current which could flow through the module from L+ to Px.0, a current greater than the OFF state leakage current for the module. Therefore, achieving safety ratings for SIL 3/Cat. 4/PL e requires an additional connection from the load to the module's M terminal.

F-DQ application mode 2, alternative wiring

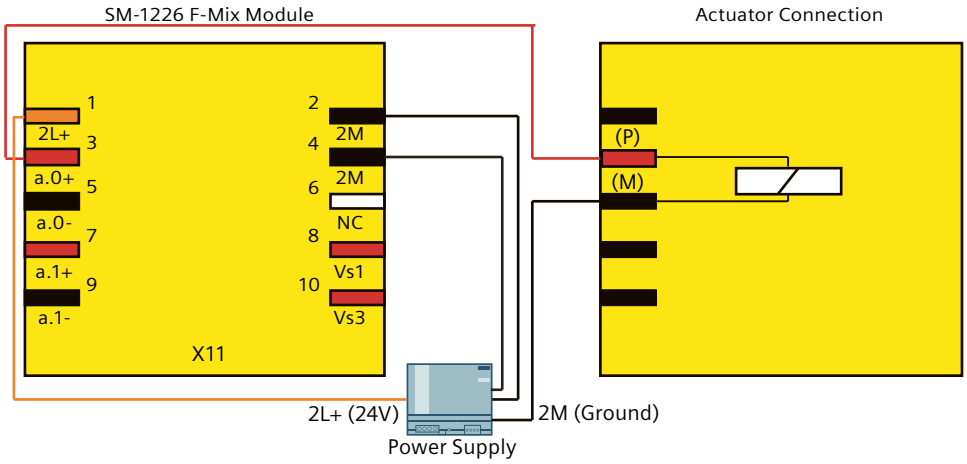

Figure 1-32 F-DQ Application Mode 2, alternative wiring

If the load is wired to the M (Ground) of the power supply, redundant connections are required from the power supply return to the module's 2M terminals for potential fault mitigation. Without the additional connections, ground disruptions could result in the module being left in a floating condition with no reference to ground.

It is possible that current flowing thru L+ to Px.0 which is greater than the OFF state leakage current specified in this manual could energize the module. Redundant connections are required to the module's 2M terminals in order to achieve safety ratings for SIL 3/Cat. 4/PL e.

WARNING

Connecting loads to ground in PP mode
When connecting the load to the ground of the power supply unit when a channel is in PP mode, the maximum residual current at signal "0", which is specified in the technical specifications, cannot be maintained if a single ground line is interrupted. Unexpected current flow can result.
You must run two ground lines between the power supply unit and the module for safety reasons to achieve SIL 3/Cat. 4/PL e.
Unexpected current flow can enable the output, resulting in death, severe personal injury, and/or property damage.

F-DQ application mode 2, Cat. 3/PL d wiring

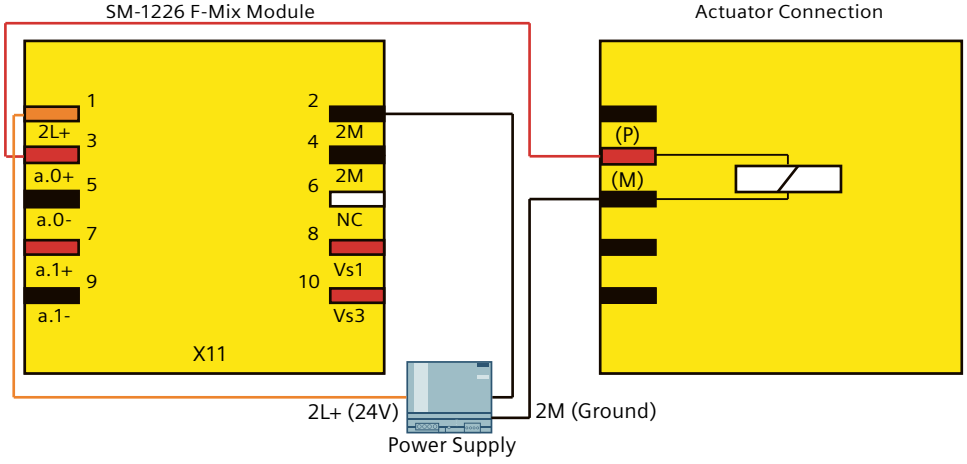

Figure 1-33 F-DQ Application Mode 2: Category 3

If a disruption occurs while the M (Ground) of the power supply is connected to the module's 2M terminal, the module could be left in a floating condition with no reference to ground.

It is possible that current flowing through the module from L+ to Px.0 which is greater than the OFF state leakage current specified in this manual could energize the actuator. Since there is no redundant ground, the configuration can only achieve a SIL 3/Cat. 3/PL d safety rating.

5.2.4 F-DQ Application 3: Using two relays to control an actuator, relays are connected between output and supply rail

This Application Mode features controlling a load by means of the series-connected normally open contacts of two relays. The coil of one relay is connected between the P-output of a channel and M, while the coil of the other relay is connected between the M-output of the same channel and L+.

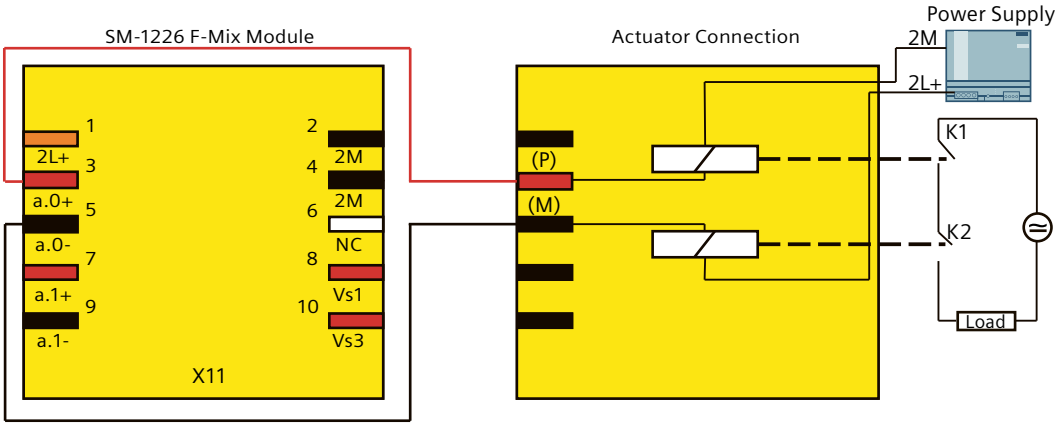

Figure 1-34 F-DQ Application Mode 3

NOTE

This configuration achieves SIL 3/Cat. 4/PL e only if the following conditions are fulfilled:

- The relay status is checked by means of a separate digital input.
- The wiring is adequately protected against shorts between the P and M outputs, as the actuator cannot be switched off if such a fault occurs.

5.2.5 F-DQ Application 4: Using two relays to control an actuator, relays are connected in parallel across one output

This Application Mode features controlling a load by means of series-connected, normally-open contacts of two relays. The coils of both relays are connected in parallel across the outputs of one channel.

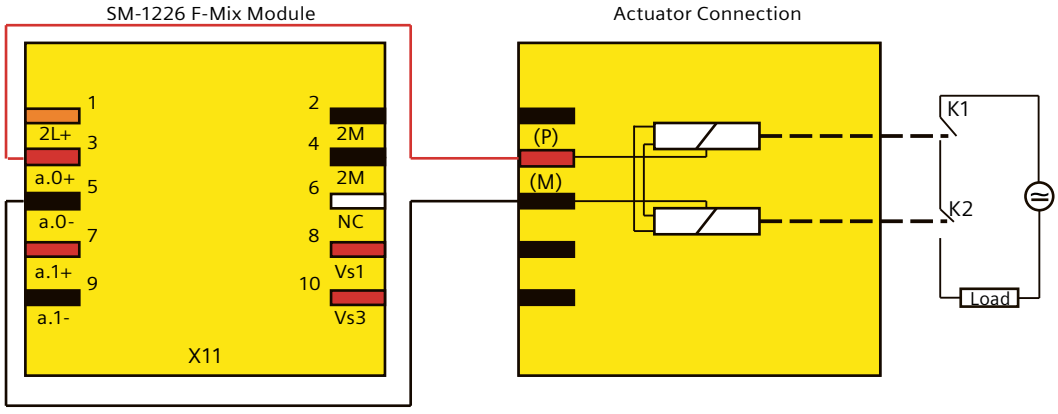

Figure 1-35 F-DQ Application Mode 4

NOTE

This configuration achieves SIL 3/Cat. 4/PL e only if the relay status is checked by means of a separate digital input.

NOTE

This configuration is the preferred way of controlling an actuator by means of relays in a safety-related application, as it avoids the problems associated with F-DQ Application Mode 1 regarding short circuits between the P and M outputs.

5.2.6 F-DQ Application 5: Using separate relays to control an actuator, relays are connected in parallel across two outputs

This Application Mode features controlling a load by means of series-connected, normally-open contacts of two relays. The coil of each relay is connected across the PM output of a unique output channel. Both outputs are independent of each other and are independently controlled and enabled from the safety program.

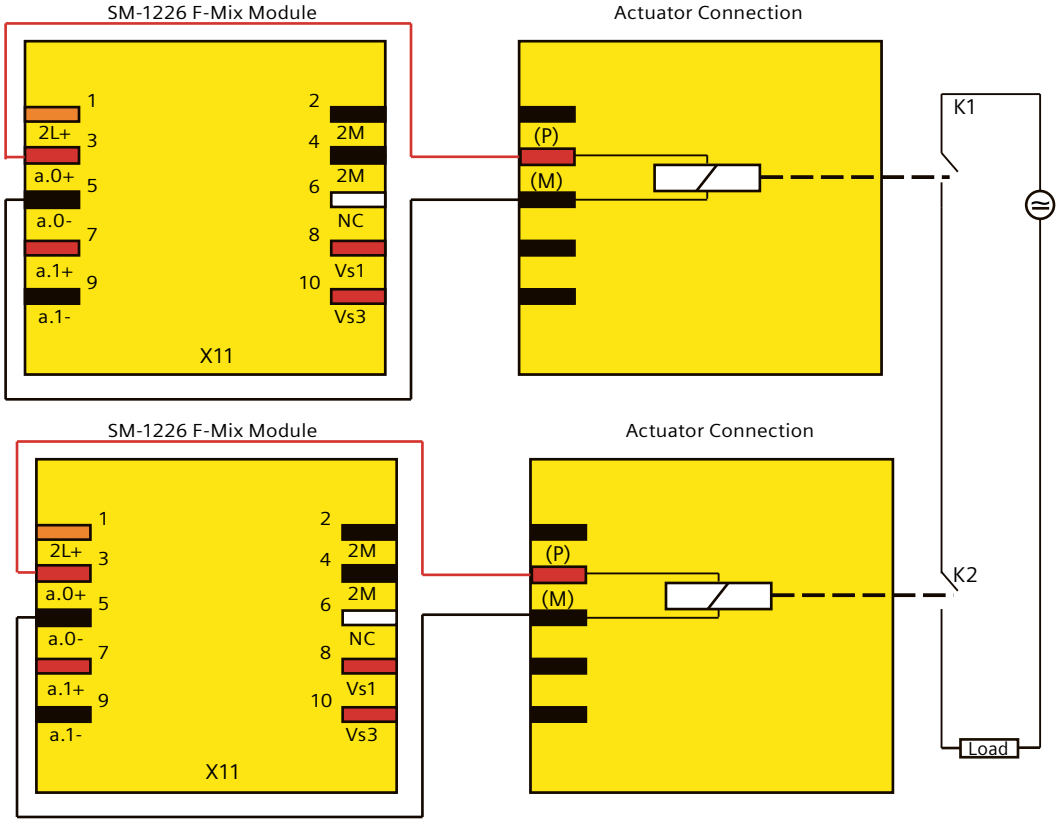

Figure 1-36 F-DQ Application Mode 5

NOTE

This configuration achieves SIL 3/Cat. 4/PL e only if the relay status is checked by means of a separate digital input.

Technical specifications

A

A.1 General technical specifications

Standards compliance

The S7-1200 G2 F-IO design conforms with the following standards and test specifications. The test criteria for the S7-1200 G2 F-IO are based on these standards and test specifications.

Note that not all S7-1200 G2 F-IO are certified to these standards, and certification status can change without notification. It is your responsibility to determine applicable certifications by referring to the ratings marked on the product. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

All S7-1200 G2 Fail-safe signal modules (SM) are certified by TÜV SÜD. The fail-safe signal modules are certified to the IEC 61508, EN ISO 13849, and IEC 62061 standards and guidelines for functional safety. For further information, refer to the current associated Annex of the report for the TÜV SÜD certificate (https://support.industry.siemens.com/cs/document/109825198/information-on-t%C3%BCv-certification?dti=0&lc=en-WW) for the F-CPU (https://support.industry.siemens.com/cs/ww/en/view/109978389) and the F-I/O (https://support.industry.siemens.com/cs/ww/en/view/109825424).

The following specifications are those which differ from those in the *S7-1200 G2 Programmable Logic Controller System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109997791) (A5E52923928).

Industrial environments

The S7-1200 G2 F-IO are designed for use in industrial environments.

Table 1-132 Industrial environments

Application field	Emission requirements	Immunity requirements
Industrial	EN 61000-6-4	EN 61000-6-2

Environmental conditions

The following environmental conditions are those which differ from those in the *S7-1200 G2 Programmable Logic Controller System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109997791).

Table 1-133 Climatic ambient conditions

Environmental conditions – Climatic ambient operating conditions (OTH4)	
Ambient temperature (Inlet Air 25 mm below unit)	Horizontal Mounting: 0 °C to 40 °C Max. specifications 0 °C to 60 °C With derating
	Vertical Mounting: 0 °C to 40 °C Max. specifications 0 °C to 50 °C With derating
	95% non-condensing humidity
	Derating method may change from device to device. See each device for derating method.
EN 60068-2-14, Test Nb (Temperature change)	0 °C to 60 °C, dwell time 3 hours, 5 cycles

Electromagnetic compatibility

Electromagnetic Compatibility (EMC) is the ability of an electrical device to operate as intended in an electromagnetic environment and to operate without emitting levels of electromagnetic interference (EMI) that can disturb other electrical devices in the vicinity.

Table 1-134 Immunity

Electromagnetic compatibility - Immunity per EN 61000-6-2	
EN 61000-4-2 Electrostatic discharge	8 kV air discharge to all surfaces 6 kV contact discharge to exposed conductive surfaces
EN 61000-4-3 Radiated, radio-frequency, electromagnetic field immunity test	80 MHz to 1000 MHz, 10 V/m, 80% AM (1 kHz) 1.4 GHz to 6 GHz, 3 V/m, 80% AM (1 kHz)
EN 61000-4-4 Fast transient bursts	2 kV, 5 kHz with coupling network to AC and DC system power 2 kV, 5 kHz with coupling clamp to I/O
EN 61000-4-5 Surge immunity	AC systems - 2 kV common mode, 1 kV differential mode DC systems - 1 kV common mode, 0.5 kV differential mode
EN 61000-4-6 Conducted disturbances	150 kHz to 80 MHz, 10 V RMS, 80% AM at 1 kHz

Table 1-135 Emissions

Electromagnetic compatibility - Conducted and radiated emissions per EN 61000-6-4		
Conducted emissions DC power ports	0.15 MHz to 0.5 MHz	< 89 dBµV quasi-peak, < 76 dBµV average
	0.5 MHz to 30 MHz	< 83 dBµV quasi-peak, < 70 dBµV average
Radiated emissions	30 MHz to 230 MHz	< 40 dBµV/m quasi-peak at 10 m
	230 MHz to 1000 MHz	< 47 dBµV/m quasi-peak at 10 m
	1000 MHz to 3000 MHz	< 76 dBµV/m peak, < 56 dBµV/m average at 3 m
	3000 MHz to 6000 MHz	< 80 dBµV/m peak, < 60 dBµV/m average at 3 m

DC outputs

Short-circuit protection circuitry is provided for fail-safe DC outputs.

Probabilities of failure

Quantitative safety properties like PDF and PFH are estimated using standard data tables and calculation methods according to international standards, including IEC 61508, ISO 13849, and IEC 61131-6.

The values are based upon the assumption of continuous full nominal load, nominal voltage, and 60 °C equipment ambient temperature.

A.2 SM 1226 F-DI 4x, F-DQ 2x, DI 2x

Table 1-136 General specifications

Technical data		**SM 1226 F-DI 4x, F-DQ 2x, DI 2x**
Article number		6ES7226-6ME50-0XB0
Dimensions W x H x D		30 x 125 x 100 mm
Weight (Product/Shipping)		177 grams / 214 grams
Power dissipation		6.0 W
Current consumption (bus)		80 mA max. (5 V DC)
Current consumption (24 V DC)		42 mA (1L+) plus 45 mA (2L+) plus 6 mA / input used plus any V_{S0} to V_{S3} current used plus load current for all P-switch outputs
Rated supply voltage		24 V DC
Supply voltage range		20.4 to 28.8 V DC
Reverse supply voltage protection		Yes
Highest safety class achievable in safety mode		
Performance level according to ISO 13849-1		PLd (F-DI single-channel, F-DQ with Dark test disabled), PLe (F-DI two-channel, F-DQ including Dark test disabled for 48 hours)
Category according to ISO 13849-1		Cat. 3 (F-DI single-channel, F-DQ with Dark test disabled), Cat. 4 (F-DI two-channel, F-DQ including Dark test disabled for 48 hours)
SIL according to IEC 61508		SIL 2 (F-DI single-channel, F-DQ with Dark test disabled), SIL 3 (F-DI two-channel, F-DQ including Dark test disabled for 48 hours)
Probability of failure (for service life of 20 years and repair time of 100 hours)		Altitude <= 5000 m
	Low demand mode: PFDavg in accordance with SIL2	<2.00E-04 F-DI; <2.00E-04 F-DQ
	Low demand mode: PFDavg in accordance with SIL3	<3.00E-05 F-DI; <3.00E-05 F-DQ

[1] Operating temperature range using maximum voltages and maximum specifications

Technical data		**SM 1226 F-DI 4x, F-DQ 2x, DI 2x**
	High demand/continuous mode: PFH in accordance with SIL2	<5.00E-09 1/h F-DI; <6.00E-09 1/h F-DQ
	High demand/continuous mode: PFH in accordance with SIL3	<5.00E-10 1/h F-DI; <5.00E-09 1/h F-DQ
Operating Environment		Horizontal Mounting 0 °C to 60 °C[1]
		Vertical Mounting 0 °C to 50 °C[1]
		95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

Table 1-137 Digital inputs

Technical data	**SM 1226 F-DI 4x, F-DQ 2x, DI 2x**
Number of inputs	Fail-safe: 2 (1oo2), 4 (1oo1), or a mix Standard: 2
Type	Sink (IEC 61131-2 Type 1)
Rated voltage	24 V DC at 4 mA nominal
Continuous permissible voltage	30 V DC at 6 mA
Logic 1 signal	15 V DC min. at 2.5 mA
Logic 0 signal	5 V DC max. or 0.5 mA
Isolation (field side to logic)	707 V DC (type test)
Filter times	Fail-safe: 0.8, 1.6, 3.2, 6.4, and 12.8 ms (selectable individually) Standard: 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, and 12.8 ms (selectable together)
Diagnostics	Fail-safe: Yes Standard: No
Number of sensor supplies	4
Sensor supply current	0.5 A max. per sensor supply / 1.0 A max. for all sensor supplies
Cable length	500 m shielded, 300 m unshielded
Cable size	AWG 24 to 16 (0.2 mm^2 to 1.5 mm^2)

Table 1-138 Digital outputs

Technical data	**SM 1226 F-DI 4x, F-DQ 2x, DI 2x**
Number of outputs	2, in 1 isolation group of 2 outputs
Type	PM-switching or PP-switching
Rated voltage	24 V DC
Voltage range	20.4 to 28.8 V DC
Logic 1 signal at max. current	2L+ minus 2 V (2L+ minus 1.5 V P-switch; 0.5 V M-switch)
Current	10 mA to 2 A
Lamp load	10 W
Leakage current per point	0.5 mA P-switch; 0.5 mA M-switch
Short-circuit protection	Yes, electronic per point; 10 A threshold

[1] For burner applications, the unshielded cable length is a maximum of 10 m.

Technical data	**SM 1226 F-DI 4x, F-DQ 2x, DI 2x**
Overload protection	Yes, electronic per point; 4 A threshold measured at P-switch for more than 0.5 s
Isolation (field side to logic)	707 V DC (type test)
Current per common	4 A max.
Inductive clamp voltage	Typ. -74 V (typ. -26 V P-switch; typ. +48 V M-switch)
Control of a digital input	Yes in PP mode No in PM mode
Parallel outputs for redundant load control	No
Parallel outputs for increased load	No
Diagnostics	Yes
Switching frequency	
with resistive load, max.	30 Hz
with inductive load, max.	0.1 Hz
on lamp load, max.	10 Hz
Cable length	500 m shielded, 30 m unshielded[1]
Cable size	AWG 24 to 16 (0.2 mm^2 to 1.5 mm^2)

[1] For burner applications, the unshielded cable length is a maximum of 10 m.

Fail-safe response times

C

C.1 Maximum response time of the system

This section shows the response times of the F-DI 4/F-DQ 2/ DI 2 Fail-safe module. The response times are included in the calculation of the F-system response time.

Times required for the calculation

T_{cycle} 7 ms	Firmware cycle time: This is the maximum internal cycle time of the fail-safe module.
T_{DAT_i} 12 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the fail-safe module to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

You assign the "Max. readback time" and "Max. readback time switch on test" settings in STEP 7.

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times" (http://support.automation.siemens.com/WW/view/en/49368678/133100).) Excel file (RT_calculator). Use your configured individual fail-safe module timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{cycle} parameter values include an allowance for the fail-safe module to acquire and deliver PROFIsafe messages in transactions with the PLC I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe module location and the fail-safe CPU. There are no separate transport delay parameters that you must include in your calculations.

C.2 Input response time parameters

Maximum reaction time for 1oo1 fail-safe digital inputs

$T_{WCDT_i} = (2 \times T_{cycle}) + T_{filter} + T_{sct} + T_{stup}$

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input to the availability of the PROFIsafe message frame for request from the fail-safe CPU.
T_{filter}	Configured "Input filter" time for the channel
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "Duration of short-circuit test" + "Input filter" time if short-circuit test is configured (Confirmation: "Input filter" can occur twice in the equation for T_{WCDT_i} if the short-circuit test is configured).
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test is configured • Duration of the startup time

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

Maximum reaction time for 1oo2 fail-safe digital inputs

$T_{WCDT_i} = (2 \times T_{cycle}) + T_{filter}$ + SUM (T_{sct} primary input, T_{sct} secondary input) + SUM (T_{stup} primary input, T_{stup} secondary input)

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input to the availability of the PROFIsafe message frame for request from the fail-safe CPU.
T_{filter}	Configured "Input filter" time for the channel
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filter" time if short-circuit test is configured (Confirmation: "Input filter" can occur twice in the equation for T_{WCDT_i} if the short-circuit test is configured).
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test is configured • Duration of the startup time

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

Maximum fault reaction time for 1oo2 fail-safe digital input discrepancy errors

$T_{OFDT_i} = (2 \times T_{cycle}) + T_{filter} + T_{dis} + MAX (SUM (T_{sct}$ primary input, T_{stup} primary input, T_{sct} secondary input, T_{stup} secondary input), $T_{cycle})$

An activated short-circuit test summation must be included for each activated sensor supply.

Where:

T_{OFDT_i}	One Fault Delay Time: Maximum response time for the F-DI 1oo2 channel to report as passivated
T_{filter}	Fixed "Input filter" time for the channel
T_{dis}	Discrepancy time: • Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" • Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filter" time if short-circuit test is configured (Confirmation: "Input filter" can occur twice in the equation for T_{OFDT_i} if the short-circuit test is configured.)
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test configured • Duration of the startup time

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

The term "MAX (SUM (T_{sct} primary input, T_{stup} primary input, T_{sct} secondary input, T_{stup} secondary input), T_{cycle})" includes an additional T_{cycle} to ensure that the minimum amount of time for a complete firmware cycle is included. This applies to situations where the summation of the short-circuit times is less than the duration of a firmware cycle.

Maximum fault reaction time for external short-circuit errors on the fail-safe digital inputs

$T_{OFDT_isc} = (2 \times T_{cycle}) + T_{filter} + T_{scf}$

Where:

T_{OFDT_isc}	One Fault Maximum Delay Time: Maximum delay time to passivate an F-DI channel with an external short-circuit.
T_{filter}	Configured "Input filter" time for the channel
T_{scf}	T_{base} + MAX (T_{fmax} - T_{othr}, 0): The total time interval for short-circuit testing for all channels whose short-circuit test is enabled • T_{base} = SUM (T_{dur}): Where T_{dur} is the total test duration for all channels where short-circuit testing is enabled, including both short-circuit test durations and sensor startup times • $T_{othr} = T_{base}$ - MAX (T_{dur}): The total test duration for all channels other than the channel with the largest duration • T_{fmax} = MAX (T_{filter}) + 1: Maximum filter of all channels where short-circuit testing is enabled

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

C.3 Output response time parameters

Maximum reaction time for the fail-safe digital outputs

$T_{WCDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{WCDT_q}	Maximum response time of the F-DQ DC from the receipt of a safety message frame from the safety program in the fail-safe CPU to the signal transition at the digital output
T_{rb}	Configured "Max. readback time" for the channel
T_{rb_swon}	Configured "Max. readback time switch on test" for the channel

The term "2 x T_{cycle}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

After the F-DQ DC commands the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Maximum fault reaction time for the fail-safe digital outputs

$T_{OFDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{OFDT_q}	One Fault Delay Time: Maximum response time for the F-DQ DC to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Max. readback time" for the channel
T_{rb_swon}	Configured "Max. readback time switch on test" for the channel

The term "2 x T_{cycle}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

Maximum fault reaction time for the fail-safe digital outputs with the Dark Test disabled

$T_{OFDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{OFDT_q}	One Fault Delay Time: Maximum response time for the F-DQ DC to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Max. readback time" for the channel
T_{rb_swon}	Configured "Max. readback time switch on test" for the channel

The term "2 x T_{cycle}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

NOTE
When dark testing is disabled for a given output, particular channel faults for this output might not be detected until a process value change occurs from "1" to "0". When dark testing is disabled and the process value is "1" for a given channel, the various safety measures do not manipulate the respective output switches.

C.4 ESF response time parameters

Maximum reaction time for an embedded safety function using a standard input

$T_{WCDT_SDI_FDQ} = T_{rb} + T_{filter}$
Where:

$T_{WCDT_SDI_FDQ}$	Worst Case Delay Time: Maximum response time from a transition of a standard input to a reaction of a fail-safe digital output
T_{rb}	Configured "Max. readback time" for the channel
T_{filter}	Configured "Input filters" time for the standard channel

After the F-DQ commands the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Maximum reaction time for an embedded safety function using a fail-safe input

The maximum reaction time for an embedded safety function with or without chaining dependencies is as follows:

$T_{WCDT_FDI_FDQ} = MAX\ (T_{WCDT\ (1oo1),}\ T_{WCDT\ (1oo2)}) + MAX\ (T_{WCDT_q})$
Where:

MAX ($T_{WCDT(1oo1),}\ T_{WCDT(1oo2)}$) applies to each input used within the respective embedded safety function. Each input is calculated separately and the maximum time applied.

T_{WCDT_q} applies to each output used within the respective embedded safety function. Each output is calculated separately and the maximum time applied.

After the F-DQ commands the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Maximum fault reaction time for an embedded safety function

The maximum fault reaction time for an embedded safety function with or without chaining dependencies is as follows:

$T_{_OFDT_ESF}$ = MAX ($T_{OFDT(1oo1)}$, $T_{OFDT(1oo2)}$) + MAX (T_{OFDT_q})

Where:

T_{OFDT_esf}	One Fault Delay Time: Maximum response time for the safety function to turn an output OFF. Refer to the individual $_{OFDT}$ fault reaction time calculations for detailed information.

MAX ($T_{OFDT(1oo1)}$, $T_{ODFT(1oo2)}$)T_{WCDT_q} applies to each input used within the respective embedded safety function. Each input is calculated separately and the maximum time applied.

T_{OFDT_q} applies to each output used within the respective embedded safety function. Each output is calculated separately.

Switching of loads

D

D.1 Connecting capacitive loads

If a fail-safe module is interconnected with loads that require little current and have capacitance, it is important that the readback time parameters are set to a large enough value to allow the capacitive load time to charge or discharge. If the value is too small, the module could issue a diagnostic error due to the load not responding with the correct process value in time. To avoid this, you must calculate appropriate readback time values. This ensures that your load does not respond to test pulses but has sufficient time to react to changes of the process value. Load capacitance can delay the diagnostic voltage response at the P- and M-switches of the fail-safe module's digital outputs. The pattern testing of this module requires the voltage at the P- and M-switches to be nearly zero across the load whenever the process value is "1".

You can place a diode between the P-switch and the capacitive load. This ensures that when the output is turned off, the voltage on the capacitor is not present at the P-switch during diagnostic testing. Typically, this diode is built into power supplies with input capacitors that have reverse voltage protection implemented. Using an additional diode can greatly reduce the "Max. readback time". The reduced "Max. readback time" allows the load to operate normally (load stays ON) during diagnostic testing. Alternatively, you can change the parameterization of a channel to not perform dark testing by selecting the check box for the "Disable dark test (max. SIL2, CAT3, PLd)" parameter.

Stray capacitance between the load circuit/wiring and ground, as well as between M and P, can increase the time needed for the "Max. readback time switch on test". During module diagnostics when the P- or M-switch is turned on to a load that is not powered during bit pattern testing, both sides of the load are influenced by stray capacitance. This effect is typically minor, but it is important for the "Max. readback time switch on test" duration to be long enough for the load circuit voltage to react, yet short enough that if one side of the load connects to P or M, the testing of the opposite switch does not cause the load to react.

Capacitive loads with low series resistance, including power supplies with input capacitors, can experience large inrush current. To avoid this, you should add series resistance to reduce inrush on large capacitive loads. Doing so reduces inrush current and minimizes risk of blown fuses or overcurrent fault detection during normal load switch-on events.

D.2 Switching of inductive loads

The diagram below shows the maximum permitted inductive load and switching frequency allowed using only the internal suppression circuits of the fail-safe module digital outputs. You should equip larger or more frequently switched inductive loads with external suppression circuits to avoid early failure of the fail-safe module digital output switch. External suppression conducts the load current at a voltage less than the internal suppression threshold to avoid overloading the internal suppression.

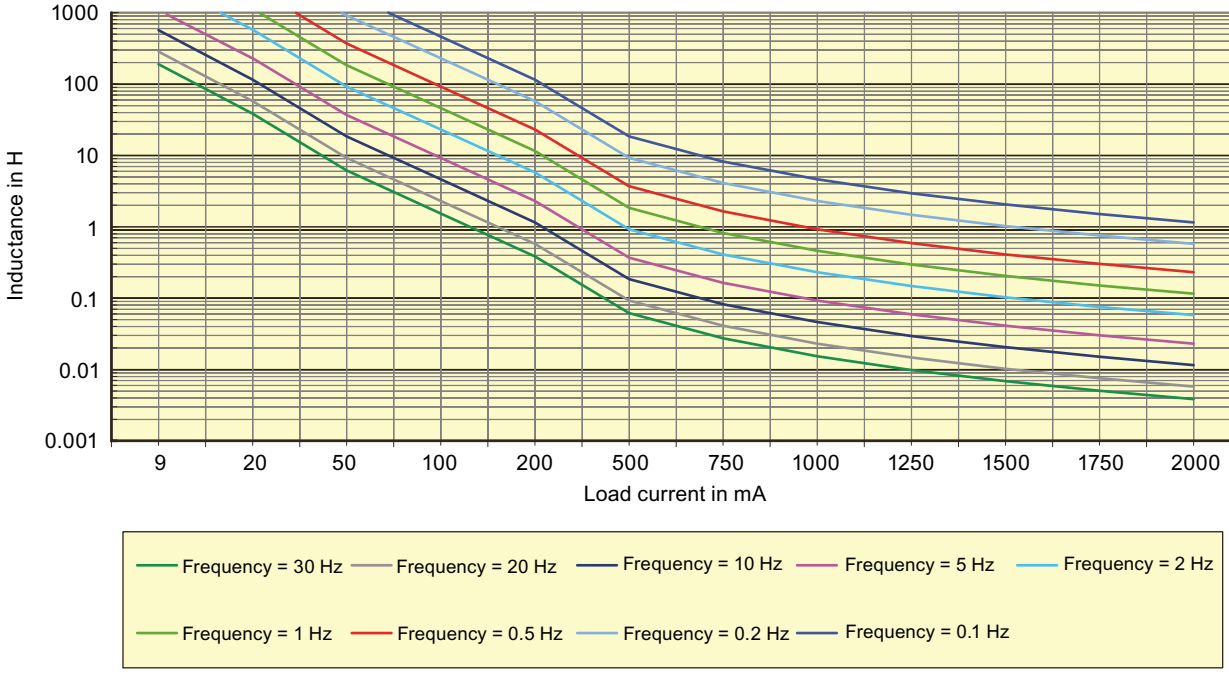

Figure 1-37 Switching of inductive loads depending on the load current and switching frequency

NOTE

Minimum permissible OFF time for fail-safe digital outputs

The fail-safe module's digital outputs expect to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than T_{WCDT_q} can cause the channel to passivate.

⚠ WARNING

Failures of unsuppressed inductive loads
The following failures can result from a lack of suppression of inductive loads:

- Unsuppressed inductive loads can lead to early "stuck-on"' failures of the Fail-safe module digital outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads. For more information on using suppressor circuits, refer to the *S7-1200 G2 Programmable Logic Controller System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109997791).
Failure to observe proper precautions can result in death, severe personal injury, and/or property damage.

Introduction

1

1.1 General information

Purpose of the documentation

The S7-1200 G2 programmable logic controllers (PLCs) can control a variety of automation applications. Compact design, affordable price, and a powerful instruction set make the S7-1200 G2 CPU and modules a perfect solution for controlling a wide variety of applications. Together with the STEP 7 configuration and programming tool (Page 93), you have the flexibility you need to design your automation solutions.

This documentation provides information about the S7-1200 G2 CPU and modules. It contains information for engineers, programmers, installers, and electricians.

Required basic knowledge

To understand this documentation, you need a general knowledge of automation and programmable logic controllers.

Validity of the documentation

This documentation applies to the S7-1200 G2 CPU family and G2 modules.

Refer to the technical specifications (Page 337) for each CPU and module in the S7-1200 G2 family.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

NOTE

A note contains important information on the product described in the documentation, on the handling of the product, or on the section of the documentation to which particular attention should be paid.

ID link for the digital nameplate

The ID link is a globally unique identifier according to IEC 61406-1, which you will find as a QR code on your product.

The figure shows an example of an ID link for the CPU 1212C AC/DC/RLY.

You can recognize the ID link by the frame with a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Access the ID link.

In the digital nameplate, you can find product data, manuals, declarations of conformity, certificates and other helpful information about your product.

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Certifications and approvals

Refer to the technical specifications (Page 337) for details on certifications and approvals.

Glossary

The definitions in the glossary provide an easy first reference for understanding the terms in this documentation.

1.2 Maintaining operational safety of your plant

NOTE

Operators of plants with safety-related features must meet operational safety requirements. Suppliers must also take measures when monitoring products.
To stay up-to-date on the latest operational safety requirements, visit the Siemens Industry Online Support (https://sieportal.siemens.com/en-ww/support) site and subscribe to email notifications:

1. Follow one of the links below:
   - SIMATIC S7-1200 G2/SIMATIC S7-1200 G2 F (https://support.industry.siemens.com/cs/us/en/ps/30068)
   - Distributed I/O (https://support.industry.siemens.com/cs/ww/en/ps/14029)
   - STEP 7 TIA Portal (https://support.industry.siemens.com/cs/ww/en/ps/14667)
2. To subscribe to notifications, select "email on update".

NOTE

To reduce the risks associated with malicious or counterfeit CPUs and modules, use only official sales channels, such as the following:

- Siemens Industry Mall
- Official Siemens distributors
- Country-specific official Siemens sales and distribution channels

NOTE

To reduce the risks associated with compromised CPU or module firmware, only download firmware from the Siemens Industry Online Support website and verify the file integrity against the associated published SHA checksum.

NOTE

To reduce the risk of physical tampering with critical industrial equipment, implement the measures defined in the Operational guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html).

NOTE

For additional security, the CPU uses firmware encryption. While encryption provides confidentiality of the firmware, the main purpose is to enhance the secure boot process.

1.3 S7-1200 G2 documentation guide

S7-1200 G2 and the TIA Portal provide a variety of documentation and other resources for finding the technical information that you require.

- The S7-1200 G2 Programmable Logic Controller System Manual provides specific information about the operation, programming, and the specifications for the complete S7-1200 G2 product family.

  The system manual is available on Siemens Industry Online Support (https://support.industry.siemens.com/) in multiple display formats and languages.
- The TIA Portal Information System provides access to the conceptual information and specific instructions that describe the operation and functionality of the programming package and basic operation of SIMATIC CPUs.
- You can also follow or join product discussions on the Service & Support technical forum (https://support.industry.siemens.com/tf/ww/en/?Language=en&siteid=csius&treeLang=en&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=34612486). These forums allow you to interact with various product experts.
  - Forum for S7-1200 G2 (https://support.industry.siemens.com/tf/ww/en/threads/237?title=simatic-s7-1200&skip=0&take=10&orderBy=LastPostDate+desc)
  - Forum for TIA Portal (https://support.industry.siemens.com/tf/ww/en/threads/243?title=step-7-tia-portal&skip=0&take=10&orderBy=LastPostDate+desc)
- The SIMATIC Industrial Software SIMATIC Safety - Configuring and Programming Manual (http://support.automation.siemens.com/WW/view/en/54110126/0/en) provides information about configuring and programming fail-safe PLCs.

Contact your Siemens distributor or sales office for assistance in answering any technical questions, for training, or for ordering S7 products. Because sales representatives are technically trained and have knowledge about your operations, process and industry, as well as about the Siemens products that you are using, they can provide efficient answers to problems you might encounter.

System manual updates

When needed, changes and supplements to released system manuals are available in a system manual update document. These updates take precedence over the system manual. You can find the latest system manual updates on Siemens Industry Online Support (https://support.industry.siemens.com/)

1.4 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)

     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:

     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.5 Tool support

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/us/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/us/en/view/109986787)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://www.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

Industrial cybersecurity

2

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

In the first part of this section you will find basic information on the subject of industrial cybersecurity. Subsequent sections describe recommended measures for protecting the entire system and the individual components from manipulation and unwanted access.

NOTE

Security-relevant changes to software or devices are documented in the section New properties/functions (Page 28).

2.1 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

2.2 Security update notification

Read the special information on maintaining the operational safety of your plant in the Introduction (Page 15) section.

Set up notification of security updates

To receive notifications about security updates, proceed as follows:

1. Register with mySiePortal (https://sieportal.siemens.com/en-ww/mysieportal).
2. Enter the keyword "Security" in the search engine.
3. Choose the "Search in Knowledge base" option.
4. Enter the name or article number of the product in the product search.
5. Select the "Other types" option from the filter menu for "Type," and choose "Download" and "Product note".
6. For the document you want to be informed about, select "Add to my favorites" using the 3 dots on the right.

   For example, if you would like to be informed about all firmware versions of the CPUs, select the entry "Firmware update S7-1500 CPUs incl. displays and ET 200 CPUs (ET 200SP, ET 200pro)".
7. In the following dialog, enter the name of the favorite, select the storage location, and select the "Notify me" option. Then click the "+ Add to my favorites" button.

Result: You will be notified by email each time the document is changed.

Under "mySiePortal" > "Lists & notifications" > "My notifications", you can display your notifications and delete them if necessary.

2.3 Basic information on industrial cybersecurity

2.3.1 Definition of industrial cybersecurity

Industrial cybersecurity is generally understood to mean all measures to protect against the following threats:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability (for example, due to the destruction of data or denial of service (DoS))

2.3.2 Objectives of industrial cybersecurity

The objectives of industrial cybersecurity are:

- Ensuring trouble-free operation of industrial plants and production processes
- Preventing threats to people and production from cybersecurity attacks
- Protection of industrial plants against espionage and manipulation
- Protection of industrial automation systems and components against unauthorized access and data loss
- Provision of a practical and cost-effective concept for securing existing plants and devices that do not have their own security functions

- Use of existing, open, and proven industrial cybersecurity standards
- Compliance with legal requirements

An optimized and adapted security concept applies to automation and drive technology. The security measures must not impede or endanger production.

2.4 Integrated security concept and security strategies

2.4.1 Comprehensive security concept "Defense in Depth"

With Defense in Depth, Siemens provides a multi-layer security concept that offers industrial plants comprehensive and far-reaching protection in accordance with the recommendations of the IEC 62443 international standard.

Productivity and know-how are protected on 3 levels:

Plant security
Plant security uses various methods to safeguard critical components from physical access by people. This starts with classic building access and extends to securing sensitive areas using access control (for example, code card, iris scan, fingerprint or access code).

Network security
Automation networks must be protected against unauthorized access. This is achieved through security measures on the product, but also those in the product-related environment.

System integrity
Targeted measures must be taken to protect existing know-how or to prevent unauthorized access to automation processes. The measures protect against unauthorized configuration changes, and highlight attempts at manipulation.

You can find more information on the topics of Defense in Depth, plant security, network security, and system integrity on the SIEMENS Industrial cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) Web page.

You can also visit the download center (https://cert-portal.siemens.com/operational-guidelines-industrial-security.pdf?ste_sid=0d5cc2df23db50211d4d0a3c7653cba7) to obtain more information on the topic of industrial cybersecurity. The "Operational Guidelines", for example, provide recommendations on basic security measures for secure machine and plant operation in an industrial environment.

2.4.2 Security management

The ISO 27001 and IEC 62443 standards call for a comprehensive approach in information technology (IT) and operational technology (OT) to protect against cyber attacks.

Responsibility for cybersecurity and IT security

Every operator of machinery and equipment is responsible for:

- Defining cybersecurity and IT security as an important criterion in the procurement and selection of machines and software applications
- Use of suitable measures to protect production resources, data, and communication from manipulation and theft
- Providing all necessary resources and training to employees to fully support these goals

For this purpose, suitable measures must be selected after a risk assessment and a cost-benefit analysis in order to protect material and intellectual property and prevent damage from occurring. These measures should be integrated into corporate processes and procedures, evaluated regularly, and firmly anchored in the corporate culture. In addition to protecting intellectual property, the protection of personal data must be ensured at all organizational units and levels.

Siemens will provide you with information and support. Subscribe to the Security feeds (https://www.siemens.com/cert) for information on vulnerabilities. Register with mySiePortal (https://sieportal.siemens.com/en-ww/mysieportal) and create filters to be notified when important information is published. The procedure is described in the section Notification of security updates (Page 22). Consider using Siemens Cybersecurity Services.

Responsibility in the digital supply chain

Cybersecurity should play a critical role in the evaluation and procurement process. The entire life cycle of a product should be considered to ensure protection against current and future risks. These include, for example, security updates throughout the product life cycle, including guidelines for secure disposal of the product.

Siemens plans and announces the provision of security updates, as well as total discontinuation of products, as part of product support.

Employee awareness

Regular training in cybersecurity and continuous testing of training success are essential so that cybersecurity measures are internalized in processes and work instructions. This involves general training in the use of software and IT hardware for company communication and as work equipment, for example:

- Secure handling of USB devices
- Encrypted communication
- Use of VPN
- Rules for passwords and use of access
- Setting up two-factor authentication
- Educating employees about the dangers posed by malware, phishing, social engineering and other factors

Furthermore, if applicable, production equipment and software training should always include the topic of cybersecurity.

Maintaining the security concept through updates

Keeping software up-to-date is essential, for example, to benefit from the following measures:

- Implementation of new security strategies, protocols and techniques
- Closing of security vulnerabilities
- Elimination of security vulnerabilities

To this end, it is necessary to keep a constant eye on the further development of protective measures and, if necessary, the expansion of requirements.

Recommendations:

- Set up notifications for (security) updates
- Subscribe to information on vulnerabilities
- Monitor and implement the further development of the technology, especially in the area of cybersecurity

Always keep technology and knowledge up to date.

Consideration of the risks posed by cyber attacks in the Threat and Risk Assessment (TRA)

Make an inventory of all software, hardware, and infrastructure devices, in order to identify risks to the location or organization. Incident response procedures must be incorporated into all IT and manufacturing processes. The choice of risk mitigation measures should be based on a cost-benefit analysis and classification of risks. This is followed by the introduction of cybersecurity rules and procedures and the training of personnel.

Living the concept

Technical solutions alone are not sufficient to effectively counter threats.

Cybersecurity must be part of the corporate culture and process landscape and must be internalized and lived by all employees.

Continuously monitoring the security situation

You have the following options to monitor the cybersecurity situation continuously:

- Setting anomaly references and creating allow and deny lists based on normal network communication and production machine behavior. The SINEC software family offers you reliable security tools (https://www.siemens.com/global/en/products/automation/industrial-communication/sinec-network-software/cybersecurity.html) to detect potential vulnerabilities in OT networks, quickly initiate suitable measures and resolve security vulnerabilities in a targeted manner.
- Establishment of an intrusion detection system (IDS) that generates alarms when unusual behavior occurs in the network

- Introduction of a Security Information and Event Management (SIEM) system to collect, analyze, and evaluate events in real time to enable early countermeasures
- Measures regarding network security: for example, network segmentation, firewalls, VPN, DMZ (demilitarized zones)

2.5 Operational application environment and security assumptions

2.5.1 Intended use

SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.

The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

Operational reliability and intended use

Before using your product, read the introductory information about operational guidelines and intended use. Also read the Technical Specifications for your components of your system.

2.5.2 Requirements for the operational application environment and security assumptions

Siemens recommends the following security measures:

- Threat and Risk Assessments (as part of security management)
- Network security concepts
  - Network segmentation
  - Asset and network management
  - Network protection
  - Remote access
- Access control concepts (utilizing access control systems)
  - Physical protection
  - Physical corporate security
  - Physical product security

Threat and Risk Assessment

Vulnerabilities and risks are identified, and countermeasures are proposed to ensure the security of the system, networks, and data.

Network security concepts

You can find information on network security in the whitepaper "Industrial Network Security Architecture", available at the Download Center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) on the Industrial Cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) website.

Access control concepts

Physical protection
In addition to closing off and/or monitoring entire production facilities, it may be necessary to physically secure cabinets or even individual components such as circuit breakers.

Physical corporate security
You can ensure physical corporate security by the following measures, among others:

- Closed off and monitored company premises
- Access control, locks/card readers, and/or security personnel
- Accompaniment of non-employees by company personnel
- Employees are trained on and embrace security processes within the company

Physical production security
You can ensure the physical production security by, among others, the following measures:

- Separate access control for critical areas, such as production zones.
- Installation of critical components in lockable cabinets/control rooms with monitoring and alarm capabilities. The cabinets/control rooms must be secured with a cylinder lock. Do not use simple locks, such as universal, triangular/square, or double-bit locks.
- Radio field planning to limit WLAN coverage areas, preventing them from extending beyond defined zones (e.g. factory floor).
- Guidelines that prohibit the use of external data storage media (such as USB flash drives) and IT devices (such as laptops) classified as unsafe on systems.

2.6 Security properties of the devices

The security properties of the individual devices are listed in the Equipment Manuals.

2.7 Secure operation of the system

This section describes measures recommended by Siemens to protect your system from manipulation and unauthorized access.

2.7.1 Hardening measures

System hardening, also simply referred to as hardening, is the secure configuration of products or systems. The aim is to close security gaps and take various measures to reduce the attack surfaces for cyberattacks.

Measures for system hardening include, for example:

- Secure configuration in which only necessary software components and services are installed or activated for proper operation.
- Access control, by which a restrictive user and rights management system is implemented.

2.7.2 Secure configuration

Secure configuration involves control over all software components, along with their interfaces, ports, and services.

Activated services and ports pose a risk, for example of unauthorized access to the network and to programs.

To minimize the risk, activate solely the required services at all the automation components. Take all activated services (especially Web servers, FTP, remote maintenance etc.) into account in the security concept. Consider the default states of ports and services in your security concept.

You can find an overview of all ports and services used in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

2.7.3 Access control

In addition to physical protection, also establish logical safeguards to control access to your system:

- Use a restrictive user and rights management system, for example, for accessing the CPUs and TIA Portal.
- Refer to the information about password management in the section Protection (Page 176) and in the STEP 7 online help (TIA Portal).

See also

Password management (Page 36)

2.7.4 Handling of sensitive data

Data protection information

Siemens Aktiengesellschaft observes the applicable data protection laws, including the General Data Protection Regulation (GDPR), in particular the rules of data minimization and data-protection-friendly default settings (privacy by design, privacy by default).

This means for the products in this system:

Products with user management save user names and passwords to manage access rights. User names are also saved in logging alarms. These logging alarms are provided with a time stamp and stored in the internal cache of the CPU. They can be forwarded to a central syslog server. You can find more information in the section Syslog messages (Page 42).

In addition, the products do not store any personal data.

If you establish a reference to an identifiable person by linking these data with other data (such as shift schedules), or if you store personal data on the same medium (such as a hard disk), you must yourself ensure that the data protection regulations are observed.

Information on the secure removal of data from the CPU, interface module and SIMATIC Memory Card is provided in the section Secure decommissioning (Page 31).

Storage of security-relevant data

When storing your security-relevant data on your PC, independently ensure secure data storage.

Also observe the section Sensitive data (Page 39).

2.7.5 Regular firmware updates

NOTE

Outdated firmware versions might not be monitored for security vulnerabilities.

- Always keep your plant/products up to date to benefit from troubleshooting and to minimize potential risks.
- Use email notifications to be automatically informed about firmware updates.

You can find more information in the following:

- The section Firmware update (https://sieportal.siemens.com/su/blqEr)
- The section Notification of security updates (Page 30)

2.7.6 Notifications about security vulnerabilities (Siemens Security Advisories)

A vulnerability is a security vulnerability in information security. A vulnerability can pose a threat as it provides intruders with the opportunity to access system resources and manipulate or steal data. Many vulnerabilities allow availability to be impaired.

Siemens ProductCERT

If Siemens identifies or fixes Security Vulnerabilities in the products, this will be published in the Security Advisories.

You can find the documents for SIMATIC on the following website of the Siemens Aktiengesellschaft: Siemens ProductCERT and Siemens CERT (https://new.siemens.com/global/en/products/services/cert.html?s=SIMATIC#SecurityPublications)

"Search Security Advisories" is the default entry in the "SIMATIC" search field. You can also enter other product names or other terms in the search field and search for them.

On this page, you will also find all the required information on how to deal with vulnerabilities:

- Contact persons for matters related to vulnerabilities
- Options for automated notifications regarding vulnerabilities
- Notifications are also possible in CSAF format
- Option to subscribe to RSS feeds and newsletters
- List of all current vulnerabilities and detailed information such as:
  - Description
  - Classification according to Common Vulnerability Scoring System (CVSS)
  - Measures
  - Availability
  - Etc.

Set up Security feeds (https://www.siemens.com/cert) to receive notifications about security-related topics.

If you suspect or have discovered a vulnerability in a Siemens product, please let us know immediately. To do this, press the "Contact" button on the CERT Services page (https://www.siemens.com/cert) and follow the instructions.

2.7.7 Data backup

Secure your configuration and parameter settings so that you can quickly restore this data if needed.

2.7.8 Security checks

Security checks for data, files, and archives serve to ensure data integrity at the storage location and during file transmission, protecting against manipulation and transmission errors. This is often achieved using digital checksums that are provided alongside the data. Tools (such as SHA-256 or SHA-512) for calculating and verifying these checksums are provided in many systems and named according to their respective calculation methods.

File Integrity Guidelines describe the prescribed procedure for integrity checks.

Integrity protection is a protection function for engineering data and firmware files.

Communication integrity means protecting communication against unauthorized manipulations to ensure high system availability. A central element in this regard is, for example, the use of digital checksums when accessing controllers. (Source: Industrial Cybersecurity website (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html))

2.7.9 Secure decomissioning

In the following section, you will find information on how to properly decommission individual components of your automation system. Decommissioning is necessary when the component has reached the end of its service life.

Decommissioning includes environmentally sound disposal and secure removal of all digital data of electronic components with storage medium.

2.7.9.1 Securely removing data

Before disposing of components of your automation system, you should securely delete all data from the storage media of these components. How to securely delete data from the devices so that it cannot be recovered is described below.

NOTICE
Data misuse resulting from non-secure deletion of data Incomplete or non-secure deletion of data from data memories can result in data misuse by third parties. For this reason, ensure secure deletion of data from all storage media used before disposing of the product.

Secure erasure of data from the CPU and SIMATIC Memory Card

To delete all data from the data memories of the CPU, reset the CPU to factory settings. The function deletes all information that was saved internally on the module.

For secure deletion of the data, follow these steps in the order given:

1. Format the SIMATIC Memory Card.

   The formatting deletes all contents from the SIMATIC Memory Card.

   Formatting with STEP 7:

   – Establish an online connection.
   – Open the online and diagnostics view of the CPU (either from the project context or via "Accessible devices").
   – In the dialog window, select "Functions > Format memory card" and then click the "Format" button.

   Formatting using the display of a CPU:

   – In the display of the CPU, select the menu "Settings" > "Card functions" > "Format card" and confirm with OK.

2. Restore the factory settings of the CPU.

   We recommend resetting the CPU in STEP 7. When you reset a CPU to factory settings, select the options shown in the figure before the reset.

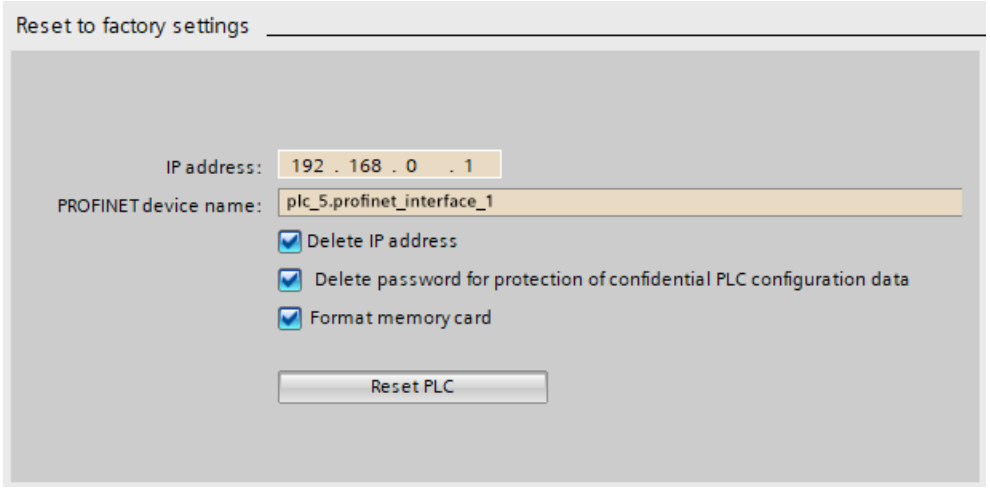

Figure 1-38 Resetting the CPU to factory settings

NOTE

If you reset the CPU using STEP 7 and you have selected the "Format memory card" option, you can skip step 1 of the described sequence of steps.

Result: All data that was still contained in the data memories of the modules and the SIMATIC Memory Card has been deleted. You can now dispose of the components.

For more information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (https://docs.tia.siemens.cloud/access?ft:originId=HWCDiagenUS_20.00.00.00_release&ft:clusterIdHWCDiag).

NOTE

If you no longer plan to use the SIMATIC Memory Card after formatting it, destroy it before disposing of it.
A secure destruction method is to shred the card to such a degree that it cannot be reconstructed. For this, you can also use a waste disposal service that specializes in data storage medium destruction.

Secure erasure of data from the interface module

With the following tools, you can securely erase the data from the interface module:

- STEP 7 < V19
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Follow these steps in the order given:

1. Establish an online connection.
2. Open the Online and Diagnostics view of the IM (either from the project context or via "Accessible devices").
3. In the dialog box "Functions > Reset to factory settings", select the option "Delete I&M data" and then the "Reset" button.

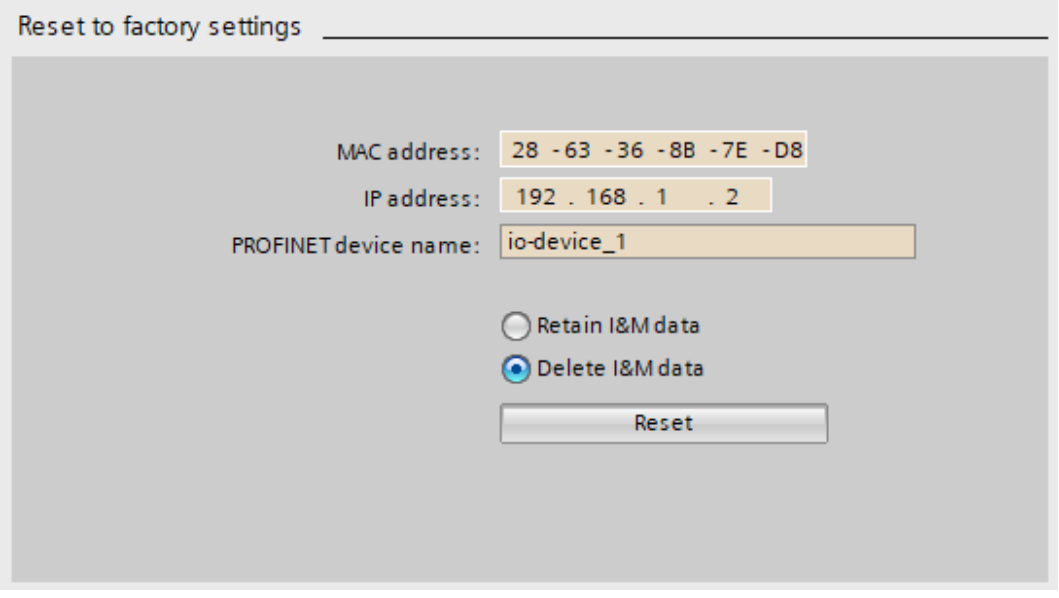

Figure 1-39 Resetting an interface module to factory settings

Result: All the data that was still in the data memories of the interface module was deleted. You can now dispose of the components.

For more information on resetting the interface module to factory settings, refer to the section Resetting an interface module to factory settings (https://docs.tia.siemens.cloud/access?ft:originId=HWCDiagenUS_20.00.00.00_release&ft:clusterIdHWCDiag).

NOTE

STEP 7 ≥ V19

Only the communication parameters will be securely deleted on "Reset to factory settings" with the "Delete I&M data" option enabled when you use STEP 7 ≥ V19.

Deleted communication parameters:

- IP address
- Device name
- PROFINET configuration data

If you want to securely remove all data, use one of the tools listed above for this purpose.

2.7.9.2 Recycling and disposal

For environmentally sustainable recycling and disposal of your old equipment, contact a certified electronic waste disposal service and dispose of the equipment according to the applicable regulations in your country.

NOTE

Recycler Guides

Disassembly of electronic devices may only be carried out by specialists trained in the recycling of electronic products.

The Siemens Recycler Guides provide step-by-step disassembly instructions and material composition information of the products. This information helps recyclers direct specific materials to specialized recyclers and thus maximize the recovery of resources.

You can find the Recycler Guides in the SiePortal (https://sieportal.siemens.com/en-ww/mysieportal) in the "Support" area by using the search term "Recycler Guide".

2.8 Secure operation of the engineering software

For more information on secure operation of the engineering software, refer to the TIA Portal online help.

2.9 Secure operation of the CPUs

This section describes measures recommended by Siemens to protect your device from manipulation and unauthorized access.

2.9.1 Secure configuration

Information about ports, services, and default states can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and the Equipment Manual.

2.9.2 User management and access control

2.9.2.1 Administration of user accounts

Creating and managing user accounts with appropriate usage rights is an important measure, as every active user represents a potential security risk.

Take the following security measures:

- Train your personnel in understanding their rights and password assignment
- Regularly check the user accounts

You can find information on creating and managing user accounts in the Protection (https://docs.tia.siemens.cloud/access?ft:originId=./100365717643/100365717643_enUS.htm&ft:clusterId./100365717643/100365717643.htm) section under "User management" and in the online help for STEP 7 (TIA Portal).

2.9.2.2 Assigning secure passwords

Using non-secure passwords can easily lead to data misuse. Non-secure passwords can be easily guessed or decrypted.

- Therefore, always change the default passwords during commissioning and use different passwords for different users, functions and devices.
- When changing the password, do not use passwords (or parts of passwords) that were used in the past.
- Also, change passwords for functions you don't personally use to prevent misuse of such unused functions.
- Always keep your passwords confidential and ensure that only authorized individuals have access to the respective passwords.
- Go over the required minimum password length and use a mixture of lower- and upper-case letters, numbers and characters.

The STEP 7 online help (TIA Portal) provides information on creating secure passwords.

Overview of all components and functions with password protection

Components and functions with password protection	Comment
SIMATIC S7 app	See section SIMATIC S7 app (https://www.siemens.com/global/en/products/software/mobile-apps/simatic2go.html)
Syslog (with certificate protection)	See section Syslog messages (Page 42)
CPU	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
OPC UA	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section OPC UA communication
SNMP Community-String (similar to a password)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section SNMP
Secure communication (with certificate protection)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
Web server	See the Web server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/109977246)

2.9.2.3 Password management

- You can find comprehensive recommendations for creating secure passwords in the Industrial security Configuration Manual (https://support.industry.siemens.com/cs/us/en/view/109974047).
- Establish guidelines for assigning passwords and intervals for password changes.
- Settings for checking password policies when passwords are assigned or changed can be configured in the TIA Portal. For more information, please refer to the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).
- Modify and reset the password for protecting confidential configuration data.
  You can find information on the following topics in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925):
  - Description of how to change the password
  - Description of how to delete or reset the password
  - Description of how to assign the password via a SIMATIC Memory Card
- Access to a password-protected CPU can be configured through the display, if the CPU has a display; see section Using the display to set additional password protection.
- For user management and access control, use the Local/central user management (https://docs.tia.siemens.cloud/access?ft:originId=./100365717643/100365717643_enUS.htm&ft:clusterId./100365717643/100365717643.htm).
- Using a password provider: In STEP 7, you can set up a password provider; see section Know-how protection (https://docs.tia.siemens.cloud/access?ft:originId=ProgBlockProtectionenUS_20.00.00.00_release&ft:clusterIdProgBlockProtection).

- In addition, you can use commercially available password management programs.

Setting password protection without engineering system

You can change your password for a user account in the user management via the web server of the CPU:

- API method Api.ChangePassword: Changing a password in runtime

You can find more information about the available methods of the web server's Web API in the Web server (https://support.industry.siemens.com/cs/ww/en/view/109977246) Function Manual.

2.9.2.4 Setting protection levels

For detailed information about setting up protection levels for the CPU and assigning user authorizations, refer to the section Configuring access protection for the CPU (https://docs.tia.siemens.cloud/access?ft:originId=./11627607179/171587178635_enUS.htm&ft:clusterId./ 11627607179/171587178635.htm) and the STEP 7 online help (TIA Portal).

2.9.2.5 Certificate management

You can create, assign and manage certificates with TIA Portal for the following functions of the CPUs:

- Secure Open User Communication
- OPC UA communication
- Secure PG/HMI communication
- Web server

You can find all relevant information about "Certificate management" in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

2.9.3 Protection functions

Integrated protection functions of the CPU protect against unauthorized access.

You can find an overview of the protective functions supported by your CPU in the respective Equipment Manual.

A description of the protection functions and their activation can be found in the section Protection (https://docs.tia.siemens.cloud/access?ft:originId=ProgCPU15enUS_20.00.00.00_release&ft:clusterIdProgfCPU15).

2.9.4 Signed firmware update for CPUs

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Principle of the signed firmware updates for CPUs

Firmware updates for CPUs contain a digital signature.

The digitally signed firmware update files are available for download on the Siemens Support Web page (https://sieportal.siemens.com/su/blqEr).

The CPU verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the CPU can detect a manipulated or corrupted firmware update file and reject it.

Note that the CPU performs the verification only after the complete firmware download has taken place.

The procedure for carrying out firmware updates for CPUs is described in the section Firmware update (https://support.industry.siemens.com/cs/ww/en/view/109988293/185156409355).

Diagnostics alarms and remedy

The success/failure of the signed firmware update is reported:

- In the diagnostics buffer of the CPU
- On the display of the CPU if the CPU has a display
- In the Syslog storage of the CPU

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support Web page.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109483101).

2.9.5 Secure Boot for CPUs

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Principle of "Secure Boot" for CPUs

CPUs verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before their startup.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to the signed firmware update for CPUs (Page 38), Secure Boot prevents a manipulation of the firmware by a physical intervention into the CPU.

Secure Boot is integrated in the CPU and cannot be deactivated for security reasons.

2.9.6 Secure communication/OPC UA

Additional protection is provided by the protection functions of the secure communication and OPC UA protocols.

Information about the protocols Secure Communication and OPC UA can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

2.9.7 Sensitive data

Security-relevant and sensitive data can be protected through appropriate measures such as passwords and protection functions.
For certain data, protection is already essential and implemented within the system (e.g. certificate management in the TIA Portal).

Sensitive data	Comment	Where can I find more information?
Confidential configuration data (private keys, passwords/access data)	Protection by using a strong password	Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Protection of confidential configuration data
User management data	-	Protection (https://docs.tia.siemens.cloud/access?ft:originId=ProgCPU15enUS_20.00.00.00_release&ft:clusterIdProgfCPU15) section STEP 7 online help

Sensitive data	Comment	Where can I find more information?
Configuration of CPUs and interface modules	Protection through PROFINET Security Class 1	Function manual PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856)
Blocks (data blocks, logic blocks)	Know-how protection, copy protection, write protection	Protection (https://docs.tia.siemens.cloud/access?ft:originId=ProgBlockProtectionenUS_20.00.00.00_release&ft:clusterIdProgBlockProtection) section
Data deemed sensitive by the operator	Backups, other configuration data, analysis data	Backing up and restoring the CPU configuration (https://docs.tia.siemens.cloud/access?ft:originId=ProgOnlineBackupenUS_20.00.00.00_release&ft:clusterIdProgOnlineBackup) section

2.9.8 Backups and data backups

Regular data backups after successful installation should be part of a successful security concept. Whether for restoring a project if required, if the changes made do not yield the desired results, or for saving an installation in an emergency.

Backup of a STEP 7 project:

- Project backup via the SIMATIC Automation Tool
- Project backup via TIA Portal, see FAQ What options are there in STEP 7 (TIA Portal) for backing up projects and what is the significance of the backup files of the projects? (https://support.industry.siemens.com/cs/us/en/view/92561565)

You can find more information in the section Backing up and restoring the CPU configuration (https://docs.tia.siemens.cloud/access?ft:originId=ProgOnlineBackupenUS_20.00.00.00_release&ft:clusterIdProgOnlineBackup).

2.9.9 Additional protective measures for network security

In addition to the protective measures described in this manual, you can find information on network security and network components for protection against unauthorized access in the Network security section of the PROFINET Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).

See also

SIMATIC CP 1243-1 (https://sieportal.siemens.com/su/blYx6)

2.9.10 Using a Web server

The CPUs have an integrated Web server.
It comes with built-in security features:

- Activation for specific interfaces
- Access via the secure transmission protocol "HTTPS" using the CA-signed or self-signed web server certificate
- Authentication via local or central user management
- Changing the password of local users during runtime using Web-API

When using Web servers, traditional firewalls are no longer sufficient to protect modern networks.

Information about potential risks when using Web servers can be found in the Web server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/109977246).

2.9.11 Recording security events

Syslog storage

Syslog stands for "System Logging Protocol," a standard for transmitting log messages triggered by security events. Predefined events in a network device are collected as security events in the device (syslog client) and stored as syslog messages in the local cache.

A syslog server collects and categorizes syslog messages, which can then be analyzed and filtered and displayed in various ways. Additionally, notifications for critical events can be configured.

The following security events, for example, are collected in the CPU diagnostic buffer:

- Going online with the correct or incorrect password
- Manipulated communication data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (via an instruction or, if applicable, the CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive
- Logging on to the Web server with the correct or incorrect password
- Creating a backup of the CPU
- Restoring the CPU configuration (Restore)

The security events listed above are also stored as syslog messages in the local cache of a CPU. You can find an overview of all syslog messages in the following Entry (https://support.industry.siemens.com/cs/ww/en/view/109823696).
The content of a syslog message is based on IEC 62443-3-3.

You can find more information in the section Syslog messages (Page 42).

Connection to a SIEM system

A SIEM system (Security Information and Event Management) analyzes security events in real time and can be installed, for example, on the syslog server.

2.9.12 Syslog messages

Using syslog messages

International standards and national regulations for the IT security of automation components require, for example, the ability to log safety-related events.

Syslog (System Logging) is an IETF standard protocol (RFC 5424) for the transfer of recorded events and meets this requirement. A CPU records the following events, for example:

- Security events
- Firmware updates
- Changes to the user program
- Changes to the configuration
- Changes to the operating mode

The collecting of security-relevant events cannot be deactivated. Each CPU saves syslog messages in a local cache. By querying this cache, you can view the syslog messages and identify potential security risks.

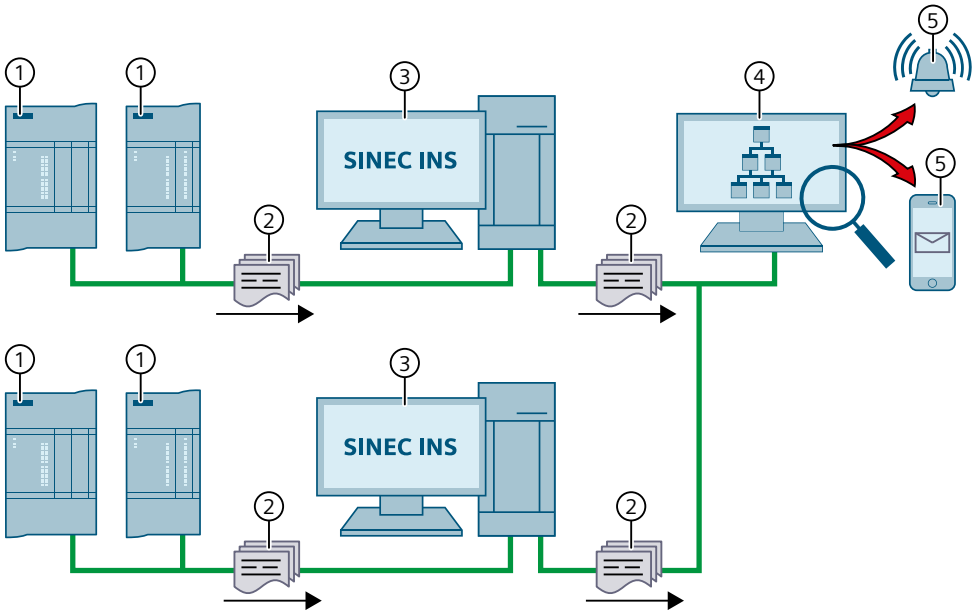
The cache of a CPU is organized as a ring buffer. If the storage limit of the cache is reached and additional security events occur, the oldest messages in the cache are overwritten.

You have the option of transferring the events collected by the CPU to a syslog server in the network.

Forwarding to a syslog server

You can transfer syslog messages to a server, for example, SINEC INS. The syslog messages are transferred to the syslog server via the syslog protocol. The syslog server saves all syslog messages from its connected devices. Messages of system and network events are stored centrally in a storage location in the syslog server. At the syslog server interface, you can view the collected syslog messages and thereby determine the source of potential security risks or problems.

Syslog messages are sent to the syslog server via port 514 (UDP) or port 6514 (TLS over TCP) by default.



NOTE

If you are using UDP as the transport protocol, the data is transmitted unencrypted. Authentication is also omitted with UDP.

Processing in a Security Information and Event Management system (SIEM system)

In order to be able to accept and process the incoming syslog messages, a SIEM system must "understand" the syslog protocol according to RFC 5424.

The SIEM system breaks down the incoming syslog messages into individual elements. These elements are assigned to their own event within the SIEM system. Within this event, it is analyzed whether there are connections between the individual syslog messages. In this way, the SIEM system detects possible attack vectors and, if necessary, informs the user, e.g. in the event of multiple attacks at several points in the system.

① CPUs
② Syslog messages
③ Syslog server, for example, SINEC INS
④ SIEM system
⑤ Notify user

More information

More information on network management with SINEC INS is available in the "SIMATIC NET: Network management SINEC INS V1.0 SP2 (https://support.industry.siemens.com/cs/us/en/view/109781023)" manual.

You can find information on the structure of syslog messages in the Structure of the Syslog messages (Page 46) section.

2.9.12.1 Transfer of the syslog messages to a syslog server

A CPU can send syslog messages to a syslog server via a TLS or UDP connection.

Recommendation: Use solely a TLS connection for the productive operation. You can also use a UDP connection for commissioning or testing scenarios.

Transmitting syslog messages via a TLS connection

A TLS connection ensures that all syslog messages from a CPU are securely transmitted to the syslog server. If the TLS connection is interrupted, the syslog messages are cached in the CPU cache. The CPU only sends the cached syslog messages when the TLS connection to the syslog server is established again.

Each syslog message is transferred to a syslog server only once. If you address another syslog server in the settings for the syslog server, syslog messages that have already been transferred are not transferred to a newly configured syslog server.

Since the cache of a CPU is organized as a ring buffer, the oldest messages are overwritten as soon as the memory limit is reached and further security events occur. Overwriting syslog messages that have not yet been transferred to a syslog server is reported as a security event (overflow event) in syslog storage. If syslog messages are overwritten over a long period of time, the overflow event is repeated regularly. As soon as the first message is sent back to the syslog server, another security event is generated. This security event confirms that syslog messages are being transferred back to the syslog server.

Message in the diagnostics buffer of the CPU

If a syslog server is configured in the CPU properties, the CPU also records overwriting of non-transmitted syslog messages in the diagnostics buffer.

As soon as a non-transmitted syslog message is overwritten, the CPU reports maintenance demanded as an incoming event in the diagnostics buffer. In addition, the MAINT LED of the CPU also signals incoming maintenance demanded.

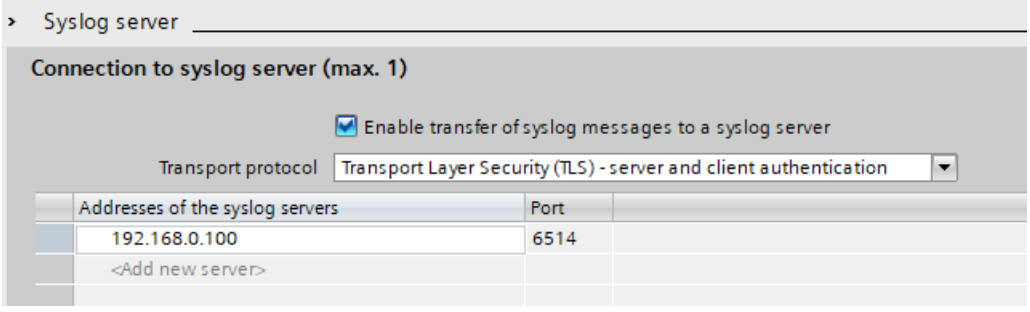
As soon as the syslog messages are sent back to the syslog server, the CPU reports maintenance demanded as an outgoing event in the diagnostics buffer. If the CPU does not report any further maintenance demanded, the MAINT LED also turns off again.

Information on the status and error display of the CPU can be found in the respective device manuals.

Requirements

If you want to transfer the syslog messages of a CPU to a syslog server, the following requirements must be met:

- STEP 7 as of version V20
- S7-1200 G2 CPU as of FW version V1.0
- A project has been created in STEP 7
- The device or network view of STEP 7 is open

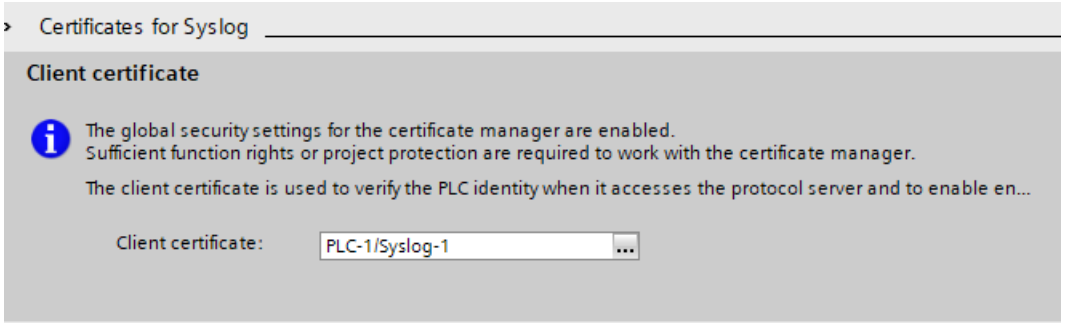


Procedure

To configure the CPU to transfer syslog messages to a syslog server, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Syslog server".
3. In the "Connection to syslog server" area, select the "Enable transfer of syslog messages to a syslog server" option. The selection options below become editable.
4. Select one of the following options from the "Transport protocol" drop-down list:
   - "Transport Layer Security (TLS) - server and client authentication": Encrypted data transfer, syslog server and client (CPU) must authenticate themselves.
   - "Transport Layer Security (TLS) - only server authentication": Encrypted data transfer, only the syslog server needs to authenticate itself.
   - "UDP": Unencrypted data transfer, syslog server and client (CPU) do not need to authenticate themselves.

   In the next sections you can read how to select the certificates for authentication (logon) depending on the settings specified.
5. In the "Addresses of the syslog servers" column, enter a valid server address.
6. In the "Port" column, enter a valid port number.
   By default, STEP 7 uses the following port numbers:
   - Standard TCP port for TLS: 6514
   - Standard UDP port: 514



Result: You have configured the transfer of syslog messages to a syslog server.

Selecting the client certificate

STEP 7 provides the required client certificate for a CPU for the TLS transport protocol. If the certificate is managed within the CPU, you can either choose an existing certificate or create a new certificate. To do so, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".
3. Select the appropriate certificate in the "Client certificate" field.

Selecting the server authentication

After selecting the TLS transport protocol, the configured syslog server must authenticate itself. This ensures that the CPU only connects to a trusted server. If you want to waive server authentication, activate the automatic acceptance of server certificates during runtime. To configure these settings, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".
3. In the "Trusted servers" area, specify whether the connected syslog server is to be authenticated. In this case, it is necessary to complete the following information:
   – Add trusted server: Add a valid server certificate in the "Common name of subject" column.
   – Automatically accept certificates during runtime: Activate the "Automatically accept server certificates during runtime" option. Editing in the table is then not possible.

NOTE

No authentication with automatically accepted server certificates
If you enable the "Automatically accept server certificates during runtime" option, a server does not need to authenticate itself. This means that the CPU can also connect to unknown servers that could represent a security risk.
Only select this option during commissioning or in a protected environment.

2.9.12.2 Structure of the Syslog messages

A CPU collects syslog messages in a local cache. These syslog messages are structured according to the syslog protocol (RFC 5424) and consist of the following elements:

- HEADER
- STRUCTURED-DATA
- MSG (Message)

The following sections describe the structure and parameters of the individual elements.

Structure of the HEADER element

The header contains all the data required for further processing of the syslog message. A space separates the individual parts of the header (exception: No space between PRI and VERSION). A CPU transmits the following header in syslog messages, for example:

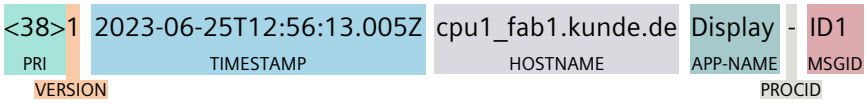


Figure 1-40 Example: HEADER of the syslog message of a CPU

The following table describes the parameters in the prescribed order.

Parameter	Description
PRI	PRI encodes the priority of the syslog message, divided into Severity (severity of the message) and Facility (origin of the message). The PRI value is formed as follows: • PRI = Facility x 8 + Severity Possible values: • Severity – 0 = Emergency: system is unusable – 1 = Alert: action must be taken immediately – 2 = Critical: critical conditions – 3 = Error: error conditions – 4 = Warning: warning conditions – 5 = Notice: normal but significant condition – 6 = Informational: informational messages – 7 = Debug: debug-level messages • Facility – 1 = User-level messages – 2 = Mail system – 3 = System daemons – 4 = Security/authorization messages – 5 = Messages generated internally by syslog – 6 = Line printer subsystem – 7 = Network news subsystem – 8 = UUCP subsystem – 9 = Clock daemon – 10 = Security/authorization messages – 11 = FTP daemon – 12 = NTP subsystem – 13 = Log audit – 14 = Log alert A CPU does not use all of the listed severity/facility values.
VERSION	Version number of the syslog specification.
TIMESTAMP	The device sends the time stamp in the format "2023-06-25T12:56:13.005Z" as UTC time without time zone and correction for daylight-saving/standard time.
HOSTNAME	Contains the name or the IP address (PROFINET interface X1) of the device or system from which the syslog message has been sent. IPv4 address according to RFC1035: Bytes in decimal representation: XXX.XXX.XXX.XXX IPv6 address according to RFC4291 Section 2.2 "-" is output if information is missing.
APP-NAME	Contains the component (device part or application) from which the message has been generated. "-" is output if information is missing.
PROCID	The process ID serves to clearly identify the individual processes, for example during analysis and troubleshooting. "-" is output if information is missing.
MSGID	ID to identify the message. "-" is output if information is missing.

Structure of the STRUCTURED-DATA element

STRUCTURED-DATA provides information in an interpretable and decomposable data format. The following applications are possible, for example:

- More information about the syslog message
- Application specific information

STRUCTURED-DATA can contain one or more elements (SD-ELEMENT). Each SD element must be enclosed in square brackets. If STRUCTURED-DATA consists of multiple SD elements, the individual SD elements are separated by a space.

Each SD-ELEMENT consists of its name (SD-ID) and one or more name-value pairs (SD-PARAM). Each name-value pair consists of a parameter name (PARAM-NAME) and the associated value (PARAM-VALUE). A space separates the individual components (SD-ID and SD-PARAM) within an SD element.

A CPU transmits the following SD ELEMENT in a syslog message, for example:

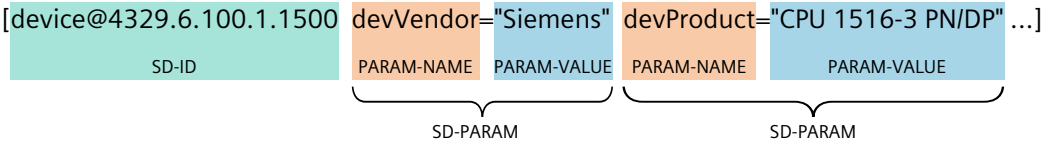

Figure 1-41 Example: SD ELEMENT of the syslog message of a CPU

Structure of the MSG element

In the MSG (MESSAGE) element, a CPU transmits the simplified name of the event in English. The following table shows what the content of a message of the MESSAGE element can look like.

MESSAGE	Description
SE_LOCAL_SUCCESSFUL_LOGON	The local logon has been successful (e.g. on the operator display of the CPU).

More information

You can read more information about the structure and transmission of syslog messages in the following RFCs (Request for Comments):

- The syslog protocol (RFC 5424) (https://tools.ietf.org/html/rfc5424)
- Transferring syslog messages via Transport Layer Security (RFC 5425) (https://tools.ietf.org/html/rfc5425)
- Transferring syslog messages via UDP (RFC 5426) (https://tools.ietf.org/html/rfc5426)

2.10 Secure operation of interface modules

Device-specific security information and instructions for interface modules can be found in the respective Equipment Manual.

2.10.1 Data integrity for interface modules

Data integrity refers to the completeness and correctness (integrity) of data, which is an essential prerequisite for the proper functioning of systems.

Measures for data privacy, data consistency, and data security ensure that data used within devices cannot be damaged, altered (manipulated), or deleted during processing or transmission, and at the very least, any changes to the data are detected.

Data integrity for interface modules

To detect intentional or accidental changes to data within an interface module and its associated modules, the possibility of dynamic integrity checking is introduced for PROFINET interface modules.

The ability to detect integrity breaches enhances the resilience of the distributed I/O system.

Data integrity within a distributed I/O system is entirely covered within the interface module and does not pertain to other components of the automation system.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as parameter settings, IP address, device name, MAC address and I&M data. The interface module stores the checksums in the I&M4 data area.

A CRC (Cyclic Redundancy Check) is always the same for specific, unchanged memory content. When the memory content changes, the interface module (IM) calculates a different checksum for this content by reading and comparing the I&M4 data. By comparing with the initial CRC, you can determine whether the data in the memory has been modified or not:

- CRC stayed the same: No change in the data within this memory area of the interface module IM
- CRC changed: The data within this memory area of the IM was modified

Only you, as the user, know whether changes to the data of an interface module were intentional or not. If changes were not intentional, you can detect that the data of the interface module has been compromised through changed CRCs and respond accordingly.

I&M data

PROFINET devices provide Identification and Maintenance data (I&M data), which is a set of predefined data structures containing the internal module status. With this data, a module can be identified, its serial number can be determined, etc.

The CRC checksums are mapped in the maintenance data **I&M4** of the interface module.

NOTE

Requirements for calculating the CRCs

The CRCs via the memory contents of the interface module are calculated only when you request to read the I&M4 data.

The CRCs cover not only the interface module itself but can also take into consideration combined checksums from associated modules (refer to the section on the structure of the data record for I&M data). Process data is not included in the calculation of CRCs.

Example:

- You put your distributed I/O system into operation and read the CRC CHK_OVERALL with the value "0x55AAA678" ("16#55AAA678") from the interface module via the I&M4 data.
- As long as no changes have been made to the data of the interface module or the associated modules, each subsequent read will give the value "0x55AAA678" or "16#55AAA678".
- Once you read a different CRC CHK_OVERALL, for example, "0xCC9876FF", you will realize that there must have been changes to the data of the interface module or the associated modules.

The quality of the statement regarding the data integrity of the distributed I/O system improves with each module associated with the interface module that supports I&M4 data. Refer to the Equipment Manual of the respective module to find out if and from which firmware version the module supports I&M4 data.

The structure of the I&M data 0 to 4 is described in the section Record structure for I&M data (https://docs.tia.siemens.cloud/access?ft:prettyUrl=simatic_s7_1500_et_200mp_manual_collection_enus_20/basic-information/simatic-drive-controller/commissioning/identification-and-maintenance-data/record-structure-for-i-m-data).

Spare parts scenario

The spare parts scenario is ensured. This means that you can replace interface modules with the same article number. For the "new" interface module, the static data such as the serial number and MAC addresses will change. Note that this is why the replacement is reflected in the changed identification data CHK_STATIC_LOCAL and consequently also in CHK_OVERALL.

More information on the spare parts scenario and compatibility can be found in the Equipment Manual of the interface module.

2.10.2 Signed firmware update for interface modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Information on whether your interface module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of the signed firmware update for interface modules

Firmware updates for interface modules may include a digital signature. The digitally signed firmware update files are available for download on the Siemens Support Web page.

The interface module verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the interface module can detect a manipulated or corrupted firmware update file and reject it.

Note that the interface module performs the verification only after the complete firmware download has taken place.

Subsequently, a notification is sent to the firmware update tool regarding the success or failure of the signature verification.

You still have all the options for firmware updates, as described in the Firmware update (https://docs.tia.siemens.cloud/access?ft:originId=HWCDiagenUS_20.00.00.00_release&ft:clusterIdHWCDiag) section, when performing signed firmware updates for modules. If the firmware update was not successful, the module will continue to run with the previous firmware.

Diagnostics alarms and remedy

When performing a firmware update for a module with an established connection between the IM and CPU, the following options for notifications are available in the CPU's diagnostic buffer:

- Successful integrity check of the firmware for the module
- Rejection of non-secure firmware for the module

You can find more information in the section on diagnostics alarms in the equipment manual for the respective module.

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support website.
3. Repeat the firmware update.

Information on the procedure for calculating and comparing hash values is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109483101).

2.10.3 Secure Boot for interface modules

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Information on whether your interface module supports Secure Boot is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of "Secure Boot" for interface modules

Interface modules verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before being executed.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to signed firmware updates for interface modules, Secure Boot also prevents manipulation of the firmware through physical intervention in the interface module.

Secure Boot is integrated into the interface module and cannot be deactivated for security reasons.

NOTE

Longer startup duration of the interface module
The signature verification of Secure Boot significantly extends the startup time of the interface module. You can find time specifications in the Equipment Manual of the interface module, in the Technical specifications section.

LED display on the interface module

If the Secure Boot verification results in an invalid signature, the LEDs RUN, ERROR, and MAINT on the interface module will flash. In this case, you need to replace the interface module.

2.11 Secure operation of I/O modules

Device-specific security information and instructions for I/O modules can be found in the respective Equipment Manual.

2.11.1 Data integrity for I/O modules

Data integrity for I/O modules

In order to detect intentional or accidental changes to the data of an interface module and the assigned modules, the dynamic integrity check for I/O modules is introduced. Information on whether your I/O module supports the data integrity check is available in the Technical specifications section of the corresponding Equipment Manual.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as serial numbers, parameter settings, calibration data and I&M data of I/O modules. The interface module stores the checksums in the I&M4 data area.

You can find more information on the principle of data integrity and I&M4 data in the section Data integrity for interface modules (Page 49).

Spare parts scenario

The spare parts scenario is still ensured. This means that you can replace I/O modules with the same article number. For the "new" I/O module, the static data such as the serial number will change. Note that the replacement is therefore reflected in the following modified I&M4 data of the interface module:

- CHK_STATIC_SUBS
- CHK_OVERALL_SUBS
- CHK_OVERALL

You can find the structure of I&M data in the section Record structure for I&M data (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/basic-information/simatic-drive-controller/commissioning/identification-and-maintenance-data/record-structure-for-i-m-data).

2.11.2 Signed firmware update for I/O modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Signed firmware update for I/O modules

Firmware updates for I/O modules can contain a digital signature. Information on whether your I/O module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms, and remedies

The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 51) applies.

2.12 Secure operation of power supply modules

Device-specific security information and instructions for the power supply modules can be found in the respective Equipment Manual.

2.12.1 Signed firmware update for system power supplies (PS)

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Signed firmware update for system power supplies (PS)

Firmware updates for system power supplies (PS) can contain a digital signature. Information on whether your power supply module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms, and remedies

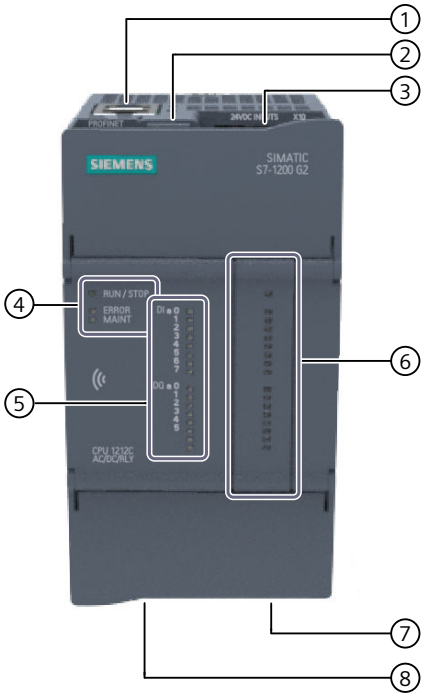
The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 51) applies.

Product overview

3

3.1 Introducing the S7-1200 G2 PLC

The S7-1200 G2 PLC family is Generation 2 of the S7-1200 and offers a significantly narrower footprint than the first generation. The CPU and devices provide the flexibility and power to control a wide variety of automation applications. The configuration and programming software is STEP 7 within the TIA Portal framework. If you have used the STEP 7 configuration and programming software (Page 93) with other CPU families, take note of compatibility information (Page 169).



The CPU combines the following elements and more in a compact housing to create a powerful controller:

- A microprocessor
- An integrated power supply
- Input and output circuits
- Built-in PROFINET
- High-speed counters
- Standard and Advanced Motion Control

The S7-1200 G2 firmware adds new functionality and supports most of the previous S7-1200 functionality, with noted differences. (Page 59)

After you download your program, the CPU contains the logic required to monitor and control the devices in your application. The CPU monitors the inputs and changes the outputs according to the logic of your user program, which can include Boolean logic, counting, timing, complex math operations, motion control, and communications with other intelligent devices.

The CPU provides a built-in PROFINET interface with two ports for communication over a PROFINET network. You can connect additional Input, Output, and Communication modules (Page 57) to support larger automation applications.

① PROFINET interface with two ports, X1 (on the top of the CPU)
② Memory card slot, X50 (behind the door)
③ Removable input connector, X10 (behind the door)
④ Status LEDs for the CPU
⑤ Status LEDs for the on-board I/O
⑥ Optional plug-in expansion board, X300 (for CPUs with two slots, X300 and X301)
⑦ Removable output connector, X11 (behind the door, on the bottom of the CPU)
⑧ Power connector, X80 (behind the door, on the bottom of the CPU)

Several security features help protect access to both the CPU and the control program:

- Password protection that allows you to configure access to the CPU functions.
- "know-how protection" to hide the code within a specific block.
- Protection of confidential PLC configuration data
- Secure PG/PC and HMI communication
- Secure boot

You configure these security features in STEP 7. The TIA Portal Information System describes the types of security configurations.

For detailed information about a specific CPU or device, see the technical specifications (Page 337).

3.2 S7-1200 G2 modules and boards

You can connect expansion boards and expansion modules to the CPU to increase its functionality. The following types are available: Communication boards (CBs), Signal boards (SBs), Battery boards (BBs), Communication modules (CMs), Communication processors (CPs), and Signal modules (SMs).

Expansion boards

A variety of plug-in expansion boards are available for use with the S7-1200 G2 system:

- Communication boards (CBs)
- Signal boards (SBs)
- Battery boards (BBs)

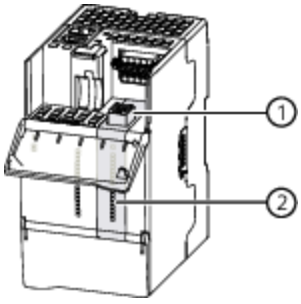
You can add CBs, such as the RS485, to increase the communication capability of a CPU.

You can add SBs to increase the digital and analog I/O capability.

You can add a BB to provide long-term backup of the CPU's real-time clock.

NOTE

BBs do not have a removable communication port or I/O wiring connector feature like CBs and SBs.



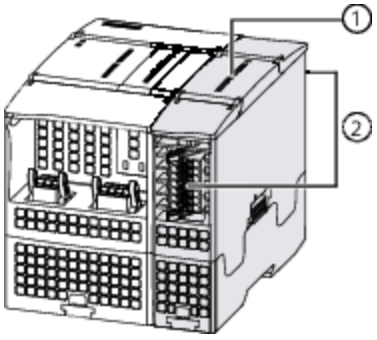
All S7-1200 G2 CPUs support plug-in expansion boards:

- The 1212 CPUs support one plug-in expansion board.
- The 1214 CPUs support two plug-in expansion boards.

NOTE

You can use any combination of plug-in expansion boards in a 1214C or 1214FC CPU, but you cannot use two BBs at the same time. Only one BB can be used. You cannot configure more than one BB for any S7-1200 G2 CPU the TIA Portal. All S7-1200 G2 CPUs support one BB.

In the following diagram, the plug-in expansion board is highlighted, and its key features are labeled:



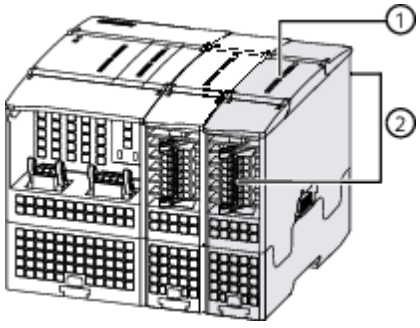
① Removable communication port or I/O wiring connector (This feature is not present on BBs.)
② Status LEDs

Communication modules (CMs) and Communication processors (CPs)

CMs and CPs add communication options to the system, such as RS232/422/485 and Ethernet connectivity. You connect CMs and CPs to the right side of a CPU or CM. All S7-1200 G2 CPUs support up to three communication devices, CMs and CPs, in any combination.

In the following diagram, a CM or CP is highlighted, and its key features are labeled:

① Status LEDs
② Removable communication connector



Signal modules (SMs)

SMs add additional functionality to the system, such as digital and analog I/O capability. Connect SMs to the right side of a CPU, CM, CP, or SM. The number of supported expansion modules depends on the CPU:

- The 1212 CPUs support up to six expansion modules (CMs, CPs, and SMs).
- The 1214 CPUs support up to ten expansion modules (CMs, CPs, and SMs).

To determine the number of SMs you can use in a system, subtract the number of CMs or CPs from the maximum number of expansion modules supported. For example, if you use three CMs or CPs with a 1212 CPU, you can use three SMs.

In the following diagram, the SM is highlighted, and its key features are labeled:

① Status LEDs
② Removable I/O wiring connector

3.3 Features

The S7-1200 G2 PLC (Page 55) provides the following features:

- Savings in Installation and wiring (Page 61) space
- Faster execution times
- Near Field Communication (NFC) (Page 299) application for mobile device access to the CPU
- Two expansion board slots (Page 57) for 1214 CPU models, one slot for 1212 CPU models
- Dual Ethernet ports for all CPU models
- Enhanced security
- 8 HSCs (High Speed Counters)
- 8 pulse generators for use as PTOs (Pulse Train Outputs) or for PWM (Pulse Width Modulation)
- Additional error OBs (Page 101)
- Basic, standard, and advanced motion control features (Page 302)
- Support for Real-Time PROFINET and Isochronous Real-Time PROFINET communication
- Ability for CPU can to act as an I-device with PROFIEnergy functionality
- Support for Media Redundancy for Planned Duplication (MRPD) (Page 249) and Media Redundancy Protocol (MRP) (Page 248)
- Support for 31 PROFINET devices (Page 203)
- User-configurable alarms
- Web server (Page 300)
- Support for DHCP and DNS (Page 228)
- Work memory reporting as code work memory and data work memory
- Power budget calculation tool in TIA Portal
- 8MB of internal load memory
- 20KB of retentive memory
- System logging (Page 42)
- Support for users and roles (Page 150)
- SIMATIC Controller Profiling (https://support.industry.siemens.com/cs/ww/en/view/109750245)
- OPC UA server (Page 257)
- Backup and restore capability (Page 336)

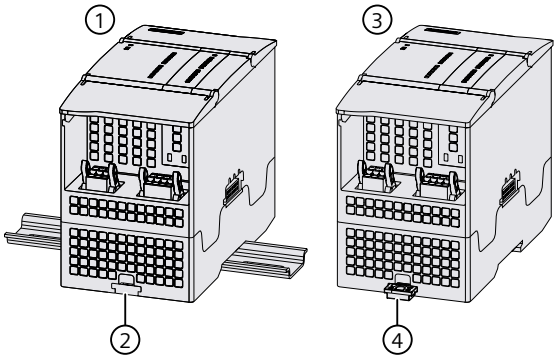
Refer to the Technical Specifications (Page 337) for more information.

Differences from the S7-1200 family

The S7-1200 G2 PLC (Page 55) provides features and differences from the S7-1200 PLC as described in Comparison to S7-1200 (Page 475).

3.4 What's new?

The following features are new with this release:



- OPC UA server (Page 257)
- System web pages for the Web server (Page 300)
- Additional modules:
  - Battery Board (BB) 1297 (Page 457)
  - Communication Processor (CP) 1243-1 G2 Ethernet (Page 458)
  - Input Simulators (8 position and 14 position) (Page 464)
  - Signal Module (SM) 1223 DI 16x24VDC / DQ 16xrelay (Page 403)
  - Signal Module (SM) 1223 DI 16x24VDC / DQ 16x24VDC Sink (Page 401)
  - Signal Module (SM) 1223 DI 16x24VDC / DQ 16x24VDC (Page 398)
- Additional spare parts:
  - CB PtP terminal block (Page 469)
  - CM PtP terminal block (Page 469)
- Support for central users on UMC server (Page 150)
- Backup and Restore (Page 336)
- Modbus TCP redundancy instructions (Page 295)
- PROFINET security class 1 (Page 203)
- Communication load default of 20% (Page 122)
- Support for a nesting depth of 26 hierarchical levels of Structs
- Support for Pulse Train Outputs (PTOs) in Motion control (https://docs.tia.siemens.cloud/access?ft:originId=./84171825419/86376357131_enUS.htm)
- Additional Motion Control (Page 302) functionality
- Enhanced support for S7-1200 G2 Near Field Communication (NFC) (Page 299)

Installation and wiring

4

4.1 Installation guidelines

You can install an S7-1200 G2 either on a standard DIN rail or on a panel, and you can orient the S7-1200 G2 either horizontally or vertically. The small size of the S7-1200 G2 allows you to make efficient use of space.

① DIN rail installation
② DIN rail clip in latched position
③ Panel installation
④ DIN rail clip in extended position for panel mounting

The S7-1200 G2 family provides a variety of expansion modules that you can use to increase the capabilities of the CPU with additional I/O or other communication protocols. For detailed information on a specific module, see the technical specifications (Page 337).

Electrical equipment standards classify the SIMATIC S7-1200 G2 system as Open Equipment. You must install the S7-1200 G2 in a housing, cabinet, or electric control room. Only allow authorized personnel access to the housing, cabinet, or electric control room.

Provide a dry environment for installation of the S7-1200 G2. SELV/PELV circuits provide protection against electric shock in dry locations.

Provide appropriate mechanical strength, flammability protection, and stability protection for open equipment in your location according to applicable electrical and building codes.

Conductive contamination due to dust, moisture, and airborne pollution can cause operational and electrical faults in the PLC.

If you locate the PLC in an area where conductive contamination might be present, protect the PLC in an enclosure with appropriate protection rating. IP54 is one rating for electronic equipment enclosures in dirty environments and might be appropriate for your application.

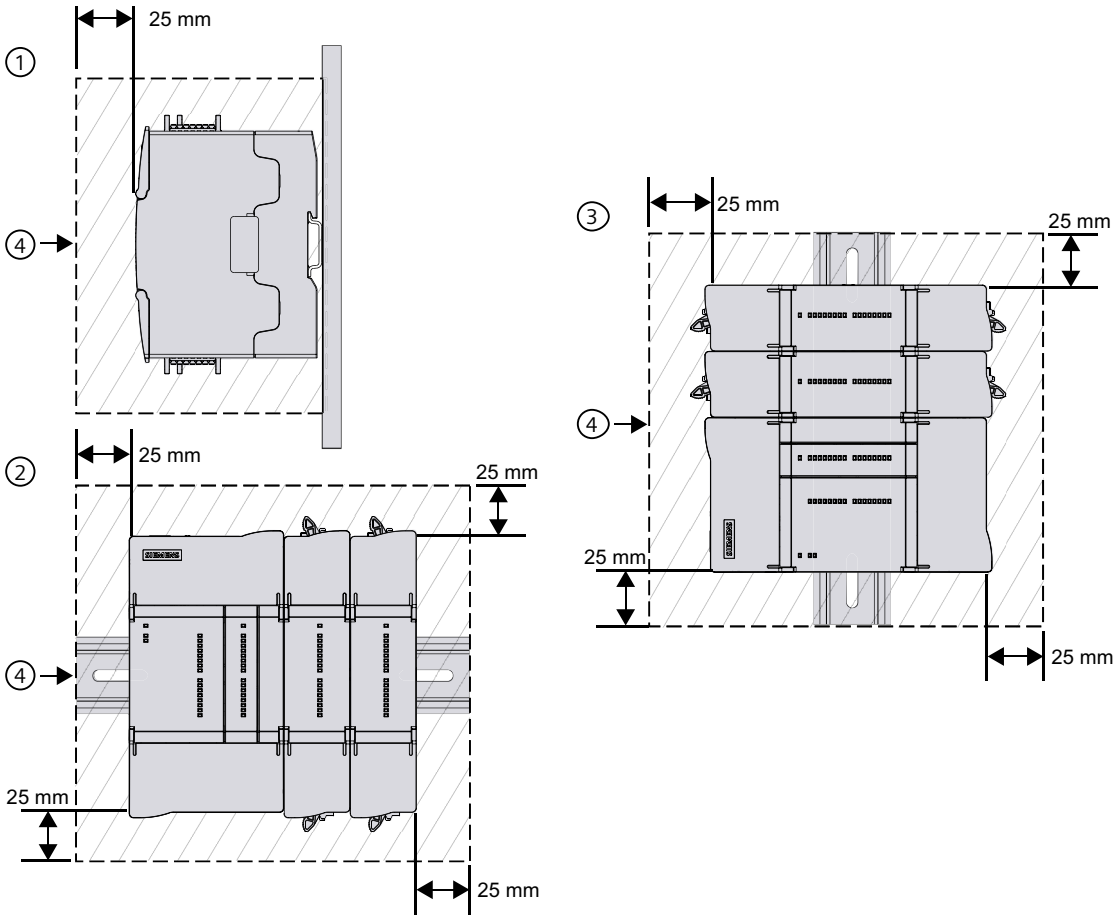
⚠ WARNING

Risks associated with improper installation
Improper installation of the S7-1200 G2 can result in electrical faults or unexpected operation of machinery.
You must follow all instructions for installation and maintenance of a proper operating environment to ensure that the equipment operates safely.
Electrical faults or unexpected machine operation can result in death, severe personal injury, and/or property damage.

Separating S7-1200 G2 devices from heat, high voltage, and electrical noise

When configuring the layout of S7-1200 G2 devices in a panel, always do the following:

- Separate the devices that generate high voltage and high electrical noise from the low-voltage, logic-type devices such as the S7-1200 G2.
- Place electronic-type devices in the cooler areas of the cabinet away from heat-generating devices to reduce exposure to high-temperatures and extend the operating life of the devices.
- Avoid placing low-voltage signal wires and communications cables in the same tray with AC power wiring and high-energy, rapidly-switched DC wiring when routing wiring for the devices.



Providing adequate clearance for cooling and wiring

The design of S7-1200 G2 devices provides for natural convection cooling. For proper cooling, allow at least 25 mm of clearance above, below, and on both sides of the system. Also, allow at least 25 mm of depth between the front of the modules and the inside of the enclosure.

⚠ CAUTION

Effect of vertical mounting on allowable ambient temperature
Vertical mounting reduces the maximum allowable ambient temperature.
Orient a vertically mounted S7-1200 G2 system as shown in the following figure: the CPU, when vertically mounted, is at the bottom with its left side down. Ensure that the S7-1200 G2 system is mounted correctly.
Improper installation of a vertically mounted system can result in personal injury.

When planning your layout for the S7-1200 G2 system, allow enough clearance for the wiring and communications cable connections.

① Side view
② Horizontal installation
③ Vertical installation
④ Clearance area

4.2 Safety information

Before you install or remove any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

⚠ WARNING

Risk of electrocution when installing or removing devices
Installing or wiring the S7-1200 G2 or related equipment with power applied could cause electric shock or unexpected operation of equipment.
Always follow appropriate safety precautions and ensure that power is disabled to the S7-1200 G2 or related equipment before attempting to install or remove any devices.
Failure to disable all power to the S7-1200 G2 and related equipment during installation or removal procedures could result in death, severe personal injury, and/or property damage due to electric shock or unexpected equipment operation.

Always ensure that whenever you replace or install an S7-1200 G2 device you use the correct module or equivalent device.

Always be sure to follow the guidelines for grounding (Page 83).

⚠ WARNING

Risks associated with replacing S7-1200 G2 devices

Incorrect installation of an S7-1200 G2 module can cause the program in the S7-1200 G2 to function unpredictably.

Use the same model, orientation, and order when replacing an S7-1200 G2 device.

Failure to do so can cause unexpected equipment operation resulting in death, severe personal injury, and/or property damage.

⚠ WARNING

Installing or removing devices in a flammable or combustible atmosphere

Disconnecting equipment in a flammable or combustible atmosphere can cause a fire or an explosion.

Do not disconnect equipment in a flammable or combustible atmosphere; follow appropriate safety precautions when working in a flammable or combustible atmosphere.

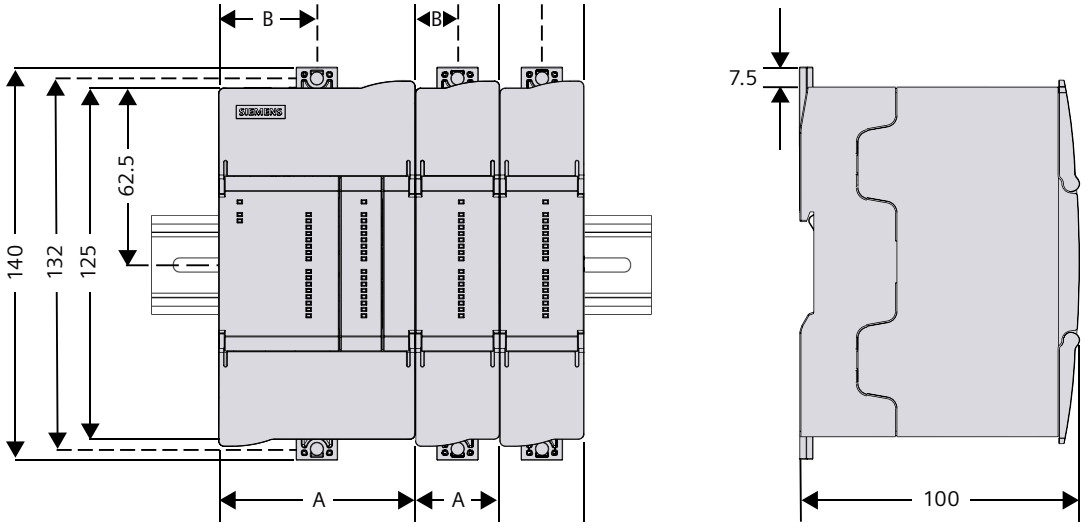
A fire or explosion can result in death, serious injury, and/or property damage.

NOTICE

Risks associated with electrostatic discharge

Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable.

To protect the memory card and receptacle from electrostatic discharge, do the following:



- Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card.
- Store the memory card in a conductive container.

Receptacle or memory card malfunction can result in property damage.

4.3 Mounting dimensions

Use the following mounting dimensions to ensure proper device installation. All mounting dimensions are shown in millimeters (mm).

CPU 1212C

CPU 1214C

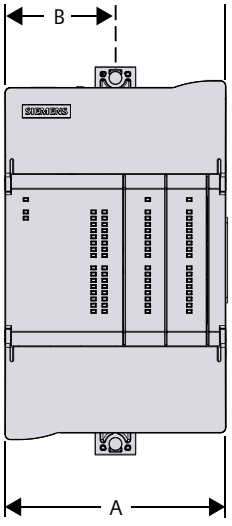


Table 1-141 Mounting dimensions (mm)

S7-1200 G2 Devices		Width A (mm)	Width B (mm)
CPUs[1]	CPU 1212C (AC/DC/Rly, DC/DC/Rly, and DC/DC/DC)	70	35
	CPU 1214C (AC/DC/Rly, DC/DC/Rly, and DC/DC/DC)	80	40
Fail-safe CPUs[1]	CPU 1212FC (DC/DC/Rly, and DC/DC/DC)	70	35
	CPU 1214FC (DC/DC/Rly, and DC/DC/DC)	80	40

[1] If you plan to use an input simulator, you must have extra clearance. See the Input simulators section of the Technical specifications chapter for specific dimensions.

S7-1200 G2 Devices		Width A (mm)	Width B (mm)
Signal modules	SM 1221 (16 DI 24V)	30	15
	SM 1222 (16 DQ 24V and 16 Rly)	30	15
	SM 1223 (8 DI / 8 DQ, 8 DI / 8 Rly)	30	15
	SM 1223 (16 DI / 16 DQ, 16 DI / 16 Rly, 16 DI / 16 DQ Sink)	50	25
	SM 1223 (8 DI / 8 DQ, 8 DI / 8 Rly, 16 Rly, 16 DI / 16 DQ Sink, and 16 DI / 16 DQ)	30	15
	SM 1231 (8 AI)	30	15
	SM1232 (8 AQ)	30	15
	SM 1233 (4 AI / 4 AQ)	30	15
	SM 1231 (8 TC and 4 RTD)	30	15
Communication modules	CM 1241 (RS485/232/422)	30	15
Communication processors	CP 1243-1 G2 Ethernet	30	15

[1] If you plan to use an input simulator, you must have extra clearance. See the Input simulators section of the Technical specifications chapter for specific dimensions.

Each CPU, SM, and CM supports mounting on either a DIN rail or on a panel. Use the DIN rail clips on the module to secure the device on the rail. These clips also snap into an extended position to provide screw mounting positions to mount the unit directly on a panel.

Always be sure to follow the guidelines for grounding (Page 83).

Input simulators (Page 464)

4.4 Providing power for the CPU

All S7-1200 G2 CPUs have an internal power supply that provides power to the CPU, any expansion modules or boards, and the 24 V DC Sensor power output.

You can connect any of the following to the CPU:

- Signal boards
- Communication modules
- Signal modules

Plug-in expansion boards, such as signal boards (SBs), install into the front of the CPU.

Communication modules (CM) and signal modules (SM) are installed to the right of the CPU. You can connect a CM to the right of a CPU or another CM. You can connect an SM to the right of a CPU, CM, or another SM.

The maximum number of expansion modules allowed for each CPU can be found in the Technical specifications (Page 337) under the CPU's General specifications and features.

For more information on expansion modules, see S7-1200 G2 modules (Page 57).

All S7-1200 G2 CPUs have a power budget calculator (Page 161) in the STEP 7 project. Select the CPU in Device view and navigate to the General tab > System power supply > Power segment overview to view the Power consumption per module and the Summary for the hardware configuration. When the chosen hardware configuration exceeds the available power budget, a compile warning is given.

Some of the 24 V DC power input ports in the PLC system are interconnected with a logic common circuit connecting multiple M terminals. The CPU 24 V DC power supply input, the SM relay coil power input, and a non-isolated analog power supply input are examples of circuits that are interconnected when designated as not isolated in the data sheets. All non-isolated M terminals must connect to the same external reference potential.

⚠ WARNING

Risks with connecting non-isolated M terminals to different reference potentials
Connecting non-isolated M terminals to different reference potentials causes unpredictable current flows. Unpredictable current flows can cause PLC damage or abnormal PLC and equipment operation.
Always ensure that all non-isolated M terminals in a PLC system are connected to the same reference potential.
PLC damage or abnormal PLC and equipment operation can cause death, severe personal injury, and/or property damage.

Each CPU supplies DC power:

- Each CPU has a 24 V DC sensor supply that can supply 24 V DC for local input points, for relay coils on the expansion modules, or for other requirements. If your 24 V DC power requirements exceed the budget of the sensor supply, you can add an external 24 V DC power supply to your system. You must manually connect the external 24 V DC supply to the input points or relay coils on the expansion modules.

  ⚠ WARNING

  Risks with parallel connections
  Connecting an external 24 V DC power supply in parallel with the CPU's DC sensor supply can result in a conflict between the two supplies as each seeks to establish its own preferred output voltage level.
  When using the CPU's DC sensor supply in conjunction with an additional external 24 V DC power supply, they must not be wired in parallel.
  Doing so could cause unpredictable operation of the PLC system, resulting in death, severe personal injury, and/or property damage.

Maximum applied voltage to S7-1200 G2 Fail-safe devices

When providing power for the S7-1200 G2 Fail-safe CPUs, you must observe the following:

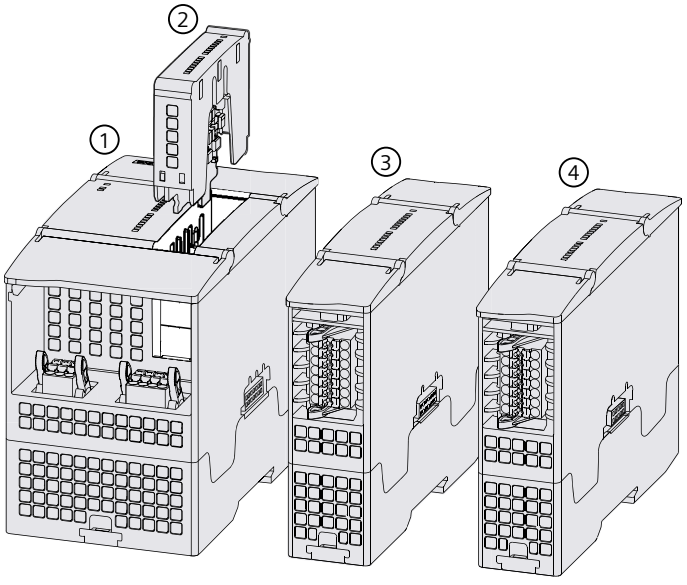
- Operational voltage: The operational voltage of the fail-safe CPUs and fail-safe SMs is 20.4 V DC - 28.8 V DC. Design and testing assure operation of the unit to specifications. Defined transients from defined source impedances per EN 61000-4-2, 61000-4-4, and 61000-4-6, as specified in the data sheet for each product, can be imposed on this voltage without disrupting operation or causing damage. Sustained operation in the range of 28.8 - 35 V DC can result in unacceptable temperature rise and thermal damage, causing the product to become inoperable.
- Absolute maximum rating regarding supply voltage: The absolute maximum rating to prevent module damage and to ensure the functional safety of the modules is 35 V DC. The manufacturer must specify these power supplies to limit the output voltage to 35 V DC or less under fault conditions. Otherwise, you must supply external protection that reliably opens the circuit or limits the output voltage to less than 35 V DC to the fail-safe CPU and fail-safe SMs.

- Immunity to surge voltages (Page 337): To meet the product standard for burner controls (EN 298), the wiring must be equipped with external protection against coupled surge voltages caused by lightning. For more information, refer to the function manual "*Designing interference-free controllers* (https://support.industry.siemens.com/cs/ww/en/view/59193566)".

Requirements for power supplies in the event of voltage interruption

To ensure adherence to IEC 61131-2, only use power packs/power supply units with a main buffering time of at least 10 ms for DC power or 1/2 AC cycle. The port that powers the CPU meets IEC61131-2 rating of PS2 with an interruption time of 10 ms for DC power and 1/2 AC cycle for AC power. Observe the relevant requirement in your product standards (for example, 30 ms for Burner applications according to EN 298) regarding possible voltage interruptions. The latest information on PS components is available on the Internet (https://support.industry.siemens.com/).

⚠ WARNING



All power supply and fail-safe SM circuits must be connected together to a common voltage reference or must be isolated SELV circuits.

The power supply M terminals on the fail-safe CPU and the fail-safe SMs must be connected together or isolated as SELV. Failure to do so can result in unexpected machine or process operation.

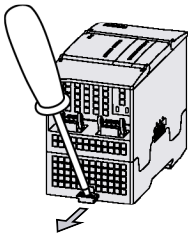
Connecting all M terminals together or isolating with approved SELV isolation prevents unwanted current flows in the event of a single fault in the CPU to SM isolation boundary.

Unexpected machine or process operation can result in death or serious injury to personnel, and/or damage to equipment.

4.5 Expansion capability of the CPU

① Central processing unit (CPU)
② Expansion board
③ Communication module (CM), if used
④ Signal module (SM)

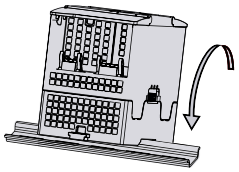
4.6 Installation and removal procedures



4.6.1 Installing and removing a CPU

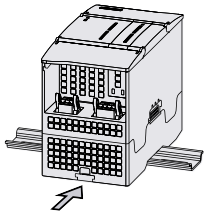
You can install the S7-1200 G2 CPU on a DIN rail or a panel.

Installing the CPU on a DIN rail



To install the CPU on a DIN rail, follow these steps:

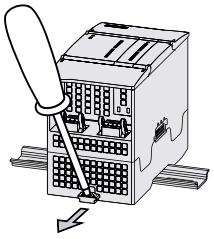
1. Install the DIN rail; secure the rail to the mounting panel every 75 mm.
2. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
3. Use an M3 screwdriver to extend the lower DIN rail clip on the CPU to allow it to fit over the rail.



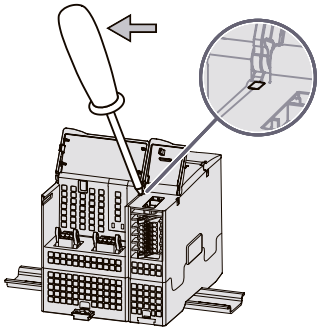
4. Hook the CPU over the top of the DIN rail.

5. Rotate the CPU down into position on the rail.

6. Push in the lower DIN rail clip to secure it to the rail.

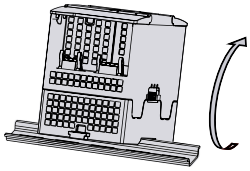


NOTE
Using DIN rail stops can be helpful if the CPU is in an environment with high vibration potential or if the CPU has been installed vertically. Use an end bracket (8WA1808 or 8WA1805) on the DIN rail to ensure that the modules remain connected.

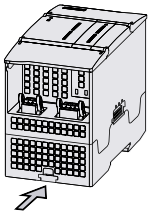


Removing the CPU from a DIN rail

To remove the CPU from a DIN rail, follow these steps:

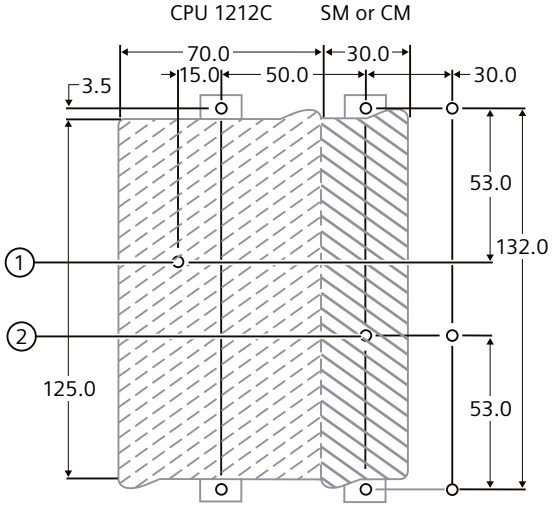


1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Disconnect the I/O connectors, wiring (Page 77), and cables from the CPU.
3. Use an M3 screwdriver to extend the lower DIN rail clip on the CPU to release it from the rail.

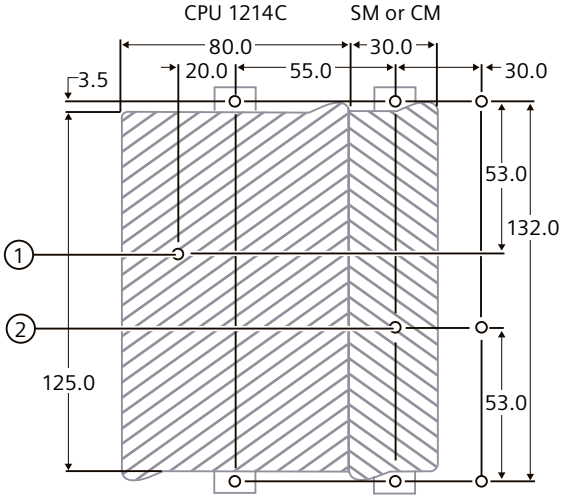


4. If the CPU is connected to an SM or CM, place an M3 screwdriver between the CPU and connected module; gently pry left to disconnect the CPU.

5. Rotate the CPU up and off the rail and remove the CPU from the system.



6. Push in the DIN rail clip to protect it from damage.



Installing the CPU on a panel

To install the CPU on a panel, follow these steps:

1. Locate, drill, and tap the mounting holes (M4), using the dimensions shown in the diagrams below.
2. Using the Guidelines for grounding (Page 83), install an M4 pan head stainless steel screw with a star washer into the panel at the grounding screw locations shown below.
3. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
4. Use a screwdriver to extend the upper and lower DIN rail clips on the CPU.
5. Secure the module to the panel, using a Pan Head M4 screw with spring and flat washer; apply the appropriate torque to compress the spring washer.

① CPU grounding screw

② SM or CM grounding screw

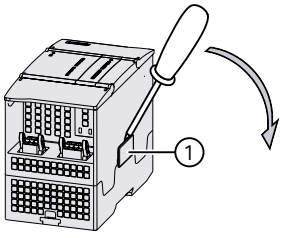
All measurements are shown in millimeters.

4.6.2 Installing and removing expansion modules

Installing and removing a CM or SM

You can connect a CM to a CPU or to another CM. Connect any CMs before installing any SMs. You can connect an SM to a CPU, CM, or SM.

Before you install or remove any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

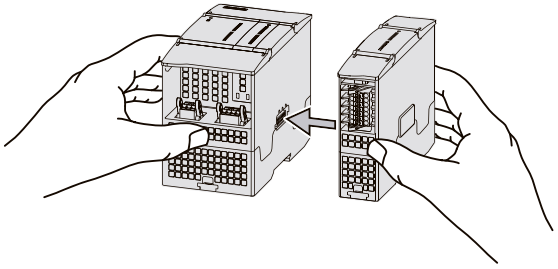


⚠ WARNING

Installation or removal of S7-1200 G2 devices with power applied
Installation or removal of S7-1200 G2 or related equipment with the power applied can cause electric shock or unexpected operation of equipment.
Always follow appropriate safety precautions and ensure that power to the S7-1200 G2 is disabled before attempting to install or remove S7-1200 G2 CPUs or related equipment.
Failure to disable all power to the S7-1200 G2 and related equipment during installation or removal procedures can result in death, severe personal injury and/or property damage due to electric shock or unexpected equipment operation.

Installing a CM or SM

To install an CM or SM, follow these steps:

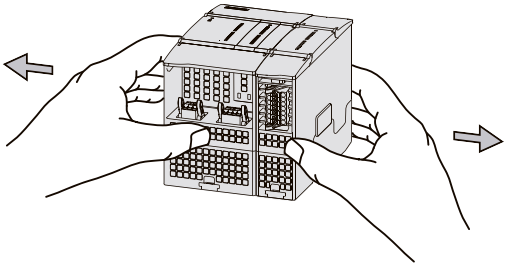


1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Remove the bus cover from the right side of the CPU or module. Insert a screwdriver into the slot above the bus cover, gently pry the cover loose, and remove it. Retain the cover for reuse.

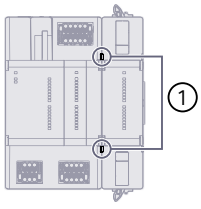
① Bus cover

3. If you are installing the module on a DIN rail extend the lower DIN rail clip, hook the module over the top of the rail, and rotate the module down into place.

4. Align the bus connector and the posts of the module with the holes of the CPU or module, and firmly press the units together until the posts snap into place.

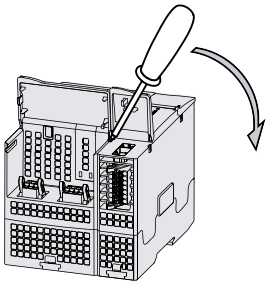


5. If you are DIN Rail mounting, push the lower DIN rail clip in to secure the module. If you are panel mounting, screw the module to the panel.



Removing a CM or SM

To remove an CM or SM, follow these steps:



1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Remove the I/O connectors and all wiring and cables from the module.
3. If the module is mounted on a DIN rail, use an M3 screwdriver to extend the lower DIN rail clip on the module. If the module is panel mounted, remove the mounting screws from the upper and lower DIN rail clips to release it from the panel.
   Note: In some cases, it may be necessary to loosen other devices mounted to the left or right to create room to disconnect the device you wish to remove.
4. Separate the module from the CPU or module using one of the following methods:
   • Grasp the units and pull them apart.

   • Place an M3 screwdriver in the provided slot under the doors and pry the devices apart.

① Slots for screwdriver

5. Remove the module(s) from the DIN rail or panel; if removing a module(s) from a DIN rail, rotate it up and off the rail.
6. Push in the DIN rail clips on the modules you are removing to protect them from damage.

4.6.3 Installing and removing expansion boards

Installing or removing an SB

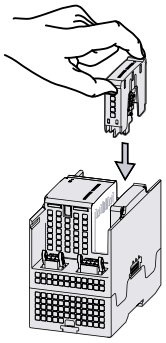
You can install one plug-in expansion board to CPU 1212 and two plug-in expansion boards of any type to CPU 1214.

Before you install or remove any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

⚠ WARNING

Installation or removal of S7-1200 G2 devices with power applied

Installation or removal of S7-1200 G2 or related equipment with the power applied can cause electric shock or unexpected operation of equipment.



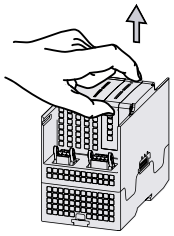
Always follow appropriate safety precautions and ensure that power to the S7-1200 G2 is disabled before attempting to install or remove S7-1200 G2 CPUs or related equipment.

Failure to disable all power to the S7-1200 G2 and related equipment during installation or removal procedures can result in death, severe personal injury and/or property damage due to electric shock or unexpected equipment operation.

Installing an SB

To install an SB, follow these steps:

1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Remove the upper and lower doors from the CPU.
3. Grasp the top and bottom of the existing blank board cover or plug-in expansion board, and pull away from the CPU to remove it. (If you are installing an SB into a newly purchased CPU, retain the preinstalled blank board cover after removing it from the CPU.)



4. Insert the plug-in expansion board into the vacant slot and press down on it until it clicks into place.
5. Replace the upper and lower doors.

Removing an SB

To remove an SB, follow these steps:

1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Remove the upper and lower doors from the CPU.
3. Grasp the top and bottom of the plug-in expansion board and pull away from the CPU to remove it.

4. Insert the desired plug-in expansion board into the vacant slot and press down on it until it clicks into place. (If no SB is required, reinsert the blank board cover that came with the CPU.)
5. Replace the upper and lower doors.

⚠ WARNING

Risks associated with leaving a plug-in expansion board slot empty
Leaving a plug-in expansion board slot empty can expose the internal elements of the CPU to environmental contaminants like moisture, dust, or debris that can damage or shorten the lifespan of the CPU.
Do not leave a plug-in expansion board slot empty. If you are not installing a new SB, reinsert the blank board cover. (Blank board covers are preinstalled in the CPU at the time of purchase.)
Damage to the CPU can cause equipment malfunction. Equipment malfunction can potentially result in property damage, severe personal injury, or death.

4.6.4 Removing and installing terminal block connectors

Removing and installing a CPU, CM, or SM terminal block connector

All S7-1200 G2 devices provide removable connectors to make connecting the wiring easy. For more information on how to wire connectors, see Wiring procedures (Page 85).

Installation risks with terminal block connectors in relay signal modules

You can incorrectly install a CPU's high voltage 6, 8, or 12 pin terminal block connector into a relay digital signal module and a CPU's high voltage 6 or 8 pin terminal block connector into an relay analog signal module.

The existing keying on the CPU's high voltage terminal block connectors does not prevent you from installing them into the following relay signal modules:

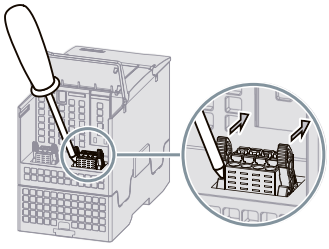
Signal modules (SMs)	Article number
SM 1222 DQ 16xRelay (Page 392)	6ES7222-5HH50-0XB0
SM 1223 DI 8x24VDC / DQ 8xRelay (Page 396)	6ES7223-5PH50-0XB0
SM 1231 AI 8x14bit (Page 405)	6ES7231-4HF50-0XB0
SM 1232 AQ 8x14bit (Page 408)	6ES7232-4HF50-0XB0
SM 1233 AI 4x14bit / AQ 4x14bit (Page 410)	6ES7233-4HF50-0XB0

⚠ WARNING

Risk of electrocution with improper terminal block installation

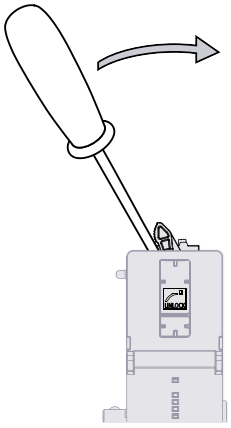
If you install a 6, 8, or 12 pin high voltage connector from a relay CPU into one of the relay SMs listed above, hazardous levels of voltage can occur on the DIN rail and connected machinery.

Ensure that the terminal block connector and the connector receptacle on the device have the same number of pins before installing the terminal block connector, and that both levers of the connector are in the locked position before restoring power to the system.



Death, severe personal injury, and property damage can result if you install a relay CPU's 6, 8, or 12 pin high voltage connector into one of the relay SMs listed above.

Removing a CPU, CM, or SM terminal block connector

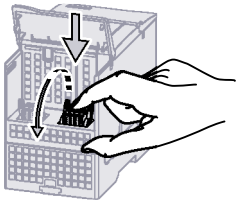


To remove an CPU, CM, or SM terminal block connector, follow these steps:

1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Use a screwdriver to release the terminal block connector levers or firmly press them in the direction shown below.

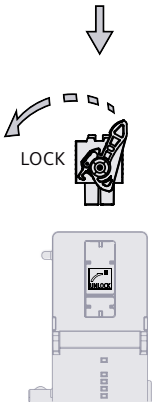
   CPU removal:

   CM or SM removal:



3. Grasp the connector and remove it from the CPU, CM, or SM.

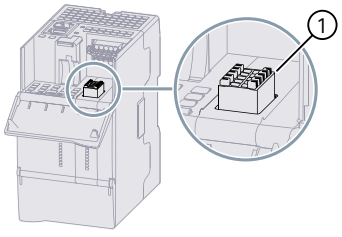
Installing a CPU, CM, or SM terminal block connector



To install an CPU, CM, or SM terminal block connector, follow these steps:

1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Align the terminal block connector with the pins on the unit; for the SM and CM you can use the symbol marked on the unit to identify proper orientation of the connector.
3. Press firmly down on the center of the terminal block connector until it snaps into place. (The levers will rotate and lock into place as you press down.)

   CPU installation:

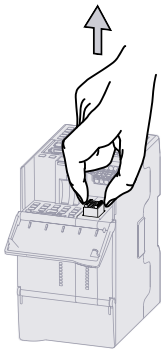


CM or SM installation:

4. Make sure that the terminal block connector is properly aligned and in the locked position.

Removing and installing an SB terminal block connector

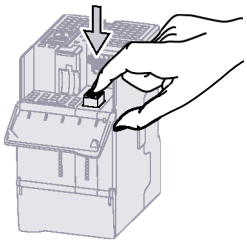
The terminal block connector for an SB is behind the top door of the CPU, as shown below.



① SB terminal block connector

Removing an SB terminal block connector

To remove an SB terminal block connector, follow these steps:



1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Firmly grasp the terminal block connector and pull away from the CPU.

Installing an SB terminal block connector

To install an SB terminal block connector, follow these steps:

1. Ensure that the CPU and all S7-1200 G2 equipment are powered down.
2. Align the terminal block connector with the pins on the unit.
3. Press down firmly on the center of the terminal block connector until it snaps into place.

4.7 Wiring guidelines and procedures

4.7.1 Safety considerations

Proper grounding and wiring of all electrical equipment are important to help ensure the optimum operation of your system and to provide additional electrical noise protection for your application and the S7-1200 G2. Refer to the technical specifications (Page 337) for the S7-1200 G2 wiring diagrams.

Prerequisites

Before grounding or installing wiring to any electrical device, ensure that the power to that device is off. Also, ensure that the power to any related equipment is off.

⚠ WARNING

Risk of electrocution when installing or removing devices
Installing or wiring the S7-1200 G2 or related equipment with power applied could cause electric shock or unexpected operation of equipment.
Always follow appropriate safety precautions and ensure that power is disabled to the S7-1200 G2 or related equipment before attempting to install or remove any devices.
Failure to disable all power to the S7-1200 G2 and related equipment during installation or removal procedures could result in death, severe personal injury, and/or property damage due to electric shock or unexpected equipment operation.

Always consider safety when designing the grounding and wiring for the S7-1200 G2 system. Follow all applicable electrical codes when wiring the S7-1200 G2 and related equipment. Install and operate all equipment according to all applicable national and local standards. Contact your local authorities to determine which codes and standards apply to your specific case.

⚠ WARNING

Risk of unexpected equipment operation
Control devices can fail in unsafe conditions, resulting in unexpected equipment operation. Use an emergency stop function, electromechanical overrides, or other redundant safeguards that are independent of the S7-1200 G2.
Unexpected operation can result in death, severe personal injury and/or property damage.

4.7.2 Guidelines for isolation

S7-1200 G2 AC power supply boundaries and I/O boundaries to AC circuits provide safe separation between AC line voltages and low voltage circuits. These boundaries include double or reinforced insulation, or basic plus supplementary insulation, according to various standards. Components which cross these boundaries such as optical couplers, capacitors, transformers, and relays have been approved as providing safe separation. Only circuits rated for AC line voltage include safety isolation to other circuits. Isolation boundaries between 24 V DC circuits are functional only. Do not depend on these boundaries for safety.

The sensor supply output, communications circuits, and internal logic circuits of an S7-1200 G2 with included AC power supply are sourced as SELV (safety extra-low voltage) according to EN 61131-2.

To ensure safe operation, you must power the external connections to the following items from approved sources that meet the requirements of SELV/PELV, Class 2, Limited Voltage, or Limited Power according to various standards:

- Communications ports

  The CPU meets isolation requirements between the ports and internal circuits (1500 V AC) according to IEEE 802.3, Chapter 27.5.3, Environment B. Therefore, do not connect LAN or LAN segments of different environments (for example, Environment A and B according to IEEE 802.3) to the dual ports of S7-1200 G2 CPUs.
- Analog circuits
- 24 V DC nominal power supply
- Digital I/O circuits

⚠ WARNING

Risk of electrocution with use of non-isolated or single insulation supplies
Using non-isolated or single insulation supplies can cause circuits that are normally safe to the touch, like communications circuits and low voltage sensor wiring, to carry hazardous levels of voltage.
Do not use non-isolated or single insulation supplies to supply low voltage circuits from an AC line.
Only use high voltage to low voltage power converters that are approved as sources of touch safe, limited voltage circuits.
Using non-isolated or single insulation supplies can cause unexpected electric shock resulting in death, severe personal injury, and/or property damage.

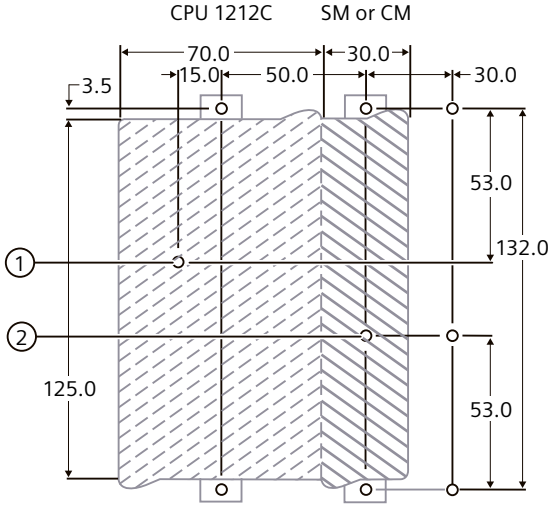
The following figure shows a simplified representation of the relationships of the S7-1200 G2 automation system. The electrical tie between Functional Earth and M on a G2 CPU is also represented in the figure.

The Functional Earth and Power supply common in all G2 CPUs are coupled with a series resistor and paralleled capacitor.

① Resistor (not present on all models)
② Din rail or panel
③ Bus 5V power
④ Bus common
⑤ Bus connection
⑥ Process electronics
⑦ Serial communication interface
⑧ Signal board
⑨ PN communication interfaces (always 2 per CPU)
⑩ Filter
⑪ AC power
⑫ DC power
⑬ Electronics

4.7.3 Guidelines for grounding

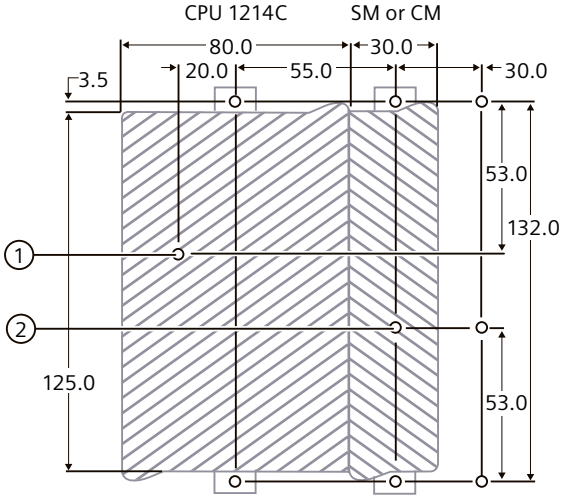
Ground all S7-1200 G2 and related equipment connections (common and ground) to a single point. Always connect this single point directly to the earth ground of the system.



Use the shortest ground wire possible; use a large wire size, such as 2.5 mm^2 (14 AWG).

When using shielded cables, always connect the cable shields to the ground at both ends to reduce low and high frequency interference.

When locating grounds, consider safety-grounding requirements and the proper operation of protective interrupting devices.



When the S7-1200 G2 is mounted to a DIN rail, the units use a spring to make proper ground connection to the DIN rail. Ensure that the DIN rail is properly grounded to the system's single point ground.

When the S7-1200 G2 is mounted to a panel, it is required to place an M4 pan head stainless steel screw with a star washer into the panel at the locations shown below. This screw will allow the units ground spring to make proper electrical contact with the panel. Ensure that the panel is properly grounded to the system's single point ground.

① CPU grounding screw

② SM or CM grounding screw

All measurements are shown in millimeters.

4.7.4 Guidelines for wiring

When designing the wiring for the S7-1200 G2, provide a single disconnect switch that simultaneously removes power from the S7-1200 G2 CPU power supply, from all input circuits, and from all output circuits. Provide over-current protection, such as a fuse or circuit breaker, to limit fault currents on supply wiring. Consider providing additional protection by placing a fuse or other current limit in each output circuit.

Install appropriate surge suppression devices for any wiring that could be subject to lightning surges.

Avoid placing low-voltage signal wires and communications cables in the same wire tray with AC wires and high-energy, rapidly switched DC wires. Always route wires in pairs, with the neutral or common wire paired with the hot or signal-carrying wire.

Use the shortest wire possible and ensure that the wire is sized properly to carry the required current. Use properly sized copper ferrule sleeves to terminate the wire into the connector.

Use wire and cable with a temperature rating that is 45 °C higher than the ambient temperature around the S7-1200 G2. Use the specific electrical circuit ratings and the installation environment to determine what other types of wiring and materials are needed.

To reduce electrical noise, use shielded wires.

In addition to using shielded wires, you can do the following to further reduce electrical noise:

- Connect the shield to the ground at both ends of the cable.
- Ground other cable shields using clamps or copper tape around the shield to provide a high surface area connection to the grounding point.

When wiring input circuits that are powered by an external power supply, include an overcurrent protection device in that circuit. External protection is not necessary for circuits

that are powered by the 24 V DC sensor supply from the S7-1200 G2 because the sensor supply is already current-limited.

All S7-1200 G2 modules have removable connectors for user wiring. To prevent loose connections, ensure that the connector is seated properly, locked in place, and that the wire is installed securely into the connector.

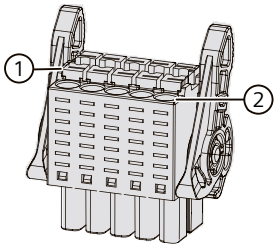
To help prevent unwanted current flows in your installation, the S7-1200 G2 provides isolation boundaries at certain points. When planning the wiring for the system, consider these isolation boundaries. Refer to the technical specifications (Page 337) for the amount of isolation provided and the location of the isolation boundaries. Circuits rated for AC line voltage include safety isolation to other circuits. Isolation boundaries between 24 V DC circuits are functional only; do not depend on these boundaries for safety.

A summary of Wiring rules for the S7-1200 G2 CPUs, CMs, SMs, SBs, and CBs is shown below:

Table 1-142 Wiring rules for S7-1200 G2 CPUs, CMs, SMs, SBs, and CBs

Wiring rules for...	**CPU, CM, and SM connector**	**SB and CB connector[1]**
Connection technology	**Push in**	**Push in**
Connectible conductor cross-sections for standard wires	0.2 mm^2 to 1.5 mm^2 (24 AWG to 16 AWG)	0.2 mm^2 to 0.8 mm^2 (24 AWG to 18 AWG)
Number of wires per connection	1 wire or combination of 2 wires in a double copper ferrule sleeve up to 1.5 mm^2 (total)	1 wire or combination of 2 wires up to 0.8 mm^2 (total)
Wire stripping length (Use copper ferrule sleeves for secure electric connection)	9 to 10 mm	7 mm

[1] Recommended ferrule sizes for SBs and CBs are listed in the Techincal specifications for each board.



NOTE

Use copper ferrule sleeves on stranded conductors to reduce the risk of stray strands causing short circuits. Ferrules longer than the recommended strip length must include an insulating collar to prevent shorts due to side movement of conductors. Cross-sectional area limits for bare conductors also apply to ferrules.

4.7.5 Wiring and unwiring terminal block connectors

Removable terminal block connectors are used to wire S7-1200 G2 CPUs and modules.

All S7-1200 G2 removable terminal block connectors have the following parts:

① Spring release
② Push-in terminal

There are various types and sizes of terminal block connectors. For CPU, CM, and SM terminal block connectors, the color of the terminal block lock handle and spring release indicates the type of connector. For example, an orange handle and release indicates a high voltage

connector. The color used on the connector matches the color of the terminal block header on the CPU or module.

The CPU, CM, and SM terminal block connectors also have openings where you can insert a 1 mm multimeter test probe to check the voltage.

For details on the terminal block connectors used in a specific CPU or module, refer to the wiring diagram of the device in the Technical specifications (Page 337). Information on terminal block spare kits can be found in Ordering information (Page 469).

NOTE

PLCs require correct wiring to ensure safety and proper operation.
When replacing the terminal block in your S7-1200 G2 CPU or module, it is important that you use the correct terminal block and correct wiring source for your module.
The G2 removable terminal block is designed to prevent you from accidentally placing a high voltage wired terminal block into a low voltage module, or from placing a special voltage wired terminal block into a normal voltage module.

Installation risks with terminal block connectors in relay signal modules

You can incorrectly install a CPU's high voltage 6, 8, or 12 pin terminal block connector into a relay digital signal module and a CPU's high voltage 6 or 8 pin terminal block connector into an relay analog signal module.

The existing keying on the CPU's high voltage terminal block connectors does not prevent you from installing them into the following relay signal modules:

Signal modules (SMs)	Article number
SM 1222 DQ 16xRelay (Page 392)	6ES7222-5HH50-0XB0
SM 1223 DI 8x24VDC / DQ 8xRelay (Page 396)	6ES7223-5PH50-0XB0
SM 1231 AI 8x14bit (Page 405)	6ES7231-4HF50-0XB0
SM 1232 AQ 8x14bit (Page 408)	6ES7232-4HF50-0XB0
SM 1233 AI 4x14bit / AQ 4x14bit (Page 410)	6ES7233-4HF50-0XB0

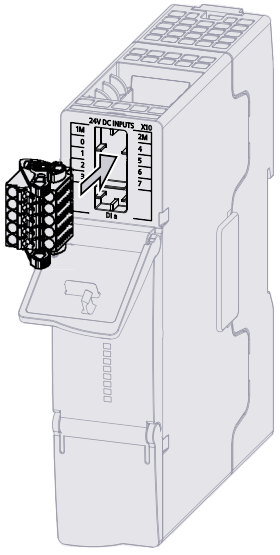
⚠ WARNING

Risk of electrocution with improper terminal block installation
If you install a 6, 8, or 12 pin high voltage connector from a relay CPU into one of the relay SMs listed above, hazardous levels of voltage can occur on the DIN rail and connected machinery.
Ensure that the terminal block connector and the connector receptacle on the device have the same number of pins before installing the terminal block connector, and that both levers of the connector are in the locked position before restoring power to the system.
Death, severe personal injury, and property damage can result if you install a relay CPU's 6, 8, or 12 pin high voltage connector into one of the relay SMs listed above.

Wiring rules

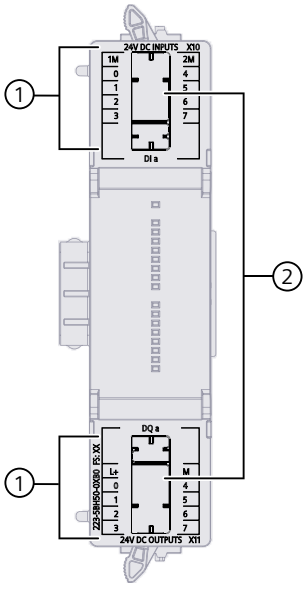
For wire size requirements and wire stripping length, refer to Wiring rules for S7-1200 G2 CPUs, SMs, SBs and CBs (Page 84).

Solid or stranded wire can be used. With stranded wire, Siemens recommends using ferrules of an appropriate size.



Wiring terminal block connectors

When wiring a removable terminal block connector, use a wire stripping tool to remove the plastic coating from the section of the wire that you are inserting into the connector.



If using stranded wire, you might also need a 0.4 to 2.0 mm flat head screwdriver and a crimping tool.

To wire the removable terminal block connector of a CPU or expansion module, follow these steps:

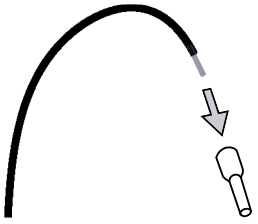
1. Disconnect the CPU and all S7-1200 G2 equipment from electrical power.
2. Remove the terminal block connector from the CPU or module as described in Removing and installing S7-1200 G2 terminal block connectors (Page 77).
3. If wiring a CM or SM, place the terminal block connector into the wiring slot on the front of the module. (Skip this step if you are wiring a CPU or SB.)

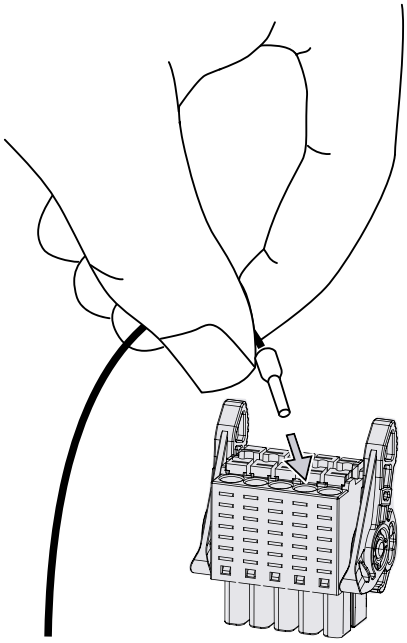
Unlike the removable terminal block connectors on a CPU or SB, each expansion module has wiring slots with pin assignments located on the front of the module. Use these slots when wiring an expansion module.

① Pin assignments
② Wiring slots

4. Strip the end of the wire(s) to the length specified in Wiring rules for S7-1200 G2 CPUs, SMs, SBs and CBs (Page 84).

NOTE
When using stranded wire, for best results, attach a ferrule to the end of the wire and crimp the end using a crimping tool. Do not attach a ferrule to solid wire. It is not necessary to use ferrules when using solid wire.





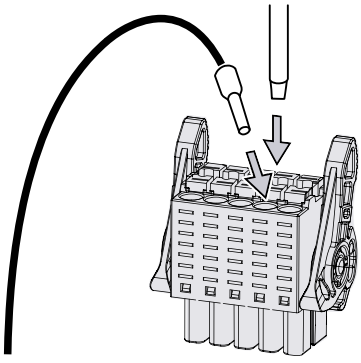


Figure 1-42 How to attach a ferrule to stranded wire

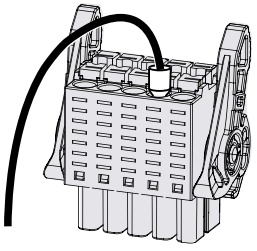
5. Use your hand to press the wire(s) into the push-in terminal,

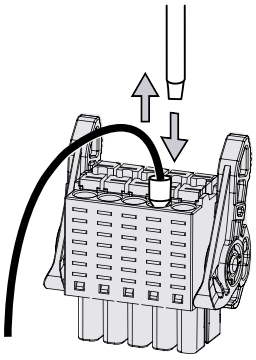


or use a 0.4 to 2.0 mm flathead screwdriver to press down on the spring release and insert the wire(s) into the push-in terminal.

NOTE

Pressing down on the spring release opens the teeth inside the connector and makes it easier to insert the wire. Once a wire is inserted into the push-in terminal, the teeth hold the wire in place.

6. Once all wires are inserted and secure, install the terminal block connector as described in Removing and installing S7-1200 G2 terminal block connectors (Page 77).



Unwiring terminal block connectors

Use a 0.4 to 2.0 mm flat head screwdriver to unwire the removable terminal block connector.

To unwire the removable terminal block connector of a CPU or expansion module, follow these steps:

1. Disconnect the CPU and all S7-1200 G2 equipment from electrical power.
2. Remove the terminal block connector from the CPU or module as described in Removing and installing S7-1200 G2 terminal block connectors (Page 77).
3. Using a 0.4 to 2.0 mm flathead screwdriver, press down on the spring release and remove the wire and ferrule from the push-in terminal.

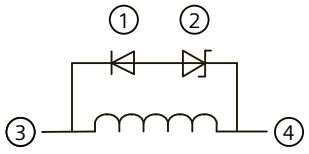
4.7.6 Guidelines for inductive loads

Use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off. Suppressor circuits protect your outputs from premature failure caused by the high voltage transient that occurs when current flow through an inductive load is interrupted.

In addition, suppressor circuits limit the electrical noise generated when switching inductive loads. High frequency noise from poorly suppressed inductive loads can disrupt the operation of the PLC. Placing an external suppressor circuit so that it is electrically across the load and physically located near the load is the most effective way to reduce electrical noise.

S7-1200 G2 DC outputs include internal suppressor circuits that are adequate for inductive loads in most applications. Internal protection is not provided for relay outputs because you can use S7-1200 G2 relay output contacts to switch either a DC or an AC load.

Consider using inductive loads with integrated suppression circuitry. However, for some applications, manufacturer-provided suppressor circuits are inadequate. You can use an additional suppressor circuit to further protect the PLC output.

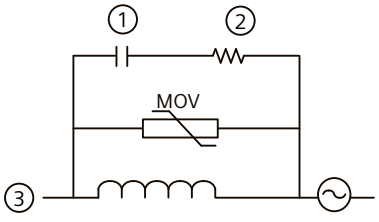


Consider using a metal oxide varistor (MOV), parallel RC circuit, or a combination of both for AC loads. A MOV suppressor with no parallel RC circuit often results in significant high frequency noise up to the clamp voltage.

A well-controlled turn-off transient will have a ring frequency of no more than 10 kHz, with less than 1 kHz preferred. Peak voltage for AC lines must be within +/- 1200 V of ground. Negative peak voltage for DC loads using the PLC internal suppression will be ~40 V below the 24 V DC supply voltage. External suppression must limit the transient to within 36 V of the supply to unload the internal suppression.

NOTE

The effectiveness of a suppressor circuit depends on the application; you must verify a suppressor circuit is suitable for your particular usage. Ensure that all components are correctly rated. Use an oscilloscope to observe the turn-off transient.



Typical suppressor circuit for DC or relay outputs that switch DC inductive loads

① 1N4001 diode or equivalent
② 8.2 V Zener (DC outputs), 36 V Zener (Relay outputs)
③ Output point
④ M, 24 V reference

In most applications, the addition of a diode (1) across a DC inductive load is suitable, but if your application requires faster turn-off times, then the addition of a zener diode (2) is recommended. Be sure to size your zener diode properly for the amount of current in your output circuit.

Typical suppressor circuit for relay outputs that switch AC inductive loads

① See table for C value
② See table for R value
③ Output point

Ensure that the working voltage of the metal oxide varistor (MOV) is at least 20% greater than the nominal line voltage.

Choose pulse-rated, non-inductive resistors, and capacitors recommended for pulse applications (typically metal film). Verify the components meet average power, peak power, and peak voltage requirements.

If you design your own suppressor circuit, the following table suggests resistor and capacitor values for a range of AC loads. These values are based on calculations with ideal component parameters. I rms in the table refers to the steady-state current of the load when fully ON.

Table 1-143 AC suppressor circuit resistor and capacitor values

Inductive load			**Suppressor values**		
I rms	230 V AC	120 V AC	Resistor		Capacitor
Amps	VA	VA	Ω	W (power rating)	nF
0.02	4.6	2.4	15000	0.1	15
0.05	11.5	6	5600	0.25	47
0.1	23	12	2700	0.5	100
0.2	46	24	1500	1	150
0.5	115	60	560	2.5	470
1	230	120	270	5	1000
2	460	240	150	10	1500

[2] **Conditions satisfied by the table values:**
Maximum turn-off transition step < 500 V
Resistor peak voltage < 500 V
Capacitor peak voltage < 1250 V
Suppressor current < 8% of load current (50 Hz)
Suppressor current < 11% of load current (60 Hz)
Capacitor dV/dt < 2 V/µs
Capacitor pulse dissipation : ∫(dv/dt) dt < 10000 V^2/µs
Resonant frequency < 300 Hz
Resistor power for 2 Hz max switching frequency
Power factor of 0.3 assumed for typical inductive load

4.7.7 Guidelines for lamp loads

Lamp loads, including LED lamp loads, are damaging to relay contacts because of the high turn-on surge current. This surge current will nominally be 10 to 15 times the steady state current for a Tungsten lamp. A replaceable interposing relay or surge limiter is recommended for lamp loads that will be switched a large number of times during the lifetime of the application.

4.8 Maintenance and repair

The components of the S7-1200 G2 automation system are maintenance-free.

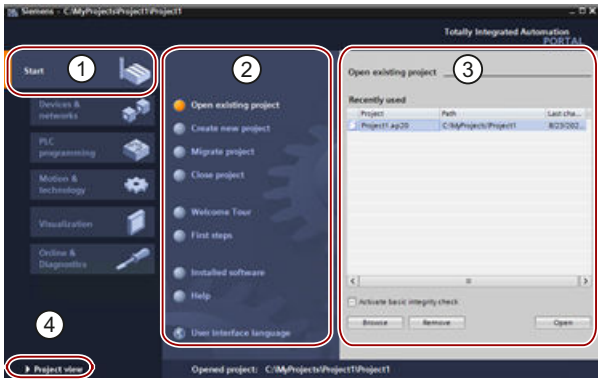
NOTE
Only the manufacturer can carry out repairs to the components of the S7-1200 G2 automation system.

PLC concepts, configuration, and programming 5

5.1 TIA Portal

The Totally Integrated Automation Portal (TIA Portal) is an engineering framework for implementing automation solutions. The TIA Portal includes STEP 7 for PLC programming and configuration. You use STEP 7 to configure CPUs and modules (Page 151) and for programming your application logic (Page 170).

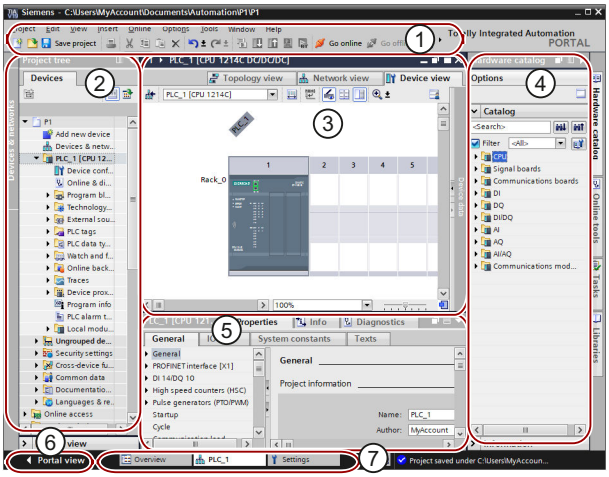
TIA Portal provides an extensive information system.



5.2 Different views in the TIA Portal

The TIA Portal provides two different views of the project that you use for your control application:

- Portal view: A task-oriented set of portals that are organized on the functionality of the tools
- Project view: A project-oriented view of the elements within the project



Choose which view helps you work most efficiently. With a single click, you can toggle between the Portal view and the Project view.

Portal view

① Portals for the different tasks
② Tasks for the selected portal
③ Selection panel for the selected action
④ Switch to Project view

Project view

① Menus and toolbar
② Project tree navigator
③ Work area
④ Task cards
⑤ Inspector window
⑥ Selector to change to the Portal view
⑦ Editor bar

With these components in one place, you have easy access to every aspect of your project. The work area consists of three tabbed views:

- Device view: Displays the device that you have added or selected and its associated modules
- Network view: Displays the CPUs and network connections in your network
- Topology view: Displays the PROFINET topology of the network including devices, passive components, ports, interconnections, and port diagnostics

Each view also enables you to perform configuration tasks. The inspector window shows the properties and information for the object that you have selected in the work area. As you select different objects, the inspector window displays the properties that you can configure. The inspector window includes tabs that allow you to see diagnostic information and other messages.

By showing all of the editors that are open, the editor bar helps you work more quickly and efficiently. To toggle between the open editors, simply click one of the open editors. You can also arrange two editors to appear together, arranged either vertically or horizontally. This feature allows you to drag and drop between editors.

5.3 Using the TIA Portal Information System

The TIA Portal Information System has extensive information about configuring and programming PLCs. In the TIA Portal Information System, refer to Help on the Information System (https://docs.tia.siemens.cloud/access?ft:originId=./11251439499/75833983499_enUS.htm&ft:clusterId./11251439499/75833983499.htm) for usage information.

When searching for information about the S7-1200 G2, note the following:

- When filtering a search on devices, S7-1200 G2 is not available as a device selection. Filtering by S7-1500 would be the closest match to S7-1200 G2 information.
- When using context-sensitive help in the TIA Portal, if the tooltip does not include S7-1200 G2, then choose the S7-1500 topic.

This system manual for the S7-1200 G2 Programmable Logic Controller provides additional information on configuration, programming, and program execution.

5.4 Program structure

5.4.1 Structure of a STEP 7 user program

The S7-1200 G2 CPU supports the following types of code blocks that allow you to create an efficient structure for your user program:

- Organization blocks (OBs) (Page 101) define the structure of the program. Some OBs run at startup. Some run continuously when the CPU is running your process. Some run under specific conditions.
- Data blocks (DBs) (Page 129) store data that can be used by the program blocks. Refer to "Data types (https://docs.tia.siemens.cloud/access?ft:originId=./65883487371/65883487371_enUS.htm&ft:clusterId./65883487371/65883487371.htm)" in the TIA Portal Information System for descriptions of the data types that STEP 7 provides.
- Functions (FCs) and function blocks (FBs) contain the program code that corresponds to specific tasks. FCs and FBs can be called from an OB or from another FC or FB. Each FC or FB provides a set of input and output parameters for sharing data with the calling block. An FB also uses an associated data block (called an instance DB) to maintain the data values for that instance of the FB call. You can call an FB multiple times, each time with a unique instance DB. Calls to the same FB with different instance DBs do not affect the data values in any of the other instance DBs.

An S7-1200 G2 F-CPU supports the following types of code blocks that allow you to create an efficient structure for your safety program:

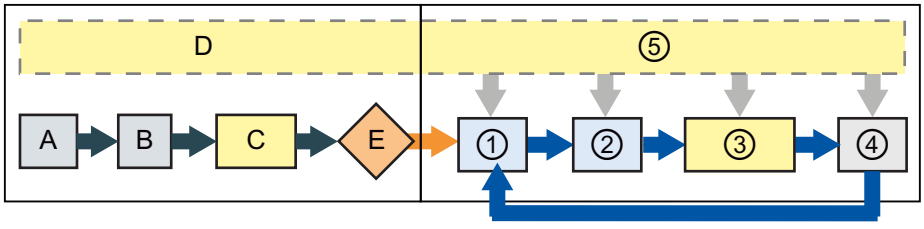
- F-I/O data blocks are automatically generated by the safety program when you configure an F-I/O.
- Fail-safe organization blocks (F-OBs) define the structure of the safety program. The F-OB calls the main safety block in an F-Runtime Group (F-RTG); this group contains F-blocks that you create or that are inserted from the project or global libraries, as well as those which are added automatically by the safety program. You can manage F-RTGs in the Safety Administration Editor (SAE). There can be either one or two F-RTGs.

- Fail-safe data blocks (F-DBs) store data that can be used by the safety program blocks.
  - F-shared data blocks are data blocks that contain all data shared between the safety program and the F-subsystems.
  - F-runtime group information data blocks are created by the safety program when you create an F-runtime group. These blocks provide information on the F-runtime group and on the safety program.
- Fail-safe functions (F-FCs) and Fail-safe function blocks (F-FBs) contain the program code that corresponds specifically to safety tasks. F-FCs and F-FBs can be called from an F-OB or from another F-FC or F-FB. Each F-FC or F-FB contains instructions from either the project or global library and can call other created F-FBs or F-FCs to structure the user safety program.

NOTE

Onboard standard I/O channels not used for fail-safe I/O function
In your STEP 7 project, you can configure the onboard I/O of the F-CPU with standard code blocks, but these I/O are not safety I/O. You can only use F-I/O to accomplish safety tasks by configuring the fail-safe I/O channels with safety blocks.

To learn more about the code blocks which structure the safety program, refer to the "SIMATIC Safety - Configuring and Programming" manual (https://support.industry.siemens.com/cs/us/en/view/54110126).



5.4.2 Execution of the user program

Execution of the user program begins with one or more optional startup OBs (Page 102) that execute once upon entering RUN mode. Execution then continues with configured program cycle OBs (Page 102) that execute cyclically. You can also associate an OB with an interrupt event, which can be either a standard event or an error event. These OBs execute whenever the corresponding standard or error event occurs.

Operating modes

The CPU has three modes of operation: STOP mode, STARTUP mode, and RUN mode. Status LEDs on the front of the CPU indicate the current mode of operation.

- In STOP mode, the CPU handles any communication requests (as appropriate) and performs self-diagnostics. The CPU does not execute the user program. Automatic updates of the process image do not occur. You can download a project to the CPU.
- In STARTUP and RUN modes, the CPU performs the tasks shown in the following figure:

STARTUP

A	Copies the state of the physical inputs to I memory
B	Initializes the Q output (image) memory area with either zero or the last value. Zeroes PN outputs
C	Initializes non-retentive M memory and data blocks to their initial value and enables configured cyclic interrupt and time of day events. Executes the startup OBs.
D	Stores any interrupt events into the queue to be processed after entering RUN mode
E	Enables the writing of Q memory to the physical outputs

RUN

①	Writes Q memory to the physical outputs
②	Copies the state of the physical inputs to I memory
③	Executes the program cycle OBs and updates the output values in the process image output area
④	Performs self-test diagnostics
⑤	Processes interrupts and communications during any part of the scan cycle

You can download some parts of a project in RUN mode (Page 323).

Restart of fail-safe system

The operating modes of the SIMATIC Safety system differ from those of the standard system only in terms of the restart characteristics.

When you switch a fail-safe CPU from STOP to RUN mode, the standard user program restarts in the usual way. When you restart the safety program, the fail-safe system initializes all data blocks with the F-Attribute with values from load memory. This is comparable to a cold restart.

Process image update and process image partitions

The CPU updates local digital and analog I/O points synchronously with the scan cycle using an internal memory area called the process image. The process image contains a snapshot of the physical inputs and outputs (the physical I/O points on the CPU, signal board, and signal modules).

You can configure I/O points to be updated in the process image every scan cycle or when a specific event interrupt occurs. You can also configure an I/O point to be excluded from process image updates. For example, your process might only need certain data values when an event such as a hardware interrupt occurs. By configuring the process image update for these I/O points to be associated with a partition that you assign to a hardware interrupt OB, you avoid having the CPU update data values unnecessarily every scan cycle when your process does not need a continual update.

For controlling whether your process updates I/O points automatically on every scan cycle, or upon the triggering of events, the S7-1200 G2 provides 32 process image partitions. The first process image partition, PIP0, is designated for I/O that is to be automatically updated every scan cycle, and is the default assignment. You can use the remaining partitions, PIP1 through PIP31, for assigning I/O process image updates to various interrupt events. You assign I/O to process image partitions in Device Configuration and you assign process image partitions to interrupt events when you create interrupt OBs (Page 101) or edit OB properties (Page 101).

By default, when you insert a module in the device view, STEP 7 sets its I/O process image update to "Automatic update". For I/O configured for "Automatic update", the CPU handles the data exchange between the module and the process image area automatically during every scan cycle.

To assign digital or analog points to a process image partition, or to exclude I/O points from process image updates, follow these steps:

1. View the Properties tab for the appropriate device in Device configuration.
2. Expand the selections under "General" as necessary to locate the desired I/O points.
3. Select "I/O addresses".
4. Optionally select a specific OB from the "Organization block" drop-down list.
5. From the "Process image" drop-down list, change "Automatic update" to a PIP from PIP1 through PIP31 or None. A selection of "None" means that you can only read from and write to this I/O using immediate instructions. To add the points back to the process image automatic update, change this selection back to "Automatic update".

You can immediately read physical input values and immediately write physical output values when an instruction executes. An immediate read accesses the current state of the physical input and does not update the process image input area, regardless of whether the point is configured to be stored in the process image. An immediate write to the physical output updates both the process image output area (if the point is configured to be stored in the process image) and the physical output point. Append the suffix ":P" to the I/O address if you want the program to immediately access I/O data directly from the physical point instead of using the process image.

NOTE

Use of process image partitions

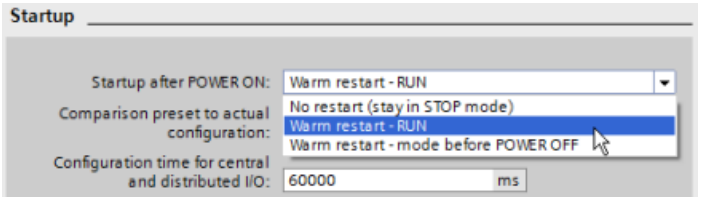
If you assign I/O to one of the process image partitions PIP1 - PIP31, and do not assign an OB to that partition, then the CPU never updates that I/O to or from the process image. Assigning I/O to a PIP that does not have a corresponding OB assignment is the same as assigning the process image to "None".

You can read a physical input directly with an immediate read instruction, or write to the physical output with an immediate write instruction. The CPU does not update the process image.

The CPU supports distributed I/O for PROFINET (Page 209) networks.

5.4.3 Startup configuration and processing

Startup configuration



The CPU supports a warm restart for entering the RUN mode. The CPU initializes all non-retentive system and user data at warm restart, and retains the values of all retentive user data.

Warm restart does not include a memory reset. A memory reset clears all work memory, clears retentive and non-retentive memory areas, copies load memory to work memory, and sets outputs to the configured "Reaction to CPU STOP". A memory reset does not clear the diagnostics buffer or the permanently saved values of the IP address.

You can configure the "startup after POWER ON" setting of the CPU. This configuration item appears under the "Device configuration" for the CPU under "Startup". Upon powering up, the CPU performs a sequence of power-up diagnostic checks and system initialization. During system initialization, the CPU deletes all non-retentive bit (M) memory and resets all non-retentive DB contents to the initial values from load memory. The CPU retains retentive bit (M) memory and retentive DB contents and then enters the appropriate operating mode. Certain detected errors prevent the CPU from entering the RUN mode. The CPU supports the following configuration choices:

- No restart (stay in STOP mode)
- Warm restart - RUN

- Warm restart - mode prior to POWER OFF

NOTICE
Risks associated with repairable faults The CPU can enter STOP mode due to repairable faults, such as the following: – Failure of a replaceable signal module – Temporary faults, such as power line disturbance or erratic power up event Such conditions can result in property damage. If you have configured the CPU to "Warm restart - mode prior to POWER OFF", the CPU goes to the operating mode that the CPU was in prior to the loss of power or fault. If the CPU was in STOP mode at the time of power loss or fault, the CPU goes to STOP mode on power up. The CPU stays in STOP mode until the CPU receives a command to go to RUN mode. If the CPU was in RUN mode at the time of power loss or fault, the CPU goes to RUN mode on the next power up. The CPU goes to RUN mode providing the CPU detects no errors that would inhibit a transition to RUN mode. Configure CPUs that you intend to operate independently of a STEP 7 connection to "Warm restart - RUN". This startup mode sets the CPU to return to RUN mode on the next power cycle.

Startup processing

See Execution of the user program (Page 97) for the processing sequence during startup.

Each startup OB includes startup information that helps you determine the validity of retentive data and the time-of-day clock. You can program instructions inside the startup OBs to examine these startup values and to take appropriate action.

The CPU also performs the following tasks during the startup processing:

- Interrupts are queued but not processed during the startup phase
- No cycle time monitoring is performed during the startup phase
- Configuration changes to HSC (high-speed counter), PTO (pulse train output), and PtP (point-to-point communication) modules can be made in startup
- Actual operation of HSC, PTO, and point-to-point communication modules only occurs in RUN

After the execution of the startup OBs finishes, the CPU goes to RUN mode and processes the control tasks in a continuous scan cycle.

Changing the operating mode

You can use the "STOP" or "RUN" commands (Page 299) from the online tools of the TIA Portal to change the current operating mode. You can also include an STP instruction in your program to change the CPU to STOP mode. Other tools provide a means to change the operating mode as well.

5.4.4 Processing the scan cycle in RUN mode

For each scan cycle, the CPU performs processing as described in Execution of the user program (Page 97).

The CPU handles interrupt events that are enabled according to priority in the order in which they occur. For interrupt events, the CPU reads the inputs, executes the OB, and then writes the outputs, using the associated process image partition (PIP), if applicable.

The system guarantees that the scan cycle will be completed in a time period called the maximum cycle time; otherwise a time error event is generated.

- Each scan cycle begins by retrieving the current values of the digital and analog outputs from the process image and then writing them to the physical outputs of the CPU, SB, and SM modules configured for automatic I/O update (default configuration). When a physical output is accessed by an instruction, both the output process image and the physical output itself are updated.
- The scan cycle continues by reading the current values of the digital and analog inputs from the CPU, SB, and SMs configured for automatic I/O update (default configuration), and then writing these values to the process image. When a physical input is accessed by an instruction, the value of the physical input is accessed by the instruction, but the input process image is not updated.
- After reading the inputs, the user program is executed from the first instruction through the end instruction. This includes all the program cycle OBs plus all their associated FCs and FBs. The program cycle OBs are executed in order according to the OB number with the lowest OB number executing first.

Communications processing occurs periodically throughout the scan, possibly interrupting user program execution (https://support.industry.siemens.com/cs/de/en/view/59193558/158758826123).

Self-diagnostic checks include periodic checks of the system and the I/O module status checks.

Interrupts can occur during any part of the scan cycle, and are event-driven. When an event occurs, the CPU interrupts the scan cycle and calls the OB that was configured to process that event. After the OB finishes processing the event, the CPU resumes execution of the user program at the point of interruption.

5.4.5 Organization blocks (OBs)

Organization blocks (OBs) control the execution of the user program.

The program cycle OB contains your main program. You can include more than one program cycle OB in your user program. During RUN mode, the program cycle OBs execute at the lowest priority level (Page 117) and can be interrupted by all other event types. The CPU executes the program cycle OBs in a continuous cycle known as the "program cycle" or "scan cycle". This cyclic processing is the normal type of processing used for programmable logic controllers. For many applications, the entire user program is located in a single program cycle OB.

Specific events in the CPU trigger the execution of other organization blocks. OBs cannot call each other. The startup OB runs when you start the CPU. It does not interrupt the program cycle OB. The CPU executes the startup OB before going to RUN mode.

Other OBs, called interrupt OBs, run when associated events or errors occur. These OBs interrupt the execution of the program cycle OBs.

An FC or FB cannot call an OB. Only an event such as a diagnostic interrupt or a time delay can start the execution of an OB. The CPU handles OBs according to their respective priority classes (Page 117), with higher priority OBs executing before lower priority OBs.

5.4.5.1 Program cycle OB

Program cycle OBs execute cyclically while the CPU is in RUN mode. The main block of the program is a program cycle OB. This is where you place the instructions that control your program and where you call additional user blocks. You can have multiple program cycle OBs, which the CPU executes in numerical order. Main (OB 1) is the default.

Program cycle events

The program cycle event happens once during each program cycle (or scan). During the program cycle, the CPU writes the outputs, reads the inputs and executes program cycle OBs. The program cycle event is required and is always enabled. You might have no program cycle OBs, or you might have multiple program cycle OBs. After the program cycle event occurs, the CPU executes the lowest numbered program cycle OB (usually "Main" OB 1). The CPU executes the other program cycle OBs sequentially (in numerical order) within the program cycle. Program execution is cyclical such that the program cycle event occurs at the following times:

- When the last startup OB finishes execution
- When the last program cycle OB finishes execution

You can delay the next program cycle after the program cycle OB finishes by configuring a minimum cycle time in the device configuration

Table 1-144 Start information for a program cycle OB

Input	Data type	Description
Initial_Call	Bool	True for initial call of the OB
Remanence	Bool	True if retentive data are available

5.4.5.2 Startup OB

Startup OBs execute one time when the operating mode of the CPU changes from STOP to RUN, including powering up in the RUN mode and in commanded STOP-to-RUN transitions. After completion, the main "Program cycle" begins executing. Refer to "Startup processing" in Startup configuration and processing (Page 99)

The Startup OBs support the following startup data bits:

Table 1-145 Startup locations supported by the startup OB

Input	Data Type	Description
LostRetentive	Bool	This bit is true if the retentive data storage areas have been lost
LostRTC	Bool	This bit is true if the time-of-day clock (real-time clock) has been lost

5.4.5.3 Time delay interrupt OB

Time delay interrupt OBs execute after a time delay that you configure.

Time delay interrupt events

You configure time delay interrupt events to occur after a specified delay time has expired from the beginning of execution of the SRT_DINT instruction. You assign the delay time with the SRT_DINT instruction. The time delay events interrupt the program cycle to execute the corresponding time delay interrupt OB. You can attach only one time delay interrupt OB to a time delay event. The CPU supports 20 time delay events.

Table 1-146 Start information for a time delay interrupt OB

Input	Data type	Description
Sign	Word	Identifier passed to triggering call of SRT_DINT

5.4.5.4 Cyclic interrupt OB

Cyclic interrupt OBs execute at a specified interval. You can configure up to a total of 20 cyclic interrupt events, with one OB corresponding to each cyclic interrupt event.

Cyclic interrupt events

The cyclic interrupt events allow you to configure the execution of an interrupt OB at a configured cycle time. You configure the initial cycle time when you create the cyclic interrupt OB. A cyclic event interrupts the program cycle and executes the corresponding cyclic interrupt OB. Note that the cyclic interrupt event is at a higher priority class than the program cycle event.

You can attach only one cyclic interrupt OB to a cyclic event.

You can assign a phase shift to each cyclic interrupt so that the execution of cyclic interrupts can be offset from one another by the phase offset amount. For example, if you have a 5 ms cyclic event and a 10 ms cyclic event, every ten milliseconds both events occur at the same moment. If you phase shift the 5 ms event by 1 to 4 ms and the 10 ms event by 0 ms, then the two events do not occur at the same moment.

The default phase offset is 0. To change the initial phase shift, or to change the cyclic time for a cyclic event, follow these steps:

1. Right-click the cyclic interrupt OB in the project tree.
2. Select "Properties" from the context menu.
3. Click "Cyclic interrupt" from the "Cyclic interrupt [OB 30]" dialog, and enter the new initial values.

The maximum phase offset is 6000000 microseconds (6 seconds) or the maximum Cyclic time, whichever is smaller.

You can also query and change the cycle time and the phase shift from your program using the Query cyclic interrupt (QRY_CINT) and Set cyclic interrupt (SET_CINT) instructions. Cycle time and phase shift values set by the SET_CINT instruction do not persist through a power cycle or a transition to STOP mode; cycle time and phase shift values return to the initial values following a power cycle or a transition to STOP. The CPU supports a total of 20 cyclic interrupt events.

Table 1-147 Start information for cyclic interrupt OB

Name	Data type	Meaning
Initial_Call	BOOL	=TRUE in the first call of this OB • At the transition from STOP or HOLD to RUN • After reloading
Event_Count	INT	Number of discarded cyclic interrupt events since the last start of this OB

5.4.5.5 Hardware interrupt OB

Hardware interrupt OBs execute when the relevant hardware event occurs. A hardware interrupt OB interrupts normal cyclic program execution in reaction to a signal from a hardware event.

Hardware interrupt events

Changes in the hardware, such as a rising or falling edge on an input point, or an HSC (High Speed Counter) event trigger hardware interrupt events. The S7-1200 G2 supports hardware interrupt OBs to respond to hardware interrupt events.

You enable the hardware events in the device configuration, and assign an OB for an event in the device configuration or with an ATTACH instruction in the STEP 7 program. The CPU supports several hardware interrupt events. The CPU model and the number of input points determine the exact events that are available.

Limits on hardware interrupt events are as follows:

Edges:

- One for each CPU and SB digital input
- Additional hardware interrupt events are possible from distributed I/O depending on the device and submodules that you use.

HSC events:

- CV=PV: maximum of 8
- Direction changed: maximum of 8
- External reset: maximum of 8

Table 1-148 Start information for a hardware interrupt OB

Input	Data type	Description
LADDR	HW_IO	Hardware identifier of the module that triggered the hardware interrupt
USI	WORD	User structure identifier (16#0001 to 16#FFFF), reserved for future use
IChannel	USINT	Number of the channel that triggered the interrupt
EventType	BYTE	Identifier for the module-specific event type associated with the event triggering the interrupt, for example falling edge or rising edge.

Table 1-149 Bits in EventType based on module and process event

Module / Sub-module	Value	Process event
Onboard I/O from CPU, SB, or distributed I/O	16#0	Rising edge
	16#1	Falling edge
HSC	16#0	HSC CV=RV1
	16#1	HSC direction changed
	16#2	HSC reset

5.4.5.6 Time error interrupt OB

If configured, the time error interrupt OB (OB 80) executes when either the scan cycle exceeds the maximum cycle time or a time error event occurs. If triggered, it executes, interrupting normal cyclic program execution or any event OB at priority 21 or lower.

The occurrence of either of these events generates a diagnostics buffer entry describing the event. The diagnostics buffer entry is generated regardless of the existence of the time error interrupt OB.

Time error interrupt events

The occurrence of any of several different time error conditions results in a time error event:

- Scan cycle exceeds maximum cycle time

  The "maximum cycle time exceeded" condition results if the program cycle does not complete within the specified maximum scan cycle time. See the topic Monitoring and configuring the cycle time (Page 120) for more information.
- CPU cannot start requested OB because a second time interrupt (cyclic or time-delay) starts before the CPU finishes execution of the first interrupt OB
- Queue overflow occurred

  The "queue overflow occurred" condition results if the interrupts are occurring faster than the CPU can process them. The CPU limits the number of pending (queued) events by using a different queue for each event type. If an event occurs when the corresponding queue is full, the CPU generates a time error event.

All time error events trigger the execution of the time error interrupt OB if it exists. If the time error interrupt OB does not exist, then the following conditions determine the CPU behavior:

- If a time error interrupt OB has never been downloaded to the CPU, the CPU ignores the first scan timeout condition and remains in RUN mode. If a second scan timeout condition occurs in the same program scan (two times the maximum cycle time value), the CPU generates a diagnostic buffer entry and transitions to STOP mode.
- If the time error interrupt OB has previously been downloaded, but has since been deleted, the CPU transitions to STOP mode if a time error event occurs, because the CPU cannot find the time error OB.

The user program can extend the program cycle execution time up to ten times the configured maximum cycle time by executing the RE_TRIGR instruction to restart the cycle time monitor. However, if two "maximum cycle time exceeded" conditions occur within the same program cycle without resetting the cycle timer, then the CPU transitions to STOP, regardless of whether the time error interrupt OB exists. See the topic Monitoring and configuring the cycle time (Page 120).

Time error interrupt OB includes start information that helps you determine which event and OB generated the time error. You can program instructions inside the OB to examine these start values and to take appropriate action.

Table 1-150 Start information for the time error OB (OB 80)

Input	Data type	Description
Fault_ID	BYTE	16#01: Cycle time exceeded 16#02: The requested OB is still being processed. 16#05: Expired time interrupt due to time jump 16#06: Expired time interrupt upon re-entry into RUN after HOLD 16#07: Overflow of the OB request buffer for the current priority class 16#08: Isochronous mode interrupt - time error 16#09: Interrupt loss due to high interrupt load 16#0B: Technology synchronization interrupt - time error 16#0C: (only for S7-1500 R/H CPUs) cycle time exceeded for the second time
Csg_OBnr	OB_ANY	Number of the OB which was being executed when the error occurred
Csg_Prio	UINT	Priority of the OB causing the error

See topic Organization blocks (OBs) (Page 101) for instructions on adding OBs to your project.

5.4.5.7 Diagnostic error interrupt OB

The diagnostic error interrupt OB executes when the CPU detects a diagnostic error, or if a diagnostics-capable module recognizes an error and you have enabled the diagnostic error interrupt for the module. The diagnostic error interrupt OB interrupts the normal cyclic program execution. You can include an STP instruction in the diagnostic error interrupt OB to put the CPU in STOP mode if you desire your CPU to enter STOP mode upon receiving this type of error.

If you do not include a diagnostic error interrupt OB in your program, the CPU ignores the error and stays in RUN mode.

Diagnostic error events

PROFINET, local analog, and some local digital devices are capable of detecting and reporting diagnostic errors. The occurrence or removal of any of several different diagnostic error conditions results in a diagnostic error event. Standard CPUs and modules can generate the following diagnostic errors:

- No user power
- High limit exceeded
- Low limit exceeded
- Wire break
- Short circuit

Distributed devices can generate additional diagnostic errors.

Diagnostic error events trigger the execution of the diagnostic error interrupt OB (OB 82) if it exists. If it does not exist, then the CPU ignores the error.

See topic Organization blocks (OBs) (Page 101) for instructions on adding an OB to your project.

NOTE

Diagnostic errors for multi-channel local analog devices

The diagnostic error interrupt OB can process only one channel's diagnostic error at a time. If two channels of a multi-channel device have an error, then the second error only triggers the diagnostic error interrupt OB under the following conditions: the first channel error clears, the execution of the diagnostic error interrupt OB that the first error triggered is complete, and the second error still exists.

The diagnostic error interrupt OB includes startup information that helps you determine whether the event is due to the occurrence or removal of an error, and the device and channel which reported the error. You can program instructions inside the diagnostic error interrupt OB to examine these startup values and to take appropriate action.

NOTE

If the outgoing event leaves the submodule with no pending diagnostics, the Diagnostic error OB start information references the submodule as a whole (16#8000), even if the source of the event was a specific channel.

Table 1-151 Startup information for the diagnostic error interrupt OB

Input	Data type	Description
IOstate	WORD	IO state of the device: • Bit 0 = 1 if the configuration is correct, and = 0 if the configuration is no longer correct. • Bit 4 = 1 if an error is present (such as a wire break). (Bit 4 = 0 if there is no error.) • Bit 5 = 1 if the configuration is **not** correct, and = 0 if the configuration is correct again. • Bit 7 = 1 if an I/O access error has occurred. Refer to LADDR for the hardware identifier of the I/O with the access error. (Bit 6 = 0 if there is no error.) Status of the hardware object: • Bit 0: Good • Bit 1: Deactivated • Bit 2: Maintenance required • Bit 3: Maintenance demanded • Bit 4: Error • Bit 5: Not available • Bit 6: Qualified • Bit 7: Not available • Bits 8 to 14: Reserved (always "0") • Bit 15: Network / hardware fault If bit 4 = 1 or bit 5 = 1: – Bit 15 = 0: Network error – Bit 15 = 1: Hardware error

[1] The LADDR input contains the hardware identifier of the device or functional unit which returned the error. The hardware identifier is assigned automatically when components are inserted in the device or network view and appears in the System constants tab of PLC tags. A name is also assigned automatically for the hardware identifier. These entries in the System constants tab of the PLC tags cannot be changed.

Input	Data type	Description
LADDR	HW_ANY	Hardware identifier of the device or functional unit that reported the error[1]
Channel	UINT	Channel number
MultiError	BOOL	TRUE if more than one error is present

[1] The LADDR input contains the hardware identifier of the device or functional unit which returned the error. The hardware identifier is assigned automatically when components are inserted in the device or network view and appears in the System constants tab of PLC tags. A name is also assigned automatically for the hardware identifier. These entries in the System constants tab of the PLC tags cannot be changed.

5.4.5.8 Pull or plug of modules OB

The "Pull or plug of modules" OB executes when a configured and non-disabled distributed I/O module or submodule generates an event related to inserting or removing a module.

Pull or plug of modules event

The following conditions generate a pull or plug of modules event:

- Someone removes or inserts a configured module
- A configured module is not physically present in an expansion rack
- An incompatible module is in an expansion rack that does not correspond to the configured module
- A compatible module for a configured module is in an expansion rack, but the configuration does not allow substitutes
- A module or submodule has parameterization errors

If you have not programmed this OB, the CPU remains in RUN mode when any of these conditions occur with a configured and non-disabled distributed I/O module.

Regardless of whether you have programmed this OB, the CPU changes to STOP mode when any of these conditions occur with a module in the local rack.

Table 1-152 Start information for pull or plug of modules OB

Input	Data type	Description
LADDR	HW_IO	Hardware identifier
Event_Class	Byte	16#38: module inserted 16#39: module removed
Fault_ID	Byte	Fault identifier For event class 16#38: • 54: Submodule inserted, which conforms to the parameterized submodule • 55: Submodule inserted, which does not conform to the submodule parameter assignment • 56: Submodule inserted, but error in module parameter assignment • 57: Submodule inserted, but with a fault or maintenance issue • 58: Submodule access error remedied For event class 16#39 • 51: Module removed • 54: Submodule removed

5.4.5.9 Rack or station failure OB

The "Rack or station failure" OB executes when the CPU detects the failure or communication loss of a distributed rack or station.

Rack or station failure event

The CPU generates a rack or station failure event when it detects one of the following:

- The failure of a DP master system or of a PROFINET IO system (in the case of either an incoming or an outgoing event).
- The failure of a DP slave or of an IO device (in the case of either an incoming or an outgoing event)
- Failure of some of the submodules of a PROFINET I-device

If you have not programmed this OB, the CPU remains in RUN mode when any of these conditions occur.

Table 1-153 Start information for rack or station failure OB

Input	Data type	Description
LADDR	HW_Device	Hardware identifier
Event_Class	Byte	16#38: outgoing event 16#39: incoming event
Fault_ID	Byte	Fault identifier (possible values: 16#C3, 16#C4, 16#C9, 16#CA, 16#CB, 16#CC, 16#CD, 16#CE, 16#CF, 16#F8, 16#F9)

The following table shows which event caused the start of OB 86.

ev_class 16# ...	fault_id 16# ...	Meaning
39	C3	Failure of a DP master system
39/38	C4	Failure/return of a DP slave
39	CA	Failure of a PROFINET IO system
39/38	CB	Failure/return of a PROFINET IO device
38	CC	Return of a PROFINET IO device with fault or maintenance
38	CD	Return of a PROFINET IO device, deviation between preset/actual configuration
38	CE	Return of a PROFINET IO device, error in module configuration
39/38	F8	Failure/return of some of the submodules of a PROFINET I-device
38	F9	Return of some of the submodules of a PROFINET I-device with a device configuration difference

5.4.5.10 Time of day OB

Time of day OBs execute based on configured clock time conditions. The CPU supports up to 20 time of day OBs.

Time of day events

You can configure a time of day interrupt event to occur once on a specified date or time or cyclically with one of the following cycles:

- Every minute: The interrupt occurs every minute.
- Hourly: The interrupt occurs every hour.
- Daily: The interrupt occurs every day at a specified time (hour and minute).
- Weekly: The interrupt occurs every week at a specified time on a specified day of the week (for example, every Tuesday at 4:30 in the afternoon).
- Monthly: The interrupt occurs every month at a specified time on a specified day of the month. The day number must be between 1 and 28, inclusive.
- Every end of month: The interrupt occurs on the last day of every month at a specified time.
- Yearly: The interrupt occurs every year on the specified date (month and day). You cannot specify a date of February 29.

Table 1-154 Start information for a time of day event OB

Input	Data type	Description
CaughtUp	Bool	OB call is caught up because time was set forward
SecondTime	Bool	OB call is started a second time because time was set backward

5.4.5.11 Synchronous cycle OB

IRT (Isochronous Realtime) is a transmission method that can synchronize PROFINET devices with very high accuracy. You can operate I/O modules in distributed PROFINET I/O systems isochronously, for example, ET 200SP and ET 200MP distributed I/O systems. Both the I/O modules and the interface modules of the I/O systems must support isochronous mode.

The Synchronous cycle interrupt OB uses an isochronous mode interrupt to trigger the start of subprograms isochronously to the PROFINET send clock.

Refer to Cycle time and communication load (Page 122) for considerations of how higher priority OBs affect the main scan cycle.

Table 1-155 Start information for Synchronous cycle OB

Input	Data type	Meaning
Initial_Call	BOOL	TRUE = the first call of this OB during transition from STOP to RUN
PIP_Input	BOOL	Always FALSE. The program must call the SYNC_PI instruction to update the corresponding process image partition of the inputs.
PIP_Output	BOOL	Always FALSE. The program must call the SYNC_PO instruction to update the corresponding process image partition.

Input	Data type	Meaning
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	• = n: Number of lost cycles • = -1: An unknown number of cycles has been lost (for example, because cycle has changed)
SyncCycleTime	LTIME	Configured cycle time of the Synchronous cycle OB

5.4.5.12 Status OB

Status OBs execute if a PNIO slave triggers a status interrupt. This might be the case if a component (module or rack) of a PNIO slave changes its operating mode, for example from RUN to STOP.

Status events

For detailed information on events that trigger a status interrupt, refer to the manufacturer's documentation for the PNIO device.

Table 1-156 Start information for status OB

Input	Data type	Description
LADDR	HW_IO	Hardware identifier
Slot	UInt	Slot number
Specifier	Word	Alarm specifier

5.4.5.13 Update OB

Update OBs execute if a PNIO slave triggers an update interrupt.

Update events

For detailed information on events that trigger an update interrupt, refer to the manufacturer's documentation for the PNIO slave.

Table 1-157 Start information for update OB

Input	Data type	Description
LADDR	HW_IO	Hardware identifier
Slot	UInt	Slot number
Specifier	Word	Alarm specifier

5.4.5.14 Profile OB

Profile OBs execute if a DPV1 or PNIO slave triggers a profile-specific interrupt.

Profile events

For detailed information on events that trigger a profile interrupt, refer to the manufacturer's documentation for the DPV1 or PNIO slave.

Table 1-158 Start information for profile OB

Input	Data type	Description
LADDR	HW_IO	Hardware identifier
Slot	UInt	Slot number
Specifier	Word	Alarm specifier

5.4.5.15 MC-Servo and MC-Interpolator OB

STEP 7 creates the read-only MC-Servo and MC-Interpolator OBs automatically when you create a motion technology object and set the drive interface to be "Analog drive connection" or "PROFIDrive". You do not need to edit any OB properties or create this OB directly. The CPU uses these OBs for closed loop control. Refer to the STEP 7 Information System for further details.

The MC Servo OB uses a system-defined PIP with the name "PIP OB Servo".

Table 1-159 Start information for MC-Servo OB

Input	Data type	Description
Initial_Call	BOOL	TRUE indicates first call of this OB on transition from STOP to RUN
PIP_Input	BOOL	TRUE indicates the associated process image input is up to date.
PIP_Output	BOOL	TRUE indicates that the CPU transferred the associated process image output to the outputs in good time after the last cycle.
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	n: number of lost cycles -1: unknown number of cycles lost (for example, because cycle has changed)
Synchronous	BOOL	TRUE: The MC-Servo [OB91] is called synchronously with a bus system

Table 1-160 Start information for MC-Interpolator OB

Input	Data type	Description
Initial_Call	BOOL	TRUE indicates first call of this OB on transition from STOP to RUN
PIP_Input	BOOL	TRUE indicates the associated process image input is up to date.
PIP_Output	BOOL	TRUE indicates that the CPU transferred the associated process image output to the outputs in good time after the last cycle.
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	n: number of lost cycles -1: unknown number of cycles lost (for example, because cycle has changed)
Reduction	UInt	Reduction ratio of MC-Interpolator [OB92] to MC-Servo [OB91]

5.4.5.16 MC-PreInterpolator

The organization block MC_PreInterpolator [OB68] can be programmed and is called in the application cycle configured at the MC_Servo (Page 112). The MC_PreInterpolator is called directly before the MC_Interpolator .

Via the organization block, you can read out the configured application cycle.

Structure of the start information

Optimized start information:

Name	Data type	Meaning	
Initial_Call	BOOL	TRUE	In the first call of this OB after the CPU is switched on
PIP_Input	BOOL	TRUE	The associated process image input is up-to-date.
PIP_Output	BOOL	TRUE	The associated process image output was transferred to the outputs in time after the last cycle.
IO_System	USINT	Number of the distributed I/O system triggering the interrupt	
Event_Count	INT	n	Number of lost cycles
		-1	An unknown number of cycles has been lost, e.g. because the cycle has changed.
Reduction	UINT	Reduction ratio of MC_Interpolator to MC_Servo	
CycleTime	UDINT	Display of the application cycle configured for the MC_Interpolator in ns	

5.4.5.17 MC-PreServo

You can program the MC-PreServo OB to contain program logic for the STEP 7 program to execute directly before the MC-Servo OB executes.

MC-PreServo events

The MC-PreServo OB allows you to read out the configured application cycle information in microseconds.

Table 1-161 Start information for MC-PreServo OB

Input	Data type	Description
Initial_Call	BOOL	TRUE indicates first call of this OB on transition from STOP to RUN
PIP_Input	BOOL	TRUE indicates the associated process image input is up to date.
PIP_Output	BOOL	TRUE indicates that the CPU transferred the associated process image output to the outputs in good time after the last cycle.
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	n: number of lost cycles -1: unknown number of cycles lost (for example, because cycle has changed)
Synchronous	BOOL	Reserved
CycleTime	UDINT	Display of the application cycle configured for the MC-Servo OB in microseconds

5.4.5.18 MC-PostServo

You can program the MC-PostServo OB to contain program logic for the STEP 7 program to execute directly after the MC-Servo OB executes.

MC-PostServo events

The MC-PostServo OB allows you to read out the configured application cycle information in microseconds.

Table 1-162 Start information for MC-PostServo OB

Input	Data type	Description
Initial_Call	BOOL	TRUE indicates first call of this OB on transition from STOP to RUN
PIP_Input	BOOL	TRUE indicates the associated process image input is up to date.
PIP_Output	BOOL	TRUE indicates that the CPU transferred the associated process image output to the outputs in good time after the last cycle.
IO_System	USINT	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	n: number of lost cycles -1: unknown number of cycles lost (for example, because cycle has changed)
Synchronous	BOOL	Reserved
CycleTime	UDINT	Display of the application cycle configured for the MC-Servo OB in microseconds

5.4.5.19 MC-LookAhead

STEP 7 creates the read-only MC_LookAhead OB automatically when you create a kinematics technology object. MC_LookAhead calculates the motion preparation of the kinematics technology object.

STEP 7 creates only one MC_LookAhead OB for all kinematics.

MC_LookAhead prepares the jobs of the job sequence in advance. In this way, less time is required for motion preparation in the MC_Interpolator organization block (Page 112) and you can set a shorter application cycle of the MC_Servo organization block (Page 112).

Downloading in RUN mode (Page 323) increases the CPU time required to prepare the motion jobs in the job sequence.

Block call and priority

MC_LookAhead is triggered by MC_Interpolator.

You configure the priority of the MC_LookAhead in the properties of the organization block under "General > Attributes > Priority". You can set values from 15 to 16 (default setting 15) for the priority. The priority of MC_LookAhead must be lower than the priority of MC_Interpolator.

Process response

Overflows can occur in the program scan cycle. Note the following response to overflows:

- The CPU tolerates a maximum of three consecutive MC_Interpolator overflows.
- The execution of an MC_Interpolator can only be interrupted by an MC_Servo call.

If more overflows or interruptions occur, the CPU transitions to STOP mode.

5.4.5.20 Programming error OB

The programming error OB executes if a programming error occurs during the processing of an instruction of the STEP 7 program. The programming error OB is processed according to its priority (Page 117).

You can handle programming errors locally using the GET_ERROR or GET_ERR_ID instructions within a program block. Otherwise, the CPU performs global error handling.

With global error handling, a programming error event triggers the execution of the programming error OB, if it exists, and the CPU stays in RUN mode. If the STEP 7 program does not include the programming error OB, the CPU goes to STOP mode when a programming error occurs.

Table 1-163 Start information for the programming error OB

Name	Data type	Meaning
BlockNr	UINT	Number of the block in which the programming error occurred
Reaction	USINT	• 0: Ignore errors • 1: Replace incorrect value • 2: Skip command • 3: Programmed error handling, triggered by an array access with invalid index, for example, or by an error during parameter supply of an FC or FB
Fault_ID	BYTE	Error code (possible values: B#16#00, B#16#03, B#16#04, B#16#05, B#16#20, B#16#21, B#16#22, B#16#23, B#16#24, B#16#25, B#16#26, B#16#27, B#16#28, B#16#29, B#16#2C, B#16#30, B#16#31, B#16#32, B#16#33, B#16#34, B#16#35, B#16#38, B#16#39, B#16#3A, B#16#3B, B#16#3C, B#16#3D, B#16#3E, B#16#3F, B#16#50, B#16#51, B#16#75, B#16#76, B#16#A1, B#16#A2)
BlockType	USINT	Type of block in which the error occurred: • OB: 1 • FC: 2 • FB: 3 • SFC: 4 • SFB: 5 • DB: 6
Area	USINT	Area in which the incorrect access occurred: • Local data: B#16#40 to 4E, 86, 87, 8E, 8F, C0 to CE • Process image input: B#16#01 • Process image output: B#16#02 • Technology DB: B#16#04 • I: B#16#81 • Q: B#16#82 • M: B#16#83 • DB: B#16#84, 85, 8A, 8B
DBNr	DB_ANY	DB no. if AREA = DB or DI
Csg_OBNr	OB_ANY	OB number
Csg_Prio	USINT	OB priority

Name	Data type	Meaning
Width	USINT	Type of access during which the error occurred: • Bit: – B#16#00 for access to the standard memory area – B#16#01 for access to the optimized memory area • Byte: B#16#01 • Word: B#16#02 • DWord: B#16#03 • LWord: B#16#04

5.4.5.21 I/O access error OB

I/O access error OBs execute when the CPU executes an instruction that references I/O that does not exist.

You can handle I/O access errors locally using the GET_ERROR or GET_ERR_ID instructions within a program block. Otherwise, the CPU performs global error handling. With global error handling, an I/O access error event triggers the execution of the I/O access error OB, if it exists.

Table 1-164 Start information for the I/O access error OB

Name	Data type	Meaning
BlockNr	UINT	Number of the block in which the I/O access error occurred
Reaction	USINT	0: Ignore error, 1: Replace incorrect value, 2: Skip command
Fault_ID	BYTE	Error code: • B#16#42: I/O access error, reading • B#16#43: I/O access error, writing
BlockType	USINT	Type of block in which the error has occurred: • OB: 1 • FC: 2 • FB: 3 • SFC: 4 • SFB: 5 • DB: 6
Area	USINT	Identifier for the range in which the incorrect access occurred: • B#16#01: Direct access to input • B#16#02: Direct access to output • B#16#81: Access to process image input • B#16#82: Access to process image output
DBNr	DB_ANY	not user-relevant
Csg_OBNr	OB_ANY	OB number causing the I/O access error
Csg_Prio	USINT	OB priority that causes the I/O access error
Width	USINT	Type of access during which the error occurred: • Bit: B#16#00 • Byte: B#16#01 • Word: B#16#02 • DWord: B#16#03 • LWord: B#16#04

5.4.5.22 Event execution priorities and queuing

Events control CPU processing. An event triggers an interrupt OB to be executed. You can specify the interrupt OB for an event during the creation of the block, during the device configuration, or with an ATTACH or DETACH instruction. Some events happen on a regular basis like the program cycle or cyclic events. Other events happen only a single time, like the startup event and time delay events. Some events happen when the hardware triggers an event, such as an edge event on an input point or a high speed counter event. Events like the diagnostic error and time error event only happen when an error occurs. The event priorities and queues are used to determine the processing order for the event interrupt OBs.

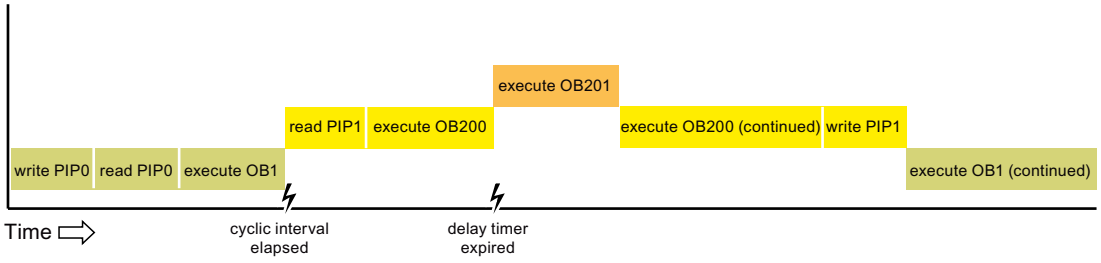
The CPU processes events in order of priority where 1 is the lowest priority and 26 is the highest priority. You can assign a priority class to an OB in the attributes of the OB properties.

Interruptible OBs

OBs (Page 101) execute in priority order of the events that trigger them.

If an OB is executing and a higher priority event occurs before the OB completes its execution, the running OB is interrupted to allow the higher-priority event OB to run. The higher-priority event runs, and at its completion, the OB that was interrupted continues. When multiple events occur while an interruptible OB is executing, the CPU processes those events in priority order.

Consider the case where interrupt events trigger a cyclic OB and a time delay OB. In this example, the time delay OB (OB 201) has no process image partition assignment (Page 97) and executes at priority 4. The cyclic OB (OB 200) has a process image partition assignment of PIP1 and executes at priority 2. The following illustration shows interruptible OB execution mode:



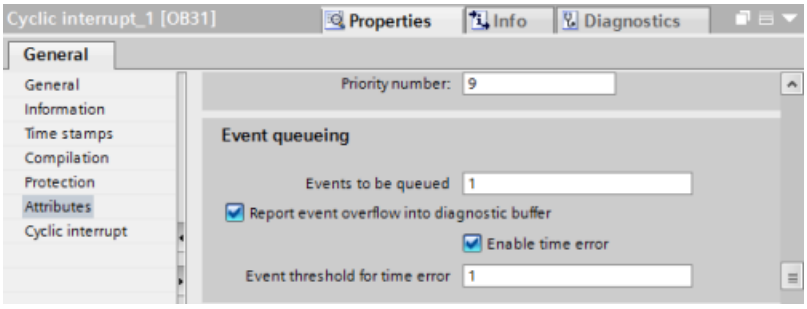


Figure 1-43 Interruptible OB execution

Understanding event execution priorities and queuing

The CPU limits the number of pending (queued) events from a single source, using a different queue for each event type. Upon reaching the limit of pending events for a given event type, the next event is lost. You can use a time error interrupt OB (Page 105) to respond to queue overflows.

Note that STEP 7 allows you to configure some specific event queueing parameters for the Cyclic interrupt OB and the Time of day OB.

For further information on CPU overload behavior and event queueing, refer to the "CPU overload behavior (https://docs.tia.siemens.cloud/access?ft:originId=./39470090251/39481356555_enUS.htm&ft:clusterId./39470090251/39481356555.htm)" topic. The TIA Portal Information System does not have a specific S7-1200 G2 topic on overload behavior and event queueing.

Each CPU event has an associated priority. In general, the CPU services events in order of priority (highest priority first). The CPU services events of the same priority on a "first-come, first-served" basis.

Table 1-165 OB events

Event	Quantity allowed	Default OB priority
Program cycle	1 program cycle event[1] Multiple OBs allowed	1
Startup	1 startup event [1] Multiple OBs allowed	1
Time delay	Up to 20 time events 1 OB per event	OB 20: 3 OB 21: 4 OB 22: 5 OB 23: 6 OB 123 to OB 32767: 3
Cyclic interrupt	Up to 20 events 1 OB per event	8 to 17
Hardware interrupt	Up to 50 hardware interrupt events[2] 1 OB per event, but you can use the same OB for multiple events	16
Time error	1 event (only if configured)[3]	22

1 The startup event and the program cycle event never occur at the same time because the startup event runs to completion before the program cycle event starts.

2 You can have more than 50 hardware interrupt event OBs if you use the DETACH and ATTACH instructions.

3 You can configure the CPU to stay in RUN if the scan cycle exceeds the maximum scan cycle time or you can use the RE_TRIGR instruction to reset the cycle time. However, the CPU goes to STOP mode the second time that one scan cycle exceeds the maximum scan cycle time.

4 Programming errors enable the program block to handle errors with GET_ERROR and GET_ERROR_ID within a program block. In the absence of these instructions, the CPU uses global error handling.

5 The CPU logs the first direct I/O read/write error in the diagnostics buffer and stays in RUN mode. You can access the error cause using the GET_ERROR_ID instruction.

Event	Quantity allowed	Default OB priority
Diagnostic error	1 event (only if configured)	5
Pull or plug of modules	1 event	6
Rack or station failure	1 event	6
Synchronous cycle	1 event	21
Time of day	Up to 20 events	2
Status	1 event	4
Update	1 event	4
Profile	1 event	4
MC-Servo	1 event	25
MC-Interpolator	1 event	24
MC-PreServo	1 event	Same priority as MC-Servo
MC-PostServo	1 event	Same priority as MC-Servo
MC-PreInterpolator	1 event	Same priority as MC-Interpolator
MC-Lookahead	1 event	15
Programming error[4]	1 event	7
I/O access error[5]	1 event	7

1 The startup event and the program cycle event never occur at the same time because the startup event runs to completion before the program cycle event starts.

2 You can have more than 50 hardware interrupt event OBs if you use the DETACH and ATTACH instructions.

3 You can configure the CPU to stay in RUN if the scan cycle exceeds the maximum scan cycle time or you can use the RE_TRIGR instruction to reset the cycle time. However, the CPU goes to STOP mode the second time that one scan cycle exceeds the maximum scan cycle time.

4 Programming errors enable the program block to handle errors with GET_ERROR and GET_ERROR_ID within a program block. In the absence of these instructions, the CPU uses global error handling.

5 The CPU logs the first direct I/O read/write error in the diagnostics buffer and stays in RUN mode. You can access the error cause using the GET_ERROR_ID instruction.

In addition, the CPU recognizes other events that do not have associated OBs. The following table describes these events and the corresponding CPU actions:

Table 1-166 Additional events

Event	Description	CPU action
Max cycle time error	CPU exceeds the configured cycle time twice	The CPU logs the error in the diagnostics buffer and transitions to STOP mode.
Peripheral access error	I/O error during process image update	The CPU logs the first occurrence in the diagnostics buffer and stays in RUN mode.

Interrupt latency

The interrupt event latency (the time from notification of the CPU that an event has occurred until the CPU begins execution of the first instruction in the OB that services the event) is approximately 200 µsec, provided that a program cycle OB is the only event service routine active at the time of the interrupt event.

5.4.6 Monitoring and configuring the cycle time

The cycle time is the time that the CPU operating system requires to execute the cyclic phase of the RUN mode. The CPU provides two methods of monitoring the cycle time:

- Maximum scan cycle time
- Minimum scan cycle time

Scan cycle monitoring begins after the startup event is complete. Configuration for this feature appears under the "Device Configuration" for the CPU under "Cycle".

The CPU monitors the scan cycle. If the scan cycle time exceeds the configured maximum scan cycle time, the CPU generates an error and responds as follows:

- If the user program includes a time error interrupt OB (Page 105), then the CPU executes it.
- If the user program does not include a time error interrupt OB, then the time error event generates a diagnostic buffer entry. The CPU behavior is determined by the following:
  - If a time error interrupt OB has never been downloaded to the CPU, the CPU ignores the first scan timeout condition and remains in RUN mode. If a second scan timeout condition occurs in the same program scan (two times the maximum cycle time value), the CPU generates a diagnostic buffer entry and transitions to STOP mode.
  - If the time error interrupt OB has previously been downloaded, but has since been deleted, the CPU transitions to STOP mode if a time error event occurs, because the CPU cannot find the time error OB.

The RE_TRIGR instruction (re-trigger cycle time monitoring) allows you to reset the timer that measures the cycle time. If the elapsed time for the current program cycle execution is less than ten times the configured maximum scan cycle time, the RE_TRIGR instruction retriggers the cycle time monitoring and returns with ENO = TRUE. If not, the RE_TRIGR instruction does not retrigger the cycle time monitoring. It returns ENO = FALSE.

Typically, the scan cycle executes as fast as it can and the next scan cycle begins as soon as it completes. Depending upon the user program and communication tasks, the time period for a scan cycle can vary from scan to scan. To eliminate this variation, the CPU supports an optional minimum scan cycle time. By default, the minimum scan cycle time is enabled and is 1ms. When enabled, the CPU delays after the execution of the program cycle OBs until the minimum scan cycle time elapses before repeating the program cycle.

In the event that the CPU completes the normal scan cycle in less time than the specified minimum cycle time, the CPU spends the additional time of the scan cycle performing runtime diagnostics and/or processing communication requests (Page 122).

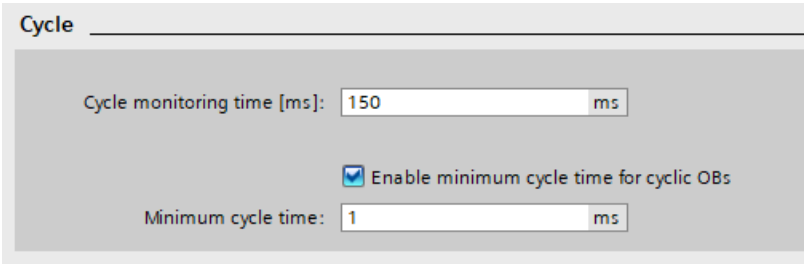
In the event that the CPU does not complete the scan cycle in the specified minimum cycle time, the CPU completes the scan normally (including communication processing) and does not create any system reaction as a result of exceeding the minimum scan time. The following table defines the ranges and defaults for the cycle time monitoring functions:

Table 1-167 Range for the cycle time

Cycle time	Range (ms)	Default
Maximum scan cycle time[1]	1 to 6000	150 ms
Minimum scan cycle time[2]	1 to maximum scan cycle time	1 ms

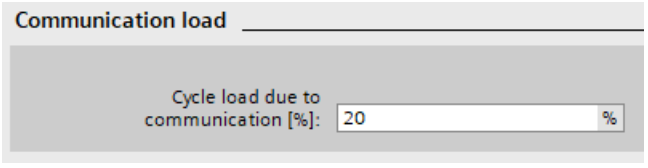
1 The maximum scan cycle time is always enabled. Configure a cycle time between 1 ms to 6000 ms. The default is 150 ms.

2 The minimum scan cycle time is 1 ms by default. If required, configure a cycle time between 1 ms and the maximum scan cycle time.



NOTE

To run as fast as possible, deselect "Enable minimum cycle time for cyclic OBs" under "Cycle > Cycle monitoring time [ms]" in Device configuration.



5.4.7 Cycle time and communication load

You use the CPU properties in the Device configuration to configure the following parameters:

- Cycle: You can enter a maximum scan cycle monitoring time. You can also enable and enter a minimum scan cycle time.

- Communication load: You can configure a percentage of the time to be dedicated for communication tasks.

NOTE

Communication impact on scan cycle

Using OBs with a higher priority than the main scan cycle can cause a performance strain on the execution cycle of the CPU. To mitigate this issue, reduce the Communication load setting. more information about cycle and response times, see SIMATIC S7-1500, S7-1500R/H, ET 200SP, ET 200pro Cycle and response times (https://support.industry.siemens.com/cs/us/en/view/59193558/158758826123).

NOTE

Communication priority

Communication tasks have a priority of 15. CPU events with a priority of 16 or higher can interrupt communication processing. Interrupts from other events can negatively affect communication processing during the scan cycle. You can adjust the "Cycle load due to communication" percentage to increase the portion of the scan cycle dedicated to communication processing.

For more information about the scan cycle, see Execution of the user program (Page 97)

5.4.8 CPU memory

5.4.8.1 Memory management

The CPU provides the following memory areas to store the user program, data, and configuration:

- Load memory is non-volatile storage for the user program, data and configuration. When you download a project to the CPU, the CPU first stores the program in the Load memory area. This area is located either in a SIMATIC memory card (if present) or in the CPU. The CPU maintains this non-volatile memory area through a power loss. The memory card supports a larger storage space than that built-in to the CPU.
- Work memory is volatile storage for some elements of the user project while executing the user program. The CPU copies some elements of the project from load memory into work memory. This volatile area is lost when power is removed and is restored by the CPU when power is restored. Work memory consists of two types:
  - Code work memory
  - Data work memory
- Retentive memory is non-volatile storage for a limited quantity of work memory values. The CPU uses the retentive memory area to store the values of selected user memory locations during power loss. When a power down or power loss occurs, the CPU restores these retentive values upon power up.

The size of the user program, data, and configuration is limited by the available load memory and work memory in the CPU.

To display the memory usage for a compiled program block, right-click the block in the "Program blocks" folder in the STEP 7 project tree and select "Properties" from the context menu. The Compilation properties display the load memory and work memory for the compiled block.

To display the memory usage for the online CPU, double-click "Online & diagnostics" in STEP 7, expand "Diagnostics", and select "Memory".

Representation of load memory

Load memory as represented in the Project info window includes the program blocks, technology objects, data types, and PLC tags.

Load memory as represented in Online & diagnostics includes additional objects that correspond to the project, such as project languages, certificates, and other configuration data.

Retentive memory

You can avoid data loss after power failure by marking certain data as retentive. The CPU allows you to configure the following data as retentive:

- Bit memory (M): You can define the size of retentive memory for bit memory in the PLC tag table or in the assignment list. Retentive bit memory always starts at MB0 and runs consecutively up through a specified number of bytes. Specify this value from the PLC tag table or in the assignment list by clicking the "Retain" toolbar icon. Enter the number of M bytes to retain starting at MB0.

Note: You can display an assignment list for bit memory (M) by selecting the CPU in the project tree and selecting the **Tools > Assignment list** menu command.

- Tags of a function block (FB): If an FB is of type "Optimized block access", then the interface editor for this FB includes a "Retain" column. In this column, you can select either "Retain", "Non-retain", or "Set in IDB" individually for each tag. When you place such an FB in the program, the instance DB that corresponds to the FB includes this "Retain" column as well. You can only change the retentive state of a tag from within the instance DB interface editor if you selected "Set in IDB" (Set in instance data block) in the Retain selection for the tag in the optimized FB.

  If an FB is **not** of type "Optimized block access", then the interface editor for this FB does not include a "Retain" column. When you place such an FB in the program, the instance DB that corresponds to the FB does, however, include a "Retain" column that is available for edit. In this case, selecting the "Retain" option for any tag results in the selection of **all** tags. Similarly, deselecting the option for any tag results in the deselection of **all** tags.

  To view or modify whether an FB is optimized, open the properties of the FB and select the attributes.
- Tags of a global data block: If you select "Optimized block access" for the attributes in the properties of the data block, you can set each tag to be retentive or not. If you do not select "Optimized block access", then all of the data block tags have the same state. The tags are either all retentive or all non-retentive.

The technical specifications for the CPUs state the retentive data allocation. The STEP 7 project version can alter the amount of retentive memory. From the PLC tag table in STEP 7 or the assignment list, click the "Retain" toolbar icon to see how much memory is available.

5.4.8.2 Notes about retentive memory

NOTE

Downloading a program does not clear or make any changes to existing values in retentive memory. If you want to clear retentive memory before a download, then reset your CPU to factory settings prior to downloading the program.

NOTE

When power failure occurs, the CPU switches off power to all expansion modules and expansion boards. This ensures that the CPU has sufficient power to save retentive data to non-volatile memory.

5.4.8.3 System and clock memory

Use the CPU properties to enable bytes for "system memory" and "clock memory". Your program logic can reference the individual bits of these functions by their tag names.

The CPU initializes these bytes on the transition from STOP mode to STARTUP mode. The bits of the clock memory change synchronously to the CPU clock throughout the STARTUP and RUN modes.

⚠ WARNING

Risks with overwriting the system memory or clock memory bits

Overwriting the system memory or clock memory bits can corrupt the data in these functions and cause your user program to operate incorrectly. Because both the clock memory and system memory are unreserved in M memory, instructions or communications can write to these locations and corrupt the data.

Avoid writing data to these locations to ensure the proper operation of these functions, and always implement an emergency stop circuit for your process or machine.

Incorrect program operation can cause damage to equipment, severe injury, or death.

System memory

You can assign one byte in M memory for system memory. The byte of system memory provides the following four bits that can be referenced by your user program by the following tag names:

- First cycle: (Tag name "FirstScan") bit is set to1 for the duration of the first scan after the startup OB finishes. (After the execution of the first scan, the "first scan" bit is set to 0.)
- Diagnostics status changed: (Tag name: "DiagStatusUpdate") is set to 1 for one scan after the CPU logs a diagnostic event. Because the CPU does not set the "DiagStatusUpdate" bit until the end of the first execution of the program cycle OBs, your user program cannot detect if there has been a diagnostic change either during the execution of the startup OBs or the first execution of the program cycle OBs.
- Always 1 (high): (Tag name "AlwaysTRUE") bit is always set to 1.
- Always 0 (low): (Tag name "AlwaysFALSE") bit is always set to 0.

System memory bits have specific meanings, as shown in the table below:

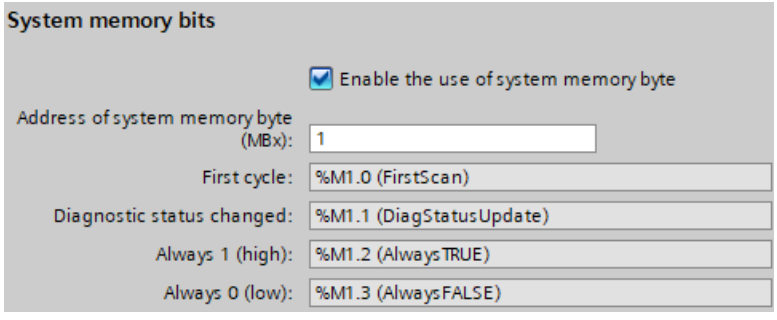


Table 1-168 System memory

7	6	5	4	3	2	1	0
Reserved Value 0				Always off Value 0	Always on Value 1	Diagnostic status indicator • 1: Change • 0: No change	First scan indicator • 1: First scan after startup • 0: Not first scan

Clock memory

You can assign one byte in M memory for clock memory. Each bit of the byte configured as clock memory generates a square wave pulse on the corresponding M memory bit. The byte of clock memory provides 8 different frequencies, from 0.5 Hz (slow) to 10 Hz (fast). You can use these bits as control bits, especially when combined with edge instructions, to trigger actions in the user program on a cyclic basis.

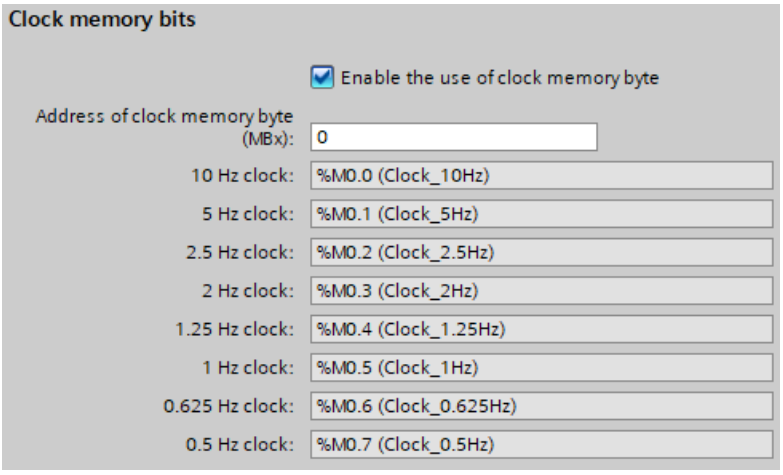

Table 1-169 Clock memory

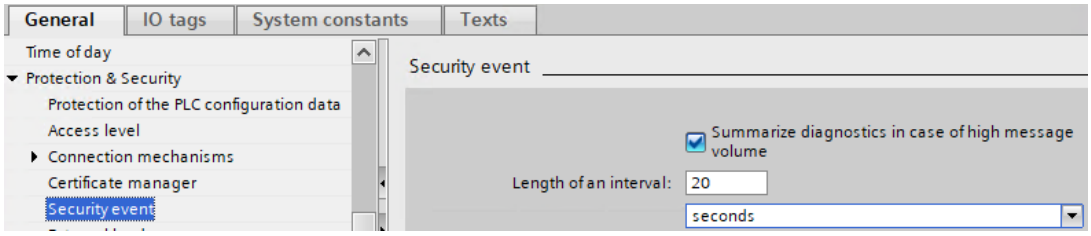
Bit number	7	6	5	4	3	2	1	0
Period (s)	2.0	1.6	1.0	0.8	0.5	0.4	0.2	0.1
Frequency (Hz)	0.5	0.625	1	1.25	2	2.5	5	10

Because clock memory runs asynchronously to the CPU cycle, the status of the clock memory can change several times during a long cycle.

5.4.9 Diagnostics buffer

The CPU supports a diagnostics buffer that contains an entry for each diagnostic event. Each entry includes a date and time the event occurred, an event category, and an event description. The entries are displayed in chronological order, with the most recent event at the top. When the log is full (500 events), a new event replaces the oldest event in the log. If the CPU loses power, the diagnostics buffer retains the 100 most recent diagnostic events.



The following types of events are recorded in the diagnostics buffer:

- Each system diagnostic event; for example, CPU errors and module errors
- Each state change of the CPU (each power up, each transition to STOP, each transition to RUN)
- Each user diagnostic alarm generated by the Gen_UsrMsg instruction.

To access the diagnostics buffer, you must be online. From the "Online & diagnostics (Page 313)" view, locate the diagnostics buffer under "Diagnostics > Diagnostics buffer".

Reducing the number of security diagnostic events

Some security events generate repeated entries in the diagnostics buffer. These messages can fill up the diagnostics buffer and potentially obscure other event messages. You can configure the PLC to limit the number of diagnostic messages from security events. You make selections in the device configuration of the CPU based on the time interval in which you want to suppress recurring messages:

If you choose to summarize security events within a time interval, you have the choice of setting a time interval in seconds, minutes, or hours, and a numerical value in the range 1 .. 255.

If you choose to restrict security events, you will be restricting these types of events:

- Going online with the correct or incorrect password
- Manipulated communications data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (by instruction or CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive
- Logging in to the Web server with the correct or incorrect password

5.4.10 Program alarms

The S7-1200 G2 allows you to create, edit, and monitor Program alarms in your STEP 7 project. These alarms deliver error messages or notifications about the PLC program running on your CPU.

From your STEP 7 project's Device configuration, select the "Diagnostics" tab and then select the "Alarm display" tab to view a log of Program alarms and their associated information. You can also configure Program alarms to display and be acknowledgeable in an HMI.

You can edit existing Program alarms in the Project tree under "PLC supervisions and alarms".

NOTE

The S7-1200 G2 CPU does not support supervisions.

See the following TIA Portal Information System topics for more detailed information on creating and editing Program alarms:

- Creating and editing alarms (https://docs.tia.siemens.cloud/access?ft:originId=./4511680523/41028912907_enUS.htm&ft:clusterId./4511680523/41028912907.htm)
- Program_Alarm: Generate program alarm with associated values (https://docs.tia.siemens.cloud/access?ft:originId=./15889165323/41068416779_enUS.htm&ft:clusterId./15889165323/41068416779.htm)
- Program example for Get_Alarm & Ack_Alarms (https://docs.tia.siemens.cloud/access?ft:originId=./15889165323/90334347915_enUS.htm&ft:clusterId./15889165323/90334347915.htm)

5.4.11 Time of day clock

The CPU supports a time-of-day clock. A super-capacitor supplies the energy required to keep the clock running during times when the CPU is powered down. The super-capacitor charges while the CPU has power. After the CPU has been powered up at least 24 hours, then the super-capacitor has sufficient charge to keep the clock running for typically 20 days.

STEP 7 sets the time-of-day clock to system time, which has a default value out of the box or following a factory reset. To utilize the time-of-day clock, you must set it. Timestamps such as those for diagnostics buffer entries, data log files, and data log entries, are based on the system time. You set the time of day from the "Set time of day" function (Page 313) in the "Online & diagnostics" view of the online CPU. STEP 7 then calculates the system time from the time you set plus or minus the Windows operating system offset from UTC (Coordinated Universal Time). Setting the time of day to the current local time produces a system time of UTC if your Windows operating system settings for time zone and daylight savings time correspond to your locale.

⚠ WARNING

Risk of attacker accessing your networks through open interfaces

If an attacker can access your networks through open interfaces, such as software like STEP 7, the SIMATIC Automation Tool, or through an HMI, the attacker can possibly disrupt control of your process by shifting the CPU system time.

The CPU supports "time of day" interrupts and clock instructions that depend upon accurate CPU system time. You must restrict access to the CPU by enabling access control and disabling the "Anonymous" user. Failure to do so can cause a security breach that allows an unknown user to disrupt control of your process by shifting the CPU system time.

Disruptions to process control can possibly cause death, severe injury, or property damage.

For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Website.

STEP 7 includes instructions (Page 172) to read and write the system time (RD_SYS_T and WR_SYS_T), to read the local time (RD_LOC_T), and to set the time zone (SET_TIMEZONE). The RD_LOC_T instruction calculates local time using the time zone and daylight saving time offsets that you set in the "Time of day" configuration in the general properties of the CPU (Page 158). These settings enable you to set your time zone for local time, optionally enable daylight saving time, and specify the start and end dates and times for daylight saving time. You can also use the SET_TIMEZONE instructions to configure these settings.

NOTE

Time zone differences

If you set the time of day clock and the time zone of your programming device is different from the time zone you configured in the device configuration for your CPU (Page 158), then you might see unexpected timestamps for items such as the following:

- Diagnostic buffer entries
- Data log files
- Entries in data logs

5.4.12 Data storage, memory areas, I/O and addressing

5.4.12.1 Accessing the data of the CPU

STEP 7 facilitates symbolic programming. You can create symbolic names or "tags" for I/O and memory. To use these tags in your user program, enter the tag name for the instruction parameter.

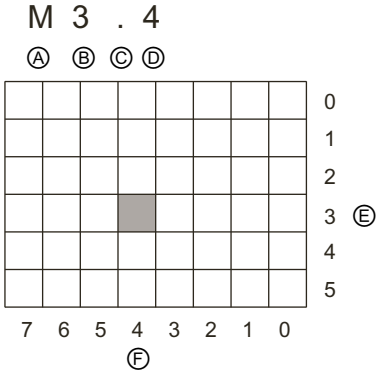
The CPU provides several options for storing data:

- Global memory: The CPU provides a variety of specialized memory areas, including inputs (I), outputs (Q) and memory (M). This memory is accessible by all code blocks without restriction.
- PLC tag table: You can enter symbolic names in the STEP 7 PLC tag table for specific memory locations. These tags are global to the STEP 7 program and allow programming with names that are meaningful for your application.
- Data block (DB): You can include DBs in your user program to store data for the code blocks. The data stored persists when the execution of the associated code block comes to an end. A "global" DB stores data that can be used by all code blocks, while an instance DB stores data for a specific FB and is structured by the parameters for the FB.
- Temp memory: Whenever the program calls a code block, the CPU allocates temporary, or local, memory (L) to be used during the execution of the block. When the execution of the code block finishes, the CPU reallocates the local memory for the execution of other code blocks.

Each memory location has a unique address. Your user program uses these addresses to access the information in the memory location. References to the input (I) or output (Q) memory areas, such as I0.3 or Q1.7, access the process image. To immediately access the physical input or output, append the reference with ":P" (such as I0.3:P, Q1.7:P, or "Stop:P").

You can force values (Page 322) for some memory areas. Some memory areas are retentive (Page 123) or optionally retentive.

Table 1-170 Memory areas



Memory area	Description	Force	Retentive
I Process image input I_:P [1] (Physical input)	Copied from physical inputs at the beginning of the scan cycle	No	No
	Immediate read of the physical input points on the CPU, SB, and SM	Yes	No
Q Process image output Q_:P [1] (Physical output)	Copied to physical outputs at the beginning of the scan cycle	No	No
	Immediate write to the physical output points on the CPU, SB, and SM	Yes	No
M Bit memory	Control and data memory	No	Yes (optional)
DB Data block	Data memory and also parameter memory for FBs	No	Yes (optional)
Temp memory	Temporary data for a block local to that block	No	No

[1] To immediately access (read or write) the physical inputs and physical outputs, append a ":P" to the address or tag (such as I0.3:P, Q1.7:P, or "Stop:P").

Each memory location has a unique address. Your user program uses these addresses to access the information in the memory location. The absolute address consists of the following elements:

- Memory area identifier (such as I, Q, or M)
- Size of the data to be accessed ("B' for Byte, "W" for Word, or "D" for DWord)
- Starting address of the data (such as byte 3 or word 3)

When accessing a bit in the address for a Boolean value, enter the memory area, the byte location, and the bit location for the data (such as I0.0, Q0.1, or M3.4).

A	Memory area identifier	E	Bytes of the memory area
B	Byte address: byte 3	F	Bits of the selected byte
C	Separator ("byte.bit")		
D	Bit location of the byte (bit 4 of 8)		

In the example, the memory area and byte address (M = bit memory area, and 3 = Byte 3) are followed by a period (".") to separate the bit address (bit 4).

5.4.12.2 Using absolute addressing to access CPU data

When using symbolic names for data (Page 129), you typically create tags either in the PLC tag table, a data block, or in the interface of an OB, FC, or FB. These tags include a name, data type, offset, and comment. Additionally, in a data block, you can specify a start value. You can use these tags when programming by entering the tag name at the instruction parameter.

Optionally, you can enter the absolute operand (memory area, size and offset) at the instruction parameter for most data types. The examples in the following sections show how to enter absolute operands. The % character is inserted automatically in front of the absolute operand by the program editor. You can toggle the view in the program editor to one of these: symbolic, symbolic and absolute, or absolute.

You cannot use absolute addressing for the long data types (64-bit) such as LWORD, LINT, ULINT, LREAL, LTIME, LTOD, and LDT. You must use symbolic addressing for the long data types.

I (process image input): The CPU samples the peripheral (physical) input points just prior to the cyclic OB execution of each scan cycle (Page 97) and writes these values to the input process image. You can access the input process image as bits, bytes, words, or double words. Both read and write access is permitted, but typically, process image inputs are only read.

Table 1-171 Absolute addressing for I memory

Bit	I[byte address].[bit address]	I0.1
Byte, Word, or Double Word	I[size][starting byte address]	IB4, IW5, or ID12

By appending a ":P" to the address, you can immediately read the digital and analog inputs of the CPU, SB, SM or distributed module. The difference between an access using I_:P instead of I is that the data comes directly from the points being accessed rather than from the input process image. This I_:P access is referred to as an "immediate read" access because the data is retrieved immediately from the source instead of from a copy that was made the last time the input process image was updated.

Because the physical input points receive their values directly from the field devices connected to these points, you cannot write to these points. I_:P accesses are read-only, as opposed to I accesses which can be read or written to.

I_:P accesses are also restricted to the size of inputs supported by a single CPU, SB, or SM, rounded up to the nearest byte.

For example, if the inputs of a 4 DI / 4 DQ SB are configured to start at I4.0, then the input points can be accessed as I4.0:P, I4.1:P, I4.2:P, and I4.3:P or as IB4:P. Accesses to I4.4:P through I4.7:P are not rejected, but make no sense since these points are not used. Accesses to IW4:P and ID4:P are prohibited since they exceed the byte offset associated with the SB.

Accesses using I_:P do not affect the corresponding value stored in the input process image.

Table 1-172 Absolute addressing for I memory (immediate)

Bit	I[byte address].[bit address]:P	I0.1:P
Byte, Word, or Double word	I[size][starting byte address]:P	IB4:P, IW5:P, or ID12:P

Q (process image output): The CPU copies the values stored in the output process image to the physical output points. You can access the output process image in bits, bytes, words, or double words. Both read and write access is permitted for process image outputs.

Table 1-173 Absolute addressing for Q memory

Bit	Q[byte address].[bit address]	Q1.1
Byte, Word, or Double word	Q[size][starting byte address]	QB5, QW10, QD40

By appending a ":P" to the address, you can immediately write to the physical digital and analog outputs of the CPU, SB, SM or distributed module. The difference between an access using Q_:P instead of Q is that the data goes directly to the points being accessed in addition to the output process image (writes to both places). This Q_:P access is sometimes referred to as an "immediate write" access because the data is sent immediately to the target point; the target point does not have to wait for the next update from the output process image.

Because the physical output points directly control field devices that are connected to these points, reading from these points is prohibited. That is, Q_:P accesses are write-only, as opposed to Q accesses which can be read or write.

Q_:P accesses are also restricted to the size of outputs supported by a single CPU, SB, or SM, rounded up to the nearest byte.

For example, if the outputs of a 4 DI / 4 DQ SB are configured to start at Q4.0, then the output points can be accessed as Q4.0:P, Q4.1:P, Q4.2:P, and Q4.3:P or as QB4:P. Accesses to Q4.4:P through Q4.7:P are not rejected, but make no sense since these points are not used. Accesses to QW4:P and QD4:P are prohibited since they exceed the byte offset associated with the SB.

Accesses using Q_:P affect both the physical output as well as the corresponding value stored in the output process image.

Table 1-174 Absolute addressing for Q memory (immediate)

Bit	Q[byte address].[bit address]:P	Q1.1:P
Byte, Word, or Double word	Q[size][starting byte address]:P	QB5:P, QW10:P or QD40:P

M (bit memory area): Use the bit memory area (M memory) for both control relays and data to store the intermediate status of an operation or other control information. You can access the bit memory area in bits, bytes, words, or double words. Both read and write access is permitted for M memory.

Table 1-175 Absolute addressing for M memory

Bit	M[byte address].[bit address]	M26.7
Byte, Word, or Double Word	M[size][starting byte address]	MB20, MW30, MD50

Temp (temporary memory): The CPU allocates the temp memory on an as-needed basis. The CPU allocates the temp memory for the code block and initializes the memory locations to 0 at the time when it starts the code block (for an OB) or calls the code block (for an FC or FB).

Temp memory is similar to M memory with one major exception: M memory has a "global" scope, and temp memory has a "local" scope:

- M memory: Any OB, FC, or FB can access the data in M memory, meaning that the data is available globally for all of the elements of the user program.
- Temp memory: The CPU restricts access to the data in temp memory to the OB, FC, or FB that created or declared the temp memory location. Temp memory locations remain local and different code blocks do not share temp memory, even when the code block calls another code block. For example: When an OB calls an FC, the FC cannot access the temp memory of the OB that called it.

The CPU limits memory as follows:

- 16 Kbytes temp (local) memory per block (OB/FB/FC)
- 64 Kbytes total temp (local) memory per event priority class.

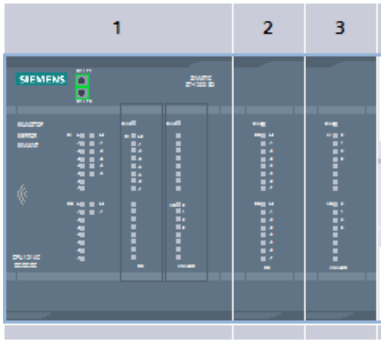
You must consider each block's memory allocation and the nesting depth from the calling OB in planning memory usage.

You access temp memory by symbolic addressing only.

You can find out the amount of temp (local) memory that the blocks in your program use through the call structure in STEP 7. From the project tree select Program info and then select the Call structure tab. You will see all of the OBs in your program and you can drill down to see the blocks that they call. For each block, you can see the local data allocation. You can also access the Call structure display from the STEP 7 **Tools > Call structure** menu command.

DB (data block): Use the DB memory for storing various types of data, including intermediate status of an operation or other control information parameters for FBs, and data structures required for many instructions such as timers and counters. You can access data block memory in bits, bytes, words, or double words. Both read and write access is permitted for read/write data blocks. Only read access is permitted for read-only data blocks.

Table 1-176 Absolute addressing for DB memory



Bit	DB[data block number].DBX[byte address].[bit address]	DB1.DBX2.3
Byte, Word, or Double Word	DB[data block number].DB [size][starting byte address]	DB1.DBB4, DB10.DBW2, DB20.DBD8

NOTE

When you specify an absolute address in LAD or FBD, STEP 7 precedes this address with a "%" character to indicate that it is an absolute address. While programming, you can enter an absolute address either with or without the "%" character (for example %I0.0 or I.0). If omitted, STEP 7 supplies the "%" character.

In SCL, you must enter the "%" before the address to indicate that it is an absolute address. Without the "%", STEP 7 generates an undefined tag error at compile time

5.4.12.3 Addressing the local and expansion I/O

When you add a CPU and I/O boards or modules to your device configuration, STEP 7 automatically assigns input and output addresses. You can change the default addressing by selecting the address field in the device overview and entering new numbers.

- STEP 7 assigns digital inputs and outputs in groups of 8 points (1 byte), whether the module uses all the points or not.
- STEP 7 allocates analog inputs and outputs in groups of 4, where each analog point occupies 2 bytes.

The Device overview shows the I/O address assignments.

Device overview

...	Module	Slot	I address	Q address	Type
		0			
	G2_PLC_1	1			CPU 1214C DC/DC/DC
	DI 14/DQ 10_1	1 8	0...1	0...1	DI 14/DQ 10
	DI8 signal board (100 kHz)_1	1 9	4		DI8 signal board (100 kHz)
	AQ4 Signal board_1	1 10		80...87	AQ4 Signal board
	SM 1222 DQ16 x 24VDC_1	2		8...9	SM 1222 DQ16 x 24VDC
	SM 1233 AI4/AQ4_1	3	112...119	112...119	SM 1233 AI4/AQ4

This example represents the following configuration:

- CPU
- Signal board with 8 digital inputs
- Signal board with 4 analog outputs
- Signal module with 16 digital outputs
- Signal module with 4 analog inputs and 4 analog outputs

You can change I and Q addresses. STEP 7 assists you by preventing changes that are the wrong size or conflict with other addresses.

5.4.13 Processing of analog values

General purpose analog signal modules provide input signals or expect output values that represent either a voltage range or a current range. These ranges are as follows:

- Analog inputs: ±10 V, ±5 V, ±2.5 V, 0 to 20 mA, or 4 to 20 mA
- Analog outputs: ±10 V, 0 to 20 mA, or 4 to 20 mA

The values returned by the modules are integer values where 0 to 27648 represents the rated range for current, and -27648 to 27648 for voltage. Anything outside the range represents either an overflow or underflow. See the tables for analog input representation (Page 415) and analog output representation (Page 416) for details about the types of out-of-range values.

In your control program, you probably need to use these values in engineering units, for example to represent a volume, temperature, weight or other quantitative value. To do this

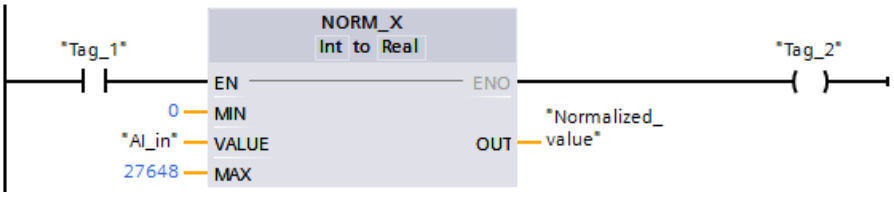
for an analog input, you must first normalize the analog value to a real (floating point) value from 0.0 to 1.0. Then you must scale it to the minimum and maximum values of the engineering units that it represents. For values that are in engineering units that you need to convert to an analog output value, you first normalize the value in engineering units to a value between 0.0 and 1.0, and then scale it between 0 and 27648 or -27648 to 27648, depending on the range of the analog module. STEP 7 provides the NORM_X and SCALE_X instructions for this purpose. You can also use the CALCULATE instruction to scale the analog values.

Example: analog value processing

Consider, for example, an analog input that has a current range of 0 - 20 mA. The analog input module returns values in the range 0 to 27648 for measured values. For this example, consider that you are using this analog input value to measure a temperature range from 50 °C to 100 °C. A few sample values would have the following meanings:

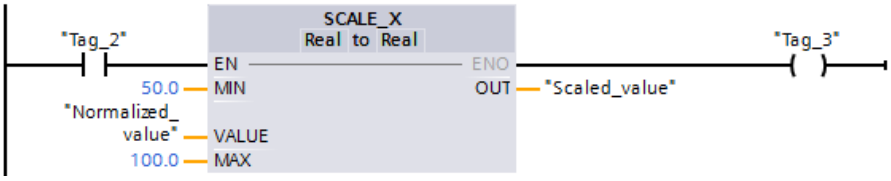
Analog input value	Engineering units
0	50 °C
6192	62.5 °C
12384	75 °C
18576	87.5 °C
27648	100 °C

The calculation for determining engineering units from the analog input value in this example is as follows:



Engineering units value = 50 + (Analog input value) * (100 - 50) / (27648 - 0)

For the general case, the equation would be:



Engineering units value = (Low range of engineering units) +
(Analog input value) *
(High range of engineering units - Low range of engineering units) /
(Maximum analog input range - Minimum analog input range)

In PLC applications, the typical method is to normalize the analog input value to a floating point value between 0.0 and 1.0. Then, you would scale the resulting value to a floating point value in the range of your engineering units. For simplicity, the following LAD instructions use constant values for the ranges; you might actually choose to use tags:

Network 1

Network 2

5.4.14 Using a memory card

5.4.14.1 Memory cards

NOTE

The CPU supports SIMATIC memory cards (Page 468) for the following purposes:

- Empty memory card (Page 139)
- Transfer card (Page 139)
- Program card (Page 141)
- Firmware update card (Page 144)
- Card for protection of confidential PLC configuration data (Page 146)

You can use supported non-SIMATIC memory cards (Page 468) only for transferring the license conditions and copyrights OSS information (Page 149) to a memory card.

Transfer cards and program cards contain the following elements if they exist in the project:

- Device configuration
- Code blocks
- Data blocks
- Technology objects
- Data logs
- Recipes
- User files

Transfer cards and program cards do not contain the following:

- Force tables
- Watch tables
- PLC tag tables

Use a transfer card to copy a program to the internal load memory (ILM) of the CPU without using STEP 7.

Use an empty transfer card to recover a password-protected CPU when you have lost or forgotten the password (Page 148).

Use a program card as external load memory for the CPU.

NOTE
Do not use the Windows formatter utility or any other formatting utility to reformat the memory card.
If a Siemens memory card is reformatted using the Microsoft Windows formatter utility, then the memory card will no longer be usable by any Siemens CPU.

Inability to use memory cards created with S7-1200 G2 V1.0

If you formatted a SIMATIC memory card for an S7-1200 G2 V1.0 CPU in the TIA Portal, the card is incorrectly formatted for use with firmware V4.1.

The invalid memory card prevents the CPU from starting. The Diagnostic buffer reports the error and the Status LEDs (Page 315) indicate the missing program memory card pattern.

To correct the card formatting problem, follow these steps:

1. Copy the memory card contents to your computer.*
2. Using the CPU that you upgraded to firmware V4.1, format the memory card from the TIA Portal.
3. Restore the memory card contents from your computer to the memory card.

*Do not include the system files crdinfo.bin and __LOG__.

5.4.14.2 Inserting a memory card in the CPU

NOTICE

Risks associated with electrostatic discharge
Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable.
To protect the memory card and receptacle from electrostatic discharge, do the following:

- Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card.
- Store the memory card in a conductive container.

Receptacle or memory card malfunction can result in property damage.

Check that the memory card is not write-protected. Slide the protection switch away from the "Lock" position.

The memory card is keyed for proper installation. Insert the memory card with the correct orientation.

If you insert a write-protected memory card into the CPU, STEP 7 displays a diagnostic message on the next power up, alerting you to that fact. The CPU powers up without failure as long as the memory card you inserted is not blank. Instructions involving recipes or data logs, for example, return errors if the card is write-protected.

⚠ WARNING

Verify that the CPU is not running a process before inserting the memory card.
If you insert or remove a memory card of any type into a running CPU, the CPU restarts, resulting in diagnostic events, temporary loss of communication, and process disruption. Before inserting or removing a memory card, always ensure that the CPU is not actively controlling a machine or process. Always install an emergency stop circuit for your application or process. Power off the CPU before inserting or removing a memory card. Disruption of a running process can result in death, severe personal injury, and/or property damage.

NOTE

Do not insert program cards (Page 141) or transfer cards (Page 139) with S7-1200 projects into S7-1200 G2 CPUs.
S7-1200 projects are not compatible with version S7-1200 G2 CPUs. Inserting a memory card that is incompatible causes a CPU error.
If you do insert an invalid program card or transfer card, remove the card.

CPU behavior when you insert a memory card

When you insert a memory card in the CPU, the CPU restarts and performs the following steps:

1. Evaluates the card, and flashes the LEDs while evaluating
2. Performs actions based on the type of card:
   - Empty memory card (Page 139)
   - Transfer card (Page 139)
   - Program card (Page 141)
   - Firmware update card (Page 144)
   - Memory card for protecting confidential PLC configuration data (Page 146)
   - Memory card for copying license conditions and copyrights from the CPU (Page 149)

Procedure after card evaluation and processing

If the card is not an empty memory card (Page 139) or a program card (Page 141), power off the CPU and remove it.

After you remove the card, the CPU restarts and remains in STOP mode.

5.4.14.3 Empty memory card

An empty memory card does not have a job file (S7_JOB.S7S). The CPU behavior when you insert an empty memory card (Page 137) depends on the selection for "Disable copy from internal load memory to external load memory" in the "Protection & Security > External load memory" CPU properties (Page 158):

- If the check box is not selected, the CPU adds a job file. The CPU then copies internal load memory to external load memory (memory card) and erases internal load memory.
- If the check box is selected, the CPU does not create a program job file and it does not copy internal load memory to external load memory (memory card). It does not erase internal load memory.

If you insert a memory card that is not an empty memory card into the CPU, the configuration setting for "Disable copying from internal load memory to external load memory" has no effect on how the CPU evaluates the memory card.

5.4.14.4 Configuring the startup parameter of the CPU before copying the project to the memory card

When you copy a program to a transfer card or a program card, the program includes the startup parameter for the CPU (Page 158). Before copying the program to the memory card, always ensure that you have configured the operating mode for the CPU following a power-cycle. Select whether the CPU starts in STOP mode, RUN mode, or in the previous mode (prior to the power cycle).

5.4.14.5 Transfer card

NOTICE
Risks associated with electrostatic discharge Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable. To protect the memory card and receptacle from electrostatic discharge, do the following: • Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card. • Store the memory card in a conductive container. Receptacle or memory card malfunction can result in property damage.

Creating a transfer card

Configure the startup parameter of the CPU (Page 139) before copying a program to the transfer card.

To create a transfer card, follow these steps:

1. Insert an empty SIMATIC memory card that is not write-protected into an SD card reader/writer attached to your computer. (If the card is write-protected, slide the protection switch away from the "Lock" position.)

   If you are reusing a SIMATIC memory card that contains a user program, data logs, recipes, or a firmware update, you **must** delete the files before reusing the card. Use Windows File

Explorer to display the contents of the memory card and delete the following files and folders if they exist:

- S7_JOB.S7S
- SIMATIC.S7S
- FWUPDATE.S7S
- DataLogs
- Recipes
- UserFiles

NOTICE
Do NOT delete the hidden files "__LOG__" and "crdinfo.bin" from the memory card. The "__LOG__" and "crdinfo.bin" files are required for the memory card. If you delete these files, you cannot use the memory card with the CPU.

2. In the Project tree (Project view), expand the "Card Reader/USB memory" folder and select your card reader. If you are creating an empty transfer card, you can go to Step 6.
3. Add the program by selecting the CPU in the Project tree and dragging the CPU to the memory card. Another method is to copy the CPU and paste it to the memory card. Copying the CPU to the memory card opens the "Load preview" dialog.
4. In the "Load preview" dialog, click the "Load" button to copy the CPU to the memory card.
5. When the dialog displays a message that the CPU (program) has been loaded without errors, click the "Finish" button.
6. Right-click the drive letter corresponding to the memory card and select "Properties" from the shortcut menu.
7. In the "Memory card" dialog, select "Transfer" from the "Card type" drop-down menu and click OK.

8. Remove the transfer card from the card reader.

Using a transfer card

⚠ WARNING

Risks when inserting a transfer card
Inserting a memory card causes the CPU to restart and evaluate the card, which can affect the operation of an online process or machine.
Before inserting a transfer card, ensure that the CPU is in STOP mode and your process is in a safe state.
Unexpected operation of a process or machine can result in death or injury to personnel and/or property damage.

To transfer the program to a CPU, insert the transfer card into the CPU (Page 137). At this point, the existing program is still in the CPU.

The CPU evaluates the memory card and attempts to copy the program and all files on it to the internal load memory of the CPU. The CPU then responds as follows:

- If the copy process completes successfully, the MAINT LED flashes (yellow). Remove the transfer card.
- If the copy process fails for any reason, including exceeding the size of internal load memory (ILM), the copy aborts. The Diagnostic buffer shows an error. The ERROR LED blinks red and the STOP LED is solid yellow.

  If the program transferred successfully, but data logs and recipes did not transfer, you can set the CPU to RUN mode after you remove the transfer card and the CPU restarts.

  Instructions that require the missing data logs and recipes will report errors. You can retry the transfer if the failure occurred due to a disruption in the transfer process. If the failure was a result of ILM not having enough space for all the transfer card contents, you can delete some files from the transfer card and try again.

The CPU is in STOP mode after a transfer. The transfer card is unchanged.

See also

Recovery from a lost password (Page 148)

5.4.14.6 Program card

NOTICE

Risks associated with electrostatic discharge
Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable.
To protect the memory card and receptacle from electrostatic discharge, do the following:

- Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card.
- Store the memory card in a conductive container.

Receptacle or memory card malfunction can result in property damage.

Check that the memory card is not write-protected. Slide the protection switch away from the "Lock" position.

The memory card is keyed for proper installation. Insert the memory card with the correct orientation.

If you insert a write-protected memory card into the CPU, STEP 7 displays a diagnostic message on the next power up, alerting you to that fact. The CPU powers up without failure, but instructions involving recipes or data logs, for example, return errors if the card is write-protected.

Before you copy any program elements to the program card, delete any previously saved programs from the memory card.

Creating a program card

When used as a program card, the memory card is the external load memory of the CPU. If you remove the program card, the internal load memory of the CPU is empty. A program card includes the STEP 7 program and any data logs, recipes, or user files that belong to the program.

NOTE

If you insert an empty memory card into the CPU, the CPU copies the program and force values from internal memory to the memory card. After the copy has completed, the program in internal load memory is erased.

If you powered off the CPU before inserting the memory card, the CPU then goes to the configured startup mode (Page 139).

If you inserted the memory card without powering off, the CPU remains in STOP mode.

Always remember to configure the startup parameter of the CPU (Page 139) before copying a project to the program card. To create a program card, follow these steps:

1. Insert an empty SIMATIC memory card that is not write-protected into an SD card reader/writer attached to your computer.

   If you are reusing a SIMATIC memory card that contains a user program, data logs, recipes, or a firmware update, delete the files before reusing the card. Use Windows File Explorer to display the contents of the memory card and delete the following files and folders if they exist:

   – S7_JOB.S7S
   – SIMATIC.S7S
   – FWUPDATE.S7S
   – DataLogs
   – Recipes
   – UserFiles

NOTICE
Do NOT delete the hidden files "__LOG__" and "crdinfo.bin" from the memory card. The "__LOG__" and "crdinfo.bin" files are required for the memory card. If you delete these files, you cannot use the memory card with the CPU.

2. In the Project tree (Project view), expand the "Card Reader/USB memory" folder and select the card reader.

3. Display the "Memory card" dialog by right-clicking the drive letter corresponding to the memory card in the card reader and selecting "Properties" from the context menu.
4. In the "Memory card" dialog, select "Program" from the Card type dropdown menu.

5. Add the program by selecting the CPU device (such as G2_PLC_1 [CPU 1214C DC/DC/DC]) in the Project tree and dragging the CPU device to the memory card. (Another method is to copy the CPU device and paste it to the memory card.) Copying the CPU device to the memory card opens the "Load preview" dialog.
6. In the "Load preview" dialog, click the "Load" button to copy the CPU device to the memory card.
7. When the dialog displays a message that the download completed without errors, click the "Finish" button.

Using a program card as the load memory for a CPU

⚠ WARNING

Risks associated with inserting a program card
Use caution when inserting a program card while the CPU is in RUN mode. If you insert a program card into a CPU, the CPU restarts. Unexpected equipment operation can occur.
Ensure that the CPU is in STOP mode before inserting a program card.
Unexpected equipment operation can result in death, injury, and equipment damage.

To use a program card with a CPU, insert the program card (Page 137) into the CPU. The CPU evaluates the program card and erases the internal load memory of the CPU.

The program card must then remain in the CPU.

WARNING

Risks associated with removing a program card
If a program card is removed while the CPU is in RUN mode, the CPU restarts.
Use caution when removing a program card while the CPU is in RUN mode. Removing the program card removes the program from the CPU.
Unexpected equipment operation can occur resulting in death, injury, and equipment damage.

Service life of a SIMATIC memory card

The service life of a SIMATIC memory card depends on factors such as the following:

- Number of delete and write operations per memory block
- Number of bytes written
- External influences, such as ambient temperature

NOTE

Effect of write and delete operations on SIMATIC memory card service life
Write or delete operations, particularly repeated (cyclic) write/delete operations, reduce the service life of the SIMATIC memory card.
Cyclic execution of the following actions reduces the service life of the memory card depending on the number of write operations and data:

- Data Log handling (for example, DataLogWrite)
- Recipe handling (for example, RecipeExport)
- System Function Calls (SFCs) that write/delete to the file system (for example, WRIT_DBL, CREATE)
- System Function Blocks (SFBs) that write/delete to file system (for example, FileWriteC, FileDelete)
- Any other cyclic action that changes data on the persistent store (for example, Tracing, SET-TimeZone)

5.4.14.7 Firmware update card

You can use a SIMATIC memory card for performing a firmware update.

NOTE

You cannot update an S7-1200 CPU to S7-1200 G2 by firmware update.

Firmware updates are available on the Siemens Industry Online Support (https://sieportal.siemens.com/en-ww/support) Web site. From this Web site, navigate to "Downloads". From there, search for the specific type of module that you need to update.

Alternatively, you can access the downloads Web page (https://support.industry.siemens.com/cs/ww/en/ps/13639/dl) directly. Filter the downloads for S7-1200 G2 or a specific article number.

NOTICE
Risks associated with electrostatic discharge Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable. To protect the memory card and receptacle from electrostatic discharge, do the following: • Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card. • Store the memory card in a conductive container. Receptacle or memory card malfunction can result in property damage.

You can also use one of these methods to perform a firmware update:

- Online and diagnostic tools of STEP 7 (Page 313)
- SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300)

Downloading and installing a firmware update

To download the firmware update to your memory card, follow these steps:

1. Insert an empty SIMATIC memory card that is not write-protected into an SD card reader/writer attached to your computer. If the card is write-protected, slide the protection switch away from the "Lock" position.

   You can reuse a SIMATIC memory card that contains a user program or another firmware update. To avoid any confusion, you should also delete files S7_JOB.S7S, SIMATIC.S7S, and FWUPDATE.S7S if they exist.

   NOTE

   Do NOT delete the hidden files "__LOG__" and "crdinfo.bin" from the memory card. The "__LOG__" and "crdinfo.bin" files are required for the memory card. If you delete these files, you cannot use the memory card with the CPU.

2. Select the zip file for the firmware update that corresponds to your module, and download it to your computer. Double-click the file, set the file destination path to be the root directory of the SIMATIC memory card, and start the extraction process. After the extraction is complete, the root directory (folder) of the memory card will contain a "FWUPDATE.S7S" directory and the "S7_JOB.S7S" file.

   NOTE

   Do not put multiple firmware updates for the same article number (MLFB) on your memory card. Putting multiple updates for the same article number on the memory card causes the firmware update to fail.

   You can put multiple firmware updates for different article (MLFB) numbers on a single memory card. This allows you to use a single memory card to update the firmware of multiple station hardware modules.

3. Safely eject the card from the card reader/writer.

Installing a firmware update

⚠ WARNING

Risks when installing firmware updates
Installing the firmware update causes the CPU to restart, which can affect the operation of an online process or machine.
Verify that the CPU is not actively running a process before installing the firmware update. Before inserting the memory card, always ensure that the CPU is offline and in a safe state.
Unexpected operation of a process or machine can result in death or injury to personnel and/or property damage.

To install the firmware update, insert the firmware update card into the CPU (Page 137).

After you insert the card, the firmware update starts. When the MAINT LED flashes (yellow), the firmware update has finished. Remove the firmware update card. A firmware update does not affect the STEP 7 program and device configuration.

During update, the firmware update procedure ignores UPD files that do not correspond to any station hardware modules. If you have multiple station hardware modules with the same article number (MLFB), the firmware update is installed on all of those modules. This allows you to create a master firmware update memory card to update all stations in your facility.

If you powered off the CPU before removing the memory card, the CPU then goes to the configured startup mode (Page 139).

If you removed the memory card without powering off, the CPU remains in STOP mode.

The Diagnostics buffer includes entries when firmware update attempts are made, whether successful or not. In the case of a failure, the Diagnostics buffer message provides an explanation for the failure. You can then easily scan the Diagnostics buffer for any unexpected anomalies.

5.4.14.8 Memory card for protecting confidential PLC configuration data

You can use a SIMATIC memory card to set or remove the password for Protection of confidential PLC configuration data. To change an existing password for Protection of confidential PLC configuration data, you must first clear the existing password and then set the new password.

NOTICE

Risks associated with electrostatic discharge
Electrostatic discharge can damage the memory card or the receptacle on the CPU. If damaged, the receptacle or memory card can malfunction or become inoperable.
To protect the memory card and receptacle from electrostatic discharge, do the following:

- Make contact with a grounded conductive pad or wear a grounded wrist strap when handling the memory card.
- Store the memory card in a conductive container.

Receptacle or memory card malfunction can result in property damage.

Risks associated with the decommissioning process

S7-1200 G2 CPUs do not support secure erasure of the memory card and internal flash. Therefore, during the decommissioning process, you must securely dispose of the CPU and memory card to prevent the loss of proprietary or confidential information.

How to create a memory card with a Protection of confidential PLC configuration data password

To create the memory card with this password, follow these steps:

1. Insert an empty SIMATIC memory card that is not write-protected into an SD card reader/writer attached to your computer. If the card is write-protected, slide the protection switch away from the "Lock" position.
   You can reuse a SIMATIC memory card that contains a user program or firmware update, but you must delete some of the files on the memory card. To reuse a memory card, you must delete the "S7_JOB.S7S" file before creating the Protection of confidential PLC configuration data file. Use Windows Explorer to display the contents of the memory card and to delete the "S7_JOB.S7S" file.

NOTICE
Do NOT delete the hidden files "__LOG__" and "crdinfo.bin" from the memory card. The "__LOG__" and "crdinfo.bin" files are required for the memory card. If you delete these files, you cannot use the memory card with the CPU.

2. Create a file on the root of the memory card called "S7_JOB.S7S". Open the file with a text editor and type the following: SET_PWD.
3. Create a folder on the root of the memory card called: SET_PWD.S7S.
4. Under the "SET_PWD.S7S" folder, create a text file called "PWD.TXT". The file must be named "PWD.TXT".
5. Enter your Protection of confidential PLC configuration data password as the text contents of the file. The file must contain a single line of text representing the Protection of confidential PLC configuration data password. Follow the STEP 7 rules for passwords when creating the password, using these characters:
   - 0123456789
   - A...Z a...z
   - !#$%&()*+,-./:;<=>?@ [\]_{|}~^
6. Safely eject the card from the card reader/writer.

How to use a memory card to clear the Protection of confidential PLC configuration data password

To clear the Protection of confidential PLC configuration data password, follow these steps to create a memory card with an empty password, and then use that card to clear the password in the CPU:

1. Follow steps 1 - 4 above to create a memory card with the required structure.
2. Leave the PWD.TXT file empty.
3. Insert the memory card (Page 137)with no password into the CPU. The CPU evaluates the card and clears the Protection of confidential PLC configuration data password.
4. Remove the memory card. After the CPU restarts, it has no Protection of confidential PLC configuration data password.

How to set the Protection of confidential PLC configuration data password

To set the Protection of confidential PLC configuration data password, follow these steps:

1. Verify that the CPU is not actively running a process before setting the Protection of confidential PLC configuration data password.
2. Insert the memory card (Page 137) you created with your password into the CPU. The CPU evaluates the card and sets the Protection of confidential PLC configuration data password.
3. Remove the memory card. After the CPU restarts, it uses the new Protection of confidential PLC configuration data password.

If the existing program requires the Protection of confidential PLC configuration data password you set with the memory card, the PLC can go to RUN based on the project configuration.

If the existing user program requires a different Protection of confidential PLC configuration data password than what you set with the memory card, the program will not load after restarting. You must clear the existing program and download a program that uses the Protection of confidential PLC configuration data password that you set in the previous steps.

5.4.14.9 Recovery from a lost password

If you have lost the password for a password-protected CPU, use an empty transfer card (Page 139) to delete the password-protected program. The empty transfer card erases the internal load memory of the CPU. You can then download a new user program from STEP 7 to the CPU.

⚠ WARNING

Risks when inserting transfer cards
If you insert a transfer card in a running CPU, the CPU goes to STOP. Control devices can fail in an unsafe condition, resulting in unexpected operation of controlled equipment.
Verify that the CPU is not actively running a process before inserting the memory card.
Before inserting a transfer card, always ensure that the CPU is in STOP mode and your process is in a safe state.
Such unexpected operations can result in death or serious injury to personnel, and/or damage to equipment

You must remove the transfer card before setting the CPU to RUN mode.

5.4.14.10 Memory card for copying license conditions and copyrights from the CPU

License conditions and copyright files for open-source and third-party software (OSS files) are embedded in the CPU firmware. You can copy them to a supported non-SIMATIC standard memory card (Page 468).

Copying license conditions and copyrights to a non-SIMATIC memory card

To copy the license conditions and copyright files to a supported non-SIMATIC standard memory card, insert a supported non-SIMATIC standard memory card (Page 137) into the CPU. The format of the memory card must be "FAT32" file system.

The CPU restarts and copies the license conditions and copyrights to the memory card. They are in a zip file in a folder named OSS at the root level of the memory card file system. You can remove the memory card.

5.4.14.11 Using a memory card with the S7-1200 G2 fail-safe CPU

The S7-1200 G2 fail-safe CPU behavior when using a memory card has some differences from the standard CPU:

- When the S7-1200 G2 fail-safe CPU starts with no memory card and the Internal Load Memory (ILM) is empty, the fail-safe CPU's STOP and MAINT LEDs flash for three seconds. Power cycle the CPU. This provides a temporary visual indication that the ILM is empty. You must use the TIA Portal, the SIMATIC Automation Tool, or a memory card to load a user program.
- When the fail-safe CPU starts with a program memory card installed and the ILM is not empty, the fail-safe CPU erases the ILM, flashes the STOP and MAINT LEDs, and waits for user action. This is a visual indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. After the power cycle or memory reset, subsequent power cycles load the program from the memory card.
- When the fail-safe CPU starts with an empty memory card installed and the ILM is not empty, the fail-safe CPU copies the program from the ILM to the memory card. The fail-safe CPU then erases the ILM, flashing the STOP and MAINT LEDs, and waits for user action. This is an indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. After the power cycle or memory reset, subsequent power cycles load the program from the memory card.
- When the fail-safe CPU starts with a transfer memory card installed and the ILM is not empty, the fail-safe CPU erases the ILM, flashing the STOP and MAINT LEDs. This is a visual indication that the ILM is erased and that the fail-safe CPU is waiting for a power cycle or a memory reset command in order to continue. After the power cycle or memory reset, the fail-safe CPU copies the user program from the memory card to the ILM, and the fail-safe CPU stops, with the STOP LED on and the MAINT LED flashing. At this point, you must remove the transfer memory card. After the fail-safe CPU restarts, subsequent power cycles load the program from the ILM.

Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual", "Function test of safety program and protection through program identification" for instructions on transferring programs.

⚠ WARNING

Loading an incorrect user program into a fail-safe CPU results in incorrect execution and total or partial loss of the safety function.
Loss of the safety function can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.
Follow the instructions as provided in the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* for properly identifying safety programs and controlling how you load programs into a fail-safe CPU.

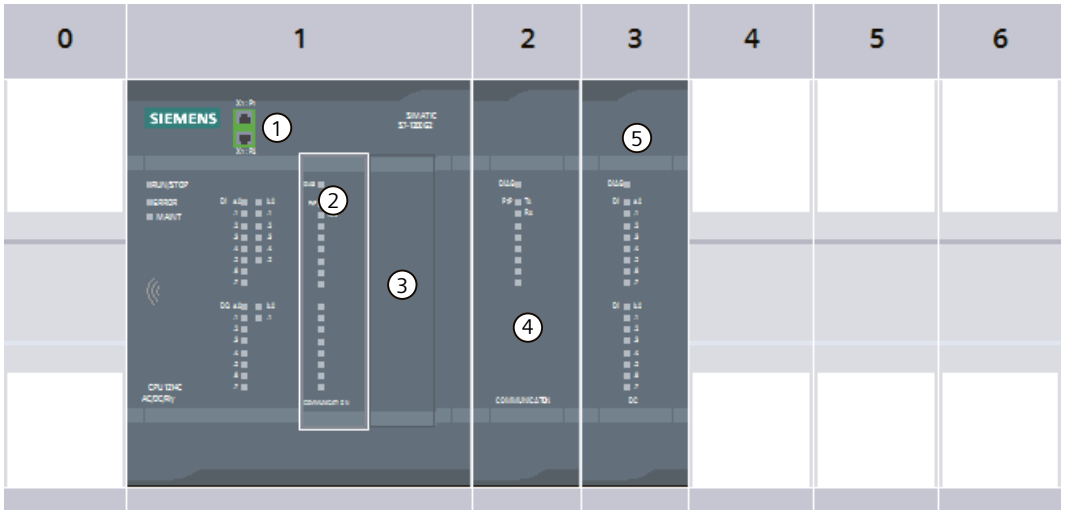
See also

SIMATIC Safety - Configuring and Programming manual (https://support.industry.siemens.com/cs/us/en/view/54110126)

5.5 Managing users and roles

With the TIA Portal you can perform user management and access control (UMAC). This allows you to create and manage users and roles in your project who are allowed to perform specific functions. You can assign roles with specific rights to each user. You can then assign runtime rights to your S7-1200 G2 PLC.

You can also create and manage central users outside the TIA Portal in UMC (User Management Component). UMC provides the capability to define users and roles in a central location that can then be used across multiple projects.



After adding users and making role assignments, you must load the project to the CPU(s) to activate UMAC. After you load the project to your S7-1200 G2 PLC, only authorized users can access various CPU functions (Page 313).

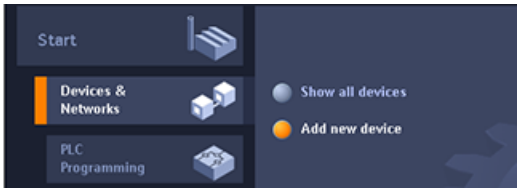
For more information, refer to "Managing users and roles" in the TIA Portal Information System.

5.6 Device configuration

5.6.1 Overview

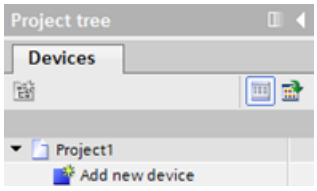
You create the device configuration for your PLC by adding a CPU and additional boards and modules to your project as needed.

① PROFINET port(s) of CPU (under door)
② Signal board (SB) or Communication board (CB)
③ CPU
④ Communication module (CM) or Communication processor (CP)
⑤ Signal module (SM) for digital or analog I/O



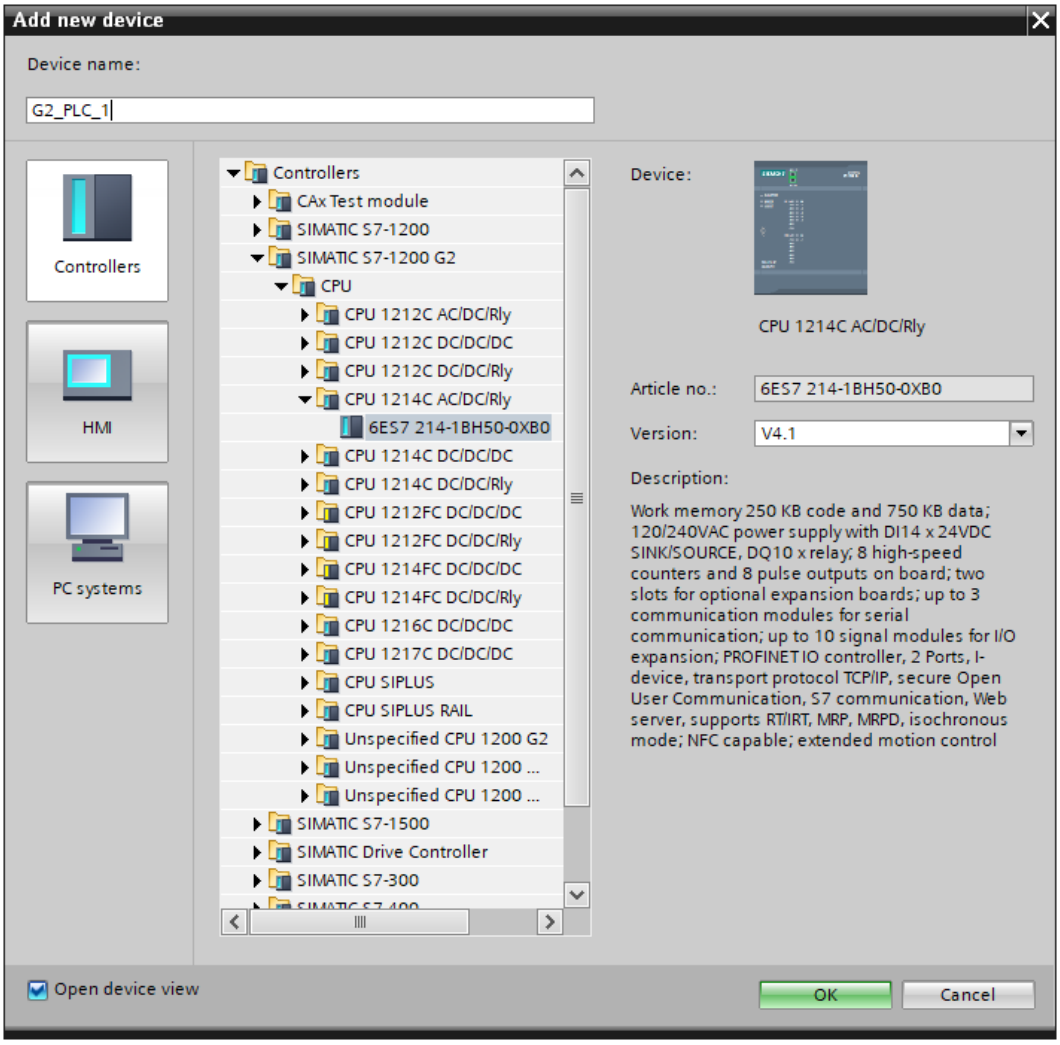
To learn more about the number of modules you can configure in your project, see Installing and removing expansion modules (Page 72).

Refer to Ordering Information (Page 467) for expansion boards and modules that are available.



5.6.2 Inserting a CPU

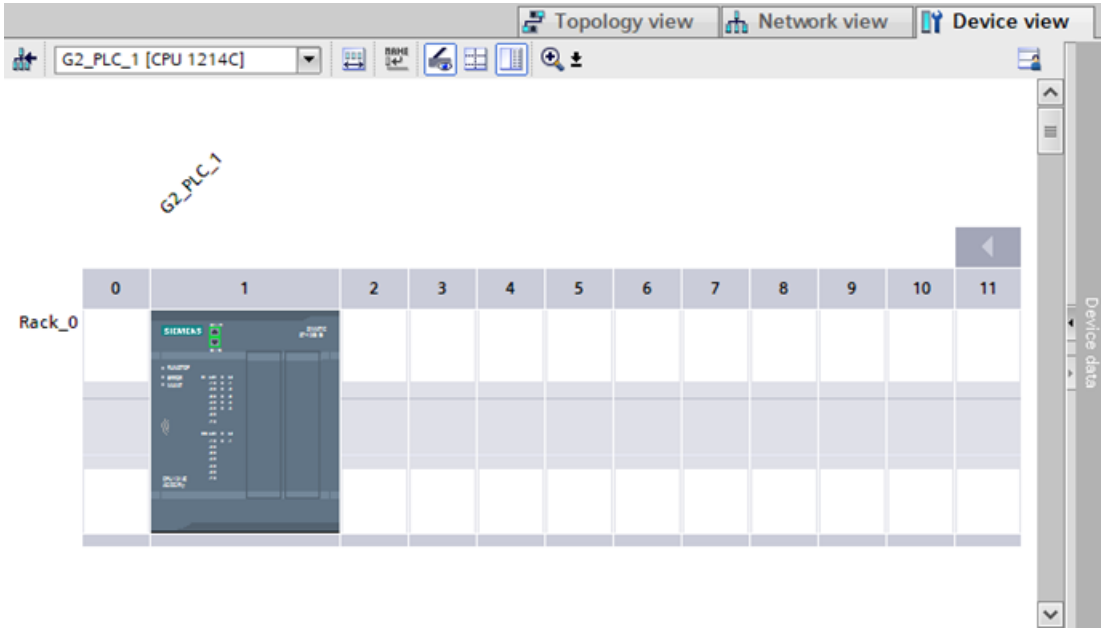
You can insert a CPU into your project from either the Portal view or the Project view of STEP 7:



- In the Portal view, select "Devices & Networks" and click "Add new device".

- In the Project view, under the project name, double-click "Add new device".

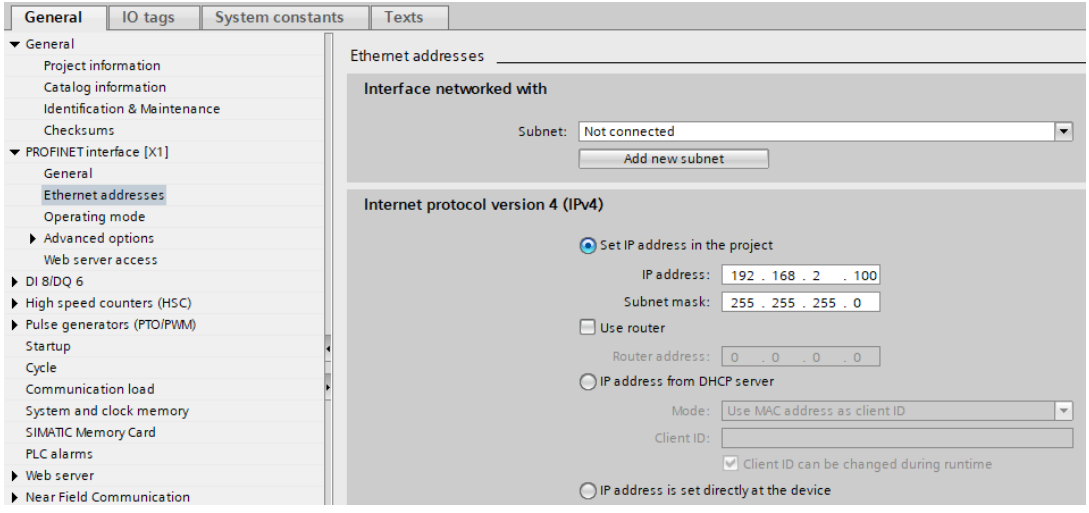
From the "Add new device" dialog, select the correct Article Number and firmware version from the list.



Configuring PLC security settings for your inserted CPU

When you insert an S7-1200 G2 CPU, STEP 7 launches the security wizard to help you set up your PLC security settings. Follow the steps in the wizard to set up your PLC security settings.

Refer to Protection & Security topics in the TIA Portal Information System to learn more about each configuration task and related security concepts.



Device configuration for the inserted CPU

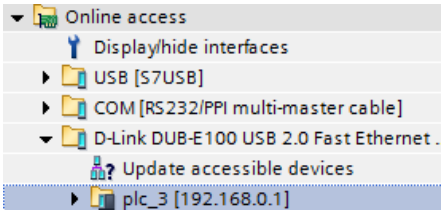
After you add a CPU, STEP 7 creates the rack and displays the CPU in the Device view:

Clicking the CPU in the Device view displays the CPU properties in the inspector window.

You can assign an IP address for the CPU during the device configuration. If your CPU is connected to a router on the network, select the checkbox next to "Use router" and enter the router's IP address.

5.6.3 Uploading the configuration of a connected CPU

STEP 7 provides two methods for uploading the hardware configuration of a connected CPU:



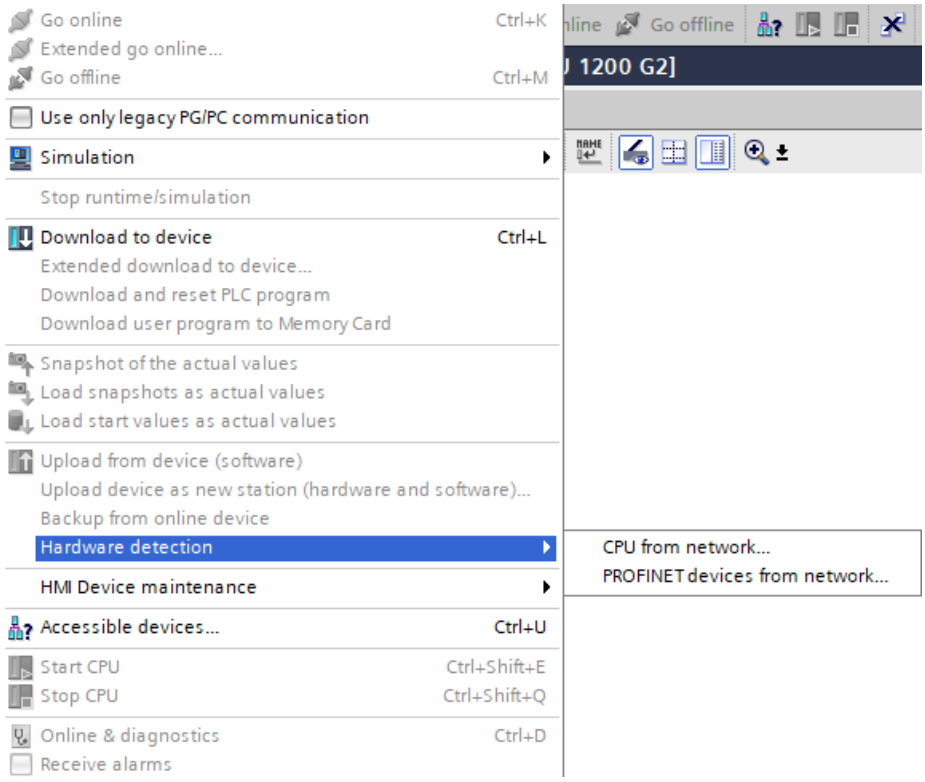
- Uploading the connected device as a new station
- Configuring an unspecified CPU and detecting the hardware configuration of the connected CPU

Note that the first method uploads both the hardware configuration and the software of the connected CPU.

Uploading a device as a new station

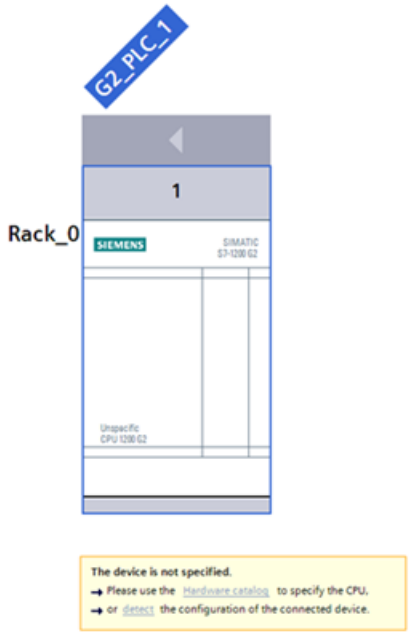
To upload a connected device as a new station, follow these steps:

1. Expand your communications interface from the "Online access" node of the project tree.



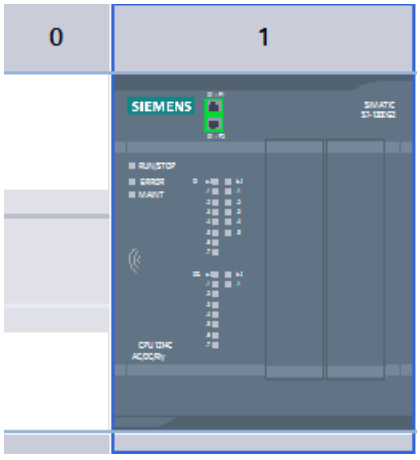
2. Double-click "Update accessible devices".
3. Select the PLC from the detected devices.
4. From the Online menu of STEP 7, select the "Upload device as new station (hardware and software)" menu command.

STEP 7 uploads both the hardware configuration and the program blocks.



Detecting the hardware configuration of an unspecified CPU

If you are connected to a CPU, you can upload the configuration of that CPU, including any modules, to your project. Create a new project and use "Add new device (Page 157)" to add an "Unspecific S7-1200 G2 CPU".



From the program editor, select the "Hardware detection" command from the "Online" menu.

From the device configuration, select "detect" in the box below the CPU. STEP 7 then detects the configuration of the PLC.

After you select the CPU from the online dialog and click Load, STEP 7 uploads the hardware configuration from the CPU, including any devices. You can then configure the parameters for the CPU and the modules (Page 158).

NOTE

Increased CPU Power-on time with missing/unplugged modules

Powering the CPU while it has missing or unplugged modules relative to your downloaded configuration causes an increased power-on time. During this period, the CPU and NFC functionality (Page 299) are unresponsive due to a longer CPU startup time. The length of the timeout for SBs is shorter than for CMs or SMs.

5.6.4 Adding modules to the configuration

Use the STEP 7 hardware catalog to add any of the following expansion modules or expansion boards to the CPU device configuration:

- Signal modules (SM) provide additional digital or analog I/O points. These modules are connected to the right side of a CPU, CM, CP, or SM.
- Signal boards (SB) provide additional I/O points for the CPU. The SB is installed on the front of the CPU.
- A Communication board (CB) provides an additional communication port (such as RS485). The CB is installed on the front of the CPU.
- A Communication module (CM) or Communication processor (CP) provides an additional communication port (such as RS232/RS485/RS422). Either module is connected to the right side of a CPU, CM, or CP.
- A Battery board (BB) provides long-term backup for the CPU's Real-Time Clock (RTC). The BB is installed in an SB slot on the front of the CPU. You can only add one BB to the device configuration.

To learn more about possible configurations of expansion modules, see S7-1200 G2 Modules (Page 57).

To insert a module into the device configuration, select the device in the hardware catalog and either double-click or drag the device to the appropriate slot. If you have one or more CMs or CPs in your project, add them to the right of the CPU before adding any SMs. An invalid module order causes a compile error. You must download your device configuration to the CPU for the devices to be functional.

5.6.5 Configuring the operation of the CPU

STEP 7 enables you to configure your S7-1200 G2 CPU by editing the CPU properties listed below. You can change Startup behavior, modify the behavior of digital I/O, or enable security settings, in addition to other valuable functions.

To configure the operational parameters for the CPU, select the CPU in the Device view and use the "Properties" tab of the inspector window.

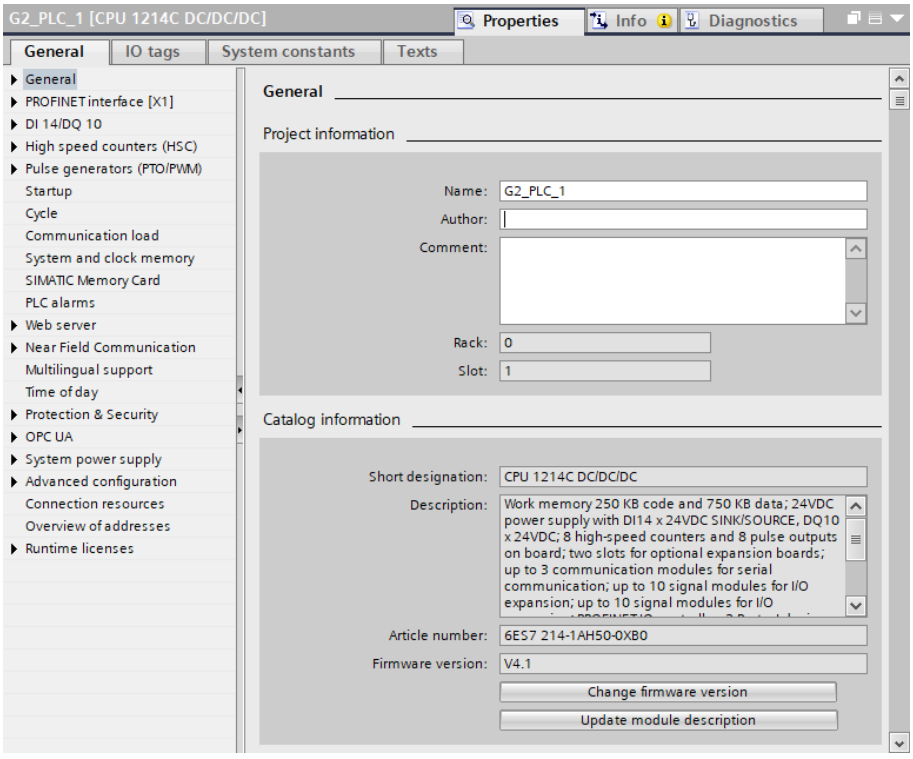


Table 1-177 CPU properties

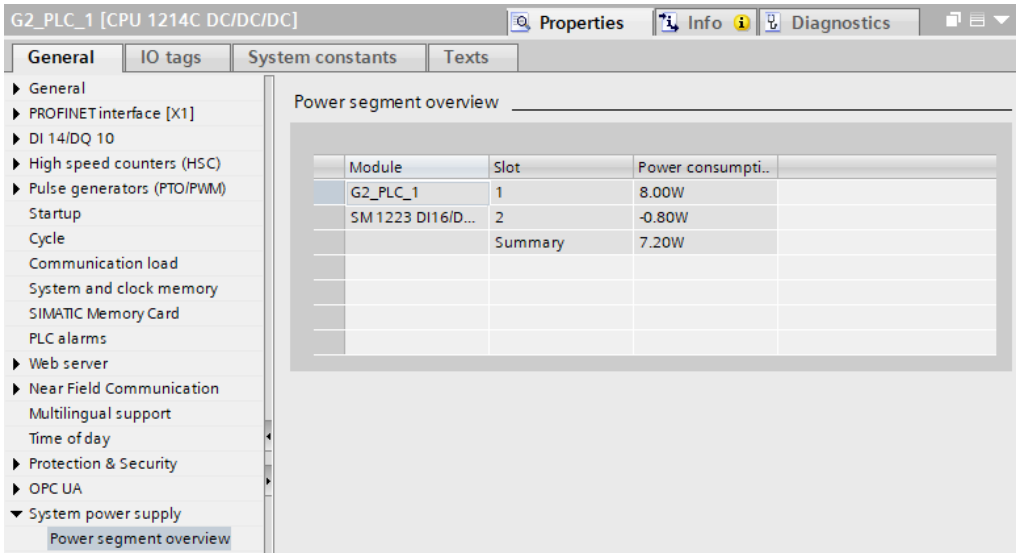
Property	Description
General	Contains Project information, Catalog information, Identification & Maintenance, and Checksums.
PROFINET interface	Sets the IP address and Advanced PROFINET features.
DI and DQ	Configures the behavior of the local (onboard) digital I/O (for example, digital input filter times and digital output reaction to a CPU stop).
High-speed counters (Page 174) and pulse generators (Page 172)	Enables and configures the high-speed counters (HSC) and the pulse generators used for pulse train output (PTO) and pulse-width modulation (PWM). When you configure a digital output of the CPU or signal board (SB) as an HSC Compare output, or as a pulse output for use with PWM, PTO, or motion control instructions, that physical output is now controlled by the HSC or pulse-generator function. The corresponding process-image value is no longer written to that physical output; changes to the process image will be ignored by a physical output assigned to an HSC or pulse generator.

[1] If you disable access control, every user has full access to the CPU without a password. You are essentially granting users "Full access (no protection)" (if using a standard CPU) or "Full access incl. fail-safe (no protection)" (if using an F-CPU). Users can access most CPU functions. Because of this, Siemens recommends disabling access control only during commissioning and that only authorized persons have access to the CPU during this phase.

Property	Description
Startup (Page 99)	**Startup after POWER ON:** Selects the behavior of the CPU following an off-to-on transition, such as to start in STOP mode or to go to RUN mode after a warm restart.
	Comparison preset to actual configuration: Specifies the startup characteristics of the CPU for situations in which the actual configuration of the S7-1200 G2 station does not correspond to the preset configuration: • Startup of the CPU only if compatible • Startup of the CPU even if mismatch A module in the configured slot must be compatible with the configured module. Compatible means that the module that is present matches the number of inputs and outputs and must match with respect to its electrical and functional properties. It may be more capable, but not less capable. Beginning with S7-1200 G2 firmware version V4.1, this setting applies to configurations with missing SMs, SBs, CMs, CPs, or CBs.
	Configuration time: Specifies a maximum amount of time (default: 60000 ms) in which the local I/O and distributed I/O must start up. (The CMs receive power and communication parameters from the CPU during startup. This assignment time allows time for the I/O connected to the CM to be brought online.) The CPU goes to RUN as soon as the local I/O and distributed I/O have started and are ready for operation, regardless of the assignment time. If the local I/O and distributed I/O have not been brought online within this time, the CPU still goes to RUN--without the local I/O and distributed I/O.
Cycle (Page 120)	Defines a maximum cycle time or a fixed minimum cycle time.
Communication load	Allocates a percentage of the CPU time to be dedicated to communication tasks.
System and clock memory (Page 125)	Enables a byte for "system memory" functions and enables a byte for "clock memory" functions (where each bit toggles on and off at a predefined frequency).
SIMATIC Memory Card	Allows you to configure the CPU to determine when the SD card has aged to a configured percentage value. You can select the "Aging of the SIMATIC Memory card" checkbox to configure the threshold value percentage. You can use the GetSMCInfo instruction to check the SIMATIC memory card against this configured value.
PLC alarms	Enables central alarm management, allowing the CPU to transfer alarm text to the HMI device.
Web server (Page 300)	Enables and configures the Web server feature.
Near Field Communication (Page 299)	Enables reading data from a supported CPU with the S7-1200 G2 NFC app.
Multilingual support	Assigns a project language for the device and the Web server to use for displaying diagnostics buffer entry texts for each of the possible Web server user interface display languages.
Time of day	Selects the time zone and configures daylight saving time. Allows for Time Synchronization across plant components.
Protection & Security	**Protection of the PLC configuration data** (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/141646478219_enUS.htm&ft:clusterId./10866368523/141646478219.htm): Allows for password protection of confidential PLC configuration data.

[1] If you disable access control, every user has full access to the CPU without a password. You are essentially granting users "Full access (no protection)" (if using a standard CPU) or "Full access incl. fail-safe (no protection)" (if using an F-CPU). Users can access most CPU functions. Because of this, Siemens recommends disabling access control only during commissioning and that only authorized persons have access to the CPU during this phase.



Property	Description
Protection & Security	**Access control**: Allows for disabling or enabling access control and, optionally, access levels.[1]
	Lockout of user account at runtime: Allows for the configuration of settings for the lockout of user accounts following a failed login attempt.
	Connection mechanisms (Page 209): Permits access with PUT/GET communication from a remote partner when the Anonymous user is enabled. Allows for configuration of secure PG/HMI certificate-based communication.
	Certificate manager (Page 209): Enables certificate-based security settings for global or partner devices.
	Syslog: Allows for the logging and non-retentive storage of critical operations event messages.
	Security event: Details important actions and events in the diagnostics buffer which can trigger group alarms.
	External load memory: Allows for the disabling of copying from internal to external load memory.
OPC UA	Enables access to the PLC as an OPC UA server and allows for the configuration of security settings through security policies and certificates on the server.
System power supply (Page 161)	Enables automatic calculation of power consumption by providing an overview of power segments representing each configured module.
Advanced configuration	Contains: • Hostname and domain - Assign the name or IP address of the host computer and activate the domain configuration in STEP 7. • DNS configuration (Page 203) - Configure the DNS server address. • SNMP (Page 203) - Activate SNMP (Simple Network Management Protocol).
Connection resources (Page 207)	Provides a summary of the communication connection resources that are available for the CPU and the number of connection resources that have been configured.
Overview of addresses	Provides a summary of the I/O addresses that have been configured for the CPU.
Runtime licenses	Allows for the selection of runtime licenses that enable the CPU to act as an OPC UA server.

[1] If you disable access control, every user has full access to the CPU without a password. You are essentially granting users "Full access (no protection)" (if using a standard CPU) or "Full access incl. fail-safe (no protection)" (if using an F-CPU). Users can access most CPU functions. Because of this, Siemens recommends disabling access control only during commissioning and that only authorized persons have access to the CPU during this phase.

You can learn more about the above CPU properties by referring to the related device configuration topics in the TIA Portal Information System.

5.6.5.1 Configuring the system power supply

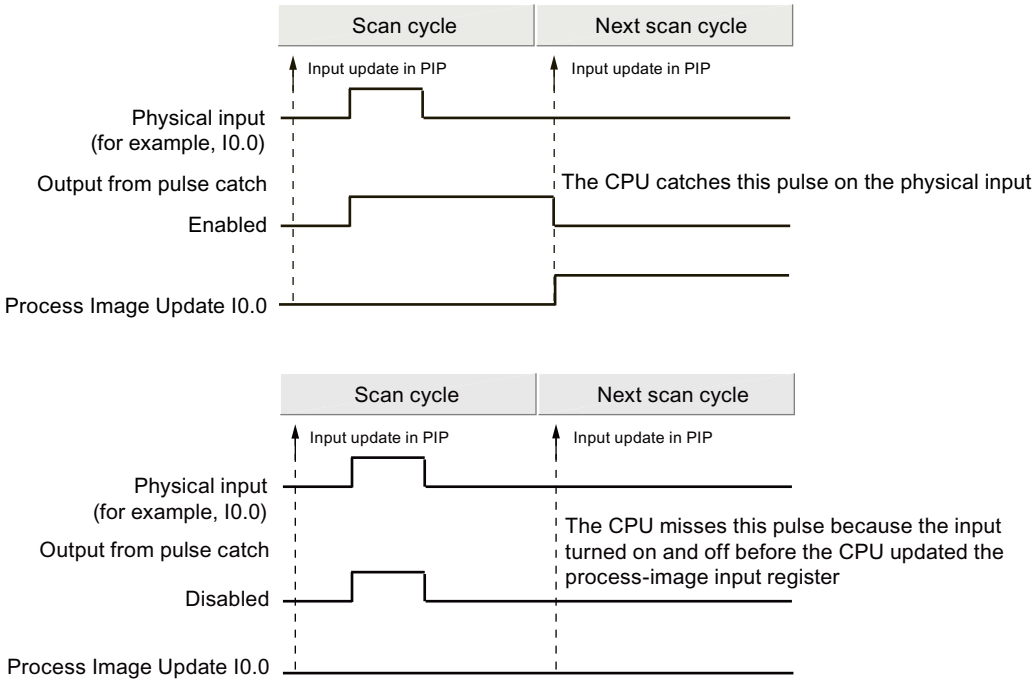
As you add modules to your configuration of the S7-1200 G2, TIA Portal automatically calculates your overall power consumption (Page 66). This enables you to anticipate the energy needs of a given physical device configuration.

You can configure the Sensor Supply wired interface to suit your application.

5.6.5.2 Pulse catch

The S7-1200 G2 CPU provides a pulse catch feature for digital input points. The pulse catch feature allows you to capture high-going pulses or low-going pulses that are of such a short duration that they would not always be seen when the CPU reads the digital inputs at the beginning of the scan cycle (Page 97).

Enabling pulse catch

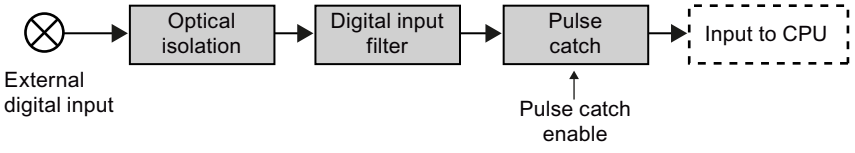


To enable pulse catch for a digital input, follow these steps:

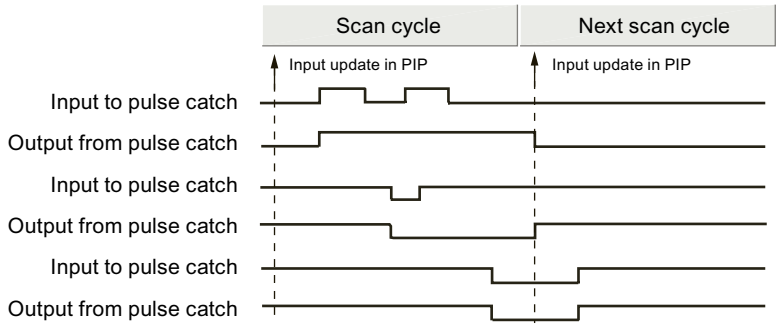
1. Select "Digital inputs" in the Inspector window.
2. Select the desired channel.
3. Select "Enable pulse catch."

Basic operation of pulse catch

When you enable pulse catch for an input, a change in state of the input is latched and held until the next input cycle update. This ensures that a pulse that lasts for a short period of time will be caught and held until the CPU reads the inputs.



The figures below show the basic operation of the S7-1200 G2 CPU with and without pulse catch enabled:



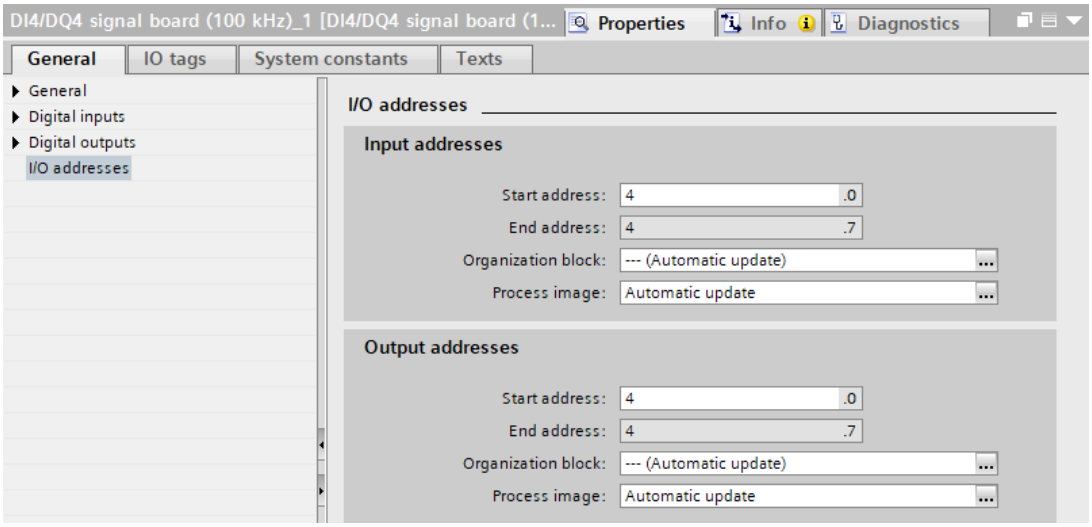
NOTE

Because the pulse catch function operates on the input after it passes through the input filter, you must adjust the input filter time so that the filter does not remove the pulse.

The figure below shows a block diagram of the digital input circuit:

The figure below shows the response of an enabled pulse catch function to various input conditions. If you have more than one pulse in a given scan, only the first pulse is read. If you have multiple pulses in a given scan, you should use the rising/falling edge interrupt events:

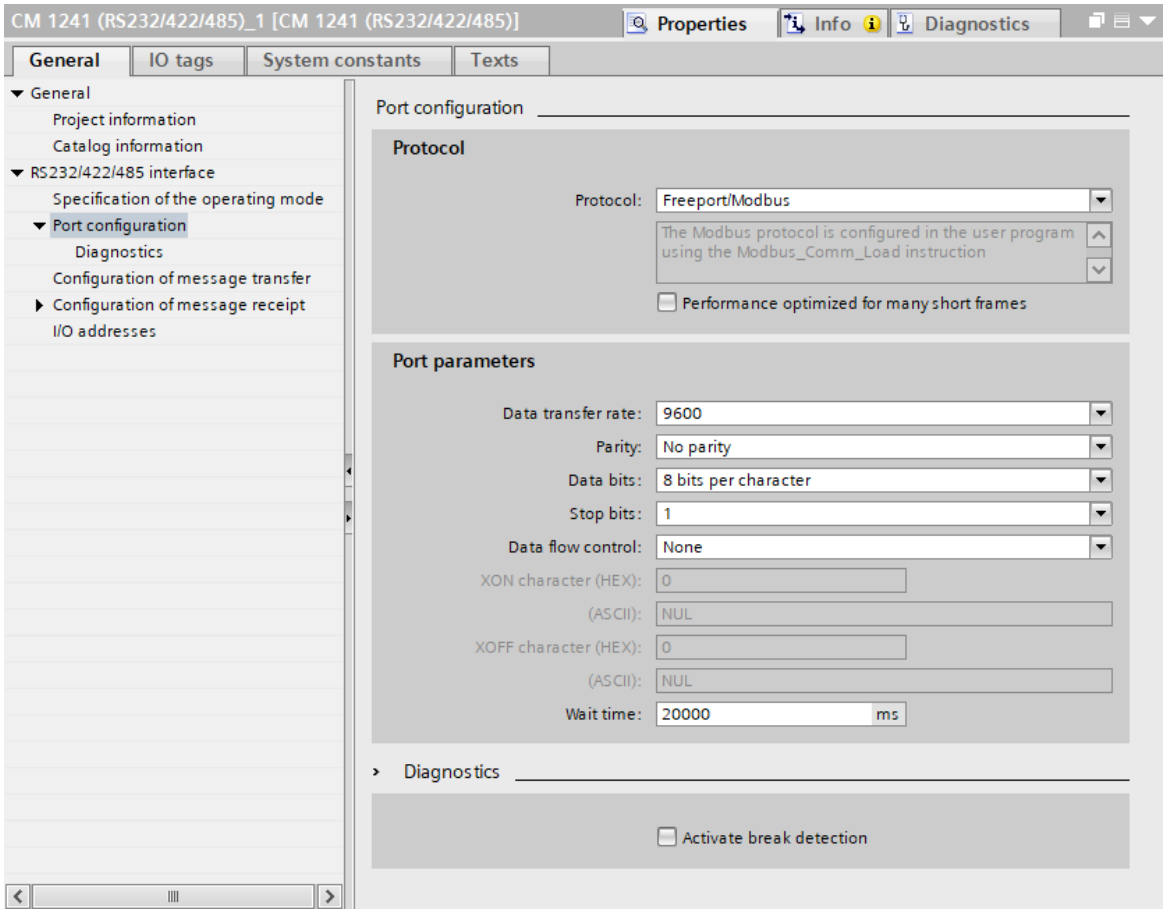
5.6.6 Configuring the parameters of the modules



STEP 7 enables you to configure the inputs and outputs of devices connected to your S7-1200 G2 CPU on the network. You can assign values to both analog and digital I/O to accomplish tasks such as "pulse catch", to update process image partitions, or to monitor diagnostic functions.

To configure the operational parameters for the modules, select the module in the Device view and use the "Properties" tab of the inspector window.

Configuring a signal module (SM) or a signal board (SB)

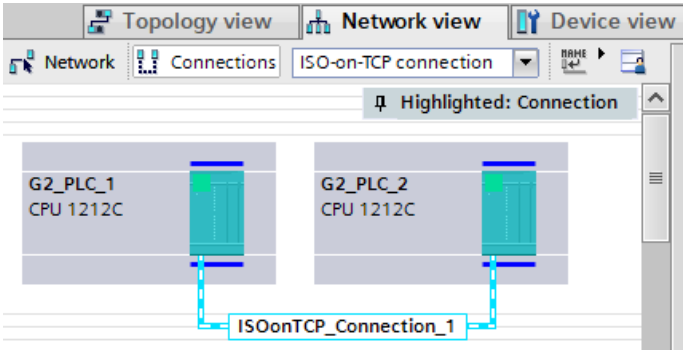


The device configuration for signal modules and signal boards provides the means to configure the following:

- Digital I/O: You can configure inputs for rising-edge detection or falling-edge detection (associating each with an event and hardware interrupt) or for "pulse catch" (to stay on after a momentary pulse) through the next update of the input process image. Outputs can use a freeze or substitute value.
- Analog I/O: For individual inputs, you can configure parameters such as measurement type (voltage or current), range, and smoothing, as well as enable underflow or overflow diagnostics. Analog outputs provide parameters such as output type (voltage or current) and for diagnostics, such as short circuit (for voltage outputs) or upper/lower limit diagnostics. You can configure the ranges of analog inputs and outputs in engineering units in your program logic.
- I/O addresses: You can configure the start address for the set of inputs and outputs of the module. You can also assign the inputs and outputs to a process image partition (PIP) or to automatically update, or to use no process image partition. See "Execution of the user program" (Page 97) for an explanation of the process image and process image partitions.

Configuring a communication module (CM)

You can configure the parameters for point-to-point communication modules (CMs) on the network.

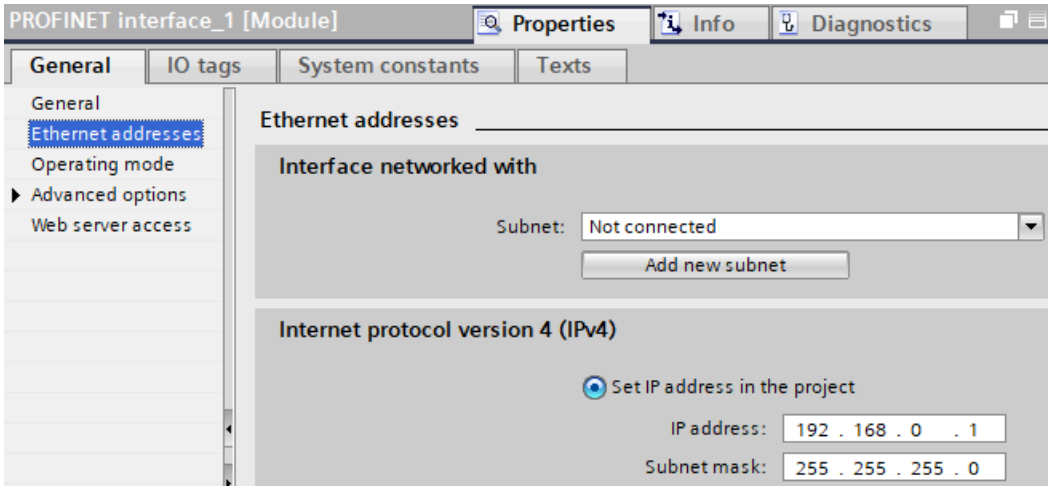


5.6.7 Configuring the CPU for communication

The S7-1200 G2 is designed to solve your communications and networking needs by supporting both simple and complex networks. The S7-1200 G2 also provides tools that allow you to communicate with other devices, which might use their own communications protocols.

Creating a network connection

Use the "Network view" of Device configuration to create the network connections (Page 212) between the devices in your project. After creating the network connection, use the "Properties" tab of the inspector window to configure the parameters of the network.



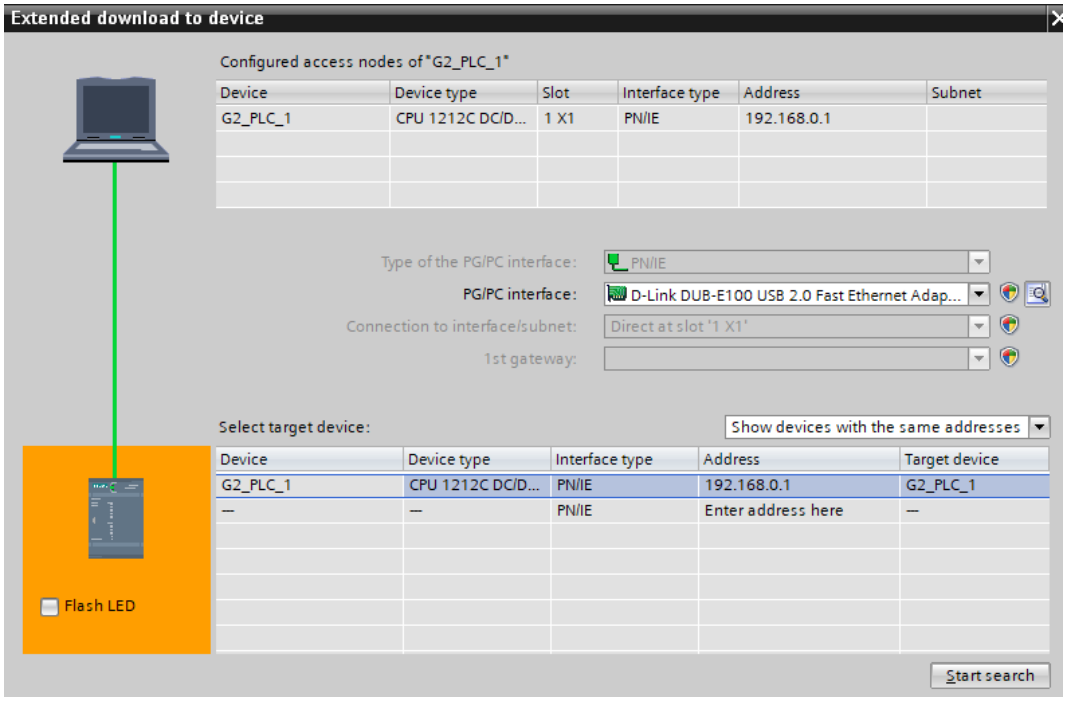
The S7-1200 G2 CPU supports the following connections:

- S7 connection (Page 252)
- ISO-on-TCP connection (Page 225)
- TCP connection (Page 224)
- UDP connection (Page 225)
- HMI connection (PLC to an HMI) (Page 209)

Assigning the IP address and Subnet

The S7-1200 G2 CPU does not have a pre-configured IP address. You must manually assign an IP address (Page 217) for the CPU in the Properties Tab under "General > Ethernet addresses".

To make a connection to your CPU, your chosen network interface and the CPU must be on the same class of network and on the same subnet. You can either set up your network interface to match the default IP address of the CPU, or you can change the IP address of the CPU to match the network class and subnet of your network interface.



Configuring the Local/Partner connections

For the TCP, ISO-on-TCP, and UDP Ethernet protocols, use the "Properties" of the instruction (TSEND_C, TRCV_C, or TCON) to configure the "Local/Partner" connections (Page 213).

Downloading to the CPU

After configuration, download your STEP 7 project to the CPU to test the PROFINET network (Page 221). The download operation sets all IP addresses for devices configured as "Set IP address in the project".

5.6.8 Time synchronization

The objective of time synchronization of the time-of-day clocks is to have one master clock that synchronizes all other local clocks. The master clock synchronizes the local clocks initially and also periodically re-synchronizes the clocks to avoid the effects of drift over time.

In the case of the S7-1200 G2 and its local base components, only the CPU has time-of-day clocks that might need to be synchronized. You can configure the CPU's time-of-day clock to be synchronized to an external master clock. The external master clock might supply the time of day using an NTP server.

Setting the time-of-day clock

There are multiple ways to set the time-of-day clock in the S7-1200 G2 CPU:

- Using the NTP server (Page 223)
- Using STEP 7
- From the user program
- Using an HMI panel
- From the SIMATIC Automation Tool
- From the Web server

By default, time synchronization using the NTP server to change the CPU's clock is disabled.

You can select the update interval using the NTP server. The update interval of the NTP server is set to 10 seconds by default.

When you activate time synchronization in a module, STEP 7 prompts you to select the "CPU synchronizes the modules of the device", if you have not already selected the check box in the CPU's "Time synchronization" dialog. STEP 7 also warns you if you configured more than one master clock source for time synchronization.

⚠ WARNING

Risk of attacker accessing your networks through open interfaces
If an attacker can access your networks through open interfaces, such as software like STEP 7 or SAT, or through an HMI, the attacker can possibly disrupt control of your process by shifting the CPU system time.
The S7-1200 G2 CPU supports "time of day" interrupts and clock instructions that depend upon accurate CPU system time. You must restrict access to the CPU by enabling access control and disabling the "Anonymous" user. Failure to do so can cause a security breach that allows an unknown user to disrupt control of your process by shifting the CPU system time. Disruptions to process control can possibly cause death, severe injury, or property damage.
For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Website.

NOTE

Receiving time synchronizations for the CPU from more than one source could cause conflicting time updates. Time synchronizations from multiple sources could adversely affect instructions and events based on time of day.

5.7 Compatibility between STEP 7 versions and the S7-1200 G2 CPU

TIA Portal versions V20 and later support configuration and programming of the S7-1200 G2 CPU. Older versions of the TIA Portal do not support the S7-1200 G2 family.

Working with an older project and adding S7-1200 G2 CPUs

You might want to add S7-1200 G2 CPUs to an existing application that uses other CPUs and that was created in an older version of the TIA Portal. To do this, you will need a TIA Portal V21 project.

You can open a V14 or later project in the latest version of the TIA Portal and upgrade the project to the latest TIA Portal version. The TIA Portal dialogs guide you in upgrading the project if it is possible. You can then add the S7-1200 G2 CPUs for your application and perform these tasks in the TIA Portal:

1. Configure the S7-1200 G2 devices.
2. Program the logic for the S7-1200 G2 CPUs.
3. Download the hardware configuration and software to the S7-1200 CPUs.

⚠ WARNING

Risks with editing and executing program logic from versions older than TIA Portal V13
Do not attempt to upgrade a project that is older than V14 to the current version by copying program logic from one CPU to an S7-1200 G2 CPU.
You must first open the older project in TIA Portal V14 and upgrade the project to V14. Then you can open the latest version of the TIA Portal and upgrade the project from V14 to the current TIA Portal version.
Executing STEP 7 program logic that you copied from an older version to a newer version can cause unpredictable program behavior and can result in death or severe personal injury.

Migrating program logic from an S7-1200 CPU to an S7-1200 G2 CPU

If you want to migrate existing program logic from an S7-1200 CPU to an S7-1200 G2 CPU, note that there is no device exchange from any type of CPU to an S7-1200 G2 CPU. Note also that the instruction set and library support in S7-1200 G2 has differences from other CPU families. To migrate program logic from an S7-1200 CPU to an S7-1200 G2 CPU, follow these steps:

1. Add an S7-1200 G2 CPU to the upgraded project that has S7-1200 CPUs and configure the device. Be sure to observe the Warning above when upgrading a project.
2. Copy the program blocks (Page 95) from the S7-1200 CPU to the program blocks of the S7-1200 G2 CPU.
3. Create and edit any PLC tag tables that you need.
4. Attempt to compile the program, choosing "rebuild all" for both hardware and software.
5. Resolve any memory and I/O addressing differences between the two CPUs. Resolve any instruction differences between the two CPUs. Continue resolving compiler errors until the program compiles.

TIA Portal Add-ins (https://support.industry.siemens.com/cs/us/en/view/109773999) might also be useful in program migration.

5.8 Instruction set

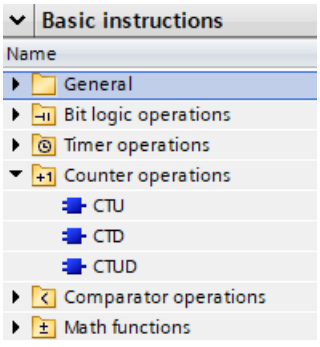
5.8.1 Supported programming languages

STEP 7 provides the following standard programming languages for the S7-1200 G2:

- LAD (ladder logic) is a graphical programming language. The representation is based on circuit diagrams.
- FBD (Function Block Diagram) is a programming language that is based on the graphical logic symbols used in Boolean algebra.
- SCL (structured control language) is a text-based, high-level programming language.
- CEM (Cause-Effect-Matrix) for programming Function Blocks (FBs)

When you create a code block (Page 95), you select the programming language for that block.

The STEP 7 program can utilize code blocks created in any or all of the programming languages.



See the STEP 7 Information System for information on any of the programming languages.

5.8.2 Instructions for programming the PLC

STEP 7 provides instructions to program your S7-1200 G2 PLC. Categories and folders differ based on your programming language. The LAD Programming language presents instructions in the following main categories:

- Basic
- Extended
- Technology
- Communication
- Optional Packages

Folders under each main category list the instruction group as shown in the example below:

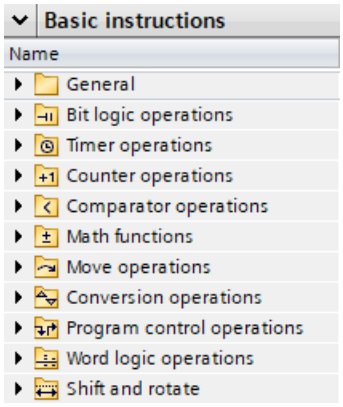
To find more information about each instruction and its use, follow these steps:

1. Open a program block to display the Instruction task card.
2. Expand an instruction group.
3. Do one of the following:
   - Select the individual instruction and press F1.
   - Hover over an individual instruction to reveal a TIA Portal tooltip. If you click the tooltip, or continue to hover over the instruction, a cascading tooltip provides a link to the corresponding instruction topic in the TIA Portal Information System.

You can access the TIA Portal Information System in one of the following ways:

- Select “Help” in the Portal view.
- Select the “Help > Show help” menu command in the Project view.

There you can find information on programming and instructions (https://docs.tia.siemens.cloud/access?ft:originId=./16544462091/16544462091_enUS.htm&ft:clusterId./16544462091/16544462091.htm).



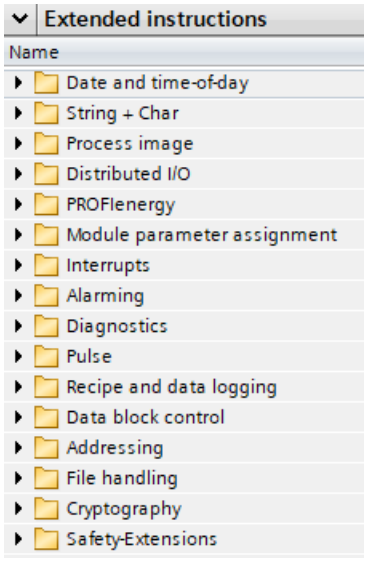
NOTE

Choosing an instruction by PLC family

If the TIA Portal Information System presents an instruction differently within the tooltips or table of contents based on PLC family, follow the S7-1500 option for the instruction topic.

5.8.3 Basic instructions

Basic Instructions are instructions that you use often and include the following folder groups:



Instructions in these folders allow you to do the following:

- General - Add a network and connect network elements.
- Bit logic operations - Perform Boolean logic.
- Timer operations - Delay actions and measure elapsed time.
- Counter operations - Count internal program or external process events.
- Comparator operations - Compare two values or compare a value with a range and use the compare result in Boolean logic.
- Math functions - Perform calculations including integer and floating-point math.
- Move operations - Copy data elements to a new memory address and convert from one data type to another.
- Conversion operations - Convert from one data type to another, perform scaling, and round a floating-point number to the nearest integer.
- Program control operations - Control program sequence including jumps, retrigger cycle monitoring timer, and STOP the PLC.
- Word logic operations - Compare two values, bit by bit, using Boolean logic.
- Shift and rotate - Shift or rotate a value right or left by a specified number of bits.

5.8.4 Extended instructions

Extended instructions allow for more possibilities and include the following folder groups:

Instructions in these folders allow you to do the following:

- Date and time-of-day - Manipulate and compare time values. Set and read local time and system time.
- String + Char - Create, convert, and manipulate strings and characters. Search for, replace, insert, or append substrings.
- Process image - Update or synchronize the process image inputs or outputs.
- Distributed I/O - Exchange information with distributed I/O using read and write records.
- PROFIenergy - Activate or deactivate energy-saving states in lower-level PROFIenergy devices.
- Module parameter assignment - Read and write parameter records to modules.
- Interrupts - Control runtime aspects of interrupt events. Attach and detach OBs to interrupt events.
- Alarming - Generate program alarms and user diagnostic alarms.
- Diagnostics - Read status and diagnostic information. Generate diagnostic information for third-party components.
- Pulse - Control pulse width modulation (PWM) and pulse train output (PTO) functions.
- Recipe and data logging
  - Import and export recipes
  - Create, open, write, clear, close, and delete data logs (See "Working with data logs" below.)
- Data block control - Create a new data block in load or work memory. Transfer data between data blocks.
- Addressing - Convert module addresses among these options:
  - IO address
  - Hardware identifier
  - Slot
- File handling - Create a file on a memory card; write to and read from this file.

- Cryptography - Generate a random number. Perform encoding and decoding.
- Safety-Extensions - Acknowledge warning message about exceeding the F-cycle time.

Working with data logs

The TIA Portal Information System documents data logging at this path: Information System > Programming a PLC > Instructions > Instructions (S7-1200, S7-1500) > Extended instructions > Recipes and data logging > Data logging

In addition, be aware of this information when working with data logs:

NOTICE
Recommended frequency for write operations when using data logs When using data logs in internal or external load memory, a high frequency of write operations can affect the S7-1200 system negatively. To ensure the overall performance and robustness of your system, limit write operations to every 200 ms or longer. Exceeding this limit can shorten the lifespan of the memory card or internal flash.

NOTE

Data log management

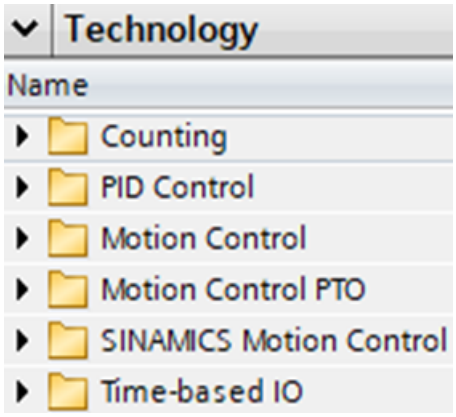
Keep no more than 1000 data logs in a file system. Exceeding this number can prevent the Web server from having enough CPU resources to display the data logs.

Manage your data logs to ensure that you only keep the number that you need to maintain, and do not exceed 1000 data logs.

NOTE

Editing data logs on the memory card

You can copy data logs from a memory card using a PC card reader. Do not change them or delete them using a PC card reader.



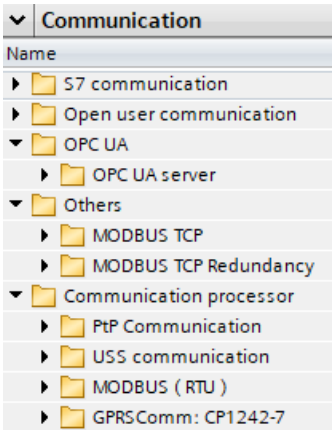
To delete, download, or display data logs use one of the following methods:

- SIMATIC Automation Tool
- DataLogDelete instruction
- Web API (Page 300) methods "DataLogs.DownloadAndClear", "Files.Browse", "Files.Download" and supporting code as documented for displaying data logs.

If you open the file system of the memory card in the File explorer, you run the risk of accidentally deleting or changing a data log or other system files, potentially damaging files or making the memory card unusable.

5.8.5 Technology instructions

Technology Instructions allow you to perform technological functions and include the following folder groups:

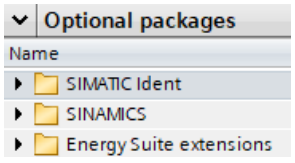


Instructions in these folders allow you to do the following:

- Counting - Control high-speed counter (HSC) functions such as counting and frequency measurement.
- PID Control - Control proportional-integral-derivative (PID) functions.
- Motion Control - Initiate absolute or relative moves. Perform homing and jog operations.
- Motion Control PTO - Power, reset, move, halt, home, and manage parameters for motion axes controlled via Pulse Train Output (PTO).
- SINAMICS Motion Control - Control stepper motors and servo motors. Coordinate motion axes.
- Time-based IO - Precisely monitor digital input state changes. Precisely control digital output state changes.

5.8.6 Communication instructions

Communication Instructions provide for communication using various network protocols and include the following folder groups:



Instructions in these folders allow you to do the following:

- S7 Communication – Read data from or write data to a remote CPU using S7 protocol.
- Open user communication - Establish and terminate communication connections, send and receive data, send emails.
- OPC UA (server) - Define custom logic and actions that execute before and after a client calls an OPC UA server method.
- Others -
  - MODBUS TCP - Exchange data using Modbus TCP protocol (client or server) over the PROFINET interface.
  - MODBUS TCP Redundancy - Establish and manage redundant TCP communication connections between clients and servers.
- Communication Processor - Control serial communications such as point-to-point (PtP), Universal Serial Interface Protocol (USS), and Modbus Remote Terminal Unit (Modbus RTU).

5.8.7 Optional instructions

Optional Instructions provide additional functionality and include the following folder groups:

Instructions in these folders allow you to do the following:

- SIMATIC Ident - Interface with Siemens radio-frequency (RF) and optical identification systems.
- SINAMICS - Control Siemens variable-frequency drives (VFD).
- Energy Suite extensions - Calculate energy data. Create an energy report as a data log.

Protection

6

6.1 Overview of the protection functions

Advantages and customer benefits of protection functions

The protection functions listed protect your investments from unauthorized access and manipulation, helping to secure plant availability.

Protection functions

To set up secure networks, the SIMATIC S7-1200 G2 automation system offers an integrated security concept:

Table 1-178 Overview of protection functions

Protection function	Description
Integrity protection	The CPUs come with integrity protection functions as standard. These help detect any manipulations in the following: • Engineering data on the SIMATIC Memory Card • Engineering data during data transfer between TIA Portal and CPU • Engineering data during data transfer between HMI system and CPU • Encrypted firmware
Protection of confidential configuration data	Protection of confidential CPU configuration data (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/141646478219_enUS.htm&ft:clusterId./10866368523/141646478219.htm)
Central user management	Connection of a central server (UMC server) that is responsible for the administration and authentication of users. The central user management UMC (User Management Component) allows management of user groups and users independently of TIA Portal for extensive automation solutions.
Local user management	Management of users, roles, and CPU function rights (User Management & Access Control, UMAC). You can use the local user management in the editor to manage all project users along with their rights, including access rights for project users and roles in the TIA Portal.
Access protection	Protection against unauthorized configuration changes using authorization levels
Know-how protection	Protection against unauthorized access and modifications to algorithms with password protection

You can find more information about security mechanisms of the SIMATIC automation systems in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

Integrity protection of the SIMATIC Memory Card

Integrity protection of the SIMATIC Memory Card depends on the password for protecting confidential configuration data that you assigned during the configuration of the CPU. This results in the following changes when using SIMATIC Memory Cards:

- To transfer a CPU to a card reader/USB memory device with drag and drop:

  You must enter the password of the CPU you want to use with the SIMATIC Memory Card. If you enter an incorrect password, the CPU does not start booting after power on and reports the content of the SIMATIC Memory Card as faulty.
- To insert a CPU from a card reader/USB memory device:

  You must enter the password of the CPU from which the project was loaded. In this case, STEP 7 checks the data on the SIMATIC Memory Card and reports potential damage.

  Entering the password is optional. If you do not want to use the integrity check, you do not need to enter the password to restore the project.

You can select whether you also want to protect the entire configuration of the CPU in addition to protecting the configuration data. The data is encrypted and stored in the SIMATIC.S7S folder on the SIMATIC Memory Card and can only be decrypted with the password for the protection of confidential configuration data.

If you remove or add the setting for the protection of all data, the SIMATIC.S7S folder on the SIMATIC Memory Card remains formatted the next time it is loaded onto the CPU. Other files, for example, recipes or backup files on the SIMATIC Memory Card, are not formatted. After formatting, the CPU performs a restart.

You can find more information about the folder structure on the SIMATIC Memory Card in the "Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101)" Function Manual.

Secure communication

There is an increasing need to transfer data to external computers in encrypted form via Intranet or public networks.

SIMATIC S7-1200 G2 CPUs support the Internet PKI (RFC 5280) with STEP 7. This makes the configuration and the operation of secure communication possible, for example:

- Hypertext Transfer Protocol Secure (HTTPS)
- Secure Open User Communication
- Secure communication with OPC UA

A public key infrastructure (PKI) can issue, distribute, and check digital certificates. For S7-1200 G2 CPUs, you create certificates for various applications in the CPU properties in STEP 7, for example, TLS certificates for Secure Open User Communication, Web server certificates, or OPC UA certificates.

SIMATIC S7-1200 G2 CPUs, together with STEP 7 and WinCC, support innovative and standardized secure PG/PC and HMI communication.

Further measures for protecting the CPU

The following measures additionally increase the protection against unauthorized access to functions and data of the S7-1200 G2 CPU from external sources and through the network:

- Deactivation of the Web server
- Disabling the OPC UA server

You can find more information on the security mechanisms for OPC UA server in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

- Deactivation of the time synchronization via an NTP Server
- Deactivation of the PUT/GET communication
- Deactivation of SNMP

When you use the Web server, protect your S7-1200 G2 automation system against unauthorized access by doing the following:

- Set password-protected access rights for specific users in the user administration.
- Use the pre-set option "Permit access only via HTTPS".

The option allows access to the Web server only with the secure hypertext transmission protocol HTTPS.

When you use the OPC UA server, protect your S7-1200 G2 automation system against unauthorized access by doing the following:

- Do not set up OPC UA server access for the "Anonymous" user.
- Disable the "Automatically accept client certificates during runtime" option

Security functions in communications processors

Communication processors support security functions, such as access protection using a firewall, protection against data manipulation using VPN, FTPS, HTTPS, SNMPv3, and secure NTP.

More information

You can find more information on the protection functions described in the TIA Portal Information System.

Siemens products and solutions are only one element of a comprehensive industrial security concept. Observe the additional information on Industrial Security (http://www.siemens.com/industrialsecurity).

6.2 Protection of confidential configuration data

You can assign a password for protecting confidential configuration data of a CPU, such as private keys that are required for the proper functioning of certificate-based protocols.

You can find detailed information on protecting confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual.

6.3 Local user management

6.3.1 Useful information on the local user administration and access control

The S7-1200 G2 CPUs and TIA Portal provide management of users, roles, and CPU function rights (User Management & Access Control, UMAC).

You can manage all project users along with their rights, including access rights for all CPUs in the projects. In the TIA Portal, navigate to Security settings > Users and roles to manage users, role, and rights.

TIA Portal saves the assignment of the function rights of a CPU to user-defined roles and the assignment of these roles to users for each CPU. There are no system-defined roles with predefined function rights for CPUs.

After loading the configuration, the user management becomes effective in the respective CPUs. After loading, every CPU "knows" who may access which service and execute certain functions.

This new feature is also called "local user management and access control" below.

NOTE

Support of central users and groups for CPU function rights
UMC (User Management Component) can also be used to manage users (Page 150) centrally in TIA Portal. With this component, you can manage central users and groups on connected UMC servers, for example, by connecting an MS Active Directory. The authentication is then implemented via UMC.

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution, but only if you ensure the confidentiality of the user-relevant information.

In addition, the rules for industrial cybersecurity must be observed, for example regarding the "Defense in Depth" security concept, in particular the remarks on plant security and hardening measures.

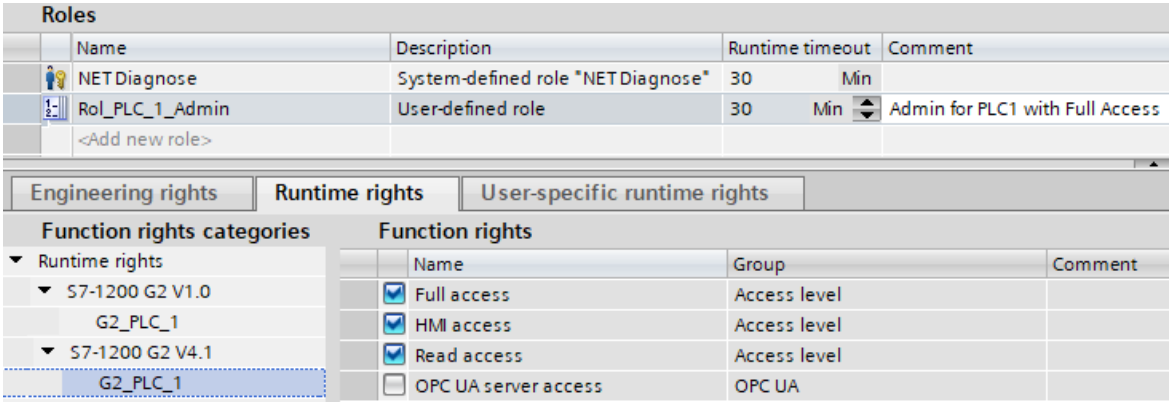
You can find detailed information in the Industrial cybersecurity (Page 21) section.

Users, roles and function rights

Users and roles are managed in the TIA Portal under "Security settings > Users and roles".

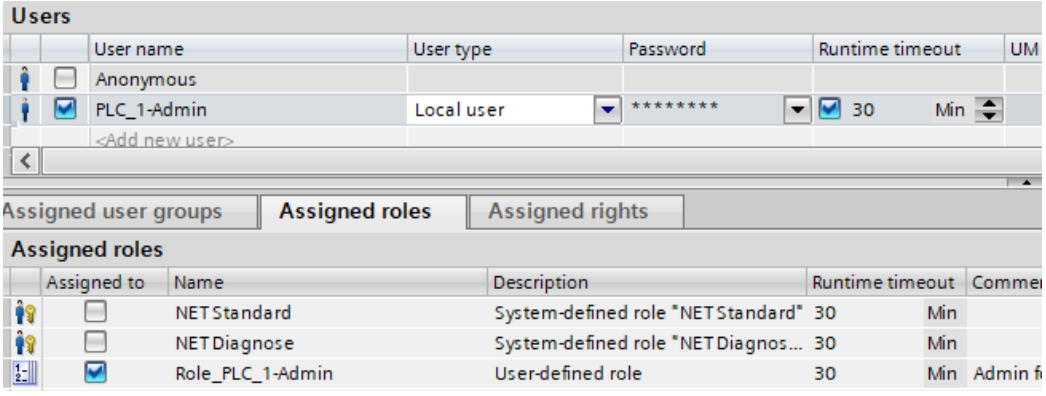
CPU function rights are valid during runtime. These rights are located in the "Runtime rights" tab in the Users and roles editor. For each CPU in the project, there is a section for assigning CPU function rights, which are listed according to CPU services such as PG/HMI communication, Web server, and OPC UA.

In addition to user management for projects, user management possibilities are available for the following:



- OPC UA server users (authentication)
- Web server users (authentication and access control)

Local user management and access control



Use "Security settings > Users and roles" in the TIA Portal project tree to manage all users, roles, and CPU function rights. User management also enables you to set access protection (Page 182) for engineering/HMI access.

As with engineering rights, you use role assignments for combining individual function rights. You can assign these roles to individual users. You can see the function rights that are assigned to user from user roles for a specific CPU in the "Assigned rights" tab.

The following example shows the available and activated function rights of a CPU. At least one user must have full access to the CPU. Otherwise, the configuration cannot be compiled. A role with full access to the CPU must be created for this.

In this example, the "PLC_1-Admin" user has a role ("Role_PLC_1-Admin") that provides full access to PLC "G2_PLC_1".

Requirement

To make use of users, roles and function rights for a CPU, the "Enable access control" option must be selected in the "Protection & Security > Access control" area.

In the "Configuration of user management" area, the "Local user management" option is preset, whereby the users are loaded to the CPU.

If you select the "Central user management" option, you must add additional parameters such as the UMC server address and server ID.

No project protection is required for user management (Page 150).

Default characteristics

The "Activate access control" option is preset for access control. Users can be configured with their assigned passwords and their roles and function rights.

Downloading to device

If you want to download changes to the user configuration in RUN mode, the hardware configuration in the CPU and in the STEP 7 project must be unchanged. Otherwise, a transition to STOP is required to download the user configuration together with the changed hardware configuration.

To download in RUN mode, save your STEP 7 project and then configure only the desired changes in the user configuration prior to loading the project into the CPU.

You can only download changes to access rights for the "Anonymous" user in STOP mode.

For an F-CPU, only a user with the runtime right "Full access incl. fail-safe (no protection)" can download a STEP 7 project. Otherwise, STEP 7 displays an error message when loading the configuration.

Explanations of the options for the user management download (Load preview):

- If you select the option "Keep online user management data", the local user management is not downloaded to the CPU.
- If you select the option "Download all user management data (reset to project)", all passwords changed online via WebAPI are deleted. After the download, the configured local user data is valid.
- If you select the option "Update user management data, but keep online passwords" and have not changed existing user names, the passwords changed online via WebAPI are retained. Only changes to function rights and/or roles take effect. Newly configured users are downloaded with their settings and deleted users are no longer available after the download to the CPU.

If you have changed a user name in the project and assigned a password to this user in the project, this setting becomes valid after the download. The previously valid user name in the online CPU is deleted during the download.

Runtime timeout

You can set a runtime timeout for both the role and the user in "Security Settings > Users and Roles".

For a S7-1200 G2 CPU, these settings are taken into account by the various services as follows:

- From the Web API you can, for example, create a Web page or application that takes the settings for the runtime timeout into account. Standard web pages do not take the settings for runtime timeout into account and use the default value.
- The other services (PG/HMI communication and OPC UA server) do not use the runtime timeout. The logged-in user is not logged out after the set time.

6.3.2 Advantages of the local user administration and access control

Quick activation/deactivation of local user management

The options for user administration are located in the "Protection & Security > Access control" tab:

- Access control deactivated: Every user has full access to all functions.

  ⚠ WARNING

  Disabling access control
  Disabling access control carries the risk of unauthorized access to the CPU.
  Only disable access control in a protected environment, such as during commissioning.
  Unauthorized access can cause death, personal injury, or property damage.

- Access control enabled: The configured users with their assigned roles and associated function rights become effective after loading.

Access protection and user authentication for PG/HMI access

In addition to assigning passwords for access levels for S7-1200 G2 CPUs, you can configure users with corresponding function rights for the CPUs.

In the TIA Portal project tree, you can configure protection for the project and password settings for runtime and engineering. From Security settings > Users and roles (Page 150), you can configure users for each CPU with designated roles and rights.

Powerful password functions

TIA Portal together with the CPU provide powerful password functions:

- Support for compliance with complexity rules for password creation:

  At the password creation stage, you can have the TIA Portal check for compliance with complexity rules, such as rules on password length, uppercase/lowercase letters (project tree, "Security settings > Settings" area).

  The complexity rules are also saved in the CPU when the user management is loaded. When the password is changed online, the CPU determines and considers these rules. This prevents a user from overriding the complexity rules set by the configuration engineer and assigning a non-secure password.

- The period of validity of passwords is adjustable:

  To ensure that a user does not have access to the CPU with a compromised password for an unlimited time, you can parameterize a period of validity. Before the period of validity expires, the remaining time is then displayed on login so that each user has the possibility to change their password in time.

Loading the user management during operation

You can load certain security-relevant configuration data in both STOP and RUN modes. This means that loading the hardware configuration does not necessarily lead to a CPU STOP.

You can download the following hardware configuration changes in STOP or RUN mode:

- Local user management extensions/changes
- TIA Portal-configured certificate modifications
- Syslog configuration changes

If you made additional changes to the hardware configuration (for example, modules added, parameters reassigned, or others), then the CPU automatically requests STOP mode before loading the configuration.

For example, if you load just one user with modified roles/function rights to the CPU, this process does not require the CPU to be in STOP mode.

The preview dialog for loading contains a security area so that you can determine how the CPU should deal with user data that has changed. (This is not applicable for loading for the first time). This allows changes to user data, for example, password changes during runtime, to be retained.

Loading the device as a new station - with user data

If you load a previously configured CPU into a new project, the user data is also loaded into the project and is available for further editing of the CPU settings.

Changing of passwords during operation

You can use the Web server API to write an application with which each user can change their password at runtime, provided that the original password was entered correctly and the new password corresponds to the password guidelines.

Requirement: You have enabled access control for the CPU.

Users can change their own password at any time, even if the password has expired. If the password has expired, the user must change the password. Login is not possible with an expired password.

API methods used:

- Api.ChangePassword
- Api.GetPasswordPolicy

You can find more information about the API methods in the Web server Function Manual (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/comprehensive-information/cpu-function-manuals/web-server).

NOTE

Passwords changed at runtime take priority over loaded passwords
If you have changed your password during running operation and subsequently load your project, the password assigned during runtime takes precedence over the password set in the project (default setting).
If you want to overwrite the passwords changed during runtime by loading the project, you have to select the option "Load all user management data (reset to project data)". In this case, **all** passwords changed during runtime will be lost.

6.3.3 Access levels and function rights

Access levels as function rights

From the TIA Portal project, you can add users and roles (Page 150) with the necessary function rights for access control. The assignment between access level and the associated function right is as follows:

- Users who are to have full access must have a role with the function right "Full access", or "Full access incl. failsafe" for F-CPUs.

  You can only compile and load a CPU configuration if at least one user has the function right "Full access" or "Full access incl. failsafe".
- Users who are to have read access must have a role with the function right "Read access".
- Users who are to have HMI access must have a role with the function right "HMI access".

If a user does not have any of these specified function rights, that user has no access to the CPU.

Access levels also follow a hierarchical organization for the corresponding function rights:

- A user with "Full access incl. failsafe" also has "Full access".
- A user with "Full access" also has the function rights "Read access" and "HMI access".
- A user with "Read access" also has the function right "HMI access".

NOTE

Compatibility of the ENDIS_PW instruction
The ENDIS_PW instruction (https://docs.tia.siemens.cloud/access?ft:originId=./10867183243/52385784203_enUS.htm&ft:clusterId./10867183243/52385784203.htm) can only be used to disable or enable passwords for access levels. The ENDIS_PW instruction has no effect on assigned rights for users or roles. When using ENDIS_PW, take care to prevent users from being locked out of access to the CPU (Page 186). (Page 186)

Continuing to use access levels

You can use access level protection only. This is required, for example, for HMI devices that only support access levels and do not yet support assignment of users and roles.

If, for example, you require the configuration of an access level to ensure HMI device access, you must activate the "Use legacy access control via access levels" option in the CPU properties.

NOTE

Users for OPC UA and for the web server

Independent of the access protection, you always have to configure the users (Page 150) for the Web server and OPC UA server.

Restrictions on continued use of the access levels

When using the "Legacy access control" option, you cannot select the access level directly in the table for setting the access levels. You can only set access protection via the function rights of the "Anonymous" user.

The local user "Anonymous" is created in a project by the system by default. With the "Anonymous" user, you determine the behavior of the CPUs in the project for someone who logs in without a user name and password. For security reasons, the Anonymous user is deactivated. You must activate it to use it.

In the CPU properties in the device configuration or in the security wizard when you add a CPU, you can access the editor to provide settings for the "Anonymous" user.

Examples:

- If the "Anonymous" user is deactivated or if the "Anonymous" user is activated and no function rights have been assigned to that user, then nobody can log in without a user name and password. This corresponds to the access level "No access (complete protection").
- If the "Anonymous" user is activated and the "Full access" function right for a CPU is assigned to that user via a corresponding role, the result of this setting is "No protection". You can achieve the same effect with regard to access protection by setting "No access protection" in the "Protection & Security" area of the CPU properties.

Procedure

To activate the "Legacy access control" and set the required access level, follow these steps:

1. In the CPU properties, go to "Protection & Security > Access control".
2. Select the option "Activate access control" and, in addition, select the check box "Use legacy access control via access levels" check box.

   The access level selection cannot be used in this setting. You have to set the access level via the "Anonymous" user of the CPU.

   The "Anonymous" user is deactivated by default. This means that the resulting access level for users without a password is "No access (complete protection)" (default setting).
3. Go to "Security Settings > Users and roles" in the project tree.

4. Activate the "Anonymous" user if you want to set a different access level than "No access (complete protection)". You can assign a role with function rights that grants access to the CPU without password input, only to the activated "Anonymous" user.
5. You cannot assign function rights for a CPU directly to a user. You must first assign a role.

To assign a role, switch to the "Roles" tab and add a new role. Assign a meaningful name, for example, "PLC1-Read-Access-Role". If you assign this role to a user, this user should have read access to PLC1 during operation.

1. Assign the required function right for the access to the CPU with the name "PLC1" to the role "PLC1-Read-Access-Role", in this case "Read access".
2. Switch to the "User" tab and assign the "PLC1-Read-Access-Role" role to the activated "Anonymous" user.

   Result: The "Anonymous" user has read access for PLC1. This means that the access level tables of the CPU "PLC1" in the project are preset to "Read access" (cannot be changed) and users who are not logged in only have read access.

   For full access, or full access including fail-safe, you must configure a password for the full access in the table for the access protection. Users who need full access to the CPU during runtime via an action, for example, because a project is to be loaded onto the CPU, must legitimize themselves for this action with this password.

6.3.4 Important information when using the ENDIS_PW instruction

Using the ENDIS_PW instruction (https://docs.tia.siemens.cloud/access?ft:originId=./10867183243/52385784203_enUS.htm&ft:clusterId./10867183243/52385784203.htm) to disable password access on the S7-1200 G2 CPU requires planning to prevent being locked out from CPU access. Because the S7-1200 G2 CPU does not have a display or keyswitch, like the S7-1500 CPU, if a reset of the CPU occurs where the startup state transitions to STOP mode, the ENDIS_PW instruction cannot run to re-enable passwords. This could cause users to be locked out of access to the CPU.

In versions 4.1 and later of the S7-1200 G2 CPU, existing password locks are removed during the transition from POWER OFF to POWER ON. This was not the case for V1.0.x versions where the passwords remained locked after POWER ON..

The S7-1200 G2 CPU applies configured passwords on power-up of the CPU. To have the passwords disabled after power-up, you must re-run the ENDIS_PW instruction to disable the passwords again.

Preventing unintentional lockout of an S7-1200 G2 CPU

Existing password locks are removed during the transition from POWER OFF to POWER ON of an S7-1200 G2 CPU. This means that it is possible and advisable to prevent unintentional lockout with the help of specific program sequences within your program.

To avoid unintentional lockout, program a time control with either a Cyclic interrupt OB or a timer in
OB 1. This gives you the option of calling the ENDIS_PW instruction in OB1 or the Cyclic interrupt OB relatively quickly after a transition from POWER OFF to POWER ON.

Call ENDIS_PW in the Startup OB to keep as short as possible the time window in which the application is not active and thus ensure that no restrictions exist in the password legitimization. This procedure offers you the greatest possible protection against unauthorized access.

If there has been an accidental lockout, you can omit the call in the Startup OB, by querying an input parameter, for example, and setting a time, for example, ten seconds up to one minute to establish a connection to the CPU before the lock becomes active once again.

If there is no timer in your program code and a lockout has occurred, follow the procedure below to recover from lost passwords.

Procedure for lost passwords with an S7-1200 G2 CPU

If you have lost the password for a password-protected S7-1200 G2 CPU, delete the password-protected program with an empty transfer card or program card. The empty transfer card or program card deletes the internal load memory of the CPU. You can then load a new user program from STEP 7 to in the CPU.

6.4 Central user management

6.4.1 Useful information on central user management and access control

S7-1200 G2 CPUs have a feature whereby authentication of users can be left to a central UMC server.

You manage users centrally and combine multiple users with the same roles/function rights into one group.

The central authentication service is performed by the UMC (User Management Component) (https://support.industry.siemens.com/cs/us/en/view/109780337).

You set up linking between user/group and assigned roles and function rights in the editor "Users and roles (Page 150)" in TIA Portal - as with the local user management.

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution, but only if you ensure the confidentiality of the user-relevant information.

In addition, you must observer the rules for industrial cybersecurity (Page 21), for example regarding the "Defense in Depth" security concept, and in particular the remarks on plant security and hardening measures.

Advantages of central user management

Central user management allows management of users and user groups independently of TIA Portal. This enables the user management to be scaled from a few users and CPUs in a single project (local user management) up to extensive automation solutions with multiple projects, users and user groups (central user management) without increased workload.

If you use the central user management (UMC), you can, for example, configure user groups on the UMC server set up for this purpose. The users of a group then have the same roles and function rights on the CPU.

During operation, users can be added to or removed from a group or passwords can be changed on the UMC server. The CPU configurations do not need to be changed and reloaded.

NOTE

Decoupling the user management from the CPU involves risks

When central user management is used, the CPU or TIA project has no way of checking the central user administration. UMC administrators must carefully check the effect of their changes with regard to modified roles and function rights.

Changes to central users at the time of the change do not affect the existing connection to the CPU. These include, for example, the following changes:

- Deletion of a user on the UMC server
- Moving users to other groups on the UMC server, which causes changes to roles and rights.

The changed user configuration only takes effect when you log in again.

Requirements

The Users and roles editor in the TIA Portal provides you with a wide scope of usage scenarios in connection with UMC:

- Programming device with TIA Portal that is connected to a UMC domain: In this case, the users and groups can be synchronized in the editor for users and roles.
- Programming device with TIA Portal that is not connected to a UMC domain but the names of the user groups/central users used in operation are known and can be added without contact to the UMC server:
  - The names of the user groups/central users can also be entered without connection to the UMC domain and synchronized with the UMC domain later.
  - Synchronization is not necessary for authentication of CPU users via a UMC server. The group names or user names only have to match to make use of the authentication service.

A CPU that needs to authenticate the querying users (for example, via web, PG/HMI communication, or OPC UA) for diverse online functions requires the following information for accessing the authentication service:

- The UMC server address

  Example: https://central.umc.testnet:443/ra

  (443 = Port for https, ra = remote authentication)
- A server ID (fingerprint of the server certificate).

  You can determine the fingerprint of a certificate through Windows: (Open the certificate, "Details" tab, "Fingerprint" field).

As an alternative to the server ID, you can configure a list of CA certificates. These certificates are used by the CPU to verify the certificate returned by the UMC server when a connection is established. In order for the verification to be successful, the entire certificate chain down to the root certificate must have been loaded. The verification does not work for end-entity certificates or for intermediate certificates without a certificate chain to the root certificate.

Further requirements for operation during runtime are as follows:

- User groups and users have been set up on the UMC server.
- A connection can be established between the CPU and UMC server via the configured UMC server address.
- CPU time is current. As with local user management, central users are informed about the remaining validity of their password. CPU and UMC server must have the same date and time settings.

NOTE

No logon possible if the UMC server is not available or the CPU time is reset

– If you use only UMC users and UMC user groups to access the CPU during operation and the UMC server becomes unreachable, for example, due to connection abort, then no one can log on anymore.
  – To enable access to the CPU in this case, configure at least one local user with the required roles/function rights.
– If you use UMC user groups or UMC users to access the CPU during operation, the CPU time must be up-to-ate.
  If the CPU time has been reset, for example, by restoring the factory settings, and no NTP time synchronization has been configured, it is also not possible to log on via the central user management. Authentication of the UMC server using certificates requires an up-to-date CPU time.
  – To enable access to the CPU in this case, configure at least one local user with the required roles/function rights to set the time (for example, from the "Web server – Maintenance" group).
  – Alternatively, you can synchronize the CPU time using NTP servers (Page 167)

Basic procedure for using the User Management Component (UMC)

The following tasks are required to use the User Management Component (UMC):

1. Installation of UMC on one or more computers in the system
2. Assigning a corresponding UMC version as a UMC ring server or UMC server to create a UMC system consisting of one or multiple UMC computers.
3. Creating users and user groups in UMC: These can exist only in UMC or can be imported from a Microsoft Active Directory.
4. Connection of the UMC agent that is installed on the computer with the TIA Portal installation: The connection can be established with the TIA Administrator or with the Windows command line.
5. Use of UMC users and UMC user groups, for example, in the context of the TIA Portal project creation
6. Authentication of UMC users after logging on via UMC

NOTE

Enabled "Anonymous" user is always loaded

An enabled "Anonymous" user with its configured roles/function rights is loaded even if you only enabled the central user management. Local user management does not have to be additionally enabled for the "Anonymous" user to take effect.

6.4.2 Configuring central user management in the editor for users and roles

The following procedures describe central user management in TIA Portal with an S7-1200 G2 CPU for the following use cases:

- The project is configured in the environment that has access to the UMC server.
- The project is created in an environment that has no access to the UMC server.

  This is, for example, the case for a machine that is configured independently of the later place of installation and environment. The parameters for the user management must still be modified at the installation location.

Requirements - TIA Portal has access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is an online connection to the UMC server.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (Project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click the "Add new UMC user group" button.

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the user groups, select the user groups to be imported into the editor.
6. Assign the desired roles to the groups.

Procedure - Creating a new central user

To create a new central user, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User" tab.
3. Click "Add user".

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the central users, select the users to be imported into the editor.
6. Assign the desired roles to the users.

Requirements - TIA Portal has no access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is no online connection to the UMC server at the time in which user management is configured.

NOTE

Case sensitivity of user name

Although the UMC server does not differentiate between upper and lower case of the user name/group name when logging on, deviations in case prevent the user from logging on for users/groups configured offline or unsynchronized in the TIA Portal.

Recommendation:

- Before login, synchronize users and user groups in the TIA Portal and download this configuration to the CPU. In this practice, the case of the user name is not relevant during logon.
- If possible, import users/groups as described above.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click in the <Add new user group> field in the "Name" column.
   The TIA Portal enters a default name.
4. Modify the default name. This name will be used in the target environment of UMC.
   The name can also be modified in the target environment during commissioning.

Result: The groups are set up but not synchronized, that is, no UM domain ID is assigned.

When a connection to the UMC server exists in the target environment, the following process takes place when a central user logs on:

- The CPU forwards the authentication request to the UMC server.
- After a successful check, the UMC server returns a list of groups to which the logged-on user belongs.
- The CPU determines the assigned roles and function rights for the user based on the group names.

Procedure - Creating a new central user

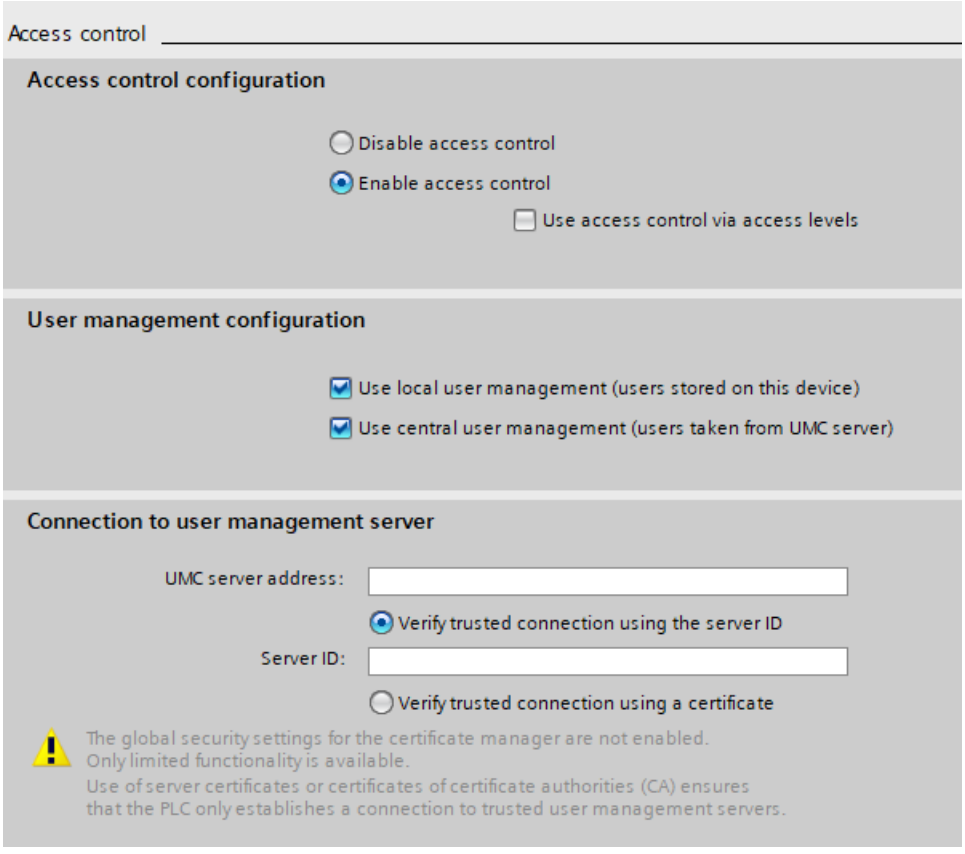
To create a new central user, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Click in the <Add new user> field in the "User name" column.
   The user type "Local user" is preset.
3. Modify the default user name - this name will be used in the target environment of UMC.
4. In the column "User type" change the entry to "Central user".

Result: The central user has been set up but not yet synchronized, meaning that no UM domain ID is assigned.

In the target environment with a connection to a UMC server, you can still adjust the provisional group and central user names using the TIA Portal.

Effects of changing the user type



- When you change the user type from central user > to local user, the data for the connection to the UMC server is lost.
- When the user type is changed from local user to a central user, the configured password and the comment are lost.

6.4.3 Configuring central user management for an S7-1200 G2 CPU

Procedure - CPU configuration for central user management

To configure the central user management for an S7-1200 G2 CPU, follow these steps:

1. From the properties of the CPU in Device configuration, navigate to "Protection & Security > Access control".
2. Ensure that access control has been enabled.
3. Activate the option "Use central user management (users taken from UMC server)".
   In addition, you can also activate local user management to be able to access the CPU if, for example, the connection to the UMC server fails.
4. Add the specifications to the UMC server address and server ID for authentication of the UMC server.
   As an alternative to the server ID, you can also add the CA certificate or intermediate certificate for authentication. The CPU must have the entire certificate chain for verification of the server certificate including root certificate.

Changing the connection data for the UMC server

A user with a role that grants full access to the CPU can download modified connection data (UMC server address and server ID) in both STOP and RUN modes of the CPU.

6.4.4 Logon of central users

The processes for the logon of central users are described below from the perspective of different applications.

Requirements

Requirements for logging on as a central user are as follows:

- A UMC server is connected to the CPU and is accessible.
- The required central users and groups have been set up for the UMC server.
- The CPUs are configured accordingly for the central user management (roles and function rights) and the configuration is loaded.

Logging onto a protected CPU

If you access a CPU online and the operation requires function rights, a dialog appears where you enter the user type. You can log on as a central user.

Causes of a failed logon of a central user

Common logon failures include the following:

- Entering an unconfigured or wrong user name
- Entering a wrong password
- A network problem such as the UMC server is not reachable or an oversized response frame

Tip: Set up a local user who can read the diagnostic buffer in the event of a failed logon and determine the exact cause. In the diagnostic buffer, the causes are represented by an error code that you can interpret using the following table. Each entry in the diagnostic buffer also leads to a corresponding syslog message so that connected evaluation systems can record the processes.

Table 1-179 Error codes for failed login

Error code	Meaning
#8000 0001	Missing configuration. The UMC server endpoint is not specified.
#8000 1000	Unspecified UMC system error.
#8000 1001	No DNS address configured.
#8000 1002	The DNS server is not reachable, for example, because it was shut down as the remote port is not reachable due to firewall settings.
#8000 1003	During data exchange with the UMC server: The interface is currently receiving new parameters.
#8000 1004	The UMC server is not reachable. The UMC server does not respond to the ARP frame or there are problems with the TCP handshake to establish a connection.
#8000 1005	The IP address of the UMC server is not reachable due to missing routing information.

Error code	Meaning
#8000 1006	The UMC server refuses to establish the connection. Connection was closed unexpectedly.
#8000 2xxx	Internal, unrecoverable TLS error.
#8000 3001	Validation of the UMC server certificate failed. Possible causes: Verification against the chain of trust not possible. Certificate not valid or expired. Verification of Identity failed (subject alternative name, FQDN, IPv4 check). Server ID verification failed (fingerprint).
#8000 4001	UMC server does not respond (timeout).
#8000 4002	HTTP response frame too long (system limit exceeded).
#8000 4003	Invalid HTTP response.
#8000 5xxx	Encoded HTTP status code of the HTTP request. Example of an encoding of Status Code 500 (#1F4) = Internal Server Error: Coding: #8000 5000 + #1F4 (=500) = #8000 51F4
#8000 6001	Syntax error in JSON response frame from UMC server.
#8000 6002	JSON response frame from the UMC server too long (system limit exceeded).
#8000 6003	Unexpected JSON format. The message has a valid JSON format, but it is not a valid UMC authentication response from the UMC server.
#8000 7xxx	Login failed (unknown error).

Logging on as an OPC UA client or as a Web client

When an OPC UA client logs on to the OPC UA server of the S7-1200 G2 CPU, the user name and password are transferred via the UserNameIdentityToken.

The user name and password are also queried for Web clients if you want to use the full functionality of the Web server (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/comprehensive-information/cpu-function-manuals/web-server). The following process applies to OPC UA clients and Web clients:

- For central users, the CPU forwards the authentication query to the UMC server.
- If the authentication is successful, the UMC server returns the assigned groups to which the user belongs.
- The CPU generates the corresponding session context and grants the authorizations (function rights from the determined roles).
- The client can then execute the access in the context of the session in accordance with the granted function rights.

How does the CPU (OPC UA server or the Web site of the Web server) detect whether the user is a local or central user?

You have the freedom to configure a user both as a local user and as a central user. This results in an ambiguity about which service is responsible for the authentication and which user ultimately gains access. Since access permission for the user depends solely on the

password in this case, you should use strong passwords, for example, created by a password generator.

The following rules apply to ensure unambiguousness for the responsible authentication service (local or central user management):

- For logon of a local user, add the prefix "L:" (uppercase or lowercase) in front of the user name.

  Example: L:username
- If you do not use a prefix for the user names, central user management is automatically responsible (when central and local user management are used at the same time). If you use only one type of user management, access is unambiguous even without a prefix.
- A user name must not begin with the string "L:" (uppercase or lowercase).

6.5 Configuring access protection for the CPU

Introduction

You can use the local user management (Page 179) in the editor for users and roles in the project tree. The access levels are represented there by function rights of the same name which you assign to individual users through their roles.

The CPU provides you with various access levels to limit access to specific functions.

By setting up access levels and passwords, you limit the functions and memory areas that are accessible without a password. The individual access levels and their associated passwords are specified in the object properties of the CPU.

Rules for passwords

Ensure that passwords are sufficiently secure by applying the following rules:

- Assign a password that is at least ten characters long.
- Use different cases and characters: uppercase/lowercase, numbers and special characters.

Passwords must not follow a machine-recognizable pattern.

Access levels of the CPU

Access levels	Access restrictions
Full access including fail-safe (no protection)	Users of STEP 7 and HMI applications have access to all standard and fail-safe functions. A password is not required.
Complete access (no protection)	Users of STEP 7 have access to standard functions. HMI applications can access all functions (fail-safe and standard). Additionally, to access the fail-safe functions, the user must enter the password for "Full access incl. fail-safe" in STEP 7.
Read access	In this access level, only read access to the hardware configuration and the blocks is possible without a password. HMI access and access to diagnostics data is also possible. You can download neither blocks nor the hardware configuration to the CPUs without the password. Additionally, you cannot write test functions or perform an online firmware update without the password.

Access levels	Access restrictions
HMI access	The access restrictions that apply to read access also apply to HMI access. Additionally, you cannot perform test functions, change the operating mode (RUN/STOP), perform a firmware update, or display an online/offline comparison status.
No access (complete protection)	When the CPU has complete protection, no read or write access to the hardware configuration and the blocks is possible (without access authorization in the form of a password). HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level and cannot be changed. Authentication with the password provides you full access to the CPU.

An enumeration of which functions are available in the different access levels is available in "Setting options for the protection" in the TIA Portal Information System.

Properties of the access levels

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

The default of the CPUs is "No access (complete protection)". In the default access level, the user can neither read nor change the hardware configuration or the blocks. To obtain access to the CPUs, use one of the following alternative parameter assignments in the properties of the CPU:

- A password for the protection level "No access (complete protection)"
- A different protection level, for example, "Full access (no protection)"

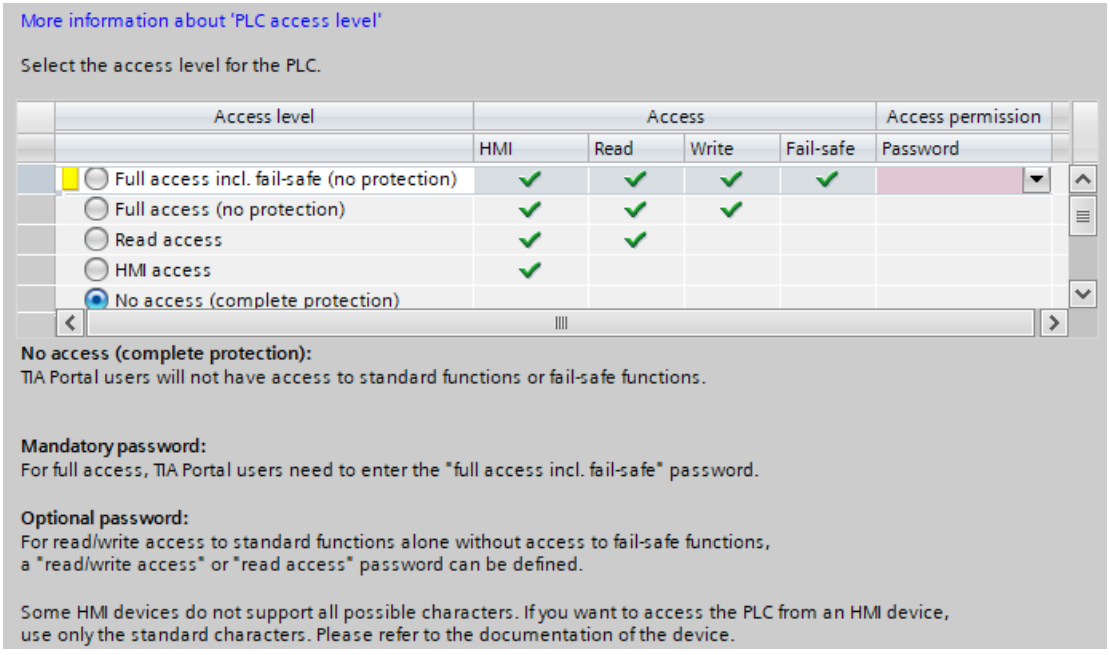
Communication between the CPUs, such as through the communication functions in the blocks, is not restricted by the access level of the CPU, unless PUT/GET communication is deactivated in the "No access (complete protection)" access level.

Entry of the right password allows access to all the functions that are allowed in the corresponding level.

NOTE

Configuring an access level does not replace know-how protection

Configuring access levels offers a high degree of protection against unauthorized changes on the CPU through network access. Access levels are used to restrict the rights to download the hardware and software configuration to the CPU. However, blocks on the SIMATIC Memory Card are not write-protected or read-protected. Use know-how protection to protect the code of blocks on the SIMATIC Memory Card.



Behavior of functions with different access levels

The TIA Portal Information System contains a tabular list of the online functions that are possible in the various access levels.

Configuring access levels

To configure the access levels for an S7-1200 G2 CPU, follow these steps:

1. Open the properties of the S7-1200 G2 CPU in the Inspector window.
2. Open the "Protection & Security" entry in the area navigation.
   A table with the possible access levels appears in the Inspector window.

3. Activate the desired protection level in the first column of the table. The green check marks in the columns to the right of the respective access level show you which operations are still available without entering the password. In this example, access is not possible without a password.
4. In the "Access permission" column, specify a password for the access level "Full access" in the first row. In the "Confirm password" column, enter the selected password again to prevent incorrect entries.
5. Assign additional passwords as required for other access levels.
6. Download the hardware configuration for the access level to take effect.

The CPU logs the following actions with an entry in the diagnostic buffer:

- Input of the correct or incorrect password
- Changes to access level configuration

Behavior of a password-protected CPU during operation

Protection of an S7-1200 G2 CPU takes effect for an online connection after you have downloaded the settings to the CPU. If you set a higher access level and download it to the CPU, all other online connections are interrupted. You must then establish a new online connection.

Before an online function is executed, STEP 7 checks the necessary permission and, if necessary, prompts the user to enter a password. The functions protected by a password can

only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Logon authorization to the protected data applies for the duration of the online connection or for as long as you have STEP 7 open. The menu command "Online > Delete access rights" cancels the access authorization.

Access level for F-CPUs

For fail-safe CPUs, there is an additional access level in addition to the four described access levels. For more information on this access level, refer to the description of the fail-safe system in SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/us/en/view/54110126).

6.6 Know-how protection

Application

You can use know-how protection to protect one or more OB, FB or FC blocks as well as global data blocks in your program from unauthorized access. Enter a password to restrict access to a block. The password offers high-level protection against unauthorized reading or manipulation of the block. Know-how protection does not involve the CPU (offline access in STEP 7).

Password provider

As an alternative to manual password input, you can assign a password provider to STEP 7. When using a password provider, you select a password from a list of available passwords. When a protected block is opened, STEP 7 connects to the password provider and retrieves the corresponding password.

To connect a password provider you have to install and activate it. A settings file in which you define the use of a password provider is also required.

A password provider offers you the following advantages:

- The password provider defines and manages the passwords. When know-how protected blocks are opened, you work with symbolic names for passwords. For example, a password is marked with the symbolic name "Machine_1" n the password provider. The actual password behind "Machine1" remains hidden from you.
  A password provider therefore offers optimum block protection as the users do not know the password themselves.
- STEP 7 automatically opens know-how protected blocks without the direct entry of a password. This saves you time.

You can find more information on connecting a password provider in the STEP 7 online help.

Readable data

If a block is know-how protected, only the following data is readable without the correct password:

- Block title, comments and block properties
- Block parameters (INPUT, OUTPUT, IN, OUT, RETURN)
- Call structure of the program
- Global tags without information on the point of use

Further actions

Further actions that can be carried out with a know-how protected block:

- Copying and deleting
- Calling within a program
- Online/offline comparison
- Load

Global data blocks and array data blocks

You protect global data blocks (global DBs) from unauthorized access with know-how protection. If you do not have the valid password, you can read the global data block but not change it.

Know-how protection is not available for array data blocks (array DBs).

Setting up block know-how protection

To set up block know-how protection, follow these steps:

1. Open the properties of the respective block.
2. Select the "Protection" option under "General".

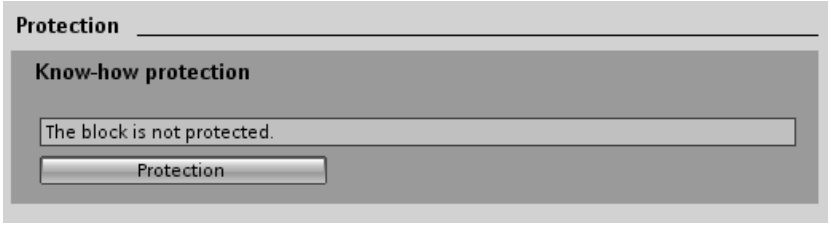


Figure 1-44 Setting up block know-how protection (1)

3. Click the "Protection" button to display the "Define protection" dialog.

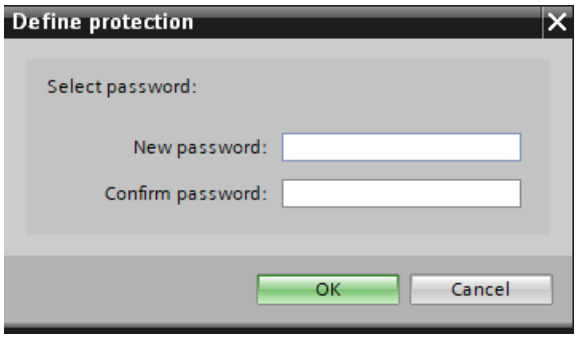

Figure 1-45 Setting up block know-how protection (2)

4. Enter the new password in the "New password" field. Enter the same password in the "Confirm password" field.
5. Click "OK" to confirm your entry.
6. Close the "Know-how protection" dialog by clicking "OK".

Result: The blocks selected will be know-how-protected. Know-how protected blocks are marked with a lock symbol in the project tree. The password entered applies to all blocks selected.

NOTE

Password provider

Alternatively, you can set up know-how protection for blocks with a password provider.

Opening know-how protected blocks

To open a know-how protected block, follow these steps:

1. Double-click the block to open the "Access protection" dialog.
2. Enter the password for the know-how protected block.
3. Click "OK" to confirm your entry.

Result: The know-how-protected blockopens.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or STEP 7 is open. You need to enter the password again the next time you open the block. If you close the "Access protection" dialog with "Cancel", the block will open but the block code will not be displayed. You will not be able to edit the block.

If you copy the block or add it to a library, for example, this does not cancel the know-how protection of the block. The copies will also be know-how-protected.

Changing know-how protection for blocks

To change the know-how protection for blocks, follow these steps:

1. Select the block for which you want to change the know-how protection. The protected block must not be open in the program editor.
2. To open the "Change protection" dialog, select the "Know-how protection" command in the "Edit" menu.
3. To change the password for the know-how protection, enter the current password under "Old password".
4. Then enter a new password under "New password" and confirm the password under "Confirm password".
5. Click "OK" to confirm your entry.

Result: The password for the know-how protection of the selected block has been changed.

Removing know-how protection for blocks

To remove block know-how protection, follow these steps:

1. Select the block from which you want to remove know-how protection. The protected block must not be open in the program editor.
2. Select the "Know-how protection" command in the "Edit" menu.

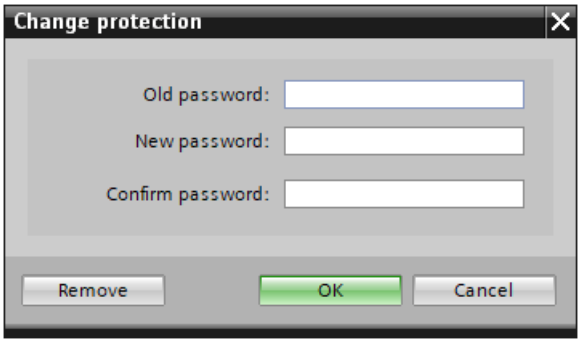

Figure 1-46 Removing know-how protection for blocks

3. To remove the block protection, enter the current password under "Old password". Leave the fields for the new password empty.
4. Click "Remove" to confirm your entry.

Result: Know-how protection for the selected block has been canceled.

6.7 Using the user program to set additional access protection

Access protection by means of the user program

In addition to access protection, you can also restrict access to a password-protected CPU using the ENDIS_PW instruction (https://docs.tia.siemens.cloud/access?ft:originId=./10867183243/52385784203_enUS.htm&ft:clusterId./10867183243/52385784203.htm) in STEP 7. When using ENDIS_PW, take care to prevent users from being locked out of access to the CPU (Page 186).

Communication 7

7.1 Overview

The S7-1200 G2 offers several types of communication between CPUs and programming devices, HMIs, and other CPUs.

PROFINET

PROFINET (https://us.profinet.com/) (PN) is used for exchanging data through the STEP 7 program with other communications partners through Ethernet.

For the S7-1200 G2, PROFINET supports 31 IO devices with a maximum of 512 submodules as well as the following:

- S7 communication (Page 252)
- Open User Communication with the following protocols:
  - User Datagram Protocol (Page 225) (UDP)
  - ISO on TCP (Page 225) (RFC 1006)
  - Transport Control Protocol (Page 224) (TCP)
- PROFINET Security Class 1 (https://support.industry.siemens.com/cs/ww/en/view/49948856/184125926283)

PROFINET IO controller

As an IO controller using PROFINET IO, the CPU communicates with up to 31 PN devices on the local PN network.

CPU-to-CPU S7 communication

You can create a communication connection (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/34492344715_enUS.htm&ft:clusterId./10866368523/34492344715.htm) to a partner station and use the PUT and GET instructions (Page 252) to communicate with S7 CPUs.

Network security

⚠ WARNING

Avoiding security risks from network attacks
If an attacker can access your networks, the attacker can possibly read and write data.
For example, I/O exchange through PROFINET, PUT/GET (Page 252), T-Block, and communication modules (CMs) have no security features. You must protect these forms of communication.
If you fail to protect these forms of communication, death or severe personal injury can result.
For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Web site.

OPC UA server

S7-1200 G2 CPUs support configuration as an OPC UA server (Page 257) for data access. OPC UA clients can securely connect to the S7-1200 G2's OPC UA serverto read or write the PLC data.

7.2 Secure communication

S7-1200 G2 CPUs implement secure communication between PLCs and the TIA Portal, SIMATIC Automation Tool, and HMIs. This implementation uses the industry standard TLS 1.3 (Transport Layer Security) protocol. The S7-1200 G2 CPU does not support legacy PG/PC communication.

Advantages of secure communication

Secure communication offers the following advantages:

- Confidentiality: Ensures that data remains confidential and cannot be accessed by unauthorized individuals.
- Integrity: Guarantees that the received message has not been modified during transmission.
- End point authentication: Verifies the identity of the communication partner.

Today, networked industrial machinery and control systems with sensitive data are at high risk and consequently pose high security requirements for data exchange.

Protection through firewall, VPN connection, or a security module, was common in the past and remains common. In addition to physical security, secure communication supports the transfer of data to external communication partners in encrypted form.

The CPU uses X.509 certificates (Page 209) to provide secure communication between the CPU and clients. Clients such as STEP 7 and the SIMATIC Automation Tool might require that you trust the certificate that is in the CPU. Be aware of the certificate you download to a CPU so that you can trust it when prompted.

Considerations when using secure communication

Communication speeds can be slower with secure communication.

- Actual firmware version of the physical CPU
- Configured firmware version (Page 169) of the CPU in the STEP 7 project

Additional information

You can find additional details about the implementation of secure communication in the TIA Portal Information System. In particular, additional information about certificates is in the following TIA Portal Information System topics:

- Confidentiality through encryption
- Managing certificates with STEP 7
- Examples for the management of certificates
- Authenticity and integrity through signatures

7.3 Communication protocols and ports used by Ethernet communication

The specified ports are the standard port numbers that the S7-1200 G2 CPU uses. Many communication protocols and implementations enable you to use other port numbers. The following tables show different layers, protocols, and ports used in the S7-1200 G2 CPU.

Table 1-180 Transport layer ports and protocols by S7-1200 G2

Port(s)	Direction	Protocol	Application	Description	Default setting/notes
25	Outbound	TCP	SMTP	SMTP is used for sending e-mails.	Default: Deactivated. Can be enabled via TMAIL_C instruction in the STEP 7 program.
68	Outbound	UDP	DHCP	The IP address suite is obtained from a DHCP server during the startup of the PROFINET interface.	Default: Deactivated. Can be changed in the CPU properties
102	Inbound/ Outbound	TCP	ISO-on-TCP	ISO-on-TCP (according to RFC 1006). The S7 protocol uses ISO-on-TCP according to RFC 1006 for PG/HMI communication with TIA Portal.	Default: Activated. This function cannot be deactivated.
123	Outbound	UDP	NTP	NTP is used for synchronization of the CPU system time with the time of an NTP server.	Default: Deactivated. Can be enabled in the CPU properties.
161	Inbound	UDP	SNMP	SNMP is used for reading and setting network management data (SNMP managed Objects) by the SNMP Manager.	Default: Deactivated. Can be enabled via data record in the STEP 7 project or in CPU Properties. Provides customizable community strings to limit access.
443	Inbound	TCP	HTTPS	HTTPS is used for secure communication with the CPU-internal web server over TLS.	Default: Deactivated. Can be enabled by enabling the Web server in the CPU properties.
465, 587	Outbound	TCP	SMTPS	SMTPS is used for sending e-mails over secure connections.	Default: Deactivated. Can be enabled via TMAIL_C instruction in the STEP 7 program.

Port(s)	Direction	Protocol	Application	Description	Default setting/notes
502	Inbound/ Outbound	TCP	Modbus	Modbus/TCP is used by MB_CLIENT/MB_SERVER instructions in the STEP 7 program.	Default: Deactivated. Can be activated via Modbus instructions in the STEP 7 project. Port 502 is the default port for Modbus, but can be configured to other values via the Modbus instructions in the STEP 7 program.
4840	Inbound	TCP	OPC UA	Open Platform Communications Unified Architecture (based on TCP/IP protocol). A communication standard ranging from the enterprise level to the field level.	Default: Deactivated. Can be enabled in the CPU properties.
6514, 514	Outbound	TCP (6514) UDP (514)	Syslog Client	The Syslog client of the CPU is used for transferring syslog messages to a server.	Default: Deactivated. Can be enabled in the CPU properties. You can configure the forwarding of syslog messages to a syslog server in the CPU properties. The collection of system logging events within a CPU cannot be disabled. Port 6514 is the default value for Syslog servers in STEP 7. Port 514 is the standard port for UDP Syslog servers, but it is not the default value even if you select UDP in the STEP 7 project configuration.
34964	Inbound/ Outbound	UDP	PROFINET Context Manager	The PROFINET Context Manager provides an endpoint mapper in order to establish an application relation (PROFINET AR).	Default: Enabled (UDP port open). This function cannot be deactivated.

Table 1-181 Port ranges that could be used by Open User Communication (OUC) and other protocols.

Port Range	Direction	Protocol	Application	Description
1-1999	Varies	TCP/UDP	OUC	This port range can be used to limited extent, excluding already used ports.
2000-5000	Varies	TCP/UDP	OUC	This is the recommended port range for OUC.
5001-49151	Varies	TCP/UDP	OUC	This port range can be used to limited extent, excluding already used ports.
49152-65535	Outbound	TCP/UDP	Varies	This is the Dynamic port area used for active connection end point if the application does not determine the local port number.

You define these communication parameters in the STEP 7 program.

Table 1-182 Protocols used by S7-1200 G2 in the Data Link and Network Layer (Layer 2, 3) of the OSI model.

Protocol	Direction	Ethertype	Description
PROFINET DCP	Inbound/Outbound	0x8892	DCP is used by PROFINET to discover PROFINET devices and provide basic settings. DCP uses the special multicast MAC addresses: 01-0E-CF-00-00-00 and 01-0E-CF-00-00-01.
LLDP	Outbound	0x88CC	LLDP is used by PROFINET to discover and manage neighbor relationships between PROFINET devices. LLDP uses the special multicast MAC address: 01-80-C2-00-00-0E.

Protocol	Direction	Ethertype	Description
PROFINET IO	Inbound/Outbound	0x8892	The PROFINET IO frames are used to transmit IO data cyclically between PROFINET IO controller and IO devices via Ethernet.
ICMP	Inbound	0x0800	Internet Control Message Protocol is used for diagnostic or control purposes.
MRP	Inbound/Outbound	0x88E3	Media Redundancy Protocol enables control of redundant transmission paths in a ring topology. MRP uses the special multicast MAC addresses: 01:15:4E:00:00:01 and 01:15:4E:00:00:02

7.4 Asynchronous communication connections

Overview of communication services

The CPU supports the following communication services:

Communication service	Functionality	Ethernet
PG communication	Commissioning, testing, diagnostics	Yes
HMI communication	Operator control and monitoring	Yes
S7 communication	Data exchange using configured connections	Yes
PROFINET IO	Data exchange between I/O controllers and I/O devices	Yes
Web server	Diagnostics, maintenance, and process data	Yes
SNMP (Page 250) [1] (Simple Network Management Protocol)	Standard protocol for network diagnostics and parameterization	Yes
Open communication over TCP/IP	Data exchange over Industrial Ethernet with TCP/IP protocol (with Open user communication instructions)	Yes
Open communication over ISO on TCP	Data exchange over Industrial Ethernet with ISO on TCP protocol (with Open user communication instructions)	Yes
Open communication over UDP	Data exchange over Industrial Ethernet with UDP protocol (with Open user communication instructions)	Yes
Near Field Communication (NFC) (Page 299)	Data exchange between the PLC and a mobile phone	No

[1] The CPU supports SNMP V1 without TRAPs (alarm frames).

Available connections

The CPU supports a fixed number of maximum simultaneous asynchronous communication connections for PROFINET; you cannot change these values. You can configure the "Free available connections" to increase the number of any category as required by your application.

Some connection types have a fixed number of reserved resources (sometimes called guaranteed). This means that the CPU is guaranteed to support up to the number of reserved resources for the connection type. Additional connections beyond the number of reserved

resources can be made for a connection type, but those connection resources must come from the "dynamic" resources pool.

The dynamic resources (sometimes called Free) are a collection of resources that can be used for any connection type. These resources are used by connections that do not have any reserved resources or by connections that have used up all of their reserved resources.

S7-1200 G2 CPUs have 10 reserved connection resources and 78 dynamic resources for a total of 88 connection resources.

Based upon the allocated connection resources, the following number of connections per CPU are available:

Type	Maximum guaranteed connections	Maximum dynamic connections	Total connections possible[2]
Programming device (PG) communication	4	78[1]	82
Human Machine Interface (HMI) communication	4	78[1]	82
S7 communication	0	78[1]	78
Open User communication	0	78[1]	78
Web communication	2	78	80

[1] Adding CMs/CPs allows for 40 additional dynamic connections.

[2] Since the dynamic connections are shared, it is not possible to max out all connections simultaneously.

For an example, the CPU has four available PG connection resources. Depending on the current PG functions in use, the PG might actually use one, two, three, or four of its available connection resources. You can always use one PG.

NOTE

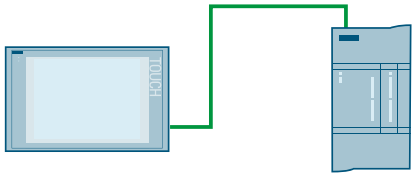
Web server connections: The CPU provides connections for multiple Web browsers. The number of browsers that the CPU can simultaneously support depends upon how many connections a given Web browser requests/utilizes and the number of dynamic connection resources available in the CPU.

NOTE

The Open user communication, S7 connection, HMI, programming device, and Web server communication connections can utilize multiple connection resources based upon the features currently being used.

7.5 Supported certificates

Secure communication services require certificates with certain security parameters.



You can create or select these certificates from the following areas in the TIA Portal "General" tab of the CPU "Properties" window:

- "Web server > Security": Use for the generation and assignment of Web server certificates.
- "Protection & Security > Connection mechanisms": Use for the generation or assignment of PLC communication or Secure PG/PC and HMI communication certificates.
- "Protection & Security > Certificate manager": Use for the generation or assignment of all types of certificates. The default setting for the creation of certificates is TLS certificates for Secure Open User Communication (Secure OUC), Syslog, and OPC UA.

For more information on generating and assigning certificates or certificate parameters, refer to the TIA Portal Information System.

7.6 PROFINET

The S7-1200 G2 CPU supports PROFINET communications connections to HMIs.

Consider the following requirements when setting up communications between CPUs and HMIs:

Configuration/Setup:

- The PROFINET port of the CPU must be configured to connect with the HMI.
- The HMI must be setup and configured.
- The HMI configuration information is part of the CPU project and can be configured and downloaded from within the project.
- The HMI driver must be selected from the Device wizard. The S7-1200 G2 CPU uses the "SIMATIC S7-1500" driver to communicate with Basic or Comfort HMIs, and the "SIMATIC S7-1200/1500" driver to communicate with Unified panels.

NOTE

All S7-1200 G2 CPUs feature one PROFINET interface equipped with two ports that operate as an Ethernet switch.

Configuring communication between the HMI and a CPU

To configure communication between the HMI and a CPU, do the following:

1. Establish the hardware communications connection (Page 231). A PROFINET interface establishes the physical connection between an HMI and a CPU. Since Auto-Cross-Over functionality is built into the CPU, you can use either a standard or crossover Ethernet cable for the interface. An Ethernet switch is not required to connect an HMI and a CPU.
2. Configure the device (Page 232).

3. Configure the logical network connections between an HMI and a CPU (Page 212).
4. Configure an IP address in your project (Page 217). You must configure IP addresses for the HMI and the CPU.
5. Test the PROFINET network (Page 233). You must download the configuration for each CPU and HMI device.

Supported HMI connection mechanisms

You can configure your HMI communication preferences in the "Device configuration" for your CPU under "Protection & Security > Connection mechanisms". The S7-1200 G2 supports the following HMI connection mechanisms based on panel type:

Panel type	S7-1200 G2 supported HMI connection mechanisms
Basic Panel	GET/PUT (Page 252)
	Secure PG/PC and HMI Communication
Comfort Panel	GET/PUT
	Secure PG/PC and HMI Communication
Unified Panel	GET/PUT
	Secure PG/PC and HMI Communication
	Standard Modbus TCP/IP (Page 293)

NOTE

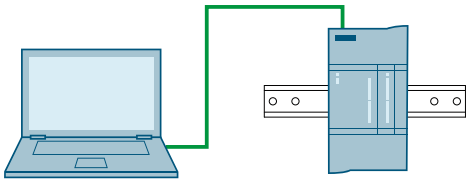
Secure PG/PC and HMI Communication requires an HMI device image of V17 or later.

Supported HMI tags and subscriptions

The CPU supports 2000 tags for up to 250 HMI subscriptions. For further details on HMI connection resources and connection optimization, see the "Connection resources and connection optimization for HMI operator panels with S7-Controllers (https://support.industry.siemens.com/cs/pl/en/view/109479986)" FAQ.

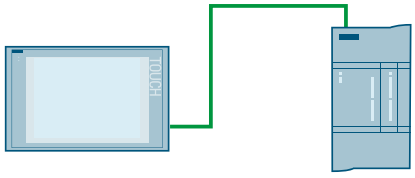
See also

Supported certificates (Page 209)



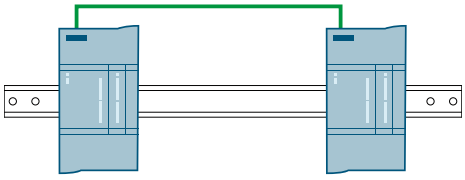
7.6.1 CPU communication

The S7-1200 G2 CPU can communicate with the following devices:



- Other CPUs
- Programming devices
- HMI devices
- Non-Siemens devices using standard TCP communications protocols

Example connections are as follows:

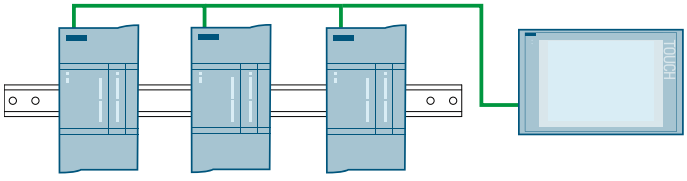


Programming device connected to the CPU (Page 230)

HMI connected to the CPU (Page 209)

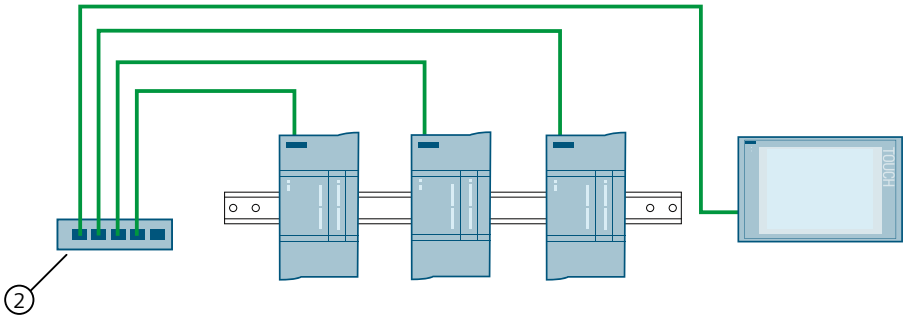
A CPU connected to another CPU (Page 234)

NOTE



S7-1200 G2 CPUs do not support the IE/PB Link module.

Ethernet switching

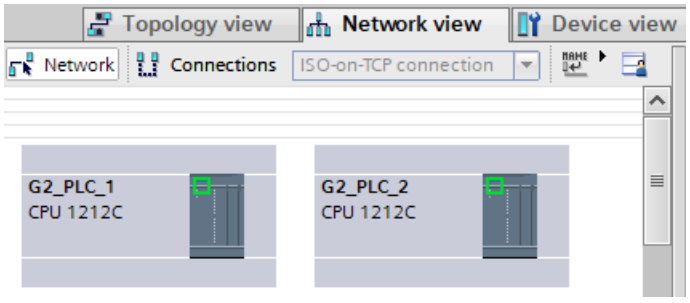


The S7-1200 G2 CPUs have a built-in 2-port Ethernet switch. You can use these built-in switches to create a network.

Example connections are as follows:

Multiple CPUs connected to an HMI device using the built-in 2-port Ethernet switch

Multiple CPUs connected to an HMI device using an external ethernet switch

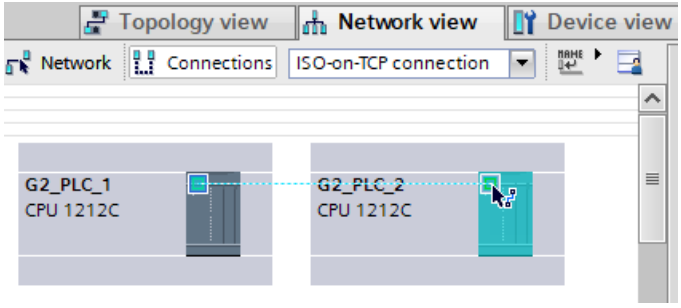


② External Ethernet switch

7.6.2 Creating a network connection

Use the "Network view" of Device configuration to create the network connections between the devices in your project.

1. Select "Network view" to display the devices to be connected.



2. Select the "Connections" tab in the toolbar of Network view and choose your connection type from the dropdown menu.

   Note: the S7-1200 G2 supports the following connections:

   – S7 connection (Page 252)
   – ISO-on-TCP connection (Page 225)
   – TCP connection (Page 224)
   – UDP connection (Page 225)
   – HMI connection (Page 209) (PLC to an HMI)

3. Select the port on one device and drag the connection to the port on the second device.

4. Release the mouse button to create the network connection.

After creating the network connection, use the "Properties" tab of the inspector window to configure the parameters of the network.

7.6.3 Configuring the Local/Partner connection path

A Local/Partner (remote) connection defines a logical assignment of two communication partners to establish communication services. A connection defines the following:

- Communication partners involved (one active, one passive)
- Type of connection (for example, a PLC, HMI, or device connection)
- Connection path

Communication partners execute the instructions to set up and establish the communication connection. You use instruction parameters to specify the active and passive communication end point partners. After the STEP 7 program sets up and establishes the connection, the CPU automatically maintains and monitors the connection.

If the connection is terminated (for example, due to a line break), the active partner attempts to re-establish the configured connection. You do not have to execute the communication instruction again.

For more information, see the following:

- "Connection configuration (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/42307475211_enUS.htm&ft:clusterId./10866368523/42307475211.htm)"
- "Connection parameters (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13452671883_enUS.htm&ft:clusterId./10866368523/13452671883.htm)"

7.6.4 Locating the Ethernet (MAC) address on the CPU

In PROFINET networking, a Media Access Control address (MAC address) is an identifier assigned to the network interface by the manufacturer for identification. A MAC address usually encodes the manufacturer's registered identification number.

The standard (IEEE 802.3) format for printing MAC addresses in human-friendly form is six groups of two hexadecimal digits, separated by hyphens (-) or colons (:), in transmission order, (for example, 01-23-45-67-89-ab or 01:23:45:67:89:ab).

Each CPU is loaded at the factory with a permanent, unique MAC address. You cannot change the MAC address of a CPU.

The MAC address is printed on the front, upper-left corner of the CPU. Note that you have to lower the upper door to see the MAC address information.

The CPU interface is designated as X1, and initially has no IP address, only a factory-installed MAC address. PROFINET communication requires that all devices be assigned a unique IP address.

NOTE

Three sequential MAC addresses are assigned to the CPU:

- The lowest number, the number printed on the CPU, is for the X1 interface.
- The next higher number is for port P1R.
- The highest number is for port P2R.

The low-level protocols (Page 243) require the MAC addresses for P1R and P2R.

7.6.5 Assigning Internet Protocol (IP) addresses

7.6.5.1 Assigning IP addresses to programming and network devices

If the network interface of your programming device connects to a local area network (LAN) with multiple subnets, both the programming device and the CPU must be on the same subnet. You assign the subnet as a combination of the IP address and subnet mask for the device. See your local network administrator for help.

The Network ID of a Class C IP address is the first three octets of the IP address. The network ID of 211.154.184.16, for example, is 211.154.184. This network ID uniquely identifies your IP network. The subnet mask normally has a value of 255.255.255.0. Because your computer is on a plant LAN, however, the subnet mask might have various values, for example, 255.255.254.0, to set up unique subnets. The subnet mask, when combined with the device IP address in a logical AND operation, defines the boundaries of an IP subnet.

NOTE

You must assign unique IP addresses to all devices on your subnet.

⚠ WARNING

Unauthorized access to a CPU

Users with CPU full access or full access (incl. fail-safe) privileges have privileges to read and write PLC variables. Regardless of the access level for the CPU, Web server users can have privileges to modify PLC data and execute functions. Unauthorized access to the CPU can disrupt process operation.

Siemens recommends that you observe the following security practices:

- Enable Access control under "Protection & Security > Access control".
- Do not enable the "Anonymous" user.
- Use strong passwords, as defined in STEP 7.
- Use a secure Virtual Private Network (VPN) to connect to the S7-1200 G2 PLC from a location outside your protected network.
- Perform error-checking and range-checking on your variables in your program logic because Web server or users can change PLC variables to invalid values.

Disruption of process operations can result in death, severe personal injury, and/or property damage.

NOTE

A secondary network adapter card is useful when you do not want your CPU on your company LAN. During initial testing or commissioning tests, this arrangement is particularly useful.

Assigning or checking the IP address of your programming device

To assign or check your programming device's IP address, follow these steps:

1. Open the Control Panel.
2. Navigate to the "Network and Sharing Center".
3. Click "Change adapter settings" in the left column.

4. Right-click the network interface connected to your CPU.
5. Select "Properties" to open the properties dialog.
6. In the properties dialog, select the checkbox for "Internet Protocol Version 4 (TCP/IPv4)".
7. Click the "Properties" button.
8. Select "Obtain an IP address automatically" or to enter a static IP address select "Use the following IP address".

   If you selected "Use the following IP address", set the IP address and subnet mask:

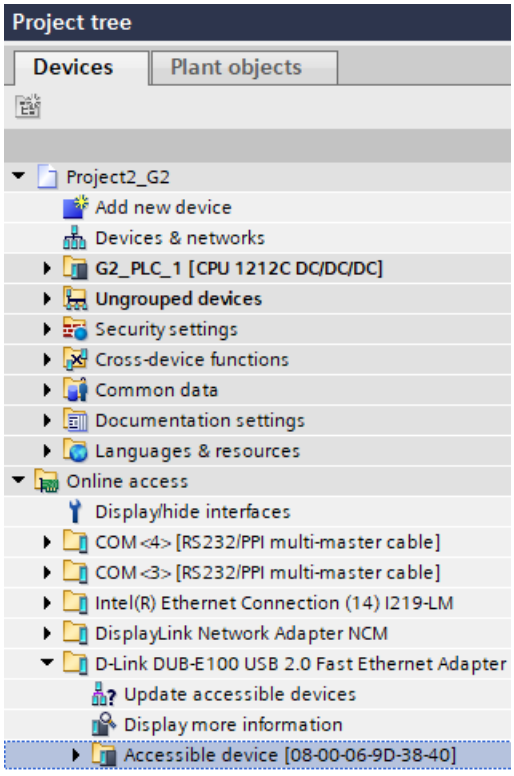
   – Set the IP address to use the same Network ID and same subnet as the CPU. For example, if the CPU IP address is **192.168.0**.1, you could set the IP address to **192.168.0**.200.
   – Select a subnet mask of 255.255.255.0.
   – Leave the default gateway blank.

Consult your network administrator to help you set up a network configuration to allow you to connect to the S7-1200 G2 CPU.

7.6.5.2 Checking the IP address and MAC address of your network interface

To check the MAC and IP addresses of your network interface in STEP 7, follow these steps:

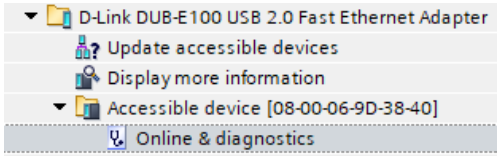
1. In the "Project tree", expand "Online access".
2. Right-click the required network interface, and select "Properties".
3. In the dialog, expand "Configurations", and select "Industrial Ethernet".



The window displays the MAC and IP addresses of the network interface.

7.6.5.3 Assigning an IP address to an online CPU

You can assign an IP address to a network device online. This is particularly useful in an initial device configuration.

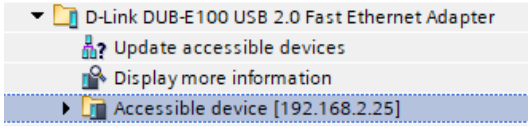


To verify that the CPU does not have a configured IP address, do the following:

1. In the "Project tree", expand "Online access".
2. Expand the network in which the device is located.
3. Double-click "Update accessible devices".
   If STEP 7 displays a MAC address instead of an IP address, then no IP address has been assigned.

To assign an IP address, follow these steps:

1. Expand the PLC for which you want to assign an IP address.
2. Double-click "Online & diagnostics".



3. In the "Online & diagnostics" dialog, select "Functions > Assign IP address".

4. In the "IP address" field, enter your new IP address, and click "Assign IP address".

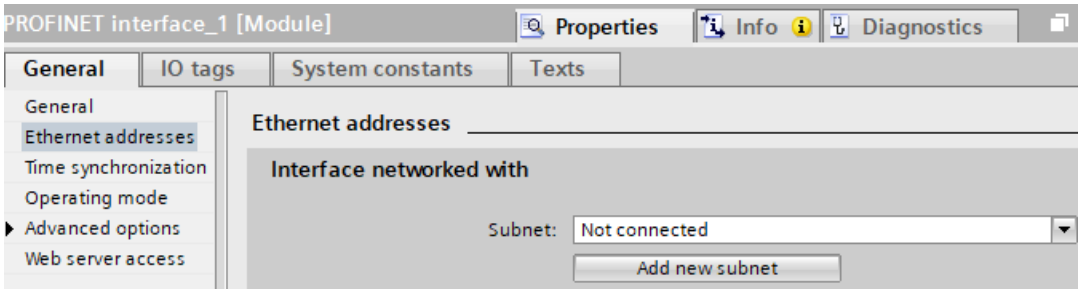
To verify that STEP 7 has assigned your new IP address to the CPU, double-click "Update accessible devices". It should now display the IP address that you configured.

7.6.5.4 Configuring an IP address for a CPU in your project

Configuring the PROFINET interface

In the Device configuration (Page 151) of the CPU, you can configure parameters for the PROFINET interface. Click the green PROFINET interface on the CPU and then select the "Properties" tab in the inspector window to display the PROFINET port.

Subnet and Subnet mask



A subnet is a logical grouping of connected network devices. Nodes on a subnet tend to be located in close physical proximity to each other on a Local Area Network (LAN). A mask, known as the subnet mask or network mask, defines the boundaries of an IP subnet.

A subnet mask of 255.255.255.0 is suitable for a small local network. This means that all IP addresses on this network should have the same first three octets, and the various devices on this network are identified by the last octet (8-bit field). An example of this is to assign a subnet mask of 255.255.255.0 and an IP address of 192.168.2.0 through 192.168.2.255 to the devices on a small local network.

The only connection between different subnets is through a router. You must use an IP router if you use more than one subnet.

To set your subnet in your STEP 7 project, follow these steps:

1. In Device configuration, select the "Properties" Tab.
2. Under the "General" tab, select "Ethernet addresses".
3. In the "Interface networked with" section, click "Add new subnet" to create a new subnet. The default "Not connected" provides a local connection. You can choose a previously added subnet from the dropdown menu.

Internet Protocol (IP) address

Each device must also have an Internet Protocol (IP) address. This address allows the device to deliver data on a more complex, routed network. Each IP address is divided into four 8-bit octets and is expressed in a dotted, decimal format (for example, 211.154.184.16). The first part of the IP address is used for the Network ID, and the second part of the address is for the Host ID which is unique for each device on the network. An IP address of 192.168.x.y is a standard designation recognized as part of a private network that is not routed on the Internet.

In your STEP 7 project, you can configure how the IP address is set. In Device configuration, click the "Properties" Tab and select "Ethernet addresses". Choose one of the following options:

- Set IP address in the project
- IP address from DHCP (Dynamic HostConfiguration Protocol) server
- IP address is set directly at the device

Optionally, select "Use router" and enter the router's IP address if your network uses a router.

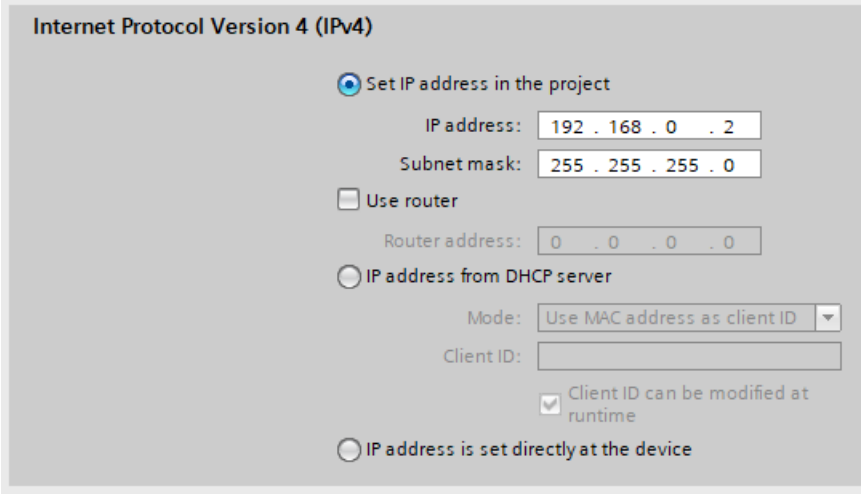


Table 1-183 Parameters for the IP address

Protocol	Parameter	Description
Set IP address in the project	IP address	Assigned IP address for the CPU
	Subnet mask	Assigned subnet mask
Use router		Click the checkbox to indicate the use of an IP router. Routers are the link between LANs. Using a router, a computer in a LAN can send messages to any other networks, which might have other LANs behind them. If the destination of the data is not within the LAN, the router forwards the data to another network or group of networks where it can be delivered to its destination. Routers rely on IP addresses to deliver and receive data packets.
	Router address	Assigned IP address for the router, if applicable
IP address from DHCP server	Mode	An external DHCP server provides the IP address (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/139974759307_enUS.htm&ft:clusterId./10866368523/139974759307.htm) based on either the MAC address of your network interface or an optional client ID. However, if the client ID is not configured, the server will not provide the MAC address as the identification.
	Client ID	
IP address is set directly at the device		Click the radio button set the IP address set directly at the device.

NOTE

The download operation sets all IP addresses for devices configured as "Set IP address in the project". If the CPU does not have a pre-configured IP address, download to the accessible device with the MAC address of your target device. If your CPU is connected to a router on a network, you must also enter the IP address of the router.

The "IP address is set directly at the device" radio button allows you to change the IP address through a tool such as the SIMATIC Automation Tool, Online & Diagnostics in the TIA Portal (Page 216), or by using the T_CONFIG instruction (Page 226) after the program is downloaded.

⚠ WARNING

Downloading a hardware configuration with "IP address is set directly at the device"

After downloading a hardware configuration with the "IP address is set directly at the device" option enabled, you cannot use communication functions to transition the CPU from RUN to STOP or from STOP to RUN until you set an IP address. User equipment continues to run under these conditions and can result in unexpected equipment and process operations.

Ensure that your CPU IP address(es) are set before using the CPU in an actual automation environment. This can be done by using STEP 7, the SIMATIC Automation Tool, or an attached HMI device in conjunction with the T_CONFIG instruction.

Unexpected equipment and process operations can cause death, severe personal injury, or property damage if proper precautions are not taken.

⚠ WARNING

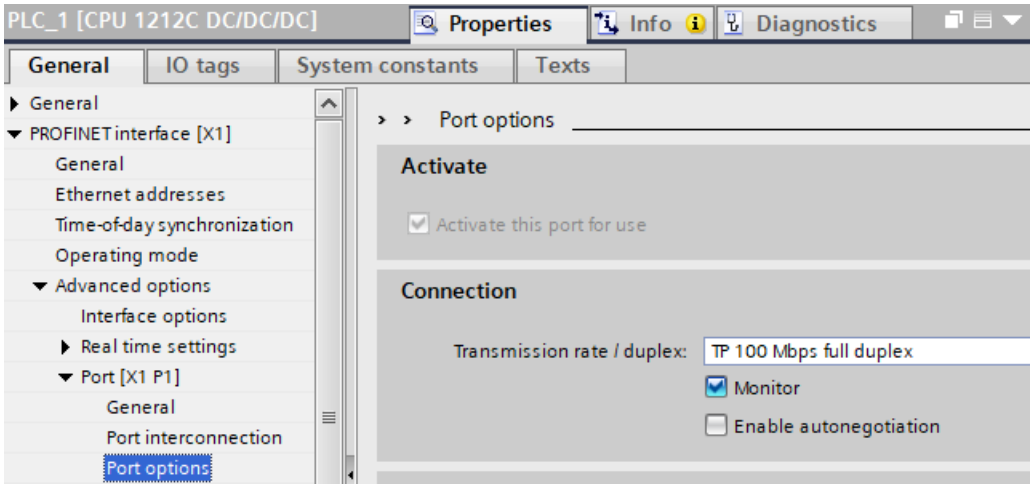
Condition in which PROFINET network might stop
Changing the IP address of a CPU online or from the STEP 7 program can create a condition where the PROFINET network might stop. If the CPU's IP address is changed to one outside the subnet, the PROFINET network loses communication, and all data exchange stops. User equipment might be configured to keep running under these conditions. Loss of PROFINET communication can result in unexpected machine or process operations.
If an IP address must be changed, ensure that the new IP address lies within the subnet.
Unexpected machine or process operations can cause death, severe personal injury, or property damage if proper precautions are not taken.

Configuring the PROFINET port

By default, the CPU configures port(s) of the PROFINET interface for autonegotiation, a feature that allows connected devices to automatically determine and configure the best possible parameters for communication. For autonegotiation to function properly, you must configure both stations to autonegotiate. If one station has a fixed configuration (for example, full-duplex at 100 Mbps) and the other station is set to autonegotiate, then autonegotiation fails, resulting in half-duplex operation.

To overcome this limitation of autonegotiation, the S7-1200 G2 provides an option to disable autonegotiation. When you disable autonegotiation, the S7-1200 G2 is automatically configured for full-duplex operation at 100 Mbps.

To set the transmission rate and duplex to a fixed value for each port, follow these steps:



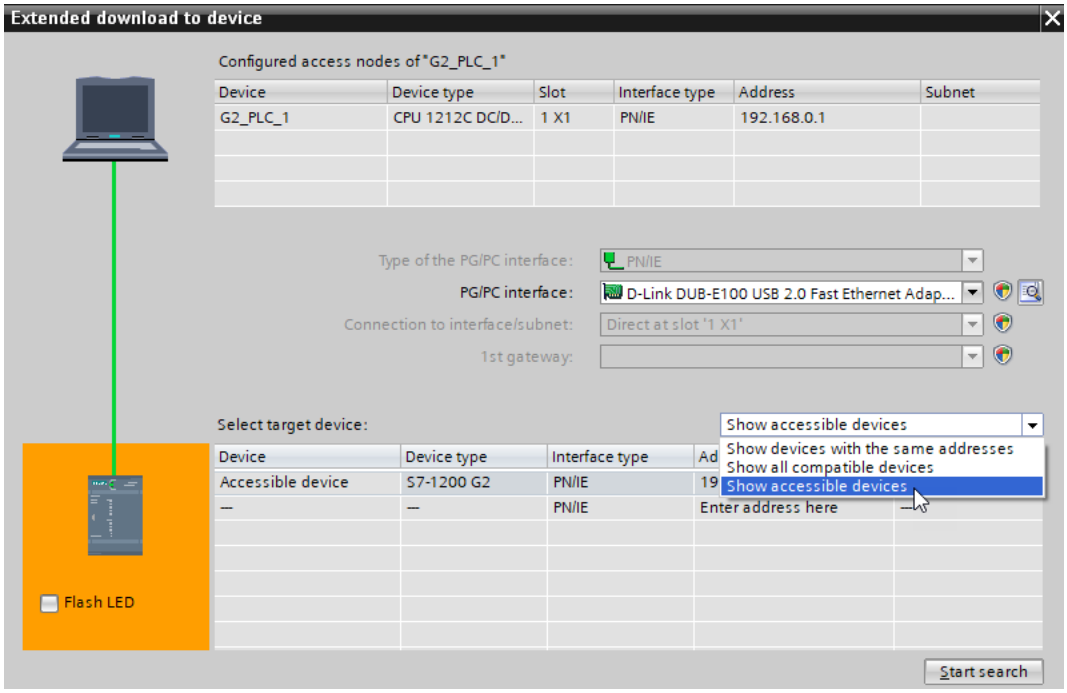
1. Select Advanced options and the port you need to configure. Then, select Port options.
2. In the Connection, Transmission rate / duplex field, select one of the following:
   - Automatic: The CPU and the peer device determine the port's transmission rate and duplex by autonegotiation.
   - TP 100 Mbps full-duplex: If you disable autonegotiation, the port operates at 100 Mbps full-duplex. If you enable autonegotiation, the port can operate at 100 Mbps full-duplex or another transmission rate / duplex that is autonegotiated between the CPU and the peer device. This places a message in the diagnostics buffer if "Monitor" is selected (see below).

You have the option to select the following parameters:

- Monitor: When you select this checkbox, the CPU places a message in the diagnostics buffer if any of the following occur at the port:
  - A link cannot be established
  - An established link fails
  - You select "TP 100 Mbps full-duplex" as the Transmission rate / duplex, and the CPU establishes a link using autonegotiation with the negotiated transmission rate not equal to 100 Mbps or the negotiated duplex equal to half-duplex.
- Enable autonegotiation: Once you set the Transmission rate / duplex field to full-duplex at 100 Mbps, you can then disable autonegotiation. Deselect the "Enable autonegotiation" checkbox to disable autonegotiation.

NOTE

If you disable autonegotiation, the CPU and the peer device do not negotiate the port's transmission rate and duplex.



7.6.6 Testing the PROFINET network

After completing the configuration, download the project (Page 165) to the CPU.

Using the "Extended download to device" dialog to test for connected network devices

The S7-1200 G2 CPU "Download to device" function and its "Extended download to device" dialog show all accessible network devices and whether unique IP addresses have been assigned to all devices. To display all accessible and available devices with their assigned MAC or IP addresses, select "Show accessible devices" from the "Select target device" dropdown menu.

If the required network device is not in this list, communications to that device have been interrupted. The device and network must be investigated for hardware and/or configuration errors.

7.6.7 PROFINET device startup time, naming, and address assignment

PROFINET IO can extend the startup time for your system (Configuration time). More devices and slow devices impact the amount of time it takes to switch to RUN.

On your PROFINET network, you can have a maximum of 31 PROFINET IO devices, reducing to 30 devices if the CPU is an I-Device and 29 if the CPU is a shared I-Device.

All PROFINET devices must have a Device name and an IP Address.

Each station (or IO Device) starts up independently on startup, and this affects the overall CPU startup time. If you set the "Configuration time" too low, there might not be a sufficient overall CPU startup time for all stations to complete startup. If this situation occurs, false station errors will result.

The default Configuration time is 60,000 ms (1 minute). You can configure this in CPU Properties > Startup > Configuration time.

PROFINET address assignment at system startup

The controller broadcasts the names of the devices to the network, and the devices respond with their MAC addresses. The controller then assigns an IP address to the device using the PROFINET DCP protocol:

- If the MAC address has a configured IP address, then the station performs startup.
- If the MAC address does not have a configured IP address, STEP 7 assigns the address that is configured in the project, and the station then performs startup.

If there is a problem with this process, a station error occurs and no startup takes place. This situation causes the configurable time-out value to be exceeded.

7.6.8 Configuring Network Time Protocol (NTP) synchronization

The Network Time Protocol (NTP) is widely used to synchronize the clocks of computer systems to Internet time servers. In NTP mode, the CPU sends time-of-day queries at regular intervals (in the client mode) to the NTP server in the subnet (LAN). Based on the replies from the server, the NTP determines the most reliable and most accurate time and synchronizes the time of day on the querying module.

⚠ WARNING

Risk of network attacks through Network Time Protocol (NTP) synchronization
If an attacker can access your networks through Network Time Protocol (NTP) synchronization, the attacker can possibly disrupt control of your process by shifting the CPU system time.
The S7-1200 G2 CPU disables the NTP client feature by default. When you enable the NTP feature, then only the IP addresses that you configure can act as NTP servers. You must configure the NTP feature to allow CPU system time corrections from remote servers.
The S7-1200 G2 CPU supports "time of day" interrupts and clock instructions that depend upon accurate CPU system time. If you configure NTP and accept time synchronization from a server, you must ensure that the server is a trusted source. Failure to do so can cause a security breach that allows an unknown user to disrupt control of your process by shifting the CPU system time.
For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Web site.
Disruptions to process control can cause death, severe injury, or property damage.

The advantage of NTP mode is that it allows the time to be synchronized (https://docs.tia.siemens.cloud/access?ft:originId=./52541677963/31476189579_enUS.htm&ft:clusterId./52541677963/31476189579_enUS.htm) across subnets.

7.6.9 Open user communication

7.6.9.1 Protocols

The integrated PROFINET interface of the CPU supports multiple communications standards over an Ethernet network:

- Transport Control Protocol (TCP) (Page 224)
- ISO on TCP (Page 225)
- User Datagram Protocol (UDP) (Page 225)

Table 1-184 Protocols and communication instructions for each

Protocol	Usage examples	Entering data in the receive area	Communication instructions	Addressing type
TCP (Page 224)	CPU-to-CPU communication Transport of frames	Ad hoc mode (Page 226)	Only TRCV_C and TRCV	Assigns port numbers to the Local (active) and Partner (passive) devices
		Data reception with specified length	TSEND_C, TRCV_C, TCON, TCONSettings, TDISCON, TSEND, TRCV, T_RESET, and T_DIAG	
ISO on TCP (Page 225)	CPU-to-CPU communication Message fragmentation and reassembly	Ad hoc mode	Only TRCV_C and TRCV	Assigns TSAPs to the Local (active) and Partner (passive) devices
		Protocol-controlled	TSEND_C, TRCV_C, TCON, TCONSettings, TDISCON, TSEND, TRCV, T_RESET, and T_DIAG	
UDP (Page 225)	CPU-to-CPU communication STEP 7 program communications	User Datagram Protocol	TUSEND and TURCV	Assigns port numbers to the Local (active) and Partner (passive) devices, but is not a dedicated connection

7.6.9.2 TCP, ISO on TCP, and UDP

TCP

Transport Control Protocol (TCP) is a standard protocol described by RFC 793: Transmission Control Protocol (https://www.rfc-editor.org/info/rfc793). The primary purpose of TCP is to provide reliable connection service between pairs of processes. Most of the user application protocols, such as TELNET and FTP, commonly use TCP. This protocol offers the following features and capabilities:

- Offers an efficient communications protocol that is closely tied to the hardware
- Allows for the handling of data amounts up to 64 KB.
- Provides extensive facilities for applications, notably error recovery, flow control, and reliability
- Operates as a connection-oriented protocol
- Offers flexibly for integration with third-party systems that exclusively support TCP
- Provides routing capabilities
- Supports only static data lengths
- Acknowledges messages
- Addresses applications using port numbers
- Requires programming effort for data management due to the SEND / RECEIVE programming interface

ISO on TCP

International Organization for Standardization on Transport Control Protocol, commonly known as "ISO on TCP", is described by RFC 1006 (https://www.rfc-editor.org/info/rfc1006) as a mechanism that enables ISO applications to be ported to the TCP/IP network. This protocol has the following features and capabilities:

- Offers an efficient communications protocol that is closely tied to the hardware
- Allows for the handling of medium-sized to large data amounts (up to 64 KB)
- Provides routing capabilities; can be used in WAN
- Supports dynamic data lengths
- Requires programming effort for data management due to the SEND / RECEIVE programming interface

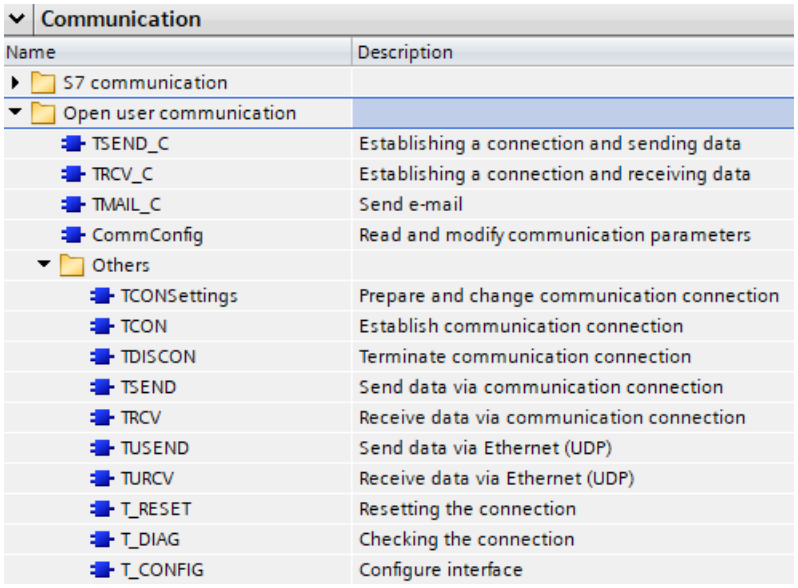
In contrast to TCP, the messages feature an end-of-data identification and are message-oriented.

Using Transport Service Access Points (TSAPs), TCP protocol allows multiple connections to a single IP address (up to 64K connections). With RFC 1006, TSAPs uniquely identify these communication end point connections to an IP address.

UDP

UDP (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/25643073419_enUS.htm&ft:clusterId./10866368523/25643073419.htm) is a standard protocol described by RFC 768: User Datagram Protocol (https://www.rfc-editor.org/info/rfc768). UDP is a simpler transport control protocol than TCP that provides a mechanism for one application to send a datagram to another; however, delivery of data is not guaranteed. UDP has the following features and capabilities:

- Offers a quick communications protocol
- Allows for the handling of small-sized to medium data amounts (up to 2048 bytes)
- Provides a thin layer that yields low overheads
- Offers flexibly for integration with many third-party systems
- Provides routing capabilities
- Uses port numbers to direct the datagrams
- Requires the application to take responsibility for error recovery and security as messages are unacknowledged
- Requires programming effort for data management due to the SEND / RECEIVE programming interface



UDP supports broadcast communication. To use broadcast, you must configure the IP address portion of the ADDR configuration. For example: A CPU with an IP address of 192.168.2.10 and subnet mask of 255.255.255.0 would use a broadcast address of 192.168.2.255.

7.6.9.3 Ad hoc mode

Typically, TCP and ISO on TCP receive data packets of a specified length, ranging from 1 to 8192 bytes. However, the TRCV_C (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/19135463947_enUS.htm&ft:clusterId./18560165643/19135463947.htm) and TRCV (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/19142302219_enUS.htm&ft:clusterId./18560165643/19142302219.htm) communication instructions also provide an "ad hoc" communications mode that can receive data packets of a variable length from 1 to 1460 bytes.

7.6.9.4 Instructions

Open user communication instructions (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13367222283_enUS.htm&ft:clusterId./10866368523/13367222283.htm) provide for communication using various network protocols and include the following folder groups:

NOTE

Choosing an instruction by PLC family

If the TIA Portal Information System presents an instruction differently within the tooltips or table of contents based on PLC family, follow the S7-1500 option for the instruction topic.

7.6.9.5 Connection IDs for the Open user communication instructions

Create an instance DB to configure the communications channel (or connection) between the devices by inserting the TSEND_C, TRCV_C or TCON instructions into STEP 7. To configure the parameters for the connection, utilize the Properties of the instruction. One of these parameters is the connection ID, which must be unique for the CPU. Ensure that each connection you create has a different DB and connection ID. Also, note the following:

- Both the local CPU and the partner CPU can use the same connection ID number for the same connection, but the connection ID numbers are not required to match. The connection ID number is relevant only for the Open user communication instructions within the user program of the individual CPU.
- You can use any number in the range of 1 to 4095 for the connection ID of the CPU. However, configuring the connection IDs sequentially from "1" provides an easy method for tracking the number of connections in use for a specific CPU. Alternatively, you can use the TCONSettings instruction to request a connection ID from the CPU.

NOTE

Each TSEND_C, TRCV_C, or TCON instruction in STEP 7 creates a new connection. It is important to use the correct connection ID for each connection.

For more information, see the following topics in the Open User Communication chapter of the TIA Portal Information System:

- TCON: Establish communication connection (S7-1200, S7-1500) (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/46790960779_enUS.htm&ft:clusterId./18560165643/46790960779.htm)
- TSEND_C: Establishing a connection and sending data (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/41150802699_enUS.htm&ft:clusterId./18560165643/41150802699.htm)
- TRCV_C: Establishing a connection and receiving data (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/41150876811_enUS.htm&ft:clusterId./18560165643/41150876811.htm)

7.6.9.6 Parameters for the OUC connection

The TSEND_C, TRCV_C, and TCON instructions require connection-related parameters (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13452671883_enUS.htm&ft:clusterId./10866368523/13452671883.htm) to connect to the partner device. The TCON_Param structure assigns these parameters for the TCP, ISO-on-TCP, and UDP protocols. Use the "Configuration" tab of the "Properties" of the instruction to specify these parameters. If the "Configuration" tab is not accessible, provide the TCON_Param structure in the instruction parameters.

NOTE

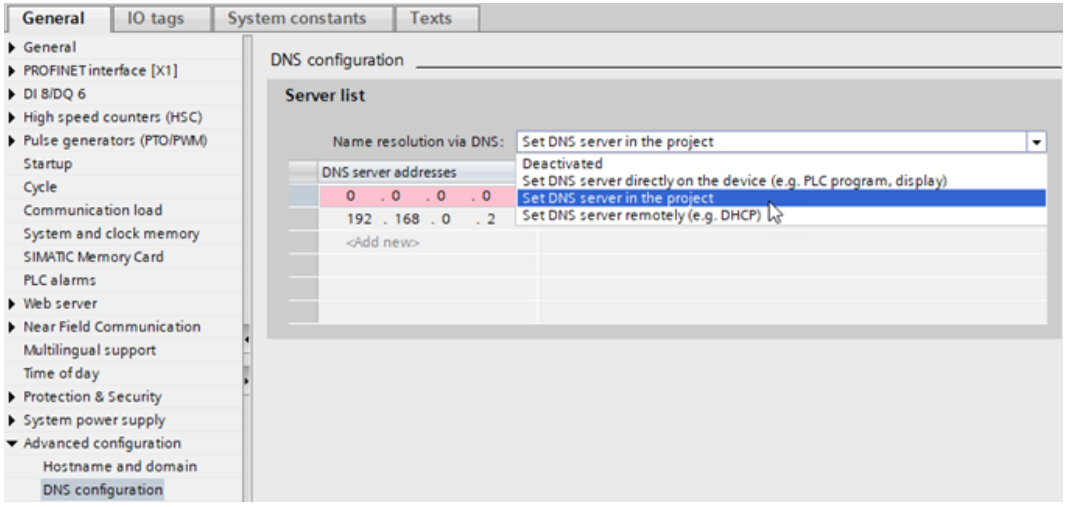
If you specify the address of a device as an FQDN via the connection types of TCON_QDN or TCON_QDN_SEC, you need to configure a DNS server (Page 228).

NOTE

Connection types of TCON_QDN_SEC and TCON_IP_V4_SEC use TLS for security (Page 228).

7.6.9.7 Transport Layer Security (TLS)

TLS is Transport Layer Security in the application layer of data communications. TLS increases security and privacy in communication between the S7-1200 G2 CPU and other devices.



7.6.9.8 Configuring DNS

A DNS server might be required when the module itself, a communications partner, or for example an FTP server should be reachable via the host name (FQDN). If you specify the address of a connection partner as FQDN, configure a DNS server. In this case, the IP address of the connection partner is obtained via the configured DNS server.

To use DNS, you must have at least one DNS server in your network, and you must configure at least one DNS server for the S7-1200 G2 CPU.

To configure a DNS server, follow these steps:

1. From the Device view for your S7-1200 G2 CPU, navigate to "Properties > General".
2. Navigate to "Advanced configuration > DNS configuration" to display the configuration pane.
3. Select "Set DNS servers in the project" in the dropdown menu.

4. In the Server list table, click "<Add new>" and enter the IP address of your DNS server.

7.6.9.9 Configuring an OUC connection in the TIA Portal

For complete information on configuring an Open User Communication connection in STEP 7, see the following topics and chapters under "Using Open User Communication" in the TIA Portal Information System:

- Basics of Open User Communication (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13367222283_enUS.htm&ft:clusterId./10866368523/13367222283.htm)
- Connection configuration (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/42307475211_enUS.htm&ft:clusterId./10866368523/42307475211.htm)
- Connection parameters (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13452671883_enUS.htm&ft:clusterId./10866368523/13452671883.htm)

7.6.9.10 Common parameters for instructions

REQ input parameter

Many of the OUC instructions use the REQ input to initiate the operation on a low to high transition. The REQ input must be high (TRUE) for one execution of an instruction, but the REQ input can remain TRUE for as long as you choose. The instruction does not initiate another operation until it has been executed with the REQ input FALSE so that the instruction can reset the history state of the REQ input. This is required so that the instruction can detect the low to high transition to initiate the next operation.

When you place one of these instructions in your program, STEP 7 prompts you to identify the instance DB. Use a unique DB for each instruction call. This ensures that each instruction properly handles inputs such as REQ.

ID input parameter

The ID parameter is a reference to the "Local ID (hex)" on the "Network view" of "Devices and networks" in STEP 7 and is the ID of the network that you want to use for this communication block. The ID must be identical to the associated parameter ID in the local connection description.

DONE, NDR, BUSY, ERROR, and STATUS output parameters

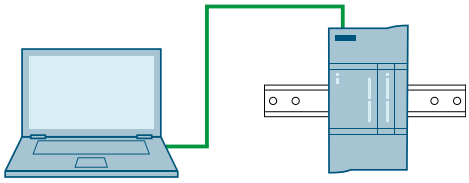
The following parameters are common to the OUC instructions and provide outputs describing the completion status:

Table 1-185 Open User Communication instruction output parameters

Parameter	Data type	Default	Description
DONE	Bool	FALSE	Is set TRUE for one execution to indicate that the last request completed without errors; otherwise, FALSE.
NDR	Bool	FALSE	Is set TRUE for one execution to indicate that the requested action has completed without error and new data has been received; otherwise, FALSE.

Parameter	Data type	Default	Description
BUSY	Bool	FALSE	Is set TRUE when active to indicate that: • The job is not yet complete. • A new job cannot be triggered. Is set FALSE when job is complete.
ERROR	Bool	FALSE	Is set TRUE for one execution to indicate that the last request completed with errors, with the applicable error code in STATUS; otherwise, FALSE.
STATUS	Word	0	Is set to a status value as follows: • If the DONE or NDR bit is set, then STATUS is set to 0 or to an informational code. • If the ERROR bit is set, then STATUS is set to an error code. • If none of the above bits are set, then the instruction returns status results that describe the current state of the function. STATUS retains its value for the duration of the execution of the function.

NOTE
Note that DONE, NDR, and ERROR are set for one execution only.



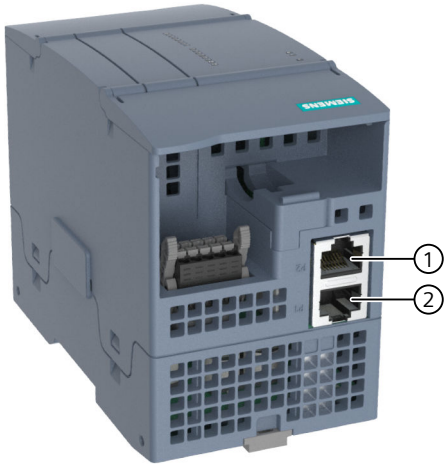
7.6.9.11 Restricted TSAPs or port numbers for passive ISO and TCP communication

If you use the TCON instruction to set up and establish a passive communications connection, do not use the following restricted port addresses:

- ISO TSAP (passive):
  - 01.00, 01.01, 02.00, 02.01, 03.00, 03.01
  - 10.00, 10.01, 11.00, 11.01, ... BF.00, BF.01
- TCP port (passive) and UDP port (passive):
  - 20, 21, 25, 80, 102, 443, 5001, 34962, 34963, 34964, 49152 to 65535

7.6.10 Communication with a programming device

A CPU can communicate with a STEP 7 programming device on a network.

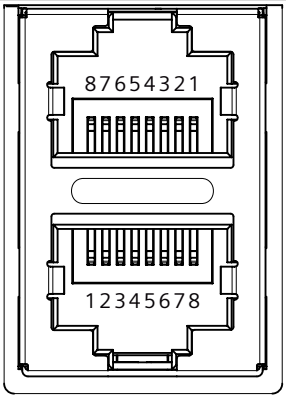


7.6.10.1 Establishing the hardware communications connection

PROFINET interfaces establish the physical connections between a programming device and a CPU. Since Auto-Cross-Over functionality is built into the CPU, either a standard or crossover Ethernet cable can be used for the interface. An Ethernet switch is not required to connect a programming device directly to a CPU.

Follow the steps below to create the hardware connection between a programming device and a CPU:

1. Install the CPU (Page 69).
2. Plug the Ethernet cable into one of the two PROFINET ports located on the top left of the CPU.
3. Connect the Ethernet cable to the programming device.

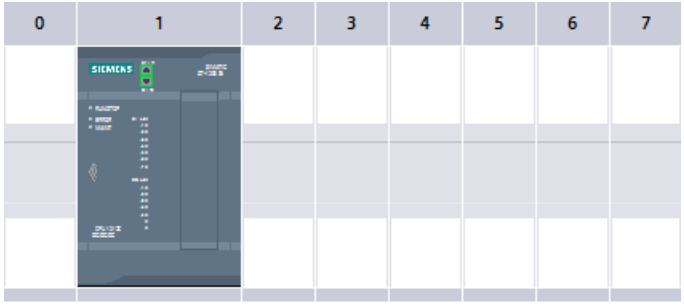


① X1P2
② X1P1

PROFINET interface X1 port pinouts

S7-1200 G2 CPUs connect to the PROFINET network using standard female RJ45 jacks. All S7-1200 G2 CPUs have dual-ports, but one interface. The connector pinout is the same for all CPUs.

The dual-ports of S7-1200 G2 CPUs have a standard Ethernet MDI-X pin configuration as follows:



Pin	Signal name	Description	RJ45 female jack pinout
1	TD+	Transmit data	
2	TD-		
3	RD+	Receive data	
4	GND	Ground	
5	GND		

Pin	Signal name	Description	RJ45 female jack pinout
6	RD-	Receive data	
7	GND	Ground	
8	GND		

NOTE
All S7-1200 G2 CPUs are dual-port CPUs with no crossover between pins. There is an internal Ethernet switch in the units: The TD+/- and RD+/- pairs are not crossed over internally.

7.6.10.2 Configuring the devices

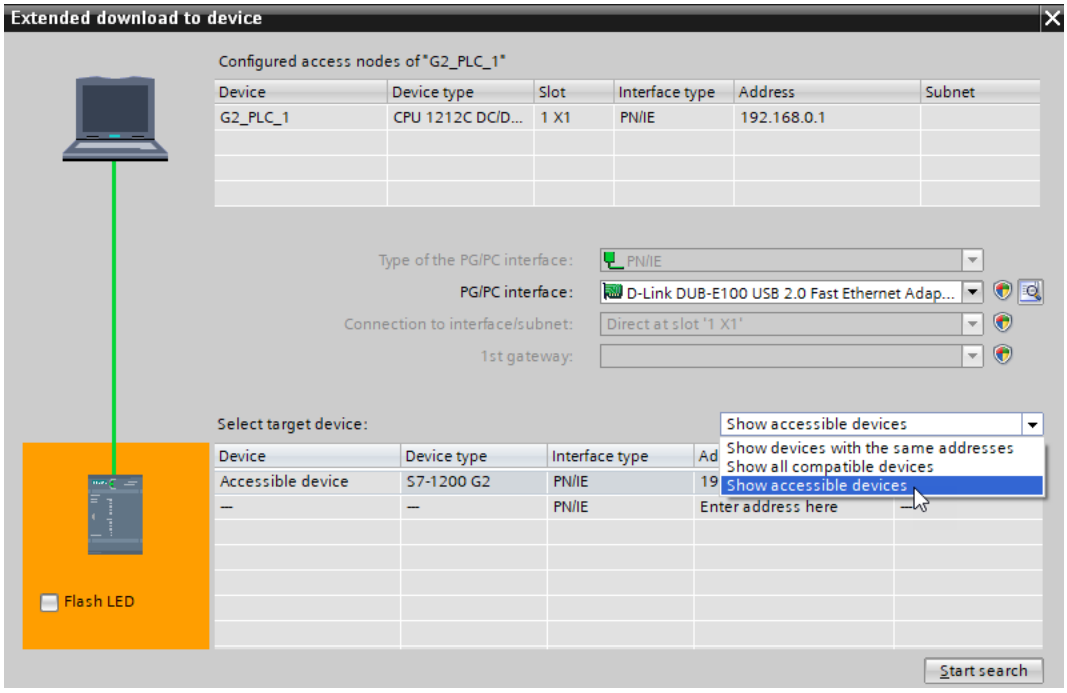
If you have already created a project with a CPU, open your project in STEP 7.
If not, create a project and insert a CPU (Page 152) into the rack.

Autonegotiation

If the port's configuration enables autonegotiation, the S7-1200 G2 CPU automatically detects the cable type and swaps the transmit/receive lines, if needed. If the port's configuration disables autonegotiation, the CPU also disables this automatic swap. You configure a port's autonegotiation setting (Page 217) in the TIA Portal's port options dialog. This is a port-specific advanced option for the PROFINET interface (X1) of the CPU's properties.

7.6.10.3 Testing the PROFINET network

After completing the configuration, download the project to the CPU. The download operation sets all IP addresses for devices configured as "Set IP address in the project".



Assigning an IP address to an online CPU

The CPU does not have a pre-configured IP address. You must manually assign an IP address for the CPU in one of the following ways:

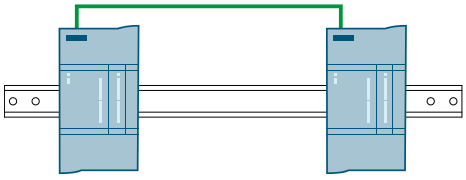
- Assign an IP address to an online CPU (Page 216).
- Assign IP address for a CPU in your project (Page 217). You must configure the IP address, save the configuration, and download it to the CPU.

Using the "Extended download to device" dialog to test for connected network devices

The CPU "Download to device" function and its "Extended download to device" dialog can show all accessible network devices and whether or not unique IP addresses have been assigned to all devices. To display all accessible and available devices with their assigned MAC or IP addresses, select "Show all accessible devices" from the dropdown menu.

If the required network device is not in this list, communications to that device have been interrupted for some reason. Check the device and network for hardware or configuration errors.

7.6.10.4 Assigning Internet Protocol (IP) addresses



In a PROFINET network, each device must have an Internet Protocol (IP) address. This address allows the device to deliver data on a more complex, routed network:

- If you have programming or other network devices that use a network interface connected to your plant LAN or an Ethernet-to-USB adapter connected to an isolated network, you must assign IP addresses to them. Refer to "Assigning IP addresses to programming and network devices" (Page 214) for more information.
- You can also assign an IP address to a CPU or network device online (Page 216). This is particularly useful in an initial device configuration.
- After you have configured your CPU or network device in your project, you can configure parameters for the PROFINET interface to include its IP address. Refer to "Configuring an IP address for a CPU in your project" (Page 217) for more information.

7.6.11 PLC-to-PLC communication

A CPU can communicate with another CPU on a network.

One way to configure two CPUs to communicate with each other is by using the TSEND_C and TRCV_C instructions.

Consider the following when setting up communications between two CPUs:

- Configuration/Setup
- Supported functions: Reading/Writing data to a peer CPU
- No Ethernet switch is required for one-to-one communications; an Ethernet switch is required for more than two devices in a network unless the devices have a built in switch.

Configuring communication between two CPUs

To configure communication between two CPUs, follow these steps:

1. Establish the hardware communications connection (Page 231). A PROFINET interface establishes the physical connection between two CPUs. Since Auto-Cross-Over functionality is built into the CPU, you can use either a standard or crossover Ethernet cable for the interface. An Ethernet switch is not required to connect the two CPUs.
2. Configure the devices (Page 232). You must configure two CPUs in your project.
3. Configure the logical network connections between two CPUs (Page 212).
4. Configure an IP address in your project (Page 217). You must configure IP addresses for two CPUs (for example, PLC_1 and PLC_2).
5. Configure transmit (send) and receive parameters (Page 235). You must configure TSEND_C and TRCV_C instructions in both CPUs to enable communications between them.
6. Test the PROFINET network (Page 233). You must download the configuration for each CPU.

7.6.11.1 Configuring connection parameters

Configuring connection parameters

To specify the connection parameters, select any part of the instruction and do the following:

1. In the inspector window of STEP 7, select the "Properties" tab
2. Select the "Configuration" tab at right.
3. Select "Connection parameter".

Refer to "Configuring the Local/Partner connection path (Page 213)" for more information on each parameter.

Defining TSAPs (Transport Service Access Points) or Ports

If you configure a communication connection in your STEP 7 program, STEP 7 automatically assigns the TSAP (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/13575570443_enUS.htm&ft:clusterId./10866368523/13575570443.htm).

If you are using TBlocks, you can edit the TSAP fields in the "Address Details" section of the Connection parameters dialog or directly in the connection parameter Data block .

7.6.11.2 Configuring transmit (send) and receive parameters

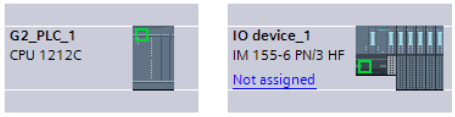
Communication blocks (for example, TSEND_C and TRCV_C) are used to establish a connection between two CPUs. Before the CPUs can engage in PROFINET communications, you must configure parameters for transmitting (or sending) messages and receiving messages.

For more information on Configuring the TSEND_C and TRCV_C instructions, see the following topics:

- TSEND_C: Establishing a connection and sending data (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/41150802699_enUS.htm&ft:clusterId./18560165643/41150802699.htm)
- TRCV_C: Establishing a connection and receiving data (https://docs.tia.siemens.cloud/access?ft:originId=./18560165643/41150876811_enUS.htm&ft:clusterId./18560165643/41150876811.htm)

7.6.12 Configuring a CPU and PROFINET IO device

7.6.12.1 Adding a PROFINET IO device



CPU-to-PROFINET IO device communication allows for data transmission and reception with specified length.

To add PROFINET IO devices in your STEP 7 program, follow these steps:

1. From the "Project tree", double click to select "Device configuration" for your CPU.
2. In the center window, select the "Network view" tab.
3. From the "Hardware catalog" pane at right, select the PROFINET IO device (sorted by part number).
4. Drag and drop the selected IO device into the "Network view" inspector window.

For example, expand the following containers in the hardware catalog to add an ET 200SP IO device: Distributed I/O, ET 200SP, Interface modules, and PROFINET. You can then select the interface module from the list of ET 200SP devices and add the ET 200SP IO device.

Table 1-186 Adding an ET 200SP IO device to the device configuration

Insert the IO device	Result
	

You can now connect the PROFINET IO device to the CPU:

1. Right-click the "Not assigned" link on the device and select "Assign new IO controller" from the context menu to display the "Select IO controller" dialog.
2. Select your CPU (in this example, "S7-1200 G2") from the list of IO controllers in the project.
3. Click "OK" to create the network connection.

You can also go to the "Devices and networks" window and use the "Network view" to create the network connections between the devices in your project:

1. To create a PROFINET connection, click the green (PROFINET) box on the first device, and drag a line to the PROFINET box on the second device.
2. Release the mouse button to configure the PROFINET connection.

Refer to "Device Configuration: Configuring the CPU for communication (Page 165)" for more information.

7.6.12.2 Assigning CPUs and device name

Network connections between the devices also assign the PROFINET IO device to the CPU, which is required for that CPU to control the device. To change this assignment, click the PLC name shown on the PROFINET IO device. Use the dialog box to disconnect the PROFINET IO device from the current CPU and reassign it to another CPU. Alternatively, you can leave the PROFINET IO device unassigned.

To connect with the CPU, you must assign a name to the devices on your PROFINET network (https://docs.tia.siemens.cloud/access?ft:originId=./19260980235/20299041291_enUS.htm&ft:clusterId./19260980235/20299041291.htm). If you have not assigned a name to the

devices, or if you need to change a device's name, use the "Network view" option. Select the PROFINET IO device and right-click to choose "Assign device name".

NOTE
You must assign the same name to each PROFINET IO device in both the STEP 7 project and the PROFINET network.

You can use one of the following tools to assign the device name in the PROFINET network:

- STEP 7 "Online & diagnostics" tool
- PRONETA commissioning, configuration, and diagnostics tool
- SIMATIC Automation Tool

If a name is missing or does not match in either location, the PROFINET IO data exchange mode will not run.

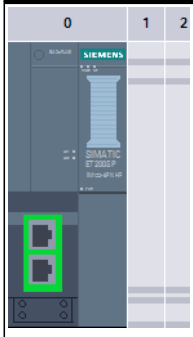
7.6.12.3 Assigning Internet Protocol (IP) addresses

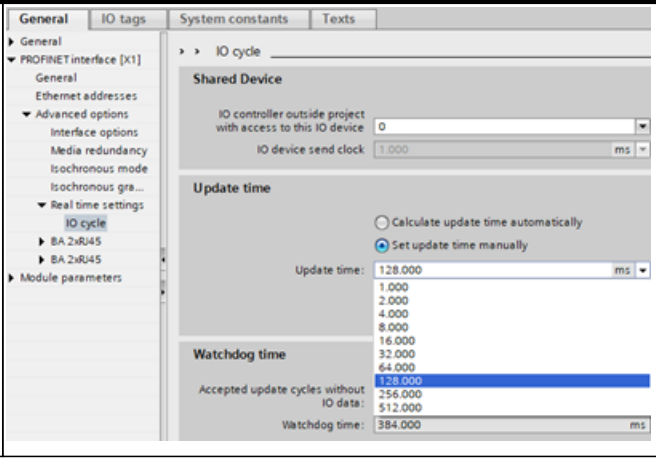
In a PROFINET network, each device must have an Internet Protocol (IP) address. Note the following:

- If you have programming or other network devices that use an onboard adapter interface connected to your plant LAN or an Ethernet-to-USB adapter card connected to an isolated network, you must assign IP addresses to them. Refer to "Assigning IP addresses to programming and network devices" (Page 214) for more information.
- You can also assign an IP address to a CPU or network device online. This is particularly useful in an initial device configuration. Refer to "Assigning an IP address to a CPU online" (Page 216) for more information.
- After you have configured your CPU or network device in your project, you can configure parameters for the PROFINET interface to include its IP address. Refer to "Configuring an IP address for a CPU in your project" (Page 217) for more information.

7.6.12.4 Configuring the IO cycle time

The CPU supplies a PROFINET IO device with new data within an IO cycle time period. The update time can be separately configured for each device and determines the time interval in which data is transmitted from the CPU to and from the device.





STEP 7 calculates the IO cycle update time automatically in the default setting for each device of the PROFINET network, taking into account the volume of data to be exchanged and the number of devices assigned to this controller. If you do not want to have the update time calculated automatically, you can change this setting.

To access the IO cycle parameters, click a PROFINET port on the ET 200SP IO device. From Properties dialog, select "Advanced options > Realtime settings > IO cycle".

Define the IO cycle "Update time" with the following selections:

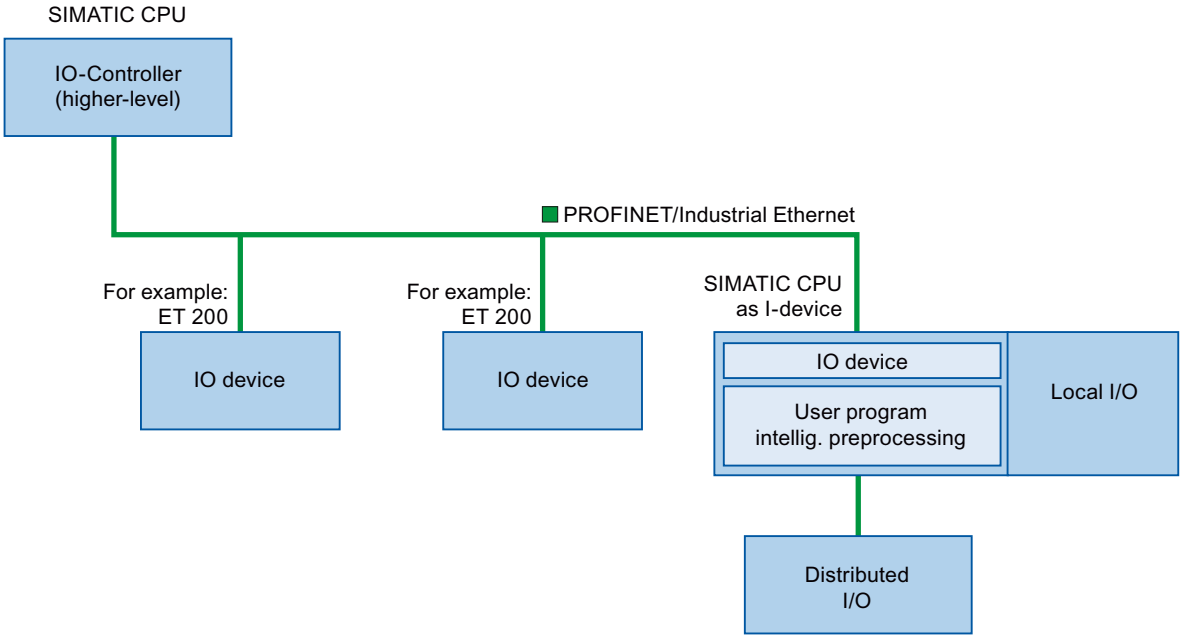
- To have a suitable update time calculated automatically, select "Calculate update time automatically".
- To set the update time yourself, select "Set update time manually" and choose the required update time in ms from the dropdown menu.

Table 1-187 Configuring the ET 200SP PROFINET IO cycle time

ET 200SP PROFINET IO device	ET 200SP PROFINET IO cycle dialog
	

7.6.12.5 Prioritized startup of an IO device

IO devices can use "Prioritized Startup (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/22911324171_enUS.htm&ft:clusterId./10866368523/22911324171.htm)" to reduce CPU connection time during power-up. With an S7-1200 G2 CPU, selecting this option implements Accelerated Startup instead of Fast Startup. Accelerated Startup provides faster device initialization than standard startup, but does not utilize DCP Hello messages to establish communication.



7.6.13 Configuring a CPU and PROFINET I-device

7.6.13.1 I-device functionality

A CPU with I-device functionality is called an "I-device".

The "I-device" (intelligent IO device) functionality of a CPU facilitates data exchange with an IO controller and operation of the CPU as an intelligent preprocessing unit of subprocesses, for example. The I-device is linked as an IO device to a "higher-level" IO controller.

STEP 7 handles the preprocessing on the CPU. The process values acquired in the local or distributed (PROFINET IO) I/O are preprocessed by STEP 7 and made available through a PROFINET IO interface to the CPU of a higher-level station.

The S7-1200 G2 CPU can act as an I-device with PROFI-Energy functionality.

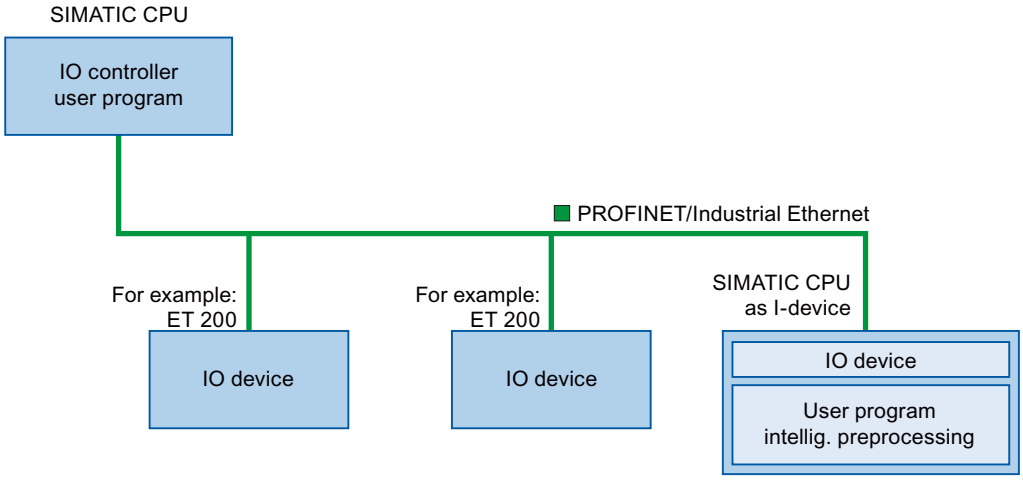
7.6.13.2 Properties and advantages of the I-device

The I-device allows you to separate STEP 7 automation projects between creators and users, with the GSD file serving as the interface between these projects. This establishes a connection to standard IO controllers through a standardized interface. Additionally, the I-device has a deterministic PROFINET IO system for real-time communication through the PROFINET IO interface.

Advantages

The I-device offers the following advantages:

- Simple linking of IO controllers
- Real-time communication between IO controllers
- Relieving the IO controller by distributing the computing capacity to I-devices
- Lower communications load by processing process data locally



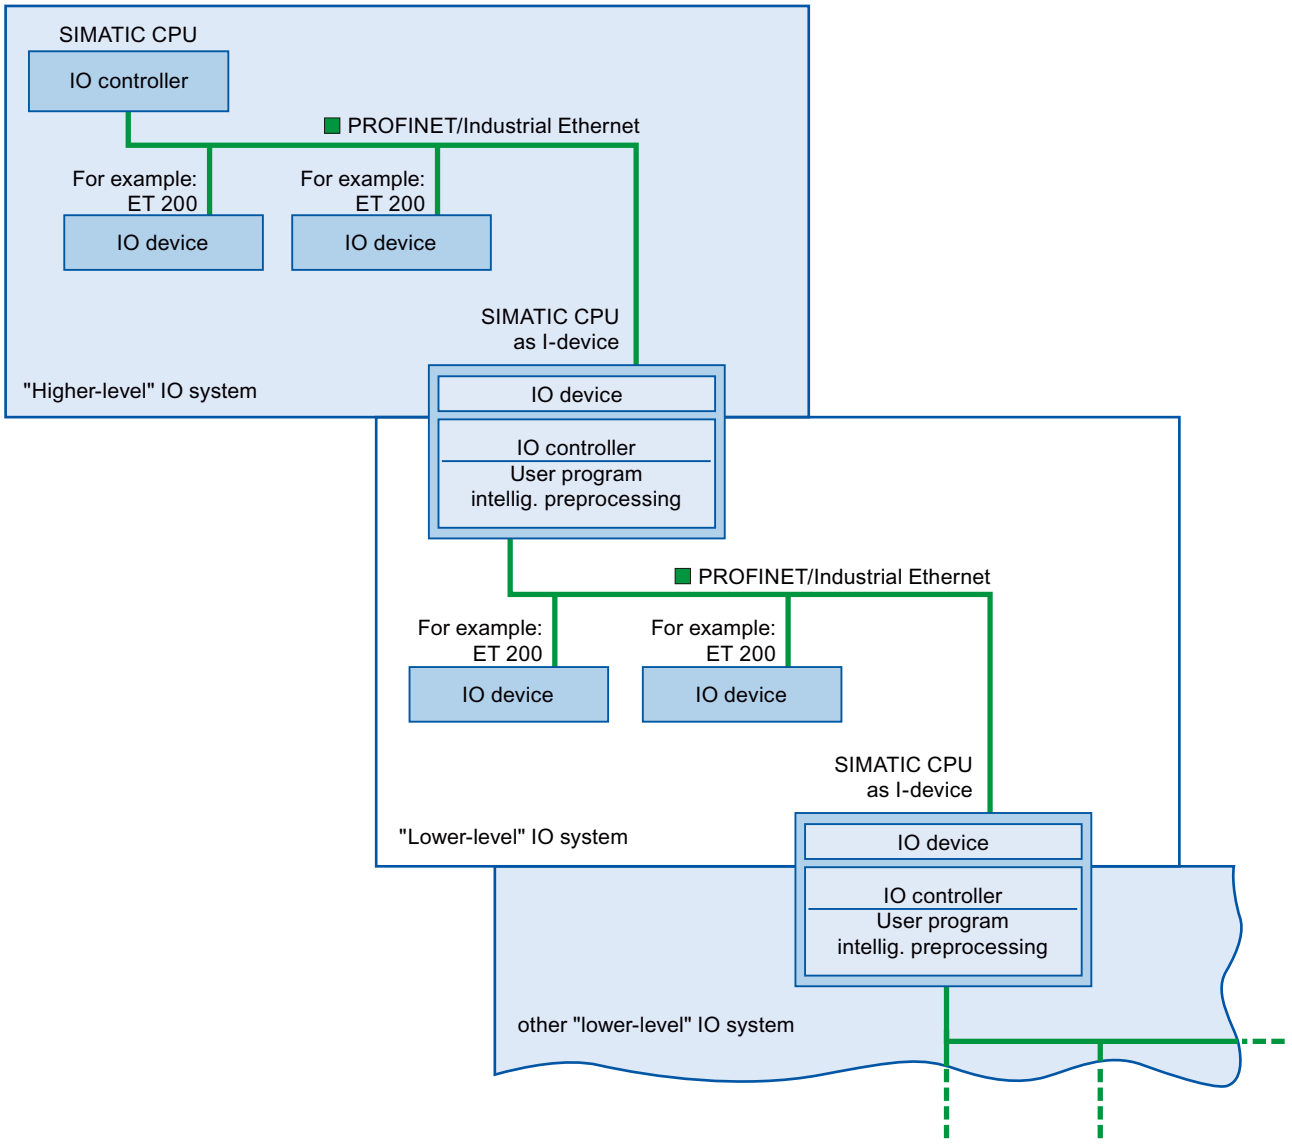
- Manageable solution design that includes the following:
  - Distributed processing: Divide complex automation tasks into smaller subprocesses for increased manageability and simplified subtasks.
  - Separating subprocesses: You can subdivide complicated, widely distributed and extensive processes into subprocesses with manageable interfaces by using I-devices. Store these subprocesses in separate STEP 7 projects and later merge them into a single master project.
  - Know-how protection: Deliver components with a GSD file for the I-device interface description instead of a STEP 7 project. This approach protects your program and eliminates the need for program publication.

7.6.13.3 Characteristics of an I-device

An I-device is included in an IO system like a standard IO device.

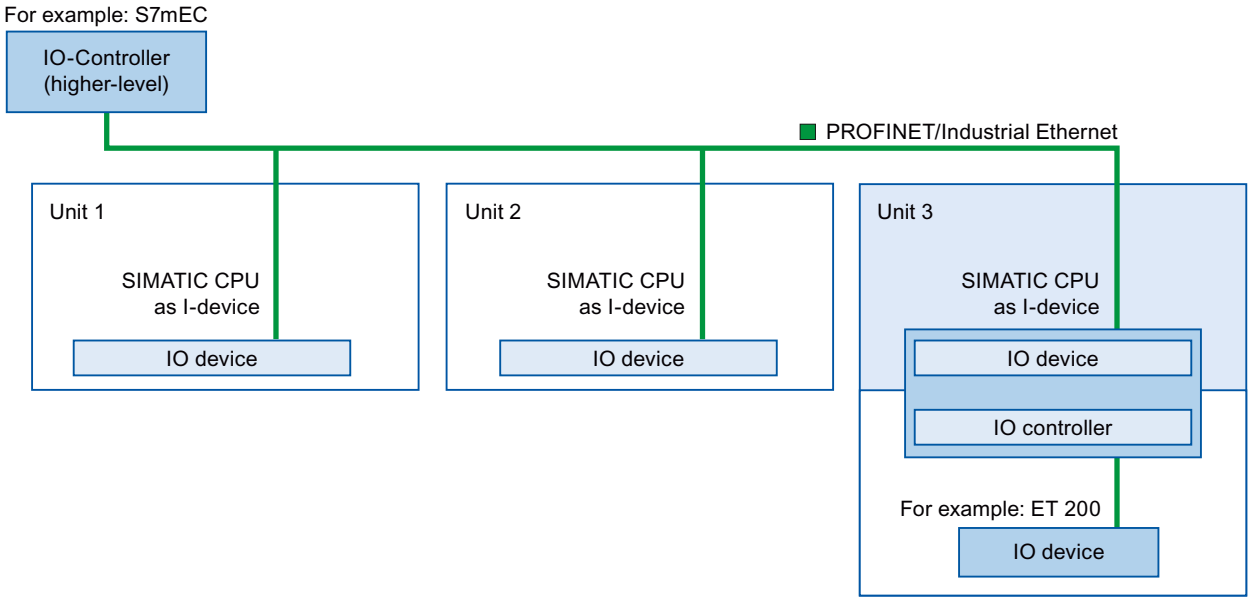
I-device without lower-level PROFINET IO system

The I-device does not have its own distributed I/O. The configuration and parameter assignment of the I-devices in the role of an IO device is the same as for a distributed I/O system (for example, ET 200).



I-device with lower-level PROFINET IO system

Depending on the configuration, an I-device can also be an IO controller on a PROFINET interface in addition to having the role of an IO device.



This means that the I-device can be part of a higher-level IO system through its PROFINET interface and as an IO controller can support its own lower-level IO system.

The lower-level IO system can, in turn, contain I-devices. This makes hierarchically structured IO systems possible.

Example: I-device as IO device and IO controller

This example explains the use of an I-device as IO device and IO controller in a print process. The I-device controls a unit (a subprocess). One unit is used, for example, to insert additional sheets such as flyers or brochures in a package of printed material.

Unit 1 and unit 2 each consist of an I-device with local I/O. The I-device along with the distributed I/O system (for example, ET 200) forms unit 3.

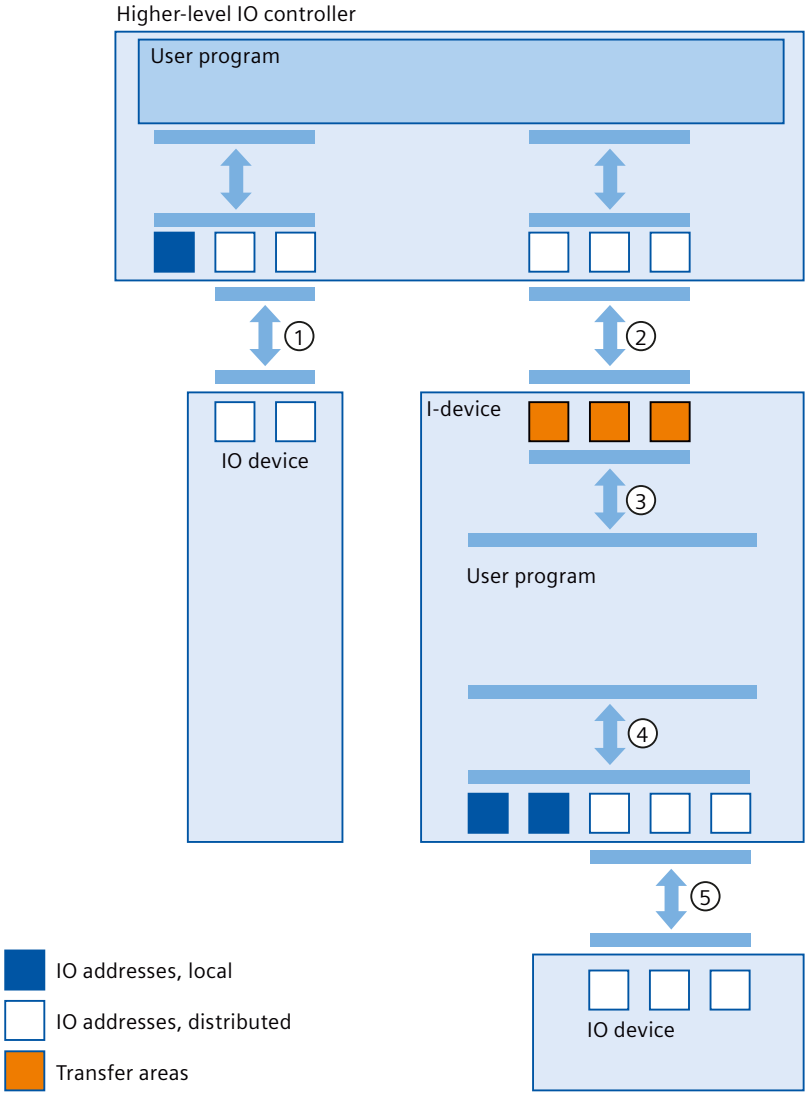
The STEP 7 program on the I-device is responsible for preprocessing the process data. For this task, the STEP 7 program of the I-device requires default settings (for example, control data) from the higher-level IO controller. The I-device provides the higher-level IO controller with the results (for example, status of its subtask).

7.6.13.4 Data exchange between higher- and lower-level IO system

Transfer areas are an interface to the STEP 7 program of the I-device CPU. The CPU processes the inputs and sets the outputs.

The data for communication between IO controller and I-device is available in the transfer areas. A transfer area contains an information unit that is exchanged consistently between IO controller and I-device (Page 245).

Input transfer areas behave differently upon network loss between controller and I-device



On the controller, the CPU writes zero to the input transfer areas upon network loss. On the I-device, the input transfer areas retain their last values.

You can configure your system to avoid this condition for the general I-device case (non-shared I-device). To do this, clear the input transfer areas for the I-device in a "Rack or Station Failure OB" for a coming event. Follow these steps:

1. Add a "Rack or Station Failure OB (Page 109)" to your project.
2. Add logic to the OB to write the values of the inputs for the I-device to zero when the startup variable of LADDR indicates the value of the I-device hardware ID and the startup variable of Event_Class indicates a "coming" event:
   - You can find the I-device hardware ID in the Default tag table in the "System constants" tab. The hardware ID is a type of "HW_Device", and the name of the tag indicates that it is an I-device (for example, "Local~PROFINET_interface_1~IODevice").
   - A value of "16#39" in the Event_Class indicates a "coming" event. If the "Event_Class" input variable contains the value of "16#39", this indicates that the "Rack or Station Failure OB" is now active (as opposed to being cleared).

Data exchange flow

The data exchange between the higher- and lower-level IO system is as follows:

① **Data exchange between higher-level IO controller and IO-device** through PROFINET.

② **Data exchange between higher-level IO controller and I-device** through PROFINET.
The data exchange between a higher-level IO controller and an I-device is based upon the conventional IO controller / IO device relationship.
For the higher-level IO controller, the transfer areas of the I-devices represent submodules of a preconfigured station.
The output data of the IO controller is the input data of the I-device. Similarly, the input data of the IO controller is the output data of the I-device.

③ **Transfer relationship between the STEP 7 program and the transfer area**
STEP 7 and the transfer area exchange input and output data.

④ **Data exchange between the STEP 7 program and the I/O of the I-device**
STEP 7 and the local / distributed I/O exchange input and output data.

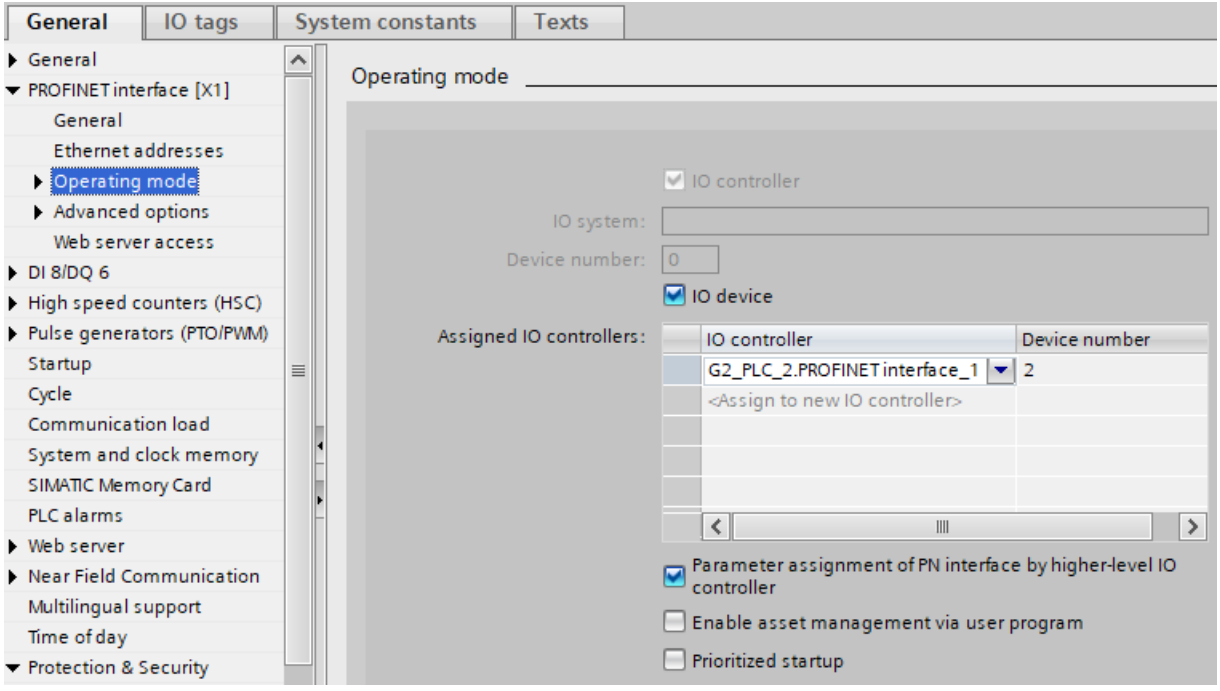
⑤ **Data exchange between the I-device and a lower-level IO device** through PROFINET.

7.6.13.5 Configuring the I-device

You have two possibilities for configuration:

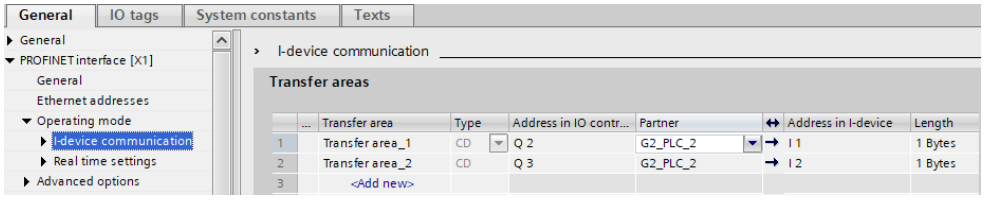
- Configuration of an I-device within a project
- Configuration of an I-device that is used in another project or in another engineering system

STEP 7 allows you to configure an I-device for another project or for another engineering system by exporting a configured I-device to a GSD file. You import the GSD file in other projects or engineering systems as with other GSD files. The transfer areas for the data exchange, among other data, are stored in this GSD file.



NOTE

When you use the S7-1200 G2 as a shared I-device and as a controller, ensure that you increase the PROFINET I-device and PROFINET IO update times to alleviate the communications performance impact. The system is very stable and works well when you select 2 ms for the update time of a single PROFINET device time and you select 2 ms for the update time of a single PROFINET IO time.



Configuration of an I-device within a project

1. Drag-and-drop a PROFINET CPU from the hardware catalog into the network view.
2. Drag-and-drop the second PROFINET CPU, which can also be configured as an IO device, from the hardware catalog into the network view. This device is configured as an I-device (for example, CPU 1212C).
3. Click the device in the Device view to display the "Properties" tab view.
4. In the left column, select and expand the PROFINET interface for the I-device and select the "Operating Mode" category.
5. In the inspector window, select the checkbox for "IO device".

6. Choose the IO controller in the "Assigned IO controller" drop-down list.
   After you have chosen the IO controller, the network view displays the networking and the IO system between both devices.

7. With the "Parameter assignment of PN interface by higher-level IO controller" checkbox, you specify whether the interface parameters will be assigned by the Idevice or by a higher-level IO controller.
   If you operate the I-device with a lower-level IO system, then the parameters of the I-device PROFINET interface (for example, the port parameter) cannot be assigned with the higher-level IO controller.
8. Configure the transfer areas. The transfer areas are found in the area navigation section "I-device communication":
   – Click in the first field of the "Transfer area" column. STEP 7 assigns a default name, which you can change.
   – Type of communication relation is set to CD (Communication Direction) by default.
   – Addresses are automatically preset; you can correct addresses if necessary, and determine the length of the transfer area which is to be consistently transferred.

9. A separate entry is created under "I-device communication" for each transfer area. If you select one of these entries, you can adjust the details of the transfer area, or correct them and comment on them.

NOTE
If you configure an S7-1200 G2 as an I-device, the maximum size of a transfer area is 1024 input or output bytes. There are possible constraining factors depending on local I/O as well as address space limitations on the controlling device.

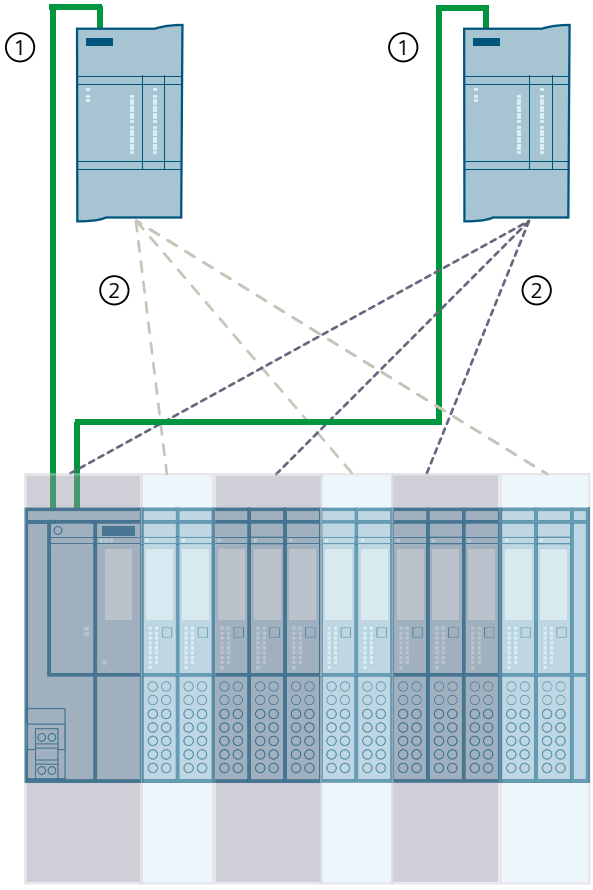
Configuring an I-device with a GSD file

If you use an I-device in another project, or if the I-device is used in another engineering system, you must configure the higher-level IO controller and the I-device as follows:

1. Configure the transfer areas so the I-device creates a new GSD file (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/26415319307_enUS.htm&ft:clusterId./10866368523/26415319307.htm). This GSD file represents the configured I-device in other projects.
2. Assign a name for the I-device proxy as well as a description in the fields provided.
3. Click the "Export" button in the "I-device communication" section of the Inspector window.

To test, import the GSD file, for example, in another project.

7.6.14 Shared device functionality



Large or widely distributed systems might use multiple IO controllers.

By default, one IO controller manages each IO module of an IO device. The "Shared Device" function allows you to divide the modules or submodules of an IO device among different IO controllers.

Configuration

When you configure an S7-1200 G2 CPU as an I-device, it enables the support of shared I-device functionality (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/159334733835_enUS.htm&ft:clusterId=./10866368523/159334733835.htm) for up to two IO controllers. If both the IO controllers and the I-device are SIMATIC CPUs, configure them within a single STEP 7 project.

If one or both IO controllers are non-SIMATIC CPUs, use a GSD file for the configuration process (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/59728529419_enUS.htm&ft:clusterId=./10866368523/59728529419.htm).

① PROFINET
② Logical assignment

7.6.15 Media Redundancy Protocol (MRP)

The S7-1200 G2 CPUs support Media Redundancy Protocol (MRP) functionality and MRP ring setup as either a "Manager" or a "Client":

Media Redundancy Protocol	CPU as a Client	CPU as a Manager or Manager (Auto)
Functionality	Must operate in an MRP ring by forwarding MRP packets over its interface and reporting connection breaks to a manager in the network.	Must send MRP packets around the network, detect open ports in the ring, and manage blocked ports. Manager (Auto) only: Negotiate manager status with other potential managers.
Ring setup	Forwards test frames instead of making the check itself.	Uses test frames to check and make sure the ring is not interrupted.

Use the MRP protocol and configuration parameters (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/20055466635_enUS.

htm&ft:clusterId./10866368523/20055466635.htm) to initialize MRP client and manager operation.

7.6.16 Media Redundancy with Planned Duplication of frames (MRPD)

The MRP extension "Media Redundancy with Planned Duplication of frames" (MRPD) (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/89155688459_enUS.htm&ft:clusterId./10866368523/89155688459.htm) provides the advantage that, in the case of a failure of a device or a line in the ring, all other devices continue to be supplied with IO data without interruption and with short update times.
MRPD is based on IRT and MRP. To realize media redundancy with short update times, the PROFINET devices participating in the ring send their data in both directions. The devices receive this data at both ring ports so that there is no reconfiguration time.

Requirements for media redundancy with MRPD

- All the devices of the ring must support MRPD. Terminal devices at the switch that cyclically exchange IRT data with a ring component must also support MRPD.
  MRPD support is listed in the device information in the STEP 7 hardware catalog (Devices & networks).
- You have configured MRP for all the devices of the ring.
- You have assigned the MRP role "Not device in the ring" to devices that are not located in the ring.
- You have configured IRT for all the involved components.

Configuring MRPD

You do not have to activate MRPD in STEP 7. The function is available automatically as soon as all the requirements for MRPD are fulfilled.

7.6.17 S7 routing

The S7-1200 G2 CPU supports S7 routing (https://docs.tia.siemens.cloud/access?ft:originId=./20713735819/26747797643_enUS.htm&ft:clusterId./20713735819/26747797643.htm) for up to 16 connections. When you have at least two PROFINET interfaces and up to three CP devices installed, the S7-1200 G2 CPUs offer two routing options within the station:

- Between the CPU and a CP
- From one CP to another CP

NOTE
You must add at least one CP.

7.6.18 Isochronous Real-Time PROFINET (IRT)

The S7-1200 G2 CPUs support Isochronous Real-Time PROFINET (IRT).

IRT is a transmission method by which PROFINET devices are synchronized with very high accuracy. A sync master specifies the clock to which sync slaves are synchronized. An IO controller or an IO device can have the role of sync master.

Sync master and sync slaves are always devices in a sync domain. Bandwidth is reserved within the sync domain for IRT communication. Real-time and non-real-time communication (TCP/IP communication) is possible outside of the reserved bandwidth.

PROFINET with IRT (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/39589711499_enUS.htm&ft:clusterId./10866368523/39589711499.htm) is especially suited for the following:

- High performance and deterministics for large quantity structures with regard to user data communications (productive data).
- High performance even with many devices in the line topology with regard to user data communications (productive data).
- Parallel transmission of production and TCP/IP data over wire, and securing the forwarding of production data when data volume is high by reserving transmission bandwidth.

7.6.19 SNMP

Simple Network Management Protocol (SNMP) is an Internet standard protocol for collecting and organizing information about managed devices on IP networks and for modifying that information to change device behavior. Devices that typically support SNMP include routers, switches, servers, workstations, printers, modem racks, and more.

Network management systems use SNMP to monitor network-attached devices for conditions that warrant administrative attention. SNMP uses various services and tools for detection and diagnostics of the network topology. You can find information about the properties of devices capable of SNMP in the Management Information Base (MIB) files. You must have the required rights to access the MIB files.

SNMP exposes management data in the form of variables on the managed systems, which describe the system configuration. Managing applications can query (and sometimes set) these variables.

SNMP uses the UDP transport protocol and has two network components:

- SNMP manager: Monitors the network nodes
- SNMP client: Collects the various network-specific information in the individual network nodes and stores it in a structured form in the Management Information Base (MIB). You can use this data to perform detailed network diagnostics.

For security reasons, SNMP is disabled by default on S7-1200 G2 CPUs, preventing read and write access of SNMP variables. You must enable SNMP to remotely view and edit SNMP variables.

After enabling SNMP, certain conditions might require you to disable it. Examples of these conditions include the following:

- The security settings in your network do not allow the use of SNMP.
- You use your own SNMP solution (for example, with your own communications instructions).

If SNMP is disabled on the device, some functions and tools that rely on access to SNMP variables are unavailable or inoperable. For example, topology detection in TIA Portal is

inoperable, and some functions of the SIMATIC Automation Tool V4.x and prior, are inoperable.

NOTE
Restoring the CPU to factory defaults disables SNMP.

Enabling and disabling SNMP from the device configuration

To enable or disable SNMP follow these steps:

1. From the Project Tree, under the CPU, double-click Device configuration.
2. From the General tab of the device properties, expand Advanced configuration and select SNMP.
3. To enable SNMP, select the "Activate SNMP" checkbox or to disable SNMP, deselect it.
4. Enter a Read-only community string or use the default (public) and enter a Read-write community string or use the default (private).

   NOTE
   To share SNMP data between the STEP 7 project and the PLC, the community name entered in the STEP 7 project must match the community name entered for the host when creating the SNMP database connection.

5. Download the configuration to the CPU.

Enabling and disabling SNMP from the STEP 7 program

For detailed information on enabling and disabling SNMP from your STEP 7 program, see the following areas in the TIA Portal Information System:

- Configuring SNMP (https://docs.tia.siemens.cloud/access?ft:originId=./52499730827/59148451211_enUS.htm&ft:clusterId./52499730827/59148451211.htm)
- Activating and deactivating SNMP (https://docs.tia.siemens.cloud/access?ft:originId=./11627607179/90872859787_enUS.htm&ft:clusterId./11627607179/90872859787.htm)
- Disabling SNMP: Full program example (https://docs.tia.siemens.cloud/access?ft:originId=./11627607179/96590122635_enUS.htm&ft:clusterId./11627607179/96590122635.htm)

7.7 S7 communication

7.7.1 PUT and GET (Write and read from a remote CPU)

You can use the PUT and GET instructions to communicate with S7 CPUs through PROFINET connections. This is only possible if the "Permit access with PUT/GET communication from remote partner" function is activated for the partner CPU in the "Protection & Security" property of the local CPU properties:

- Accessing data in a remote CPU: An S7-1200 G2 CPU can only use absolute addresses in the ADDR_x input field to address variables of remote CPUs (S7-200/300/400/1200).
- Accessing data in a standard DB: An S7-1200 G2 CPU can only use absolute addresses in the ADDR_x input field to address DB variables in a standard DB of a remote S7 CPU.
- Accessing data in an optimized DB: An S7-1200 G2 CPU cannot access DB variables in an optimized DB of a remote S7-1200 G2 CPU.
- Accessing data in a local CPU: An S7-1200 G2 CPU can use either absolute or symbolic addresses as inputs to the RD_x or SD_x input fields of the PUT or GET instruction, respectively.

Enabling PUT/GET access

PUT/GET operation is not automatically enabled.

To enable PUT/GET access, follow these steps:

1. In the Project tree under "Security settings" > "Users and roles", click the checkbox to enable the Anonymous user.
2. In the "Roles" tab, click "Add new role" and give it a name.
3. From the "Roles" tab, click the "Runtime rights" tab and select your PLC from the dropdown menu at left.
4. Assign at least one of the following function rights for your PLC:
   - HMI access
   - Read Access
   - Full access
5. Select the "Users" tab in the top right and click the checkbox beside the new role to assign it to the Anonymous user.
6. In the CPU's "Device configuration" inspector window, select the "Properties" tab > "Protection & Security > Connection mechanisms" and click the checkbox to "Permit access with PUT/GET communication from remote partner".

⚠ WARNING

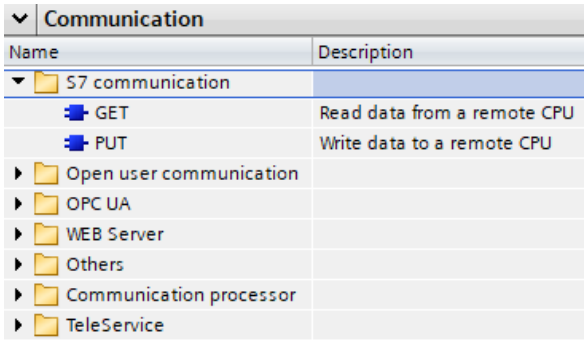
Avoiding security risks from network attacks

If an attacker can access your networks, the attacker can possibly read and write data.

For example, I/O exchange through PROFINET, PUT/GET, T-Block, and communication modules (CMs) have no security features. You must protect these forms of communication.

If you fail to protect these forms of communication, death or severe personal injury can result.

For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Web site.



Protocol

The protocol for S7 communication and communication instructions are as follows:

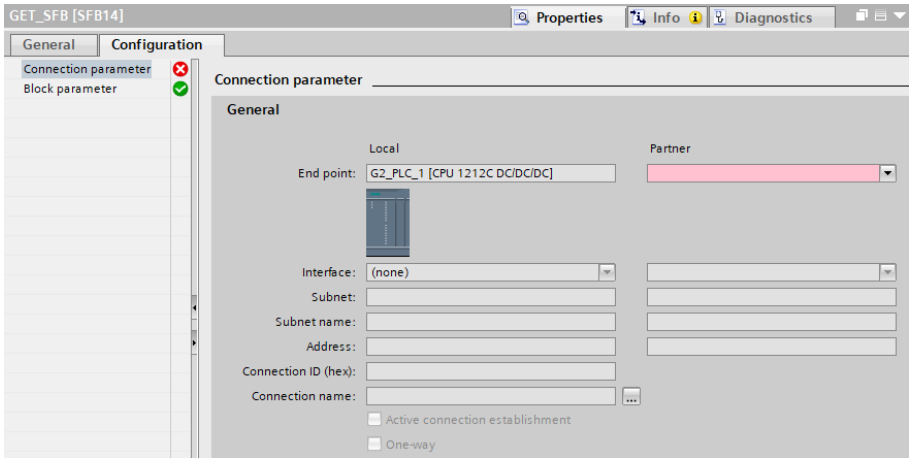
Protocol	Usage examples	Entering data in the receive area	Communication instructions	Addressing type
S7 communication	CPU-to-CPU communication Read/write data from/to a CPU	Data transmission and reception with specified length	PUT and GET	Assigns TSAPs to the Local (active) and Partner (passive) devices

Instructions

The S7 communication (https://docs.tia.siemens.cloud/access?ft:originId=./15891429899/15891429899_enUS.htm&ft:clusterId./15891429899/15891429899.htm) PUT and GET instructions allow you to read and write data from a remote CPU:

7.7.2 Creating an S7 connection

You must have permission to access remote connection partners with PUT/GET instructions.



By default, the "Permit access with PUT/GET communication from remote partner" option is disabled. In this case, read and write access to CPU data is only possible for communication connections that require configuration (https://docs.tia.siemens.cloud/access?ft:originId=./10866368523/25480655883_enUS.htm&ft:clusterId./10866368523/25480655883.htm) or programming both for the local CPU and for the communication partner.

7.7.3 PUT/GET connection parameter assignment

The PUT/GET instructions connection parameter assignment is a user aid for configuring CPU-to-CPU S7 communication connections.

After inserting a PUT or GET instruction, the Properties tab for the instruction displays the connection parameter assignment dialog for the GET/PUT instructions.

The "Connection parameters" dialog allows you to configure the necessary S7 connection and to configure the parameter "Connection ID" that is referenced by the GET/PUT block parameter "ID". The dialog has information about the local endpoint and allows you to define the local interface. You can also define the partner end point.

The "Block parameters" dialog allows you to configure the additional block parameters.

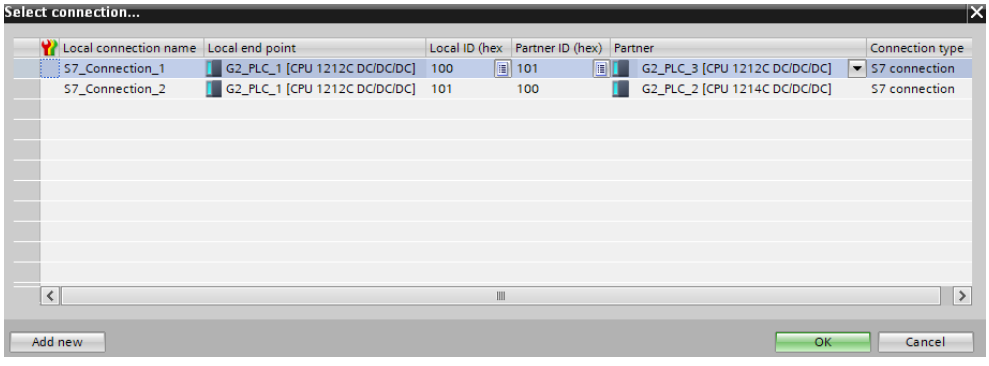
Table 1-188 Connection parameter: General definitions

Parameter		Definition
Connection parameter: General	End point	"Local End point": Name assigned to the Local CPU "Partner End point": Name assigned to the Partner (remote) CPU Note: In the "Partner End point" dropdown list, the system displays all potential S7 connection partners of the current project as well as the option "unspecified". An unspecified partner represents a communication partner which is not currently in the STEP 7 project (for example, a third party device communication partner).
	Interface	Name assigned to the interfaces Note: You can change the connection by changing the Local and Partner interfaces
	Subnet	Type of subnet
	Subnet name	Name assigned to the subnets
	Address	Assigned IP addresses Note: You can specify the remote address of a third party device for an "unspecified" communication partner.
	Connection ID (hex)	ID number: Automatically generated by the GET/PUT connection parameter assignment

Parameter		Definition
Connection parameter: General	Connection name	Local and Partner CPU data storage location: Automatically generated by the GET/PUT connection parameter assignment
	Active connection establishment	Checkbox to select Local CPU as the active connection
	One-way	Checkbox to specify a one-way or two-way connection; read-only Note: In a PROFINET GET/PUT connection, both the local and partner devices can act as a server or a client. This allows a two-way connection, and the "One-way" checkbox is unchecked.

7.7.3.1 Connection ID parameter

You can change the system-defined connection IDs in one of the following ways:



- Change the current ID directly on the GET/PUT instruction. If the new ID belongs to an already existing connection, the connection is changed.
- Change the current ID directly on the GET/PUT instruction, but the new ID does not already exist. A new S7 connection is created by the system.
- Change the current ID through the "Connection overview" dialog: Your input is synchronized with the ID-parameter on the corresponding GET/PUT instruction.

NOTE

The parameter "ID" of the GET/PUT instruction is not a connection name, but a numerical expression, which is written like the following example: W#16#1

7.7.3.2 Connection name parameter

The connection name is editable through the "Select connection" dialog. This dialog offers all the available S7 connections that could be selected as an alternative for the current GET/PUT communication. You can create a new connection in this table. Click the button to the right of the "Connection name" field to start the "Select connection" dialog.

7.8 Diagnostic events for distributed I/O

As shown in the following table, the CPU supports diagnostics that can be configured for the components of the distributed I/O system. Each of these errors generates a log entry in the diagnostics buffer.

Table 1-189 Handling of diagnostic events for PROFINET

Type of error	Diagnostic information for the station?	Entry in the diagnostics buffer?	CPU operating mode
Diagnostic error	Yes	Yes	Stays in RUN mode
Rack or station failure	Yes	Yes	Stays in RUN mode
I/O access error [1]	No	Yes	Stays in RUN mode
Peripheral access error [2]	No	Yes	Stays in RUN mode
Pull / plug event	Yes	Yes	Stays in RUN mode

[1] I/O access error example cause: Reading inputs or writing outputs for a module that has been removed or not communicating.

[2] Peripheral access error example cause: Reading peripheral inputs or writing peripheral outputs for a module that has been removed or not communicating.

Use the GET_DIAG instruction for each station to obtain the diagnostic information. This will allow you to programmatically handle the errors encountered on the device and if desired take the CPU to STOP mode. This method requires you to specify the hardware device from which to read the status information.

The GET_DIAG instruction uses the "L address" (LADDR) of the station to obtain the health of the entire station. This L Address can be found within the Network Configuration view and by selecting the entire station rack, the L Address is shown in the Properties Tab of the station. The LADDR for each individual module is either in the properties for the module in the device configuration or in the default tag table for the CPU.

7.9 What to do when you cannot access the CPU by the IP address

In case you cannot reach a CPU by the IP address, you can set an emergency (temporary) IP address for the CPU. The emergency IP address enables you to re-establish communication with the CPU in order to download a device configuration with a valid IP address.

Reasons why you might need an emergency IP address

Your CPU might be inaccessible if someone downloaded a project with one of the following problems:

- The IP address of the PROFINET interface of the CPU is a duplicate of another device on the network.
- The subnet is incorrect for the CPU.
- The subnet mask makes the CPU unreachable.

In these cases, the CPU is no longer accessible from STEP 7.

Assigning an emergency IP address

You can assign an emergency IP address under the following conditions:

- The device configuration in STEP 7 has "Set IP address in the project" for the IP protocol.
- The CPU is in STOP mode.

Under these conditions, you can use a DCP tool to set the IP address of the device to an emergency IP address. The SIMATIC Automation Tool, for example, has a DCP Set IP address command. You can set an emergency IP address regardless of the protection level of the CPU. After you set a temporary IP address with a DCP tool, the Maintenance LED on the CPU turns on. The Diagnostics Buffer also includes an entry indicating that you enabled an emergency address of an Ethernet interface.

Restoring an IP address after assigning an emergency IP address

The diagnostics buffer informs you when you have enabled or disabled an emergency IP address. You can reset the emergency IP address by powering the CPU off and on.

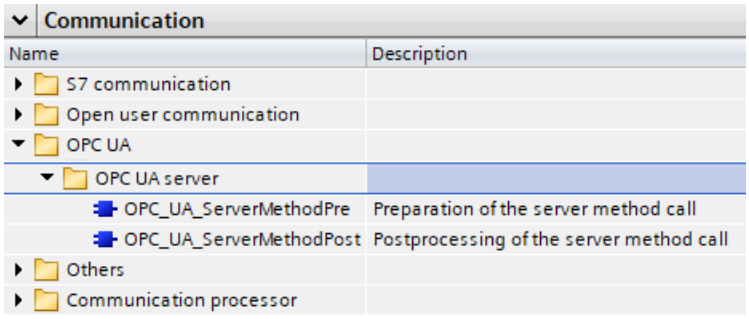
After you have assigned an emergency IP address, you can then download a STEP 7 project with a valid IP address for the CPU. After you download the project, power cycle the CPU.

7.10 OPC UA server

S7-1200 G2 CPUs support configuration as an OPC UA server (https://docs.tia.siemens.cloud/access?ft:originId=./19342675723/111512317451_enUS.htm&ft:clusterId./19342675723/111512317451.htm) for data access. For additional information on OPC UA servers, visit the OPC Foundation Web site (https://opcfoundation.org/).

S7-1200 G2 OPC UA server features

The S7-1200 G2 CPUs provide OPC UA server capabilities, including the following:



- Data access
- Diagnostics
- Server method support

OPC UA server configuration

The OPC UA server is deactivated by default. To use the OPC UA server, you must configure the OPC UA settings in STEP 7.

7.10.1 OPC UA Server method instructions

The OPC UA Server method instructions provide the capability to inject custom logic and checks before an OPC UA method (https://docs.tia.siemens.cloud/access?ft:originId=./19342675723/111512403723_enUS.htm&ft:clusterId./19342675723/111512403723.htm) is executed and to process its outcome or perform follow-up actions after it completes. These can be found in the following folders:{"OPC UA Server method instructions"}{"Instructions";"OPC UA Server method"}

7.10.2 Limitations of the OPC UA server

When using OPC UA server interfaces, you must comply with the following limitations:

- Number of server interfaces
- Number of companion specifications
- Reference namespaces
- Number of OPC UA nodes
- Number of namespaces

NOTE

The S7-1200 G2 OPC UA server does not support the S7-1500 feature of “standard SIMATIC” server interface. You must define and download an OPC UA server interface in STEP 7.

Interface, method, and subscription limitations

The following tables apply to S7-1200 G2 CPUs and S7-1200 G2 Fail-safe CPUs. Consider these limitations when compiling and loading a configuration. Exceeding these limitations results in an error message.

Interface limitations	Description	Maximum
Number of server interfaces	The number of concurrent OPC UA server connections that can be established. A server interface can be a "Companion specification" type or a "Server interface" type.	2
Number of companion specifications	The number of extra templates or add-ons that your OPC UA server can use to share data.	2

Interface limitations	Description	Maximum
Reference namespaces	Unique identifiers that organize related data items into separate groups.	10
Number of OPC UA nodes	The maximum number includes nodes internally defined by the server interface.	2000
Total number of namespaces	The total number of defined namespaces for all server interface types: " server interface", "companion specification", and "reference namespace"	18

Method limitations	Maximum
Server methods	20[1]
Server method instance DBs for all server interfaces and associated server methods	20
Server method input arguments	20
Server method output arguments	20

[1] If you download a program with more than the maximum allowed OPC UA methods, the program cannot call any of the OPC UA methods.

Subscription limitations	Maximum
Concurrent subscriptions[1]	50
Subscriptions per session	5

[1] Concurrent subscriptions is equal to the configured number of concurrent sessions multiplied by the maximum number of subscriptions per session.

7.10.3 OPC UA server security

The OPC UA server requires a certificate for activation. When you activate the server, TIA Portal generates a certificate. You can change this certificate in the PLC properties.

Supported security policies

Selecting a supported security policy at runtime determines the security of communications (https://docs.tia.siemens.cloud/access?ft:originId=./19342675723/111512278283_enUS.htm&ft:clusterId./19342675723/111512278283.htm) between the client and server. The S7-1200 G2 supports the following security policies:

Security Policy	Enabled by default?
No security	No
Basic128Rsa15 - Sign	No
Basic128Rsa15 - Sign & Encrypt	No
Basic256 - Sign	No
Basic256 - Sign & Encrypt	No
Basic256Sha256 – Sign	No
Basic256Sha256 – Sign & Encrypt	Yes
Aes128-Sha256-RsaOaep - Sign	No

Security Policy	Enabled by default?
Aes128Sha256RsaOaep - Sign & Encrypt	No
Aes256Sha256RsaPss - Sign	No
Aes256Sha256RsaPss - Sign & Encrypt	No

Trusted Clients

You can accept client certificates using one of the following two methods from the "Trusted clients" window in your STEP 7 project:

- You can define a list of trusted clients by adding their certificates to the list. At runtime, only clients with a trusted certificate can connect.
- You can select the checkbox at the bottom of the window to "Automatically accept client certificates during runtime". At runtime, all client certificates are accepted automatically.

7.11 Communication Processor (CP)

7.11.1 CP 1243-1

The S7-1200 G2 Ethernet Communications Processor (CP) equips the S7-1200 G2 with an extra Ethernet interface. Through this interface, the CP establishes a reliable, secure link for data exchange and remote command execution, facilitating Industrial Remote Control (TeleControl) of S7-1200 G2 processes. The CP further supports web server access.

Ethernet CP for the S7-1200 G2

For TeleControl applications, the CP 1243-1 is available with details as follows:

- Article number: 6GK7243-1BX50-0XE0
- Communications processor for connecting the SIMATIC S7-1200 G2 to Industrial Ethernet or via the Internet to the DNP3 master station.
- You can use the CP as an interface extension of the CPU. In this role, it serves the purpose of network separation.
- You communicate between the CP and CPU using configurable data points that access PLC tags.

Secure communication

The well-proven SINAUT ST7 protocol or the standardized DNP3 or IEC 60870-5 protocol adds security to Industrial Remote Communication. The TeleControl solution provides comprehensive measures to prevent data falsification and loss. Each transmission module has a large memory for several thousand data frames, which offers the ability to bridge downtimes in the transmission link.

The TeleControl solution via DNP3 provides comprehensive measures to prevent data falsification and loss. Each transmission module has a large memory for several thousand data frames, which offers the ability to bridge downtimes in the transmission link. The DNP3 implementation also provides security via TLS.

Updating CP 1243-1 firmware

If you update the CP firmware, you must power cycle your PLC to activate the new firmware.

7.11.2 Further information

The SIMATIC CP 1243-1 (https://sieportal.siemens.com/su/blZek) manual provides detailed information on connection, requirements, applications, block instructions, accessories, and configuration examples.

For further information and documentation, visit the following:

- CP 1243-1 (https://sieportal.siemens.com/su/blYx6)
- Firmware updates as available (https://sieportal.siemens.com/su/blYzU)

7.12 Point-to-point (PtP) communication

7.12.1 Overview

The following table outlines the point-to-point (PtP) character-based serial protocols supported by the CPU, along with the available instruction sets and communication hardware options for each protocol.

Protocol	Instruction Folder	Local CM 1241 RS232/422/485	Local CB 1241 RS485	Distributed CM PtP (example: ET 200MP CM or ET 200SP CM)
Freeport (Page 265)	Communication > Communication processor > PtP communication	Yes	Yes	Yes
3964(R) (Page 279)	Communication > Communication processor > PtP communicaton	Yes (RS232 or RS422)	No	Yes (RS232 or RS422)
USS (Page 287)	Communication > Communication processor > USS communication	Yes (RS485)	Yes	Yes (RS485)

7.12.2 Using the serial communication interfaces

The CM 1241 RS232/422/485 (Page 460) and the CB 1241 RS485 (Page 462) provide the interface for Point-to-point (PtP) communications.

You can connect up to three CMs and the following number of CBs as serial communication interfaces:

- One CB for the 1212C or 1212FC CPUs
- Up to two CBs for the 1214C or 1214FC CPUs

Install the CM to the right of the CPU or another CM or CP. Install the CB(s) on the front of the CPU. Refer to the installation guidelines (Page 72) for information on module installation and removal.

The serial communication interfaces feature the following:

- Isolated port
- Support for Point-to-Point protocols
- Configuration and programming through the PtP communication processor instructions
- Display of transmit and receive activity, as well as diagnostics, by means of LEDs
- No external power connection is needed as they are powered by the CPU

Refer to the technical specifications for communication interfaces (Page 458).

LED indicators

The CM and CB each have three LED indicators:

- Diagnostic LED (DIAG): This LED flashes red until it is addressed by the CPU. After the CPU powers up, it checks for CM/CB and addresses them. The diagnostic LED begins to flash green. This means that the CPU has addressed the CM/CB, but has not yet provided the configuration to it. The CPU downloads the configuration to the configured CM/CB when the program is downloaded to the CPU. After a download to the CPU, if no errors are detected, the diagnostic LED on the communication module shows a steady green. If an error is detected, the diagnostic LED flashes red.
- Transmit LED (Tx): The transmit LED illuminates when data is being transmitted out the communication port.
- Receive LED (Rx): This LED illuminates when data is being received by the communication port.

7.12.3 Biasing and terminating an RS422 or RS485 network connector

Biasing

The S7-1200 G2 CM/CB includes built-in biasing functionality. This allows the CM/CB to automatically select and apply the appropriate biasing based on the mode or configuration you have selected and downloaded to the CPU from your STEP 7 project.

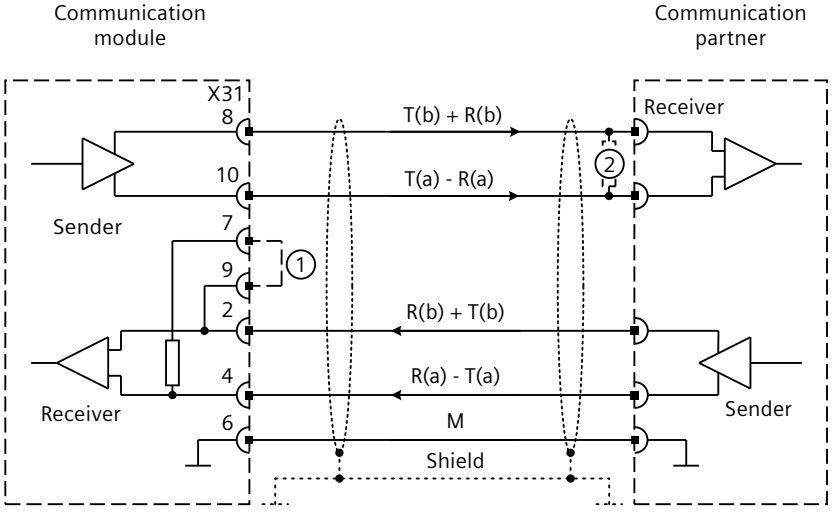
Terminating a network connector

To ensure optimal signal transmission and prevent signal reflections or interference, you must properly connect and terminate the ends of an RS422 or RS485 network connector.

To ensure interference-free data traffic for RS422 or RS485, add a terminating resistor of approximately 330Ω at the receiving end of the cable.

NOTE

When the parallel terminating resistor is wired in the circuit, you must enable the bias resistors in your STEP 7 project. Otherwise, data reads are incorrect because the receive buffer incorrectly detects the wrong start bit and bit-shifts the data being received.

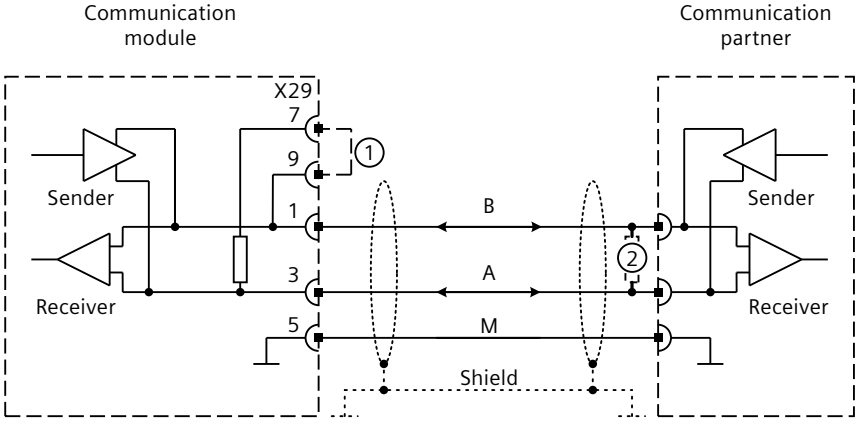


You can use the following cable types with both RS422 and RS485 network connectors. The cable supports various lengths based on the baud rate as follows:

- Max. 1200 m at 19200 baud
- Max. 500 m at 38400 baud
- Max. 350 m at 76800 baud
- Max. 250 m at 115200 baud
- Max. 200 m at 250000 baud (RS485 only)

NOTICE
Risks of connecting a cable shield directly to the ground (GND) Connecting a cable shield directly to the GND can cause electrical current induction, which could damage the expansion modules. To mitigate this risks, connect the GND wire on both ends of the cable. This helps maintain a consistent ground potential and minimizes the chances of electrical current induction or other related issues that can affect the performance and reliability of the network connection.

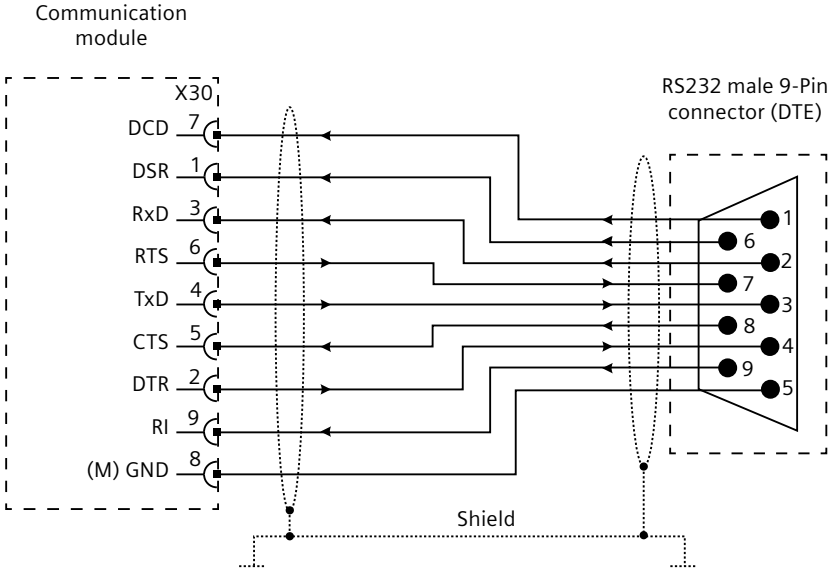
Terminating the RS422 network connector



You can confiure the RS422 point-to-point connection cable as shown in the following example:

① Jumper (adds internal terminating resistor)
② Terminating resistor

Terminating the RS485 network connector



You can configure the RS485 point-to-point connection cable as shown in the following example:

① Jumper (adds internal terminating resistor)
② Terminating resistor

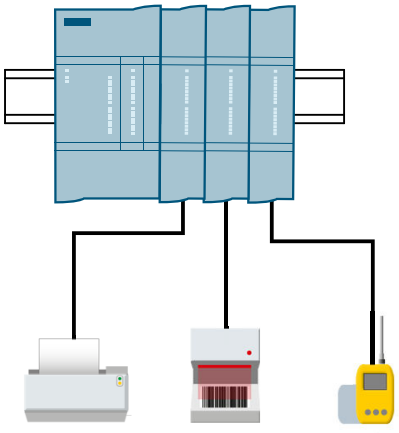
Connecting an S7-1200 G2 CPU to a 9-pin D connector

You can connect the S7-1200 G2 CPU to a standard RS232 DTE 9-pin D connector as shown in the following example:

Your application might not require all of these signal connections.

NOTE

The maximum cable length for this connection should not exceed 10 meters.



7.12.4 PtP, Freeport communication

PtP with a Freeport, or freely constructed, protocol provides maximum freedom and flexibility, but requires extensive implementation in the STEP 7 program.

PtP enables a wide variety of possibilities:

- The ability to send information directly to an external device such as a printer
- The ability to receive information from other devices such as barcode readers, RFID readers, third-party camera or vision systems, and many other types of devices
- The ability to exchange information, sending and receiving data, with other devices such as GPS devices, third-party camera or vision systems, radio modems, and many more

This type of PtP communication is serial communication that uses standard UARTs to support a variety of baud rates and parity options.The RS232/422/485 communication module (CM 1241) and the RS485 communication board (CB 1241) provide the electrical interfaces for performing the PtP communications.

PtP Freeport over PROFINET

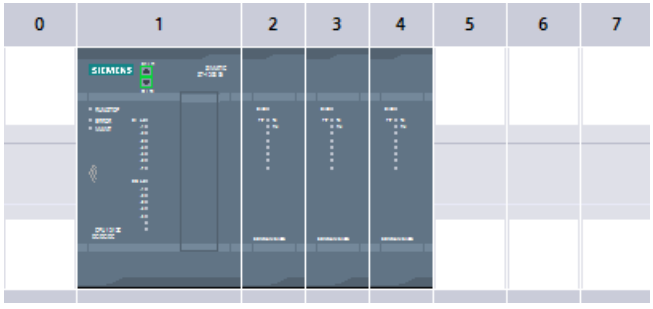
PtP enables you to use a PROFINET distributed I/O rack to communicate to various devices (RFID readers, GPS device, and others). You connect the Ethernet interface of the S7-1200 G2 CPU to a PROFINET interface module. PtP communication modules in the rack with the interface module can then provide serial communications to the PtP devices.

Communications over distributed I/O use the following modules:

Station	Module	Article number	Interface
ET 200MP	CM PtP RS232 BA	6ES7540-1AD00-0AA0	RS232
	CM PtP RS232 HF	6ES7541-1AD00-0AB0	RS232
	CM PtP RS422/485 BA	6ES7540-1AB00-0AA0	RS422/RS485
	CM PtP RS422/485 HF	6ES7541-1AB00-0AB0	RS422/RS485
ET 200SP	CM PtP	6ES7137-6AA01-0BA0	RS232 and RS422/RS485

NOTE

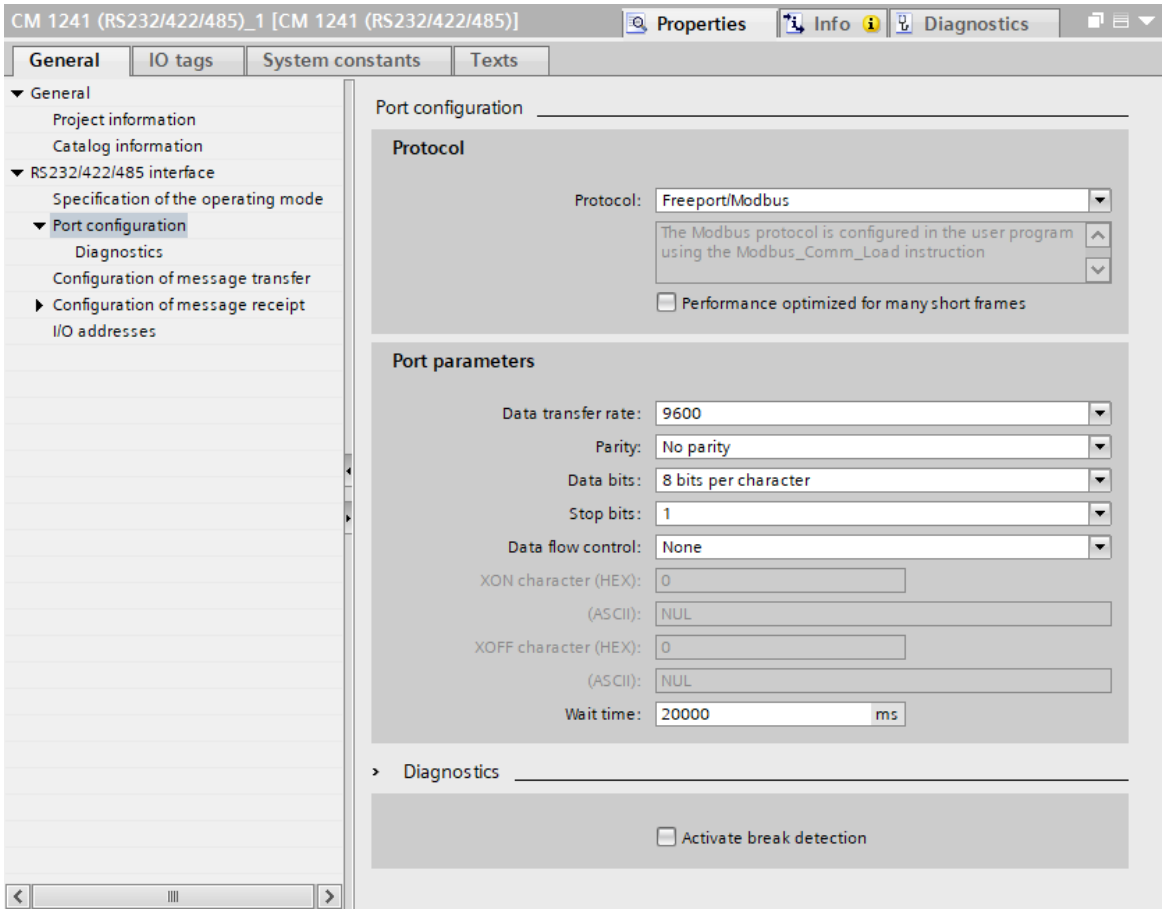
You can use the same point-to-point instructions to access a communication board, local serial modules, and serial modules over PROFINET.



7.12.5 Configuring the PtP Freeport communication

7.12.5.1 Configuring the communication ports

You can use either of the following methods to configure the communication interfaces for PtP Freeport communication:



- Use the device configuration in STEP 7 to configure the port parameters (baud and parity), the send parameters, and the receive parameters. The CPU stores the device configuration settings and applies the settings after a power cycle and a RUN to STOP transition.
- Use the Port_Config, Send_Config, and Receive_Config instructions (Page 284) to set the parameters. The port settings set by the instructions are valid while the CPU is in RUN mode. The port settings revert to the device configuration settings after a STOP transition or power cycle.

After configuring the hardware devices (Page 151), select one of the configured CMs or CBs to configure parameters for the communication interfaces.

The "Properties" tab of the inspector window displays the parameters of the selected CM. Select "Port configuration" to edit the following parameters:

- Protocol - "Performance optimized for many short frames"[1]
- Operating mode
- Data transmission rate
- Parity
- Data bits
- Stop bits
- Flow control - RS232 or RS422 only
- Wait time

The CB 1241 supports standard performance only; The CM 1241 supports both standard performance and "Performance optimized for many short frames". Optimized performance is faster but requires more process image space.

- Standard performance
  - Handshaking is done via the process image.
  - Data are sent via records.
- Optimized performance
  - Handshaking is done via the process image.
  - Data are sent via the process image.

For more information regarding the sending and receiving of data for both standard and optimized performance, see the the following chapters in the SIMATIC S7-1500, ET 200MP, ET 200SP CM PtP - Configurations for point-to-point connections Function manual (https://support.industry.siemens.com/cs/us/en/view/59057093):

- "Configuring/parameter assignment"
- "Programming - communication using instructions"

The STEP 7 program can also configure the port or change the existing configuration (https://docs.tia.siemens.cloud/access?ft:originId=./39512235019/CM1500_Prog_Port_Config_enUS.htm&ft:clusterId=./39512235019/CM1500_Prog_Port_Config.htm) with the Port_Config instruction.

Parameter	Definition
Protocol	This selects the Protocol Freeport/Modbus or 3964(R) (CM only).
Performance optimized for many short frames	Click the checkbox to optimize performance (CM only).
Operating mode	This selects the type of communication (RS232, RS422, or RS485) and the network configuration. The default mode for Operating mode is RS232 mode. Other valid choices are: • Full duplex (RS422) 4-wire operation point to point • Full duplex (RS422) 4-wire operation multipoint master • Full duplex (RS422) 4-wire operation multipoint slave • Half duplex (RS485) 2-wire operation
Data transfer rate	The default value for the data transmission rate is 9600 bits/s. Valid choices in bits/s are: • 300 • 600 • 1200 • 2400 • 4800 • 9600 • 19200 • 38400 • 57600 • 76800 • 115200 • 250000 (RS422 and RS485 only)
Parity	The default value for parity is no parity. Valid choices are: • No parity • Even • Odd • Mark (parity bit always set to 1) • Space (parity bit always set to 0)
Data bits per character	The number of data bits in a character. Valid choices are 7 or 8.
Number of stop bits	The number of stop bits can be either 1 or 2. The default is 1.
Data flow control	The RS485 communication interfaces do not support flow control. The RS232 mode of the CM 1241 RS232/422/485 module allows you to select either hardware or software flow control (Page 269). If you select hardware flow control, you can select whether the RTS signal is always on, or RTS is switched. If you select software flow control, you can define the XON and XOFF characters. The RS422 mode of the CM 1241 RS232/422/485 module supports software flow control.
Wait time	Wait time specifies the time that the CM or CB waits to receive CTS after asserting RTS, or for receiving an XON after receiving an XOFF, depending on the type of data flow control. If the wait time expires before the communication interface receives an expected CTS or XON, the CM or CB aborts the transmit operation and returns an error to the STEP 7 program. You specify the wait time in milliseconds. The range is 1 to 65535 milliseconds.

7.12.5.2 Managing flow control

Flow control refers to a mechanism for balancing the sending and receiving of data transmissions to avoid the loss of data. Flow control ensures that a transmitting device is not sending more information than a receiving device can handle. Flow control can be accomplished through either hardware or software. The RS232 mode of the CM 1241 RS232/422/485 module supports both hardware and software flow control. The RS422 mode of the CM 1241 RS232/422/485 module supports software flow control. You specify the type of flow control either when you configure the port or with the Port_Config instruction. The RS485 mode of the CM (1241 RS232/422/485) and the CB 1241 RS485 do not support flow control.

Hardware flow control works through the Request-to-send (RTS) and Clear-to-send (CTS) communication signals. For the RS232 mode of the CM 1241 RS232/422/485 module (Page 460), the RTS signal is output from pin 6 and the CTS signal is received through pin 5 of the X30 wiring terminal. The RS232 mode of the CM 1241 RS232/422/485 module is a DTE (Data Terminal Equipment) device which asserts RTS as an output and monitors CTS as an input.

Hardware flow control: RTS switched

If you enable RTS switched hardware flow control for the RS232 mode of the CM 1241 RS232/422/485, the module sets the RTS signal active to send data. The CM module monitors the CTS signal to determine whether the receiving device can accept data. When the CTS signal is active, the module can transmit data as long as the CTS signal remains active. If the CTS signal goes inactive, then the transmission must stop.

Transmission resumes when the CTS signal becomes active. If the CTS signal does not become active within the configured wait time, the module aborts the transmission and returns an error to the STEP 7 program. You specify the wait time in the port configuration (Page 266).

The RTS switched flow control is useful for devices that require a signal that the transmit is active. An example would be a radio modem that uses RTS as a "Key" signal to energize the radio transmitter. The RTS switched flow control will not function with standard telephone modems. Use the RTS always on selection for telephone modems.

Hardware flow control: RTS always on

In "RTS always ON" mode, the CM 1241 RS232/422/485 sets RTS active by default. A device acting as a communication partner monitors the RTS signal from the CM and utilizes this signal as a clear-to-send. The device only transmits to the CM when RTS is active, that is, when the device sees an active CTS. If RTS is inactive, the device does not transmit to the CM.

To allow the device to send data to the CM at any time, configure "RTS always ON" hardware flow control. The CM thus sets the RTS signal active all the time. The CM will not set RTS inactive even if the device cannot accept characters. The transmitting device must ensure that it does not overrun the receive buffer of the CM.

Data Terminal Ready (DTR) and Data Set Ready (DSR) signal utilization

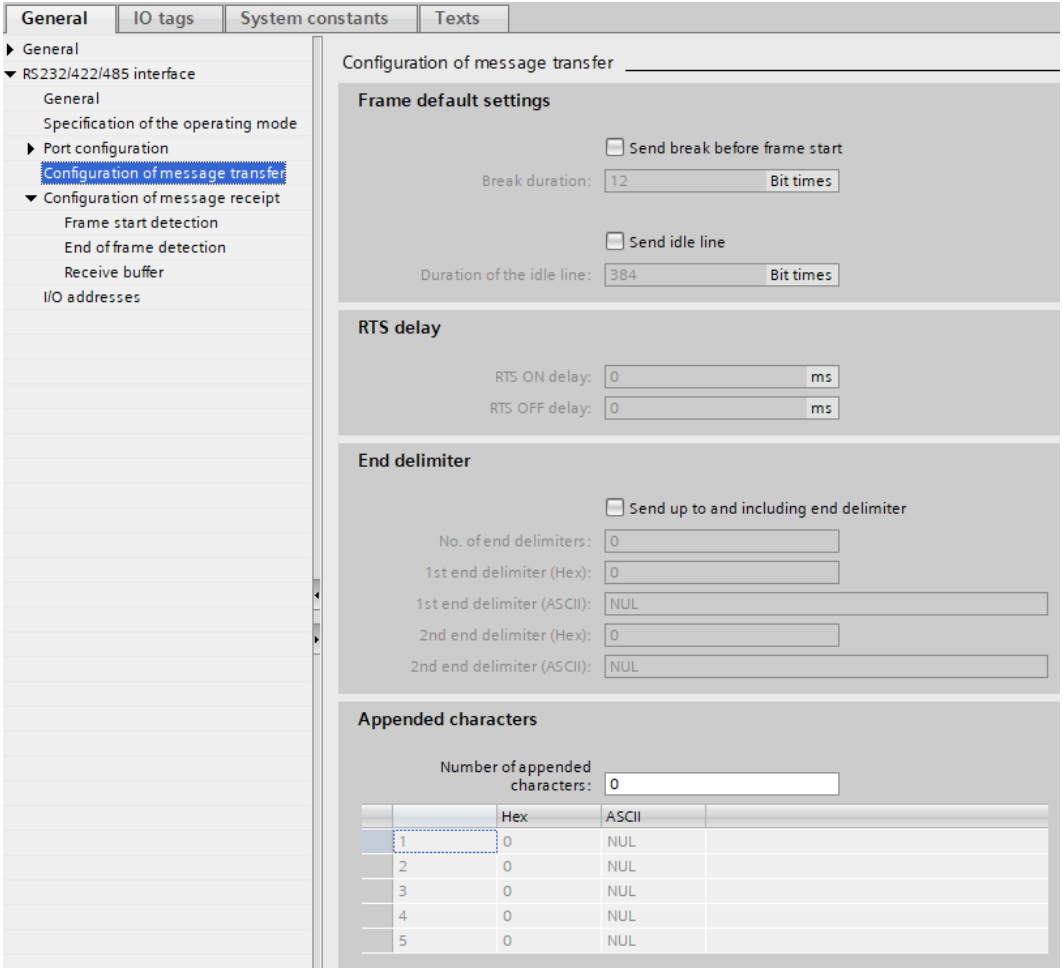
The CM sets DTR active for either type of hardware flow control. The module transmits only when the DSR signal becomes active. The state of DSR is only evaluated at the start of the send operation. If DSR becomes inactive after transmission has started, the transmission will not be paused.

Software flow control

Software flow control uses special characters in the messages to provide flow control. You configure Hex characters that represent XON and XOFF.

XOFF indicates that a transmission must stop. XON indicates that a transmission can resume. XOFF and XON must not be the same character.

When the transmitting device receives an XOFF character from the receiving device, it stops transmitting. Transmitting resumes when the transmitting device receives an XON character. If it does not receive an XON character within the wait time that is specified in the port configuration (Page 266), the CM aborts the transmission and returns an error to the STEP 7 program.



Software flow control requires full-duplex communication, as the receiving partner must be able to send XOFF to the transmitting partner while a transmission is in progress. Software flow control is only possible with messages that contain only ASCII characters. Binary protocols cannot utilize software flow control.

7.12.5.3 Configuring transmit (send) and receive parameters

Before the CPU can engage in PtP Freeport communications, you must configure parameters for transmitting (or sending) messages and receiving messages. These parameters dictate how communications operate when messages are being transmitted to or received from a target device.

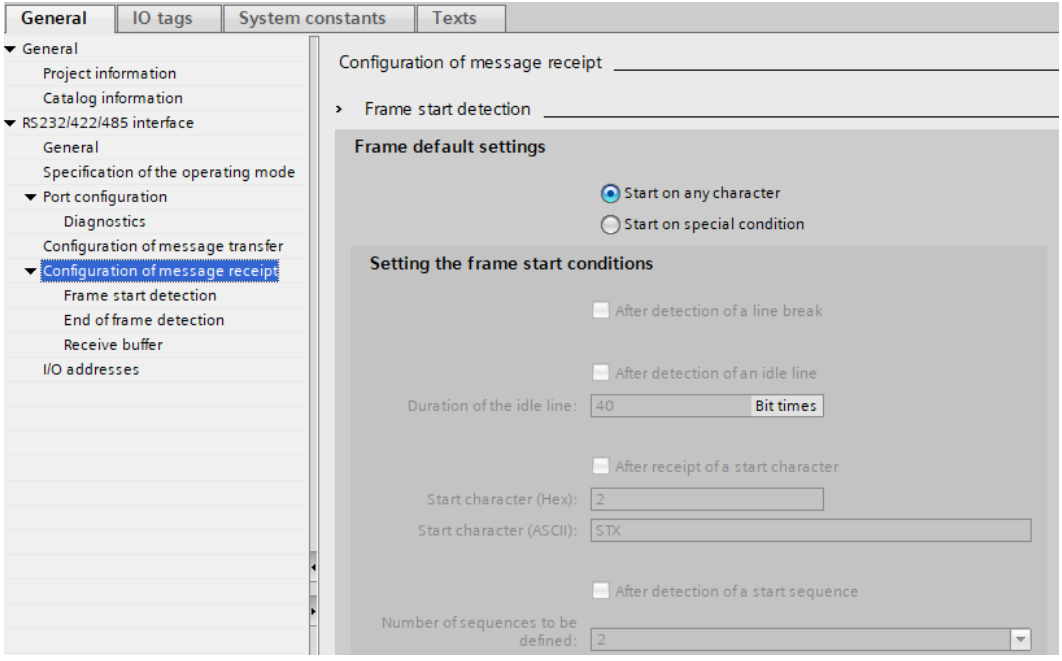
7.12.5.4 Configuring transmit (send) parameters

From the device configuration of the CPU, you configure how a communication interface transmits data by setting the "Configuration of message transfer" properties for the selected interface.

You can also dynamically configure or change the message transfer parameters from the STEP 7 program by using the Send_Config instruction (Page 284).

NOTE

Parameter values set from the Send_Config instruction in the STEP 7 program override the "Configuration of message transfer" properties. Note that the CPU does not retain parameters set from the Send_Config instruction in the event of power down or transition to STOP.



Parameter	Definition
Send break before frame start Break duration	Specifies that upon the start of each frame, a break will be sent after the RTS On delay (if configured) has expired and CTS is active. You specify how many bit times constitute a break where the line is held in a spacing condition. The default is 12 and the maximum is 65535, up to a limit of eight seconds.

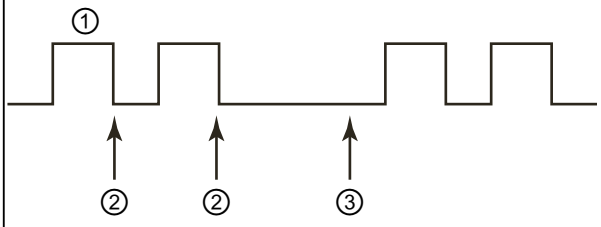
Parameter	Definition
Send idle line Duration of the idle line	Specifies that an idle line will be sent before message start. It is sent after the break, if a break is configured. The "Duration of the idle line" parameter specifies how many bit times constitute an idle line where the line is held in a marking condition. The default is 384 and the maximum is 65535, up to a limit of eight seconds.
RTS ON delay	Specifies the amount of time to wait after activating RTS before transmission is initiated. The range is 0 to 65535 ms, with a default value of 0. This parameter is valid only when the port configuration (Page 266) specifies hardware flow control. CTS is evaluated after the RTS On delay time has expired. This parameter is applicable for the RS232 mode of CM 1241 RS232/422/485 only.
RTS OFF delay	Specifies the amount of time to wait before deactivating RTS after completion of transmission. The range is 0 to 65535 ms, with a default value of 0. This parameter is valid only when the port configuration (Page 266) specifies hardware flow control. This parameter is applicable for RS232 mode of CM 1241 RS232/422/485 only.
Send up to and including end delimiter No. of end delimiters	You can configure the number of end delimiters (1 or 2) and their value. All data up to the end delimiter(s) is sent, independent of the selected frame length. The end delimiter must be included in the data to be sent. Data is sent only up to and including the delimiter, even if the specified data length is longer.
1st end delimiter (Hex) 1st end delimiter (ASCII)	Entry of the first end delimiter of a maximum of two end delimiters for the end criteria "Send up to and including end delimiter". The selected end delimiter or the selected end delimiter combination limits the length of the frame.
2nd end delimiter (Hex) 2nd end delimiter (ASCII)	Entry of the second end delimiter of a maximum of two end delimiters for the end criteria "Send up to and including end delimiter". The selected end delimiter combination limits the length of the frame.
Number of appended characters	Input of the number of appended characters. Sending takes place up to the configured length. The end delimiter(s) is/are appended automatically. Depending on the number of end delimiters, the CM sends one to five characters more than the number specified at the instruction to the partner.

7.12.5.5 Configuring receive parameters

The configuration options for a communication interface include settings for receiving data and recognizing the start and end of a message.

Set these parameters in the "Configuration of message receipt" properties for the selected interface.

You can also dynamically configure or change the receive message parameters from the STEP 7 program by using the Receive_Config instruction (Page 284).



NOTE

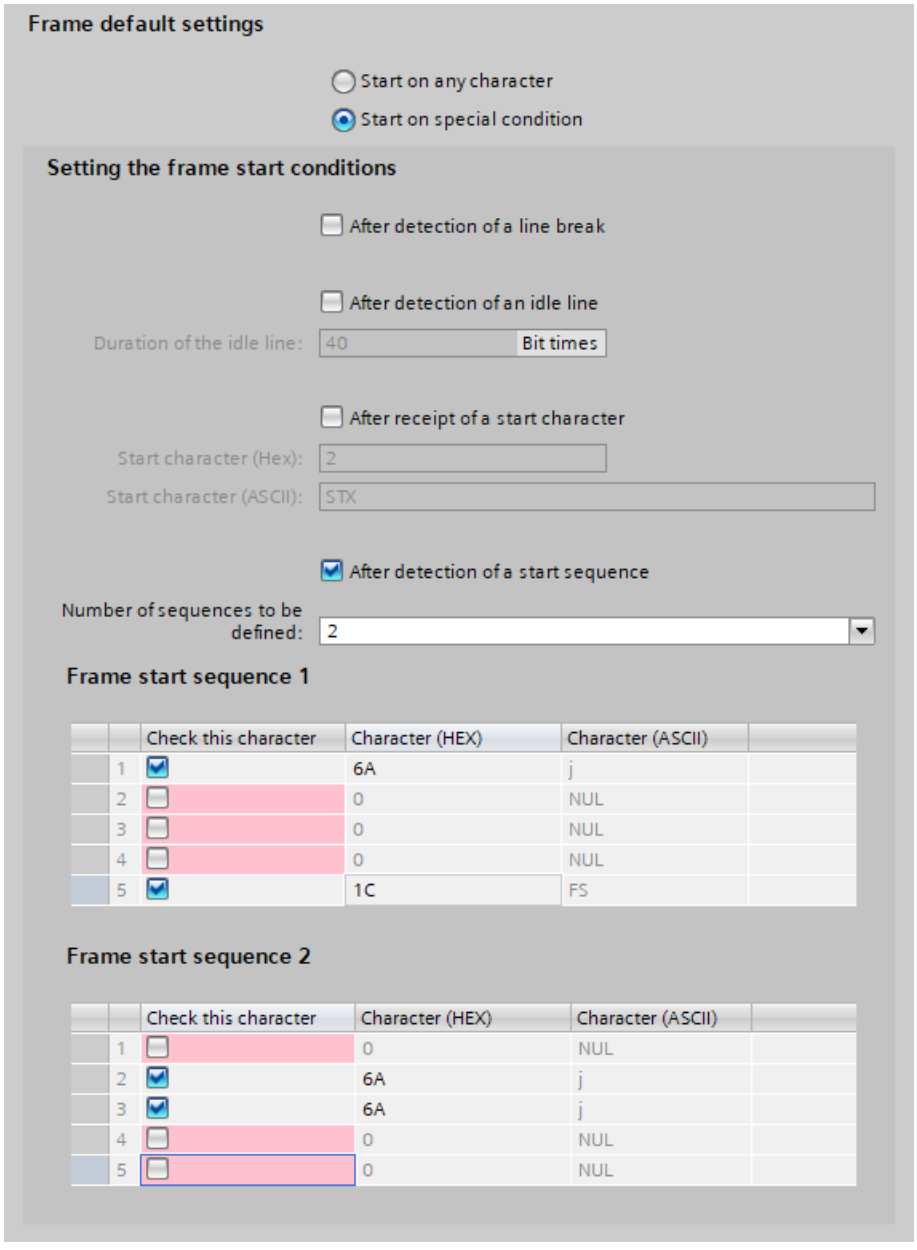
Parameter values set from the Receive_Config instruction in the STEP 7 program override the "Receive message configuration" properties. Note that the CPU does not retain parameters set from the Receive_Config instruction in the event of power down or transition to STOP.

Frame start detection

You can determine how the communication interface recognizes the start of a message. The start characters and the characters comprising the message go into the receive buffer until a configured end condition is met.

You can specify multiple start conditions. If you specify more than one start condition, all of the start conditions must be met before the message is considered started. For example, if you configure an idle line time and a specific start character, the CM or CB will first look for the idle line time requirement to be met and then the CM or CB will look for the specified start character. If some other character is received (not the specified start character), the CM or CB will restart the start of message search by again looking for an idle line time.

Parameter	Definition
Start on any character	The "Start on any character" condition specifies that any successfully received character indicates the start of a message. This character is the first character within a message.
Start on special condition	The start of the message is detected based on the following specified conditions: • After detection of a line break • After detection of an idle line • After receipt of a start character • After receipt of a start sequence
Special condition: After detection of a line break	Specifies that a message receive operation starts after a break character is received.
Special condition: After detection of an idle line	Specifies that a message reception starts once the receive line has been idle or quiet for the number of specified bit times. Once this condition occurs, the start of a message begins.  ① Characters ② Restarts the idle line timer ③ Idle line is detected and message receive is started
Special condition: After receipt of a start character	Specifies that a particular character indicates the start of a message. This character is then the first character within a message. Any character that is received before this specific character is discarded. The default character is STX.
Special condition: After detection of a start sequence	Specifies that a particular character sequence from up to four configured sequences indicates the start of a message. For each sequence, you can specify up to five characters. For each character position, you specify either a specific hex character, or that the character is ignored in sequence matching (wildcard character). The last specific character of a character sequence terminates that start condition sequence. Incoming sequences are evaluated against the configured start conditions until a start condition has been satisfied. Once the start sequence has been satisfied, evaluation of end conditions begins. You can configure up to four specific character sequences. You use a multiple-sequence start condition when different sequences of characters can indicate the start of a message. If any one of the character sequences is matched, the message is started.



The communication interface checks start conditions in the following order:

- Idle line
- Broken line
- Character or character sequences

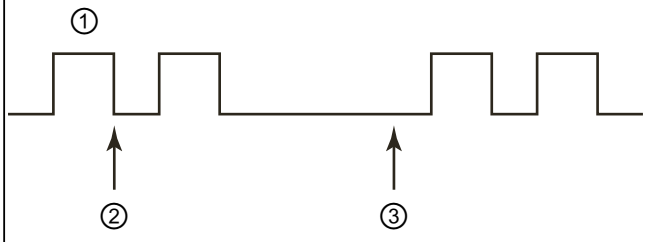
While checking for multiple start conditions, if one of the conditions is not met, the CM or CB restarts the checking with the first required condition. After the CM or CB establishes that the start conditions have been met, it begins evaluating end conditions.

Example configuration: Start message on one of two character sequences

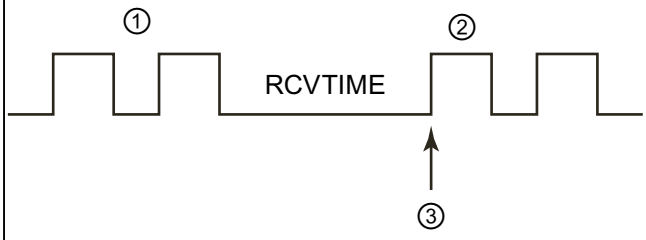
Consider the following start message condition configuration:

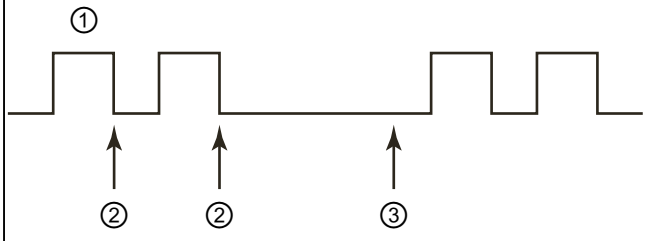
With this configuration, the start condition is satisfied when either pattern occurs:

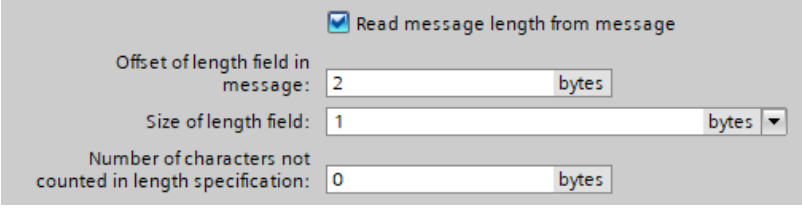
- When a five-character sequence is received where the first character is 0x6A and the fifth character is 0x1C. The characters at positions 2, 3, and 4 can be any character with this configuration. After the fifth character is received, evaluation of end conditions begins.
- When two consecutive 0x6A characters are received, preceded by any character. In this case, evaluation of end conditions begins after the second 0x6A is received (3 characters). The character preceding the first 0x6A is included in the start condition.



The following are example sequences that would satisfy this start condition:







- <any character> 6A 6A
- 6A 12 14 18 1C
- 6A 44 A5 D2 1C

End of frame detection

You also configure how the communication interface recognizes the end of a message. You can configure multiple message end conditions. If any one of the configured conditions occurs, the message ends.

For example, you could specify an end condition with an end of message timeout of 300 milliseconds, an inter-character timeout of 40 bit times, and a maximum length of 50 bytes. The message ends if the message takes longer than 300 milliseconds to receive, or if the gap between any two characters exceeds 40 bit times, or if 50 bytes are received.

Parameter	Definition
Recognize message end by message timeout	The message end occurs when the configured amount of time to wait for the message end has expired. The message timeout period begins when a start condition has been satisfied. The default is 200 ms and the range is 1 to 65535 ms.  ① Received characters ② Start Message condition satisfied: message timer starts ③ Message timer expires and terminates the message
Recognize message end by response timeout	The message end occurs when the configured amount of time to wait for a response expires before a valid start sequence is received. The response timeout period begins when a transmission ends and the CM or CB begins the receive operation. The default response timeout is 200 ms and the range is 1 to 65535 ms. If a character is not received within the response time period, RCVTIME, then an error is returned to the corresponding Receive_P2P instruction. The response timeout does not define a specific end condition. It only specifies that a character must be successfully received within the specified time. You must configure another end condition to indicate the actual end of a message.

Parameter	Definition
	 ① Transmitted characters ② Received characters ③ First character must be successfully received by this time.
After character delay time elapses	The message end occurs when the maximum configured timeout between any two consecutive characters of a message has expired. The default value for the inter-character gap is 288 bit times and the maximum number is 65535 bit times, up to a maximum of eight seconds.  ① Received characters ② Restarts the intercharacter timer ③ The intercharacter timer expires and terminates the message.
After receipt of a fixed frame length	The message end occurs after a fixed frame length has been received. The valid range for the fixed length is 1 to 4096. The default is 1.
After receipt of a maximum number of characters	The message end occurs when the specified number of characters has been received. The valid range for the number of specified characters is 1 to 4096. the default is 1.
Read message length from message	The message specifies the length of the message. The message end occurs when a message of the specified length has been received. When you select the special condition where the message length is included in the message, you must provide three parameters that define information about the message length. The actual message structure varies according to the protocol in use. The three parameters are as follows: • Offset of length field in message: Set the character position (1-based) within the message that starts the length specifier. The valid range is 0-4095 with a default of 0 bytes. • Size of length field: Set the number of bytes (one, two, or four) of the length specifier. • Number of characters not counted in length specification: Set the number of characters following the length specifier that are not included in the length count. The valid range 0-255 with a default of 0 bytes. The ending characters do not need to be contiguous. The "Number of characters not counted in length specification" value can be used to specify the length of a checksum field whose size is not included in the length field. 

Parameter	Definition
After receipt of an end sequence	The message end occurs when a specified character sequence is received. You can specify a sequence of up to five characters. For each character position, you specify either a specific hex character, or that the character is ignored in sequence matching. Leading characters that are ignored characters are not part of the end condition. Trailing characters that are ignored characters are part of the end condition.

Example configuration: Read message length from message

Example 1: Consider a message structured according to the following protocol:

STX	Len (n)	Characters 3 to 14 counted by the length												
		ADR	PKE		INDEX		PWD		STW		HSW		BCC
1	2	3	4	5	6	7	8	9	10	11	12	13	14
STX	0x0C	xx	xxxx		xxxx		xxxx		xxxx		xxxx		xx

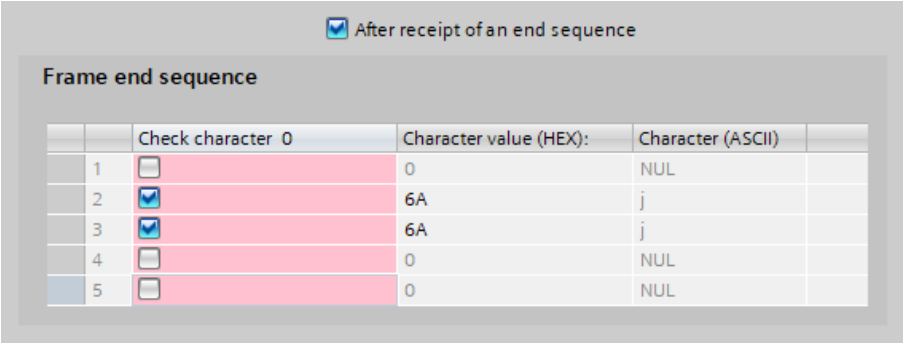
Configure the receive message length parameters for this message as follows:

- n = 2 (The message length starts with byte 2.)
- Length size = 1 (The message length is defined in one byte.)
- Length m = 0 (There are no additional characters following the length specifier that are not counted in the length count. Twelve characters follow the length specifier.)

In this example, the characters from 3 to 14 inclusive are the characters counted by Len (n).

Example 2: Consider another message structured according to the following protocol:

SD1	Len (n)	Len (n)	SD2	Characters 5 to 10 counted by length						FCS	ED
				DA	SA	FA	Data unit=3 bytes				
1	2	3	4	5	6	7	8	9	10	11	12
xx	0x06	0x06	xx	xx	xx	xx	xx	xx	xx	xx	xx



Configure the receive message length parameters for this message as follows:

- n = 3 (The message length starts at byte 3.)
- Length size = 1 (The message length is defined in one byte.)
- Length m = 3 (There are three characters following the length specifier that are not counted in the length. In the protocol of this example, the characters SD2, FCS, and ED are not counted in the length count. The other six characters are counted in the length count; therefore the total number of characters following the length specifier is nine.)

In this example, the characters from 5 to 10 inclusive are the characters counted by Len (n).

Example configuration: After receipt of an end sequence

Consider the following end message condition configuration:

In this case, the end condition is satisfied when two consecutive 0x6A characters are received, followed by any two characters. The character preceding the 0x6A 0x6A pattern is not part of the end character sequence. Two characters following the 0x6A 0x6A pattern are required to terminate the end character sequence. The values received at character positions 4 and 5 are irrelevant, but they must be received to satisfy the end condition.

NOTE

If you want your character sequence to indicate the end of the message, put the sequence in the last character positions. In the example above, if you wanted 0x6A 0x6A to end the message with no trailing characters, you would configure 0x6A in character positions 4 and 5.

7.12.6 3964(R) communication

The S7-1200 G2 CPU supports the 3964(R) protocol (RS232 or RS422 only) to enable communication between a CM 1241 RS232/422/485 and a communication partner that uses the 3964(R) protocol. Unlike PtP Freeport communication, where you define specific send (transmit) and receive characteristics for the messages, the 3964(R) protocol requires the following control characters:

- STX Start of text
  Start of character string to be transmitted
- DLE Data Link Escape
  Data transmission switchover
- ETX End of Text
  End of character string to be transmitted
- BCC Block check character
- NAK Negative Acknowledge

Refer to the chapter describing serial data transmission principles in the S7-300 CP 341 Point-to-Point Communication, Installation, and Parameter Assignment Manual (https://support.industry.siemens.com/cs/us/en/view/1117397) for a complete description of the protocol.

Configuring the communication interface

To communicate to a partner using the 3964(R) protocol, you must include the CM 1241 RS232/422/485 (Page 460) in your device configuration in STEP 7. You then configure the communication ports (Page 266), priority, and protocol parameters (Page 282).

Communication to a partner with the 3964(R) protocol

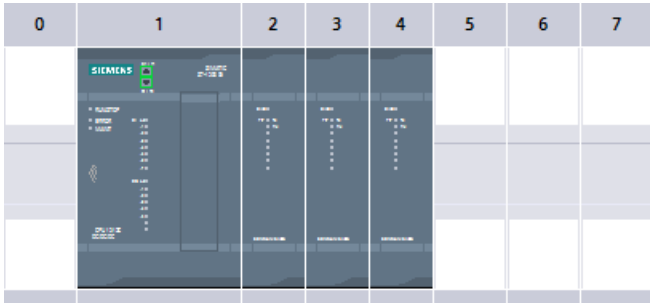
When you configure a CM for 3964(R) protocol, you use the standard point-to-point send and receive instructions to transfer data between the CPU and its communication partner.

The CM embeds your data from the BUFFER parameter of the send instruction into the 3964(R) protocol and sends the data to the communication partner.

The CM receives data from the communication partner by means of the 3964(R) protocol, removes the protocol information, and returns the data in the BUFFER parameter of the receive instruction.

Refer to the following point-to-point instructions in the TIA Portal Information System:

- "Send_P2P: Sending data (S7-1200, S7-1500)" (https://docs.tia.siemens.cloud/access?ft:originId=./39512235019/CM1500_Prog_Send_P2P_enUS.htm&ft:clusterId./39512235019/CM1500_Prog_Send_P2P.htm)
- "Receive_P2P: Receiving data (S7-1200, S7-1500)" (https://docs.tia.siemens.cloud/access?ft:originId=./39512235019/CM1500_Prog_Receive_P2P_enUS.htm&ft:clusterId./39512235019/CM1500_Prog_Receive_P2P.htm)



7.12.7 Configuring the 3964(R) communication

7.12.7.1 Configuring the 3964(R) communication ports

You can use either of the following methods to configure the communication interfaces for 3964(R) communication:

- Use the device configuration in STEP 7 to configure the port parameters. The CPU stores the device configuration settings and applies the settings after a power cycle.
- Use the Port_Config instruction to set the port parameters. The port settings set by the instructions are valid while the CPU is in RUN mode. The port settings revert to the device configuration settings after a power cycle.

After adding the communication interfaces to the device configuration (Page 157), you configure parameters for the communication interfaces by selecting one of the configured CMs.

The "Properties" tab of the inspector window displays the parameters of the selected CM. Select "Port configuration" to edit the following parameters:

- Protocol: 3964(R) with "Performance optimized for many short frames" optional
- Data transfer rate
- Parity
- Data bits
- Stop bits
- "Activate break detection" optional (RS232 only)

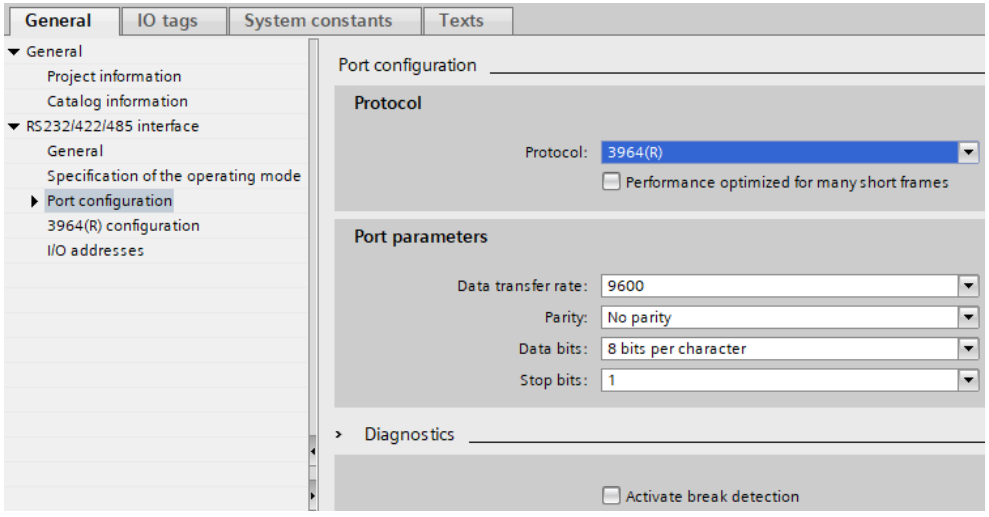


Table 1-190 Parameter definitions

Parameter	Definition
Protocol	3964R or Freeport/Modbus. Select 3964R to configure port for 3964(R) communication. Select the checkbox to optimize performance for many short frames.
Data transfer rate	The default value for the data transmission rate is 9600 bits/s. Valid choices in bits/s are: • 300 • 600 • 1200 • 2400 • 4800 • 9600 • 19200 • 38400 • 57600 • 76800 • 115200 • 250000 (RS422 only)
Parity	The default value for parity is no parity. Valid choices are: • No parity • Even parity • Odd parity • Mark (set parity bit to 1) • Space (set parity bit to 0)

Parameter	Definition
Data bits	The number of data bits in a character. Valid choices are 7 or 8.
Stop bits	The number of stop bits can be either 1 or 2. The default is 1.
Activate break detection	Select the "Activate break detection" checkbox (RS232 only) to allow the CM to continuously monitor the communication line for any breaks or interruptions in the data transmission.

NOTE

Set the "Specification of the operating mode" for 3964R to one of the following two modes:

- RS232 mode
- Full duplex (RS422) 4-wire operation point to point

7.12.7.2 Configuring the 3964(R) priority and protocol parameters

You can use either of the following methods to configure the communication interfaces for 3964(R) communication:

- In the device configuration of the communication interface, click "3964(R) configuration" to set the priority and configure the protocol parameters. The CPU stores the device configuration settings and applies the settings after a power cycle.
- Use the P3964_Config instruction (Page 284) to set the priority and protocol configuration parameters. The values set by the instructions are valid while the CPU is in RUN mode. The values revert to the device configuration settings after a power cycle.

The "Properties" tab of the inspector window displays the parameters of the selected CM. Select "3964(R) configuration" to edit the parameters.

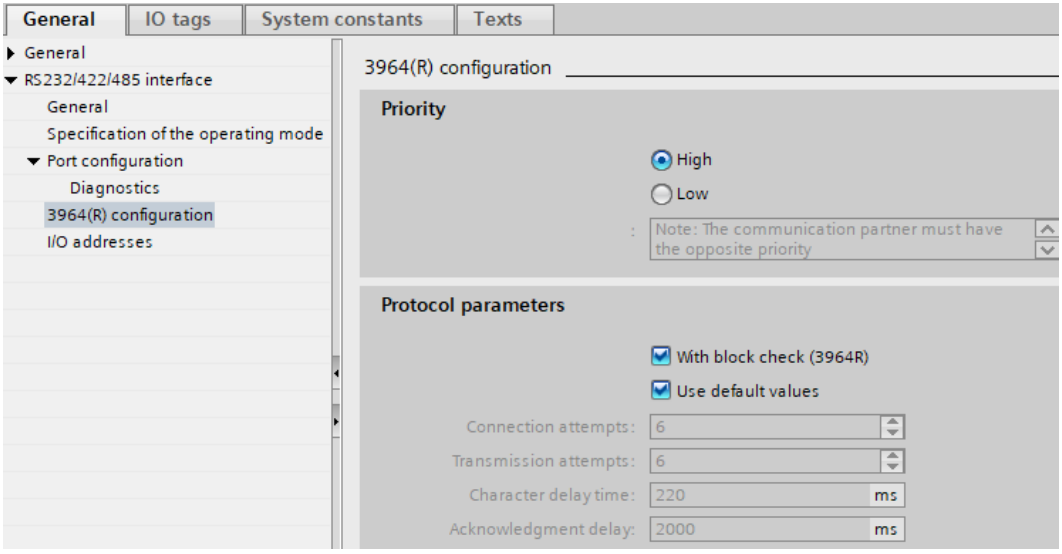

Table 1-191 Parameter definitions

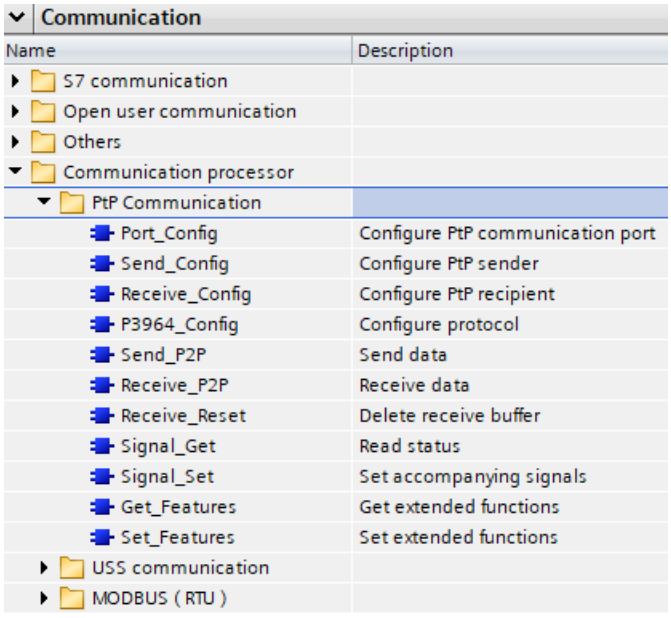


Parameter	Definition
Priority	High or low: The CM will be either high or low and the communication partner must be the opposite.
With block check (3964R)	If selected, 3964(R) communication employs transmission security by including a block check character (BCC). If not selected transmission security does not include a block check character.
Use default values	If selected, 3964(R) uses default values for the following protocol parameters: • Connection attempts • Transmission attempts • Character delay time • Acknowledgement delay If not selected, you can configure values for each of these parameters.
Connection attempts	Number of connection attempts (default value: 6 connection attempts) 1 to 255
Transmission attempts	Number of transmission attempts (default value: 6 transmission attempts) 1 to 255
Character delay time	Character delay time setting (depending on the set data transmission rate) (default value: 220 ms) 20 ms to 65535 ms
Acknowledgement delay	Acknowledgment delay time setting (depending on the set data transmission rate) (default value: 2000 ms when block check is enabled; 550 ms when block check is not enabled) 20 ms to 65535 ms

NOTE

With the exception of Priority, the protocol settings must be the same for the CM module and the communication partner.

7.12.8 Point-to-Point Instructions

The PtP instructions (https://docs.tia.siemens.cloud/access?ft:originId=./39512235019/39512235019_enUS.htm&ft:clusterId./39512235019/39512235019.htm) provide for communication using various network protocols and include the following folder:

NOTE

Choosing an instruction by PLC family

If the TIA Portal Information System presents an instruction differently based on PLC family, follow the S7-1500 option for the instructon topic.

7.12.9 Programming the PtP communications

7.12.9.1 Programming overview

The Point-to-Point instructions (Page 284) fall into two categories:

- Configuration instructions
- Communication instructions

Configuration instructions

Before your STEP 7 program can engage in PtP communication, you must configure the communication interface port and the parameters for sending data and receiving data.

You can perform the port configuration and message configuration for each CM or CB through the device configuration or through these instructions in your STEP 7 program:

- Port_Config
- Send_Config
- Receive_Config
- P3964_Config

Communication instructions

The PtP communication instructions enable the STEP 7 program to send messages to and receive messages (https://docs.tia.siemens.cloud/access?ft:originId=./15891429899/20448736523_enUS.htm&ft:clusterId./15891429899/20448736523.htm) from the communication interfaces.

All of the PtP functions operate asynchronously. The STEP 7 program can use a polling architecture to determine the status of transmissions and receptions. Send_P2P and Receive_P2P can execute concurrently. The communication modules and communication board buffer the transmit and receive messages as necessary up to a maximum buffer size of 1024 bytes.

CMs and CBs send messages to and receive messages from the actual point-to-point devices. The message protocol is in a buffer that is either received from or sent to a specific communication port. The buffer and port are parameters of the send and receive instructions:

- Send_P2P
- Receive_P2P

Additional instructions provide the capability to reset the receive buffer, and to get and set specific CM signals and features:

- Receive_Reset
- Signal_Get
- Signal_Set
- Get_Features
- Set_Features

7.12.9.2 Polling architecture

The STEP 7 program must call the point-to-point instructions cyclically or periodically to check for received messages. Polling the send cyclically or periodically determines when the transmit has completed.

Polling architecture: client

The typical sequence for a client is as follows:

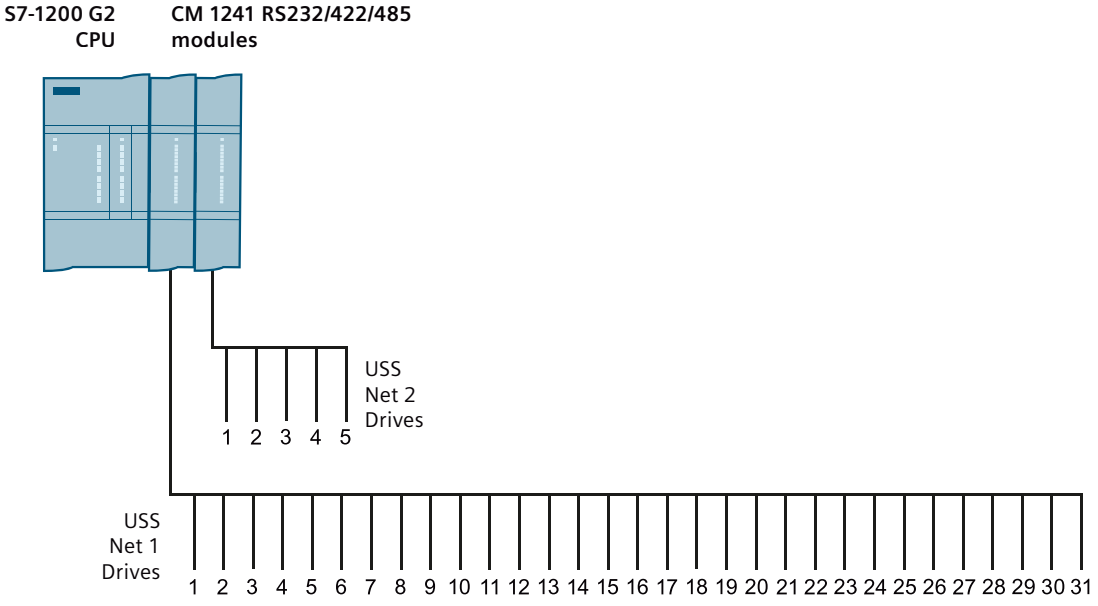
1. A Send_P2P instruction initiates a transmission to the CM or CB.
2. The Send_P2P instruction executes on subsequent scans to poll for the transmit complete status.
3. When the Send_P2P instruction indicates that the transmission is complete, the STEP 7 program logic can prepare to receive the response.
4. The Receive_P2P instruction executes repeatedly to check for a response. When the CM or CB has collected a response message, the Receive_P2P instruction copies the response to the CPU and indicates that new data have been received.
5. The STEP 7 program can process the response.
6. Go to step 1 and repeat the cycle.

Polling architecture: server

The typical sequence for a server is as follows:

1. The STEP 7 program executes the Receive_P2P instruction every scan.
2. When the CM or CB has received a request, the Receive_P2P instruction indicates the availability of new data and the request is copied into the CPU.
3. The STEP 7 program services the request and generates a response.
4. Use a Send_P2P instruction to send the response back to the client.
5. Repeatedly execute Send_P2P to be sure the transmit occurs.
6. Go to step 1 and repeat the cycle.

The server must be responsible for calling Receive_P2P frequently enough to receive a transmission from the client before the client times out while waiting for a response. To accomplish this task, the STEP 7 program can call Receive_P2P from a cyclic OB, where the cycle time is sufficient to receive a transmission from the client before the timeout period expires. If you set the cycle time for the OB to provide for two executions within the timeout period of the client, the STEP 7 program can receive transmissions without missing any.

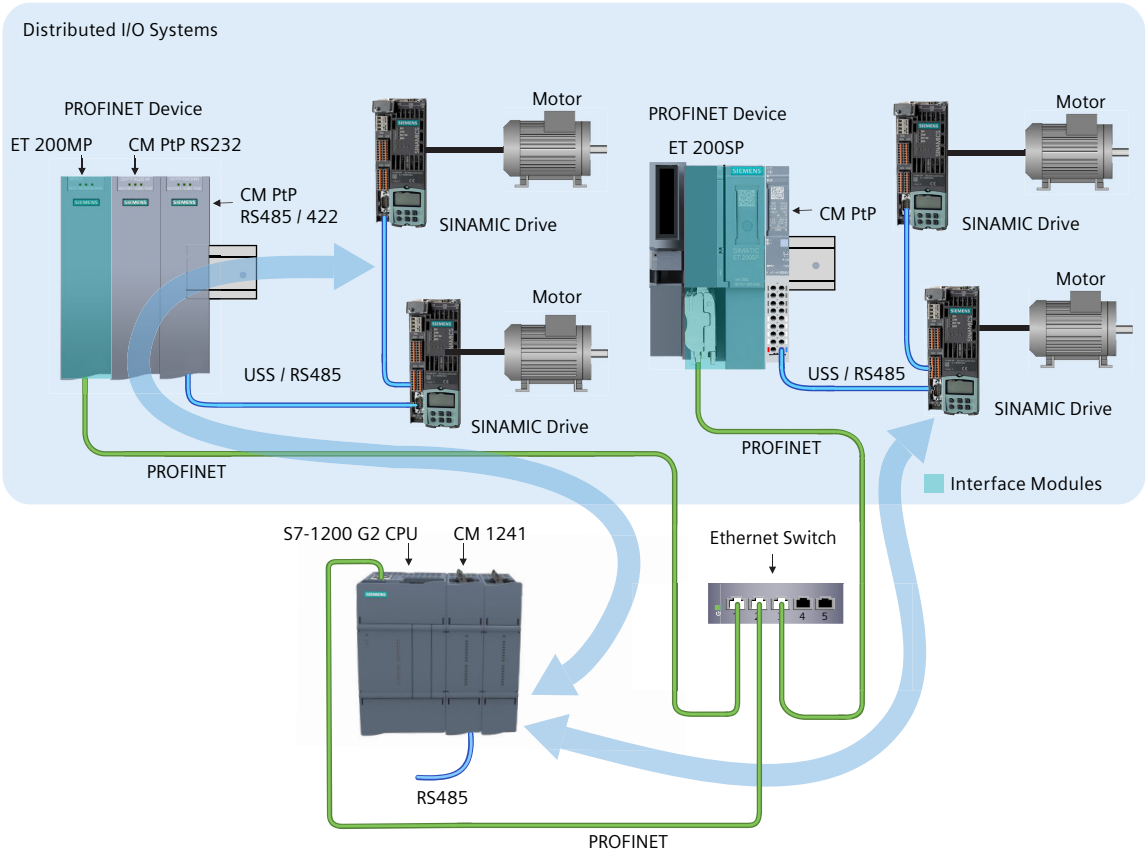


7.13 Universal serial interface (USS) communication

The USS instructions (Page 289) control the operation of motor drives which support the universal serial interface (USS) protocol. You can use the USS instructions to communicate with multiple drives through RS485 connections. Each RS485 port can operate up to 31 drives.

You can use the USS instructions to communicate with multiple drives through RS485 connections to CM 1241 RS232/422/485 communication modules or CB 1241 RS485 communication boards. The following CM/CB combinations can be installed:

- For 1212C and 1212FC CPUs, up to three CM 1241 RS232/422/485 modules and one CB 1241 RS485 for a total of four communication interfaces
- For 1214C and 1214FC CPUs, up to three CM 1241 RS232/422/485 modules and up to two CBs 1241 RS485 for a total of five communication interfaces



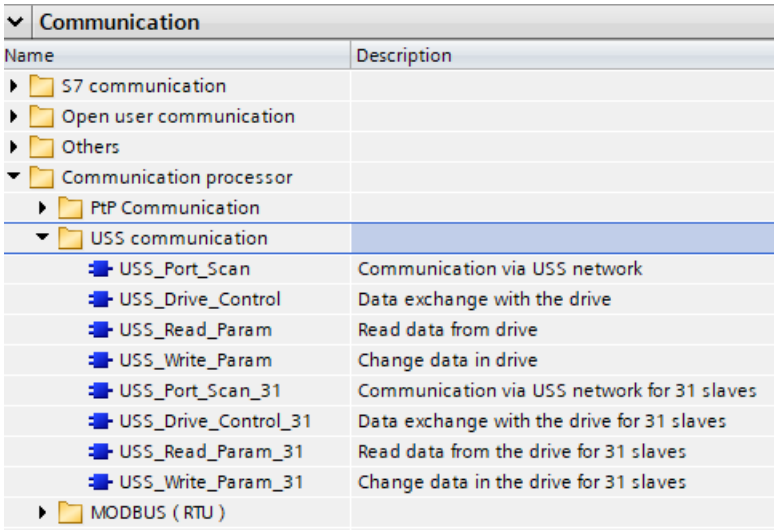
The USS protocol uses a master-slave network for communications over a serial bus. The master uses an address parameter to send a message to a selected slave. A slave itself can never transmit without first receiving a request to do so. Direct message transfer between the individual slaves is not possible. USS communication operates in half-duplex mode. The following USS illustration shows a network diagram for an example drive application.

USS communications through PROFINET

USS communication enables you to use a PROFINET distributed I/O rack to communicate to various devices (RFID readers, GPS device, and others). You connect the Ethernet interface of the S7 1200 G2 CPU to a PROFINET interface module. PtP communication modules in the rack with the interface module provide serial communications to USS drives.

USS instructions allow you to configure the communications between the PtP communication modules in the distributed I/O rack and the USS drives.

The blue arrows indicate the flow of bidirectional communication between devices.



Note that STEP 7 provides different versions (https://docs.tia.siemens.cloud/access?ft:originId=./75629918475/95949438091_enUS.htm&ft:clusterId=./75629918475/95949438091.htm) of the USS instructions (Page 289)depending on the number of drives.

Requirements for using the USS protocol

The USS communication instructions support the USS protocol with usage requirements (https://docs.tia.siemens.cloud/access?ft:originId=./39512292235/40514327819_enUS.htm&ft:clusterId=./39512292235/40514327819.htm). For each USS network, one instance data block (DB) is used for USS_Port_Scan and one instance data block for all calls of USS_Drive_Control.

7.13.1 USS instructions

USS instructions (https://docs.tia.siemens.cloud/access?ft:originId=./39512292235/39512292235_enUS.htm&ft:clusterId./39512292235/39512292235.htm) provide for communication using various network protocols and include the following folder groups:

The following instructions operate a maximum of 16 USS drives:

- USS-Port_Scan
- USS_Drive_Control
- USS_Read_Param
- USS_Write_Param

The following instructions operate a maximum of 31 USS drives:

- USS-Port_Scan_31
- USS_Drive_Control_31
- USS_Read_Param_31
- USS_Write_Param_31

NOTE

Choosing an instruction by PLC family

If the TIA Portal Information System presents an instruction differently based on PLC family, follow the S7-1500 option for the instructon topic.

7.13.2 USS status codes

The STATUS output of the USS functions returns the USS instruction status codes.

Table 1-192 STATUS codes [1]

STATUS (W#16#....)	Description
0000	No error
8180	The length of the drive response did not match the characters received from the drive. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8181	VALUE parameter was not a Word, Real or DWord data type.
8182	The instruction supplied a Word for a parameter value and received a DWord or Real from the drive in the response.
8183	The instruction supplied a DWord or Real for a parameter value and received a Word from the drive in the response.
8184	The response telegram from drive had a bad checksum. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8185	Illegal drive address. Valid drive address range: 1 to16 (or 1-31 if using the _31 instructions).
8186	The speed set point is out of the valid range (valid speed SP range: -200% to 200%).
8187	The wrong drive number responded to the request sent. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8188	Illegal Programmable Zero Delay (PZD) word length specified (valid range = 2, 4, 6 or 8 words).
8189	Illegal Baud Rate was specified.
818A	The parameter request channel is in use by another request for this drive.
818B	The drive has not responded to requests and retries. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
818C	The drive returned an extended error on a parameter request operation. See the extended error description below this table.
818D	The drive returned an illegal access error on a parameter request operation. See your drive manual for information of why parameter access may be limited.
818E	The drive has not been initialized. This error code is returned to USS_Read_Param or USS_Write_Param when USS_Drive_Control, for that drive, has not been called at least once. This keeps the initialization on first scan of USS_Drive_Control from overwriting a pending parameter read or write request, since it initializes the drive as a new entry. To fix this error, call USS_Drive_Control for this drive number.
8280	Negative acknowledgment when reading module.
8281	Negative acknowledgment when writing module.
8FFF	The module is not ready temporarily due to a reset.
80Ax-80Fx	Specific errors returned from PtP communication instructions called by the USS Library - These error code values are not modified by the USS library and are defined in the PtP instruction descriptions.

[1] In addition to the USS instruction errors listed above, errors can be returned from the underlying PtP communication instructions.

For several STATUS codes, additional information is provided in the USS_Extended_Error variable of the USS_Drive_Control Instance DB. For STATUS codes hexadecimal 8180, 8184, 8187, and 818B, USS_Extended_Error contains the drive number where the communication error occurred. For STATUS code hexadecimal 818C, USS_Extended_Error contains a drive error code returned from the drive when using a USS_Read_Param or USS_Write_Param instruction.

Read and write access to a drive's internal parameters

USS drives support read and write access to a drive's internal parameters. This feature allows remote control and configuration of the drive. Drive parameter access operations can fail due to errors such as values out of range or illegal requests for a drive's current mode. The drive generates an error code value that is returned in the USS_Extended_Error variable when the STATUS code value is hexadecimal 818C. This error code value is only valid for the last execution of a USS_Read_Param or USS_Write_Param instruction. The error code value of USS_Extended_Error depends on the drive model. See the drive's manual for a description of the extended error codes for read and write parameter operations.

7.13.3 USS general drive setup requirements

USS general drive setup requirements consist of the following points:

- The drives must be set to use 4 Parameter Control Words (PKW).
- The drives can be configured for 2, 4, 6, or 8 Programmable Zero Delay (PZD) words.
- The number of PZD words in the drive must match PZD_LEN input on the USS_Drive_Control instruction for that drive.
- The baud rate in all the drives must match the BAUD input on the USS_Port_Scan instruction.
- The drive must be set for remote control.
- The drive must be set for frequency set-point to USS on COM Link.
- The drive address must be set to 1 to 16 (or 1-31 if using the _31 instructions) and match the DRIVE input on the USS_Drive_Control block for that drive.
- The drive direction control must be set to use the polarity of the drive set-point.
- The RS485 network must be terminated properly.

7.14 Modbus communication

Modbus function codes

A CPU operating as a Modbus TCP client or Modbus RTU master can read/write both data and I/O states in a remote Modbus TCP server or Modbus RTU slave. Remote data can be read and then processed in your program logic.

A CPU operating as a Modbus TCP server or Modbus RTU slave allows a supervisory device to read/write both data and I/O states in CPU memory. A Modbus TCP client or Modbus RTU master can write new values into server/slave CPU memory that is available to your program logic.

⚠ WARNING

Avoiding security risks from network attacks

If an attacker can access your networks, the attacker can possibly read and write data.

For example, I/O exchange through PROFINET, PUT/GET (Page 252), T-Block, and communication modules (CMs) have no security features. You must protect these forms of communication.

If you fail to protect these forms of communication, death or severe personal injury can result.

For security information and recommendations, see the "Operational Guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html)" white paper on the Siemens Industrial Cybersecurity Web site.

Table 1-193 Read data functions: Read remote I/O and program data

Modbus function code	Read slave (server) functions - standard addressing
01	Read output bits: 1 to 2000 bits per request
02	Read input bits: 1 to 2000 bits per request
03	Read holding registers: 1 to 125 words per request
04	Read input words: 1 to 125 words per request

Table 1-194 Write data functions: Write remote I/O and modify program data

Modbus function code	Write slave (server) functions - standard addressing
05	Write one output bit: 1 bit per request
06	Write one holding register: 1 word per request
15	Write one or more output bits: 1 to 1968 bits per request
16	Write one or more holding registers: 1 to 123 words per request

Modbus function codes 08 and 11 provide slave device communication diagnostic information.

Modbus function code 0 broadcasts a message to all slaves (with no slave response). The broadcast function is not available for Modbus TCP, because communication is connection based.

Modbus function code 23 can write and read one or more holding registers: 1 to 121/125 (Write/Read) words per request. This function code is only available for Modbus TCP.

Modbus network station addresses

In a Modbus TCP network, each device is uniquely addressed using its IP address and port number. To establish a connection, enter these details into the appropriate configuration field. The Modbus protocol then uses this address information to access and communicate with devices over the network.

Table 1-195 Modbus memory addresses

Station		Address range
TCP station	Station address	IP address and port number
RTU station	Standard station address	1 to 247
	Extended station address	1 to 65535

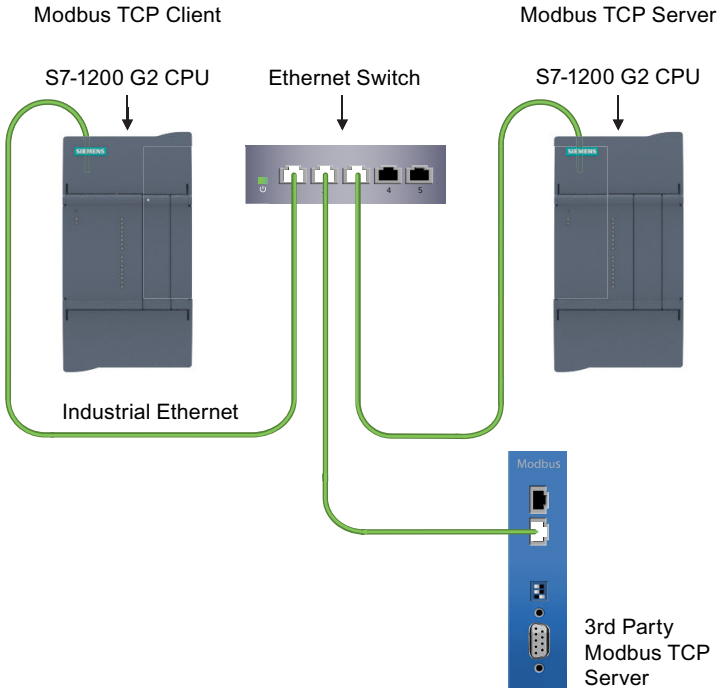
Modbus memory addresses

The actual number of available Modbus memory addresses depends on the CPU model, how much work memory exists, and how much CPU memory is used by other program data. The table below gives the nominal value of the address range.

Table 1-196 Modbus memory addresses

Station		Address range
TCP station	Standard memory address	10K
	Extended memory address	64K
RTU station	Standard memory address	10K
	Extended memory address	64K

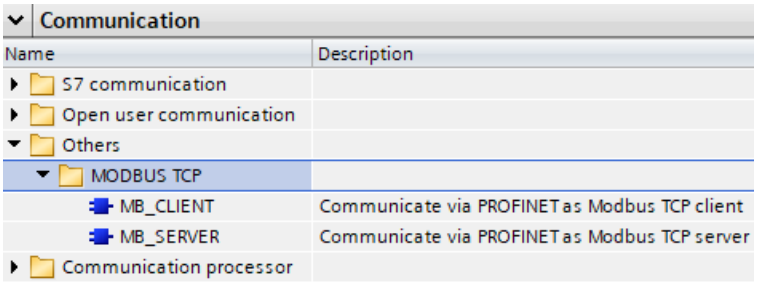
7.14.1 Modbus TCP



Modbus TCP (Transmission Control Protocol) is a standard network communication protocol that uses the PROFINET connector on the CPU for TCP/IP communication.

Modbus TCP uses Open User Communication (OUC) connections as a Modbus communication path. Multiple client-server connections can exist in addition to the connection between STEP 7 and the CPU. Mixed client and server connections are supported up to the maximum number of connections allowed by the CPU model (Page 207).

Each MB_SERVER connection must use a unique instance DB and port number. Only one connection per port number is supported. Each MB_SERVER (with its unique instance DB, IP address, and port number) must be executed individually for each connection.

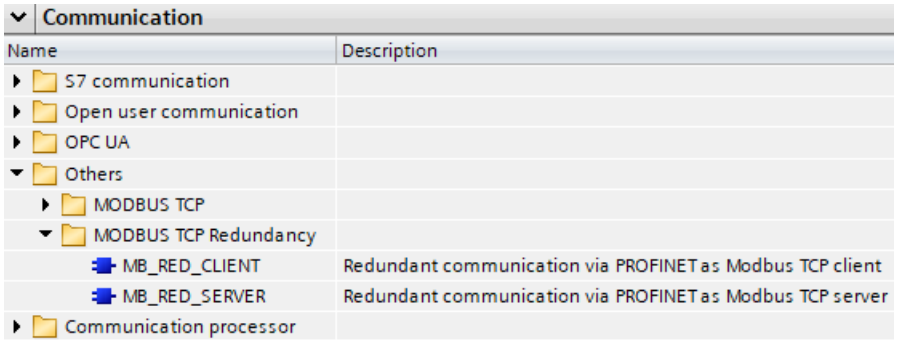


A Modbus TCP client must control the client-server connection with the DISCONNECT parameter. The basic Modbus client actions are shown below:

1. Initiate a connection to a particular server IP address and port number.
2. Initiate client transmission of a Modbus message and receive the server responses.
3. Initiate the disconnection of client and server to enable connection with a different server.

7.14.1.1 Modbus TCP Instructions

The Modbus TCP instructions (https://docs.tia.siemens.cloud/access?ft:originId=./30931262347/53718390539_enUS.htm&ft:clusterId=./30931262347/53718390539.htm) provide the capability to communicate between Modbus TCP clients, Modbus TCP servers, and third-party Modbus TCP devices through a switch. These can be found in the following folders:



NOTE

Choosing an instruction by PLC family

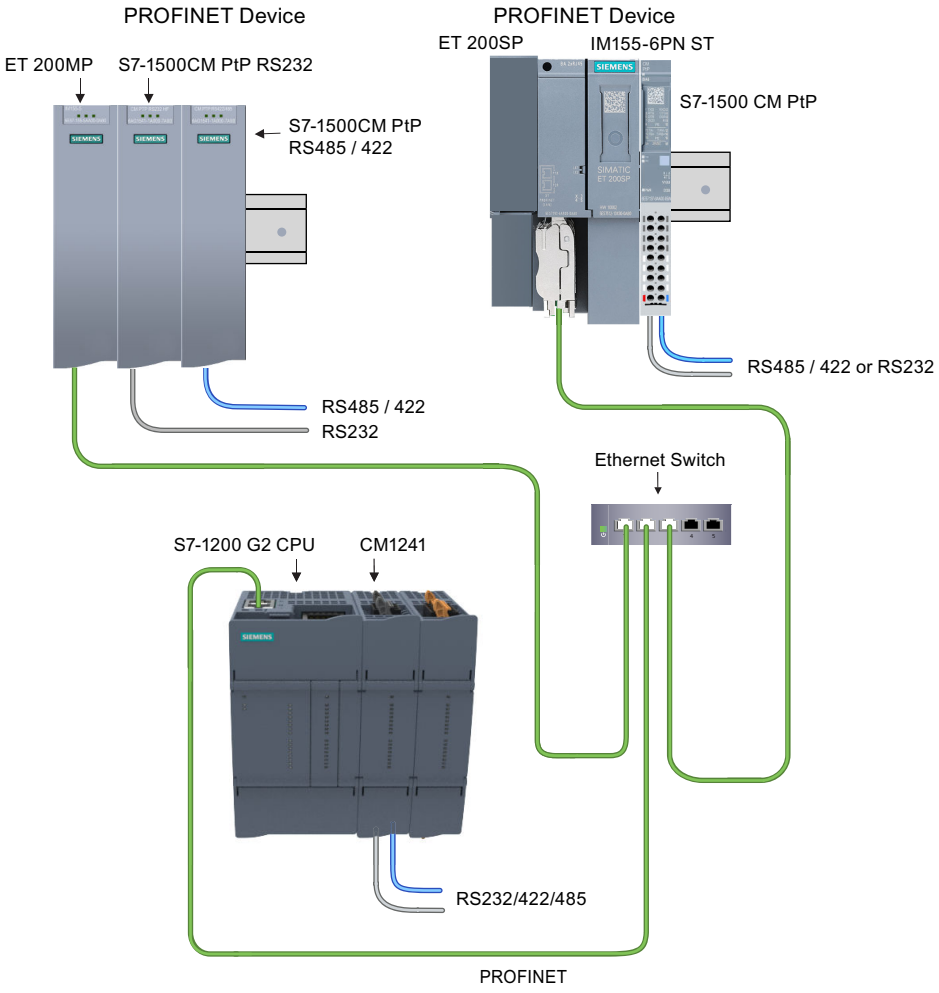
If the TIA Portal Information System presents an instruction differently based on PLC family and "S7-1200 G2" is not an option , follow the S7-1500 option for the instruction topic.

Modbus TCP Redundancy instructions

The Modbus TCP Redundancy instructions (https://docs.tia.siemens.cloud/access?ft:originId=./30931262347/104082829707_enUS.htm&ft:clusterId./30931262347/104082829707.htm) provide the capability to ensure continuous and reliable communication between devices even in the event of a network or device failure. These can be found in the following folders:

NOTE

Choosing an instruction by PLC family



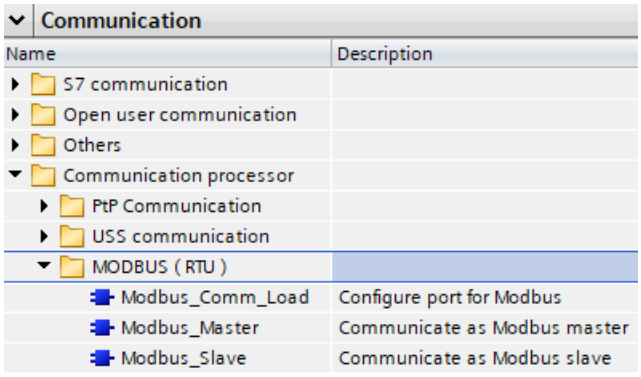
If the TIA Portal Information System presents an instruction differently based on PLC family and "S7-1200 G2" is not an option, follow the S7-1500 option for the instruction topic.

7.14.2 Modbus RTU

Modbus RTU (Remote Terminal Unit) is a standard network communication protocol that uses the RS232, RS422, or RS485 electrical connection for serial data transfer between Modbus network devices. You can add PtP (Point to Point) network ports to a CPU with a CM 1241 RS232/422/485 or a CB 1241 RS485.

Modbus RTU uses a master/slave network where all communications are initiated by a single Master device and slaves can only respond to a master's request. The master sends a request to one slave address and only that slave address responds to the command.

Modbus RTU enables you to use PROFINET distributed I/O to communicate to various devices (RFID readers, GPS device, and others). You connect the Ethernet interface of the S7-1200 G2 CPU to a PROFINET interface module. PtP communication modules in the rack with the interface module can then provide serial communications to external Modbus devices.



Modbus RTU communications hardware compatibility

The following table outlines the Modbus RTU protocol along with the available instruction set and communication hardware options for the protocol.

Protocol	Instruction Folder	Local CM 1241 RS232/422/485	Local CB 1241 RS485	Distributed CM PtP (example: ET 200MP CM or ET 200SP CM)
Modbus RTU	Communication > Communication processor > MODBUS (RTU)	Yes	Yes	Yes

7.14.2.1 Modbus RTU instructions and versions

The Modbus RTU instructions provide the ability to communicate between PtP communication modules or boards and Modbus devices in the network using RS232, RS422, or RS485.

For more information on the Modbus RTU instructions and their uses, see the following topics in the TIA Portal Information System:

- "Modbus_Comm_Load: Configure communication module for Modbus" (https://docs.tia.siemens.cloud/access?ft:originId=./39512297483/CM1500_Prog_Modbus_Comm_Load_enUS.htm&ft:clusterId./39512297483/CM1500_Prog_Modbus_Comm_Load.htm)
- "Modbus_Master: Communicate as Modbus master" (https://docs.tia.siemens.cloud/access?ft:originId=./39512297483/CM1500_Prog_Modbus_Master_enUS.htm&ft:clusterId./39512297483/CM1500_Prog_Modbus_Master.htm)
- "Modbus_Slave: Communicate as Modbus slave" (https://docs.tia.siemens.cloud/access?ft:originId=./39512297483/CM1500_Prog_Modbus_Slave_enUS.htm&ft:clusterId./39512297483/CM1500_Prog_Modbus_Slave.htm)

NOTE

STEP 7 provides different library versions of the Modbus RTU instructions. For correct information on S7-1200 G2 Modbus RTU instruction library versions, refer to "Dependencies between library versions (https://docs.tia.siemens.cloud/access?ft:originId=./39512297483/127801431179_enUS.htm&ft:clusterId./39512297483/127801431179.htm)" in the TIA Portal Information System.

NOTE

Choosing an instruction by PLC family

If the TIA Portal Information System presents an instruction differently based on PLC family and "S7-1200 G2" is not an option, follow the S7-1500 option for the instructon topic.

7.14.2.2 Maximum number of supported Modbus slaves

Modbus addressing supports a maximum of 247 slaves (slave numbers 1 through 247). Each Modbus network segment can have a maximum of 32 devices, based upon the loading and drive capabilities of the RS485 interface. When you reach the 32-device limit, you must use a repeater to expand to the next segment. You need seven repeaters to support the 247 slaves connected to one master for RS485.

You cannot use Siemens repeaters with PROFINET. You require third party repeaters for Modbus.

Modbus timeouts are long by default; the use of multiple repeaters does not create a time-delay problem. Response delays do not affect the Modbus master.

Near Field Communication (NFC) 8

The S7-1200 G2 CPUs are equipped with embedded Near Field Communication (NFC) tags. This allows you to scan the passive tag in your CPU and access information via the S7-1200 G2 NFC application (app) from a smartphone device.

By default, NFC is disabled in a new STEP 7 project. If you want to use NFC in your STEP 7 project, you must enable it in the project before downloading the project to your CPU.

NOTE

if you disable NFC in your STEP 7 project and perform a new download to the CPU, the CPU clears the data on the NFC tag.

Installing the S7-1200 G2 NFC app on your smartphone device allows you to read information from the CPU.

For more information on using the Near Field Communication feature with S7-1200 G2, see the Near Field Communication (NFC) Function Manual (https://support.industry.siemens.com/cs/ww/en/view/109994538).

⚠ WARNING

Risks when using a cellular phone in close proximity to the S7-1200 G2 CPU

Using a cellular phone in close proximity to the S7-1200 G2 system with cellular and Wi-Fi communications active could cause unpredictable behavior.

To reduce any influence of a cellular phone on the S7-1200 G2 system, and to ensure proper operation of your CPU, place the phone in "Airplane mode" to disable cellular and Wi-Fi before bringing the phone into proximity (<10 cm) of the CPU.

Failure to comply with these guidelines can cause damage or unpredictable operation which could result in severe personal injury, property damage, and/or death.

⚠ WARNING

Risks when operating a cellular phone in a hazardous or explosive environment

Do not use a cellular phone in a hazardous or explosive environment unless the phone has been approved for use in such environments.

Failure to comply with these guidelines can cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.

Web server

9

The S7-1200 G2 CPU Web server provides system Web pages (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/comprehensive-information/cpu-function-manuals/web-server/system-web-pages) and a Web API (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/comprehensive-information/cpu-function-manuals/web-server/api-application-programming-interface/web-api) for you to develop custom Web pages that can read and write process data.

Your STEP 7 project enables system Web pages by default. You can find or change this setting from Web applications in the project tree.

Differences from the S7-1500 Web server

The S7-1200 G2 Web server implements the functionality of the S7-1500 Web server, with the following difference: The number of concurrent API sessions is 30.

Default page for Web application

You can set a default page from STEP 7 from Web applications in the project tree.

You can also use the following methods to set a default page for Web pages that you create with the Web API:

- WebServer.SetDefaultPage
- WebApp.SetDefaultPage

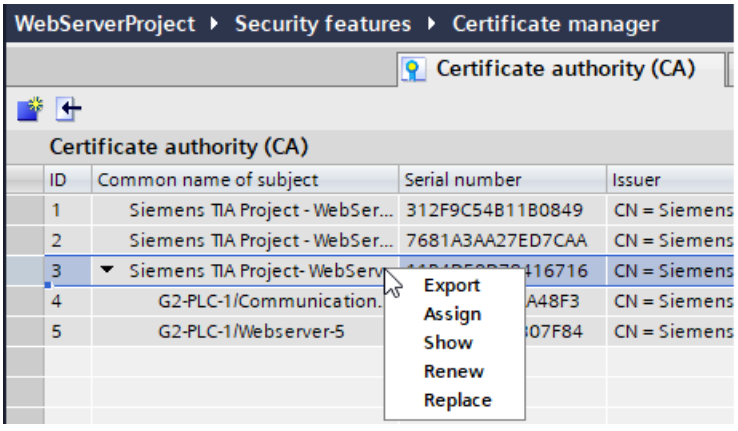
If you have not created a Web application and configured a default page, the Web browser returns a 404 error. For information on configuring and setting default pages, refer to the Web server manual (https://docs.tia.siemens.cloud/r/simatic_s7_1500_et_200mp_manual_collection_enus_20/comprehensive-information/cpu-function-manuals/web-server). Use the Edition dropdown menu to select the correct version of the manual.

Examples

Refer to the online examples (https://support.industry.siemens.com/cs/ww/en/view/68011496) for developing Web pages. The examples demonstrate a variety of functions.

Additional information

With the functionality of the Web API, S7-1200 G2 does not support the former AWP commands for developing user-defined Web pages.



The Web API does not include a method for updating firmware.

9.1 Certificate requirements for the Web server

To communicate with the S7-1200 G2 Web API using a web browser, you must have a trusted Certificate Authority (CA) installed on your programming device. The trusted Certificate Authority (CA) enables secure communications over HTTPs.

The process includes the following tasks:

- Protecting the TIA Portal project from Security settings > Settings > Protect this project, as described in the TIA Portal Information System, Activating project protection topic
- Selecting "Use global security settings for certificate manager" for your CPU in the device configuration properties, Protection & Security > Certificate manager
- Creating a PLC communication certificate (Page 209)
- Enabling the Web server in the device configuration of the CPU (Page 158)
- Using the Security settings > Security features > Certificate manager to install or export the PLC communication certificate and Web server certificate, as described in the TIA Portal Information System, Certificate manager chapter

- Following the FAQ (https://support.industry.siemens.com/cs/ww/en/view/103528224) beginning with Step 2 to install, store, and trust the certificates you installed or exported from the TIA Portal project.

References

For additional information on managing certificates for the Web server, refer to the TIA Portal Information System and these documents:

- Web server manual (https://support.industry.siemens.com/cs/ww/en/view/59193560)
- How to install a certificate for the Web server (https://support.industry.siemens.com/cs/ww/en/view/103528224)

These documents are applicable to S7-1500 CPUs, but most of the content is applicable to S7-1200 G2 CPUs.

Motion control 10

10.1 Introducing S7-1200 G2 Motion Control

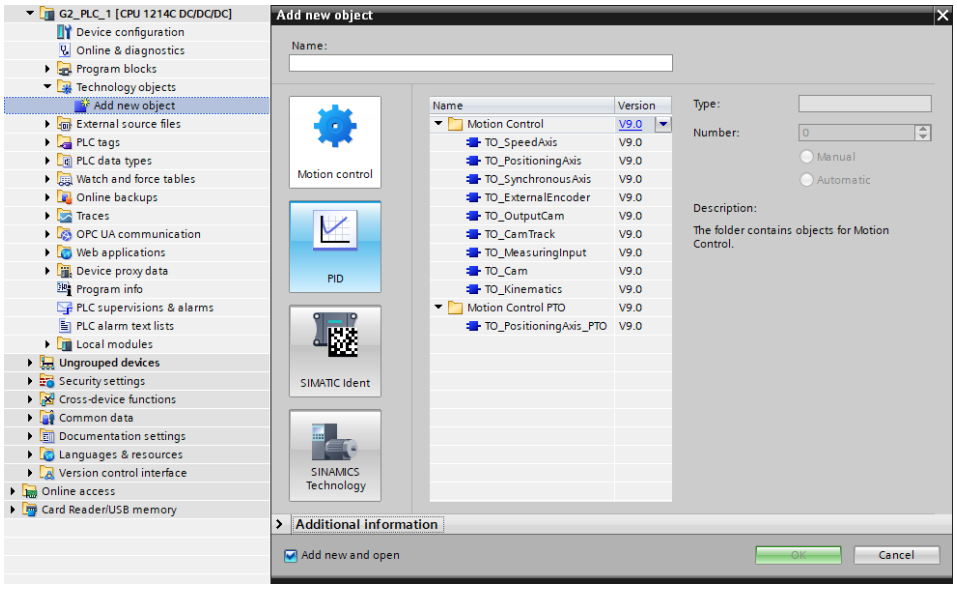
Motion Control allows users to accomplish specific tasks that require movement of tools or materials, such as bottling, machining, or welding.

Machines and production lines must increasingly be adapted to different formats, sizes, product types, and production processes. S7-1200 G2 Motion Control offers a precise, dynamic, and easy-to-implement solution.

Motion Control instructions control drives with PROFIdrive capability, drives with analog setpoint interface, servo motors, and stepper motors in accordance with the PLCopen standard. The axis control panel and comprehensive online and diagnostic functions support commissioning and optimization of drives. S7-1200 G2 Motion Control is fully integrated into the S7-1200 G2 CPU.

Achieving motion control

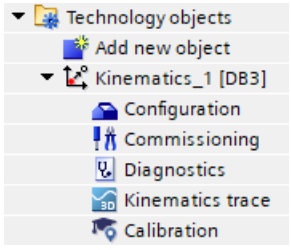
You can achieve Motion Control with the S7-1200 G2 CPU using the following concepts:



- Technology Objects serve as links to the drive and allow for configuration of dynamic behavior.
- Motion Control instructions allow you to control each Technology Object.
- Organization Blocks execute the Motion Control instructions of the user program in a structured manner.

10.2 Motion Control Technology Objects (TOs)

In S7-1200 G2 Motion Control, the technology objects (TO) represent control elements of Motion Control, such as a position axis or an output cam. A TO establishes a logical relationship between the user program and the physical device and defines the motion profile by allowing for parameterization, such as setting limits like acceleration, deceleration, and jerk. This information is stored in a corresponding technology data block (DB), where you can read information about the status of the motion control job, such as speed, position, or error status.



Creating a new TO

You can add a TO to your STEP 7 project by selecting "Add new object" under the Technology objects folder in the project tree.

Configuration and commissioning

Within STEP 7, multiple tools exist to help configure, commission, and debug TOs in your motion control project.

Motion resources

When you create a motion control TO, that TO draws from a pool of resources that represents the resources available within the CPU for motion tasks. There are two pools, one each for Motion Control and Extended Motion Control. If you exceed the number of resources available from either pool, an error occurs when you compile your program in the TIA Portal.

You can add up to 16 Pulse Train Output (PTO) TOs, which are independent of all other types of TOs. The PTO TOs do not draw from either pool of Motion Control resources.

The costs associated with each TO are additive in some cases. For example, implementing a three-axis Cartesian Portal solution requires one Kinematics TO, costing 30 Extended Motion

Control resources, and three PositioningAxis TOs, costing 80 Motion Control resources each. In this case, the total cost is 30 Extended resources and 240 Motion resources.

You can find more information about motion resources in the Technical Specifications (Page 337).

NOTE
While S7-1200 CPUs allow for the sharing of a single PTO output between two configured positioning axes, this functionality might not function as intended in S7-1200 G2 projects. The first configured positioning axis behaves as expected, but the second configured positioning axis does not move.

Supported TOs

The S7-1200 G2 CPU provides varying levels of support for a range of Motion Control TOs, as described in the table below:

TO	Supported	Motion Control resources required (out of 800 provided by the CPU)	Extended Motion Control resources required (out of 40 provided by the CPU)
TO_SpeedAxis	✓	40	
TO_PositioningAxis	✓	80	
TO_SynchronousAxis	✓	160	
TO_ExternalEncoder	✓	80	
TO_OutputCam	✓	20	
TO_CamTrack	✓	160	
TO_MeasuringInput	✓	40	
TO_Cam	✓		2
TO_Kinematics	Partially supported		30
TO_PositioningAxis_PTO	✓	0	0

You can find help on programming each Motion Control TO in the TIA Portal Information System, as defined for the S7-1500/S7-1500T. These TOs are equivalent in S7-1200 G2.

10.3 Motion Control instructions

The STEP 7 program calls the Motion Control (MC) instructions and acts upon configured TOs. These blocks exist within the motion library as function blocks (FB) and create a data instance when they are placed into the user program in STEP 7.

You can use MC instructions to accomplish motion tasks of varying complexity, such as setting a constant velocity, moving a tool to a desired position, or synchronizing two axes.

Supported instructions

The following MC instructions are available for the S7-1200 G2 CPU:

MC instruction	Motion Control	Extended Motion Control	PTO Motion Control
MC_Power	✓		
MC_Reset	✓		
MC_Home	✓		
MC_Halt	✓		
MC_MoveAbsolute	✓		
MC_MoveRelative	✓		
MC_MoveVelocity	✓		
MC_MoveJog	✓		
MC_MoveSuperimposed	✓		
MC_HaltSuperimposed	✓		
MC_Stop	✓		
MC_SetAxisSTW	✓		
MC_SaveAbsoluteEncoderData	✓		
MC_WriteParameter	✓		
MC_SetSensor		✓	
MC_MeasuringInput	✓		
MC_MeasuringInputCyclic	✓		
MC_AbortMeasuringInput	✓		
MC_OutputCam	✓		
MC_CamTrack	✓		
MC_GearIn	✓		
MC_GearInVelocity		✓	
MC_GearInPos		✓	
MC_PhasingRelative		✓	
MC_PhasingAbsolute		✓	
MC_CamIn		✓	

[1] You can find this instruction under the main "Motion Control" Technology folder in STEP 7.

MC instruction	Motion Control	Extended Motion Control	PTO Motion Control
MC_GearOut		✓	
MC_CamOut		✓	
MC_InterpolateCam		✓	
MC_GetCamLeadingValue		✓	
MC_GetCamFollowingValue		✓	
MC_GetCamFollowingValueCyclic[1]		✓	
MC_CopyCamData		✓	
MC_TorqueAdditive	✓		
MC_TorqueRange	✓		
MC_TorqueLimiting	✓		
MC_GroupInterrupt		✓	
MC_GroupContinue		✓	
MC_GroupStop		✓	
MC_MoveLinearAbsolute		✓	
MC_MoveLinearRelative		✓	
MC_MoveCircularAbsolute		✓	
MC_MoveCircularRelative		✓	
MC_MoveDirectAbsolute		✓	
MC_MoveDirectRelative		✓	
MC_DefineWorkspaceZone		✓	
MC_SetWorkspaceZoneActive		✓	
MC_SetWorkspaceZoneInactive		✓	
MC_DefineTool		✓	
MC_SetTool		✓	
MC_Power_PTO			✓
MC_Reset_PTO			✓
MC_MoveAbsolute_PTO			✓
MC_MoveRelative_PTO			✓
MC_MoveVelocity_PTO			✓
MC_MoveJog_PTO			✓
MC_Halt_PTO			✓
MC_Home_PTO			✓

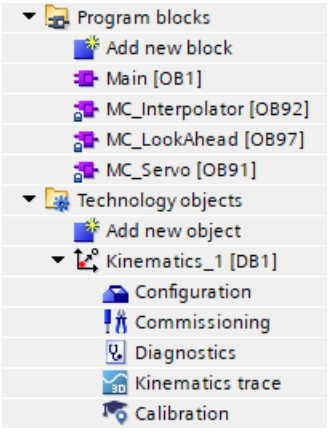
[1] You can find this instruction under the main "Motion Control" Technology folder in STEP 7.

MC instruction	Motion Control	Extended Motion Control	PTO Motion Control
MC_ChangeDynamic_PTO			✓
MC_ReadParam_PTO			✓
MC_WriteParam_PTO			✓

[1] You can find this instruction under the main "Motion Control" Technology folder in STEP 7.

You can find help on programming each MC instruction in the TIA Portal Information System, as defined for the S7-1500/S7-1500T. These instructions are equivalent in S7-1200 G2. "_PTO" instructions, however, are unique to S7-1200 G2 and are defined as such in the TIA Portal Information System.

10.4 Motion Control Organization Blocks (OBs)



You can use an organization block (OB) to control how the CPU executes STEP 7 programs and handles interrupts and events. For Motion Control, this might mean executing closed-loop position control algorithms of TOs, monitoring and generating setpoints, or executing logic to create the desired movement of the axis.

Generated OBs

There are two types of OBs related to motion control. User OBs allow you to enter your motion control logic. Compiler-generated OBs are protected blocks and cannot be edited.

Supporting OBs

STEP 7 creates supporting organization blocks (OB) when you create a TO in your project.

G2-supported OBs

The S7-1200 G2 CPU provides support for the following Motion Control OBs:

- MC_PreServo (Page 113) - the CPU calls MC_PreServo immediately before MC_Servo, allowing you to make adjustments before the Servo logic executes.
- MC_Servo (Page 112) - performs calculations required to control the speed and position of axes. This block is protected.

- MC_PostServo (Page 114) - the CPU calls MC_PostServo immediately after MC_Servo executes, allowing you to modify outputs.
- MC_PreInterpolator - the CPU calls MC_PreInterpolator immediately before MC_Interpolator executes, allowing you to adjust inputs used by MC_Interpolator. These inputs will be IPO-synchronous.
- MC_Interpolator (Page 112) - evaluates Motion Control instructions, generates setpoints, and monitors inputs. This block is protected.
- MC_LookAhead (Page 114) - calculates motion processing for the Kinematics TO. This block is protected.

You can find help on programming each Motion Control OB in the TIA Portal Information System, as defined for the S7-1500/S7-1500T. These OBs are equivalent in S7-1200 G2.

10.5 Differences between S7-1200 G2 and S7-1500/S7-1500T

S7-1200 G2 Motion Control is similar In function to that of the S7-1500/1500T, with the following notable additions:

- Support for a subset of Extended Motion Control
- Support for a subset of Kinematics devices
  - Kinematics Cartesian Portal up to 3D with Orientation
  - SCARA up to 3D with Orientation
- Support for a subset of Cam TOs
- Support for Cam segments and VDI optimization

S7-1200 G2 Motion Control is similar In function to that of the S7-1500/1500T, with the following notable differences:

- No support for Kinematics Zones
- No support for User Defined Kinematics; however, Workspaces are supported
- No support for distributed motion control
- No support for TO_Cam_10k, TO_Cam_6kSeg, or TO_Cam_600Seg

10.5.1 Adapting Motion Control to S7-1200 G2

S7-1200 G2 motion control differs from that of the S7-1200. The S7-1200 G2 CPU uses Motion Control based upon the same technology used by the S7-1500/S7-1500T. In addition, however, the S7-1200 G2 uses a modified Basic Motion Control, which differs from the S7-1200 implementation. For these reasons, you cannot load an S7-1200 project with motion control into an S7-1200 G2 CPU.

There are differences between servo and PTO axes, such as the PLCOpen block layout and error codes. Refer to the PLCOpen standards for more information.

To learn about how Basic Motion Control operates in the S7-1200 G2 CPU, see the S7-1200 G2 Motion Control Function Manual (https://support.industry.siemens.com/cs/us/en/view/109995039).

Migration paths

You must manually port your S7-1200 motion control projects into S7-1200 G2. Consider the following when performing this migration:

- The TOs are different
  - BMC objects are now contained within the folder "Motion PTO" and possess the suffix "_PTO".
  - Only PTO is supported. If you used PTO in your S7-1200 project, choose the relevant "_PTO" block. If you used Analog or PROFIdrive in your S7-1200 project, select the relevant block from the Standard Motion Control library.
  - TO_CommandTable is not supported.
  - Configuration interfaces in STEP 7 differ.
- The MC library is different
  - The "Motion Control" folder now contains both SMC and AMC blocks, while you can find the new BMC blocks in "Motion PTO".
  - You must drop and replace new blocks from the new library.
  - The behavior of most blocks is the same across libraries, though some names have changed.
  - Some MC instructions no longer exist.

You must manually port your S7-1500(T) motion control projects into S7-1200 G2. Consider the following when performing this migration:

- The TOs are different
  - Select the relevant blocks from the S7-1200 G2 Standard Motion Control library to replace those in your S7-1500(T) project using Analog or PROFIdrive.
  - Configuration interfaces in STEP 7 differ. While the functionality of both CPUs is identical, in some instances the S7-1200 G2 supports fewer configuration options.
- The MC library is different
  - You must drop and replace new blocks from the new library.
  - The behavior of most blocks is the same across libraries.
  - Some MC instructions are not available.
- Some tags in the PositioningAxis_PTO TO must be activated in the user program

To active these tags, do the following:

1. Disable the PositioningAxis_PTO TO.
2. Download your new PositioningAxis_PTO configuration.
3. Execute MC_Reset_PTO with Restart = TRUE or transition the PLC from STOP to RUN.

NOTE
This is not a comprehensive list of differences.

NOTE

Compiling errors when copying Basic Motion Control blocks

Whenever you attempt to copy a Basic Motion Control block from an S7-1200 project to an S7-1200 G2 project in STEP 7 and download to your CPU, compiling errors occur. To avoid errors, you should instead first create a new TO_PositioningAxis_PTO in your S7-1200 G2 project before adding Basic Motion Control blocks.

10.6 Additional information

Siemens offers additional support for S7-1200 G2 Motion Control.

See also

You can learn more about Motion Control topics through the TIA Portal Information System.

You can also refer to the family of Motion Control V9.0 manuals available through Siemens Industry Online Support (https://support.industry.siemens.com/cs/us/en/view/109974347).

PID

11

11.1 PID functionality

STEP 7 provides the following PID instructions for the S7-1200 G2 CPU:

- The PID_Compact instruction is used to control technical processes with continuous or PWM input variables.
- The PID_3Step instruction is used to control motor-actuated devices, such as valves that require discrete signals for open- and close actuation or analog signal for specification of the target position.
- The PID_Temp instruction provides a universal PID controller that allows handling of the specific requirements of temperature control.

NOTE

Changes that you make to the PID configuration and download in RUN do not take effect until the CPU transitions from STOP to RUN mode. Changes that you make in the "PID parameters" dialog might not take effect immediately.

All three PID instructions (PID_Compact, PID_3Step, and PID_Temp) can calculate the proportional, integral, and derivative parameters for your controlled system during pretuning. You can also use fine tuning to tune the parameters further. You do not need to manually determine the parameters.

NOTE

Execute the PID instruction at constant intervals of the sampling time, preferably in a cyclic OB. Do not execute the PID instruction in the main program cycle OB, such as OB 1.

The sampling time of the PID algorithm represents the time between two calculations of the output value (control value). The sampling time of the PID algorithm is calculated during self-tuning and rounded to a multiple of the cycle time. All other functions of PID instruction are executed at every call.

PID algorithm

The output value for the PID controller consists of three components:

- P (proportional): When calculated with the "P" component, the output value is proportional to the difference between the setpoint and the process value (input value).
- I (integral): When calculated with the "I" component, the output value increases in proportion to the duration and value of the difference between the setpoint and the process value (input value) to correct the difference.
- D (derivative): When calculated with the "D" component, the output value increases as a function of the rate of change of the difference between the setpoint and the process value (input value). The process value is corrected to the setpoint as quickly as possible.

The PID controller uses the following formula to calculate the output value for the PID_Compact and PID_Temp instructions.

$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

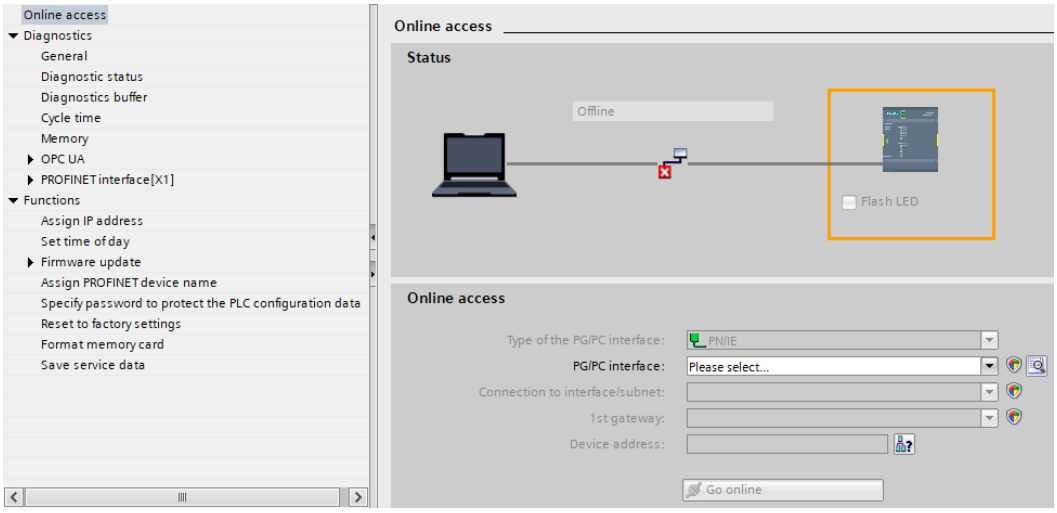
y	Output value	x	Process value
w	Setpoint value	s	Laplace operator
K_p	Proportional gain (P, I, D components)	a	Derivative delay coefficient (D component)
T_I	Integral action time (I component)	b	Proportional action weighting (P component)
T_D	Derivative action time (D component)	c	Derivative action weighting (D component)

The PID controller uses the following formula to calculate the output value for the PID_3Step instruction.

$$\Delta y = K_p \cdot s \cdot \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

y	Output value	x	Process value
w	Setpoint value	s	Laplace operator
K_p	Proportional gain (P, I, D components)	a	Derivative delay coefficient (D component)
T_I	Integral action time (I component)	b	Proportional action weighting (P component)
T_D	Derivative action time (D component)	c	Derivative action weighting (D component)

See also



For a comprehensive explanation of PID functions and instructions, see the "SIMATIC S7-1200, S7-1500 PID control" Function Manual (https://support.industry.siemens.com/cs/us/en/view/108210036), or find more information in the TIA Portal Information System.

Online and diagnostic tools

12

TIA Portal enables you to set diagnostic parameters and modify settings for the online behavior of your S7-1200 G2 CPU by using the tools listed below. You can update firmware, monitor cycle time and memory usage, and monitor or modify values in the CPU, in addition to other valuable functions.

To configure these parameters, select the CPU in the Project tree and select "Online & diagnostics" from the drop-down menu.

Tool	Description
Online access	
Online access	You can establish an online connection between the programming device and CPU for loading programs and project engineering data. For protected CPUs, you must enter either the access level CPU password or a user and user password. User roles and passwords are part of User Management and Access Control (UMAC) (Page 150) in the STEP 7 project.
Diagnostics	
General	Displays general information about the modules in your project.
Diagnostic status	Displays the status of diagnostic processes.
Diagnostics buffer (Page 126)	Use the diagnostics buffer to review the recent activity in the CPU. The diagnostics buffer is accessible from "Online & diagnostics" for an online CPU in the Project tree. It contains the following entries: • Diagnostic events • Changes in the CPU operating mode (transitions to STOP or RUN mode)
Cycle time	You can monitor the cycle time of an online CPU. After connecting to the online CPU, open the Online tools task card to view the relevant measurements.
Memory	You can monitor the memory usage (Page 123) of an online CPU. After connecting to the online CPU, open the Online tools task card to view the relevant measurements.
PROFINET interface	You can use the PROFINET interface to view MAC addresses, IP Addresses, and Port settings.

Tool	Description
OPC UA	You can configure the CPU as an OPC UA server for data access and view the status of the server, as well as diagnostic information about the sessions running on the server.
Functions	
Assign IP address	After accessing "Online & diagnostics" from the Project tree for an online CPU, you can display or change the IP address.
Set time	You can display or set the time and date parameters of the online CPU.
Firmware update	You can update the firmware of a connected CPU from the TIA Portal online and diagnostics tools using one of two methods: • Updating from the CPU in the project • Updating from the accessible devices in the project tree
Assign PROFINET device name	The devices on your PROFINET network must have an assigned name before you can connect with the CPU. Use the "Devices & networks" editor to assign names to your PROFINET devices if the devices have not already been assigned a name, or if the name of the device is to be changed.
Specify password to protect the PLC configuration data	The "Protection of confidential PLC configuration data" feature allows you to protect each CPU in your project individually. From the device configuration, you can enable this protection and set a password for the "protection of confidential PLC configuration data". Clients such as TIA Portal and the SIMATIC Automation Tool can only access the confidential data in the PLC through use of the password. You can also use the security wizard to enable this feature and set the password for the "Protection of confidential PLC configuration data".
Reset to factory settings	You can reset an S7-1200 G2 CPU to its original factory settings under the following conditions: • The CPU has an online connection. • The CPU is in STOP mode. If you reset the CPU to factory defaults, the CPU time will be reset to its default value.
Format memory card	You can format the memory card in a connected CPU from the TIA Portal online and diagnostic tools.
Save service data	In the event of servicing, the SIEMENS Customer Support requires information about the state of a module of your system for diagnostic purposes. If such a case occurs in your system, Customer Support can ask you to save the service data of the module and send the resulting file to them.
Online	
Backup and restore	You can create backups of your CPU configuration and software in the TIA Portal to be restored at a later point. This feature is available through the TIA Portal, the Web server, and the SIMATIC Automation Tool.

You can learn more about the above Tool properties by referring to the related topics in the TIA Portal Information System.

12.1 Status LEDs

The CPU and the I/O modules use LEDs to provide information about the operating state of the CPU and status of the devices.

Status LEDs on a CPU

The CPU provides the following status indicators:

- STOP/RUN
  - Solid yellow indicates STOP mode
  - Solid green indicates RUN mode
  - Flashing (alternating green and yellow) indicates that the CPU is in the STARTUP operating state
- ERROR
  - Flashing red indicates an error, such as an internal error in the CPU, an error with the memory card, or a configuration error (mismatched modules)
  - Flashing red for three seconds indicates a temporary error. An example is if the real-time clock (RTC) resets to the default time due to a power loss. Another example would be the failure of an NFC transaction.
  - Defective state:
    - STOP (ON), ERROR (Blinking), MAINT (Blinking)
- MAINT (Maintenance) is ON whenever maintenance is required, or if the NFC tag is defective while NFC is enabled in Device Configuration.

You can also use the LED instruction to determine the status of the LEDs.

Table 1-197 Status LEDs for a CPU

Description	RUN/STOP Green / Yellow	ERROR Red	MAINT Yellow
CPU power off	Off	Off	Off
CPU power up	Flashing (alternating yellow and green)[1]	Flashing[1]	Flashing[1]
STARTUP state	Flashing (alternating yellow and green)	-	Off
Firmware update in progress	Flashing (yellow)	-	-
Firmware update complete	-	-	Flashing
STOP state	On (yellow)	-	-
RUN state	On (green)	-	-
Missing program memory card (Page 136) (if External Load Memory used)	On (yellow)	Flashing	-
Memory card evaluation	Flashing (yellow)	-	-
Error	On (either yellow or green)	Flashing	-

1 When power is applied to the CPU, all three system-status indicators flash such that ERROR and MAINT are both ON when RUN/STOP is yellow and both OFF when RUN/STOP is green.

2 Cyclically; three seconds Flashing, one second pause.

3 For each NFC transaction failure between CPU and NFC tag, the ERROR LED flashes three times.

Description	RUN/STOP Green / Yellow	ERROR Red	MAINT Yellow
Forced I/O	On (either yellow or green)	-	On
NFC defective, NFC enabled in configuration	On (either yellow or green)	-	On
NFC transaction failure	On (either yellow or green)	Flashing (3x)[3]	-
Defective hardware (Page 319)	On (yellow)	On	Off
LED test or defective CPU firmware (Page 319)	Flashing (alternating yellow and green)	Flashing	Flashing
Unknown or incompatible version of CPU configuration (Page 319)	On (yellow)	Flashing	Flashing
Flash LED (Online access feature to identify CPU)[2]	Flashing (alternating yellow and green)	Flashing	Flashing
Internal Load Memory was erased	Flashing (yellow)	Off	Flashing
Internal Load Memory is empty	Flashing (3 seconds) (yellow)	Off	Flashing (3 seconds)
Low battery powering the real-time clock (2.5 V or less remaining)	-	-	On

1 When power is applied to the CPU, all three system-status indicators flash such that ERROR and MAINT are both ON when RUN/STOP is yellow and both OFF when RUN/STOP is green.

2 Cyclically; three seconds Flashing, one second pause.

3 For each NFC transaction failure between CPU and NFC tag, the ERROR LED flashes three times.

Status LEDs for onboard I/O

Each CPU shall provide an I/O channel indicator for each onboard digital input and output, according to the table below:

Description	Digital I/O Channel (Green)
CPU power off	Off
Input or output point is Off	Off
Input or output point is On	On

Status LEDs for communication on the CPU

The CPU also provides two LEDs that indicate the status of the PROFINET communications. These LEDs are visible from the top of the CPU near the PROFINET connectors. Each PROFINET port has one LED which behaves according to the table below:

Description	PROFINET port (Green)
CPU power off	Off
Link down (no connection established)	Off
Link up (connection established)	On
Communication activity	Flashing

Status LEDs on a Signal Module (SM) and a Signal Board (SB)

Each digital or analog SM/SB provides a DIAG LED that indicates the status of the module or board:

- Green indicates that the module or board is operational
- Red indicates that the module or board is defective or non-operational

Each digital module or board provides an I/O Channel LED for each of the digital inputs and outputs.

- Green indicates the channel is ON
- OFF indicates the channel is OFF

Each analog module or board provides an I/O Channel LED for each of the analog inputs and outputs.

- Green indicates that the channel has been configured and is active
- Red indicates an error condition of the individual analog input or output

Each analog SB/SM provides an I/O Channel LED for each of the analog inputs and outputs, according to the following table:

Table 1-198 Status LEDs for an analog signal board (SB) or analog signal module (SM)

Description	DIAG (Green/Red)	Analog I/O Channel (Green/Red)
I/O bus power off, user power either on or off	Off	Off
I/O bus power on, user power off		
• Power fault diagnostic is enabled	Flashing (red)	Off
• Power fault diagnostic is disabled	On (green)	On (green)
STARTUP, but not yet logged into the CPU	Flashing (red)	Off
Logged in, but not yet configured	Flashing (green)	Off
Module configured with no errors	On (green)	On (green), all enabled channels
Error[1] [2]		

[1] Flashing the LED is only possible when the firmware is operational.

[2] The red DIAG LED acts like a summary fault indication which includes module errors and channel errors with channel diagnostics enabled.

Description	DIAG (Green/Red)	Analog I/O Channel (Green/Red)
• Module error	Flashing (red)	Flashing (red), all channels
• Channel error with channel diagnostic enabled	Flashing (red)	Flashing (red), affected channel
• Channel error with channel diagnostic disabled	On (green)	On (green), affected channel
Firmware update is running	Flashing (green)	Off

[1] Flashing the LED is only possible when the firmware is operational.

[2] The red DIAG LED acts like a summary fault indication which includes module errors and channel errors with channel diagnostics enabled.

Each digital SB/SM provides an I/O Channel LED for each of the digital inputs and outputs, according to the following table:

Table 1-199 Status LEDs for a digital signal board (SB) or digital signal module (SM)

Description	DIAG (Green/Red)	Digital I/O Channel (Green)
I/O bus power off, user power either on or off	Off	Off
I/O bus power on, user power off		
• Power fault diagnostic is enabled	Flashing (red)	Off
• Power fault diagnostic is disabled	On (green)	Off
STARTUP, but not yet logged into the CPU	Flashing (red)	Off
Logged in, but not yet configured	Flashing (green)	Off
Module configured with no errors		
• Input or output point is Off	On (green)	Off
• Input or output point is On	On (green)	On
Error	Flashing (red)	Off
Firmware update is running	Flashing (green)	Off

Serial communications indicators on a Communication Module (CM)/Communication Board (CB)

Each serial communications CM/CB provides a single DIAG indicator (green/red), plus a TxD transmit (yellow) and a RxD receive (yellow) indicator, according to the following table:

Description	DIAG Green / Red	TxD (yellow)	RxD (yellow)
I/O bus power off	Off	Off	Off
STARTUP, but not yet logged into CPU	Flashing (red)	-	-
Logged in, but not yet configured	Flashing (green)	-	-

Description	DIAG Green / Red	TxD (yellow)	RxD (yellow)
Module configured with no errors • Transmit data in process • Receive data in process	On (green)	On -	- On
Error	Flashing (red)	-	-
Firmware update is running	Flashing (green)	Off	Off

Battery Board (BB) indicator

The battery board provides a single DIAG indicator (green/red), according to the following table:

Description	DIAG Green / Red
CPU power off	Off
STARTUP, but not yet logged into CPU	Flashing (red)
Logged in, but not yet configured	Flashing (green)
Configured with no errors	On (green)
Error: voltage detected to be below the allowed threshold	Flashing (red)

12.2 CPU error behavior

"Unknown or incompatible version of CPU configuration" error

The diagnostics buffer can report an "Unknown or incompatible version of CPU configuration" error, which can occur in one of the following ways:

- Attempting to load an invalid project.
- Attempting to download a project with different protection of confidential PLC configuration data (Page 313) between the CPU and the project

If you reached this state by using an invalid version transfer card (Page 139), follow these steps to recover:

1. Remove the transfer card.
2. Perform a STOP to RUN transition.
3. Reset the memory (MRES) or cycle power.

If you reach this state by using an invalid project on a program card (Page 141), reset the CPU to factory settings (Page 313) using the "Format memory card" option .

If your reach this state from a mismatch between the CPU and the project for the protection of confidential PLC configuration data, use the Online & Diagnostics tools (Page 313) to set the online CPU's password for protection of confidential PLC configuration data to the password in the project, or delete it from the online CPU.

After you recover the CPU from the error condition, you can download a valid program.

S7-1200 G2 behavior following a fatal error

If the CPU firmware detects a fatal error, it attempts a defect-mode restart, and if successful, signals the defective mode by continually flashing the STOP/RUN, ERROR and MAINT LEDs.

If the CPU successfully completes the defect-mode restart, the CPU performs these actions:

- Sets the CPU and signal board outputs to the configured value
- Sets the outputs of local rack signal modules and distributed I/O to the selection for "Reaction to CPU STOP" in the device configuration of the digital outputs of the module

If the defect-mode restart fails, (for example, due to a hardware fault), the STOP and ERROR LEDs are ON and the MAINT LED is OFF.

⚠ WARNING

Operation in defect state cannot be guaranteed
Control devices can fail in an unsafe condition, resulting in unexpected operation of controlled equipment.
Use an emergency stop function, electromechanical overrides or other redundant safeguards that are independent of the PLC.
Such unexpected operations can result in death or serious injury to personnel, and/or damage to equipment.

12.3 Analog module diagnostics

Analog modules have multiple diagnostics depending on the module and channel type. You can separately enable or disable these diagnostics for each module and channel by using the TIA Portal under the project's device configuration/general properties of the module.

Power supply errors are reported as follows:

Power supply error	Error reported
Analog module with a power supply diagnostic error reports:	Overflow: 32767 for all input channels
	Missing power supply diagnostic, if enabled for output modules

You can enable these diagnostics separately by channel and type for each channel. See the table below:

Channel type	Error reported
Voltage input	Overflow: 32767
	Underflow: -32768
Current input (0 to 20 mA)	Overflow: 32767
	Underflow: -32768
Current input (4 to 20 mA) (for < 1.185 mA input)	Broken wire: 32767
	Overflow: 32767
Voltage output (for > 0.5 V output)	Short circuit diagnostic, if enabled
Current output (for > 1.0 mA output)	Open circuit diagnostic, if enabled
RTD input	Broken wire: 32767
	Overflow: 32767
	Underflow: -32768

Channel type	Error reported
Resistor input	Broken wire: 32767
	Overflow: 32767
Thermocouple input	Broken wire: 32767
	Overflow: 32767
	Underflow: -32768

An analog input module with a diagnostic error on any channel reports 32767 or -32768 on that channel even if the diagnostics is not enabled. Analog input channels report 32767 when deactivated.

12.4 Comparing offline and online CPUs

You can compare the code blocks in an online CPU with the code blocks in your project. If the code blocks of your project do not match the code blocks of the online CPU, the "Compare" editor allows you to synchronize your project with the online CPU by downloading the code blocks of your project to the CPU, or by deleting blocks from the project that do not exist in the online CPU.

NOTE

Read access required on protected CPU for the Offline/Online compare operations
For TIA Portal, the "HMI access" security level is insufficient to perform the Offline/Online compare operations. You must have "Read access" or "Full access", to do Offline/Online compare operations.
See also Protection & Security in CPU properties (Page 158).

You can learn more about comparing offline/online CPUs, as well as their related topologies in your network, by referring to the TIA Portal Information System.

12.5 Monitoring and modifying values in the CPU

12.5.1 Overview of the online monitoring and modification tools

TIA Portal provides online tools for monitoring the CPU:

- You can display or monitor the current values of the tags. The monitoring function does not change the program sequence. It presents you with information about the program sequence and the data of the program in the CPU.
- You can also use other functions to control the sequence and the data of the user program:
  - You can modify the value for the tags in the online CPU to see how the user program responds.
  - You can force a peripheral output (such as Q0.1:P or "Start":P) to a specific value.

NOTE

Always exercise caution when using control functions. These functions can influence the execution of the user/system program.

Table 1-200 Online capabilities of the TIA Portal editors

Editor	Monitor	Modify	Force
Watch table	Yes	Yes	No
Force table	Yes	No	Yes
Program editor	Yes	Yes	No
Tag table	Yes	No	No
DB editor	Yes	Yes	No

You can learn more about online tools for monitoring the CPU by referring to the related topics in the TIA Portal Information System.

12.5.2 Watch tables for monitoring the user program

A watch table allows you to perform monitoring and control functions on data points as the CPU executes your program. These data points can be process image (I or Q), M, DB or physical inputs (I_:P), depending on the monitor or control function. You cannot accurately monitor the physical outputs (Q_:P) because the monitor function can only display the last value written from Q memory and does not read the actual value from the physical outputs.

The monitoring function does not change the program sequence. It presents you with information about the program sequence and the data of the program in the CPU.

Control functions enable the user to control the sequence and the data of the program. You must exercise caution when using control functions. These functions can influence the execution of the user/system program. The two control functions are Modify and Force.

With the watch table, you can perform the following online functions:

- Monitoring the status of the tags
- Modifying values for the individual tags

You can learn more about using a watch table for monitoring and modifying values in the CPU by referring to the related topics in the TIA Portal Information System.

12.5.3 Using the force table

A force table provides a "force" function that overwrites the value for an input or output point to a specified value for the peripheral input or peripheral output address. The CPU applies this forced value to the input process image prior to the execution of the user program and to the output process image before the outputs are written to the modules.

You can learn more about forcing values in the CPU with the Force function by referring to the related topics in the TIA Portal Information System.

12.6 Downloading in RUN mode

12.6.1 Overview

The CPU supports "Download in RUN mode". This capability allows you to download program changes while the program is running.

⚠ WARNING

Risks when downloading in RUN mode
When you download changes to the CPU in RUN mode, the changes immediately affect process operation. Changing the program in RUN mode can result in unexpected system operation.
Only authorized personnel who understand the effects of RUN mode changes on system operation should perform a download in RUN mode.
Unexpected system operation can cause death or serious injury to personnel, and/or damage to equipment.

The "Download in RUN mode" feature allows you to make changes to a program and download them to your CPU without switching to STOP mode:

- You can make minor changes to your current process without having to shut down (for example, change a parameter value).
- You can debug a program more quickly with this feature (for example, invert the logic for a normally open or normally closed switch).

You can make the following program block and tag changes and download them in RUN mode:

- Create, overwrite, and delete Functions (FC), Function Blocks (FB), and Tag tables.
- Create, delete, and overwrite Data Blocks (DB) and instance data blocks for Function Blocks (FB). You can add to DB structures and download them in RUN mode. The CPU can maintain the values of existing block tags and initialize the new data block tags to their initial values, or the CPU can set all data block tags to initial values, depending on your configuration settings.
- Create, overwrite, modify, and delete Organization Blocks (OB).

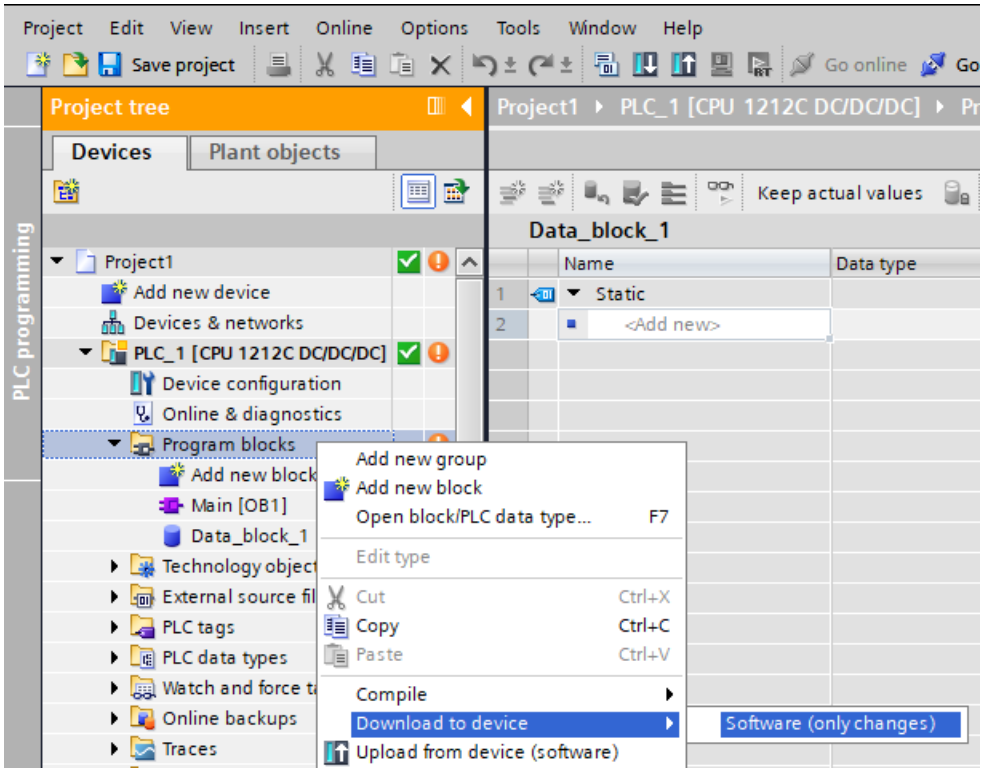
You can download a maximum number of 20 blocks in RUN mode at one time. If you need to download more than 20 blocks, you must place the CPU in STOP mode.

If you download changes to a running process, you must think through the possible safety consequences to machines and machine operators before you download.

NOTE

If the CPU is in RUN mode and program changes have been made, TIA Portal always tries to download in RUN first. If you do not want this to happen, you must put the CPU into STOP.
If the changes made are not supported in "Download in RUN", TIA Portal prompts you that the CPU must go to STOP.

12.6.2 Prerequisites for "Download in RUN mode"



To be able to download your program changes to a CPU that is in RUN mode, you must meet these prerequisites:

- Your program blocks must compile successfully.
- You must have successfully established communication between the CPU and the programming device.

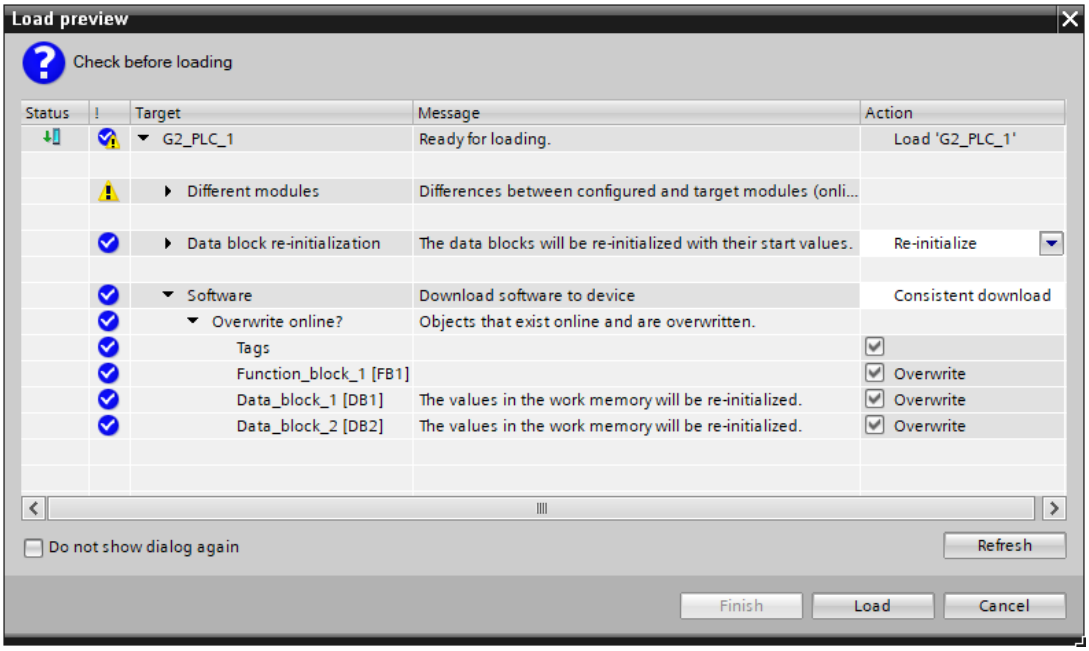
12.6.3 Changing your program in RUN mode

To change the program in RUN mode, you must first ensure that the CPU and program meet the prerequisites (Page 324), and then follow these steps:

1. To download your program in RUN mode, select one of the following methods:
   - Select the "Download to device" command from the "Online" menu.
   - Click the "Download to device" button in the toolbar.
   - In the "Project tree", right-click "Program blocks" and select the "Download to device > Software (only changes)" command.

   If the program compiles successfully, TIA Portal starts to download the program to the CPU. You might be prompted for choices about synchronization.
2. When TIA Portal prompts you to load your program or cancel the operation, click "Load" to download the program to the CPU.

12.6.4 Downloading selected blocks



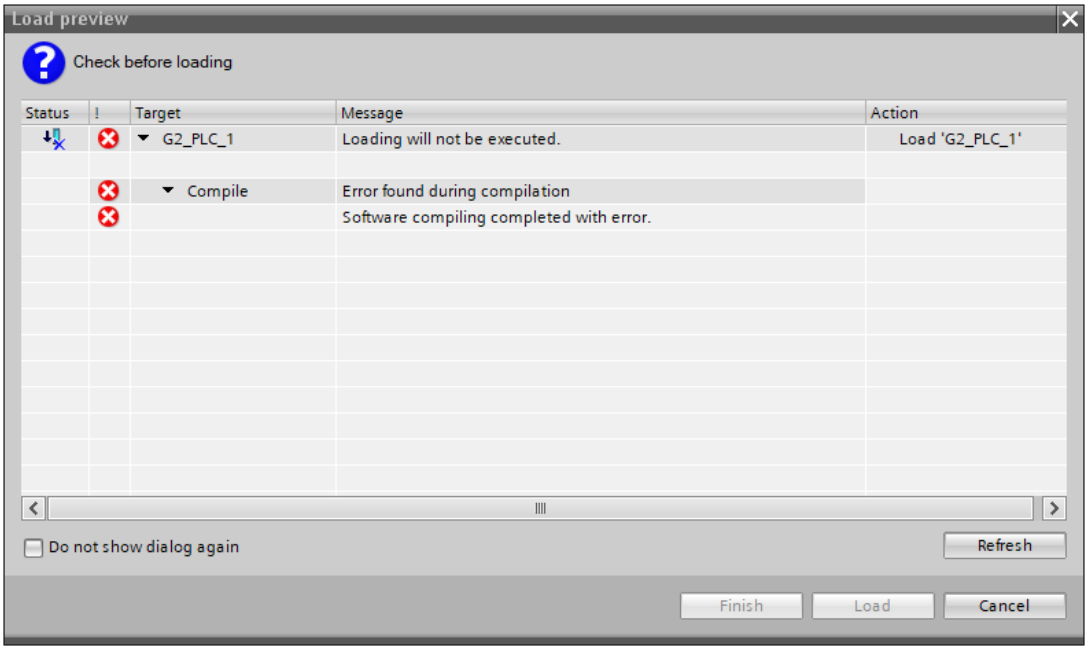
From the Program blocks folder, you can select a single block or a selection of blocks for downloading.

If you select a single block for downloading, then the only option in the "Action" column is "Consistent download".

You can expand the category line to be sure what blocks are to be loaded. In this example, a small change was made to the offline block, and no other blocks need to be loaded.

In this example, more than one block is needed for downloading.

NOTE



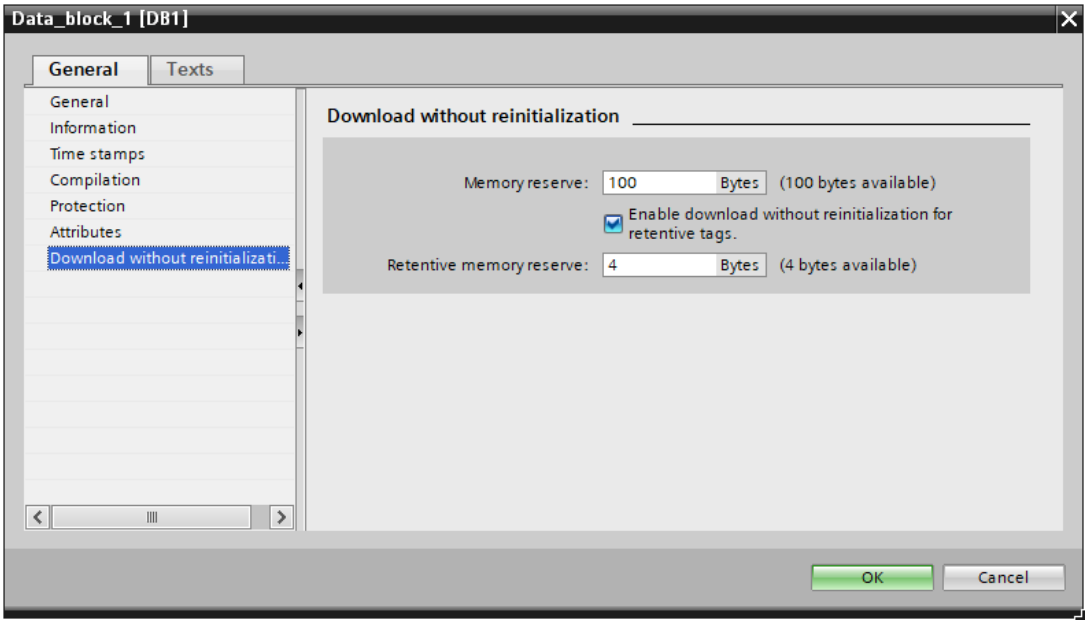
You can download a maximum number of 20 blocks in RUN mode at one time. If you need to download more than 20 blocks, you must place the CPU in STOP mode.

If you attempt to download in RUN, but the system detects that this is not possible, you must put the CPU in STOP mode.

Click the "Load" button, and the "Load results" dialog appears. Click the "Finish" button to complete the download.

12.6.5 Downloading a single selected block with a compile error in another block

If you attempt a consistent download with a compile error in another block, then the dialog indicates an error, and the load button is disabled.



You must correct the compile error in the other block. Then, the "Load" button becomes active.

12.6.6 Modifying and downloading existing tags in RUN mode

The Download in Run feature allows you to add and modify tags in data blocks and function blocks and then download the changed block to the CPU in RUN mode.

Download without reinitialization

Each DB and FB has an amount of reserved memory, which you can use for adding tags to the block that you can subsequently download in RUN mode. By default, the initial size of the memory reserve is 100 bytes. You can add additional tags to your data up to the size of the memory reserve and download the extended block to the CPU in RUN mode. You can also increase the memory reserve if you need more memory for additional tags in your block. If you add more tags than the amount of memory you have allocated, you cannot download the extended block to the CPU in RUN mode.

The "Download without reinitialization" feature allows you to extend a data block by adding more data block tags and download the extended data block in RUN mode. In this way, you can add tags to a data block and download it without reinitializing your program. The CPU retains the values of the existing data block tags and initializes the newly-added tags to their start values.

To enable this function for an online project with a CPU in RUN mode, follow these steps:

1. From the Program blocks folder in the TIA Portal project tree, right-click the block and select "Properties".
2. Click "Download without reinitialization" and select the "Enable download without reinitialization for retentive tags" checkbox in the block editor to enable the function.
3. Click "OK" on the prompt to confirm your choice.
4. Add tags to the block interface and download the block in RUN mode. You can add and download as many new tags as your memory reserve allows.

If you have added more bytes to your block than you have configured for the memory reserve, TIA Portal displays an error when you attempt to download the block in RUN mode. You must edit the block properties to increase the amount. You cannot delete existing entries or modify the “Memory reserve” of the block while the “Download without reinitialization”

function is enabled. To disable the "Download without reinitialization" function, follow these steps:

1. From the Program blocks folder in the TIA Portal project tree, right-click the block and select "Properties".
2. Click "Download without reinitialization" and de-select the "Enable download without reinitialization for retentive tags" checkbox in the block editor to disable the function.
3. Click "OK" on the prompt to confirm your choice.
4. Download the block. On the download dialog, you must select "reinitialize" in order to download the extended block.

The download then reinitializes all existing and new block tags to their start values.

Downloading retentive block tags

Downloading retentive block tags in RUN mode requires the allocation of a retentive memory reserve. To configure this retentive memory reserve, follow these steps:

1. From the Program blocks folder in the TIA Portal project tree, right-click the block and select "Properties" from the context menu.
2. Select the "Download without reinitialization" property.
3. Select the check box for "Enable download without reinitialization for retentive tags".
4. Configure the number of bytes available for the retentive memory reserve.
5. Click "OK" to save your changes.
6. Add retentive data block tags to the data block and download the data block in RUN mode.

To add and download as many new retentive data block tags as your retentive memory reserve allows, click "Activate memory reserve" on the toolbar. For more information, refer to "Basic information on loading block extensions without reinitialization" in the TIA Portal Information System.

If you have added more retentive bytes to your data block than you have configured for the retentive memory reserve, TIA Portal displays an error when you attempt to download the block in RUN mode. You can only add retentive block tags up to the retentive memory reserve in order to be able to download them in RUN mode.

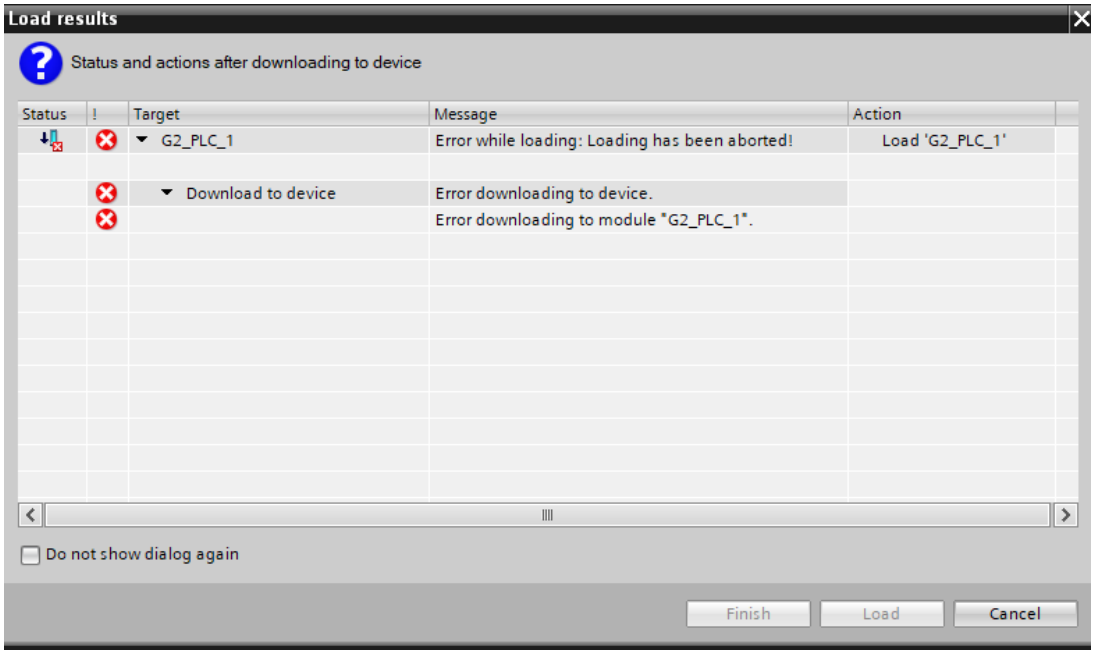
When you download the extended retentive block tags, the tags contain their current values.

Configuring amount of reserved memory for new blocks

The default memory reserve size for new data blocks is 100 bytes. When you create a new block, it has 100 bytes available in reserve. If you want the memory reserve size to be different for new blocks, you can change the setting in the PLC programming settings:

1. From TIA Portal, select the **Options > Settings** menu command.
2. From the Settings dialog, expand "PLC programming" and select "General".
3. In the "Download without reinitialization" section, enter the number of bytes for the memory reserve.

When you create new blocks, TIA Portal uses the memory reserve configuration that you entered for the new blocks.



Restrictions

The following restrictions apply to editing and downloading blocks in RUN mode:

- Extending the block interface by adding new tags and downloading in RUN mode is only available for optimized blocks.
- You cannot change the structure of a block and download the changed block in RUN mode without reinitializing. Adding new members to a Struct tag, changing tag names, array sizes, data types, or retentive status all require that you reinitialize the block if you download it in RUN mode. The only modifications to existing block tags that you can perform and still download the block in RUN mode without reinitialization are changes to start values (data blocks), default values (function blocks) or comments.
- You cannot download more new block tags in RUN mode than the memory reserve can accommodate.
- You cannot download more new retentive block tags in RUN mode than the retentive memory reserve can accommodate.

12.6.7 System reaction if the download process fails

During the initial Download in RUN operation, if a network connection failure occurs, STEP 7 displays the following "Load results" dialog:

12.6.8 Considerations when downloading in RUN mode

Before downloading the program in RUN mode, consider the effect of a RUN-mode modification on the operation of the CPU for the following situations:

- If you deleted the control logic for an output, the CPU maintains the last state of the output until the next power cycle or transition to STOP mode.
- If you deleted a high-speed counter or pulse output functions which were running, the high-speed counter or pulse output continues to run until the next power cycle or transition to STOP mode.

- Any logic that is conditional on the state of the first scan bit will not be executed until the next power cycle or transition from STOP to RUN mode. The first scan bit is set only by the transition to RUN mode and is not affected by a download in RUN mode.
- The current values of data blocks (DBs) and/or tags can be overwritten.

Requirements

Before you can download your program in RUN mode, the program must compile with no errors, and the communication between TIA Portal and the CPU must be error-free.

You can make the following changes in program blocks and tags and download them in RUN mode:

- Create, overwrite, and delete Functions (FCs), Function Blocks (FBs), and Tag tables.
- Create and delete Data Blocks (DBs); however, DB structure changes cannot be overwritten. Initial DB values can be overwritten. You cannot download a Web server DB (control or fragment) in RUN mode.
- Create, overwrite, and delete Organization Blocks (OBs).

You can download a maximum number of 20 blocks in RUN mode at one time. If you need to download more than 20 blocks, you must place the CPU in STOP mode.

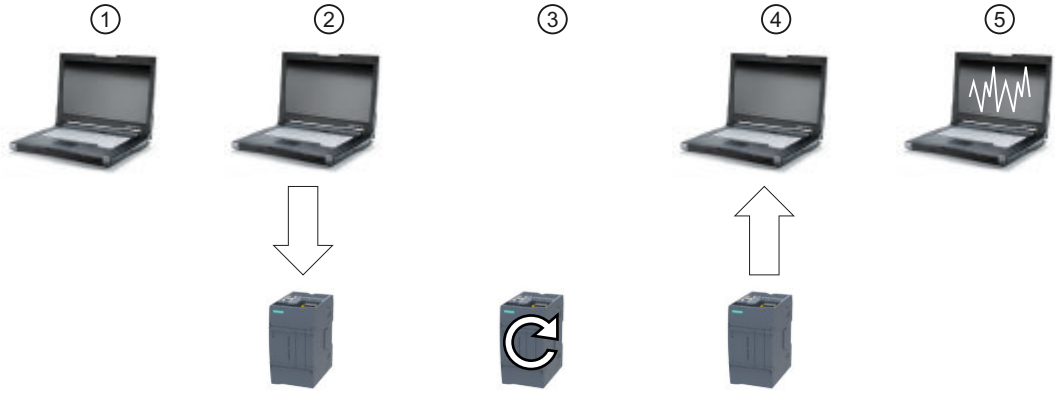
Once you initiate a download, you cannot perform other tasks in TIA Portal until the download completes.

Instructions that might fail due to "Download in RUN mode"

The following instructions might experience a temporary error when download in RUN mode changes are being activated in the CPU. The error occurs when the instruction is initiated while the CPU is preparing to activate the downloaded changes. During this time, the CPU suspends initiation of user-program access to the Load Memory, while it completes in-progress user program access to Load Memory. This is done so that downloaded changes can be activated consistently.

Instruction	Response while Activation is Pending
DataLogCreate	STATUS = W#16#80C0, ERROR = TRUE
DataLogOpen	STATUS = W#16#80C0, ERROR = TRUE
DataLogWrite	STATUS = W#16#80C0, ERROR = TRUE
DataLogClose	STATUS = W#16#80C0, ERROR = TRUE
DataLogNewFile	STATUS = W#16#80C0, ERROR = TRUE
DataLogClear	STATUS = W#16#80C0, ERROR = TRUE
DataLogDelete	STATUS = W#16#80C0, ERROR = TRUE
READ_DBL	RET_VAL = W#16#82C0
WRIT_DBL	RET_VAL = W#16#82C0
CREATE_DB	RET_VAL = W#16#80C0
DELETE_DB	RET_VAL = W#16#80C0
RTM	RET_VAL = W#16#80C0

In all cases the RLO output from the instruction will be false when the error occurs. The error is temporary. If it occurs, the instruction should be retried later.



If one of the above instructions fails to execute because a download in RUN mode was in process, retry the failed instruction in a subsequent execution of that OB. If you retry the instruction in the same OB execution, it will fail.

12.7 Tracing and recording CPU data on trigger conditions

TIA Portal provides trace and logic analyzer functions with which you can configure variables for the PLC to trace and record. You can then upload the recorded trace measurement data to your programming device and use TIA Portal tools to analyze, manage, and graph your data. You use the Traces folder in the TIA Portal project tree to create and manage traces.

NOTE
The trace measurement data is available only within the TIA Portal project and is not available for processing by other tools.

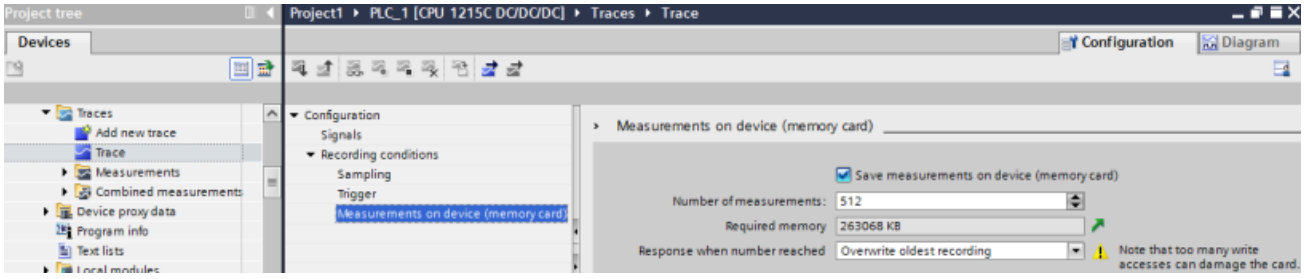
The following figure shows the various steps of the trace feature:

① Configure the trace in the trace editor of TIA Portal You can configure the following options:
- Data values to record
- Recording duration
- Recording frequency
- Trigger condition

② Transfer the trace configuration from TIA Portal to the PLC.

③ The PLC executes the program, and when the trigger condition occurs, begins recording the trace data.

④ Transfer the recorded values from the PLC to TIA Portal.



⑤ Use the tools in TIA Portal to analyze, graphically display, and save the data.

The S7-1200 G2 supports four trace jobs with a maximum of 16 variables captured per trigger event. Each trace job provides 512 Kbytes of RAM for the recording of trace values and associated overhead, for example variable addresses and time stamps.

Saving trace measurements to the memory card

The S7-1200 G2 CPU can only save trace measurements to the SIMATIC memory card. If you do not have a memory card in your CPU, the CPU will log a diagnostics buffer entry if the program attempts to save trace measurements. The CPU limits the space allocated to trace measurements such that 1 MB of external load memory must always be available. If a trace measurement would require more memory than the maximum allowance, the CPU will not save the measurement and will log a diagnostics buffer entry.

In addition, if you select "Overwrite oldest recording" in TIA Portal, the continual writing can reduce the lifetime of load memory. When you select "Overwrite oldest recording", the CPU replaces the oldest measurement with the newest measurement after it has stored the configured number of trace measurements, and continues tracing and saving measurements. Overwriting the oldest measurements is useful in capturing intermittent problems.

The CPU supports a maximum of 1000 trace measurement results. During the time that the CPU is saving the trace measurements to external load memory, the CPU does not check the trigger condition for the trace job. Once the CPU finishes saving the trace measurements, the CPU resumes checking for trigger conditions.

Access to examples

See the TIA Portal Information System for details about how to program a trace, how to download the configuration, upload the trace data, and display the data in the logic analyzer. You can find detailed examples there in the "Using the trace and logic analyzer function (https://docs.tia.siemens.cloud/access?ft:originId=./29275874699/29275874699_enUS.htm&ft:clusterId./29275874699/29275874699.htm)" chapter.

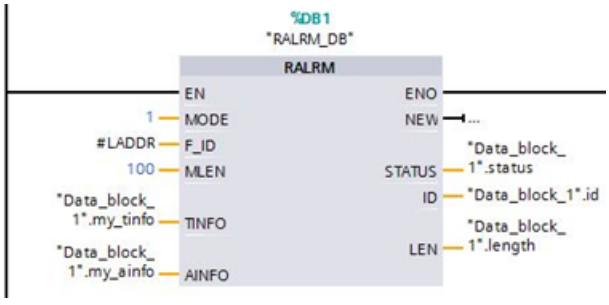
In addition, the online manual "Industry Automation SINAMICS/SIMATIC Using the trace and logic analyzer function" (https://support.industry.siemens.com/cs/us/en/view/64897128) is an excellent reference.

12.8 Determining the type of error from an analog module

As described in the topic Analog module diagnostics (Page 320), an analog module returns an analog input value of 32767 (16#7FFF) for both a wire break condition and an overflow condition. These conditions apply to the channel only and not to the module. If you want to determine which of these two conditions occurred, you can include logic in your STEP 7 program to make the determination. The method to determine the condition type consists of these tasks:

- Create a Diagnostic error interrupt OB to be called whenever there is an incoming or outgoing diagnostic event.
- Include a call to the RALRM instruction.
- Set up an array of bytes for the AINFO parameter, which includes the information about the condition type.
- Evaluate bytes 32 and 33 of the AINFO structure of the RALRM_DB when the CPU triggers the Diagnostic Interrupt OB..

Creating a Diagnostic error interrupt OB



To be able to determine when a wire break condition occurs, create a Diagnostic error interrupt OB. The CPU calls this OB whenever an incoming or outgoing diagnostic event occurs.

When the CPU calls the Diagnostic error interrupt OB, the input parameter LADDR will contain the hardware identifier for the module with the error. You can find the hardware identifier for the SM 1231 module in the STEP 7 device configuration for the SM 1231 module.

Calling the RALRM instruction

To program the RALRM instruction call, follow these steps:

1. Add a call to RALRM in your STEP 7 program.
2. Set the F_ID input parameter to the hardware identifier in the LADDR parameter of the Diagnostic error interrupt OB.
3. Use an array of bytes for the TINFO and AINFO input parameters. Use an array size of 34 bytes or greater.

Interpreting AINFO after a diagnostic interrupt has occurred

The AINFO byte array will contain the information about the module diagnostics after the Diagnostic error interrupt OB executes.

Bytes 0 - 25 are header information. The bytes pertaining to the module diagnostic are as follows:

Byte	Description	
26 and 27	Word value 16#8000 - indicates the diagnostic is a PROFINET style diagnostic	
28 and 29	Word containing channel number responsible for this diagnostic	
30	Bit pattern aaabb000 that indicates the type of channel (aaa) and type of error (bb)	
	aaa	bb
	000: reserved	00: reserved
	001: input channel	01: incoming error
	010: output channel	10: outgoing error
	011: input/output channel	11: outgoing error, other errors present
31	Indication of data format 0: Free data format 1: Bit 2: Two bits 3: Four bits 4: Byte 5: Word (two bytes) 6: Double word (four bytes) 7: Two double words (eight bytes)	
32 and 33	Word that defines the type of error: 16#0000: reserved 16#0001: short circuit 16#0002: undervoltage 16#0003: overvoltage 16#0004: overload 16#0005: over temperature 16#0006: wire break 16#0007: high limit exceeded 16#0008: low limit exceeded 16#0009: error	

For example, consider bytes 26 - 33 of this AINFO structure:

29		my_ainfo[26]	Byte	16#0	16#80
30		my_ainfo[27]	Byte	16#0	16#00
31		my_ainfo[28]	Byte	16#0	16#00
32		my_ainfo[29]	Byte	16#0	16#00
33		my_ainfo[30]	Byte	16#0	16#28
34		my_ainfo[31]	Byte	16#0	16#05
35		my_ainfo[32]	Byte	16#0	16#00
36		my_ainfo[33]	Byte	16#0	16#07

- The Word at bytes 26 and 27 is 16#8000, which indicates that this is a PROFINET style diagnostic.
- The Word at bytes 28 and 29 indicates this is a diagnostic for channel 0 or the module.
- Byte 30 is 16#28, which when interpreted as the bit pattern aaa bb 00 is 001 01 000. This value indicates that this diagnostic is for an input channel and is an incoming error.
- Byte 31 is 5, which indicates a Word value
- The word value at bytes 32 and 33 is 16#0007, which indicates high limit exceeded.

By capturing the AINFO information from a Diagnostic error interrupt event, you can thus determine the nature of the diagnostic event.

12.9 Backup and restore options

You can create a backup of your CPU. You can then restore this backup file to the CPU or to another CPU. You can find the backups in the project tree under the CPU in the "Online backups" folder.

Scope of the backup

The backup file contains the following:

- Contents of the memory card, if present
- Retentive memory areas (for example, data blocks, counters, and bit memory)
- Other retentive memory contents, such as IP address parameters

The backup is performed with the current values of the CPU. Entries in the diagnostics buffer are not included in the backup, and neither is the current time.

The backup does not contain the password to protect confidential PLC configuration data.

Backup and restore operations

STEP 7 and the S7-1200 G2 CPU offer the following options for backing up and restoring the hardware configuration and software:

- Snapshot of the actual values
- Upload from device (software)
- Upload device as new station (hardware and software)
- Backup from online device

To learn more about options for backing up and restoring your CPU, refer to the following:

- The topic "Creating a backup of an S7 CPU (https://docs.tia.siemens.cloud/access?ft:originId=ProgOnlineBackupenUS_20.00.00.00_release&ft:clusterIdProgOnlineBackup)" in the TIA Portal Information System
- The S7-1500/ET 200, SIMATIC Drive Controller Web server (https://support.industry.siemens.com/cs/ww/en/view/109977246) function manual
- The SIMATIC Automation Tool user guide (https://support.industry.siemens.com/cs/us/en/view/109986787)

Technical specifications

A

A.1 General technical specifications

Standards compliance

The S7-1200 G2 automation system design conforms with the following standards and test specifications. The test criteria for the S7-1200 G2 automation system are based on these standards and test specifications.

NOTE

Some S7-1200 G2 devices are not certified to all the following standards, and certification status can change without notice. Most certification approval markings are listed on the device or packaging. You are responsible for determining whether the devices in your system meet the required certifications for your application. For additional information on the certifications of a specific device, consult with a local Siemens representative or visit the Siemens Industry Online Support Web site (https://sieportal.siemens.com/en-ww/support). Device certificates can be downloaded from the Siemens Industry Online Support Web site.

CE approval

CE

The S7-1200 G2 automation system satisfies requirements and safety related objectives according to the EC directives listed below, and conforms to the harmonized European standards (EN) for the programmable controllers listed in the Official Journals of the European Community.

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2014/53/EU "Radio Equipment" (RED Directive)
- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (ATEX Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
- 2006/42/EC "Machinery Directive" for S7-1200 G2 F-CPU, F-SM, and F-SB modules

EU declarations of conformity for the respective authorities are available from:

Siemens AG
Digital Industries
Factory Automation
P.O. Box 1963
D-92209 Amberg

The EU declarations of conformity are also available for download from the Siemens Industry Online Support Web site (https://sieportal.siemens.com/en-ww/support), under the keyword “Declaration of Conformity”.

Radio Equipment Directive (RED) compliance

The S7-1200 G2 automation system complies with the Radio Equipment Directive (RED) 2014/53/EU. The RED defines NFC tags as radio equipment. The frequency 13.56 MHz is regulated under ETSI EN 300 330 v2.1.1.

UK Conformity Assessed marking

The S7-1200 G2 automation system complies with the designated British standards (BS) for programmable controllers published in the official consolidated list of the British Government. The S7-1200 G2 automation system meets the requirements and protection targets of the following regulations and related amendments:

- Electromagnetic Compatibility Regulations 2016 (EMC)
- Radio Equipment Regulations 2017
- Equipment and Protective Systems Intended for use in Potentially Explosive Atmospheres Regulations 2016 (ATEX)
- Regulations on the restriction of the use of certain hazardous substances in electrical and electronic equipment 2012 (RoHS)
- Supply of Machinery (Safety) Regulations 2008 for S7-1200 G2 F-CPU, F-SM, and F-SB modules

UK Declarations of Conformity for the respective authorities are available from:

Siemens AG
Digital Industries
Factory Automation
P.O. Box 1963
D-92209 Amberg

The UK Declaration of Conformity is also available for download from the Siemens Industry Online Support Web site (https://sieportal.siemens.com/en-ww/support) under the keyword "Declaration of Conformity".

cULus approval

Underwriters Laboratories Inc. complying with:

- Underwriters Laboratories, Inc.: UL 61010-1, Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use; Part 1: General Requirements and UL 61010-2-201, Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-201: Particular Requirements for Control Equipment.
- Canadian Standards Association: CAN/CSA-C22.2 No. 61010-1-12, Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 1: General Requirements and CSA C22.2 No. 61010-2-201, Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-201: Particular Requirements for Control Equipment.

NOTE

The SIMATIC S7-1200 G2 series meets the CSA standard.
The cULus logo indicates that the S7-1200 G2 has been examined and certified by Underwriters Laboratories (UL) to the standards referenced above.

cULus HAZ. LOC. approval

Underwriters Laboratories Inc. in accordance with:

- UL 121201
- CAN/CSA C22.2 No. 213 (Hazardous Location) APPROVED for use in Class I, Division 2, Group A, B, C, D T4C; Class I, Zone 2, Group IIC T4 Installation Instructions for cULus haz.loc.
- WARNING – Explosion Hazard – Do not disconnect while circuit is live unless area is known to be non-hazardous.
- WARNING – Explosion Hazard – Substitution of components can impair suitability for Class I, Division 2 or Zone 2.
- This equipment is suitable for use in Class I, Division 2, Groups A, B, C, D; Class I, Zone 2, Group IIC; or non-hazardous locations.

IMPORTANT EXCEPTION: Some models are de-rated for Ta = 60 °C. See the Technical Specifications of each device for derating information.

ATEX approval

According to EN 60079-7 (Electrical apparatus for potentially explosive atmospheres – Part 7: Increased safety “e”), EN IEC 60079-0 (Electrical apparatus for potentially explosive gas atmospheres – Part 0: General requirements), and IEC 60079-15 (Electrical apparatus for potentially explosive atmospheres - Part 15: Equipment protection by type of protection "n").

II 3 G Ex ec IIC T4 Gc (some models are II 3 G Ex ec nC IIC T4 Gc, see product marking) (Page 347)

UL 24 ATEX 3237X

Special conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in EN 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with EN 60079-7.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

IECEx approval

According to IEC 60079-7 (Explosive atmospheres – Part 7: Equipment protection by increased safety "e"), IEC 60079-0 (Explosive atmospheres – Part 0: Equipment – General requirements), and IEC 60079-15 (Electrical apparatus for potentially explosive atmospheres - Part 15: Equipment protection by type of protection "n").

II 3 G Ex ec IIC T4 Gc (some models are II 3 G Ex ec nC IIC T4 Gc, see product marking) (Page 347)

IECEx UL 24.0044X

Specific conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in IEC 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with EN IEC 60079-0.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

UKEX approval

According to EN 60079-7 (Explosive atmospheres – Part 7: Equipment protection by increased safety "e"), EN IEC 60079-0 (Explosive atmospheres – Part 0: Equipment – General requirements), and IEC 60079-15 (Electrical apparatus for potentially explosive atmospheres - Part 15: Equipment protection by type of protection "n").

II 3 G Ex ec IIC T4 Gc (some models are II 3 G Ex ec nC IIC T4 Gc, see product marking) (Page 347)

UL 24UKEX2991X

Specific conditions of use:

- The equipment shall only be used in an area of not more than pollution degree 2, as defined in EN 60664-1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with EN 60079-7.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

CCCEx approval

According to GB/T 3836.1 (Explosive atmospheres – Part 1: Equipment – General requirements), GB/T 3836.3 (Explosive atmospheres – Part 3: Equipment protection by increased safety "e"), and GB/T 3836.8 (Explosive atmospheres – Part 8: Equipment protection by type of protection "n" see product marking) (Page 347)

Specific conditions of safety use:

- The equipment shall only be used in an area of at least pollution degree 2, as defined in GB/T 16935.1.
- The equipment shall be installed in an enclosure that provides a degree of protection not less than IP54 in accordance with GB/T 3836.3.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage value at the supply terminals to the equipment.

Australia and New Zealand - RCM Mark (Regulatory Compliance Mark)

The S7-1200 G2 automation system satisfies the requirements of AS/NZS 2064 standards (Class A).

Korea Certification

The S7-1200 G2 automation system satisfies the requirements of the Korean Certification (KC Mark). It has been defined as Class A Equipment and is intended for industrial applications and has not been considered for home use.

Eurasian Customs Union approval

EAC (Eurasian Conformity): Declaration of Conformity according to Technical Regulation of Customs Union (TR CU)

Industrial environments

The S7-1200 G2 automation system is designed for use in industrial environments.

Table 1-201 Industrial environments

Application field	Emission requirements	Immunity requirements
Industrial	EN 61000-6-4	EN 61000-6-2

Environmental conditions

The S7-1200 G2 automation system is suitable for use in weather-proof, fixed locations. The operating conditions are based on requirements of IEC 61131-2:2017.

Table 1-202 Shipping and storage

Environmental conditions – Shipping and storage conditions (TTH4 and STH4)	
EN 60068-2-1, Test Ab, Cold EN 60068-2-2, Test Dc, Dry heat	-40 °C to 70 °C
EN 60068-2-30, Test Db, Damp heat	25 °C to 55 °C, 95% RH
EN 60068-2-14, Test Na, Temperature shock	-40 °C to 70 °C, dwell time 3 hours, 2 cycles
EN 60068-2-31, Free fall	0.3 m, 5 times, product packaging
Atmospheric pressure	1140 to 540 hPa (corresponding to an altitude of -1000 to 5000 m)

Table 1-203 Climatic ambient conditions

Environmental conditions – Climatic ambient operating conditions (OTH4)	
Ambient temperature (Inlet Air 25 mm below unit)	-20 °C to 40 °C Max. specifications[1] -20 °C to 60 °C With derating[2] For vertical mounting see individual device specifications. Minimum temperature for fail-safe SMs/SBs is 0 °C.
	95% non-condensing humidity
Atmospheric pressure	1140 to 540 hPa (corresponding to an altitude from -1000 to 5000 m) For altitudes above 2000 m, the maximum permissible ambient temperature must be derated: >2000 m 0.9 factor, >3000 m 0.8 factor, >4000 m 0.7 factor. 5000 m is max allowed altitude.
Effects on the availability of modules at altitude	The higher cosmic radiation present during operation at altitudes above 2000 m affects the failure rate of electronic components. This is what is called a soft-error rate. In rare cases, this can result in a transition of modules to the safe state, especially for fail-safe modules. However, the functional safety of the modules is fully retained.
Concentration of contaminants	$S0_2$: < 0.5 ppm; H_2S: < 0.1 ppm; RH < 60% non-condensing
	ISA-S71.04 severity level G1, G2, G3
EN 60068-2-14, Test Nb (Temperature change)	-20 °C to 60 °C, dwell time 3 hours, 5 cycles
EN 60068-2-78, Test Cab (Damp heat)	30 °C, 95% RH, 16 hours
EN 60068-2-27 (Shock)	15 g, 11 ms pulse, 6 shocks in each of 3 axes (when panel mounted)
EN 60068-2-6 (Sinusoidal vibration)	3.5 mm from 5 to 8.4 Hz, 1g from 8.4 to 150 Hz 10 sweeps each axis, 1 octave per minute (when panel or DIN rail mounted) Note: In high vibration applications, Siemens recommends panel mounting or the use of a Siemens DIN Rail with DIN Rail End Retainers to secure devices.

[1] Operating temperature range using maximum voltages and maximum specifications.

[2] Operating temperature range using the rated voltages, 50% of maximum specifications with alternate I/O active:

50% of maximum specifications includes half of the following values with alternate I/O active:

- Current available for expansion devices
- Current available on sensor supply
- Current for the digital outputs (includes relay outputs)

Alternate I/O active means that every other input or output is active. Using alternate I/O reduces the concentration of heat around active circuits. Refer to the specifications of your CPU for the number of supported inputs and outputs.

Maximum installation altitude

You can install all S7-1200 G2 devices at a maximum altitude of 5000 m except for the following devices:

Description	Article number	Version	Maximum installation altitude
SM 1222 DQ 16xRLY	6ES7222-5HH50-0XB0	FS01 or higher	4000 m
SM 1223 DI 8x24VDC / DQ 8x RLY	6ES7223-5PH50-0XB0	FS01 or higher	4000 m
SM 1223 DI 16x24VDC / DQ 1-6xRLY	6ES7223-5PL50-0XB0	FS01 or higher	4000 m

Electromagnetic compatibility

Electromagnetic Compatibility (EMC) is the ability of an electrical device to operate as intended in an electromagnetic environment and to operate without emitting levels of electromagnetic interference (EMI) that can disturb other electrical devices in the vicinity.

Table 1-204 Immunity

Electromagnetic compatibility - Immunity per EN 61000-6-2	
EN 61000-4-2[1] Electrostatic discharge	8 kV air discharge to all surfaces 6 kV contact discharge to exposed conductive surfaces
EN 61000-4-3[2] Radiated, radio-frequency, electromagnetic field immunity test	80 MHz to 1000 MHz, 10 V/m, 80% AM (1 kHz) 1.4 GHz to 6 GHz, 3 V/m, 80% AM (1 kHz)
EN 61000-4-4[1] Fast transient bursts	2 kV, 5 kHz with coupling network to AC and DC system power 2 kV, 5 kHz with coupling clamp to I/O
EN 61000-4-5[1] Surge immunity	AC systems - 2 kV common mode, 1 kV differential mode DC systems - 1 kV common mode, 0.5 kV differential mode
EN 61000-4-6[2] Conducted disturbances	150 kHz to 80 MHz, 10 V RMS, 80% AM at 1 kHz
EN 61000-4-11 Voltage dips	AC systems 0% for 1 cycle, 40% for 12 cycles, and 70% for 30 cycles at 60 Hz

[1] The maximum short-term influence on analog modules during the duration of the EMC tests can be +/- 10% of the full-scale value.

[2] The maximum short-term influence on analog modules during the duration of the EMC tests can be +/- 1% of the full-scale value.

Table 1-205 Emissions

Electromagnetic compatibility - Conducted and radiated emissions per EN 61000-6-4		
Conducted emissions AC power ports	0.15 MHz to 0.5 MHz	< 79 dBµV quasi-peak, < 66 dBµV average
	0.5 MHz to 30 MHz	< 73 dBµV quasi-peak, < 60 dBµV average
Conducted emissions DC power ports	0.15 MHz to 0.5 MHz	< 89 dBµV quasi-peak, < 76 dBµV average
	0.5 MHz to 30 MHz	< 83 dBµV quasi-peak, < 70 dBµV average
Radiated emissions	30 MHz to 230 MHz	< 40 dBµV/m quasi-peak at 10 m
	230 MHz to 1000 MHz	< 47 dBµV/m quasi-peak at 10 m
	1000 MHz to 3000 MHz	< 76 dBµV/m peak, < 56 dBµV/m average at 3 m
	3000 MHz to 6000 MHz	< 80 dBµV/m peak, < 60 dBµV/m average at 3 m

Insulation

The insulation is designed in accordance with the requirements of IEC 61010-2-201.

NOTE
For modules having 24 V DC (SELV / PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Pollution degree / overvoltage category in accordance with IEC 61131-2 and IEC 61010-2-201

- Pollution degree 2
- Overvoltage category II

Protection class according to IEC 61131-2 and IEC 61010-2-201

- Protection class II

Degree of protection

- IP20 Mechanical Protection, EN 60529
- Protects against finger contact with high voltage as tested by standard probe. External protection required for dust, dirt, water and foreign objects of < 12.5 mm in diameter.

Rated voltages

The rated voltages are:

- 24 V DC
- 120/240 V AC

⚠ WARNING

Risks when turning on output power
When a mechanical contact turns on output power to the S7-1200 G2 CPU, or any digital expansion module or board, it sends a “1” signal to the digital outputs for approximately 50 microseconds.
This could cause unexpected machine or process operation, which could result in death or serious injury to personnel and/or damage to equipment.
You must plan for the "1" signal to the digital outputs.

Reverse voltage protection

Reverse voltage protection circuitry is provided on each terminal pair of +24 V DC power or user input power for CPUs, signal modules (SMs), and signal boards (SBs). It is still possible to damage the system by wiring different terminal pairs in opposite polarities.

Some of the 24 V DC power input ports in the S7-1200 G2 system are interconnected, with a common logic circuit connecting multiple M terminals. For example, the following circuits are interconnected when designated as "not isolated": the 24 V DC power supply of the CPU, the sensor power of the CPU, the power input for the relay coil of an SM, and the power supply for a non-isolated analog input. All non-isolated M terminals must connect to the same external reference potential.

⚠ WARNING

Risks when connecting non-isolated M terminals to different reference potentials
Connecting non-isolated M terminals to different reference potentials causes unintended current flows that can cause damage or unpredictable operation in the PLC and any connected equipment.
Always ensure that all non-isolated M terminals in an S7-1200 G2 system are connected to the same reference potential.
Failure to comply with these guidelines could cause damage or unpredictable operation, which can result in death or severe personal injury and/or property damage.

DC Outputs

Short-circuit protection circuitry is not provided for DC outputs on CPUs, signal modules (SMs), and signal boards (SBs).

Relay electrical service life

The typical performance data estimated from sample tests is shown below. Actual performance can vary depending upon your specific application. An external protection circuit that is adapted to the load enhances the service life of the contacts. Normally closed contacts have a typical service life of about one-third that of normally open contacts under inductive and lamp load conditions.

Table 1-206 Typical performance data

Data for selecting an actuator			
Continuous thermal current	2 A max.		
Switching capacity and life of the contacts			
For ohmic load	Voltage	Current	Number of operating cycles (typical)
	24 V DC	2.0 A	0.1 million
	24 V DC	1.0 A	0.2 million
	24 V DC	0.5 A	1.0 million
	48 V AC	1.5 A	1.5 million
	60 V AC	1.5 A	1.5 million
	120 V AC	2.0 A	1.0 million
	120 V AC	1.0 A	1.5 million
	120 V AC	0.5 A	2.0 million

Data for selecting an actuator			
For ohmic load	230 V AC	2.0 A	1.0 million
	230 V AC	1.0 A	1.5 million
	230 V AC	0.5 A	2.0 million
For inductive load (according to IEC 947-5-1 DC13/AC15)	Voltage	Current	Number of operating cycles (typical)
	24 V DC	2.0 A	0.05 million
	24 V DC	1.0 A	0.1 million
	24 V DC	0.5 A	0.5 million
	24 V AC	1.5 A	1.0 million
	48 V AC	1.5 A	1.0 million
	60 V AC	1.5 A	1.0 million
	120 V AC	2.0 A	0.7 million
	120 V AC	1.0 A	1.0 million
	120 V AC	0.5 A	1.5 million
	230 V AC	2.0 A	0.7 million
	230 V AC	1.0 A	1.0 million
	230 V AC	0.5 A	1.5 million
Activating a digital input	Possible		
Switching frequency			
Mechanical	Max. 10 Hz		
At ohmic load	Max. 1 Hz		
At inductive load (according to IEC 947-5-1 DC13/AC15)	Max. 0.5 Hz		
At lamp load	Max. 1Hz		

Internal CPU memory retention

The CPU performs operations to extend the life of the internal memory devices that contain the application data. Below is the life expectancy of the internal memory.

- Lifetime of retentive data and data log data: 10 years
- Power down retentive data, write cycle endurance: 2 million cycles
- Data log data, write cycle endurance: 500 million data log entries

NOTE

Effect of data logs on internal CPU memory

Each data log write consumes at a minimum 2 KB of memory. If your program writes small amounts of data frequently, it is consuming at least 2 KB of memory on each write. A better implementation would be to accumulate the small data items in a data block (DB), and to write the data block to the data log at less frequent intervals.

If your program writes many data log entries at a high frequency, consider using a replaceable SD memory card.

Use of cellular phones

You can read information from the CPU and write operations to the CPU from the passive Near Field Communication (NFC) (Page 299) tag in your S7-1200 G2 CPU by placing your iPhone near the NFC symbol on the CPU.

All S7-1200 G2 CPUs and modules have a scannable QR code lasered on the housing. Use your smartphone's camera to read the QR code. The QR code provides a direct link to the Siemens Industrial Online Support information for your device.

⚠ WARNING

Risks when using a cellular phone in close proximity to the S7-1200 G2 CPU
Using a cellular phone in close proximity to an S7-1200 G2 system with cellular and Wi-Fi communications active can cause unpredictable behavior.
To reduce any influence of a cellular phone on the S7-1200 G2 system, and to ensure proper operation of your CPU, place the phone in “Airplane mode” to disable cellular and Wi-Fi before bringing the phone into proximity (<10 cm) of the CPU.
Failure to comply with these guidelines can cause damage or unpredictable operation which could result in severe personal injury, property damage, and/or death.

⚠ WARNING

Risks when operating a cellular phone in a hazardous or explosive environment
Do not use a cellular phone in a hazardous or explosive environment unless the phone has been approved for use in such environments.
Failure to comply with these guidelines can cause damage or unpredictable operation which could result in severe personal injury, property damage, and/or death.

A.2 Protection methods

The S7-1200 G2 automation system is covered by two protection methods:

Article numbers covered by II 3 G Ex ec IIC T4 Gc / Ex ec IIC T4 Gc	Article numbers covered by II 3 G Ex ec nC IIC T4 Gc / Ex ec nC IIC T4 Gc

Current available on sensor supply	300 mA (24 V DC sensor power, current limited)		
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]		
	Vertical mounting -20 °C to 50 °C[2]		Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum		

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-208 CPU features

Technical data	Description	
User memory	Work Memory	150 Kbytes (Program) 500 Kbytes (Data)
	Load Memory	8 Mbytes (Internal) 32 Gbytes (using SD card)
	Retentive Memory	20 Kbytes
Onboard digital I/O	8 inputs / 6 outputs	
Process image size	1024 bytes of inputs (I) / 1024 bytes of outputs (Q)	

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

Technical data	Description	
Bit memory size	8192 bytes (M)	
Temporary (local) memory	Per priority class, max.	64 Kbytes
	Per block, max.	16 Kbytes
Communication module/processor expansion	3 max. (must connect to the right of the CPU or to the right of another CM/CP)	
Signal module expansion (SM plus CM)	6 max.	
Signal board or Communication board expansion	1 max.	
High-speed counters	Max. number of high-speed counters	8 (any CPU or SB digital input)
	Max. rate, CPU inputs Ia.0 to Ia.5	100 kHz (80 kHz in quadrature mode)
	Max. rate, CPU inputs Ia.6 to Ia.7	30 kHz (20 kHz in quadrature mode)
	Max. rate, SB inputs	See SB specifications
Pulse outputs[1]	Max. number of pulse outputs	8 (any CPU or SB digital output)
	Max. rate, CPU outputs Qa.0 to Qa.3	100 kHz
	Max. rate, CPU outputs Qa.4 to Qa.5	20 kHz
	Max. rate, SB outputs	See SB specifications
Pulse catch inputs	Yes, each onboard CPU digital input and SB digital input	
Time delay interrupts	20 total with 1 ms resolution	
Cyclic interrupts	20 total with 1 µs resolution	
Edge interrupts	Rising and falling for each onboard CPU digital input and SB digital input	
Memory card (Page 468)	SIMATIC memory card (optional).	
Motion control	Available Resources	800
	Required Resources	40 per speed-controlled axis
		80 per positioning axis
		160 per synchronous axis
		80 per external encoder
		20 per output cam
		160 per cam track
		40 per measuring input
	Available Extended Resources	40
	Required Extended Resources	2 per cam (1000 points)
		30 for each set of kinematics
PID	PID Compact	Yes, universal PID controller with integrated optimization
	PID 3Step	Yes, PID controller with integrated optimization for valves
	PID Temp	Yes, PID controller with integrated optimization for temperature
Real-time clock	Accuracy	+/- 60 seconds per month
	Retention time, super capacitor	20 days typical at 40 °C, 12 days minimum at 40 °C

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

A.3.2 Performance

Table 1-209 Performance

Type of instruction[1]	Direct addressing (I, Q, and M)	DB accesses
Boolean	0.037 µs/instruction	
Move_Bool	0.067 µs/instruction	0.066 µs/instruction
Move_Word	0.027 µs/instruction	0.030 µs/instruction
Move_Real	0.027 µs/instruction	0.030 µs/instruction
Add_Real	0.119 µs/instruction	0.074 µs/instruction

[1] Many variables affect measured times. The above performance times are for the fastest instructions in each category and error-free programs.

A.3.3 Blocks, timers, and counters

Table 1-210 Blocks, times, and counters

Element	Description	
Blocks	Type	OB, FB, FC, DB
	Max. number of elements	4000; Blocks (OB, FB, FC, DB) and UDTs
	Max. OB, FB, FC size	64 Kbytes
	Max. DB size (Optimized)	500 Kbytes Work Memory 16 Mbytes Load Memory
	Max. DB size (Non-optimized)	64 Kbytes (DBs with absolute addressing)
	Address range for FBs and FCs	1 to 65535
	Address range for DBs	1 to 59999
	Nesting depth per priority class[1]	24 (OB plus 23 more levels)
	Monitoring	Status of 8 code blocks can be monitored simultaneously.
Number of OBs per event class	Program cycle	100
	Startup	100
	Time delay interrupt	20 (one per event)
	Cyclic interrupt	20 (one per event)
	Hardware interrupt	50
	Time error interrupt	1
	Diagnostic error interrupt	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	20 (one per event)
	Synchronous Cycle	1
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

Element	Description	
Number of OBs per event class	MC-LookAhead	1
	MC-PreInterpolator	1
	Programming error	1
	I/O access error	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon time type
	IEC_TIMER	16 bytes
	IEC_LTIMER	28 bytes
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon count type
	IEC_SCOUNTER, IEC_USCOUNTER	3 bytes
	IEC_COUNTER, IEC_UCOUNTER	6 bytes
	IEC_DCOUNTER, IEC_UDCOUNTER	12 bytes
	IEC_LCOUNTER, IEC_ULCOUNTER	24 bytes
Runtime Meters	Quantity	16

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

A.3.4 Communications

Table 1-211 Communications

Technical data	Description	
Number of ports	2 with an integrated switch	
Type	Ethernet (RJ-45 connector)	
Connections	88 connections max. (integrated into CPU) 10 reserved for ES/HMI/web	
Data rates	100 Mb/s	
Isolation (Page 81) (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]	
Cable type	CAT5e shielded	
Interfaces	1 PROFINET	
	0 PROFIBUS	
PROFINET Protocols	PROFINET IO controller	Yes
	PROFINET IO device	Yes
	SIMATIC communication	Yes
	Open IE communication	Yes
	Web server	Yes
	Media redundancy	Yes
PROFINET IO controller services	PG/OP communication	Yes

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
PROFINET IO controller services	S7 routing	Yes (requires more than one communication interface)
	Isochronous mode	Yes
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	MRPD	Yes – Requires an IRT sync domain
	PROFIenergy	Yes (per user program)
	Prioritized startup	Yes (max. 16 PROFINET devices)
	Number of connectable I/O devices, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of submodules, max.	512
	Number of IO devices that you can connect for RT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of in line IO devices that you can connect for RT, max.	31
	Number of IO devices that you can connect for IRT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of IO devices that can be activated/deactivated simultaneously, max.	8
	The minimum update time depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.	RT Send clock: 1 ms to 512 ms IRT Send clock: 1 ms to 512 ms (1 ms resolution)
PROFINET I-Device	Number of connections, max.	2
PROFINET I-Device services	PG/OP communication	Yes
	S7 routing	No
	Isochronous mode	No
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	PROFIenergy	Yes (per user program)
	Shared device	Yes
	Number of IO controllers with shared device, max.	2
SIMATIC communication	S7 communication as server	Yes
	S7 communication as client	Yes
	User data per job, max.	See TIA Portal information system (S7 communication, user data size)
Open IE communication	TCP/IP	Yes, 64 Kbytes max. data length Several passive connections per port
	ISO-on-TCP (RFC1006)	Yes, 64 Kbytes max. data length
	UDP	Yes, 2048 bytes max. data length 1472 bytes max. for UDP broadcast
	DHCP	Yes
	SNMP	Yes

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
Open IE communication	DCP	Yes
	LLDP	Yes
Near Field Communication (NFC)	Yes, with the S7-1200 G2 NFC app	
S7 message functions	Number of login stations for message functions, max.	32
	Program alarms	Yes
	Number of configurable program messages, max.	5000
	Number of loadable program messages in RUN, max.	2500
	Number of simultaneously active program alarms	600 program alarms 100 alarms for system diagnostics 160 for motion technology objects
Test commissioning functions	Joint commission (Team Engineering)	Yes, parallel online access possible for up to 5 engineering systems
	Program status	Yes, up to 8 blocks simultaneously (in total across all ES clients)
	Single step	No
	Breakpoints	No
	SIMATIC Controller Profiling	Yes
Monitor/modify	Variables	Inputs/outputs, memory bits, DBs, distributed I/Os, timers, counters
	Number of monitor variables, max.	200 per job
	Number of modify variables, max.	200 per job
Force	Variables	Peripheral inputs/outputs
	Number of variables, max.	200
Trace	Number of configurable traces	4
	Variables captured per trace, max.	16
	Data captured per trace, max.	512 KB
Diagnostics buffer	Number of entries, max.	500
	Retentive	100

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

A.3.5 Power supply and sensor power

Table 1-212 Power supply

Technical data	CPU 1212C AC/DC/RLY	CPU 1212C DC/DC/RLY	CPU 1212C DC/DC/DC
Rated voltage	120/240 V AC	24 V DC	
Voltage range	85 to 264 V AC	20.4 to 28.8 V DC	
Reverse voltage protection	--	Yes	
Line frequency	47 to 63 Hz	--	
Input current (CPU only)	70 mA at 120 V AC 38 mA at 240 V AC	185 mA at 24 V DC	125 mA at 24 V DC
Input current (with all accessories)	330 mA at 120 V AC 200 mA at 240 V AC	765 mA at 24 V DC	700 mA at 24 V DC

Technical data	**CPU 1212C AC/DC/RLY**	**CPU 1212C DC/DC/RLY**	**CPU 1212C DC/DC/DC**
Inrush current	20 A max. at 264 V AC	12 A max. at 28.8 V DC	
I^2t	0.8 A^2 s	0.5 A^2 s	
Isolation (input power to logic)	1500 V AC	Not isolated	
Ground leakage (AC line to functional earth)	0.5 mA max.	--	
Hold up time (loss of power)	20 ms at 120 V AC 80 ms at 240 V AC	10 ms at 24 V DC	
Internal fuse	3 A, 250 V, slow blow not user replaceable		

Table 1-213 Sensor power

Technical data	**CPU 1212C AC/DC/RLY**	**CPU 1212C DC/DC/RLY**	**CPU 1212C DC/DC/DC**
Rated voltage	24 V DC		
Voltage range	20.4 to 28.8 V DC	L+ minus 4 V DC min.	
Output current rating	300 mA max. (short-circuit protected)		
Ripple noise (<10 MHz)	< 1 V peak to peak max.	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		
Cable length	500 m shielded		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

A.3.6 Digital inputs and outputs

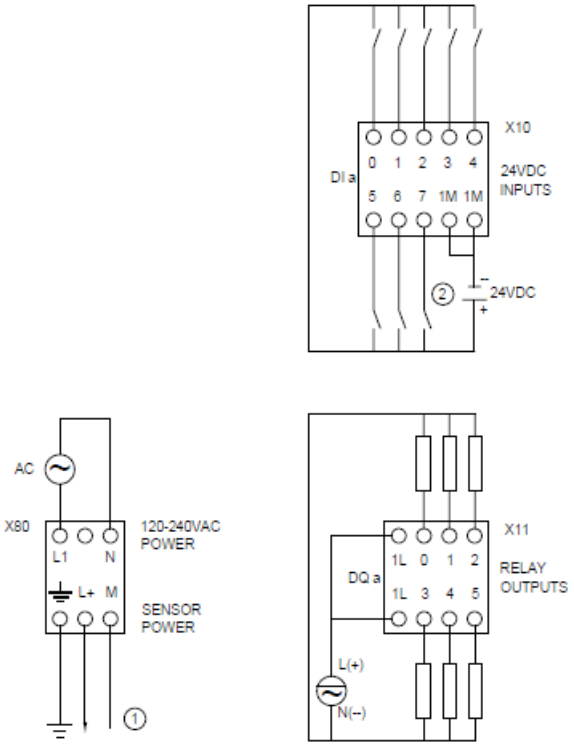
Table 1-214 Digital inputs

Technical data	**CPU 1212C AC/DC/RLY**	**CPU 1212C DC/DC/RLY**	**CPU 1212C DC/DC/DC**
Number of inputs	8, in 1 isolation group of 8 inputs		
Assignment	Ia.0 to Ia.5 (high-speed) Ia.6 to Ia.7 (standard)		
Type	Sink/Source (IEC Type 1 sink)		
Rated voltage	24 V DC at 6 mA, nominal (high-speed) 24 V DC at 4 mA, nominal (standard)		
Continuous permissible voltage	30 V DC, max. at 8 mA, max. (high-speed) 30 V DC, max. at 6 mA, max. (standard)		
Logic 1 signal	15 V DC min. at 2.5 mA		
Logic 0 signal	5 V DC max. or 0.5 mA		
Isolation (field side to logic)	707 V DC (type test)		
Filter times (selectable by channel)	µs settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0		
HSC clock input rates (Logic 1 level = 15 to 30 V DC)	Single phase: 100 kHz (Ia.0 to Ia.5) Single phase: 30 kHz (Ia.6 to Ia.7) Quadrature phase: 80 kHz (Ia.0 to Ia.5) Quadrature phase: 20 kHz (Ia.6 to Ia.7)		
Cable length	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

Table 1-215 Digital outputs

Technical data	**CPU 1212C AC/DC/RLY**	**CPU 1212C DC/DC/RLY**	**CPU 1212C DC/DC/DC**
Number of outputs	6, in 1 isolation group of 6 outputs		
Assignment	Qa.0 to Qa.5		Qa.0 to Qa.3 (high-speed) Qa.4 to Qa.5 (standard)
Type	Relay, dry contact		Solid state – MOSFET (sourcing)
Rated voltage	--		24 V DC
Voltage range	5 to 30 V DC or 5 to 250 V AC		20.4 to 28.8 V DC
Logic 1 signal at max. current	--		20 V DC min.
Logic 0 signal with 10 kΩ load	--		0.1 V DC max.
Current	2.0 A max.		0.5 A max.
Minimum load[1]	125 mW DC / 500 mW AC		--
Lamp load	30 W DC / 200 W AC		5 W
ON state resistance	0.2 Ω max. when new		0.6 Ω max.
Leakage current per point	--		10 µA max.
Overload protection	No		
Isolation (field side to logic)	1500 V AC (type test)		707 V DC (type test)
Isolation (coil to logic)	None		--
Current per common	12 A max. (10 A max. per pin)		3 A max.
Inductive clamp voltage	--		L+ minus 40 V, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.		1.0 µs max., OFF to ON 3.0 µs max., ON to OFF
Switching delay (Qa.4 to Qa.5)	10 ms max.		5 µs max., OFF to ON 20 µs max., ON to OFF
Maximum relay switching frequency	1 Hz		--
Pulse Train Output (PTO) rate	Not recommended[2]		100 kHz max. (Qa.0 to Qa.3) 20 kHz max. (Qa.4 to Qa.5) 2 Hz min.[3]
Lifetime mechanical (no load)	10000000 open/close cycles		--
Lifetime contacts at rated load	100000 open/close cycles		--
Behavior on RUN to STOP	Last value or substitute value (default value 0)		
Control of a digital input	Yes		
Parallel outputs for redundant load control	Yes (with same common)		
Parallel outputs for increased load	No		
Cable length	500 m shielded, 150 m unshielded		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.



[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

A.3.7 Wiring diagrams

The wiring diagrams and pin connector locations are shown below:

CPU 1212C AC/DC/RLY

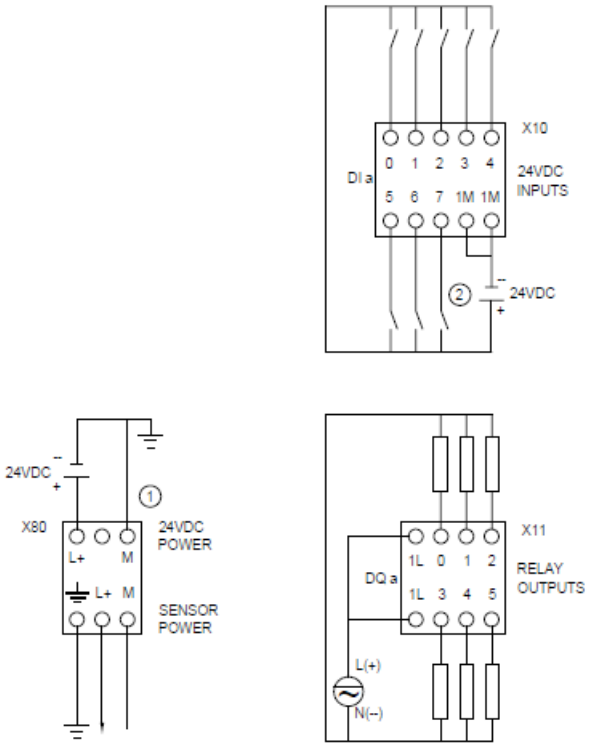
X80: AC power wiring terminal (Orange, Type-A keying)					
AC power	L1		N		
Pin #	1	3	5		
Pin #	2	4	6		
Sensor power	GND	L+	M		
X10: DC input wiring terminal (Gray, No keying)					
Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4
Pin #	1	3	5	7	9
Pin #	2	4	6	8	10
Signal	DI a.5	DI a.6	DI a.7	1M	1M
X11: Relay output wiring terminal (Orange, Type-A keying)					
Signal	1L	DQ a.0	DQ a.1	DQ a.2	
Pin #	1	3	5	7	
Pin #	2	4	6	8	
Signal	1L	DQ a.3	DQ a.4	DQ a.5	

① For additional noise immunity, jumper the Sensor Power "M" to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

NOTE

You can connect either the L1 or N (L2) terminal to a voltage source up to 240 V AC. The N terminal can be considered L2 and is not required to be grounded. No polarization is required for L1 and N (L2) terminals.



CPU 1212C DC/DC/RLY

X80: DC power wiring terminal (Gray, No keying)					
DC power	L+		M		
Pin #	1	3	5		
Pin #	2	4	6		
Sensor power	GND	L+	M		
X10: DC input wiring terminal (Gray, No keying)					

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

CPU 1212C DC/DC/RLY

Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4
Pin #	1	3	5	7	9
Pin #	2	4	6	8	10
Signal	DI a.5	DI a.6	DI a.7	1M	1M

X11: Relay output wiring terminal (Orange, Type-A keying)

Signal	1L	DQ a.0	DQ a.1	DQ a.2
Pin #	1	3	5	7
Pin #	2	4	6	8
Signal	1L	DQ a.3	DQ a.4	DQ a.5

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

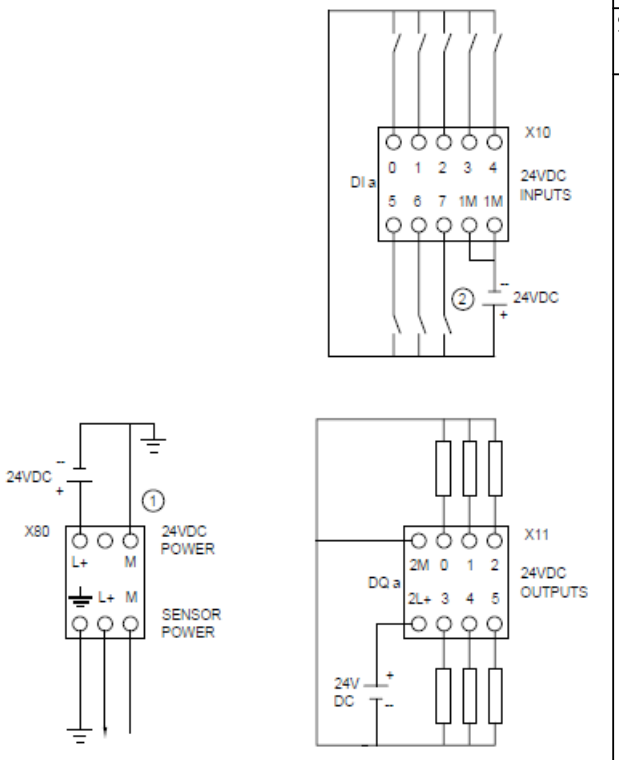
CPU 1212C DC/DC/DC

X80: DC power wiring terminal (Gray, No keying)

DC power	L+		M
Pin #	1	3	5
Pin #	2	4	6
Sensor power	GND	L+	M

X10: DC input wiring terminal (Gray, No keying)

Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4
Pin #	1	3	5	7	9
Pin #	2	4	6	8	10
Signal	DI a.5	DI a.6	DI a.7	1M	1M



X11: DC output wiring terminal (Gray, No keying)

Signal	2M	DQ a.0	DQ a.1	DQ a.2
Pin #	1	3	5	7

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

CPU 1212C DC/DC/DC

Pin #	2	4	6	8
Signal	2L+	DQ a.3	DQ a.4	DQ a.5

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

A.4 CPU 1212FC

A.4.1 General specifications and features

Table 1-216 General

Technical data	**CPU 1212FC DC/DC/RLY**	**CPU 1212FC DC/DC/DC**
Article number	6ES7212-1HF50-0XB0	6ES7212-1AF50-0XB0
Dimensions W x H x D	70 x 125 x 100 mm	
Weight (product/shipping)	333 grams / 380 grams	319 grams / 366 grams
Power dissipation	3.0 W	
Current available for expansion devices	1000 mA max. (5 V DC)	
Current available on sensor supply	300 mA (24 V DC sensor power, current limited)	
Safety class (highest)	PL e (performance level according to ISO 13849-1) SIL 3 (safety integrity level according to IEC 61508)	
Probability of failure	Low demand mode: PFDavg in accordance with SIL 3	

Technical data	CPU 1212FC DC/DC/RLY	CPU 1212FC DC/DC/DC
	< 2.00E-05 High demand/continuous mode: PFH in accordance with SIL 3 < 1.00E-09 (altitude -1000 m to 3000 m) < 2.00E-09 (altitude >3000 m to 5000 m) For service life of 20 years and repair time of 100 hours	
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]	
	Vertical mounting -20 °C to 50 °C[2]	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum	

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-217 CPU features

Technical data	Description	
User memory	Work Memory	200 Kbytes (Program) 500 Kbytes (Data)
	Load Memory	8 Mbytes (Internal) 32 Gbytes (using SD card)
	Retentive Memory	20 Kbytes
Onboard digital I/O	8 inputs / 6 outputs	
Process image size	1024 bytes of inputs (I) / 1024 bytes of outputs (Q)	
Bit memory size	8192 bytes (M)	
Temporary (local) memory	Per priority class, max.	64 Kbytes
	Per block, max.	16 Kbytes
Communication module/processor expansion	3 max. (must connect to the right of the CPU or to the right of another CM/CP)	
Signal module expansion (SM plus CM)	6 max.	
Signal board or Communication board expansion	1 max.	
High-speed counters	Max. number of high-speed counters	8 (any CPU or SB digital input)
	Max. rate, CPU inputs Ia.0 to Ia.5	100 kHz (80 kHz in quadrature mode)
	Max. rate, CPU inputs Ia.6 to Ia.7	30 kHz (20 kHz in quadrature mode)
	Max. rate, SB inputs	See SB specifications
Pulse outputs[1]	Max. number of pulse outputs	8 (any CPU or SB digital output)
	Max. rate, CPU outputs Qa.0 to Qa.3	100 kHz
	Max. rate, CPU outputs Qa.4 to Qa.5	20 kHz
	Max. rate, SB outputs	See SB specifications
Pulse catch inputs	Yes, each onboard CPU digital input and SB digital input	
Time delay interrupts	20 total with 1 ms resolution	
Cyclic interrupts	20 total with 1 µs resolution	
Edge interrupts	Rising and falling for each onboard CPU digital input and SB digital input	

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

Technical data	Description	
Memory card (Page 468)	SIMATIC memory card (optional).	
Motion control	Available Resources	800
	Required Resources	40 per speed-controlled axis
		80 per positioning axis
		160 per synchronous axis
		80 per external encoder
		20 per output cam
		160 per cam track
		40 per measuring input
	Available Extended Resources	40
	Required Extended Resources	2 per cam (1000 points)
		30 for each set of kinematics
PID	PID Compact	Yes, universal PID controller with integrated optimization
	PID 3Step	Yes, PID controller with integrated optimization for valves
	PID Temp	Yes, PID controller with integrated optimization for temperature
Real-time clock	Accuracy	+/- 60 seconds per month
	Retention time, super capacitor	20 days typical at 40 °C, 12 days minimum at 40 °C

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

A.4.2 Performance

Table 1-218 Performance

Type of instruction[1]	Direct addressing (I, Q, and M)	DB accesses
Boolean	0.037 µs/instruction	
Move_Bool	0.067 µs/instruction	0.066 µs/instruction
Move_Word	0.027 µs/instruction	0.030 µs/instruction
Move_Real	0.027 µs/instruction	0.030 µs/instruction
Add_Real	0.119 µs/instruction	0.074 µs/instruction

[1] Many variables affect measured times. The above performance times are for the fastest instructions in each category and error-free programs.

A.4.3 Blocks, timers, and counters

Table 1-219 Blocks, times, and counters

Element	Description	
Blocks	Type	OB, FB, FC, DB
	Max. number of elements	4000; Blocks (OB, FB, FC, DB) and UDTs
	Max. OB, FB, FC size	64 Kbytes

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

Element	Description	
Blocks	Max. DB size (Optimized)	500 Kbytes Work Memory 16 Mbytes Load Memory
	Max. DB size (Non-optimized)	64 Kbytes (DBs with absolute addressing)
	Address range for FBs and FCs	1 to 65535
	Address range for DBs	1 to 59999
	Nesting depth per priority class[1]	24 (OB plus 23 more levels)
	Monitoring	Status of 8 code blocks can be monitored simultaneously.
Number of OBs per event class	Program cycle	100
	Startup	100
	Time delay interrupt	20 (one per event)
	Cyclic interrupt	20 (one per event)
	Hardware interrupt	50
	Time error interrupt	1
	Diagnostic error interrupt	1
	Pull or plug of modules	1
	Rack or station failure	1

A.4.4 Communications

Table 1-220 Communications

Technical data	Description	
Number of ports	2 with an integrated switch	
Type	Ethernet (RJ-45 connector)	
Connections	88 connections max. (integrated into CPU) 10 reserved for ES/HMI/web	
Data rates	100 Mb/s	
Isolation (Page 81) (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]	
Cable type	CAT5e shielded	
Interfaces	1 PROFINET	
	0 PROFIBUS	
PROFINET Protocols	PROFINET IO controller	Yes
	PROFINET IO device	Yes
	SIMATIC communication	Yes
	Open IE communication	Yes
	Web server	Yes
	Media redundancy	Yes
PROFINET IO controller services	PG/OP communication	Yes
	S7 routing	Yes (requires more than one communication interface)
	Isochronous mode	Yes
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	MRPD	Yes – Requires an IRT sync domain
	PROFIenergy	Yes (per user program)
	Prioritized startup	Yes (max. 16 PROFINET devices)
	Number of connectable I/O devices, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of submodules, max.	512
	Number of IO devices that you can connect for RT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of in line IO devices that you can connect for RT, max.	31
	Number of IO devices that you can connect for IRT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
PROFINET IO controller services	Number of IO devices that can be activated/deactivated simultaneously, max.	8
	The minimum update time depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.	RT Send clock: 1 ms to 512 ms IRT Send clock: 1 ms to 512 ms (1 ms resolution)
PROFINET I-Device	Number of connections, max.	2
PROFINET I-Device services	PG/OP communication	Yes
	S7 routing	No
	Isochronous mode	No
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	PROFIenergy	Yes (per user program)
	Shared device	Yes
	Number of IO controllers with shared device, max.	2
SIMATIC communication	S7 communication as server	Yes
	S7 communication as client	Yes
	User data per job, max.	See TIA Portal information system (S7 communication, user data size)
Open IE communication	TCP/IP	Yes, 64 Kbytes max. data length Several passive connections per port
	ISO-on-TCP (RFC1006)	Yes, 64 Kbytes max. data length
	UDP	Yes, 2048 bytes max. data length 1472 bytes max. for UDP broadcast
	DHCP	Yes
	SNMP	Yes
	DCP	Yes
	LLDP	Yes
Near Field Communication (NFC)	Yes, with the S7-1200 G2 NFC app	
S7 message functions	Number of login stations for message functions, max.	32
	Program alarms	Yes
	Number of configurable program messages, max.	5000
	Number of loadable program messages in RUN, max.	2500
	Number of simultaneously active program alarms	600 program alarms 100 alarms for system diagnostics 160 for motion technology objects
Test commissioning functions	Joint commission (Team Engineering)	Yes, parallel online access possible for up to 5 engineering systems
	Program status	Yes, up to 8 blocks simultaneously (in total across all ES clients)
	Single step	No

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
Test commissioning functions	Breakpoints	No
	SIMATIC Controller Profiling	Yes
Monitor/modify	Variables	Inputs/outputs, memory bits, DBs, distributed I/Os, timers, counters
	Number of monitor variables, max.	200 per job
	Number of modify variables, max.	200 per job
Force	Variables	Peripheral inputs/outputs
	Number of variables, max.	200
Trace	Number of configurable traces	4
	Variables captured per trace, max.	16
	Data captured per trace, max.	512 KB
Diagnostics buffer	Number of entries, max.	500
	Retentive	100

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

A.4.5 Power supply and sensor power

Table 1-221 Power supply

Technical data	CPU 1212FC DC/DC/RLY	CPU 1212FC DC/DC/DC
Rated voltage	24 V DC	
Voltage range	20.4 to 28.8 V DC	
Reverse voltage protection	Yes	
Input current (CPU only)	185 mA at 24 V DC	125 mA at 24 V DC
Input current (with all accessories)	765 mA at 24 V DC	700 mA at 24 V DC
Inrush current	12 A max. at 28.8 V DC	
I^2t	0.5 A^2 s	
Isolation (input power to logic)	Not isolated	
Hold up time (loss of power)	10 ms at 24 V DC	
Internal fuse	3 A, 250 V, slow blow not user replaceable	

Table 1-222 Sensor power

Technical data	CPU 1212FC DC/DC/RLY	CPU 1212FC DC/DC/DC
Rated voltage	24 V DC	
Voltage range	L+ minus 4 V DC min.	
Output current rating	300 mA max. (short-circuit protected)	
Ripple noise (<10 MHz)	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated	
Cable length	500 m shielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

A.4.6 Digital inputs and outputs

Table 1-223 Digital inputs

Technical data	CPU 1212FC DC/DC/RLY	CPU 1212FC DC/DC/DC
Number of inputs	8, in 1 isolation group of 8 inputs	
Assignment	Ia.0 to Ia.5 (high-speed) Ia.6 to Ia.7 (standard)	
Type	Sink/Source (IEC Type 1 sink)	
Rated voltage	24 V DC at 6 mA, nominal (high-speed) 24 V DC at 4 mA, nominal (standard)	
Continuous permissible voltage	30 V DC, max. at 8 mA, max. (high-speed) 30 V DC, max. at 6 mA, max. (standard)	
Logic 1 signal	15 V DC min. at 2.5 mA	
Logic 0 signal	5 V DC max. or 0.5 mA	
Isolation (field side to logic)	707 V DC (type test)	
Filter times (selectable by channel)	µs settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0	
HSC clock input rates (Logic 1 level = 15 to 30 V DC)	Single phase: 100 kHz (Ia.0 to Ia.5) Single phase: 30 kHz (Ia.6 to Ia.7) Quadrature phase: 80 kHz (Ia.0 to Ia.5) Quadrature phase: 20 kHz (Ia.6 to Ia.7)	
Cable length	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

Table 1-224 Digital outputs

Technical data	CPU 1212FC DC/DC/RLY	CPU 1212FC DC/DC/DC
Number of outputs	6, in 1 isolation group of 6 outputs	
Assignment	Qa.0 to Qa.5	Qa.0 to Qa.3 (high-speed) Qa.4 to Qa.5 (standard)
Type	Relay, dry contact	Solid state – MOSFET (sourcing)
Rated voltage	--	24 V DC
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 kΩ load	--	0.1 V DC max.
Current	2.0 A max.	0.5 A max.
Minimum load[1]	125 mW DC / 500 mW AC	--
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (type test)	707 V DC (type test)
Isolation (coil to logic)	None	--
Current per common	12 A max. (10 A max. per pin)	3 A max.

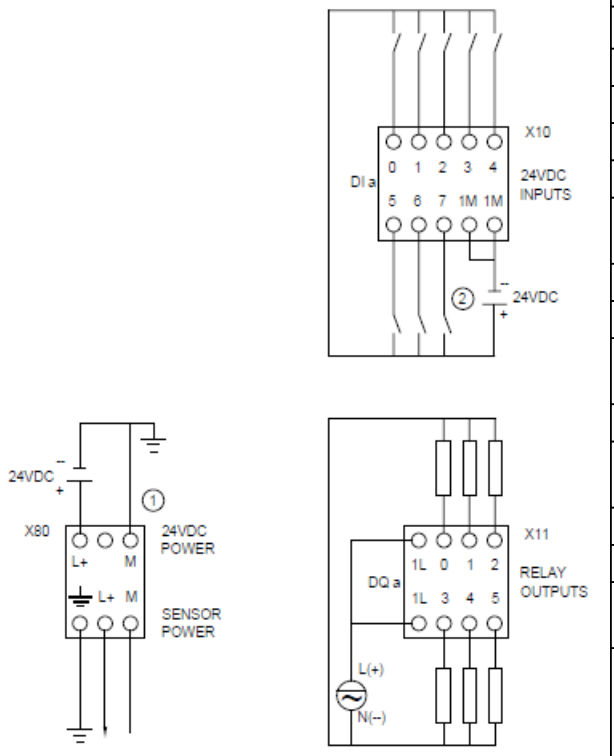
[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.

[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

Technical data	**CPU 1212FC DC/DC/RLY**	**CPU 1212FC DC/DC/DC**
Inductive clamp voltage	--	L+ minus 40 V, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., OFF to ON 3.0 µs max., ON to OFF
Switching delay (Qa.4 to Qa.5)	10 ms max.	5 µs max., OFF to ON 20 µs max., ON to OFF
Maximum relay switching frequency	1 Hz	--
Pulse Train Output (PTO) rate	Not recommended[2]	100 kHz max. (Qa.0 to Qa.3) 20 kHz max. (Qa.4 to Qa.5) 2 Hz min.[3]
Lifetime mechanical (no load)	10000000 open/close cycles	--
Lifetime contacts at rated load	100000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Control of a digital input	Yes	
Parallel outputs for redundant load control	Yes (with same common)	
Parallel outputs for increased load	No	
Cable length	500 m shielded, 150 m unshielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.



[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

A.4.7 Wiring diagrams

The wiring diagrams and pin connector locations are shown below:

CPU 1212FC DC/DC/RLY

X80: DC power wiring terminal (Gray, No keying)

DC power	L+		M
Pin #	1	3	5
Pin #	2	4	6
Sensor power	GND	L+	M

X10: DC input wiring terminal (Gray, No keying)

Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4
Pin #	1	3	5	7	9
Pin #	2	4	6	8	10
Signal	DI a.5	DI a.6	DI a.7	1M	1M

X11: Relay output wiring terminal (Orange, Type-A keying)

Signal	1L	DQ a.0	DQ a.1	DQ a.2
Pin #	1	3	5	7
Pin #	2	4	6	8
Signal	1L	DQ a.3	DQ a.4	DQ a.5

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

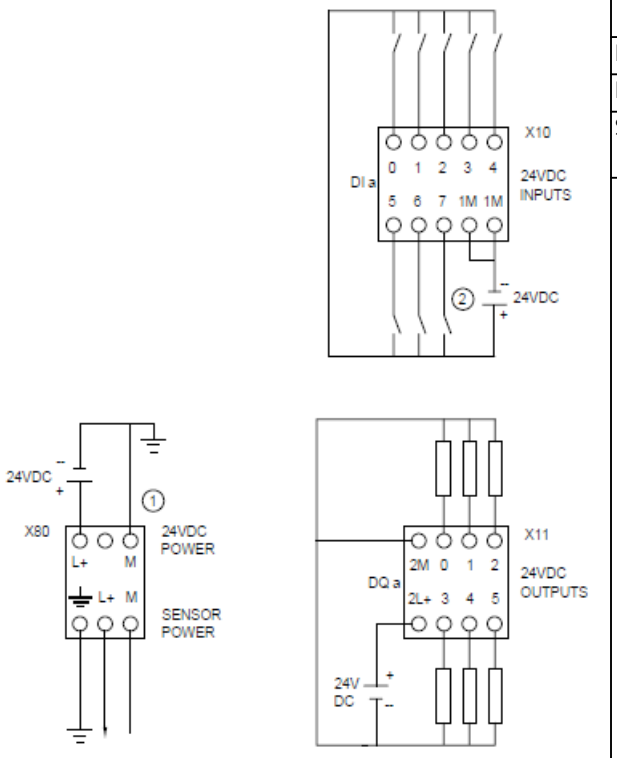
② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

CPU 1212FC DC/DC/DC

X80: DC power wiring terminal (Gray, No keying)

DC power	L+		M
Pin #	1	3	5
Pin #	2	4	6
Sensor power	GND	L+	M

X10: DC input wiring terminal (Gray, No keying)



Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4
Pin #	1	3	5	7	9
Pin #	2	4	6	8	10
Signal	DI a.5	DI a.6	DI a.7	1M	1M

X11: DC output wiring terminal (Gray, No keying)

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

CPU 1212FC DC/DC/DC

Signal	2M	DQ a.0	DQ a.1	DQ a.2
Pin #	1	3	5	7
Pin #	2	4	6	8
Signal	2L+	DQ a.3	DQ a.4	DQ a.5

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

A.5 CPU 1214C

A.5.1 General specifications and features

Table 1-225 General

Technical data	CPU 1214C AC/DC/RLY	CPU 1214C DC/DC/RLY	CPU 1214C DC/DC/DC
Article number	6ES7214-1BH50-0XB0	6ES7214-1HH50-0XB0	6ES7214-1AH50-0XB0
Dimensions W x H x D	80 x 125 x 100 mm		
Weight (product/shipping)	417 grams / 474 grams	376 grams / 433 grams	352 grams / 409 grams
Power dissipation	4.0 W	3.5 W	
Current available for expansion devices	1600 mA max. (5 V DC)		
Current available on sensor supply	400 mA (24 V DC sensor power, current limited)		

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Technical data	**CPU 1214C AC/DC/RLY**	**CPU 1214C DC/DC/RLY**	**CPU 1214C DC/DC/DC**
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]		
	Vertical mounting -20 °C to 50 °C[2]		Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum		

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-226 CPU features

Technical data	**Description**	
User memory	Work Memory	250 Kbytes (Program) 750 Kbytes (Data)
	Load Memory	8 Mbytes (Internal) 32 Gbytes (using SD card)
	Retentive Memory	20 Kbytes
Onboard digital I/O	14 inputs / 10 outputs	
Process image size	1024 bytes of inputs (I) / 1024 bytes of outputs (Q)	
Bit memory size	8192 bytes (M)	
Temporary (local) memory	Per priority class, max.	64 Kbytes
	Per block, max.	16 Kbytes
Communication module/processor expansion	3 max. (must connect to the right of the CPU or to the right of another CM/CP)	
Signal module expansion (SM plus CM)	10 max.	
Signal board or Communication board expansion	2 max.	
High-speed counters	Max. number of high-speed counters	8 (any CPU or SB digital input)
	Max. rate, CPU inputs Ia.0 to Ia.5	100 kHz (80 kHz in quadrature mode)
	Max. rate, CPU inputs Ia.6 to Ib.5	30 kHz (20 kHz in quadrature mode)
	Max. rate, SB inputs	See SB specifications
Pulse outputs[1]	Max. number of pulse outputs	8 (any CPU or SB digital output)
	Max. rate, CPU outputs Qa.0 to Qa.3	100 kHz
	Max. rate, CPU outputs Qa.4 to Qb.1	20 kHz
	Max. rate, SB outputs	See SB specifications
Pulse catch inputs	Yes, each onboard CPU digital input and SB digital input	
Time delay interrupts	20 total with 1 ms resolution	
Cyclic interrupts	20 total with 1 µs resolution	
Edge interrupts	Rising and falling for each onboard CPU digital input and SB digital input	
Memory card (Page 468)	SIMATIC memory card (optional).	
Motion control	Available Resources	800
	Required Resources	40 per speed-controlled axis
		80 per positioning axis
		160 per synchronous axis

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

Technical data	Description	
Motion control	Required Resources	80 per external encoder
		20 per output cam
		160 per cam track
		40 per measuring input
	Available Extended Resources	40
	Required Extended Resources	2 per cam (1000 points)
		30 for each set of kinematics
PID	PID Compact	Yes, universal PID controller with integrated optimization
	PID 3Step	Yes, PID controller with integrated optimization for valves
	PID Temp	Yes, PID controller with integrated optimization for temperature
Real-time clock	Accuracy	+/- 60 seconds per month
	Retention time, super capacitor	20 days typical at 40 °C, 12 days minimum at 40 °C

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

A.5.2 Performance

Table 1-227 Performance

Type of instruction[1]	Direct addressing (I, Q, and M)	DB accesses
Boolean	0.037 µs/instruction	
Move_Bool	0.067 µs/instruction	0.066 µs/instruction
Move_Word	0.027 µs/instruction	0.030 µs/instruction
Move_Real	0.027 µs/instruction	0.030 µs/instruction
Add_Real	0.119 µs/instruction	0.074 µs/instruction

[1] Many variables affect measured times. The above performance times are for the fastest instructions in each category and error-free programs.

A.5.3 Blocks, timers, and counters

Table 1-228 Blocks, times, and counters

Element	Description	
Blocks	Type	OB, FB, FC, DB
	Max. number of elements	4000; Blocks (OB, FB, FC, DB) and UDTs
	Max. OB, FB, FC size	64 Kbytes
	Max. DB size (Optimized)	750 Kbytes Work Memory 16 Mbytes Load Memory
	Max. DB size (Non-optimized)	64 Kbytes (DBs with absolute addressing)
	Address range for FBs and FCs	1 to 65535
	Address range for DBs	1 to 59999
	Nesting depth per priority class[1]	24 (OB plus 23 more levels)

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

Element	Description	
Blocks	Monitoring	Status of 8 code blocks can be monitored simultaneously.
Number of OBs per event class	Program cycle	100
	Startup	100
	Time delay interrupt	20 (one per event)
	Cyclic interrupt	20 (one per event)
	Hardware interrupt	50
	Time error interrupt	1
	Diagnostic error interrupt	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	20 (one per event)
	Synchronous Cycle	1
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
	MC-LookAhead	1
	MC-PreInterpolator	1
	Programming error	1
	I/O access error	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon time type
	IEC_TIMER	16 bytes
	IEC_LTIMER	28 bytes
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon count type
	IEC_SCOUNTER, IEC_USCOUNTER	3 bytes
	IEC_COUNTER, IEC_UCOUNTER	6 bytes
	IEC_DCOUNTER, IEC_UDCOUNTER	12 bytes
	IEC_LCOUNTER, IEC_ULCOUNTER	24 bytes
Runtime Meters	Quantity	16

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

A.5.4 Communications

Table 1-229 Communications

Technical data	Description	
Number of ports	2 with an integrated switch	
Type	Ethernet (RJ-45 connector)	
Connections	88 connections max. (integrated into CPU) 10 reserved for ES/HMI/web	
Data rates	100 Mb/s	
Isolation (Page 81) (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]	
Cable type	CAT5e shielded	
Interfaces	1 PROFINET	
	0 PROFIBUS	
PROFINET Protocols	PROFINET IO controller	Yes
	PROFINET IO device	Yes
	SIMATIC communication	Yes
	Open IE communication	Yes
	Web server	Yes
	Media redundancy	Yes
PROFINET IO controller services	PG/OP communication	Yes
	S7 routing	Yes (requires more than one communication interface)
	Isochronous mode	Yes
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	MRPD	Yes – Requires an IRT sync domain
	PROFIenergy	Yes (per user program)
	Prioritized startup	Yes (max. 16 PROFINET devices)
	Number of connectable I/O devices, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of submodules, max.	512
	Number of IO devices that you can connect for RT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of in line IO devices that you can connect for RT, max.	31
	Number of IO devices that you can connect for IRT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of IO devices that can be activated/deactivated simultaneously, max.	8
	The minimum update time depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.	RT Send clock: 1 ms to 512 ms IRT Send clock: 1 ms to 512 ms (1 ms resolution)
PROFINET I-Device	Number of connections, max.	2

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
PROFINET I-Device services	PG/OP communication	Yes
	S7 routing	No
	Isochronous mode	No
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	PROFIenergy	Yes (per user program)
	Shared device	Yes
	Number of IO controllers with shared device, max.	2
SIMATIC communication	S7 communication as server	Yes
	S7 communication as client	Yes
	User data per job, max.	See TIA Portal information system (S7 communication, user data size)
Open IE communication	TCP/IP	Yes, 64 Kbytes max. data length Several passive connections per port
	ISO-on-TCP (RFC1006)	Yes, 64 Kbytes max. data length
	UDP	Yes, 2048 bytes max. data length 1472 bytes max. for UDP broadcast
	DHCP	Yes
	SNMP	Yes
	DCP	Yes
	LLDP	Yes
Near Field Communication (NFC)	Yes, with the S7-1200 G2 NFC app	
S7 message functions	Number of login stations for message functions, max.	32
	Program alarms	Yes
	Number of configurable program messages, max.	5000
	Number of loadable program messages in RUN, max.	2500
	Number of simultaneously active program alarms	600 program alarms 100 alarms for system diagnostics 160 for motion technology objects
Test commissioning functions	Joint commission (Team Engineering)	Yes, parallel online access possible for up to 5 engineering systems
	Program status	Yes, up to 8 blocks simultaneously (in total across all ES clients)
	Single step	No
	Breakpoints	No
	SIMATIC Controller Profiling	Yes
Monitor/modify	Variables	Inputs/outputs, memory bits, DBs, distributed I/Os, timers, counters
	Number of monitor variables, max.	200 per job
	Number of modify variables, max.	200 per job
Force	Variables	Peripheral inputs/outputs

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
Force	Number of variables, max.	200
Trace	Number of configurable traces	4
	Variables captured per trace, max.	16
	Data captured per trace, max.	512 KB
Diagnostics buffer	Number of entries, max.	500
	Retentive	100

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

A.5.5 Power supply and sensor power

Table 1-230 Power supply

Technical data	CPU 1214C AC/DC/RLY	CPU 1214C DC/DC/RLY	CPU 1214C DC/DC/DC
Rated voltage	120/240 V AC	24 V DC	
Voltage range	85 to 264 V AC	20.4 to 28.8 V DC	
Reverse voltage protection	--	Yes	
Line frequency	47 to 63 Hz	--	
Input current (CPU only)	80 mA at 120 V AC 44 mA at 240 V AC	245 mA at 24 V DC	145 mA at 24 V DC
Input current (with all accessories)	480 mA at 120 V AC 275 mA at 240 V AC	1100 mA at 24 V DC	1000 mA at 24 V DC
Inrush current	20 A max. at 264 V AC	12 A max. at 28.8 V DC	
I^2t	0.8 A^2 s	0.5 A^2 s	
Isolation (input power to logic)	1500 V AC	Not isolated	
Ground leakage (AC line to functional earth)	0.5 mA max.	--	
Hold up time (loss of power)	20 ms at 120 V AC 80 ms at 240 V AC	10 ms at 24 V DC	
Internal fuse	3 A, 250 V, slow blow not user replaceable		

Table 1-231 Sensor power

Technical data	CPU 1214C AC/DC/RLY	CPU 1214C DC/DC/RLY	CPU 1214C DC/DC/DC
Rated voltage	24 V DC		
Voltage range	20.4 to 28.8 V DC	L+ minus 4 V DC min.	
Output current rating	400 mA max. (short-circuit protected)		
Ripple noise (<10 MHz)	< 1 V peak to peak max.	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		
Cable length	500 m shielded		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

A.5.6 Digital inputs and outputs

Table 1-232 Digital inputs

Technical data	CPU 1214C AC/DC/RLY	CPU 1214C DC/DC/RLY	CPU 1214C DC/DC/DC
Number of inputs	14, in 1 isolation group of 14 inputs		
Assignment	Ia.0 to Ia.5 (high-speed) Ia.6 to Ib.5 (standard)		
Type	Sink/Source (IEC Type 1 sink)		
Rated voltage	24 V DC at 6 mA, nominal (high-speed) 24 V DC at 4 mA, nominal (standard)		
Continuous permissible voltage	30 V DC, max. at 8 mA, max. (high-speed) 30 V DC, max. at 6 mA, max. (standard)		
Logic 1 signal	15 V DC min. at 2.5 mA		
Logic 0 signal	5 V DC max. or 0.5 mA		
Isolation (field side to logic)	707 V DC (type test)		
Current per common	20 A mix. (10 A max. per pin)		5 A max.
Filter times (selectable by channel)	µs settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0		
HSC clock input rates (Logic 1 level = 15 to 30 V DC)	Single phase: 100 kHz (Ia.0 to Ia.5) Single phase: 30 kHz (Ia.6 to Ib.5) Quadrature phase: 80 kHz (Ia.0 to Ia.5) Quadrature phase: 20 kHz (Ia.6 to Ib.5)		
Cable length	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

Table 1-233 Digital outputs

Technical data	CPU 1214C AC/DC/RLY	CPU 1214C DC/DC/RLY	CPU 1214C DC/DC/DC
Number of outputs	10, in 1 isolation group of 10 outputs		
Assignment	Qa.0 to Qb.1		Qa.0 to Qa.3 (high-speed) Qa.4 to Qb.1 (standard)
Type	Relay, dry contact		Solid state – MOSFET (sourcing)
Rated voltage	--		24 V DC
Voltage range	5 to 30 V DC or 5 to 250 V AC		20.4 to 28.8 V DC
Logic 1 signal at max. current	--		20 V DC min.
Logic 0 signal with 10 kΩ load	--		0.1 V DC max.
Current	2.0 A max.		0.5 A max.
Minimum load[1]	125 mW DC / 500 mW AC		--
Lamp load	30 W DC / 200 W AC		5 W
ON state resistance	0.2 Ω max. when new		0.6 Ω max.
Leakage current per point	--		10 µA max.
Overload protection	No		
Isolation (field side to logic)	1500 V AC (type test)		707 V DC (type test)
Isolation (coil to logic)	None		--

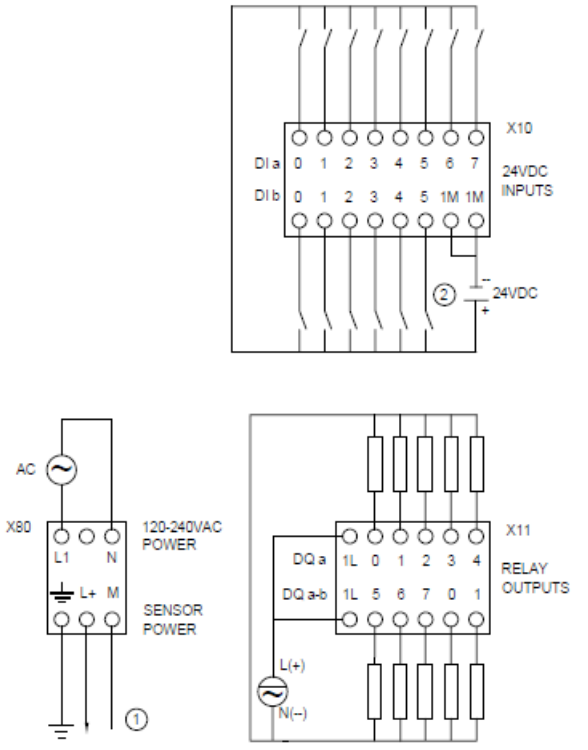
[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.

[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

Technical data	**CPU 1214C AC/DC/RLY**	**CPU 1214C DC/DC/RLY**	**CPU 1214C DC/DC/DC**
Current per common	20 A max. (10 A. max. per pin)		5 A. max.
Inductive clamp voltage	--		L+ minus 40 V, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.		1.0 µs max., OFF to ON 3.0 µs max., ON to OFF
Switching delay (Qa.4 to Qb.1)	10 ms max.		5 µs max., OFF to ON 20 µs max., ON to OFF
Maximum relay switching frequency	1 Hz		--
Pulse Train Output (PTO) rate	Not recommended[2]		100 kHz max. (Qa.0 to Qa.3) 20 kHz max. (Qa.4 to Qb.1) 2 Hz min.[3]
Lifetime mechanical (no load)	10000000 open/close cycles		--
Lifetime contacts at rated load	100000 open/close cycles		--
Behavior on RUN to STOP	Last value or substitute value (default value 0)		
Control of a digital input	Yes		
Parallel outputs for redundant load control	Yes (with same common)		
Parallel outputs for increased load	No		
Cable length	500 m shielded, 150 m unshielded		
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)		

[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.



[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

A.5.7 Wiring diagrams

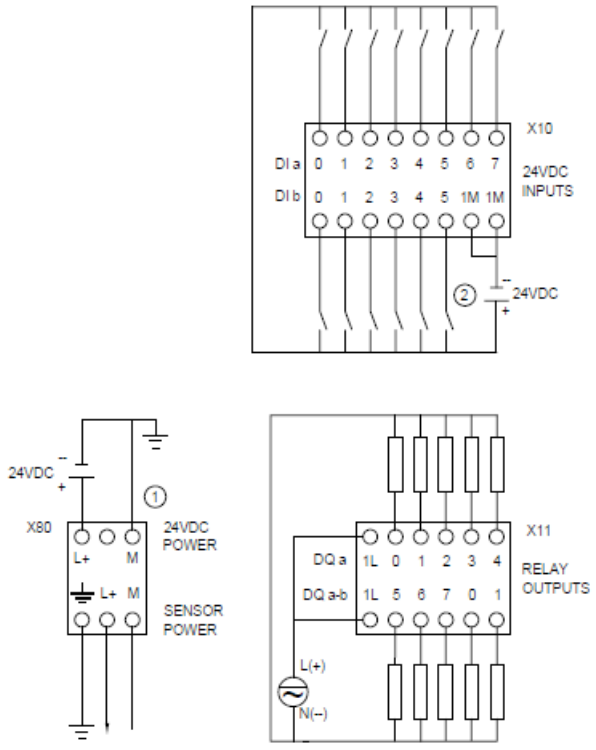
The wiring diagrams and pin connector locations are shown below:

CPU 1214C AC/DC/RLY

X80: AC power wiring terminal (Orange, Type-A keying)								
AC power	L1		N					
Pin #	1	3	5					
Pin #	2	4	6					
Sensor power	GND	L+	M					
X10: DC input wiring terminal (Gray, No keying)								
Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4	DI a.5	DI a.6	DI a.7
Pin #	1	3	5	7	9	11	13	15
Pin #	2	4	6	8	10	12	14	16
Signal	DI b.0	DI b.1	DI b.2	DI b.3	DI b.4	DI b.5	1M	1M
X11: Relay output wiring terminal (Orange, Type-A keying)								
Signal	1L	DQ a.0	DQ a.1	DQ a.2	DQ a.3	DQ a.4		
Pin #	1	3	5	7	9	11		
Pin #	2	4	6	8	10	12		
Signal	1L	DQ a.5	DQ a.6	DQ a.7	DQ b.0	DQ b.1		

① For additional noise immunity, jumper the Sensor Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".



CPU 1214C DC/DC/RLY

X80: DC power wiring terminal (Gray, No keying)								
DC power	L+		M					
Pin #	1	3	5					
Pin #	2	4	6					
Sensor power	GND	L+	M					
X10: DC input wiring terminal (Gray, No keying)

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

CPU 1214C DC/DC/DC

Pin #	2	4	6	8	10	12
Signal	2L+	DQ a.5	DQ a.6	DQ a.7	DQ b.0	DQ b.1

① For additional noise immunity, jumper the 24 V DC Power “M” to Chassis Ground on the connector.

② For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

A.6 CPU 1214FC

A.6.1 General specifications and features

Table 1-234 General

Technical data	**CPU 1214FC DC/DC/RLY**	**CPU 1214FC DC/DC/DC**
Article number	6ES7214-1HF50-0XB0	6ES7214-1AF50-0XB0
Dimensions W x H x D	80 x 125 x 100 mm	
Weight (product/shipping)	376 grams / 433 grams	352 grams / 409 grams
Power dissipation	3.5 W	
Current available for expansion devices	1600 mA max. (5 V DC)	
Current available on sensor supply	400 mA (24 V DC sensor power, current limited)	
Safety class (highest)	PL e (performance level according to ISO 13849-1) SIL 3 (safety integrity level according to IEC 61508)	
Probability of failure	Low demand mode: PFDavg in accordance with SIL 3	

Technical data	**CPU 1214FC DC/DC/RLY**	**CPU 1214FC DC/DC/DC**
	< 2.00E-05 High demand/continuous mode: PFH in accordance with SIL 3 < 1.00E-09 (altitude -1000 m to 3000 m) < 2.00E-09 (altitude >3000 m to 5000 m) For service life of 20 years and repair time of 100 hours	
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]	
	Vertical mounting -20 °C to 50 °C[2]	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum	

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-235 CPU features

Technical data	**Description**	
User memory	Work Memory	300 Kbytes (Program) 750 Kbytes (Data)
	Load Memory	8 Mbytes (Internal) 32 Gbytes (using SD card)
	Retentive Memory	20 Kbytes
Onboard digital I/O	14 inputs / 10 outputs	
Process image size	1024 bytes of inputs (I) / 1024 bytes of outputs (Q)	
Bit memory size	8192 bytes (M)	
Temporary (local) memory	Per priority class, max.	64 Kbytes
	Per block, max.	16 Kbytes
Communication module/processor expansion	3 max. (must connect to the right of the CPU or to the right of another CM/CP)	
Signal module expansion (SM plus CM)	10 max.	
Signal board or Communication board expansion	2 max.	
High-speed counters	Max. number of high-speed counters	8 (any CPU or SB digital input)
	Max. rate, CPU inputs Ia.0 to Ia.5	100 kHz (80 kHz in quadrature mode)
	Max. rate, CPU inputs Ia.6 to Ib.5	30 kHz (20 kHz in quadrature mode)
	Max. rate, SB inputs	See SB specifications
Pulse outputs[1]	Max. number of pulse outputs	8 (any CPU or SB digital output)
	Max. rate, CPU outputs Qa.0 to Qa.3	100 kHz
	Max. rate, CPU outputs Qa.4 to Qb.1	20 kHz
	Max. rate, SB outputs	See SB specifications
Pulse catch inputs	Yes, each onboard CPU digital input and SB digital input	
Time delay interrupts	20 total with 1 ms resolution	
Cyclic interrupts	20 total with 1 µs resolution	
Edge interrupts	Rising and falling for each onboard CPU digital input and SB digital input	

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

Technical data	Description	
Memory card (Page 468)	SIMATIC memory card (optional).	
Motion control	Available Resources	800
	Required Resources	40 per speed-controlled axis
		80 per positioning axis
		160 per synchronous axis
		80 per external encoder
		20 per output cam
		160 per cam track
		40 per measuring input
	Available Extended Resources	40
	Required Extended Resources	2 per cam (1000 points)
		30 for each set of kinematics
PID	PID Compact	Yes, universal PID controller with integrated optimization
	PID 3Step	Yes, PID controller with integrated optimization for valves
	PID Temp	Yes, PID controller with integrated optimization for temperature
Real-time clock	Accuracy	+/- 60 seconds per month
	Retention time, super capacitor	20 days typical at 40 °C, 12 days minimum at 40 °C

[1] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

A.6.2 Performance

Table 1-236 Performance

Type of instruction[1]	Direct addressing (I, Q, and M)	DB accesses
Boolean	0.037 µs/instruction	
Move_Bool	0.067 µs/instruction	0.066 µs/instruction
Move_Word	0.027 µs/instruction	0.030 µs/instruction
Move_Real	0.027 µs/instruction	0.030 µs/instruction
Add_Real	0.119 µs/instruction	0.074 µs/instruction

[1] Many variables affect measured times. The above performance times are for the fastest instructions in each category and error-free programs.

A.6.3 Blocks, timers, and counters

Table 1-237 Blocks, times, and counters

Element	Description	
Blocks	Type	OB, FB, FC, DB
	Max. number of elements	4000; Blocks (OB, FB, FC, DB) and UDTs
	Max. OB, FB, FC size	64 Kbytes

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

Element	Description	
Blocks	Max. DB size (Optimized)	750 Kbytes Work Memory 16 Mbytes Load Memory
	Max. DB size (Non-optimized)	64 Kbytes (DBs with absolute addressing)
	Address range for FBs and FCs	1 to 65535
	Address range for DBs	1 to 59999
	Nesting depth per priority class[1]	24 (OB plus 23 more levels)
	Monitoring	Status of 8 code blocks can be monitored simultaneously.
Number of OBs per event class	Program cycle	100
	Startup	100
	Time delay interrupt	20 (one per event)
	Cyclic interrupt	20 (one per event)
	Hardware interrupt	50
	Time error interrupt	1
	Diagnostic error interrupt	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	20 (one per event)
	Synchronous Cycle	1
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
	MC-LookAhead	1
	MC-PreInterpolator	1
	Programming error	1
	I/O access error	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon time type
	IEC_TIMER	16 bytes
	IEC_LTIMER	28 bytes
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size depends upon count type
	IEC_SCOUNTER, IEC_USCOUNTER	3 bytes
	IEC_COUNTER, IEC_UCOUNTER	6 bytes

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

Element	Description	
Counters	IEC_DCOUNTER, IEC_UDCOUNTER	12 bytes
	IEC_LCOUNTER, IEC_ULCOUNTER	24 bytes
Runtime Meters	Quantity	16

[1] Safety programs use 2 nesting levels; the user program, therefore, has a nesting depth of 22 in safety programs.

A.6.4 Communications

Table 1-238 Communications

Technical data	Description	
Number of ports	2 with an integrated switch	
Type	Ethernet (RJ-45 connector)	
Connections	88 connections max. (integrated into CPU) 10 reserved for ES/HMI/web	
Data rates	100 Mb/s	
Isolation (Page 81) (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]	
Cable type	CAT5e shielded	
Interfaces	1 PROFINET	
	0 PROFIBUS	
PROFINET Protocols	PROFINET IO controller	Yes
	PROFINET IO device	Yes
	SIMATIC communication	Yes
	Open IE communication	Yes
	Web server	Yes
	Media redundancy	Yes
PROFINET IO controller services	PG/OP communication	Yes
	S7 routing	Yes (requires more than one communication interface)
	Isochronous mode	Yes
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	MRPD	Yes – Requires an IRT sync domain
	PROFIenergy	Yes (per user program)
	Prioritized startup	Yes (max. 16 PROFINET devices)
	Number of connectable I/O devices, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of submodules, max.	512
	Number of IO devices that you can connect for RT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)
	Number of in line IO devices that you can connect for RT, max.	31
	Number of IO devices that you can connect for IRT, max.	31 (30 if I-Device is used, 29 if shared I-Device is used)

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
PROFINET IO controller services	Number of IO devices that can be activated/deactivated simultaneously, max.	8
	The minimum update time depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.	RT Send clock: 1 ms to 512 ms IRT Send clock: 1 ms to 512 ms (1 ms resolution)
PROFINET I-Device	Number of connections, max.	2
PROFINET I-Device services	PG/OP communication	Yes
	S7 routing	No
	Isochronous mode	No
	Open IE communication	Yes
	IRT	Yes
	MRP	Yes
	PROFIenergy	Yes (per user program)
	Shared device	Yes
	Number of IO controllers with shared device, max.	2
SIMATIC communication	S7 communication as server	Yes
	S7 communication as client	Yes
	User data per job, max.	See TIA Portal information system (S7 communication, user data size)
Open IE communication	TCP/IP	Yes, 64 Kbytes max. data length Several passive connections per port
	ISO-on-TCP (RFC1006)	Yes, 64 Kbytes max. data length
	UDP	Yes, 2048 bytes max. data length 1472 bytes max. for UDP broadcast
	DHCP	Yes
	SNMP	Yes
	DCP	Yes
	LLDP	Yes
Near Field Communication (NFC)	Yes, with the S7-1200 G2 NFC app	
S7 message functions	Number of login stations for message functions, max.	32
	Program alarms	Yes
	Number of configurable program messages, max.	5000
	Number of loadable program messages in RUN, max.	2500
	Number of simultaneously active program alarms	600 program alarms 100 alarms for system diagnostics 160 for motion technology objects
Test commissioning functions	Joint commission (Team Engineering)	Yes, parallel online access possible for up to 5 engineering systems
	Program status	Yes, up to 8 blocks simultaneously (in total across all ES clients)
	Single step	No

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Technical data	Description	
Test commissioning functions	Breakpoints	No
	SIMATIC Controller Profiling	Yes
Monitor/modify	Variables	Inputs/outputs, memory bits, DBs, distributed I/Os, timers, counters
	Number of monitor variables, max.	200 per job
	Number of modify variables, max.	200 per job
Force	Variables	Peripheral inputs/outputs
	Number of variables, max.	200
Trace	Number of configurable traces	4
	Variables captured per trace, max.	16
	Data captured per trace, max.	512 KB
Diagnostics buffer	Number of entries, max.	500
	Retentive	100

[1] Ethernet port isolation limits hazards during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

A.6.5 Power supply and sensor power

Table 1-239 Power supply

Technical data	CPU 1214FC DC/DC/RLY	CPU 1214FC DC/DC/DC
Rated voltage	24 V DC	
Voltage range	20.4 to 28.8 V DC	
Reverse voltage protection	Yes	
Input current (CPU only)	245 mA at 24 V DC	145 mA at 24 V DC
Input current (with all accessories)	1100 mA at 24 V DC	1000 mA at 24 V DC
Inrush current	12 A max. at 28.8 V DC	
I^2t	0.5 A^2 s	
Isolation (input power to logic)	Not isolated	
Hold up time (loss of power)	10 ms at 24 V DC	
Internal fuse	3 A, 250 V, slow blow not user replaceable	

Table 1-240 Sensor power

Technical data	CPU 1214FC DC/DC/RLY	CPU 1214FC DC/DC/DC
Rated voltage	24 V DC	
Voltage range	L+ minus 4 V DC min.	
Output current rating	400 mA max. (short-circuit protected)	
Ripple noise (<10 MHz)	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated	
Cable length	500 m shielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

A.6.6 Digital inputs and outputs

Table 1-241 Digital inputs

Technical data	CPU 1214FC DC/DC/RLY	CPU 1214FC DC/DC/DC
Number of inputs	14, in 1 isolation group of 14 inputs	
Assignment	Ia.0 to Ia.5 (high-speed) Ia.6 to Ib.5 (standard)	
Type	Sink/Source (IEC Type 1 sink)	
Rated voltage	24 V DC at 6 mA, nominal (high-speed) 24 V DC at 4 mA, nominal (standard)	
Continuous permissible voltage	30 V DC, max. at 8 mA, max. (high-speed) 30 V DC, max. at 6 mA, max. (standard)	
Logic 1 signal	15 V DC min. at 2.5 mA	
Logic 0 signal	5 V DC max. or 0.5 mA	
Isolation (field side to logic)	707 V DC (type test)	
Filter times (selectable by channel)	µs settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0	
HSC clock input rates (Logic 1 level = 15 to 30 V DC)	Single phase: 100 kHz (Ia.0 to Ia.5) Single phase: 30 kHz (Ia.6 to Ib.5) Quadrature phase: 80 kHz (Ia.0 to Ia.5) Quadrature phase: 20 kHz (Ia.6 to Ib.5)	
Cable length	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

Table 1-242 Digital outputs

Technical data	CPU 1214FC DC/DC/RLY	CPU 1214FC DC/DC/DC
Number of outputs	10, in 1 isolation group of 10 outputs	
Assignment	Qa.0 to Qb.1	Qa.0 to Qa.3 (high-speed) Qa.4 to Qb.1 (standard)
Type	Relay, dry contact	Solid state – MOSFET (sourcing)
Rated voltage	--	24 V DC
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 kΩ load	--	0.1 V DC max.
Current	2.0 A max.	0.5 A max.
Minimum load[1]	125 mW DC / 500 mW AC	--
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (type test)	707 V DC (type test)
Isolation (coil to logic)	None	--
Current per common	20 A max. (10 A max. per pin)	5 A max.

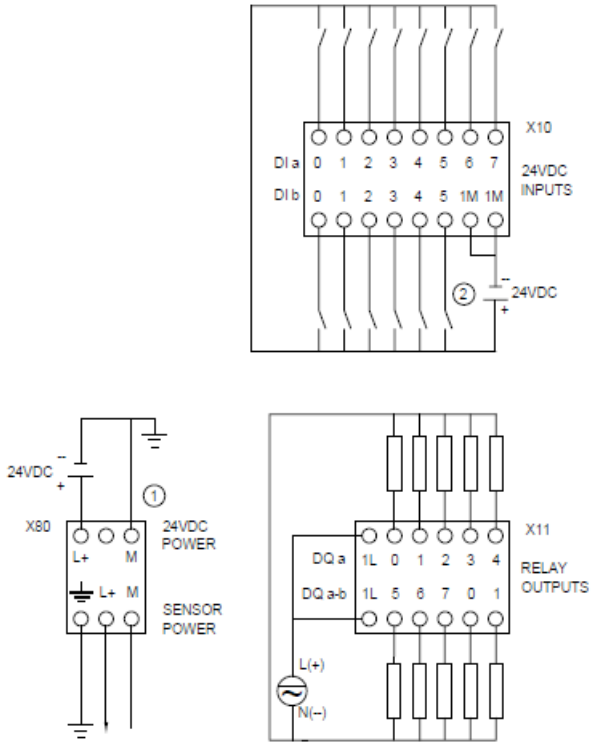
[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.

[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

Technical data	**CPU 1214FC DC/DC/RLY**	**CPU 1214FC DC/DC/DC**
Inductive clamp voltage	--	L+ minus 40 V, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., OFF to ON 3.0 µs max., ON to OFF
Switching delay (Qa.4 to Qb.1)	10 ms max.	5 µs max., OFF to ON 20 µs max., ON to OFF
Maximum relay switching frequency	1 Hz	--
Pulse Train Output (PTO) rate	Not recommended[2]	100 kHz max. (Qa.0 to Qa.3) 20 kHz max. (Qa.4 to Qb.1) 2 Hz min.[3]
Lifetime mechanical (no load)	10000000 open/close cycles	--
Lifetime contacts at rated load	100000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Control of a digital input	Yes	
Parallel outputs for redundant load control	Yes (with same common)	
Parallel outputs for increased load	No	
Cable length	500 m shielded, 150 m unshielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.



[2] For CPU models with relay outputs, you must install a signal board (SB) containing DC digital outputs to use the pulse outputs.

[3] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) can improve pulse signal quality and noise immunity.

A.6.7 Wiring diagrams

The wiring diagrams and pin connector locations are shown below:

CPU 1214FC DC/DC/RLY

X80: DC power wiring terminal (Gray, No keying)

DC power	L+		M
Pin #	1	3	5
Pin #	2	4	6
Sensor power	GND	L+	M

X10: DC input wiring terminal (Gray, No keying)

Signal	DI a.0	DI a.1	DI a.2	DI a.3	DI a.4	DI a.5	DI a.6	DI a.7
Pin #	1	3	5	7	9	11	13	15

A.7 Digital signal modules (SMs)

A.7.1 SM 1221 DI 16x24VDC

Table 1-243 General specifications

Technical data	SM 1221 DI 16x24VDC
Article number	6ES7221-1BH50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	166 grams / 203 grams
Power dissipation	3.2 W
Current consumption (bus)	90 mA max. (5 V DC)
Current consumption (24 V DC)	4.1 mA / input used
Operating environment	Horizontal mounting -20 °C to 60 °C[1]
	Vertical mounting -20 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

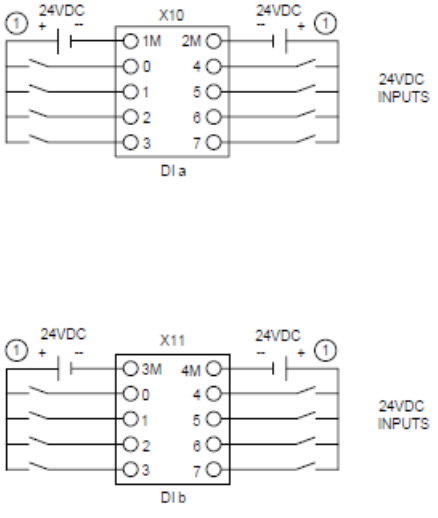

Table 1-244 Digital inputs

Technical data	**SM 1221 DI 16x24VDC**
Number of inputs	16, in 4 isolation groups of 4 inputs each
Type	Sink/Source (IEC Type 1 sink)
Rated voltage	24 V DC at 4.1 mA nominal
Continuous permissible voltage	30 V DC max.
Logic 1 signal	15 V DC min. at 2.5 mA
Logic 0 signal	5 V DC max. or 0.5 mA
Isolation (field side to logic)	707 V DC (type test)
Filter times (selectable in groups of 4)	0.2, 0.4, 0.8, 1.6, 3.2, 6.4, and 12.8 ms
Diagnostics	No
Cable length	500 m shielded, 300 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SM 1221 DI 16x24VDC

X10: Upper User Wiring Terminal (Gray, No Keying)

A.7.2 SM 1222 DQ 16x24VDC

Table 1-245 General specifications

Technical data	SM 1222 DQ 16x24VDC
Article number	6ES7222-5BH50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	173 grams / 210 grams
Power dissipation	3.5 W
Current consumption (bus)	120 mA max. (5 V DC)
Current consumption (24 V DC)	45 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 60 °C[1]
	Vertical mounting -20 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

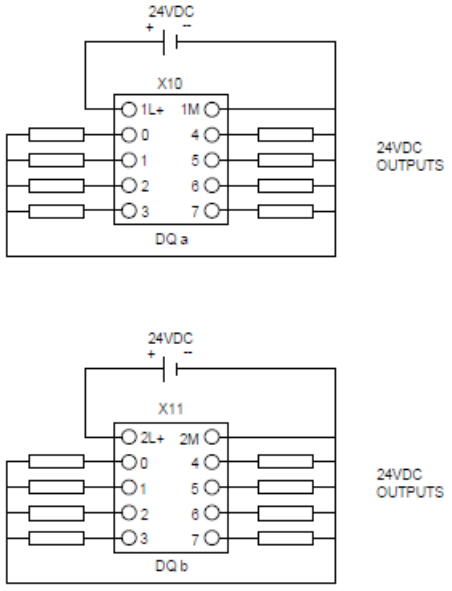

Table 1-246 Digital outputs

Technical data	SM 1222 DQ 16x24VDC
Number of outputs	16, in 2 isolation groups of 8 outputs each
Type	Solid state – MOSFET (sourcing)
Rated voltage	24 V DC
Voltage range	20.4 to 28.8 V DC
Logic 1 signal at max. current	L+ (-0.5 V)
Logic 0 signal with 10 kΩ load	0.1 V DC max.
Current	0.5 A max.
Lamp load	5 W
ON state resistance	0.6 Ω max.
Leakage current per point	10 µA max.
Overload protection	No
Isolation (field side to logic)	707 V DC (type test)
Current per common	4 A max.
Inductive clamp voltage	L+ minus 40 V, 1 W dissipation
Switching delay	50 µs max. OFF to ON 200 µs max. ON to OFF
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Control of a digital input	Yes
Parallel outputs for redundant load control	Yes (with same common)
Parallel outputs for increased load	No
Diagnostics	24 V DC low voltage
Cable length	500 m shielded, 150 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

Wiring diagram

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

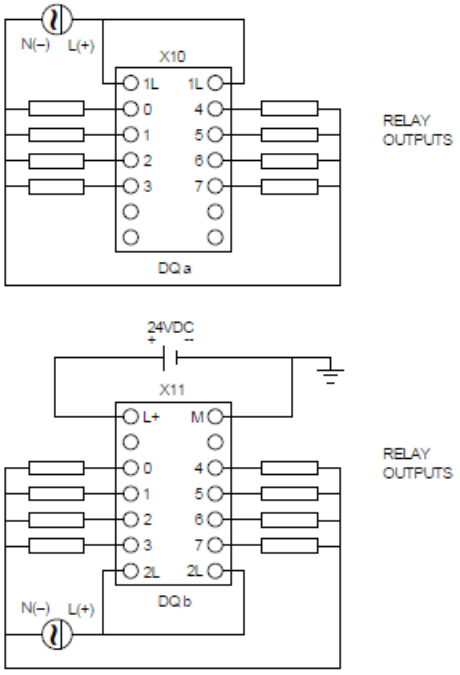
Table 1-248 Digital outputs

Technical data	SM 1222 DQ 16xRLY
Number of outputs	16, in 2 isolation groups of 8 outputs each
Type	Relay, mechanical
Voltage range	5 to 30 V DC or 5 to 250 V AC
Current	2.0 A max.
Minimum load[1]	125 mW DC / 500 mW AC
Lamp load	30 W DC / 200 W AC
ON state resistance	0.2 Ω max. when new
Overload protection	No
Isolation (field side to logic)	1500 V AC (type test)
Isolation (coil to logic)	None
Isolation between groups	1500 V AC
Current per common	16 A max. (10 A max. per pin)
Switching delay	10 ms max.
Maximum relay switching frequency	1 Hz
Lifetime mechanical (no load)	10000000 open/close cycles
Lifetime contacts at rated load (N.O. contact)	100000 open/close cycles
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Control of a digital input	Yes
Parallel outputs for redundant load control	Yes (with same common)
Parallel outputs for increased load	No
Diagnostics	24 V DC low voltage
Cable length	500 m shielded, 150 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)



[1] When using relays at minimum load, avoid ambient temperatures below 0 °C.

Continuous permissible voltage	30 V DC max.
Logic 1 signal	15 V DC min. at 2.5 mA
Logic 0 signal	5 V DC max. or 0.5 mA
Isolation (field side to logic)	707 V DC (type test)
Filter times (selectable in groups of 4)	0.2, 0.4, 0.8, 1.6, 3.2, 6.4, and 12.8 ms
Cable length	500 m shielded, 300 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

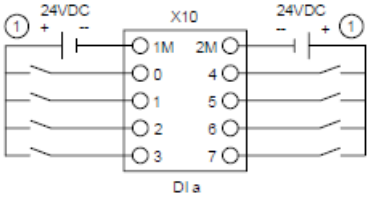
Table 1-260 Digital outputs



Technical data	SM 1223 DI 16x24VDC / DQ 16x24VDC Sink
Number of outputs	16, in 2 isolation groups of 8 outputs each
Type	Solid state – MOSFET (sinking)
Rated voltage	24 V DC
Voltage range	20.4 to 28.8 V DC
Logic 1 signal at max. current	0.5 V DC
Logic 0 signal with 10 kΩ load	24 V (typical) minus 0.75 V DC
Current	0.5 A max.
Lamp load	5 W
ON state resistance	0.5 Ω max.
Leakage current per point	75 µA max.
Overload protection	Yes, current limit protected range 1 A to 3.5 A
Isolation (field side to logic)	707 V DC (type test)
Current per common	4 A max.
Inductive clamp voltage	45 V

Technical data	SM 1223 DI 16x24VDC / DQ 16x24VDC Sink
Switching delay	20 µs max. OFF to ON 350 µs max. ON to OFF
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Control of a digital input	Yes (sourcing input)
Parallel outputs for redundant load control	Yes (with same common)
Parallel outputs for increased load	No
Diagnostics	24 V DC low voltage
Cable length	500 m shielded, 150 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

Wiring diagram

A.7.8 SM 1223 DI 16x24VDC / DQ 16xRLY

Table 1-261 General specifications

Technical data	SM 1223 DI 16x24VDC / DQ 16xRLY
Article number	6ES7223-5PL50-0XB0
Dimensions W x H x D	50 x 125 x 100 mm
Weight (product/shipping)	311 grams / 354 grams
Power dissipation	8.2 W
Current consumption (bus)	160 mA max. (5 V DC)
Current consumption (24 V DC)	175 mA plus 4.1 mA / input used plus 9.3 mA / relay coil used
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-262 Digital inputs

Technical data	SM 1223 DI 16x24VDC / DQ 16xRLY
Number of inputs	16, in 4 isolation groups of 4 inputs each
Type	Sink/Source (IEC Type 1 sink)
Rated voltage	24 V DC at 4 mA nominal
Continuous permissible voltage	30 V DC max.
Logic 1 signal	15 V DC min. at 2.5 mA
Logic 0 signal	5 V DC max. or 0.5 mA
Isolation (field side to logic)	707 V DC (type test)
Filter times (selectable in groups of 4)	0.2, 0.4, 0.8, 1.6, 3.2, 6.4, and 12.8 ms
Cable length	500 m shielded, 300 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

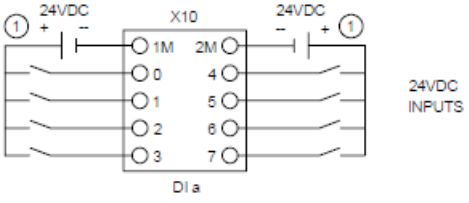

Table 1-263 Digital outputs

Technical data	SM 1223 DI 16x24VDC / DQ 16xRLY
Number of outputs	16, in 2 isolation groups of 8 outputs each
Type	Relay, mechanical
Voltage range	5 to 30 V DC or 5 to 250 V AC
Current	2.0 A max.
Minimum load[1]	125 mW DC / 500 mW AC
Lamp load	30 W DC / 200 W AC
ON state resistance	0.2 Ω max. when new
Overload protection	No
Isolation (field side to logic)	1500 V AC (type test)
Isolation (coil to logic)	None
Current per common	16 A max. (10 A max. per pin)
Switching delay	10 ms max.
Maximum relay switching frequency	1 Hz
Lifetime mechanical (no load)	10,000,000 open/close cycles
Lifetime contacts at rated load (N.O. contact)	100,000 open/close cycles
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Control of a digital input	Yes
Parallel outputs for redundant load control	Yes (with same common)
Parallel outputs for increased load	No
Diagnostics	24 V DC low voltage
Cable length	500 m shielded, 150 m unshielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

A.8 Analog signal modules (SMs)

A.8.1 SM 1231 AI 8x14bit

Table 1-264 General specifications

Technical data	SM 1231 AI 8x14bit
Article number	6ES7231-4HF50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	175 grams / 212 grams

[1] Operating temperature range using maximum voltages and maximum specifications

Technical data	**SM 1231 AI 8x14bit**
Power dissipation	2.5 W
Current consumption (bus)	75 mA max. (5 V DC)
Current consumption (24 V DC)	45 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 60 °C[1]
	Vertical mounting -20 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

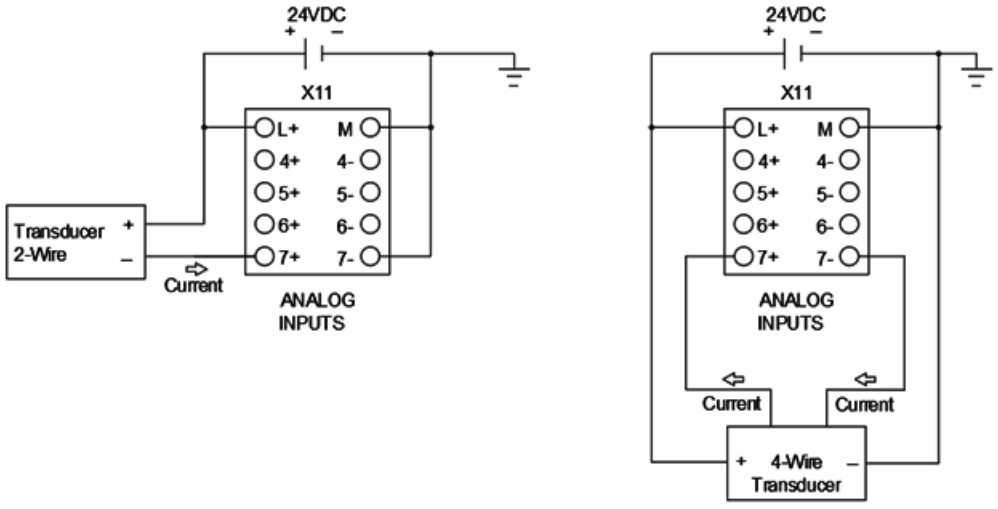

Table 1-265 Analog inputs

Technical data	**SM 1231 AI 8x14bit**	
Number of inputs	8	
Type	Voltage or current (differential), selectable in groups of 2	
Range	±10 V, ±5 V, ±2.5 V, 0 to 20 mA or 4 to 20 mA	
Full scale range (data word)	-27648 to 27648 voltage / 0 to 27648 current	
Overshoot/undershoot range (data word)	Voltage: 32511 to 27649 / -27649 to -32512 Current: 32511 to 27649 / 0 to -4864	
Overflow/underflow (data word)	Voltage: 32767 to 32512 / -32513 to -32768 Current 0 to 20 mA: 32767 to 32512 / -4865 to -32768 Current 4 to 20 mA: 32767 to 32512 (values below -4864 indicate open wire)	
Resolution	13 bits plus sign bit	
Maximum withstand voltage/current	±35 V / ±40 mA	
Smoothing	None, weak, medium, or strong	
Noise rejection	400, 60, 50, or 10 Hz	
Input impedance	Before parameterization	>= 1 MΩ
	Voltage	>= 1 MΩ
	Current	< 290 Ω, > 270 Ω
Isolation	Field side to logic	None
	Logic to 24 V DC	None
	Field side to 24 V DC	None
	Channel to channel	None
Accuracy (25 °C / -20 to 60 °C)	±0.1% / ±0.2% of full scale	
Measuring principle	Successive approximation	
Common mode rejection	40 dB, DC to 60 Hz	
Operational signal range[1]	Signal plus common mode voltage must be less than +12 V and greater than -12 V	
Diagnostics	Overflow/underflow	
	24 V DC low voltage	
	Open wire, 4 to 20 mA range only (if input is below -4864; 1.185 mA)	
Cable length	100 m, twisted and shielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

[1] Voltages outside the operational range applied to one channel can cause interference on other channels.

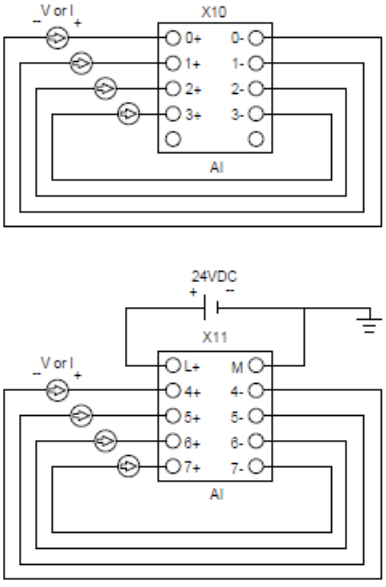
Current measurement

You can implement current measurement with either a 2-wire transducer or a 4-wire transducer as shown below:

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SM 1231 AI 8x14bit



X10: Upper User Wiring Terminal (Light Gray, Type-B Keying)

Signal	Pin #		Signal
AI 0+	1	2	AI 0-
AI 1+	3	4	AI 1-
AI 2+	5	6	AI 2-
AI 3+	7	8	AI 3-
	9	10	

X11: Lower User Wiring Terminal (Light Gray, Type-B Keying)

Signal	Pin #		Signal
L+	1	2	M
AI 4+	3	4	AI 4-
AI 5+	5	6	AI 5-

SM 1231 AI 8x14bit

AI 6+	7	8	AI 6-
AI 7+	9	10	AI 7-

NOTE

When wiring and configuring analog input channels consider the following:

- Connect the positive input terminal to the negative input terminal on each unused voltage input channel.
- Set unused current input channels to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode do not conduct loop current if the module is not powered and configured.

Current input channels are operable only when you supply external power to the transmitter.

A.8.2 SM 1232 AQ 8x14bit

Table 1-266 General specifications

Technical data	SM 1232 AQ 8x14bit
Article number	6ES7232-4HF50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	173 grams / 210 grams
Power dissipation	5.6 W

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

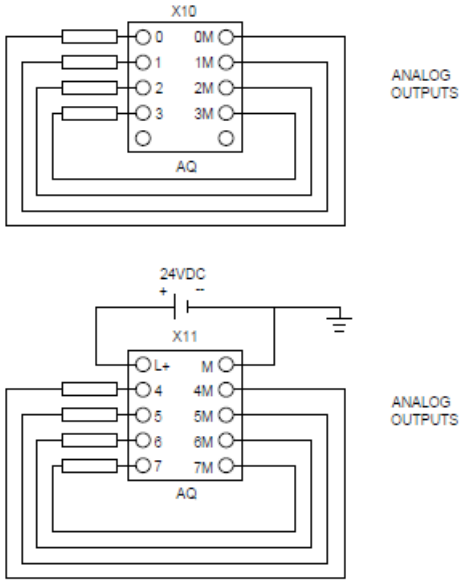
Technical data	SM 1232 AQ 8x14bit
Current consumption (bus)	90 mA max. (5 V DC)
Current consumption (24 V DC)	45 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-267 Analog outputs

Technical data	SM 1232 AQ 8x14bit	
Number of outputs	8	
Type	Voltage or current	
Range	±10 V, 0 to 20 mA, or 4 to 20 mA	
Resolution	Voltage: 14 bits Current: 13 bits	
Full scale range (data word)	Voltage: -27648 to 27648 Current: 0 to 27648	
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale	
Settling time (95% of new value)	Voltage: 300 µs (R), 750 µs (1 µF) Current: 600 µs (1 mH), 2 ms (10 mH)	
Load impedance	Voltage: >= 1000 Ω Current: <= 600 Ω	
Maximum output short circuit current	Voltage: <= 24 mA Current: <= 24 mA	
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Isolation	Field side to logic	None
	24 V to output	None
Diagnostics	Overflow/underflow	
	Short to ground (voltage mode only)[1]	
	Wire break (current mode only)[2]	
	24 V DC low voltage	
Cable length	100 m, twisted and shielded	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	



[1] Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

[2] Wire break detection is only possible when the output current is greater than 1 mA.

Isolation (24 V to output)	None
Diagnostics	Overflow/underflow
	Short to ground (voltage mode only)[1]
	Wire break (current mode only)[2]
	24 V DC low voltage
Cable length	100 m, twisted and shielded
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

[1] Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

[2] Wire break detection is only possible when the output current is greater than 1 mA

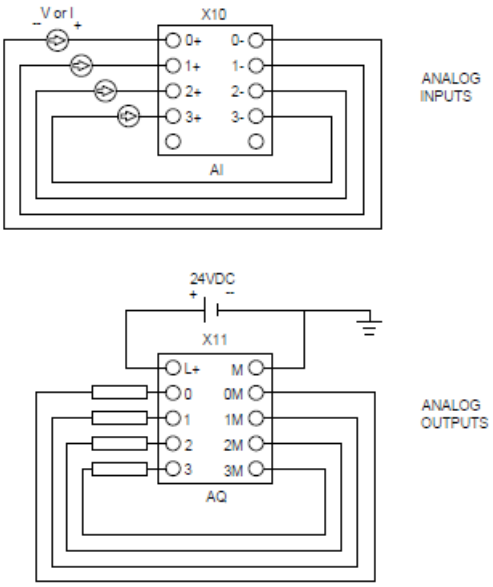
Current measurement

You can implement current measurement with either a 2-wire transducer or a 4-wire transducer as shown below:

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SM 1233 AI 4x14bit / AQ 4x14bit



X10: Upper User Wiring Terminal (Light Gray, Type-B Keying)

Signal	Pin #		Signal
AI 0+	1	2	AI 0-
AI 1+	3	4	AI 1-
AI 2+	5	6	AI 2-
AI 3+	7	8	AI 3-
	9	10	

X11: Lower User Wiring Terminal (Light Gray, Type-B Keying)

Signal	Pin #		Signal
L+	1	2	M
AQ 0	3	4	0M
AQ 1	5	6	1M

SM 1233 AI 4x14bit / AQ 4x14bit

AQ 2	7	8	2M
AQ 3	9	10	3M

NOTE

When wiring and configuring analog input channels consider the following:

- Connect the positive input terminal to the negative input terminal on each unused voltage input channel.
- Set unused current input channels to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode do not conduct loop current if the module is not powered and configured.

Current input channels are operable only when you supply external power to the transmitter.

A.8.4 Step response of the analog inputs

Table 1-271 Step response (ms), 0 to full scale measured at 95%

Smoothing selection (sample averaging)	Noise reduction/rejection frequency (Integration time selection)			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
None (1 cycle): No averaging	4 ms	18 ms	22 ms	100 ms
Weak (4 cycles): 4 samples	9 ms	52 ms	63 ms	320 ms
Medium (16 cycles): 16 samples	32 ms	203 ms	241 ms	1200 ms
Strong (32 cycles): 32 samples	61 ms	400 ms	483 ms	2410 ms

A.8.5 Sample time and update times for the analog inputs

Table 1-272 Sample time and update times for the analog inputs, all channels

Rejection frequency (Integration time)	Sample and module update times for all channels			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
4 channels	0.625 ms	4.17 ms	5 ms	25 ms
8 channels	1.25 ms	4.17 ms	5 ms	25 ms

A.8.6 Measurement ranges of the analog inputs for voltage and current

Table 1-273 Analog input representation for voltage

System		Voltage measuring range				
Decimal	Hexadecimal	+/- 10 V	+/- 5 V	+/- 2.5 V	+/- 1.25 V	
32767	7FFF[1]	11.851 V	5.926 V	2.963 V	1.481 V	Overflow
32512	7F00					
32511	7EFF	11.759 V	5.879 V	2.940 V	1.470 V	Overshoot range
27649	6C01					
27648	6C00	10 V	5 V	2.5 V	1.250 V	Rated range
20736	5100	7.5 V	3.75 V	1.875 V	0.938 V	
1	1	361.7 µV	180.8 µV	90.4 µV	45.2 µV	
0	0	0 V	0 V	0 V	0 V	
-1	FFFF					
-20736	AF00	-7.5 V	-3.75 V	-1.875 V	-0.938 V	
-27648	9400	-10 V	-5 V	-2.5 V	-1.250 V	
-27649	93FF					Undershoot range
-32512	8100	-11.759 V	-5.879 V	-2.940 V	-1.470 V	
-32513	80FF					Underflow
-32768	8000	-11.851 V	-5.926 V	-2.963 V	-1.481 V	

[1] The channel can return 7FFF for one of the following reasons: overflow (as noted in this table), before valid values are available (for example, immediately upon a power up), or if a wire break is detected.

Table 1-274 Analog input representation for current

System		Current measuring range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Undershoot range
-4864	ED00	-3.52 mA	1.185 mA	
32767[1]	7FFF		< 1.185 mA	Wire break (4 to 20 mA)
-32768	8000	< -3.52 mA		Underflow (0 to 20 mA)

[1] The wire break value of 32767 (16#7FFF) is always returned regardless of the state of the wire break alarm.

[1] In an overflow or underflow condition, analog outputs take on the substitute value of the STOP mode.

A.8.8 Basic operation of a thermocouple

A thermocouple is formed whenever two dissimilar metals are electrically bonded to each other. A voltage is generated across the bonded junction that is proportional to the junction temperature. This voltage is small; one microvolt could represent many degrees. Measuring the voltage from a thermocouple, compensating for extra junctions, and then linearizing the result forms the basis of temperature measurement using thermocouples.

The place where the two dissimilar wires are attached to each other forms the sensor thermocouple. The other ends of the thermocouple wires are each attached to a module or board at the signal connector.

Two more thermocouples are formed where the two wires are attached to the signal connector. The connector temperature causes a voltage that adds to the voltage from the sensor thermocouple. If this voltage is not corrected, then the temperature reported will deviate from the sensor temperature.

Cold junction compensation is used to compensate for the connector thermocouples. Thermocouple tables are based on a reference junction temperature, usually zero degrees Celsius. The cold junction compensation compensates the connector to zero degrees Celsius.

The cold junction compensation restores the voltage added by the connector thermocouples. The temperature of the module or board is measured internally, and then converted to a value to be added to the sensor conversion. The corrected sensor conversion is then linearized using the thermocouple tables.

For optimum operation of the cold junction compensation, the thermocouple module or board must be located in a thermally stable environment. Slow variation (less than 0.1 °C/minute) in ambient temperature is correctly compensated within the module or board specifications. Air movement across the module or board will also cause cold junction compensation errors.

If better cold junction error compensation is needed, an external iso-thermal terminal block can be used. The thermocouple board provides for use of a 0 °C referenced or 50 °C referenced terminal block.

A.8.9 SM 1231 AI 8xTC

Table 1-277 General specifications

Technical data	SM 1231 AI 8xTC
Article number	6ES7231-5QF50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	171 grams / 208 grams
Power dissipation	0.6 W
Current consumption (bus)	60 mA max. (5 V DC)
Current consumption (24 V DC)	15 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 60 °C[1]
	Vertical mounting -20 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

Table 1-278 Analog inputs

Technical data	SM 1231 AI 8xTC	
Number of inputs	8	
Sensor types	J, K, T, E, R & S, B, N, C, TXK/XK(L), voltage	
Ranges	See Selection tables for thermocouple sensors.	
Resolution Temperature	0.1 °C / 0.1 °F	
Resolution Voltage	15 bits plus sign	
Maximum withstand voltage	±35 V	
Noise rejection	85 dB for selected filter setting (10 Hz, 50 Hz, 60 Hz or 400 Hz)	
Common mode rejection	> 120 dB at 120 V AC	
Impedance	>= 10 MΩ	
Isolation	Field side to logic	707 V DC (type test)
	Logic to 24 V DC	707 V DC (type test)
	Field side to 24 V DC	707 V DC (type test)
	Channel to channel	120 V AC
Accuracy	See Selection tables for thermocouple sensors.	
Repeatability	±0.05% of full scale	
Measuring principle	Integrating	
Module update time	See Noise reduction and update times for the Termocouple module.	
Cold junction error	±1.5 °C	
Wire resistance	100 Ω max.	
Diagnostics	Overflow/underflow[1]	
	Wire break[2, 3]	

Technical data	SM 1231 AI 8xTC
Diagnostics	24 V DC low voltage[1]
Cable length	100 m to sensor max.
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

[1] The overflow, underflow, and low voltage diagnostic alarm information is reported in the analog data values, even if the alarms are disabled in the module configuration.

[2] When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module can report random values.

[3] The module performs wire break testing every 6 seconds, which extends the update time by 9 ms for each enabled channel once every 6 seconds.

The SM 1231 Thermocouple (TC) analog signal module measures the value of voltage connected to the module inputs. The temperature measurement type can be either "Thermocouple" or "Voltage".

- "Thermocouple": The value is reported in degrees multiplied by ten. (For example, 25.3 degrees is reported as decimal 253).
- "Voltage": The nominal range full scale value is decimal 27648.

Selection tables for thermocouple sensors

Table 1-279 Thermocouple selection table

Type	Under-range minimum[1]	Nominal range low limit	Nominal range high limit	Over-range maximum[2]	Normal range accuracy @ 25 °C[3]	Normal range accuracy -20 °C to 60 °C[1, 2, 5]
J	-210.0 °C -346.0 °F	-150.0 °C -238.0 °F	1200.0 °C 2192.0 °F	1450.0 °C 2642.0 °F	±0.3 °C ±0.5 °F	±1.2 °C ±2.2 °F
K	-270.0 °C -454.0 °F	-200.0 °C -328.0 °F	1372.0 °C 2501.6 °F	1622.0 °C 2951.6 °F	±0.4 °C ±0.7 °F	±2.0 °C ±3.6 °F
T	-270.0 °C -454.0 °F	-200.0 °C -328.0 °F	400.0 °C 752.0 °F	540.0 °C 1004.0 °F	±0.5 °C ±0.9 °F	±1.0 °C ±1.8 °F
E	-270.0 °C -454.0 °F	-200.0 °C -328.0 °F	1000.0 °C 1832.0 °F	1200.0 °C 2192.0 °F	±0.3 °C ±0.5 °F	±0.6 °C ±1.1 °F
R & S	-50.0 °C -58.0 °F	100.0 °C 212.0 °F	1768.0 °C 3214.4 °F	2019.0 °C 3276.6 °F[4]	±1.0 °C ±1.8 °F	±2.5 °C ±4.5 °F
B	0.0 °C 32.0 °F -- --	200.0 °C 392.0 °F 800.0 °C 1472.0 °F	800.0 °C 1472.0 °F 1820.0 °C 3276.6 °F[4]	-- -- 1820.0 °C 3276.6 °F[4]	±2.0 °C ±3.6 °F ±1.0 °C ±1.8 °F	±2.5 °C ±4.5 °F ±2.3 °C ±4.1 °F
N	-270.0 °C -454.0 °F	-200.0 °C -328.0 °F	1300.0 °C 2372.0 °F	1550.0 °C 2822.0 °F	±1.0 °C ±1.8 °F	±1.6 °C ±2.9 °F

[1] Thermocouple values below the under-range minimum value are reported as -32768.

[2] Thermocouple values above the over-range maximum value are reported as 32767.

[3] Internal cold junction error is ±1.5 °C for all ranges. This adds to the error values in this table. The module requires at least 30 minutes of warm-up time to meet this specification. For module ambient temperatures below -10 °C internal cold junction error can be greater than 1.5 °C.

[4] Lower limit of 3276.6 °F with °F reporting

[5] Cold junction compensation error has not been characterized for module ambient temperatures below 0 °C, and can exceed the specified value.

Type	Under-range minimum[1]	Nominal range low limit	Nominal range high limit	Over-range maximum[2]	Normal range accuracy @ 25 °C[3]	Normal range accuracy -20 °C to 60 °C[1, 2, 5]
C	0.0 °C 32.0 °F	100.0 °C 212.0 °F	2315.0 °C 3276.6 °F[4]	2500.0 °C 3276.6 °F[4]	±0.7 °C ±1.3 °F	±4.5 °C ±8.1 °F
TXK/XK(L)	-200.0 °C -328.0 °F	-150.0 °C 302.0 °F	800.0 °C 1472.0 °F	1050.0 °C 1922.0 °F	±0.6 °C ±1.1 °F	±1.2 °C ±2.2 °F
Voltage	-32512	-27648 -80mV	27648 80mV	32511	±0.05%	±0.1%

[1] Thermocouple values below the under-range minimum value are reported as -32768.

[2] Thermocouple values above the over-range maximum value are reported as 32767.

[3] Internal cold junction error is ±1.5 °C for all ranges. This adds to the error values in this table. The module requires at least 30 minutes of warm-up time to meet this specification. For module ambient temperatures below -10 °C internal cold junction error can be greater than 1.5 °C.

[4] Lower limit of 3276.6 °F with °F reporting

[5] Cold junction compensation error has not been characterized for module ambient temperatures below 0 °C, and can exceed the specified value.

NOTE

Thermocouple channel

Each channel on the Thermocouple signal module can be configured with a different thermocouple type (selectable in the software during configuration of the module).

Table 1-280 Noise reduction and update times for the Thermocouple module

Rejection frequency selection	Integration time	Module update time (seconds)
400 Hz (2.5 ms)	10 ms[1]	0.285
60 Hz (16.67 ms)	16.67 ms	0.445
50 Hz (20 ms)	20 ms	0.525
10 Hz (100 ms)	100 ms	2.450

[1] To maintain resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Siemens recommends using a 100 ms integration time for measuring thermocouples. The use of smaller integration times increases the repeatability error of the temperature readings.

Internal calibration

After power is applied, the module performs internal calibration for the analog-to-digital converter. During this time the module reports a value of 32767 on each channel until the channel provides valid data. The STEP 7 program might need to allow for this initialization time. Because the initialization time varies based on the module's configuration, you must verify the behavior of the module in your system. If required, you can include logic in the STEP 7 program to accommodate the initialization time of the module.

You can implement this logic using a polling read in the "Startup OB" which blocks operation until the initialization is complete. You must implement the polling read with an immediate access. If the value of the thermocouple polling read is 32767, you must repeat the read until the value changes. For each module, use only the input channel with the greatest value for the thermocouple polling read. For example, if input channel number 2 is the highest used input channel, you should execute the thermocouple polling read on channel number 2. The module initializes the channels in order from 0 to 7.

Representation of analog values for Thermocouple Type J

A representation of the analog values of thermocouples type J is shown in the table below:

Table 1-281 Representation of analog values of thermocouple type J

Type J in °C[1]	Units		Type J in °F[1]	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1450.0	32767	7FFF	> 2642.0	32767	7FFF	Overflow
1450.0 : 1200.1	14500 : 12001	38A4 : 2EE1	2642.0 : 2192.2	26420 : 21922	6734 : 55A2	Over-range
1200.0 : -150	12000 : 1500	2EE0 : FA24	2192.0 : -238.0	21920 : -2380	55A0 : F6B4	Rated range
-150.1 : -210	-1501 : -2100	FA23 : F7CC	-238.1 : -346.0	-2381 : -3460	F6B3 : F27C	Under-range
< -210.0	-32768	8000	< -346.0	-32768	8000	Underflow[2]

[1] A value change of 1 indicates a temperature change of +/- one-tenth degree.

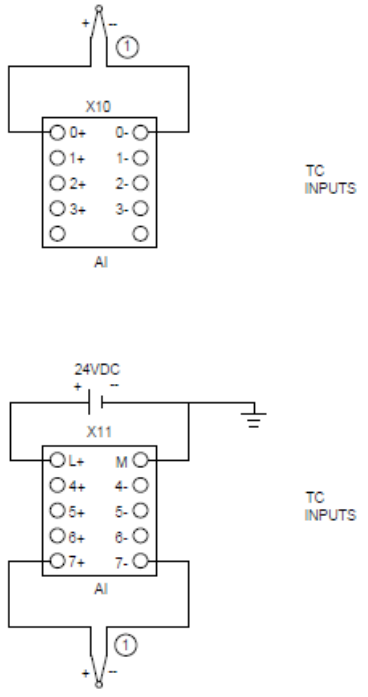
[2] Faulty wiring (for example, polarity reversal, or open inputs) or sensor error in the negative range (for example, wrong type of thermocouple) can cause the thermocouple module to signal underflow.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SM 1231 AI 8xTC

X10: Upper user wiring terminal (Light gray, Type-B keying)



Signal	Pin #		Signal
AI 0+	1	2	AI 0-
AI 1+	3	4	AI 1-
AI 2+	5	6	AI 2-
AI 3+	7	8	AI 3-
	9	10	

X11: Lower user wiring terminal (Light gray, Type-B keying)

Signal	Pin #		Signal
L+	1	2	M
AI 4+	3	4	AI 4-
AI 5+	5	6	AI 5-

① TC 1, 2, 3, 4, 5, and 6 are not shown for clarity.

SM 1231 AI 8xTC

AI 6+	7	8	AI 6-
AI 7+	9	10	AI 7-

① TC 1, 2, 3, 4, 5, and 6 are not shown for clarity.

NOTE

Connect the positive input terminal to the negative input terminal on each unused TC input channel. You can deactivate unused thermocouple channels. Deactivated channels do not report errors.

A.8.10 SM 1231 AI 4xRTD

Table 1-282 General specifications

Technical data	SM 1231 AI 4xRTD
Article number	6ES7231-5PD50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	169 g / 206 grams

Diagnostics	Overflow/underflow[1, 2]	
	Wire break[3]	
	24 V DC low voltage[1]	
Wire resistance	20 Ω, 2.7 Ω for 10 Ω RTD max.	
Cable length	100 m to sensor max.	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

[1] The overflow, underflow and low voltage diagnostic alarm information is reported in the analog data values even if the alarms are disabled in the module configuration.

[2] For resistance ranges underflow detection is never enabled.

[3] When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module can report random values.

[4] Accuracy can be affected when the signal module is subjected to radio frequency radiation between 480 MHz to 800 MHz or when the signal module's ambient temperature changes at a rate of 3 °C per minute or faster.

The SM 1231 AI 4xRTD measures the value of resistance connected to the module inputs. The measurement type can be selected as either "Resistor" or "Thermal resistor".

- "Resistor": The nominal range full scale value is decimal 27648.
- "Thermal resistor": The value is reported in degrees multiplied by ten. (For example, 25.3 degrees is reported as decimal 253.) The climatic range values are reported in degrees multiplied by one hundred. (For example, 25.34 degrees is reported as decimal 2534.)

The SM 1231 AI 4xRTD uses a current to measure the resistance of the sensor. For resistance ranges and the RTD ranges of 200 ohms or less the current is 0.25 mA. For the 500- and 1000-ohm RTD ranges the current is 0.20 mA. This current is pulsed depending on the number of active channels on the module. For two active channels, the duty cycle for one channel is 50%. If four channels are active, the duty cycle for one channel is 25%. The maximum output voltage for an open circuit condition on the sensor is 3.3 V DC (measured between the I+ and I- terminals).

The SM 1231 AI 4xRTD supports measurements with 2-wire, 3-wire and 4-wire connections to the sensor resistor.

Selection table for the RTD sensors

Table 1-284 Ranges and accuracy for the different sensors supported by the RTD module

	Cu 100						

[1] RTD values below the under-range minimum value report -32768.

[2] RTD values above the over-range maximum value report +32767.

Table 1-285 Resistance

Range	Under range minimum	Nominal range low limit	Nominal range high limit	Over range maximum[1]	Normal range accuracy @ 25 °C	Normal range accuracy -20 °C to 60 °C
150 Ω	n/a	0 (0 Ω)	27648 (150 Ω)	176.383 Ω	±0.05%	±0.1%
300 Ω	n/a	0 (0 Ω)	27648 (300 Ω)	352.767 Ω	±0.05%	±0.1%
600 Ω	n/a	0 (0 Ω)	27648 (600 Ω)	705.534 Ω	±0.05%	±0.1%

[1] Resistance values above the over-range maximum value are reported as +32767.

The module reports 32767 on any activated channel with no sensor connected. If open wire detection is also enabled, the module flashes the appropriate red LEDs.

When 500 Ω and 1000 Ω RTD ranges are used with other lower value resistors, the error can increase to two times the specified error.

Best accuracy is achieved for the 10 Ω RTD ranges if 4 wire connections are used.

The resistance of the connection wires in 2 wire mode causes an error in the sensor reading; therefore, accuracy is not guaranteed.

Table 1-286 Noise reduction and update times for the RTD module

Rejection frequency selection	Integration time	Module update time (seconds)
400 Hz (2.5 ms)	10 ms[1]	4- / 2-wire: 0.142 3-wire: 0.285
60 Hz (16.67 ms)	16.67 ms	4- / 2-wire: 0.222 3-wire: 0.445
50 Hz (20 ms)	20 ms	4- / 2-wire: 0.262 3-wire: 0.505
10 Hz (100 ms)	100 ms	4- / 2-wire: 1.222 3-wire: 2.445

[1] To maintain resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Internal calibration

After power is applied, the module performs internal calibration for the analog-to-digital converter. During this time the module reports a value of 32767 on each channel until the channel provides valid data. The STEP 7 program might need to allow for this initialization time. Because the initialization time varies based on the module's configuration, you must verify the behavior of the module in your system. If required, you can include logic in the STEP 7 program to accommodate the initialization time of the module.

You can implement this logic using a polling read in the "Startup OB" which blocks operation until the initialization is complete. You must implement the polling read with an immediate

access. If the value of the RTD polling read is 32767, you must repeat the read until the value changes. For each module, use only the input channel with the greatest value for the RTD polling read. For example, if input channel number 2 is the highest used input channel, you should execute the RTD polling read on channel number 2. The module initializes the channels in order from 0 to 3.

Representation of analog values for RTDs

A representation of the digitized measured value for the RTD standard temperature range sensors is shown in the table below:

Table 1-287 Representation of analog values for resistance temperature detectors PT 100, 200, 500, 1000 and PT 10, 50, 100, 500 GOST (0.003850) standard

Pt x00 standard in °C[1]	Units		Pt x00 standard in °F[1]	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1000.0	32767	7FFF	> 1832.0	32767	7FFF	Overflow
1000.0 : 850.1	10000 : 8501	2710 : 2135	1832.0 : 1562.1	18320 : 15621	4790 : 3D05	Over-range
850.0 : -200.0	8500 : -2000	2134 : F830	1562.0 : -328.0	15620 : -3280	3D04 : F330	Rated range
-200.1 : -243.0	-2001 : -2430	F82F : F682	-328.1 : -405.4	-3281 : -4054	F32F : F02A	Under-range
< -243.0	-32768	8000	< -405.4	-32768	8000	Underflow

[1] A value change of 1 indicates a temperature change of +/- one-tenth degree.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

Signal	Pin #		Signal
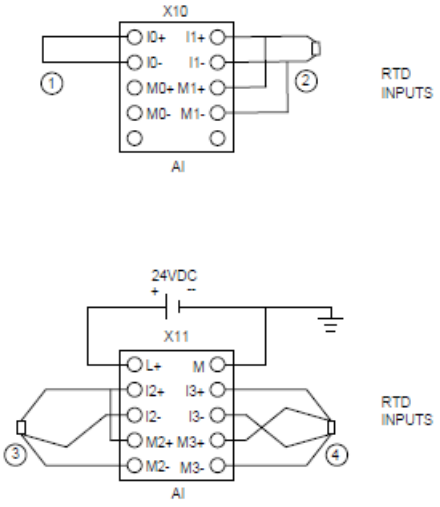
L+	1	2	M
AI I2+	3	4	AI I3+



① Loop-back unused RTD inputs

② 2-wire RTD connection represented

③ 3-wire RTD connection represented

④ 4-wire RTD connection represented

SM 1231 AI 4xRTD

AI I2-	5	6	AI I3-
AI M2+	7	8	AI M3+
AI M2-	9	10	AI M3-

① Loop-back unused RTD inputs

② 2-wire RTD connection represented

③ 3-wire RTD connection represented

④ 4-wire RTD connection represented

NOTE

You can deactivate unused RTD channels. Deactivated channels do not report errors.
To avoid extra stabilization time, which is automatically added to an active unused channel, make the current loop continuous. For consistency, connect a resistor like the 2-wire RTD connection to the RTD module.

A.9 Digital signal boards (SBs)

A.9.1 SB 1221 DI 8x24VDC

Table 1-288 General specifications

Technical data	SB 1221 DI 8x24VDC
Article number	6ES7221-3BF50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	26 grams / 53 grams
Power dissipation	2.4 W
Current consumption (bus)	108 mA max. (5 V DC)
Current consumption (24 V DC)	6 mA / input used
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

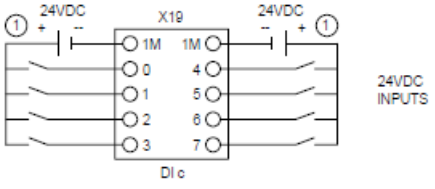
[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-289 Digital inputs

Technical data	SB 1221 DI 8x24VDC
Number of inputs	8, in 1 isolation group of 8 inputs
Type	Sink/Source (IEC Type 1 sink)
Rated voltage	24 V DC at 5.8 mA nominal
Continuous permissible voltage	30 V DC max.
Logic 1 signal	15 V DC min. at 2.5 mA
Logic 0 signal	5 V DC max. or 0.5 mA
Isolation (field side to logic)	707 V DC (type test)
Filter times (selectable by channel)	µs settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0,12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0
HSC clock input rates (Logic 1 Level = 15 to 30 V DC)	Single phase: 100 kHz max. Quadrature phase: 80 kHz max.
Cable length	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)

NOTE



When switching frequencies above 20 kHz, you must have a clean square wave. Consider the following options to improve the signal quality:

- Minimize the cable length.
- Change the driver from a sink or source only to a push-pull driver.
- Change to a higher quality cable.
- Reduce the circuit/components from 24 V to 5 V.
- Add an external load at the input.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1221 DI 8x24VDC

X19: Upper User Wiring Terminal (Gray, No Keying)

Signal	Pin #		Signal
1M	1	2	1M

DI c.1	5	6	DI c.5
DI c.2	7	8	DI c.6
DI c.3	9	10	DI c.7

① For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".

A.9.2 SB 1222 DQ 8x24VDC

Table 1-290 General specifications

Technical data	SB 1222 DQ 8x24VDC
Article number	6ES7222-5BF50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	29 grams / 53 grams
Power dissipation	1.0 W
Current consumption (bus)	30 mA max. (5 V DC)
Current consumption (24 V DC)	15 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

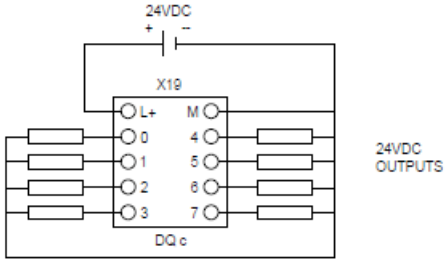
[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-291 Digital outputs

Technical data	SB 1222 DQ 8x24VDC
Number of outputs	8, in 1 isolation group of 8 outputs
Type	Push-pull
Rated voltage	24 V DC
Voltage range	20.4 to 28.8 V DC
Logic 1 signal at max. current	L+ minus 1.5 V
Logic 0 signal at max. current	1.0 V DC max.

Technical data	SB 1222 DQ 8x24VDC
Current	0.1 A max.
ON state resistance	6 Ω max.
OFF state resistance	10 Ω max.
Leakage current per point	10 µA max.
Pulse Train Output (PTO) rate	100 kHz max., 2 Hz min.
Overload protection	Yes
Isolation (field side to logic)	707 V DC (type test)
Current per common	0.8 A max.
Inductive clamp voltage	0 V, 1 W dissipation
Switching delay	1.5 µs + 300 ns rise 1.5 µs + 300 ns fall
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Control of a digital input	Yes
Parallel outputs for redundant load control	Yes
Parallel outputs for increased load	No
Diagnostics	24 V DC low voltage
Cable length	500 m shielded, 150 m unshielded, 50 m shielded for PTO outputs
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)

NOTE



When switching frequencies above 20 kHz, you must have a clean square wave. Consider the following options to improve the signal quality:

- Minimize the cable length.
- Change the driver from a sink or source only to a push-pull driver.
- Change to a higher quality cable.
- Reduce the circuit/components from 24 V to 5 V.
- Add an external load at the input.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1222 DQ 8x24VDC

X19: Upper User Wiring Terminal (Gray, No Keying)

Signal	Pin #		Signal
L+	1	2	M
DQ c.0	3	4	DQ c.4
DQ c.1	5	6	DQ c.5
DQ c.2	7	8	DQ c.6
DQ c.3	9	10	DQ c.7

⚠ WARNING

Risk of current leakage from ungrounded connections
Loss of the ground wire connection to the high-speed DQ SBs can allow enough leakage current to activate a DC load resulting in unexpected equipment operation.
Ensure that the M connection wire is securely grounded. If the outputs are used for critical DC load applications, exercise extra caution by using a redundant ground wire to the SB.
Unexpected equipment operation can result in property damage, severe personal injury, and death.

A.9.3 SB 1223 DI 4x24VDC / DQ 4x24VDC

Table 1-292 General specifications

Technical data	SB 1223 DI 4x24VDC / DQ 4x24VDC
Article number	6ES7223-7BF50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	28 grams / 55 grams
Power dissipation	1.7 W
Current consumption (bus)	48 mA max. (5 V DC)
Current consumption (24 V DC)	15 mA plus 6 mA / input used
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]

A.10 Analog signal boards (SBs)

A.10.1 SB 1231 AI 4x14bit

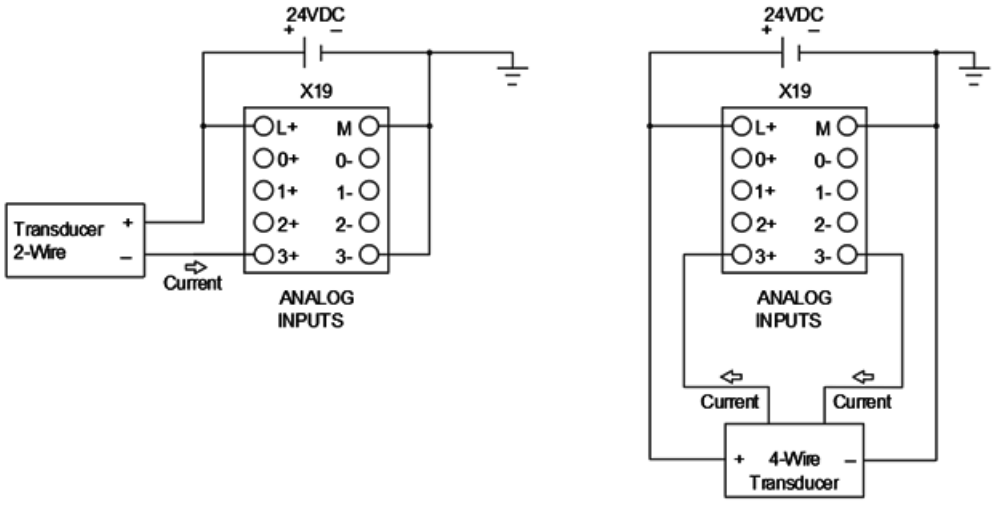
Table 1-298 General specifications

Technical data	SB 1231 AI 4x14bit
Article number	6ES7231-4HD50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	30 grams / 57 grams
Power dissipation	1.4 W
Current consumption (bus)	28 mA max. (5 V DC)
Current consumption (24 V DC)	30 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-299 Analog inputs

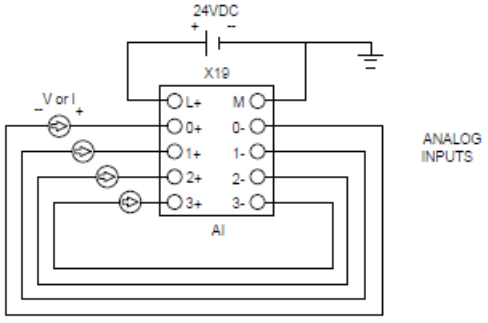


Technical data	**SB 1231 AI 4x14bit**	
Number of inputs	4	
Type	Voltage or current (differential)	
Range	±10 V, ±5 V, ±2.5 V, 0 to 20 mA or 4 to 20 mA	
Full scale range (data word)	-27648 to 27648 voltage / 0 to 27648 current	
Overshoot/undershoot range (data word)	Voltage: 32511 to 27649 / -27649 to -32512 Current: 32511 to 27649 / 0 to -4864	
Overflow/underflow (data word)	Voltage: 32767 to 32512 / -32513 to -32768 Current 0 to 20 mA: 32767 to 32512 / -4865 to -32768 Current 4 to 20 mA: 32767 to 32512 (values below -4864 indicate open wire)	
Resolution	13 bits plus sign bit	
Maximum withstand voltage/current	±35 V / ±40 mA	
Smoothing	None, weak, medium, or strong	
Noise rejection	400, 60, 50, or 10 Hz	
Input impedance	Before parameterization	>= 1 MΩ
	Voltage	>= 1 MΩ
	Current	< 290 Ω, > 270 Ω
Isolation	Field side to logic	None
	Logic to 24 V DC	None
	Field side to 24 V DC	None
	Channel to channel	None
Accuracy[1] (25 °C / -20 to 60 °C)	±0.1% / ±0.2% of full scale	
Measuring principle	Actual value conversion	
Common mode rejection	40 dB, DC to 60 Hz	
Operational signal range[2]	Signal plus common mode voltage must be less than +12 V and greater than -12 V	
Diagnostics	Overflow/underflow	
	24 V DC low voltage	
	Open wire, 4 to 20 mA range only (if input is below -4864; 1.185 mA)	
Cable length	100 m, twisted and shielded	
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)	
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)	

[1] The presence of radio frequencies of 500 MHz to 600 MHz can degrade accuracy.

[2] Voltages outside the operational range applied to one channel can cause interference on other channels.

Current measurement



You can implement current measurement with either a 2-wire transducer or a 4-wire transducer as shown below:

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1231 AI 4x14bit

X19: Upper user wiring terminal (Light gray, No keying)

Signal	Pin #		Signal
L+	1	2	M
AI 0+	3	4	AI 0-
AI 1+	5	6	AI 1-
AI 2+	7	8	AI 2-
AI 3+	9	10	AI 3-

NOTE

When wiring and configuring analog input channels consider the following:

- Connect the positive input terminal to the negative input terminal on each unused voltage input channel.
- Set unused current input channels to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode do not conduct loop current if the module is not powered and configured.

Current input channels are operable only when you supply external power to the transmitter.

A.10.2 SB 1232 AQ 4x14bit

Table 1-300 General specifications

Technical data	SB 1232 AQ 4x14bit
Article number	6ES7232-4HD50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	28 grams / 55 grams
Power dissipation	3.0 W
Current consumption (bus)	25 mA max. (5 V DC)
Current consumption (24 V DC)	30 mA
Rated supply voltage	24 V DC
Supply voltage range	20.4 to 28.8 V DC
Reverse supply voltage protection	Yes

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Technical data	SB 1232 AQ 4x14bit
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

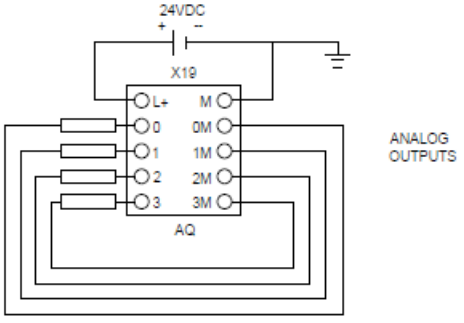
[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-301 Analog outputs

Technical data	SB 1232 AQ 4x14bit
Number of outputs	4
Type	Voltage or current
Range	±10 V, 0 to 20 mA, or 4 to 20 mA
Resolution	Voltage: 14 bits Current: 13 bits
Full scale range (data word)	Voltage: -27648 to 27648 Current: 0 to 27648
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale
Settling time (95% of new value)	Voltage: 300 µs (R), 750 µs (1 µF) Current: 600 µs (1 mH), 2 ms (10 mH)
Load impedance	Voltage: >= 1000 Ω Current: <= 600 Ω
Maximum output short circuit current	Voltage: <= 24 mA Current: <= 24 mA
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Isolation (field side to logic)	None
Isolation (24 V to output)	None
Diagnostics	Overflow/underflow
	Short to ground (voltage mode only)[1]
	Wire break (current mode only)[2]
	24 V DC low voltage
Cable length	100 m, twisted and shielded
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)

[1] Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.



[2] Wire break detection is only possible when the output current is greater than 1 mA.

Wiring diagram

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-303 Analog inputs

Technical data	SB 1233 AI 2x14bit / AQ 2x14bit
Number of inputs	2
Type	Voltage or current (differential)
Range (Page 445)	±10 V, ±5 V, ±2.5 V, 0 to 20 mA or 4 to 20 mA
Full scale range (data word)	-27648 to 27648 voltage / 0 to 27648 current

[1] Voltages outside the operational range applied to one channel can cause interference on other channels.

Technical data	SB 1233 AI 2x14bit / AQ 2x14bit	
Overshoot/undershoot range (data word)	Voltage: 32511 to 27649 / -27649 to -32512 Current: 32511 to 27649 / 0 to -4864	
Overflow/underflow (data word)	Voltage: 32767 to 32512 / -32513 to -32768 Current 0 to 20 mA: 32767 to 32512 / -4865 to -32768 Current 4 to 20 mA: 32767 to 32512 (values below -4864 indicate open wire)	
Resolution	13 bits plus sign bit	
Maximum withstand voltage/current	±35 V / ±40 mA	
Smoothing	None, weak, medium, or strong	
Noise rejection	400, 60, 50, or 10 Hz	
Input impedance	Before parameterization	>= 1 MΩ
	Voltage	>= 1 MΩ
	Current	< 290 Ω, > 270 Ω
Isolation	Field side to logic	None
	Logic to 24 V DC	None
	Field side to 24 V DC	None
	Channel to channel	None
Accuracy (25 °C / -20 to 60 °C)	±0.1% / ±0.2% of full scale	
Measuring principle	Actual value conversion	
Common mode rejection	40 dB, DC to 60 Hz	
Operational signal range[1]	Signal plus common mode voltage must be less than +12 V and greater than -12 V	
Diagnostics	Overflow/underflow	
	24 V DC low voltage	
	Open wire, 4 to 20 mA range only (if input is below -4864; 1.185 mA)	
Cable length	100 m, twisted and shielded	
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)	
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)	

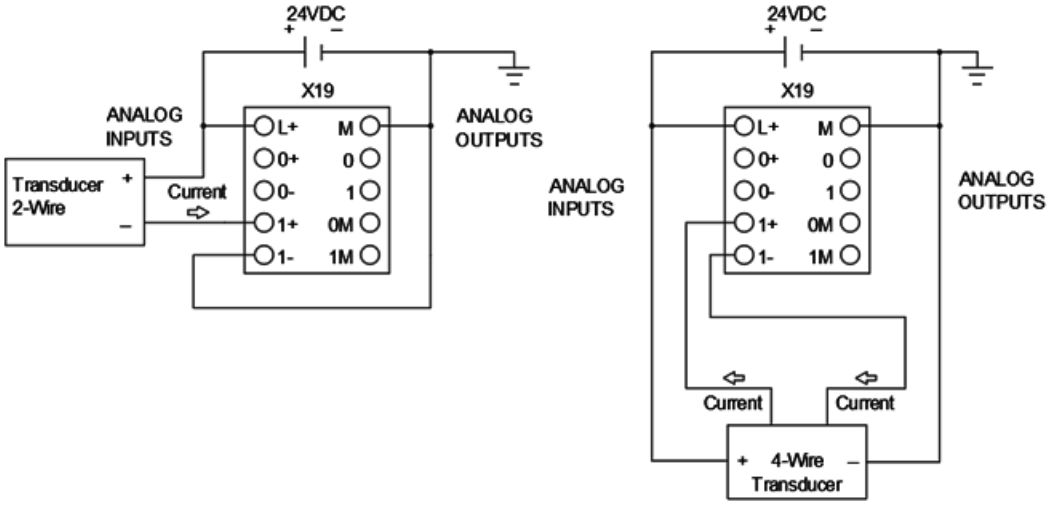
[1] Voltages outside the operational range applied to one channel can cause interference on other channels.

Table 1-304 Analog outputs

Technical data	SB 1233 AI 2x14bit / AQ 2x14bit
Number of outputs	2
Type	Voltage or current
Range (Page 446)	±10 V, 0 to 20 mA, or 4 to 20 mA
Resolution	Voltage: 14 bits Current: 13 bits
Full scale range (data word)	Voltage: -27648 to 27648 Current: 0 to 27648
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale
Settling time (95% of new value)	Voltage: 300 µs (R), 750 µs (1 µF) Current: 600 µs (1 mH), 2 ms (10 mH)
Load impedance	Voltage: >= 1000 Ω Current: <= 600 Ω
Maximum output short circuit current	Voltage: <= 24 mA Current: <= 24 mA
Behavior on RUN to STOP	Last value or substitute value (default value 0)

[1] Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

[2] Wire break detection is only possible when the output current is greater than 1 mA.



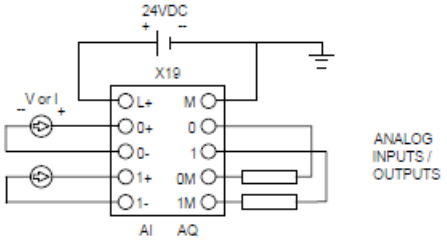
Technical data	SB 1233 AI 2x14bit / AQ 2x14bit
Isolation (field side to logic)	None
Isolation (24 V to output)	None
Diagnostics	Overflow/underflow
	Short to ground (voltage mode only)[1]
	Wire break (current mode only)[2]
	24 V DC low voltage
Cable length	100 m, twisted and shielded
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)

[1] Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

[2] Wire break detection is only possible when the output current is greater than 1 mA.

Current measurement

You can implement current measurement with either a 2-wire transducer or a 4-wire transducer as shown below:



Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1233 AI 2x14bit / AQ 2x14bit				
	X19: Upper User Wiring Terminal (Light Gray, No Keying)			
	Signal	Pin #		Signal
	L+	1	2	M
	AI 0+	3	4	AQ 0
	AI 0-	5	6	AQ 1

SB 1233 AI 2x14bit / AQ 2x14bit

AI 1+	7	8	AQ 0M
AI 1-	9	10	AQ 1M

NOTE

When wiring and configuring analog input channels consider the following:

- Connect the positive input terminal to the negative input terminal on each unused voltage input channel.
- Set unused current input channels to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode do not conduct loop current if the module is not powered and configured.

Current input channels are operable only when you supply external power to the transmitter.

A.10.4 Step response of the analog inputs

Table 1-305 Step response (ms), 0 to full scale measured at 95%

Smoothing selection (sample averaging)	Noise reduction/rejection frequency (Integration time selection)			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
None (1 cycle): No averaging	4 ms	18 ms	22 ms	100 ms
Weak (4 cycles): 4 samples	9 ms	52 ms	63 ms	320 ms
Medium (16 cycles): 16 samples	32 ms	203 ms	241 ms	1200 ms
Strong (32 cycles): 32 samples	61 ms	400 ms	483 ms	2410 ms

A.10.5 Sample time and update times for the analog inputs

Table 1-306 Sample time and update times

Rejection frequency (Integration time)	Sample and board update times for all channels			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
2 or 4 channels	0.625 ms	4.17 ms	5 ms	25 ms

A.10.6 Measurement ranges of the analog inputs for voltage and current

Table 1-307 Analog input representation for voltage

System		Voltage measuring range				
Decimal	Hexadecimal	+/- 10 V	+/- 5 V	+/- 2.5 V	+/- 1.25 V	
32767	7FFF[1]	11.851 V	5.926 V	2.963 V	1.481 V	Overflow
32512	7F00					
32511	7EFF	11.759 V	5.879 V	2.940 V	1.470 V	Overshoot range
27649	6C01					
27648	6C00	10 V	5 V	2.5 V	1.250 V	Rated range
20736	5100	7.5 V	3.75 V	1.875 V	0.938 V	
1	1	361.7 µV	180.8 µV	90.4 µV	45.2 µV	
0	0	0 V	0 V	0 V	0 V	
-1	FFFF					
-20736	AF00	-7.5 V	-3.75 V	-1.875 V	-0.938 V	
-27648	9400	-10 V	-5 V	-2.5 V	-1.250 V	
-27649	93FF					Under-shoot range
-32512	8100	-11.759 V	-5.879 V	-2.940 V	-1.470 V	
-32513	80FF					Underflow
-32768	8000	-11.851 V	-5.926 V	-2.963 V	-1.481 V	

[1] The channel can return 7FFF for one of the following reasons: overflow (as noted in this table), before valid values are available (for example, immediately upon a power up), or if a wire break is detected.

Table 1-308 Analog input representation for current

System		Current measuring range		
Decimal	Hexadecimal	0 mA to 20 mA	4 mA to 20 mA	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Undershoot range

[1] The wire break value of 32767 (16#7FFF) is always returned regardless of the state of the wire break alarm.

System		Current measuring range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
-4864	ED00	-3.52 mA	1.185 mA	Undershoot range
32767[1]	7FFF		< 1.185 mA	Wire break (4 to 20 mA)
-32768	8000	< -3.52 mA		Underflow (0 to 20 mA)

[1] The wire break value of 32767 (16#7FFF) is always returned regardless of the state of the wire break alarm.

A.10.7 Measurement ranges of the analog outputs for voltage and current

Table 1-309 Analog output representation for voltage

System		Voltage output range	
Decimal	**Hexadecimal**	**+/- 10 V**	
32767	7FFF	See note 1	Overflow
32512	7F00	See note 1	
32511	7EFF	11.76 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
1	0001	361.7 µV	
0	0000	0 V	
-1	FFFF	-361.7 µV	
-20736	AF00	-7.5 V	
-27648	9400	-10 V	
-27649	93FF		Undershoot range
-32512	8100	-11.76 V	
-32513	80FF	See note 1	Underflow
-32768	8000	See note 1	

[1] In an overflow or underflow condition, analog outputs take on the substitute value of the STOP mode.

Table 1-310 Analog output representation for current

System		Current output range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
32767	7FFF	See note 1	See note 1	Overflow
32512	7F00	See note 1	See note 1	
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Rated range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF		4 mA to 578.7 nA	Undershoot range
-6912	E500		0 mA	
-6913	E4FF			Not possible. Output

[1] In an overflow or underflow condition, analog outputs take on the substitute value of the STOP mode.

System		Current output range		
Decimal	Hexadecimal	0 mA to 20 mA	4 mA to 20 mA	
-32512	8100			value limited to 0 mA.
-32513	80FF	See note 1	See note 1	Underflow
-32768	8000	See note 1	See note 1	

[1] In an overflow or underflow condition, analog outputs take on the substitute value of the STOP mode.

A.10.8 Basic operation of a thermocouple

A thermocouple is formed whenever two dissimilar metals are electrically bonded to each other. A voltage is generated across the bonded junction that is proportional to the junction temperature. This voltage is small; one microvolt could represent many degrees. Measuring the voltage from a thermocouple, compensating for extra junctions, and then linearizing the result forms the basis of temperature measurement using thermocouples.

The place where the two dissimilar wires are attached to each other forms the sensor thermocouple. The other ends of the thermocouple wires are each attached to a module or board at the signal connector.

Two more thermocouples are formed where the two wires are attached to the signal connector. The connector temperature causes a voltage that adds to the voltage from the sensor thermocouple. If this voltage is not corrected, then the temperature reported will deviate from the sensor temperature.

Cold junction compensation is used to compensate for the connector thermocouples. Thermocouple tables are based on a reference junction temperature, usually zero degrees Celsius. The cold junction compensation compensates the connector to zero degrees Celsius.

The cold junction compensation restores the voltage added by the connector thermocouples. The temperature of the module or board is measured internally, and then converted to a value to be added to the sensor conversion. The corrected sensor conversion is then linearized using the thermocouple tables.

For optimum operation of the cold junction compensation, the thermocouple module or board must be located in a thermally stable environment. Slow variation (less than 0.1 °C/minute) in ambient temperature is correctly compensated within the module or board specifications. Air movement across the module or board will also cause cold junction compensation errors.

If better cold junction error compensation is needed, an external iso-thermal terminal block can be used. The thermocouple board provides for use of a 0 °C referenced or 50 °C referenced terminal block.

A.10.9 SB 1231 AI 4xTC

Table 1-311 General specifications

Technical data	SB 1231 AI 4xTC
Article number	6ES7231-5QD50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	29 grams / 56 grams
Power dissipation	0.4 W
Current consumption (bus)	65 mA max. (5 V DC)

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Technical data	SB 1231 AI 4xTC
Current consumption (24 V DC)	None
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-312 Analog inputs

Technical data	SB 1231 AI 4xTC	
Number of inputs	4	
Sensor types	J, K, T, E, R & S, B, N, C, TXK/XK(L), voltage	
Ranges	See Selection tables for thermocouple sensors.	
Resolution	Temperature	0.1 °C / 0.1 °F
	Voltage	15 bits plus sign
Maximum withstand voltage	±35 V	
Noise rejection	85 dB for selected filter setting (10 Hz, 50 Hz, 60 Hz or 400 Hz)	
Common mode rejection	> 120 dB at 120 V AC	
Impedance	>= 10 MΩ	
Isolation	Field side to logic	707 V DC (type test)
	Logic to 24 V DC	707 V DC (type test)
	Field side to 24 V DC	707 V DC (type test)
	Channel to channel	120 V AC
Accuracy	See Selection tables for thermocouple sensors.	
Repeatability	±0.05% of full scale	
Measuring principle	Integrating	
Board update time	See Noise reduction and update times for the Thermocouple board.	
Cold junction error (Page 447)	±1.5 °C	
Wire resistance	100 Ω max.	
Diagnostics	Overflow/underflow[1]	
	Wire break[2, 3]	
Cable length	100 m to sensor max.	
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)	
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)	

[1] The overflow and underflow diagnostic alarm information is reported in the analog data values even if the alarms are disabled in the board configuration.

[2] When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the board can report random values.

[3] The board performs wire break testing every 6 seconds, which extends the update time by 9 ms for each enabled channel once every 6 seconds.

The SB 1231 Thermocouple (TC) analog signal board measures the value of voltage connected to the board inputs. The temperature measurement type can be either "Thermocouple" or "Voltage".

- "Thermocouple": The value is reported in degrees multiplied by ten. (For example, 25.3 degrees is reported as decimal 253).
- "Voltage": The nominal range full scale value is decimal 27648.

Selection tables for thermocouple sensors

Table 1-313 Thermocouple selection table

Type	Under-range minimum[1]	Nominal range low limit	Nominal range high limit	Over-range maximum[2]	Normal range accuracy @ 25 °C[3]	Normal range accuracy -20 °C to 60 °C[1, 2, 5]
J	-210.0 °C -346.0 °F	-150.0 °C -238.0 °F	1200.0 °C 2192.0 °F	1450.0 °C 2642.0 °F	±0.3 °C ±0.5 °F	±1.2 °C ±2.2 °F

B	0.0 °C 32.0 °F -- --	200.0 °C 392.0 °F 800.0 °C 1472.0 °F	800.0 °C 1472.0 °F 1820.0 °C 3276.6 °F[4]	-- -- 1820.0 °C 3276.6 °F[4]	±2.0 °C ±3.6 °F ±1.0 °C ±1.8 °F	±2.5 °C ±4.5 °F ±2.3 °C ±4.1 °F
N	-270.0 °C -454.0 °F	-200.0 °C -328.0 °F	1300.0 °C 2372.0 °F	1550.0 °C 2822.0 °F	±1.0 °C ±1.8 °F	±1.6 °C ±2.9 °F
C	0.0 °C 32.0 °F	100.0 °C 212.0 °F	2315.0 °C 3276.6 °F[4]	2500.0 °C 3276.6 °F[4]	±0.7 °C ±1.3 °F	±4.5 °C ±8.1 °F
TXK/XK(L)	-200.0 °C -328.0 °F	-150.0 °C 302.0 °F	800.0 °C 1472.0 °F	1050.0 °C 1922.0 °F	±0.6 °C ±1.1 °F	±1.2 °C ±2.2 °F
Voltage	-32512	-27648 -80mV	27648 80mV	32511	±0.05%	±0.1%

[1] Thermocouple values below the under-range minimum value are reported as -32768.

[2] Thermocouple values above the over-range maximum value are reported as 32767.

[3] Internal cold junction error is ±1.5 °C for all ranges. This adds to the error in this table. The board requires at least 30 minutes of warm-up time to meet this specification. For board ambient temperatures below -10 °C, internal cold junction error can be greater than 1.5 °C.

[4] Lower limit of 3276.6 °F with °F reporting

[5] Cold junction compensation error has not been characterized for board ambient temperatures below 0 °C, and can exceed the specified value.

NOTE

You can configure each channel on the Thermocouple signal board with a different thermocouple type (selectable in the software during configuration of the board).

Table 1-314 Noise reduction and update times for the Thermocouple board

Rejection frequency selection	Integration time	Board update time (seconds)
400 Hz (2.5 ms)	10 ms[1]	0.285
60 Hz (16.67 ms)	16.67 ms	0.445
50 Hz (20 ms)	20 ms	0.525
10 Hz (100 ms)	100 ms	2.450

[1] To maintain resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Siemens recommends using a 100 ms integration time for measuring thermocouples. The use of smaller integration times increases the repeatability error of the temperature readings.

Internal calibration

After power is applied, the board performs internal calibration for the analog-to-digital converter. During this time, the board reports a value of 32767 on each channel until the channel provides valid data. The STEP 7 program might need to allow for this initialization time. Because the initialization time varies based on the board's configuration, you must verify the behavior of the board in your system. If required, you can include logic in the STEP 7 program to accommodate the initialization time of the board.

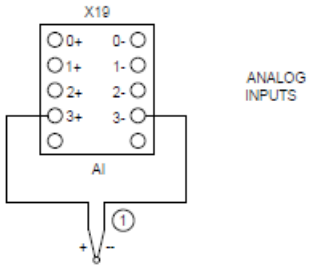
You can implement this logic using a polling read in the "Startup OB" which blocks operation until the initialization is complete. You must implement the polling read with an immediate access. If the value of the thermocouple polling read is 32767, you must repeat the read until the value changes. For each board, use only the input channel with the greatest value for the thermocouple polling read. For example, if input channel number 2 is the highest used input channel, you should execute the thermocouple polling read on channel number 2. The board initializes the channels in order from 0 to 3.

Representation of analog values for Thermocouple Type J

A representation of the analog values of thermocouple type J is shown in the table below:

Table 1-315 Representation of analog values of thermocouple type J

Type J in °C[1]	Units		Type J in °F[1]	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1450.0	32767	7FFF	> 2642.0	32767	7FFF	Overflow
1450.0 : 1200.1	14500 : 12001	38A4 : 2EE1	2642.0 : 2192.2	26420 : 21922	6734 : 55A2	Over-range
1200.0 : -150	12000 : 1500	2EE0 : FA24	2192.0 : -238.0	21920 : -2380	55A0 : F6B4	Rated range
-150.1 : -210	-1501 : -2100	FA23 : F7CC	-238.1 : -346.0	-2381 : -3460	F6B3 : F27C	Under-range
< -210.0	-32768	8000	< -346.0	-32768	8000	Underflow[2]



[1] A value change of 1 indicates a temperature change of +/- one-tenth degree.

[2] Faulty wiring (for example, polarity reversal, or open inputs) or sensor error in the negative range (for example, wrong type of thermocouple) can cause the thermocouple module to signal underflow.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1231 AI 4xTC

X19: Upper user wiring terminal (Light gray, No keying)

Signal	Pin #		Signal
AI 0+	1	2	AI 0-
AI 1+	3	4	AI 1-
AI 2+	5	6	AI 2-
AI 3+	7	8	AI 3-
	9	10	

① TC 0, 1, and 2 are not shown connected for clarity.

NOTE

Connect the positive input terminal to the negative input terminal on each unused TC input channel. You can deactivate unused thermocouple channels. Deactivated channels do not report errors.

A.10.10 SB 1231 AI 2xRTD

Table 1-316 General specifications

Technical data	SB 1231 AI 2xRTD
Article number	6ES7231-5PB50-0XB0
Dimensions W x H x D	15 x 62 x 63 mm
Weight (product/shipping)	29 grams / 56 grams
Power dissipation	0.3 W
Current consumption (bus)	50 mA max. (5 V DC)
Current consumption (24 V DC)	None
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active

Table 1-317 Analog inputs

Technical data	SB 1231 AI 2xRTD	
Number of inputs	2	
Sensor types	See Selection table for RTD sensors.	
Ranges	See Selection table for RTD sensors.	
Resolution	Temperature	0.1 °C / 0.1 °F
	Resistance	15 bits plus sign
Maximum withstand voltage	±35 V	
Noise rejection	85 dB for the selected noise reduction (10 Hz, 50 Hz, 60 Hz or 400 Hz)	
Common mode rejection	> 120 dB	
Impedance	>= 10 MΩ	
Isolation	Field side to logic	707 V DC (type test)
	Logic to 24 V DC	707 V DC (type test)
	Field side to 24 V DC	707 V DC (type test)
	Channel to channel	None
Accuracy	See Selection table for RTD sensors.[4]	
Repeatability	±0.05% of full scale	
Maximum sensor dissipation	0.2 mW	
Measuring principle	Integrating	
Board update time	See Noise reduction and update times for the RTD board.	
Wire resistance	20 Ω, 2.7 Ω for 10 Ω RTD max.	
Diagnostics	Overflow/underflow[1, 2]	
	Wire break[3]	
Cable length	100 m to sensor max.	
Cable size	0.2 mm^2 to 0.8 mm^2 (AWG 24 to 18)	
Ferrule size	0.25 mm^2 or 0.34 mm^2 (AWG 24 or 22)	

[1] The overflow and underflow diagnostic alarm information is reported in the analog data values, even if the alarms are disabled in the board configuration.

[2] For resistance ranges, underflow detection is never enabled.

[3] When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the board can report random values.

[4] Accuracy can be affected when the signal board is subjected to radio frequency radiation between 480 MHz to 800 MHz or when the signal board's ambient temperature changes at a rate of 3 °C per minute or faster.

The SB 1231 AI 2xRTD measures the value of resistance connected to the signal board inputs. The measurement type can be selected as either "Resistor" or "Thermal resistor".

- "Resistor": The nominal range full scale value is decimal 27648.
- "Thermal resistor": The value is reported in degrees multiplied by ten. (For example, 25.3 degrees is reported as decimal 253.) The climatic range values are reported in degrees multiplied by one hundred. (For example, 25.34 degrees is reported as decimal 2534.)

The SB 1231 AI 2xRTD uses a current to measure the resistance of the sensor. For resistance ranges and the RTD ranges of 200 ohms or less the current is 0.25 mA. For the 500- and 1000-ohm RTD ranges the current is 0.20 mA. This current is pulsed depending on the number of active channels on the module. For two active channels, the duty cycle for one channel is 50%. If four channels are active, the duty cycle for one channel is 25%. The maximum output voltage for an open circuit condition on the sensor is 3.3 V DC (measured between the I+ and I- terminals).

The SB 1231 AI 2xRTD supports measurements with 2-wire, 3-wire, and 4-wire connections to the sensor resistor.

Selection table for RTD sensors

Table 1-318 Ranges and accuracy for the different sensors supported by the RTD board

Temperature coefficient	RTD type	Under range minimum[1]	Nominal range low limit	Nominal range high limit	Over range maximum[2]	Normal range accuracy @ 25 °C	Normal range accuracy -20 °C to 60 °C

	Cu 100						

[1] RTD values below the under-range minimum value are reported as -32768.

[2] RTD values above the over-range maximum value are reported as +32767.

Table 1-319 Resistance

Range	Under range minimum	Nominal range low limit	Nominal range high limit	Over range maximum[1]	Normal range accuracy @ 25 °C	Normal range accuracy -20 °C to 60 °C
150 Ω	n/a	0 (0 Ω)	27648 (150 Ω)	176.383 Ω	±0.05%	±0.1%
300 Ω	n/a	0 (0 Ω)	27648 (300 Ω)	352.767 Ω	±0.05%	±0.1%
600 Ω	n/a	0 (0 Ω)	27648 (600 Ω)	705.534 Ω	±0.05%	±0.1%

[1] Resistance values above the over-range maximum value are reported as +32767.

The board reports 32767 on any activated channel with no sensor connected. If open wire detection is also enabled, the board flashes the appropriate red LEDs.

When 500 Ω and 1000 Ω RTD ranges are used with other lower value resistors, the error can increase to two times the specified error.

Best accuracy is achieved for the 10 Ω RTD ranges if 4 wire connections are used.

The resistance of the connection wires in 2 wire mode causes an error in the sensor reading; therefore, accuracy is not guaranteed.

Table 1-320 Noise reduction and update times for the RTD board

Rejection frequency selection	Integration time	Board update time (seconds)
400 Hz (2.5 ms)	10 ms[1]	4- / 2-wire: 0.142 3-wire: 0.285
60 Hz (16.67 ms)	16.67 ms	4- / 2-wire: 0.222 3-wire: 0.445
50 Hz (20 ms)	20 ms	4- / 2-wire: 0.262 3-wire: 0.505
10 Hz (100 ms)	100 ms	4- / 2-wire: 1.222 3-wire: 2.445

[1] To maintain resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Internal calibration

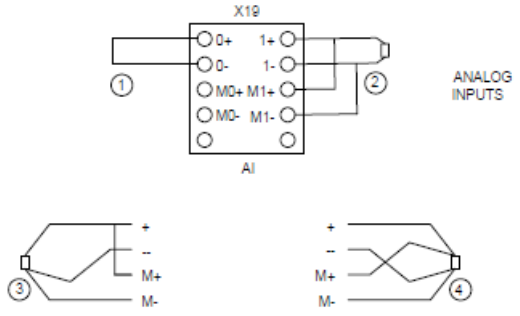
After power is applied, the board performs internal calibration for the analog-to-digital converter. During this time, the board reports a value of 32767 on each channel until the channel provides valid data. The STEP 7 program might need to allow for this initialization time. Because the initialization time varies based on the board's configuration, you must verify the behavior of the board in your system. If required, you can include logic in the STEP 7 program to accommodate the initialization time of the board.

You can implement this logic using a polling read in the "Startup OB" which blocks operation until the initialization is complete. You must implement the polling read with an immediate access. If the value of the RTD polling read is 32767, you must repeat the read until the value changes. For each board, use only the input channel with the greatest value for the RTD polling read. For example, if input channel number 0 is the highest used input channel, you should execute the RTD polling read on channel number 0. The board initializes the channels in order from 0 to 1.

Representation of analog values for RTDs

A representation of the digitized measured value for the RTD standard temperature range sensors is shown in the table below:

Table 1-321 Representation of analog values for resistance temperature detectors PT 100, 200, 500, 1000 and PT 10, 50, 100, 500 GOST (0.003850) standard



Pt x00 standard in °C[1]	Units		Pt x00 standard in °F[1]	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1000.0	32767	7FFF	> 1832.0	32767	7FFF	Overflow
1000.0 : 850.1	10000 : 8501	2710 : 2135	1832.0 : 1562.1	18320 : 15621	4790 : 3D05	Over-range
850.0 : -200.0	8500 : -2000	2134 : F830	1562.0 : -328.0	15620 : -3280	3D04 : F330	Rated range
-200.1 : -243.0	-2001 : -2430	F82F : F682	-328.1 : -405.4	-3281 : -4054	F32F : F02A	Under-range
< -243.0	-32768	8000	< -405.4	-32768	8000	Underflow

[1] A value change of 1 indicates a temperature change of +/- one-tenth degree.

Wiring diagram

The wiring diagram and pin connector locations are shown below:

SB 1231 AI 2xRTD

X19: Upper user wiring terminal (Light gray, No keying)

Signal	Pin #		Signal
AI I0+	1	2	AI I1+
AI I0-	3	4	AI I1-
AI M0+	5	6	AI M1+
AI M0-	7	8	AI M1-
	9	10	

① Loop back unused inputs.

② 2-wire RTD connection represented.

③ 3-wire RTD connection represented.

④ 4-wire RTD connection represented.

NOTE

You can deactivate unused RTD channels. Deactivated channels do not report errors.
To avoid extra stabilization time, which is automatically added to an active unused channel, make the current loop continuous. For consistency, connect a resistor like the 2-wire RTD connection to the RTD board.

A.11 Battery board (BB) 1297

The S7-1200 G2 Battery board (BB) 1297 provides long-term backup of the real-time clock. It is pluggable in the signal board slot(s) of the S7-1200 G2 CPU. You must add the battery board to the device configuration and download the hardware configuration to the CPU for the battery board to be functional. The battery is not included and must be purchased separately. When adding or replacing the battery, a UL certified CR2032 (Li/MnO_2) battery with a rating of 3 V, 225 mAh must be used.

⚠ WARNING

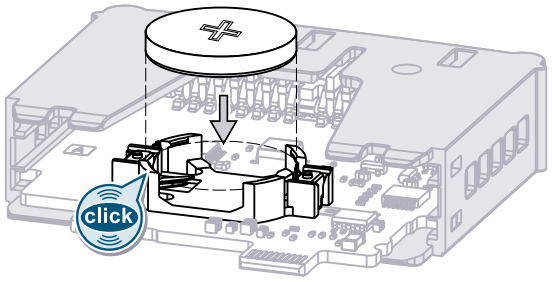
Risks when installing or connecting an unspecified battery in the BB 1297
Installing an unspecified battery in the battery board or otherwise connecting an unspecified battery to the circuit can result in fire or component damage and unpredictable operation of machinery. The battery must be installed in a non-hazardous environment.
Use only the specified battery for backup of the real-time clock.
Fire or unpredictable operation of machinery can result in death, severe personal injury, or property damage.

Table 1-322 General specifications

Technical data	**BB 1297**
Article number	6ES7297-4AX50-0XA0
Dimensions W x H x D (mm)	15 x 62 x 63 mm
Weight (product/shipping)	26 grams / 42 grams
Power dissapation	0.2 W
Current consumption (SM Bus)	35 mA max. (5 V DC)
Current consumption (24 V DC)	None
Operating environment	Horizontal mounting -20 °C to 40 °C[1] -20 °C to 60 °C[2]
	Vertical mounting -20 °C to 40 °C[1] -20 °C to 50 °C[2]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

[2] Operating temperature range using rated voltages, 50% of maximum specifications, and alternate I/O active



Battery (not included)	**BB 1297**
Hold up time	Approximately 1 year
Battery type	CR2032, temperature rating of ≥ 85 °C recommended
Nominal voltage	3 V
Nominal capacity	At least 200 mAH

Diagnostics	BB 1297
Critcal battery level	< 2.5 V[1]
Battery diagnostic	Low voltage indicator:[2] • Low battery voltage causes the CPU MAINT LED to illuminate with the yellow light continuously ON. • Diagnostic buffer event: 16#06:2700 "Maintenance demanded: At least one battery empty"
Battery status	You can use input bit Ic.0 in the STEP 7 program to monitor the battery status. 0 = Battery OK 1 = Battery low
Battery status update	Battery status updates at power up and then once per day while CPU is in RUN mode.

[1] If the battery charge is 2.5 V or less, it triggers the diagnostic buffer event 16#06:2700 and causes the yellow light of the CPU MAINT LED to be continuously lit. The CPU can maintain the real-time clock until the battery charge is 1.1 V or less. At this point, the real-time clock loads a default date and time (UTC Jan 1, 2012 00:00) because the value could be inaccurate.

[2] The battery only powers the real-time clock. The deterioration of the battery does not affect the retentive memory.

A.12.2 CM 1241 RS232/422/485

Table 1-326 General specifications

Technical data	CM 1241 RS232/422/485
Article number	6ES7241-1EA50-0XB0
Dimensions W x H x D	30 x 125 x 100 mm
Weight (product/shipping)	178 grams / 215 grams
Power dissipation	0.9 W
Current consumption (bus)	170 mA max. (5 V DC)
Current consumption (24 V DC)	None
Operating environment	Horizontal mounting -20 °C to 60 °C[1]
	Vertical mounting -20 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum

[1] Operating temperature range using maximum voltages and maximum specifications

NOTE

The CM 1241 supports three configuration types: RS232, RS422, and RS485. You can only use one configuration type per CM; you cannot use these configuration types simultaneously on the same CM. However, you can configure each CM in the G2 system with a different type.

Table 1-327 Transmitter and receiver for CM 1241 RS232/422/485 when configured as RS232

Technical data	CM 1241 RS232/422/485	
Type	RS232 (full duplex)	
Parity	No parity (default), even, odd, Mark (parity bit always set to 1), Space (parity bit always set to 0)	
Number of stop bits	1 (default), 2	
Wait time	0 to 65535 ms	
Data transmission rate	300, 600, 1200, 2400, 4800, 9600 (default), 19200, 38400, 57600, 76800, 115200 bits/s	
Transmitter output voltage	±5 V min. at R_L = 3 kΩ	
Transmit output voltage	±15 V DC max.	
Receiver input impedance	3 kΩ min.	
Receiver threshold/sensitivity	0.8 V min. low, 2.4 max. high; 0.5 V typical hysteresis	
Isolation	RS232 signal to chassis ground	707 V DC (type test)
	RS232 signal to CPU logic common	707 V DC (type test)
Receiver input voltage	±25 V DC max.	
Flow control	Hardware, software	
Cable length	10 m shielded max.	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)	

Table 1-328 Transmitter and receiver for CM 1241 RS232/422/485 when configured as RS422/485

Technical data	CM 1241 RS232/422/485
Type	RS422 (full duplex) or RS485
Parity	No parity (default), even, odd, Mark (parity bit always set to 1), Space (parity bit always set to 0)

Technical data	CM 1241 RS232/422/485	
Number of stop bits	1 (default), 2	
Wait time	0 to 65535 ms	
Data transmission rate	300, 600, 1200, 2400, 4800, 9600 (default), 19200, 38400, 57600, 76800, 115200, 250000 bits/s	
Common mode voltage range	RS422: -7 V to +12 V, 1 second, 3 VRMS continuous	
Transmitter differential output voltage	2 V min. at R_L = 100 Ω 1.5 V min. at R_L = 54 Ω	
Termination and bias (Page 262)	Internal bias options provided, including none. Optional 300 Ω internal termination provided. No external termination required.	
Receiver input impedance	5.4 kΩ min. including termination	
Receiver threshold/sensitivity	±0.2 V min., 60 mV typical hysteresis	
Isolation	RS422/485 signal to chassis ground	707 V DC (type test)
	RS422/485 signal to CPU logic common	707 V DC (type test)
Flow control	RS422: XON/XOFF	
Cable length	1000 m shielded max. (data transmission rate dependent)	
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

A.14 Companion products

A.14.1 Power module (PM) 1207

The PM 1207 is an optional external power supply for the SIMATIC S7-1200 G2 system.

Technical data	PM 1207
Article number	6EP3333-4SC00-3AX0 (with EX certification) 6EP3333-4SB00-3AX0 (without EX certification)
Dimensions W x H x D	70 x 125 x 100 mm
Weight (product/shipping)	450 grams / 600 grams
Design format	Matches the S7-1200 G2 shape and color
Input	120 to 240 V AC
Voltage range	85 to 264 V AC
Line frequency	47 to 63 Hz
Input current (full load)	1.1 A at 120 V AC 0.56 A at 240 V AC
Inrush current	43 A max. at 240 V AC
I^2t	1.8 A^2 s
Isolation (input AC to output DC)	3000 V AC
Hold up time (loss of power)	20 ms at 120 V AC 85 ms at 240 V AC
Internal fuse	3.15 A, slow blow, not user replaceable

[1] Operating temperature range using maximum voltages and maximum specifications

Technical data	PM 1207
External miniature circuit breaker recommended	16 A characteristic B or 10 A characteristic C
Output	24 V DC / 5A
UDI diagnostic interface	Yes
Power dissipation	13 W
Current consumption (bus)	Not connected to CPU bus
Operating environment	Horizontal mounting -25 °C to 60 °C[1]
	Vertical mounting -25 °C to 50 °C[1]
	95% relative humidity at 25 °C during operation, without condensation, maximum
Cable size	0.2 mm^2 to 1.5 mm^2 (AWG 24 to 16)

[1] Operating temperature range using maximum voltages and maximum specifications

You can find more information about this module on the product catalog (https://support.industry.siemens.com/cs/us/en/ps) web site.

B.6 Memory cards

SIMATIC memory cards	Description	Article number
Siemens SIMATIC MC	32 GB	6ES7954-8LT0x-0AA0
	2 GB	6ES7954-8LP0x-0AA0
	256 MB	6ES7954-8LL0x-0AA0
	24 MB	6ES7954-8LF0x-0AA0
	12 MB	6ES7954-8LE0x-0AA0
	4 MB	6ES7954-8LC0x-0AA0

Standard memory cards[1]	Description	Vendor part number[2]
INDMEM	512 MB, Type SDHC	B0CVVRFCQ4
	1 GB, Type SDHC	B0CVVR1W9T
Transcend	4 GB, Type SDHC	TS4GSDHC4
	8 GB, Type SDHC	TS8GSDC300S
Verbatim	4 GB, Type SDHC	B000RLBWJK
	8 GB, Type SDHC	B000WJ725U
	16 GB, Type SDHC	B001L1RGUE
SanDisk	16 GB, Type SCHC	SDSDBNN-016G-AW6VN
	32 GB, Type SDHC	SDSQUA4-032G-AW6KA
Onn	32 GB, Type SCHC	100006056

[1] You can only use Standard (non-SIMATIC) memory cards for transferring the license conditions and copyrights Open Source Software (OSS) information to a memory card for viewing.

[2] These devices are not sold by Siemens. Other memory cards of type SDHC may also work.

B.7 Spare parts and other hardware

Table 1-337 Simulators, spare doors, DIN rails, and end retainer

Item		Article number
Input simulator	Input simulator, 8 position (CPU 1212C, CPU 1212FC)	6ES7274-1XF50-0XA0
	Input simulator, 14 position (CPU 1214C, CPU 1214FC)	6ES7274-1XH50-0XA0
Spare door kit (one pair per kit)	CPU 1212C, CPU 1212FC (70 mm)	6ES7291-1AA50-0XA0
	CPU 1214C, CPU 1214FC (80 mm)	6ES7291-1AB50-0XA0
	SM, CM (30 mm)	6ES7291-1BA50-0XA0
	SM (50 mm)	6ES7291-1BB50-0XA0
DIN rail	DIN rail 35 mm, length 483 mm	6ES5710-8MA11
	DIN rail 35 mm, length 530 mm	6ES5710-8MA21
	DIN rail 35 mm, length 830 mm	6ES5710-8MA31
	DIN rail 35 mm, length 2000 mm	6ES5710-8MA41
DIN rail end retainer	End retainer thermoplastic, 5.2 mm	8WH9150-0CA00

B.8 Terminal block spare kits

Replacing the terminal block connector

Refer to the tables below and your module specifications to determine the correct terminal block replacement.

NOTE

PLCs require correct wiring to ensure safety and proper operation.

When replacing the terminal block in your S7-1200 G2 CPU or module, it is important that you use the correct terminal block and correct wiring source for your module.

The G2 removable terminal block is designed to prevent you from accidentally placing a high voltage wired terminal block into a low voltage module, or from placing a special voltage wired terminal block into a normal voltage module.

Table 1-338 CPU - Terminal block spare kits

CPU (article number)	Use this terminal block spare kit (four per pack)	
	Terminal block description	Terminal block article number
CPU 1212C DC/DC/DC (6ES7212-1AG50-0XB0)	6 position, tin-plated, gray	6ES7292-2AF50 0XA0

Safety-relevant symbols

C

C.1 Devices without explosion protection

The following table explains the symbols located on your SIMATIC device, on its packaging, or in the accompanying documentation:

Symbol	Meaning
	General warning sign **Caution/Notice** Read the product documentation. The product documentation contains information about potential risks and enables you to recognize these risks and to implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by an electrically skilled person. IEC 60417 No. 6182
 CABLE SPEC.	Connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	The device must be constructed and connected in accordance with EMC regulations.
 230V MODULES	A 230 V device can be exposed to electrical voltages, which can be dangerous. ANSI Z535.2
 24V MODULES	A device of Protection Class III can only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	The device is only approved for the industrial field and only for indoor use.
	An enclosure is required for installing the device. The following are considered to be enclosures: • Standing control cabinet • Modular control cabinet • Terminal boxes • Wall enclosure

C.2 Devices with explosion protection

The following table explains the symbols located on your SIMATIC device, on its packaging, or in the accompanying documentation:

Symbol	Meaning
	General warning sign **Caution/Notice** Read the product documentation. The product documentation contains information about potential risks and enables you to recognize these risks and to implement countermeasures.
	The assigned safety symbol applies to devices **with Ex approval**. Read the product documentation. The product documentation contains information about potential risks and enables you to recognize these risks and to implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by an electrically skilled person. IEC 60417 No. 6182
 F<2N DISPLAY F<4N HOUSING	Observe the mechanical rating of the device.
 CABLE SPEC.	Connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
 EMC	The device must be constructed and connected in accordance with EMC regulations.
 U = 0V	When the device is under voltage, it cannot be installed or removed, or plugged or pulled.
 230V MODULES	A 230 V device can be exposed to electrical voltages, which can be dangerous. ANSI Z535.2
 24V MODULES	A device of Protection Class III can only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
 INDOOR USE ONLY INDUSTRIAL USE ONLY	The device is only approved for the industrial field and only for indoor use.
 ZONE 2 INSIDE CABINET IP54	For Zone 2 potentially explosive atmospheres, the device can only be used when it is installed in an enclosure with a degree of protection ≥ IP54.
 ZONE 22 INSIDE CABINET IP6x	For Zone 22 potentially explosive atmospheres, the device can only be used when it is installed in an enclosure with a degree of protection ≥ IP6x.

Comparison to S7-1200

D

The following tables represent a comparison between S7-1200 and S7-1200 G2:

Major features	S7-1200	S7-1200 G2
Web API Support (Page 300)	Yes (subset)	Yes
Maximum number of concurrent Web API sessions	50	30
Mobile phone NFC Application (Page 299)	No	Yes
DHCP	No	Yes
DNS	No	Yes
OPC UA Server	Yes	Yes
Numerous Communication Modules:		
• PROFIBUS	Yes	No
• AS-I Master	Yes	No
• LTE (US and EU)	Yes	No
Configuration control (option handling)	Yes	No
S7 Routing	Yes	Yes

Features	S7-1200	S7-1200 G2
CPU Variants	1211C, 1212C, 1214C, 1215C, 1217C, 1212FC, 1214FC, 1215FC	1212C 1214C 1212FC 1214FC
Physical Dimensions, W x H x D (mm)	CPU 1211C/1212C: 90 x 100 x 75 CPU 1214C: 110 x 100 x 75 CPU 1215C: 130 x 100 x 75 CPU 1217C: 150 x 100 x 75 SM: 45 or 70 x 100 x 75 CM/CP: 30 x 100 x 75 SB/CB: 38 x 62 x 21	CPU 1212C/1212FC: 70 x 125 x 100 CPU 1214C/1214FC: 80 x 125 x 100 SM/CM: 30 or 50 x 125 x 100 SB/CB: 15 x 62 x 63
Built-in Analog	Yes	No, analog SMs (Page 405) and SBs (Page 436) available
Signal Boards Slots	1 for all CPU variants	CPU 1212C/1212FC: 1 CPU 1214C/1214FC: 2
SM/CM/CP	CPU 1211C: 3 CM/CP / 0 SM CPU 1212C: 3 CM/CP / 2 SM CPU 1214C/1215C/1217C: 3 CM/CP / 8 SM	CPU 1212C/1212FC: 6 total, 3 can be CMs or CPs CPU 1214C/1214FC: 10 total, 3 can be CMs or CPs
Module Placement	Left side (CM/CPs) Right side (SMs)	Right side only (CMs/CPs must be next to CPU)
Security (Page 158)	Standard Security Measures	Enhanced Security

Features	S7-1200	S7-1200 G2
Number of Ethernet Ports	CPU 1211C/1212C/1214C: 1 port (one interface) CPU 1215C/1217C: 2 switched ports (one interface)	All CPUs: 2 switched ports (one interface)
Load Memory Reporting (Online & diagnostics)	Load memory only reports program blocks	Reports the size of everything
IRT (Isochronous Real-Time PN) (Page 250)	No Support	HW Support
RT (Real-Time PN)	SW Support	HW Support
Motion Control (Page 302)	Yes	Yes (different)
Number of PROFINET Devices (Page 222)	16	31
Communication Priority	1 (will not interrupt 2 and above)	15 (will not interrupt 16 and above)
Memory Card Evaluation (what happens when you plug a memory card (Page 137))	Evaluates on transition to RUN, power up, and memory reset (MRES)	Evaluates on insertion, power up, and memory reset (MRES)
Work Memory Reporting	Work Memory (includes both code and data)	Code Work Memory / Data Work Memory
Cyclic OB (Page 102) (TIA cycle configuration)	milliseconds	microseconds
Synchronous Isochronous Interrupt OB 61	Cyclic only	Tied to Isochronous Scan
Programming Error OB 121 (Page 115) (synchronous)	No	Yes
I/O Access Error OB 122 (Page 116) (synchronous)	No	Yes
Number of User PIP(s) (Page 97)	4	32
Number of Diagnostics buffer (Page 126) Events		
• Visible in the buffer • Retentive	50 50	500 100
Reaction after serious firmware or hardware exception	Attempts defect-mode restart; LEDs show fatal error flash pattern	Attempts defect-mode restart (Page 319); attempts to load device configuration and program; LEDs (Page 315) show fatal error flash pattern;
Alarming configure, display, acknowledge		
• Program alarm wizard • PLC alarms editor • Alarm display • PLC alarm text lists • Central alarm management	No No No Yes No	Yes Yes Yes Yes Yes
Local output substitute values during startup	System automatically sets the output image	System automatically sets the output image
Distributed output substitute values during startup	User must use startup OB to set	User must use startup OB to set
Process image size	1 Kbyte inputs 1 Kbyte outputs	1 Kbyte inputs 1 Kbyte outputs
Bit memory size	8 Kbytes	8 Kbytes
Retentive Memory	14KB	20KB
TIA Languages	LAD, FBD, SCL, and CEM	LAD, FBD, SCL, and CEM

Features	S7-1200	S7-1200 G2
Media Redundancy Protocol (MRP) Support	Yes	Yes
Media Redundancy for Planned Duplication (MRPD) Support	No	Yes
TIA Portal Power Budget Calculation for local rack	No	Yes
Insertion or extraction of modules under power (hot swap)	No	No
EN 60068-2-6 Sinusoidal vibration	DIN rail / Panel mount: 1G/2G	DIN rail / Panel mount: 1G/1G
TOD (End of Month)	Follows START Date and only runs when TOD >= START Date	Ignores START Date and always runs at the end of Month
Enable Outputs in STOP	Allowed when only local IO is configured	Not supported
Backup and restore	Yes	Yes
CPU clears Temp memory on each OB call		
• Optimized block (OB, FC, or FB)	Yes	Yes
• Non-optimized block (FC or FB)	Yes	No
SIMATIC Controller Profiling (https://support.industry.siemens.com/cs/ww/en/view/109750245)	No	Yes

Instruction set[1] (Page 170)	S7-1200	S7-1200 G2
Legacy instructions		
• FieldRead, FieldWrite	Yes	Superseded by variable array index and multi-dimensional arrays
• CTRL_HSC	Yes	Superseded by CTRL_HSC_EXT
• "Point-to-Point" instructions	Yes	Superseded by "PtP Communication" instructions
• "USS" instructions	Yes	Superseded by "USS communication" instructions
• "MODBUS" instructions	Yes	Superseded by "MODBUS (RTU)" instructions
• TM_MAIL	Yes	Superseded by TMAIL_C
Distributed I/O instructions		
• PROFIBUS[2]	Yes	No
• AS-i control[2]	Yes	No
Communication instructions		
• GPRSComm: CP1242-7	Yes	No
• OPC UA Server	Yes	Yes
• MODBUS TCP redundancy instructions	Yes	Yes
Safety instructions		
• RD_ARRAY_I	No	Yes

1 Instruction groups indicate folders in the TIA Portal instruction task card

2 These instructions are in the Extended instructions > Distributed I/O instructions

Instruction set[1] (Page 170)	**S7-1200**	**S7-1200 G2**
• RD_ARRAY_DI	No	Yes
• Range_16	No	Yes
Motion control instructions (Page 302)	Yes	Yes (different)
Alarming Instructions		
• Generate user message	Yes	Yes
• Generate program alarms	No	Yes
• Read status of program alarms	No	Yes
• Copy alarm to DB	No	Yes
• Acknowledge all alarms	No	Yes
• Read alarm resources	No	Yes
PID Instructions		
• Compact PID instructions	Yes	Yes
• Auxiliary functions instructions	Yes	Yes – adds instruction Filter_Universal
Instruction categories (folders in STEP 7 Instructions task card)		
• Process Image	No	Yes
• Module Parameterization	No	Yes
• Cryptography	No	Yes
• Time-based IO (requires IRT and special modules)	No	Yes
• OPC UA	Yes	Yes
• Teleservice	Yes	No
Miscellaneous instructions in existing categories		
• Move: Array_DB and Symbolic Move instructions	No	Yes
• Convert: REF	No	Yes
• Program Control: INIT_RD and WAIT	No	Yes
• Date and time-of-day: T_COMP and TIME_TCK	No	Yes
• String + Char: S_COMP, JOIN, SPLIT, and GetSymbolForReference	No	Yes

1 Instruction groups indicate folders in the TIA Portal instruction task card

2 These instructions are in the Extended instructions > Distributed I/O instructions

Instruction set[1] (Page 170)	S7-1200	S7-1200 G2
• PROFIEnergy: PE_START_END, PE_CMD, PE_DS3_Write_ET200-S, and PE_WOL	No	Yes
• Interrupts: MSK_FLT, DMSK_FLT, READ_ERR, DIS_IRT, and EN_IRT	No	Yes
• Diagnostics:GetClock-Status, and GEN_DIAG	No	Yes
Data consistency for MOVE_BLK and MOVE_BLK_VARIANT	64 bytes	Element size

1 Instruction groups indicate folders in the TIA Portal instruction task card

2 These instructions are in the Extended instructions > Distributed I/O instructions

Quantities and default values	S7-1200	S7-1200 G2
Minimum cycle time	Disabled	Enabled (1 ms)
Communication Load	20%	20% See SIMATIC S7-1500, S7-1500R/H, ET 200SP, ET 200pro Cycle and response times (https://support.industry.siemens.com/cs/us/en/view/59193558/-158758826123)
Size of Internal Load Memory	4MB	8 MB
HSC	6	8
PWM/PTO	4	8
Number of CPU connections	68	88
Number of active Trace jobs	2	4
Runtime meters	10	16
Hierarchical nesting depth of data type STRUCT	8	26 An array of STRUCT/UDT requires 3 hierarchical levels each. When using arrays of struct/UDT, the maximum nesting depth is reduced accordingly.

Legacy Scalance device support	S7-1200	S7-1200 G2
Scalance X005: 1P6GK50050BA001AA3	Yes	Not all
Scalance X31OFE: 1P6GK53100BA002AA3	Yes	No

SIMATIC S7-1200 G2 data

E

The EU Data Act, a key component of the European data strategy, went into effect on January 11, 2024.

The following information provides an overview of the data that is generated by the SIMATIC S7-1200 G2 automation system and accessible to you.

E.1 CPU data

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and program data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, system and security events, service data	Time formats, string formats, CSV, binary formats	Depending on application Several hundred bytes per event
Operating data (runtimes, cycle times, CPU utilization)	Numeric formats, time formats, JSON	Depending on application
Log data	Time formats, string formats, CSV	Depending on application

Continuous and real-time data generation

The SIMATIC S7-1200 G2 is able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The CPU operates with defined cycle times in which process data is acquired and processed.

Data storage and storage duration

Local data storage

The SIMATIC S7-1200 G2 stores data in integrated memory areas of the CPU and on the SIMATIC Memory Card.

Local data storage	Storage capacity	Storage duration
Load memory (with SIMATIC Memory Card)	Up to 32 Gbytes, depending upon SIMATIC Memory Card	Permanent
Program work memory	Up to 300 Kbytes, depending upon CPU	During operation of the CPU
Data work memory	Up to 750 Kbytes, depending upon CPU	During operation of the CPU
Retentive memory	20 Kbytes	Permanent
NFC tag memory	8 Kbytes	While NFC is enabled in the STEP 7 program

More information
You can find more information on memory areas, retentivity, and memory usage in the SIMATIC S7-1200 G2 Programmable Logic Controller system manual (https://support.industry.siemens.com/cs/us/en/view/109988293), "CPU memory" section.

Remote data storage
Data can be transmitted to external systems through various communication interfaces of the SIMATIC S7-1200 G2, such as PROFINET, Industrial Ethernet.

The SIMATIC S7-1200 G2 can send data to various remote systems, including SCADA systems, SQL databases, cloud platforms (e.g. Insights Hub), and file servers.

The SIMATIC S7-1200 G2 can send logging data to a SIEM system in the form of syslog messages.

The storage duration on external systems depends on the configuration of the respective system.

The SIMATIC S7-1200 G2 CPU can be integrated as a data source into the Siemens Industrial Edge concept.

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	TIA Portal Web server OPC UA HMI/SCADA systems CPU display	User management Authentication Certificates	Prioritization of control tasks over data access Data throughputs up to 1 Gbps via PROFINET Encrypted data transmission available (HTTPS, TLS)
Configuration and program data	TIA Portal Web server SIMATIC Memory Card	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Diagnostics data, system and security events, service data	TIA Portal SIMATIC Automation Tool Web server CPU display	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Operating data (runtimes, cycle times, CPU utilization)	TIA Portal Web server HMI/SCADA systems SIMATIC Controller Profiling	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Log data	TIA Portal Trace and logic analyzer function	User management Authentication	Encrypted data transmission available (HTTPS, TLS)

* "Quality of service" refers to the ability of the SIMATIC S7-1200 G2 to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from CPUs

To delete all data from the data memories of the CPU, the "Reset to factory settings" function is available.

A reset of the CPU to factory settings can be implemented using any of the following:

- Mode selector keys/switches of the CPU
- TIA Portal
- SIMATIC Automation Tool

More information
You can find more information on deleting data in the SIMATIC S7-1200 G2 Programmable Logic Controller system manual (https://support.industry.siemens.com/cs/us/en/view/109988293), "Securely removing data" section or in the TIA Portal Information System.

E.2 Data of the interface and I/O modules

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and parameter data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, service data	Binary formats	Depending on application Less than 100 bytes per diagnostic event; several kilobytes of service data
Fieldbus* metadata: I&M data, log data, statistics data	Binary formats, string formats	Approximately 100 bytes per read-out data record

* PROFIBUS, PROFINET, EtherNet/IP, Modbus TCP (only for interface modules as MultiFieldbus devices)

Continuous and real-time data generation

The interface and I/O modules are able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The cycle time is specified by the CPU.

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval by	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Through fieldbus without authentication With CPU (Page 480)	Prioritization of control tasks over data access Standard fieldbus transmission mechanisms Data throughputs up to 1 Gbps through PROFINET
Configuration and parameter data (upload to programming device/PC)	TIA Portal (through CPU) S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Through fieldbus without authentication With CPU (Page 480)	Standard fieldbus transmission mechanisms
Diagnostics data, service data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Through fieldbus without authentication With CPU (Page 480)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the interface, power supply, and I/O modules to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Type of data	Access/retrieval by	Terms of use	Quality of service*
Fieldbus metadata: I&M data, log data, statistics data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT (for interface modules as MultiFieldbus devices)	Through fieldbus without authentication With CPU (Page 480)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the interface, power supply, and I/O modules to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from interface and I/O modules

Interface modules

To delete all data from the data memories of the interface module, the "Reset to factory settings" function is available.

A reset of the IM to factory settings can be implemented using any of the following:

- TIA Portal
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

I/O modules

The data of an IO-Link master can be deleted using S7-PCT by executing the "Reset to factory settings" function.

For all other I/O modules, no delete function is available.

More information

You can find more information on deleting data in the SIMATIC S7-1200 G2 Programmable Logic Controller system manual (https://support.industry.siemens.com/cs/ww/en/view/109988293), "Securely removing data" topic and in the TIA Portal Information System.

SIEMENS
SIMATIC

S7-1200 G2 Firmware update V4.1.4
Product Information

Description

Firmware update V4.1.4 corrects an issue where, when the S7-1200 G2 CPU is operating as a PROFINET iDevice, repeated communication interruptions cause the S7-1200 G2 CPU and its controlled PROFINET devices to report persistent faults and trigger alarms.

Required user action

You can update the CPU firmware using one of the following methods:

- The Online & diagnostics functions of STEP 7
- The SIMATIC Automation Tool V5.0 SP4 or later
- A SIMATIC Memory Card that contains the firmware update file from the Siemens Industry Online Support site

The S7-1200 G2 System Manual and the SIMATIC Automation Tool User Guide document these methods.
After you apply the CPU firmware update, verify that your application operates as expected.

NOTE

The firmware update process discards any additional data appended to the firmware update file. Appending data to a firmware update file has no effect on the firmware update or the S7-1200 G2 CPU. You cannot append data, for example, to add components.

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://www.siemens.com/cert.

Introduction

1

Purpose of the documentation

This documentation provides important information on configuring, installing, wiring and commissioning the ET 200SP distributed I/O system.

Basic knowledge required

A basic knowledge of automation technology is required to understand the documentation.

Validity of the documentation

This documentation applies to the distributed I/O system, ET 200SP.

Definition

In this document, " motor starter" always refers to all variants of the ET 200SP motor starters.

Conventions

Please pay particular attention to notes highlighted as follows:

NOTE
Notes contain important information on the product, handling the product or on part of the documentation to which you should pay particular attention.

ID link for the digital nameplate

The ID Link is a globally unique identifier according to IEC 61406, which you will find in the future as a QR code on your product.

The figure shows an example of an ID link for the digital input module DI 8x24 VDC HF.

You can recognize the ID link by the frame with a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner or reader app. Call the ID link.

In the digital nameplate, you will find product data, manuals, declarations of conformity, certificates and other helpful information about your product.

Standards

You can find a dated reference to the respective standards or the EC Declaration of Conformity on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=439&ci=526)

Special information

WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.

Proper use of hardware products

This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.

Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.

EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Directive 2006/42/EC.

NOTE

Important note for maintaining operational safety of your plant

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. Even suppliers are required to observe special measures during product monitoring. For this reason, we inform you in the form of personal notifications about product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

By subscribing to the appropriate notifications, you will ensure that you are always up-to-date and able to make changes to your system, when necessary.

Log onto Industry Online Support. Go to the following links and, on the side, right click on "email on update":

- SIMATIC WinAC RTX (F) (https://support.industry.siemens.com/cs/ww/en/ps/13915)
- SIMATIC S7-1500/SIMATIC S7-1500F (https://support.industry.siemens.com/cs/ww/en/ps/13716)
- SIMATIC S7-1200/SIMATIC S7-1200F (https://support.industry.siemens.com/cs/ww/en/ps/13683)
- Distributed I/O (https://support.industry.siemens.com/cs/ww/en/ps/14029)
- STEP 7 (TIA Portal) (https://support.industry.siemens.com/cs/ww/en/ps/14667)

NOTE

When using F-CPUs in safety mode and fail-safe modules, observe the description of the SIMATIC Industrial Software SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/de/view/54110126/en) fail-safe system.

1.1 Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySupport**
  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (https://support.industry.siemens.com).

1.2 Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

1.3 ET 200SP Documentation Guide

1.3.1 Information classes ET 200SP

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/de/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet. (https://support.industry.siemens.com/cs/cn/en/view/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.3.2 Basic tools

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/98161300)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

1.3.3 MultiFieldbus Configuration Tool (MFCT)

MultiFieldbus Configuration Tool

MultiFieldbus Configuration Tool (MFCT) is a PC-based software and supports the configuration of MultiFieldbus- and DALI-devices. In addition, the MFCT offers convenient options for mass firmware updates of ET 200 devices with MultiFieldbus- support and reading service data for many other Siemens devices.

Functional scope of the MFCT

- MultiFieldbus configuration:
  Engineering, configuration and diagnostics of MultiFieldbus-devices, provision of the required project files (project, UDT-, CSV- and EDS-file), transfer/export of the files to device and/or data memory.
- DALI configuration:
  Device selection and online configuration of DALI devices.
- TM FAST:
  Generation and download of FPGA-UPD- and FPGA-DB-files.
- Maintenance:
  Topology scan of a Ethernet network, reading of service data, parameter assignment and firmware update.
- Settings:
  Language switching German / English, network scanner speed, setting of the network adapter, installation of GSDML-and EDS-files.

System/installation requirements for MFCT

The MFCT runs under Microsoft Windows and does not require installation or administrator rights.

For MFCT you must also install the following software:

- Microsoft .NET Framework 4.8 (You can find an Offline Installer on the Internet. (https://support.microsoft.com/en-us/topic/microsoft-net-framework-4-8-offline-installer-for-windows-9d23f658-3b97-68ab-d013-aa3c3e7495e0))
- NPcap from directory "Misc"
- PG/PC interface from directory "Misc"
- Microsoft C++ Redistributable for x86-systems (you can find the installation data for download on the Internet. (https://aka.ms/vs/15/release/vc_redist.x86.exe))

The download of the tool and further information as well as documentation on the individual functions of the MFCT can be found on the Internet.
(https://support.industry.siemens.com/cs/de/en/view/109773881)

1.3.4 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)

     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:

     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Safety information

2

2.1 Warnings in this document

You can find explanations of the warnings used in this document in the "Legal information" section.

2.2 Safety-related symbols

2.2.1 Devices without explosion protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
	General warning sign **Caution/Notice** You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
	Note that the device must be constructed and connected in accordance with EMC regulations.
	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2

Symbol	Meaning
	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
	Be aware that the device is only approved for the industrial field and only for indoor use.
	Note that an enclosure is required for installing the device. Enclosures are considered: • Standing control cabinet • Serial control cabinet • Terminal boxes • Wall enclosure

2.2.2 Devices with explosion protection

The following table contains an explanation of the symbols located in your SIMATIC device, its packaging or the accompanying documentation.

Symbol	Meaning
	The assigned safety symbols apply to devices **with Ex approval**. You must read the product documentation. The product documentation contains information about the potential risks and enable you to recognize risks and implement countermeasures.
	Read the information provided by the product documentation. ISO 7010 M002
	Ensure the device is only installed by electrically skilled person. IEC 60417 No. 6182
	Observe the mechanical rating of the device.
	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.
	Note that the device must be constructed and connected in accordance with EMC regulations.
	When the device is under voltage, note that it may not be installed or removed, or plugged or pulled.
	Note that a 230 V device can be exposed to electrical voltages which can be dangerous. ANSI Z535.2

Symbol	Meaning
	Note that a device of Protection Class III may only be supplied with a protective low voltage according to the standard SELV/PELV. IEC 60417-1-5180 "Class III equipment"
	Be aware that the device is only approved for the industrial field and only for indoor use.
	For Zone 2 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP54.
	For Zone 22 potentially explosive atmospheres, be aware that the device may only be used when it is installed in an enclosure with a degree of protection ≥ IP6x.

2.3 Intended use

The system is used to control machines and plants.

Intended use also includes observance of this documentation, in particular the safety instructions and conditions of use. See Technical specifications (Page 345) section.

2.4 Changes to the device and spare parts

Modifications to the device can impair the safety and function of the device:

- Do not make any changes or modifications to the device.
- Do not remove or tape over safety instructions on the device.
- Do not tape over, cover or obstruct ventilation slots.
- Only use original spare parts and accessories.

2.5 Target group and personnel qualifications

All persons working with this device require the following knowledge:

- Contents of this document as well as contents of the enclosed documents
- Handling the device (after instruction)
- Relevant standards and regulations
- Accident prevention regulations

The following activities are reserved for specially qualified personnel:

Working on electrical parts

Work on electrical parts may only be performed by the following persons:

- Qualified electricians
- Persons trained in electrical engineering under the direction and supervision of qualified personnel

Commissioning and configuration
Commissioning and configuration requires general knowledge in the field of automation technology.

2.6 Personal protective equipment

The personal protective equipment depends on the activity and is determined by the operator.

To avoid material damage during packing, unpacking and installation activities we recommend:

- ESD wrist strap
- ESD shoes

2.7 Safe working

2.7.1 Working on electrical parts

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 23)).
- Always observe the country-specific safety rules.
- Notify all those who will be affected by the procedure.
- Follow the 5 safety rules according to DIN EN 50110-1 (VDE 0105-1):

1. Disconnect
2. Secure to prevent reconnection
3. Verify safe isolation from the supply (all poles)
4. Ground and short-circuit
5. Erect barriers around or cover adjacent live parts

The 5 safety rules must be applied in the above order prior to starting work on an electrical system. After completing the work, proceed in the reverse order.

It is assumed that every electrician is familiar with the 5 rules.

2.8 Residual risks

Despite all the technical and procedural risk reductions that have been carried out, not all dangers can be avoided.

The following sections describe these residual risks and measures to avoid them.

2.8.1 Live parts

Electrocution on contact with live parts leads to life-threatening injuries (death).

Operation

- Do not open the device.
- Never use damaged devices.
- Pull the plug and not the cable.

Installation and connection

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 23)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 24)).
- Fuse the connection cables according to the current-carrying capacity of the cable used, taking into account the applicable standards.
- Install the device in a control cabinet. The enclosures, cabinets or electrical equipment rooms must guarantee protection against electric shock and spread of fire.
- Ground the device in compliance with the applicable regulations.
- For the 24 V DC supply (SELV/PELV), only use power supply units that provide safe electrical extra-low voltage in accordance with IEC 61131-2 or IEC 61010-2-201.

Maintenance

- Only work on electrical parts if you are a qualified specialist (see section Target group and personnel qualifications (Page 23)).
- Adhere to the protective measures for safe working on electrical parts (see section Working on electrical parts (Page 24)).

2.8.2 External power supply to modules

Even if the main supply to the plant is disconnected, externally supplied modules can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.

For special SIMATICmodules, e.g. relay modules, you can connect or switch voltages larger than 24 V DC, e.g. 230 V AC. In some applications, these modules are supplied with voltages from outside the system (external power supply). In the event of an external power supply, a dangerous voltage may still be present on these modules even if the system is disconnected.

Maintenance

Ensure the following points before starting work:

- The plant is completely disconnected from the power supply.
- All externally supplied plant units are disconnected from the power supply

2.8.3 Voltage dangerous to touch due to permissible electric potential difference

Due to the permissible electric potential difference, a dangerous voltage may be present at the inputs of modules. An electric shock on contact with live parts can lead to death or serious injury.

Special SIMATIC modules, such as analog input modules, have isolated channels. In this case, there is no connection between the potential of the sensor and the potential of the module. If a dangerous voltage within the permissible electric potential difference occurs at the sensor, this voltage may also be present at the measurement channel of the module.

You can find the permissible electric potential differences in the technical specifications section of the modules' Equipment Manuals.

Maintenance

Ensure the following points before starting work:

- The plant is completely disconnected from the power supply.
- All externally supplied plant units are disconnected from the power supply

2.8.4 Conductive pollution

Electrocution during transmission of electrical energy via conductive contamination to the body leads to life-threatening injuries (death).

- Install the device in a control cabinet.
- Keep the control cabinet free of conductive contamination.

2.8.5 Overheating

Smoke development and fire due to overheating of the device and cables lead to burns and life-threatening injuries (death).

To avoid overheating:

- Ensure the correct installation position.
- Ensure sufficient air supply (e.g. do not tape over or cover ventilation slots, maintain mounting clearances).
- Only use undamaged cables.

Installation and connection

- Follow the instructions for the mounting position.
- Adhere to the specified ventilation clearances.
- Fuse the connecting cables according to the cable cross-section.

Maintenance

- Check plug-in connections and cables regularly for damage.

2.8.6 Uncontrolled movements

Uncontrolled movements of driven machine or system parts during commissioning, operation, maintenance and repair.

- Follow the safety instructions described in the function manuals.

2.8.7 Unsafe operating states

Unsafe operating states may result in personal injury of unknown extent.
The following factors can be triggers:

- Manipulation of the software, e.g. viruses, trojans or worms

Manipulation of the software, e.g. viruses, trojans or worms

- Adhere to the protective measures against tampering with the software (see section Industrial cybersecurity (Page 33)).
- Perform available updates in a timely manner.
- Protect files stored on removable media from malware with appropriate protective measures, e.g. virus scanner.
- Set up access protection for the CPU.

2.9 Behavior in case of emergency

- Force EMERGENCY OFF

When the safe operating state has been restored:

- Unlock the EMERGENCY OFF mechanism.
- The person responsible for the system ensures that the system starts up in a controlled and defined manner.

2.10 Material damage

2.10.1 Transport and storage

- Only pack, store, transport and ship electronic components, modules or devices in the original product packaging or in other suitable materials, e.g. conductive foam rubber or aluminum foil.
- Observe the limits during transport and storage. See Technical specifications (Page 345) section.

2.10.2 Installation and connection

- We recommend touching components, modules and devices only if they are grounded by one of the following measures:
  - With an ESD wrist strap.
  - With ESD shoes or ESD grounding strips in ESD areas with conductive flooring.
- Place electronic components, modules and devices only on conductive surfaces (e.g. tables with ESD coating, conducting ESD plastic foam, ESD packing bags, ESD transport containers).
- Ensure that there is sufficient overvoltage protection.

Do not install/remove the following elements when the power is on

- Read the section Removing and inserting I/O modules/motor starters (hot swapping) (Page 314).
- Observe the special conditions for hazardous areas in the section Marks and approvals (Page 346).

New properties/functions

3

What's new in Edition 11/2025 of the ET 200SP System Manual compared with Edition 06/2025

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Backup and restore configuration of the ET 200SP CPU by a central user	As of FW version V4.1 of a ET 200SP CPU, a central user can also back up and restore the configuration. Read about the rules you need to follow when backing up and restoring.	Section Backing up and restoring the CPU configuration (Page 298)
	Integrated security		
	Temporary account lockout for local user accounts	Starting from STEP 7 V21, you can set up a temporary account lockout for local user accounts for ET 200SP CPUs with FW version V4.1 or higher. The temporary account lockout provides protection against brute force attacks.	Section Temporary account lockout in case of brute force attacks (Page 232)
	SIMATIC S7 data	This appendix in the ET 200SP System Manual provides you with an overview of the data that the ET 200SP distributed I/O system generates and makes available to you.	Appendix SIMATIC ET 200SP data (Page 388)
	Communication of the CPU		
	New function for OPC UA	Enables cross-vendor communication.	Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual
	Activating IP forwarding through a data record transfer	For ET 200SP CPUs as of FW version V4.1, you can also activate/deactivate the "IP forwarding" function for local interfaces of the CPU via data record transfer.	

What's new in Edition 06/2025 of the ET 200SP System Manual compared with Edition 11/2024

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Information on the data integrity and the signed firmware update of I/O modules	Data integration and signed firmware updates offer protection against manipulation of the system and increase the system security.	Section Secure operation of I/O modules (Page 65)
	BaseCarrier	New, wire-free assembly technology offers a customer-specific PCB for reduced mounting times and avoiding faulty wiring. Use of "BaseCarriers" instead of conventional "BaseUnits".	Section Installing and uninstalling BaseCarrier (Page 130)

What's new in Edition 11/2024 of the ET 200SP System Manual compared with Edition 11/2023

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Retentive memory area for syslog messages	ET 200SP CPUs FW version V4.0 or higher store syslog messages retentively. This means that events that require a restart of the CPU also remain in the syslog storage.	Section Industrial cybersecurity (Page 33)
	Central user management	System-wide, central management of users and user groups outside TIA Portal via UMC server. User management for comprehensive automation solutions with multiple projects, users, and user groups. Users and user groups can work in all projects in which they are activated and for which they have been assigned the appropriate rights. During operation, users can be added to a group, removed from a group, or their passwords can be changed. All without the CPU configuration having to be changed or loaded.	Section Central user management (Page 234)
	SIMATIC Controller Profiling	Using the new instruction "Profiling", you can start or stop the profiling of an ET 200 CPU with firmware version V4.0 or higher. When starting the profiling, specify the configuration with which the profiling data is to be recorded.	STEP 7 online help

What's new in Edition 11/2023 of the ET 200SP System Manual compared with Edition 11/2022

What's new?		What are the customer benefits?	Where can I find the information?
New contents	General safety information	The section contains a compilation of general safety information for the ET 200SP distributed I/O system.	Section General safety information
	Section "Industrial cybersecurity"	Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyberattacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities. The section contains the following information: • Basic information on the subject of industrial cybersecurity • Measures to protect individual components and the entire system against manipulation and unwanted access.	Section Industrial cybersecurity (Page 33)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Syslog messages	As of TIA Portal version V19 and FW version V3.1, you can forward the syslog messages of an ET 200SP CPU to a syslog server.	Section Industrial cybersecurity (Page 33)
	Local user management	As of TIA Portal version V19 and FW version V3.1, ET 200SP CPUs have improved management of users, roles and CPU function rights (User Management & Access Control, UMAC). As of the above-mentioned version, you manage all project users along with their rights (e.g. access rights) for all CPUs in the project. You do this in the editor for users and roles in the TIA Portal.	Section Local user management (Page 222)
	SIMATIC Controller Profiling	With SIMATIC Controller Profiling you can analyze and evaluate the runtime behavior of your user program on an ET 200 CPU as of FW Version V3.1. All the relevant information can be displayed graphically and evaluated in a web browser.	Application example SIMATIC Controller Profiling (https://support.industry.siemens.com/cs/us/en/view/109750245)

What's new in Edition 11/2022 of the ET 200SP System Manual compared with Edition 04/2022?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Support of PROFINET system redundancy R1	The redundant ET 200SP R1 system ensures high availability through redundant PROFINET connections. In contrast to S2 devices, R1 devices are equipped with two interface modules. If one interface module fails, the R1 device can still be reached by the H-CPUs via the second interface module. Thus, R1 devices have a higher availability than S2 devices.	Starting with section System overview (Page 67)
	BaseUnit BU type M0		Starting with section System overview (Page 67)
	IM 155-6 PN R1 interface module		Starting with section System overview (Page 67)

What's new in Edition 04/2022 of the ET 200SP System Manual compared with Edition 05/2021?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	New shield terminal for connecting cable shields	The new stacked shield terminal provides extended space for clamping thanks to two clamping positions. In addition, a supporting element absorbs torsional and bending forces.	Section Connecting cable shields for I/O modules (Page 166)

What's new in Edition 05/2021 of the ET 200SP System Manual compared with Edition 09/2019?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Modules for hazardous area	The Ex BaseUnits and Ex I/O modules enable the connection of intrinsically safe devices from the hazardous area Zone 0 and Zone 1.	System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533-/en) Starting from section System overview (Page 67)

What's new in Edition 09/2019 of the ET 200SP System Manual compared with Edition 02/2018?

What's new?		What are the customer benefits?	Where can I find the information?
New contents	BaseUnits BU30-MS7, BU30-MS8, BU30-MS9 and BU30-MS10 for fail-safe motor starters	A simple, wire-saving group shutdown for fail-safe motor starters. In contrast to the earlier solution (BU30-MS5 and BU30-MS6), the fail-safe signal only has to be wired to the first motor starter. The fail-safe signal is internally routed via the BaseUnits.	Section Selecting a motor starter with suitable BaseUnit (Page 91) Section Forming potential groups (Page 99) Section Wiring BaseUnits for motor starters (Page 169)

Industrial cybersecurity

4

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyberattacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

In the first part of this section you will find basic information on the subject of industrial cybersecurity. Subsequent sections describe recommended measures for protecting the entire system and individual components from manipulation and unwanted access.

NOTE

Security-relevant changes to software or devices are documented in the section New properties/functions (Page 29).

4.1 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

4.2 Security update notification

Observe the special information on maintaining the operational security of your plant in the section Introduction (Page 11).

Set up notification of security updates

To receive notifications about security updates, proceed as follows:

1. Register on mySiePortal (https://sieportal.siemens.com/en-ww/home).
2. Enter the keyword "Security" in the search engine.
3. Choose the "Search in Knowledge base" option.
4. Enter the name or article number of the product in the product search.
5. Select the "Other types" option from the filter menu for "Type," and then choose "Download" and "Product note".
6. For the document you want to be informed about, select "Add to my favorites" using the 3 dots on the right.

   For example, if you would like to be informed about all firmware versions of the CPUs, select the entry "Firmware update S7-1500 CPUs incl. displays and ET 200 CPUs (ET 200SP, ET 200pro)".
7. In the following dialog, enter the name, select the storage location and the "Notify me" option for the favorite. Then click on the "+ Add to my favorites" button.

Result: You will be notified by email each time the document is changed.

Under "mySiePortal" > "Lists & notifications" > "My notifications", you can display your notifications and delete them if necessary.

4.3 Basic information on industrial cybersecurity

4.3.1 Definition of industrial cybersecurity

Industrial cybersecurity is generally understood to mean all measures to protect against the following threats:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability (e.g. due to the destruction of data or denial of service (DoS))

4.3.2 Objectives of industrial cybersecurity

The objectives of industrial cybersecurity are:

- Ensuring trouble-free operation of industrial plants and production processes
- Prevention of risks to people and production from cybersecurity attacks
- Protection of industrial plants against espionage and manipulation
- Protection of industrial automation systems and components against unauthorized access and data loss
- Provision of a practical and cost-effective concept for securing existing plants and devices without their own security functions

- Use of existing, open, and proven industrial cybersecurity standards
- Compliance with legal requirements

An optimized and adapted security concept applies to automation and drive technology. The security measures must not impede or endanger production.

4.4 Integrated security concept and security strategies

4.4.1 Comprehensive security concept "Defense in Depth"

With Defense in Depth, Siemens provides a multi-layer security concept that offers industrial plants comprehensive and far-reaching protection in accordance with the recommendations of the IEC 62443 international standard.

Productivity and know-how are protected on 3 levels:

Plant security
Plant security uses various methods to secure the physical access of people to critical components. This starts with classic building access and extends to securing sensitive areas using access control (for example, code card, iris scan, fingerprint or access code).

Network security
Automation networks must be protected against unauthorized access. This is achieved through security measures on the product, but also those in the product-related environment.

System integrity
Targeted measures must be taken to protect existing know-how or prevent unauthorized access to automation processes.
The measures protect against unauthorized configuration changes and identify attempts at manipulation.

You can find more information on the topics of Defense in Depth, plant security, network security, and system integrity on the SIEMENS Industrial cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) Web page.

You can also visit the download center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) to obtain more information on the topic of industrial cybersecurity. The "Operational Guidelines", for example, provide recommendations on basic security measures for secure machine and plant operation in an industrial environment.

4.4.2 Security management

The ISO 27001 and IEC 62443 standards call for a comprehensive approach in information technology (IT) and operational technology (OT) to protect against cyber attacks.

Responsibility for cybersecurity and IT security

Every operator of machinery and equipment is responsible for:

- Establishment of cybersecurity and IT security as an important criterion in the procurement and selection of machines and software applications.
- Use of suitable measures to protect production resources, data, and communication from manipulation and theft
- Provision of all necessary resources and training to employees to fully support these goals

For this purpose, suitable measures must be selected after a risk assessment and a cost-benefit analysis in order to protect material and intellectual property and prevent damage from occurring. These measures should be integrated into corporate processes and procedures, evaluated regularly, and firmly anchored in the corporate culture. In addition to protecting intellectual property, the protection of personal data must be ensured at all organizational units and levels.

Siemens will provide you with information and support. Subscribe to the Security feeds (https://www.siemens.com/cert) for information on vulnerabilities. Register on mySiePortal (https://sieportal.siemens.com/en-ww/home) and create filters to be notified when important information is published. The procedure is described in the section Notification of security updates (Page 34). Consider using Siemens Cybersecurity Services.

Responsibility in the digital supply chain

Cybersecurity should play a critical role in the evaluation and procurement process. The entire life cycle of a product should be considered to ensure protection against current and future risks. These include, for example, security updates throughout the product life cycle, including guidelines for secure disposal of the product.

Siemens plans and announces the provision of security updates, as well as total discontinuation of products, as part of product support.

Employee awareness

Regular training in cybersecurity and continuous testing of training success are essential so that cybersecurity measures are internalized in processes and work instructions. This involves general training in the use of software and IT hardware for company communication and as work tools, e.g.:

- secure handling of USB devices
- encrypted communication
- use of VPN
- rules for passwords and use of access
- setting up two-factor authentication
- educating employees about the dangers posed by malware, phishing, social engineering, etc.

Furthermore, if applicable, production equipment and software training should always include the topic of cybersecurity.

Maintaining the security concept through updates

Keeping software up-to-date is essential, for example, to benefit from the following measures:

- Implementation of new security strategies, protocols and techniques
- Closing of security vulnerabilities
- Elimination of security vulnerabilities

To this end, it is necessary to keep a constant eye on the further development of protective measures and, if necessary, the expansion of requirements.

Recommendations:

- Set up notifications for (security) updates
- Subscribe to information on vulnerabilities
- Monitor and implement the further development of the technology, especially in the area of cybersecurity

Always keep technology and knowledge up to date.

Consideration of the risks posed by cyber attacks in the Threat and Risk Assessment (TRA)

Make an inventory of all software, hardware, and infrastructure devices, in order to identify risks to the location or organization. Incident response procedures must be incorporated into all IT and manufacturing processes. The choice of risk mitigation measures should be based on a cost-benefit analysis and classification of risks. This is followed by the introduction of cybersecurity rules and procedures and the training of personnel.

Living the concept

Technical solutions alone are not sufficient to effectively counter threats.

Cybersecurity must be part of the corporate culture and process landscape and must be internalized and lived by all employees.

Continuously monitoring the security situation

You have the following options to monitor the cybersecurity situation continuously:

- Setting anomaly references and creating allow and deny lists based on normal network communication and production machine behavior. The SINEC software family offers you reliable security tools (https://www.siemens.com/global/en/products/automation/industrial-communication/sinec-network-software/cybersecurity.html) to detect potential vulnerabilities in OT networks, quickly initiate suitable measures and effectively resolve security vulnerabilities.
- Establishment of an intrusion detection system (IDS) that generates alarms when unusual behavior occurs in the network

- Introduction of a Security Information and Event Management (SIEM) system to collect, analyze, and evaluate events in real time to enable early countermeasures
- Measures regarding network security: e.g. network segmentation, firewalls, VPN, DMZ (demilitarized zones)

4.5 Operational application environment and security assumptions

4.5.1 Intended use

SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.

The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

Operational reliability and intended use

Observe the "Special information" section in Introduction (Page 11).

Area of application

Observe the "Area of application" section in System overview (Page 67).

4.5.2 Requirements for the operational application environment and security assumptions

Siemens recommends the following security measures:

- Threat and Risk Assessments (as part of security management)
- Network security concepts
  - Network segmentation
  - Asset and network management
  - Network protection
  - Remote access
- Access control concepts (utilizing access control systems)
  - Physical protection
  - Physical enterprise security
  - Physical product security

Threat and Risk Assessment

Vulnerabilities and risks are identified, and countermeasures are proposed to ensure the security of the system, networks, and data.

Network security concepts

You can find information on network security in the white paper "Industrial Network Security Architecture", available from the Download Center (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security/downloads.html) on the Industrial Cybersecurity (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html) website.

Access control concepts

Physical protection
In addition to closing off and/or monitoring entire production facilities, it may be necessary to physically secure cabinets or even individual components such as circuit breakers.

Physical enterprise security
You can ensure physical corporate security by the following measures, among others:

- Closed off and monitored company premises
- Access control, locks/card readers, and/or security personnel
- Accompaniment of non-employees by company personnel
- Employees are trained on and embrace security processes within the company

Physical production security
You can ensure physical production security by the following measures, among others:

- Separate access control for critical areas, such as production areas.
- Installation of critical components in lockable cabinets/control rooms with monitoring and alarm capabilities. The cabinets/control rooms must be secured with a cylinder lock. Do not use simple locks, such as universal, triangular/square, or double-bit locks.
- Radio field planning to limit WLAN coverage areas, preventing them from extending beyond defined zones (e.g. factory floor).
- Guidelines that prohibit the use of external, insecure data storage media (such as USB flash drives) and IT devices (such as laptops) on systems.

4.6 Security properties of the devices

The security properties of the individual devices are listed in the Equipment Manuals.

4.7 Secure operation of the system

4.7.1 Introduction to secure operation of the system

This section describes measures recommended by Siemens to protect your system from manipulation and unauthorized access.

4.7.2 Hardening measures

System hardening, also referred to simply as hardening, is the secure configuration of products or systems. The aim is to close vulnerabilities and take various measures to reduce the attack surfaces for cyberattacks.

Measures for system hardening include, for example:

- Secure configuration in which only software components and services actually needed for operation are installed or activated.
- Access control in which restrictive user and rights management system is implemented.

4.7.3 Secure configuration

Secure configuration involves control over all software components, along with their interfaces, ports, and services.

Activated services and ports pose a risk, for example of unauthorized access to the network and to programs.

To minimize the risk, activate solely the required services at all the automation components. Take into account all activated services (especially web servers, FTP, remote maintenance etc.) in the security concept. Consider the default states of ports and services in your security concept.

You can find an overview of all ports and services used in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.7.4 Access control

In addition to physical protection, also establish logical safeguards to control access to your system:

- Use a restrictive user and rights management system, e.g. for accessing the CPUs and TIA Portal
- Observe the information regarding password management in the section Protection (Page 219) and in the STEP 7 online help (TIA Portal).

4.7.5 Handling of sensitive data

Data protection information

Siemens Aktiengesellschaft observes the applicable data protection laws, including the General Data Protection Regulation (GDPR), in particular the rules of data minimization and data-protection-friendly default settings (privacy by design, privacy by default).

This means for the products in this system:

Products with user management save user names and passwords to manage access rights. User names are also saved in logging alarms. These logging alarms are provided with a time stamp and stored in the internal cache of the CPU. They can be forwarded to a central syslog server.
You can find more information in the section Syslog messages (Page 54).

In addition, the products do not store any personal data.

If you establish a reference to an identifiable person by linking these data with other data (for example shift schedules), or if you store personal data on the same medium (for example a hard disk), you must yourself ensure that the data protection regulations are observed.

Information on the secure removal of data from the CPU, interface module, and SIMATIC Memory Card is provided in the section Secure decommissioning (Page 43).

Storage of security-related data

When storing your security-relevant data on your PC, independently ensure secure data storage.

Observe also the section Data worth protecting (Page 51).

4.7.6 Regular firmware updates

NOTE

Outdated firmware versions might not be monitored for security vulnerabilities.

- Always keep your plant/products up to date to benefit from bug fixes and to minimize potential risks.
- Use email notifications to be automatically informed about firmware updates.

For more information, refer to:

- The section Firmware update (Page 322)
- The section Notification of security updates (Page 34)

4.7.7 Notifications about security vulnerabilities (Siemens Security Advisories)

A vulnerability is a security vulnerability in information security. A vulnerability can pose a threat as it provides intruders with the opportunity to access system resources and manipulate or steal data. Many vulnerabilities allow availability to be impaired.

Siemens ProductCERT

If Siemens identifies or fixes security gaps (Security Vulnerabilities) in the products, this will be published in the Security Advisories.

You can find the documents for SIMATIC on the following Siemens AG Web page: Siemens ProductCERT and Siemens CERT (https://new.siemens.com/global/en/products/services/cert.html?s=SIMATIC#SecurityPublications)

"SIMATIC" is the default in the "Search Security Advisories" search field. You can also enter other product names or other terms in the search field and search for them.

On this page, you will also find all necessary information on handling vulnerabilities:

- Contact persons for matters related to vulnerabilities
- Options for automated notifications regarding vulnerabilities
- Notifications are also possible in CSAF format
- Option to subscribe to RSS feeds and newsletters
- List of all current vulnerabilities and detailed information such as:
  - Description
  - Score according to Common Vulnerability Scoring System (CVSS)
  - Measures
  - Availability
  - Etc.

Set up Security feeds (https://www.siemens.com/cert) to receive notifications about security-related topics.

If you suspect or have discovered a vulnerability in a Siemens product, please inform us immediately. To do this, press the "Contact" button on the CERT Services page (https://www.siemens.com/cert) and follow the instructions.

4.7.8 Data backup

Secure your configuration and parameter settings so that you can quickly restore this data if needed.

4.7.9 Security checks

Security checks for data, files and archives serve to protect data integrity at the storage location and during file transfer from manipulation and transmission errors. This is often achieved using digital checksums that are provided alongside the data. Tools (such as SHA-256 or SHA-512) for calculating and verifying these checksums are provided in many systems and named according to their respective calculation methods.

File Integrity Guidelines describe the prescribed procedure for integrity checks.

Integrity protection is a protection function for engineering data and firmware files.

Communication integrity means protecting communication against unauthorized manipulations to ensure high system availability. A central element in this regard is, for example, the use of digital checksums when accessing controllers. (Source: Industrial Cybersecurity website (https://www.siemens.com/us/en/company/topic-areas/cybersecurity/industrial-security.html))

4.7.10 Secure decommissioning

4.7.10.1 Introduction

In the following section, you will find information on how to properly decommission individual components of your automation system. Decommissioning is necessary when the component has reached the end of its service life.

Decommissioning includes environmentally sound disposal and secure removal of all digital data of electronic components with storage medium.

4.7.10.2 Securely removing data

Before disposing of components of your automation system, you should securely delete all data from the storage media of these components. How to securely delete data from the devices so that it cannot be recovered is described below.

NOTICE
Data misuse resulting from non-secure deletion of data Incomplete or non-secure deletion of data from data memories can result in data misuse by third parties. For this reason, ensure secure deletion of data from all storage media used before disposing of the product.

Secure erasure of data from the CPU and SIMATIC Memory Card

To delete all data from the data memories of the CPU, reset the CPU to factory settings. The function deletes all information that was saved internally on the module.

For secure deletion of the data, follow these steps in the order given:

1. Format the SIMATIC Memory Card.

   The formatting deletes all contents from the SIMATIC Memory Card.

   Formatting with STEP 7:

   – Establish an online connection.
   – Open the online and diagnostics view of the CPU (either from the project context or via "Accessible devices").
   – In the dialog window, select "Functions > Format memory card" and then click the "Format" button.

2. Reset the CPU to factory settings.
   We recommend resetting the CPU in STEP 7. When you reset a CPU to factory settings, select the options shown in the figure before the reset.

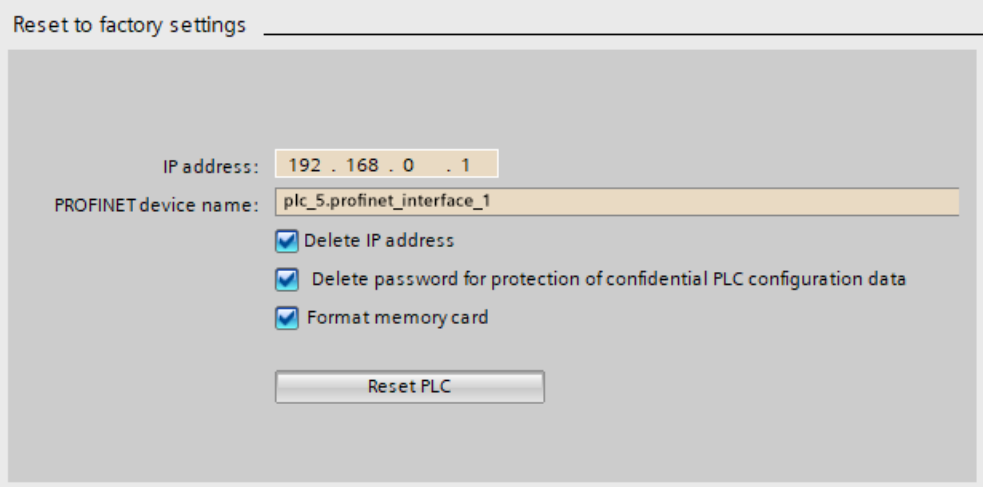

Figure 1-47 Resetting the CPU to factory settings

NOTE
If you reset the CPU using STEP 7 and you have selected the "Format memory card" option, you can skip step 1 of the described sequence of steps.

Result: All data that was still contained in the data memories of the modules and the SIMATIC Memory Card has been deleted. You can now dispose of the components.

For more information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 328).

NOTE
If you no longer plan to use the SIMATIC Memory Card after formatting it, destroy it before disposing of it.
A secure destruction method is to shred the card to such a degree that it cannot be reconstructed. For this, you can also use a waste disposal service that specializes in data storage medium destruction.

Secure erasure of data from the interface module

With the following tools, you can securely erase the data from the interface module:

- STEP 7 < V19
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA

Follow these steps in the order given:

1. Establish an online connection.
2. Open the Online and Diagnostics view of the IM (either from the project context or via "Accessible devices").
3. In the dialog box "Functions > Reset to factory settings", select the option "Delete I&M data" and then the "Reset" button.

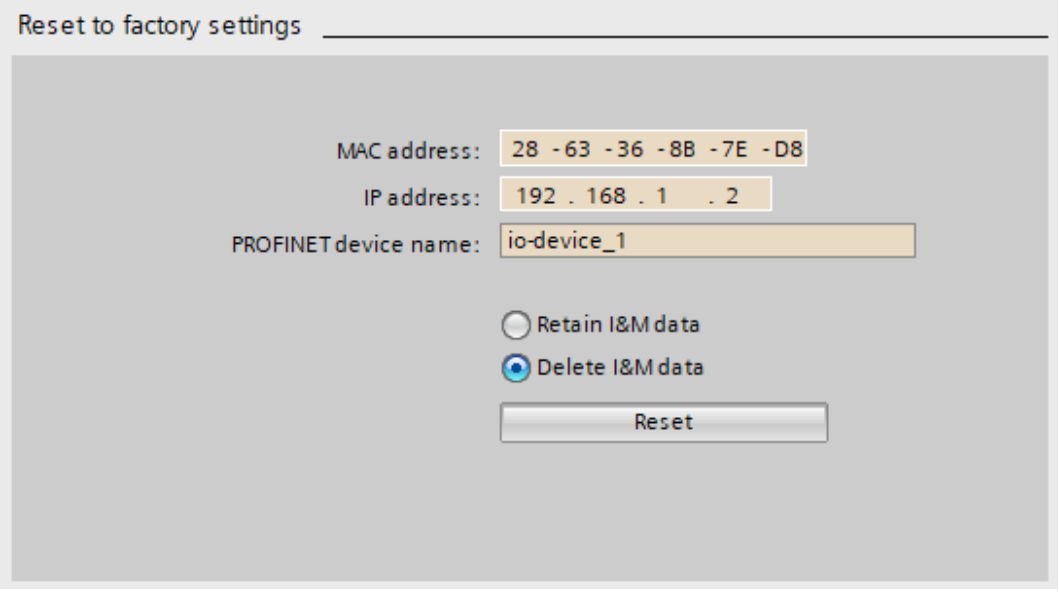

Figure 1-48 Resetting an interface module to factory settings

Result: All the data that was still in the data memories of the interface module was deleted. You can now dispose of the components.

For more information on resetting the interface module to factory settings, refer to the section Resetting an interface module to factory settings (Page 332).

NOTE

STEP 7 ≥ V19

Only the communication parameters will be securely deleted for "Reset to factory settings" with the "Delete I&M data" option enabled when you use STEP 7 ≥ V19.

Deleted communication parameters:

- IP address
- Device name
- PROFINET configuration data

If you want to securely remove all data, use one of the tools listed above for this purpose.

4.7.10.3 Recycling and disposal

For environmentally sustainable recycling and disposal of your old equipment, contact a certified electronic waste disposal service and dispose of the equipment according to the applicable regulations in your country.

NOTE

Recycler Guides

Disassembly of electronic devices may only be carried out by specialists trained in the recycling of electronic products.

The Siemens Recycler Guides provide step-by-step disassembly instructions and material composition information of the products. This information helps recyclers direct specific materials to specialized recyclers and thus maximize the recovery of resources.

You can find the Recycler Guides in the SiePortal (https://sieportal.siemens.com/en-ww/home) in the "Support" area by using the search term "Recycler Guide".

4.8 Secure operation of the engineering software

For more information on secure operation of the engineering software, refer to the TIA Portal online help.

4.9 Secure operation of CPUs

4.9.1 Introduction to secure operation of CPUs

This section describes measures recommended by Siemens to protect your device from manipulation and unauthorized access.

4.9.2 Secure configuration

Information about ports, services and default states can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and the Equipment Manual.

4.9.3 User management and access control

4.9.3.1 Administration of user accounts

Creating and managing user accounts with appropriate usage rights is an important measure, as every active user represents a potential security risk.

Take the following security measures:

- Train your personnel in understanding their rights and password assignment
- Regularly check the user accounts

You can find information on creating and managing user accounts in the Protection (Page 219) section under "User management" and in the online help for STEP 7 (TIA Portal).

4.9.3.2 Assigning secure passwords

Using non-secure passwords can easily lead to data misuse. Non-secure passwords can be easily guessed or decrypted.

- Therefore, always change the default passwords during commissioning and use different passwords for different users, functions and devices.
- When changing passwords, do not use passwords (or parts of passwords) that have been used in the past.
- Also, change passwords for functions you don't personally use to prevent misuse of such unused functions.
- Always keep your passwords confidential and ensure that only authorized individuals have access to the respective passwords.
- Exceed the required minimum password length and use a combination of lowercase letters, uppercase letters, numbers and special characters.

The STEP 7 online help (TIA Portal) provides information on creating secure passwords.

Overview of all components and functions with password protection

Components and functions with password protection	Comment
SIMATIC S7 app	See the SIMATIC S7 app (https://new.siemens.com/global/en/produkte/software/mobile-apps/simatic2go.html)
Syslog (with certificate protection)	See section Syslog messages (Page 54)
CPU	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
OPC UA	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section OPC UA Communication
SNMP Community-String (similar to a password)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section SNMP
Secure communication (with certificate protection)	See the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Secure Communication
Web server	See the Web Server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59193560)

4.9.3.3 Password management

- You can find comprehensive recommendations for assigning secure passwords in the Industrial Security Configuration Manual (https://support.industry.siemens.com/cs/us/en/view/108862708).
- Set guidelines for assigning passwords and intervals for password changes.
- Settings for checking password policies when passwords are assigned or changed can be configured in the TIA Portal. You can find more information in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).
- Changing and resetting the password for protection of confidential configuration data
  You can find information on the following topics in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925):
  - Description on how to change the password
  - Description on how to delete or reset the password
  - Description on how to assign the password via a SIMATIC Memory Card.
- For user management and access control, use the local/central user management.
- Using a password provider: A password provider can be set up in STEP 7, see the section Know-how protection (Page 246).
- In addition, you can use commercially available password management programs.

Setting password protection without engineering system

You can change your password for a user account in the user management via the web server of the CPU:

- API method Api.ChangePassword: Changing a password in runtime

You can find more information about the available methods of the web server's Web API in the Web server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59193560).

4.9.3.4 Setting protection levels

For detailed information about setting up protection levels for the CPU and assigning user authorizations, refer to the Configuring access protection for the CPU (Page 243) section and the STEP 7 online help (TIA Portal).

4.9.3.5 Certificate management

You can use TIA Portal to create, assign, and manage certificates for the following functions of the ET 200SP CPUs:

- Secure Open User Communication
- OPC UA communication
- Secure PG/HMI communication
- Web server

You can find all the relevant information about "Certificate management" in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.9.4 Protection functions

Integrated protection functions of the CPU protect against unauthorized access.

You can find an overview of the protection functions supported by your CPU in the respective Equipment Manual.

A description of the protection functions and their activation can be found in the section Protection (Page 219).

4.9.5 Signed firmware update for CPUs

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect internet source

Principle of the signed firmware updates for CPUs

Firmware updates for CPUs contain a digital signature.

The digitally signed firmware update files are available for download on the Siemens Support website (https://support.industry.siemens.com/cs/de/en/view/109478459).

The CPU verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the CPU can detect a manipulated or corrupted firmware update file and reject it.

Note that the CPU performs the verification only after the complete firmware download has taken place.

The procedure for carrying out firmware updates for CPUs is described in the section Firmware update (Page 322).

Diagnostics alarms and remedy

The success/failure of the signed firmware update is reported:

- In the diagnostic buffer of the CPU
- On the display of the CPU if the CPU has a display
- In the Syslog storage of the CPU

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check, calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support Web page.
3. Repeat the firmware update.

You can find information on the procedure for calculating and comparing hash values on the Internet (https://support.industry.siemens.com/cs/de/de/view/109483101/en).

4.9.6 Secure Boot for CPUs

Secure Boot

Secure Boot verifies, before the boot process, whether firmware has been falsified, for example through manipulation or accidental falsification.
Secure Boot ensures the authenticity and integrity of the firmware executed by the device.

Principle of "Secure Boot" for CPUs

CPUs starting from article number 6ES751x-xxx03-0AB0 verify the authenticity and integrity of the firmware to be executed using "Secure Boot" before their startup.

The verification is carried out using standardized asymmetric cryptography methods.

In addition to the signed firmware update for CPUs (Page 49), Secure Boot prevents a manipulation of the firmware by a physical intervention into the CPU.

Secure Boot is integrated in the CPU and cannot be deactivated for security reasons.

4.9.7 Web server

The CPUs have an integrated Web server.

It comes with built-in security features:

- Activation for specific interfaces
- Access via the secure transmission protocol "HTTPS" using the CA-signed or self-signed Web server certificate
- Authentication via local or central user management
- Changing the password of local users during runtime using Web-API

The functions are described in detail in the Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) Function Manual.

4.9.8 Secure Communication/OPC UA

Additional protection is provided by the protection functions of the secure communication and OPC UA protocols.

Information about the protocols Secure Communication and OPC UA can be found in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).

4.9.9 Sensitive data

Security-relevant and sensitive data can be protected through appropriate measures such as passwords and protection functions.
For certain data, protection is already essential and implemented within the system (e.g. certificate management in the TIA Portal).

Sensitive data	Comment	Where can I find more information?
Confidential configuration data (private keys, passwords/access data)	Protection by using a strong password	Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925), section Protection of confidential configuration data
User management data	-	STEP 7 online help
Configuration of CPUs and interface modules	Protection through PROFINET Security Class 1	PROFINET with STEP 7 Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856)
Blocks (data blocks, logic blocks)	Know-how protection, copy protection, write protection	Section Protection (Page 219)
Data deemed sensitive by the operator	Backups, other configuration data, analysis data	Section Backing up and restoring the CPU configuration (Page 298)

4.9.10 Backups and data backups

Regular backups or data backups after successful installation should be part of a successful security concept. Whether for restoring a project if required, if the changes made do not yield the desired results, or for saving an installation in an emergency.

Backing up a STEP 7 project:

- Project backup via the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300)
- Project backup via TIA Portal, see FAQ What options are there in STEP 7 (TIA Portal) for backing up projects and what is the significance of the backup files of the projects? (https://support.industry.siemens.com/cs/en/de/view/92561565)

You can find more information in the section Backing up and restoring the CPU configuration (Page 298).

4.9.11 Additional measures for network security

To secure a CPU via further measures, the following options are available:

- Deployment of CP 1543SP-1 with security functions

  The use of an Ethernet CP provides you with additional access protection through a firewall and possibilities to establish secure VPN connections. See also operating instructions SIMATIC NET: S7-1500 - Industrial Ethernet CP 1543-1 (https://support.industry.siemens.com/cs/us/en/view/67700710) and S7-1500 - Industrial Ethernet SIMATIC CP 1545-1 (https://support.industry.siemens.com/cs/us/en/view/109771664).

  The following measures additionally increase the protection against unauthorized access to functions and data of the CPU from external sources and via the network: You can find information on these topics in the section Further measures for protecting the CPU in Overview of the protective functions of the CPU (Page 219).
- You can find information on network security and network components for protection from unauthorized access in the PROFINET Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856), section Network security.

4.9.12 Remote access to CPU

4.9.12.1 Using a Web server

When using Web servers, traditional firewalls are no longer sufficient to protect modern networks.

You can find information on potential risks when using web servers in the Web Server Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59193560).

4.9.12.2 Remote access via Internet

Communication via SINEMA Remote Connect (SINEMA RC)

The "SINEMA Remote Connect" (SINEMA RC) application is available for remote maintenance purposes. SINEMA RC uses OpenVPN to encrypt the data. The center of communication is the SINEMA RC server, which is used for communication between the devices and manages the configuration of the communication system.

You can use the CP 1543-1 communication processor for remote maintenance via SINEMA RC.

More information on communication via SINEMA RC can be found in the Operating instructions S7-1500 - Industrial Ethernet SIMATIC CP 1543-1 (https://support.industry.siemens.com/cs/de/de/view/109986722/en) and on the Internet.

4.9.12.3 Remote access via TIA Portal

Communication via TIA Portal Cloud Connector

The TIA Portal Cloud Connector enables you to access the local PG/PC interface and the SIMATIC hardware connected to it from a TIA Portal Engineering in a cloud environment.

Use the "TIA Portal Cloud Connector" via a VPN solution (for example, SINEMA RC).

More information on communication via TIA Portal Cloud Connector in the STEP 7 (TIA Portal) online help. You can find details on working with the TIA Portal Cloud Connector in this application example (https://support.industry.siemens.com/cs/de/de/view/109747305/en).

4.9.13 Recording Security events

Syslog storage

Syslog stands for "System Logging Protocol," a standard for transmitting log messages triggered by security events. Predefined events in a network device are collected as security events in the device (syslog client) and stored as syslog messages in the local cache.

A syslog server collects and categorizes syslog messages, which can then be analyzed and filtered and displayed in various ways. Additionally, notifications for critical events can be configured.

The following security events, for example, are collected in the CPU diagnostic buffer:

- Going online with the correct or incorrect password
- Manipulated communication data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (via an instruction or, if applicable, the CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive

- Logging on to the Web server with the correct or incorrect password
- Creating a backup of the CPU
- Restoring the CPU configuration (Restore)

The above-listed security events are also stored as syslog messages in the local cache of a CPU as of firmware version V3.1. You can find an overview of all syslog messages in the following Entry (https://support.industry.siemens.com/cs/ww/en/view/109823696).
The content of a syslog message is based on IEC 62443-3-3.

You can find more information in the section Syslog messages (Page 54).

Connection to a SIEM system

A SIEM system (Security Information and Event Management) analyzes security events in real time and can be installed, for example, on the syslog server.

4.9.14 Syslog messages

Using syslog messages

International standards and national regulations for the IT security of automation components require, for example, the ability to log safety-related events.
Syslog (System Logging) is an IETF standard protocol (RFC 5424) for the transfer of recorded events and meets this requirement. A CPU records the following events, for example:

- Security events
- Firmware updates
- Changes to the user program
- Changes to the configuration
- Changes to the operating state

The collecting of security-relevant events cannot be deactivated. Each CPU as of FW version V3.1 saves syslog messages in a local cache. By querying this cache, you can view the syslog messages and identify potential security risks.

For CPUs as of FW version V4.0, the local cache is located in the retentive memory area. As a result, syslog messages are retained after a POWER OFF/POWER ON transition or when the CPU is switched off. As a result, events that require one or more CPU restarts are also retained in syslog storage, such as restoring the CPU configuration.

The cache of a CPU is organized as a ring buffer. If the storage limit of the cache is reached and additional security events occur, the oldest messages in the cache are overwritten.

You have the option of transferring the security events collected by the CPU to a syslog server in the network.

NOTE

Deleting the retentive syslog storage

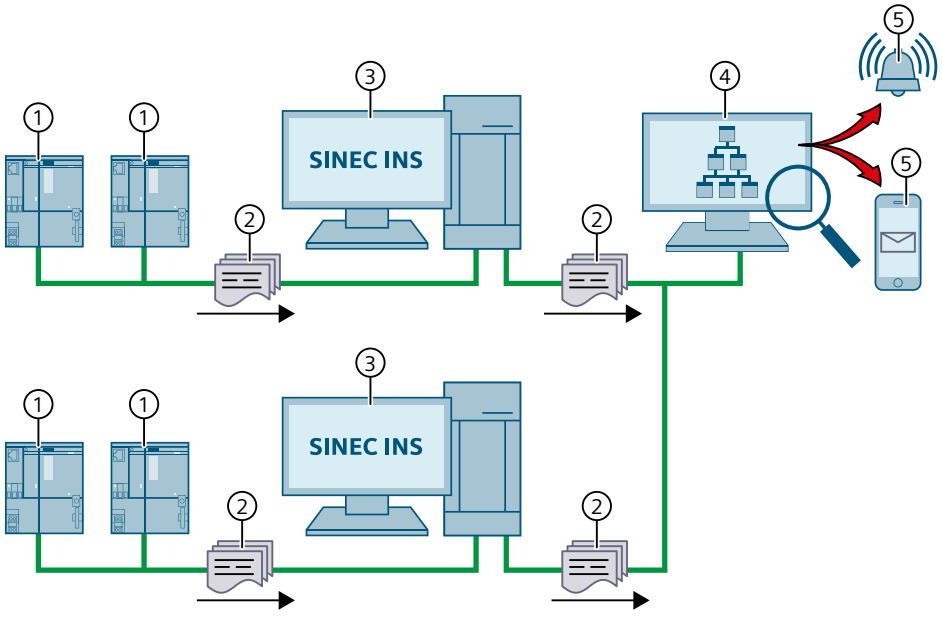
If you want to expand or store a CPU as of FW version V4.0, the syslog messages are retained in the syslog storage of the CPU. To prevent unwanted transmission of saved syslog messages, return the CPU to factory settings (reset to factory settings) before removing or storing.

After a successful reset, the syslog storage only contains one boot up entry, which provides information about the reset to factory settings.

Forwarding to a syslog server

From STEP 7 V19 and a CPU as of FW version V3.1, it is possible to transfer syslog messages to a server, e.g. SINEC INS. The syslog messages are transferred to the syslog server via the syslog protocol. The syslog server saves all syslog messages from its connected devices. Messages of system and network events are stored centrally in a storage location in the syslog server. At the syslog server interface, you can view the collected syslog messages and thereby determine the source of potential security risks or problems.

If you want CPUs to transfer their syslog messages to a syslog server, configure either a TLS or UDP connection. Syslog messages are sent to the syslog server via port 514 (UDP) or port 6514 (TLS over TCP) by default.



Use solely a TLS connection in productive operation. TLS ensures that all syslog messages from the CPU are securely transferred to the syslog server.

You can also use a UDP connection for commissioning and testing scenarios. A UDP connection is not secured. A UDP connection does not even guarantee transferring of all syslog messages to the configured syslog server.

Processing in a Security Information and Event Management system (SIEM system)

In order to be able to accept and process the incoming syslog messages, a SIEM system must "understand" the syslog protocol according to RFC 5424.

The SIEM system breaks down the incoming syslog messages into individual elements. These elements are assigned to their own event within the SIEM system. Within this event, it is analyzed whether there are connections between the individual syslog messages. In this way, the SIEM system detects possible attack vectors and, if necessary, informs the user, e.g. in the event of multiple attacks at several points in the system.

① CPUs
② Syslog messages
③ Syslog server, e.g. SINEC INS
④ SIEM system
⑤ Notify user

Figure 1-49 Forwarding and processing of syslog messages

More information

More information on network management with SINEC INS is available in the "SIMATIC NET: Network management SINEC INS V1.0 SP2" (https://support.industry.siemens.com/cs/us/en/view/109781023) manual.

You can find information on the structure of syslog messages in the Structure of the Syslog messages (Page 59) section.

4.9.14.1 Transfer the syslog messages to a syslog server

A CPU can send syslog messages to a syslog server via a TLS or UDP connection.

Recommendation: Use solely a TLS connection for the productive operation. You can also use a UDP connection for commissioning or testing scenarios.

Transmitting syslog messages via a TLS connection

A TLS connection ensures that all syslog messages from a CPU are securely transmitted to the syslog server. If the TLS connection is interrupted, the syslog messages are cached in the CPU cache. The CPU only sends the cached syslog messages when the TLS connection to the syslog server is established again.

Each syslog message is transferred to a syslog server only once. If you address another syslog server in the settings for the syslog server, syslog messages that have already been transferred are not transferred to a newly configured syslog server.

Since the cache of a CPU is organized as a ring buffer, the oldest messages are overwritten as soon as the memory limit is reached and further security events occur. Overwriting syslog messages that have not yet been transferred to a syslog server is reported as a security event (overflow event) in syslog storage. If syslog messages are overwritten over a long period of time, the overflow event is repeated regularly. As soon as the first message is sent back to the syslog server, another security event is generated. This security event confirms that syslog messages are being transferred back to the syslog server.

Message in the diagnostic buffer of the CPU

If a syslog server is configured in the CPU properties, the CPU records overwriting of non-transmitted syslog messages in the diagnostic buffer also.

As soon as a non-transmitted syslog message is overwritten, the CPU reports maintenance demanded as an incoming event in the diagnostic buffer. In addition, the MAINT LED of the CPU also signals incoming maintenance demanded.

As soon as the syslog messages are sent back to the syslog server, the CPU reports maintenance demanded as outgoing event in the diagnostic buffer. If the CPU does not report any further maintenance demanded, the MAINT LED also turns off again.

Information on the status and error display of the CPU can be found in the respective device manuals.

Requirements

If you want to transfer the syslog messages of a CPU to a syslog server, the following requirements must be met:

- STEP 7 as of version V19
- CPU as of FW version V3.1
- A project has been created in STEP 7
- The device or network view of STEP 7 is open

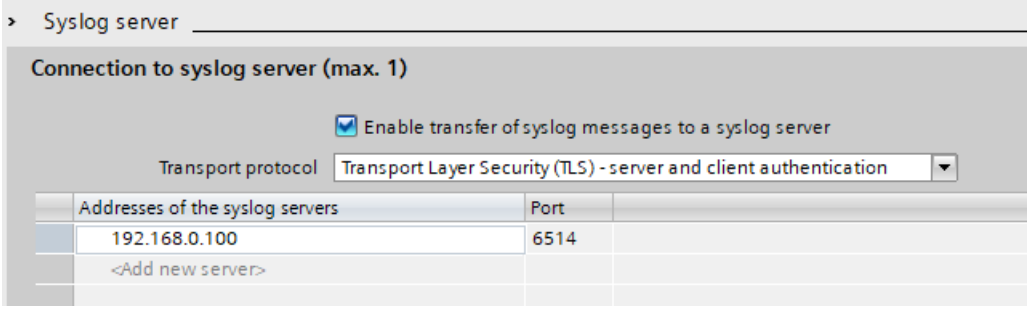
Procedure

To configure the CPU to transfer syslog messages to a syslog server, following these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Syslog server".
3. In the "Connection to syslog server" area, select the "Enable transfer of syslog messages to a syslog server" option. The selection options below become editable.
4. Select one of the following options from the "Transport protocol" drop-down list:
   - "Transport Layer Security (TLS) - server and client authentication": Encrypted data transfer, syslog server and client (CPU) must authenticate themselves.
   - "Transport Layer Security (TLS) - only server authentication": Encrypted data transfer, only the syslog server needs to authenticate itself.
   - "UDP": Unencrypted data transfer, syslog server and client (CPU) do not need to authenticate themselves.

   In the next sections you can read how to select the certificates for authentication (logon) depending on the settings specified.
5. In the "Addresses of the syslog servers" column, enter a valid server address.
6. In the "Port" column, enter a valid port number.
   By default, STEP 7 uses the following port numbers:
   - Standard TCP port for TLS: 6514
   - Standard UDP port: 514

Result: You have configured the transfer of syslog messages to a syslog server.



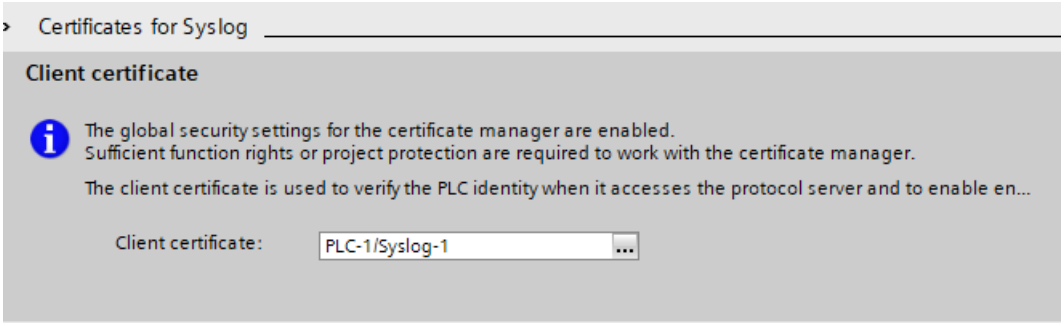


Figure 1-50 Transfer of syslog messages to a syslog server configured

Selecting the client certificate

STEP 7 provides the required client certificate for a CPU for the TLS transport protocol. If the certificate is managed within the CPU, you can either choose an existing certificate or create a new certificate. To do so, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".

3. Select the appropriate certificate in the "Client certificate" field.

Selecting the server authentication

After selecting the TLS transport protocol, the configured syslog server must authenticate itself. This ensures that the CPU only connects to a trusted server. If you want to waive server authentication, activate the automatic acceptance of server certificates during runtime. To configure these settings, follow these steps:

1. Select the required CPU in the device or network view of STEP 7.
2. In the Inspector window, navigate to "Properties > Protection & Security > Syslog > Certificates for Syslog".
3. In the "Trusted servers" area, specify whether the connected syslog server is to be authenticated. In this case, it is necessary to complete the following information:
   - Add trusted server: Add a valid server certificate in the "Common name of subject" column.
   - Automatically accept certificates during runtime: Activate the "Automatically accept server certificates during runtime" option. Editing in the table is then not possible.

NOTE

No authentication with automatically accepted server certificates

If you enable the "Automatically accept server certificates during runtime" option, a server does not need to authenticate itself. This means that the CPU can also connect to unknown servers that could represent a security risk.

Only select this option during commissioning or in a protected environment.

4.9.14.2 Structure of the Syslog messages

A CPU collects syslog messages in a local cache. These syslog messages are structured according to the syslog protocol (RFC 5424) and consist of the following elements:

- HEADER
- STRUCTURED-DATA
- MSG (Message)

The following sections describe the structure and parameters of the individual elements.

Structure of the HEADER element

The header contains all the data required for further processing of the syslog message. A space separates the individual parts of the header (exception: No space between PRI and VERSION). A CPU transmits the following header in syslog messages, for example:

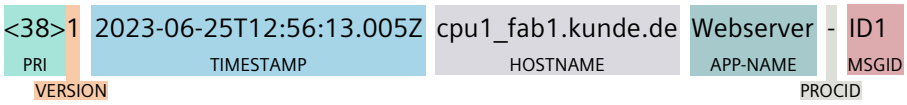

Figure 1-51 Example: HEADER of the syslog message of a CPU

The following table describes the parameters in the prescribed order.

Parameter	Description
PRI	PRI encodes the priority of the syslog message, divided into Severity (severity of the message) and Facility (origin of the message). The PRI value is formed as follows: • PRI = Facility x 8 + Severity Possible values: • Severity – 0 = Emergency: system is unusable – 1 = Alert: action must be taken immediately – 2 = Critical: critical conditions – 3 = Error: error conditions – 4 = Warning: warning conditions – 5 = Notice: normal but significant condition – 6 = Informational: informational messages – 7 = Debug: debug-level messages • Facility – 1 = User-level messages – 2 = Mail system – 3 = System daemons – 4 = Security/authorization messages – 5 = Messages generated internally by syslog – 6 = Line printer subsystem – 7 = Network news subsystem – 8 = UUCP subsystem – 9 = Clock daemon – 10 = Security/authorization messages – 11 = FTP daemon – 12 = NTP subsystem – 13 = Log audit – 14 = Log alert A CPU does not use all of the listed severity/facility values.
VERSION	Version number of the syslog specification.
TIMESTAMP	The device sends the time stamp in the format "2023-06-25T12:56:13.005Z" as UTC time without time zone and correction for daylight-saving/standard time.
HOSTNAME	Contains the name or the IP address (PROFINET interface X1) of the device or system from which the syslog message has been sent. IPv4 address according to RFC1035: Bytes in decimal representation: XXX.XXX.XXX.XXX IPv6 address according to RFC4291 Section 2.2 "-" is output if information is missing.
APP-NAME	Contains the component (device part or application) from which the message has been generated. "-" is output if information is missing.
PROCID	The process ID serves to clearly identify the individual processes, for example during analysis and troubleshooting. "-" is output if information is missing.
MSGID	ID to identify the message. "-" is output if information is missing.

Structure of the STRUCTURED-DATA element

STRUCTURED-DATA provides information in an interpretable and decomposable data format. The following applications are possible, for example:

- More information about the syslog message
- Application specific information

STRUCTURED-DATA can contain one or more elements (SD-ELEMENT). Each SD element must be enclosed in square brackets. If STRUCTURED-DATA consists of multiple SD elements, the individual SD elements are separated by a space.

Each SD-ELEMENT consists of its name (SD-ID) and one or more name-value pairs (SD-PARAM). Each name-value pair consists of a parameter name (PARAM-NAME) and the associated value (PARAM-VALUE). A space separates the individual components (SD-ID and SD-PARAM) within an SD element.

A CPU transmits the following SD ELEMENT in a syslog message, for example:

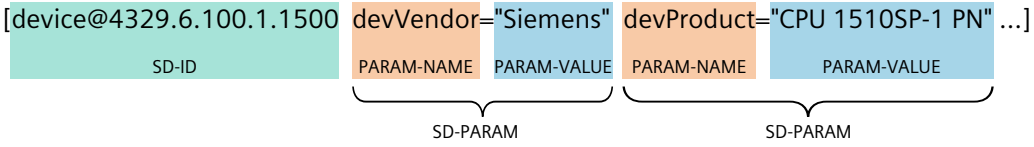

Figure 1-52 Example: SD ELEMENT of the syslog message of a CPU

Structure of the MSG element

In the MSG (MESSAGE) element, a CPU transmits the simplified name of the event in English. The following table shows what the content of a message of the MESSAGE element can look like.

MESSAGE	Description
SE_LOCAL_SUCCESSFUL_LOGON	The local logon has been successful (e.g. on the operator display of the CPU).

More information

You can read more information about the structure and transmission of syslog messages in the following RFCs (Request for Comments):

- The syslog protocol (RFC 5424) (https://tools.ietf.org/html/rfc5424)
- Transferring syslog messages via Transport Layer Security (RFC 5425) (https://tools.ietf.org/html/rfc5425)
- Transferring syslog messages via UDP (RFC 5426) (https://tools.ietf.org/html/rfc5426)

4.10 Secure operation of interface modules

Device-specific security information and instructions for interface modules can be found in the respective Equipment Manual.

4.10.1 Data integrity for interface modules

Data integrity refers to the completeness and correctness (integrity) of data, which is an essential prerequisite for the proper functioning of systems.

Measures for data privacy, data consistency, and data security ensure that data used within devices cannot be damaged, altered (manipulated), or deleted during processing or transmission, and at the very least, any changes to the data are detected.

Data integrity for interface modules

To detect intentional or accidental changes to data within an interface module and its associated modules, the possibility of dynamic integrity checking is introduced for PROFINET interface modules.

The ability to detect integrity breaches enhances the resilience of the distributed I/O system.

Data integrity within a distributed I/O system is entirely covered within the interface module and does not pertain to other components of the automation system.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as parameter settings, IP address, device name, MAC address and I&M data. The interface module stores the checksums in the I&M4 data area.

A CRC (Cyclic Redundancy Check) is always the same for a specific, unchanged memory content. When the memory content changes, the interface module (IM) calculates a different checksum for this content by reading and comparing the I&M4 data. By comparing with the initial CRC, you can determine whether the data in the memory has been modified or not:

- CRC stayed the same: No change in the data within this memory area of the interface module IM
- CRC changed: The data within this memory area of the IM was modified

Only you, as the user, know whether changes to the data of an interface module were intentional or not. If changes were not intentional, you can detect that the data of the interface module has been compromised through changed CRCs and respond accordingly.

I&M data

PROFINET devices provide Identification and Maintenance data (I&M data), which is a set of predefined data structures containing the internal module status. With this data, a module can be identified, its serial number can be determined, etc.

The CRC checksums are mapped in the maintenance data **I&M4** of the interface module.

NOTE

Requirements for calculating the CRCs

The CRCs via the memory contents of the interface module are calculated only when you request to read the I&M4 data.

The CRCs cover not only the interface module itself but can also take into consideration combined checksums from associated modules (refer to the section on the structure of the data record for I&M data). Process data is not included in the calculation of CRCs.

Example:

- You put your distributed I/O system into operation and read the CRC CHK_OVERALL with the value "0x55AAA678" ("16#55AAA678") from the interface module via the I&M4 data.
- As long as no changes have been made to the data of the interface module or the associated modules, each subsequent read will give the value "0x55AAA678" or "16#55AAA678".
- Once you read a different CRC CHK_OVERALL, for example, "0xCC9876FF", you will realize that there must have been changes to the data of the interface module or the associated modules.

The quality of the statement regarding the data integrity of the distributed I/O system improves with each module associated with the interface module that supports I&M4 data. Refer to the Equipment Manual of the respective module to find out if and from which firmware version the module supports I&M4 data.

The structure of the I&M data 0 to 4 is described in the section Record structure for I&M data (Page 308).

Spare parts scenario

The spare parts scenario is ensured. This means that you can replace interface modules with the same article number. For the "new" interface module, the static data such as the serial number and MAC addresses will change. Note that this is why the replacement will be reflected in the changed identification data CHK_STATIC_LOCAL and consequently also in CHK_OVERALL.

More information on the spare parts scenario and compatibility can be found in the Equipment Manual of the interface module.

4.10.2 Signed firmware update for interface modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect internet source

Information on whether your interface module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

Principle of signed firmware updates for interface modules

Firmware updates of interface modules may include a digital signature. The digitally signed firmware update files are available for download on the Siemens Support website.

The interface module verifies the authenticity and integrity of the firmware update file before installation using the digital signature with standardized asymmetric cryptography methods. As a result, the interface module can detect a manipulated or corrupted firmware update file and reject it.

Note that the interface module performs the verification only after the complete firmware download has taken place.

Subsequently, a notification is sent to the firmware update tool regarding the success or failure of the signature verification.

You still have all the options for firmware updates, as described in the Firmware update (Page 322) section, when performing signed firmware updates for interface modules. If the firmware update was not successful, the module will continue to run with the previous firmware.

Diagnostics alarms and remedy

When performing a firmware update for an interface module with an established connection between the IM and CPU, there are the following options for notifications in the CPU's diagnostic buffer:

- Successful integrity check of the firmware for the interface module
- Rejection of non-secure firmware for the interface module

You can find more information in the channel diagnostics table in the equipment manual of the interface module.

In case of firmware update rejection, proceed as follows:

1. Check whether the firmware update file used by you originates from a secure source and was downloaded unchanged. As a check, calculate the hash value of the downloaded firmware update file and compare it with the value specified on the download page.
2. Download the firmware again from the Siemens Support Web page.
3. Repeat the firmware update.

You can find information on the procedure for calculating and comparing hash values on the Internet (https://support.industry.siemens.com/cs/de/de/view/109483101/en).

4.11 Secure operation of I/O modules

Device-specific security information and instructions for I/O modules can be found in the respective Equipment Manual.

4.11.1 Data integrity for I/O modules

Data integrity for I/O modules

In order to detect intentional or accidental changes to the data of an interface module and the assigned modules, the dynamic integrity check for I/O modules is introduced. Information on whether your I/O module supports the data integrity check is available in the Technical specifications section of the corresponding Equipment Manual.

Principle

The interface module calculates checksums based on its used data and the supplied data from the associated modules, such as serial numbers, parameter settings, calibration data and I&M data of I/O modules. The interface module stores the checksums in the I&M4 data area.

You can find more information on the principle of data integrity and I&M4 data in the section Data integrity for interface modules (Page 62).

Spare parts scenario

The spare parts scenario is still ensured. This means that you can replace I/O modules with the same article number. For the "new" I/O module, the static data such as the serial number will change. Note that the replacement is therefore reflected in the following modified I&M4 data of the interface module:

- CHK_STATIC_SUBS
- CHK_OVERALL_SUBS
- CHK_OVERALL

You can find the structure of I&M data in the section Record structure for I&M data (Page 308).

4.11.2 Signed firmware update for I/O modules

Signed firmware update

A signed firmware update ensures the authenticity and integrity of the firmware loaded onto a device.

It protects you against installing malicious firmware in case:

- Firmware was modified
- Firmware was downloaded from an incorrect Internet source

Signed firmware update for I/O modules

Firmware updates for I/O modules can contain a digital signature. Information on whether your I/O module supports signed firmware updates is available in the Technical specifications section of the corresponding Equipment Manual.

The digitally signed firmware update files are available for download on the Siemens Support Web page.

Principle, diagnostics alarms, and remedies

The principle and diagnostics of the signed firmware update are the same for interface modules and I/O modules. The information in the section Signed firmware update for interface modules (Page 64) applies.

Firmware update (Page 322)

4.12 Secure operation of the power supply modules

Device-specific security information and instructions for the power supply modules can be found in the respective Equipment Manual.

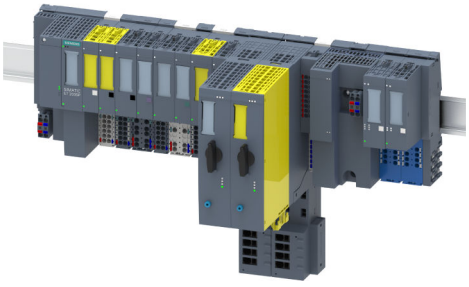
System overview

5

5.1 What is the SIMATIC ET 200SP distributed I/O system?

SIMATIC ET 200SP

SIMATIC ET 200SP is a scalable and highly flexible distributed I/O system for connecting process signals to a higher-level controller via a fieldbus.



Customer benefits of the system

Compact design

- Small size and high variability through scalability
- Maximum level of clarity through innovative labeling system in minimum space
- System-integrated load current supply

Easy to use

- Compact modules, fixed wiring with single-cable and multi-cable connection
- Less time due to connection technology Connection system with push-in terminals
- Adaptation of the configuration for future expansions through integrated configuration control

Safety Integrated

- Easy integration of fail-safe CPUs and modules
- All F-parameters set in software

Communication standards

- PROFINET IO
- PROFIBUS DP
- EtherNet/IP
- Modbus TCP
- ET-Connection
- AS-Interface
- IO-Link
- Point-to-point (RS232, RS485)
- DALI
- DMX
- CAN/CANopen

High performance

- Isochronous PROFINET IO with the PROFIsafe and PROFIenergy profiles

Energy efficiency

- PROFIenergy as integrated function

CPU

- PROFINET interface
- IO controller
- I-device
- Optional CM DP module for connection to PROFIBUS DP
- available as PC-based system, combines CPU, HMI and Windows/Linux Application on a single device

Modules for hazardous area

- Modules for the connection of devices in hazardous areas of Zone 0 and Zone 1.

Motor starter

- Easy integration of motor starters with overload and short-circuit protection
- Compact design with a maximum connectable motor output of up to 5.5 kW

Motion integrated

- All CPUs offer integrated Motion Control functions. For extended motion control function the Technology CPUs are available.

Powerful technology

- Modules for Counting, Positioning, Weighing and Measuring functions of electrical parameters

Figure 1-53 SIMATIC ET 200SP distributed I/O system - Customer benefits

Area of application

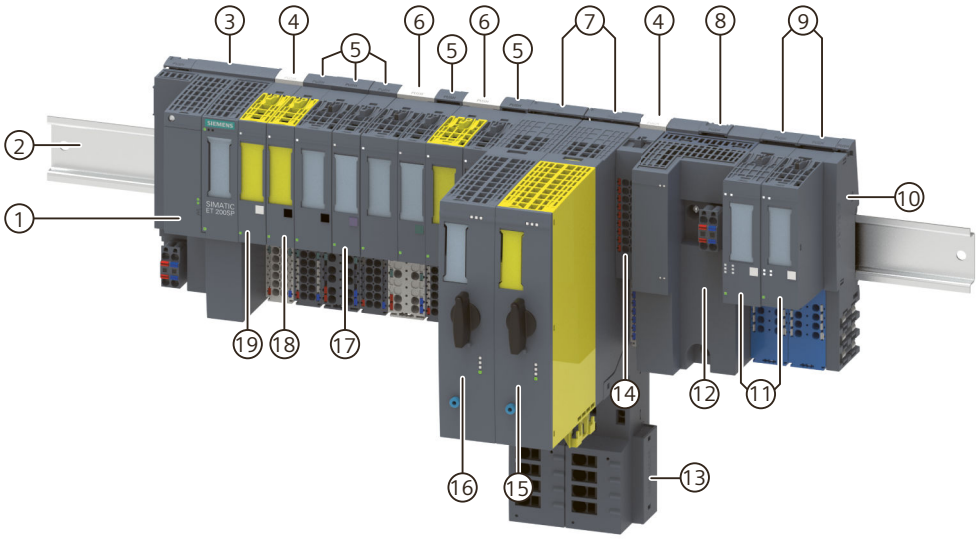
Thanks to its multifunctionality, the SIMATIC ET 200SP distributed I/O system is suitable for a wide range of applications. Its scalable design allows you to tailor your configuration to local requirements. Various CPUs/interface modules are available for connection to PROFINET IO, PROFIBUS DP, EtherNet/IP or Modbus TCP.

SIMATIC ET 200SP with CPU allows intelligent pre-processing to relieve the higher-level controller. The CPU can also be used as standalone device.

By using fail-safe CPUs, you can implement applications for safety engineering. Configuration and programming of your safety program takes place the same way as for standard CPUs.

An extensive range of I/O modules extends the area of application of the ET 200SP system.

SIMATIC ET 200SP is designed with degree of protection IP20 and is intended for installation in a control cabinet.



With use of an ET 200SP R1, you increase the availability of the system through redundant interface modules.

Configuration

The SIMATIC ET 200SP distributed I/O system is installed on a mounting rail. It consists of:

- CPU/interface module
- Up to 64 I/O modules, which can be plugged into BaseUnits in any combination
- Up to 31 motor starters
- A server module that completes the configuration of the ET 200SP.

5.2 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher safety requirements. F-systems control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Safety Integrated

Safety Integrated is the integrated safety concept for automation and drive technology from Siemens.

Proven technologies and systems from automation technology are used for safety systems. Safety Integrated includes the complete safety sequence, ranging from sensor, actuator and fail-safe modules right through to the controller, including safety-related communication via standard fieldbuses. Drives and controllers handle safety tasks in addition to their actual functions.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard modules is that they have an internal two-channel design. This means the two integrated processors monitor each other, automatically test the input and output circuits, and switch the fail-safe module to a safe state in the event of a fault.

The F-CPU communicates with a fail-safe module via the safety-related PROFIsafe bus profile.

Fail-safe motor starters

Fail-safe motor starters enable safety-related tripping of motor loads. Fail-safe motor starters are not PROFIsafe nodes. Motor starters operate together with the fail-safe modules of the ET 200SP system.

Area of application of ET 200SP with fail-safe I/O modules

By using the ET 200SP distributed I/O system with fail-safe I/O modules, you are replacing conventional safety engineering configurations. This includes the replacement of switching devices for emergency STOP, protective door monitors, two-hand operation, etc.

5.3 How are SIMATIC Safety F-systems structured with ET 200SP?

SIMATIC Safety F-system with ET 200SP

The figure below shows an example of a configuration for a SIMATIC Safety F-system with ET 200SP distributed I/O system and PROFINET IO. You can configure the PROFINET IO lines with copper cable, fiber-optic cable or WLAN.

Fail-safe I/O modules and non-fail-safe I/O modules can be combined in an ET 200SP configuration.

The fail-safe IO controller (F-CPU) exchanges safety-related and non-safety-related data with fail-safe and non-fail-safe ET 200SP modules.

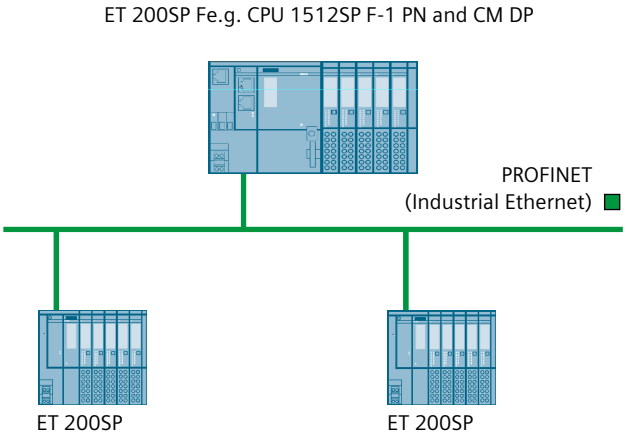

Figure 1-55 Fail-safe SIMATIC Safety automation system (sample configuration)

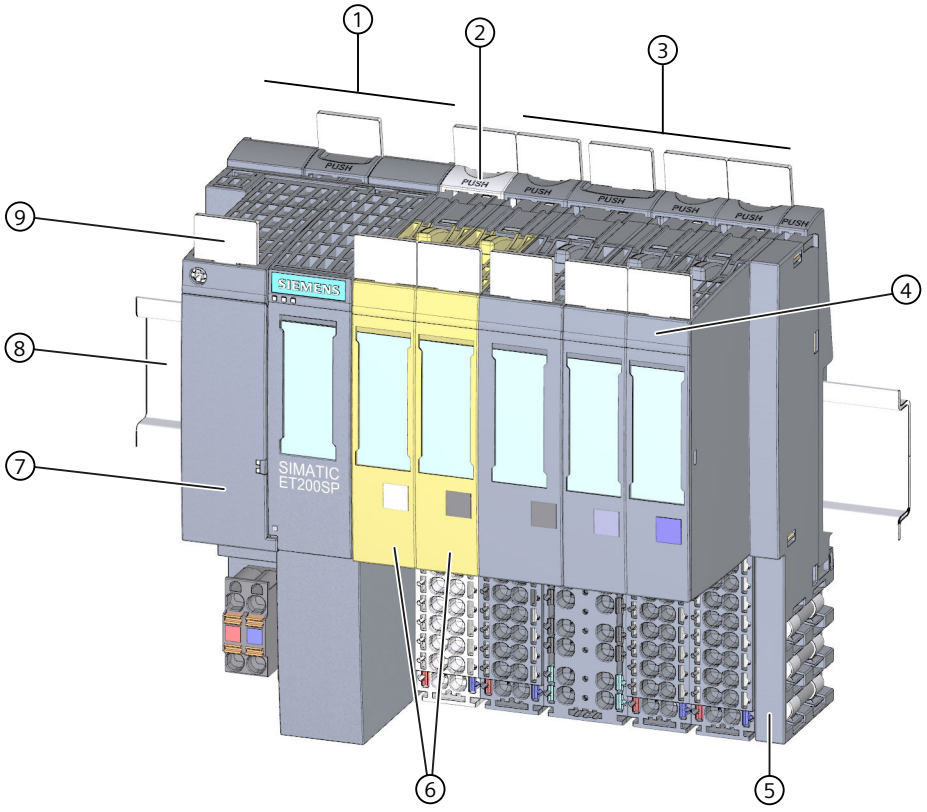
Fail-safe ET 200SP I/O modules



The following fail-safe I/O modules are available for the ET 200SP distributed I/O system:

- Fail-safe power modules are used to supply the potential group load voltage and for the safety-related tripping of the load voltage for non-fail-safe output modules.
- Fail-safe digital input modules detect the signal states of safety-related sensors and send the relevant safety frames to the F-CPU.
- Fail-safe digital output modules are suitable for safety-related shutdown procedures with short circuit and cross-circuit protection up to the actuator.

ET 200SP fail-safe motor starters

Fail-safe motor starters are suitable for safety-related tripping of motor loads.

Example of a configuration with fail-safe I/O modules

① Interface module

⑤ Server module (ships with the interface module)
⑥ Fail-safe I/O modules
⑦ BusAdapter
⑧ Mounting rail
⑨ Reference identification label

Figure 1-56 Example of a configuration of the ET 200SP with fail-safe I/O modules

Hardware and software requirements

Fail-safe modules ET 200SP are supported by IM155-6PN ST interface modules as of firmware V1.1.1, IM155-6PN HF as of firmware V2.0, IM155-6PN HS as of firmware V4.0 and IM155-6DP HF as of firmware V1.0.

You require the STEP 7 Safety Advanced option package, V12 or higher including HSP 54, for configuration and programming of the ET 200SP fail-safe modules with the SIMATIC Safety fail-safe system.

You require the F-Configuration Pack V5.5 SP10 or later for configuring and programming the ET 200SP failsafe modules with the Distributed Safety failsafe system.

You require the F-Configuration Pack V5.5 SP12 or later for configuring and programming the ET 200SP failsafe modules with the F/FH Systems failsafe system.

ET 200SP fail-safe motor starters are supported by interface modules IM155-6PN BA, firmware V3.2 or higher, IM155-6PN ST, firmware V3.1 or higher, IM155-6PN HF, firmware V3.1 or higher and IM155-6DP HF firmware V3.0 or higher.

You require SIMATIC Step 7 V14 or higher for configuration and programming of ET 200SP fail-safe motor starters. The F-Configuration Pack is not needed for configuration and programming of the ET 200SP fail-safe motor starter.

NOTE

Configuration of ET 200SP motor starters, SIMATIC Step 7 V13 or higher, is possible with a GSD file (GSDML).

Use in safety mode only

Safety mode is the F-I/O operating mode that allows safety-related communication using safety frames.

Safety mode of motor starters is characterized by the fail-safe digital input (F-DI) and availability of the 24 V power supply.

You can only use the ET 200SP fail-safe I/O modules in safety mode. They cannot be used in non-fail-safe mode.

Achievable safety classes

The fail-safe modules are equipped with integrated safety functions for safety mode.

You can achieve the safety classes of the table below:

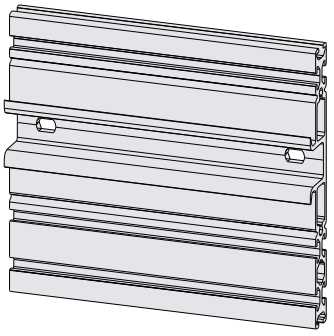
- With the appropriate parameter assignment of the safety functions in STEP 7
- With a specific combination of fail-safe and non-fail-safe I/O modules
- With a special arrangement and wiring of the sensors and actuators

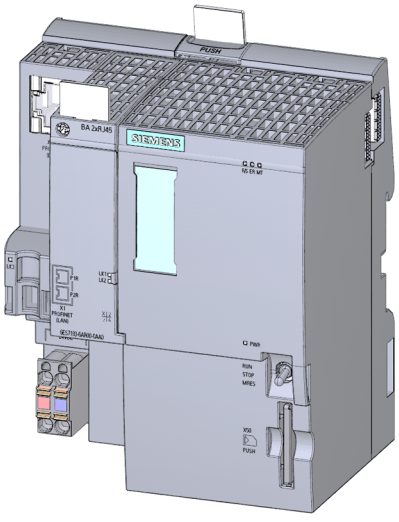
Table 1-346 Safety classes that can be achieved with ET 200SP in safety mode

Safety class in safety mode		
According to IEC 61508	**According to ISO 13849-1**	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

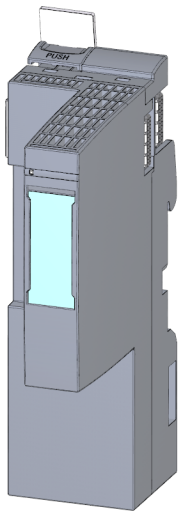
More information

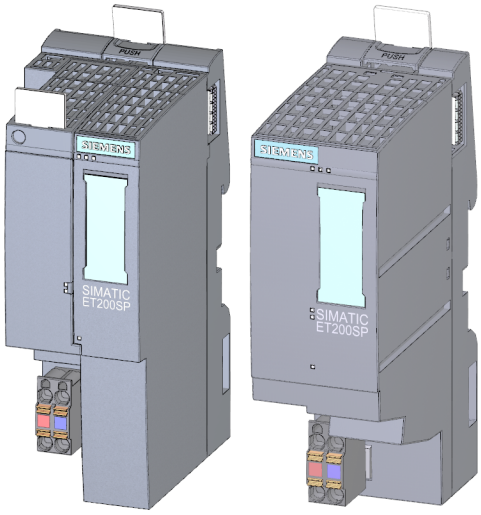
You will find the use cases and wiring for the relevant safety class in the manuals of the fail-safe I/Os and the fail-safe motor starters.

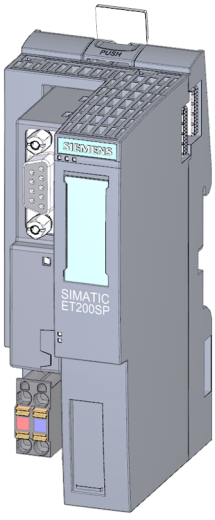




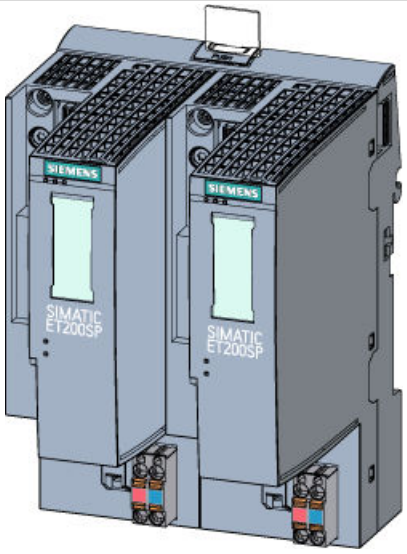
5.4 Components



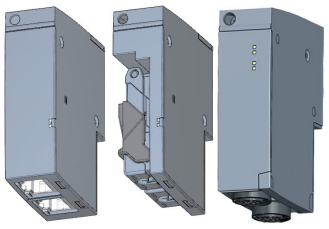


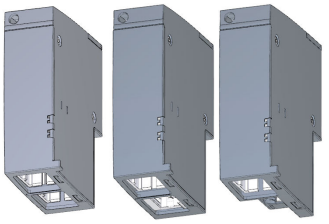


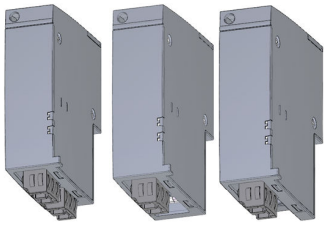
Overview of ET 200SP modules and accessories

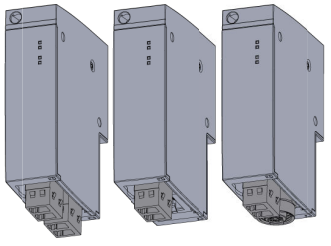


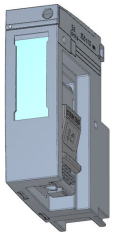
NOTE
A complete overview of the ET 200SP modules and accessories is available in the Product information on documentation of the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/de/de/view/73021864/en).



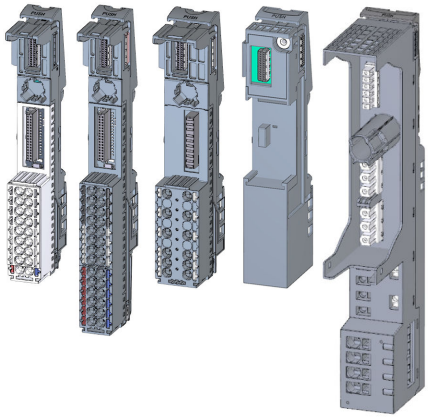


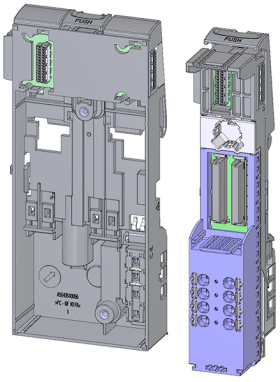






Basic components of the ET 200SP distributed I/O system





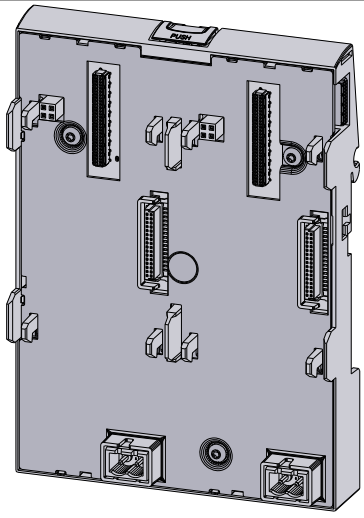


Table 1-347 Basic components of the ET 200SP

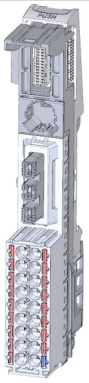
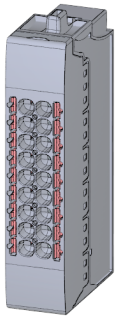
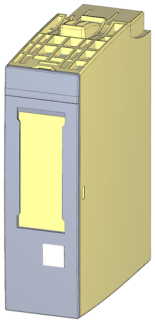
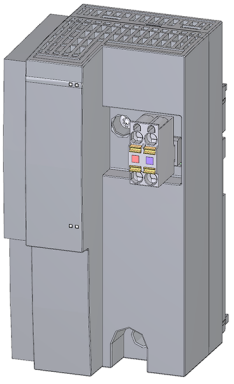
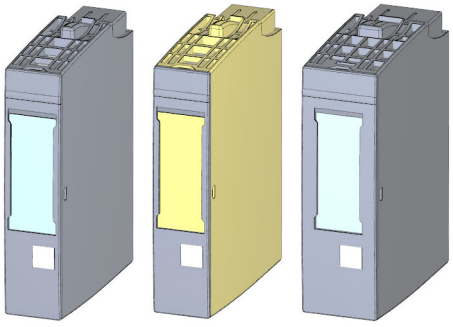


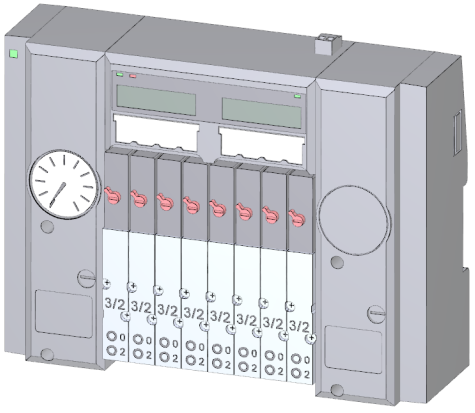




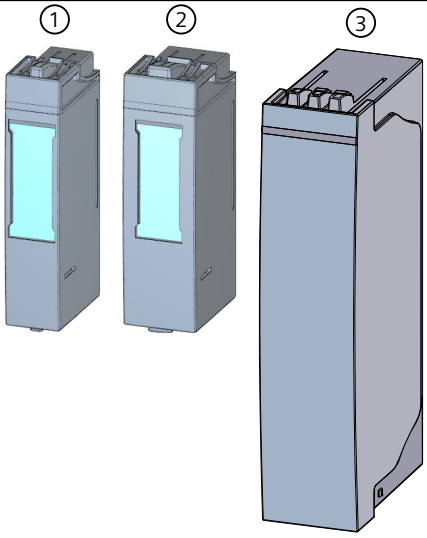


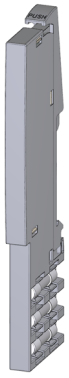
Basic component	Function	Figure
Mounting rail in accordance with EN 60715	The mounting rail is the rack of the ET 200SP distributed I/O system. You install the ET 200SP system on the mounting rail. The mounting rail is 35 mm high.	
SIMATIC system rail	The system rail is the mounting rack of the ET 200SP R1 distributed I/O system. The ET 200SP R1 system must be installed on the system rail. You can also mount all other interface modules on the system rail to improve the stability of the system.	
CPU/Fail-safe CPU	The (F) CPU: • Runs the user program. The F-CPU also runs the safety program. • Can be used as an IO controller or I-Device on PROFINET IO or as a standalone CPU • Links the ET 200SP to the IO devices or the IO controller • Exchanges data with the I/O modules via the backplane bus. Additional CPU functions: • Communication via PROFIBUS DP (the CPU can be used as a DP master or DP slave in combination with the CM DP communication module) • Integrated Web server • Integrated technology • Integrated trace functionality • Integrated system diagnostics • Integrated safety • Safety mode (when using fail-safe CPUs)	

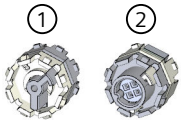




Basic component	Function	Figure
Communication module CM DP	The communication module CM DP • Connects the CPU with PROFIBUS DP • The bus connection is an RS485 interface.	
Interface module for PROFINET IO	The interface module: • Can be used as IO device on PROFINET IO • Links the ET 200SP with the IO controller • Exchanges data with the I/O modules via the backplane bus.	
Interface module for MultiFieldbus	The interface module: • Use as IO device on PROFINET IO • Links the ET 200SP with the IO controller • Links the ET 200SP via EtherNet/IP • Links the ET 200SP via Modbus TCP • Exchanges data with the I/O modules via the backplane bus You can find more information about MultiFieldbus in the MultiFieldbus Function Manual (https://support.industry.siemens.com/cs/ww/en/view/109773209) and in the Interface Module IM 155-6 MF HF Equipment Manual (https://support.industry.siemens.com/cs/ww/en/view/109773210).	
Interface module for PROFIBUS DP	The interface module: • Can be used as DP slave on PROFIBUS DP • Links the ET 200SP with the DP master • Exchanges data with the I/O modules via the backplane bus.	







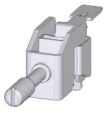
Basic component	Function	Figure
Interface modules and BaseUnit BU type M0 for redundant connection	The ET 200SP R1 system: • Use as redundant IO device on PROFINET IO • Connects the ET 200SP to the IO controller • Exchanges data with the I/O modules via the backplane bus.	

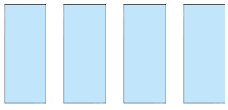
Basic component	Function	Figure
BusAdapter	The BusAdapters allow free selection of the connection technology for PROFINET IO. The following versions are available for PROFINET CPU/interface modules: • For standard RJ45 connector (BA 2×RJ45) ① • For direct connection of the bus cable (BA 2×FC) ② • For standard M12 connector (D-coded) with screw-type terminal or plug-in push-pull version (BA 2xM12) ③ • For POF/PCF fiber-optic cable (BA 2xSCRJ) ④ • As media converter for POF/PCF fiber-optic cable ⇔ standard RJ45 plug (BA SCRJ/RJ45) ⑤ • As media converter for POF/PCF fiber-optic cable ⇔ direct connection of the bus cable (BA SCRJ/FC) ⑥ • For glass fiber-optic cable (BA 2xLC) ⑦ • As media converter for glass fiber-optic cable ⇔ standard RJ45 plug (BA LC/RJ45) ⑧ • As media converter for glass fiber-optic cable ⇔ direct connection of the bus cable (BA LC/FC) ⑨ • For single-mode fiber-optic cable with maximum length of 20 km (BA 2xLC-LD, long distance) ⑩ • As media converter for glass fiber-optic cable with an LC plug connector ⇔ standard RJ45 connector (BA LC-LD/RJ45) ⑪ • As media converter for glass fiber-optic cable with an LC plug connector ⇔ standard M12 plug or M12 push-pull connector (BA LC-LD/M12) ⑫	① ② ③  ④ ⑤ ⑥  ⑦ ⑧ ⑨  ⑩ ⑪ ⑫ 
	For mixed ET 200SP/ET 200AL configuration, you require the BusAdapter BA-Send 1xFC ① (plugged into the BaseUnit BU-Send). Connect the bus cable for ET-Connection to the BusAdapter BA-Send 1xFC.	① 

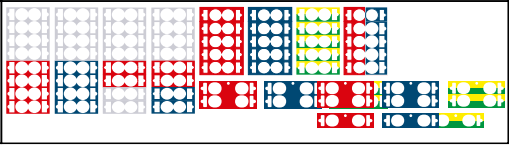
Basic component	Function	Figure
BaseUnit	The BaseUnits provide the electrical and mechanical connection of the ET 200SP modules. Place the I/O modules or the motor starter onto the BaseUnits. Respectively suitable BaseUnits are available for the different requirements. You can find additional information in section Selecting the BaseUnit for I/O modules (Page 89).	
Ex BaseUnit	You need the following BaseUnits for an Ex module group: • Ex BaseUnit for Ex power module • Ex BaseUnit for Ex I/O module	
BaseUnit ET 200SP R1	Connects the IM 155-6 PN R1 redundant interface modules to the backplane bus. It enables data exchange with the I/O modules. Note: Interface modules cannot be plugged in if the associated supply voltage connector is plugged in. Only use BusAdapters of the same type.	

Basic component	Function	Figure
PotDis-BaseUnit potential distribution module	You use the potential distribution module to distribute a variety of potentials (P1, P2). This allows you to implement a multi-cable connection without external terminals with 16-channel digital modules. The assembly has two parts: • If you need additional potential terminals, plug a PotDis-TerminalBlock in the PotDis-BaseUnit. • Alternatively, plug a BU cover (15 mm) on the PotDis-BaseUnit. With potential distribution modules, you may only connect to the PotDis-TB versions BR-W and n.c.-G potential, which exceed the voltage level of SELV/PELV. Other SELV/PELV potential groups should be separated with light-colored PotDis BUs. Suitable PotDis-BaseUnits are available in each case for the different requirements. You can find additional information in section Selecting a PotDis-BaseUnit (Page 95).	
PotDis-TerminalBlock	If you need additional potential terminals for a PotDis-BaseUnit, plug a PotDis-TerminalBlock in the PotDis-BaseUnit. Voltages greater than SELV/PELV are only permitted for the PO PotDis-TBs BR (bridged) and NC (not connected). The same applies to PE. Voltages at the terminals of the PotDis modules connected to the P1/P2 rails must not be greater than SELV/PELV. Suitable PotDis-TerminalBlocks are available in each case for the different requirements. You can find additional information in section Selecting a PotDis-TerminalBlock (Page 96).	
Fail-safe power module	The fail-safe power module allows the safety-related shutdown of digital output modules / fail-safe digital output modules.	
Ex power module	The Ex power module supplies the downstream Ex I/O modules via the power bus on the Ex BaseUnit of the Ex power module. An Ex BaseUnit is required for installing the Ex power module.	

Basic component	Function	Figure
I/O module / Fail-safe I/O module / Ex I/O module	The I/O module determines the function at the terminals. The controller detects the current process state via the connected sensors and actuators, and triggers the corresponding reactions. I/O modules are divided into the following module types: • Digital input (DI, F-DI, Ex-DI) • Digital output (DQ, F-DQ PM, F-DQ PP, F-RQ, Ex-DQ) • Analog input (AI, F-AI, Ex-AI) • Analog output (AQ, Ex-AQ) • Technology module (TM, F-TM-C) • Communication module (CM) • Power module (F-PM-E)	
Motor starter/fail-safe motor starter	The motor starter is a switching and protection device for 1-phase and 3-phase loads. The motor starter is available as a direct-on-line and reversing starter.	
Vale terminal AirLINE SP type 8647 (Bürkert GmbH & Co. KG) [1) 2)]	Basic component: Valve terminal AirLINE SP type 8647 (Bürkert). For more information on the AirLINE SP, type 8647 (e.g. data sheet and operating instructions), please contact Bürkert (https://www.burkert.co.uk/en/type/8647) directly. Function: Valve terminals are common in industrial automation and are used as pilot valves for controlling pneumatic actuators, for example in areas of the food, pharmaceutical and water treatment industries. The ET 200SP in combination with the AirLINE SP, type 8647 from Bürkert provides a universal interface between process and plant control that enables the flexible, modular configuration of pilot valves and I/O modules. The valve terminal can also be fitted to the base of the control cabinet with the help of the AirLINE Quick Adapter. This further reduces the space required in the control cabinet and considerably simplifies installation of the pneumatic system. [1) 2)]	







Basic component	Function	Figure
BU cover	Insert the BU cover on the BaseUnits: • Whose slots are not equipped with I/O modules/ motor starters//PotDis-TerminalBlocks • Whose slots have been reserved for future expansion (as empty slots). You can keep a reference identification label for the planned I/O module inside the BU cover. There are three versions: • For BaseUnits with a width of 15 mm ① • For BaseUnits/Ex BaseUnits with a width of 20 mm ② • For BaseUnits of motor starters with a width of 30 mm ③	
Server module	The server module completes the configuration of the ET 200SP. The server module includes holders for 3 spare fuses (5 × 20 mm). The server module ships with the CPU/interface module and is available as spare part.	
Coding element	The coding element codes the I/O module with the BaseUnit. There are two versions: • Mechanical coding element ①: Ensures the coding • Electronic coding element ②: This version also has an electronic, rewritable memory for module-specific configuration data (such as the F-destination address for fail-safe modules, parameter data for the IO link master).

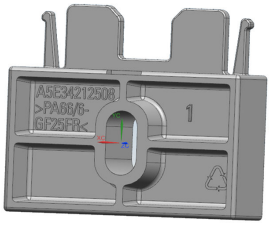
Accessories of the ET 200SP distributed I/O system



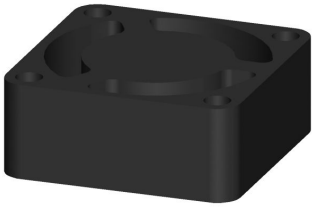


Table 1-348 Accessories of the ET 200SP

Accessories	Function	Figure
24 V DC connector	Application of the 24 V DC supply to the connector, and connection, e.g. to the CPU/interface module/Ex power module. The 24 V DC connector is available as a spare part.	
Shield connection	The shield connection allows the low-impedance contacting of cable shields with minimum installation times.	
Labeling strips	Attach the labeling strips to the modules for system-specific labeling of the ET 200SP distributed I/O system. The labeling strips can be printed. The labeling strips can be ordered as accessories (Page 370) on a roll for thermal transfer printers or as DIN A4 format sheets for laser printers.	
Reference identification labels	The labels enable the reference identification labeling of the ET 200SP components. The labels can be ordered on a mat for thermal transfer and inkjet printers as accessories (Page 370).	
Color identification labels	The color identification labels are module-specific and can be ordered for the process terminals, AUX terminals and additional terminals as accessories (Page 370).	

Accessories of the SIMATIC ET 200SP motor starters

Table 1-349 SIMATIC ET 200SP motor starter accessories

Accessories	Function	Figure
3DI/LC module	The optional 3DI/LC module has three digital inputs and one LC input. For reasons of operational safety, input LC is permanently set to manual local mode. By parameterizing the inputs DI1 - DI3 with motor CLOCKWISE or motor COUNTER-CLOCKWISE, you can control the motor in manual local mode. The functions of the 3DI/LC module are not relevant to functional safety.	

Accessories	Function	Figure
	Detailed information on the functions when using a 3DI/LC module can be found in the Manual (https://support.industry.siemens.com/cs/ww/en/view/109479973).	
Mechanical bracket for BaseUnit	Use the mechanical bracket for additional fixing of the motor starter. You can use the mechanical bracket on 7.5 mm and 15 mm mounting rails.	
Infeed bus cover	For finger-safe termination of the infeed bus, use the cover.	
Fan	You can use the motor starter at higher ambient temperatures if a fan is installed.	

Application planning

6

Overview

The BaseUnits (BU) are classified according to different types. Every BaseUnit type is distinguished by characteristics that match certain I/O modules and motor starters (see the following table and graphics).

You recognize the BU type for an I/O module by the last two digits of an I/O module's article number.

The BU type onto which you can plug the respective I/O module is printed on the I/O modules. You can therefore read which BU type you need straight from the I/O module (see Factory labels (Page 186) (page 122)).
Example: On the output module DQ 16x24VDC/0.5A ST with article number 6ES7132-6BH01-0B**A0** the information "BU: A0" is printed. This means you can plug this I/O module into a BaseUnit of BU type "A0", which means any BaseUnit whose article number ends in "A0". I/O modules that are suitable for two BU types are labeled accordingly, for example "BU: A0, A1".

NOTE

You will find a complete module overview of the ET 200SP distributed I/O system and an overview of possibilities of combining BaseUnits and I/O modules /motor starters in the Product information for documentation of the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/de/de/view/73021864/en).

NOTE

Use of Ex modules

If you are using Ex I/O modules for the connection of intrinsically safe devices from Zone 0 or Zone 1 in the ET 200SP configuration, observe the information for plant planning in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en).

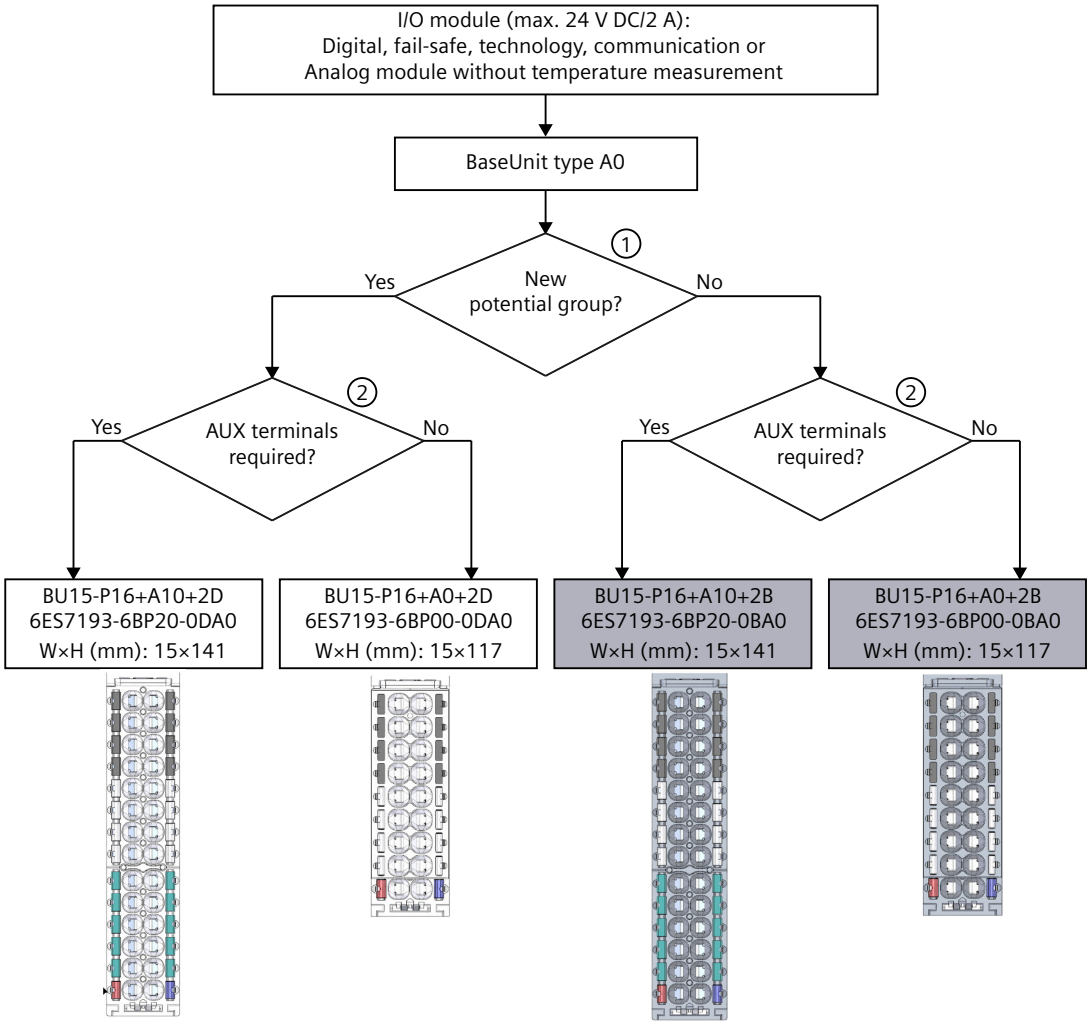
Additional information



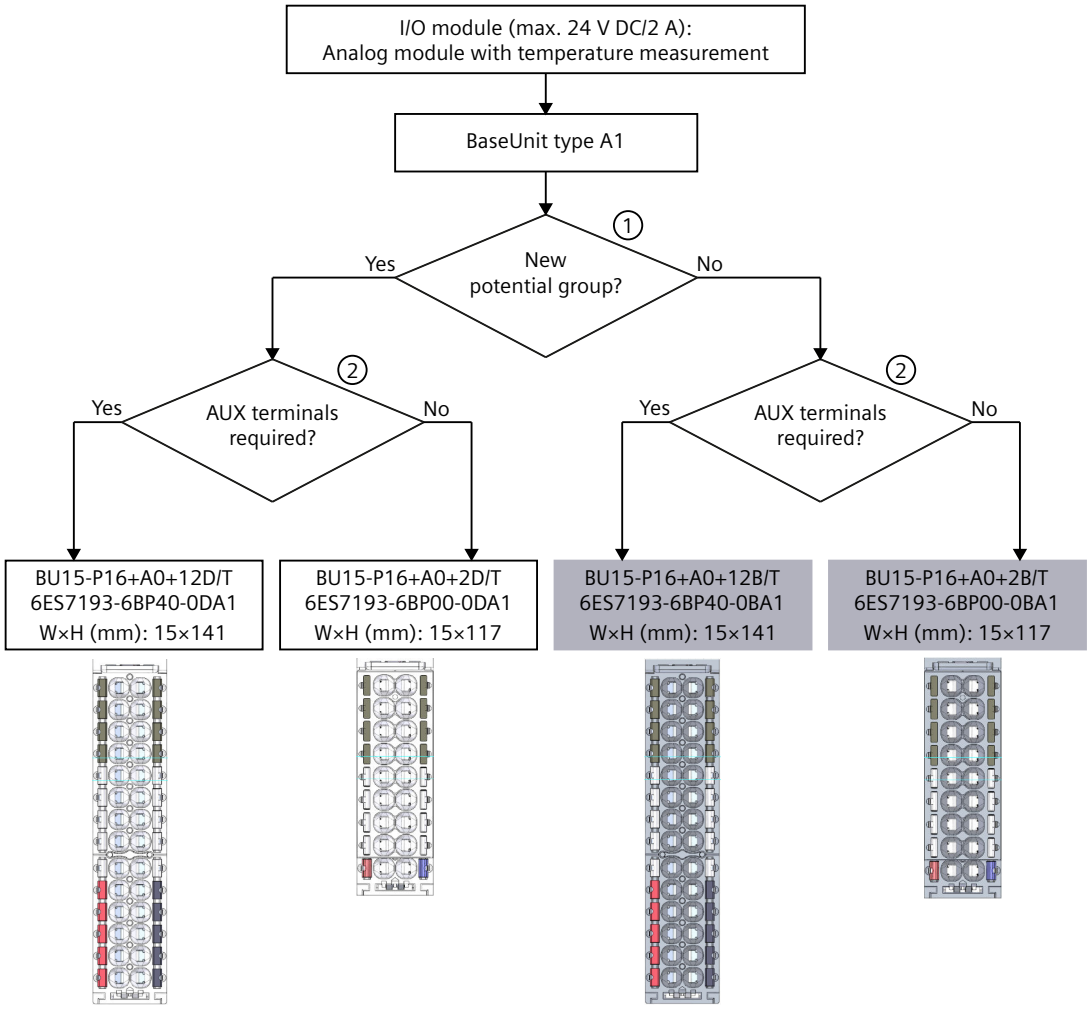
Additional information on the functional assignment of the terminals and on the associated BaseUnits can be found in one of the following manuals:

- Manual for the relevant I/O module (https://support.industry.siemens.com/cs/ww/en/ps/14039/man)
- Manual BaseUnits (https://support.industry.siemens.com/cs/ww/de/view/59753521/en)
- Motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual

6.1 Selecting the BaseUnit for I/O modules

6.1.1 Digital, fail-safe, communication, technology or analog modules without temperature measurement

Selection of a suitable BaseUnit



① Light-colored BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light-colored BaseUnit for the incoming supply voltage L+. A potential group opened with a light-colored BU type U0 must not contain any dark-colored BaseUnit of BU type A0 or A1.
Exception: If you insert an AC I/O module as the first I/O module, an AI Energy Meter 400VAC or an AI Energy Meter 480VAC, the first BaseUnit in the ET 200SP configuration can be a dark-colored BaseUnit. The requirement is that you use a CPU or IM 155-6 (as of V3.0).
Dark-colored BaseUnit: Conduction of the internal power and AUX buses from the adjacent module on the left.

② AUX terminal: 10 internally bridged terminals for individual use up to 24 V DC/10 A or as protective conductors.
Example: Multiple cable connection for DI 8×24VDC ST

Figure 1-57 Digital, fail-safe, communication, technology or analog modules without temperature measurement

6.1.2 Analog modules with temperature measurement

Selection of a suitable BaseUnit

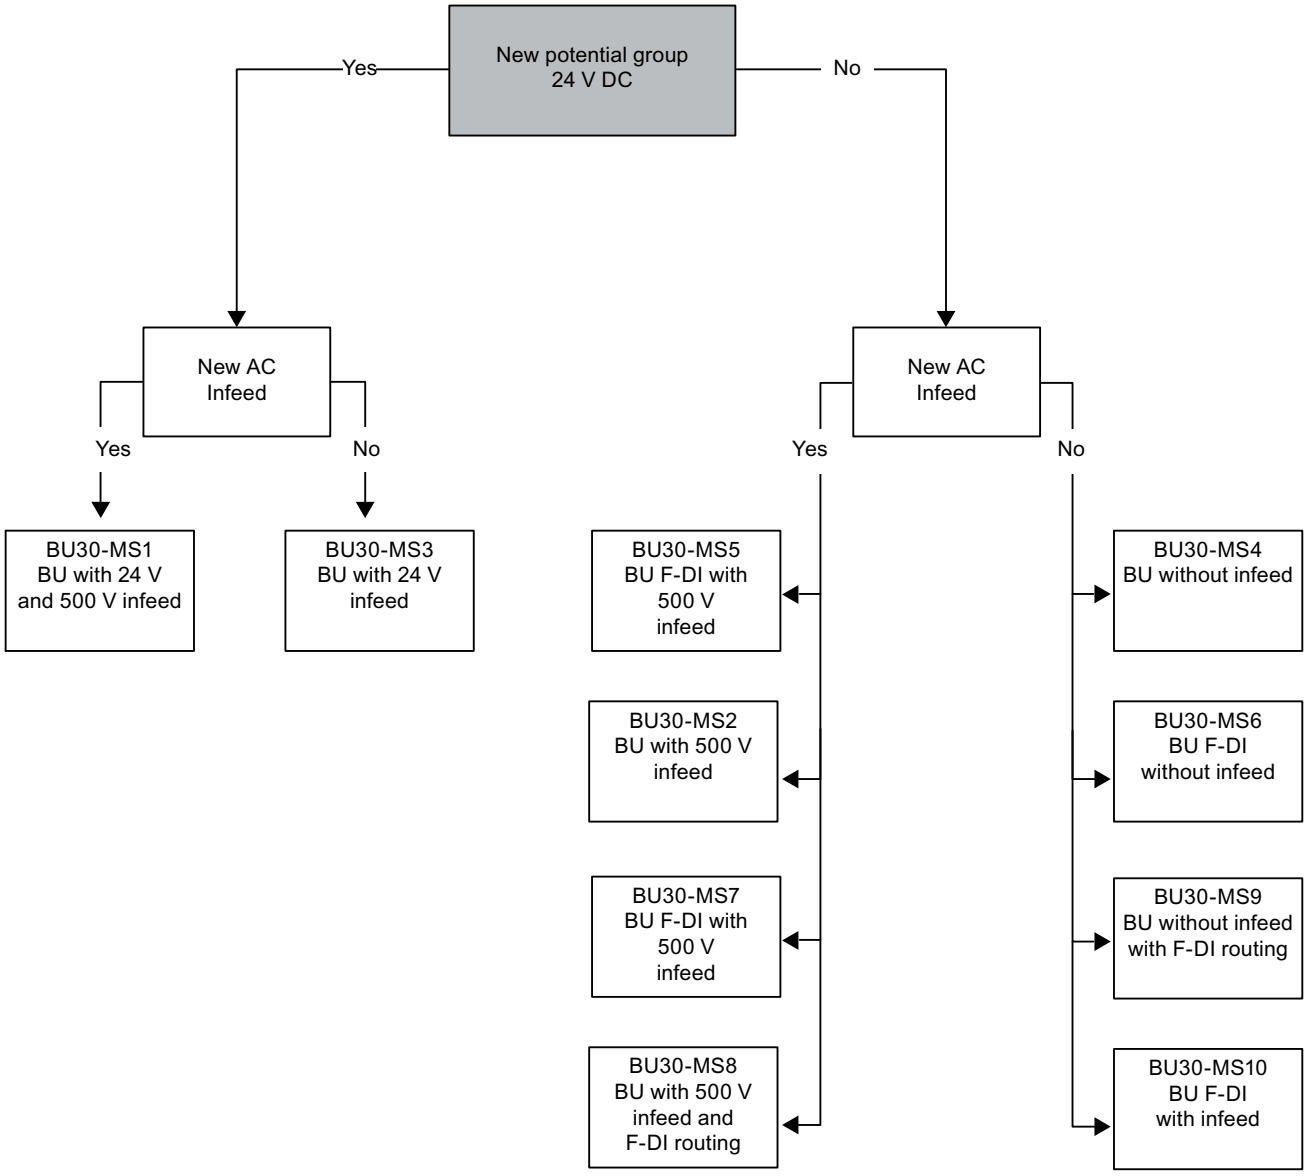
① Light-colored BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light-colored BaseUnit for incoming supply voltage L+.
Dark BaseUnit: Continuation of the internal power and AUX buses from the adjacent module on the left.

② Additional terminals: 2×5 internally bridged terminals for individual use up to 24 V DC/2 A
Example: Sensor supply for AI 4×U/I 2-wire ST

Figure 1-58 Analog modules with temperature measurement

6.2 Selecting a motor starter with suitable BaseUnit

6.2.1 Selecting a BaseUnit for motor starters

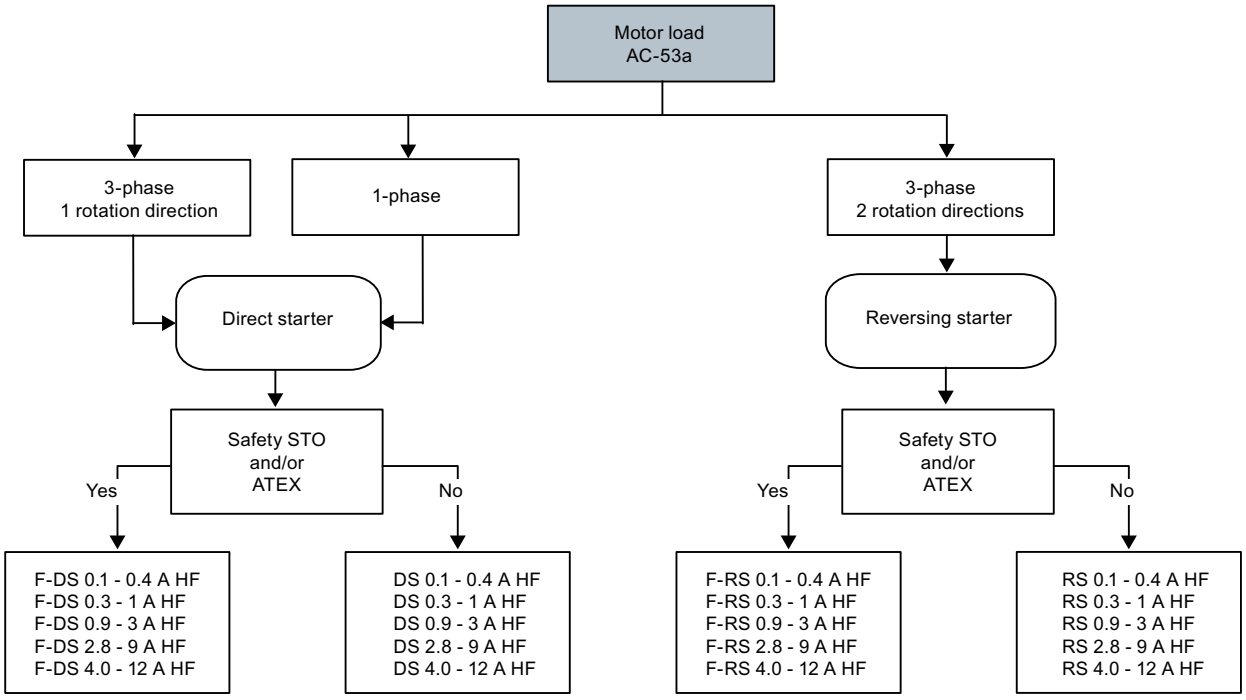


The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3" and "BU30-MS4" are compatible with all non-fail-safe motor starters. The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3", "BU30-MS4", "BU30-MS5", "BU30-MS6", "BU30-MS7", "BU30-MS8", "BU30-MS9" and "BU30-MS10" are compatible with all fail-safe motor starters. You will find an overview of available BaseUnits for motor starters here (Page 85). With the different BaseUnits, you can form different potential groups for the 24 V DC electronics supply (L+/M) and for the AC infeed.

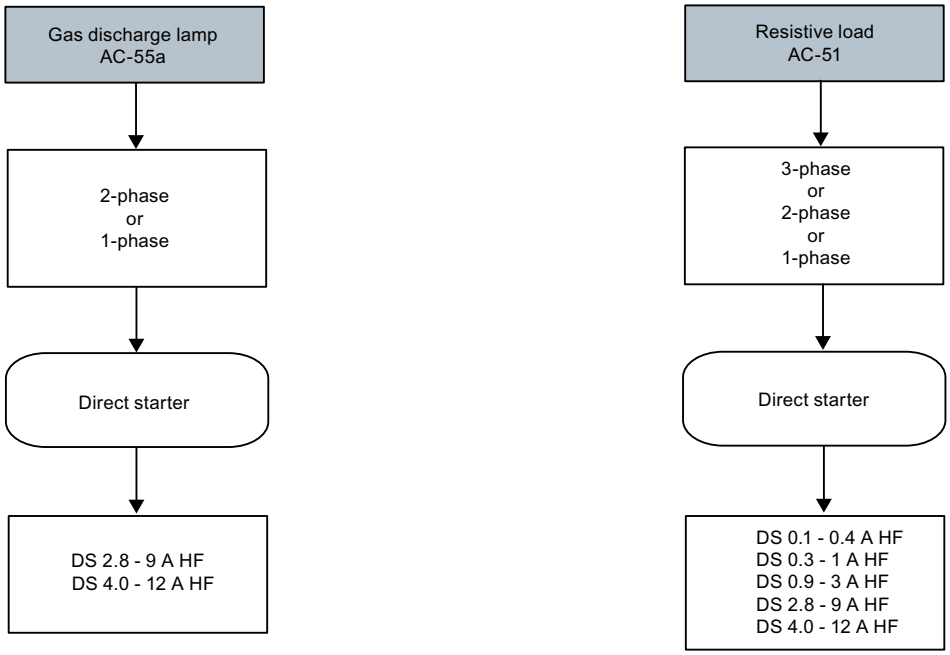
Voltage range

The voltage range of the AC infeed is between 48 V AC and 500 V AC.

Selection criteria for the BaseUnit

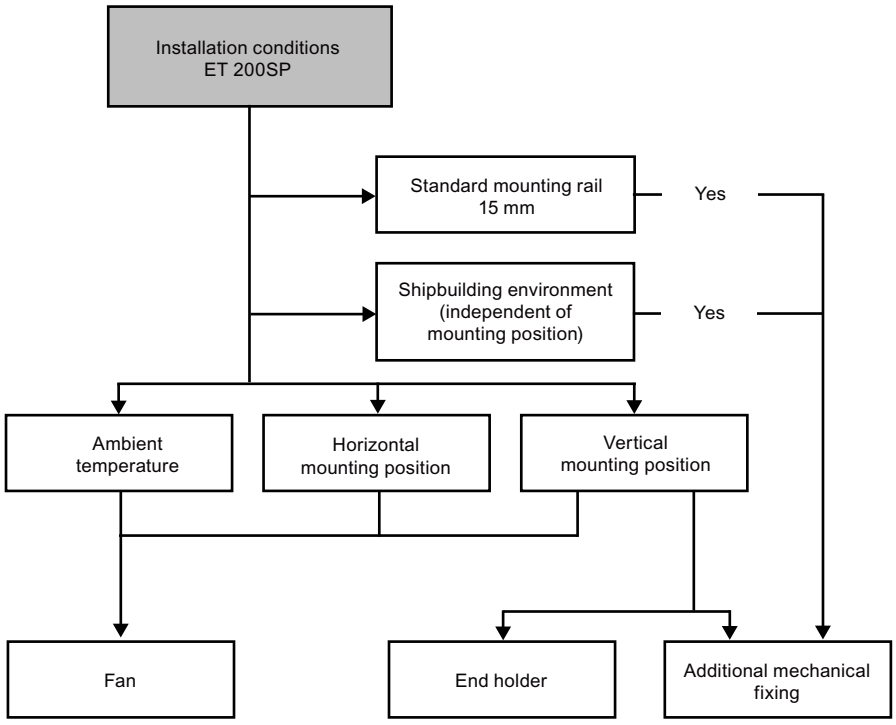


The figure below shows the criteria you use to select the appropriate BaseUnit:



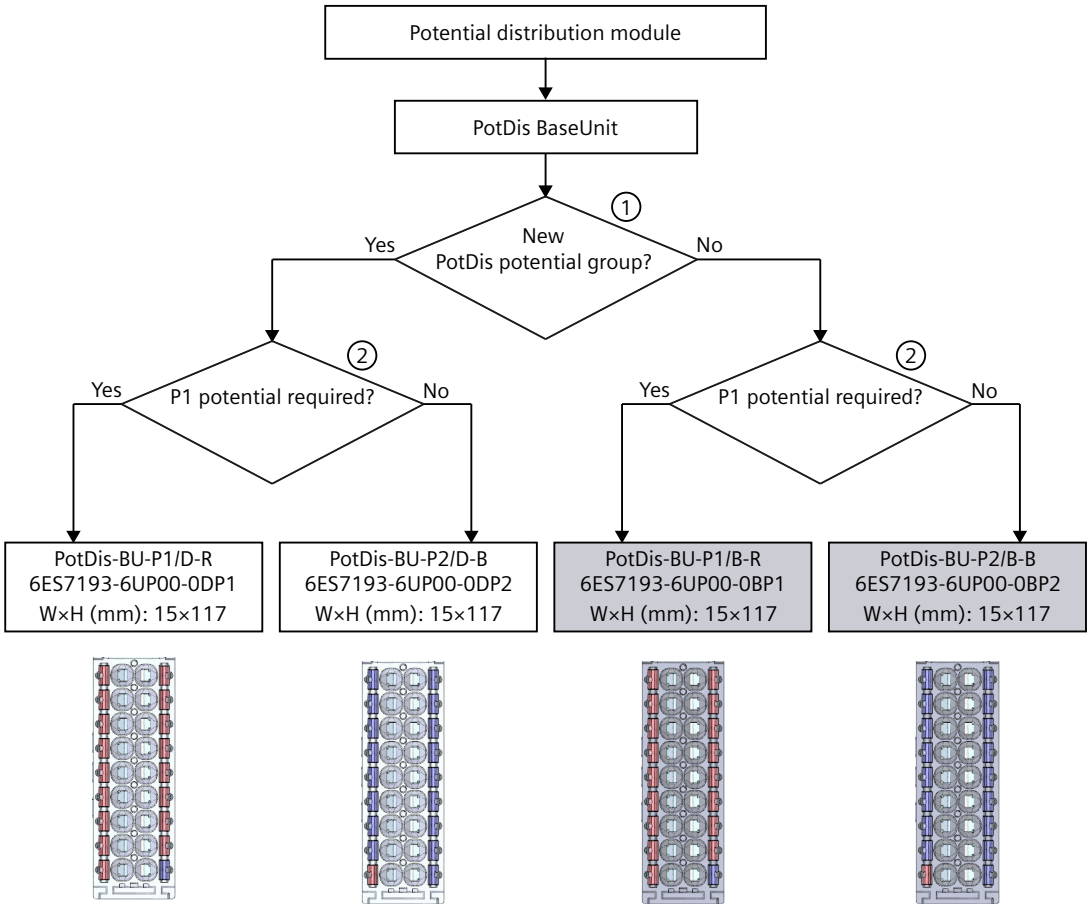
Form separate potential groups on the infeed bus for single-phase (L, N, PE) and three-phase (L1, L2, L3, PE) operation.

6.2.2 Selecting the motor starter



You select the suitable motor starter using the load type according to the following scheme:

6.2.3 Selecting accessories for motor starters



Observe the installation conditions of the station with ET 200SP motor starters. The figure below shows the criteria the station must meet:

6.3 Selecting potential distributor modules

6.3.1 Selecting a PotDis-BaseUnit

Selection of a suitable PotDis-BaseUnit potential distributor module

① Light-colored PotDis-BaseUnit: Configuration of a new potential group, electrical isolation from adjacent module on the left. The first BaseUnit of the ET 200SP is usually a light-colored BaseUnit for the incoming supply voltage.

② P1 terminal: 16 internally bridged terminals for individual use up to 48 V DC/10 A
Example: Multiple cable connection for DI 16×24VDC ST

Figure 1-59 PotDis-BaseUnits

Please note:

- The potential groups opened with a light-colored PotDis-BU must not contain any I/O modules. You can integrate any dark-colored PotDis-BUs into I/O module potential groups provided they are based on an SELV/PELV supply.
- If you do not need the additional terminals of the PotDis-TB in a potential distributor module, replace the PotDis-TB with a BU cover. You may only connect one potential group within a combination of PotDis-BU and PotDis-TB.

- Only SELV/PELV potentials are permitted on PotDis-BUs. Separate different SELV/PELV potential groups using light-colored PotDis-BUs.
- With potential distributor modules, you may only connect to the PotDis-TB versions BR-W and n.c.-G potential, which exceed the voltage level of SELV/PELV.
- PotDis terminals are not directly configurable as PotDis via GSD/GSDML. When configuring with GSD, always use an dummy module; with GSDML, integrate a free space.

Additional information

Additional information on the potential distributor modules (PotDis-BaseUnits and PotDis-TerminalBlocks) is available in the BaseUnits (https://support.industry.siemens.com/cs/ww/de/view/59753521/en) manual.

6.3.2 Selecting a PotDis-TerminalBlock

Selection of a suitable PotDis-TerminalBlock

With a PotDis-TerminalBlock you are expanding a PotDis-BaseUnit potential distributor module by an additional 18 potential terminals.

You can freely combine PotDis-TerminalBlocks and PotDis-BaseUnits.

The following PotDis-TerminalBlocks are available:

Table 1-353 Selection of TerminalBlock PotDis-TB

PotDis-TerminalBlocks		
TerminalBlock	**Explanation**	**Application**
PotDis-TB-P1-R	Terminal block with 18 terminals with red spring releases with connection to the supply voltage P1 of the PotDis-BaseUnit with SELV/PELV.	Provision of 18 x P1 potential, e.g. for P1 sensor supply with 3-wire connection for 16-channel digital input modules
PotDis-TB-P2-B	Terminal block with 18 terminals with blue spring releases with connection to ground (P2) of the PotDis-BaseUnit	Provision of 18 x P2 potential, e.g. for ground of the sensor supply with 2-wire connection for 16-channel digital output modules
PotDis-TB-n.c.-G	Terminal block with 18 terminals with gray spring releases without connection to each other or to a voltage bus of the PotDis-BaseUnit	Provision of 18 x n.c. (not connected), for reserving ("parking") unused signals/lines, e.g. for antivalent sensors in the same potential group
PotDis-TB-BR-W	Terminal block with 18 terminals connected to each other with white spring releases without connection to a voltage bus of the PotDis-BaseUnit	Provision of 17 terminals with shared potential (the 18th terminal is used for infeed) for supply of external consumers

Additional information

Additional information on the potential distributor modules (PotDis-BaseUnits and PotDis-TerminalBlocks) is available in the BaseUnits (https://support.industry.siemens.com/cs/ww/de/view/59753521/en) manual.

6.4 Hardware configuration

Maximum mechanical configuration

As soon as **one** of the following rules applies, the maximum configuration of the ET 200SP has been reached:

Table 1-354 Maximum mechanical configuration

Properties	Rule
Number of modules	Maximum of 12/30/32/64 I/O modules (depending on the CPU used/the interface module used; see CPU (https://support.automation.siemens.com/WW/view/en/90466439/133300) and interface module (https://support.automation.siemens.com/WW/view/en/55683316/133300) manuals)
	For every 6 F-modules F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0), the maximum configuration is reduced by 1 module.
Number of motor starters	Maximum of 31 motor starters
Backplane bus length of the ET 200SP	maximum 1 m mounting width (without CPU/interface module, including server module)

Electrical maximum configuration for I/O modules

The number of operable I/O modules of a potential group is limited by the following factors:

- Power consumption of the I/O modules
- Power consumption of the components supplied via these I/O modules

The maximum current carrying capacity of the terminals on the BaseUnit L+/M amounts to 10 A. "Current carrying capacity" refers to the current load via the power bus and the infeed bus of the ET 200SP station. Consider the current carrying capacity when using a motor starter.

Maximum electrical configuration for motor starter power bus (24 V DC)

To determine the current requirement of an individual motor starter via the power bus, take account of the following parameters:

- Current consumption via DC infeed in the ON state
- Current consumption via DC infeed when switching on (40 ms peak load)
- Increased power consumption through fan operation
- Current requirement via encoder supply of the connected DI module

The maximum current carrying capacity of the 24 V potential group is 7 A across the entire permissible temperature range.

Maximum electrical configuration for motor starter infeed bus (500 V AC)

To determine the current requirement of an individual motor starter via the infeed bus, proceed as follows:

Calculate the current requirement via the main current paths of the individual motor starter. In doing so, take into account the parameter I_e (set rated operational current of the motor starter). The permissible overload characteristics of the motor feeder for motors are determined with the thermal motor model. You calculate the current value ($I_{infeed\ bus}$) for the infeed bus of the ET 200SP system according to the following formula:

$I_{infeed\ bus} = \sum_n (I_e * 1.125)$
n = number of motor starters of a potential group on the infeed bus

Refer to the Manual (https://support.industry.siemens.com/cs/ww/en/view/109479973) for details of how to assign the basic rated operational current I_e parameter.

The following values apply for the potential group of the AC infeed:

- The maximum current carrying capacity is 32 A at an ambient temperature of up to 50 °C.
- The maximum current carrying capacity is 27 A at an ambient temperature of up to 60 °C.
- The maximum current carrying capacity for applications according to UL requirements is 24 A at an ambient temperature of up to 60 °C.

Address space

The address space depends on the CPU/interface module (see CPU (https://support.automation.siemens.com/WW/view/en/90466439/133300) Manual) and the interface module used (see Interface module (https://support.automation.siemens.com/WW/view/en/55683316/133300) Manual):

- For PROFINET IO: Dependent on the IO controller/IO device used
- For PROFIBUS DP: Dependent on the DP master used

6.5 Forming potential groups

6.5.1 Basics

Introduction

Potential groups for the ET 200SP distributed I/O system are formed by systematically arranging the BaseUnits.

Requirements

For formation of potential groups, the ET 200SP distinguishes between the following BaseUnits:

- BaseUnits BU...D (recognizable by the light-colored terminal box and the light-colored mounting rail release button):
  - Opening of a new potential group (power busbar and AUX bus are interrupted to the left)
  - Feeding in the supply voltages (DC or AC) up to an infeed current of 10 A, depending on the BaseUnit used.
- BaseUnits BU...B (recognizable by the dark-colored terminal box and the dark-colored mounting rail release button):
  - Conduction of the potential group (power busbar and AUX bus continued)
  - Tapping the supply voltages (DC or AC) for external components or looping through with a maximum total current of 10 A, depending on the BaseUnit used.
- BaseUnits BU30-MSx (BaseUnit for the motor starter only)

  Depending on the version, the BaseUnits in the "BU30-MSx" model series possess the following properties:
  - Opening a new potential group or continuing an existing one
  - Feeding in the supply voltage L+ up to an infeed current of 7 A DC
  - Opening a new load group or continuing an existing one by means of 500 V AC infeed bus
  - Feeding in the line voltage up to an infeed current of 32 A AC
  - Feeding in and routing the F-DI signal

NOTE

The BaseUnits BU...B of type B1 and D0 loop through the voltage buses P1/P2 and the AUX bus. The buses are not tapped by the module.

Placement and grouping of I/O modules

Each BaseUnit BU...D that you install in the ET 200SP configuration opens a new potential group and supplies all subsequent I/O modules (on BaseUnits BU...B) with the necessary supply voltage. The first 24 V DC I/O module to the right of the CPU/interface module must be installed on a light-colored BaseUnit BU...D. Exception: If you insert an AC I/O module or an AI Energy Meter as the first I/O module, the first BaseUnit in the ET 200SP configuration can be a dark-colored BaseUnit. The requirement is that you use a CPU or IM 155-6 (as of V3.0).

If you want to place another BaseUnit BU...B after a BaseUnit BU...D, disconnect the power busbar and AUX bus and open a new potential group at the same time. This allows individual grouping of the supply voltages.

NOTE

All BaseUnits placed in a load group have to match the infeed potential of the corresponding light-colored BaseUnit.

Do not connect any BaseUnit of the "BU...B" type on the right of the BaseUnit of a motor starter (BU30-MSxx).

Placing and connecting potential distribution modules

Potential distribution modules provide potential distributors integrated into the system that you can use to configure a rapid, space-saving customized replacement for standard potential distribution systems.

You can place potential distribution modules at any location within the ET 200SP distributed I/O system. To do so, you must observe the same design rules as for placing and connecting I/O modules. Potential distribution modules are only suitable for SELV/PELV.

A potential distribution module consists of a potential distributor BaseUnit (PotDis-BU) and (if necessary) a potential distributor terminal block (PotDis-TB) plugged onto it. If you do not need the additional terminals of the PotDis-TB, install a BU cover (15 mm) on the PotDis-BaseUnit.

You must not place a BaseUnit for I/O modules in a PotDis potential group formed with a light-colored PotDis-BaseUnit.

NOTE

Identical voltages with potential distribution modules

You can only connect identical (supplied) SELV/PELV voltages to the terminals of a potential distribution module or PotDis potential group. Example: You only connect 24 V DC.

Placement and grouping of I/O modules and motor starters

For the potential group (L+/M), the following slot rules apply within the motor starter modules and other I/O modules of the ET 200SP:

- An unassembled BaseUnit (BaseUnit with BU cover) must be inserted between the CPU, an interface module or an I/O module and the motor starter. This is not necessary between the motor starters.
- The empty slot can take on the potential (24 V DC) of the potential group on the left of it (L+, M), i.e. I/O modules and motor starters can be operated in the same potential group.

- If you would like to insert an I/O module on the right of a motor starter, then use only one BaseUnit of the BU...D Typ A0 type (light terminal box).
- The BaseUnits BU30-MS2, BU30-MS4, BU30-MS5, BU30-MS6, BU30-MS7, BU30-MS8, BU30-MS9 and BU30-MS10 can continue the potential group of other BaseUnit types. However, note the following exceptions:
  - Only a BaseUnit of type BU30-MS1 or BU30-MS3 may follow an AS-i module (AS-i potential group).
  - Only BaseUnits with fail-safe motor starters can be connected together in the same potential group of an F-PM-E.

⚠ WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Hazardous electrical voltage can cause electric shock, burns and property damage.
Disconnect your system and devices from the power supply before starting any assembly tasks.

AUX bus (AUX(iliary) bus)

BaseUnits with additional AUX terminals (e.g. BU15-P16+**A10**+2D) enable the additional connection of a potential (up to the maximum supply voltage of the module), which is applied via the AUX bus.

In the case of light-colored BaseUnits, the AUX bus is interrupted to the left. In the case of BaseUnits BU30-MS1 to BU30-MS7 and BU30-MS10 , the AUX bus is interrupted to the left. The AUX bus of BU30-MS8 and BU30-MS9 is used for F-DI routing.

The AUX bus can be used individually:

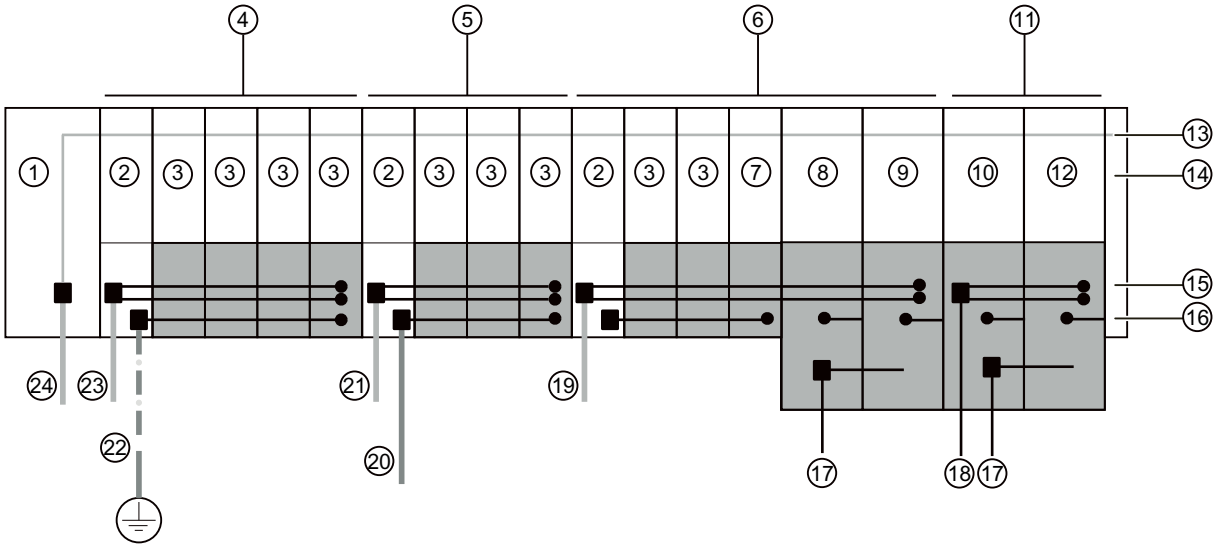
- As a PE bar, in which case you may plug a maximum of 8 BaseUnits in the corresponding potential group
- For additionally required voltage

NOTICE

AUX bus as PE bar
If you use an AUX bus as a protective conductor bar, attach the yellow-green color identification labels to the AUX terminals, and establish a functional connection to the central protective conductor connection.
If you stop using the AUX bus as a protective conductor bar, make sure you remove the yellow-green color identification labels and remove the connection to the central protective conductor connection again.
If you use the AUX bus as a protective conductor bar, the corresponding protective conductor tests must be conducted by the installer of the system before commissioning. In addition, both ends of the ET 200SP system assembly must be mechanically fixed to the mounting rail in this case (e.g using 8WA1010-1PH01 ground terminals); this connection can only be detached by using a tool.

The AUX bus is designed as follows:

- Maximum current carrying capacity (at 60 °C ambient air temperature): 10 A
- Permissible voltage: Depending on the BaseUnit type (see BaseUnit manual (https://support.automation.siemens.com/WW/view/en/59753521))



NOTE
The AUX potential must always be identical to the potential group of the supply voltage if it is not being used as PE.

Self-assembling voltage buses

You must feed in the supply voltage L+ via the BaseUnit BU...D, BU30-MS1 or BU30-MS3 .

Each BaseUnit BU...B allows access to the supply voltage L+ via terminals (red/blue). The motor starter BaseUnits "BU30-MS1", "BU30-MS2", "BU30-MS3", "BU30-MS4", "BU30-MS5", "BU30-MS6", "BU30-MS7", "BU30-MS8", "BU30-MS9" and "BU30-MS10" do not have this access.

Operating principle

Figure 1-60 Placing the BaseUnits

Connecting different potentials to the power or AUX bus

NOTE

If you apply different potentials to the power busbar or AUX bus within an ET 200SP station, you need to separate the potential groups with a BaseUnit BU...D.

6.5.2 Forming potential groups with BaseUnit type B1

Introduction

The AC I/O modules of the ET 200SP are required to connect sensors/actuators with alternating voltage 24 to 230 V AC.

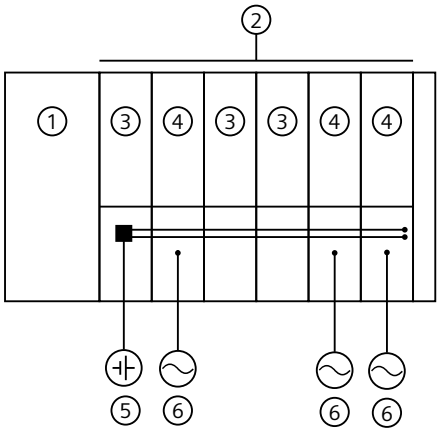
Requirements

BaseUnits BU20-P12+A0+4B (BU type B1) and

- DI 4x120..230VAC ST digital input module
- DQ 4x24..230VAC/2A ST digital output module

Operating principle

Connect the required module-dependent alternating voltage for the AC I/O modules directly to the BaseUnits BU20-P12+A0+4B (terminals 1L, 2L/1N, 2N). Insert the AC I/O modules on the BaseUnits.



NOTE

Placing the BaseUnits for AC I/O modules

If you insert an AC I/O module as the first I/O module, then a BaseUnit BU20-P12+A0+4B can also be the first BaseUnit to the right of the CPU/interface module in the ET 200SP configuration.

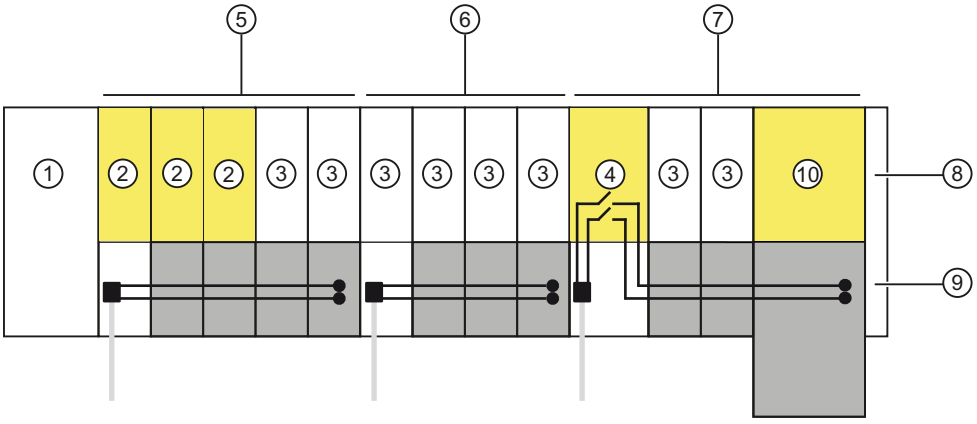
The requirement is that you use a CPU as of V3.0 or IM 155-6 (as of V3.0).

- The BaseUnits BU20-P12+A0+4B do not monitor the connected alternating voltage. Please note the information on limiting the overvoltage and power rating in the AC I/O module manuals.
- Pay attention to the type of the BaseUnits during configuration.

① CPU/interface module
② 24 V DC potential group
③ BaseUnits with DC I/O modules
④ BaseUnits BU 20-P12+A0+4B with AC I/O modules
⑤ Direct voltage
⑥ Alternating voltage

Figure 1-61 Placing the BaseUnits for the AC I/O modules

6.5.3 Forming potential groups with fail-safe modules



Introduction

ET 200SP distributed I/O systems can be configured using fail-safe and non-fail-safe modules. This chapter provides an example of a mixed configuration comprising fail-safe and non-fail-safe modules.

Example of an ET 200SP configuration with fail-safe and non-fail-safe modules

In principle, it is not necessary to operate fail-safe and non-fail-safe modules in separate potential groups. You can divide the modules into fail-safe and non-fail-safe potential groups and install them.

The figure below shows an example of a configuration with fail-safe and non-fail-safe modules within a single ET 200SP distributed I/O system.

① IM 155-6 PN HF interface module
② F-module
③ Non-fail-safe module
④ Power module F-PM-E 24VDC/8A PPM ST
⑤ Mixed fail-safe and non-fail-safe potential group with BaseUnits BU15..D and BU15..B. You achieve SIL3/Cat. 4/PLe for the fail-safe modules. No safety category can be achieved with the non-fail-safe motor starter.
⑥ Non-fail-safe potential group with BaseUnits BU15..D and BU15..B
⑦ Fail-safe potential group with BaseUnits BU20..D, BU15..B and BU30-MSx. Up to SIL2/Cat. 3/PLd is possible if you disconnect the self-assembling voltage bus and thus the non-failsafe modules.
⑧ Server module
⑨ Self-assembling voltage buses P1/P2
⑩ Fail-safe motor starter F-DS HF

Figure 1-62 ET 200SP - example of a configuration with fail-safe modules

6.5.4 Forming potential groups with Ex modules

Ex module group

When you form an Ex module group with Ex BaseUnits and Ex power module/Ex I/O modules, observe the information in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en).

NOTE

Thermal decoupling required

For thermal decoupling of ET 200SP modules and Ex module groups, you must install the following in front of the first Ex power module:

- An empty slot with BU cover
  or
- Recommendation: Potential distributor (PotDis-TerminalBlock PotDis-TB-P1-R on a PotDis-BaseUnit PotDis-BU-P2/B-B). This allows for a distribution of the supply voltage for the downstream Ex power modules.

6.5.5 Forming potential groups with motor starters

Overview of the functions of the BaseUnits

	24 V infeed	24 V continuation from left module	24 V transmission	500 V infeed	500 V continuation from left module	500 V transmission	F-DI infeed	F-DI continuation from left module	F-DI routing

✓ Function available

-- Function not available

Properties of the 500 V AC infeed bus

The infeed bus has the following properties:

- The infeed bus is assembled by lining up the motor starter BaseUnits "BU30-MSx".
- The infeed bus distributes the energy to the SIMATIC ET 200SP motor starter within one load group.
- You can open load groups by plugging in a 500 V infeed BaseUnit (BU30-MS1, BU30-MS2, BU30-MS5, BU30-MS7 or BU30-MS8). With BaseUnits BU30-MS3, BU30-MS4, BU30-MS6, BU30-MS9 or BU30-MS10, you can continue the infeed bus from the left BaseUnit.
- Via the infeed bus, you have the option of supplying three-phase load groups via L1, L2 and L3 or with single-phase load groups via L and N.
- The permissible voltage range is between 48 and 500 V AC.
- The maximum current carrying capacity is up 32 A (3-phase) at 50 °C and 500 V. Pay attention to the derating values depending on the configuration.

Properties of the self-assembling voltage bus (L+)

Self-assembling voltage buses have the following properties:

- Maximum current: 7 A
- Rated voltage: 24 V

Pay attention to the derating values depending on the configuration.

The AUX1 bus is not supported in the BaseUnits of the SIMATIC ET 200SP motor starters. The AUX1 bus is used in ET 200SP motor starters for routing the F-DI signal in BU30-MS7 to BU30-MS10.

⚠ WARNING

Electric shock when operating the infeed bus without touch protection cover
There is a risk of electric shock when touching the infeed bus if you have not fitted a touch protection cover on the infeed bus on the right.
Always fit a touch protection cover on the infeed bus on the right (article number: 3RK1908-1DA00-2BP0).

⚠ WARNING

Electric shock when operating a BaseUnit without an inserted motor starter
If you fit a BaseUnit for motor starters without cover (e.g. option handling), there is a risk of an electric shock when touching the BaseUnit.
Always fit a cover on the BaseUnit (article number: 3RK1908-1CA00-0BP0).

Requirements

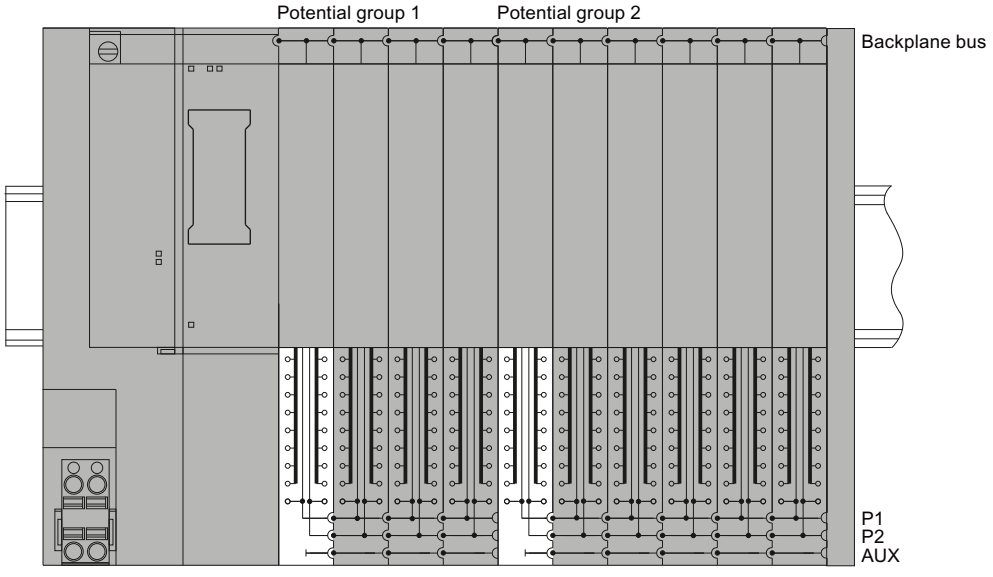
Use the following devices to form potential groups with motor starters:

- BaseUnits BU30-MSx
- 3RK1308-0xx00-0CP0 motor starters

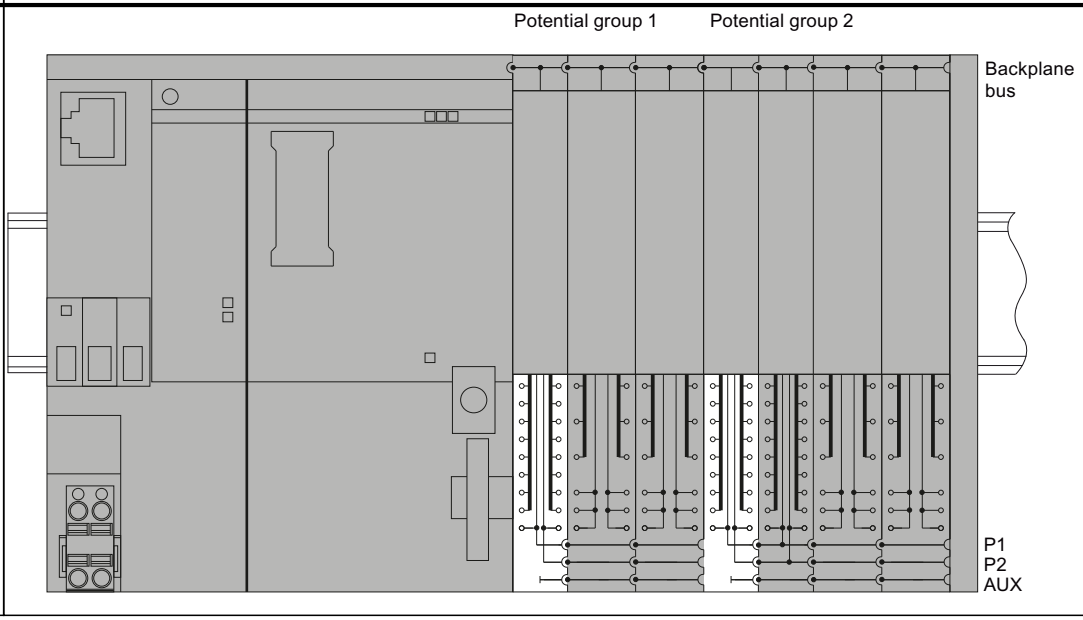
Operating principle

Connect the supply voltage L+ via the BaseUnit BU30-MS1 and BU30-MS3 to the terminals 24 V DC and M.

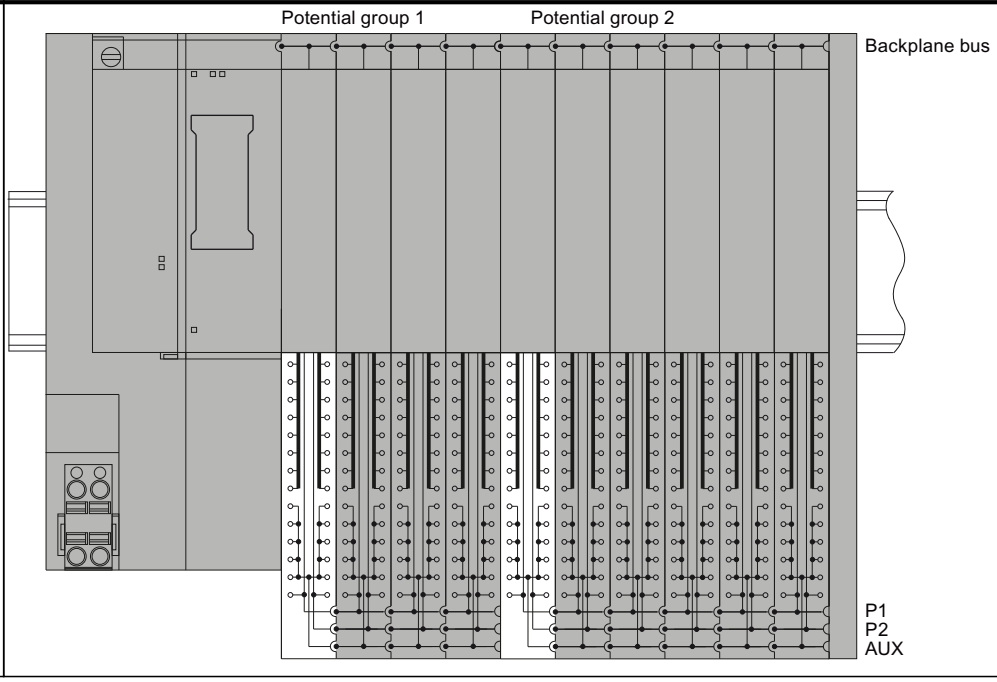
You can operate the motor starter on a single-phase (L1, N, PE) or a three-phase (L1, L2, L3, PE) AC voltage system. You connect the required AC voltage directly to the BaseUnits BU30-MSx (terminals L1, L2(N), L3, PE). You plug the motor starter onto the BaseUnits.



NOTE



The motor starters' AC power supply is not connected to the AC power supply for the AC I/O modules (see Chapter "Forming potential groups with BaseUnit type B1 (Page 104)").



6.6 Configuration examples for potential groups

6.6.1 Configuration examples with BaseUnits

Table 1-355 Configuration examples with BaseUnits

BaseUnits	Configuration
BU15-P16+A0+-2D BU15-P16+A0+-2B	

BaseUnits	Configuration
BU15-P16+A0+-2D BU15-P16+A0+-2B BU20-P12+A0+-0B	

BaseUnits	Configuration
BU15-P16+A10-+2D BU15-P16+A10-+2B	

6.6.2 Configuration examples with potential distributor modules

3-wire connection

The potential distributor modules allow for a space-saving design. For a 3-wire connection, you can, for example, replace two digital input modules with 8 channels on a 141 mm long BaseUnit with a digital input module with 16 channels and a potential distributor module, each of which is only 117 mm long.

NOTE

You must not place a BaseUnit for I/O modules in a PotDis potential group formed with a light-colored PotDis-BaseUnit.

The figure below shows a configuration example with a DI 16×24VDC ST digital input module on a BU15-P16+A0+2B BaseUnit and a PotDis-TerminalBlock PotDis-TB-P1-R on a PotDis-BaseUnit PotDis-BU-P2/B-B.

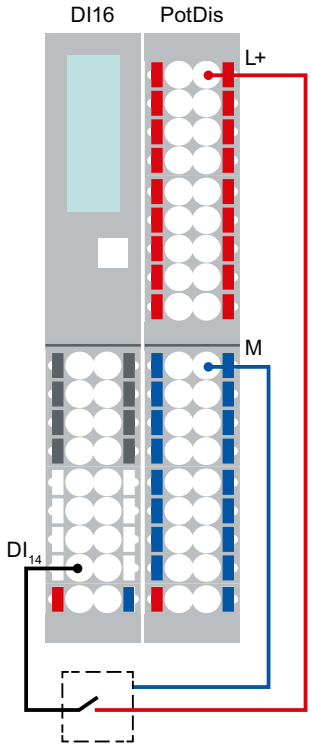


Figure 1-63 **Example: 3-wire connection**

Supply of external components

Another application of the potential distributor modules is the supply of potentials for external components. Potential distributor modules enable simple, compact, integrated and clear design.

Observe the current carrying capacity of each terminal: max. 10 A.

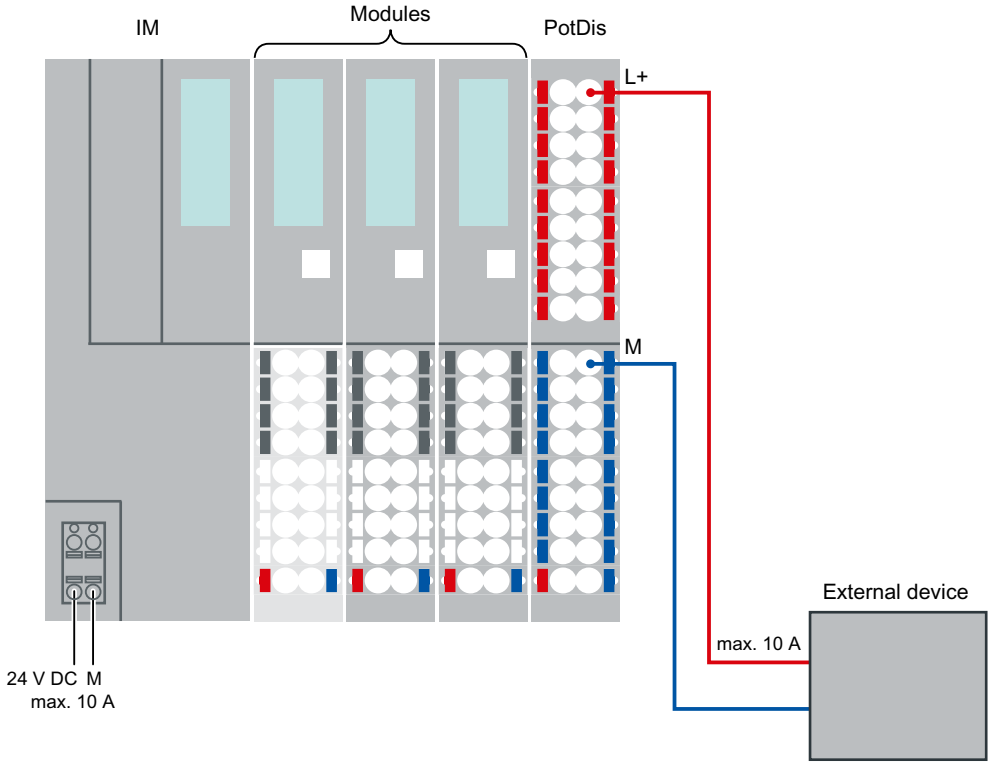

Figure 1-64 **Example: Supply of external components**

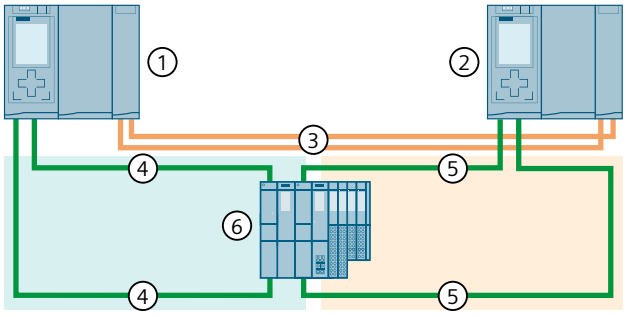
6.7 System redundancy R1



6.7.1 General notes on operating an ET 200SP R1 system

6.7.1.1 Example configuration of a system with ET 200SP R1

You need at least the following components for configuration of an ET 200SP R1 station:

- SIMATIC system rail (1 unit)
- BaseUnit BU type M0 (1 unit)
- Interface module IM 155-6 PN R1 (2 units)
- SIMATIC BusAdapter (2 units, e.g. BA 2×M12)
- BaseUnits and electronic modules (see section Configuration examples for potential groups (Page 109))
- Server module (1 unit)

- To operate a station with R1 system redundancy, you also need a set of R1-compatible S7-1500 CPUs (e.g. CPU 1517H-3 PN or CPU 1518HF-4 PN, 2 units).

① CPU 1
② CPU 2
③ Two fiber-optic cables (redundancy connections)
④ PROFINET cable (PROFINET ring 1)
⑤ PROFINET cable (PROFINET ring 2)
⑥ ET 200SP I/O device (with system redundancy R1)

Figure 1-65 Configuration of S7-1500H with R1 devices in the PROFINET ring

You can find additional configuration examples in the SIMATIC S7-1500 S7-1500R/H Redundant System (https://support.industry.siemens.com/cs/ww/de/view/109754833) System Manual.

6.7.1.2 Commissioning an R1 station

After you configure an ET 200SP R1 station, you perform a commissioning maintenance cycle before the deployment in productive operation. This ensures that both redundant interface modules have been correctly contacted and can operate the electronic modules. The following is checked at the same time:

- Test for hardware integrity. Especially for hardware units that are not used while the device is passive and has no access to the SP bus. To ensure that the hardware is fully intact, perform at least a temporary takeover of the SP bus.
- After the maintenance cycle, the redundancy group must return to its pre-maintenance state.

To perform a commissioning maintenance cycle, proceed as follows:

The initial state is: The S7-1500H redundant system is in the RUN-Redundant system state. The ACT LED of one of the two interface modules (IM 1: regardless whether slot 0 or slot 1) is continuously lit.

1. Test step: Disconnect the interface module with the continuously lit ACT LED (IM 1) from the operating voltage by removing the connector from the 24 V connection. The station must assume the following state:
   - The LEDs of interface module 1 all go out.
   - The ACT LED of interface module 2 starts to flash.
   - In the CPU user program, an OB 70 (loss of redundancy) is reported on the station.
   - In the CPU user program, no OB 86 (station failure) is reported on the station.
2. Test step: Check the inputs and outputs via interface module 2. Use the engineering or configuration tool (e.g. user program or tag table).

3. Test step: Restore the operating voltage of interface module 1. The station must assume the following state after restart of interface module 1:
   – The ACT LED of interface module 2 lights up continuously.
   – In the CPU user program, an OB 70 (redundancy return) is reported.
   – The S7-1500H redundant system is again in the RUN-Redundant system state.
4. Test step: Disconnect the interface module with the permanently lit LED ACT (IM 2) from the operating voltage by pulling the plug out of the 24 V connection. The station must assume the following state:
   – The LEDs of interface module 2 all go out.
   – The ACT LED of the interface module 1 starts to flash.
   – In the CPU user program, an OB 70 (loss of redundancy) is reported on the station.
   – In the CPU user program, no OB 86 (station failure) is reported on the station.
5. Test step: Check the inputs and outputs via interface module 1. Use the engineering or configuration tool (e.g. user program or tag table).
6. Test step: Restore the operating voltage of interface module 2. The station must assume the following state after restart from interface module 2:
   – The ACT of interface module 1 is lit continuously.
   – In the CPU user program, an OB 70 (redundancy return) is reported.
   – The S7-1500H redundant system is again in the RUN-Redundant system state.
   – The system is again in the same state as before test step 1. The commissioning maintenance cycle has been successfully completed.

6.7.1.3 Increased availability

Compared to other ET 200SP interface modules, the system availability has been increased through use of PROFINET R1 redundancy. Even if one interface module fails, the function of the station is maintained.

The module automatically restarts to quickly return to the redundant state if one of the two redundant interface modules of a station fails (e.g. due to a critical error). This eliminates repair time.

Critical failures are stored in the device for later evaluation. You make this information available to Customer Support by reading the service data. You can find information on reading out the service data in the Interface Module IM 155-6 PN R1 Equipment Manual.

6.7.2 Improving the switchover time of the ET 200SP R1 system

Definition

The switchover time of the ET 200SP R1 station is the time that elapses after failure of the primary connection until the back-up IM has established the primary connection and takes control of the process. The response time is extended once during a redundancy switchover.

Composition of the cycle time and response time

You can find information and notes on the configuration of the CPU, the general composition of the cycle time and response time and how you can improve these times in the Cycle and Response Times (https://support.industry.siemens.com/cs/ww/en/view/59193558) Function Manual.

Improving the switchover time through configuration of the ET 200SP R1 station

To improve response times for an R1 system, we recommend that you follow the instructions below when configuring the ET 200SP R1 station:

- The shorter the PROFINET update time of an IO device, the shorter the response time of the R1 system tends to be.
- The fewer the number of I/O modules plugged into an R1 station, the shorter the response time of the R1 system tends to be.
- The smaller the input and output data range of the I/O modules, the shorter the response time of the R1 system tends to be.
- Certain module types increase the switchover time. Therefore, configure the stations in such a way that these module types are configured in a separate ET 200SP R1 station. This ensures that the switchover time of the ET 200SP R1 station that does not contain these module types is shorter.

  The following table provides you an overview of the modules that belong to these module types.

Name	MLFB
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter 480VAC/CT HF for 1 A or 5 A current transformer, with network analysis functions	6ES7134-6PA00-0CU0 (no longer available)
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter CT ST, for 1 A or 5 A current transformer	6ES7134-6PA01-0BU0
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter CT HF, for 1 A or 5 A current transformer, with network analysis functions	6ES7134-6PA01-0CU0
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter 480V AC ST	6ES7134-6PA20-0BD0
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter 480V AC/RC HF for Rogowski coils, current/voltage transformer 333 mV, with network analysis functions	6ES7134-6PA20-0CU0 (no longer available)
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter RC HF, for Rogowski coils or current/voltage transformer 333 mV, with network analysis functions	6ES7134-6PA21-0CU0
SIMATIC ET 200SP, Analog Input Module, AI Energy Meter RC ST, for Rogowski coils or current/voltage transformer 333 mV	6ES7134-6PA21-0BU0
SIMATIC ET 200SP, CM 4xIO-Link ST Communication module IO-Link Master V1.1	6ES7137-6BD00-0BA0
Technology Module SITRANS FST070 Ultrasonic Flow Transmitter	7ME3448-6AA00-0BB1
Technology Module SITRANS FCT070 Coriolis Flow Transmitter	7ME4138-6AA00-0BB1

NOTE

You can find additional information on switchover times from SIEMENS Customer Support.

Installation 7

7.1 Basics

Introduction

All modules of the ET 200SP distributed I/O system are open equipment. This means you may only install the ET 200SP distributed I/O system in housings, cabinets or electrical operating rooms and in a dry indoor environment (degree of protection IP20). The housings, cabinets and electrical operating rooms must guarantee protection against electric shock and spread of fire. The requirements regarding mechanical strength must also be met. The housings, cabinets, and electrical operating rooms must not be accessible without a key or tool. Personnel with access must have been trained or authorized.

Installation location

Install the ET 200SP distributed I/O system in a suitable enclosure/control cabinet with sufficient mechanical strength and fire protection. Take into account the environmental conditions for operating the devices.

Mounting position

You can mount the ET 200SP distributed I/O system in any position. The preferred mounting position is horizontal mounting on a vertical wall.

The ambient temperature may be restricted in certain installation positions. You will find more information in section Mechanical and climatic environmental conditions (Page 360).

Pay attention to chapter "Installation conditions for motor starters (Page 120)" when using motor starters.

Mounting rail

Install the ET 200SP distributed I/O system on a mounting rail in accordance with ISO 60715 (35 × 7.5 mm or 35 × 15 mm) or on a SIMATIC system rail.

The ET 200SP R1 system must be mounted on the SIMATIC system rail only.

You need to ground the mounting rail separately in the control cabinet. Exception: If you install the rail on grounded, zinc-plated mounting plates, there is no need to ground the rail separately.

NOTE

If the ET 200SP distributed I/O system is exposed to vibration and shock loads, both ends of the ET 200SP system assembly must be mechanically fixed to the mounting rail (e.g using 8WA1010-1PH01 ground terminals). This measure prevents the ET 200SP distributed I/O system from shifting to the side.

NOTE

If the ET 200SP, distributed IO system is exposed to increased vibrations and shock, fasten the mounting rail to the mounting surface at intervals of approx. 200 mm.
For increased vibration and shock loads, you can mount the ET 200SP system on the SIMATIC system rail.

The following are suitable surfaces for the mounting rails:

- Steel strip in accordance with Appendix A of EN 60715 or
- Tinned steel strip. We recommend these in conjunction with the mounting rails in the section Accessories/spare parts (Page 370).

NOTE

If you use mounting rails from other manufacturers, make sure that they have the required properties for your ambient climatic conditions.

Minimum clearances

The figure below shows the minimum clearances you must observe when installing or dismantling the ET 200SP distributed I/O system.

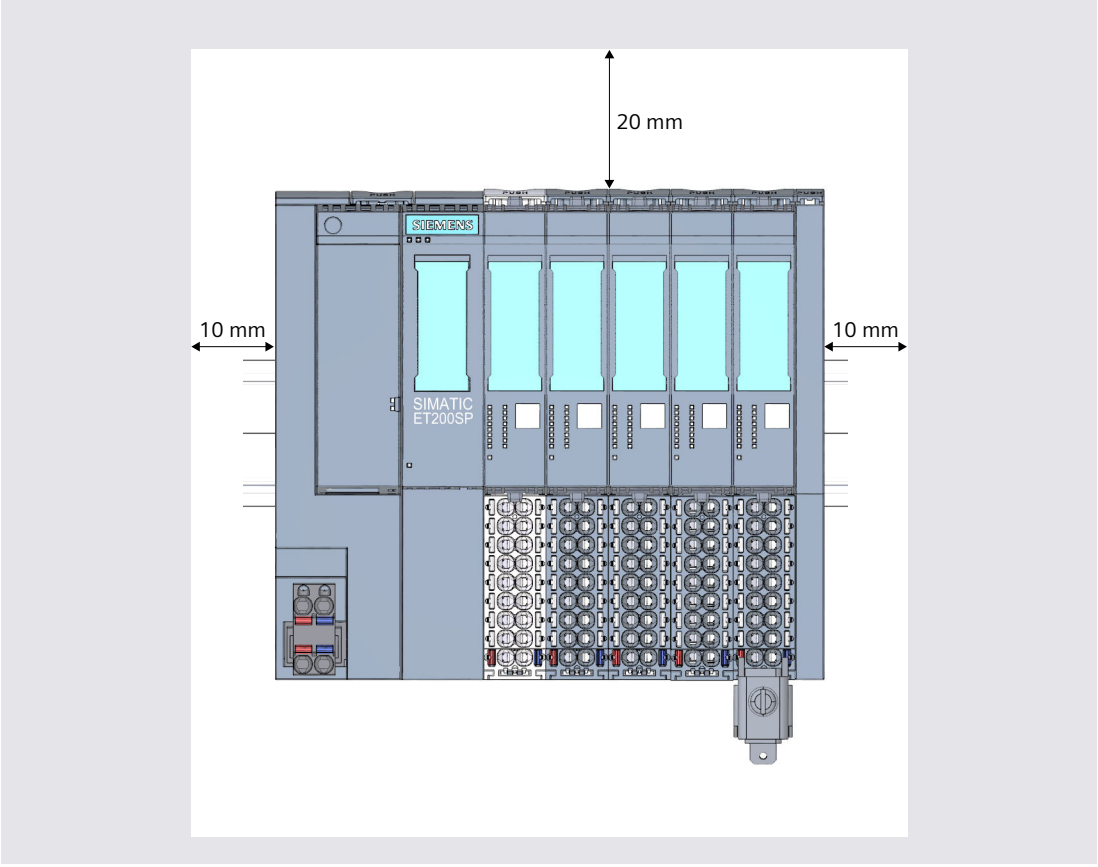


Figure 1-66 Minimum clearances

NOTE

Ex module group

When you are using an Ex module group in your configuration, you must observe other minimum clearances.

Additional information on minimum clearances and installing/removing Ex modules is available in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en).

General rules for installation

⚠ WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Hazardous electrical voltage can cause electric shock, burns and property damage.
Disconnect your system and devices from the power supply before starting any assembly tasks.

Observe the following rules:

- Installation starts on the left-hand side with the CPU/interface module.
- A light-colored BaseUnit BU..D0, BU30-MS1 or BU30-MS3 with infeed of supply voltage L+ follows the CPU/interface module or is placed at the start of each potential group.
  If you use a CPU or IM 155-6 (V3.0 or higher), the first BaseUnit in the installation of the ET 200SP may also be a dark-colored BaseUnit of type B1 or D0.
- This is followed by BaseUnits BU..B, BU30-MS2 or BU30-MS4 (with a dark-colored terminal box).
- The matching I/O modules / motor starters can be plugged onto the BaseUnits. You will find matching combinations of BaseUnits and I/O modules / motor starters in Application planning (Page 85).
- The server module completes the configuration of the ET 200SP distributed I/O system.

NOTE
Mount the ET 200SP distributed I/O system only with disconnected supply voltage.

⚠ WARNING

Protection from conductive contamination
Taking into account the environmental conditions, the devices must be protected from conductive contamination.
This can be achieved, for example, by installing the devices in a control cabinet with the appropriate degree of protection.

Mounting rules for reducing the thermal load

The following rules reduce the thermal load of the ET 200SP distributed I/O system in the control cabinet:

- Separate 2 modules with high power dissipation with a module of low power dissipation or by an empty space.
- Mix modules with higher power dissipation and modules with less power dissipation. For example, modules with 16 outputs have a higher power dissipation than modules with 8 outputs.
- You should give preference to the horizontal mounting position.
- For vertical mounting position, plug modules with high power dissipation at the top, the interface module/CPU at the bottom.

- Mount an ET 200SP station with modules with high power dissipation in the lower area of the control cabinet.
- For a multi-tier configuration, plug modules with high power dissipation on the sides so that the waste heat can rise to the top unhindered.
- Avoid air movements at the terminals when using TC measurement with internal compensation.

7.2 Installation conditions for motor starters

Observe the following installation conditions when using an ET 200SP motor starter:

- Mounting position

  You can fit the motor starter vertically or horizontally. The mounting position refers to the alignment of the mounting rail The maximum permissible ambient temperature range depends on the mounting position:

  – Up to 60° C: Horizontal mounting position
  – Up to 50° C: Vertical installation position

  You also need to consider the current carrying capacity of the ET 200SP components.

  In the case of a vertical mounting position, use end retainers "8WA1808" at both ends of the ET 200SP station:
- Mounting rail

  Use one of the following mounting rails:

  – 35x15 mm DIN rail in accordance with DIN EN 60715
  – 35x7.5 mm DIN rail in accordance with DIN EN 60715
  – SIMATIC S7 mounting rail
- Current carrying capacity of the ET 200SP station
  Current carrying capacity refers to the current load via the power bus and the infeed bus of the ET 200SP station.

Depending on the ambient conditions and mounting position, you have to take account of the fan unit or additional mechanical fixings.

Mechanical brackets

Use the mechanical brackets in the following situations:

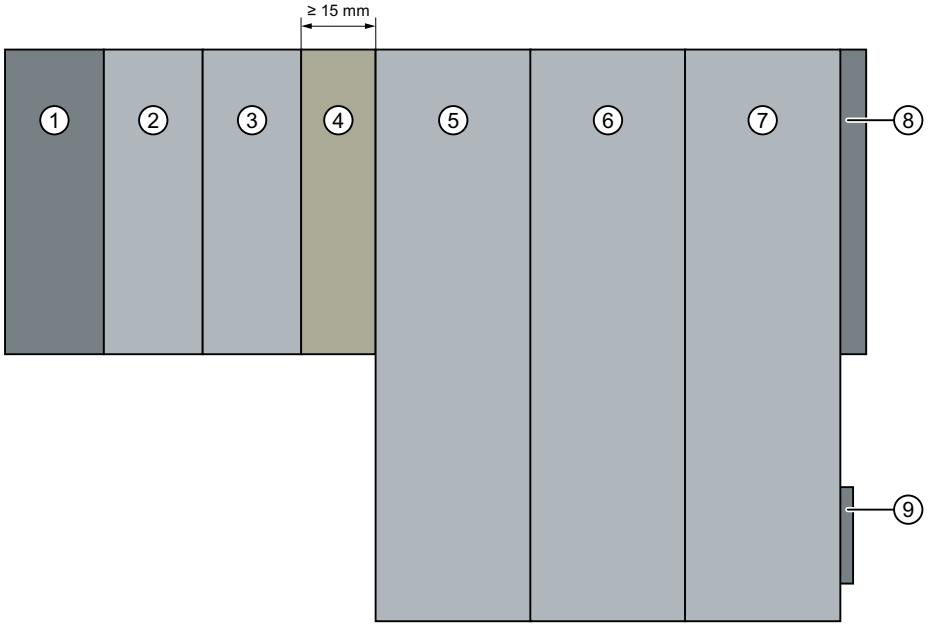
- When using a 15 mm mounting rail with a single motor starter installation, i.e. no motor starter mounted directly next to it in the system
- With a vertical mounting position
- For applications according to shipbuilding standards in all mounting positions with 7.5 mm and 15 mm mounting rails

Designing interference-free motor starters

For interference-free operation of the ET 200SP station in accordance with standard IEC 60947-4-2, use a dummy module before the first motor starter. No dummy module is required to the right of the motor starter.

Note the following mounting rules:

Use the following dummy module on the standard mounting rail between the previous module and the SIMATIC ET 200SP motor starter:



BU cover 15 mm: 6ES7133-6CV15-1AM0 with BaseUnit 6ES7193-6BP00-0BA0

For operation of the ET 200SP station with an unused BaseUnit, a cover must be provided for the open BaseUnit plug contacts (power connector, power bus connector, and backplane bus connector).

The cover protects the plug contacts against dirt. The BU cover can be ordered as an accessory.

Mount the dummy module

The figure below provides a schematic representation of how to implement measures for improving interference immunity.

①	Interface module	⑥	Motor starter
②	Digital input module	⑦	Motor starter
③	Digital output module	⑧	Server module
④	Dummy module	⑨	Infeed bus cover
⑤	Motor starter		

NOTICE

Ensure interference immunity
You must not plug any other module into the BaseUnit of the dummy module, otherwise interference immunity is no longer ensured.

7.3 Mounting the CPU/interface module

Introduction

The CPU/the interface module connects the ET 200SP distributed I/O system to the fieldbus and exchanges the data between the higher-level control system and the I/O modules / motor starters.

Requirement

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only for mounting and removing the BusAdapter)

Mounting the CPU/interface module

Watch the video sequence (https://support.automation.siemens.com/WW/view/en/95886218)

To install a CPU/interface module, follow these steps:

1. Install the CPU/interface module on the mounting rail.
2. Swivel the CPU/interface module towards the back until you hear the mounting rail release button click into place.

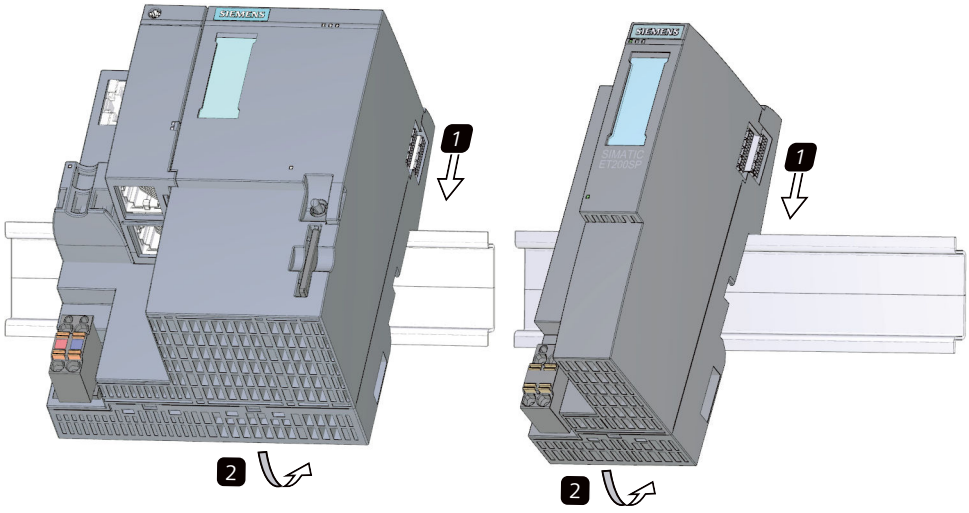


Figure 1-67 Mounting the CPU/interface module

Dismantling the CPU/interface module

The CPU/interface module is wired and BaseUnits are located to its right.

To remove the CPU/interface module, follow these steps:

1. Switch off the supply voltage for the CPU/interface module. Remove the 24 V DC connector from the CPU/interface module.
2. Confirm the mounting rail release on the first BaseUnit. At the same time, shift the CPU/interface module parallel to the left until it detaches from the rest of the module group.

   Note: The mounting rail release button is located above the CPU/interface module or BaseUnit.
3. While pressing the mounting rail release button on the CPU/interface module, swivel the CPU/interface module off of the mounting rail.

NOTE

It is not necessary to remove the BusAdapter from the CPU/interface module.

7.4 Installing ET 200SP R1

Introduction

The ET 200SP R1 system connects the ET 200SP distributed I/O system to the fieldbus and exchanges the data between the higher-level controller and the I/O modules / motor starters.

Requirement

The SIMATIC system rail is installed.

Tools required

3 to 3.5 mm screwdriver (only for mounting and removing the BusAdapter)

Mounting the ET 200SP R1 system

To mount the ET 200SP R1 system, proceed as follows:

1. Hang the BaseUnit BU type M0 onto the SIMATIC system rail.
2. Swivel the BaseUnit BU type M0 backwards until the system rail release audibly engages.
3. Plug the IM 155-6 PN R1 interface modules onto the BaseUnit BU type M0 until the lock audibly engages.
4. Plug the 24 V DC connectors into both interface modules.
5. Connect a BusAdapter to each interface module. Screw the BusAdapter to the interface module.

Removing the ET 200SP R1 system

To remove the ET 200SP R1 system, proceed as follows:

1. Switch off the supply voltage for the ET 200SP R1 system. Unplug the 24 V DC connectors from both interface modules.
2. Press the interface module release on the BaseUnit BU type M0. Detach the interface modules from the BaseUnit BU type M0.
3. Press the system rail release on the BaseUnit. Move the BaseUnit BU type M0 parallel to the left until it detaches from the rest of the module group.

   Note: The system rail release is located above the BaseUnit BU type M0.
4. With the system rail release pressed on the BaseUnit, swivel the BaseUnit BU type M0 off of the system rail.

NOTE

It is not necessary to remove the BusAdapter from the IM 155-6 PN R1 interface modules.

7.5 Installing the CM DP communication module

Introduction

You need the CM DP communication module to use the CPU with a DP master or DP slave.

Requirements

- The mounting rail is fitted.
- The CPU is installed.

Installing CM DP

To install the CM DP communication module, follow these steps:

1. Install the CM DP to the right of the CPU.
2. Swivel the CM DP towards the back until you hear the mounting rail release button click into place.

3. Slide the CM DP to the left until you hear it click into the CPU.

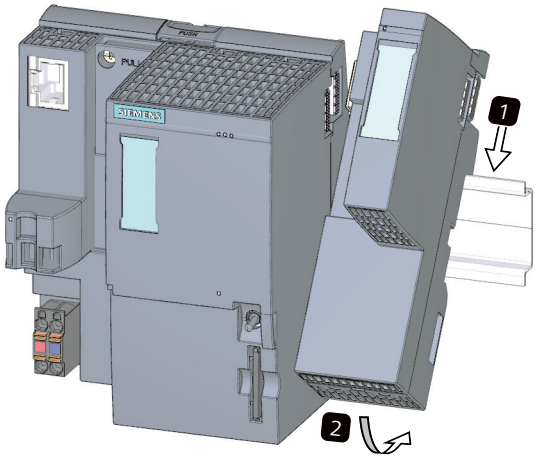

Figure 1-68 Installing CM DP

Removing a CM DP

The CPU and the CM DP are wired and BaseUnits are located to its right.

To remove the CM DP communication module, follow these steps:

1. Switch off the supply voltage on the CPU.
2. Press the mounting rail release button on the first BaseUnit and, at the same time, move the CPU and the CM DP parallel to the left until they detach from the rest of the module group (clearance about 16 mm).
3. Press the mounting rail release button on the CM DP and move it to the right until it detaches from the CPU (clearance about 8 mm).
4. While pressing the mounting rail release button on the CM DP, swivel the CM DP off of the mounting rail.

NOTE

It is not necessary to remove the bus connector from the CM DP unless you have to replace the CM DP.

7.6 Mounting BaseUnits for I/O modules

Introduction

The BaseUnits are used for electromechanical connection between the individual ET 200SP components. They also provide terminals for connecting external sensors, actuators and other devices.

Requirements

The mounting rail is fitted.

Required tools

3 to 3.5 mm screwdriver (only for dismantling the terminal box and the encoding element)

Installing a BaseUnit

Watch "Install configuration" video sequence
(https://support.automation.siemens.com/WW/view/en/95886218)

To install a BaseUnit, follow these steps:

1. Hook the BaseUnit onto the mounting rail.
2. Swivel the BaseUnit backwards until you hear it click into place on the mounting rail.
3. Slide the BaseUnit parallel to the left until you hear it latch onto the preceding CPU/interface module or BaseUnit.

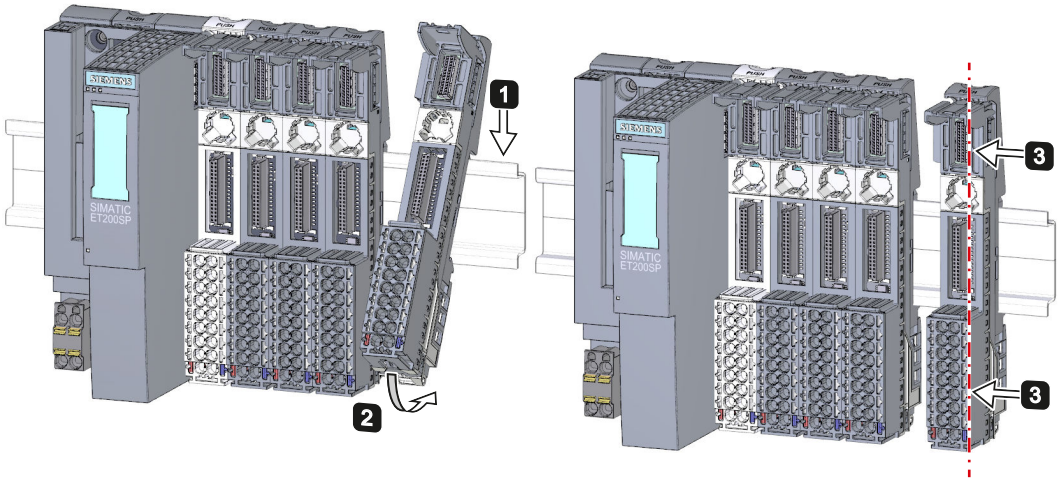

Figure 1-69 Installing a BaseUnit

Removing a BaseUnit

⚠ WARNING

Hazardous Voltage
Hazardous electrical voltage can cause electric shock, burns and property damage.
Disconnect your system and devices from the power supply before starting any assembly tasks.

To remove a BaseUnit, follow these steps:

The BaseUnit is wired and there are other BaseUnits to its right and left.

To remove a specific BaseUnit, move the adjacent modules. As soon as you have created a clearance of about 8 mm from the adjacent BaseUnits, you can remove the BaseUnit.

NOTE
You can replace the terminal box without removing the BaseUnit. Refer to section Replacing the terminal box on the BaseUnit (Page 320).

To remove a BaseUnit, follow these steps:

1. Switch off all supply voltages on the ET 200SP distributed I/O system.
2. Loosen the wiring on the BaseUnit (with a 3 to 3.5 mm screwdriver).
3. **Removing (from the right):**
   Press the mounting rail release on the relevant BaseUnit. Move the BaseUnit parallel to the right and swivel the BaseUnit off of the mounting rail while pressing the mounting rail release.
   Removing (from the left):
   Press the mounting rail release on the relevant BaseUnit and the BaseUnit located to its right. Move the BaseUnit parallel to the left and swivel the BaseUnit off of the mounting rail while pressing the mounting rail release.
   Note: The mounting rail release is located above the BaseUnit

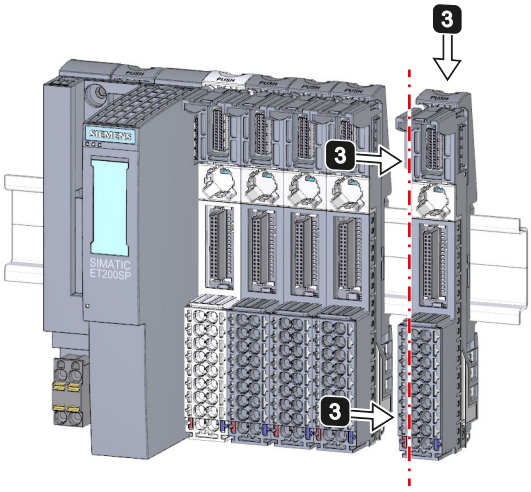

Figure 1-70 Removing the BaseUnit (removing from the right)

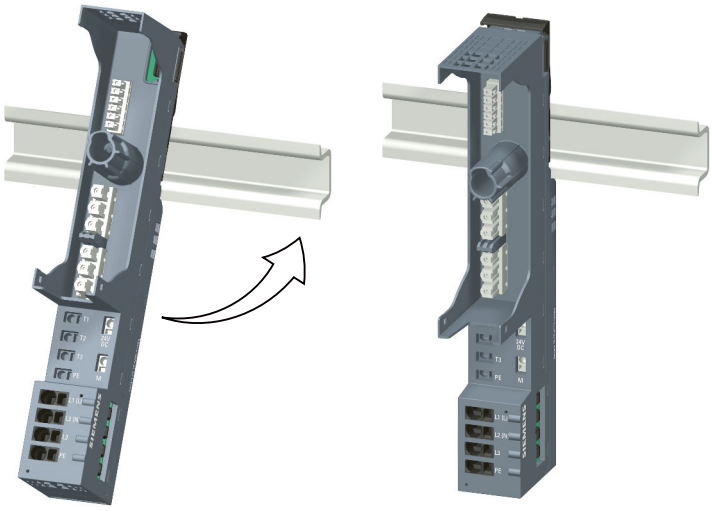
7.7 Mounting and dismantling BaseUnits for motor starters

Requirements

- The mounting rail is fitted.
- When using a 15 mm mounting rail, you must install the additional mechanical mounting (3RK1908-1EA00-1BP0).

NOTE

Mechanical bracket for BaseUnit
You will find out how to mount the mechanical bracket for the BaseUnit in chapter "Mounting the mechanical bracket for the BaseUnit (Page 144)".



⚠ CAUTION

Protection against electrostatic charge
When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

Mounting a BaseUnit

Proceed as follows to mount a BaseUnit for motor starters:

1. Hook the BaseUnit into the DIN rail from above.
2. Swing the BaseUnit to the rear until the BaseUnit audibly engages.

3. Slide the individual BaseUnits to the left to the previous BaseUnit until they audibly engage.

   Assemble the BaseUnits only on the DIN rail.

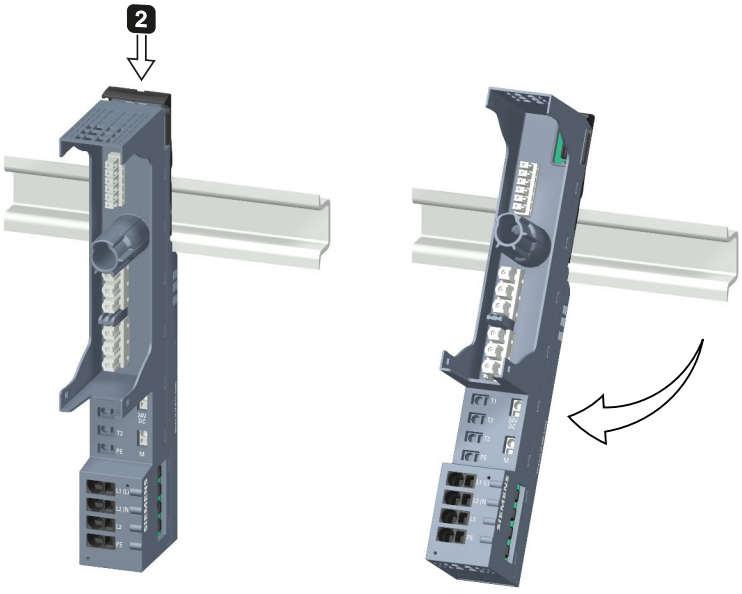
NOTE

The BaseUnits for motor starters can be plugged together with the BaseUnits for I/O modules.

Disassembling the BaseUnit

⚠ WARNING

Hazardous Voltage



Hazardous electrical voltage can cause electric shock, burns and property damage.

Disconnect your system and devices from the power supply before starting any assembly tasks.

To disassemble the BaseUnit, proceed as follows:

1. Disconnect the main power supply and the control current supply of the SIMATIC ET 200SP motor starter.
2. Actuate the DIN rail release on the BaseUnit of the motor starter.
3. Move the BaseUnit to the left. As soon as there is a clearance of approximately 8 mm to the neighboring BaseUnits, you can disassemble the BaseUnit of the motor starter.

4. Swing the BaseUnit away from the DIN rail while pressing the DIN rail release.

7.8 Installing and uninstalling BaseCarrier

7.8.1 Installing BaseCarrier

Requirements

- The printed circuit board with all the holes and connectors required is available to you. You can find more information in PCB Design Guide (http://support.automation.siemens.com/WW/view/en/109988377)

  Please note the following guidelines for obtaining possible approvals:

  – ATEX/IECEX/UKEX:

    For use of the BaseCarrier system in Zone 2, the customized printed circuit board must meet the applicable requirements according to the current version of EN IEC 60079-0, EN 60079-7, IEC 60079-0 and IEC 60079-7.

  – FM:

    In order to use the customized printed circuit board with the BaseCarrier as an FM Approved device, the printed circuit board must be FM Approved with the Base Carrier.

  – UL:

    The customized PCB must be UL rated according to ZPMV2 min 130°C, V-0.

- The bus housing with the bus PCB of the BaseCarrier is in position B.

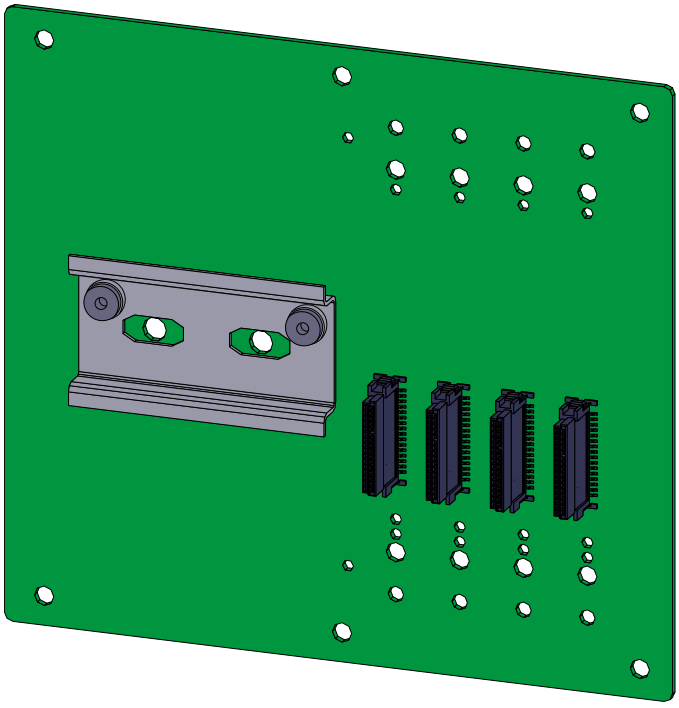
① Bus PCB in position A
② Bus PCB in position B
③ Detail of the bus circuit board

Figure 1-71 Positions of the bus PCB

Installing system with BaseCarrier

To install the BaseCarrier, follow these steps:

1. Screw the DIN rail to the printed circuit board. To do this, use the supplied hexagon socket-head screw adapters with a width A/F of 2.5 mm.



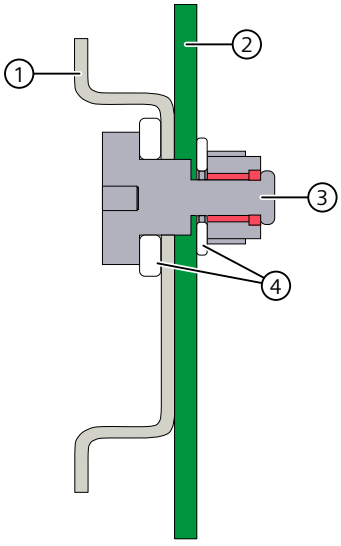


Figure 1-72 Mounted DIN rail on the printed circuit board.

① DIN rail
② Printed circuit board
③ Screw adapter
④ Washer (not included in the scope of delivery)

Figure 1-73 Example of a mounted DIN rail on a thin printed circuit board with washes

2. Insert the I/O adapter in the first BaseCarrier.

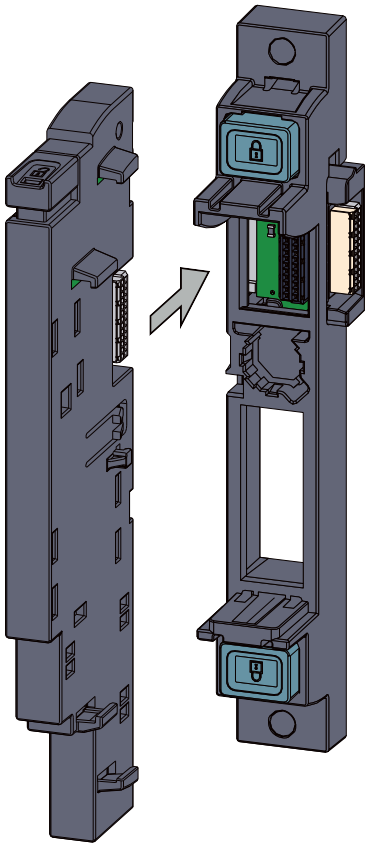

Figure 1-74 Inserting I/O adapter in the BaseCarrier

3. Position the first BaseCarrier using the centering pins and press the “Push-Lock” elements down. Ensure that both elements engage audibly.

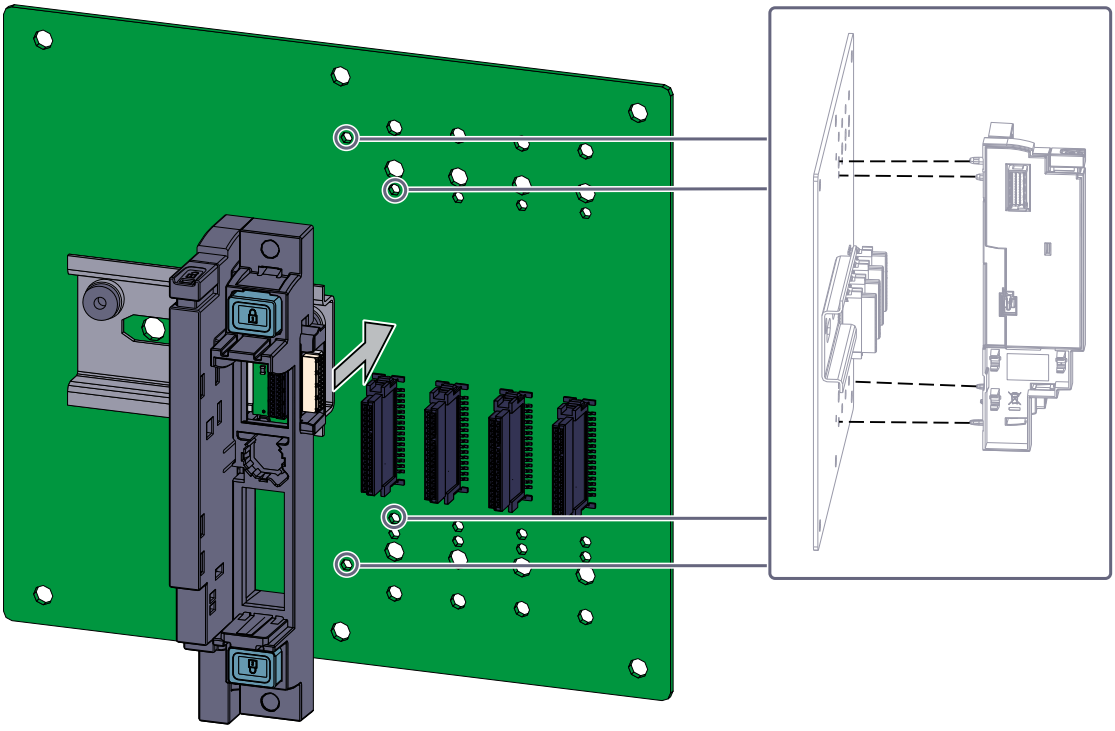

Figure 1-75 Holes on the printed circuit board

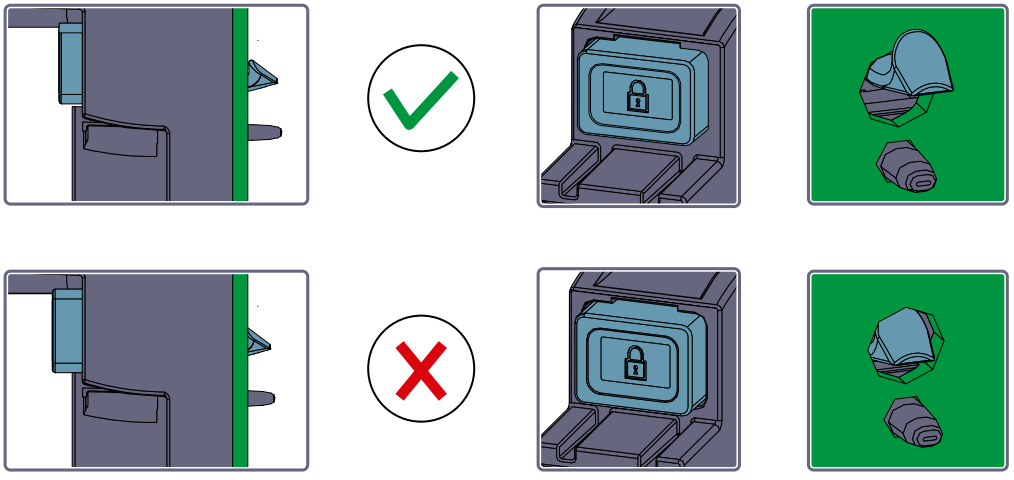

Figure 1-76 Visual control of the hooks

4. Connect the SP bus by sliding the bus housing with the bus PCB to the left in position A.

5. Insert the other BaseCarriers on the printed circuit board.
   Complete the setup with a BaseCarrier for the server module.

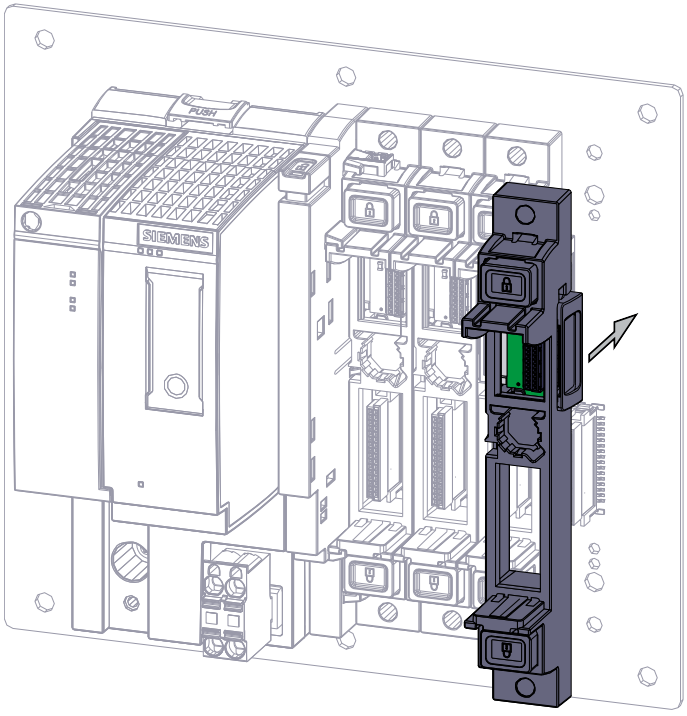

Figure 1-77 Mounting the last BaseCarrier

NOTE

Different position of the centering pins and corresponding holes

To ensure that you insert the right BaseCarrier type in the correct position, the centering pins and the corresponding holes on the printed circuit board for the BaseCarrier types are encoded differently.

6. To install the interface module, hang the interface module into the DIN rail ① and swing the interface module backwards ② until the DIN rail lock clicks into place. Slide the interface module to the right until it clicks into place on the I/O adapter ③.

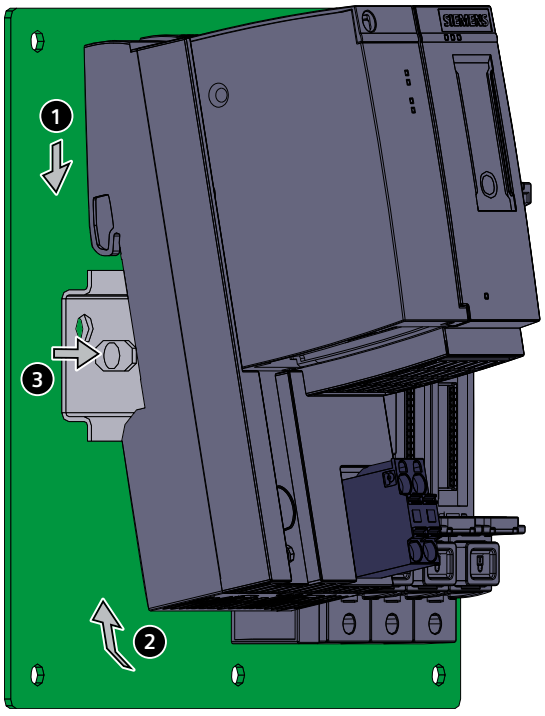

Figure 1-78 Installing the interface module

7. Place the end clamp on the DIN rail in front of the interface module and fix the end clamp by tightening the screw.

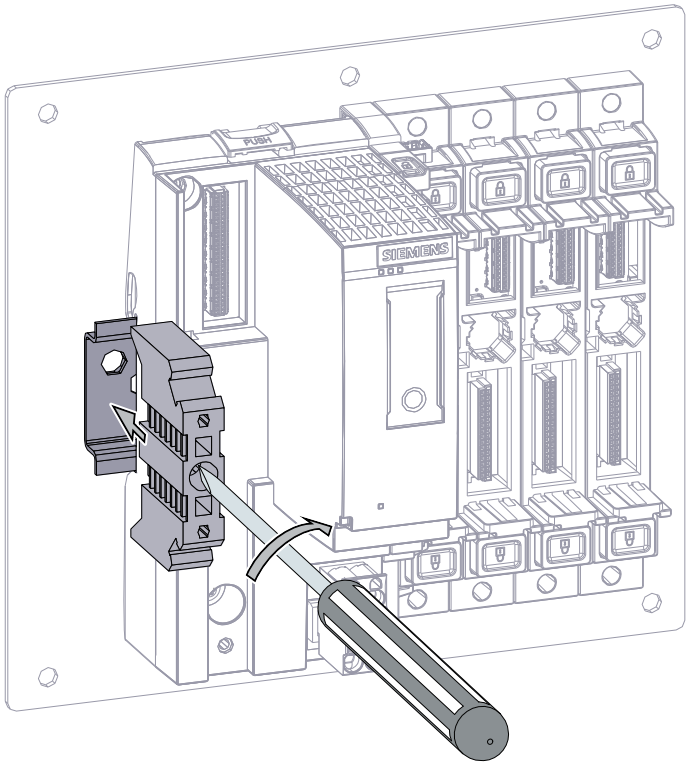

Figure 1-79 Attaching the end clamp

8. Insert the ET 200SP I/O modules and the server module into the BaseCarrier.

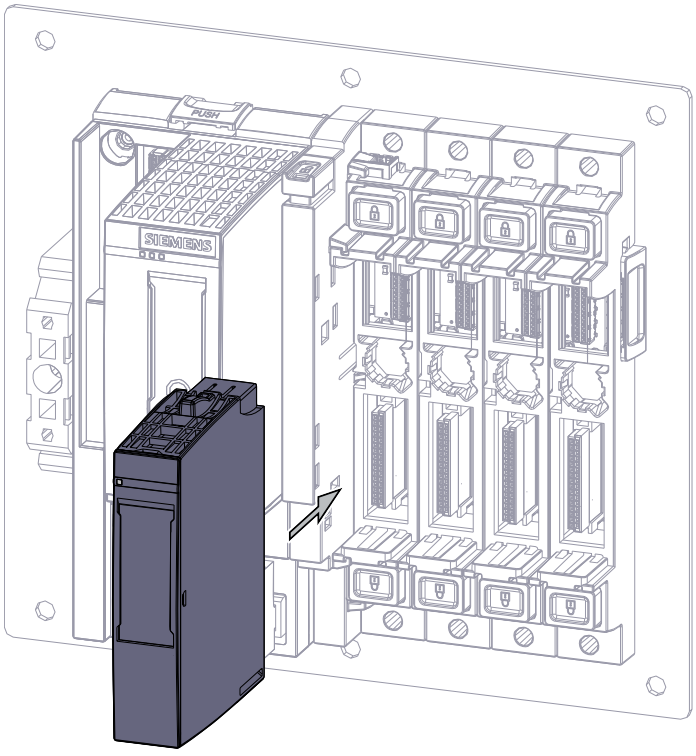

Figure 1-80 Setting up I/O modules

9. Put the SIMATIC bus adapter onto the interface module.

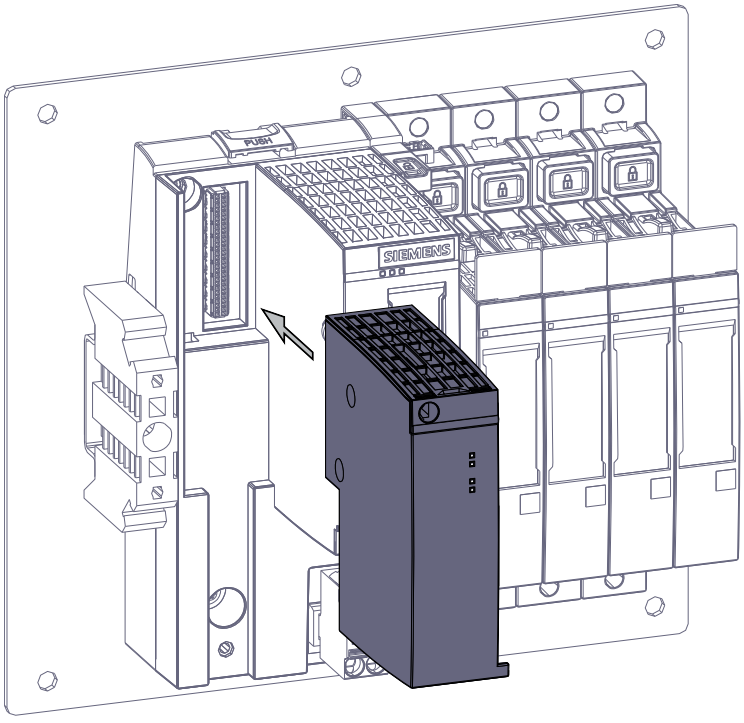

Figure 1-81 Inserting SIMATIC bus adapter to the interface module

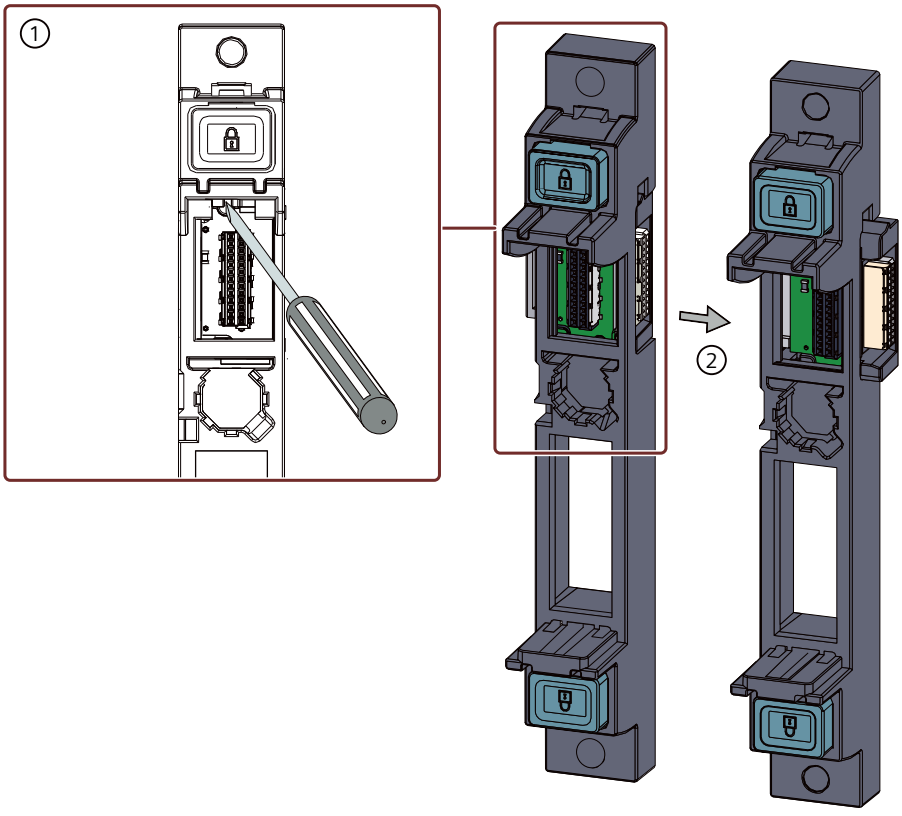
7.8.2 Dismantling BaseCarrier

Dismantling ET 200SP system



To dismantle the system, proceed as follows:

1. Remove the BusAdapter and the I/O modules.
2. Loosen the screw of the end clamp and remove the end clamp.
3. To decouple the interface module from the I/O adapter, press the "Push lock" element on the I/O adapter and slide the interface module to the left.

Dismantling BaseCarrier

To dismantle the BaseCarrier, proceed as follows from right to left:

1. To detach the SP bus, slide the bus housing to the right in position B.
   Use a slotted screw as in the following image.

① Detailed view bus housing with attachment point for the screwdriver
② Bus housing from position A to position B

Figure 1-82 Detaching the bus PCB

2. To detach the BaseCarrier from the printed circuit board, press the slotted screw into the recesses on the "Push lock" elements.

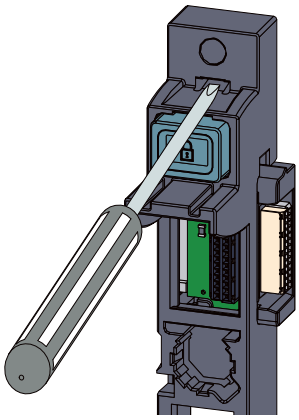


Figure 1-83 Detaching the BaseCarrier from the printed circuit board

The hooks come loose and you can pull the BaseCarrier off the printed circuit board.

3. To detach the I/O adapter from the BaseCarrier, press the slotted screw into the recesses on the I/O adapter ① and pull the I/O adapter from the BaseCarrier. Ensure that the bus housing is in position B.

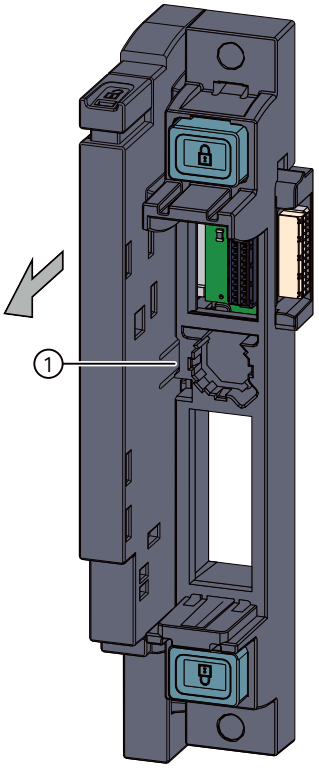

Figure 1-84 Detaching the I/O adapter from the BaseCarrier

7.9 Installing potential distributor modules

Introduction

You use the potential distributor module to distribute a variety of potentials (P1, P2).

Requirements

The mounting rail is installed.

Installing and uninstalling PotDis-BaseUnit

You install/uninstall PotDis-BaseUnits as you would the BaseUnits for I/O modules. You can find additional information in section Mounting BaseUnits for I/O modules (Page 125).

Installing and uninstalling PotDis-TerminalBlock

Installing
Plug the PotDis-TerminalBlock in die PotDis-BaseUnit. Proceed exactly as described in Section Inserting I/O modules / motor starters and BU covers (Page 178).

Uninstalling
To remove a PotDis-TerminalBlock, follow these steps:

1. Switch off all supply voltages on the ET 200SP distributed I/O system.
2. Simultaneously press the top and bottom release buttons of the PotDis-TerminalBlock.
3. Remove the PotDis-TerminalBlock from the front of the PotDis-BaseUnit.

7.10 Installing the server module

Introduction

The server module on the far right of the assembly/line completes the ET 200SP distributed I/O system.

Requirement

The last BaseUnit is mounted.

Installing the server module

Watch "Install configuration" video sequence
(https://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to install a server module:

1. Hook the server module onto the mounting rail to the right of the last BaseUnit.
2. Swivel the server module backwards on the mounting rail.
3. Move the server module parallel to the left until you hear it latch onto the last BaseUnit that precedes it.

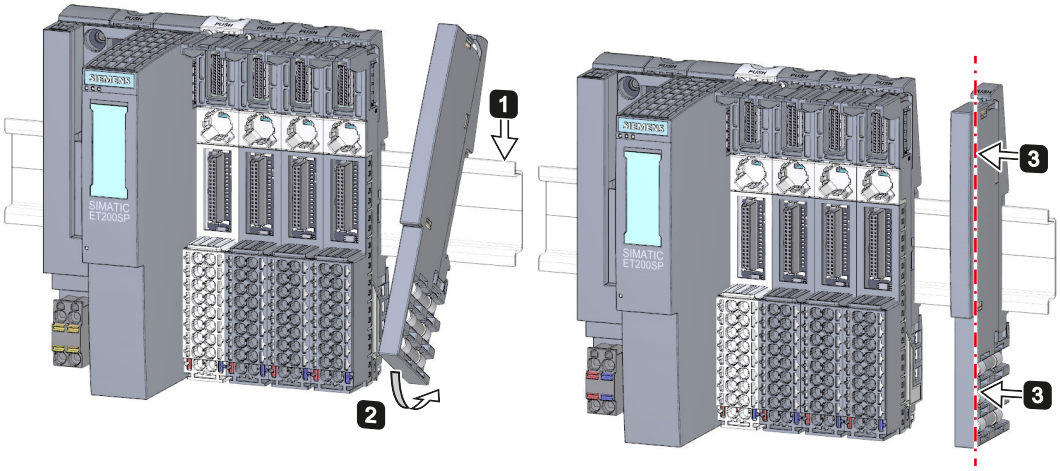

Figure 1-85 Installing the server module

Removing the server module

Proceed as follows to remove a server module:

1. Press the mounting rail release button on the server module.
2. Move the server module parallel to the right.
3. While pressing the mounting rail release button, swivel the server module off the mounting rail.

7.11 Mounting further accessories for motor starters

7.11.1 Mounting the cover for the 500 V AC infeed bus

Introduction

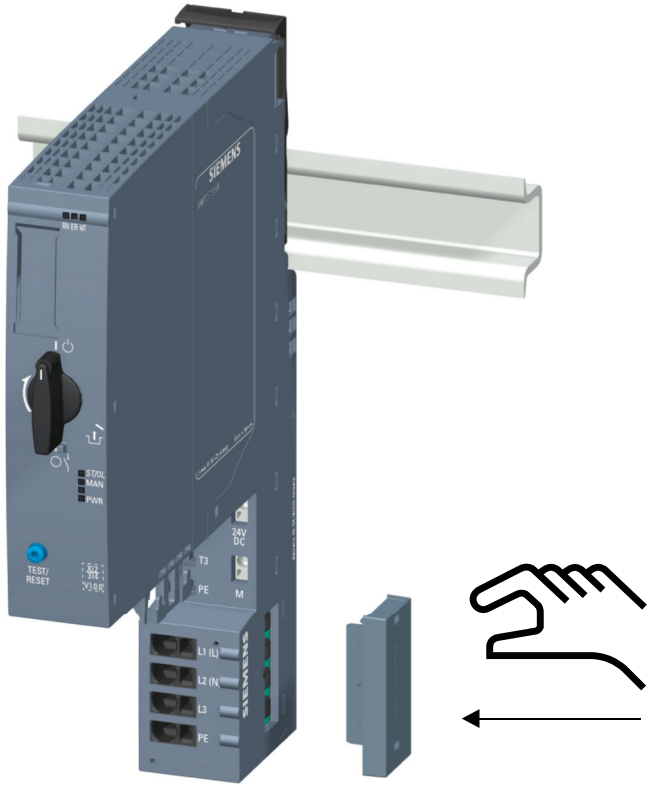
The 500 V infeed bus connects all SIMATIC ET 200SP motor starters. For finger-safe termination of the infeed bus, you must use the cover.

⚠ DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Hazardous electrical voltage causes electric shock, burns and property damage.
Disconnect your system and devices from the power supply before starting any assembly tasks.

⚠ DANGER

Infeed bus - electric shock
You must provide the infeed bus with a touch protection cover on the right (Article No.: 3RK1308-1DA00-2BP0).
Failure to do so will result in the danger of electric shock.



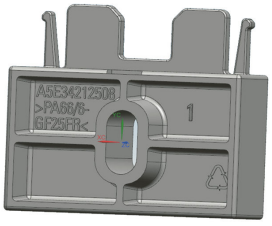
⚠ WARNING

Personal injury may occur
On the last plugged-in BaseUnit of a motor starter, place a cover on the opening of the contacts of the infeed bus.

Procedure

Proceed as follows to mount the infeed bus cover on a SIMATIC ET 200SP motor starter:

1. Press the cover onto the opening of the BaseUnit on the right until it audibly engages.



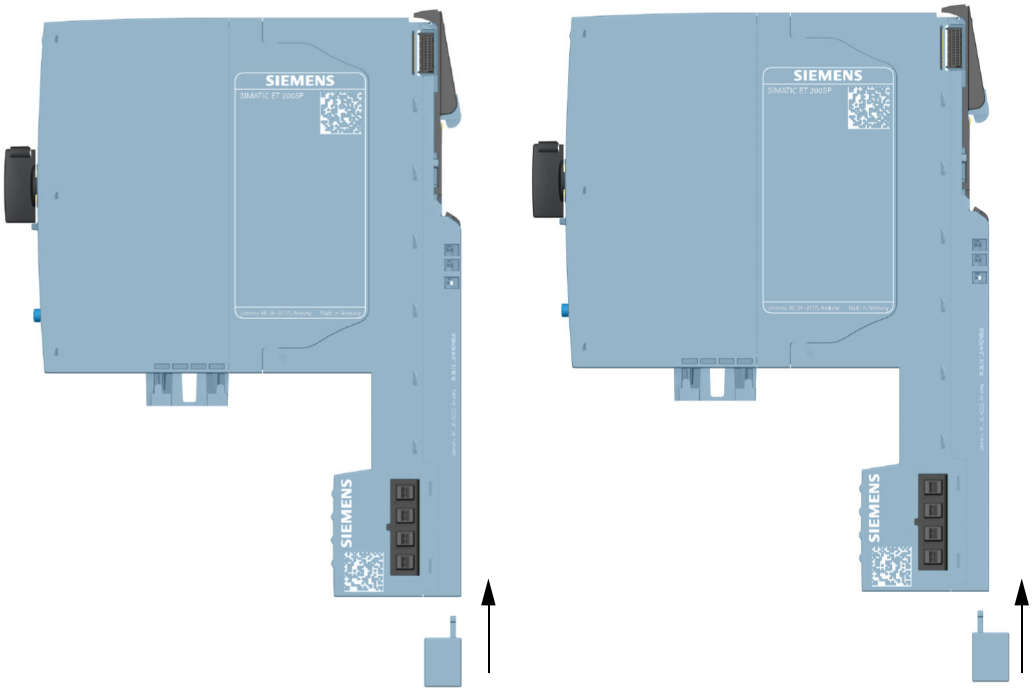
The cover can be removed again using 2 fingers and without tools.

7.11.2 Mounting the mechanical bracket for the BaseUnit

Introduction

To achieve higher stability, you can use a mechanical bracket on 7.5 mm and 15 mm mounting rails.

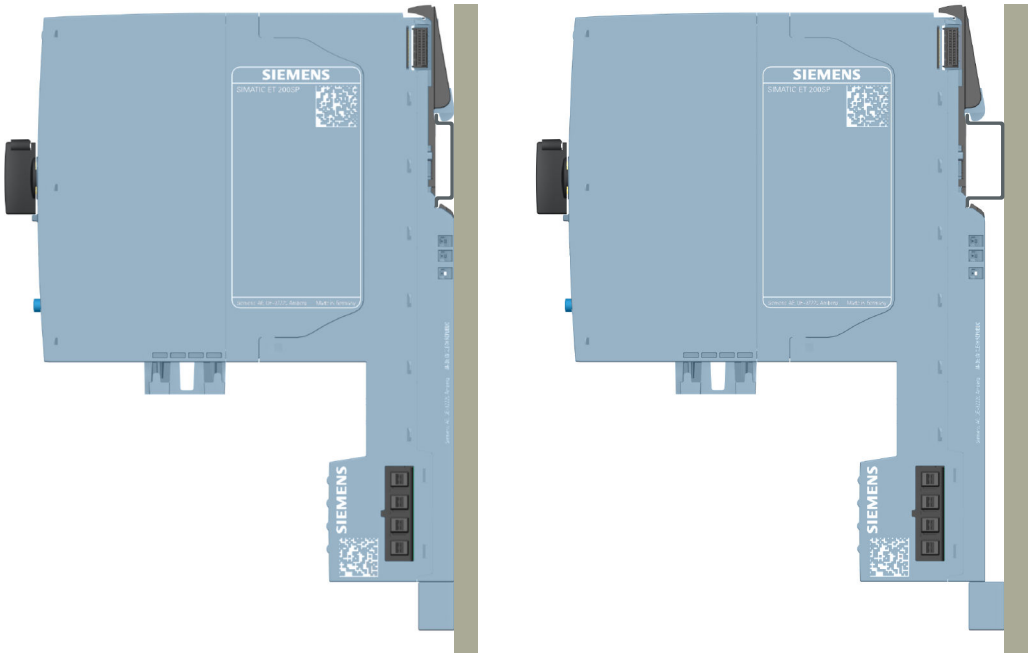
You must use the mechanical bracket in the following situations:



- When using a 15 mm mounting rail
- With a vertical mounting position
- For applications according to shipbuilding standards in all mounting positions with 7.5 mm and 15 mm mounting rails

You can find further information on the mechanical bracket in chapter "Installation conditions for motor starters (Page 120)".

Procedure



To mount the mechanical bracket, proceed as follows:

1. Insert the mechanical bracket into the opening at the bottom of the BaseUnit.
   You use the same mechanical bracket for both mounting rails, rotated through 180° respectively.

2. Hook the BaseUnit into the mounting rail.
3. Insert the mechanical bracket into the BaseUnit.
4. Screw the mechanical bracket securely onto the mounting panel. Use an M4 screw and a suitable washer.

The figures below show the mechanical bracket after installation on a 7.5 mm or 15 mm mounting rail.

7.11.3 Mounting the BU cover

Introduction

BU covers are plugged onto BaseUnits whose slots have been reserved for future expansion (as empty slots). The BU covers for motor starters serve as touch protection covers for unoccupied slots.

⚠ DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Hazardous electrical voltage causes electric shock, burns and property damage.
Disconnect your system and devices from the power supply before starting any assembly tasks.

⚠ DANGER

BaseUnit without motor starter - electric shock
If you install a BaseUnit without motor starter in the ET 200SP system (e.g. options handling), you must provide the BaseUnit with a BU cover (Article No: 3RK1908-1CA00-0BP0).
Failure to do so will result in the danger of electric shock.

Procedure

To mount the BU cover onto a SIMATIC ET 200SP motor starter, insert the BU cover in the BaseUnit in parallel until both interlocks audibly engage.

Wiring

8

8.1 Rules and regulations for operation

Introduction

When installing the ET 200SP distributed I/O system as part of a plant or system, special rules and regulations need to be adhered to depending on the area of application.

This section provides an overview of the most important rules that must be observed for the integration of the ET 200SP distributed I/O system in a plant or system.

Specific application

Adhere to the safety and accident prevention regulations applying to specific applications, for example machine protection guidelines.

EMERGENCY STOP devices

EMERGENCY STOP devices in accordance with IEC 60204 (corresponds to DIN VDE 0113) must remain effective in all operating modes of the plant or system.

External fuses/switches

Install the external fuses/switches in the proximity of the ET 200SP distributed I/O system.

Excluding hazardous plant states

Hazardous operating states must not occur when

- the plant restarts after a voltage dip or power failure.
- Bus communication is reestablished following a fault.

If necessary, EMERGENCY STOP must be forced!

An uncontrolled or undefined startup must not occur after the EMERGENCY STOP is unlocked.

Line voltage

Below, everything you need to consider in terms of line voltage is described (refer to section Insulation, protection class, degree of protection and rated voltage (Page 364)):

- For fixed plants or systems without an all-pole mains disconnection switch, a mains disconnection device (all-pole) must be available in the building installation.
- For load power supplies, the configured rated voltage range must correspond to the local line voltage.
- For all power circuits of the ET 200SP distributed I/O system, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance.

24 V DC supply

Below you will find a description of what you need to pay attention to with 24 V DC supply:

- In the event of danger through overload, you must provide lightning protection measures:
  - For external lightning protection
  - For internal lightning protection: Only if greater values (phase - ground) or (phase - phase) are required for the power surge than those specified in the section Electromagnetic compatibility (Page 364).
- For 24 V DC supply: Ensure protection by electrical separation and separate cable routing or increased insulation of circuits with dangerous potentials from extra low voltage (SELV/PELV) in accordance with IEC 61131-2 / IEC 61010-2-201.

Requirements for power supplies in the event of voltage interruption

NOTE

To ensure adherence to IEC 61131-2, only use power packs/power supply units (e.g. 230/400 V AC → 24 V DC) with a mains buffering time of at least 10 ms. Observe the relevant requirements in your application (e.g. product standard for "burners" 30 ms according to EN 298 or 20 ms according to NAMUR recommendation NE 21) with respect to possible voltage interruptions. The latest up-to-date information on PS components is available on the Internet (https://mall.industry.siemens.com).
Of course, these requirements also apply to power packs/power supply units not constructed using ET 200SP or S7-1500/S7-300-/S7-400 design.

Protection against outside electrical influences

Below is a description of what you must pay attention to in terms of protection against electrical impacts and/or faults:

- Make sure that the system for discharging electromagnetic interference is connected to a functional earth or to protective conductor with a sufficient cross-section for all plants with an ET 200SP distributed I/O system.
- For supply, signal and bus lines, you must ensure that the laying of the lines and the installation is correct.
- For signal and bus lines, you must ensure that a wire/cable break or a cross-circuit does not lead to undefined states of the plant or system.

Reference

You can find more information in the Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) function manual.

8.2 Additional rules and regulations for the operation of the ET 200SP with fail-safe modules

8.2.1 Safety extra-low voltage (SELV, PELV) for failsafe modules and failsafe motor starters

⚠ WARNING

The failsafe modules must be operated with safety extra-low voltage (SELV, PELV).
You can find more information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.
The fail-safe modules operate with the 24 V DC rated voltage. The tolerance range is 19.2 V DC to 28.8 V DC.
The fail-safe motor starters operate with the 24 V DC rated voltage. The tolerance range is 20.4 V DC to 28.8 V DC.
Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.
Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g. use of an overvoltage protector.
All system components that can supply electrical energy in any form whatsoever must fulfill this condition.
Each additional circuit (24 V DC) used in the system must have a safety extra-low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.
Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.

⚠ WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.
An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage U_m to be exceeded.

8.2.2 Requirements for sensors and actuators for fail-safe modules and fail-safe motor starters

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety.
The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".
To achieve the required safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat. 3/PLe, it is sufficient that a sensor has a single-channel connection. However, to achieve SIL3/Cat. 3/PLe with a single-channel connected sensor, the sensor itself must be SIL3/Cat. 3/PLe-capable. Otherwise, this safety level can only be achieved through two-channel connection of sensors.

To achieve SIL3/Cat. 4/PLe, sensors must be connected by two channels.

⚠ WARNING

In the case of fail-safe input modules, the value "0" is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.
Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Additional requirements for sensors for fail-safe motor starters

Only single-channel sensors that fulfill the required safety category themselves may be connected to the fail-safe motor starter's F-DI. Fail-safe laying must be observed in accordance with the required safety category.

⚠ WARNING

Safety-related shutdown using the F-DI

Depending on the I/O used, the shutdown takes place via one or two output channels (terminals):

- PM-switching: The shutdown takes place via two output channels.
- PP-switching: The shutdown takes place via one output channel.

Shutdown via only one output channel (PP-switching) achieves SIL 3 according to ISO 62061 and PLe/Cat.4 according to EN ISO 13849-1, if it is ensured that the cabling is installed in a cross-circuit-proof/P-short-circuit-proof manner.

Duration requirements for sensor signals

⚠ WARNING

Observe the following requirements for sensor signals:

- To ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in the section "Response times" of the relevant F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

Fast reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g. 230 V AC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (in accordance with IEC 60664-1).
This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

8.2.3 Crosstalk of digital input/output signals

When fail-safe digital output and input signals are in a single cable, F-DQ modules and F-PM-E modules may experience readback errors.

Cause: capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. A cross circuit/short-circuit is detected, which leads to safety-related tripping.

Remedy:

- Separate cables for F-DI modules, F-DQ modules, and F-PM-E modules or non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels for the F-PM-E module
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it.

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

Remedy:

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

8.3 Additional rules and regulations for operation of an Ex module group

Ex module group

You can find the rules and regulations for operation of an Ex module group in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en)

8.4 Additional rules and instructions for operation with motor starters

8.4.1 Protection against short circuit

The motor starter complies with type of coordination 1. Secure the feeder cable for the infeed bus according to current, country-specific rules for conductor protection.

⚠ WARNING

Hazardous Voltage at the Motor
Can Cause Death, Serious Injury, or Property Damage.
Following a short-circuit, the SIMATIC ET 200SP motor starter is defective. Replace the motor starter following a short-circuit.

8.5 Operating the ET 200SP on grounded incoming supply

Introduction

Below you will find information on the overall configuration of an ET 200SP distributed I/O system on a grounded incoming supply (e.g. TN-S network). The specific subjects discussed are:

- Disconnecting devices and short-circuit and overload protection according to IEC 60364 (corresponds to DIN VDE 0100) and IEC 60204 (corresponds to DIN VDE 0113)
- Load power supplies and load circuits.

Grounded incoming supply

In the case of grounded incoming supplies (TN-S system) the neutral conductor (N) and the protective conductor (PE) are each grounded. Both conductors form a part of the overvoltage concept. When a plant is in operation, the current flows across the neutral conductor. When a fault occurs, for example, a single ground fault between a live conductor and ground, the current flows through the protective conductor.

Safe electrical separation (SELV in accordance with IEC 61131-2 or IEC 61010-2-201)

Load power supplies/power supply modules with 24 V DC output voltage require safe electrical separation and voltage limiting (extra low voltage). Load power supplies/power supply modules with 24 V DC output voltage are not connected to the protective conductor. According to IEC 61131-2 and IEC 61010-2-201, this protection is referred to as SELV (Safety Extra Low Voltage).

The wiring of SELV circuits must be safely separated from the wiring of other circuits that are not SELV, or the insulation of all conductors must be dimensioned for the higher voltage.

Grounded extra-low voltage (PELV in accordance with IEC 61131-2 or IEC 61010-2-201)

Load power supplies/power supply modules with grounded 24 V DC output voltage require safe connection to the protective conductor and voltage limiting (extra low voltage).

According to IEC 61131-2 and IEC 61010-2-201, this protection is referred to as PELV (Protective Extra Low Voltage).

The wiring of PELV circuits must be safely separated from the wiring of other circuits that are not PELV, or the insulation of all conductors must be dimensioned for the higher voltage.

Configuration of ET 200SP with ungrounded reference potential

To conduct interference currents, the reference potential of the CPU/interface module and the BaseUnits BU15...D is connected internally via an RC combination (IM/CPU: R = 10 MΩ / C = 100 nF, BU15...D: R = 10 MΩ / C = 4 nF) with the mounting rail (functional grounding).

- This configuration conducts high-frequency interference currents and prevents static charges.
- It is always possible to configure an ungrounded setup of the ET 200SP distributed I/O system as the ET 200SP distributed I/O system has no fixed ground connection. The power pack/power supply module for 24 V DC must also be ungrounded and electrically isolated.

If you want to configure the ET 200SP distributed I/O system with grounded reference potential, connect the 1M connection of the CPU/interface module electrically with the protective conductor.

Short-circuit / overload protection

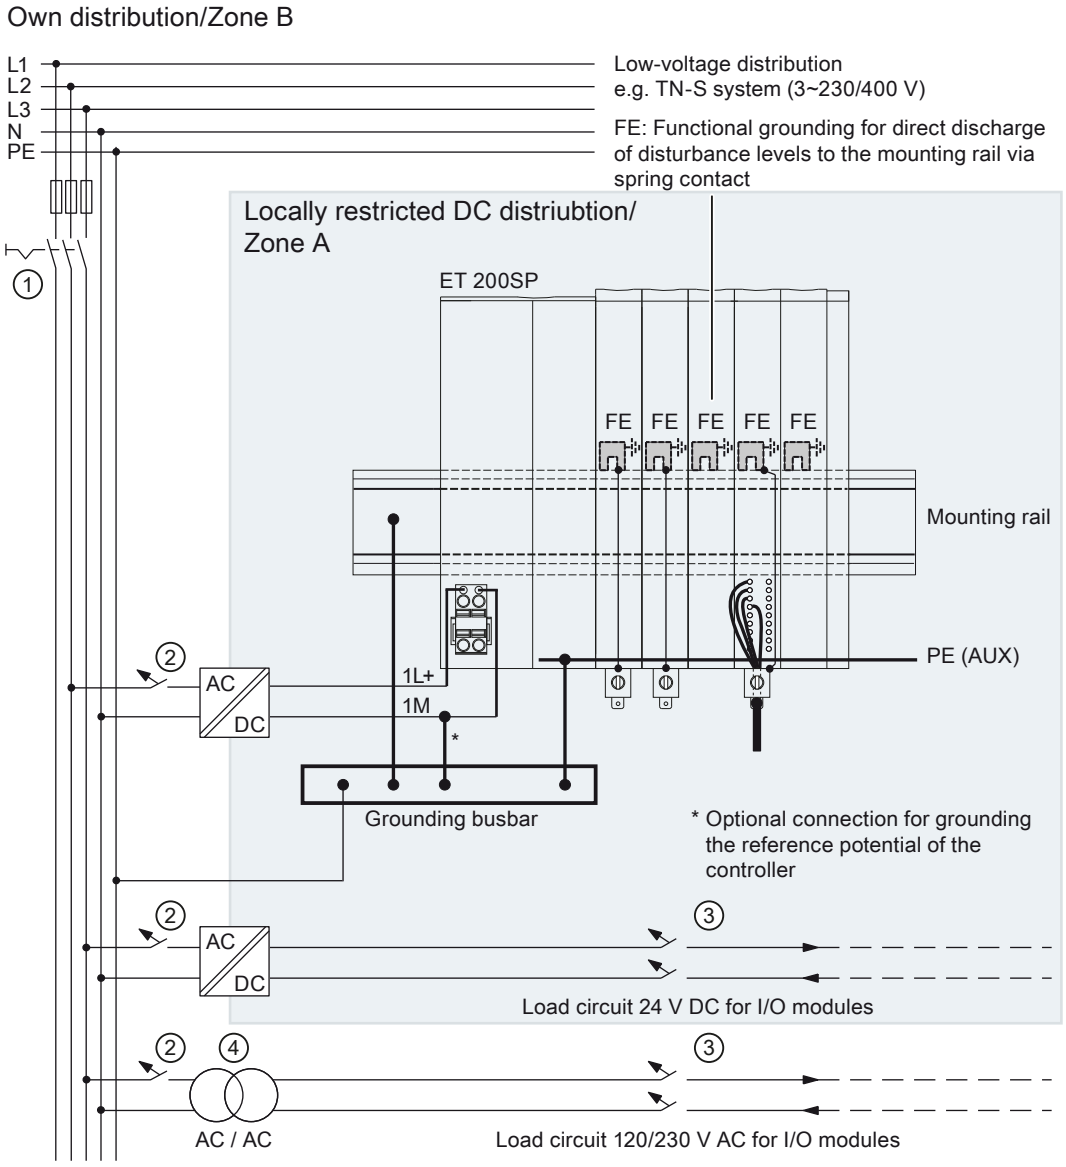
Various measures as protection against short-circuits and overloads are required for setting up a full installation. The type of components and the binding protective measures depend on which IEC (DIN VDE) regulation applies to your system configuration. The table refers to the figure below and compares the IEC (DIN VDE) regulations.

Table 1-356 Components and protective measures

	Refer to figure	IEC 60364 (DIN VDE 0100)	IEC 60204 (DIN VDE 0113)
Disconnecting device for controller, sensors, and actuators	①	Main switch	Disconnector
Short-circuit / overload protection: In groups for sensors and actuators	② ③	Single-pole protection of circuits	With grounded secondary circuit: **single-pole** protection otherwise: **all-pole** protection
Load current supply for AC load circuits with more than five items of electromagnetic equipment	②	Galvanic isolation by transformer **recommended**	Galvanic isolation by transformer **recommended**

Cable temperature measurement threshold

NOTE



Cable temperature measurement threshold

When choosing a cable, remember that the cable temperature in operation can be up to 30 °C higher than the ambient temperature of the ET200SP system (example: at an ambient temperature of 60 °C, a connection conductor must be dimensioned for a temperature range of at least 90 °C).

You should specify other connection types and material requirements based on the electrical characteristics of the circuits you use and the installation environment.

ET 200SP in the overall configuration

The figure below shows the overall configuration of the ET 200SP distributed I/O system (load current supply and grounding concept) with supply from a TN-S network.

① Main switch
② Short-circuit / overload protection
③ Load current supply
④ Optional for galvanic isolation

Figure 1-86 ET 200SP in the total configuration

NOTE
In general, you need to connect the DC I/O modules of the ET 200SP distributed I/O system to your own distribution (or batteries) via an upstream, local power supply unit.
If you connect the DC I/O modules directly to your own distribution, you need to provide additional protective measures against overvoltages.

8.6 Electrical configuration of the ET 200SP

Electrical isolation

Electrical relationships

With the ET 200SP distributed I/O system, there is electrical isolation between:

- The load circuits/process and all other circuit components of the ET 200SP distributed I/O system.
- The communication interfaces of the CPU (PROFINET) or of the interface module (PROFINET/PROFIBUS) and all other circuit components.

The figures below show the electrical relationships of the ET 200SP distributed I/O system with the CPU and the interface module. Only the most important components are represented in the figures.

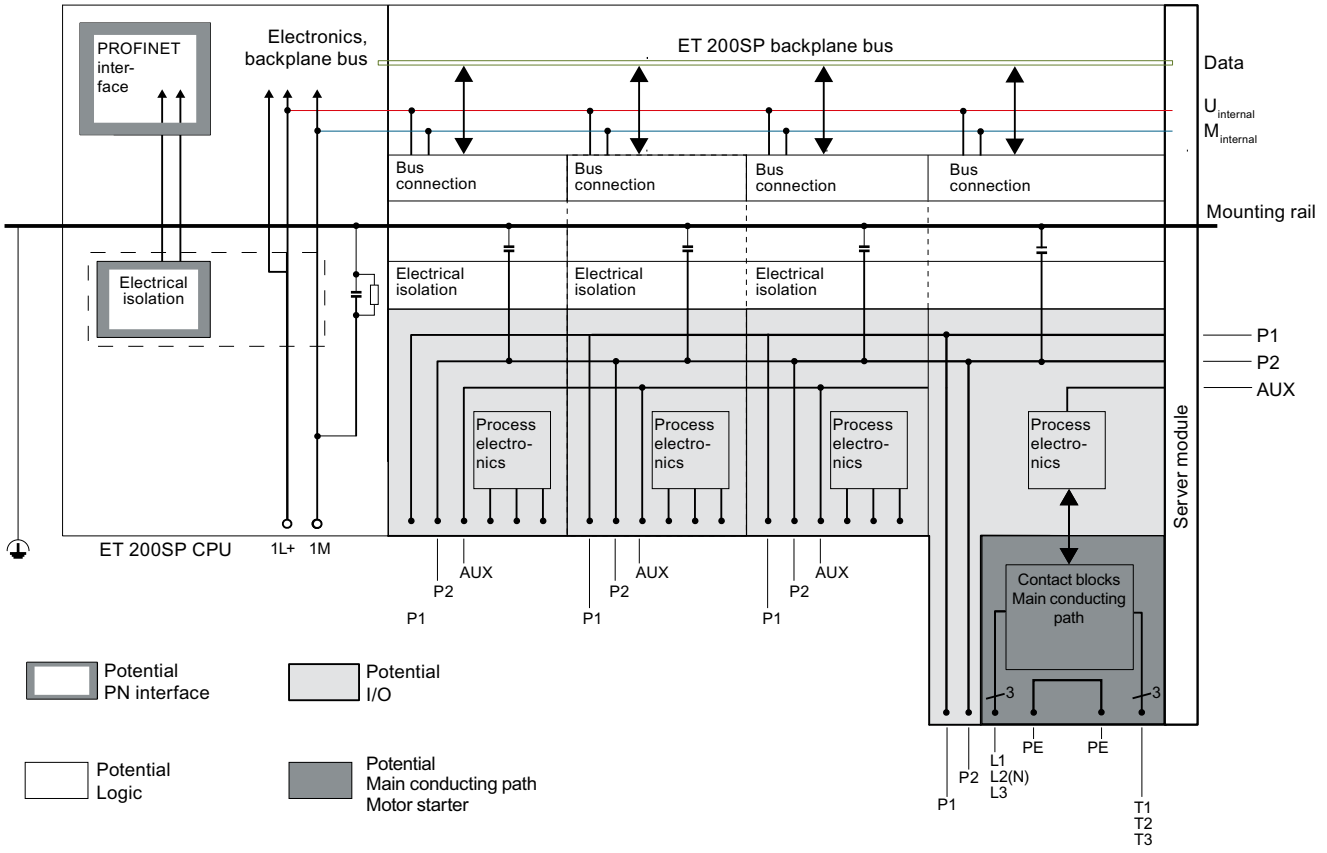


Figure 1-87 Electrical relationships for ET 200SP with CPU

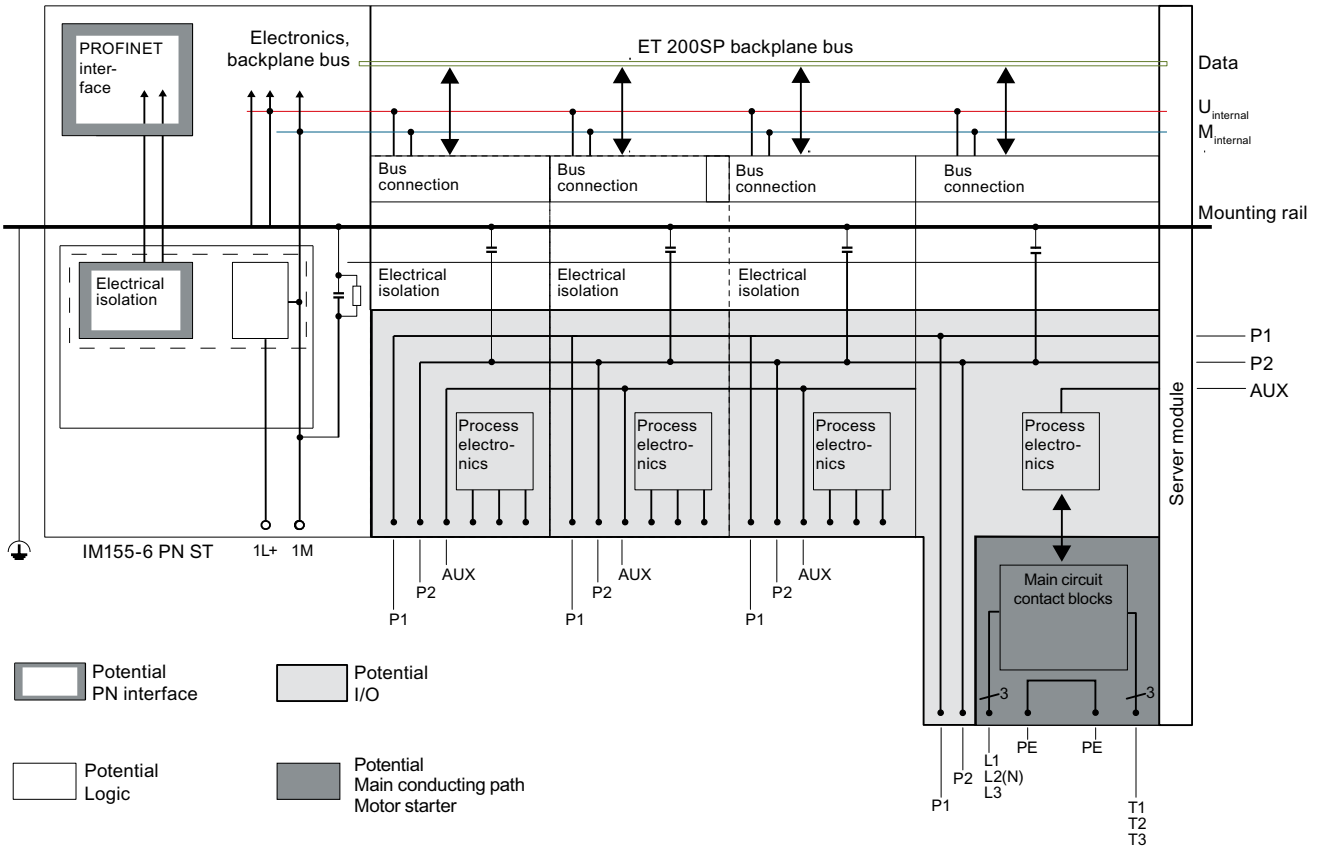

Figure 1-88 Electrical relationships for ET 200SP with interface module (using IM 155-6 PN ST as an example)

8.7 Wiring rules

Introduction

Use suitable cables to connect the ET 200SP distributed I/O system. Also select the cable insulation corresponding to the applied voltage. The tables below set out the wiring rules for CPU/interface module, BaseUnits and motor starter.

⚠ CAUTION

Use copper cables on connectors with terminal connections
Use solely copper cables (Cu) for all signal and supply lines that are connected to the device via terminals, e.g. 24 V DC power supply cable to the 24 V DC power supply connections.

Wiring rules for the CPU/interface module and BaseUnits for I/O modules

Wiring rules for ...		CPU/interface module (supply voltage)	BaseUnits (push-in terminal)
Permitted cable cross-sections of solid cables (Cu)		0.2 to 2.5 mm^2	
		AWG*: 24 to 13	
Connectable cable cross-sections for flexible cables (Cu)	Without wire end ferrule	0.2 to 2.5 mm^2	
		AWG*: 24 to 13	AWG*: 24 to 14
	With end sleeve (with plastic sleeve)***	0.25 to 1.5 mm^{2**}	0.14 to 1.5 mm^2
		AWG*: 24 to 16	AWG*: 26 to 16
	With TWIN end sleeve***	0.5 to 1 mm^2	0.5 to 0.75 mm^2 (see below)
		AWG*: 20 to 17	AWG*: 20 to 18
Stripping length of the cables		8 to 10 mm	
Wire-end ferrules in accordance with DIN 46228 with plastic sleeve***		8 and 10 mm long	
TWIN end sleeves		12 mm long	

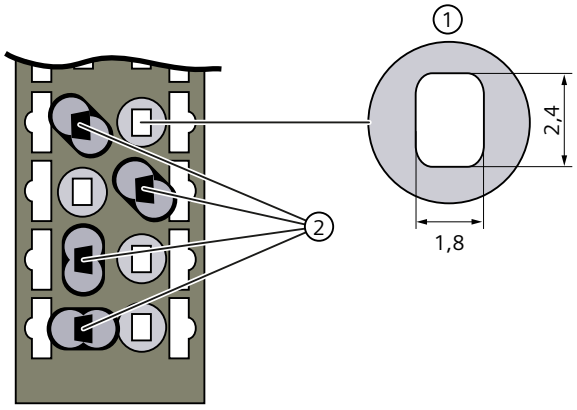
* AWG: American Wire Gauge

** Wire end ferrules without plastic sleeve: 0.25 to 2.5 mm^2/AWG: 24 to 13

*** See note on wire-end ferrules

Note the following for BaseUnits with function version < FS10:

NOTE



Wire-end ferrules

Optimum results with respect to a high-quality and permanent electrical connection with maximum conductor pull forces at the same time can be achieved by using crimping dies, preferably with smooth surfaces, which are provided, for example, with rectangular and trapezoidal crimp cross-sections.

Crimping dies with a pronounced wave profile are unsuitable.

TWIN end sleeves for the cables of the I/O modules' push-in terminals

Due to the space required by TWIN end sleeves with 0.75 mm² cross-section, you must ensure a correct angle for the cable arrangement when crimping the TWIN end sleeve so that the cables are optimally arranged.

① Cross-section of the terminal compartment
② Crimping TWIN end sleeves at the correct angle

Figure 1-89 TWIN end sleeves

Wiring rules for motor starters

Wiring rules for ...		L1(L), L2(N), L3, PE	T1, T2, T3, PE, 24 V DC, F-DI, M	DI1 ... DI3, LC, M, 24 V OUT
Permitted cable cross-sections of solid cables (Cu)		1 to 6 mm²	0.5 to 2.5 mm²	0.2 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
Connectable cable cross-sections for flexible cables (Cu)	Without wire end ferrule	1 to 6 mm²	0.5 to 2.5 mm²	0.2 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
	With end sleeve	1 to 6 mm²	0.5 to 2.5 mm²	0.25 to 1.5 mm²
		AWG: 18 to 10	AWG: 20 to 12	AWG: 24 to 16
	With end sleeve (with plastic sleeve)	1 to 4 mm²	0.5 to 1.5 mm²	0.25 to 0.75 mm²
		AWG: 18 to 11	AWG: 20 to 16	AWG: 24 to 18
Stripping length of the cables		15 mm	10 mm	8 mm
End sleeves according to DIN 46228 with plastic sleeve		15 mm long	10 mm long	8 mm long

Safety standards for fail-safe motor starters

Fail-safe motor starters fulfill the following standards under certain conditions:

- PLe/Cat.4 according to EN ISO 13849-1
- Safety Integrity Level SIL 3 according to IEC 62061

To fulfill both standards, lay cross-circuit proof and P-cross-circuit proof control cables from the safe output of a sensor or F-DQ to the safe input of the motor starter, e.g. as a separately sheathed cable or in a separate cable duct.

Line protection

The line protection of the SIMATIC ET 200SP motor starter is provided for the motor outgoing feeder cable when the following condition is met:

The cross-section of the motor outgoing feeder cable must be dimensioned for the load ratios of the motor and for the cable-laying method.

Comply with national regulations. The user is responsible for the correct selection and dimensioning of the motor connection cable to DIN VDE 0100 and DIN VDE 0298-4 and/or UL 508.

The conductor protection for the incoming feeders must be ensured by the owner of the installation depending on the cross-section.

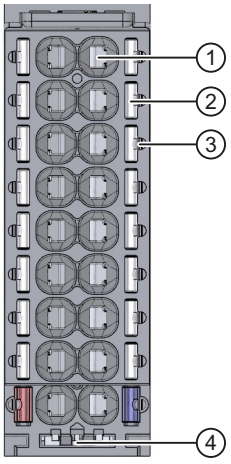
Cable temperature measurement threshold

NOTE

Cable temperature measurement threshold

When choosing a cable, remember that the cable temperature in operation can be up to 30 °C higher than the ambient temperature of the ET200SP system (example: At an ambient temperature of 60 °C, a connection conductor must be dimensioned for a temperature range of at least 90 °C).

You should specify other connection types and material requirements based on the electrical characteristics of the circuits you use and the installation environment.



8.8 Wiring BaseUnits for I/O modules

Introduction

The BaseUnits connect the ET 200SP distributed I/O system to the process. The following versions of the BaseUnits can be used:

- BaseUnits (with light-colored terminal box) for opening a potential group: BU..D
- BaseUnits (with dark-colored terminal box) for extending the potential group: BU..B
- BaseUnits with additional AUX terminals or additional terminals: BU..+10..
- BaseUnits with integrated thermal resistor for compensation of the reference junction temperature when connecting thermocouples: BU..T
- PotDis-BaseUnits (with light-colored terminal box) for opening a PotDis potential group: PotDis-BU..D

- PotDis-BaseUnits (with dark-colored terminal box) for extending the potential group: PotDis-BU..B

① Push-in terminal
② Spring release
③ Measuring probe (suitable probes: 1 mm diameter, length ≥ 10 mm while observing the permitted voltage category)
④ Holder for shield connection

Figure 1-90 View of the BaseUnit

NOTE

The pin assignment of the BaseUnit depends on the connected I/O module. Information on the BaseUnits and I/O modules can be found in the associated manuals.
Replacement of the terminal box on the BaseUnit is described in the section Replacing the terminal box on the BaseUnit (Page 320).

NOTE

Special terminal designations in the wiring and block diagrams of the I/O modules/BaseUnits

- **RES**: Reserve, these terminals must remain unconnected so that they can be used for future expansions
- **n.c.**: Not connected, these terminals have no function. However, they can be connected to potentials specifically defined for a module, for example, for the laying unused wires.

Requirements

- The supply voltages are turned off.
- Follow the wiring rules.
- Color identification labels (Page 189) (optional) have been applied.

Required tools

3 to 3.5 mm screwdriver

Tool-free connection of cables: single-wire without wire end ferrule, multi-wire (stranded) with wire end ferrule or ultrasonically sealed

Watch the video sequence (https://support.automation.siemens.com/WW/view/en/95886218)

To connect a wire without tools, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Only in the case of stranded conductors (except for 2.5 mm^2 cross-section):
   Seal or crimp the wire with wire end ferrules.
3. Insert the wire into the push-in terminal as far as it will go.

Connection of cables: multi-wire (stranded), without wire end ferrule, unprocessed

To connect a wire without a wire end ferrule, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Push with the screwdriver into the spring release.
3. Insert the wire into the push-in terminal as far as it will go.
4. Pull the screwdriver out of the spring release.

Removing wires

Using the screwdriver, press the spring release of the terminal as far as it will go and pull out the wire.

NOTE

When you press the spring release, you should not pull on the wire/cable at the same time. This prevents you from damaging the terminal.

8.9 Connecting cable shields for I/O modules

Introduction

- You need the shield connector to contact cable shields (e.g. for analog modules). The shield connector conducts interference currents on cable shields to ground via the mounting rail. It is not necessary to contact the shield at where the cable enters the cabinet.
- Fasten the shield connector to the BaseUnit.
- The shield connection consists of a shield support, a shield terminal and a supporting element.
- The shield connector is automatically connected to the functional ground (FG) of the mounting rail after installation.

Requirements

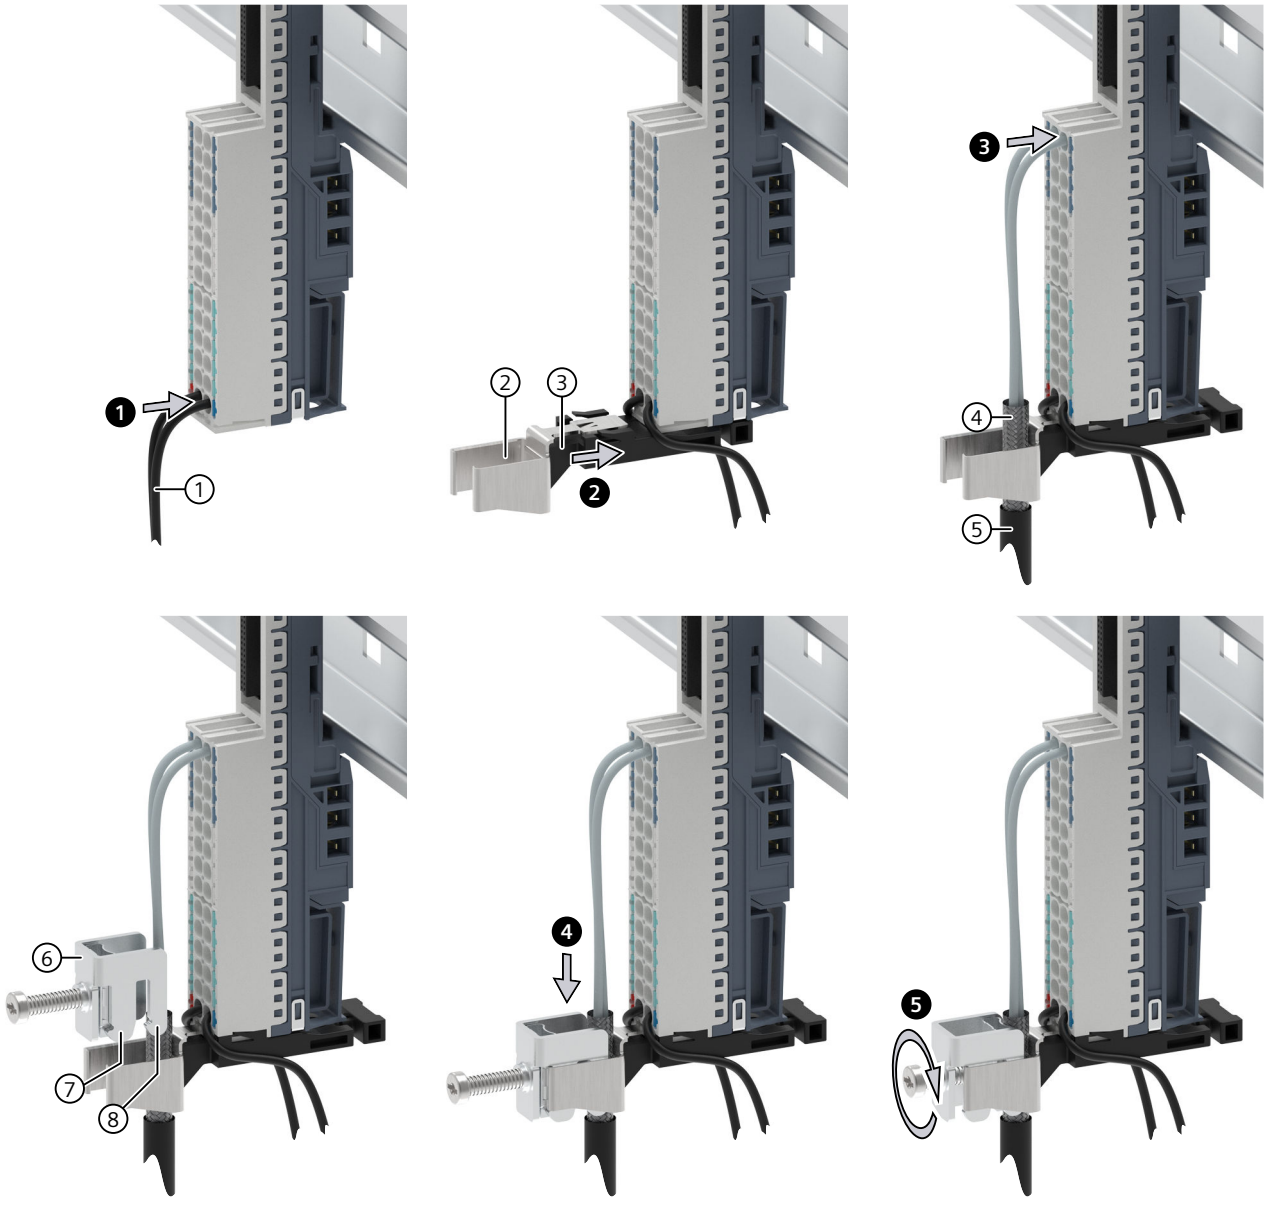
- BaseUnit must be one of the following types:
  - A0, A1
  - B0
  - C0, C1
  - F0
  - U0
- The shield terminal is suitable for cables with max. ∅ 7 mm each.

Required tools

- Stripping tool
- Slotted screwdriver with a 3.5 mm blade or Torx T10

Procedure

Watch the "Wiring BaseUnits" video sequence (https://support.automation.siemens.com/WW/view/en/95886218)



To connect the cable shield, follow these steps:

1. If required, connect the supply voltage L+ and ground to the BaseUnit.
2. Push the supporting element with the shield support into the guideway till the supporting element clicks into place.

   If you use a 7.5 mm mounting rail, you must first shorten the supporting element. To do so, unscrew the spacer of the support element.
3. Remove the cable insulation material around the shield terminal.

   Connect the cable to the BaseUnit and place the cable in the shield contact.
4. Insert the shield terminal into the corresponding clamping position of the shield support.
   - Clamping space height 1: 1.9 mm to 15.5 mm
   - Clamping space height 2: 10.9 mm to 23.5 mm

5. Tighten the shield terminal with approximately 0.5 Nm.
   When doing this, ensure that the terminal is completely in contact with the exposed protective braided shield.

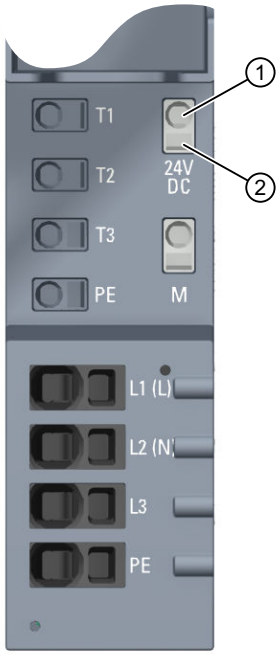
①	Supply voltage L+, M	⑤	Cable to the encoder
②	Shield support	⑥	Shield terminal
③	Supporting element	⑦	Suspension for clamping position 1
④	Insulation material removed (approx. 20 mm)	⑧	Suspension for clamping position 2

Figure 1-91 Mounting the shield contact

NOTE

Shield terminal does not have a null terminal.

Fix the shield terminal only when there is at least one inserted cable.

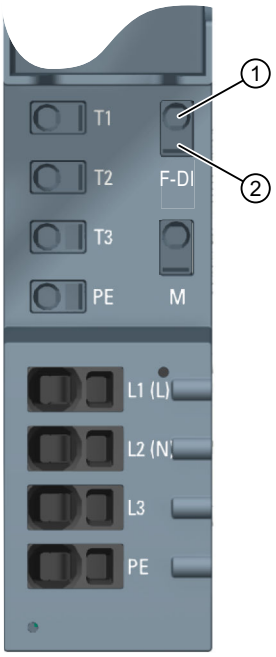


8.10 Wiring BaseUnits for motor starters

Introduction

The following versions of BaseUnits can be used:

- BU30-MS1 (with 24 V DC and 500 V AC infeed)
- BU30-MS2 (with 500 V AC infeed)
- BU30-MS3 (with 24 V DC infeed)
- BU30-MS4 (without infeed)
- BU30-MS5 (with 500 V AC infeed and single F-DI)
- BU30-MS6 (without infeed and with single F-DI)
- BU30-MS7 (with F-DI and 500 V AC infeed)
- BU30-MS8 (with 500 V AC infeed and F-DI routing)
- BU30-MS9 (with F-DI routing)
- BU30-MS10 (with F-DI infeed)



The following figure shows an example of a BaseUnit BU30-MS1 (with the maximum number of terminals):

① Push-in terminal
② Spring release

Figure 1-92 Terminals on a BaseUnit BU30-MS1

The following figure shows an example of a BaseUnit BU30-MS5 (with the maximum number of terminals):

① Push-in terminal
② Spring release

Figure 1-93 Terminals on a BaseUnit BU30-MS5

DANGER

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Hazardous electrical voltage can cause electric shock, burns and property damage.
Turn off and lock out all power supplying this device before working on this device.

For wiring finely-stranded or stranded conductors without end sleeves on push-in connections, a screwdriver is required.

Requirements

- The supply voltages are switched off
- Observe the wiring rules

NOTICE

Interconnection of the F-DI input of BaseUnits BU-30-MS5, BU-30-MS6, BU-30-MS7 and BU-30-MS10 with surge filters
If your system requires overvoltage protection, you must interconnect the F-DI input of the BaseUnits BU-30-MS5, BU-30-MS6, BU-30-MS7 and BU-30-MS10 with surge filters.
Please see "Electromagnetic Compatibility" in the technical specifications.

Required tools

Use the screwdriver "SZF 1-0.6x3.5" (for finely-stranded cables only).

Connecting conductors: Solid without end sleeve, stranded (stranded wire) with end sleeve

To connect a cable, proceed as follows:

1. Insulate the cables in accordance with the table in chapter "Electromagnetic compatibility of fail-safe modules (Page 357)".
2. Only in the case of stranded conductors:
   Crimp the cable with end sleeves.
3. Insert the cable into the push-in terminal as far as it will go.
4. Pull on the cable to ensure it is tight.

Connecting conductors: multi-wire (stranded), without end sleeve, unfinished

To connect a cable, proceed as follows:

1. Insulate the cables in accordance with the table in chapter "Wiring rules (Page 161)".
2. Press the screwdriver into the spring release.
3. Insert the conductor into the push-in terminal until it engages.
4. Pull the screwdriver out of the spring release.
5. Check whether or not the conductor is firmly connected by pulling on the cable.

Video sequence

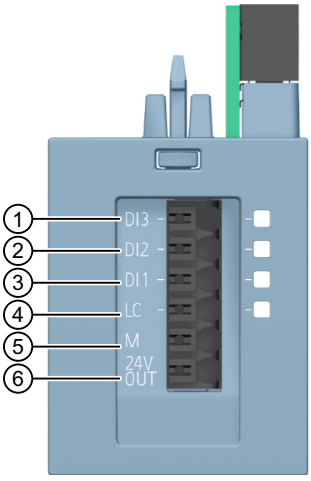
At the following Internet link, you can see a video about connecting conductors: Wire BaseUnits (http://support.automation.siemens.com/WW/view/en/95886218)

Releasing conductors

To release a conductor, proceed as follows:

1. Press the screwdriver into the spring release of the terminal until it engages.
2. Pull the conductor out.

NOTE



When pressing the spring release, you must not pull on the wire/cable at the same time. In this way, you avoid damaging the terminal.

8.11 Connecting the 3DI/LC module for the motor starter

You will find further information on the 3DI/LC module in the ET 200SP motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual.

Procedure

The figure below shows the connections of the 3DI/LC module.

① Digital input 3
② Digital input 2
③ Digital input 1
④ Local control (manual local)
⑤ Ground
⑥ 24 V DC/ 100 mA output

NOTE

The digital inputs (1 to 4) are not isolated. The reference potential is M (5). Control the digital inputs only via a unit supplied from the 24 V DC output (6).
Connect only cables of a width not exceeding 30 m to the 3DI/LC module.
The supply (5 and 6) is protected against short-circuits.

Terminal sketch of the 3DI/LC module

The following diagram shows a terminal sketch of the 3DI/LC module:

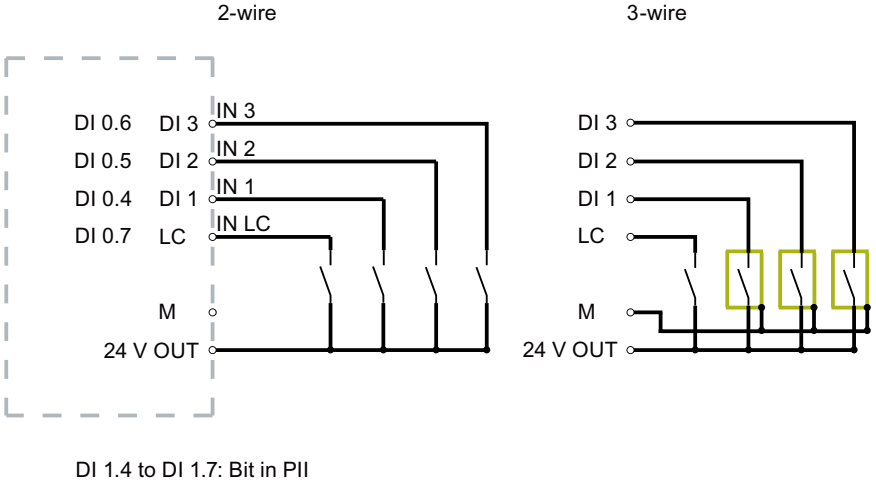


Figure 1-94 Connection example of inputs

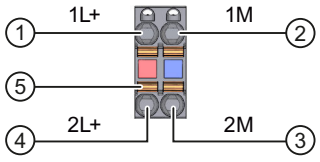
8.12 Connecting the supply voltage to the CPU/interface module

Introduction



The supply voltage of the CPU/interface module is supplied by means of a 4-pin connector plug located on the front of the CPU/interface module.

Power supply unit

Only use power supply units of type SELV/PELV with safe electrically isolated functional extra low voltage (≤ 28.8 V DC).

Connection for supply voltage (X80)

The connections of the 4-pole connector have the following meaning:

① +24 V DC of the supply voltage (current limited to 10 A)
② Ground of the supply voltage (current limited to 10 A)
③ Ground of the supply voltage for loop-through
④ +24 V DC of the supply voltage for loop-through
⑤ Spring opener (one spring opener per terminal)

1L+ and 2L+ and 1M and 2M are internally jumpered

Figure 1-95 Supply voltage connection

A strain relief is not present. The cable connector offers you the option of looping the supply voltage uninterrupted, even when it is unplugged.

For the maximum wire cross-sections, observe the information in the tables of the wiring rules (Page 161).

Requirements

- Only wire up the connector plug when the supply voltage is turned off.
- Follow the wiring rules (Page 161).

Required tools

3 to 3.5 mm screwdriver

Tool-free connection of cables: single-wire without end sleeve, multi-wire (stranded) with end sleeve or ultrasonically sealed

Watch video sequence: "Connect BusAdapter to the interface module" (https://support.automation.siemens.com/WW/view/en/95886218)

To connect a wire without tools, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Only in the case of stranded conductors:
   Seal or crimp the wire with end sleeves.
3. Insert the cable into the push-in terminal as far as it will go.
4. Push the wired connector plug into the plug socket of the interface module.

Connection of cables: multi-wire (stranded), without end sleeve, unfinished

To connect a wire without an end sleeve, follow these steps:

1. Strip 8 to 10 mm of the wires.
2. Using a screwdriver, press the spring release and insert the wire into the push-in terminal as far as it will go.
3. Pull the screwdriver out of the spring release.
4. Push the wired connector plug into the socket in the interface module.

Removing a wire

Using the screwdriver, press the spring release as far as it will go and pull out the wire.

8.13 Connecting interfaces for communication

Connect the communication interfaces of the ET 200SP distributed I/O system using the standardized connector or directly. If you want to prepare communication cables yourself, the interface assignment is specified in the manuals of the corresponding modules. Observe the mounting instructions for the connectors.

Detailed information on the available BusAdapters and the procedure for connecting PROFINET IO to the CPU/interface module is available in the BusAdapter (https://support.industry.siemens.com/cs/ww/en/view/109751716) manual.

8.13.1 Connecting PROFINET IO (RJ45 port) to the CPU

Introduction

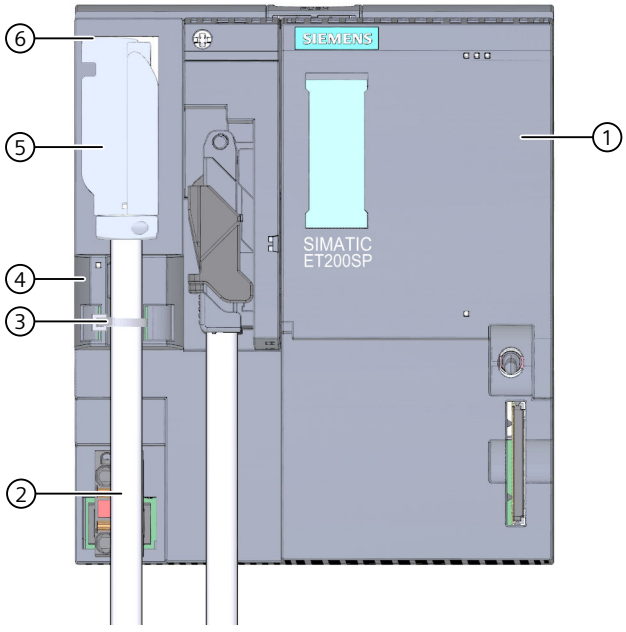
You use the RJ45 bus connector to connect PROFINET IO (RJ45 port) directly to the CPU.

Required accessories

- Cable ties with standard width of 2.5 mm or 3.6 mm for strain relief
- Please observe the specifications in the PROFINET Installation Guide (https://www.profibus.com).

Mounting the bus connector

Mount the PROFINET connector in accordance with the instructions in the PROFINET Installation Guide (https://www.profibus.com).



Procedure

Insert the RJ45 bus connector into the PROFINET port (RJ45 port) on the CPU.

NOTE

Cable support and strain relief

If you are using a FastConnect RJ45 bus connector with 90° cable outlet (6GK1901-1BB20-2AA0), we recommend you provide strain relief for the PROFINET connecting cable. For this you need a cable tie with a standard width of 2.5 mm or 3.6 mm. Use it to fasten the PROFINET connecting cable directly after it exits the bus connector to the provided cable support on the CPU (on the front directly below the PROFINET interface X1P3).

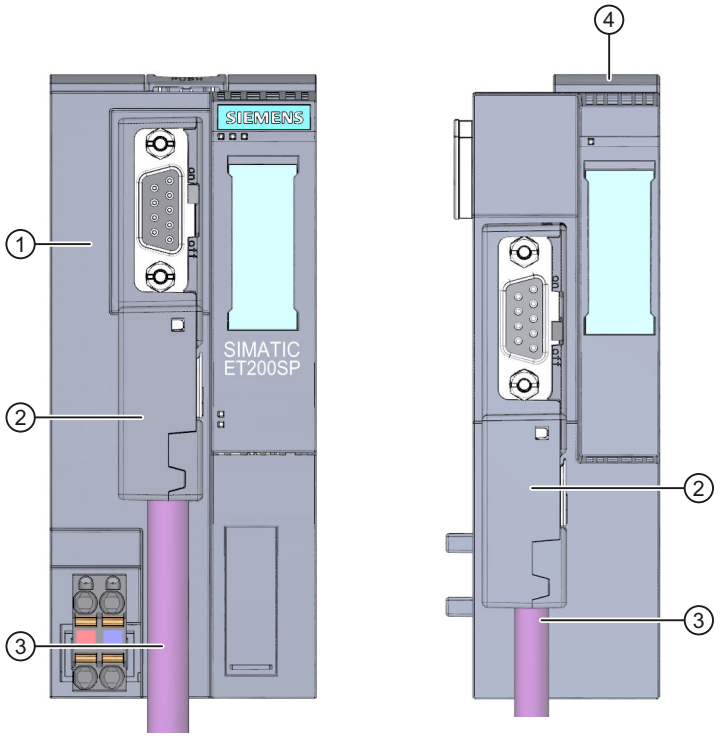
① CPU
② PROFINET connecting cable
③ Strain relief (cable tie)
④ Cable support
⑤ FastConnect RJ45 bus connector with 90° cable outlet
⑥ PROFINET connector (RJ45 port)

Figure 1-96 Connecting PROFINET IO (RJ45 port) to the CPU

8.13.2 Connecting the PROFIBUS DP interface to the interface module/communications module CM DP

Introduction

Using the bus connector (RS485), connect the PROFIBUS DP to the interface module/communications module CM DP.



Required tools

3 to 3.5 mm screwdriver

Procedure

To connect the PROFIBUS DP interface to the interface module / DP communication module CM DP, follow these steps:

1. Connect the PROFIBUS cable to the bus connector.
2. Plug the bus connector into the PROFIBUS DP connector.
3. Securely tighten the fixing screws of the bus connector (0.3 Nm).

① Interface module
② PROFIBUS FastConnect bus connector
③ PROFIBUS connecting cable
④ Communications module CM DP

Figure 1-97 Connect PROFIBUS DP to the interface module/communications module CM DP

Reference

You can find additional information on the PROFIBUS FastConnect bus connector in the corresponding product information on the Internet (https://support.industry.siemens.com/cs/ww/de/view/109793857/en).

8.14 Inserting I/O modules / motor starters and BU covers

Introduction

- You insert the I/O modules on the BaseUnits. The I/O modules are self-coding and type-coded.
- You insert the PotDis-TerminalBlocks on the PotDis-BaseUnits.
- You insert the BU covers on BaseUnits whose slots are not equipped with I/O modules/PotDis-TerminalBlocks.
- You insert the BU covers on BaseUnits whose slots have been reserved for future expansion (as empty slots).
- The BU covers for motor starters serve as touch protection covers for unoccupied slots.
  The BU covers have a holder for the reference identification label on the inside. For future expansion of the ET 200SP, remove the reference identification label from the holder and insert it into the final I/O module.
  It is not possible to attach a reference identification label to the BU cover itself.
  There are three versions:
  - BU cover with a width of 15 mm
  - BU cover with a width of 20 mm
  - BU cover with a width of 30 mm (for motor starters)

Requirement

Refer to chapter "Application planning (Page 85)".

Plugging in I/O modules and BU covers

Watch video sequence: "Insert I/O modules"
(https://support.automation.siemens.com/WW/view/en/95886218)

Insert the I/O module or BU cover parallel into the BaseUnit until you hear both latches click into place.

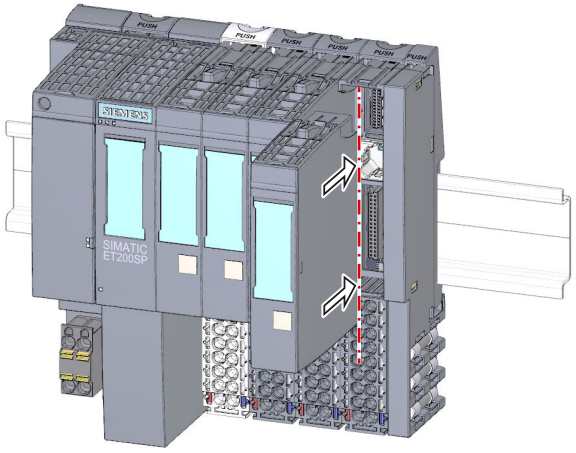


Figure 1-98 Plugging in I/O modules or BU covers (using an I/O module as example)

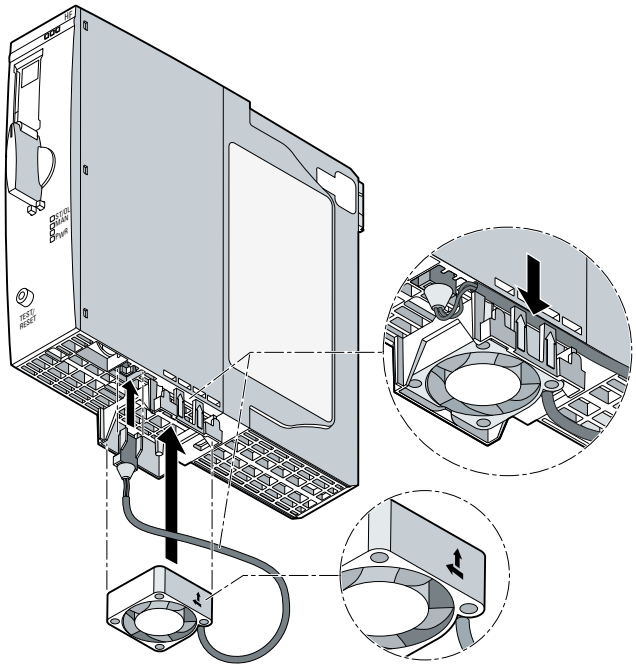


8.15 Mounting/disassembly of motor starters

8.15.1 Mounting the fan

Procedure

Proceed as follows to mount a fan on a SIMATIC ET 200SP motor starter:

1. Slide the fan onto the motor starter until you can hear the fan engage.
   Observe the blowing direction of the fan when mounting. The air stream must be directed to the inside of the motor starter. The correct blowing direction is indicated by arrows on the bottom of the fan.
2. Insert the connection plug into the opening above the fan.

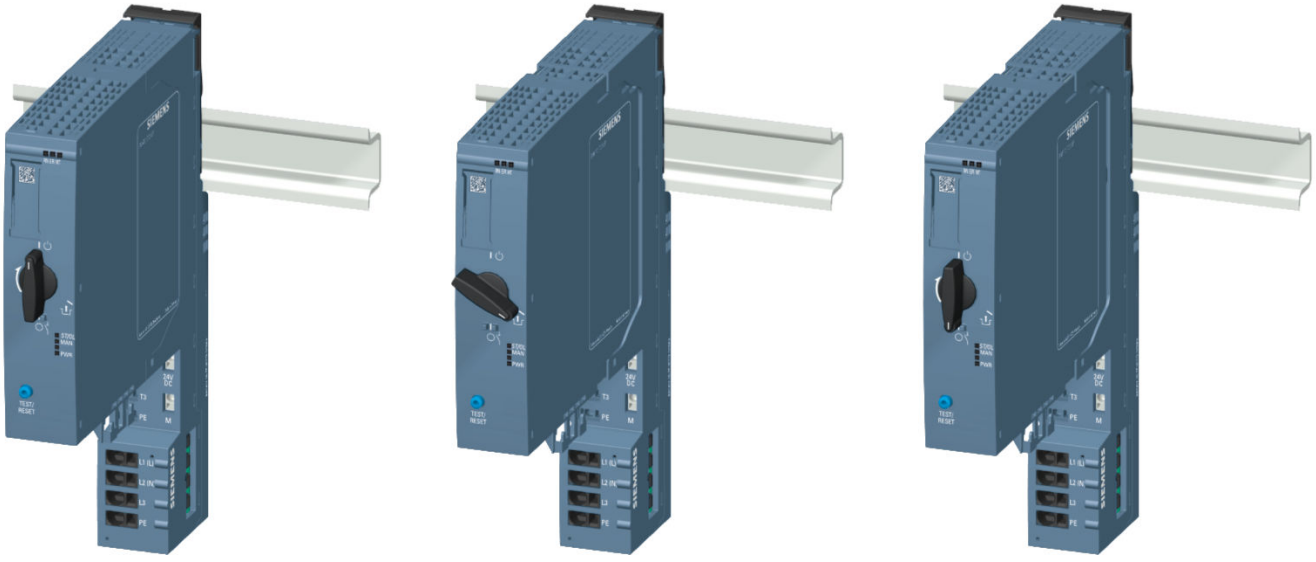
3. Secure the fan cable to the fixing eyes on the right-hand side of the fan cover.

NOTE

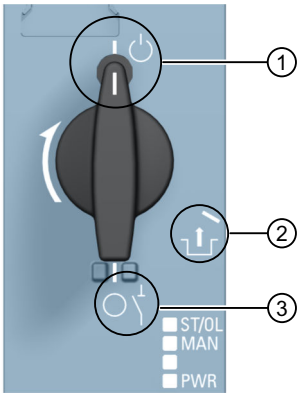
Specified ambient temperatures are not reached if the fan is incorrectly installed
If you do not observe the blowing direction of the fan when mounting, the specified ambient temperatures will not be reached. The device shuts down prematurely due to excessively high temperature.

8.15.2 Mounting/disassembly of motor starters

Procedure



⚠ CAUTION



Protection against electrostatic charge
When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

To assemble a SIMATIC ET 200SP motor starter, proceed as follows:

- Position the mechanical interlock of the SIMATIC ET 200SP motor starter in the assembly/disassembly position ②
- Place the SIMATIC ET 200SP motor starter onto the BaseUnit.
- Turn the mechanical interlock clockwise to the parking position ③
- Turn the mechanical interlock counterclockwise to the operating position (= end position) ①

① ② ③

① Operating position/READY
The motor starter is firmly locked in the BaseUnit, and all electrical contacts are connected.

② Assembly/disassembly position
All electrical contacts are open, and you can use the SIMATIC ET 200SP motor starter in the BaseUnit, or you can remove it from the BaseUnit.

③ Parking position/OFF
In this position, you cannot remove the SIMATIC ET 200SP motor starter from the BaseUnit, but all electrical contacts are open. In addition, you can open the locking lever on the mechanical rotary interlock in this position, and fix the position with a padlock (shackle diameter 3 mm). This ensures the isolating function in accordance with IEC 60947-1.
In the parking position, the motor starter counts as a disconnected element for the head module. During operation, the parking position is therefore a hot swapping state. See also Removing and inserting I/O modules/motor starters (hot swapping) (Page 314)

NOTE

Parking position/OFF

This position is only permissible for maintenance purposes and not for continuous operation. In this position, dust protection and mechanical durability are not ensured.
If you do not use the motor starter for an extended period, remove it and attach the BU cover (3RK1908-1CA00-0BP0).

Mount the touch protection cover for the infeed bus on the last BaseUnit.

NOTE

Touch protection cover for the infeed bus

You will find out how to mount the touch protection cover of the infeed bus on a SIMATIC ET 200SP motor starter in chapter "Mounting the cover for the 500 V AC infeed bus (Page 143)".

To connect the assembly, mount the server module after the last BaseUnit.

NOTE

Server module

You can find out how to assemble/disassemble the server module in chapter "Installing the server module (Page 141)".

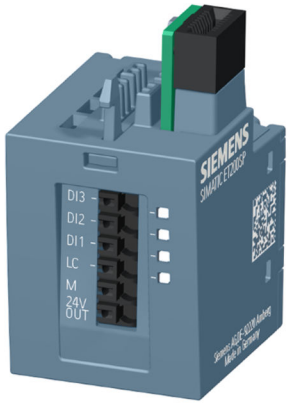
NOTE

Removing the motor starter

You will find out how to remove the motor starter in chapter "Replacing a motor starter (Page 320)".

8.15.3 3DI/LC module

Introduction



The optional 3DI/LC module with three inputs and one further LC input can be connected to the motor starter. The status of the inputs of the 3DI/LC module can be seen via the process image input (PII) of the motor starter.

NOTE

The 3DI/LC module can be used for the motor starter and the fail-safe motor starter.

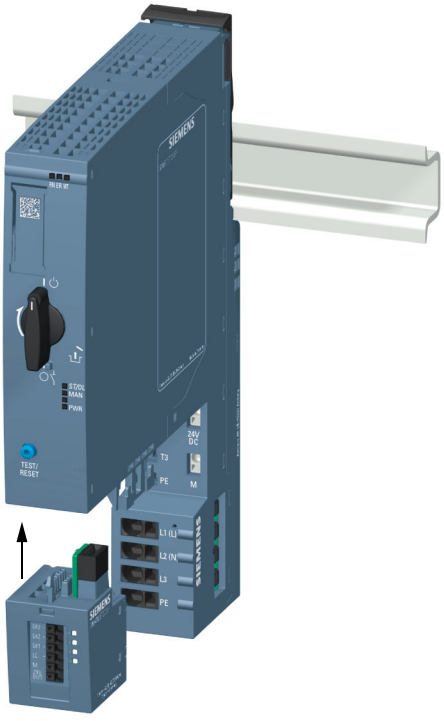
The input actions can be parameterized. For reasons of operational safety, the LC input is permanently set to manual local mode. For example, by parameterizing the inputs DI1 - DI3 with motor CLOCKWISE or motor COUNTER-CLOCKWISE, you can control the motor in manual local mode.

The figure below shows the 3DI/LC module.

Assembly

⚠ WARNING

Risk of injury from automatic restart
When you mount the the 3DI/LC module, the motor starter can switch on autonomously if an ON command (DI1 to DI3) is active. This can result in property damage or serious injury caused by connected devices that are automatically started up.
Revoke the ON commands at DI1 to DI3 before mounting the 3DI/LC module.



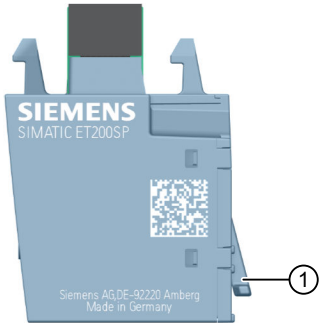
Proceed as follows to mount a 3DI/LC module onto a motor starter:

1. Wire the 3DI/LC module according to the connection diagram.

NOTE

Connecting the 3DI/LC module
You will find out how to connect the 3DI/LC module in chapter "Connecting the 3DI/LC module for the motor starter (Page 172)".

2. Slide the 3DI/LC module into the motor starter until the 3DI/LC module engages.



The figure below shows a motor starter with a mounted 3DI/LC module.

Disassembly

Proceed as follows to remove a 3DI/LC module from a motor starter:

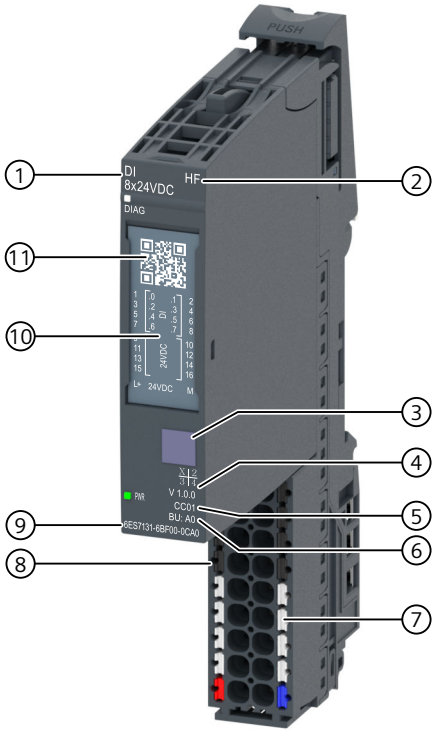
1. Push the release lever on the rear of the 3DI/LC module.

① Release lever

2. Remove the 3DI/LC module from the motor starter while pressing the release lever.

8.16 Labeling ET 200SP

8.16.1 Factory markings



Introduction

For better orientation, the ET 200SP is equipped with various markings ex factory, which help in the configuration and connection of the modules.

Factory markings

- Module labeling
- Color coding of module type
  - Digital input modules: white
  - Digital output modules: black
  - Analog input modules: light blue
  - Analog output modules: dark blue
  - Technology module: turquoise
  - Communication module: light gray
  - Special module: mint green
- Module information
  - Functional version of the module, e.g. "X/2/3/4" (= functional version 1)
  - Functional status in plain text
  - Firmware version of the module at delivery, e.g. "V1.0.0"
  - Information on the ID link
  - Color code for usable color identification label, e.g. "CC0"
  - Usable BaseUnit type, e.g. "BU: A0"
- Color coding of the potential group
  - Opening the potential group: Light-colored terminal box and light-colored mounting rail release button
  - Further conduction of the potential group: Dark-colored terminal box and dark-colored mounting rail release button
- Color coding of the spring releases
  - Process terminals: gray, white
  - AUX terminals: turquoise
  - Additional terminals: red, blue

– Terminals for self-assembling voltage buses P1, P2: red, blue

① Module type and name
② Function class
③ Color coding of module type
④ Function and firmware version
⑤ Color code for selection of the color coding labels
⑥ BU type
⑦ Color coding of the spring releases (by group)
⑧ Color coding of the potential group
⑨ Article number
⑩ Wiring diagram
⑪ 2D matrix code/ID link

Figure 1-99 Factory markings

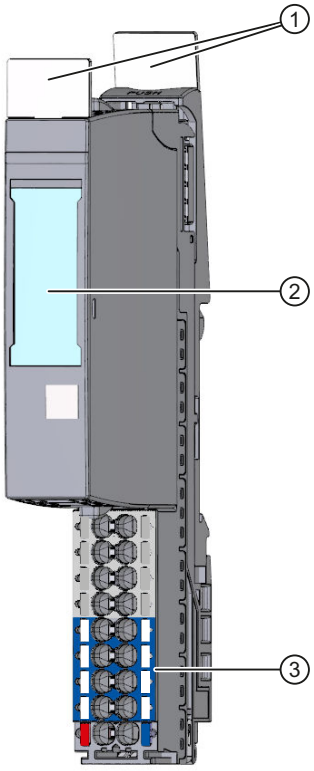
8.16.2 Optional markings

Introduction

In addition to the factory markings, there are also other options for labeling and/or marking terminals, BaseUnits and I/O modules for the ET 200SP distributed I/O system.

Optional markings

Color identification labels
The color identification labels are module-specific labels for color coding the potentials of the I/O modules. A color code (e.g. 01) is printed on each color identification label and I/O module. The color code allows you to read which color identification label is required for the terminals of the associated BaseUnit directly from the I/O module.



The following versions of color coded labels are available:

- Module-specific color combinations for the process terminals (see the device manuals I/O modules (https://support.automation.siemens.com/WW/view/en/55679691/133300)). The different colors have the following meaning: Gray = input or output signal, red = potential +, blue = ground.
- For the AUX terminals in the colors yellow-green, blue or red
- For the add-on terminals in the colors blue-red
- For the potential distributor modules (see manual BaseUnits (https://support.automation.siemens.com/WW/view/en/59753521)):
  - For PotDis-BaseUnit PotDis-BU-P1/x-R: red
    For PotDis-BaseUnit PotDis-BU-P2/x-B: blue
  - For PotDis-TB-P1-R: red or gray
    For PotDis-TB-P2-B: blue or gray
    For PotDis-TB-BR-W: depending on application, yellow/green, blue, red or gray
    For PotDis-TB-n.c.-G: gray

Reference identification labels
The reference identification labels (in accordance with EN 81346) can be inserted onto each CPU/interface module, BusAdapter, BaseUnit, I/O module and PotDis-TerminalBlock. This makes it possible to create a fixed assignment between the reference identification label of the BaseUnit and the I/O module/PotDis-TerminalBlock.

With the standard plotter setting, the reference identification label is suitable for automatic labeling with E-CAD systems.

Labeling strips
The labeling strips can be inserted in the CPU/interface module, I/O module and BU cover and allow identification of the ET 200SP distributed I/O system. The labeling strips can be ordered on a roll for thermal transfer printers or as DIN A4 format sheets for laser printers.

① Reference identification labels
② Labeling strips
③ Color identification labels

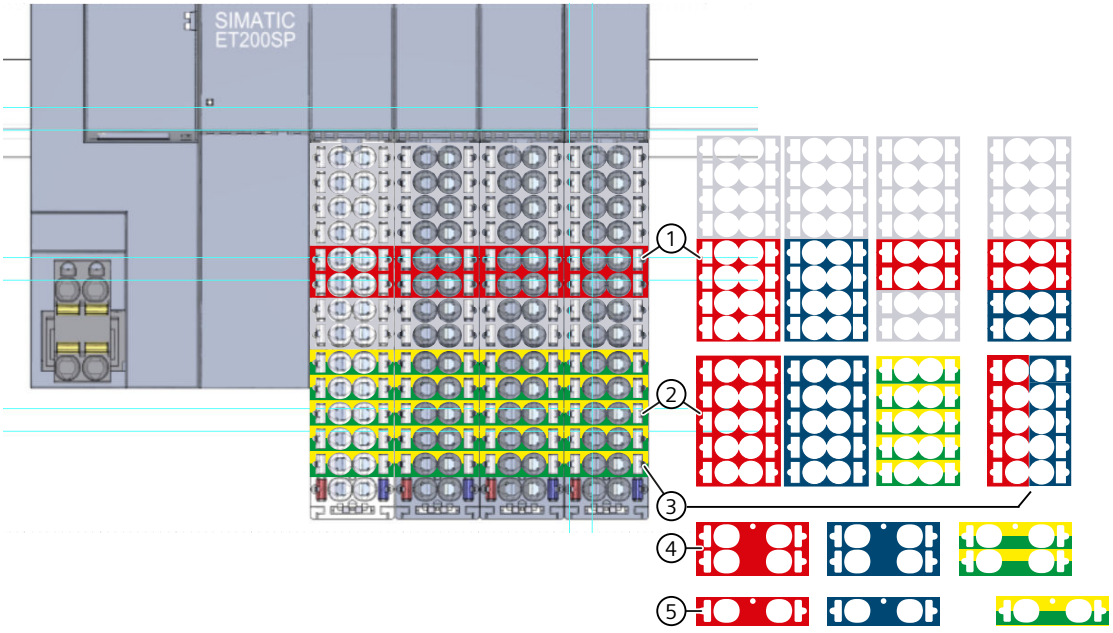
Figure 1-100 Optional markings

8.16.3 Applying color identification labels

Requirements

The BaseUnits must not be wired when you apply the color identification labels.

Required tools



3 mm screwdriver (only for removing the color identification labels)

Applying color identification labels

Press the color-coded labels into the terminal box of the BaseUnit.

NOTE

To remove the color-coded labels, you must first disconnect the wiring on the BaseUnit and then carefully lever the color-coded labels out of the holder using a screwdriver.

① Module-specific color identification labels (15 mm) for the process terminals. You can find additional information in the I/O Module (https://support.automation.siemens.com/WW/view/en/55679691/133300) manual.
② Color identification labels (15 mm) for the 10 AUX terminals
③ Color identification label (15 mm) for the 10 add-on terminals
④ Color identification labels (20 mm) for the 4 AUX terminals
⑤ Color identification labels (20 mm) for the 2 AUX terminals

Figure 1-101 Applying color identification labels (example)

NOTICE

AUX bus as PE bar
If you use an AUX bus as a protective conductor (PE), attach the yellow-green color identification labels to the AUX terminals.
If you stop using the AUX terminals as a protective conductor bar, remove the yellow-green color identification labels and make sure that the system is still protected.

NOTICE

Supply of incorrect potential possible
Check that the color-coded labels/wiring is correct before commissioning the plant.

8.16.4 Applying labeling strips

Procedure

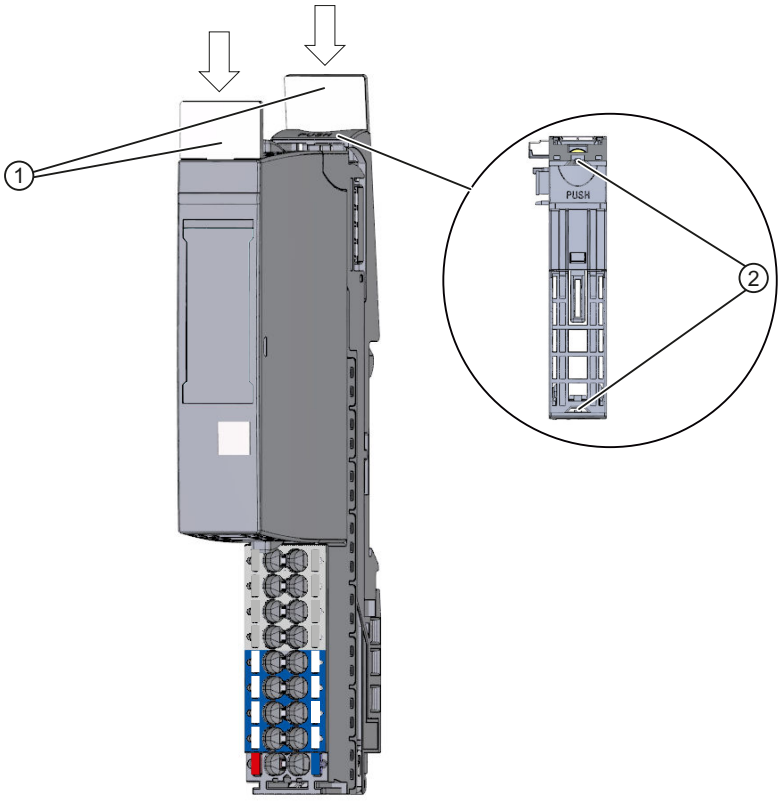
Watch video sequence: "Labeling"
(https://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to install a labeling strip:

1. Label the strips.
2. Insert the labeling strip into the interface module or I/O module.

8.16.5 Applying reference identification labels

Procedure



Watch video sequence: "Labeling"
(https://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to install a reference identification label:

1. Break off the reference identification labels from the sheet.
2. Insert the reference identification labels into the opening on the CPU/interface module, BusAdapter, BaseUnit, I/O module and PotDis-TerminalBlock. The insertion opening is located on top of the BaseUnit or the I/O module/PotDis-TerminalBlock.

NOTE

Reference identification label
The printable side of the reference identification label must be facing forward.

① Reference identification labels
② Opening for label

Figure 1-102 Applying reference identification labels

Configuring

9

9.1 Configuring ET 200SP

Introduction

The ET 200SP distributed I/O system is configured and assigned parameters with STEP 7 (CPU/interface module, I/O modules, motor starter and server module) or using configuration software of a third-party manufacturer (interface module, I/O modules, motor starter and server module).

"**Configuring**" is understood to mean the arranging, setup and networking of devices and modules within the device view or network view. STEP 7 graphically represents modules and racks. Just like "real" module racks, the device view allows the insertion of a defined number of modules.

When the modules are inserted, STEP 7 automatically assigns the addresses and a unique hardware identifier (HW identifier). You can change the addresses later. The hardware identifiers cannot be changed.

When the automation system is started, the CPU/interface module compares the configured planned configuration with the system's actual configuration. You can make parameter settings to control the response of the CPU/interface module to errors in the hardware configuration.

"**Parameterizing**" the components used signifies setting their properties. During parameter assignment, the hardware parameters are set and the settings for data exchange are made:

- Properties of the modules to which parameters can be assigned
- Settings for data exchange between components

STEP 7 compiles the hardware configuration (result of "configuring" and "assigning parameters") and downloads it to the CPU/interface module. The CPU/interface module then connects to the configured components and transfers their configuration and parameters. Modules can be replaced very easily because STEP 7 transfers the configuration and parameters when a new module is inserted.

Requirements for configuration of the CPU

Table 1-357 Requirement for installing the CPU

Configuration software	Requirements	Installation information
CPU 151xSP-1 PN: STEP 7 (TIA Portal) as of V13 Update 3	• PROFINET IO • PROFIBUS DP (optional): With the communication module CM DP	STEP 7 online help
CPU 151xSP F-1 PN: STEP 7 (TIA Portal) as of V13 SP1		
CPU 151xSP-1PN (as of FW version V1.8), CPU 151xSP F-1 PN (as of FW version V1.8): STEP 7 (TIA Portal) as of V13 SP1 Update 4		

Configuring a motor starter

You configure SIMATIC ET 200SP motor starters in exactly the same way as the I/O modules of the ET 200SP distributed I/O system. The GSD files can be used with STEP 7 V5.5 SP4 and higher, and TIA Portal V13 SP1 and higher.

Configuring ET 200SP

See the STEP 7 online help or the documentation of the configuration software manufacturer.

NOTE

For I/O modules that are installed on a BaseUnit BU..D (light-colored BaseUnit), you always have to set the parameter "Potential group" to "Enable new potential group". If you do not set this parameter correctly, the CPU/interface module goes to STOP and generates a parameter error.

NOTE

For PROFIBUS with configuration via GSD file

In the configuration software, you must set for the BU covers whether these are on a light-colored or dark-colored BaseUnit.

Configuring F-modules with a GSD file

If you want to configure F-modules with a GSD file, you need S7-FCT in order to calculate the F_iPar_CRC and assign the PROFIsafe addresses. Additional information can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109763833).

You can find S7-FCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

See also

GSD file (https://support.industry.siemens.com/cs/ww/en/view/57138621)

9.2 Configuring the CPU

9.2.1 Reading out the configuration

Introduction

When a connection to a CPU present in the configuration exists, you use the "Hardware detection" function to read out the configuration of this CPU, including centrally configured modules, and apply it to your project. You do not need to manually configure the CPU and the centrally present modules, as the physical configuration is read out automatically.

If you have already configured a CPU and the centrally present modules and you want to load the current configuration and parameters in a new project, it is advisable to use the "Upload device as new station" function. For additional information about this function, refer to section Backing up and restoring the CPU configuration (Page 298).

Procedure for reading out an existing configuration

1. Create a new project and configure an "Unspecified CPU".

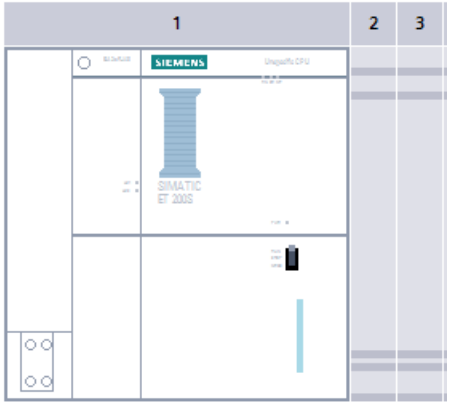


Figure 1-103 Unspecified CPU in the device view

2. In the device view (or in the network view), select the "Hardware detection" command in the "Online" menu.

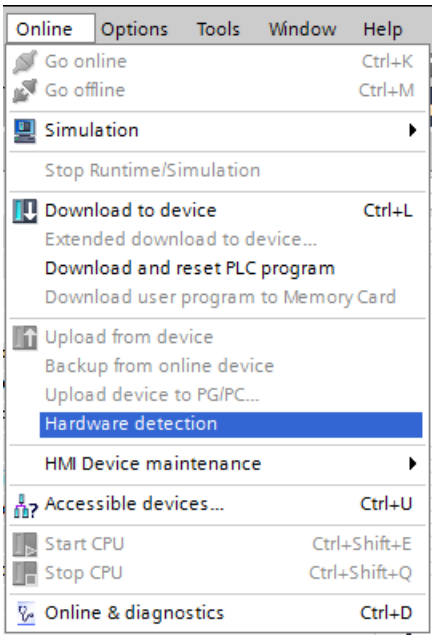

Figure 1-104 Hardware detection in the Online menu

You can also double-click the CPU and click "Detect" in the message.

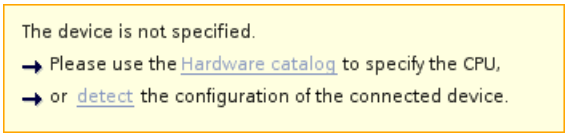

Figure 1-105 Hardware detection message in the device view

3. In the "Hardware detection for PLC_x" dialog box, click "Refresh". Then, select the CPU and the PG/PC interface and click "Detect".
STEP 7 downloads the hardware configuration including the modules from the CPU to your project.

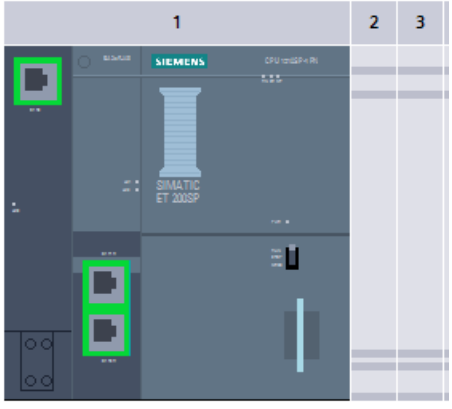

Figure 1-106 Result of the hardware detection in the device view

STEP 7 assigns a valid default parameter assignment for all modules. You can change the parameter assignment subsequently.

NOTE
If you want to go online after the hardware detection, you have to first download the detected configuration to the CPU; otherwise, an error may occur due to inconsistent configurations.

Properties of central modules

The properties of the CPUs have special significance for system behavior. You can set the following for a CPU using STEP 7:

- Startup behavior
- Parameter assignment of the interface(s), for example, IP address, subnet mask
- Web server, e.g. activation, user administration, and languages
- OPC UA server
- Global Security Certificate Manager
- Cycle times, e.g. maximum cycle time
- System and clock memory
- Protection level for access protection with assigned password parameter
- Time and day settings (daylight saving/standard)

The properties that can be set and the corresponding value ranges are specified by STEP 7. Fields that cannot be edited are grayed out.

Reference

Information about the individual settings can be found in the online help and in the manuals of the relevant CPUs.

9.2.2 Addressing

Introduction

In order to address the automation components or I/O modules, they have to have unique addresses. The following section explains the various address areas.

I/O address

I/O addresses (input/output addresses) are required in the user program to read inputs and set outputs.

STEP 7 automatically assigns input and output addresses when you connect the modules. Each module uses a continuous area in the input and/or output addresses corresponding to its volume of input and output data.

Module	Rack	Slot	I address	Q addr...	Type	Order no.	Firmware
PLC_1	0	1			CPU 1510SP-1 PN	6ES7 510-1DJ00-0AB0	V1.6
PROFINET-Schnittstelle_1	0	1 X1			PROFINET interface		
Port_1	0	1 X1 P1			Port		
Port_2	0	1 X1 P2			Port		
Port_3	0	1 X1 P3			Port		
	0	1 X2					
DI 4x120..230VAC ST_1	0	2	0		DI 4x120..230VAC ST	6ES7 131-6FD00-0BB1	V1.0
DQ 8x24VDC/0.5A ST_1	0	3		0	DQ 8x24VDC/0.5A ST	6ES7 132-6BF00-0BA0	V1.1
AI 8xRTD/TC 2-wire HF_1	0	4	1...16		AI 8xRTD/TC 2-wire ...	6ES7 134-6JF00-0CA1	V2.0
AQ 2xU/I HF_1	0	5		1...4	AQ 2xU/I HF	6ES7 135-6HB00-0CA1	V1.0

Figure 1-107 Example with input / output addresses from STEP 7

STEP 7 assigns the address areas of the modules by default to the process image partition 0 ("Automatic updating"). This process image partition is updated in the main cycle of the CPU.

Device address (e.g. Ethernet address)

Device addresses are addresses of programmable modules with interfaces to a subnet (e.g., IP address or PROFIBUS address). They are required to address the various devices on a subnet, for example, to download a user program.

Hardware identifier

STEP 7 automatically assigns a hardware identifier to identify and address modules and submodules. You use the hardware identifier in the case of diagnostic messages or operations, for example, to identify a defective module or the module addressed.

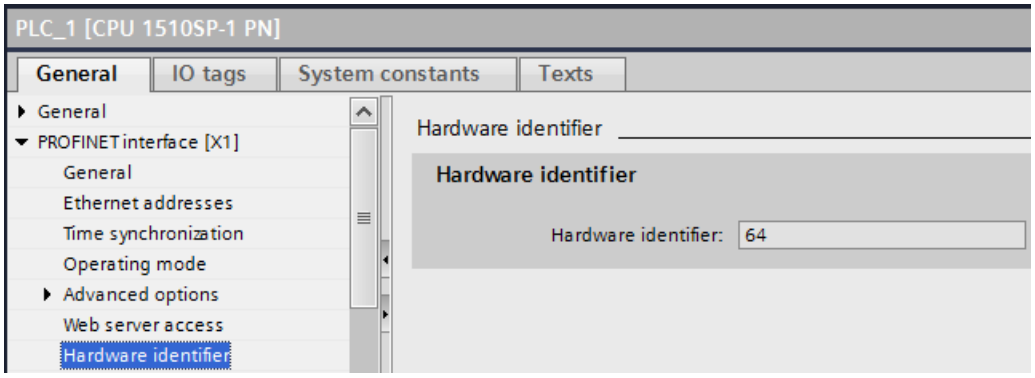

Figure 1-108 Example of a hardware identifier from STEP 7

In the "System constants" tab, you will find all hardware identifiers and their symbolic names (of the hardware identifier) for the selected module.

You can also find the hardware identifiers and names for all modules of a device in the default tag table of the "System constants" tab.

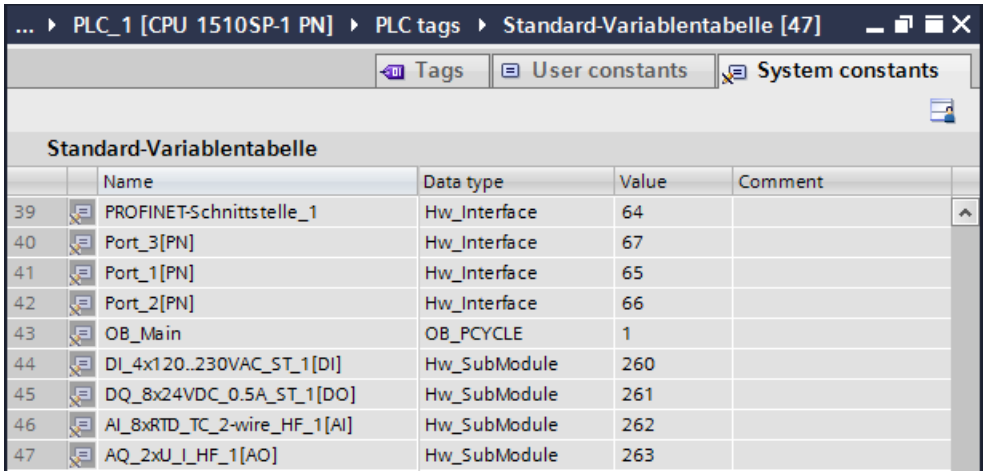

Figure 1-109 Example of an excerpt from a default tag table in STEP 7

9.2.3 Process images and process image partitions

9.2.3.1 Process image - overview

Process image of the inputs and outputs

The process image input and output is an image of the signal states. The CPU transfers the values from the input and output modules to the process image input and output. At the start of the cyclic program, the CPU transfers the process image output as a signal state to the output modules. Afterwards the CPU transfers the signal states of the input modules to the process image input.

Advantages of the process image

The process image accesses a consistent image of the process signals during cyclic program execution. If a signal state at an input module changes during program processing, the signal state is retained in the process image. The CPU does not update the process image until the next cycle.

You can only assign the addresses of a module to a single process image partition.

32 process image partitions

By means of process image partitions, the CPU synchronizes the updated inputs/outputs of particular modules with defined user program sections.

The overall process image is subdivided into up to 32 process image partitions (PIP).

The CPU updates PIP 0 in each program cycle (automatic update) and assigns it to OB 1.

You can assign the process image partitions PIP 1 to PIP 31 to the other OBs during configuration of the input/output modules in STEP 7.

After the OB has been started, the CPU updates the assigned process image partition for inputs and reads in the process signals. At the end of the OB the CPU writes the outputs of the assigned process image partition directly to the peripheral outputs without having to wait for the completion of the cyclic program processing.

9.2.3.2 Automatically updating process image partitions

You can assign one process image partition to each organization block. In this case, the user program automatically updates the process image partition. The exceptions are PIP 0 and isochronous OBs.

Updating the process image partition

The process image partition is divided into two parts:

- Process image partition of the inputs (PIPI)
- Process image partition of the outputs (PIPQ)

The CPU always updates/reads the process image partition of the inputs (PIPI) before processing of the associated OB. The CPU outputs the process image of the outputs (PIPQ) at the end of the OB.

The figure below illustrates the updating of the process image partitions.

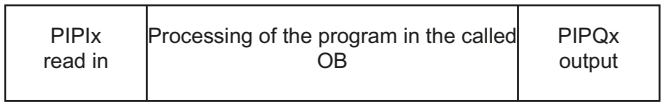

Figure 1-110 Updating process image partitions

9.2.3.3 Update process image partitions in the user program

Requirements

Alternatively, you can also use the following instructions for the process image update:

- "UPDAT_PI" instruction
- "UPDAT_PO" instruction

You will find the instructions in STEP 7 in the "Instructions" task card under "Extended instructions". The instructions can be called from any point in the program.

Requirements for updating process image partitions with the "UPDAT_PI" and "UPDAT_PO" instructions:

- The process image partitions must not be assigned to any OB. This means the process image partitions are not automatically updated.

NOTE

Update of PPI 0

PIP 0 (automatic update) cannot be updated with the "UPDAT_PI" and "UPDAT_PO" instructions.

UPDAT_PI: updates the process image partition of the inputs

With this instruction you read the signal states from the input modules into the process image partition of the inputs (PIPI).

UPDAT_PO: updates the process image partition of the outputs

With this instruction you transfer the process image partition of the outputs to the output modules.

Synchronous cycle interrupt OB

In the synchronous cycle interrupt OBs, you use the "SYNC_PI" and "SYNC_PO" operations to update the process image partitions of the operations. For additional information on the synchronous cycle interrupt OBs, refer to the STEP 7 Online Help.

Direct I/O access to the inputs and outputs of the module

As an alternative to access via the process image, you can directly access the I/O (write and read access) if this is necessary for program-related reasons. Direct (write) access to I/O also writes to the process image. This prevents a subsequent output of the process image from again overwriting the value written by direct access.

Reference

Additional information on process image partitions is available in the function manual, Cycle and response times (https://support.automation.siemens.com/WW/view/en/59193558).

9.3 Configuring the interface module

Configuring

Read the STEP 7 online help and/or the documentation of the configuration software manufacturer when configuring the interface module.

The F-destination address is saved permanently on the coding element of the ET 200SP fail-safe modules. Fail-safe motor starters do not need an F-destination address or a coding element.

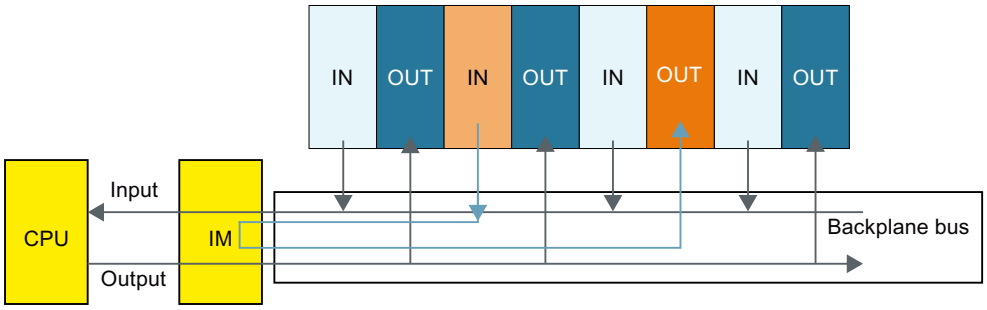
NOTE
The supply voltage L+ must be applied to the F-module when the F-destination address is assigned.

NOTE
Note the following in conjunction with configuration control:
Before you can use configuration control together with F-modules, you must assign the F-destination address to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the F-destination address, refer to the SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126) Programming and Operating Manual and to the online help for the *S7 Configuration Pack*.

9.4 Module-to-Module Communication (MtM)

Introduction



Module-to-Module Communication (MtM) offers the following advantages:

- Improved performance during transmission of data by bypassing the IO controller.
- Deterministic cycle times
- Cost-effective, high-performance solutions for applications where the performance of a specific technology module is not required.

Module-to-Module Communication (MtM)

Module-to-Module Communication (MtM) enables direct exchange of data between specific IO modules within a station via the interface module. This enables you to move small and/or time-critical tasks to the IO module. You achieve better performance while reducing the load on the CPU.

With Module-to-Module Communication (MtM), the interface module copies the input data of an IO module directly to a different IO module via the ET 200SP backplane bus. The IO module (data sink) carries out application-specific processing of the data.

You configure the data source and data sink for Module-to-Module Communication (MtM) in the hardware configuration of the respective output module. Programming of the user program is **not** required in the variant for Module-to-Module Communication (MtM).

NOTE

The preparation of the input data in the output module (mapping) and the output of the data to the outputs are application- and technology-specific.
Example: The DQ 4x24VDC/2A HS digital output module supports

- the application cam control with Module-to-Module Communication (MtM) under the designation DQ 4x24VDC/2A HS **MCC MtM**

Additional information can be found in the manuals of the corresponding IO modules. An overview of which I/O modules support module-to-module communication (MtM) can be found in the ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/73021864)Product Information. Information on which interface module supports module-to-module communication (MtM) can be found in the Equipment Manuals of the interface modules.

See also

FAQ "How do you parameterize module-to-module communication?" (https://support.industry.siemens.com/cs/ww/en/view/109767618)

9.5 Value status

Introduction

Value status (QI, quality information) refers to status information of I/O channels that is made available to the user program via the process image input (PII). However, since the value status is partly derived from the diagnostics, there may be a time delay between the occurrence of the error and the message depending on the diagnostics.

Each bit of the value status is assigned to a channel and provides information about the validity of the process value of the respective channel (1 = no errors on the channel of the I/O module, 0 = value is bad).

The assignment of the value status bytes in the process image input depends on the module used. Detailed information can be found in the manual for the relevant I/O module.

Summary: Possible cause for value status = 0:

- A channel has an error (overflow/underflow, wire break, short-circuit, etc.)
- The supply voltage L+ is missing at the terminals or is not sufficient
- A channel has been deactivated
- PROFIenergy pause is activated

  If you set the "Continue working" mode, the value status remains = 1.
- Outputs are inactive (value status = 0: Module not plugged in. Value status is generated via interface module in distributed mode)

If, for example, there is a wire break at an input but the wire break diagnostics is disabled, the value status of the channel is set to "0" but no diagnostics is triggered. Diagnostics is only also triggered if the wire break diagnostics is enabled.

With module-by-module channel diagnostics of the I/O modules, these also map the value status module-by-module. The channels are mapped here module-by-module to value status = 0 or value status = 1.

Which interface modules support the value status?

The following interface modules support the value status:

- IM 155-6 PN ST
- IM 155-6 PN HS
- IM 155-6 PN/2 HF
- IM 155-6 PN/3 HF
- IM 155-6 PN R1
- IM 155-6 MF HF
- IM 155-6 DP HF

Which I/O modules support the value status?

The I/O modules of the function classes Standard, High Feature and High Speed support the value status.

Activating value status

Table 1-358 Value status depending on the respective configuration variant

	STEP 7 TIA (integrated I/O module; PROFINET and PROFIBUS)	**STEP 7 HSP (PROFINET and PROFIBUS)**	**GSD PROFINET (can be integrated in STEP 7 TIA and STEP 7)**	**GSD PROFIBUS (can be integrated in STEP 7 TIA and STEP 7)**
Select the I/O module from the hardware catalog and activate the value status	There is only **one** entry in the hardware catalog for each I/O module. In the configuration dialog, you can set whether the I/O module is to be operated with or without value status.		There are **multiple** entries in the hardware catalog for each I/O module. On selection in the hardware catalog, it must be determined whether the I/O module is to be operated with or without value status. The value status can be recognized by the suffix "QI".	
Input substitute value behavior	The "Input values with module failure" parameter (input substitute value behavior) is available for CPUs 1500 from FW version V2.0. If the I/O module is configured with value status, the parameter is fixed at "Input value 0". Input substitute value behavior can only be configured if no value status has been configured.	The "Input values with module failure" parameter is not available.	The "Input values with module failure" parameter (input substitute value behavior) is available for CPUs 1500 from FW version V2.0. The same restrictions apply as for I/O modules integrated in STEP 7 TIA. Due to the limited capabilities of the GSD, however, these are not locked in the GSD interface.	The "Input values with module failure" parameter is not available.

Special features for modules with MSI/MSO

The meaning of the value status of the basic submodule is described above. The value status of the MSI/MSO submodules are copies of the base submodule. The value status of the MSI/MSO submodules remains set to "0" as long as the base submodule has not been configured.

9.6 Substitute value behavior

The substitute value behavior in the ET 200SP distributed I/O system is executed by the IO controller for each IO module.

The respective output behaves according to its configured substitute value behavior:

- Current-free/voltage-free
- Output substitute value
- Keep last value

The substitute value behavior is triggered in the following cases:

- STOP controller
- Controller failure (connection interrupted)
- Deactivating the IO device
- Station stop, for example, due to:
  - Missing server module
  - At least one I/O module is installed on an incorrect BaseUnit
  - With the ET 200SP R1, the pulling of the server module during ongoing operation does not lead to a station stop

The "current-free/voltage-free" behavior takes effect in the following cases:

- IO module firmware update
- Reset to factory settings
- With enabled configuration control without presence of a valid control data record (DS196)
- Incorrectly configured module
- Module with incorrect parameter assignment

NOTE

Reducing a configuration

If you reduce the configuration of the ET 200SP distributed I/O system and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value behavior. This applies until the supply voltage is switched off at the interface module.

Basics of program execution

10

10.1 Events and OBs

Start events

The table below gives an overview of the possible event sources for start events and their OBs.

Table 1-359 Start events

Types of event sources	Possible priorities (default priority)	Possible OB numbers	Default system response [1]	Number of OBs
Starting [2]	1	100, ≥ 123	Ignore	0 to 100
Cyclic program [2]	1	1, ≥ 123	Ignore	0 to 100
Time-of-day interrupt [2]	2 to 24 (2)	10 to 17, ≥ 123	Not applicable	0 to 20
Time-delay interrupt [2]	2 to 24 (3)	20 to 23, ≥ 123	Not applicable	0 to 20
Cyclic interrupt [2]	2 to 24 (8 to 17, frequency dependent)	30 to 38, ≥ 123	Not applicable	0 to 20
Hardware interrupt [2]	2 to 26 (18)	40 to 47, ≥ 123	Ignore	0 to 50
Status interrupt	2 to 24 (4)	55	Ignore	0 or 1
Update interrupt	2 to 24 (4)	56	Ignore	0 or 1
Manufacturer-specific or profile-specific interrupt	2 to 24 (4)	57	Ignore	0 or 1
Synchronous cycle interrupt	16 to 26 (21)	61 to 64, ≥ 123	Ignore	0 to 2
Time error [3]	22	80	Ignore	0 or 1
Cycle monitoring time exceeded once			STOP	
Diagnostics interrupt	2 to 26 (5)	82	Ignore	0 or 1
Pull/plug interrupt for modules	2 to 26 (6)	83	Ignore	0 or 1
Rack error	2 to 26 (6)	86	Ignore	0 or 1
MC-servo [4]	17 to 26 (25)	91	Not applicable	0 or 1
MC-PreServo [4]	17 to 26 (25)	67	Not applicable	0 or 1
MC-PostServo [4]	17 to 26 (25)	95	Not applicable	0 or 1

1) If you have not configured the OB.

2) In the case of these event sources, besides the permanently assigned OB numbers (see column: Possible OB numbers) in STEP 7 you can assign OB numbers from the range ≥ 123.

3) If the maximum cycle time has been exceeded twice within one cycle, the CPU always assumes the STOP state, regardless of whether you have configured OB 80.

4) You will find more information on these event sources and the starting behavior in the S7-1500 Motion Control function manual.

Types of event sources	Possible priorities (default priority)	Possible OB numbers	Default system response [1]	Number of OBs
MC-Interpolator [4]	16 to 26 (24)	92	Not applicable	0 or 1
Programming error (only for global error handling)	2 to 26 (7)	121	STOP	0 or 1
I/O access error (only for global error handling)	2 to 26 (7)	122	Ignore	0 or 1

1) If you have not configured the OB.

2) In the case of these event sources, besides the permanently assigned OB numbers (see column: Possible OB numbers) in STEP 7 you can assign OB numbers from the range ≥ 123.

3) If the maximum cycle time has been exceeded twice within one cycle, the CPU always assumes the STOP state, regardless of whether you have configured OB 80.

4) You will find more information on these event sources and the starting behavior in the S7-1500 Motion Control function manual.

Response to triggers

The occurrence of a start event results in the following reaction:

- If the event comes from an event source to which you have assigned an OB, this event triggers the execution of the assigned OB. The event enters the queue according to its priority.
- If the event comes from an event source to which you have not assigned an OB, the CPU executes the default system reaction.

NOTE

Some event sources, such as startup, pull/plug, exist even if you do not configure them.

Assignment between event source and OBs

The type of OB determines where you make the assignment between OB and event source:

- With hardware interrupts and isochronous mode interrupts, the assignment is made during the configuration of the hardware or when the OB is created.
- In the case of the MC-Servo, MC-PreServo, MC-PostServo and MC-Interpolator, STEP 7 automatically assigns the OBs 91/92 as soon as you add a technology object.
- For all other types of OB, the assignment is made when the OB is created, where applicable after you have configured the event source.

For hardware interrupts, you can change an assignment which has already been made during runtime with the instructions ATTACH and DETACH. In this case, only the actually effective assignment changes, and not the configured assignment. The configured assignment takes effect after loading, and at startup.

The CPU ignores hardware interrupts to which you did not assign an OB in your configuration or which occur after the DETACH instruction. The CPU does not check whether an OB is assigned to this event when an event arrives, but only prior to the actual processing of the hardware interrupt.

OB priority and runtime behavior

If you have assigned an OB to the event, the OB has the priority of the event. The CPU supports the priority classes 1 (lowest priority) to 26 (highest priority). The following items are essential to the processing of an event:

- Calling and processing of the assigned OB
- The update of the process image partition of the assigned OB

The user program processes the OBs exclusively on a priority basis. This means the program processes the OB with the highest priority first when multiple OB requests occur at the same time. If an event occurs that has a higher priority than the currently active OB, this OB is interrupted. The user program processes events of the same priority in order of occurrence.

NOTE

Communication

Communication (e.g. test functions with the PG) always works permanently with the priority 15. So as not to unnecessarily prolong program runtime in the case of time-critical applications, these OBs should not be interrupted by communication. Assign a priority >15 for these OBs.

Programming guideline and programming style guide

The programming guideline gives you many recommendations and tips for optimal programming of the S7-1500 automation system.

The programming guidelines described in the programming style guide help you to create a uniform program code. You can better maintain and reuse the uniform program code. This allows you to detect or avoid errors early on, for example, through compilers.

You can find the programming guideline and programming style guide on the Internet (https://support.industry.siemens.com/cs/us/en/view/81318674).

Reference

You can find more information on organization blocks in the STEP 7 online help.

10.2 Asynchronous instructions

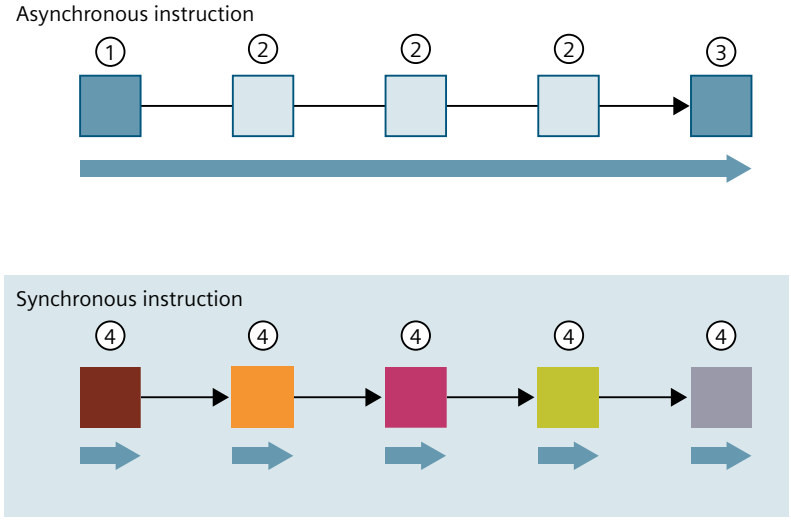
Introduction

In program processing, a differentiation is made between synchronous and asynchronous instructions.

The "synchronous" and "asynchronous" properties relate to the temporal relationship between the call and execution of the instruction.

The following applies to synchronous instructions: When the call of a synchronous instruction is ended, the execution is also ended.

This is different in the case of asynchronous instructions: When the call of an asynchronous instruction is ended, the execution of the asynchronous instruction is not necessarily ended



yet. This means the execution of an asynchronous instruction can extend over multiple calls. The CPU processes asynchronous instructions in parallel with the cyclic user program. Asynchronous instructions generate jobs in the CPU for their processing.

Asynchronous instructions are usually instructions for transferring data (data records for modules, communication data, diagnostics data).

Difference between synchronous/asynchronous instructions

The figure below shows the difference between processing an asynchronous instruction and processing a synchronous instruction. In this figure the asynchronous instruction is called five times before the execution is completed, for example, a data record is completely transferred.

With a synchronous instruction, the instruction is fully executed in each call.

① First call of the asynchronous instruction, start of processing
② Intermediate call of asynchronous instruction, continuation of processing
③ Last call of the asynchronous instruction, termination of processing
④ The synchronous instruction is completely processed at each call
➡ Duration of the complete processing

Figure 1-111 Difference between synchronous and asynchronous instructions

Parallel processing of asynchronous instruction jobs

A CPU can process several asynchronous instruction jobs in parallel. The CPU processes the jobs in parallel under the following conditions:

- Several asynchronous instruction jobs are called at the same time.
- The maximum number of concurrently running jobs for the instruction is not exceeded.

The figure below shows the parallel processing of two jobs of the instruction WRREC. The two instructions are processed in parallel for a specific period here.

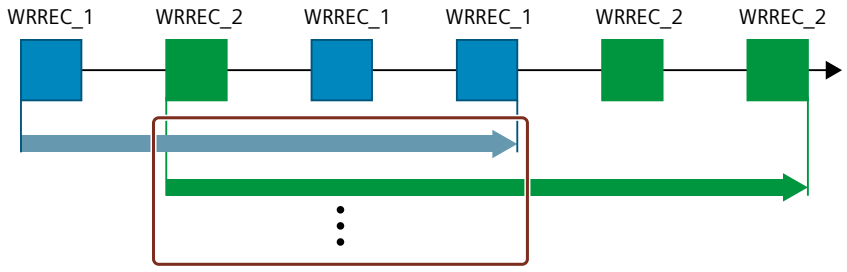


Figure 1-112 Parallel processing of the asynchronous instruction WRREC

NOTE

Dependencies between asynchronous instructions

The call sequence in the user program may differ from the processing sequence of the asynchronous instructions. This can lead to problems with dependencies between asynchronous instructions.

Solution: To ensure correct timing of processing, use the status outputs of the asynchronous instructions in a sequencer. If an asynchronous instruction is finished and this is acknowledged via the parameter DONE, then only the next asynchronous instruction should start.

Example: For the RecipeImport and RecipeExport recipe functions, you need a CSV file for the recipe data. If you use the same CSV file for import and export, then the two asynchronous statements are dependent on each other. Link the status of the DONE parameter of the RecipeImport instruction in a sequencer to the next step where the RecipeExport is executed. The link thus ensures correct processing.

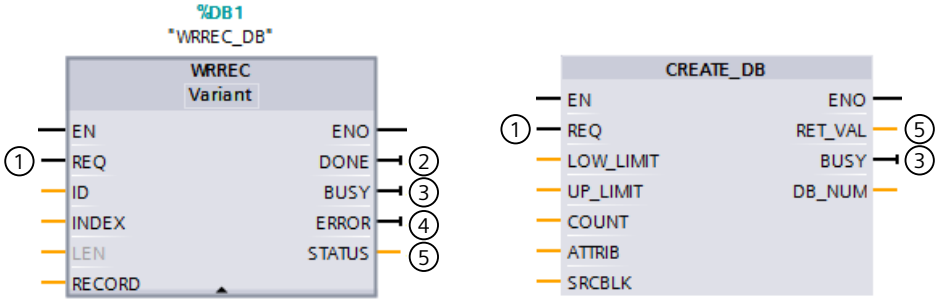
Assignment of call to job of the instruction

To execute an instruction over multiple calls, the CPU must be able to uniquely assign a subsequent call to a running job of the instruction.

To assign a call to a job, the CPU uses one of the following two mechanisms, depending on the type of the instruction:

- Via the instance data block of the instruction (in the case of the "SFB" type)
- The input parameters of the instruction identifying the job. These input parameters must match in each call during processing of the asynchronous instruction.
  Example: A "Create_DB" instruction job is identified by the input parameters LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB and SRCBLK.

  The following table shows which instruction you can identify with which input parameters.



Instruction	Job is identified by
DPSYC_FR	LADDR, GROUP, MODE
D_ACT_DP	LADDR
DPNRM_DG	LADDR
WR_DPARM	LADDR, RECNUM
WR_REC	LADDR, RECNUM

Instruction	Job is identified by
RD_REC	LADDR, RECNUM
CREATE_DB	LOW_LIMIT, UP_LIMIT, COUNT, ATTRIB, SRCBLK
READ_DBL	SRCBLK, DSTBLK
WRIT_DBL	SRCBLK, DSTBLK
RD_DPARA	LADDR, RECNUM
DP_TOPOL	DP_ID

Status of an asynchronous instruction

An asynchronous instruction shows its status via the block parameters STATUS/RET_VAL and BUSY. Many asynchronous instructions also use the block parameters DONE and ERROR.

The figure below shows the two asynchronous instructions WRREC and CREATE_DB.

① The input parameter REQ starts the job to execute the asynchronous instruction.

② The output parameter DONE indicates that the job was completed without error.

③ The output parameter BUSY indicates whether the job is currently being processed. When BUSY =1, a resource is assigned for the asynchronous instruction. If BUSY = 0, then the resource is free.

④ The output parameter ERROR indicates that an error has occurred.

⑤ The output parameter STATUS/RET_VAL provides information on the status of the job execution. The output parameter STATUS/RET_VAL receives the error information after the occurrence of an error.

Figure 1-113 Block parameters of asynchronous instructions using the instructions WRREC and CREATE_DB as examples.

Summary

The table below provides you with an overview of the relationships described above. It shows in particular the possible values of the output parameters if processing is not completed after a call.

NOTE

Following every call, you must evaluate the relevant output parameters in your program.

Relationship between REQ, STATUS/RET_VAL, BUSY and DONE during a "running" job.

Seq. no. of the call	Type of call	REQ	STATUS/RET_VAL	BUSY	DONE	ERROR
1	First call	1	W#16#7001	1	0	0
			Error code (for example, W#16#80C3 for lack of resources)	0	0	1
2 to (n - 1)	Intermediate call	Not relevant	W#16#7002	1	0	0
n	Last call	Not relevant	W#16#0000, if no errors have occurred.	0	1	0
			Error code, if errors have occurred	0	0	1

Consumption of resources

Asynchronous instructions occupy resources in the CPU while they are being processed. The resources are limited depending on the type of CPU and instruction; the CPU can only process a maximum number of asynchronous instruction jobs simultaneously. The resources are available again after a job has been successfully completed or processed with an error.

Example: For the RDREC instruction, a 1512SP-1 PN CPU can process up to 20 jobs in parallel.

If the maximum number of concurrent jobs for an instruction is exceeded, the following occurs:

- The instruction returns error code 80C3 (lack of resources) in the block parameter STATUS.
- The CPU does not execute the job until a resource becomes free again.

NOTE

Lower-level asynchronous instructions

Several asynchronous instructions use one or more lower-level asynchronous instructions for their processing. This dependence is shown in the tables below.

Please note that, if there are several lower-level instructions, typically only one lower-level instruction is occupied at one time.

11 Protection

11.1 Overview of the protection functions

Advantages and customer benefits of protection functions

The protection functions listed protect your investments from unauthorized access and manipulation, helping to secure plant availability.

Protection functions

To set up secure networks, the SIMATIC S7-1500 automation system offers an integrated security concept:

Table 1-368 Overview of protection functions

Protection function	Description
Integrity protection	The CPUs come with an integrity protection function as standard. This helps detect any manipulations: • In the engineering data on the SIMATIC Memory Card; see also information on the integrity protection of the SIMATIC Memory Card as of CPU FW version V3.1 in the next section • At the engineering data during data transfer between TIA Portal and CPU • At the engineering data during data transfer between HMI system and CPU • At the encrypted firmware
Protection of confidential configuration data	Protection of confidential CPU configuration data
Central user administration (as of firmware version 4.0)	Connection of a central server (UMC server) that is responsible for the administration and authentication of users. The central user management (User Management Component) allows the management of user groups and users independent of TIA Portal for comprehensive automation solutions.
Local user management (as of FW version V3.1)	Improved management of users, roles, and CPU function rights (User Management & Access Control, UMAC). You can used the local user management in the editor to manage all project users along with their rights (e.g. access rights) for project users and roles in the TIA Portal.
Access protection (up to FW version V3.0)	Protection against unauthorized configuration changes using authorization levels
Know-how protection	Protection against unauthorized access and modifications to algorithms with password protection
Copy protection	Protection against duplication of programs by linking individual blocks to the serial number of the original memory card on the SIMATIC Memory Card
Protection by locking the CPU/interface module	Protection against unauthorized access by locking the front cover with a seal or a lock

You can find more information about security mechanisms of the SIMATIC automation systems in the Security with SIMATIC S7 controllers (https://support.industry.siemens.com/cs/ww/en/view/77431846) document and in the Communication (https://support.industry.siemens.com/cs/us/en/view/59192925) Function Manual.

Integrity protection of the SIMATIC Memory Card, as of CPU FW version V3.1 or higher

With CPUs as of FW version V3.1, the integrity protection of the SIMATIC Memory Card depends on the password for protecting confidential configuration data that you assigned during the configuration of the CPU. This results in the following changes when using SIMATIC Memory Cards:

- To transfer a CPU to a card reader/USB memory device via drag and drop:
  For CPUs as of FW version V3.1, you need to enter the password of the CPU you want to use with the SIMATIC Memory Card. If you enter an incorrect password, the CPU will not start up after power on and will report the contents of the SIMATIC Memory Card as faulty.
- To insert a CPU from a card reader/USB memory device:
  In order to be able to verify the integrity of the included configuration in STEP 7, you must enter the password of the CPU from which the project was loaded. In this case, STEP 7 checks the data on the SIMATIC Memory Card and reports potential damage.
  Entering the password is optional. If you do not want to use the integrity check, you do not need to enter the password (restore project).

For CPUs with FW version V4.1 or higher, you can select whether you also want to protect the entire configuration of the CPU in addition to protecting the configuration data. The data is stored encrypted in the SIMATIC.S7S folder on the SIMATIC Memory Card and can only be decrypted with the password for protection of confidential configuration data.
If you revoke or add the setting for protection of all data, the contents of the SIMATIC.S7S folder on the SIMATIC Memory Card will be deleted at the next download to the CPU. Other files, such as recipes or backup files on the SIMATIC Memory Card, are not deleted. After the deletion, the CPU performs a restart.

You can find information on the folder structure on the SIMATIC Memory Card in the Structure and Use of the CPU Memory
(https://support.industry.siemens.com/cs/ww/en/view/59193101) Function Manual.

Secure communication

There is an increasing need to transfer data to external computers in encrypted form via Intranet or public networks.

SIMATIC S7-1500 CPUs and ET 200 CPUs with firmware version 2.0 and higher support the Internet PKI (RFC 5280) with STEP 7 as of V14. This makes the configuration and the operation of Secure Communication possible, for example:

- Hypertext Transfer Protocol Secure (HTTPS)
- Secure Open User Communication
- Secure Communication with OPC UA

A public key infrastructure (PKI) can issue, distribute and check digital certificates. For S7-1500 CPUs, you create certificates for various applications in the CPU properties in STEP 7, for example: TLS certificates for Secure Open User Communication, web server certificates, OPC UA certificates.

With STEP 7 and WinCC as of version V17, SIMATIC S7-1500 CPUs and ET 200 CPUs as of firmware version 2.9 support innovated and standardized secure PG/PC and HMI communication – referred to as Secure PG/HMI communication for short.

Further measures for protecting the CPU

The following measures additionally increase the protection against unauthorized access to functions and data of the ET 200SP CPU from external sources and via the network:

- Deactivation of the Web server
- Deactivation of the OPC UA server (you can find additional information on the security mechanisms for OPC UA server in the Communication (https://support.industry.siemens.com/cs/us/en/view/59192925) Function Manual)
- Deactivation of the time synchronization via an NTP Server
- Deactivation of the PUT/GET communication
- Deactivation of SNMP

When you use the Web server, protect your S7-1500 automation system against unauthorized access:

- By setting password-protected access rights for specific users in the user administration.
- By using the pre-set option "Permit access only via HTTPS".
  The option allows access to the web server only with the secure hypertext transmission protocol HTTPS.

When you use the OPC UA server, protect your S7-1500 automation system against unauthorized access:

- By not setting up OPC UA server access for the "Anonymous" user.
- By disabling the "Automatically accept client certificates during runtime" option.

Security functions in communications processors

Communications processors support security functions, such as access protection using a firewall, protection against data manipulation using VPN, FTPS, HTTPS, SNMPv3, and secure NTP.

More information

You can find more information on the protection functions described in the STEP 7 online help.

Siemens products and solutions are only one element of a comprehensive industrial security concept. Observe the additional information on Industrial Security (http://www.siemens.com/industrialsecurity).

11.2 Protection of confidential configuration data

As of STEP 7 V17, you have the option of assigning a password for protecting confidential configuration data of the respective CPU. This refers to data such as private keys that are required for the proper functioning of certificate-based protocols.

You can find detailed information on protecting confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual.

NOTE

Replacement part scenario
Replacing the CPU in a replacement part scenario has an impact on the password for protection of confidential configuration data. When you replace the CPU, observe the rules for the replacement part scenario in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual.

11.3 Local user management

11.3.1 Useful information on local user management and access control

As of TIA Portal version V19 and CPU firmware version V3.1, ET 200SP CPUs have an improved way to manage users, roles and CPU function rights (User Management & Access Control, UMAC).

For HMI devices, authentication is not possible via either local or central users (TIA Portal V19/V20).

Starting from the above-named versions, you manage all project users along with their rights (e.g. access rights) for CPUs in the project in the editor for users and roles of the project in TIA Portal:

- To manage users along with their rights, for example, to control access rights, navigate to the "Security Settings > Users and roles" area in the project tree.

TIA Portal saves the assignment of the function rights of a CPU to user-defined roles and the assignment of these roles to users for each CPU. There are no system-defined roles with predefined function rights for CPUs.

The user management becomes effective in the respective CPUs after the configuration is loaded. Each CPU then "knows" who may access which service and execute specific functions.

This new approach is also referred to hereinafter as "local user management and access control".

NOTE

Support of central users and groups for CPU function rights
UMC (User Management Component) can also be used to manage users centrally in TIA Portal. With this component, you manage central users and groups on connected UMC servers, e.g. by connecting an MS Active Directory. The authentication is then implemented using UMC. The central user management for CPU-specific function rights via UMC is currently supported as of TIA Portal V20 and CPU FW version V4.0 (see Useful information on central user management and access control (Page 234)).

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution - but only if you ensure the confidentiality of the user-relevant information.

In addition, the rules for industrial cybersecurity must be observed, for example the security concept "Defense in Depth", in particular the remarks on plant security and hardening measures.

Detailed information is available in the section Industrial cybersecurity (Page 33).

Users, roles and function rights

Users and roles were also managed in the predecessor versions of TIA Portal under "Security settings > Users and roles". In addition to the existing user management options, e.g. for HMI devices, you can also manage all CPU function rights in this editor starting from TIA Portal Version V19.

The CPU function rights are effective in runtime, which is why you will find these rights on the "Runtime rights" tab in the editor for users and roles. For each CPU in the project, there is a section with all CPU function rights to choose from - separated according to CPU services such as PG/HMI communication (engineering access, access levels), web server and OPC UA.

Besides the user management for projects, additional user management possibilities were available for the web server and OPC UA server in the CPU properties (static user management for CPUs up to FW version V3.0):

- Users for the OPC UA server (authentication)
- Users for the web server (authentication and access control)

These additional user management possibilities have been integrated in the local user management in the project tree as of TIA Portal V19 and CPU FW version V3.1.

Introduction to local user management and access control

For CPUs up to firmware version V3.0, users were managed under the respective CPU properties for the individual services "Web server", "OPC UA", etc. Web server users were managed in the "Web server" area, OPC UA users in the "OPC UA" area.

To restrict access by the PG/HMI to the CPU using access levels, you assigned passwords for the respective levels. With this approach, for example, HMI accesses could be permitted without restriction, but write accesses could be made dependent on the knowledge of a password. You assigned the passwords for the different access levels in the "Protection & Security" area of the CPU properties. As a result, the access protection always applied to groups having the corresponding passwords and not to individual users.

With the introduction of local user management and access control in TIA Portal version V19, you use the "Security settings > Users and roles" area in the project tree in TIA Portal to manage all users, together with their roles and function rights, of a CPU. This same holds for the access protection for engineering/HMI accesses, which as of TIA Portal version V19 no longer relies on access levels with password protection by default but instead on the user management.

You can find more information on the new access protection here (Page 228).

As already introduced, e.g. for engineering rights, you use role assignments for combining individual function rights. In a further step, you assign the roles to individual users. The "Assigned rights" tab lists all function rights that were assigned to a user via roles and that the user can exercise for the corresponding CPU.

The following figure shows an example of the available and activated function rights of a CPU. At least one user must have full access to the CPU. Otherwise, the configuration cannot be compiled. A role with full access to the CPU must be created for this.

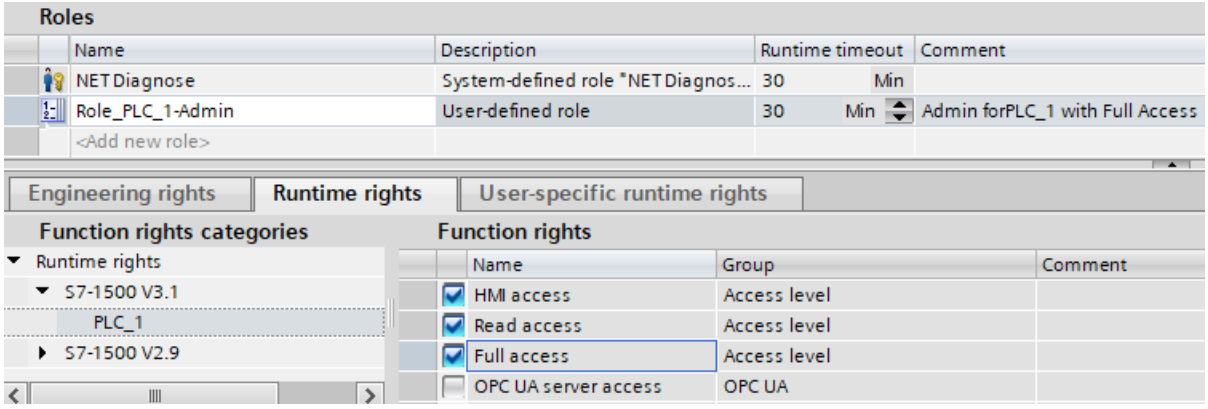

Figure 1-114 Assigning function rights of a CPU to a role

The following figure shows the assignment of the role with full access to a user ("Admin").

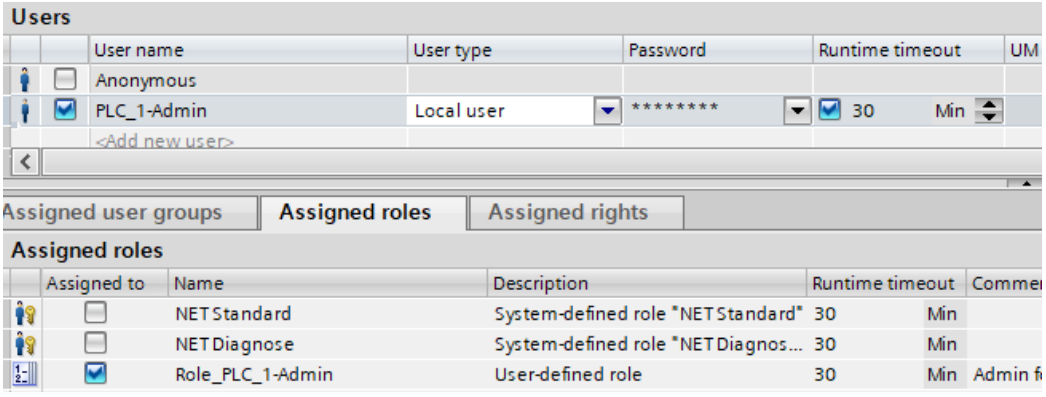

Figure 1-115 Assigning a role to a user

Requirement

CPU parameter assignment: To make use of users, roles and function rights for a CPU, the "Enable access control" option must be selected in the "Protection & Security > Access control" area.

In the "Configuration of user management" area, the "Local user management" option is preset, whereby the users are loaded to the CPU.

If you select the option "Central user management", you have to add additional parameters such as the UMC server address and server ID (see Useful information on central user management and access control (Page 234)).

No project protection is required for the user management.

Default characteristics

The "Enable access control" option is selected by default for the access control. Users can be configured with their assigned passwords and their roles and function rights.

Loading to device

If you want to download changes to the user configuration in RUN mode, the hardware configuration in the CPU and in the STEP 7 project must be unchanged. Otherwise, a transition to STOP is required to download the user configuration together with the changed hardware configuration.

Save your STEP 7 project and then configure only the desired changes in the user configuration. Load your project into the CPU.

Changes to the access rights for the "Anonymous" user can only be loaded in STOP mode.

A fail-safe ET 200SP CPU may only load a user to whom the runtime right "Full access including fail-safe" is assigned. Otherwise, STEP 7 displays an error message when loading the configuration.

Explanations of the options for the user management download (Load preview):

- If you select the option "Keep online user management data", the local user management is not downloaded to the CPU.
- If you select the option "Download all user management data (reset to project)", all passwords changed online via WebAPI are deleted. After the download, the configured local user data is valid.
- If you select the option "Update user management data, but keep online passwords" and have not changed existing user names, the passwords changed online via WebAPI are retained. Only changes to function rights and/or roles take effect. Newly configured users are downloaded with their settings and deleted users are no longer available after the download to the CPU.
  If you have changed a user name in the project and assigned a password to this user in the project, this setting takes effect after the download. The previously valid user name with the password changed online is deleted during the download.

Runtime timeout

You can set a runtime timeout for both the role and the user in "Security settings > Users and roles".

For an ET 200SP CPU, these settings are taken into account by the various services as follows:

- By means of the Web API you can, for example, create a web page or application that takes the settings for the runtime timeout into account. Standard web pages do not take the settings for the runtime timeout into account and use the default value.
- The other services (PG/HMI communication and OPC UA server) do not use the runtime timeout; the logged-in user is not logged out after the set time.

11.3.2 Advantages of local user management and access control

The advantages of the new local user management for CPUs and the changes associated with it are described in the following.

Quick activation/deactivation of local user management

The options for user management can be found in the "Protection & Security > Access control" area:

- Access control disabled: Every user has full access to all functions with the exception of the GDS Push function for the online transfer of certificates.

  ⚠ WARNING

  Disabled access control carries the risk of unauthorized access and thus the risk of personal injury and property damage.
  Only use this setting in a protected environment, such as during commissioning.

- Access control enabled: The configured users with their assigned roles and associated function rights become effective after the configuration is loaded.

Access protection for PG/HMI accesses, now with user authentication

While it was possible to assign passwords for access levels for CPUs with firmware versions <V3.1, you can configure users with corresponding function rights for the current CPUs. This means that PG/HMI accesses can be authenticated in the same way as OPC UA and web server accesses.

Everything in one place

Irrespective of the service for which you configure users, roles and rights for a CPU: you manage the data at the same place.

All users, no matter if you're managing their engineering rights for the project or their local runtime rights for individual CPUs in the project, can be found in the editor for users and roles in the project tree.

Powerful password functions

- Support for compliance with complexity rules for password creation:
  Already at the password creation stage, you can have the TIA Portal check for compliance with complexity rules, such as rules on password length, uppercase/lowercase letters (project tree, "Security settings > Settings" area).
  The complexity rules are also saved in the CPU when the user management is loaded. When the password is changed online, the CPU identifies and applies these rules. This prevents a user from overriding the complexity rules set by the configuration engineer and assigning an insecure password.

- The period of validity of passwords can be set:
  To ensure that a user does not have access to the CPU with a compromised password for an unlimited time, you can assign a period of validity. The time remaining until the validity expires is then displayed on login so that each user can change his password in time.

Loading the user management during operation

As of firmware version V3.1, certain security-relevant configuration data can be loaded in both STOP and RUN system state. This means that loading the hardware configuration does not necessarily lead to a CPU STOP.

You can load the following changes in both STOP and RUN system state (Download to device > Hardware configuration):

- Local user management extended/changed
- TIA Portal-configured certificates modified
- Syslog configuration changed

If you made additional changes to the hardware configuration (for example, modules added, parameters changed, etc.), then the CPU automatically requests the STOP state before loading the configuration.

Therefore, when loading just one user with modified roles/function rights to the CPU, for example, this process does not require the CPU to be in STOP state.

The load preview dialog contains a security area where you can define how the CPU is to handle user data changed since the last load operation (not when loading for the first time). This allows changes to user data (e.g. password changes during runtime) to be retained.

Loading the device as a new station - with user data

If you load a previously configured CPU into a new project, for example, because you do not have the original project, the user data is also loaded into the project and is available for further editing of the CPU settings.

Changing passwords during operation

You can use the web server API to write an application that any user can use to change his password at runtime, provided that the original password was entered correctly and the new password complies with the configured password policy.

Requirement: You have enabled access control for the CPU.

A use can change his own password at any time, even if the password has expired. If the password has expired, the user must change his password. Login is not possible with an expired password.

API methods used:

- Api.ChangePassword
- Api.GetPasswordPolicy

You can find more information about the API methods in the Web server Function Manual (https://support.industry.siemens.com/cs/us/en/view/59193560).

NOTE

Passwords changed at runtime take precedence over loaded passwords
If you changed your password during operation and subsequently load your project, the password assigned during runtime takes precedence over the password set in the project (default setting).
If you want to overwrite the passwords changed during runtime by loading the project, you must select the option "Load all user management data (reset to project data)". In this case, **all** passwords changed during runtime will be lost.

11.3.3 From access level to user function rights

The implementation of access protection for CPUs with the new local user management is described in the following.

Access levels as function rights

While access could only be controlled using passwords for ET 200SP CPUs up to FW version V3.0, you create corresponding users and roles with the necessary function rights for access control for CPUs as of FW version V3.1. The assignment between access level and the associated function right results from the already known access levels:

- Users who are to have full access must have a role with the function right "Full access".
  A CPU configuration can only be compiled and loaded if at least one user has the function right "Full access" or "Full access incl. fail-safe".
- Users who are to have read access must have a role with the function right "Read access".
- Users who are to have HMI access must have a role with the function right "HMI access".

If a user has none of these function rights, that user also has no access to the CPU.

The hierarchical organization of the access levels also remains the same for the corresponding function rights:

- A user with full access also has the function rights "Read access" and "HMI access".
- A user with read access also has the function right "HMI access".

NOTE

Compatibility of the "ENDIS_PW" instruction
The "ENDIS_PW" instruction can be used only to disable or enable passwords for protection levels. The "ENDIS_PW" instruction has no effect on assigned rights for users or roles.

Continued use of access levels

Even though the new local user management replaces the familiar access protection using corresponding function rights of individual users, the option exists to continue using this familiar access protection. This is required, for example, for HMI devices that only support access levels and are unable to make use of the new user management.

If you need configuration of an access level, for example, to grant access to an HMI device without user and password assignment, select the "Use legacy access control via access levels" option in the CPU properties.

NOTE

Users for OPC UA and web server

Independent of the access protection, you always have to configure the users for the web server and OPC UA server in the project tree ("Security settings > Users and roles" area).

Restrictions on continued use of the access levels

When using the "Legacy access control" option, you cannot select the access level directly in the table for setting the access levels. This selection can only be made for the new local user management in one way: using the access protection function rights of the "Anonymous" user.

The system creates the local "Anonymous" user in a project by default. With the help of this user, you define the behavior of the CPUs in the project for anyone who logs in without a user name and password. For security reasons, the anonymous user is deactivated and must be activated before use.

A link in the area where you set the access levels takes you to the editor for the required settings for the "Anonymous" user.

Examples:

- If the "Anonymous" user is deactivated or if the "Anonymous" user is activated and no function rights have been assigned to that user, then nobody can log in without a user name and password (corresponds to the access level "No access (complete protection")).
- If the "Anonymous" user is activated and the "Full access" function right for a CPU is assigned to that user via a corresponding role, the result of this setting is "No protection". You achieve the same effect with regard to access protection by setting "No access protection" in the "Protection & Security" area of the CPU properties.

Procedure

To activate the "Legacy access control" and set the required access level, follow these steps:

1. In the CPU properties, go to "Protection & Security > Access control".
2. Select the option "Enable access control" and, in addition, select the "Use legacy access control via access levels" check box.

   The access level selection cannot be used in this setting. You set the access level using the "Anonymous" user of the CPU.

   The "Anonymous" user is deactivated by default. This means that the resulting access level for users without a password is "No access (complete protection)" (default setting).
3. Go to "Security Settings > Users and roles" in the project tree.

4. Activate the "Anonymous" user, if you want to set a different access level than "No access (complete protection)". You can assign a role with function rights that grants access to the CPU without password input only to the activated "Anonymous" user.
5. You cannot assign function rights for a CPU directly to a user. You must first create a role: Therefore switch to the "Roles" tab and add a new role. Assign a meaningful name, e.g. "PLC1-Read-Access-Role". If you assign this role to a user, this user is to have read access to PLC1 during operation.
6. Assign the required function right for accessing the CPU named "PLC1" – in this case "Read access" – to the role "PLC1-Read-Access-Role".
7. Switch to the "Users" tab and assign the "PLC1-Read-Access-Role" role to the activated "Anonymous" user.

   Result: The "Anonymous" user has read access for PLC1. This means that the access level tables of the CPU "PLC1" in the project are preset to "Read access" (cannot be changed) and users who are not logged in only have read access.

   For full access, or full access including fail-safe, you must configure a password for the full access in the table for the access protection. Anyone performing an action at runtime requiring full access to the CPU, e.g. a project is to be loaded to the CPU, must legitimize themselves for this action with this password.

Tip

To make the user rights transparent, use meaningful names for the respective roles. You create users and roles for the entire project; you must select the function rights of a role individually for each CPU in the project. A descriptive name allows you to recognize immediately the CPUs for which read access is granted and the CPUs for which no access is granted (complete protection).

11.3.4 Information regarding compatibility

In the following sections, you will find information on the behavior of the CPUs with local user administration when, for example, modules are exchanged in STEP 7 and on further use of projects and programs without local user administration.

Replacement part scenario

If you replace a CPU with firmware version <V3.1 with a CPU with firmware version V3.1 or higher, the program stored on the memory card runs the same as on the original CPU. The behavior with regard to the configured access levels and the users for the OPC UA server and web server corresponds to the behavior of the predecessor CPU.

In this case, the "Change password function" via the web server API is not accepted by the CPU because the CPU has been configured for firmware version < V3.1 and has no local user management.

Exchanging the CPU (upgrade)

If you exchange a CPU (FW <V3.1) in the TIA Portal for a current CPU (FW V3.1 or higher), the configured user data is affected as follows:

- The user data of the OPC UA server and web server is transferred to the "Users and roles" editor in the project tree.

NOTICE
Passwords are lost when the CPU is exchanged Make sure that the passwords are available before exchanging the CPU. They must be entered again in the "Users and roles" editor. Otherwise, you have to assign new passwords and inform the users.

- A corresponding role is created for each web server user in the "Users and roles" editor; the name of the role contains the CPU name, the string "Web" and the already configured web server user name. In this way, you can easily restore the original rights for each CPU by assigning these roles in the "Users and roles" editor.
- The "OPC UA server access" role is created for each OPC UA server user.
- OPC UA guest access and the web server user "Everybody" are migrated to the "Anonymous" user.
- Each OPC UA user and each web server user is listed in the "User" column in the "Users and roles" editor. If there is a web server user and a OPC UA user with the same name, only one user is created.
- For a protected project, you can select which action the CPU performs:
  - Migrate users (requirement: you are logged in as a user with the right to manage users and roles and the right to edit the project/configuration)
  - Remove users
  - Cancel
- The "Legacy access control via access levels" option is set for access protection.

Exchanging the CPU (downgrade)

If you exchange a CPU (FW V3.1 or higher) in the TIA Portal for a predecessor CPU (< FW V3.1), the configured user data is affected as follows:

- The local user management is no longer available.
- Users with function rights for the web server are not transferred.
- Users of the OPC UA server remain with their user rights in the "Users and roles" editor. No users are moved to the "OPC UA" area of the CPU parameters.
- It is no longer possible for users to change passwords during runtime (via web server API).

11.4 Temporary account lock in case of brute force attacks

Useful information about brute force attacks

In a brute force attack, combinations of credentials (for example, user name and password) are systematically tried out with the aim of gaining access to a user account. Trying all options requires a lot of computing effort and time until a correct combination of user name and password is found.

Brute force attacks are particularly effective with weak or simple passwords.

Protecting a CPU from brute force attacks

As of STEP 7 V19, you can define password policies in the project tree under "Security settings" and thus ensure that strong passwords are assigned.

As of STEP 7 V21, there is the additional option of setting up a temporary account lock for CPUs as of FW version V4.1. You can only configure the temporary account lock for local user accounts. For central user accounts, protection against brute force attacks is configured directly on the UMC server.

You specify a maximum number of failed login attempts per time unit (monitoring time). If the specified number of failed login attempts is reached within the monitoring time, the period of the account lock (lockout duration) begins. During this time period, every login attempt is unsuccessful, regardless of whether the login data is correct or incorrect.

The indicator for hits ("correct password") is masked. The attacker does not receive any feedback about the temporary lock.

Configuring the locking of the local user account in STEP 7

To configure the locking of the local user account, follow these steps:

1. Place the required ET 200SP CPU from the hardware catalog in the network view.
2. Select the ET 200SP CPU in the network view of STEP 7.
3. In the Inspector window, navigate to "Properties > General > Protection & Security > Lockout of user account at runtime".
4. Select the "Lockout of the user account after failed login attempts" check box.
   The fields below become editable.
5. Edit the other fields according to the following options:
   - Max. failed login attempts:
     Define the number of failed login attempts that will be accepted by the ET 200SP CPU for a user account. If this number is reached within the monitoring time, the affected user account will be locked.
     Default: 5 failed login attempts
   - Monitoring time:
     Determine the time period between failed login attempts for a user account. The time period starts again after each failed login. If a valid login attempt is made within the time period, the time is reset.
     Default: 2 minutes

– Lockout duration:
  Determine the time period for which the user account should be locked. The time period starts when the set number of failed login attempts for a user account is reached within the monitoring time. The ET 200SP CPU refuses all login attempts during the lockout duration. If an unsuccessful login attempt is made during the lockout duration, the set lockout duration starts again.
  Default: 2 minutes

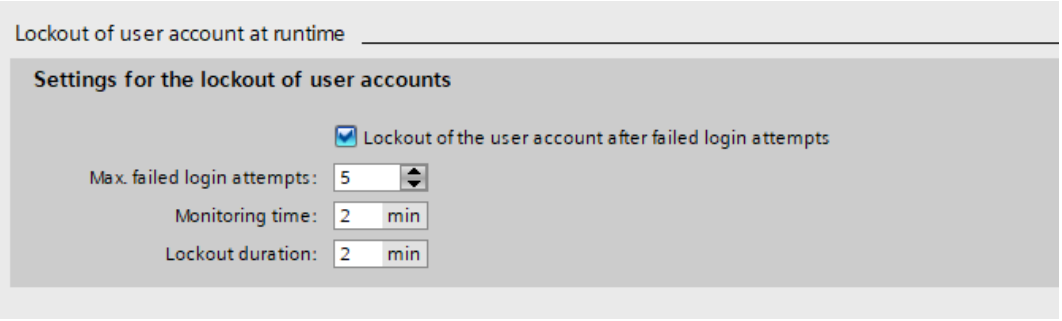

Figure 1-116 Configure the locking of the user account during runtime

6. Download the configuration to the ET 200SP CPU.

Result: You have configured the settings for lockout of user accounts and downloaded them to the ET 200SP CPU.

The following figure shows an example of the procedure for locking a user account. A maximum number of 4 incorrect login attempts was set here.

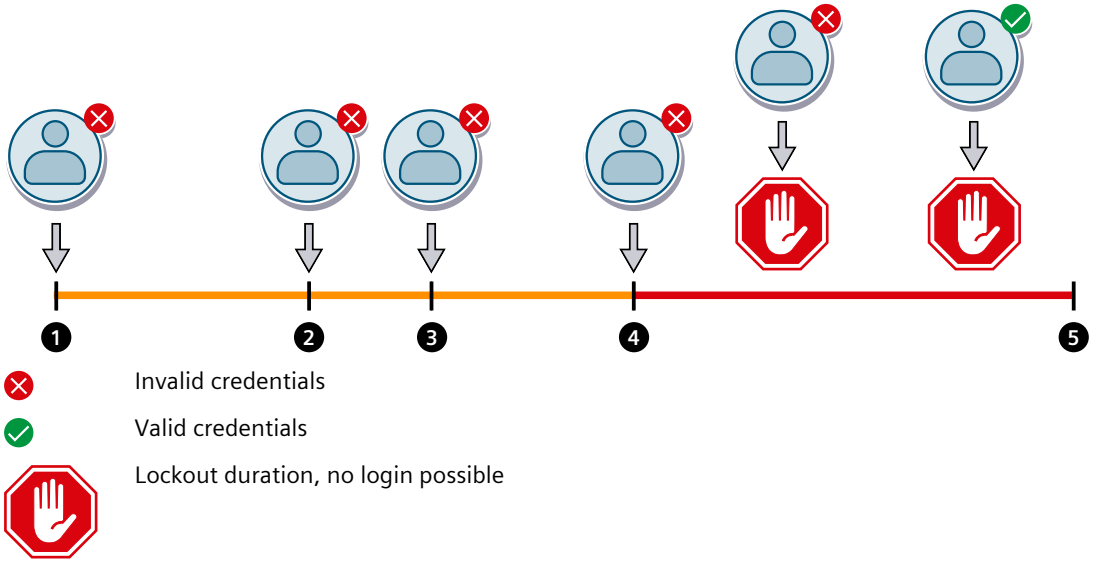

Figure 1-117 Sequence in the event of failed login attempts on an ET 200SP CPU

1. Failed login attempt no. 1:
   The set monitoring time ▬ starts. The counter for the number of failed login attempts is set to 1.
2. Failed login attempt no. 2 within the monitoring time:
   The set monitoring time ▬ starts again. The counter for the number of failed login attempts is incremented by 1.

3. Failed login attempt no. 3 within the monitoring time:
   The set monitoring time starts again. The counter for the number of failed login attempts is incremented by 1.
4. Failed login attempt no. 4 within the monitoring time:
   The set number of failed login attempts within the monitoring time has been reached. The set lockout duration starts.
   As long as the lockout duration is running, the CPU responds to each login as if it were an incorrect login attempt (no login possible). A login attempt with incorrect credentials during the lockout duration leads to a restart of the lockout duration.
5. After lockout duration elapses:
   Login attempts are again accepted by the CPU. The counter for the number of failed login attempts is reset to 0.

Influence of events on the temporary account lock

The following states and events belong to the temporary account lock:

- Incorrect login attempt detected
- Ongoing monitoring time
- Current lockout duration

The following events reset all states of the temporary account lock for all local users:

- Transition from POWER-ON to POWER-OFF
- Download to CPU

Password changes by local users during operation via the Web API have **no** effect on the temporary account lockout.

11.5 Central user management

11.5.1 Useful information on central user management and access control

As of TIA Portal version V20 and CPU firmware version V4.0, ET 200SP CPUs have the possibility to leave the authentication of users to a central UMC server.

As of the versions specified above, you manage users centrally and combine multiple users with the same roles/function rights into one group.

The central authentication service is performed in this case by the UMC (User Management Component).

You set up linking between user/group and assigned roles and function rights in the editor "Users and roles" in TIA Portal - as with the local user management.

For HMI devices, the authentication is not possible via either local or central users (TIA Portal V19/V20).

User management as a component of your security strategy

Carefully designed user management increases the security of your automation solution - but only if you ensure the confidentiality of the user-relevant information.

In addition, the rules for industrial cybersecurity must be observed, for example the security concept "Defense in Depth", in particular the remarks on plant security and hardening measures.

Detailed information is available in the section Industrial cybersecurity (Page 33).

Advantages of central user management

Central user management allows management of users and user groups independently of TIA Portal. This enables the user management to be scaled from a few users and CPUs in a single project (local user management) up to extensive automation solutions with multiple projects, users and user groups (central user management) – without increased workload.

If you use the central user management (UMC), you can, for example, configure user groups on the UMC server set up for this purpose. The users of a group then have the same roles and function rights on the CPU.

During operation, users can be added to or removed from a group or passwords can be changed on the UMC server. The CPU configurations do not need to be changed and reloaded.

⚠ WARNING

Decoupling the user management from the CPU involves risks

When central user management is used, the CPU or TIA Project has no way of checking the central user administration. UMC administrators must carefully check the effect of their changes with regard to modified roles and function rights.

Changes to central users at the time of the change do not affect the existing connection to the CPU at this time. These include, for example, the following changes:

- Delete a user on the UMC Server
- Users are moved to other groups on the UMC server and thus get other roles and rights.

The changed user configuration will only take effect when you log in again.

Requirements

The configuration in the editor for users and roles (TIA Portal) provides you with a wide scope of usage scenarios in connection with UMC:

- Programming device with TIA Portal is connected to a UMC domain. In this case, the users and groups can be synchronized in the editor for users and roles.
- Programming device with TIA Portal is not connected to a UMC domain but the names of the user groups/central users used in operation are known and can be added without contact to the UMC server.

  The names of the user groups/central users can also be entered without connection to the UMC domain and synchronized with the UMC domain later.

  The synchronization is not necessary for authentication of CPU users via a UMC server. The group names or user names only have to match to make use of the authentication service.

A CPU which needs to authenticate the querying users (e.g. via web, PG/HMI communication or OPC UA) for diverse online functions requires the following information for access to the authentication service:

- The UMC server address
  Example: https://central.umc.testnet:443/ra
  (443 = port for https, ra = remote authentication)
- A server ID (fingerprint of the server certificate).
  You can determine the fingerprint of a certificate through Windows (open the certificate, "Details" tab, "Fingerprint" field).

As an alternative to the server ID, you can configure a list of CA certificates. These certificates are used by the CPU to verify the certificate returned by the UMC server when a connection is established. In order for the verification to be successful, the entire certificate chain down to the root certificate must have been loaded. The verification does not work for end-entity certificates or for intermediate certificates without a certificate chain to the root certificate.

Further requirements for operation (Runtime):

- User groups and users have been set up on the UMC server.
- A connection can be established between the CPU and UMC server via the configured UMC server address.
- CPU time is current. As with local user management, central users are informed about the remaining validity of their password. CPU and UMC server must have the same date and time settings.

NOTE

No logon possible if the UMC server is not available or the CPU time is reset

- If you use only UMC users and UMC user groups to access the CPU during operation and the UMC server becomes unreachable, e.g. due to connection abort, then no one can log on anymore.
  - To enable access to the CPU in this case, configure at least one local user with the required roles/function rights.
- If you use UMC user groups or UMC users to access the CPU during operation, the CPU time must be up-to-ate.
  If the CPU time has been reset, e.g. by restoring the factory settings, and no NTP time synchronization has been configured, it is also not possible to log on via the central user management. Authentication of the UMC server using certificates requires an up-to-date CPU time.
  - To enable access to the CPU in this case, configure at least one local user with the required roles/functional rights to set the time (e.g. from the "Web server - Maintenance" group).
  - Alternatively, you can synchronize the CPU time using NTP servers (for information on configuration, see section Time synchronization (Page 302)).

Basic procedure for using the User Management Component (UMC)

The following basic steps are required to use the User Management Component (UMC):

1. Installation of UMC on one or more computers in the system.
2. Assigning a corresponding UMC version as a UMC ring server or UMC server. This creates a UMC system consisting of one or multiple UMC computers.
3. Creating users and user groups in UMC. These can exist only in UMC or can be imported from a Microsoft Active Directory.
4. Connection of the UMC agent that is installed on the computer with the TIA Portal installation. The connection can be established with the TIA Administrator or with the Windows command line.
5. Usage of UMC users and UMC user groups, for example, in the context of the TIA Portal project creation.
6. Authentication of UMC users after logging on via UMC.

NOTE

Enabled "Anonymous" user is always loaded
An enabled "Anonymous" user with its configured roles/function rights is loaded even if you only enabled the central user management. Local user management does not have to be additionally enabled for the "Anonymous" user to take effect.

Additional information on the UMC server

More information on setting up (installing, configuring) a UMC server as well as creating central users and groups can be found here (https://support.industry.siemens.com/cs/us/en/view/109780337).

11.5.2 Configuring central user management in the editor for users and roles

The procedure for the configuration of the central user management in the TIA Portal version V20 with an ET 200SP CPU is described below (firmware version as of V4.0).

We distinguish between the following use cases:

- The project is configured in the environment that has access to the UMC server.
- The project is created in an environment that has no access to the UMC server.
  This is, for example, the case for a machine that is configured independently of the later place of installation and environment. The parameters for the user management must still be modified at the installation location.

Requirements - TIA Portal has access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is an online connection to the UMC server.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click the "Add new UMC user group" button.

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the user groups, select the user groups to be imported into the editor.
6. Assign the desired roles to the groups.

Procedure - Creating a new central user

To create a new central user, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User" tab.
3. Click "Add user".

4. Log on to the UMC server as the admin user.
5. In the dialog for selecting the central users, select the users to be imported into the editor.
6. Assign the desired roles to the users.

Requirements - TIA Portal has no access to the UMC server

- TIA Portal, editor for users and roles: The needed roles have been configured and the required function rights for these roles have been assigned.
- There is no online connection to the UMC server at the time in which user management is configured.

NOTE

Case sensitivity of user name

Although the UMC server does not differentiate between upper and lower case of the user name/group name when logging on, deviations in case prevent the user from logging on for users/groups who are configured offline or unsynchronized in the TIA Portal.

Recommendation:

- Before login, synchronize users and user groups in the TIA Portal and download this configuration to the CPU. In this case, the case of the user name is not relevant during logon.
- If possible, import users/groups as described above.

Procedure - Creating a new user group

To create a new user group, follow these steps:

1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Select the "User groups" tab.
3. Click in the <Add new user group> field in the "Name" column.
   The TIA Portal enters a default name.
4. Modify the default name - this name will be used in the target environment of UMC.
   The name can also be modified in the target environment during commissioning.

Result: The groups are set up but not synchronized, i.e. no UM domain ID is assigned.

When a connection to the UMC server exists in the target environment, the following process takes place when a central user logs on:

- The CPU forwards the authentication request to the UMC server.
- After a successful check, the UMC server returns a list of groups to which the logged-on user belongs.
- The CPU determines the assigned roles and function rights for the user based on the group names.

Procedure - Creating a new central user

To create a new central user, follow these steps:

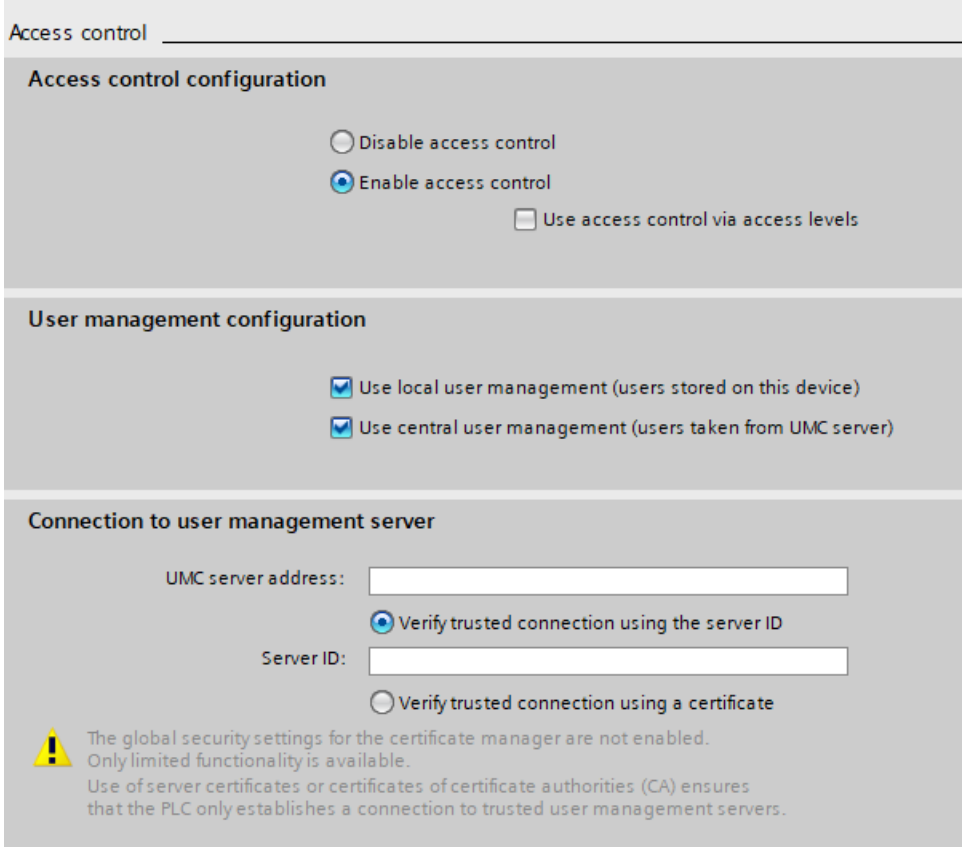
1. Open the editor for users and roles (project tree: Security settings > Users and roles).
2. Click in the <Add new user> field in the "User name" column.
   The user type "Local user" is preset.
3. Modify the default user name - this name will be used in the target environment of UMC.
4. In the column "User type" change the entry to "Central user".

Result: The central user has been set up but not yet synchronized, meaning that no UM domain ID is assigned.

In the target environment with a connection to a UMC server, you can still adjust the provisional group and central user names using the TIA Portal.

Changing the user type - Effects

- When you change the user type (central user > local user), the data for the connection to the UMC server is lost (UM domains ID).
- When the user type is changed from local user to a central user, the configured password and the comment are lost.



11.5.3 Configuring central user management for an ET 200SP CPU

The procedure for configuration of the ET 200SP CPU is described below (firmware version as of V4.0).

Procedure - CPU configuration for central user management

To configure the central user management for an ET 200SP CPU, follow these steps:

1. Place the CPU and navigate to the area "Protection & Security > Access control".
2. Ensure that access control has been enabled (access control via protection levels may be enabled or disabled).
3. Select the option "Use central user management (users taken from UMC server)".
   In addition, the local user management can also be activated in order to still be able to access the CPU if the connection to the UMC server fails, for example.
4. Add the specifications to the UMC server address and server ID for authentication of the UMC server.
   As an alternative to the server ID, you can also add the CA certificate or intermediate certificate for authentication. The CPU must have the entire certificate chain for verification of the server certificate including root certificate.

Changing the connection data for the UMC server

A user with a role that grants full access to the CPU can download modified connection data (UMC server address and server ID) in both STOP and RUN modes of the CPU.

11.5.4 Logon of central users

The processes for the logon of central users are described below from the perspective of different applications.

Requirements

- A UMC server is connected to the CPU (firmware version V4.0 or higher) and is accessible.
- The required central users and groups have been set up for the UMC server.
- The CPUs are configured accordingly for the central user management (roles and function rights) and the configuration is loaded.

Logging onto a protected CPU

If you access a CPU online and the operation requires function rights from users, a dialog appears, as with the local user management, which queries the user type. As of TIA Portal version V20, you can log on as central user.

Causes of a failed logon of a central user

Besides known causes, such as a wrong user name (not configured) or wrong password, the logon may, for example, fail due to network problems (UMC server not reachable) or an oversized response frame.

Tip

To handle such cases, set up a local user who can read the diagnostic buffer in the event of a failed logon and determine the exact cause.

In the diagnostic buffer, the causes are represented by an error code that you can interpret using the following table.

Each entry in the diagnostic buffer also leads to a corresponding syslog message so that connected evaluation systems can record the processes.

Table 1-369 Error codes for failed login

Error code	Meaning
#8000 0001	Missing configuration. The UMC server endpoint is not specified.
#8000 1000	Unspecified UMC system error.
#8000 1001	No DNS address configured.
#8000 1002	The DNS server is not reachable, e.g. because it was shut down as the remote port cannot be reached due to firewall settings.
#8000 1003	During data exchange with the UMC server: The interface is currently receiving new parameters.

Error code	Meaning
#8000 1004	The UMC server cannot be reached. The UMC server does not respond to the ARP telegram or there are problems with the TCP handshake to establish a connection.
#8000 1005	The IP address of the UMC server cannot be reached due to missing routing information.
#8000 1006	The UMC server refuses to establish the connection. Connection was closed unexpectedly.
#8000 2xxx	Internal, unrecoverable TLS error.
#8000 3001	Validation of the UMC server certificate failed. Possible causes: Verification against the chain of trust not possible. Certificate not valid or expired. Verification of Identity failed (subject alternative name, FQDN, IPv4 check). Server ID verification failed (fingerprint).
#8000 4001	UMC server does not respond (timeout).
#8000 4002	HTTP response telegram too long (system limit exceeded).
#8000 4003	Invalid HTTP response.
#8000 5xxx	Encoded HTTP status code of the HTTP request. Example of an encoding of Status Code 500 (#1F4) = Internal Server Error: Coding: #8000 5000 + #1F4 (=500) = #8000 51F4
#8000 6001	Syntax error in JSON response telegram from UMC server.
#8000 6002	JSON response telegram from the UMC server too long (system limit exceeded).
#8000 6003	Unexpected JSON format. The message has a valid JSON format, but it is not a valid UMC authentication response from the UMC server.
#8000 7xxx	Login failed (unknown error).

Logging on as an OPC UA client or as a web client

The user name and password are transferred via the UserNameIdentityToken during logon of an OPC UA client to the OPC UA server of the ET 200SP CPU.

The user name and password are also queried for web clients if you want to use the full functionality of the web server of the ET 200SP CPU. See also the Web server function manual, section "Authentication". The following process applies to OPC UA clients and web clients:

- For central users, the CPU forwards the authentication query to the UMC server.
- If the authentication is successful, the UMC server returns the assigned groups to which the user belongs.
- The CPU generates the corresponding session context and grants the authorizations (function rights from the determined roles).
- The client can then execute the access in the context of the session in accordance with the granted function rights.

How does the CPU (OPC UA server or the website of the web server) recognize whether the user is a local or a central user?

You have the freedom to configure a user both as a local user and as a central user. This results in an ambiguity about which service is responsible for the authentication and which user ultimately gains access. Since access permission for the user depends solely on the password in this case, you should use strong passwords, e.g. created by a password generator.

The following rules apply to ensure unambiguousness for the responsible authentication service (local or central user management):

- For logon of a local user, add the prefix "L:" (uppercase or lowercase) in front of the user name.
  Example: L:username

  If you do not use a prefix for the user names, central user management is automatically responsible (when central and local user management are used at the same time). If you use only one type of user management, access is unambiguous even without a prefix.
- A user name must not begin with the string "L:" (uppercase or lowercase).

11.6 Configuring access protection for the CPU

Introduction

The following section describes how to use the individual access levels of the CPUs. The description applies to ET 200SP CPUs up to firmware version V3.0. In later firmware versions, you use the local user management (Page 222) in the "Users and roles" editor in the project tree. The access levels are represented there by function rights of the same name, which you assign to individual users via roles.

The CPU offers four access levels to limit access to specific functions.

By setting up the access levels and the passwords for a CPU, you limit the functions and memory areas that are accessible without entering a password. You specify the individual access levels as well as the entry of their associated passwords in the object properties of the CPU.

Rules for passwords

Ensure that passwords are sufficiently secure. Passwords must not follow a machine-recognizable pattern. Follow the rules below:

- Assign a password that is at least 8 characters long.
- Use different cases and characters: uppercase/lowercase, numbers and special characters.

Access levels of the CPU

Table 1-370 Access levels and access restrictions

Access levels	Access restrictions
Full access (no protection)	Any user can read and change the hardware configuration and the blocks.
Read access	With this access level, read-only access to the hardware configuration and the blocks is possible without entering a password, which means you can download the hardware configuration and blocks to the programming device. In addition, HMI access and access to diagnostics data is possible. Without entering the password, you cannot load any blocks or hardware configuration into the CPU. Additionally, the following are **not** possible without the password: • Writing test functions • Firmware update (online)
HMI access	With this access level only HMI access and access to diagnostics data are possible without entering the password. Without entering the password, you can neither load blocks nor the hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. Additionally, the following are **not** possible without the password: • Writing test functions • Changing the mode (RUN/STOP) • Firmware update (online) • Display of the online/offline comparison status
No access (complete protection)	When the CPU has complete protection, no read or write access to the hardware configuration and the blocks is possible (without access authorization in the form of a password). HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed). Authentication with the password will again provide you full access to the CPU.

An enumeration of which functions are available in the different protection levels is available in the "Setting options for the protection" entry in the STEP 7 online help.

Properties of the access levels

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

The default setting of the CPUs is "No access (complete protection)". In the default access level, the user is not allowed to read or modify the hardware configuration or the blocks. To obtain access to the CPUs, assign parameters alternatively in the properties of the CPU:

- A password for the protection level "No access (complete protection)"
- Another protection level, e.g. "Full access (no protection)".

Communication between the CPUs (via the communication functions in the blocks) is not restricted by the access level of the CPU, unless PUT/GET communication is deactivated in the "No access" (complete protection) access level.

Entry of the right password allows access to all the functions that are allowed in the corresponding level.

NOTE

Configuring an access level does not replace know-how protection

Configuring access levels offers a high degree of protection against unauthorized changes to the CPU by restricting the rights to download the hardware and software configuration to the CPU. However, blocks on the SIMATIC memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the SIMATIC memory card.

Behavior of functions with different access levels

The STEP 7 online help includes a table which lists the online functions that are available in the different access levels.

Selecting the access levels

To configure the access levels of a CPU, follow these steps:

1. Open the properties of the CPU in the Inspector window.
2. Open the "Protection" entry in the area navigation.
   A table with the possible access levels is available in the Inspector window.

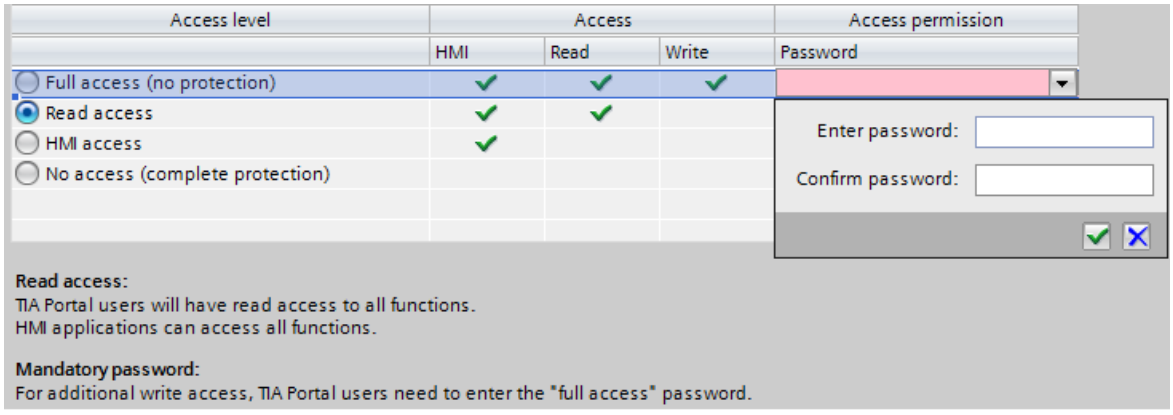


Figure 1-118 Possible access levels

3. Activate the desired protection level in the first column of the table. The green check marks in the columns to the right of the access level show you which operations are still available without entering the password. In the example (see above), read access and HMI access are still possible without a password.
4. In the "Enter password" column, specify a password for the access level "Full access" in the first row. In the "Confirm password" column, enter the selected password again to guard against incorrect entries.
5. Assign additional passwords as required for other access levels.
6. Download the hardware configuration for the access level to take effect.

The CPU logs the following actions with an entry in the diagnostic buffer:

- Input of the correct or incorrect password, as the case may be
- Changes in the configuration of access levels

Behavior of a password-protected CPU during operation

The CPU protection takes effect after you have downloaded the settings to the CPU.

Before an online function is executed, the CPU checks the necessary permission and, if necessary, prompts the user to enter a password. You can only execute password-protected functions from one programming device/PC at any time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until you rescind the access authorization manually with "Online > Delete access rights".

Access levels for F-CPUs

For the fail-safe CPUs, there is an additional access level in addition to the four described access levels. For additional information on this access level, refer to the description of the fail-safe system SIMATIC Safety Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126).

11.7 Using the user program to set additional access protection

Access protection via user program

You can also restrict access to a password-protected CPU in STEP 7 via the ENDIS_PW operation. You can find a description of this block in the online help under the keyword "ENDIS_PW: Limit and enable password legitimation".

11.8 Know-how protection

Application

You can use know-how protection to protect one or more OB, FB or FC blocks as well as global data blocks in your program from unauthorized access. Enter a password to restrict access to a block. The password offers high-level protection against unauthorized reading or manipulation of the block.

Password provider

As an alternative to manual entry of password, you can connect a password provider to STEP 7. When using a password provider, you select a password from a list of available passwords. When a protected block is opened, STEP 7 connects to the password provider and retrieves the corresponding password.

To connect a password provider you have to install and activate it. A settings file in which you define the use of a password provider is also required.

A password provider offers the following advantages:

- The password provider defines and manages the passwords. When know-how protected blocks are opened, you work with symbolic names for passwords. A password is marked, for example, with the symbolic name "Machine_1" n the password provider. The actual password behind "Machine1" remains hidden from you.
  A password provider therefore offers you optimum block protection as the users do not know the password themselves.
- STEP 7 automatically opens know-how protected blocks without the direct entry of a password. This saves you time.

You will find more information on connecting a password provider in the STEP 7 online help.

Readable data

If a block is know-how protected, only the following data is readable without the correct password:

- Block title, comments and block properties
- Block parameters (INPUT, OUTPUT, IN, OUT, RETURN)
- Call structure of the program
- Global tags without information on the point of use

Further actions

Further actions that can be carried out with a know-how protected block:

- Copying and deleting
- Calling in a program
- Online/offline comparison
- Load

Global data blocks and array data blocks

You protect global data blocks (global DBs) from unauthorized access with know-how protection. If you do not have the valid password, you can read the global data block but not change it.

Know-how protection is not available for array data blocks (array DBs).

Setting up block know-how protection

To set up block know-how protection, follow these steps:

1. Open the properties of the block in question.
2. Select the "Protection" option under "General".

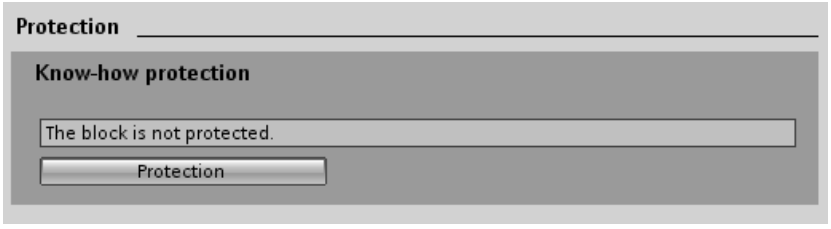

Figure 1-119 Setting up block know-how protection (1)

3. Click the "Protection" button to display the "Know-how protection" dialog.

Figure 1-120 Setting up block know-how protection (2)

4. Click the "Define" button to open the "Define Password" dialog.

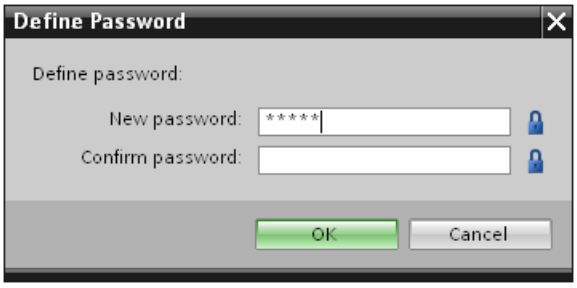

Figure 1-121 Setting up block know-how protection (3)

5. Enter the new password in the "New password" box. Enter the same password in the "Confirm password" box.
6. Click "OK" to confirm your entry.
7. Close the "Know-how protection" dialog by clicking "OK".

Result: The selected blocks are now know-how protected. Know-how protected blocks are marked with a lock in the project tree. The password entered applies to all blocks selected.

NOTE

Password provider
Alternatively, you can set up know-how protection for blocks with a password provider.

Opening know-how protected blocks

To open a know-how protected block, follow these steps:

1. Double-click the block to open the "Access protection" dialog.
2. Enter the password for the know-how protected block.
3. Click "OK" to confirm your entry.

Result: The know-how-protected block is open.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or STEP 7 is open. You must enter the password again the next time you open the block. If you close the "Access protection" dialog with "Cancel", you will be able to open the block but you cannot display the block code or edit the block.

If you copy the block or add it to a library, for example, this does not cancel the know-how protection of the block. The copies will also be know-how-protected.

Removing block know-how protection

To remove block know-how protection, follow these steps:

1. Select the block from which you want to remove know-how protection. The protected block must not be open in the program editor.
2. In the "Edit" menu, select the "Know-how protection" command to open the "Know-how protection" dialog.
3. Clear the "Hide code (Know-how protection)" check box.

Figure 1-122 Removing block know-how protection (1)

4. Enter the password.

Figure 1-123 Removing block know-how protection (2)

5. Click "OK" to confirm your entry.

Result: Know-how protection is removed from the selected block.

See also

Copy protection (Page 250)

11.9 Copy protection

Application

The copy protection allows you to protect your program against unauthorized duplication. With copy protection you associate the blocks with a specific SIMATIC memory card or CPU. Through the linking of the serial number of a SIMATIC memory card or of a CPU the use of this program or of this block is only possible in conjunction with a specific SIMATIC memory card or CPU.

Copy and know-how protection

Recommendation: to prevent unauthorized reset of copy protection, additionally apply know-how protection to a copy-protected block. To do this, first set up copy protection and then apply know-how protection for the block. You can find further information on setting up know-how protection in section Know-how protection (Page 246)

Setting up copy protection

To set up copy protection, follow these steps:

1. Open the properties of the block in question.
2. Select the "Protection" option under "General".

Figure 1-124 Setting up copy protection (1)

3. In the "Copy protection" area, select either the "Bind to serial number of the CPU" entry or the "Bind to serial number of the memory card" entry from the drop-down list.

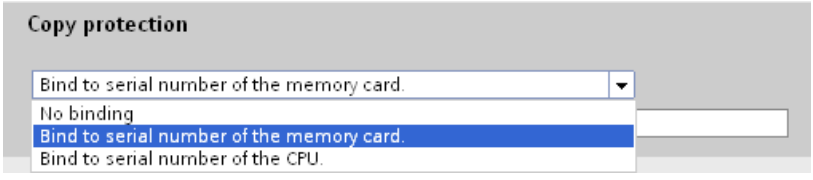

Figure 1-125 Setting up copy protection (2)

4. Activate the option "Serial number is inserted when downloading to a device or a memory card" if the serial number is to be inserted automatically during the uploading process (dynamic binding). Assign a password using the "Define password" button to link the use of a block additionally to the input of a password.
   Activate the option "Enter serial number" if you want to manually bind the serial number of the CPU or the SIMATIC memory card to a block (static binding).

5. You can now set up the know-how protection for the block in the "Know-how protection" area.

NOTE
If you download a copy-protected block to a device that does not match the specified serial number, the entire download operation will be rejected. This means that blocks without copy protection will also not be downloaded.

Removing copy protection

To remove copy protection, follow these steps:

1. Remove any existing know-how protection.
2. Open the properties of the block in question.
3. Select the "Protection" option under "General".
4. In the "Copy protection" area, select the "No binding" entry from the drop-down list.

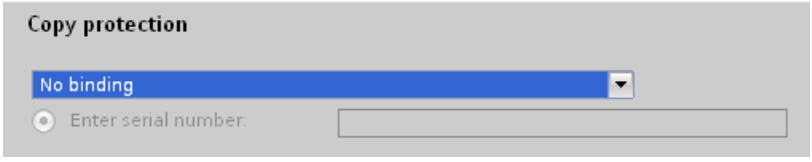

Figure 1-126 Removing copy protection

Configuration control (option handling) 12

Introduction

Configuration control (option handling) is used to operate various standard machine configuration levels in one project without changing the configuration or the user program.

Operating principle of configuration control

You can use configuration control to operate different standard machine configurations with a single configuration of the ET 200SP distributed I/O system.

- A station master is configured in a project (maximum configuration). The station master comprises all modules needed for all possible plant parts of a modular standard machine.
- The project's user program provides for several station options for various standard machine configuration levels as well as selection of a station option. A station option uses, for example, only some of the configured modules of the station master and these modules are inserted in the slots in a different order.
- The standard machine manufacturer selects a station option for a configuration of the standard machine. To do this, the project need not be modified, and it is not necessary to load a modified configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. The configuration control does not have an impact on the parameter assignment of the modules.

Configuration control allows you to flexibly vary the centralized/distributed configuration. This is only possible if the station option can be derived from the station master.

The following figure shows three configurations of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

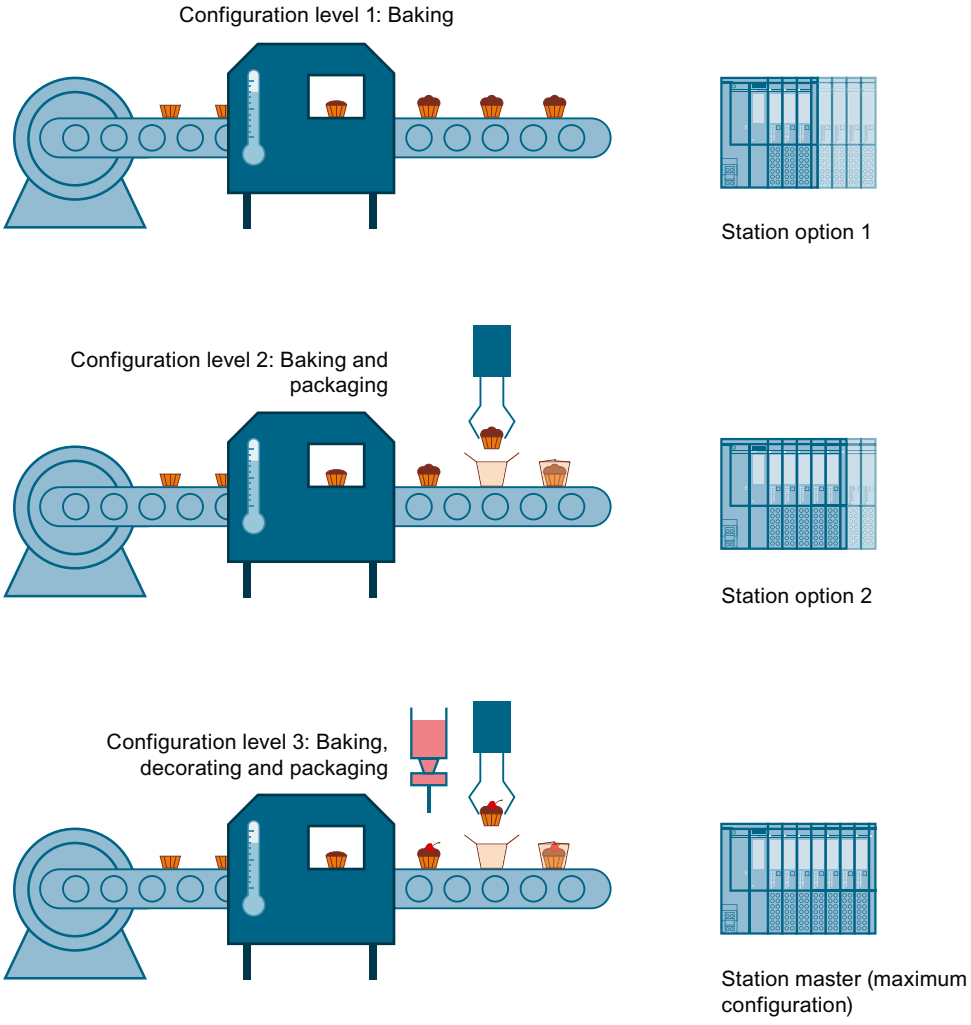

Figure 1-127 Various configuration levels of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

Advantages

- Simple project management and commissioning by using a single STEP 7 project for all station options.
- Simple handling for maintenance, versioning and upgrade:
- Hardware savings: Only those I/O modules are installed that are required for the machine's current station option.
- Savings potential in the creation, commissioning and the documentation for standard machines.
- Simple station expansion by using pre-wired empty slots. To expand, you simply exchange the BU cover for the new model. You can find further information on this in section Examples of configuration control (Page 271).

Procedure

To set up the configuration control, follow these steps:

Step	Procedure	See...
1	Enable configuration control in STEP 7	Section Configuring (Page 254)
2	Create control data record	Section Creating the control data record (Page 256)
3	Transfer control data record	Section Transferring the control data record in the startup program of the CPU (Page 266)

Library for configuration control

A library for configuration control is available on the Internet for download (https://support.industry.siemens.com/cs/#document/29430270?lc=en-WW). The library contains data types with the structure of the control data records for the ET 200SP distributed I/O system. You can implement your flexible automation solution inexpensively with the help of these data types.

NOTE

Configuration control in the case of motor starters
"Manual local" mode is possible in the case of motor starters when configuration control is active. The motor starter works with the last valid parameters. Do not change the parameterization while "manual local" mode is active.

12.1 Configuring

Requirements

Configuration control is supported by the ET 200SP distributed I/O system with both an ET 200SP CPU and with interface modules via PROFINET IO and PROFIBUS DP.

Centrally for ET 200SP CPU:

- STEP 7 Professional V13 Update 3 or higher
- CPU
  - CPU 1510SP-1 PN
  - CPU 1512SP-1 PN
  - CPU 1514SP-2 PN
  - CPU 1515SP PC2
- Firmware version V1.6 or higher

- All modules of the CPU must be able to start up even with different configurations.
  - The startup parameter "Comparison preset to actual configuration" of the CPU is set to "Startup CPU even if mismatch" (default setting) and the module parameter "Comparison preset to actual module" of the module is set to "From CPU" (default setting).
    or
  - The module parameter "Comparison preset to actual module" for the module is set to "Startup CPU even if mismatch".

Distributed via PROFINET IO:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 PN BA/ST/HF/HS, IM 155-6 MF HF
- You have assigned the interface module to an IO controller.

Distributed via PROFIBUS DP:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 DP HF
- You have assigned the interface module to a DP master.
- The startup parameter is set to "Operate if preset configuration does not match actual configuration"

Modules with submodules distributed across different ARs/fieldbuses may not be a part of the AR for the active configuration control.

Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU/interface module in STEP 7 (TIA Portal).

- The "Allow to reconfigure the device via the user program" parameter is located in the "Configuration control" area for an ET 200SP CPU.
- The "Allow to reconfigure the device via the user program" parameter is located in the "Module parameter" area under "General" for an IM 155-6 PN or IM 155-6 MF HF interface module.

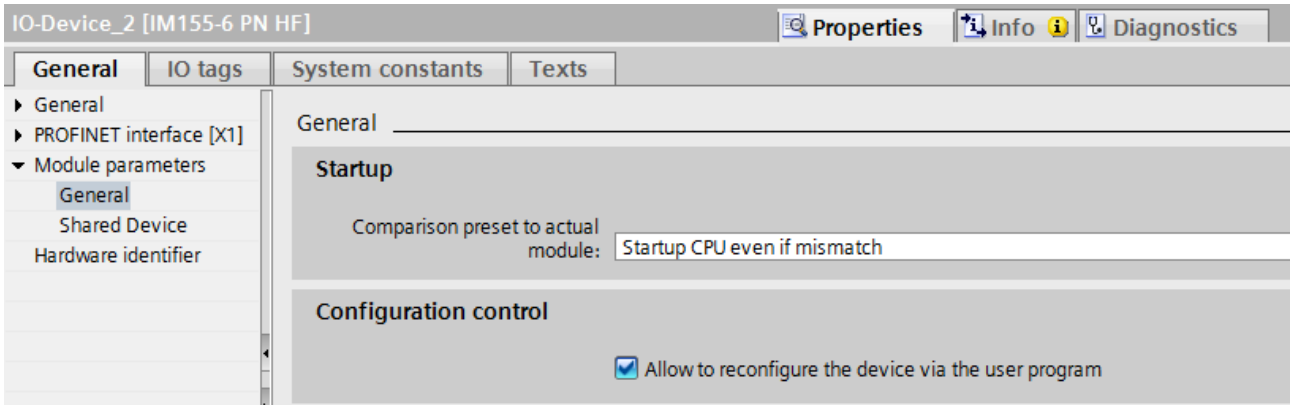

Figure 1-128 Enabling configuration control using an IM 155-6 PN HF as an example

12.2 Creating the control data record

12.2.1 Introduction

Required steps

To create a control data record for the configuration control, follow these steps:

1. Create a PLC data type that contains the structure of the control data record.
   The following figure shows a PLC data type "CTR_REC", which contains the structure of the control data record for an ET 200SP interface module.

CTR_REC

	Name	Data type	Default value	A...	V...	S...	Comment
1	Block_Lenght	USInt	134	☑	☑	☐	4 + (2 x number of Slots)
2	Block_ID	USInt	196	☑	☑	☐	
3	Version	USInt	2	☑	☑	☐	ET 200SP
4	Subversion	USInt	0	☑	☑	☐	
5	Slot 1	USInt	1	☑	☑	☐	assigned "real" slot
6	Add 1	USInt	0	☑	☑	☐	additional function
7	Slot 2	USInt	2	☑	☑	☐	assigned "real" slot
8	Add 2	USInt	0	☑	☑	☐	additional function
9	Slot 3	USInt	3	☑	☑	☐	assigned "real" slot
10	Add 3	USInt	0	☑	☑	☐	additional function
11	Slot 4	USInt	4	☑	☑	☐	assigned "real" slot
12	Add 4	USInt	0	☑	☑	☐	additional function
		USInt	5	☑	☑	☐	

Figure 1-129 Creating control data record 196 using an IM 155-6 PN HF as an example

2. Create a global data block.
3. In the data block, create an array that is based on the created PLC data type.

4. In the control data records, enter the slot assignments in the "Start value" column.
   The figure below shows the global data block "ConfDB". The data block "ConfDB" contains an array [0..5] of the PLC_DataType "CTR_REC".

ConfDB

	Name	Data type	Start value	R..	A...	V...	S..	Comment
1	Static			☐	☐	☐	☐	
2	Option	Int	0	☑	☑	☑	☐	Selection of record
3	ConfigControl	Array[0..5] of "CTR_REC"		☐	☑	☑	☐	
4	ConfigControl[0]	"CTR_REC"		☐	☑	☑	☐	
5	ConfigControl[1]	"CTR_REC"		☐	☑	☑	☐	
6	Block_Length	USInt	0	☐	☑	☑	☐	4 + (2 x number of slots)
7	Block_ID	USInt	196	☐	☑	☑	☐	
8	Version	USInt	2	☐	☑	☑	☐	ET 200SP
9	Subversion	USInt	0	☐	☑	☑	☐

11	Add 1	USInt	0	☐	☑	☑	☐	additional function
12	Slot 2	USInt	2	☐	☑	☑	☐	assigned "real" slot
13	Add 2	USInt	0	☐	☑	☑	☐	additional function
14	Slot 3	USInt	3	☐	☑	☑	☐	assigned "real" slot
15	Add 3	USInt	0	☐	☑	☑	☐	additional function
16	Slot 4	USInt	4	☐	☑	☑	☐	assigned "real" slot
17	Add 4	USInt	0	☐	☑	☑	☐	additional function

Figure 1-130 Data block for configuration control

Rules

Observe the following rules:

- Slot entries in the control data record outside the station master are ignored by the CPU/interface module.
- The control data record must contain the entries up to the last slot of the station option.
- Multiple configured slots may not be assigned to the same actual slot. In other words, each station option slot may be present only once in the control data record.

Using communication modules

When configuration control (option handling) is used, you may insert the following communication modules:

- CM DP
- CP 1542SP-1
- CP 1543SP-1
- CP 1542SP-1 IRC
- BusAdapter BA-Send 1xFC

For the communication modules listed above, special slot rules apply for use with the ET 200SP CPUs:

If you insert the communication modules as mentioned above (e.g. CM DP) in the central configuration, then these modules cannot be influenced by the configuration control. You

must therefore leave these modules in the slots preassigned in the station master and enter the slot numbers from the station master in the control data record ("Station option slot = Station master slot").

In a station option, all slots up to the module furthest from the CPU (see list above) must be present in the control data record.

The CM AS-i Master and F-CM AS-i Safety communication modules can be used for configuration control without the above-mentioned restrictions relating to slot numbers.

12.2.2 Control data record for an ET 200SP CPU

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP CPU:

Table 1-371 Slot assignment

Modules	Possible slots	Comment
CPU	1	Slot 1 is always the CPU
Station extension BA-Send	2	In a mixed configuration with ET 200AL modules, BA-Send is always on slot 2.
I/O modules	2 - 65	Downstream of CPU
Server module	2 - 66	The server module completes the configuration of the ET 200SP station after the CPU/the last I/O module.
ET 200AL I/O modules	67 - 82	For mixed configuration with ET 200AL modules

Control data record

For the configuration control of an ET 200SP CPU, you define a control data record 196 V2.0, which includes a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or last slot of an ET 200AL I/O module (in a mixed ET 200SP/ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-372 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + (maximum slot × 2)	Header
1	Block ID	196	
2	Version	2	
3	Version	0	
4	Slot 1 of the station master	Slot assignment 1 in the station option (always 1, because the CPU is always in slot 1)	**Control element** Contains the information on which module is inserted in which slot.
5	Additional function for slot 1		
6	Slot 2 of the station master	Slot assignment in the station option	

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Byte	Element	Code	Explanation
7	Additional function for slot 2		The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0. **Additional function** Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit. • If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function. • If you accept the BaseUnit from the station master, enter 0 as additional function.
8	Slot 3 of the station master	Slot assignment in the station option	
9	Additional function for slot 3		
:	:	:	
4 + ((server module slot - 1) × 2)	Server module slot	Server module slot assignment in the station option*	
4 + ((server module slot - 1) × 2) + 1	Additional function for server module slot		
:	:	:	:
136	First slot of ET 200AL (slot 67)	Slot assignment in the station option	**Control element ET 200AL** Contains information on which ET 200AL module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
137	Reserved		
:	:	:	
166	Last slot of ET 200AL (slot 82)	Slot assignment in the station option	
167	Reserved		

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

12.2.3 Control data record for an interface module

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP interface module:

Table 1-373 Slot assignment

Modules	Possible slots	Comment
Interface module	0	The interface module (slot 0) is not an element of the configuration control, but instead controls this.
Station extension BA-Send	1	For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.

Modules	Possible slots		Comment
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 30	for IM 155-6 PN HS	
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-6 PN HF, IM 155-6 PN/3 HF, IM 155-6 MF HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 31	for IM 155-6 PN HS	
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF, IM 155-6 MF HF	
	1 - 65	for IM 155-6 PN HF, IM 155-6 PN/3 HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF, IM 155-6 PN/3 HF, IM 155-6 MF HF	

Simplified control data record (V1)

For the configuration control of interface modules of the ET 200SP distributed I/O system, you define a control data record 196 V1.0, which includes a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-374 Structure of the simplified control data record V1.0

Byte	Element	Code	Explanation
0	Block length	4 + maximum slot	Header
1	Block ID	196	
2	Version	1	
3	Version	0	

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Byte	Element	Code	Explanation
4	Slot 1 of the station master	Slot assignment in the station option	**Control element ET 200SP** Contains the information on which ET 200SP module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0.
5	Slot 2 of the station master	Slot assignment in the station option	
:	:	:	
4 + (slot server module - 1)	Server module slot	Server module slot assignment in the station option*	
:	:	:	:
4 + (first slot ET 200AL - 1)	First slot ET 200AL	Slot assignment in the station option	**Control element ET 200AL** Contains information on which ET 200AL module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
:	:	:	
4 + (last slot ET 200AL - 1)	Last slot ET 200AL	Slot assignment in the station option	

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Control data record (V2)

If you change the potential groups in the station option compared to the station master, define a control data record 196 V2.0 for the ET 200SP interface module which contains a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 1-375 Structure of control data record 196 V2.0

Byte	Element	Code	Explanation
0	Block length	4 + (maximum slot x 2)	Header
1	Block ID	196	
2	Version	2	
3	Version	0	
4	Slot 1 of the station master	Slot assignment in the station option	**Control element ET 200SP** Contains the information on which ET 200SP module is inserted in which slot.
5	Additional function for slot 1		
6	Slot 2 of the station master	Slot assignment in the station option	
7	Additional function for slot 2		

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Byte	Element	Code	Explanation
8	Slot 3 of the station master	Slot assignment in the station option	The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0. **Additional function** Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit. • If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function. • If you accept the BaseUnit from the station master, enter 0 as additional function.
9	Additional function for slot 3		
:	:	:	
4 + ((server module slot - 1) × 2)	Server module slot	Server module slot assignment in the station option*	
4 + ((server module slot - 1) × 2) + 1	Additional function for server module slot		
:	:	:	:
4 + ((first slot ET 200AL - 1) x 2)	First slot ET 200AL	Slot assignment in the station option	**Control element ET 200AL** Contains information on which ET 200AL module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
4 + ((first slot ET 200AL - 1) x 2) + 1	Reserved		
:	:	:	
4 + ((last slot ET 200AL - 1) x 2)	Last slot ET 200AL	Slot assignment in the station option	
4 + ((last slot ET 200AL - 1) x 2) + 1	Reserved		

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

NOTE

If a BU cover or no I/O module is plugged on a light-colored BaseUnit, you should enter 1 in the additional function for the slot.

The function "Group diagnostics: Missing supply voltage L+" requires proper assignment of the slots to a shared supply voltage L+ (potential group). All light-colored BaseUnits must be known to the interface module. By entering 1 in the additional function, you make a light-colored BaseUnit known to the interface module, even if an I/O module is not inserted.

Combination of configuration control and shared device (for PROFINET)

The configuration control function in a shared device is therefore only for the I/O modules of the IO controller to which the interface module has subscribed. I/O modules that are assigned to no controller or a different controller behave like a station without activated configuration control.

You cannot make any change to the slot assignment for modules that are assigned to another IO controller or are not assigned to an IO controller (shared device on module level). The CPU assumes a one-to-one assignment for the modules.

If additional IO controllers subscribe to a module intended for configuration control (shared device on submodule level), only one-to-one assignment is permitted for this module. It is not possible to deselect such a module using the control data record (code 0 for this slot in the control data record). This means the combination of "Configuration control" and "Shared device on submodule level" is only possible to a limited extent.

Please note that all modules affected by the configuration control including all assigned submodules are reset when you change the module assignment. Submodules that are assigned to a second IO controller are affected as well.

Combination of configuration control and virtual IO modules

A combination of configuration control and virtual IO modules (interface-local coupling of IO data) is possible. However, you can only create the control data record for configuration control up to the last real slot. The virtual IO modules cannot be contained in the control data record. Virtual IO modules have a fixed slot/subslot that cannot be mapped and also cannot be contained in the remap record. If the control data record contains the virtual IO modules, the control data record becomes too long and the error code $80B1_H$ is returned. See section Feedback data record for interface modules (Page 264).

12.2.4 Feedback data record for interface modules

Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0. The feedback data record exists only with configured configuration control.

Slot assignment

The feedback data record refers to the configured station configuration and always includes the maximum configuration limits. The maximum configuration limits comprise 13/49/81 slots depending on the interface module in use. Partial reading of the feedback data record is possible.

The following table shows the slot assignment of the modules:

Table 1-376 Slot assignment

Modules	Possible slots		Comment
Station extension BA-Send	1		For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 30	for IM 155-6 PN HS	
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-6 PN HF, IM 155-6 PN/3 HF, IM 155-6 MF HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 31	for IM 155-6 PN HS	
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 65	for IM 155-6 PN HF, IM 155-6 PN/3 HF, IM 155-6 MF HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF, IM 155-6 PN/3 HF, IM 155-6 MF HF	

Feedback data record

Table 1-377 Feedback data record

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots x 2)	Header
1	Block ID	197	

* Not possible if the slot is marked as not available.

Byte	Element	Code	Explanation
2	Version	2	Header
3		0	
4	Slot 1 status	0/1	Status = 1: • Module from station master is inserted in the station option • Slot is marked as not available in the control data record Status = 0: • Module pulled • Incorrect module is inserted in the station option*
5	Reserved	0	
6	Slot 2 status	0/1	
7	Reserved	0	
:	:	:	
4 + ((max. slot - 1) × 2)	Max. slot status	0/1	
4 + ((max. slot - 1) × 2) + 1	Reserved	0	

* Not possible if the slot is marked as not available.

NOTE

The data in the feedback data record is always mapped for all modules. In a shared device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record has been sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

Error messages

In case of error, the RDREC instruction returns the following error messages via the STATUS block parameter while reading the feedback data record:

Table 1-378 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 197 is not correct.
$80B5_H$	Configuration control not configured
$80B8_H$	Parameter error The following events cause a parameter error: • Incorrect block ID in the header (not equal to 197) • Invalid version identifier in the header • A reserved bit has been set • The same slot in the station option has been assigned to more than one slot in the station master

12.2.5 Data records and functions

Supported data records and functions

The table below shows a comparison of the supported data records and functions depending on the CPU/interface module used.

	CPU...		Interface module (IM...)					
Supported data records and functions	**151xSP-1 (F) PN 1514SP-2 (F) PN**	**1515SP PC2**	**155-6 PN HS**	**155-6 PN HF 155-6 MF HF**	**155-6 PN/2 HF 155-6 PN/3 HF**	**155-6 PN ST**	**155-6 PN BA**	**155-6 DP HF**
Control data record (V2)	✓	✓	✓	✓	✓	✓	✓	✓
Simplified control data record (V1)	--	--	✓	✓	✓	✓	✓	--
Read back control data record*	✓	✓	✓	✓	✓	✓	✓	✓
Read feedback data record	--	--	✓	✓	✓	✓	✓	✓

* You can read back the control data record with the RDREC instruction.

12.3 Transferring control data record in the startup program of the CPU

Required steps

Transfer the created control data record 196 to the CPU/the interface module using the instruction WRREC (Write data record) instruction.

Parameters of the instruction WRREC

Below, you will find explanations of individual parameters of the WRREC instruction which you must supply with specific values in the configuration control context. You can find additional information on the WRREC instruction in the STEP 7 online help.

ID	Hardware identifier • Use the HW identifier of the CPU for the configuration control for centrally arranged modules. If you have selected the CPU in the network view or device view, the HW identifier is available in the **System constants** tab of the Inspector window. Use the value of the system constant "Local~Configuration". • Use the HW identifier of the interface module for the configuration control for distributed I/O. If you have selected the interface module in the network view or device view, the HW identifier is available in the **System constants** tab of the Inspector window. Use the value of the system constant "<Name_of_the_interface_module>~Head".

INDEX	Data record number: 196 (decimal)
RECORD	Control data record to be transferred. See the section Creating the control data record (Page 256) for the structure of the control data record.

Error messages

In case of error, the instruction WRREC returns the following error messages via the STATUS block parameter:

Table 1-379 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 196 is not correct.
$80B5_H$	Configuration control parameters not assigned.
$80E2_H$	Data record was transferred in the wrong OB context. The data record must be transferred in the startup program.
$80B8_H$	Parameter error A parameter error is caused by: • Incorrect block ID in the header (not equal to 196) • Invalid version identifier in the header • A reserved bit was set • A station master slot was assigned an invalid slot in the station option • Multiple slots in the station master are assigned to the same slot in the station option • For shared device on submodule level: Violation of defined restrictions

Selection of the station option in the user program

In order for the CPU to know which station option you want to operate, you must set up a possibility to select between the various control data records in the user program. You can implement the selection, for example, via an Int tag which references an array element.

Note that the tag used to select the control data record must be stored in the retentive memory area. If the tag is not retentive it will be initialized during the startup of the CPU and thus be unavailable for selection of the station option.

Special aspects relating to the transfer of the control data record to the CPU

- If you have enabled configuration control, the CPU is not ready for operation without a control data record. The CPU returns from startup to STOP if a valid control data record is not transferred in the startup OB. The central I/O is not initialized in this case. The cause for the STOP mode is entered in the diagnostics buffer.

  NOTE
  If an incorrect control data record is transferred to the CPU in the startup OB, the startup of the CPU may be prevented.
  In this case, perform a reset to factory settings of the CPU and then transfer a correct control data record.

- The CPU processes the WRREC instruction for transfer of the control data record asynchronously. For this reason, you must call WRREC in the startup OB repeatedly in a loop until the output parameters "BUSY" or "DONE" indicate that the data record has been transferred.
  - Tip: To program the loop, use the SCL programming language with the REPEAT ... UNTIL instruction.

```
REPEAT
 "WRREC_DB"(REQ := "start_config_control",
            ID := "Local~Configuration",
            INDEX := 196,
            LEN := "conf_LEN",
            DONE => "conf_DONE",
            BUSY => "conf_BUSY",
            RECORD := "ConfDB".ConfigControl["ConfDB".Option],
//Selection of control data record
            ERROR => "conf_ERROR",
            STATUS => "conf_STATUS");
UNTIL NOT "conf_BUSY"
END_REPEAT;
```

– In the graphical programming languages, you implement the loop using instructions for program control.
  Example in FBD: Use the LABEL (jump label) and JMP (jump at RLO=1) instructions to program a loop.

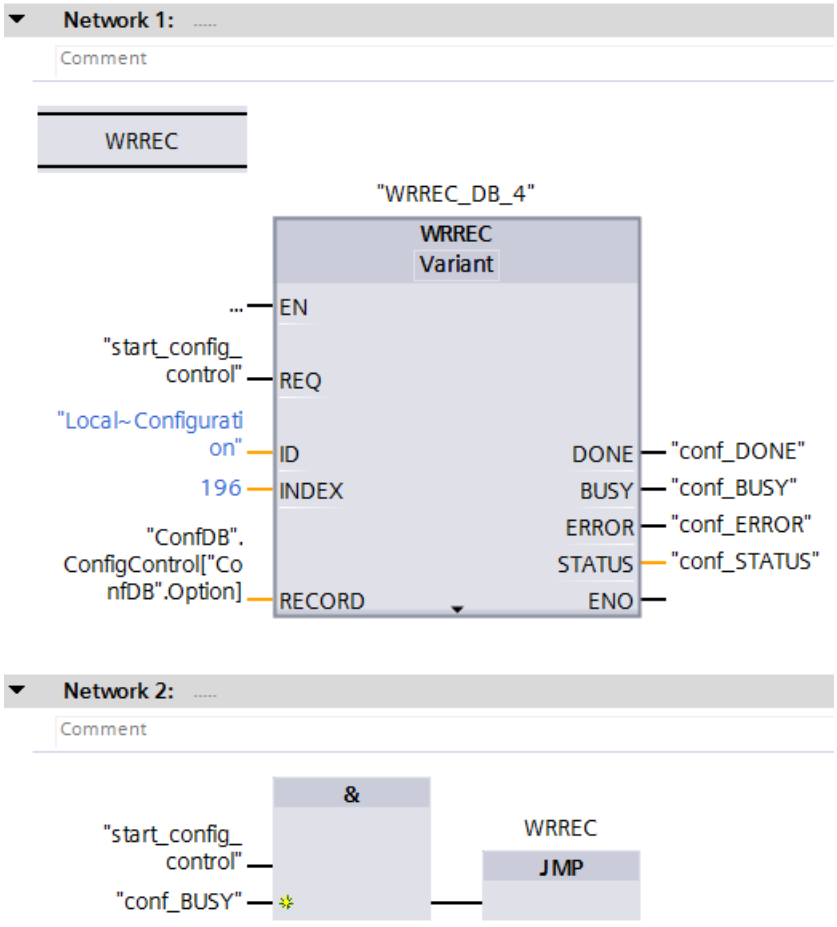

Figure 1-131 WRREC

- The control data record is stored retentively in the CPU. Note:
  – The retentivity of the control data record is independent of the retentivity settings in the STEP 7 memory area. This means that the memory area in which the control data record is configured does not have to be configured as retentive for this purpose.
  – If you write a control data record with modified configuration, the original data record 196 is deleted and the new data record 196 is saved retentively. The CPU will then restart with the modified configuration.
  – The control data record is saved retentively in the CPU, which means that it is not necessary to write the control data record 196 again at a restart if the configuration is unchanged. We recommend that a memory reset of the CPU be performed prior to commissioning to delete any control data record that may be present.

Special aspects relating to the transfer of the control data record to the interface module

- If you have enabled configuration control, the ET 200SP station is not ready for operation without a control data record. As long as no valid control data record has been transferred, the I/O modules are considered as failed by the CPU and exhibit substitute value behavior. The interface module continues to exchange data.
- The control data record is stored retentively in the interface module. Note:
  - If there have been no changes to the configuration, you do not need to rewrite the control data record 196 during restart.
  - If you write a control data record with modified configuration to the interface module, it will result in a station failure in the distributed I/O system. The original data record 196 is deleted and the new data record 196 is saved retentively. The station will then restart with the modified configuration.

12.4 Behavior during operation

Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module supplies diagnostic information. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows a faulty module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

Response when modules are missing

If modules are entered as not present in the control data record, the automation system behaves as follows:

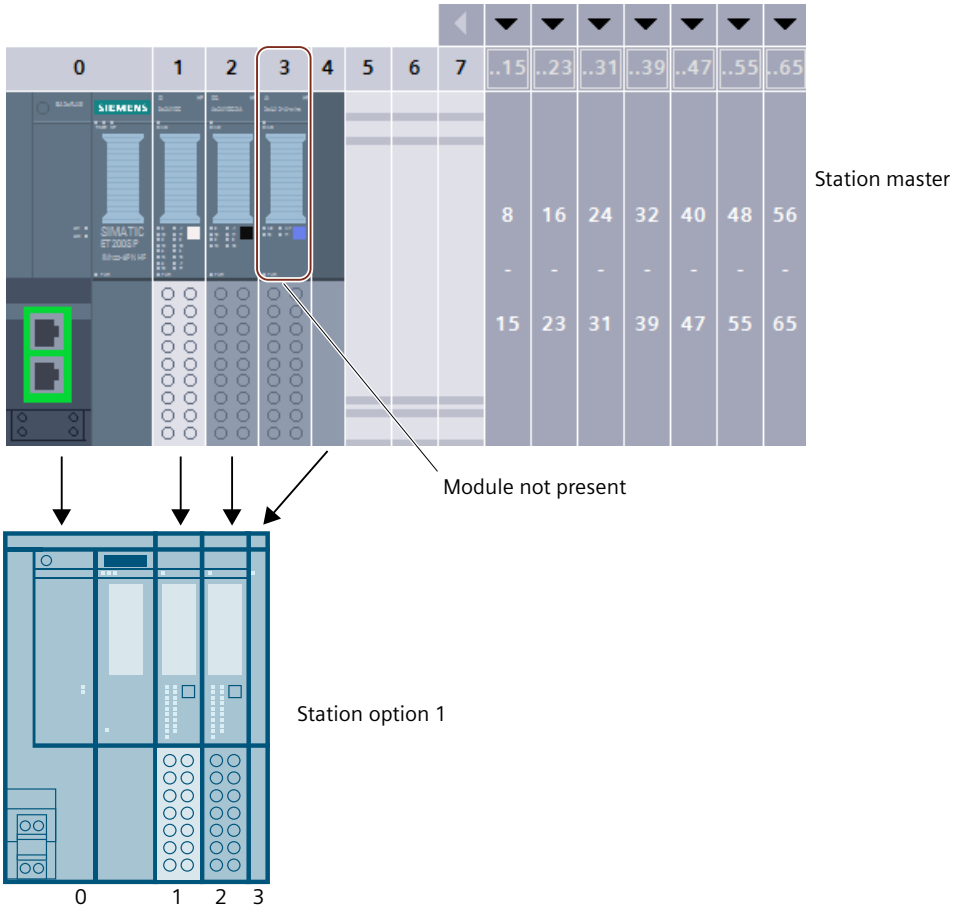
- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct write access to the outputs that are not present or write access to the process image of the outputs that are not present: Remains without effect; no access error is signaled.
- Direct read access to the inputs that are not present or read access to the process image of the inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: An error is signaled because a valid data record cannot be returned.

Inserting modules on empty slots

If you replace a BU cover placed on an empty slot with an I/O module when configuration control is enabled, the ET 200SP distributed I/O system behaves as follows:

- Interface module: When the BU cover is removed, a removal interrupt is signaled. When the I/O module is inserted, an insertion alarm (wrong module) is signaled.
- CPU: A removal/insertion interrupt is not signaled when the BU cover is removed or when the I/O module is inserted.

12.5 Examples of configuration control



A station master consisting of an interface module, three I/O modules and the server module is configured in STEP 7 in the following section.

Four station options are derived from the station master with the configuration control:

- Station option 1 with module that is not present
- Station option 2 with modified order of modules
- Station option 3 with empty slot
- Station option 4: Opening a new potential group

Station option 1 with module that is not present

The module that is located in slot 3 in the station master is not present in the station option 1. Slot 3 must be designated in the control data record accordingly with 0 (= not present). The server module is located in slot 3 in the station option.

Commissioning 13

13.1 Overview

Introduction

This section includes information on the following topics:

- Commissioning the ET 200SP distributed I/O system on the PROFINET IO
- Commissioning the ET 200SP distributed I/O system on the PROFIBUS DP
- Startup of the ET 200SP distributed I/O system with empty slots
- Removing/inserting the SIMATIC memory card
- Operating modes of the CPU
- CPU memory reset
- Reassigning parameters during operation
- Identification and maintenance data

Commissioning requirements

NOTE

Performing tests

You must ensure the safety of your plant. You therefore need to run a complete functional test and make the necessary safety checks before the final commissioning of a plant.
Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

NOTE

Check coding element in the I/O module

Make sure that the coding element is present in the I/O module before you plug in the I/O module for the first time. This reduces the risk of plugging the wrong type of module onto a wired BaseUnit when replacing a module.

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the system network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.automation.siemens.com/WW/view/en/67460624).

MultiFieldbus Configuration Tool (MFCT)

MultiFieldbus Configuration Tool (MFCT) is a PC-based software and supports the configuration of MultiFieldbus- and DALI-devices. In addition, the MFCT offers convenient options for bulk firmware update of ET 200 devices with MultiFieldbus-support and reading of service data for many other Siemens devices.

You can find MFCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109773881).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

General function overview:

- Network browsing and creation of a table showing the accessible devices in the network.
- Flashing of device LEDs or HMI display to locate a device
- Loading addresses (IP, subnet, gateway) into a device
- Loading the PROFINET name (station name) into a device name
- Placing a CPU in RUN or STOP mode
- Setting the time in a CPU to the current time of your programming device/PC
- Downloading a new program to a CPU or an HMI device
- Downloading from CPU, downloading to CPU or deleting recipe data from a CPU
- Downloading from CPU or deleting data log data from a CPU
- Backup/restore of data from/to a backup file for CPUs and HMI devices
- Downloading service data from a CPU
- Reading the diagnostics buffer of a CPU
- General reset of a CPU's memory
- Resetting devices to factory settings
- Downloading a firmware update to a device

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/de/view/98161300).

13.2 Commissioning the ET 200SP for PROFINET IO

Requirements

- The CPU/interface module is in the "Factory settings" status or has been reset to factory settings (see section Interface module (https://support.automation.siemens.com/WW/view/en/55683316/133300)).
- For CPU: The SIMATIC memory card is as delivered or has been formatted.

13.2.1 ET 200SP CPU as an IO controller

Configuration example

To use the ET 200SP distributed I/O system as an IO controller, you require the CPU 151xSP-1 PN.

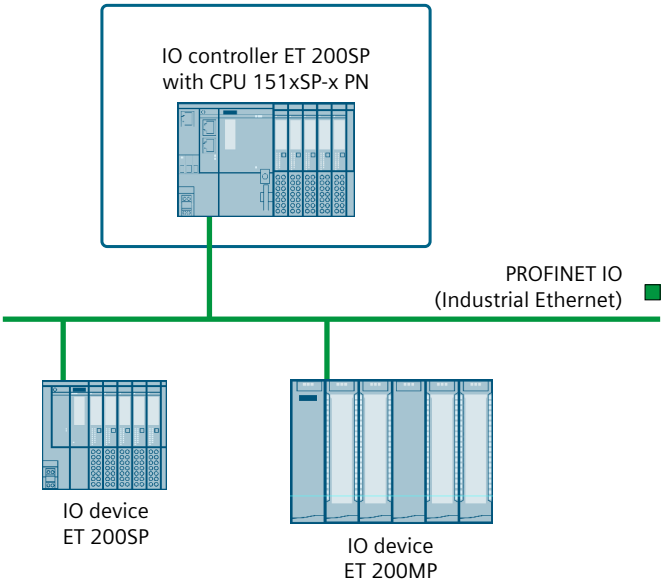

Figure 1-136 ET 200SP CPU as an IO controller

Commissioning procedure

To commission the ET 200SP distributed I/O system CPU as an IO controller for PROFINET IO, we recommend the following procedure:

Table 1-380 Procedure for commissioning the ET 200SP CPU as an IO controller for PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 116)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 148)
3	Inserting a SIMATIC memory card in the IO controller	Section Removing/inserting a SIMATIC memory card on the CPU (Page 287)
4	Configuring the IO controller[1]	Section Configuring (Page 193)
5	Checking the protective measures	-

[1] The IO devices are configured with the IO controller.

Step	Procedure	See ...

13.2.2 ET 200SP CPU as an I-device

Configuration example

You need the CPU 151xSP-1 PN to use the ET 200SP distributed I/O system as an I-device.

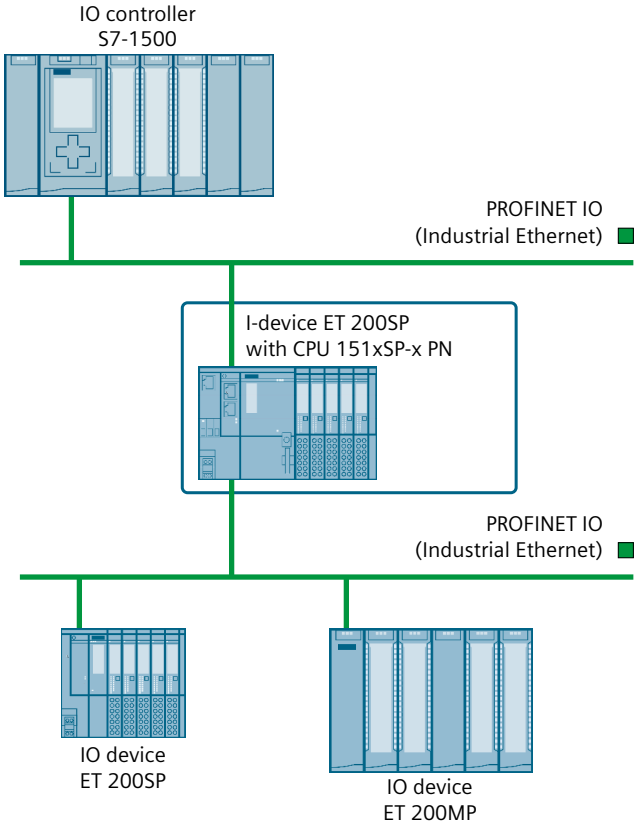

Figure 1-137 ET 200SP CPU as an I-device

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an I-device on the PROFINET IO, we recommend the following procedure:

Table 1-381 Procedure for commissioning the ET 200SP as an I-device on the PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 116)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 148)
3	Inserting a SIMATIC memory card in the I-device	Section Removing/inserting a SIMATIC memory card on the CPU (Page 287)

13.2.3 ET 200SP as an IO device

Configuration example

To use the ET 200SP distributed I/O system as an IO device, you need the IM 155-6 PNxx interface module.

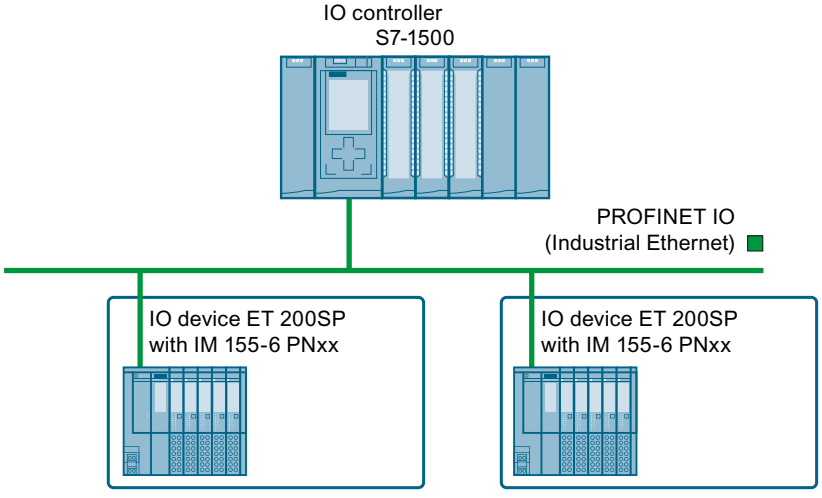

Figure 1-138 ET 200SP as an IO device

You can find information on further configuration variants of the ET 200SP distributed I/O system in redundancy mode in section "Configuration variants" of the Redundant System

S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) System Manual.

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an IO device on the PROFINET IO, we recommend the following procedure:

Table 1-382 Procedure for commissioning the ET 200SP as an IO device for PROFINET IO

Step	Procedure	See ...
1	Installing ET 200SP	Section Installation (Page 116)
2	Connecting ET 200SP • Supply voltages • PROFINET IO • Sensors and actuators	Section Wiring (Page 148)

13.3 Commissioning the ET 200SP on PROFIBUS DP

Requirements

- The CPU/interface module is in the "Factory settings" status or has been reset to factory settings (see section Interface module (https://support.automation.siemens.com/WW/view/en/55683316/133300)).
- For CPU: The SIMATIC memory card is as delivered or has been formatted.

13.3.1 ET 200SP as a DP master

Configuration example

To use the ET 200SP distributed I/O system as a DP master, you need the CPU 151xSP-1 PN and the CM DP communication module.

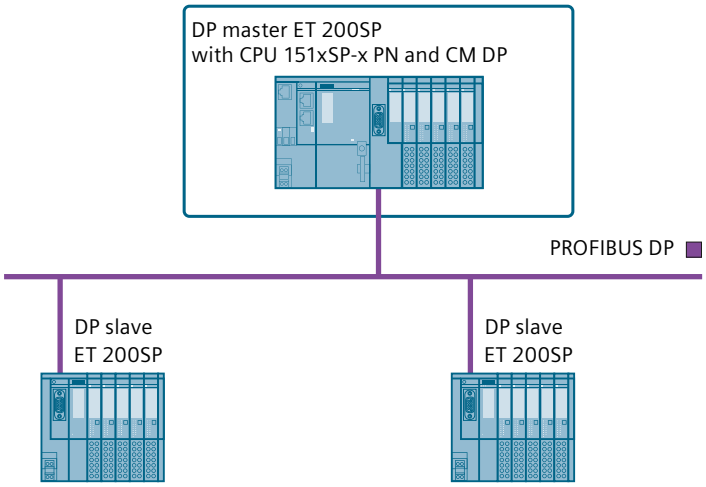

Figure 1-139 ET 200SP as a DP master

Commissioning procedure

To commission the ET 200SP distributed I/O system as a DP master on PROFIBUS DP, we recommend the following procedure:

Table 1-383 Procedure for commissioning the ET 200SP as a DP master on the PROFIBUS DP

Step	Procedure	See ...
1	Installing ET 200SP (with CPU and CM DP)	Section Installation (Page 116)
2	Connecting ET 200SP • Supply voltages • PROFIBUS DP • Sensors and actuators	Section Wiring (Page 148)
3	Inserting a SIMATIC memory card in the DP master (CPU)	Section Removing/inserting a SIMATIC memory card on the CPU (Page 287)

13.3.2 ET 200SP as I-slave

Configuration example

To use the ET 200SP distributed I/O system as I-slave, you need the CPU 151xSP-1 PN and the CM DP communication module.

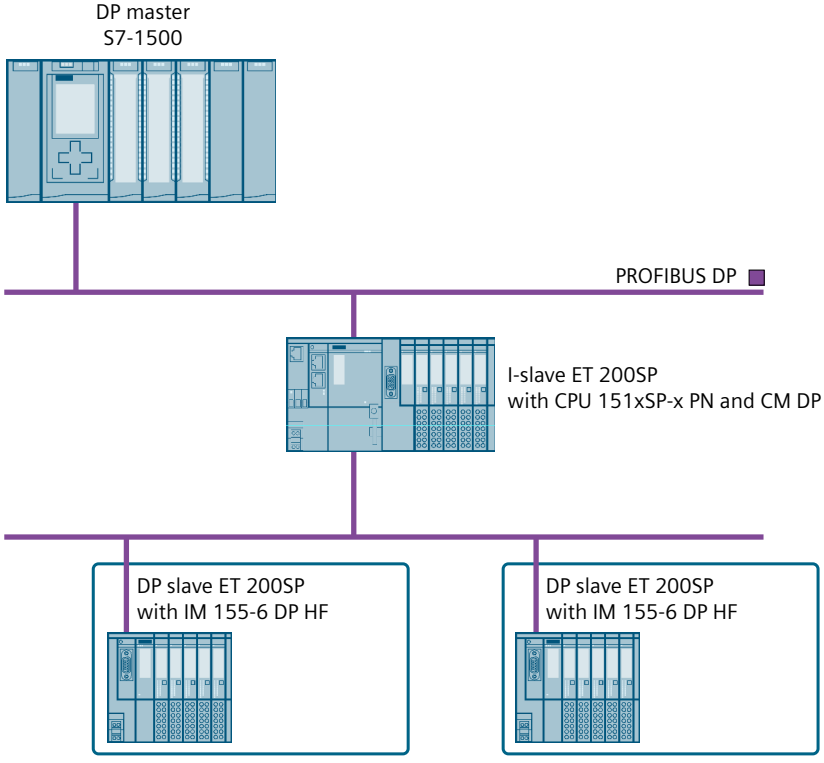

Figure 1-140 ET 200SP as I-slave

Commissioning procedure

For commissioning of the ET 200SP distributed I/O system as an I-slave on the PROFIBUS DP, we recommend the following procedure:

Table 1-384 Procedure for commissioning the ET 200SP as an I-slave for PROFIBUS DP

Step	Procedure	See ...
1	Installing ET 200SP (with CPU and CM DP)	Section Installation (Page 116)

13.4 Startup of the ET 200SP with empty slots

Procedure

You can configure the ET 200SP distributed I/O system with any number of empty slots.

To build the ET 200SP distributed I/O system with any number of empty slots, follow these steps:

1. Cover all empty slots with BU covers.
2. Finish the configuration with a server module.

Special consideration: A "Module missing in slot x" diagnostic message is generated by the CPU/interface module for empty slots in which I/O modules are configured.

13.5 Removing/inserting a SIMATIC memory card on the CPU

Requirement

The CPU only supports pre-formatted SIMATIC memory cards. If necessary, delete all previously stored data before using the SIMATIC memory card. You can find more information on deleting the content of the SIMATIC memory card in the function manual Structure and use of the CPU memory.

In order to work with the SIMATIC memory card, first ensure that the SIMATIC memory card is not write-protected. If it is, move the slider out of the lock position.

Inserting the SIMATIC memory card

To insert a SIMATIC memory card, follow these steps:

1. Ensure that the CPU is either switched off or in STOP mode.
2. Insert the SIMATIC memory card, as depicted on the CPU, into the slot for the SIMATIC memory card.

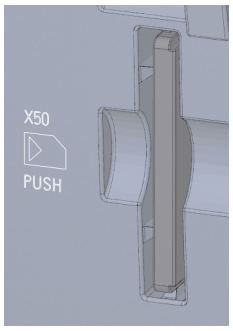

Figure 1-142 Slot for the SIMATIC memory card

3. Insert the SIMATIC memory card with light pressure into the CPU, until the SIMATIC memory card latches.

Removal of the SIMATIC memory card

To remove a SIMATIC memory card, follow these steps:

1. Switch the CPU to STOP mode.
2. Press the SIMATIC memory card into the CPU with light pressure. After audible unlatching of the SIMATIC memory card, remove it.

Only remove the SIMATIC memory card in POWER OFF or STOP mode of the CPU. Ensure that no writing functions (online functions with the programming device, e.g. loading/deleting a block, test functions) are active in STOP mode or were active before POWER OFF.

Reactions after removing/inserting the SIMATIC memory card

Inserting and removing the SIMATIC memory card in STOP, STARTUP or RUN mode triggers a re-evaluation of the SIMATIC memory card. The CPU hereby compares the content of the configuration on the SIMATIC memory card with the backed-up retentive data. If the backed-up retentive data matches the data of the configuration on the SIMATIC memory card, the retentive data is retained. If the data differs, the CPU automatically performs a memory reset (which means the retentive data is deleted) and then goes to STOP.

The CPU evaluates the SIMATIC memory card, and this is indicated by the RUN/STOP LED flashing.

Reference

You can find more information on the SIMATIC memory card in the function manual Structure and use of the CPU memory (https://support.industry.siemens.com/cs/ww/en/view/59193101).

13.6 Operating modes of the CPU

Introduction

Operating modes describe the status of the CPU. The following operating modes are possible using the mode selector:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate, for example, via the PROFINET interface.

The status LEDs on the front of the CPU indicate the current operating mode.

13.6.1 STARTUP mode

Behavior

Before the CPU starts to execute the cyclic user program, a startup program is executed.

By suitably programming startup OBs, you can specify initialization tags for your cyclic program in the startup program. You have the option of programming no, one or several startup OBs.

Special features during startup

Note the following points regarding STARTUP mode:

- The CPU resets the process image input.
- All outputs are disabled or respond as configured for the given module: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe operational status.
- Before processing the start-up routine, the CPU transfers the I/O inputs to the process image input.
- After processing the start-up routine, the CPU releases the peripheral outputs.

NOTE

To read the current state of inputs during STARTUP, you can access inputs via the process image or via direct I/O access.
To initialize outputs during STARTUP, you can write values via the process image or via direct I/O access. The values are output to the outputs during the transition to RUN mode.

- The CPU always starts up in warm restart mode.
  - The non-retentive bit memory, timers and counters are initialized.
  - The non-retentive tags in data blocks are initialized.
- During startup, cycle-time monitoring is not yet running
- The CPU processes the startup OBs in the order of the startup OB numbers. The CPU processes all programmed startup OBs regardless of the selected startup mode. (Figure "Setting the startup behavior").

- If a corresponding event occurs, the CPU can start the following OBs during startup:
  - OB 82: Diagnostics interrupt
  - OB 83: Pull/plug interrupt for modules
  - OB 86: Rack error
  - OB 121: Programming error (only for global error handling)
  - OB 122: I/O access error (only for global error handling)

    You can find a description of how to use global and local error handling in the STEP 7 online help.

  The CPU does not start all the other OBs until the transition to RUN mode.

Response when expected and actual configurations do not match

The configuration downloaded to the CPU represents the expected configuration. The actual configuration is the actual configuration of the ET 200SP distributed I/O system. If the expected configuration and actual configuration do not match, the setting of the "Comparison preset to actual configuration" parameter determines the behavior of the CPU. You can find additional information on hardware compatibility in the section Operating mode transitions (Page 293).

Cancellation of startup

If errors occur during startup, the CPU cancels startup and returns to STOP mode.

The CPU does not perform the startup or interrupts the startup under the following conditions:

- You have not inserted a SIMATIC memory card or have inserted an invalid one.
- You have not downloaded a hardware configuration to the CPU.

Configuring the startup behavior

You configure the behavior of the CPU in the Startup group in the CPU properties.

Setting the startup behavior

To set the startup behavior, follow these steps:

1. Select the CPU in the device view of the STEP 7 hardware network editor.
2. In the properties under "General" select the "Startup" area.

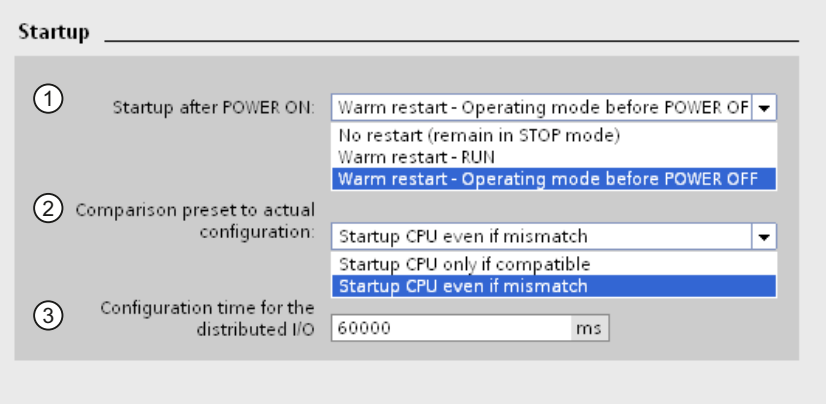

Figure 1-143 Setting the startup behavior

① Sets the startup type after POWER ON

② Defines the startup behavior when a module in a slot does not correspond to the configured module. You can set this parameter centrally, on the CPU or for each module. When you change the setting for a module, the setting made centrally for this module no longer applies.

- Startup CPU only if compatible: In this setting a module on a configured slot has to be compatible with the configured module. Compatible means that the module matches in terms of the number of inputs and outputs and with respect to its electrical and functional properties.
- Startup CPU even if mismatch: With this setting the CPU starts up regardless of the type of module plugged in.

③ Specifies a maximum period (default: 60000 ms) in which the I/O must be ready for operation. The CPU changes to RUN.

If the central and distributed I/O is not ready for operation within the configuration time, the startup characteristics of the CPU depends on the setting of the "Comparison preset to actual configuration" parameter.

Example for the "Comparison preset to actual configuration" parameter

"Startup CPU only if compatible":

The DI 16x24VDC ST input module with 16 digital inputs is a compatible replacement for a DI 8x24VDC ST input module with 8 digital inputs. The pin assignment and all electrical and functional properties are identical.

"Startup CPU even if mismatch":

Instead of a configured digital input module, you insert an analog output module or no module is present in this slot and thus in all subsequent slots. Although the configured inputs cannot be accessed, the CPU starts up.

Note that the user program cannot function correctly in this case and take the appropriate measures.

13.6.2 STOP mode

Behavior

The CPU does not execute the user program in STOP mode.

All outputs are disabled or react according to the parameter settings for the particular I/O module: They provide a substitute value as set in the parameters or retain the last value output keeping the controlled process in a safe operating status.

In STOP mode, the motor starter responds according to how it was parameterized for the CPU STOP state. The CPU STOP state can be circumvented with the manual local control (Local Control) function. If the CPU is switched off, a motor can be switched on in the motor starter's commissioning mode.

You will find additional information in the Motor starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) manual.

13.6.3 RUN mode

Behavior

In "RUN" mode the cyclic, time-driven, and interrupt-driven program is executed. Addresses that are in the "Automatic Update" process image are automatically updated in each program cycle. See also the section Process images and process image partitions (Page 199).

Execution of the user program

Once the CPU has read the inputs, the cyclic program is executed from the first instruction to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is finished even if the user program is completed sooner.

A cycle monitoring time is set to ensure that the cyclic program is completed within a specified time. You can change the cycle monitoring time to suit your requirements. If the cyclic program has not finished running within this time, the system responds with a time error.

Further events such as hardware interrupts and diagnostics interrupts can interrupt the cyclic program flow and prolong the cycle time.

Reference

Further information about cycle and response times is available in the Function Manual Cycle and response times (https://support.automation.siemens.com/WW/view/en/59193558).

13.6.4 Operating mode transitions

Operating modes and operating mode transitions

The following figure shows the operating modes and the operating mode transitions:

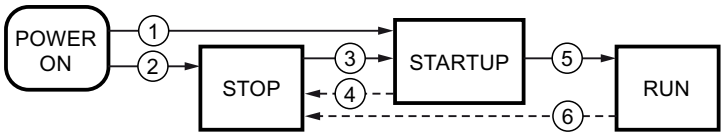

Figure 1-144 Operating modes and operating mode transitions

The table below shows the effects of the operating mode transitions:

Table 1-386 Operating mode transitions

No.	Operating mode transitions		Effects
①	POWER ON → STARTUP	After switching on, the CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • The preceding "POWER OFF" was triggered by an interruption in the power supply. • Startup type "Warm restart - RUN" is set. Or • Startup type "Warm restart - mode before POWER OFF" is set and the CPU was in RUN mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
②	POWER ON → STOP	After switching on, the CPU goes to "STOP" mode if: • The hardware configuration and program blocks are inconsistent. Or • The "No restart" startup type is set. Or • Startup type "Warm restart - mode before POWER OFF" is set and the CPU was in STOP mode before POWER OFF.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: • The hardware configuration and program blocks are consistent. • You set the CPU to "RUN" mode via the programming device and the mode switch in is RUN position. Or • You set the mode switch from STOP to RUN.	The CPU clears the non-retentive memory, and resets the content of non-retentive DBs to the start values of the load memory. Retentive memory and retentive DB contents are retained. The 500 newest entries in the diagnostics buffer are retained.
④	STARTUP → STOP	In the following cases, the CPU goes from "STARTUP" to "STOP" mode when: • The CPU detects an error during startup. • You set the CPU to "STOP" via the programming device or mode switch. • The CPU executes a STOP command in the Startup OB.	These operating mode transitions have no effect on data.

No.	Operating mode transitions		Effects
⑤	STARTUP → RUN	In the following cases, the CPU goes from "STARTUP" to "RUN" mode when: • The CPU has initialized the PLC tags. • The CPU has executed the startup blocks successfully.	These operating mode transitions have no effect on data.
⑥	RUN → STOP	In the following cases, the CPU goes from "RUN" back to "STOP" mode when: • The CPU detects an error which prevents further work. • The CPU executes a STOP command in the user program. • You set the CPU to "STOP" via the programming device or mode switch.	

13.7 CPU memory reset

Basics of a memory reset

The CPU must be in STOP mode for a memory reset.

A memory reset returns the CPU to its "initial state".

Memory reset means:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data (applies only to manual memory reset by the user) are deleted.
- The diagnostics buffer, time of day, IP address and the device name are retained.
- Subsequently the CPU is initialized with the loaded project data (hardware configuration, code and data blocks, force jobs). The CPU copies this data from the load memory to the work memory.

  Result:

  – If you set an IP address in the hardware configuration ("Set IP address in the project" option) and a SIMATIC memory card with the project is in the CPU, this IP address is valid after the memory reset.
  – Data blocks no longer have current values but rather their configured start values.
  – Force jobs remain active.

Detecting a CPU memory reset

The RUN/STOP LED flashes yellow at 2 Hz. After completion, the CPU switches to STOP. The RUN/STOP LED is on (constant yellow light).

Result after memory reset

The following table provides an overview of the contents of the memory objects after memory reset.

Table 1-387 Memory objects after memory reset

Memory object	Content
Actual values of the data blocks, instance data blocks	Initialized
Bit memory, timers and counters	Initialized
Retentive tags from technology objects (for example, adjustment values of absolute encoders)*	Retained
Diagnostics buffer entries	Retained
IP address	Retained
Device name	Retained
Counter readings of the runtime meters	Retained
Time of day	Retained

* The retentive tags from technology objects are retained but the content of certain tags is re-initialized in some cases.

NOTE

Password for protection of confidential configuration data

The password for protection of confidential configuration data is retained after a memory reset of the CPU. The password is only deleted when the "Delete password for protection of confidential PLC configuration data" option is set.

You can find additional information on the password for protection of confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) function manual.

13.7.1 Automatic memory reset

Possible causes of automatic memory reset

The CPU executes an automatic memory reset if an error occurs that prevents normal further processing.

Causes of such errors are:

- User program is too large, and cannot be completely loaded into work memory.
- The project data on the SIMATIC memory card is corrupt, for example, because a file was deleted.
- If you remove or insert the SIMATIC memory card and the backed-up retentive data differs in structure from that of the configuration on the SIMATIC memory card.

13.7.2 Manual memory reset

Reason for a manual memory reset

CPU memory reset is required to reset the CPU to its "original state".

CPU memory reset

Two options are available for performing a CPU memory reset:

- Using the mode selector
- Using STEP 7

Procedure using the mode selector

NOTE

Memory reset ↔ Reset to factory settings

The procedure described below also corresponds to the procedure for resetting to factory settings:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

To reset the CPU memory using the mode selector, proceed as follows:

1. Set the mode selector to the STOP position.
   Result: The RUN/STOP LED lights up yellow.
2. Set the mode selector to the MRES position. Hold the selector in this position until the RUN/STOP LED lights up for the 2nd time and remains continuously lit (this takes three seconds). After this, release the switch.
3. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes memory reset.

For information on resetting the CPU to factory settings, refer to the section Resetting the CPU to factory settings (Page 328).

Procedure using STEP 7

For a memory reset of the CPU using STEP 7 proceed as follows:

1. Open the "Online Tools" task card of the CPU.
2. Click the "MRES" button in the "CPU control panel" pane.
3. Click "OK" in response to the confirmation prompt.

Result: The CPU switches to STOP mode and performs a memory reset.

13.8 Reassigning parameters during operation

Introduction

You have the option of reassigning the parameters for the ET 200SP I/O modules during operation.

Changing parameters during operation

You make the parameter settings of the I/O modules using data records. Each I/O module has a separate data record. The instruction "WRREC" applies the changed parameters to the I/O module. The parameters that you have set with STEP 7 are not changed. After a POWER OFF/POWER ON of the ET 200SP, the parameters set with STEP 7 are valid again.

If you are using the CPU as an I-device, you reassign the parameters of the I/O modules via the I-device.

NOTE

If you write data records from the user program to the modules of the distributed I/O, make sure that these modules actually exist and are available. You can evaluate OB83 for this purpose. After inserting a module, the CPU does not call OB83 until the module has started up and its parameters are assigned. This ensures the execution of the data record operations without errors.

NOTE

You need to transfer the new parameters with the "WRREC" instruction after a POWER OFF/POWER ON of the ET 200SP.

Instruction for parameter assignment

The following instruction is provided for assigning parameters to the I/O module in the user program:

Instruction	Application
"WRREC"	Transfer the modifiable parameters to the addressed ET 200SP module.

Error message

In the event of an error, the following return values are reported:

Table 1-388 Error message

Error code	Meaning
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Reference

You can find the structure of the parameter data record and the module-specific error codes in the manuals of the I/O modules (https://support.automation.siemens.com/WW/view/es/55679691/133300).

13.9 Backing up and restoring the CPU configuration

13.9.1 Overview

Backup from online device
You make changes where necessary in the system operation. You add new devices, replace existing devices or adapt the user program. If these changes result in undesirable behavior, you can restore the plant to an earlier state. Before you load a changed configuration to the CPU, first use the option "Backup from online device" to create a complete backup of the current device status. If you have assigned a password to protect confidential PLC configuration data, then this password is not secured.

When a backup is restored that has a password set for protection of confidential configuration data, the following applies:
The password in the CPU must match the password in the backup.
Transfer the password to the CPU before restoring the backup. You transfer the password either using a SIMATIC Memory Card or online in STEP 7 via "Online & Diagnostics". If the password in the CPU does not match the password entered in STEP 7, the SIMATIC Memory Card will be rejected when restoring the backup. The CPU generates an entry in the diagnostic buffer.

You can find more information in section Protection of confidential configuration data (Page 222) and in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) Function Manual.

Upload from device (software)
With the option "Upload from device (software)", you load the software project data from the CPU to an existing CPU in the project.

Upload device as new station
If you are operating a new PG/PC on a system, the STEP 7 project that was used to create the system configuration might not be available. In this case, you upload the data to a project in your PG/PC with the "Upload device as new station" option.

Snapshot of the monitor values
To allow you to restore the actual values after changes, back up the actual values of the data blocks with the "Snapshot of the monitor values" option.

Overview of backup types

The table below shows the backup of CPU data depending on the selected type of backup and its specific characteristics:

	Backup from online device	Upload from device (software)	Upload device as new station	Snapshot of the monitor values
Current values of all DBs (global and instance data blocks) [1]	✓	✓	✓	✓
Blocks of the type OB, FC, FB and DB	✓	✓	✓	--
PLC tags (tag names and constant names)	✓	✓	✓	--
Technology objects	✓	✓	✓	✓ [3]
Hardware configuration	✓	--	✓	--
Actual values (bit memories, timers, counters)*	✓	--	--	--
Contents of the SIMATIC memory card	✓	--	--	--
Archives, recipes	✓	--	--	--
Entries in the diagnostics buffer	--	--	--	--
Current time	--	--	--	--
Properties of the type of backup				
Backup possible for fail-safe CPUs	✓	✓ [2]	--	✓
Backup can be edited	--	✓	✓	✓
Backup possible in operating mode	STOP	RUN, STOP	RUN, STOP	RUN, STOP

1) Only the values of the tags that are set as retentive are saved.

2) Only possible in the STOP operating state and for individual fail-safe blocks.

3) Nur die High_Speed_Counter and SSI_Absolute_Encoder modules

Example: Backup from online device

The following example shows the procedure for a complete backup of the current device state of the CPU in STEP 7. The S7-1500 automation system is in RUN mode. Before the backup, the CPU goes into STOP mode.

To start the backup, proceed as follows:

1. Right-click on the CPU in the project tree.
2. Select the "Backup from online device" command from the context menu.
   The "Upload preview" dialog window summarizes key information about the upcoming backup. You must switch the CPU to STOP mode to perform a backup.
3. In the "Action" column, select the "Stop module" command from the drop-down menu.
4. Click "Upload from device". The CPU switches to STOP mode. The backup of the CPU data starts. The backup is saved in the folder of the CPU under "Online backups" in the project tree.

Example: Restoring backup from online device

If you have backed up the CPU data earlier, you can transfer the backup back to the device. The saved backup is then restored on the CPU.

The automation system is in RUN mode. Before the restore operation, the CPU goes into STOP mode.

To start restoring the backup, proceed as follows:

1. Expand the folder of the CPU in the project tree. The lower-level objects are displayed.
2. Open the "Online backups" folder.
3. Select the backup you want to restore.
4. In the "Online" menu, select the "Download to device" command.
5. The "Load preview" dialog window summarizes key information about the upcoming restore operation. You must switch the CPU to STOP mode to restore a backup.
6. In the "Action" column, select the "Overwrite" command from the drop-down menu.
7. Click "Load". The CPU switches to STOP mode. The backup is transferred to the CPU and restored. The "Load results" dialog then opens. In this dialog, you can check whether the download was successful and select any other actions (no action, start modules).
8. Click the "Finish" button.

Rules for backup and restore

Observe the following rules when backing up/restoring:

- Complete the process quickly and without interruptions.
- The CPU and the programming device must be in a protected network.
- Decide in advance whether you want to back up/restore the data of a CPU in STEP 7 or via the web server of the CPU.
  If you start the operation in STEP 7, you must also finish it in STEP 7. The same applies if you use the web server.
  - To perform the operation in STEP 7, the user requires either the "PLC administrator" role or a role with the "Full access" function right.
  - To perform the operation via the web server of the CPU, the user requires a role with the "Create a backup of the CPU" or "Restore the CPU using a backup file" function right.
- The user who starts the operation must also complete the operation.
- If a user cancels the operation or the CPU cancels the operation due to an error, only the user who canceled the operation can resume it. To do so, the following intermediate steps are required:
  - Reset to factory settings
  - Download from STEP 7
  - Start a new backup/restore

Reference

You can find more information on the different backup types in the STEP 7 online help.

Emergency address (emergency IP)

The emergency address (emergency IP address) of a CPU was conceived for diagnostic and downloading functions, e.g. if the CPU can no longer be reached via the IP protocol due to loading of an incorrect project. You can find information on the emergency address in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) function manual.

Archiving multilingual project texts

When you configure a CPU, different categories of texts come into being, e.g.

- Object names (names of blocks, modules, tags, etc.)
- Comments (for blocks, networks, watch tables, etc.)
- Messages and diagnostic texts

Texts are provided by the system (e.g. diagnostic buffer texts) or are created during configuration (e.g. messages).

In a project, texts exist in one single language or in several languages after a translation process. You can maintain project texts in all languages, which are at your disposal in the project navigator (Languages & Resources > Project Texts). The texts arising during configuration can be loaded into the CPU.

The following texts containing the project data are loaded into the CPU in the chosen languages and are also used by the Web server:

- Diagnostic buffer texts (not editable)
- Module status texts (not editable)
- Message texts with associated text lists
- Tag comments and step comments for S7 GRAPH and PLC Code Viewer
- Comments in watch tables

The following texts containing the project languages are also loaded into the CPU in the chosen languages, but are not used by the Web server:

- Comments in tag tables (for tags and constants)
- Comments in global data blocks
- Comments of elements in block interfaces of FBs, FCs, DBs and UDTs
- Network titles in data blocks that are written in ladder logic (LAD), function block diagram (FBD) or statement list (STL)
- Block comments
- Network comments
- Comments of LAD and FBD elements

The CPUs support archiving of multilingual project texts in up to three different project languages. If the project texts for a particular project language nevertheless exceed the memory space reserved for them, the project cannot be downloaded to the CPU. The download is aborted with a notice that not enough memory space is available. In such a case, take measures to reduce the required storage space, for example by shortening comments.

NOTE

Size of the SIMATIC memory card

If, when loading projects, the required memory space is more extensive/larger than the memory space on the
SIMATIC memory card used, the download to the CPU is canceled. You receive an error message.
Therefore, make sure that there is enough available storage space on your SIMATIC memory card for loading projects.

You will find information on reading out the storage space capacity utilization of the CPU and the SIMATIC memory card in the Structure and use of the CPU memory (https://support.industry.siemens.com/cs/de/de/view/59193101/en) function manual.

You will find information on parameterization of multilingual project texts in STEP 7 in the STEP 7 online help.

13.10 Time synchronization

Introduction

All CPUs are equipped with an internal clock. The clock shows:

- The time of day with a resolution of 1 millisecond
- The date and the day of the week

The CPU takes into account the time change caused by daylight saving time.

You can synchronize the time of the CPUs with an NTP server in NTP mode (NTP: Network Time Protocol).

Operating principle

In NTP mode, the device sends time queries at regular intervals (in client mode) to the NTP server in the subnet (LAN). Based on the replies of the servers, the most reliable and most accurate time is calculated and the time of day of the CPU is synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. You can synchronize the time of day of up to a maximum of four NTP servers. You address a communications processor or an HMI device, for example, as sources for time synchronization via the IP addresses.

The update interval defines the interval between the time queries (in seconds). The value range of the interval is between 10 seconds and one day. In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. UTC corresponds to GMT (Greenwich Mean Time).

NTP server for the ET 200SP CPU

You can assign an ET 200SP CPU to up to 4 NTP servers.

You have the following options to reset the IP addresses of the NTP servers:

- Configure IP addresses of the NTP servers in STEP 7.
- Set IP addresses of the NTP servers with the "T_CONFIG" instruction.
- Obtain IP addresses of the NTP servers via DHCP.
  As of firmware version V2.9, the CPU can also obtain the NTP servers via DHCP. You can find more information on the procedure and the DHCP communication protocol in the Communication (https://support.industry.siemens.com/cs/ww/de/view/59192925/en) function manual.

Configuring IP addresses of the NTP servers in STEP 7

To configure the IP addresses of the NTP servers in STEP 7, follow these steps:

1. Select the ET 200SP CPU in STEP 7.
2. In the properties of the CPU, navigate to "Time of day" > "Time synchronization"> "NTP mode".
3. For "Time synchronization:", select "Set NTP server in the project" from the drop-down list.
4. Enter the IP addresses of up to four NTP servers for "Server 1" to "Server 4".
5. Set the time interval of time queries for "Update interval". Set the update interval to between 10 s and 86400 s.

Setting the IP addresses of the NTP servers with the "T_CONFIG" instruction

Requirements:

- You selected the option "Set NTP server directly on the device (e.g. PLC program, display)" in the "Time synchronization" drop-down list in STEP 7.

Proceed as follows to set the IP addresses of the NTP servers with the T_CONFIG instruction:

1. Enter the IP addresses of up to four NTP servers in a tag of the data type IF_CONF_NTP.
2. Interconnect the tag of data type IF_CONF_NTP at the block parameter CONF_DATA of the T_CONFIG instruction.
3. Call the T_CONFIG instruction in the user program.

Result: The addresses of the NTP servers from the T_CONFIG instruction are transferred to the CPU.

If necessary, you can change the addresses of the NTP servers several times with T_CONFIG.

Reference

For additional information on time synchronization in the automation environment, refer to the following FAQ on the Internet (https://support.industry.siemens.com/cs/de/en/view/86535497).

13.10.1 Example: Configuring and changing NTP server

Automation task

You are using your own NTP server in your network with the IP address 192.168.1.15. Your own server provides you with the following advantages:

- Protection against unauthorized accesses from outside
- Every device that you synchronize with your own NTP server uses the same time.

You want to synchronize the ET 200SP CPU with this NTP server.

The following sections describe how to configure the IP address of the NTP server in STEP 7 or set it in the user program.

Configuring the IP address of the NTP server in STEP 7

Procedure

1. Select the ET 200SP CPU in STEP 7.
2. In the properties of the CPU, navigate to "Time of day" > "Time synchronization"> "NTP mode".
3. For "Time synchronization:", select "Set NTP server in the project" from the drop-down list.
4. For "Server 1:", enter the IP address of the NTP server: 192.168.1.15.
5. Download the hardware configuration to the CPU.

Result

The CPU synchronizes the time with the NTP server 192.168.1.15.

Set IP addresses of the NTP server with the "T_CONFIG" instruction

Requirements:

- You selected the option "Set NTP server directly on the device (e.g. PLC program, display)" in the "Time synchronization" drop-down list in STEP 7.

To set the IP address for the NTP server, use the following block parameters of the "T_CONFIG" instruction:

- Req: A positive edge at the block parameter "Req" starts a job of the "T_CONFIG" instruction.
- Interface: Enter the HW ID of the PROFINET interface 1 of the CPU at the block parameter "Interface". In this example, the HW ID is "64".
- Conf_Data: Area in which you save the IP addresses of the NTP server. Use the data type "IF_CONF_NTP" for this purpose.

Procedure

Proceed as follows to set the IP address of the NTP server in the user program to "192.168.1.15":

1. Create a global data block in the project tree under "Program blocks > Add new block". Name the global data block "NTP".
2. Create a tag of the data type "IF_CONF_NTP" in the global data block "NTP".

NTP

	Name	Data type	Start value	Comment
1	Static			
2	NTP_Server	IF_CONF_NTP		
3	Id	UInt	17	
4	Length	UInt	22	
5	Mode	UInt	0	
6	NTP_IP	Array[1..4] of IP_V4		
7	NTP_IP[1]	IP_V4		
8	ADDR	Array[1..4] of Byte		IPv4 address
9	ADDR[1]	Byte	192	IPv4 address
10	ADDR[2]	Byte	168	IPv4 address
11	ADDR[3]	Byte	1	IPv4 address
12	ADDR[4]	Byte	10	IPv4 address
13	NTP_IP[2]	IP_V4		
14	NTP_IP[3]	IP_V4		
15	NTP_IP[4]	IP_V4		
16	change_NTP-Server	Bool	false	
17	done	Bool	false	
18	busy	Bool	false	
19	error	Bool	false	
20	status	DWord	16#0	
21	err_loc	DWord	16#0	

Figure 1-145 Example: Data block with IF_CONF_NTP

3. Create a "T_CONFIG" instruction in the user program.
4. Connect the "T_CONFIG" instruction as follows.

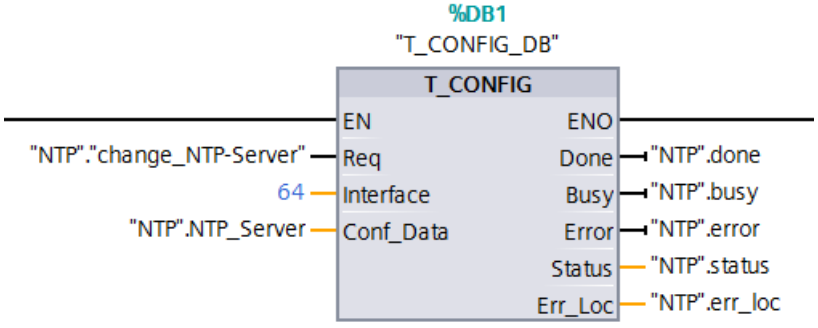

Figure 1-146 Example T_CONFIG: Changing the NTP server

5. In the user program, assign the IP address 192.168.1.15 to the data type "IF_CONF_NTP":
```
"NTP".NTP_Server.NTP_IP[1].ADDR[1] := 192;
"NTP".NTP_Server.NTP_IP[1].ADDR[2] := 168;
"NTP".NTP_Server.NTP_IP[1].ADDR[3] := 1;
"NTP".NTP_Server.NTP_IP[1].ADDR[4] := 15;
```
6. Generate a positive edge for the tag "change_NTP-Server" in the user program:
```
"NTP"."change_NTP-Server" := true;
```

Result
The CPU synchronizes the time with the NTP server 192.168.1.15.

13.11 Identification and maintenance data

13.11.1 Reading out and entering I&M data

I&M data

Identification and maintenance data (I&M data) is information saved on the module. The data is:

- Read-only (I-data) or
- Readable/writable (M-data)

Identification data (I&M0): Manufacturer information about the module that can only be read. Some identification data is also printed on the housing of the module, for example article number and serial number.
Maintenance data (I&M1, 2, 3): Plant-dependent information, e.g. installation location. Maintenance data is created during configuration and downloaded to the module.
All modules of the ET 200SP distributed I/O system support identification data (I&M0 to I&M3).

The I&M identification data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a plant
- Correcting errors in a plant

Modules can be clearly identified online using the I&M identification data.

Maintenance data (I&M4): Storage of a CRC checksum for interface modules IM 155-6 PN ST for ensuring data integrity of data used by the interface module.

NOTE
The BusAdapter and the interface module IM 155-6 PN HF support the identification data I&M0 to I&M4 (signature).

Options for reading out I&M data

- Via the user program
- Via STEP 7 or HMI devices
- Via the CPU web server

Reading I&M data via the user program

You have the following options to read the modules' I&M data in the user program:

- Using the RDREC instruction
  The record structure for distributed modules that are accessible via PROFINET IO/PROFIBUS DP, is described in the chapter Record structure for I&M data (Page 308).
- Using the Get_IM_Data instruction

Reference

The description of the instructions can be found in the STEP 7 online help.

Reading I&M data via STEP 7

Requirements: There must be an online connection to the CPU/interface module.

To read I&M data using STEP 7, follow these steps:

1. In the project tree, under "Distributed I/O" select the IO device IM 155-6 PN ST (for example)
2. Select **> IO device > Online & diagnostics > Identification & Maintenance**.

Entering maintenance data via STEP 7

STEP 7 assigns a default module name. You can enter the following information:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)

To enter maintenance data via STEP 7, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the interface module, for example.
2. In the properties under "General", select the "Identification & Maintenance" area and enter the data.

During the loading of the hardware configuration, the I&M data is also loaded.

Procedure for reading I&M data via the Web server

The procedure is described in detail in the Web server (https://support.automation.siemens.com/WW/view/en/59193560) Function Manual.

13.11.2 Data record structure for I&M data

Reading I&M records via the user program (distributed via PROFINET IO)

You directly access specific identification data using **Read data record** ("RDREC" instruction). You obtain the corresponding part of the identification data under the relevant data record index.

The data records are structured as follows:

Table 1-389 Basic structure of data records with I&M identification data

Content	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H I&M4: 0024_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H I&M4: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	I&M0/index $AFF0_H$: 54 I&M1/index $AFF1_H$: 54 I&M2/index $AFF2_H$: 16 I&M3/index $AFF3_H$: 54 I&M4/Index $AFF4_H$: 54	

Table 1-390 Data record structure for I&M identification data

Identification data	Access	Default	Explanation
Identification data 0: (data record index AFF0 hex)			
VendorIDHigh	Read (1 byte)	00_H	This is where the name of the manufacturer is stored (42_D = SIEMENS AG).
VendorIDLow	Read (1 byte)	$2\ A_H$	
Order_ID	Read (20 bytes)	6ES7155-6AU02-0BN0	Article number of the module (e.g. of the IM 155-6 PN ST interface module)
IM_SERIAL_NUMBER	Read (16 bytes)	-	Serial number (device-specific)
IM_HARDWARE_REVISION	Read (2 bytes)	1	Corresponding HW version

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the assigned modules support I&M4 data.

Identification data	Access	Default	Explanation
IM_SOFTWARE_REVISION	Read	Firmware version	Provides information about the firmware version of the module
• SWRevisionPrefix	(1 byte)	V	
• IM_SWRevision_Functional_Enhancement	(1 byte)	00 - FF_H	
• IM_SWRevision_Bug_Fix	(1 byte)	00 - FF_H	
• IM_SWRevision_Internal_Change	(1 byte)	00 - FF_H	
IM_REVISION_COUNTER	Read (2 bytes)	0000_H	Provides information about parameter changes on the module (not used)
IM_PROFILE_ID	Read (2 bytes)	0000_H	Generic Device
IM_PROFILE_SPECIFIC_TYPE	Read (2 bytes)	0005_H	Interface modules/BusAdapters
		0003_H	I/O modules and motor starters
		0001_H	CPU
IM_VERSION	Read	0101_H	Provides information on the version of the identification data (0101_H = Version 1.1)
• IM_Version_Major	(1 byte)		
• IM_Version_Minor	(1 byte)		
IM_SUPPORTED	Read (2 bytes)	$000E_H$	Provides information about the available identification data (I&M1 to I&M3)
Maintenance data 1: (data record index AFF1 hex)			
IM_TAG_FUNCTION	Read/write (32 bytes)	-	Enter a module identifier here that is unique plant-wide.
IM_TAG_LOCATION	Read/write (22 bytes)	-	Enter the installation location of the module here.
Maintenance data 2: (data record index AFF2 hex)			
IM_DATE	Read/write (16 bytes)	YYYY-MM-DD HH:MM	Enter the installation date of the module here.
Maintenance data 3: (data record index AFF3 hex)			
IM_DESCRIPTOR	Read/write (54 bytes)	-	Enter a comment describing the module.
Maintenance data 4: (data record index AFF4 hex)			
USI	Read (4 bytes)	0x63726331	UserstructureIdentifier: Internal, fixed value
CHK_OVERALL	Read (4 bytes)	-	Overall CRC of all individual CRCs
CHK_OVERALL_SUBS	Read (4 bytes)	0 or value*	Overall CRC of all assigned modules of the IM
CHK_STATIC_LOCAL	Read (4 bytes)	-	CRC of static data of the IM
CHK_STATIC_SUBS	Read (4 bytes)	0 or value*	CRC of all static data of the modules of the IM
CHK_OVERALL_SETUP	Read (4 bytes)	-	Overall CRC of all setup data of the IM and modules of the IM
CHK_REMANENT_LOCAL	Read (4 bytes)	-	CRC of retentive data of the IM
CHK_REMANENT_SUBS	Read (4 bytes)	0 or value*	CRC of all retentive data of the modules of the IM

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the assigned modules support I&M4 data.

Identification data	Access	Default	Explanation
CHK_WORKING_LOCAL	Read (4 bytes)	-	CRC of the parameters in STEP 7 for the IM
CHK_WORKING_SUBS	Read (4 bytes)	0 or value*	CRC of all parameters in STEP 7 for the modules of the IM
NOT USED	Read (14 bytes)	0	14 reserved bytes

* A value of 0 indicates that the IM firmware does not yet support the CRC calculation of the assigned modules.
If the value is ≠ 0, the IM supports this function, regardless of whether the assigned modules support I&M4 data.

Reading I&M data records with data record 255 (distributed via PROFIBUS DP)

The modules support standardized access to identification data via DS 255 (index 65000 to 65003). For more information on the DS 255 data structure, refer to the specifications of the Profile Guidelines Part 1: Identification & Maintenance Functions, Order No.: 3.502, Version 2.1, May 2016

13.11.3 Example: Read out firmware version of the CPU with Get_IM_Data

Automation task

You want to check whether the modules in your automation system have the current firmware. You can find the firmware version of the modules in the I&M0 data. The I&M0 data is the basic information for a device. The I&M0 data contains information such as:

- Manufacturer ID
- Order number, serial number
- Hardware and firmware version

To read out the I&M0 data, use the "Get_IM_Data" instruction. You read the I&M0 data of all the modules in the user program of the CPU using "Get_IM_Data" instructions and store it in a data block.

Conditions and parameters

To read out the I&M data of the CPU, use the following block parameters of the "Get_IM_Data" instruction:

- LADDR: Enter the HW ID of the module at the block parameter "LADDR".
- IM_TYPE: Enter the I&M data number (e.g. "0" for I&M0 data) at the "IM_TYPE" block parameter.
- DATA: Area for storing the read I&M data (e.g. in a global data block). Store I&M0 data in an area of data type "IM0_Data".

This example shows you how to read out the I&M0 data of an ET 200SP CPU. To read out the I&M0 data of a different module, simply use the HW ID of the module at the LADDR parameter.

Solution

Proceed as follows to read out the I&M0 data of the CPU:

1. Create a global data block to store the I&M0 data.
2. Create a structure of the data type "IM0_Data" in the global data block. You can assign any name to the structure ("imData") in this case.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value
1	Static		
2	imData	IM0_Data	
3	done	Bool	false
4	busy	Bool	false
5	error	Bool	false
6	status	Word	16#0

Figure 1-147 Example: Data block for I&M data

3. Create the "Get_IM_Data" instruction in the user program, e.g. in OB 1.
4. Connect the "Get_IM_Data" instruction as follows:

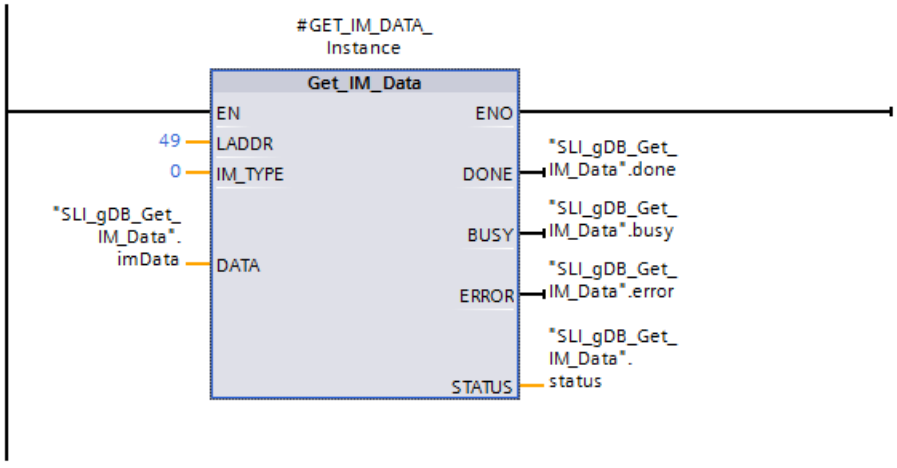

Figure 1-148 Example: Calling the "Get_IM_Data" instruction

5. Call the "Get_IM_Data" instruction in the user program.

Result

The "Get_IM_Data" instruction has stored the I&M0 data in the data block.

You can view the I&M0 data online in STEP 7, for example, in the data block with the "Monitor all" button. The CPU in the example is a 1512SP-1 PN (6ES7512-1DK01-0AK0) with the firmware version V2.5.

SLI_gDB_Get_IM_Data

	Name	Data type	Start value	Monitor value
1	Static			
2	imData	IM0_Data		
3	Manufacturer_ID	UInt	0	42
4	Order_ID	String[20]	''	'6ES7 512-1DK01-0...
5	Serial_Number	String[16]	''	'S C-DOS710132013'
6	Hardware_Revision	UInt	0	3
7	Software_Revision	IM0_Version		
8	Type	Char	' '	'V'
9	Functional	USInt	0	2
10	Bugfix	USInt	0	5
11	Internal	USInt	0	0
12	Revision_Counter	UInt	0	0
13	Profile_ID	UInt	0	0
14	Profile_Specific_Ty...	UInt	0	0
15	IM_Version	Word	16#0	16#0101
16	IM_Supported	Word	16#0	16#001E
17	done	Bool	false	TRUE
18	busy	Bool	false	FALSE
19	error	Bool	false	FALSE
20	status	Word	16#0	16#0000

Figure 1-149 Example: I&M0 data of an ET 200SP CPU

13.12 Shared commissioning of projects

Team Engineering

In Team Engineering several users from various engineering systems work on a project at the same time and access one ET 200SP CPU.

The users can edit separate parts of a master project independently of one another at the same time. The changes of the other editors are displayed in a synchronization dialog during the loading of the configuration in the CPU and synchronized automatically, if possible.

Certain online functions can also be executed at the same time from several engineering systems on a shared CPU, such as:

- Monitoring blocks on the CPU
- Modifying blocks on the CPU
- Trace functions

You can find detailed information on the topic of Team Engineering in the STEP 7 online help.

Maintenance 14

Maintenance of Ex modules

When you use an Ex module group, observe the information in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en).

14.1 Removing and inserting I/O modules/motor starters (hot swapping)

Introduction

The ET 200SP distributed I/O system supports removal and insertion of I/O modules and motor starters (hot swapping) during operation (RUN mode):

- CPU/interface module HF, HS, R1: You can remove and insert any number of I/O modules/motor starters.
- ST, BA interface module: You can only remove and insert one I/O module/motor starter.

This section provides more information on removing and inserting I/O modules/motor starters.

I/O modules/motor starters must not be removed or inserted during operation (RUN operating state) in hazardous areas.

Requirements

The following table describes which modules you may insert and remove under which conditions:

Table 1-391 Removal and insertion of modules

Modules	Removal and insertion	Conditions
CPU	No	---
BusAdapter	No	---
CM DP module	No	---
Interface module	No	---
Interface module R1	Yes	The second interface module must be operational.
I/O modules	Yes	• Digital output modules: Only when load is switched off • Digital modules: For load voltage above the safe extra-low voltage: Only with switched off load voltage supply • Technology modules: Only with switched off supply voltage L+

Modules	Removal and insertion	Conditions
		• AI Energy Meter: – Only when measuring voltage on primary side is switched off, or – Without the special current transformer terminal, measuring voltage and load current must be through the converters, which means the machine or the load must be switched off in the process. With the special terminal, the process can continue because the current transformer is isolated safely. However, the measuring voltage on the module, at connections UL1-UL3, still needs to be isolated.
PotDis-TerminalBlock	Yes	Only in de-energized state.
Motor starter	Yes [1)]	Only when the load is disconnected; when switched on, the motor starter switches off automatically when the rotary interlock is operated.
Server module	No	---

1) The motor starter also counts as removed in the parking position

NOTICE

Risk of hazardous system states

If you remove and insert digital output modules with the load switched on or technology modules with the supply voltage switched on, this can result in hazardous system states. The ET 200SP distributed I/O system or the connected sensors may be damaged as a result. Therefore, a digital output module may only be inserted and removed when the load is switched off and a technology module may only be inserted and removed when the supply voltage is switched off.

NOTICE

Risk of hazardous system states

If you remove and insert the AI Energy Meter ST with the primary-side voltage switched on at the current transformer, this can result in hazardous system states.

The ET 200SP distributed I/O system may be damaged as a result.

For this reason, remove and insert the AI Energy Meter ST only in the following cases:

- When measuring voltage is switched off on the primary side, or
- When a special current transformer terminal is used that short-circuits the secondary side of the transformer when the module is removed

Do not remove or insert the AI Energy Meter ST until you have removed this current transformer terminal. With the special terminal, the process can continue because the current transformer is isolated safely. However, the measuring voltage on the module at the connections UL1-UL3 still needs to be isolated.

⚠ WARNING

Risk of injury from automatic restart
Inserting a motor starter can result in dangerous system states. The motor starter can restart again autonomously if an ON command is active.
This can result in serious injury caused by connected devices that are automatically started up.
Withdraw and insert a motor starter only after disconnecting the load.

Removing and inserting an I/O module or a motor starter in case of CPU/interface module HF, HS, R1

You can remove and insert any number of I/O modules/motor starters during operation. The CPU/interface module and the inserted I/O modules/motor starters remain in operation.

NOTICE

Reaction of the CPU to removal and insertion of the ET 200SP server module
Please note that the backplane bus is deactivated when you remove the server module, regardless of the CPU operating state. Also note that the outputs do not adopt their configured substitute value behavior when you remove the server module.
This means you should not remove the server module when the CPU is in STARTUP, RUN and STOP modes. If you have nevertheless removed the server module, perform a POWER OFF/POWER ON after you have inserted the server module again.

Removing and inserting BusAdapter or CM DP module

Do not remove or insert the BusAdapter or CM DP module when the supply voltage is switched on. If you remove the BusAdapter or CM DP module after CPU startup, the supply voltage of the BusAdapter or CM DP module is switched off automatically. To switch on the supply voltage again, you need to perform a POWER OFF/POWER ON after inserting the BusAdapter/CM DP module.

Removing and inserting I/O module or motor starter with interface module ST, BA

1. You can remove **one** I/O module/**one** motor starter during operation. If you remove another I/O module/motor starter, this results in a station stop of the ET 200SP distributed I/O system:
   - All I/O modules/motor starters of the ET 200SP distributed I/O system fail → Substitute value behavior.
   - The interface module continues to exchange data with the IO controller and report diagnostics.

   NOTE

   If you want to replace several I/O modules/motor starters during operation, you must replace them one after the other.

2. If you insert all but one of the I/O modules/motor starters withdrawn during operation, all I/O modules will start up again.

NOTE
I/O modules/motor starters inserted in empty slots and then removed are also regarded as withdrawn during operation.

3. After a POWER OFF/POWER ON of the supply voltage 1L+ of the interface module, all available I/O modules/motor starters start up again in line with the configuration. Evaluation of the I/O modules/motor starters removed during operation starts again (see 1).

Removing I/O modules

To remove an I/O module, follow these steps:

1. Simultaneously press the top and bottom release buttons of the I/O module.
2. Pull the I/O module out of the BaseUnit, parallel in a forward direction.

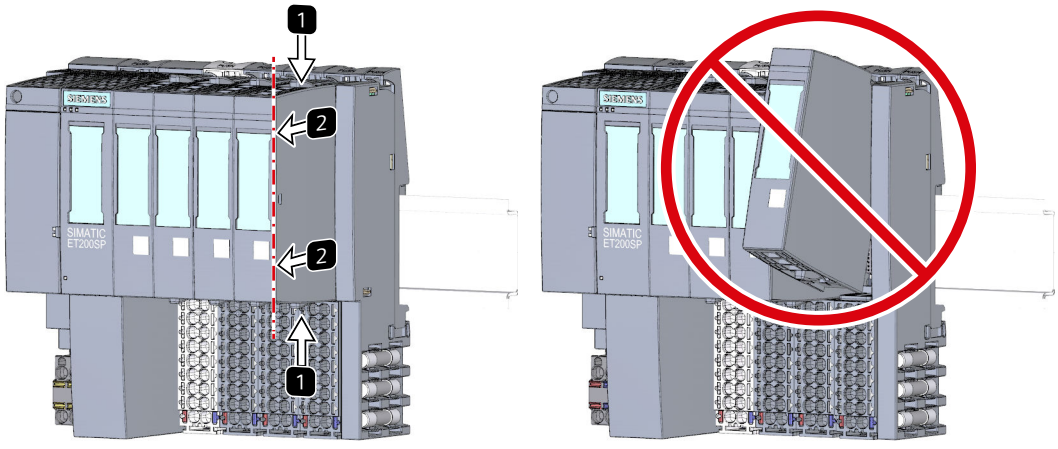

Figure 1-150 Removing I/O modules

14.2 Changing the type of an I/O module

Introduction

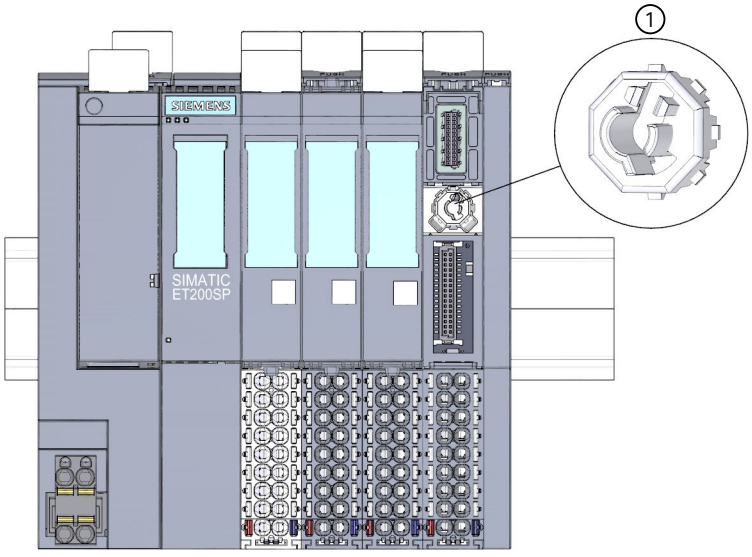
The coding element is a two-part element. When shipped from the factory, both parts are in the I/O module. When an I/O module is installed for the first time, a part of the coding element clicks into the BaseUnit. This mechanically prevents the insertion of a different module type.

There are two versions of the ET 200SP distributed I/O system:

- Mechanical coding element: Ensures the mechanical coding described above.
- Electronic coding element: In addition to the above-mentioned mechanical coding, this version also has an electronic, rewritable memory for module-specific configuration data (such as the F-destination address for fail-safe modules, parameter data for IO link master).

Requirement

Refer to section Application planning (Page 85).



NOTICE
Do not manipulate the coding element Making changes to the coding element may cause dangerous conditions in your plant and/or result in damage to the outputs of the ET 200SP distributed I/O system. To avoid physical damage, do not manipulate the coding.

Changing the type of an I/O module

You have already removed the I/O module.

To make a type change for an I/O module, follow these steps:

1. Push the coding element out of the BaseUnit using a screwdriver.
2. Put the coding element back onto the removed I/O module.
3. Insert the new I/O module (other module type) into the BaseUnit until you hear it click into place.
4. Label the new I/O module.

① Coding element

Figure 1-151 Changing the type of an I/O module

14.3 Replacing an I/O module

Introduction

When an I/O module is installed for the first time, a part of the coding element clicks into the BaseUnit. When you replace an I/O module with the same type of module, the correct coding element is already present in the BaseUnit.

Requirement

Refer to section Application planning (Page 85).

Replacing an I/O module

You have already removed the I/O module.

To replace an I/O module, follow these steps:

1. Remove the coding element (part) from the underside of the new I/O module.
2. Insert the new I/O module (same module type) into the BaseUnit until you hear it click into place.
3. Mark the new I/O module (labeling strip, equipment labeling plate).

14.4 Replacing a motor starter

The SIMATIC ET 200SP motor starter is wired.

To replace a SIMATIC ET 200SP motor starter, proceed as follows:

1. Turn the mechanical rotary interlock counter-clockwise to the assembly/disassembly position.

NOTE

Operating position/READY
Turn the mechanical rotary interlock out of the READY position only in the current-free state (motor off).

2. Remove the SIMATIC ET 200SP motor starter from the BaseUnit.
3. Assemble the new motor starter as described.

NOTE

Mounting the motor starter
You will find out how to mount the motor starter in chapter "Mounting/disassembly of motor starters (Page 180)".

⚠ WARNING

Risk of injury from automatic restart
When you replace the motor starter, the motor starter can restart again autonomously if an ON command is active. This can result in property damage or serious injury caused by connected devices that are automatically started up.
Revoke the ON commands on the motor starter before replacing the motor starter.

⚠ CAUTION

Protection against electrostatic charge
When handling and installing the SIMATIC ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.

14.5 Replacing the terminal box on the BaseUnit

Introduction

The terminal box is part of the BaseUnit. You can replace the terminal box if necessary. You do not need to dismantle the BaseUnit to do this.

The power and AUX buses of the potential group are not interrupted when you replace the terminal box.

Requirements

- The BaseUnit is mounted, wired and fitted with an I/O module.
- The terminal may only be replaced when the supply voltage is switched off.

Required tools

3 to 3.5 mm screwdriver

Procedure

Viewing the video sequence "Replacing the terminal box on the BaseUnit" (https://support.automation.siemens.com/WW/view/en/95886218)

Proceed as follows to replace the terminal box on a BaseUnit:

1. Switch off the supply voltage at the BaseUnit.
2. Simultaneously press the top and bottom release buttons of the I/O module and pull the module out of the BaseUnit.
3. Disconnect the wiring on the BaseUnit.
4. The release button of the terminal box is located on the underside of the BaseUnit. Use a screwdriver to push in the small opening at an angle from above.
5. Swivel the screwdriver slightly upwards to loosen the latching mechanism of the terminal box and lever the terminal box up out of the BaseUnit at the same time.
6. Remove the coding element (part) from the terminal box and press it onto the coding element (part) of the I/O module that you removed in step 2.
7. Insert the new terminal box into the BaseUnit at the top and swivel it downwards until it clips into the BaseUnit.
8. Wire the BaseUnit.
9. Insert the I/O module into the BaseUnit.
10. Switch on the supply voltage at the BaseUnit.

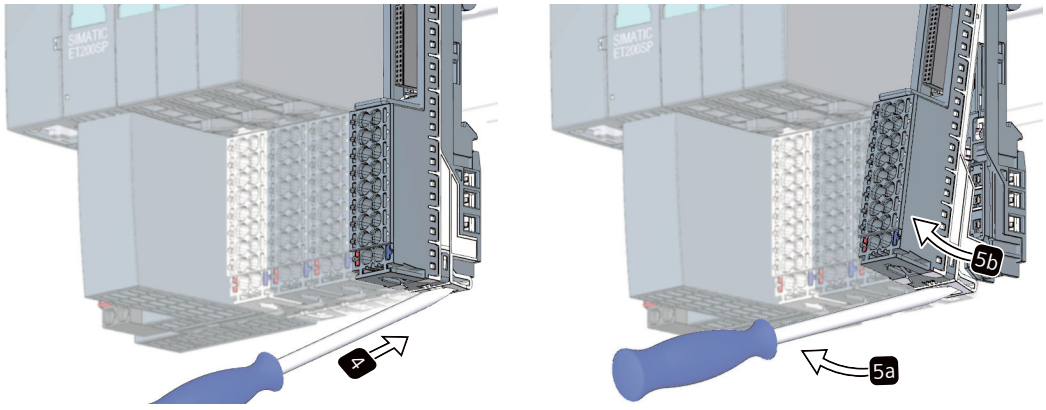


Figure 1-152 Replacing the terminal box on the BaseUnit

NOTE

When replacing the terminal box outside the control cabinet, make sure that you only mount light-colored terminal boxes on the matching BaseUnits with light-colored latch.

14.6 Firmware update

Introduction

During operation it may be necessary to update the firmware (e.g. to extend the available functions).

Update the firmware of the CPU/interface module and the I/O modules using firmware files. The retentive data is retained after the firmware has been updated.

We recommend that you always update to the latest firmware version available for the respective article number. The previous versions of the firmware are only intended as a backup to enable you to downgrade to the original version.

A firmware update has no effects on the user program of the CPU on which the update was performed. However, a downgrade can have effects on the user program if you use new functions in the user program which were not yet supported by the firmware of the CPU.

The following entry (https://support.industry.siemens.com/cs/ww/en/view/109804718) contains the current firmware statuses of the interface modules and modules of the ET 200SP.

The following entry (https://support.industry.siemens.com/cs/de/en/view/109478459) lists all firmware versions for the CPUs. You will also find a description of the new functions of the respective firmware versions.

Requirement

- You have downloaded the file(s) for the firmware update from the Product Support (https://support.industry.siemens.com/cs/ww/en/ps) web page.
  On this web page, select:
  – Automation Technology > Automation Systems > Industrial Automation Systems SIMATIC > SIMATIC ET 200 I/O Systems > ET 200 systems for the cabinet > ET 200SP.

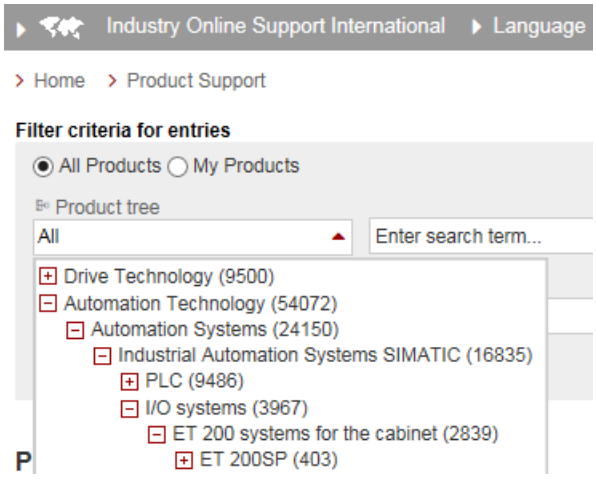

Figure 1-153 ET 200SP in the product tree

From this position, navigate to the specific type of module that you want to update. To continue, click on the "Software downloads" link under "Support". Save the desired firmware update files.

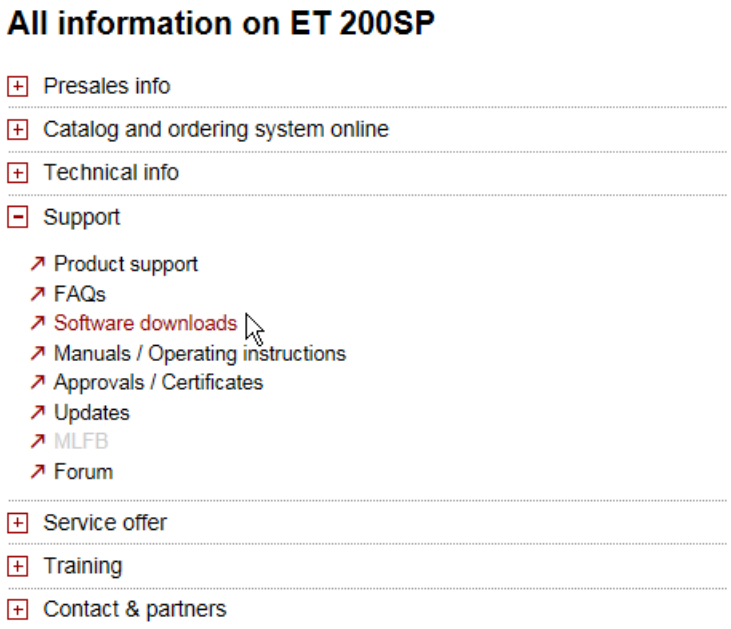

Figure 1-154 Selecting the software downloads

- Before installing the firmware update, make sure that the modules are not being used.
- Modules with firmware version V0.0.0 do not support the "firmware update" function.

NOTE

Firmware update of I/O modules

The L+ supply voltage must be present on the module at the start of and during the firmware update.

Additional requirement for fail-safe modules

⚠ WARNING

Check the firmware version for fail-safe approval

When using a new firmware version, always check that the version is approved for use in the module in question.

The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Options for the firmware update

The following options are available for updating firmware:

- Online in STEP 7 via Online & Diagnostics
- Online in STEP 7 via accessible devices (PROFINET)
- Online with the MultiFieldbus Configuration Tool (MFCT) (https://support.industry.siemens.com/cs/ww/en/view/109781837)
- Using a SIMATIC memory card (possible for CPU and central I/O modules)
- Via the integrated Web server (possible for CPU as well as centralized and distributed I/O modules)
- Online via the SIMATIC Automation Tool

NOTE

Firmware files of the CPU
If you perform a CPU update with STEP 7, you require STEP 7 (TIA Portal as of V13 Update 3).

The table below provides an overview of the media that can be used to update the firmware of a specific module.

Table 1-392 Overview of firmware update options

Firmware update	CPU	Interface module	I/O module
STEP 7 (TIA Portal)	✓ 1)	✓	✓
STEP 7 (V5.5 SP2 or higher) 2)	--	✓	✓
Accessible devices	✓	✓	✓
MFCT	--	✓	✓
SIMATIC memory card	✓	--	✓
Web server of the CPU	✓	--	✓
SIMATIC Automation Tool	✓	✓	✓

1) V13 update 3 or higher

2) If the firmware files are only available in this format, you can also install the files using STEP 7 (TIA Portal) but not the SIMATIC memory card or the Web server.

Firmware update for the motor starter
The following options are available for updating firmware for the motor starter.

- Online via PROFINET IO/PROFIBUS DP (with STEP 7)
- Via the integrated Web server (possible for CPU as well as centralized and distributed I/O modules)
- With the TIA Portal:
  - As of SIMATIC STEP 7 V13 SP1 with installed HSP for the ET 200SP motor starter
  - SIMATIC STEP 7 V14 and higher

  Over a SIMATIC memory card
- With SIMATIC STEP 7 version V5.5 SP4 and higher
- For fail-safe motor starters with the TIA Portal Version V14 SP1 or higher and installed HSP.

NOTE

The firmware update for fail-safe motor starters must take place in a separate ET 200SP system in which only the fail-safe motor starter that is to be updated is inserted.

Downtime during the firmware update

When you start a firmware update, for example online in STEP 7 via "Online & Diagnostics", the CPU goes into STOP mode and executes the firmware update. The time from start of the firmware update until RUN of the CPU with the new firmware takes a few minutes (typically < 3 minutes).

Installation of the firmware update

⚠ WARNING

Risk of impermissible system states
The CPU switches to STOP mode or the interface module to "station failure" as a result of the firmware update being installed. STOP or station failure can have an adverse effect on the operation of an online process or a machine.
Unexpected operation of a process or a machine can lead to fatal or severe injuries and/or to material damages.
Make sure that the CPU/interface module is not executing any active process before installing the firmware update.

Procedure online in STEP 7 via Online & Diagnostics

Requirements: There is an online connection between the CPU/module and PG/PC.

Proceed as follows to perform an online firmware update via STEP 7:

1. Select the module in the device view.
2. Select the "Online & diagnostics" command from the shortcut menu.

3. Select the "Firmware update" group in the "Functions" folder.
4. Click the "Browse" button to select the path to the firmware update files in the "Firmware update" area.
5. Select the suitable firmware file. The table in the firmware update area lists all modules for which an update is possible with the selected firmware file.
6. Click the "Run update" button. If the module can interpret the selected file, the file is downloaded to the module.

Updating the firmware

The "Run firmware after update" check box is always selected. When the loading process is complete, the CPU adopts the firmware and then operates with this new firmware.

If you have not selected the "Run firmware after update" check box, the previous firmware remains active until the module is reset (for example by power cycling). The new firmware only becomes active after the module has been reset.

You can find more information in the online help for STEP 7 under "General information on firmware update of a module".

NOTE

If a firmware update is interrupted, you need to remove and insert the module before starting the firmware update again.

Procedure online in STEP 7 via accessible devices

To perform a firmware update online via accessible devices, follow these steps:

1. From the "Online" menu, select the "Accessible devices" menu item.
2. In the "Accessible devices" dialog, search for the accessible devices for the selected PROFINET interface.
3. To go to a device in the project tree, select the desired device from the list of accessible devices and click the "Show" button.
4. In the project tree, select the "Online & diagnostics" option of the relevant device and perform the firmware update under the category "Functions/Firmware Update" (CPU, Local modules).

You can find information on how to perform a firmware update when your project has no connection to a CPU in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/89257657).

Procedure using the SIMATIC memory card

To perform a firmware update using the SIMATIC memory card, follow these steps:

1. Insert a SIMATIC memory card into the SD card reader of your programming device/computer.
2. To store the update file on the SIMATIC memory card, select the SIMATIC memory card in the "Card Reader/USB memory" folder in the project tree.
3. Select the "Card Reader/USB memory > Create firmware update memory card" command in the "Project" menu.

4. Use a file selection dialog to navigate to the firmware update file. In a further step you can decide whether you want to delete the content of the SIMATIC memory card or whether you want to add the firmware update files to the SIMATIC memory card.
5. Insert the SIMATIC memory card with the firmware update files into the CPU.

Point to note when updating firmware for analog modules and the IO-Link Master CM 4xIO-Link communication module
If you want to update firmware for analog modules or the IO-Link Master CM 4xIO-Link communication module, you must supply a load current of 24 V DC to the modules through the infeed element.

Procedure
1. Remove any inserted SIMATIC memory card.
2. Insert the SIMATIC memory card with the firmware update files into the CPU.
3. The firmware update begins shortly after the SIMATIC memory card has been inserted.
4. Remove the SIMATIC memory card after the firmware update has been completed. The RUN LED on the CPU lights up yellow, the MAINT LED flashes yellow.

If you want to use the SIMATIC memory card later as a program card, delete the firmware update files manually.

NOTE
If your hardware configuration contains several modules, the CPU updates all affected modules in the slot sequence, which means in ascending order of the module position in the STEP 7 device configuration.

NOTE
Memory size of the SIMATIC memory card
If you perform a firmware update via the SIMATIC memory card, you must use a large enough card based on the CPU used and the associated I/O modules.
Note the specified file sizes of the update files when downloading them from Siemens Industry Online Support. The file size information is especially important when you perform the firmware update not only for the CPU but also for the associated I/O modules, communication modules, etc. The total size of the update files must not exceed the available memory size of your SIMATIC memory card.
You can find more information on the capacity of SIMATIC memory cards in the section Accessories/spare parts (Page 370)and in the function manual Structure and use of the CPU memory (https://support.industry.siemens.com/cs/de/en/view/59193101).

Procedure: via the integrated Web server

The procedure is described in the Web server (https://support.automation.siemens.com/WW/view/en/59193560) function manual.

Procedure: online via the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Behavior during the firmware update

Note the following behavior of the relevant I/O module when carrying out a firmware update:

- The DIAG LED display flashes red.
- The I/O module retains its current diagnostic status.
- Diagnostics alarm: Channel temporarily unavailable (error code $31_D/1F_H$)
- All outputs are in a current-free/voltage-free state

Note the following behavior when carrying out the firmware update of the motor starter:

- RN flashes green and ER flashes red.
- ST/OL flashes green and MAN flashes yellow.
- The motor starter powers up after completion of the firmware update. Diagnoses are reset. The firmware update does not affect the TMM and the cooling time.
- The sensor supply of the DI module remains active.

Behavior after the firmware update

After the firmware update, check the firmware version of the updated module.

Reference

You will find more information on these procedures in the STEP 7 online help.

14.7 Resetting the CPU/interface module (PROFINET IO) to factory settings

14.7.1 Resetting the CPU to factory settings

Introduction

The CPU can be reset to its delivery state using "Reset to factory settings". The function deletes all information saved internally on the CPU.

If you want to remove a PROFINET CPU and use it elsewhere with a different program, or put it into storage, we recommend that you reset the CPU to its factory settings. When restoring the factory settings, remember that you also delete the IP address parameters.

Recommendation

Put the CPU into its delivery state if:

- You remove a CPU and use it elsewhere with a different program
- You return the CPU to stock

When resetting to factory settings, remember that the IP address parameters are also deleted.

Options for resetting a CPU to factory settings

The following options are available for resetting the CPU to its factory settings:

- Using the mode selector
- Using STEP 7
- Using the SIMATIC Automation Tool

Procedure using the mode selector

Make sure that there is no SIMATIC memory card in the CPU and that the CPU is in STOP mode (the RUN/STOP LED is lit yellow).

NOTE

Reset to factory settings ↔ Memory reset

The procedure described below also corresponds to the procedure for a memory reset:

- Selector operation with inserted SIMATIC memory card: CPU executes a memory reset
- Selector operation without inserted SIMATIC memory card: CPU executes reset to factory settings

---

Perform a reset to factory settings when there is no SIMATIC memory card inserted as follows:

1. Set the mode selector to the STOP position.
   Result: The RUN/STOP LED lights up yellow.
2. Set the mode selector to the MRES position. Hold the mode selector in this position until the RUN/STOP LED lights up for the second time and remains lit (this takes 3 seconds). After this, release the switch.
3. Within the next three seconds, switch the mode selector back to the MRES position, and then back to STOP again.

Result: The CPU executes the "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, the CPU has been reset to factory settings and is in the STOP mode. The "Reset to factory settings" event is entered in the diagnostics buffer.

NOTE

The IP address of the CPU is also deleted when the CPU is reset to the factory settings through the mode selector.

For information on the memory reset of the CPU, refer to the section CPU memory reset (Page 294).

Procedure using STEP 7

Make sure that an online connection to the CPU exists.

To reset a CPU to factory settings using STEP 7, follow these steps:

1. Open the Online and Diagnostics view of the CPU.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. If you want to keep the IP address, select the "Retain IP address" option button. If you want to delete the IP address, select the "Reset IP address" option button.

NOTE

"Delete IP address" deletes all IP addresses, regardless of how you established the online connection.

If there is a SIMATIC memory card inserted, selecting the "Delete IP address" option has the following effect:

- The IP addresses are deleted and the CPU is reset to factory settings.
- The configuration (including IP address) on the SIMATIC memory card is then downloaded to the CPU. If there is no saved configuration (because the SIMATIC memory card has been cleared or formatted, for example), no new IP address is assigned.

4. Click the "Reset" button.
5. Click "OK" in response to the confirmation prompts.

Result: The CPU executes the "Reset to factory settings", during which time the RUN/STOP LED flashes yellow. When the RUN/STOP LED lights up yellow, the CPU has been reset to factory settings and is in the STOP mode. The "Reset to factory settings" event is entered in the diagnostics buffer.

Procedure using the SIMATIC Automation Tool

The procedure is described in the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) manual (included in the SIMATIC Automation Tool).

Result after resetting to factory settings

The following table provides an overview of the contents of the memory objects after the reset to factory settings.

Table 1-393 Result after resetting to factory settings

Memory object	Content
Actual values of the data blocks, instance data blocks	Initialized
Bit memory, timers and counters	Initialized
Certain retentive tags from technology objects (e.g. adjustment values of absolute encoders)	Initialized
Entries in the diagnostic buffer	Initialized, including a startup entry that informs about the reset to factory settings.
Entries in the syslog storage	Now only contains a startup entry that informs about the reset to factory settings.

Memory object	Content
IP address	Depends on the procedure: • Using mode switch: is deleted • Using STEP 7: Depending on the setting of the "Keep IP address"/"Delete IP address" option buttons
Device name	Is set to "CPU"
Counter readings of the runtime meters	Initialized
Time of day	Is set to "00:00:00, 01.01.2012"
Deleting passwords for protecting confidential PLC configuration data	Depends on the procedure: • Using mode switch: Retained • Using STEP 7: Depends on the setting of the "Delete password for the protection of confidential PLC configuration data" option button

If a SIMATIC memory card was inserted prior to the factory reset, the CPU downloads the configuration contained on the SIMATIC memory card (hardware and software). A configured IP address then becomes valid again.

NOTE

Password for protecting confidential configuration data after resetting the CPU to factory settings

- **Via the mode selector (SIMATIC Memory Card is not inserted):** The password for protection of confidential configuration data is retained.
- **Using STEP 7:** The password for protection of confidential configuration data is retained. The password is only deleted when the "Delete password for protection of confidential PLC configuration data" option is set.

You can find more information on the password for protection of confidential configuration data in the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual.

Reference

Additional information on the topic "Resetting to factory settings" can be found in the Structure and use of the CPU memory (https://support.automation.siemens.com/WW/view/en/59193101) function manual, section on memory areas and retentivity, and in the STEP 7 online help.

14.7.2 Resetting interface module (PROFINET IO) to factory settings

Function

The "Reset to factory settings" function returns the interface module (PROFINET) to its delivery state.

Reset options

- Using STEP 7 (online via PROFINET IO)
- Using a reset button on the interface module (on rear). Exception: There is no reset button on the IM 155-6 PN BA and the IM 155-6 PN R1. See section Resetting the interface module (PROFINET IO) to factory settings with a RESET button (Page 333).

Procedure using STEP 7

To reset an interface module to factory settings using STEP 7, follow these steps:

Make sure that an online connection to the interface module exists.

1. Open the online and diagnostics view of the interface module.
2. In the "Functions" folder, select the "Reset to factory settings" group.
3. Click the "Reset" button.
4. Click "OK" in response to the confirmation prompt.

Result: The interface module then performs "Reset to factory settings".

Result after resetting to factory settings

The following table shows the values of the interface module properties after a factory reset:

Table 1-394 Properties of the interface module as shipped

Properties	Value
Parameters	Default setting
IP address	Not available
Device name	Not available
MAC address	Available
I&M data	Identification data (I&M0) available Maintenance data (I&M1, 2, 3, 4) reset *
Firmware version	Available

NOTE

Failure of downstream stations is possible

Downstream stations on a bus segment can fail when the factory settings are restored on an interface module.

NOTE

Behavior of the installed I/O modules during reset to factory settings

The I/O modules of the ET 200SP distributed I/O system assume the unconfigured state after a reset to factory settings. The interface module does not acquire any input data and does not output any output data.

Reference

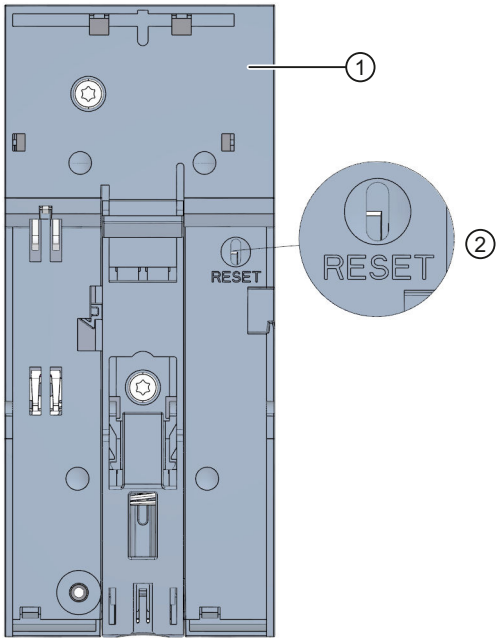
You will find more information on the procedure in the STEP 7 online help.

14.7.3 Resetting the interface module (PROFINET IO) to factory settings with a RESET button

Requirement

The supply voltage to the interface module is turned on.

Required tools



3 to 3.5 mm screwdriver (for resetting with a RESET button)

Procedure

Proceed as follows to reset an interface module to factory settings by means of the RESET button:

1. Remove the interface module from the mounting rail (see Mounting the CPU/interface module (Page 122)) and swivel it downwards.
2. The RESET button is located on the rear of the interface module behind a small opening: Press a screwdriver into the small opening for at least 3 seconds to activate the RESET button.
3. Install the interface module back on the mounting rail (see Mounting the CPU/interface module (Page 122)).

4. Assign parameters to the interface module again.

① Rear of the interface module
② RESET button

Figure 1-155 RESET button

14.8 Reaction to faults in fail-safe modules and fail-safe motor starters

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

NOTE

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators. In the case of the fail-safe motor starters, the load is shut down in a fail-safe manner.

Fault reactions and startup of the F-system

The safety function means that fail-safe modules use substitute values (safe state) instead of process values (**passivation of the fail-safe module**) in the following situations:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If F-I/O faults or channel faults are detected (e.g. crossover or discrepancy errors)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. After a POWER OFF / POWER ON, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

⚠ WARNING

For channels that you set to "deactivated" in STEP 7, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnosing and repairing the fault
2. Revalidation of the safety function
3. Recording in the service report

Substitute value output for fail-safe modules

In the case of F-modules with inputs, if there is passivation, the F-system provides substitute values (0) for the safety program instead of the process data pending at the fail-safe inputs.

In the case of F-modules with outputs, if there is passivation, the F-system transfers substitute values (0) to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized. This also applies when the F-CPU goes to STOP mode. Assignment of substitute values is not possible.

Substitute values are used either for the relevant channel only or for all channels of the relevant failsafe module depending on:

- The F-system used
- The type of error that occurred (F-I/O, channel fault or communication error)
- The F-module parameter assignment

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs is made available to the safety program again
- In the case of an F-module with outputs, the output values provided in the safety program are transferred to the fail-safe outputs again

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (https://support.automation.siemens.com/WW/view/en/54110126) manual.

Behavior of the fail-safe module with inputs in the event of a communication disruption

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

14.9 Maintenance and repair

The components of the ET 200SP distributed I/O system are maintenance-free.

NOTE

Repairs to a SIMATIC ET 200SP system may only be carried out by the manufacturer.

NOTE

Cleaning the ET 200SP

Requirement: All supply voltages on the ET 200SP distributed I/O system are switched off.
Observe the five safety rules for working in and on electrical installations.
If you need to clean the devices, use dry ESD cleaning cloths (observing the ESD protective measures).

14.10 Warranty

To meet the conditions of the warranty, you must observe the safety and commissioning instructions.

Test and service functions

15

15.1 Test functions

Introduction

You can test the flow of your user program on the CPU. You monitor signal states and values of tags, and preassign tags with values so that you can simulate specific situations for the program flow.

NOTE

Using test functions

The use of test functions can influence the program execution time and thus the cycle and response times of the controller to a slight extent (a few milliseconds).

Requirements

- There is an online connection to the relevant CPU.
- An executable program is in the CPU.

Test options

- Testing with program status
- Testing with breakpoints
- Testing with a watch table
- Testing with a force table
- Testing with PLC tag table
- Testing with data block editor
- Testing with the LED flash test
- Testing with trace function

Testing with program status

The program status allows you to monitor the execution of the program. You can display the values of operands and the results of logic operations (RLO) allowing you to recognize and fix logical errors in your program.

NOTE

Restrictions for the "Program status" function

The monitoring of loops can significantly increase the cycle time. The increase in cycle time depends on the following factors:

- The number of tags to be monitored
- The actual number of loops run through

⚠ WARNING

Testing with program status

A test with the "Program status" function can produce serious property damage and personal injury in the event of malfunctions or program errors.

Make sure that you take appropriate measures to exclude the risk of hazardous conditions occurring before running a test with the "Program status" function.

Testing with breakpoints

With this test option, you set breakpoints in your program, establish an online connection, and enable the breakpoints on the CPU. You then execute a program from one breakpoint to another.

Requirements:

- Setting breakpoints is possible in the programming language SCL or STL.

Testing with breakpoints provides you with the following advantages:

- Localization of logic errors step by step
- Simple and quick analysis of complex programs prior to actual commissioning
- Recording of current values within individual executed loops
- Use of breakpoints for program validation also possible in SCL/STL networks within LAD/FBD blocks

NOTE

Restriction during testing with breakpoints

- When you test with breakpoints, there is a risk of overwriting the cycle time of the CPU.
- If you are using technology objects and test them with breakpoints, the CPU switches to STOP mode.

NOTE

F-System SIMATIC Safety

The setting of breakpoints in the standard user program results in errors in the safety program:

- Sequence of F cycle time monitoring
- Error in communication with the fail-safe I/O
- Error during safety-oriented CPU-CPU communication
- Internal CPU error

If you still wish to use breakpoints for testing, you must deactivate the safety mode beforehand. This will result in the following errors:

- Error in communication with the fail-safe I/O
- Error during safety-oriented CPU-CPU communication

Testing with watch tables

The following functions are available in the watch table:

- Monitoring of tags

  With watch tables, you can monitor the current values of individual tags of a user program or a CPU on the PG/PC and Web server. For the Web server to be able to display the value of tags, you must specify a symbolic name for each tag in the "Name" column of the watch table.

  You can monitor the following operand areas:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs
  – Timers and counters

- Modifying tags

  Use this function to assign fixed values to the individual tags of a user program or CPU. Modifying is also possible for testing with program status.

  You can control the following operand areas:

  – Inputs and outputs (process image) and bit memory
  – Contents of data blocks
  – Peripheral inputs and peripheral outputs (for example, %I0.0:P, %Q0.0:P)
  – Timers and counters

- "Enable peripheral outputs" and "Control immediately"

  These two functions enable you to assign fixed values to individual peripheral outputs of a CPU in the STOP mode. You can also use them to check your wiring.

Testing with the force table

The following functions are available in the force table.

- Monitoring of tags

  With force tables, you can display the current values of individual tags of a user program or a CPU on the PG/PC and Web server. You can monitor the table with or without a trigger condition. For the Web server to be able to display the value of tags, you must specify a symbolic name for each tag in the "Name" column of the force table.

  You can monitor the following tags:

  – Bit memory
  – Contents of data blocks
  – Peripheral inputs (e.g. %I0.0:P)

- Modifying tags

  With this function, you assign fixed values to the individual tags of a user program or a CPU on the PG/PC and Web server. Modifying is also possible for testing with program status.

  You can control the following tags:

  – Bit memories
  – Contents of data blocks
  – Peripheral inputs (e.g. %I0.0:P)

- Forcing of peripheral inputs and peripheral outputs

  You can force individual peripheral inputs or peripheral outputs.

  – Peripheral inputs: Forcing of peripheral inputs (for example %I0.0:P) represents the "bypassing" of sensors/inputs by specifying fixed values to the program. Instead of the actual input value (via process image or via direct access) the program receives the force value.
  – Peripheral outputs: Forcing of peripheral outputs (for example %Q0.0:P) represents the "bypassing" of the complete program by setting fixed values for the actuators.

You can use the force table to simulate different test environments and also overwrite tags in the CPU with a fixed value. This enables you to intervene in the running process to control it.

Difference between modifying and forcing

The fundamental difference between the modifying and forcing functions consists in the storage behavior:

- Modifying: Modifying of tags is an online function and is not stored in the CPU. You can end modifying of tags in the watch table or by disconnecting the online connection.
- Forcing: A force job is written to the SIMATIC memory card and is retained after a POWER OFF. You can only end the forcing of peripheral inputs and peripheral outputs in the force table.

Testing with PLC tag table

You can monitor the data values that tags currently assume in the CPU directly in the PLC tag table. To do this, open the PLC tag table and start monitoring.

Additionally, you have a possibility of copying PLC tags to a monitoring or force table and of monitoring, controlling or forcing them there.

Testing with data block editor

Various possibilities of monitoring and controlling tags are at your disposal in the data block editor. These functions directly access the current values of the tags in the online program. Current values are the values that the tags assume at the current time during program execution in the CPU's work memory. The following functions for monitoring and control are possible via the data block editor:

- Monitoring tags online
- Controlling individual actual values
- Creating a snapshot of the actual values
- Overwriting actual values with a snapshot

NOTE

Setting data values during commissioning

During commissioning of a system, data values often have to be adjusted to optimally adapt the program to the general conditions prevailing locally. To this end, the declaration table offers a few functions for data blocks.

Testing with the LED flash test

In many online dialogs, you can perform an LED flash test. This function is useful, for example, when you are not sure which device in the hardware configuration corresponds to the device currently selected in the software.

When you click the "Flash LED" button, an LED flashes on the currently selected device. In the case of the CPU, the RUN/STOP, ERROR and MAINT LEDs flash. They flash until you cancel the flashing test.

Testing with trace function

The trace function is used to record the CPU tags, depending on the settable trigger conditions. Tags are, for example, the drive parameters or system and user tags of a CPU. The CPU saves the recordings. You can display and evaluate the recordings with STEP 7, if necessary.

The trace function can be called from the CPU's folder in the project tree, under the name "Traces".

In connection with trace functions, also pay attention to the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/102781176).

Simulation

With STEP 7 you can run and test the hardware and software of the project in a simulated environment. Start the simulation using the menu command "Online" > "Simulation" > "Start".

Reference

You can find more information on test functions in the STEP 7 online help.

Further information about testing with trace and logic analyzer functions is available in the Function Manual Using the trace and logic analyzer function (https://support.automation.siemens.com/WW/view/en/64897128).

15.2 Reading out/saving service data

Service data

In addition to the contents of the diagnostics buffer, the service data contains a wide range of extra information about the internal status of the CPU. If a problem occurs with the CPU that cannot be solved with other methods, send the service data to Service & Support. The service data allows Service & Support to run fast analysis of the problems that have occurred.

NOTE

You cannot simultaneously execute a download to the device while reading out the service data of the CPU.

Methods of reading service data

You can read service data with:

- The Web server
- STEP 7
- the SIMATIC memory card
- MultiFieldbus Configuration Tool (MFCT)

Procedure using the Web server

To read service data using the Web server, follow these steps:

1. Open a Web browser that is suitable for communication with the CPU.
2. Enter the following address in the address bar of the web browser:
   https://<CPU IP address>/save_service_data, e.g. https://172.23.15.3/save_service_data

3. The service data page will appear on your screen, with a button for saving the service data.

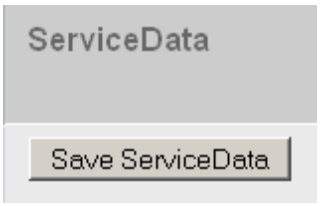


Figure 1-156 Reading out service data with the Web server

4. Save the service data locally on your PC/programming device, by clicking "Save ServiceData".

Result: The CPU stores the data in a .dmp file with the following naming convention: "<Article number> <Serial number> <Time stamp>.dmp". The file name cannot be changed.

NOTE

If you have defined your user page as the Web server's home page, direct access to the service data by entering the CPU's IP address is not possible. You will find more information on reading out service data via a user-defined page in the Web server (https://support.automation.siemens.com/WW/view/en/59193560) function manual.

Procedure using STEP 7

You can find more information on saving service data of the CPU (and interface module) in the STEP 7 online help using keyword "Saving service data".

Procedure via the SIMATIC memory card

If Ethernet communication with the CPU is not possible, use the

SIMATIC memory card to read out the service data. In all other cases, read the service data via the web server or STEP 7..

The procedure using the SIMATIC memory card is more time-consuming than the other options for reading out the service data. You must also ensure before reading out that there is sufficient memory space on the SIMATIC memory card.

To read service data using the SIMATIC memory card, follow these steps:

1. Insert the SIMATIC memory card into the card reader of your PC / programming device.
2. Open the job file S7_JOB.S7S in an editor.
3. Overwrite the entry PROGRAM with the string DUMP in the editor.
   Do not use any spaces/line breaks/quotation marks to ensure that the file size is exactly 4 bytes.
4. Save the file under the existing file name.
5. Ensure that the SIMATIC memory card is not write-protected and insert the SIMATIC memory card in the card slot of the CPU. Pay attention to the procedure described in Removing/inserting the SIMATIC memory card on the CPU (Page 287).

Result: The CPU writes the service data file DUMP.S7S to the SIMATIC memory card and remains in STOP mode.

Service data transfer is complete when the STOP LED stops flashing and is lit continuously. If the service data transfer was successful, only the STOP LED lights up.

In the event of errors during the transfer, the STOP LED is lit continuously and the ERROR LED flashes. The CPU also stores a text file with information on the error that occurred in the DUMP.S7S folder.

Technical specifications 16

16.1 Introduction

Introduction

This chapter lists the technical specifications of the system:

- The standards and test values that the ET 200SP distributed I/O system complies with and fulfills.
- The test criteria according to which the ET 200SP distributed I/O system was tested.

Technical specifications of the (F-)modules

The technical specifications of the individual (F-)modules can be found in the equipment manuals of the corresponding (F-)modules. In the event of deviations between the statements in this document and the manuals, the statements in the manuals take priority.

Technical specifications of the Ex modules

You can find the technical specifications of the Ex modules in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/en/view/109795533) and in the Ex I/O modules manuals.

Technical specifications of the motor starters

You can find the technical specifications of the motor starters in the ET 200SP Motor Starter (https://support.industry.siemens.com/cs/ww/en/view/109479973) Equipment Manual.

16.2 Safety information

Safety information

⚠ WARNING

Personal injury and damage to property may occur

In hazardous areas, personal injury and damage to property may occur if you disconnect plug-in connections during operation of an ET 200SP distributed I/O system.

Always switch off the power to the ET 200SP distributed I/O system when disconnecting plug-in connections in hazardous areas.

⚠ WARNING
Explosion hazard If you replace components, compliance with Class I, Div. 2 or zone 2 may become invalid.

⚠ WARNING
Area of application This device is only suitable for use in Class I, Div. 2, Group A, B, C, D; Class I, zone 2, Group IIC, or in non-hazardous areas.

Safety of the plant or the system

NOTICE
Safety is the responsibility of the assembler The safety of any plant or system incorporating the equipment is the responsibility of the assembler of the plant or system.

16.3 Marks and approvals

Marks and approvals on the nameplate

The following overview provides information about the possible marks and approvals. Only the marks and approvals specified on the nameplate apply to the device.

You can find the associated certificates for download on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert).

CE marking

CE

The ET 200SP distributed I/O system meets the requirements and protection targets of the following directives. The distributed I/O system complies with the harmonized European standards (EN) for programmable logic controllers published in the official journals of the European Union.

- Directive 2014/35/EU of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits; OJ L 96, 29/03/2014, pp. 357-374
- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive) Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the member states relating to electromagnetic compatibility; Official Journal of the European Union L96, 29/03/2014, pp. 79-106

- 2014/34/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to equipment and protective systems intended for use in potentially explosive atmospheres (recast); Official Journal of the European Union L96, 29/03/2014, pp. 309–356
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment, Official Journal of the European Union L174, 01/07/2011, pp 88-110
- 2006/42/EC "Machinery, and amending Directive 95/16/EC (Machinery directive) for F-modules" ET 200SP Directive of the European Parliament and of the Council of 17 May, 2006 on machinery, and amending Directive 95/16/EC (recast); official journal of the EU, L157, 09/06/2006, pp. 24–87

The EC Declarations of Conformity are available for the responsible authorities and are kept at the following address:

Siemens Aktiengesellschaft
Digital Industries
Factory Automation
DI FA DSP SYS
PO Box 1963
D-92209 Amberg

You can also find the EC Declarations of Conformity on the Internet (https://support.industry.siemens.com/cs/ww/es/ps/14031/cert?ct=444&ci=526).

UK Conformity Assessed marking

The ET 200SP distributed I/O system complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The ET 200SP distributed I/O system meets the requirements and protection targets of the following regulations and associated supplements:

- The Electrical Equipment (Safety) Regulations 2016 (S.I. 2016 No. 1101), and related amendments
- Electromagnetic Compatibility Regulations 2016 (S.I. 2016 No. 1091), and related amendments
- Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations 2016 (S.I. 2016 No. 1107), and related amendments
- Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012 (S.I. 2012 No. 3032), and related amendments
- Supply of Machinery (Safety) Regulations 2008 (S.I. 2008 No. 1597), and related amendments for ET 200SP safety components (fail-safe modules)

The UK Declarations of Conformity are available to the relevant authorities at the following address:

Siemens Aktiengesellschaft
Digital Industries
Factory Automation
DI FA DSP SYS

PO Box 1963
D-92209 Amberg
You can also find the UK Declarations of Conformity on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=444&ci=5596).

- Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 119V.

RCM Australia/New Zealand

The ET 200SP distributed I/O system meets the requirements of EN 61000-6-4 Generic standards – Emission standard for industrial environments.

Korea Certificate

Note that this device conforms to Limit Class A for emission of radio interference. This device is not intended to be used in residential areas.
이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며 가정 외의 지역에서 사용하는 것을 목적으로 합니다.

Mark for Eurasian Economic Union

The EAC (Eurasian Conformity) mark confirms conformity with the technical regulations (TR) of the Eurasian Economic Union.

16.4 Certificates

Shipbuilding certificates

The following shipbuilding certificates are planned:

- ABS (American Bureau of Shipping)
- BV (Bureau Veritas)
- DNV (Det Norske Veritas)
- LRS (Lloyds Register of Shipping)
- Class NK (Nippon Kaiji Kyokai)
- KR (Korean Register of Shipping)
- CCS (China Classification Society)
- RINA (Registro Italiano Navale)

Following approval, you will find the certificates with the certified article numbers on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=446).

16.5 Standards and requirements

The ET 200SP distributed I/O system meets the following standards and requirements.

IEC 61131-2

The ET 200SP distributed I/O system fulfills the requirements and criteria of IEC 61131-2 (Programmable controllers, Part 2: Equipment requirements and tests) and the EMC requirements for use in Zone B.

IEC 61010-2-201

The ET 200SP distributed I/O system fulfills the requirements and criteria of standard IEC 61010-2-201 (Safety requirements for electrical equipment for measurement, control, and laboratory use Part 2-201: Particular requirements for control equipment).

IEC 60695-11-10

The ET 200SP distributed I/O system fulfills the requirements and criteria of standard IEC 60695-11-10 (Fire hazard testing - Part 11-10: Test flames - 50 W horizontal and vertical flames test methods).

UL 94

The ET 200SP distributed I/O system fulfills the requirements and criteria of UL 94 (Tests for Flammability of Plastic Materials for Parts in Devices and Appliances).

IEC 60947

The motor starters belonging to the ET 200SP distributed I/O system meet the requirements and criteria of the IEC 60947 standard.

PROFINET
