You can find the EC type examination certificate with the approved ET 200eco PN I/O devices on the Internet at the following link: Type test (http://support.automation.siemens.com/WW/view/de/71748103)

Approval

The approval is available in the section Standards and certifications (Page 88).

⚠ WARNING

Risk of personal injury and damage to property.
In hazardous areas, personal injury or damage to property may occur if you disconnect any plug connections during operation of an ET 200eco PN.
In hazardous areas, always switch off the power to the ET 200eco PN when disconnecting plug connections.

Special conditions

1. The I/O devices should be set up in such a way that the risk of mechanical danger is low.
2. The technical specifications of the I/O devices specified in the EC type examination certification must be adhered to:
   - Supply voltage of ET 200eco PN
   - Input and output currents
   - Ambient temperatures
3. M12 connectors (for PROFINET, supply voltage, encoders and actuators) must never be connected or disconnected with the power on.
4. Use the following cables with even connector outlets to wire the different M12 interfaces:
   - PROFINET: SIEMENS, order number 6XV1 870-8A or 6XV1 871-5T
   - Supply voltage: SIEMENS, order number 6XV1 801-5D
   - Encoders and actuators: SIEMENS, Y-cable, order number 6ES7194-6KA00-0XA0; PHOENIX CONTACT *, product designation SAC-3P-M12MS

5. All M12 connectors must be protected against unauthorized opening, for example with safety clips. Suitable safety clips are available with PHOENIX CONTACT *, product designation SAC-M12-EXCLIP-F or SAC-M12-EXCLIP-M.

SAC-M12-EXCLIP-F

SAC-M12-EXCLIP-M

6. All unoccupied M12 circular sockets should be closed using sealing caps in such a way that the caps cannot be loosened by hand (torque: 0.6 Nm). Suitable sealing caps are available from: Binder GmbH + Co. **, item no. 08 2769 000 000.

* PHOENIX CONTACT GmbH & Co. KG, Flachsmarktstr. 8, D-32825 D-Blomberg, http://www.phoenixcontact.com (http://www.phoenixcontact.com)

** Fa. Binder GmbH & Co., Elektrische Bauelemente KG, Rötelstr. 7, D-74148 Neckarlsulm, http://www.binder-connector.com (http://www.binder-connector.com)

I/O device digital inputs/digital outputs

9

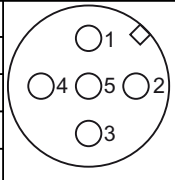
9.1 I/O device digital inputs

9.1.1 I/O device 8 DI DC 24 V 4xM12

Article number

6ES7141-6BF00-0AB0

Properties



The 8 DI DC 24V 4×M12 I/O device has the following properties:

- 8 digital inputs
- Dimensions 30 x 200 mm, dual assignment of the sockets
- Rated input voltage DC 24 V
- Suitable for switches and proximity switches
- Diagnostics
  - "Missing 1L+" for the I/O device
  - "Short-circuit to M at sensor supply", per channel group
  - "Wire break", per channel
- Prioritized startup
- Media redundancy

Pin assignment of the DI sockets

The table below shows the pin assignment of the four sockets for connecting the digital inputs

Table 1-1076 Pin assignment of the digital input sockets X1 to X4

Pin	Assignment				View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	
1	24 V sensor supply $1U_S$(derived from 1L+ non-switched)				
2	Input signal				
	DI_4	DI_5	DI_6	DI_7	
3	Sensor supply ground 1M				
4	Input signal				
	DI_0	DI_1	DI_2	DI_3	
5	Functional earth FE				

Block diagram

The block diagram below shows the 8 DI DC 24V 4×M12 I/O device.

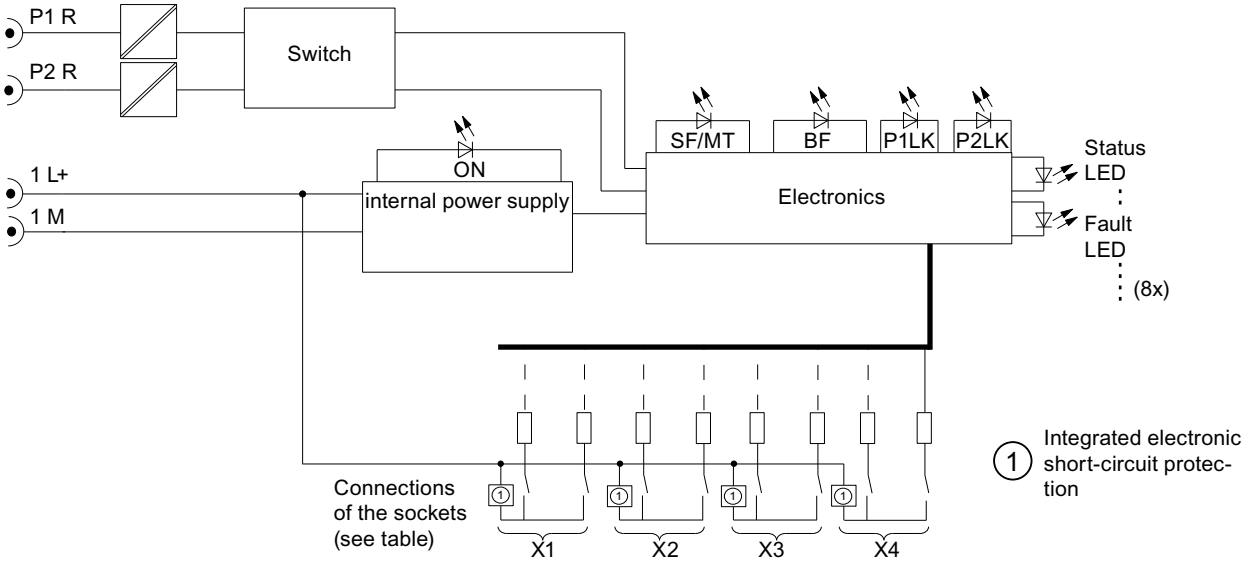


Figure 1-773 Block diagram of the 8 DI DC 24V 4×M12 I/O device

Technical data of the 8 DI DC 24V 4×M12 I/O device

Technical data	
Dimensions and weight	
Dimensions W x H x D (mm)	30 x 200 x 49
Weight	Approx. 550 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes; against destruction
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Infeed current 2L+	Max. 4 A
Current consumption	
From supply voltage (1L+)	Typ. 100 mA
Power loss of the device	Typ. 5.5 W
Digital inputs	
Number of inputs	8
Number of inputs that can be controlled simultaneously	8, in all mounting positions
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No

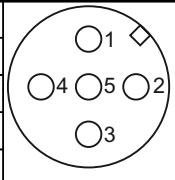
Technical data	
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red/yellow "SF/MT" LED
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through
• Digital input	Green LED
• Fault at digital input	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Short-circuit	Yes, per channel group
• Wire break	Input current < 0.3 mA, per channel
• Missing sensor supply	Yes
Sensor supply	
Number of sensor supplies	4
Load current	100 mA per output
Short-circuit protection	Yes, electronic
Sensor selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Input voltage	
• Nominal value	DC 24 V
• For signal "1"	11 to 30 V
• For signal "0"	-3 to +5 V
Input current	
• At signal "1"	Typ. 7 mA
Input delay	
• At "0" to "1"	Typ. 3 ms
• At "1" to "0"	Typ. 3 ms
Input characteristic	According to IEC 61131, Type 3
Connection of 2-wire proximity switches	Supported
• Permitted quiescent current	Max. 1.5 mA

9.1.2 I/O device 8 DI DC 24 V 8xM12

Article number

6ES7141-6BG00-0AB0

Properties



The 8 DI DC 24V 8×M12 I/O device has the following properties:

- 8 digital inputs
- Dimensions 60 x 175 mm, single assignment of the sockets
- Rated input voltage DC 24 V
- Suitable for switches and proximity switches
- Diagnostics
  - "Missing 1L+" for the I/O device
  - "Short-circuit to M at sensor supply" per channel
  - "Wire break", per channel
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the eight sockets for connecting the digital inputs.

Table 1-1077 Pin assignment of sockets X1 to X8 for digital inputs

Pin	Assignment								View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	**Socket X5**	**Socket X6**	**Socket X7**	**Socket X8**	
1	24 V sensor supply $1U_S$(derived from 1L+ non-switched)								
2	Not used								
3	Sensor supply ground 1M								
4	Input signal								
	DI_0	DI_1	DI_2	DI_3	DI_4	DI_5	DI_6	DI_7	
5	Functional earth FE								

Block diagram

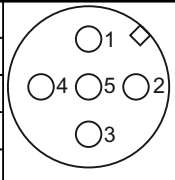
• At "0" to "1"	Typ. 3 ms
• At "1" to "0"	Typ. 3 ms
Input characteristic	According to IEC 61131, Type 3
Connection of 2-wire proximity switches	Supported
• Permitted quiescent current	Max. 1.5 mA

9.1.3 I/O device 16 DI DC 24 V 8xM12

Article number

6ES7141-6BH00-0AB0

Properties



The 16 DI DC 24V 8×M12 I/O device has the following properties:

- 16 digital inputs
- Dimensions 60 x 175 mm, dual assignment of the sockets
- Rated input voltage DC 24 V
- Suitable for switches and proximity switches
- Diagnostics
  - "Missing 1L+" for the I/O device
  - "Short-circuit to M at sensor supply", per channel group
  - "Wire break", per channel
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the eight sockets for connecting the digital inputs.

Table 1-1078 Pin assignment of sockets X1 to X8 for digital inputs

Pin	Assignment								View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	**Socket X5**	**Socket X6**	**Socket X7**	**Socket X8**

9.1.4 Parameter overview digital inputs

Parameters for 8 DI DC 24V 4×M12 (6ES7141-6BF00-0AB0) and for 8 DI DC 24V 8×M12 (6ES7141-6BG00-0AB0)

Parameter	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 1L+	• Disable • Enable	Disable	Device
Diagnostics: Wire break at inputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel
Diagnostics: Short-circuit to M, inputs 0,4/1,5/2,6/3,7 (channels 0,4/1,5/2,6/3,7)	• Disable • Enable	Disable	Channel group

Parameters for 16 DI DC 24V 8×M12 (6ES7141-6BH00-0AB0)

Parameter	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 1L+	• Disable • Enable	Disable	Device
Diagnostics: Wire break at inputs 0 to 15 (channels 0 to 15)	• Disable • Enable	Disable	Channel
Diagnostics: Short-circuit to M, inputs 0,8/1,9/2,10/3,11/4,12/5,13/6,14/7,15 (channels 0,8/1,9/2,10/3,11/4,12/5,13/6,14/7,15)	• Disable • Enable	Disable	Channel group

9.2 I/O device digital outputs

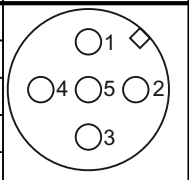
9.2.1 I/O device 8 DO DC 24 V/1.3A 4xM12

Article number

6ES7142-6BF00-0AB0

Properties

The 8 DO DC 24V/1,3A 4×M12 I/O device has the following properties:



- 8 digital outputs
- Dimensions 30 x 200 mm and duplicate assignment of the sockets
- Output current: 1.3 A per output
- Rated load voltage DC 24 V
- Suitable for solenoid valves, DC contactors, and indicator lights

- Diagnostics
  - "Missing 1L+ or 2L+" for the I/O device
  - "Wire break at outputs" per channel
  - "Short-circuit to M at outputs" per channel
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

Pin assignment of the sockets for digital outputs

The table below shows the pin assignment of the four sockets for connecting digital outputs.

Table 1-1079 Pin assignment of sockets X1 to X4 for digital outputs

Pin	Assignment				View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	
	24 V (1L+ non-switched)		**24 V (2L+ switched)**		
1	Not used				
2	Output signal				
	DQ_4	DQ_5	DQ_6	DQ_7	
3	Ground 1M		Ground 2M		
4	Output signal				
	DQ_0	DQ_1	DQ_2	DQ_3	
5	Functional earth FE				

Block diagram

The block diagram below shows the 8 DO DC 24V/1,3A 4×M12 I/O device.

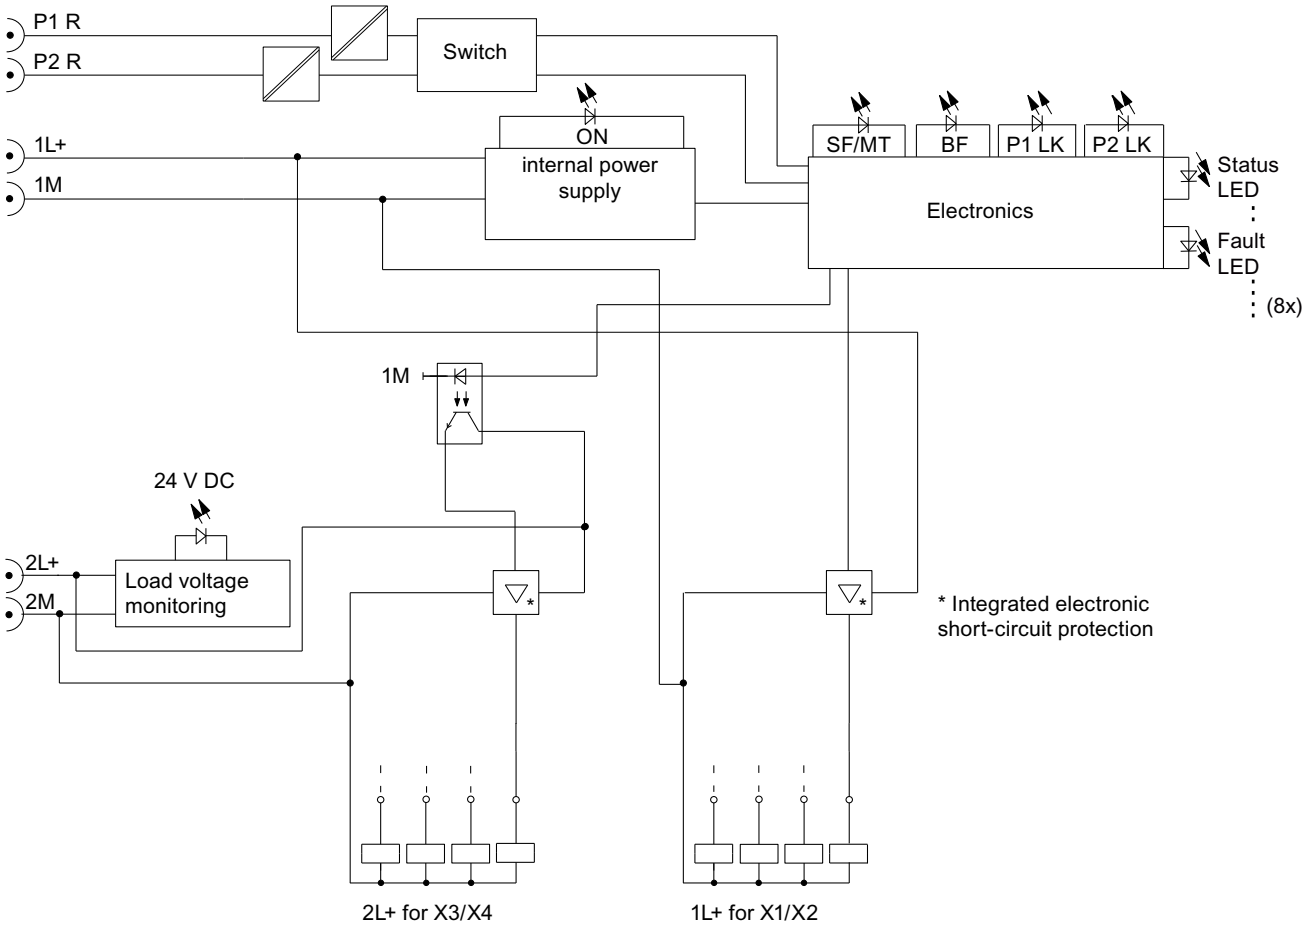


Figure 1-776 Block diagram of the 8 DO DC 24V/1,3A 4×M12 I/O device

Technical specifications of the 8 DO DC 24V/1,3A 4×M12 I/O device

Technical specifications	
Dimensions and weight	
Dimensions W x H x D (mm)	30 x 200 x 49
Weight	Approx. 550 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"

Technical specifications	
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Total current of the outputs *	
• All mounting positions to 55°C	3.9 A per 1L+ and 2L+
• All mounting positions to 60°C	2.6 A per 1L+ and 2L+
Current consumption	
From supply voltage (1L+)	Typ. 100 mA
Power loss of the device	Typ. 5.5 W
Digital outputs	
Number of outputs	8
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red/yellow "SF/MT" LED
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED
• Monitoring of supply voltage 2L+	Green "DC24V" LED

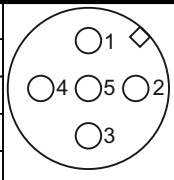
Technical specifications	
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through
• Digital output	Green LED
• Fault at digital output	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Short-circuit	Yes
• Wire break	Yes, in the off state, per channel
• Failure of 1L+ and 2L+	Yes
Actuator selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Output voltage	
• Nominal value	DC 24 V
• For signal "1"	Min. 1L+/2L+ (-0.8 V)
Output current	
• At signal "1"	Max. 1.3 A
• For "0" signal (residual current)	Max. 1.5 mA
Load resistance range	22 Ω to 3.3 kΩ
Lamp load	Max. 5 W
Parallel wiring of two outputs	
• To increase performance	No
• For redundant control of a load	Supported
Controlling of a digital input	Yes
Switching frequency	
• With resistive load	Max. 100 Hz
• With inductive load	Max. 0.5 Hz
• With lamp load	Max. 1 Hz
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 1.8 A (per channel)
* Make allowances for the maximum total current when configuring the module.	

9.2.2 I/O device 8 DO DC 24 V/0.5A 4xM12

Article number

6ES7142-6BF50-0AB0

Properties



The 8 DO DC 24V/0,5A 4×M12 I/O device has the following properties:

- 8 digital outputs
- Dimensions 30 x 200 mm, dual assignment of the sockets
- Output current: 0.5 A per output
- Rated load voltage DC 24 V
- Suitable for solenoid valves, DC contactors, and indicator lights
- Diagnostics
  - "Missing 1L+ or 2L+" for the I/O device
  - "Wire break at outputs" per channel
  - "Short-circuit to M at outputs" per channel
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the four sockets for connecting digital outputs.

Table 1-1080 Pin assignment of sockets X1 to X4 for digital outputs

Pin	Assignment				View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	
1	Not used				
2	Output signal				
	DQ_4	DQ_5	DQ_6	DQ_7	
3	Ground 2M				
4	Output signal				
	DQ_0	DQ_1	DQ_2	DQ_3	
5	Functional earth FE				

Block diagram

The block diagram below shows the 8 DO DC 24V/0,5A 4×M12 I/O device.

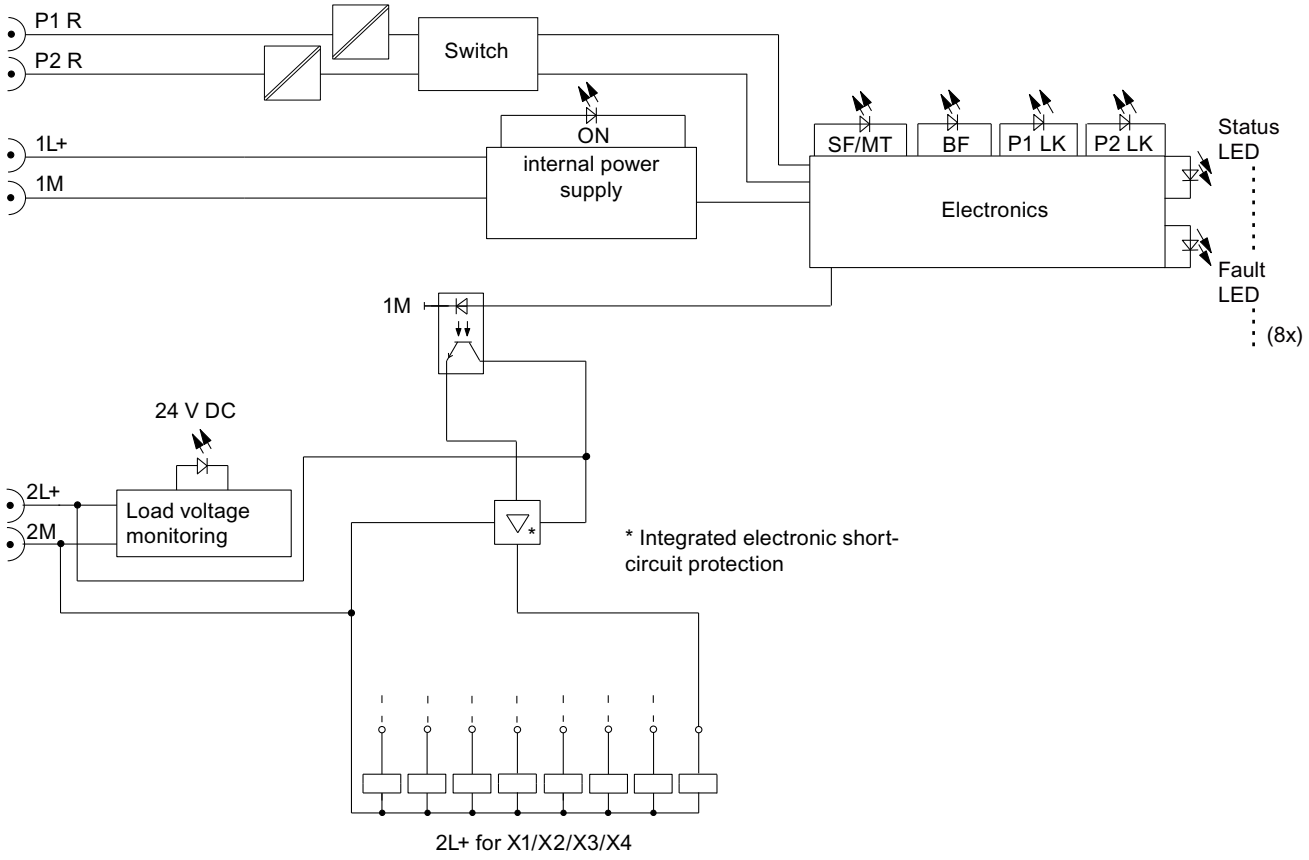


Figure 1-777 Block diagram of the 8 DO DC 24V/0,5 A 4×M12 I/O device

Technical data of the 8 DO DC 24V/0,5A 4×M12 I/O device

Technical data	
Dimensions and weight	
Dimensions W x H x D (mm)	30 x 200 x 49
Weight	Approx. 550 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"

Technical data	
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Total current of the outputs	
• All mounting positions to 60°C	Max. 4 A (only 2L+)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Current consumption	
• From supply voltage (1L+)	Typ. 100 mA
• From supply voltage (2L+)	Typ. 5 mA
Power loss of the device	Typ. 3 W
Digital outputs	
Number of outputs	8
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red/yellow "SF/MT" LED
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED

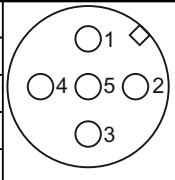
Technical data	
• Monitoring of supply voltage 2L+	Green "DC24V" LED
• Existing connection to network	Green LED "P1 LK" and "P2 LK";
• Digital output	Green LED
• Fault at digital output	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Failures of 2L+	Yes
• Short-circuit	Yes
• Wire break	Yes, in the off state, per channel
Actuator selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Output voltage	
• Nominal value	DC 24 V
• For signal "1"	Min. 1L+/2L+ (-0.8 V)
Output current	
• At signal "1"	0.5 A
• For "0" signal (residual current)	Max. 1.5 mA
Load resistance range	48 Ω to 3.3 kΩ
Lamp load	Max. 5 W
Parallel wiring of two outputs	
• To increase performance	No
• For redundant control of a load	Supported
Control of a digital input	Yes
Switching frequency	
• With resistive load	Max. 100 Hz
• With inductive load	Max. 0.5 Hz
• With lamp load	Max. 1 Hz
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 0.7 A (per channel)

9.2.3 I/O device 8 DO DC 24 V/1.3A 8xM12

Article number

6ES7142-6BG00-0AB0

Properties



The 8 DO DC 24V/1,3A 8×M12 I/O device has the following properties:

- 8 digital outputs
- Dimensions 60 x 175 mm, single assignment of the sockets
- Output current: 1.3 A per output
- Rated load voltage DC 24 V
- Suitable for solenoid valves, DC contactors, and indicator lights
- Diagnostics
  - "Missing 1L+ or 2L+" for the I/O device
  - "Wire break at outputs" per channel
  - "Short-circuit to M at outputs" per channel
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the eight sockets for connecting digital outputs.

Table 1-1081 Pin assignment of sockets X1 to X8 for digital outputs

Pin	Assignment								View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	**Socket X5**	**Socket X6**	**Socket X7**	**Socket X8**	
	24 V (1L+ non-switched)				**24 V (2L+ switched)**				
1	Not used								
2	Not used								
3	Ground 1M				Ground 2M				
4	Output signal								
	DQ_0	DQ_1	DQ_2	DQ_3	DQ_4	DQ_5	DQ_6	DQ_7	
5	Functional earth FE								

Block diagram

The block diagram below shows the 8 DO DC 24V/1,3A 8×M12 I/O device.

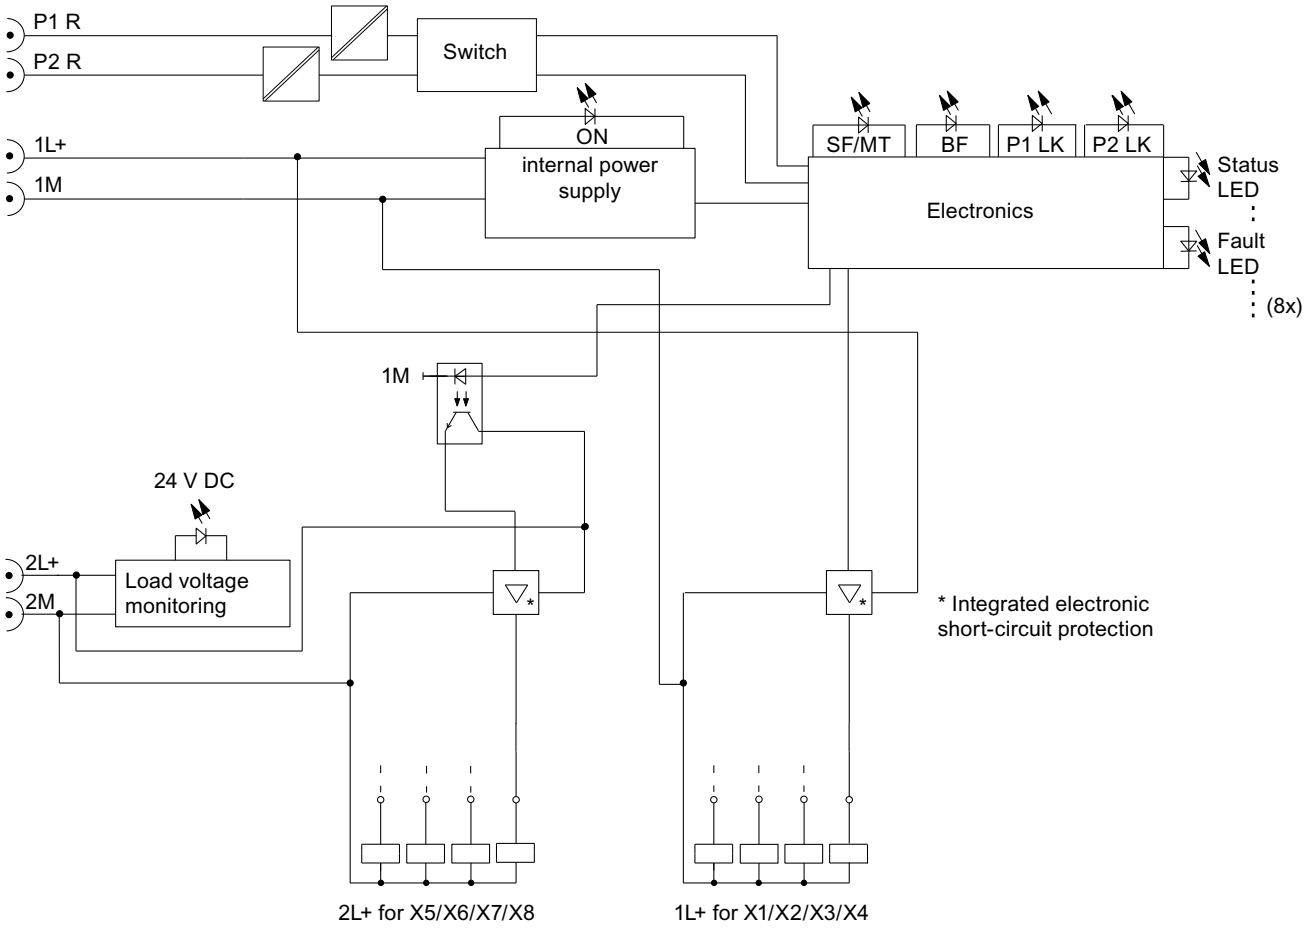


Figure 1-778 Block diagram of the 8 DO DC 24V/1,3A 8×M12 I/O device

Technical data of the 8 DO DC 24V/1,3A 8×M12 I/O device

Technical data	
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight	Approx. 910 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"

Technical data	
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Total current of the outputs *	
• All mounting positions to 60°C	Max. 3.9 A per 1L+ and 2L+
Current consumption	
From supply voltage (1L+)	Typ. 100 mA
From supply voltage (2L+)	Typ. 5 mA
Power loss of the device	Typ. 5.5 W
Digital outputs	
Number of outputs	8
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red/yellow "SF/MT" LED
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED
• Monitoring of supply voltage 2L+	Green "DC24V" LED

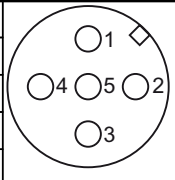
Technical data	
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through
• Digital output	Green LED
• Fault at digital output	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Failure of 1L+ and 2L+	Yes
• Short-circuit	Yes, per channel
• Wire break	Yes, in the off state, per channel
Actuator selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Output voltage	
• Nominal value	DC 24 V
• For signal "1"	Min. 1L+/2L+ (-0.8 V)
Output current	
• At signal "1"	Max. 1.3 A
• For "0" signal (residual current)	Max. 1.5 mA
Load resistance range	22 Ω to 3.3 kΩ
Lamp load	Max. 5 W
Parallel wiring of two outputs	
• To increase performance	No
• For redundant control of a load	Supported
Control of a digital input	Yes
Switching frequency	
• With resistive load	Max. 100 Hz
• With inductive load	Max. 0.5 Hz
• With lamp load	Max. 1 Hz
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 1.8 A (per channel)
* Make allowances for the maximum total current when configuring the module.	

9.2.4 I/O device 8 DO DC 24V/2.0A 8xM12

Article number

6ES7142-6BR00-0AB0

Properties



The 8 DO DC 24V/2,0A 8×M12 I/O device has the following properties:

- 8 digital outputs
- Dimensions 60 x 175 mm, single assignment of the sockets
- Output current: 2.0 A per output
- Rated load voltage DC 24 V
- Suitable for solenoid valves, DC contactors, and indicator lights
- Diagnostics
  - "Missing 1L+ or 2L+" for the I/O device
  - "Wire break at outputs" per channel
  - "Short-circuit to M at outputs" per channel
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the eight sockets for connecting digital outputs.

Table 1-1082 Pin assignment of sockets X1 to X8 for digital outputs

Pin	Assignment								View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	**Socket X5**	**Socket X6**	**Socket X7**	**Socket X8**	
	24 V (1L+ non-switched)				**24 V (2L+ switched)**				
1	Not used								
2	Not used								
3	Ground 1M				Ground 2M				
4	Output signal								
	DQ_0	DQ_1	DQ_2	DQ_3	DQ_4	DQ_5	DQ_6	DQ_7	
5	Functional earth FE								

Block diagram

The block diagram below shows the 8 DO DC 24V/2,0A 8×M12 I/O device.

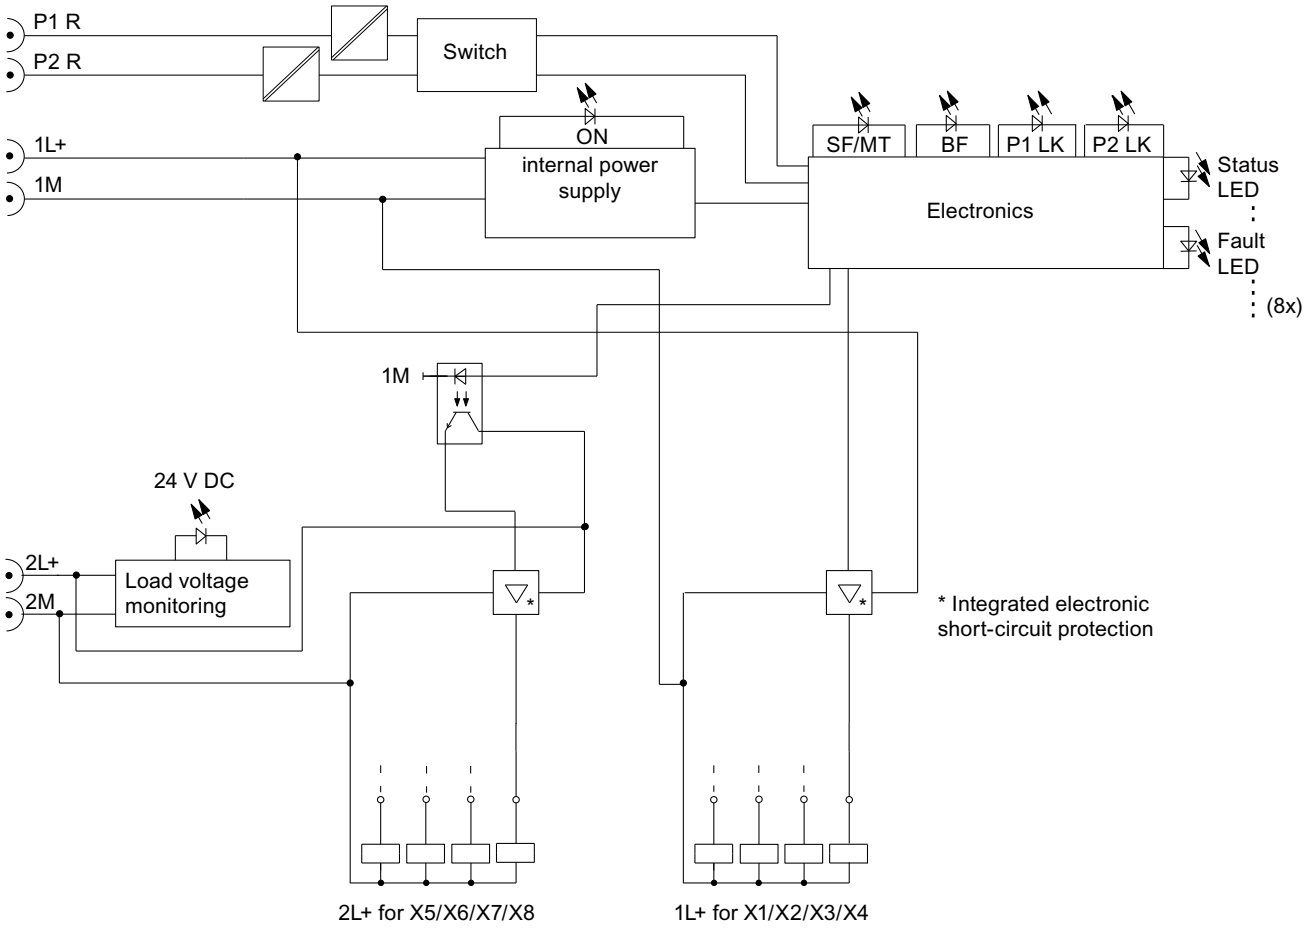


Figure 1-779 Block diagram of the 8 DO DC 24V/2,0A 8×M12 I/O device

Technical data of the 8 DO DC 24V/2,0A 8×M12 I/O device

Technical data

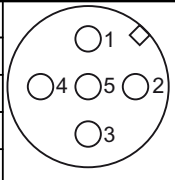
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 2.8 A (per channel)
* Make allowances for the maximum total current when configuring the module.	

9.2.5 I/O device 16 DO DC 24 V/1.3A 8xM12

Article number

6ES7142-6BH00-0AB0

Properties



The 16 DO DC 24V/1,3A 8×M12 I/O device has the following properties:

- 16 digital outputs
- Dimensions 60 x 175 mm, dual assignment of the sockets
- Output current: 1.3 A per output
- Rated load voltage DC 24 V
- Suitable for solenoid valves, DC contactors, and indicator lights
- Diagnostics
  - "Missing 1L+ and 2L+" for the I/O device
  - "Wire break at outputs" per channel
  - "Short-circuit to M at outputs" per channel
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

Pin assignment of the sockets

The table below shows the pin assignment of the eight sockets for connecting digital outputs.

Table 1-1083 Pin assignment of sockets X1 to X8 for digital outputs

Pin	Assignment								View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	**Socket X5**	**Socket X6**	**Socket X7**	**Socket X8**

• Response threshold	Typ. 1.8 A (per channel)
* Make allowances for the maximum total current when configuring the module.	

9.2.6 Parameter overview digital outputs

Parameters for

- 8 DO DC 24V/1,3A 4×M12 (6ES7142-6BF00-0AB0)
- 8 DO DC 24V/1,3A 8×M12 (6ES7142-6BG00-0AB0)
- 8 DO DC 24V/2,0A 8×M12 (6ES7142-6BR00-0AB0)

Parameter	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 1L+ or 2L+	• Disable • Enable	Disable	Channel group
Response to CPU/Master STOP	• Shut down • Retain last value	Shut down	Device
Diagnostics: Wire break at outputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel
Diagnostics: Short circuit to M, outputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel

Parameters for 8 DO DC 24V/0,5A 4×M12 (6ES7142-6BF50-0AB0)

Parameter	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 2L+	• Disable • Enable	Disable	Device
Response to CPU/Master STOP	• Shut down • Retain last value	Shut down	Device
Diagnostics: Wire break at outputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel
Diagnostics: Short circuit to M, outputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel

Parameters for 16 DO DC 24V/1,3A 8×M12 (6ES7142-6BH00-0AB0)

Parameter	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 1L+ or 2L+	• Disable • Enable	Disable	Channel group
Response to CPU/Master STOP	• Shut down • Retain last value	Shut down	Device
Diagnostics: Wire break at outputs 0 to 15 (channels 0 to 15)	• Disable • Enable	Disable	Channel
Diagnostics: Short circuit to M, outputs 0 to 15 (channels 0 to 15)	• Disable • Enable	Disable	Channel

9.3 I/O device digital inputs/digital outputs

9.3.1 I/O device 8 DIO DC 24V/1.3A 8xM12

Article number

6ES7147-6BG00-0AB0

Properties

The 8 DIO DC 24V/1,3A 8×M12 I/O device has the following properties:

- 8 freely parameterizable digital inputs/outputs
- Prioritized startup
- Media redundancy
- Dimensions 60 x 175 mm, single assignment of the sockets
- Digital inputs
  - Rated input voltage DC 24 V
  - Suitable for switches and proximity switches
  - Diagnostics
    "Missing 1L+ or 2L+" for the I/O device
    "Short-circuit to M at sensor supply", per channel group
    "Wire break", per channel
- Digital outputs
  - Rated load voltage DC 24 V
  - Output current: 1.3 A per output
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Diagnostics
    "Missing 1L+ or 2L+" for the I/O device
    "Wire break at outputs" per channel
    "Short-circuit to M at outputs" per channel
  - Parameterizable response to CPU/Master STOP for I/O device

Pin assignment of the DIO sockets

The table below shows the pin assignment of the eight sockets for connecting digital inputs and digital outputs.

Table 1-1084 Pin assignment of sockets X1 to X8 for digital inputs/digital outputs

Pin	Assignment								View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	Socket X5	Socket X6	Socket X7	Socket X8	
1	24 V sensor supply $1U_S$ (derived from 1L+ non-switched)				24 V sensor supply $2U_S$ (derived from 2L+ switched)				
2	Not used								
3	Supply ground 1M				Supply ground 2M				

Pin	Assignment								View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	Socket X5	Socket X6	Socket X7	Socket X8	
4	Input/output signal								X01 - X04
	DIQ_0	DIQ_1	DIQ_2	DIQ_3	DIQ_4	DIQ_5	DIQ_6	DIQ_7	
5	Functional earth FE								

Block diagram

The block diagram below shows the 8 DIO DC 24V/1,3A 8×M12 I/O device.

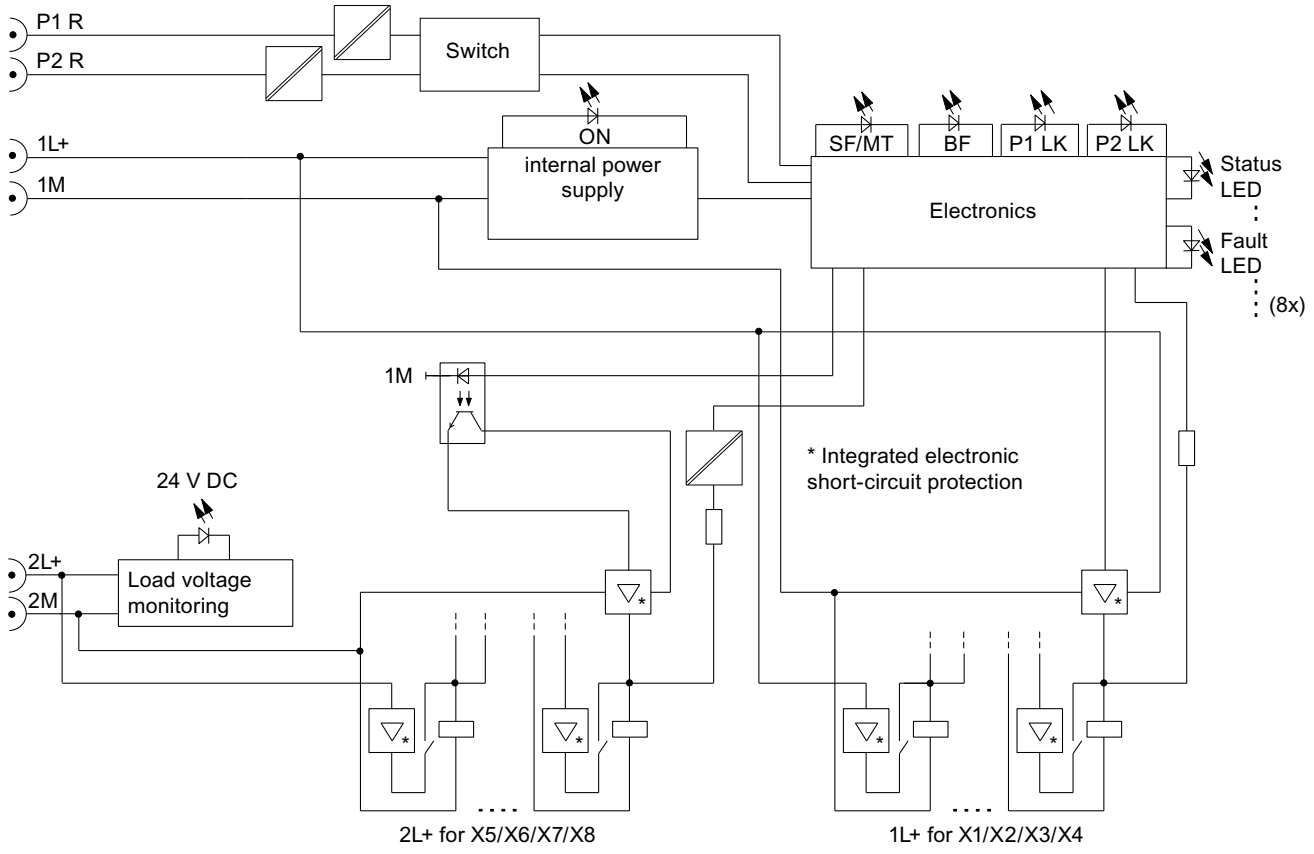

Figure 1-781 Block diagram of the 8 DIO DC 24V/1,3A 8×M12 I/O device

Technical data of the 8 DIO DC 24V/1,3A 8×M12 I/O device

Technical data	
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight	Approx. 910 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Current consumption	
From supply voltage (1L+)	Typ. 100 mA (no digital output activated)
From supply voltage (2L+)	Typ. 5 mA (no digital output activated)
Power loss of the device	type 4.5 W (if all channels are set as digital input) type 6.5 W (if all channels are set as digital output)
Total current of the outputs	
• All mounting positions to 60°C	Max. 3.9 A per 1L+ and 2L+
Digital inputs/digital outputs	
Number of configurable inputs/outputs	8
Number of inputs that can be controlled simultaneously	8, in all mounting positions
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)

Technical data	
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red/yellow "SF/MT" LED
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through
• Digital input	Green LED
• Fault at digital input	Red LED
• Digital output	Green LED
• Fault at digital output	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Failure of 1L+ and 2L+	Yes
• Sensor supply short-circuit	Yes, per channel
• Digital output short-circuit	Yes, per channel
• Digital input wire break	Yes, input current < 0.3 mA, per channel
• Digital output wire break	Yes, in the off state, per channel
Sensor supply	
Number of sensor supplies	8, 4×1L+ and 4×2L+ Note: The sensor supply is only available when the corresponding channel is parameterized as an "Input".
Load current	100 mA per output
Short-circuit protection	Yes, electronic
Sensor selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Input voltage	
• Nominal value	24 V DC
• For signal "1"	11 to 30 V
• For signal "0"	-3 to +5 V
Input current	
• At signal "1"	Typ. 7 mA
Input delay	
• At "0" to "1"	Typ. 3 ms

Technical data	
• At "1" to "0"	Typ. 3 ms
Input characteristic	According to IEC 61131, Type 3
Connection of 2-wire proximity switches	Supported
• Permitted quiescent current	Max. 1.5 mA
Actuator selection data	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Output voltage	
• Nominal value	24 V DC
• For signal "1"	Min. 1L+/2L+ (-0.8 V)
Output current	
• At signal "1"	Max. 1.3 A
• For "0" signal (residual current)	Max. 1.5 mA
Load resistance range	22 Ω to 3.3 kΩ
Lamp load	Max. 5 W
Parallel wiring of two outputs	
• To increase performance	No
• For redundant control of a load	Supported
Control of a digital input	Yes
Switching frequency	
• With resistive load	Max. 100 Hz
• With inductive load	Max. 0.5 Hz
• With lamp load	Max. 1 Hz
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 1.8 A (per channel)

9.3.2 Parameter overview digital inputs/digital outputs

Parameters for 8 DIO DC 24V/1,3A 8×M12 (6ES7147-6BG00-0AB0)

Parameters	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics: Missing 1L+ or 2L+	• Disable • Enable	Disable	Channel group
Diagnostics: Wire break at inputs 0 to 7 (channels 0 to 7)	• Disable • Enable	Disable	Channel
Diagnostics: Short-circuit to M, inputs 0 to 7	• Disable • Enable	Disable	Channel
Response to CPU/Master STOP	• Shut down • Retain last value	Shut down	Device

Parameters	Range of values	Default setting	Range of effectiveness
Diagnostics: Wire break outputs 0 to 7	• Disable • Enable	Disable	Channel
Diagnostics: Short-circuit to M, outputs 0 to 7	• Disable • Enable	Disable	Channel
Freely parameterizable	• Digital input • Digital output	Digital input	Channel

10.1.1 I/O device 8 AI 4 U/I + 4 RTD/TC 8xM12

Article number

6ES7144-6KD00-0AB0

Properties

- 4 inputs for voltage and current measurement (2-wire and 4-wire transducers)
- 4 inputs for resistance (2-/3-/4-wire transducer), thermal resistor (2-/3-/4-conductor connection system), thermocouple or ±80 mV
- Input ranges:
  - ±10 V, resolution 15 bits + sign
  - ±80 mV, resolution 15 bps + sign
  - 0 to 10 V, resolution 15 bits
  - 1 to 5 V, resolution 15 bits
  - ±20 mA, resolution 15 bits + sign
  - 0 to 20 mA, resolution 15 bps + sign
  - 4 to 20 mA, resolution 15 bits

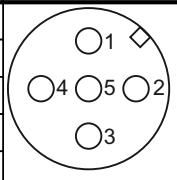
NOTE

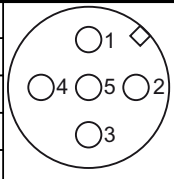
During startup
As long as no parameters are assigned for the I/O device, the I/O device supplies the process values 0x7FFF.

Pin assignment

The tables below show the pin assignment for the 8 AI 4 U/I + 4 RTD/TC 8×M12 I/O device.

Table 1-1085 Pin assignment for voltage and current for the 8 AI 4 U/I + 4 RTD/TC 8×M12 I/O device





Pin	Assignment for U/I				View of socket (front view)
	Socket X1 (Channel 0)	Socket X3 (Channel 1)	Socket X5 (Channel 2)	Socket X7 (Channel 3)

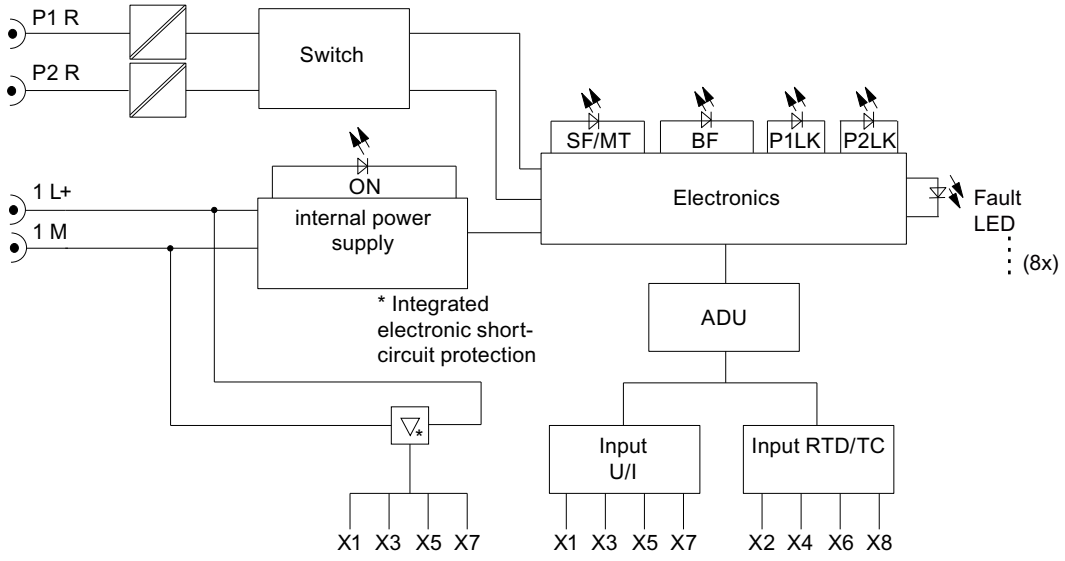

Figure 1-782 Block diagram 8 AI 4 U/I + 4 RTD/TC 8×M12

Technical specifications

Technical specifications	
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight	Approx. 930 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy

Technical specifications	
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes; if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
Reverse polarity protection	Yes; against destruction
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Infeed current 2L+	Max. 4 A
Current consumption	
• From supply voltage 1L+	Typ. 110 mA
• From supply voltage 2L+	0 mA
Power loss of the device	Typ. 2.8 W, without sensor current
Analog inputs	
Number of inputs	8 (4 for U or I, 4 for RTD or thermocouple)
Cable length, shielded	Max. 30 m
Sensor supply	
Number of sensor supplies	4
Total current	Max. 1 A
Short-circuit protection	Yes; electronic, for each module, to ground
• Response threshold	Min. 1.4 A
Sensor selection data	
Input ranges (Rated value)/input resistance or input voltage	
• Voltage	±80 mV/10 MΩ ±10 V/100 kΩ 0 to 10 V/100 kΩ 1 to 5 V/100 kΩ
• Current	±20 mA/17 V for 2-wire transducer, 3.5 V for 4-wire transducer 0 to 20 mA/17 V for 2-wire transducer, 3.5 V for 4-wire transducer 4 to 20 mA/17 V for 2-wire transducer, 3.5 V for 4-wire transducer

Technical specifications		
• Resistor and thermal resistor		150 Ω/10 MΩ 300 Ω/10 MΩ 600 Ω/10 MΩ 3000 Ω/10 MΩ Ni100/10 MΩ Ni1000/10 MΩ Ni120/10 MΩ Ni200/10 MΩ Ni500/10 MΩ Pt100/10 MΩ Pt1000/10 MΩ Pt200/10 MΩ Pt500/10 MΩ
• Thermocouple		Types E, J, K, N
Permitted input voltage for voltage input (destruction limit)		28.8 V continuous, 35 V for max. duration of 500 ms
Connection of sensors for voltage measurement		Yes
Connection of sensors for current measurement		Yes (as 2-wire/4-wire transducer)
Connection of sensors for RTD		Yes (with 2-/3-/4-conductor connection)
Connection of sensors for thermocouples		Yes
Temperature compensation for thermocouples [1]		
• Internal temperature compensation		Yes, parameterizable
• External temperature compensation		Yes, parameterizable
Technical unit for temperature measurement		°C, °F, K
Formation of analog values		
Measuring principle		Integrating
Integration time and conversion time/resolution (per channel)		
• Integration time parameterizable		Yes
• Interference frequency suppression in Hz		500/60/50/10
• Integration time in ms		2.0/16.667/20/100
• Conversion time in ms (per channel) [2]		4/19/22/102
• Resolution for voltage (including overrange)		±80 mV/15 bps + sign ±10 V/15 bps + sign 0 to 10 V/15 bps 1 to 5 V/15 bps
• Resolution for current (including overrange)		±20 mA/15 bps + sign 0 to 20 mA/15 bps 4 to 20 mA/15 bps
• Resolution for RTD (including overrange)		150 Ω, 300 Ω, 600 Ω, 3000 Ω/15 bps, Ni100, Ni1000, Ni120, Ni200; Ni500, Pt100, Pt1000, Pt200, Pt500/15 bps + sign
• Resolution for thermocouples (including overrange)		Types E, J, K, N/15 bps + sign
Measured value smoothing		Yes, parameterizable in 4 levels
	Level None Weak Medium Strong	**Time constant** 1 x cycle time 4 x cycle time 16 x cycle time 64 x cycle time

Technical specifications				
Interference suppression, error limits				
Interference suppression for f = n x (f1 ± 0.5%), (f1 = interference frequency)	46 dB			
• Common-mode interference (interference voltage < 5 V)	70 dB			
• Series-mode interference (peak value of interference < Rated value of input range)	46 dB			
Crosstalk between inputs	< -85 dB			
Operational limit (across temperature range, relative to input range)		Ambient temperature		
		positive	negative (0 °C to -25 °C)	negative (-25 °C to -40 °C)
	U	0.15%	0.2%	0.35%
	I	0.2%	0.25%	0.4%
	R, RTD	0.1%	0.15%	0.3%
	TC	0.2%	0.25%	0.4%
Basic error limit (operational limit at 25 °C, relative to input range) [3]	U	0.1%		
	I	0.1%		
	R, RTD	0.05%		
	TC	0.1%		
Temperature error (relative to input range)		Ambient temperature		
		positive	negative	
	U	0.0035%/K	0.007%/K	
	I	0.006%/K	0.007%/K	
	R, RTD	0.0005%/K	0.001%/K	
	TC	0.0035%/K	0.007%/K	
Linearity error (relative to input range)	±0.01%			
Repeat accuracy (in steady-state condition at 25°C, relative to input range)	±0.008%			
Operational limit for internal temperature sensor	±3 °C			
Basic error limit for internal temperature sensor	±2 °C			
Status, interrupts, diagnostics				
Interrupts	Yes			
Diagnostics functions				
• Group error/maintenance	Red/yellow "SF/MT" LED			
• Bus monitoring PROFINET IO	Red "BF" LED			
• Monitoring of supply voltage 1L+	Green "ON" LED			
• Existing connection to bus	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through			
• Analog input error	Red LED			
• Diagnostic information can be read	Yes			
Monitoring for				
• Sensor supply short-circuit	Yes, only if channel is enabled			
• Wire break	4 to 20 mA, 1 to 5 V, resistors and thermoresistors			
• Underflow and overflow	Yes			

Technical specifications	
• Supply voltage 1L+	Yes
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Standards, approvals, certificates	
Suitable for applications according to AMS 2750	Yes; Declaration of Conformity, see online support entry 109757262
Suitable for applications according to CQI-9	Yes; based on AMS 2750 E
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes

[1] "No temperature compensation" is always run when using the measuring type ±80 mV regardless of the configured temperature compensation.
[2] With 3-wire resistance measurement (and thermal resistor) the measuring resistances and the line resistances are updated in alternating cycles. Rapid changes in the measuring resistance therefore impair the accuracy.
[3] For thermocouples, the information refers to the temperature range from -100 °C to nominal value

NOTE

The accuracy information is valid for static thermal states and changes in ambient temperature < 1 K/h.
The I/O device achieves the highest accuracy with the 4-wire connection system (see technical specifications above).
Although the 3-wire connection system compensates for the missing wire, the accuracy is impaired. With the 2-wire connection system, the line resistances considerably impair the accuracy.
In the last two cases this impairment is not determinable.

NOTE

With the 3-wire connection system, the compensation of the missing cable is only ensured if all three cores in the cable have the same length and cross-section.

10.1.2 8 AI RTD/TC 8×M12 I/O device

Article number

6ES7144-6KD50-0AB0

Properties

The electronic module 8 AI RTD/TC 8×M12 has the properties listed below:

- 8 freely parameterizable inputs:
  - Resistance (2-/3-/4-wire transmitter)
  - Thermoresistor (2-/3-/4-conductor connection system)
  - Thermocouple or ±80 mV
- Input ranges:
  - Voltage measurement: ±80 mV; resolution 15 bit + sign
  - Resistance measurement: 150 Ω, 300 Ω, 600 Ω, 3000 Ω; resolution 15 bits
  - Resistance thermometer: Pt100, Ni100, Ni120, Pt200, Ni200, Pt500, Ni500, Pt1000, Ni1000; resolution 15 bits + sign
  - Thermocouple elements: E, J, K, N; resolution 15 bits + sign
- Dimensions 60 x 175 mm
- Diagnostics
  - "No 1L+" supply voltage
  - "Wire break"
  - "Underflow"
  - "Overflow"
- Permitted common-mode voltage AC $10V_{PP}$
- Prioritized startup
- Media redundancy

NOTE
During startup
As long as no parameters are assigned for the I/O device, the I/O device supplies the process values $7FFF_H$.

Pin assignment

The tables below show the pin assignment for the 8 AI RTD/TC 8xM12 electronic module.

Measuring type with 8 AI RTD

The following table lists the temperature coefficients and measuring ranges you can assign for each measurement type:

Measurement type	Temperature coefficient	Measuring range
Thermoresistor 4-conductor Thermoresistor 3-conductor Thermoresistor 2-conductor	Pt 0.003851[1, 2]/ Pt 0.003916/ Pt 0.003902/ Pt 0.003920	Pt100 Climatic range / Pt100 Standard range / Pt200 Climatic range / Pt200 Standard range / Pt500 Climatic range / Pt500 Standard range /

Measurement type	Temperature coefficient	Measuring range
Thermoresistor 4-conductor Thermoresistor 3-conductor Thermoresistor 2-conductor		Pt1000 Climatic range / Pt1000 Standard range
	Ni 0.006180[1]/ Ni 0.006720/ Ni 0.005[3]	Ni100 Climatic range / Ni100 Standard range / Ni120 Climatic range / Ni120 Standard range / Ni200 Climatic range / Ni200 Standard range / Ni500 Climatic range / Ni500 Standard range / Ni1000 Climatic range / Ni1000 Standard range
[1] The default settings for the temperature coefficients apply according to the standard EN60751. [2]This value can also be shown as α = 0.00385055 in the parameter assignment. [3] The thermoresistor LG-Ni1000 corresponds to the thermoresistor Ni1000 with the temperature coefficient 0.005		

NOTE

For a thermoresistor, the climatic type is only possible with temperature units Celsius (°C) and Fahrenheit (°F).

10.1.4 Parameter description analog input

Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter.

The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

Diagnostics: Missing 1L+

If you enable this parameter, the check for missing supply voltage is enabled.

Diagnostics: Short-circuit sensor supply

If you enable this parameter, a diagnostics event is generated if a short-circuit of the sensor supply to ground is detected and the channel is enabled. The sensor supply is monitored for connectors X1, X3, X5, and X7. No differentiation is made as to the connector where the sensor short-circuit occurred.

Interference frequency suppression

With this parameter, you set the integration time of the device, based on the selected interference frequency. Select the frequency of the supply voltage used. Interference frequency suppression "Off (Fast Mode)" means 500 Hz, which corresponds to an integration time of 2 ms for a measurement channel.

Temperature unit

This parameter is used to select the unit in which the temperature is detected.

Reference temperature for TC

The reference temperature applies to all channels at which "Fix Ref. Temp." was selected at "Reference junction". Information about the value range of the reference temperature is available in the table Reference temperature for TC.

Measurement type (channel-wise)

Click the field to have the available measurement types displayed and select them.

Possible measurement types:

- Voltage ±80 mV
- Resistor (4-wire connection)
- Resistor (3-wire connection)
- Resistor (2-wire connection)
- Thermal resistor (linear, 4-wire connection)
- Thermal resistor (linear, 3-wire connection)
- Thermal resistor (linear, 2-wire connection)
- Thermocouple

This parameter is used to set the measuring method, for example voltage. For any unused channels, you must select the **disabled** setting. For a disabled channel, the conversion time and integration time of the channel = 0 s, and the overall cycle time of the device is reduced.

Measuring range

With this parameter, you set the measuring range of the selected measurement type.

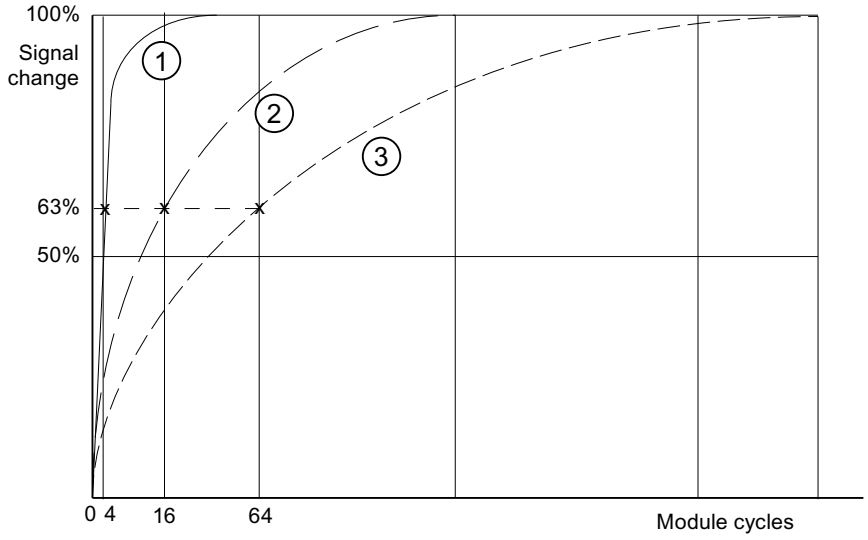
Temperature coefficient (for RTD, thermoresistor)

The correction factor for the temperature coefficient (α-value) specifies the extent to which the resistance of a certain material changes when the temperature is raised by 1 °C.

The α-values conform to EN 60751, GOST 6651, JIS C 1604, and ASTM E-1137.

The temperature coefficient depends on the chemical composition of the material.

Smoothing



Smoothing of the analog values produces a stable analog signal for further processing. The smoothing of analog values is useful when handling wanted signals (measured values) with a slow rate of change, for example, temperature measurements.

The measured values are smoothed by digital filtering. To achieve smoothing, the device generates a mean value from a specified number of converted (digitized) analog values.

You assign a maximum of four levels for the smoothing (none, weak, medium, strong). The level determines the number of module cycles, from which the mean value is generated.

The stronger the smoothing, the more precisely the smoothed analog value reaches the setpoint value. The time interval until the smoothed analog value is applied after a signal change is also prolonged.

The figure below shows the number of cycles a module requires to apply the smoothed analog value at almost 100% after a step response, based on the smoothing function settings. The figure applies to all signal changes at the analog input. The smoothing value defines the number of cycles a module requires to reach 63% of the end value of the changed signal.

① Smoothing, weak
② Smoothing, medium
③ Smoothing, strong

Diagnostics: Wire break

When this parameter is enabled, the **Wire break** diagnostics event is generated when a wire break is detected.

Observe the rules outlined below to handle a wire break in the 1 V to 5 V and 4 mA to 20 mA measuring ranges:

Parameters	Event	Measured value	Explanation
Enable wire break[1]	Wire break	$7FFF_H$	Diagnostics, **wire break**
Wire break disabled[1] Underflow enabled	Wire break	8000_H	Measured value after leaving the undershoot range Diagnostic message **Lower limit value undershot**
Wire break disabled[1] Underflow disabled	Wire break	8000_H	Measured value after leaving the undershoot range

[1] Measuring range limits for wire break detection and measuring range undershoot detection:
- 1 V to 5 V: At 0.296 V
- 4 mA to 20 mA: At 1.185 mA

Diagnostics at 8AI RTD/TC

Take the following diagnostics into account:

Diagnostics, wire break	Diagnostics, overflow	Diagnostics, underflow	Event	Process data	Diagnostic message per channel:
Activated	Deactivated	Deactivated	Wire break	0x7FFF	Wire break
Deactivated	Deactivated	Activated	Wire break	0x8000	Low limit violated
Deactivated	Activated	Deactivated	Wire break	0x7FFF	High limit violated
Deactivated	Activated	Activated	Wire break	0x8000	Low limit violated
Deactivated	Deactivated	Deactivated	Wire break	0x7FFF	

Diagnostics: Underflow

If the measured value reaches the underflow range and you enable this parameter, the **Underflow** diagnostics event is generated.

Diagnostics: Overflow

If the measured value reaches the overflow range and you enable this parameter, the **Overflow** diagnostics event is generated.

Reference junction for thermoresistor (TC)

A difference in temperature between the measuring point and the free ends of the thermocouple (terminal point) generates a voltage between the free ends, namely the thermoelectric voltage. The value of this thermoelectric voltage is determined by the temperature difference between the measuring point and the free ends, and by the type of material combination of the thermocouple. Since a thermocouple always measures a temperature difference, the free ends at the reference junction must be maintained at a known temperature in order to determine the temperature of the measuring point.

In the case of the I/O device 8 AI 4 U/I + 4 RTD/TC 8×M12 and 8 AI RTD/TC 8xM12, the following compensation settings are possible:

- No / external compensation: The reference junction temperature is measured outside the module, e.g., via a compensation slot.

  With this compensation type, the reference junction temperature of the thermocouples is measured outside the two I/O devices. For this purpose you can, for example, connect a compensation slot to the thermocouple.

  With this compensation type, the temperature of the reference junction is specified at 0 °C .

  The temperature of 0 °C is reached when a compensation slot is used. One compensation slot is required per thermocouple.
- Internal: The temperature of the measuring point is measured in the housing of the I/O device.

  With this type of compensation the reference junction temperature is determined with an internal temperature sensor. One temperature sensor is integrated into each I/O device.

  The reference junction temperature is detected by an internal temperature sensor.

  The same reference junction temperature is assigned to all the channels of the I/O devices that you selected for this type of compensation.

With the I/O device 8 AI RTD/TC 8xM12, the following compensation settings are also possible :

- RTD (0): The reference junction temperature is determined by means of a thermal resistor (Pt1000).

  With this compensation the reference junction temperature is determined by measuring the resistance value of a Pt1000 at the terminal point of the M12 compensation connector. The resistance measurement may only be carried out on the round socket X1 (Channel 0).

  The reference junction temperature is determined by the resistance value Pt1000.

  The same reference junction temperature is assigned to all the channels of the I/O device 8 AI RTD/TC 8xM12 that you selected for this type of compensation.

  The cycle time increases by 1 x the conversion time.

  If the compensation RTD (0) is selected on a channel of the I/O device 8 AI RTD/TC 8xM12, the measurement type for Channel 0 (X1) is limited; that is, only the measurement types "Thermocouple" or "±80 mV" are possible.

  A wire break at Pt1000 cannot be detected and is reported with the diagnosis "Reference channel error".
- The M12 compensation connector is provided for the temperature compensation "RTD (0)" (prerequisite: "Reference junction" parameter set to "RTD (0)". For all other temperature compensations, no M12 compensation connector is required.

  The M12 compensation connector has an integrated resistance thermometer Pt1000 (with α = 0.003851) for compensating the reference junction temperature of the

thermocouples. The α value conforms to the standards EN 60751, GOST 6651, JIS C 1604 and ASTM E-1137.

The M12 compensation connector is delivered unassembled. You can connect a thermocouple by using terminals 2 and 4 of the M12 compensation connector.

The M12 compensation connector is bolted to the round socket X1 on the connection module CM IO 4 x M12 (torque: 1.5 Nm). The procedure is identical to the M12 connector (see section Mounting (Page 19)).

NOTE

The M12 compensation connector is only designed for the electronic module 8 AI RTD/TC 8xM12. Operation without a cable is not permitted in order to comply with degree of protection IP67.

- Dynamic Ref. Temp.: The reference junction temperature is measured via a module on a different station.

  With this type of compensation the reference junction temperature (compensation voltage) is measured by means of an external module on another station.

  The reference junction temperature is transferred from the CPU to the I/O device 8 AI RTD/TC 8xM12 by means of the data record DS2 using the SFB 53.

  An separate reference junction temperature can be assigned by means of the the user program to each channel for which you select this type of compensation.
- Fixed Ref. Temp.: The reference temperature is specified permanently.

  With this type of compensation, the reference junction temperature is stored as a parameter.

  The reference junction temperature is specified in the parameter "Reference temperature for TC".

  The possible value range is listed in the table Reference temperature for TC.

  The parameterized reference junction temperature is valid for all the channels of the I/O device for which you have selected this type of compensation.

10.1.5 Analog value representation for measuring ranges with SIMATIC S7

Representation of analog values

With the same nominal range, the digitized analog value is the same for input and output values. Analog values are represented in two's complement.

The following table shows the representation of analog values of the analog input.

Table 1-1090 Representation of analog values (SIMATIC S7 format)

Resolution	**Analog value**															
Bit number	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Significance of the bits	Sign	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}

Sign

The sign (S) of the analog value is always in bit number 15:

- "0" → +
- "1" → -

10.1.6 Measuring ranges of the analog input device in S7 format

Voltage measuring ranges: Measuring range 1 to 5 V

Measuring range 1 to 5 V	Units		Range
	Decimal	Hexadecimal

10.1.7 Dynamic reference temperature with module 8 AI RTD/TC 8xM12

Properties

You can measure the reference junction temperature of the measuring point by using the I/O device 8 AI RTD/TC 8xM12 or an external module from another station when you use the compensation type "Dynamic reference temperature". To do so, the reference temperature is transmitted with SFB 53 "WRREC" using the data record DS2 to the I/O device 8 AI RTD/TC 8xM12.

Requirements

- Standard function block SFB 53 "WRREC"
- User program

Programming

Observe the following notes on the user program:

- The permitted value range of the reference junction temperature in standard resolution corresponds to the temperature range Pt100 Climatic for platinum RTDs.
- If a reference junction temperature is received in data record DS2 that is outside the permitted value range, a diagnostic interrupt "Reference channel fault" is signaled if the "Group diagnostics" parameter has been enabled.
- All inputs signal overflow (32767) when you start the I/O device 8 AI RTD/TC 8xM12. After receiving a compensation value by means of the data record DS2, the I/O device starts reading the TC inputs and signals correct data.
- The I/O device 8 AI RTD/TC 8xM12 has a watchdog set to 5 minutes that is reset after a new compensation value was received by means of DS2. If the I/O device in standard operation does not receive DS2 data within the 5-minute interval of the watchdog, a diagnostic interrupt "Reference channel fault" is signaled if the "Group diagnostics" parameter has been enabled.
- When you use ET 200eco PN modules or other modules for measuring the reference junction temperature, the RTD module parameters/module parameters for the output structure and measuring accuracy must be represented in the DS2 by bytes 0 and 1. The figure below "Structure of data record DS2" illustrates this setting.

Structure of data record DS2

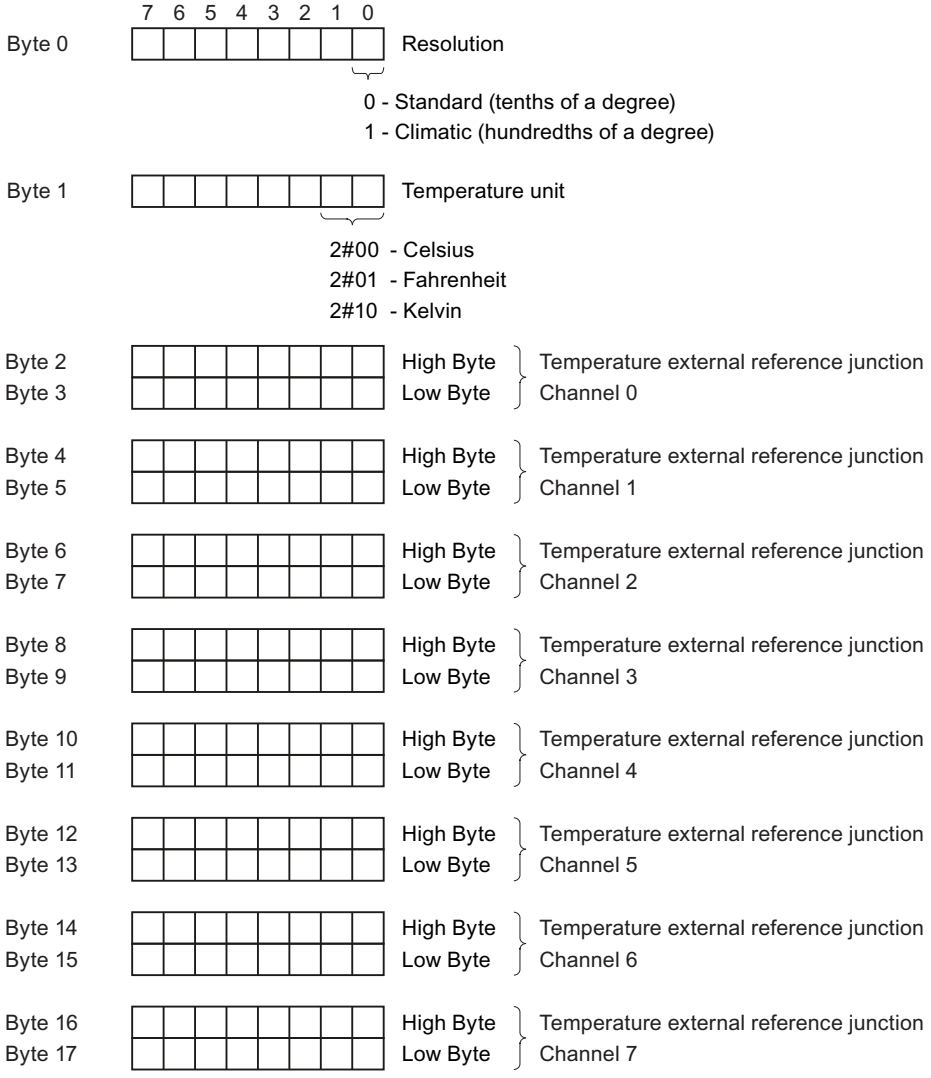

Figure 1-784 Structure of data record DS2

Table 1-1091 Reference temperature for TC

Temperature unit	Decimal	Hexadecimal
Standard temperature unit		
Celsius	-1450 to 1550	$FA56_H$ to $60E_H$
Fahrenheit	-2290 to 3110	$F70E_H$ to $C26_H$
Kelvin	1282 to 4282	502_H to $10BA_H$
Climatic temperature unit		
Celsius	-14500 to 15500	$C75C_H$ to $3C8C_H$
Fahrenheit	-22900 to 31100	$A68C_H$ to $797C_H$
Kelvin	12815 to 32760	$320F_H$ to $7FF8_H$

NOTE

You can use a separate reference junction for each channel due to the flexible structure of the data record DS2. You can also combine channels with the user program so that they use the same reference junction. All channels that operate with the same reference junction temperature must have the same temperature value in the DS2.

User program

The following user program shows an example for the compensation type "Dynamic reference temperature" of channels 0 to 7 of the I/O device 8 AI RTD/TC 8xM12 of an RTD module. The reference junction temperature of the RTD module applies to all channels of the I/O device 8 AI RTD/TC 8xM12.

Requirements:

- Input address of the I/O device 8 AI RTD/TC 8xM12: 120 (module address)
- Input address of the RTD module: 136 (channel address)
- Request bit for SFB "WRREC": M 20.0
- Busy bit for SFB "WRREC": M 20.1
- Memory for data transmission: MW 0 to MW 16

```

U M 20.1                            Checking if WRREC is "Busy"
SPB END
CLR
= M 20.0                            Reset request for Dynamic Ref. Temp.
END :NOP 0
```

This is only an example. The logic and memory assignment have to be adapted to the structure of the used PLC program.

Addition information on SFB 53 "WRREC" is available in the System Software for S7-300/400 System and Standard Functions manual.

10.2 I/O device analog output

10.2.1 I/O device 4 AO U/I 4xM12

Article number

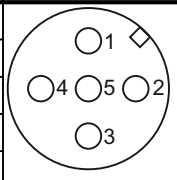
6ES7145-6HD00-0AB0

Properties

- 4 outputs for voltage or current output
- Output ranges:
  - ±10 V, resolution 15 bits + sign
  - 1 to 5 V, resolution 15 bits
  - 0 to 10 V, resolution 15 bits
  - ±20 mA, resolution 15 bits + sign
  - 4 to 20 mA, resolution 15 bits
  - 0 to 20 mA, resolution 15 bits
- Supply voltage DC 24 V
- Dimensions 60 x 175 mm
- Diagnostics
  - "Missing 1L+" supply voltage
  - "Sensor supply short-circuit"
  - "Wire break"
  - "Short-circuit"
  - "Overload"
- Parameterizable response to CPU/Master STOP
- Prioritized startup
- Media redundancy

NOTE

Incorrect intermediate values at the output are possible when supply voltage 1L+ is switched on and off.



NOTE

The outputs are in voltage mode and supply a signal 0 V until the parameter assignment becomes effective after switching on.

Pin assignment

You will find the pin assignment for the 4 AO U/I 4×M12 I/O device in the table below.

Table 1-1092 Pin assignment for voltage and current for the 4 AO U/I 4×M12 I/O device

Pin	Assignment for U/I				View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	
1	24 V actuator supply $1U_A$(derived from 1L+ non-switched)				
2	Output signal				
	Q_0+	Q_1+	Q_2+	Q_3+	
3	Actuator supply ground 1M				
4	Output signal				
	Q_0-	Q_1-	Q_2-	Q_3-	
5	Functional earth FE				

Block diagram

The block diagram below shows the 4 AO U/I 4×M12.

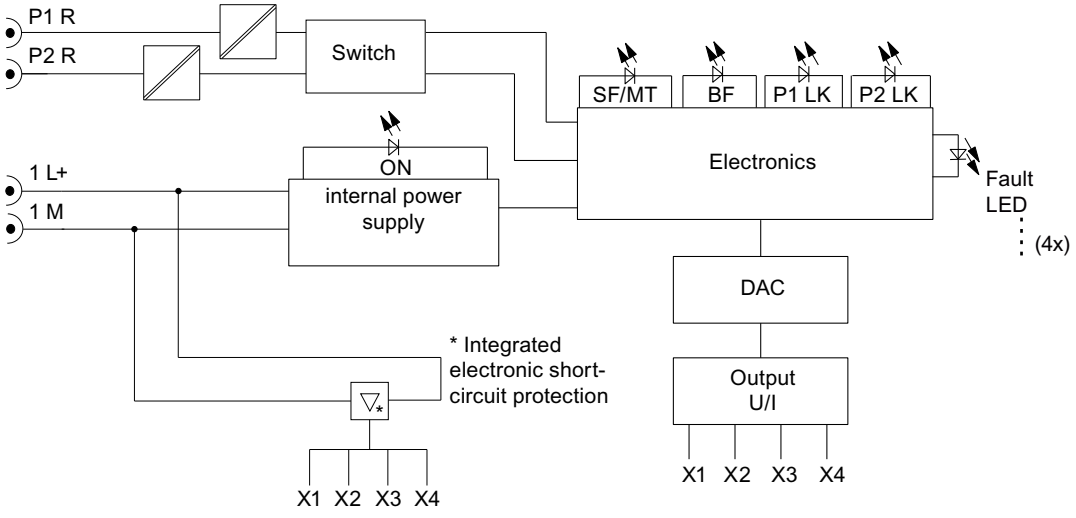


Figure 1-785 Block diagram 4 AO U/I 4xM12

Technical specifications

Technical specifications	
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight	Approx. 930 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility" • IRT with the option "high performance"
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy
PROFINET interface	
• Connection socket	2 x M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes, if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes; against destruction
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Infeed current 2L+	Max. 4 A
Current consumption	
• From supply voltage (1L+)	Typ. 280 mA
• From supply voltage (2L+)	0 A
Power loss of the device	Typ. 5.5 W
Analog outputs	
Number of outputs	4
Cable length, shielded	Max. 30 m
Voltage	
• Short-circuit protection	Yes, electronic, to ground
• Short-circuit current	Max. 30 mA
Current	
• No-load voltage	Max. 20 V
Actuator supplies	
Number of actuator supplies	4

Technical specifications				
Total current	Max. 1 A			
Short-circuit protection	Yes, electronic			
• Response threshold	Min. 1.4 A			
Actuator selection data				
Output ranges (Rated value)				
Voltage	±10 V 1 V to 5 V 0 V to 10 V			
Current	±20 mA 4 to 20 mA 0 to 20 mA			
Load resistance (in the Rated range of the output)				
• For voltage outputs	Min. 1 kΩ			
• For voltage outputs, capacitive load	Max. 1 µF			
• For current outputs	Max. 0.6 kΩ			
• For current outputs, inductive load	Max. 1 mH			
Permissible input voltage at the output (destruction limit)	28.8 V continuous, 35 V for 500 ms			
Connection of actuators				
• For voltage output, 2-wire connection	Yes			
• For current output, 2-wire connection	Yes			
Formation of analog values				
Conversion principle	Resistor network			
• Conversion time per channel, in ms	1 ms			
• Voltage resolution (including overrange)	±10 V/15 bits + sign 1 to 5 V/15 bits 0 to 10 V/15 bits			
• Current resolution (including overrange)	±20 mA/15 bits + sign 4 to 20 mA/15 bits 0 to 20 mA/15 bits			
Settling time	U	I		
• For resistive load	1.3 ms	2 ms		
• For capacitive load	1.8 ms	-		
• For inductive load	-	2 ms		
Ability to switch to substitute values	Yes			
Interference suppression, error limits				
Crosstalk between outputs	Min. 70 dB			
Operational limit (across the temperature range, relative to output range)		Ambient temperature		
		positive	negative (0 °C to -25 °C)	negative (-25 °C to -40 °C)
	U	0.1%	0.15%	0.3%
	I	0.15%	0.25%	0.4%
Basic error limit (operational limit at 25°C, relative to output range)	U	0.08%		
	I	0.1%		
Temperature error (relative to output range)		Ambient temperature		

Technical specifications			
Temperature error (relative to output range)		positive	negative
	U	0.001%/K	0.003%/K
	I	0.0025%/K	0.005%/K
Linearity error (relative to output range)	± 0.02%		
Repeat accuracy (in steady-state condition at 25°C, relative to output range)	±0.008%		
Output ripple (relative to output range, bandwidth 0 to 50 kHz	U	±0.6 mVrms	
	I	±0.4 nArms	
Status, interrupts, diagnostics			
Interrupts	Yes		
Diagnostics functions			
• Group error/maintenance	Red/yellow "SF/MT" LED		
• Bus monitoring PROFINET IO	Red "BF" LED		
• Monitoring of supply voltage 1L+	Green "ON" LED		
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through		
• Fault at analog output	Red LED		
• Diagnostic information can be read	Yes		
Monitoring for			
• Supply voltage 1L+	Yes		
• Sensor supply short-circuit	Yes		
• Short-circuit	Yes; channel (voltage)		
• Wire break	Yes; channel (current)		
• Thermal overload at output	Yes; channel		
Insulation			
Insulation test voltage			
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)		
• All other circuit elements	707 V DC (type test)		
Electrical isolation			
• Between 1L+ and 2L+	Yes		
• Between 1L+, channels and all other circuit elements	No		
• Between channels	No		
• Between Ethernet and all other circuit elements	Yes

10.2.2 Parameter overview analog output

Parameters for analog output 4 AO U/I 4xM12 (6ES7145-6HD00-0AB0)

Parameters	Range of values	Default setting	Range of effectiveness
Group diagnostics	• Disable • Enable	Disable	Device
Diagnostics, missing 1L+	• Disable • Enable	Disable	Device
Diagnostics, sensor supply short-circuit	• Disable • Enable	Disable	Device
Response to CPU/Master STOP	• Output has no current or voltage • Retain last value • Switch to substitute values	Output has no current or voltage	Device
Type of output	• Disabled • Voltage • Current	Voltage	Channel
Output range	• 1 to 5 V • 0 to 10 V • ±10 V • 0 to 20 mA • 4 to 20 mA • ±20 mA	±10 V	Channel
Diagnostics, wire break at outputs	• Disable • Enable	Disable	Channel
Diagnostics, short-circuit at outputs	• Disable • Enable	Disable	Channel
Diagnostics, overload	• Disable • Enable	Disable	Channel
Substitute value	Each value in the nominal range, overrange, and underrange	0	Channel

Output range	Permitted substitute value
1 to 5 V	0.000 V to 5.704 V
0 to 10 V	0.000 V to 11.759 V
±10 V	-11.759 V to 11.759 V
0 to 20 mA	0.000 mA to 23.518 mA
4 to 20 mA	0.000 mA to 22.814 mA
±20 mA	-23.519 mA to 23.518 mA

10.2.3 Parameter description analog output

Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter.

The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

Diagnostics, missing 1L+

If you enable this parameter, the check for missing supply voltage is enabled.

Diagnostics, sensor supply short circuit

When this parameter is enabled, the system generates a diagnostics event if it detects a short-circuit of the sensor supply to ground. This diagnostics function is activated when the group diagnostics function is enabled.

Response to CPU/Master STOP

Select how the module's outputs will respond to a CPU STOP:

- Shut down
  The I/O device goes to the safe state. The process image output is deleted (=0).
- Keep last value
  The I/O device retains the last value to be output before STOP.
- Substitute value
  The I/O device outputs the value for the channel set beforehand.

NOTE

Make sure that the plant is always in a safe state if "Keep last value" is selected.

Type of output

With this parameter, you set the output type, for example, voltage. For any unused channels, select the **disabled** setting. For a disabled channel, the conversion time and integration time of the channel = 0 s, and the cycle time is optimized.

Output range

With this parameter, you set the output range of the selected output type.

Diagnostics, wire break (in current mode)

When this parameter is enabled, the **Wire break** diagnostics event is generated when a wire break is detected. This diagnostics event cannot be detected in the zero range.

Diagnostics, short circuit (in voltage mode)

If you enable this parameter, a diagnostics event is generated in the event of a short circuit in the output line. This diagnostics event cannot be detected in the zero range.

Diagnostics, overload

If you enable this parameter, the diagnostics event is generated in the event of an overload.

Substitute values

With this parameter, you enter a substitute value that the module is to output in CPU-STOP mode. The substitute value must be in the nominal range, overrange, or underrange.

10.2.4 Output ranges of analog output device

Output ranges for voltage and current: ±10 V; ±20 mA

Output range ±10 V	Output range ±20 mA	Units		Range
		Decimal	Hexadecimal	
0.00 V	0.00 mA	32767	$7FFF_H$	Overflow
		32512	$7F00_H$	
11.76 V	23.52 mA	32511	$7EFF_H$	Overrange
		27649	$6C01_H$	
10 V	20 mA	27648	$6C00_H$	Nominal range
7.5 V	15 mA	20736	5100_H	
361.7 µV	723.4 nA	1	0001_H	
0 V	0 mA	0	0000_H	
-361.7 µV	-723.4 nA	-1	$FFFF_H$	
-7.5 V	-15 mA	-20736	$AF00_H$	
-10 V	-20 mA	-27648	9400_H	
		-27649	$93FF_H$	Underrange
-11.76 V	-23.52 mA	-32512	8100_H	
		-32513	$80FF_H$	Underflow
0.00 V	0.00 mA	-32768	8000_H	

Output ranges for voltage and current: 1 to 5 V; 4 to 20 mA

Output range 1 to 5 V	Output range 4 to 20 mA	Units		Range
		Decimal	Hexadecimal	
0.00 V	0.00 mA	32767	$7FFF_H$	Overflow
		32512	$7F00_H$	
5.70 V	22.81 mA	32511	$7EFF_H$	Overrange
		27649	$6C01_H$	
5 V	20 mA	27648	$6C00_H$	Nominal range
4 V	16 mA	20736	5100_H	
1 V + 144.7 µV	4 mA + 578.7 nA	1	0001_H	
1 V	4 mA	0	0000_H	
		-1	$FFFF_H$	Underrange
0 V	0 mA	-6912	$E500_H$	
		-6913	$E4FF_H$	Underflow
0.00 V	0.00 mA	-32768	8000_H	

Output ranges for voltage and current: 0 to 10 V; 0 to 20 mA

Output range 0 to 10 V	Output range 0 to 20 mA	Units		Range
		Decimal	Hexadecimal	
0.00 V	0.00 mA	32767	$7FFF_H$	Overflow
		32512	$7F00_H$	
11.76 V	23.52 mA	32511	$7EFF_H$	Overrange
		27649	$6C01_H$	
10 V	20 mA	27648	$6C00_H$	Nominal range
7.5 V	15 mA	20736	5100_H	
361.7 µV	723.4 nA	1	0001_H	
0 V	0 mA	0	0000_H	
		-1	$FFFF_H$	Underflow
0.00 V	0.00 mA	-32768	8000_H	

10.3 Influence of the range of values

Influence of analog signal on input value

The response of the I/O devices with analog inputs depends on the position of the input values within the range of values. The table below shows this dependency.

The measured value lies	Result	SF LED	Diagnostics data range of device	Interrupt
Within the nominal range	Measured value	-	-	-
Within the overrange/underrange	Measured value	-	-	-
Within the overflow	$7FFF_H$	On	Entry[1]	Diagnostic interrupt[1]

The measured value lies	Result	SF LED	Diagnostics data range of device	Interrupt
Within the underflow	8000_H	On	Entry[1]	Diagnostic interrupt[1]
Before parameter assignment	$7FFF_H$	-	-	-
Within an incorrect parameter assignment[2]	Measured value	On	Entry	Diagnostic interrupt
Within an incorrect initial parameter assignment	$7FFF_H$	On	Entry	Diagnostic interrupt
[1] If the the **group diagnostics** and **measuring range** parameters are enabled for the input device. [2] If a channel was previously parameterized correctly, it continues running with the last parameters.				

Influence of output value on analog output

The response of I/O devices with analog outputs depends on the position of the input values within the range of values. The table below shows this dependency.

The output value lies	Result	SF LED	Diagnostics data range of device	Interrupt
Within the nominal range	Value from the IO Controller	-	-	-
Within the overrange/underrange	Value from the IO Controller	-	-	-
Within the overflow	0 signal	-	-	-
Within the underflow	0 signal	-	-	-
Before parameter assignment	0 signal	-	-	-
Within an incorrect parameter assignment[1]	Value from the IO Controller	On	Entry	Diagnostic interrupt
Within an incorrect initial parameter assignment	0 signal	On	Entry	Diagnostic interrupt
[1] If a channel was previously parameterized correctly, it continues running with the last parameters.				

IO-Link Master

11

11.1 IO-Link Master (6ES7148-6JA00-0AB0)

Article number

6ES7148-6JA00-0AB0

Properties

The IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12 has the following technical specifications:

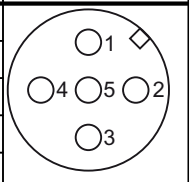
- IO-Link Master according to IO-Link specification V1.0
- Dimensions 60 x 175 mm
- Double assignment of the sockets
- 4 IO-Link ports (Port Class A)
- IO-Link ports can be used optionally as:
  - 4 IO-Link devices as 3-conductor connection
  - 4 standard actuators/encoders (SIO mode)
- 8 digital inputs and 4 digital outputs
- Digital inputs
  - Rated input voltage DC 24 V
  - Suitable for switches and proximity switches
  - Diagnostics
    "Missing 2L+" for the I/O device
    "Short-circuit to M at sensor supply", per channel group
    "Wire break", per channel
  - Channels 4 to 7 are diagnostics-capable, Channels 0 to 3 do not have diagnostics.
- Digital outputs
  - Rated load voltage DC 24 V
  - Output current: 1.3 A per output
  - Suitable for solenoid valves, DC contactors, and indicator lights
  - Diagnostics
    "Missing 2L+" for the I/O device
    "Wire break at outputs" per channel
    "Short-circuit to M at outputs" per channel
  - Parameterizable response to CPU/Master STOP
- Data transfer rates COM1 (4.8 kBaud), COM2 (38.4 kBaud)

The module supports the following functions:

- Prioritized startup
- Media redundancy (as of firmware V7.0)

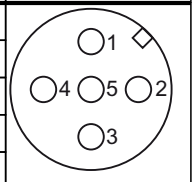
General pin assignment

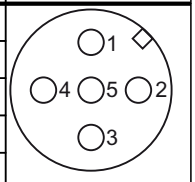
Table 1-1093 Pin assignment of sockets X1 to X4 for IO-Link Master and digital inputs



Pin	Assignment				View of socket (front view)
	Socket X1	**Socket X2**	**Socket X3**	**Socket X4**	
1	24 V sensor supply $1U_S$(derived from 1L+ non-switched)				
2	Input signal				
	DI_0	DI_1	DI_2	DI_3	
3	Sensor supply ground 1M				
4	IO-Link port 1	IO-Link port 2	IO-Link port 3	IO-Link port 4	
5	Not used				

Table 1-1094 Pin assignment of the sockets X5 to X6 for digital inputs





Pin	Assignment		View of socket (front view)
	Socket X5	**Socket X6**	
1	24 V sensor supply $1U_S$(derived from 1L+ non-switched)		
2	Input signal		
	DI_5	DI_7	
3	Sensor supply ground 1M		
4	Input signal		
	DI_4	DI_6	
5	Functional earth FE		

Table 1-1095 Pin assignment of sockets X7 and X8 for digital outputs

Pin	Assignment		View of socket (front view)
	Socket X7 (2L+ switched)	**Socket X8 (2L+ switched)**	
1	Not used		
2	Output signal		
	DQ_1	DQ_3	
3	Supply ground 2M		
4	Output signal		
	DQ_0	DQ_2	
5	Functional earth FE		

Block diagram

The figure below shows the block diagram of the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12.

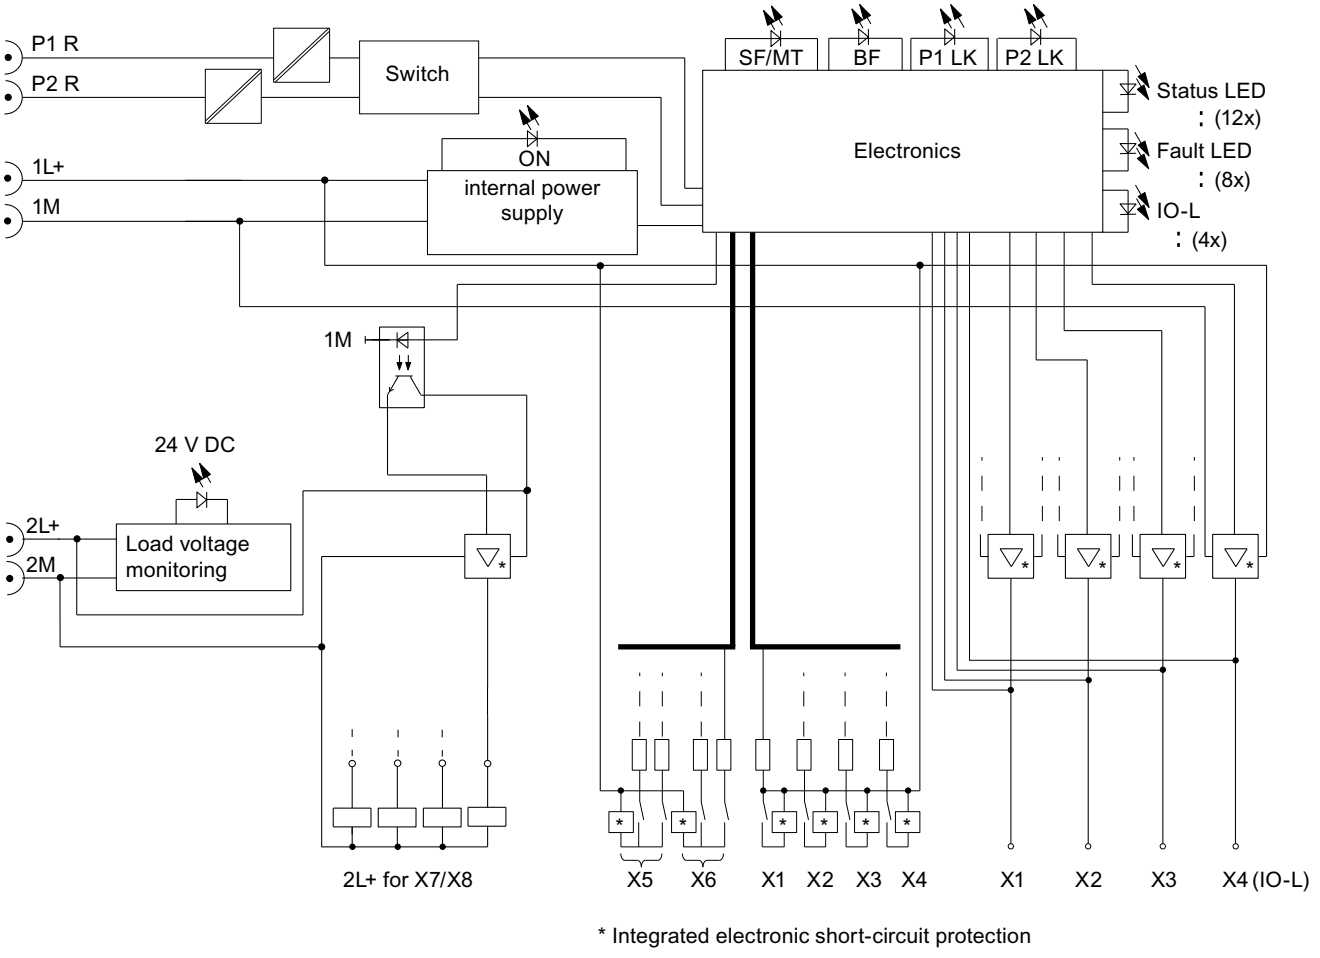


Figure 1-786 Block diagram of the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12

Technical data of the IO-Link Master

Technical data	
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight	Approx. 910 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX

Technical data	
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT with the option "high flexibility"
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Prioritized startup • Media redundancy (as of firmware V7.0)
PROFINET interface	
• Connection socket	2 × M12 d-coded
• Switch function	Yes, internal
• Auto-crossover	Yes; if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes; against destruction
• Infeed current 1L+	Max. 4 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Total current of the outputs	
• All mounting positions to 60°C	3.9 A
Current consumption	
From supply voltage (1L+)	Typ. 200 mA
From supply voltage (2L+)	Typ. 5 mA
Power loss of the device	Typ. 8 W
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
• Between 1L+, channels and all other circuit elements	No
• Between channels	No
• Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
Diagnostics function	Yes
• Group error/maintenance	Red LED / yellow LED "SF/MT"
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED

Technical data	
• Monitoring of supply voltage 2L+	Green "24 V DC" LED
• Existing connection to network	Green "P1 LK" and "P2 LK" LED; LED for PROFINET IO infeed and loop-through
• IO-Link port	Green LED "IO-L"
• Digital input/digital output	Green LED
• Fault at digital input/digital output	Red LED
• Diagnostic information can be read	Yes
Monitoring for	
• Missing 2L+	Yes
• Short-circuit of the sensor supply to M	Yes, for Channels 4 to 7, per channel group
• Short-circuit at output (Channel 0 to 3)	Yes, per channel
• Wire break at input	Input current < 0.3 mA per channel
• Wire break at output (Channel 0 to 3)	Yes, in the off state, per channel
Sensor supply	
Number of sensor supplies	6 (X1-X4 (IO-LINK/DI) and X5-X6 (DI))
Load current	200 mA per output to X1-X4 (IO-LINK/DI) 100 mA per output to X5-X6 (DI)
Short-circuit protection	Yes, electronic
IO-Link port	
Number of ports	4
Number of ports that can be controlled simultaneously	4, in all mounting positions
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	No
Transmission rate	4.8 kBaud (COM1), 38.4 kBaud (COM2)
Size of the process data, input per port	32 bytes
Size of the process data, input per module	32 bytes
Size of the process data, output per port	32 bytes
Size of the process data, output per module	32 bytes
Digital inputs	
Number of inputs	8
Number of inputs that can be controlled simultaneously	8, in all mounting positions
Digital outputs	
Number of outputs	4
IO-Link Device selection data (Port 1 to 4)	
Cable length, unshielded	Max. 20 m
Connection of IO-Link devices	
Port type A	Yes; with 3-wire cable
Operating modes	
IO-Link	Yes
DI	Yes
DQ	Yes
Sensor selection data (input signals 0 to 7 only)	
Cable length, shielded	Max. 30 m

Technical data	
Cable length, unshielded	Max. 30 m
Input voltage	
• Nominal value	DC 24 V
• For signal "1"	11 to 30 V
• For signal "0"	-3 to 5 V
Input current	
• At signal "1"	Typ. 7 mA
Input delay	
• At "0" to "1"	Typ. 3 ms
• At "1" to "0"	Typ. 3 ms
Input characteristic	According to IEC 61131, Type 3
Connection of 2-wire proximity switches	Supported
• Permitted quiescent current	Max. 1.5 mA
Actuator selection data (output signals 0 to 3 only)	
Cable length, shielded	Max. 30 m
Cable length, unshielded	Max. 30 m
Output voltage	
• Nominal value	DC 24 V
• For signal "1"	Min. 1L+/2L+ (-0.8 V)
Output current	
• At signal "1"	Max. 1.3 A
• For "0" signal (residual current)	Max. 1.5 mA
Load resistance range	22 Ω to 3.3 kΩ
Lamp load	Max. 5 W
Parallel wiring of two outputs	
• To increase performance	No
• For redundant control of a load	Supported
Controlling of a digital input	Yes
Switching frequency	
• With resistive load	Max. 100 Hz
• With inductive load	Max. 0.5 Hz
• With lamp load	Max. 1 Hz
Limiting of the inductive shutdown voltage to lamp load	Typ. 1L+/2L+ (-47 V)
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 1.8 A (per channel)

11.1.1 Parameters for IO-Link Master

Parameters for the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12

Parameters		Range of values	Default setting	Range of effectiveness
Slot 1 "4 IO-L"				
Group diagnostics		• Disable • Enable	Disable	Slot 1
Diagnostics enable for Ports 1		• Disable • Enable	Disable	Channel
Diagnostics enable for Port 2		• Disable • Enable	Disable	Channel
Diagnostics enable for Port 3		• Disable • Enable	Disable	Channel
Diagnostics enable for Port 4		• Disable • Enable	Disable	Channel
Slot 2 "8 DI + 4 DO DC 24V/1,3A 8×M12"				
Group diagnostics		• Disable • Enable	Disable	Slot 2
Diagnostics: Missing 2L+		• Disable • Enable	Disable	Channel group
Response to CPU/Master STOP		• Shut down • Retain last value	Shut down	Slot 2
Inputs				
Channel 4	Diagnostics: Short-circuit of the sensor supply to M	• Disable • Enable	Disable	Channel group*
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 5	Diagnostics: Short-circuit of the sensor supply to M	• Disable • Enable	Disable	Channel group*
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 6	Diagnostics: Short-circuit of the sensor supply to M	• Disable • Enable	Disable	Channel group*
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 7	Diagnostics: Short-circuit of the sensor supply to M	• Disable • Enable	Disable	Channel group*
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Outputs				
Channel 0	Diagnostics: Short-circuit of outputs to M	• Disable • Enable	Disable	Channel
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 1	Diagnostics: Short-circuit of outputs to M	• Disable • Enable	Disable	Channel
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 2	Diagnostics: Short-circuit of outputs to M	• Disable • Enable	Disable	Channel

Parameters		Range of values	Default setting	Range of effectiveness
Channel 2	Diagnostics: Wire break	• Disable • Enable	Disable	Channel
Channel 3	Diagnostics: Short-circuit of outputs to M	• Disable • Enable	Disable	Channel
	Diagnostics: Wire break	• Disable • Enable	Disable	Channel

* Channel group is defined by the digital inputs of the M12 socket. Example:
- Channel 4 and Channel 5 form the channel group of connection socket X5.
- Channel 6 and Channel 7 form the channel group of connection socket X7.

Generally short-circuit monitoring of the M12 digital input socket is only carried once via Pin 1 (1L+) and Pin 3 (1M). The short-circuit parameterization can be used to select which channel of the M12 socket reports the short-circuit or whether both channels report the short-circuit.

11.1.2 Functions

Introduction

You can select one of the following operating modes for each of the four ports of the IO-Link Master:

- IO-Link
- DI
- DQ
- Disabled

You make the selection in the Port Configurator tool during parameterization. If no parameters have been assigned, the ports will be disabled.

NOTE

Value status
The value status (PortQualifier) is relevant in IO-Link mode only.

Value status

Each port has a value status display (PortQualifier) per device. The value status shows if the process data is valid or invalid.

By default, the value status (PortQualifier) is disabled.

IO-Link

In IO-Link mode, the port is in IO-Link communication. There are two data transmission rates in this operating mode. COM1 with 4.8 kBaud; COM2 with 38.4 kBaud. The data transmission rate depends on the IO-Link Device used. The IO-Link Master and the IO-Link Device used automatically negotiate the maximum data transmission rate at startup.

DI

In DI mode, a port of the IO-Link Master behaves like a standard DI.

DQ

In DQ mode, a port of the IO-Link Master behaves like a standard DQ.

Disabled

The respective port of the IO-Link Master is disabled in Disabled mode. The ports are disabled if the IO-Link Master has not yet been parameterized with *S7-PCT* (default setting).

Consistency width of 8 byte

The IO-Link Master has a consistency width of 8 byte. In addition to the upper limit of 32 byte input and 32 byte output for the entire IO-Link Master, there are other upper limits of 8 byte input and 8 byte output per IO-Link Device (per port).

11.2 IO-Link Master (6ES7148-6JD00-0AB0)

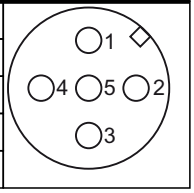
Article number

6ES7148-6JD00-0AB0

Properties

The IO-Link Master 4 IO-L 4×M12 has the following technical specifications:

- IO-Link Master according to IO-Link specification V1.1
- Dimensions 30 x 200 mm
- 4 IO-Link ports (Port Class B)
- IO-Link ports can be used optionally as:
  - 4 IO-Link devices (Port Class A oder Class B) with variable address area up to 32 byte inputs/32 byte outputs per port
  - 4 standard actuators/encoders (SIO mode)
- Data transfer rates COM1 (4.8 kBaud), COM2 (38.4 kBaud), COM3 (230.4 kBaud)
- Identification and maintenance data I&M0 to I&M3
- Media redundancy
- Configurable diagnostics can be set per port (in IO-Link mode)
- Hardware interrupts (in IO-Link mode)



The module supports the following functions:

Table 1-1096 Version dependencies of the functions of the module

Function	Firmware version of the module
Master backup with function block "LIOLink_Master"	As of V1.0
Port Qualifier Information (PQI)	As of V1.0
IO-Link port configuration with S7-PCT (as of V3.4)	As of V1.0
IO-Link port configuration without S7-PCT • IO-Link auto start • IO-Link manual	 As of V1.0 As of V1.1

General pin assignment

Table 1-1097 Pin assignment of sockets X1 to X4 for IO-Link master

Pin	Assignment				View of socket (front view)
	Socket X1	Socket X2	Socket X3	Socket X4	
1	24 V sensor supply $1U_S$ (derived from 1L+ non-switched)				
2	24 V actuator supply $2U_A$ (derived from 2L+ switched)				
3	Sensor supply ground 1M				
4	IO-Link port 1	IO-Link port 2	IO-Link port 3	IO-Link port 4	
5	Actuator supply ground 2M				

Additional information on pin assignment including wiring examples for the 3- and 5-conductor connection (Port Class A or Class B) is available in the chapter Pin assignment for IO-Link Masters (Page 44).

Block diagram

The figure below shows the block diagram of the IO-Link master 4 IO-L 4×M12.

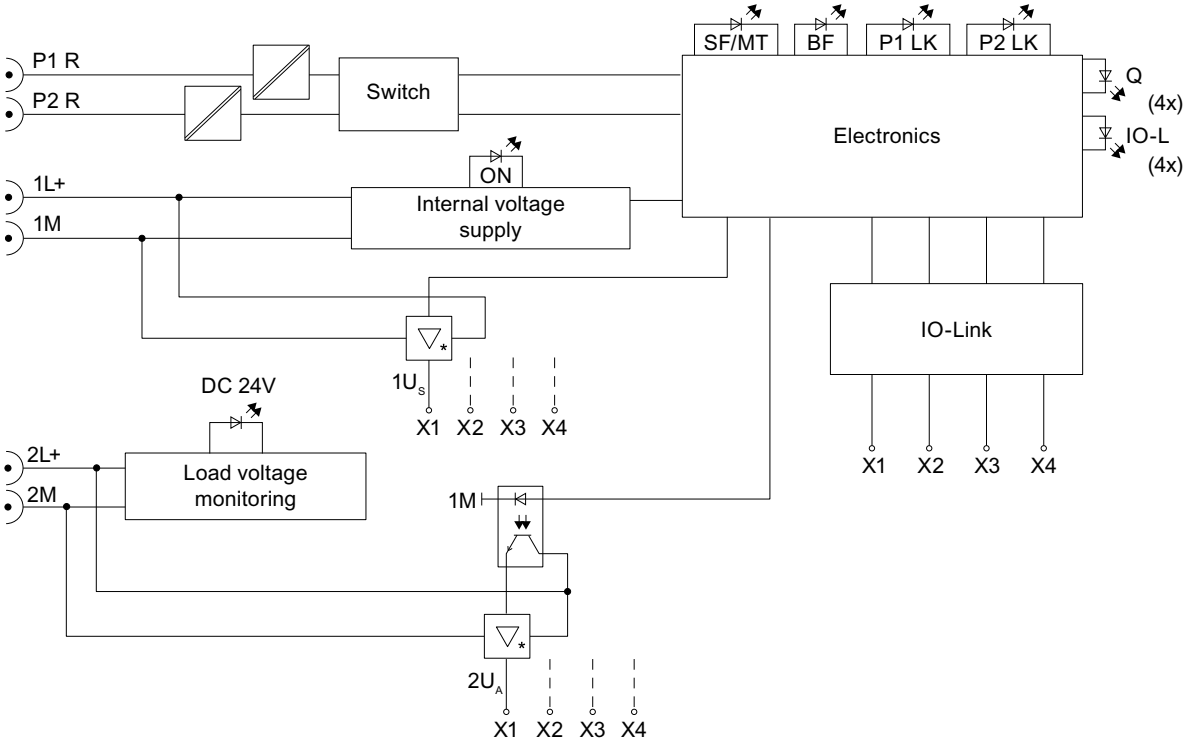


Figure 1-787 Block diagram of the IO-Link Master 4 IO-L 4×M12

Technical specifications of the IO-Link Master

Technical specifications	
Dimensions and weight	
Dimensions W x H x D (mm)	30 x 200 x 49
Weight	Approx. 550 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes
Bus protocol	PROFINET IO • IRT
Supported Ethernet services	PROFINET IO (Device) • ping • arp • LLDP • Network diagnostics (SNMP) • DCP • Media redundancy

Technical specifications	
PROFINET interface	
• Connection socket	2 × M12 d-coded
• Switch function	Yes, internal
• Autocrossing	Yes; if autonegotiation is enabled
Manufacturer ID (Vendor ID)	$002A_H$
Device ID (DeviceID)	0306_H
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes
• Infeed current 1L+	Max. 4 A
Load voltage 2L+	DC 24 V
• Reverse polarity protection	Yes, against destruction, loads are activated
• Infeed current 2L+	Max. 4 A
Current consumption	
From supply voltage (1L+)	Typ. 100 mA
From supply voltage (2L+)	Typ. 15 mA
Power loss of the device	Typ. 4.8 W
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• between 1L+ and 2L+	Yes
• between 1L+, channels and all other switching parts	No
• Between channels	No
• between Ethernet and all other switching parts	Yes
Status, interrupts, diagnostics	
Interrupts	Yes
• Hardware interrupt (device notification)	Yes
Diagnostics function	Yes
• Group error/maintenance	Yes; red/yellow LED "SF/MT"
• Bus monitoring PROFINET IO	Red "BF" LED
• Monitoring of supply voltage 1L+	Green "ON" LED
• Monitoring of supply voltage 2L+	Green "24 V DC" LED
• Existing connection to network	Green "P1 LK" and "P2 LK" LED for PROFINET IO infeed and loop-through
• IO-Link port – Port in IO-Link mode – Port in SIO mode	 green/red LED "IO-L" Green LED "Q"
• Diagnostic information can be read	Yes
Monitoring for	
• Missing 2L+	Yes
• Sensor supply short-circuit	Yes; device supply to ground

Technical specifications	
Sensor supply	
Number of outputs	4
Load current	500 mA per output
Short-circuit protection	Yes, electronic
IO-Link port	
Number of ports	4
Number of ports that can be controlled simultaneously	4, in all mounting positions
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	Yes
Transmission rate	4.8 kBaud (COM1), 38.4 kBaud (COM2), 230.4 kBaud (COM3)
Size of the process data, input per port	32 bytes + 1 byte PQI
Size of the process data, input per module	128 bytes + 4 bytes PQI
Size of the process data, output per port	32 bytes
Size of the process data, output per module	128 bytes
Memory size for device parameters	2 Kbytes; for each port
Master backup	possible; with function block LIOLink_Master
Configuration without S7-PCT	supported; autostart function
Data for selection of an IO-Link device	
Cable length, unshielded	Max. 20 m
Connection of IO-Link devices	
Port type A	Yes; with 3-wire cable
Port type B	Yes; additional device supply: Max. 2 A per Port, max. 4 A per module
Operating modes	
IO-Link	Yes
DI	Yes
DQ	Yes; max. 100 mA

11.2.1 Configuration

Introduction

The IO-Link Master 4 IO-L 4×M12 has four ports. Each port is represented by a submodule.

Configuration of the IO-Link port of the IO-Link Master 4 IO-L 4×M12

You specify the various operating modes of each IO-Link port by configuring a relevant submodule:

- as digital input by configuring a digital input submodule,
- as digital output by configuring a digital output submodule,
- as IO-Link device by configuring an IO-Link submodule.
- Port deactivated:
  - In STEP 7 V5.5 and higher and with GSD: By deleting the submodule,
  - in STEP 7 (TIA Portal): By deactivating the port enable.

The IO-Link ports are preconfigured as 2I + PQI.

When configuring IO-Link submodules, you can select address spaces for I/O data in the following byte scales:

- 1 I/1 O + PQI
- 2 I + PQI
- 2 I/2 O + PQI
- 4 I/4 O + PQI
- 8 I/8 O + PQI
- 16 I/16 O + PQI
- 32 I/32 O + PQI

NOTE

Port Qualifier Information (PQI)

The Port Qualifier Information (PQI) with the size of 1 byte is always transferred together with the input data of the IO-Link device. The PQI cannot be deactivated.

Additional information on the structure of the PQI byte is available in the appendix I/O address space (Page 232).

Various parameters are available depending on the operating mode.

More information on the parameters is available in the chapter Parameter (Page 202).

11.2.2 Parameter

Port parameters for the IO-Link Master 4 IO-L 4×M12

The following tables show the parameters that you can set for each submodule (each port) of the 4 IO-L 4×M12 IO-Link Master.

Table 1-1098 Diagnostics

Parameters	Range of values	Default setting
Diag: Missing 2L+	• Disable • Enable	Disable
Diag: Port	• Disable • Enable	Disable
Hardware interrupt (device notification)	• Disable • Enable	Disable

The following table shows the port parameters for 4 IO-L 4×M12 the IO-Link Master with firmware as of V1.1.

Table 1-1099 Port parameter

Parameter	Range of values	Default setting
Port configuration without S7-PCT	• Disable • Enable	Disable
Operating mode	• IO-Link auto start • IO-Link manual	IO-Link auto start
VendorID*	Manufacturer ID of the connected IO-Link device	0
DeviceID*	Device ID of the connected IO-Link device	0
Test accuracy / data backup*	• Same type (V1.0) without backup & restore • Type compatible (V1.1) without backup & restore • Type compatible (V1.1) with backup & restore • Type compatible (V1.1) with restore	Type compatible (V1.1) with backup & restore

* Only effective if you use the port mode "IO-Link Manual".

11.2.3 Explanation of the parameters

Diag: Missing 2L+

Enabling of diagnostics in the case of missing or insufficient load voltage 2L+.

Diag: Port

Enabling of the diagnostics for the selected port.
A distinction is made between error and maintenance interrupts during the diagnostics. The possible diagnostics depend IO-Link device used. More information on the diagnostic interrupts is available in the description of the IO-Link device that is used.

Hardware interrupt (device notification)

Enabling of hardware interrupts for the selected port.
The possible hardware interrupts depend on the IO-Link device that is used. More information on the hardware interrupts is available in the description of the IO-Link device that is used.

NOTE

Configuration as digital input or output
Please not that you cannot activate any port parameters or diagnostic alarms in SIO mode.

Port configuration without S7-PCT

This parameter enables the port configuration without S7-PCT for the module.

NOTE

Changes to the port configuration
If you have assigned the parameters for the IO-Link device via port configuration without S7-PCT, or have configured the port as digital input, digital output or disabled, you can no longer change the port configuration via S7-PCT.

Operating mode

This parameter specifies the mode in which the selected port is to be operated.
The following options are available for selection:

- IO-Link auto start
- IO-Link manual

IO-Link auto start

The connected IO-Link device starts automatically (Plug & Play functionality) The IO-Link device is operational and immediately available to you.

IO-Link manual

The connected IO-Link Device is **not** started automatically.
You have to store the VendorID and DeviceID of the connected IO-Link Device in STEP 7.
In addition, you can select the test accuracy for data storage:

- Same type (V1.0) without backup & restore
- Type compatible (V1.1) without backup & restore
- Type compatible (V1.1) with backup & restore
- Type compatible (V1.1) with restore

You can find the VendorID and DeviceID on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109748852).

11.2.4 Functions

Introduction

A brief overview of the functions of the 4 IO-L 4×M12 IO-Link Master is presented below.

Master backup

The "LIOLink_Master" function block is used to read all relevant IO-Link device and IO-Link master parameters. These an be stored retentively at a central location, for example, in a data block in the IO controller.

The status of the IO-Link devices or IO-Link ports stored in the IO-Link master can be restored with the "LIOLink_Master" function block.
As a result, the IO-Link ports and the IO-Link master are configured with the values stored in the master backup.

A typical use case is restoring the parameters after the exchange of the IO-Link master.

NOTE

Availability
Note that the Master Backup function is only available for IO-Link devices that are specified for the IO-Link standard as of V1.1.

More information on the use of the function blocks for the master backup and master restore is available in the chapter Acyclic data exchange with the IO-Link library (Page 72).

More information on Master Backup and Master Restore is available in the Master Backup section of the Integration in the Automation System chapter of the IO-Link System (https://support.industry.siemens.com/cs/ww/en/view/65949252) function manual.

Identification and maintenance data

The identification and maintenance data (I&M data) is information that is saved as read-only (I data) or read/write (M data) on the module.

Identification data (I&M0): Manufacturer information on the module to which you only have read access and some of which may be printed on the module housing, for example, article number and serial number.
Maintenance data (I&M1, 2, 3): Plant dependent information, such as installation location.

The identification data I&M support you in the following tasks:

- Checking the plant configuration
- Locating hardware modifications in a plant
- Correcting errors in a plant

Modules are uniquely identifiable online with the I&M identification data.

In addition, you can read the identification data contained in the IO-Link device as I&M0 via the associated submodule.

Port Qualifier Information (PQI)

Each port has a PortQualifierInformation (PQI). This PQI provides information on the port and IO-Link device status. The PQI is transferred cyclically with the process data. The PQI cannot be deactivated.

The structure of the PQI byte is available in the appendix I/O address space (Page 232).

Port configuration

With a 4 IO-L 4×M12 IO-Link Master as of firmware version V1.1 you can commission the IO-Link submodules (ports) of the IO-Link Masters or the connected IO-Link Devices in two different ways:

- Port configuration without S7-PCT
- Port configuration with S7-PCT

Port configuration without S7-PCT

Requirement

You have activated the "Port configuration with S7-PCT" check box at the configuration of the IO-Link Master submodules in STEP 7.

Procedure

You carry out the configuration of the IO-Link Master submodules directly in STEP 7:

- Activating diagnostics
- Port mode:
  - Operation in "IO-Link auto start" mode (pre-selected)
  - Operation in "IO-Link manual" mode

NOTE

Changing settings of IO-Link devices

If in the further course of the project you want to carry out settings at the connected IO-Link Devices with S7-PCT, you require S7-PCT as of V3.5 with Hotfix 1.

Port configuration with S7-PCT

Requirement

You have **de**activated (default) the "Port configuration without S7-PCT" check box for the configuration of all the IO-Link Master submodules in STEP 7.

Procedure

You carry out the port configuration of the IO-Link Master via the Port Configuration Tool S7-PCT as of V3.2.

You can find more detailed information on the submodule configuration in the section "Configuration (Page 201)".

11.2.5 Interrupts

Introduction

According to IEC 61131-9, IO-Link devices are able to generate events of the types error, warning and notification. These events are mapped directly to the interrupts of the assigned submodule.

Evaluating interrupts with IO controller

The IO-Link Master 4 IO-L 4×M12 supports the following interrupts:

- Diagnostic interrupts (at IO-Link Master / at submodule port)
- Hardware interrupts (at submodule port)
- Pull/plug interrupts (at submodule port)
- Maintenance events (at submodule port)

In the case of an interrupt, the CPU of the IO controller automatically calls the interrupt OBs. The OB number and the start information provide you with information about the cause and class of the error.

You can obtain detailed information on the error event in the error OB with the "RALRM" instruction (read supplementary interrupt information).

System diagnostics

In STEP 7 (TIA Portal), the innovated system diagnostics is available for the devices of the S7-1500 automation system (IO controller CPU S7-1500) and ET 200eco PN (IO device). Alarms are made available on the display of the S7-1500 CPU, the CPU Web server and the HMI device.

More information on system diagnostics is available in the Diagnostics function manual on the Internet (https://support.industry.siemens.com/cs/ww/en/view/59192926).

11.2.5.1 Triggering of a diagnostic interrupt

Introduction

All IO-Link events of the type error, which the IO-Link Device generates, as well as problems and errors at the IO-Link port (for example Diag: Missing 2L+), are mapped to the diagnostic interrupts for the assigned submodule.

Triggering of a diagnostic interrupt

If you have assigned the parameters for the IO-Link master accordingly, this triggers a diagnostic interrupt for an incoming or outgoing event of the IO-Link device.

The CPU interrupts the processing of the user program and processes the diagnostic interrupt OB (OB 82). The event that led to the triggering of the interrupt is entered in the start information of the diagnostic interrupt OB.

11.2.5.2 Triggering a hardware interrupt

Introduction

All IO-Link events of the type notification which the IO-Link device generates are mapped to the hardware interrupts of the assigned submodule.

Triggering a hardware interrupt

In the event of a hardware interrupt the CPU interrupts the processing of the user program and processes the hardware interrupt OB (for example, OB 40). The event that led to the triggering of the interrupt is entered in the start information of the hardware interrupt OB.

11.2.5.3 Triggering of a pull/plug interrupt

Introduction

If your remove an IO-Link device or interrupt communication, a pull interrupt is generated by the assigned submodule.
A plug interrupt is triggered as soon as the IO-Link device is plugged in again or IO-Link communication re-established.

Triggering of a pull/plug interrupt

In the case of a pull/plug interrupt, the CPU interrupts the processing of the user program and process the pull/plug OB (OB 83). The event that led to the triggering of the interrupt is entered in the start information of the pull/plug OB.

11.2.6 Maintenance events

Introduction

All IO-Link events of the type warning which the IO-Link device generates are mapped to the maintenance interrupts of the assigned submodule. The objective is early detection and elimination of potential disturbances.
With the IO-Link master, maintenance events indicate to the user when a check or an exchange of network components is required.

The CPU interrupts processing of the user program and processes the diagnostics block OB82. The event which led to the triggering of the maintenance event is entered in the start information of the OB82.

System alarms in STEP 7 (TIA Portal)

The maintenance information is generated in STEP 7 (TIA Portal) with the following system alarms:

- Maintenance demanded - symbolized for each port by a wrench (on a yellow background)  in the device view or in the hardware configuration.

You can find additional information in the STEP 7 online help.

Terminal block and voltage distributor 12

12.1 Terminal block

Article number

6ES7194-6CA00-0AA0

Properties

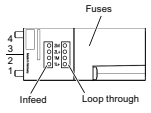
The terminal block has the following properties:

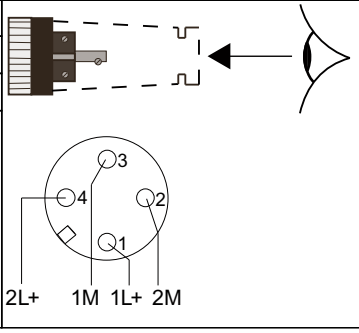
- The terminal block can be inserted and screw-mounted on any I/O device
- It can also be used separately.
- It distributes 10 A per supply voltage 1L+ and 2L+ to the I/O devices. You can tap a maximum load of 4 A from each supply voltage of the I/O device. The voltages are protected with two 7.5 A fuses.

Pin assignment

The tables below show the pin assignments.

Table 1-1100 Pin assignment of the terminal block





Pin	Assignment	View of the insulation displacement terminal block:
1	24 V (1L+ non-switched)	
2	Ground 1M (non-switched)	
3	24 V (2L+ switched)	
4	Ground 2M (switched)	

Table 1-1101 Pin assignment of the M12 connector

Pin	Assignment	View of the cable connector
1	24 V (1L+ non-switched)	
2	Ground 2M (switched)	
3	Ground 1M (non-switched)	
4	24 V (2L+ switched)	

Block diagram

The block diagram below shows the terminal block.

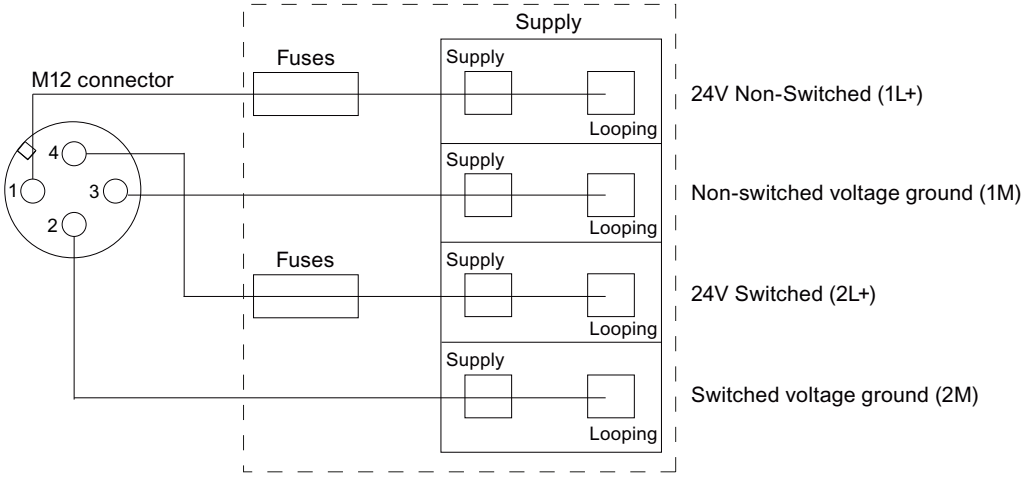


Figure 1-788 Block diagram of the terminal block

Technical specifications

Dimensions and Weight	
Dimensions W x H x D (mm)	30 x 50 x 98
Weight	Approx. 90 g
Current	
Infeed current 1L+ and 2L+	Max. 10 A per 1L+ and 2L+
Output current via the M12 connector	Max. 4 A per 1L+ and 2L+
Power loss	
Power loss of the terminal block	1 W, typical

12.2 Voltage distributor

Article number

6ES7148-6CB00-0AA0

Properties

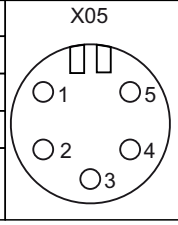
The voltage distributor PD DC 24V 1×7/8" 4×M12 has the following properties:

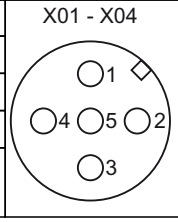
- It distributes the centrally fed supply voltage (7/8") to 4 connectors (M12).
- Integrated electronic short-circuit protection
- Direct connection of up to 4 I/O devices
- Distribution of 1L+ and 2L+

Pin assignment

The tables below show the pin assignments.

Table 1-1102 Pin assignment of the 7/8" connector as current input





Pin	Assignment	View of the 7/8" cable connector, 24 V connection
1	Ground 2M (switched)	
2	Ground 1M (non-switched)	
3	Functional earth FE	
4	24 V (1L+ non-switched)	
5	24 V (2L+ switched)	

Table 1-1103 Pin assignment of the M12 connector as current output

Pin	Assignment	View of the M12 connection plug (front view)
1	24 V (1L+ non-switched)	
2	Ground 2M (switched)	
3	Ground 1M (non-switched)	
4	24 V (2L+ switched)	
5	Not used	

Block diagram

The figure below shows the block diagram of the voltage distributor PD DC 24V 1×7/8" 4×M12.

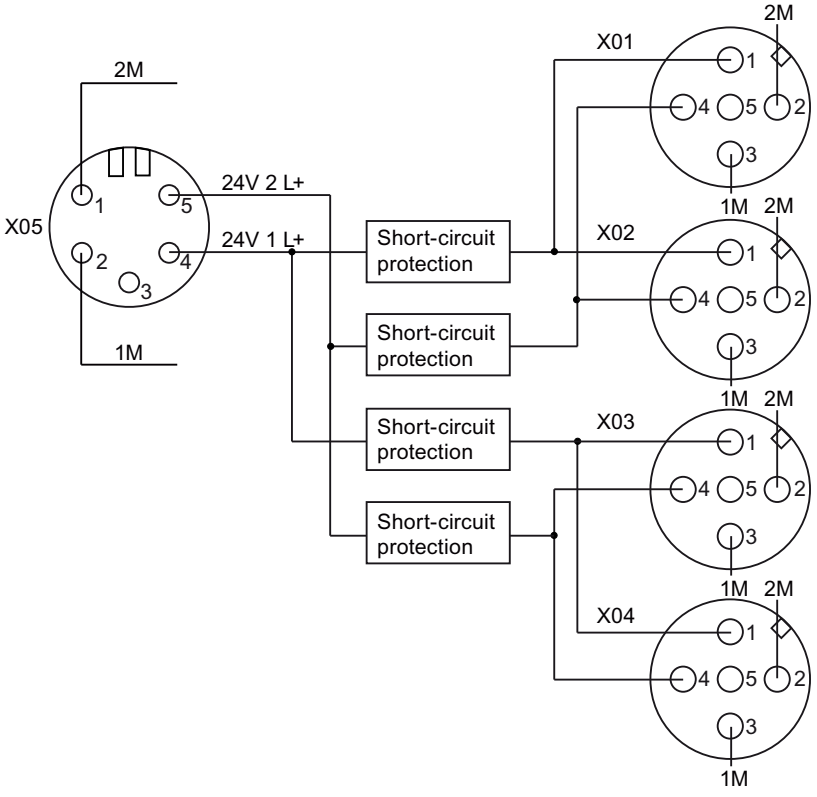


Figure 1-789 Block diagram of the voltage distributor PD DC 24V 1×7/8" 4×M12

Technical specifications

Dimensions and Weight	
Dimensions W x H x D (mm)	45 x 175 x 49
Weight	Approx. 590 g
Voltages and currents	
Supply voltage 1L+	DC 24 V
• Reverse polarity protection	Yes; against destruction (continuously without load)
• Infeed current 1L+	8 A
Supply voltage 2L+	DC 24 V
• Reverse polarity protection	Yes; against destruction (continuously without load)
• Infeed current 2L+	8 A
Total current of the outputs	

Dimensions and Weight	
• All mounting positions to 45 °C	for X1 and X2 in total max. 4 A for 1L+ for X1 and X2 in total max. 4 A for 2L+ for X3 and X4 in total max. 4 A for 1L+ for X3 and X4 in total max. 4 A for 2L+
• All mounting positions to 55 °C	for X1 and X2 in total max. 3 A for 1L+ for X1 and X2 in total max. 3 A for 2L+ for X3 and X4 in total max. 3 A for 1L+ for X3 and X4 in total max. 3 A for 2L+
• Number of outputs	4, with 1L+ and 2L+ each
Input voltage/loop-through	Green LED "1L+" and "2L+"
• Nominal value	DC 24 V
Short-circuit protection of the output	Yes, electronic
• Response threshold	Typ. 4.5 A
Power loss of the voltage distributor	Typ. 3.5 W
Insulation	
Insulation test voltage	
• Ethernet interface	1500 V_{rms} (IEEE802.3, Type Test)
• All other circuit elements	707 V DC (type test)
Electrical isolation	
• Between 1L+ and 2L+	Yes
Status, interrupts, diagnostics	
Diagnostics functions	
• Input/output voltage	Green LED "1L" and "2L"

Signal names

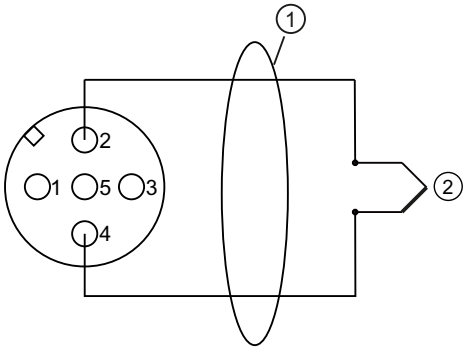
D.2 Connection of thermocouples to the analog inputs

Introduction

Different options are available for the analog I/O device 8 AI RTD/TC 8xM12 for compensation of the reference junction temperature. The corresponding connection examples are shown below. In practice, different connection variants may be possible due to the conditions on site.

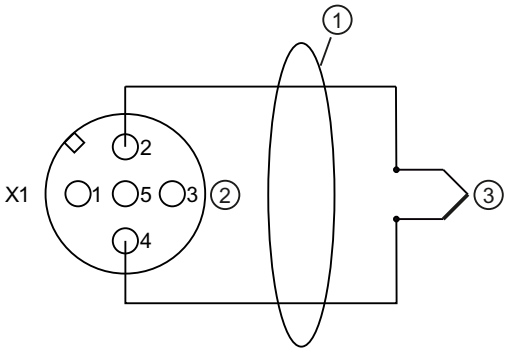


Connection example "No" compensation as reference junction

① Copper cables
② e. g. compensating box (per channel); thermocouple type B does not need a compensating box
③ Thermocouple

Figure 1-791 Connection example "No" compensation as reference junction

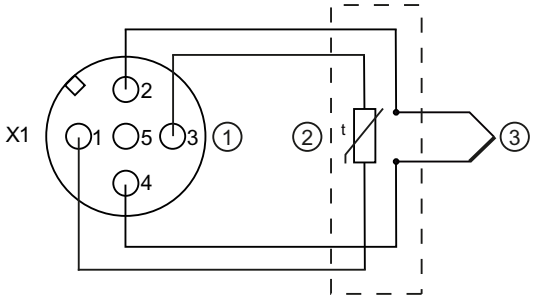
Connection example "Internal" compensation or "Fixed reference temperature" as reference junction



① Direct connection of the thermocouple or with compensating lines
② Thermocouple

Figure 1-792 Connection example "Internal" compensation or "Fixed reference temperature" as reference junction

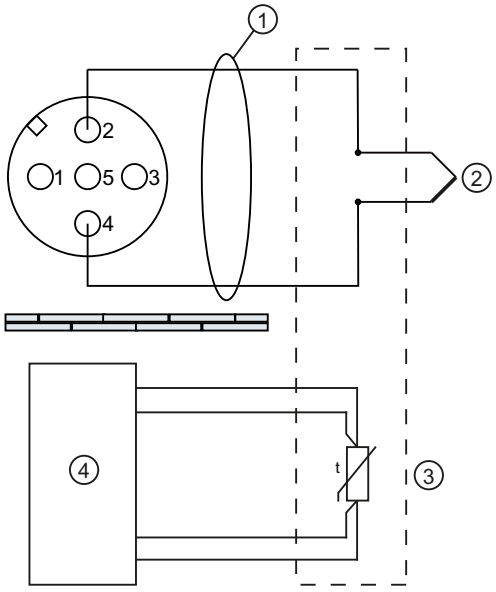
Connection example "RTD (0)" as reference junction



- With M12 compensation connector (integrated resistance thermometer Pt1000)

① Direct connection of the thermocouple or with compensating lines
② M12 compensation connector (terminals 1 and 3 assigned with internal Pt1000) only on round socket X1. The comparison value of the M12 compensation connector at round socket X1 also applies to thermocouples at X2, X3, X4, X5, X6, X7 and X8.
③ Thermocouple

Figure 1-793 Connection example "RTD (0)" as reference junction in M12 compensation connector

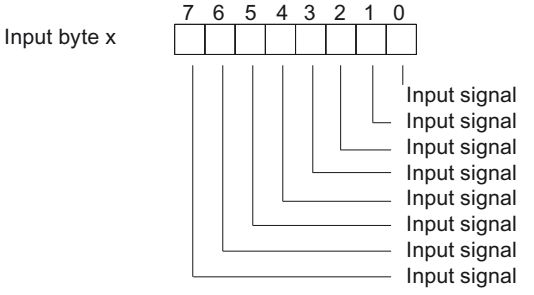


- With external resistance thermometer Pt1000

① M12 connector only on round socket X1
② External Pt1000 (α = 0.003851) in the area of the reference junction with copper cables at terminals 1 and 3. The comparison value of the external Pt1000 at round socket X1 also applies to thermocouples at X2, X3, X4, X5, X6, X7 and X8.
③ Thermocouple

Figure 1-794 Connection example "RTD (0)" as reference junction with external Pt1000

Connection example "Dynamic reference temperature" as reference junction



① Copper cables
② Thermocouple at 8 AI RTD/TC 8xM12
③ e. g. Pt100 in the area of the reference junction
④ RTD module of another station

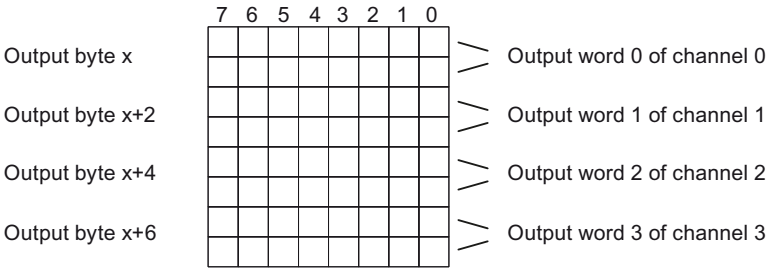

Figure 1-806 Address space of 4 AO U/I 4×M12 I/O device

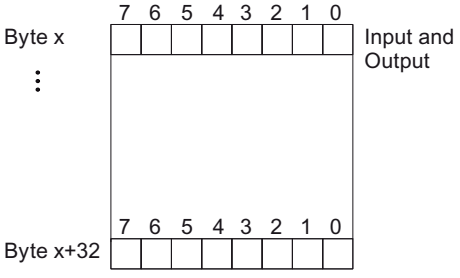
IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12

During the STEP 7 configuration, you can select the address space according to use.

During GSD configuration, Slot 1 "4 IO-L" has fixed 32 bytes input and 32 bytes output. Addressing of the input and output data can be selected freely using *S7-PCT*.

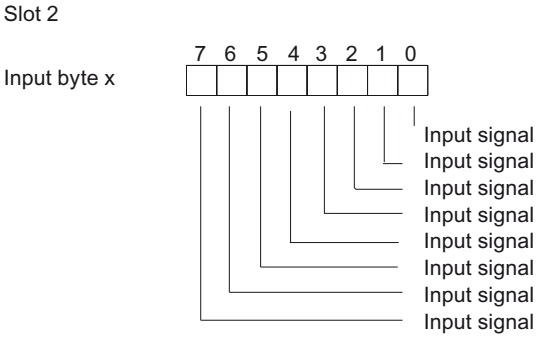


NOTE

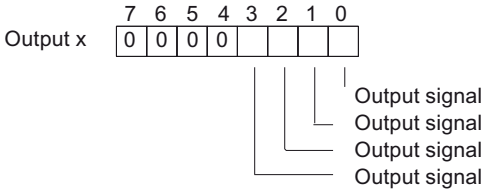
Value status (PortQualifier)

The value status (PortQualifier) is disabled by default. An active value status (PortQualifier) is generally at byte x, bit 0 to bit 3. It can also be placed freely within the address space (byte x to x+32).

Assignment of the inputs and IO-Link channels as an example:



Slot 1



4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8xM12	Input signal	Diagnostic channel	Comment
X1 at Pin 4 X2 at Pin 4 X3 at Pin 4 X4 at Pin 4	1 2 3 4	1 2 3 4	The PCT-Tool takes over the partitioning of the IO-link-channels in the process image of the inputs and outputs and also the addressing of the value status (port qualifier)

Figure 1-807 Address space of the IO-Link channels of the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12

Slot "8 DI + 4DO" has its own address space. The scope amounts to one byte inputs and one byte outputs.

8 DI + 4 DO	Input signal	Diagnostic channel
X1 at Pin 2	0	No diagnostics
X2 at Pin 2	1	
X3 at Pin 2	2	
X4 at Pin 2	3	
X5 at Pin 4	4	4
X5 at Pin 2	5	5
X6 at Pin 4	6	6
X6 at Pin 2	7	7

4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8xM12	Output signal	Diagnostic channel	Supply voltage
X7 at Pin 4	0	0	2L+
X7 at Pin 2	1	1	
X8 at Pin 4	2	2	
X8 at Pin 2	3	3	

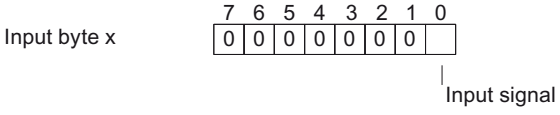


Figure 1-808 Address space of the inputs and outputs of the IO-Link Master 4 IO-L + 8 DI + 4 DO DC 24V/1,3A 8×M12

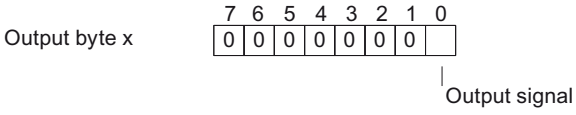
IO-Link Master 4 IO-L 4×M12

During the configuration, you can select the address space according to use.

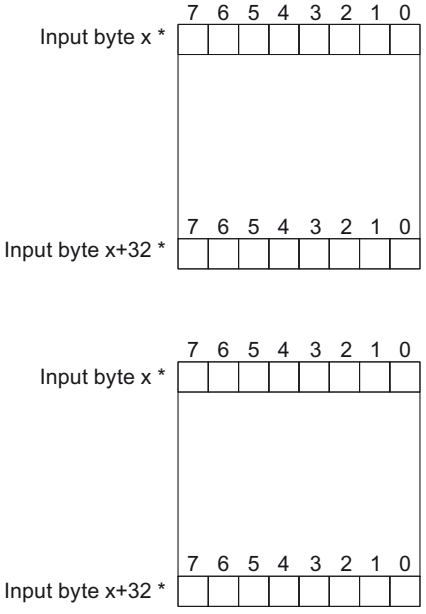


SIO mode

The following figures show the assignment of the address spaces of a submodule/port with the IO-Link Master 4 IO-L 4×M12, if you have configured the port as digital input or digital output in SIO mode.

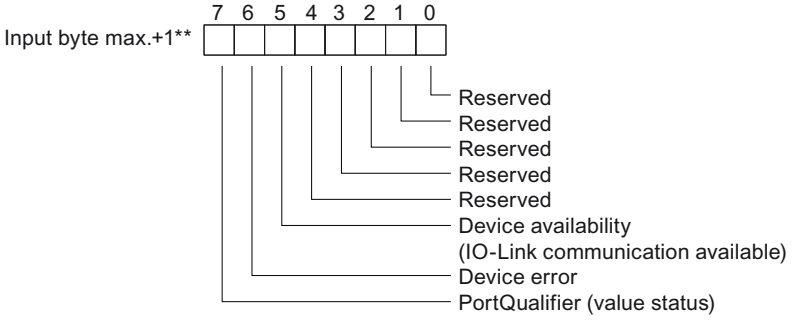
4 IO-L 4xM12	Port
X1 at Pin 4	0
X2 at Pin 4	1
X3 at Pin 4	2
X4 at Pin 4	3

Figure 1-809 Address space of the inputs of the IO-Link Master 4 IO-L 4×M12 in SIO mode



4 IO-L 4xM12	Port
X1 at Pin 4	0
X2 at Pin 4	1
X3 at Pin 4	2
X4 at Pin 4	3

Figure 1-810 Address space of the outputs of the IO-Link Master 4 IO-L 4×M12 in the SIO mode



IO-Link mode

The following figure shows the assignment of the address spaces of a submodule/port with the IO-Link Master 4 IO-L 4×M12, if you have configured the port in IO-Link mode.

4 IO-L 4xM12	Channel
X1 at Pin 4	0
X2 at Pin 4	1
X3 at Pin 4	2
X4 at Pin 4	3

Port Qualifier Information (PQI)

* Detailed information on the assignment of the input and output bytes is available in the description of the IO-Link devices that are used.
** The PQI byte is always located behind the last input byte of the port. Depending on the configuration, the PQI byte is thus at byte 2, 3, 5, 9, 17 or 33 in the process input image.

Figure 1-811 Address space of the inputs and outputs and of the PQI byte of the IO-Link Master 4 IO-L 4×M12 in IO-Link mode

Response times for analog input device and output device

F

F.1 Response times for analog input device

Conversion time

The basic conversion time depends directly on the conversion method of the analog input channel (integrating method, instantaneous value conversion). For the integrating conversion method, the integration time is included directly in the conversion time. The integration time depends on the interference frequency suppression.

For information on the basic conversion times and additional processing times of the individual analog devices, refer to the technical data of the corresponding analog I/O device.

Cycle time

The analog-digital conversion and the transfer of the digitized measured values to memory or to the backplane bus take place sequentially. In other words, the analog input channels are converted one after the other. The cycle time, that is, the time until an analog input value is converted again, is the sum of the conversion times of all the activated analog input channels of the analog input devices. You should deactivate unused analog input channels during parameter assignment in order to reduce the cycle time. The conversion and integration time for a deactivated channel is 0.

The figure below provides an overview of the cycle time elements of an n-channel analog input device.

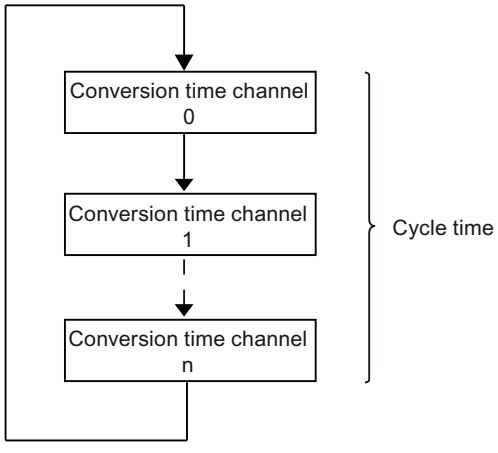


Figure 1-812 Cycle time for analog input devices

Settling time

See *Smoothing*.

F.2 Response times for analog output device

Conversion time

The conversion time of the analog output channels includes the transfer of digitized output values from internal memory, and their digital-to-analog conversion.

Cycle time

The analog output channels are converted for the device with an execution time plus the sequential conversion time for channels 0, 1, 2, and 3.

The cycle time, i.e., the time until an analog output value is converted again, is the sum of the conversion times of all the activated analog output channels and of the processing time of the analog output device. You should deactivate unused analog output channels during parameter assignment in order to reduce the cycle time. The conversion time for a deactivated channel is 0 ms.

The following figure provides you with an overview of the cycle time elements for an analog output device.

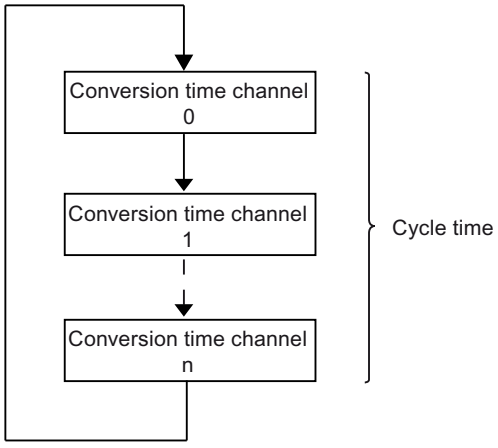

Figure 1-813 Cycle time of analog output modules

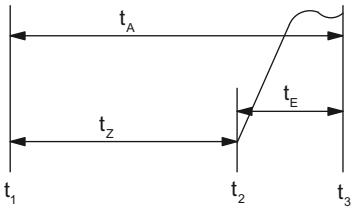

Settling time

The settling time (t_2 to t_3)—that is, the time from the application of the converted value until the specified value is reached at the analog output—depends on the load. We therefore distinguish between resistive, capacitive, and inductive loads.

Response time

The response time (t_1 to t_3)—that is, the time from the application of the digital output values in internal memory until the specified value is reached at the analog output—is, in the most unfavorable case, the sum of the cycle time and the settling time. The worst case scenario is when the analog channel has been converted immediately before a new output value is transferred and is not converted again until all other channels have been converted (cycle time).

This figure shows the response time of an analog output channel:

t_A Response time

t_Z Cycle time, corresponding to the processing time of the device and the conversion time of the channel

t_E Settling time

t_1 New digital output value applied

t_2 Output value transferred and converted

t_3 Specified output value obtained

Figure 1-814 Response time of an analog output channel

Fail-safe shutdown of ET 200eco PN standard modules

G

G.1 Back-up oriented shutdown of ET 200eco PN standard modules

Introduction

The following structure describes how to perform a fail-safe shutdown of ET 200eco PN standard modules.

In the configuration shown in the diagram below (e.g. with the safety shutdown device 3SK1), all digital outputs that are connected to the 2L+ and 2M supply (24 V switched) of the ET 200eco PN standard modules are switched to the safe OFF state. This step achieves the safety class SIL2/category 3/PL d.

Principle of operation

The higher-level safety shutdown device (e.g. 3SK1) disconnects the supply 2L+ and 2M switched. The digital outputs of the ET 200eco PN standard modules operated at the 2L+ and 2M (24 V switched) supply are switched to the safe state. The digital outputs connected to the supply 1L+ and 1M (24 V non-switched) are not intended for switching under normal operating conditions and cannot be safely shutdown.

There is no opposite influence of the outputs.

⚠ WARNING

Pay attention to the potential groups

When a digital output is connected to a digital input, pay attention to the respective potential groups. Depending on the configuration, 1M and 2M can then be connected, resulting in elimination of the electrical isolation between 1L+ and 2L+. In this case, a safety-oriented shutdown is not possible.

Block diagram

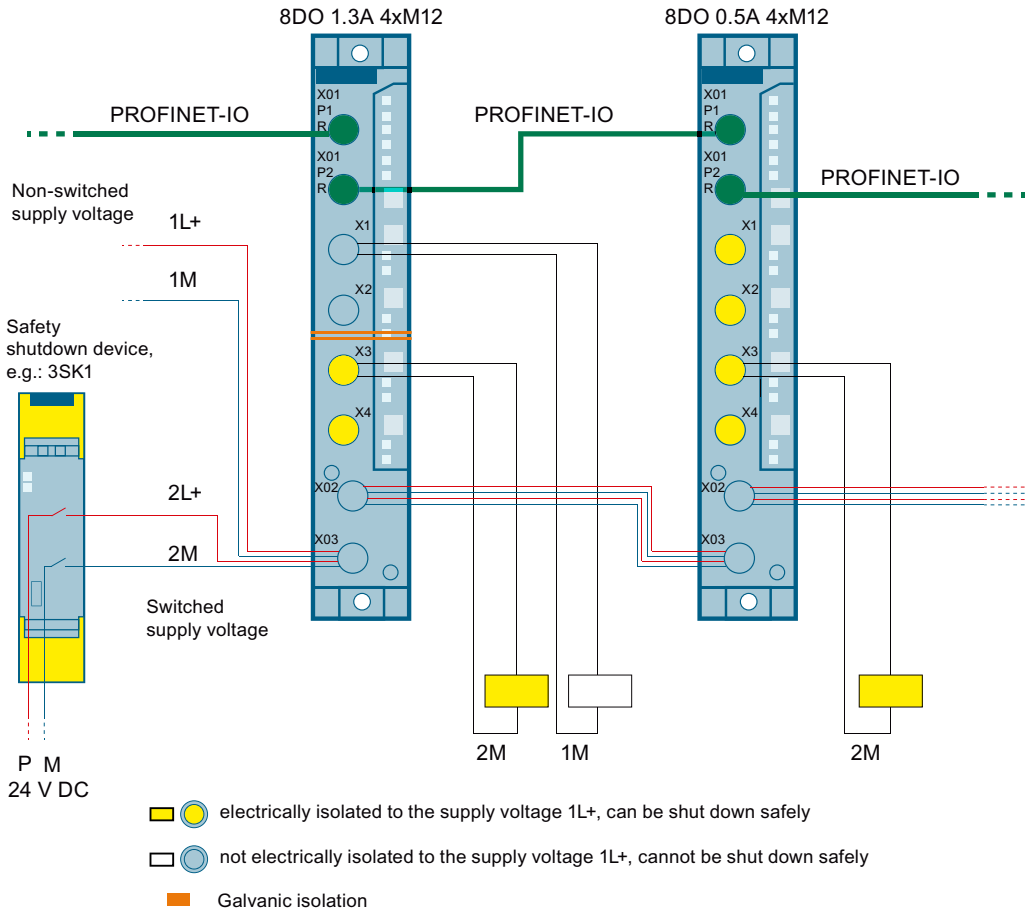

Figure 1-815 Higher-level safety shutdown of the outputs

WARNING

When you use a pp-switching safety shutdown device, the power supply cable for connection of the ET 200eco PN modules must be routed cross-circuit proof.
Note the requirements of the standard EN 60204-1, "Cross-circuit proof routing".

NOTE

Maintain safe electrical isolation for voltages higher than SELV/PELV.

Limits of the higher-level safety circuit

The ET 200eco PN standard modules do not fulfill any safety functions. Safety functions are performed by the safety relay or the F-switch to bring the system into a safe state.
Adjust the operation inspection interval of the safety relay with relay output according to the safety class.
Take the following measures if energy that is not provided by the higher-level safety circuit is used to control the safety function.

Cover critical errors in the safety function that are not detected by the higher-level safety circuit (e.g. 3SK1, F-switch etc.) with suitable safety measures. The "diagnostics" must be performed indirectly via the controlled process.

Specifications for safety-relevant process data:

- Functionally safe
- Read via fail-safe inputs (e.g. F-DI)
- Fail-safe processing unit (e.g. F-CPU) for issuing commands
- Output through fail-safe outputs (e.g. F-DQ) to control the safety function

Requirements on the power supply

Operation requires a SELV/PELV power supply to limit overvoltages to L+ and M (24 V). This measure prevents possible errors from the power supply side at the same time.

Select the power supply according to the requirements of the respective operating instructions for the shutdown device or for the ET 200eco PN system.

You can find more information on safe SELV/PELV in the data sheets of the power supplies used.

FAQ

Read the latest information on safety-related shutdown in the FAQ (https://support.industry.siemens.com/cs/ww/en/view/39198632).

In this FAQ, you will find the SIMATIC standard modules that are suitable for safety-related shutdown.

Introduction

1

1.1 General information ET 200eco PN Master

Purpose of the documentation

This equipment manual supplements the ET 200eco PN M12-L Distributed I/O System manual (https://support.industry.siemens.com/cs/us/en/view/109778292). Functions that relate in general to the distributed I/O devices ET 200eco PN M12-L are described in the system manual.

The information provided in this equipment manual, in the system manual, and in the functional manuals supports you in commissioning ET 200eco PN M12-L F distributed I/O devices.

Conventions

For the sake of readability, this manual refers to the module as the "ET 200eco PN M12-L F".

ID link for the digital nameplate

The ID link is a globally unique identifier according to IEC 61406-1, which you will find as a QR code on your product.

The figure shows an example of an ID link for the ET 200eco PN M12-L F.

You can recognize the ID link by the frame with a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product.

Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Access the ID link.

In the digital nameplate, you can find product data, manuals, declarations of conformity, certificates and other helpful information about your product.

⚠ WARNING

Risks when using a cellular phone in close proximity to an ET 200eco PN M12-L F module

Using a cellular phone in close proximity to an ET 200eco PN M12-L F module with cellular and Wi-Fi communications active can cause unpredictable behavior.

To reduce any influence of a cellular phone on the ET 200eco PN M12-L F module, and to ensure proper operation of your devices, place the phone in "Airplane mode" to disable cellular and Wi-Fi before bringing the phone into proximity (<10 cm) of the device.

Failure to comply with these guidelines can cause damage or unpredictable operation, which could result in death, severe personal injury, and/or property damage.

Industry Mall

The Industry Mall is the catalog and order system of Siemens Aktiengesellschaft for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Certifications and approvals

Refer to the technical specifications (Page 110)for details on certifications and approvals.

Glossary

The definitions in the glossary provide an easy first reference for understanding the terms in this manual. Some terms have detailed formal definitions in IEC 61508, EN ISO 13849, IEC 61784-3-3, and associated standards. These terms refer to broad safety concepts, for which the standards provide specific details.

1.2 Documentation guide

Basic information

The *SIMATIC ET 200eco PN Distributed I/O system ET 200eco PN M12-L System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109778292) describes in detail the configuration, installation, wiring, and commissioning of the SIMATIC ET 200eco PN M12-L distributed I/O system. The TIA Portal Information System supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics, and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200eco PN M12-L distributed I/O system; for example, diagnostics, communication, Motion Control, and Web server.

Manual Collection ET 200eco PN M12-L

The Manual Collection (https://support.industry.siemens.com/cs/us/en/view/109781058) contains the complete documentation on the SIMATIC ET 200eco PN M12-L distributed I/O system gathered together in one file.

TIA Selection Tool

With the TIA Selection Tool (https://support.industry.siemens.com/cs/us/en/view/109767888), you can select, configure, and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300) to perform commissioning and maintenance activities on various SIMATIC devices as operations independent of TIA Portal. The supported devices are listed in the SIMATIC Automation Tool Device Catalog within the SIMATIC Automation Tool.

For more information, refer to the SIMATIC Automation Tool user guide (https://support.industry.siemens.com/cs/ww/en/view/109827741).

PRONETA

SIEMENS PRONETA (https://support.industry.siemens.com/cs/ww/en/view/67460624) (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks.

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used.

SINETPLAN

SINETPLAN (https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html), the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

Safety technology support

Siemens provides the following online comprehensive support for your use of safety technology:

- Safety Evaluation Tool (https://support.industry.siemens.com/cs/us/en/view/109767888) - assists you in determining required safety levels.
- Siemens training (SITRAIN) classes (https://www.siemens.com/global/en/products/services/digital-enterprise-services/training-services/sitrain.html?gclid=EAIaIQobChMIlvun-NDEhgMVHYVaBR2NkQM0EAAYASAAEgLFe_D_BwE&acz=1&gad_source=1) - offers training in safety standards and products.
- SIMATIC STEP 7 Safety Advance F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times Excel file (RT_calculator) (https://support.industry.siemens.com/cs/ww/en/view/58856512) - assists you in calculating your maximum system response time.

1.3 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)

     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:

     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.

Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.4 S7 Port Configuration Tool (S7-PCT)

The S7 Port Configuration Tool (S7-PCT) is a PC-based software for the parameter assignment of Siemens IO-Link Master modules and IO-Link devices from any manufacturer.

You integrate IO-Link (https://new.siemens.com/global/en/products/automation/industrial-communication/io-link.html) devices using the standardized device description, which you get from the device manufacturer. S7-PCT supports V1.0 and V1.1 of the IO-Link Device Description (IODD).

The hardware configuration of the IO-Link Master in STEP 7 calls the S7-PCT. When STEP 7 is not used, or the IO-Link Master is not operated on a SIMATIC controller, "standalone" operation is not possible.

1.5 S7 Fail-safe Configuration Tool (S7-FCT)

The SIMATIC S7 Fail-safe Configuration Tool (S7-FCT)
(https://support.industry.siemens.com/cs/us/en/view/109762827) allows you to use selected functionally fail-safe SIMATIC I/O devices and the SIRIUS ACT PROFINET interface from SIEMENS in an engineering system from a third-party manufacturer.

You can assign the F-source and F-destination address of a fail-safe SIMATIC I/O device and support the calculation and provision of the F_iPar_CRC in STEP 7.

For more information on using the S7-FCT, refer to "Configuring ET 200eco PN F-IO M12-L Fail-safe modules with a GSDML file".
(https://support.industry.siemens.com/cs/ww/en/view/109976831)

Industrial cybersecurity 2

2.1 Introduction to industrial cybersecurity

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

Refer to the SIMATIC ET 200eco PN Distributed I/O system ET 200eco PN M12-L (https://support.industry.siemens.com/cs/us/en/view/109778292) System Manual for general information and measures regarding industrial cybersecurity.

This section provides an overview of security-relevant information pertaining to your SIEMENS device.

2.2 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

2.3 Cybersecurity-relevant information

Observe all cybersecurity-relevant information.

Topics with cybersecurity-relevant information	Reference
Operational application environment and security assumptions	
Requirements for the operational application environment of the system and security assumptions	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
The security "Defense in Depth" strategy for the product to support installation, operation, and maintenance	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Guidelines for performing security hardening during installation and maintenance of the product	This information can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Security properties of the product	
Access protection	Note the information on the topic of access protection in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Data integrity	The topic of data integrity is described in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Signed firmware update	The topic of signed firmware updates is described in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
PROFINET Security Class 1 • The device supports PROFINET Security Class 1. • With the introduction of PROFINET Security Class 1, additional security settings have been integrated into the PROFINET communication.	Detailed information about PROFINET Security Class 1 and the additional security settings can be found in the PROFINET with STEP 7 Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856)
Supported Ethernet services	You can find information on supported services in the Technical specifications (https://support.industry.siemens.com/cs/ww/en/view/109994978/188110615563). You can find detailed information on supported Ethernet services in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925).
Interfaces, ports, protocols, and services	
Information on the following is security-relevant: • Communication layer and communication role • Default states • Enabling/disabling of ports and services	You can find detailed information on these topics in the Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925). Note exceptions outlined in the Communication protocols and ports Appendix (Page 128).
Secure operation	
Recommendations for safe operation	Information on the safe operation of the module can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).

Topics with cybersecurity-relevant information	Reference
Corrective measures for known risks	Corrective measures for known risks are announced on the Siemens ProductCERT and Siemens CERT (https://www.siemens.com/global/en/products/services/cert.html) web page. For more information on SIEMENS ProductCERT, refer to the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Security checks	Application-specific security measures such as cyclic checks of the configuration via checksums are described in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Secure decommissioning Products that contain security-relevant data must be securely decommissioned before disposal or resale.	Information on secure decommissioning can be found in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Account management guidelines	You can find Information on access control, user rights, and default accounts in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Security events	You can find a list of all events in Fault types, causes, and corrective measures (Page 67).
Security update notifications	You can find Information on security patches for dependent components and operating systems and how to install them in the "Industrial cybersecurity" section of the System Manual (https://support.industry.siemens.com/cs/us/en/view/109778292).
Integrity	
Integrity of documentation and other important files	You can find information on how to verify the integrity of documentation and file downloads like firmware updates using checksums on the SiePortal (https://support.industry.siemens.com/cs/ww/en/view/109483101) website.

Product overview

3.1 Properties

Article Number

6ES7146-6FF00-0BB0

View of the Module

Properties

The ET 200eco PN M12-L F module is a PROFINET device that combines different I/O architectures into a single module. The module incorporates fail-safe I/O, standard I/O, and IO-Link ports. It includes built-in distributed PROFINET device capability which does not require the presence of a head-module. The ET 200eco PN M12-L F module is IP65 and IP67 compliant and is capable of being installed independently from typical IP20 control cabinetry.

The module has the following technical properties:

- Two M12-L module voltage ports, which contain both logic and input power (1L+) and output power (2L+) and can provide power to the next module by means of a daisy chain
- Two PROFINET M12 communication ports

- Eight M12 connector ports
  - Two connectors for fail-safe inputs, supporting four 1oo1 (1 out of 1) inputs or two 1oo2 (1 out of 2) inputs
  - Two connectors for fail-safe outputs, supporting two PM outputs with optional provision of 1L+ power to support safety shutdown applications
  - Two connectors for standard I/O, supporting four DIQ points
  - One connector for an IO-Link Class B port with optional provision for safety shutdown or optional safety PM output
  - One connector for a specialized eCoding plug whose purpose is safety address storage

Accessories

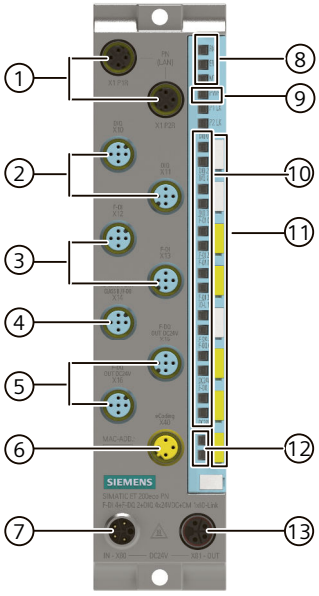
The module package includes the following components:

- Identification labels (yellow and white)
- eCoding plug (used to store the application's PROFIsafe addresses)

Other components

You can order the following components as spare parts:

- Identification labels (yellow and white)
- eCoding plug



You can order the following components as accessories:

- Mounting rail
- Connectors and cables
- M12 sealing cap

You can find more information on accessories in "Accessories/spare parts" in the *SIMATIC ET 200eco PN Distributed I/O system ET 200eco PN M12-L system manual* (https://support.industry.siemens.com/cs/us/en/view/109778292).

3.2 Operator controls and display elements

The figure below shows the operator controls and display elements of the ET 200eco PN M12-L F module:

① X1 P1R / X1 P2R: Connector for PROFINET I/O
② X10 / X11: Connector for standard DIQ x2 (each)
③ X12 / X13: Connector for F-DI and sensor supply x2 (each)
④ X14: Connector for IO-Link Class B or F-DQ
⑤ X15 / X16: Connector for F-DQ on 2L+ and 1L+ switch (each)
⑥ X40: Connector for eCoding Plug
⑦ X80: Socket for voltage infeed
⑧ LED indicators for module status/fault (RUN, ERROR, MAINT)
⑨ PWR: LED status for load voltage 2L+
⑩ LED status for channel status/fault
⑪ Removable I/O labels (yellow = fail-safe I/O, white = standard I/O)
⑫ Reintegration LED
⑬ X81: Socket for loop-through of the voltage

Figure 1-816 Operator controls and display elements

3.3 Functions

The module supports the following functions:

Module

- PROFINET device
- Shared device
- Firmware update
- Identification and maintenance data I&M0 to I&M3

Fail-safe

- Fail-safe digital inputs
- Fail-safe digital outputs
- Embedded safety functions
- Safety shutdown of standard outputs

Standard

- IO-Link
- Standard digital inputs/outputs

3.3.1 Hardware and software components

Fail-safe CPUs

You can use any of the following fail-safe CPUs with the ET 200eco PN M12-L F module:

- S7-1200 F/S7-1200 G2 F
- S7-1500 F
- ET 200SP F

A fail-safe system requires a fail-safe CPU with fail-safe central I/O and/or fail-safe distributed I/O.

Required software components

You require a STEP 7 V20 Basic / Professional license, which includes STEP 7 Safety Basic as an integral product.

STEP 7 V20 is the configuration and programming software for the SIMATIC Safety fail-safe system. STEP 7 V20 includes the following:

- Support for configuring the fail-safe CPUs and I/O in the hardware and network editor of the TIA Portal
- Support for creating the safety program using LAD and FBD to integrate error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD

You also require a Hardware Support Package (HSP) which corresponds with used devices and their firmware versions.

3.3.2 Fail-safe functions

3.3.2.1 Fail-safe digital inputs

The fail-safe digital inputs of the ET 200eco PN M12-L F module are rated for connection to 24 V DC sensors/switches and 3/4-wire proximity switches (for example, BEROs: no-touch sensors) and have an EN61131-2 Type 3 input rating.

The fail-safe module has four sensor supply outputs that can power external sensors (inputs). You can configure each fail-safe input channel to provide 24 V sensor power from the module or to provide external 24 V sensor power.

You can integrate these sensors directly as inputs into safety functions, which are embedded within this F-module to control F-outputs. By configuring the F-inputs in this way, you can achieve faster reaction times when the Emergency Stop and/or Internal Evaluation safety functions use these sensors.

Inputs and test circuit

The fail-safe digital inputs consist of four input channels (F-DI x.0 to x.3). You can configure these inputs as four 1 out of 1 (1oo1) inputs (SIL 2/Cat. 3/PL d), two 1 out of 2 (1oo2) inputs (SIL 3/Cat. 3 or Cat. 4/PL e), or combinations of 1oo1 and 1oo2 inputs.

Connections	Input channel pairs
X12	0 and 2
X13	1 and 3

One microcontroller monitors inputs 0 and 1, and the other microcontroller monitors inputs 2 and 3. The corresponding channels (0, 2) and (1, 3) each form a 1oo2 channel group. The first of the two fail-safe inputs conveys the signal in a 1oo2 configuration. For example, if you wire x.0 and x.2 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal appears at only the x.0 input when you close or open the circuit for both. This also applies to the channel quality.

When you configure a channel group as 1oo2, the two microcontrollers must sense an appropriate input change within a configured time. Otherwise, the module reports a discrepancy error.

If you use a sensor supply output to provide power to a sensor, you can enable short-circuit testing. The short-circuit test checks for shorts to 24 V DC on your inputs by periodically pulsing the sensor output off and verifying that the associated input is off. The sensor supply can also detect shorts to 24 V DC and ground on the sensor supply itself, as well as cross-connected shorts between sensor supplies and inputs.

3.3.2.2 Fail-safe digital outputs

The fail-safe digital outputs of the ET 200eco PN M12-L F are for use in fail-safe applications and are suitable for various actuators including solenoid valves, DC contactors, and indicator LEDs. The two fail-safe digital outputs have P- and M-switching that are rated for connections to 24 V DC actuators with up to a 2.0 A rating, and a third additional PM output is optionally configurable. The fail-safe digital outputs use the supply voltage 2L+.

The fail-safe digital outputs consist of three output channels (F-DQ x.0, x.1, and, optionally, x.2). The fail-safe output F-DQ x.2 is shared with the IO-Link Class B port and can be configured to operate solely as an F-DQ for a third fail-safe digital output. You can use each

output for SIL 3 applications; however, F-DQ x.2 must be configured to "Operate as F-DQ only" for these applications.

Connections	Output channel
X14	IO-Link Class B / 2
X15	0
X16	1

Each output consists of two switches:

- A P-switch connects 24 V DC positive (L+) through the load.
- An M-switch connects the load to M or 24 V DC return.

When you enable an output, both switches are turned ON, which allows current to flow through the load.

The fail-safe digital outputs use two microcontrollers to implement the safety function. One microcontroller controls the P-switch while the other microcontroller controls the M-switch. There is feedback from the P-switch output to the other microcontroller that is controlling the M-switch. Likewise, there is feedback from the M-switch output to the other microcontroller that is controlling the P-switch. The feedback verifies that the output switches are operating properly and in the commanded state.

You can configure a "Maximum readback time" in STEP 7 device configuration that specifies the maximum amount of time that the output channel waits for the voltage to respond when the process value changes. The higher the capacitance of the connected load is, the higher your set value for "Maximum readback time" must be.

The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. Your configured "Maximum readback time" sets the duration of the "OFF" test pulse. Your configured "Maximum readback time switch on test" sets the duration of the "ON" test pulse. Choose short enough durations to not affect your load. You can disable the "OFF" test pulse during this switch test with the "Disable dark test" parameter.

The module can detect a broken wire or missing load only when the output PV is "OFF" and the load is wired in PM mode.

The module provides overload protection through current measurement of the P-outputs when the output is ON. M-outputs are short-circuit protected, but are not monitored for over-current.

Safety shutdown

You can configure outputs F-DQ x.0 and x.1 to operate in the following fail-safe modes:

- "Operate as F-DQ only"
- "Operate as F-DQ with Safety shutdown"

You can configure output F-DQ x.2 to operate in the following fail-safe mode:

- "Operate as F-DQ only"

Configuring one of these outputs as "Operate as F-DQ only" provides switchable 2L+ 24 V DC power, while configuring as "Operate as F-DQ with Safety shutdown" provides switchable 2L+ 24 V DC power, as well as non-switchable 1L+ 24 V DC power. See Pin assignment of connectors (Page 36).

Output F-DQ x.2 can also operate in Safety shutdown mode, but it cannot simultaneously operate as an F-DQ if you select this mode.

⚠ WARNING

IO-Link port safety ratings
F-DQ x.2 is only rated for safety applications when you configure its "Channel operating Mode" as "Operate as F-DQ only".
You must ensure that F-DQ x.2 is configured appropriately for your intended application.
Attempting to use F-DQ x.2 as a fail-safe output configured for Class B operation could result in death, severe personal injury, and/or property damage.

NOTE

Parameterization of the IO-Link port
Because the IO-Link port can also serve as an F-DQ channel, when you change the parameter "Operating mode" under "IO-Link > Port 1 > Port configuration", the safety program always treats it as a safety parameter. Regardless of whether the port is currently configured as an F-DQ or as an IO-Link, the safety program requires that you input the safety program password.
In the absence of parameterization, such as in the case of CPU factory reset or upon module power up, the operating mode of the FDQ2 / IO-Link port operates as an IO-Link port.

3.3.2.3 Requirements for sensors and actuators for fail-safe modules

When using sensors and actuators in safety-related applications, observe the following general requirements:

⚠ WARNING

Safety-related responsibility
Instrumentation with sensors and actuators bears a considerable safety responsibility. Also bear in mind that sensors and actuators generally require proof-test intervals that are more frequent than the service life of Siemens products, which is generally 20 years.
The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. You can find a listing of values achieved by each F-module in its respective technical specifications.
To achieve the required safety class, suitably qualified sensors and actuators are necessary.
Failure to use suitably qualified sensors and actuators can result in death, severe personal injury, and/or property damage.

Additional sensor requirements

Generally, to achieve SIL 3/Cat. 3/PL e, a single-channel sensor is adequate. However, with a single-channel sensor, the sensor itself must be SIL 3/Cat. 3/PL e capable. Otherwise, two sensors must be used. To achieve SIL 3/Cat. 3/PL e, sensors must be connected to the module using two input channels.

⚠ WARNING

Additional sensor requirements
In the case of fail-safe input channels, the value "0" is output to the F-CPU after detection of faults. You need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.
Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the relevant actuator when it is in the "0" state (EMERGENCY-STOP button pressed).
Failure to ensure that sensors are implemented to ensure reliable reaction of the safety program can result in death, severe personal injury, and/or property damage.

Duration requirements for sensor signals

⚠ WARNING

Duration requirements for sensor signals
To ensure the correct detection of the sensor signals by fail-safe modules with input channels, you need to make sure that the sensor signals are output for a minimum duration.
For pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.
Failure to ensure that the sensor signals are output for a sufficient duration can result in death, severe personal injury, and/or property damage.

Reliable detection by F-modules with input channels

The minimum duration of sensor signals for F-modules with input channels depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in "Fail-safe response times (Page 119)".

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output channels test the outputs at regular intervals. The F-module briefly turns off output channels that are turned on and turns on particular switches of output channels that are turned off. You can assign the maximum duration of the test pulses (dark and switch-on) with the "Max. readback time" and "Max. readback time switch on test" parameters, respectively.

Fast-reacting actuators may briefly drop out or be activated during the test. If your process does not tolerate this, set the pulse duration by changing the readback and readback switch-on test times correspondingly, or use actuators that have sufficient lag. Alternately, you can select "Disable Dark Test (max. SIL2, CAT3, PLd)"; however, this reduces the capability of the used output from SIL 3/Cat. 4/PL e to SIL 2/Cat. 3/PL d.

⚠ WARNING

Additional requirements for actuators
If the actuators switch voltages greater than 24 V DC (for example, 230 V AC), the outputs of a fail-safe output channel and the parts carrying a higher voltage must be electrically isolated (in accordance with IEC 60664-1).
This is generally the case for relays and contactors. Particular attention must be paid to this with semiconductor switching devices.
Failure to provide proper electrical isolation can result in death, severe personal injury, and/or property damage.

Technical specifications of sensors and actuators

Refer to the technical specifications (Page 110) to assist you in selecting sensors and actuators.

3.3.2.4 Crosstalk of digital input/output signals

Readback errors could occur on the F-DQ channels if the fail-safe digital output signals and fail-safe digital input signals are routed through a single cable.

Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply test of the input channels, the steep switching edge of the output drivers caused by the coupling capacitance of the line could result in crosstalk to other non-activated output or input channels. This could then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short-circuit, which leads to safety-related tripping.

To remedy this situation, do the following:

- Separate cables for fail-safe DQ channels and non-fail-safe DQ channels.
- Separate cables for F-DQ channels and F-DI channels.
- Couple relays or diodes in the outputs.
- Disable the sensor supply test if safety class requirements allow it.

Magnetic crosstalk

An inductive load connected to the F-DQ channels can induce coupling of a strong magnetic field.

To remedy this situation, do the following:

- Separate the inductive loads spatially or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

3.3.2.5 Embedded Safety Functions (ESFs)

The ET 200eco PN M12-L F module can perform additional important safety functions with local I/O, such as Emergency Stop, Internal Evaluation, and the chaining together of these safety functions. When using the ESFs, you can achieve significantly faster reaction times.

The module provides two configurable Emergency Stop safety functions and two configurable Internal Evaluation safety functions.

When using ESFs, the module can override the process value from the F-CPU to "0" if the module invokes an ESF. Additionally, when the F-CPU sets the module's output(s) to "1" and the module clears the invocation of the ESF, the module stops overriding the output. This allows the F-CPU to resume controlling the process value to the output(s). The following table explains this principle:

Table 1-1111 ESF truth table

F-CPU PV	ESF State	ESF PV Override	Output State	Description
0	Invoked	Override to 0	0	The ESF is overriding the process value from the F-CPU to "0".
0	Not invoked	No override	0	The F-CPU is in full control of the output(s).
1	Invoked	Override to 0	0	The ESF is overriding the process value from the F-CPU to "0".
1	Not invoked	No override	1	The F-CPU is in full control of the output(s).

The ESFs provide significantly faster reaction times when setting the output(s) to "0" than what can be achieved through the F-CPU safety program alone. ESFs allow the module to set the output(s) to "0" without the F-CPU safety program overhead and communication overhead from the total reaction time (Page 122).

NOTE

The numbered inputs for the ESFs, such as "Input #1" or "Emergency Stop 0", which are configurable in STEP 7 device configuration under "General > Safety Functions", do not correlate to the physical inputs of the fail-safe module.

Emergency Stop (Estop)

The module's Estop function is a safety measure used to de-energize the desired machine function(s). When activated in STEP 7 Device configuration under "Safety Functions" > "Emergency Stop" and subsequently downloaded, the module begins to evaluate the configured Estop input to determine the state of the Estop button.

When the module detects that the Estop button is pressed, the module overrides the process value provided from the F-CPU to "0". The configured Estop output is de-energized in this state. If you have configured the Estop "Stop category" parameter for delayed deactivation, then the output remains energized for the configured Estop "Delay time" before the module overrides the process value to "0".

When the module detects that the Estop button has been reset, the user acknowledgement process is initiated if the Estop "Acknowledge necessary" is set to "Manually using rising edge". The module enables the configured "Acknowledge requested output", indicating that the Estop is ready to be acknowledged. You can then perform acknowledgement with the configured "Acknowledge input".

Once acknowledgement is complete, the module removes the override of the process value from the F-CPU.

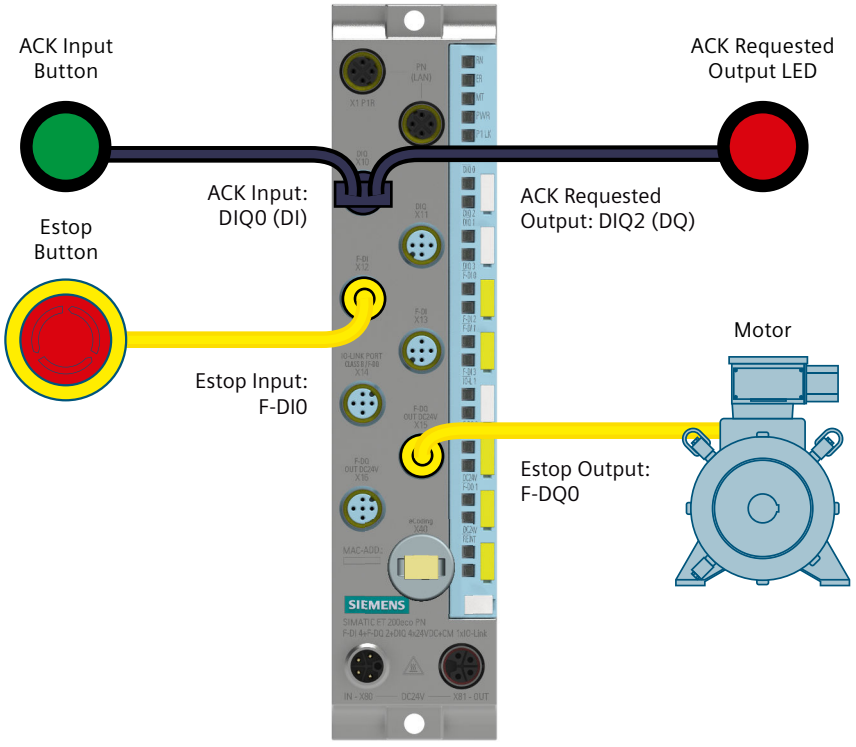


Figure 1-817 A motor controlled by the module's Estop with local I/O for acknowledgement process

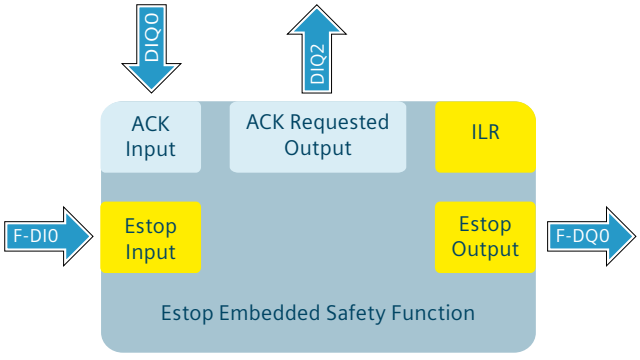

Figure 1-818 Visualization of module parameter assignment

Internal Evaluation (IE)

The module's IE function is a safety measure used to de-energize the desired machine function(s). When activated in STEP 7 Device configuration under "Safety Functions" > "Internal Evaluation" and subsequently downloaded, the module begins to evaluate the configured IE input(s) to determine the state of the connected sensor(s) and/or chained safety functions.

The IE safety function performs a Boolean "AND" operation on the configured input(s).

If the evaluation of the configured input(s) evaluates to "0", the module invokes the safety function and overrides the process value from the F-CPU to "0" to de-energize the configured output(s).

If the evaluation of the configured input(s) evaluates to "1", then the module does not override the configured output(s).

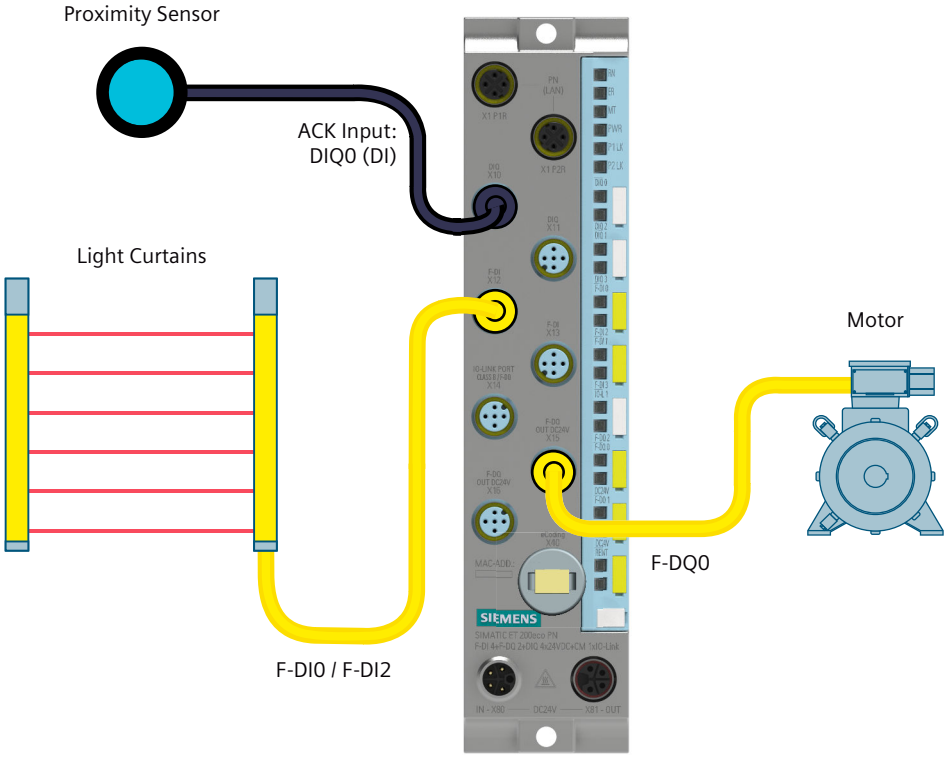

Figure 1-819 A motor controlled by the module's internal evaluation using light curtains

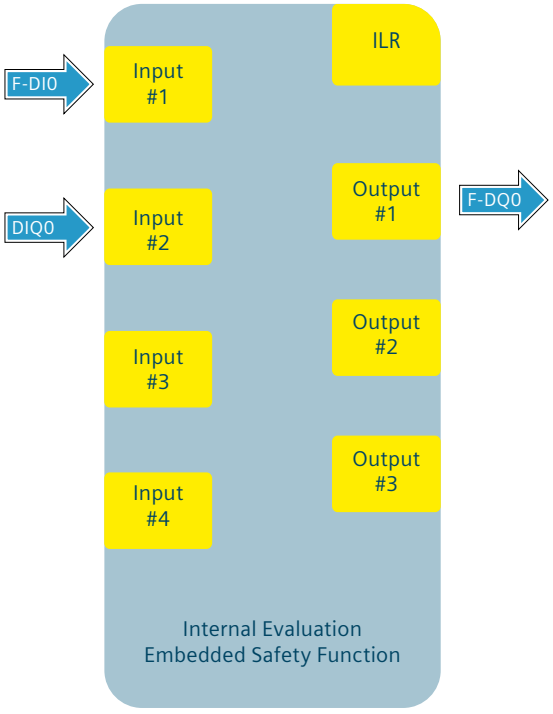

Figure 1-820 Visualization of module parameter assignment

Embedded safety function chaining

The ET 200eco PN M12-L F module allows for chaining of embedded safety function outputs to safety function inputs.

In addition to applying the evaluation result of the ESFs to the configured output(s), each ESF provides the result of its evaluation as an Internal Logic Result (ILR). The ILR for each ESF is accessible at all times through the process image and as an input to another ESF.

You create an ESF chain by configuring the input(s) of an ESF to the ILR of another ESF. You can configure these ESF chains in different ways.

NOTE

You must not create a circular dependency within an ESF chain. A circular dependency occurs when the ILR of an ESF is used in another ESF that precedes it.

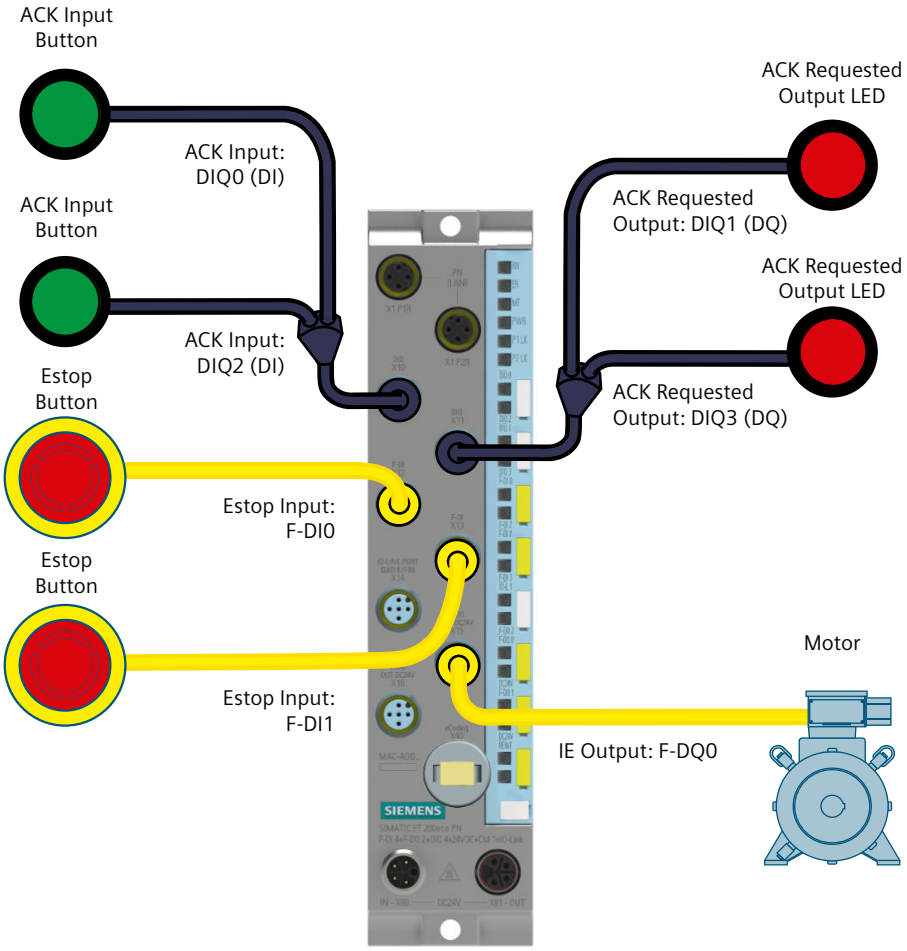

Figure 1-821 A motor controlled by the module's internal evaluation using two Estops

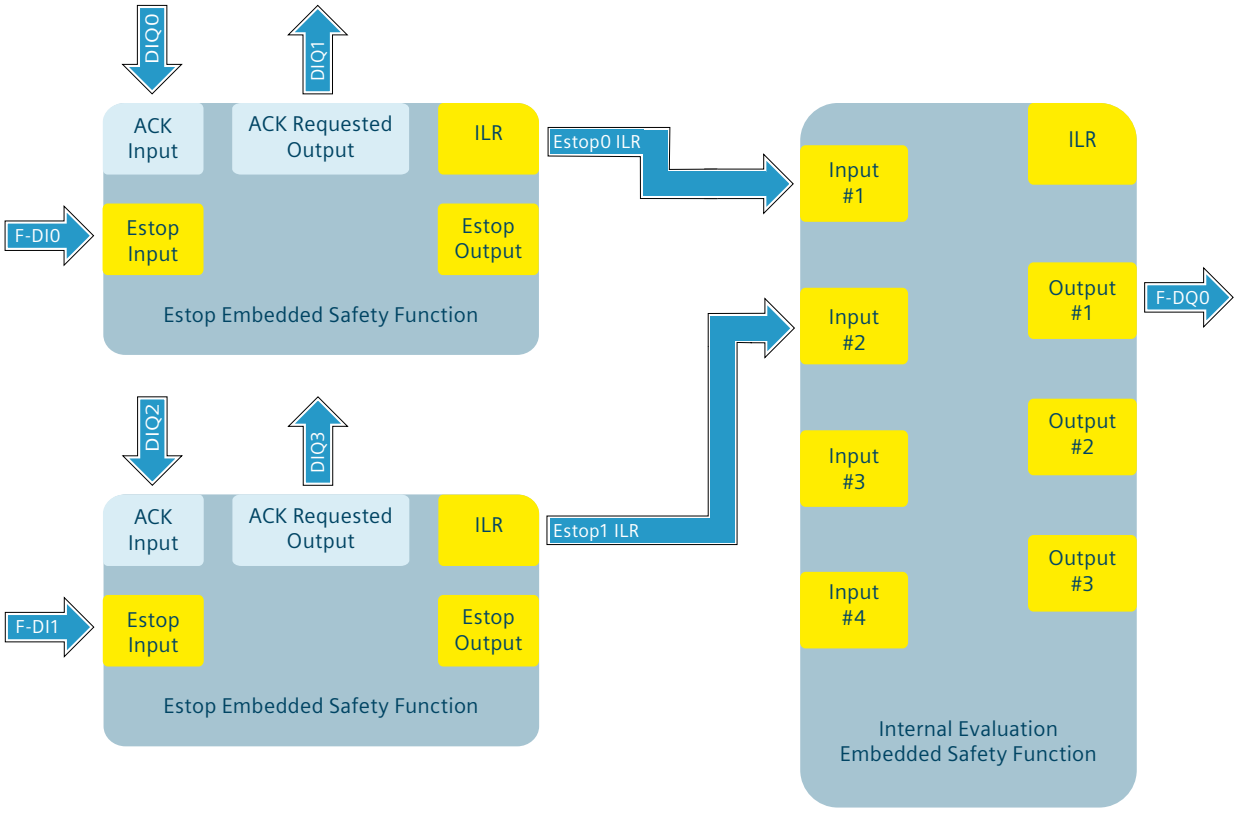

Figure 1-822 Visualization of module parameter assignment

3.3.3 Standard functions

3.3.3.1 IO-Link

IO-Link (https://support.industry.siemens.com/cs/us/en/view/65949252) is a point-to-point connection between an IO-Link master and an IO-Link device. On the IO-Link master, you can use IO-Link devices, as well as conventional sensors/actuators with unshielded standard cables using proven 3-wire technology. IO-Link is downward-compatible to conventional digital sensors and actuators. The switching state and data channels are designed with trusted 24 V DC technology.

Master backup

The "LIOLink_Master" function block is used to read all relevant IO-Link device and IO-Link master parameters. You can store these retentively at a central location, such as in a data block in the IO controller.

The "LIOLink_Master" function block can restore the status of the IO-Link devices or IO-Link ports stored in the IO-Link master. As a result, you can configure the IO-Link ports and the IO-Link master in STEP 7 with the values stored in the master backup.

A typical application is the restoration of parameters after replacement of the IO-Link master.

Port Qualifier Information (PQI)

Each port has Port Qualifier Information (PQI). This PQI provides information on the device status of the port and IO-Link. The PQI is transmitted cyclically with the process data. You cannot deactivate the PQI.

Port configuration

With an IO-Link master ET 200eco PN M12-L F, you can commission the IO-Link submodules (ports) of the IO-Link master or the connected IO-Link devices in two different ways:

- Port configuration with S7-PCT
- Port configuration without S7-PCT

NOTE

Shared device support and submodule assignment
You can assign standard I/O and IO Link submodules to either standard PLCs or fail-safe PLCs; however, you can only assign a PROFIsafe submodule to a fail-safe PLC.
Standard I/O and IO Link process data exchange are also independent of PROFIsafe process data exchange. Standard I/O data exchange is also performed when PROFIsafe data exchange is not operating.

Port configuration with S7-PCT

To configure the port with S7-PCT, do the following:

1. Deselect the "Autostart (without S7-PCT)" checkbox in the configuration of all IO-Link master submodules in STEP 7 (default).
2. Configure the IO-Link master with the Port Configuration Tool S7-PCT (PDCT) V3.5 SP3 or higher by activating the desired diagnostics.

Port configuration without S7-PCT

To configure the port without S7-PCT, do the following:

1. Select the "Autostart (without S7-PCT)" checkbox in the configuration of the IO-Link master submodule in STEP 7.
2. Configure the IO-Link master submodules directly in STEP 7 by activating the desired diagnostics.
3. Choose which mode you want the port to operate in:

- "IO-Link Autostart" (default)
- "IO-Link Manual"

3.3.3.2 Standard digital inputs/outputs

The standard digital inputs are rated for connection to 24 V DC sensors/switches and have an IEC 61131 Type 3 input rating. The standard digital outputs are rated for connection to 24 V DC and are configured as high-side outputs where a high side switch is connected to the high side of the load.

There are two sensor supply outputs provided for the standard digital inputs, which are assigned to the following connectors:

- X10: U_{S0}
- X11: U_{S1}

Inputs/outputs and test circuit

The standard DIQ consists of four channels (DIQ x.0 to x.3), which you can configure in any combination of inputs and outputs.

Connectors	Input/output channels
X10	0 and 2
X11	1 and 3

If you use a sensor supply output to provide power to a sensor, you can enable short-circuit testing. The short-circuit test checks for shorts to ground on your sensor supply. You can configure the DIQ channel to detect short-circuits. If the DIQ channel is configured as an input, then the short-circuit diagnostic detects short-circuits to ground on the sensor supply output. If the DIQ channel is configured as an output, then the short-circuit diagnostic detects short-circuits to ground and short-circuits to L+ on the output channel. The short-circuit test also detects cross-connected shorts between sensor supplies and inputs.

You can configure the DIQ channel to detect a broken wire when the channel is configured as an input.

The standard DIQ can also detect low voltage on 1L+ and trigger the "Undervoltage" maintenance event (Page 92).

You can set the reaction of the standard outputs to a CPU STOP using the parameters (Page 76) in STEP 7.

NOTE

Shared device support and submodule assignment

You can assign standard I/O and IO Link submodules to either standard PLCs or fail-safe PLCs; however, you can only assign a PROFIsafe submodule to a fail-safe PLC.

Standard I/O and IO Link process data exchange are also independent of PROFIsafe process data exchange. Standard I/O data exchange is also performed when PROFIsafe data exchange is not operating.

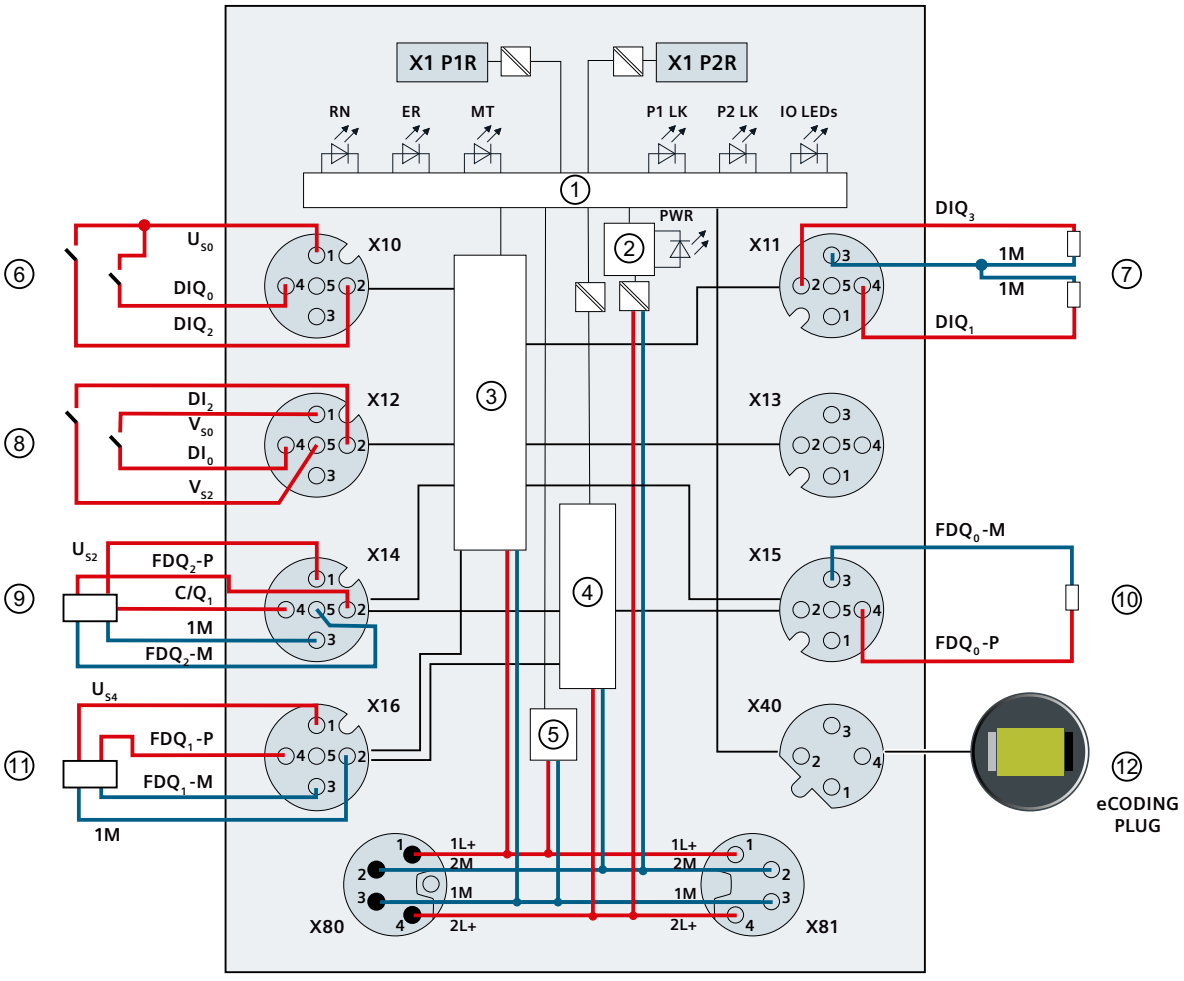
⚠ WARNING

Standard port safety ratings
Standard DIQ channels have no safety ratings and are not functionally safe. They should not be used in place of fail-safe I/O.
You must ensure that the appropriate I/O are used for your intended application.
Attempting to use standard I/O in place of fail-safe I/O in a safety related context could result in death, severe personal injury, and/or property damage.

Wiring

4

⚠ WARNING



Contact with live electrical wires

You can come into contact with live electrical wires connected to the main power supply.

Shut off the supply and load voltage before you wire the fail-safe module.

Death, severe personal injury, and/or property damage could result if proper precautions are not taken.

Thread	Functional earth FE	

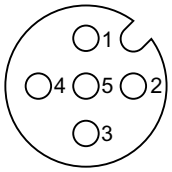
4.2.2 Pin assignment of standard inputs/outputs

The module has two M12 connectors with four female pins that are A-coded.

Table 1-1113 Pin assignment of Standard I/O (DIQ)

Pin	Assignment	Front view of the sockets (X10, X11)
1	24 V sensor supply U_{S0}: X10 24 V sensor supply U_{S1}: X11	
2	Standard I/O signal DIQ_2: X10 Standard I/O signal DIQ_3: X11	
3	Ground 1M	
4	Standard I/O signal DIQ_0: X10 Standard I/O signal DIQ_1: X11	
5	Not used	

NOTE



24 V encoder supplies U_{S0}-U_{S1}

Use only the 24 V encoder supplies U_{S0}-U_{S1} provided by the I/O device to supply power to the encoders.

4.2.3 Pin assignment of fail-safe digital inputs

The module has two M12 connectors with five female pins that are A-coded.

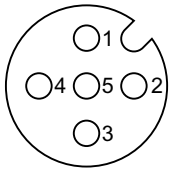


Table 1-1114 Pin assignment of fail-safe digital inputs

Pin	Assignment	Front view of the sockets (X12, X13)
1	24 V sensor supply V_{S0}: X12 24 V sensor supply V_{S1}: X13	
2	Input signal FDI_2: X12 Input signal FDI_3: X13	
3	Sensor supply ground 1M	
4	Input signal FDI_0: X12 Input signal FDI_1: X13	
5	24 V sensor supply V_{S2}: X12 24 V sensor supply V_{S3}: X13	

4.2.4 Pin assignment of IO-Link Class B / fail-safe digital output x.2

The module has one M12 connector for IO-Link Class B / fail-safe digital output x.2 with five female pins that are A-coded.

Table 1-1115 Pin assignment of IO-Link Class B / fail-safe digital output x.2

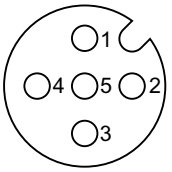
Pin	Assignment	Front view of the socket (X14)
1	24 V encoder supply U_{S2}	
2	Output signal FDQ_2P • Class B only (always on) • Class B with safety shutdown (optionally switchable) • Safety-rated F-DQ only	
3	Ground 1M (non-switched)	
4	IO-Link port 1: C/Q1	
5	Output signal FDQ_2M • Class B only (always on) • Class B with safety shutdown (optionally switchable) • Safety-rated F-DQ only	

NOTE

Port Class B

The pin assignment of the IO-Link interface of socket X14 corresponds to the IO-Link specification, as per Port Class B. Port Class B is especially suited for the connection of actuators with additional supply, such as valve terminals.

NOTE



24 V encoder supply U_{S2}

Use only the 24 V encoder supply U_{S2} provided by the IO-Link master to supply power to devices.

4.2.5 Pin assignment of fail-safe digital outputs x.0 and x.1

The module has two M12 connectors with five female pins that are A-coded.

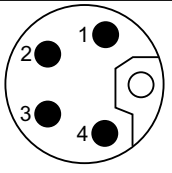


Table 1-1116 Pin assignment of fail-safe digital outputs

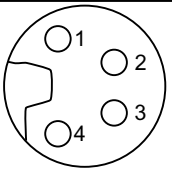
Pin	Assignment	Front view of the sockets (X15, X16)
1	Encoder supply U_{S3}: X15 Encoder supply U_{S4}: X16 (Optionally assigned)	
2	1M	
3	Output signal FDQ_0M: X15 Output signal FDQ_1M: X16	
4	Output signal FDQ_0P: X15 Output signal FDQ_1P: X16	
5	Functional earth (FE)	

4.2.6 Pin assignment for feeding and looping the voltage



The module has an M12 connector with four male pins that are L-coded.

Table 1-1117 Pin assignment of the M12 cable connector for the supply voltage infeed

Pin	Assignment	Front view of the socket (X80)
1	Supply voltage 1L+	
2	Ground 2M	
3	Ground 1M	
4	Supply voltage 2L+	

The module has an M12 connector with four female pins that are L-coded.

Table 1-1118 Pin assignment of the M12 cable connector for loop-through of the supply voltage

Pin	Assignment	Front view of the socket (X81)

2	Ground 2M	
3	Ground 1M	
4	Supply voltage 2L+	

4.3 Electrical configuration of the ET 200eco PN M12-L F

Electrical isolation

The ET 200eco PN M12-L F electrical configuration features electrical isolation between the following:

- 1L+ supply voltage (electronic/fail-safe DI/fail-safe sensor supply/standard DIQ/standard sensor supply/1L+ switched 24 V DC/IO-Link Class B sensor supply and C/Q):
  Electrically isolated from PROFINET IO and 2L+ (load voltage supply).
- 2L+ supply voltage (electronic/load voltage supply for F-DQ0&1/IO-Link Class B F-DQ2):
  Electrically isolated from all other circuit components.
- PROFINET IO interface:
  Electrically isolated from all other circuit components.

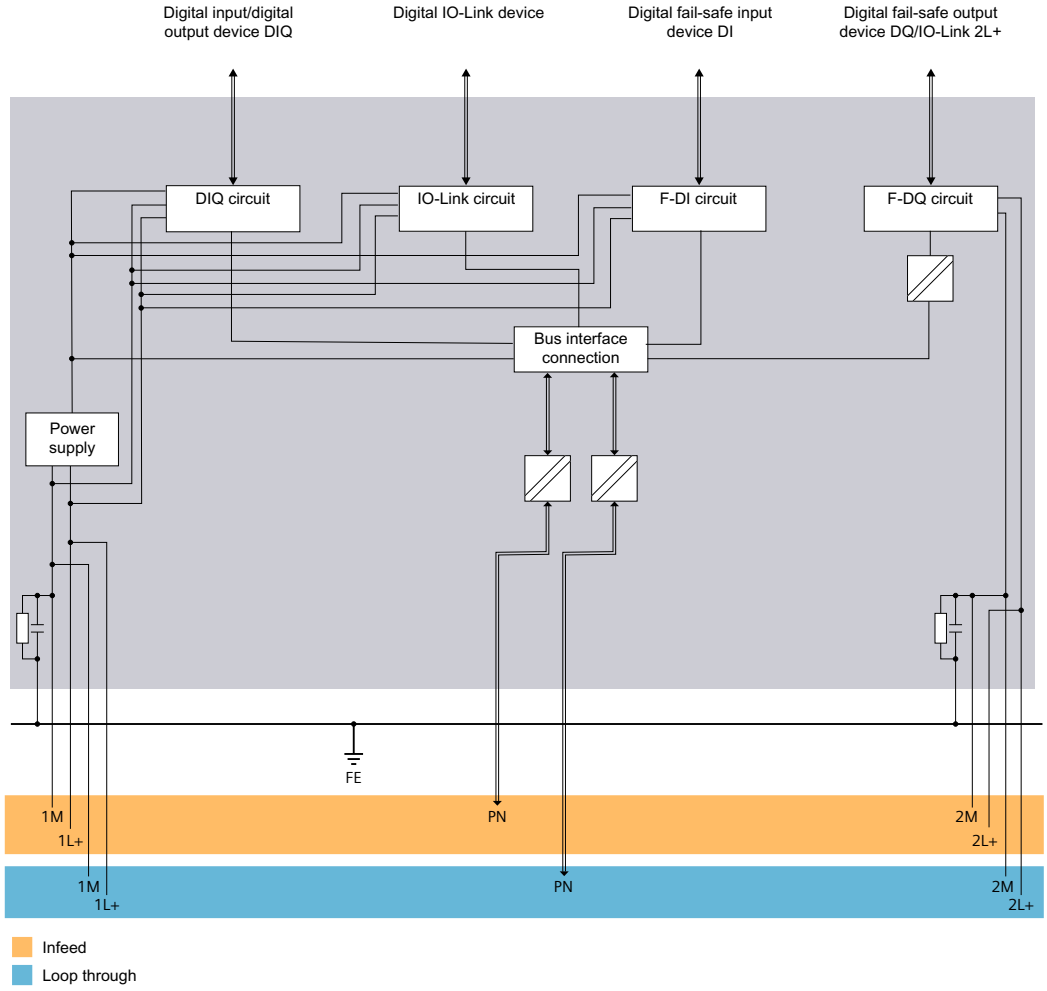

Figure 1-823 Electrical relationships

Fail-safe IO

5

5.1 Parameters/address space

You use the STEP 7 Safety configuration software to configure the properties of the fail-safe module. You must ensure that all modules in your fail-safe automation system are configured.

Configuring module I/O properties

To configure the fail-safe module's properties, follow these steps:

1. Select "Device configuration" in the project tree.
2. Place the fail-safe module into your project's "Device view".

NOTE

The fail-safe module uses both I's and Q's. There are extra bytes allocated at the end of the address space that carry safety status and data integrity information.

Number of channels	Address (I/Q)	Bytes required
4 (fail-safe input) 2 (fail-safe output)	I Q	12 6

3. Select the image of the fail-safe module and view the module's "Properties" tab.
4. On the **"**Properties**"** view, select the **"**General**"** tab.
5. Click the module properties tree and expand the branches for the fail-safe module. You can select a module and see all the properties. You can also select a module branch (for example, "F-parameters", "DI-parameters", or "Channel parameters") and see a subset of the properties.
6. Select a property and set values in the appropriate fields.
7. A successful compile and download of your Device configuration to the CPU automatically puts your new configuration settings in the I/O modules.

5.1.1 F-parameters

5.1.1.1 Parameters

You must configure and then assign the PROFIsafe addresses (F-destination address and F-source address) to the F-module before you put it into operation as follows:

- Configure the F-source address using the "Central F-source addresses" parameter in the Device configuration of the F-CPU.
- Configure the F-destination address using the "F-destination address" parameter in the Device configuration of each fail-safe module.
- Download the Device configuration to the F-CPU.
- Assign the F-destination address for each fail-safe module using the "Assign PROFIsafe address" dialog in STEP 7 Device configuration.

You can find further information on F-parameters such as the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address), F-parameter signature (with or without addresses) and the F-I/O DB in the *SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

The following table shows the F-parameters for the ET 200eco PN M12-L F:

Table 1-1119 Configurable F-parameters

Channel	Value range	Default	Scope
Manual assignment of F-monitoring time	• Unchecked • Checked	Unchecked	Module
F-monitoring time	1 to 65535 ms	150 ms (disabled)	Module
F-source address	1 to 65534	1 (always disabled)	Module
F-destination address	1 to 65534	65534	Module
F-parameter signature (with addresses)	0 to 65535	always disabled	Module
F-parameter signature (without addresses)	0 to 65535	always disabled	Module
Behavior after channel fault	• Passivate channel • Passivate entire module	Passivate channel	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	All channels manually	Module
F-I/O DB manual number assignment	• Unchecked • Checked	Unchecked	Module
F-I/O DB number	• Fixed value, if DB manual number assignment is disabled • Value can be edited by user, if DB manual number assignment is enabled	Fixed value	Module
F-I/O DB name	-	always disabled	Module

5.1.1.2 Explanation of the F-parameters

Behavior after channel fault

You can specify whether the entire F-module is passivated or only the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

Reintegration after channel fault

Use the "Reintegration after channel fault" parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Set this parameter in the STEP 7 dialog of the fail-safe module as follows:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". You can specify the reintegration type of the respective channel with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

5.1.2 F-DI

5.1.2.1 Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "F I/O parameters" > "Input parameters" for the F-DI of the ET 200eco PN M12-L F:

Table 1-1120 Configurable F-DI parameters

Parameter	Value range	Default	Scope
Sensor supply			
Short-circuit test	• Unchecked • Checked	Checked	Module
Duration of short-circuit test	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms	3.2 ms	Module

Parameter	Value range	Default	Scope
Startup time after short-circuit test is completed	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms	3.2 ms	Module
Channel group settings			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation: – 2 channel - 4 wire equivalent – 2 channel - 3 wire non-equivalent – 2 channel - 4 wire non-equivalent	1oo2 evaluation, 2 channel - 4 wire equivalent	Channel
Discrepancy behavior	• Supply value 0 • Supply last valid value	Supply value 0	Channel
Discrepancy time	5 ms to 30000 ms	500 ms	Channel
Reintegration after discrepancy error	• Test 0-Signal not necessary • Test 0-Signal necessary	Test 0-Signal not necessary	Channel
Channel settings			
Activated	• Unchecked • Checked	Checked	Channel
Input filters	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms	3.2 ms	Channel
Channel failure acknowledge	• Automatic • Manual	Manual	Channel
Sensor supply	• Sensor supply x (where "x" is the respective channel number) • External	Sensor supply x (where "x" is the respective channel number)	Channel

5.1.2.2 Explanation of the F-DI parameters

Short-circuit test

You can enable the short-circuit detection for the sensor supplies and the fail-safe input channels configured to use their respective sensor supply. Short-circuit test only applies to one activated single sensor supply at a time.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply.

The short-circuit test switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Duration of short-circuit test". When the sensor supply is turned back on, the module will wait to evaluate the sensor signal until the sensor has powered on and the sensor signal has stabilized. The length of the startup time for the sensor is equivalent to the configured "Startup time after short-circuit test is completed".

If the module detects a short-circuit, the fault is reported to the F-CPU and the entire module can be passivated.

The following short-circuits are detectable:

- Short-circuit of input to L+
- Short-circuit of the input to another channel when it has a "1" signal
- Short-circuit of the sensor supply to L+
- Short-circuit of the sensor supply to ground
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If you disable the short-circuit test, you must make your wiring short-circuit and cross-circuit proof or select a sensor evaluation type (discrepancy, non-equivalent) that can detect the cross circuits using discrepancy.

During the execution time (duration of short-circuit test + startup time of sensor after the short-circuit test + input filters) of the short-circuit test, the state of the input before the start of the short-circuit test is provided. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

Duration of short-circuit test

You can specify the duration of the test pulse applied to the sensor supply when you select the check box "Short-circuit test".

This value is the time that the sensor supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs.

Short-circuit evaluations are dependent upon customer-selected input filter times. This means that you must take care to ensure that input filter time selections are appropriately chosen. These must be faster than the selected duration of short-circuit test settings; otherwise, the module might not detect potential sensor supply and/or input short-circuit errors because of inappropriate filter times.

Startup time after short-circuit test

You can specify the startup time after the short-circuit test completes when you select the check box "Short-circuit test".

This value is the time that the module waits to evaluate the sensor signal after it has powered on and the sensor signal has stabilized. This duration must be long enough to allow your sensor time to power on.

Sensor evaluation

You can specify signal evaluation and wiring definitions. These selections correspond with the various application mode wiring examples (Page 95).

You can assign whether “channel n” input operates individually (1oo1) or is paired with its companion channel "n+2" input (1oo2).

1oo1 evaluation: One sensor is connected to the module on a single channel.

1oo2 evaluation: Two input channels are occupied by one of the following:

- **2 channel - 4 wire equivalent**: One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair.
- **2 channel - 3 wire non-equivalent**: One two-channel non-equivalent sensor is connected to the two channels, in a channel pair.
- **2 channel - 4 wire non-equivalent** One two-channel non-equivalent sensor or two single-channel non-equivalent sensors are connected to the two channels, in a channel pair.

If you select a 1oo2 evaluation mode, you can assign the discrepancy properties.

When you select the channel group as 1oo2, STEP 7 enables the parameters in the first channel of the group and disables the parameters in the second channel of the group. The second channel derives its parameter values from the first channel's parameter values. When you select the channel group as 1oo1, STEP 7 enables all of the parameters in both channels.

NOTE

Safety program access to 1oo2 input data

For 1oo2 evaluation, two paired input channels (for example, F-DI 0 and F-DI 2) are connected to one or two sensors. The F-DI module performs the discrepancy analysis and sends the result to the safety program at the input address of the low-ordered channel of the pair (in the above example, F-DI 0).

Discrepancy behavior

A 1oo2 input configuration allows a logical difference between the two signals, without error, for the configured discrepancy time. You assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

NOTE

Sensor-actuator response time is increased when you add more input discrepancy time

The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0" but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0' and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides normal operation. Refer to "Maximum fault reaction time for 1oo2 fail-safe digital input discrepancy errors (Page 120)" for further information.

Discrepancy time

The two signals in a 1oo2 input configuration will not change exactly at the same time, due to differences in sensors, contacts, and wiring. You can configure a maximum expected duration for a mismatch between signals during transition.

Discrepancy evaluations and other diagnostic evaluations are dependent upon customer-selected input filter times. These evaluations occur using input samples generated after input filtering is complete. This means that you must take care to ensure that input filter time selections are appropriately chosen. These must be faster than selected discrepancy time evaluations; otherwise, the module might not detect potential 1oo2 input discrepancy differences because of inappropriate filter times.

Reintegration after discrepancy error

You can select whether a zero state must be detected on both 1oo2 inputs before a previously declared discrepancy can be reintegrated.

"Test 0-signal necessary"
If you have selected "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels for a duration of at least 100 ms.

If you are using non-equivalent sensors, which means you have set "Sensor evaluation" to a non-equivalent mode, a 0-signal must be present at the low-order channel of the channel pair, and a 1-signal must be present at the high-order channel of the channel pair for a duration of at least 100 ms.

"Test 0-signal not necessary"
If you have selected "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists between the two relevant input channels.

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

Input filters

The module filters the digital inputs to remove contact bounce and noise. This parameter assigns the duration of the filter time. As the filter time increases, the reaction times of the digital inputs also increase.

Channel failure acknowledge

You can specify in the F-Parameters (Page 39) whether the channel is automatically reintegrated after a fault clears or requires a manual acknowledgement. Refer to "Reactions to faults (Page 59)" for the reintegration procedure.

Sensor supply

You can select whether to supply 24 V DC power to sensors from the module's integrated sensor supply (internal) or from an external power supply (external).

Short-circuit tests are not performed for any channel where external power is selected.

5.1.3 F-DQ

5.1.3.1 Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "F I/O parameters" > "Output parameters" for the F-DQ of the ET 200eco PN M12-L F:

Table 1-1121 Configurable F-DQ parameters

Channel	Value range	Default	Scope
Maximum test period	• 100 s • 1000 s	1000 s	Channel
Channel settings			
Wire break	• Unchecked • Checked	Unchecked	Channel
Activated	• Unchecked • Checked	Checked	Channel
Channel Operating Mode	• Operate as F-DQ only • Operate as F-DQ with Safety shutdown	Operate as F-DQ only	Channel
Channel failure acknowledge	• Manual • Automatic	Manual	Channel
Maximum readback time	1.0 ms to 400.0 ms	2.0 ms	Channel
Maximum readback time switch on test	0.5 ms to 5.0 ms	1.0 ms	Channel
Disable Dark Test (max. SIL 2, Cat3, PLd)	• Unchecked • Checked	Unchecked	Channel

5.1.3.2 Explanation of the F-DQ parameters

Maximum test period

You can assign the time interval between bit pattern tests for F-DQ DC outputs to a value of either 100 seconds or 1000 seconds.

The module applies test pulses to the output switches. These tests detect faulted P- or M-output switches and wiring faults. Short-circuits to other signals or power rails can be detected by the module.

If the module detects an error on a channel, the test interval shortens to 60 seconds. If an error is no longer detected on any output channel, the configured test interval is used again.

A detected fault is reported to the fail-safe CPU, and the affected channels or the module is passivated according to the configured selection of "Behavior after channel fault".

Activated

You can enable the corresponding channel for signal processing in the safety program.

If you disable a channel, channel diagnostics are no longer reported to the F-CPU for the deactivated channel.

NOTE

Suspension of 2L+ undervoltage
Whenever you disable all output channels, you do not need to power 2L+. Undervoltage reporting is suspended for 2L+.

Channel Operating Mode

You can choose whether outputs F-DQ x.0 and x.1 operate as fail-safe outputs only or as fail-safe outputs capable of Safety shutdown. See "Fail-safe digital outputs (Page 19)".

Channel failure acknowledge

You can specify in the F-Parameters (Page 39) whether the channel is automatically reintegrated after a fault clears or requires a manual acknowledgement. Refer to "Reactions to faults (Page 59)" for the reintegration procedure.

Maximum readback time

You can configure a "Maximum readback time" that specifies the maximum amount of time that the output channel waits for the voltage to respond when the process value changes. If any P- or M-switch does not reach the expected voltage within the readback time, the module passivates the output channel.

Your configured "Maximum readback time" also sets the duration of the "OFF" test pulse during the bit pattern test. Choose a short enough duration where your load will not be affected.

The module does not apply new process values to the output channels while a test pattern is being applied to the outputs. This means that a higher "Maximum readback time" increases the response time of the F-module.

⚠ WARNING

Short-circuit (cross-circuit) detection might not be possible for high frequency signals
Through the configured "Maximum readback time", short-circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured "Maximum readback time") Hz cannot be detected by the module (50:50 sampling ratio).
You must take this into consideration for your application and respective requirements of your product standards.
Short-circuits (cross-circuits) to an output of the same module are recognized regardless of the frequency of the output channel.
You can adjust the maximum readback time to change the frequency of the signal that can be detected.
Short-circuits of high frequency signals that are undetected can cause death, severe personal injury, and/or property damage.

The parameter also effects the short-circuit detection (cross-circuit) with a "1" signal when the safety program changes the output signal from "1" to "0".

Setting the parameter "Maximum readback time"

Siemens recommends that you set the "Maximum readback time" as low as possible because the fault response time is extended by the configured value for this parameter; however, you must set this value to a high enough value where the module will not passivate the output channel as a result of your connected load

You determine the readback time required for your actuator with the diagram in "Switching of loads (Page 125)".

If the capacitance of the actuator is not known, it might be necessary for you to determine the value for the "Maximum readback time" by trial and error. This might also be necessary due to the part variances in the actuator, or to external influences.

Proceed as follows:

- Set the "Maximum readback time" so that the output channel can be read back correctly but your actuator does not respond during a bit-pattern test sequence.
- For verification, use the process value "0" with a minimum duration that corresponds to the "Maximum test period" parameter. Execute a process value change from "1" to "0".
- If the output channel is passivated, the "Maximum readback time" is too small for the connected capacitive load. The discharge cannot take place within the configured "Maximum readback time". Increase the "Maximum readback time".

If you have set the "Maximum readback time" to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacitance is outside the permitted range.

Maximum readback time switch on test

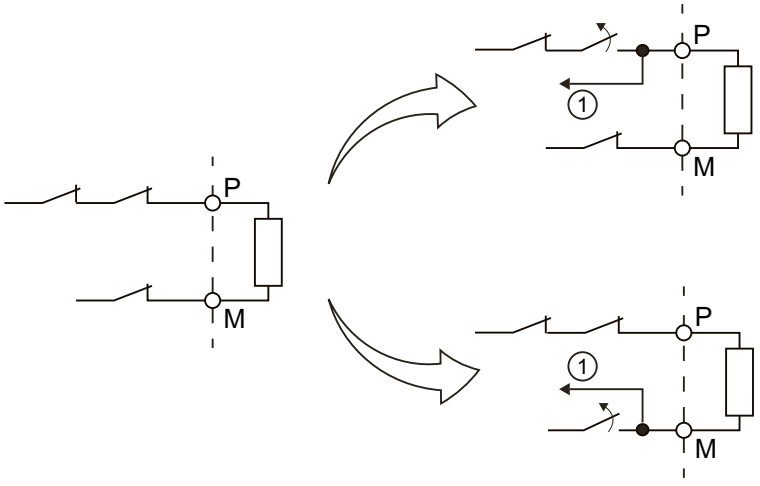
You can configure the "Maximum readback time switch on test" that specifies the duration of the "ON" test pulse for any P- or M-switch during the bit pattern test. You must choose a short enough duration that does not affect your load.

Any pulse during the bit pattern test does not generate a light pulse in the absence of faults.

Any pulse during the bit pattern test under fault conditions can result in a light pulse, which can energize the load if the "Maximum readback time switch on test" is long enough to affect the load.

Wire break

You can enable or disable wire break testing. The module can detect a broken wire or missing load only when the output PV is "OFF" and the load is wired in PM mode.



Disable Dark Test (max. SIL2, CAT3, PLd)

You can select the check box to disable dark testing for a channel.

Dark tests are switch-off tests that occur during an output bit-pattern test sequence.

For a dark test, one of the output channel's switches is briefly turned OFF while the output channel is active (output signal "1"). As a result, current flow through the output is interrupted for a short time. A sufficiently slow actuator does not respond to this and remains switched on.

When the dark test is disabled on an output channel, the parameter "Maximum readback time" is only relevant for the process value change.

① Readback

Figure 1-824 Functional principle of the dark test

Test pulses of the dark test

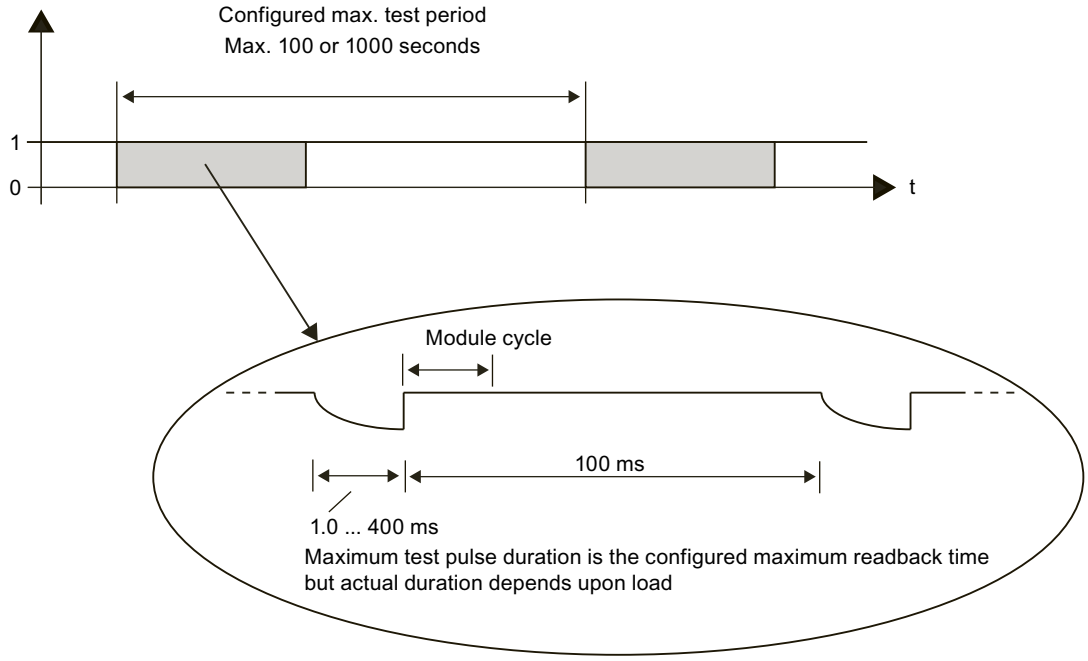


Figure 1-825 Test pulses of the dark test

You configure the time between output bit pattern test sequences to either 100 or 1000 seconds. Each output bit pattern test sequence includes multiple test pulses. The interval between two test pulses is at least 100 ms.

To prevent an unwanted reaction of the actuator to a dark test, you can also disable the dark test individually for each F-output channel.

A capacitive load that does not meet the load curve (Page 125) can result in a passivation of the output in case of a process value change or switch-on test, even if the dark test is disabled.

With the dark test disabled, you can only reach up to SIL 2/Cat. 3/PL d.

⚠ WARNING

Loss of SIL 2/Cat. 3/PL d rating, loss of output control due to potential undetected faults
SIL 2/Cat. 3/PL d requires that there is a signal change from "1" to "0" at the corresponding output at least once a year. With the dark test disabled, an output that is turned on for more than 1 year might not be able to be turned off. This could result in an accumulation of undetected faults.
Ensure the "0" signal has a duration of at least 2 seconds. It is not enough to simply turn off the supply or load voltage of the F-module and turn it on again.
If control of an output is lost due to potential undetected faults, death, severe personal injury, and/or property damage can result.

⚠ WARNING

Reduction of short-circuit detection
When you disable dark testing, cross-circuits between channels with "1" signal are not detected. An undetected accumulation of faults could result in unexpected operation.
You must take this into consideration for your application and respective requirements of your product standards.
You must also take into consideration the respective requirements of your product standards regarding error detection time.
Unexpected operation can result in death, severe personal injury, and/or property damage.

5.1.3.3 I/O address parameters

The following table shows the parameters that you can set to specify F-input and F-output starting image register addressing:

Table 1-1122 Configurable I/O address parameters

Parameter	Value range	Default
Input addresses		
Start address	0 to 1023	Calculated
End address	N/A	Calculated
Organization block	"---"	"---"
Process image	"---"	"---"
Output addresses		
Start address	0 to 1023	Calculated
End address	"---"	"---"
Organization block	"---"	"---"
Process image	"---"	"---"

5.1.4 Embedded Safety Functions (ESF)

5.1.4.1 Estop

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Emergency Stop" for an Estop of the ET 200eco PN M12-L F:

Table 1-1123 Configurable Estop parameters

Channel	Value range	Default	Scope
Emergency Stop activated	• Checked • Unchecked	Unchecked	Module
Stop category	• 0 (Immediate deactivation) • 1 (Delayed deactivation)	0 (Immediate deactivation)	Module

Channel	Value range	Default	Scope
Emergency Stop input	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • "Internal Evaluation #0 result" • "Internal Evaluation #1 result" • "Emergency Stop #x result" (where "x" is the number of the other Emergency Stop) • "Selection Needed"	"Selection Needed"	Module
Emergency Stop output	• F-DQ 0 • F-DQ 1 • F-DQ 2 • "Selection Needed"	"Selection Needed"	Module
Delay time	500 ms to 7200000 ms (2 hrs) in 1 ms steps	500 ms	Module
Acknowledge necessary	• "Manually using rising edge" • "Automatic"	"Manually using rising edge"	Module
Type of manual acknowledge	• "Either process image or local I/O" • "Local I/O only" • "Process image only"	"Either process image or local I/O"	Module
Acknowledge input	• F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "None"	"None"	Module
Acknowledge requested output	• DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "None"	"None"	Module

Explanation of the Estop parameters

Emergency Stop activated

You can enable or disable the Emergency Stop function.

Stop Category

You can set the Estop to either deactivate the fail-safe output immediately or after a configured delay time.

Emergency Stop Input

You can select the F-input address that serves as the Estop input. You can also select the Internal Logic Result of another ESF as the input.

NOTE

Using the same input causes a compiler warning
Do not use the same input for both the "Emergency Stop Input" and the "Emergency Stop Acknowledge Input". Doing so results in a compiler warning.

Emergency Stop Output

You can select the F-output address that serves as the Estop output. When you configure this parameter, the Estop functions are only able to override the respective F-CPU's output PV to "0".

Delay Time

You can configure the time delay for how long the module waits before turning the output off when the Emergency Stop function has been invoked.

Acknowledge Necessary

You can select the acknowledgement type that returns the safety function to service, whether manual acknowledgement is required or acknowledgment is automatic.

Type of Manual Acknowledge

You can define the type of permissible manual acknowledgement.

- Either process image or local I/O: Performed using either approach.
- Local I/O only: Performed using the acknowledge input specified by "Acknowledge Input".
- Process image only: Performed using the process image "ESTOP ACK" and "ACK REQ" bits.

Acknowledge Input

You can select the DIQ I/O or F-input address that serves as the Acknowledge Input. You cannot, however, select an input already configured for Emergency Stop input.

NOTE

Using the same input causes a compiler warning
Do not use the same input for both the "Emergency Stop Input" and the "Emergency Stop Acknowledge Input". Doing so results in a compiler warning.

Acknowledge Requested Output

You can select the standard DIQ output (if so configured) that serves as the Acknowledge Requested Output. You cannot, however, select an output already configured for IE or Estop. When you configure this parameter, the ESFs are able to override the respective F-CPU's output PV to either "0" or "1".

5.1.4.2 Internal Evaluation (IE)

Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "Safety Functions" > "Internal Evaluation" for an IE of the ET 200eco PN M12-L F:

Table 1-1124 Configurable IE parameters

Channel	Value range	Default	Scope
Activated	• Checked • Unchecked	Unchecked	Module
Input #1	• "None" • F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation)	"None"	Module
Input #2	• "None" • F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation)	"None"	Module

Channel	Value range	Default	Scope
Input #3	• "None" • F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation)	"None"	Module
Input #4	• "None" • F-DI 0 • F-DI 1 • F-DI 2 • F-DI 3 • DIQ 0 • DIQ 1 • DIQ 2 • DIQ 3 • "Emergency Stop #0 result" • "Emergency Stop #1 result" • "Internal Evaluation #x result" (where "x" is the number of the other Internal Evaluation)	"None"	Module

Output #2	• "None" • F-DQ 0 • F-DQ 1 • F-DQ 2	"None"	Module
Output #3	• "None" • F-DQ 0 • F-DQ 1 • F-DQ 2	"None"	Module

Explanation of the IE parameters

Activated

You can either enable or disable the IE.

Input Selection

You can select the standard DIQs or F-input addresses that serve as the IE inputs. You can also select the Internal Logic Result of another ESF as the input.

NOTE

Using the same address causes a compiler warning
Do not select two inputs with the same address. Doing so results in a compiler warning.

NOTE

Fail-safe input requirement
When choosing inputs for the IE, at least one of the enabled inputs must be fail-safe. Failure to do so results in a compilation error.
When chaining together ESFs, all inputs must be fail-safe.

Output Selection

You can select the F-output addresses that serve as the IE outputs.

NOTE

Using the same address causes a compiler warning
Do not select two outputs with the same address. Doing so results in a compiler warning.

5.1.5 Address space

The table below shows the number of I and Q bytes required by the PROFIsafe profile:

Module	PROFIsafe profile	Input (I) bytes required	Output (Q) bytes required
F-DI 4 x 24 VDC, 2xM12, F-DQ 2 x 24 VDC/2.0A PM, 2xM12, DIQ 4 x 24 VDC, 2xM12, IO-Link Class B, 1xM12	V2.6.1	12	6

NOTE

PROFIsafe profile impacts I and Q memory requirements
The I/O module uses more I and Q memory than required for the physical number of inputs and outputs on the module. The extra bytes carry the PROFIsafe safety status and data integrity information. The number of input (I) bytes and output (Q) bytes that the module requires depends upon which PROFIsafe profile your fail-safe CPU uses.

5.1.6 Control and feedback interfaces

Assignment of the control interface

Your safety program uses the control interface to influence the behavior of the module.

The following table shows the assignment of the control interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
QB x	0	0	ESTOP 1 ACK	ESTOP 0 ACK	0	F-DQ 0.2	F-DQ 0.1	F-DQ 0.0
QB x + 1-5 (PS)	PROFIsafe trailer (V2.6.1)							

Explanations of the control interface

Byte	Bit	Control bit/value	Explanation
QB x	0	F-DQ 0.0	The process value (PV) of fail-safe digital output channel 0.
	1	F-DQ 0.1	The process value (PV) of fail-safe digital output channel 1.
	2	F-DQ 0.2	The process value (PV) of fail-safe digital output channel 2.
	4	ESTOP 0 ACK	The ESTOP 0 ACK bit is used to acknowledge the reset of the Emergency Stop. Not used when you configure Emergency Stop 0's "Type of manual acknowledgement" for "Local I/O only".
	5	ESTOP 1 ACK	The ESTOP 1 ACK bit is used to acknowledge the reset of the Emergency Stop. Not used when you configure Emergency Stop 1's "Type of manual acknowledgement" for "Local I/O only".
QB x + 1-5 (PS)	1-5	PROFIsafe trailer (V2.6.1)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.6.1.

Assignment of the feedback interface

Your safety program receives current values and status information from the module by means of the feedback interface.

The following table shows the assignment of the feedback interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IB x	0	0	0	0	F-DI 0.3 or 0 (SIL 3)	F-DI 0.2 or 0 (SIL 3)	F-DI 0.1	F-DI 0.0
IB x +1	0	0	ESTOP 1 Internal Logic Result (ILR)	ESTOP 0 Internal Logic Result (ILR)	Internal Eval. 1 Internal Logic Result (ILR)	Internal Eval. 0 Internal Logic Result (ILR)	ESTOP 1 ACK REQ	ESTOP 0 ACK REQ
IB x +2	ESTOP #1 Status bit 3	ESTOP #1 Status bit 2	ESTOP #1 Status bit 1	ESTOP #1 Status bit 0	ESTOP #0 Status bit 3	ESTOP #0 Status bit 2	ESTOP #0 Status bit 1	ESTOP #0 Status bit 0
IB x +3	0	0	0	0	CQ F-DI 0.3 or 0 (SIL 3)	CQ F-DI 0.2 or 0 (SIL 3)	CQ F-DI 0.1	CQ F-DI 0.0
IB x +4	0	0	0	0	0	0	0	0

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IB x +5	0	0	0	0	0	0	0	0
IB x +6	0	0	0	0	0	CQ F-DQ 0.2	CQ F-DQ 0.1	CQ F-DQ 0.0
IB x +7-11 (PS)	PROFIsafe trailer (V2.6.1)							

Explanations of the feedback interface

Byte	Bit	Control bit/value	Explanation
IB x	0	F-DI 0.0	The process value (PV) of fail-safe digital input channel 0.
	1	F-DI 0.1	The process value (PV) of fail-safe digital input channel 1.
	2	F-DI 0.2, or 0 (SIL 3)	The process value (PV) of fail-safe digital input channel 2. Not used when you configure the input channel pair for 1oo2 evaluation.
	3	F-DI 0.3, or 0 (SIL 3)	The process value (PV) of fail-safe digital input channel 3. Not used when you configured the input channel pair for 1oo2 evaluation.
IB x +1	0	ESTOP 0 ACK REQ	The Acknowledge Input state of Emergency Stop 0. Not used when you configure Emergency Stop 0's "Type of manual acknowledgement" for "Local I/O only".
	1	ESTOP 1 ACK REQ	The Acknowledge Input state of Emergency Stop 1. Not used when you configure Emergency Stop 1's "Type of manual acknowledgement" for "Local I/O only".
	2	Internal Eval. 0 Internal Logic Result (ILR)	The internal logic result from the execution of the Internal Evaluation 0 ESF.
	3	Internal Eval. 1 Internal Logic Result (ILR)	The internal logic result from the execution of the Internal Evaluation 1 ESF.
	4	ESTOP 0 Internal Logical Result (ILR)	The internal logic result from the execution of the Emergency Stop 0 ESF.
	5	ESTOP 1 Internal Logical Result (ILR)	The internal logic result from the execution of the Emergency Stop 1 ESF.
IB x +2	0	ESTOP #0 Status	The ESF reports one of the following status codes: • "1" - The module detects the acknowledge input as on when the Emergency Stop is not awaiting manual acknowledgement. • "2" - The module detected the acknowledge input as on when the Emergency Stop began awaiting manual acknowledgement; the module must detect a rising edge on the acknowledge input for acknowledgement to occur. • "3" - The module detects that the DIQ channel assigned as the Emergency Stop's acknowledge requested output has been incorrectly configured as an input channel; you must configure the DIQ channel as an output for the acknowledge requested output. More than one status code might be present at a given time; however, only one is represented in the process image. Therefore, the status code with the highest priority is returned. Any other status codes are retained such that if a higher priority status code is cleared, the lower priority status code is presented.
	1		
	2		
	3		
	4	ESTOP #1 Status	The ESF reports one of the following status codes:
	5		
	6		

Byte	Bit	Control bit/value	Explanation
IB x +2	7	ESTOP #1 Status	• "1" - The module detects the acknowledge input as on when the Emergency Stop is not awaiting manual acknowledgement. • "2" - The module detected the acknowledge input as on when the Emergency Stop began awaiting manual acknowledgement; the module must detect a rising edge on the acknowledge input for acknowledgement to occur. • "3" - The module detects that the DIQ channel assigned as the Emergency Stop's acknowledge requested output has been incorrectly configured as an input channel; you must configure the DIQ channel as an output for the acknowledge requested output. More than one status code might be present at a given time; however, only one is represented in the process image. Therefore, the status code with the highest priority is returned. Any other status codes are retained such that if a higher priority status code is cleared, the lower priority status code is presented.
IB x +3	0	CQ F-DI 0.0	The channel quality (value status) of fail-safe digital input channel 0. This represents the channel quality (value status) of input channel pair 0/2 when you configure the input channel pair for 1oo2 evaluation.
	1	CQ F-DI 0.1	The channel quality (value status) of fail-safe digital input channel 1. This represents the channel quality (value status) of input channel pair 1/3 when you configure the input channel pair for 1oo2 evaluation.
	2	CQ F-DI 0.2, or 0 (SIL 3)	The channel quality (value status) of fail-safe digital input channel 2. Not used when the input channel pair is configured for 1oo2 evaluation.
	3	CQ F-DI 0.3, or 0 (SIL 3)	The channel quality (value status) of fail-safe digital input channel 3. Not used when the input channel pair is configured for 1oo2 evaluation.
IB x +6	0	CQ F-DQ 0.0	The channel quality (value status) of fail-safe digital output channel 0.
	1	CQ F-DQ 0.1	The channel quality (value status) of fail-safe digital output channel 1.
	2	CQ F-DQ 0.2	The channel quality (value status) of fail-safe digital output channel 2.
IB x +7-11 (PS)	0-7	PROFIsafe trailer (V2.6.1)	The number of additional I and Q bytes used for safety status and data integrity information, according to PROFIsafe profile V2.6.1.

Evaluating the value status

The channel quality (value status) bits provide information regarding the validity of the channel quality (value status):

- Bit = 1: Corresponding process value is valid.
- Bit = 0: Channel is passivated.

5.2 Interrupts/diagnostic alarms

5.2.1 Reaction to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends upon the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. This applies to both sensors and actuators.

The safety function requires that safe state values be applied to one or more of the fail-safe channels instead of process values (passivation of the fail-safe module or of one or more channels) in the following situations:

- When the fail-safe system starts up
- If module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If module channel faults occur (for example, short-circuit and discrepancy errors)

The fail-safe CPU enters information about detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-safe modules do not retain errors after a power cycle. When you power down and restart the system, fail-safe modules detect any faults that still exist.

⚠ WARNING

No error handling or diagnostics for deactivated channels
When channels are set to "deactivated", fail-safe diagnostic responses or error handling do not occur. This could result in an accumulation of undetected faults.
For channels that you set to "deactivated" in STEP 7, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).
An accumulation of undetected faults can result in death, severe personal injury, and/or property damage.

Fail-safe value for fail-safe modules

If fail-safe digital input channels are passivated by the module, the fail-safe system always provides safe state values ("0") for the safety program instead of the process values applied to the fail-safe inputs.

If fail-safe digital output channels are passivated, the fail-safe system always transfers safe state values ("0") to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized.

The passivation safe state value and the output state value in CPU STOP mode are always "0", de-energized. You cannot select or program a default "ON" state for passivation or STOP mode.

Passivation is applied to individual channels when a channel-specific diagnostic failure is detected. Failures that can affect the entire module result in passivation of all channels.

NOTE
If you select "Passivate the entire module" in the Device configuration properties "F-IO parameters > F-parameters > Behavior after channel fault" field for the module, a single channel fault results in passivation of all channels.

Timeout of the PROFIsafe message (F-monitoring time exceeded) passivates the entire module.

Table 1-1125 Module signal type and passivation result

Module signal type	Passivation of channel result	Passivation of module result
Fail-safe digital inputs	For a 1oo1 input channel: • The passivated channel reports a diagnostic. • The module reports the safe state value "0" for the affected channel's process and quality values. For a 1oo2 input channel pair: • The passivated channel, as well as the other input channel in the channel pair, report a diagnostic.[1)] • The module reports the safe state value of "0" for the low-order input channel pair's process and quality values. The high-order input always reports "0".	For a 1oo1 input channel: • The passivated channel reports a diagnostic. • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels. For a 1oo2 input channel pair: • The passivated channel, as well as the other input channel in the channel pair, report a diagnostic.[1)] • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels.
Fail-safe digital outputs	• The passivated channel reports a diagnostic. • The F-CPU substitutes the safe state value "0" for the affected channel's process and quality values.	• The passivated channel reports a diagnostic. • The module reports the safe state value "0" for all channels' process and quality values, and the F-CPU substitutes the safe state value "0" for the process value of all output channels.

1) A discrepancy error between two inputs in a channel pair results in one diagnostic. The diagnostic's message indicates which type of discrepancy occurred (0/0, 0/1, 1/0, or 1/1).

Response to faults in the fail-safe system

To remedy faults in your fail-safe system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and in IEC 61508-2:2010 section 7.6.2.1 e.

A maintenance procedure, for example, might include a statement to perform the following steps:

1. Diagnose and repair the fault.
2. Revalidate the safety function.
3. Record steps taken in the service report.

Reintegration of a fail-safe module

A channel or module can be reintegrated into an operational state after diagnostics determine that a fault has cleared successfully.

You can configure reintegration as automatic or manual. You can make this selection on a per-channel basis in the Device configuration. Module-wide errors such as PROFIsafe communication errors or supply voltage errors are always manually reintegrated. Fatal diagnostic errors require a power cycle to reintegrate.

Automatic reintegration

Channels that you select to be automatically reintegrated are immediately reintegrated when the fault has cleared.

Manual reintegration

Channels that you select to be manually reintegrated are acknowledged after the fault has cleared.

The "ACK_REQ" bit for the module goes true to indicate that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Fatal diagnostic errors require a power cycle with successful diagnostics to reintegrate.

Reintegration after high-stress events

High temperature, high voltage, or excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Solid state switch outputs can be damaged by high currents prior to protective device activations. The PFD and PFH reliability calculations assume the fail-safe module is operated within its specified operating parameters. When a module has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future dangerous failure might be increased.

⚠ WARNING

Reintegration of a channel or module with an undetected fault

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics. Undetected faults can result in unexpected operation.

After any reported fault, follow the steps outlined in this chapter and in safety standards applicable to your system to assure that you understand the reason for the fault and how to take corrective action before reintegration.

Reintegration of a faulty system can result in unexpected operation, which can cause death, severe personal injury, and/or property damage.

For an exact list of faults for the module, refer to "Fault types, causes, and corrective measures (Page 67)".

After reintegration, the following occurs:

- For a fail-safe digital input, the process values pending at the fail-safe inputs are again provided for the safety program.
- For a fail-safe digital output, the output values provided in the safety program are again transferred to the fail-safe outputs.

Safety repair time

The repair time used for PFH and PFD calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. Respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

Deactivated fail-safe I/O are not being diagnosed and are subject to dangerous failure without warning.

If any error persists for 100 hours, the module issues a fatal diagnostic error and can only be recovered by power cycling.

If a repair within 100 hours is not possible, take passivated fail-safe outputs out of service by physically disconnecting or opening circuits so that faults in the fail-safe module cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs must be removed from any operating CPU Safety program logic that can result in activation of a safety function output.

Do not depend upon channel or module passivation to maintain safe state for more than 100 hours.

Do not depend upon channel deactivation or removal of the module from hardware configuration to maintain safe state in any circumstances.

⚠ WARNING

Unintentional activation of F-I/O module with fail-safe output

If a fail-safe output is passivated for a period longer than the safety repair time (> 100 hours) and the fault remains uncorrected, an F-output could be activated unintentionally due to a second fault, placing the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of a fail-safe output by using measures for the physical circuits or other organizational measures. Some possibilities are the shutdown of the power supply to the affected F-module or taking the outputs out of service. Required measures are often standardized for operations with defined design and risk reduction principles. For all other situations, necessary measures must be defined and approved.

The unintentional activation of an F-output can result in death, severe personal injury, and/or property damage.

Additional information on passivation and reintegration

For further information about fail-safe module access, refer to the *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* (https://support.industry.siemens.com/cs/ww/en/view/54110126).

5.2.2 Fault diagnostics

Diagnostics detect faults that can affect the integrity of safety-related I/O. The faults can be in the fail-safe module, communication with the F-CPU, or external circuits. Diagnostic information is specific to either a single channel or to the entire fail-safe module.

Most diagnostics operate without user selection. You can configure the following diagnostic options:

- Short-circuit testing using the digital input sensor supplies can be enabled. The duration and startup time of the short-circuit tests are configurable for each sensor supply.
- Discrepancy times for 1oo2 digital inputs are configurable.
- The readback times for 24 V DC digital outputs are configurable.
- The timeout intervals for failures in the safety communication or failure of a safety program to run is configurable.
- Wire break testing is supported only when the output is wired in PM mode, and is only detected when the output is off.
- Dark testing of the digital outputs can be disabled (max. SIL 2, Cat. 3, PL d).

The safety-critical and validated action of the diagnostics is to passivate I/O when faults are detected. The reporting of status and diagnostic results through the LED displays and diagnostic messages is subject to single point failures in electronics or software. These reports are offered as maintenance and debugging aids. Observe and interpret the reports with caution.

In the presence of single faults, any or all LED indications can be wrong. Do not rely solely on the presence or absence of red or green LED indicators to make safety decisions.

In the presence of single faults, diagnostic messages can fail to be delivered, or the numerical event ID or text message can be wrong. Do not rely solely on the presence, absence, or content of diagnostic reports to make safety decisions.

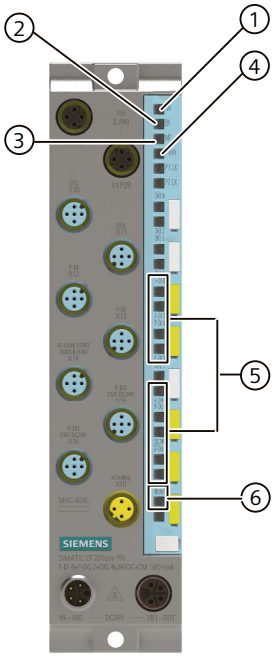
⚠ WARNING

Diagnostic and status reports and single point failure errors
Diagnostic and status reports through LEDs and text messages are subject to single point failure errors. These are not sufficient for determining a safety-controlled state.
If the integrity of your fail-safe system is in doubt, use additional measures such as restricted access or power removal to control hazards during maintenance and debug activities.
Relying solely upon such reported information to determine that a system or I/O point is in a safety-controlled state can result in death, severe personal injury, and/or property damage.

5.2.2.1 Diagnostics performed at startup

The ET 200eco PN M12-L F executes self-diagnostics at power-up to assure that the electronics and software operate as expected before allowing the module to participate in process control. If tests are not successful, the module passivates the affected channel or all channels.

In addition to internal tests, some tests create signal changes at the terminals.



The fail-safe module executes tests for its digital input sensor supplies at power-up, including ON and OFF pulses, whether or not you have enabled the sensor supply or short-circuit testing in your configuration. If your configuration includes short-circuit testing, the module also executes a short-circuit test according to your configured parameters after receiving the parameters from the F-CPU at power-up.

The fail-safe module executes tests for the digital outputs of the P- and M-switches. These tests are defined by your configured parameters for "Maximum readback time" and "Maximum readback time switch on test" in STEP 7 Device configuration under "F I/O parameters" > "Output parameters" after the module receives configuration parameters from the F-CPU at power-up. P- and M-switch ON tests are sequenced so that there is no energy applied to the load in the absence of faults.

5.2.2.2 Status and error displays

LED displays

The figure below shows the LED displays (status and error displays) of the ET 200eco PN M12-L F module:

① RUN LED (RN - Green)
② ERROR LED (ER - Red)
③ MAINTENANCE LEDs (MT - Green/Red)
④ POWER LED (PWR - Green)
⑤ F-DQ / F-DI channel status / channel fault LEDs (Green/Red)
⑥ REINTEGRATION LED (REINT - Green/Red)

Figure 1-826 Fail-safe IO LED displays

Meaning of the LEDs

The following tables describe the meaning of the status and error displays. You can find remedial measures for diagnostic alarms in "Fault types, causes, and corrective measures (Page 67)".

Module LED states

The behavior of the module-relevant LEDs follows the definitions in the table below:

Count	LED	Description
1	RN/NS	RUN/network status • RN/NS LED is Green ON when configuration/parameterization is complete and all coming events have been acknowledged by going events. • RN/NS LED is Green blinking when configuration/parameterization has not been received and all incoming events have been acknowledged by outgoing events.
1	ER/MS	ERROR/module status • ER/MS LED is Red blinking when coming diagnostic events are currently active.
1	MT/IO	MAINT/IO status • MAINT LED Yellow ON during a firmware update • MAINT LED Yellow ON when the 1L+ bus supply voltage is below tolerance • MAINT LED Yellow blinking during a "Node flash test"

LED states for module and channel behaviors

Description	RN/NS LED	ER/MS LED	MT/IO LED	Input Channel LEDs		Output Channel LEDs	
LED color	Green	Red	Yellow	Red	Green	Red	Green
Missing or insufficient supply voltage	Off	Off	Off	Off	Off	Off	Off
Module / System / Parameter Fault[2)]	Blinking[2)]	Off	Off	Off	Off	Off	Off
Not or improperly configured, includes overvoltage of 1L+ and 2L+ when not configured[2)]	Blinking[2)]	Off	Off	Off	Off	Off	Off
Parameters are being assigned or F/W update during startup	Blinking[2)]	Off	Off	Off	Off	Off	Off
Reset to Factory Operation	On[3)]	On[3)]	On[3)]	Off	Off	Off	Off
Startup LED test	On[4)]	On[4)]	On[4)]	Off	Off	Off	Off
States after the module is successfully configured							
Channel deactivated	On	Off	Off	Off	Input state	Off	Off
No channel faults	On	Off	Off	Off	Input state	Off	Output state
Channel faults	On	Blinking[2)]	Off	On	Off	On	Off

1) Alternating blinking of Red and Green LEDs, for channels awaiting reintegration (blinking frequency: 2 Hz)
2) Blinking frequency (2 Hz)
3) LED is on for approximately 2.0 seconds.
4) LED is on for approximately 0.25 seconds.

Description	RN/NS LED	ER/MS LED	MT/IO LED	Input Channel LEDs		Output Channel LEDs	
LED color	**Green**	**Red**	**Yellow**	**Red**	**Green**	**Red**	**Green**
Awaiting manual reintegration after channel fault	On	Blinking[2)]	Off	Blinking[1)]	Blinking[1)]	Blinking[1)]	Blinking[1)]
Awaiting manual reintegration of module after 1L+/2L+ voltage too high/too low	On	Blinking[2)]	Off	Blinking[1)]	Blinking[1)]	Blinking[1)]	Blinking[1)]
Awaiting reintegration after PROFIsafe communication error (detected by host)	On	Blinking[2)]	Off	Off	Input state	Off	Off
1L+ module supply voltage too high/too low	On	Blinking[2)]	Off	On	Off	On	Off
2L+ module supply voltage too high/too low	On	Blinking[2)]	Off	On	Off	On	Off
PROFIsafe communication error (detected by module)	On	Blinking[2)]	Off	Off	Input state	Off	Off
Identification of the F-module when assigning the PROFIsafe address	On	Off	Off	Off	Blinking[2)]	Off	Blinking[2)]
PROFIsafe address does not match the configured PROFIsafe address	On	Blinking[2)]	Off	On	Off	On	Off
Inconsistent FW versions and/or HW revisions between TPS and uCs	On	Blinking[2)]	Off	Off	Input state	Off	Off
F-DQ Channels 1L+ pin	On	Off	Off	N/A	N/A	Off	1L+ state
F-DQ Channels 1L+ pin error	On	Blinking[2)]	Off	N/A	N/A	On	Off
IO-Link 2L+ pin (switched, non-switched)	On	Off	Off	N/A	N/A	Off	2L+ state
IO-Link 2L+ pin error (switched, non-switched)	On	Blinking[2)]	Off	N/A	N/A	On	Off

1) Alternating blinking of Red and Green LEDs, for channels awaiting reintegration (blinking frequency: 2 Hz)
2) Blinking frequency (2 Hz)
3) LED is on for approximately 2.0 seconds.
4) LED is on for approximately 0.25 seconds.

Reintegration LED states

The behavior of the module's reintegration LEDs follows the definitions in the table below:

Count	LED	Description
1	REINT	Reintegration status: REINT LED is Green/Red blinking whenever a reintegratable module-wide diagnostic event has been resolved and is awaiting reintegration. The following events are applicable: • Reintegratable overvoltage • Reintegratable undervoltage • Module-detected PROFIsafe CRC error • Module-detected PROFIsafe timeout error REINT LED is Red whenever there is a hardware/firmware version mismatch.

5.2.2.3 Fault types, causes, and corrective measures

The table below lists the messages of the fail-safe I/O. These messages are displayed in STEP 7 under "Online & diagnostics" > "Diagnostics" > "Diagnostic buffer". When you highlight an individual text line in the diagnostic buffer, the Event ID for that text item is displayed, along with the module identity and location that generated the message. You might need to expand the window to see all of the information.

Table 1-1126 Fault types, causes, and corrective measures

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0001	Short-circuit	Fail-safe digital outputs	Short-circuit on one of the switches in the output	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			"Maximum readback time switch on test" value is configured too small	Increase "Maximum readback time switch on test" if permissible.
			Defective output driver	Replace the fail-safe module.
0x0005	Overtemperature	Module	Excessive heat within the module	Check the ambient temperature. Once the fault has been eliminated, the power must be switched off and on.
			Excessive heat within the environment surrounding the module	
0x0006	Wire break	Fail-safe digital outputs	No load is connected to the PM output.	Check the wiring between the affected output channel and the load.
			Output is configured as a PM output, but not wired as a PM output.	Check that the affected output channel is wired in PM mode.
			Too small of a load is detected.	Change the output load.
			There is a fault in the external circuitry.	Deactivate the "Wire break" diagnostic.
			A PM output load with reverse voltage protection could cause a wire break diagnostic.	Provide a small reverse current path through the PM load.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0009	Error	Module	Hardware version of the module is set to "0" due to an internal error.	Replace module.
0x0010	Parameter error	Module	i-Parameter CRC error	Check the communications connection or eliminate any electrical interference.
				Resolve the invalid parameters and perform another download.
			Invalid F-parameters, I-parameters, and/or parameter CRCs were configured and downloaded to the module.	Assign the new fail-safe address to the module's eCoding plug.
				Determine if parameter ranges have been exceeded.
				Determine if parameter dependency requirements have been violated.
				Check if CRC needs updating when using GSDML.
			A different F-Source and/or F-Destination address has been downloaded and does not match what had been previously assigned to the module's eCoding plug.	Change the fail-safe addresses back to what had been previously assigned to the module's eCoding plug and download.
0x0040	Mismatch of safety destination address (F_Dest_Add)	Module	eCoding plug has been replaced with a different plug.	Change the F-Destination address back to what had been previously assigned to the module's eCoding plug and download.
			The downloaded F-Destination address does not match what has been previously assigned to the module's eCoding plug.	Reassign the new F-Destination address to the module's eCoding plug.
0x0041	Safety destination address not valid (F_Dest_Add)	Module	Invalid F-Destination address was downloaded.	The downloaded F-Destination address does not match what had been previously assigned to the module's eCoding plug.
				Resolve the invalid F-Destination address and perform another download.
0x0042	Safety source address not valid (F_Source_Add)	Module	eCoding plug has been replaced with a different plug	Reassign or reinitialize the PROFIsafe F addresses using STEP 7.
0x004D	PROFIsafe communication	Module	Communication interference between the fail-safe	Check the communications connection.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x004D	error (CRC)	Module	CPU and the fail-safe module (for example, due to electromagnetic interference in excess of limits or sign-of-life monitoring error)	Eliminate the interference.
0x004E	PROFIsafe communication failure (timeout)	Module	F-monitoring time exceeded.	Adjust F-monitoring time.
			Transmission error: timeout (watchdog time 1 or 2 elapsed)	Check Safety program and all other CPU activities for excessive execution or demands: • Interrupts • Ethernet communication • OB scheduling conflicts • Long program paths
0x004F	User acknowledgement request of channel failures	Module	Fail-safe module awaits an acknowledge of channel failures.	Acknowledge channel failures.
0x0100	Module is defective	Module	Fail-safe module is defective.	Replace the fail-safe module.
0x0102	Error (0102)	Module	The front connector is not plugged in correctly, or there is no voltage to operate the module.	Check the front connector or correct the process wiring.
0x0103	Watchdog tripped	Module	Fail-safe module is defective.	Replace the fail-safe module.
0x0105	Short-circuit to L+	Fail-safe digital outputs	Short-circuit to L+	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			Defective output driver	Replace the fail-safe module.
			"Maximum readback time" value is configured too small.	Increase readback time.
0x0106	Short-circuit to ground	Fail-safe digital outputs	Short-circuit to M.	Eliminate the short-circuit.
			Short-circuit between channels with different signals	Eliminate the short-circuit.
			Defective output driver	Replace the fail-safe module.
			"Maximum readback time" value is configured too small.	Increase readback time.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x011B	Invalid/inconsistent firmware present	Module	Inconsistent firmware version can occur between Network Interface ASIC firmware, IO-Link firmware, and/or fail-safe microcontroller firmware if the firmware update was interrupted.	Repeat the firmware update operation.
0x013E	Diagnostic event queue overflow	Module	This can happen if channel errors come and go very quickly (for example, discrepancy errors when automatically acknowledged).	
0x0300	Discrepancy failure, channel state 0/0	Fail-safe digital inputs	Process signal faulty, sensor can be defective. Configured discrepancy time too short Short-circuit Sensor mechanical activation or alignment out of tolerance	Check process signal, replace sensor if necessary. Check the configured discrepancy time. Check the wiring. Check that both sensors are mounted and aligned to be activated together.
0x0301	Discrepancy failure, channel state 0/1	Fail-safe digital inputs		
0x0302	Discrepancy failure, channel state 1/0	Fail-safe digital inputs		
0x0303	Discrepancy failure, channel state 1/1	Fail-safe digital inputs		
0x0306	Sensor supply short-circuit to P	Fail-safe digital inputs	Sensor supply shorted to P	Eliminate the short-circuit.
			Short-circuit test duration configured too short	Increase short-circuit test duration.
			Failed sensor supply	Replace the fail-safe module.
0x0307	Sensor supply short-circuit to ground	Fail-safe digital inputs	Short-circuit	Eliminate the short-circuit.
			Excessive load on sensor supply	Reduce load on sensor supply.
			Failed sensor supply	Replace the fail-safe module.
0x030D	F-address memory not accessible	Module	eCoding plug is missing.	Install an eCoding plug into X40 of the module and power cycle.
			eCoding plug is defective.	Replace the defective eCoding plug and power cycle.
0x030E	No valid F-address available	Module	eCoding plug has never been assigned a PROFIsafe address.	Assign the PROFIsafe Address.
			eCoding plug is defective.	Replace the eCoding plug.
0x0311	Frequency too high	Fail-safe digital outputs	Process value from safety program changing too rapidly for module to follow	Change safety program logic to guarantee more time between output changes.
0x0312	Undertemperature	Module	The ambient temperature is too cold.	Check the ambient temperature. Once the fault has been eliminated, the power must be cycled.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x0313	Failure in the input circuit	Fail-safe digital inputs	The module has detected a failure in the input circuitry during diagnostic testing.	If intermittent, possibly due to interference. Eliminate interference. If persistent, or repeats after efforts to eliminate interference, replace the fail-safe module.
0x0314	Discrepancy failure	Fail-safe digital inputs	The discrepancy time set for two-channel mode in the input pair of the module has been exceeded.	Check the discrepancy time, the encoders, and their wiring.
			Incorrect parameter assignment	
			Short-circuit of the disconnected encoder cable	
			Short-circuit of the connected encoder cable	
			Wire break of the encoder supply cable	
			Encoder error	
0x0315	Internal discrepancy failure	Module	The module has detected an internal error.	Replace the module if the error continues.
			Increased EMC interference	
			Module is defective.	
0x031C	Input shorted to P	Fail-safe digital inputs	External signal for input or sensor supply shorted to L+	Check/correct external short-circuit.
			Input configured for internal sensor supply with short-circuit detection enabled, but wired to external L+	Make wiring and configuration agree.
			Input defective	Replace the module.
0x031D	Output defective	Fail-safe digital outputs	The module has detected an internal error.	Replace the module.
			The module is defective.	
0x031E	Read back failure	Fail-safe digital outputs	"Maximum readback time" or "Maximum readback time switch on test" configured value is too small.	Increase readback time or readback switch on test time.
			Output switch failure	Replace the fail-safe module if output does not respond.
0x0320	Overload	Fail-safe digital outputs	Excessive load on output	Reduce the current demand on output.

Event ID	Diagnostic message	Diagnostic type	Possible causes	Corrective measures
0x032F	Module is defective	Module	Fail-safe module is defective.	Replace the fail-safe module.
0x0321	Supply too high	Module	Supply is set too high.	Adjust 1L+ and/or 2L+ voltage.
0x0322	Supply too low	Module	Supply is set too low.	Adjust 1L+ and/or 2L+ voltage.

Electromagnetic interference and diagnostic reports

Electromagnetic interference can cause communication errors, disturb external and internal signal measurements, and cause processing errors. When error reports do not relate to an identifiable device failure, wiring problem, programming, or configuration error, consider sources of electromagnetic interference and installation and wiring problems that might introduce electromagnetic interference in your installation. Typical problem sources include poor suppression of inductive loads and voltage dips due to excessive load in-rush currents.

PROFINET IO

6

6.1 Parameters/address space

6.1.1 IO-Link

6.1.1.1 Parameters

The following table shows the parameters that you can set in Device configuration for each port (submodule) of the IO-Link master ET 200eco PN M12-L F:

Table 1-1127 Diagnostics and port parameters

Parameters	Value range	Default	Scope in STEP 7
Port			
Port 1	• Disable • Enable	Enable	Channel
Diagnostics			
Low Voltage 1L+	• Disable • Enable	Disable	Channel
Port	• Disable • Enable	Disable	Channel
Enable hardware interrupt	• Disable • Enable	Disable	Channel
Port configuration			
Autostart (without S7 PCT)	• Disable • Enable	Disable	Channel
Operating mode	• IO-Link Autostart • IO-Link Manual	Disable	Channel
Vendor ID*	Vendor ID of the connected IO-Link device	Disable	Channel
DeviceID*	Device ID of the connected IO-Link device	Disable	Channel
Inspection / Backup level*	• Same type (V1.0) without Backup&Restore • Type compatible (V1.1) without Backup&Restore • Type compatible (V1.1) with Backup&Restore • Type-compatible (V1.1) with Restore	Disable	Channel

* Only configurable if you use the "IO-Link Manual" port mode.

Parameters	Value range	Default	Scope in STEP 7
Port cycle time*	• As fast as possible • 1.6 ms • 3.2 ms • 4.8 ms • 8.0 ms • 20.8 ms • 40.0 ms • 80.0 ms • 120.0 ms	Disable	Channel

* Only configurable if you use the "IO-Link Manual" port mode.

6.1.1.2 Explanation of the IO-Link parameters

Low Voltage 1L+

This parameter enables the diagnostics for insufficient supply voltage 1L+.

Port

This parameter enables the diagnostics for the selected IO-Link port.

The diagnostics make a distinction between error and maintenance interrupts. The possible diagnostics are dependent upon your specific IO-Link device. More information about the diagnostic interrupts can be found in the description of the utilized IO-Link device.

Enable hardware interrupt

This parameter enables the hardware interrupt for the selected IO-Link port.

The possible hardware interrupts are dependent upon your specific IO-Link device. More information on the hardware interrupts can be found in the description of your specific IO-Link device.

NOTE

Configuration as digital input or digital output

You cannot enable any port parameters or diagnostics alarms in SIO mode.

Autostart (without S7-PCT)

This parameter releases the port configuration without S7-PCT for the module.

NOTE

Changes to the port configuration

If you have assigned the IO-Link device parameters using port configuration without S7-PCT, or you have configured the port as a digital input, digital output or deactivated, you can no longer change the port configuration using S7-PCT.

Operating mode

This parameter determines the mode in which the selected port is operated.
You can select from the following options:

- IO-Link Autostart: The connected IO-Link device starts automatically (Plug&Play functionality). The IO-Link device is immediately ready for operation.
- IO-Link Manual: The connected IO-Link device is **not** started automatically. You must store the Vendor ID and Device ID of the connected IO-Link device in STEP 7.

Vendor ID

This parameter displays the Vendor ID of the connected IO-Link device. You can configure this parameter only if you use the "IO-Link Manual" port mode.

DeviceID

This parameter determines the Device ID of the connected IO-Link device. You can configure this parameter only if you use the "IO-Link Manual" port mode.

Inspection/Backup level

You can select the inspection level for data storage:

- Same type (V1.0) without Backup&Restore
- Type-compatible (V1.1) without Backup&Restore
- Type-compatible (V1.1) with Backup&Restore
- Type-compatible (V1.1) with Restore

Port cycle time

This parameter sets the IO-Link cycle time at the corresponding port.

ET 200eco PN M12-L F IO-Link devices configured on the IO-Link submodules

You can find the parameters for the ET 200eco PN M12-L F IO-Link modules that can be selected as IO-Link submodules in the manual for the respective module: ET 200eco PN, CM 8x IO-Link, M12-L (6ES7148-6JG00-0BB0).

6.1.2 DIQ

6.1.2.1 Parameters

The following table shows the parameters that you can set in STEP 7 Device configuration under "I/O parameters" > "Inputs/Outputs" for the DIQ of the ET 200eco PN M12-L F:

Table 1-1128 Configurable parameters and their defaults (GSD file)

Parameters	Value range	Default	Scope in STEP 7
Undervoltage 1L+	• Deactivated • Activated	Deactivated	Channel
Short-circuit	• Deactivated • Activated	Deactivated	Module (sensor supplies) Standard digital outputs
Wire break	• Deactivated • Activated	Deactivated	Channel (Standard digital inputs)
Input delay	• 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	3.2 ms	Channel (Standard digital inputs)
Hardware interrupt on rising edge	• Deactivated • Activated	Deactivated	Channel (Standard digital inputs)
Hardware interrupt on fall edge	• Deactivated • Activated	Deactivated	Channel (Standard digital inputs)
Operating mode	• DI • DQ	DI	Channel
Reaction to CPU STOP	• Shutdown • Keep last value • Output substitute value 1	Shutdown	Channel (Standard digital outputs)

6.1.2.2 Explanation of the DIQ parameters

Undervoltage 1L+

This parameter enables the diagnostics for insufficient supply voltage 1L+.

Short-circuit

This parameter enables diagnostics for the following events:

- Short-circuit of the encoder supply to ground
- Short-circuit of the standard output to ground
- Short-circuit of the standard output to 1L+

Wire break

This parameter activates wire break detection and enables diagnostics for the standard digital input. In the event of an interruption of the cable between the encoder and the I/O device, a diagnostics alarm is generated.

NOTE

This diagnostic is only available for channels configured as standard inputs. If the parameter is deactivated, wire break detection is switched off. A wire break does not affect the value status.

Input delay

This parameter suppresses signal interference. Changes to the signal are only detected if they are present consistently for longer than the set input delay time.

For standard input channels with longer input delays, the read-in time is moved accordingly. This means that individual channels can be assigned input delays, if necessary, without a negative impact upon the possible cycle time.

Hardware interrupt on rising edge

This parameter specifies whether a hardware interrupt is generated for a rising edge on the channel.

Hardware interrupt on falling edge

This parameter specifies whether a hardware interrupt is generated for a falling edge on the channel.

Operating mode

This parameter specifies whether the channel operates as a standard digital input (DI) or a standard digital output (DQ).

Reaction to CPU STOP

This parameter sets the reaction of the standard digital outputs of the I/O device after a CPU STOP:

- Shutdown: The standard digital output is de-energized.
- Keep last value: The last value of the standard digital output remains activated.
- Output substitute value 1: The standard I/O device outputs the substitute value "1".

6.1.3 Address space

The IO-Link master ET 200eco PN M12-L F has one port. The port is represented by a submodule.

Configuration of the IO-Link ports of the IO-Link master ET 200eco PN M12-L F

The different operating modes of each IO-Link port are defined by configuring a corresponding submodule in STEP 7:

- As a digital input by configuring a digital input submodule
- As a digital output by configuring a digital output submodule
- As an IO-Link device by configuring an IO-Link submodule

Port disabled:

- In STEP 7: By deactivating the port enable

The IO-Link ports are preconfigured as 2I + PQI.

When configuring IO-Link submodules, you can select the address spaces for I/O data in the following byte scales:

- 1 I/1 O + PQI
- 2 I + PQI
- 2 I/2 O + PQI
- 4 I/4 O + PQI
- 8 I/8 O + PQI
- 16 I/16 O + PQI
- 32 I/32 O + PQI

For more information, refer to the IO-Link system (https://support.industry.siemens.com/cs/us/en/view/65949252) function manual.

Port Qualifier Information (PQI)

NOTE

Port Qualifier Information (PQI)

The Port Qualifier Information (PQI) with the size 1 byte is always transmitted together with the input data of the IO-Link device. The PQI cannot be deactivated.

	Description	Value	Meaning
Bit0	-	-	Reserved
Bit1	-	-	Reserved
Bit2	NewPar*	0	No update of the device parameters detected
		1	Device parameter update detected
Bit3	SubstDev*	0	No backup device detected (identical serial number)
		1	Backup device detected (different serial number)
Bit4	PortActive	0	Port disabled
		1	Port enabled

* Bits are reset with function block "LIOLink_Master" .

	Description	Value	Meaning
Bit5	DevCom	0	IO-Link device is not available
		1	IO-Link device is in the "Preoperate" or "Operate" state
Bit6	DevErr	0	No error
		1	An error or warning has occurred.
Bit7	PQ	0	The data of the IO-Link device is invalid
		1	The data of the IO-Link device is valid

* Bits are reset with function block "LIOLink_Master" .

Port Qualifier Information (PQI)

* The PQI byte is always after the last input byte of the port.

6.1.4 Control and feedback interfaces

Assignment of the feedback interface

Your program receives current values and status information from the module by means of the feedback interface.

The following table shows the assignment of the feedback interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
IB x	0	0	0	0	DI 0.3 or 0 (DQ)	DI 0.2 or 0 (DQ)	DI 0.1 or 0 (DQ)	DI 0.0 or 0 (DQ)

Explanations of the feedback interface

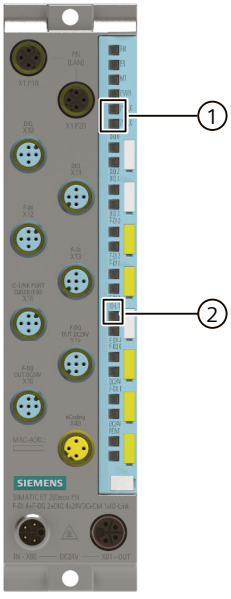
Byte	Bit	Control bit/value	Explanation
IB x	0	DI 0.0, or 0 (DQ)	The process value (PV) of standard digital input channel 0.
	1	DI 0.1, or 0 (DQ)	The process value (PV) of standard digital input channel 1.
	2	DI 0.2, or 0 (DQ)	The process value (PV) of standard digital input channel 2.
	3	DI 0.3, or 0 (DQ)	The process value (PV) of standard digital input channel 3.

Assignment of the control interface

Your program uses the control interface to influence the behavior of the module.
The following table shows the assignment of the control interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
QB x	0	0	0	0	DQ 0.3 or 0 (DI)	DQ 0.2 or 0 (DI)	DQ 0.1 or 0 (DI)	DQ 0.0 or 0 (DI)

Explanations of the control interface



Byte	Bit	Control bit/value	Explanation
QB x	0	DQ 0.0, or 0 (DI)	The process value (PV) of standard digital output channel 0.
	1	DQ 0.1, or 0 (DI)	The process value (PV) of standard digital output channel 1.
	2	DQ 0.2, or 0 (DI)	The process value (PV) of standard digital output channel 2.
	3	DQ 0.3, or 0 (DI)	The process value (PV) of standard digital output channel 3.

6.2 Interrupts/diagnostics alarms

6.2.1 IO-Link

6.2.1.1 Status and error displays

The figure below shows the LED displays (status and error displays) of the ET 200eco PN M12-L F module for IO-Link:

① P1 LK / P2 LK LEDs (Green)
② IO-Link channel status / channel fault LED (Green/Red)

Figure 1-827 IO-Link IO LED displays

Meaning of LEDs

The following tables describe the meaning of the status and error displays:

Behavior of the LEDs RN/NS (RUN/network status), ER/MS (ERROR/module status) and MT/IO (MAINT/IO status)

Table 1-1129 Error display of the LED

LED			Meaning	Remedy
RN/NS (green)	ERR/MS (red)	MT/IO (yellow)		
Off	Off	Off	No or insufficient supply voltage	Check the supply voltage.
On	On	On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-
			The three LEDs light up simultaneously for approximately 2 s while "Reset to factory settings" is running.	-
Flashes	Off	Off	Module is disabled.	Activate ET 200eco PN M12-L F with the configuration software or with the user program.
			Module is not configured.	Configure ET 200eco PN M12-L F using the configuration software.
			Module is starting up.	-
			Parameters are assigned to the module.	
			Loading firmware (when the firmware update is performed during startup, all LEDs retain their current status).	-
On	N/A	N/A	The ET 200eco PN M12-L F is currently exchanging data with the IO controller.	-
N/A	Flashes	N/A	Module diagnostics are available.	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not match the actual configuration.	Check the configuration of the ET 200eco PN M12-L F.
			Parameter error	Correct the errors in the parameter assignment.
N/A	N/A	On	Maintenance	Evaluate the maintenance events.
Flashes	Flashes	Flashes	The "Node flash test" is running (the P1 LK and P2 LK LEDs of the PROFINET interface are also flashing).	-
			Hardware or firmware faulty. (The P1 LK and P2 LK LEDs of the PROFINET interface are not flashing).	Replace the ET 200eco PN M12-L F I/O device.

PWR LED

Table 1-1130 Status display of the PWR LED

PWR LED	Meaning
□ Off	Load voltage 2L+ is missing or too low.
■ On	Load voltage 2L+ is present.

LEDs P1 LK and P2 LK

The following table describes the behavior of LEDs that indicate the connection status with a PROFINET IO controller or a PROFINET switch:

Table 1-1131 Status displays of the LEDs P1 LK and P2 LK

P1 LK and P2 LK LEDs	Meaning	Remedy
□ Off	There is no Ethernet connection between the communications interface of your IO device and a communication partner (for example, an IO controller).	Check whether the bus cable to the switch/communication partner is interrupted.
■ On	There is an Ethernet connection between the communications interface of your IO device and a communication partner (for example, an IO controller).	-
☼ Flashes	The "Node flash test" is running (the RN/NS, ER/MS and MT/IO LEDs also flash).	-
	Communication error: A physical connection exists, but communication is not possible.	Check the PROFINET IO settings.

LEDs channel status DI

Table 1-1132 Status displays of the DI0, DI1, DI2, and DI3 LEDs

LEDs Channel status/channel error	Meaning
□ Off	Process value = 0
■ On	Process value = 1

Channel status/channel error LEDs IO-Link

Table 1-1133 Status displays of the channel/channel error LEDs for IO-Link

LEDs Channel status/error	Meaning
Off	Input or output value is 0 or port is disabled.
On	IO-Link communication established, active device or channel fault.
Flashes	At startup or permanently, if no functional IO-Link device was found.
On	• DI/DQ operating mode: Input or output value is "1". • IO-Link operating mode: Communication is running.

6.2.1.2 Interrupts

The IO-Link Master ET 200eco PN M12-L F supports the following interrupts:

- Diagnostics interrupts
- Hardware interrupts (at submodule port)
- Pull/plug interrupt (at submodule port)

If you have added these interrupt OBs to your STEP 7 program, the CPU of the IO controller calls the appropriate OB when one of these interrupts occurs. Information on the cause and class of the error is available, based upon the OB number and start information.

You can use the "RALRM" instruction to obtain detailed information on the error event in the error OB.

Diagnostics interrupts

All IO-Link events of the type "Error" or "Warning" are mapped to the diagnostic interrupts of the assigned submodule. If you have parameterized the IO-Link master accordingly, it triggers a diagnostic interrupt for an incoming or outgoing event (alarm). The coding of the events corresponds to the PROFINET standard of the extended channel diagnostics (USI=0x8002).

The CPU interrupts STEP 7 program execution and processes the diagnostics interrupt OB. You can determine the error events (channel diagnostics) with the "RALRM" instruction.

Hardware interrupts

All IO-Link events of the type "Notification" generated by the IO-Link device are mapped to the hardware interrupts of the assigned submodule.

The coding of the additional alarm information corresponds to the PROFINET standard "ProcessAlarmReason" (USI = 0x8320).

When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the hardware interrupt OB. You can determine the events (ProcessAlarmReason) with the "RALRM" instruction.

Pull/plug interrupts

If you remove an IO-Link device or the IO-Link communication is interrupted, the assigned submodule generates a pull alarm.

As soon as you plug the IO-Link device back in or the IO-Link communication is re-established, the assigned submodule generates a plug alarm.

When an insert/remove module interrupt occurs, the F-CPU interrupts execution of the STEP 7 program and processes the insert/remove module interrupt OB. The event that triggered the interrupt is set in the start information of the insert/remove OB.

6.2.1.3 Alarms

Diagnostics alarms

IO-Link master error types

All IO-Link events of the type Error generated by the IO-Link device or port are mapped to the PROFINET diagnostics alarm of the type (severity) "Diagnosis" of the assigned submodule.

IO-Link device diagnostics

The IO-Link master generates PROFINET channel diagnostics (CET, ECET) from the IO-Link events of an IO-Link device according to the following mapping regulations:

- The "IO-Link Device Diagnostics - Page 1" (CET $0x9500_H$) displays IO-Link event codes in the range 0x0000 - $0x7FFF_H$ directly: $ECET_H$ = IO-Link Event $Code_H$
- The "IO-Link Device Diagnostics - Page 2" (CET $0x9501_H$) displays IO-Link event codes in the range 0x8000 - $0xFFFF_H$ directly: $ECET_H$ = (IO-Link Event $Code_H$ - $0x8000_H$)

Table 1-1134 Overview of error types for IO-Link device diagnostics

IO-Link event code	Error type (CET)	Extended error type (ECET)	Error text	Meaning
0x0000 - $0x7FFF_H$	$0x9500_H$ (38144_D)	0x0000 - $0x7FFF_H$ (0 - 32767_D)	Error / warning	See the manual of the IO-Link device or IODD file used.
0x8000 - $0xFFFF_H$	$0x9501_H$ (38134_D)	0x0000 - $0x7FFF_H$ (0 - 32767_D)	Error / warning	See the manual of the IO-Link device or IODD file used.

Example

An IO-Link device generates event code $0x4000_H$ (type "Error").

The channel diagnostics from the event code as follows:

PROFINET channel diagnostics type: Diagnosis, CET: $0x9500_H$, ECET: 0x4000

Diagnostics alarm "IO-Link Device Diagnostics - Pag 1, Temperature fault - Overload", generated from the IO-Link event code $0x4000_H$.

IO-Link port diagnostics

The IO-Link master generates channel diagnostics for each port. The port diagnostics (CET $0x9502_H$) show port-specific channel diagnostics.
The following table provides an overview of the possible diagnostic events and their meanings:

Error type (CET)	Extended Error type (ECET)	Error text	Meaning
$0x9502_H$ (38136_D)	$0x17FF_H$ (6143_D)	Process data mismatch	Check module configuration.
	$0x1800_H$ (32546_D)	Device does not exist.	Communication cancelled
	$0x1801_H$ (6145_D)	Parameter assignment error in startup	Check parameter assignment.
	$0x1802_H$ (6146_D)	Wrong device VendorID	Check device.
	$0x1803_H$ (6147_D)	Wrong device DeviceID	Check device.
	$0x1804_H$ (6148_D)	Short-circuit to C/Q	Check port connection.
	$0x1805_H$ (6149_D)	IO-Link PHY overtemperature	
	$0x1806_H$ (6150_D)	Short-circuit to L+	Check port connection.
	$0x1808_H$ (6152_D)	Event overflow on the device	
	$0x1809_H$ (6153_D)	Backup failed	Memory outside of range (2k)
	$0x180A_H$ (6154_D)	Backup invalid	Mismatch when identifying data storage
	$0x180B_H$ (6155_D)	Backup invalid	Data storage unspecified error
	$0x180C_H$ (6156_D)	Backup invalid	Upload error
	$0x180D_H$ (6157_D)	Backup invalid	Download error
	$0x180E_H$ (6158_D)	P24 (Class B) missing or undervoltage	Check voltage supply.
	$0x180E_H$ (6158_D)	Short-circuit at P24 (Class B)	Check port connection.
	$0x6000_H$ (24576_D)	Cycle time invalid	Check cycle time.
	$0x6001_H$ (24577_D)	Revision error	Incompatible protocol version
	$0x6002_H$ (24578_D)	ISDU batch failed	Parameter inconsistency

Maintenance events

All IO-Link events of the type "Warning" generated by the IO-Link device or port are mapped to the PROFINET diagnostics alarm of the type "Maintenance" of the assigned submodule. The purpose of this is the early detection and elimination of potential faults.

For the IO-Link master, maintenance events signal to the user when a network component must be checked or replaced.

Examples of displaying the IO-Link event codes

An IO-Link device generates EventCode $0x8CA0_H$ (type "Warning").

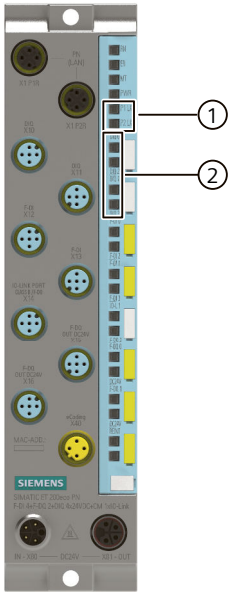
The following event code results in channel diagnostics:

PROFINET channel diagnostics type: Maintenance CET: $0x9501_H$, ECET: $0x0CA0_H$.

Maintenance "IO-Link Device Diagnostics - Page 2, Ambient light interference", generated from the IO-Link event code $0x8CA0_H$.

Process alarm events

All IO-Link events (event codes) of the Notification type that are generated by the IO-Link device are mapped to the PROFINET process alarm of the assigned submodule.



The additional alarm information read out using RALRM contains the relevant IO-Link event code.

The coding of the additional alarm information corresponds to the coding USI = 0x8320 (ProcessAlarmReason).

6.2.2 DIQ

6.2.2.1 Status and error displays

The figure below shows the LED displays (status and error displays) of the ET 200eco PN M12-L F module for DIQ:

① P1 LK / P2 LK LEDs (Green)
② DIQ channel status / channel fault LEDs (Green/Red)

Figure 1-828 LED displays

Meaning of LEDs

The following tables describe the meaning of the status and error displays:

Behavior of the LEDs RN/NS (RUN/network status), ER/MS (ERROR/module status) and MT/IO (MAINT/IO status)

Table 1-1135 Error display of the LED

LED			Meaning	Remedy
RN/NS (green)	ER/MS (red)	MT/IO (yellow)		
□ Off	□ Off	□ Off	Missing or insufficient supply voltage at the I/O device.	Check the supply voltage.
■ On	■ On	■ On	Test of LEDs during startup: The three LEDs light up simultaneously for approximately 0.25 s.	-

LED			Meaning	Remedy
RN/NS (green)	ER/MS (red)	MT/IO (yellow)		
On	On	On	The three LEDs light up simultaneously for approximately 2 s while "Reset to factory settings" is running.	-
Flashes	Off	Off	Module is disabled.	Activate the ET 200eco PN M12-L F with the configuration software or with the user program.
			Module is not configured or is incorrectly configured.	Configure the ET 200eco PN M12-L F using the configuration software.
			Module is starting up.	-
			Parameters are being assigned to the module.	
			Loading firmware (when the firmware update is performed during startup, all LEDs retain their current status).	-
On	N/A	N/A	The ET 200eco PN M12-L F is currently exchanging data with the IO controller.	-
N/A	Flashes	N/A	Module diagnostics is available.	Evaluate the diagnostics and eliminate the error.
			The preset configuration does not match the actual configuration.	Check the configuration of the ET 200eco PN M12-L F.
			Parameter error	Correct the errors in the parameter assignment.
N/A	N/A	On	Maintenance	Evaluate the maintenance events.
Flashes	Flashes	Flashes	The "Node flash test" is running (the P1 LK and P2 LK LEDs of the PROFINET interface are also flashing).	-
			Hardware or firmware defective (The P1 LK and P2 LK LEDs of the PROFINET interface are not flashing).	Replace the ET 200eco PN M12-L F IO device.

PWR LED

Table 1-1136 Status display of the PWR LED

PWR LED	Meaning
Off	Load voltage 2L+ is missing or too low.
On	Load voltage 2L+ is present.

P1 LK and P2 LK LEDs

Table 1-1137 Error display of the P1 LK and P2 LK LEDs

P1 LK and P2 LK LEDs	Meaning	Remedy
Off	There is no Ethernet connection between the communications interface of your IO device and a communication partner (for example, an IO controller).	Check whether the bus cable to the switch/communication partner is interrupted.
On	There is an Ethernet connection between the communications interface of your IO device and a communication partner (for example, an IO controller).	-
Flashes	The "Node flash test" is running (the RN/NS, ER/MS, and MT/IO LEDs also flash).	-
	Communication error: A physical connection exists, but communication is not possible.	Check the PROFINET IO settings.

Channel status/channel error LEDs

Table 1-1138 Status and error display of the channel status/channel error LEDs

LEDs Channel status/error	Meaning
Off	Process value = 0
On	Process value = 1
On	Channel diagnostics

6.2.2.2 Interrupts

The DIQs support diagnostic and maintenance interrupts.

Diagnostics interrupt

The I/O device generates a diagnostic interrupt on the following events:

- Wire break
- Internal module fault
- Parameter error
- Hardware interrupt lost
- Short-circuit

Maintenance alarm

The I/O device generates a maintenance alarm on the following events:

- Low voltage 1L+
- Loss of synchronization

Hardware interrupt

If the fault-free signal (value status/QI = 1) is pending at the channel, meaning no diagnostic interrupt is present, the I/O device generates a hardware interrupt for the following events:

- Rising edge
- Falling edge

6.2.2.3 Alarms

Diagnostics alarms

Each diagnostics event triggers a diagnostics alarm. On the I/O device ET 200eco PN M12-L F, the LED ER/MS flashes red. You can read out the diagnostics alarms in the diagnostics buffer of the CPU and evaluate error codes with the user program.

NOTE

Wiring two outputs in parallel

For parallel connection of two outputs for redundant control of a load, deactivate the channel diagnostics "Wire break" and "Short-circuit".

Uncouple the parallel switched outputs with external diodes.

Table 1-1139 Diagnostics alarms, their meanings and corrective measures

Diagnostics alarm	Error code	Meaning	Corrective measures
Wire break	6_H	Fault in the external circuitry	Check the external circuitry and correct the fault.
		Encoder faulty	Replace the encoder.
		Impedance of encoder circuitry is too high.	Use a different encoder type or modify the wiring. For example, use cables with a larger cross-section.
		Interruption of cable between the I/O device and sensor.	Establish the connection.
		Channel not connected (open).	• Disable diagnostics. • Connect a resistor of 25 kΩ to 45 kΩ to the encoder contacts.
Parameter error	10_H	• I/O device cannot evaluate parameters for the channel. • Incorrect parameter assignment	Correct the parameter assignment.

Diagnostics alarm	Error code	Meaning	Corrective measures
Hardware interrupt lost	16_H	The I/O device cannot trigger an interrupt because the previous interrupt was not acknowledged; possible configuration error	• Change the interrupt handling on the CPU and reassign the parameters to the I/O device, if necessary. • The error persists until the I/O device is assigned new parameters.
Short-circuit	105_H	Short-circuit to L+	• Correct the process wiring. • Replace the defective encoder/actuator.
	106_H	Short-circuit to ground	

Maintenance events

Triggering of a maintenance event

The MultiFieldbus interfaces of the ET 200eco PN M12-L F support the diagnostics concept and maintenance concept in PROFINET according to the IEC 61158-6-10 standard. The goal is to detect and remove potential problems as soon as possible.

The I/O device signals a maintenance event to the higher-level diagnostic system on the following event:

Table 1-1140 Triggering of a maintenance event

Maintenance alarm	Error code	Event	Meaning
Maintenance demanded MT/IO LED is lit	2_H	Undervoltage	Supply voltage 1L+ is below the tolerance limit.
	8003_H	Loss of synchronization	• No synchronization frame received. No synchronization telegram was received by the sync master within the timeout period after parameter assignment or during operation. • Successive synchronization telegrams are located outside of permitted limits (jitter).

System alarms in STEP 7

The maintenance information is generated in STEP 7 for the "Maintenance demanded" system alarm, indicated for each port by a yellow wrench icon in the device view or in the device configuration.

You can find additional information in the TIA Portal Information System.

Hardware interrupts

During a hardware interrupt, the CPU interrupts processing of the user program and processes the hardware interrupt organization block.

For detailed information on the event, refer to the hardware interrupt organization block with the "RALRM" instruction to read additional interrupt info, as well as to the TIA Portal Information System. The start information of the organization block shows information on which channel of the I/O device triggered the hardware interrupt. The figure below shows the assignment to the bits of the local data double word 8:

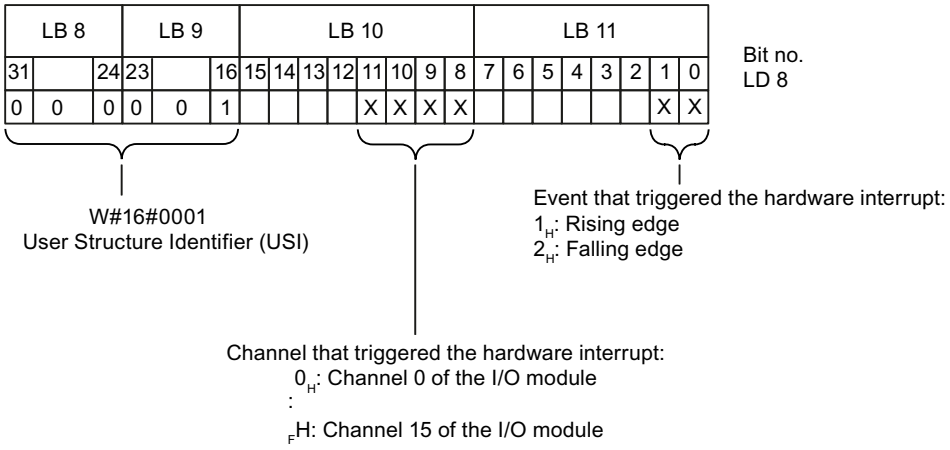


Figure 1-829 Start information of the organization block

Applications

7

This chapter presents typical application examples for connection of fail-safe input and output channels, with a statement of the safety performance (SIL/Cat./PL) that is possible for each example.

The PLC system has an extremely low failure rate and therefore contributes only a small part of the total probability of dangerous failure of an automated system. The probability of dangerous failures of the sensors and actuators is typically far larger than the probability of dangerous failure per hour (PFH)/probability of dangerous failure on demand (PFD) of the PLC system. Estimates for quantitative safety properties like PDF and PFH are calculated using the following methods:

- Standard data tables
- Calculation methods according to international standards, which include the following:
  - IEC 61508
  - ISO 13849
  - IEC 61131-6

  The values are based on the following assumptions:
  - Continuous full nominal load
  - Nominal voltage
  - Equipment ambient temperature of 60 °C

Faults in the wiring system can also be a substantial contributor to failures.

To achieve a targeted level of safety performance for each safety function, perform these actions:

- Choose an appropriate architecture.
- Choose sensors and actuators that are appropriately rated.
- Provide a safety program that meets the requirements of the safety function.
- Provide diagnostics and proof-tests to maintain the ratings of the sensors and actuators.
- Use wiring installation practices, diagnostics, and proof-tests to assure wiring integrity.
- Generate and control operating and maintenance procedures for the lifetime of the installation.

The S7-1200/S7-1200 G2/S7-1500, ET 200pro (IP67 compliant), ET 200S/ET 200SP, ET 200eco PN, and ET 200M/ET 200MP Fail-safe systems provide a high level of internal diagnostic coverage. Diagnostic coverage of your external circuits, sensors, and actuators depends on your design choices using features of the PLC system and other measures.

The PFH/PFD of each fail-safe PLC component is stated assuming no field proof-test within the lifetime of the product. Sensors and actuators typically require regular proof-tests to maintain an expected level of safety performance.

The reaction time (Page 119) of each safety function depends on the reaction time of each component, including the sensor, the PLC system, and the actuator. You must choose PLC parameters and external component reaction times to achieve a total safety reaction time goal.

In addition to the total delay (Page 119) from the fail-safe input to the safe actuator response, you must consider these additional time-related factors:

- To be assured of a safety response, a safety signal from the fail-safe input sensor must last long enough to be seen by the safety program, which varies based upon your configured input filter, the duration of short-circuit test, and startup after short-circuit test is completed times.
- The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is functional and under independent control. The OFF test pulse duration can be as long as your configured "Maximum readback time". The ON test pulse duration can be as long as your configured "Maximum readback time switch on test". For a given output, the ON test pulse is only provided to one of the P- or M- switches at a time, but in the presence of a single fault this could apply energy to your load. Make sure that your actuator does not respond to an OFF signal up to the "Maximum readback time" or to an ON signal up to the "Maximum readback time switch on test".
- The fail-safe digital outputs verify that any transition of the output process value reaches the expected state within the configured "Maximum readback time". When an output process value transition occurs, your program must wait the configured "Maximum readback time" before changing the output process value again. If the output does not reach the expected state in the configured "Maximum readback time", the output channel passivates.

⚠ WARNING

Safety performance depends upon design and continued maintenance
The ET 200pro, ET 200SP, and S7-1200/S7-1200 G2/S7-1500 Fail-safe CPUs and F-DI 4/F-DQ 2/DIQ 4/IOL 1 Fail-safe module provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions.
You must choose all components of your installation and complete your design according to accepted safety standards and practices to achieve your required level of safety.
Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.

7.1 Digital input applications

Consider the application modes presented here along with the features of the fail-safe module as described in the product overview (Page 15):

You configure each channel as a 1oo1 or as part of a 1oo2 evaluation pair. The corresponding channels from input bytes "a" (a.0, a.2), (a.1, a.3) form 1oo2 channel groups. Within this restriction, you can assign 1oo1 and 1oo2 in any order.

Short-circuit testing requires use of the internal sensor supply. Each input can optionally have its own Vs supply. If you enable the short-circuit test, and your inputs are configured as 1oo2, sensors used with the 1oo2 pair are configured with the same parameters. All channels you configured for internal sensor supply are subject to the same short-circuit test. You configure a test duration and sensor startup time.

The sensor supply is monitored to detect short-circuit or overload. It is cycled on each power up to assure control and readback are working, and the sensor supply continuously monitors the readback. You configure a discrepancy time to identify unacceptable differences between 1oo2 inputs. You configure a filter time for each channel or each 1oo2 pair.

Achieving SIL 2/Cat. 3/PL d in 1oo1 configuration

You can achieve SIL 2/Cat. 3/PL d in 1oo1 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- Each F-DI input includes sufficient diagnostics and redundant components such that no single internal fault can cause a dangerous failure.
- An appropriately-rated, single sensor can reach SIL 2/Cat. 3/PL d by internal fault tolerance.
- The external wiring of a single sensor to a single input is vulnerable to single fault dangerous failure, unless additional measures are applied.

Achieving SIL 3/Cat. 4/PL e in 1oo2 configuration

You can achieve SIL 3/Cat. 4/PL e in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof testing of conductors:

- With 1oo2 evaluation, a pair of F-DI inputs is not subject to dangerous internal failure within a reasonable number of accumulated internal faults.
- Appropriately-rated, external-paired sensors or equivalent redundancy can achieve Cat. 4.
- The duplicated external wiring of 2 sensors to 2 input points is vulnerable to accumulated fault dangerous failure, unless additional measures are applied.

The F-DI is recommended for SIL 3/Cat. 4/PL e only when 1oo2 evaluation is selected. A single high-integrity sensor can be rated up to SIL 3/Cat. 4/PL e, but it should be wired and configured for 1oo2 evaluation for the channel to achieve SIL 3/Cat. 4/PL e.

7.1.1 Selecting the digital input application

Input architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

You can choose a digital input application based upon your functional and safety-related needs when wiring inputs. The applications and their achievable safety ratings are described in the table below:

Table 1-1141 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Sensor supply *	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
1	Internal	1oo1 evaluation	Single input	1 channel	2/3/d	
2	External					

* The ET 200eco PN M12-L F uses M12 connections and is intended for use outside a cabinet in IP67 applications (everything sealed). If you require the use of an external supply, cut the M12 cable and make the connection inside a sealed cabinet or inside a sealed sensor. For external supplies, do not connect the pin 1 wire (V_{S1}) or the pin 5 wire (V_{S2}) in the M12 cable. In addition, make the external 24 V DC connection inside a sealed cabinet or inside a sealed sensor.

Application	Sensor supply *	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
3	Internal	1oo2 evaluation	Two inputs	2 channel equivalent	3/3/e	3/4/e
4	External				3/3/d	
5	Internal				3/3/e	3/4/e
6	External				3/3/e	
7	Internal			2 channel - 3 wire non-equivalent	3/3/e	3/4/e
8	External				3/3/e	
9	Internal			2 channel - 4 wire non-equivalent	3/3/e	3/4/e
10	External				3/3/e	

* The ET 200eco PN M12-L F uses M12 connections and is intended for use outside a cabinet in IP67 applications (everything sealed). If you require the use of an external supply, cut the M12 cable and make the connection inside a sealed cabinet or inside a sealed sensor. For external supplies, do not connect the pin 1 wire (V_{S1}) or the pin 5 wire (V_{S2}) in the M12 cable. In addition, make the external 24 V DC connection inside a sealed cabinet or inside a sealed sensor.

⚠ WARNING

Incorporation into SIL 2 and SIL 3 applications

To incorporate an Application Mode into a SIL 2 or SIL 3 rated application, the sensor must be an appropriately qualified device for that SIL level. Failure to use an appropriately qualified device can prevent your safety application from reaching a sufficient safety rating, which increases the probability of dangerous failures occurring.

Use sensors that are appropriately qualified devices: either SIL 3 or SIL 2 with Systematic Capability rules defined in IEC 61508-2:2010 observed (sufficient independence in design and application or SC3).

Dangerous failures could result in death, severe personal injury, and/or property damage.

7.1.2 F-DI Applications 1 and 2: 1oo1 evaluation of a single sensor

F-DI application mode 1

This Application Mode features a single one-channel sensor using 1oo1 evaluation and an internal sensor supply.

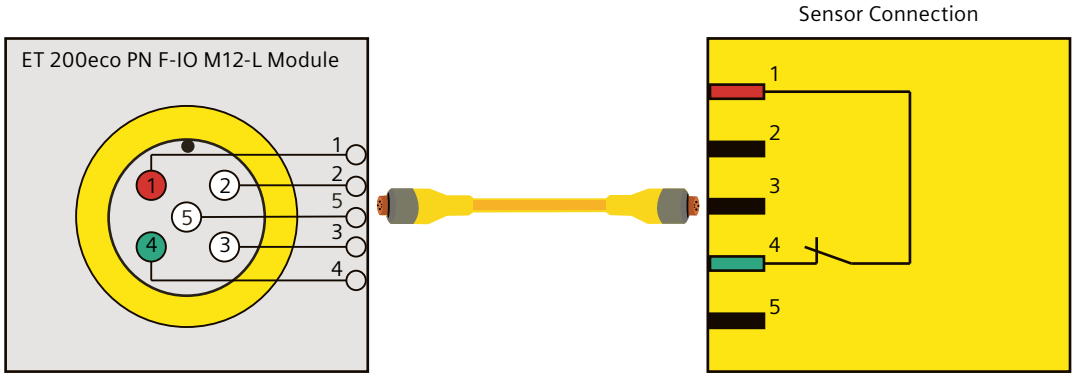

Figure 1-830 F-DI Application Mode 1

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	Sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 2

This Application Mode features a single one-channel sensor using 1oo1 evaluation and an external sensor supply.

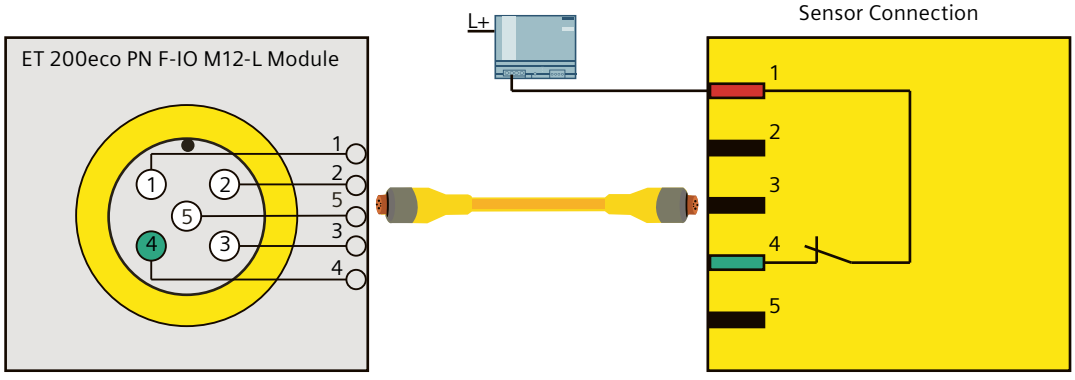

Figure 1-831 F-DI Application Mode 2

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	External

7.1.3 F-DI Applications 3 and 4: 1oo2 equivalent evaluation of a single sensor

F-DI application mode 3

This Application Mode features a single two-channel sensor using 1oo2 equivalent evaluation and an internal sensor supply.

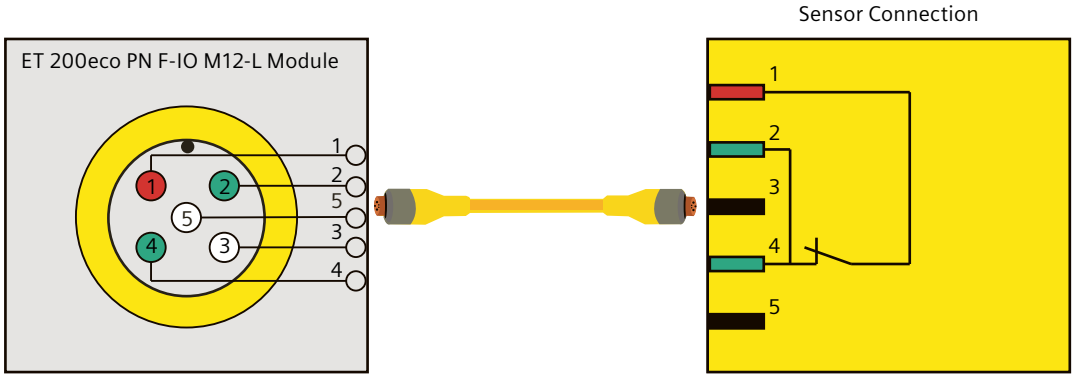

Figure 1-832 F-DI Application Mode 3

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire equivalent
Sensor supply	Sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 4

This Application Mode features a single two-channel sensor using 1oo2 equivalent evaluation and an external sensor supply.

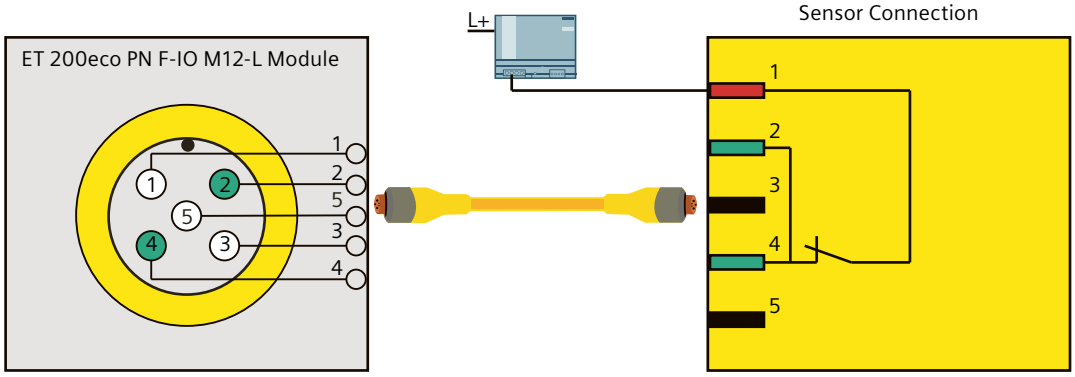

Figure 1-833 F-DI Application Mode 4

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire equivalent
Sensor supply	External

7.1.4 F-DI Applications 5 and 6: 1oo2 evaluation of a mechanically-coupled two-channel sensor

F-DI application mode 5

This Application Mode features a single two-channel sensor, with two mechanically-coupled contacts, using 1oo2 equivalent evaluation and internal sensor supplies.

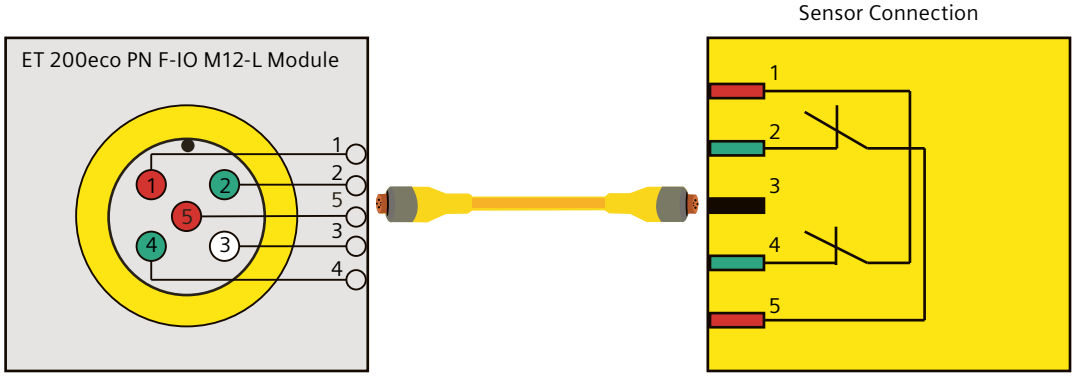

Figure 1-834 F-DI Application Mode 5

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire equivalent
Sensor supply	Sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 6

This Application Mode features a single two-channel sensor, with two mechanically-coupled contacts, using 1oo2 equivalent evaluation and external sensor supplies.

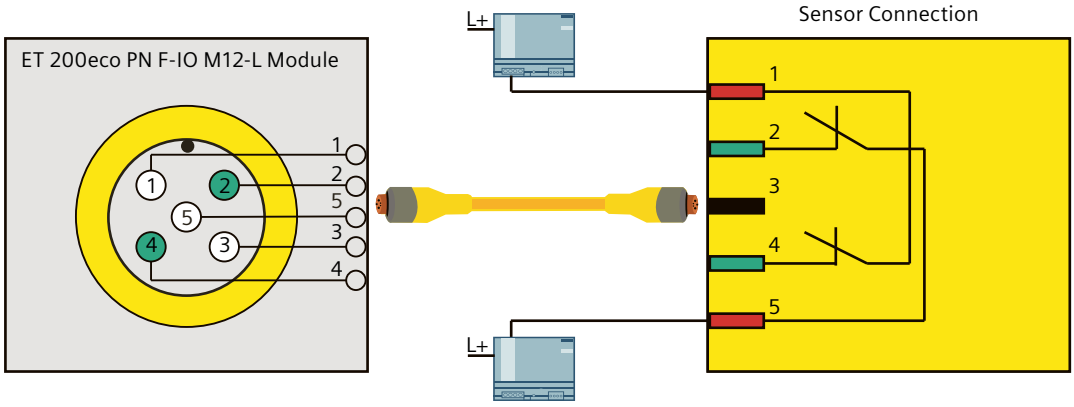

Figure 1-835 F-DI Application Mode 6

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire equivalent
Sensor supply	External

7.1.5 F-DI Applications 7 and 8: 1oo2 evaluation of a single 3 wire non-equivalent sensor

F-DI application mode 7

This Application Mode features a single two-channel sensor using 1oo2, 3 wire non-equivalent evaluation and an internal sensor supply.

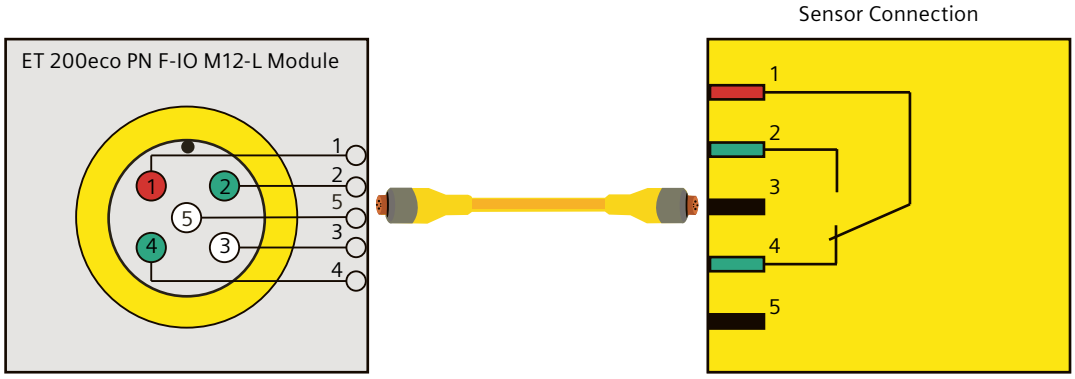

Figure 1-836 F-DI Application Mode 7

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire non-equivalent
Sensor supply	Sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI application mode 8

This Application Mode features a single two-channel sensor using 1oo2, 3 wire non-equivalent evaluation and an external sensor supply.

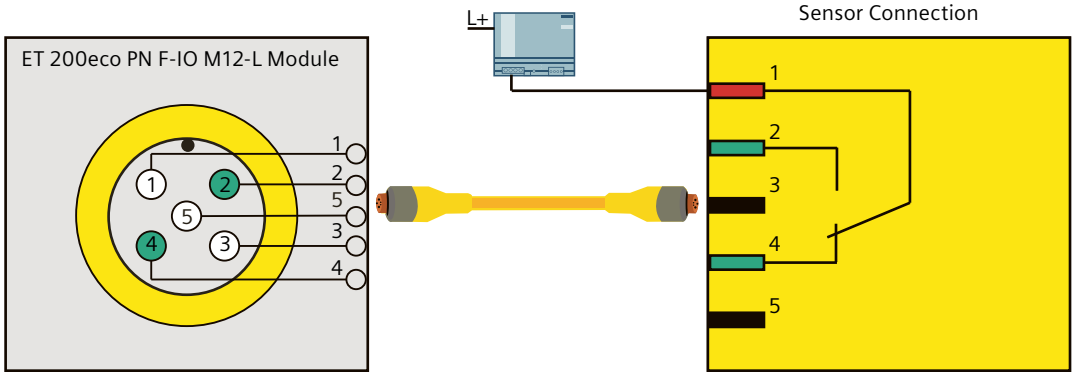

Figure 1-837 F-DI Application Mode 8

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire non-equivalent
Sensor supply	External

7.1.6 F-DI Applications 9 and 10: 1oo2 non-equivalent evaluation of a non-equivalent single channel sensor

F-DI Application Mode 9

This Application Mode features a single two-channel sensor using 1oo2, 4 wire non-equivalent evaluation and internal sensor supplies.

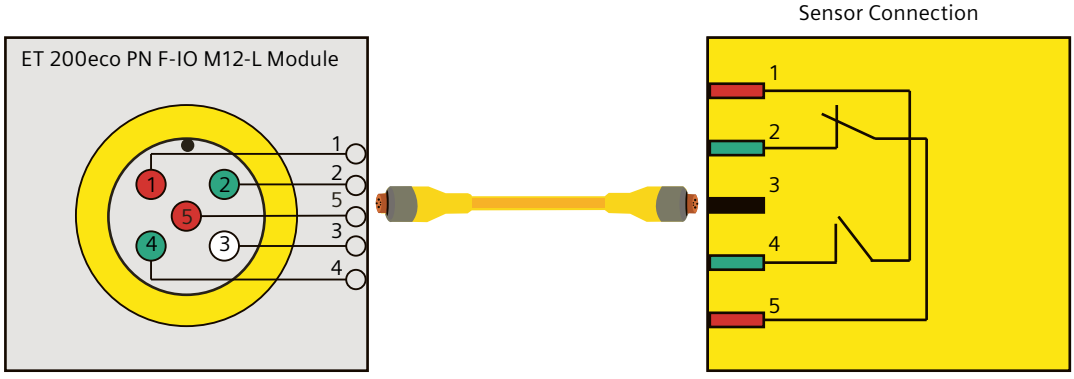

Figure 1-838 F-DI Application Mode 9

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire non-equivalent
Sensor supply	Sensor supply x (where "x" is the respective input channel number)
Short-circuit test	Optional (configurable)

F-DI Application Mode 10

This Application Mode features a single two-channel sensor using 1oo2, 4 wire non-equivalent evaluation and external sensor supplies.

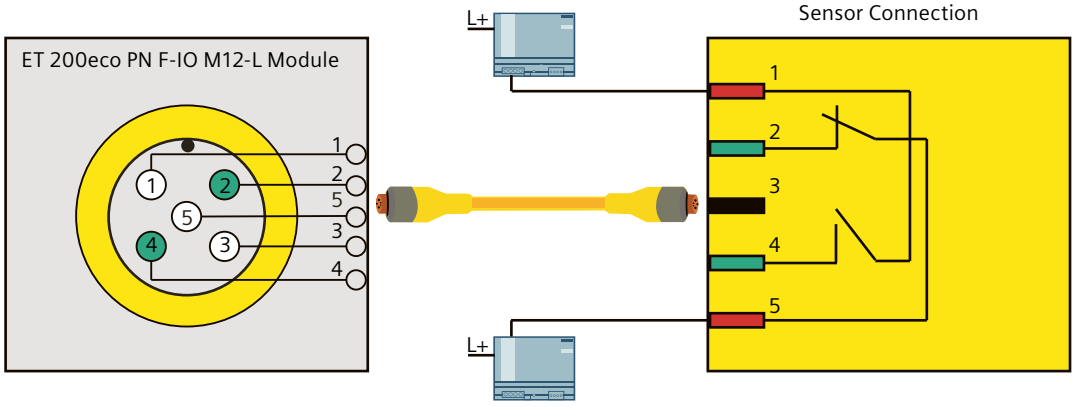

Figure 1-839 F-DI Application Mode 10

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire non-equivalent
Sensor supply	External

7.2 Digital output applications

The main features of the fail-safe digital outputs (Page 19) include the following:

- The fail-safe module separately controls current flow in the P (24 V DC to load) and M (load to common) sides of the circuit.
- The voltage at each P- and M- switch is read back to confirm proper state.
- The P- and M- switches are regularly tested with short ON and OFF pulses to confirm control.
- You must configure readback times that allow the external voltage to respond, but do not cause your load to physically respond.
- Internal current limiting as described in the data sheet is sufficient in combination with your 24 V DC supply. However, you must consider whether additional current limits or fuses are necessary. Refer to "Specifications" (Page 111).

The module controls all output channels with cross-diagnostics.

All applications shown are capable of reaching SIL 3/Cat. 4/PL e.

To reach Cat. 4, external contactors must be SIL-rated with sense contacts. Read the sense contacts back and confirm the external contactor response in your program. Siemens recommends using an F-DI input for sense contact and other safety diagnostic inputs, but external feedback inputs can also be standard inputs.

7.2.1 Selecting the digital output application

You can choose a digital output application based upon your functional and safety-related needs when wiring output actuators. The applications and their achievable safety ratings are described in the table below:

Application	Description	Achievable SIL/Category/PL
1	Directly-connected SIL-rated actuator	3/4/e
2	External contactors: Separate P- and M-controlled contactors	3/4/e
3	External contactors: Parallel-connected contactors between P and M	3/4/e
5	External contactors: Separate output channels for each contactor	3/4/e
6	External contactors: Separate output channels for each contactor connected across the PM	3/4/e

7.2.2 F-DQ Application 1: Wiring a load directly to a digital output, channel 2

This Application Mode features directly connecting a load to the P- and M- outputs of fail-safe output channel 2.

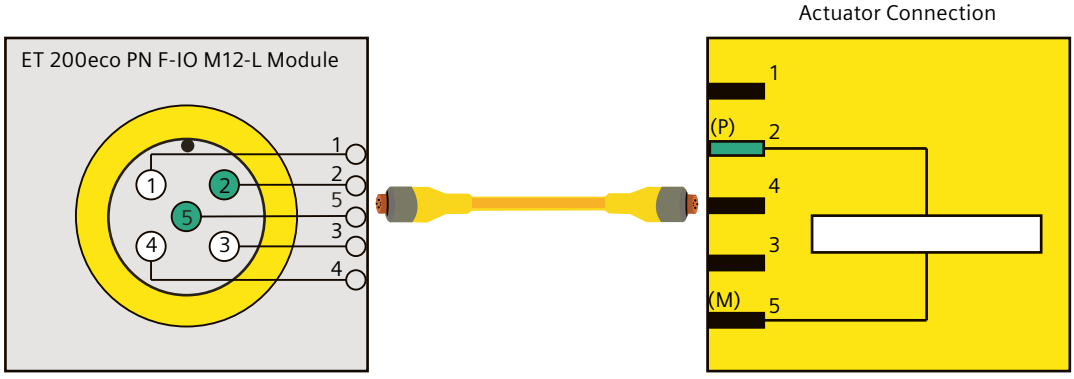

Figure 1-840 F-DQ Application Mode 1

NOTE

This fail-safe output uses the IO-Link Class B port, and the pinning of the output is different than the other fail-safe output channels.

7.2.3 F-DQ Application 2: Wiring a load directly to a digital output, channels 0 and 1

This Application Mode features directly connecting a load to the P- and M- outputs of one channel.

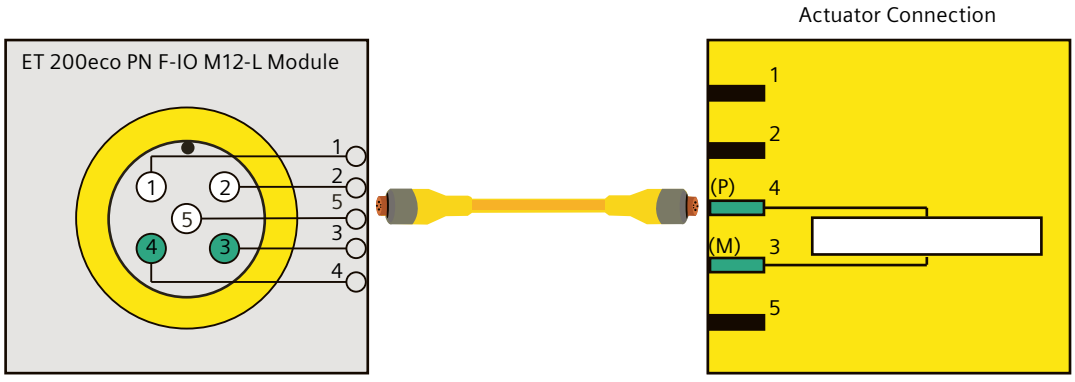

Figure 1-841 F-DQ Application Mode 2

7.2.4 F-DQ Application 3: Using two relays to control an actuator, relays connected between output and supply rail

This Application Mode features controlling a load by means of the series-connected, normally-open contacts of two relays. The coil of one relay is connected between the P-output of a channel and M, while the coil of the other relay is connected between the M-output of the same channel and L+.

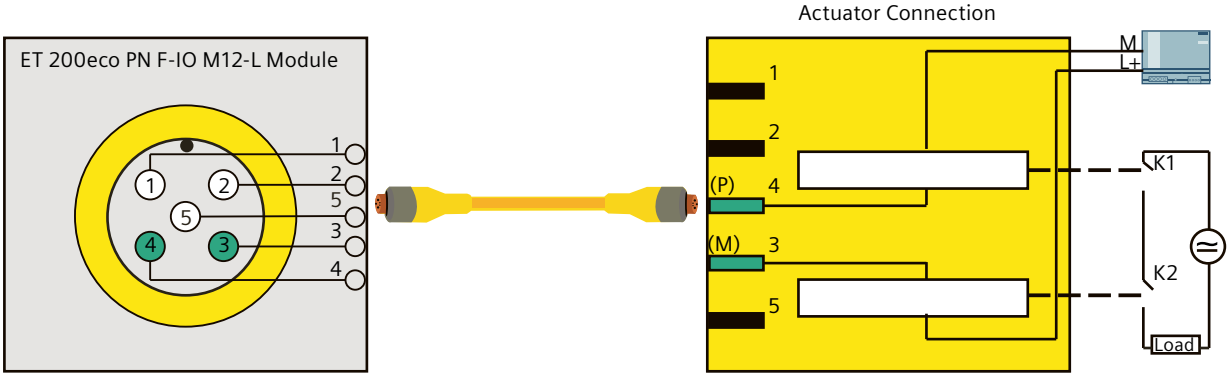

Figure 1-842 F-DQ Application Mode 3

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if the following conditions are fulfilled:

- You check the relay status by means of a separate digital input.
- You adequately protect the wiring against shorts between the P- and M- outputs, as you cannot switch off the actuator if such a fault occurs.

7.2.5 F-DQ Application 5: Using two relays to control an actuator, relays connected in parallel across one output

This Application Mode features controlling a load by means of series-connected, normally-open contacts of two relays. The coils of both relays are connected in parallel across the outputs of one channel.

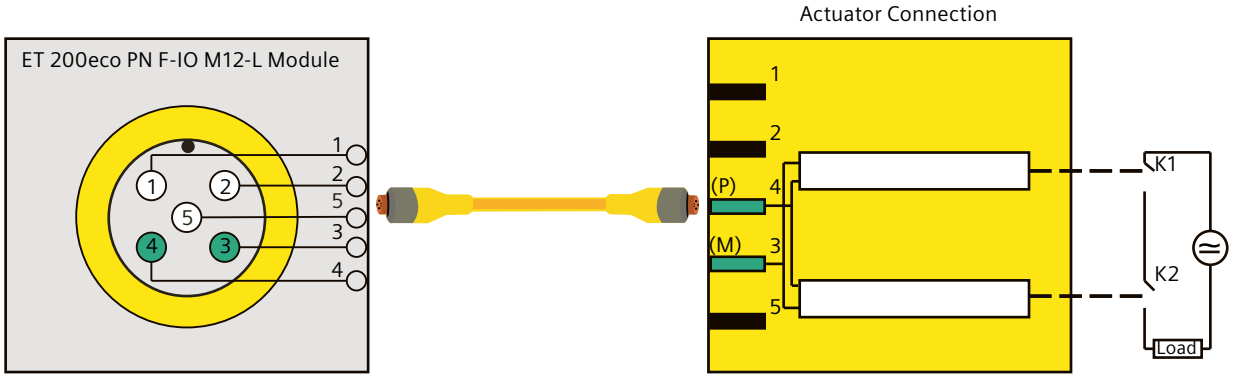

Figure 1-843 F-DQ Application Mode 5

NOTE

This configuration achieves SIL 3/Cat. 4/PL e if you check the relay status by means of a separate digital input.

7.2.6 F-DQ Application 6: Using separate relays to control an actuator, relays connected in parallel across two outputs

This Application Mode features controlling a load by means of series-connected, normally-open contacts of two relays. The coil of each relay is connected across the PM output of a unique output channel. Both outputs are independent of each other and are independently controlled and enabled from the safety program.

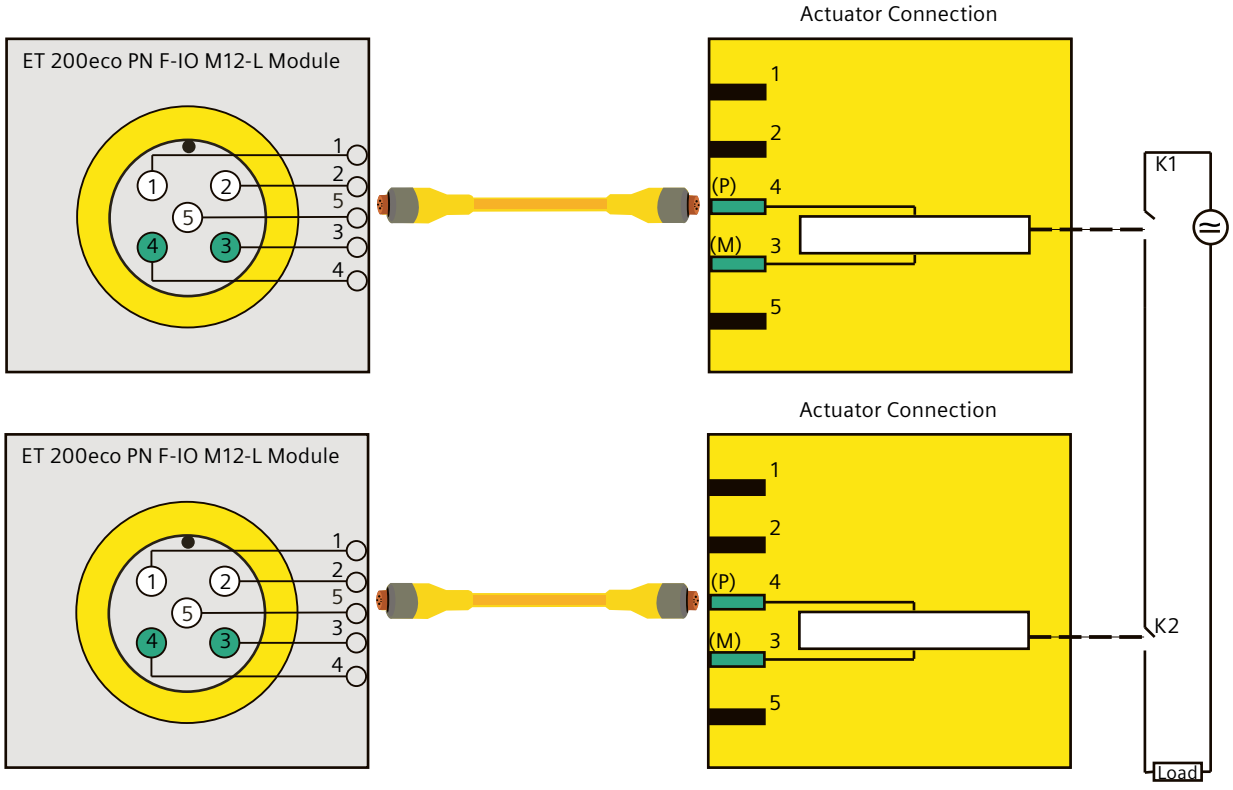

Figure 1-844 F-DQ Application Mode 6

NOTE
This configuration achieves SIL 3/Cat. 4/PL e if you check the relay status by means of a separate digital input.

7.3 Digital input/output applications

7.3.1 DIQ Application 1: Internal sensor supply

This Application Mode features a single one-channel sensor using an internal sensor supply.

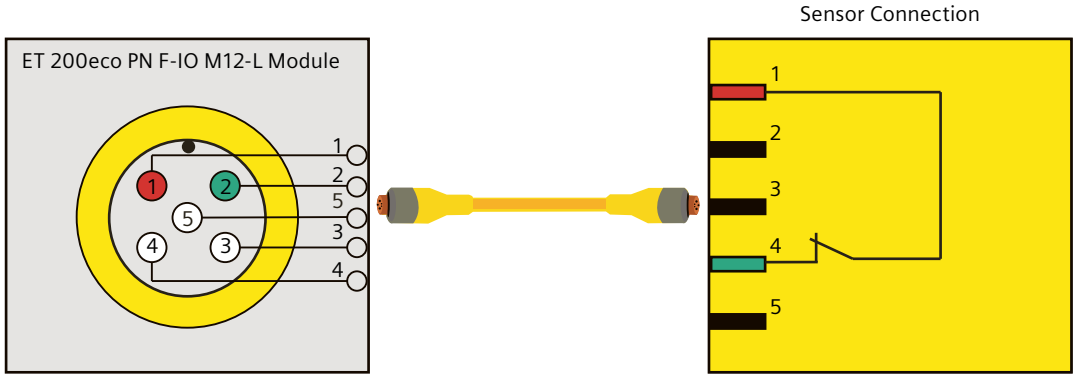

Figure 1-845 DIQ Application Mode 1

Parameter assignment

Parameter name	Parameter value
Short-circuit test	Optional (configurable)

7.3.2 DIQ Application 2: External sensor supply

This Application Mode features a single one-channel sensor using an external sensor supply.

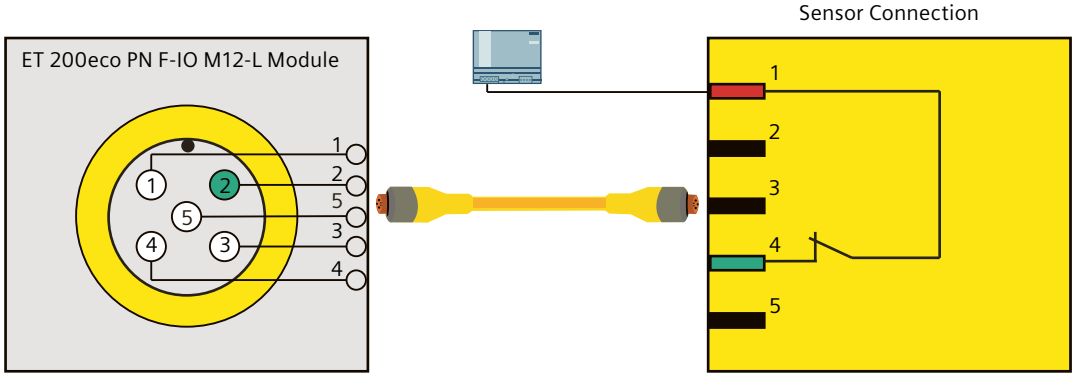

Figure 1-846 DIQ Application Mode 2

Technical specifications

A

A.1 Details on insulation, protection class, degree of protection, and rated voltage

The ET 200eco PN M12-L F module varies from other M12-L modules in specific ways, meaning that there are exceptions for the F-module.

Severity for voltage interruption

This I/O device meets the severity class PS1 for voltage interruption (1 ms). To ensure compliance with IEC 61131-2, use only power supply units/power supplies with a power failure bridging time of at least 10 ms. Observe the relevant requirement in your product standards (for example, 30 ms for "burners" according to EN 298) with regard to possible voltage interruptions.

Immunity to surge voltages

The ET 200eco PN M12-L F module is equipped with internal protection for overloads coupled by surge voltage caused by lightning that meets the levels called out as "high-energy single pulse (surge) to IEC 61000-4-5" in the *Distributed I/O system ET 200eco PN M12-L System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109778292). If you need higher limit values, then use external protective circuits, for example a surge filter, between the voltage power supplies and the voltage input of the module to ensure surge immunity for the ET 200eco PN M12-L F module. Additionally, use external protection between the I/O and the sensors/actuators to which the module is connected.

You can find further information in the *Designing interference-free controllers* (https://support.industry.siemens.com/cs/ww/en/view/59193566) function manual.

NOTE

Overvoltage protection measures always require a case-by-case examination of the entire application. Optimal overvoltage protection requires a comprehensive protective scheme that encompasses the entire facility infrastructure and all peripheral installations. In particular, this involves structural measures in the building design phase.
For detailed information regarding overvoltage protection, contact your Siemens representative or a company specializing in lightning protection.

Use in industrial burner and firing environments

The ET 200eco PN M12-L F module meets the requirements and criteria of the following standards when using 10m or less maximum cable length for the F-DQs:

- EN 298:2022 - Automatic burner control systems for burners and appliances burning gaseous or liquid fuels
- EN 50156-1:2015 - Electrical equipment for furnaces and ancillary equipment - Part 1: Requirements for application design and installation
- EN 50156-2:2015 - Electrical equipment for furnaces and ancillary equipment - Part 2: Requirements for design, development, and type approval of safety devices and subsystems

A.2 Specifications

Standards compliance

The ET 200eco M12-L F design conforms with the following standards and test specifications. The test criteria for the ET 200eco M12-L F are based on these standards and test specifications.

Note that certification status can change without notification. It is your responsibility to determine applicable certifications by referring to the ratings marked on the product. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

All ET 200eco M12-L F modules are certified by TÜV SÜD. The fail-safe module is certified to the IEC 61508, EN ISO 13849, and IEC 62061 standards and guidelines for functional safety. For further information, refer to the current associated Annex of the report for the TÜV SÜD certificate (https://support.industry.siemens.com/cs/ww/en/view/109825198) for the F-module (https://support.industry.siemens.com/cs/ww/en/view/109825395).

Technical specifications

The following table shows the technical specifications as of the issue date. You can find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/de/en/pv/6ES7146-6FF00-0BB0/td?dl=en).

Article number	6ES7146-6FF00-0BB0
General information	
HW functional status	from FS01
Firmware version	V1.1.x
• FW update possible	Yes
Vendor identification (VendorID)	002AH
Device identifier (DeviceID)	0306H
Product function	
• I&M data	Yes; I&M0 to I&M3
• Isochronous mode	No
• IRT	No; module will participate within an IRT topology
• Fast startup	No

Article number	**6ES7146-6FF00-0BB0**
• Prioritized startup	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated from version	STEP 7 V20 or higher with HSP0468
• PROFINET from GSD version/GSD revision	GSDML V2.43 2025.05
Operating mode	
• DI	Yes
• Counter	No
• DQ	Yes
• MSI	No
• MSO	No
Supply voltage	
Rated value (DC)	24 V
Reverse polarity protection	Yes
power supply according to NEC Class 2 required	No
Load voltage 1L+	
• Rated value (DC)	24 V
• permissible range, lower limit (DC)	20.4 V
• permissible range, upper limit (DC)	28.8 V
• Reverse polarity protection	Yes; Against destruction; encoder power supply outputs applied with reversed polarity
Load voltage 2L+	
• Rated value (DC)	24 V
• permissible range, lower limit (DC)	20.4 V
• permissible range, upper limit (DC)	28.8 V
• Reverse polarity protection	Yes; against destruction
Input current	
Current consumption (rated value)	100 mA 1L+ without load; 45 mA 2L+ without load
from load voltage 1L+ (unswitched voltage)	12 A; Maximum value
from load voltage 2L+, max.	12 A; Maximum value
Encoder supply	
Number of outputs	6; Us0, Us1, Vs0 - Vs3
24 V encoder supply	
• Short-circuit protection	Yes; per channel, electronic
• Output current, max.	0.5 A
Actuator supply	
Number of outputs	3; Us2 - Us4
Short-circuit protection	Yes; per channel, electronic
Output current	
• Rated value	1 A
Power loss	
Power loss, typ.	12 W

Article number	**6ES7146-6FF00-0BB0**
Address area	
Address space per module	
• Inputs	46 byte
• Outputs	39 byte
Hardware configuration	
Submodules	
• Number of configurable submodules, max.	3
Digital inputs	
Number of digital inputs	4 single-channel F-DI (SIL2) parameterizable as 2 two-channel (SIL3); 4 parameterizable as DIQ
Digital inputs, parameterizable	Yes
Source/sink input	P-reading
Input characteristic curve in accordance with IEC 61131, type 1	Yes; F-DI
Input characteristic curve in accordance with IEC 61131, type 3	Yes; DIQ
Number of simultaneously controllable inputs	
all mounting positions	
– up to 60 °C, max.	8
Input voltage	
• Rated value (DC)	24 V
• for signal "0"	-3 to +5V
• for signal "1"	+15 to +30 V F-DI; +11 to +30 V DIQ
Input current	
• for signal "1", typ.	3 to 6 mA F-DI; 2.5 mA DIQ
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; 0.8 / 1.6 / 3.2 / 6.4 / 12.8 ms F-DI; 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms DIQ
Cable length	
• unshielded, max.	30 m
Digital outputs	
Number of digital outputs	7; 2 F-DQ; 1 parameterizable F-DQ or IO-LINK Class B (with or without safety-shutdown); 4 parameterizable as DIQ
• in groups of	3 F-DQ (2L+); 4 DIQ (1L+)
Short-circuit protection	Yes; per channel, electronic
• Response threshold, typ.	10 A F-DQ; 1 A DIQ
Limitation of inductive shutdown voltage to	Typ. -74 V (typ. -26 V P-switch; typ. +48 V M-switch) F-DQ; Typ. 1L+ (-70 V) DIQ
Controlling a digital input	No F-DQ; Yes DIQ
Switching capacity of the outputs	
• with resistive load, max.	2 A F-DQ; 0.5 A DIQ
• with inductive load, max.	2 A F-DQ; 0.5 A DIQ
• on lamp load, max.	10 W F-DQ; 5 W DIQ

Article number	6ES7146-6FF00-0BB0
Load resistance range	
• lower limit	12 Ohm F-DQ; 48 Ohm DIQ
• upper limit	2 kOhm F-DQ; 4 kOhm DIQ
Output voltage	
• for signal "1", min.	2L+ (-2 V) F-DQ (2L+ (-1.5 V) P-switch; 0.5 V M-switch); 1L+ (-0.8 V) DIQ
Output current	
• for signal "1" rated value	2 A F-DQ; 0.5 A DIQ
• for signal "0" residual current, max.	0.5 mA F-DQ; 0.1 mA DIQ
Output delay with resistive load	
• "0" to "1", max.	100 µs
• "1" to "0", max.	100 µs; F-DQ; 150 µs DIQ
Parallel switching of two outputs	
• for uprating	No
• for redundant control of a load	No F-DQ; Yes DIQ
Switching frequency	
• with resistive load, max.	30 Hz F-DQ; 100 Hz DIQ
• with inductive load, max.	0.1 Hz F-DQ; 0.5 Hz DIQ
• on lamp load, max.	30 Hz F-DQ; 100 Hz DIQ
Cable length	
• unshielded, max.	30 m; 10 m F-DQ in hardware revision FS-01 for burner applications related to EN 298
Encoder	
Connectable encoders	
• 2-wire sensor	No F-DI; Yes DIQ
– permissible quiescent current (2-wire sensor), max.	0.5 mA F-DI; 1.5 mA DIQ
IO-Link	
Number of ports	1
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	Yes
Transmission rate	4.8 kBd (COM1); 38.4 kBd (COM2)
Cycle time, min.	2 ms
Size of process data, input per port	33 byte
Size of process data, input per module	33 byte
Size of process data, output per port	32 byte
Size of process data, output per module	32 byte
Memory size for device parameter	2 kbyte
Master backup	Possible with function block IO_LINK_MASTER
Configuration without S7-PCT	Possible; autostart/manual function
Cable length unshielded, max.	20 m
Connection of IO-Link devices	
• Port type A	Yes; via 3-core cable
• Port type B	Yes; additional device supply: max. 2 A; also available with integrated Safety Shutdown via F-DQ 2

Article number	**6ES7146-6FF00-0BB0**
Interfaces	
Number of PROFINET interfaces	1
1. Interface	
Interface type	PROFINET with 100 Mbit/s full duplex (100BASE-TX)
Interface types	
• M12 port	Yes; 2x M12, 4-pin, D-coded
• Number of ports	2
• integrated switch	Yes
Protocols	
• PROFINET IO Device	Yes
• Open IE communication	Yes
PROFINET IO Device	
Services	
– IRT	No; module will participate within an IRT topology
– Prioritized startup	No
– Shared device	Yes
– Number of IO Controllers with shared device, max.	2
Interface types	
M12 port	
• Autonegotiation	Yes
• Autocrossing	Yes
• Transmission rate, max.	100 Mbit/s
Protocols	
Supports protocol for PROFINET IO	Yes
PROFIsafe	Yes
EtherNet/IP	No
Modbus TCP	No
Redundancy mode	
• PROFINET system redundancy (S2)	Yes
• PROFINET system redundancy (R1)	No
• H-Sync forwarding	No
Media redundancy	
– MRP	Yes
Open IE communication	
• TCP/IP	No
• SNMP	Yes
• DCP	Yes
• LLDP	Yes
• ping	Yes
• ARP	Yes
Interrupts/diagnostics/status information	
Substitute values connectable	Yes

Article number	6ES7146-6FF00-0BB0
Alarms	
• Diagnostic alarm	Yes; Parameterizable
• Maintenance interrupt	Yes; Parameterizable
• Hardware interrupt	Yes; Parameterizable
Diagnoses	
• Diagnostic information readable	Yes
• Monitoring the supply voltage	Yes
– parameterizable	Yes
• Wire-break	Yes; DI, input current < 0.3 mA, per channel
• Wire-break in actuator cable	Yes
• Short-circuit	Yes; F-DI, F-DQ, DIQ as output, encoder supply
Diagnostics indication LED	
• RUN LED	Yes; green LED
• ERROR LED	Yes; red LED
• MAINT LED	Yes; Yellow LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green LED
• NS LED	No
• MS LED	No
• IO LED	Yes; red/green/yellow LEDs
• Channel status display	Yes; green LED
• for channel diagnostics	Yes; red LED
• For load voltage monitoring	Yes; green LED
• Connection display LINK TX/RX	Yes; green LED, only link
Potential separation	
between the load voltages	Yes
between Ethernet and electronics	Yes
Potential separation channels	
• between the channels	Yes
• between the channels and the power supply of the electronics	4 F-DI / 4 DIQ / 1 IO-LINK are non-isolated and 3 F-DQ are isolated from supply voltage 1L+
Isolation	
tested with	
• 24 V DC circuits	707 V DC (type test)
• Test voltage for interface, rms value [Vrms]	1 500 V; According to IEEE 802.3
Degree and class of protection	
IP degree of protection	IP65/67/69K
Standards, approvals, certificates	
Suitable for safety-related tripping of standard modules	No
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLd (F-DI single-channel, F-DQ with dark test disabled), PLe (F-DI two-channel, F-DQ with dark test enabled)

Article number	**6ES7146-6FF00-0BB0**
• Category according to ISO 13849-1	Cat. 3 (F-DI single-channel, F-DQ with dark test disabled), Cat. 4 (F-DI two-channel, F-DQ with dark test enabled)
• SIL acc. to IEC 61508	SIL 2 (F-DI single-channel, F-DQ with dark test disabled), SIL 3 (F-DI two-channel, F-DQ with dark test enabled)
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL2	< 8.00E-05 F-DI; < 3.00E-04 F-DQ for altitude <= 5 000 m
– Low demand mode: PFDavg in accordance with SIL3	< 7.00E-05 F-DI; < 8.00E-05 F-DQ for altitude <= 5 000 m
– High demand/continuous mode: PFH in accordance with SIL2	< 1.00E-09 1/h F-DI; < 5.00E-09 1/h F-DQ for altitude <= 5 000 m
– High demand/continuous mode: PFH in accordance with SIL3	< 6.00E-10 1/h F-DI; < 4.00E-09 1/h F-DQ for altitude <= 5 000 m
Use in hazardous areas	
• Explosion protection category for gas	ATEX, UKEX, IECEx, CCCEx for Zone 2
• Explosion protection category for dust	ATEX, UKEX, IECEx, CCCEx for Zone 22
Security	
signed firmware update	Yes
safely removing data	Yes
Ambient conditions	
Ambient temperature during operation	
• min.	-25 °C
• max.	60 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	Up to max. 5 000 m, at installation height > 2 000 m additional restrictions
Connection method	
Design of electrical connection	4/5-pin M12 circular connectors
Design of electrical connection for the inputs and outputs	M12, 5-pin, A-coded
Design of electrical connection for supply voltage	M12, 4-pin, L-coded
Dimensions	
Width	45 mm
Height	200 mm
Depth	48 mm
Weights	
Weight, approx.	900 g

Power reduction (derating) to total current of sensor supplies, actuator supplies, and outputs per module

The following derating tables show the load capacity of the sensor supplies, actuator supplies, and outputs in relation to the ambient temperature:

	Up to 40 °C	Up to 50 °C	Up to 60 °C
Total current of the outputs X10-X11 (DIQ_0 - DIQ_3 via 1L+)	2 A	1.5 A	1 A
Total current of the sensor supplies X10-X13 (U_{S0} - U_{S1}, and V_{S0} - V_{S3} via 1L+)	3 A	2.5 A	2 A
Total current of the actuator supplies X14-X16 (U_{S2} - U_{S4} via 1L+)	3 A	2.5 A	2 A
Total current of the fail-safe outputs X14-X16 (FDQ_0 - FDQ_2 via 2L+)	4 A	3.5 A	3 A

Refer to "Connecting cables for ET 200eco PN M12-L" in the *Distributed I/O System ET 200eco PN M12-L System Manual* (https://support.industry.siemens.com/cs/ww/en/view/109778292) for more information about derating of input currents to the module.

Fail-safe response times

B

B.1 Maximum response time of the system

This section shows the response times of the F-DI 4/F-DQ 2/ DIQ 4/IOL 1 Fail-safe module. The response times are included in the calculation of the F-system response time.

Times required for the calculation

T_{cycle} 11 ms	Firmware cycle time: This is the maximum internal cycle time of the fail-safe module.
T_{DAT_i} 18 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the fail-safe module's digital inputs to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

You assign the "Maximum readback time" and "Maximum readback time switch on test" settings in STEP 7.

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times (https://support.industry.siemens.com/cs/us/en/view/58856512)" Excel file (RT_calculator). Use your configured individual fail-safe module timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{cycle} parameter values include an allowance for the fail-safe module to acquire and deliver PROFIsafe messages in transactions with the PLC I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe module location and the fail-safe CPU. There are no separate transport delay parameters that you must include in your calculations.

B.2 Response time parameters for the ET 200eco PN F-I/O M12-L digital inputs

Maximum reaction time for 1oo1 fail-safe digital inputs

$T_{WCDT_i} = (2 \times T_{cycle}) + T_{filter} + T_{sct} + T_{stup}$

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input to the availability of the PROFIsafe message frame for request from the fail-safe CPU.
T_{filter}	Configured "Input filters" time for the channel
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in the equation for T_{WCDT_i} if the short-circuit test is configured).
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test is configured • Duration of the startup time

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

Maximum reaction time for 1oo2 fail-safe digital inputs

$T_{WCDT_i} = (2 \times T_{cycle}) + T_{filter}$ + SUM (T_{sct} primary input, T_{sct} secondary input) + SUM (T_{stup} primary input, T_{stup} secondary input)

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input to the availability of the PROFIsafe message frame for request from the fail-safe CPU.
T_{filter}	Configured "Input filters" time for the channel
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in the equation for T_{WCDT_i} if the short-circuit test is configured).
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test is configured • Duration of the startup time

Maximum fault reaction time for 1oo2 fail-safe digital input discrepancy errors

$T_{OFDT_i} = (2 \times T_{cycle}) + T_{filter} + T_{dis} + MAX (SUM (T_{sct}$ primary input, T_{stup} primary input, T_{sct} secondary input, T_{stup} secondary input), $T_{cycle})$

An activated short-circuit test summation is included for each sensor supply.

Where:

T_{OFDT_i}	One Fault Delay Time: Maximum response time for the F-DI 1oo2 channel to report as passivated
T_{dis}	Discrepancy time: • Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" • Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior
T_{sct}	Time delay for short-circuit test: • "0" if no short-circuit test is configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in the equation for T_{WCDT_i} if the short-circuit test is configured).
T_{stup}	Startup time after short-circuit test completion: • "0" if no short-circuit test configured • Duration of the startup time

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

The term "MAX (SUM (T_{sct} primary input, T_{stup} primary input, T_{sct} secondary input, T_{stup} secondary input), T_{cycle})" includes an addition T_{cycle} to ensure that the minimum amount of time for a complete firmware cycle is included. This applies to situations where the summation of the short-circuit times are less than the time of a firmware cycle.

Maximum fault reaction time for external short-circuit errors on the fail-safe digital inputs

$T_{OFDT_isc} = (2 \times T_{cycle}) + T_{filter} + T_{scf}$

Where:

T_{OFDT_isc}	One Fault Maximum Delay Time: Maximum delay time to passivate an F-DI channel with an external short-circuit.
T_{filter}	Configured "Input filters" time for the channel
T_{scf}	T_{base} + MAX (T_{fmax} - T_{othr}, 0): The total time interval for short-circuit testing for all channels whose short-circuit test is enabled • T_{base} = SUM (T_{dur}): The total test duration for all channels where short-circuit testing is enabled. This includes both the short-circuit test durations and sensor startup times. • $T_{othr} = T_{base}$ - MAX (T_{dur}): The total test duration for all channels other than the channel with the largest duration • T_{fmax} = MAX (T_{filter}) + 1: Maximum filter of all channels where short-circuit testing is enabled

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

B.3 Response time parameters for the ET 200eco PN F-I/O M12-L digital outputs

Maximum reaction time for the fail-safe digital outputs

$T_{WCDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{WCDT_q}	Maximum response time of the F-DQ DC from the receipt of a safety message frame from the safety program in the fail-safe CPU to the signal transition at the digital output
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel

The term "2 x T_{cycle}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

After the F-DQ DC commands the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Maximum fault reaction time for the fail-safe digital outputs

$T_{OFDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{OFDT_q}	One Fault Delay Time: Maximum response time for the F-DQ DC to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel

Maximum fault reaction time for the fail-safe digital outputs with the Dark Test disabled

$T_{OFDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycle}$

Where:

T_{OFDT_q}	One Fault Delay Time: Maximum response time for the F-DQ DC to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel

NOTE

When dark testing is disabled for a given output, particular channel faults for this output might not be detected until a process value change occurs from "1" to "0". When dark testing is disabled and the process value is "1" for a given channel, the various safety measures do not manipulate the respective output switches.

B.4 Response time parameters for the ET 200eco PN F-I/O M12-L embedded safety functions

Maximum reaction time for an embedded safety function

$T_{WCDT_esf} = MAX (T_{WCDT(1oo1)}, T_{WCDT(1oo2)}) + MAX (T_{WCDT_q})$

Where:

T_{WCDT_esf}	Worst Case Delay Time: Maximum response time from a signal transition at the digital input(s) to a corresponding action at the specified digital output(s)
$T_{WCDT(1oo1)}$	$T_{filter} + T_{sct} + T_{stup}$ • T_{filter}: Configured "Input filters" time for the channel • T_{sct}: Time delay for short-circuit test: – "0" if no short-circuit test is configured – "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured • T_{stup}: Startup time after short-circuit test completion: – "0" if no short-circuit test configured – Duration of the startup time
$T_{WCDT(1oo2)}$	T_{filter} + MAX (T_{sct} primary input, T_{sct} secondary input) + T_{stup} • T_{filter}: Configured "Input filters" time for the channel • T_{sct}: Time delay for short-circuit test: – "0" if no short-circuit test is configured – "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured • T_{stup}: Startup time after short-circuit test completion: – "0" if no short-circuit test configured – Duration of the startup time
T_{WCDT_q}	T_{rb} + MAX(T_{rb}, T_{rb_swon}) • T_{rb}: Configured "Maximum readback time" for the channel • T_{rb_swon}: Configured "Maximum readback time switch on test" for the channel

MAX ($T_{WCDT(1oo1)}$, $T_{WCDT(1oo2)}$) applies to each individual 1oo1 and/or 1oo2 input used with the respective embedded safety function. Each input is calculated separately and the maximum time applied.

T_{WCDT_q} applies to each output used within the respective embedded safety function. Each output is calculated separately and the maximum time applied.

Maximum fault reaction time for an embedded safety function

$T_{_OFDT_esf}$ = MAX ($T_{OFDT(1oo1)}$, $T_{OFDT(1oo2)}$) + MAX (T_{OFDT_q})
Where:

T_{OFDT_esf}	One Fault Delay Time: Maximum response time for the safety function to turn an output OFF. Refer to the individual $_{OFDT}$ fault reaction time calculations.
$T_{OFDT(1oo1)}$	T_{filter} + SUM (T_{sct} + T_{stup} + T_{cycle}) • T_{filter}: Configured "Input filters" time for the channel • T_{sct}: Time delay for short-circuit test: – "0" if no short-circuit test is configured – "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured • T_{stup}: Startup time after short-circuit test completion: – "0" if no short-circuit test configured – Duration of the startup time
$T_{OFDT(1oo2)}$	T_{filter} + MAX (T_{dis}, SUM (T_{sct} + T_{stup} + T_{cycle}) • T_{filter}: Configured "Input filters" time for the channel • T_{dis}: Discrepancy time – Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" – Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior – "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • T_{sct}: Time delay for short-circuit test: – "0" if no short-circuit test is configured – "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured • T_{stup}: Startup time after short-circuit test completion: – "0" if no short-circuit test configured – Duration of the startup time
T_{OFDT_q}	T_{rb} + MAX (T_{rb}, T_{rb_swon}) • T_{rb}: Configured "Maximum readback time" for the channel • T_{rb_swon}: Configured "Maximum readback time switch on test" for the channel

MAX ($T_{OFDT(1oo1)}$, $T_{OFDT(1oo2)}$) applies to each input used within the respective embedded safety function. Each input is calculated separately and the maximum time applied.

T_{OFDT_q} applies to each output used within the respective embedded safety function. Each output is calculated separately.

Switching of loads

C

C.1 Connecting capacitive loads

If a fail-safe module is interconnected with loads that require little current and have capacitance, it is important that the readback time parameters are set to a large enough value to allow the capacitive load time to charge or discharge. If the value is too small, the module could issue a diagnostic error due to the load not responding with the correct process value in time. To avoid this, you must calculate appropriate readback time values. This ensures that your load does not respond to test pulses but has sufficient time to react to changes of the process value. Load capacitance can delay the diagnostic voltage response at the P- and M-switches of the fail-safe module's digital outputs. The pattern testing of this module requires the voltage at the P- and M-switches to be nearly zero across the load whenever the process value is "1".

You can place a diode between the P-switch and the capacitive load. This ensures that when the output is turned off, the voltage on the capacitor is not present at the P-switch during diagnostic testing. Typically, this diode is built into power supplies with input capacitors that have reverse voltage protection implemented. Using an additional diode can greatly reduce the "Maximum readback time". The reduced "Maximum readback time" allows the load to operate normally (load stays ON) during diagnostic testing. Alternatively, you can change the parameterization of a channel to not perform dark testing by selecting the check box for the "Disable Dark Test (max. SIL2, CAT3, PLd)" parameter.

Stray capacitance between the load circuit/wiring and ground, as well as between M and P, can increase the time needed for the "Maximum readback time switch on test". During module diagnostics when the P- or M-switch is turned on to a load that is not powered during bit pattern testing, both sides of the load are influenced by stray capacitance. This effect is typically minor, but it is important for the "Maximum readback time switch on test" duration to be long enough for the load circuit voltage to react, yet short enough that if one side of the load connects to P or M, the testing of the opposite switch does not cause the load to react.

Capacitive loads with low series resistance, including power supplies with input capacitors, can experience large inrush current. To avoid this, you should add series resistance to reduce inrush on large capacitive loads. Doing so reduces inrush current and minimizes risk of blown fuses or overcurrent fault detection during normal load switch-on events.

C.2 Switching of inductive loads

The diagram below shows the maximum permitted inductive load and switching frequency allowed using only the internal suppression circuits of the fail-safe module digital outputs. You should equip larger or more frequently switched inductive loads with external suppression circuits to avoid early failure of the fail-safe module digital output switch. External suppression conducts the load current at a voltage less than the internal suppression threshold to avoid overloading the internal suppression.

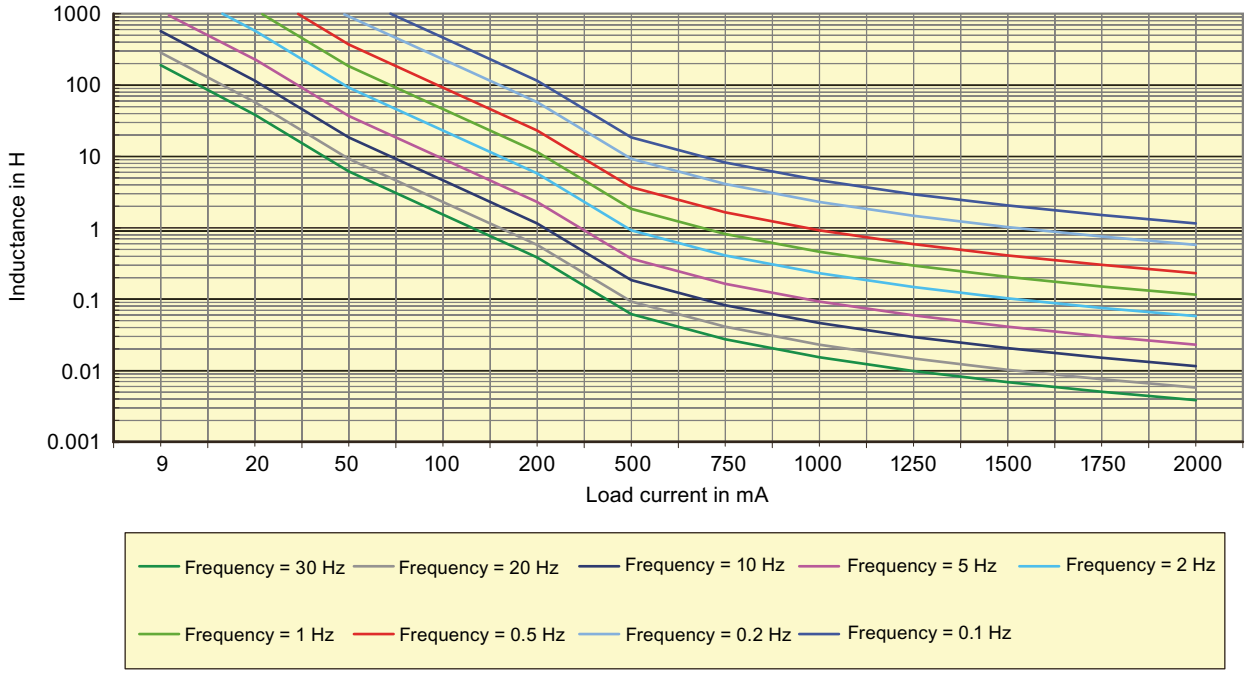

Figure 1-847 Switching of inductive loads depending on the load current and switching frequency

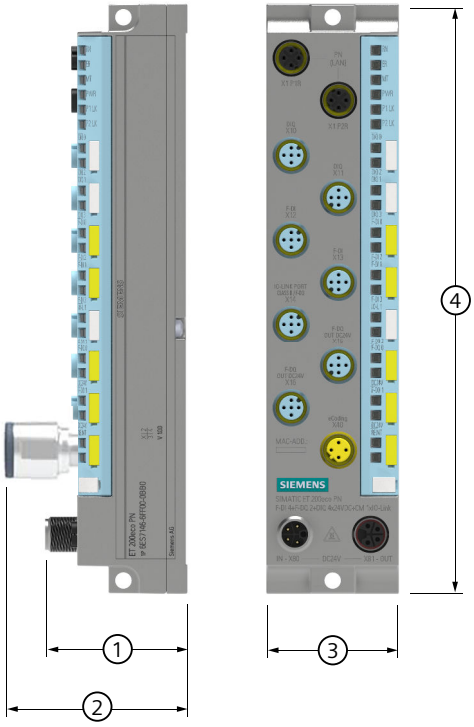
NOTE

Minimum permissible OFF time for fail-safe digital outputs

The fail-safe module's digital outputs expect to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than T_{WCDT_q} can cause the channel to passivate.

⚠ WARNING

Failures of unsuppressed inductive loads



The following failures can result from a lack of suppression of inductive loads:

- Unsuppressed inductive loads can lead to early "stuck-on"" failures of the Fail-safe module digital outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads.
Failure to observe proper precautions can result in death, severe personal injury, and/or property damage.

Dimension drawing

The following figure shows the dimension drawing of the ET 200eco PN M12-L F mix module in side and front view:

①	Depth	48 mm
②	Depth with eCoding Plug installed	65 mm
③	Width	45 mm
④	Height	200 mm

Communication protocols and ports

E

You can find tables showing the different layers and protocols used in ET 200 interface modules in the S7-1500/ET 200 Communication Function Manual (https://support.industry.siemens.com/cs/ww/en/view/59192925/184317883915). The layers and protocols used by the ET 200eco PN M12-L F module are the same, with the following exceptions:

Protocol / Role	Port number	(2) Link layer (4) Transport layer	Description / function	Default setting / notes
Connection-oriented communication protocols				
IGMPv2	Not relevant	(3) Network layer	Internet Group Management Protocol. IGMPv2 is a network protocol for the organization of multicast groups (UDP multicast only).	IGMPv2 is a functionality of the IP stack. This system function is activated by the multicast function.
MODBUS TCP Slave	502	(4) TCP	MODBUS Transmission Control Protocol.	Default: Deactivated. Can be activated via MultiFieldbus Configuration Tool (MFCT).
EtherNet/IP CIP	44818 (TCP) 2222 (UDP)	(4) TCP (4) UDP	The EtherNet/IP protocol and Common Industrial Protocol (CIP) protocols enable communication between interface modules and CPUs. EtherNet/IP use MultiFieldbus devices for data exchange. CIP Implicit Messaging is used for the continuous transmission of real-time data in time-critical applications. CIP Explicit Messaging is used for the targeted retrieval or transmission of configuration and diagnostic data.	Default: Deactivated. Can be activated via MultiFieldbus Configuration Tool (MFCT).

Product Information for ET 200eco PN M12-L System Manual to add the F-DI 4 x 24 VDC, 2xM12, F-DQ 2 x 24 VDC/2.0A PM, 2xM12, DIQ 4 x 24 VDC, 1xM12, IO-Link Class B, 1xM12

Product Information

Validity

Scope of the product information

This product information amends the *ET 200eco PN M12-L Distributed I/O system ET 200eco PN System Manual* (https://support.industry.siemens.com/cs/us/en/view/109778292) to include the ET 200eco PN M12-L Fail-safe module.

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://new.siemens.com/cert.

This document contains the following updates

- Addition of Special information (Page 1)
- Change to "What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?" (Page 2)
- Change to Components table (Page 3)
- Change to "Rules and regulations for operation" (Page 6)
- Addition of "What are fail-safe automation systems and fail-safe modules?" (Page 6)
- Addition of "Additional rules and regulations for the operation of the ET 200eco PN M12-L with fail-safe modules" (Page 8)
- Change to Y cable and addition of Inverted Y cable (Page 9)
- Change to Configuration software and requirements table (Page 10)
- Addition of "Assigning the PROFIsafe addresses" (Page 10)
- Changes and additions to Standards and authorizations (Page 11)
- Additions to "Accessories/spare parts" (Page 12)
- Additions to "Glossary" (Page 12)

Addition of Special information

The following supplements "Introduction", "Standards":

Maintaining operational safety of your plant

NOTE

Operators of plants with safety-related features must meet operational safety requirements. Suppliers must also take measures when monitoring products.

To stay up-to-date on the latest operational safety requirements, visit the Siemens Industry Online Support (https://support.industry.siemens.com/) site and subscribe to email notifications:

1. Follow one of the links below:
   - SIMATIC S7-1200 G2/SIMATIC S7-1200 G2 F (https://support.industry.siemens.com/cs/us/en/ps/30068)
   - Distributed I/O (https://support.industry.siemens.com/cs/ww/en/ps/14029)
   - STEP 7 TIA Portal (https://support.industry.siemens.com/cs/ww/en/ps/14667)
2. To subscribe to notifications, select "email on update".

NOTE

To reduce the risks associated with malicious or counterfeit CPUs and modules, use only official sales channels, such as the following:

- Siemens Industry Mall
- Official Siemens distributors
- Country-specific official Siemens sales and distribution channels

NOTE

To reduce the risks associated with compromised CPU or module firmware, only download firmware from the Siemens Industry Online Support website and verify the file integrity against the associated published SHA checksum.

NOTE

To reduce the risk of physical tampering with critical industrial equipment, implement the measures defined in the Operational guidelines (https://www.siemens.com/global/en/products/services/cert/news/operational-guidelines-for-industrial-security.html).

Change to "What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?"

The following is a correction to "What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?", "Customer benefits of the system":

Easy to use

- Simple wiring through coded M12 connections
- CAx compliant labeling of all interfaces
- Quick, comfortable configuration and commissioning viaSTEP 7 (TIA Portal)

Simple power supply concept

- High power input through power connector M12-L
- Supply of 2 power supplies isolated from each other

Compact design

- High IP quantity structures for module widths of 45 mm
- High degree of protection IP65/IP67 and IP69K
- Suitable for temperatures from -40 ° C to +60 °C and accelerations up to 20 g

Communication standards

- PROFINET IO
- EtherNet/IP
- Modbus TCP

Flexible mounting

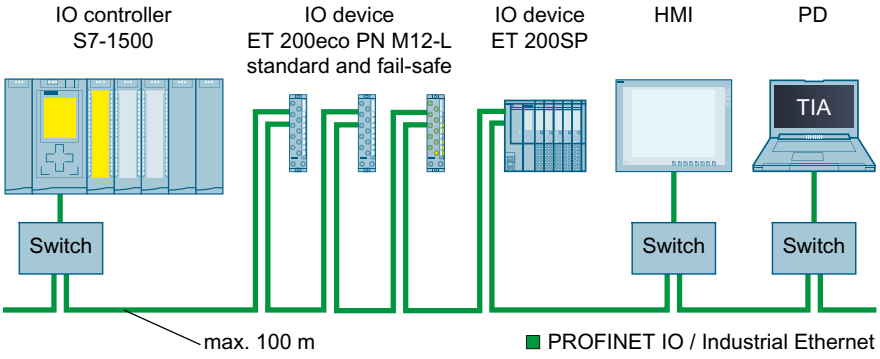
- Simple installation in all mounting positionseven in the very confined
- Spatially separated assemblyof the I/O devices
- Integration of sensor technology and actuator technology via M12 connection technology

Flexible automation concepts

- Access of multiple controllers with shared device and module-internal shared input / shared output (MSI/MSO)
- Deterministic connection of the sensors / actuators by means of clock-synchrono-us operation
- Use in fault-tolerant applications using S2 redundancy

Figure 1 Row of connected devices (M12-L Standard and Fail-safe)

The following is a correction to "What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?", "Configuration example of the ET 200eco PN M12-L":



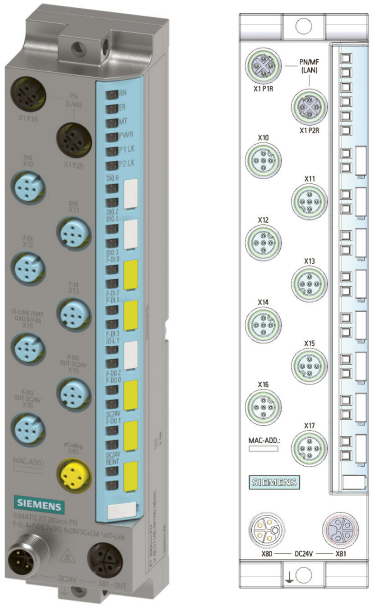


Figure 2 Configuration Example with M12-L F

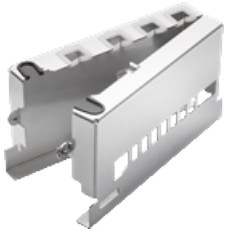
Change to Components table



The following is a correction to "Components", "Overview of components":

Components of the ET 200eco PN M12-L distributed I/O system
The following table shows and explains the function of the most important components of the ET 200eco PN M12-L distributed I/O system:

Table 1 Overview of components

Component	Function	Figure
I/O devices	• The I/O devices form the interface to the process. • Recording and controlling of the current process status via the connected sensors and actuators	
Mounting rail	• Simple installation of several I/O devices next to one another • Without drilling holes for I/O devices	
Profile screws for mounting rail	• Suitable screw for mounting the I/O device on the mounting rail	

Component	Function	Figure
Identification labels	• The identification labels come with the module and can be machine printed. • Can be ordered separately (white or yellow (used on fail-safe modules)).	
Sealing cap	• Caps for unused connections • IP protection class is maintained through use.	
PROFINET IO cable and M12-D plug	• Connection to the MultiFieldbus	
eCoding plug	• Electronic coding element has an electronic, rewritable memory for module-specific fail-safe addressing data, such as the F-destination address.	
Power connecting cable and M12-L plug / coupling	• Connection of supply and load voltages • Looping through of supply and load voltages to other devices	

Component	Function	Figure
Y cable	• Double connection of actuators or sensors to one socket • IP protection class is maintained when 2 actuators or sensors are connected to one socket.	
Y-connector	• Double connection of actuators or sensors to one socket • IP protection class is maintained when 2 actuators or sensors are connected to one socket.	
Plug cover	• For use in Zone 2 / Zone 22 hazardous area.	

Change to "Rules and regulations for operation"

The following supplements "Rules and regulations for operation", "24 V supply" after the last bullet:

- Sustained operation of the fail-safe modules above 28.8 V DC can cause injury to personnel and equipment damage.

⚠ WARNING

Sustained operation of fail-safe modules above 28.8 V DC

Sustained operation of fail-safe modules above 28.8 V DC can cause injury to personnel and equipment damage.

Defined transients from defined source impedances (for example, EN 61000-4-2, 61000-4-4, and 61000-4-5), as specified in the "Electromagnetic compatibility" section, can be imposed on this voltage without interruption operation or causing damage.

Operate the fail-safe module within the voltage parameters in technical specifications to prevent unacceptable temperature rise and thermal damage that can cause the product to become inoperable.

Failure to operate the fail-safe module within the defined voltage parameters can result in death, severe personal injury, and/or property damage.

Requirements for power supplies in the event of voltage interruption

To ensure adherence to IEC 61131-2, only use power packs/power supply units (https://support.industry.siemens.com/cs/ww/en/) (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirement in your product standards (for example, 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions.

Addition of "What are fail-safe automation systems and fail-safe modules?"

Description of change to manual

The following supplements "System overview" after "What are the SIMATIC ET 200eco PN M12-L distributed I/O devices?":

What are fail-safe automation systems and fail-safe modules?

SIMATIC ET 200eco PN M12-L Fail-safe system
The objective of safety engineering is to minimize danger to humans and the environment as much as possible through use of safety-oriented technical installations without restricting industrial production and the use of machines and chemical products any more than necessary. The SIMATIC safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency STOP devices for machining and processing equipment).

What are fail-safe automation systems?
Safety-related automation systems are primarily concerned with applications whose failure could have impact upon the safety of people and/or the environment. As a result, safety-related systems are used to mitigate hazards or failures that are likely to cause physical harm. Their intent is to achieve safety to an acceptable level of tolerable risk.
F-systems serve to control processes and ensure safe states upon detected failures. Failures are detected using very high levels of diagnostic coverage. Upon detection of failures, actions are taken to attempt to bring the respective application to a safe state.
F-systems provide improved fault detection and fault localization through detailed diagnostic identification and reporting. This is the primary difference between fail-safe systems and standard systems. Use of fail-safe systems should be considered for applications in which hazards are inherently present and may result in physical harm.

What are fail-safe modules?
The fail-safe CPU (F-CPU) communicates with the fail-safe modules via the PROFIsafe protocol.
Fail-safe digital I/O modules detect the signal states of safety-oriented sensors and cause safety-related shutdown procedures with short-circuit and cross-circuit protection up to the actuator.

Use in SIMATIC Safety F-systems
ET 200eco PN M12-L fail-safe modules can be used with the *STEP 7 Safety Advanced V20* or later using PROFINET configuration, together with an F-CPU.

Achievable safety classes
SIMATIC Safety fail-safe systems can satisfy the following safety requirements:

Table 2

Safety class		
According to IEC 61508	**According to ISO 13849-1**	
SIL 2	Category 3	(PL) Performance Level d
SIL 3	Category 3	(PL) Performance Level e
SIL 3	Category 4	(PL) Performance Level e

⚠ WARNING

The safety performance of your installation depends on your design and continued maintenance of each complete safety function.
SIMATIC Fail-safe CPUs and ET 200eco PN M12-L Fail-safe modules provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions.
You must choose all components of your installation and complete your design and maintenance according to accepted safety standards and practices to achieve your required level of safety.
Failure to comply with these guidelines could cause damage or unpredictable operation which can result in death, severe personal injury, and/or property damage.

Addition of "Additional rules and regulations for the operation of the ET 200eco PN M12-L with fail-safe modules"

Description of change to manual

The following supplements "Additional rules and regulations for ET 200eco PN M12-L with fail-safe modules" before "Connecting", "Operation on grounded/non-grounded infeed":

Safety extra-low voltage (SELV, PELV) for fail-safe modules

⚠ WARNING

Operation of fail-safe modules with safety extra-low voltage (SELV, PELV)
You can find more information on safety extra-low voltage (SELV, PELV) in the data sheets of the applicable power supplies, for example.
The fail-safe modules operate with the 24 V DC rated voltage. The tolerance range is 20.4 V DC to 28.8 V DC.
Within the overvoltage range from 28.8 V DC to 35 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 35 V DC, the F-modules are permanently de-energized.
Use a power supply unit that does not exceed U_m = 35 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g. use of an overvoltage protector.
All system components that can supply electrical energy in any form whatsoever must fulfill this condition.
Each additional circuit (24 V DC) used in the system must have a safety extra-low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.
Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safety extra-low voltage (SELV, PELV) as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.
Failure to operate fail-safe modules with safety extra-low voltage (SELV, PELV) can result in death, severe personal injury, and/or property damage.

⚠ WARNING

Permissible potential difference

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.

An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage U_m to be exceeded.

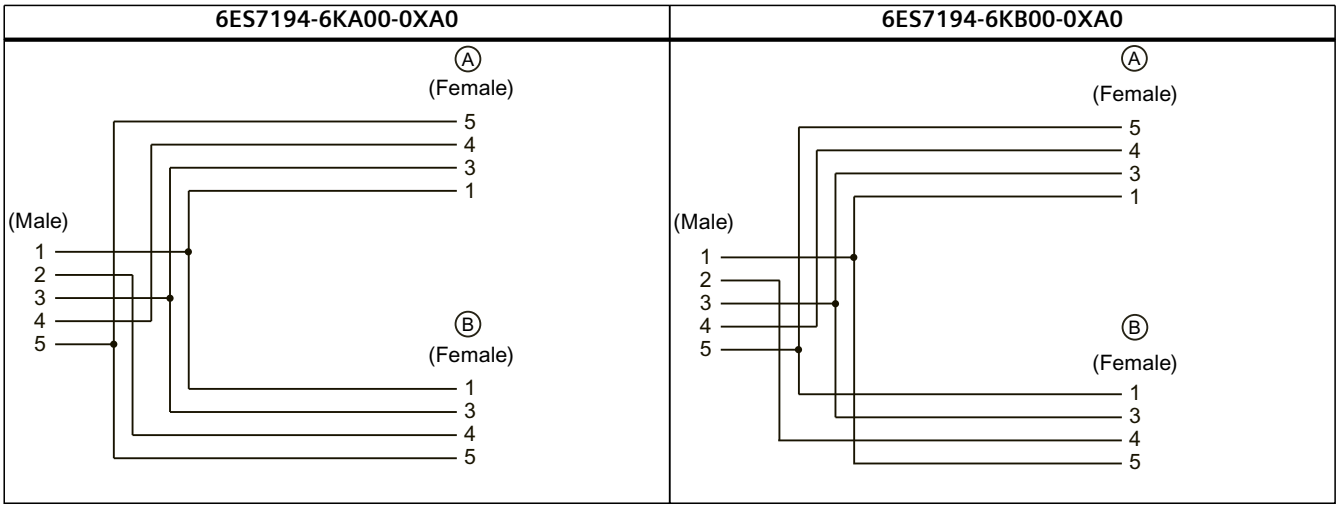
Exceeding the fault voltage U_m can result in death, severe personal injury, and/or property damage.

Change to Y cable and addition of Inverted Y cable

The following is a correction to "Wiring", "Y-connection":

Y cables

Use of the Y cable is recommended when two channels are occupied for each socket of the distributed I/O device. The Y cable distributes the channels to two circular connectors as follows:



- Y cable (6ES7194-6KA00-0XA0) allows you to connect two actuators or sensors for double connection of inputs (including fail-safe inputs) or for double connection of outputs with one cable.
- Y cable (6ES7194-6KB00-0XA0) allows you to connect two sensors for double connection of fail-safe inputs with one cable.

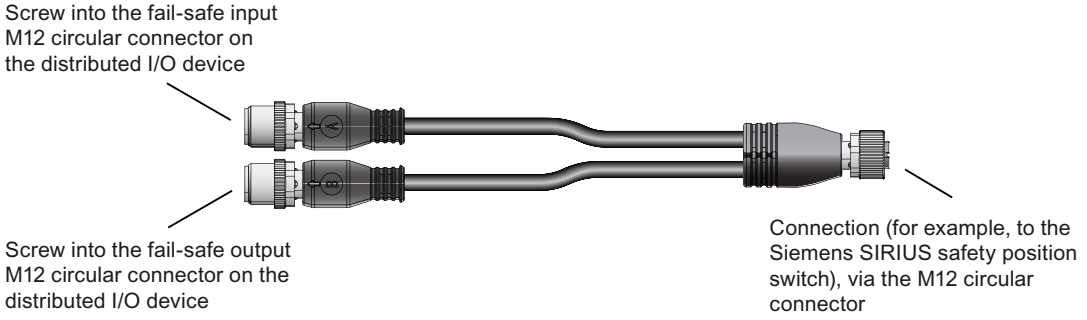
Refer to the respective product user manual for connection details.

Figure 3 Y cable (6ES7194-6KA00-0XA0 or 6ES7194-6KB00-0XA0)

Wiring of the Y cable (6ES7194-6KA00-0XA0 or 6ES7194-6KB00-0XA0) is shown below:

Inverted Y cable

Inverted Y cable (6ES7194-6KC00-0XA0) provides a method of connecting fail-safe inputs and a fail-safe output to an I/O device (for example, Siemens SIRIUS safety position switch with an interlock) with one cable.
Refer to the respective product user manual for connection details.



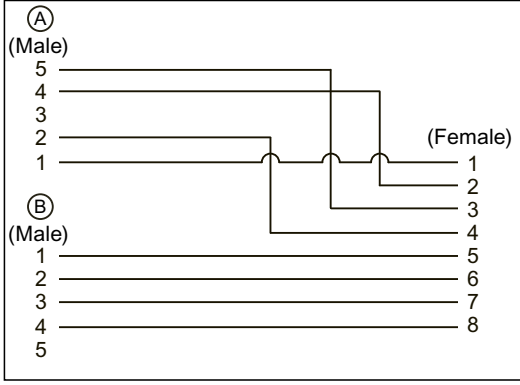


Figure 4 Inverted Y cable (6ES7194-6KC00-0XA0)

Wiring of the inverted Y cable (6ES7194-6KC00-0XA0) is shown below:

6ES7194-6KC00-0XA0	
	

Change to Configuration software and requirements table

The following supplements "Configuring the ET 200eco PN M12-L", "Requirements for installation" to add new rows at the top of the table:

Configuration software	Requirements	Installation information
STEP 7 (TIA Portal) as of V20	PROFINET	STEP 7 online help
STEP 7 (TIA Portal) as of V20	PROFINET GSD file	The GSD versions are largely downward compatible.

Addition of "Assigning the PROFIsafe addresses"

The following supplements "Configuring" after "MF Shared Device":

Assigning the PROFIsafe addresses
The F-destination address is saved permanently on the eCoding plug of the ET 200eco PN M12-L F Fail-safe modules.

NOTE
During assignment of the PROFIsafe addresses, the F-modules must be supplied with supply voltage 1L+.

NOTE
Note the following in conjunction with configuration control:
Before you can use configuration control together with F-modules, you must assign the PROFIsafe addresses to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the PROFIsafe addresses, refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/us/en/view/54110126).

Changes and additions to Standards and authorizations

The following are corrections to "Codes and approvals" in their respective sections:

CE marking

The ET 200eco PN M12-L distributed I/O system fulfills the requirements and protection targets of the following directives and complies with the harmonized European standards (EN) which have been promulgated for programmable logic controllers in the official gazettes of the European Community:

- 2014/30/EU "Electromagnetic Compatibility" (EMC guidelines)
- 2011/65/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (RoHS Directive)

The fail-safe modules belonging to the ET 200eco PN M12-L distributed I/O system satisfy requirements and safety-related objectives according to the EC directives listed below and conform to the harmonized European standards (EN) for the programmable controllers listed in the Official Journals of the European Union:

- 2014/30/EU "Electromagnetic Compatibility" (EMC guidelines)
- 2011/65/EU "Equipment and protective systems intended for use in potentially explosive atmospheres" (RoHS Directive)
- 2006/42/EC "Machinery Directive"

The EU declarations of conformity are also available for download from the Siemens Industry Online Support Web site, under the keyword “Declaration of Conformity”.

UKCA mark

The object of the declaration described above is in conformity with the relevant Union harmonisation legislation and the designated British regulations, depending on the components used, as described in Annexes EMC 1, EMC 2, ATEX/UKEX, RoHS, which are an integral part of this declaration of conformity:

- Directive of the European Parliament and of the Council of 26 February 2014 and the harmonisation of the laws of the Member States relation to electromagnetic compatibility; Official Journal of the EU L96, 29/03/2014, p. 79-106
- Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations 2016 (S.I. 2016 No. 1107), and related amendments
- Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012 (S.I. 2012 No. 3032), and related amendments
- Supply of Machinery (Safety) Regulations 2008 (S.I. 2008 No. 1597), and related amendments for ET 200eco PN M12-L safety components (fail-safe modules)

UK Declarations of Conformity are available to the relevant authorities at the following address:
Siemens Aktiengesellschaft
Digital Factory
Factory Automation
DI FA TI COS TT
Postfach 1963
D-92209 Amberg

Additions to "Accessories/spare parts"

The following is a correction to "Accessories/spare parts", "Y-connection":

Table 3 Y cables

Designation		Article number
SIMATIC DP, Y cable for distributed I/O for double connection of F-DI with one cable, 5-pin M12	200 mm	6ES7194-6KB00-0XA0
SIMATIC DP, Inverted Y cable for distributed I/O for connecting an F-DI and F-DQ with one cable, 5-pin M12	200 mm	6ES7194-6KC00-0XA0

Change to "Accessories/spare parts", "Additional accessories" adds the following rows at the end of the table:

Designation	Article number
eCoding plug Stores the F-destination and F-source addresses for F-modules	6ES7194-6KB01-0AA0
Identification labels 10 x 5 mm RAL1018, yellow, composed of 200 labels on frames, 40 labels per frame	6ES7194-2BB00-0AA0
Identification labels 10 x 7 mm, yellow, composed of 816 labels on frames, 48 labels per frame (used on eCoding plug)	6ES7194-6HA00-0AA0

Additions to "Glossary"

The following supplements the Glossary with terms used in the context of fail-safe modules:

1oo1
A functional safety architecture with no redundancy. The safety function requires 1 out of 1 provided signal/logic channels for implementation. A single dangerous fault results in dangerous loss of the safety function.

1oo2
A functional safety architecture with two channels. The safety function requires 1 out of 2 provided signal/logic channels for implementation. The safety function is still fulfilled in the presence of a dangerous fault in one channel.

Actuator
Field device that converts the electrical signal from the PLC into an action of controlled machinery. In this manual, the term can include interposing contactors and relays that control machinery, as well as directly connected motors or solenoids.

Category
Category according to EN ISO 13849 defines architectural requirements for functional safety. The products in this manual can fulfill Category 2 to Category 4. Category 4 requires that no single fault can be dangerous and no undetected accumulation of faults can be dangerous.
See also Overvoltage category.

CET
In the context of IO-Link, CET (Cyclic Event Timer) refers to a parameter used to define the interval at which cyclic data is transmitted between the IO-Link master and the connected outputs devices, such as sensors or actuators.

Channel
In IEC 61508 terminology, a channel is a single signal/logic path that supports a safety function. The definition of 1oo1 and 1oo2 above uses channel in this sense. In most uses in this manual, a channel refers to one process value, whether implemented as 1oo1 or 1oo2.

Channel fault
A fault that causes one process value to be passivated, such as a detected wiring fault on one input. Other channels in the module can continue to support a safety function.

CRC signature
The CRC (Cyclic Redundancy Check) signature is a cyclic redundancy checksum that confirms the integrity of the PROFIsafe message contents and sequence.

Cyclic interrupt / cycle time
The start-to-start user configured time delay between executions of the safety program.

Dark test / dark time
The test or time in which a "0" signal is deliberately created to confirm that "0" can be controlled or detected when needed. On DC outputs, the F-DQ performs a dark test by briefly turning off one of the P or M output switches.

Discrepancy time (of inputs)
The configured discrepancy time during which you expect 1oo2 inputs to disagree due to mechanical and electrical differences in input signals. The F-DI interprets differences between inputs lasting longer than the discrepancy time as a channel fault.

ECET
In the context of IO-Link, ECET (Event Code Extended Text) is used in diagnostics to provide detailed information about events and errors that occur within an IO-Link system.

ESF
Embedded Safety Function (ESF): A safety function that is evaluated locally by the module and can override its configured output(s) to "0". Emergency Stop and Internal Evaluation are supported ESFs.

Equivalent (input)
A 1oo2 input channel where both signal inputs interpret high voltage as a process value "1" and low voltage as a process value "0".

Fail-safe
A system or component designed to reliably provide a defined, safe result in the event of a fault.

F-I/O
A general term for fail-safe input and output modules.

F-monitoring time
The F-monitoring time is the amount of time a fail-safe module or F-CPU waits for an error-free communication including the expected new Virtual Monitoring Number before passivating channels.

Internal Evaluation
The module's Internal Evaluation (IE) function is a safety measure used to de-energize the desired machine function(s).

Internal Logic Result
An Internal Logic Result (ILR) is the result of an ESF's evaluation to determine the override state of a configured output(s). This result can be used as an input to another ESF during embedded safety function chaining.

IODD
An IO-Link Device Description describes sensors and actuators with an IO-Link communication interface containing information about the device's identity, parameters, process data, diagnostic data, communication properties, and the design of the user interface of engineering tools.

Light test / light time
The test or time in which a "1" signal is deliberately created to confirm that "1" can be controlled or detected when needed. The signal modules described in this manual do not deliberately conduct light tests that can affect your program or the output load. The fail-safe module produces ON test pulses up to the Maximum readback time switch on test on each of the P and M switches individually, but do not intentionally turn on both P and M switches at once for a test when commanded process value is "0". In the unlikely event of an undetected fault on the opposite switch, the test pulses can result in energy applied to the load.

Load voltage
The voltage supplied to or required by a device connected to one of the module's I/O. This load must match the supplies to controlled devices (24 VDC).
Output modules need to provide the correct voltage to external devices to ensure they function correctly, while input modules need to be compatible with the voltage levels output by the sensors or devices to which they are connected.

M
Refers to the 24 V DC power circuit 0 V DC reference. In the context of the F-DQ DC module outputs, M can refer to the switch output connecting the load to M.

Module fault
A fault that affects all channels of a fail-safe module. The fail-safe module attempts to passivate all channels.
See also Channel fault.

Non-equivalent (input)
A 1oo2 input channel where one signal input interprets high voltage as a process value "1" and the redundant signal input interprets high voltage as a process value "0". A common configuration is complementary normally-open and normally-closed switches connected to the same process event.

Overvoltage category
A definition of transient voltage threat due to lightning strikes and other sources, generally associated with how closely the circuit is coupled to outdoor electrical wiring. Category III represents a higher voltage level threat than Category II.

P
Refers to the 24 V DC positive supply. In the context of the F-DQ DC module outputs, P can refer to the switch output connecting the load to P.

Passivate / passivated / passivation
The F-CPU or fail-safe module has identified a channel or module as faulty. The F-CPU or fail-safe module supplies the fail-safe process value "0" instead of any detection or logic evaluation that can result in process value "1".

PFD_avg
Average probability of a dangerous failure on demand (PFD_avg). An estimate of how likely a safety function will fail to perform as expected when required to function only rarely (on demand). PFD is typically used for safety function applications that are required to operate in response to unusual accidental or emergency events occurring less frequently than once per year.

PFH
Average frequency of a dangerous failure per hour (PFH). The average frequency of dangerous failures for systems that are required more frequently than once per year to initiate or maintain a safe state. Most safety functions associated with routine machine operation use PFH as a defining safety metric.

PL
Performance Level (PL): Levels "a" through "e" are defined in EN ISO 13849, with level "e" being the high level of safety performance. A higher PL is associated with a lower probability of dangerous failure.

PM
In the context of the F-DQ DC output module, refers to the DC output point including a switch to P and a switch to M. The typical application is for the load to be connected between the P and M switches, sometimes called "PM mode".

Process value bit
The data bit accessible to the user program representing the process value. If an input channel is passivated, the process value bit is set to "0". If an output channel is passivated, the user program can set the process value bit to "1", but this is not effective at the SM outputs.

PROFIsafe
A communication protocol providing for secure transport of safety information, including provisions for sequence and time monitoring of messages.

PROFIsafe address
A unique identifier for every F-IO in a network including central F-IOs. The PROFIsafe address consists of the F-source address and the F-destination address.

Proof-test / Proof-test interval
A proof test is a verification that a safety component or system operates as expected. Immediately after each successful proof test, the safety component or system is considered to have a minimum probability of dangerous failure. The probability of dangerous failure increases with time until the next proof test. The maximum probability of dangerous failure is calculated assuming the component or system is tested or replaced within the proof test interval.

Reintegration
The procedure that allows a passivated channel or module to become active again after diagnostics indicate that faults are removed or corrected.

Safe state
The basic principle behind the safety concept is the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. This applies to both sensors and actuators.

Safety function (context: PLC internals)
The term "safety function" can refer to PLC system internal features, including program block elements, which contribute to the development of your safety program and the assurance that your user or application safety function is executed as designed.

Safety function (context: user or application level)
One specific action of a safety system. While the term can be used for general goals (for example, "Protect the operator from the saw blade"), safety system analysis typically includes decomposing the general goal into elemental specific actions designed to minimize risk (for example, "When the hand control is released, turn off the motor" or "Keep the access guard locked until the motor has been deenergized for at least 60 seconds"). Each of these items can be considered a safety function.

Safety mode
1. Safety mode is the operating mode of the fail-safe modules that allows safety-related communication using safety message frames.
2. Operating mode of the safety program: In safety mode of the safety program, all safety mechanisms for fault detection and fault reaction are activated. The safety program cannot be modified during operation in safety mode. Safety mode can be deactivated by the user (deactivated safety mode).

Safety program
The safety program is a safety-related STEP 7 program.

Sensor
Field device that converts a physical quantity (for example, location, temperature, or speed) into an electrical signal that can be read by the PLC.

SIL
Safety Integrity Level (SIL) values 1 through 4 are defined in IEC 61508. A higher safety integrity level is associated with a lower probability of dangerous failure.

SIO mode
Standard I/O mode allows unidirectional data transfer between the IO-Link master module and the standard I/O.

Standard user program
The standard program is a non-safety-related STEP 7 program.

Value status
The data bit accessible to the STEP 7 program indicating whether or not a safety I/O channel is passivated. If the value status bit is "0", the channel is passivated or deactivated. For a 1oo2 input, the low numbered value status bit is effective, and the high numbered status value bit is always "0". If encountered, consider the terms "Quality bit" and "Qualifier" synonymous to "Value status (bit)".

Preface

Preface

Purpose of the manual

The S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), and ET 200S/ET 200SP series are families of Siemens programmable logic controllers (PLCs) that can control a variety of automation applications. The S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), and ET 200S/ET 200SP models and Windows-based programming tools give you the flexibility you need to solve your automation problems.

This manual provides information about installing, wiring, configuring, commissioning, and maintaining the ET 200eco PN F-DI 8 / F-DQ 3 module to work with the S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), and ET 200S/ET 200SP fail-safe CPUs. The manual is designed for engineers, programmers, installers, and electricians who have a general knowledge of programmable logic controllers.

NOTE

"ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12" is the official name of the product. For ease of use, the manual uses the shortened name "ET 200eco PN F-DI 8 / F-DQ 3" and "ET 200eco PN F" throughout the manual.

Required basic knowledge

To understand this manual, you require a general knowledge of automation and programmable logic controllers.

Scope of the manual

This manual describes or references the following products:

- *STEP 7 Professional V15* or later with *STEP 7 Safety Advanced V15* or later
- S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), and ET 200S/ET 200SP fail-safe CPUs
- ET 200eco PN F-DI 8 / F-DQ 3 module
- Hardware Support Packages (HSP) 204, required with *STEP 7 Professional V15* and *STEP 7 Safety Advanced V15*. With *STEP 7 Professional V15.1* or later and *STEP 7 Safety Advanced V15.1* or later, the HSP is no longer required.

For a complete list of the products described in this manual, refer to "Ordering information" (Page 185).

WARNING

The "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" in the current version is the authoritative source for Functional Safety-related information concerning configuring and programming.
Siemens identifies the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) as the authoritative and/or original source in the case of discrepancies between the manuals.
All warnings in the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" have to be observed.

NOTE

Refer to the "Distributed I/O ET 200eco PN Operating Instructions" (https://support.industry.siemens.com/cs/document/29999018/simatic-distributed-i-o-et-200eco-pn?dti=0&lc=en-WW) for further information about the ET 200eco PN system.

Certification, CE label, C-Tick, and other approvals

Refer to the technical specifications (Page 168) for more information.

Glossary

The definitions in the glossary are provided to give the reader an easy first reference for understanding the terms used in this manual. Some terms have detailed formal definitions in IEC 61508, EN ISO 13849, EN 62061, IEC 61784-3-3, and associated standards, and must be understood in terms of broad safety concepts detailed in these standards.

Another reference for more exact definitions is the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

Service and support

In addition to our documentation, Siemens offers our technical expertise on the Internet on the customer support web site (http://www.siemens.com/automation/).

Contact your Siemens distributor or sales office for assistance in answering any technical questions, for training, or for ordering S7 products. Because your sales representatives are technically trained and have specific knowledge about your operations, processes, and industry, as well as the individual Siemens products that you are using, they can provide the fastest and most efficient answers to any problems you might encounter.

Documentation and information

STEP 7; S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), and ET 200S/ET 200SP CPUs; and ET 200eco PN provide a variety of documentation and other resources for finding the technical information that you require:

- The *SIMATIC ET 200eco PN F-DI 8 / F-DQ 3 Manual* presents an overview of the Siemens Safety software, fail-safe CPUs and distributed I/O, and a Getting Started configuration and programming example. However, the focus of the manual is the ET 200eco PN F-DI 8 / F-DQ 3 module. Module installation, configuration, diagnostics, applications, and technical specifications are emphasized.

  The English version of the *SIMATIC ET 200eco PN F-DI 8 / F-DQ 3 Manual* is the authoritative (original) language for Functional Safety-related information. All translated manuals refer back to the English manual as the authoritative, original source. Siemens identifies the English manual as the authoritative, original source in the case of discrepancies between the translated manuals.
- The *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual* provides information that enables you to configure and program SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance testing of a SIMATIC Safety fail-safe system. Read and understand this entire manual before attempting to configure and program an actual live, fail-safe operation.
- The *SIMATIC Distributed I/O ET 200eco PN, Operating Instructions* provides information that enables you to operate the ET 200eco PN F distributed I/O device on PROFINET.
- The *SIMATIC S7-1200 Functional Safety Manual* presents an overview of the Siemens Safety software, fail-safe CPUs and SMs, and a Getting Started configuration and programming example. However, the focus of the manual is the S7-1200 fail-safe SMs. SM installation, configuration, diagnostics, applications, and technical specifications are emphasized.

- The *SIMATIC S7-1200 Programmable Controller System Manual* provides specific information about the operation, programming, and the specifications for the complete S7-1200 product family. In addition to the system manual, the *S7-1200 Easy Book* provides a more general overview to the capabilities of the S7-1200 family.
- The *SIMATIC S7-1200/S7-1500 F-CPUs Product Information* provides important information on the available S7-1200/1500 F-CPUs.
- The *SIMATIC S7-1500, ET 200MP Automation System Manual* provides you with important information on how to configure, install, wire, and commission the S7-1500 automation system/ET 200MP distributed I/O system.
- The *SIMATIC S7-300 CPU 31xC and CPU 31x: Technical specifications Manual* and *SIMATIC S7-300 Module Data Manual* is a reference to operating, to functions, and to the technical data of the signal modules, power supply modules, and interface modules of the S7-300.
- The *SIMATIC S7-400 Automation System, CPU Specifications Manual* and *SIMATIC S7-400 Module Data Manual* is a reference to operating, to functions, and to the technical data of the signal modules, power supply modules, and interface modules of the S7-400.
- The *SIMATIC ET 200SP Distributed I/O system, System Manual* provides important information on configuring, installing, wiring, and commissioning the ET 200SP distributed I/O system.
- The *SIMATIC ET 200pro Distributed I/O system, Operating Instructions* provide important information on configuring, installing, wiring, and commissioning the ET 200pro distributed I/O system.
- *SIMATIC ET 200pro CPU 1516PRO-2 PN, Operating Instructions:* The information provided in this manual and the operating instructions of the ET 200pro enables you to commission the ET 200pro CPU 1516PRO-2 PN and to run it as an IO controller on PROFINET.
- *SIMATIC ET 200pro IM 154-8 PN/DP CPU interface module, Operating Instructions:* The information provided in this manual and the operating instructions of the ET 200pro enables you to commission the ET 200pro IM 154-8 PN/DP CPU interface module and to run it as an IO controller on PROFINET.
- The *SIMATIC ET 200S Distributed I/O system, Operating Instructions* provide important information on configuring, installing, wiring, and commissioning the ET 200S distributed I/O system.
- *SIMATIC ET 200S Distributed I/O, IM 151-8 PN/DP CPU interface module, Operating Instructions*: The information provided in this manual and the operating instructions of the ET 200S enables you to commission ET 200S with the IM 151-8 PN/DP CPU interface module and to run it as an IO controller on PROFINET.
- The *SIMATIC ET 200AL Distributed I/O system, System Manual* provides you with important information on how to configure, install, wire, and commission the SIMATIC ET 200AL distributed I/O system.
- The following manuals/product informations are available as electronic (PDF) manuals. You can download or view the electronic manuals from the Siemens Industry Online Support Web site (http://support.industry.siemens.com).
  - *SIMATIC ET 200eco PN F-DI 8 / F-DQ 3 Manual*
  - *SIMATIC Safety - Configuring and Programming, Programming and Operating Manual*
  - *SIMATIC Distributed I/O ET 200eco PN, Operating Instructions*
  - *SIMATIC S7-1200 Functional Safety Manual*
  - *SIMATIC S7-1200 Programmable Controller System Manual*

  - *SIMATIC S7-1200 Easy Book*
  - *SIMATIC S7-1200/S7-1500 F-CPUs Product Information*
  - *SIMATIC S7-1500, ET 200MP Automation System Manual*
  - *SIMATIC S7-300 CPU 31xC and CPU 31x: Technical specifications Manual* and *SIMATIC S7-300 Module Data Manual*
  - *SIMATIC S7-400 Automation System, CPU Specifications Manual* and *SIMATIC S7-400 Module Data Manual*
  - *SIMATIC ET 200SP Distributed I/O system System Manual*
  - *SIMATIC ET 200pro Distributed I/O system, Operating Instructions*
  - *SIMATIC ET 200pro CPU 1516PRO-2 PN, Operating Instructions*
  - *SIMATIC ET 200pro IM 154-8 PN/DP CPU interface module, Operating Instructions*
  - *SIMATIC ET 200S Distributed I/O system, Operating Instructions*
  - *SIMATIC ET 200S Distributed I/O, IM 151-8 PN/DP CPU interface module*
  - *SIMATIC ET 200AL Distributed I/O system System Manual*
- The TIA portal STEP 7 online help information system provides immediate access to the conceptual information, specific instructions, and error code event IDs that describe the operation and functionality of the programming package and basic operation of SIMATIC CPUs.
- The Siemens Industry Online Support Web site (http://support.industry.siemens.com) provides access to the electronic (PDF) versions of the SIMATIC documentation set. Existing documents are available from the Product Support link. With this online documentation access, you can also drag and drop topics from various documents to create your own custom manual.

  You can access online documentation by clicking "mySupport" from the left side of the page and selecting "Documentation" from the navigation choices. To use the mySupport Documentation features, you must sign up as a registered user.
- Siemens also provides online comprehensive support for your use of safety technology. A Safety Evaluation Tool assists you in determining required safety levels, Functional Examples guide you in your safety applications, SITRAIN classes offer training in safety standards and products, and you can calculate your maximum system response time using the RT_calculator Excel file. Visit the following web sites to access these support activities:
  - Safety Evaluation Tool (http://www.siemens.com/safety-evaluation-tool)
  - Functional examples (http://www.siemens.com/safety-functional-examples)
  - SITRAIN (http://www.siemens.com/sitrain-safetyintegrated)
  - SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times (http://support.automation.siemens.com/WW/view/en/49368678/133100).) Excel file (RT_calculator)
- The customer support web site also provides FAQs and other helpful documents for STEP 7. Visit the following web site to access the collection of podcasts: STEP 7 Professional (http://w3.siemens.com/mcms/simatic-controller-software/en/step7/step7-professional/Pages/Default.aspx)

- You can also follow or join product discussions on the Service & Support technical forum (https://support.industry.siemens.com/tf/ww/en/?Language=en&siteid=csius&treeLang=en&groupid=4000002&extranet=standard&viewreg=WW&nodeid0=34612486). These forums allow you to interact with various product experts.

Table of contents

1 Product overview 13

1.1 Hardware and software components 14

1.2 Fail-Safe CPUs 16
1.2.1 Overview 16
1.2.2 Behavior differences between standard and fail-safe CPUs 17
1.2.2.1 Safety mode 17
1.2.2.2 Fault reactions 18
1.2.2.3 Restart of fail-safe system 20

1.3 ET 200eco PN F-DI 8 / F-DQ 3 module 20
1.3.1 Overview 20
1.3.2 Description 21
1.3.3 Properties 22
1.3.4 User data space 23
1.3.5 Fail-Safe digital inputs 23
1.3.6 Fail-Safe digital outputs 25

2 Getting started 26

2.1 Introduction to example 26
2.1.1 Requirements for configuring and programming 26
2.1.2 Example structure and task definition 27
2.1.3 Operating the Getting Started example 28
2.1.4 Procedure 29

2.2 Configuring 30
2.2.1 Introduction 30
2.2.2 Step 1: Configuring the fail-safe CPU 31
2.2.3 Step 2: Configuring the ET 200eco PN 16DI 34
2.2.4 Step 3: Configuring the ET 200eco PN F-DI 8 / F-DQ 3 35
2.2.4.1 Installing the Hardware Support Package (HSP) 35
2.2.4.2 Configuring the PROFINET IO device 35
2.2.4.3 Configuring F-parameters 37
2.2.5 Step 4: Assigning the IP addresses and PROFINET device names 38
2.2.5.1 Assigning the IP addresses 38
2.2.5.2 Assigning the PROFINET device names 39
2.2.6 Step 5: Assigning PROFIsafe addresses 42
2.2.7 Step 6: Configuring the standard digital inputs for the user acknowledgement, feedback circuit, and start pushbutton 43
2.2.8 Step 7: Configuring the Process value and Value status bits 45
2.2.9 Step 8: Connecting digital inputs to an emergency stop switch, position switches, and a laser scanner 48
2.2.10 Step 9: Connecting a digital output to a motor 50
2.2.11 Summary: Configuring the Hardware 51

2.3 Programming 52

2.3.1 Introduction ... 52
2.3.2 Step 10: Specifying the centralized settings for the safety program ... 54
2.3.3 Step 11: Creating an F-FB ... 57
2.3.4 Step 12: Programming the safety door function ... 58
2.3.5 Step 13: Programming the emergency stop function ... 59
2.3.6 Step 14: Programming the feedback monitoring ... 62
2.3.7 Step 15: Programming the user acknowledgment for reintegration of the fail-safe module ... 64
2.3.8 Step 16: Programming of the main safety block ... 65
2.3.9 Step 17: Compiling the safety program ... 66
2.3.10 Step 18: Downloading the complete safety program to the fail-safe CPU and activating safety mode ... 67

3 Applications ... 71

3.1 Digital input applications ... 72
3.1.1 Overview ... 72
3.1.2 Selecting the digital input application ... 74
3.1.3 F-DI Applications 1 and 2: 1oo1 evaluation of single-channel sensors ... 74
3.1.4 F-DI Applications 3 and 4: 1oo2 evaluation of equivalent sensors ... 77
3.1.5 F-DI Applications 5 and 6: 1oo2 evaluation of 3-wire, nonequivalent sensor circuit ... 80
3.1.6 F-DI Applications 7 and 8: 1oo2 evaluation of 4-wire nonequivalent sensor circuit ... 83

3.2 Digital output applications ... 86
3.2.1 Overview ... 86
3.2.2 Selecting the digital output application ... 86
3.2.3 F-DQ Application 1: Wiring a directly-connected SIL-rated actuator ... 87
3.2.4 F-DQ Application 2: Wiring external contactors: Separate P and M controlled contactors ... 87
3.2.5 F-DQ Application 3: Wiring external contactors: Parallel connected between P and M ... 88
3.2.6 F-DQ Application 4: Wiring external contactors: Separate P and M output channels for each contactor ... 89

3.3 Examples of application modes for the ET 200eco PN F-DI 8 / F-DQ 3 ... 90
3.3.1 Examples of application modes for the ET 200eco PN F-DI 8 / F-DQ 3 ... 90

4 Installation ... 95

4.1 Installation without mounting rail ... 95
4.2 Installation with mounting rail ... 96
4.3 Mounting position and dimensions ... 96
4.4 Connecting the M12 eCoding plug ... 97
4.5 Installing the terminal block ... 98
4.6 Replacing labels ... 100

5 Wiring ... 101

5.1 Fail-Safe system electrical design rules ... 101
5.1.1 Safe functional extra low voltage requirement (power supplies and other system components) ... 101
5.2 Control system electrical rules ... 102

5.2.1 General rules and regulations for operating an ET 200eco PN F-DI 8 / F-DQ 3 102
5.2.2 Electrical configuration of the ET 200eco PN F-DI 8 / F-DQ 3 103
5.2.3 Influence of cable length on the supply voltage 105
5.2.4 Guidelines for grounding and wiring 105
5.2.5 Grounding the ET 200eco PN F-DI 8 / F-DQ 3 module 106
5.2.6 Operating the ET 200eco PN F-DI 8 / F-DQ 3 on grounded mains 107
5.2.7 Wiring the ET 200eco PN F-DI 8 / F-DQ 3 109
5.2.7.1 Guidelines for wiring the ET 200eco PN F-DI 8 / F-DQ 3 109
5.2.7.2 Wiring the ET 200eco PN F-DI 8 / F-DQ 3 to functional earth (FE) 110
5.2.7.3 Wiring I/O devices for 1oo2 evaluation using M12 connecting cables 112
5.2.7.4 Wiring I/O devices for 1oo1 evaluation or 1oo2 evaluation using M12 Y cables 113
5.2.7.4.1 SIMATIC DP, Y cable for distributed I/O for double connection of F-DI with one cable (6ES7194-6KB00-0XA0) . 115
5.2.7.4.2 SIMATIC DP, Y cable for distributed I/O for double connection of F-DI with one cable (6ES7194-6KA00-0XA0) . 116
5.2.7.4.3 SIMATIC DP, Inverted Y cable for distributed I/O for connecting an F-DI and F-DQ with one cable (6ES7194-6KC00-0XA0) . 117
5.2.8 Pin assignment of connectors 117
5.2.8.1 Pin assignment of the PROFINET connector 117
5.2.8.2 Pin assignment for feeding and looping the voltage 118
5.2.8.3 Pin assignment of digital inputs 120
5.2.8.4 Pin assignment of digital outputs 121
5.2.9 Wiring the terminal block 122
5.2.10 Wiring the voltage distributor 125
5.2.11 Looping PROFINET and the supply voltage 127
5.2.12 Guidelines for inductive loads 128

6 Configuring 130

6.1 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module 130
6.2 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module I/O properties 130
6.3 Configuring F-parameters 131
6.4 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module DI and channel parameters 133
6.5 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module DQ and channel parameters 138
6.6 Assigning PROFIsafe addresses 140
6.6.1 Basic PROFIsafe address assignment steps 140
6.6.2 Identifying the ET 200eco PN F modules 141
6.6.2.1 Identification requirements 141
6.6.2.2 Identification procedure 141
6.6.3 Assigning PROFIsafe addresses 142
6.6.3.1 Assignment requirements 142
6.6.3.2 Assignment procedure 142
6.7 Using the eCoding plug for PROFIsafe address assignment storage 142

7 Commissioning 143

7.1 PROFINET IO 143
7.1.1 Commissioning the ET 200eco PN F-DI 8 / F-DQ 3 on PROFINET IO 143
7.1.2 Startup on PROFINET IO 144

7.2 Identification and maintenance (I&M) data 144
7.2.1 Reading out and entering I&M data 144

Product overview

1

SIMATIC Safety fail-safe system

The objective of safety engineering is to minimize danger to humans and the environment as much as possible through use of safety-oriented technical installations without restricting industrial production and the use of machines and chemical products any more than necessary. The SIMATIC Safety Fail-Safe system is available to implement safety concepts in the area of machine and personnel protection (for example, emergency STOP devices as a part of machining and processing equipment).

What are fail-safe automation systems?

Fail-safe automation systems control processes that can achieve a safe state immediately as a result of an unexpected operation or failure. These are fail-safe control processes where an immediate shutdown to safe state does not endanger humans or the environment.

Fail-safe systems go beyond conventional safety engineering to enable far-reaching intelligent systems that extend all the way to the electrical drives and measuring systems. You use fail-safe systems in applications with specific safety requirements. You can resume production quickly following a safety-related interruption, using the improved fault detection and localization provided in fail-safe systems through detailed diagnostic information.

Achievable safety requirements

SIMATIC Safety fail-safe systems can satisfy the following safety requirements:

- Safety class (Safety Integrity Level) SIL 1 to SIL 3 in accordance with IEC 61508
- Category 2 to 4, Performance Level (PL) a to e in accordance with EN ISO 13849-1

Principles of safety functions in SIMATIC Safety

You implement functional safety using the hardware and firmware of the fail-safe CPUs and modules in conjunction with the safety program downloaded by the TIA Portal software Engineering System (ES). The SIMATIC Safety system executes the safety function to bring the system to a safe state or maintain a safe state in case of a dangerous event.

The fail-safe modules ensure the safe application of process information (for example, sensors such as pushbuttons and light curtains that initiate emergency OFF operations and actuators that move or control a mechanism). The fail-safe modules have the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level (SIL).

You provide the safety function for the process through the application program that you create or by the reaction of the fail-safe system to a fault. In the event of an error, the fail-safe system executes the fault reaction function (for example, the fail-safe system shuts down the associated outputs).

Example of user safety function

If an object interrupts the beam of a light curtain, the fail-safe system stops the motion in the area protected by the light curtain (user safety function):

- The light curtain provides a "1" signal, perhaps redundantly, to say the light beam is not broken or "0" to say the light beam is broken.
- The fail-safe digital inputs acquire the signal from the light curtain and provide the state to the fail-safe CPU through a safe communication protocol. Redundant microcontrollers with mutual diagnostics in the fail-safe digital inputs provide a high assurance that a "1" or a "0" is provided only when correct.
- The fail-safe CPU executes your user program for normal control of the motion and includes your programmed safety logic that says a "1" from the light curtain is required to enable the motion. Your programmed safety logic is encoded by the Engineering System in redundant logic steps that gives a high assurance that any fault in CPU execution results in outputs of "0". If the CPU fails to receive verifiable communication from the fail-safe digital inputs within a required time, the fail-safe CPU replaces the signal from the fail-safe digital inputs with "0".
- The fail-safe CPU delivers the results of the safety logic to the fail-safe digital outputs through the safe communication protocol. A "1" signal from your safety logic enables motion by turning an output channel ON, or a "0" turns the output channel OFF. Redundant microcontrollers with mutual diagnostics in the fail-safe digital outputs provide a high assurance that redundant output switches (P/M 24 V DC solid state switches) are turned ON only when this condition is correct and at least one output switch turns OFF if a fault occurs. If the fail-safe digital outputs fail to receive verifiable communication from the fail-safe CPU within a required time, the fail-safe digital outputs replace the signal from the fail-safe CPU with "0" and turn outputs OFF.

1.1 Hardware and software components

Fail-Safe CPUs

You can use any of the following fail-safe CPUs with the ET 200eco PN F-DI 8 / F-DQ 3 module:

- S7-1200/1500
- S7-300/400
- ET 200pro (IP67 compliant)
- ET 200S/ET 200SP

A fail-safe system requires a fail-safe CPU with fail-safe central I/O and/or fail-safe distributed I/O.

Hardware components for PROFINET IO

You can use the following fail-safe PROFINET IO hardware components in a fail-safe system:

- Fail-Safe CPUs with built-in PROFINET interface
- Fail-Safe inputs and outputs (F-I/O), such as:
  - ET 200eco PN fail-safe modules (includes module described in this manual)
  - ET 200SP fail-safe modules
  - ET 200MP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200M fail-safe modules
  - ET 200pro fail-safe modules
  - Fail-Safe GSDML-based, PROFIsafe-capable I/O devices (for example, a light curtain or laser scanner)

Hardware components for PROFIBUS DP

You can use the following fail-safe PROFIBUS DP hardware components in a fail-safe system:

- Fail-Safe CPUs with the CM 1243-5 (PROFIBUS DP master)
- Fail-Safe inputs and outputs (F-I/O), such as:
  - ET 200SP fail-safe modules
  - ET 200MP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200M fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-Safe GSDML-based, PROFIsafe-capable DP slaves (for example, a light curtain or laser scanner)

Required software components

You require the *STEP 7 Professional V15* or later with *STEP 7 Safety Advanced V15* or later optional package software combination to configure and program the ET 200eco PN F-DI 8 / F-DQ 3 in a SIMATIC Safety Fail-Safe system.

In the *STEP 7 Safety Advanced V15* software package, you receive the following:

- Support for configuring the fail-safe CPUs with fail-safe central I/O and/or fail-safe distributed I/O in the hardware and network editor of the TIA portal
- Support for creating the safety program using LAD and FBD and integrating error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your safety program in LAD and FBD with special safety functions

1.2 Fail-Safe CPUs

1.2.1 Overview

You can use any of the following fail-safe CPUs with the ET 200eco PN F-DI 8 / F-DQ 3 module:

- S7-1200/1500
- S7-300/400
- ET 200pro (IP67 compliant)
- ET 200S/ET 200SP

The fail-safe CPU can execute your safety program along with a standard applications program. Communication between the fail-safe CPU and the fail-safe module is verified using the PROFIsafe protocol.

 S7-300 F	 IM 154-8F PN/DP CPU for ET 200pro	 S7-400 F
 S7-1200 F	 S7-1500 F	 ET 200pro 1516PRO F-2 PN
 ET 200SP F	 ET 200S PN F	

Safety program

You can create a safety program using the program editor. You can program fail-safe function blocks (FB) and functions (FC) in the Function Block Diagram (FBD) or Ladder Logic (LAD) programming languages and create fail-safe data blocks (DB).

The fail-safe CPU performs a dual execution using coded processing. The fail-safe ES automatically performs safety checks and inserts additional fail-safe logic for error detection and error response when the safety program compilation occurs. These safety checks and additional fail-safe logic ensure the detection of failures and faults and appropriate execution of reactions to maintain the fail-safe system in the safe state or bring it to a safe state.

In addition to the safety program, you can run a standard user program on the fail-safe CPU. A standard program can coexist with a safety program in a fail-safe CPU. The fail-safe CPU protects the safety-related data of the safety program from the unintentional effects of the standard user program data.

⚠ WARNING

You cannot put an S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP Fail-Safe system that provides safety-related functions into operation after installation or modification until after you successfully validate the safety-related functionality.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
An S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP Fail-Safe system that provides both safety-related functions and standard (non safety-related) functions must not be put into operation in order to use the standard functions before you successfully validate the safety-related functions, even if all fail-safe signal modules go to the error state and thus remain safe.

You can exchange data between the safety program and the standard user program in the fail-safe CPU by means of bit memory or data of a standard DB.

1.2.2 Behavior differences between standard and fail-safe CPUs

1.2.2.1 Safety mode

Safety mode

In safety mode, the safety functions for fault detection and fault reaction are activated in the following:

- Safety program of the fail-safe CPU
- Fail-safe modules

Safety mode of safety program

The safety program runs in the fail-safe CPU in safety mode. The safety program activates safety mechanisms for fault detection and fault reaction. You cannot modify the safety program during operation in safety mode, while the fail-safe CPU is in RUN mode.

You can deactivate and reactivate the safety mode of the safety program. "Deactivated safety mode" enables the safety program for online tests and changes as needed while the fail-safe CPU is in RUN mode.

For SIMATIC Safety, you can switch back to safety mode only after an operating mode change of the fail-safe CPU from RUN to STOP to RUN.

Safety message frame

The fail-safe CPU and fail-safe modules consistently transmit data between each other in a safety message frame. The safety message frame in accordance with PROFIsafe standards consists of the following:

- Process data (user data)
- Status byte/control byte (coordination data for safety mode)
- Virtual Monitoring Number (encoded in CRC signature, provides keep-alive mechanism and detection of out-of-sequence messages)
- CRC signature

1.2.2.2 Fault reactions

Safe state

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. The safe state value of "0" (de-energized) applies to both sensors and actuators.

Passivation

Passivation applies safe state values to the fail-safe channel(s) instead of process values when the fail-safe system detects faults. The safety function requires passivation of the fail-safe channel(s) in the following situations:

- When the fail-safe system starts up
- If the fail-safe system detects overall module faults, such as RAM or Processor failures
- If the fail-safe system detects errors during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If fail-safe channel faults occur (for example, short-circuit and discrepancy errors or internal faults of fail-safe input or output channels)

When passivation occurs in the digital inputs of the fail-safe module, SIMATIC Safety provides the safety program with safe state values (0) instead of the process data pending at the fail-safe inputs in the input process image.

When passivation occurs in the digital outputs of the fail-safe module, the module sets the passivated channel(s) to a value of (0).

Reintegration

Reintegration returns the process from passivation to a normal state after successful diagnostics determine that the fault has cleared. After reintegration of a fail-safe digital input, SIMATIC Safety again provides the process data pending at the inputs to the safety program. For a fail-safe digital output, SIMATIC Safety again transfers the output values provided by the safety program to the fail-safe outputs. Reintegration from safe state values to process data can be automatic or require acknowledgement by your safety program. See "Reactions to faults" (Page 148) for steps to reintegrate.

Detection and response to faults

SIMATIC Safety systems detect and respond to faults in several different conditions:

- Faults in the fail-safe CPU hardware and firmware
- Faults in the fail-safe user program
- PROFIsafe communication errors caused by conditions in either the fail-safe CPU or modules
- Fail-safe module-wide errors such as microprocessor errors or memory errors
- Fail-safe module channel errors such as discrepancy errors, wiring shorts, or internal channel faults

Fail-safe CPU faults and fail-safe user program faults often result in the CPU operating mode being set to STOP. You can reintegrate PROFIsafe communication faults once communication is successfully restored. In some cases, you can reintegrate module-wide faults. In other cases, you must power cycle the fail-safe module to recover from a module-wide fault. You can often reintegrate and return channel faults to proper operation by removing the fault and reintegrating the channel.

Virtual monitoring number, cyclic interrupt time, and F-monitoring time

The following parameters are integral to fault reactions:

- Virtual monitoring number: The PROFIsafe protocol provides time monitoring and detection of message sequence errors by means of a periodically-updated monitoring number.
- Cyclic interrupt time: The cyclic interrupt time is the interval by which the F-runtime group executes and determines how often the fail-safe CPU sends the PROFIsafe frame to the fail-safe modules. When you add a fail-safe CPU to your project, STEP 7 creates Functional Safety Organization Block 1 (FOB_1) (OB123 by default). FOB_1 contains the cyclic time interrupt time. You can configure the cyclic interrupt time (100 ms by default).
- F-monitoring time: The F-monitoring time is the amount of time a fail-safe module or CPU waits for an error-free communication including a new Virtual Monitoring Number before passivating channels. You can configure the F-monitoring time. The fail-safe CPU and modules must receive a valid, current safety message frame with a valid monitoring number within the configured F-monitoring time.

If the fail-safe system fails to detect a valid monitoring number within the F-monitoring time, the fail-safe system passivates the fail-safe module. Expiration of a module's F-monitoring time causes a transition to safe state for all F-inputs and F-outputs of the module.

CRC (Cyclic Redundancy Check) signature

A CRC signature contained in the safety message frame protects the validity of the process data in the safety message frame, the accuracy of the assigned address references, and the safety-relevant parameters.

If a CRC signature error occurs during communication between the fail-safe CPU and fail-safe modules, the fail-safe system passivates the fail-safe modules.

1.2.2.3 Restart of fail-safe system

The operating modes of the SIMATIC Safety system differ from those of the standard system only in terms of the restart characteristics.

Restart characteristics

When you switch a fail-safe CPU from STOP to RUN mode, the standard user program restarts in the usual way. When you restart the safety program, the fail-safe system initializes all data blocks having the F-Attribute with values from load memory. This action is comparable to a cold restart.

The fail-safe system attempts to reintegrate each fail-safe module at restart. In contrast to the standard user program, you cannot use startup OBs in the safety program.

1.3 ET 200eco PN F-DI 8 / F-DQ 3 module

1.3.1 Overview

Siemens intends for you to use the ET 200eco PN F-DI 8 / F-DQ 3 module to help achieve functional safety in machine applications.

Redundant two-microcontroller functional safety design

The major difference between the ET 200eco PN F-DI 8 / F-DQ 3 and standard modules is that this module uses redundancy to achieve functional safety, including two microcontrollers that control fail-safe operation. Both microcontrollers monitor each other verifying they are executing the same code at the same time, automatically test the I/O circuits, and setting the fail-safe module to safe state in the event of a fault. Each processor monitors internal and external power supplies and module internal temperature and can passivate the module if an abnormal condition is detected.

Safety-related input and output signals form the interface to the process. This interface enables direct connection of single-channel and two-channel input signals from devices such as emergency STOP buttons or light curtains. If in two-channel mode, the fail-safe module redundantly combines the safety-related signals internally and passes the unified result on to the CPU in a fail-safe manner for further processing.

The fail-safe CPU sends the safety-related output states from the CPU to the fail-safe module for each individual output channel. Each output then sets two independent switches for each channel, a P and M solid-state switch. For each channel, the P switch is controlled by one processor, and the M switch is controlled by the other processor.

Use as a safety module

You can use the ET 200eco PN F-DI 8 / F-DQ 3 as a safety module, but not as a standard module.

1.3.2 Description

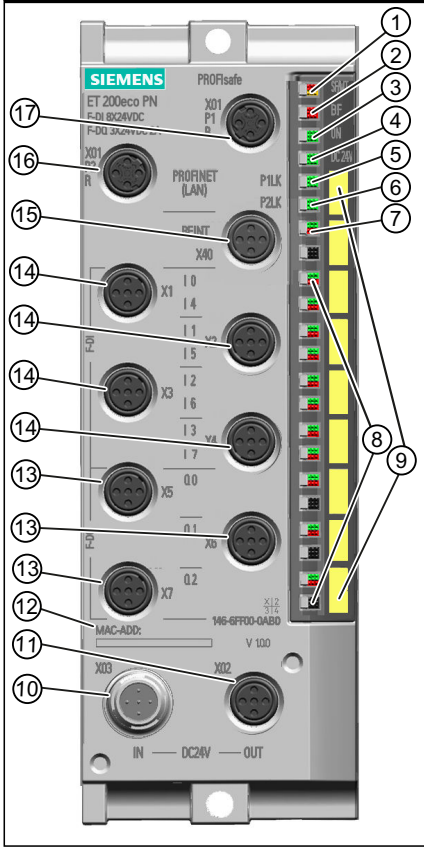
The ET 200eco PN F-DI 8 / F-DQ 3 module is a safety module with built-in distributed PROFINET device capability (in other words, the safety module does not require the presence of a separate interface module). The ET 200eco PN F-DI 8 / F-DQ 3 is IP67 compliant and is capable of being installed independently from typical IP20 control cabinetry.

You can connect to the module from a PROFIsafe compliant controller, V2.6.x (RIOforFA-Safety profile) or PROFIsafe V2.4. The module supports either version.

The ET 200eco PN F-DI 8 / F-DQ 3 contains twelve M12 connectors which support the following connections. Refer to the figure below:

- Two PROFINET communication connections (X01 P1 and X01 P2) which function as a single switch, useful for passing PROFINET to the next module
- One eCoding plug (X40) which contains the PROFIsafe address assignment unique to this module
- Four pairs of inputs (X1 through X4) which allow up to eight 1oo1 or up to four 1oo2 safety inputs
- Three PM outputs (X5 through X7)
- One power input (X03) which contains both logic and input power (1L+) and output power (2L+)
- One power output (X02) to send 1L+ and 2L+ to the next module

⚠ WARNING



If you insert an M12 I/O cable (X1 to X7 connectors) into the M12 X02 power connector, you can damage the ET 200eco PN F module or provide power to a safety load. On the ET 200eco PN F module, M12 I/O connectors and the M12 X02 power connector are the same physical connector.

Death or serious personal injury and damage to the ET 200eco PN F module and associated machines/equipment may result if proper precautions are not taken.

Only insert an M12 I/O cable into the X1 to X7 connectors. Always comply with the required standards and safety guidelines when configuring a system.

1.3.3 Properties

Article number

6ES7146-6FF00-0AB0

Properties

The ET 200eco PN F-DI 8 / F-DQ 3 module has the following features:

- PROFINET IO Device
- PROFIsafe communication
- Supports the "RIOforFA-Safety" profile on S71200/1500 fail-safe CPUs
- PROFIsafe address type 2
- Four pairs of inputs (X1 through X4) which allow up to eight 1oo1 (SIL 2/Category 3/PL d) or up to four 1oo2 (SIL 3/Category 3 or Category 4/PL e) safety inputs
- Three PM outputs (X5 through X7) (SIL 3/Category 3 or Category 4/PL e)
- One eCoding plug (X40) which contains the PROFIsafe address assignment unique to this module
- One power input (X03) which contains both logic and input power (1L+) and output power (2L+)

- One power output (X02) to send 1L+ and 2L+ to the next module
- Two PROFINET connections (X01 P1 and X01 P2) which function as a single switch (single MAC address), useful for passing PROFINET to the next module
- 24 V DC-rated input voltage
- Suitable for switches and 3/4-wire proximity switches (BEROs)
- Two short-circuit proof sensor supplies, each one for four inputs
- External sensor supply possible
- Module fault display (System Fault (SF) red LED)
- Status display for each input and each output (green LED)
- Fault display for each input and each output (red LED)
- Refer to "Fault diagnostics" (Page 151) for a description of LED and diagnostic message functions.

The module supports the following functions:

- Firmware update
- I&M identification data

1.3.4 User data space

The ET 200eco PN F-DI 8 / F-DQ 3 module's digital inputs user data space is one byte (8 bits) of Process value input, followed by one byte of Value status bits.

This is the bit structure for the module's digital inputs configured with the input start address of 8:

Table 1-1145 Input terminal F-DI start F-DI end

Input terminal	F-DI start	F-DI end
Process value bit	I8.0	I8.7
Value status bit	I9.0	I9.7

The ET 200eco PN F-DI 8 / F-DQ 3 module's digital outputs user data space is the first three bits of one byte (8 bits) of Process value output, followed by the first three bits of the third byte of Value status bits.

This is the bit structure for the module's digital outputs configured with the output start address of 8:

Output terminal	Process value bit	Value status bit
Process value bit	Q8.0	Q8.2
Value status bit	I10.0	I10.2

1.3.5 Fail-Safe digital inputs

The digital inputs of the ET 200eco PN F-DI 8 / F-DQ 3 are rated for connection to 24 V DC sensors/switches and 3/4-wire proximity switches (for example, BEROs: Siemens line of no-touch sensors) and have an EN61131-2 type 1 input rating.

The fail-safe module has two sensor supply outputs that can power external sensors (inputs). All 1oo1 and 1oo2 application modes, except the "1oo2, 2 channel 3-wire nonequivalent" application mode, use the Vs1 sensor supply to provide power for channels 0 to 3 and the Vs2 sensor supply to provide power for channels 4 to 7. The "1oo2, 2 channel 3-wire

nonequivalent" application mode uses the Vs1 sensor supply to provide power for all eight inputs and does not use the Vs2 sensor supply.

Inputs and test circuit

The fail-safe digital inputs consist of eight input channels (F-DI x.0 to x.7). You can configure these inputs as eight one-out-of-one (1oo1) inputs (SIL 2/Category 3/PL d), four one-out-of-two (1oo2) inputs (SIL 3/Category 3 or Category 4/PL e), or combinations of 1oo1 and 1oo2 channels.

Connections	Input channel pairs
X1	0 and 4
X2	1 and 5
X3	2 and 6
X4	3 and 7

NOTE

A configuration of an input channel pair as one-out-of-one (1oo1) inputs requires the use of a Y cable. Refer to Appendix B.2: "Accessories for the ET 200eco PN F-DI 8 / F-DQ 3 module" (Page 185) for ordering information on the Siemens SIMATIC DP, Y cable.

One microcontroller monitors inputs 0 to 3, and the other microcontroller monitors inputs 4 to 7. The corresponding channels (0, 4), (1, 5), (2, 6), and (3, 7) each form a 1oo2 channel group. The first of the two inputs, conveys the signal in a 1oo2 configuration. For example, if you wire I0.0 and I0.4 in a 1oo2 configuration and configure STEP 7 to use 1oo2 sensor evaluation, the signal appears at only the I0.0 input when you close or open the circuit for both.

When you configure a channel group as 1oo2, the two controllers must sense the same input change within a configured time. Otherwise, the two controllers detect a discrepancy error.

If you use a sensor supply output to provide power to a sensor, you can enable short-circuit testing. The short-circuit test checks for shorts to 24 V DC by periodically pulsing the sensor output off and verifying that the associated input is off.

This short-circuit test also checks for shorts to the other circuit in "1oo2, 2 channel equivalent" and "1oo2, 2 channel 4-wire nonequivalent" because the test pulses the two sensor outputs off at different times.

Both microcontrollers cooperate in providing internal test pulses to each others process input circuits to verify that sensing electronics are responsive to "1" and "0" inputs.

1.3.6 Fail-Safe digital outputs

The digital outputs of the ET 200eco PN F-DI 8 / F-DQ 3 are for use in fail-safe applications and are suitable for various actuators including solenoid valves, DC contactors, and indicator LEDs. The three digital outputs have P- and M-switching that are rated for connection to 24 V DC actuators with up to a 2.0 A rating. The three digital outputs use the supply voltage 2L+, having a maximum infeed current of 4.0 A. This means that the total current usage by the three digital outputs cannot exceed 4.0 A.

Outputs

The fail-safe digital outputs consist of three output channels (F-DQ x.0 to x.2). You can use each output for SIL 3 applications.

Connections	Output channel
X5	0
X6	1
X7	2

Each output consists of two switches:

- A P-switch connects 24 V DC positive (L+) through the load.
- An M-switch connects the load to M or 24 V DC return.

Both switches must be turned ON for current to flow to the load.

The fail-safe digital outputs use two microcontrollers to implement the safety function. One microcontroller controls the P-switch while the other microcontroller controls the M-switch. There is feedback from the P-switch output to the other microcomputer that is controlling the M-switch. Likewise, there is feedback from the M-switch output to the other microcomputer that is controlling the P-switch. The feedback verifies that the output switches are operating properly and in the commanded state.

You must configure a "Maximum readback time" that specifies the allowed delay for the output voltage to respond to the switch change.

The fail-safe digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. Your configured "Maximum readback time" also sets the duration of the "OFF" test pulse. You must configure a "Maximum readback time switch on test" which sets the duration of the "ON" test pulse. You should choose these durations short enough to not affect your load.

The module can detect a broken wire or missing load only when the output PV is "OFF" and the load is wired as a PM mode.

Getting started

2

2.1 Introduction to example

2.1.1 Requirements for configuring and programming

These instructions will guide you step-by-step through a specific example for configuring and programming with *STEP 7 Safety Advanced V15* or later.

You will become acquainted with the basic functions and special features of *STEP 7 Safety Advanced V15* or later.

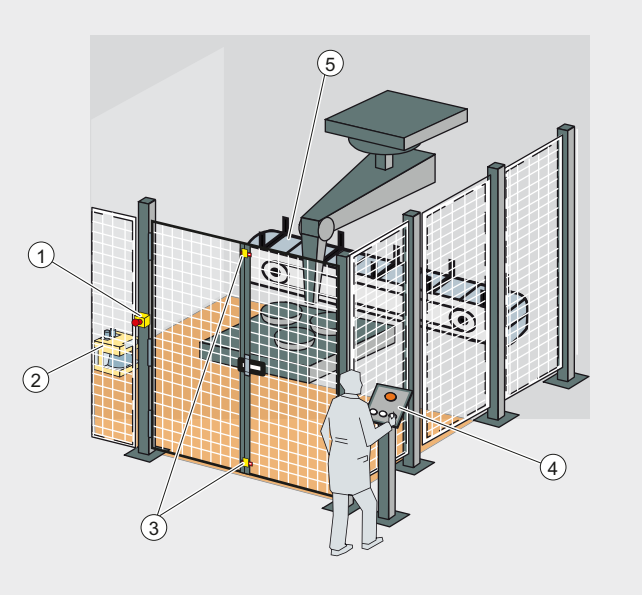
You can work through this example in one or two hours, depending on your level of experience.

Requirements for the example

The following requirements must be met:

- In order to understand these Getting Started instructions, you need general knowledge of automation technology. You also need to be familiar with *STEP 7 Professional V15* or later and *STEP 7 Safety Advanced V15* or later.
- You need a PLC station consisting of the following components:
  - Fail-Safe CPU (S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPUs)
  - ET 200eco PN 16DI module
  - ET 200eco PN F-DI 8 / F-DQ 3 module
- *STEP 7 Professional V15* or later and *STEP 7 Safety Advanced V15* or later must be correctly installed on your Windows-based programming device with an Ethernet interface.
- You must install an HSP in order to add the ET 200eco PN F-DI 8 / F-DQ 3 module to the Hardware catalog. TIA Portal V15 does not include the ET 200eco PN F module in its initial release. Hardware Support Packages (HSP) provide a way to configure modules that are not contained in the hardware catalog of your current STEP 7 installation. Refer to "Installing the Hardware Support Package (HSP)" (Page 35) for further information.
- You must connect a programming device to the fail-safe CPU through the PROFINET interface.
- The S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPUs must be fully installed and wired. Documentation on the installation and wiring of these fail-safe CPUs can be found in the Preface, "Documentation and information" (Page 4).
- You can find information on the installation and wiring of the ET 200eco PN 16DI in the "Distributed I/O ET 200eco PN, Operating Instructions" (https://support.industry.siemens.com/cs/document/29999018/simatic-distributed-i-o-et-200eco-pn?dti=0&lc=en-WW) and of the ET 200eco PN F-DI 8 / F-DQ 3 in the "Installation (Page 95)" and "Wiring" (Page 101) chapters of this manual.

WARNING



As components in plants and systems, the S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPUs and the ET 200eco PN F-DI 8 / F-DQ 3 module are subject to specific standards and regulations depending on the area of application. Please note the applicable safety and accident prevention regulations (for example, IEC 60204-1 (General Requirements for Safety of Machinery)).

The example in these Getting Started instructions serves as an introduction to configuring and programming of *STEP 7 Safety Advanced V15* or later. The example does not lead to actual live operation in every case. Before you work on the example, it is essential that you refer to the current version of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en). The warnings and other notes contained in that manual must be heeded at all times even if they are not repeated in this document.

Serious injury and damage to machines and equipment may result if these regulations are ignored.

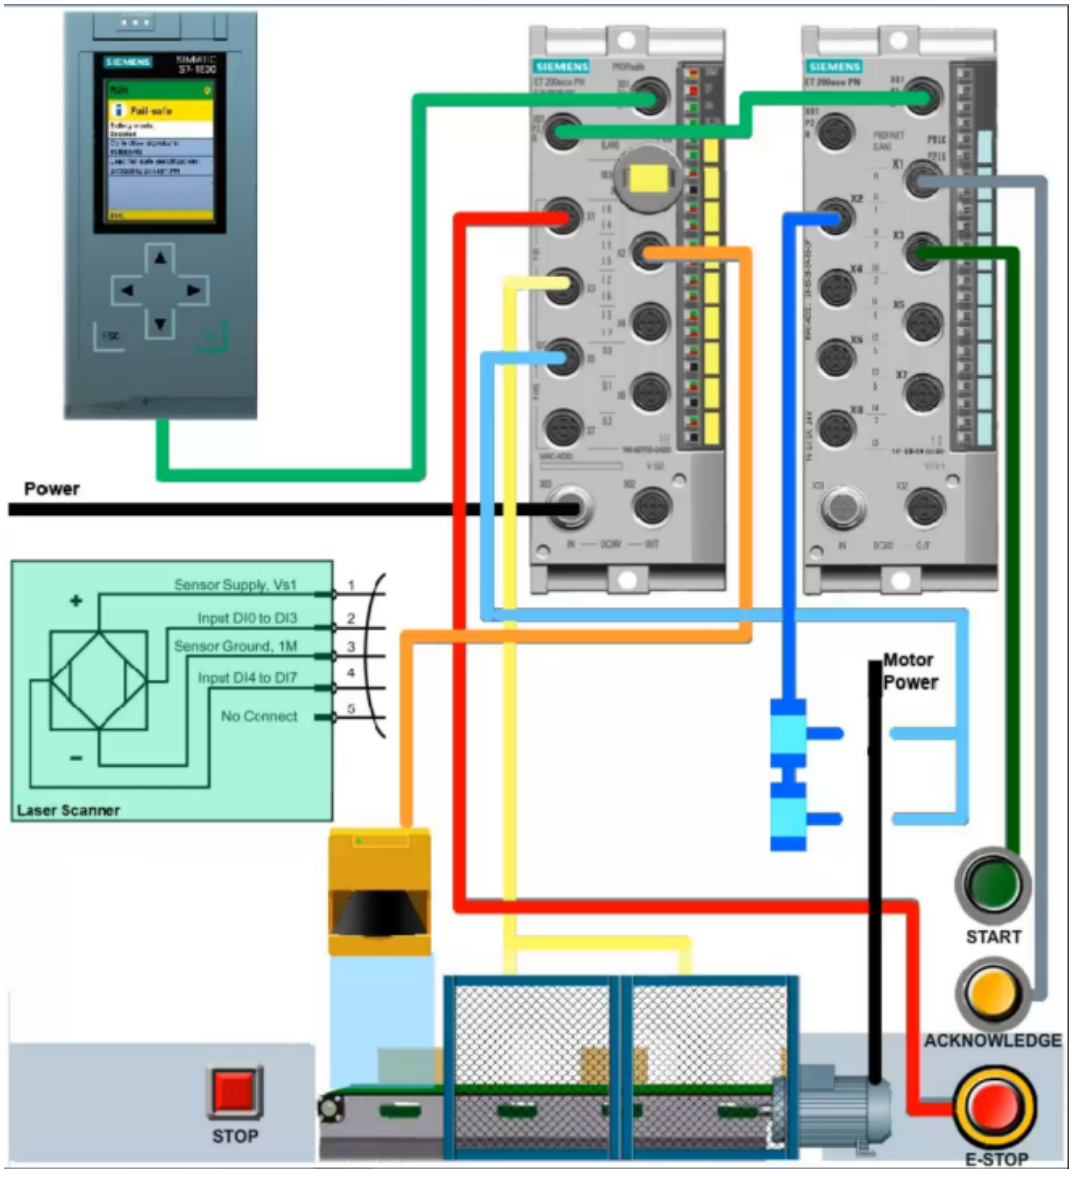
2.1.2 Example structure and task definition

The Getting Started example consists of a production cell with access protection. Your task is to configure and program the field devices (shown in the image below) to provide that access protection.

① Emergency stop (E-Stop)
② Laser scanner
③ Safety door
④ Control panel with start and acknowledgement pushbuttons
⑤ Conveyor motor

A laser scanner monitors the entry to the production area. A safety door secures the service area.

Entering the production area or opening the safety door results in a stop or shutdown of the production cell similar to an emergency stop.



The system can only be restarted when the emergency stop is cancelled, the safety door is closed, and the laser scanner detects no one in the protected area. The user must acknowledge that conditions have returned to a safe state before production can be restarted.

2.1.3 Operating the Getting Started example

The following graphic gives you the opportunity to become familiar with how the example functions in this Getting Started.

This example switches the Laser Scanner, E-Stop, and Safety Door on and off to simulate unsafe conditions. Each device operates independently of the other two devices. If you do activate a device, you must deactivate that device before continuing.

The example also shows that you must press the "Acknowledge" button to notify the system that you have returned to a safe state. Then, you can press the "Start" button to operate the system again.

The table below describes the steps and their actions:

Step	Action	Description
1	Press the Stop button.	The motor stops.
2	Press the Start button.	The motor restarts.
3	Activate the E-Stop. [1, 2]	This action prevents resumption of the operation.
4	Deactivate the E-Stop. [3]	The E-Stop deactivates.
5	Press the Acknowledge button.	The safety program requires manual acknowledgement.
6	Press the Start button.	The motor restarts.
7	Open the Safety Door. [1, 2]	This action prevents resumption of the operation.
8	Close the Safety Door. [3]	The Safety Door closes.
9	Press the Acknowledge button.	The safety program requires manual acknowledgement.
10	Press the Start button.	The motor restarts.
11	Trigger the Laser Scanner. [1, 2]	This action prevents resumption of the operation.
12	Deactivate the Laser Scanner. [3]	The Laser Scanner deactivates.
13	Press the Acknowledge button.	The safety program requires manual acknowledgement.
14	Press the Start button.	The motor restarts.

1 You can activate the E-STOP, trigger the Laser Scanner, or open the Safety Door individually or in any order to stop operations and bring the system to a safe state.

2 To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device, 2. Press the Acknowledge button, and 3. Press the Start button.

3 This action allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart the motor.

2.1.4 Procedure

In summary, the example in these Getting Started instructions consists of the following sections:

Configuring

1. Configure the following components:
   - S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU
   - ET 200eco PN 16DI module
   - ET 200eco PN F-DI 8 / F-DQ 3 module.
2. Use the ET 200eco PN 16DI module standard digital inputs for a user acknowledgement, a feedback loop, and a start pushbutton.
3. Configure the ET 200eco PN F-DI 8 / F-DQ 3 module fail-safe inputs for connecting an emergency stop switch, the position switches for monitoring a safety door, and the laser scanner for monitoring the entry area.
4. Finally, configure an ET 200eco PN F-DI 8 / F-DQ 3 module fail-safe output for connecting a motor.

The "Configuring" (Page 30) section describes the configuration process.

Programming

Once you successfully complete the configuration, program your safety program.
In the example, you program a fail-safe block with the following instructions:

- Emergency stop
- Safety door function
- Feedback loop (as restart protection, when an incorrect load exists)
- User acknowledgement for reintegration

You then compile the block to form a safety program.
The "Programming" (Page 52) section describes the programming process.

2.2 Configuring

2.2.1 Introduction

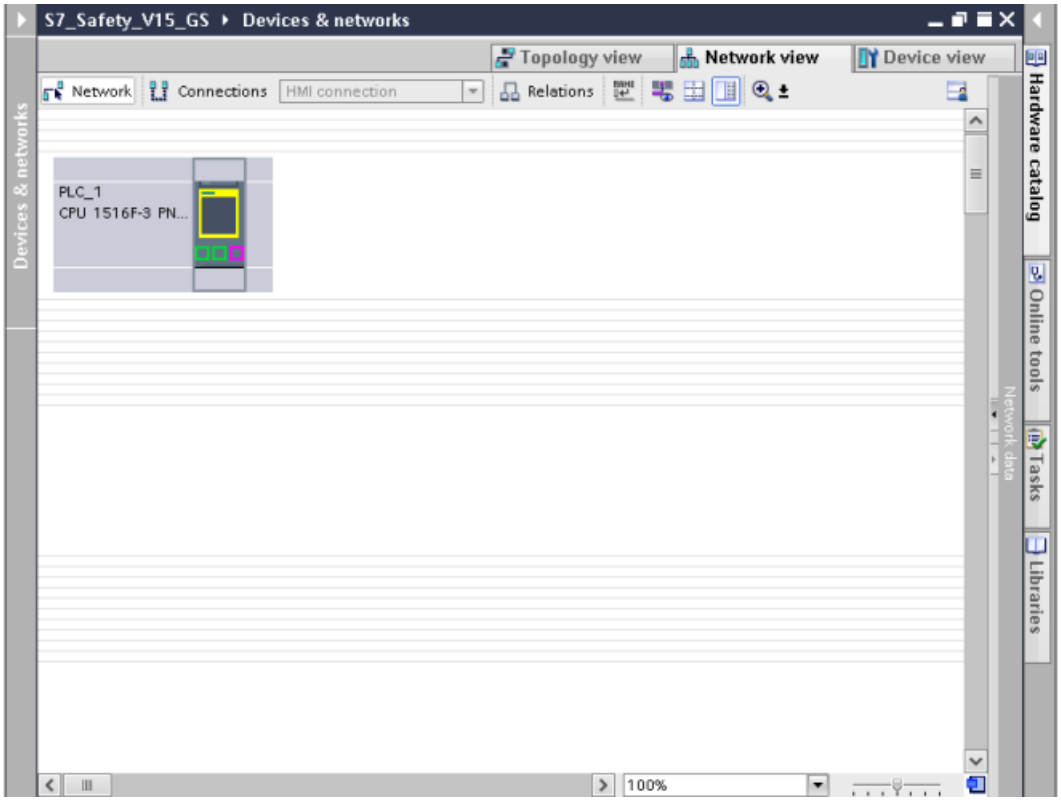
You require a PLC station consisting of an S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU, an ET 200eco PN 16DI module, and an ET 200eco PN F-DI 8 / F-DQ 3 module. Your programming device must be connected to the fail-safe CPU through a PROFINET interface.

⚠ WARNING

You may come into contact with live electrical wires connected to the main power supply.
Only wire the fail-safe CPU, ET 200eco PN 16DI, and ET 200eco PN F-DI 8 / F-DQ 3 control system when the input power is turned OFF.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.

Documentation on the installation and wiring of the S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPUs can be found in the Preface, "Documentation and information" (Page 4). You can find information on the installation and wiring of the ET 200eco PN 16DI in the "Distributed I/O ET 200eco PN, Operating Instructions" (https://support.industry.siemens.com/cs/document/29999018/simatic-distributed-i-o-et-200eco-pn?dti=0&lc=en-WW) and of the ET 200eco PN F-DI 8 / F-DQ 3 in the "Installation (Page 95)" and "Wiring" (Page 101) chapters of this manual.

Configuring the Hardware



After installing and wiring your PLC station, in STEP 7 Safety, you configure the following components:

- Fail-Safe CPU
- ET 200eco PN 16DI standard digital inputs for user acknowledgement, feedback loop, and start pushbutton
- ET 200eco PN F-DI 8 / F-DQ 3 module fail-safe digital inputs for connecting an emergency stop switch and position switches for monitoring a safety door and the laser scanner
- ET 200eco PN F-DI 8 / F-DQ 3 module fail-safe digital output for connecting a motor

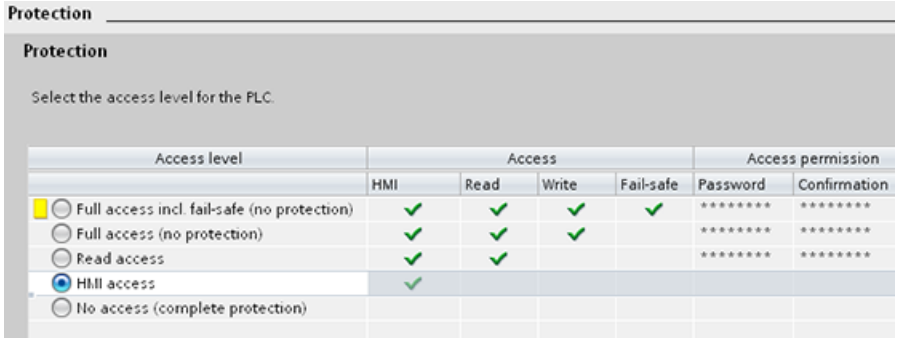
2.2.2 Step 1: Configuring the fail-safe CPU

In this step, you create a new project, add a fail-safe CPU, and assign parameters..

Procedure

1. In the portal view of STEP 7 Safety, create a new project named "S7_Safety_V15_GS"
2. Use "Add new device" to add a CPU 1516F-3 PN/DP.

NOTE



You can use any of the following fail-safe CPUs in this example:

- S7-1200/1500
- S7-300/400
- ET 200pro (IP67 compliant)
- ET 200S/ET 200SP

Result: The Device View containing the CPU 1516F-3 PN/DP opens.

3. Locate the "Fail-safe: F-parameters" area.
   You can change the following parameters or accept the default setting:
   – "Low limit for F-destination addresses": Default value is suitable for a stand-alone S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU.
   – "High limit for F-destination addresses": Default value is suitable for a stand-alone S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU.
   – "Central F-source address": Default value is suitable for a stand-alone S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU.

   Refer to "Configuring F-parameters" (Page 131) for further information.
   Leave the default values unchanged for this example.
4. Move to the "Protection & Security" area.
   Select the "Access level" property to select the access level and enter passwords. "Full access incl. fail-safe (no protection)" access level is the lowest level for a fail-safe CPU. Enter and confirm a password for the required protection. Passwords are case-sensitive.

When you download the protection configuration, in the figure above, to the fail-safe CPU, you have HMI access and can access HMI functions without a password. To read data, you must enter the configured password for one of the following access levels:

– "Read access"
– "Full access (no protection)"
– "Full access incl. fail-safe (no protection)".

To write data, the user must enter the configured password for one of the following access levels:

– "Full access (no protection)"
– "Full access incl. fail-safe (no protection)"

NOTE

If you require a password for only the Read access security level, you must also enter a password for the "Full access incl. fail-safe (no protection)" access security level.
If you require a password for only the Full access (no protection) security level, you must also enter a password for "Full access incl. fail-safe (no protection)" access security level.

Access protection for the fail-safe CPU

The fail-safe CPU provides five levels of security for restricting access to specific functions. When you configure the security level and password for a fail-safe CPU, you limit the functions and memory areas that can be accessed without entering a password.

Each level allows certain functions to be accessible without a password. The default condition for the fail-safe CPU is to have no restriction and no password-protection. To restrict access to a fail-safe CPU, you configure the properties of the fail-safe CPU, and enter and confirm the password.

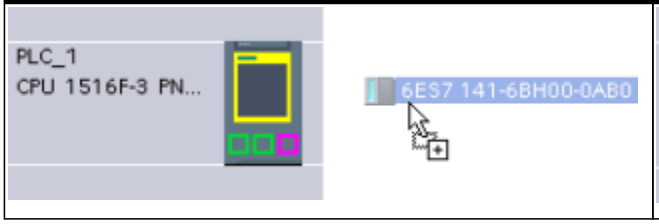
Table 1-1146 Access levels for the CPU

Access level	Access restrictions
Full access incl. fail-safe (no protection)	Allows full access without password. This is the lowest level of protection for a fail-safe CPU.
Full access (no protection)	Allows full access, except write access to fail-safe blocks, without password protection. Password is required for the following operations: • Modifying (writing to) fail-safe blocks • Changing the CPU mode (RUN/STOP)
Read access	Allows reading the data in the CPU, HMI access, and all forms of PLC-to-PLC communications without password protection. Password is required for following operations: • Modifying (writing to) fail-safe blocks • Modifying (writing to) the CPU • Changing the CPU mode (RUN/STOP)
HMI access	Allows HMI access and all forms of PLC-to-PLC communications without password protection. Password is required for the following operations: • Modifying (writing to) fail-safe blocks • Modifying (writing to) the CPU • Reading the data in the CPU • Changing the CPU mode (RUN/STOP)
No access (complete protection)	Allows no access without password protection. Password is required for the following operations: • Modifying (writing to) fail-safe blocks • Modifying (writing to) the CPU • Reading the data in the CPU • Changing the CPU mode (RUN/STOP) • Access to HMI

Result

The new project has been created and the configuration of the fail-safe CPU is complete.

2.2.3 Step 2: Configuring the ET 200eco PN 16DI



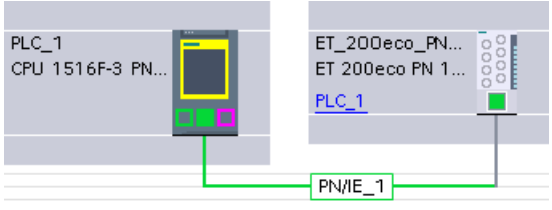
In the "Devices and networks" portal, use the hardware catalog to add PROFINET IO devices.

For example, expand the following containers in the hardware catalog to add an ET 200eco PN IO device:

- Distributed I/O
- ET 200eco PN
- Interface modules
- PROFINET
- DI
- 16DI x 24VDC 8xM12
- 6ES7141-6BH00-0AB0

You can then select from the list of ET 200eco PN devices (sorted by part number) and add the ET 200eco PN 16DI IO device.

Table 1-1147 Adding an ET 200eco PN 16DI IO device to the device configuration



Insert the IO device	Result
	

You can now connect the PROFINET IO device to the CPU:

1. Right-click the "Not assigned" link on the device and select "Assign to new IO controller" from the context menu to display the "Select IO controller" dialog.
2. Select your S7-1516F-3 PN/DP CPU (in this example, "PLC_1") from the list of IO controllers in the project.
3. Click "OK" to create the network connection.

You can also go to the "Devices and networks" portal and use the "Network view" to create the network connections between the devices in your project:

1. To create a PROFINET connection, click the green (PROFINET) box on the first device, and drag a line to the PROFINET box on the second device.
2. Release the mouse button and your PROFINET connection is joined.
3. Save the configuration, or download it to the fail-safe CPU.

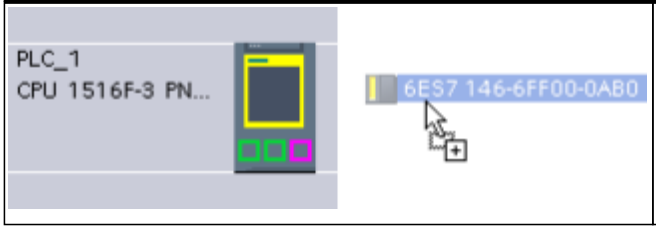
2.2.4 Step 3: Configuring the ET 200eco PN F-DI 8 / F-DQ 3

2.2.4.1 Installing the Hardware Support Package (HSP)

Hardware Support Packages (HSP) provide a way to configure modules that are not contained in the hardware catalog of your current STEP 7 installation. You can download the HSPs from the Siemens Industry Online Support Web site at "Support Packages for the hardware catalog in the TIA Portal (HSP)" (https://support.industry.siemens.com/cs/us/en/view/72341852). Use the following steps to install the ET 200eco PN F-DI 8 / F-DQ 3 HSP:

1. Create a project.
2. Select project view.
3. From the TIA Portal main menu, select the Options > Support Packages menu command.
4. In the dialog, ensure that you select "Installation of support packages" in the left pane (should already be selected).
5. Click the "Download from the Internet" link.
6. Navigate to the required HSP zip file (that contains HSP_V15_0204_001_ET200eco_FDI8_FDQ3_1.0.isp15) in the Siemens support site's "Support Packages for the hardware catalog in the TIA Portal (HSP)".
7. Click the required HSP zip file, download to a folder on your computer, and unzip the HSP.
8. Click the "Add from file system" button.
9. Navigate to the HSP (HSP_V15_0204_001_ET200eco_FDI8_FDQ3_1.0.isp15) on your local drive.
10. Click the "Open" button.
11. The HSP is inserted into the "Local support packages" list. Select the HSP by putting a check mark in the check box on the left.
12. Click the "Install" button on the bottom right of the dialog.
13. Click "Continue" on the pop up that appears
14. Click "Finish".
15. Click "Close".

2.2.4.2 Configuring the PROFINET IO device



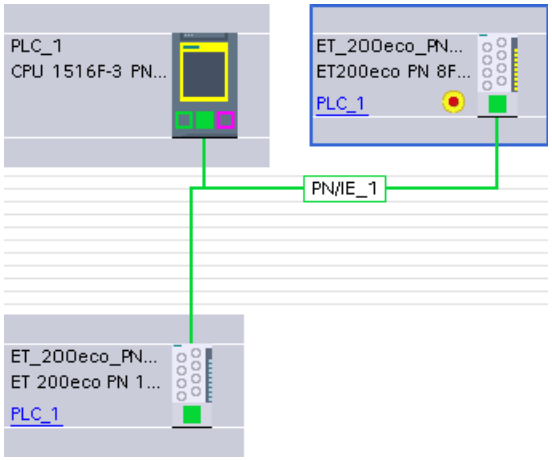
In the "Devices and networks" portal, use the hardware catalog to add PROFINET IO devices.

For example, expand the following containers in the hardware catalog to add an ET 200eco PN F IO device:

- Distributed I/O
- ET 200eco PN
- Interface modules
- PROFINET
- DI/DO
- F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A, 3xM12
- 6ES7146-6FF00-0AB0

Add the ET 200eco PN F-DI 8 / F-DQ 3 IO device. You can double-click the part number or drag it to the "Devices and networks" view to insert the module.

Table 1-1148 Adding an ET 200eco PN F-DI 8 / F-DQ 3 IO device to the device configuration



Insert the IO device	Result
	

You can now connect the PROFINET IO device to the CPU:

1. Right-click the "Not assigned" link on the device and select "Assign to new IO controller" from the context menu to display the "Select IO controller" dialog.
2. Select your S7-1516F-3 PN/DP CPU (in this example, "PLC_1") from the list of IO controllers in the project.
3. Click "OK" to create the network connection.

You can also go to the "Devices and networks" portal and use the "Network view" to create the network connections between the devices in your project:

1. To create a PROFINET connection, click the green (PROFINET) box on the first device, and drag a line to the PROFINET box on the second device.
2. Release the mouse button and your PROFINET connection is joined.
3. Save the configuration, or download it to the fail-safe CPU.

2.2.4.3 Configuring F-parameters

Procedure

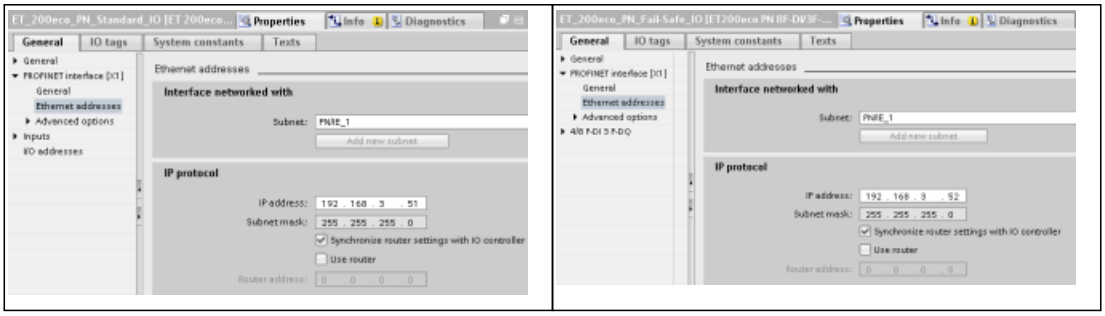
1. Under the "Properties" tab, select the "General" tab, and then select the "F-parameters" area. Here, you can change the following parameters or apply the default settings:
   – "F-monitoring time": A valid current safety message frame must be received from the fail-safe CPU to the ET 200eco PN F-DI 8 / F-DQ 3 within the F-monitoring time. Otherwise, the fail-safe module goes to safe state. The F-monitoring time must be set high enough so that message frame delays are tolerated and, at the same time, low enough that the process can react as quickly as possible when a fault occurs.

   NOTE
   The "F-runtime group cycle time" is a closely-related parameter to the F-monitoring time. The cycle time is the interval by which the F-runtime group executes and determines how often the fail-safe CPU sends the PROFIsafe frame to the ET 200eco PN F-DI 8 / F-DQ 3.
   When you add a fail-safe CPU to your project, STEP 7 creates Functional Safety Organization Block 1 (FOB_RTG1) (OB123 by default). FOB_RTG1 is a cyclic-interrupt OB which executes using the "cycle time" interval specified in the Safety Administration editor for the corresponding F-runtime group.

   – "F-destination address": A unique PROFIsafe address is critical for every F-IO module used in a safety system (network and CPU-wide). Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for procedures to set and verify unique PROFIsafe addresses in networked systems.

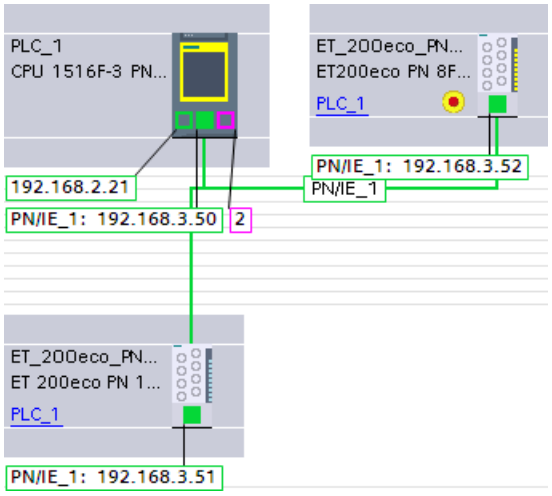
   Leave the settings unchanged for the F-parameters for this example.

Result



The configuration of the ET 200eco PN F-DI 8 / F-DQ 3 F-parameters is now complete.

2.2.5 Step 4: Assigning the IP addresses and PROFINET device names



2.2.5.1 Assigning the IP addresses

An IO device is configured and an IP address assigned in the hardware configuration.

To assign an IP address to your ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3 modules, navigate to each module's Property page, and select **General > PROFINET interface [Xn] > Ethernet addresses**. Locate the "IP protocol" field, and enter the IP address for your ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3. as shown in the figure below:

The TIA portal, Network view displays your IP addresses as shown in the example below:

2.2.5.2 Assigning the PROFINET device names

Every PROFINET device is assigned a unique device ID (MAC address) before it leaves the factory.

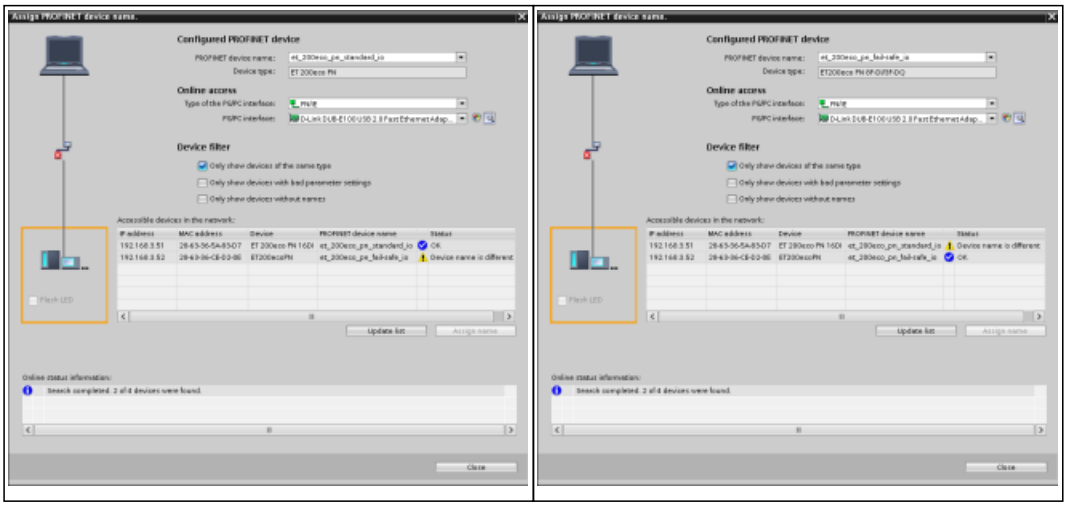
Each ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3 IO device is addressed based on its device name during configuration.

Requirements

- An online PROFINET connection from the programming device to the IO device is required for assigning the device name to the IO device.
- The IO device is configured and an IP address assigned in hardware configuration.

NOTE

When you assign PROFINET device names to devices on the PROFINET network using an S7-1500 CPU, your programming device, S7-1500 CPU, and distributed IO devices must all be on the same subnet.



In this example, you communicate from your S7-1500 CPU to your programming device through the S7-1500 CPU's "X2" Ethernet port. You communicate from your S7-1500 CPU to your distributed IO devices through the S7-1500 CPU's "X1" Ethernet port. The "X1" Ethernet port has two physical Ethernet cable connections.

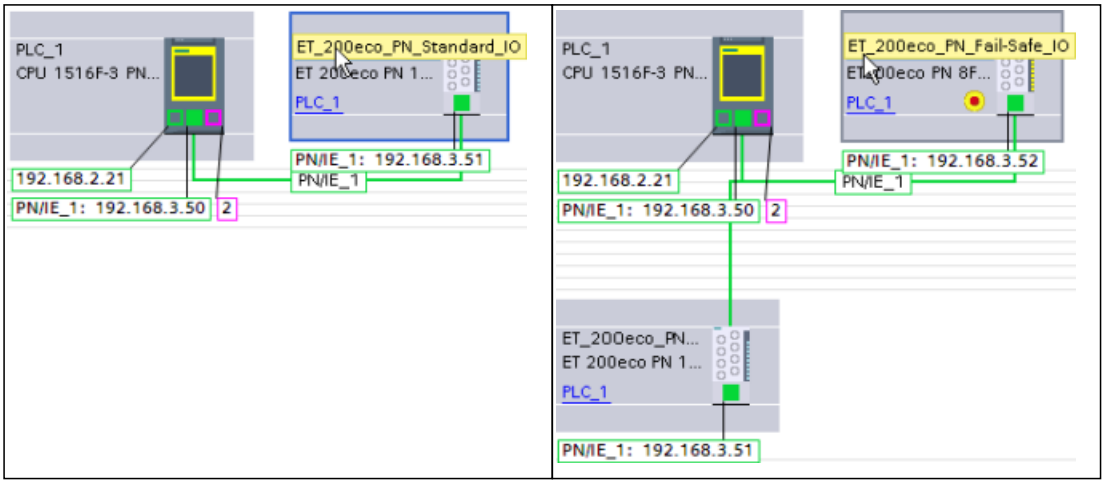
In order to have all of your PROFINET devices on the same subnet, you must communicate to all of your devices through the S7-1500 "X1" Ethernet port. Therefore, you must move the S7-1500 "X2" port Ethernet connection cable to the bottom "X1" Ethernet port. Then, you can communicate with the modules because then you are on the same Ethernet network.

Assigning device names

1. Switch on the supply voltages for the ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3 modules.
2. Open the ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3 Property pages.
3. Select **General > Project information > Name** and enter a device name.

4. Right-click on the module in the "Devices and networks" view, and select "Assign device name" to bring up the "Assign PROFINET device name" dialog.

5. Ensure that you select the "Only show devices of the same type" check box (should be selected by default).
6. Click the "Update list" button.
7. Select the MAC address for your IO device from the list.
8. Click the "Assign name" button.



NOTE

If the module is not found, be sure the programming device is on the same network as the module (can connect Ethernet cable direct from the programming device to the module for this function).

Refer to the TIA Portal online help for further information on assigning PROFINET IO device names.

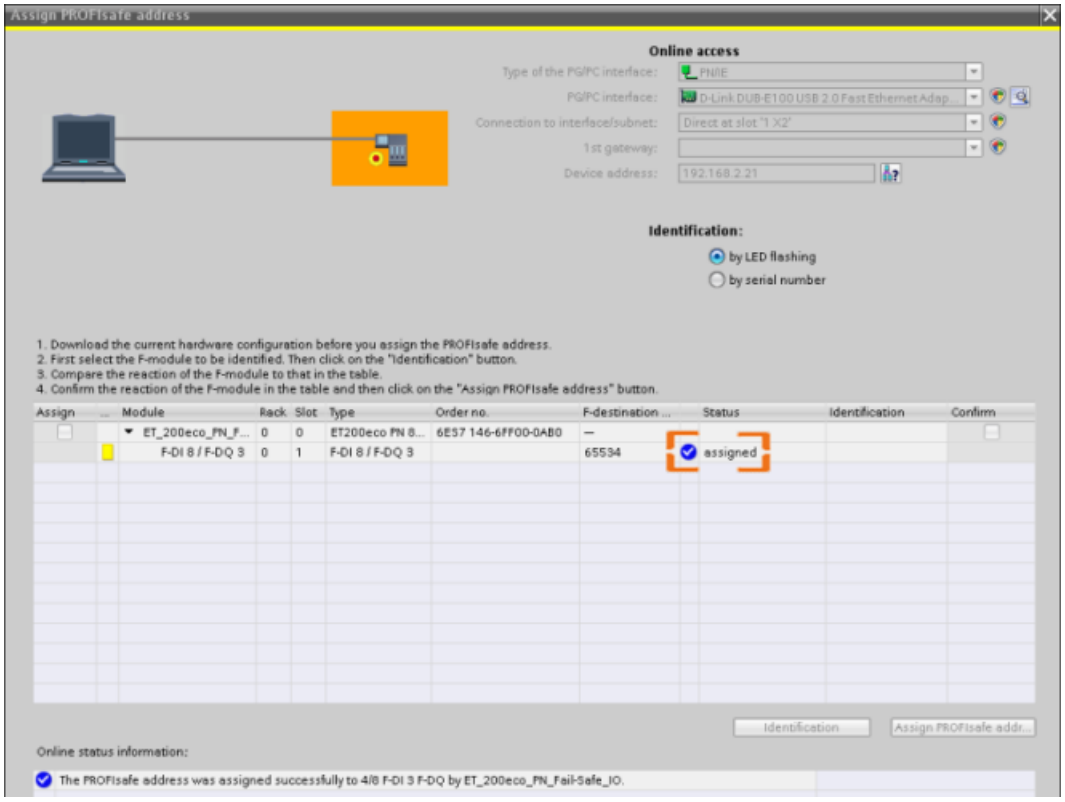
Result

The device name is saved internally in the ET 200eco PN 16 DI and ET 200eco PN F-DI 8 / F-DQ 3:

Node flash test

The "Assign PROFINET device name" dialog box displays all IO devices used. Compare the MAC address of the device with the MAC address displayed, and then select the correct IO device.

A node flash test facilitates the identification of IO devices in a plant. You activate the flash test as follows:



1. Select the required IO device from the "Accessible devices in the network" list.
2. Select the "Flash LED" check box.

The LINK LEDs flash on the selected IO device.

2.2.6 Step 5: Assigning PROFIsafe addresses

In this step, you identify the ET 200eco PN F-DI 8 / F-DQ 3 module for assignment and assign a PROFIsafe address to it.

Procedure

Identifying the module

You identify the ET 200eco PN F-DI 8 / F-DQ 3 module using the following steps:

1. Download the current hardware configuration before you assign the PROFIsafe addresses.
2. In the network view, select the ET 200eco PN F module to which you want to assign the PROFIsafe address.
3. Right-click the ET 200eco PN F module, and select "Assign PROFIsafe address" from the context menu to display the "Assign PROFIsafe address" dialog.
4. In the "Identification" field, select the method to be used for identifying the ET 200eco PN F module:
   - "By LED flashing": This is the default setting. The System Fault, Channel Fault, and Channel Status LEDs of the ET 200eco PN F module that you want to identify flash upon identification.
   - "By serial number": If you cannot see the ET 200eco PN F module directly, you can identify the module by the serial number of the module.
5. In the "Assign" column, select the check box for the ET 200eco PN F module to which you want to assign PROFIsafe address.

6. Click the "Identification" button, and compare the reaction of the fail-safe module to that in the table:
   - Check whether the Channel Status LEDs of the ET 200eco PN F modules whose PROFIsafe addresses you want to assign are flashing green.
   - If you identify using the serial number, compare the displayed serial number to the serial number of the module.
7. In the "Confirm" column, select the check box for the ET 200eco PN F module for which you want to confirm the reaction of the fail-safe module in the table.

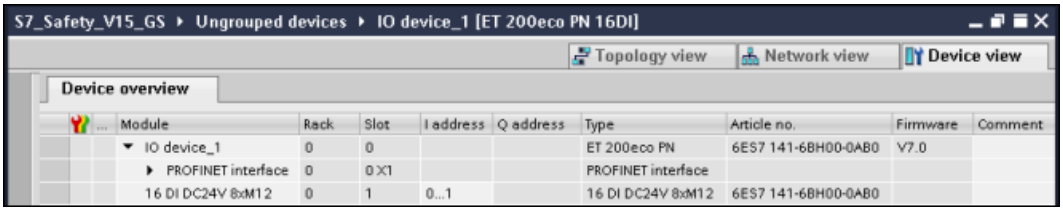
Assigning a PROFIsafe address to the module

To assign an F-destination address, proceed as follows:

1. Ensure that you install an eCoding plug on each ET 200eco PN F-DI 8 / F-DQ 3 module.
2. Use the "Assign PROFIsafe addr..." button to assign the PROFIsafe address to the ET 200eco PN F-DI 8 / F-DQ 3 module. You may have to enter the password of the fail-safe CPU.
3. You must answer "yes" to the "Confirm PROFIsafe address assignment" dialog within 60 seconds to assign the PROFIsafe address.

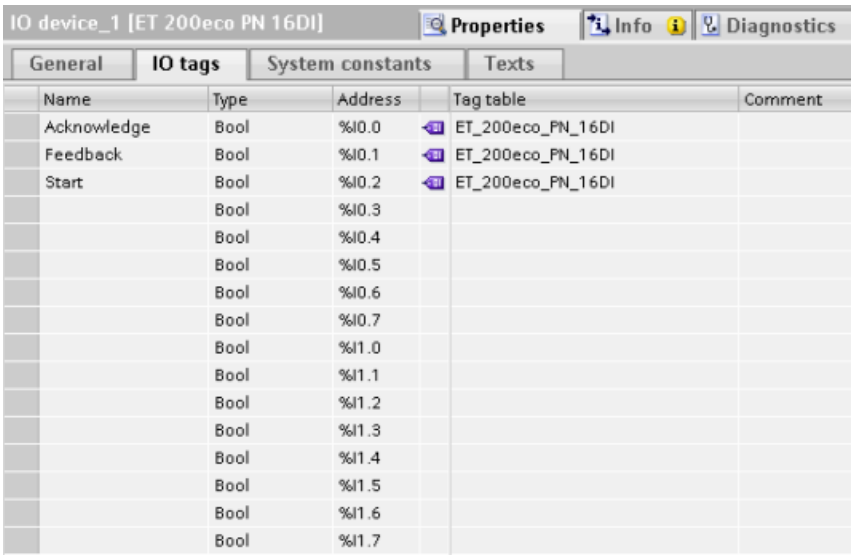
NOTE

Refer to the "Assigning PROFIsafe addresses" (Page 140) for further information about PROFIsafe address identification and assignment.



2.2.7 Step 6: Configuring the standard digital inputs for the user acknowledgement, feedback circuit, and start pushbutton

In this step, you connect ET 200eco PN 16DI standard digital inputs to the non-fail-safe signals (user acknowledgement, feedback loop, and start pushbutton) in your program.



Procedure

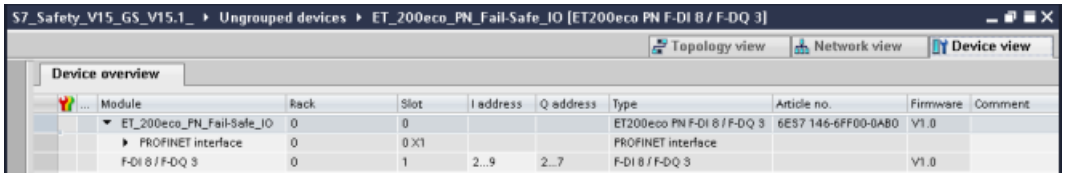
1. Assign the input address of the ET 200eco PN digital input module (16 DI DC 24 V DC 8xM12 (6ES7141-6BH00-0AB0)) to "0" for this example. You can assign these addresses in the ET 200eco PN digital input module's device configuration under "16 DI DC24V 8xM12", "I/O addresses".

   Refer to the "ET 200eco PN 16DI Device view" information from the TIA Portal shown below:

2. Return to the "Device view" and select the ET 200eco PN 16DI. Under the "Properties" tab, select the "IO tags" tab. Here, you can define tags for each channel:

Name	Type	Address	Tag table	Comment
Acknowledge	Bool	%I0.0	ET_200eco_PN_16DI	
Feedback	Bool	%I0.1	ET_200eco_PN_16DI	
Start	Bool	%I0.2	ET_200eco_PN_16DI	
	Bool	%I0.3		
	Bool	%I0.4		
	Bool	%I0.5		
	Bool	%I0.6		
	Bool	%I0.7		
	Bool	%I1.0		
	Bool	%I1.1		
	Bool	%I1.2		
	Bool	%I1.3		
	Bool	%I1.4		
	Bool	%I1.5		
	Bool	%I1.6		
	Bool	%I1.7		

Result



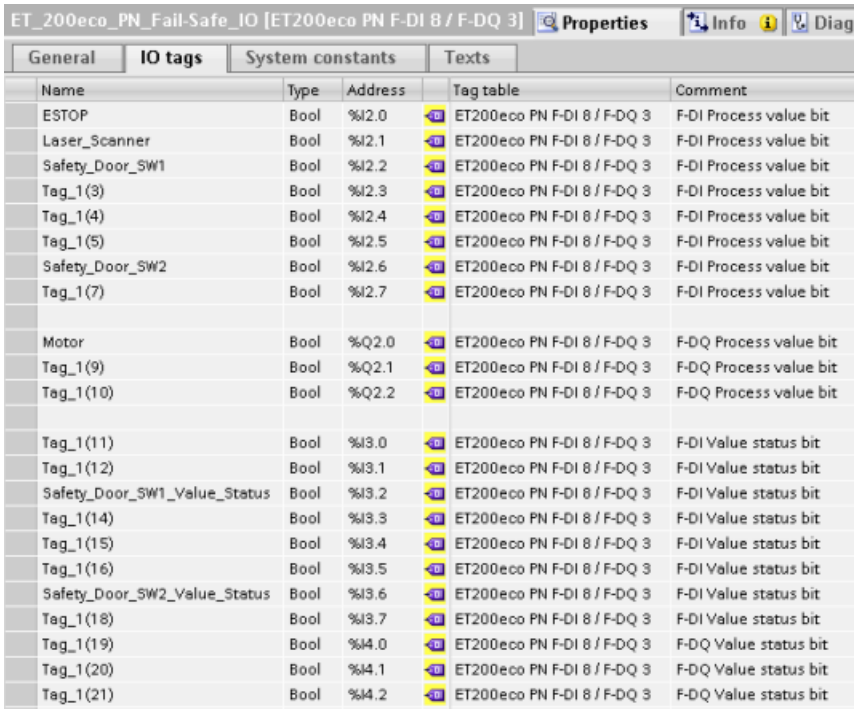
The configuration of the ET 200eco PN 16DI standard digital inputs is now complete.

2.2.8 Step 7: Configuring the Process value and Value status bits

In this step, you configure the Process value and Value status bits of the ET 200eco PN F-DI 8 / F-DQ 3.

Procedure

1. Select the "Device view" tab to display the "Device overview" area. Here, you can change the starting addresses for the inputs and outputs of your fail-safe module. Use the module default I/O addresses of "2" and "2" for this example (inputs begin at byte 2, and outputs begin at byte 2).



NOTE

The ET 200eco PN F-DI 8 / F-DQ 3 internally uses both Is and Qs to work with the physical input and output channels.

The ET 200eco PN F-DI 8 / F-DQ 3 digital inputs can have 4 - 8 input channels, and the digital outputs have 3 output channels.

The number of input (I) bytes and output (Q) bytes that the ET 200eco PN F-DI 8 / F-DQ 3 requires depends upon which PROFIsafe profile your fail-safe CPU uses. If using PROFIsafe profile V2.4 (with S7-300/S7-400), the module requires 7 input (I) bytes and 5 output (Q) bytes. If using PROFIsafe profile V2.6 (with S7-1200/S7-1500), the module requires 8 input (I) bytes and 6 output (Q) bytes.

2. Return to the "Device view" and select the ET 200eco PN F-DI 8 / F-DQ 3. Under the "Properties" tab, select the "IO tags" tab. This action displays the "Process value" and "Value status" bits for the fail-safe module. Here, you can define tags for each channel:

ET_200eco_PN_Fail-Safe_IO [ET200eco PN F-DI 8 / F-DQ 3] | Properties | Info | Diag

General | IO tags | System constants | Texts

Name	Type	Address	Tag table	Comment
ESTOP	Bool	%I2.0	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Laser_Scanner	Bool	%I2.1	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Safety_Door_SW1	Bool	%I2.2	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Tag_1(3)	Bool	%I2.3	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit

Tag_1(5)	Bool	%I2.5	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Safety_Door_SW2	Bool	%I2.6	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Tag_1(7)	Bool	%I2.7	ET200eco PN F-DI 8 / F-DQ 3	F-DI Process value bit
Motor	Bool	%Q2.0	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Process value bit
Tag_1(9)	Bool	%Q2.1	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Process value bit
Tag_1(10)	Bool	%Q2.2	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Process value bit
Tag_1(11)	Bool	%I3.0	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(12)	Bool	%I3.1	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Safety_Door_SW1_Value_Status	Bool	%I3.2	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(14)	Bool	%I3.3	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(15)	Bool	%I3.4	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(16)	Bool	%I3.5	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Safety_Door_SW2_Value_Status	Bool	%I3.6	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(18)	Bool	%I3.7	ET200eco PN F-DI 8 / F-DQ 3	F-DI Value status bit
Tag_1(19)	Bool	%I4.0	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Value status bit
Tag_1(20)	Bool	%I4.1	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Value status bit
Tag_1(21)	Bool	%I4.2	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Value status bit

Each Process value bit has an associated Value status bit that reports whether the corresponding process value is valid (ON) or associated with a passivated channel (OFF). If an entire module is passivated, then the Value status bits associated with all channels are all OFF.

Digital input Process value and Value status bits

To check the Process value bits and the Value status bits, you must know where these bits are mapped in the module. For an ET 200eco PN F-DI 8 / F-DQ 3, the first byte of the input (I) image register is the Process value bits for the digital inputs, and the next byte of the input (I) image register is the Value status bits for the digital inputs. For example, if the module starting address is I2.0 and Q2.0 for the ET 200eco PN F-DI 8 / F-DQ 3 and you have a 1oo1 configuration, then the Process value bits and corresponding Value status bits for the digital inputs are allocated as shown in the following table:

Digital input Process value bits - 1oo1 configuration	Digital input Value status bits - 1oo1 configuration
I2.0	I3.0
I2.1	I3.1
I2.2	I3.2
I2.3	I3.3
I2.4	I3.4

Digital input Process value bits - 1oo1 configuration	Digital input Value status bits - 1oo1 configuration
I2.5	I3.5
I2.6	I3.6
I2.7	I3.7

If you have all channel pairs configured to use 1oo2 evaluation, then the Process value bits and corresponding Value status bits for the digital inputs are allocated as shown in the following table:

Digital input Process value bits - 1oo2 configuration	Digital input Value status bits - 1oo2 configuration
I2.0	I3.0
I2.1	I3.1
I2.2	I3.2
I2.3	I3.3
-	-
-	-
-	-
-	-

Digital Output Process value and Value status bits

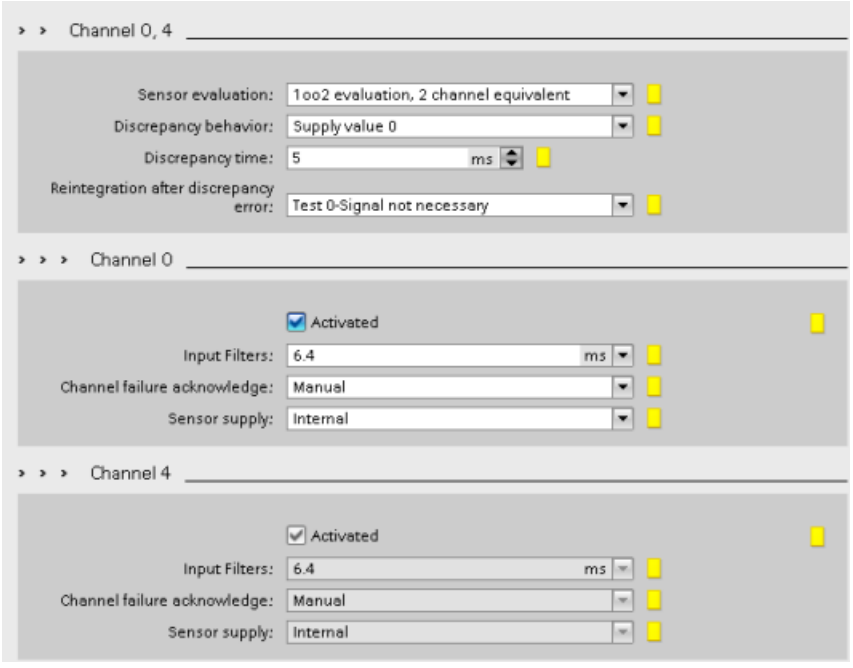
To check the Process value bits and the Value status bits, you must know where these bits are mapped in the module. For an ET 200eco PN F-DI 8 / F-DQ 3, the first three bits of the output (Q) image register are the Process value bits, and the first three bits of the third byte of the input (I) image register are the Value status bits for the digital outputs. For example, if the module starting address is I2.0 and Q2.0 for the ET 200eco PN F-DI 8 / F-DQ 3, then the Process value bits and corresponding Value status bits for the digital outputs are allocated as shown in the following table:

Digital output Process value bits	Digital output Value status bits
Q2.0	I4.0
Q2.1	I4.1
Q2.2	I4.2

Result

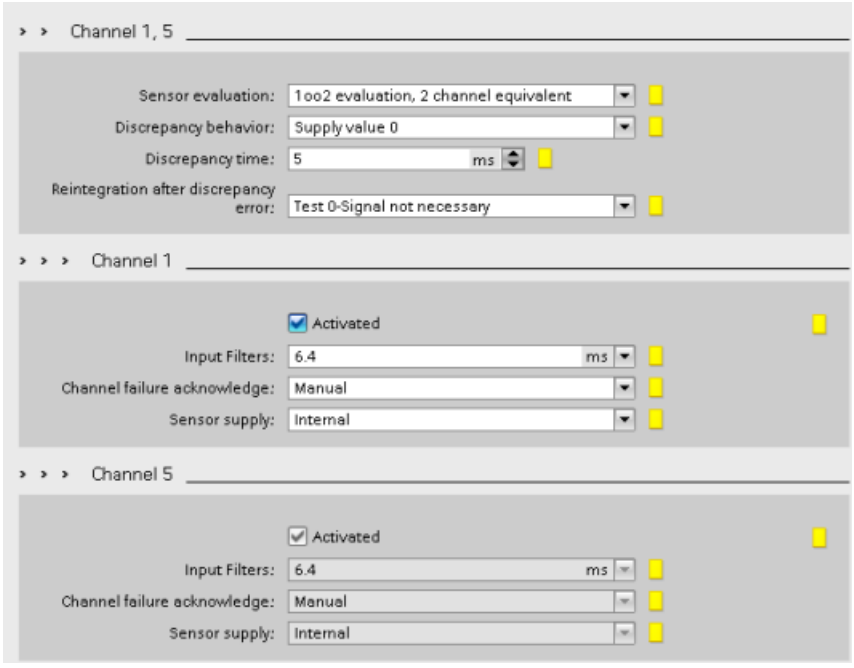
The configuration of the ET 200eco PN F-DI 8 / F-DQ 3 Process value and Value status bits is now complete.

2.2.9 Step 8: Connecting digital inputs to an emergency stop switch, position switches, and a laser scanner



In this step, you connect ET 200eco PN F-DI 8 / F-DQ 3 digital inputs to an emergency stop switch, the position switches for monitoring a safety door, and a laser scanner for monitoring the entry area.

Procedure



1. Select "4/8 F-DI 3 F-DQ", "DI parameters", and "Channel parameters".
2. Connect a two-channel emergency stop switch (emergency stop) to channels 0 and 4.

   Our example wires these channels to Process value bits I2.0 and I2.4. The first of the two inputs, I2.0, conveys the signal in this 1oo2 configuration. Expand "DI parameters" and "Channel parameters", and select "Channel 0, 4".

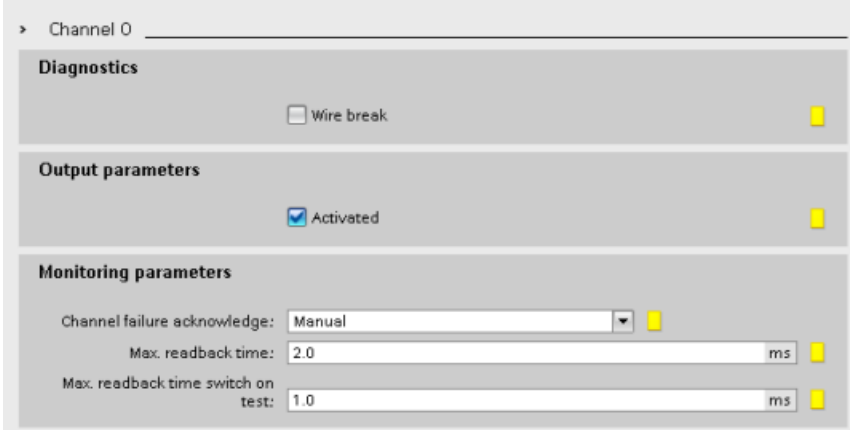
   Enter the settings as shown in the following figure:

3. In this example, in a 1oo2 configuration, connect the laser scanner for monitoring the accessible entry area to channels 1 and 5. Make the settings as shown in the following figure:

4. In this example, in a 1oo1 configuration, connect the position switches for monitoring a two-switch safety door to channels 2 and 6. Make the settings as shown in the following figure:

5. Disable the unused DI channels 3 and 7 by clearing the "Activated" check box:

Result



The configuration of the ET 200eco PN F-DI 8 / F-DQ 3 digital inputs is now complete.

2.2.10 Step 9: Connecting a digital output to a motor

In this step, you configure an ET 200eco PN F-DI 8 / F-DQ 3 module's digital outputs for indirect connection of a motor to channel 0, using 2 contactors.

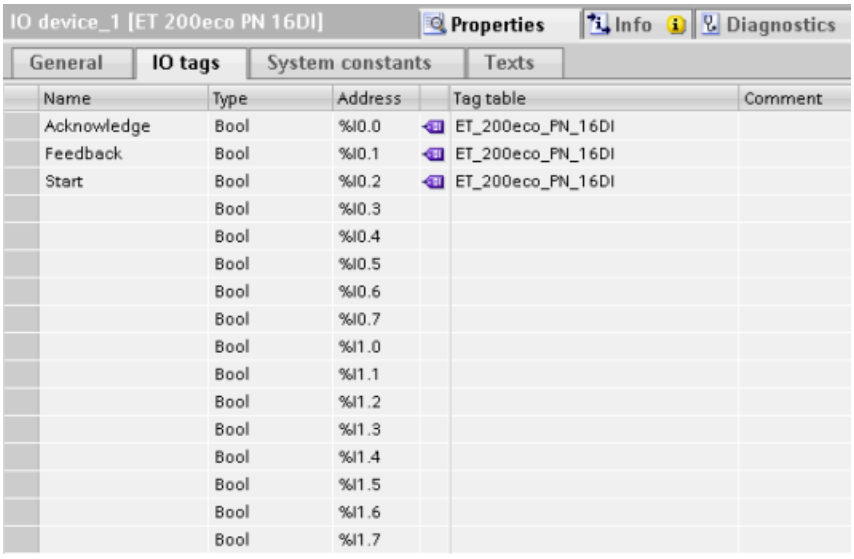
Procedure

1. Select the "DQ parameters" area. Here, you can change channel-specific parameters or apply the default settings.
   Enter the settings for the example as shown in the following figure:

2. Disable the unused DQ channels 1 and 2 by clearing the "Activated" check box.

Result

The configuration of the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs is now complete.



2.2.11 Summary: Configuring the Hardware

Summary

So far, you have configured the CPU 1516F-3 PN/DP and ET 200eco PN F-DI 8 / F-DQ 3 module according to the task definition for the example:

- CPU 1516F-3 PN/DP
- ET 200eco PN 16 DI standard digital inputs for user acknowledgment, feedback loop, and start pushbutton:

  - Starting byte addresses of the input and output data areas: IB0 and QB0
  - Input channel (bit) 0 for reintegration acknowledgement (I0.0)
  - Input channel (bit) 1 for feedback (I0.1)
  - Input channel (bit) 2 for start (I0.2)

Name	Type	Address	Tag table	Comment
Acknowledge	Bool	%I0.0	ET_200eco_PN_16DI	
Feedback	Bool	%I0.1	ET_200eco_PN_16DI	
Start	Bool	%I0.2	ET_200eco_PN_16DI	
	Bool	%I0.3		
	Bool	%I0.4		
	Bool	%I0.5		
	Bool	%I0.6		
	Bool	%I0.7		
	Bool	%I1.0		
	Bool	%I1.1		
	Bool	%I1.2		
	Bool	%I1.3		
	Bool	%I1.4		
	Bool	%I1.5		
	Bool	%I1.6		
	Bool	%I1.7		

- ET 200eco PN F-DI 8 / F-DQ 3 fail-safe digital inputs for connecting an emergency stop switch, position switches for monitoring a safety door, and the laser scanner for monitoring the accessible production area:

  - Starting byte addresses of the input and output data areas: IB2 and QB2
  - Input channel (bits) 0 and 4 for the emergency stop (I2.0)
  - Input channel (bits) 1 and 5 for the laser scanner (I2.1)
  - Input channel (bit) 2 for one safety door position switch (I2.2)
  - Input channel (bit) 6 for other safety door position switch (I2.6)

- ET 200eco PN F-DI 8 / F-DQ 3 fail-safe digital output for connecting a motor:
  - Starting byte addresses of the input and output data areas: IB2 and QB2
  - Output channel (bit) 0 for indirect switching of a motor using 2 contactors (Q2.0)

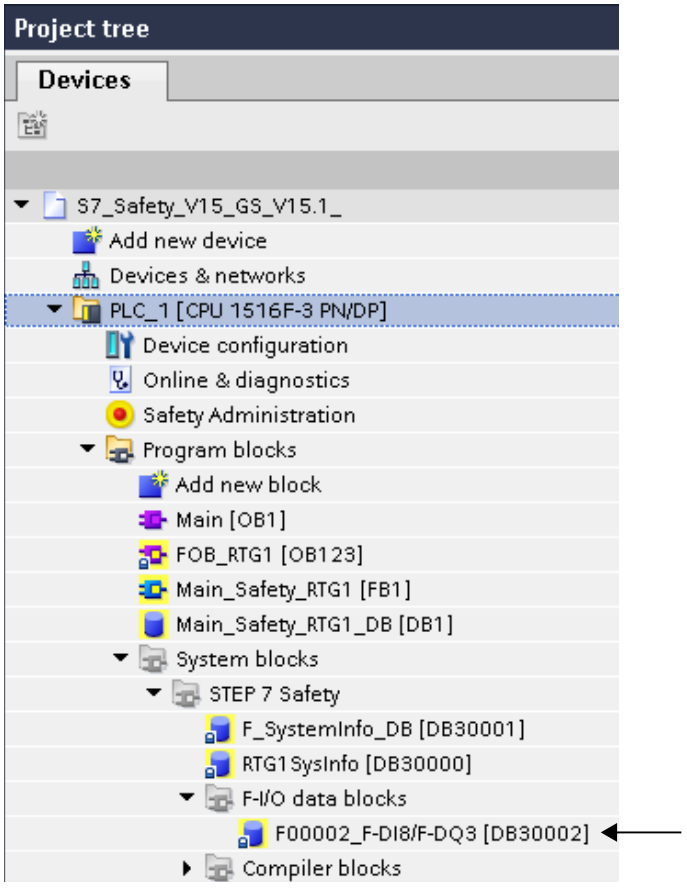
Tag_1(21)	Bool	%I4.2	ET200eco PN F-DI 8 / F-DQ 3	F-DQ Value status bit

You can now continue with programming the safety program.



2.3 Programming

2.3.1 Introduction

In this example, a fail-safe function block (F-FB) will be programmed with a safety door function, an emergency stop function (safety circuit for switch-off in case of emergency stop, open safety door, or someone entering the protected area monitored by the laser scanner), a feedback circuit (as protection against reclosing in case of faulty load), a user acknowledgement for reintegration, and indirect switching of a motor using two contactors. The programmed F-FB will then be compiled to form a safety program and downloaded to the fail-safe CPU.

Fail-Safe module data blocks (F-IO DBs)

An F-IO DB is automatically generated when you add a fail-safe module to your configuration. The F-I/O DBs generated for the example I/O are located in the "Project tree" in the "Program blocks", "System blocks" folder:

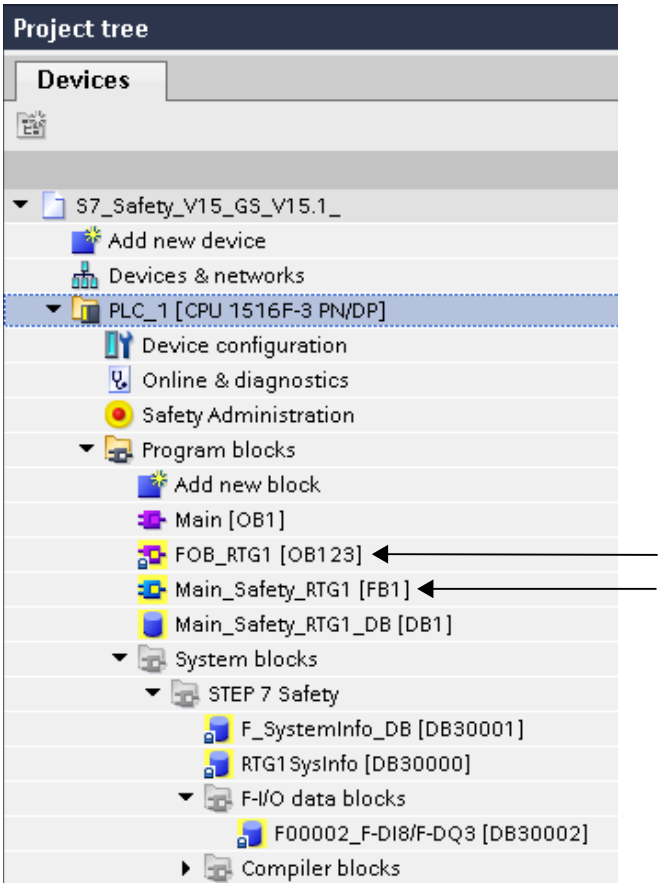
The default name of the F-I/O DB is formed from the fixed prefix "F", the start input address of the fail-safe module, and the names entered in the properties for the fail-safe module in the hardware and network editor.

You can access the tags of the F-I/O DB with a fully qualified DB access (that is, by specifying the name of the F-I/O DB and the name of the tag).

Programming

You can program the safety program in LAD and FBD. In so doing, the instructions, data types, and operand areas you can use are subject to certain restrictions (see the "Programming" chapter, "Overview of programming" section of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en)).

The FBD programming language is used in this example.



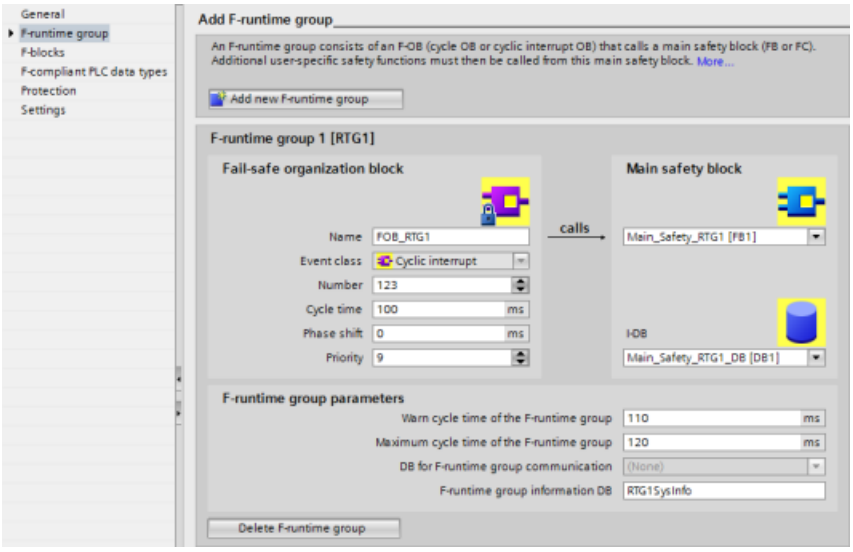
NOTE

Fail-safe signals are shown in yellow in the "LAD/FBD Editor".

NOTE
Note the rules for the program structure in the "Programming" chapter, "Defining F-runtime groups" section of the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

2.3.2 Step 10: Specifying the centralized settings for the safety program

When the fail-safe CPU is inserted, an F-runtime group and the associated main safety block are created by default and assigned to the CPU. An F-runtime group consists of an F-OB (cyclic interrupt OB) that calls a main safety block FB. Additional user-specific safety functions must then be called from this main safety block:



The first step in programming of the safety program is the main safety block. The program calls the main safety block (which is an F-FB (with instance DB)) from the "Fail-Safe Organization Block" (F-OB) (cyclic interrupt OB), assigned in each F-runtime group. By default, the F-OB has a higher priority than other standard OBs.

The program calls the F-blocks that you create from the main safety block. You can change the calling block and the called block at any time.

After the CPU executes the safety program, the standard user program will resume.

Opening the Safety Administration editor

1. In the "Project tree" of the fail-safe CPU, double-click on "Safety Administration".
   Result: The "Safety Administration" editor opens.
   You make central settings for the safety program in the Safety Administration editor.
2. In the area navigation of the Safety Administration editor, click "F-runtime group". The F-runtime group is created automatically when the fail-safe CPU is created and the associated main safety block is displayed:

The cyclic interrupt OB (FOB_RTG1 [OB123]) calls the main safety block (Main_Safety_RTG1 [FB1]) by default. The program calls the F-blocks that you create from the main safety block. You can change the calling block and the called block at any time.

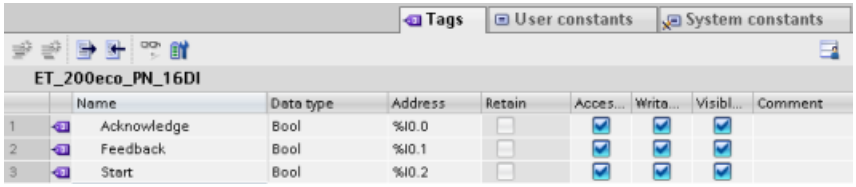
Leave the preset blocks for this example.

For additional information on the Safety Administration editor, refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

Numbering ranges of fail-safe system blocks

When the safety program is compiled, F-blocks are automatically added in order to generate an executable safety program.

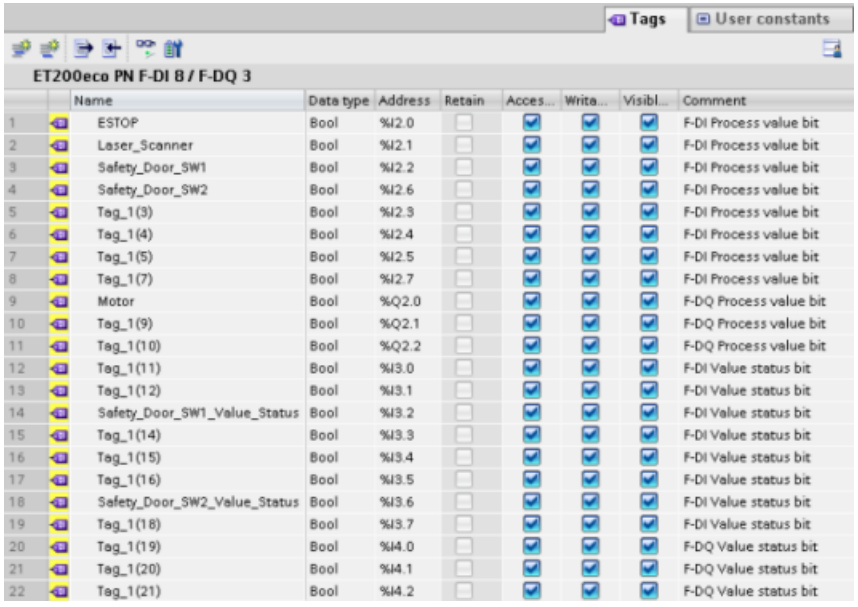
By default, the system automatically manages the numbering range, which is displayed in the Safety Administration editor under "Settings".



Keep the pre-assigned settings for this example.

Specifying inputs and outputs for the safety program

After configuring the hardware as described in Configuring (Page 30) in steps 1 to 6, the CPU creates the following standard module and fail-safe module symbolic names and DBs for programming the example:



Configured hardware	Starting input/output address	Symbolic name
ET 200eco PN 16DI standard digital inputs	IB0	IO device_1 [ET 200eco PN 16DI]
ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	IB2	F00002_F-DI 8 / F-DQ 3[DB30002]
ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	QB2	F00002_F-DI 8 / F-DQ 3[DB30002]

Assign the following symbolic names for the standard inputs and outputs:

	Name	Data type	Address	Retain	Acces...	Writa...	Visibl...	Comment
1	Acknowledge	Bool	%I0.0		☑	☑	☑	
2	Feedback	Bool	%I0.1		☑	☑	☑	
3	Start	Bool	%I0.2		☑	☑	☑	

Assign the following symbolic names for the fail-safe inputs and outputs:

	Name	Data type	Address	Retain	Acces...	Writa...	Visibl...	Comment
1	ESTOP	Bool	%I2.0		☑	☑	☑	F-DI Process value bit
2	Laser_Scanner	Bool	%I2.1		☑	☑	☑	F-DI Process value bit
3	Safety_Door_SW1	Bool	%I2.2		☑	☑	☑	F-DI Process value bit
4	Safety_Door_SW2	Bool	%I2.6		☑	☑	☑	F-DI Process value bit
5	Tag_1(3)	Bool	%I2.3		☑	☑	☑	F-DI Process value bit
6	Tag_1(4)	Bool	%I2.4		☑	☑	☑	F-DI Process value bit
7	Tag_1(5)	Bool	%I2.5		☑	☑	☑	F-DI Process value bit
8	Tag_1(7)	Bool	%I2.7		☑	☑	☑	F-DI Process value bit
9	Motor	Bool	%Q2.0		☑	☑	☑	F-DQ Process value bit
10	Tag_1(9)	Bool	%Q2.1		☑	☑	☑	F-DQ Process value bit
11	Tag_1(10)	Bool	%Q2.2		☑	☑	☑	F-DQ Process value bit
12	Tag_1(11)	Bool	%I3.0		☑	☑	☑	F-DI Value status bit
13	Tag_1(12)	Bool	%I3.1		☑	☑	☑	F-DI Value status bit
14	Safety_Door_SW1_Value_Status	Bool	%I3.2		☑	☑	☑	F-DI Value status bit
15	Tag_1(14)	Bool	%I3.3		☑	☑	☑	F-DI Value status bit
16	Tag_1(15)	Bool	%I3.4		☑	☑	☑	F-DI Value status bit
17	Tag_1(16)	Bool	%I3.5		☑	☑	☑	F-DI Value status bit
18	Safety_Door_SW2_Value_Status	Bool	%I3.6		☑	☑	☑	F-DI Value status bit
19	Tag_1(18)	Bool	%I3.7		☑	☑	☑	F-DI Value status bit
20	Tag_1(19)	Bool	%I4.0		☑	☑	☑	F-DQ Value status bit
21	Tag_1(20)	Bool	%I4.1		☑	☑	☑	F-DQ Value status bit
22	Tag_1(21)	Bool	%I4.2		☑	☑	☑	F-DQ Value status bit

2.3.3 Step 11: Creating an F-FB

In this step, you create the F-FB where you will program the safety functions for this example.

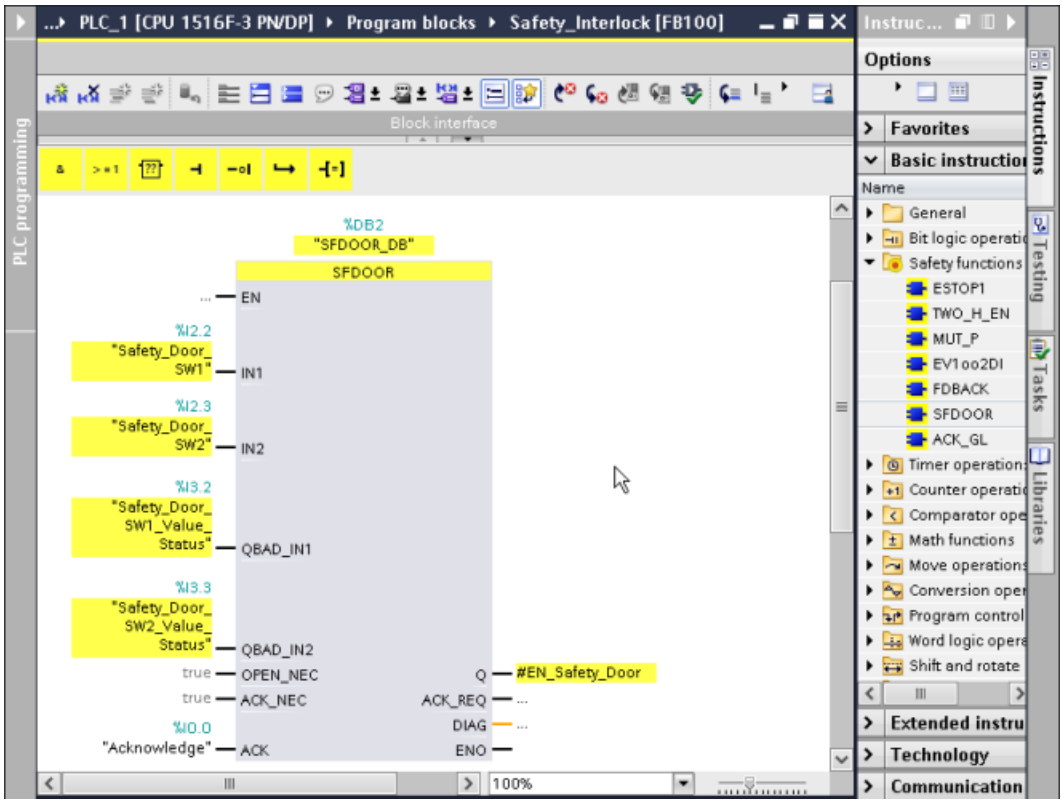
Procedure

1. Insert an F-FB. Go to the "Program blocks" folder of the fail-safe CPU and double-click "Add new block".

   The "Add new block" dialog opens.
2. Under "Name" enter "Safety_Interlock" for the name of the F-FB.
3. Click the "Function block" button on the left.
4. Select "FBD" as the language for the F-FB.
5. Under "Number" choose the "Manual" option, and enter 100.
6. Ensure that you select the "Create F-block" check box so that a fail-safe function block is created.
7. Close the dialog box with "OK"

Result

The F-FB "Safety_Interlock" is created in the "Program blocks" folder and opens automatically in the "FBD Editor".



You can now continue with programming the safety functions in the next step.

2.3.4 Step 12: Programming the safety door function

In this step, you program the safety door function for this example.

The safety door secures the application's service area. Opening the safety door results in a stop or shutdown of the production cell similar to an emergency stop.

Procedure

1. In the interface of the "Safety_Interlock" F-FB, create a static tag of data type "Bool" named "EN_Safety_Door" (Enable safety door).
2. Insert the "SFDOOR" instruction from the "Safety functions" subfolder of the "Instructions" task card.
3. Click "OK" to confirm the "Call options" dialog.
4. Initialize the inputs and outputs with parameters as described in the table below.

Parameter assignment of the "SFDOOR" instruction

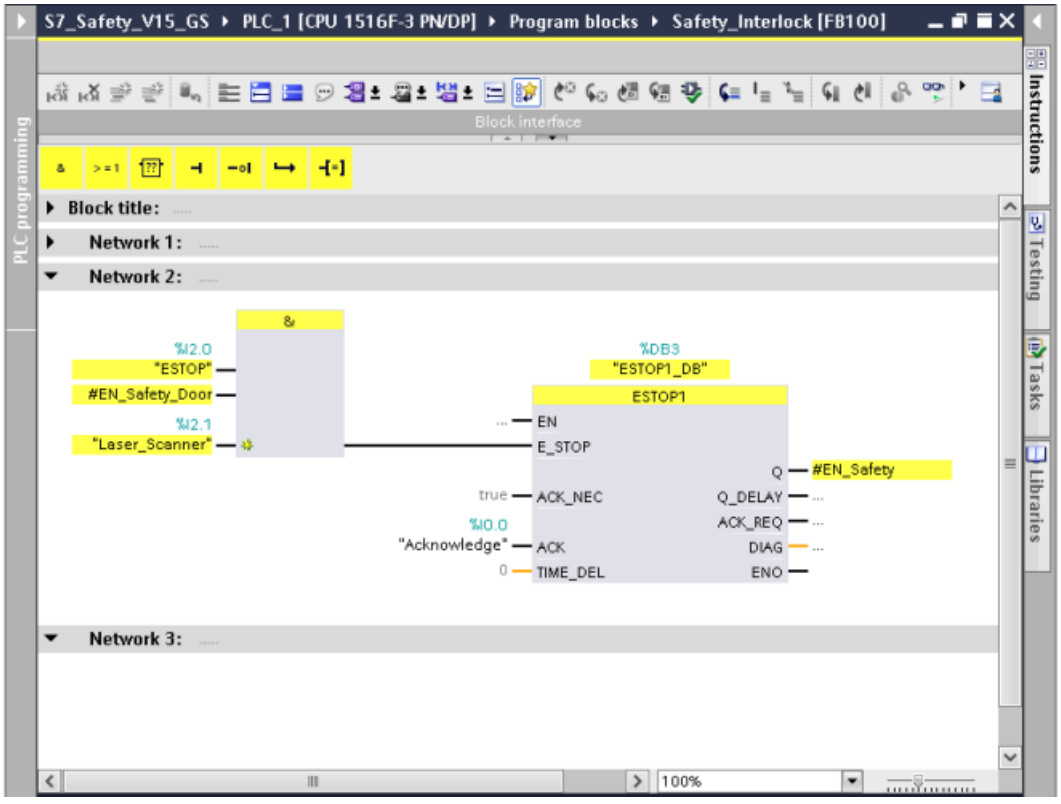
Inputs/outputs	Parameter	Data type	Description	Default
"Safety_Door_SW1" (I2.2)	IN1	Bool	Input 1	FALSE
"Safety_Door_SW2" (I2.6)	IN2	Bool	Input 2	FALSE

[1] The two inputs QBAD_IN1 and QBAD_IN2 must be interconnected. In this example, both safety door position switches are connected through the SFDOOR and ESTOP1 program logic with the QBAD signal of the F-I/O DB of the ET 200eco PN F-DI 8 / F-DQ 3 in the FDBACK program logic.

Inputs/outputs	Parameter	Data type	Description	Default
"Safety_Door_SW1_Value_Status" (I3.2)	QBAD_IN1	Bool	Value status bit signal for input IN1 [1]	TRUE
"Safety_Door_SW1_Value_Status" (I3.6)	QBAD_IN2	Bool	Value status bit signal for input IN2 [1]	TRUE
TRUE	OPEN_NEC	Bool	TRUE = Opening required on startup	TRUE
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (Pushbutton)	FALSE
#EN_Safety_Door	Q	Bool	Output (Enable safety door)	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0

[1] The two inputs QBAD_IN1 and QBAD_IN2 must be interconnected. In this example, both safety door position switches are connected through the SFDOOR and ESTOP1 program logic with the QBAD signal of the F-I/O DB of the ET 200eco PN F-DI 8 / F-DQ 3 in the FDBACK program logic.

Result



You have completed the programming of the safety door function.

2.3.5 Step 13: Programming the emergency stop function

In this step, you program the emergency stop function for this example.

Used for emergencies only, the emergency stop button is a safety measure to immediately shut down all machine functions. An emergency stop button must be highly visible in color and shape and must be easy to operate in emergency situations. In this example, the emergency stop is a manual push button attached next to the safety door entrance to the service area enclosure. The emergency stop function provides shutdown in the case of an emergency stop, an open safety door, or someone entering the protected area monitored by the laser scanner.

Procedure

1. In the interface of the "Safety_Interlock" F-FB, create a static tag of data type "Bool" named "EN_Safety" (Enable safety circuit).

NOTE

If the emergency stop is off, the safety door is closed, and nothing triggers the protected area laser scanner, the inputs from the emergency stop, safety door, and the laser scanner are all true. All three inputs must be true, before the ESTOP1 instruction can power "EN_Safety". When "EN_Safety" is true, then you know that your operation is back to normal and that you can startup safely.

2. Insert a new network.
3. Insert the "AND logic operation" instruction from the "Bit logic operations" subfolder of the "Instructions" task card.
4. Insert a third input to the "AND logic operation" instruction and initialize the inputs of the instruction with parameters as described in the table below.
5. Insert the "ESTOP1" instruction from the "Safety functions" subfolder of the "Instructions" task card.
6. Click "OK" to confirm the "Call options" dialog.
7. Initialize the inputs and outputs of the instruction with parameters as described in the tables below.
8. Connect the output of the "AND logic operation" instruction to the "ESTOP" input of the "ESTOP1" instruction.

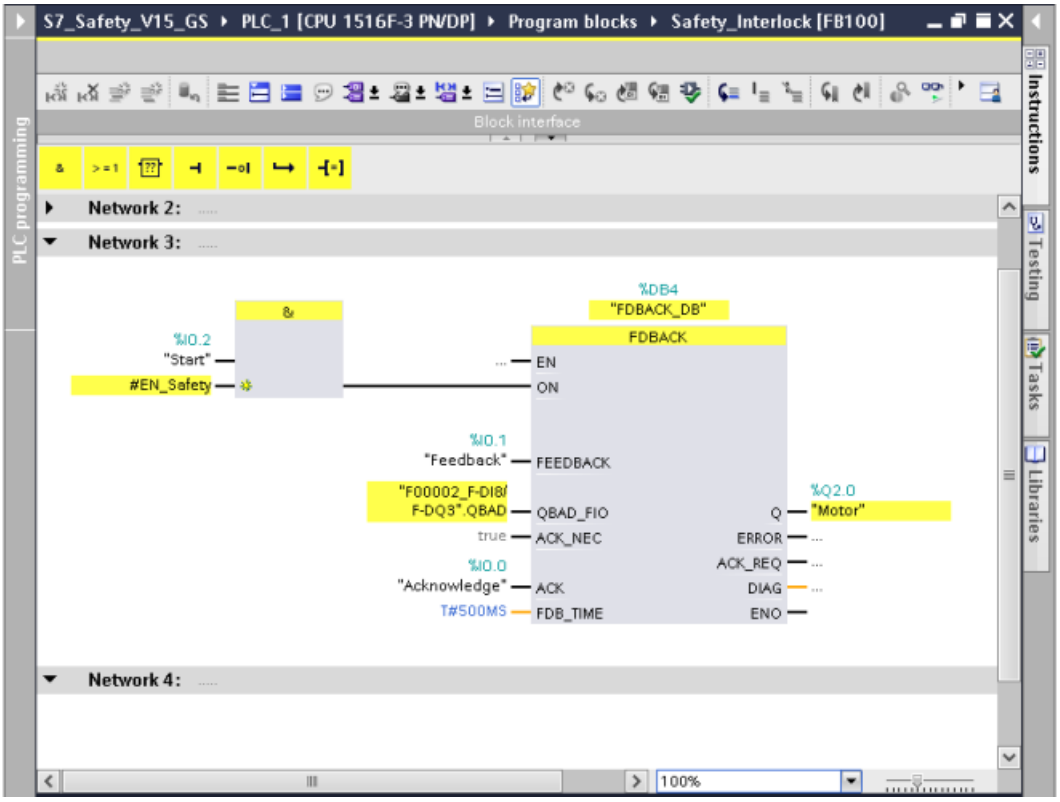
Parameter assignment of the "AND logic operation" instruction

Inputs	Parameter	Data type	Description	Default
"ESTOP" (I2.0)	Input 1	Bool	Emergency STOP	FALSE
#EN_Safety_Door	Input 2	Bool	Enable safety door	FALSE
"Laser_scanner" (I2.1)	Input 3	Bool	Laser scanner	FALSE

Parameter assignment of the "ESTOP1" instruction

Inputs/outputs	Parameter	Data type	Description	Default
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (using a pushbutton)	FALSE
T#0MS	TIME_DEL	Time	Time delay	T#0MS
#EN_Safety	Q	Bool	Enable safety circuit	FALSE
—	Q_DELAY	Bool	Enable is OFF delayed	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0

Result



You have completed the programming of the emergency stop function.

2.3.6 Step 14: Programming the feedback monitoring

In this step, you program the feedback circuit monitoring for this example.

The feedback circuit provides protection against restarting normal operations while unsafe conditions still exist. The system can only be restarted when the emergency stop is cancelled, the safety door is closed, and the laser scanner detects no one in the protected area.

Procedure

1. Insert a new network.
2. Insert the "AND logic operation" instruction from the "Bit logic operations" subfolder of the "Instructions" task card.
3. Initialize the inputs of the instruction with parameters as described in the table below
4. Insert the "FDBACK" instruction from the "Safety functions" subfolder of the "Instructions" task card.
5. Click "OK" to confirm the "Call options" dialog.
6. Initialize the inputs and outputs of the instruction with parameters as described in the tables below.
7. Connect the output of the "AND logic operation" instruction to the "ON" input of the "FDBACK" instruction.

Parameter assignment of the "AND logic operation" instruction

Inputs	Parameter	Data type	Description	Default
"Start" (I0.2)	Input 1	Bool	TRUE = Switch on output	FALSE
#EN_Safety	Input 2	Bool	Enable safety circuit	FALSE

Parameter assignment of the "FDBACK" instruction

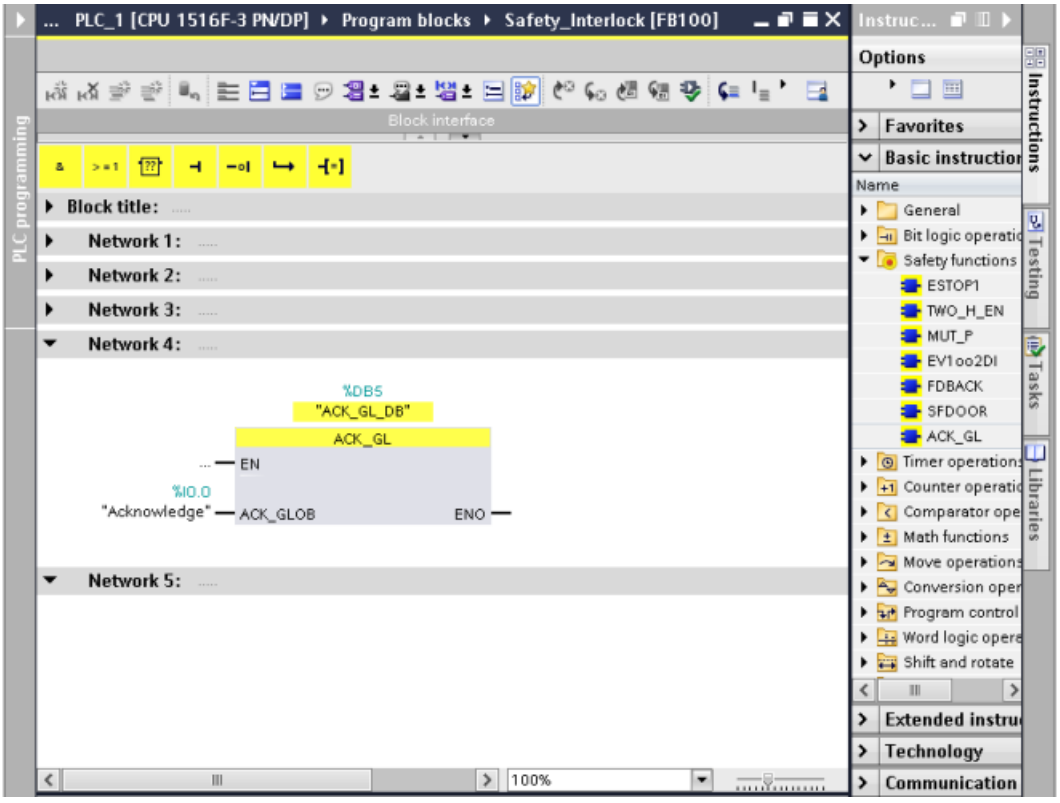
Inputs/outputs	Parameter	Data type	Description	Default
"Feedback" (I0.1)	FEEDBACK	Bool	Readback input	TRUE (No error detected)
"F00002_4/8F-DI3F-DQ". QBAD	QBAD_FIO	Bool	QBAD signal from the fail-safe signal module DB of output Q [1]	FALSE (No error detected)
TRUE	ACK_NEC	Bool	TRUE = Acknowledgment required	TRUE
"Acknowledge" (I0.0)	ACK	Bool	User acknowledgement (via pushbutton)	FALSE
T#500MS	FDB_TIME	Time	Readback time	T#0MS
"Motor" (Q2.0)	Q	Bool	Output	FALSE
—	ERROR	Bool	Readback error	FALSE
—	ACK_REQ	Bool	Acknowledgement prompt	FALSE
—	DIAG	Byte	Service information	B#16#0

[1] In this example, this is the QBAD signal from the F-I/O DB of the ET 200eco PN F-DI 8 / F-DQ 3.

Result

You have completed the programming of the feedback monitoring.

2.3.7 Step 15: Programming the user acknowledgment for reintegration of the fail-safe module



In this step, you program the user acknowledgement for reintegration of the fail-safe module I/O for this example.

The user must acknowledge that conditions have returned to a safe state before production operations can be restarted.

Procedure

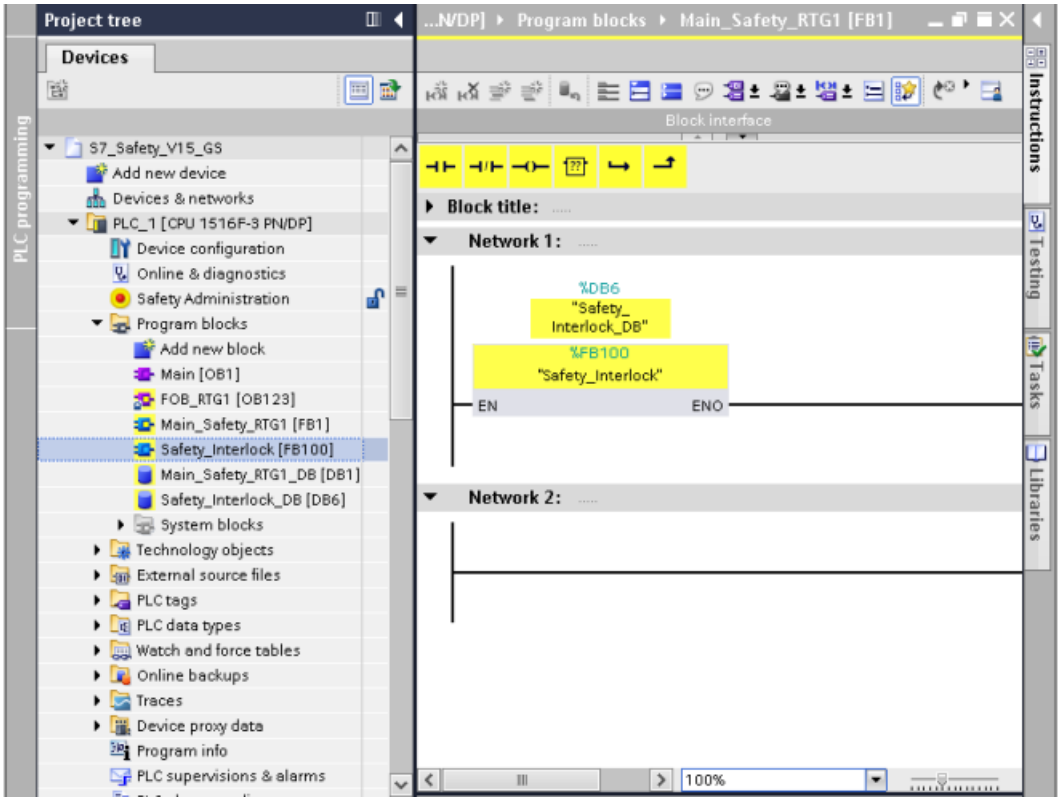
In your safety program, you must provide a user acknowledgment for the reintegration of the fail-safe module I/O. In order to acknowledge in the event of passivated F-I/O, the acknowledgement pushbutton is evaluated using a standard input. In this example, this is the "Acknowledge" input.

You can use the ACK_GL instruction to reintegrate all F-I/O of an F-runtime group.

1. Insert a new network.
2. Insert the "ACK_GL" instruction from the "Safety functions" subfolder of the "Instructions" task card.
3. Click "OK" to confirm the "Call options" dialog.
4. Initialize the input with parameters as described in the table below.

Parameter assignment of the "ACK_GL" instruction

Input	Parameter	Data type	Description	Default
"Acknowledge" (I0.0)	ACK_GLOB	Bool	Acknowledgement for reintegration	FALSE



Result

You have completed the programming of the user acknowledgment.

2.3.8 Step 16: Programming of the main safety block

In this step, you program the main safety block for this example.

Procedure

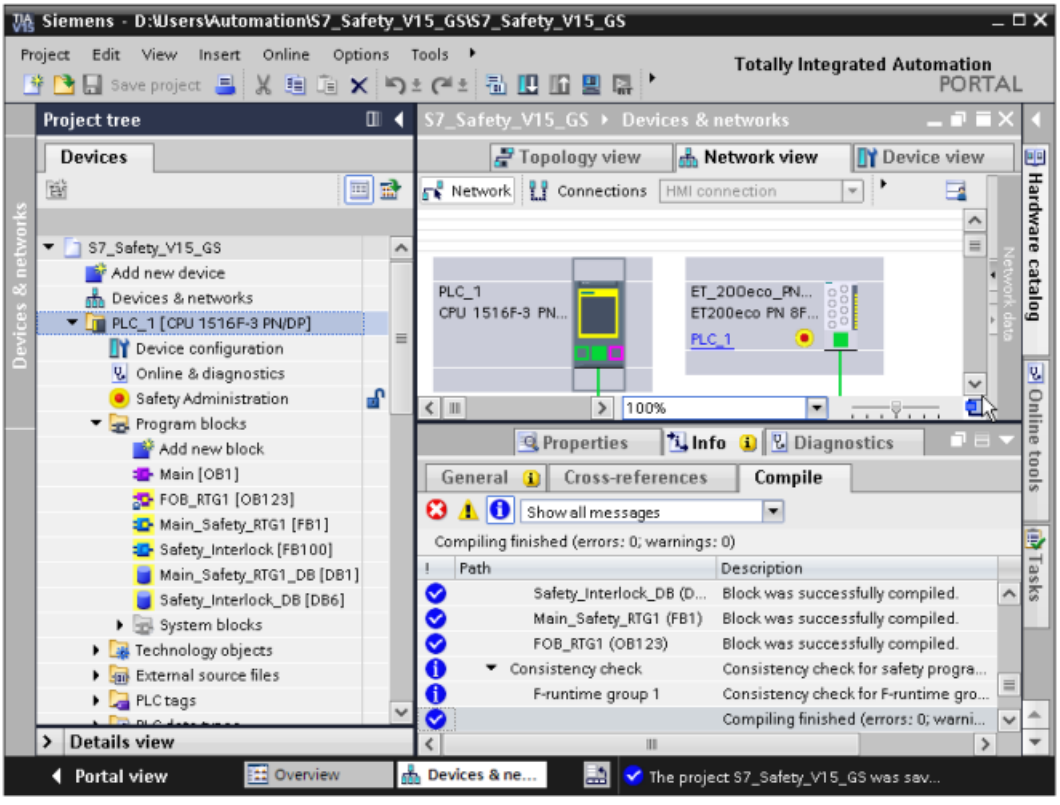
1. Double-click in the project navigation to open the main safety block "Main_Safety".
2. Use drag-and-drop to insert the F-FB "Safety_Interlock" in Network 1 of the main safety block.
3. Click "OK" to confirm the "Call options" dialog.

Result

The main safety block cyclically calls the F-FB "Safety_Interlock".

You have now programmed the functionality according to the task definition of the example. You can proceed with the next steps to compile the safety program and download the safety program, along with the hardware configuration, to the fail-safe CPU.

NOTE



For simpler safety programs, you can locate the entire safety program code directly within the main safety block rather than in FBs or FCs called from the main safety block.

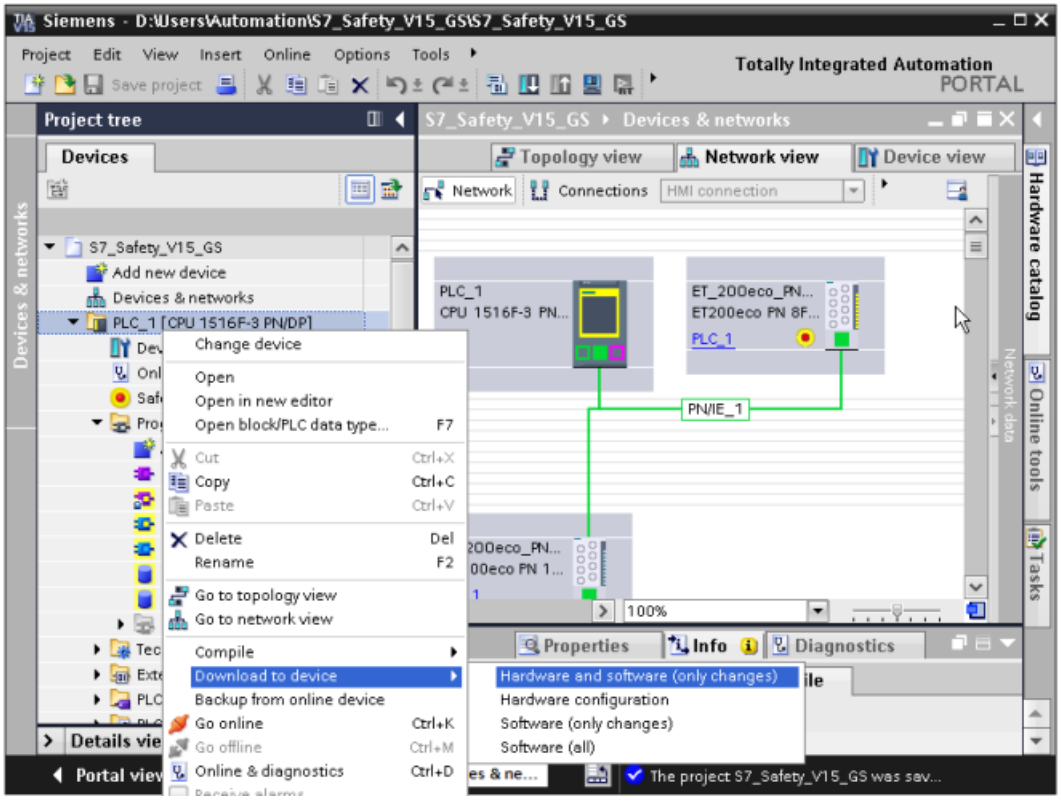
2.3.9 Step 17: Compiling the safety program

In this step, you compile the safety program and the hardware configuration.

A consistency check is performed on the execution-relevant F-blocks when the safety program is compiled, that is, the safety program is checked for errors. Any error messages are output in an error window. After a successful consistency check, the additionally required F-blocks are generated automatically and added to the F-runtime group in order to generate an executable safety program.

Procedure

1. Select the fail-safe CPU in the project tree.
2. In the shortcut menu for the fail-safe CPU, select "Compile", then select "Hardware and software (only changes)".
   The CPU compiles the safety program.



Result

If compilation is successful, the result is always a consistent and executable safety program comprising all F-blocks with F-attributes. STEP 7 notifies you of this with the message "Safety program is consistent".

2.3.10 Step 18: Downloading the complete safety program to the fail-safe CPU and activating safety mode

In this step, you download the hardware configuration and the safety program to the fail-safe CPU.

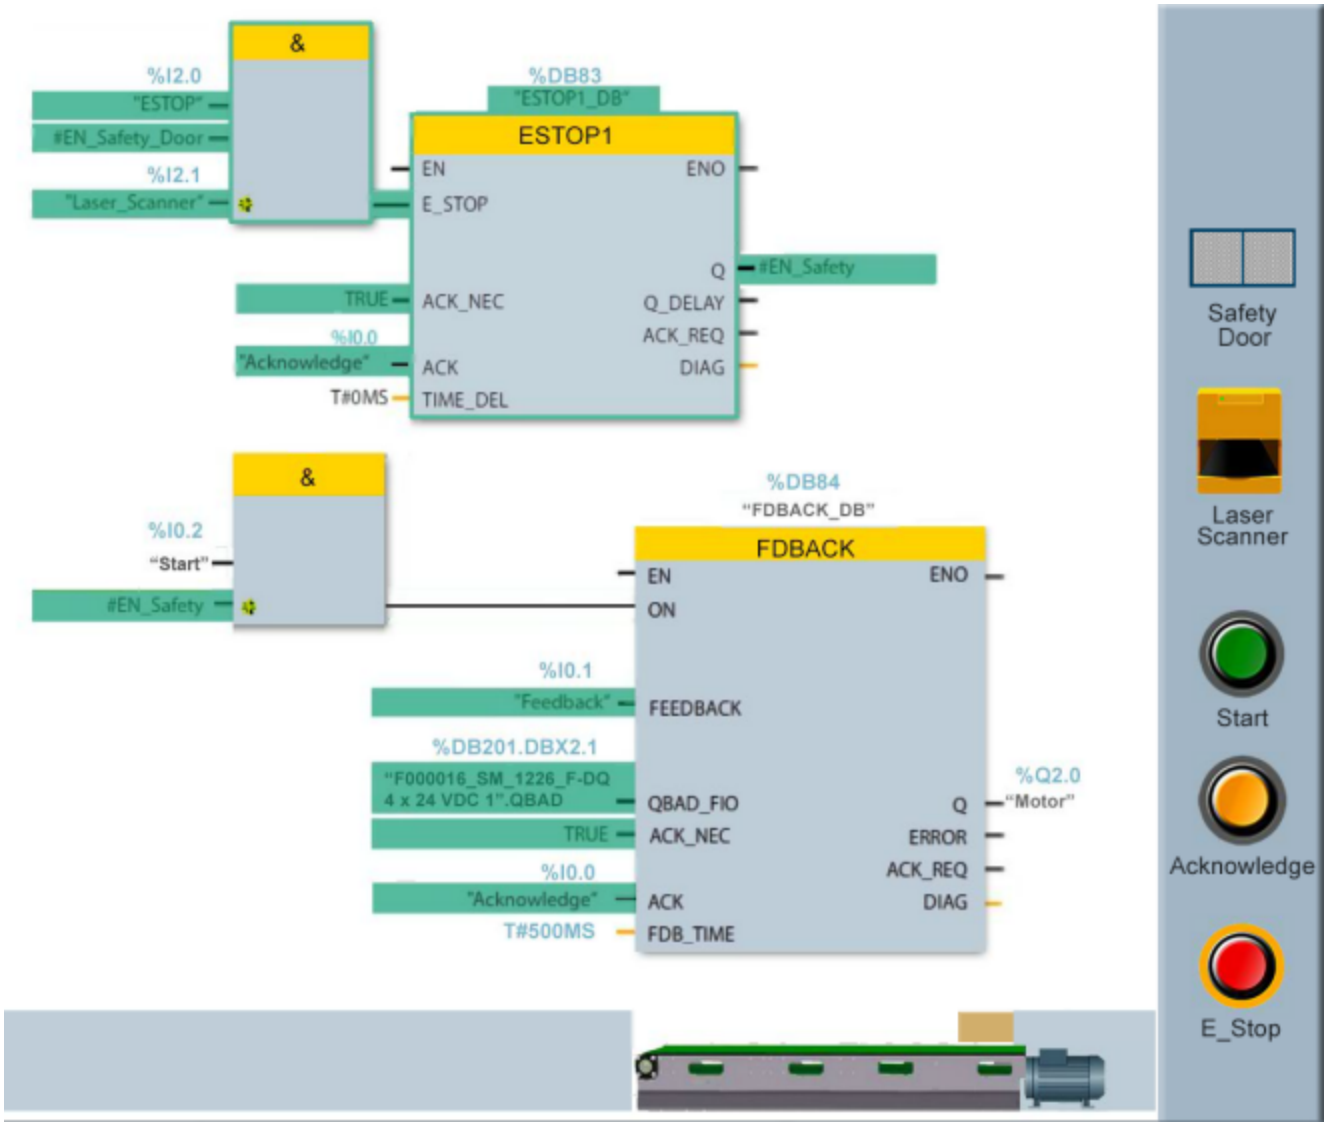
Procedure

1. In the "Project tree", select the fail-safe CPU.
2. In the shortcut menu for the fail-safe CPU, select "Download to device", then select "Hardware and software (only changes)". If an online connection to the fail-safe CPU does not yet exist, you will be prompted to establish this connection.

3. Select "Consistent download" in the "Action" column in each case.

NOTE
To download the entire safety program, the fail-safe CPU must be in STOP mode.

4. Click the "Load" button.
   Result: The "Load results" dialog is displayed.
5. Click the "Finish" button.
6. In the "Project tree", double-click "Safety Administration".
7. In the "Safety Administration" editor, check to see if the F-collective signatures of all F-blocks with F-attributes match online and offline to confirm whether your offline safety program blocks match what is in your connected CPU. You must be online in order to perform the signature comparison.
8. To activate safety mode, switch the fail-safe CPU from STOP to RUN mode.
   The Safety Administration editor displays the current safety mode status in the "General" area under "Safety Mode Status".



NOTE
Once a safety program has been created, you must perform a full function test according to your automation task (see SIMATIC Safety Configuring and Programming Manual (http://support.automation.siemens.com/WW/view/en/54110126/0/en)).

Result of programming

You have now finished creating the safety program according to the task definition of the example.

The example below switches the Laser Scanner, E-Stop, and Safety Door on and off to simulate unsafe conditions. Each device operates independently of the other two devices. If you do activate a device, you must deactivate the device before continuing.

You must press the "Acknowledge" button to notify the system that you have returned to a safe state. Then, you can press the "Start" button to operate the system again.

The table below describes the steps and their actions:

Step	Action	Description
1	Activate the E-Stop. [1, 2]	This action prevents resumption of the operation.
2	Deactivate the E-Stop. [3]	The E-Stop deactivates.
3	Press the Acknowledge button.	The safety program requires manual acknowledgement.
4	Press the Start button.	The motor restarts.
5	Trigger the Laser Scanner. [1, 2]	This action prevents resumption of the operation.

1 You can activate the E-STOP, trigger the Laser Scanner, or open the Safety Door individually or in any order to stop operations and bring the system to a safe state.

2 To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device, 2. Press the Acknowledge button, and 3. Press the Start button.

3 This action allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart the motor.

Step	Action	Description
6	Deactivate the Laser Scanner. [3]	The Laser Scanner deactivates.
7	Press the Acknowledge button.	The safety program requires manual acknowledgement.
8	Press the Start button.	The motor restarts.
9	Open the Safety Door. [1, 2]	This action prevents resumption of the operation.
10	Close the Safety Door. [3]	The Safety Door closes.
11	Press the Acknowledge button.	The safety program requires manual acknowledgement.
12	Press the Start button.	The motor restarts.

1 You can activate the E-STOP, trigger the Laser Scanner, or open the Safety Door individually or in any order to stop operations and bring the system to a safe state.

2 To continue operations, you must do the following steps in this order: 1. Deactivate the fail-safe device, 2. Press the Acknowledge button, and 3. Press the Start button.

3 This action allows reintegration from safe state values to process data and, if required, acknowledgement by your safety program. You can now restart the motor.

Applications

3

This chapter presents typical application examples for connection of functional safety input and output channels, with a statement of the safety performance (SIL/Category/PL) that is possible for each example.

The PLC system has an extremely low failure rate and therefore contributes only a small part of the total probability of dangerous failure of an automated system. The probability of dangerous failures of the sensors and actuators is typically far larger than the probability of dangerous failure per hour (PFH)/probability of dangerous failure on demand (PFD) of the PLC system. Estimates for quantitative safety properties like PDF and PFH are calculated using the following methods:

- Standard data tables
- Calculation methods according to international standards which include the following standards:
  - IEC 61508
  - ISO 13849
  - IEC 61131-6

  The values are based on the following assumptions:
  - Continuous full nominal load
  - Nominal voltage
  - Equipment ambient temperature of 60 °C

Faults in the wiring system can also be a substantial contributor to failures.

To achieve a targeted level of safety performance for each safety function, perform these actions:

- Choose an appropriate architecture
- Choose sensors and actuators that are appropriately rated
- Provide a safety program that meets the requirements of the safety function
- Provide diagnostics and proof-tests to maintain the ratings of the sensors and actuators
- Use wiring installation practices, diagnostics, and proof-tests to assure wiring integrity
- Generate and control operating and maintenance procedures for the lifetime of the installation

The S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), ET 200S/ET 200SP, ET 200eco PN, and ET 200M/ET 200MP Fail-Safe systems provide a high level of internal diagnostic coverage. Diagnostic coverage of your external circuits, sensors, and actuators depends on your design choices using features of the PLC system and other measures.

The PFH/PFD of each fail-safe PLC component is stated assuming no field proof-test within the lifetime of the product. Sensors and actuators typically require regular proof-tests to maintain an expected level of safety performance.

The reaction time of each safety function depends on the reaction time of each component, including the sensor, the PLC system, and the actuator. "Fail-Safe response times" (Page 190) gives further information on delay times through the PLC components. You must choose PLC parameters and external component reaction times to achieve a total safety reaction time goal.

In addition to the total delay from the safety demand input to the safe actuator response, you must consider these additional time-related factors. Refer to "Fail-Safe response times" (Page 190) for exact information:

- To be assured of a safety response, a safety demand signal from the input sensor must last long enough to be seen by the safety program. Your configured filter time, discrepancy resolution time, and short circuit test duration all contribute to this time.
- The ET 200eco PN F-DI 8 / F-DQ 3 digital outputs regularly test each P- and M-switch to verify that each switch is still functional and under independent control. The OFF test pulse duration can be as long as your configured "Maximum readback time". The ON test pulse duration can be as long as your configured "Maximum readback time switch on test". For a given output, the ON test pulse is only provided to one of the P or M switches at a time, but in the presence of single fault this could apply energy to your load. Your actuator should not respond to an OFF signal up to the "Maximum readback time" duration, or to an ON signal up to the "Maximum readback time switch on test" duration.
- The ET 200eco PN F-DI 8 / F-DQ 3 digital outputs expect to complete and confirm any commanded transition from the ON to OFF output state. After your program changes the process output value from "1" to "0", do not change the "0" back to a "1" until the program completes the fail-safe digital outputs' readback time. The affected output passivates on commanded "0" states that are too short to confirm.

⚠ WARNING

The safety performance of your installation depends on your design and continued maintenance of each complete safety function.
The ET 200pro, ET 200SP and S7-1200/1500 Fail-Safe CPUs and F-DI 4/F-DQ 2 Fail-Safe module provide components for logic processing with a certified level of safety integrity when used in accordance with ratings, specifications, and instructions. Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage. You must choose all components of your installation and complete your design according to accepted safety standards and practices to achieve your required level of safety.

3.1 Digital input applications

3.1.1 Overview

You should consider the application modes presented here along with the features of the ET 200eco PN F-DI 8 / F-DQ 3 as described in the overview. Refer to "Fail-Safe digital inputs" (Page 23).

The main features of the ET 200eco PN F-DI 8 / F-DQ 3 digital inputs include the following items:

- Inputs are 24 V DC rated inputs that meet the requirements of IEC 61131-2 as Type 1 inputs.
- Configure each channel as a 1oo1 or part of a 1oo2 evaluation pair. The corresponding channels (x.0, x.4), (x.1, x.5), (x.2, x.6), and (x.3, x.7) form a 1oo2 channel group. The lower numbered channel of the group is called the primary input and the other channel is called the secondary input. Within this restriction, you can assign 1oo1 or 1oo2 in any order.

- Short-circuit testing requires use of the internal sensor supply. For all evaluation and sensor interconnections except for 1oo2, 2 channel - 3 wire nonequivalent, use Vs1 with inputs x.0 to x.3 and Vs2 with inputs x.4 to x.7. For evaluation and sensor interconnection for 1oo2, 2 channel - 3 wire nonequivalent, use Vs1 with inputs x.0 to x.7, and do not use Vs2.
- If you enable the short-circuit test, you configure both Vs1 and Vs2 with the same parameters. All channels that you configure for internal sensor supply are subject to the same short-circuit test. You configure a test duration (length of dark time) and test interval (time between the start of the dark tests).
- The module performs these short-circuit functions for F-DI channels:
  - Monitors the sensor supply to detect short-circuit or overload
  - Cycles the sensor supply once on each power up to assure control and readback are working. This ensures operational integrity of the sensor supply at power up even when disabled.
  - Monitors the readback during input short-circuit tests
- Configure a discrepancy time to identify unacceptable differences between 1oo2 inputs.
- Configure a filter time for each 1oo1 channel or each 1oo2 channel pair.

You can achieve Category 3 in 1oo1 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof-testing of conductors:

- Each F-DI input includes sufficient diagnostics and redundant components such that no single internal fault can cause a dangerous failure.
- An appropriately-rated, single sensor can reach Category 3 by internal fault tolerance.
- The external wiring of a single sensor to a single input is vulnerable to single fault dangerous failures unless you apply additional measures.

You can achieve Category 4 in 1oo2 configurations if you diagnose external wiring faults or exclude them according to standards by proper routing, protection, and proof-testing of conductors:

- With 1oo2 evaluation, a pair of F-DI inputs is not subject to dangerous internal failure within a reasonable number of accumulated internal faults.
- Appropriately-rated, external-paired sensors or equivalent redundancy can achieve Category 4.
- The duplicated external wiring of two sensors to two input points is vulnerable to accumulated fault dangerous failure unless you apply additional measures.

The fail-safe digital inputs are certified for SIL 3/PL e only when you select 1oo2 evaluation.

3.1.2 Selecting the digital input application

Input architectures for achieving Safety Integrity Level (SIL)/Category/Performance Level (PL)

Table 1-1149 Safety Integrity Level (SIL)/Category/Performance Level (PL) requirements

Application	Sensor supply *	Sensor evaluation	Channel connection	Type of sensor connection	Achievable SIL/Category/PL	
					Without short-circuit detection	With short-circuit detection
1	Internal or External	1oo1 evaluation	Single input	1 channel	2/3/d	
3	Internal	1oo2 evaluation	Two inputs	2 channel equivalent	3/3/e	3/4/e
2	External				3/3/e	
5	Internal			2 channel - 3 wire nonequivalent	3/3/e	3/4/e
6	External				3/3/e	
7	Internal			2 channel - 4 wire nonequivalent	3/3/e	3/4/e
8	External				3/3/e	

* The ET 200eco PN F-DI 8 / F-DQ 3 uses M12 connections and is intended for use outside a cabinet in IP67 applications (everything sealed). If you require the use of an external supply, cut the M12 cable and make the connection inside a sealed cabinet or inside a sealed sensor. For external supplies, do not connect the pin 1 wire (Vs1) or the pin 5 wire (Vs2) in the M12 cable. This action prevents the Vs (which may be ON due to a different channel being configured as internal) from being shorted to the external 24 V DC. In addition, make the external 24 V DC connection inside a sealed cabinet or inside a sealed sensor.

Refer to "Pin assignment of connectors" (Page 117) for further information on connector pin assignments.

3.1.3 F-DI Applications 1 and 2: 1oo1 evaluation of single-channel sensors

F-DI application mode 1

This application mode uses two single-channel sensors with a 1oo1 evaluation for each sensor, as shown in the following illustrations. When you use an internal sensor supply, you can successfully perform short-circuit detection.

NOTE

To incorporate F-DI Application Mode 1 into a SIL 2-rated application, the sensor must be an appropriately qualified device.

Figure 1-852 F-DI Application Mode 1: Internal sensor supply (1oo1 evaluation of a single-channel sensor shown)

This application mode uses two single-channel sensors with a 1oo1 evaluation for each senseor. When you use an internal sensor supply, you can successfully perform short-circuit detection. Use Y cable (6ES7194-6KB00-0XA0) for F-DI application mode 1 to connect two single-channel sensors in 1oo1 evaluation as follows:

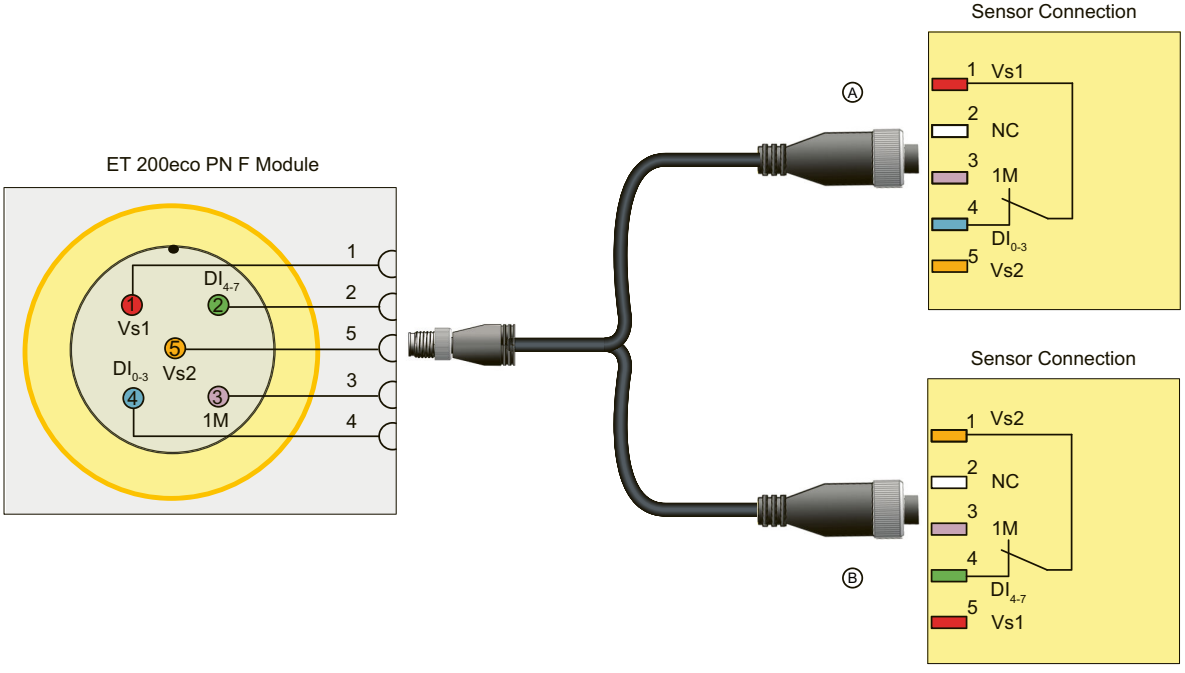


Figure 1-853 F-DI Application Mode 1: Internal sensor supply (1oo1 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 2

This application mode uses single-channel sensors with a 1oo1 evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing.

NOTICE
To incorporate F-DI Application Mode 2 into a SIL 2-rated application, the sensor must be an appropriately qualified device.

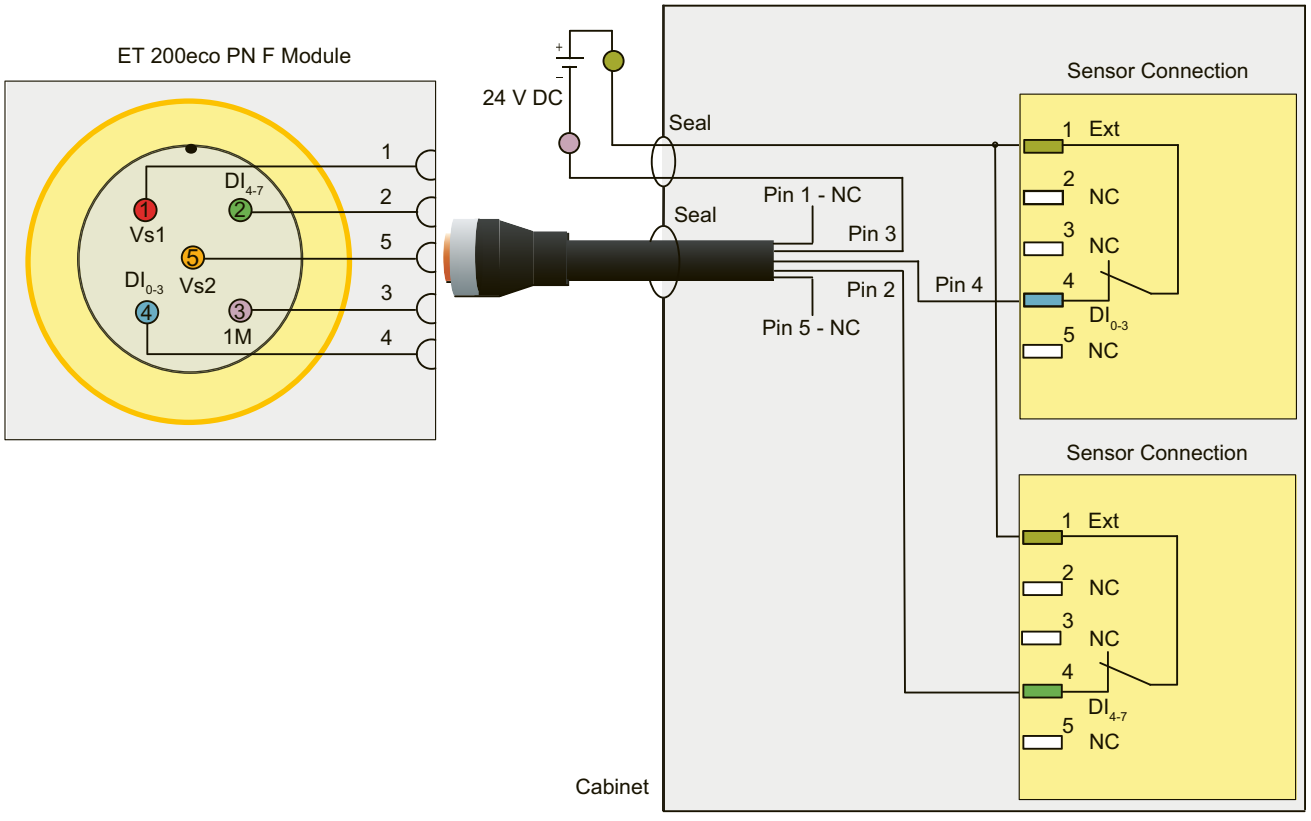

Figure 1-854 F-DI Application Mode 2: External sensor supply (1oo1 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo1 evaluation
Sensor supply	External

3.1.4 F-DI Applications 3 and 4: 1oo2 evaluation of equivalent sensors

F-DI application mode 3

This application mode uses a two-channel sensor in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection.

NOTE

To incorporate F-DI Application Mode 3 into a SIL 3-rated application, the sensor must be an appropriately qualified device.

Figure 1-855 F-DI Application Mode 3: Internal sensor supply (1oo2 evaluation of two-channel sensor shown)

Use Y cable (6ES7194-6KB00-0XA0) for F-DI Application Mode 3 as follows:

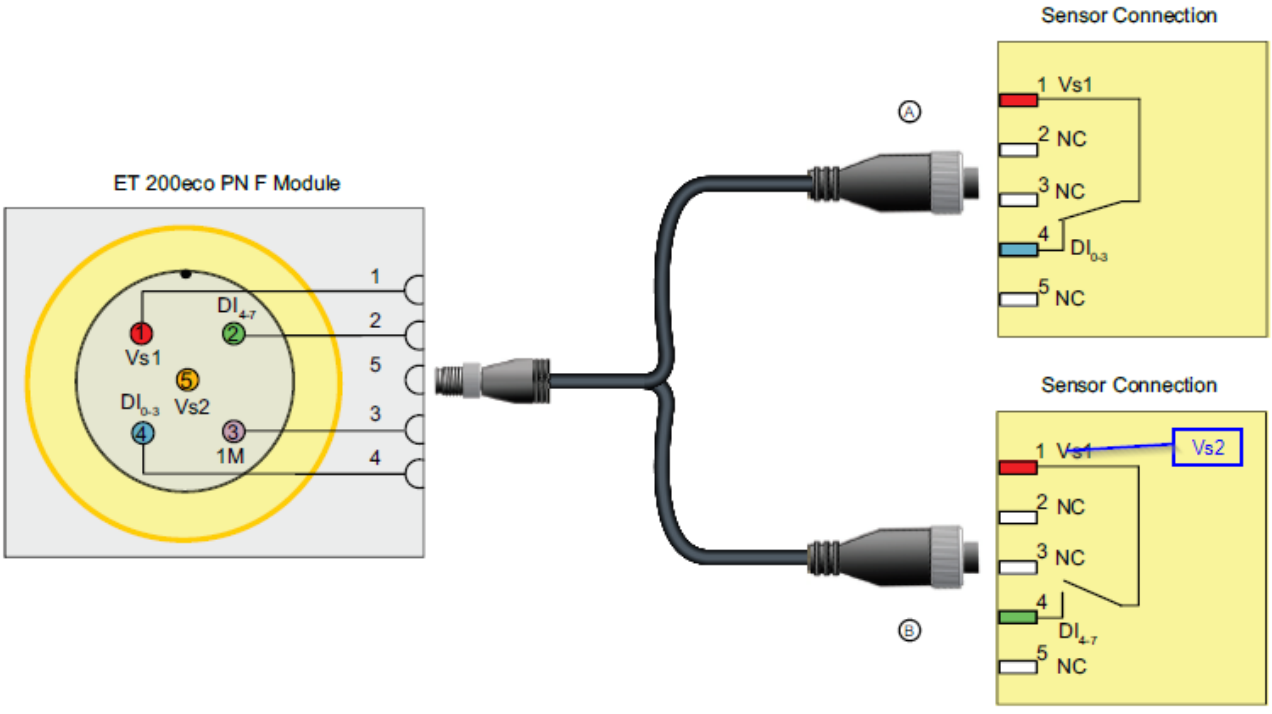

Figure 1-856 F-DI Application Mode 3: Internal sensor supply (1oo2 evaluation of two single-channel sensors shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel equivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 4

This application mode uses a two-channel sensor or two single-channel sensors in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing.

NOTE

To incorporate F-DI Application Mode 4 into a SIL 3-rated application, the sensor must be an appropriately qualified device.

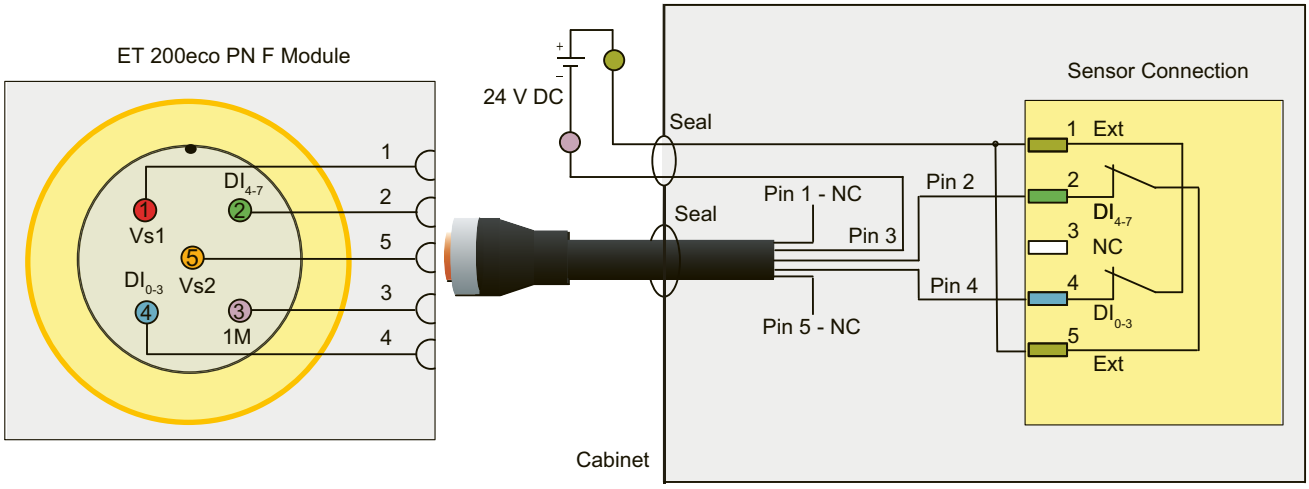

Figure 1-857 F-DI Application Mode 4: External sensor supply (1oo2 evaluation of two-channel sensor shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel equivalent
Sensor supply	External

3.1.5 F-DI Applications 5 and 6: 1oo2 evaluation of 3-wire, nonequivalent sensor circuit

F-DI application mode 5

This application mode uses a two-channel sensor or two single-channel sensors with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection. The application mode uses the following pins:

- Pin 2 (channels 4, 5, 6, and 7) is the inverted input of the nonequivalent configuration.
- Pin 4 (channels 0, 1, 2, and 3) is the non-inverted input of the nonequivalent configuration.

NOTE

To incorporate F-DI Application Mode 5 into a SIL 3-rated application, the sensor must be an appropriately qualified device.

Figure 1-858 F-DI Application Mode 5: Internal sensor supply (1oo2 evaluation of dual-channel sensor with nonequivalent outputs shown)

Use Y cable (6ES714-6KA00-0XA0) for application mode as follows:

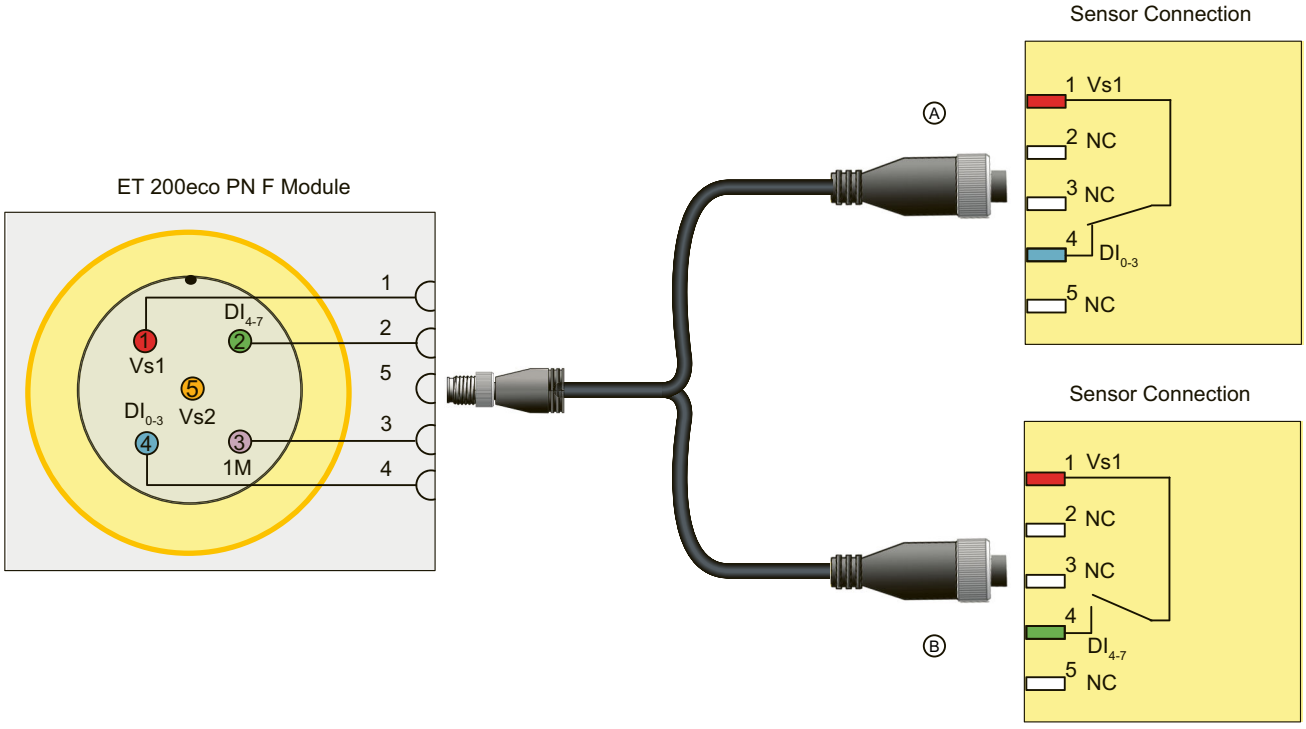

Figure 1-859 F-DI Application Mode 5: Internal sensor supply (1oo2 evaluation of two single-channel sensors with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire nonequivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 6

This application mode uses a two-channel sensor or two single-channel sensors with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing. The application mode uses the following pins:

- Pin 2 (channels 4, 5, 6, and 7) is the inverted input of the nonequivalent configuration.
- Pin 4 (channels 0, 1, 2, and 3) is the non-inverted input of the nonequivalent configuration.

NOTE

To incorporate F-DI Application Mode 6 into a SIL 3-rated application, the sensor must be an appropriately qualified device.

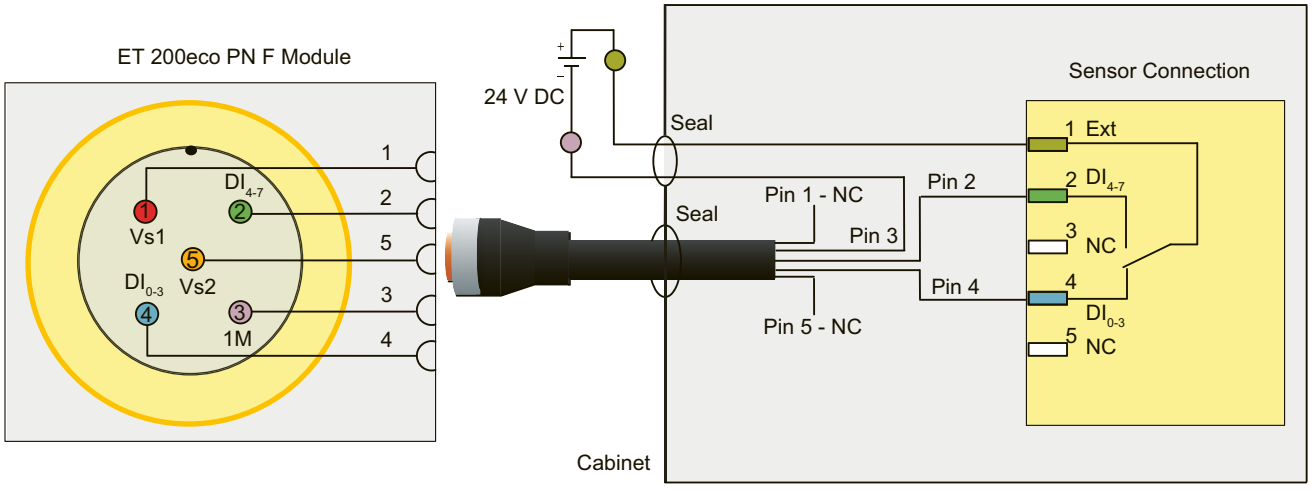

Figure 1-860 F-DI Application Mode 6: External sensor supply (1oo2 evaluation of two-channel sensor with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 3 wire nonequivalent
Sensor supply	External

3.1.6 F-DI Applications 7 and 8: 1oo2 evaluation of 4-wire nonequivalent sensor circuit

F-DI application mode 7

This application mode uses a two-channel sensor or two single-channel sensors in nonequivalent configuration (4-wire connection) in a 1oo2 voting with discrepancy evaluation. When you use an internal sensor supply, you can successfully perform short-circuit detection. The application mode uses the following pins:

- Pin 2 (channels 4, 5, 6, and 7) is the inverted input of the nonequivalent configuration.
- Pin 4 (channels 0, 1, 2, and 3) is the non-inverted input of the nonequivalent configuration.

NOTE

To incorporate F-DI Application Mode 7 into a SIL 3-rated application, the sensor must be an appropriately qualified device.

Figure 1-861 F-DI Application Mode 7: Straight 5-pin cable with Internal sensor supply (1oo2 evaluation of two-channel sensor with nonequivalent outputs shown)

Use Y cable (6ES7194-6KB00-0XA0) for application mode 7 as follows:

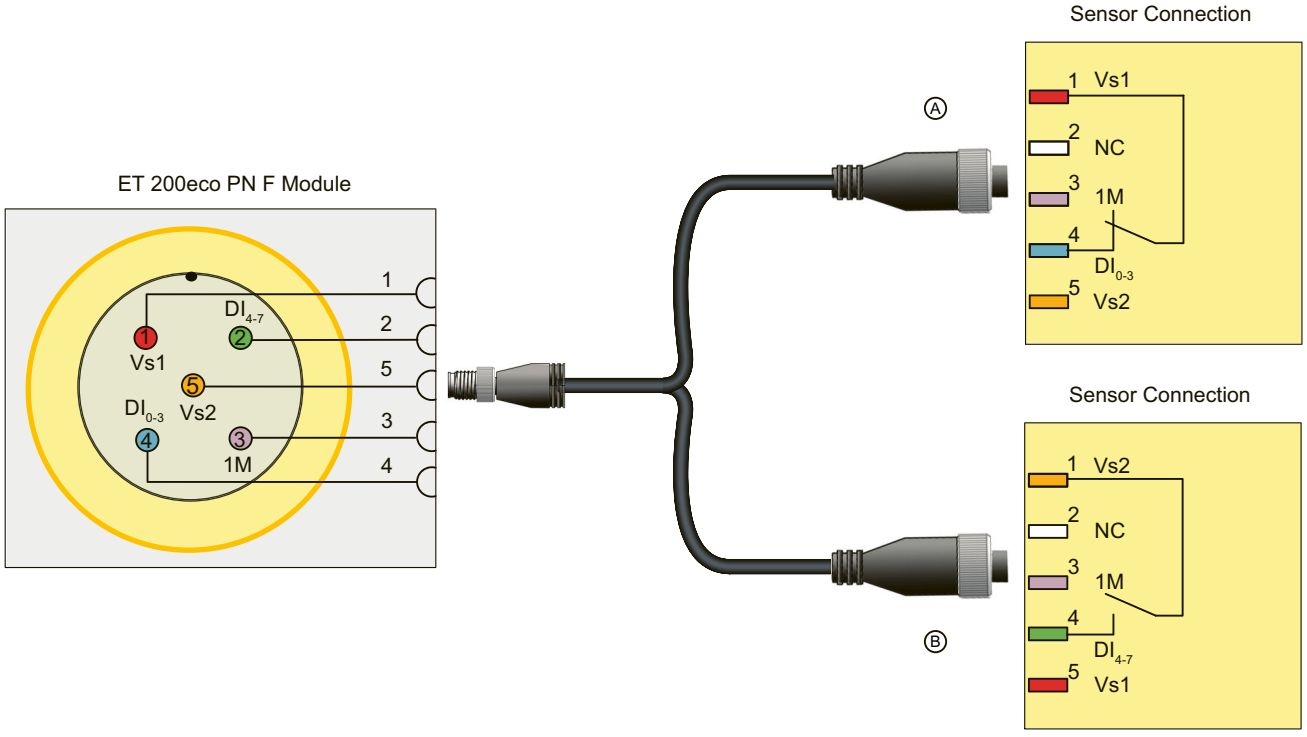

Figure 1-862 F-DI Application Mode 7: Y cable with Internal sensor supply

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire nonequivalent
Sensor supply	Internal
Short-circuit test	Enable

F-DI application mode 8

This application mode uses two single-channel sensorsor a two-channel sensor with two nonequivalent outputs in a 1oo2 voting with discrepancy evaluation. When you use an external sensor supply, the module does not evaluate that channel for short-circuit testing. The application mode uses the following pins:

- Pin 2 (channels 4, 5, 6, and 7) is the inverted input of the nonequivalent configuration.
- Pin 4 (channels 0, 1, 2, and 3) is the non-inverted input of the nonequivalent configuration.

NOTE

To incorporate F-DI Application Mode 8 into a SIL 3-rated application, the sensors must be appropriately qualified devices.

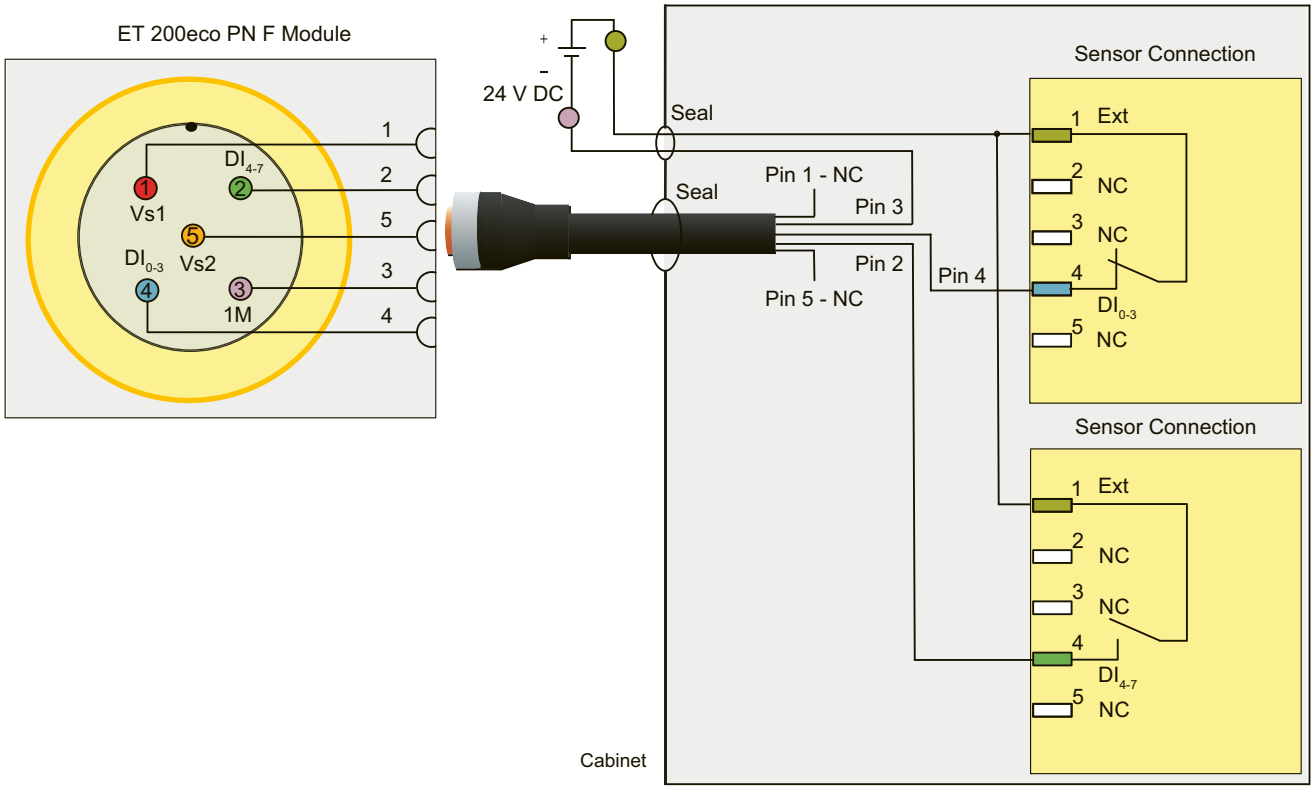

Figure 1-863 F-DI Application Mode 8: External sensor supply (1oo2 evaluation of two single-channel sensors with nonequivalent outputs shown)

Parameter assignment

Parameter name	Parameter value
Sensor evaluation	1oo2 evaluation, 2 channel - 4 wire nonequivalent
Sensor supply	External

3.2 Digital output applications

3.2.1 Overview

You should consider the application modes presented here along with the features of the ET 200eco PN F-DI 8 / F-DQ 3 as described in the overview. Refer to "Fail-Safe digital outputs" (Page 25).

The main features of the digital outputs include the following items:

- The fail-safe module separately controls current flow in the P (24 V DC to load) and M (load to common) sides of the circuit.
- The voltage at P and M outputs is read back to confirm proper state.
- The P and M switches are regularly tested with short ON and OFF pulses to confirm control.
- You must configure readback times that allow the external voltage to respond, but do not cause your load to physically respond.
- Internal current limiting as described in the data sheet may be sufficient in combination with your 24 V DC supply. However, you must consider whether additional current limits or fuses are necessary. Refer to "Specifications" (Page 173).

The module controls all output channels as 1oo2 with cross-diagnostics.

All applications shown are capable of reaching SIL 3/Category 4/PL e.

To reach Category 4, external contactors must be SIL-rated with sense contacts. Read the sense contacts back and confirm the external contactor response in your program. Siemens recommends using an F-DI input for sense contact and other safety diagnostic inputs.

3.2.2 Selecting the digital output application

Application	Description	Achievable SIL/Category/PL
1	Directly-connected SIL-rated actuator	3/4/e
2	External contactors: Separate P and M controlled contactors	3/4/e
3	External contactors: Parallel-connected contactors between P and M	3/4/e
4	External contactors: Separate output channels for each contactor	3/4/e

3.2.3 F-DQ Application 1: Wiring a directly-connected SIL-rated actuator

The module supports Application Mode 1, where there is a direct connection of a load between the P and M outputs of one channel. Both switches are opened when de-energizing the load.

NOTE

This configuration achieves SIL 3/Category 4/PL e.

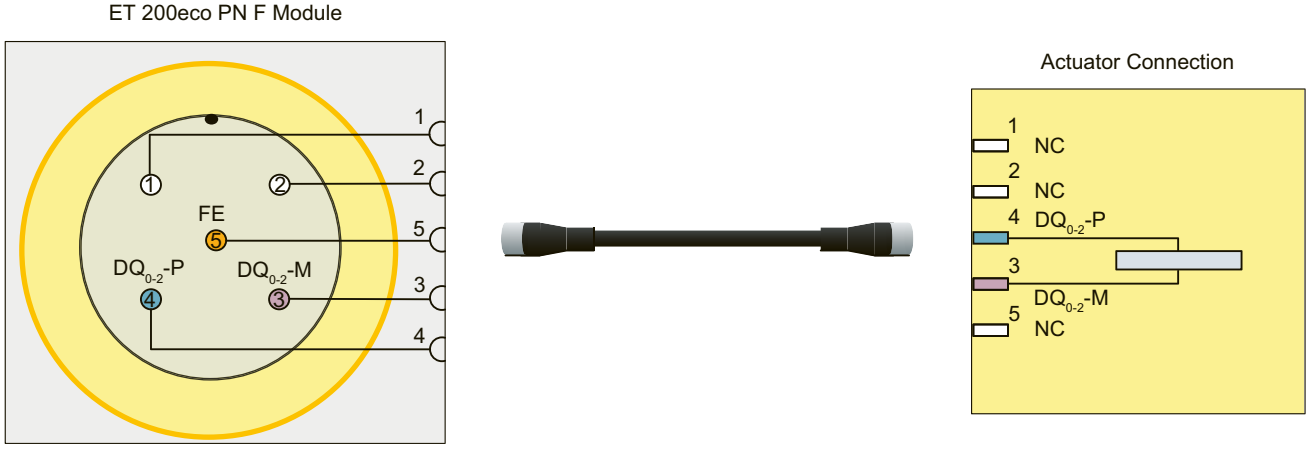

Figure 1-864 F-DQ Application Mode 1

3.2.4 F-DQ Application 2: Wiring external contactors: Separate P and M controlled contactors

The module supports F-DQ Application Mode 2, where the module controls the load using series-connected, normally-open contacts of two relays. The coil of one relay connects the P-output of a channel and M. The coil of the other relay connects the M-output of the same channel and L+.

NOTE

This configuration achieves SIL 3/Category 4/PL e if you fulfill the following conditions:The CPU checks the relay status (feedback) using a separate digital input.You adequately protect the wiring against shorts between the P and M outputs. The CPU cannot switch off the actuator if such a fault occurs.

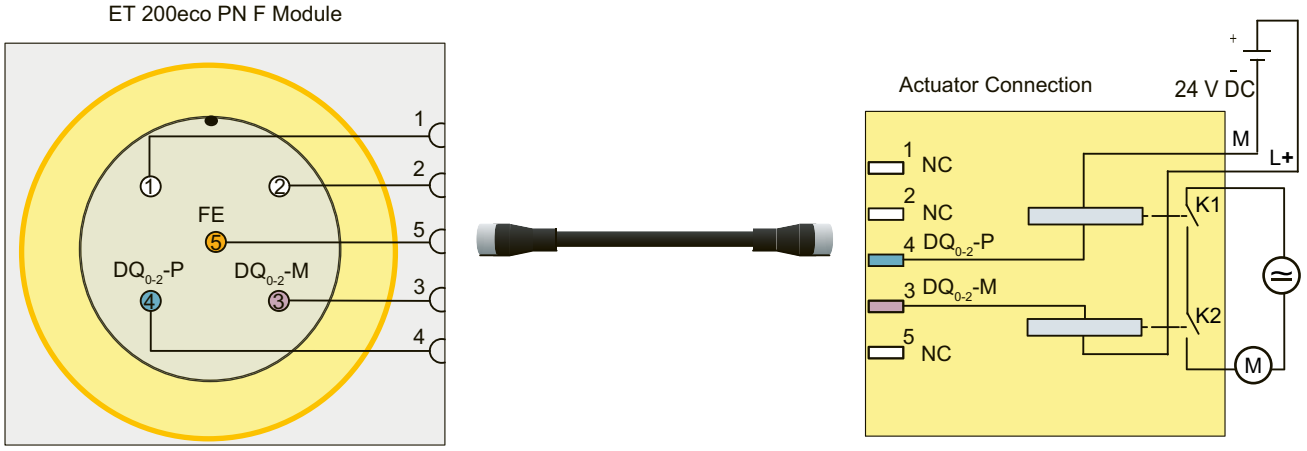

Figure 1-865 F-DQ Application Mode 2

3.2.5 F-DQ Application 3: Wiring external contactors: Parallel connected between P and M

The module supports F-DQ Application Mode 3, where the module controls the load using the series-connected, normally-open contacts of two relays. You connect the coils of both relays, in parallel, across the outputs of one channel.

NOTE

This configuration achieves SIL 3/Category 4/PL e if the CPU checks the relay status (feedback) using a separate digital input. Application Mode 3 is the preferred way of controlling an actuator using relays in a safety-related application. Application Mode 3 avoids the problems mentioned for Application Mode 2, regarding short-circuits between the P and M outputs.

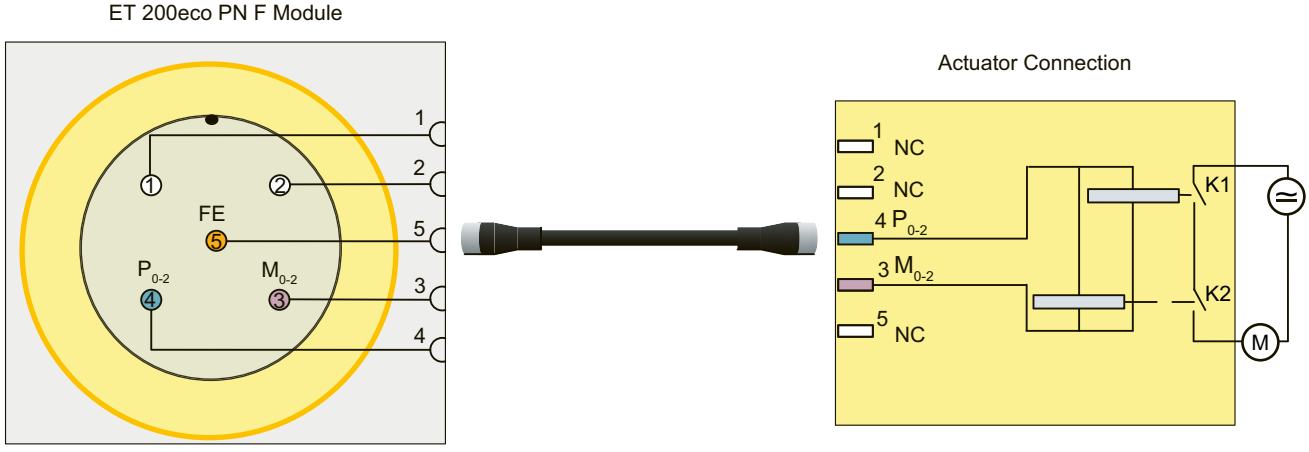

Figure 1-866 F-DQ Application Mode 3

3.2.6 F-DQ Application 4: Wiring external contactors: Separate P and M output channels for each contactor

The module supports F-DQ Application Mode 4, where the module controls the load using the series-connected, normally-open contacts of two relays. Connect the coils of both relays across the outputs of two channels. In the safety program, write the same process value (ON or OFF) to both output channels.

NOTE

The Application Mode 4 configuration achieves SIL 3/Category 4/PL e if the CPU checks the relay status (feedback) using a separate digital input.

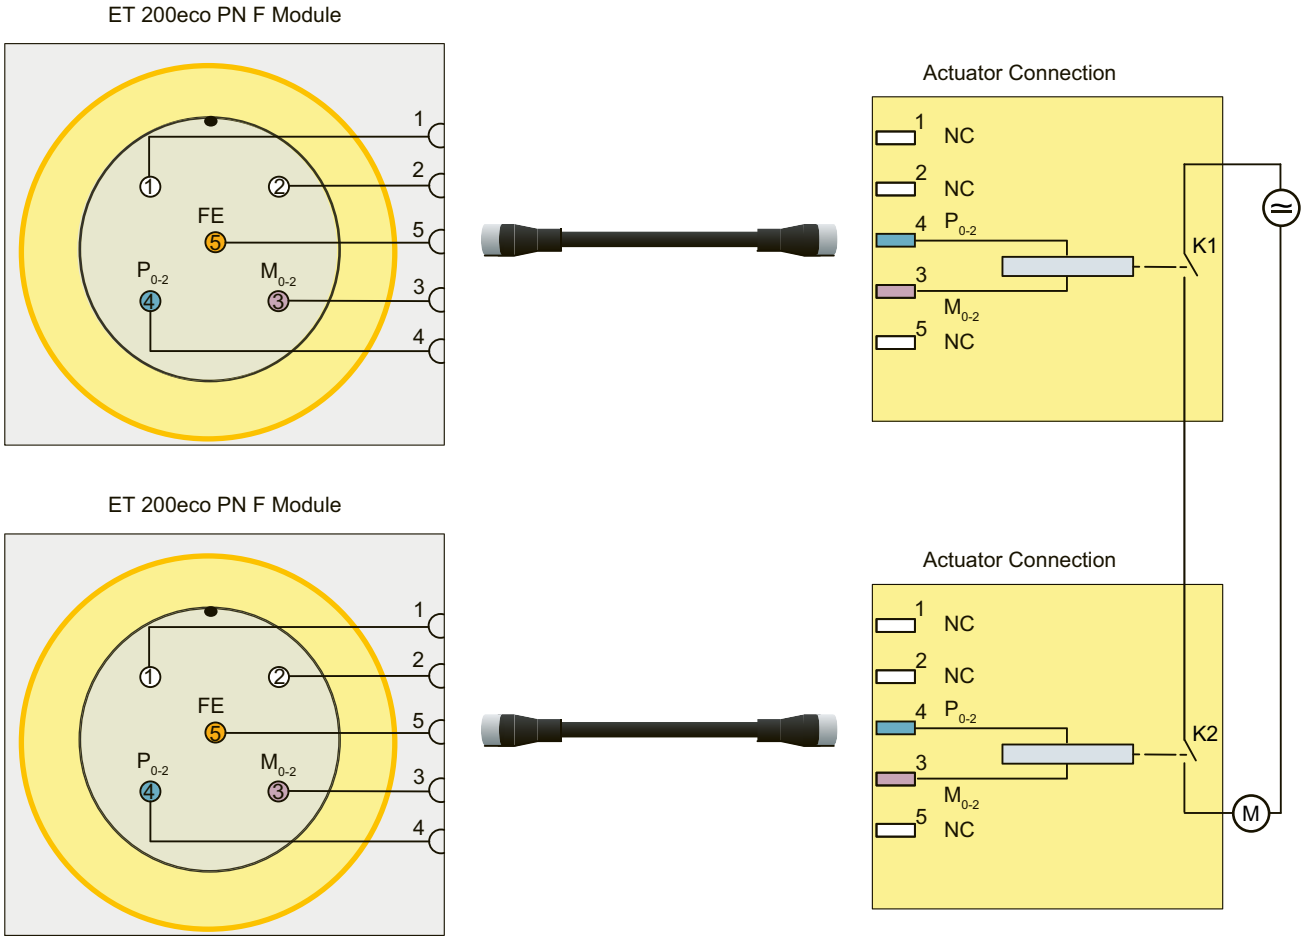

Figure 1-867 F-DQ Application Mode 4

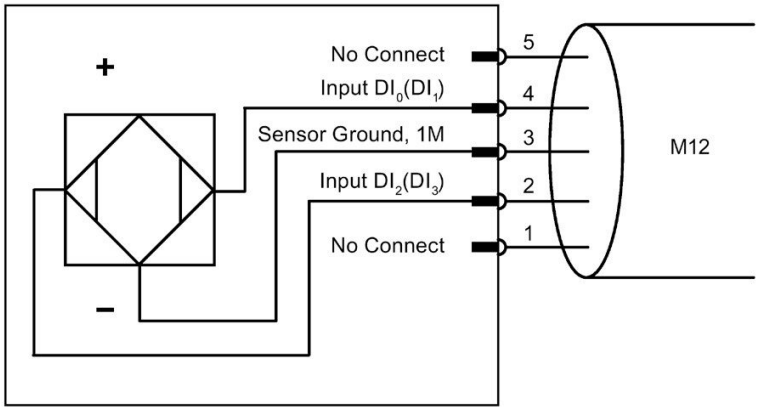


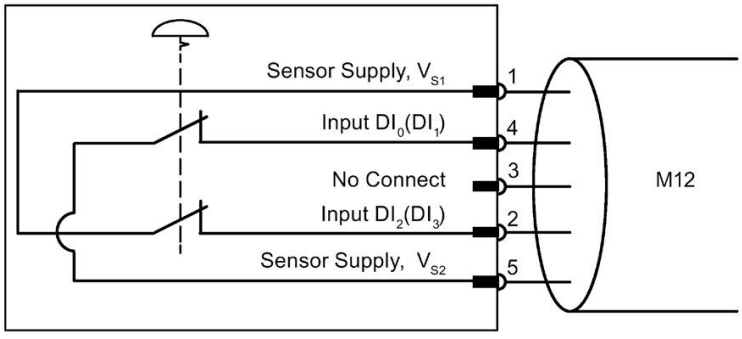
3.3 Examples of application modes for the ET 200eco PN F-DI 8 / F-DQ 3

3.3.1 Examples of application modes for the ET 200eco PN F-DI 8 / F-DQ 3

Laser Scanner (1oo2 evaluation)

For the output signal switching device (OSSD) sensors of a Laser Scanner, use F-DI application mode 4 to conect the Laser Scanner output signal switching device with 1oo2 evaluation to the ET 200eco PN F:

Laser Scanner (1oo2)

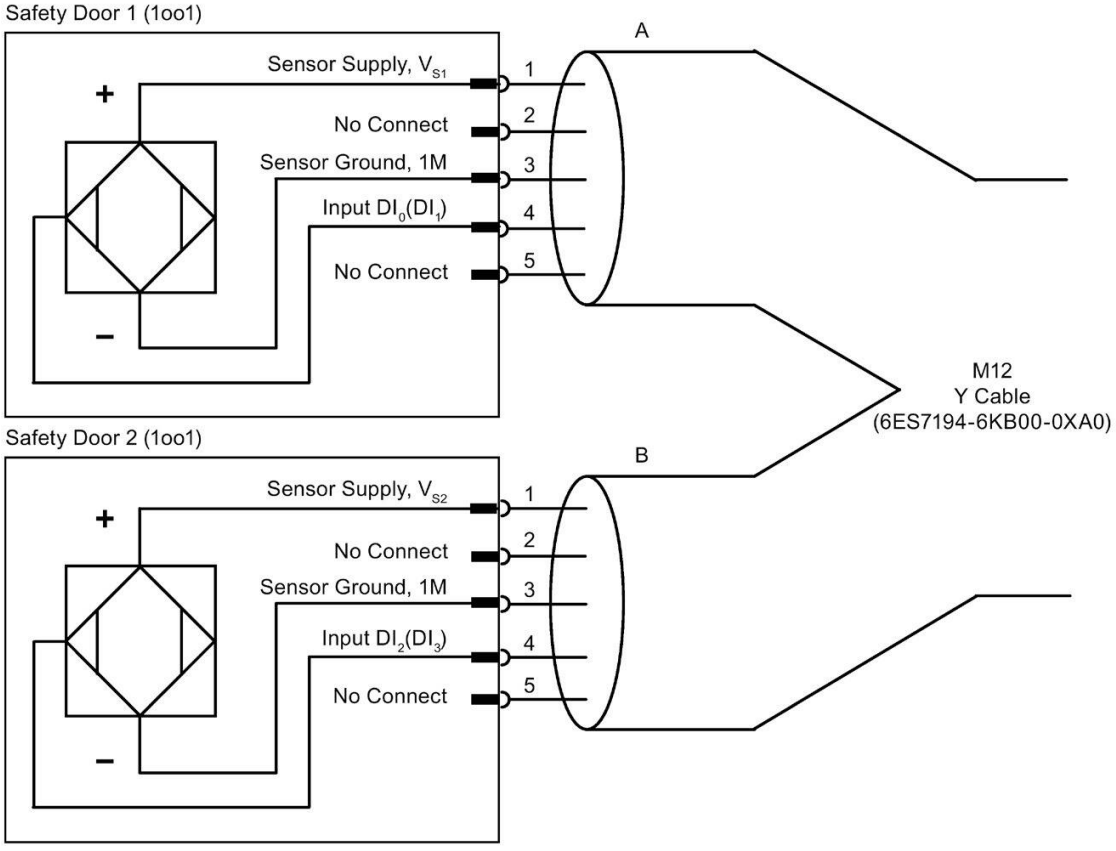


Alternatively, use F-DI application mode 3 and disable the parameter "Short-circuit test" for both sensor supplies.

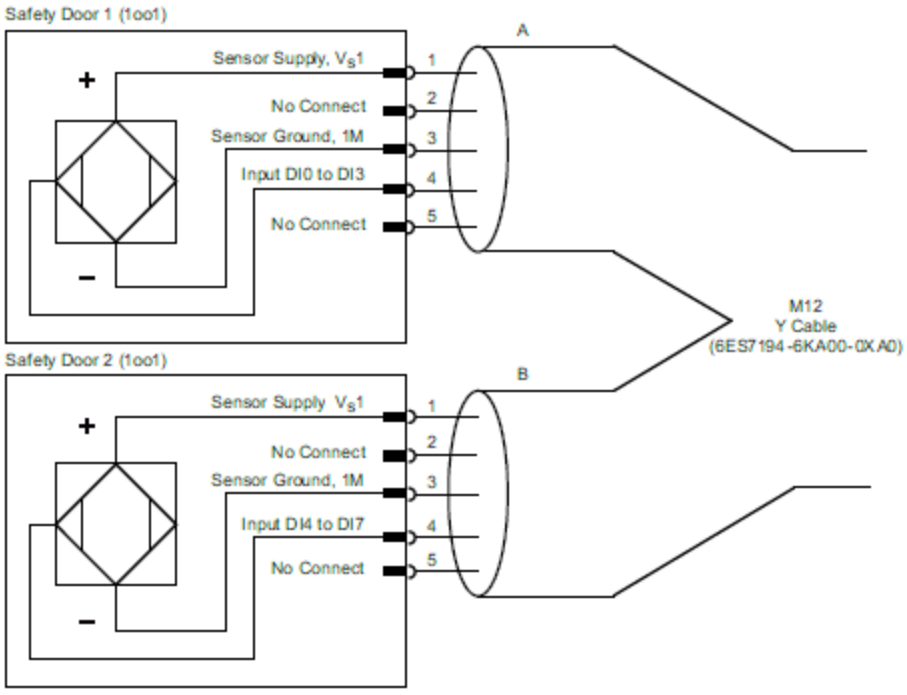
ESTOP (Emergency Stop) (1oo2 evaluation)

For the ESTOP, use F-DI application mode 3 to connect the ESTOP device with 1oo2 evaluation to the ET 200eco PN F:

ESTOP (1oo2)



Alternatively, use F-DI applications modes 5 or 7 if nonequivalent evaluation is required for your ESTOP device.



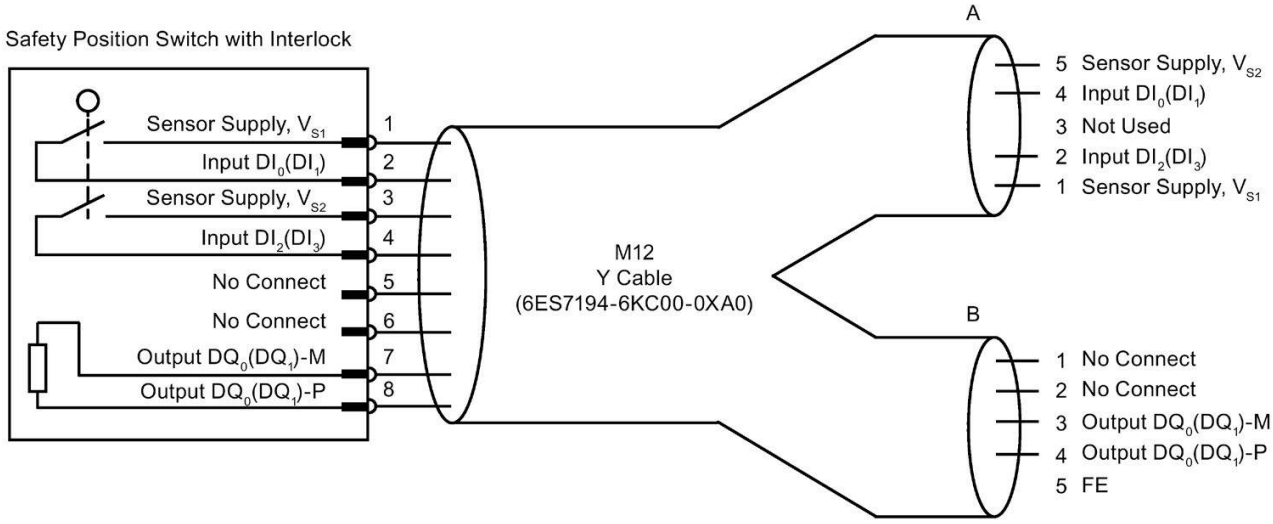
Safety Doors (1oo1 or 1oo2 evaluation)

For the Safety Doors, you can do one of the following:

- Use F-DI application mode 1 with the fail-safe Y cable (6ES7194-6KB00-0XA0) to connect two single-channel sensors with 1oo1 evaluation to one input connection of the ET 200eco PN F as follows:

- Use F-DI application mode 3 (1oo2 evaluation), using two single-channel sensors on the same safety door.
- Alternatively, use F-DI application mode 5 with the fail-safe Y cable (6ES7194-6KA00-0XA0) to connect two nonequivalent single-channel sensors with 1002 evaluation on the same safety door.

SIRIUS Safety position switch with interlock (1oo2 evaluation)



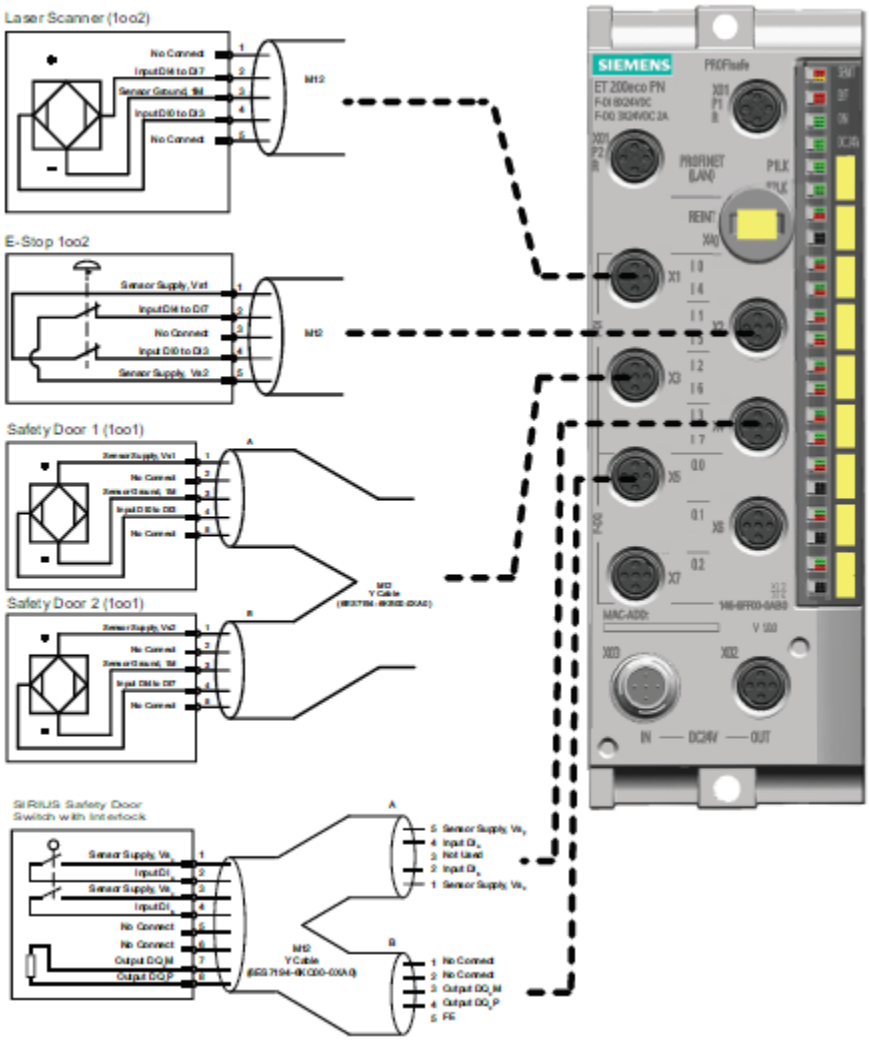
Use F-DI application mode 3 and F-DQ application mode 1 to connect the safety position switch with interlock to the ET 200eco PN F-DI 8 / F-DQ 3.

Use inverted Y cable (6ES7194-6KC00-0XA0) for a safety position switch with interlock. The inverted Y cable is designed to properly connect the fail-safe module F-inputs and F-ouput to the safety position switch.

NOTE

To incorporate this application into a SIL 3-rated application, ensure the sensors are appropriately qualified devices: either SIL 3 or SIL 2 with the Systematic Capability rules defined in the SIRIUS documenation.

For further information, refer to the "Industrial Controls, Detecting devices SIRIUS 3SE5/3SF1/3SE66/3SE67 position switches configuration manual" on the Internet.



The table below shows the pin assignments for the inputs and outputs of the ET 200eco PN F:

Connector A	**DI_a**	**DI_b**	**Vs_x**	**Vs_y**
X1	0	4	1	2
X2	1	5	1	2
X3	2	6	1	2
X4	3	7	1	2
Connector B	**DQ_a**			
X5	0			
X6	1			
X7	2			

Connect devices to the ET 200eco PN F

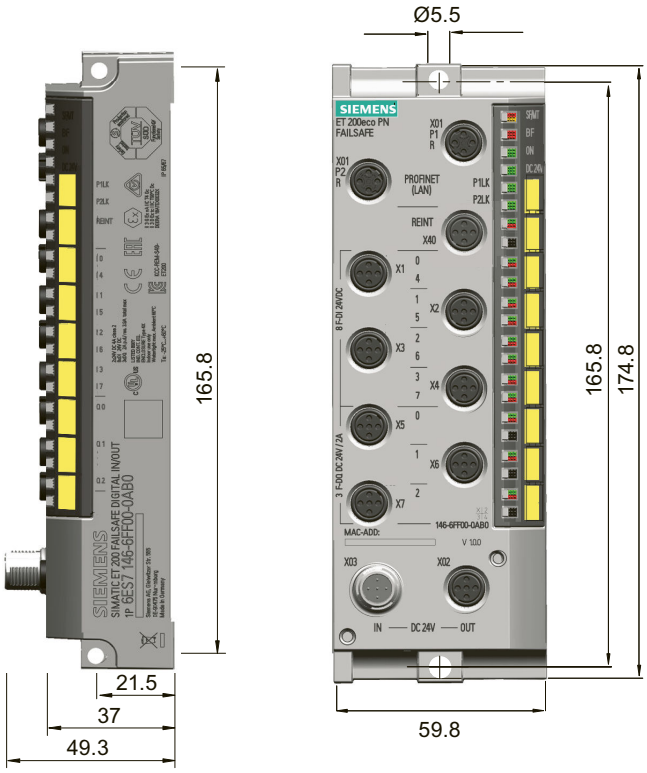
The figure below shows examples of field devices connected to the input and output sockets of the ET 200eco PN F as shown below:

See also

SIMATIC DP, Inverted Y cable for distributed I/O for connecting an F-DI and F-DQ with one cable (6ES7194-6KC00-0XA0) (Page 117)
SIRIUS position switches Configuration Manual (https://support.industry.siemens.com/cs/us/en/view/43920150)

Installation

4



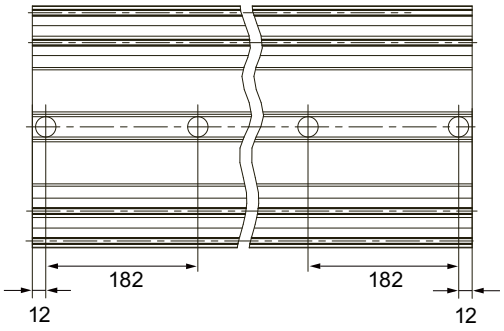
There are two installation variants:

- Without mounting rail (Page 95)
- With mounting rail (Page 96)

4.1 Installation without mounting rail

The ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O device is designed for easy installation. You must mount the I/O device on a solid base. Use the appropriate fasteners to mount the I/O device to the intended material.

The figures below show the dimensional information for mounting:



4.2 Installation with mounting rail

The mounting rail is available with a length of 500 mm. Refer to "Ordering information" (Page 185) to find the article number for this item.

Installing the mounting rail

Cut the 500-mm rail to suit your requirements and drill mounting holes for the appropriate fasteners to mount the I/O device to the intended material. You should distribute the mounting holes evenly at a pitch of 182 mm on the rail, starting at a distance of 12 mm from the edge.

Use the rack screw to bolt the I/O devices onto the mounting rail.

NOTE

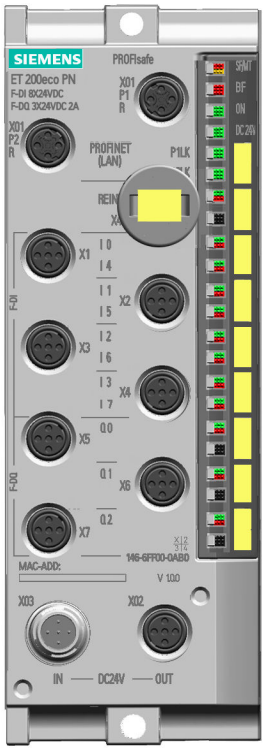
It is not mandatory that you use this mounting rail.

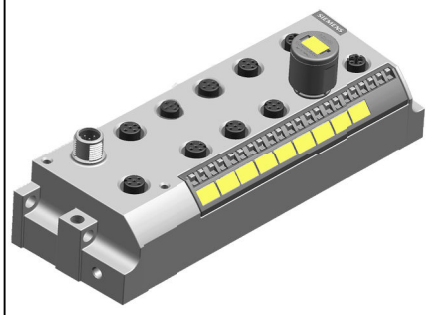
4.3 Mounting position and dimensions

Mounting position

When the ET 200eco PN F-DI 8 / F-DQ 3 is used in isochronous real-time (IRT) mode, the module should be mounted at the end of the configuration. Do not place the ET 200eco PN F-DI 8 / F-DQ 3 in the middle of the configuration.

NOTE





Use 3 m cables when mounting the ET 200eco PN F-DI 8 / F-DQ 3 in IRT mode instead of the 30 cm I/O cables.

Mounting and clearance dimensions

Dimension	Dimensions
Module mounting width	60 mm
Module mounting height	175 mm
Module mounting depth without eCoding Plug	49 mm
Module mounting depth with eCoding Plug	65 mm

4.4 Connecting the M12 eCoding plug

The eCoding plug (Page 185) is a specialized plug that stores the PROFIsafe addresses that you assign to the ET 200eco PN F-DI 8 / F-DQ 3 module.

eCoding Plug (side view)	ET 200eco PN F with eCoding Plug Attached (front view)	ET 200eco PN F with eCoding Plug Attached (side view)
		

The eCoding plug stores assigned PROFIsafe source and destination addresses received from the fail-safe ES into its non-volatile memory. The ecoding plug occupies the X40 M12 connector, utilizing a B-coded plug. You use the eCoding plug to facilitate module replacement.

The module receives PROFIsafe source and destination addresses during parameterization, which are then checked against the PROFIsafe addresses stored in the eCoding plug.

Protection mechanisms prevent you from damaging the eCoding plug or an I/O channel due to attempted plugging of the eCoding plug into an I/O M12 connector port.

Install the eCoding plug into the M12 connector port at X40 with a torque of 1.5 Nm. Do not overtighten the eCoding plug as it could damage the threading of the eCoding plug.

⚠ WARNING

If you remove/insert the eCoding plug with the power connected, this can lead to undefined states in your system.
Death or serious personal injury and damage to the ET 200eco PN F-DI 8 / F-DQ 3 module and associated machines/equipment may result if proper precautions are not taken.
Only remove or replace the eCoding plug when the power is disconnected. Always comply with the required standards and safety guidelines when configuring a system.

⚠ WARNING

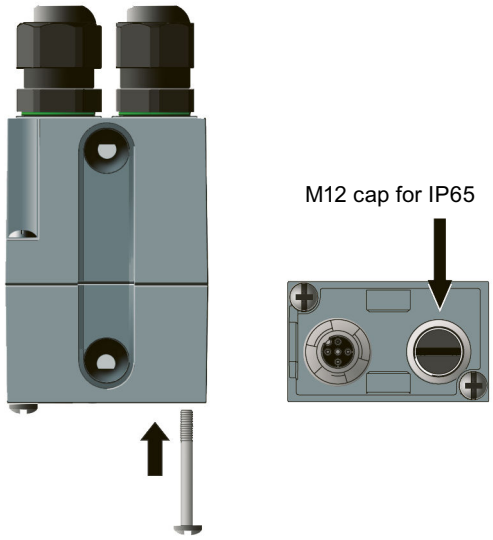
When replacing the ET200eco PN F module, transfer the eCoding plug inserted in the failed module to the replacement module to retain the PROFIsafe address stored in the eCoding plug..
Otherwise, it is necessary to use the ES to configure the PROFIsafe address in the replacement module. Ensure that the eCoding plug is not accidentally inserted in a module other than the intended ET200eco PN F module

4.5 Installing the terminal block

The terminal block (6ES7194-6CA00-0AA0) (Page 184) connects the ET 200eco PN F-DI 8 / F-DQ 3 and supplies the I/O device with power.

You can install the terminal block in one of two ways:

- Install the terminal block separately on each module
- Screw the terminal block onto each module

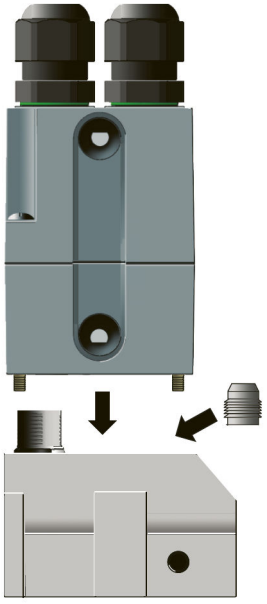


NOTE
You must wire the terminal block before you install it.

Tools required

Recessed head screwdriver, medium size

Installing the terminal block separately



To install the terminal block separately, remove the screws and then screw them in again at the bottom of the housing:

Installing the terminal block on an I/O device

You can install the terminal block horizontally on a housing of 60 mm width.

You can attach an M12 cap to the bottom of the terminal block to implement the corresponding degree of protection. Do not attach the M12 cap to the terminal block connector; mount the M12 cap onto connector X02 of the I/O device. Bolt the terminal block onto the I/O device by tightening the screws.

Refer to the "Terminal block (Page 184)" technical specifications and "Wiring the terminal block" (Page 122) for further information.

4.6 Replacing labels

You can identify the I/O device and the I/O connectors using labels. The module has the following plastic yellow connector labels already clipped into the holder:

- One label for PROFINET device communication
- One label for the eCoding plug
- Seven labels for the I/O connectors

You can order replacement labels.

Tools required

2.5 to 4 mm slotted screwdriver

Replacing labels

1. Push the screwdriver into the small opening of the label at an angle and then pry it out.

2. Push the new label into the holder on the device. The label should snap into place.

Wiring

5

5.1 Fail-Safe system electrical design rules

5.1.1 Safe functional extra low voltage requirement (power supplies and other system components)

⚠ WARNING

Fail-safe modules must be operated with safe functional extra-low voltage (SELV, PELV) power sources.
To maintain safety of the modules' low voltage circuits, external connections to communications ports, analog circuits, 24 V DC nominal supply voltage, and I/O circuits must be powered from approved sources that meet the requirements of SELV, PELV, Class 2, Limited Voltage, or Limited Power according to various standards.
The external power supply should limit the maximum voltage to 35 V DC even under fault conditions. Please consult the manufacturer's data for the power supplies that you use.

Maximum applied voltage to ET 200eco fail-safe devices

- Operational voltage: The fail-safe module's operational voltage is 20.4 V DC - 28.8 V DC, 35 V DC surge for 0.5 second. Operation of the unit to specifications is assured by design and testing. Defined transients from defined source impedances per EN 61000-4-2, 61000-4-4, 61000-4-6, as specified in the data sheet for each product, may be imposed on this voltage without disrupting operation or causing damage. Sustained operation in the range of 28.8 - 35 V DC can result in unacceptable temperature rise and thermal damage, causing the product to become inoperable.
- Absolute maximum rating regarding supply voltage: The absolute maximum rating to prevent module damage and to ensure the functional safety of the modules is 35 V DC. These power supplies must be specified by the manufacturer to limit the output voltage to 35 V DC or less under fault conditions. Otherwise, external protection must be supplied that will reliably open the circuit or limit the output voltage to less than 35 V DC to the modules.
- Surge immunity: Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. This protection must be sufficient to clamp surge voltages and/or open the supply circuit to assure the PLC system is not exposed to voltages greater than 35 V DC. One specification for evaluation of protection from lightning type surges is found in EN 61000-4-5, with operational limits established by EN 61000-6-2. The ET 200eco PN F module requires external protection to maintain safe operation when subject to surge voltages defined by this standard. Refer to Appendix A.1.5.1: "Surge immunity (Page 170)" for further information.

⚠ WARNING

All power supply and fail-safe module circuits must be connected together to a common voltage reference or must be isolated SELV circuits.
The power supply M terminals on the fail-safe CPU and the fail-safe modules must be connected together or isolated as SELV. Failure to do so can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
Connecting all M terminals together or isolating with approved SELV isolation prevents unwanted current flows in the event of a single fault in the CPU to module isolation boundary.

NOTE

Requirements for power supplies in the event of voltage interruption
To ensure adherence to IEC 61131-2 and NAMUR Recommendation NE 21, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirement in your product standards (for example, 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions. The latest information on PS components is available on the Internet (https://mall.industry.siemens.com).

5.2 Control system electrical rules

5.2.1 General rules and regulations for operating an ET 200eco PN F-DI 8 / F-DQ 3

When operating the ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O device as part of a plant or system, special rules and regulations have to be followed depending on the field of application.

This section provides an overview of the most important rules you have to observe when integrating the ET 200eco PN F distributed I/O device in a plant or system.

EMERGENCY-STOP equipment

EMERGENCY STOP equipment according to IEC 204 (corresponds to DIN VDE 113) must remain effective in all operating modes of the plant or system.

System startup after specific events

The table below identifies situations you must pay attention to when the system starts up after the occurrence of certain events:

If ...	then ...
Startup follows a power dip / failure Startup of the ET 200eco PN F after bus communication has been interrupted	Dangerous operating states must be avoided at all times. If necessary, force an "EMERGENCY OFF"!
Startup after releasing the EMERGENCY OFF equipment	Any uncontrolled or undefined startup must be avoided.

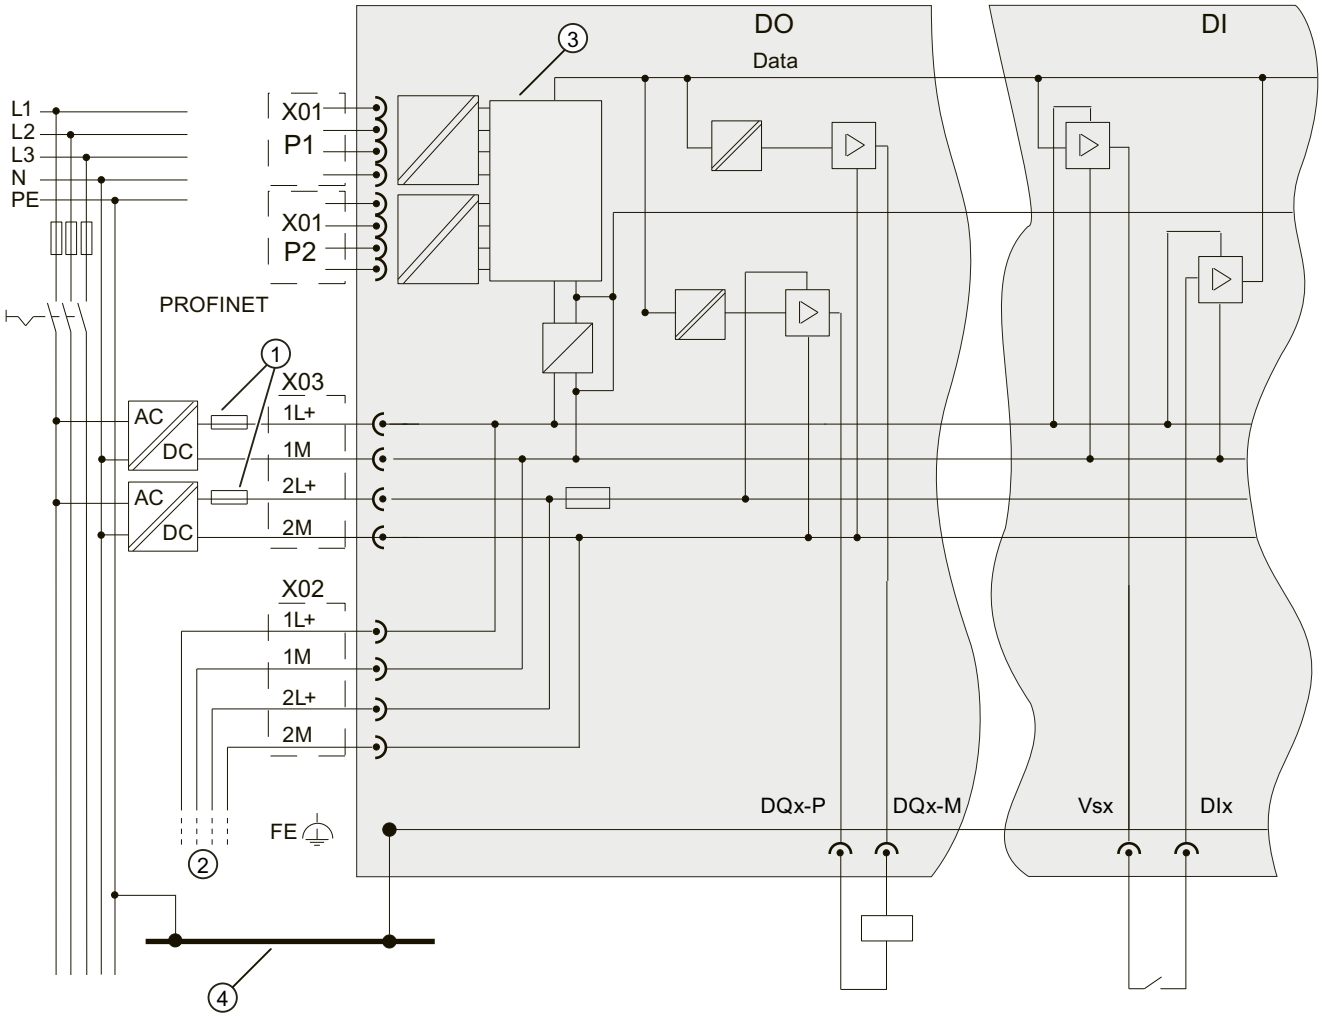
24 V DC supply

The table shows what you have to observe for the 24 V DC supply:

At ...	Requirements ...	
Buildings	External lightning protection	Take lightning protection measures (for example, lightning protection elements)
24 V DC supply lines, signal lines	Internal lightning protection	
24 V DC supply	Safe (electrical) isolation of the extra-low voltage	
Loop-through of supply voltage	Voltage drop in the case of loop-through (Refer to "Looping PROFINET and the supply voltage" (Page 127) for further information.)	

Protection against external electrical interference

The table below shows what to observe in order to protect the system against electrical interference or faults:



At ...	ensure that ...
all plants or systems in which the ET 200eco PN F is installed	the plant or system is EMC-compatible and properly grounded for the discharge of electromagnetic interference.
supply, signal, and bus lines	the wiring arrangement and installation is correct.
signal and bus lines	a wire break or conductor break does not result in undefined states of the plant or system.

5.2.2 Electrical configuration of the ET 200eco PN F-DI 8 / F-DQ 3

Electrical isolation

The ET 200eco PN F-DI 8 / F-DQ 3 electrical configuration features electrical isolation between:

- 1L+ supply voltage (electronic/sensor supply)
  Electrically isolated from PROFINET IO and 2L+ (load voltage supply)
- 2L+ supply voltage (load voltage supply):
  Electrically isolated from all other circuit components.
- PROFINET IO interface:
  Electrically isolated from all other circuit components.

①	Infeed of supply voltage 1L+ and 2L+ with line protection	③	Microprocessor and switch
②	Loop-through of supply voltage	④	Main ground line

Line protection

Line protection is required in accordance with DIN VDE 0100, that is, you must always provide external fusing.

You must fuse the 1L+ and 2L+ power supplies of the following devices:

- I/O device using a 24 V DC/4.0 A miniature circuit breaker with tripping characteristic type B or C
- Terminal block using a 24 V DC/10.0 A miniature circuit breaker with tripping characteristic type B or C
- Voltage distributor using a 24 V DC/8.0 A miniature circuit breaker with tripping characteristic type B or C

5.2.3 Influence of cable length on the supply voltage

If you are wiring your configuration, then you must take into account the impact of cable gauge and length on the supply voltage to the ET 200eco PN F-DI 8 / F-DQ 3.

Example

A 10 m cable with 0.75 mm^2 has a resistance of 0.5 Ω, which corresponds with a voltage drop of 2 V DC at a load of 4.0 A.

⚠ CAUTION

If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you will risk overheating the cable insulation and contacts resulting in damage to the device.
Electrical faults or unexpected machine operation can result in minor personal injury if proper precautions are not taken.
You must follow all instructions for installation and maintenance of a proper operating environment to ensure the equipment operates safely.

5.2.4 Guidelines for grounding and wiring

Proper grounding and wiring of all electrical equipment is important to provide electrical noise protection for your application and the ET 200eco PN F-DI 8 / F-DQ 3 module. Refer to the technical specifications (Page 173) for the ET 200eco PN F-DI 8 / F-DQ 3 wiring diagrams.

Prerequisites

Before you ground or install wiring to any electrical device, ensure that the power to that equipment has been turned off. Also, ensure that the power to any related equipment has been turned off.

Ensure that you follow all applicable electrical codes when wiring the ET 200eco PN F and related equipment. Install and operate all equipment according to all applicable national and local standards. Contact your local authorities to determine which codes and standards apply to your specific case.

⚠ WARNING

Installing or wiring the ET 200eco PN F or related equipment with power applied could cause electric shock or unexpected operation of equipment.
Failure to disable all power to the ET 200eco PN F and related equipment during installation or removal procedures could result in death, severe personal injury, and damage due to electric shock or unexpected equipment operation.
Always follow appropriate safety precautions and ensure that power to the ET 200eco PN F is disabled before attempting to install or remove the ET 200eco PN F or related equipment.

Always take safety into consideration as you design the grounding and wiring of your ET 200eco PN F system. Electronic control devices, such as the ET 200eco PN F, can fail and cause unexpected operation of the equipment that is being controlled or monitored:

- Fail-safe modules: Internal dangerous failures can occur on these devices with a probability as reflected in the SIL rating, PFD, and PFH as stated in this manual.
- Each control's installation: Common cause failure threats can occur such as overvoltage, over-temperature, electrical faults, EMC interference, and fire, water, or mechanical damage to the installation.

You must evaluate every control point for the threat level and consequences of failure. Your installation can require safeguards that are independent of the ET 200eco PN F to achieve an appropriate level of risk for personal injury or equipment damage.

⚠ WARNING

Control devices can fail in an unsafe condition, resulting in unexpected operation of controlled equipment.
Such unexpected operations could result in death, severe personal injury, and property damage.
When using fail-safe I/O, design safety-related control functions to account for the probability of faults, including redundancy to achieve an appropriate level of risk for the consequences of failure.
When using standard I/O, always include an emergency stop function, electromechanical overrides, or other redundant safeguards when a failure could cause personal injury or significant property damage.

5.2.5 Grounding the ET 200eco PN F-DI 8 / F-DQ 3 module

The best way to ground your application is to ensure that all the common and ground connections of your ET 200eco PN F-DI 8 / F-DQ 3 and related equipment are grounded to a single point. This single point should be connected directly to the earth ground for your system.

All ground wires should be as short as possible and should use a stranded wire of large size, such as 4 mm^2.

When locating grounds, consider safety-grounding requirements and the proper operation of protective interrupting devices.

5.2.6 Operating the ET 200eco PN F-DI 8 / F-DQ 3 on grounded mains

This section provides information about the overall configuration of an ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O device with a grounded infeed (TN-S system). The section focuses on the following topics:

- Disconnecting devices
- Short-circuit and overload protection according to DIN VDE 0100 and DIN EN 60204-1.

Supply voltages of the ET 200eco PN F

There are two supply voltages:

- 1L+: Electronic/sensor supply
- 2L+: Load supply

Definition: Grounded infeed

A TN-S system always bonds the neutral conductor to ground. A simple short-circuit to ground of a live conductor, or of a grounded component of the plant trips the disconnecting devices.

Safe electrical isolation (SELV/PELV according to IEC 60364-4-41)

You can only operate the ET 200eco PN F using power supplies/power supply units with safe electrical isolation.

Components and protective measures

Safety standards stipulate various components and protective measures for plant installation. The type of components and the degree to which the protective measures are mandatory depend on the DIN VDE regulation that applies to your plant configuration. The next table refers to the diagram below:

Compare ...	Reference to the diagram	DIN VDE 0100	DIN EN 60204
Disconnecting device for controller, sensors, and actuators	"Grounding concept for ET 200eco PN F" (See ① in figure below.)	... Part 460: Main switch	... Part 1: Disconnect switch
Short-circuit and overload protection	"Grounding concept for ET 200eco PN F" (See ② in figure below.)	... Part 725: Single-pole protection of circuits	... Part 1: with grounded secondary power circuit: **single-pole** protection
Line protection		... Part 430: Protection of cables and lines against over-current	-

Safe electrical isolation

You require safety isolation for the following items:

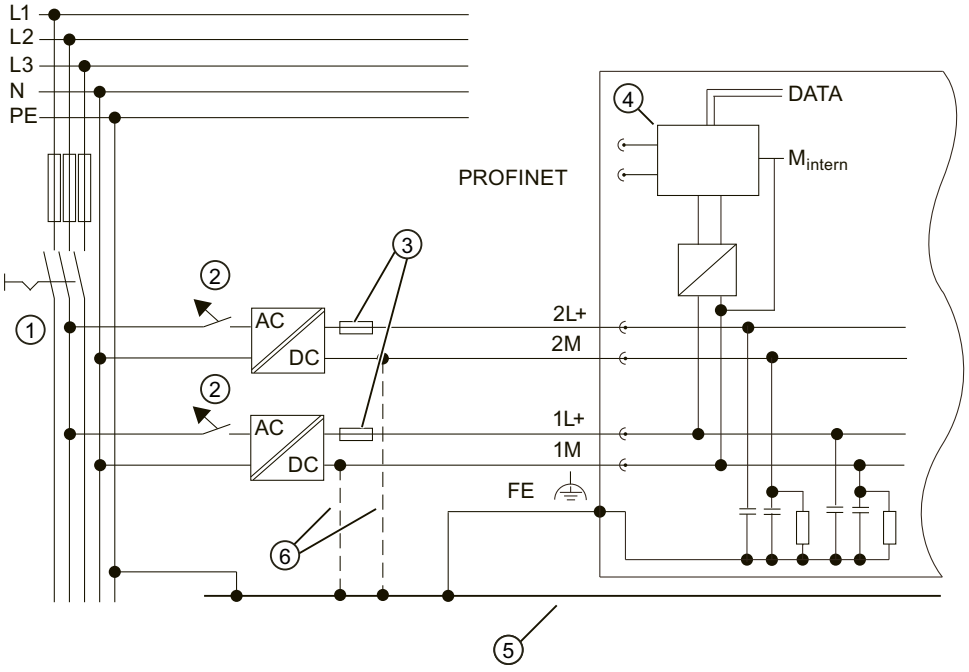
- Modules which must be supplied with ≤ 60 V DC or ≤ 25 V AC
- 24 V DC load circuits

Configuring ET 200eco PN F with grounded reference potential

Any interference currents generated within an ET 200eco PN F configuration with grounded reference potential discharge to protective earth. You must connect the terminals externally. Refer to the figure below: Connection between 1M and FE

Configuring ET 200eco PN F with ungrounded reference potential

In an ET 200eco PN F configuration with ungrounded reference potential, any interference currents discharge to protective ground through an internal RC circuit. Refer to the figure below: No connection between 1M and FE



Isolation monitoring

Isolation monitoring must be provided if the following exist:

- Ungrounded ET 200eco PN F configuration
- A repetitive error that is liable to cause dangerous plant states

ET 200eco PN F in its overall configuration

The figure below shows the overall configuration of the ET 200eco PN F distributed I/O device (load voltage supply and grounding concept) with infeed from a TN-S system:

① Disconnecting device for controller, sensors, and actuators
② Short-circuit and overload protection
③ Fuses for line protection
④ Microprocessor and module switch
⑤ Main ground line
⑥ When you configure the ET 200eco PN F with ungrounded reference potential, you eliminate the connection between 1M and FE and 2M and FE.

5.2.7 Wiring the ET 200eco PN F-DI 8 / F-DQ 3

5.2.7.1 Guidelines for wiring the ET 200eco PN F-DI 8 / F-DQ 3

When designing the wiring for your ET 200eco PN F-DI 8 / F-DQ 3, provide a single disconnect switch that simultaneously removes power from all input circuits and from all output circuits. Provide over-current protection, such as a fuse or circuit breaker, to limit fault currents on supply wiring. Consider providing additional protection by placing a fuse or other current limit in each output circuit.

Install appropriate surge suppression devices for any wiring that could be subject to lightning surges.

Do not place low voltage signal wires and communications cables in the same wire tray with AC wires and high energy, rapidly switched DC wires. Always route wires in pairs, with the neutral or common wire paired with the hot or signal-carrying wire.

Use the shortest wire possible and ensure that the wire is sized properly to carry the required current.

Wire and cable should have a temperature rating 30 °C higher than the ambient temperature around the ET 200eco PN F (for example, a minimum of 85 °C-rated conductors for 55 °C ambient temperature). You should determine other wiring type and material requirements from the specific electrical circuit ratings and your installation environment.

Use shielded wires for optimum protection against electrical noise. Typically, grounding the shield at the ET 200eco PN F gives the best results. You should ground communication cable shields to ET 200eco PN F communication connector shells using connectors that engage the cable shield, or by bonding the communication cable shields to a ground.

When wiring input circuits that are powered by an external power supply, include an overcurrent protection device in that circuit.

Refer to "Pin assignment of connectors" (Page 117) for further information on pin assignment for PROFINET, feeding and looping the voltage, digital inputs, and digital outputs connectors.

To help prevent unwanted current flows in your installation, the ET 200eco PN F provides isolation boundaries at certain points. When you plan the wiring for your system, you should consider these isolation boundaries. Refer to the technical specifications (Page 173) for the amount of isolation provided and the location of the isolation boundaries. Circuits rated for AC line voltage include safety isolation to other circuits. Isolation boundaries between 24 V DC circuits are functional only, and you should not depend on these boundaries for safety.

5.2.7.2 Wiring the ET 200eco PN F-DI 8 / F-DQ 3 to functional earth (FE)

All ET 200eco PN I/O devices have a functional earth connection. This connection is used to suppress interference, but not for protective purposes. You establish a direct electrical connection to a point in your plant or a shield using the functional earth connection. EMC interference is discharged directly to earth through this connection. The interference immunity of the entire I/O device is increased by the discharge of the EMC interference.

Installing ET 200eco PN F I/O devices on a conductive base

You require the following items to install ET 200eco PN F I/O devices on a conductive base:

- Conductive base for installation of the I/O device
- Screwdriver to connect to the functional ground
- 2 x M5 x 8 fixing screws and washers to connect to the functional ground

To connect ET 200eco PN F I/O devices to functional earth with a conductive base, follow these steps:

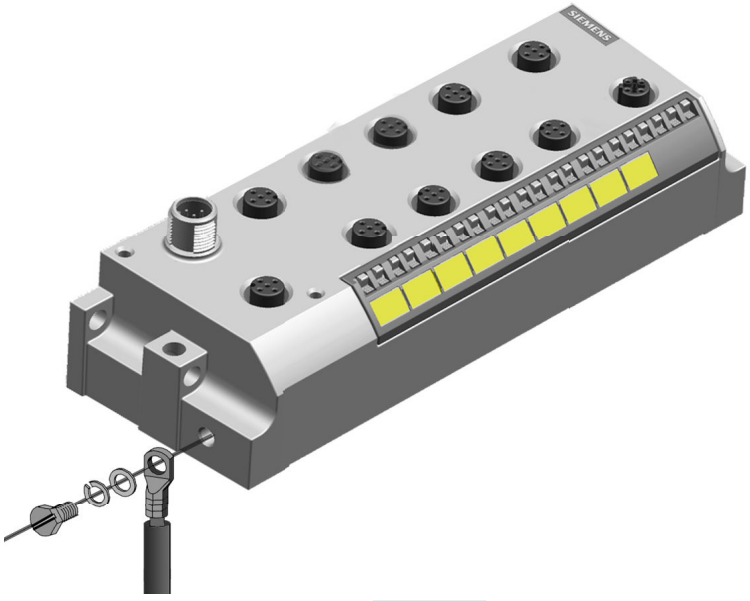
1. Drill two fixing holes.
2. Bolt the I/O device with the M5 fixing screws and washers using a torque of 1.5 Nm.

NOTE

Grounding with a conductive base

When you fasten an I/O device of ET 200eco PN F to a conductive, grounded base, the lower fixing screw creates a conductive connection to the ground potential.

Make sure there is a low-impedance connection between the peripheral device and the conductive substrate and between the conductive substrate and the functional ground.



Installing ET 200eco PN F I/O devices on a non-conductive base

You require the following items to install ET 200eco PN F I/O devices on a non-conductive base:

- Non-conductive base for installation of the I/O device
- Tools to connect to the functional ground:
  - Stripping tool
  - Crimp tool
  - Screwdriver
- Accessories to connect to the functional ground:
  - M5 x 8 fixing screw and washers
  - Grounding cable (copper braid cable) with a minimum cross-section of 4 mm^2
  - Cable lug suitable for M5 screws

To connect ET 200eco PN F I/O devices to functional earth with a non-conductive base, follow these steps:

1. Drill 2 fixing holes.
2. Strip the grounding conductor and crimp on the cable lug.
3. Screw the cable lug onto the I/O device and voltage distributor (M5 fixing screw) with a torque of 1.5 Nm.

Refer to Installation "Overview" (Page 95) for further information on installing ET 200eco PN F I/O devices.

5.2.7.3 Wiring I/O devices for 1oo2 evaluation using M12 connecting cables

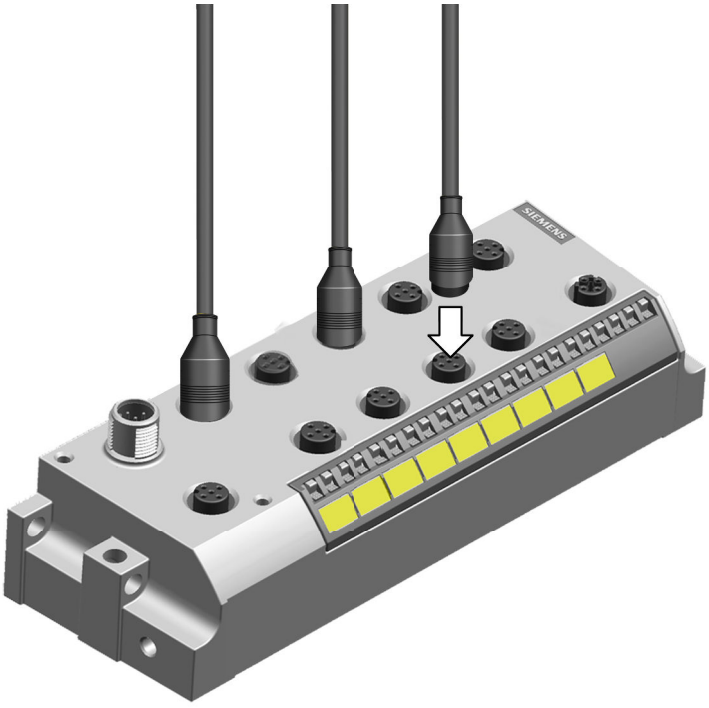
Connections for the sensors to the 5-pin M12 circular sockets, X1 to X4, are on the front panel of the ET 200eco PN F-DI 8 / F-DQ 3:

- Use M12 connecting cable for 1oo2 evaluation.
- The fail-safe digital input M12 connector cables are black in color.

⚠ WARNING

You may come into contact with live electrical wires connected to the main power supply.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
Shut off the supply voltage before you wire the I/O devices.

Requirements



You require the following items to wire the ET 200eco PN F-DI 8 / F-DQ 3:

- Stripping tool and screwdriver for wiring the M12 cable connector, if you do not use prefabricated cables
- One of the following accessories:
  - Prefabricated cable with 5-pin M12 cable connector
  - 3-, 4-, or 5-wire copper cable (conductor cross-section must be ≤0.75 mm^2) with 5-pin M12 cable connector. Refer to "Pin assignment of digital inputs" (Page 120) and "Pin assignment of digital outputs" (Page 121) for further information.
- M12 sealing caps

Refer to "Ordering information" (Page 185) to find the article numbers for these items.

To connect the ET 200eco PN F M12 connectors, follow these steps:

1. Plug the connector into the relevant circular socket connector on the I/O block. Make sure the connectors and sockets are properly interlocked (matched joint).
2. Secure the connector by tightening the knurled ring nut with a torque of 1.5 Nm.

Sealing round sockets not in use

Always seal all unused, round sockets using M12 sealing caps to achieve degree of protection IP65, IP66, or IP67. Refer to "Ordering information" (Page 185) to find the article numbers for these items.

Pin assignment of connectors

Refer to "Pin assignment of connectors" (Page 117) for further information on pin assignment for PROFINET, feeding and looping the voltage, digital input, and digital output connectors.

5.2.7.4 Wiring I/O devices for 1oo1 evaluation or 1oo2 evaluation using M12 Y cables

You can connect two one-channel sensors with 1oo1 evaluation to one input connection of the ET 200eco PN F with a Y cable. The Y cable divides the two channels for two jacks. You can use either Y cable, 6ES7194-6KB00-0XA0 (Page 115)or 6ES7194-6KA00-0XA0 (Page 116), for this application.

You can connect SIRIUS safety position switches with interlock that have M12 8-pin connectors to one input and one output connection of the ET 200eco PN F with an inverted Y cable. You can use the inverted Y cable, 6ES7194-6KC00-0XA0 (Page 117), for this application.

Refer to "Pin assignment of digital inputs" (Page 120) and "Pin assignment of digital outputs" (Page 121) for further information.

⚠ WARNING

You may come into contact with live electrical wires connected to the main power supply.
Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
Shut off the supply voltage before you wire the ET 200eco PN F-DI 8 / F-DQ 3.

Requirements

You require the following items to wire the ET 200eco PN F I/O devices:

- Stripping tool and screwdriver for wiring the M12 cable connector, if you do not use prefabricated cables
- Y cable
- M12 sealing caps

Refer to "Ordering information" (Page 185) to find the article numbers for these items.

Sealing round sockets not in use

Always seal all unused, round sockets using M12 sealing caps to achieve degree of protection IP65, IP66, or IP67. Refer to "Ordering information" (Page 185) to find the article numbers for these items.

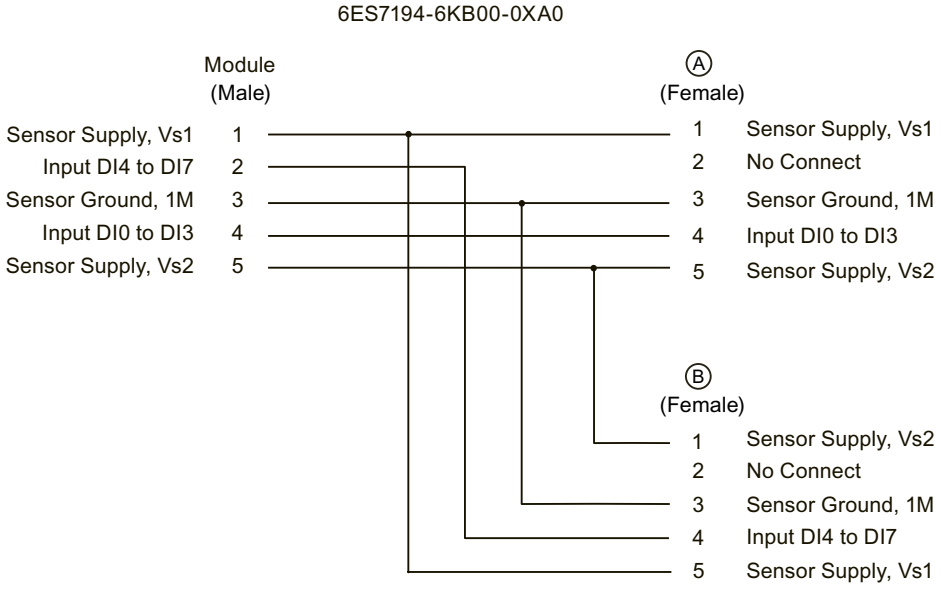
Pin assignment of connectors

Refer to "Pin assignment of connectors" (Page 117) for further information on pin assignment for PROFINET, feeding and looping the voltage, digital inputs, and digital outputs connectors.

SIMATIC DP, Y cable for distributed I/O for double connection of F-DI with one cable (6ES7194-6KB00-0XA0)

Use this Y cable (6ES7194-6KB00-0XA0) for applications with the following requirements:

- Sensor connections to the 5-pin M12 circular sockets (X1 to X4) on the front panel of the I/O device
- 1oo1 evaluation (double connection of F-DI with one cable) (See the wiring diagram below.)

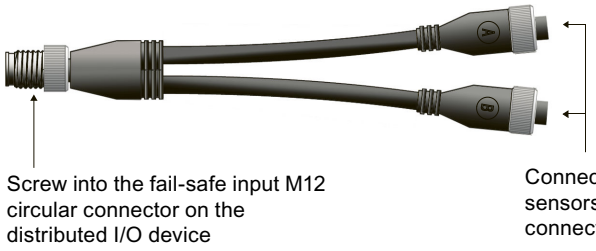


Refer to "Pin assignment of digital inputs" (Page 120) for further information.

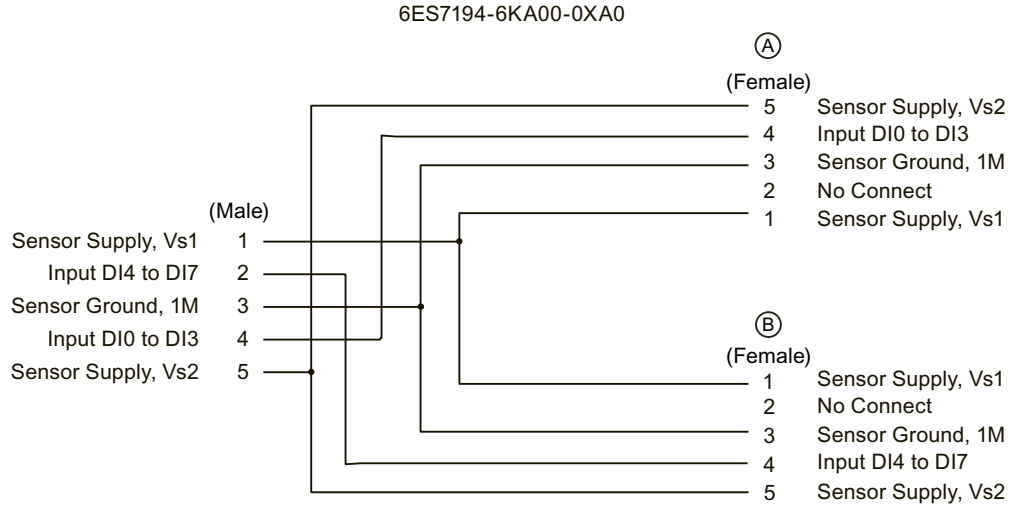
Screw into the fail-safe input M12 circular connector on the distributed I/O device

Connection to the input sensors via the M12 circular connectors

The wiring of the Y cable is shown below:



SIMATIC DP, Y cable for distributed I/O for double connection of F-DI with one cable (6ES7194-6KA00-0XA0)

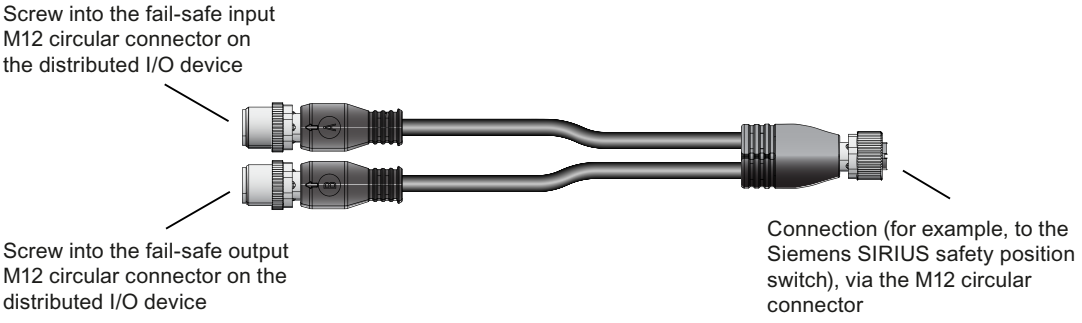


Use this Y cable (6ES7194-6KA00-0XA0) for applications with the following requirements:

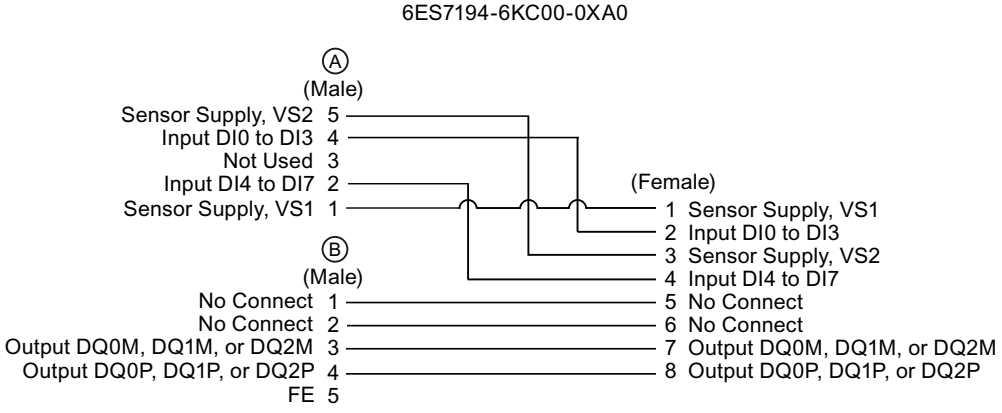
- Sensor connections to the 5-pin M12 circular sockets (X1 to X4) on the front panel of the I/O device
- 1oo1 evaluation (double connection of I/O with one cable) (See the wiring diagram below.)

Refer to "Pin assignment of digital inputs" (Page 117) for further information.

The wiring of the Y cable is shown below:



SIMATIC DP, Inverted Y cable for distributed I/O for connecting an F-DI and F-DQ with one cable (6ES7194-6KC00-0XA0)



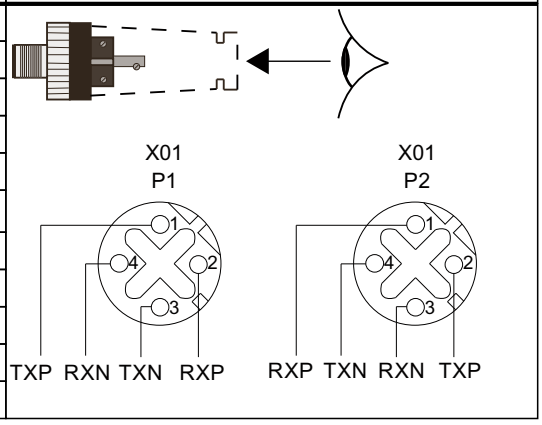
Use this inverted Y cable (6ES7194-6KC00-0XA0) for applications with the following requirements (for example, connecting a SIRIUS safety position switch):

- Sensor connections to the 5-pin M12 circular sockets (X1 to X4) on the front panel of the I/O device
- 1oo1 evaluation (connection of an F-DI and F-DQ with one cable) (See the wiring diagram below.)

Refer to "Pin assignment of digital inputs" (Page 120) and "Pin assignment of digital outputs" (Page 121) for further information.

The wiring of the inverted Y cable is shown below:

5.2.8 Pin assignment of connectors



5.2.8.1 Pin assignment of the PROFINET connector

PROFINET connector, X01 connector, port 1 and port 2

The module has a M12 connector with four female pins that are D-coded.

Table 1-1150 Pin assignment of the M12 cable connector for PROFINET connector, ports 1 and 2

Pin	Assignment	View of the cable connector (PROFINET), port 1 and port 2
	Assignment X01 P1

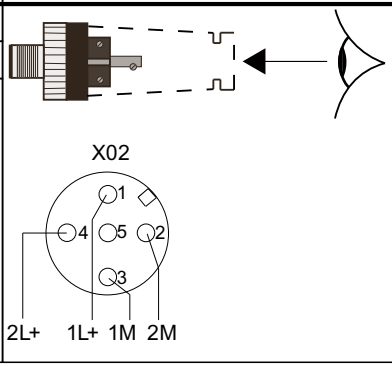
5.2.8.2 Pin assignment for feeding and looping the voltage

Cable connector for supply voltage infeed, X03 connector

The module has an M12 connector with five male pins that are A-coded.

Table 1-1151 Pin assignment of the M12 cable connector for the supply voltage infeed



Pin	Assignment	View of the cable connector (wiring side)
1	Supply voltage 1L+	
2	Ground 2M	
3	Ground 1M	
4	Supply voltage 2L+	
5	Reserved	

Cable connector for loop-through of the supply voltage, X02 socket

The module has an M12 connector with five female pins that are A-coded.

Table 1-1152 Pin assignment of the M12 cable connector for loop-through of the voltage

Pin	Assignment	View of the cable connector (wiring side)
1	Supply voltage 1L+	
2	Ground 2M	

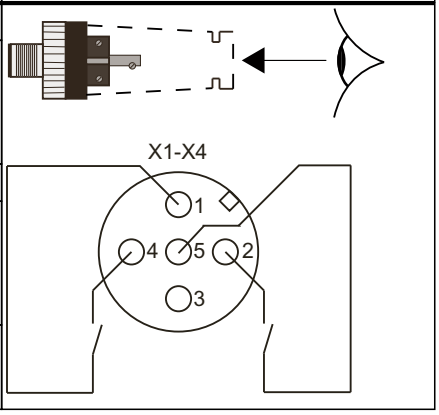
Pin	Assignment	View of the cable connector (wiring side)
3	Ground 1M	
4	Supply voltage 2L+	
5	Reserved	

NOTE

The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.

NOTE

PROFINET IO



Modules with PROFINET interfaces may only be operated if all of the connected nodes are equipped with SELV/PELV power supplies (or with protection systems of equal quality).

5.2.8.3 Pin assignment of digital inputs

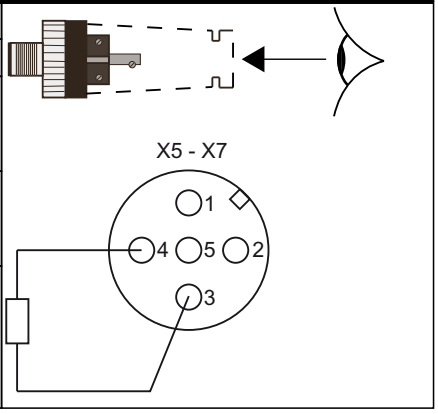
Cable connector for digital inputs, X1 - X4

The module has an M12 connector with five female pins that are A-coded.

Table 1-1153 Pin assignment of digital inputs

Pin	Assignment	View of the cable connector (wiring side)
1	24 V DC sensor supply Vs1	
2	Input signal DI_4: Connector X1 Input signal DI_5: Connector X2 Input signal DI_6: Connector X3 Input signal DI_7: Connector X4	
3	Sensor supply ground 1M	
4	Input signal DI_0: Connector X1 Input signal DI_1: Connector X2 Input signal DI_2: Connector X3 Input signal DI_3: Connector X4	
5	24 V DC sensor supply Vs2	

NOTE



The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.

5.2.8.4 Pin assignment of digital outputs

Cable connector for digital outputs, X5 - X7

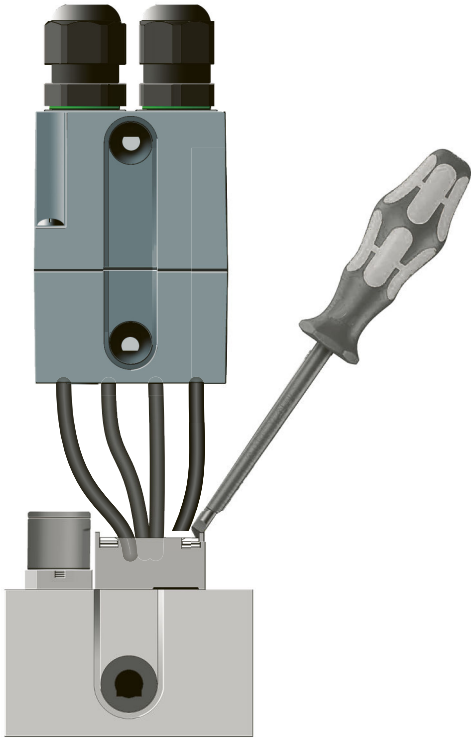
The module has an M12 connector with five female pins that are A-coded.

Table 1-1154 Pin assignment of digital outputs

Pin	Assignment	View of the cable connector (wiring side)
1	Not used	
2	Not used	
3	Output signal DQ_0-M: Connector X5 Output signal DQ_1-M: Connector X6 Output signal DQ_2-M: Connector X7	
4	Output signal DQ_0-P: Connector X5 Output signal DQ_1-P: Connector X6 Output signal DQ_2-P: Connector X7	
5	Functional earth FE	

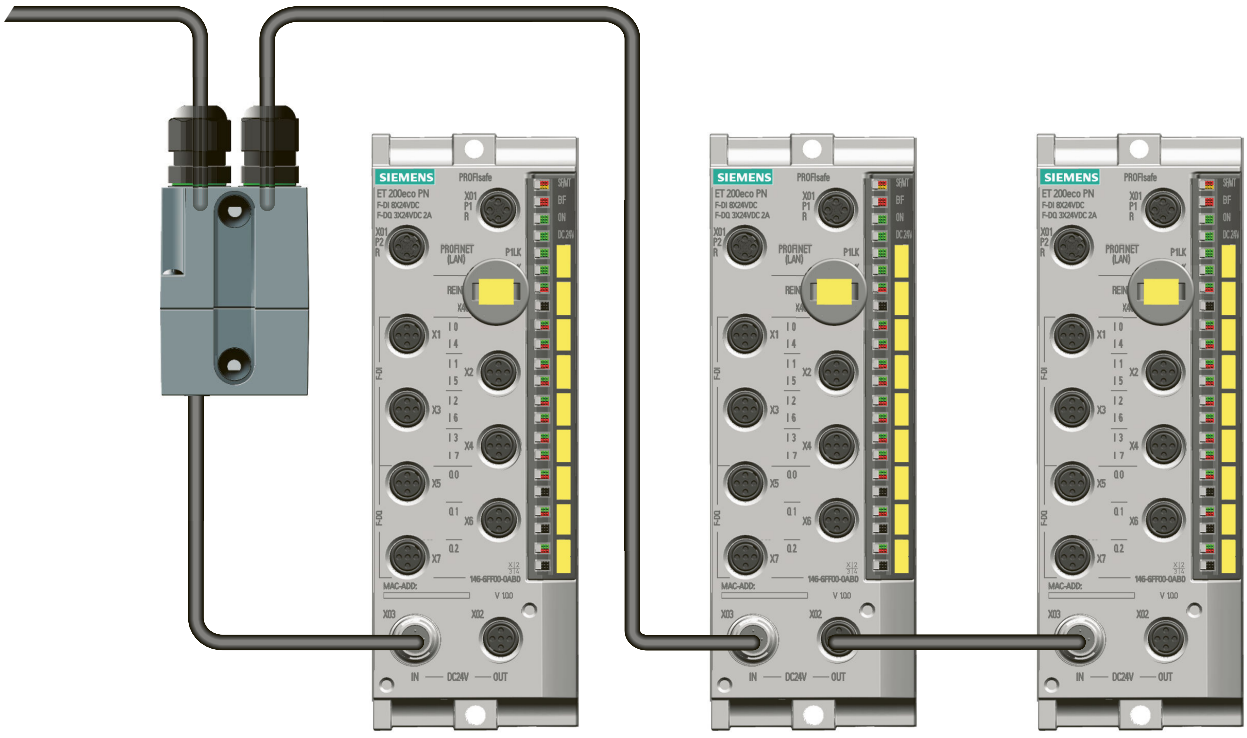
NOTE

The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.



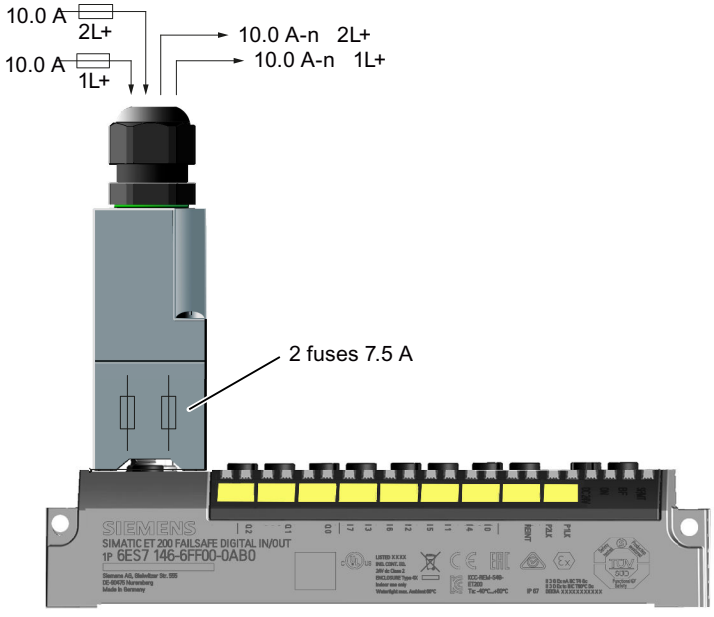
5.2.9 Wiring the terminal block

Tools required



You need a medium-sized cross-tip screwdriver to screw on the terminal block and a slotted screwdriver to press down the insulation displacement terminals.

Wiring the terminal block connectors



You do not have to strip the cables. You strip the cables automatically when you press down the insulation displacement terminals.

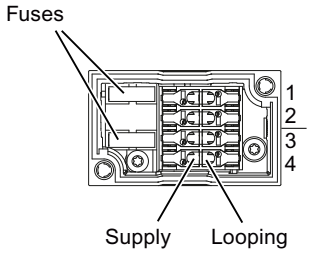
The following figure shows an example of the separate installation of the terminal block and how to wire it to several I/O devices.

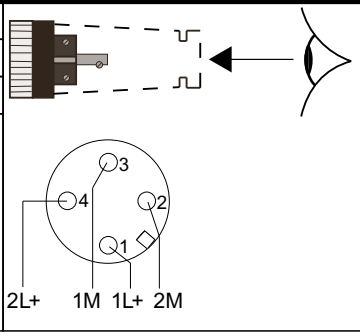
You can tap a maximum load of 4.0 A from each supply voltage of the I/O device. You can loop-through the remaining supply voltages.

Pin assignment

The tables below show the terminal block pin assignments:

Table 1-1155 Pin assignment of the insulation displacement terminal block





Pin	Assignment	View of the insulation displacement terminal block:
1	24 V DC 1L+	
2	Ground 1M	
3	24 V DC 2L+	
4	Ground 2M	

Table 1-1156 Pin assignment of the M12 connector

Pin	Assignment	View of the cable connector
1	24 V DC 1L+	
2	Ground 2M	
3	Ground 1M	
4	24 V DC 2L+	

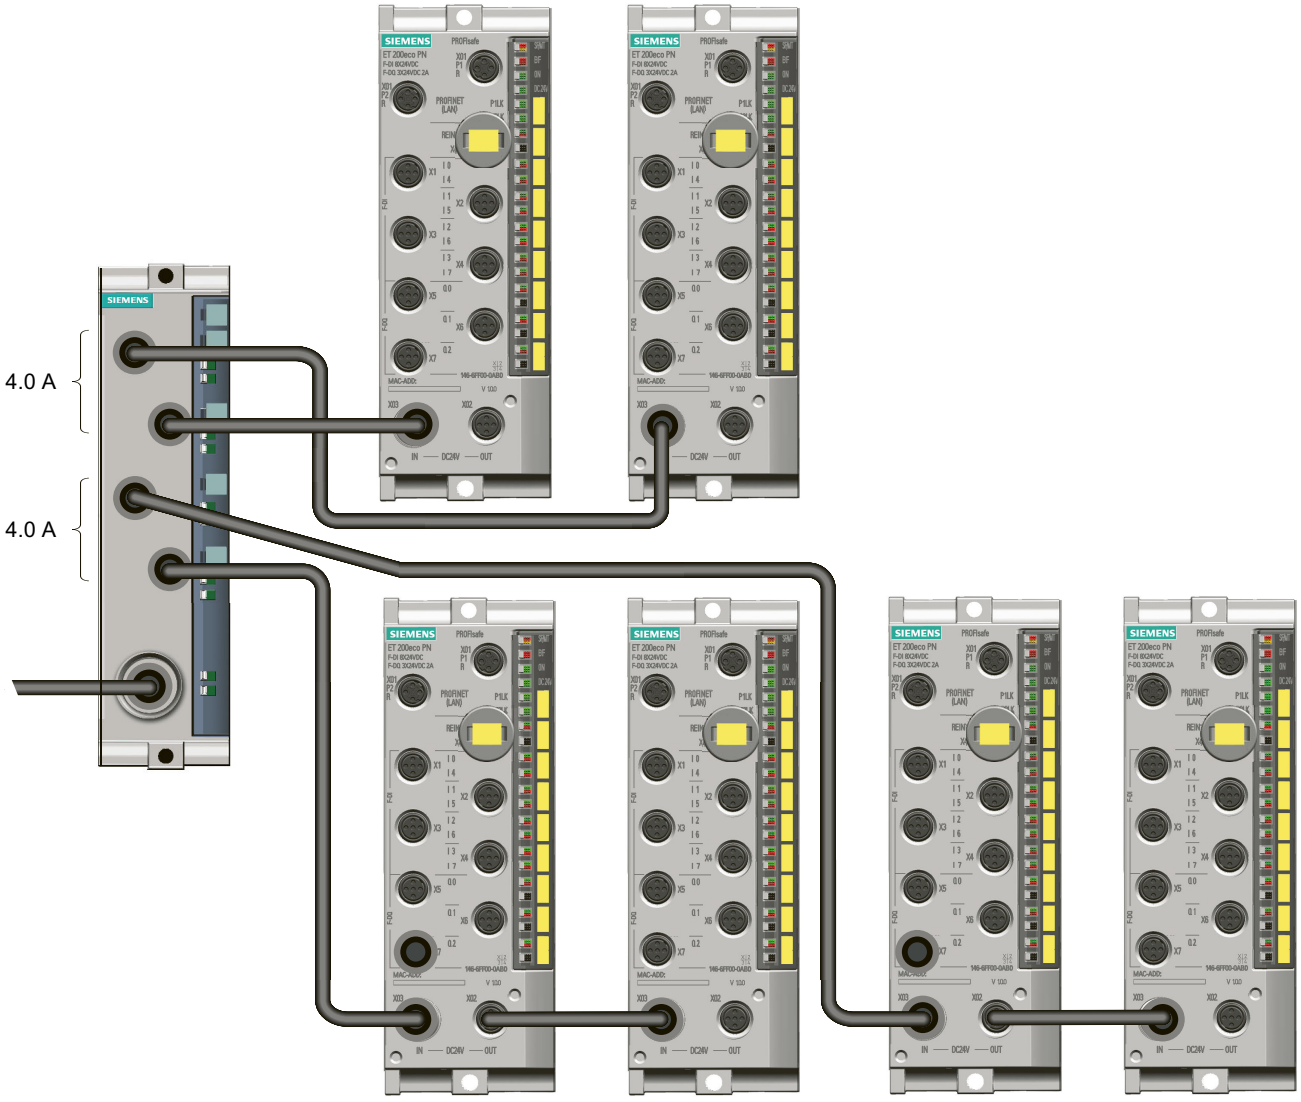
Information on wiring

Keep the following considerations in mind when you wire the terminal block:

- If you wire your configuration, you must take into account the impact of cable length on the supply voltage to the ET 200eco PN (permitted tolerance).
- The maximum infeed current of the terminal block is 10.0 A for 1L+ and 10.0 A for 2L+. Do not exceed these values.

⚠ CAUTION

If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you risk overheating the cable insulation and contacts resulting in damage to the device.
Electrical faults or unexpected machine operation can result in minor personal injury if proper precautions are not taken.
You must follow all instructions for installation and maintenance of a proper operating environment to ensure the equipment operates safely.



Additional information

Refer to "Installing the terminal block" (Page 98) and "Terminal block" (Page 184) technical specifications for further information.

5.2.10 Wiring the voltage distributor

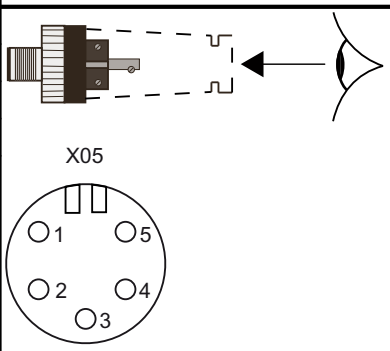
Wiring the connectors

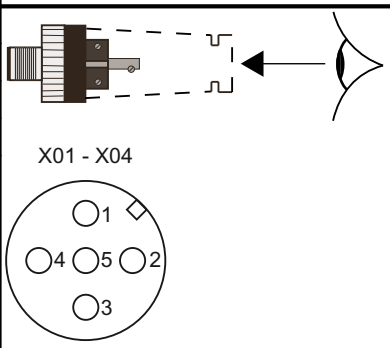
The following figure shows an example of the configuration of the PD DC 24V 1×7/8" 4×M12 voltage distributor with connected I/O devices:

Pin assignment

The tables below show the pin assignments:

Table 1-1157 Pin assignment of the 7/8" connector at the current input





Pin	Assignment	View of the 7/8" cable connector, 24 V DC connection
1	Ground 2M	
2	Ground 1M	
3	Functional earth FE	
4	24 V DC 1L+	
5	24 V DC 2L+	

Table 1-1158 Pin assignment of the M12 connector at the current output

Pin	Assignment	View of the M12 connection plug (front view)
1	24 V DC 1L+	
2	Ground 2M	
3	Ground 1M	
4	24 V DC 2L+	
5	Not used	

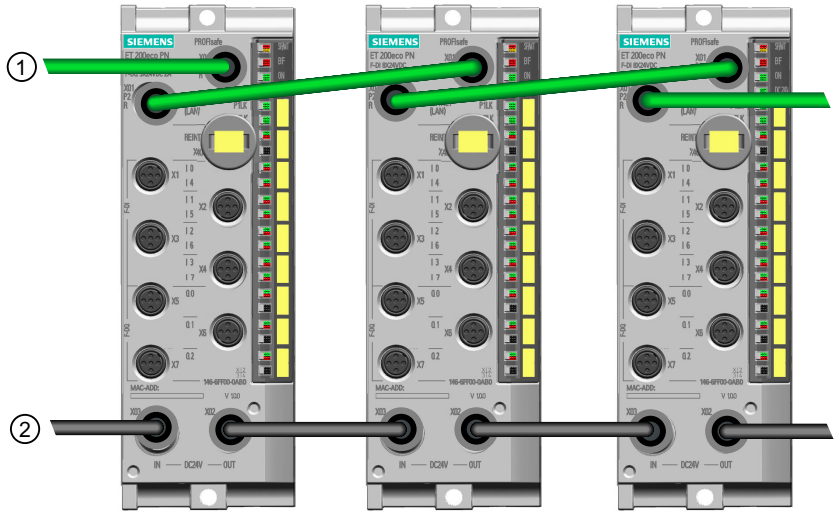
Information on wiring

Keep the following considerations in mind when you wire the voltage distributor:

- If you wire your configuration, you must take into account the impact of cable length on the supply voltage to the ET 200eco PN F (permitted tolerance).
- The maximum infeed current of the voltage distributor is 8.0 A for 1L+ and 8.0 A for 2L+. Do not exceed these values.

⚠ CAUTION

If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you risk overheating the cable insulation and contacts resulting in damage to the device.
Electrical faults or unexpected machine operation can result in minor personal injury if proper precautions are not taken.
You must follow all instructions for installation and maintenance of a proper operating environment to ensure the equipment operates safely.



Additional information

Refer to "Voltage distributor" (Page 184) technical specifications for further information.

5.2.11 Looping PROFINET and the supply voltage

The I/O device is equipped with one connector (X03) for the infeed and one socket (X02) for loop-through of the supply voltage. The connector for infeed and the socket for loop-through are interconnected internally.

The I/O device is equipped with two sockets for PROFINET IO (X01 P1 and X01 P2). One socket is available for the infeed and one socket for loop-through of the PROFINET IO.

① PROFINET
② Supply voltage

Information on wiring

Keep the following considerations in mind when you loop PROFINET and the supply voltage:

- If you wire your configuration, you must take into account the impact of cable length on the supply voltage to the ET 200eco PN F (permitted tolerance).
- The maximum infeed current of the I/O device is 4.0 A for 1L+ and 4.0 A for 2L+.

  Do not exceed these values.

⚠ CAUTION

If you do not adhere to the maximum infeed currents and the cable cross-sections required for these currents, you risk overheating the cable insulation and contacts resulting in damage to the device.

Electrical faults or unexpected machine operation can result in minor personal injury if proper precautions are not taken.

You must follow all instructions for installation and maintenance of a proper operating environment to ensure the equipment operates safely.

Reference

Refer to "Pin assignment of connectors" (Page 117) for further information on pin assignment for PROFINET and feeding and looping the voltage connectors.

5.2.12 Guidelines for inductive loads

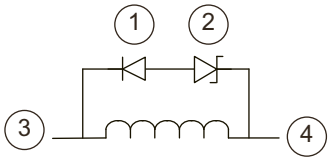
Guidelines for inductive loads

Use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off. Suppressor circuits protect your outputs from premature failure caused by the high voltage transient that occurs when current flow through an inductive load is interrupted.

In addition, suppressor circuits limit the electrical noise generated when switching inductive loads. High frequency noise from poorly suppressed inductive loads can disrupt the operation of the module. Placing an external suppressor circuit so that it is electrically across the load and physically located near the load is the most effective way to reduce electrical noise.

ET 200eco PN F-DI 8 / F-DQ 3 module DC outputs include internal suppressor circuits that are adequate for inductive loads in most applications.

A good suppressor solution is to use contactors and other inductive loads for which the manufacturer provides suppressor circuits integrated in the load device, or as an optional accessory. However, some manufacturer provided suppressor circuits may be inadequate for your application. An additional suppressor circuit may be necessary for optimal noise reduction.



A well-controlled turn-off transient will have a ring frequency of no more than 10KHz, with less than 1KHz preferred. The data sheets list voltage thresholds for the internal suppression circuits on DC outputs. (Refer to Appendix A: "Technical specifications" (Page 173) for further information.) External suppression should limit the transient to less than this threshold to ensure that the internal suppression circuit does not attempt to suppress an excessive load.

An external suppression circuit connected directly across the load also avoids the hazard of energizing the load if suppression circuit components fail short.

NOTE

The effectiveness of a suppressor circuit depends on the application and must be verified for your particular usage. Ensure that all components are correctly rated and use an oscilloscope to observe the turn-off transient.

Typical suppressor circuit for DC outputs that switch DC inductive loads

① Diode

In most applications, the addition of a diode ① across a DC inductive load is suitable, but if your application requires faster turn-off times, then the addition of a Zener diode ② is recommended. Be sure to size your Zener diode properly for the amount of current in your output circuit.

② Zener diode
③ Output channel F-DQ (P-switch)
④ Output channel F-DQ (M-switch)

In most applications, the addition of a diode ① across a DC inductive load is suitable, but if your application requires faster turn-off times, then the addition of a Zener diode ② is recommended. Be sure to size your Zener diode properly for the amount of current in your output circuit.

Configuring

6

All connected fail-safe I/O must have their operating properties configured by the STEP 7 Safety configuration software. You have the responsibility to ensure that no unconfigured modules are connected in a fail-safe automation system.

6.1 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module

You configure the ET200eco PN F-DI 8 / F-DQ 3 using the TIA Portal. STEP 7 configuration of the module requires a Hardware Support Package (HSP).

Refer to "Step 3: Configuring the ET 200eco PN F-DI 8 / F-DQ 3" (Page 35) in the Getting Started chapter for step-by-step instructions.

6.2 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module I/O properties

All connected fail-safe modules must have their operating properties configured by the STEP 7 Safety configuration software. You have the responsibility to ensure that no unconfigured modules are connected in a fail-safe automation system.

To configure fail-safe module I/O properties, follow these steps:

1. Select "Device configuration" in the project tree.
2. Place fail-safe I/O devices into your project's "Device view".

NOTE

The ET 200eco PN F-DI 8 / F-DQ 3 uses more I and Q memory than required for the physical number of inputs and outputs on the module. The extra bytes carry the PROFIsafe safety status and data integrity information.

The number of input (I) bytes and output (Q) bytes that the ET 200eco PN F-DI 8 / F-DQ 3 requires depends upon which PROFIsafe profile your fail-safe CPU uses. If using PROFIsafe profile V2.4 (with S7-300/S7-400), the module requires 7 input (I) bytes and 5 output (Q) bytes. If using PROFIsafe profile V2.6 (with S7-1200/S7-1500), the module requires 8 input (I) bytes and 6 output (Q) bytes.

Module	PROFIsafe profile	Input (I) bytes required	Output (Q) bytes required
ET 200eco PN F-DI 8 / F-DQ 3	V2.4 (with S7-300/S7-400)	7	5
	V2.6 (with S7-1200/S7-1500	8	6

3. Select the image of a fail-safe I/O device (on the Device view or Device overview) and view the module's "Properties" tab.
4. On the **"Properties"** view, select the **"General"** tab.

5. Click on the module properties tree and expand the branches for an I/O module. You can select a module (for example, "ET 200eco PN F-DI 8 / F-DQ 3") and see all the properties. You can also select a module branch (for example, "F-parameters", "DI-parameters", or "Channel parameters") and see a subset of the properties.
6. Select a property in the left-side property tree and then set values in the right-side property fields.
7. A successful compile and download of your hardware configuration to an S7-1200/1500, S7-300/400, ET 200pro (IP67 compliant), or ET 200S/ET 200SP fail-safe CPU automatically puts your new configuration settings in the I/O modules.

6.3 Configuring F-parameters

The image below shows the F-parameters for the ET 200eco PN F-DI 8 / F-DQ 3:

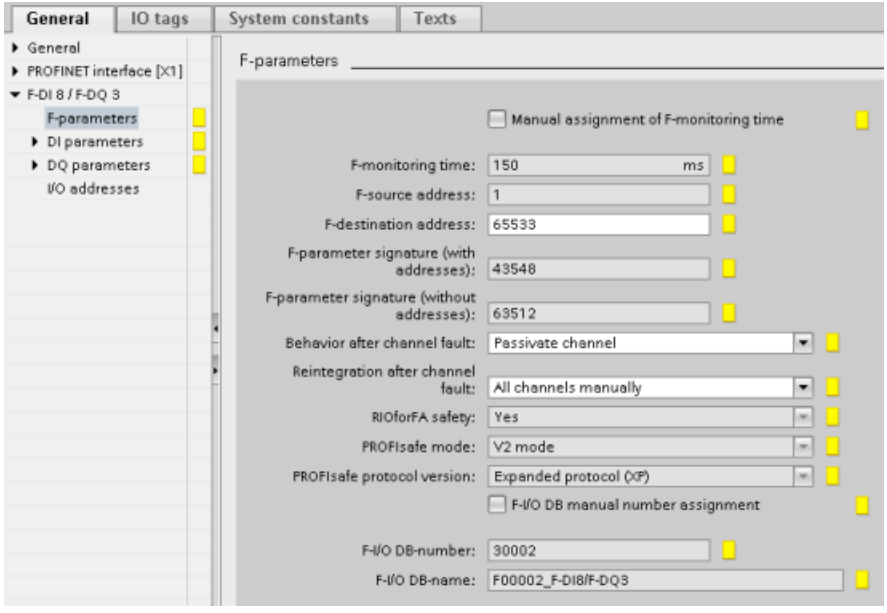


Table 1-1159 F-parameters

F-parameters	Description	Default	Options
Manual assignment of F-monitoring time	You must select the check box to change PROFIsafe F-monitoring time from the central value propagated by the fail-safe CPU.	Check box deselected	Check box: • Selected (manual assignment enabled) • Deselected (manual assignment disabled)
F-monitoring time [1]	Watchdog timer monitoring safety-related communication between the fail-safe CPU and ET 200eco PN F-DI 8 / F-DQ 3 (PROFIsafe monitoring time) Note: Disabled if "Manual assignment of F-monitoring time" check box is deselected.	150 ms	1 to 65535 ms in 1 ms steps

[1] STEP 7 uses this number to set the F-monitoring time in each ET 200eco PN F-DI 8 / F-DQ 3 unless you select the check box for "Manual Assignment of F-monitoring time" in that module configuration and assign a different time.

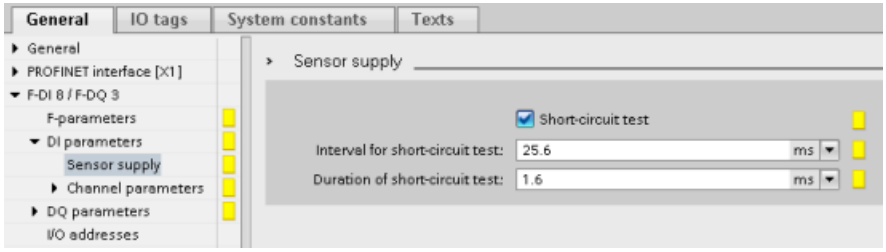
F-parameters	Description	Default	Options
F-source address	Unique network-wide address for the fail-safe CPU	1 (Always disabled)	1 to 65534 Note: You can configure the F-source address using the fail-safe CPU parameter "Central F-source address".
F-destination address	Unique F-destination address for each fail-safe module (usually in descending order, starting with 65534)	65534 (Always enabled)	1 to 65534
F-parameter signature (with addresses)	Signature for all F-parameters including addresses; used to uniquely identify a given set of parameterization values	Always disabled	
F-parameter signature (without addresses)	Signature for all F-parameters without addresses; used to uniquely identify a given set of parameterization values	Always disabled	
Behavior after channel fault	Passivation response by the ET 200eco PN F-DI 8 / F-DQ 3 to channel faults such as a short-circuit, overload, or discrepancy error	Passivate channel (Always enabled)	• Passivate channel • Passivate the entire module
Reintegration after channel fault	You have two methods, manual and automatic, to reintegrate your ET 200eco PN F-DI 8 / F-DQ 3 channels after a channel fault. You can configure one of the following options: • All channels automatically (no acknowledgement necessary for reintegration) • All channels manually (acknowledgement necessary for reintegration) • Adjustable (reintegration method is selectable (manual or automatic) channel-by-channel)	All channels manually (Always enabled)	• Adjustable • All channels automatically • All channels manually
F-I/O DB manual number assignment	You must select the check box to enable manual assignment of DB numbers.	Check box deselected	Check box: • Selected • Deselected
F-I/O DB number	F I/O block DB number: • Disabled if F-I/O DB manual number assignment check box is deselected (DB number derived from the Engineering Station (ES)) • Enabled if F-I/O DB manual number assignment check box is selected (edited by user)	-	-
F-I/O DB name	F I/O block DB name	Always disabled	-

[1] STEP 7 uses this number to set the F-monitoring time in each ET 200eco PN F-DI 8 / F-DQ 3 unless you select the check box for "Manual Assignment of F-monitoring time" in that module configuration and assign a different time.

Refer to the SIMATIC, Industrial Software, SIMATIC Safety - Configuring and Programming, Programming and Operating Manual (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for further F-parameter information.

6.4 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module DI and channel parameters

The image below shows the sensor supply parameters for the F-DI on the ET 200eco PN F-DI 8 / F-DQ 3:



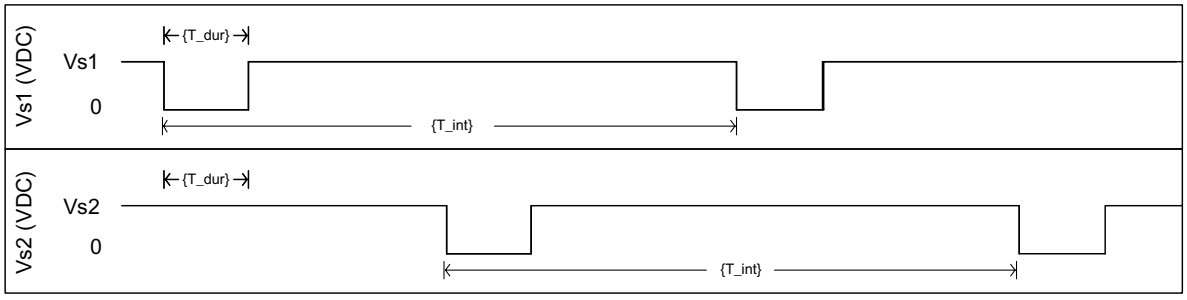


Table 1-1160 ET 200eco PN F-DI 8 / F-DQ 3 DI parameters

DI parameters	Description	Default	Options
Short-circuit test	This test creates short duration OFF pulses on the sensor power supplies. Input circuits powered by Vs1 and Vs2 are expected to be OFF during the sensor OFF time. Failure to detect OFF when a sensor supply is OFF indicates a short-circuit to a power source or another fault that prevents the input from properly detecting a "0". Input channels which fail this test are passivated. During the test, the reported process value will not change, so the configured "Duration of short-circuit test" increases the response time. An actual process "0" occurring near the beginning of a test will not be reported to the user program until after the "Duration of short-circuit test" time has elapsed. Note: The check box must be selected to activate the short-circuit test.	Check box selected	Check box: • Selected (short-circuit test enabled) • Deselected (short-circuit test disabled)
Interval for short-circuit test (see T_int in figure below)	Specifies how often the short circuit test is executed (Interval). It defines the period of time between two consecutive sensor supply off test pulses. This value is the time between the OFF pulses of the sensor supply. Refer to the figure below for further information. Note: The interval must be a minimum of eight times the duration. Note: Disabled if "Short-circuit test" check box is deselected.	25.6 ms	• 12.8 ms • 25.6 ms • 51.2 ms • 102.4 ms • 204.8 ms • 409.6 ms • 819.2 ms

DI parameters	Description	Default	Options
Duration of short-circuit test (see T_dur in figure below)	Specifies the duration of the test pulse generated by the sensor supply. It is the period of time for which the test pulse is applied. This value is the time that the power supply remains off during the test. The short-circuit test OFF pulse must be long enough for the external sensors and wiring to respond and present a "0" to the inputs. Refer to the figure below for further information. Note: The interval must be a minimum of eight times the duration. Note: Disabled if "Short-circuit test" check box is deselected.	1.6 ms	• 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms

Vs1 and Vs2 perform short-circuit testing independently, allowing module circuitry to detect shorts between the two sensor supplies:

Vsx Vs1 or Vs2 sensor supplies (VDC)
T_int Short-circuit test interval (time period) between the OFF pulses of the sensor supply
T_dur Short-circuit test OFF pulse time duration (msec)

The image below shows the channel parameters for the F-DI on the ET 200eco PN F-DI 8 / F-DQ 3:

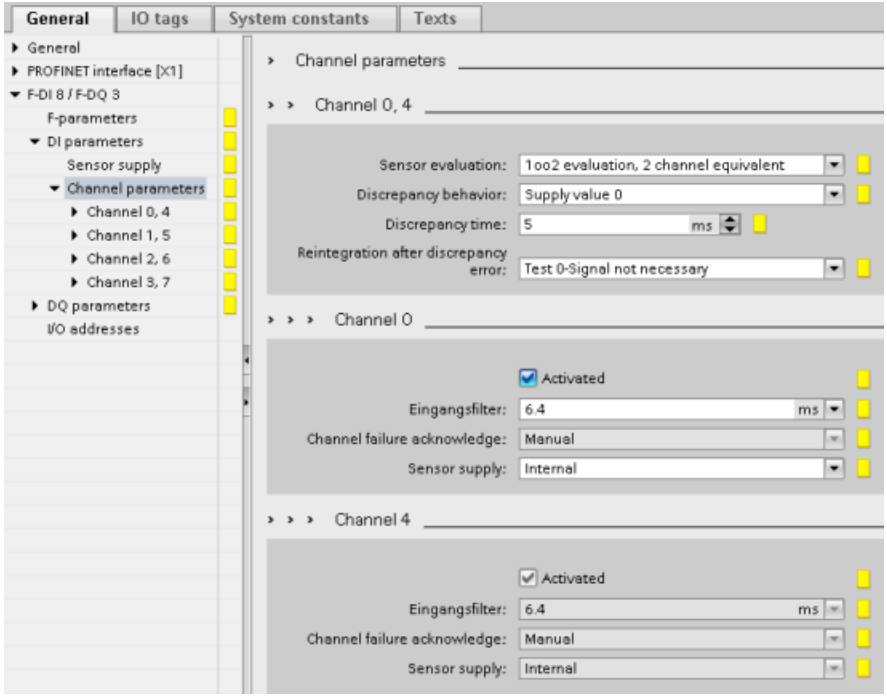

Table 1-1161 ET 200eco PN F-DI 8 / F-DQ 3 DI channel parameters

Channel parameters	Description	Default	Options
F-DI Channel Group Settings			
Sensor evaluation	Assigns whether “channel x” input operates individually (1oo1) or is paired with its companion channel "x+4" input (1oo2). Defines signal evaluation and wiring definitions. These selections correspond with the various application mode wiring examples. **1oo1 evaluation:** One sensor is connected to the module on a single channel. **1oo2 evaluation:** Two input channels are occupied by either: • **2 channel equivalent** (with equivalent signals): One two-channel equivalent sensor or two single-channel equivalent sensors are connected to the two channels, in a channel pair. • **2 channel - 3 wire nonequivalent**: One two-channel nonequivalent sensor is connected to the two channels, in a channel pair. • **2 channel - 4 wire nonequivalent** One two-channel nonequivalent sensor or two single-channel nonequivalent sensors are connected to the two channels, in a channel pair. If 1oo2 is selected, you must assign the discrepancy properties. Note: Refer to "Digital input applications" (Page 72) for illustrations of connection modes.	1oo2 evaluation, 2 channel equivalent	• 1oo1 evaluation • 1oo2 evaluation: – 2 channel equivalent – 2 channel - 3 wire nonequivalent – 2 channel - 4 wire nonequivalent

Channel parameters	Description	Default	Options
Discrepancy behavior	A 1oo2 input configuration allows a logical difference between the two signals, without error, for the configured discrepancy time. You can choose whether the reported process value should be "0" or the last valid value during the configured discrepancy time while the signals do not match. If a logical difference in 1oo2 inputs persists for more than the configured discrepancy time, the module or channel will become passivated with process value(s) set to 0.	Supply value 0	• Supply value 0 • Supply last valid value
Discrepancy time	The two signals in a 1oo2 input configuration will not change exactly at the same time, due to differences in sensors, contacts, and wiring. The discrepancy time parameter allows you to configure a normally expected duration for a mismatch between signals during transition.	5 ms	5 ms to 30000 ms in 1 ms steps
Reintegration after discrepancy error	Assigns whether a zero state must be detected on both 1oo2 inputs before a previously declared discrepancy can be cleared. A channel cannot be reintegrated until a zero has been detected on both 1oo2 signals.	Test 0-Signal not necessary	• Test 0-Signal necessary Note: The test 0-signal must be applied for at least 100 ms. • Test 0-Signal not necessary
F-DI Channel Settings			
Activated	Select the check box to activate the channel. Deselect the check box and the unused channel is deactivated. If you deactivate a channel, you also deactivate its diagnostic function.	Check box selected	Check box: • Selected (channel activated) • Deselected (channel deactivated)
Input filter	The module filters the digital inputs to remove contact bounce and short duration noise. This parameter assigns the duration of the filter time.	6.4 ms	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms
Channel failure acknowledge	Controls whether the channel is automatically reintegrated after a fault clears, or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults" (Page 148) for the reintegration procedure.	Manual	• Automatic • Manual Note: The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can override the "Channel failure acknowledge" parameter's selection.
Sensor supply	You can assign whether to supply 24 V DC power to sensors from a sensor supply output of the module (internal) or from an external power supply (external). Note: Short-circuit tests are not performed for any channel where external power is selected.	Internal	• Internal • External

NOTE

When you select the channel group as 1oo2, the module enables the parameters in the first channel of the group and completely disables the parameters in the second channel of the group. The second channel derives its parameter values from the first channel's parameter values.

When you select the channel group as 1oo1, the module enables all of the parameters in both channels.

NOTE

Safety program access to 1oo2 input data

For 1oo2 evaluation, two paired input channels (for example, F-DI 0 and F-DI 4) are connected to one or two sensors. The F-DI performs the discrepancy analysis and sends the result to the safety program, **at the input address of the low-numbered channel** (F-DI 0, in the example).

Sensor-actuator response time is increased when you add more input discrepancy time

The discrepancy time adds directly to the maximum response time of a 1oo2 evaluation if the two signals do not agree in logical state. If you select the "Supply value 0" option, then the F-DI does not delay a transition from "1" to "0", but can delay the transition from "0" to "1". If you select the "Supply last valid value" option, then the F-DI can delay both transitions from "1" to "0' and "0" to "1". The discrepancy time is influenced by sensor specifications, installation tolerances, and wiring. For best response time, select the smallest discrepancy time that provides reliable normal operation. Refer to "Response time parameters for the ET 200eco PN F-DI 8 / F-DQ 3 digital inputs" (Page 190) for further information.

Discrepancy time variation with short circuit test

If your process input changes near a short-circuit test, a discrepancy is detected in less time than your configured discrepancy time.

With:

Tdisc = configured discrepancy time

Tsct = configured short circuit test duration

Tfilter = configured input filter time

Tda = actual discrepancy time, time between process signal changes that can be detected as a fault

The range of detected discrepancy time is:

If Tfilter < Tsct: {Tdisc - (Tfilter + Tsct)} <= Tda <= Tdisc

If Tfilter >= Tsct: {Tdisc - (2 x Tsct)} <= Tda <= Tdisc

Your configured discrepancy time should account for this variation to avoid unexpected passivations.

6.5 Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module DQ and channel parameters

The image below shows the parameters for the F-DQ on the ET 200eco PN F-DI 8 / F-DQ 3:

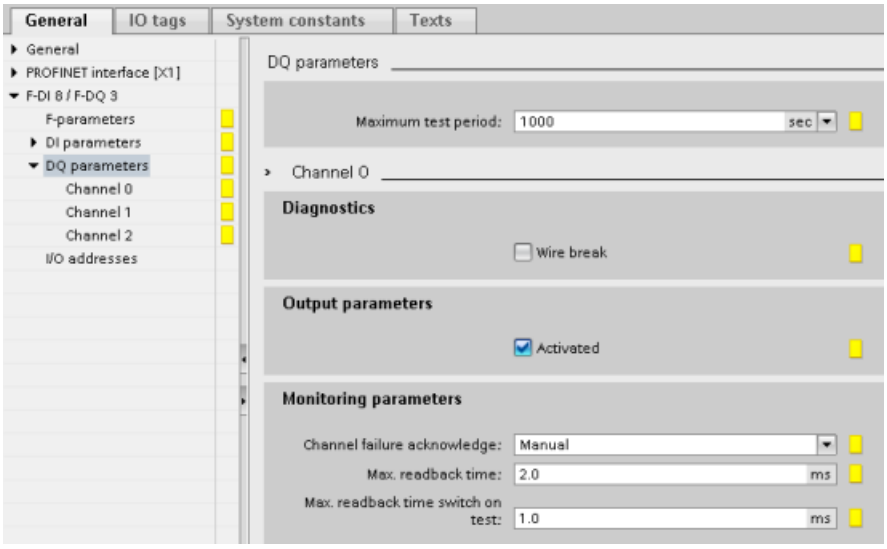

Table 1-1162 ET 200eco PN F-DI 8 / F-DQ 3 DQ parameters

DQ parameters	Description	Default	Options
Maximum test period	Assign the time interval between bit pattern tests for F-DQ DC output faults. Functional bit pattern tests are applied to the output switches. These tests detect faulted P- or M- output switches and wiring faults. Short circuits to other signals or power rails can be detected. Open circuits between the wiring terminals and the load are not detected. If an error is detected on a channel, the test interval is shortened to approx. 1 min. If an error is no longer detected, the configured test interval is used again. A persistent fault is reported to the fail-safe CPU and the affected channels are passivated.	1000 sec	• 100 sec • 1000 sec

Table 1-1163 ET 200eco PN F-DI 8 / F-DQ 3 DQ channel parameters

Channel parameters	Description	Default	Options
Wire break	You can activate or deactivate wire break testing.	Check box deselected	Check box: • Selected (wire break activated) • Deselected (wire break deactivated)
Activated	Select the check box to activate the channel. Deselect the check box and the unused channel is deactivated. If you deactivate a channel, you also deactivate its diagnostic function.	Check box selected	Check box: • Selected (channel activated) • Deselected (channel deactivated)

Channel parameters	Description	Default	Options
Channel failure acknowledge	Controls whether the channel is automatically reintegrated after a fault clears, or requires an acknowledgement (manual) in the user program. Refer to "Reactions to faults" (Page 148) for the reintegration procedure.	Manual	• Automatic • Manual Note: The configuration of the "F-Parameters": "Reintegration after channel fault" parameter can override the "Channel failure acknowledge" parameter's selection.
Maximum readback time	The maximum readback time is a user-configured parameter that assigns the maximum time allowed for an output to reach the new state (ON or OFF) due to a process value change without generating an error. Also, this is the maximum width of a diagnostic test pulse applied to verify that an output can be turned OFF while it is ON. The time of the OFF pulse should be as long as possible, but short enough so that the actuator cannot react.	2.0 ms	1.0 ms to 400.0 ms, in 0.1 ms increments
Maximum readback time switch on test	The maximum readback time switch on test is a user-configured parameter that assigns the maximum time for which the P-switch or the M-switch of a channel that is currently in OFF state can be switched ON during a bit pattern test step. This action tests the P- and M-switches on a channel such that only one switch is turned on at a time. Unless there is a fault in the system (for example, actuator shorted to ground), the actuator is not energized during either the P- or M-switch on tests. Under single fault conditions (either internal or external to the module), test pulses applied to either the P- or the M-switch of channels in the OFF state can repeatedly energize the actuator. You must select the parameter so that the duration of such pulses is too short to cause the actuator to react and, therefore, cannot have a hazardous effect on the equipment under control.	1.0 ms	0.5 ms to 5.0 ms, in 0.1 ms increments

⚠ WARNING

In the presence of a single fault, the bit pattern tests can apply energy to the load for a duration up to the configured "Maximum readback time switch on test".
If the load can respond dangerously within the configured readback time, it can respond to bit pattern tests in the presence of a single fault, resulting in death or serious injury to personnel and/or property damage.
Always choose a maximum readback configuration time that is guaranteed not to activate the load.

6.6 Assigning PROFIsafe addresses

Fail-safe ET 200eco PN modules, fail-safe ET 200SP modules, fail-safe S7-1500/ET 200MP modules, and fail-safe S7-1200 modules do not have a DIP switch that allows you to set the unique F-destination address for each module. Instead, you assign the PROFIsafe address consisting of the F-source address and the F-destination address directly from STEP 7 Safety for fail-safe ET 200eco PN modules, fail-safe ET 200SP modules, and fail-safe S7-1500/ET 200MP modules.

The S7-1200 CPU automatically assigns the PROFIsafe address consisting of the F-source address and the F-destination address to the fail-safe S7-1200 modules.

6.6.1 Basic PROFIsafe address assignment steps

These are the three basic steps for assigning PROFIsafe addresses:

1. Configure the F-destination address and F-source address in the hardware configuration in STEP 7 Safety and download the hardware configuration.
2. Identify the ET 200eco PN F modules to which you want to assign the configured F-destination and F-source addresses.
3. Assign the PROFIsafe addresses to the fail-safe modules.

NOTE

Refer to "Step 5: Assigning PROFIsafe addresses" (Page 42) in the Getting Started chapter for step-by-step instructions.

NOTE

Refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en) for further information about PROFIsafe address identification and assignment.

6.6.2 Identifying the ET 200eco PN F modules

6.6.2.1 Identification requirements

Ensure that you download the current hardware configuration before you assign the PROFIsafe addresses.

6.6.2.2 Identification procedure

You identify the ET 200eco PN F modules using the following steps:

1. In the network view, select the ET 200eco PN F module to which you want to assign the PROFIsafe address.
2. Right-click the ET 200eco PN F module, and select "Assign PROFIsafe address" from the context menu to display the "Assign PROFIsafe address" dialog.
3. In the "Identification" field, select the method to be used for identifying the ET 200eco PN F module:
   - "By LED flashing": This is the default setting. Channel Status LEDs of the ET 200eco PN F module that you want to identify flash upon identification.
   - "By serial number": If you cannot see the ET 200eco PN F module directly, you can identify the module by the serial number of the module.
4. In the "Assign" column, select the check box for the ET 200eco PN F module to which you want to assign the PROFIsafe address.
5. Click the "Identification" button, and compare the reaction of the fail-safe module to that in the table:
   - If you identify using LED flashing, check whether the Channel Status LEDs of the ET 200eco PN F module whose PROFIsafe address you want to assign are flashing green.
   - If you identify using the serial number, compare the displayed serial number to the serial number of the module.
6. In the "Confirm" column, select the check box for the ET 200eco PN F module for which you want to confirm the reaction of the fail-safe module in the table.

6.6.3 Assigning PROFIsafe addresses

6.6.3.1 Assignment requirements

In order to assign PROFIsafe addresses, you must have successfully identified your ET 200eco PN F modules and installed an eCoding plug on each module.

6.6.3.2 Assignment procedure

To assign the PROFIsafe addresses, proceed as follows:

1. Use the "Assign PROFIsafe addr..." button to assign the PROFIsafe address to the ET 200eco PN F modules. You may have to enter the password of the fail-safe CPU.
2. You must answer "yes" to the "Confirm PROFIsafe address assignment" dialog within 60 seconds to assign the PROFIsafe address.

6.7 Using the eCoding plug for PROFIsafe address assignment storage

The ET 200eco PN F-DI 8 / F-DQ 3 uses an eCoding plug to store the module's PROFIsafe addresses (F-source address and F-destination address).

⚠ WARNING

If you remove/insert the eCoding plug with the power connected, this can lead to undefined states in your system.
Death or serious personal injury and damage to the ET 200eco PN F-DI 8 / F-DQ 3 module and associated machines/equipment may result if proper precautions are not taken.
Only remove or replace the eCoding plug when the power is disconnected. Always comply with the required standards and safety guidelines when configuring a system.

NOTE

When replacing the ET200eco PN F module, transfer the eCoding plug inserted in the failed module to the replacement module to retain the PROFIsafe address stored in the eCoding plug. Otherwise, it is necessary to use the Engineering System to configure the PROFIsafe address in the replacement module. Ensure that eCoding plug in not accidentally inserted in a module other than the intended ET200eco PN F module.

Commissioning

7

7.1 PROFINET IO

7.1.1 Commissioning the ET 200eco PN F-DI 8 / F-DQ 3 on PROFINET IO

The commissioning of your distributed I/O system depends on the system configuration. The following procedure describes the commissioning of the ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O system on an IO controller.

Requirements for the ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O system on the PROFINET IO

NOTE

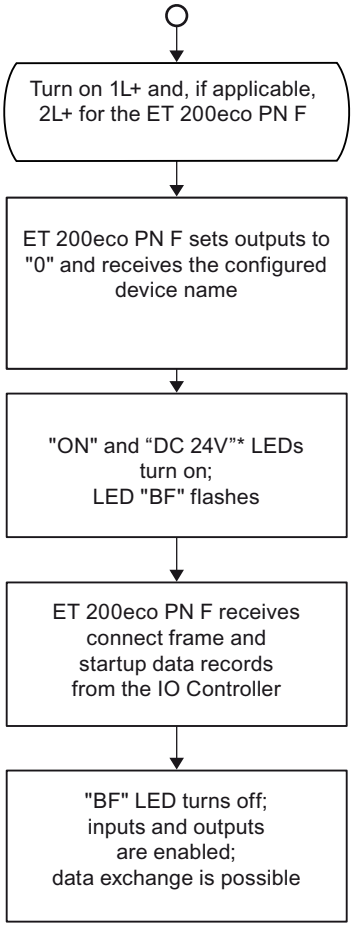
You must ensure the safety of your plant. To do so, you need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Plan the tests to include any possible foreseeable errors. This allows you to prevent people or plants from being placed in danger during operation.

Procedure

The following table shows the chapters in which the required actions are described:

Table 1-1164 Requirements for the ET 200eco PN F-DI 8 / F-DQ 3 distributed I/O system on the PROFINET IO

Step	Procedure	See...
1	Installing the ET 200eco PN F-DI 8 / F-DQ 3 module	"Installation" (Page 95)
2	Wiring the ET 200eco PN F-DI 8 / F-DQ 3 module	"Wiring" (Page 101)
3	Configuring the ET 200eco PN F-DI 8 / F-DQ 3 module	"Configuring" (Page 130)
4	Turning on the supply voltage for the ET 200eco PN F-DI 8 / F-DQ 3 module	"Wiring" (Page 101)



Reference

You can find additional information on assigning the PROFINET IO parameters in the PROFINET with STEP 7 V15 Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).

7.1.2 Startup on PROFINET IO

Principle of operation

The diagram below illustrates the startup of the ET 200eco PN F-DI 8 / F-DQ 3 on PROFINET IO:

* "DC 24V" only for digital output and if 2L+ is connected

7.2 Identification and maintenance (I&M) data

7.2.1 Reading out and entering I&M data

Identification and maintenance (I&M) data is information that is saved either as read-only or read/write on the ET 200eco PN F-DI 8 / F-DQ 3 module.

Identification data (I&M0): Manufacturer information on the module that is read-only and in some cases is also printed on the module housing (for example, article number, serial number, and firmware version).

Maintenance data (I&M1, 2, 3): Plant-dependent information (for example, installation location). You create maintenance data during configuration and write that data to the module.

The ET 200eco PN F distributed I/O module supports I&M0 to I&M3.

The I&M data supports you in the following activities:

- Checking the plant configuration
- Locating hardware changes in a system
- Correcting errors in a system

With the I&M identification data, you have the option of clearly identifying modules online.

STEP 7 displays the identification data in the "Properties..." tabs (see STEP 7 online help).

Options for reading out I&M data

You have the following options for reading the I&M data:

- Using the user program
- Using STEP 7 or HMI devices

Procedure for reading I&M data by means of the user program

To read the I&M data of the ET 200eco PN F module in the user program, use the instruction "RDREC".

Procedure for reading the I&M data using STEP 7

NOTE

You must have an online connection to the ET 200eco PN F module.

1. In the project navigation, under "Distributed I/O", select the I/O device (for example, "ET 200eco PN F-DI 8 / F-DQ 3").
2. Select: **Go to device > Online & Diagnostics > Diagnostics** > **General** > "Module information" field

Procedure for input of maintenance data using STEP 7

STEP 7 assigns the default module name. You have the option to enter the following data:

- Plant designation (I&M1)
- Location identifier (I&M1)
- Installation date (I&M2)
- Additional information (I&M3)

To enter the data, follow these steps:

1. In the device view of the STEP 7 hardware network editor, select the ET 200eco PN F-DI 8 / F-DQ 3 module.
2. In the module Properties, select: **General** > "Identification & Maintenance" field
3. Enter your I&M data.

NOTE

You must select an Options setting before you can edit and download I&M1 to 3 data. Select: **Options** > **Settings** > **Hardware configuration** > **Compile & download** > "Download" field > "Download Identification & Maintenance (I&M) data" check box

STEP 7 downloads the I&M data during the downloading of the hardware configuration.

Reference

You can find additional information on ET 200eco PN F-DI 8 / F-DQ 3 I&M data in the "Distributed I/O ET 200eco PN Operating Instructions" (https://support.industry.siemens.com/cs/document/29999018/simatic-distributed-i-o-et-200eco-pn?dti=0&lc=en-WW).

7.2.2 Data record structure for I&M data

Reading I&M data records (distributed using PROFINET IO)

You can directly access specific identification data by selecting the **Read data record** ("RDREC" instruction). You obtain the corresponding part of the identification data under the associated data record index.

The following table shows the principle behind the structure of data records:

Table 1-1165 Basic structure of data records with I&M identification data

Contents	Length (bytes)	Coding (hex)
Header information		
BlockType	2	I&M0: 0020_H I&M1: 0021_H I&M2: 0022_H I&M3: 0023_H
BlockLength	2	I&M0: 0038_H I&M1: 0038_H I&M2: 0012_H I&M3: 0038_H
BlockVersionHigh	1	01
BlockVersionLow	1	00
Identification data		
Identification data (see table below)	54 54 16 54	I&M0/Index $AFF0_H$ I&M1/Index $AFF1_H$ I&M2/Index $AFF2_H$ I&M3/Index $AFF3_H$

The following table shows the structure of data records for I&M identification data:

Table 1-1166 Data record structure for I&M identification data

Identification and maintenance data	Access	Default	Explanation
Identification data 0: (data record index AFF0 hex)			
DEVICE_MAN_ID	read (1 Word)	0x002A	Name of the manufacturer ($2A_H$ = SIEMENS AG).
DEVICE_ID	read (20 Char)	6ES7146-6FF00-0AB0	Information to order the module
DEVICE_SER_NUM	read (16 Char)	Serial number	Serial number (device-specific)
HARDWARE_REVISION	read (2 Bytes)	0x0001	Corresponding hardware version
SOFTWARE_REVISION	read (1 Char, 3 Bytes)	V01.00.00	Provides information about the firmware version of the module
MODUL_REVISION_COUNTER	read (1 Word)	0x0000	Provides information about configured changes on the module
Profile_ID	read (1 Word)	0x0000 (PROFIsafe)	Generic device
Profile_Specific_Type	read (1 Word)	0x0005 (I/O Module)	Interface modules
IM_Version	read (2 Bytes)	0x0101 (Version 1.1)	Provides information about the version of the identification data
IM_Supported	read (1 Word)	0x000E	Provides information about the existing identification data (I&M1 though I&M3)
Maintenance data 1: (data record index AFF1 hex)			
TAG_FUNCTION	read/write (32 Bytes)	Initialized with 0x20 (Blank)	Enter an identifier for the module here that is unique plant-wide.
TAG_LOCATION	read/write (22 Bytes)	Initialized with 0x20 (Blank)	Enter the installation location of the module here.
Maintenance data 2: (data record index AFF2 hex)			
INSTALLATION_DATE	read/write (16 bytes)	Initialized with 0x20 (Blank)	Enter the installation date of the module here (YYYY-MM-DD HH:MM).
Maintenance data 3: (data record index AFF3 hex)			
DESCRIPTOR	read/write (54 bytes)	Initialized with 0x20 (Blank)	Enter a comment describing the module.

Diagnostics

8

8.1 Reactions to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends on the identification of a safe state for all process variables. The value "0" (de-energized) represents this safe state for digital fail-safe modules. This applies to both sensors and actuators.

The safety function requires that safe state values be applied to the fail-safe channel(s) instead of process values (passivation of the fail-safe module or channel(s)) in the following situations:

- When the fail-safe system is started up
- If module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If module channel faults occur (for example, short-circuit and discrepancy errors)

The fail-safe CPU enters detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-Safe modules do not remember errors upon power cycle. When the system is powered down and then restarted, the modules detect any faults still existing again. The exception to this is a permanent deactivation fault such as "sustained over-voltage".

Fail-Safe value for fail-safe modules

If digital input channels are passivated , the fail-safe system always provides safe state values ("0") for the safety program instead of the process values applied to the fail-safe inputs.

If digital output channels are passivated in the fail-safe module digital outputs, the fail-safe system always transfers safe state values "0" to the fail-safe outputs instead of the output values provided by the safety program. The output channels are de-energized.

The passivation safe state value and the output state value in CPU STOP mode are always "0", de-energized. You cannot select or program a default "ON" state for passivation or STOP mode.

Passivation is applied to individual channels when a channel-specific diagnostic failure is detected. Failures that can affect the entire module result in passivation of all channels.

NOTE

In the ET 200eco PN F-DI 8 / F-DQ 3 **Properties** > **4/8 F-DI 3 F-DQ** > **F-parameter**s > "Behavior after channel fault" field, if you select "Passivate the entire module", a single channel fault can result in passivation of all channels.

Timeout of the PROFIsafe message (F-monitoring time exceeded) passivates all module channels.

Table 1-1167 Module signal type and passivation result

Module signal type	Passivation result
Fail-safe digital inputs	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective inputs. • If a channel fault occurs for a 1oo1 configuration, depending on your configuration, only the affected channel or all channels may be passivated. For a 1oo2, the channel group of two inputs in the 1oo2 configuration are passivated.
Fail-safe module digital outputs	• Tests are evaluated per channel, in order to allow channel-granular passivation of defective outputs. • Diagnostic evaluations are performed separately for each of the two switches of a channel. Depending on your configuration, failure detection for one switch may lead to passivation of only the affected channel or all channels.

Response to faults in the fail-safe system

You should prepare maintenance procedures for your system to assure that return to operation after a detected fault is controlled and documented.

The following steps must be performed:

1. Diagnosis and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Reintegration of a fail-safe module

A channel or module can be reintegrated after successful diagnostics determine that a fault has cleared.

You can configure reintegration as automatic or manual. You can make this selection on a per channel basis in the Device Configuration. Module wide errors such as PROFIsafe communication errors or supply voltage errors must always be manually reintegrated.

Channels that you select to be automatically reintegrated are immediately reintegrated when the fault has cleared.

Channels that you select to be manually reintegrated must also be acknowledged in your program after the fault has cleared.

The "ACK_REQ" bit for that module goes true to indicate that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Some fatal diagnostic errors require a power cycle with successful diagnostics to reintegrate.

Reintegration after high stress events

High temperature, high voltage, and excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Solid state switch outputs can be damaged by high currents prior to protective device activations. The PFD and PFH reliability calculations assume the fail-safe module is operated within its specified operating parameters. When a module has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future dangerous failure may be increased.

⚠ WARNING

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics.
Reintegration of a faulty system can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
After any reported fault, the steps outlined in this chapter and in safety standards applicable to your system should be followed to assure that the fault is completely understood and corrected before reintegration.

For an exact list of faults for the module, refer to "Fault types, causes, and corrective measures" (Page 157).

At reintegration, the following occurs:

- For a fail-safe module digital input, the process values pending at the fail-safe inputs are provided for the safety program.
- For a fail-safe module digital output, the output values provided in the safety program are again transferred to the fail-safe outputs.

Safety repair time

The repair time used for PFH and PFD calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. You should respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

Deactivated fail-safe I/O are not being diagnosed and are subject to dangerous failure without warning.

If any channel passivation persists for 100 hours, the entire module is passivated and can only be recovered through power cycle.

If a repair within 100 hours is not possible, passivated fail-safe outputs should be taken out of service by physically disconnecting or opening circuits so that faults in the fail-safe module cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs must be removed from any operating CPU Safety program logic that can result in activation of a safety function output.

Do not depend on channel or module passivation to maintain safe state for more than 100 hours.

Do not depend on deactivation or lack of configuration to maintain safe state in any circumstances.

Additional information on passivation and reintegration

For further information about fail-safe module access, refer to the "SIMATIC Safety - Configuring and Programming, Programming and Operating Manual" (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

8.2 Fault Diagnostics

8.2.1 Overview

Diagnostics detect faults that can affect the integrity of safety-related I/O. The faults can be in the fail-safe module, communication with the CPU, or external circuits. Diagnostic information is assigned either to a single channel or to the entire fail-safe module.

Most diagnostics operate without user selection. You can configure the following diagnostic options:

- Short-circuit testing using the digital input sensor supply can be enabled. The interval and duration of short-circuit tests is configurable.
- The readback times for 24 V DC digital outputs are configurable.
- The timeout intervals for failures in the safety communication or failure of a safety program to run is configurable.

  Refer to "Configuring" (Page 130) for a complete description of these options.

The safety-critical and validated action of the diagnostics is to passivate I/O when faults are detected. The reporting of status and diagnostic results through the LED displays and diagnostic messages is subject to single point failures in electronics or software. These reports are offered as maintenance and debugging aids, but must be observed and interpreted with caution.

In the presence of single faults, any or all LED indications can be wrong. You should not rely solely on the presence or absence of red or green LED indicators to make safety decisions.

In the presence of single faults, diagnostic messages may fail to be delivered, or the numerical event ID or text message can be wrong. You should not rely solely on the presence, absence, or content of diagnostic reports to make safety decisions.

⚠ WARNING

Diagnostic and status reports through LEDs and text messages are subject to single point failure errors.

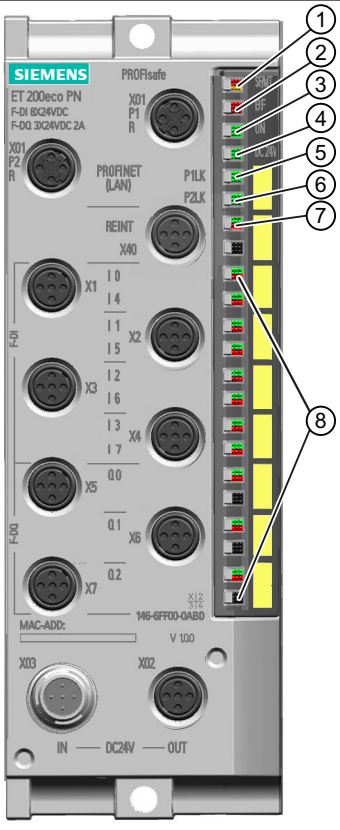
Reliance on such reported information to determine that a system or I/O point is in a safely-controlled state can result in death, severe personal injury, or property damage.

If the integrity of your fail-safe system is in doubt, you should use additional measures such as restricted access or power removal to control hazards during maintenance and debug activities.

8.2.2 Diagnostics performed at startup

Each fail-safe module executes self-diagnostics at power-up to assure that the electronics and software meet testable expectations before allowing the module to participate in process control. If tests are not successful, the module passivates individual channels or all channels.

In addition to internal tests, some tests create signal changes at the terminals.



The ET 200eco PN F-DI 8 / F-DQ 3 module executes tests for its digital outputs of the P and M switches as defined by your configured parameters for "Maximum readback time" and "Maximum readback time switch on test" after receiving configuration parameters from the fail-safe CPU at power-up. P and M switch ON tests are sequenced so that normally or in the presence of a single detected fault, there is no complete PM circuit to energize the load.

The ET 200eco PN F-DI 8 / F-DQ 3 module executes tests for its digital inputs of the sensor supply at power up, including ON and OFF pulses, whether or not you have enabled the sensor supply or short-circuit testing in your configuration. If your configuration includes short-circuit testing, the F-DI also executes a short-circuit test according to your configured parameters after receiving the parameters from the fail-safe CPU at power-up.

8.2.3 Diagnostics by LED Display

8.2.3.1 Overview

The ET 200eco PN F-DI 8 / F-DQ 3 module has the following LED position, arrangement, and types:

Module	Location	LED	LED Color	Description
	①	SF/MT	Red/Yellow	System fault/Maintenance
	②	BF	Red	Bus monitoring
	③	ON	Green	Power at 1L+
	④	DC 24V	Green	Power at 2L+
	⑤	P1 LK	Green	Port to Ethernet switch connection
	⑥	P2 LK	Green	Port to Ethernet switch connection
	⑦	REINT	Green/Red	Module reintegration
	⑧	Channel Status	Green	Channel status LED for each channel
	⑧	Channel Fault	Red	Channel fault LED for each channel

NOTE
Each M12 channel connector has two LED light-pipes. F-DI channels use both LED light-pipes, one for each input. F-DQ channels use a single LED light-pipe.

8.2.3.2 Module LED states

Module LED states

The behavior of the module-relevant LEDs follows the definitions in the table below:

LED	LED color	Description
SF/MT (System fault and maintenance)	● On red	The SF LED is controlled by incoming and outgoing diagnostic events. The SF LED is ON whenever at least one incoming event is active.
	○ Off	The SF LED is OFF when all incoming events have been acknowledged by outgoing events.
	● On yellow	The MT LED is ON during a firmware update, once the update procedure commences within the module.
BF (Bus monitoring)	● On red	The BF LED is ON whenever the IO device is not connected to an Ethernet switch.
	✶ Flashing red	The BF LED is flashing whenever there is faulty or absent data exchange between the IO Controller and the ET 200eco PN F IO Device. Faulty or absent data exchange can include the following items: • No connect message frame • Faulty connect message frame • No data exchange between the module and the host, although the module is physically connected to the switch. Possible causes can include the following items: – Incorrect device name – Error in or no configuration – Parameterization errors or no parameterization
	○ Off	The BF LED is OFF whenever the IO device successfully exchanges data with the IO controller.
ON (Power at 1L+)	● On green	The ON LED is ON whenever the 24 V DC supply voltage is present at 1L+.
	○ Off	The ON LED is OFF whenever the 24 V DC supply voltage is too low or not present at 1L+.
DC 24V (Power at 2L+)	● On green	The DC 24V LED is ON whenever the 24 V DC supply voltage is present at 2L+.
	○ Off	The DC 24V LED is OFF whenever the 24 V DC supply voltage is too low or not present at 2L+.
	○ Off	The DC 24V LED is also OFF whenever the 24 V DC supply voltage is too low or not present at 1L+.
P1 LK and P2 LK (Port to Ethernet switch	● On green	The Px LK LED is ON whenever there is a connection to Ethernet switch or IO controller.

○- Off;●- On;✶- Flashing (Flashing frequency: 2.0 Hz)

LED	LED color	Description
connection)	○ Off	The Px LK LED is OFF whenever there is no connection to the Ethernet switch or IO controller.
REINT (Module reintegration)	✶ / ✶ Flashing red and green	The REINT LED flashes Green/Red whenever a reintegratable module-wide diagnostic event has been resolved. This can include the following events: • Reintegratable over-voltage • Reintegratable under-voltage • Module detected PROFIsafe CRC error • Module detected PROFIsafe timeout error
	● On red	The REINT LED is ON red whenever there are compatibility issues between FW or HW revisions.
	○ Off	The REINT LED is otherwise OFF.

○- Off;●- On;✶- Flashing (Flashing frequency: 2.0 Hz)

8.2.3.3 LED states for 1oo1 input channels

The behavior of the 1oo1 input channel LEDs follows the definitions in the table below:

Description	Reintegration LEDs	Input Channel LEDs	
		Fault	Status
LED color	Green / red	Red	Green
Input state 0	○ Off	○ Off	○ Off
Input state 1	○ Off	○ Off	● On green
Channel fault	○ Off	● On red	○ Off
Channel fault resolved, awaiting reintegration	○ Off	✶ / ✶[1] Flashing	

○ - Off;● - On;✶- Flashing (Flashing frequency: 2.0 Hz)

[1] Alternating flashing of the separate fault (red) and status (green) LEDs for channels awaiting reintegration (flashing frequency: 2.0 Hz)

8.2.3.4 LED states for 1oo2 input channels

The behavior of the 1oo2 input channel LEDs follows the definitions in the table below:

Description	Reintegration LEDs	Primary input channel LEDs		Secondary input channel LEDs	
		Fault	Status	Fault	Status
LED color	Green / red	Red	Green	Red	Green
Input state 0 (equivalent)	○ Off	○ Off	○ Off	○ Off	○ Off
Input state 1 (equivalent)	○ Off	○ Off	● On green	○ Off	● On green
Input state 0 (nonequivalent)	○ Off	○ Off	○ Off	○ Off	● On green
Input state 1 (nonequivalent)	○ Off	○ Off	● On green	○ Off	○ Off
Discrepancy error	○ Off	● On red	○ Off	● On red	○ Off
Discrepancy error resolved, awaiting reintegration	○ Off	✶ / ✶[1] Flashing		✶ / ✶[1] Flashing	

○ - Off;● - On;✶- Flashing (Flashing frequency: 2.0 Hz)

1 Alternating flashing of the separate fault (red) and status (green) LEDs for channels awaiting reintegration (flashing frequency: 2.0 Hz)

8.2.3.5 LED states for sensor supply behaviors

The behavior of the input LEDs due to sensor supply faults follows the definitions in the table below:

Description	Reintegration LEDs	Input Channel LEDs	
		Fault	Status
LED color	Green / red	Red	Green
Sensor supply fault; for inputs affected by the fault	○ Off	● On red	○ Off
Sensor supply fault; for inputs not affected by the fault	○ Off	○ Off	Input state

○ - Off;● - On;✶- Flashing (Flashing frequency: 2.0 Hz)

8.2.3.6 Channel LED states

The behavior of the module and channel-relevant LEDs and reintegration LEDs follows the definitions in the table below:

Description	Reintegration LEDs	Input Channel LEDs		Output Channel LEDs	
		Fault	Status	Fault	Status
LED color	Green / red	Red	Green	Red	Green
Module / System fault	○ Off	● On red	○ Off	● On red	○ Off
Module not configured, includes: under-voltage, over - voltage of 1L+ and 2L+ when not configured	○ Off	○ Off	Input state	○ Off	○ Off
States after the module is successfully configured					
Channel deactivated	○ Off	○ Off	Input state	○ Off	○ Off
No channel faults	○ Off	○ Off	Input state	○ Off	Output state
Channel faults	○ Off	● On red	○ Off	● On red	○ Off
Awaiting manual reintegration after channel fault	○ Off	✶ / ✶[1] Flashing		✶ / ✶[1] Flashing	
Awaiting manual reintegration after 1L+ voltage too high or too low	✶ / ✶ Flashing red and green	✶ / ✶[1] Flashing		✶ / ✶[1] Flashing	
Awaiting automatic reintegration after 1L+ voltage too high or too low	✶ / ✶ Flashing red and green	○ Off	Input state	○ Off	○ Off
Awaiting reintegration after PROFIsafe communication error (detected by host)	✶ / ✶ Flashing red and green	○ Off	Input state	○ Off	○ Off
1L+ supply or 2L+ load voltage too high / too low	○ Off	● On red	○ Off	● On red [3]	○ Off
PROFIsafe communication error (detected by module)	○ Off	○ Off	Input state	○ Off	○ Off
Identification of the F-module when assigning the PROFIsafe address	○ Off	○ Off	✶ Flashing green [2]	○ Off	✶ Flashing green [2]
PROFIsafe address does not match the configured PROFIsafe address	○ Off	● On red	○ Off	● On red	○ Off
Firmware Update (LED indication of FW update activity)	○ Off	○ Off	○ Off	○ Off	○ Off
Inconsistent FW versions and/or HW revisions between TPS and F-µCs	● On red	○ Off	Input state	○ Off	○ Off

○ - Off;● - On;✶- Flashing (Flashing frequency: 2.0 Hz)

1 Alternating flashing of the separate fault (red) and status (green) LEDs for channels awaiting reintegration (flashing frequency: 2.0 Hz)

2 Flashing frequency (0.5 Hz)

3 Assuming channels are activated. F-DQ channels can be deactivated. Whenever you deactivate all F-DQ channels, you do not have to power 2L+. When you deactivate all F-DQ channels, you change some F-DQ relevant behaviors (for example, 2L+ under-voltage reporting is suspended).

8.2.3.7 LED states for 24 V DC supply behaviors

The behavior of the 24 V DC LEDs follows the definitions in the table below:

Description	ON (1L+)	DC 24V (2L+)	Reintegration LEDs	Input Channel LEDs		Output Channel LEDs	
				Fault	Status	Fault	Status
LED color	Green	Green	Green / red	Red	Green	Red	Green
24 V DC module 1L+ off; 24 V DC module 2L+ off	○ Off	○ Off	○ Off	○ Off	○ Off	○ Off	○ Off
24 V DC module 1L+ off; 24 V DC module 2L+ on	○ Off	○ Off	○ Off	○ Off	○ Off	○ Off	○ Off
24 V DC module 1L+ on; 24 V DC module 2L+ off (At least one output activated)	● On green	○ Off	○ Off	● On red	○ Off	● On red	○ Off
24 V DC module 1L+ on; [1] 24 V DC module 2L+ off (All outputs deactivated)	● On green	○ Off	○ Off	○ Off	Input state	○ Off	○ Off
24 V DC module 1L+ on; 24 V DC module 2L+ on	● On green	● On green	○ Off	○ Off	Input state	○ Off	Output state

○ - Off;● - On;✶- Flashing (Flashing frequency: 2.0 Hz)

[1] Whenever you deactivate all F-DQ channels, you do not have to power 2L+.

8.2.4 Fault types, causes, and corrective measures

The "Fault types, causes, and corrective measures" table below lists the messages of the ET 200eco PN F-DI 8 / F-DQ 3. These messages are displayed in the TIA Portal under "Online & diagnostics" > "Diagnostics" > "Diagnostic buffer". When you highlight an individual text line in the diagnostic buffer, the Event ID for that text item is displayed, along with module identity and location that generated the message. You may need to expand the window to see all information.

Table 1-1168 Fault types, causes, and corrective measures

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0001	Short-circuit	Digital outputs	A channel problem has been detected where either the P terminal or M terminal is at an unexpected potential.	Short-circuit of the output	Eliminate the short-circuit.
				Short-circuit between channels with different signals	Eliminate the short-circuit.
				Output overload	Eliminate the overload.
				"Maximum readback time switch on test" value is configured too small	Increase "Maximum readback time switch on test" if permissible.
				Short-circuit of output to M	Eliminate the short-circuit.
				Defective output driver	Replace the fail-safe module.

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0005	Overtemperature	Module	• Overtemperature at microcomputer • Overtemperature at I/O	Shutdown due to violation of high temperature limit value in the module case	Check the ambient temperature. Once the fault has been eliminated, the power must be switched off and on.
0x0006	Wire break	Module	WIre break failure. Note: The module detects a wire break. The module can detect a wire break when the channel is wired using a PM load, when the PV=0, and the wire break diagnostic is enabled.	Output is activated: • No load is connected to the PM output. • Output is not wired in a PM configuration. • Too small of a load is detected.	Change the output load characteristics, deactivate unused channels, or disable wire break diagnostic for the offending channels.
0x0009	Hardware revision mismatch	Module	The module detects hardware mismatch. REINT LED is ON red.		Replace module.
0x0010	Parameterization failure (invalid parameters)	Module	On detection of invalid parameters, the module stays in the configured state and signals the rejection of the faulty parameter to the fail-safe CPU. The module LEDs give an immediate indication of this fault.	i-Parameter CRC error	
				Invalid i-parameters (for example, invalid selection, parameter out-of-range, unsupported feature selected, and wrong value of reserved field)	
				Any PROFIsafe parameterization problem detected by the PROFIsafe driver.	
0x0010	Parameterization failure (address assignment failure)	Module	On detection of an address assignment failure that indicates a hardware fault, the module enters the fatal error state. The module performs this fault reaction if the address verification information provided by the F parameters is different than what has been previously assigned to the module.	• Indicates assignment of an incorrect F address to one or more module(s). • Missing eCoding plug	• Reinsert the eCoding plug • Reassign or reinitialize the PROFIsafe F addresses using TIAP • Replace the eCoding plug
0x0010	Parameter error	Module	When the module receives new parameters, the module checks for parameter failures.	Parameter failure detected.	

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0040	Mismatch of safety destination address (F_Dest_Add)	Module	The PROFIsafe driver has detected a destination address mismatch. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective	• Reassign or reinitialize the PROFIsafe F addresses using TIAP • Replace the eCoding plug
0x0041	Safety destination address not valid (F_Dest_Add)	Module	The PROFIsafe driver has detected an invalid destination address. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective	• Reassign or reinitialize the PROFIsafe F addresses using TIAP • Replace the eCoding plug
0x0042	Safety source address not valid (F_Source_Add)	Module	The PROFIsafe driver has detected a source address mismatch or an invalid source address. Checked after new parameters received.	• eCoding plug has been replaced with a different plug • eCoding plug is defective	• Reassign or reinitialize the PROFIsafe F addresses using TIAP • Replace the eCoding plug
0x004D	PROFIsafe communication error (CRC)	Module	Transmission error in data message frame: Data inconsistent (CRC (cyclic redundancy check) error). Checked after new output telegram received.	Communication interference between the fail-safe CPU and the fail-safe module (for example, due to electromagnetic interference in excess of limits or sign-of-life monitoring error)	• Check the communications connection. • Eliminate the interference.
0x004E	PROFIsafe communication failure (timeout)	Module	Monitoring time exceeded for data message frame (timeout). Checked after new output telegram received.	F-monitoring time exceeded. Transmission error: timeout (watchdog time 1 or 2 elapsed)	• Adjust F-monitoring time. • Check Safety program and all other CPU activities for excessive execution or demands: – Interrupts – Ethernet communication – OB scheduling conflicts – Long program paths.
0x0100	Module is defective	Module	Fatal internal error	Fail-Safe module is defective.	Replace the fail-safe module. [2]
0x0103	Watchdog tripped	Module	The watchdog timer in the module communications processor timed out.	Fail-Safe module is defective.	Replace the fail-safe module.
0x0105	Short-circuit to L+	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	Output shorted to P. The fail-safe module detects a channel problem where the	Short-circuit to L+	Eliminate the short-circuit.
				Short-circuit between channels with different signals	Eliminate the short-circuit.

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0105	Short-circuit to L+	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	P-terminal is unexpectedly at L+ potential.	Defective output driver	Replace the fail-safe module.
				"Maximum readback time" value is configured too small.	Increase readback time.
0x0106	Short-circuit to ground	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	The fail-safe module detects a channel problem where the M-switch output terminal is unexpectedly at M potential.	Short-circuit of output to M, ground, or another channel.	Eliminate the short-circuit.
				Defective output driver	Replace the fail-safe module.
				"Maximum readback time" value is configured too small.	Increase readback time.
0x011B	Invalid/inconsistent firmware present	Module	The firmware is inconsistent after a firmware update. Inconsistency between bus ASIC firmware and failsafe firmware. Checked again after firmware update.	Inconsistent firmware version may occur between Network Interface ASIC firmware and failsafe controller firmware if the firmware update is supported.	The firmware update operation should be repeated.
0x013E	Diagnostic event queue overflow	Module	Overflow of the diagnostic events queue has occurred. A newly-occurred diagnostic event could not be queued for transmission to the CPU because the buffer is full.	This can happen if channel errors come and go very quickly (for example, discrepancy errors).	
0x0300	Discrepancy failure, channel state 0/0	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	External discrepancy failure: Channel state 0/0 with 1oo2 non-equivalent configuration	• Process signal faulty, sensor may be defective. • Configured discrepancy time too short • Short-circuit • Sensor mechanical activation or alignment out of tolerance	• Check process signal, replace sensor if necessary. • Check the configured discrepancy time. • Check the wiring. • Check that both sensors are mounted and aligned to be activated together.
0x0301	Discrepancy failure, channel state 0/1	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	External discrepancy failure: Channel state 0/1 with 1oo2 equivalent configuration		
0x0302	Discrepancy failure, channel state 1/0	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	External discrepancy failure: Channel state 1/0 with 1oo2 equivalent configuration		
0x0303	Discrepancy failure, channel state 1/1	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	External discrepancy failure: Channel state 1/1 with 1oo2 non-equivalent configuration		
0x0306	Internal sensor supply	ET 200eco PN F-DI 8 / F-DQ 3	Module-provided sensor supply voltage	Sensor supply shorted to P	Eliminate the short-circuit.

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0306	short-circuit to P	digital inputs	shorted to P	Short-circuit test duration configured too short	Increase short-circuit test duration.
				Failed sensor supply	Replace the fail-safe module.
0x0307	Overload or internal sensor supply short-circuit to ground	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	Internal sensor supply voltage shorted to M, ground, or excessive load on sensor supply. Note: An overload condition is detected if the filtered current measurement of a channel is in the over-current threshold range of 2.4 A and 3.83 A. Overload protection is provided using current measurement of the P outputs. M outputs are short-circuit protected, but not monitored for over-current.	Short-circuit	Eliminate the short-circuit.
				Excessive load on sensor supply	Reduce load on sensor supply.
				Failed sensor supply	Replace the fail-safe module.
0x030B	Channel failure acknowledgement	Module	Channel configured for manual acknowledgement is ready to reintegrate.	Manual acknowledgement required	Manually acknowledge correction of channel fault so that reintegration can occur.
0x030D	F-address memory not accessible	Module	The memory where the F-Address is stored is not accessible.	• eCoding plug is missing • eCoding plug is defective	• Install an eCoding plug into X40 of the module • Replace the defective eCoding plug
0x030E	No valid F-address available	Module	Fail-safe address is not valid (F-address and CRC inconsistent).	• eCoding plug has never been assigned a PROFIsafe address • eCoding plug is defective	• Assign the PROFIsafe Address • Replace the eCoding plug
0x0311	Frequency too high	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	Switching frequency exceeded; readback not in time.	Process value from safety program changing too rapidly for module to follow	• Change Safety program logic to guarantee more time between output changes.
0x0312	Undertemperature	All	• Under-temperature at microcomputers • Under-temperature at I/O	Shutdown due to violation of low temperature limit value in the module case	• Check the ambient temperature. • Once the fault has been eliminated, the power must be switched off and on.

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Event ID	Diagnostic message	ET 200eco PN F-DI 8 / F-DQ 3 module	Description	Possible causes	Corrective measures [1]
0x0313	Failure in the input circuit	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	Internal fault at the read circuit/test circuit	The module digital inputs detect a failure during bit pattern testing of inputs. EMI or module hardware fault.	• If intermittent, probably due to interference. Eliminate interference. • If persistent, or repeats after efforts to eliminate interference, replace the fail-safe module.
0x031C	Input shorted to P	ET 200eco PN F-DI 8 / F-DQ 3 digital inputs	Input shorted to P failure	External wiring or sensor shorts input signal to L+.	Check/correct external short-circuit.
				Input configured for internal sensor supply with short-circuit detection enabled, but wired to external L+	Make wiring and configuration agree.
				Input defective	Replace the fail-safe module.
0x031E	Read back failure	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	The module has detected a channel problem where the expected terminal voltage(s) are not reached.	"Maximum readback time" or "Maximum readback time switch on test" configured value is too small.	Increase readback time.
				Output switch failure	Replace the fail-safe module if output does not respond.
0x0320	Overload	ET 200eco PN F-DI 8 / F-DQ 3 digital outputs	Over load condition at the output driver that leads to passivation of the channel	Over load at output	Eliminate over load.
0x0321	Supply or load voltage too high	Module	Supply voltage (1L+) or load voltage (2L+) maximum exceeded.	Supply or load voltage is set too high.	Adjust supply or load voltage.
0x0322	Supply or load voltage too low	Module	Supply voltage (1L+) or load voltage (2L+) minimum exceeded.	Supply or load voltage is set too low.	Adjust supply or load voltage.

[1] Once the fault is eliminated, the fail-safe module must be reintegrated (returned to normal state) from passivation into the safety program.

Electromagnetic interference and diagnostic reports

Electromagnetic interference can cause communication errors, disturb external and internal signal measurements, and cause processing errors. When error reports do not apparently relate to an identifiable device failure, wiring problem, programming, or configuration error, consider sources of electromagnetic interference and installation and wiring problems that might introduce electromagnetic interference in your installation. Typical problem sources include poor suppression of inductive loads and voltage dips due to excessive load in-rush currents.

Maintenance

9

9.1 Replacing the ET 200eco PN F-DI 8 / F-DQ 3 module

Replacing modules

Replacing a module is not permitted during ongoing operation.

⚠ WARNING

If you remove/insert modules and the eCoding plug with the power connected, this can lead to undefined states in your system.
Death or serious personal injury and damage to the ET 200eco PN F-DI 8 / F-DQ 3 module and associated machines/equipment may result if proper precautions are not taken.
Only remove or replace modules and the eCoding plug when the power is disconnected.
Always comply with the required standards and safety guidelines when configuring a system.

NOTE

When replacing the ET200eco PN F module, transfer the eCoding plug inserted in the failed module to the replacement module to retain the PROFIsafe address stored in the eCoding plug. Otherwise, it is necessary to use the Engineering System to configure the PROFIsafe address in the replacement module. Ensure that eCoding plug in not accidentally inserted in a module other than the intended ET200eco PN F module.

Procedure

To replace a module, proceed as follows:

1. Disconnect the supply and load voltages to the module to be replaced.
2. Remove the eCoding plug.
3. Completely remove all cables connected to the module.
4. Completely remove the fixing screws of the module
5. Replace the module.
6. Fasten the module with a torque of 1.2 Nm.
7. Connect all cables.
8. Connect the eCoding plug to the module.
9. Turn the supply and load voltages on.

Result

The disconnected I/O module and all downstream I/O modules start up again by themselves.

NOTE

Refer to the "Looping PROFINET and the supply voltage" (Page 127) when replacing the ET 200eco PN F module.

9.2 Resetting the ET 200eco PN F-DI 8 / F-DQ 3 module to factory settings (PROFINET)

When you "Reset to factory settings", you reset the ET 200eco PN F-DI 8 / F-DQ 3 module to the delivery state settings. This means that all information that you saved internally on the ET 200eco PN F is deleted.

Result after resetting to factory settings

The following table shows an overview of the contents of the saved items after resetting to factory settings:

Table 1-1169 Result after resetting to factory settings

Memory object	Contents
IP address	Deleted
Device name	Deleted
MAC address	Not deleted
Identification data (I&M0)	Not deleted
Maintenance data (I&M1, 2, 3,)	Deleted (optional)
Firmware version	Not deleted
PROFIsafe addresses stored in eCoding Plug	Not affected

NOTE

When "Resetting to factory settings", the ET 200eco PN F assumes a substitute value behavior (takes on the non-configured state), which means that the module does not enter input data or transmit output data.

Reset options

You can go online with STEP 7 (TIA Portal) to reset an ET 200eco PN F to factory settings

The ET 200eco PN F only works with TIA Portal V15 and later. An HSP is used with TIA Portal V15. Later versions of V15 will not require an HSP.

Requirement

You need an online connection to reset an ET 200eco PN F to factory settings.

Procedure with STEP 7 (TIA Portal)

Connect the PG/PC to the PROFINET IO interface of the ET 200eco PN F distributed I/O system.

Make sure that there is an online connection to the ET 200eco PN F module which is to be reset to factory settings:

1. Navigate to "Devices & Networks" and the "Network view".
2. Right-click on the ET 200eco PN F-DI 8 / F-DQ 3 and select "Online and diagnostics".
3. Go online.
4. In the "Functions" folder, select "Reset to factory settings".
5. Select the "Retain I&M data" option button if you want to retain the I&M data, or the "Reset I&M data" option button if you want to delete the I&M data.
6. Click the "Reset" button.
7. Click "OK" in response to the confirmation prompts.

Result: This command resets the following data:

- PROFINET device name
- IP address
- SNMP parameters
- I&M data (if "Reset I&M data" is selected)

Reference

You will find more information on the procedure in the TIA Portal online help.

9.3 Firmware update

During operation, it can become necessary to update the firmware (for example, for function extensions).

Options for the firmware update

You update the firmware in the ET 200eco PN F-DI 8 / F-DQ 3 module using one of the following:

- TIA Portal
- Embedded web server executing on a SIMATIC CPU
- SIMATIC Automation Tool (SAT)

NOTE

Temporary network interruption
When you perform a firmware update of an ET 200eco PN F-DI 8 / F-DQ 3 I/O module, the module's PROFINET connection is temporarily interrupted due to the restart of the module. All downstream PROFINET devices are interrupted until the firmware update is complete.

Reference

You can find additional information on the procedure in the FAQs on the Internet (https://support.industry.siemens.com/cs/us/en/view/88778936) and in the online help for TIA Portal.

9.4 Cleaning modules

When wired, ET 200eco PN F-DI 8 / F-DQ 3 modules comply with the IP65/IP67 degree of protection and require no cleaning. If you do have to clean the modules, use a dry or damp cloth. Please ensure that you comply with the IP66/67 degree of protection when cleaning with liquids.

Technical specifications

A

A.1 General technical specifications

Table 1-1173 Shipping and storage conditions

Type of conditions	Permissible range
EN 60068-2-2, Test Bb, Dry heat and EN 60068-2-1, Test Ab, Cold	-40 °C to +70 °C
EN 60068-2-30, Test Db, Damp heat	25 °C to 55 °C, 95% humidity
EN 60068-2-14, Test Na, temperature shock	-40 °C to +70 °C, dwell time 3 hours, 5 cycles
EN 60068-2-32, Free fall	0.3 m, 5 times, product packaging
EN 60068-2-6, Sinusoidal Vibration	5 - 8.4 Hz, 3.5 mm 8.4 - 500 Hz, 1 g 10 cycles per axis
EN 60068-2-27, Shock Strain	25 g, 6 ms, 1000 shocks per axis
Barometric pressure	1140 hPa to 660 hPa (corresponding to an altitude of -1000 m to 3500 m)

A.1.1 Standards compliance

The ET 200eco PN F design conforms to the following standards and test specifications. The test criteria for the ET 200eco PN F are based on these standards and test specifications.

Not all ET 200eco PN F models may be certified to these standards, and certification status may change without notification. It is the user's responsibility to determine applicable certifications by referring to the ratings marked on the product. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

Siemens products will generally be in accordance with the latest released standards as of the time of product release. For European Norm (EN) standards, the effective version will be in accordance with listings in the official journal of the European Union. Product certifications including the CE declaration of conformity and certificates from listing agencies cite the exact standards applicable to each certification.

A.1.2 Fail-Safe standards and approvals

The ET 200eco PN F-DI 8 / F-DQ 3 module is certified by TÜV. The fail-safe modules are certified to the IEC 61508, ISO EN 13849, and EN 62061 standards for functional safety. For further information, refer to the current "Report to the Certificate" for the TÜV certificate "SIMATIC Safety" (http://support.automation.siemens.com/WW/view/en/49368678/134200) from the Internet.

A.1.3 PROFIsafe compatibility

- PROFIsafe address type 2
- Supports the RIOforFA-Safety profile
- Supports the PROFIsafe V2.4 profile

A.1.4 Standards and Approvals

A.1.4.1 General certifications

CE approval

The ET 200eco PN F module satisfies requirements and safety-related objectives according to the EC directives listed below and conforms to the harmonized European standards (EN) for the programmable controllers listed in the Official Journals of the European Union.

- 2014/30/EU "Electromagnetic Compatibility" (EMC Directive)
- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS Directive)
- 2006/42/EC "Machinery Directive" for S7-1200 safety components (fail-safe modules)

The EU Declaration of Conformity is held on file available to competent authorities at:

Siemens AG
Digital Industries
Factory Automation
DI FA AS SYS
Postfach 1963
D-92209 Amberg
Germany

UKCA approval

The ET 200eco PN F module complies with the designated British standards (BS) for programmable logic controllers published in the official consolidated list of the British Government. The ET 200eco PN F module meets the requirements and protection targets of the following regulations and related amendments:

- Electromagnetic Compatibility Regulations 2016 (EMC)
- Regulations on the restriction of the use of certain hazardous substances in electrical and electronic equipment 2012 (RoHS).
- Supply of Machinery (Safety) Regulations 2008 for S7-1200 safety components (fail-safe modules)

UK Declarations of Conformity for the respective authorities are available from:

Siemens AG
Digital Industries
Factory Automation
P.O. Box 1963
D-92209 Amberg

The UK Declaration of Conformity is also available for download from the Siemens Industry Online Support website under the keyword "Declaration of Conformity".

cULus approval

Underwriters Laboratories Inc. in accordance with:

- UL 61010-1 and UL 61010-2-201
- UL 50 Enclosure Type 1
- CSA C22.2 No. 61010-1 and No. 61010-2-201
- CSA C22.2 No. 94.2-15

NOTE

Class 2 power supply unit

The components must be supplied with a class 2 power supply unit.

Australia and New Zealand - RCM Mark (Regulatory Compliance Mark)

The ET 200eco PN F satisfies requirements of standards to AS/NZS 61000.6.4 and IEC 61000-6-4 (Class A).

Korea Certification

The ET 200eco PN F satisfies the requirements of the Korean Certification (KC Mark). It has been defined as Class A Equipment and is intended for industrial applications and has not been considered for home use.

Eurasian Customs Union approval (Belarus, Kazakhstan, Russian Federation)

EAC (Eurasion Conformity): Declaration of Conformity according to Technical Regulation of Customs Union (TR CU)

A.1.4.2 Industrial environments

The ET 200eco PN F is designed for use in industrial environments.

Table 1-1170 Industrial environments

Application field	Emission requirements	Immunity requirements
Industrial	EN 61000-6-4	EN 61000-6-2

A.1.5 Electromagnetic compatibility

A.1.5.1 Electromagnetic compatibility overview

Electromagnetic Compatibility (EMC) is the ability of an electrical device to operate as intended in an electromagnetic environment and to operate without emitting levels of electromagnetic interference (EMI) that may disturb other electrical devices in the vicinity.

For safety related functions, additional EMC requirements are applied according to IEC 61326-3-1 and IEC 61326-3-2.

Table 1-1171 Immunity per EN 61000-6-2

Electromagnetic compatibility - Immunity per EN 61000-6-2	
EN 61000-4-2 Electrostatic discharge	8 kV air discharge to all surfaces 6 kV contact discharge to exposed conductive surfaces
EN 61000-4-3 Radiated, radio-frequency, electro-magnetic field immunity test	80 to 1000 MHz, 10 V/m, 80% AM at 1 kHz 1.4 to 6.0 GHz, 3 V/m, 80% AM at 1 kHz
EN 61000-4-4 Fast transient bursts	2 kV, 5 kHz with coupling network to AC and DC system power 2 kV, 5 kHz with coupling clamp to I/O
EN 61000-4-5 Surge immunity	AC systems - 2 kV common mode, 1kV differential mode DC systems - 2 kV common mode, 1kV differential mode For DC systems (I/O signals, DC power systems) external protection is required. Refer to "Safe functional extra low voltage requirement (power supplies and other system components)" (Page 101), "Surge immunity" for the recommended protection devices.
EN 61000-4-6 Conducted disturbances	150 kHz to 80 MHz, 10 V RMS, 80% AM at 1kHz

Table 1-1172 Conducted and radiated emissions per EN 61000-6-4

Electromagnetic compatibility - Conducted and radiated emissions per EN 61000-6-4		
Conducted Emissions EN 55016, Class A, Group 1	0.15 MHz to 0.5 MHz	< 79dB (µV) quasi-peak; <66 dB (µV) average
	0.5 MHz to 5 MHz	< 73dB (µV) quasi-peak; <60 dB (µV) average
	5 MHz to 30 MHz	< 73dB (µV) quasi-peak; <60 dB (µV) average
Radiated Emissions EN 55016, Class A, Group 1	30 MHz to 230 MHz	< 40dB (µV/m) quasi-peak; measured at 10 m
	230 MHz to 1 GHz	< 47dB (µV/m) quasi-peak; measured at 10 m
	1 GHz to 6 GHz	< 76dB (uV/m) quasi peak, measured at 10 m

A.1.5.2 Surge immunity

Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. You can find one specification for evaluation of protection from lightning-type surges in EN 61000-4-5, with operational limits established by EN 61000-6-2. The ET 200eco PN F requires external protection to maintain safe operation when subject to surge voltages defined by this standard. The module could issue a channel readback error and passivate the output if you do not appropriately set the "Maximum readback time".

A.1.6 Mechanical and climatic ambient conditions

Test of mechanical ambient conditions

The table below provides important information with respect to the type and scope of the test of ambient mechanical conditions:

Table 1-1174 Test of mechanical ambient conditions

Condition tested	Permissible range
Sinusoidal Vibration, IEC 60068-2-6	
Without mounting rail	10 Hz ≤ f ≤ 58 Hz, constant amplitude 1.5 mm peak 58 Hz ≤ f ≤ 150 Hz, constant acceleration 20 g
With mounting rail	5 Hz ≤ f ≤ 8 Hz, constant amplitude 15 mm peak 8 Hz ≤ f ≤ 150 Hz, constant acceleration 5 g
Vibration (sinusoidal) test in accordance with IEC 60068-2-6	
Shock, IEC 60068-2-27	Type of shock: Half-sine; Shock intensity: 30 g peak value, 18 ms duration, direction of shock: 3 shocks in each +/- direction at each of three vertically-aligned axes

Climatic ambient conditions

The following table shows the permissible climatic ambient conditions for the ET 200eco PN F-DI 8 / F-DQ 3 module:

Table 1-1175 Climatic ambient conditions

Ambient conditions	Permissible range
Ambient temperature range	-25 °C to 60 °C, all mounting positions
Relative humidity	5% to 100% condensing humidity or sprayed water Note: Refer to the ET 200eco PN F-DI 8 / F-DQ 3 "Degree of protection IP65/67" (Page 172) for information on the IP67 rating.
Barometric pressure	1140 hPa to 795 hPa (corresponding to an altitude of -1000 m to 2000 m)
Concentration of contaminants	SO2: < 0.5 ppm with relative humidity < 60% non-condensing H2S: < 0.1 ppm with relative humidity < 60%, non-condensing
EN 60068-2-14, Test Nb, temperature change	-25 °C to 60 °C

Extended environmental conditions for outdoor use: This product does not support outdoor use.

A.1.7 Information on protection class, degree of protection, and rated voltages

A.1.7.1 Contamination level and overvoltage category in accordance with IEC 61010-2-201

The following levels are provided:

- Pollution degree 2
- Overvoltage category: II, unless otherwise noted

A.1.7.2 Protection class in accordance with IEC 61010-2-201

Protection Class II is provided according to IEC 61010-2-201:

- The ET 200eco PN F including only connections to SELV / PELV achieves Protection Class III.
- The ET 200eco PN F does not require a protective earth connection. A functional earth connection is provided and is used for non-safety purposes such as interference immunity improvement.

A.1.7.3 Degree of protection IP65/67

The following degrees of protection in accordance with IEC 60529 is provided for the ET 200eco PN F module:

- Degree of Protection IP 65 (Degree of protection according to IEC 60529):
  - Protection against the ingress of dust and full touch protection
  - Water projected by a nozzle against the module from any direction shall have no harmful effect.
- Degree of Protection IP 66 (Degree of protection according to IEC 60529):
  - Protection against the ingress of dust and full touch protection
  - Water projected by powerful jets against the module from any direction shall have no harmful effect.
- Degree of Protection IP 67 (Degree of protection according to IEC 60529):
  - Protection against the ingress of dust and full touch protection
  - Protection against water when the module is immersed at specified pressures over a specified time period (water must not enter the module in harmful quantities)

A.1.7.4 Rated voltages

Rated voltage	Tolerance	Notes
24 V DC	20.4 V DC to 28.8 V DC	Refer to "Safe functional extra low voltage requirement (power supplies and other system components)" (Page 101) for additional requirements of a 24 V DC power source.

When you suddenly apply 24 V DC power to the ET 200eco PN F modules, short-term current flows can occur which briefly mimic the effect of "1" signals at process outputs and inputs. Digital outputs can trigger to ON state for approximately 50.0 microseconds at power application. The modules deliberately test functional safety P- and M-switch outputs ON at

different times for up to the user-configurable "Maximum readback time switch on test" (0.5 ms to 5.0 ms) during the power up sequence and as a cyclic bit pattern test. This test pulse can energize the load in the presence of a switch or wiring fault on the opposite side of the load circuit. Such short pulses are typically not a hazard for electromechanical loads, but you must consider the effect. High-speed electronic receiver circuits can detect short pulses and improperly interpret the short pulses as deliberate "1" signals.

⚠ WARNING

Short term current and voltage pulses can occur on 24 V DC I/O circuits near the time that power is applied.
Such short term pulses can cause unexpected activation or position changes in machinery, resulting in death or serious injury to personnel and/or property damage.
If your installation includes receivers which can be responsive to short pulses as described above, you should apply measures such as power sequencing or progressive removal of safety lockouts to assure that unexpected machine operations do not occur.

A.2 ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12 technical specifications

A.2.1 Overview

Module model	Digital inputs	Digital outputs
ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12	4 x 24 V DC (1oo2), 8 x 24 V DC (1oo1), or a mix	3 x 24 V DC

A.2.2 Specifications

A.2.2.1 ET 200eco PN F technical specifications

Technical Data	Value
Dimensions and weight	
Dimensions W x H x D (mm)	60 x 175 x 49
Weight (without packaging)	940 g
Module-specific data	
Transmission rate	100 Mbps full duplex
Transmission mode	100BASE-TX
Autonegotiation	Yes

[1] Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg

[2] Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH

[3] Maximum useful lifetime of this product

Technical Data	**Value**		
Bus protocol	PROFINET IO: RT • Minimum update time of 250 microseconds Note: No IRT support, but module will participate within an IRT topology		
Supported Ethernet services	PROFINET IO (Device): • ping • ARP • LLDP • Network diagnostics (SNMP)/MIB-2 • DCP • MRP - Media redundancy • I&M0-3 • Port diagnostics • Resetting to factory settings using PROFINET IO • FW update using PROFINET IO • Deactivating of ports (yes) • Device replacement with topological configuration		
PROFINET interface			
Connection socket	2 x M12 D-coded		
Switch function	Yes, internal		
Auto-crossover	Yes, if autonegotiation is enabled		
Manufacturer ID (Vendor ID)	$002A_H$		
Device ID (DeviceID)	0306_H		
Maximum achievable safety class			
Number of channels	1-channel input	2-channel input	Output channel
In accordance with IEC 61508:2010	SIL 2	SIL 3	SIL 3
In accordance with EN ISO 13849-1:2015	Cat 3, PL d	Cat 4, PL e	Cat 4, PL e
Fail-safe performance characteristics			
Safety Integrity Level (SIL)	SIL 2	SIL 3	SIL 3
PFD_avg [1]	≤6e-4	≤1e-5	≤2e-5
PFH [2]	≤1e-8	≤2e-10	≤7e-9
Useful Lifetime (Mission Time) [3]	20 years	20 years	20 years
Safety repair time	100 hours	100 hours	100 hours
Voltages and currents			
Supply voltage 1L+	24 V DC		
• Permissible range	20.4 V DC to 28.8 V DC		
• Surge voltage	35 V DC for 0.5 s		
• Reverse polarity protection	Yes		
• Infeed current 1L+	4.0 A (maximum)		
• Hold up time (loss of power)	0.1 ms at 20.4 V DC		
Supply voltage 2L+	24 V DC		
• Permissible range	20.4 V DC to 28.8 V DC		
• Surge voltage	35 V DC for 0.5 s		
• Reverse polarity protection	Yes		
• Infeed current 2L+	4.0 A (maximum)		
• Hold up time (loss of power)	None for outputs 0.1 ms at 20.4 V DC for internal power		

[1] Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg

[2] Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH

[3] Maximum useful lifetime of this product

Technical Data	Value
Current consumption	
From supply voltage (1L+)	Typical 200 mA (no sensor supply output current)
From supply voltage (2L+)	Typical 70 mA (no digital output activated)
Power loss of the device	9.0 W
Total current of the Sensor Supply outputs: All mounting positions to 60°C	1.6 A through 1L+ (maximum)
Total current of the outputs: All mounting positions to 60°C	3.9 A per 2L+ (maximum)
Insulation	
Insulation test voltage	DC 707 V (type test)
Ethernet interface	1500 V_{RMS} (IEEE802.3)
Electrical isolation	
Between 1L+ and 2L+	Yes
Between 1L+, digital inputs and sensor supply outputs	No
Between input channels	No
Between 2L+ and digital outputs	No
Between output channels	No
Between Ethernet and all other circuit elements	Yes
Status, interrupts, diagnostics	
Interrupts	No
Diagnostic function	
Group error/maintenance	Red/yellow "SF/MT" LED
Bus monitoring PROFINET IO	Red "BF" LED
Monitoring of supply voltage 1L+	Green "ON" LED
Monitoring of supply voltage 2L+	Green "DC 24V" LED
Existing connection to network	Green "P1 LK" and P2 LK" LED; LED for PROFINET IO infeed and loop-through
Host-directed reintegration	Red/green "REINT" LED
Digital input status	Green LED
Fault at digital input	Red LED
Digital output status	Green LED
Fault at digital output	Red LED
Diagnostic information can be read	Yes
Monitoring for	
Failure of 1L+ and 2L+	Yes, under- and over-voltage
Sensor supply short-circuit	Yes
Digital input short-circuit	Yes, per channel
Digital output short-circuit	Yes, per channel
Digital input wire break	No
Digital output wire break	Yes, at PV=0, per channel
Sensor supply	
Number of sensor supplies	2 x 1L+
Voltage range	1L+ minus 2.0 V DC minimum
Load current	800 mA per sensor supply

[1] Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg

[2] Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH

[3] Maximum useful lifetime of this product

Technical Data	Value
Short-circuit protection	Yes, electronic Threshold: 1.4 A to 4.5 A
Sensor selection data / Digital inputs	
Number of inputs	
1oo1 evaluation	8 (maximum)
1oo2 evaluation	4 (maximum)
Type	Sink, Type 1 according to IEC 61131
Rated voltage	24 V DC at 5 mA, typical
Surge voltage	35 V DC for 0.5 s
Logic "1" signal	15 V DC at 3 mA to 30 V DC at 6 mA
Logic "0" signal	-30 V DC to 5 V DC
Connection of 2-wire proximity switch (BERO):	Not possible
• Permissible quiescent current	0.5 mA (maximum)
Filter delay (Configurable) [4]	• 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 12.8 ms
Cable length, shielded	30 m (maximum)
Cable length, unshielded	30 m (maximum)
Number of Inputs that can be controlled simultaneously	8, in all mounting positions
Actuator selection data/ Digital outputs	
Number of outputs	3
Type	P- and M- switching
Logic "1" signal at maximum current	2L+ minus 2.0 V DC (minimum): • P-switch: 2L+ minus 1.5 V DC (maximum) • M-switch: 0.5 V DC (maximum)
Logic "1" current	• 2.0 A (nominal) • 10 mA to 2.4 A
Lamp load	10.0 W (maximum)
Logic 0 current (residual)	• P-switch: 0.5 mA (maximum) • M-switch: 0.5 mA (maximum)
Wire break monitoring	Yes, only when output is off
Output overload protection: [5] • M-switch • P-switch	Yes, electronic in addition to internal non-replaceable fuse. Threshold of 10.0 A to 34.0 A turns M-switch OFF. Threshold of 2.4 A to 4.4 A, 30 ms time constant filter, measured at P-switch, turns both switches OFF. 7.0 A fuse can open for large faults.
Inductive clamp voltage	• P-switch: -26 V DC $_{\text{referenced to 2M}}$ • M-switch: +48 V DC $_{\text{referenced to 2M}}$
Number of Outputs that can be controlled simultaneously	3, in all mounting positions
Parallel connection of 2 outputs	Not possible
Control of a digital input	Not possible
Switching frequency	

[1] Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg

[2] Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH

[3] Maximum useful lifetime of this product

Technical Data	Value
With resistive load	30 Hz symmetrical (maximum)
With inductive load in accordance with IEC 60947-5-1, DC13	0.1 Hz symmetrical (maximum)
With lamp load	10 Hz symmetrical (maximum)
Reverse polarity protection [6]	Yes, except loads connected between M-switch and L+ will conduct if M and L+ are reversed.
Cable length, shielded	30 m (maximum)
Cable length, unshielded	30 m (maximum)

[1] Operation in Low Demand Mode (Average probability of a dangerous failure on demand), PFD_avg

[2] Operation in High Demand or Continuous Mode (Average frequency of a dangerous failure per hour), PFH

[3] Maximum useful lifetime of this product

[5] Refer to "Fuse and electronic overload protection" (Page 177) for more information.

[6] Refer to "Digital Output Application Mode 2" (Page 87) for more information.

A.2.2.2 Fuse and electronic overload protection

Overload protection attempts to protect the module from damage from moderate faults in the range of 2.4 A to 15.0 A at the P switch. Above 15.0 A on each P-switch fuse, the internal non-replaceable fuse can open. Supply your ET 200eco PN F-DI 8 / F-DQ 3 digital outputs from a source limited to less than 15.0 A, or use an external fuse or non-shorting load element to prevent opening of the internal fuse.

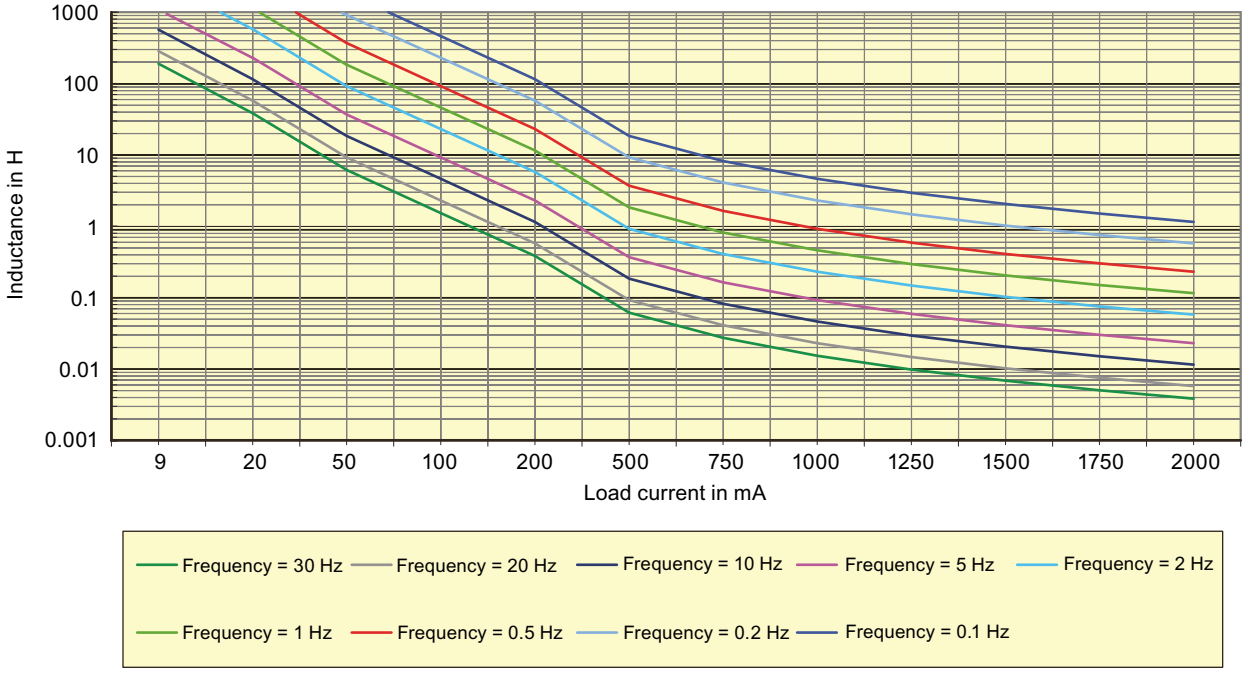
The internal electronic limiting causes the channel to passivate and reports as an overload. If no damage results, you can reintegrate the channel after removal of the external fault.

A.2.2.3 Switching of loads

Connecting capacitive loads

Load capacitance can delay the voltage response as seen at the P- and M- switches of the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs. For a capacitive load with capacitance C across P and M, and a parallel load resistance R, the "Maximum readback time" needs to be in the range of 2.5 to 3.1 time constant (R * C) of the load. This allows enough time for an appreciable voltage change to be seen when you briefly de-energize an energized load during bit pattern testing. If the resulting "Maximum readback time" is too long for your application, you can reduce this time constant by adding parallel resistance across the load to reduce the realized R * C time constant.

Alternatively, you can add a diode between the P-output and the load (capacitor and resistors) so that when you turn off the output, the voltage on the capacitor is not present at the P-output. Typically, power supplies with input capacitors that have reverse voltage protection have this diode built into the power supply. Using the added diode, you can greatly reduce the "Maximum readback time" to some portion of the hold-up time of the power supply/capacitor. This reduced "Maximum readback time" allows the load to operate normally (load stays ON) during the bit pattern tests.



Stray capacitance between the load circuit and ground, M, and P increases the time required for the "Maximum readback time switch on test". When module diagnostics switch "ON" a P or M switch to a de-energized load during bit pattern testing, both sides of the load are driven towards L+ or M, limited by stray capacitance. This effect is typically small.

Your "Maximum readback time switch on test" should be long enough for the load circuit voltage to react, but short enough that if one side of the load faults to P or M, testing of the opposite switch should not cause the load to mechanically react.

Capacitive loads (including power supplies with input capacitors) with low series resistance can have a large inrush current. If you have a large capacitive load, you should add series resistance to reduce the inrush current to reduce the risk of opened fuses or overcurrent fault detection on normal load switch ON events.

Switching of inductive loads

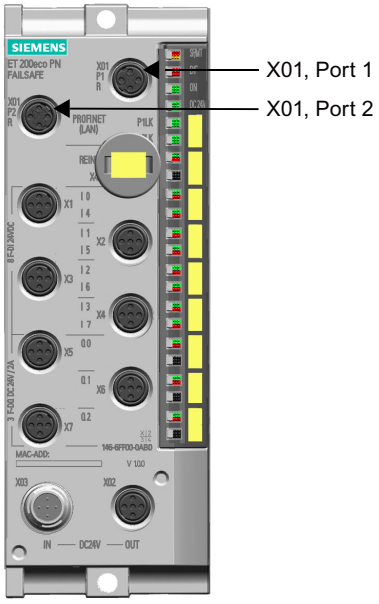
The graph below shows the maximum permitted inductive load and switching frequency allowed using only the internal suppression circuits of the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs. You should equip larger or more frequently switched inductive loads with external suppression circuits to avoid early failure of the ET 200eco PN F-DI 8 / F-DQ 3 digital output switch. The external suppression must conduct the load current at a voltage less than the internal suppression threshold to avoid overloading the internal suppression. Refer to "Guidelines for inductive loads" (Page 128) for more information:

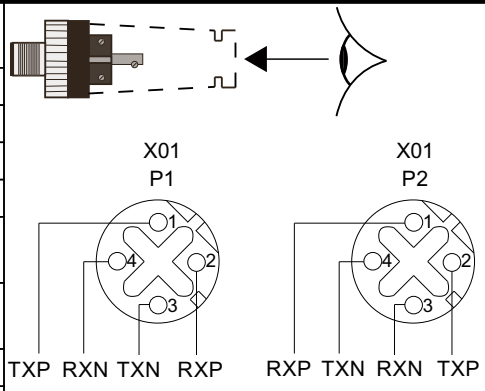
WARNING

Unsuppressed inductive loads can lead to failures.
The following failures can result:

- Unsuppressed inductive loads can lead to early "stuck-on'" failures of the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs.
- Unsuppressed inductive load switching generates an EMI hazard to the PLC system and correct processing of the safety function.

Death or serious personal injury and damage to machines and equipment may result if proper precautions are not taken.
You should use suppressor circuits with inductive loads to limit the voltage rise when a control output turns off and to limit the electrical noise generated when switching inductive loads.





A.2.3 Wiring diagrams

A.2.3.1 Pin assignment of the PROFINET connector

PROFINET connector, X01 connector, port 1 and port 2

The module has a M12 connector with four female pins that are D-coded.

Table 1-1176 Pin assignment of the M12 cable connector for PROFINET connector, ports 1 and 2

ET 200eco PN F	Pin	Assignment	View of the cable connector (PROFINET), port 1 and port 2
		**Assignment X01 P1**

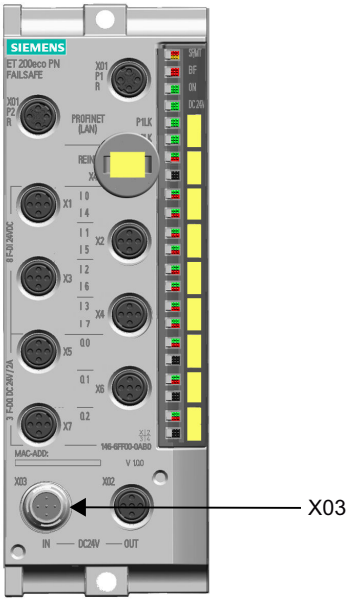
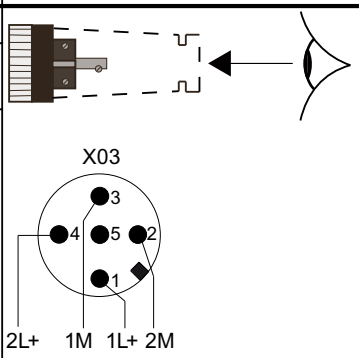
	3	RXN	
	4	TXN	
	Thread	Functional earth FE	



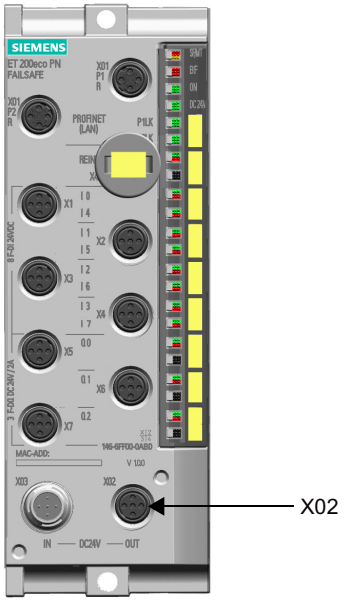


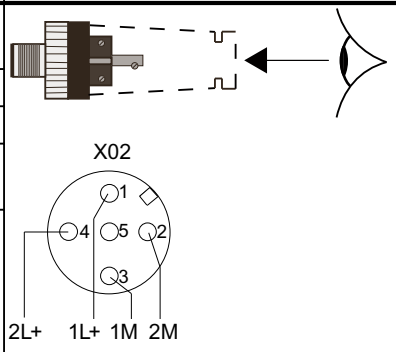
A.2.3.2 Pin assignment for feeding and looping the voltage

Cable connector for supply voltage infeed, X03 connector

The module has an M12 connector with five male pins that are A-coded.

Table 1-1177 Pin assignment of the M12 cable connector for the supply voltage infeed





ET 200eco PN F	Pin	Assignment	View of the cable connector (wiring side)
	1	Supply voltage 1L+	
	2	Ground 2M	

ET 200eco PN F	Pin	Assignment	View of the cable connector (wiring side)
	3	Ground 1M	
	4	Supply voltage 2L+	
	5	Reserved	

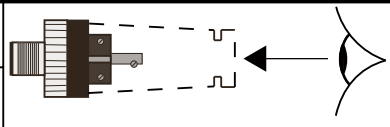
Cable connector for loop-through of the supply voltage, X02 socket

The module has an M12 connector with five female pins that are A-coded.

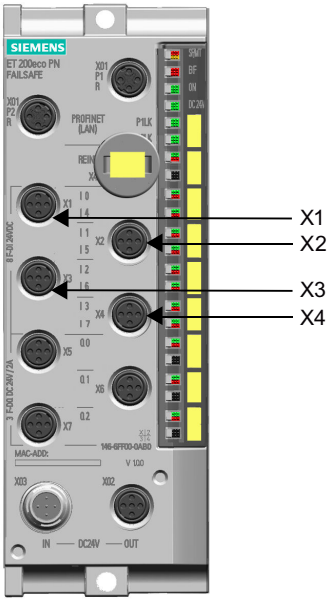
Table 1-1178 Pin assignment of the M12 cable connector for loop-through of the voltage

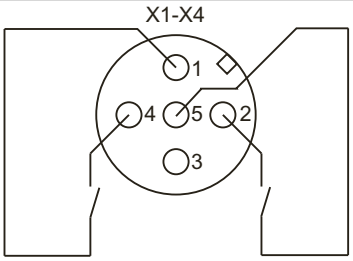
ET 200eco PN F	Pin	Assignment	View of the cable connector (wiring side)
	1	Supply voltage 1L+	
	2	Ground 2M	
	3	Ground 1M	
	4	Supply voltage 2L+	
	5	Reserved	

NOTE



The M12 sockets for the supply and I/O have the same coding.
Make sure that you wire the supply and the I/O correctly.





A.2.3.3 Pin assignment of digital inputs

Cable connector for digital inputs, X1 - X4

The module has an M12 connector with five female pins that are A-coded.

Table 1-1179 Pin assignment of digital inputs

ET 200eco PN F	Pin	Assignment	View of the cable connector (wiring side)
	1	24 V DC sensor supply Vs1	
	2	Input signal DI_4: Connector X1 Input signal DI_5: Connector X2 Input signal DI_6: Connector X3 Input signal DI_7: Connector X4	

ET 200eco PN F	Pin	Assignment	View of the cable connector (wiring side)

Item		Article number
Digital inputs and digital outputs	ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12	6ES7146-6FF00-0AB0

B.2 Accessories for the ET 200eco PN F-DI 8 / F-DQ 3 module

⚠ CAUTION

In order to maintain the IP65/67 rating of the ET 200eco PN F-DI 8 / F-DQ 3 module, you can only utilize the appropriately approved accessories, some are listed below, for connection to the ET 200eco PN F-DI 8 / F-DQ 3 module.
Failure to use listed accessories can allow for ingress of water or dust into the ET 200eco PN F-DI 8 / F-DQ 3 module causing damage to the module. Electrical faults or unexpected machine operation can result in minor personal injury if proper precautions are not taken.
You must follow all instructions for installation and maintenance of a proper operating environment to ensure the equipment operates safely.

The table below contains the article numbers for the accessories of the ET 200eco PN F-DI 8 / F-DQ 3 module:

Table 1-1182 Accessories for the ET 200eco PN F-DI 8 / F-DQ 3 module

	WinCC Professional max. PowerTags V15	6AV2103-0XA01-0AA5

Fail-Safe response times

C

C.1 Maximum response time of the system

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times" (http://support.automation.siemens.com/WW/view/en/49368678/133100).) Excel file (RT_calculator). Use your configured individual fail-safe module timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{CYCLE} parameter values given below include an allowance for the fail-safe module to acquire and deliver PROFIsafe messages in transactions with the PLC I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe module location and the fail-safe CPU. There are no separate transport delay parameters that you must include in your calculations.

C.2 Response time parameters for the ET 200eco PN F-DI 8 / F-DQ 3 digital inputs

Maximum Device Acknowledge Time of the ET 200eco PN F-DI 8 / F-DQ 3 module

T_{DAT_i} 16 ms	Device Acknowledge Time: This is the maximum time for the PROFIsafe message from the fail-safe module's digital inputs to include a response to a new Virtual Monitoring Number. You enter this value in the RT_calculator for a calculation of F-monitoring time.

Maximum response time of the ET 200eco PN F-DI 8 / F-DQ 3 digital inputs

1oo1 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle}$

$T_{OFDT_i} = T_{WCDT_i} + T_{scf}$

1oo2 evaluation:

$T_{WCDT_i} = T_{filter} + T_{sct} + 2 \times T_{cycle}$

$T_{OFDT_i} = T_{WCDT_i} + MAX (T_{scf}, T_{dis})$

Where:

T_{WCDT_i}	Worst Case Delay Time: Maximum response time of the fail-safe module's digital inputs from a signal transition at the digital input to the reliable availability of the safety message frame available for the fail-safe CPU request.
T_{OFDT_i}	One Fault Delay Time: Maximum response time for the fail-safe module's digital inputs to report a channel as passivated.
T_{filter}	Configured "Input filters" time for the channel
T_{DIS}	Discrepancy time: • Configured "Discrepancy time" for 1oo2 channels changing from "0" to "1" • Configured "Discrepancy time" for 1oo2 channels changing from "1" to "0" and "Supply last valid value" option configured for discrepancy behavior • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "0" for 1oo1 channels You should include the expected discrepancy time between your sensor inputs in your external sensor delay. Your configured T_{DIS} contributes to T_{OFDT_i} as the time delay for the fail-safe module's digital inputs to passivate the channel due to fault case extension of the discrepancy time. This parameter can be listed separately in the RT_calculator. Do not include T_{DIS} in the value of T_{OFDT} that you enter into the RT_calculator if you enter T_{DIS} as a separate item.
T_{sct}	Time delay for short-circuit test duration: • "0" if no short-circuit test configured • "0" for 1oo2 channels changing from "1" to "0" and "Supply value 0" option configured for discrepancy behavior • "Duration of short-circuit test" + "Input filters" time if short-circuit test is configured (Confirmation: "Input filters" can occur twice in equation for T_{WCDT_i} if short-circuit test is configured.)
T_{scf}	Time delay for short-circuit fault detection: • Configured "Interval for short-circuit test", when operating in high demand or continuous mode and depending on the short-circuit test to achieve your required level of safety integrity • "0" when not depending on the short-circuit test to achieve your required level of safety integrity
T_{cycle} 9 ms	Internal cycle time of the fail-safe module

The term "2 x T_{cycle}" allows for other input delays to complete just after the beginning of a cycle. The fail-safe module's digital inputs process and report the changed input data on the next cycle.

C.3 Response time parameters for the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs

Maximum response time of the ET 200eco PN F-DI 8 / F-DQ 3 digital outputs

$T_{WCDT_q} = T_{rb} + MAX (T_{rb}, T_{rb_swon}) + 2 \times T_{cycleq}$

$T_{OFDT_q} = T_{WCDT_q}$

Where:

T_{WCDT_q}	Maximum response time of the fail-safe module's digital outputs from the receipt of a safety message frame from the safety program in the fail-safe CPU to the signal transition at the digital output
T_{OFDT_q}	One Fault Delay Time: Maximum response time for the module's digital outputs to turn an output OFF upon detection of a channel or module fault
T_{rb}	Configured "Maximum readback time" for the channel
T_{rb_swon}	Configured "Maximum readback time switch on test" for the channel
T_{cycleq} 9 ms	Internal cycle time of the fail-safe module

The term "2 x T_{cycleq}" allows for a new process value to be delivered from the fail-safe CPU just after the beginning of a cycle. The fail-safe module's digital outputs process the changed output request and apply new data to the output switches on the next cycle.

After the fail-safe module's digital outputs command the output switch to change, the actual voltage on the load might not be realized until the configured readback time completes. If a bit pattern test is in progress, the new process value cannot be applied to the switches until the applicable readback time completes.

Minimum permissible OFF time for ET 200eco PN F-DI 8 / F-DQ 3 digital outputs

The fail-safe module's digital outputs expect to complete and confirm each ON to OFF transition before receiving a new command to go from OFF to ON. A process value of "0" presented for less than T_{WCDT_q} can cause the channel to passivate.

Update to the ET 200eco PN F-DI 8 / F-DQ 3 Manual, edition 07/2018

Product Information

Overview to Documentation Update for the ET 200eco PN F

In spite of efforts to ensure the accuracy and clarity in the product documentation, some of the pages in the *ET 200eco PN F-DI 8 / F-DQ 3 Manual* contain information that has been identified as being incomplete, incorrect or misleading.

This document contains the following updates

- Corrections and additions to Section 5.1.1: "Safe functional extra low voltage requirement (power supplies and other system components)" (Page 1)
- Corrections to pin notations in wiring diagrams: "Laser Scanner (1oo2 evaluation)" and "ESTOP (1oo2 evaluation)" (Page 2)

Corrections and additions to Section 5.1.1: "Safe functional extra low voltage requirement (power supplies and other system components)"

Section 5.1.1: "Safe functional extra low voltage requirement (power supplies and other system components)" contains the following corrections and additions:

- Maximum voltage is 35 V DC
- Note detailing the requirements for power supplies in the event of voltage interruption (at the end of the section)

5.1.1 Safe functional extra low voltage requirement (power supplies and other system components)

NOTE

Fail-safe modules must be operated with safe functional extra-low voltage (SELV, PELV) power sources.
To maintain safety of the modules' low voltage circuits, external connections to communications ports, analog circuits, 24 V DC nominal supply voltage, and I/O circuits must be powered from approved sources that meet the requirements of SELV, PELV, Class 2, Limited Voltage, or Limited Power according to various standards.
The external power supply should limit the maximum voltage to 35 V DC even under fault conditions. Please consult the manufacturer's data for the power supplies that you use.

Maximum applied voltage to ET 200eco fail-safe devices

- Operational voltage: The fail-safe module's operational voltage is 20.4 V DC - 28.8 V DC, 35 V DC surge for 0.5 second. Operation of the unit to specifications is assured by design and testing. Defined transients from defined source impedances per EN 61000-4-2, 61000-4-4, 61000-4-6, as specified in the data sheet for each product, may be imposed on this voltage without disrupting operation or causing damage. Sustained operation in the range of 28.8 - 35 V DC can result in unacceptable temperature rise and thermal damage, causing the product to become inoperable.
- Absolute maximum rating regarding supply voltage: The absolute maximum rating to prevent module damage and to ensure the functional safety of the modules is 35 V DC. These power supplies must be specified by the manufacturer to limit the output voltage to 35 V DC or less under fault conditions. Otherwise, external protection must be supplied that will reliably open the circuit or limit the output voltage to less than 35 V DC to the modules.

© Siemens 2019. All rights reserved

- Surge immunity: Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. This protection must be sufficient to clamp surge voltages and/or open the supply circuit to assure the PLC system is not exposed to voltages greater than 35 V DC. One specification for evaluation of protection from lightning type surges is found in EN 61000-4-5, with operational limits established by EN 61000-6-2. The ET 200eco PN F module requires external protection to maintain safe operation when subject to surge voltages defined by this standard. Refer to Appendix A.1.5.1: "Surge immunity" for further information.

NOTE

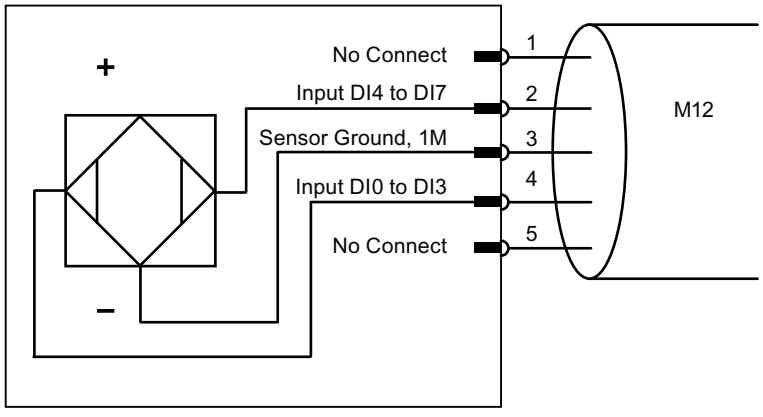
All power supply and fail-safe module circuits must be connected together to a common voltage reference or must be isolated SELV circuits.

The power supply M terminals on the fail-safe CPU and the fail-safe modules must be connected together or isolated as SELV. Failure to do so can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.

Connecting all M terminals together or isolating with approved SELV isolation prevents unwanted current flows in the event of a single fault in the CPU to module isolation boundary.

NOTE

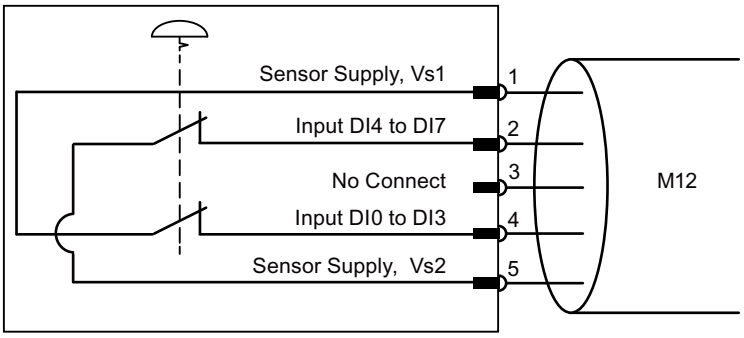
Requirements for power supplies in the event of voltage interruption



To ensure adherence to IEC 61131-2 and NAMUR Recommendation NE 21, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirement in your product standards (for example, 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions. The latest information on PS components is available on the Internet (https://mall.industry.siemens.com).

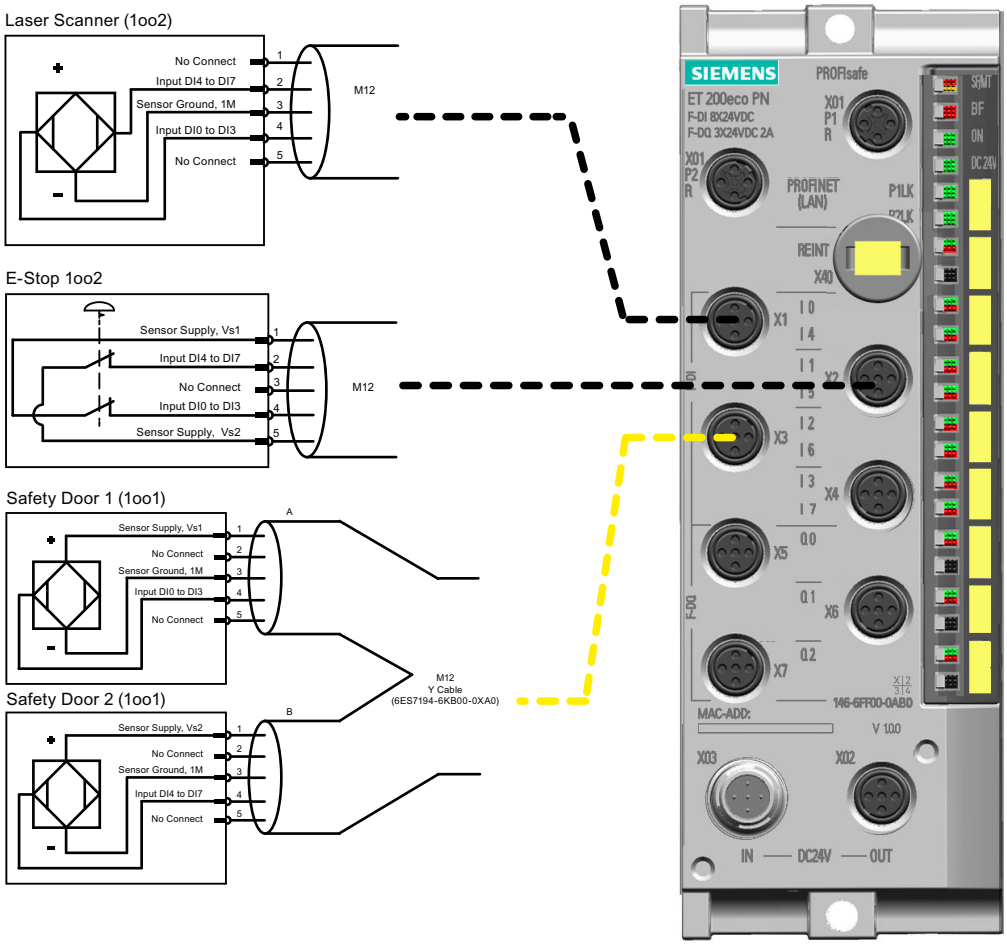
Corrections to pin notations in wiring diagrams: "Laser Scanner (1oo2 evaluation)" and "ESTOP (1oo2 evaluation)"

The pin notations for the following wiring diagrams are corrected:



- Laser Scanner (1oo2 evaluation): Located in Section 5.2.7.5: "Configuring 1oo2 and 1oo1 evaluations in the ET 200eco PN F-DI 8 / F-DQ 3" and Section 2.1.4: "Operating the Getting Started example"

Laser Scanner (1oo2)



- ESTOP (Emergency Stop) (1oo2 evaluation): Located in Section 5.2.7.5: "Configuring 1oo2 and 1oo1 evaluations in the ET 200eco PN F-DI 8 / F-DQ 3" and Section 2.1.4: "Operating the Getting Started example"

  ESTOP (1oo2)

- Connections to the ET 200eco PN F: Located in Section 5.2.7.5: "Configuring 1oo2 and 1oo1 evaluations in the ET 200eco PN F-DI 8 / F-DQ 3"

Distributed I/O
M12 Fail-Safe Y cable and M12 Fail-Safe inverted Y cable
Product Information

Introduction
The Y cable allows you to connect two sensors to the inputs with the M12 connection method. Use of the Y cable is recommended when two channels are occupied for each socket of the distributed I/O device. The Y cable distributes the two fail-safe input channels to two circular connectors.
The "inverted" Y cable provides a method of connecting an F-DQ channel and F-DI channel with one cable for use with a Siemens SIRIUS safety position switch with an interlock.
Refer to the respective product user manual for connection details.

Y cable (double connection of F-DI: 6ES7194-6KB00-0XA0)Y cable
The following figure shows the structure of the Y cable:

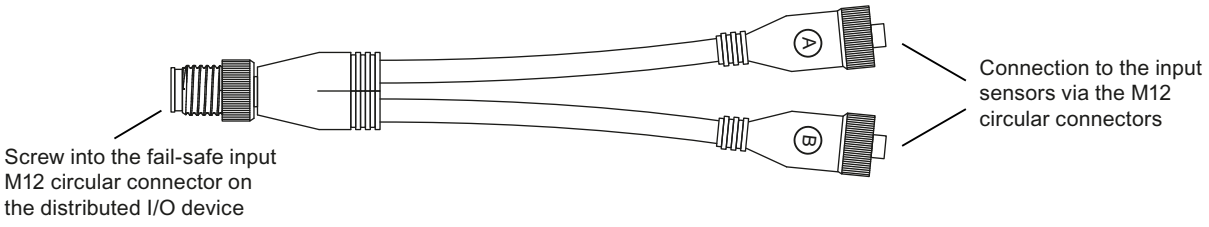

Figure 1 Y cable

Preface

Purpose of this Manual

The information in this manual is a reference source for operations, function descriptions, and technical specifications of the fail-safe modules of the ET 200pro distributed I/O system.

Basic Knowledge Requirements

This manual is a supplement to the *ET 200pro Distributed I/O System* manual. Working with this manual requires general knowledge of automation engineering. Knowledge of the *STEP 7* basic software and the ET 200pro distributed I/O system is also required.

Scope of this Manual

Module	Order Number	Release Number and Higher
CM IO 16xM12 fail-safe connection module for EM 8/16 F-DI electronic module	6ES7194-4DD00-0AA0	01
CM IO 12xM12 fail-safe connection module for EM 4/8 F-DI/4 F-DO electronic module	6ES7194-4DC00-0AA0	01
CM F-IO 2×M12 fail-safe connection module for F-Switch PROFIsafe	6ES7194-4DA00-0AA0	01
EM 8/16 F-DI DC24V PROFIsafe fail-safe digital electronic module	6ES7148-4FA00-0AB0	01
EM 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe fail-safe digital electronic module	6ES7148-4FC00-0AB0	01
F-Switch PROFIsafe fail-safe digital electronic module	6ES7148-4FS00-0AB0	01

What's New

Compared with the previous version, this manual includes the following major changes/additions:

- F-Switch PROFIsafe digital electronic module

Approvals

See "Standards and Approvals"

In addition, ET 200pro fail-safe modules are certified for use in safety mode up to the following levels:

- Safety Integrity Level SIL3 in accordance with IEC 61508:2000
- Performance level (PL) e and category 4 in accordance with ISO 13849-1:2006 or EN ISO 13849-1:2008

CE Certification

See "Standards and Approvals"

Certification Mark for Australia (C-Tick Mark)

See "Standards and Approvals"

Standards

See "Standards and Approvals"

Position in the Information Landscape

When working with ET 200pro fail-safe modules and depending on your particular application, you will need to consult the additional documentation listed below.

References to additional documentation are included in this manual where appropriate.

Documentation	Brief Description of Relevant Contents
ET 200pro Distributed I/O System Manual	Describes all generally applicable topics for the ET 200pro hardware (including configuration, installation, and wiring of ET 200pro)
Safety Engineering in SIMATIC S7 System Description	• Provides an overview of the application, configuration, and method of operation of S7 Distributed Safety and S7 F/FH Systems fail-safe automation systems • Contains a summary of detailed technical information concerning fail-safe engineering in S7-300 and S7-400 • Includes monitoring and response time calculations for S7 Distributed Safety and S7 F/FH Systems fail-safe systems
For integration in the S7 Distributed Safety fail-safe system	The following elements are described in the *S7 Distributed Safety Configuring and Programming* Operating Manual and Online Help: • Configuration of the F-CPU and the F-I/O • Programming of the F-CPU in F-FBD or F-LAD
	Depending on which F-CPU you are using, you will need the following documentation: • The *S7-300, CPU 31xC and CPU 31x Operating Instructions: Installation* describes the assembly and wiring of S7-300 systems. • The *CPU 31xC and CPU 31x, Technical Data* Manual describes the standard functions of the CPU 315-2 DP and PN/DP and the CPU 317-2 DP and PN/DP. • The *Automation System S7-400 Hardware and Installation* Installation Manual describes the assembly and wiring of S7-400 systems.

Documentation	Brief Description of Relevant Contents
	• The *Automation System S7-400 CPU Specifications* Reference Manual describes CPU 416-2. • Each applicable F-CPU has its own product information bulletin. These product information bulletins describe only the deviations from the relevant standard CPUs.
STEP 7 manuals	• The *Configuring Hardware and Communication Connections with STEP 7 V5.x* Manual describes the operation of the relevant standard tools of *STEP 7*. • The *System Software for S7-300/400 System and Standard Functions* Reference Manual describes functions for distributed I/O access and diagnostics.
STEP 7 Online Help	• Describes how to operate the standard tools of *STEP 7* • Contains information about how to configure and assign parameters for modules and intelligent slaves with *HW Config* • Contains a description of the FBD and LAD programming languages
PCS 7 manuals	• Describe how to operate the *PCS 7* process control system (required when ET 200pro with fail-safe modules is integrated in a higher-level control system).

The entire SIMATIC S7 documentation is available on CD-ROM.

Guide

This manual describes the fail-safe modules of the ET 200pro distributed I/O system. It consists of instructional sections and reference sections (technical specifications and appendices).

This manual presents the following basic aspects of fail-safe modules:

- Structure and application
- Configuring
- Addressing, installing, and wiring
- Diagnostic evaluation
- Technical Specifications
- Order numbers

Conventions

In this manual, the terms "safety engineering" and "fail-safe engineering" are used synonymously. The same applies to the terms "fail-safe" and "F-".

"When *"S7 Distributed Safety"* appears in italics, it refers to the optional packages for the two "S7 Distributed Safety" fail-safe systems.

Recycling and Disposal

Due to the low levels of pollutants in the fail-safe modules of the ET 200pro, the modules can be recycled. For proper recycling and disposal of your old module (device), consult a certified disposal facility for electronic scrap.

Additional Support

If you have further questions about the use of products presented in this manual, contact your Siemens representative in your local office.
(http://www.siemens.com/automation/partner)

Training Center

We offer courses to help you get started with the S7 automation system. Contact your regional training center or the central training center in D 90327 Nuremberg, Federal Republic of Germany.

Internet: (http://www.sitrain.com)

H/F Competence Center

The H/F Competence Center in Nuremberg offers special workshops on SIMATIC S7 fail-safe and fault-tolerant automation systems. The H/F Competence Center can also provide assistance with onsite configuration, commissioning, and troubleshooting.

For questions about workshops, etc., contact: hf-cc@siemens.com

Technical Support

Technical support for all A&D products can be obtained

- Using the Support Request Web form on the Internet (http://www.siemens.en/automation/support-request)

You can find additional information about our Technical Support on the Internet (http://www.siemens.en/automation/service)

Service & Support on the Internet

In addition to our paper documentation, we offer our complete knowledge base on the Internet (http://www.siemens.com/automation/service&support).

There, you will find the following information:

- Newsletters providing the latest information on your products
- Relevant documentation for your application, which you can access via the search function in Service & Support
- A forum where users and experts from all over the world exchange ideas
- Your local Automation & Drives representative
- Information about local service, repair, and replacement parts and much more can be found under "Services."

Important Note for Maintaining the Operational Safety of Your System

NOTE

Operators of systems with safety-related characteristics are subject to special requirements for operational safety. The supplier is also obliged to comply with special product monitoring measures. For this reason, we publish a special newsletter containing information on product developments and product properties that are important (or potentially important) for operation of systems where safety is an issue. By subscribing to the relevant newsletter, you will ensure that you are always up-to-date and able to make changes to your system, when necessary. Please go to the Internet (http://my.ad.siemens.de/myAnD/guiThemes2Select.asp?subjectID=2&lang=en) and register for the following newsletters:

- SIMATIC S7-300
- SIMATIC S7-400
- Distributed I/O
- SIMATIC Industrial Software

To receive these newsletters, select the corresponding check boxes.

Product Overview

1

Overview

This chapter provides information about the following topics:

- ET 200pro distributed I/O system with fail-safe modules and its place in SIMATIC S7 fail-safe automation systems
- Components comprising the ET 200pro distributed I/O system with fail-safe modules
- The steps you must perform, ranging from selection of the F-modules to commissioning of ET 200S on PROFIBUS DP/PROFINET IO

1.1 ET 200pro Fail-Safe Modules

Fail-Safe Automation System

Fail-safe automation systems (F-systems) are used in systems with increased safety requirements. F-systems are used to control processes that can achieve a safe state immediately as a result of a shutdown. In other words, F-systems control processes where an immediate shutdown will not endanger humans or the environment.

ET 200pro Distributed I/O System

The ET 200pro distributed I/O system is a DP slave/IO device on PROFIBUS DP/PROFINET IO that can contain fail-safe modules in addition to ET 200pro standard modules.

You can use copper cables to assemble the PROFIBUS DP/PROFINET IO lines.

Fail-Safe Modules

The primary difference between fail-safe modules and ET 200pro standard modules is that fail-safe modules have a two-channel internal design. The two integrated processors monitor each other, automatically test the input and output circuits and set the F-module to a safe state in the event of a fault. The F-CPU communicates with the fail-safe module using the PROFIsafe safety-related bus profile.

Fail-safe digital input modules record the signal states of safety-related sensors and send corresponding safety message frames to the F-CPU.

Fail-safe digital output modules are suitable for shutdown operations with short-circuit and cross-circuit monitoring up to the actuator.

Fail-safe switch acquires the signal states of safety-related sensors and sends corresponding safety message frames to the F-CPU and is suitable for connection of frequency converters, motors, and output modules.

Fail-safe connection modules are mounted on the fail-safe electronic modules. They are used to connect sensors and actuators.

1.2 Application of ET 200pro fail-safe modules

Possible Applications of ET 200pro With Fail-Safe Modules

The use of ET 200pro with fail-safe modules enables conventional safety engineering designs to be replaced with PROFIBUS DP/PROFINET IO components. This includes replacement of switching devices for emergency stop, protective door monitors and two-hand operation.

Use in F-Systems

ET 200pro fail-safe modules can be used:

- In the S7 Distributed Safety F-system with the *S7 Distributed Safety* V 5.1 or higher and *F-Configuration Pack* V 5.4 or higher optional packages

The following manuals are applicable to the use of ET 200pro fail-safe modules in F-systems:

- *ET 200pro Distributed I/O Device*
- *Safety Engineering in SIMATIC S7*
- *S7 Distributed Safety, Configuring and Programming*

F-System with ET 200pro

The following figure presents an example configuration for an S7 Distributed Safety F-system including an ET 200pro on PROFIBUS DP/PROFINET IO.

The fail-safe DP master/IO controller exchanges safety-relevant and non-safety-relevant data, for example, with the fail-safe and standard ET 200pro modules.

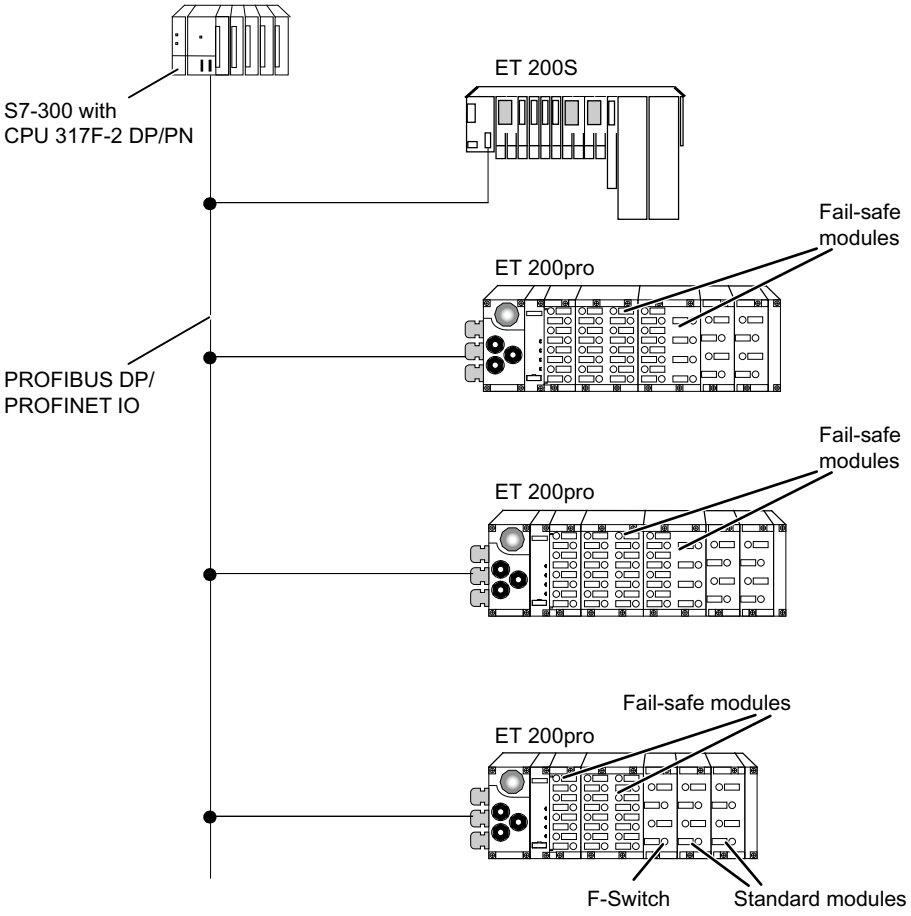

Figure 1-872 S7 Distributed Safety Fail-Safe Automation System

Availability of Fail-Safe Electronic Modules

The following fail-safe electronic modules are available for ET 200pro:

- 8/16 F-DI DC24V PROFIsafe Digital Electronic Module
- 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe digital electronic module; P/M switching (current sourcing/sinking)
- F-Switch PROFIsafe digital electronic module, (one F-switch per potential group allowed)

Fail-safe connection modules are available for the fail-safe electronic modules. A detailed list of these modules is included in this manual.

Application Limited to Safety Mode

You can operate standard and fail-safe modules simultaneously in an ET 200pro.

Fail-safe modules can only be used in safety mode. They cannot be operated in standard mode.

Achievable Safety Classes

Fail-safe modules are equipped with integrated safety functions for safety mode.

The following safety classes can be achieved by assigning applicable parameters to the safety functions in *STEP 7* with the *S7 Distributed Safety* or *S7 F/FH Systems* optional package, combining certain standard and F-modules and arranging the wiring of the sensors and actuators in a specific way:

Table 1-1186 Achievable Safety Classes in Safety Mode

Safety class in safety mode	
According to IEC 61508:2000	**According to ISO 13849-1:2006 or EN ISO 13849-1:2008**
SIL2	Cat. 3/PLe
SIL3	Cat. 4/PLe

Configuration of ET 200pro with Fail-Safe Modules (Page 15)

1.3 Guide for Commissioning of ET 200pro with Fail-Safe Modules

Introduction

The following table lists all important steps required for commissioning ET 200pro distributed I/O systems with fail-safe modules as DP slaves/IO devices on PROFIBUS DP/PROFINET IO.

Sequence of Steps Starting From Selection of F-Modules to Commissioning of ET 200pro

Table 1-1187 Sequence of Steps Starting From Selection of F-Modules to Commissioning of ET 200pro

Step	Procedure	See ...
1.	Select F-modules for ET 200pro configuration.	Chapter "Configuration Options"
2.	Configure and assign parameters for F-modules in *STEP 7*.	Chapter "Configuration and Parameter Assignment" and "Fail-Safe Modules"
3.	Set PROFIsafe addresses on F-modules.	Chapter "Address Assignment and Installation"
4.	Mount ET 200pro.	Chapter "Address Assignment and Installation"
5.	Wire ET 200pro.	Chapter "Wiring and Assembly"
6.	Commission ET 200pro on PROFIBUS DP/PROFINET IO.	*ET 200pro Distributed I/O Device* manual
7.	If commissioning was not successful, perform diagnostics on ET 200pro.	Chapters "Diagnostics" and "Fail-Safe Modules" and *ET 200pro Distributed I/O Device* manual

NOTE

You must configure and assign parameters for the F-modules in *STEP 7* prior to commissioning.

Reason: *STEP 7* automatically assigns the PROFIsafe addresses to the F-modules. You must set these PROFIsafe addresses on each F-module via a switch before mounting the module.

Configuration

2

2.1 Configuration of ET 200pro with Fail-Safe Modules

Introduction

You can configure ET 200pro distributed I/O systems with standard and fail-safe modules. This chapter presents an example configuration.

Configuration Example for ET 200pro with Fail-Safe Modules

The figure below presents a configuration example with standard and fail-safe modules within an ET 200pro.

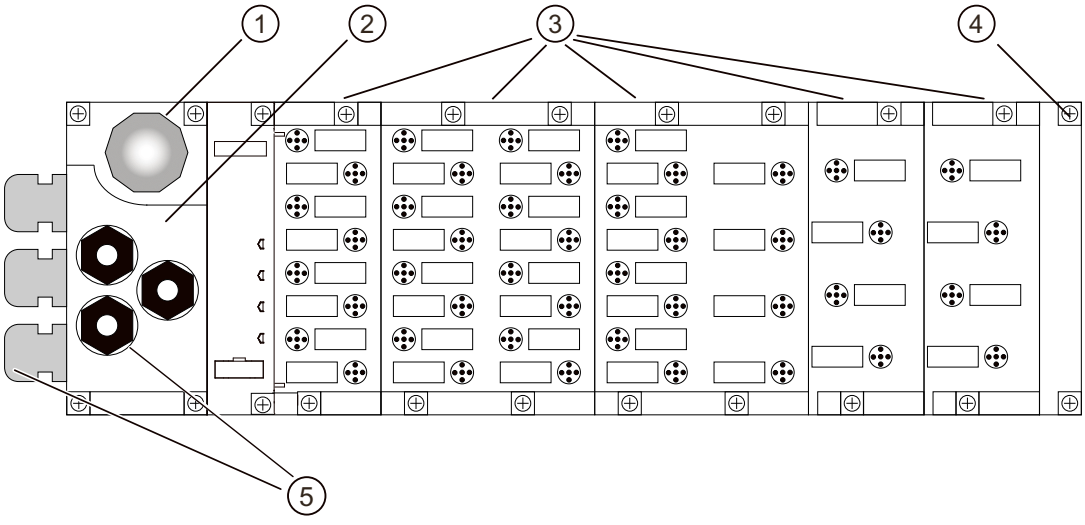

Figure 1-873 Configuration Example for ET 200pro with Fail-Safe Modules

① CM IM DP Direct connection module for the interface module

② IM 154-2 DP HIGH FEATURE (PROFIBUS DP) interface module (6ES7 154-2AA00-0AB0)
IM 154-4 PN HIGH FEATURE (PROFINET IO) interface module (6ES7 154-4AA00-0AB0)

③ Connection modules for the electronic modules

④ Terminating module

⑤ Heavy-gauge threaded joints for cables at the connection module

2.2 Allocation of Modules of an ET 200pro

Introduction

This chapter describes the assignment of F-electronic modules to F-connection modules for ET 200pro.

Assignment of F-Electronic Modules to F-Connection Modules

You can use the following fail-safe electronic modules and connection modules together:

Table 1-1188 Assignment of F-Electronic Modules to F-Connection Modules

F-electronic modules	F-connection modules
8/16 F-DI DC24V PROFIsafe electronic module (6ES7 148-4FA00-0AB0)	CM IO 16×M12 for 8/16 F-DI electronic module (6ES7 194-4DD00-0AA0)
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module (6ES7 148-4FC00-0AB0)	CM IO 12×M12 for 4/8 F-DI/4 F-DO electronic module (6ES7 194-4DC00-0AA0)
F-Switch PROFIsafe electronic module (6ES7 148-4FS00-0AB0)	CM F-IO 2×M12 for F-Switch PROFIsafe electronic module (6ES7 194-4DA00-0AA0)

See also

Properties of 8/16 F-DI DC24V PROFIsafe Electronic Module (Page 51)
Properties of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module (Page 79)
Properties of the F-Switch PROFIsafe Electronic Module (Page 96)

2.3 Limitation of Connectable Modules/Maximum Configuration

Maximum Number of Modules

PROFIBUS DP: The maximum number of modules in an ET 200pro depends on the parameter length of the modules. A total of 244 bytes per ET 200pro are possible.

PROFINET IO: A maximum installation width of 1 m must not be exceeded.

Table 1-1189 Parameter Length of F-Modules in Bytes

Fail-Safe Module	Parameter length
8/16 F-DI DC24V PROFIsafe	42 bytes
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe	34 bytes
F-Switch PROFIsafe	26 bytes

Example for PROFIBUS DP

In the following example, modules with a total parameter length of 205 bytes were used in an ET 200pro. There are also 39 bytes available for installation of additional modules.

Number and type of modules	:	1 x IM154-2 HIGH FEATURE	+	2 x 8/16 F-DI	+	2 x 4/8 F-DI/4 F-DO	+	1 x F-Switch PROFIsafe	= 6 modules
Parameter length	:	27 bytes	+	84 bytes	+	68 bytes	+	26 bytes	= 205 bytes

ET 200pro: Limitation and Maximum Configuration

For information on the limitations and maximum configuration of the standard ET 200pro, refer to the *ET 200pro Distributed I/O System* manual.

2.4 Configuration and Parameter Assignment

Requirements

The following are required for configuring and assigning parameters for ET 200pro fail-safe modules:

- *STEP 7*, V 5.3 SP2 or higher; HSP 63 to 68
- *S7 Distributed Safety*, V 5.1 or higher
- *F Configuration Pack*, V 5.5 SP2 or higher

The *F Configuration Pack* V 5.5 SP2 is available for download on the Internet at: http://www.siemens.com/automation/service&support

Configuring

Fail-safe modules are configured in the same way as ET 200pro standard modules with *STEP 7 HW Config*.

Assigning Parameters for Electronic Module Properties

To assign parameters to fail-safe electronic module properties, select the module in *STEP 7 HW Config* and select "Edit > Object Properties".

During a download operation, the parameters are transferred from the programming device (PG) to the F-CPU and stored there. The parameters are then transferred from the F-CPU to the fail-safe module.

Parameter Description

You will find a description of assignable fail-safe electronic module parameters in this manual.

PROFIsafe Address and PROFIsafe Address Assignment

You will find a description of the PROFIsafe address and the procedure for assigning the address in this manual.

See also

Assignment of PROFIsafe Address (Page 20)
Parameters for the 8/16 F-DI DC24V PROFIsafe Electronic Module (Page 54)
Parameters for the 4/8 F-DI/4 F-DO DC24V/2 A PROFIsafe Electronic Module (Page 82)
Parameters for the F-Switch PROFIsafe Electronic Module (Page 98)

Address Assignment and Installation

3

3.1 Address Assignments in the F-CPU

Address Assignment

The fail-safe modules occupy the following address ranges in the F-CPU:

- For S7 Distributed Safety: in the process image area

Table 1-1190 Address Assignment in the F-CPU

F-module	Occupied bytes in the F-CPU:	
	In input range	In output range
8/16 F-DI DC24V PROFIsafe	x + 0 to x + 7	x + 0 to x +3
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe	x + 0 to x +6	x + 0 to x +4
F-Switch PROFIsafe	x + 0 to x + 6	x + 0 to x + 4
x = Module start address		

Addresses Occupied by User Data

Of the assigned fail-safe module addresses in the F-CPU, the user data occupy the following:

Table 1-1191 Addresses Occupied by Input User Data

Bytes in the F-CPU	Occupied bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
8/16 F-DI DC24V PROFIsafe:								
x + 0	Channel 7 or 0 (SIL3)	Channel 6 or 0 (SIL3)	Channel 5 or 0 (SIL3)	Channel 4 or 0 (SIL3)	Channel 3	Channel 2	Channel 1	Channel 0
x +1	Channel 15 or 0 (SIL3)	Channel 14 or 0 (SIL3)	Channel 13 or 0 (SIL3)	Channel 12 or 0 (SIL3)	Channel 11	Channel 10	Channel 9	Channel 8
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe:								
x + 0	Channel 7 or 0 (SIL3)	Channel 6 or 0 (SIL3)	Channel 5 or 0 (SIL3)	Channel 4 or 0 (SIL3)	Channel 3	Channel 2	Channel 1	Channel 0
F-Switch PROFIsafe:								
X + 0	0	0	0	0	0	0	Channel 1	Channel 0
x = Module start address								

Table 1-1192 Addresses Occupied by Output User Data

Bytes in the F-CPU	Occupied bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe:								
x + 0	-	-	-	-	Channel 3	Channel 2	Channel 1	Channel 0

Bytes in the F-CPU	**Occupied bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
F-Switch PROFIsafe:								
X + 0	0	0	0	0	0	Channel 2	Channel 1	Channel 0
x = Module start address								

WARNING

You can only access addresses occupied by user data. The other addresses occupied by the F-modules are assigned for functions including safety-related communication between F-modules and the F-CPU in accordance with PROFIsafe.
In 1oo2 sensor evaluation, only the lower-value channel of the channels combined by the 1oo2 sensor evaluation can be accessed in the safety program.

Additional Information

For detailed information about F-I/O access, refer to the *S7 Distributed Safety, Configuring and Programming* manual.

3.2 Assignment of PROFIsafe Address

PROFIsafe Address

Each fail-safe module has its own PROFIsafe address in addition to the PROFIBUS/Industrial Ethernet address. Before installing fail-safe modules, you must set the PROFIsafe address of the F-module on each F-module.

PROFIsafe Address Assignment

The PROFIsafe addresses (F_source_address, F_destination_address) are automatically assigned when the fail-safe modules are configured in *STEP 7*.

The F_destination_address is shown in binary format in the "DIP switch setting" parameter in the object properties for the fail-safe modules in *HW Config*. You must obtain this PROFIsafe address from the parameter assignment dialog box and set it on the fail-safe modules using an address switch.

You can change the configured F_destination_address in *HW Config*. To prevent addressing errors, however, we recommend that you use the automatically assigned F_destination_address.

Address Switch for Setting the PROFIsafe Address

An address switch (10-pin DIP switch) is located on the electronic module. You set the PROFIsafe address (F_destination_address) of the F-module at this address switch.

NOTE

Fail-safe modules in ET 200pro can only be used in safety mode.

Setting the Address Switch

Make sure that the address switch is set properly **before installing** the F-module.

PROFIsafe addresses 1 through 1022 are permitted. The figure below illustrates an example of the switch setting for an address.

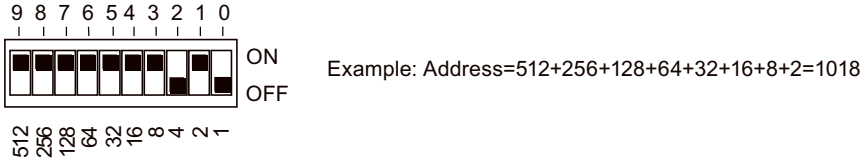

Figure 1-874 Example for Setting the Address Switch (DIP Switch)

NOTE

An address switch of the smallest possible dimensions is installed for reasons of space saving. This makes it sensitive to pressure and objects with sharp edges. Always use a suitable tool to operate the address switch.

Diverse tools suitable for activating the address switch are available on the market, for example, the Grayhill DIPSTICK. A ballpoint pen may be employed if used carefully. It is imperative to avoid any burring which would prevent the switch from reaching its home position. Therefore, DO NOT use screwdrivers or knives to operate the address switch.

Rules for Address Assignment

⚠ WARNING

Observe the following rules when assigning the address:

- Make sure that the address switch setting of the F-I/O matches the PROFIsafe destination address in *STEP 7 HW Config* (Parameter "F_Destination_Address").

3.3 Installing

Installing Fail-Safe Modules

Fail-safe electronic modules and connection modules are part of the ET 200pro range of modules. They are installed in the same way as standard modules in an ET 200pro.

For more information about module installation, refer to the *ET 200pro Distributed I/O Device* manual.

Wiring

4

> **WARNING**
>
> In order to prevent danger to humans or the environment, you must not under any circumstances override safety functions or implement measures that cause safety functions to be bypassed or result in the bypassing of safety functions. The manufacturer is not liable for the consequences of such manipulations or for damage resulting from a failure to heed this warning.

Overview

This chapter presents the specific characteristics involved in wiring fail-safe modules. Generally applicable information about wiring both ET 200pro with fail-safe modules and ET 200pro with standard modules can be found in the *ET 200pro Distributed I/O Device* manual.

4.1 Safe Functional Extra Low Voltage for Fail-Safe Modules

Safe Functional Extra Low Voltage

> **WARNING**
>
> Fail-safe modules must be operated with safe functional extra low voltage (SELV, PELV). This means that only a maximum voltage U_m can ever be applied to these modules, even in the event of a fault. The following applies to all fail-safe modules:
> **U_m < 60.0 V**
> You can find additional information about safe functional extra low voltage, for example, in the data sheets for the applicable power supplies.

All components of the system that are capable of supplying electrical energy in any form must meet this requirement.

Each additional power circuit (24 V DC) installed in the system must be operated with safe functional extra low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer for information.

Note, too, that sensors and actuators with an external power supply can be connected to F-modules. In this context, bear in mind the supply voltage from safe functional extra low voltage. The process signal of a 24 V DC digital module must not exceed a fault voltage U_m, even in the event of a fault.

⚠ WARNING

All voltage sources, for example, internal 24 V DC load voltage supplies, external 24 V DC load voltage supplies and 5 V DC bus voltage, must be electrically connected externally. This prevents voltage additions in the individual voltage sources that would cause the fault voltage U_m to be exceeded, even in the event of potential differences.
Make sure that the cable cross section is sufficient for the electrical connection, in accordance with the ET 200pro configuration guidelines (see *ET 200pro Distributed I/O Device* manual).

Power Supply Requirements for Compliance With the NAMUR Recommendation

NOTE

To comply with NAMUR recommendation NE 21, IEC 61131-2 and EN 298, only power packs or power supplies (230 V AC --> 24 V DC) with a power loss ride-through of at least **20 ms** can be used. The latest information about PS components can be accessed on the Internet at: https://mall.ad.siemens.com
These requirements also apply to power packs or power supplies not produced in ET 200pro or S7-300/400 designs.

4.2 Wiring of Fail-Safe Modules

Same Wiring Procedure as ET 200pro

Fail-safe electronic modules and connection modules are part of the ET 200pro range of modules. They are wired in the same way as standard modules in an ET 200pro.

For more information about wiring modules, refer to the *ET 200pro Distributed I/O Device* manual.

⚠ WARNING

When assigning the F-DI module signals, remember that signals should only be routed within a cable or a non-metallic sheathed cable if:

- A short circuit in the signals does not conceal a serious safety risk.
- Signals are supplied by different sensor supplies of this F-DI module.

Applicable Mounting Rails

Only racks for ET 200pro can be used for installing ET 200pro with fail-safe modules (see *ET 200pro Distributed I/O Device* manual).

Terminal Assignment of Connection Modules

The terminal assignment of the connection modules depends on which electronic module is inserted.

4.3 Inserting and removing fail-safe connection modules and electronic modules

Inserting and Removing Modules

Fail-safe modules in ET 200pro are inserted and removed in the same way as all standard modules in an ET 200pro.

Inserting and Removing Modules During Operation

F-modules can be removed and inserted during operation in exactly the same way as standard modules in ET 200pro.

Follow the instructions in the *"Maintenance and Service"* chapter in the *ET 200pro Distributed I/O Device* manual.

NOTE

Note that replacing fail-safe modules in ET 200pro during operation will generate a communication error in the F-CPU.

You must acknowledge the communication error in your safety program (for information about F-system behavior after communication errors, fail-safe value output and user acknowledgment, refer to the *S7 Distributed Safety, Configuring and Programming* manual).

If the communication error is not acknowledged, the user data of the F-DO modules will remain passivated (outputs at "0").

Remember to Set the PROFIsafe Address

When an F-module is replaced, make sure that the address switch (DIP switch) setting on the electronic module is the same.

See also

Assignment of PROFIsafe Address (Page 20)

4.4 Requirements for Sensors and Actuators

General Requirements for Sensors and Actuators

Note the following important information for the safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Note that sensors and actuators generally do not withstand a proof-test interval of 10 years according to the IEC 61508:2000 standard without considerable safety degradation.
The probability of dangerous faults and the rate of occurrence of dangerous faults of a safety function must adhere to an SIL-based upper limit. You will find a list of values achieved by F-modules under "Fail-Safe Performance Characteristics" in the technical specifications for the F-modules.
To achieve SIL3 (Category 4), suitably qualified sensors and actuators are necessary.

Requirements for the Duration of Sensor Signals

⚠ WARNING

Note the following requirements for sensor signals:

- In order to guarantee accurate detection of sensor signals by the F-DI/F-DO module inputs, you must ensure that the sensor signals exhibit a certain minimum duration.
- In order for pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable Detection by the F-DI/F-DO Module Inputs

The following table lists the minimum duration of the sensor signals for the F-DI module. The minimum duration depends on the parameter settings for the short-circuit test and the input delay in *STEP 7*.

Table 1-1193 Minimum Duration of Sensor Signals for Proper Detection by an F-DI Module

Electronic module	Short-circuit test parameter	Assigned input delay		
		0.5 ms	3 ms	15 ms
8/16 F-DI	Disabled	10 ms	13 ms	25 ms
	Enabled	10 ms	18 ms	56 ms
4/8 F-DI/4 F-DO	Disabled	11 ms	13 ms	25 ms
	Enabled	11 ms	20 ms	57 ms
F-Switch PROFIsafe	Disabled	-	14 ms	-
	Enabled	-	27 ms	-

Reliable Detection By the Safety Program in the F-CPU

For information about the times for proper detection of sensor signals in the safety program, refer to *"Fail-Safe Modules"* in the *Safety Engineering in SIMATIC S7* system description.

Additional Requirements for Sensors

General rule: A single-channel sensor is sufficient to achieve SIL2/Category 3. However, the sensors must be connected using two channels in order to achieve SIL3/Category 4. However, to achieve SIL2/Category 3 with a single-channel sensor, the sensor itself must be SIL2/Category 3-capable, otherwise the sensors must be connected using two channels in order to achieve this safety level.

Additional Requirements for Actuators

Fail-safe output modules test the outputs at regular intervals. For this purpose, the F-module briefly switches off enabled outputs. The test pulses have the following duration:

- Dark period < 1 ms

Fast-acting actuators can drop out briefly during the test. If your process does not tolerate this, you must use actuators with a sufficient lag (> 1 ms).

⚠ WARNING

If the actuators are operated at voltages greater than 24 V DC (for example, 230 V DC) or if the actuators switch higher voltages, safe isolation must be ensured between the outputs of a fail-safe output module and the components conducting the higher voltage (in accordance with EN 50178).
This is generally the case for relays and contactors. Particular attention must be paid to this requirement for semiconductor switching devices.

Diagnostics 5

5.1 Reactions to Faults

Safe State (Safety Concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

NOTE

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators.

Reactions to Faults and F-System Startup

The safety function requires the use of fail-safe values (safe state) instead of process data (**passivation of the fail-safe module**) in the following situations:

- When the F-system starts up
- In the event of errors during safety-related communication between the F-CPU and F-module via the PROFIsafe safety protocol (communication error)
- In the event of F-I/O or channel faults (e.g., wire break, short circuit, discrepancy error)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot store faults retentively. When the system is powered down and then restarted, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

⚠ WARNING

For channels that you have set to "disabled" in *STEP 7*, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group ("Channel enabled/disabled" parameter).

Fail-Safe Value Output for Fail-Safe Modules

In the case of F-DI modules, if channels are passivated, the F-system provides fail-safe values for the safety program instead of the process data pending at the fail-safe inputs:

- For F-DI modules, this is always the fail-safe value (0).

In the case of F-DO modules, if channels are passivated, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety

program. The output channels are set to the zero current and zero voltage state. This also applies when the F-CPU switches to STOP mode. It is not possible to assign fail-safe values.

Depending on which F-system you are using and the type of fault that occurred (F-I/O fault, channel fault or communication error), fail-safe values are used either for the relevant channel only or for all channels of the relevant fail-safe module.

In *S7 Distributed Safety* F-systems up to V 5.3, when a channel fault occurs the entire F-module is passivated (in *S7 Distributed Safety* V 5.4 and higher, the entire module or, alternatively, selected channel(s) are passivated).

Reintegration of a Fail-Safe Module

Switchover from fail-safe values to process data (reintegration of an F-module) occurs automatically or, alternatively, after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in

- the "Diagnostic Messages of 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module, Causes of Faults and Corrective Actions" tables for *"8/16 F-DI DC24V PROFIsafe"* to *"4/8 F-DI/4 F-DO DC24V/2A PROFIsafe"*
- the "Diagnostic Messages of F-Switch PROFIsafe Electronic Module, Causes of Faults and Corrective Actions" tables for *"F-Switch PROFIsafe"*.

After reintegration:

- In the case of a fail-safe DI module, the process data pending at the fail-safe inputs are provided to the safety program
- In the case of a fail-safe DO module, the output values provided in the safety program are again transferred to the fail-safe outputs

Additional Information About Passivation and Reintegration

For additional information about passivation and reintegration of F-I/O, refer to the *S7 Distributed Safety, Configuring and Programming* manual.

Behavior of the F-DI Module When a Communication Error Occurs

The F-DI module responds differently to a communication error than to other faults or errors.

If a communication error occurs, the current process data remain set at the inputs of the F-DI module; the channels are not passivated. The current process data are sent to the F-CPU and are passivated there.

5.2 Error Diagnostics

Purpose of Diagnostics

Diagnostics are used to determine whether fail-safe modules are detecting signals without errors. Diagnostic information is assigned either to one channel or to the entire F-module.

Diagnostic Functions Are Not Safety-Critical

None of the diagnostic functions (displays and messages) are safety-critical. Consequently, they are not implemented as safety-related features, i.e., they are not tested internally.

Diagnostic Options for Fail-Safe Modules in ET 200pro

The following diagnostic options are available for fail-safe modules:

- LED display on the module front panel
- Diagnostic functions of F-modules

Non-Assignable Diagnostic Functions

Fail-safe electronic modules provide non-assignable diagnostic functions. This means that diagnostics are always enabled and are automatically made available by the F-module in *STEP 7* and forwarded to the F-CPU in the event of an error.

Assignable Diagnostic Functions

You can assign (enable) certain diagnostic functions as parameters in *STEP 7*:

- Short-circuit monitoring for the F-DI module
- Wire break detection for the F-DO module
- Short-circuit monitoring for the F-Switch PROFIsafe

WARNING
Diagnostic functions should be enabled or disabled in accordance with the application.

Diagnostics Using LED Display

Every fail-safe connection module indicates faults via its channel LED and SF LED (group fault LED).

The channel LED and SF LED turn red as soon as a diagnostic function is triggered by the F-module. The LEDs go out once all faults have been eliminated.

The SF LED flashes until you acknowledge passivation following a module fault.

Slave Diagnostics

Slave diagnostics comply with IEC 61784-1 Ed3 CP 3/1. The fail-safe electronic modules support slave diagnostics in exactly the same way as standard ET 200pro modules.

For information about the universal structure of the slave diagnostics for ET 200pro and the fail-safe modules, refer to the *ET 200pro Distributed I/O Device* manual. A supplementary description of channel-specific diagnostics for fail-safe modules appears below.

Channel-Specific Diagnostics

As with ET 200pro, there are three bytes available for each channel-specific diagnosis starting at byte 19. A maximum of 10 channel-specific diagnostic messages are possible per distributed I/O device. Channel-specific diagnostics for fail-safe modules are structured as follows:

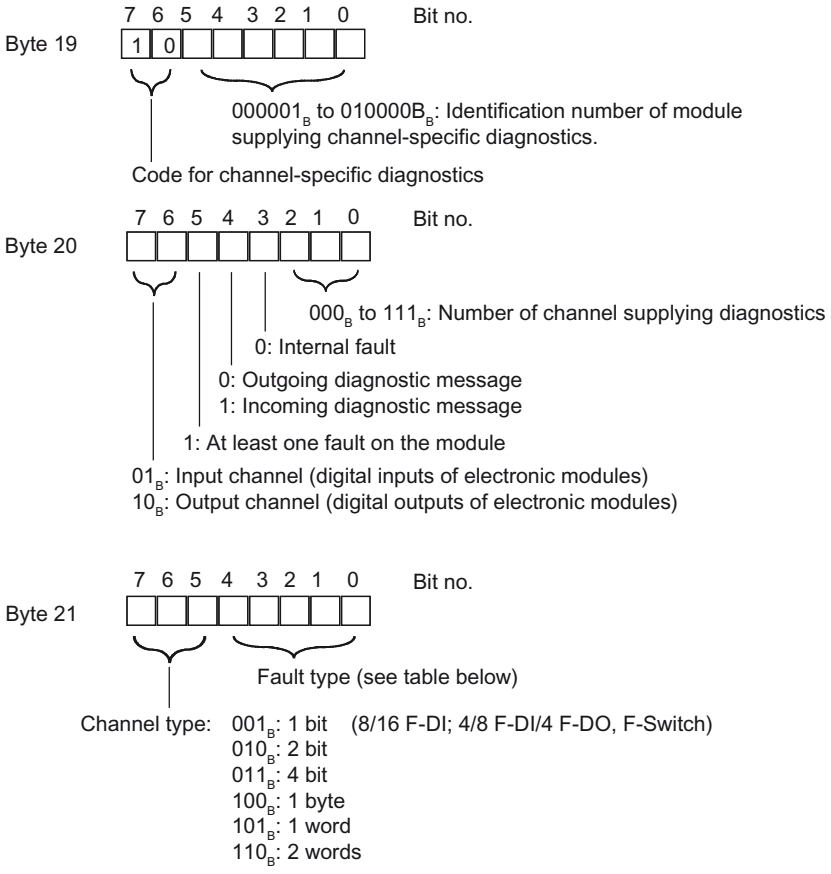

Figure 1-875 Structure of Channel-Specific Diagnostics

NOTE

Channel-specific diagnostics are always updated as far as the current diagnostic function in the diagnostic frame. Subsequent, older diagnostic functions are not deleted.
Remedy: Evaluate the valid current length of the diagnostic frame in *STEP 7* using the RET_VAL parameter of SFC 13.

Possible Fault Types of Fail-Safe Modules

The following table lists the fault types of channel-specific diagnostics. You can obtain detailed diagnostic information via *HW Diagnostics* in *STEP 7*.

Table 1-1194 Fault Types of Channel-Specific Diagnostics

Fault type		Diagnostic function in STEP 7	F-module	Special meaning for F-modules
00001_B	1_D	Short circuit	All	Short circuit to L+ on the unconnected sensor wire Short circuit to L+ sensor supply Ground short circuit or defective sensor supply Internal fault in the read circuit/test circuit
			4/8 F-DI/4 F-DO	P output driver defective Short circuit of output to L+ or output driver M output driver defective Short circuit of output to M or output driver
			F-Switch	Output driver overcurrent P output driver defective Short circuit of output to L+ or output driver Short circuit of output to M or output driver
00100_B	4_D	Overload	4/8 F-DI/4 F-DO	Output driver overcurrent
00101_B	5_D	Overtemperature	All	-
00110_B	6_D	Open circuit	4/8 F-DI/4 F-DO	Wire break
01001_B	9_D	Fault	All	RAM error EPROM error Processor failure (expected DIP switch value/actual DIP switch value) Internal fault in the read circuit/test circuit
10000_B	16_D	Parameter assignment error	All	Parameter assignment error
10001_B	17_D	Sensor voltage or load voltage is missing	All	Module-internal supply voltage
			4/8 F-DI/4 F-DO, F-Switch	Load voltage is defective or not connected
10011_B	19_D	Communication error	All	Cyclic redundancy check (CRC) error in data message frame Monitoring time for data message frame exceeded
11001_B	25_D	Safety-related shutdown	All	Discrepancy error
			4/8 F-DI/4 F-DO, F-Switch	Switching frequency too high

Behavior of F-Modules When a Module Failure Occurs

In the event of a fatal internal fault in the F-module resulting in failure of the F-module, the following occurs:

- The connection to the backplane bus is interrupted and the fail-safe inputs and outputs are passivated.
- Diagnostics are not issued by the F-module and the standard "Module Fault" diagnostics message is issued.
- The SF LED of the relevant F-module illuminates.

Specific Information About Diagnostic Functions

All module-specific diagnostic functions, possible causes, and corrective actions are described in *"8/16 F-DI DC24V PROFIsafe"*, *"4/8 F-DI/4 F-DO DC24V/2A PROFIsafe"* to *"F-Switch PROFIsafe"*.

The status and diagnostic functions indicated by LEDs on the front panel of each F-module are also presented in these sections.

Reading Out Diagnostic Functions

You can have the cause of a fault displayed in the module diagnostics in *STEP 7* (see *STEP 7 online help*).

You can read out diagnostic functions (slave diagnostics) by means of SFC 13 in the standard user program (see *System and Standard Functions* reference manual).

General Technical Specifications

6

Overview

This chapter presents the following information about fail-safe modules:

- Information about the most important standards and approvals
- Information about the general technical specifications

General Technical Specifications

The general technical specifications include the standards and test values met by the fail-safe modules when used in an ET 200pro as well as the criteria used to test the fail-safe modules. The transport and storage requirements for the fail-safe modules and the prescribed environmental conditions are also included.

6.1 Standards and Approvals

CE Certification

CE

The ET 200pro fail-safe modules meet the requirements and protection targets of the following EC Directives and comply with the harmonized European Standards (EN) for programmable logic controllers published in the Official Journal of the European Communities:

- 2006/42/EC "Machinery Directive"
- 73/23/EEC "Electrical Equipment for Use within Fixed Voltage Ranges" (Low-Voltage Directive)
- 89/336/EEC "Electromagnetic Compatibility" (EMC Directive)

The EC declarations of conformity are kept available for the responsible authorities at:

Siemens Aktiengesellschaft
Bereich Automatisierungstechnik
A&D AS RD ST Type Test
Postfach 1963
D-92209 Amberg, Germany

UL/CSA Approval

Underwriters Laboratories Inc., in accordance with

- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142 (Process Control Equipment)

NOTE

The nameplate of the specific module indicates the currently valid approvals.

Certification Mark for Australia

The fail-safe modules of the ET 200pro satisfy the requirements of AS/NZS 2064 (Class A).

IEC 61131

The fail-safe modules of the ET 200pro satisfy the requirements and criteria of IEC 61131-2 (Programmable Controllers - Part 2: Equipment Requirements and Tests).

PROFIBUS/Industrial Ethernet Standard

The ET 200pro distributed I/O device is based on the IEC 61784-1 standard.

Marine approval

Submitted to the following classification organizations
ABS (American Bureau of Shipping)
BV (Bureau Veritas)
DNV (Det Norske Veritas)
GL (Germanischer Lloyd)
LRS (Lloyds Register of Shipping)
Class NK (Nippon Kaiji Kyokai)

Use in Industrial Environment

SIMATIC products are designed for use in industrial environments.

Area of Application	Requirement for	
	Emitted Interference	Interference Immunity
Industry	EN 61000-6-4	EN 61000-6-2

Use in Residential Areas

If you are using the ET 200pro in residential areas, you must ensure compliance with limit class B for emission of radio interference in accordance with EN 61000-6-4.

Suitable measures for achieving a limit class B radio interference level are:

- Installation of the ET 200pro in grounded control cabinets/control boxes
- Use of filters in supply lines

TÜV Certificate and Standards

Fail-safe modules are certified to the following standards. Refer to the report accompanying the TÜV certificate for the current version/edition of the standard.

Standard/Directive	Designation
Standards/Directives for Functional Safety	IEC 61508:2000
	prEN 50159-1 and 2
Standards/Directives for Process Engineering	VDI/VDE 2180-1 to 5
	NE 31
	ISA S 84.01
Standards/Directives Machine Safety	IEC 62061
	98/37/EC
	EN 60204-1
Standards/Directives for Burner Management Systems	DIN VDE 0116, Clause 8.7
	prEN 50156-1
	EN 230, Clause 7.3
	EN 298, Clauses. 7.3, 8, 9, and 10
	DIN V ENV 1954 (stop to position)
Additional Standards/Guidelines	DIN VDE 0110-1
	DIN VDE 0160
	93/68/EEC
	92/31/EEC and 93/68/EEC
	DIN EN 55011 (stop to position)
	EN 50081-2 (stop to position)
	EN 61000-6-2
	DIN EN 61131-2

The current TÜV certificate report is available for downloading on the Internet at https://support.automation.siemens.com under "Product Support".

Requesting TÜV Certificate

You can request copies of the TÜV certificate and the accompanying report at the following address:

Siemens Aktiengesellschaft
Bereich Automatisierungstechnik
A&D AS RD ST Type Test
Postfach 1963
D-92209 Amberg, Germany

6.2 Electromagnetic Compatibility

Introduction

This chapter presents information about the interference immunity of fail-safe modules and information about RFI suppression.

Definition of EMC

Electromagnetic compatibility is the ability of an electrical device to function satisfactorily in its electromagnetic environment without interfering with that environment.

The fail-safe modules meet the requirements of the European Union's EMC law, for example. This requires that the *ET 200pro Distributed I/O System* meets the specifications and directives concerning electrical installation.

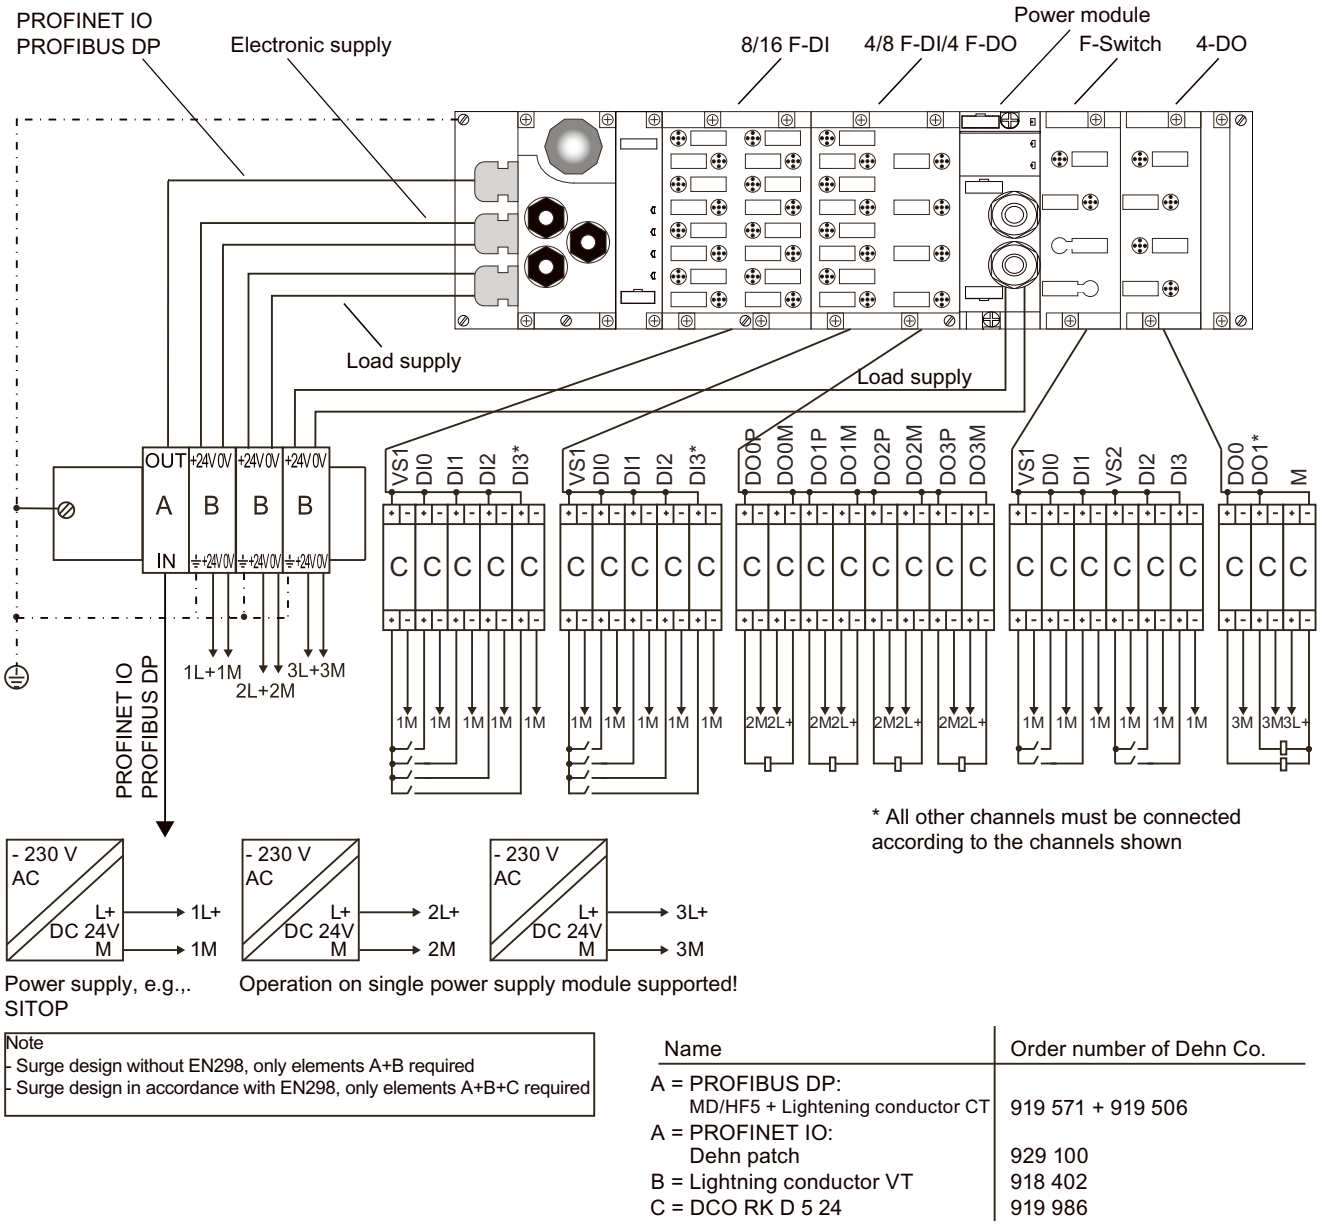
Pulse-Shaped Interference

The following table shows the electromagnetic compatibility of the fail-safe modules relative to pulse-shaped interference.

Pulse-shaped interference	Tested with	Degree of severity
Electrostatic discharge in accordance with IEC 61000-4-2 (DIN VDE 0843 Part 2)	8 kV 6 kV	3 (air discharge) 3 (contact discharge)
Burst pulses (rapid transient interference) in accordance with IEC 61000-4-4 (DIN VDE 0843 Part 4)	2 kV (supply line) 2 kV (signal line)	3 4
Surge in accordance with IEC 61000-4-5 (DIN VDE 0839 Part 10) Degrees of severity 2 and 3 require an external protective circuit (see section further down).		
Asymmetrical connection	1 kV (supply line) 1 kV (signal line/data line) 2 kV (supply line)	2
Symmetrical connection	0.5 kV (supply line) 0.5 kV (signal line/data line) 1 kV (supply line) 1 kV (signal line/data line)	3 2 3

Protecting the ET 200pro With Fail-Safe Modules Against Overvoltages

If your equipment makes protection against overvoltage necessary, we recommend that you use an external protective circuit (surge filter) between the load voltage supply and the load voltage input of the terminal modules to ensure surge immunity for the ET 200pro with fail-safe modules.



NOTE

Lightning protection measures always require a case-by-case examination of the entire system. Virtually complete protection against overvoltages, however, can only be achieved if the entire building surrounding the system has been designed for protection against overvoltages. In particular, this involves structural measures in the building design phase. Therefore, for detailed information regarding protection against overvoltages, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure illustrates an example configuration with ET 200pro F-modules and standard modules.

You can also use fewer power supplies. However, you must ensure that the total current of the modules fed from one power supply does not exceed the permissible limits.

For additional information about surge protection for standard modules, see the *ET 200pro Distributed I/O System* Manual.

Note
- Surge design without EN298, only elements A+B required
- Surge design in accordance with EN298, only elements A+B+C required

Name	Order number of Dehn Co.
A = PROFIBUS DP: MD/HF5 + Lightening conductor CT	919 571 + 919 506
A = PROFINET IO: Dehn patch	929 100
B = Lightning conductor VT	918 402
C = DCO RK D 5 24	919 986

Figure 1-876 Example Configuration with F Modules and Standard Modules of ET200pro

NOTE

Note for Installation in Accordance with EN928

You must disable the "Load voltage failure diagnostics" for the head-end of the ET 200pro-F.

Sinusoidal Interference

HF radiation:

Tested in accordance with IEC 61000-4-3, "Radiated Electromagnetic Field Requirements"

- Standard test:
  - from 80 MHz through 1 GHz, tested at 10 V/m and 20 V/m; 80 % AM (1 kHz)
  - from 1.4 GHz through 2.7 GHz, tested at 10 V/m; 80 % AM (1 kHz)
- GSM/ISM/UMTS field interferences of different frequencies (Standard: EN 298: 2004, IEC 61326-3-1 (draft))

HF interference on signal and data lines:

Tested in accordance with IEC 61000-4-6, "Testing and measurement techniques – Immunity to conducted disturbances induced by radio-frequency fields"

- Standard test:
  - RF band, asymmetrical, amplitude modulated:
    From 0.15 MHz through 80 MHz, tested at 10 V and 20 V rms; 80 % AM (1 kHz)
- ISM interferences of different frequencies (Standard: EN 298: 2004, IEC 61326-3-1 (draft))

Emission of Radio Interference

Interference transmission of electromagnetic fields in accordance with EN 61000-6-4: Limit class A, group 1 (measured at a distance of 10 m).

Frequency	Emitted Interference
Between 30 MHz and 230 MHz	< 40 dB (µV/m)Q
Between 230 MHz and 1,000 MHz	< 47 dB (µV/m)Q

Interference transmission via supply AC input in accordance with EN 61000-6-4: Limit class A, group 1.

Frequency	Emitted Interference
Between 0.15 MHz and 0.5 MHz	< 79 dB (µV)Q, < 66 dB (µV)M
Between 0.5 MHz and 5 MHz	< 73 dB (µV)Q, < 60 dB (µV)M
Between 5 MHz and 30 MHz	< 73 dB (µV)Q, < 60 dB (µV)M

6.3 Transport and storage conditions

Requirements for Fail-Safe Modules

Fail-safe modules surpass the requirements for transport and storage conditions defined in IEC 61131, Part 2. The following specifications apply to fail-safe modules that are transported and stored in the original packaging.

Type of condition	Permissible range
Free fall	≤ 1 m
Temperature	From -25°C to +70°C

Type of condition	Permissible range
Temperature change	20 K/h
Air pressure	From 1080 hPa to 660 hPa (corresponds to an altitude of -1000 m to 3500 m)
Relative humidity	From 5% to 95%, without condensation

6.4 Mechanical and Climatic Environmental Conditions

Climatic environmental conditions

The following climatic environmental conditions are applicable:

Environmental Conditions	Areas of Application	Comments
Temperature	From -25 °C to 55 °C	All mounting positions
Temperature change	10 K/h	
Relative humidity	From 5% to a maximum of 100%	With condensation
Air pressure	From 1080 hPa to 795 hPa	Corresponds to an altitude of -1000 m to 2000 m
Pollutant concentration	SO_2: < 0.5 ppm; Relative humidity < 60%, no condensation H_2S: < 0.1 ppm; Relative humidity < 60%, no condensation	Test: 10 ppm; 4 days 1 ppm; 4 days

Mechanical Environmental Conditions

The requirements for mechanical environmental conditions are presented in the following table in the form of sinusoidal vibrations.

Frequency range	Constant	Intermittent
5 ≤ f ≤ 8 Hz	0.35 mm amplitude	0.75 mm amplitude
8 ≤ f ≤ 150 Hz	5 g constant acceleration	10 g constant acceleration

Testing for Mechanical Environmental Conditions

The following table provides information on the type and scope of tests for mechanical environmental conditions.

Condition	Test Standard	Terminal and Electronic Modules
Vibrations	Vibration test in accordance with IEC 60068-2-6	Type of vibration: Frequency sweeps with a sweep rate of 1 octave/minute. 5 Hz ≤ f ≤ 8 Hz, constant amplitude of 0.75 mm 8 Hz ≤ f ≤ 150 Hz, constant acceleration of 10 g Duration of vibration: 10 frequency sweeps per axis in each of the 3 perpendicular axes

Condition	Test Standard	Terminal and Electronic Modules
Shock	Shock, tested in accordance with IEC 60068-2-27	Type of shock: half sine Force of shock: 30 g peak value, 18 ms duration Direction of shock: 3 shocks each in +/- direction in each of the 3 perpendicular axes
Repetitive shock	Shock, tested in accordance with IEC 60068-29	Type of shock: half sine Force of shock: 25 g peak value, 6 ms duration Direction of shock: 1000 shocks each in +/- direction in each of the three perpendicular axes

Reduction of Vibrations

If fail-safe modules are subjected to greater shocks or vibrations, you must take appropriate measures to reduce acceleration and amplitude.

We recommend that you mount the ET 200pro on damping material (e.g., on a rubber-metal vibration damper).

6.5 Specifications for Dielectric Tests, Protection Class, Degree of Protection, and Rated Voltage

Test Voltage

Dielectric strength is proven during the type test with the following test voltage in accordance with IEC 61131-2:

Circuits with rated voltage U_e to other circuits or to ground	Test voltage
≤ 50V	500 V DC
≤ 150V	2,500 V DC
≤ 250V	4,000 V DC

Pollution Degree/Overvoltage Category in Accordance With IEC 61131

- Pollution degree 2
- Overvoltage category
  - At U_r = 24 V DC: II

Degree of Protection IP65

Degree of protection in accordance with IEC 529

- Protection against the ingress of dust and full protection against physical contact
- Water projected by a nozzle against the enclosure from any direction shall have no harmful effect.

Degrees of Protection IP66 and IP67

Degree of protection in accordance with IEC 529

- Protection against the ingress of dust and full protection against physical contact
- IP66: Water from heavy seas or water projected in powerful jets shall not enter the enclosure in harmful quantities.
- IP67: Protection against water when enclosure is immersed at specified pressures over a specified time period (water must not enter the enclosure in any harmful amount)

Rated Voltage for Operation

The ET 200pro distributed I/O device operates at the following rated voltage and corresponding tolerance.

Rated voltage	Tolerance range
24 V DC	20.4 V DC to 28.8 V DC

Fail-Safe Connection Modules

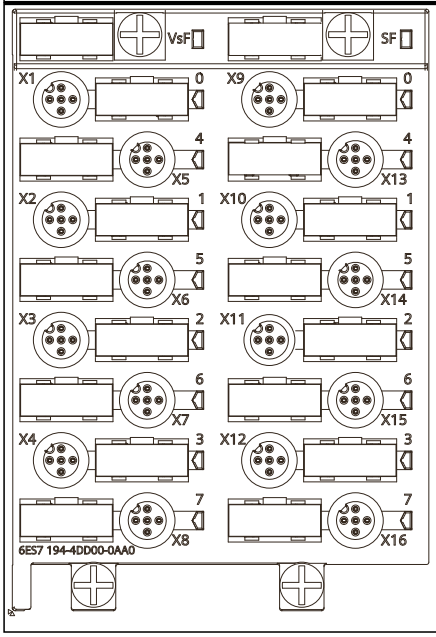
7

7.1 CM IO 16xM12 Fail-Safe Connection Module for EM 8/16 F-DI DC24V PROFIsafe

Order Number

6ES7 194-4DD00-0AA0

Properties



The CM IO 16 x M12 connection module has the following properties:

- Can be plugged in and screwed to the electronic module
- 16 M12 circular socket connectors
- 16 labels and one module label

Terminal assignment

The terminal assignment depends on which electronic module is being used.

View	Terminal	Designation
	X1	1. M12 circular socket connector
	X2	2. M12 circular socket connector
	X3	3. M12 circular socket connector
	X4	4. M12 circular socket connector
	X5	5. M12 circular socket connector
	X6	6. M12 circular socket connector
	X7	7. M12 circular socket connector
	X8	8. M12 circular socket connector
	X9	9. M12 circular socket connector
	X10	10. M12 circular socket connect-or
	X11	11. M12 circular socket connect-or
	X12	12. M12 circular socket connect-or
	X13	13. M12 circular socket connect-or

View	Terminal	Designation
	X14	14. M12 circular socket connector
	X15	15. M12 circular socket connector
	X16	16. M12 circular socket connector

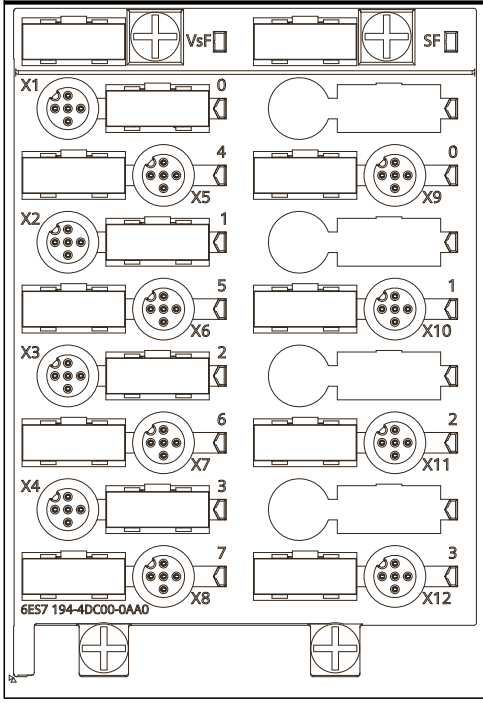
Order Number

6ES7 194-4DC00-0AA0



Properties

The CM IO 12 x M12 connection module has the following properties:

- Can be plugged in and screwed to the electronic module
- 12 M12 circular socket connectors
- 12 labels and one module label

Terminal assignment

The terminal assignment depends on which electronic module is being used.

View	Terminal	Designation
	X1	1. M12 circular socket connector

Fail-Safe Electronic Modules

8

Overview

Fail-safe digital modules are available for connecting digital sensors or encoders and actuators or loads to ET 200pro. This chapter provides the following information for each fail-safe module:

- Properties and specific characteristics
- Front view, terminal assignment for connection modules and block diagram
- Wiring diagram and assignable parameters
- Diagnostic functions, including corrective actions
- Technical specifications

WARNING

The fail-safe performance characteristics in the technical specifications are applicable to a proof-test interval of 10 years and a mean time to repair of 100 hours.

Description of Applicable Electronic Modules and Connection Modules

The applicable standard electronic modules and standard connection modules are described in the *ET 200pro Distributed I/O Device* manual.

8.1 8/16 F-DI DC24V PROFIsafe Digital Electronic Module

8.1.1 Properties of 8/16 F-DI DC24V PROFIsafe Electronic Module

Order Number

6ES7 148-4FA00-0AB0

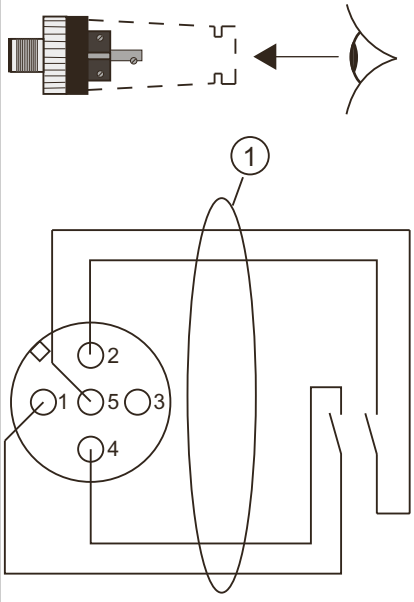
Properties

The F-Switch electronic module has the following properties:

- 16 inputs (SIL2/Category 3) or 8 inputs (SIL3/Category 3 or Category 4)
- 24 V DC rated input voltage
- Suitable for switches and 3- or 4-wire proximity switches (BEROs)
- Four short-circuit-proof sensor supplies for each of the four inputs
- External sensor supply possible
- Group fault display (SF; red LED)

- Fault LED for each sensor supply (Vs1F to Vs4F) is mapped to VsF LED and the associated channels
- Status and fault LEDs for each input (two-color green/red LED)
- Identification data (*see ET 200pro Distributed I/O System Standard Manual*)
- Assignable diagnostics
- Can only be operated in safety mode

8.1.2 Terminal Assignment of 8/16 F-DI DC24V PROFIsafe Electronic Module



Terminal Assignment on CM IO 16×M12 Connection Module

The following table presents the terminal assignment of the 8/16 F-DI DC24V PROFIsafe electronic module on the CM IO 16×M12 connection module.

Sockets X1 to X4 and X9 to X12 are assigned twice. This enables you to implement a 1oo2 evaluation with one connecting cable, e.g., channels 0 and 4 at connector X1.

The functional ground (FG) is located on the shield.

Table 1-1195 Terminal Assignment on the CM IO 16xM12 Connection Module for 8/16 F-DI DC24V PROFIsafe

Block Diagram

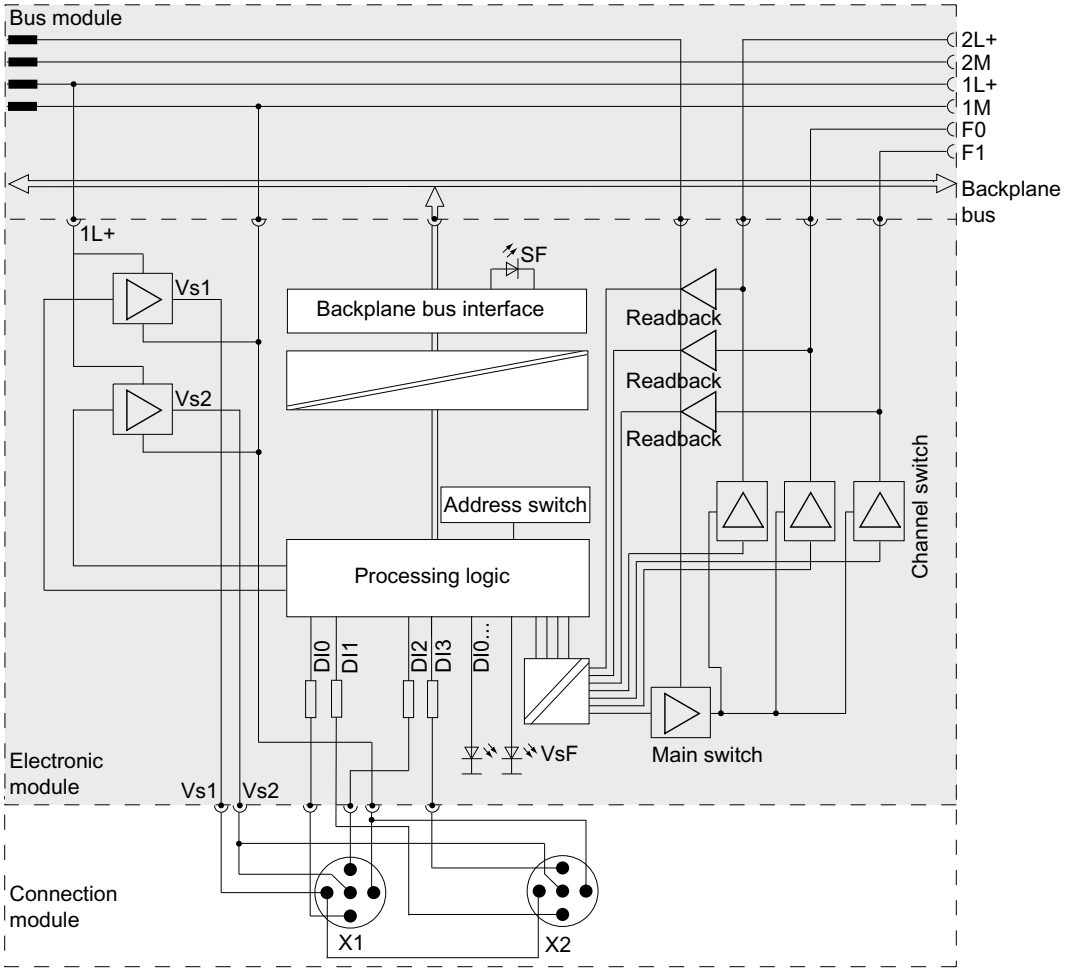

Figure 1-880 Block Diagram of 8/16 F-DI DC24V PROFIsafe Electronic Module

8.1.4 Parameters for the 8/16 F-DI DC24V PROFIsafe Electronic Module

Parameters in *STEP 7*

The following table presents the parameters that can be assigned to the 8/16 F-DI DC24V PROFIsafe electronic module.

Table 1-1196 Parameters for the 8/16 F-DI DC24V PROFIsafe Electronic Module

Parameters	Range	Default	Type of parameter	Range of effectiveness
F-parameters:				
F_destination_address	1 to 1022	Assigned by *STEP 7*	Static	Module
F-monitoring time	10 to 10000 ms	150 ms	Static	Module
Module Parameters:				
Input delay	0.5; 3; 15 ms	3 ms	Static	Module
Short-circuit test	Cyclic/Disable	Cyclic	Static	Module
Behavior after channel faults*	Passivate the entire module/Passivate the channel	Passivate the entire module	Static	Module
Channel n, n+4	Enabled/disabled	Enabled	Static	Channel group
Evaluation of the sensors	1oo2 evaluation/ 1oo1 evaluation	1oo2 evaluation	Static	Channel group
Type of sensor interconnection	1-channel; 2-channel equivalent; 2-channel nonequivalent	2-channel equivalent	Static	Channel group
Behavior at discrepancy	Provide last valid value; Provide value 0	Provide last valid value	Static	Channel group
Discrepancy time	10 to 30000 ms	10 ms	Static	Channel group
Reintegration after discrepancy error	Test of 0-signal not required/Test of 0-signal required	Test of 0-signal not required	Static	Channel group
* This setting is only relevant when the S7 Distributed Safety V 5.4 or higher optional package is installed.				

Short-Circuit Test Parameter

The cyclic short-circuit test is enabled and disabled using the short-circuit test parameter. The short-circuit test is only useful for simple switches that do not have their own power supply. If the short-circuit test has been enabled, the internal sensor supplies must be used (see also "*Use Cases of the 8/16 F-DI DC24V PROFIsafe Electronic Module*").

Behavior at Discrepancy Parameter

As the "behavior at discrepancy" you assign the value that is made available to the safety program in the F-CPU while there is a discrepancy between the two input channels involved, i.e., during the discrepancy time. You assign the behavior at discrepancy as follows:

- "Provide last valid value", or
- "Provide value 0"

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation"

"Provide last valid value"

The last valid value (old value) before discrepancy occurs is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the two relevant input channel signals. This value is supplied until the discrepancy disappears or until the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is extended by an amount equal to this time.

As a result, the discrepancy time of sensors connected via two channels must be set for fast reactions to short response times. It makes no sense, for example, for a time-critical shutdown to be triggered by sensors connected via two channels with a discrepancy time of 500 ms. In the worst case, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time.

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time that includes a sufficient cushion against false tripping of discrepancy errors.

"Provide value 0"

The value "0" is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two relevant input channels.

If you specified "Provide value 0", the sensor-actuator response time will not be affected by the discrepancy time.

Discrepancy Time Parameter

Here, you can specify the discrepancy time for each channel pair. The entered value is rounded to a multiple of 10 ms.

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation" and
- Type of sensor interconnection: "2-channel equivalent" or "2-channel nonequivalent"

Discrepancy Analysis and Discrepancy Time

If you are using one two-channel sensor, one nonequivalent sensor or two single-channel sensors that are measuring the same physical process variable, the sensors will respond with a time delay due to the limited accuracy of their arrangement.

The discrepancy analysis for equivalence/nonequivalence is used with fail-safe inputs to detect faults based on the timing of two signals with the same functionality. Discrepancy analysis is initiated when different levels (when testing for nonequivalence: same voltage levels) are detected at two associated input signals. A test is conducted to determine whether

the difference in levels (when testing for nonequivalence: the consistency) has disappeared within a programmable period known as the discrepancy time. If not, a discrepancy error exists.

In most cases, the discrepancy time starts but does not elapse completely, since the signal differences disappear after a short time.

Select a discrepancy time of sufficient length so that in case of no error, the difference between the two signals (when checking for nonequivalence: the consistency) has definitely disappeared before the discrepancy time expires.

Behavior While Discrepancy Time is Running

While the assigned discrepancy time is running internally on the module, either the **last valid value** or **"0"** is made available to the safety program in the F-CPU by the relevant input channels, depending on the parameter assignment for the behavior at discrepancy.

Behavior After Discrepancy Time Elapses

If the input signals are not equivalent following expiration of the specified discrepancy time (when checking for nonequivalence: no inequality), for example due to wire break at a sensor line, the system detects a discrepancy error and generates a "discrepancy" diagnostic message in the diagnostic buffer of the F-I/O module to identify the faulty channels.

Reintegration After Discrepancy Error Parameter

This parameter is used to specify when a discrepancy error is regarded as eliminated and, thus, when the relevant input channels can be reintegrated. The following can be assigned:

- "Test of 0-signal required" or
- "Test of 0-signal not required"

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation"

"Test of 0-signal required"

If you assigned "Test of 0-signal required", a discrepancy error is regarded as eliminated once a 0-signal is present again at both of the relevant input channels.

If you are using nonequivalent sensors, i.e., the "Type of sensor interconnection" is set to "2-channel nonequivalent", a 0-signal must be present again at the channel supplying the wanted signal.

For information about which F-module channels supply the wanted signals, refer to the manual for the F-module you are using.

"Test of 0-signal not required"

If you assigned "Test of 0-signal not required", a discrepancy error is regarded as eliminated once the discrepancy at the two relevant input channels disappears.

F-modules in SIMATIC S7 for which the "Reintegration after discrepancy error" parameter is not available also exhibit this behavior.

8.1.5 Wiring of Inputs of 8/16 F-DI DC24V PROFIsafe Electronic Module

NOTE

The following sections on wiring options and specific *STEP 7* parameters (use cases) apply to the 8/16 F-DI and the inputs of the 4/8 F-DI/4 F-DO.

Use Case Selection

The following figure provides information to help you select the use case that corresponds to your fail-safe requirements. The following sections provide instructions on wiring the F-module and identify the parameters you must assign in *STEP 7* for each use case.

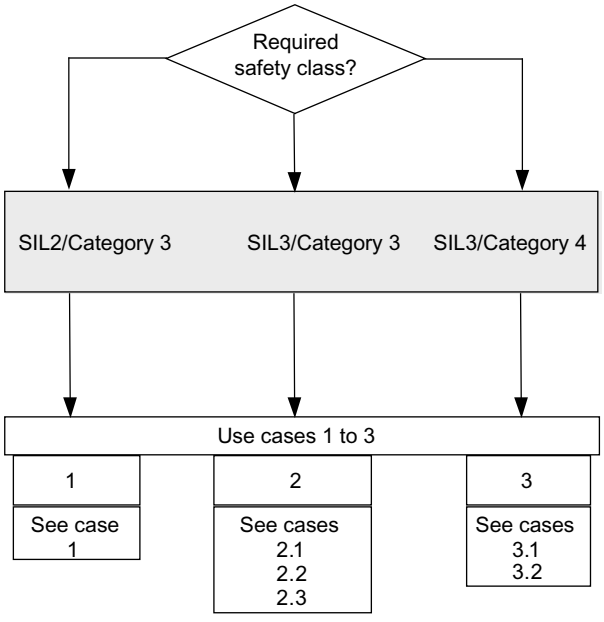

Figure 1-881 Use Case Selection

WARNING

The achievable Safety Integrity Level is determined by the sensor quality and the length of the proof-test interval according to the IEC 61508:2000 standard. If the sensor quality does not meet Safety Integrity Level requirements, always use the sensor in redundant operation and connect it via two channels.

Conditions for Achieving SIL/Category

The conditions for achieving the respective safety requirements are presented in the following table.

Table 1-1197 F-DI Modules: Conditions for Achieving SIL/Category

Use case	Sensors	Evaluation of the sensors	Sensor supply	Achievable SIL/Category
1	1-channel	1oo1	Internal, with short-circuit test	2 / 3
			Internal, without short-circuit test	
			External	
2.1	1-channel	1oo2	Internal, with short-circuit test	3 / 3
			Internal, without short-circuit test	
			External	
2.2	2-channel equivalent	1oo2	Internal, without short-circuit test	
			External	
2.3	2-channel nonequivalent	1oo2	Internal, without short-circuit test	
			External	
3.1	2-channel equivalent	1oo2	Internal, with short-circuit test	3 / 4
3.2	2-channel nonequivalent			

NOTE

You can operate the various inputs of an F-DI module simultaneously in SIL2/Category 3 **and** SIL3/Category 3 or 4. You only have to connect the inputs and assign parameters as shown in the following sections.

Sensor Requirements

Please note the information in *"Requirements for Sensors and Actuators"* when using sensors for safety-related applications.

8.1.6 Use Case 1: Safety Mode SIL2/Category 3

Sensor Supply

The sensors can be powered internally or externally.

Table 1-1198 Use Case 1: Assignment of Sensor Supply to Input Channels

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2 Input channels DI 8 to DI 11: Sensor supply Vs3 Input channels DI 12 to DI 15: Sensor supply Vs4	Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2

Wiring Diagram for Use Case 1 – Connecting One Sensor Via One Channel

One sensor is connected via one channel for each process signal (1oo1 evaluation).
The wiring is carried out at the appropriate connection module.
The figures below illustrate an example wiring diagram for channel groups 1 and 2.

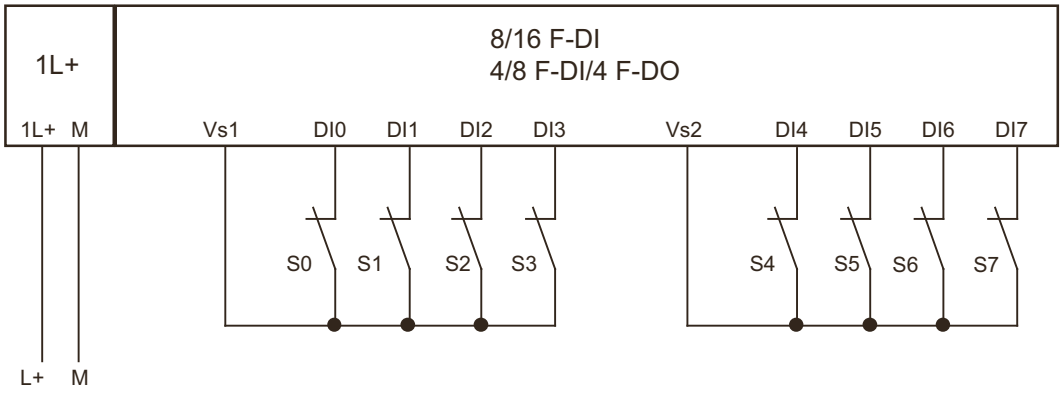

Figure 1-882 Wiring Diagram for F-DI Modules - One Sensor Connected Via One Channel, Internal Sensor Supply

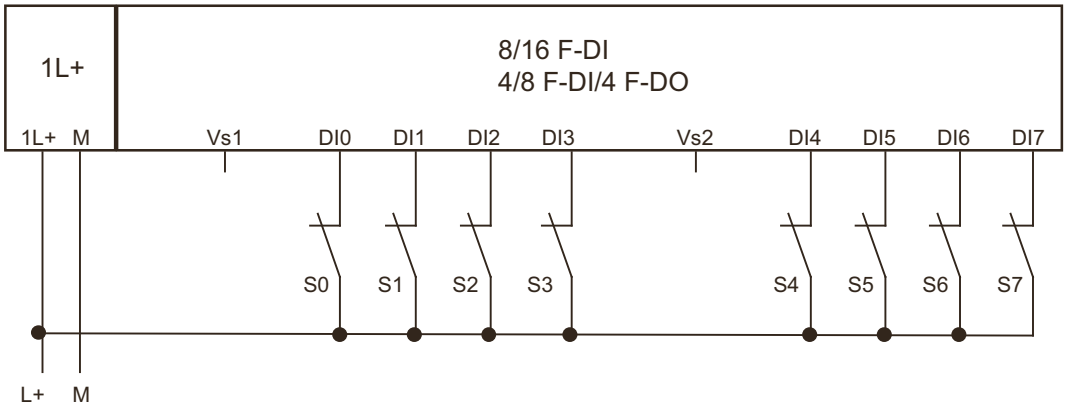

Figure 1-883 Wiring Diagram for F-DI Modules - One Sensor Connected Via One Channel, External Sensor Supply

Assignable Parameters for Use Case 1

Set the "Evaluation of the sensors" parameter to "1oo1 evaluation" for the respective input.

You can enable or disable the "Short-circuit test" parameter. However, you must disable the short-circuit test as soon as at least one fail-safe digital input is **externally** supplied. Otherwise, the "Short circuit" diagnostic is reported.

Specific Characteristics for Fault Detection (Use Case 1)

The following table summarizes fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1199 F-DI Modules: Fault Detection (Use Case 1)

Example of fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	No	No	No
Short circuit of DI 0 with DI 4	Yes*	No	No
P-short circuit of DI 0	Yes	No	No
M-short circuit of DI 0	Yes*	Yes*	No
Discrepancy error	-	-	-
P-short circuit of Vs1	Yes	No	No
M-short circuit of Vs1, or Vs2 defective	Yes	Yes	Yes
Short circuit of Vs1 with Vs2	Yes	No	No
Fault in read/test circuit	Yes	Yes	Yes
Supply voltage fault	Yes	Yes	Yes
*: Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal. If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.			

8.1.7 Use Case 2: Safety Mode SIL3/Category 3

Assigning Inputs to Each Other

The F-DI modules have 2, 8, or 16 fail-safe inputs (SIL2). A pair of these inputs can be used as one input (SIL3). The following assignments apply in this case:

Table 1-1200 Use Case 2: Assignment of Input Channels to Each Other

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channels DI 0 and DI 4 Input channels DI 1 and DI 5 Input channels DI 2 and DI 6 Input channels DI 3 and DI 7 Input channels DI 8 and DI 12 Input channels DI 9 and DI 13	Input channels DI 0 and DI 4 Input channels DI 1 and DI 5 Input channels DI 2 and DI 6 Input channels DI 3 and DI 7

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channels DI 10 and DI 14 Input channels DI 11 and DI 15	

Sensor Supply

The sensor supply can be provided internally or externally.

Table 1-1201 Use Case 2: Assignment of Sensor Supply to Inputs

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2 Input channels DI 8 to DI 11: Sensor supply Vs3 Input channels DI 12 to DI 15: Sensor supply Vs4	Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2

Wiring Diagram for Use Case 2.1 – Connecting One Sensor Via One Channel to Two Inputs

One sensor is connected via one channel to two inputs of the F-module for each process signal (1oo2 evaluation).

NOTE

If the voltage is supplied to the sensor from the F-DI module, you must use the internal sensor supply Vs1. Connection to Vs2 is not possible.

The wiring is carried out at the appropriate connection module.

The figures below illustrate an example wiring diagram for channel groups 1 and 2.

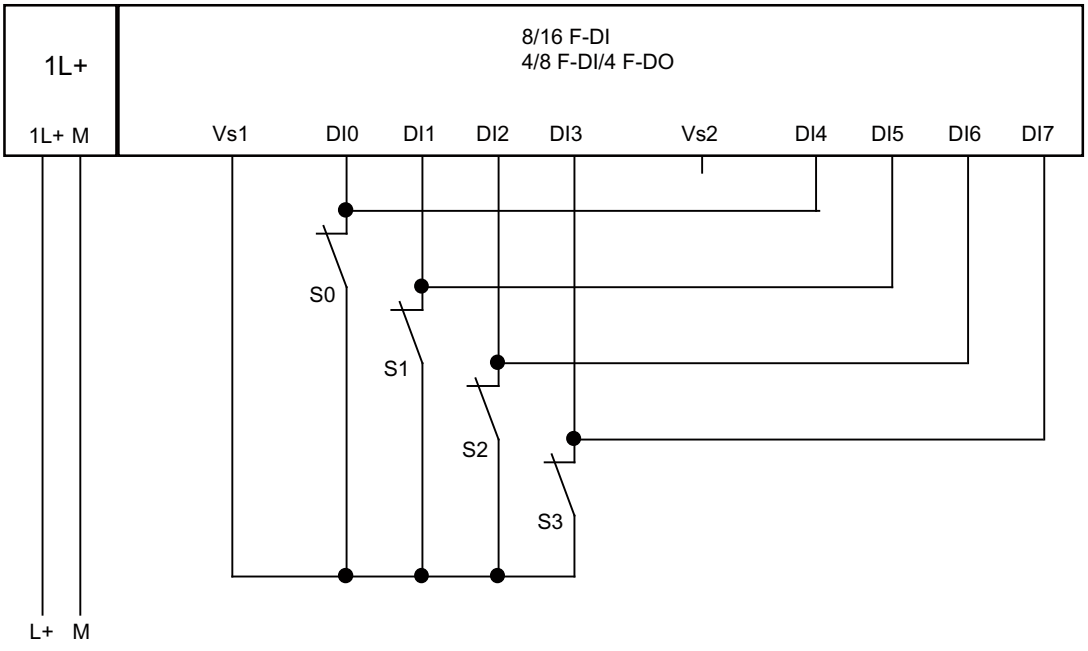

Figure 1-884 Wiring Diagram for F-DI Modules - One Sensor Connected Via One Channel to Two Inputs, Internal Sensor Supply

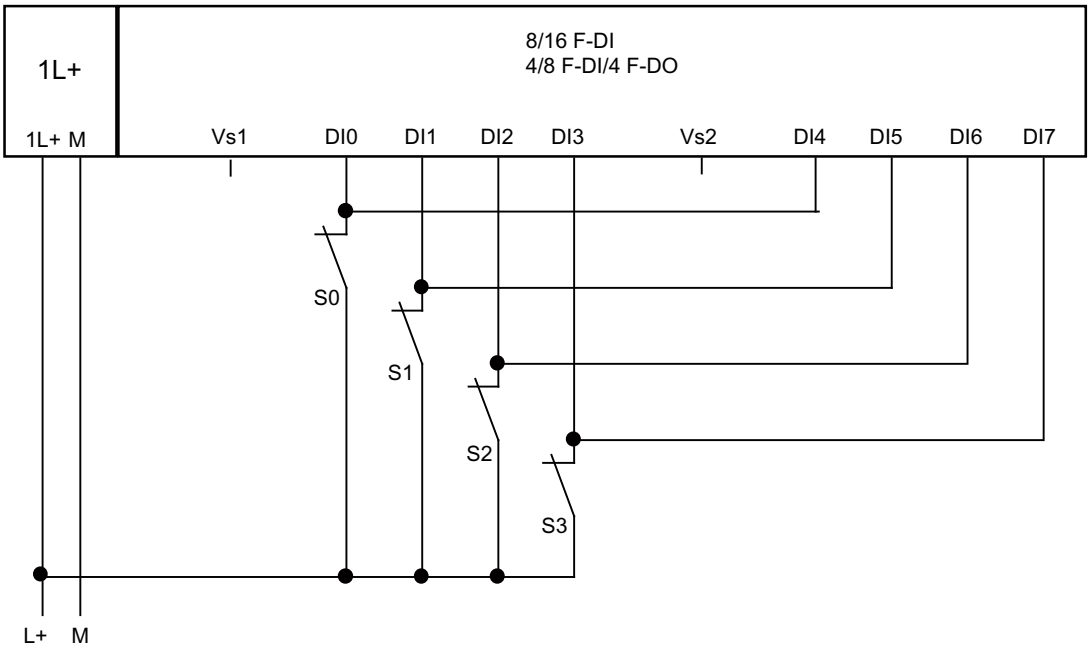

Figure 1-885 Wiring Diagram for F-DI Modules - One Sensor Connected Via One Channel to Two Inputs, External Sensor Supply

WARNING

In order to achieve SIL3/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 2.1

Set the "Evaluation of the sensors" parameter to "1oo2 evaluation" and the "Type of sensor interconnection" parameter to "1-channel" for the relevant input. The discrepancy time is permanently preset to 10 ms and cannot be changed.

You can enable or disable the "Short-circuit test" parameter. However, you must disable the short-circuit test as soon as at least one fail-safe digital input is **externally** supplied. Otherwise, the "Short circuit" diagnostic is reported.

Specific Characteristics for Fault Detection (Use Case 2.1)

The following table summarizes fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1202 8/16 F-DI DC24V PROFIsafe Electronic Module: Fault Detection (Use Case 2.1)

Example of fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	No	No	No
Short circuit of DI 0 with DI 5	No	No	No
P-short circuit of DI 0	Yes	No	No
M-short circuit of DI 0	Yes*	Yes*	No
Discrepancy error	Yes	Yes	Yes
P-short circuit of Vs1	Yes	No	No
M-short circuit of Vs1, or Vs2 defective	Yes	Yes	Yes
Short circuit of Vs1 with Vs2	Yes	No	No
Fault in read/test circuit	Yes	Yes	Yes
Supply voltage fault	Yes	Yes	Yes
***:** Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.			

Wiring Diagram for Use Case 2.2 – Connecting One Two-Channel Sensor Via Two Channels

One two-channel sensor is connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The wiring is carried out at the appropriate connection module.

The figures below illustrate an example wiring diagram for channel groups 1 and 2.

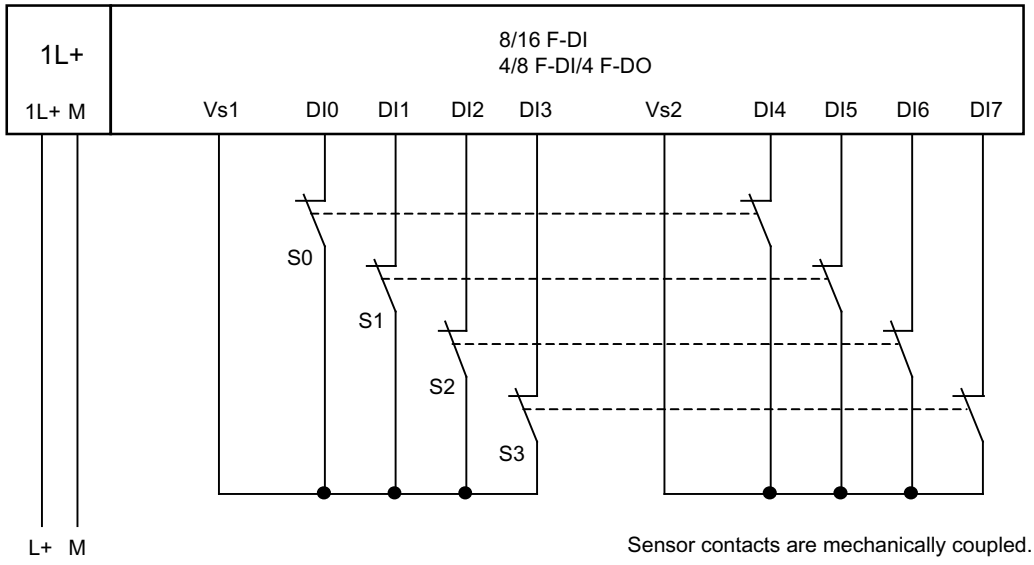

Figure 1-886 Wiring Diagram for F-DI Modules - One Two-Channel Sensor Connected, Internal Sensor Supply

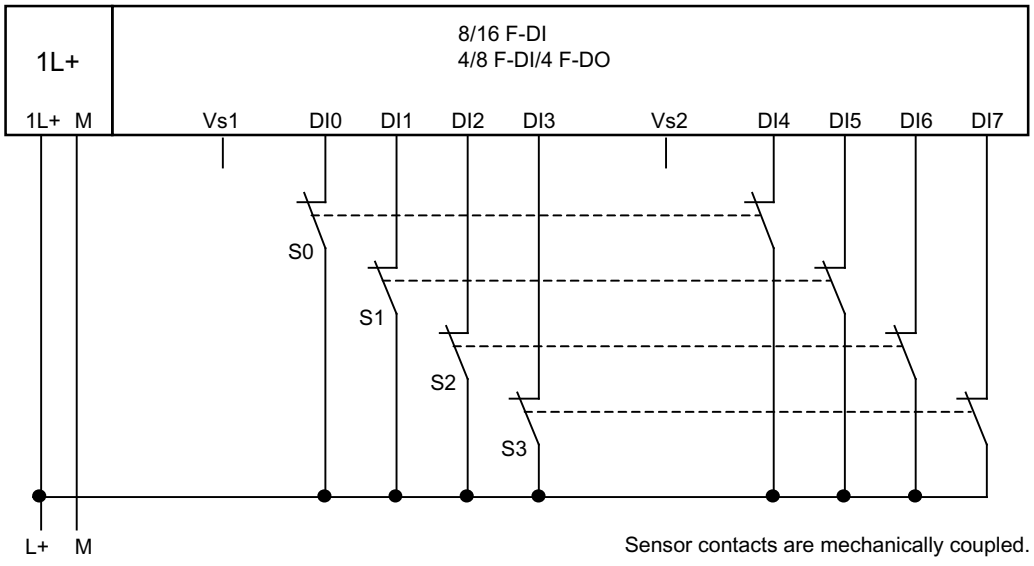

Figure 1-887 Wiring Diagram for F-DI Modules - One Two-Channel Sensor Connected Via Two Channels, External Sensor Supply

Wiring Diagram for Use Case 2.2 – Connecting Two One-Channel Sensors Via Two Channels

Two single-channel sensors are connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation). The sensors can also be supplied via an external sensor supply.

The figure below illustrates an example wiring diagram for channel groups 1 and 2.

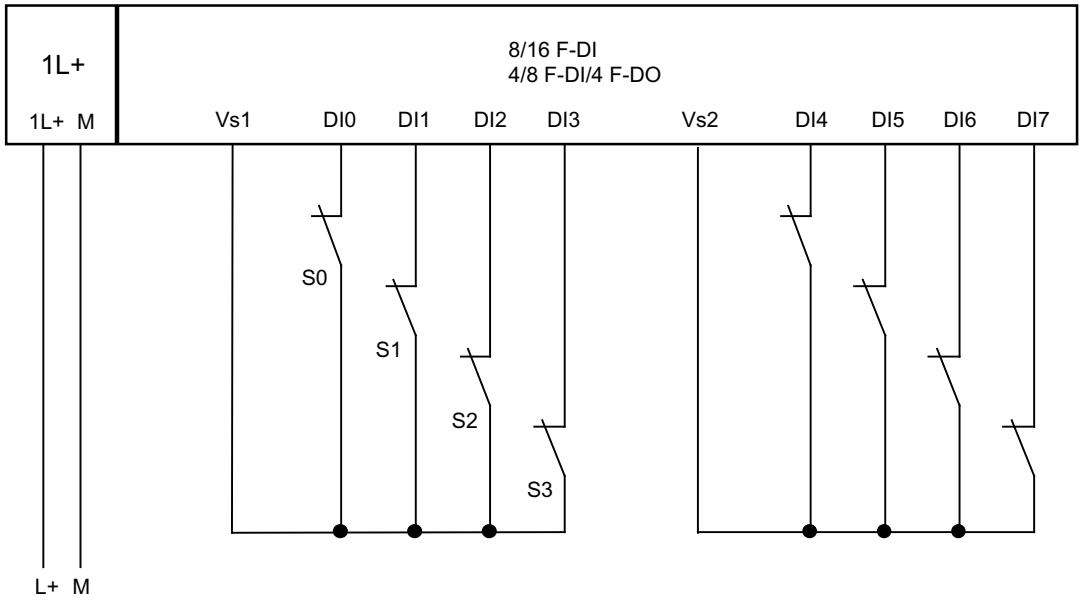

Figure 1-888 Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Via Two Channels, Internal Sensor Supply

WARNING

In order to achieve SIL3/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 2.2

Set the "Evaluation of the sensors" parameter to "1oo2 evaluation" and the "Type of sensor interconnection" parameter to "2-channel equivalent" for the relevant input. Disable the "Short-circuit test" parameter.

Specific Characteristics for Fault Detection (Use Case 2.2)

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1203 F-DI Modules: Fault Detection (Use Case 2.2)

Example of fault	Fault detection in case of ...	
	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	Yes*	Yes*
Short circuit of DI 0 with DI 4	No	No
Short circuit of DI 0 with DI 5	Yes*	Yes*
P-short circuit of DI 0	Yes*	Yes*
M-short circuit of DI 0	Yes*	Yes*
Discrepancy error	Yes	Yes
P-short circuit of Vs1	No	No
M-short circuit of Vs1, or Vs2 defective	Yes	Yes
Short circuit of Vs1 with Vs2	No	No
Fault in read/test circuit	Yes	Yes
Supply voltage fault	Yes	Yes
***:** Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.		

Wiring Diagram for Use Case 2.3 – Connecting One Nonequivalent Sensor Via Two Channels Nonequivalently

One nonequivalent sensor is connected nonequivalently via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The left channels on the F-module (DI 0 to DI 2, DI 0 to DI 3, or DI 8 to DI 11) supply the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs in the F-CPU.

NOTE

If the voltage is supplied to the sensor from the F-DI module, you must use the internal sensor supply Vs1 (or Vs3). Connection to Vs2 (or Vs4) is not possible.

The wiring is carried out at the appropriate connection module.

The figures below illustrate an example wiring diagram for channel groups 1 and 2.

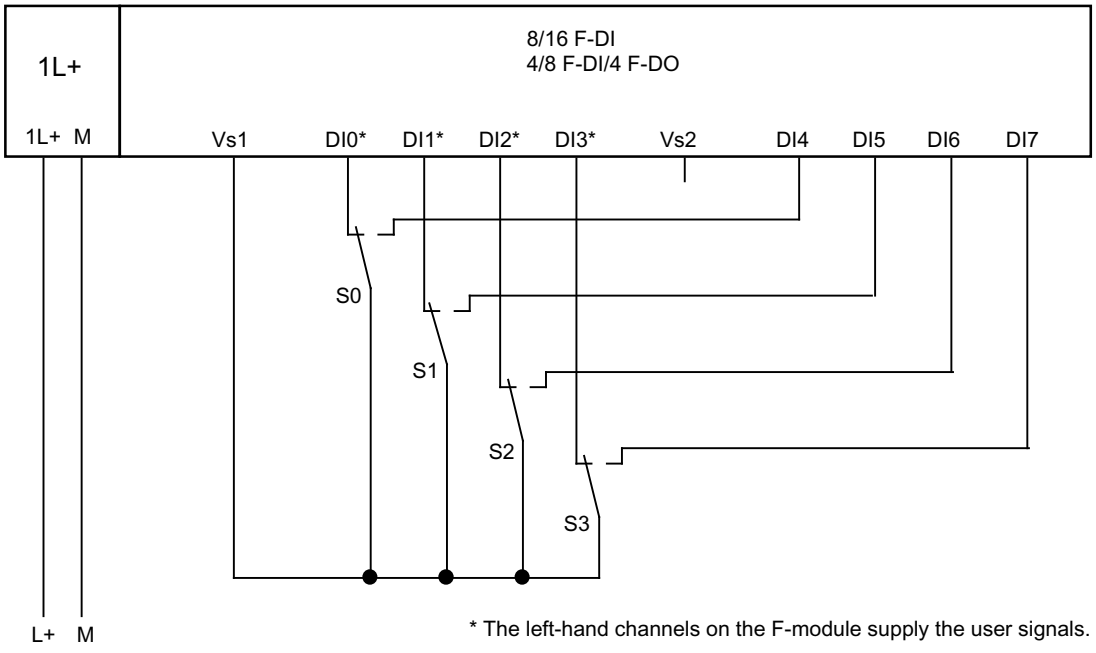

Figure 1-889 Wiring Diagram for F-DI Modules - One Nonequivalent Sensor Connected Nonequivalently Via Two Channels, Internal Sensor Supply

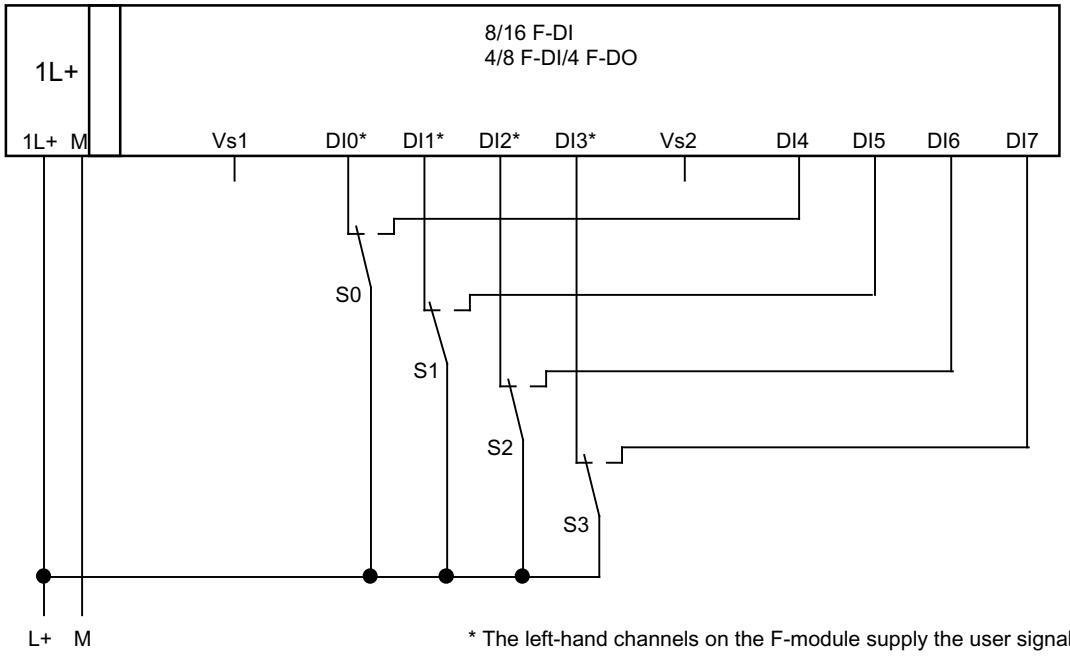

Figure 1-890 Wiring Diagram for F-DI Modules - One Nonequivalent Sensor Connected Nonequivalently Via Two Channels, External Sensor Supply

Wiring Diagram for Use Case 2.3 – Connecting Two One-Channel Sensors Nonequivalently Via Two Channels

Two one-channel sensors are connected nonequivalently via two channels to two inputs of the F-I/O module for each process signal (1oo2 evaluation).

The left channels on the F-module (DI 0 to DI 2, DI 0 to DI 3, or DI 8 to DI 11) supply the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs in the F-CPU.

The sensors can also be supplied via an external sensor supply.

The figure below illustrates an example wiring diagram for channel groups 1 and 2.

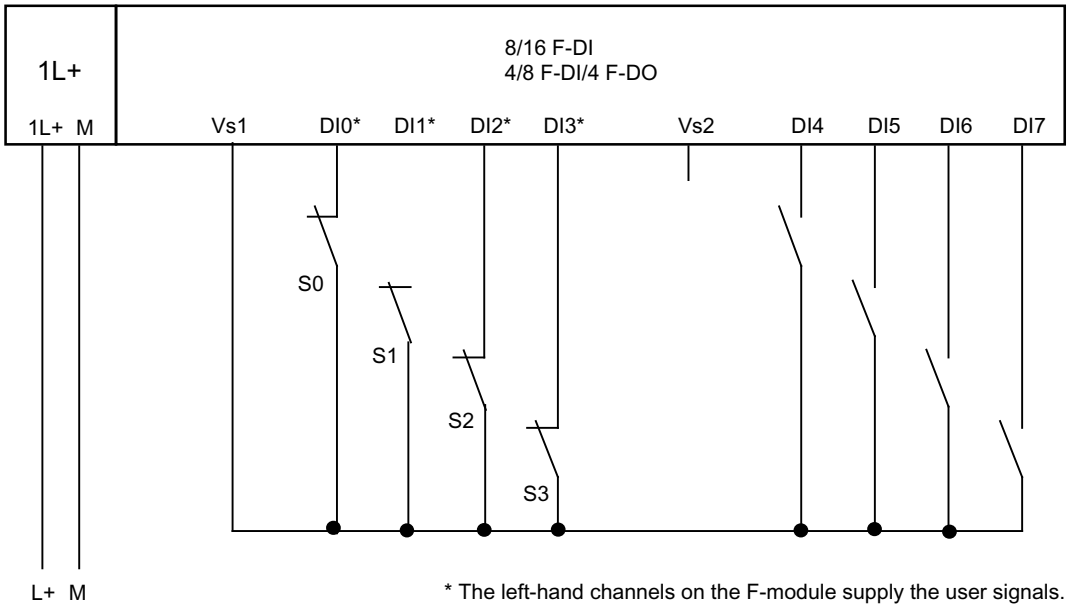

Figure 1-891 Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Nonequivalently Via Two Channels, Internal Sensor Supply

⚠ WARNING

In order to achieve SIL3/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 2.3

Set the "Evaluation of the sensors" parameter to "1oo2 evaluation" and the "Type of sensor interconnection" parameter to "2-channel nonequivalent" for the relevant input. Disable the "Short-circuit test" parameter.

Specific Characteristics for Fault Detection (Use Case 2.3)

The following table summarizes fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1204 F-DI Modules: Fault Detection (Use Case 2.3)

Example of fault	Fault detection in case of ...	
	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	Yes*	Yes*
Short circuit of DI 0 with DI 4	Yes	Yes
Short circuit of DI 0 with DI 5	Yes*	Yes*
P-short circuit of DI 0	Yes*	Yes*
M-short circuit of DI 0	Yes*	Yes*
Discrepancy error	Yes	Yes
P-short circuit of Vs1	No	No
M-short circuit of Vs1, or Vs2 defective	Yes	Yes
Short circuit of Vs1 with Vs2	No	No
Fault in read/test circuit	Yes	Yes
Supply voltage fault	Yes	Yes
*: Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.		

8.1.8 Use Case 3: Safety Mode SIL3/Category 4

Assigning Inputs to Each Other

The F-DI modules have 2, 8, or 16 fail-safe inputs (SIL2). A pair of these inputs can be used as one input (SIL3). The following assignments apply in this case:

Table 1-1205 Use Case 3: Assignment of Input Channels to Each Other

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channel DI 0 and DI 4	Input channel DI 0 and DI 4
Input channel DI 1 and DI 5	Input channel DI 1 and DI 5
Input channel DI 2 and DI 6	Input channel DI 2 and DI 6
Input channel DI 3 and DI 7	Input channel DI 3 and DI 7
Input channel DI 8 and DI 12	
Input channel DI 9 and DI 13	
Input channel DI 10 and DI 14	
Input channel DI 11 and DI 15	

Sensor supply

The sensor must be supplied internally.

Table 1-1206 Use Case 2: Assignment of Sensor Supply to Inputs

8/16 F-DI DC24V PROFIsafe	4/8 F-DI/4 F-DO DC24V/2A PROFIsafe
Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2 Input channels DI 8 to DI 11: Sensor supply Vs3 Input channels DI 12 to DI 15: Sensor supply Vs4	Input channels DI 0 to DI 3: Sensor supply Vs1 Input channels DI 4 to DI 7: Sensor supply Vs2

Wiring Diagram for Use Case 3.1 – Connecting One Two-Channel Sensor Via Two Channels

One two-channel sensor is connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The wiring is carried out at the appropriate connection module.

The figure below illustrates an example wiring diagram for channel groups 1 and 2.

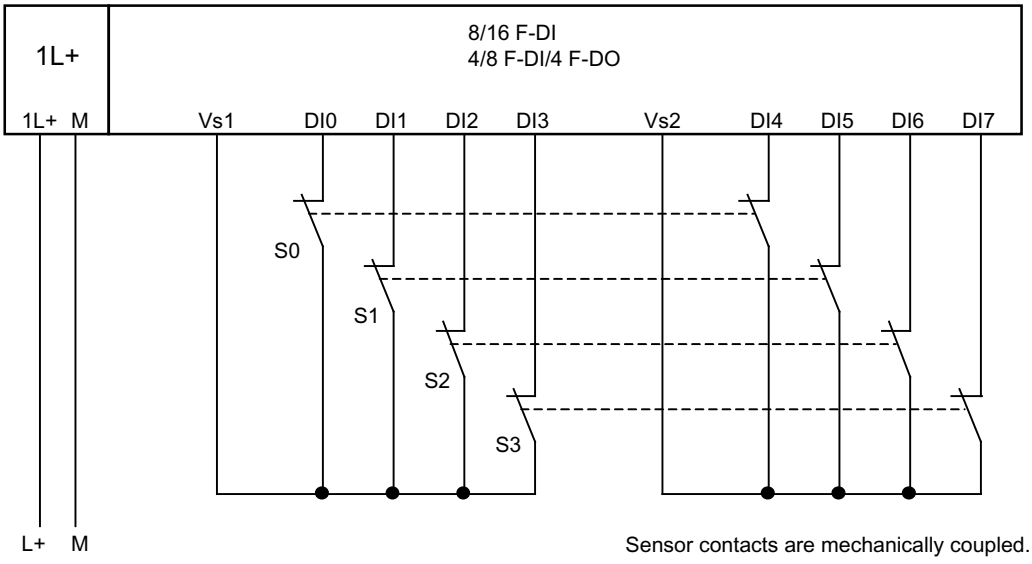

Figure 1-892 Wiring Diagram for F-DI Modules - One Two-Channel Sensor Connected Via Two Channels, Internal Sensor Supply

Alternatively, two one-channel sensors can be connected via two channels (see Figure *"Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Via Two Channels, Internal Sensor Supply"*). In this case, the same process variable is measured with mechanically separated sensors.

⚠ WARNING

In order to achieve SIL3/Category 4 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 3.1

Set the "Evaluation of the sensors" parameter to "1oo2 evaluation" and the "Type of sensor interconnection" parameter to "2-channel equivalent" for the relevant input. Enable the "Short-circuit test" parameter.

Wiring Diagram for Use Case 3.2 – Connecting One Nonequivalent Sensor Via Two Channels Nonequivalently

Eight process signals can be connected to an 8/16 F-DI DC24V PROFIsafe electronic module, 4 process signals to a 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module, and 2 process signals to an F-Switch PROFIsafe. One sensor is connected nonequivalently via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The left channels on the F-module (DI 0 to DI 3 or DI 8 to DI 11) supply the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs in the F-CPU.

NOTE

You must use internal sensor supply Vs1 (or Vs3) to supply voltage to the sensor. Connection to Vs2 (or Vs4) is not possible.

The wiring is carried out at the appropriate connection module.

The figure below illustrates an example wiring diagram for channel groups 1 and 2.

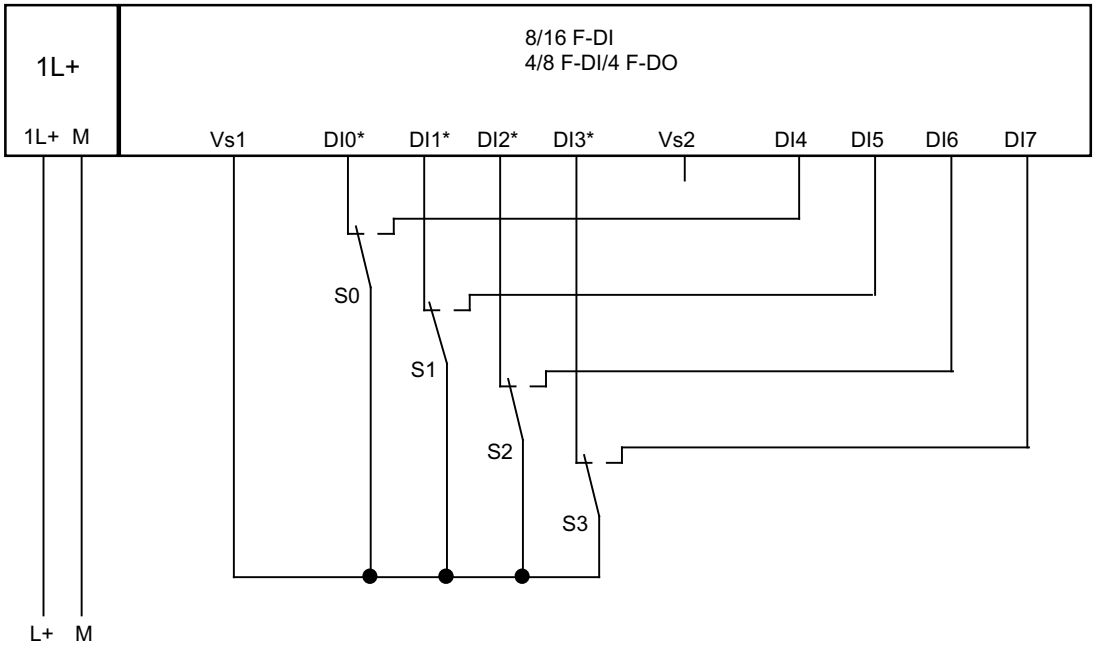

Figure 1-893 Wiring Diagram for F-DI Modules - One Nonequivalent Sensor Connected Nonequivalently Via Two Channels, Internal Sensor Supply

Alternatively, two one-channel sensors can be connected nonequivalently via two channels (see Figure *"Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Nonequivalently Via Two Channels, Internal Sensor Supply"*). In this case, the same process variable is measured with mechanically separated sensors.

⚠ WARNING

In order to achieve SIL3/Category 4 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 3.2

Set the "Evaluation of the sensors" parameter to "1oo2 evaluation" and the "Type of sensor interconnection" parameter to "2-channel nonequivalent" for the relevant input. Enable the "Short-circuit test" parameter.

Specific Characteristics for Fault Detection (Use Cases 3.1 and 3.2)

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1207 F-DI Modules: Fault Detection (Use Cases 3.1 and 3.2)

Example of fault	Fault detection with internal sensor supply and enabled short-circuit test for ...	
	Sensor 2-channel equivalent	Sensor 2-channel nonequivalent
Short circuit of DI 0 with DI 1	Yes*	Yes*
Short circuit of DI 0 with DI 4	Yes*	Yes
Short circuit of DI 0 with DI 5	Yes*	Yes*
P-short circuit of DI 0	Yes	Yes
M-short circuit of DI 0	Yes*	Yes*
Discrepancy error	Yes	Yes
P-short circuit of Vs1	Yes	Yes
M-short circuit of Vs1, or Vs2 defective	Yes	Yes
Short circuit of Vs1 with Vs2	Yes	Yes
Fault in read/test circuit	Yes	Yes
Supply voltage fault	Yes	Yes

***:** Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Requirements for Machine Protection Applications With Category 4

The following requirements apply to machine protection applications with Category 4:

- State-of-the-art wiring must be used between the sensors and the automation system or between the automation system and the actuators to prevent short circuits.
- All short circuits listed in the above table are detected. Detection of a short circuit is sufficient in this case, because two faults must exist for the short circuit to occur (both of the short-circuited signal cables exhibit an insulation fault). Thus, a multiple short-circuit analysis is not required.

Processes for detection of all short circuits are also permissible if individual short circuits are not detected, provided:

- The short circuits do not cause corruption of read signals compared to the sensor signals or
- The short circuits cause corruption of read signals compared to the sensor signals, but in the direction that ensures safety.

8.1.9 Diagnostic Functions of the 8/16 F-DI DC24V PROFIsafe Electronic Module

Behavior in Case of Supply Voltage Failure

Failure of sensor supplies Vs1 to Vs4 is indicated by the SF LED, the VsF LED, and the LEDs of the relevant channel group on the F-module. This information is also provided on the module (diagnostic entry). The relevant channel groups or channels (in the case of channel-level passivation) of the module are passivated.

Diagnostic Functions

The following table presents an overview of the diagnostic functions of the 8/16 F-DI DC24V PROFIsafe electronic module. The diagnostic functions are assigned either to one channel or to the entire module.

Table 1-1208 Diagnostic Functions of the 8/16 F-DI DC24V PROFIsafe Electronic Module

Diagnostic Function*	Fault Number	LED	Signaled in Use Case	Range of Effectiveness of Diagnostic	Assignable
Short circuit	1_H	SF	1, 2, 3	Channel	Yes
Overtemperature	5_H	SF	1, 2, 3	Module	No
Fault	9_H	SF	1, 2, 3	Module	No
Parameter assignment error	10_H	SF	1, 2, 3	Module	No
Sensor voltage or load voltage is missing	11_H	VsF VsF	1, 2, 3	Module	No
Communication error	13_H	SF	1, 2, 3	Module	No
Safety-related shutdown	19_H	SF	2.3	Channel	No
*: Specifically for F-modules; display in *STEP 7*, see the "Channel-Specific Diagnostics, Fault Types of Fail-Safe Modules" table					

NOTE

If you have enabled the **short-circuit test** for the F-DI module in *STEP 7* and are using only one of the two internal sensor supplies of the module (Vs1 or Vs2, or Vs3 or Vs4), a channel M-short circuit is detected for each of the four channels whose sensor supply is not used. Four "short-circuit" diagnostic functions are generated in the diagnostic buffer of the F-module.

Specific Characteristics for Fault Detection

Detection of some faults (such as short circuits or discrepancy errors) is dependent on the use case, wiring, and parameter assignment of the short-circuit test. For this reason, tables on fault detection are presented for the use cases in *"Use Case 1: Safety Mode SIL2/Category 3" to "Use Case 3: Safety Mode SIL3/Category 4"*.

Causes of Faults and Corrective Actions

The following table presents the possible causes of faults and corrective actions for the individual diagnostic messages of the 8/16 F-DI DC24V PROFIsafe electronic module.

Table 1-1209 Diagnostic Messages of the 8/16 F-DI DC24V PROFIsafe Electronic Module, Causes of Faults and Corrective Actions

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Short circuit	Always	Internal fault	Replace module
	Cyclically during short-circuit test	Short circuit at the sensor Cross circuit at the sensor	Eliminate short circuit/cross circuit on sensor
Overtemperature	Always	Shutdown due to violation of temperature limit values in the module case.	Check ambient temperature. Check whether permissible output current of the sensor power supply is exceeded for the ambient temperature. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on.
Fault	Always	Internal module fault has occurred	Replace module
Parameter assignment error	Always	Inserted module does not match configuration	Correct the configuration (compare actual and preset configuration).
		PROFIsafe address set incorrectly on the F-module	Check whether the PROFIsafe address on the module matches the configuration in *STEP 7 HW Config*
Sensor voltage or load voltage is missing	Always	No supply voltage or supply voltage is too low	Check module for proper contact. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on.
		Voltage dip due to short circuit	Eliminate short circuit/cross circuit.
Communication error	Always	Error in communication between the F-CPU and module, e.g., due to defective PROFIBUS/Industrial Ethernet connection or higher than permissible electromagnetic interferences.	Check the PROFIBUS/Industrial Ethernet connection. Eliminate the interferences.
		PROFIsafe monitoring time set too low	Set a higher value for the "F-monitoring time" parameter for the module in *STEP 7 HW Config*
		Configuration of the F-module does not match the fail-safe program	Recompile the safety program; then reload the configuration and safety program to the F-CPU
Safety-related shutdown	Always	Faulty process signal Defective sensor	Check process signal. Replace sensor if necessary.

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Safety-related shutdown	Always	Short circuit between unconnected sensor cable and the sensor supply cable	Eliminate short circuit
		Wire break in connected sensor cable or sensor supply cable	Eliminate broken wire
		Assigned discrepancy time is too short	Check the assigned discrepancy time. Once the error is eliminated, the F-module must be reintegrated in the safety program.

For more information on passivation and reintegration of F-I/O, refer to *"Diagnostics"* and the *S7 Distributed Safety Configuring and Programming* or *Programmable Controllers S7 F/FH* manuals.

Generally Applicable Information on Diagnostics

For information on diagnostics pertaining to all fail-safe modules (e.g., readout of diagnostic functions; passivation of channels), refer to *"Diagnostics"* in this manual as well as the *S7 Distributed Safety Configuring and Programming* or *Programmable Controllers S7 F/FH* manuals.

8.1.10 Technical Specifications for the 8/16 F-DI DC24V PROFIsafe Electronic Module

Overview

Technical Specifications		
Dimensions and Weight		
Dimensions W x H x D (mm)	90 x 175 x 65.2 (including rack)	
Weight	Approx. 270 g	
Module-Specific Specifications		
Number of inputs		
• 1-channel	Max. 16	
• 2-channel	Max. 8	
Assigned address area		
• I/O area for inputs	8 bytes	
• I/O area for outputs	4 bytes	
Cable length		
• Unshielded	Max. 30 m	
• Shielded	Max. 30 m	
Maximum achievable safety class	1-channel	2-channel
• According to IEC 61508:2000	SIL2	SIL3
• According to ISO 13849-1:2006 or EN ISO 13849-1:2008	Category 3	Category 4

Technical Specifications		
Fail-safe performance characteristics	SIL2	SIL3
• Low demand mode (average probability of failure on demand)	< 1.00E-03	< 1.00E-05
• High demand/continuous mode (probability of a dangerous failure per hour)	< 1.00E-08	< 1.00E-09
Voltages, Currents, Potentials		
Rated supply voltage L+	24 V DC	
• Permissible range	20.4 V to 28.8 V	
• Power loss ride-through of L+	None	
• Power loss ride-through of internal P5	5 ms	
• Reverse polarity protection	Yes	
Number of simultaneously controllable inputs		
• All mounting positions – Up to 40°C – Up to 55°C	 16 (for 28.8 V) 16 (for 24.7 V) or 8 (for 28.8 V)	
Electrical isolation		
• Between channels and backplane bus	Yes	
• Between channels and power supply	No	
• Between channels	No	
• Between channels/power supply and shield	Yes	
Permissible potential difference between		
• Shield and ET 200pro bus connection	75 V DC/60 V AC	
• Shield and I/O (DIs)	75 V DC/60 V AC	
• ET 200pro bus connection and I/O (DIs)	75 V DC/60 V AC	
Insulation tested during type test with		
• Shield and ET 200pro bus connection	350 V AC/1 min	
• Shield and I/O (DIs)	350 V AC/1 min	
• ET 200pro bus connection and I/O (DIs)	350 V AC/1 min	
Current consumption		
• From backplane bus	Typ. 20 mA	
• From load voltage L+ (without sensor)	Typ. 120 mA	
Power loss of module	Typ. 4.5 W	
Status, Interrupts, Diagnostics		
Status displays		
• Inputs	Two-color red/green LED per channel	
• Sensor supply	LED VsF and display via channel LEDs of channel groups	
Diagnostic functions		
Interrupts		
• Diagnostic interrupt	Channel LED red	
• Group fault display	Red LED (SF)	
• Diagnostic information can be read out	Possible	
• I&M functionality *	See "ET 200pro Distributed I/O" Manual	

Technical Specifications		
Sensor Supply Outputs		
Number of outputs	4	
Output voltage		
• Loaded	Min. L+ (-1.5 V)	
Output current		
• Rated value	200 mA	
• Permissible range	0 mA to 200 mA	
Permissible aggregate current of outputs	800 mA	
Short-circuit protection	Yes, electronic	
• Operating value	0.7 A to 2.1 A	
Data for Selecting a Sensor **		
Input voltage		
• Rated value	24 V DC	
• At signal "1"	15 V to 30 V	
• At signal "0"	-30 V to 5 V	
Input current		
• At signal "1"	Typ. 3.7 mA	
Input delay	Assignable (for all inputs together)	
• At "0" after "1"	Typ. 0.5 ms	(0.3 ms to 0.7 ms)
	Typ. 3 ms	(2.6 ms to 3.4 ms)
	Typ. 15 ms	(13 ms to 17 ms)
• At "1" after "0"	Typ. 0.5 ms	(0.3 ms to 0.7 ms)
	Typ. 3 ms	(2.6 ms to 3.4 ms)
	Typ. 15 ms	(13 ms to 17 ms)
Input characteristic	In accordance with IEC 61131-2, Type 1	
Connection of 2-wire BERO	Not possible	
• Permissible quiescent current	Max. 0.6 mA	
Time, Frequency		
Internal preprocessing times	See *"Response Times"*	
Acknowledgment time in safety mode		
• Short-circuit test enabled With input delay of 0.5 ms: With input delay of 3 ms: With input delay of 15 ms:	 Min. 4 ms / max. 7 ms Min. 4 ms / max. 12 ms Min. 4 ms / max. 9 ms	
• Short-circuit test disabled	Min. 4 ms / max. 6 ms	
Minimum sensor signal duration	See *"Minimum Duration of Sensor Signals for Proper Detection by F-DI Module"* table in *"Wiring"*	
Protection against Overvoltage		
Protection of supply voltage L+ from surge in accordance with IEC 61000-4-5 with external protection elements only		
• Symmetrical (L+ to M)	+ 1 kV; 1.2/50 µs	
• Asymmetrical (L+ to PE, M to PE)	+ 2 kV; 1.2/50 µs	

Technical Specifications	
Protection of inputs and outputs from surge in accordance with IEC 61000-4-5 with external protection elements only	Not required since cable length is < 30 m
Protection of supply voltage 1L+ from overvoltages	Internal fuse tripped
*: Identification sets are described in the "ET200 pro Distributed I/O System" manual.	
**: For requirements for sensors and actuators, see "*Requirements for Sensors and Actuators*"	

8.2 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Digital Electronic Module

8.2.1 Properties of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Order Number

6ES7 148-4FC00-0AB0

Properties

The 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module has the following properties:

- Inputs
  - 8 inputs (SIL2/Category 3) or four inputs (SIL3/Category 3 or Category 4)
  - 24 V DC rated input voltage
  - Suitable for switches and 3- or 4-wire proximity switches (BEROs)
  - Two short-circuit-proof sensor supplies for each of the four inputs
  - External sensor supply possible
- Outputs
  - Four outputs, P/M switching (current sourcing/sinking)
  - 2 A output current
  - 24 V DC rated load voltage
  - Suitable for solenoid valves, DC contactors and indicator lights
- Group fault display (SF; red LED)
- Fault LED for each sensor supply (Vs1F to Vs2F) is mapped to VsF LED and the associated channels.
- Status and fault LEDs for each input/output (two-color green/red LED)
- Identification data (*see ET 200pro Distributed I/O System Standard Manual*)
- Assignable diagnostics
- Safety class SIL3 achievable
- Can only be operated in safety mode

Switching of Grounded Loads

If the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module switches loads that have a connection between the chassis and ground (e.g., to improve the EMC properties) **and** if the chassis and ground are connected in the power supply, a "short circuit" will be detected.

From the perspective of the F-module, the M-switch (current sinking) is bridged by the chassis-ground connection (refer to the following figure for an example for a 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module).

Remedy:

The resistance (R) between the chassis and ground on the load side must be greater than 100 kΩ.

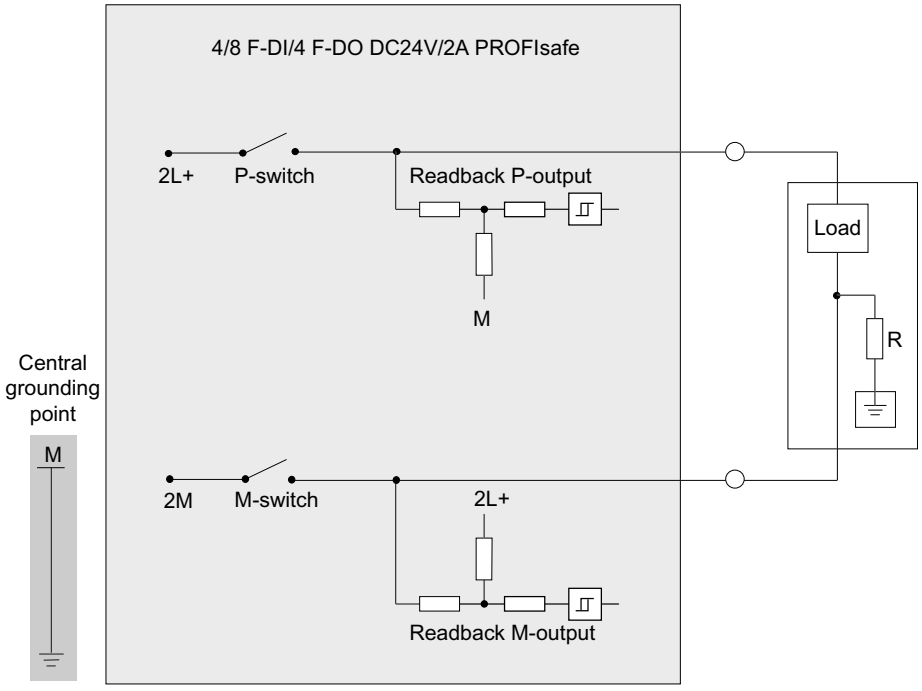

Figure 1-894 Switching Grounded Loads (Resistance Between Chassis and Ground)

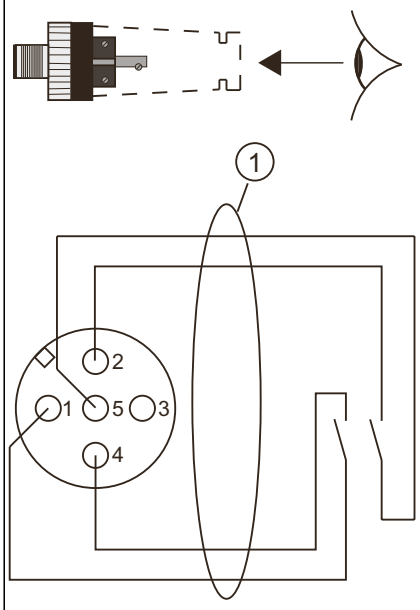
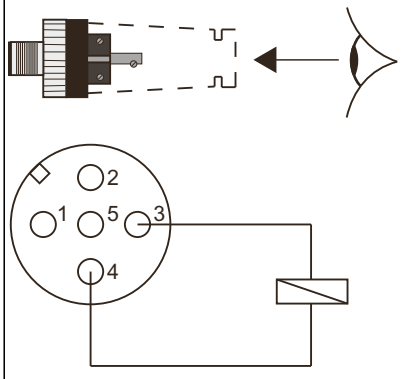
8.2.2 Terminal Assignment of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module



Terminal Assignment on CM IO 12×M12 Connection Module



The following table presents the terminal assignment of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module on the CM IO 12×M12 connection module.

Sockets X1 to X4 are assigned twice. This enables you to implement a 1oo2 evaluation with one connecting cable, e.g., channels 0 and 4 at connector X1.

Table 1-1210 Terminal Assignment on the CM IO 12xM12 Connection Module for 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe

Circular connector view	Terminal	Assignment of X1 to X12
Digital inputs	1	Connectors X1 to X4: 24 V sensor supply 1 (Vs1) Connectors X5 to X8: 24 V sensor supply 2 (Vs2) Connectors X9 to X12: Not assigned

8.2.3 Block Diagram for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Block Diagram

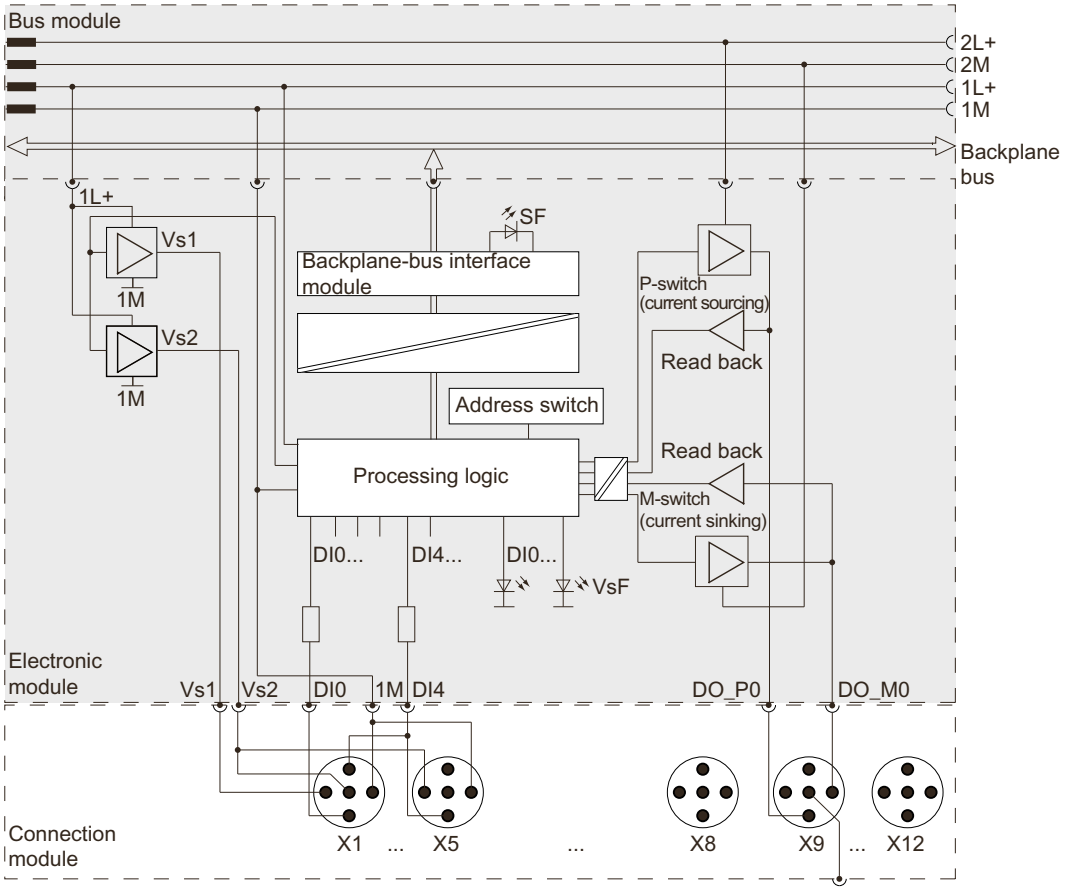

Figure 1-895 Block Diagram for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

8.2.4 Parameters for the 4/8 F-DI/4 F-DO DC24V/2 A PROFIsafe Electronic Module

Parameters in *STEP 7*

The following table shows the parameters that can be set for the F-DI/F-DO module (see also *"Configuration and Parameter Assignment"*).

Table 1-1211 Parameters of the F-DI/DO Module

Parameters	Range	Default	Type of parameter	Range of effectiveness
F-parameters:				
F_destination_address	1 to 1022	Assigned by *STEP 7*	Static	Module
F-monitoring time	10 to 10000 ms	150 ms	Static	Module

Parameters	Range	Default	Type of parameter	Range of effectiveness
Module Parameters:				
Behavior after channel faults*	Passivate the entire module/Passivate the channel	Passivate the entire module	Static	Module
Module Parameter Inputs:				
Input delay	0.5; 3; 15 ms	3 ms	Static	Module
Short-circuit test	Cyclic/Disable	Cyclic	Static	Module
Channel n, n+4	Enabled/disabled	Enabled	Static	Channel group
Evaluation of the sensors	1oo2 evaluation/ 1oo1 evaluation	1oo2 evaluation	Static	Channel group
Type of sensor interconnection	1-channel; 2-channel equivalent; 2-channel nonequivalent	2-channel equivalent	Static	Channel group
Behavior at discrepancy	Provide last valid value; Provide value 0	Provide last valid value	Static	Channel group
Discrepancy time	10 to 30000 ms	10 ms	Static	Channel group
Reintegration after discrepancy error	Test of 0-signal not required/Test of 0-signal required	Test of 0-signal not required	Static	Channel group
Module Parameter Outputs:				
DO channel n	Enabled/disabled	Enabled	Static	Channel
Readback time	1 to 400 ms	1 ms	Static	Channel
Diagnostics: Wire break	Enabled/disabled	Disabled	Static	Channel
* This setting is only relevant when the *S7 Distributed Safety* V 5.4 or higher optional package is installed.				

Short-Circuit Test Parameter

The cyclic short-circuit test is enabled and disabled using the short-circuit test parameter. The short-circuit test is only useful for simple switches that do not have their own power supply. If the short-circuit test has been enabled, the internal sensor supplies must be used (see also *"Use Cases of the 8/16 F-DI DC24V PROFIsafe Electronic Module"*).

Behavior at Discrepancy Parameter

As the "behavior at discrepancy" you assign the value that is made available to the safety program in the F-CPU while there is a discrepancy between the two input channels involved, i.e., during the discrepancy time. You assign the behavior at discrepancy as follows:

- "Provide last valid value", or
- "Provide value 0"

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation"

"Provide last valid value"

The last valid value (old value) before discrepancy occurs is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the two relevant input channel signals. This value is supplied until the discrepancy disappears or until the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is extended by an amount equal to this time.

As a result, the discrepancy time of sensors connected via two channels must be set for fast reactions to short response times. It makes no sense, for example, for a time-critical shutdown to be triggered by sensors connected via two channels with a discrepancy time of 500 ms. In the worst case, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time.

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time that includes a sufficient cushion against false tripping of discrepancy errors.

"Provide value 0"

The value "0" is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two relevant input channels.

If you specified "Provide value 0", the sensor-actuator response time is not affected by the discrepancy time.

Discrepancy Time Parameter

Here, you can specify the discrepancy time for each channel pair. The entered value is rounded to a multiple of 10 ms.

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation" and
- Type of sensor interconnection: "2-channel equivalent" or "2-channel nonequivalent"

Discrepancy Analysis and Discrepancy Time

If you are using one two-channel sensor, one nonequivalent sensor or two single-channel sensors that are measuring the same physical process variable, the sensors will respond with a time delay due to the limited accuracy of their arrangement.

The discrepancy analysis for equivalence/nonequivalence is used with fail-safe inputs to detect faults based on the timing of two signals with the same functionality. Discrepancy analysis is initiated when different levels (when testing for nonequivalence: same voltage levels) are detected at two associated input signals. A test is conducted to determine whether the difference in levels (when testing for nonequivalence: the consistency) has disappeared within a programmable period known as the discrepancy time. If not, a discrepancy error exists.

In most cases, the discrepancy time starts but does not elapse completely, since the signal differences disappear after a short time.

Select a discrepancy time of sufficient length so that in case of no error, the difference between the two signals (when checking for nonequivalence: the consistency) has definitely disappeared before the discrepancy time expires.

Behavior While Discrepancy Time is Running

While the assigned discrepancy time is running internally on the module, either the **last valid value** or **"0"** is made available to the safety program in the F-CPU by the relevant input channels, depending on the parameter assignment for the behavior at discrepancy.

Behavior After Discrepancy Time Elapses

If the input signals are not equivalent following expiration of the specified discrepancy time (when checking for nonequivalence: no inequality), for example due to wire break at a sensor line, the system detects a discrepancy error and generates a "discrepancy" diagnostic message in the diagnostic buffer of the F-I/O module to identify the faulty channels.

Reintegration After Discrepancy Error Parameter

This parameter is used to specify when a discrepancy error is regarded as eliminated and, thus, when the relevant input channels can be reintegrated. The following can be assigned:

- "Test of 0-signal required" or
- "Test of 0-signal not required"

Requirements

You have assigned the following:

- Evaluation of the sensors: "1oo2 evaluation"

"Test of 0-signal required"

If you assigned "Test of 0-signal required", a discrepancy error is regarded as eliminated once a 0-signal is present again at both of the relevant input channels.

If you are using nonequivalent sensors, i.e., the "Type of sensor interconnection" is set to "2-channel nonequivalent", a 0-signal must be present again at the channel supplying the wanted signal.

For information about which F-module channels supply the wanted signals, refer to the manual for the F-module you are using.

"Test of 0-signal not required"

If you assigned "Test of 0-signal not required", a discrepancy error is regarded as eliminated once the discrepancy at the two relevant input channels disappears.

F-modules in SIMATIC S7 for which the "Reintegration after discrepancy error" parameter is not available also exhibit this behavior.

Readback Time Parameter

Each output channel has its own assignable readback time. This time specifies the maximum duration of the switch-off test for the corresponding channel and, thus, also the readback time for the switch-off operation of the channel.

The following readback times can be assigned: 1 ms, 5 ms, 10 ms, 50 ms, 100 ms, 200 ms, and 400 ms.

You should set a sufficiently long readback time if the relevant channel switches high-capacitive loads. If the readback time for a controlled capacitive load is set too low, the output channel is passivated because the discharge of the capacitance does not take place within the switch-off test.

In the event of false readback signals, an amount of time equivalent to the readback time is permitted to elapse before the "short circuit" fault causes the output channel to become passivated.

8.2.5 Wiring of Inputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Use cases

NOTE

The use cases for the digital input modules apply to all digital inputs of the ET 200pro fail-safe modules.
For this reason, the wiring diagrams for the inputs are presented for the 8/16 F-DI DC24V PROFIsafe digital electronic module.

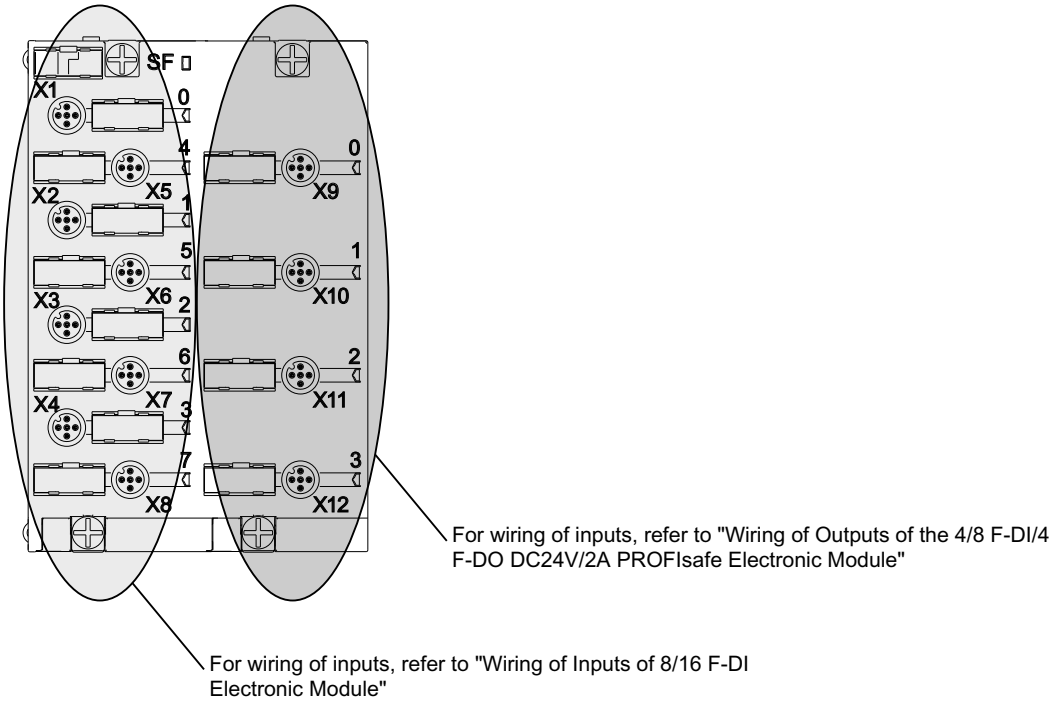

Figure 1-896 Wiring of Inputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

8.2.6 Wiring of Outputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Use Case 1: Wiring a Load to Each Digital Output

Each of the four fail-safe digital outputs consists of one DOx P P-switch (current sourcing) and one DOx M M-switch (current sinking). They connect the load between the P- and M-switches. The two switches are always controlled so that voltage is applied to the load.

The wiring is carried out at the connection module.

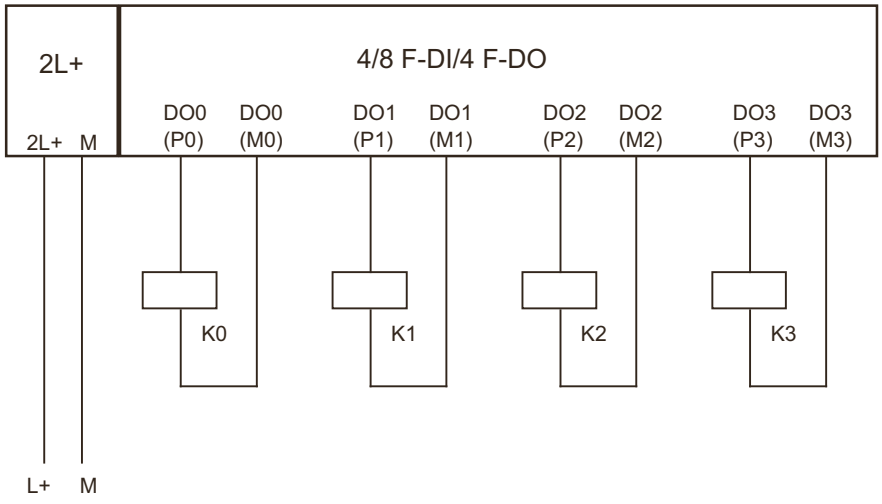

Figure 1-897 Wiring Diagram for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Use Case 2: Wiring Loads to L+ and M at Each Digital Output

You can switch two relays with one fail-safe digital output. The following conditions should be kept in mind:

- L+ and M of the relays must be connected with L+ and M of the F-DO module (reference potential must be equal).
- The normally open contacts of the two relays must be switched in series.

A connection to each of the four digital outputs is possible. The following figure shows an example of the connection at DO 0. This circuit achieves SIL3/Category 4.

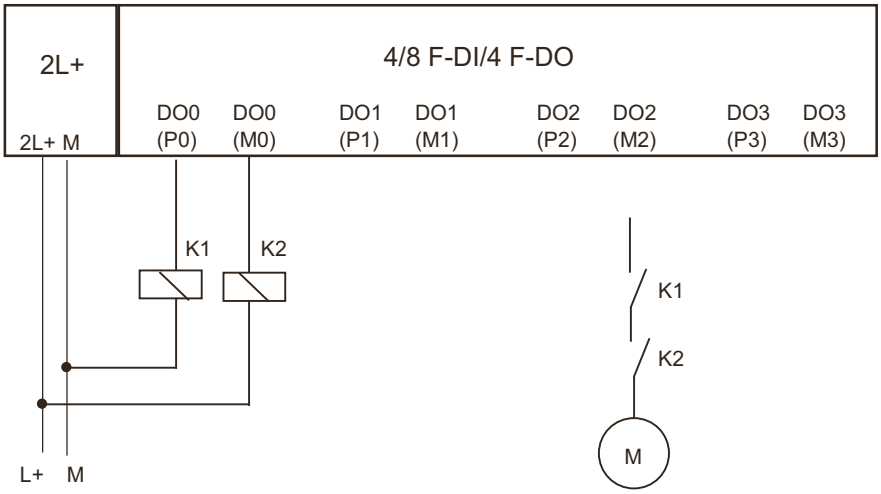

Figure 1-898 Wiring Diagram for Each of Two Relays at One F-DO of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

WARNING

When two relays are connected at one digital output (as shown in the figure above), "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).
The controlled actuator can no longer be switched off in the event of a cross circuit between the P- and M-switches of the output.

WARNING

To avoid cross circuits between P- and M-switches of a fail-safe digital output, you must route the cables for the relay connection at the P- and M-switches to protect against cross circuits (e.g., as separately sheathed cables or in separate cable ducts).

Use Case 3: Wiring Two Loads in Parallel to Each Digital Output

Avoiding/Managing Cross Circuits:

To protect against cross circuits between P- and M-switches of a fail-safe digital output, we recommend the following wiring schemes:

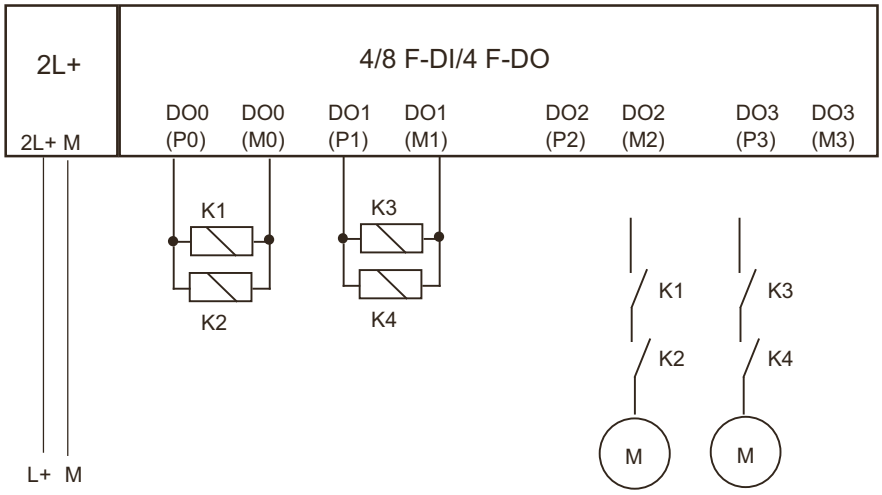

Figure 1-899 Wiring Diagram for Each of Two Relays Parallel at One F-DO of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Block Diagram for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module (Page 82)

8.2.7 Diagnostic Functions of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Behavior in Case of Supply Voltage Failure

Failure of sensor supplies Vs1 and Vs2 is indicated by the SF LED, VsF LED, and the LEDs of the relevant channel group on the F-module. This information is also provided on the module (diagnostic entry). All channels of the module are passivated.

Diagnostic Functions

The following table presents an overview of the diagnostic functions of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module. The diagnostic functions are assigned either to one channel or to the entire module.

Table 1-1212 Diagnostic Functions of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Diagnostic Function*	Fault Number	LED	Range of Effectiveness of Diagnostic	Assignable
Short circuit	1_H	SF	Channel	No
Overload	4_H	SF	Channel	No
Overtemperature	5_H	SF	Module	No
Wire break	6_H	SF	Channel	Yes
Fault	9_H	SF	Module	No

Diagnostic Function*	Fault Number	LED	Range of Effectiveness of Diagnostic	Assignable
Parameter assignment error	10_H	SF	Module	No
Sensor voltage or load voltage is missing	11_H	SF	Module	No
Communication error	13_H	SF	Module	No
Safety-related shutdown	19_H	SF	Channel	No
*: Specifically for F-modules; display in *STEP 7*, see the "Channel-Specific Diagnostics, Fault Types of Fail-Safe Modules" table				

Causes of Faults and Corrective Actions

The following table presents the possible causes of faults and corrective actions for the individual diagnostic messages of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module.

Table 1-1213 Diagnostic Messages of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module, Causes of Faults and Corrective Actions

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Short circuit	Always	Short circuit in the actuator	Eliminate short circuit/cross circuit on actuator Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on.
		Cross-circuit in the actuator	
		Internal fault	Replace module
Short circuit	Cyclically during short-circuit test	Short circuit at the sensor Cross circuit at the sensor	Eliminate short circuit/cross circuit on sensor
Overload	For "1" output signal only	Output stage is overloaded and becomes too hot	Eliminate overload.
Overtemperature	Always	Shutdown due to violation of temperature limit values in the module case.	Check load wiring. Check ambient temperature. Check whether permissible output current (aggregate current) is exceeded for the ambient temperature. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on.
Open circuit	For "1" output signal only	Open circuit	Correct the wire break. Ensure specified minimum load (see *"Technical Specifications of the 4/8 F-DO/4 F-DO DC24V/2A PROFIsafe Electronic Module"*).
Fault	Always	Internal module fault has occurred	Replace module
Parameter assignment error	Always	Inserted module does not match configuration; incorrect parameter assignment	Correct the configuration (compare actual and preset configuration). Check communication paths. Correct the configuration.
		PROFIsafe address set incorrectly on the F-module	Check whether the PROFIsafe address on the module matches the configuration in *STEP 7 HW Config*

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Sensor voltage or load voltage is missing	Always	No supply voltage or supply voltage is too low	Check module for proper contact. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on.
		Voltage dip due to short circuit	Eliminate short circuit/cross circuit.
Communication error	Always	Error in communication between the F-CPU and module due to defective PROFIBUS/Industrial Ethernet connection or higher than permissible electromagnetic interferences, for example	Test PROFIBUS/Industrial Ethernet connection. Eliminate the interferences.
		PROFIsafe monitoring time set too low	Reduce the call interval for F-program, or Set a higher value for the "F-monitoring time" parameter for the module in *STEP 7 HW Config*
		Configuration of the F-module does not match the fail-safe program	Recompile the safety program; then reload the configuration and safety program to the F-CPU
Safety-related shutdown	Always	Process signal is faulty Sensor is defective	Check process signal. Replace sensor if necessary.
		Short circuit between unconnected sensor cable (open switch) and the sensor supply cable	Eliminate short circuit
		Wire break in connected sensor cable (closed switch) or sensor supply cable	Eliminate broken wire
		Assigned discrepancy time is too short	Check the assigned discrepancy time.
			Once the error is eliminated, the F-module must be reintegrated in the safety program.
		Switching frequency exceeded	Reduce the switching frequency

Generally Applicable Information on Diagnostics

For information on diagnostics pertaining to all fail-safe modules (e.g., for reading out diagnostic functions, passivating channels), refer to "*Diagnostics*".

8.2.8 Technical Specifications for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Overview

Technical Specifications		
Dimensions and Weight		
Dimensions W x H x D (mm)	90 x 175 x 65.2 including rack	
Weight	Approx. 280 g	
Module-Specific Specifications		
Number of inputs		
• 1-channel	Max. 8	
• 2-channel	Max. 4	
Number of outputs (P/M switching)	4	
Assigned address area		
• I/O area for inputs	7 bytes	
• I/O area for outputs	5 bytes	
Cable length		
• Unshielded	< 30 m	
• Shielded	< 30 m	
Maximum achievable safety class	1-channel	2-channel
• According to IEC 61508:2000	SIL2	SIL3
• According to ISO 13849-1:2006 or EN ISO 13849-1:2008	Category 3	Category 4
Fail-safe performance characteristics	SIL2	SIL3
• Low demand mode (average probability of failure on demand)	< 1.00E-03	< 1.00E-05
• High demand/continuous mode (probability of a dangerous failure per hour)	< 1.00E-08	< 1.00E-09
Voltages, Currents, Potentials		
Rated supply voltage L+	24 V DC	
• Permissible range	20.4 V to 28.8 V	
• Power loss ride-through of L+	None	
• Power loss ride-through of internal P5	5 ms	
• Reverse polarity protection (1L/1M)	Yes	
• Reverse polarity protection (2L/2M)	No	
Number of simultaneously controllable inputs		
• All mounting positions – Up to 40 °C – Up to 55 °C	 8 (for 28.8 V) 8 (for 24.8 V) or 4 (for 28.8 V)	
Aggregate current of outputs		
• All mounting positions – Up to 40 °C – Up to 50 °C – Up to 55 °C	 6 A 4 A 3 A	

Technical Specifications	
Electrical isolation	
• Between channels and backplane bus	Yes
• Between channels and power supply	No
• Between DIs	No
• Between DOs	No
• Between DIs and DOs	Yes
• Between channels/power supply and shield	Yes
Permissible potential difference between	
• Shield and ET 200pro bus connection	75 V DC/60 V AC
• Shield and I/O (DIs, DOs)	75 V DC/60 V AC
• ET 200pro bus connection and I/O (DIs, DOs)	75 V DC/60 V AC
• Between DIs and DOs	75 V DC/60 V AC
Insulation tested during type test with	
• Shield and ET 200pro bus connection	350 V AC/1 min
• Shield against I/O (DOs)	350 V AC/1 min
• ET 200pro bus connection against I/O (DOs)	350 V AC/1 min
Current consumption	
• From backplane bus	Max. 20 mA
• From the electronic supply (without load)	Typ. 100 mA
• From load voltage L+ (without load)	Typ. 50 mA
Power loss of module	Typ. 5.8 W
Status, Interrupts, Diagnostics	
Status display	
• Inputs	Two-color red/green LED per channel
• Outputs	Two-color red/green LED per channel
• Sensor supply	LED VsF and display via channel LEDs of channel groups
Interrupts	
• Diagnostic interrupt	Channel LED red
Diagnostic functions	
• Group fault display	Red LED (SF)
• Diagnostic information can be read out	Possible
• I&M functionality *	See "ET 200pro Distributed I/O" Manual
Sensor Supply Outputs	
Number of outputs	2
Output voltage	
• Loaded	Min. L+ (-1.5 V)
Output current	
• Rated value	200 mA
• Permissible range	0 mA to 200 mA
• Permissible aggregate current of outputs	400 mA
• Short-circuit protection	Yes, electronic

Technical Specifications		
• Operating value	0.7 A to 2.1 A	
Data for Selecting a Sensor **		
• Input voltage		
• Rated value	24 V DC	
• At signal "1"	15 V to 30 V	
• At signal "0"	-30 V to 5 V	
Input current		
• At signal "1"	Typ. 3.7 mA	
Input delay	Assignable (for all inputs together)	
• At "0" after "1"	Typ. 0.5 ms	(0.3 ms to 0.7 ms)
	Typ. 3 ms	(2.6 ms to 3.4 ms)
	Typ. 15 ms	(13 ms to 17 ms)
• At "1" after "0"	Typ. 0.5 ms	(0.3 ms to 0.7 ms)
	Typ. 3 ms	(2.6 ms to 3.4 ms)
	Typ. 15 ms	(13 ms to 17 ms)
Input characteristic	In accordance with IEC 61131-2, Type 1	
Connection of 2-wire BERO	Not possible	
• Permissible quiescent current	Max. 0.6 mA	
Data for Selecting an Actuator**		
Output voltage		
• At signal "1"	• Min. L+ (-1.5 V) • P-switch: L+ (-1.5 V), minimum; voltage drop at M-switch: 0.5 V, maximum	
Output current for "1" signal		
• Rated value	2 A	
• Permissible range	20 mA to 2.4 A	
For "0" signal (residual current)	Max. 0.5 mA	
Indirect control of load by means of coupling relay:		
For "0" signal (residual current)		
• P-switch	Max. 0.5 mA	
• M-switch	Max. 1 mA	
Load resistance range	12 Ω to 1 kΩ	
Lamp load	Max. 10 W	
Wire break monitoring (open load detection) and overload monitoring		
• Response threshold	I < 4 to 19 mA	
• Fault detection time	Depends on the assigned readback time (see "*Response Times*")	
Parallel switching of 2 outputs	Not possible	
Control of a digital input	Not possible	
Switching frequency		
• With resistive load	Max. 30 Hz	

Technical Specifications	
• With inductive load in accordance with IEC 60947-5-1, DC13	Max. 0.1 Hz
• With lamp load	Max. 10 Hz
Limit on inductive shutdown voltage to	Typ. 2L+ (-2×47 V)
Short-circuit protection of output	Yes, electronic
• Response threshold (short circuit)	5 A to 12 A
• Response threshold (external M-short circuit)	5 A to 12 A
• Response threshold (external P-short circuit)	25 A to 45 A
Overload protection	Yes
• Response threshold	I > 2.8 A to 3.2 A
Time, Frequency	
Internal preprocessing times	See *"Response Times"*
Acknowledgment time in safety mode	Min. 4 ms / max. 8 ms
• Short-circuit test enabled For input delay of 0.5 ms For input delay of 3 ms: For input delay of 15 ms:	 Min. 4 ms / max. 7 ms Min. 4 ms / max. 12 ms Min. 4 ms / max. 9 ms
• Short-circuit test disabled	Min. 4 ms / max. 6 ms
Minimum sensor signal duration	See *"Minimum Duration of Sensor Signals for Proper Detection by F-DI Module"* table in *"Wiring"*.
Protection against Overvoltage	
Protection of supply voltage L+ from surge in accordance with IEC 61000-4-5 with external protection elements only	
• Symmetrical (L+ to M)	+ 1 kV; 1.2/50 µs
• Asymmetrical (L+ to PE, M to PE)	+ 2 kV; 1.2/50 µs
Protection of inputs and outputs from surge in accordance with IEC 61000-4-5 with external protection elements only	Not required since cable length is < 30 m
Protection of supply voltage 1L+ from overvoltage	Internal fuse tripped
*: Identification sets are described in the "ET200 pro Distributed I/O System" manual.	
**: For more information on the requirements for sensors and actuators, refer to *"Wiring"*.	

8.3 F-Switch PROFIsafe Digital Electronic Module

8.3.1 Properties of the F-Switch PROFIsafe Electronic Module

Order Number

6ES7 148-4FS00-0AB0

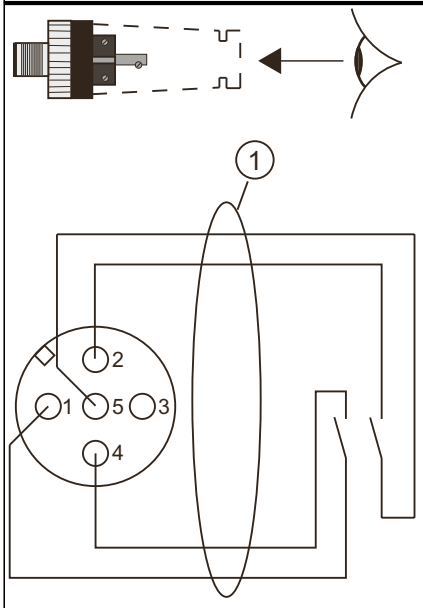
Properties

The F-Switch PROFIsafe electronic module has the following properties:

- Inputs
  - 2 inputs (SIL3/Category 3 or 4)
  - 24 V DC rated input voltage
  - Suitable for switches and 3- or 4-wire proximity switches (BEROs)
  - Two short-circuit-proof sensor supplies for each pair of inputs
  - External sensor supply possible
  - 1oo2 evaluation only supported
- Outputs
  - 3 outputs, PP-switching
  - Output current 1 A (F0/F1) in SIL3/Category 4, 6 A (2L+) in SIL2/Category 3
  - 24 V DC rated input voltage
  - Suitable for standard output modules (2L+ power bus), frequency converter, and motor starter (F0, F1 power bus)
- Group fault display (SF; red LED)
- Group fault display for the sensor supplies (VsF; red LED)
- Status and fault LEDs for each input/output (two-color green/red LED)
- Identification data (*see ET 200pro Distributed I/O System Standard Manual*)
- Can only be operated in safety mode

8.3.2 Terminal Assignment of the F-Switch PROFIsafe Electronic Module

Terminal Assignment on CM F-IO 2xM12 Connection Module



The following table contains the terminal assignment of the F-Switch PROFIsafe on the CM F-IO 2xM12 connection module.

Sockets X1 to X2 are assigned twice. This enables you to implement a 1oo2 evaluation with one connecting cable, e.g., channels 0 and 2 at connector X1.

The functional ground (FG) is located on the shield.

Table 1-1214 Terminal Assignment on CM F-IO 2×M12 Connection Module for F-Switch PROFIsafe

Circular connector view	Terminal	Assignment of X1 to X2
	1	Connectors X1 to X2: 24 V sensor supply 1 (Vs1)[2]
	2	Input signal:

Circular connector view	Terminal	Assignment of X1 to X2
	2	Connector X1: Channel 2 Connector X2: Channel 3
	3	Sensor supply ground (1M)
	4	Input signal:
		Connector X1: Channel 0 Connector X2: Channel 1
	5	Connectors X1 to X2: 24 V sensor supply 2 (Vs2)[2]

[1] 3-, 4- or 5-core copper cable
[2] Provided by the ET 200pro for the connected sensor

8.3.3 Block Diagram of the F-Switch PROFIsafe Electronic Module

Block Diagram

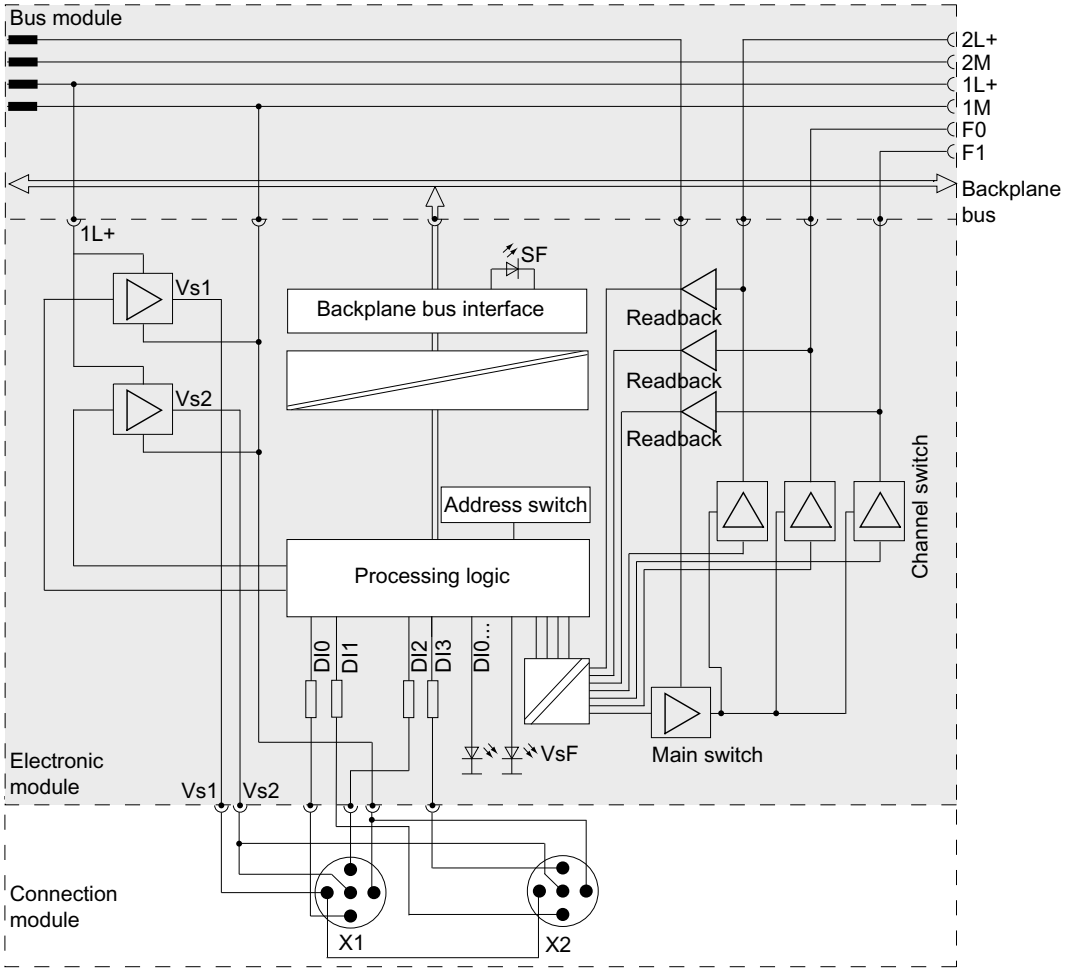


Figure 1-900 Block Diagram of the F-Switch PROFIsafe Electronic Module

8.3.4 Parameters for the F-Switch PROFIsafe Electronic Module

Parameters in *STEP 7*

The table below lists the parameters that can be assigned for the F-Switch PROFIsafe (see also *"Configuration and Parameter Assignment"*).

Table 1-1215 Parameters of the F-Switch PROFIsafe Module

Parameters	Range	Default	Type of Parameter	Range of Effectiveness
F-parameters:				
F_destination_address	1 to 1022	Assigned by *STEP 7*	Static	Module

Parameters	Range	Default	Type of Parameter	Range of Effectiveness
F-monitoring time	10 to 10000 ms	150 ms	Static	Module
Module Parameters:				
Behavior after channel faults*	Passivate the entire module/Passivate the channel	Passivate the entire module	Static	Module
Module Parameter Inputs:				
Input delay	3 ms	3 ms	Static	Module
Short-circuit test	Cyclic/Disable	Cyclic	Static	Module
Channel n, n+2	Enabled/disabled	Enabled	Static	Channel group
Sensor supply	Internal/external	Internal	Static	Module
Evaluation of the sensors	1oo2 evaluation	1oo2 evaluation	Static	Channel group
Type of sensor interconnection	1-channel; 2-channel equivalent; 2-channel nonequivalent	1-channel equivalent 2-channel equivalent	Static	Channel group
Behavior at discrepancy	Provide last valid value; Provide value 0	Provide last valid value	Static	Channel group
Discrepancy time	10 to 30000 ms	10 ms	Static	Channel group
Reintegration after discrepancy error	Test of 0-signal not required/Test of 0-signal required	Test of 0-signal not required	Static	Channel group
Module Parameter Outputs:				
Test of outputs	Enabled/disabled	Enabled	Static	Module
* This setting is only relevant when the *S7 Distributed Safety* V 5.4 or higher optional package is installed.				

Short-circuit test parameter

The cyclic short-circuit test is enabled and disabled using the short-circuit test parameter. The short-circuit test is only useful for simple switches that do not have their own power supply. If the short-circuit test has been enabled, the internal sensor supplies must be used (see also *"Use Cases of the F-Switch PROFIsafe Electronic Module"*).

Sensor Supply Parameter

This parameter can be used to enable the "internal sensor supply" of the F-module. This setting is a prerequisite for using the short-circuit test.

NOTE

When there are different sensor supply parameter settings (internal/external) for the individual channel groups, the use cases presented in the section "Use Cases of the F-Switch PROFIsafe Electronic Module" apply to specific channel groups.

Behavior at Discrepancy Parameter

As the "behavior at discrepancy" you assign the value that is made available to the safety program in the F-CPU while there is a discrepancy between the two input channels involved, i.e., during the discrepancy time. You assign the behavior at discrepancy as follows:

- "Provide last valid value", or
- "Provide value 0"

"Provide last valid value"

The last valid value (old value) before discrepancy occurs is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the two relevant input channel signals. This value is supplied until the discrepancy disappears or until the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is extended by an amount equal to this time.

As a result, the discrepancy time of sensors connected via two channels must be set for fast reactions to short response times. It makes no sense, for example, for a time-critical shutdown to be triggered by sensors connected via two channels with a discrepancy time of 500 ms. In the worst case, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time.

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time that includes a sufficient cushion against false tripping of discrepancy errors.

"Provide value 0"

The value "0" is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two relevant input channels.

If you specified "Provide value 0", the sensor-actuator response time will not be affected by the discrepancy time.

Discrepancy Time Parameter

Here, you can specify the discrepancy time for each channel pair. The entered value is rounded to a multiple of 10 ms.

Requirements

You have assigned the following:

- Type of sensor interconnection: "2-channel equivalent" or "2-channel nonequivalent"

Discrepancy Analysis and Discrepancy Time

If you are using one two-channel sensor, one nonequivalent sensor or two single-channel sensors that are measuring the same physical process variable, the sensors will respond with a time delay due to the limited accuracy of their arrangement.

The discrepancy analysis for equivalence/nonequivalence is used with fail-safe inputs to detect faults based on the timing of two signals with the same functionality. Discrepancy analysis is initiated when different levels (when testing for nonequivalence: same voltage levels) are detected at two associated input signals. A test is conducted to determine whether the difference in levels (when testing for nonequivalence: the consistency) has disappeared within a programmable period known as the discrepancy time. If not, a discrepancy error exists.

In most cases, the discrepancy time starts but does not elapse completely, since the signal differences disappear after a short time.

Select a discrepancy time of sufficient length so that in case of no error, the difference between the two signals (when checking for nonequivalence: the consistency) has definitely disappeared before the discrepancy time expires.

Behavior While Discrepancy Time is Running

While the assigned discrepancy time is running internally on the module, either the **last valid value** or **"0"** is made available to the safety program in the F-CPU by the relevant input channels, depending on the parameter assignment for the behavior at discrepancy.

Behavior After Discrepancy Time Elapses

If the input signals are not equivalent following expiration of the specified discrepancy time (when checking for nonequivalence: no inequality), for example due to wire break at a sensor line, the system detects a discrepancy error and generates a "discrepancy" diagnostic message in the diagnostic buffer of the F-I/O module to identify the faulty channels.

Reintegration After Discrepancy Error Parameter

This parameter is used to specify when a discrepancy error is regarded as eliminated and, thus, when the relevant input channels can be reintegrated. The following can be assigned:

- "Test of 0-signal required" or
- "Test of 0-signal not required"

"Test of 0-signal required"

If you assigned "Test of 0-signal required", a discrepancy error is regarded as eliminated once a 0-signal is present again at both of the relevant input channels.

If you are using nonequivalent sensors, i.e., the "Type of sensor interconnection" is set to "2-channel nonequivalent", a 0-signal must be present again at the channel supplying the wanted signal.

For information about which F-module channels supply the wanted signals, refer to the manual for the F-module you are using.

"Test of 0-signal not required"

If you assigned "Test of 0-signal not required", a discrepancy error is regarded as eliminated once the discrepancy at the two relevant input channels disappears.

F-modules in SIMATIC S7 for which the "Reintegration after discrepancy error" parameter is not available also exhibit this behavior.

8.3.5 Wiring of Inputs of the F-Switch PROFIsafe Electronic Module

NOTE
The information about wiring options and specific parameters in *STEP 7* (use cases) in the following section is applicable to the F-Switch PROFIsafe.

Use Case Selection

The following figure provides information to help you select the use case that corresponds to your fail-safe requirements. The following sections provide instructions on wiring the F-module and identify the parameters you must assign in *STEP 7* for each use case.

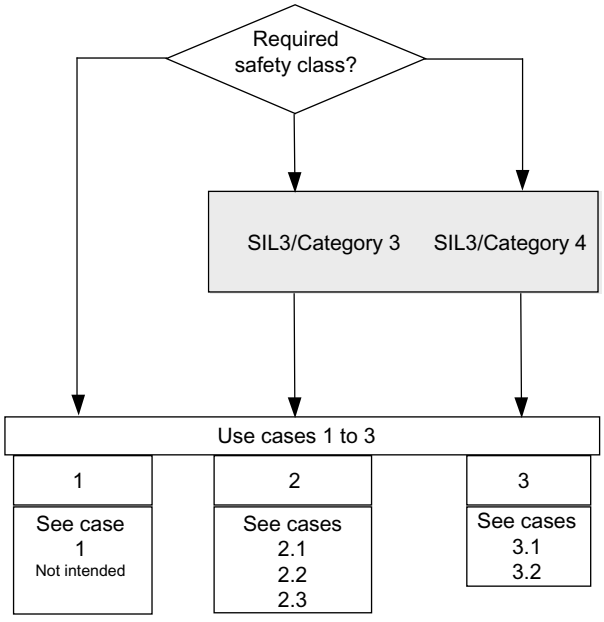

Figure 1-901 Selecting a use case

WARNING

The achievable safety class is dependent on the quality of the sensor and the length of the proof-test interval in accordance with IEC 61508:2000.

Conditions for Achieving SIL/Category

The conditions for achieving the respective safety requirements are presented in the following table.

Table 1-1216 F-DI Modules: Conditions for Achieving SIL/Category

Use case	Sensors	Evaluation of the sensors	Sensor supply	Achievable SIL/Category
2.1	1-channel	1oo2	Internal, with short-circuit test	3 / 3
			Internal, without short-circuit test	
			External	
2.2	2-channel equivalent	1oo2	Internal, without short-circuit test	
			External	
2.3	2-channel nonequivalent	1oo2	Internal, without short-circuit test	
			External	
3.1	2-channel equivalent	1oo2	Internal, with short-circuit test	3 / 4
3.2	2-channel nonequivalent			

NOTE

You can operate the various inputs of an F-Switch PROFIsafe simultaneously in SIL3/Category 3 **and** in SIL3/Category 4. You only have to connect the inputs and assign parameters as shown in the following sections.

Sensor Requirements

Please note the information in "*Requirements for Sensors and Actuators*" when using sensors for safety-related applications.

8.3.6 Use Case 1: Safety Mode of F-Switch PROFIsafe

Use Case 1

NOTE

Use case 1 is not intended for the F-Switch PROFIsafe.

8.3.7 Use Case 2: Safety Mode SIL3/Category 3

Conditions for Achieving SIL/Category

NOTE

For the conditions for achieving the SIL/Category and the requirements for sensors, see "Wiring of Inputs of the F-Switch PROFIsafe Electronic Module".

Assigning Inputs to Each Other

The F-Switch PROFIsafe electronic module has 2 fail-safe inputs (SIL3). The following assignment applies:

F-Switch PROFIsafe
Input channels DI 0 with DI 2
Input channels DI 1 with DI 3

Sensor Supply

The F-Switch PROFIsafe electronic module provides sensor supplies VS1 and VS2 for inputs 0 to 3.

The sensors can be powered internally or externally.

F-Switch PROFIsafe
Input channels DI 0 with DI 1 with sensor supply Vs1
Input channels DI 2 with DI 3 with sensor supply Vs2

Wiring Diagram for Use Case 2.1 – Connecting One Sensor Via One Channel to Two Inputs

One sensor is connected via one channel to two inputs of the F-module for each process signal (1oo2 evaluation).

The wiring is carried out at the appropriate connection module.

⚠ WARNING

In order to achieve SIL3/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

NOTE

If the voltage is supplied to the sensor from the F-Switch PROFIsafe electronic module, you must use the internal sensor supply Vs1. Connection to Vs2 is not possible.

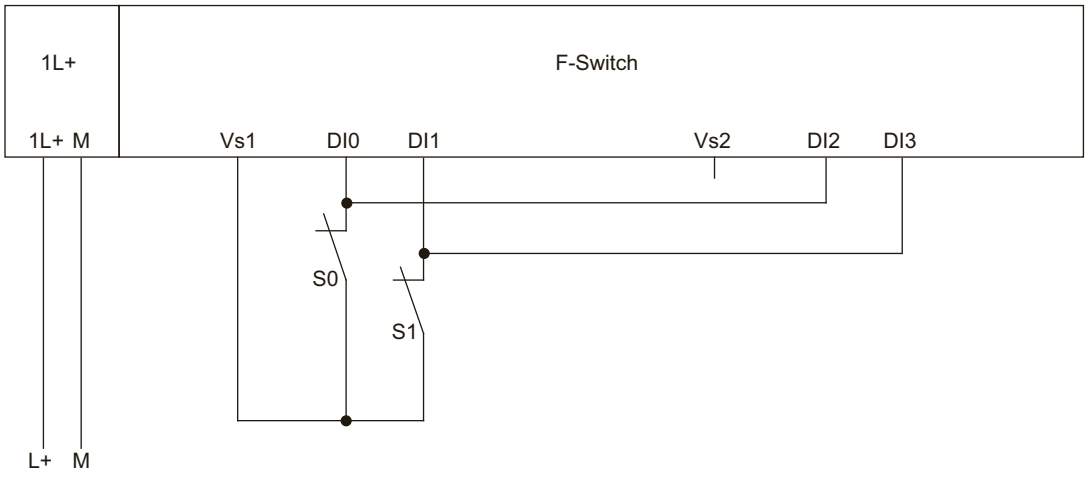

Figure 1-902 Wiring Diagram for F-Switch - One Sensor Connected Via One Channel to Two Inputs, Internal Sensor Supply

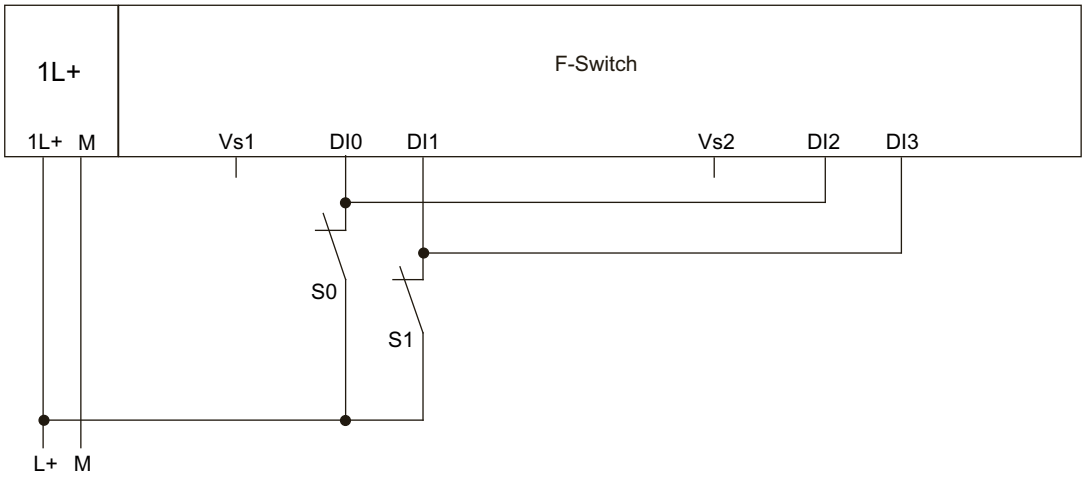

Figure 1-903 Wiring Diagram for F-Switch - One Sensor Connected Via One Channel to Two Inputs, External Sensor Supply

Assignable Parameters for Use Case 2.1

Set the "Type of sensor interconnection" parameter to "1-channel" for the corresponding input. The discrepancy time is permanently preset to 10 ms and cannot be changed.

You can enable or disable the "short-circuit test" parameter. For digital inputs connected to an external supply, set the "Sensor supply" parameter for the corresponding digital input to "external". The program will otherwise report a "short circuit" diagnostics event if the "short-circuit test" is enabled.

Special Features for Fault Detection in Use Case 2.1

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1217 F-Switch PROFIsafe Electronic Module: Fault Detection

Example of Fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	**Internal sensor supply and short-circuit test disabled**	**External sensor supply**
Short circuit of DI 0 with DI 1	No	No	No
Short circuit of DI 0 with DI 3	No	No	No
P-short circuit of DI 0	Yes	No	No
M-short circuit of DI 0	Yes*	Yes*	No
Discrepancy error	Yes	Yes	Yes
P-short circuit of sensor supply	Yes	No	No
M-short-circuit in sensor supply or defective	Yes	Yes	Yes
Short-circuit in sensor supply at DI 0	No	No	No
Supply voltage fault	Yes	Yes	Yes
***:** Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.			

WARNING

If the short-circuit test is disabled or cannot be enabled, the wiring between the sensor and input channel must be short circuit-proof.

Wiring Diagram for Use Case 2.2 – Connecting One Two-Channel Sensor Via Two Channels

One two-channel sensor is connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The wiring is carried out at the appropriate connection module.

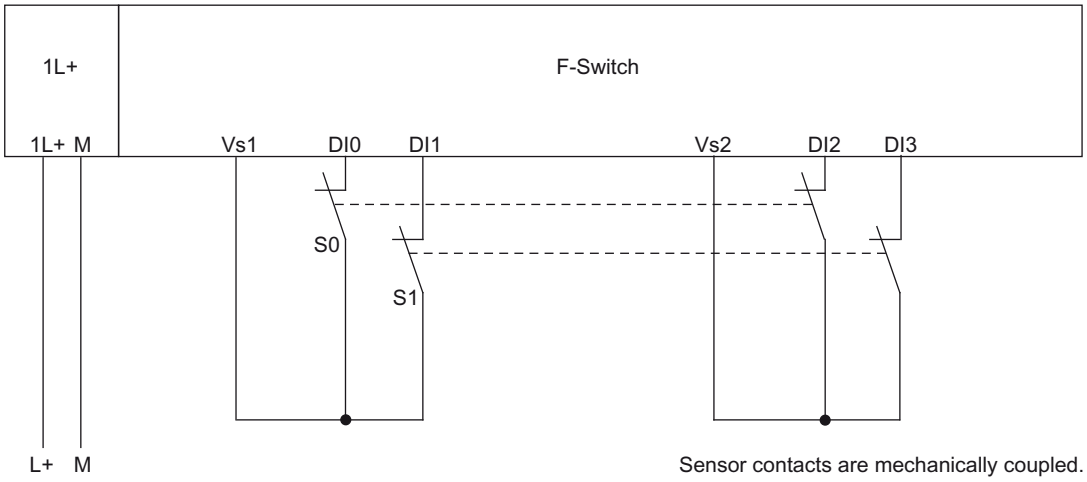

Figure 1-904 Wiring Diagram for F-Switch - One Two-Channel Sensor Connected, Internal Sensor Supply

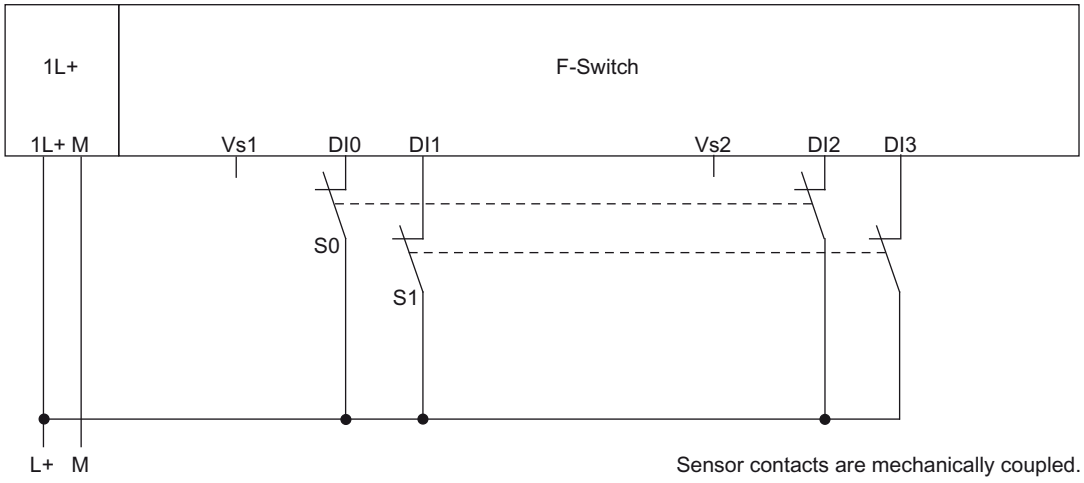

Figure 1-905 Wiring Diagram for F-Switch - One Two-Channel Sensor Connected Via Two Channels, External Sensor Supply

Wiring Diagram of the Connection of Two Single-Channel Sensors to Two Channels

Two single-channel sensors are connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation). The sensors can also be supplied via an external sensor supply.

⚠ WARNING
In order to achieve SIL2/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 2.2

Set the "Type of sensor interconnection" parameter to "2-channel equivalent" for the corresponding input.

You can enable or disable the "short-circuit test" parameter. For digital inputs connected to an external supply, set the "Sensor supply" parameter for the corresponding digital input to "external". The program will otherwise report a "short circuit" diagnostics event if the "short-circuit test" is enabled.

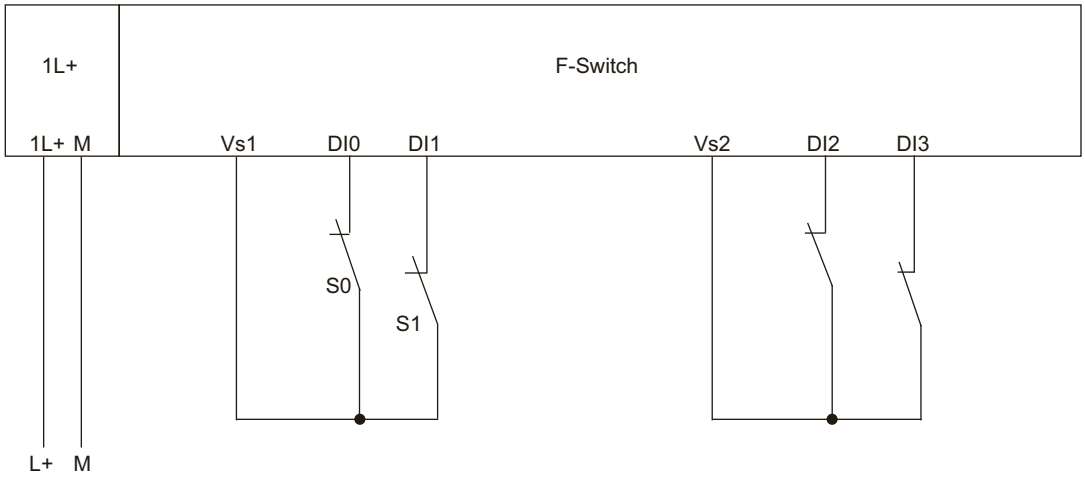

Figure 1-906 Wiring Diagram for F-Switch - Two One-Channel Sensors Connected Via Two Channels, Internal Sensor Supply

Special Features for Fault Detection in Use Case 2.2

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1218 F-Switch PROFIsafe Electronic Module: Fault Detection

Example of Fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	Yes*	Yes*	Yes*
Short circuit of DI 0 with DI 2	No	No	No
Short circuit of DI 0 with DI 3	Yes*	Yes*	Yes*
P-short circuit of DI 0	Yes*	Yes*	Yes*
M-short circuit of DI 0	Yes*	Yes*	Yes*
Discrepancy error	Yes	Yes	Yes
P-short circuit of sensor supply	Yes	No	No
M-short-circuit in sensor supply or defective	Yes	Yes	Yes

Example of Fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	Internal sensor supply and short-circuit test disabled	External sensor supply
Short-circuit in sensor supply at DI 0	Yes*	Yes*	Yes*
Supply voltage fault	Yes	Yes	Yes
*: Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.			

WARNING

If the short-circuit test is not enabled or the sensor supply to digital inputs is set to "external", the wiring between the sensor and the input channel must be short circuit-proof.

Wiring Diagram for Use Case 2.3 – Connecting One Nonequivalent Sensor Via Two Channels Nonequivalently

One nonequivalent sensor is connected nonequivalently via two channels to two inputs of the F-I/O module for each process signal (1oo2 evaluation).

The left channels on the F-module (DI0 through DI1) supply the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs on the F-CPU.

NOTE

If the voltage is supplied to the sensor from the F-Switch PROFIsafe module, you must use the internal sensor supply Vs1. Connection to Vs2 is not possible.

The wiring is carried out at the appropriate connection module.

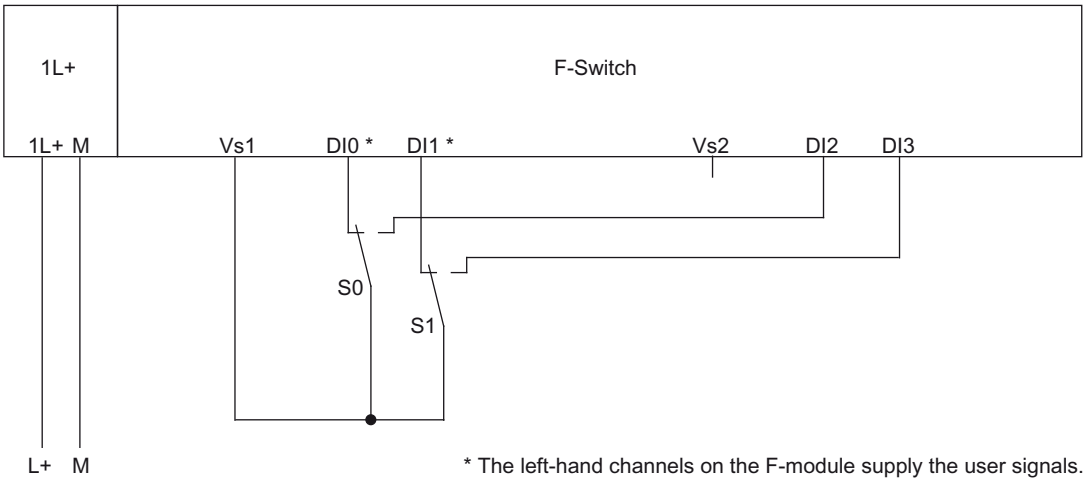

Figure 1-907 Wiring Diagram for F-Switch - One Nonequivalent Sensor Connected Via Two Channels Nonequivalently, Internal Sensor Supply

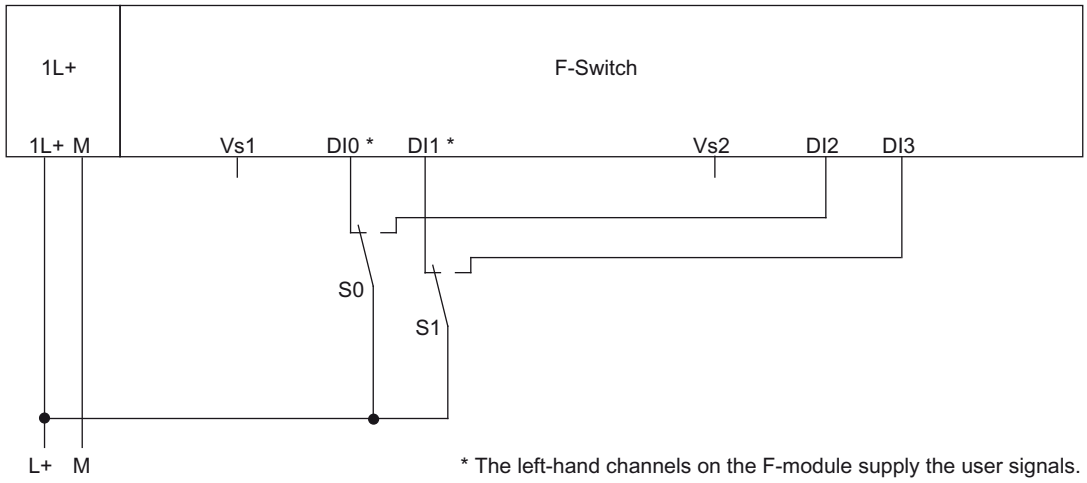

Figure 1-908 Wiring Diagram for F-Switch - One Nonequivalent Sensor Connected Via Two Channels Nonequivalently, External Sensor Supply

Wiring Diagram for Nonequivalent Connection of Two Single-Channel Sensors to Two Channels

Two single-channel sensors are connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The left channels of the F-module (DI 0 through DI 1) return the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs on the F-CPU.

The sensors can also be supplied via an external sensor supply.

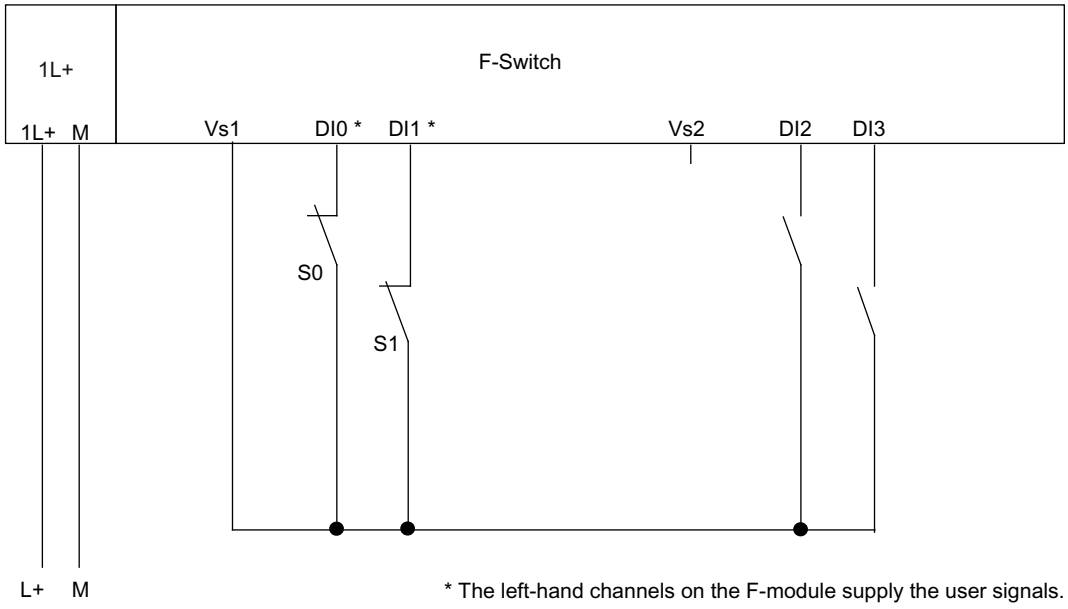

Figure 1-909 Wiring Diagram for F-Switch - Two One-Channel Sensors Connected Via Two Channels Nonequivalently, Internal Sensor Supply

⚠ WARNING

In order to achieve SIL2/Category 3 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 2.3

Set the "Type of sensor interconnection" parameter to "2-channel nonequivalent" for the corresponding input.

You can enable or disable the "short-circuit test" parameter. For digital inputs connected to an external supply, set the "Sensor supply" parameter for the corresponding digital input to "external". The program will otherwise report a "short circuit" diagnostics event if the "short-circuit test" is enabled.

Special Features for Fault Detection in Use Case 2.3

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1219 F-Switch PROFIsafe Electronic Module: Fault Detection (Use Case 2.3)

Example of Fault	Fault detection in case of ...		
	Internal sensor supply and short-circuit test enabled	Internal sensor supply and short-circuit test disabled	External sensor supply
Short circuit of DI 0 with DI 1	Yes*	Yes*	Yes*
Short circuit of DI 0 with DI 2	Yes	Yes	Yes
Short circuit of DI 0 with DI 3	Yes*	Yes*	Yes*
P-short circuit of DI 0	Yes*	Yes*	Yes*
M-short circuit of DI 0	Yes*	Yes*	Yes*
Discrepancy error	Yes	Yes	Yes
P-short circuit of sensor supply	Yes	No	No
M-short circuit of sensor supply or sensor supply defective	Yes	Yes	Yes
Short-circuit in sensor supply at DI 0	Yes*	Yes*	Yes*
Supply voltage fault	Yes	Yes	Yes
*: Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.			

8.3.8 Use Case 3: Safety Mode SIL3/Category 4

Assigning Inputs to Each Other

The F-Switch PROFIsafe has 2 fail-safe inputs (SIL3). The following assignments apply in this case:

Table 1-1220 Use Case 3: Assignment of Input Channels to Each Other

F-Switch PROFIsafe
Input channels DI 0 with DI 2
Input channels DI 1 with DI 3

Sensor Supply

The F-Switch PROFIsafe electronic module provides sensor supplies VS1 and VS2 for inputs 0 to 3.

The sensor must be supplied internally.

Table 1-1221 Use Case 2: Assignment of Sensor Supply to Inputs

F-Switch PROFIsafe
Input channels DI 0 with DI 1 with sensor supply Vs1
Input channels DI 2 with DI 3 with sensor supply Vs2

Wiring Diagram for Use Case 3.1 – Connecting One Two-Channel Sensor Via Two Channels

One two-channel sensor is connected via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The wiring is carried out at the appropriate connection module.

The figure below illustrates an example wiring diagram for channel groups 1 and 2.

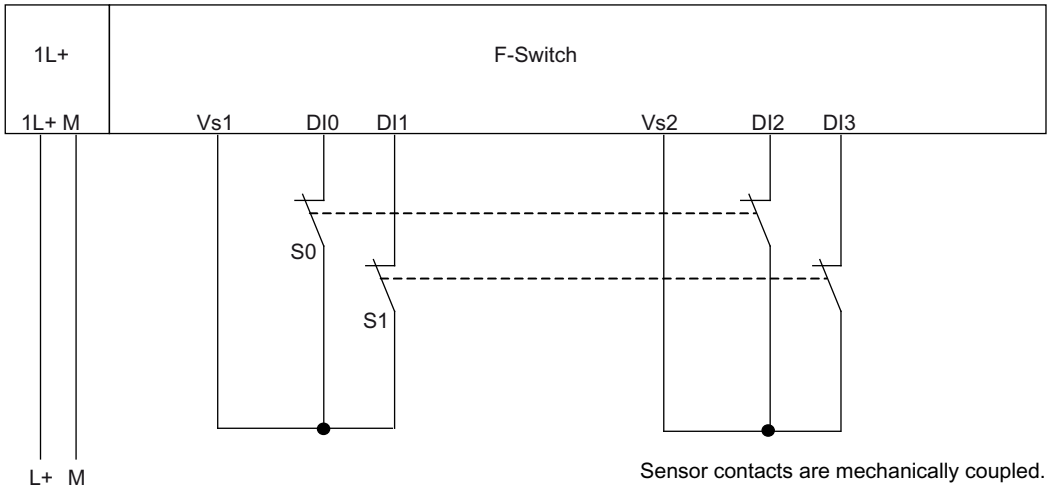

Figure 1-910 Wiring Diagram for F-Switch - One Two-Channel Sensor Connected Via Two Channels, Internal Sensor Supply

Alternatively, two one-channel sensors can be connected via two channels (see Figure *"Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Via Two Channels, Internal Sensor Supply"*). In this case, the same process variable is measured with mechanically separated sensors.

⚠ WARNING

In order to achieve SIL3/Category 4 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 3.1

Set the "Type of sensor interconnection" parameter to "2-channel equivalent" for the corresponding input. Enable the "short-circuit test" parameter and set "internal" at the "sensor supply" parameter.

Wiring Diagram for Use Case 3.2 – Connecting One Nonequivalent Sensor Via Two Channels Nonequivalently

You can connect two process signals to an F-Switch PROFIsafe. One sensor is connected nonequivalently via two channels to two inputs of the F-module for each process signal (1oo2 evaluation).

The left channels of the F-module (DI 0 through DI 1) return the wanted signals. If no faults are detected, these signals will be available in the I/O area for inputs on the F-CPU.

NOTE

You must use the internal sensor supply Vs1 to supply voltage to the sensor. Connection to Vs2 is not possible.

The wiring is carried out at the appropriate connection module.

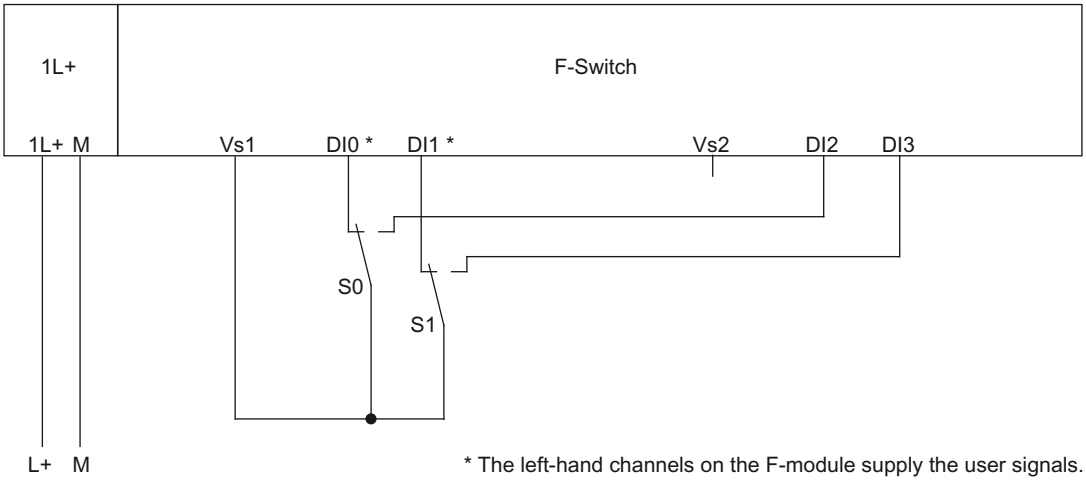

Figure 1-911 Wiring Diagram for F-Switch - One Nonequivalent Sensor Connected Via Two Channels Nonequivalently, Internal Sensor Supply

Alternatively, two one-channel sensors can be connected nonequivalently via two channels (see Figure *"Wiring Diagram for F-DI Modules - Two One-Channel Sensors Connected Nonequivalently Via Two Channels, Internal Sensor Supply*"). In this case, the same process variable is measured with mechanically separated sensors.

⚠ WARNING

In order to achieve SIL3/Category 4 with this wiring, you must install a suitably qualified sensor, for example, in accordance with IEC 60947.

Assignable Parameters for Use Case 3.2

Set the "Type of sensor interconnection" parameter to "2-channel nonequivalent" for the corresponding input. Enable the "short-circuit test" parameter and set "internal" at the "sensor supply" parameter.

Specific Characteristics for Fault Detection (Use Cases 3.1 and 3.2)

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-1222 F-Switch PROFIsafe Electronic Module: Fault Detection (Use Cases 3.1 and 3.2)

Example of Fault	Fault detection with internal sensor supply and enabled short-circuit test for ...	
	Sensor 2-channel equivalent	Sensor 2-channel nonequivalent
Short circuit of DI 0 with DI 1	Yes*	Yes*
Short circuit of DI 0 with DI 2	Yes*	Yes
Short circuit of DI 0 with DI 3	Yes*	Yes*
P-short circuit of DI 0	Yes	Yes
M-short circuit of DI 0	Yes*	Yes*
Discrepancy error	Yes	Yes
P-short circuit of Vs1	Yes	Yes
M-short circuit of Vs1, or Vs2 defective	Yes	Yes
Short circuit of Vs1 with Vs2	Yes	Yes
Fault in read/test circuit	Yes	Yes
Supply voltage fault	Yes	Yes
***:** Fault is detected only in case of signal corruption. That is, the signal read differs from the sensor signal (discrepancy error). If there is no signal corruption relative to the sensor signal, fault detection is not possible and is not required from a safety standpoint.		

Requirements for Machine Protection Applications With Category 4

The following requirements apply to machine protection applications with Category 4:

- State-of-the-art wiring must be used between the sensors and the automation system or between the automation system and the actuators to prevent short circuits.
- All short circuits listed in the above table are detected. Detection of a short circuit is sufficient in this case, because two faults must exist for the short circuit to occur (both of the short-circuited signal cables exhibit an insulation fault). Thus, a multiple short-circuit analysis is not required.

Processes for detection of all short circuits are also permissible if individual short circuits are not detected, provided:

- The short circuits do not cause corruption of read signals compared to the sensor signals or
- The short circuits cause corruption of read signals compared to the sensor signals, but in the direction that ensures safety.

8.3.9 Wiring of Outputs of the F-Switch PROFIsafe Electronic Module

Assignment of Channels

Channel	Power bus
DO0	F0
DO1	F1
DO2	2L+

A list of the modules operated behind the F-Switch can be obtained on the Internet under ID 25371449.

Actuator Interconnection

The actuators are interconnected via the power bus.

The PP-switching outputs of the F-Switch PROFIsafe are fed to the actuators via the power bus. The power bus is permanently wired within the system. As a result, only limited wiring variations are possible. The power buses can be tapped and routed or conditioned only from modules of the ET 200pro system.

Wiring Diagram of Frequency Converter (SIL2/Category 3)

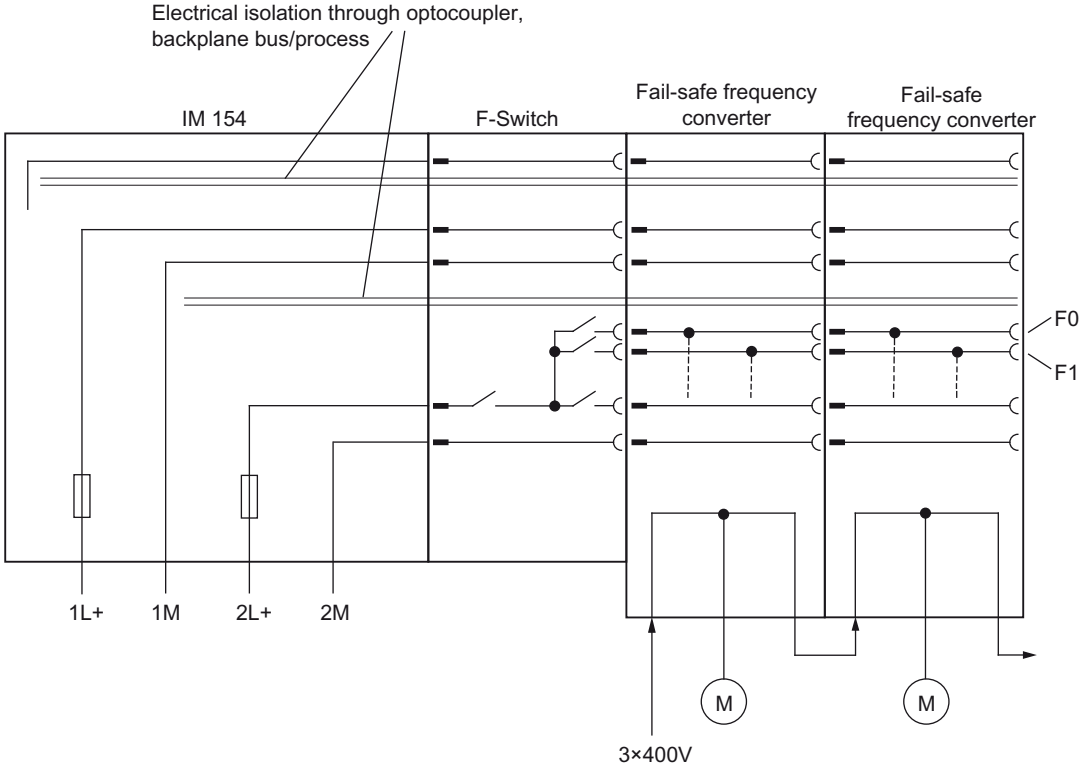

Figure 1-912 Wiring Diagram of F-Switch PROFIsafe - Connection of Frequency Converter

Wiring Diagram of Standard Digital Outputs (SIL2/Category 3)

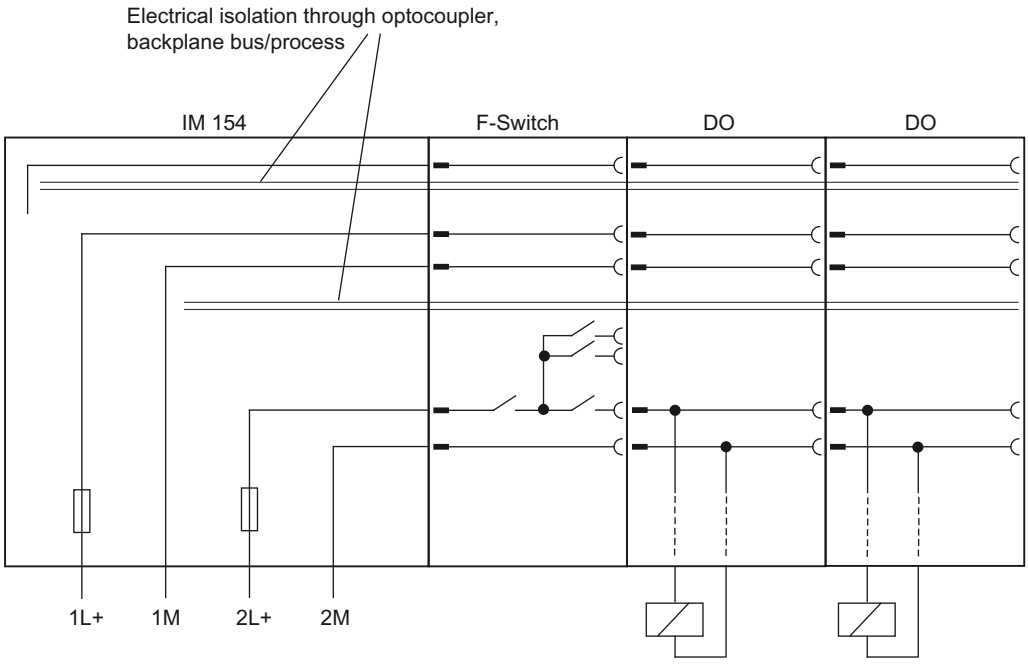

Figure 1-913 Wiring Diagram of F-Switch PROFIsafe - Connection of Digital Outputs

⚠ WARNING

In the event of a cross circuit between 2L+ and DO or an external P-short circuit, the controlled actuator or the 2L+ power bus is no longer switched off. You should always wire the actuators in a cross-circuit-proof and an external P-short-circuit-proof manner, for example, using sheathed cables or separate cable ducts, in order to prevent a cross-circuit or an external P-short circuit.

⚠ WARNING

When supplying power to standard digital output modules, always use the CM modules of these digital output modules to supply the actuators (actuator feedback on the DO module). Otherwise, a residual current can flow for a "0-signal" in the event of a current break.

Wiring Diagram of Shutdown Modules (SIL3/Category 4)

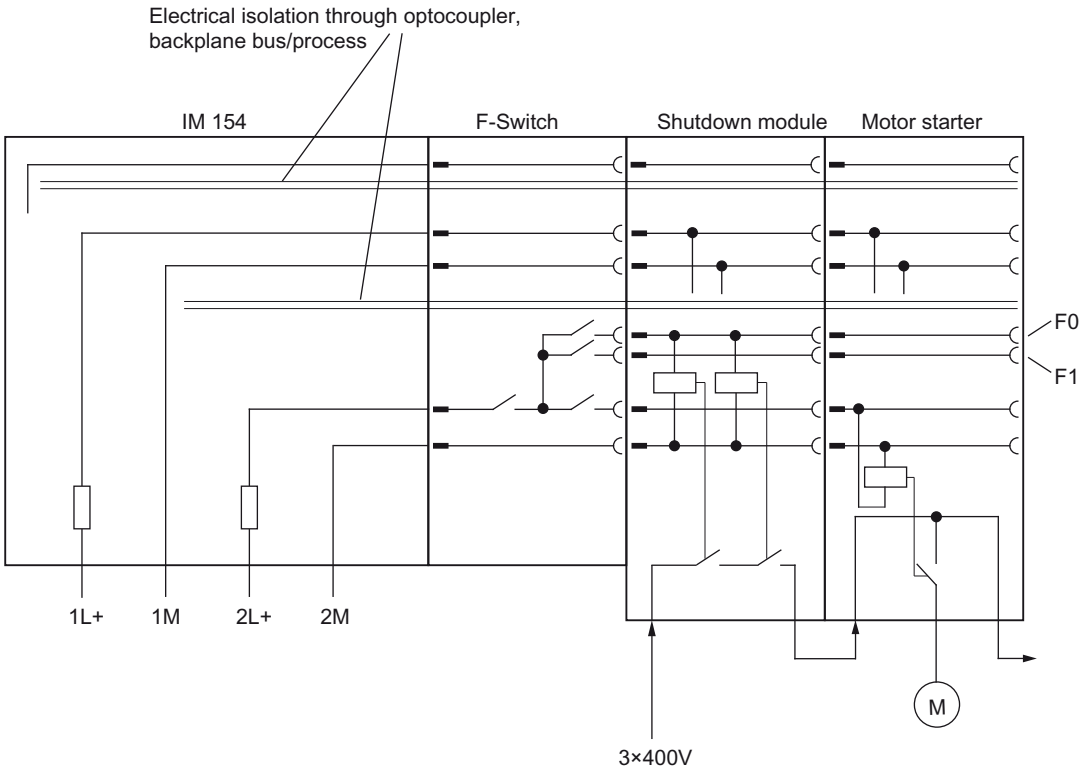

Figure 1-914 Wiring Diagram of F-Switch PROFIsafe - Connection of Shutdown Modules

WARNING

"Test of outputs" must be enabled for this mode for SIL3/Category 4.

Safety-Related Shutdown of Standard Output Modules

WARNING

Safety-related activation of standard DO module outputs is not possible. Only safety-related shutdown is possible. The following issues must therefore be taken into consideration:
In the worst case you must consider all possible faults of the standard DO modules and the program controlling them for which there is no direct fault detection. For example, the FM-Switch PROFIsafe does not detect external short circuits to L+ at the standard DO module outputs.
All faults of the standard DO modules influence the process by means of final controlling elements.
The process status must be made known to the F-CPU by way of sensors and a suitable safety program.
The safety program must react in a safety-related and logically suitable fashion to unwanted or potentially dangerous states in the process using the F-Switch PROFIsafe and fail-safe output modules.

8.3.10 Properties of the F-Switch PROFIsafe Electronic Module

Behavior in Case of Supply Voltage Failure

Failure of sensor supplies Vs1 and Vs2 is indicated by the SF LED, the VsF LED, and the LEDs of the relevant channel group on the F-module. This information is also provided on the F-module (diagnostic entry). All channels of the F-module are passivated.

Diagnostic Functions

The following table shows an overview of the diagnostic functions of the F-Switch PROFIsafe electronic module. The diagnostic functions are assigned either to one channel or to the entire module.

Table 1-1223 Properties of the F-Switch PROFIsafe Electronic Module

Diagnostic Function*	Fault Number	LED	Range of Effectiveness of Diagnostic	Assignable
Short circuit	1_H	SF	Channel	Yes
Overtemperature	5_H	SF	Module	No
Fault	9_H	SF	Module	No
Parameter assignment error	10_H	SF	Module	No
Sensor voltage or load voltage is missing	11_H	SF	Module	No
Communication error	13_H	SF	Module	No
Safety-related shutdown	19_H	SF	Channel	No
*: Specifically for F-modules; display in *STEP 7*, see the "Channel-Specific Diagnostics, Fault Types of Fail-Safe Modules" table				

Causes of Faults and Corrective Actions

The following table lists the possible causes of faults and corrective measures for the individual diagnostic messages of the F-Switch PROFIsafe electronic module.

Table 1-1224 Causes of Faults and Corrective Measures for Diagnostic Messages of the F-Switch PROFIsafe Electronic Module

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Short circuit	Always	Short circuit in the actuator	Eliminate short circuit/cross circuit on actuator Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on
		Cross-circuit in the actuator	
		Internal fault	Replace module
	For output signal "1" only	Overload: output stage is overloaded and becomes too hot.	Eliminate overload.

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Short circuit	Cyclically during short-circuit test	Short circuit at the sensor Cross circuit at the sensor	Eliminate short circuit/cross circuit on sensor
Overtemperature	Always	Shutdown due to violation of temperature limit values in the module case.	Check load wiring. Check ambient temperature. Check whether permissible output current (aggregate current) is exceeded for the ambient temperature. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on
Fault	Always	Internal module fault has occurred	Replace module
Parameter assignment error	Always	Inserted module does not match configuration; incorrect parameter assignment	Correct the configuration (compare actual and preset configuration). Check communication paths. Correct the configuration.
		PROFIsafe address set incorrectly on the F-module	Check whether the PROFIsafe address on the module matches the configuration in *STEP 7 HW Config*
Sensor voltage or load voltage is missing	Always	No supply voltage or supply voltage is too low	Check module for proper contact. Once the fault has been eliminated, the module must be removed and inserted, or the power switched off and on
		Voltage dip due to short circuit	Eliminate short circuit/cross circuit.
Communication error	Always	Error in communication between the F-CPU and module, e.g., due to defective PROFIBUS/Industrial Ethernet connection or higher than permissible electromagnetic interferences	Test PROFIBUS/Industrial Ethernet connection. Eliminate the interferences.
		PROFIsafe monitoring time set too low	Reduce the call interval for F-program, or Set a higher value for the "F-monitoring time" parameter for the module in *STEP 7 HW Config*
		Configuration of the F-module does not match the safety program	Recompile the safety program; then reload the configuration and safety program to the F-CPU
Safety-related shutdown	Always	Process signal is faulty Sensor is defective	Check process signal. Replace sensor if necessary.
		Short circuit between unconnected sensor cable (open switch) and the sensor supply cable	Eliminate short circuit
		Wire break in connected sensor cable (closed switch) or sensor supply cable	Eliminate broken wire

Diagnostic Message	Fault Detection	Possible Causes	Corrective Actions
Safety-related shutdown	Always	Assigned discrepancy time is too short	Check the assigned discrepancy time.
			Once the error is eliminated, the F-module must be reintegrated in the safety program.
		Switching frequency exceeded	Reduce the switching frequency

Generally Applicable Information on Diagnostics

For information on diagnostics pertaining to all fail-safe modules (e.g., for reading out diagnostic functions, passivating channels), refer to "*Diagnostics*".

8.3.11 Technical Specifications for the F-Switch PROFIsafe Electronic Module

Overview

Technical Specifications	
Dimensions and Weight	
Dimensions W x H x D (mm)	45 x 130 x 65.2 (including rack)
Weight	Approx. 170 g
Module-Specific Specifications	
Number of inputs	
• 2-channel	Max. 2
Number of outputs (P/P switching)	Max. 3
Assigned address area	
• I/O area for inputs	7 bytes
• I/O area for outputs	5 bytes
Cable length	
• Unshielded	< 30 m
• Shielded	< 30 m
Maximum achievable safety class	2-channel
• According to IEC 61508:2000	SIL3
• According to ISO 13849-1:2006 or EN ISO 13849-1:2008	Category 4
Fail-safe performance characteristics	SIL2 / SIL3
• Low demand mode (average probability of failure on demand)	< 1.00 E-05
• High demand/continuous mode (probability of a dangerous failure per hour)	< 1.00 E-09
Voltages, Currents, Potentials	
Rated supply voltage L+	24 V DC
• Permissible range	20.4 V to 28.8 V

Technical Specifications	
• Power loss ride-through of L+	None
• Power loss ride-through of internal P5	5 ms
• Reverse polarity protection	Yes: electronics, No: load supply (reverse polarity causes fuse to trip (12.5 A quick-response) in the head module)
Electrical isolation	
• Shield and ET 200pro bus connection	Yes
• ET 200pro bus connection and I/O	Yes
• Shield and I/O (DIs, DOs)	Yes
• Between DIs and DOs	Yes
Permissible potential difference between:	
• Shield and ET 200pro bus connection	75 V DC/60 V AC
• ET 200pro bus connection and I/O	75 V DC/60 V AC
• Shield and I/O (DIs, DOs)	75 V DC/60 V AC
• Between DIs and DOs	75 V DC/60 V AC
Insulation tested during type test with	
• Shield and ET 200pro bus connection	370 V AC / 1 min or 520 V DC / 1 min
• ET 200pro bus connection and I/O	370 V AC / 1 min or 520 V DC / 1 min
• Shield and I/O (DIs, DOs)	370 V AC / 1 min or 520 V DC / 1 min
• Between DIs and DOs	370 V AC / 1 min or 520 V DC / 1 min
Current consumption	
• From backplane bus	Max. 40 mA
• From the electronic supply (without load)	50 mA
• From load voltage L+ (without load)	Typ. 25 mA
Power loss of module	3 W
Status, Interrupts, Diagnostics	
Status displays	
• Inputs	Two-color red/green LED per channel
• Outputs	Two-color red/green LED per channel
• Sensor supply	LED VsF and display via channel LEDs of channel group
Interrupts	
• Diagnostic interrupt	Channel LED red
Diagnostic functions	
• Group fault display	Red LED (SF)
• Diagnostic information can be read out	Possible
• I&M functionality *	See "ET 200pro Distributed I/O" Manual
Sensor Supply Outputs	
Number of outputs	2
Output voltage	
• Loaded	Min. L+ (-1.5 V)
Output current	
• Rated value	200 mA

Technical Specifications		
• Permissible range	0 mA to 200 mA	
• Permissible aggregate current of outputs	400 mA	
• Short-circuit protection	Yes, electronic	
• Operating value	4 A to 9 A	
Data for Selecting a Sensor **		
Input voltage		
• Rated value	24 V DC	
• At signal "1"	15 V to 30 V	
• At signal "0"	-30 V to 5 V	
Input current		
• At signal "1"	Typ. 3.5 mA	
Input delay	For all inputs together	
• At "0" after "1"	Typ. 3 ms	2.0 ms to 4.5 ms
• At "1" after "0"	Typ. 3 ms	2.0 ms to 4.5 ms
Input characteristic	In accordance with IEC 1131-2, Type 1	
Connection of 2-wire BERO	Not possible	
• Permissible quiescent current	• Max. 0.6 mA	
Data for Selecting an Actuator*		
Output voltage		
• At signal "1"	• L+ -1.5 V (F0 / F1) • L+ -1.5 V (2L+)	
Output current for "1" signal		
• Rated value	• 1 A (F0 / F1) • 6 A (2L+)	
• Permissible range	• Up to 1.2 A (F0 / F1) • 20 mA to 6 A (2L+)	
For "0" signal (residual current)	Max. 0.5 mA	
Indirect control of load by means of coupling relay:		
For "0" signal (residual current)		
P-switch	Max. 0.5 mA	
Lamp load	• Not possible (F0 / F1) • Max. 60 W (2L+)	
Parallel switching of 2 outputs	Not possible	
Control of a digital input	Possible	
Switching frequency		
• With resistive load	• Max. 10 Hz 1 A (F0 / F1) • Max. 2 Hz (2L+)	
• With inductive load in accordance with IEC 60947-5-1, DC13	• Max. 0.1 Hz (F0 / F1) • Max. 0.1 Hz (2L+)	
• With lamp load	Max. 2 Hz (2L+)	
Limit on inductive shutdown voltage to	• -36 V (F0 / F1) • -1 V (2L+)	
Short-circuit protection of output	Yes, electronic	
• Response threshold (short circuit) (FO/FI)	5 A to 12 A	

Technical Specifications	
• Response threshold (short circuit) (2L+)	20 A to 120 A
Time, Frequency	
Internal preprocessing times	See *"Response Times"*
Acknowledgment time in safety mode	Min. 4 ms / max. 8 ms
Short-circuit test enabled • With input delay of 3 ms:	2.0 ms -4.5 ms
Minimum sensor signal duration	See Table *"Minimum Duration of Sensor Signals for Proper Detection by F-DI Module"* in *"Wiring"*
Outputs	
• Safety mode SIL3, Category 4	20 ms
• Safety mode with fault reaction	< 20 ms for signal change < 15 min for static signals
Protection against Overvoltage	
Protection of supply voltage 1L+ and 2L+ from surge in accordance with IEC 61000-4-5 with external protection elements only	
• Symmetrical (L+ to M)	+ 1 kV; 1.2/50 µs
• Asymmetrical (L+ to PE, M to PE)	+ 2 kV; 1.2/50 µs
Protection of inputs from surge in accordance with IEC 61000-4-5 with external protection elements only	
• Symmetrical (L+ to M)	+1 kV; 1.2/50 µs
• Asymmetrical (L+ to PE, M to PE)	+2 kV; 1.2/50 µs
Protection of supply voltage 1L+ from overvoltages	Internal fuse tripped
*: Identification sets are described in the "ET200 pro Distributed I/O System" manual.	
**: For requirements for sensors and actuators, see "*Requirements for Sensors and Actuators*"	

Diagnostic Data of Fail-Safe Modules

A

Introduction

This appendix describes the structure of diagnostic data in the system data. You need to know this structure if you want to evaluate diagnostic data of fail-safe modules in the standard user program.

Further Reading

The *System and Standard Functions* reference manual describes in detail the principles of evaluating diagnostic data of F-modules in the standard user program and describes the SFCs used for this.

SFCs for Reading Out Diagnostic Data

The following SFCs are available for reading out diagnostic data of fail-safe modules in the standard user program:

Table 1-1225 SFCs for Reading Out Diagnostic Data

SFC Number	Identifier	Application
59	RD_REC	Reading out data records of S7 diagnostics (storing in data area of the standard user program)
13	DPNRM_DG	Reading out slave diagnostics (storing in data area of the standard user program)

Position in the Diagnostic Frame of the Slave Diagnostics

When fail-safe modules are being used in the ET 200pro and a diagnostic interrupt occurs, data records 0 and 1 are entered in the slave diagnostics of the ET 200pro (= interrupt section).

The position of the interrupt section in the slave diagnostics depends on the structure of the diagnostic frame and the length of the channel-specific diagnostics.

You will find a detailed description of the structure of the diagnostic frame and the position of the interrupt section in accordance with the PROFIBUS standard in the section on "Commissioning and Diagnostics" in the *ET 200pro Distributed I/O System* Manual.

Data Records 0 and 1 of the System Data

The diagnostic data of a module can be up to 44 bytes long and is located in data records 0 and 1 of the system data area:

- Data record 0 contains 4 bytes of diagnostic data that describe the state of the F-module.
- Data record 1 contains
  - The 4 bytes of diagnostic data of the F-module that are also in data record 0 and
  - Up to 40 bytes of channel-specific diagnostic data depending on the F-module (see "*Channel-Specific Diagnostics Starting at Byte 8*").

Description

The structure and content of the individual diagnostic data bytes are described below.
In general, the following applies: If a fault occurs, the corresponding bit is set to "1".

Bytes 0 and 1

The following figure shows the content of bytes 0 and 1 of the diagnostic data.

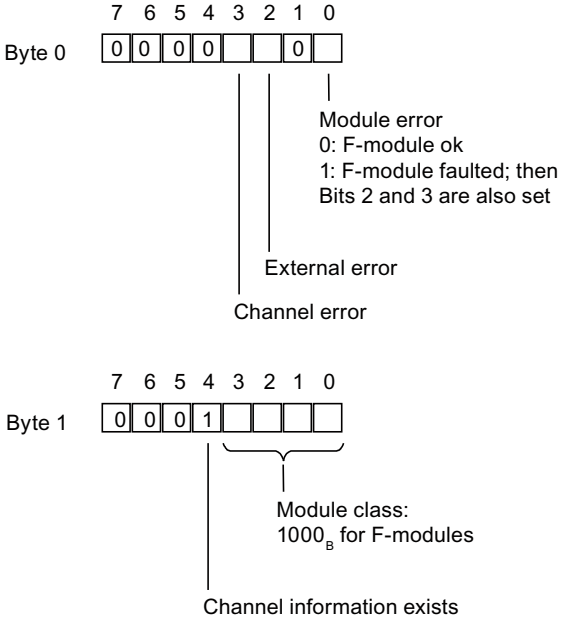

Figure 1-915 Bytes 0 and 1 of Diagnostic Data

Bytes 2 and 3

The following figure shows the content of bytes 2 and 3 of the diagnostic data.

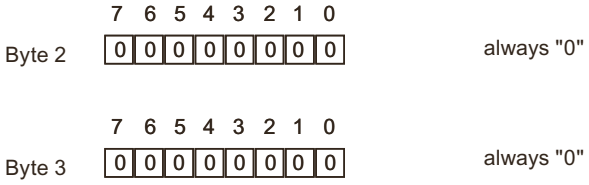

Figure 1-916 Bytes 2 and 3 of Diagnostic Data

Bytes 4 to 6

The following figure shows the content of bytes 4 to 6 of the diagnostic data.

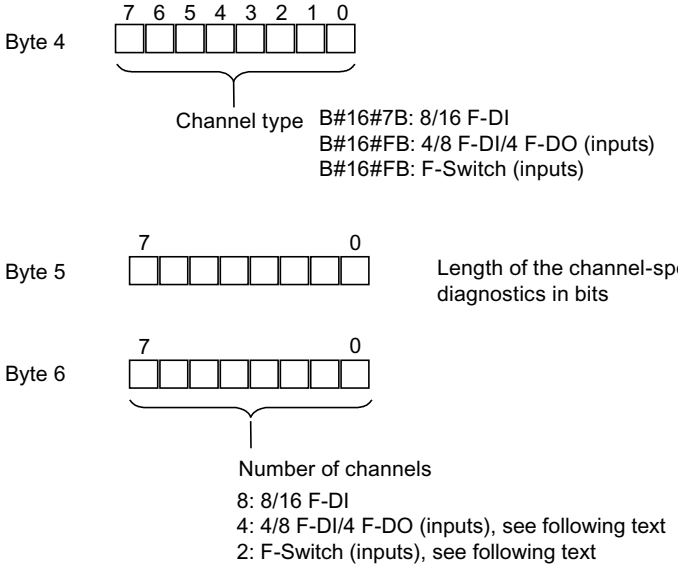

Figure 1-917 Bytes 4 to 6 of Diagnostic Data

4/8 F-DI/4 F-DO:

For the 4/8 F-DI/4 F-DO module, the diagnostic data are separated according to inputs and outputs. The diagnostic data for the inputs are in bytes 4 to 23 and the diagnostic data for outputs are in bytes 24 to 43.

You can determine whether the module has diagnostic data in bytes 24 to 43 by evaluating bit 7 in byte 4.

F-Switch:

For the F-Switch electronic module, the diagnostic data are divided according to inputs and outputs. The diagnostic data for the inputs are in bytes 4 to 15, and the diagnostic data for outputs are in bytes 16 to 31.

Byte 7 for 8/16 F-DI and 4/8 F-DI/4 F-DO (Inputs)

The figure below shows the content of byte 7 of the diagnostic data for the 8/16 F-DI and the inputs of 4/8 F-DI/4 F-DO.

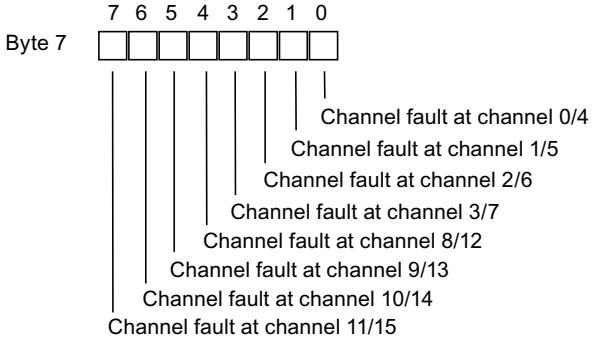

Figure 1-918 Byte 7 of the Diagnostic Data for 8/16 F-DI and Inputs of 4/8 F-DI/4 F-DO

Byte 7 for F-Switch

The figure below shows the content of byte 7 of the diagnostic data for the inputs of the F-Switch electronic module.

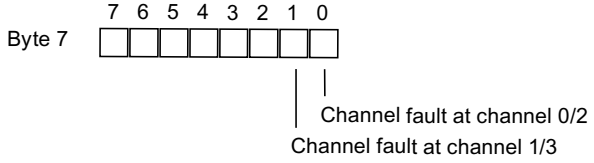

Figure 1-919 Byte 7 of the Diagnostic Data for the Inputs of the F-Switch

Channel-Specific Diagnostics Starting at Byte 8 to Byte 23

The channel-specific diagnostics start in byte 8 of the diagnostic data. Four bytes of diagnostic information are provided per channel.

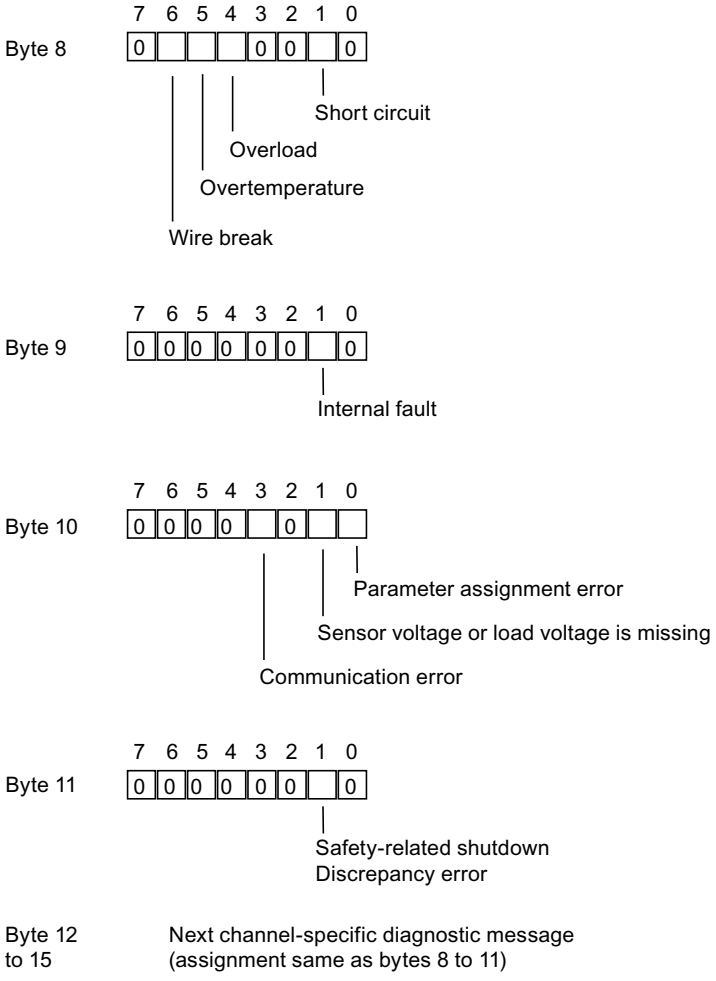

Figure 1-920 Channel-Specific Diagnostics Starting in Byte 8 of the Diagnostic Data

Bytes 24 to 26 for 4/8 F-DI/4 F-DO

The following figure shows the content of bytes 24 to 26 of the diagnostic data.

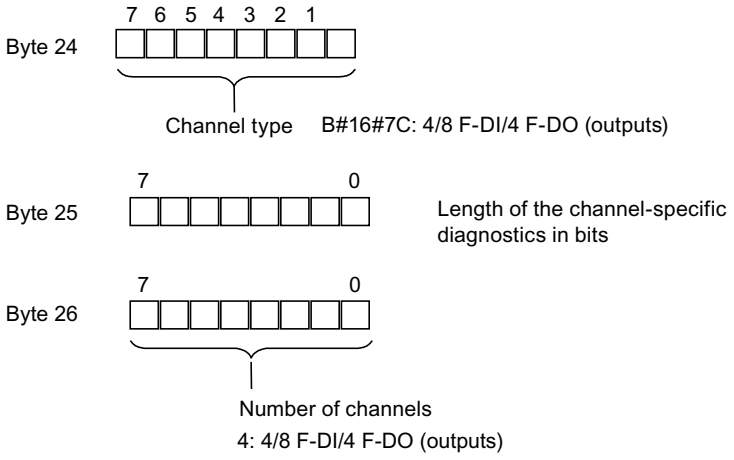

Figure 1-921 Bytes 24 to 26 of Diagnostic Data

Bytes 16 to 18 for F-Switch

The following figure shows the content of bytes 16 to 18 of the diagnostic data of the F-Switch.

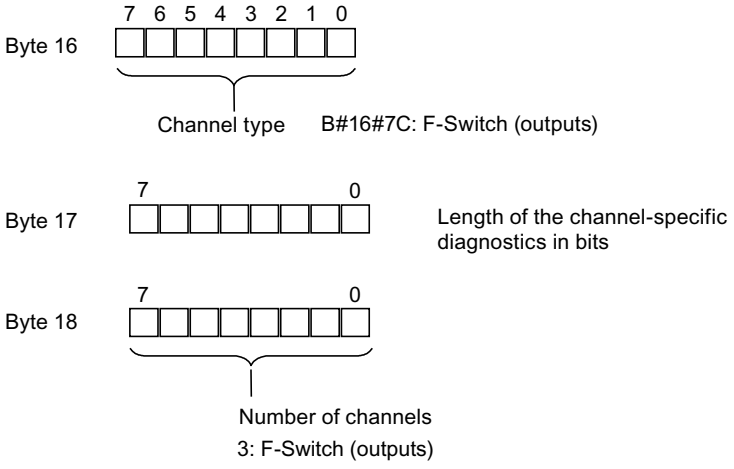

Figure 1-922 Bytes 16 to 18 of the Diagnostic Data of the F-Switch

Byte 27 for 4/8 F-DI/4 F-DO (Outputs)

The following figure shows the content of byte 27 of the diagnostic data for the outputs of 4/8 F-DI/4 F-DO.

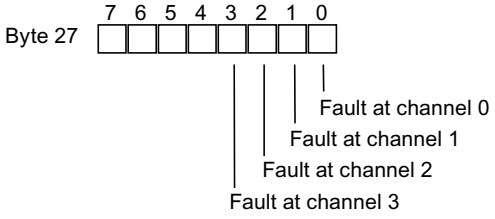

Figure 1-923 Byte 27 of Diagnostic Data for the Outputs of 4/8 F-DI/4 F-DO

Byte 19 for F-Switch (Outputs)

The figure below shows the content of byte 19 of the diagnostic data for the outputs of the F-Switch.

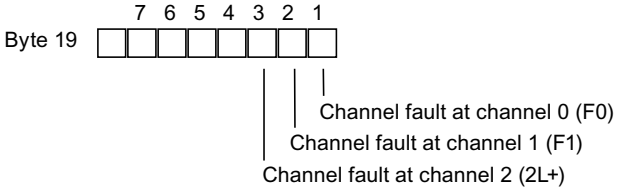

Figure 1-924 Byte 19 of the Diagnostic Data for the Outputs of the F-Switch

Channel-Specific Diagnostics Starting at Byte 28 to Byte 43 for 4/8 F-DI/4 F-DO

The channel-specific diagnostics start in byte 28 of the diagnostic data. Four bytes of diagnostic information are provided per channel.

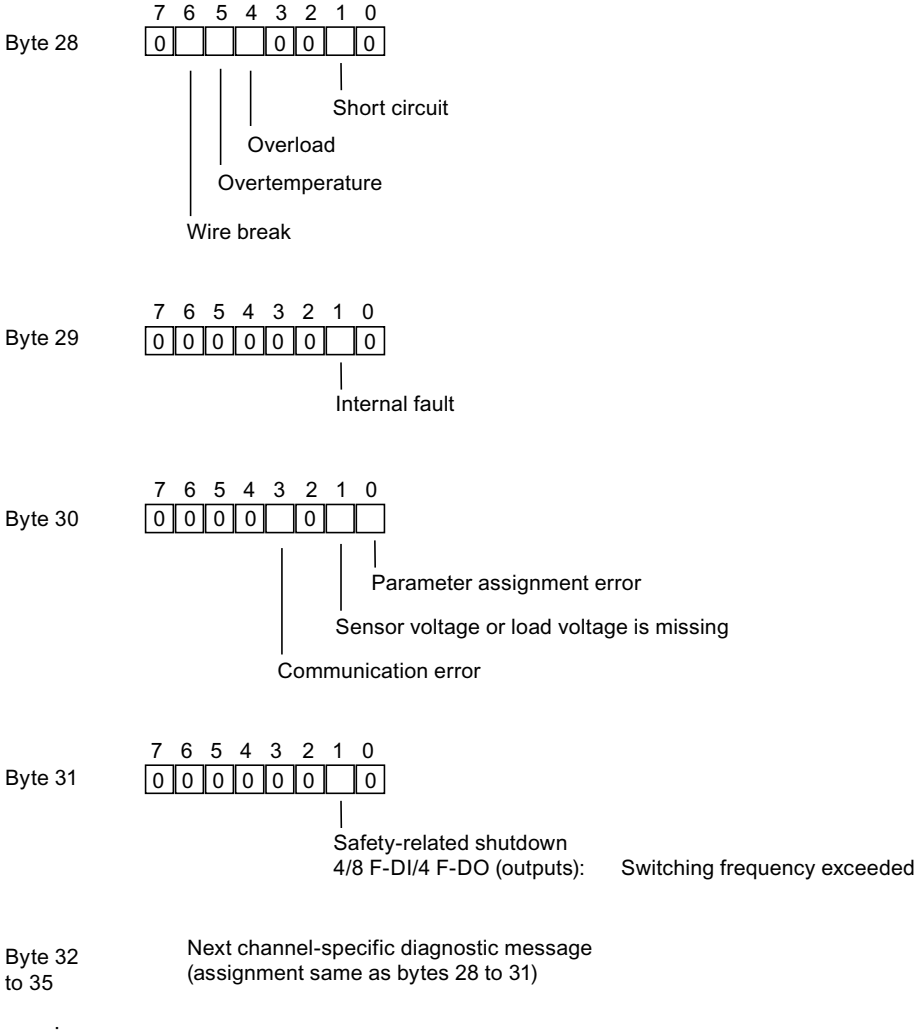

Figure 1-925 Channel-Specific Diagnostics Starting in Byte 28 of the Diagnostic Data

Channel-Specific Diagnostics Starting at Byte 20 to Byte 31 for F-Switch

The channel-specific diagnostics start in byte 20 of the diagnostic data. Four bytes of diagnostic information are provided per channel.

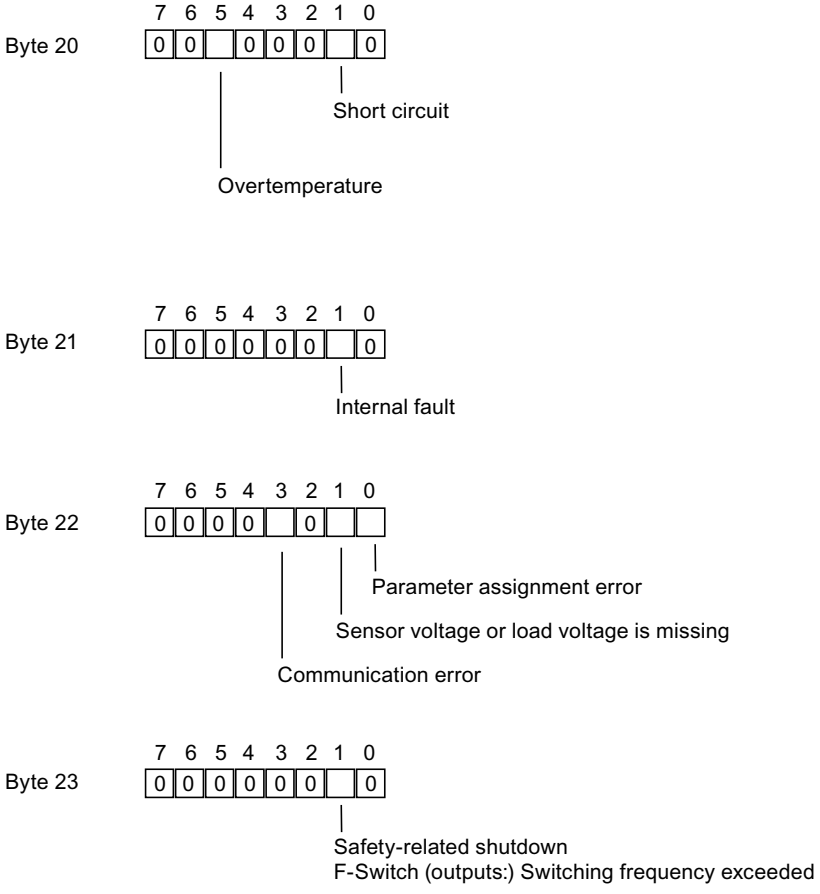

Figure 1-926 Channel-Specific Diagnostics Starting at Byte 20 of the Diagnostic Data of the F-Switch

Due to the different numbers of channels of the F-modules, data record 1 has differing lengths:

8/16 F-DI	40 bytes
4/8 F-DI/4 F-DO	44 bytes
F-Switch	32 bytes

Dimension Drawings

B

F-Connection Module With Inserted F-Module

A dimension drawing for an F-connection module with inserted F-electronic module is shown below. The upper figure shows a narrow rack, while the lower figure shows a compact rack.

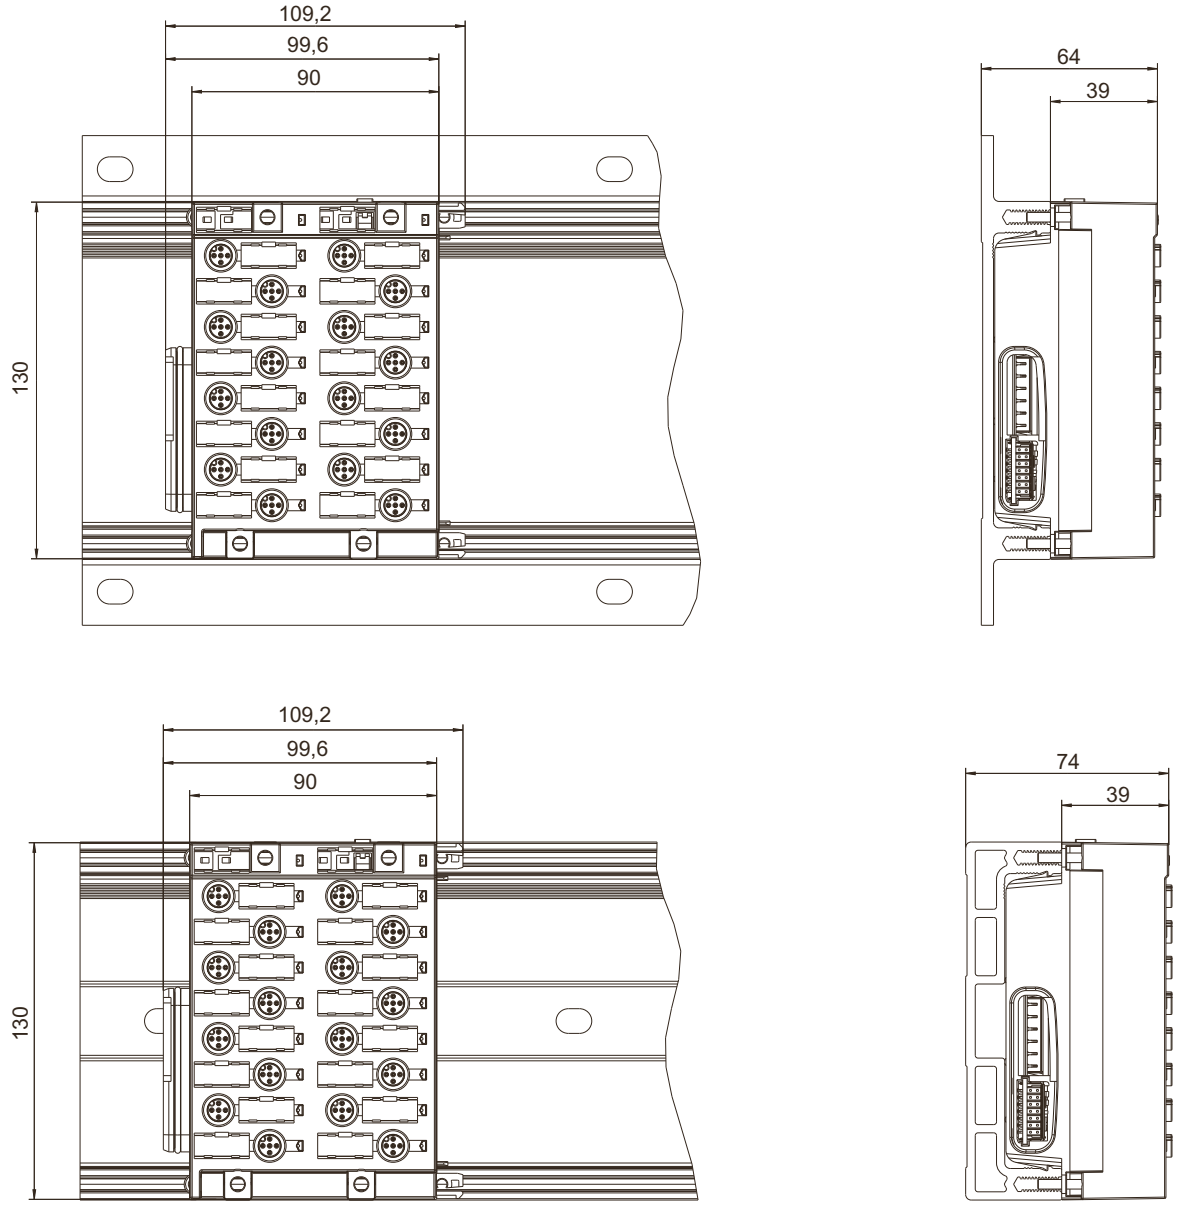

Figure 1-927 Dimension Drawing of F-Connection Module With Inserted F-Electronic Module

CM F-IO 2×M12 Fail-Safe Connection Module with Inserted F-Switch PROFIsafe

A dimension drawing for a CM F-IO 2×M12 fail-safe connection module with inserted F-Switch PROFIsafe is shown below. The upper figure shows a narrow rack, while the lower figure shows a compact rack.

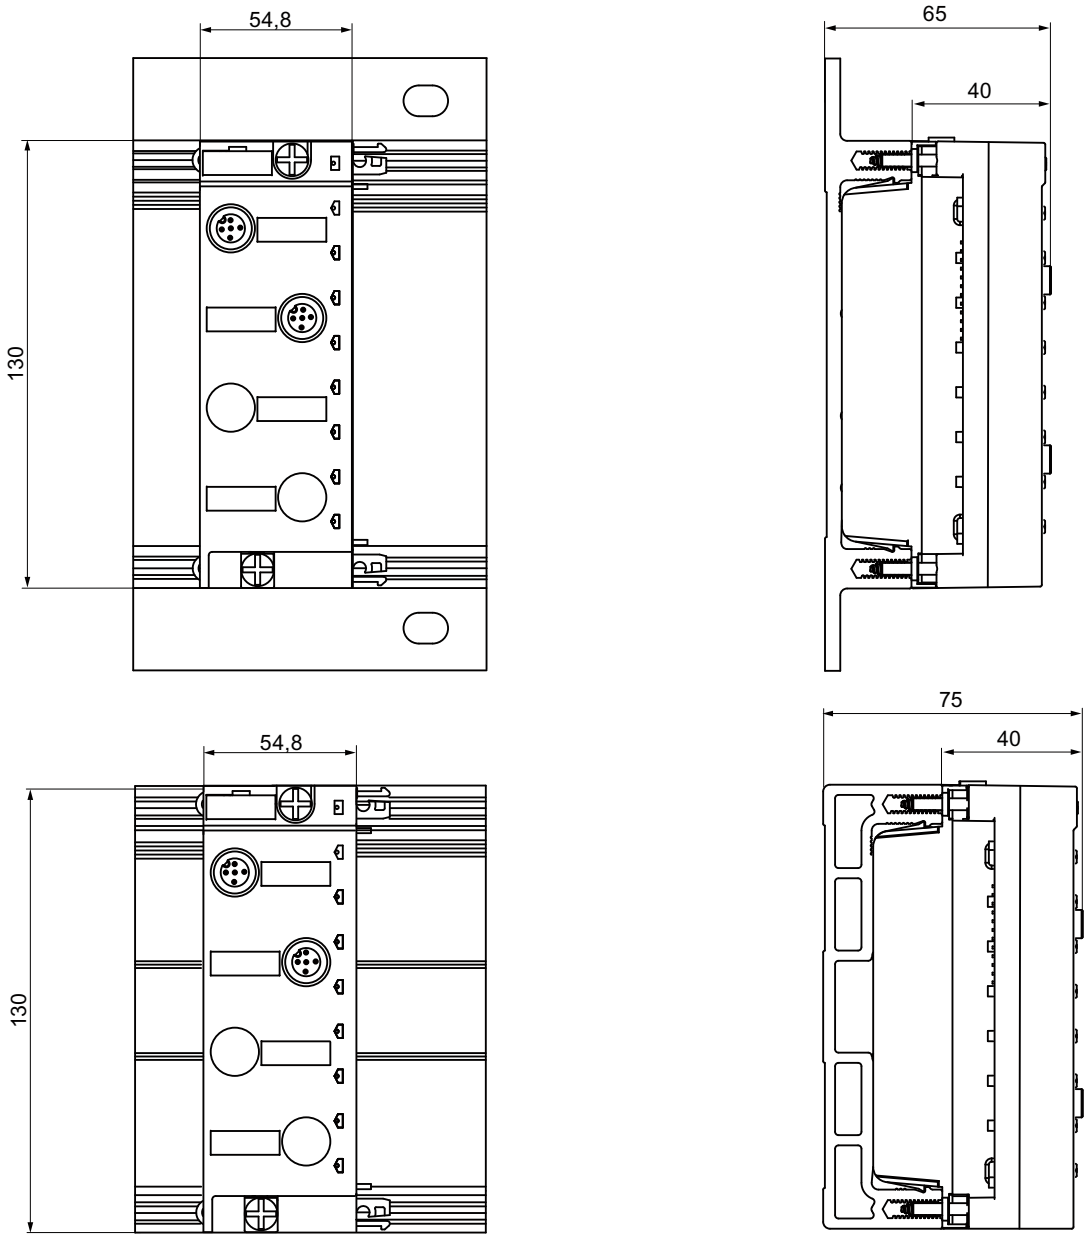

Figure 1-928 Electronic Module with CM F-IO 2xM12 Connection Module

Accessories and Order Numbers

C

C.1 Accessories and Order Numbers

Accessories and Order Numbers

The order numbers and accessories are found in the appendix of the *ET 200pro Distributed I/O Device* manual.

Component	Order Number
8/16 F-DI DC24V PROFIsafe	6ES7 148-4FA00-0AB0
4/8 F-DI/4 F-DO DC24V/2A PROFIsafe	6ES7 148-4FC00-0AB0
F-Switch PROFIsafe	6ES7 148-4FS00-0AB0
CM 16×M12 for 8/16 F-DI	6ES7 194-4DD00-0AA0
CM 12×M12 for 4/8 F-DI/4 F-DO	6ES7 194-4DC00-0AA0
CM F-IO 2×M12 for F-Switch PROFIsafe	6ES7 194-4DA00-0AA0

Response Times

D

D.1 Response Times

Introduction

The response times of the ET 200pro fail-safe modules are presented below. The response times of the fail-safe modules enter into the calculation of the F-system response time.

For information on calculating the F-system response time, refer to the *Safety Engineering in SIMATIC S7* system description.

Definition of Response Time

The response time is the time between detection of an input signal and a change in the gated output signal.

The actual response time lies somewhere between a minimum and maximum response time. The maximum response time must always be anticipated when configuring a system.

For fail-safe digital inputs: The response time is the time between a signal change at the digital input and safe loading of the -> safety message frame on the backplane bus.

For fail-safe digital outputs: The response time is the time between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Maximum Response Time of the 8/16 F-DI DC24V PROFIsafe, the Inputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe, and the F-Switch PROFIsafe

In the case of problem-free operation:

Table 1-1226 In the Case of Problem-Free Operation

Electronic module	Short-circuit test parameter	Assigned input delay		
		0.5 ms	3 ms	15 ms
8/16 F-DI	Disabled	10 ms	13 ms	25 ms
	Enabled	10 ms	18 ms	56 ms
4/8 F-DI/4 F-DO	Disabled	11 ms	13 ms	25 ms
	Enabled	11 ms	20 ms	57 ms
F-Switch PROFIsafe	Disabled	-	14 ms	-
	Enabled	-	27 ms	-

Table 1-1227 8/16 F-DI DC24V PROFIsafe Electronic Module, Inputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe, and F-Switch PROFIsafe: Internal Preprocessing Times

Electronic module	Evaluation of the sensors	Minimum internal preprocessing time T_{min}	Maximum internal preprocessing time T_{max}
8/16 F-DI	1oo1 and 1oo2	3 ms	12 ms
4/8 F-DI/4 F-DO	1oo1 and 1oo2	4 ms	7 ms
F-Switch PROFIsafe	1oo2	4 ms	8 ms

Maximum response time if a fault occurs:

The following table shows the maximum response time of the F-DI module when a fault occurs, depending on the parameter assignment in *STEP 7* and the evaluation of the sensors.

Table 1-1228 Electronic Modules: Maximum Response Time if a Fault Occurs

Electronic module	Input delay	1oo1 evaluation			1oo2 evaluation**		
		0.5 ms	3 ms	15 ms	0.5 ms	3 ms	15 ms
8/16 F-DI	Short-circuit test disabled	15 ms	15 ms	15 ms	10 ms	10 ms	10 ms
	Short-circuit test enabled	37 ms	58 ms	161 ms	10 ms	15 ms	41 ms
4/8 F-DI/4 F-DO	Short-circuit test disabled	19 ms	19 ms	19 ms	10 ms	10 ms	10 ms
	Short-circuit test enabled	30 ms	40 ms	90 ms	10 ms	18 ms	42 ms
F-Switch PROFIsafe	Short-circuit test disabled	-			-	10 ms	-
	Short-circuit test enabled	-			-	23 ms	-

: With **1oo2 evaluation, the response times also depend on the assigned behavior at discrepancy:
Provide value 0: The times in the above table apply.
Provide last valid value: The times in the above table are extended by the amount of the assigned discrepancy time.

NOTE

Please note that the Excel file for calculation of the maximum response times provided with the *S7 Distributed Safety* optional package already supports calculation of the extension of the "Maximum response time if a fault occurs" by the assigned discrepancy time.

Maximum Response Time of the Outputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

The maximum response time of the outputs of the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe electronic module (in the fault-free case and when a fault occurs) corresponds to the maximum internal preprocessing time T_{max}.

The internal preprocessing times depend on the assigned readback time (see table below).

Table 1-1229 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module: Internal Preprocessing Times

4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module			
Assigned Read-back Time	**Limit Frequency**	**Minimum Internal Preprocessing Time T_{min}**	**Maximum Internal Preprocessing Time T_{max}**
1 ms	62.5 Hz	4 ms	13 ms
5 ms	50.0 Hz	4 ms	14 ms
10 ms	40.0 Hz	4 ms	17 ms
50 ms	15.4 Hz	4 ms	30 ms
100 ms	8.7 Hz	4 ms	46 ms
200 ms	4.6 Hz	4 ms	71 ms
400 ms	2.4 Hz	4 ms	135 ms

Maximum Response Time of Outputs of the F-Switch PROFIsafe Electronic Module

The maximum response time of the outputs of the F-Switch PROFIsafe electronic module (with or without fault) is equivalent to the maximum internal preprocessing time T_{max}.

The internal preprocessing times depend on the assigned readback time (see table below).

Table 1-1230 F-Switch PROFIsafe Electronic Module: Internal Preprocessing Time

F-Switch PROFIsafe Electronic Module			
Assigned Read-back Time	**Limit Frequency**	**Minimum Internal Preprocessing Time T_{min}**	**Maximum Internal Preprocessing Time T_{max}**
3 ms	45.4 Hz	4 ms	11 ms

Switching of Loads

E

E.1 Switching of Capacitive Loads

Switching of Capacitive Loads

If the electronic outputs of the 4/8 F-DI/4F-DO DC24V/2A PROFIsafe electronic module are interconnected with loads that draw little current and have capacitance, the "short circuit" error message can result. Reason: capacitances are not sufficiently discharged within the assigned readback time during the self-test.

The following figure shows typical curves indicating the relationship between the load current and switchable load capacitance for the assignable readback times.

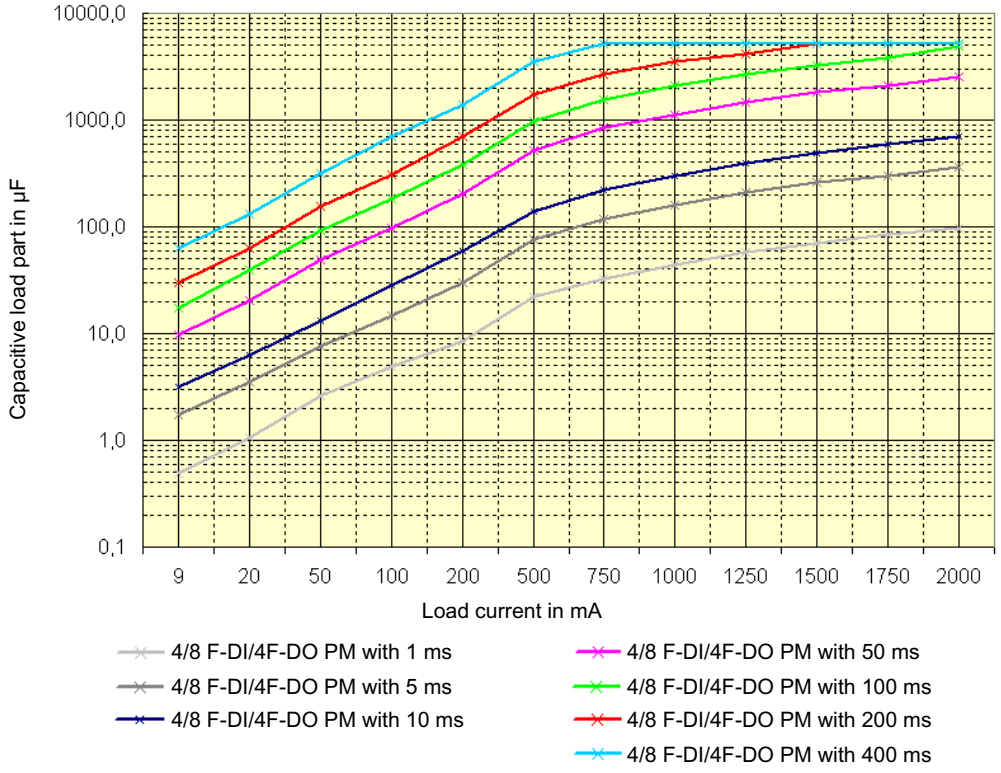

Figure 1-929 Relationship Between Load Current and Switchable Load Capacity for the 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe Electronic Module

Remedy:

1. Determine the load current and capacitance of the load.
2. Determine the operating point in the figure above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

Switching of Capacitive Loads for the F-Switch PROFIsafe

The figure below shows the typical curves indicating the relationship between load resistance and switchable load capacitance.

Behavior is as described above.

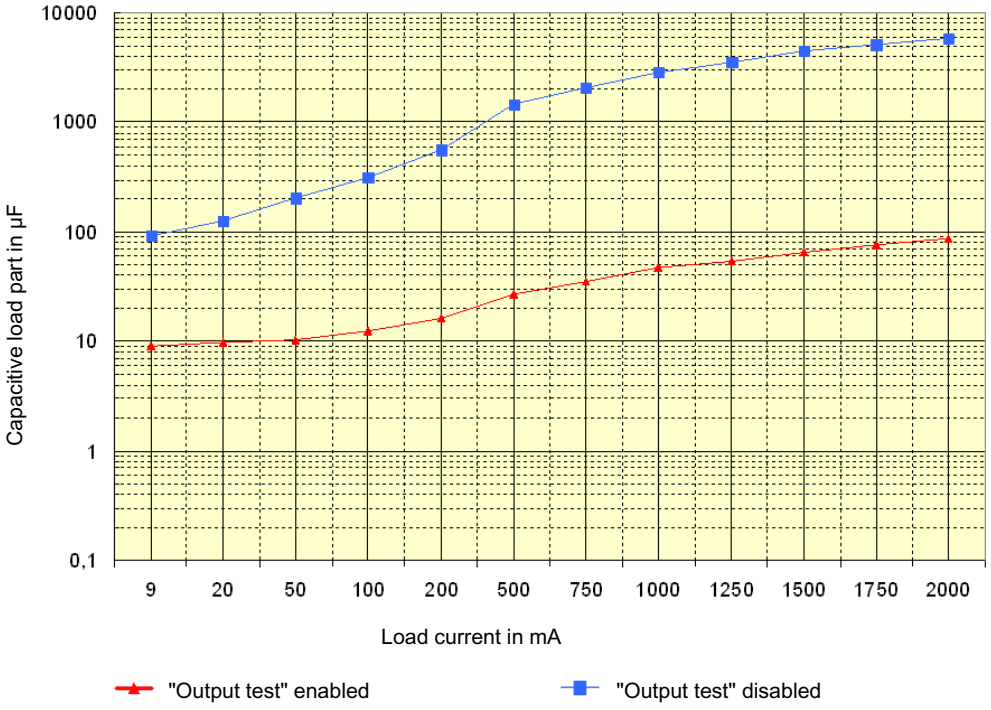

Figure 1-930 Comparison of Maximum Switchable Capacitive Loads for the F-Switch PROFIsafe

E.2 Switching of Inductive Loads

Switching of Inductive Loads for EM 4/8 F-DI/4 F-DO DC24V/2A PROFIsafe

The diagram below shows the maximum permitted inductive load as a function of the load current and switching frequency.

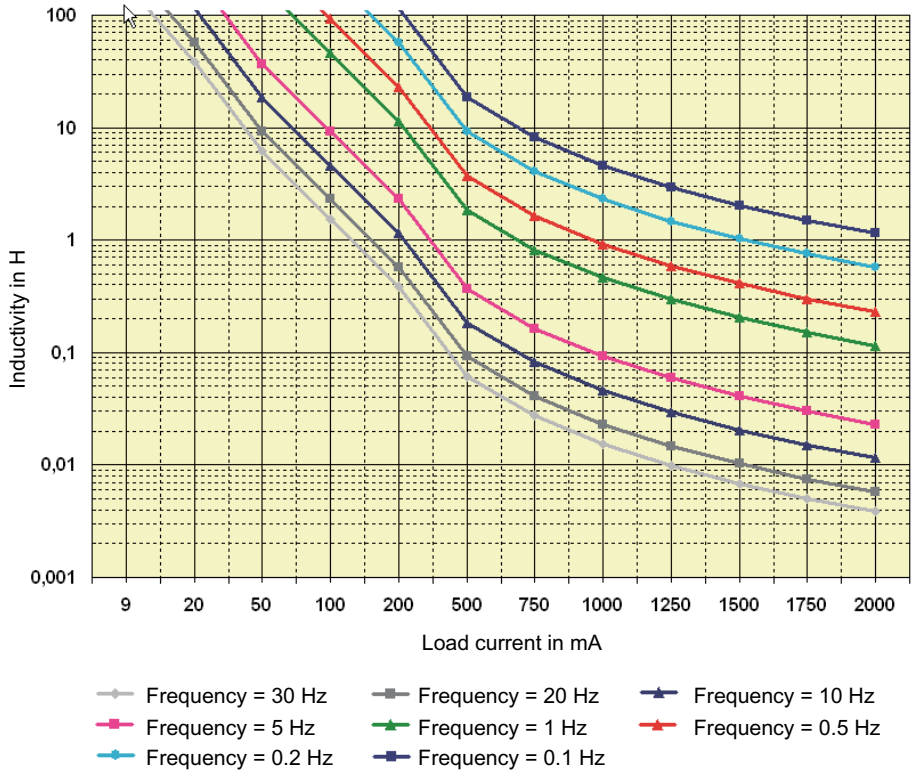

Figure 1-931 Relationship between Load Resistance and Inductive Loads

SIEMENS
SIMATIC

Distributed I/O system ET 200pro
Compact Operating Instructions
Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity

- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14218/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14218/cert?ct=444&ci=5596).

Firmware
You can find the latest firmware versions for the I/O system (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/search?t=all&search=et%20200pro&type=Download&lc=en-WW).

Documentation
The complete documentation for the I/O system consists of product information, operating instructions, equipment manuals and function manuals. You will find these on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109748221).

Retention of the documentation
Retain this documentation for later use.

1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Install products with degree of protection IP65/67 according to IEC 60529 weatherproof and stationary indoors.

⚠ WARNING

Electric shock due to externally supplied plant units
Even if the main supply to the plant is disconnected, externally supplied plant units can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.
Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Safety functional extra low voltage
The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221) of the fail-safe I/O and in the data sheets of the power supplies to be used.
Use a power supply unit with output voltage that does not exceed 36 V DC even in the event of a fault.
Follow the notes and warnings in the respective manual.

Electromagnetic Compatibility
The I/O system is intended for operation in the EMC environment class Industry.
Ensure an EMC-compliant design of your automation system as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221) for the I/O system.

NOTICE

Interference emission / Interference immunity
The operation of the I/O system can cause radio interference in residential areas.
If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

Cleaning
When wired, the product complies with degree of protection IP65/IP67 and does not require any cleaning.
If you do have to clean the product, then use a dry or damp cloth. Take care to comply with the conditions of degree of protection IP65/IP67 when cleaning with liquids.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221).

Functional safety

⚠ WARNING

Danger to humans and the environment
To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components.

For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation (https://support.industry.siemens.com/cs/ww/en/view/109748221).

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether the firmware version is approved for the respective fail-safe I/O.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

2 Use of radio devices and cell phones

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

SIMATIC Safety - Configuring and Programming

Programming and Operating Manual

Important notes

Purpose of this documentation

The information in this documentation enables you to configure (Page 33) and program (Page 108) SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance (Page 407) of a SIMATIC Safety F-system.

NOTE

The Programming and Operating Manual "SIMATIC Safety - Configuring and Programming" in its latest version (possibly including product information for the manual) is the relevant source of all information on functional safety regarding configuring and programming. This also applies in the event of discrepancies between this manual and other documentation on functional safety regarding configuring and programming of SIMATIC Safety.
You must heed all warnings in the Programming and Operating Manual "SIMATIC Safety - Configuring and Programming".

Basic knowledge requirements

General basic knowledge of automation engineering is needed to understand this documentation. Basic knowledge of the following is also necessary:

- Fail-safe automation systems
- Automation systems
  - S7-300
  - S7-400
  - S7-1200
  - S7-1500
  - S7-1500H
  - S7-1500 Virtual Controller
  - S7-1500 Software Controller
  - SIMATIC Drive Controller
- Distributed I/O systems on
  - PROFIBUS DP
  - PROFINET IO
- Totally Integrated Automation Portal, including:
  - Hardware configuration with the *hardware and network editor*
  - Programming in the LAD and FBD programming languages using the *program editor*.
  - Communication between CPUs
  - OPC UA for communication between CPUs with OPC UA Safety

Scope of this documentation

This documentation is valid for *STEP 7 Safety Advanced V21*.

STEP 7 Safety Advanced V21 is used for configuring and programming the SIMATIC Safety fail-safe system.

In this context, integration of the F-I/O listed below in SIMATIC Safety is also addressed:

- S7-1500/ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200SP HA fail-safe modules
- ET 200S fail-safe modules
- ET 200eco fail-safe I/O modules
- ET 200eco PN fail-safe I/O modules
- ET 200AL fail-safe I/O modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules
- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- Fail-safe GSD based DP slaves
- Fail-safe GSD based I/O devices

Approvals

The SIMATIC Safety F-system is certified for use in safety mode up to:

- Safety Integrity Level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Incorporation in the information landscape

Depending on your application, you will need the following supplementary documentation when working with *STEP 7 Safety*.

This documentation includes references to the supplementary documentation where appropriate.

Documentation	Brief description of relevant content
For the SIMATIC Safety F-system	Depending on which F-CPU you are using, you will need the following documentation: • For the F-CPUs S7-1200/1500, a Product Information (https://support.industry.siemens.com/cs/ww/en/view/109478599) describes all deviations from the respective standard CPUs. • Each F-CPU S7-300/400 that can be used has its own product information. The product information describes the deviations from the respective standard CPUs. • The Device manuals (https://support.industry.siemens.com/cs/ww/en/ps/13717/man) describe the S7-1500 CPUs.

Documentation	Brief description of relevant content
	• The "S7-300, CPU 31xC and CPU 31x: Installation" (https://support.industry.siemens.com/cs/ww/en/view/13008499) operating instructions describe the installation and wiring of S7-300 systems. • The "CPU 31xC and CPU 31x, Technical Data" (https://support.industry.siemens.com/cs/ww/en/view/12996906) device manual describes the CPUs 315-2 DP and PN/DP, the CPU 317-2 DP and PN/DP, and the CPU 319-3 PN/DP. • The "S7-400 Automation System, Installation (https://support.industry.siemens.com/cs/ww/en/view/1117849) installation manual describes the installation and wiring of S7-400 systems. • The "S7-400 Automation System, CPU Data" (https://support.industry.siemens.com/cs/ww/en/view/109818285) reference manual describes the CPUs 414-3 PN/DP, the CPU 416-2, and the CPU 416-3 PN/DP. • The "ET 200S Interface Module IM 151-7 CPU" (https://support.industry.siemens.com/cs/ww/en/view/12714722) manual describes the IM 151-7 CPU. • The "ET 200S, Interface Module IM 151-8 PN/DP CPU" (https://support.industry.siemens.com/cs/ww/en/view/47409312) manual describes the IM 151-8 PN/DP CPU. • The "ET 200S, Interface Module IM 154-8 CPU" (https://support.industry.siemens.com/cs/ww/en/view/44251850) manual describes the IM 154-8 CPU. • The "SIMATIC S7-1500 Software Controller CPU 1505SP (F), CPU 1507S (F) and CPU 1508S (F) SIMATIC Industrial OS Version (https://support.industry.siemens.com/cs/ww/en/view/109808199)" manual describes the SIMATIC S7-1500 Software Controllers CPU 1505SP (F), CPU 1507S (F) and CPU 1508S (F). • The function manuals (https://sieportal.siemens.com/su/blSqW) describe the S7-1500 Virtual Controller.
"S7-1200 Functional Safety manual (https://support.industry.siemens.com/cs/ww/en/view/104547552)" system manual	Describes the F-CPUs S7-1200 and the fail-safe modules S7-1200 (including installation, wiring, and technical specifications)
"S7-1500/ET 200MP system manual (https://support.industry.siemens.com/cs/ww/en/view/59191792)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/29727/man) for the corresponding S7-1500/ET 200MP fail-safe modules	Describes the hardware of the S7-1500 systems and the S7-1500/ET 200MP fail-safe modules (including installation, wiring, and technical specifications)
System manual "Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)"	Describes the hardware of S7-1500R/H systems (including design, wiring and technical specifications)
"SIMATIC Drive Controller (https://support.industry.siemens.com/cs/ww/en/view/109766665)" system manual and "SIMATIC Drive Controller (https://support.industry.siemens.com/cs/ww/en/view/109766666)" equipment manual	Describes the hardware of the SIMATIC Drive Controller (including design, wiring and technical specifications)

Documentation	Brief description of relevant content
"SIMATIC S7-1500 S7-PLCSIM Advanced (https://support.industry.siemens.com/cs/ww/en/view/109955578)" function manual	Describes the operation of S7-PLCSIM Advanced
"ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/14059/man) for the corresponding ET 200SP fail-safe modules	Describes the hardware of the ET 200SP fail-safe modules (including installation, wiring, and technical specifications)
System manual "Distributed I/O System ET 200SP HA (https://support.industry.siemens.com/cs/ww/en/view/109817158)" and the equipment manuals (https://support.industry.siemens.com/cs/ww/en/ps/28940/man) for the respective ET 200SP HA fail-safe modules	Describes the hardware of the ET 200SP HA fail-safe modules (including setup, wiring and technical specifications).
"ET 200eco Distributed I/O Station Fail-safe I/O Block (https://support.industry.siemens.com/cs/ww/en/view19033850)" manual	Describes the hardware of the ET 200eco fail-safe I/O module (including installation, wiring, and technical specifications)
Manual "ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12 (https://support.industry.siemens.com/cs/ww/en/view/109765611)"	Describes the hardware of the ET 200eco PN fail-safe I/O module (including installation, wiring, and technical specifications)
System manual "ET 200AL system manual (https://support.industry.siemens.com/cs/ww/en/view/89254965)" and equipment manual "Digital I/O Module F-DI 4+F-DQ 2x24VDC/2A, 4xM12" (https://support.industry.siemens.com/cs/ww/en/view/109798489)	Describes the hardware of the ET 200AL fail-safe I/O module (including installation, wiring, and technical specifications)
"Distributed I/O System ET 200S, Fail-Safe Modules (https://support.industry.siemens.com/cs/ww/en/view/27235629)" operating instructions	Describes the hardware of the ET 200S fail-safe modules (including installation, wiring, and technical specifications)
"S7-300 Automation System, ET 200M Distributed I/O System, Fail-safe Signal Modules (https://support.industry.siemens.com/cs/ww/en/view/19026151)" manual	Describes the hardware of the S7-300 fail-safe signal modules (including installation, wiring, and technical specifications)
"Distributed I/O system ET 200pro, fail-safe I/O modules (https://support.industry.siemens.com/cs/ww/en/view22098524)" operating instructions	Describes the hardware of the ET 200pro fail-safe modules (including installation, wiring, and technical specifications)

Documentation	Brief description of relevant content
"ET 200iSP distributed I/O device - Fail-safe modules (https://support.industry.siemens.com/cs/ww/en/view/47357221)" operating instructions	Describes the hardware of the ET 200iSP fail-safe modules (including installation, wiring, and technical specifications)
"Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925)" Function Manual	Contains the description of communication with OPC UA
Help on *STEP 7*	• Describes the operation of the standard tools in *STEP 7* • Contains information regarding configuration and parameter assignment of hardware • Contains a description of the programming languages FBD and LAD • Contains the description of communication with OPC UA

Fail-safe modules Manual Collection

The Manual Collection contains all the documentation for the SIMATIC fail-safe modules collected into one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109806400).

Guide

This documentation describes how to work with *STEP 7 Safety*. It includes instructions and reference sections (description of the instructions for the Safety program).

The following topics are addressed:

- Configuration of SIMATIC Safety
- Access protection for SIMATIC Safety
- Programming of the Safety program (safety-related user program)
- Safety-related communication
- Instructions for the Safety program
- Support for the system acceptance
- Operation and maintenance of SIMATIC Safety
- Monitoring and response times

Conventions

The following conventions apply:

- In this documentation, the terms "safety engineering" and "fail-safe engineering" are used synonymously. The same applies to the terms "fail-safe" and "F-".
- "F-systems" include redundant S7-1500HF systems. Special features and restrictions of H systems are described in the system manual "Redundant S7-1500R/H system (https://support.industry.siemens.com/cs/ww/en/view/109754833)" and also apply to the redundant S7-1500HF systems.
- *"STEP 7 Safety V21"* stands for *"STEP 7 Safety Advanced V21"*.
- "(S7-300)" indicates that the section **only** applies to S7-300 F-CPUs. S7-300 F-CPUs also includes the F-CPUs ET 200S and ET 200pro (IM F-CPUs).
- "(S7-400)" indicates that the section **only** applies to S7-400 F-CPUs.
- "(S7-1200 G1)" indicates that the section **only** applies to S7-1200 F-CPUs with article number 6ES721x-1xF**40**....
- "(S7-1200 G2)" indicates that the section **only** applies to S7-1200 F-CPUs with article number 6ES721x-1xF**50**....
- "(S7-1200)" indicates that the section **only** applies to S7-1200 G1 F-CPUs and S7-1200 G2 F-CPUs.
- "(S7-1500)" indicates that the section **only** applies to S7-1500 F-CPUs. S7-1500 F-CPUs also include S7-1500 HF-CPUs, ET 200SP F-CPUs, the CPU 151xpro F-2 PN, the S7-1500 F Software Controller, the SIMATIC Drive Controller and the S7-1500 F Virtual Controller. In the case of exceptions, these are indicated.

The scopes can be combined.

The term **Safety program** refers to the fail-safe portion of the user program and is used instead of "fail-safe user program", "F-program", etc. For purposes of contrast, the non-safety-related part of the user program is referred to as the "standard user program".

The **hardware configuration** includes the configuration of standard CPUs and standard I/Os as well as the configuration of F-CPUs and F-I/Os.

The **safety-related hardware configuration** includes the safety-related parameters of the F-CPUs and F-I/Os.

The **safety-related project data** includes the safety-related hardware configuration as well as the Safety program.

NOTE

Each warning is marked with a unique number at the end of the text. This enables you to easily reference other documents, for example, to obtain an overview of the safety requirements for the system.

Additional support

If you have further questions about the use of products presented in this manual, contact your local Siemens representative.

You can find information on whom to contact on the Web (https://www.automation.siemens.com/aspa_app).

A guide to the technical documentation for the various SIMATIC products and systems is available on the Web (http://www.siemens.com/simatic-tech-doku-portal).

You can find the online catalog and online ordering system on the Web (www.siemens.com/industrymall).

Training center

We offer courses to help you get started with the S7 automation system. To do this, contact your regional training center or the central training center in Nuremberg, Germany.

More information can be found on the Internet (http://www.sitrain.com).

Technical Support

To contact Technical Support for all Industry Automation products, use the Support Request Web form (http://www.siemens.com/automation/support-request).

More information can be found about our Technical Support on the Web (http://www.siemens.com/automation/service).

Important note for maintaining the operational safety of your system

NOTE

The operators of systems with safety-related characteristics must adhere to operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which could be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

SiePortal

You can find current information on the following topics quickly and easily here:

- **Catalog and ordering system**
  Ordering system for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).
- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySiePortal**
  Your personal work area in the SiePortal for notifications, support requests, and configurable documents.

Table of contents

1 Product Overview 22

1.1 Overview 22
1.2 Hardware and Software Components 23
1.3 Installing/uninstalling the STEP 7 Safety Advanced V21 license 29
1.4 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced 30
1.5 Migrating PLC programs to a n F-CPU S7-1500 30
1.6 Upgrading projects to the latest version of STEP 7 Safety 31
1.6.1 Upgrading projects from STEP 7 Safety as of V14 SP1 to the latest version 31
1.7 First steps 32

2 Configuring 33

2.1 Overview of Configuration 33
2.2 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices 37
2.3 Configuring an F-CPU 39
2.3.1 Special features of the S7-1500 F Virtual Controller 46
2.3.1.1 Operating the S7-1500 F Virtual Controller without central Virtual Timeservice 47
2.3.1.2 Operating the S7-1500 F Virtual Controller with central Virtual Timeservice 49
2.4 Configuring F-I/O 51
2.5 Configuration control (option handling) for F-I/Os 55
2.5.1 Example 56
2.6 Configuring shared device 59
2.7 Configuring isochronous mode (S7-1200 G2, S7-1500) 60
2.8 Recommendation for PROFIsafe address assignment 61
2.9 Configurations supported by the SIMATIC Safety F-system 62
2.10 PROFIsafe addresses for F-I/O of PROFIsafe address type 1 65
2.11 PROFIsafe addresses for F-I/O of PROFIsafe address type 2 66
2.12 PROFIsafe addresses for F-I/O of PROFIsafe address type 3 68
2.13 Setting the F-destination address for F-I/O with DIP switches 70
2.14 Assigning a PROFIsafe address of the F-I/Os with SIMATIC Safety 70
2.14.1 Identifying F-modules 73
2.14.2 Assign PROFIsafe address 75
2.14.3 Assigning PROFIsafe address to an F-module in a shared device in multiple projects 75
2.14.4 Assigning PROFIsafe address to an F-module in a shared device in a common project 76
2.14.5 Changing the PROFIsafe address 76

3 Safety Administration Editor 78

3.1 Opening the Safety Administration Editor 81

3.2 "General" area of the Safety Administration Editor 81

3.3 "F-runtime group" area of the Safety Administration Editor 85
3.3.1 "F-runtime group" area 85
3.3.2 Pre-/postprocessing (S7-1200, S7-1500) 85

3.4 "F-blocks" area of the Safety Administration Editor 86

3.5 "F-compliant PLC data types" area of the Safety Administration Editor (S7-1200, S7-1500) 88

3.6 "Web server F-admins" area of the Safety Administration Editor (S7-1200 G1, S7-1500) 88

3.7 "Settings" area of the Safety Administration Editor 89

3.8 "Flexible F-Link" area of the Safety Administration Editor (S7-1200, S7-1500) 94

4 Access protection 96

4.1 Overview of access protection 96

4.2 Access protection for the safety-related project data 97
4.2.1 CPU-wide access protection for the safety-related project data 97
4.2.2 Project-wide access protection for the safety-related project data 99

4.3 Access protection for the F-CPU 100
4.3.1 Access protection through the use of protection levels 100
4.3.2 Access protection through user management 103

4.4 Access protection through organizational measures 105

5 Programming 108

5.1 Overview of Programming 108
5.1.1 Program structure of the safety program (S7-300, S7-400) 108
5.1.2 Program structure of the safety program (S7-1200, S7-1500) 110
5.1.3 Safety program in Software Unit (Safety Unit) (S7-1500) 113
5.1.4 Fail-Safe Blocks 114
5.1.5 Restrictions in the programming languages FBD/LAD 116
5.1.6 F-compliant PLC data types (UDT) (S7-1200, S7-1500) 122
5.1.6.1 Grouping PLC tags for inputs and outputs of F-I/O in structures (S7-1200, S7-1500) 123
5.1.6.2 Example of structured PLC tags for inputs and outputs of F-I/O (S7-1200, S7-1500) 124
5.1.7 Named value data types (S7-1500) 127
5.1.8 Editing PLC tags with external editors 127
5.1.9 Using Multiuser engineering 128
5.1.10 Deleting the safety program 128

5.2 Defining F-Runtime Groups 129
5.2.1 Rules for F-Runtime Groups of the Safety Program 129
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400) 130
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500) 134
5.2.4 F-runtime group communication (S7-300, S7-400) 138
5.2.5 F-runtime group communication (S7-1200, S7-1500) 141

5.2.6 Deleting an F-runtime group ... 144
5.2.7 Changing the F-runtime group (S7-300, S7-400) ... 144
5.2.8 Changing the F-runtime group (S7-1200, S7-1500) ... 144

5.3 Creating F-blocks ... 145
5.3.1 Creating F-blocks ... 145
5.3.2 Know-how protection ... 146
5.3.3 Reuse of F-blocks ... 147

5.4 Information interface to the safety program ... 148
5.4.1 F-shared DB (S7-300, S7-400) ... 148
5.4.2 F-runtime group information DB (S7-1200, S7-1500) ... 149

5.5 Programming startup protection ... 150

6 F-I/O access ... 151

6.1 Addressing F-I/O ... 151

6.2 Value status (S7-1200, S7-1500) ... 153

6.3 Process Data or Fail-Safe Values ... 155

6.4 F-I/O DB ... 157
6.4.1 Name and number of the F-I/O DB ... 157
6.4.2 Tags of the F-I/O DB ... 158
6.4.2.1 PASS_ON ... 159
6.4.2.2 ACK_NEC ... 159
6.4.2.3 ACK_REI ... 160
6.4.2.4 IPAR_EN ... 160
6.4.2.5 DISABLE ... 162
6.4.2.6 QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status ... 162
6.4.2.7 ACK_REQ ... 163
6.4.2.8 IPAR_OK ... 163
6.4.2.9 DIAG ... 164
6.4.2.10 BASEID_ACTIVE ... 165
6.4.3 Accessing tags of the F-I/O DB ... 165

6.5 Passivation and reintegration of F-I/O ... 166
6.5.1 After startup of F-system ... 166
6.5.2 After communication errors ... 169
6.5.3 After F-I/O or channel faults ... 171
6.5.4 Group passivation ... 175

6.6 F-I/O access via I-slave-slave communication (S7-300, S7-400) ... 177
6.6.1 Overview ... 177
6.6.2 Configuring Safety-Related I-Slave-Slave Communication ... 178
6.6.3 Safety-related I-slave-slave communication - F-I/O access via process image ... 183
6.6.4 Limits for data transfer of safety-related I-slave-I-slave communication ... 183

7 Implementation of user acknowledgment ... 184

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller ... 184

7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device ... 189

8 Data exchange between standard user program and safety program 192

8.1 Data Transfer from the Safety Program to the Standard User Program 192

8.2 Data Transfer from Standard User Program to Safety Program 194

9 Safety-related communication 196

9.1 Communication via SENDDP/RCVDP or SENDS7/RCVS7(S7-300, S7-400) instructions: 196
9.1.1 Overview 196
9.1.2 Safety-related IO controller-IO controller communication 199
9.1.2.1 Configure safety-related IO controller-IO controller communication 199
9.1.2.2 Program safety-related IO controller-IO controller communication 203
9.1.2.3 Safety-related IO controller-IO controller communication - Limits for data transfer 206
9.1.3 Safety-related master-master communication 206
9.1.3.1 Configure safety-related master-master communication 206
9.1.3.2 Program safety-related master-master communication 211
9.1.3.3 Safety-related master-master communication:Limits for data transfer 214
9.1.4 Safety-related IO controller-I-device communication 214
9.1.4.1 Configuring safety-related communication between IO controller and I-device 214
9.1.4.2 Programming safety-related IO controller I-device communication 217
9.1.4.3 Safety-related IO-Controller-IO-Device communication - Limits for data transfer 219
9.1.5 Safety-related master-I-slave communication 219
9.1.5.1 Configuring safety-related master-I-slave communication 219
9.1.5.2 Program the safety-related master-I-slave or I-slave-I-slave communication 222
9.1.5.3 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication 224
9.1.6 Safety-related I-slave-I-slave communication 225
9.1.6.1 Configure safety-related I-slave-I-slave communication 225
9.1.6.2 Programming safety-related I-slave-I-slave communication 229
9.1.6.3 Limits for data transfer of safety-related I-slave-I-slave communication 229
9.1.7 Safety-related IO controller-I-slave communication 230
9.1.8 Safety-related communication via S7 connections 230
9.1.8.1 Configuring safety-related communication via S7 connections 230
9.1.8.2 Programming safety-related communication via S7 connections 232
9.1.8.3 Safety-related communication via S7 connections - Limits of data transfer 236
9.1.9 Safety-related communication with other S7 F-systems 236
9.1.9.1 Introduction 236
9.1.9.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication) 236
9.1.9.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication) 237
9.1.9.4 Communication with S7 Distributed Safety via S7 connections 238
9.1.9.5 Communication with S7 F/FH Systems via S7 connections 239

9.2 Communication via SENDDP/RCVDP instructions (S7-1200, S7-1500): 241
9.2.1 Overview 241
9.2.2 Safety-related IO controller-IO controller communication 243
9.2.2.1 Configure safety-related IO controller-IO controller communication 243
9.2.2.2 Program safety-related IO controller-IO controller communication 246
9.2.2.3 Safety-related IO controller-IO controller communication - Limits for data transfer 250
9.2.3 Safety-related master-master communication 251
9.2.3.1 Configure safety-related master-master communication 251
9.2.3.2 Program safety-related master-master communication 254
9.2.3.3 Safety-related master-master communication:Limits for data transfer 258

9.2.4 Safety-related IO controller-I-device communication ... 258
9.2.4.1 Configuring safety-related communication between IO controller and I-device ... 258
9.2.4.2 Programming safety-related IO controller I-device communication ... 263
9.2.4.3 Safety-related IO-Controller-IO-Device communication - Limits for data transfer ... 266
9.2.5 Safety-related master-I-slave communication ... 267
9.2.5.1 Configuring safety-related master-I-slave communication ... 267
9.2.5.2 Programming safety-related master-I-slave communication ... 270
9.2.5.3 Limits for data transfer of safety-related master-I-slave communication ... 273
9.2.6 Safety-related IO controller-I-slave communication ... 274
9.2.7 Safety-related communication to S7 F-System S7 Distributed Safety ... 274
9.2.7.1 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication) ... 275
9.2.7.2 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication) ... 276
9.3 Communication via SENDDP/RCVDP instructions between S7-300/400 and S7-1200/1500 F-CPUs ... 276
9.4 Communication via SENDDP/RCVDP instructions: IO controller and I-device in different projects ... 277
9.4.1 Configuring safety-related communication between IO controller and I-device ... 277
9.4.2 Programming safety-related IO Controller I-device communication ... 278
9.5 Communication with OPC UA Safety (S7-1500) ... 279
9.5.1 Configuration and programming interfaces ... 280
9.5.1.1 Safety Parameter Interface (SPI) of the SafetyProvider ... 280
9.5.1.2 Safety Application Program Interface (SAPI) of the SafetyProvider ... 284
9.5.1.3 Safety Parameter Interface (SPI) of the SafetyConsumer ... 288
9.5.1.4 Safety Application Program Interface (SAPI) of the SafetyConsumer in the F-OPC UA Consumer DB ... 293
9.5.1.5 Other variables in the F-OPC UA Consumer DB ... 297
9.5.2 Configuring and programming a SafetyProvider ... 300
9.5.2.1 Preparing the Safety program (or standard user program) for creation of an OPC UA SafetyProvider information model ... 300
9.5.2.2 Creating an OPC UA SafetyProvider information model for an individual data structure ... 302
9.5.2.3 Creating a server interface for an OPC UA SafetyProvider information model ... 307
9.5.2.4 Programming the initialization or evaluation of SAPI parameters in your safety program (or standard user program) ... 311
9.5.3 Configuring and programming a SafetyConsumer ... 314
9.5.3.1 Creating a client interface for an OPC UA SafetyProvider information model ... 315
9.5.3.2 Configuring properties of a SafetyConsumer ... 319
9.5.3.3 Programming the initialization or evaluation of SAPI parameters in your Safety program (or standard user program) ... 321
9.5.3.4 Programming underlying OPC UA communication ("client instructions") using the F-OPC UA Consumer Com FB ... 323
9.5.4 Special use cases for communication with OPC UA Safety ... 325
9.5.4.1 Introduction ... 325
9.5.4.2 Safety Multicast ... 325
9.5.4.3 Series machines ... 326
9.5.4.4 Changing communication partners ... 327
9.5.5 Avoiding connection resource bottlenecks ... 329
9.5.6 Using diagnostic options when communicating with OPC UA Safety ... 330
9.5.6.1 ReadSafetyDiagnostics ... 330
9.5.6.2 SafetyConsumerType ... 331
9.5.6.2.1 Configuring and programming a SafetyConsumerType ... 331

9.5.6.2.2 Creating an OPC UA SafetyConsumerType information model 331
9.5.6.2.3 Creating a server interface for an OPC UA SafetyConsumerType information model 335
9.6 Communication with Flexible F-Link (S7-1200, S7-1500) 338
9.6.1 Flexible F-Link 338
9.6.2 F-communication DB (S7-1200, S7-1500) 341

10 Compiling and commissioning a safety program 344

10.1 Compiling the safety program 344
10.2 Safety program work memory requirements (S7-300, S7-400) 344
10.3 Downloading project data 345
10.3.1 Downloading project data to an S7-300/400 F-CPU 350
10.3.1.1 Downloading project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card or flash card) 350
10.3.1.2 Downloading project data to an S7-400 F-CPU without flash card inserted 350
10.3.1.3 Downloading individual F-blocks to an S7-300/400 F-CPU 351
10.3.1.4 Downloading project data to a memory card and inserting at an F-CPU S7-300/400 352
10.3.2 Downloading project data into an F-CPU S7-1200 353
10.3.2.1 Downloading project data to an S7-1200 F-CPU without program card inserted 353
10.3.2.2 Downloading project data to an S7-1200 F-CPU with program card inserted 354
10.3.2.3 Loading project data of an F-CPU S7-1200 with a transfer card into the internal load memory 357
10.3.2.4 Downloading project data of an S7-1200 F-CPU from the internal load memory to an empty SIMATIC Memory Card 360
10.3.2.5 Downloading project data to a SIMATIC Memory Card and inserting it at an F-CPU S7-1200 362
10.3.3 Downloading project data to an S7-1500 F-CPU 362
10.3.3.1 Downloading project data to an S7-1500 F-CPU 362
10.3.3.2 Downloading project data into a redundant S7-1500HF system 363
10.3.3.3 Downloading project data to an S7-1500 F Software Controller 364
10.3.3.4 Downloading project data to a SIMATIC Memory Card or removable storage device and inserting it into an F-CPU S7-1500 366
10.3.4 Restoring a backup of the safety program to an F-CPU 368
10.3.5 Specifics on creating and installing an image file of an S7-1500 F Software Controller 369
10.3.6 Loading project data (including safety-related project data) from an F-CPU into a PG/PC (S7-1500/S7-1200 G2 V4.1) 371
10.3.7 Loading project data (including safety-related project data) from a memory card into a PG/PC (S7-1500/S7-1200 G2 V4.1) 372
10.3.8 Loading a PC system configuration file for S7-1500 F software controllers 373
10.3.8.1 Creating a configuration file 374
10.3.8.2 Importing the configuration file 374
10.3.8.2.1 Import via the PC Station Panel menu (only possible with firmware < V30.0) 374
10.3.8.2.2 Import by means of a script 375
10.4 Program identification 378
10.5 Comparing Safety Programs 380
10.6 Creating a safety summary 382
10.7 Testing the safety program 384
10.7.1 Overview of Testing the Safety Program 384
10.7.2 Disabled safety mode 385

10.7.2.1 Configuring the time limit for disabled safety mode (S7-1200, S7-1500) ... 386
10.7.2.2 Disabling safety mode ... 386
10.7.3 Testing the safety program ... 390
10.7.4 Testing the Safety program with S7-PLCSIM/S7-PLCSIM Advanced ... 393
10.7.5 Changing the safety program in RUN mode (S7-300, S7-400) ... 397
10.7.6 Safety program in RUN mode (S7-1200, S7-1500) ... 399
10.8 F-change history ... 405

11 System acceptance ... 407
11.1 Overview of System Acceptance ... 407
11.2 Correctness of the safety program including hardware configuration (including testing) ... 408
11.3 Completeness of the safety summary ... 409
11.4 Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate ... 410
11.5 Compliance of the know-how protected F-blocks used in the Safety program with their safety summary. ... 411
11.6 Completeness and correctness of the hardware configuration ... 412
11.7 Completeness and correctness of safety-related communication ... 418
11.7.1 Completeness and correctness of safety-related communication ... 419
11.7.2 Procedure to check the correctness of the configuration of communication with OPC UA Safety ... 420
11.8 Identity of online and offline program ... 424
11.9 Other characteristics ... 425
11.10 Acceptance of Changes ... 427

12 Operation and maintenance ... 434
12.1 Notes on startup of the F-system ... 434
12.2 Notes on Safety Mode of the Safety Program ... 435
12.3 Replacing Software and Hardware Components ... 437
12.4 PFDavg and PFH values ... 439
12.5 Guide to Diagnostics ... 441

13 STEP 7 Safety V21 instructions ... 443
13.1 Connection of the Enable input EN and Enable output ENO ... 443
13.2 Temporal blurring for instructions with time processing ... 444
13.3 General ... 446
13.3.1 LAD ... 446
13.3.1.1 New network (STEP 7 Safety V21) ... 446
13.3.1.2 Empty box (STEP 7 Safety V21) ... 446
13.3.1.3 Open branch (STEP 7 Safety V21) ... 447
13.3.1.4 Close branch (STEP 7 Safety V21) ... 448
13.3.2 FBD ... 449
13.3.2.1 New network (STEP 7 Safety V21) ... 449
13.3.2.2 Empty box (STEP 7 Safety V21) ... 449

13.3.2.3 Open branch (STEP 7 Safety V21) 450
13.3.2.4 Insert binary input (STEP 7 Safety V21) 451
13.3.2.5 Invert RLO (STEP 7 Safety V21) 452

13.4 Bit logic operations 452
13.4.1 LAD 452
13.4.1.1 ---| |---: Normally open contact (STEP 7 Safety V21) 452
13.4.1.2 ---| / |---: Normally closed contact (STEP 7 Safety V21) 453
13.4.1.3 --|NOT|--: Invert RLO (STEP 7 Safety V21) 454
13.4.1.4 ---( )---: Assignment (STEP 7 Safety V21) 455
13.4.1.5 ---(R)---: Reset output (STEP 7 Safety V21) 455
13.4.1.6 ---(S)---: Set output (STEP 7 Safety V21) 457
13.4.1.7 SR: Set/reset flip-flop (STEP 7 Safety V21) 458

13.4.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V21) 476
13.4.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V21) 477

13.5 Safety functions 478
13.5.1 ESTOP1: Emergency STOP/emergency OFF up to stop category 1 (STEP 7 Safety V21) 478
13.5.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V21) (S7-300, S7-400) 482
13.5.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V21) 483
13.5.4 MUTING: Muting (STEP 7 Safety Advanced V21) (S7-300, S7-400) 486
13.5.5 MUT_P: Parallel muting (STEP 7 Safety V21) 495
13.5.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V21) 505
13.5.7 FDBACK: Feedback monitoring (STEP 7 Safety V21) 510
13.5.8 SFDOOR: Safety door monitoring (STEP 7 Safety V21) 515
13.5.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V21) 520

13.6 Timer operations 522
13.6.1 TP: Generate pulse (STEP 7 Safety V21) 522
13.6.2 TON: Generate on-delay (STEP 7 Safety V21) 524
13.6.3 TOF: Generate off-delay (STEP 7 Safety V21) 527

13.7 Counter operations 529
13.7.1 CTU: Count up (STEP 7 Safety V21) 529
13.7.2 CTD: Count down (STEP 7 Safety V21) 531
13.7.3 CTUD: Count up and down (STEP 7 Safety V21) 533

13.8 Comparator operations 535

13.8.1 CMP ==: Equal (STEP 7 Safety V21) ... 535
13.8.2 CMP <>: Not equal (STEP 7 Safety V21) ... 536
13.8.3 CMP >=: Greater or equal (STEP 7 Safety V21) ... 537
13.8.4 CMP <=: Less or equal (STEP 7 Safety V21) ... 538
13.8.5 CMP >: Greater than (STEP 7 Safety V21) ... 539
13.8.6 CMP <: Less than (STEP 7 Safety V21) ... 540

13.9 Math functions ... 542
13.9.1 ADD: Add (STEP 7 Safety V21) ... 542
13.9.2 SUB: Subtract (STEP 7 Safety V21) ... 545
13.9.3 MUL: Multiply (STEP 7 Safety V21) ... 548
13.9.4 DIV: Divide (STEP 7 Safety V21) ... 551
13.9.5 NEG: Create twos complement (STEP 7 Safety V21) ... 554
13.9.6 ABS: Form absolute value (STEP 7 Safety V21) (S7-1200, S7-1500) ... 556

13.10 Move operations ... 558
13.10.1 MOVE: Move value (STEP 7 Safety V21) ... 558
13.10.2 RD_ARRAY_I: Read value from INT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500) ... 559
13.10.3 RD_ARRAY_DI: Read value from DINT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500) ... 561
13.10.4 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 563
13.10.5 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 565

13.11 Conversion operations ... 566
13.11.1 CONVERT: Convert value (STEP 7 Safety V21) ... 566
13.11.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V21) ... 568
13.11.3 W_BO: Convert a data element of data type WORD to 16 data elements of data type BOOL (STEP 7 Safety V21) ... 570
13.11.4 SCALE: Scale (STEP 7 Safety V21) ... 572
13.11.5 SCALE_D: Scale to data type DINT (STEP 7 Safety V21) (S7-1200, S7-1500) ... 574

13.12 Program control operations ... 576
13.12.1 JMP: Jump if RLO = 1 (STEP 7 Safety V21) ... 576
13.12.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V21) ... 578
13.12.3 LABEL: Jump label (STEP 7 Safety V21) ... 580
13.12.4 RET: Return (STEP 7 Safety V21) ... 581
13.12.5 OPN: Open global data block (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 582

13.13 Word logic operations ... 584
13.13.1 AND: AND logic operation (STEP 7 Safety V21) ... 584
13.13.2 OR: OR logic operation (STEP 7 Safety V21) ... 585
13.13.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V21) ... 586

13.14 Shift and rotate ... 587
13.14.1 SHR: Shift right (STEP 7 Safety V21) ... 587
13.14.2 SHL: Shift left (STEP 7 Safety V21) ... 589

13.15 Operating ... 591
13.15.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V21) ... 591

13.16 Additional instructions ... 596
13.16.1 LAD ... 596
13.16.1.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 596
13.16.1.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 597

13.16.2 FBD ... 598
13.16.2.1 OV: Get status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 598
13.17 Communication ... 599
13.17.1 PROFIBUS/PROFINET ... 599
13.17.1.1 SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) ... 599
13.17.2 S7 communication ... 608
13.17.2.1 SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V21) (S7-300, S7-400) ... 608

A Monitoring and response times ... 615

A.1 Configuring monitoring times ... 616
A.1.1 Minimum monitoring time for the F-runtime group cycle time ... 618
A.1.2 Minimum monitoring time of the F-I/O access ... 618
A.1.3 Minimum monitoring time for communication via the SENDDP/RCVDP or SENDS7/RCVS7 instructions ... 619
A.1.4 Minimum monitoring time of communication with OPC UA Safety ... 620
A.1.5 Minimum monitoring time for communication with Flexible F-Link ... 620
A.1.6 Monitoring Time for Safety-Related Communication between F-Runtime Groups ... 620
A.2 Response Times of Safety Functions ... 621

B Checklist ... 624

C Assignment of the F-BaseID during runtime (delayed transfer) (S7-1200 G2, S7-1500) ... 629

C.1 Safety Extensions ... 631
C.1.1 BASEID_GEN ... 631
C.1.2 BASEID_DATA ... 632
C.1.3 BASEID_CODING ... 634
C.1.4 BASEID_HOST ... 636

Product Overview

1

1.1 Overview

SIMATIC Safety fail-safe system

The SIMATIC Safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency STOP devices for machining and processing equipment) and in the process industry (for example, for implementation of protection functions for safety devices of instrumentation and controls and of burners).

⚠ WARNING

The SIMATIC Safety F-system is used to control processes that reach their safe state immediately through shutdown. This also applies in particular to redundant S7-1500HF systems.
SIMATIC Safety may only be used for controlling processes in which a shutdown does not pose a danger to humans or the environment.
When realizing safety applications including the creation of the safety-related project data you have to take into consideration the standards, directives and guidelines relevant for your application. In particular include standards in which the software creation process is described (for example IEC 61508-3 or ISO 13849-1). *(S062)*

Achievable safety requirements

SIMATIC Safety F-systems can satisfy the following safety requirements:

- Safety Integrity Level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Functional safety in SIMATIC Safety

Functional safety is implemented primarily in the software. The SIMATIC Safety F-System brings the plant into a safe state in the event of a hazardous event and maintains this state. Safety mechanisms are contained mainly in the following components:

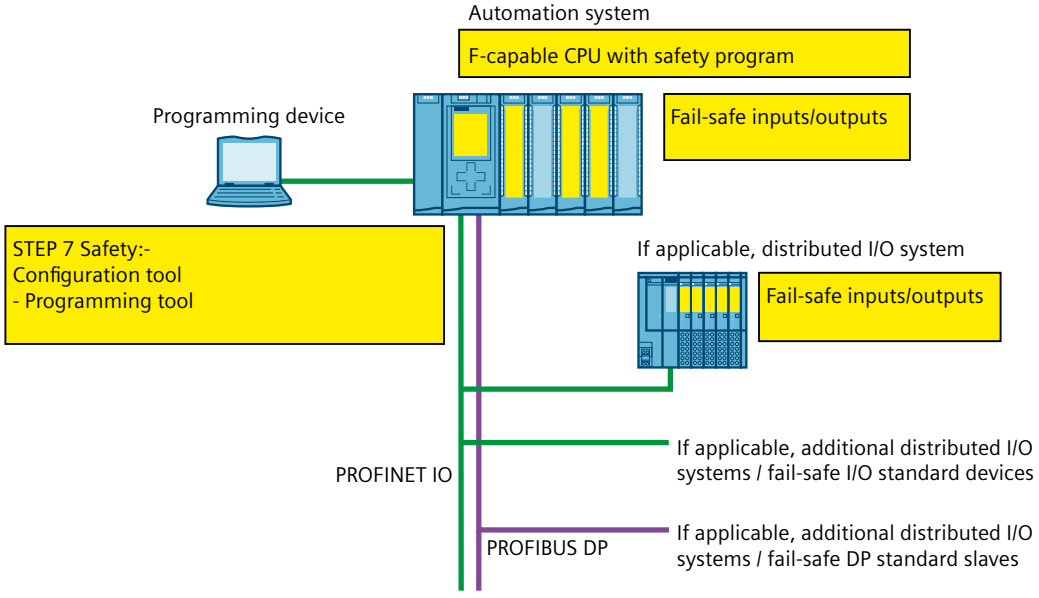
- In the safety-related user program (safety program) in the F-CPU
- In the fail-safe inputs and outputs (F-I/O)

The F-I/O ensure the safe processing of field information (sensors: e.g. emergency STOP pushbutton, light barriers; actuators, e.g. for motor control). They have all of the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level. The user only has to program the user safety function. Functional safety for the process can be provided by a user safety function or a fault reaction function.

The F-system cyclically checks the integrity of the safety program and the safety-related data. This check is generally always performed when safety-related data leaves an F-runtime group via safety-related communication or F-I/O access. If this check detects a fault, the F-system executes the fault reaction function, which switches off the associated outputs and, if necessary, sets the F-CPU to STOP.

NOTE

If the F-CPU switches to STOP mode due to a fault reaction function, with a redundant S7-1500HF system, it leads to the STOP of the primary CPU **and** the backup CPU.



Example of user safety function and fault reaction function

In the event of overpressure, the F-system will open a valve (user safety function). In the event of a hazardous fault in the F-CPU, all outputs are deactivated (fault reaction function), whereby the valve is opened, and the other actuators also attain a safe state. For a non-faulty F-system, only the valve would be opened.

1.2 Hardware and Software Components

Hardware and software components of SIMATIC Safety

The following schematic diagram provides an overview of the hardware and software components required to configure and operate a SIMATIC Safety F-system.

Hardware components for PROFIBUS DP

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFIBUS DP:

- F-CPUs with DP interface, such as CPU 1516F-3 PN/DP
- SIMATIC Drive Controller, for example, CPU 1504D TF
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe I/O modules ET 200eco (S7-300, S7-400)
  - Fail-safe GSD based DP slaves (light array, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFIBUS DP for connection to distributed F-I/O:

- CP 443-5 Extended
- CM 1243-5
- CM 1542-5
- CP 1542-5
- SP CM DP

Hardware components for PROFINET IO

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFINET IO:

- F-CPUs with PN interface, e.g. CPU 1214FC DC/DC/DC
- SIMATIC Drive Controller, for example, CPU 1504D TF
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200SP HA fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200eco PN fail-safe I/O modules
  - ET 200AL fail-safe I/O modules
  - Fail-safe GSD based I/O devices (light array, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFINET IO for connection to distributed F-I/O:

- CP 443-1
- CP 443-1 Advanced-IT
- CM 1542-1

Hardware components for central configuration

You can use the following fail-safe components in SIMATIC Safety F-systems centrally on an F-CPU (not HF-CPU):

- S7-300/ET 200M fail-safe signal modules
- S7-1200 fail-safe modules
- S7-1500/ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules (can also be used with CPU 1516proF-2)

You have the option to expand the configuration with standard I/O.

STEP 7 Safety

This documentation describes *STEP 7 Safety Advanced V21*. *STEP 7 Safety* is the configuration and programming software for the SIMATIC Safety F-system. With *STEP 7 Safety*, you receive the following:

- The support for configuring the F-I/O in the *hardware and network editor* of TIA Portal
- The support for creating the Safety program using LAD and FBD and integrating error detection functions into the Safety program
- Instructions for programming your Safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your Safety program in LAD and FBD with special safety functions

Moreover, *STEP 7 Safety* offers functions for comparing Safety programs and for assisting you with the system acceptance.

⚠ WARNING

The configuration of F-CPUs and F-I/Os as well as the programming of F-blocks must be carried out in TIA Portal as described in this documentation. To ensure safe operation with the SIMATIC Safety system, you must comply with the requirements of the relevant standards, such as IEC 61508. The section System acceptance (Page 407) describes procedures and tools of STEP 7 Safety to meet these requirements. *(S056)*

Optional packages

In addition to *STEP 7 Safety*, you can use option packages with F-I/O and F-CPUs and use instructions for programming your Safety program with special safety functions within the SIMATIC Safety F-system, for example SINUMERIK.

The installation, parameter assignment and programming as well as what is important to note during system acceptance, is described in the documentation for the specific optional packages.

Also read the notes in "Configurations supported by the SIMATIC Safety F-system (Page 62)".

TIA Portal Cloud Connector

⚠ WARNING

Use of the TIA Portal Cloud Connector is only intended for engineering work with TIA Portal. This means online access in productive operation (e.g. SCADA) is not permitted. This is particularly true for Safety programs. *(S068)*

Openness

Openness (https://support.industry.siemens.com/cs/ww/en/view/109826886) as part of *STEP 7 Safety* is supported with the functions listed below. The use of Openness in productive operation is not permitted.

As part of *STEP 7 Safety* the following is supported:

- Inserting / removing F-CPUs and F-I/Os
- Copying / deleting F-CPUs and F-I/Os from templates
- Compiling hardware
- Compiling software (incl. Safety program)
- Handling access protection for the safety-related project data (for TIA projects not protected by project protection)
- Reading/configuring F-parameters of the F-CPU (for S7-1500 F-CPUs)
- Reading/configuring F-parameters of F-I/Os
- Reading/configuring i-parameters of F-I/Os (for ET 200SP, ET 200AL, ET 200MP, ET 200eco PN, ET 200pro)
- Downloading safety-related project data to a SIMATIC Memory Card or storing it in a file folder
- Reading, declaring or deleting fail-safe tags in the PLC tag table
- Updating projects to the latest type versions of F-blocks
- Consistent station upload
- Export and import of F-blocks and F-compliant PLC data types (UDT)
- Comparison of hardware and software
- Version control interface (VCI) support
- Reading out PLC online fingerprint for the Safety program
- Storing safety-related project data as a PC System Configuration file

- Reading out the F-signatures and block signatures
- Adding and removing OPC UA Safety configurations (SafetyProvider/SafetyConsumer)

The following are not supported.

- Downloading to device

⚠ WARNING

When using Openness or other tools for operating the TIA Portal in combination with safety-related project data, integrity of the data must be ensured (for example, as part of the save or transfer functions of "Source Code Management" applications). If there is a connection of external tools, the requirements for offline support tools according to IEC 61508-3 must be observed. A violation of the integrity of the safety-related project data either offline or online cannot be detected by *STEP 7 Safety*. A final verification of the correctness of the safety-related project data has to be carried out as described in the section System acceptance (Page 407). *(S070)*

Openness programs can also be integrated into TIA Portal as an add-in. It is also possible to include so-called workflow add-ins, which are automatically called before a Safety program is compiled. See "Extending workflows" in the standard help.
If you have integrated such a workflow add-in, this is output in the safety summary.

Openness service

The Openness interface has been expanded to include the following services:

- `GlobalSettings` (see name area **Siemens.Engineering.Safety**), which provides the following actions:
  - `SafetyModificationsPossible(bool safetyModificationsPossible)`
  - `UsernameForFChangeHistory(string userName)`
  - `bool SafetyModificationsPossible()`
  - `string UsernameForFChangeHistory()`
- `SafetyBaseIdProvider` with the following action in the name area **Siemens.Engineering.Safety**:
  - `void GenerateBaseId()`

  `SafetySignatureProvider` which provides the following actions and properties:
  - `SafetySignatureComposition Signatures`
  - `UInt64 SafetySignature.Value`
  - `SafetySignatureType SafetySignature.Type`

- `SafetyAdministration` with the following actions and properties in the name area **Siemens.Engineering.Safety:**
  - `bool IsSafetyOfflineProgramPasswordSet`
  - `void SetSafetyOfflineProgramPassword(SecureString newPassword)`
  - `void RevokeSafetyOfflineProgramPassword(SecureString currentPassword)`
  - `bool IsLoggedOnToSafetyOfflineProgram`
  - `void LoginToSafetyOfflineProgram(SecureString currentPassword)`
  - `void LogoffFromSafetyOfflineProgram()`
- `Safety Administration`, which can be accessed from the `PLc-DeviceItem`.
  The `SafetyAdministration` service offers the following properties in the **Siemens.Engineering.Safety** namespace. These three properties include additional properties that are listed in the description.
  - `RuntimegroupComposition RuntimeGroups { get; }`
  - `SafetySettings Settings { get; }`
  - `SafetySignatureProvider ProgramSignatures { get; }`
- `SafetyPrintout` with the following action in the name area **Siemens.Engineering.Safety**:
  - `bool Print(SafetyPrintoutFilePrinter filePrinter, FileInfo fullOutputPath, string documentLayout, SafetyPrintoutOption documentationOption);`

More information can be found in the System Manual "SIMATIC TIA Portal Openness: Automating creation of projects (https://support.industry.siemens.com/cs/ww/en/view/109826886)" in the section "F-specific openness".

Virtual environments

⚠ WARNING

Use of virtual environments in the engineering system
Note that a hypervisor or a client software of a hypervisor is not permitted to perform any function that reproduces recorded message frame sequences with correct time response in a network with real F-CPUs and F-I/Os.
Make sure that this condition is met, for example, when using the following functions:

- Reset of captured statuses (snapshots) of the virtual machines (VMs)
- Suspending and resuming the VMs
- Replay of recorded sequences in the VMs
- Moving VMs between hosts in productive operation (e.g. Fault Tolerance (FT))
- Digital twins of VMs in the virtual environment

If in doubt, disable these functions in the settings (Hypervisor administration console). *(S067)*

Operating system installations with S7-150xS(P) F

⚠ WARNING

When using a PC with multiple Windows or Linux operating system installations (e.g. via boot manager), only one S7-150xS(P) F may be installed on this PC. *(S095)*

Safety program

You can create a Safety program using the *program editor*. You can program fail-safe FBs and FCs in the FBD or LAD programming languages using the instructions from *STEP 7 Safety* and create fail-safe DBs.

Safety checks are automatically performed and additional fail-safe blocks for error detection and fault reaction are inserted when the Safety program is compiled. This ensures that failures and errors are detected and appropriate reactions are triggered to maintain the F-system in the safe state or bring it to a safe state.

In addition to the Safety program, a standard user program can be run on the F-CPU. A standard program can coexist with a Safety program in an F-CPU because unintentional influencing of the safety-related data of the Safety program is uncovered by the standard user program.

Data can be exchanged between the safety program and the standard user program in the F-CPU by means of bit memory or data of a standard DB or by accessing the process image input and output.

Note possible restrictions/particularities when using Software Units or a Safety Unit (Page 113).

See also

Data Transfer from the Safety Program to the Standard User Program (Page 192)

1.3 Installing/uninstalling the STEP 7 Safety Advanced V21 license

After installation of the *STEP 7 Safety Advanced V21* license, the range of functions of *STEP 7 Safety Advanced V21* is available to you. This license is not required for S7-1200 F-CPUs.

Software requirements for *STEP 7 Safety Advanced V21*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Professional V21*

Installing the *STEP 7 Safety Advanced V21* license

1. Start the *Automation License Manager* on the programming device/PC on which the *"SIMATIC STEP 7 Professional V21"* software package is installed.
2. Install the *STEP 7 Safety Advanced V21* license as described in the *Automation License Manager help*.

Uninstalling the *STEP 7 Safety Advanced V21* license

To uninstall the *STEP 7 Safety Advanced V21* license, proceed as described in the *Automation License Manager help*.

1.4 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced

Migration of *S7 Distributed Safety* projects to *STEP 7 Safety Advanced* is no longer supported as of *STEP 7 Safety V21*. Migration is still possible with earlier versions of the *TIA Portal*. The project can then be upgraded from an earlier version to the current version in the usual way.

1.5 Migrating PLC programs to a n F-CPU S7-1500

To migrate an F-CPU S7-300/400 onto an F-CPU S7-1500, proceed as with the migration of a standard CPU S7-300/400 onto a CPU S7-1500.

Points to note after migration:

- Non-automatable actions
  - Creating an F-runtime group and assigning it to the main safety block.
  - The hardware configuration including the I/O of the initial F-CPU is not automatically transferred to an S7-1500 F-CPU. Implement the hardware configuration of the new CPU manually after migration.

    Please also read the sections
    "Specify F-destination address for F-I/O of PROFIsafe address type 1" and "Specify F-destination address for F-I/O of PROFIsafe address type 2" in chapter "Configuring an F-CPU (Page 39)". Otherwise, this can lead to a reassignment of the F-destination addresses in the configuration.
  - When using F-I/O with PROFIsafe Protocol Version = Expanded Protocol (XP) (for example S7-1500/ET 200MP F-modules), keep in mind that you need one byte more in the address area of S7-1200/1500 F-CPUs than in S7-300/400 F-CPUs.
  - Replacement of the OV instruction by the connection of the ENO output for mathematical functions (Page 542).
  - Replacement of the RD_FDB instruction by the instructions RD_ARRAY_I (Page 559) and RD_ARRAY_DI (Page 561).
  - Replacement of the F-runtime group communication through Communication via Flexible F-Link (Page 141).
- Instructions not supported:
  - MUTING
  - TWO_HAND
  - WR_FDB
  - OPN
  - SENDS7
  - RCVS7
- Data types not supported
  - DWORD

- Changes to safety program programming
  - F_GLOBDB.VKE0/1 replaced by FALSE/TRUE (Page 116).
  - Readable values from the F_GLOBDB replaced by the F-runtime group information DB. Additional information is available under F-shared DB (S7-300, S7-400) (Page 148) and F-runtime group information DB (S7-1200, S7-1500) (Page 149).
  - Replacement of the QBAD_I_xx or QBAD_O_xx tag by the value status. Additional information is available under Value status (S7-1200, S7-1500) (Page 153) and F-I/O DB (Page 157).
- New naming convention when naming the F-I/O DBs
- Modified behavior of QBAD and PASS_OUT (Page 162) tags for F-I/O with "RIOforFA safety" profile.

Compile the safety program and eliminate any compilation errors displayed.

NOTE
A new acceptance must be carried out following F-CPU migration.

Programming (Page 108)

1.6 Upgrading projects to the latest version of STEP 7 Safety

Re-create the safety summary after an upgrade to a newer version of *STEP 7 Safety*. The versions listed in the new safety summary of *STEP 7 Safety* will then match the new version of *STEP 7 Safety*.

1.6.1 Upgrading projects from STEP 7 Safety as of V14 SP1 to the latest version

If you want to continue working with a project from *STEP 7 Safety* as of *V14 SP1*, you must upgrade the project to the latest version of *STEP 7 Safety*.

NOTE
The project must be consistent before upgrading.

Perform the upgrade following the usual procedure for *STEP 7*. After upgrading to the latest version, you must compile your safety program and download it in STOP.

If you want to compile a migrated safety program with STEP 7 Safety for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.

If you have upgraded a project <= V17 to the latest version and compiled it, the Collective F-signature remains the same, but the version comparison between the online and offline programs shows a change. The differences shown are due to the improved calculation of the signatures as of V18. Because the Collective F-Signature has remained the same, re-acceptance is not necessary. We recommend creating a new safety summary so that the new signatures are documented.

Keep in mind that existing change histories are not upgraded. All previous entries are deleted after the upgrade. If required, print out the change log before you upgrade.

If you have created your project with *STEP 7 Safety V18* and have stored the Safety program in a Safety unit in this project, you must upgrade the project and then re-create the safety summary, which replaces the Safety summary created with *STEP 7 Safety V18*. This is required for the SENDDP and RCVDP instructions in the "System library elements used in Safety program" section to be displayed correctly.

1.7 First steps

Getting Started in SIMATIC Safety

Three Getting Started documents are available to help you begin using SIMATIC Safety.

The Getting Started documentation is an instruction manual that provides a step-by-step description of how to create a project with SIMATIC Safety. It gives you the opportunity to quickly become familiar with the scope of features of SIMATIC Safety.

Contents

The Getting Started documentation describes the creation of a single, continuous project that is extended with each section. Based on the configuration, you program a fail-safe shutdown, make changes to the programming, and accept the system.

In addition to the step-by-step instructions, the Getting Started documentation also gives you background information for every new topic, which explains the functions used in more detail and how they interrelate.

Target audience

The Getting Started documentation is intended for beginners but is also suitable for users who are switching from *S7 Distributed Safety*.

Download

Three Getting Started documents are available as PDF files for free download in the Industry Online Support:

- STEP 7 Safety Advanced V11 with S7-300/400 F-CPUs (https://support.industry.siemens.com/cs/ww/en/view/49972838)
- STEP 7 Safety Basic V13 SP1 with S7-1200 F-CPUs (https://support.industry.siemens.com/cs/ww/en/view/104547552) (part of the manual "S7-1200 Functional Safety manual")
- STEP 7 Safety Advanced V13 with S7-1500 F-CPUs (https://support.industry.siemens.com/cs/ww/en/view/101177693)

Configuring

2

2.1 Overview of Configuration

Introduction

You basically configure a SIMATIC Safety F-system in the same way as a standard S7-300, S7-400, S7-1200, S7-1500 or ET 200MP, ET 200SP, ET 200SP HA, ET 200AL, ET 200S, ET 200iSP, ET 200eco, ET 200eco PN or ET 200pro automation system in *STEP 7*.

This section presents only the essential differences compared to standard configuration you encounter when configuring a SIMATIC Safety F-system.

This documentation distinguishes between three groups of F-I/O:

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/O for which the uniqueness of the PROFIsafe address can be ensured through the combination of F-source address and F-destination address, for example, S7-1500/ET 200MP F-modules. You normally assign the PROFIsafe address with *STEP 7 Safety*.

F-I/O of PROFIsafe address type 3

F-I/O for which the uniqueness of the PROFIsafe address can be ensured through an F-BaseID in addition to the combination of F-source address and F-destination address, for example, certain S7-1500/ET 200SP F-modules. The F-BaseID saves you the work of ensuring the uniqueness of the PROFIsafe address network-wide/worldwide yourself (for more information, see "PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68)"). You normally assign the PROFIsafe address (including the F-BaseID) with *STEP 7 Safety*.

NOTE

The terminology "PROFIsafe address type 3" used in this documentation is equivalent to the designation "PROFIsafe address type 2 with BaseID". This applies in TIA Portal as well as to F-I/Os.

Which F-components can you configure with *STEP 7 Basic/STEP 7 Professional* and *STEP 7 Safety Advanced*?

The table below shows you which F-CPUs you can configure with *STEP 7 Safety Advanced*:

F-CPUs	*STEP 7 Safety Advanced*
S7-300	x
S7-400	x
S7-1200	x *
S7-1500(H)	x
SIMATIC Drive Controller	x
S7-1500 F Software Controller	x
S7-1500 F Virtual Controller	x

* You can configure S7-1200 F-CPUs without a license for *STEP 7 Safety*.

The table below shows you which F-I/Os you can configure with *STEP 7 Safety Advanced* as well as which PROFIsafe address type they support:

F-I/O	*STEP 7 Safety Advanced*	PROFIsafe address type
S7-300 F-SMs	x**	1
ET 200S F-modules	x	1
ET 200pro F-modules	x	1
ET 200iSP F-modules	x	1
ET 200eco DP F-I/O modules	With S7-300/400 F-CPUs (only PROFIsafe V1 mode)	1
ET 200eco PN F-I/O modules	x	2
S7-1200 F-modules (centrally on S7-1200 F-CPUs)	x***	2
ET 200SP F-modules	x	2 or 3
ET 200SP HA F-modules	x	2
S7-1500/ET 200MP F-modules	x	2
ET 200AL F-modules	x	2
fail-safe GSD based DP slaves	x	*
fail-safe GSD based I/O devices	x	*

* Consult the respective documentation to determine the PROFIsafe address type of a GSD based DP slave/GSD based I/O device. If in doubt, assume that the PROFIsafe address is type 1.

*** F-SMs that only support PROFIsafe V1 mode can only be used on F-CPUs S7-300/400.

*** You can configure S7-1200 F-modules without a license for *STEP 7 Safety*.

Special F-parameters

For the F-functionality there are special F-parameters that you can review and set in the "Properties" of the fail-safe components (F-CPU and F-I/O). F-parameters are marked in yellow.

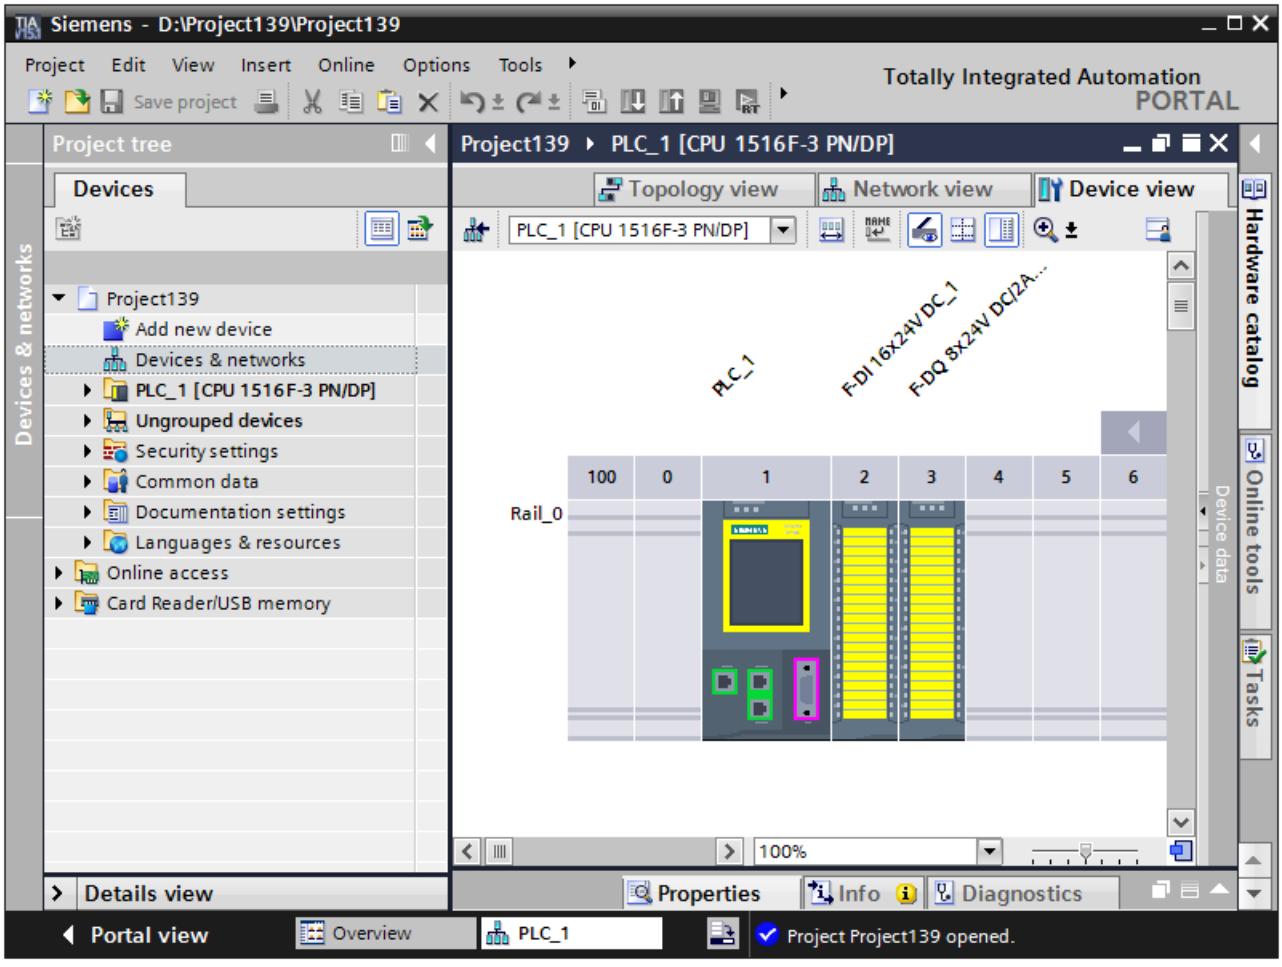
F-parameters are explained in "Configuring an F-CPU (Page 39)" and "Configuring F-I/O (Page 51)".

Changing safety-related parameters

NOTE

If you change a safety-related parameter (marked in yellow) for an F-I/O or an F-CPU, you must then compile and download the modified hardware configuration and the Compiling the safety program (Page 344) (context menu "Compile > Hardware and software (only changes)"). This also applies to changes to F-I/O that are not used in the safety program. F-I/O in standard operation is not affected by this.

Compiling the hardware configuration



You must compile the hardware configuration of the SIMATIC Safety F-system (context menu "Compile > Hardware configuration"). A configured F-CPU with enabled F-capability is the only prerequisite for programming the safety program.

NOTE

Inconsistencies are possible when configuring the hardware and can also be saved. A full consistency check of the hardware configuration and possible connection data is performed only during compilation. Therefore, perform "Edit > Compile" regularly.

Example: Configured F-system in *STEP 7 Professional*

The following figure presents a configured F-system. You choose the fail-safe components in the "Hardware catalog" task card as you would do with standard components and place them in the work area of the network or device view. F-components are shown in yellow.

More information

For detailed information on F-I/O, refer to the *manuals for the relevant F-I/O*.

Which safety-related communication options can you configure?

You need to use the *hardware and network editor* to configure the following safety-related communication options (see Communication via SENDDP/RCVDP or SENDS7/RCVS7(S7-300, S7-400) instructions: (Page 196) or Communication via SENDDP/RCVDP instructions (S7-1200, S7-1500): (Page 241)):

- Communication with OPC UA Safety (Page 279)
- Communication with Flexible F-Link (Page 338)
- Safety-related master-master communication

- Safety-related master-master communication for *S7 Distributed Safety*
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related I-slave-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for *S7 Distributed Safety*
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication
- Safety-related communication via S7 connections
- Safety-related communication via S7 connections for *S7 Distributed Safety* or *S7 F Systems*

2.2 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices

Requirement

In order to use fail-safe GSD based DP slaves for SIMATIC Safety, these GSD based slaves must be operated on PROFIBUS DP and support the PROFIsafe bus profile. When used in an S7-1200/1500 F-CPU, they must support the PROFIsafe bus profile in V2 mode.

Fail-safe GSD based DP slaves used in hybrid configurations on PROFIBUS DP and PROFINET IO downstream from a IE/PB link must support the PROFIsafe bus profile in V2 mode.

In order to use fail-safe GSD based I/O devices for SIMATIC Safety, the GSD based devices must be operated on PROFINET IO and support the PROFIsafe bus profile in V2 mode.

Configuration with GSD files

As is the case in a standard system, the basis for configuring fail-safe GSD based DP slaves/IO devices is the device specification in the GSD file (device master file).

A GSD file contains all of the properties of a GSD based DP slave or GSD based I/O device. For fail-safe GSD based DP slaves/GSD based I/O devices, certain parts are protected by a CRC.

The GSD files are supplied by the device manufacturers.

Protection of the data structure of the device in GSD files

The only GSD files supported are those that satisfy the requirements for protection defined as of *PROFIsafe Specification* V2.0 using a CRC stored in this file ("setpoint" for F_IO_StructureDescCRC).

The data structure described in the GSD file is checked when the F-I/O is added to the hardware configuration and when the hardware configuration is compiled. When an error is detected, you should clarify whether the GSD file provided by the device manufacturer contains the setpoint for F_IO_StructureDescCRC.

Assignment and setting of the PROFIsafe address

⚠ WARNING

Check the documentation for your fail-safe GSD based DP slaves / fail-safe GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. For configuring, proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 65), PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 66) or PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68).
Set the F-source address for fail-safe GSD based DP slaves / fail-safe GSD based I/O devices according to the manufacturer's specifications. If the F-source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, check the safety summary to verify that the value for the "Central F-source address" parameter corresponds to the value of the F-source address of the fail-safe GSD based DP slave/fail-safe GSD based I/O device.
(S053)

Configuration procedure with GSD files

You import the GSD files to your project (see *Help on STEP 7 "GSD files"*).

1. Select the fail-safe GSD based DP slave / GSD based I/O device in the "Hardware catalog" task card and connect it to the relevant subnet in the network view.
2. Select the fail-safe GSD based DP slave/GSD based I/O device and insert the necessary F-modules, if this does not occur automatically.
3. Select the relevant F-module and open the "Properties" tab in the inspector window.

For fail-safe GSD based DP slaves/GSD based I/O devices (contrary to other F-I/O), the "Manual assignment of F-monitoring time" parameter is enabled. The result is that the value specified in the GSD file for the F-monitoring time is used as default value when the slaves/devices are plugged. You can change both values (time and type of assignment) later manually.

F-parameter "F_CRC_Seed" and "F_Passivation" for fail-safe GSD based I/O devices

The F-parameters "F_CRC_Seed" and "F_Passivation" influence the behavior of a fail-safe GSD based I/O device. The combination of the F-parameters cannot be set but is specified by selecting a corresponding F-module. Up to three F-module variants can be used, depending on the S7-300/400 or S7-1200/1500 F-CPU used.

F-module variant	F_CRC_Seed	F_Passivation	Behavior of the fail-safe GSD based I/O device	Can be used with F-CPU
1	Parameter does not exist	Parameter does not exist	The GSD based I/O device works with the Basic Protocol (BP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-300/400/1200/1-500*
2	CRC-Seed24/32	Device/module	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-1200/1500
3	CRC-Seed24/32	Channel	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is supported.	S7-1200/1500

* Only use the F-module variant 1 with S7-1200/1500 F-CPUs if neither F-module variant 2 nor 3 exists.

More information

You can find the description of the parameters in the Help on fail-safe GSD based DP slaves and GSD based I/O devices.

2.3 Configuring an F-CPU

Introduction

You configure the F-CPU basically in the same way as a standard automation system.

F-CPUs are always configurable in *STEP 7*, regardless of whether or not the *STEP 7 Safety* license is installed.

If you want to use the F-I/O in safety mode or in safety-related communication, the F-capability of the F-CPU must be enabled.

F-capability is activated by default when *STEP 7 Safety* license is installed.

Enabling F-capability

If you want to enable the F-capability, proceed as follows:

1. Select the F-CPU in the device or network view, and select the "Properties" tab in the Inspector window.
2. Select "Fail-safe" in the area navigation.
3. Enable the F-capability with the "Enable F-activation" button.

Disabling F-capability

If you want to disable the F-capability for an F-CPU because you intend to use the F-CPU as a standard CPU, note the following:

- You need F-access permission for the safety program, if assigned.
- The Safety Administration Editor (Page 78) is deleted from the project tree.
- The F-OBs are deleted. (S7-1200, S7-1500)
- All F-blocks are deleted.
- From now on you cannot use F-I/O in safety mode with this F-CPU.

If you want to disable the F-capability, proceed as follows:

1. Select the F-CPU in the device or network view, and select the "Properties" tab in the Inspector window.
2. Select "Fail-safe" in the area navigation.
3. Disable the F-capability with the "Disable F-activation" button.
4. Confirm the "Disable F-activation" dialog with "Yes".

Although you can enable the F-capability of the F-CPU without F-access permission, this permission is required to disable it.
If you do not have F-access permission and have enabled the F-capability accidentally, you can only disable it using "Undo".

Configuring the F-parameters of the F-CPU

In the "Properties" tab of the F-CPU, you can change or apply the default settings for the following parameters:

- F-destination address range
  - Low limit for F-destination addresses for F-I/Os of PROFIsafe address type 1
  - High limit for F-destination addresses for F-I/Os of PROFIsafe address type 1
- The F-source address for F-I/Os of PROFIsafe address types 2 and 3.
- The F-BaseID for F-I/O of PROFIsafe address type 3 at the F-CPU
  - Enable manual assignment and set F-BaseID
  - Button for automatic generation according to PROFIsafe specification
  - Activate delayed transfer (internal value 0x7C6)
- Default F-monitoring time for central or distributed F-I/O at the F-CPU
  (For HF-CPUs, only the default F-monitoring time for distributed F-I/O.)

NOTE
A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

Specify F-destination address for F-I/O of PROFIsafe address type 1

With the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" you specify a range for this F-CPU in which the F-destination address of newly inserted F-I/Os of PROFIsafe address type 1 (Page 65) is assigned automatically. The F-destination address of an F-I/O is automatically moved to the destination address range of an F-CPU as soon as it is newly assigned to it.

The F-destination address is assigned in ascending order starting at the "Low limit for F-destination addresses". When no free F-destination address is available in the F-destination address range, the next available free F-destination address outside the F-destination address range is assigned and a warning is output during compilation.

The maximum possible F-destination address for ET 200S, ET 200eco, ET 200pro, ET 200iSP F-modules and S7-300 F-SMs is 1022.

The F-destination addresses for F-I/O of PROFIsafe address type 1 must be unique network-wide and CPU-wide.

By selecting different F-destination address ranges for different F-CPUs, you can define different ranges for the automatic assignment of the F-destination address. This is useful when you are operating multiple F-CPUs in one network. Subsequent manual address changes are possible. (see also Recommendation for PROFIsafe address assignment (Page 61))

Example:

You have configured the F-destination address range as follows:

- Low limit for F-destination addresses = 100
- High limit for F-destination addresses = 199

When inserting the first F-I/O of PROFIsafe address type 1, the F-destination address 100 is assigned. When inserting an additional F-I/O of PROFIsafe address type 1, the F-destination address 101 is assigned.

NOTE

The parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" have no effect on the following F-I/Os:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 bit (article number 6ES7336-1HE00-0AB0)

Specifying the F-destination address range for F-I/O of PROFIsafe address types 2 and 3

The F-destination address of F-I/O of PROFIsafe address type 2 (Page 66) and F-I/O of PROFIsafe address type 3 (Page 68) is assigned automatically for each F-CPU in descending order starting from 65534. The low limit is the value configured with the parameter "High limit for F-destination addresses" (for F-I/O of PROFIsafe address type 1) + 1.
If the value configured with the parameter "High limit for F-destination addresses" is reached, a warning is output during compilation. (See also Recommendation for PROFIsafe address assignment (Page 61))

Specifying F-source address for F-I/O of PROFIsafe address types 2 and 3

You specify the F-source address for F-I/O of PROFIsafe address type 2 (Page 66) and for F-I/O of PROFIsafe address type 3 (Page 68) assigned to this F-CPU with the parameter "Central F-source address". The F-source address must be unique network-wide for F-I/O of PROFIsafe address type 2. The F-source address or F-BaseID must be unique network-wide for F-I/O of PROFIsafe address type 3 (see also Recommendation for PROFIsafe address assignment (Page 61))

NOTE

A change to the "Central F-source address" parameter has the consequence that the safety program is different after recompilation. A new acceptance may therefore be required because the F-source addresses of all F-I/Os of address types 2 and 3 are changed centrally as a result.

Specifying F-BaseID for F-I/O of PROFIsafe address type 3

You specify the F-BaseID for the F-CPU and for F-I/O of PROFIsafe address type 3 (Page 68) assigned to this F-CPU with the parameter "F-BaseID". This is a uniformly distributed 64-bit random number that is generated by an algorithm in accordance with the PROFIsafe specification.
A manual assignment of values generated otherwise in accordance with the PROFIsafe specification is possible provided that the requirement for uniqueness is complied with:

⚠ WARNING

Only use generation tools with which you can track adherence to the PROFIsafe generation rules, e.g. based on the documentation. The TIA Portal tools comply with these rules. *(S116)*

⚠ WARNING

The F-BaseID may only be assigned manually in exceptional cases, when you are sure that the PROFIsafe addresses of the F-I/Os of the F-CPU are unique (worldwide). F-I/Os with the same F-BaseID must differ in the combination of F-source and F-destination address. We explicitly advise against manual assignment and recommend generation with the tools offered in the TIA Portal.
With the manual assignment of value "0" as F-BaseID, you lose the advantages of PROFIsafe address type 3 and must adhere to the specifications for PROFIsafe address type 2 (see warning S052). *(S115)*

To enable assignment of the F-BaseID during startup of the F-CPU, "Delayed transfer" can be activated (see also Assignment of the F-BaseID during runtime (delayed transfer) (S7-1200 G2, S7-1500) (Page 629)).

NOTE

A change to the "F-BaseID " parameter has the consequence that the hardware configuration must be compiled and downloaded again because the F-BaseID values of all F-I/Os of address type 3 are changed centrally as a result. If you change the F-BaseID from "Delayed transfer" to another setting, you must also compile and download the safety program again.

Normally, a new acceptance of the safety-related project data (Page 427) is not required after a change of the F-BaseID because this does not change the behavior of the safety program and/or the F-I/Os. For this reason, it is also not included in the Collective F-Signature. However, an acceptance of the overall function on the destination hardware may still be necessary.

"Default F-monitoring time" parameter

Configure the "Default F-monitoring time" for monitoring the communication between the F-CPU and F-I/O.

You can adjust the F-monitoring time via the following parameters:

- "Default F-monitoring time for central F-I/O"
- "Default F-monitoring time for F-I/O of this interface"

The **default F-monitoring time for the central F-I/O** acts on the F-I/O that is arranged centrally, i.e. near the F-CPU. You set this parameter in the properties of the F-CPU (select F-CPU, then select "Properties > Fail-safe > F-parameters").

The **default F-monitoring time for the F-I/O of this interface** acts on the F-I/O that is assigned to this interface of the F-CPU (PROFIBUS or PROFINET). You change this parameter in the properties of the relevant interface (selection of the interface in the "Device view" tab, then "F-parameters").

The various settings available allow you to flexibly adapt the F-monitoring time to the conditions of your F-system, for example to take account of different bus cycles.

You can also change the F-monitoring time individually for each F-I/O in the F-I/O properties (see Configuring F-I/O (Page 51) or Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 37)).

NOTE

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

NOTE
The default value for the "Default F-monitoring time for the F-I/O" for an HF-system is 2300 ms and is designed for an MRP ring. For line topology, you can set the "Default F-monitoring time for the F-I/O" smaller by a factor of approx. 2. You can determine the exact value as described in section "Monitoring and response times (Page 615)". You can set this value in the properties of the F-CPU (selection of the F-CPU, then "Properties > Fail-safe > F-parameters > PROFINET interface [X1]").

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find more information in Monitoring and response times (Page 615).

Automatic generation of the safety program

The safety program of an F-CPU consists of one or two F-runtime groups that contain the F-blocks (see also Defining F-Runtime Groups (Page 129)). When the F-CPU (with activated F-capability) is inserted into the work area of the device view or network view, a safety program with an F-runtime group is generated automatically.

You can define in *STEP 7 Safety* that no F-runtime group is generated while inserting the F-CPU (with activated F-capability).

Proceed as follows:

1. Select the "Options > Settings" menu command.
2. Select the "STEP 7 Safety" area.
3. If it is not already disabled, disable automatic generation of an F-runtime group by deselecting the "Generate default fail-safe program" option.

This change has no influence on any existing safety programs; it only defines whether an F-runtime group is automatically generated for each one of the subsequently inserted F-CPUs.

Configuring the protection level of the F-CPU

⚠ WARNING

(S7-300, S7-400) In productive operation, it must be prevented that changes to the standard user program are unintentionally made in the safety program as well. For this purpose, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU.
With the "Write protection" or "Write/read protection" protection level, the password would apply to the standard and the safety program. *(S001)*

⚠ WARNING

(S7-1200, S7-1500) In productive operation, the safety-related project data must be protected against unintentional changes.
If you use user management, the Runtime rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" and the engineering right "Manage users and roles" may only be granted to authorized users. You must also limit the assignment of user rights to trained personnel. Before the transition into productive operation, you must remove the "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" rights from the "Anonymous" user.
If you are not using user management or the "Access control via access levels" parameter is activated, then configure at least the "Full access (no protection)" protection level and assign a password under "Full access incl. fail-safe (no protection)". This protection level allows full access only to the standard user program and not the safety program.
If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".
Assign different passwords for the individual access levels. *(S041)*

You configure the protection level following the same procedure as for standard CPUs.
For information on the password for the F-CPU, refer to Access protection (Page 96). Pay special attention to the warnings in Access protection for the F-CPU (Page 100).

2.3.1 Special features of the S7-1500 F Virtual Controller

When you configure an S7-1500 F Virtual Controller, you must provide an additional timer for forming the safe time within the S7-1500 F Virtual Controller. This timer must always involve a network card or a selected Ethernet interface of the Edge device.

In this context, observe the following warning:

⚠ WARNING

You must configure an Ethernet interface or network adapter for your S7-1500 F Virtual Controller or central Virtual Timeservice in the Edge Resource Manager of the respective Edge Device.

You need to add the respective network card via the installation interface in the configuration menu of the Industrial Edge applications S7-1500VF or the virtual time service.

- Ensure, for example using data sheets or manufacturer confirmation, that the network card you selected is a separate, non-integrated IEEE1588-capable network card within your device or an externally plugged IEEE1588-capable network card.
- Ensure that the network card has a built-in quartz for the functionality according to IEEE 1588, e.g. through data sheets or manufacturer confirmation.

You must not use network cards or Ethernet interfaces configured for the safe time of an S7-1500 F Virtual Controller for time synchronization via PTP. Neither read nor write access is permitted to the physical hardware clock (PHC) of the network card.

You must differentiate between two types of operation in the Edge environment of an S7-1500 F Virtual Controller.

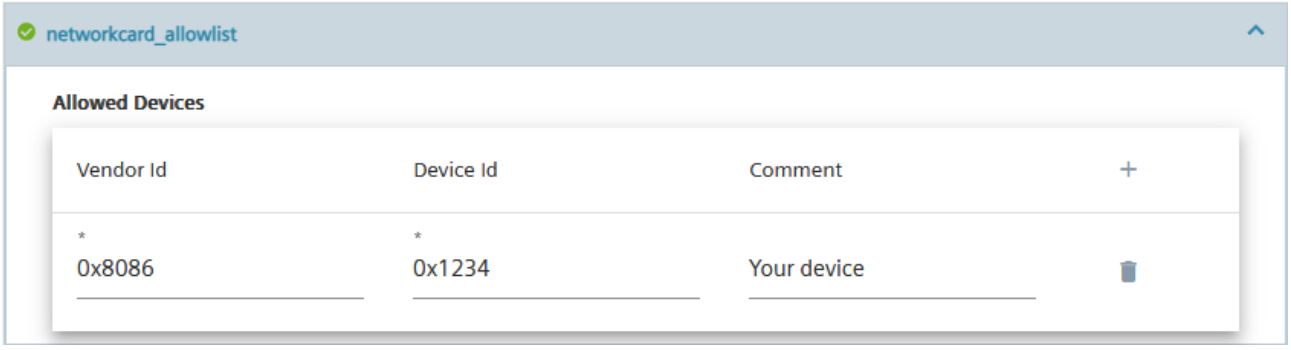
- You can operate the S7-1500 F Virtual Controller on an IED. In this case, you must always configure the network card or Ethernet interface directly for the S7-1500 F Virtual Controller.
- In the second case, you can operate the S7-1500 F Virtual Controller on an IEVD within a host. Depending on the application, you can directly assign a network card or Ethernet interface to the S7-1500 F Virtual Controller in an IEVD, as in the IED case.
  If you operate multiple S7-1500 F Virtual Controllers, you can use the Virtual Timeservice offered as an Industrial Edge application. The Virtual Timeservice distributes the safe time centrally for all S7-1500 F Virtual Controllers within your host. For this, you must configure the network card or Ethernet interface for the Virtual Timeservice and set up a suitable network for distributing the time stamp. An S7-1500 F Virtual Controller supports up to two Virtual Timeservices in a network. You must label the network for the Virtual Timeservice for each S7-1500 F Virtual Controller as "virtual-timeservice".
  If you operate the S7-1500 F Virtual Controller on a virtual Edge device within a host, you must provide the network cards or Ethernet interfaces for forming the safe time of an S7-1500 F Virtual Controller in the hypervisor of your host directly, exclusively and not virtualized via PCI passthrough for the respective Virtual Timeservice application or your S7-1500 F Virtual Controller application.

Check that the network card driver for the hardware time stamping function based on PTP is compatible with the version of your hypervisor and the kernel version of your IE(V)D.

Note that a reconfiguration of the settings of an IE(V)D with an S7-1500 F Virtual Controller during operation can result in STOP. *(S101)*

2.3.1.1 Operating the S7-1500 F Virtual Controller without central Virtual Timeservice

Installing the S7-1500 F Virtual Controller application



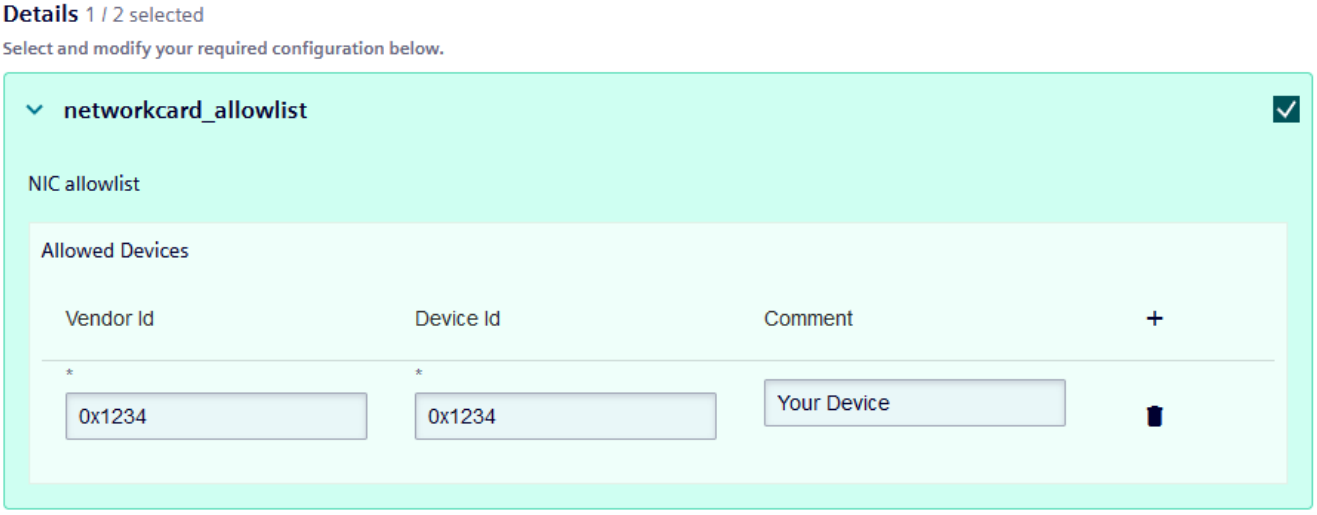
If you have not set up a central Virtual Timeservice and you want to configure a shared IEEE1588-capable interface (according to warning S101) for PROFINET communication and provision of the 2nd time base for the S7-1500 F Virtual Controller, add the network card or Ethernet interface to the "allow list" of the network cards.

NOTE

In the Installation menu, if you click "Back" and deselect the configuration with the plus sign, the previously configured networkcard_allowlist is installed/updated nonetheless. If you wish to correct your configuration, close the window by clicking the "X" and start the installation/update again.

Proceed as follows:

1. Select the "CPU 1517VF" app in the "Edge Management" under "Catalog".
2. Click "Install".
3. Add an IEEE1588-capable network card to the "vplc_x1" interface from the Resource Manager in accordance with warning S101. The "Application Manager" must be installed for this purpose.
   - To do this, check the box next to "networkcard_allowlist" and click on the plus sign in the "Allowed Devices" list.
   - Fill in "Vendor ID" and "Device ID" and, if desired, "Comment".



4. Click "Next".
5. Select the Edge device on which you want to install the app.
6. Click "Install Now".

Please note: The allow list can also be replaced later by updating the app.

If you are using the new UX of Edge via "new experience", follow these steps:

1. In "Edge Management", under Devices, select the Edge device on which you wish to install the "CPU 1517VF" app.
2. Click "Install application".
3. By means of the checkbox, select the "CPU 1517VF" app, whereupon the configuration menu for the app appears on the right.

4. Add an IEEE1588-capable network card to the "vplc_x1" interface from the Resource Manager in accordance with S101.
   - Open the "networkcard_allowlist" tab and click the plus sign in the "Allowed Devices" list.
   - Fill in "Vendor ID" and "Device ID" and, if desired, "Comment".
   - To install the configuration, put a check mark in the checkbox at the top right of the field so that the field becomes green.
5. Click "Install(1)".

Updating the S7-1500 F Virtual Controller application or replacing the allow list by updating the configuration

If you want to update the S7-1500 F Virtual Controller app without a set-up central Virtual Timeservice and **not** replace the allow list in the process, follow these steps:

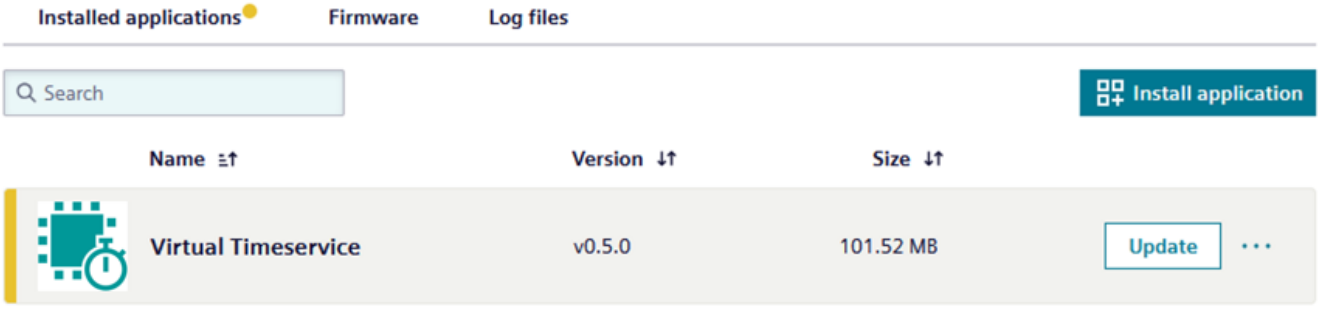
1. Select the new version of the "CPU1517VF" app under "Catalog" in "Edge Management".
2. Click "Update". (For all Edge devices on which no version of the "CPU1517VF" app is installed, "Install" is displayed)
3. Use "Next" to jump to the "Configuration" menu. The green check mark next to "networkcard_allowlist" must be cleared.

If you want to update the S7-1500 F Virtual Controller app or update the configuration and replace the allow list in the process, follow these steps:

1. In "My Installed Apps", click on the respective app and select "Update Configuration" in the menu.

   For an update of the app, select the new version of the "CPU1517VF" app under "Catalog" in "Edge Management".
2. Click "Update".
3. Click on the plus sign.
4. Fill in "Vendor ID" and "Device ID" and, if desired, "Comment".
5. Set the green check mark to the left of "networkcard-allowlist".

6. Click "Next".
7. Select "Update Now".



Note that when the configuration is updated, the allow list is only replaced after a STOP/START of the "CPU1517VF" app and not after a STOP/RUN of the S7-1500VF Virtual Controller.

If you are using the new UX of Edge via "new experience", follow these steps for an "Update Configuration":

1. Select the Edge device with your app in "Edge Management", under Devices.
2. Right-click on the three dots and select "Update Configuration".
3. Thereafter, follow the same procedure as for installing an app.
4. Click "Update(1)".

If you are using the new UX of Edge via "new experience", follow these steps for an "Update":

1. Select the Edge device with your app in "Edge Management", under Devices.
2. If there is an update available, you will see the "Update" button. Click "Update".
3. Thereafter, follow the same procedure as for installing an app.
4. Click "Update(1)".

NOTE

When you perform an Update Configuration, you need to stop and then restart the app for the configuration change to take effect.

2.3.1.2 Operating the S7-1500 F Virtual Controller with central Virtual Timeservice

Installation and setup of the Industrial Edge Virtual Timeservice application for forming a second time base for the S7-1500 F Virtual Controller

If you want to set up the Virtual Timeservice centrally for multiple S7-1500 F Virtual Controllers on a host with multiple S7-1500 F Virtual Controllers, observe the following:

- Install the Virtual Timeservice on a separate virtual Edge Device. You must not operate a Virtual Timeservice and an S7-1500 F Virtual Controller on the same virtual Edge Device.
- Connect all participating virtual Edge devices with an S7-1500 F Virtual Controller to the virtual Edge Device on which the central Virtual Timeservice has been installed and set up via a dedicated real-time capable network.
- This network should be used exclusively by the Virtual Timeservice for distributing the second time base.

- You can set up up to two central Virtual Timeservices for a dedicated network. To increase the availability of the system, you should set up two Virtual Timeservices.
- You must configure a separate IEEE1588-capable Ethernet interface or network card for each virtual time service in accordance with warning S101.
- Active PTP synchronization between the Virtual Timeservice and the S7-1500VF using, for example, boundary clock switches in the network can result in a connection abort and, thus, a STOP of the S7-1500VF. The active Virtual Timeservice ID indicated in the S7-1500VF can be changed by an active PTP-synchronizing component and consequently differ from the original Virtual Timeservice ID.

More information on setting up the Virtual Timeservice is provided in the "Virtual Timeservice App" Operating Manual.

Configuring a second network interface for the S7-1500 F Virtual Controller with a central Virtual Timeservice

For the S7-1500 F Virtual Controller to use the Virtual Timeservice as 2nd time base, follow these steps to configure network resources for the IEVD with the S7-1500 F Virtual Controller.

1. Open the "Settings" menu item in the IEVD web interface.
2. Go to the "Ressource Manager" tab.
3. To add a network, click on the plus sign to the right of "Isolatable Networks" under "Configuration".

   The new input fields appear at the end of the page (you may have to scroll down).
4. Under "Name", enter the name of the corresponding network interface.

   In "Annotations", right-click on the plus sign again to be able to assign a label for the interface.
5. For the S7-1500 F Virtual Controller with a Virtual Timeservice, create an additional entry for the provision of the 2nd time base next to the interface with label "vplc_x1".

   Assign the "virtual-timeservice" label to the interface to the real-time-capable network via which the time stamp is distributed and received by the S7-1500 F Virtual Controller
6. Click on "Submit" at the bottom to accept the entries.

Installing the S7-1500 F Virtual Controller application with central Virtual Timeservice

If you have set up a central Virtual Timeservice, install the app as described in the "Virtual Timeservice App" Operating Manual. Do not specify any additional network card under "Configurations" in the installation menu.

2.4 Configuring F-I/O

Introduction

You configure the S7-1500/ET 200MP, ET 200SP, ET 200SP HA, ET 200AL, ET 200S, ET 200eco (S7-300, S7-400), ET 200eco PN, ET 200pro, ET 200iSP F-modules, the S7-300 F-SMs and the S7-1200 F-modules as usual in *STEP 7*.

After you have inserted the F-I/O in the work area of the *device or network view*, you access the configuration dialogs by selecting the relevant F-I/O and the "Properties" tab.

NOTE

Changes to the parameter assignment result in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

The ET 200SP F-modules can be used in distributed system with:

- IM 155-6 PN ST as of firmware V1.1
- IM 155-6 PN HF
- IM 155-6 PN/2 HF as of firmware V4.2
- IM 155-6 PN/3 HF as of firmware V4.2
- IM 155-6 MF HF
- IM 155-6 PN HS
- IM 155-6 DP HF
- IM 155-6 PN R1

  You can find information on whether operation with R1 is supported for an ET 200SP F-module on the Internet. (https://support.industry.siemens.com/cs/ww/en/view/73021864)

The distributed use of S7-1500/ET 200MP F-modules is possible with:

- IM 155-5 PN BA as of firmware V4.3
- IM 155-5 PN ST as of firmware V3.0
- IM 155-5 PN HF as of firmware V2.0
- IM 155-5 DP ST as of firmware V3.0

The central use of S7-1500/ET 200MP F-modules is possible with S7-1500 F-CPUs as of firmware V1.7, distributed use as of firmware V1.5.

(S7-1200 G1) We recommend you limit the total number of F-I/Os used centrally or distributed in an S7-1200 G1 F-CPU to 12. Depending on the volume of project data, the maximum number of F-I/Os can be smaller.

WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test (Page 390).
Examples for such changes are:

- Adding F-I/O
- Changing the start address of F-I/O
- Changing the slot position of F-I/O
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Channel-granular passivation after channel faults

You can configure how the F-I/O will respond to channel faults, such as a short-circuit, overload, discrepancy error, or wire break, provided the F-I/O supports this parameter (e.g. for ET 200S or ET 200pro F-modules). You configure this response in the properties for the relevant F-I/O ("Behavior after channel fault" parameter). This parameter is used to specify whether the entire F-I/O or just the faulty channel(s) are passivated in the event of channel faults.

NOTE

(S7-300, S7-400) Note that channel-granular passivation increases the runtime of the F-runtime group(s) compared to passivation of the entire F-I/O (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).

"Channel failure acknowledge" parameter (S7-1200, S7-1500)

In the case of F-I/Os that support the "Channel failure acknowledge" channel parameter (for example S7-1500/ET 200MP F-modules, S7-1200 F-modules or ET 200AL F-modules), this function replaces the ACK_NEC tag of the F-I/O DB.

If an F-I/O fault is detected by the F-I/O, passivation of all channels of the relevant F-I/O occurs. If channel faults are detected, the relevant channels are passivated if "Passivate channel" is configured. If "Passivate the entire module" is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, reintegration of the relevant F-I/O/the relevant channel occurs in line with the "Channel failure acknowledge" parameter.

- Automatically
- Manually

The parameter "Channel failure acknowledge" can be set individually for each channel with channel-granular passivation if "Adjustable" has been parameterized at the "Reintegration after channel fault" parameter.

⚠ WARNING

The parameter assignment "Channel failure acknowledge = Automatic" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint.*(S045)*

NOTE

The default assignment for the "Channel failure acknowledge" parameter when the F-module is created is "Manually".

Organization block/Process image (S7-1200, S7-1500)

If you use F-I/O in standard mode, you can select the organization block/process image as you do for standard I/O.

If you use F-I/O in safety mode, no selection is possible. The process image is always updated automatically at the beginning or end of the F-runtime group (see section Program structure of the safety program (S7-1200, S7-1500) (Page 110)).

Contrary to F-I/O operated in non-isochronous mode, you need to selected a process image partition, such as PIP 1 for F-I/O that is operated in isochronous mode (see "Configuring isochronous mode (S7-1200 G2, S7-1500) (Page 60)").

Changing the name and number of the F-I/O DB

For more information, refer to the section "Fail-safe I/O data block (Page 157)".

Customizing the F-monitoring time for F-I/O

You can customize the F-monitoring time in the properties of the F-I/O under "F-parameters". This may be necessary to prevent a timeout being triggered when no error occurs and the F-I/O requires a longer F-monitoring time or assignment with a default F-monitoring time is not possible. For this purpose, activate the corresponding check box and assign an F-monitoring time.

NOTE

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find more information in Monitoring and response times (Page 615).

Group diagnostics for fail-safe S7-300 signal modules

By disabling a channel of the fail-safe signal module in the module properties, you also disable the group diagnostics for this channel.

Exception for S7-300/400 F-CPUs:

For the following S7-300 fail-safe signal modules, the monitoring of channel-specific diagnostic messages (for example, wire break, short-circuit) from the F-SM to the F-CPU is enabled and disabled with the "Group diagnostics" parameter.

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13Bit (article number 6ES7336-1HE00-0AB0)

You should disable group diagnostics for **unused** input or output channels.

⚠ WARNING

(S7-300, S7-400) For the following S7-300 fail-safe signal modules (F-SMs) with activated safety mode, "Group diagnostics" must be enabled on all used channels:

- SM 326; DI 8 x NAMUR (article numbers 6ES7326-1RF00-0AB0 and 6ES7326-1RF01-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

(S003)

Diagnostic interrupts can be enabled optionally.

More information

For detailed description of the **parameters**, refer to the help on the properties of the respective F-I/O and in the respective *manual for the F-I/O*.

2.5 Configuration control (option handling) for F-I/Os

For configuration control (option handling) with F-I/Os proceed as with the standard I/O devices. Detailed information can be obtained by searching for "Configuration control (option handling)" in the help of *STEP 7*.

The following section describes what you have to observe additionally for F-I/Os.

Requirements

- The requirements that are specified under "Configuration control (option handling)" in the help of *STEP 7* are fulfilled.
- The requirements that are specified under "Configuration control (option handling)" in the help of *STEP 7* are fulfilled. Handle the F-I/O as standard I/O.
- V2.1 or higher is set as the safety system version.
- The F-I/Os for which you use the configuration control (option handling) are located
  - Distributed at an F-CPU S7-300/400/1200/1500
  - Centrally at an F-CPU S7-1500

  The PROFIsafe address of the F-I/Os are set or assigned.

NOTE

Only if the maximum configuration actually exists is assigning the PROFIsafe addresses (Page 70) possible.

Procedure

(S7-1200, S7-1500) Disable the F-I/Os not existing in the respective variant (option) by setting the DISABLE (Page 162) variable in the associated F-I/O DB (Page 157) to "1". This prevents the flashing of the error LED of the F-CPU and diagnostic entries of the safety program that reference these F-I/Os. With the DISABLED (Page 162) variable of the associated F-IO data block, you can evaluate whether an F-module is deactivated.

(S7-300, S7-400) To prevent the flashing of the error LEDs of the F-CPUs you do not have to observe anything further. You cannot suppress diagnostics entries.

⚠ WARNING

If configuration control is used, your actual configuration deviates from the configured maximum configuration. You identify F-I/Os that do not exist in the current option (station option) via control record as "not available".
If an F-I/O marked as "not available" is possibly nevertheless in the real system, it has to be ensured that substitute values (0) are provided for these F-I/Os in the safety program or output at the outputs. This is achieved by setting the DISABLE tag (S7-1200, S7-1500) or respectively PASS_ON tag (S7-300, S7-400) in the associated F-I/O DB to "1". *(S077)*

2.5.1 Example

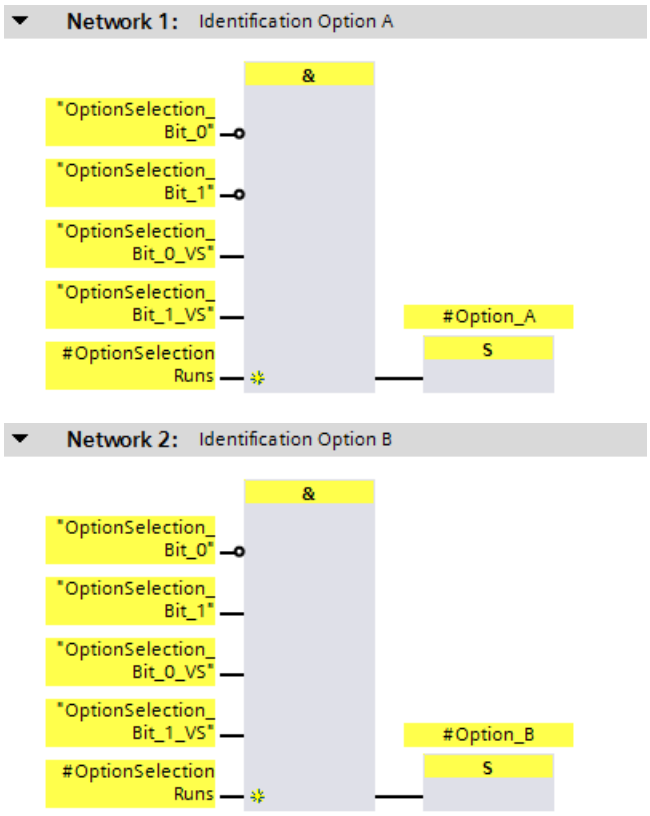
Introduction

The following example shows how you to

- Select/detect a station option
- Deactivate F-I/Os that are not present in a station option (S7-1200, S7-1500)
- Provide your safety program for various station options

Safe selection/detection of the station option

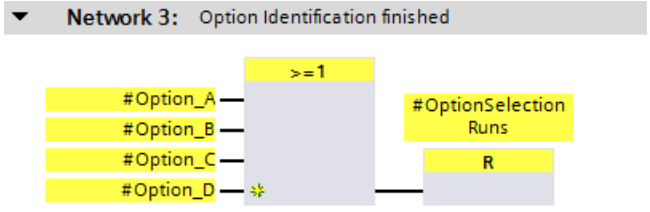
You carry out a safe selection/detection of a station option with inputs of an F-I/O wired fixed to M/L+.



For example, you can select up to 4 station options with 2 inputs of an F-I/O.

Option	OptionSelection_Bit_0	OptionSelection_Bit_1
Q	0	0
B	0	1
C	1	0
D	1	1

Note when detecting the station option that substitute values (0) are used for the inputs of the F-I/O in certain situations, e.g. during startup of the F-system or when F-I/O channel errors occur.



In these situations, the present station option cannot be detected. You should therefore also evaluate the value status of inputs and only apply the station option one-time after startup of the F-system.

For one-time recognition of the station option, define a static local datum, for example, OptionSelectionRuns with default value "TRUE".

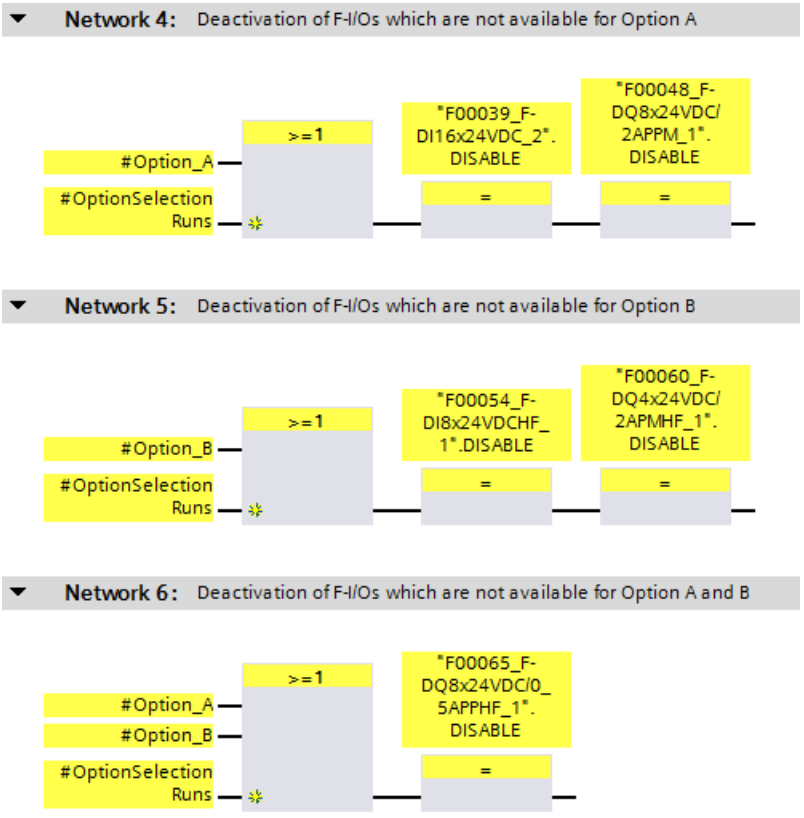
Correspondingly for options C and D.

As soon as a station option is detected, reset the static local datum for one-time detection of the station option:

NOTE

When you make the selection/detection of a station option only in the standard user program, only the "Station option" is available to you as a standard datum that is not secured. Make sure that no dangerous states arise from this.

Read the section "Data exchange between standard user program and safety program (Page 192)".



Disabling F-I/Os that are not present in a station option

If one or more F-I/Os are not present in a station option, you can prevent the blinking of the error LED of the F-CPU by disabling these F-I/Os.

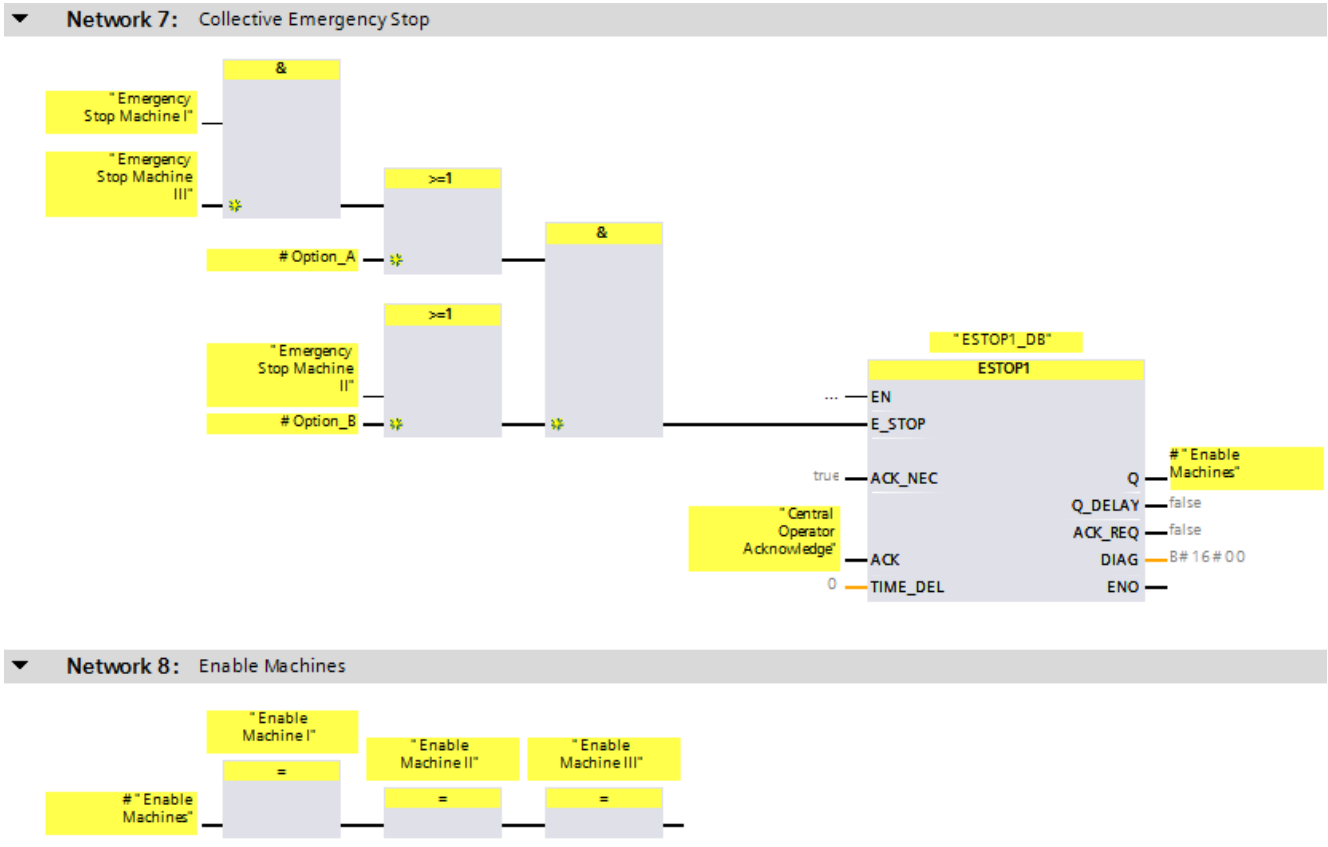
In addition, diagnostic messages of the safety program that refer to these F-I/Os are suppressed.

NOTE

As long as the detection of the station option (during startup of the F-system) is not yet complete (OptionSelectionRuns = TRUE), you should disable all "optional" F-I/O devices.

Providing the safety program for various station options

In the following example, the EMERGENCY STOP signals of different plant units or machines are combined into a collective EMERGENCY STOP signal.



Machines I and III and the corresponding F-I/O with the EMERGENCY STOP signal for machines I and III are not present with station option A.

Machine II and the corresponding F-I/O with the EMERGENCY STOP signal for machine II is not present with station option B.

The substitute values (0) are therefore used in the safety program for the EMERGENCY STOP signals from the respective unavailable machines.

In order to prevent the collective EMERGENCY STOP from being triggered because machines / EMERGENCY STOP signals are not present with certain station options, you can suppress the

evaluation of the EMERGENCY STOP signal for unavailable machines by taking into account the present station option.

2.6 Configuring shared device

To configure shared devices follow the procedure as in the standard. The configuration is described in the *STEP 7* help under "Configuring shared devices" and in the function manual "PROFINET with STEP 7 (https://support.industry.siemens.com/cs/ww/en/view/49948856)" in the chapter "Shared Device".

F-destination addresses

Please also read the chapter "Recommendation for PROFIsafe address assignment (Page 61)" for assigning the F-destination address.

See also

Assigning PROFIsafe address to an F-module in a shared device in multiple projects (Page 75)
Assigning PROFIsafe address to an F-module in a shared device in a common project (Page 76)

2.7 Configuring isochronous mode (S7-1200 G2, S7-1500)

To configure isochronous mode for F-I/Os that support this mode, e.g. "Profisafe Telgr 902" submodule of the SINAMICS S120 CU310-2 PN V5.1 drive, proceed as in the standard. The configuration is described in the *STEP 7* help under "Configuring isochronous mode".

Note the following:

- Contrary to F-I/O operated in non-isochronous mode, you need to selected a process image partition, such as PIP 1 for F-I/O that is operated in isochronous mode.
  This process image partition must contain only F-I/O operated in isochronous mode and no standard I/O.
- The assigned isochronous mode interrupt OB must first be generated as F-OB by specifying a F-runtime group (see Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 134)). It is not possible to add an F-OB with event class "Synchronous Cycle" directly during the configuration of the isochronous mode.

Requirement

F-CPUs that support IRT.

Connection of F-I/O operated in isochronous mode to the isochronous mode interrupt OB

You access F-I/O operated in isochronous mode in the same way as you do standard I/O operated in isochronous mode, via the select process image partition.

Contrary to standard I/O that is operated in isochronous mode, the process image partition is updated by the F-system at the beginning or end of the F-OB (see Program structure of the safety program (S7-1200, S7-1500) (Page 110)).

No calling of the instructions SYNC_PI and SYNC_PO is required in the F-OB.

NOTE

With isochronously operated F-I/O, it is not ensured (fail-safe) that all input data of the F-I/Os assigned to the process image partition are consistently available at the beginning of the main safety block or all output data is transferred consistently to the F-I/Os, in other words, logically and temporally together. The consistency is only ensured within an F-I/O.
The consistency of all isochronous F-I/Os of the process image partition usually depends on the number of isochronous F-I/Os and the scope of the safety program in the isochronous mode interrupt OB.
If corresponding consistency requirements exist, you need to check the consistency of the input and output data yourself, e.g. by also transferring and evaluating time stamps in the input and output data of the isochronously operated F-I/O.

2.8 Recommendation for PROFIsafe address assignment

Before inserting the F-I/O, specify an address range for each F-CPU for the F-destination addresses of the F-I/O of PROFIsafe address type 1 (Page 65) that does not overlap with the address range of any other F-CPU network-wide or CPU-wide (system-wide). You define the range with the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" (see also section Configuring an F-CPU (Page 39)).

In a redundant S7-1500HF system, consider both F-CPUs of the redundant S7-1500HF system as one F-CPU with regard to the PROFIsafe addresses. The "Low/high limit for F-destination addresses" or the "Central F-source address" and, if present, the F-BaseID is therefore set identically by the system for both F-CPUs.

The F-destination addresses of F-I/O of PROFIsafe address type 2 (Page 66) must not overlap with any address range of the F-I/O of PROFIsafe address type 1. The ranges of the F-destination addresses of the F-I/O of PROFIsafe address type 2 may overlap if the F-source addresses are different. This is the case for supported configurations (Page 62) if the "Central F-source address" parameter has been set differently for each F-CPU.

If the F-BaseID was generated individually for each F-CPU by the TIA Portal for an F-I/O of PROFIsafe address type 3, its F-source addresses and/or F-destination addresses can overlap with those of the F-I/Os of F-address type 1 or 2 of any other F-CPUs as needed.

Assign relatively low F-destination addresses for F-I/O of PROFIsafe address type 1 and relatively high F-destination addresses for F-I/O of PROFIsafe address type 2 and 3.

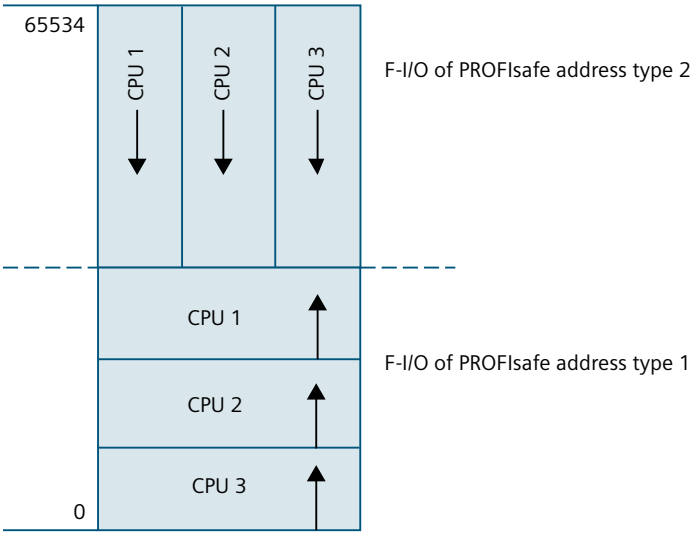


Figure 2-1 Address assignment for F-I/O of PROFIsafe address types 1 and 2

The safety summary (Page 409) lists the following information for each F-CPU:

- "Central F-source address" parameter (F-source address for F-I/O of PROFIsafe address type 2 and 3)
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 1
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 2
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 3

Any F-I/O configured using I-slave-slave communication is taken into account in the safety summary as part of the F-destination address range of the I-slave.

Any F-I/O configured in a shared device is indicated in the safety summary as part of the F-destination address range of the F-CPU to which this F-I/O is assigned.

2.9 Configurations supported by the SIMATIC Safety F-system

Supported configurations

F-I/Os (see Overview of Configuration (Page 33)) are supported in the following configurations:

Central configuration (also I-slave):

- The F-I/O is in the same rack as the associated F-CPU.
- The F-I/O is located in a subrack of the rack of the associated F-CPU.

Distributed configuration (at integrated DP-/PN interface of the CPU or at CP/CM):

- PROFIBUS DP (also after IE/PB link)
  - The F-I/O is located on a DP Slave.
  - The F-I/O is located on a DP Slave and is addressed via I-slave-slave communication. The assigned DP master (of the assigned IO controller of the IE/PB link) can be a standard CPU or an F-CPU.
- PROFINET IO
  - The F-I/O is located on an IO Device.
  - The F-I/O is located in a shared I-device.
  - The F-I/O is located in a shared device.

For a redundant S7-1500HF system the only supported configuration is:

Distributed configuration (at integrated PN interface of the HF-CPU)

- PROFIBUS DP after IE/PB link
  - The F-I/O is located on a DP slave
- PROFINET IO
  - The F-I/O is located in an IO device that is assigned to the IO systems of both F-CPUs.

    More information on IO devices for R1, S1 and S2 redundancy is available in the PROFINET Function Manual (https://support.industry.siemens.com/cs/ww/en/view/49948856) in section "PROFINET with the redundant S7-1500R/H system".

For F-I/O not listed in "Overview of Configuration (Page 33)", check the relevant documentation to see whether it is supported by the SIMATIC Safety F-system. If in doubt, treat these F-I/Os as part of a configuration that is not supported.

Checks performed by the SIMATIC Safety F-system

For supported configuration, the F-system checks:

- Whether the PROFIsafe operating mode parameter (F_Par_Version) is set to V2 mode in the PROFINET IO environment**.
- Whether the F-destination addresses have been assigned uniquely CPU-wide.
  You yourself must ensure the network-wide uniqueness of the PROFIsafe address when using F-modules with F-PROFIsafe address type 1 and/or PROFIsafe address type 2 (see also "Recommendation for PROFIsafe address assignment (Page 61)")
- Whether the F-source address for F-I/O of PROFIsafe address types 2 and 3 corresponds to the "Central F-source address" parameter of the F-CPU.
- Whether the F-BaseID for F-I/O of PROFIsafe address type 3 corresponds to the "F-BaseID" parameter of the F-CPU.

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

Not supported configurations

For configurations that are not supported, the TIA Portal cannot automatically check the parameter assignment of the F-I/Os. In addition, it is not assured that these have been captured in the safety summary. You must therefore observe the following warning:

⚠ WARNING

If you create a configuration that is not one of the supported configurations, you must observe the following in addition to the warnings S051, S052, S053 and S115:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/O in the PROFINET IO environment[1], you must check the safety summary for correctness of the PROFIsafe operating mode parameter (F_Par_Version). V2 mode must be set in the PROFINET IO environment. F-I/O that support only V1 mode must not be used in the PROFINET IO environment.
- Based on the safety summary, you must check whether the components of the PROFIsafe address centrally assigned for the F-CPU were transferred correctly into the respective F-I/Os:
  - PROFIsafe address type 3: F-BaseID from the "F-BaseID" parameter of the F-CPU.
  - PROFIsafe address type 2 and 3: F-source addresses from the "Central F-source address" parameter of the F-CPU.
- You must ensure the CPU-wide[2,3] and/or network-wide[4] unique assignment of the F-destination address for F-I/Os:
  - For F-I/O of PROFIsafe address type 1 or 2 (if you cannot set the F-source address to match the "Central F-source address" parameter of the F-CPU), you must ensure the network-wide[4] uniqueness of the PROFIsafe address through the unique assignment of the F-destination address alone.
  - In an unsupported configuration, you must check the uniqueness of the F-destination address individually for each F-I/O using the safety summary, regardless of the PROFIsafe address type.
    PROFIsafe address type 1: Network-wide[4] and CPU-wide[2,3]
    PROFIsafe address type 2 and 3: Only CPU-wide[2,3].

(S050)

1) The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

2) "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

3) In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

4) A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In

PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

2.10 PROFIsafe addresses for F-I/O of PROFIsafe address type 1

F-destination address

The uniqueness of the PROFIsafe address is ensured solely with the F-destination address. The F-source address is not displayed and has no effect on whether or not the PROFIsafe address is unique.

Therefore, the F-destination address must be unique network-wide and CPU-wide (see the following rules for address assignment).

To prevent incorrect parameter assignment, an F-destination address which is unique CPU-wide is automatically assigned during placement of the F-I/O in the work area of the device or network view as long as you only configure supported configurations (Page 62).

To ensure a network-wide unique F-destination address assignment when multiple DP master systems and PROFINET IO systems are operated on one network, you must set the "Low limit for F-destination addresses" and "High limit for F-destination addresses" in the properties of the F-CPU in SIMATIC Safety F-systems appropriately, before placing the F-I/O (see section "Recommendations for address assignment") so that the F-destination address ranges do not overlap.

When you change the F-destination address of an F-I/O, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations. You yourself must ensure the network-wide uniqueness of the F-destination address.

For ET 200S, ET 200eco (PROFIBUS), ET 200pro, ET 200iSP F-modules and S7-300 F-SMs: You must set the F-destination address at the F-I/O with the DIP switch before you install the F-I/O. You can assign up to 1022 different F-destination addresses.

NOTE

(S7-300, S7-400) For the following fail-safe S7-300 signal modules, the F-destination address is the start address of the F-SM divided by 8:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You must check the F-destination addresses in the safety summary during system acceptance.

Rules for address assignment

⚠ WARNING

F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).
The F-destination address (and therefore also the switch position on the address switch) of the F-I/O of PROFIsafe address type 1 must be unique network-wide* and CPU-wide**/*** (system-wide) **for the entire** F-I/O. For this, the F-I/O of PROFIsafe address type 2 and PROFIsafe address type 3 when F-BaseID is inactive (value = 0) must also be taken into account. *(S051)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/O assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

*** In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

Also note Recommendation for PROFIsafe address assignment (Page 61).

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

Completeness of the safety summary (Page 409)

2.11 PROFIsafe addresses for F-I/O of PROFIsafe address type 2

F-source address and F-destination address

The uniqueness of the PROFIsafe address is ensured by the combination of F-source address and F-destination address.

The PROFIsafe address must be unique network-wide and CPU-wide. This is the case if the following two conditions are met:

- The F-source address ("Central F-source address" parameter) of the F-CPU is unique network-wide. Keep this in mind for changes.
- The F-destination address of the F-module is unique CPU-wide.

You define the F-source address using the "Central F-source address" parameter in the F-CPU. Provided you only configure supported configurations (Page 62), this parameter is

automatically applied as the F-source address and a CPU-wide unique F-destination address is assigned (usually in descending order starting with 65534).

For supported configurations, if you change the F-destination address, then the CPU-wide uniqueness of the F-destination address is checked automatically.

You must assign the F-source address and F-destination address to the F-I/O before you commission the F-I/O. You can find more information in Assigning a PROFIsafe address of the F-I/Os with SIMATIC Safety (Page 70).

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You must check the F-source and F-destination addresses in the safety summary during system acceptance.

Rules for address assignment

⚠ WARNING

F-I/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O of PROFIsafe address type 2 must be unique network-wide* and CPU-wide**/*** (system-wide). In addition, the F-destination address must not be occupied by F-I/O of PROFIsafe address type 1.

If you use a supported configuration (Page 62), you only have to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/O assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

*** In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

Also note Recommendation for PROFIsafe address assignment (Page 61).

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

Completeness of the safety summary (Page 409)

2.12 PROFIsafe addresses for F-I/O of PROFIsafe address type 3

Introduction

As well as the F-source address and F-destination address, F-I/Os of the PROFIsafe address type 3 have an additional address named the F-BaseID.

NOTE

The terminology "PROFIsafe address type 3" used in this documentation is equivalent to the designation "PROFIsafe address type 2 with BaseID". This applies in TIA Portal as well as to F-I/Os.

This F-BaseID is a 64-bit number, which is valid centrally for all F-I/Os of PROFIsafe address type 3 of an F-CPU and must be randomly generated and evenly distributed by a generator. The TIA Portal has these generators so that you can easily generate an F-BaseID.

The advantage of the F-BaseID is that, for F-I/Os with PROFIsafe address type 3, you do not need to worry about uniqueness within the network and CPU. Network boundaries are irrelevant, so you do not need network isolators (e.g. SCALANCE SC622-2C) in systems in which only F-I/Os with F-address type 3 are used. Due to its 64-bit size and its generation as an evenly distributed random number, the F-BaseID is sufficiently likely to be unique worldwide.

You no longer need to manage or coordinate the PROFIsafe addresses of your plant for F-I/Os with PROFIsafe address type 3 to guarantee that they are unique network-wide. The TIA Portal ensures that the F-destination addresses are unique CPU-wide (for supported configurations (Page 62)). Therefore, you only need to generate a new F-BaseID.

Delayed transfer

Another advantage of the F-BaseID is the "delayed transfer" property. With this, you can have the F-BaseID generated in the user program on an F-CPU on the first startup. In this way, you can create series machine programs that you distribute to multiple F-CPUs by simply copying SD cards. *STEP 7 Safety* offers specific instructions, which are described in the appendix "Assignment of the F-BaseID during runtime (delayed transfer) (S7-1200 G2, S7-1500) (Page 629)", to generate the F-BaseID in the user program.

Requirements for using the F-BaseID

The F-BaseID is supported for S7-1200 G2 F-CPUs and S7-1500 F-CPUs as of firmware V4.1 or F-Software Controllers as of V40.1. Safety system version V2.8 or higher must also be set in the *Safety Administration Editor*.

To find out which F-modules support the F-BaseID, refer to the respective equipment manual.

Generation of the F-BaseID

To have an F-BaseID generated, press the "Generate F-BaseID" button in the "F-BaseID for PROFIsafe address type 3" section in the "Fail-safe" area of the properties of an F-CPU.

⚠ WARNING

The F-BaseID may only be assigned manually in exceptional cases, when you are sure that the PROFIsafe addresses of the F-I/Os of the F-CPU are unique (worldwide). F-I/Os with the same F-BaseID must differ in the combination of F-source and F-destination address. We explicitly advise against manual assignment and recommend generation with the tools offered in the TIA Portal.
With the manual assignment of value "0" as F-BaseID, you lose the advantages of PROFIsafe address type 3 and must adhere to the specifications for PROFIsafe address type 2 (see warning S052). *(S115)*

You can also generate the F-BaseID using tools outside of the TIA Portal and then assign it manually. However, observe the following warning in this case:

⚠ WARNING

Only use generation tools with which you can track adherence to the PROFIsafe generation rules, e.g. based on the documentation. The TIA Portal tools comply with these rules. *(S116)*

If you select the "Activate delayed transfer of F-BaseID" option, a specific value (0x7C6) is set for the F-BaseID which informs the F-CPU and all F-I/Os (of PROFIsafe address type 3) assigned to it that the F-BaseID will be determined and possibly re-generated on startup of the F-CPU. It is not possible to operate the F-I/Os with this F-BaseID (0x7C6). You can find more information on this in the appendix "Assignment of the F-BaseID during runtime (delayed transfer) (S7-1200 G2, S7-1500) (Page 629)".

Rules for address assignment

In a homogeneous network in which all F-I/O have PROFIsafe address type 3 and a generated F-BaseID, the following conditions must be met:

- The F-destination address of the F-module is unique CPU-wide.
- The F-BaseID has been generated individually for the F-CPU according to the requirements of the PROFIsafe specification.

The F-destination address is automatically assigned uniquely CPU-wide for supported configurations by the TIA Portal (normally in descending order from 65534) and there is an automatic check that the F-destination address is unique CPU-wide in the event of changes. If you have the F-BaseID generated in the TIA Portal, the requirements of the PROFIsafe specification are adhered to.

⚠ WARNING

If you are uncertain whether the F-BaseID is unique, generate a new F-BaseID. *(S117)*

Note that F-I/Os of PROFIsafe address type 3 with inactive F-BaseID (value = 0) should be viewed the same as F-I/Os of PROFIsafe address type 2.

In a heterogeneous network with F-I/O of PROFIsafe address types 2 and 3, the F-source address ("Central F-source address" parameter) of the F-CPUs ensures that the PROFIsafe addresses are unique network-wide. Therefore, for the F-I/Os of PROFIsafe address type 3, you can use the F-BaseID with the value "0", but you must consider the network boundaries and the conditions for the F-destination address (see warning S052) for PROFIsafe address type 2. To be future-proof, generate an F-BaseID for the F-I/Os of PROFIsafe address type 3.

We recommend that you generate the F-BaseID directly before downloading the fail-safe project data to a productive system for the first time. In general, you are prompted at this time for the serial number of the productive F-CPU, and the PROFIsafe addresses of the F-I/Os of PROFIsafe address type 2 and 3 are not yet assigned. If you assign them after downloading, the newly generated F-BaseID is automatically also assigned.

Even with a generated F-BaseID, uniqueness is not automatically guaranteed. For example, when copying a TIA project or an SD card with loaded fail-safe project data, the F-BaseIDs contained therein are also copied. It is your responsibility to generate new F-BaseIDs in each copy after the copying in order to restore their uniqueness.

⚠ WARNING

For copy operations that also copy the value of the F-BaseID, e.g. copying the project or copying the SD card, we strongly recommend generating a new F-BaseID. Otherwise, you must ensure the uniqueness of the PROFIsafe addresses for F-I/Os in another way. *(S114)*

Projects in which you have activated the delayed transfer for the F-BaseID are an exception. In these projects, a valid F-BaseID is generated using the instructions made available by the TIA Portal on the first startup of the F-CPU. You can copy the SD card as much as you like before this first startup. Copying the TIA Portal project data is also possible later. Therefore, the delayed transfer is especially suitable for creating series machines.

2.13 Setting the F-destination address for F-I/O with DIP switches

Information on how to set the F-destination address for F-I/O with DIP switches is available in the documentation of the respective F-I/O.

2.14 Assigning a PROFIsafe address of the F-I/Os with SIMATIC Safety

Introduction

You assign the PROFIsafe address of PROFIsafe address type 2 (Page 66) or PROFIsafe address type 3 (Page 68), consisting of F-source address and F-destination address and, optionally for PROFIsafe address type 3, the F-BaseID for the following F-I/Os directly from *STEP 7 Safety*:

- ET 200SP fail-safe modules
- ET 200SP HA fail-safe modules
- S7-1500/ET 200MP fail-safe modules
- ET 200AL fail-safe I/O modules
- ET 200eco PN fail-safe I/O modules

Refer to the equipment manual of the respective F-I/O for the exact PROFIsafe address type.

The PROFIsafe addresses for S7-1200 F-modules are automatically assigned during download of the hardware configuration.

None of these F-I/O modules have a DIP switch for setting the unique F-destination address for each module.

A new assignment is required for the F-modules mentioned above in the following situations:

- Later placement of a fail-safe module during initial commissioning (not for ET 200eco PN)
- Intentional modification of the F-destination address
- Modification of the "Central F-source address" parameter for the associated F-CPU (changes the F-source address).
- Modification of the "F-BaseID" parameter of the associated F-CPU
- Replacement of the electronic coding element
- Commissioning of a mass-produced machine

In the following cases, a reassignment is not required for fail-safe ET 200SP modules, fail-safe ET 200SP HA modules and fail-safe S7-1500/ET 200MP modules:

- POWER OFF/POWER ON
- Replacement of an F-module (repair) without PG/PC
- Replacement of the BaseUnit (transfer of electronic coding element with assigned F-source address and F-destination address and, if present, F-BaseID to the new BaseUnit)
- Replacement of a BaseUnit without electronic coding element
- Changes in the design in case a new BaseUnit is inserted in front of a fail-safe module
- Repair/replacement of the interface module

Reassignment is not required for fail-safe ET 200eco PN and ET 200AL I/O modules in the following cases:

- POWER OFF/POWER ON
- Replacement of the compact device (transfer of electronic coding element with assigned F-source address and F-destination address and, if present, F-BaseID to the new compact device)

Basic procedure

NOTE

Assigning the PROFIsafe address for S7-1200 fail-safe modules

The procedure described below for identifying and assigning the PROFIsafe addresses is not required for S7-1200 fail-safe modules.

Note that an S7-1200 must not include an additional unconfigured F-module.

1. Set the F-destination address (Page 66) and F-source address (Page 66) and, optionally for F-I/Os of PROFIsafe address type 3, the F-BaseID (Page 68) in the hardware configuration in *STEP 7 Safety*.
2. Identify the F-modules ET 200SP, ET 200SP HA, S7-1500/ET 200MP, F-I/O modules ET 200AL or F-I/O modules ET 200eco PN to which you want to assign the PROFIsafe address.
3. Assign the PROFIsafe address to the F-I/Os.

Assigning the PROFIsafe address for F-I/Os via a redundant S7-1500HF system

In the "Assign PROFIsafe address" dialog under "Select PLC of HF-System", select the HF-CPU of the redundant S7-1500HF system via which you want to assign the PROFIsafe address.

The following table uses the system status to show you via which HF-CPU of the redundant S7-1500HF system you can assign the PROFIsafe address.

System status/F-CPU role	Primary	Backup
RUN-Redundant	x	x
RUN-Solo	x	-
STOP	x	-

x: Assignment possible, -: Assignment not possible

NOTE

Use of R1 devices

Assigning the PROFIsafe address for F-I/Os in an R1 device is only possible via the left interface module of the R1 device. Therefore, the left interface module is always displayed in the "Assign PROFIsafe address" dialog. The left interface module must be supplied with voltage for the assignment of the PROFIsafe address.

If the two HF-CPUs of the redundant S7-1500HF system are located in two separate subnets, the PG and the HF-CPU via which the assignment of the PROFIsafe address is to be performed must be located in the same subnet.

2.14.1 Identifying F-modules

Requirement

The following requirements must be met:

- The F-CPU and fail-safe modules are configured.
- When using an ET 200SP Open Controller, the hardware configuration of the ET 200SP Open Controller **and** of the fail-safe Software Controller must be downloaded.
- The F-CPU and fail-safe modules can be reached online.

⚠ WARNING

Make sure that the latest hardware configuration has been downloaded to the F-CPU before identification. By clicking the "Identification" button and then clicking on "Assign PROFIsafe address", you confirm the correctness of the PROFIsafe addresses for the F-I/Os.
Therefore, proceed carefully when confirming the F-I/Os by LED flashing or the serial number of the F-CPU with central F-I/Os or the serial number of the interface module with F-I/Os.
To do this, you must read and write down the serial number directly at the F-CPU* or the interface module**. Reading out the serial number via the online and diagnostics view of the TIA Portal is not permitted.
With F-I/O of PROFIsafe address type 3, you need to confirm the assignment by flashing or serial number even if you have only changed the F-BaseID.
A special rule applies for F-I/Os of the ET 200AL distributed I/O system. For these F-I/Os, only identification by LED flashing is permissible and only exactly one F-I/Os at a time may be selected for assignment of the PROFIsafe address.
* When an ET 200SP Open Controller is used, you must read and write down the serial number from the display of the S7-1500 Fail-safe Software Controller in menu "Overview > CPU".
** When an R1 device is used, you must read and write down the serial number of the left interface module. *(S046)*

Procedure

Proceed as follows to identify the F-modules:

1. Establish an online connection to the F-CPU to which the F-modules are assigned.
2. In the network view, select
   - the F-CPU with F-modules,
   - the interface module with F-modules,

   to which you want to assign PROFIsafe addresses.
   Alternatively, you can select only a single F-module.

3. Select "Assign PROFIsafe address" from the shortcut menu.

   NOTE
   If you integrate a fail-safe ET 200AL module into a configuration of the ET 200SP distributed I/O system (mixed configuration ET 200AL/ET 200SP with ET connection), you must open the dialog "Assign PROFIsafe address" in the device view of the ET 200SP separately for each fail-safe ET 200AL module.

4. Under "Assign PROFIsafe address by", select the method to be used for identifying the F-modules.
   – "Identification by LED flashing"
     This is the default setting. The DIAG and STATUS LEDs of the F-modules to be identified flash upon identification.
   – "Identification by serial number"
     If you cannot see the fail-safe modules directly, you can identify the fail-safe modules by the noted serial number of the F-CPU or interface module.

     NOTE
     The displayed serial number may be amended with a year number compared to the serial number printed on the F-CPU or the interface module. The serial numbers are nevertheless identical.

5. With identification in the "Assign" column, select all F-modules to which you want to assign the PROFIsafe address.
   If you select the F-CPU or the interface module in the "Assign" column, all F-modules of the station are selected.

   NOTE
   For F-I/Os of PROFIsafe address type 3 for which the F-BaseID is set to "Delayed transfer", there can be no identification or assignment (see section PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68)). For identification and assignment of the F-source address and F-destination address only, the value "0" must be configured and downloaded for the F-Base ID of these F-I/Os.

6. Click the "Identification" button. Check whether the DIAG and STATUS LEDs for the F-modules whose PROFIsafe address you want to assign are flashing green. If you identify using the serial number, compare the displayed serial number to the noted serial number of the F-CPU with central fail-safe modules or the interface module with fail-safe modules.
   Observe the following behavior for certain F-modules and configuration variants:
   – If you have configured more F-modules than actually exist, a dialog is displayed. In this dialog, enter the number of F-modules actually existing and confirm the dialog.
   – If you have configured fewer F-modules than are actually available, an online-offline difference is shown and the assignment of the PROFIsafe address is not possible.

2.14.2 Assign PROFIsafe address

Requirement

The F-modules have been successfully identified.

Procedure

To assign a PROFIsafe address, proceed as follows:

1. In the "Confirm" column, select all the F-modules to which you want to assign the PROFIsafe address.
2. Use the "Assign PROFIsafe address" button to assign the PROFIsafe address to the fail-safe modules. You may have to enter the password of the F-CPU or need the user right "Full access including fail-safe".

   To assign the PROFIsafe address, you must confirm the "Confirm PROFIsafe address assignment" dialog within 60 seconds.

2.14.3 Assigning PROFIsafe address to an F-module in a shared device in multiple projects

Introduction

The assignment of the PROFIsafe address for a F-module in a shared device in different projects can only take place after the selection of the IO Controller (F-CPU) to which the F-module is assigned

Therefore, only the F-modules that are assigned to an IO controller (F-CPU) of this project can be selected for assigning the PROFIsafe address in the "Assign PROFIsafe address" dialog.

Requirement

The following requirements must be met:

- All requirements from the sections "Identifying F-modules (Page 73)" and "Assign PROFIsafe address (Page 75)".
- The hardware configuration of all IO controllers (F-CPUs) to which an F-module from the shared device has been assigned is loaded.
- All IO controllers (F-CPUs) to which an F-module from the shared device has been assigned and the shared device must be located in the same subnet.

Procedure

To identify the F-modules and assign the PROFIsafe address, proceed as described in sections "Identifying F-modules (Page 73)" and "Assign PROFIsafe address (Page 75)".

If the F-modules in a shared device are assigned to several IO controllers (F-CPUs) in different projects, make the assignment from the different projects one after the other.

Configuring shared device (Page 59)

2.14.4 Assigning PROFIsafe address to an F-module in a shared device in a common project

Introduction

The assignment of the PROFIsafe address for a F-module in a shared device in a common project can only take place after the selection of the IO Controller (F-CPU) to which the F-module is assigned.
Therefore, only the F-modules that are assigned to the selected IO controller (F-CPU) can be selected for assigning the PROFIsafe address in the "Assign PROFIsafe address" dialog.

Requirement

The following requirements must be met:

- All requirements from the sections "Identifying F-modules (Page 73)" and "Assign PROFIsafe address (Page 75)".
- The hardware configuration of all IO controllers (F-CPUs) to which an F-module from the shared device has been assigned is loaded.
- All IO controllers (F-CPUs) to which an F-module from the shared device has been assigned and the shared device must be located in the same subnet.

Procedure

To identify the F-modules and assign the PROFIsafe address, proceed as described in sections "Identifying F-modules (Page 73)" and "Assign PROFIsafe address (Page 75)".

If the F-modules in a shared device in a common project are assigned to several IO controllers (F-CPUs), select an IO controller in the "Assign PROFIsafe address" dialog and first carry out the assignment for the F-modules that are assigned to the selected IO controller.
Subsequently you select further IO controllers and proceed accordingly.

Configuring shared device (Page 59)

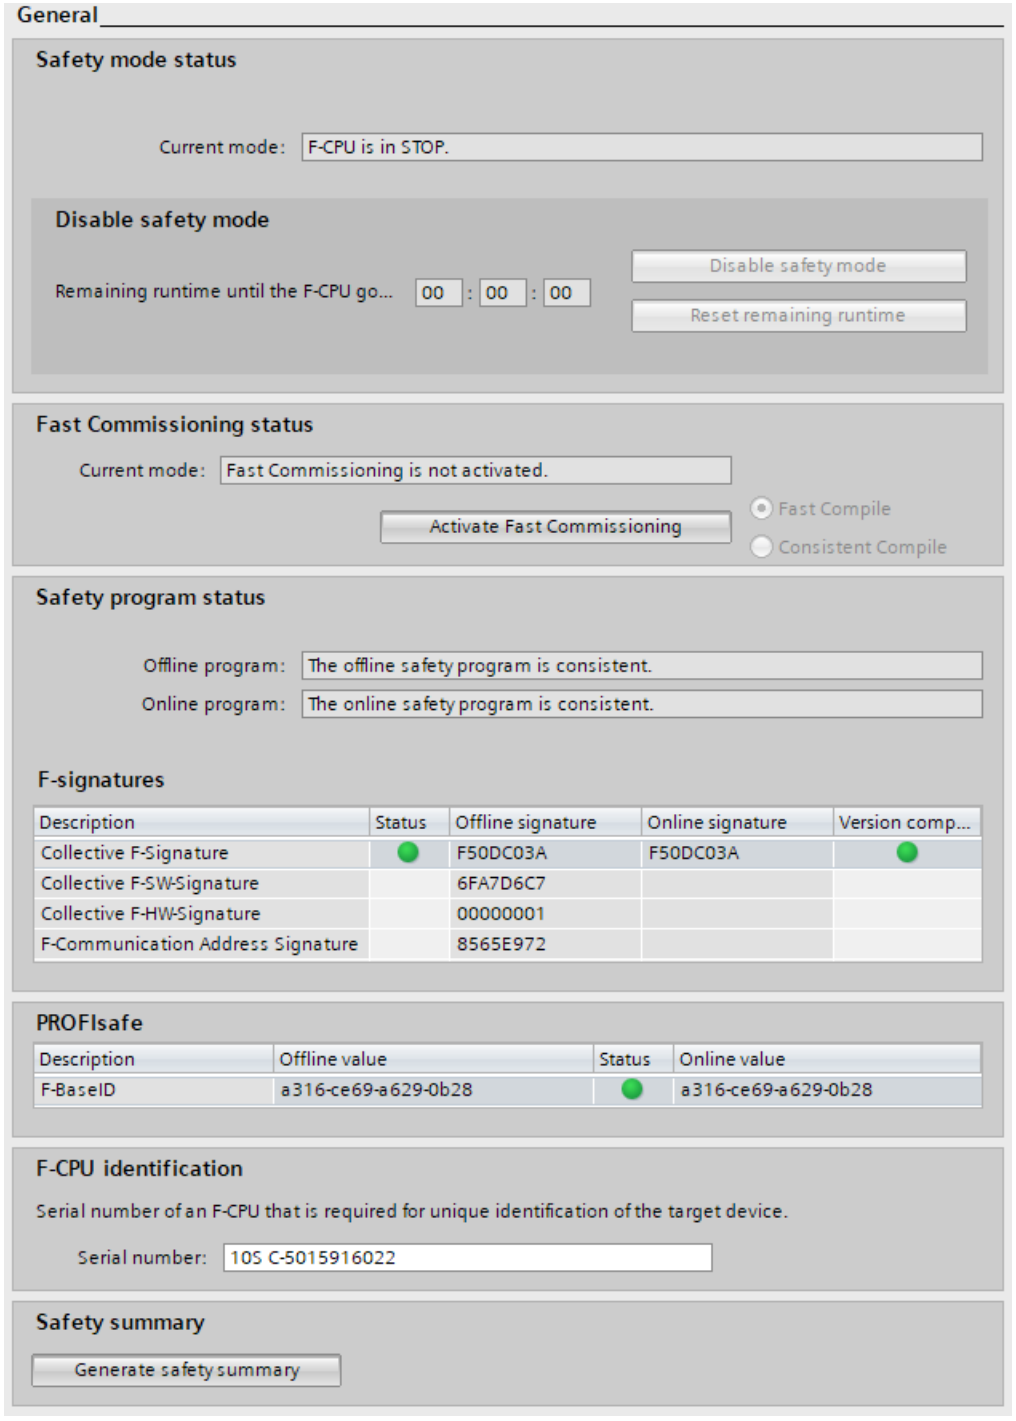
2.14.5 Changing the PROFIsafe address

Changing the PROFIsafe address

NOTE

Keep in mind that after changing the PROFIsafe address of an F-I/O you must also carry out an acceptance (Page 412) including a check of your change (Page 427) in the safety summary (Page 382).

1. Change the PROFIsafe address (F-destination address, F-source address and, if present, F-BaseID) in the hardware configuration.
2. Compile the hardware configuration.
3. Download the hardware configuration to the F-CPU.
4. Select "Assign PROFIsafe address" from the shortcut menu.
5. Proceed as described under Identifying F-modules (Page 73) and Assign PROFIsafe address (Page 75).



Safety Administration Editor

3

Overview

The *Safety Administration Editor* supports you as follows:

- Displaying of status of safety mode
- Disabling safety mode
- (S7-1200, S7-1500) Displaying and changing the Fast Commissioning Status
- Displaying of status of the safety program
- Displaying of Collective F-Signature
- (S7-1200, S7-1500) Show Collective F-SW-Signature
- (S7-1200, S7-1500) Show Collective F-HW-Signature
- (S7-1200, S7-1500) F-communication address signature
- (S7-1200 G2 as of firmware V4.1, S7-1500 as of firmware V4.1, S7-1500 F Software Controller as of V40.1) Display F-BaseID
- (S7-1200, S7-1500) Specify/change serial number for F-CPU identification
- Creating a safety summary
- Creating and organizing of F-runtime groups
- Displaying information on the F-blocks
- Displaying information about F-compliant PLC data types (UDT)
- Specifying/changing access protection
- (S7-1200 G1, S7-1500) Information for users with F-Admin permission
- Set/modify settings for the safety program, e.g. Enable F-change history
- (S7-1200, S7-1500) Create/display/delete F-communications via Flexible F-Link

Safety summary
Generate safety summary

The *Safety Administration Editor* is divided into the following areas:

- General

  Under "General" the following is displayed:

  – Safety mode status
  – Fast Commissioning Status
  – Safety program status
  – F-signatures
  – PROFIsafe
  – F-CPU identification
  – Safety summary

  More information on the "General" area can be obtained in ""General" area of the Safety Administration Editor (Page 81)".
- F-runtime group

  You define the blocks and properties of an F-runtime under "F-runtime group".

  You can find information on F-runtime groups at ""F-runtime group" area (Page 85)".
- F-blocks

  Under "F-blocks", you can find information on the F-blocks used in your safety program and their properties . More information on the "F-blocks" area can be obtained in ""F-blocks" area of the Safety Administration Editor (Page 86)".
- F-compliant PLC data types

  Under "F-compliant PLC data types", you obtain information on the created F-compliant PLC data types (UDT). There you also obtain information whether or not an F-compliant PLC data type (UDT) is used in the safety program. More information on "F-compliant PLC data types" can be found in ""F-compliant PLC data types" area of the Safety Administration Editor (S7-1200, S7-1500) (Page 88)".
- Access protection

  Under "Access protection", you can set up, change, or revoke the password for the safety program. Alternatively, you can set up access protection for safety-related project data via project protection. Access protection is mandatory for productive operation. More information on access protection can be found in "CPU-wide access protection for the safety-related project data (Page 97)".
- Web server F-Admins

  Under "Web server F-admins", you obtain information on users with the F-Admin attribute for the Web server of the F-CPU. More information on the "Web server F-Admins" area can be obtained in ""Web server F-admins" area of the Safety Administration Editor (S7-1200 G1, S7-1500) (Page 88)".
- Settings

  Under "Settings", you set the parameters for the safety program. Information on the settings for your safety program can be found in ""Settings" area of the Safety Administration Editor (Page 89)".
- Flexible F-Link

  In the "Flexible F-Link" area, you will find information about the configured F-communications via Flexible F-Link in tabular form and create F-communications. You can obtain information at ""Flexible F-Link" area of the Safety Administration Editor (S7-1200, S7-1500) (Page 94)".

See also

Program structure of the safety program (S7-1200, S7-1500) (Page 110)
Program structure of the safety program (S7-300, S7-400) (Page 108)
Defining F-Runtime Groups (Page 129)

3.1 Opening the Safety Administration Editor

Requirement

The *Safety Administration Editor* is visible as an element in the project tree, if you have configured a CPU as an F-CPU in the project, which means the "F-capability activated" option must be selected (in the properties of the F-CPU).

Procedure

To open the *Safety Administration Editor*, follow these steps:

1. Open the folder for your F-CPU in the project tree.
2. Double-click on "Safety administration" or right-click and select the corresponding shortcut menu for the *Safety Administration Editor*.

Result

The *Safety Administration Editor* for your F-CPU opens in the work area.

3.2 "General" area of the Safety Administration Editor

"Safety mode status"

The "Safety mode status" shows the current status of safety mode. The prerequisite is an existing online connection to the selected F-CPU.

The following statuses are possible:

- "Safety mode is activated"
- "The safety mode is not activated"
- "F-CPU is in STOP"
- "No active F-CPU available"
- "F-runtime group was not called"
- "The safety program is not called"
- "(No online connection)"

"Disable safety mode"

For existing online connection and active safety mode operation, you have the option of using the "Disable safety mode" button to disable safety mode for the selected F-CPU. Safety mode can be deactivated only for the entire safety program and not for individual F-runtime groups.

As of Safety system version V2.4, disabled Safety mode for S7-1200/1500 F-CPUs is time-limited.

To use Fast Commissioning mode, make sure that the option "Safety mode can be disabled" is selected in the "Settings" area (Page 89).

For more information, refer to the section "Disabling safety mode (Page 386)".

"Fast Commissioning Status"

To use the Fast Commissioning mode, make sure that the option "Safety mode can be disabled" is selected in the "Settings" area (Page 89) and that the safety program was compiled consistently. The Fast Commissioning mode can be executed with "Fast Compile" (default setting) or with "Consistent Compile". For more information, refer to the section "Safety program in RUN mode (S7-1200, S7-1500) (Page 399)".

"Safety program status"

"Safety program status" displays the current status of your online and offline program.

The following statuses are possible:

- Consistent

  With information if no password has been assigned. This information does not apply when project protection is used.
- Inconsistent
- Modified
- Fast Commissioning mode is active

  If Fast Commissioning mode was activated with "Fast Compile" and a change was made in the program.
- (No online connection)

  If no connection to the online program could be established.

"F-signatures"

When no online connection exists

Under "F-signatures" multiple signatures are displayed. Each signature is formed from different parts of the fail-safe project data.

- Collective F-Signature: This signature changes with each change of the fail-safe project data. It can contain the signatures described below.
- Collective F-SW-Signature (S7-1200, S7-1500): This signature changes with each change of the safety program.

- Collective F-HW-Signature (S7-1200, S7-1500): This signature changes with each change of the fail-safe HW configuration.
- F-Communication address signature (S7-1200, S7-1500): This signature changes with each change of the name or the F-communication UUID of communication connections with Flexible F-Link.

Note that the F-BaseID does not enter into the Collective F-HW-Signature or the Collective F-Signature.

The time of the last compilation process is displayed for the Collective F-Signature in the "Time stamp" column.

When an online connection exists

For an existing online connection, the following is displayed under the "Program signature":

- The status of safety program

Status	Meaning
	The online and offline Collective F-Signatures match.
	The online and offline Collective F-Signatures *do not* match.
—	The safety program status could not be determined.

- The online and offline Collective F-Signatures
- When the Collective F-Signatures match: Information on whether the F-block versions are consistent online and offline.

Status	Version comparison	Statement
	Not relevant	The online and offline Collective F-Signatures *do not* match.
		The online and offline Collective F-Signatures match, but the online versions of F-blocks differ from the offline versions.
		The online and offline Collective F-Signatures match, identical versions of F-blocks are being used online and offline.
Not relevant	—	The safety system versions could not be determined.

You can find more information on the consistency of the online safety program at under Identity of online and offline program (Page 424).

"PROFIsafe" (S7-1200 G2, S7-1500)

When no online connection exists

The F-BaseID is displayed under "PROFIsafe". It applies to all F-I/Os of PROFIsafe address type 3 (Page 33) assigned to the F-CPU. The F-BaseID allows a clear differentiation to be made between F-I/Os of PROFIsafe address type 3 having the same F-source address and F-destination address.

More information on the F-BaseID can be found in section "Configuring an F-CPU (Page 39)".

For S7-1200/1500 F-CPUs that do not support the F-BaseID, this area is grayed out.

When an online connection exists
When an online connection exists, the following is also displayed under "PROFIsafe":

Table 2-1 Status of the F-BaseID

Status	Meaning
	The online and offline F-BaseIDs match.
	The online and offline F-BaseIDs do *not* match.
	The F-BaseID could not be determined online or is not supported.

The online-offline comparison of the F-BaseID does not enter into the status of the "General" area.

"F-CPU identification" (S7-1200, S7-1500)

The serial number of the F-CPU to which the safety program is to be downloaded is entered under "F-CPU identification". This serial number is used to ensure connection to the correct F-CPU in the network. If the serial number is not entered at the time of download to the F-CPU, you must confirm it in the "Load preview" dialog to be able to continue the download. The confirmed serial number is then automatically entered in this field.

"Safety summary"

Under "Safety summary", you have the option to create the safety summary (Page 382) for the F-CPU.

See also

Program identification (Page 378)

3.3 "F-runtime group" area of the Safety Administration Editor

3.3.1 "F-runtime group" area

A safety program consists of one or two F-runtime groups.

General information on F-runtime groups can be found in "Program structure of the safety program (S7-300, S7-400) (Page 108)" and "Program structure of the safety program (S7-1200, S7-1500) (Page 110)".

You can find information on creating F-runtime groups at Defining F-Runtime Groups (Page 129)

(S7-1200, S7-1500) "Creating a global F-I/O status block"

You can create a standard block (FB) with the name "RTGx_GLOB_FIO_STATUS", which evaluates whether substitute values are output instead of process values for at least one F-I/O or at least one channel of an F-I/O of an F-runtime group x. The result of the evaluation is available at the "QSTATUS" output.

The following are not included:

- F-I/O that you disabled with the DISABLE tag in the F-I/O DB.
- Channel error of channels that you disabled when configuring an F-I/O.

The "RIOforFA_VALUE_STATUS" output is set to "1" if no substitute value is output for **any** F-I/O **with "RIOforFA-Safety"** profile of the F-runtime group x.

To generate this standard FB, you use the "Create global F-I/O status block" button. You can only create the standard FB when your safety program has been compiled. You can call the standard FB anywhere in your standard user program.

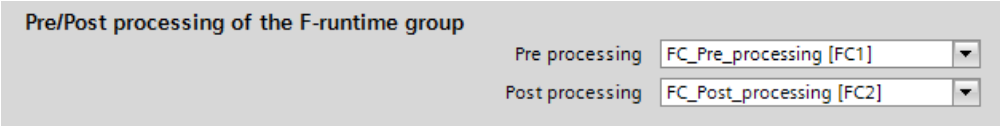
NOTE

When adding or deleting an F-I/O, you have to generate "RTGx_GLOB_FIO_STATUS" again.

See also

Process Data or Fail-Safe Values (Page 155)

3.3.2 Pre-/postprocessing (S7-1200, S7-1500)



With pre-processing and post-processing you have the option of calling standard blocks (FCs) directly before or after an F-runtime group, for example for data transfer with fail-safe communication via Flexible F-Link (Page 338) or OPC UA Safety (Page 279). The calls are made in the same F-OB or synchronized with the F-runtime group.

Requirement

- Only standard-FCs usable.
- Only temporary local data and constants are permitted in the block interface of a standard-FC.

Procedure

1. Create the standard-FCs for the pre-processing and the post-processing.
2. Assign the standard-FCs in the Safety Administration Editor under "Pre-/post-processing of the F-runtime group".

NOTE
When you delete an assigned FC or overwrite it by copying, its selection as a pre-processing / post-processing block is automatically reset.

Effect on the safety program

- The runtime of the F-runtime group is extended by the runtime of the standard FCs for pre-/post-processing (influence on TRTG_CURR and TRTG_LONG in the F-runtime group information DB).
- Because the pre-processing / post-processing does not change the functionality of the safety program, the collective F-signature remains unchanged after compilation.

Load behavior

The calls of the selected standard FCs are placed during compiling or after the call of the main safety block in the F-OB.
This means that the STOP operating state is required during a subsequent download.

Changes in the contents at the selected standard FCs can take place in RUN.

Exceptions are changes of the block name and block numbers which also include the compilation of the safety program.

When a pre-processing/post-processing block is uploaded individually by the F-CPU, it does not automatically connect to the F-runtime group in the *Safety Administration Editor*.

If consistent loading of the F-CPU into the PG/PC is performed instead, the settings for pre-processing and post-processing are updated according to the online CPU.

3.4 "F-blocks" area of the Safety Administration Editor

Overview

The "F-Blocks" area helps you in the following tasks:

- Displaying the F-blocks used in your safety programs.
- Displaying the F-blocks used in the F-runtime groups.
- Displaying additional information about the F-blocks.

The F-blocks are hierarchically displayed as in the "Program blocks" folder.

A description of the F-blocks is available in "Creating F-blocks (Page 145)".

Displayed information

The following information is displayed in offline mode:

- Have displayed F-blocks been compiled and used?
- Function of F-blocks in safety program
- Block signature
- Group signature
- Change time stamp of the F-blocks

The following information is displayed in online mode:

- Status (whether block has the same time stamp online and offline)
- Function of F-block in the safety program
- Block signature offline
- Group signature offline
- Block signature online
- Group signature online

NOTE

During the offline-online comparison, the comparison statuses may occasionally differ between the *comparison editor* and status display in the *Safety Administration Editor*. The decisive status is the result of the comparison in the *comparison editor*, since this is the only comparison that takes into account the contents of the F-blocks.

NOTE

Group signatures are formed from the signatures of the F-blocks contained in the group and in subgroups. Only F-blocks that are used in the safety program are taken into account. Only the group signatures up to the 6th hierarchy level are displayed.

Filter function

Using the filter function, you can select whether you want to view all F-blocks of a certain F-runtime group or the entire safety program.

- Select "All F-blocks " from the drop-down list to view all F-blocks.
- Select an F-runtime group from the drop-down list to see all F-blocks of this F-runtime group.

3.5 "F-compliant PLC data types" area of the Safety Administration Editor (S7-1200, S7-1500)

Overview

Under "F-compliant PLC Data Types" you obtain information on the F-compliant PLC data types (UDT) you have defined.

You can delete F-compliant PLC data types (UDT) from the shortcut menu.

More information on the F-compliant PLC data types (UDT) can be found in "F-compliant PLC data types (UDT) (S7-1200, S7-1500) (Page 122)".

Displayed information

The following information is displayed for F-compliant PLC data types (UDT) in offline mode:

- Is the F-compliant PLC data type used in the Safety program?
- Time stamp of the last change.

The following information is displayed for F-compliant PLC data types (UDT) in online mode:

- Status (whether the F-compliant PLC data types (UDT) have the same time stamp online and offline)

The F-compliant PLC data types (UDT) are displayed hierarchically as in the folder "PLC Data Types".

Double-click the F-compliant PLC data type (UDT) to open it for editing.

More information can be found on the symbols in the "Status" column at "Comparing Safety Programs (Page 380)".

NOTE

During offline-online comparison, the comparison statuses between the *comparison editor* and status display in the *Safety Administration Editor* can be different under certain circumstances. The comparison result in the *comparison editor* is decisive, since this is the only comparison that takes into account the contents of the F-compliant PLC data types (UDT).

3.6 "Web server F-admins" area of the Safety Administration Editor (S7-1200 G1, S7-1500)

The "Web server F-Admins" area is displayed for S7-1500 F-CPUs only for firmware < V3.1 and for S7-1200 G1 F-CPUs only for firmware <V4.7.

You need "F-admin" rights in order to restore a backup (Page 368) via the Web server or Web API interface of your F-CPU. You assign the "F-admin" right in the hardware configuration of the F-CPU under the user management of the Web server.

In this section, you obtain information on which users have the "F-admin" right online or offline for F-CPUs that support this right. You can see from this whether a change to the "F-admin" right is active on the F-CPU. In order to make a change to the "F-admin" right effective, you have to load the configuration to the F-CPU.

If you are using user management, this area is omitted.

See also

Completeness and correctness of the hardware configuration (Page 412)

3.7 "Settings" area of the Safety Administration Editor

"Number ranges of the generated F-system blocks"

The number ranges assigned here are used by the F-System for new, automatically generated F-blocks.

At this point, you can select whether the number ranges are managed by the F-system or if a fixed range specified by you is used.

- "F-system managed"

  The number ranges are managed automatically by the F-system, depending on the F-CPU used. The F-system selects an available number range. The start and end ranges of the number ranges are displayed.
- "Fixed range"

  You can select the start and end ranges of the number ranges from the available range. The available range depends on the F-CPU used.

  An invalid number range selection is indicated by an error message.

  The only check performed during configuration is whether the configured low limit is less than or equal to the high limit and within the available range of the F-CPU. The check as to whether the configured range is sufficiently large is first made during compiling. You need to ensure a sufficiently large range. Where the available range is insufficient, a compiling error occurs. Not all blocks are generated and the safety program is not executable.

Changes will become valid only during the next compilation. The automatically created F-blocks may be moved into the new area during compilation. The F-I/O DBs are an exception. They always retain their original number that you may change in the properties of the F-I/O.

"Safety system version"

This parameter is used to specify the safety system version (including version of the F-system blocks and automatically generated F-blocks, see Overview of Programming (Page 108)).

A number of versions are available:

Version	S7-300/4-00	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.6	—	x	—	x	These versions have identical functions. Depending on the set version, the result may be different runtimes of the F-runtime group(s) (see Excel file for response time calculation on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
2.0	x	x[1]	—	x[2]	

1 Supported as of firmware V4.2

2 Supported as of firmware V2.0

3 Fast Commissioning mode with "Fast Compile" is supported as of firmware V4.5.

4 Fast Commissioning mode with "Consistent Compile" is supported as of firmware V3.0. With the S7-1500 F-Software Controller, it is available only for approved IPCs as of firmware V30.0.

5 The F-BaseID is supported for S7-1200 G2 and S7-1500 as of firmware V4.1 or F-Software Controller as of V40.1.

6 If the F-OB of the associated F-runtime group has the event class "Cyclic interrupt".

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
2.1	—	x[1]	—	x[2]	Additionally supports the variables "DISABLE" and "DISABLED" in the F-I/O DB
2.2	—	x[1]	—	x[2]	Supports the safety-related CPU-CPU communication and F-runtime group communication with Flexible F-Link.
2.3	—	x[1]	—	x[2]	This version has identical functions to version 2.2.
2.4	—	x[1, 3]	—	x[2]	Additionally supports: • F-CPUs • Fast Commissioning mode with "Fast Compile" • Runtime for the deactivated safety mode
2.5	—	x	—	x[4]	Additionally supports: • Fast Commissioning mode with "Consistent Compile" (S7-1500) • F-I/Os with more than 13 bytes net data (e.g. F-AI 8xI 0(4)..20mA)
2.6	—	x	—	x	The functions of this version are identical to those of version 2.5.
2.7	—	x	x	x	Additionally supports: • S7-1500 F Virtual Controller • OPC UA Safety
2.8	—	x	x[5]	x[5]	Additionally supports: • F-BaseID[5] • Improved response time of F-I/O for inputs[6]

1 Supported as of firmware V4.2

2 Supported as of firmware V2.0

3 Fast Commissioning mode with "Fast Compile" is supported as of firmware V4.5.

4 Fast Commissioning mode with "Consistent Compile" is supported as of firmware V3.0. With the S7-1500 F-Software Controller, it is available only for approved IPCs as of firmware V30.0.

5 The F-BaseID is supported for S7-1200 G2 and S7-1500 as of firmware V4.1 or F-Software Controller as of V40.1.

6 If the F-OB of the associated F-runtime group has the event class "Cyclic interrupt".

Usually, you do not need to make any settings for this parameters.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

"Local data used in safety program" (S7-300, S7-400)

You use this parameter to specify the amount of temporary local data (in bytes) that is available for the call hierarchy below the main safety block.

The setting applies to each F-runtime group of a safety program. More information on F-runtime groups can be found in "Program structure of the safety program (S7-1200, S7-1500) (Page 110)" and "Program structure of the safety program (S7-300, S7-400) (Page 108)".

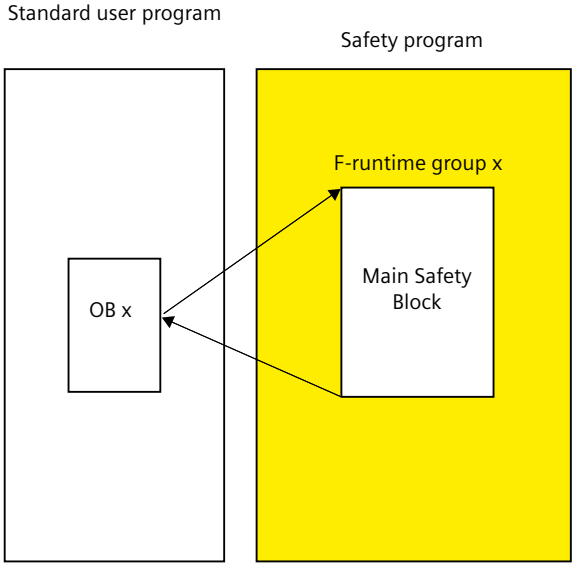
The **minimum possible amount** is determined by the local data requirement of the F-blocks generated automatically when the safety program is compiled.

For this reason, you must provide at least 440 bytes. However, the local data requirement for the automatically added F-blocks may be higher depending on the local data requirement of the F-blocks you created with FBD or LAD.

Therefore, provide as much local data as possible. If there is not enough local data available for the automatically added F-blocks (440 bytes or more), the safety program will be compiled nevertheless.

Data in automatically added F-DBs are then used instead of local data. However, this increases the runtime of the F-runtime group(s). You will receive a notice when the automatically added F-blocks require more local data than configured.

⚠ WARNING



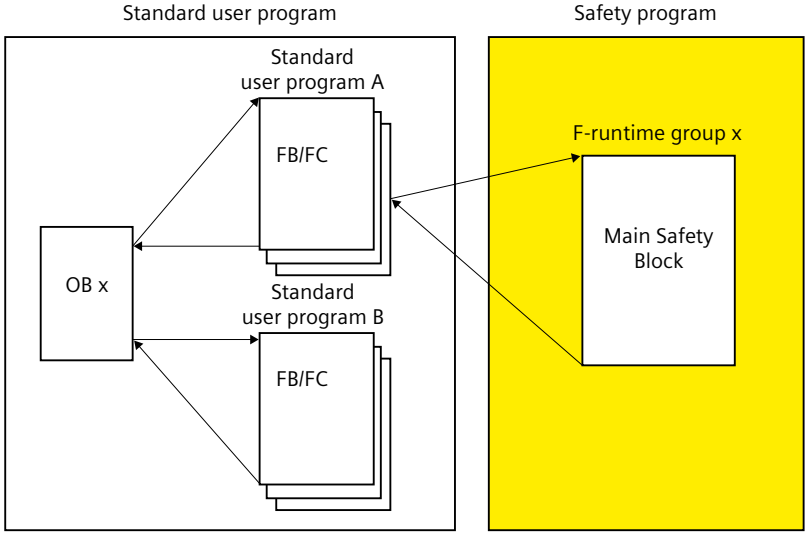
The calculated maximum runtime of the F-runtime group using the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) is no longer correct in this case because the calculation assumes sufficient availability of F-local data.
In this case, use the value you configured for the maximum cycle time of the F-runtime group (F-monitoring time) as the maximum runtime of the F-runtime group when calculating the maximum response times in the event of an error and for any runtimes of the standard system using the above-mentioned Excel file. *(S004)*

The maximum possible amount depends on:

- Local data requirement of the main safety block and the higher-level standard user program. For this reason, you should call the main safety blocks directly in OBs (cyclic interrupt OBs, whenever possible), and additional local data should not be declared in these cyclic interrupt OBs.
- Maximum volume of local data of the utilized F-CPU (see Technical Specifications in the product information for the utilized F-CPU). For S7-400 F-CPUs, you can configure the local data for each priority class. Therefore, assign the largest possible local data volume for the priority classes in which the safety program (the main safety blocks) is called (e.g., OB 35).

Maximum possible amount of local data as a function of local data requirement of main safety block and higher-level standard user program (S7-300, S7-400):

Case 1: Main safety block called directly from OBs



Set the "Local data used in safety program" parameter to the maximum amount of local data of the utilized F-CPU minus the local data requirement of the main safety block (if the main safety block has 2 F-runtime groups, use the largest local data requirement) and minus the local data requirement of the calling OBx (if there are 2 F-runtime groups, use the OB with the largest local data requirement).

Note: If you have not declared any temporary local data in the main safety blocks and calling OBx, the local data requirement of the main safety blocks is 6 bytes and the local data requirement of the calling OBx is 26 bytes. You can derive the local data requirement of the main safety blocks and calling OBx from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

Case 2: Main safety block not called directly from OBs

Set the "Local data settings" parameter to the value calculated for Case 1, minus the local data requirement of standard user program A (if standard user program A has 2 F-runtime groups, use the largest local data requirement).

Note: You can derive the local data requirement of the standard user program A from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

"Advanced settings"

"Safety mode can be disabled"

With this option you can prevent the safety mode for a safety program from being disabled.

Under "Runtime for the deactivated safety mode", you set the time after which the F-CPU goes to STOP after safety mode is deactivated.

When you change the setting for this option, you need to recompile the safety program and download it to the F-CPU for the change to become effective. This changes the Collective F-Signature and the Collective F-SW-Signatures of your safety program.

To exclude an unintentional disabling of the safety mode, make sure that the option is disabled in productive operation.

"Enable F-change history"
Enable the logging of changes to the safety program by using the "Enable F-change history" option. For more information, refer to the section "F-change history (Page 405)".

"Enable consistent upload from the F-CPU" (S7-1500)
This option allows you to load the loaded project data (including safety-related project data) consistently from the F-CPU to the PG/PC.

The option can only be activated if the F-CPU and the firmware of the F-CPU supports the loading of the project data (including safety-related project data).

F-CPUs S7-1500 as of firmware V2.1 are supported. S7-1500 F Software Controllers are not supported.

At every change to this option you have to load the project data to the F-CPU.

Note that the activation of this option extends the loading of the safety-related project data into the F-CPU.

"Activate variable F-communication- IDs" (S7-1200, S7-1500)
If you activate this option, you can supply the DP_DP_ID input of the SENDDP or RCVDP instructions with the variable values from a global F-DB.

⚠ WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide**** at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

**** With a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be regarded as one single F-CPU with regard to the DP_DP_ID.

"System-generated objects" (S7-1200, S7-1500)

"Creates F-I/O DBs without prefix"

When you select this option, the names of the F-I/O DBs (Page 157) are created without prefix.

"Clean up"

The "Clean up" button is provided for service and support purposes and cleans up the result of the fail-safe compilation.

3.8 "Flexible F-Link" area of the Safety Administration Editor (S7-1200, S7-1500)

In the "Flexible F-Link" area, you create new F-communications, obtain information on existing F-communications and delete F-communications.

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 G1 F-CPUs as of firmware V4.2
- S7-1200 G2 F-CPUs as of firmware V1.0
- Safety system version as of V2.2

Information on created F-communications

In the "Flexible F-Link" area, you receive information on configured F-communications in tabular form:

- CPU-wide unique name of F-communication
- F-compliant PLC data type (UDT) for send/receive data
- Direction of F-communication: Transmitting/receiving
- F-monitoring time of F-communication
- F-Communication UUID
- Tag for send data
- Tag for receive data

Creating F-communication

1. In an empty row of the table click "<Add new>"
2. Assign a name to the communication connection.
3. Select an F-compliant PLC data type (UUID) for the communication connection.
   If you have not yet created an F-compliant PLC data type (UDT) for the communication connection or wish to create a new one, create a new F-compliant PLC data type (UDT) (Page 122) with any structure. Note that the size can be up to 1500 bytes.
4. Select the direction of the communication connection ("Send" or "Receive").
5. Select the F-monitoring time of the communication connection (Page 616).

The UUID of the F-communication is displayed via Flexible F-Link in the "F communication UUID" column. The F-communication UUID ensures sufficient uniqueness of the safety-related communication ID even across network limits.

The "Tag for send data" column shows you the newly created tag for send data of the F-communication DB (Page 341).

The "Tag for receive data" column shows you the newly created tag for receive data of the F-communication DB (Page 341).

You can find the newly created F-communication DB for this F-communication under "Program blocks\System blocks\STEP 7 Safety\F-communication DBs".

Deleting F-communication

1. Select the entire row and confirm "Delete" in the shortcut menu. You can also delete multiple F-communications at the same time.

Copying F-communication

1. Select the entire row and confirm "Copy" in the shortcut menu. You can also copy multiple F-communications at the same time.
2. With the "Paste" menu command, you can paste the copied F-communications into the table as often as needed. The UUID for the respective F-communication is retained during copying. If necessary, re-generate the UUID.

Generating a new F-communication-UUID

1. Select the entire row and confirm "Generate UUID" in the shortcut menu. You can also generate multiple UUIDs at the same time.

4 Access protection

Access protection is necessary for productive operation

Access protection to the SIMATIC Safety F-system is mandatory for productive operation.

⚠ WARNING

Access to the SIMATIC Safety F-system without access protection is intended for test purposes, commissioning, etc., when the system is not in productive operation. Without access protection, you need to ensure the safety of the plant through other organizational measures.
Before you transition into productive operation, you must have set up and activated access protection. *(S005)*

NOTE
We recommend making the settings for access protection in the "PLC security settings" dialog when creating the project.

4.1 Overview of access protection

Introduction

You can control access to the SIMATIC Safety F-system with the access protection for the safety-related project data and the access protection for the F-CPU.

Access protection for the safety-related project data

Access protection for the safety-related project data (Page 97) is available in two forms:

- Assignment of a password for the safety-related project data (F-CPU-granular), assigned in the *Safety Administration Editor*
- Setup of project protection for all safety-related project data in the TIA project

Access protection for the F-CPU

The access protection (Page 100) is set at the F-CPU level. To do this, you assign a password for the F-CPU in the F-CPU configuration or assign F rights as part of user management, if supported by the respective F-CPU (only 1200/1500 F-CPUs as of certain firmware versions (Page 103)). For S7-300/400 F-CPUs, the password is also used to identify the F-CPU and must therefore be unique network-wide. For S7-1200/1500 F-CPUs, the password no longer needs to be unique because the serial number is used for identification.

4.2 Access protection for the safety-related project data

The access protection for the safety-related project data is in effect for all operations in which the safety-related project data can be inconsistent offline, for example:

- When changing the Safety program
- When changing and deleting F-runtime groups
- When changing safety-related parameters of F-I/O

NOTE

Note that, for usability reasons, the F-BaseID falls under the offline access protection for the safety-related project data, but it is not covered by the online access protection of the F-CPU for safety-related project data. Here, the F-BaseID is treated like a standard parameter.
There is an exception for switching between an F-BaseID with the value "Delayed transfer" and an F-BaseID with a specific value (either 0 or an active F-BaseID).

- When compiling

NOTE

Note that the access protection for the safety-related project data is only effective if you are making the changes in the TIA Portal. Although the TIA Portal detects changes to the project data made directly in the related files in the file system, these changes cannot be prevented or undone.

Safety program recompilation is required after changes to standard DBs to which the safety program has read or write access.

4.2.1 CPU-wide access protection for the safety-related project data

Requirement

The project does not use user management to protect the project data

Setting up CPU-wide access protection for safety-related project data

To set up CPU-wide access protection for safety-related project data, assign a password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.
   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Access protection" in the navigation area.
3. Under "Offline safety program protection", click "Setup" and enter the password (max. 30 characters) for the safety program in the following dialog in the "New password" and "Confirm password" fields.
4. Confirm the assigned password with "OK".

You have set up CPU-wide access protection for safety-related project data and have gained access permission for the safety-related project data.

NOTE
Use different passwords for the F-CPU and the safety program to optimize access protection.

Changing the password for safety-related project data

You can change the password for the safety-related project data as long as you have the necessary access permissions. It also takes place in the "Access protection" area (via "Change" button) and is carried out as usual under Windows through entry of the old and double entry of the new password.

Deleting CPU-wide access protection for safety-related project data

To delete CPU-wide access protection for safety-related project data, delete the password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.
   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Access protection" in the navigation area.
3. Click the "Change" button.
4. Under "Old password", enter the password for the safety program.
5. Click "Revoke" and then on "OK".

Gaining access permission through login to the safety program

Log in to the safety program as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.
   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Access protection" in the navigation area.
3. Enter the password for the safety program in the "Password" input field.
4. Select the "Login" button.

Validity of access permission for safety-related project data

If access permission for safety-related project data was obtained by entering the password, this remains until the project is closed. When the TIA Portal is closed, any project that is still open is automatically closed and any access permission granted is canceled.

Cancelling access permission through logoff

The access permission for safety-related project data can be cancelled as follows:

- By clicking the "Log off" button in the "Access protection" area in the "*Safety Administration Editor*".
- In the shortcut menu for the *Safety Administration Editor* (access by right-clicking).
- By using the lock symbol in the line of the *Safety Administration Editor*.

The user will then be prompted to enter the password for the safety program again the next time an action requiring a password is performed.

Displaying the availability of access authorization

The status of the access authorization is displayed in the project tree as follows:

- The access authorization is available when the lock symbol in the line of the *Safety Administration Editor* is shown unlocked.
- The access permission is not available, if the lock symbol shows a closed lock.
- If no lock symbol is shown, no password was assigned.

4.2.2 Project-wide access protection for the safety-related project data

As an alternative to CPU-wide access protection for the safety-related project data with a password in the *Safety Administration Editor*, you can use the project protection for the TIA project.

To do this, assign the "Edit safety-related project data" function right to users who are allowed to edit safety-related project data. To do this, proceed as usual for function rights. You can find more information in the help for *STEP 7* under "Managing users and roles".

NOTE

When project-wide project access protection is activated, any existing passwords for safety-related project data for all F-CPUs of the project are deleted.

Users who need the "Edit safety-related project data" function right may require additional function rights, for example:

- "Modify PLC program" to change the safety program
- "Downloading to PLC" to load the safety-related project data into the F-CPU
- "Modify hardware configuration" to make changes to the safety-related hardware configuration

4.3 Access protection for the F-CPU

The access protection for the F-CPU is effective for all operations in which the safety-related project data can be changed online, for example:

- When downloading the safety program to the F-CPU
- When downloading the hardware configuration to the F-CPU, also when changes are made to F-I/O not used in the Safety program

NOTE

Note that, for usability reasons, the F-BaseID falls under the access protection for the safety-related project data, but it is not covered by the access protection of the F-CPU for safety-related project data. Here, the F-BaseID is treated like a standard parameter.
There is an exception for switching between an F-BaseID with the value "Delayed transfer" and an F-BaseID with a specific value (either 0 or an active F-BaseID).

- (S7-1200, S7-1500) When downloading a hardware configuration to the F-CPU containing safety-related changes
- When assigning the PROFIsafe address
- When loading or deleting F-blocks used in the safety program
- When disabling safety mode or when resetting the remaining runtime (the password must always be entered, even if access permission for the F-CPU is still valid.)
- When restoring a backup of the F-CPU
  Exception with S7-1200/1500 F-CPUs: If neither the Safety program nor the password for the F-CPU or users with the rights "Change F-System parameters (F-Admin)" or "Full access including fail-safe" are changed as a result, the access protection for the F-CPU is not queried.

4.3.1 Access protection through the use of protection levels

This section describes the access protection for F-CPUs through the use of protection levels.

You can use access levels for the following F-CPUs:

- S7-300/400
- S7-1200 G1 up to firmware 4.6 (as of firmware V4.7 only if the option "Use access control via access levels" is activated)
- S7-1200 G2 if the parameter "Use access control via access levels" is selected.
- S7-1500 up to firmware V3.0 (as of firmware V3.1 only if the parameter "Use access control via access levels" is activated)
- S7-1500 F Software Controller up to firmware V3x.0 (as of firmware V3x.1 only if the parameter "Use access control via access levels" is activated)

Setting up access protection for the F-CPU

To set up access protection for the F-CPU, assign a password in the F-CPU configuration. Proceed as described in the *STEP 7* help under "Configuring access levels".

Clicking on the link "Go to the "Protection" area of the F-CPU" in the "Access protection" area of the *Safety Administration Editor* takes you directly to the password for the F-CPU.

⚠ WARNING

(S7-300, S7-400) In productive operation, it must be prevented that changes to the standard user program are unintentionally made in the Safety program as well. For this purpose, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU.
With the "Write protection" or "Write/read protection" protection level, the password would apply to the standard and the Safety program. *(S001)*

⚠ WARNING

(S7-1200, S7-1500) In productive operation, the safety-related project data must be protected against unintentional changes.
If you use user management, the Runtime rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" and the engineering right "Manage users and roles" may only be granted to authorized users. You must also limit the assignment of user rights to trained personnel. Before the transition into productive operation, you must remove the "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" rights from the "Anonymous" user.
If you are not using user management or the "Access control via access levels" parameter is activated, then configure at least the "Full access (no protection)" protection level and assign a password under "Full access incl. fail-safe (no protection)". This protection level allows full access only to the standard user program and not the Safety program.
If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".
Assign different passwords for the individual access levels. *(S041)*

You enable access protection by downloading (Page 345) the hardware configuration to the F-CPU.

⚠ WARNING

(S7-300, S7-400) If **several F-CPUs** can be reached via a network (such as Industrial Ethernet) by **the same programming device or PC**, you must take the following additional measures to ensure that the safety-related project data is downloaded to the correct F-CPU:
Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.
Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety-related project data to an F-CPU, existing access permission for any other F-CPU must first be cancelled.
- The last download of the safety-related project data prior to switching to productive operation must be made with enabled access protection. *(S021)*

⚠ WARNING

When using tools for the automation or operation (of TIA Portal or web server) with which the access protection for the F-CPU can be removed, the safety-related project data may not be protected against unintentional changes anymore. When using corresponding tools, the requirements regarding access protection of the F-CPU must still be met. *(S078)*

Changing the password for the F-CPU

For the new password to become valid after a change to an access level password for the F-CPU, you must download the changed configuration into the F-CPU. If necessary, you must enter the "old" password for the F-CPU for this load operation. The F-CPU must be in STOP mode.

Deleting access protection for the F-CPU

To delete configured access protection for the F-CPU, change the access level and delete the passwords for the F-CPU that are no longer required. To do this, proceed as in the standard.

Obtaining access permission for the F-CPU

You obtain access permission for the F-CPU by entering the password for the F-CPU, according to the configured protection level, prior to performing an action requiring a password.

Validity of access permission for the F-CPU

Access permission for the F-CPU remains valid until the TIA Portal is closed or access permission is revoked.

Canceling access permission for the F-CPU

You cancel the access permission with the menu command "Online > Delete access rights" auf.

⚠ WARNING

The safety-related project data must be protected against unintentional changes.
For this you must cancel the access permission and the online connection for the F-CPU whenever you leave the PG/PC.
Alternatively, you can also take other organizational measures. *(S006)*

4.3.2 Access protection through user management

This section describes the access protection for F-CPUs through the use of user management and the runtime right for the F-CPU.

You can use local user management for the following F-CPUs if the "Use access control via access levels" parameter is not activated:

- S7-1200 G1 as of firmware V4.7
- S7-1200 G2 as of firmware V1.0
- S7-1500 as of firmware V3.1
- S7-1500 F Software Controller as of firmware V3x.1

You can use central user management for the following F-CPUs:

- S7-1200 G2 as of firmware V4.1
- S7-1500 as of firmware V4.0
- S7-1500 F Software Controller as of firmware V4x.0

Setting up access protection for the F-CPU

To set up access protection for the F-CPU, use the user management with the function right for the F-CPU. Proceed as described in the *STEP 7* help under "Local user management" or "Central user management" and "Settings for users and roles".

If the "Use access control via access levels" option is selected in addition to "Enable access control", you must assign at least a password for "Full access including fail-safe" for the F-CPU in the F-CPU configuration. Proceed as described in the *STEP 7* help under "Configuring access levels".

You can go directly to the settings for access protection of the F-CPU if you click the link "Go to the "Protection" area of the F-CPU" in the "Access protection" area in the *Safety Administration Editor*.

⚠ WARNING

(S7-1200, S7-1500) In productive operation, the safety-related project data must be protected against unintentional changes.
If you use user management, the Runtime rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" and the engineering right "Manage users and roles" may only be granted to authorized users. You must also limit the assignment of user rights to trained personnel. Before the transition into productive operation, you must remove the "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" rights from the "Anonymous" user.
If you are not using user management or the "Access control via access levels" parameter is activated, then configure at least the "Full access (no protection)" protection level and assign a password under "Full access incl. fail-safe (no protection)". This protection level allows full access only to the standard user program and not the safety program.
If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".
Assign different passwords for the individual access levels. *(S041)*

You enable access protection by downloading (Page 345) the hardware configuration to the F-CPU.

⚠ WARNING

When using tools for the automation or operation (of TIA Portal or web server) with which the access protection for the F-CPU can be removed, the safety-related project data may not be protected against unintentional changes anymore. When using corresponding tools, the requirements regarding access protection of the F-CPU must still be met. *(S078)*

Changing access protection for the F-CPU

For the changed users or the changed password to take effect after a change to the users with F-right or a password change for the F-CPU, you must download the changed configuration to the F-CPU and select the "Download all user management data (reset to project settings)" option in the "Load preview" dialog when downloading. For this download, you must legitimate yourself as a user with F-right or enter the existing password for the F-CPU, if necessary. For changes in the "Access protection via protection levels" area, the F-CPU must be in STOP.

Changes that you make as part of the central user management on the associated UMC server of the F-CPU (e.g. a new user password) take effect immediately without a download.

Deleting access protection for the F-CPU

To delete the access protection for the F-CPU, grant the user Anonymous the F-right ("Full access including fail-safe").

Obtaining access permission for the F-CPU

You obtain access permission for the F-CPU by legitimating yourself as a user with F-right or when "Use access control via access levels" mode is enabled by entering the password for the F-CPU prior to performing an action requiring a password.

Validity of access permission for the F-CPU

Access permission for the F-CPU remains valid until the TIA Portal is closed, access permission is revoked or the maximum legitimation time is exceeded. A maximum legitimation time of up to 600 minutes can be set for each user.

Canceling access permission for the F-CPU

You revoke the access permission with the menu command "Online > Delete access rights".

⚠ WARNING

The safety-related project data must be protected against unintentional changes.
For this you must cancel the access permission and the online connection for the F-CPU whenever you leave the PG/PC.
Alternatively, you can also take other organizational measures. *(S006)*

4.4 Access protection through organizational measures

To prevent a safety program from being swapped without authorization by exchanging removable media (e.g. flash card, SIMATIC Micro Memory Card or hard disk with S7-1500 F Software Controller), you must observe the following warning:

⚠ WARNING

You must limit access to the F-CPU through organizational measures to persons who are authorized to plug in removable devices. *(S079)*

To prevent unintentional access to an S7-1500 F Virtual Controller and the virtual time service, you need to observe the following warning:

⚠ WARNING

You must take organizational measures to limit access to an IE(V)D with an S7-1500 F Virtual Controller or a virtual time service to persons who are authorized and appropriately trained to commission and operate an IE(V)D.
The following change must not be made by a system administrator under any circumstances, either at the level of a host hypervisor, in Industrial Edge Management or within the IE(V)D operating system:

- Change of data storage of the portion of the Linux file system of the IE(V)D managed by Docker.

If you operate the S7-1500 F Virtual Controller, note the following:

- You may not use images to duplicate the S7-1500 F Virtual Controller because the uniqueness of the S7-1500 F Virtual Controller when loading cannot be guaranteed based on the unique serial number.
- When creating images (e.g. snapshots) of virtual machines or Edge Devices with an S7-1500 F Virtual Controller, you must label them clearly. When importing an image, use program identification to ensure that the correct Safety program is executed.
- If you use automated mechanisms for mirroring images of virtual machines (e.g. cyclical mechanisms provided by the hypervisor for data backup), you need to perform the following steps each time you import new safety-related project data. This ensures that the correct Safety program is executed when the mirrored images of your virtual machines are started:
  1. Load the safety-related project data into the active target CPU
  2. Ensure that hypervisor mechanisms are used to delete all virtual machine images of the active target CPU.
  3. Make a program identification in the active target CPU.
- If you use a mechanism to provide distributed shared data storage (e.g. vSAN) without multiple protection of the data (FTT Failures To Tolerate = 0) in the virtualized environment, you have to ensure for each change of the configuration of this data storage to other retentive memory areas that the previously used memory area does not contain any safety-related project data by deleting this. If you use multiple protection of the data (FTT > 0) in this distributed data storage, you have to perform program identification before each restart of the active target CPU.

(S100)

To ensure that an S7-1500 F Software Controller is not uninstalled or installed unintentionally, you must observe the following warning:

⚠ WARNING

You must limit access to an S7-1500 F Software Controller by organizational measures to persons who are authorized to uninstall and install or repair an S7-1500 F Software Controller (e.g. via the Windows administrator privileges (ADMIN)). *(S075)*

With an S7-1500 F-Software Controller with a PC station version up to incl. V2.1, the function "Delete Configuration" on the PC Station Panel is only offered when no access protection (no protection) is set up on the F-CPU.

With a PC station as of V2.2, it is checked whether the current Windows user is a member of the "Failsafe Operators" Windows user group. When the logged-on Windows user is a member of the group, he/she can execute the "Delete Configuration" function even when the F-password is set. If the logged-on Windows user is not a member of the group, the PC station behaves as up to V2.1.

We therefore recommend that you do not set up F-access protection until after commissioning.

To prevent unintentional restoration of the safety-related project data, formatting of the F-CPU and deletion of program folders via the display of an S7-1500 F-CPU, you must observe the following warning:

⚠ WARNING

The password for the display of the F-CPU may only be disclosed to persons who are authorized to restore safety-related project data, to format the F-CPU and to delete program folders. If a password is not set up for the display, you must protect the display through organizational measures against unauthorized operation. *(S063)*

To prevent unintentional restoration of the safety-related project data of the safety program with the web server in an S7-1200/1500 F-CPU, you must observe the following warning:

⚠ WARNING

The "Change parameter of the F-System (F-Admin)" authorization for the web server (including web server API) without password protection (user "Everybody", or user "Anonymous" when using the user management) is intended only for testing, commissioning, etc. This means only when the system is not in productive operation. In this case, you must ensure the safety of the system through other organizational measures.
Before the transition to productive operation, you must remove the rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" from the "Everybody" or "Anonymous" user.
The password of the web server user with "Change parameter of the F-System (F-Admin)" right may only be disclosed to authorized persons. After downloading the hardware configuration, check whether only permitted users of the web server have the "Change parameter of the F-System (F-Admin)" right on the F-CPU. To do so, use the online mode of the *Safety Administration Editor* for an F-CPU without user management or the "Security settings\Users and roles" tab for an F-CPU with user management.
Saving the login file and the password of the web server in the browser is only permitted when usage by unauthorized persons is prevented through other organizational measures.
If you use the ticket mechanism, handling of the tickets must be just as restrictive as handling of the user password of the web server with the "Change parameter of the F-System (F-Admin)" right. *(S064)*

Programming

5

5.1 Overview of Programming

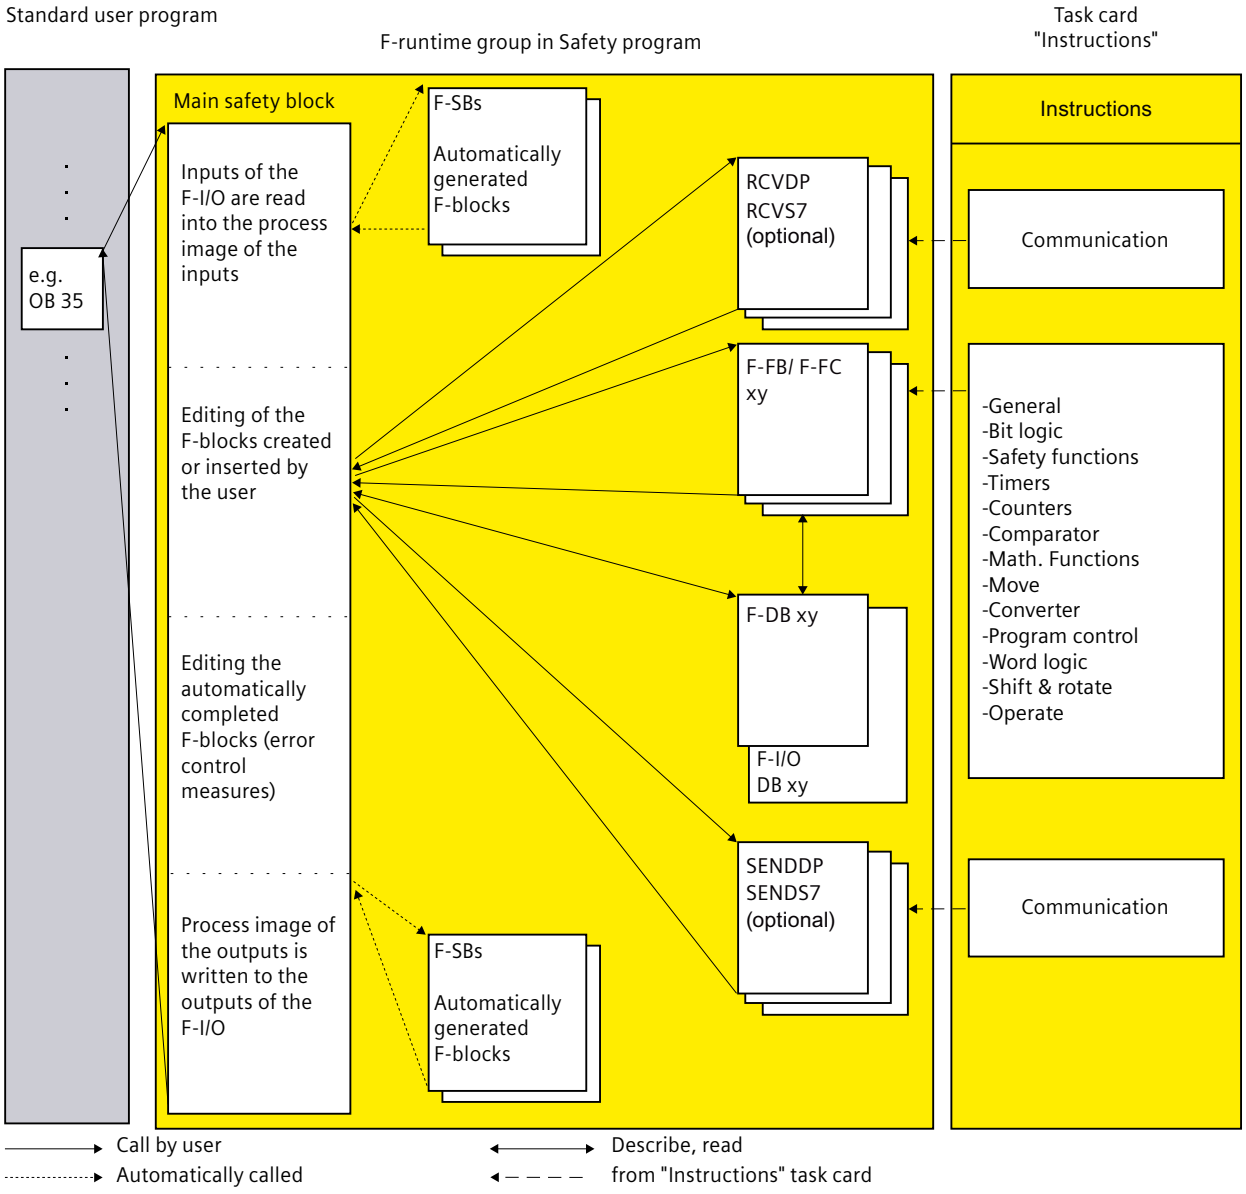
Introduction

A safety program consists of F-blocks that you create using the FBD or LAD programming language and F-blocks that are automatically added. Fault detection measures and fault reaction measures are automatically added to the safety program you create, and additional safety-related tests are performed. Moreover, you have the option to incorporate special ready-made safety functions in the form of instructions into your safety program.

An overview of the following is given below:

- The structure of the safety program
- The fail-safe blocks
- Differences in the programming of the safety program with FBD/LAD compared to programming of standard user programs

5.1.1 Program structure of the safety program (S7-300, S7-400)



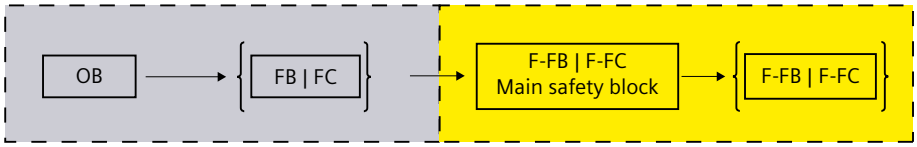
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks, automatically generated F-blocks, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-300/400 F-CPU.



Main safety block

The main safety block is the first F-block of the safety program that you program yourself. During compiling, it is supplemented by additional invisible calls of F-system blocks.

You must assign the main safety block to an F-runtime group (Page 129).

The main safety block in an S7-300/400 F-CPU is called from any block in the standard user program. We recommend a call from an OB 3x.

F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

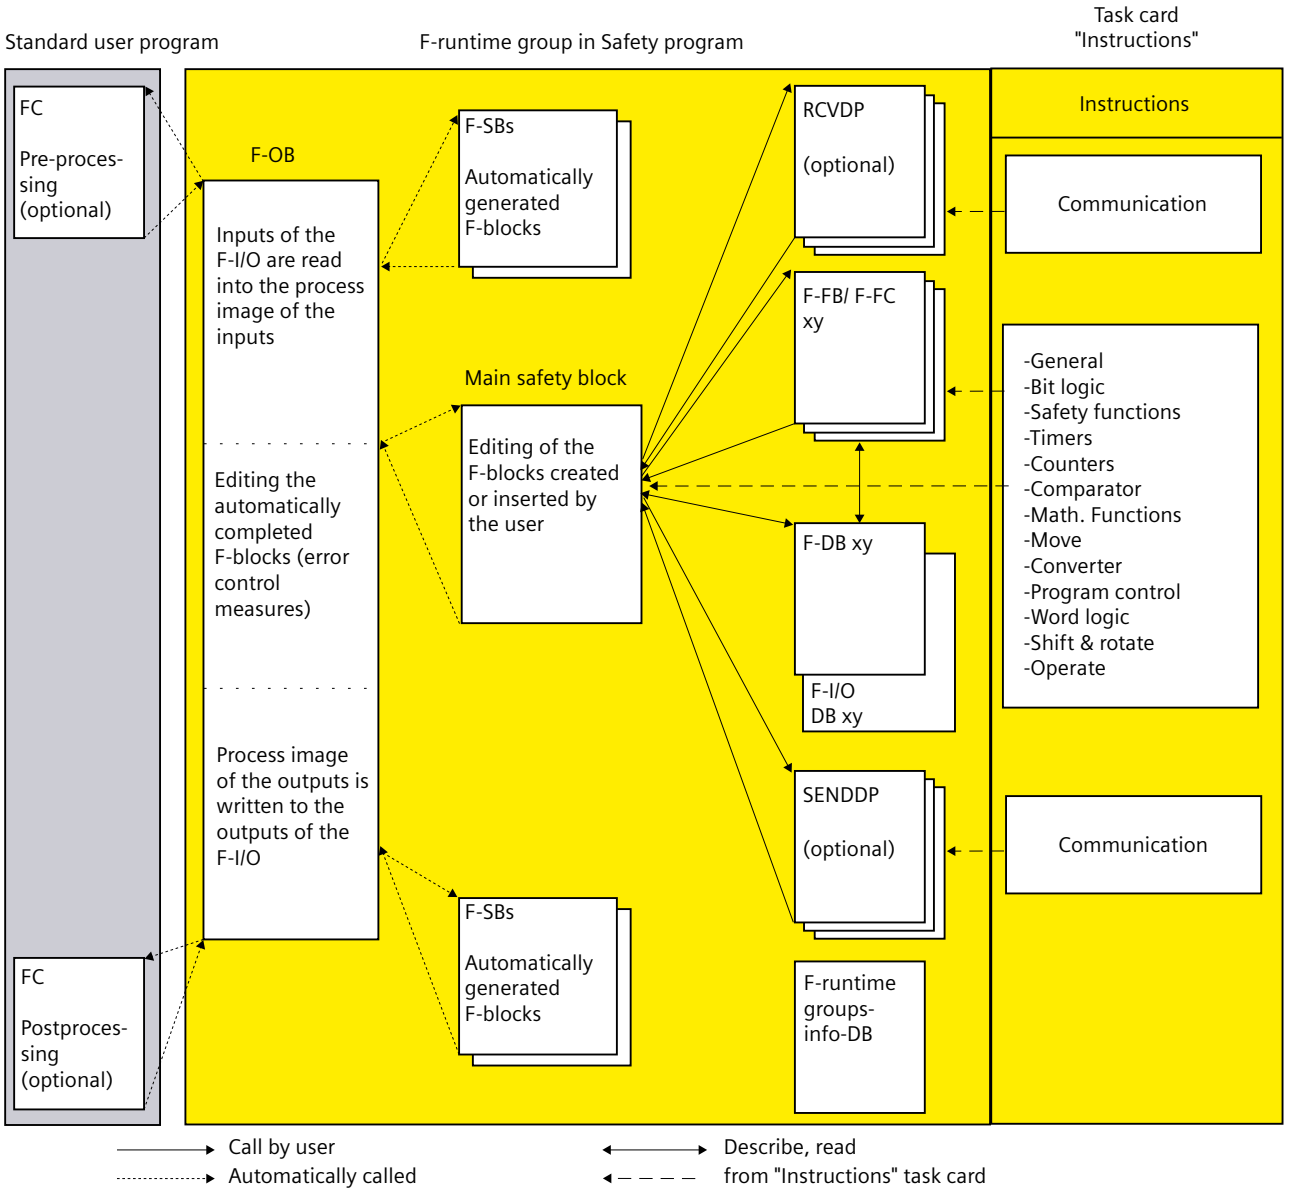
- A main safety block (an F-FB/F-FC that you assign to the calling OB (FB/FC) as needed)
- Any additional F-FBs/F-FCs that you call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

You can only transfer data between the F-runtime groups using F-runtime group communication (Page 138).

5.1.2 Program structure of the safety program (S7-1200, S7-1500)



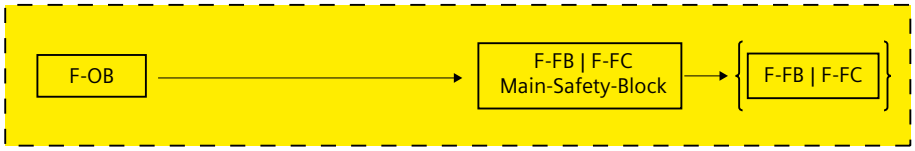
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks F-SBs, automatically generated F-blocks, F-runtime DB, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-1200/1500 F-CPU.



Main safety block

The main safety block is the first F-block of the safety program that you program yourself.

You must assign the main safety block to an F-runtime group (Page 129).

The main safety block in an S7-1200/1500 F-CPU is called by the F-OB assigned to the F-runtime group.

F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- An F-OB which calls the main safety block
- A main safety block (an F-FB/F-FC that you assign to the F-OB)
- Any additional F-FBs or F-FCs that you call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-runtime group information DB
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks
- A preprocessing and/or postprocessing block, as needed (see Pre-/postprocessing (S7-1200, S7-1500) (Page 85))

Pre-/postprocessing of an F-runtime group

You have the option of calling blocks of the standard user program (FCs) directly before or after an F-runtime group, for example, for data transfer during fail-safe communication via Flexible F-Link. (see Pre-/postprocessing (S7-1200, S7-1500) (Page 85))

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

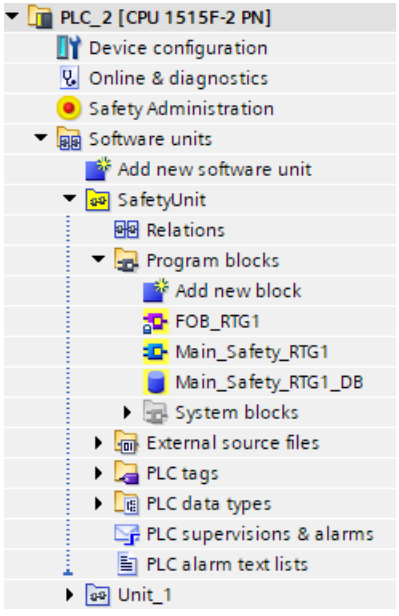
You can only transfer data between the F-runtime groups using F-runtime group communication (Page 141).

See also

F-runtime group information DB (S7-1200, S7-1500) (Page 149)

5.1.3 Safety program in Software Unit (Safety Unit) (S7-1500)

Introduction



You can use Safety Units if you want to use the advantages of the Software Units for the safety program as well, e.g. independent compiling and loading.
The blocks of the safety program are then located exclusively in the Safety Unit and can no longer be created in the "Program blocks" folder directly below the F-CPU.
You must make the decision for the Safety Unit before creating the F-CPU. After creating the F-CPU, the decision for this F-CPU can no longer be changed.

Requirement

- F-CPU S7-1500 as of FW V2.6
- The check box "Manages safety program in 'Safety Units' environment" is selected under "Options/Settings/STEP 7 Safety".
- The F-CPU is newly created.

Safety program in the Safety Unit

After a new F-CPU has been created, the safety program is located in the Safety Unit.

Store the transfer DBs for the data transfer from/to the standard user program (Page 192) in the Safety unit.

Information on Software Units is available in the help for *STEP 7* under "Using Software Units".

Particularities

- You cannot store the Safety Unit in a library.
- System blocks in the Safety Unit cannot be published.

5.1.4 Fail-Safe Blocks

F-blocks of an F-runtime group

The following table shows the F-blocks that you use in an F-runtime group:

F-block	Function	S7-300/400 F-CPUs	S7-1200/1-500 F-CPUs
Main safety block	The first step in programming of the Safety program is the main safety block. The main safety block in S7-300/400 F-CPUs is an F-FC or F-FB (with instance DB), which is called by a standard block (recommendation: OB 35) from the standard user program. The main safety block in S7-1200/1500 F-CPUs is an F-FC or F-FB (with instance DB), which is called by the F-OB.	X	X
F-FB/F-FC	Both in the main safety block as well as additional F-FBs and F-FCs, you can perform the following: • Program the Safety program with the instructions available for F-blocks • Call other created F-FBs/F-FCs for structuring the Safety program • Insert F-blocks from the project library or global libraries	X	X
F-DB	Optional fail-safe data blocks that can be read- and write-accessed within the entire Safety program.	X	X
F-I/O DB	An F-I/O DB is automatically generated for each F-I/O when it is configured. You access the tags of the F-I/O DB in connection with F-I/O access.	X	X
F-shared DB	The F-shared DB is a fail-safe data block that contains all of the shared data of the Safety program and additional information needed by the F-system.	X	—
F-runtime group information DB	An F-runtime group information DB is created when you create an F-runtime group. The F-runtime group information DB provides information on the F-runtime group and on the Safety program as a whole.	—	X
DB for F-runtime group communication	Created for safety-related communication between F-runtime groups in the *Safety Administration Editor*. With this, you can read fail-safe tags that were made available in an F-DB from an F-runtime group in a different F-runtime group.	X	—
F_SystemInfo_DB	More information (e.g. signatures) on the Safety program can be found in the F_SystemInfo_DB. You cannot access this information in the Safety program.	—	X
F-communication DB	For each communication connection with Flexible F-Link, an F-communication DB is generated automatically when the communication connection is created. You access the tags of the F-communication DB in connection with Flexible F-Link communication connections.	—	X
F-OPC UA Consumer DB	For communication connections via OPC UA Safety, an F-OPC UA Consumer DB is automatically generated for each SafetyConsumer when the OPC UA SafetyProvider information model is imported. You access the variables of the F-OPC UA Consumer DB in connection with OPC UA Safety communication connections.	—	X

NOTE

You are not permitted to insert F-system blocks from the "System blocks" folder in a main safety block/F-FB/F-FC.

Instructions for the Safety program

In the "Instructions" task card, you can find instructions for the F-CPU used and which you can to use program the Safety program.

You can find instructions that you know from the standard user program, such as bit logic operations, mathematical functions, functions for program control, and word logic operations.

Moreover, there are instructions with safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, feedback monitoring and instructions for safety-related communication between F-CPUs.

More information

For a detailed description of the instructions for the Safety program, refer to Overview of instructions (Page 443).

Using instruction versions

As with the instructions for the standard user program, there may also be different versions of the instructions for the Safety program.

More information on instruction versions can be found in the help on STEP 7 in "Basics for instruction versions".

More information on the differences of the individual versions of the instructions for the Safety program can be found in the relevant chapter of the instructions.

NOTE

Note the following:

- If you change the version of an instruction used in the Safety program in the task card "Instructions" to a version which does not have identical functions, the functioning of your Safety program may change after recompiling the Safety program. In addition to the signature of the F-block that uses the instruction, the Collective F-Signature and the Collective F-SW-Signature of your Safety program also change. You may have to perform an acceptance test (Page 427).
- (S7-300, S7-400) If you use a know-how protected F-block in your Safety program which uses an instruction which is not the same version as that set in the task card "Instructions", when the program is compiled without entering the password for the know-how protected F-block, it is adjusted to the version set in the task card "Instructions". If the instruction versions do not have identical functions, the functioning of the know-how protected F-block may change and always its signature.

5.1.5 Restrictions in the programming languages FBD/LAD

LAD and FBD programming languages

The user program in the F-CPU typically consists of a standard user program and a safety program.

The standard user program is created using standard programming languages such as SCL, STL, LAD, or FBD.

For the safety program, LAD or FBD may be used with certain restrictions in the instructions and the applicable data types and operand areas. Also note the restrictions for the individual instructions.

Supported instructions

The instructions available depend on the F-CPU used. You can find the supported instructions in the description of the instructions (starting from STEP 7 Safety V21 instructions (Page 443)).

NOTE

Enable input EN cannot be connected.
(S7 -300, S7-400) Output ENO cannot be connected.
(S7-1200, S7-1500) Output ENO can only be connected with the following instructions:

- ADD: Add (Page 542)
- SUB: Subtract (Page 545)
- MUL: Multiply (Page 548)
- DIV: Divide (Page 551)
- NEG: Create twos complement (Page 554)
- ABS: Form absolute value (Page 556)
- CONVERT: Convert value (Page 566)

Supported data types and parameter types

Only the following data types are supported:

- BOOL
- INT
- WORD
- DINT
- DWORD (S7-300, S7-400)
- TIME

- ARRAY, ARRAY[*] when using the instructions RD_ARRAY_I: Read value from INT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500) (Page 559) and RD_ARRAY_DI: Read value from DINT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500) (Page 561).

  Restrictions:
  - ARRAY only in F-DBs
  - ARRAY limits: 0 up to max. 10000
  - ARRAY[*] only as InOut parameter (InOut) in F-FCs and F-FBs
  - Only ARRAY of INT or ARRAY of DINT permissible
- F-compliant PLC data type (UDT) (S7-1200, S7-1500) (Page 122)
- Named value data types (S7-1500) (Page 127)

NOTE

If the result of an instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostic buffer of the F-CPU.
You must therefore ensure that the permitted range for the data type is observed when creating the program, select a matching data type or use the ENO output for S7-1200/1500 F-CPUs or the OV instruction (Page 596) for S7-300/400 F-CPUs.
Note the description of the individual instructions.

Non-permitted data and parameter types

The following types are **not** permitted:

- All types not listed in the section "Supported data types and parameters types" (e.g. BYTE, REAL)
- Compound data types (e.g. STRING, ARRAY (S7-300, S7-400, S7-1200 G1), STRUCT, PLC data type (UDT) (S7-300, S7-400), Named value data types (S7-300, S7-400, S7-1200))
- Parameter types (e.g. BLOCK_FB, BLOCK_DB, ANY)

Supported operand areas

The system memory of an F-CPU is divided into the same operand areas as the system memory of a standard CPU. You can access the operand areas listed in the table below from within the safety program.

Table 2-2 Supported operand areas

Operand area	Description
Process image of the inputs	
• Of F-I/O	Only read-only access to input channels of F-I/O is possible. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. The process image of the inputs of F-I/O is updated prior to the start of the main safety block.

Operand area	Description
• Of standard I/O	Input channels of standard I/O can only be accessed read-only. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. In addition, a process-specific validity check is required. See the *STEP 7 help* for the update times of the process image of the inputs of standard I/O.
Process image of the outputs	
• Of F-I/O	Only write-only access to output channels of F-I/O is possible. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the F-I/O are calculated and stored in the process image of the outputs. The process image of the outputs for F-I/O is updated after the end of the main safety block.
• Of standard I/O	Output channels of standard I/O are write-only channels. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the standard I/O are also calculated and stored in the process image of the outputs, if needed. See the *STEP 7 help* for the update times of the process image of the outputs of standard I/O.
Bit memory	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. A particular element of the bit memory can be either read- or write-accessed in the safety program. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. Note that it is only permitted to use bit memory for connecting the standard user program and the safety program; it must not be used as a buffer for F-data.
Data blocks	
• F-DB	Data blocks store information for the program. They can either be defined as global data blocks such that all F-FBs, F-FCs, or main safety blocks can access them or assigned to a particular F-FB or main safety block (instance DB). A tag of a shared DB can only be accessed from one F-runtime group, and an instance DB only from the F-runtime group in which the corresponding F-FB/instruction is called.
• DB	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. For a tag of a DB, either read access or write access is possible in the safety program. Transfer to InOut parameters of an F-FB or F-FC is therefore not valid either. Note that the tags of a DB can only be used for transferring data between the standard user program and the safety program; DBs must not be used as a buffer for F-data.
Temporary local data	This memory area holds the temporary tags of a block (or F-block) while the (F-) block is being executed. The local data stack also provides memory for transferring block parameters and for saving intermediate results.

Data type conversion

As with the standard user program, there are two possibilities for data type conversion in the safety program:

- Implicit conversion
  The implicit conversion is executed as in the standard user program with the following restrictions: The bit length of the source data type has to match the bit length of the destination data type.
- Explicit conversion
  You use an explicit conversion instruction (Page 566) before the actual instruction is executed.

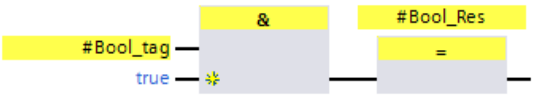
Slice access

Slice access is not possible in the safety program.

Non-permitted operand areas

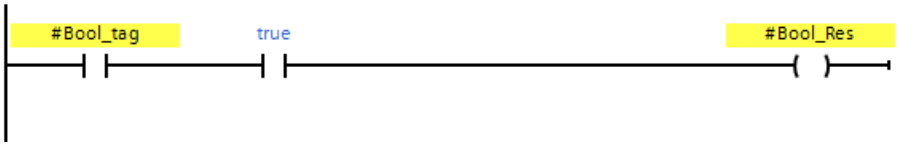
Access via units other than those listed in the table above is **not** permitted. The same applies to access to operand areas not listed, in particular:

- Data blocks that were automatically added
  Exception: Certain tags in the F-I/O DB (Page 157) and in the F-shared DB (S7-300, S7-400) (Page 148) or F-runtime group information DB (S7-1200, S7-1500) (Page 149)
- I/O area: Inputs
- I/O area: Outputs



Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-300, S7-400)

The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-300/400 F-CPUs as "Tags" "RLO0" and "RLO1" in the F-shared DB. You access them through a fully qualified DB access ("F_GLOBDB".RLO0 or "F_GLOBDB".RLO1).



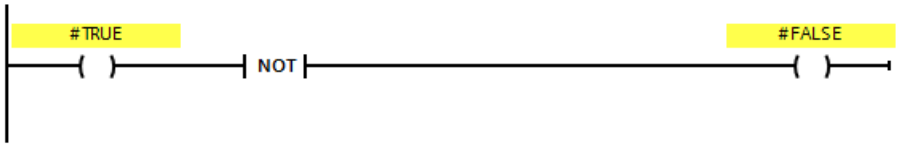
Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-1200, S7-1500)

The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-1200/1500 F-CPUs to assign parameters during block calls. You can enter this directly in FBD or LAD at the respective block inputs.

Example FBD:

Example LAD:

As an alternative, as before you have the option to also set "1" or "TRUE" in a tag using the "Assignment (Page 455)" instruction.



To do so, do not interconnect the box input of the "Assignment" instruction in FBD. In LAD, you interconnect the input directly with the supply rail.

You obtain a tag with "0" or "FALSE" by subsequent inversion with the instruction "Invert RLO (Page 452)".

Example FBD:

Example LAD:

Operand area of temporary local data: Particularities

NOTE

Note when using the operand area of temporary local data that the first access of a local data element in a main safety block/F-FB/F-FC must always be a write access. This initializes the local data element.

Make sure that a temporary local data element is initialized prior to the first JMP, JMPN, or RET instruction.

The "local data bit" should be initialized with the Assign ("=") (FBD) or ("--( )") (LAD) instruction. Assign the local data bit a signal state of "0" or "1" as a Boolean constant.

Local data bits cannot be initialized with the Flip Flop (SR, RS), Set Output (S) or Reset Output (R) instructions.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

"Fully qualified DB access"

Access to tags of a data block in an F-FB/F-FC is "fully qualified DB access". This also applies to initial access to tags of a data block after a jump label.

For S7-300/400 F-CPUs, only initial access needs to be "fully qualified DB access". Alternatively, you can use the instruction "OPN".

Example of "fully qualified DB access":

Assign a name for the F-DB, e.g. "F_Data_1". Use the names assigned in the declaration of the F-DB instead of the absolute addresses.

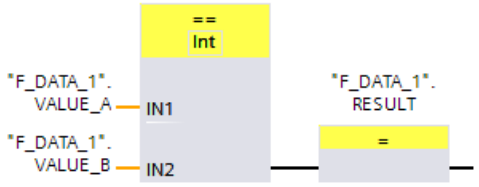


Figure 2-2 Example with fully-qualified access

Example of "non-fully qualified DB access" (S7-300, S7-400):

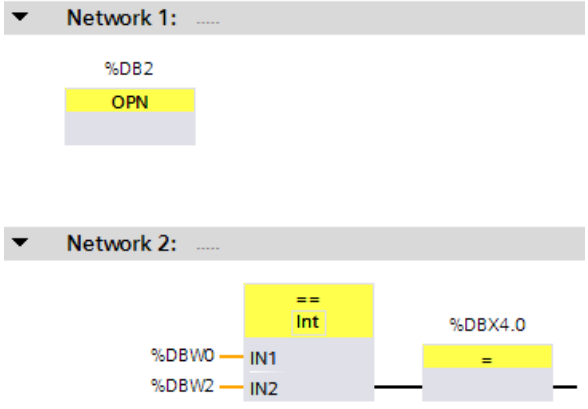

Figure 2-3 Example without fully-qualified access

Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

(S7-300, S7-400) Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

Note the following warning for S7-1200/1500 F-CPUs:

WARNING

When you program global access to instance DBs of F-FBs, you must ensure that the associated F-FB is called in the safety program. *(S096)*

5.1.6 F-compliant PLC data types (UDT) (S7-1200, S7-1500)

Introduction

You declare and use F-compliant PLC data types (UDT) as you would standard PLC data types (UDT). You can use F-compliant PLC data types (UDT) in the safety program as well as in the standard user program.

Differences to standard PLC data types (UDT) are described in this chapter.

Information on the use and declaration of standard PLC data types (UDT) is available in the *STEP 7 help* under "Declaring PLC data types".

Declaring F-compliant PLC data types (UDT)

You declare F-compliant PLC data types (UDT) as you would PLC data types (UDT).

In F-compliant PLC data types (UDT), you can use all data types (Page 116) that you can also use in safety programs. Exception: ARRAY.

Proceed as follows for declaration:

1. Click on "Add new PLC data type" in the "PLC Data Types" folder in the project tree.
2. To create an F-compliant PLC data type (UDT), enable the option "Create F-compliant PLC data type" in the "Add new PLC data type" dialog.
3. Proceed as described in the *STEP 7 help* under "Programming structure of PLC data types".

You specify default values for F-compliant PLC data types (UDT) during the declaration.

Using F-compliant PLC data types (UDT)

You use F-compliant PLC data types as you would standard PLC data types (UDT).

Nesting depth for F-compliant PLC data types

For F-compliant PLC data types, the maximum nesting depth is limited compared to the standard PLC data types (maximum nesting depth = 8). There is a dependency on the call sequence of the block in which a tag of the nested F-compliant PLC data type is declared. Each call level of F-FCs or multi-instance F-FBs reduces the maximum nesting depth of the F-compliant PLC data type used. For multi-instance F-FBs, the caller counts as an additional level.

When a tag of a nested F-compliant PLC data type is declared in a global F-DB, its maximum nesting depth is 7.

Example 1
The main safety block (level 1) calls an F-FB as multi-instance (level 2) which, in turn, calls an F-FC (level 3) in which a tag of the type of a nested F-compliant PLC data type is declared. This means a maximum nesting depth of 5 is available for the fail-safe compliant PLC data type used by the tag.

Example 2
The main safety block calls an F-FB as a single instance (level 1) which, in turn, calls an F-FC (level 2) in which a tag of the type of a nested F-compliant PLC data type is declared. This

means a maximum nesting depth of 6 is available for the fail-safe compliant PLC data type used by the tag.

Changes to F-compliant PLC data types (UDT)

You need the password for the safety program to change F-compliant PLC data types (UDT). Regardless if you are using the F-compliant PLC data type (UDT) in an F-block, in a standard block or not at all.

See also

"F-compliant PLC data types" area of the Safety Administration Editor (S7-1200, S7-1500) (Page 88)

5.1.6.1 Grouping PLC tags for inputs and outputs of F-I/O in structures (S7-1200, S7-1500)

You group PLC tags for inputs and outputs of F-I/O in structures (structured PLC tag) as you would for inputs and outputs of standard I/O.

Use F-compliant PLC data types (UDT).

Rules

When creating structured PLC tags for inputs and outputs of F-I/O, you must also observe the following rules in addition to the rules in the standard:

- You must not group inputs/outputs of standard I/O and F-I/O at the same time in a structured PLC tag.
- You may only group inputs/outputs of actually existing channels (channel value and value status) in a structured PLC tag.

  See also Addressing F-I/O (Page 151)
- You may only group inputs/outputs of channels (channel value and value status) that are enabled in the hardware configuration in a structured PLC tag.

  See also Addressing F-I/O (Page 151)
- You may only group inputs of channels (channel value and value status) that provide the result of the "1oo2 sensor evaluation" with set "1oo2 sensor evaluation".

  See also Addressing F-I/O (Page 151)
- You should combine all inputs and outputs of an F-I/O in a structured PLC tag. When divided into several structured PLC tags, these can only begin with multiples of 16 bits. This also applies to nested F-compliant PLC data types (UDT). See rules in the standard.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
- A structured PLC tag that groups outputs of an F-I/O must not overlap with other PLC tags.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
- In a structured PLC tag for inputs and outputs of F-I/O, the data types WORD, DWORD and TIME are not permitted in the associated PLC data type (UDT).

NOTE
To observe these rules, you must declare the F-compliant PLC data type that is used for the structured PLC tag accordingly.

You can find the addresses allocated to a structured PLC tag in the "IO tags" tab of an F-I/O configuration.

5.1.6.2 Example of structured PLC tags for inputs and outputs of F-I/O (S7-1200, S7-1500)

Introduction

This example uses the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation to demonstrate how you use structured PLC tags for access to F-I/O.

Channel structure of the 4 F-DI/3 F-DO DC24V/2A F-module

The table below sets out the channel structure and address assignment of the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation. You may only access existing and enabled channels (addresses I15.0 to I15.3 and I16.0 to I16.3). These channels provide the result of 1oo2 evaluation generated internally in the F-module.

Table 2-3 Channel structure and addresses of the channel values of inputs with 1oo2 evaluation

Channel	Address
DI channel 0 channel value	I15.0
DI channel 1 channel value	I15.1
DI channel 2 channel value	I15.2
DI channel 3 channel value	I15.3
—	I15.4
—	I15.5
—	I15.6
—	I15.7

Table 2-4 Channel structure and addresses of the value status of the inputs with 1oo2 evaluation

Channel	Address
DI channel 0 value status	I16.0
DI channel 1 value status	I16.1
DI channel 2 value status	I16.2
DI channel 3 value status	I16.3
—	I16.4
—	I16.5
—	I16.6
—	I16.7

Table 2-5 Channel structure and addresses of the value status of outputs

Channel	Address
DO channel 0 value status	I17.0
DO channel 1 value status	I17.1
DO channel 2 value status	I17.2
DO channel 3 value status	I17.3

Table 2-6 Channel structure and addresses of the channel values of outputs

Channel	Address
DO channel 0 channel value	Q15.0
DO channel 1 channel value	Q15.1
DO channel 2 channel value	Q15.2
DO channel 3 channel value	Q15.3

Creating F-compliant PLC data types (UDT)

Create two F-compliant PLC data types (UDT), for example, for access to all channels.

The figure below shows an F-compliant PLC data type (UDT) for access to the channel values and value status of the inputs with 1oo2 evaluation:

4 F-DI/3 F-DO DC24V/2A_DI

	Name	Data type	Comment
1	CH_DI_0	Bool	Channel 0 (DI)
2	CH_DI_1	Bool	Channel 1 (DI)
3	CH_DI_2	Bool	Channel 2 (DI)
4	CH_DI_3	Bool	Channel 3 (DI)

The figure below shows the F-compliant PLC data type (UDT) for access to the channel values and value status of the outputs:

4 F-DI/3 F-DO DC24V/2A_DO

	Name	Data type	Comment
1	CH_DO_0	Bool	Channel 0 (DO)
2	CH_DO_1	Bool	Channel 1 (DO)
3	CH_DO_2	Bool	Channel 2 (DO)

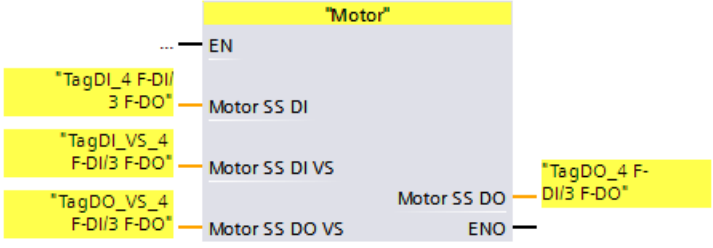
Using F-compliant PLC data types (UDT)

As demonstrated in the figure below, you can use the two F-compliant PLC data types (UDT) that you have created in an F-FC (e.g. "Motor"):

Motor

	Name	Data type	Comment
1	Input		
2	Motor SS DI	"4 F-DI/3 F-DO DC24V/2A_DI"	Motor interface channel values DI
3	CH_DI_0	Bool	Kanal 0 (DI)
4	CH_DI_1	Bool	Kanal 1 (DI)
5	CH_DI_2	Bool	Kanal 2 (DI)
6	CH_DI_3	Bool	Kanal 3 (DI)
7	Motor SS DI VS	"4 F-DI/3 F-DO DC24V/2A_DI"	Motor interface value status DI
8	CH_DI_0	Bool	Kanal 0 (DI)
9	CH_DI_1	Bool	Kanal 1 (DI)
10	CH_DI_2	Bool	Kanal 2 (DI)
11	CH_DI_3	Bool	Kanal 3 (DI)
12	Motor SS DO VS	"4 F-DI/3 F-DO DC24V/2A_DO"	Motor interface value status DI
13	CH_DO_0	Bool	Kanal 0 (DO)
14	CH_DO_1	Bool	Kanal 1 (DO)
15	CH_DO_2	Bool	Kanal 2 (DO)
16	Output		
17	Motor SS DO	"4 F-DI/3 F-DO DC24V/2A_DO"	Motor interface channel values DO
18	CH_DO_0	Bool	Kanal 0 (DO)
19	CH_DO_1	Bool	Kanal 1 (DO)
20	CH_DO_2	Bool	Kanal 2 (DO)

Creating structured PLC tag for the F-module 4 F-DI/3 F-DO DC24V/2A



Create structured PLC tags for the F-module 4 F-DI/3 F-DO DC24V/2A:

Tag table_1

	Name	Data type	Address	Comment
1	TagDI_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DI"	%I15.0	Motor 1 DI
2	TagDI_VS_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DI"	%I16.0	Motor 1 DI VS
3	TagDO_VS_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DO"	%I17.0	Motor 1 DO VS
4	TagDO_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DO"	%Q15.0	Motor 1 DO

Accessing the F-FC

Transfer the structured PLC tags you have created when you call the F-FC (e.g. "Motor"):

See also

Addressing F-I/O (Page 151)
Value status (S7-1200, S7-1500) (Page 153)

5.1.7 Named value data types (S7-1500)

You use named value data types as in the standard.

For named value data types in a safety program, you can only use the data types supported by the safety program (Page 116) (except TIME) as base data types.

NOTE

If you change Named value data types, this also changes the collective F signature.

You can find more information on named value data types in the *STEP 7 online help* under "Named value data types" and "Declaring named value data types".

5.1.8 Editing PLC tags with external editors

To edit PLC tags with external editors follow the procedure as in the standard. Additional information can be found in the *STEP 7* help in "Editing PLC tags with external editors".

Note the following:

NOTE

After importing a tag table which contains tags used in the safety program, the collective F-signature of the safety program is reset.

To form the collective F-signature again you have to recompile the project data. For this, with access protection set up for the safety program, you need a valid access authorization for the safety program.

If you would like to edit PLC tags with external editors, we therefore recommend that you store PLC tags to be used in the safety program in a separate tag table.

5.1.9 Using Multiuser engineering

If you want to use Multiuser engineering, proceed as described in the *STEP 7* help under "Using Multiuser engineering".

5.1.10 Deleting the safety program

Deleting individual F-blocks

To delete an F-block, follow the same procedure as in *STEP 7*.

Deleting an F-runtime group

See Deleting an F-runtime group (Page 144)

(S7-300, S7-400) Remove all calls that you have used to call the safety program (Main_Safety).

Deleting the entire safety program for S7-300/400 F-CPUs *with* inserted memory card (SIMATIC Micro Memory Card or flash card)

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
4. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.
5. To delete a safety program on the Memory Card (SIMATIC Micro Memory Card or Flash Card), insert the Memory Card (SIMATIC Micro Memory Card or Flash Card) in the programming device or PC or in a SIMATIC USB prommer.
6. Select the menu command "Project > Card Reader/USB memory > Show Card Reader/USB memory" in the menu bar.
7. Open the "SIMATIC Card Reader" folder and delete the Memory Card.
8. Insert the Memory Card into the F-CPU.
9. Perform a memory reset of the F-CPU (flashing of the STOP LED requests a memory reset).

You can then download the offline standard user program to the F-CPU.

Deleting the entire safety program for S7-400 F-CPUs *without* inserted flash card

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.

4. Compile the project data of the F-CPU
   The offline project no longer contains a safety program.
5. Perform a memory reset on the F-CPU (in the "Online tools" task card of the F-CPU).

You can then download the offline standard user program to the F-CPU.

Delete the entire safety program for SIMATIC S7-1200/1500 F-CPUs

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Compile the project data of the F-CPU
   The offline project no longer contains a safety program.

You can then download the offline standard user program to the F-CPU.

5.2 Defining F-Runtime Groups

5.2.1 Rules for F-Runtime Groups of the Safety Program

Rules

Note the following:

- The channels (channel values and value status) of an F-I/O can only be accessed from a single F-runtime group.
- Tags of the F-I/O DB of an F-I/O can only be accessed from one F-runtime group and only from that F-runtime group from which the channels or value status of this F-I/O are also accessed (if access is made).
- F-FBs can be used in more than one F-runtime group but they must be called with different instance DBs.
- Instance DBs of F-FB can only be accessed from the F-runtime group in which the associated F-FB is called.
- A tag of a global F-DB (except the F-global DB) can only be accessed from one F-runtime group (however, a global F-DB can be used in more than one F-runtime group).
- (S7-300, S7-400) A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", but only read-accessed by the "receiver" F-runtime group.
- (S7-300, S7-400) An F-communication DB can only be accessed from one F-runtime group.
- (S7-1200, S7-1500) You must not call the main safety block yourself. It is automatically called by the assigned F-OB.

NOTE

F-OBs are protected by F-system know-how. The OB start information of F-OBs therefore cannot be evaluated.

- (S7-1200, S7-1500). The F-OB should be created with the highest priority of all OBs.

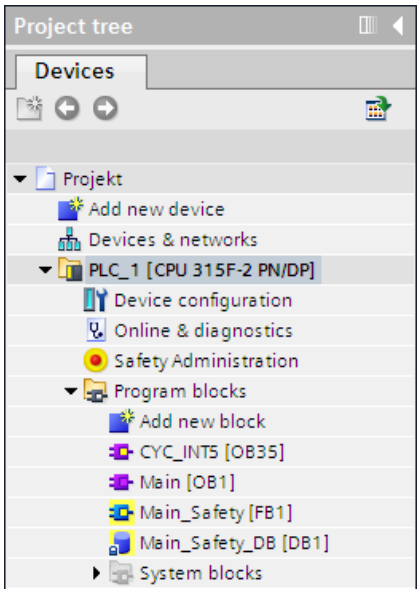
  NOTE
  The cycle time/runtime of an F-OB can be prolonged by, among other things, communication load, the processing of higher-priority interrupts, as well as by test and commissioning functions. In a redundant S7-1500HF system, it is also dependent on the current system state.

- (S7-300, S7-400) The main safety block may only be called once from a standard block. Multiple calls can cause the F-CPU to go to STOP mode.
- (S7-300, S7-400) For optimal use of temporary local data, you must call the F-runtime group (the main safety block) directly in an OB (cyclic interrupt OB, if possible); you should not declare any additional temporary local data in this cyclic interrupt OB.
- (S7-300, S7-400) Within a cyclic interrupt OB, the F-runtime group should be executed **before** the standard user program; i.e. it should be called at the very beginning of the OB, so that the F-runtime group is always called at fixed time intervals, regardless of how long it takes to process the standard user program.

  For this reason, the cyclic interrupt OB should also not be interrupted by higher priority interrupts.
- The process image of the inputs and outputs of standard I/O, bit memory, and tags of DBs in the standard user program may be accessed either as read-only or read/write from more than one F-runtime group. (see also Data exchange between standard user program and safety program (Page 192))
- F-FCs can generally be called in more than one F-runtime group.

NOTE

You can improve performance by writing sections of the program that are not required for the safety function in the standard user program.
When determining which elements to include in the standard user program and which to include in the Safety program, you should keep in mind that the standard user program can be modified and downloaded to the F-CPU more easily. In general, changes in the standard user program do not require an acceptance.



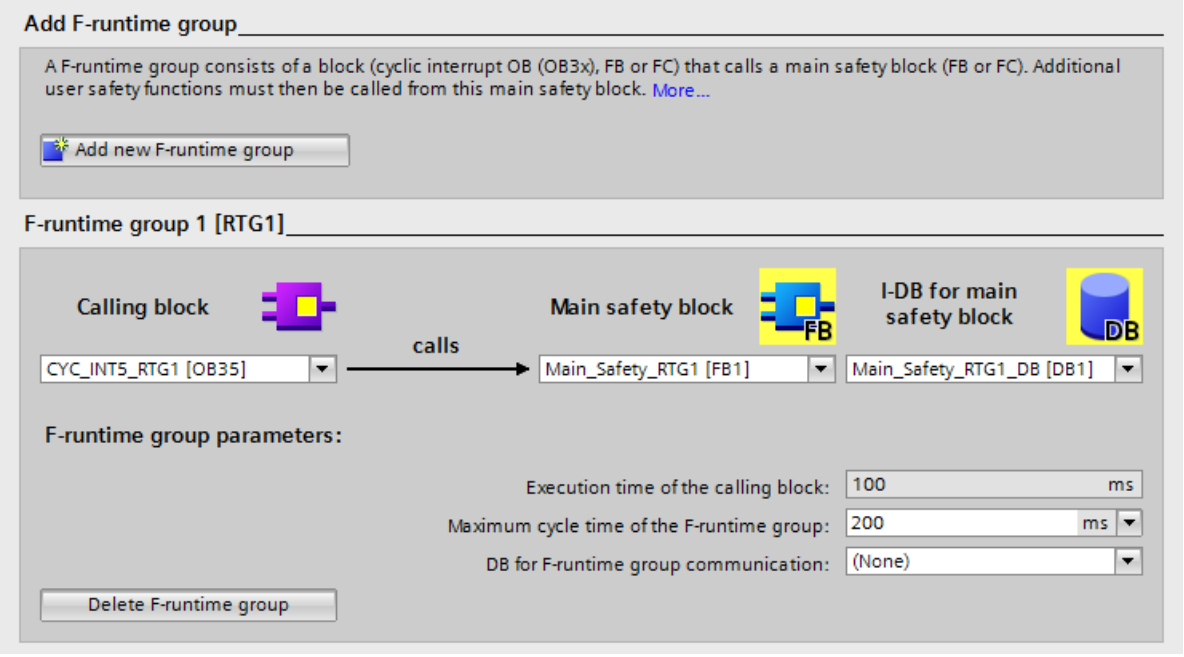
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400)

Requirements

- You have inserted an S7-300/400 F-CPU in your project.
- In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default after an F-CPU has been added. When you open the "Program blocks" folder, you see the (F-)blocks of the F-runtime group (CYC_INT5 [OB 35], Main_Safety [FB 1], and Main_Safety_DB [DB1]) in the project tree.



The following section describes how you modify the settings / parameters of the F-runtime group created by default or add and additional F-runtime group.

Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.

3. Specify the block in which the main safety block is to be called.

   Cyclic interrupt OB 35 is suggested here by default. The advantage of cyclic interrupt OBs is that they interrupt the cyclic program processing in OB 1 of the standard user program at fixed intervals. This means that the safety program is called and run at fixed time intervals in a cyclic interrupt OB.

   In this input field, you can select only those blocks that were created in the LAD, FBD, or STL programming language. If you select a block here, the call is inserted automatically into the selected block and, if necessary, removed from a previously selected block.

   If you want to call the main safety block in a block that was created in another programming language, you must program this call itself. The input field is then not editable (grayed out), and you can change the call only in the calling block and not the *Safety Administration Editor*.
4. Assign the desired main safety block to the F-runtime group. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety [FB1] and Main_Safety_DB [DB1] are suggested by default.

5. The F-CPU monitors the F-cycle time of the F-runtime group. For "Maximum cycle time of F-runtime group", enter the maximum permitted time between two calls of the F-runtime group.

⚠ WARNING

The call interval of the F-runtime group is monitored for a maximum value. This means that monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often or, for example, isochronously. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 522) from the "Instructions" task card and not using counters (OB calls). *(S007)*

⚠ WARNING

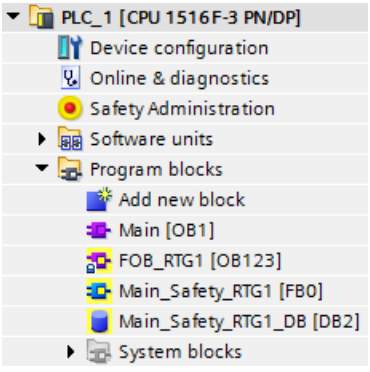
The response time of your safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.
Therefore, the configuration/parameter assignment of the standard system influences the response time of your safety function.
Examples:

– Increasing the priority of a standard OB compared to an F-OB can extend the cycle time of the F-OB or the runtime of the F-runtime group due to the higher-priority processing of the standard OB. Note that during the creation of technology objects, OBs with very high priority may be created automatically.
– The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".

Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety-related project data and does not lead to a modification of the Collective F-Signature.
If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always use the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 616)).
The monitoring times are protected against change with the access protection of the safety-related project data and are captured by the Collective F-Signature as well as the Collective F-SW-Signature.
When calculating with the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

6. If one F-runtime group is to provide tags for evaluation to another F-runtime group of the safety program, assign a DB for F-runtime group communication. Select an F-DB for "DB for F-runtime group communication". (See also F-runtime group communication (S7-300, S7-400) (Page 138))
7. If you want to create a **second F-runtime group**, click the "Add new F-runtime group" button.
8. Assign an F-FB or F-FC as the main safety block to a calling block. This F-FB or F-FC is automatically generated in the project tree, if not already present.

9. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
10. Follow steps 3 to 5 above to complete generation of the second F-runtime group.



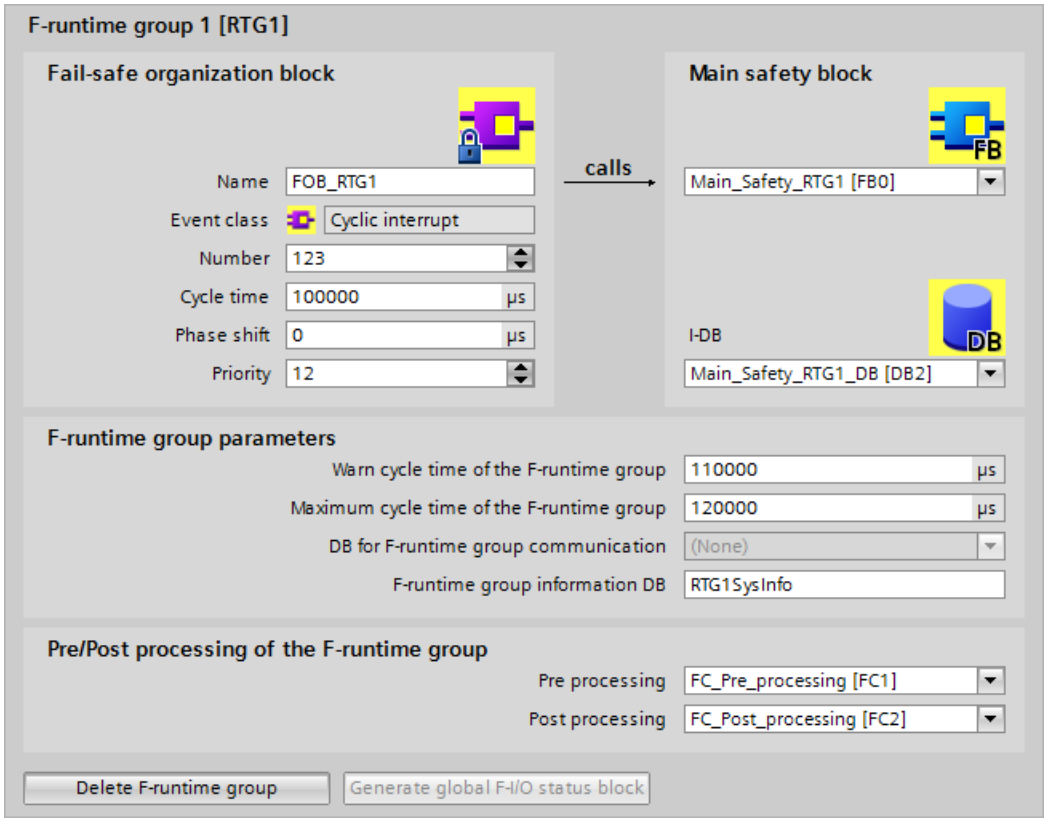
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500)

Requirements

- You have inserted an S7-1200/1500 F-CPU in your project.
- In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default after an F-CPU has been added. When you open the "Program blocks", you see the (F-)blocks of the F-runtime group (FOB_RTG1 [OB123], Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1]) in the project tree.



The following section describes how you modify the settings / parameters of the F-runtime group created by default or add and additional F-runtime group.

Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.

3. Assign a name for the F-OB under "F-OB".
4. Specify the event class of the F-OB when you create a new F-runtime group.

   For an F-OB you can select between the event classes "Program cycle", "Cyclic interrupt" or "Synchronous cycle".

   In the case of the F-runtime group created by default, the F-OB has the event class "Cyclic interrupt". To change the event class of the F-OB of an already created F-runtime group, you need to delete and F-runtime group and create a new one.

NOTE

We recommend creating the F-OB with the event class "Cyclic interrupt". The safety program will then be called and executed at fixed time intervals.
F-OBs with the event class "Synchronous cycle" are only recommended in conjunction with F-IOs that support isochronous mode, for example submodule "Profisafe Telgr 902" of drive SINAMICS S120 CU310-2 PN V5.1.
F-OBs with the event class "Program cycle" are not recommended, as these have the lowest priority "1" (see below).

NOTE
Note the maximum permissible number of OBs (incl. F-OBs) with event class "Synchronous cycle" (see technical specifications in the product manuals of the S7-1500 CPUs).

5. If required, you can manually change the number of the F-OB proposed by the system. To do so, note the number ranges valid for the relevant event class.
6. Assign cycle time, phase shift and priority parameters for F-OBs with event class "Cyclic interrupt".
   Assign the priority parameter for F-OBs with event class "Synchronous cycle".
   – Select a cycle time which is less than the "Maximum cycle time of the F-runtime group" and less than the "Cycle time warning limit of F-runtime group".
   – Select a phase shift which is less than the cycle time.
   – If possible, select a priority that is higher than the priority of all other OBs.

NOTE
Through a high priority of the F-OB you ensure that the run time of the safety program and the reaction time of your safety functions (Page 616) are influenced as little as possibly by the standard user program.

NOTE
For F-OBs with event class "Synchronous cycle" you need to also assign parameters for application cycle (ms) and possibly delay time (ms) after defining the F-runtime group and the connection of the isochronous F-I/O to the isochronous mode interrupt OB. You can find these parameters in the "Properties" dialog box of the isochronous mode interrupt OB in the "Isochronous mode" group. Proceed as described in the STEP 7 help under "Configuring isochronous mode interrupt OBs".

7. Assign the calling main safety block to the F-OB. If the main safety block is an FB, you must also assign an instance DB.
   Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1] are suggested by default.
8. The F-CPU monitors the F-cycle time of the F-runtime group. Two parameters are available:
   – If the "Warn cycle time of the F-runtime group" is exceeded, a maintenance demanded is written to the diagnostics buffer of the F-CPU and the MAINT LED of the F-CPU is activated. This parameter can, for example, be used to determine whether the cycle time exceeds a required value without the F-CPU switching to STOP mode.

     NOTE
     The maintenance demanded is marked as an outgoing event by a STOP/RUN transition of the F-CPU. In an HF-system you must set both HF-CPUs or the redundant S7-1500HF system to STOP before you restart the HF-CPUs.
     As an alternative, you can mark the maintenance demanded as outgoing with the standard instruction "ACK_FCT_WARN". To do so, call the instruction "ACK_FCT_WARN" with a rising edge at the input parameter "ACK_WARN" in your standard user program.
     A renewed violation of the warning limit is not signaled until after a STOP/RUN transition of the F-CPU.

– If the "Maximum cycle time of F-runtime group" is exceeded, the F-CPU will go to STOP. For "Maximum cycle time of F-runtime group", select the maximum time that can elapse between two calls of this F-runtime group (max. 20000000 µs).

WARNING

The call interval of the F-runtime group is monitored for a maximum value. This means that monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often or, for example, isochronously. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 522) from the "Instructions" task card and not using counters (OB calls). *(S007)*

WARNING

The response time of your safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.
Therefore, the configuration/parameter assignment of the standard system influences the response time of your safety function.
Examples:

– Increasing the priority of a standard OB compared to an F-OB can extend the cycle time of the F-OB or the runtime of the F-runtime group due to the higher-priority processing of the standard OB. Note that during the creation of technology objects, OBs with very high priority may be created automatically.
– The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".

Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety-related project data and does not lead to a modification of the Collective F-Signature.
If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always use the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 616)).
The monitoring times are protected against change with the access protection of the safety-related project data and are captured by the Collective F-Signature as well as the Collective F-SW-Signature.
When calculating with the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

The "Cycle time warning limit of F-runtime group" must be configured as less than or equal to the "Maximum cycle time of F-runtime group".

9. If necessary, you can change the name suggested by the system for the F-runtime group information DB (Page 149) under "F-runtime group information DB".

10. If required, you can select blocks of the standard program (FCs) with regard to preprocessing or postprocessing of an F-runtime group (see Pre-/postprocessing (S7-1200, S7-1500) (Page 85))
11. If you want to create a **second F-runtime group**, click the "Add new F-runtime group" button. Follow steps 3 to 10 above.

5.2.4 F-runtime group communication (S7-300, S7-400)

Safety-related communication between F-runtime groups

Safety-related communication can take place between the two F-runtime groups of a safety program. This means fail-safe tags can be provided by one F-runtime group in an F-DB and read in another F-runtime group.

NOTE

A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", while it can only be read-accessed by the "receiver" F-runtime group.

Tip: You can improve performance by structuring your safety program in such a way that as few tags as possible are exchanged between the F-runtime groups.

Procedure for defining a DB for F-runtime group communication

You define the DB for F-runtime group communication in the work area "F-runtime groups". Proceed as follows:

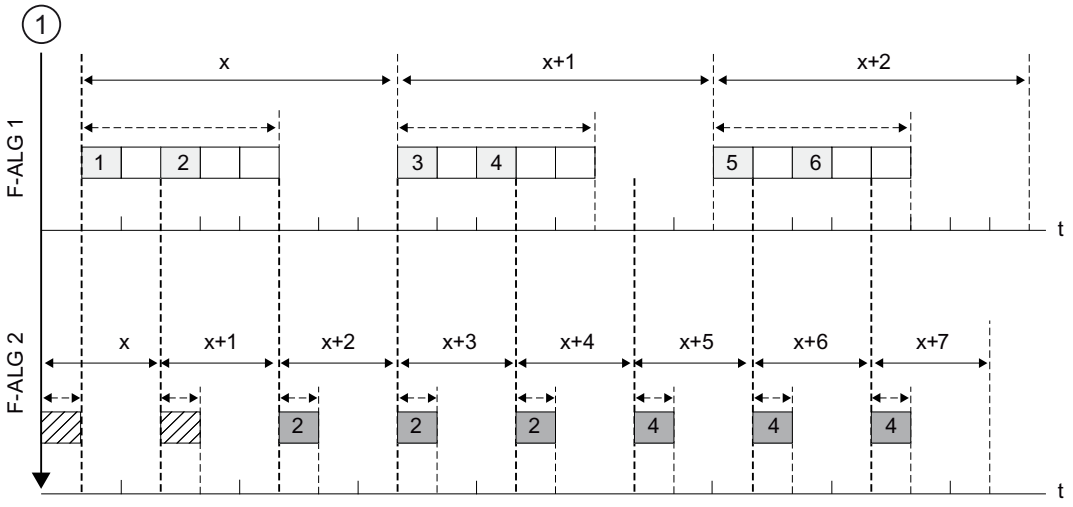
1. Click "F-runtime groups" in "*Safety Administration Editor*".
2. Select an existing F-DB in the "DB for F-runtime group communication" field or assign a new one.
3. Assign a name to the F-DB.

Up-to-dateness of tags read from another F-runtime group

NOTE

Tags read are up-to-date as at the time of the last completed processing cycle of the F-runtime group providing the tags prior to start-up of the F-runtime group reading the tags.

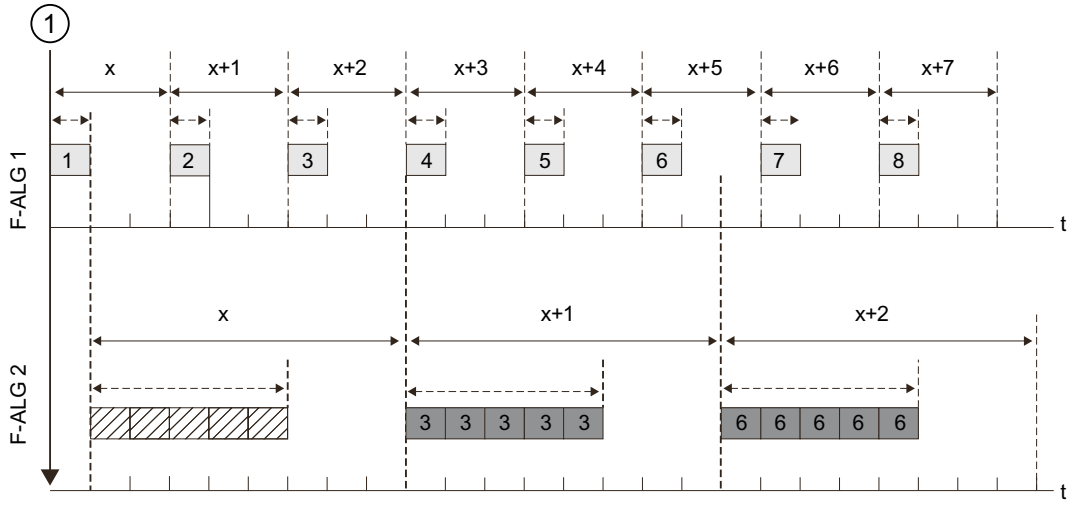
If the tags supplied undergo multiple changes during runtime of the F-runtime group supplying the tags, the F-runtime group reading the tags only receives the last change (see figure below).



Assignment of fail-safe values

After F-system start-up, fail-safe values are supplied to the F-runtime group which has read access to tags in the DB for F-runtime group communication of another F-runtime group (for example, F-runtime group 2). These are the values you specified as initial values in the DB for F-runtime group communication of F-runtime group 1.

F-runtime group 2 reads the fail-safe values the first time it is called. The second time the F-runtime group 2 is called, it reads the latest tags if F-runtime group 1 has been processed completely between the two calls of F-runtime group 2. If F-runtime group 1 has not been processed completely, F-runtime group 2 continues to read the fail-safe values until F-runtime group 1 is completely processed.



The behavior is illustrated in the two figures below.

Reading tags from F-runtime group 1, which has a longer OB cycle and lower priority than F-runtime group 2

①	Startup of F-system
←→	Cycle time of the (F-)OB in which the F-runtime group is called.
←- - -→	Runtime of the F-runtime group
1	... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1
2	...Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1
▨	Initial value in the DB for F-runtime group communication

Reading tags from F-runtime group 1, which has a shorter OB cycle and higher priority than F-runtime group 2

①	Startup of F-system
←→	Cycle time of the (F-)OB in which the F-runtime group is called.
←- - -→	Runtime of the F-runtime group
1	... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1
2	... Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1
▨	Initial value in the DB for F-runtime group communication

F-runtime group supplying tags is not processed

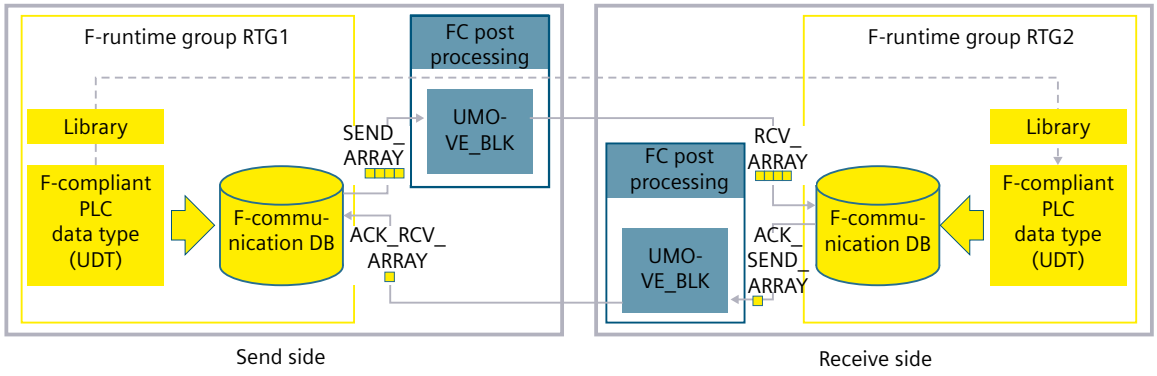
NOTE

If the F-runtime group whose DB for F-runtime group communication is to supply the tags is not processed (the main safety block of the F-runtime group is not called), the F-CPU goes to STOP mode. One of the following diagnostics events is then entered in the diagnostics buffer of the F-CPU:

- Error in safety program: cycle time exceeded
- Number of the relevant main safety block (of F-runtime group that is not processed)
- Current cycle time in ms: "0"

5.2.5 F-runtime group communication (S7-1200, S7-1500)

Introduction



With the help of Flexible F-Link you realize a F-runtime group communication.

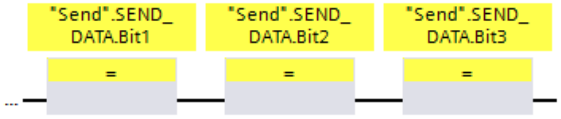
With Flexible F-Link, a coded F-array is made available for the send data of the F-runtime group. The coded F-array is transferred to the other F-runtime group with standard instructions such as UNMOVE_BLK.

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 G1 F-CPUs as of firmware V4.2
- S7-1200 G2 F-CPUs as of firmware V1.0
- Safety system version as of V2.2

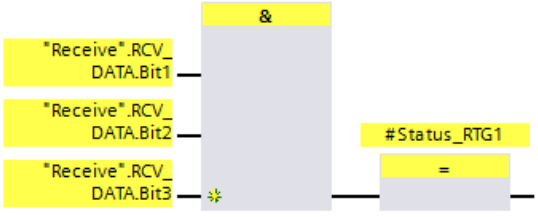
F-runtime group communication

If you want to send a data fail-safe from one F-runtime group to another F-runtime group, follow these steps:



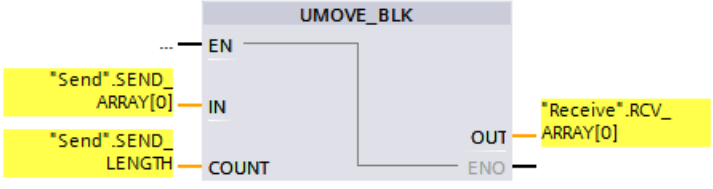
1. Create a non-nested F-compliant PLC data type (UDT) for the F-runtime group communication. The size can be up to 1500 bytes, including a maximum of 800 elements of data type BOOL.
2. Create two safety-related communications for F-runtime group communication in the Safety Administration Editor in the "Flexible F-Link" area. One safety-related communication each for the send and receive sides.

3. Configure the same F-monitoring time and F-communication UUID for each F-runtime group communication relationship.
   Information on calculating the F-monitoring times can be found in Monitoring and response times (Page 615).
   For example:



Flexible F-Link settings

	Name	PLC Data Type	Direction	F-monitoring time: (ms)	F-communication UUID
1	Send	Data	Send	500	5d61f443-ede6-4e4e-9db6-e79af634f9ad
2	Receive	Data	Receive	500	5d61f443-ede6-4e4e-9db6-e79af634f9ad



4. On the send side (e.g. RTG1) supply the data of the F-communication DB (Page 341) for the send direction with the data to be sent.
   For example:

5. On the receive side (e.g. RTG2), read the received data from the F-communication DB (Page 341) for the receive direction.
   For example:

6. Call the instruction "UMOVE_BLK" in the F-runtime group for the send data (e.g. RTG1) in the FC for post processing (Page 85).
7. Interconnect the "UMOVE_BLK" instruction for the data to be sent as follows:

   "Send" is the F-communication DB (Page 341) of the F-runtime group that sends the data.
   "Receive" is the F-communication DB (Page 341) of the F-runtime group that receives the data.
8. Call the instruction "UMOVE_BLK" in the F-runtime group for acknowledgment (e.g. RTG2) in the FC for post processing (Page 94).

9. Interconnect the "UMOVE_BLK" instruction for the acknowledgment connection as follows:

"Receive" is the F-communication DB (Page 341) of the F-runtime group that sends the acknowledgment telegram.

"Send" is the F-communication DB (Page 341) of the F-runtime group that receives the acknowledgment telegram.

10. Compile the user program.

11. Download the user program to the F-CPU.

WARNING

For each communication connection via Flexible F-Link, you must check that the offsets of the elements of the F-compliant PLC data type (UDT) used for the communication connection match on the transmit and receive sides when you accept the safety program. You can find the offsets in the respective safety summary. To do this identify the communication connection by means of the UUID. *(S088)*

WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, a unique F-communication UUID for the communication is provided by the system. When communication is copied in the Safety Administration Editor within the parameterization table or copied to another F-CPU, the F-communication UUIDs are not regenerated and therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself must ensure the uniqueness. To do this, select the relevant UUIDs and generate them again via the "Generate UUID" context menu. You must ensure the uniqueness in the safety summary during acceptance, at the latest. *(S087)*

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Up-to-dateness of tags read from another F-runtime group

The same statements as those in the section "F-runtime group communication (S7-300, S7-400) (Page 138)" apply (except for the storage locations written or read or initial values).

5.2.6 Deleting an F-runtime group

Deleting an F-runtime group

To delete an F-runtime group, proceed as follows:

1. In the area navigation of the *Safety Administration Editor*, click on the F-runtime group to be deleted.
2. Select the "Delete F-runtime group" button in the work area.
3. Confirm the dialog with "Yes".
4. Perform a Compilation of the safety program (Page 344) (menu command "Edit > Compile") for your changes to take effect.

The assignment of the F-blocks to an F-runtime group (to the calling block of the main safety block) is deleted. However, the F-blocks continue to exist.

5.2.7 Changing the F-runtime group (S7-300, S7-400)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Specify another block as the calling block of the main safety block.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time of the F-runtime group
- Specify another DB as a data block for F-runtime group communication.

5.2.8 Changing the F-runtime group (S7-1200, S7-1500)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Change the name, number, cycle time, phase shift and priority of the F-OB.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time and the cycle time warning limit of the F-runtime group.
- Assign another name for the F-runtime group information DB.
- Specify an FC for the preprocessing and postprocessing.

5.3 Creating F-blocks

5.3.1 Creating F-blocks

Introduction

In order to create F-FBs, F-FCs, and F-DBs for the safety program, you should follow the same basic procedure as in the standard. In the following, only the deviations from the procedure for standard blocks are presented.

Creating F-FBs, F-FCs, and F-DBs

You create F-blocks in the same way as for standard blocks. Proceed as follows:

1. In the project tree of the F-CPU or the Safety Unit, double-click on "Add new block" under "Program blocks".
2. In the dialog that appears, specify the type, name, and language and select the "Create F-block" check box. (If you do not select the check box, a standard block is created.)
3. After the dialog is confirmed, the F-block is opened in the *Program editor*.

Note the following

Note the following important instructions:

NOTE

- You may not declare block parameters in the block interface of the main safety block because they cannot be supplied.
- (S7-1200, S7-1500) You can edit start values in instance DBs.
- The function "Apply actual values" is not supported.
- You may not access static local data in single instances or multi-instances of other F-FBs.
- You must always initialize outputs of F-FCs.
  The F-CPU can go to STOP mode if the information above is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
- (S7-300, S7-400) If you wish to assign an address from the data area (data block) to a formal parameter of an F-FC as an actual parameter, you have to use fully qualified DB access.
- Its inputs may only be accessed by a block in reading mode and its outputs only in writing mode.
  Use an in/out if you wish to have both read and write access.
- For greater clarity, assign meaningful names to the F-blocks you have created.

Copying/pasting F-blocks

You can copy F-FBs, F-FCs, and F-DBs in exactly the same was as blocks of the standard user program.

Exceptions:

- (S7-1200, S7-1500) You may not copy an F-OB.
- You cannot copy blocks from the folder "Program blocks > System blocks".
- (S7-1500) F-blocks cannot be copied from the Safety Unit to a standard unit or between the Safety Unit and the "Program blocks" folder of the F-CPU.

See also

Changing the F-runtime group (S7-1200, S7-1500) (Page 144)

5.3.2 Know-how protection

For know-how protection of F-blocks, proceed as described in the *STEP 7* help under "Protecting blocks".

Requirements

Note the following with regard to know-how protection of F-blocks for S7-1200/1500 F-CPUs:

- An F-block to which you wish to assign know-how protection must be called in the Safety program.
- Before you can set up the know-how protection for an F-block, the Safety program must be consistent. For this purpose, compile (Page 344) the Safety program.

NOTE

No source code is output in the safety summary for know-how-protected F-blocks. Therefore, create the safety summary (for example, for carrying out a code review or for F-block acceptance) before you set up the know-how protection.

NOTE

If you want to edit the program code and/or the block interface of a know-how protected F-block, we recommend that you do not open the F-block by entering a password, but rather remove the know-how protection completely and set it up again after compiling.

NOTE

(S7-1200, S7-1500) When a know-how protected F-block or F-blocks called by it are renamed, the signature of the know-how protected F-block is not changed until the password is entered when opening or removing the know-how protection.

NOTE

When know-how protected F-blocks are used, warnings and error messages whose cause can lie in the know-how protected F-blocks can be displayed during compilation of the Safety program. The warnings and error messages contain corresponding information. Example: In a know-how protected F-block, you perform read access to a tag of the standard user program to which write access is taking place in a different (know-how protected) F-block.

For S7-1200/1500 F-CPUs, you can obtain additional information in the section "Know-how protected F-blocks in the Safety program" of the safety summary.

See also

Reuse of F-blocks (Page 147)

5.3.3 Reuse of F-blocks

Introduction

You can reuse F-blocks that you have already tested and, if applicable, approved, in other Safety programs – without having to test and approve them again.

You can protect the content of the F-block by setting up the know-how protection. You may only set this protection after acceptance of the F-block to ensure that the safety summary contains this F-block in its entirety.

Like standard blocks, you can store F-blocks as master copies or types in global libraries or in the project library.

More information can be found in the *STEP 7 help* under "Using libraries".

Creating safety summary for the F-block to be reused

Create a safety summary with the following information for F-blocks that you want to reuse.

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-FBs and F-FCs
- Signatures of all F-DBs accessed by the fail-safe block to be reused.

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version when setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-FBs and F-FCs
- Signatures of all F-DBs accessed by the fail-safe block to be reused.

The safety summary should also contain a description of the functionality of the F-block, in particular if it is know-how protected.

The required information is obtained by creating the safety summary of the Safety program in which you originally created, tested and approved the F-block to be reused.

This safety summary can also serve directly as the safety summary for the F-block to be reused.

Checks when using the F-block to be reused

When reusing the F-block, ensure the following:

- The signature and initial value signature (S7-300, S7-400) of the F-block are unchanged.
- (SIMATIC S7-1200, S7-1500) The documented safety system version is set.
- The documented (or functionally identical) versions of the versioned LAD/FBD instructions are set. You can find information about the instruction versions in the description of the instructions.
- (S7-1200, S7-1500) The called and accessed F-blocks with the documented signatures are used.
- (S7-300, S7-400) The called F-blocks with the documented signatures and initial value signatures are used.

If the version conflicts cannot be eliminated due to other dependencies, contact the author of the know-how protected block in order to obtain a compatible approved version.

Compliance of the know-how protected F-blocks used in the Safety program with their safety summary. (Page 411)

5.4 Information interface to the safety program

5.4.1 F-shared DB (S7-300, S7-400)

Function

The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system. The F-shared DB is automatically inserted when the hardware configuration is compiled.

Using its name F_GLOBDB, you can evaluate certain data elements of the safety program in the standard user program.

Reading an F-shared DB in the standard user program

You can read out the following information in the F-shared DB in the standard user program or on an operator control and monitoring system:

- Operating mode: safety mode or disabled safety mode ("MODE" tag)
- Error information "Error occurred when executing safety program" ("ERROR" tag)
- Collective F-Signature ("F_PROG_SIG" tag)
- Compilation date of the safety program ("F_PROG_DAT" tag, DATE_AND_TIME data type)

You use fully qualified access to access these tags (e.g. ""F_GLOBDB".MODE").

5.4.2 F-runtime group information DB (S7-1200, S7-1500)

Introduction

The F-runtime group information DB provides key information on the corresponding F-runtime group and on the safety program as a whole.

The F-runtime group information DB is generated automatically when an F-runtime group is created. A symbol, for example, "RTG1SysInfo", is assigned for the F-runtime group information DB. You can change the name in the *Safety Administration Editor*.

You must not access the information in the "F_SYSINFO" parameter from the safety program.

Information in the F-runtime group information DB

The F-runtime group information DB provides the following information:

Name	Data type	For processing in the safety program	For processing in the standard user program	Description
MODE	BOOL	x	x	1 = Disabled safety mode
MODE_REMAINING_TIME	TIME	x	x	Remaining runtime in deactivated safety mode until the F-CPU switches to STOP [1]
MODE_VPLC_TIME_SERVICE	BOOL	—	x	1 = Redundant operation of the Virtual Time Service application [2]
F_SYSINFO				
MODE	BOOL	—	x	1 = Disabled safety mode
TCYC_CURR	DINT	—	x	Current cycle time of the F-runtime group, in ms
TCYC_LONG	DINT	—	x	Longest cycle time of the F-runtime group, in ms
TRTG_CURR	DINT	—	x	Current runtime of the F-runtime group, in ms
TRTG_LONG	DINT	—	x	Longest runtime of the F-runtime group, in ms
T1RTG_CURR	DINT	—	x	Not supported by *STEP 7 Safety V21*.
T1RTG_LONG	DINT	—	x	Not supported by *STEP 7 Safety V21*.
F_PROG_SIG	DWORD	—	x	Collective F-Signature of the safety program
F_PROG_DAT	DTL	—	x	Compilation date of the safety program
F_RTG_SIG	DWORD	—	x	F-runtime groups signature
F_RTG_DAT	DTL	—	x	Compilation date of the F-runtime group
VERS_S7SAF	DWORD	—	x	Version identifier for *STEP 7 Safety*

1 When the F-CPU switches to STOP after the runtime for the deactivated safety mode has expired, the remaining time still present in the last cycle is displayed.

2 Only relevant for S7-1500 F Virtual Controller.

You access the content of the F-runtime group information DB with fully qualified addressing. Either collectively with the F_SYSINFO PLC data type (UDT), for example, "RTG1SysInfo.F_SYSINFO", provided by the F-system or individual information, for example, "RTG1SysInfo.F_SYSINFO.MODE".

Program identification (Page 378)

5.5 Programming startup protection

Introduction

WARNING

Unintentional restart
In contrast to the standard user program, when the safety program starts up, all tags of the F-DBs are generally initialized with their start values. This means that saved error information is lost. The F-system performs automatic reintegration of the F-I/O.
If an unintentional startup of your process is not allowed, you must program restart/startup protection in the safety program. For this, the output of process values must be blocked until user acknowledgment takes place (see "Implementation of user acknowledgment (Page 184)"). This user acknowledgment must not take place until safe output of process values is possible.
You must expect an unintentional restart in the following cases:

- After a STOP generated by PG/PC operation, mode switch, communication function or "STP" instruction
- After an operating error
- After a STOP caused by a fault reaction function
- The following applies to the S7-1500 F Virtual Controller:
  After a STOP or a restart of the S7-1500 F Virtual Controller via Industrial Edge Management.

(S008)

Example of restart/startup prevention

In order to implement a restart/startup prevention, it must be possible to detect a startup. To detect a startup, you declare a tag of data type BOOL with initial value "TRUE" in an F-DB.

Block the output of process data when this tag has the value "1," for example, by passivating F-I/O using the PASS_ON tag in the F-I/O DB.

If the output of the process values is safely possible and errors have been corrected, reset this tag by a user acknowledgment.

F-I/O DB (Page 157)

F-I/O access

6

The following sections contain a general description of F-I/O access.

The following sections are only valid to a limited extent for technology modules (e.g. F-TM Count 1x1Vpp sin/cos HF). You can find more detailed information in the respective equipment manuals.

For F-I/O with integrated safety functions (such as ET 200ecoPN M12-L F), outputs can be written from both the safety program of the F-CPU and from the integrated safety functions. You can find information on which values ultimately take effect here in the respective manuals.

6.1 Addressing F-I/O

Overview

Below you will find a description of how to address the F-I/O in the safety program and which rules must be observed in the process.

Addressing via the process image

As with standard I/O, you access F-I/O (e.g., S7-1500/ET 200MP fail-safe modules) via the **process image** (PII and PIQ).

Direct reading (with I/O identification ":P") of inputs or writing of outputs is not possible in the safety program.

Updating the process image

The process image of the inputs of F-I/O is updated at the start of the F-runtime group. The process image of the outputs of F-I/O is updated at the end of the F-runtime group (see Program structure of the safety program (S7-300, S7-400) (Page 108) or Program structure of the safety program (S7-1200, S7-1500) (Page 110)). For more information on updating the process image, refer to the note in Data Transfer from the Safety Program to the Standard User Program (Page 192).

The communication required between the F-CPU (process image) and the F-I/O to update the process image uses a special safety protocol in accordance with PROFIsafe.

Rules

- You may only address a channel (channel value and value status) of an F-I/O in **one** F-runtime group. The first programmed addressing defines the assignment for the F-runtime group.
- You may only address a channel (channel value and value status) of an F-I/O with a unit that matches the data type of the channel.
  Example: To access input channels of data type BOOL, you must use the "input (bit)" (I x.y) unit. Access to the 16 consecutive input channels of the data type BOOL via the unit "input word" (IW x) is not possible.
- Analog channels always need to be entered in the tag table with data type INT or DINT. The data types WORD, DWORD and TIME are not permissible.
- Address only inputs and outputs that reference an actually existing channel (channel value and value status) (e.g. for an F-DO 10xDC24V with start address 10 only the outputs Q10.0 to Q11.1 for the channel values and the inputs I10.0 to I11.1 for the value status). Keep in mind that due to the special safety protocol, the F-I/O occupies a larger area of the process image than is required for the existing and enabled channels on the F-I/O (channel values and value status). To find the area of the process image where the channels (channel values and value status) are stored (channel structure), refer to the relevant manuals for the F-I/O.
- Channels can be disabled for certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules). Address only channels (channel value and value status) that are enabled in the hardware configuration. When you address channels that are disabled in the hardware configuration, a warning may be output when compiling the safety program.
- For certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules), a "1oo2 (2v2) sensor evaluation" can be specified. Two channels are grouped into one channel pair in this case, and the result of the "1oo2 sensor evaluation" is usually provided under the address of the channel with the lower channel number (see relevant manuals of the F-I/O). Address only this channel (channel value and value status) of the channel pair. When you address a different channel, a warning may be output when compiling the safety program.

⚠ WARNING

If you use an additional component between the F-CPU (S7-300, S7-400) and the F-I/O that copies the safety message frame in accordance with PROFIsafe between the F-CPU (S7-300, S7-400) and F-I/O per user program, you must test all safety functions affected by the copy function whenever you change the user-programmed copy function. *(S049)*

See also

Safety-related I-slave-slave communication - F-I/O access via process image (Page 183)
Value status (S7-1200, S7-1500) (Page 153)

6.2 Value status (S7-1200, S7-1500)

Properties

The value status is additional binary information for the channel value of an F-I/O. The value status is entered in the process image input (PII).

The value status is supported by fail-safe modules S7-1500/ET 200MP, ET 200SP, ET 200SP HA, ET 200AL, ET 200eco PN, ET 200S, ET 200iSP, ET 200pro, S7-1200 or F-SMs S7-300, fail-safe GSD based IO devices as well as fail-safe GSD based DP slaves that support the "RIOforFA-Safety" profile. Information about the value status can be found in the documentation of the respective F-I/O.

We recommend you amend the name of the channel value with "_VS" for the value status, for example, "TagIn_1_VS".

The value status provides information on the validity of the corresponding channel value:

- 1: A valid process value is output for the channel.
- 0: A fail-safe value is output for the channel.

The channel value and value status of an F-I/O can only be accessed from the same F-runtime group.

Location of value status bits in the PII for F-I/O with digital inputs

The value status bits come straight after the channel values in the PII.

Table 2-7 Example: Address assignment in PII for F-I/O with 16 digital input channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	DI_{15}	DI_{14}	DI_{13}	DI_{12}	DI_{11}	DI_{10}	DI_9	DI_8
x + 2	Value status DI_7	Value status DI_6	Value status DI_5	Value status DI_4	Value status DI_3	Value status DI_2	Value status DI_1	Value status DI_0
x + 3	Value status DI_{15}	Value status DI_{14}	Value status DI_{13}	Value status DI_{12}	Value status DI_{11}	Value status DI_{10}	Value status DI_9	Value status DI_8

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs

The value status bits in the PII are mapped with the same structure as the channel values in the PIQ.

Table 2-8 Example: Address assignment in PIQ for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Table 2-9 Example: Address assignment in PII for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs and digital inputs

The value status bits come directly after the channel values in the PII in the following order:

- Value status bits for the digital inputs
- Value status bits for the digital outputs

Table 2-10 Example: Address assignment in PIQ for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bit in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Table 2-11 Example: Address assignment in PII for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status DI_1	Value status DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

The location of the channel values in the PII and PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog inputs

The value status bits come straight after the channel values in the PII.

Table 2-12 Example: Address assignment in PII for F-I/O with 6 analog input channels (data type INT)

Byte in the F-CPU	Assigned bytes/bits in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AI_0							
...	...							
x + 10	Channel value AI_5							
x + 12	—	—	Value status AI_5	Value status AI_4	Value status AI_3	Value status AI_2	Value status AI_1	Value status AI_0

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog outputs

The value status bits are mapped in the PII.

Table 2-13 Example: Address assignment in PIQ for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bytes in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AO_0							
...	...							
x + 10	Channel value AO_5							

x = Module start address

Table 2-14 Example: Address assignment in PII for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	Value status AO_5	Value status AO_4	Value status AO_3	Value status AO_2	Value status AO_1	Value status AO_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

6.3 Process Data or Fail-Safe Values

When are fail-safe values used?

The safety function requires that fail-safe values (0) be used instead of process data for passivation of the entire F-I/O or individual channels of an F-I/O in the following cases. This applies both to digital channels (data type BOOL) as well as for analog channels (data type INT or DINT):

- When the F-system starts up
- When errors occur during safety-related communication (communication errors) between the F-CPU and F-I/O using the safety protocol in accordance with PROFIsafe
- When F-I/O faults and channel faults occur (such as wire break, short circuit, and discrepancy errors)
- As long as you enable passivation of the F-I/O with PASS_ON = 1 in the F-I/O DB (see below)
- As long as you disable the F-I/O with DISABLE = 1 in the F-I/O DB (see below)

Fail-safe value output for F-I/O/channels of an F-I/O

When **passivation** occurs for an **F-I/O with inputs**, the F-system provides the safety program with fail-safe values (0) in the PII instead of the process data pending at the fail-safe inputs of the F-I/O.

The overflow or underflow of a channel of the **SM 336; AI 6 x 13Bit** or **SM 336; F-AI 6 x 0/4 ... 20 mA HART** is recognized by the F-system as an F-I/O/channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If you want to process fail-safe values other than "0" in the safety program for an F-I/O with inputs **for analog channels of data type INT or DINT**, you can assign individual fail-safe

values for QBAD = 1 and value status = 0 or QBAD_I_xx/QBAD_O_xx = 1 (instructions JMP/JMPN, LABEL and MOVE). For details about the characteristics go to QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status (Page 162).

⚠ WARNING

For an F-I/O with digital input channels (data type BOOL), the value provided in the PII must always be processed in the safety program, regardless of the value status or QBAD/QBAD_I_xx. *(S009)*

When **passivation** occurs in an **F-I/O with outputs**, the F-system outputs fail-safe values (0) at the fail-safe outputs instead of the output values provided by the safety program in the PIQ.

State of associated PAA/PIQ by ...	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs	F-I/O without "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs	F-I/O with S7-300/400 F-CPUs
Startup of F-system[1]	The F-system overwrites the PII/PIQ with fail-safe values (0).		
Communication errors			
F-I/O faults	The F-system overwrites the PII with fail-safe values (0). In the PII the values formed in the safety program are retained.	The F-system overwrites the PII/PIQ with fail-safe values (0).	
Channel faults in configuration of passivation for complete F-I/O			
Channel faults during configuration of channel-granular passivation		For the affected channels: The F-system overwrites the PII/PIQ with fail-safe values (0).	
As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1	The F-system overwrites the PII/PIQ with fail-safe values (0).		
As long as the F-I/O is deactivated in the F-I/O DB with DISABLE = 1	The F-system overwrites the PII/PIQ with fail-safe values (0).		-

[1] During the delayed transfer of the F-Base ID, the F-system remains in startup.

Reintegration of F-I/O/channels of an F-I/O

The switchover from fail-safe values (0) to process data (**reintegration of an F-I/O**) takes place **automatically** or following **user acknowledgment** in the F-I/O DB. The reintegration method depends on the following:

- The reason for passivation of the F-I/O or channels of the F-I/O
- At F-I/Os without the "Channel failure acknowledge" channel parameter on the value of the ACK_NEC variable of the associated F-IO data blocks (Page 157).
- At F-I/Os with the "Channel failure acknowledge" channel parameter (for example F-modules S7-1500 / ET 200 MP / F-modules SIMATIC S7-1200) on the value of the channel parameter.

For fail-safe GSD based DP slaves / GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation.

NOTE
Note that for channel faults in the F-I/O, channel-granular passivation takes place if configured accordingly in the *hardware and network editor*. For the concerned channels, fail-safe values (0) are output.
Reintegration after channel faults reintegrates all channels whose faults were eliminated; faulty channels remain passivated.

See also

Configuring F-I/O (Page 51)

6.4 F-I/O DB

Introduction

An F-I/O DB is automatically generated for each F-I/O (in safety mode) when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that you can evaluate or can/must write to in the safety program. It is not permitted to change the initial values of the tags directly in the F-I/O DB. When an F-I/O is deleted, the associated F-I/O DB is also deleted.

Access to an F-I/O DB

You access tags of the F-I/O DB for the following reasons:

- For reintegration of F-I/O after communication errors, F-I/O faults, or channel faults
- If you want to passivate the F-I/O depending on particular states of your safety program (for example, group passivation)
- If you want to deactivate the F-I/O (for example, configuration control)
- For changing parameters for fail-safe GSD based DP slaves/GSD based I/O devices
- If you want to evaluate whether fail-safe values or process data are output

6.4.1 Name and number of the F-I/O DB

The name of the F-I/O DB is formed by:

- the fixed prefix "F"
- the start address of the F-I/O, and the names entered in the properties of the F-I/O in the *hardware and network editor* or in the device view (max. the first 24 characters)

Example: F00004_F-DI24xDC24V_1

The number is assigned within the number range defined in the "Settings" area (Page 89) of the *Safety Administration Editor*.

Option "Creates F-I/O DBs without prefix" (S7-1200, S7-1500)

When you select the option "Creates F-I/O DBs without prefix" in the "Settings" (Page 89) area in the *Safety Administration Editor*, the name is formed only from:

- the name entered in the properties of the F-I/O in the *hardware and network editor* or in the device view (max. 117 characters)

Example: F-DI24xDC24V_1

Changing the name and number of the F-I/O DB

You change the name by changing the name entered in the properties of the F-I/O in the *hardware and network editor* or in the device view.

You change the number in the "Properties"/"F-parameters" tab of the associated F-I/O.

6.4.2 Tags of the F-I/O DB

The following table presents the variables of an F-I/O DB:

	Tag	Data type	Description	Initial value
Tags that you can or must write	PASS_ON	BOOL	1=enable passivation	0
	ACK_NEC	BOOL	1=acknowledgment for reintegration required in the event of F-I/O or channel faults	1
	ACK_REI	BOOL	1=acknowledgment for reintegration	0
	IPAR_EN	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DISABLE[1]	BOOL	1=Deactivate F-I/O	0
Tags that you can evaluate	PASS_OUT	BOOL	Passivation output	1
	QBAD	BOOL	1=Fail-safe values are output	1
	ACK_REQ	BOOL	1=Acknowledgment request for reintegration	0
	IPAR_OK	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DIAG	BYTE	Non-fail-safe service information	0
	DISABLED[1]	BOOL	1=F-I/O is deactivated	0
	QBAD_I_xx	BOOL	1=Fail-safe values are output to input channel xx (S7-300, S7-400)	1
	QBAD_O_xx	BOOL	1=Fail-safe values are output to output channel xx (S7-300, S7-400)	1
	BASEID_ACTIVE[2]	LWORD	Active F-BaseID Non-fail-safe information	0

1 As of Safety system version V2.1 for S7-1200/1500

2 As of Safety system version V2.8 for S7-1200 G2/1500

Differences in evaluation in S7-1200/1500 F-CPUs and S7-300/400

The following table describes the differences in the evaluation of tags of the F-I/O DB and the value status depending on the F-I/O and F-CPU used.

Tag in the F-I/O DB or value status	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O with S7-300/400 F-CPU
ACK_NEC	—[2]	x	x
QBAD[3]	x	x	x
PASS_OUT[3]	x	x	x
QBAD_I_xx[1]	—	—	x
QBAD_O_xx[1]	—	—	x
Wertstatus[1]	x	x	—

1 QBAD_I_xx and QBAD_O_xx display the validity of the channel value channel-granular and thus correspond to the inverted value status with S7-1200/1500. Value status or QBAD_I_xx and QBAD_O_xx are not available with fail-safe DP GSD based slaves or fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

2 In the case of F-I/Os that support the "Channel failure acknowledge" channel parameter (for example S7-1500/ET 200MP F-modules or S7-1200 F-modules), this replaces the ACK_NEC variable of the F-IO data block.

3 For details about the characteristics, see "QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status"

6.4.2.1 PASS_ON

The PASS_ON tag allows you to enable passivation of an F-I/O, for example, depending on particular states in your safety program.

Using the PASS_ON tag in the F-I/O DB, you can passivate F-I/O; channel-granular passivation is not possible.

As long as PASS_ON = 1, **passivation** of the associated F-I/O occurs.

6.4.2.2 ACK_NEC

If an F-I/O fault is detected by the F-I/O, **passivation** of the relevant F-I/O occurs. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, **reintegration** of the relevant F-I/O occurs, depending on ACK_NEC:

- With ACK_NEC = 0, you can assign an **automatic reintegration**.
- With ACK_NEC = 1, you can assign a **reintegration** by **user acknowledgment**.

⚠ WARNING

The parameter assignment of the ACK_NEC tag of the F-I/O DB with the value "0" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

NOTE
The initial value for ACK_NEC is 1 after creation of the F-I/O DB. If you do not require automatic reintegration, you do not have to write ACK_NEC.

See also

After F-I/O or channel faults (Page 171)

6.4.2.3 ACK_REI

When the F-system detects a communication error or an F-I/O fault for an F-I/O, the relevant F-I/O is passivated. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. **Reintegration** of the F-I/O/channels of the F-I/O after the fault has been eliminated requires a **user acknowledgment** with a positive edge at variable ACK_REI of the F-I/O DB:

- After every communication error
- After F-I/O or channel faults only with parameter assignment "Channel failure acknowledgement = manual" or ACK_NEC = 1

Reintegration after channel faults reintegrates all channels whose faults were eliminated.

Acknowledgment is not possible until tag ACK_REQ = 1.

In your safety program, you must provide a user acknowledgment by means of the ACK_REI tag for each F-I/O.

⚠ WARNING

A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

NOTE
Alternatively, you can use the "ACK_GL" instruction to carry out reintegration of the F-I/O following communication errors or F-I/O/channel faults (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V21) (Page 520)).

6.4.2.4 IPAR_EN

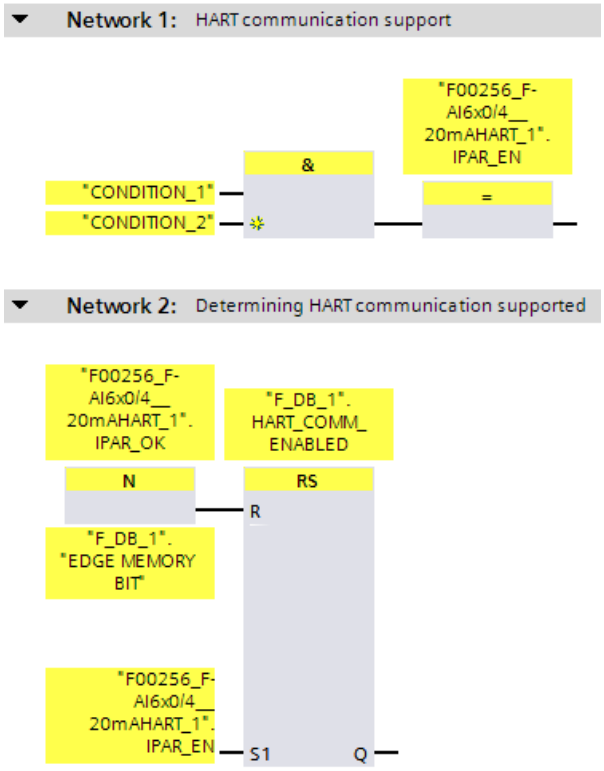
The IPAR_EN tag corresponds to the iPar_EN_C tag in the PROFIsafe bus profile as of PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out when this tag must be set or reset when parameters of fail-safe GSD based DP slaves/GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Note that IPAR_EN = 1 does not trigger passivation of the relevant F-I/O.

If passivation is to occur when IPAR_EN = 1, you must also set tag PASS_ON = 1.



HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART

If you set the IPAR_EN tag to "1" while parameter "HART_Tor" = "switchable" is assigned, the HART communication for the SM 336; F-AI 6 x 0/4 ... 20 mA HART is enabled. Setting this tag to "0" disables the HART communication. The F-SM acknowledges the enabled or disabled HART communication with tag IPAR_OK = 1 or 0.

Enable HART communication only when your system is in a status, in which any reassignment of parameters for an associated HART device can be done without any risk.

If you want to evaluate the "HART communication enabled" status in your safety program, e.g., for the purpose of programming interlocks, you must build up the information as shown in the following example. This is necessary to ensure that the information is properly available even if communication errors occur while the HART communication is enabled with IPAR_EN = 1. Only change the status of the IPAR_EN tag during this evaluation if there is no passivation due to a communication error or F-I/O or channel fault.

Example of enabling HART communication

Additional information on HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART can be found in the Automation System S7-300, ET 200M Distributed I/O System manual, Fail-Safe Signal Modules (https://support.industry.siemens.com/cs/ww/en/view/19026151) manual and in the help on the F-module.

6.4.2.5 DISABLE

The DISABLE variable allows you to deactivate an F-I/O.

As long as DISABLE = 1, the associated F-I/Os are **passivated**.

Diagnostics entries of the safety program may no longer be entered in the diagnostics buffer of the F-CPU for this F-I/O (for example, due to communication error).

Existing diagnostics entries are marked as outgoing.

6.4.2.6 QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status

The following table set outs differences in the reaction of the channel values and QBAD, PASS_OUT, DISABLED, QBAD_I_xx/QBAD_O_xx variables and of the value status depending on the F-I/O and F-CPU used.

<table>
<tr><th>Fail-safe value output after...</th><th>F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU</th><th>F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPUs</th><th>F-I/O with S7-300/400 F-CPU</th></tr>
<tr><td>Startup of F-system[2]</td><td colspan="2" rowspan="3">QBAD and PASS_OUT = 1
DISABLED unchanged
For all channels:
Channel value = fail-safe value (0)
Value status = 0[1]</td><td rowspan="3">QBAD and PASS_OUT = 1
For all channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1[1]</td></tr>
<tr><td>Communication errors</td></tr>
<tr><td>F-I/O faults</td></tr>
<tr><td>Channel faults
in configuration of passivation for complete F-I/O</td><td colspan="2">QBAD and PASS_OUT = 1
DISABLED unchanged
For all channels:
Channel value = fail-safe value (0)
Value status = 0[1]</td><td>QBAD and PASS_OUT = 1
For all channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1[1]</td></tr>
<tr><td>Channel faults during configuration of channel-granular passivation</td><td>QBAD, PASS_OUT and DISABLED unchanged
For the affected channels:
Channel value = fail-safe value (0)
Value status = 0</td><td>QBAD and PASS_OUT = 1
DISABLED unchanged
For the affected channels:
Channel value = fail-safe value (0)
Value status = 0[1]</td><td>QBAD and PASS_OUT = 1
For the affected channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1[1]</td></tr>
<tr><td>As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1</td><td colspan="2">QBAD = 1, PASS_OUT and DISABLED unchanged
For all channels:
Channel value = fail-safe value (0)
Value status = 0[1]</td><td>QBAD = 1,
PASS_OUT unchanged
For all channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1[1]</td></tr>
<tr><td>As long as the F-I/O is deactivated in the F-I/O DB with DISABLE = 1</td><td colspan="2">QBAD, PASS_OUT and DISABLED = 1
For all channels:
Channel value = fail-safe value (0)
Value status = 0[1]</td><td>-</td></tr>
</table>

1 Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile

2 During delayed transfer of the F-Base ID, the F-system remains in startup.

6.4.2.7 ACK_REQ

When the F-system detects a communication error or an F-I/O fault or channel fault for an F-I/O, the relevant F-I/O or individual channels of the F-I/O are passivated. ACK_REQ = 1 signals that **user acknowledgment** is required for reintegration of the relevant F-I/O or channels of the F-I/O.

The F-system sets ACK_REQ = 1 as soon as the fault has been eliminated and user acknowledgment is possible. For channel-granular passivation, the F-system sets ACK_REQ = 1 as soon as the channel fault is corrected. User acknowledgment is possible for this fault. Once acknowledgment has occurred, the F-system resets ACK_REQ to 0.

NOTE

For F-I/O with outputs, acknowledgment after F-I/O or channel faults may only be possible some minutes after the fault has been eliminated, until the necessary test signal is applied (see *F-I/O manuals*).

6.4.2.8 IPAR_OK

The IPAR_OK tag corresponds to the iPar_OK_S tag in the PROFIsafe bus profile, PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out how to evaluate this tag when parameters of fail-safe GSD based DP slaves or GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

For HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART see Chapter IPAR_EN (Page 160).

6.4.2.9 DIAG

The DIAG tag provides non-fail-safe information (1 byte) about errors or faults that have occurred for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you perform an acknowledgment with the ACK_REI tag or until automatic reintegration takes place.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Timeout detected by F-I/O	The PROFIBUS/PROFINET connection between F-CPU and F-I/O is faulty. The value of the F-monitoring time for the F-I/O is set too low. The F-I/O are receiving invalid parameter assignment data or	• Check the PROFIBUS/PROFINET connection and ensure that there are no external sources of interference. • Check the parameter assignment of the F-I/O. If necessary, set a higher value for the monitoring time. Recompile the hardware configuration, and download it to the F-CPU. Recompile the safety program. • Check the diagnostics buffer of the F-I/O. • Turn the power of the F-I/O off and back on.
		Internal F-I/O fault or	Replace F-I/O
		Internal F-CPU fault	Replace F-CPU
Bit 1	F-I/O fault or channel fault detected by F-I/O[1]	See *F-I/O manuals*	See *F-I/O manuals*

Bit 7	Addressing error[3]	—	Contact Service & Support

1 Not for F-I/O that support the "RIOforFA-Safety" profile.

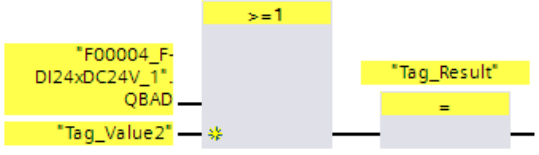
2 For S7-300/400 F-CPUs only

3 For S7-1200/1500 F-CPUs only

6.4.2.10 BASEID_ACTIVE

The BASEID_ACTIVE tag contains the active F-BaseID as non-fail-safe information. The tag is available as of Safety System Version V2.8 and is only relevant if both the F-CPU and the F-I/O support PROFIsafe address type 3.

6.4.3 Accessing tags of the F-I/O DB



Rule for accessing tags of the F-I/O DB

Tags of the F-I/O DB of an F-I/O can only be accessed from the F-runtime group from which the channels of this F-I/O are accessed (if access is made).

"Fully qualified DB access"

You can access the tags of the F-I/O DB via a "fully qualified DB access" (that is, by specifying the name of the F-I/O DB and by specifying the name of the tag).

Example of evaluating the QBAD tag

See also

F-I/O DB (Page 157)

6.5 Passivation and reintegration of F-I/O

Overview

In the following you can find information on passivation and reintegration of F-I/O.

Signal sequence charts

The signal sequences presented below represent typical signal sequences for the indicated behavior.

Actual signal sequences and, in particular, the relative position of the status change of individual signals can deviate from the given signal sequences within the scope of known "fuzzy" cyclic program execution factors, depending on the following:

- The F-I/O used
- The F-CPU used
- The cycle time of the (F-)OB in which the associated F-runtime group is called
- The target rotation time of the PROFIBUS DP or the update time of the PROFINET IO

NOTE

The signal sequences shown refer to the status of signals in the user's safety program.

6.5.1 After startup of F-system

Behavior after a startup

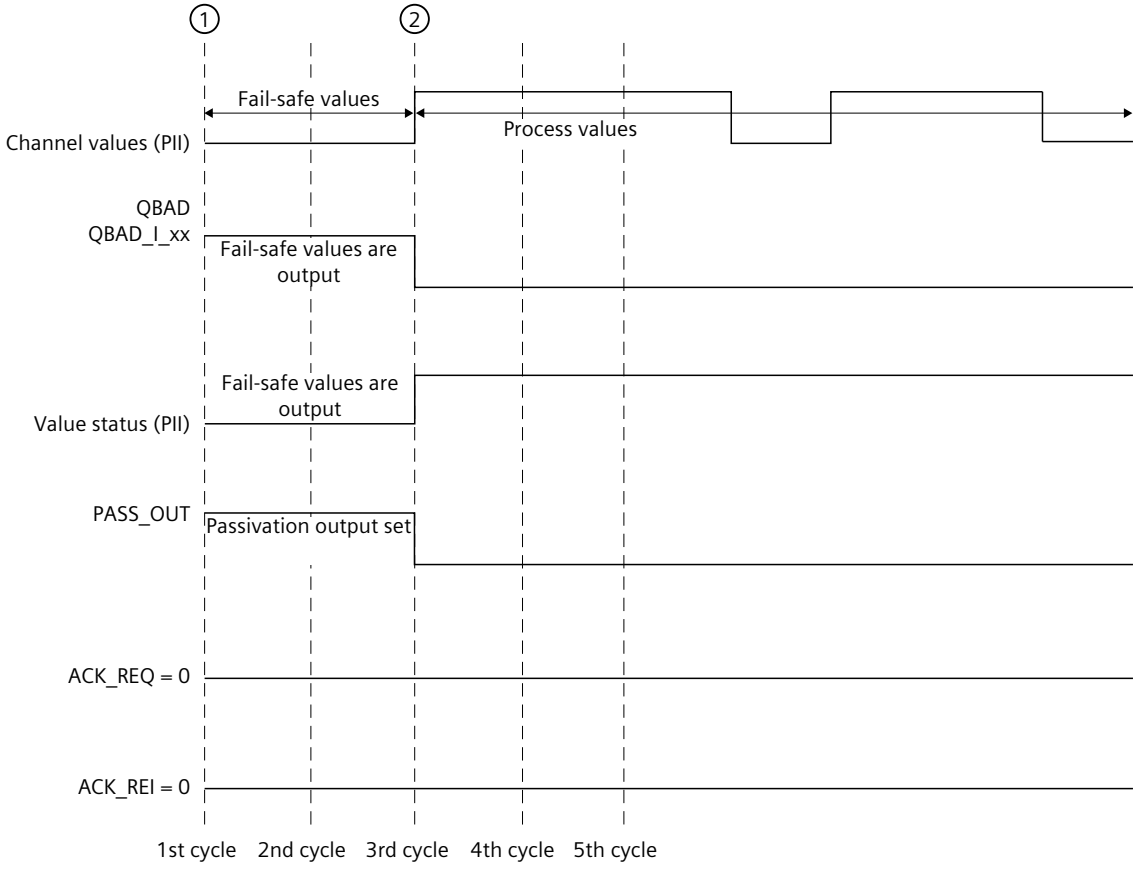
Fail-safe value output after startup of the F-system	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
Passivation of the entire F-I/O occurs during startup.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the F-I/O, i.e. the provision of process values in the PII or the output of process values provided in the PIQ at the fail-safe outputs, takes place **automatically**, regardless of the setting at the ACK_NEC tag or the configuration "Channel failure acknowledge", no sooner than the second cycle of the F-runtime group after F-system startup.

You can find more information on pending F-communication, F-I/O or channel errors during startup of the F-system in the sections After communication errors (Page 169) and After F-I/O or channel faults (Page 171).



For fail-safe GSD based DP slaves/GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Depending on the F-I/O you are using and the cycle time of the F-runtime group and PROFIBUS DP/PROFINET IO, several cycles of the F-runtime group can elapse before reintegration occurs.

If communication between the F-CPU and F-I/O takes longer to establish than the F-monitoring time set in the properties for the F-I/O, automatic reintegration does not take place.

Signal sequence for passivation and reintegration of F-I/O after F-system startup

Example for an F-I/O with inputs:

① Startup of F-system/passivation
② Automatic reintegration (e.g. third cycle)

⚠ WARNING

Unintentional restart

In contrast to the standard user program, when the safety program starts up, all tags of the F-DBs are generally initialized with their start values. This means that saved error information is lost. The F-system performs automatic reintegration of the F-I/O.

If an unintentional startup of your process is not allowed, you must program restart/startup protection in the safety program. For this, the output of process values must be blocked until user acknowledgment takes place (see "Implementation of user acknowledgment (Page 184)"). This user acknowledgment must not take place until safe output of process values is possible (see "Programming startup protection (Page 150)").

You must expect an unintentional restart in the following cases:

- After a STOP generated by PG/PC operation, mode switch, communication function or "STP" instruction
- After an operating error
- After a STOP caused by a fault reaction function
- The following applies to the S7-1500 F Virtual Controller:
  After a STOP or a restart of the S7-1500 F Virtual Controller via Industrial Edge Management.

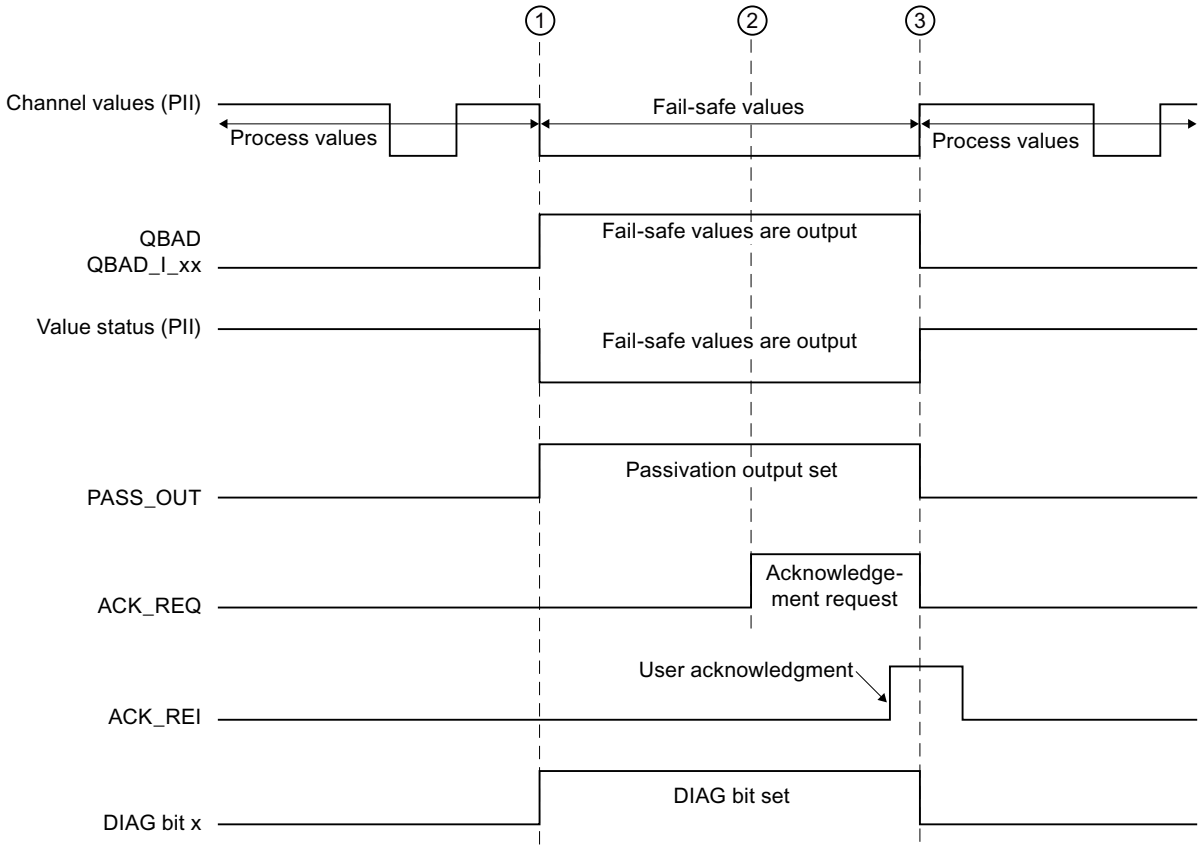
(S008)

6.5.2 After communication errors

Behavior after communication errors

Fail-safe value output after communication errors	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If a communication error between the F-CPU and the F-I/O is detected, all channels of the entire F-I/O are passivated.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.



Reintegration of F-I/O

Reintegration of the relevant F-I/O, that is, provision of process values in the PII or output of process data provided in the PIQ at the fail-safe outputs, takes place only when the following occurs:

- All communication errors have been eliminated and the F-system has set tag ACK_REQ = 1
- A **user acknowledgment** with a positive edge has occurred:
  - At the ACK_REI tag of the F-I/O DB (Page 160) or
  - At the ACK_REI_GLOB input of the "ACK_GL" instruction (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V21) (Page 520))

Signal sequence for passivation and reintegration of F-I/O after communication errors

Example for an F-I/O with inputs:

① Communication error/passivation
② All communication errors have been eliminated
③ Reintegration

Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 184)

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 189)

6.5.3 After F-I/O or channel faults

Behavior after F-I/O faults

Fail-safe value output after F-I/O faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If an F-I/O fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Behavior after channel fault

Fail-safe value output after channel faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
When passivation for **complete** F-I/O is configured: If a channel fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
With configuration of **channel-granular** passivation: If a channel fault is detected by the F-system, passivation of all the affected channels of the entire F-I/O occurs.	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the relevant F-I/O or the relevant channels of the F-I/O, that is, provision of process data in the PII or output of process data provided in the PIQ at the failsafe outputs, takes place only when the following occurs:

- All F-I/O or channel faults have been eliminated.

If you have configured channel-granular passivation for the F-I/O, the relevant channels are reintegrated once the fault is corrected; any faulty channels remain passivated.

Reintegration is performed depending on your setting for the ACK_NEC tag or the "Channel failure acknowledge" parameter (configuration of the S7-1500/ET 200MP F-module and S7-1200 F-module)

- With ACK_NEC = 0 or the configuration "Channel failure acknowledge = automatic", **automatic reintegration** is performed as soon as the F-system detects that the fault has been corrected. For F-I/O with inputs, reintegration takes place right away. For F-I/O with outputs or F-I/O with inputs and outputs, depending on the F-I/O you are using, reintegration can take several minutes, first after the necessary test signals have been applied, which are used by the F-I/O to determine that the fault has been eliminated.
- With ACK_NEC = 1 or the configuration "Channel failure acknowledge = manual", reintegration is performed only as a result of user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB or at the ACK_REI_GLOB input of the "ACK_GL" instruction. Acknowledgment can be made as soon as the F-system detects that the fault has been eliminated and tag ACK_REQ = 1 has been set.

  For fail-safe GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based I/O device .

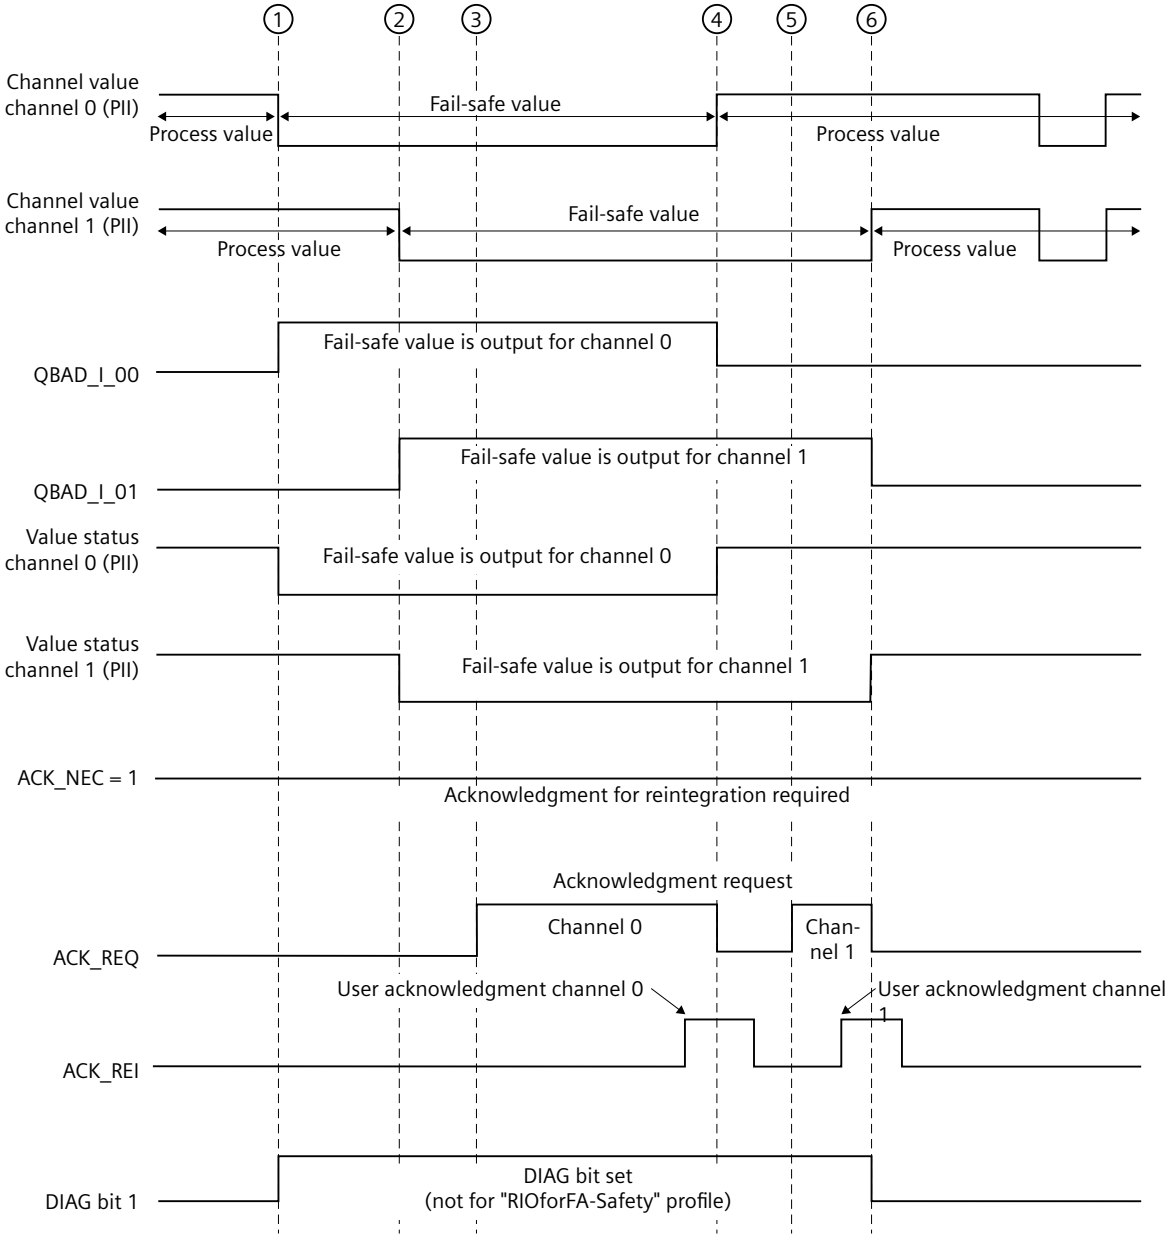
⚠ WARNING

Following a supply voltage failure of the F-I/O lasting less than the F-monitoring time assigned for the F-I/O, automatic reintegration can occur regardless of the setting for the ACK_NEC tag or the "Channel failure acknowledge" configuration.
If automatic reintegration is not permitted for the relevant process in this case, you must program startup protection by evaluating tags QBAD or QBAD_I_xx and QBAD_O_xx or value status or PASS_OUT.
In the event of a supply voltage failure of the F-I/O lasting longer than the specified F-monitoring time for the F-I/O, the F-system detects a communication error. *(S012)*

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic" (for passivation of entire F-I/O after channel faults)

Example for an F-I/O with inputs:

① F-I/O or channel faults
Passivation



② F-I/O or channel faults corrected
Automatic reintegration

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for passivation of entire F-I/O after channel faults)

For the signal sequence for passivation and reintegration of F-I/O after F-I/O or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (initial value), see After communication errors (Page 169).

Signal sequence for passivation and reintegration of F-I/O after channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for channel-granular passivation)

Example for an F-I/O with inputs:

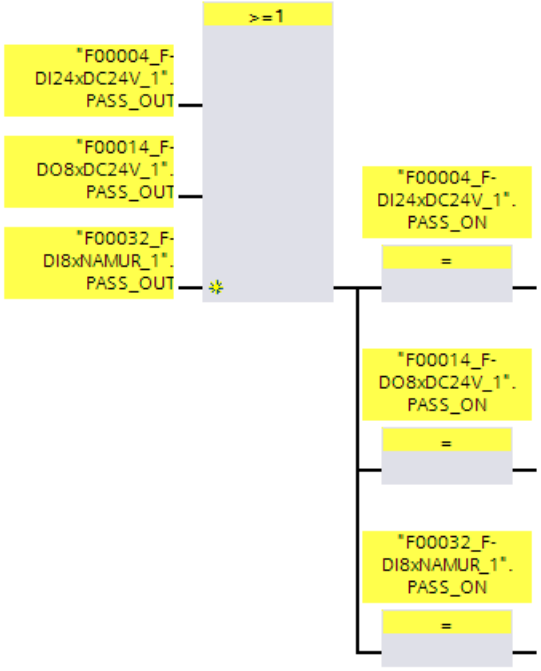
① Channel fault for channel 0/passivation of channel 0
② Channel fault for channel 1/passivation of channel 1
③ Channel fault eliminated for channel 0
④ Reintegration of channel 0
⑤ Channel fault eliminated for channel 1
⑥ Reintegration of channel 1

6.5.4 Group passivation

Programming a group passivation

If you want to enable passivation of additional F-I/O when an F-I/O or a channel of an F-I/O is passivated by the F-system, you can use the PASS_OUT/PASS_ON tags to perform **group passivation** of the associated F-I/O.

Group passivation by means of PASS_OUT/PASS_ON can, for example, be used to force simultaneous reintegration of all F-I/O after startup of the F-system.



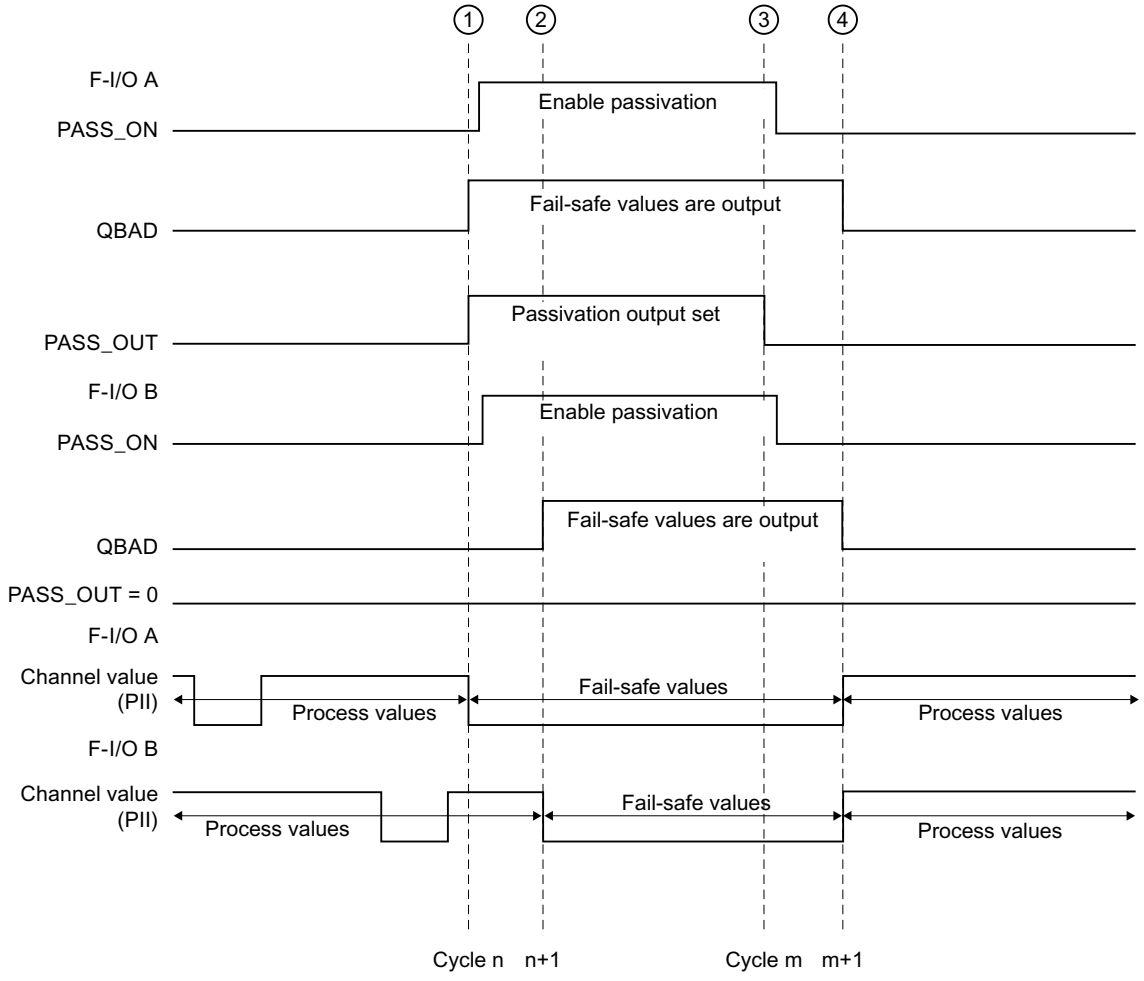
For group passivation, you must OR all PASS_OUT tags of the F-I/O in the group and assign the result to all PASS_ON tags of the F-I/O in the group.

During use of fail-safe values (0) due to group passivation by means of PASS_ON = 1, the QBAD tag of the F-I/O of this group = 1.

NOTE

Note the different behavior of PASS_OUT for F-I/O with/without "RIOforFA-Safety" profile (see table in section QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status (Page 162)).

Example of group passivation



Reintegration of F-I/O

Reintegration of F-I/O passivated by group passivation occurs **automatically**, if a reintegration (**automatic** or **through user acknowledgment**) occurs for the F-I/O that triggered the group passivation (PASS_OUT = 0).

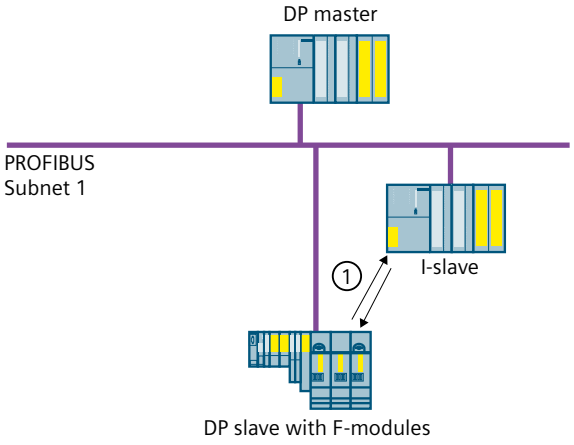
Signal sequence for group passivation following communication error

Example for two F-I/O with inputs:

① Communication error in F-I/O A
Passivation of F-I/O A

② Passivation of F-I/O B

③ Communication error in F-I/O A corrected and acknowledged



④ Reintegration F-I/O A and B

6.6 F-I/O access via I-slave-slave communication (S7-300, S7-400)

6.6.1 Overview

Principle of F-I/O access via I-slave-slave communication

The following figure shows the principle of F-I/O access via I-slave-slave communication.

① F-I/O access via I-slave-slave communication

F-I/O access via I-slave-slave communication

F-I/O access via I-slave-slave communication is possible with F-I/O in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware > V4.0.0.

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O of a DP slave takes place using direct data exchange, as in the standard program. The process image is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave.

6.6.2 Configuring Safety-Related I-Slave-Slave Communication

Introduction

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O in a DP slave takes place using direct data exchange (**F**-DX-Mod), same as in standard programs.

You do not need any additional hardware for I-slave-slave communication.

I-slave-slave communication is also possible:

- when the assigned DP master is a standard CPU, if the standard CPU supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

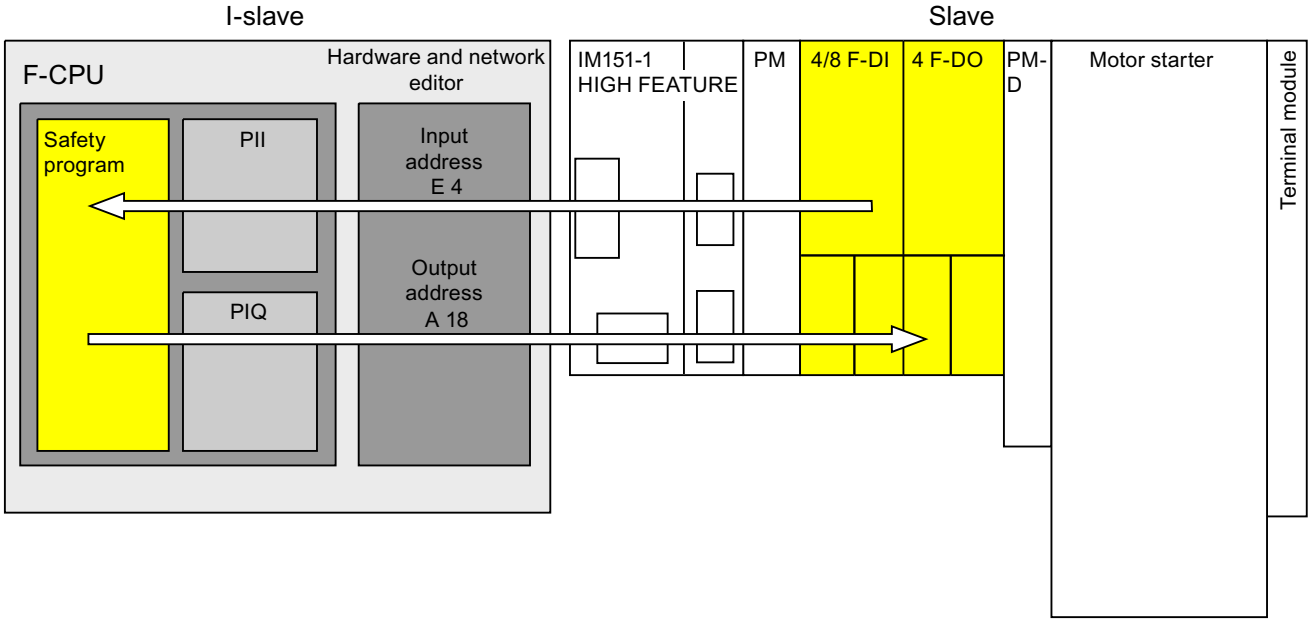
An F-I/O DB is automatically generated for each F-I/O when it is configured in the *hardware and network editor*; this is required for the F-I/O access via safety-related I-slave-slave communication. The F-I/O DB is initially created in the safety program of the DP master, provided it is an F-CPU with F-activation. Only with the setup of the F-DX-Mod connection is the F-I/O DB created in the safety program of the I-slave and deleted in the safety program of the DP master.

The process image input is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave (see description in Safety-related I-slave-slave communication - F-I/O access via process image (Page 183)).

Restrictions

NOTE

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware > V4.0.0.



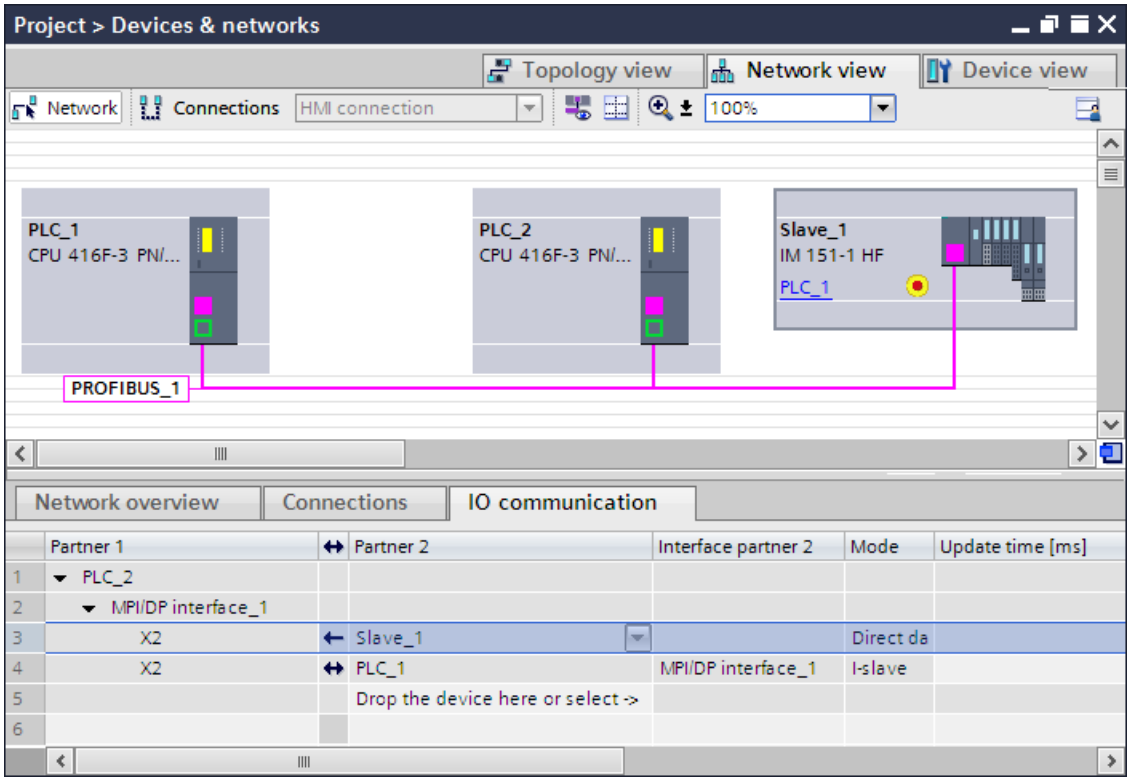
NOTE

With safety-related I-slave-slave communication, make sure that the CPU of the DP master is powered up before the F-CPU of the I-slave.
Otherwise, depending on the F-monitoring time specified for the F-I/O, the F-system can detect an error in safety-related communication (communication error) between the F-CPU and the F-I/O assigned to the I-slave. This means that the F-I/O are not reintegrated automatically after F-system startup. They are instead only reintegrated after a user acknowledgment with a positive edge in the ACK_REI tag of the F-I/O DB (see also After communication errors (Page 169) and After startup of F-system (Page 166)).

Configuring transfer areas

For every safety-related communication connection between an I-slave and slave, you must configure transfer areas in the *hardware and network editor*.

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX-Mod_PLC_2-PLC_1_1" for the first F-DX-Mod connection between F-CPU 1 and F-CPU 2.

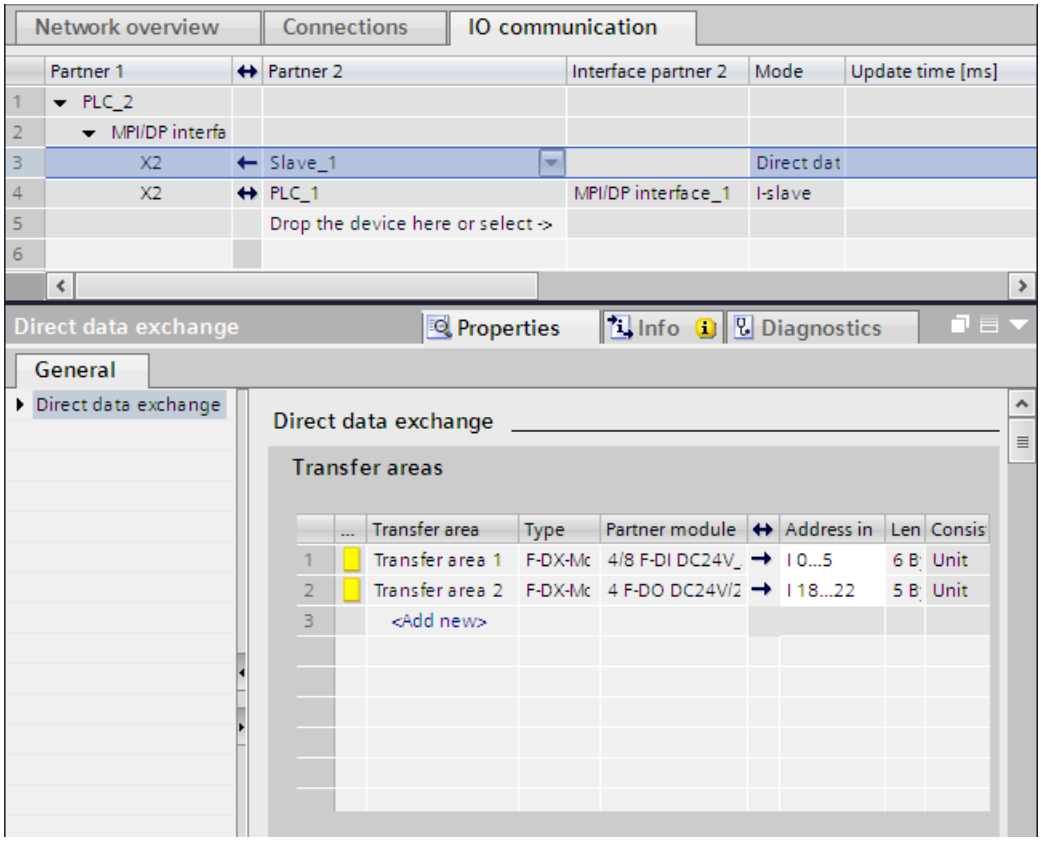


Configuration procedure using the example of an ET 200S with F-modules in the slave

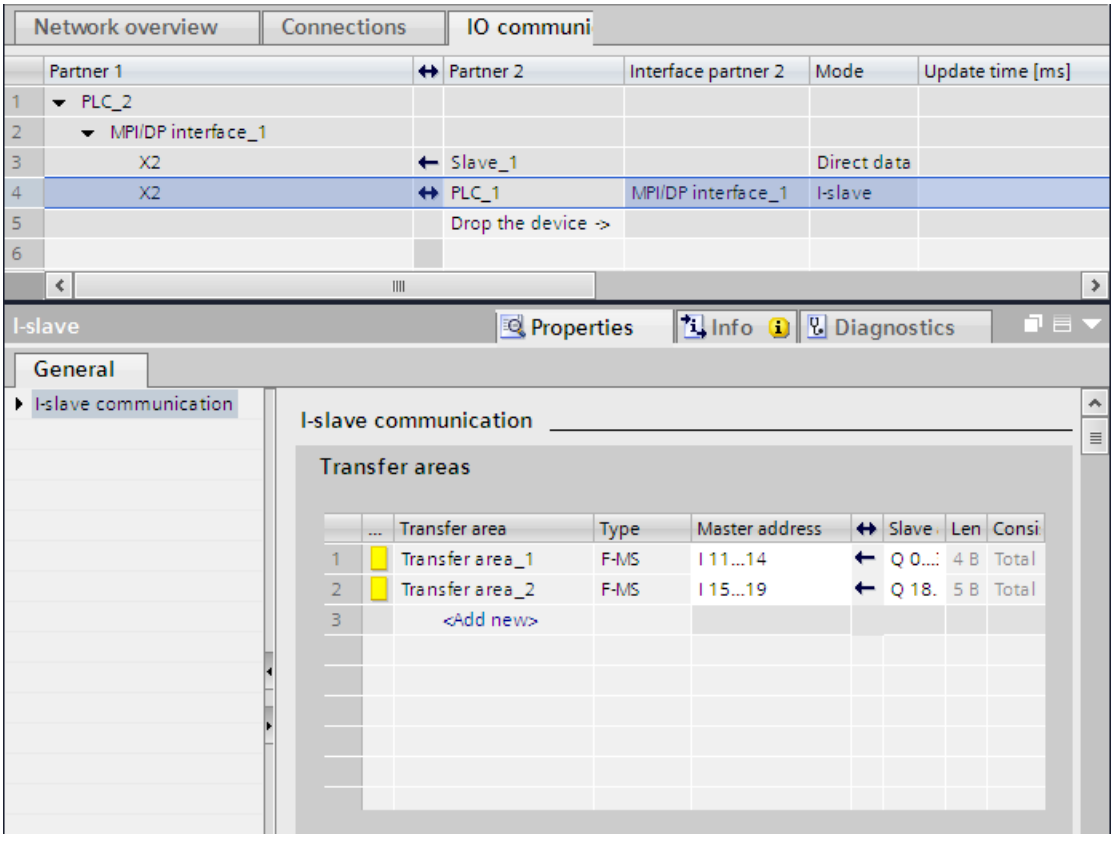
The procedure for configuring safety-related I-slave-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Insert a suitable DP slave, e.g. IM 151-1 HF, article no. 6ES7151-1BA0... from the "Hardware catalog" task card into the network view of the *hardware and network editor*.
3. Insert a power module, a 4/8 F-DI module and a 4 F-DQ module in the device view of the ET 200S.
4. Activate "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this to F-CPU 1.
5. Assign the DP interface of the IM 151-1 HF to the DP master (F-CPU 1).
6. Select the DP interface of F-CPU 2 (I-slave) in the network view.
7. Select the "I/O communication" tab.



8. Use a drag-and-drop operation in the network view to move the ET 200S to the "Partner 2" column in the "I/O-communication" tab.



9. Click in the newly created line (←).
10. In "Transfer areas", create an F-DX-Mod connection (type "F-DX-Mod"). The F-DX-Mod connection is marked in yellow in the table. The addresses for the "partner module" 4/8 F-DI in the I-Slave (PLC_2) are displayed. You can change the addresses directly in the table, if required.

    This completes the configuration for the 4/8 F-DI module.
11. In "Transfer areas", create another F-DX-Mod connection.

12. Change the partner module to the 4 F-DO module, either directly in the "Transfer areas" table or in the details of transfer area 2, if the 4 F-DO module was not already selected.
    This completes the configuration for the 4 F-DO module.

In the "I-slave communication table" of the I-slave, a transfer area (type F-MS) for the master CPU is automatically created for each F-DX-Mod connection:

Change in configuration of I-slave-slave communication

WARNING

If you have added or deleted I-slave-slave communication for an F-I/O, you must compile and download the hardware configuration of the DP master as well as the hardware configuration of the I-slave.
The Collective F-Signature in the F-CPU of the I-slave and the Collective F-Signature in the F-CPU of the DP master (if a safety program exists there, too) are set to "0". You must then recompile the safety program(s). *(S019)*

6.6.3 Safety-related I-slave-slave communication - F-I/O access via process image

For F-I/O access via I-slave-slave communication, you use the process image (PII or PIQ) to access the F-I/O in the Safety program of the F-CPU of the I-slave. This is the same as F-I/O access to F-I/O that are directly assigned to an I-slave or DP master. In the I-slave you access the F-I/O with the addresses that were assigned for the F-DX-Mod connection in "Transfer areas" ("Direct data exchange" table).

In this case, ignore the displayed operand area. Access F-I/O with inputs using the PII and F-I/O with outputs using PIQ.

Information on I/O access can be found in F-I/O access (Page 151).

6.6.4 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

An example of the amount of output data and input data that are assigned for safety-related communication is shown in the table below for an ET 200S 4/8 F-DI and an ET 200S 4 F-DO:

Safety-related communication	Communication connection	Assigned input and output data*	
		Between I-slave and DP master	
		Output Data in the I-slave	Input data in the I-slave
I-slave-slave	I-slave-slave communication with 4/8 F-DI	4 bytes	6 bytes
	I-slave-slave communication with 4 F-DO	5 bytes	5 bytes

* Example for 4/8 F-DI and 4 F-DO of ET 200S

Consider all additional configured safety-related and standard communication connections (F-MS, F-DX, F-DX-Mod., MS and DX connections) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master. If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

Implementation of user acknowledgment 7

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller

Options for user acknowledgment

Depending on the result of the risk analysis, you have the following options for implementing a user acknowledgment:

- With an acknowledgment key that you connect to an F-I/O with inputs.
- With an operator control and monitoring system.
- With an acknowledgment key that you connect to a standard I/O with inputs.
- By other mechanisms for reading in the user acknowledgment.

User acknowledgment by means of acknowledgment key

NOTE

When you implement user acknowledgment by means of acknowledgment key, and a communication error, an F-I/O fault, or a channel fault occurs in the F-I/O to which the acknowledgment key is connected, then it will not be possible to acknowledge the reintegration of this F-I/O.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU. In a redundant S7-1500HF system, you must set both HF CPUs or the redundant S7-1500HF system to STOP before you restart the HF CPUs.

Consequently, it is recommended that you also provide for an acknowledgment by means of an operator control and monitoring system, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected.

A user acknowledgment may be issued using an acknowledgment key connected to a standard I/O with inputs or other mechanisms for reading the user acknowledgment if the risk analysis allows this.

User acknowledgment by means of an operator control and monitoring system

For implementation of a user acknowledgment by means of an operator control and monitoring system, the ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V21) (Page 591) instruction is required.

Procedure for programming user acknowledgment by means of an operator control and monitoring system (S7-300, S7-400)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. On your operator control and monitoring system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and an "acknowledgment value" of "9" (2nd step in acknowledgment).

   or

   Assign function key 1 to transfer an "acknowledgment value" of "6" (1st step in acknowledgment) once, and function key 2 to transfer an "acknowledgment value" of "9" (2nd step in acknowledgment) once. You must assign the InOut IN (in the data area of the ACK_OP instruction) to the field or the function keys.
3. Optional: In your operator control and monitoring system, evaluate output Q in the instance DB of ACK_OP to show the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

If you want to perform a user acknowledgment exclusively from a programming device or PC using the watch table (monitor/modify tag) without having to disable safety mode, then you must transfer an operand (memory word or DBW of a DB of the standard user program) at InOut IN when calling ACK_OP. You can then transfer "acknowledgment values" "6" and "9" on the programming device or PC by modifying the memory word or DBW of a DB once. The memory word or DBW of a DB must not be written by the program.

NOTE

If you connect the InOut IN to a memory word or DBW of a DB, you must use a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction at the InOut IN.

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example, by programming them including the time conditions and using one function key to trigger them.
The two separate acknowledgment steps also prevent erroneous triggering of an acknowledgment, for example, by your non-fail-safe operator control and monitoring system. *(S013)*

⚠ WARNING

If you have operator control and monitoring systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- Store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your operator control and monitoring system, set up a text box from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  In your operator control and monitoring system, set up a text box to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

NOTE
The configuration of your operator control and monitoring system does not have any effect on the Collective F-Signature.

Procedure for programming user acknowledgment by means of an operator control and monitoring system (S7-1200, S7-1500)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. Assign the ACK_ID input an identifier between 9 and 30000 for the acknowledgment.
3. Assign the InOut IN a memory word or DBW of a DB of the standard user program.

   NOTE
   You must supply the InOut IN with a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction.

4. On your operator control and monitoring system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and the "Identifier" configured at the ACK_ID input (2nd step in acknowledgment).

   or

   Allocate a function key 1 for a one-time transfer of the "acknowledgment value" of "6" (1st step in acknowledgment) and a function key 2 for a one-time transfer of the "Identifier" set at the ACK_ID input (2nd step in acknowledgment).
   You must assign the memory word or the DBW of the DB of the standard user program assigned to the InOut IN to the field or the function keys.

5. Optional: In your operator control and monitoring system, evaluate output Q in the instance DB of ACK_OP to show the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

⚠ WARNING

The two acknowledgment steps must not be triggered by one single operation, for example, by programming them including the time conditions and using one function key to trigger them.
The two separate acknowledgment steps also prevent erroneous triggering of an acknowledgment, for example, by your non-fail-safe operator control and monitoring system. *(S013)*

⚠ WARNING

If you have operator control and monitoring systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.
Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access to the ACK_ID tag in the associated instance DB is not permitted!

Alternative 2:

- Store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your operator control and monitoring system, set up a text box from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  In your operator control and monitoring system, set up a text box to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

NOTE

The supply of the IN iInOut of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the Collective F-Signature, the Collective F-SW-Signature or the signature of the block that calls the ACK_OP instruction. Changes to the supply of the IN InOut or to the configuration of your operator control and monitoring system therefore do not result in a changed Collective F-Signature/Collective F-SW-Signature/signature of the calling block.

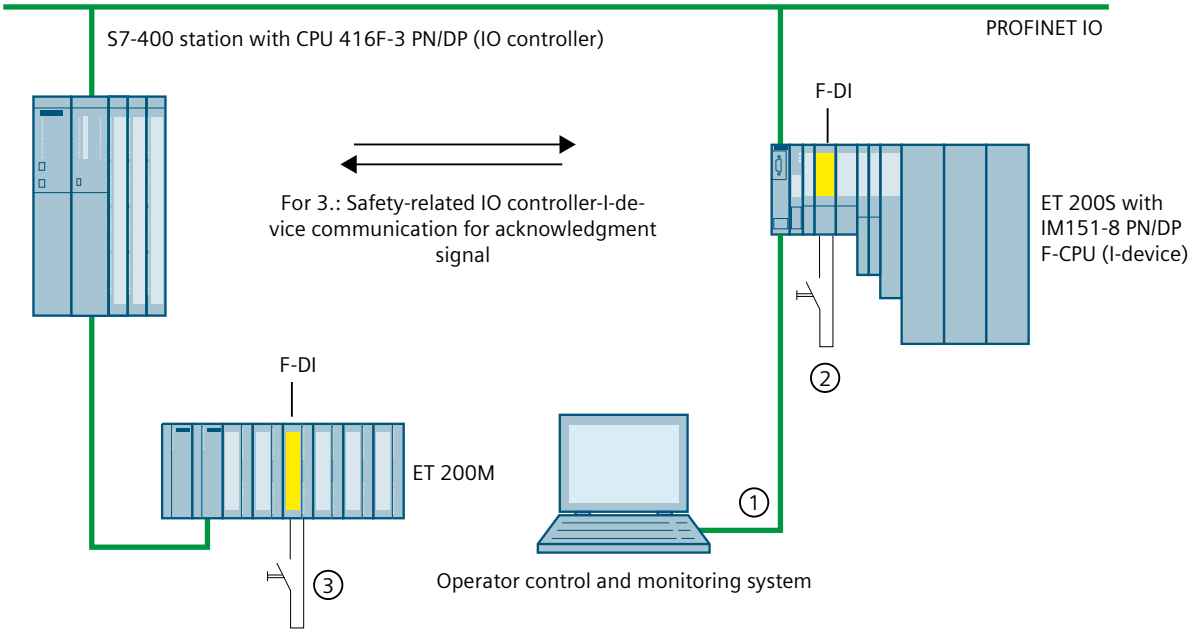
Example of procedure for programming a user acknowledgment for reintegrating an F-I/O

1. Optional: set the ACK_NEC tag in the respective F-I/O DB (Page 159) to "0" if automatic reintegration (without user acknowledgment) is to take place after an F-I/O fault or a channel fault.

   ⚠ WARNING

   The parameter assignment of the ACK_NEC tag of the F-I/O DB with the value "0" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

2. Optional: Evaluate the QBAD or QBAD_I_xx/QBAD_O_xx (S7-300, S7-400) tags or value status (S7-1200, S7-1500) or DIAG in the respective F-I/O DB to trigger an indicator light in the event of an error, and/or generate error messages on the operator control and monitoring system in your standard user program by evaluating the above tags or the value status. These messages can be evaluated before performing the acknowledgment operation. Alternatively, you can evaluate the diagnostic buffer of the F-CPU.
3. Optional: Evaluate the ACK_REQ tag in the respective F-I/O DB, for example, in the standard user program or on the operator control and monitoring system, to query or to indicate whether user acknowledgment is required.
4. Assign the input of the acknowledgment key or the OUT output of the ACK_OP instruction to the ACK_REI tag in the respective F-I/O DB or the ACK_REI_GLOB input of the ACK_GL instruction (see above).



7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device

Options for user acknowledgment

You can implement a user acknowledgment by means of:

1. An HMI system that you can use to access the F-CPU of the I-slave/I-Device
2. An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the I-slave/I-Device
3. An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the DP master/IO controller

These three options are illustrated in the figure below.

1. User acknowledgment by means of an HMI system with which you can access the F-CPU of the I-slave/I-device

The ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V21) (Page 591) instruction is required to implement user acknowledgment with an HMI system that you can use to access the F-CPU of the I-slave/I-device.

Programming procedure

Follow the procedure described in "Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 184)" under "Programming procedure ...".

From your HMI system, you can then directly access the instance DB of ACK_OP in the I-slave/I-Device.

2. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the I-slave/I-device

NOTE

In the event of a communication error, F-I/O fault, or channel fault in the F-I/O to which the acknowledgment key is connected, an acknowledgment for reintegration of this F-I/O is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-device, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected (see 1).

3. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the DP master/IO controller

If you want to use the acknowledgment key that is assigned to the F-CPU at the DP master/IO controller to perform user acknowledgment in the safety program of the F-CPU of an I-slave/I-device as well, you must transmit the acknowledgment signal from the safety program in the F-CPU of the DP master/IO controller to the safety program in the F-CPU of the I-slave/I-device using safety-related master-I-slave/IO controller-I-device communication.

Programming procedure

1. Place the SENDDP (Page 599) instruction in the safety program in the F-CPU of the DP master/IO controller.
2. Place the RCVDP (Page 599) instruction in the safety program in the F-CPU of the I-slave/I-Device.
3. Supply an input SD_BO_xx of SENDDP with the input of the acknowledgment key.
4. The acknowledgment signal for evaluating user acknowledgments is now available at the corresponding RD_BO_xx output of RCVDP.

   The acknowledgment signal can now be read in the program sections in which further processing is to take place with fully qualified access directly in the associated instance DB (for example, "RCVDP_DB".RD_BO_02).

5. Supply the corresponding input SUBBO_xx of RCVDP with FALSE (fail-safe value 0) to ensure that user acknowledgment is not accidentally triggered before communication is established for the first time after startup of the sending and receiving F-systems, or in the event of a safety-related communication error.

NOTE

If a communication error, an F-I/O error, or a channel fault occurs at the F-I/O to which the acknowledgment key is connected, then an acknowledgment for reintegration of this F-I/O will no longer be possible.
This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the DP master/IO controller.
Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the DP master/IO controller, in order to acknowledge reintegration of the F-I/O to which an acknowledgment key is connected.
If a safety-related master-I-slave/IO controller-I-Device communication error occurs, the acknowledgment signal cannot be transmitted, and an acknowledgment for reintegration of safety-related communication is no longer possible.
This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.
Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of the safety-related communication for transmission of the acknowledgment signal (see 1).

Data exchange between standard user program and safety program

8

You have the option of transferring data between the safety program and the standard user program. Tags can be transferred using DBs, F-DBs and bit memory:

	From the standard user program		From the safety program	
	Read access	**Write access**	**Read access**	**Write access**
Tag from DB	Permitted	Permitted	A tag from the DB can be read-accessed *or* write-accessed	
Tag from F-DB	Permitted	**Not permitted**	Permitted	Permitted
Bit memory	Permitted	Permitted	Bit memory can be read-accessed *or* write-accessed	

You can also access the process image of the standard I/O and F-I/O:

		From the standard user program		From the safety program	
		Read access	**Write access**	**Read access**	**Write access**
Process image of standard I/O	PII	Permitted	Permitted	Permitted	**Not permitted**
	PIQ	Permitted	Permitted	**Not permitted**	Permitted
Process image of F-I/O	PII	Permitted	**Not permitted**	Permitted	**Not permitted**
	PIQ	Permitted	**Not permitted**	**Not permitted**	Permitted

Note possible restrictions/particularities when using Software Units or a Safety Unit (Page 113).

Decoupling of the safety program from the standard user program

For data exchange between standard user program and safety program, we recommend that you define special data blocks (transfer data blocks) in which the data to be exchanged is stored. This action allows you to decouple the blocks of the standard user program and the safety program. The changes in the standard user program do not affect the safety program (and vice versa) provided these data blocks are not modified.

8.1 Data Transfer from the Safety Program to the Standard User Program

Reading data of the safety program in the standard user program

The standard user program can read all data of the safety program, for example using symbolic (fully qualified) accesses to the following:

- The instance DBs of the F-FBs ("Name of instance DB".Signal_x)
- F-DBs (for example "Name of F_DB".Signal_1)

- The process image input and output of F-I/O (for example "Emergency_Stop_Button_1" (I 5.0))

NOTE

For S7-300/400 F-CPUs

The process image input of F-I/O is updated not only at the start of the F-runtime group, but also by the standard operating system.

To find the standard operating system update times, refer to the *Help on STEP 7* under "Process image input and output". For F-CPUs that support process image partitions, also bear in mind the update times when process image partitions are used. For this reason, when the process image input of F-I/O is accessed in the standard user program, it is possible to obtain different values than in the safety program. The differing values can occur due to:

– Different update times
– Use of fail-safe values in the safety program

To obtain the same values in the standard user program as in the safety program, you must not access the process image input in the standard program until after execution of an F-runtime group. In this case, you can also evaluate the QBAD or QBAD_I_xx tag in the associated F-I/O DB in the standard user program, in order to find out whether the process image input is receiving fail-safe values (0) or process data. When using process image partitions, also make sure that the process image is not updated by the standard operating system or by the UPDAT_PI instruction between execution of an F-runtime group and evaluation of the process image input in the standard user program.

NOTE

For S7-1200/1500 F-CPUs

The process image input of F-I/O is updated prior to processing the main safety block.

During the data transfer from the safety program to the standard user program, the integrity of the safety program and the safety-related data is not checked (see also section "Product Overview (Page 22)").

Writing data from the safety program to the standard user program

You can also write safety program data directly in the safety program to the standard user program (see also the table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 116)).

This is also true for non-fail-safe service information (e.g. outputs DIAG of the fail-safe instructions).

Note the table in section "Data exchange between standard user program and safety program (Page 192)".

When writing to a tag of the ARRAY data type, the index can either be a constant or a tag.

8.2 Data Transfer from Standard User Program to Safety Program

As a basic principle, only fail-safe data or fail-safe signals from F-I/O and other safety programs (in other F-CPUs) can be processed in the safety program, as standard tags are unsafe.

If you have to process tags from the standard user program in the safety program, however, you can evaluate either bit memory, tags from a standard DB, or the process image input (PII) of standard I/O in the safety program (see table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 116)).

Note the table in section "Data exchange between standard user program and safety program (Page 192)".

When reading a tag of the ARRAY data type, the index must be a constant. Tags are not permitted as index.

Note that structural changes to standard data blocks which are used in the safety program lead to inconsistencies of the safety program and can therefore only be executed if access permission for the safety-related project data is available. In this case the Collective F-Signature is the same as the original again after compilation. To prevent this effect, use "transfer data blocks" between the standard user program and the safety program.

⚠ WARNING

Because the values in these tags are not generated safely, you must program additional process-specific plausibility checks in the safety program to ensure that no dangerous states can arise. If bit memory, a tag of a standard DB, or an input of standard I/O is used in both F-runtime groups, you must perform the plausibility check separately in each F-runtime group. *(S015)*

To facilitate checks, all PLC tags from the standard user program that are evaluated in the safety program are printed out when creating the safety summary. (Page 382)

PLC tags from the standard user program that are evaluated in know-how-protected F-blocks are not included in the safety summary. The plausibility check must already be implemented by the creator of the know-how protected F-blocks.

Examples: Programming plausibility checks

- Use Comparison (Page 535) instructions to check whether tags from the standard user program exceed or fall below permitted high and low limits. You can then influence your safety function with the result of the comparison.
- Use the ---(S)---: Set output (STEP 7 Safety V21) (Page 457), ---(R)---: Reset output (STEP 7 Safety V21) (Page 455) or SR: Set/reset flip-flop (STEP 7 Safety V21) (Page 458) instructions, for example, with tags from the standard user program to allow a motor to be switched off, but not switched on.
- For switch-on sequences, use the AND logic operation instruction, for example, to logically combine tags from the standard user program with switch-on conditions that you derive from fail-safe tags.

If you want to process tags from the standard user program in the safety program, bear in mind that there is not a sufficiently simple method of checking plausibility for all tags.

Reading tags from the standard user program that can change during the runtime of an F-runtime group

If you want to read tags from the standard user program (bit memory, tags of a standard DB, or PII of standard I/O) in the safety program, and these tags can be changed - either by the standard user program or an operator control and monitoring system - during runtime of the F-runtime group in which they are read (for example because your standard user program is being processed by a higher-priority cyclic interrupt), you must use bit memory or tags of a standard DB for this purpose. We recommend using standard FCs for preprocessing (Page 85) for S7-1200/1500 F-CPUs.

(S7-300, S7-400) You must write the bit memory or tags of a standard DB with the tags from the standard user program immediately before calling the F-runtime group.

You are then permitted to access only this bit memory or these tags of a standard DB in the safety program.

Also note that **clock memory** that you defined when configuring your F-CPU in the "Properties" tab can change during runtime of the F-runtime group, since clock memory runs asynchronously to the F-CPU cycle.

NOTE

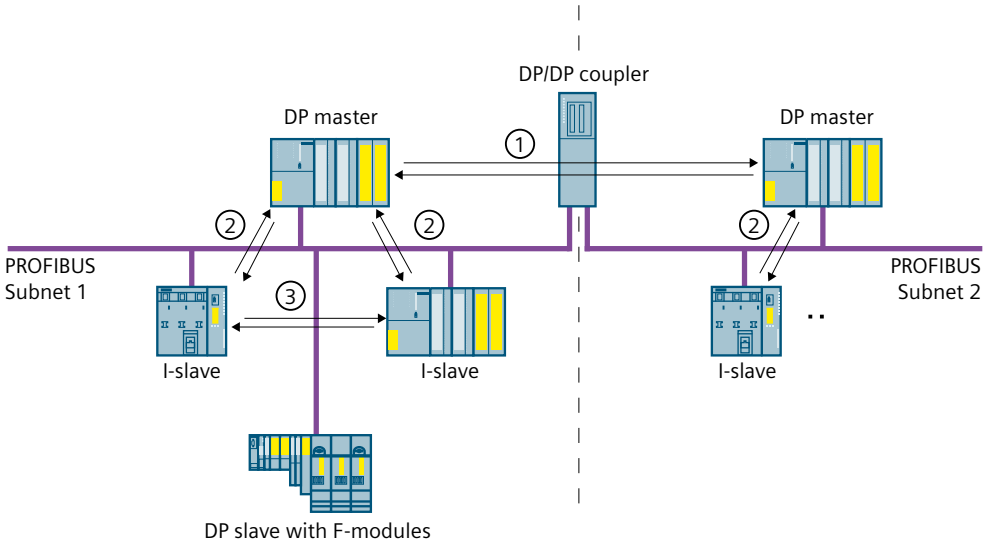
The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Safety-related communication 9

9.1 Communication via SENDDP/RCVDP or SENDS7/RCVS7(S7-300, S7-400) instructions:

9.1.1 Overview

Introduction

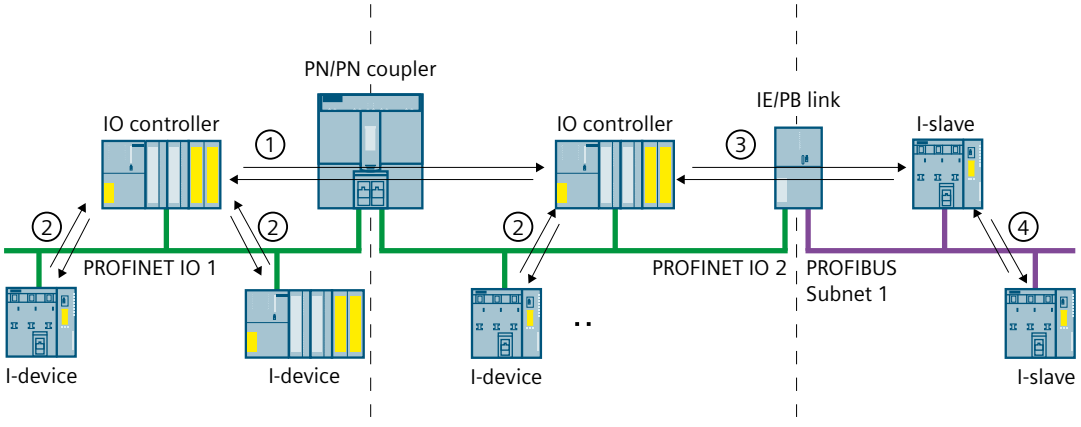


This section gives an overview of the options for safety-related communication options using the SENDDP/RCVDP or SENDS7/RCVS7 instructions in SIMATIC Safety F-systems.

Options for safety-related CPU-CPU communication

Safety-related CPU-CPU communication	On subnet	Additional hardware required	Required instructions
IO controller-IO controller communication	PROFINET IO	PN/PN coupler	SENDDP/RCVDP
Master-master communication	PROFIBUS DP	DP/DP coupler	SENDDP/RCVDP
IO controller-I-device communication	PROFINET IO	—	SENDDP/RCVDP
Master-I-slave communication	PROFIBUS DP	—	SENDDP/RCVDP
I-slave-I-slave communication	PROFIBUS DP	—	SENDDP/RCVDP
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link	SENDDP/RCVDP
Safety-related communication via S7 connections	Industrial Ethernet	—	SENDS7/RCVS7
IO controller-IO controller communication for S7 Distributed Safety	PROFINET IO	PN/PN coupler	SENDDP/RCVDP
Master-master communication for S7 Distributed Safety	PROFIBUS DP	DP/DP coupler	SENDDP/RCVDP
Safety-related communication to S7 Distributed Safety or S7 F Systems via S7 connections	Industrial Ethernet	—	SENDS7/RCVS7

Overview of safety-related communication via PROFIBUS DP



The figure below presents an overview of the three options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-300/400 F-CPUs.

① Safety-related master-master communication
② Safety-related master-I-slave communication
③ Safety-related I-slave-I-slave communication

Overview of safety-related communication via PROFINET IO

The figure below presents an overview of the four options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-300/400 F-CPUs. If an IE/PB-link is used, safety-related communication is possible between assigned I-slaves.

① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication
④ Safety-related I-slave-I-slave communication integrating an IO controller

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of fail-safe data of the data type INT or BOOL is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. Each transfer area consists of one input and one output address area.

Safety-related I-slave-slave communication via PROFIBUS DP

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware > V4.0.0.

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O of a DP slave takes place using direct data exchange, as in the standard program. The process image is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave.

Safety-related CPU-CPU communication via Industrial Ethernet

Safety-related CPU-CPU communication via Industrial Ethernet is possible using S7 connections, both from and to the following:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

In safety-related communication via S7 connections, a specified amount of fail-safe data of data type BOOL, INT, WORD, DINT, DWORD, or TIME is transferred fail-safe between the safety programs of the F-CPUs linked by the S7 connection.

The data transfer makes use of the SENDS7 instruction for sending and the RCVS7 instruction for receiving. Data are exchanged using one F-DB ("F-communication DB") each at the sender and receiver ends.

Safety-related CPU-CPU communication with *S7 Distributed Safety* or *S7 F-systems*

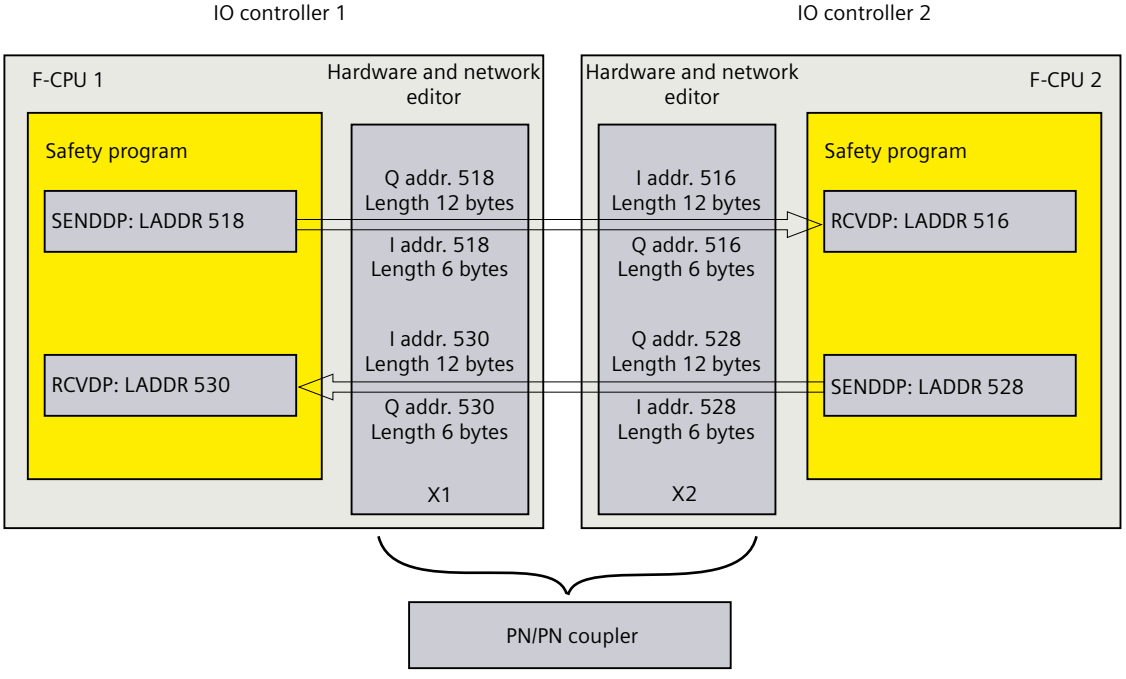
Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety* or *S7 F-systems*.

9.1.2 Safety-related IO controller-IO controller communication

9.1.2.1 Configure safety-related IO controller-IO controller communication

Introduction

Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.



For 416F-2 DP CPUs without an integrated PROFINET interface, use a CP 443-1 or CP 443-1 Advanced-IT.

NOTE

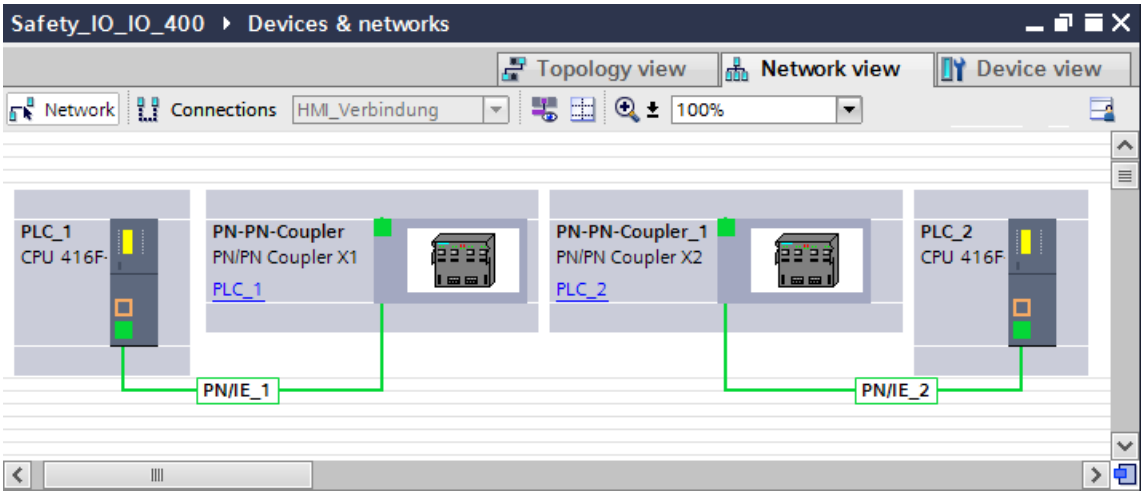
Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the PN/PN coupler for each of the two communication connections.

Rules for defining transfer areas

The transfer area for output data and the transfer area for input data for the **data to be sent** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.



The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.

5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

6. In the properties of the modules, assign the addresses outside the process image as follows:

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:

   – Input addresses: Start address 518
   – Output addresses: Start address 518

   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:

   – Input addresses: Start address 530
   – Output addresses: Start address 530

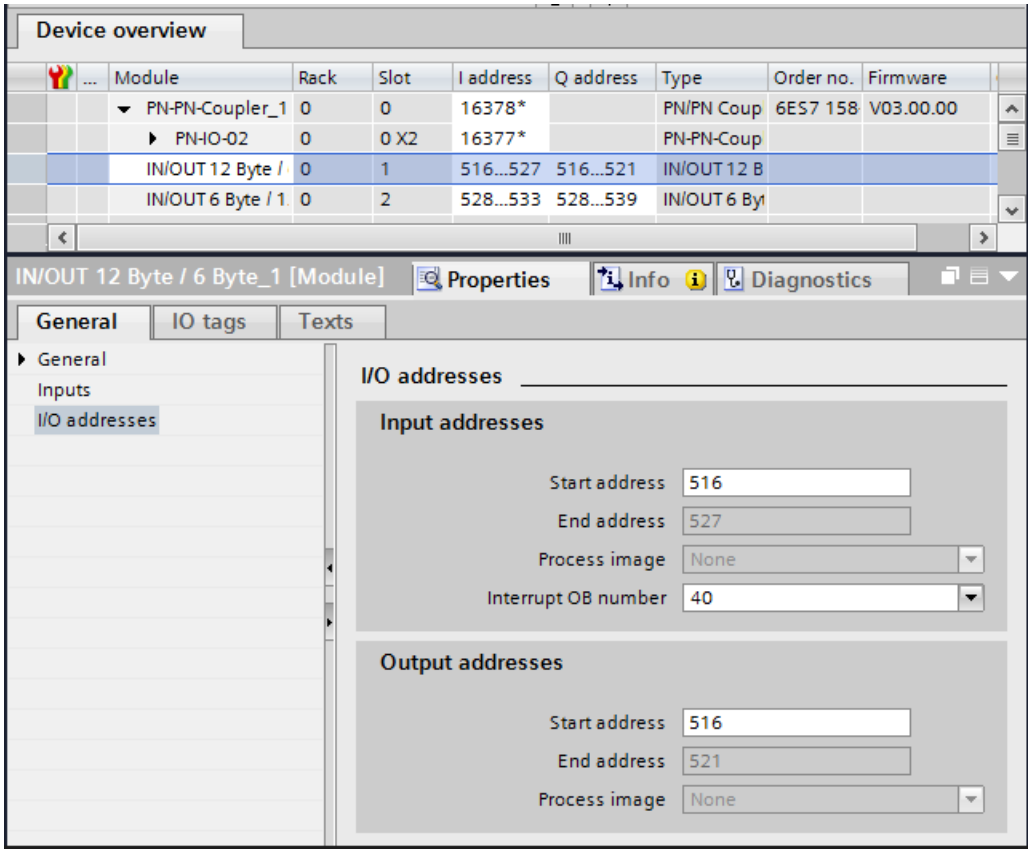
NOTE

Make sure that you assign identical start addresses for the address areas of the output and input data.

Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).

7. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:

   – One "IN/OUT 12 bytes / 6 bytes" module and
   – One "IN/OUT 6 bytes / 12 bytes" module



8. In the properties of the modules, assign the addresses outside the process image as follows:

   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:

   – Input addresses: Start address 516
   – Output addresses: Start address 516

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:

   – Input addresses: Start address 528
   – Output addresses: Start address 528

9.1.2.2 Program safety-related IO controller-IO controller communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

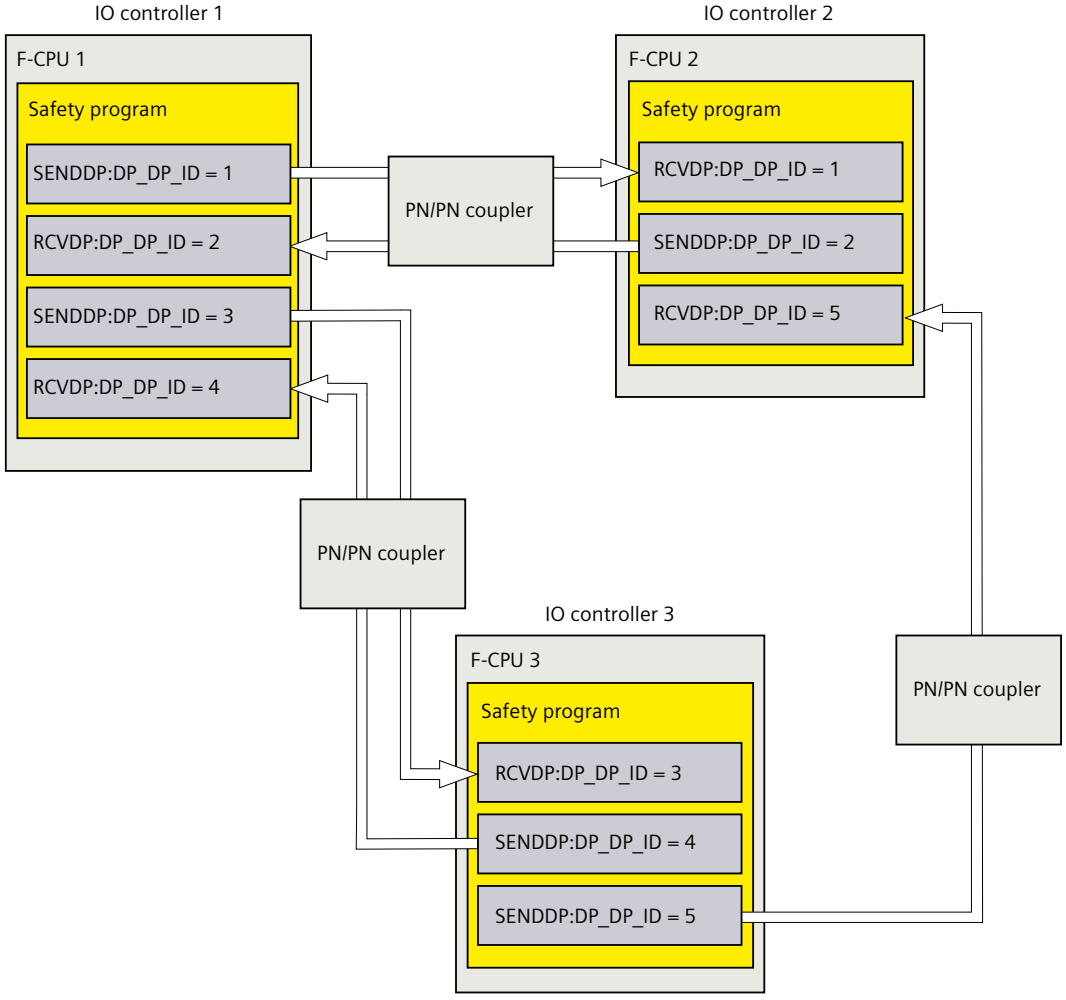
Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

Programming procedure



You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data is to be sent, call the SENDDP instruction (Page 599) for sending at the end of the main safety block.
2. In the safety program in which data is to be received, call the RCVDP instruction (Page 599) for receiving at the start of the main safety block.
3. Assign the start addresses of the output and input data transfer areas of the PN/PN coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related IO controller-IO controller communication relationships.

⚠ WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via

PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, provide the tag "F_GOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   - Specification of variable substitute values:

     If you want to specify variable substitute values, define a tag that you calculate through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note: The program logic for calculating variable substitute values can only be inserted after the RCVDP calls, because there must be no program logic before the RCVDP calls. This is why the initial values of the substitute values are active in all RCVDP instructions in the first cycle after a startup of the F-system. You must therefore assign appropriate initial values for these tags. *(S017)*
8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).
9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.

11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 386).

9.1.2.3 Safety-related IO controller-IO controller communication - Limits for data transfer

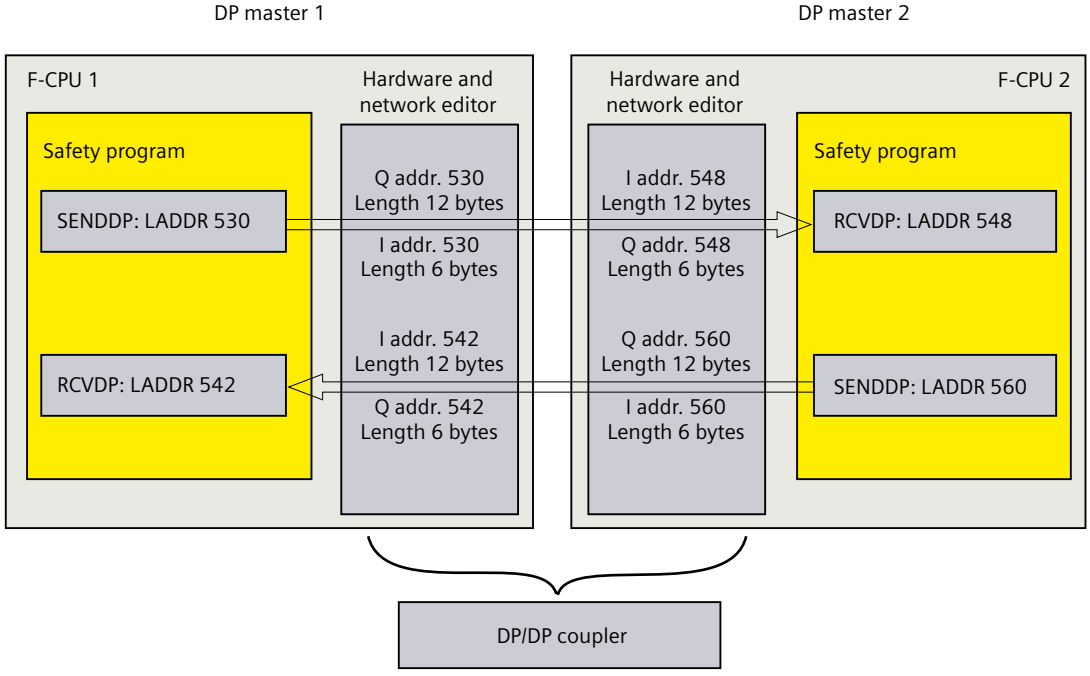
NOTE

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional communication connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.1.3 Safety-related master-master communication

9.1.3.1 Configure safety-related master-master communication

Introduction



Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

NOTE

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

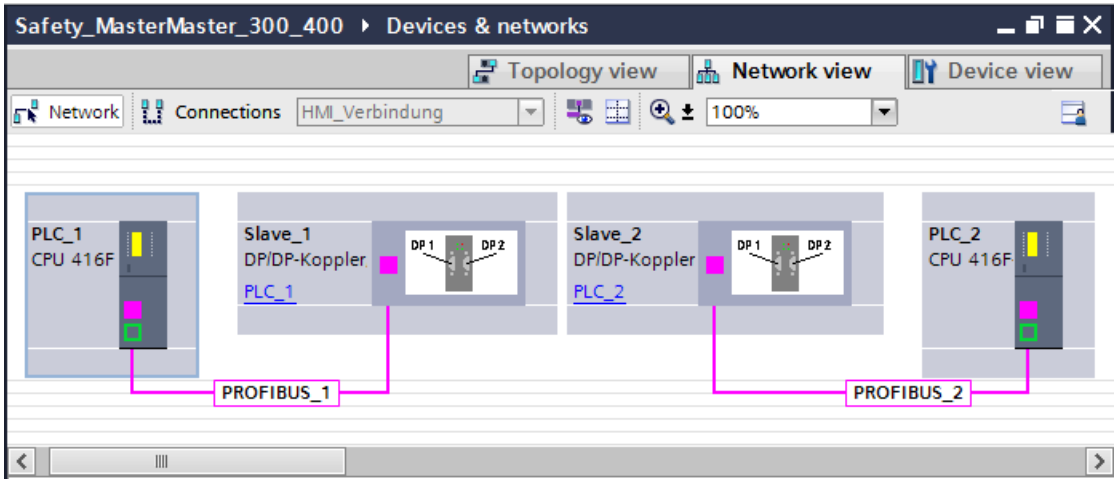
Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the DP/DP coupler for each of the two communication connections.

Rules for defining transfer areas

The transfer area for input data and the transfer area for output data for the **data to be sent** must begin with the same start address. A total of 6 bytes (consistent) is required for the transfer area for input data; 12 bytes (consistent) are required for the transfer area for output data.

The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.



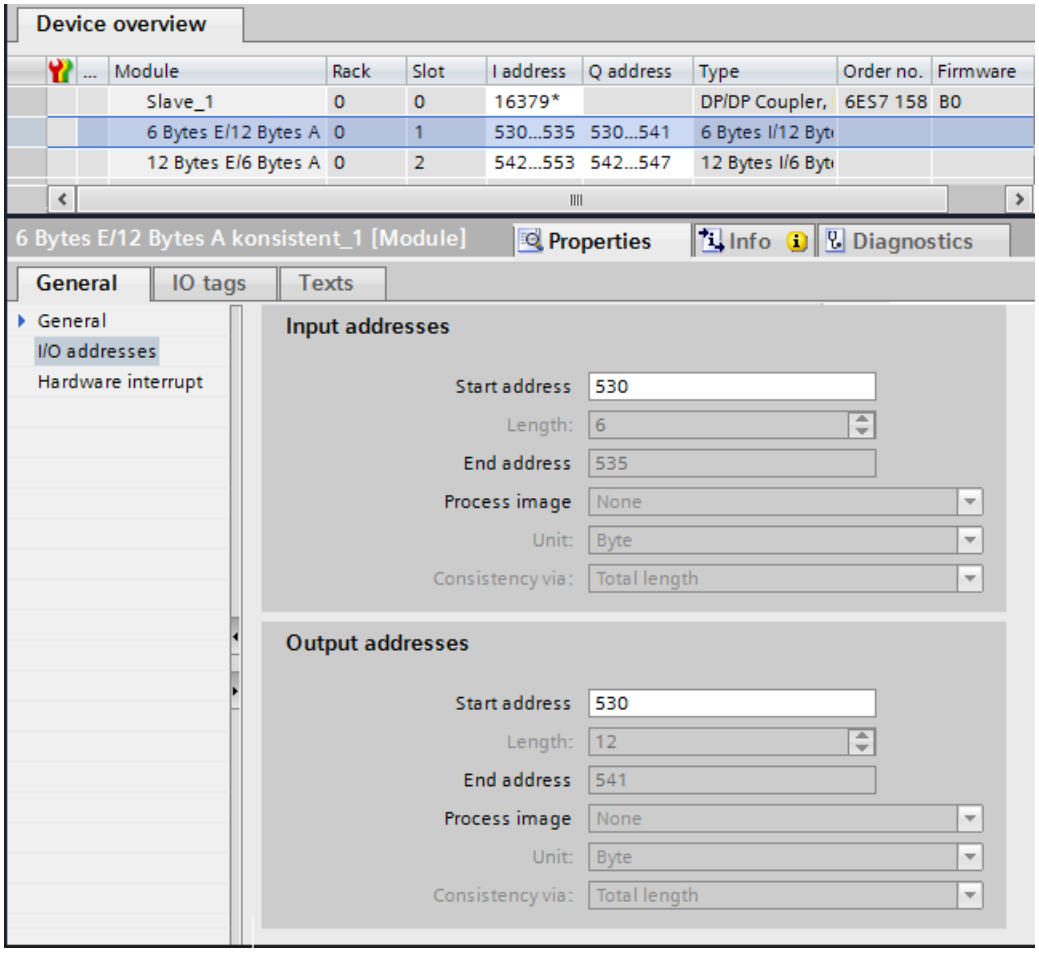
Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.

3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.

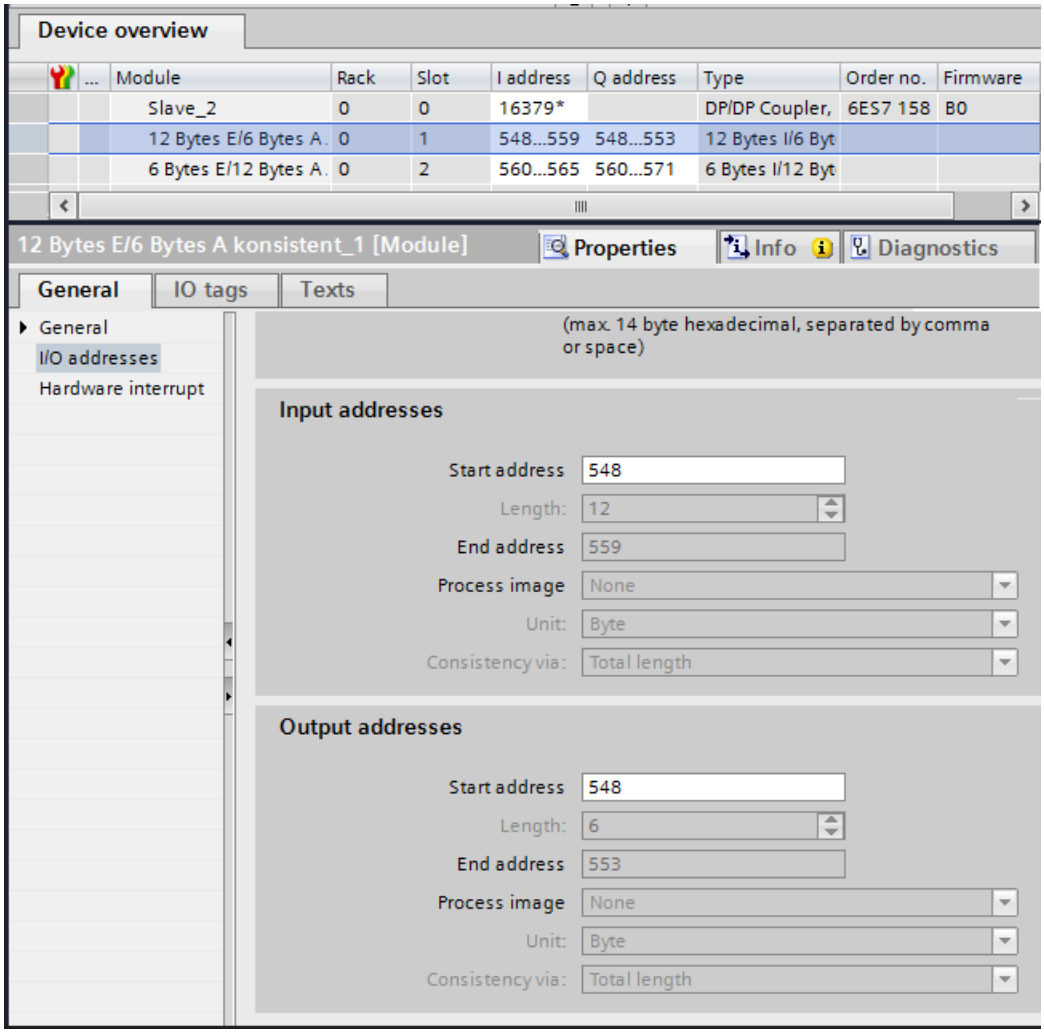


6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler of PLC 1, either by using the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (https://support.industry.siemens.com/cs/ww/en/view/1179382) manual).
7. Switch to the device view of the DP/DP coupler for PLC1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   – One "6 bytes I/12 bytes Q consistent" module, and
   – One "12 bytes I/6 bytes Q consistent" module
8. In the properties of the modules, assign the addresses outside the process image as follows:

   For "6 bytes I/12 bytes Q consistent" module for sending data for example:
   – Input addresses: Start address 530
   – Output addresses: Start address 530

   For "12 bytes I/6 bytes Q consistent" module for receiving data for example:
   – Input addresses: Start address 542
   – Output addresses: Start address 542

NOTE



Make sure that you assign identical start addresses for the address areas of the output and input data.
Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).

9. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module
10. In the properties of the modules, assign the addresses outside the process image as follows:

    For "12 bytes I/6 bytes Q consistent" module for receiving data for example:
    - Input addresses: Start address 548
    - Output addresses: Start address 548

    For "6 bytes I/12 bytes Q consistent" module for sending data for example:
    - Input addresses: Start address 560
    - Output addresses: Start address 560

9.1.3.2 Program safety-related master-master communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

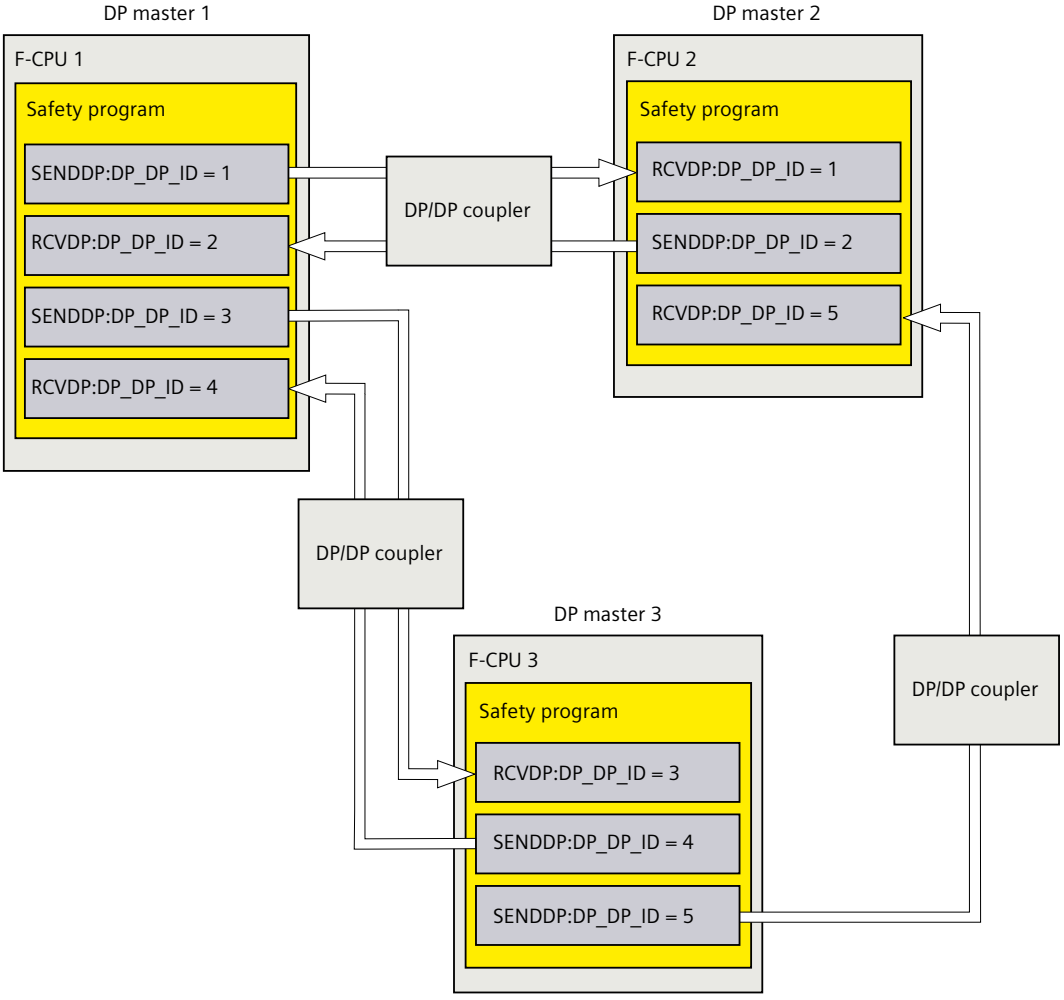
Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The transfer areas for input and output data for the DP/DP coupler must be configured.

Programming procedure



You program safety-related master-master communication as follows:

1. In the safety program from which data is to be sent, call the SENDDP instruction (Page 599) for sending at the end of the main safety block.
2. In the safety program in which data is to be received, call the RCVDP instruction (Page 599) for receiving at the start of the main safety block.
3. Assign the start addresses of the transfer areas for output and input data of the DP/DP coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related master-master communications relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via

PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g. "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value for data of the data type BOOL, provide the tag "F_GLOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   - Specification of variable substitute values:

     If you want to specify variable substitute values, define a tag that you calculate through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note: The program logic for calculating variable substitute values can only be inserted after the RCVDP calls, because there must be no program logic before the RCVDP calls. This is why the initial values of the substitute values are active in all RCVDP instructions in the first cycle after a startup of the F-system. You must therefore assign appropriate initial values for these tags. *(S017)*
8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).
9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.

11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 386).

9.1.3.3 Safety-related master-master communication:Limits for data transfer

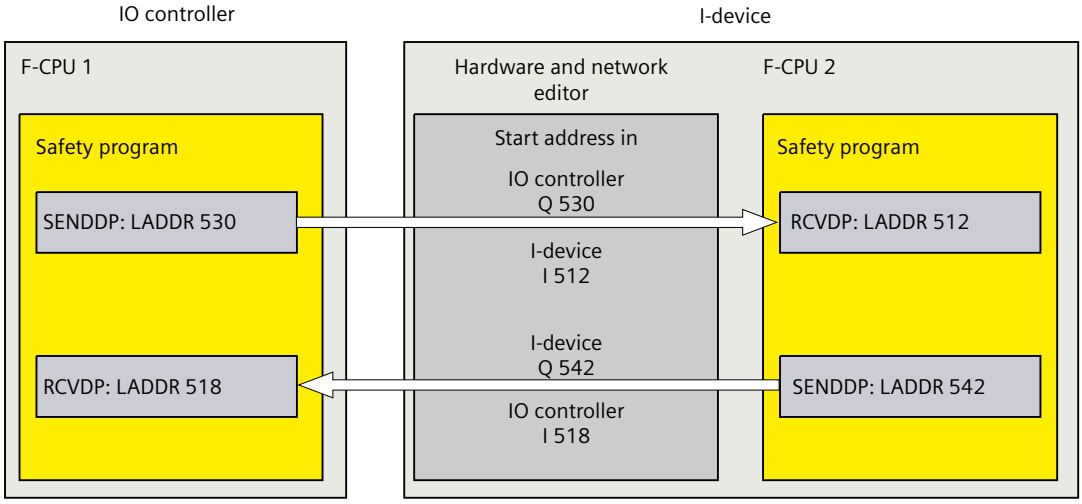
NOTE

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.1.4 Safety-related IO controller-I-device communication

9.1.4.1 Configuring safety-related communication between IO controller and I-device

Introduction



Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device transfer areas (**F**-CD) in PROFINET IO, as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

The F-CPU to be used as an I-device must support the "IO-device" operating mode.

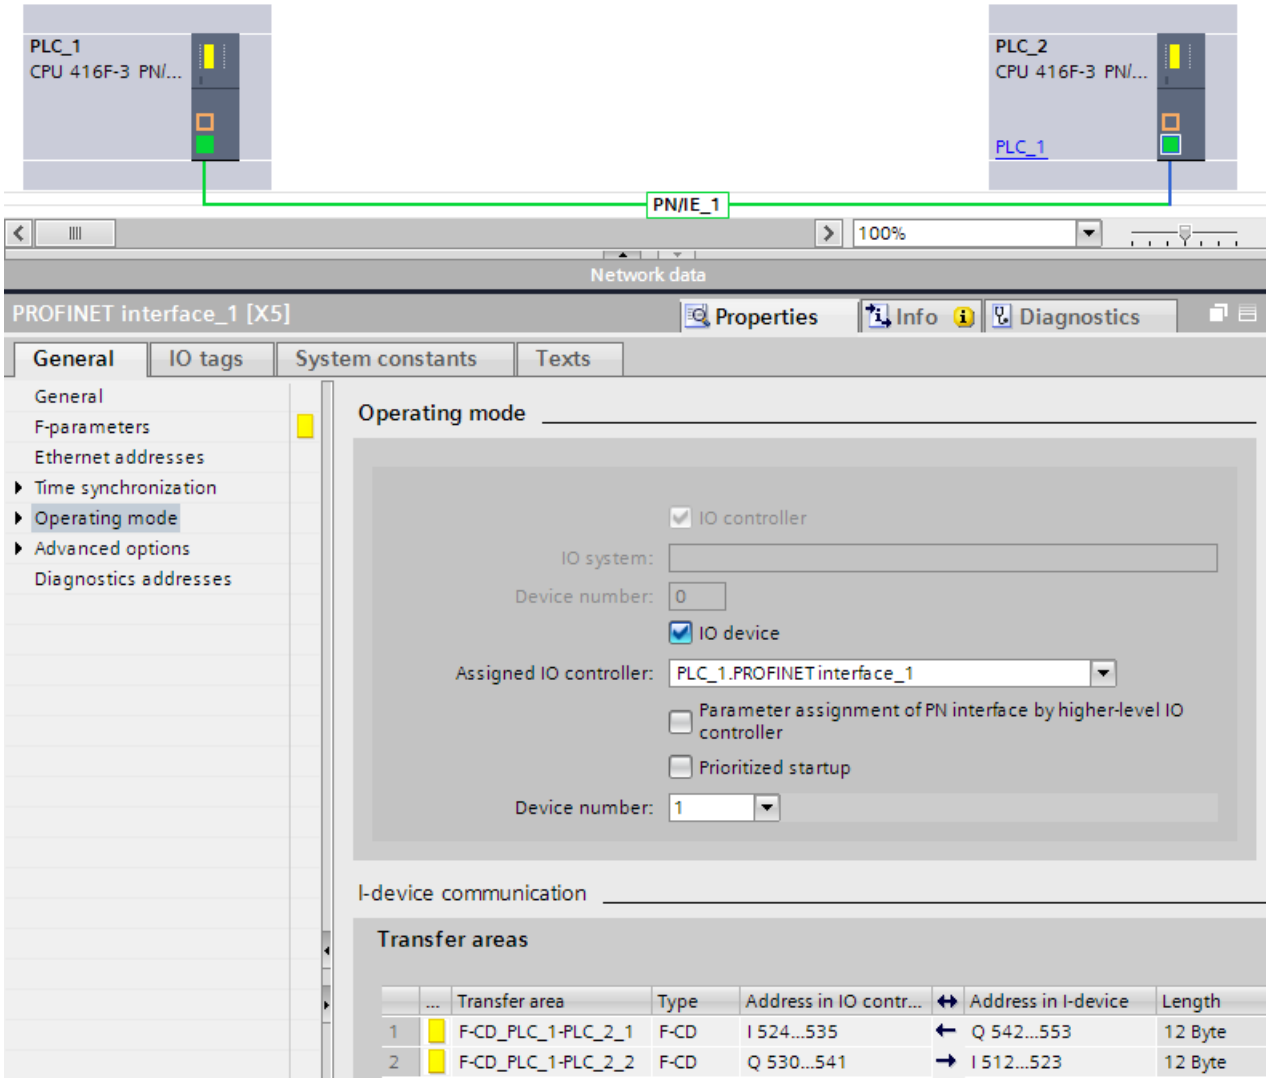
Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration



The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for sending to the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned outside of the process image are displayed.

   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").
4. Create an additional F-CD connection for receiving from the IO controller.

5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from IO controller (→).

9.1.4.2 Programming safety-related IO controller I-device communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

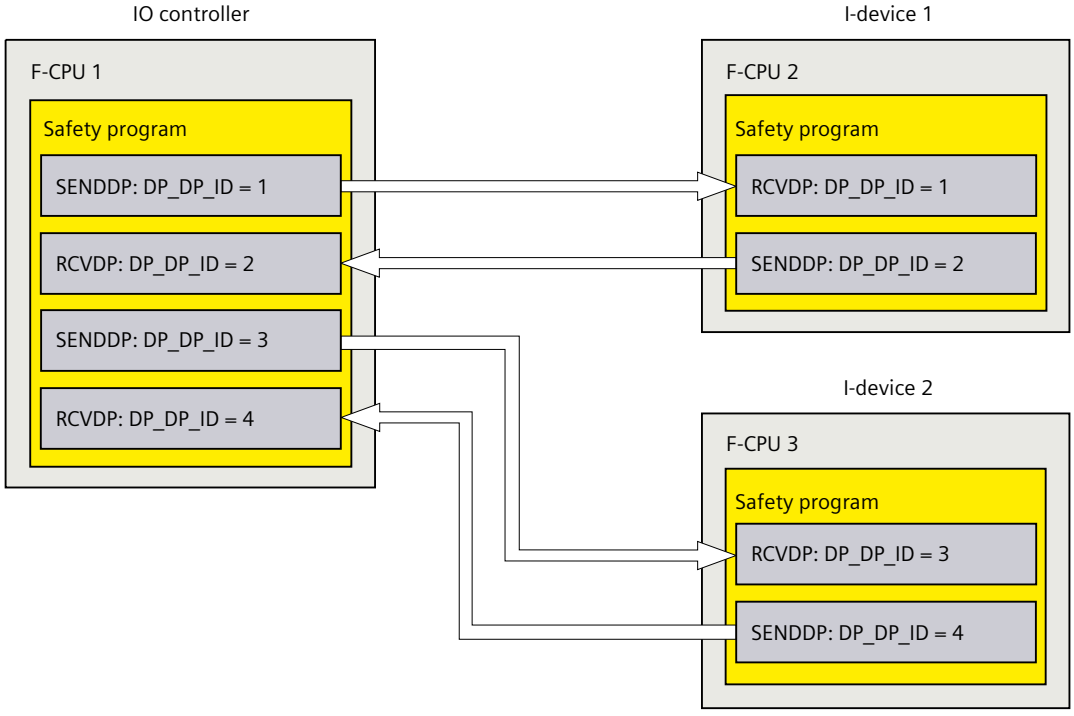
You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The transfer areas must be configured.



Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 203)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the IO controller	→	Address in the IO controller
RCVDP in the IO controller	←	Address in the IO controller
SENDDP in the I-device	←	Address in the IO device
RCVDP in the I-device	→	Address in the IO device

The figure below contains an example of how to specify the F-communication IDs for the inputs of the SENDDP and RCVDP instructions for 4 safety-related IO controller-I-device communication relationships.

⚠ WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time.*(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

9.1.4.3 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

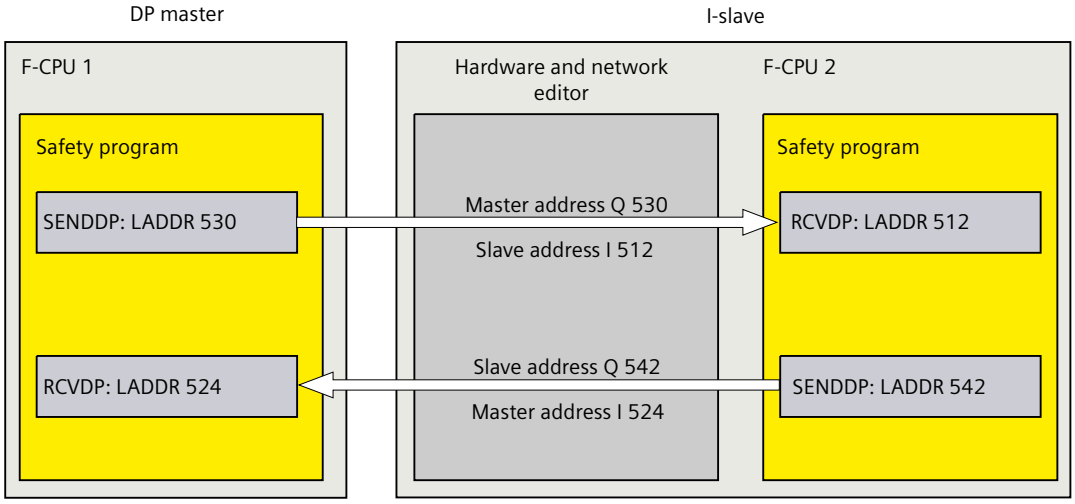
Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.1.5 Safety-related master-I-slave communication

9.1.5.1 Configuring safety-related master-I-slave communication



Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place via master-I-slave transfer areas (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

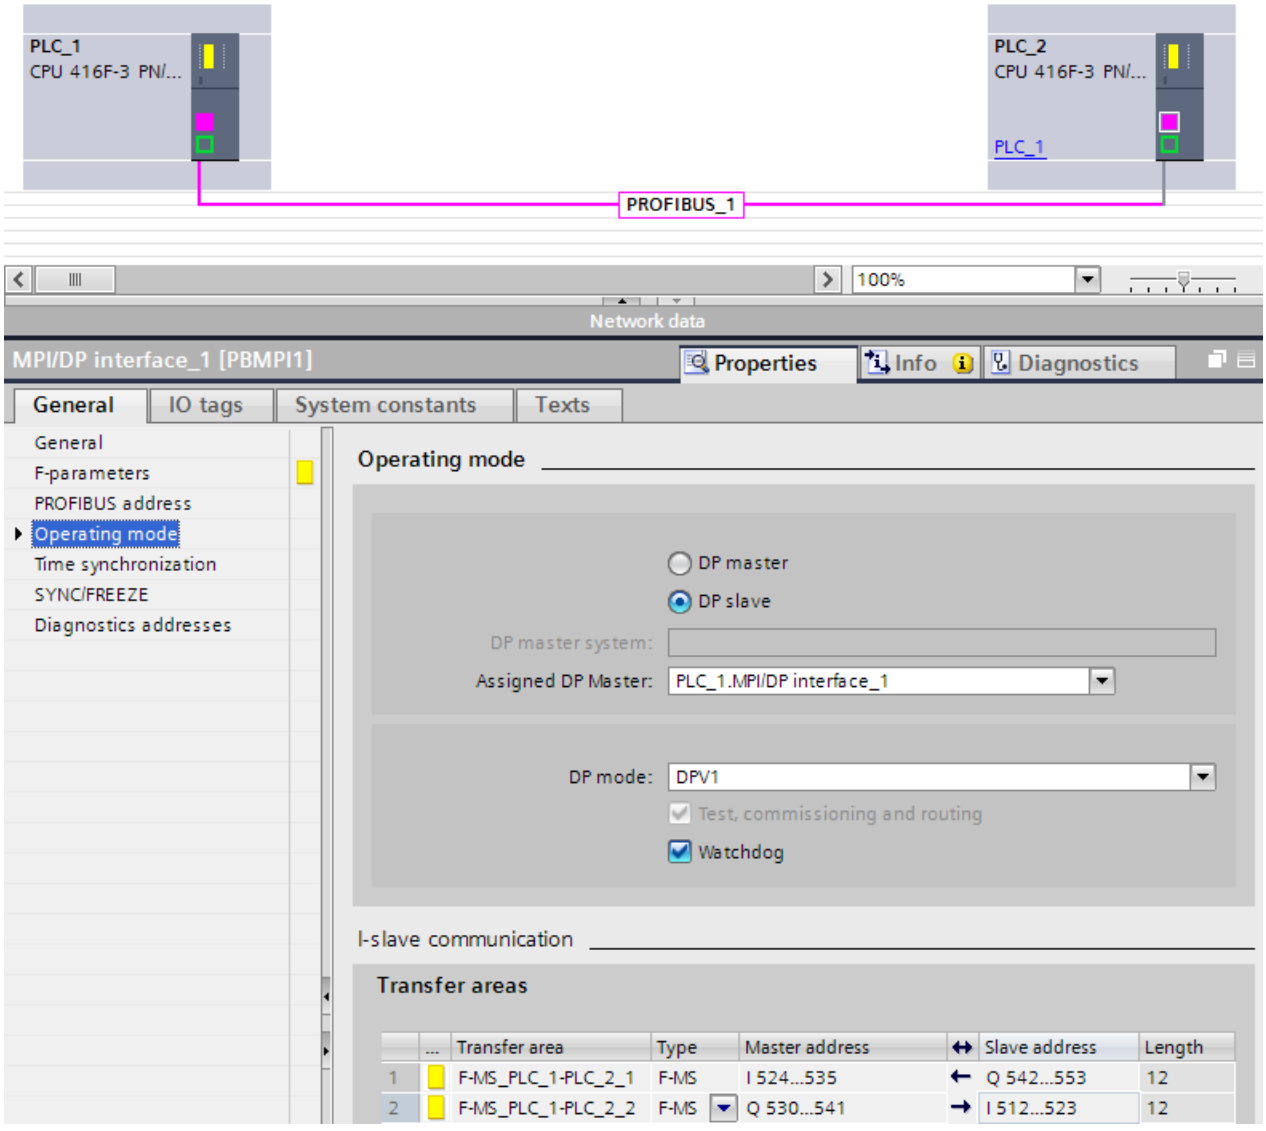
Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration



The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Activate the "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this DP interface to a DP interface of F-CPU 1.
3. Select the PROFIBUS interface of F-CPU 2. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the transfer areas in the I-slave and DP master assigned outside of the process image are displayed.

   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").
4. Create an additional F-MS connection for receiving from the DP master.

5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).

9.1.5.2 Program the safety-related master-I-slave or I-slave-I-slave communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the DP master and an I-slave or between the F-CPUs of multiple I-slaves makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

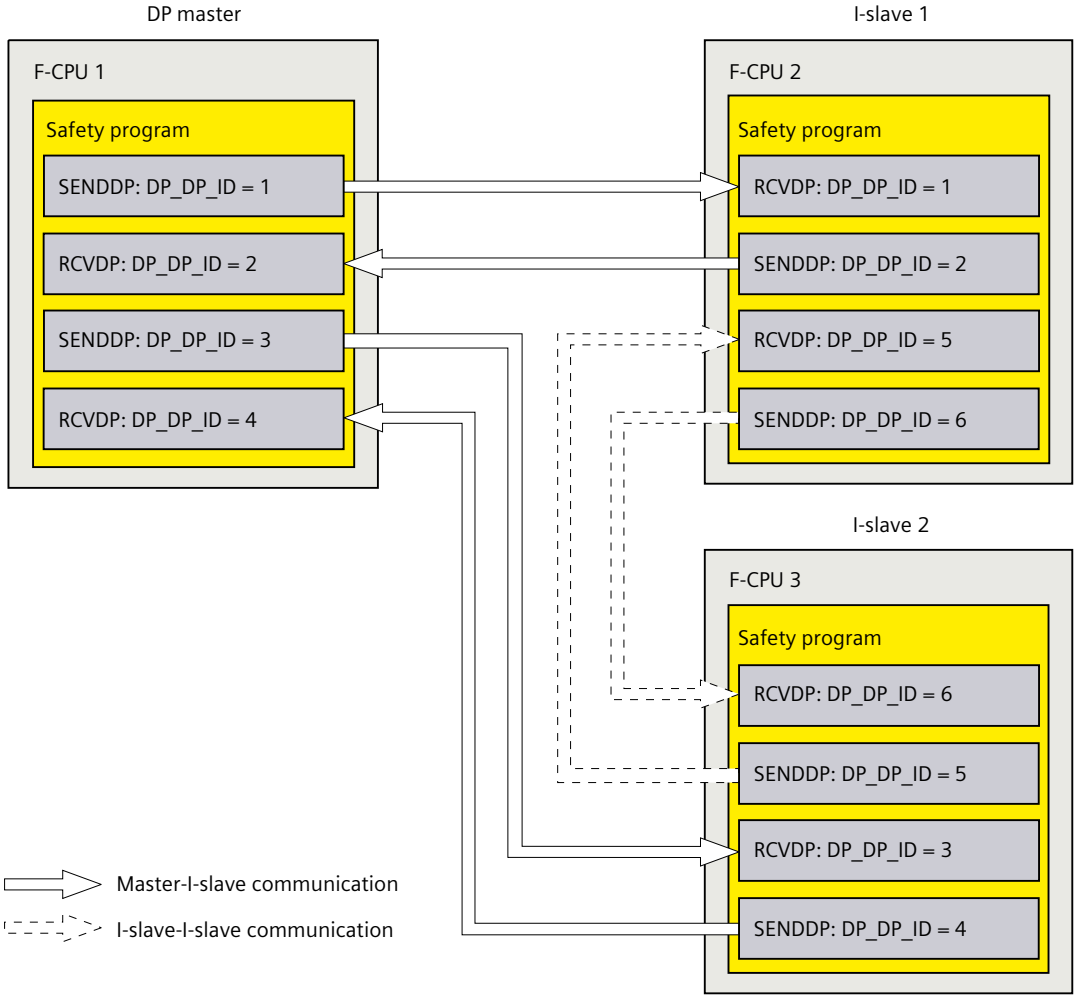
You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for configuration

The transfer areas must be configured.



Programming procedure

The procedure for programming safety-related master-I-slave communication or I-slave-I-slave communication is the same as that for programming safety-related master-master communication (see Program safety-related master-master communication (Page 211)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the DP master	→	Master address
RCVDP in the DP master	←	Master address
SENDDP in the I-slave	←	Slave address
RCVDP in the I-slave	→	Slave address

The figure below contains an example of how to specify the F-communication IDs at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave and two I-slave-I-slave communications relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

9.1.5.3 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data					
		DP master		I-slave 1		I-slave 2	
		Output data	Input data	Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes	—	—
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes	—	—
I-slave-I-slave	**Sending:** I-slave 1 to I-slave 2	—	18 bytes	12 bytes	6 bytes	6 bytes	12 bytes
	Receiving: I-slave 1 from I-slave 2	—	18 bytes	6 bytes	12 bytes	12 bytes	6 bytes

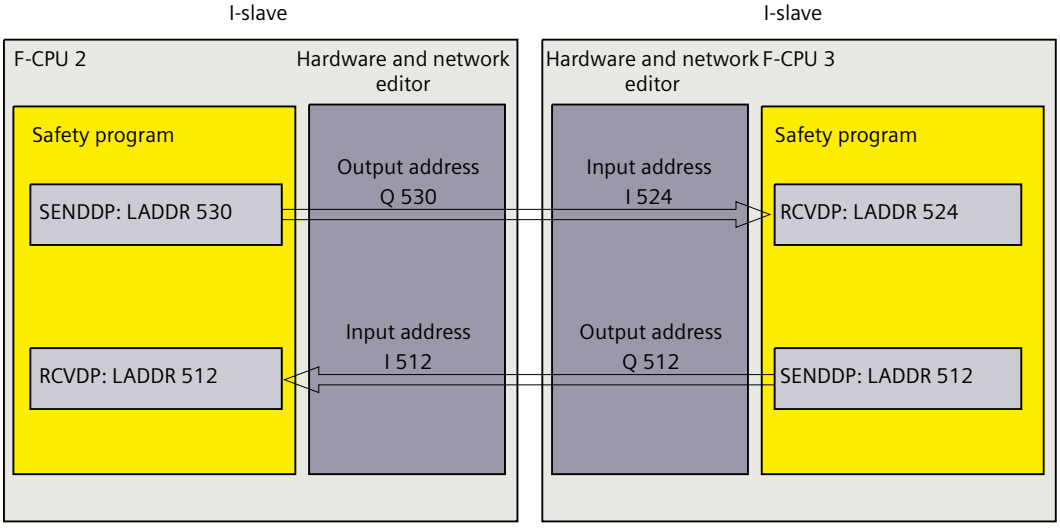
Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS, F-DX, F-DX-Mod., MS, DX). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.6 Safety-related I-slave-I-slave communication

9.1.6.1 Configure safety-related I-slave-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPUs of I-slaves takes place using direct data exchange (**F**-DX) – same as in standard programs.



You do not need any additional hardware for I-slave-I-slave communication.

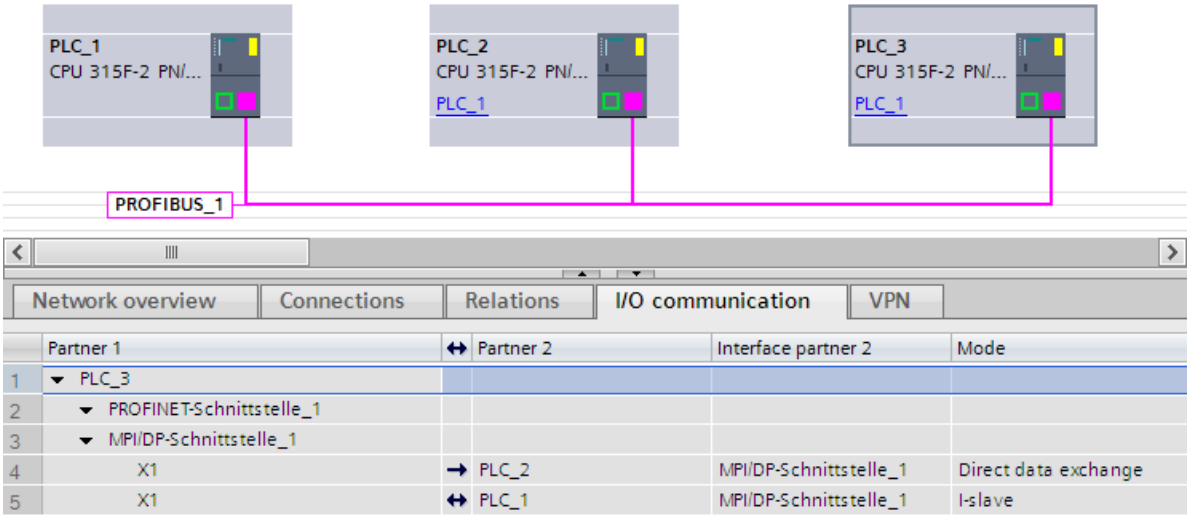
I-slave-I-slave communication is also possible:

- If the assigned DP master is a standard CPU that supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

Configuring transfer areas

For every safety-related communication connection between two I-slaves, you must configure transfer areas in the *hardware and network editor*. In the figure below, both of the I-slaves are to be able to send and receive data (bidirectional communication).

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX_PLC_2-PLC_1_1" for the first F-DX connection between F-CPU 1 and F-CPU 2.



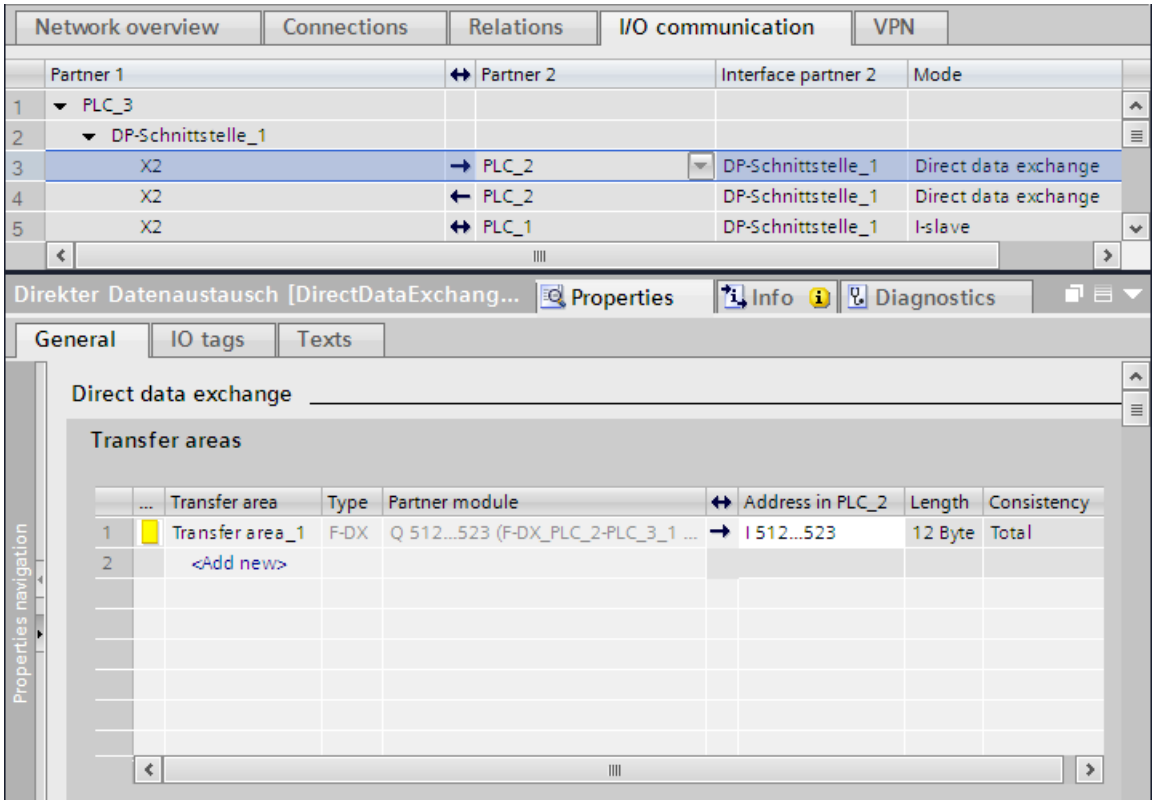
You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

The procedure for configuring safety-related I-slave-I-slave communication is identical to that in the standard system. Proceed as follows:

1. Insert three F-CPUS from the "Hardware catalog" task card in the project.
2. Activate "DP slaves" mode (I-slave) for F-CPU 2 and F-CPU 3 in the properties of their DP interfaces and assign these DP interfaces to a DP interface of F-CPU 1.
3. Select the DP interface of F-CPU 3 in the network view.
4. Select the "I/O communication" tab.
5. Use a drag-and-drop operation in the network view to move F-CPU 2 to the "Partner 2" column on the "I/O-communication" tab.

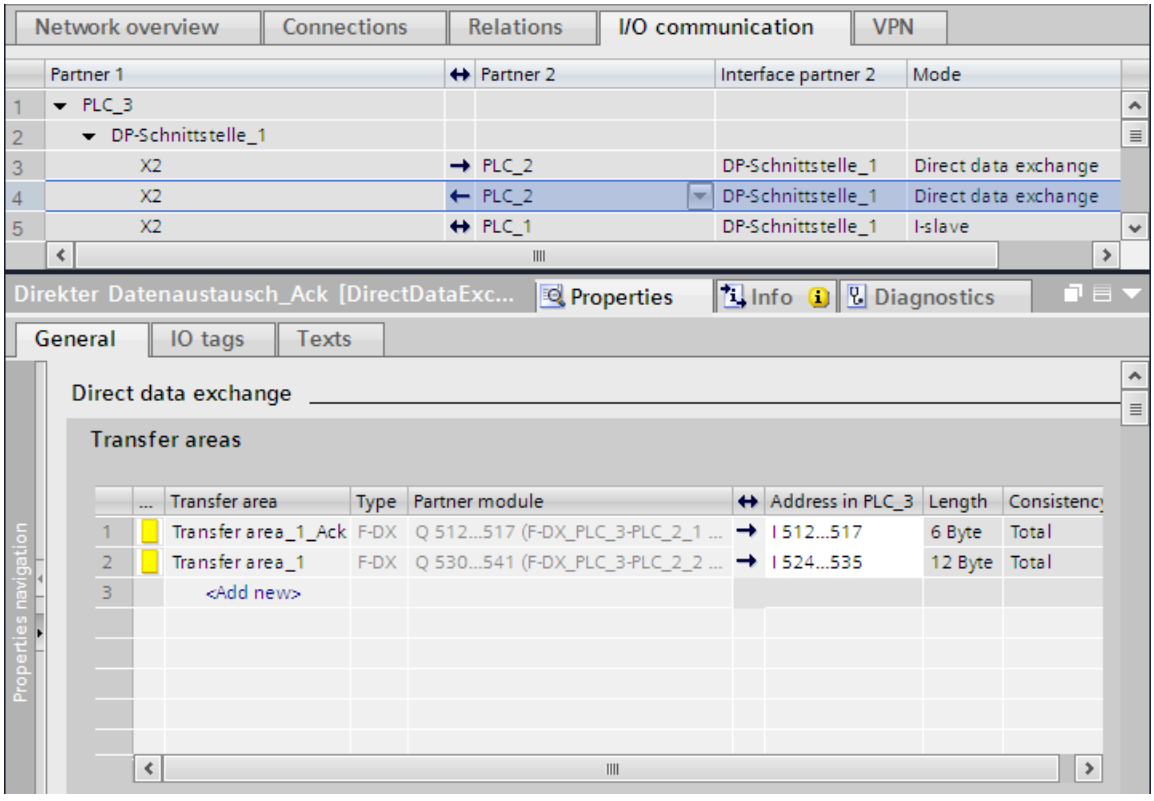
   This creates a line with "Direct data exchange" mode for sending to the I-slave (F-CPU 2) (→).



6. Click in the newly created line (→).
7. In "Transfer areas" ("Direct data exchange" table), create an F-DX connection (type "F-DX") for sending to the I-slave (F-CPU 2) (→). The F-DX connection is shown in yellow in the table and the transfer areas in the I-slaves assigned outside of the process image (PLC_2 and PLC_3) are displayed.

   In addition, a line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 2) (←) is created automatically in the "I/O communication" tab, and an acknowledgment connection (→, transfer area x_Ack) is created automatically in the associated "Direct data exchange" table.

   One transfer area (type F-MS) for the master CPU is created in the "I-slave communication table" of each I-slave.



This completes the configuration for sending to F-CPU 2.

8. In the "I/O communication" tab, select the automatically created line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 2) (←).
9. In "Transfer areas" ("Direct data exchange" table), create another F-DX connection for receiving from the I-slave (F-CPU 3).

   In this case, as well, an acknowledgment connection (→, transfer area x_Ack) is created automatically in the "Direct data exchange table" and two transfer areas (type F-MS) for the master CPU are created in the "I-slave communication" table of both I-slaves.

This completes the configuration for receiving from F-CPU 2.

Changing disabled local address areas of the transfer areas

To change the disabled local address area of the "Transfer area x", you must change the start address of the address area of the corresponding acknowledgment connection "Transfer area x_Ack".

1. In "I/O communication", select the line with the arrow pointing in the same direction as the arrow of "Transfer area x" in the "Direct data exchange" table.
2. Then select the line with "Transfer area x_Ack" in the "Direct data exchange" table.
3. Change the start address of the address range there.

9.1.6.2 Programming safety-related I-slave-I-slave communication

Reference

The description of the programming of safety-related I-slave-I-slave communication can be found in Program the safety-related master-I-slave or I-slave-I-slave communication (Page 222).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the 1st I-slave	→	Address in the <1st I-slave> (in example column "Address in PLC_2")
RCVDP in the 1st I-slave	←	Address in the <1st I-slave> (in example column "Address in PLC_2")
SENDDP in the 2nd I-slave	←	Address in the <2nd I-slave> (in example column "Address in PLC_3")
RCVDP in the 2nd I-slave	→	Address in the <2nd I-slave> (in example column "Address in PLC_3")

9.1.6.3 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

The description of the limits for the data transfer of safety-related I-slave-I-slave communication can be found in Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication (Page 224).

9.1.7 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place via master-I-slave transfer areas (**F-**MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

NOTE

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 615)).
Note that the Excel file for calculating response times (https://support.industry.siemens.com/cs/ww/en/view/109783831) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 219) also applies.

9.1.8 Safety-related communication via S7 connections

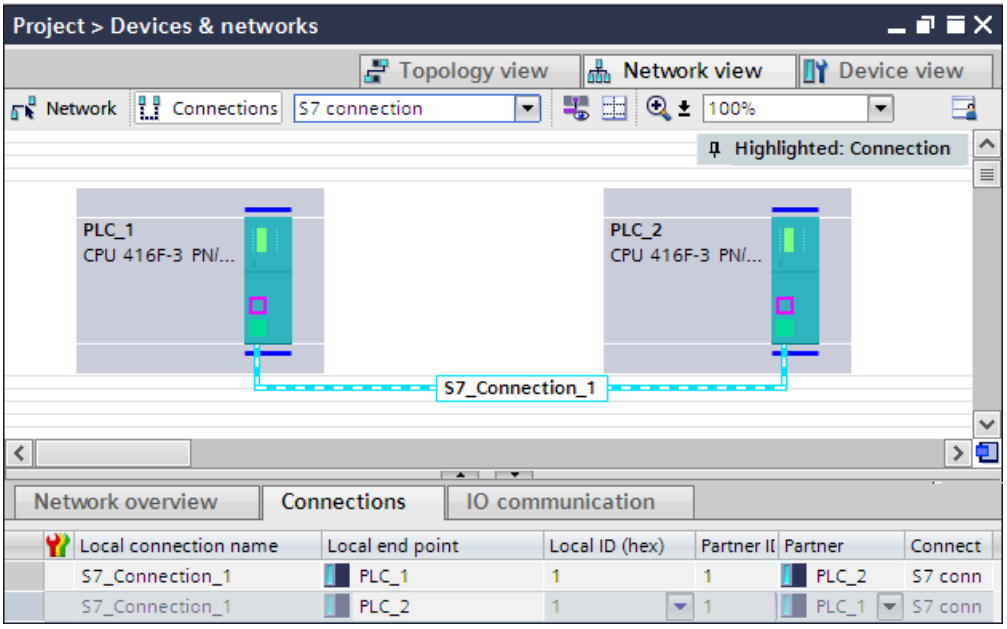
9.1.8.1 Configuring safety-related communication via S7 connections

Introduction

Safety-related communication between the safety programs of F-CPUs via S7 connections takes place by means of established S7 connections that you create in the network view of the *hardware and network editor* - same as in standard programs.

Restrictions

NOTE



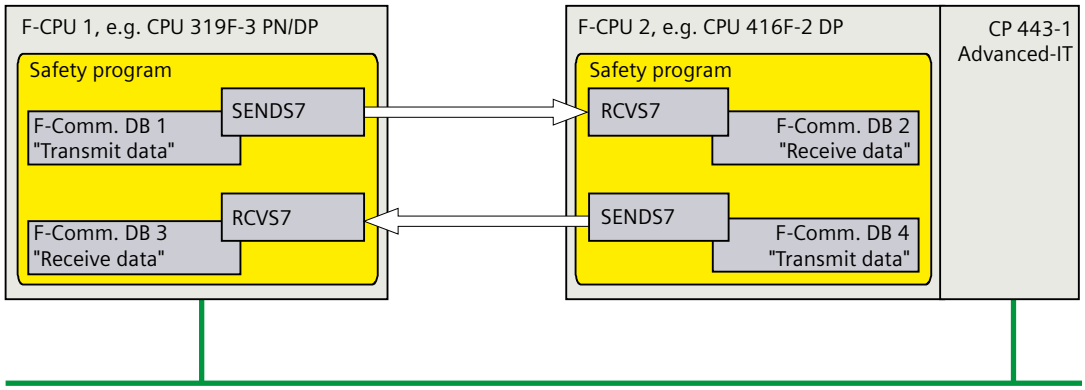
In SIMATIC Safety, S7 connections are generally permitted only via Industrial Ethernet.
Safety-related communication via S7 connections is possible from and to the following CPUs:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

Creating S7 connections

For each connection between two F-CPUs, you must create an S7 connection in the network view of the *hardware and network editor*.

For every end-point of a connection, a local and a partner ID is automatically assigned from the perspective of the end-point (the F-CPU). If necessary, you can change both IDs in the "Connections" tab. You assign the local ID to the "ID" input of the SENDS7 and RCVS7 instructions in the safety programs.



Procedure for configuring S7 connections

You configure the S7 connections for safety-related CPU-to-CPU communication in the same way as in *STEP 7 Professional* (see *Help on STEP 7 Professional* "S7 connections").

9.1.8.2 Programming safety-related communication via S7 connections

Communication via the SENDS7 and RCVS7 instructions

You use the **SENDS7 and RCVS7** instructions for fail-safe sending and receiving of data via S7 connections.

These instructions can be used to transmit a specified amount of fail-safe data of data types BOOL, INT, WORD, DINT, DWORD, and TIME in a fail-safe manner. The fail-safe data is stored in F-DBs (F-Communication DBs), which you create for each communication connection on the send and receive side.

You can find these instructions in the "Instructions" task card under "Communication". The RCVS7 instruction **must** be called at the start of the main safety block. The SENDS7 instruction **must** be called at the end of the main safety block.

Note that the send signals are sent only after calling the SENDS7 instruction at the end of the relevant F-runtime group execution.

A detailed description of the SENDS7 and RCVS7 instructions is found in SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V21) (S7-300, S7-400) (Page 608).

Requirement for programming

The S7 connections between the relevant F-CPUs must be configured in the network view in the "Connections" tab of the *hardware and network editor*.

Creating and Editing an F-Communication DB

F-communication DBs are F-DBs that you create and edit in the same way as other F-DBs in the project tree. You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

NOTE

The length and structure of the F-communication DB on the receiver side must match the length and structure of the associated F-communication DB on the sender side.
If the F-communication DBs do not match, the F-CPU can go to STOP mode. A diagnostics event is entered in the diagnostics buffer of the F-CPU.
For this reason, we recommend that you use the following procedure:

1. Create an F-communication DB in the project tree in or below the "Program blocks" folder of the F-CPU at the sender end.
2. Specify the appropriate structure of the F-communication DB, taking into account the data to be transferred.
3. Copy this F-communication DB to the project tree in or below the "Program blocks" folder of the F-CPU at the receiver end, and change the name, if necessary.

Other requirements for F-communication DBs

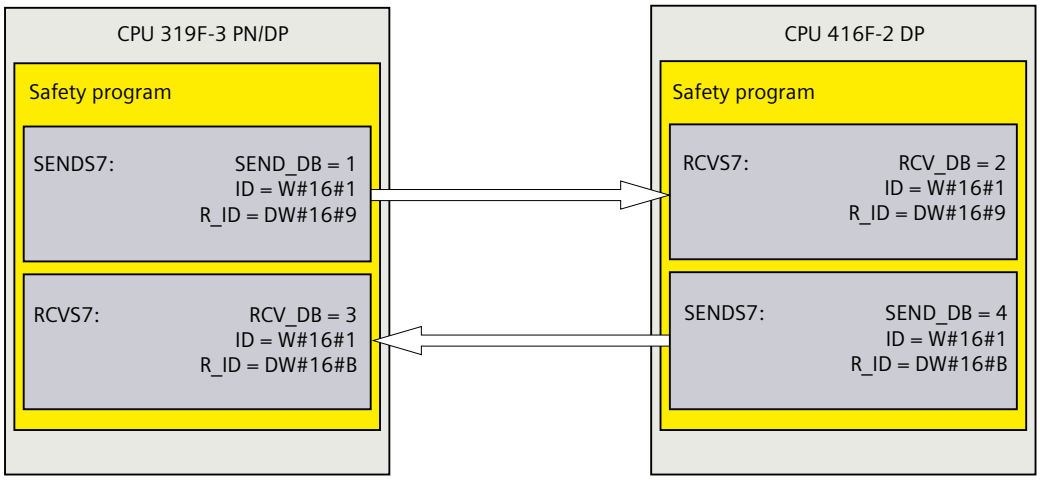
F-communication DBs must also conform to the following properties:

- They are not permitted to be instance DBs.
- Their length is not permitted to exceed 100 bytes.
- In F-communication DBs, only the following data types may be declared: BOOL, INT, WORD, DINT, DWORD, and TIME.
- The data types must be arranged block-wise and in the following order: BOOL, data types with bit length of 16 bits (INT, WORD), and data types with bit length of 32 bits (DINT, DWORD, and TIME). Within the data blocks with lengths of 16 bits and 32 bits, the data types can be arranged in any order.
- No more than 128 data elements of data type BOOL are permitted to be declared.
- The amount of data of data type BOOL must always be an integer multiple of 16 (word limit). Reserve data must be added, if necessary.

If these criteria are not fulfilled, *STEP 7 Safety Advanced* outputs an error message during compilation.

Assignment of fail-safe values

Fail-safe values are made available at the receiver end:



- While the connection between the communication partners is being established the first time after startup of the F-systems
- Whenever a communication error occurs

The values you specified as initial values in the F-communication DB at the receiver end are made available as initial values.

Programming procedure

You program safety-related communication via S7 connections as follows:

1. Supply the tags in the F-communication DB at the sender end with send signals using fully qualified access (e.g., "Name of F-communication DB".tag name).
2. Read the tags in the F-communication DB at the receiver end (receive signals) that you want to process further in other sections of the program using fully qualified access (e.g., "Name of F-communication DB".tag name).
3. In the safety program from which data is to be sent, call the SENDS7 instruction for sending at the end of the main safety block.
4. In the safety program in which data is to be received, call the instruction RCVS7 for receiving at the start of the main safety block.
5. Assign F-communication DB numbers to the SEND_DB input of SENDS7 and the RCV_DB input of RCVS7.
6. Assign the local ID of the S7 connection (data type: WORD) from the perspective of the F-CPU that was configured in the "Connections" tab of the network view to the ID input of SENDS7.
7. Assign the local ID of the S7 connection (data type: WORD) that was configured in the "Connections" tab of the network view to the ID input of RCVS7.
8. Assign an odd number (data type: DWORD) to the R_ID inputs of SENDS7 and RCVS7. This serves to specify that a SENDS7 instruction belongs to an RCVS7 instruction. The associated instructions receive the same value for R_ID.

WARNING

The value of the respective F-communication ID (input R_ID; data type: DWORD) can be freely selected; however, it must be odd and unique for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.
You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to ID and R_ID in the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via

PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

9. Assign the TIMEOUT inputs of the SENDS7 and RCVS7 instructions with the required monitoring time.

> **⚠ WARNING**
>
> It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

10. To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND (initial value = "TRUE") with 0. In this case, send data is no longer sent to the F-communication DB of the associated RCVS7 instruction and the receiver RCVS7 provides fail-safe values for this period (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.
11. Optional: Evaluate the ACK_REQ output of RCVS7, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether user acknowledgment is required.
12. Supply the ACK_REI input of RCVS7 with the signal for the acknowledgment for reintegration.
13. Optional: evaluate the SUBS_ON output of RCVS7 or SENDS7 in order to query whether the RCVS7 instruction is outputting the fail-safe values you specified as initial values in the F-communication DB.
14. Optional: Evaluate the ERROR output of RCVS7 or SENDS7, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether a communication error has occurred.
15. Optional: evaluate the SENDMODE output of RCVS7 in order to query whether the F-CPU with the associated SENDS7 instruction is in disabled safety mode (Page 386).

Particularities for migrated projects

If you have migrated a project from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced* in which safety-related communication via S7 connections is programmed, you must note the following:

- Do not delete migrated instance DBs for the SENDS7 and RCVS7 instructions in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks".

Otherwise, communication errors may occur in the relevant communication connections.

A migrated instance DB for the SENDS7 and RCVS7 instructions has been deleted if, after compiling the safety program, the "User-defined ID" in the newly generated instance DB is not identical to "FRCVS7CL" or "FSNDS7CL".

You can find the "User-defined ID" of a block in its properties in the "Information" area.

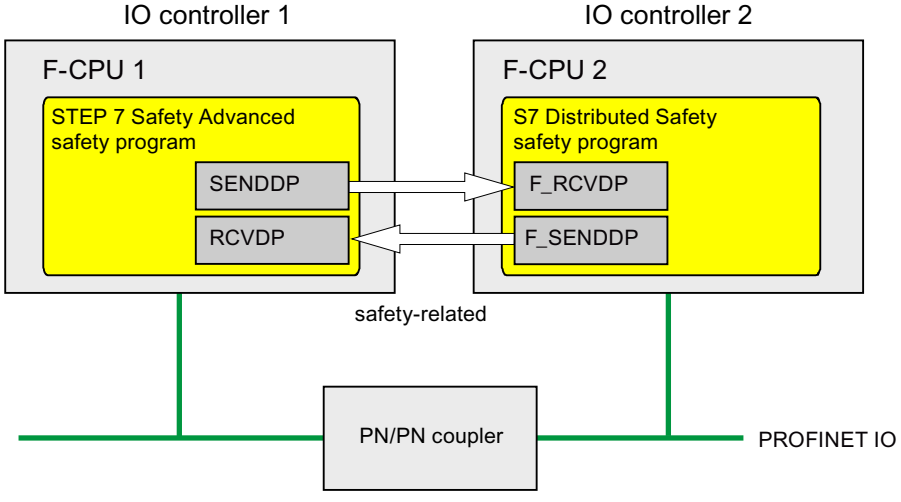
9.1.8.3 Safety-related communication via S7 connections - Limits of data transfer

NOTE
If the amount of data to be transmitted exceeds the permitted length for the F-communication DB (100 bytes), you can create a further F-communication DB that you transfer to additional SENDS7/RCVS7 instructions with a modified R_ID.

Note that USEND and URCV instructions are called internally at each SENDS7 or RCVS7 call and use connection resources in the F-CPU. This affects the maximum number of communication connections available (*see manuals for F-CPUs*).

More information can be found on the data transfer limits for S7 connections of individual F-CPUs is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/38549114).

9.1.9 Safety-related communication with other S7 F-systems



9.1.9.1 Introduction

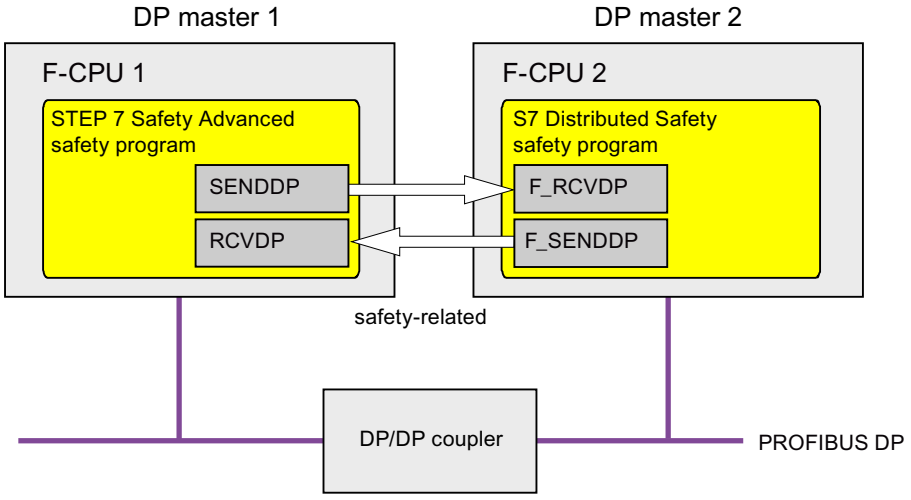
Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs as IO controller-IO controller communication, master-master communication or communication via established S7 connections.

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 F/FH Systems F-systems is possible via established S7 connections.

9.1.9.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:

Procedure at the *S7 Distributed Safety* end



At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875) manual.

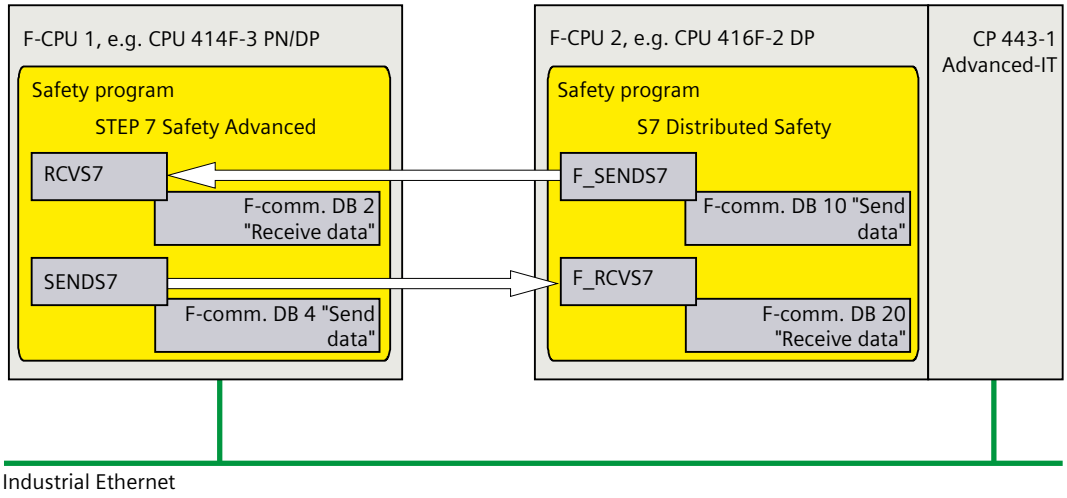
Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related IO controller-IO controller communication (Page 199).

9.1.9.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:

Procedure at the *S7 Distributed Safety* end



At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

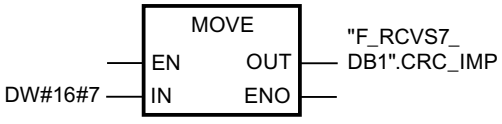
At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related master-master communication (Page 206).

9.1.9.4 Communication with S7 Distributed Safety via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SENDS7/F_RCVS7 F-application blocks at the *S7 Distributed Safety* end:

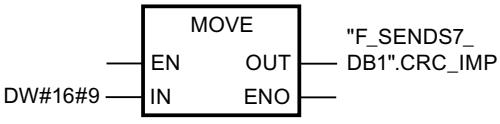
Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in section "Safety-related communication via S7 communications" in the S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875) manual.



Because safety-related communication via S7 connections is not possible with unspecified partners in S7 Distributed Safety, you must first create a "virtual" SIMATIC station in *S7 Distributed Safety* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Professional*.



In addition, for all communication connections to this F-CPU, you must transfer the F-communication ID that you assigned in the R_ID input of the associated calls of the F_SENDS7 and F_RCVS7 F-application blocks additionally to the CRC_IMP tag in the instance DB of F_SENDS7 and F_RCVS7, respectively, in the standard user program immediately before calling the F-CALL.

Program example:

Network 1: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP

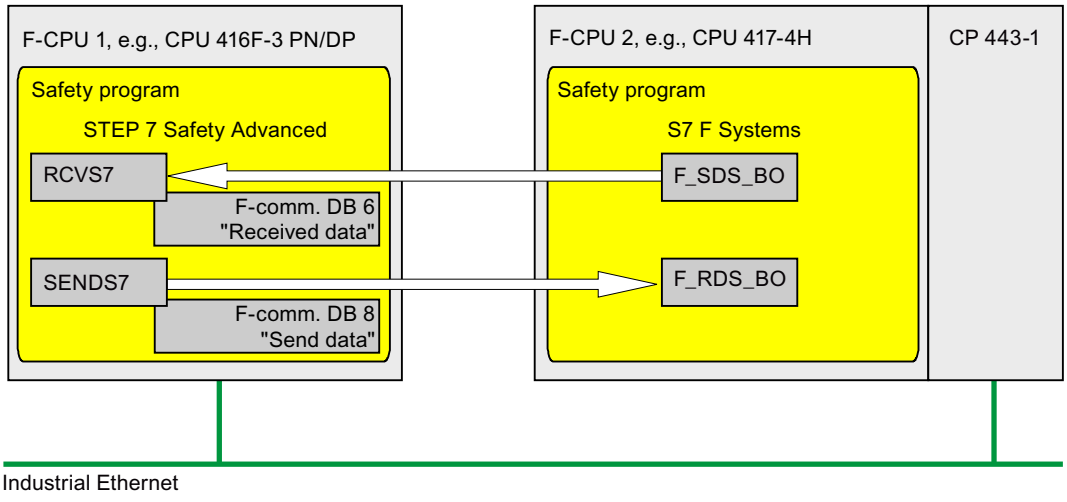
Network 2: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related communication via S7 connections (Page 230).

For the F-CPU in *S7 Distributed Safety*, you must create and specify an unspecified S7 connection. You can find information on this in the *STEP 7* help, under "Creating an unspecified connection" or "Specifying and unspecified connection".

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 Distributed Safety*.



If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

If the instance DBs of the SENDS7 and RCVS7, instructions that you want to use for communication with *S7 Distributed Safety* were migrated from *S7 Distributed Safety*, you must delete them in the project tree in the "STEP 7 Safety" folder, under "Program blocks > System blocks" (contrary to the information in Programming safety-related communication via S7 connections (Page 232), section "Particularities for migrated projects").

9.1.9.5 Communication with S7 F/FH Systems via S7 connections

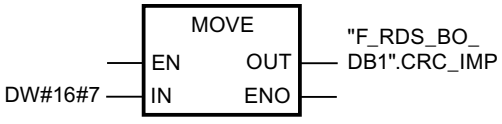
Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SDS_BO/F_RDS_BO F-blocks at the *S7 F Systems* end.

A maximum of 32 data elements of data type BOOL can be exchanged.

Procedure at the *S7 F Systems* end

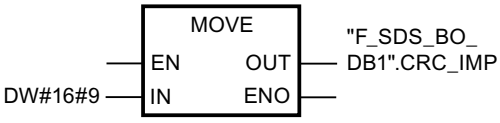
At the *S7 F systems* end, proceed as described in section "Safety-related communication between F-CPUs" in the S7 F/FH Systems - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/109802562) manual.

Because safety-related communication via S7 connections is not possible with unspecified partners in *S7 F/FH Systems*, you must first create a "virtual" SIMATIC station in *S7 F/FH Systems* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.



You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set

these in the associated, unspecified S7 connection that you created in *STEP 7 Safety Advanced*.



In addition, you must insert a function in your S7 program (in the area reserved in CFC for other applications), in which, for all communication connections for this F-CPU, you transfer the F-communication ID that you assigned in the R_ID input of the associated calls of the F_SDS_BO and F_RDS_BO F-blocks additionally to the CRC_IMP tag in the instance DB of the F_SDS_BO and F_RDS_BO, respectively. You obtain the number of the instance DB from the object properties of the block in CFC. Assign descriptive names for these instance DBs. If you perform a compress operation in CFC, you must check whether the numbers of these instance DBs have changed.

Program example:

Network 1: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP

Network 2: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP

You must then import the function in CFC as block type and insert your standard user program in a chart. In the run sequence, make sure that the associated standard runtime group is processed before the F-runtime group.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in "Safety-related communication via S7 connections" (Page 230).

Particularity: In *STEP 7 Safety Advanced*, you must create the F-communication DB with exactly 32 data elements of data type BOOL.

For the F-CPU in *S7 F/FH Systems*, you must create and specify an unspecified S7 connection. You can find information on this in the *STEP 7* help, under "Creating an unspecified connection" or "Specifying an unspecified connection".

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 F Systems*.

If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

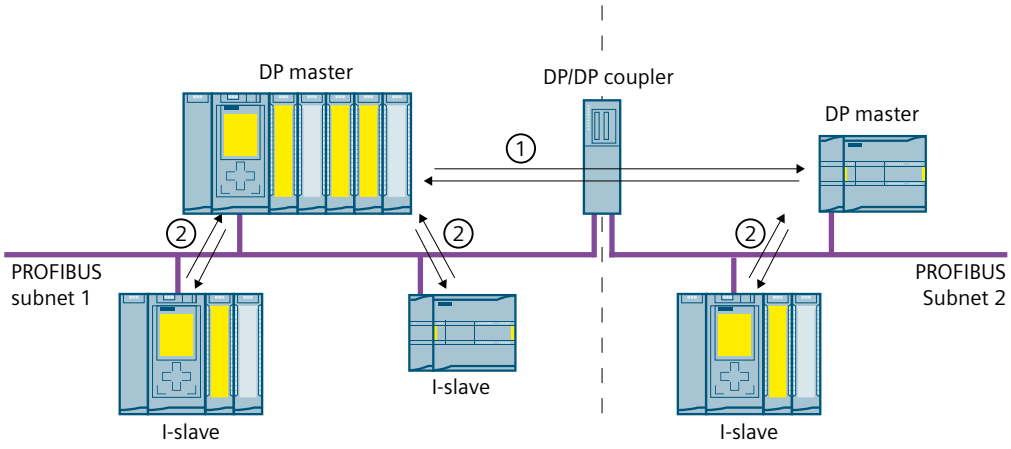
9.2 Communication via SENDDP/RCVDP instructions (S7-1200, S7-1500):

9.2.1 Overview

Introduction

This section gives an overview of the options for safety-related communication using the SENDDP/RCVDP instructions in SIMATIC Safety F-systems.

Options for safety-related CPU-CPU communication

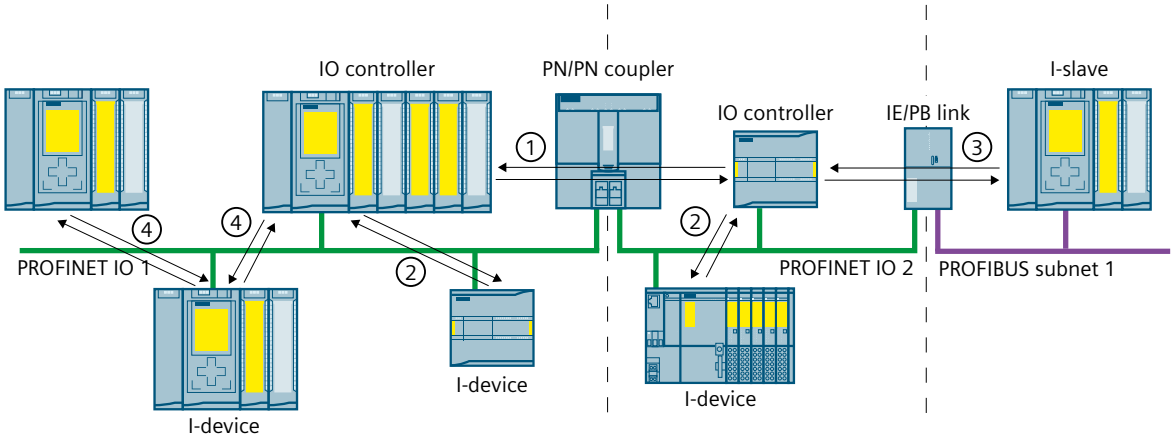


Safety-related CPU-CPU communication	On subnet	Additional hardware required	Required instructions
IO controller-IO controller communication	PROFINET IO	PN/PN coupler	SENDDP/RCVDP
Master-master communication	PROFIBUS DP	DP/DP coupler	SENDDP/RCVDP
IO controller-I-device communication	PROFINET IO	—	SENDDP/RCVDP
Master-I-slave communication	PROFIBUS DP	—	SENDDP/RCVDP
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link	SENDDP/RCVDP
IO controller-IO controller communication for *S7 Distributed Safety*	PROFINET IO	PN/PN coupler	SENDDP/RCVDP
Master-master communication for *S7 Distributed Safety*	PROFIBUS DP	DP/DP coupler	SENDDP/RCVDP

NOTE
The options for safety-related communication depend on the F-CPUs used.

NOTE
Safety-related communication with S7-1200 G1 F-CPUs is only permitted as of firmware V4.1.2.

Overview of safety-related communication via PROFIBUS DP



The figure below provides an overview of the options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.

① Safety-related master-master communication
② Safety-related master-I-slave communication

Overview of safety-related communication via PROFINET IO

The figure below provides an overview of the options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.

① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication
④ Safety-related IO controller-I-device communication (shared I-device)

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of data of the data type BOOL or INT (DINT as alternative) is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. The hardware identifier (HW identifier) defines the transfer areas configured.

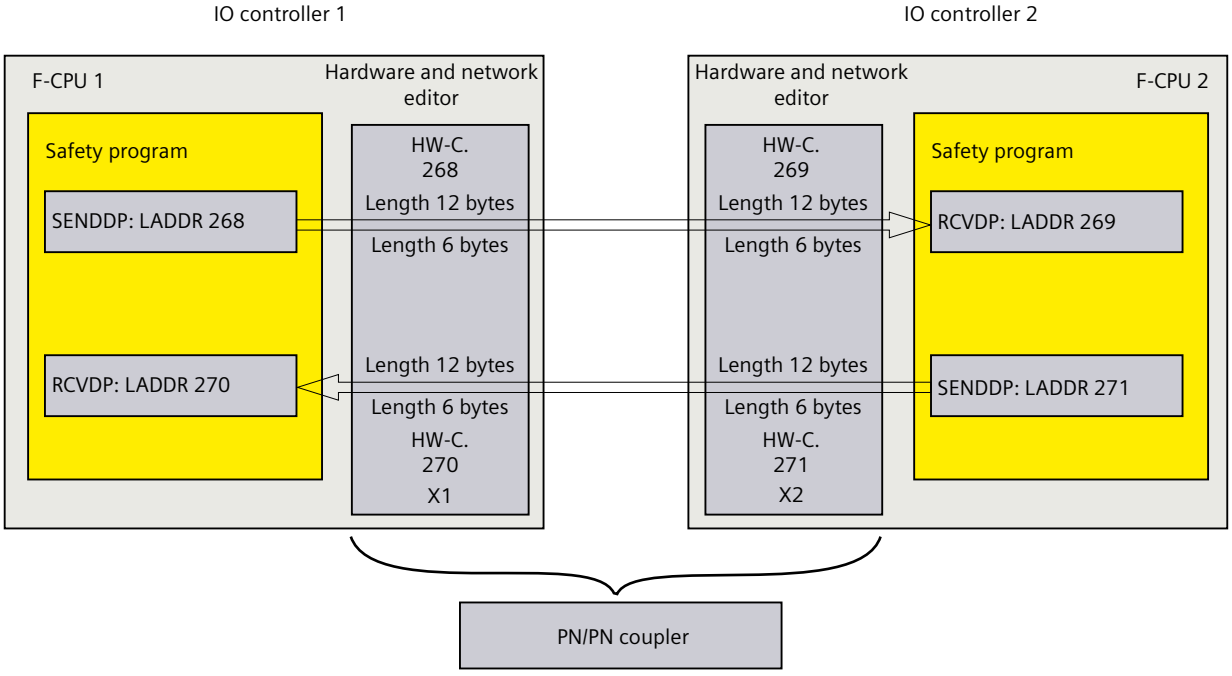
Safety-related CPU-CPU communication for *S7 Distributed Safety*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety*.

9.2.2 Safety-related IO controller-IO controller communication

9.2.2.1 Configure safety-related IO controller-IO controller communication

Introduction



Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

NOTE

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

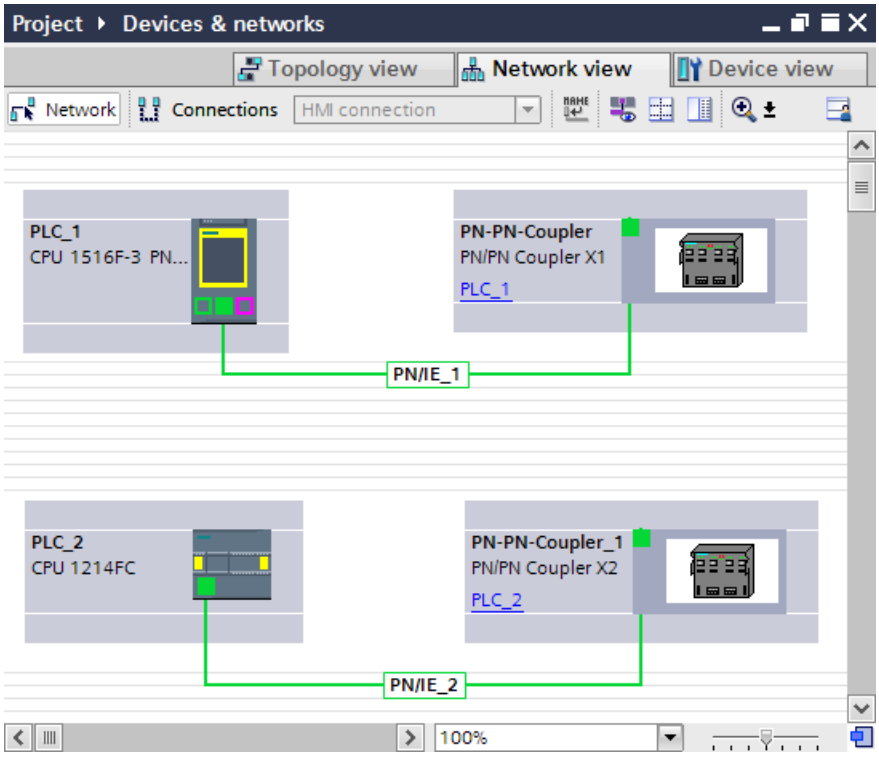
You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication).

Rules for defining transfer areas

Data to be sent:
A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:
A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

NOTE



PN/PN Coupler article number 6ES7158-3AD10-0XA0
When configuring the transfer areas for the output and input data, proceed as described in the "SIMATIC bus links PN/PN coupler (https://support.industry.siemens.com/cs/ww/en/view/44319532)" manual, section "Configuring the PN/PN Coupler with STEP 7 TIA Portal".

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.

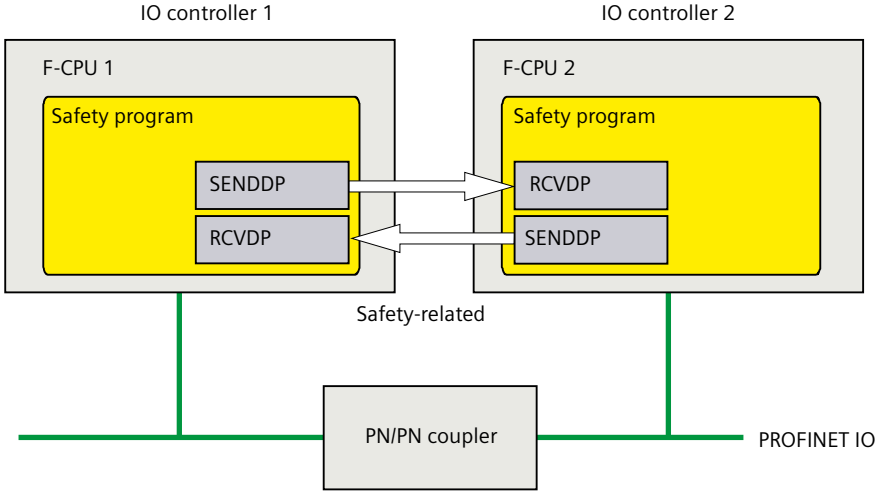
5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

NOTE

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

Device overview

Module	...	Rack	Slot	I address	Q address	Type	Article n...	Firmware
PN-PN-Coupler		0	0	8186*		PN/PN Coupler X1	6ES7 158...	V03.00.00
PN-IO-01		0	0 X1	8185*		PN-PN-Coupler		
IN/OUT 6 Byte / 12 Byte_1		0	1	0...5	0...11	IN/OUT 6 Bytes ...		
IN/OUT 12 Byte / 6 Byte_1		0	2	6...17	12...17	IN/OUT 12 Byte...		



6. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   - One "IN/OUT 12 bytes / 6 bytes" module and
   - One "IN/OUT 6 bytes / 12 bytes" module

Device overview

Module	...	Rack	Slot	I address	Q address	Type	Article n...	Firmware
PN-PN-Coupler_1		0	0	8186*		PN/PN Coupler X2	6ES7 158...	V03.00.00
PN-IO-02		0	0 X2	8185*		PN-PN-Coupler		
IN/OUT 12 Byte / 6 Byte_1		0	1	0...11	0...5	IN/OUT 12 Byte...		
IN/OUT 6 Byte / 12 Byte_1		0	2	12...17	6...17	IN/OUT 6 Bytes ...		

9.2.2.2 Program safety-related IO controller-IO controller communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the beginning or end of the main safety block.

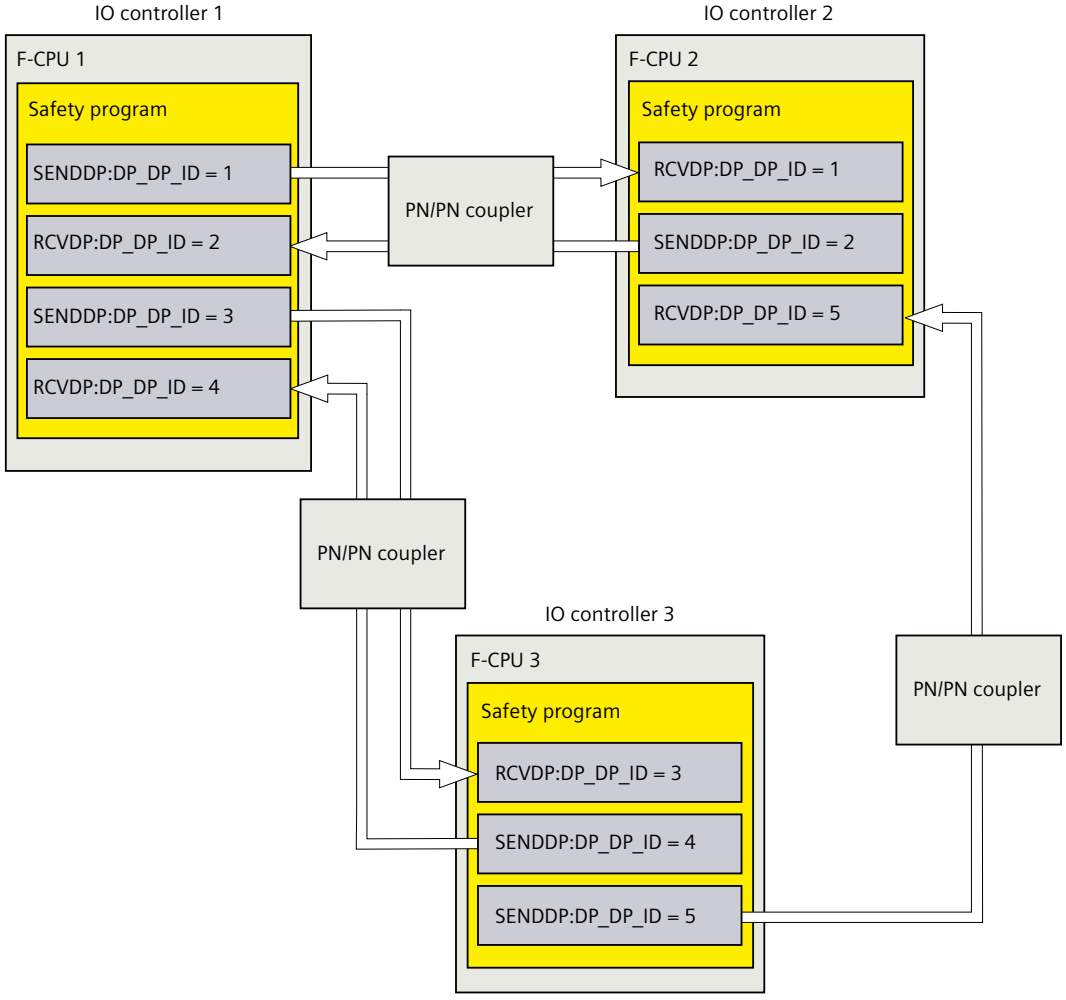
Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

Programming procedure



You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data is to be sent, call the SENDDP instruction (Page 599) for sending at the end of the main safety block.
2. In the safety program in which data is to be received, call the RCVDP instruction (Page 599) for receiving at the start of the main safety block.
3. Assign the HW identifiers (system constants in the default tag table) of the transfer areas for output and input data of the PN/PN coupler that are configured in the hardware and network editor to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related IO controller-IO controller communication relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide**** at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via

PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

**** With a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be regarded as one single F-CPU with regard to the DP_DP_ID.

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of variable substitute values:

     If you want to specify variable substitute values, define a tag that you calculate through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

⚠ WARNING

Note: The program logic for calculating variable substitute values can only be inserted after the RCVDP calls, because there must be no program logic before the RCVDP calls. This is why the initial values of the substitute values are active in all RCVDP instructions in the first cycle after a startup of the F-system. You must therefore assign appropriate initial values for these tags. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).
10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.
13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 386).

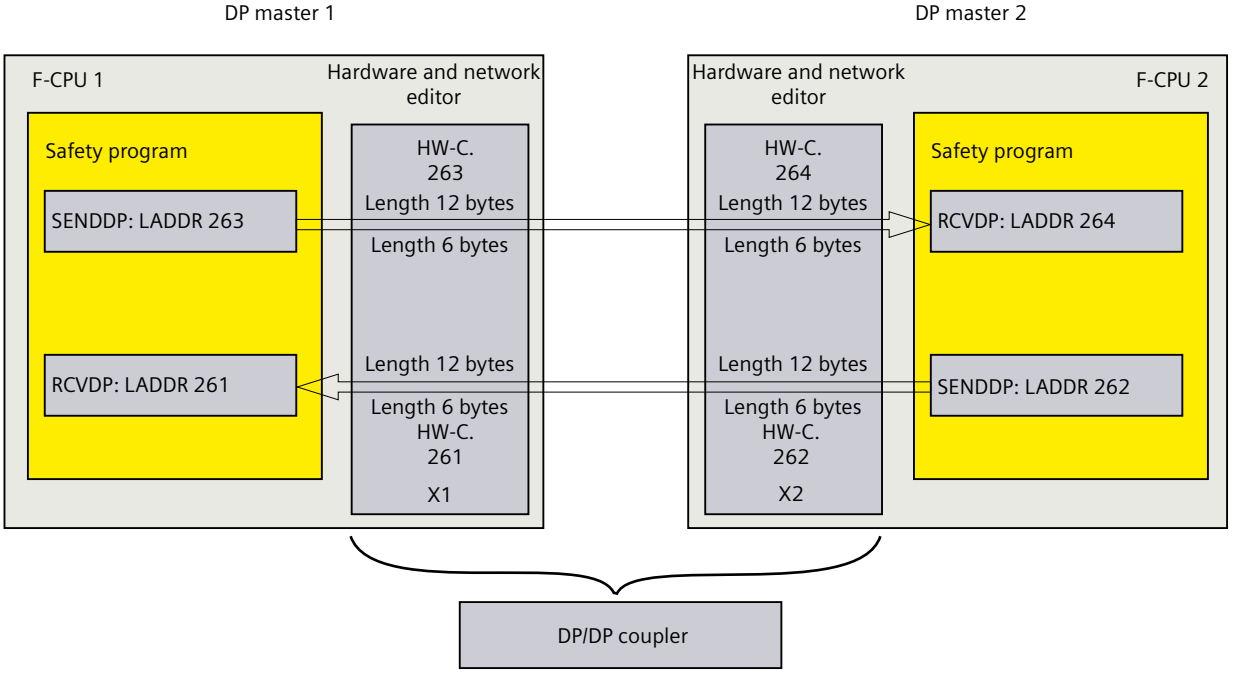
9.2.2.3 Safety-related IO controller-IO controller communication - Limits for data transfer

NOTE

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional communication connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.2.3 Safety-related master-master communication

9.2.3.1 Configure safety-related master-master communication



Introduction

Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

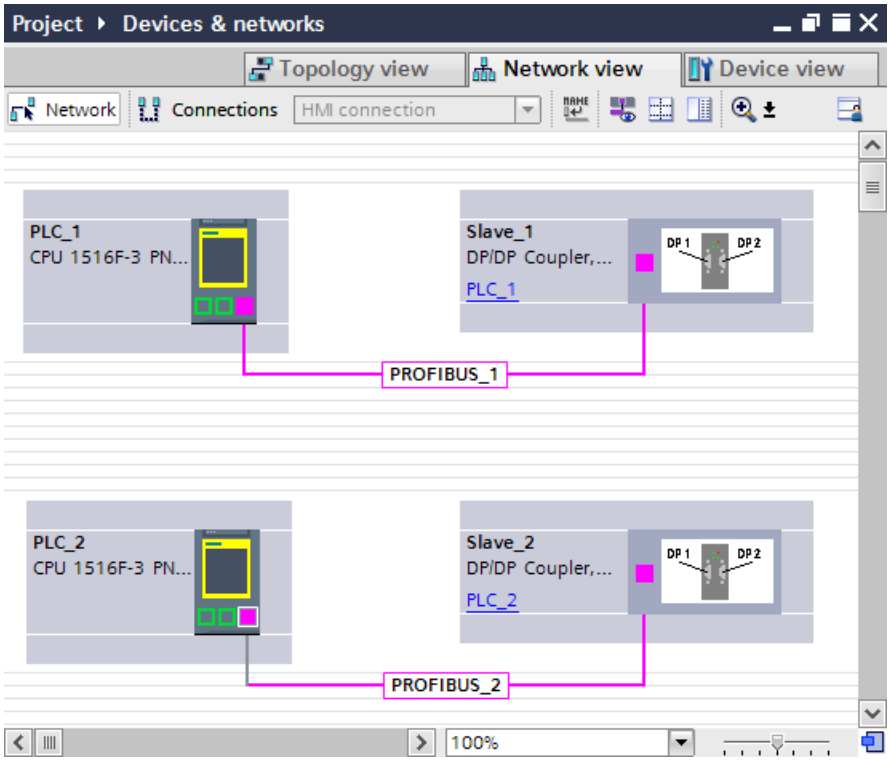
NOTE
Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).

Rules for defining transfer areas

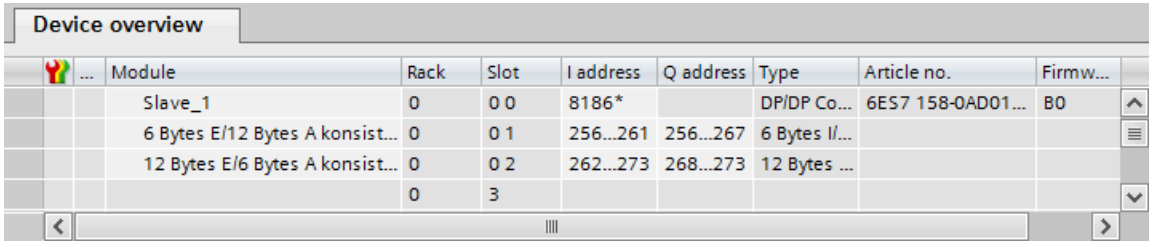
Data to be sent:
A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.



Data to be received:
A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

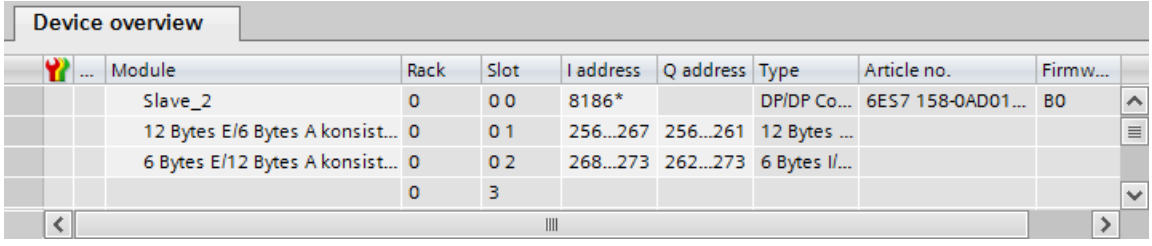
Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.



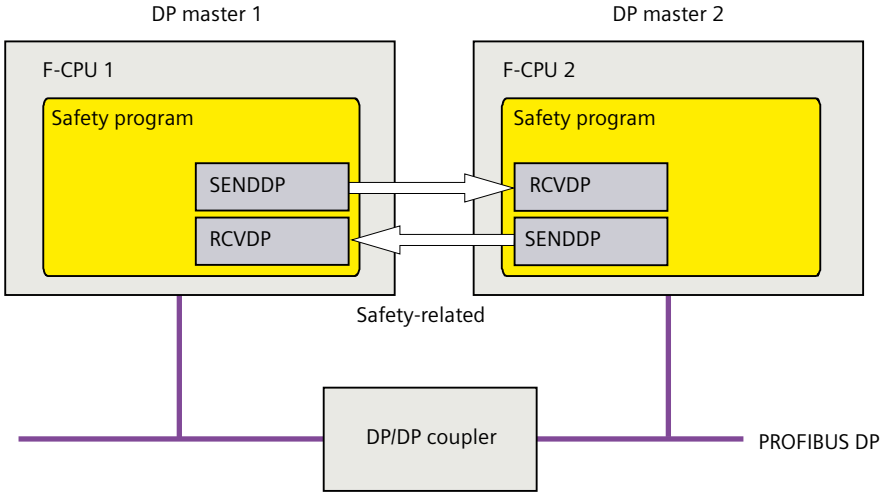
Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.



6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler, either via the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (https://support.industry.siemens.com/cs/ww/en/view/1179382) manual).
7. Switch to the device view of the DP/DP coupler PLC1 for bidirectional communication connections i.e. where each F-CPU should both send and receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab of the DP/DP coupler:
   - One "6 bytes I/12 bytes Q consistent" module, and
   - One "12 bytes I/6 bytes Q consistent" module

NOTE
The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.



8. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module

9.2.3.2 Program safety-related master-master communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the beginning or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

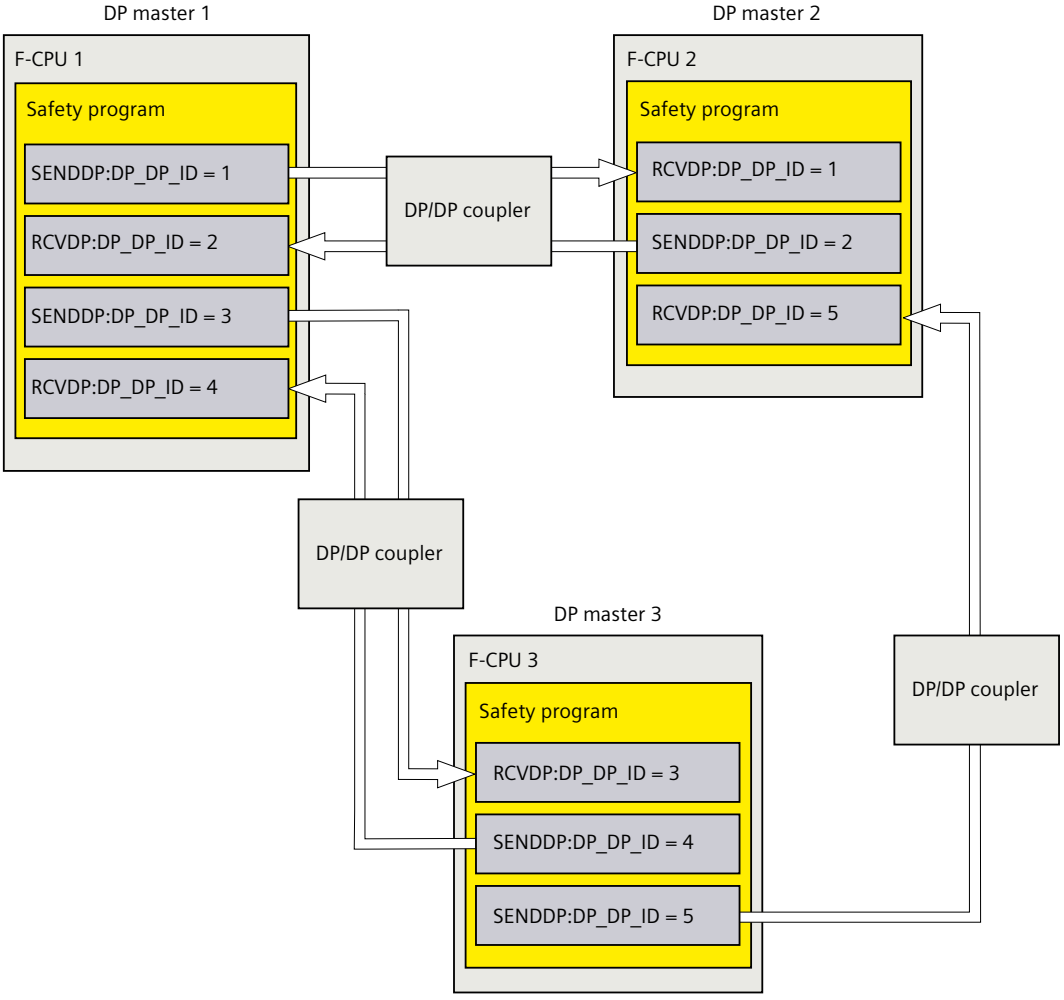
You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The address areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

You program safety-related master-master communication as follows:



1. In the safety program from which data is to be sent, call the SENDDP instruction (Page 599) for sending at the end of the main safety block or a separate F-FC/F-FB.
2. In the safety program in which data is to be received, call the RCVDP instruction (Page 599) for receiving at the start of the main safety block or a separate F-FC/F-FB.

3. Assign the HW identifiers for the output and input data of the DP/DP coupler configured in the *hardware and network editor* (constant in the tag table) to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related master-master communications relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via

PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of variable substitute values:

     If you want to specify variable substitute values, define a tag that you calculate through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

⚠ WARNING

Note: The program logic for calculating variable substitute values can only be inserted after the RCVDP calls, because there must be no program logic before the RCVDP calls. This is why the initial values of the substitute values are active in all RCVDP instructions in the first cycle after a startup of the F-system. You must therefore assign appropriate initial values for these tags. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.
13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the operator control and monitoring system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 386).

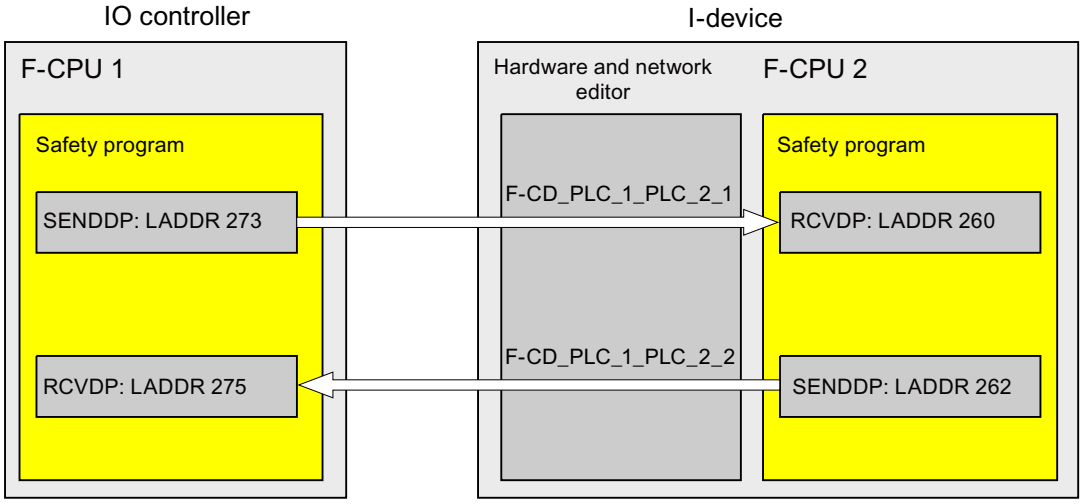
9.2.3.3 Safety-related master-master communication:Limits for data transfer

NOTE

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.2.4 Safety-related IO controller-I-device communication

9.2.4.1 Configuring safety-related communication between IO controller and I-device



Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device transfer areas (F-CD) in PROFINET IO, as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

Configuring transfer areas

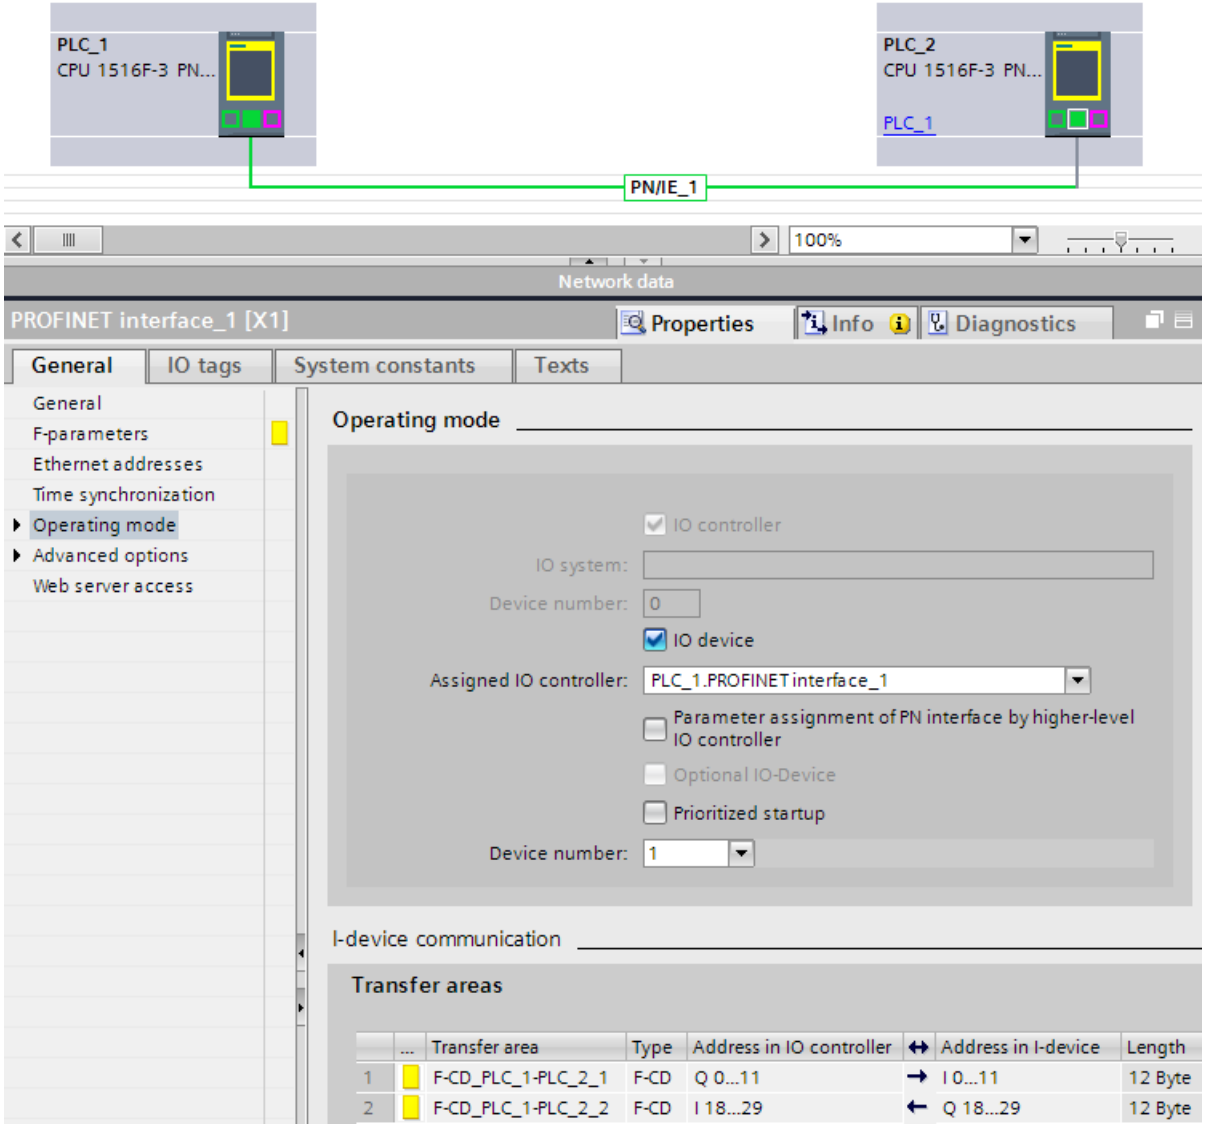
For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the IO controller and in the F-CPU of the I-device. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration



The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for receiving from the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned are displayed.

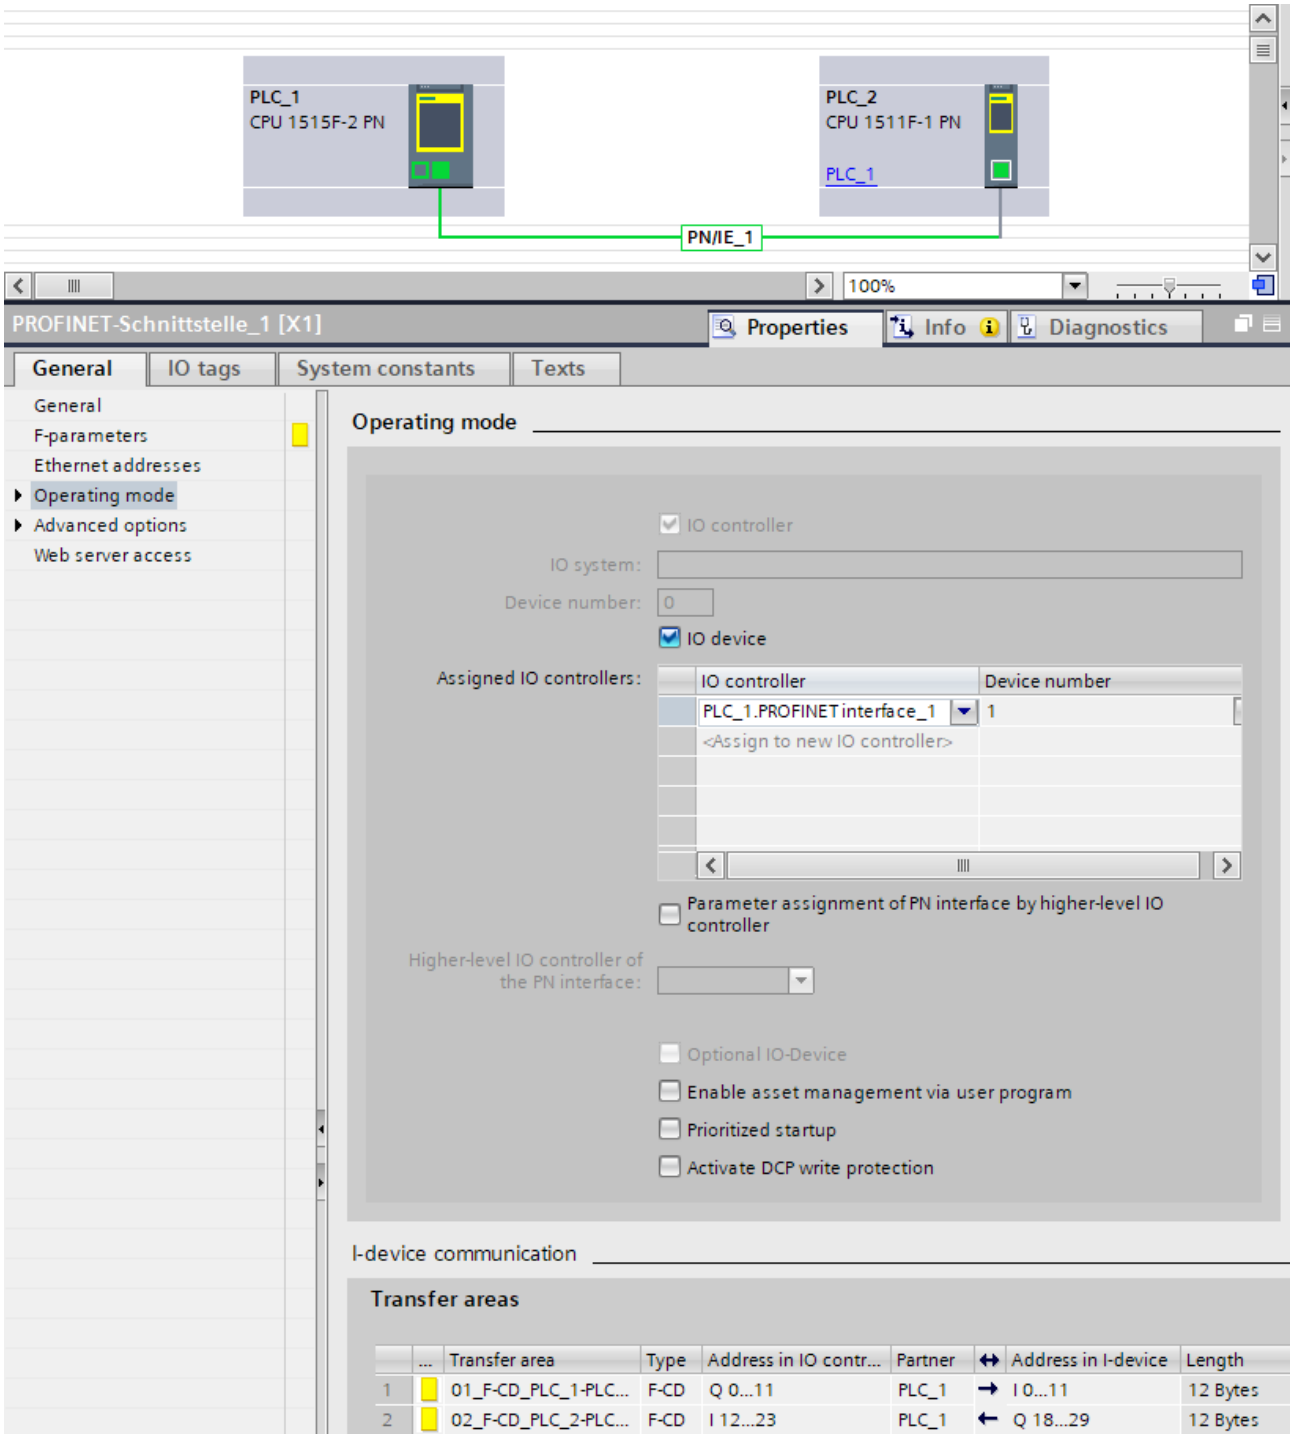
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").
4. Create an additional F-CD connection for sending to the IO controller.

5. In the transfer area you just created, click on the arrow to change the transfer direction to sending to the IO controller (←).

NOTE

You can assign up to four IO controllers in separate projects to the shared I-device, as in standard systems. To do this, export the I-device as a GSD file and import the GSD file into the projects of the IO controllers. Proceed as described in the *STEP 7 help* under "Configuring an I-device as a shared device".

Configuration procedure for an S7-1500 F-CPU as of firmware V3.1 or S7-1200 G2 F-CPU as I-device



The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. From the "Hardware catalog" task card, insert any S7-1200/1500 F-CPU into the project as F-CPU 1.
2. From the "Hardware catalog" task card, insert an S7-1200 G2/S7-1500 F-CPU as of firmware V3.1 into the project as F-CPU 2 (I-device).
3. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
4. Assign F-CPU 1 as an IO controller under "Assigned IO controllers".
5. Under "Transfer areas", you create an F-CD connection (type "F-CD") for receiving from the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned are displayed.

   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").
6. Create an additional F-CD connection for sending to the IO controller.

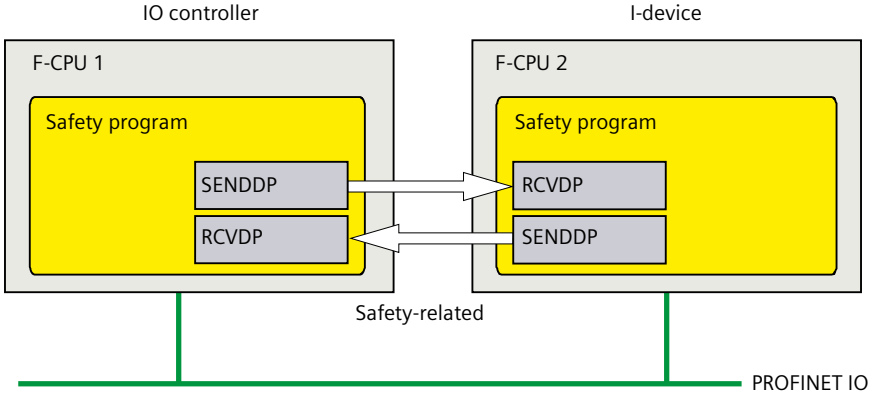
7. In the transfer area you just created, click on the arrow to change the transfer direction to sending to the IO controller (←).

NOTE

Shared I-device

If you use S7-1500 F-CPUs as of firmware V3.1 or S7-1200 G2 F-CPUs as IO controller, you can divide different transfer areas of an I-device (S7-1500 F-CPU as of firmware V3.1 or S7-1200 G2 F-CPU) between two IO controllers within the project. As of *STEP 7 Safety V20*, you can divide between four IO controllers within the project, if the I-device is an S7-1500 F-CPU with firmware V3.1 or higher.

To do this, assign the I-device to a second IO controller under "Assigned IO controllers". Select the desired IO controller (partner) for each transfer area.



More information can be found in the *STEP 7 help*.

NOTE

You have the option to assign up to four additional IO controllers to the shared I-device, like in the standard. To do this, export the I-device as a GSD file and import the GSD file into the projects of the IO controllers. Proceed as described in the *STEP 7 help* under "Configuring an I-device as a shared device".

9.2.4.2 Programming safety-related IO controller I-device communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

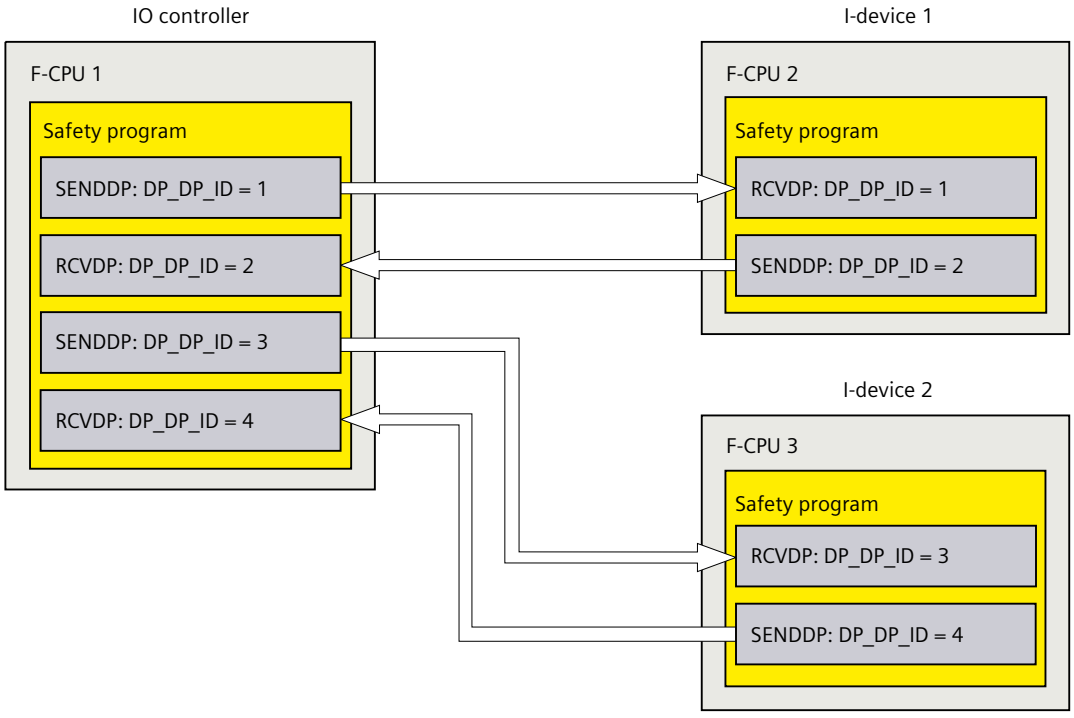
You can also call the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the beginning or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirement for programming

The transfer areas must be configured.



Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 246)).

The assignment of the HW identifiers (system constants in the standard tag table) of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table:

Instruction	HW identifier
SENDDP in the IO controller	Hardware identifier of the transfer area in the IO controller
RCVDP in the IO controller	Hardware identifier of the transfer area in the IO controller
SENDDP in the I-device	Hardware identifier of the transfer area in the I-device
RCVDP in the I-device	Hardware identifier of the transfer area in the I-device

The figure below contains an example of how to specify the F-communication IDs for the inputs of the SENDDP and RCVDP instructions for 4 safety-related IO controller-I-device communication relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide**** at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

**** With a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be regarded as one single F-CPU with regard to the DP_DP_ID.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time.*(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

9.2.4.3 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

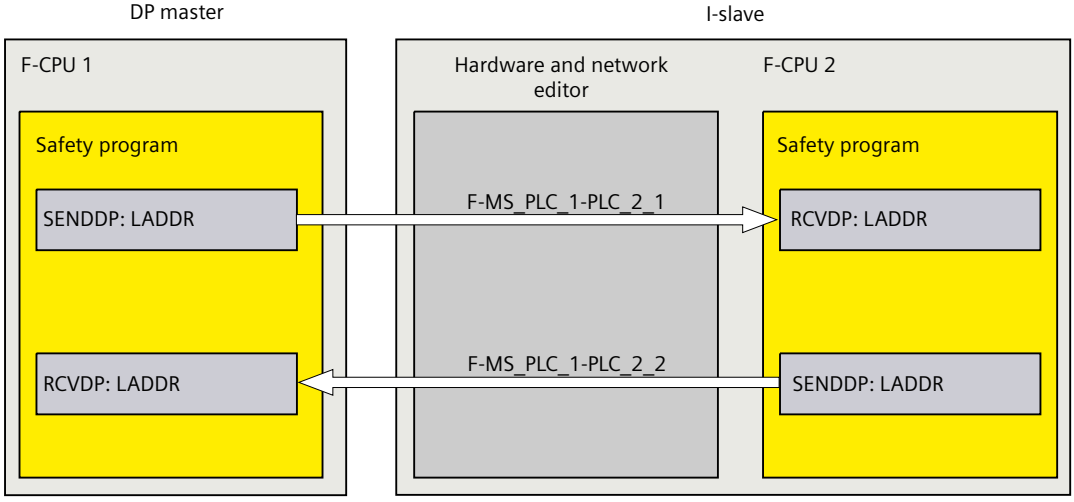
Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

You can find more information on the transfer areas in the *STEP 7 help* under "Rules for creating transfer areas".

9.2.5 Safety-related master-I-slave communication

9.2.5.1 Configuring safety-related master-I-slave communication



Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place via master-I-slave transfer areas (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

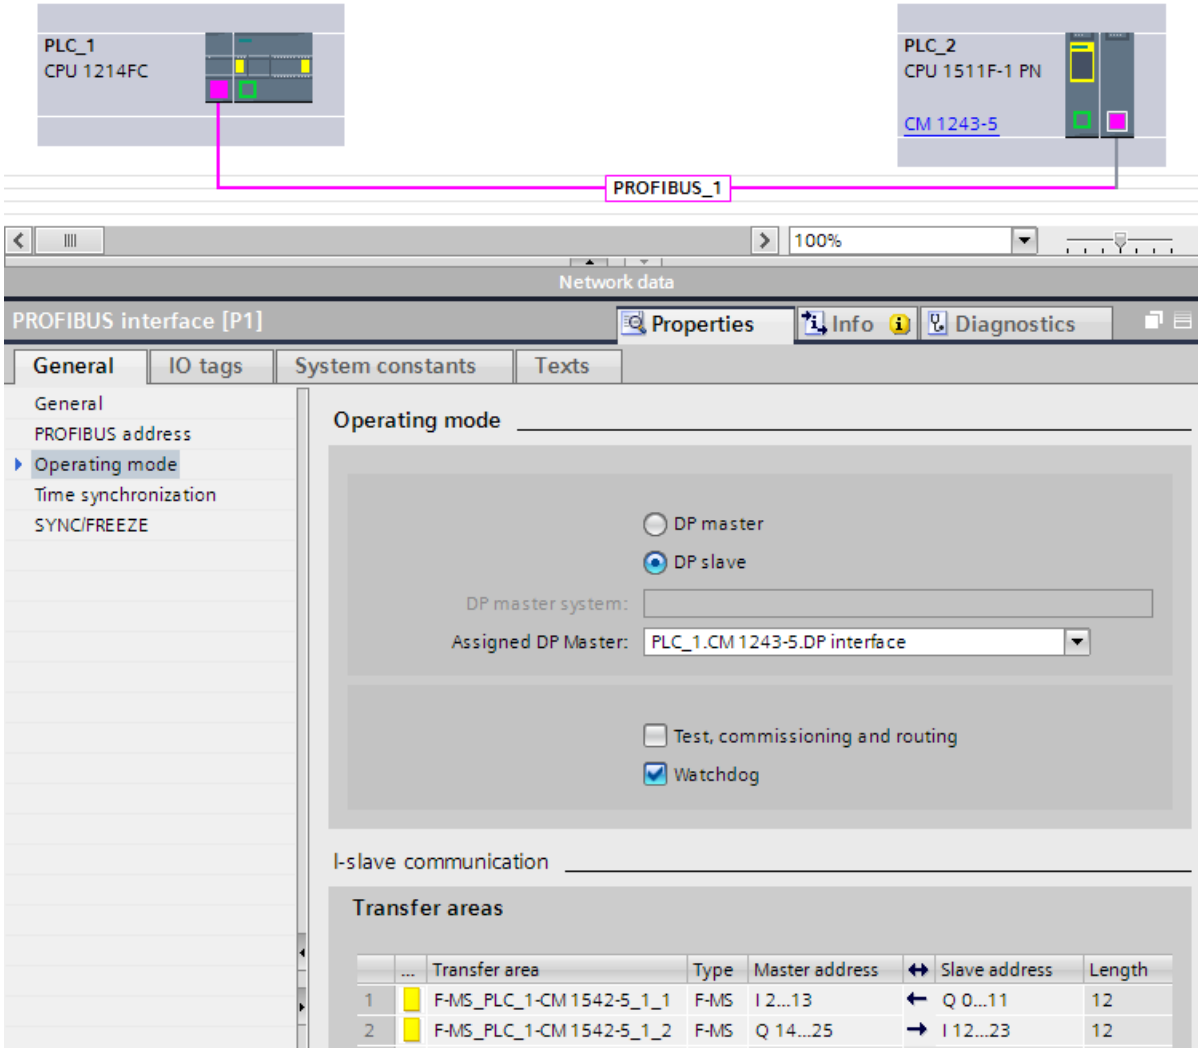
For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the DP master and in the F-CPU of the I-slave. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration



The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. If the F-CPU which is to be operated as DP master (F-CPU 1) does not have an integrated PROFIBUS DP interface, insert an PROFIBUS-CM, for example.
3. From the device view of the F-CPUs which are to be operated as I-slaves (F-CPU 2), insert a suitable CM DP module or CP DP module.
4. If necessary, enable "DP-slave" (I-slave) mode in the properties for the CM/CP DP module.
5. Assign the DP interface of the CM/CP to a DP interface of F-CPU 1.
6. Select the PROFIBUS interface of F-CPU 2 or of the CM. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the assigned transfer areas in the I-slave and DP master are displayed.

   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").
7. Create an additional F-MS connection for receiving from the DP master.

8. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).

9.2.5.2 Programming safety-related master-I-slave communication

Communication via SENDDP and RCVDP instructions

Safety-related communication between the F-CPUs of the DP master and an I-slave makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

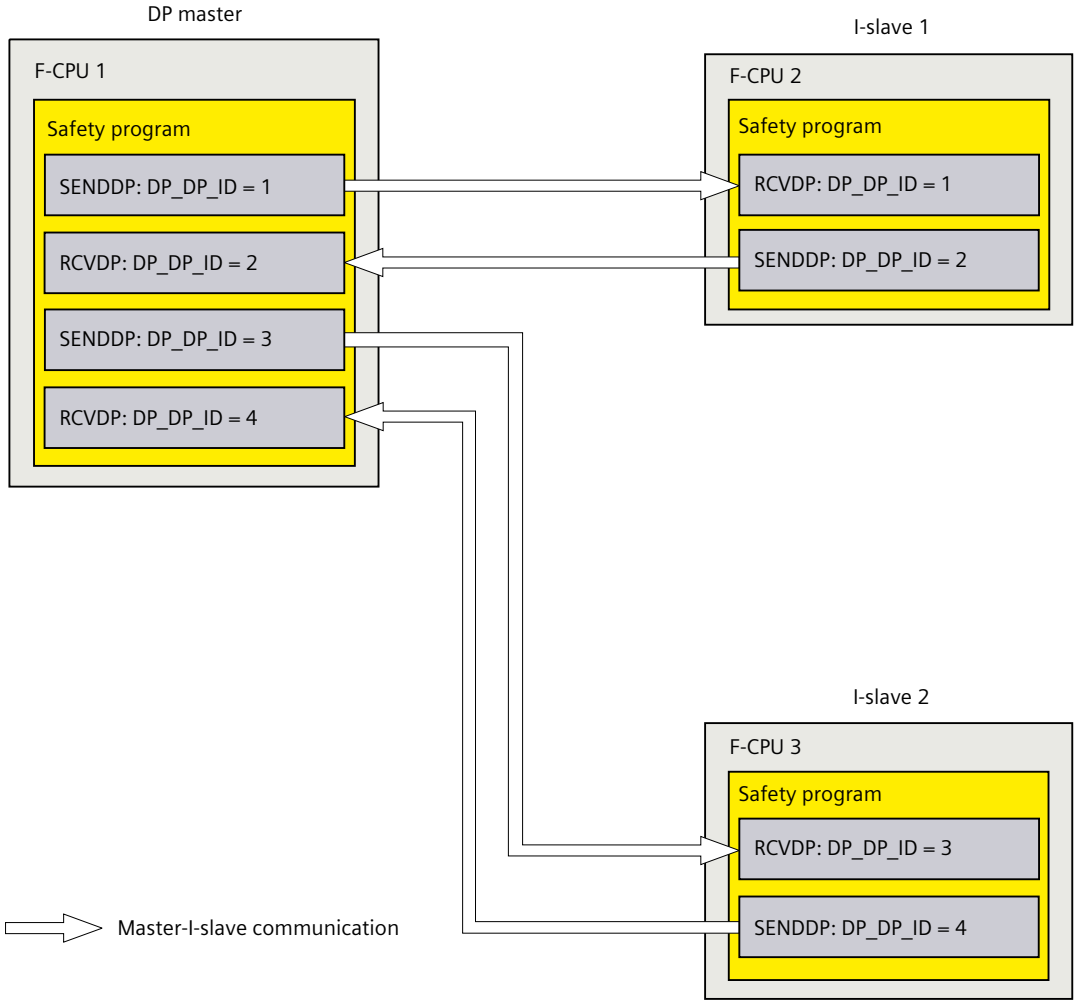
You can also call the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the beginning or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

You can find a detailed description of the SENDDP and RCVDP instructions in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21) (Page 599).

Requirements

The transfer areas must be configured.



Programming procedure

The procedure for programming safety-related master-I-slave communication is the same as that for programming safety-related master-master communication (see Safety-related master-master communication (Page 251)).

The assignment of the HW identifiers of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	HW identifier
SENDDP in the DP master	Hardware identifier of the respective transfer area in the DP master
RCVDP in the DP master	Hardware identifier of the respective transfer area in the DP master
SENDDP in the I-slave	Hardware identifier of the transfer area in the I-slave
RCVDP in the I-slave	Hardware identifier of the transfer area in the I-slave

The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for four safety-related master-I-slave communication relationships.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 615).

9.2.5.3 Limits for data transfer of safety-related master-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		DP master		I-slave	
		Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS and MS). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.2.6 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place via master-I-slave transfer areas (**F-**MS), as in standard systems.

IE/PB link

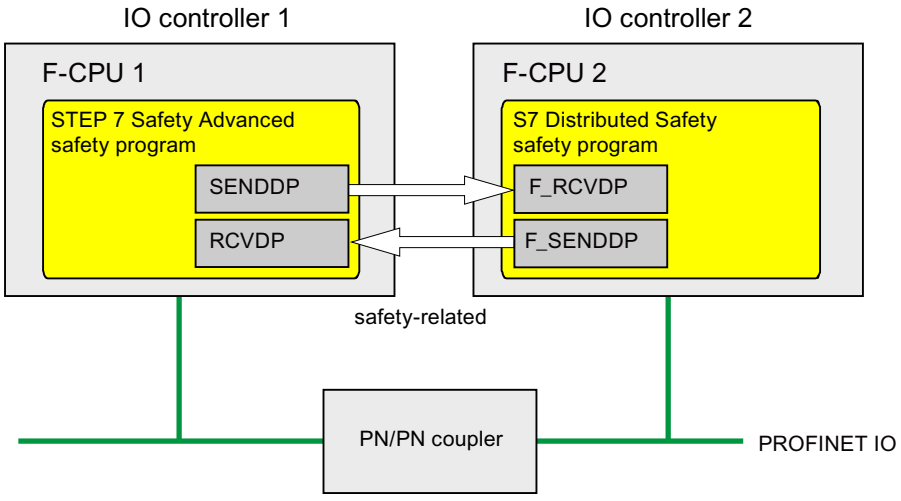
For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

NOTE

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 615)).
Note that the Excel file for calculating response times (https://support.industry.siemens.com/cs/ww/en/view/109783831) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 267) also applies.



9.2.7 Safety-related communication to S7 F-System S7 Distributed Safety

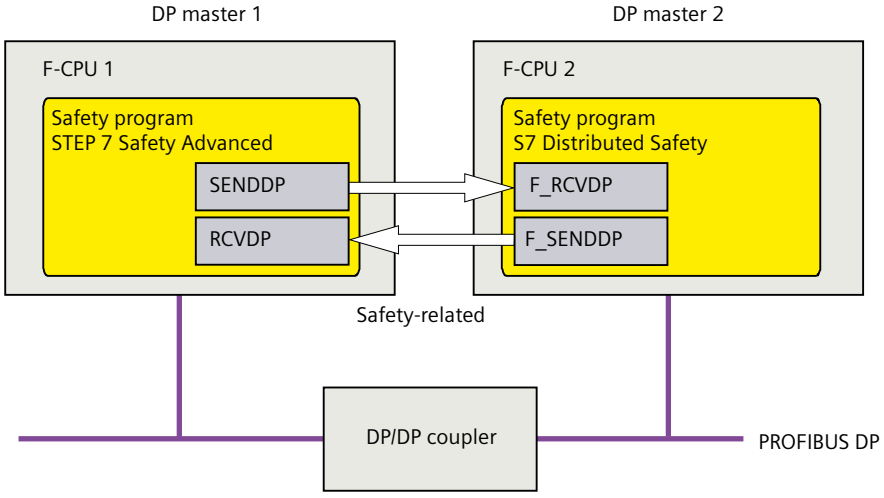
Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible, via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs, as IO controller-IO controller communication or master-master communication.

9.2.7.1 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:

Procedure at the *S7 Distributed Safety* end



At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related IO controller-IO controller communication (Page 243).

9.2.7.2 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:

Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in the section "Safety-related master-master communication" of the "S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875)" manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related master-master communication (Page 251).

9.3 Communication via SENDDP/RCVDP instructions between S7-300/400 and S7-1200/1500 F-CPUs

Introduction

This section provides an overview of the options for safety-related communication using SENDDP/RCVDP instructions between S7-300/400 F-CPUs and S7-1200/1500 F-CPUs in SIMATIC Safety F-systems.

Options for safety-related CPU-CPU communication

Safety-related communication	On subnet	Additional hardware required	Required instructions
Master-master communication	PROFIBUS DP	DP/DP coupler	SENDDP/RCVDP
Master-I-slave communication	PROFIBUS DP	—	SENDDP/RCVDP
IO controller-IO controller communication	PROFINET IO	PN/PN coupler	SENDDP/RCVDP
IO controller-I-device communication	PROFINET IO	—	SENDDP/RCVDP
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link	SENDDP/RCVDP

Basic procedure for configuring and programming

Configure and program safety-related communication between S7-300/400 F-CPUs and S7-1200/1500 F-CPUs as described in Communication via SENDDP/RCVDP or SENDS7/RCVS7(S7-300, S7-400) instructions: (Page 196) and Communication via SENDDP/RCVDP instructions (S7-1200, S7-1500): (Page 241) for your application.

To program an S7-300/400 F-CPU, use the start addresses of the transfer areas. To program an S7-1200/1500 F-CPU, use the HW identifiers of the transfer areas.

9.4 Communication via SENDDP/RCVDP instructions: IO controller and I-device in different projects

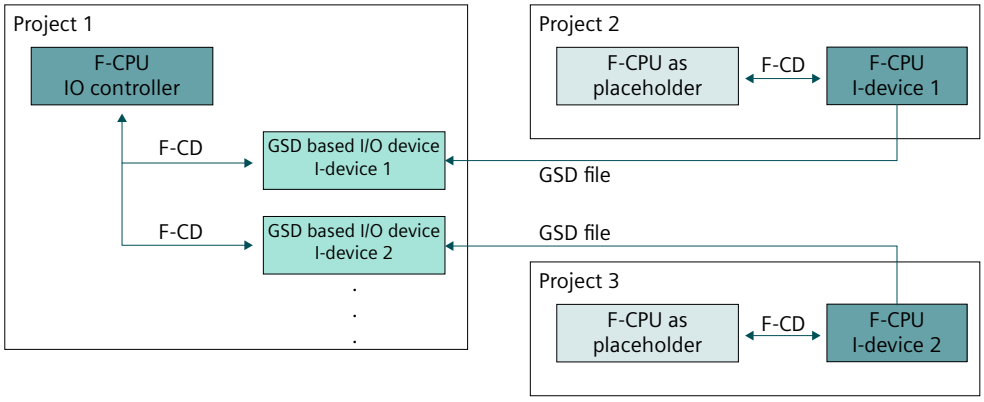
9.4.1 Configuring safety-related communication between IO controller and I-device

Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device transfer areas (F-CD) in PROFINET IO, as in standard systems.

The following section describes particular aspects when the IO Controller and the I-device are located in different projects.

Requirement



- The IO Controller is an S7-1200/1500 F-CPU that supports the IO Controller functionality.
- The I-device is an S7-300/400/1200/1500 F-CPU that supports the I-device functionality.
- The project in which the I-device is located, must have been created with *S7 Distributed Safety V5.4*, *STEP 7 Safety V13* or later.

Configuring

1. Configure the safety-related communication in the project with the I-device as described under "Configuring safety-related communication between IO controller and I-device (Page 214)" (S7-300, S7-400) or "Configuring safety-related communication between IO controller and I-device (Page 258)" (S7-1200, S7-1500) respectively. In this case the F-CPU 1 (IO Controller) is only a placeholder for the F-CPU in the project of the IO Controller.

   NOTE
   When creating with *STEP 7 Safety* < V14 SP1 avoid a subsequent change from the transfer areas from CD to F-CD.
   When creating with *S7 Distributed Safety V5.4* create the application transfer areas of the address type "Output" and "Input" directly after each other.

2. Export the I-device as a GSD file. Proceed as described in the *STEP 7* help under "Configuring an I-device".
3. Import the GSD file in the project with the IO Controller. Proceed as described in the *STEP 7* help under "Installing a GSD file".
4. Insert the I-device from the "Hardware catalog" task card into the project with the IO Controller.
5. Assign the F-CPU of the IO Controller to the I-device.

9.4.2 Programming safety-related IO Controller I-device communication

Programming procedure

To program the safety-related communication between the IO controller and I-device for an F-CPU S7-300/400, analogously follow the procedure described under "Programming safety-related IO controller I-device communication (Page 217)". To program an S7-300/400 F-CPU, use the start addresses of the transfer areas.

To program the safety-related communication between the IO controller and I-device for an F-CPU S7-1200/1500, analogously follow the procedure described under "Programming safety-related IO controller I-device communication (Page 263)". To program an S7-1200/1500 F-CPU, use the HW identifiers of the transfer areas.

9.5 Communication with OPC UA Safety (S7-1500)

With OPC UA Safety, you can exchange a defined data structure between an F-CPU S7-1500 and another F-CPU S7-1500 F-CPU or a device of a third-party manufacturer in a safety-related manner that supports OPC UA Safety. Optionally, you can also transfer non-safety-related data.

OPC UA Safety enables the configuration of static and dynamic connections. In the case of static connections, the communication relationship is already specified in the TIA Portal. In the case of dynamic connections, the communication relationship is only specified during runtime.

OPC UA Safety is specified by the OPC Foundation in OPC UA Specification OPC 10000-15 and is based on the mechanisms of OPC UA. SIMATIC Safety supports OPC UA client/server communication. More information can be found in the *STEP 7* help under "OPC UA communication".

For OPC UA Safety, the OPC Foundation provides a basic information model with the data types and methods needed for OPC UA Safety via a nodeset.

Based on this nodeset, you create the information model for your individual data structure as a nodeset as well.

OPC UA Safety designates a server interface that makes the safety-related data available as a SafetyProvider, and a corresponding client interface that reads the safety-oriented data from a SafetyProvider as a SafetyConsumer.

For a bidirectional communication connection, each communication partner must implement a SafetyProvider and a SafetyConsumer.

OPC UA Safety communication requires special parameter assignments, which you make using the Safety Parameter Interface (SPI). For communication with your Safety program or standard user program, the Safety Application Program Interface (SAPI) is available.

The following sections describe the Safety Parameter Interface (SPI) and the Safety Application Program Interface (SAPI) and the configuration and programming actions needed for an S7-1500 F-CPU for OPC UA Safety communication. All descriptions as well as the implementation of OPC UA Safety in the SIMATIC Safety F-system are based on the Version 1.05.04 of the OPC UA specification OPC 10000-15. For information on the procedure for devices of a third-party manufacturer, refer to the documentation of the device manufacturer.

NOTE

During simulation with *S7-PLCSIM*, the time monitoring that generates an error message after expiration when communication with real communication partners is interrupted (e.g. by setting a CPU to STOP) is not activated. This is why no error message is displayed in this case.

NOTE

The OPC UA Specification OPC 10000-15 specifies for the transfer of values of the BOOL data type that these be transferred in Byte format.

- "TRUE" is transferred as "0x01"
- "FALSE" is transferred as "0x00"

Since OPC UA Safety does not provide qualifier bits, they must be modeled, transferred and evaluated as part of the safety-related user data if necessary. The OPC UA Specification OPC 10000-15 prescribes the following semantics:

- "TRUE" or "0x01" corresponds to the "valid value" state
- "FALSE" or "0x00" corresponds to the "invalid value" state

Restrictions

The following *STEP 7 Safety* functions cannot be used together with OPC UA Safety:

- Safety program in RUN mode (S7-1200, S7-1500) (Page 399) (Fast Commissioning)
- Safety program in Software Unit (Safety Unit) (S7-1500) (Page 113)
- Consistent upload from the F-CPU (Page 89)

9.5.1 Configuration and programming interfaces

Introduction

A Safety Parameter Interface (SPI) and Safety Application Program Interface (SAPI) is available for each SafetyConsumer or SafetyProvider.

You must make special parameter assignments, which are required for the safety-related data transfer, in the SPI for each OPC UA Safety communication. To facilitate this, values are automatically assigned to the parameters whenever possible.

The SAPI forms the interface to your Safety program (or standard user program).

9.5.1.1 Safety Parameter Interface (SPI) of the SafetyProvider

The SPI of a SafetyProvider is shown in the properties of the SafetyProvider in the editor for server interfaces either during the creation of the information model with the special OPC UA modeling tool SiOME (Page 302) or later after import of the information model into TIA Portal (Page 307).

The following table shows the parameters of the SPI of a SafetyProvider.

Parameter	Data type	Changeable in TIA Portal	Description
SafetyProviderIDConfigured	UDINT	x	ID for authentication of a SafetyProvider
SafetyBaseIDConfigured	GUID	x	ID for authentication of a SafetyProvider
SafetyProviderLevel	BYTE	-	Safety Integrity Level (SIL) that can be achieved with the specific implementation of the SafetyProvider
SafetyStructureSignature	UDINT	-	Signature via the data structure of the OPC UA data type of the fail-safe data to be transferred
SafetyStructureSignatureVersion	UINT	-	Version of the algorithm for forming the SafetyStructureSignature

Parameter	Data type	Changeable in TIA Portal	Description
SafetyStructureIdentifier	STRING	-	Identifier of the OPC UA data types of the fail-safe data to be transferred (max. length 128 characters)
SafetyProviderDelay	UDINT	-	Maximum time in µs between the request of a SafetyConsumer and the response of a Safety-Provider
SafetyServerImplemented	BOOL	-	1=SafetyProvider supports OPC UA Client/Server communication
SafetyPubSubImplemented	BOOL	-	1=SafetyProvider supports OPC UA PubSub communication

The values of the SPI parameters of a SafetyProvider are always assigned automatically during import of the information model (Page 302) if a value has not yet been entered for a parameter in the information model. Previously entered values are applied if permissible. If there are impermissible values, an error message is output.

SafetyProviderIDConfigured/SafetyBaseIDConfigured

The SafetyProviderIDConfigured and SafetyBaseIDConfigured SPI parameters are used to uniquely and safely authenticate a SafetyProvider. For applications with changing communication partners (Page 327) or series machines (Page 326), you can overwrite the values of these SPI parameters using the SAPI parameters SafetyProviderID and SafetyBaseID (Page 284). The value that is actually in effect during runtime of the Safety program is referred to in this document as the "active SafetyBaseID" or "active SafetyProviderID".
Different combinations are conceivable with regard to the unique authentication:

- The active SafetyBaseID is identical for all SafetyProviders within a certain area of the system. The unique authentication within this plant area must take place through different active SafetyProviderIDs.
- The active SafetyProviderID is identical for all SafetyProviders. The unique authentication must then take place solely through different active SafetyBaseIDs.
- Neither the active SafetyProviderIDs nor the active SafetyBase IDs of all SafetyProviders within a specific area are identical. The unique authentication only takes place through different combinations of active SafetyProviderIDs and active SafetyBaseIDs.

In the case of automatic assignment, the following values are entered. The uniqueness is achieved solely using the SafetyBaseIDConfigured:

- **SafetyProviderIDConfigured:** If no local data mapping is available for the SAPI parameter SafetyProviderID, the value "1" is assigned. Otherwise, the value "0" is assigned.
- **SafetyBaseIDConfigured:** If no local data mapping is available for the SAPI parameter SafetyBaseID, a randomly generated value is assigned that fulfills the safety requirements of OPC UA Specification OPC 10000-15. Otherwise, the value "0" is assigned.

⚠ WARNING

For the unique and secure authentication of a SafetyProvider, the combination of active SafetyProviderID and active SafetyBaseID at any point in time must be unique for all OPC UA Safety communication connections network-wide. **
If your network is not safely separated from the outside world through physical separation, the active SafetyBaseID at any point in time must be a value that was generated randomly in accordance with the OPC UA Specification OPC 10000-15. ***
You must ensure the uniqueness in the safety summary during acceptance of the safety program. If the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S102)*

* If you cannot ensure a unique combination during startup of the Safety program because the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID is "0" during this phase.

** SafetyProviders to which the same local data element of your safety program is mapped (Safety Multicast (Page 325)) at the SafetyData SAPI parameter are permitted to use the same combination.

*** If you have entered a value for the SPI parameter SafetyBaseIDConfigured of a SafetyProvider (either in the NodeSet or in the properties of a SafetyProvider), you yourself must ensure that the value meets the safety requirements of the OPC UA Specification OPC 10000-15. Alternatively, generate the value of SafetyBaseIDConfigured again by opening the properties tab of the affected SafetyProvider and clicking on the "Generate" button.

⚠ WARNING

If you have not defined any value for the SPI parameter of a SafetyProvider in the NodeSet for the SPI parameter, a sufficiently clear UUIDV4 is made available from the system as a value for the parameter of the respective SafetyProvider when importing the NodeSet into the TIA Portal.
Through subsequent copying of a SafetyProvider (e.g. copying the NodeSet to another F-CPU, copying the F-CPU or copying the project), values provided by the system are not generated again and are therefore not unique anymore.
If such a copy is used to configure a new communication relationship, you yourself need to ensure the uniqueness. To do this, open the properties tab of all affected SafetyProvider and generate the value of SafetyBaseIDConfigured again by clicking on the "Generate" button.
The uniqueness must be checked in the safety summary during acceptance. *(S110)*

SafetyProviderLevel

The SafetyProviderLevel SPI parameter is used to publicize the Safety Integrity Level (SIL) that can be achieved by a specific SafetyProvider implementation.

With automatic assignment, the value "3" is entered. This corresponds to the maximum SIL achievable with SIMATIC Safety and is the only permissible value.

SafetyStructureSignature

The SafetyStructureSignature SPI parameter is used to protect and identify the data structure at the SafetyData of the OPC UA data type of the SAPI parameters via a signature.

With automatic assignment, the value is calculated according to the algorithm prescribed in OPC UA Specification OPC 10000-15.

SafetyStructureSignatureVersion

The SafetyStructureSignatureVersion SPI parameter is used to specify the version of the algorithm used to calculate the SafetyStructureSignature.

With automatic assignment, the value "1" is entered. This corresponds to the only permissible value at the present time.

SafetyStructureIdentifier

With the SPI parameter SafetyStructureIdentifier the identifier of the OPC UA data types of the SAPI parameter SafetyData is publicized. The SafetyStructureIdentifier is included in the calculation of the SafetyStructureSignature.

With automatic assignment, the name of the OPC UA data type that describes the data structure at the SafetyData SAPI parameter is entered.

SafetyProviderDelay

The SafetyProviderDelay SPI parameter is used to publicize the maximum time (in µs) that can elapse between the reception of the request of a SafetyConsumer and the sending of the response of a SafetyProvider under worst-case conditions. For more details, refer to OPC UA Specification OPC 10000-15.

In the case of automatic assignment, the value "0" is entered at the present time.

SafetyServerImplemented

The SafetyServerImplemented SPI parameter is used to publicize whether the SafetyProvider supports OPC UA Client/Server communication mechanisms.

In the case of automatic assignment, the value "TRUE" is entered. This corresponds to the only permissible value since SIMATIC Safety supports only OPC UA client/server communication.

SafetyPubSubImplemented

The SafetyPubSubImplemented SPI parameter is used to publicize whether the SafetyProvider supports OPC UA PubSub communication mechanisms.

With automatic assignment, the value "FALSE" is entered. This corresponds to the only permissible value since SIMATIC Safety does not support OPC UA PubSub communication.

9.5.1.2 Safety Application Program Interface (SAPI) of the SafetyProvider

The SAPI of a SafetyProvider is shown in the properties of the SafetyProvider in the editor for server interfaces either when the information model is created in SiOME (Page 302) or after the information model is imported into TIA Portal (Page 307). These properties are stored in the internal F-OPC-UA-Provider-DB. The name is shown in the SAPI interface and listed in the safety summary.

The following table shows the parameters of the SAPI of a SafetyProvider.

SAPI parameters	Data type of the mapped local data element	Mapping to a local data element of the Safety program	Mapping to a local data element of the standard user program	Description
SafetyData	UDT	x	-	Data that is made available to a SafetyConsumer in a safety-related manner
NonSafetyData	UDT	-	x	Data that is made available to a SafetyConsumer in a non-safety-related manner
InputSignals	UDT			Summary of the following SAPI parameters
OperatorAck-Provider	BOOL	x	-	1=User acknowledgment at SafetyProvider end
ActivateFSV	BOOL	x	-	1=SafetyConsumer to output substitute values
EnableTest-Mode	BOOL	x	-	1=Current values at the SafetyData SAPI parameter are test data
OutputSignals	UDT			Summary of the following SAPI parameters
OperatorAck-Requested	BOOL	-	x	1=Acknowledgment request at the SafetyConsumer side is pending
Monitoring-Number	UDINT	-	x	Current MonitoringNumber
SafetyCon-sumerID	UDINT	-	x	ID for authentication of the connected SafetyConsumer
SafetyProviderID	UDINT	x	-	ID for authentication of a SafetyProvider
SafetyBaseID	GUID	-	x	ID for authentication of a SafetyProvider

To establish a connection of your Safety program (or standard user program) to a SafetyProvider, you must map all required SAPI parameters to a local data element of your Safety program (or standard user program) in SiOME (Page 302) ("Local data mapping").

SafetyData

The SAPI parameter SafetyData is used to transfer the data of your Safety program that you want to make available to a connected SafetyConsumer in a safety-related manner. The data structure of this data must be described in an F-compliant PLC data type (UDT) which agrees with the data structure of the OPC UA data type of SafetyData. This F-compliant PLC data type (UDT) may only contain the BOOL, INT and DINT data types.

⚠ WARNING

During communication with OPC UA Safety, it is only ensured that a signal state to be transferred is acquired and transferred to the receiver if it is pending for at least twice as long as the assigned monitoring time (SafetyConsumerTimeout). *(S109)*

⚠ WARNING

For each communication connection with OPC UA Safety, you must ensure when accepting the Safety program that the data structure of the OPC UA data types used by SafetyData matches on the SafetyProvider and SafetyConsumer side. In particular, the correct order of elements of the same data type is relevant. You can find the structures of the OPC UA data types used in the respective safety summary.
To identify the communication connection, note the following points:

- For static connections:
  To do this identify the communication connection by means of the combination of SafetyProviderIDConfigured and SafeBaseIDConfigured.
- For dynamic connections:
  To do this, identify the communication connection by means of the algorithm for the allocation of the values for SafetyProviderID and SafetyConsumerID.

(S111)

NonSafetyData

The SAPI parameter NonSafetyData is used to transfer the data of your standard user program that you want to make available to a connected SafetyConsumer in a non-safety-related manner synchronously with the SafetyData. The data structure of this data must be written in a PLC data type (UDT) which agrees with the data structure of the OPC UA data type of NonSafetyData.

This PLC data type (UDT) can only contain the data types BOOL, SINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL, LREAL, WSTING, LDT and nested PLC data types (UDTs).

InputSignals

The SAPI parameter InputSignals is used to summarize the SAPI parameters OperatorAckProvider, ActivateFSV and EnableTestMode. These SAPI parameters enable you to trigger certain actions on the connected SafetyConsumer or communicate certain status information about the SafetyData to the SafetyConsumer.

An F-compliant PLC data type (UDT) that contains all the InputSignals listed in the above table is needed to use these SAPI parameters:

- **OperatorAckProvider**
  With the OperatorAckProvider SAPI parameter, you also have the option of performing user acknowledgment on the SafetyProvider side and informing the Safety program on the SafetyConsumer side (see also SAPI parameters OperatorAckConsumer and OperatorAckProvider (Page 293) of the SafetyConsumer).

  ⚠ WARNING

  A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

- **ActivateFSV**
  With the ActivateFSV SAPI parameter, you can instruct a connected SafetyConsumer to output the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) instead of the current values at the SafetyData SAPI parameter. In order for the current values to be output at the SAPI parameter SafetyData again after ActivateFSV is reset, a user acknowledgment may be required.
- **EnableTestMode**
  With the SAPI parameter EnableTestMode, you can inform a connected SafetyConsumer that the current values at the SAPI parameter SafetyData are test data and, thus, were not formed in a safety-related manner.

OutputSignals

The SAPI parameter OutputSignals is used to summarize the SAPI parameters OperatorAckRequested, MonitoringNumber and SafetyConsumerID. These SAPI parameters allow you to evaluate certain information of the connected SafetyConsumer.

A PLC data type (UDT) that contains all the OutputSignals listed in the above table is needed to use these SAPI parameters:

- **OperatorAckRequested**
  You can use the OperatorAckRequested SAPI parameter to evaluate whether there is an acknowledgment request on the SafetyConsumer.
- **MonitoringNumber**
  With the SAPI parameter MonitoringNumber, you can evaluate the current MonitoringNumber for diagnostic purposes. More information can be found in the OPC UA Specification OPC 10000-15.
- **SafetyConsumerID**
  With the SAPI parameter SafetyConsumerID, you can evaluate the SafetyConsumerID of the SafetyConsumer for diagnostic purposes. More information can be found in the OPC UA Specification OPC 10000-15.

SafetyProviderID/SafetyBaseID

With the SAPI parameters SafetyProviderID and SafetyBaseID, you can uniquely and reliably authenticate a SafetyProvider at dynamic connections. For more information, refer to the sections "Series machines (Page 326)" and "Changing communication partners (Page 327)".

SafetyProviderID and/or SafetyBaseID are initialized with values matched to the specific situation in the system during runtime of the Safety program (or standard user program). As long as the relevant value <> 0, the value assigned to the SPI parameters SafetyProviderIDConfigured and SafetyBaseIDConfigured is overwritten.

If the active SafetyProviderID or SafetyBaseID is "0", no communication with a SafetyConsumer can take place.

NOTE

The instructions "Random", "Get_IM_Data", "RD_SYS_T" and "SHA2" are available for generating a SafetyBaseID. These instructions enable the safety requirements of OPC UA Specification OPC 10000-15 regarding randomly generated values to be fulfilled.

You can find application examples for concrete implementation on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109977450).

⚠ WARNING

For the unique and secure authentication of a SafetyProvider, the combination of active SafetyProviderID and active SafetyBaseID at any point in time must be unique for all OPC UA Safety communication connections network-wide. **
If your network is not safely separated from the outside world through physical separation, the active SafetyBaseID at any point in time must be a value that was generated randomly in accordance with the OPC UA Specification OPC 10000-15. ***
You must ensure the uniqueness in the safety summary during acceptance of the safety program. If the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S102)*

* If you cannot ensure a unique combination during startup of the Safety program because the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID is "0" during this phase.

** SafetyProviders to which the same local data element of your safety program is mapped (Safety Multicast (Page 325)) at the SafetyData SAPI parameter are permitted to use the same combination.

*** If you have entered a value for the SPI parameter SafetyBaseIDConfigured of a SafetyProvider (either in the NodeSet or in the properties of a SafetyProvider), you yourself must ensure that the value meets the safety requirements of the OPC UA Specification OPC 10000-15. Alternatively, generate the value of SafetyBaseIDConfigured again by opening the properties tab of the affected SafetyProvider and clicking on the "Generate" button.

⚠ WARNING

Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
Note that these program sections are therefore not captured by the Collective F-Signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
Print the relevant program sections and supplement your safety summary with this printout. *(S103)*

9.5.1.3 Safety Parameter Interface (SPI) of the SafetyConsumer

The SPI of a SafetyConsumer is displayed to you after adding a SafetyProvider in the SafetyProvider list of the client interface (Page 315) in the properties of the SafetyConsumer in the editor for client interfaces (Page 319).

The following table shows the parameters of the SPI of a SafetyConsumer.

Parameter	Data type	Changeable in TIA Portal	Description
SafetyProviderIDConfigured	UDINT	x	ID for authentication of the intended SafetyProvider
SafetyBaseIDConfigured	GUID	x	ID for authentication of the intended SafetyProvider

Parameter	Data type	Changeable in TIA Portal	Description
SafetyConsumerIDConfigured	UDINT	x	ID for authentication of a SafetyConsumer
SafetyProviderLevel	BYTE	x	Safety Integrity Level (SIL) expected from the specific implementation of the connected SafetyProvider
SafetyStructureSignature	UDINT	-	Signature via the data structure of the OPC UA data type of the fail-safe data to be transferred
SafetyStructureSignatureVersion	UINT	-	Version of the algorithm for forming the SafetyStructureSignature
SafetyStructureIdentifier	STRING	-	Identifier of the OPC UA data types of the fail-safe data to be transferred (max. length 128 characters)
SafetyConsumerTimeout	UDINT	x	Monitoring time in µs: Maximum permissible time between the request from a SafetyConsumer and the receipt of the response from a SafetyProvider in the SafetyConsumer
SafetyOperatorAckNecessary	BOOL	x	1=Acknowledgment required
SafetyErrorIntervalLimit	INT	x	Minimum time in min. between two communication errors
SafetyClientImplemented	BOOL	-	1=SafetyConsumer supports OPC UA client/server communication mechanism
SafetyPubSubImplemented	BOOL	-	1=SafetyConsumer supports OPC UA PubSub communication mechanism

The values of individual SPI parameters of a SafetyConsumer are automatically assigned when the intended SafetyProvider is added to the SafetyProvider list of the client interface (Page 315) if no value has yet been entered for these parameters in the OPC UA SafetyProvider information model or if the parameters do not exist at the SafetyProvider. Previously entered values are applied if permissible. If necessary, you have to adjust the values in the properties of the SafetyConsumer in the editor for client interfaces (Page 315). An error message is displayed for invalid values.

SafetyProviderIDConfigured/SafetyBaseIDConfigured

The SafetyProviderIDConfigured and SafetyBaseIDConfigured SPI parameters are used to uniquely and safely authenticate a SafetyProvider. For applications with changing communication partners (Page 327) or series machines (Page 326), you can overwrite the values of these SPI parameters in the F-OPC-UA-Consumer-DB (Page 297) using the SAPI parameters SafetyProviderID and SafetyBaseID. The value that is actually in effect during runtime of the Safety program is referred to hereinafter as the "active SafetyBaseID" or "active SafetyProviderID".

If the active SafetyProviderID or SafetyBaseID is "0", the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) to the Safety program instead of the current values at the SafetyData SAPI parameter.

If the correct values are not yet present in the SafetyProvider list of the client interface (Page 315) when adding the intended SafetyProvider, you must enter these in the properties of the SafetyConsumer in the editor for client interfaces (Page 315).

⚠ WARNING

For secure authentication of the SafetyProvider whose SafetyData is to be evaluated, the values of the active SafetyProviderID and active SafetyBaseID of the SafetyConsumer must correspond to the values of the active SafetyProviderID and active SafetyBaseID of this SafetyProvider at all times*.
When accepting the Safety programs, you must ensure compliance in the relevant safety summary. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S104)*

* If you cannot yet provide the values when starting the Safety program because they are only created during the runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID or the Enable "0" SAPI parameter in this phase.

SafetyConsumerIDConfigured

The SafetyConsumerIDConfigured SPI parameter can be used to uniquely authenticate a SafetyConsumer, particularly for diagnostic purposes in applications with Safety Multicast (Page 325). For more details, refer to OPC UA Specification OPC 10000-15.

For applications with changing communication partners (Page 327) or series machines (Page 326), you can overwrite the value of this SPI parameter via the SafetyConsumerID (Page 293) SAPI parameter. The value that is actually in effect at runtime of the Safety program is referred to below as the "active SafetyConsumerID".

If the active SafetyConsumerID is "0", the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) to the Safety program instead of the current values at the SafetyData SAPI parameter.

When the foreseen SafetyProvider is added to the SafetyProvider list of the client interface (Page 315), a randomly generated value is assigned.

SafetyProviderLevel

The SafetyProviderLevel SPI parameter sets an expected value of the safety integrity level (SIL) achievable from the specific implementation of the connected SafetyProvider.

With automatic assignment, the value "3" is entered. This corresponds to the maximum SIL achievable with SIMATIC Safety. You may need to adapt this value to your individual application.

If the value does not match the value of the connected SafetyProvider, a communication error is detected (error code "0x14", see DIAG variable in the F-OPC-UA-Consumer-DB (Page 297)).

SafetyStructureSignature

The SafetyStructureSignature SPI parameter is used to protect the data structure of the OPC UA data type at the SafetyData SAPI parameter via a signature.

With automatic assignment, the value is calculated according to the algorithm prescribed in OPC UA Specification OPC 10000-15.

SafetyStructureSignatureVersion

The SafetyStructureSignatureVersion SPI parameter is used to specify the version of the algorithm used to calculate the SafetyStructureSignature.

With automatic assignment, the value "1" is entered. This corresponds to the only permissible value at the present time.

SafetyStructureIdentifier

With the SPI parameter SafetyStructureIdentifier the identifier of the OPC UA data types of the SAPI parameter SafetyData is publicized. The SafetyStructureIdentifier is included in the calculation of the SafetyStructureSignature.

With automatic assignment, the name of the OPC UA data type that describes the data structure at the SafetyData SAPI parameter is entered.

SafetyConsumerTimeout

The SafetyConsumerTimeout SPI parameter specifies the maximum time (in µs) that may elapse between the request from a SafetyConsumer and the response from the connected SafetyProvider.

If this monitoring time expires before a response from the connected SafetyProvider arrives, a communication error is detected (see DIAG variable in the F-OPC-UA-Consumer-DB (Page 297)) and the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) at the SafetyData SAPI parameter instead of the current values.

With automatic assignment, the value "2500000" (2.5 s) is currently entered as the default value. You must adapt this value to your individual application. More information can be found in the section "Response Times of Safety Functions (Page 621)".

⚠ WARNING

During communication with OPC UA Safety, it is only ensured that a signal state to be transferred is acquired and transferred to the receiver if it is pending for at least twice as long as the assigned monitoring time (SafetyConsumerTimeout). *(S109)*

SafetyOperatorAckNecessary

The SafetyOperatorAckNecessary SPI parameter is used to specify whether a manual user acknowledgment is required before the current values are output again at the SafetyData SAPI parameter instead of the substitute values from the F-OPC-UA-Consumer-DB (Page 297) after the following states have passed:

- Communication error "Timeout" (error code "0x08", see DIAG variable in the F-OPC-UA-Consumer-DB (Page 297)).
- ActivateFSV SPI parameter of the connected SafetyProvider is "1" (error code "0x20", see DIAG variable in the F-OPC-UA-Consumer-DB (Page 297)).

In the case of automatic assignment, the value "TRUE" is entered. You can adapt this value to your individual application if necessary.

SafetyErrorIntervalLimit

The SafetyErrorIntervalLimit SPI parameter specifies the minimum time (in minutes) that must elapse between two consecutive communication errors.

If this time is not reached, the SafetyConsumer outputs the substitute values from the F-OPC-UA-Consumer-DB (Page 297) at the SafetyData SAPI parameter instead of the current values. If this time is maintained, the SafetyConsumer tolerates a communication error by discarding the bad response from the SafetyProvider and waiting for the next error-free response. However, this can lead to a "Timeout" communication error if the monitoring time on the SafetyConsumerTimeout SPI parameter does not allow any reserves for repeats.

The value influences the probability of failure values (Page 439) ($PFD_{avg.}$ and PFH values) that you must take into account for communication with OPC UA Safety.

With automatic assignment, the value "600" is entered. This value achieves the lowest possible probability of failure values.

SafetyClientImplemented

The SafetyClientImplemented SPI parameter is used to indicate whether the SafetyConsumer supports OPC UA client/server communication mechanisms.

In the case of automatic assignment, the value "TRUE" is entered. This corresponds to the only permissible value since SIMATIC Safety supports only OPC UA client/server communication.

SafetyPubSubImplemented

The SafetyPubSubImplemented SPI parameter is used to indicate whether the SafetyConsumer supports OPC UA PubSub communication mechanisms.

With automatic assignment, the value "FALSE" is entered. This corresponds to the only permissible value since SIMATIC Safety does not support OPC UA PubSub communication.

9.5.1.4 Safety Application Program Interface (SAPI) of the SafetyConsumer in the F-OPC UA Consumer DB

The SAPI of a SafetyConsumer is available in the F-OPC-UA-Consumer-DB. The F-OPC-UA-Consumer-DB is automatically generated when the intended SafetyProvider is added to the SafetyProvider list of the client interface (Page 315). You can read or write directly to the corresponding variables in the F-OPC-UA-Consumer-DB.

You can find the name automatically assigned to the F-OPC-UA-Consumer-DB in the properties of the SafetyConsumer in the editor for client interfaces. If necessary, you can also adapt the name there. You can find the F-OPC-UA-Consumer-DB in the folder "Program blocks/System blocks/STEP 7 Safety/OPC UA Safety" folder in the project tree.

The following table shows the parameters of the SAPI of a SafetyConsumer.

SAPI parameter	Tag in the F-OPC-UA-Consumer-DB	Data type	Access to in the Safety program	Access in the standard user program	Description
Tags that you can or must write					
Enable	ENABLE	BOOL	x	-	1=Activation of communication to the connected SafetyProvider
OperatorAckConsumer	OPERATOR_ACK_CONSUMER	BOOL	x	-	1=User acknowledgment at SafetyConsumer end
SafetyProviderID	SAFETY_PROVIDER_ID	DINT	x	-	ID for authentication of the intended SafetyProvider
SafetyBaseID	SAFETY_BASE_ID	GUID	-	x	ID for authentication of the intended SafetyProvider
SafetyConsumerID	SAFETY_CONSUMER_ID	DINT	x	-	ID for authentication of a SafetyConsumer
Tags that you can/must evaluate					
SafetyData	SAFETY_DATA	UDT	x	(x)	Data provided by the connected SafetyProvider in a safety-related manner
NonSafetyData	NON_SAFETY_DATA	UDT	-	x	Data that is not made available by the connected SafetyProvider in a safety-related manner
FSV_Activated	FSV_ACTIVATED	BOOL	x	(x)	1=SafetyConsumer outputs substitute values
OperatorAckRequested	OPERATOR_ACK_REQUESTED	BOOL	x	(x)	1=Acknowledgment request is pending
OperatorAckProvider	OPERATOR_ACK_PROVIDER	BOOL	x	(x)	1=User acknowledgment at SafetyProvider end
TestModeActivated	TEST_MODE_ACTIVATED	BOOL	x	(x)	1=Current values at the SafetyData SAPI parameter are test data

(x) can also be evaluated non-safety-related in the standard user program if required

Enable

The Enable SAPI parameter is used to activate communication with OPC UA Safety to the connected SafetyProvider. If Enable = 0, no SafetyData/NonSafetyData is requested from the connected SafetyProvider. Instead of the current values, the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) at the SafetyData SAPI parameter.

With Enable = 0, for example, you can delay the start of communication with OPC UA Safety until the underlying OPC UA communication is ready (e.g. after switching the power supply

on). This allows you to avoid communication errors such as "timeout" in this phase (see SafetyConsumerTimeout (Page 288) SPI parameter).

NOTE
When changing from Enable = 1 to Enable = 0, the output of substitute values at the SafetyData SAPI parameter only take effect after the next data package has been received or after the monitoring time parameterized via SafetyConsumerTimeout.

OperatorAckConsumer

The OperatorAckConsumer SAPI parameter is used to perform user acknowledgment. This requires a positive edge after an acknowledgment request has been made at the OperatorAckRequested SAPI parameter.

Once the user acknowledgment has been carried out, the SafetyConsumer outputs the current values at the SafetyData SAPI parameter again instead of the substitute values from the F-OPC-UA-Consumer-DB (Page 297).

⚠ WARNING

A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

SafetyProviderID/SafetyBaseID

With the SafetyProviderID and SafetyBaseID SAPI parameters, you can uniquely and reliably authenticate the foreseen SafetyProvider for dynamic connections. For more information, refer to the sections "Series machines (Page 326)" and "Changing communication partners (Page 327)".

SafetyProviderID and/or SafetyBaseID are initialized with values matched to the specific situation in the system during runtime of the Safety program (or standard user program). As long as both values <> 0, the values assigned to the SafetyProviderIDConfigured and SafetyBaseIDConfigured SPI parameters are overwritten.

If the active SafetyProviderID or SafetyBaseID is "0", the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) to the Safety program instead of the current values at the SafetyData SAPI parameter.

NOTE
A changed value at the SAPI parameters SafetyProviderID and SafetyBaseID only becomes effective after a positive edge at the Enable SAPI parameter.

⚠ WARNING

Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
Note that these program sections are therefore not captured by the collective F-signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
Print the relevant program sections and supplement your safety summary with this printout. *(S103)*

⚠ WARNING

For secure authentication of the SafetyProvider whose SafetyData is to be evaluated, the values of the active SafetyProviderID and active SafetyBaseID of the SafetyConsumer must correspond to the values of the active SafetyProviderID and active SafetyBaseID of this SafetyProvider at all times*.
When accepting the Safety programs, you must ensure compliance in the relevant safety summary. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S104)*

* If you cannot yet provide the values when starting the Safety program because they are only created during the runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID or the Enable "0" SAPI parameter in this phase.

SafetyConsumerID

You can also use the SafetyConsumerID SAPI parameter to uniquely authenticate a SafetyConsumer in use cases with changing communication partners (Page 327) or series machines (Page 326).

The SafetyConsumerID is then only supplied with a value adapted to the specific system situation during the runtime of the Safety program. As long as the relevant value <> 0, the value assigned to the SafetyProviderIDConfigured PI parameter is overwritten.

If the active SafetyConsumerID is "0", the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) to the Safety program instead of the current values at the SafetyData SAPI parameter.

NOTE

A changed value at the SAPI parameter SafetyConsumerID only becomes effective after a positive edge at the Enable SAPI parameter.

SafetyData

The SafetyData SAPI parameter provides the data that is made available by the connected SafetyProvider in a safety-related manner for evaluation in your Safety program.

⚠ WARNING

For each communication connection with OPC UA Safety, you must ensure when accepting the Safety program that the data structure of the OPC UA data types used by SafetyData matches on the SafetyProvider and SafetyConsumer side. In particular, the correct order of elements of the same data type is relevant. You can find the structures of the OPC UA data types used in the respective safety summary.
To identify the communication connection, note the following points:

- For static connections:
  To do this identify the communication connection by means of the combination of SafetyProviderIDConfigured and SafeBaseIDConfigured.
- For dynamic connections:
  To do this, identify the communication connection by means of the algorithm for the allocation of the values for SafetyProviderID and SafetyConsumerID.

(S111)

NonSafetyData

The NonSafetyData SAPI parameter provides the data that is not made available by the connected SafetyProvider in a safety-related manner for evaluation in your standard user program.

FSV_Activated

You can use the FSV_Activated SAPI parameter to evaluate whether the SafetyConsumer outputs the designated substitute values from the F-OPC-UA-Consumer-DB (Page 297) at the SafetyData SAPI parameter instead of the current values.

OperatorAckRequested

You can use the OperatorAckRequested SAPI parameter to evaluate whether there is an acknowledgment request on the SafetyConsumer.

OperatorAckProvider

You can use the OperatorAckProvider SAPI parameter to evaluate whether there is a user acknowledgment on the side of the connected SafetyProvider.

To use this as an alternative (or in addition) to your acknowledgment signal on the SafetyConsumer side, you must link the OperatorAckProvider SAPI parameter with the OperatorAckConsumer SAPI parameter (possibly OR-linked with the acknowledgment signal on the SafetyConsumer side).

TestModeActivated

You can use the TestModeActivated SAPI parameter to evaluate whether the connected SafetyProvider "only" provides test data, i.e. non-safety-related data, at its SafetyData SAPI parameter.

This is the case if the EnableTestMode SAPI parameter has been set to "1" on the connected SafetyProvider.

If the connected SafetyProvider is located on an F-CPU S7-1500, TestModeActivated is also set to "1" if the Safety program belonging to the connected SafetyProvider is running in disabled safety mode or on an *S7-PLCSIM*. For information on the behavior of devices of a third-party manufacturer, refer to the documentation of the device manufacturer.

⚠ WARNING

If the TEST_MODE_ACTIVATED variable in the F-OPC-UA-Consumer-DB is set to "1" during communication with OPC UA Safety, you can no longer assume that the data at the SAFETY_DATA variable is formed in a safety-related manner. This is the case when the connected SafetyProvider is in deactivated safety mode on a PLCSIM instance or the EnableTestMode SAPI parameter of the connected SafetyProvider has been set in the associated user program. During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program with TEST_MODE_ACTIVATED = 1 instead of the data in the SAFETY_DATA tag. *(S108)*

9.5.1.5 Other variables in the F-OPC UA Consumer DB

In addition to the SAPI of a SafetyConsumer, the F-OPC-UA-Consumer-DB also provides you with other variables that you need for communication with OPC UA Safety in the *SIMATIC Safety* F-system and the underlying OPC UA communication ("client instructions"):

Tag in the F-OPC-UA-Consumer-DB	Data type	Access in the Safety program:	Access in the standard user program	Description
Tags that you can or must write				
RESPONSE_SPDU	STRUCT	-	x	Tag for the in-out parameter (InOut) OutputArguments of the client instruction OPC_UA_MethodCall
METHOD_CALL_DONE	BOOL	-	x	Variable for the Done output of the client instruction OPC_UA_MethodCall
METHOD_CALL_BUSY	BOOL	-	x	Variable for the Busy output of the client instruction OPC_UA_MethodCall
METHOD_CALL_ERROR	BOOL	-	x	Variable for the Error output of the client instruction OPC_UA_MethodCall

Tag in the F-OPC-UA-Consumer-DB	Data type	Access in the Safety program:	Access in the standard user program	Description
METHOD_RESULT	DWORD	-	x	Tag for the in-out parameter (InOut) MethodResult of the client instruction OPC_UA_MethodCall
Tags that you can/must evaluate				
REQUEST_SPDU	STRUCT	-	x	Tag for the in-out parameter (InOut) InputArguments of the client instruction OPC_UA_MethodCall
METHOD_CALL_REQUEST	BOOL	-	x	Tag for the REQ input of the client instruction OPC_UA_MethodCall
DIAG	BYTE	-	x	Non-fail safe service information
SAFETY_PROVIDER_ID_ACTIVE	UDINT	-	x	Active SafetyProviderID
SAFETY_BASE_ID_ACTIVE	GUID	-	x	Active SafetyBaseID
SAFETY_CONSUMER_ID_ACTIVE	UDINT	-	x	Active SafetyConsumerID
Variables for which you can/must assign start values				
PASS_VALUES	UDT (analog SafetyData)	-	-	Substitute values for SafetyData

RESPONSE_SPDU

You need this variable to call up the client instruction OPC_UA_MethodCall, which is part of the underlying OPC UA communication.

When using the F-OPC-UA-Consumer-Com-FB (Page 323), this variable is automatically interconnected with the OPC_UA_MethodCall instruction.

METHOD_CALL_DONE, METHOD_CALL_BUSY, METHOD_CALL_ERROR, METHOD_RESULT

You need these variables to call up the client instruction OPC_UA_MethodCall, which is part of the underlying OPC UA communication.

When using the F-OPC-UA-Consumer-Com-FB (Page 323), these variables are automatically interconnected with the OPC_UA_MethodCall instruction.

REQUEST_SPDU

You need this variable to call up the client instruction OPC_UA_MethodCall, which is part of the underlying OPC UA communication.

When using the F-OPC-UA-Consumer-Com-FB (Page 323), this variable is automatically interconnected with the OPC_UA_MethodCall instruction.

METHOD_CALL_REQUEST

You need this variable to call up the client instruction OPC_UA_MethodCall, which is part of the underlying OPC UA communication.

When using the F-OPC-UA-Consumer-Com-FB (Page 323), this variable is automatically interconnected with the OPC_UA_MethodCall instruction.

DIAG

The DIAG variable is used to provide a non-fail-safe code for communication errors/states that have occurred for service purposes up to the user acknowledgement. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.

Error code	Cause	Bad response from the SafetyProvider discarded *	Output of substitute values FSV_Activated = 1	User acknowledgment required
0x01	Discrepancy detected with active SafetyProviderID or SafetyBaseID	x	-	-
0x11	Discrepancy with active SafetyBaseID detected	-	x	x
0x12	Discrepancy with active SafetyProviderID detected	-	x	x
0x13	Discrepancy with SafetyStructureSignature or SafetyStructureSignatureVersion or SafetyStructureIdentifier detected	-	x	x
0x14	Discrepancy detected with SafetyProviderLevel	-	x	x
0x05	CRC error detected	x	-	-
0x15	CRC error detected	-	x	x
0x06	Discrepancy with active SafetyConsumerID detected	x	-	-
0x16	Discrepancy with active SafetyConsumerID detected	-	x	x
0x07	MonitoringNumber error detected	x	-	-
0x17	MonitoringNumber error detected	-	x	x
0x08	Timeout error detected	-	x	(-)
0x09	Enable SAPI parameter of the SafetyConsumer = 0	-	x	-
0x0A	SafetyConsumer SPI parameters are invalid.	-	x	-
0x20	SAPI parameter ActivateFSV of the SafetyProvider = 1	-	x	(-)

(-): A user acknowledgment is required for the SafetyOperatorAckNecessary SPI parameter of the SafetyConsumer = 1.

* More information can be found in the section "Safety Parameter Interface (SPI) of the SafetyConsumer (Page 288)" under "SafetyErrorIntervalLimit".

SAFETY_PROVIDER_ID_ACTIVE/SAFETY_BASE_ID_ACTIVE/SAFETY_CONSUMER_ID_ACTIVE

You can use these variables to evaluate the active SafetyProviderID, SafetyBaseID or SafetyConsumerID for diagnostic purposes.

These variables are also required for the correct display of all data of the SafetyConsumerTypes (Page 331).

PASS_VALUES

You use this variable to define the substitute values as start values in the F-OPC-UA-Consumer-DB, which the SafetyConsumer outputs instead of the current values at the SafetyData SAPI parameter in the following cases (for details see DIAG variable):

- Communication error detected.
- Enable SAPI parameter of the SafetyConsumer is "0"
- ActivateFSV SAPI parameter of the connected SafetyProvider is "1"

NOTE

If you do not explicitly define any start values in the PASS_VALUES variable in the F-OPC-UA-Consumer-DB, the default values of the PLC data type (UDT) automatically created by *STEP 7 Safety* for this data structure are used as start values. If necessary, you can adapt these default values. For further details see "Configuring properties of a SafetyConsumer (Page 319)".

9.5.2 Configuring and programming a SafetyProvider

Requirements

- An F-CPU S7-1500 as of FW 4.0 (except HF-CPUs) or an S7-1500 F Software Controller as of firmware V40.0.
- The following function right is available for the "SafetyAdmin" role: OPC UA server access. More information can be found in the help for *STEP 7* under "Users and roles with OPC UA function rights (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-as-an-opc-ua-server-s7-1500-s7-1500t/configuring-the-opc-ua-server-s7-1500-s7-1500t/users-and-roles-with-opc-ua-function-rights-s7-1500-s7-1500t)".
- The required Runtime license for OPC UA is available and is configured in *STEP 7*.
- The OPC UA server is activated.

Configuring and programming a SafetyProvider

Proceed as follows to configure and program a SafetyProvider. Repeat the following steps for each data structure that you want to make available to a SafetyConsumer.

9.5.2.1 Preparing the Safety program (or standard user program) for creation of an OPC UA SafetyProvider information model

You must make the following preparations in your Safety program (or standard user program) before creating an OPC UA SafetyProvider information model.

1. Create an F-compliant PLC data type (UDT) that describes the data structure of your safety message frame that you want to make available to a SafetyConsumer in a safety-related manner.
2. Create a tag with the previously created F-compliant PLC data type (UDT) in an F-shared DB.

3. Optional:

   Create a PLC data type (UDT) that describes the data structure of the data of your standard user program that you want to make available to a SafetyConsumer in a non-safety-related manner "synchronously" with the data of your Safety program.

   Create a tag with the previously created PLC data type (UDT) in a shared DB.

4. Optional:

   If you want to trigger certain actions on a SafetyConsumer or communicate certain status information to the SafetyConsumer, create an F-compliant PLC data type (UDT) that describes the data structure of the SAPI parameter InputSignals.

   Order, names and data types are specified as follows:

   – OperatorAckProvider: BOOL
   – ActivateFSV: BOOL
   – EnableTestMode: BOOL

   Create a tag with the previously created F-compliant PLC data type (UDT) in an F-shared DB.

5. Optional:

   If you want to evaluate certain information of a SafetyConsumer, create a PLC data type (UDT) that describes the data structure of the SAPI parameter OutputSignals.

   Order, names and data types are specified as follows:

   – OperatorAckRequested: BOOL
   – MonitoringNumber: UDINT
   – SafetyConsumerID: UDINT

   Create a tag with the previously created PLC data type (UDT) in a shared DB.

6. Optional:

   If you want to change the value of the active SafetyProviderID of a SafetyProvider at runtime, create a tag with the data type DINT in an F-shared DB.

7. Optional:

   If you want to change the value of the active SafetyBaseID of a SafetyProvider at runtime, create a tag with the GUID data type in a shared DB.

8. Compile the Safety program and, if applicable, the standard user program.

9.5.2.2 Creating an OPC UA SafetyProvider information model for an individual data structure

You create an OPC UA SafetyProvider information model for your individual data structure based on a nodeset file provided by the OPC Foundation for OPC UA Safety and using SiOME. For this purpose, you must map all the SAPI parameters you require in your Safety program (or standard user program) to the designated local data (local data mapping).

You then export the OPC UA SafetyProvider information model created in this way to an XML file (nodeset file).

Requirements

The individual data structures have been created as (F-compliant) PLC data types (UDTs).

The local data needed for the local data mapping of the SAPI parameters is available and compiled in your Safety program (or standard user program).

In order to connect SiOME (https://support.industry.siemens.com/cs/ww/en/view/109755133) to the TIA project, Openness must be installed and set up.

Creating an OPC UA SafetyProvider information model

Proceed as follows to create an OPC UA SafetyProvider XML file (nodeset file).

1. First, download the nodeset file "Opc.Ua.Safety.NodeSet2.xml" of the OPC UA Safety Specification V1.05.04 from the GitHub website of the OPC Foundation. You can find the download link here (https://github.com/OPCFoundation/UA-Nodeset/tree/Safety-1.05.04-2025-02-05/Safety).

   The "Opc.Ua.Safety.NodeSet2.xml" file serves as the basis for your individual nodeset file. It contains the type and method definitions you need to create an OPC UA SafetyProvider XML file.
2. Start SiOME.
3. First, import the namespace "http://opcfoundation.org/UA/Safety".

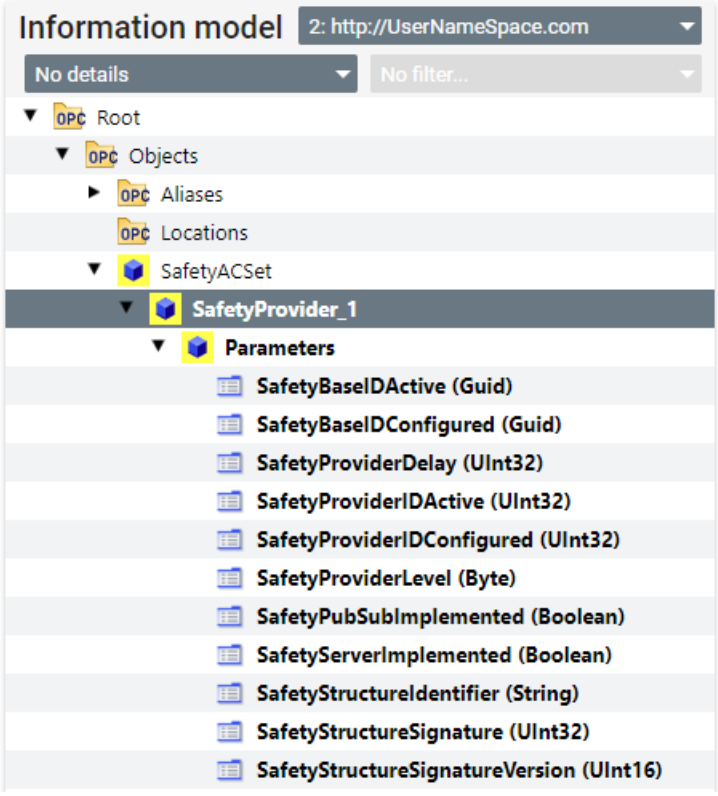
   To do so, click the "Import XML" button in the SiOME menu.

   SiOME displays the dialog for opening files.
4. Select the "Opc.Ua.Safety.NodeSet2.xml" file and click the "Open" button to import it.

   Result: SiOME imports the XML file and shows the namespace "http://opcfoundation.org/UA/Safety" in the "Namespaces" area.

5. Create your own namespace for your project.
   To do so, click "Add New Namespace" in the "Namespaces: Editing (current)" area in the SiOME menu.

   SiOME opens the "Add Namespace" dialog.
6. Enter the name of the new namespace.
   The namespace "UserNamespace.com" is used in the example.
   SiOME additionally shows the new namespace:



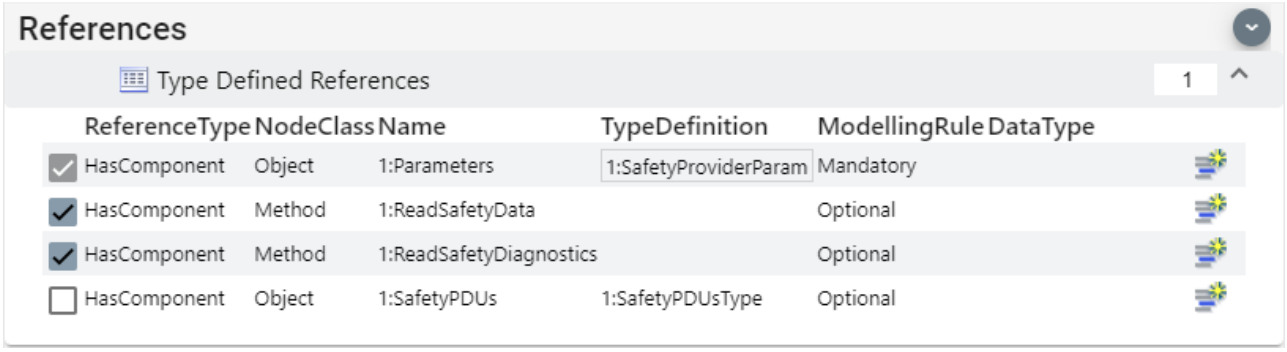
7. Create an instance from the object type "SafetyProviderType" of the OPC UA Safety Specification.
   To do so, right-click the folder "Root/Objects/SafetyACSet" in the "Information model" area and select "Add Instance".

   NOTE

   Instances of the "SafetyProviderType" object type must always be located in the folder "SafetyACSet".

   SiOME displays the dialog "Add Instance".
8. Enter a descriptive name for the new instance for "Name".
   The name "SafetyProvider_1" is used in the example.
   For "TypeDefinition", select "SafetyProviderType". You can find the type under "BaseObjectTypes/SafetyObjectsType".

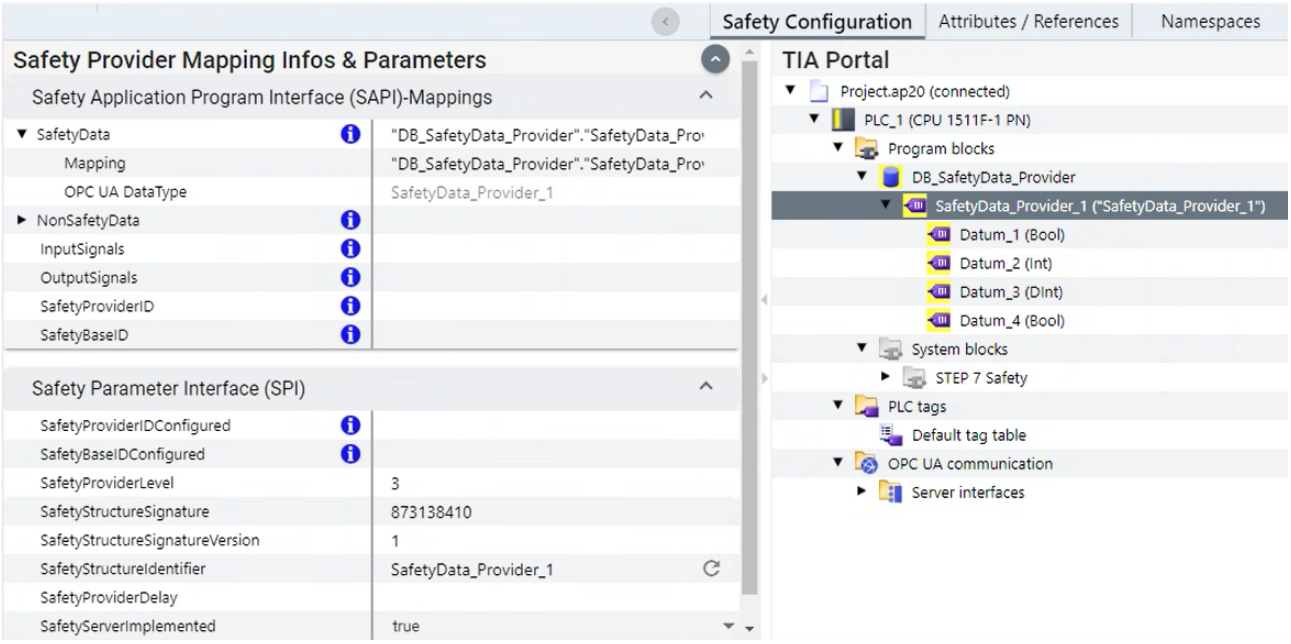
9. Click "OK".
   SiOME shows the new instance "SafetyProvider_1" under "SafetyACSet" in the "Information model" area. This instance already contains the SPI parameters required for communication with OPC UA Safety:



10. Select the Safety layout.
    To do so, select the "Safety" layout under "SIEMENS products functions" in the "Layout" area of the SiOME menu.

SiOME now shows the "Safety Configuration" area.

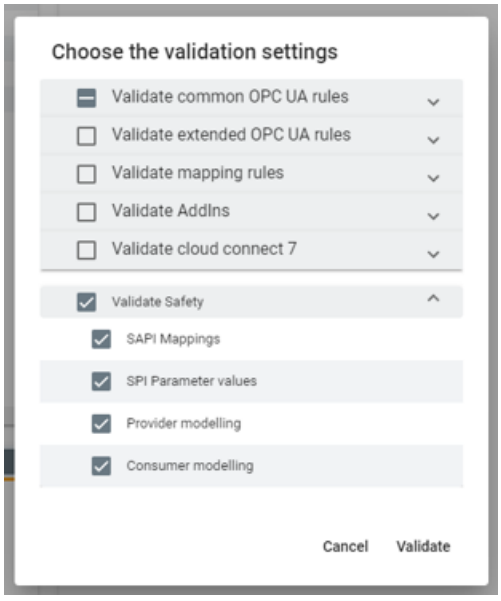
11. Add the "ReadSafetyData" and "ReadSafetyDataDiagnostics" methods. These methods are required for client access of the communication with OPC UA Safety.
    Select the corresponding check boxes for this in the "Attributes/References" area.



12. In SiOME, connect to the TIA project in which you created the data structures and local data.
    To do so, click the "Open TIA Portal project" button in the "Safety Configuration" area.

    – If a project is already opened in TIA Portal, SiOME shows the dialog "Attach to already opened TIA Portal project".
    – If no project is opened in TIA Portal, the dialog for opening of TIA Portal projects is displayed.
13. Select the project and click "Attach to selected project" or "Open". If required, enable the access in parallel in TIA Portal.
    SiOME displays the project tree of the project.
    Note: If the project contains more than one (F-)CPU, SiOME first displays the dialog "Select PLC". In this case, select the desired F-CPU.
14. Perform the mapping for SafetyData in the Safety Application Program Interface (SAPI).
    To do so, use drag-and-drop to move the variable with the data structure of the data to be sent from the F-DB to the SafetyData parameter in the SAPI. Answer "Yes" to the displayed question "Do you want to generate the OPC UA DataTyp.".
    SiOME generates the associated OPC UA data type.

15. Optional:
    Perform the mapping for NonSafetyData, InputSignals, OutputSignals, SafetyProviderID and/or SafetyBaseID accordingly. The maximum length for strings is 128 characters.



16. Optional:
    Validate the now available nodeset.
    To do so, click the "Validate information model" button in the SiOME menu.

    SiOME displays the dialog "Choose the validation settings".

17. Select the desired settings and click "Validate".

    SiOME displays the result of the validation in the "Validation" area.

18. Export the XML file.
    To do so, click the "Export XML" button in the SiOME menu.

    SiOME displays the dialog "Export XML".
    Select the path for the export and a descriptive name for the file. The name "SafetyProvider_1" is used in the example.
    Have all namespaces activated and click "OK".

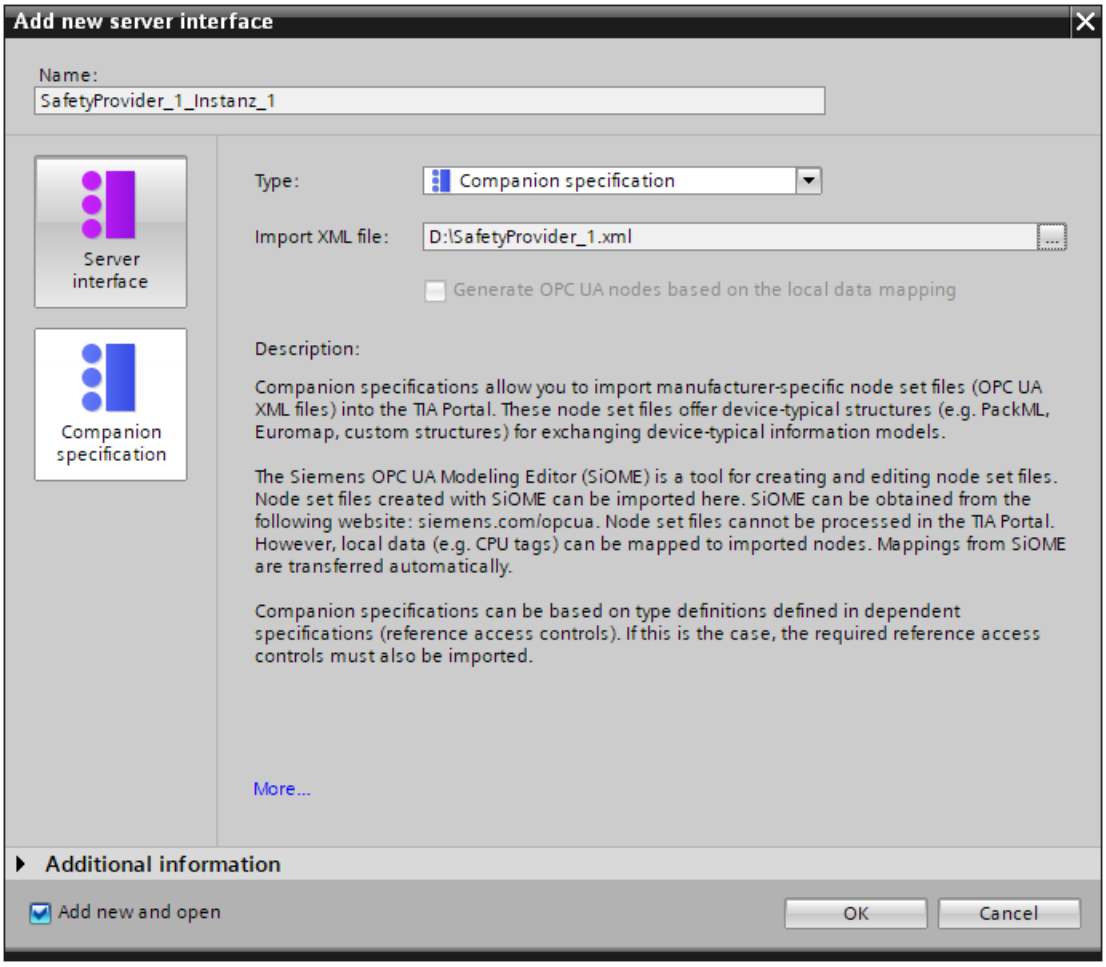
9.5.2.3 Creating a server interface for an OPC UA SafetyProvider information model

You create a server interface for an OPC UA SafetyProvider information model in a similar way as a server interface for a companion specification. More information can be found in the *STEP 7* help under "Creating a server interface for a companion specification (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-as-an-opc-ua-server-s7-1500-s7-1500t/opc-ua-server-interface-configuration-s7-1500-s7-1500t/creating-a-server-interface-for-companion-specification-s7-1500-s7-1500t)".

WARNING

Note that the data of a SafetyProvider can only be received safety-oriented if it is provided by a SafetyConsumer in the associated F-OPC UA Consumer DB. All other options for communication via OPC UA with a SafetyProvider or SafetyConsumer (OPC UA Read/Write access, OPC UA method calls) do not take place safety-oriented. *(S113)*

NOTICE

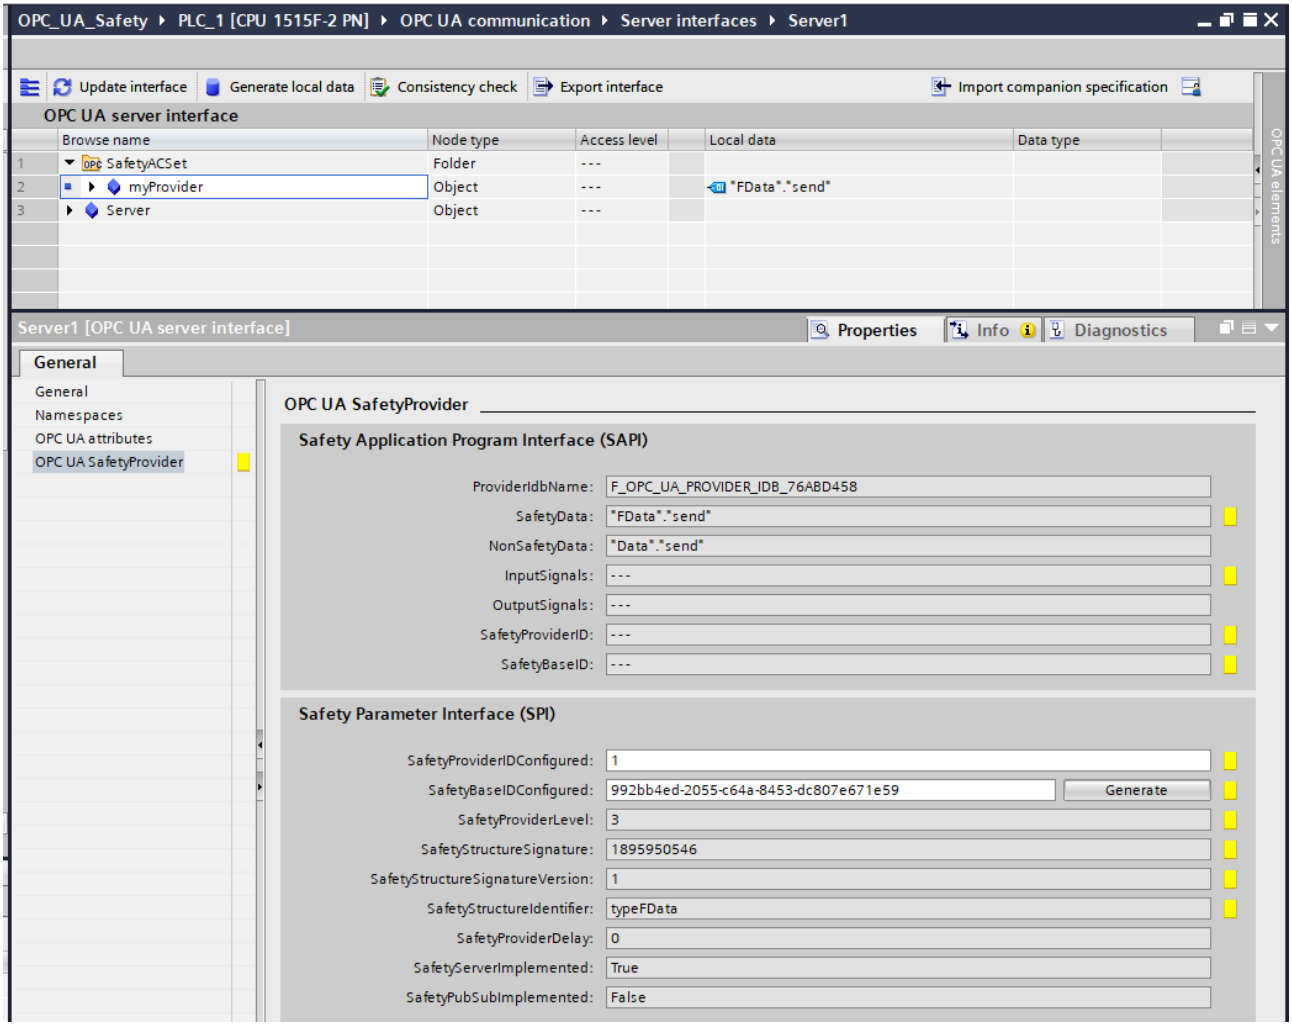


When making various changes in your user program, note that the OPC UA server of the F-CPU may need to be restarted. This can lead to an interruption of the safety-related communication with OPC UA Safety, which means that all connected SafetyConsumer output substitute values. In this case, the received process values are only output again after a user acknowledgement.
More information can be found in the *STEP 7* help under "Behavior of the OPC UA server during operation (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-as-an-opc-ua-server-s7-1500-s7-1500t/interesting-information-about-the-opc-ua-server-of-the-s7-1500-cpus-s7-1500-s7-1500t/runtime-behavior-of-the-opc-ua-server-s7-1500-s7-1500t)".

Creating a server interface for an OPC UA SafetyProvider information model

Proceed as follows to create a server interface for a companion specification with *STEP 7 (TIA Portal)*:

1. Select the F-CPU you are using as the OPC UA server.
2. In the project tree, click "OPC UA communication > Server interfaces".
3. Double-click "Add new server interface".
4. To select the type of this server interface, click the "Companion specification" button.
   A general name for the new interface, e.g. "Server_Interface_1", is entered in the dialog.



5. Change the name of the new server interface to a descriptive name in your project.
   The name "SafetyProvider_1_Instance_1" is used in the example.

6. In the "Import XML file" field, select the OPC UA SafetyProvider XML file that was created and exported in SiOME (Page 302) and contains the description of the information model for your individual data structure.
7. Click the "OK" button.
   STEP 7 (TIA Portal) imports the information model described in the selected XML file.
8. Select your SafetyProvider instance in the OPC UA server interface.
   Under "OPC UA Safety Provider" on the "Properties" tab, you see the local data of your Safety program (or standard user program) that was mapped to the SAPI parameters and the values of the SPI parameters that you assigned or that were assigned automatically during import.

NOTE

You performed the mapping of your local data previously when creating your OPC UA Safety XML file in SiOME. It is not necessary to create and map further local data with the "Generate local data" button.

9. Optional:
   Check the imported server interface for consistency.
   To do so, select your SafetyProvider instance in the OPC UA server interface and click the "Consistency check" button.

   STEP 7 displays the result of the consistency check on the "Info > General" tab.
10. Optional:
    Change the values of the SPI parameter SafetyProviderIDConfigured and/or SafetyBaseIDConfigured according to the requirements of your specific application.
    To do this, open the editor for the server interface and select "OPC UA Safety Provider" select the "Properties" tab.
    - SafetyProviderIDConfigured: Overwrite a previously entered value.
    - SafetyBaseIDConfigured: Click the "Generate" button.
      STEP 7 Safety generates a random value that fulfills the safety requirements of OPC UA Specification OPC 10000-15.

⚠ WARNING

For the unique and secure authentication of a SafetyProvider, the combination of active SafetyProviderID and active SafetyBaseID at any point in time must be unique for all OPC UA Safety communication connections network-wide. **
If your network is not safely separated from the outside world through physical separation, the active SafetyBaseID at any point in time must be a value that was generated randomly in accordance with the OPC UA Specification OPC 10000-15. ***
You must ensure the uniqueness in the safety summary during acceptance of the safety program. If the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S102)*

* If you cannot ensure a unique combination during startup of the Safety program because the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID is "0" during this phase.

** SafetyProviders to which the same local data element of your safety program is mapped (Safety Multicast (Page 325)) at the SafetyData SAPI parameter are permitted to use the same combination.

*** If you have entered a value for the SPI parameter SafetyBaseIDConfigured of a SafetyProvider (either in the NodeSet or in the properties of a SafetyProvider), you yourself must ensure that the value meets the safety requirements of the OPC UA Specification OPC 10000-15. Alternatively, generate the value of SafetyBaseIDConfigured again by opening the properties tab of the affected SafetyProvider and clicking on the "Generate" button.

9.5.2.4 Programming the initialization or evaluation of SAPI parameters in your safety program (or standard user program)

Programming procedure

You program the initialization or evaluation of SAPI parameters as follows:

1. Initialize the local data in your Safety program that you have mapped to the SafetyData SAPI parameter with the current values that you want to make available to a connected SafetyConsumer in a safety-related manner.
2. Optional:
   Initialize the local data in your standard user program that you have mapped to the NonSafetyData SAPI parameter with the current values that you want to make available to a connected SafetyConsumer in a non-safety-related manner.

3. Optional:
   If you want to perform user acknowledgment required on the connected SafetyConsumer on the SafetyProvider side:
   Initialize the local data element in your Safety program that you have mapped to the InputSignals.OperatorAckProvider SAPI parameter with your acknowledgment signal.
   For this purpose, you can also evaluate the local data element that you have mapped to the InputSignals.OperatorAckProvider SAPI parameter in your standard user program. You can then, for example, have an operator control and monitoring system display that there is an acknowledgment on the connected SafetyConsumer.

   ⚠ WARNING

   A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

4. Optional:
   If a connected SafetyConsumer should use the designated substitute values from the F-OPC-UA-Consumer-DB instead of the current values at the SafetyData SAPI parameter:
   Initialize the local data element in your Safety program that you have mapped to the InputSignals.ActivateFSV SAPI parameter with "TRUE".

   NOTE
   Always set the date to "TRUE" if you cannot provide any safety-related values for the SafetyData SAPI parameter, while, for example, the F-CPU with the associated SafetyConsumer is already integrated in a productive operation.
   Non-safety-related values are present, for example, if your Safety program with the SafetyProvider is in disabled Safety mode during a test phase, is running on an *S7-PLCSIM* or is still incomplete.

5. Optional:
   If you want to inform a connected SafetyConsumer that the current values at the SAPI parameter SafetyData are test data and, thus, were not formed in a safety-related manner:
   Initialize the local data element in your safety program that you have mapped to the InputSignals.EnableTestMode SAPI parameter with "TRUE".

   NOTE
   The EnableTestMode SAPI parameter is also set internally to "TRUE" by the Safety program if it is in disabled Safety mode or is running on an *S7-PLCSIM*.

6. Optional:
   Applications with changing communication partners (Page 327) or series machines (Page 326):
   Initialize the local data element in your Safety program that you have mapped to the SafetyProviderID SAPI parameter with a SafetyProviderID matched to the specific situation in the system.
7. Optional:
   Applications with changing communication partners (Page 327) or series machines (Page 326):
   Initialize the local data element in your standard user program that you have mapped to the SafetyBaseID SAPI parameter with a SafetyBaseID matched to the specific situation in the system.

⚠ WARNING

For the unique and secure authentication of a SafetyProvider, the combination of active SafetyProviderID and active SafetyBaseID at any point in time must be unique for all OPC UA Safety communication connections network-wide. **
If your network is not safely separated from the outside world through physical separation, the active SafetyBaseID at any point in time must be a value that was generated randomly in accordance with the OPC UA Specification OPC 10000-15. ***
You must ensure the uniqueness in the safety summary during acceptance of the safety program. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S102)*

* If you cannot ensure a unique combination during startup of the Safety program because the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID is "0" during this phase.

** SafetyProviders to which the same local data element of your safety program is mapped (Safety Multicast (Page 325)) at the SafetyData SAPI parameter are permitted to use the same combination.

*** If you have entered a value for the SPI parameter SafetyBaseIDConfigured of a SafetyProvider (either in the NodeSet or in the properties of a SafetyProvider), you yourself must ensure that the value meets the safety requirements of the OPC UA Specification OPC 10000-15. Alternatively, generate the value of SafetyBaseIDConfigured again by opening the properties tab of the affected SafetyProvider and clicking on the "Generate" button.

WARNING

Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
Note that these program sections are therefore not captured by the collective F-signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
Print the relevant program sections and supplement your safety summary with this printout.
(S103)

9.5.3 Configuring and programming a SafetyConsumer

Requirements

- An F-CPU S7-1500 as of FW 4.0 (except HF-CPUs) or an S7-1500 F Software Controller as of firmware V40.0.
- The required Runtime license for OPC UA is available and is configured in *STEP 7*.
- The OPC UA client is activated.
- An OPC UA SafetyProvider information model for your individual data structure has been created or supplied for the device from a third-party manufacturer.

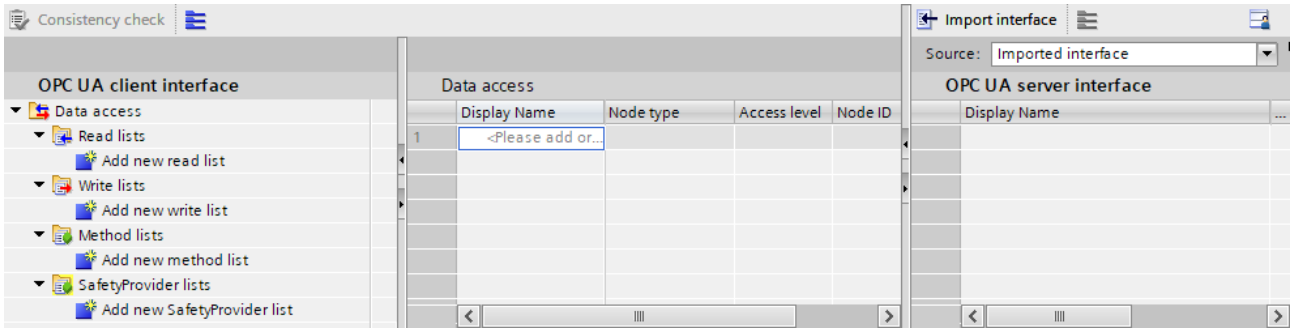
Configuring and programming a SafetyConsumer

Proceed as follows to configure and program a SafetyConsumer. Repeat the following steps for each SafetyProvider from which you want to evaluate data.

9.5.3.1 Creating a client interface for an OPC UA SafetyProvider information model

You create a client interface for an OPC UA SafetyProvider information model using the editor for client interfaces as in the standard. More information can be found in the *STEP 7* help under "Creating client interfaces (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-cpu-as-an-opc-ua-client-s7-1500-s7-1500t/creating-client-interfaces-s7-1500-s7-1500t)".

Only the special features of OPC UA Safety are described below.



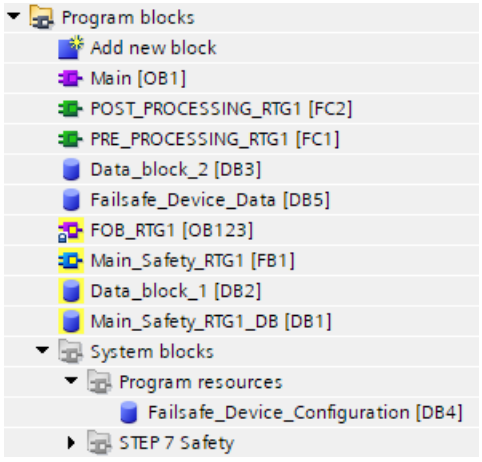
⚠ WARNING

Note that the data of a SafetyProvider can only be received safety-oriented if it is provided by a SafetyConsumer in the associated F-OPC UA Consumer DB. All other options for communication via OPC UA with a SafetyProvider or SafetyConsumer (OPC UA Read/Write access, OPC UA method calls) do not take place safety-oriented. *(S113)*

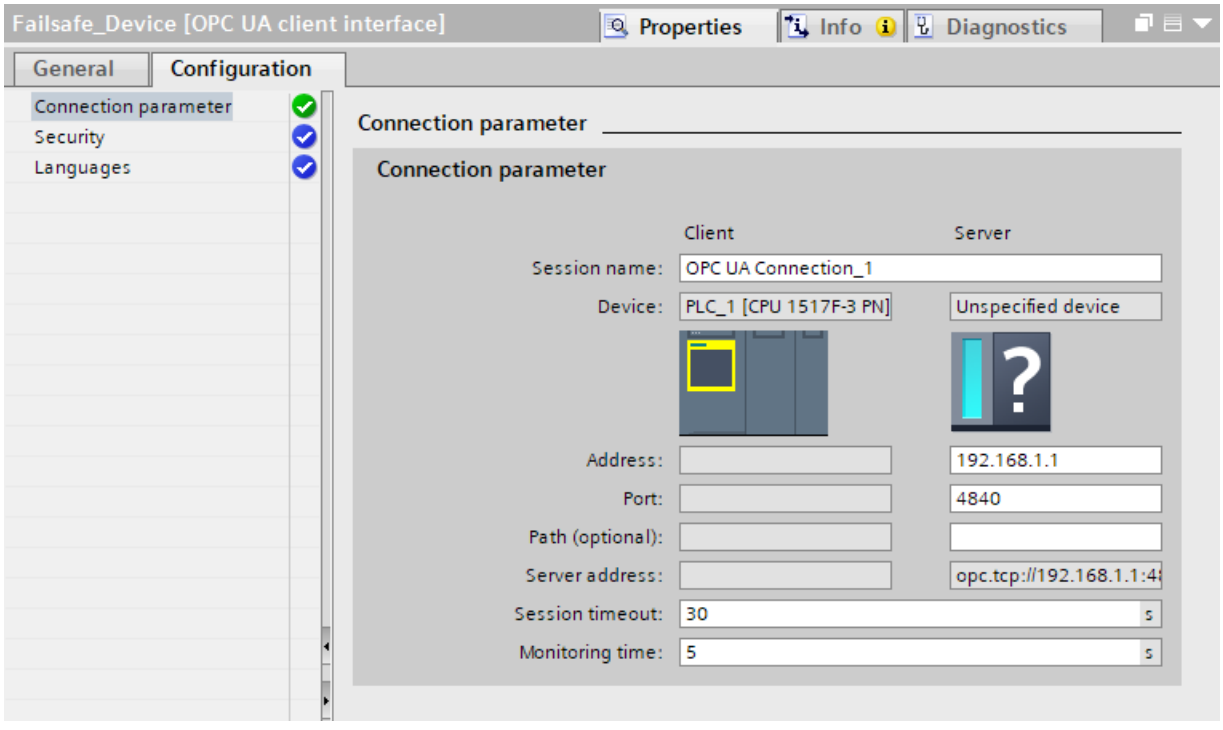
Creating a client interface for an OPC UA SafetyProvider information model

To create a client interface for an OPC UA SafetyProvider information model with *STEP 7 (TIA Portal)*, proceed as follows:

1. Select the F-CPU you are using as the OPC UA client.
2. In the project tree, click "OPC UA communication > Client interfaces".
3. Double-click on "Add new client interface".
   STEP 7 creates a new client interface and displays it in the editor:



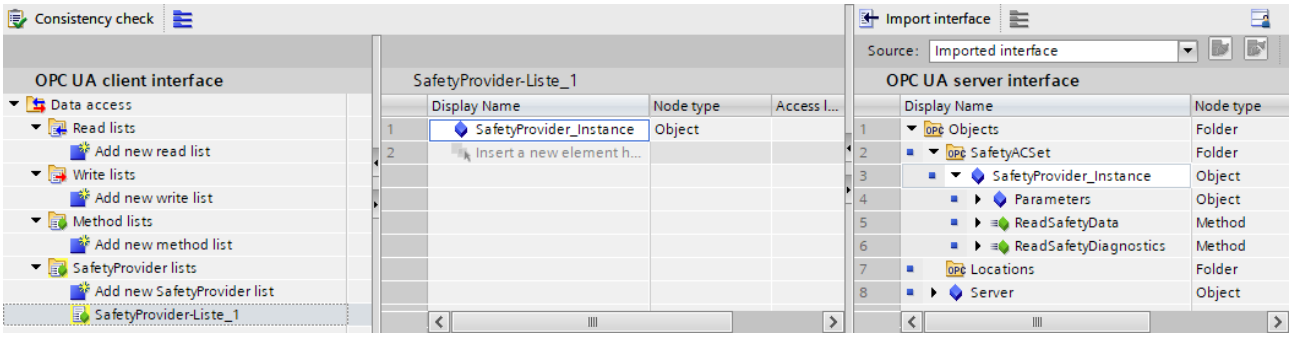
STEP 7 calls the new interface "Client interface_1".



STEP 7 also generates the following data blocks:

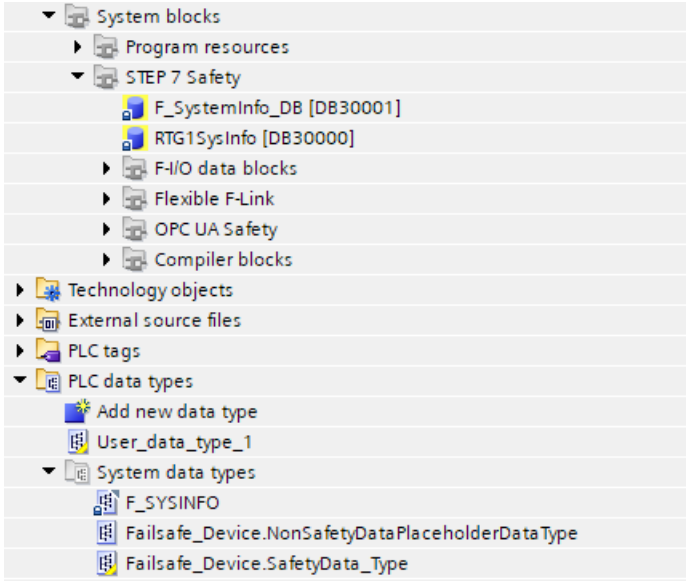
- **Client interface_1_Configuration**
  The data block contains variables that require to call the client instructions for the underlying OPC UA communication.
  When using the F-OPC-UA-Consumer-Com-FB (Page 323), these variables are automatically interconnected with the OPC_UA_MethodCall instruction.
- **Client interface_1_Data**
  This data block is not required for OPC UA Safety.

4. Change the name of the new client interface to a descriptive name in your project.
   The name "Failsafe_Device" is used in the example.
   This also changes the names of the associated data blocks to:
   – Failsafe_Device_Data
   – Failsafe_Device_Configuration



5. In the dialog that appears, specify the IP address of the desired OPC UA server in the Properties/Configuration tab under Connection parameters.

6. To import an OPC UA server interface, click the "Import interface" button at the top right of the editor when it is selected.
   Alternatively: You determine the server interface of a connected OPC UA server online. More information can be found in the STEP 7 online help under "Determining the server interface online (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-cpu-



as-an-opc-ua-client-s7-1500-s7-1500t/determine-server-interface-online-s7-1500-s7-1500t)".

7. In the "Import XML file" field of the dialog that appears, select the exported OPC UA SafetyProvider XML file (Page 302) created and exported in SiOME or the OPC UA SafetyProvider XML file supplied for a device by a third-party manufacturer, in which the information model of the intended SafetyProvider is described.
8. Generate a SafetyProvider list in this client interface.
   To do this, click on "Add new SafetyProvider list" in the left section of the editor.
   STEP 7 adds a new list with the name "SafetyProvider list_1".
9. Add the intended SafetyProvider to the new SafetyProvider list.
   To do this, drag-and-drop the SafetyProvider from the OPC UA server interface to the "SafetyProvider list_1" SafetyProvider list in the middle field of the editor.
   In the example, the SafetyProvider has the name "SafetyProvider_Instance".

STEP 7 Safety generates the following program blocks and PLC data types:

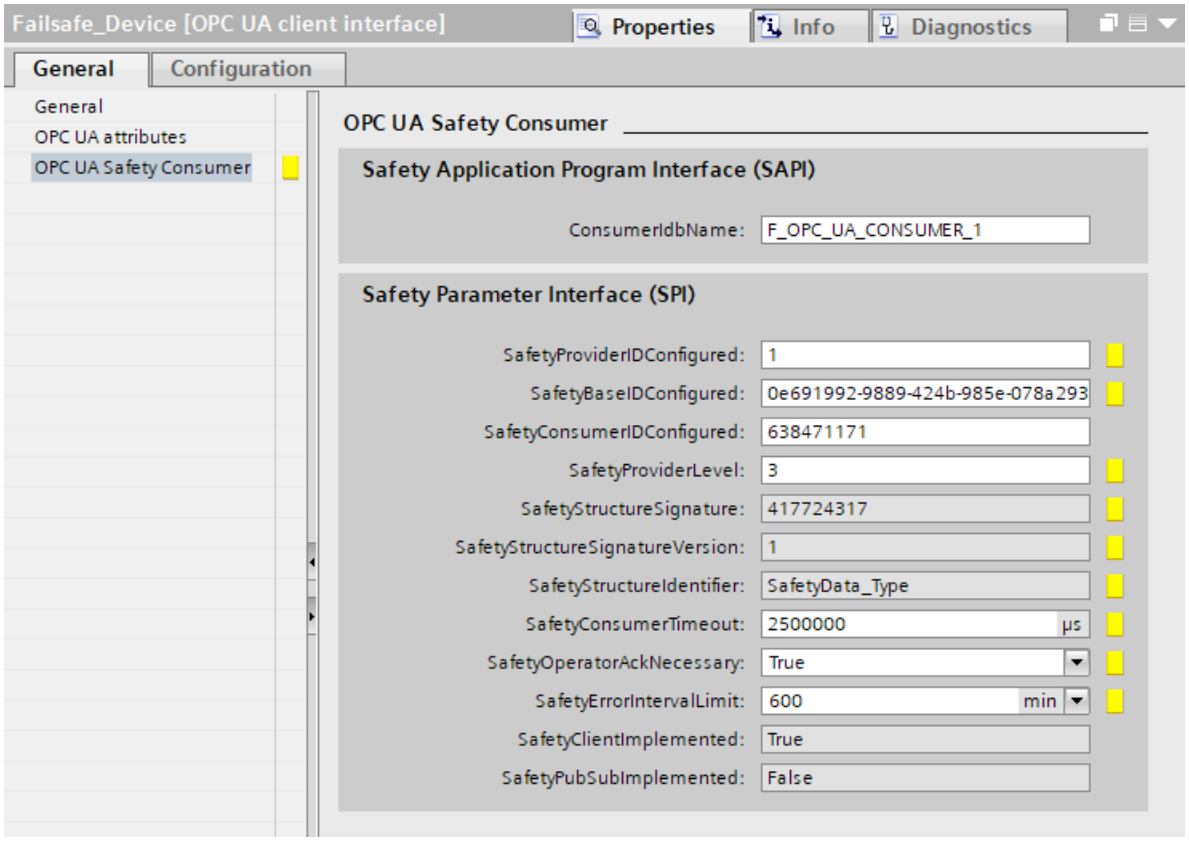
- F-OPC-UA-Consumer-DB (Page 297)
  (for example F_OPC_UA_CONSUMER)
- F-OPC-UA-Consumer-Com-FB (Page 323)
  (for example F_OPC_UA_CONSUMER_COM)
- UDT for the SafetyData SAPI parameter (Page 293) and the PASS_VALUES in the F-OPC-UA-Consumer-DB (Page 297)
  (for example Failsafe_Device.SafetyData_Type)
- UDT for the NonSafetyData SAPI parameter (Page 293)
  (for example Failsafe_Device_NonSafetyDataPlaceholderDataType)

10. Optional:

    Check the imported client interface for consistency.

    To do this, select your SafetyProvider list in the OPC UA client interface and click the "Consistency check" button.

    STEP 7 displays the result of the consistency check on the "Info > General" tab.



9.5.3.2 Configuring properties of a SafetyConsumer

You configure the properties of a SafetyConsumer in the "Properties" tab in the editor for client interfaces or in the F-OPC UA Consumer DB. Note the requirements of your specific application.

Configuring properties of a SafetyConsumer

To configure the properties of a SafetyConsumer, proceed as follows:

1. Select the intended SafetyProvider in the SafetyProvider list.
   In the "Properties/General" tab, the F-OPC UA Consumer DB is displayed under "OPC UA Safety Consumer" as a substitute for the SAPI parameters and the SPI parameters.

2. Optional:
   Change the name of the F-OPC UA Consumer DB.

3. Specify the values of the SPI parameters SafetyProviderIDConfigured (Page 288) and SafetyBaseIDConfigured (Page 288). The values must match the corresponding values of the intended SafetyProvider.

   ⚠ WARNING

   For secure authentication of the SafetyProvider whose SafetyData is to be evaluated, the values of the active SafetyProviderID and active SafetyBaseID of the SafetyConsumer must correspond to the values of the active SafetyProviderID and active SafetyBaseID of this SafetyProvider at all times*.
   When accepting the Safety programs, you must ensure compliance in the relevant safety summary. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S104)*

   * If you cannot yet provide the values when starting the Safety program because they are only created during the runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID or the Enable "0" SAPI parameter in this phase.
4. Optional:
   Change the value of the SPI parameter SafetyConsumerIDConfigured (Page 288).
5. Specify the value of the SafetyProviderLevel (Page 288) SPI parameter. The value must match the value on the connected SafetyProvider.
6. Change the value of the SPI parameter SafetyConsumerTimeout (Page 288).
   More information can be found in the section "Response Times of Safety Functions (Page 621)".
7. Optional:
   Change the value of the SafetyOperatorAckNecessary (Page 288) SPI parameter to "FALSE" if your specific system situation allows the values on the SafetyData SAPI parameter to be switched from substitute values to current values without manual user acknowledgment.
8. Optional:
   Change the value of the SafetyErrorIntervalLimit (Page 288) SPI parameter if your specific system situation requires this **as an exception**.
   Note the effects on the probability of failure values (PFDavg and PFH values) (Page 439).
9. Define the substitute values that are to be output instead of the current values at the SafetyData SAPI parameter in certain communication states.
   To do this, open the F-OPC UA Consumer DB belonging to your SafetyConsumer. You can find this in the project tree in the folder "Program blocks/System blocks/STEP 7 Safety/OPC UA Safety".
   Define the substitute values as start values in the PASS_VALUES (Page 297) variable. The data structure of the PASS_VALUES variable corresponds exactly to the data structure of your SafetyData and is specified by an automatically created PLC data type (UDT).
   Alternatively:
   If you use multiple SafetyConsumers with identical data structure (combination of SafetyData and NonSafetyData) and want to define identical substitute values for all locations of use, you can alternatively proceed as follows:
   Open the automatically created PLC data type (UDT). You can find this in the project tree in the folder "PLC data types/system data types".
   Define the substitute values as default values in this PLC data type (UDT).

9.5.3.3 Programming the initialization or evaluation of SAPI parameters in your Safety program (or standard user program)

Programming procedure

You program the initialization or evaluation of SAPI parameters as follows:

1. In your Safety program, set the ENABLE variable in the F-OPC-UA-Consumer-DB to "1" if you want to activate communication with OPC UA Safety to the connected SafetyProvider.
   Set the ENABLE variable to "0" if you want to deactivate an active communication to the connected SafetyProvider.

   NOTE
   When changing from Enable = 1 to Enable = 0, the output of substitute values at the SafetyData SAPI parameter only take effect after the next data package has been received or after the monitoring time parameterized via SafetyConsumerTimeout.

2. Optional:
   If you want to perform user acknowledgment on the SafetyConsumer side: In your Safety program, supply the OPERATOR_ACK_CONSUMER variable in the F-OPC-UA-Consumer-DB with your acknowledgment signal.
   You can evaluate the OPERATOR_ACK_REQUESTED variable for this. This allows you, for example, to display whether an acknowledgment request has been received on an operator control and monitoring system.

   ⚠ WARNING

   A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

3. Applications with changing communication partners (Page 327) or series machines (Page 326):
   In your Safety program, supply the SAFETY_PROVIDER_ID variable in the F-OPC-UA-Consumer-DB with the corresponding value of the currently intended SafetyProvider.

4. Applications with changing communication partners (Page 327) or series machines (Page 326):
   In your standard user program, supply the SAFETY_BASE_ID variable in the F-OPC-UA-Consumer-DB with the corresponding value of the currently intended SafetyProvider.

   ⚠ WARNING

   For secure authentication of the SafetyProvider whose SafetyData is to be evaluated, the values of the active SafetyProviderID and active SafetyBaseID of the SafetyConsumer must correspond to the values of the active SafetyProviderID and active SafetyBaseID of this SafetyProvider at all times*.
   When accepting the Safety programs, you must ensure compliance in the relevant safety summary. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S104)*

   * If you cannot yet provide the values when starting the Safety program because they are only created during the runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID or the Enable "0" SAPI parameter in this phase.

   ⚠ WARNING

   Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
   Note that these program sections are therefore not captured by the collective F-signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
   For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
   Print the relevant program sections and supplement your safety summary with this printout. *(S103)*

5. Applications with changing communication partners (Page 327) or series machines (Page 326):
   In your Safety program, supply the SAFETY_CONSUMER_ID variable in the F-OPC-UA-Consumer-DB with a SafetyConsumerID that is adapted to the specific system situation.
6. In your Safety program, evaluate the SAFETY DATA variable in the F-OPC-UA-Consumer-DB. This supplies the SafetyData currently provided by the SafetyProvider in a safety-related manner or, in an error case, the intended substitute values from the PASS VALUES variable.
7. Optional:
   In your standard user program, evaluate the NON_SAFETY_DATA variable in the F-OPC-UA-Consumer-DB with the NonSafetyData currently not provided by the SafetyProvider in a safety-related manner.
8. Optional:
   Use the FSV_ACTIVATED variable in the F-OPC-UA-Consumer-DB to evaluate whether current values or substitute values are output at the SAFETY_DATA variable.

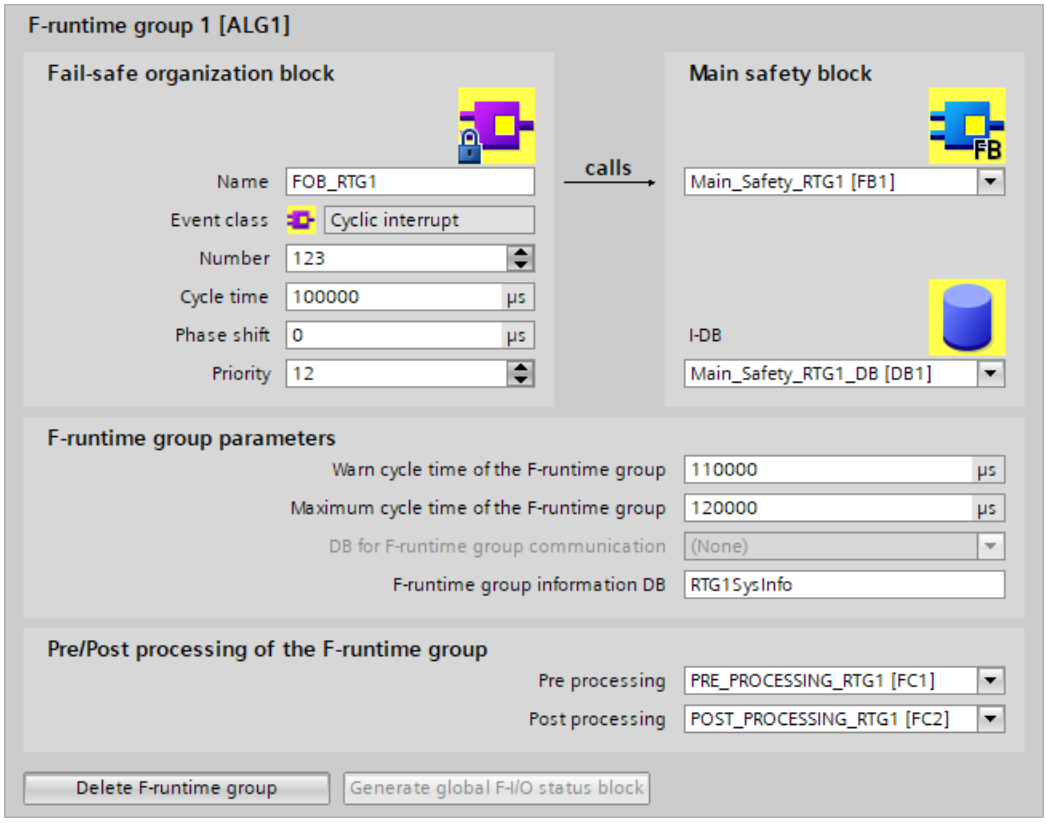
9. Optional:
   Use the TEST_MODE_ACTIVATED variable in the F-OPC UA consumer DB to evaluate whether "only" test data, i.e. data not created for safety-related purposes, is available at the SAFETY_DATA variable.

⚠ WARNING

If the TEST_MODE_ACTIVATED variable in the F-OPC-UA-Consumer-DB is set to "1" during communication with OPC UA Safety, you can no longer assume that the data at the SAFETY_DATA variable is formed in a safety-related manner. This is the case when the connected SafetyProvider is in deactivated safety mode on a PLCSIM instance or the EnableTestMode SAPI parameter of the connected SafetyProvider has been set in the associated user program. During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program with TEST_MODE_ACTIVATED = 1 instead of the data in the SAFETY_DATA tag. *(S108)*

9.5.3.4 Programming underlying OPC UA communication ("client instructions") using the F-OPC UA Consumer Com FB

OPC UA Safety is based on the mechanisms of OPC UA. SIMATIC Safety supports OPC UA client/server communication. To use OPC UA Safety communication, you first need to call the required client instructions in the standard user program for each SafetyConsumer (see *STEP 7* help "Useful information about the client instructions (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-cpu-as-an-opc-ua-client-s7-1500-s7-1500t/useful-information-about-the-client-instructions-s7-1500-s7-1500t)" and "Client instructions (https://docs.tia.siemens.cloud/r/en-us/v20/communication-s7-1200-s7-1500/opc-ua-s7-1200-s7-1500/client-instructions-s7-1500)).



To make handling in the context of OPC UA Safety easier for you, *STEP 7 Safety* has already automatically generated an F-OPC UA Consumer-Com FB when adding the foreseen SafetyProvider in the SafetyProvider list of the client interface (Page 315). This already contains the call of the
client instruction OPC_UA_MethodCall required for a specific SafetyConsumer and can be used by you.

In the project tree, you will find the F-OPC-UA-Consumer-Com-FB in the "Program blocks/System blocks/STEP 7 Safety/OPC UA Safety" folder.

You can find application examples for concrete implementation on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109977450).

Programming calls of the F-OPC-UA-Consumer-Com-FB

1. If no pre-processing or post-processing module (Page 85) exists in your F-runtime group, first create the corresponding standard FCs and select them in the *Safety Administration Editor* for your F-runtime group.
   The FCs PRE_PROCESSING_RTG1 or POST_PROCESSING_RTG1 are used in the example.

2. Call the F-OPC-UA-Consumer-Com-FB in the pre-processing module. To do this, set the IsPre input to "TRUE".
3. Call the F-OPC-UA-Consumer-Com-FB in the post-processing module. To do this, set the IsPre input to "FALSE".

NOTE

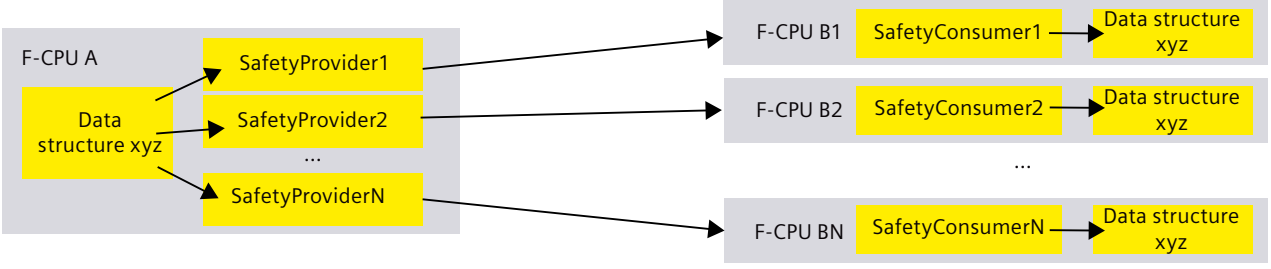
If you also use OPC UA "Standard" communication, you may want to organize the call of the client statements differently. You can find examples on this in the application examples on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109977450).

WARNING

You may only use the Excel file for response time calculation or for timeout calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) when using OPC UA Safety communication, if you have observed the following rules with regard to the standard instruction OPC_UA_MethodCall:
You must call up the standard instruction OPC_UA_METHODCALL to receive the data in the pre-processing of the F-runtime group (Page 85) and to send the request in the post-processing of the F-runtime group (Page 85). The REQ input of the instruction must be supplied with a positive signal edge during preprocessing. You can use the F-OPC-UA-Consumer-Com-FB provided by the system. *(S112)*

9.5.4 Special use cases for communication with OPC UA Safety

9.5.4.1 Introduction



This section describes some special use cases in the context of communication with OPC UA Safety. However, the details of implementation depend on your specific application. The following descriptions are therefore to be understood as suggestions and do not claim to be exhaustive. When implementing your specific application, you must observe the corresponding warnings in this manual.

9.5.4.2 Safety Multicast

In a multicast, a communication partner provides data of several communication partners on different devices at the same time.

If you want to provide data on a F-CPU via Safety Multicast, you have to set up an individual SafetyProvider for each receiver (SafetyConsumer).

If all SafetyConsumers communicate with a shared SafetyProvider, timeout errors might occur because of competing SafetyConsumer requests.

Procedure

Proceed as follows:

1. Create a SafetyProvider by copying the underlying SafetyProviderType correspondingly often for each SafetyConsumer that evaluates it from the same associated OPC UA Safety information model on the F-CPU that provides the multicast data.

   NOTE
   As the underlying SafetyProvider already contains the mapping for SafetyData in the Safety Application Program Interface (SAPI), these SafetyProviders automatically use the same data from their Safety program.

2. Create a server interface (Page 307) on the basis of this OPC UA Safety information model.

   NOTE
   All SafetyProviders belonging to a multicast may use the same combination of active SafetyProviderID and active SafetyBaseID.

3. Create a client interface (Page 315) on each F-CPU that evaluates the multicast data and add the SafetyProvider from one of the created server interfaces (Page 307) ("SafetyConsumer_x") to a SafetyProvider list.

   NOTE
   Use a different one of the created SafetyProviders for each SafetyConsumer.

9.5.4.3 Series machines

In the context of series machines, there is usually a series machine project with a configured maximum configuration, from which different variants for a series machine can then be loaded. When a real machine is commissioned, the corresponding variant is then activated.

If the series machine project includes a Safety program, there is usually a requirement that the collective F-signature from the series machine project remains unchanged after the commissioning of a real machine.

In the context of communication with OPC UA Safety, however, it is necessary for each OPC UA Safety communication connection to have a unique combination of active SafetyProviderID and active SafetyBaseID. This means that the series machine project cannot yet contain the final values for a real machine, e.g. by defining them via the SPI parameters SafetyProviderIDConfigured and/or SafetyBaseIDConfigured.

Possible solutions:

1. Use the value "1" for the SafetyProviderIDConfigured SPI parameter in the series machine project for all OPC UA Safety communication connections.

   Note: The value is usually assigned automatically by *STEP 7 Safety*.

2. Use the value "0" for the SafetyBaseIDConfigured SPI parameter in the series machine project for all OPC UA Safety communication connections.

3. In the standard user program in the series machine project, program a block that generates a randomly generated value once for each OPC UA Safety communication connection during commissioning of a real machine and assigns it to the associated SAPI parameter SafetyBaseID.

   For this purpose, use the "Random", "Get_IM_Data", "RD_SYS_T" and "SHA2" instructions to ensure that the safety requirements of the OPC UA Specification OPC 10000-15 regarding randomly generated values are fulfilled.

You can find application examples for concrete implementation on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109977450).

9.5.4.4 Changing communication partners

There are changing communication partners when, during the runtime of a Safety program,

- a SafetyProvider is to communicate with changing SafetyConsumers
- a SafetyConsumer with changing SafetyProviders

with identical data structures of the parameters SafetyData and, if applicable, NonSafetyData.

In these situations, you must pay particular attention to the correct handling of the active SafetyProviderID, SafetyBaseID, SafetyConsumerID and the Enable SAPI parameter of the SafetyConsumer.

SafetyProvider with changing SafetyConsumers

SafetyProvider:

- Specify the SafetyProviderID and SafetyBaseID consistently via the SPI parameters SafetyProviderIDConfigured and SafetyBaseIDConfigured.

  Note: The values are usually assigned automatically by *STEP 7 Safety*.

SafetyConsumer:

- Specify the SafetyProviderID and SafetyBaseID consistently via the SPI parameters SafetyProviderIDConfigured and SafetyBaseIDConfigured. The values must match the corresponding values of the intended SafetyProvider.
- Specify the SafetyConsumerID consistently via the SafetyConsumerIDConfigured SPI parameter. Use different values for each SafetyConsumer.

  Note: *STEP 7 Safety* automatically assigns a randomly generated value.
- In your safety program, only set the ENABLE variable in the F-OPC-UA-Consumer-DB to "1" once the underlying OPC UA communication to the SafetyProvider has been established.
- In your safety program, set the ENABLE variable in the F-OPC-UA-Consumer-DB to "0" before terminating the underlying OPC UA communication to the SafetyProvider.

SafetyConsumer with changing SafetyProviders for a known number of SafetyProviders.

The SafetyConsumer knows all possible SafetyProviders and their SafetyProviderIDConfigured and SafetyBaseIDConfigured and can determine the system state of the foreseen SafetyProvider.

SafetyProvider:

- For each SafetyProvider, specify the SafetyProviderID and SafetyBaseID consistently via the SPI parameters SafetyProviderIDConfigured and SafetyBaseIDConfigured.

  Note: The values are usually assigned automatically by *STEP 7 Safety*.

SafetyConsumer:

- Specify the value "0" for the SPI parameters SafetyProviderIDConfigured and SafetyBaseIDConfigured.
- Specify the SafetyConsumerID consistently via the SafetyConsumerIDConfigured SPI parameter.

  Note: *STEP 7 Safety* automatically assigns a randomly generated value.
- Save the SafetyProviderIDConfigured and SafetyBaseIDConfigured of all possible SafetyProviders in an F-DB or Standard DB.
- On the basis of the current system state, select the value of the SafetyProviderIDConfigured of the foreseen SafetyProvider in your safety program and copy this into the variable SAFETY_PROVIDER_ID of the F-OPC-UA-Consumer-DB. Use the value 0 as long as no connection is to exist to a SafetyProvider.
- On the basis of the current system state, select the value of the SafetyBaseIDConfigured of the foreseen SafetyProvider in your safety program and copy this into the variable SAFETY_BASE_ID of the F-OPC-UA-Consumer-DB. Use the value 0 as long as no connection is to exist to a SafetyProvider.
- In your safety program, only set the ENABLE variable in the F-OPC-UA-Consumer-DB to "1" if the values of the foreseen SafetyProvider are pending and the underlying OPC UA communication to the SafetyProvider has been established at the variables SAFETY_PROVIDER_ID and SAFETY_BASE_ID of the F-OPC-UA-Consumer-DB.
- In your safety program, set the ENABLE variable in the F-OPC-UA-Consumer-DB to "0" before terminating the underlying OPC UA communication to the SafetyProvider.

SafetyConsumer with changing SafetyProvider for unknown number of SafetyProviders

Not all possible SafetyProviders and their active SafetyBase ID are known to the SafetyConsumer, since, for example, additional SafetyProviders are added during running system operation.

In this case, you must use a different method (e.g. via an RFID system) to make the active SafetyBaseID of the foreseen SafetyProvider, depending on the system status, known to the SafetyConsumer.

SafetyProvider:

- Constantly and identically specify the SafetyProviderID for each SafetyProvider via the SPI parameter SafetyProviderIDConfigured.

  Note: The value is usually assigned automatically by *STEP 7 Safety*.
- For each SafetyProvider specify the SafetyBaseID analogously to the use case for series machines (Page 326). Specify the value "0" at the SPI parameter SafetyBaseIDConfigured.

SafetyConsumer:

- Constantly specify SafetyProviderIDConfigured for the SafetyProviderID via the SPI parameters. The value must match the corresponding value of the SafetyProvider setting.
- Specify the value "0" for the SPI parameter SafetyBaseIDConfigured.
- Specify the SafetyConsumerID consistently via the SafetyConsumerIDConfigured SPI parameter.

  Note: *STEP 7 Safety* automatically assigns a randomly generated value.
- In your safety program, copy the value of the active SafetyBaseID of the intended SafetyProvider determined via the diversity path into the SAFETY_BASE_ID variable of the F-OPC-UA-Consumer-DB. Use the value 0 as long as no connection is to exist to a SafetyProvider.
- In your safety program, only set the ENABLE variable in the F-OPC-UA-Consumer-DB to "1" if the value of the foreseen SafetyProvider is pending and the underlying OPC UA communication to the SafetyProvider has been established at the variable SAFETY_BASE_ID of the F-OPC-UA-Consumer-DB.
- Set the ENABLE variable in the F-OPC-UA-Consumer-DB to "0" before closing the underlying OPC UA communication to the SafetyProvider.

You can find application examples for concrete implementation on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109977450).

9.5.5 Avoiding connection resource bottlenecks

Note that influences on the lower-level OPC UA communication may cause extended response times. As a result, "Timeout" communication errors can occur.

In particular, use of encrypted communication can lead to significantly extended response times on low and medium performance class F-CPUs.

The following factors can also affect the response times:

- Utilization of the F-CPU
- Number of OPC UA and OPC UA Safety connections
- Number of implemented server methods
- Open user communication
- Web server
- S7 connections

Take this into account when configuring the OPC UA Safety connection.

Also refer to the *STEP 7* help under "Details on OPC UA client/server connections (https://docs.tia.siemens.cloud/r/en-us/v20/editing-devices-and-networks/configure-networks/communication-via-connections/working-with-connections/connection-resources/connection-resources-s7-1500-s7-1500/details-about-opc-ua-client/server-connections-s7-1500)".

9.5.6 Using diagnostic options when communicating with OPC UA Safety

Introduction

You have all diagnostic options of OPC UA at your disposal. For example, you can diagnose the OPC UA server of the F-CPU online with common OPC UA clients, such as UaExpert. In addition, you can access nodes in the OPC UA address space and thus on SafetyProvider or SafetyConsumer in your standard user program in order to evaluate the content for diagnostic purposes.

⚠ WARNING

Note that the data of a SafetyProvider can only be received safety-oriented if it is provided by a SafetyConsumer in the associated F-OPC UA Consumer DB. All other options for communication via OPC UA with a SafetyProvider or SafetyConsumer (OPC UA Read/Write access, OPC UA method calls) do not take place safety-oriented. *(S113)*

NOTICE

Writing online access to nodes in the OPC UA address space, which have a connection to variables of your Safety program, are not permitted and can lead to a STOP of the F-CPU or to communication errors.

9.5.6.1 ReadSafetyDiagnostics

For diagnostic purposes, one OPC UA server method ReadSafetyDiagnostics is available for each SafetyProvider.

You can call the method via the OPC UA server interface. It transfers the input and output data of the last processing of the associated SafetyProvider.

More information can be found in the OPC UA Safety Specification OPC 10000-15.

9.5.6.2 SafetyConsumerType

Configuring and programming a SafetyConsumerType

In accordance with the OPC UA Safety specification OPC 10000-15 a SafetyConsumerType should be provided for each SafetyConsumer in an OPC UA information model. The SafetyConsumerType is not necessary for a functioning client-server-communication. More information can be found in the OPC UA Safety Specification OPC 10000-15.

Requirements

- An F-CPU S7-1500 as of FW 4.0 (except HF-CPUs) or an S7-1500 F Software Controller as of firmware V40.0.
- The following function right is available for the "SafetyAdmin" role: OPC UA server access. More information can be found in the help for *STEP 7* under "Users and roles with OPC UA function rights (https://docs.tia.siemens.cloud/r/en-us/v20/configuring-automation-systems/using-opc-ua-communication-s7-1200-s7-1500-s7-1500t/using-the-s7-1500-as-an-opc-ua-server-s7-1500-s7-1500t/configuring-the-opc-ua-server-s7-1500-s7-1500t/users-and-roles-with-opc-ua-function-rights-s7-1500-s7-1500t)".
- The required Runtime license for OPC UA is available and is configured in *STEP 7*.
- The OPC UA server is activated.

Configuring and programming a SafetyConsumerType

Proceed as follows to configure and program a SafetyConsumerType. Repeat the following steps for each SafetyConsumer that you want to make available to a SafetyConsumerType.

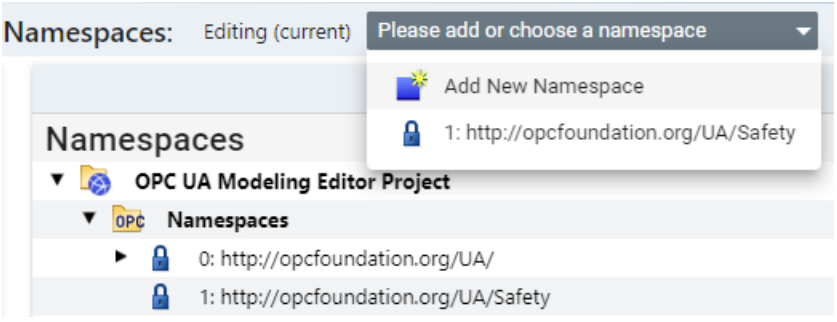
Creating an OPC UA SafetyConsumerType information model

You create an OPC UA SafetyConsumer information model for a SafetyConsumer on the basis of a nodeset file provided by the OPC Foundation for OPC UA Safety using SiOME. To do this you have to create the parameters SafetyBaseIDActive, SafetyConsumerIDActive and SafetyProviderIDActive of the SafetyConsumerType local data mappings on the SafetyConsumer previously created in TIA Portal and transfer the SPI parameters of each SafetyConsumer manually into the information model.

You then export the OPC UA SafetyConsumerType information model created in this way to an XML file (nodeset file).

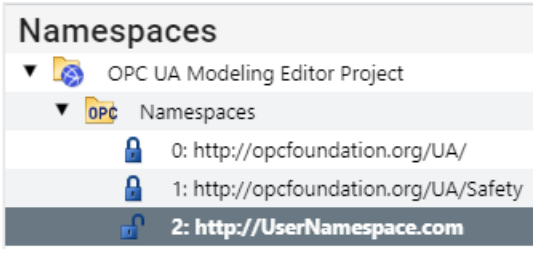
Requirements

You require the name of the F-OPC-UA-Consumer-DB (Page 319) for the local data mapping of the parameters SafetyBaseIDActive, SafetyConsumerIDActive and SafetyProviderIDActive. It is assigned automatically during the creation of a SafetyConsumer and can be modified subsequently.



Creating an OPC UA SafetyConsumerType information model

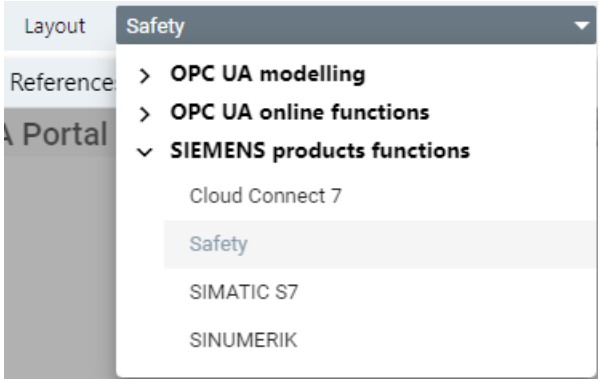
Proceed as follows to create an OPC UA SafetyConsumerType XML file (nodeset file).



1. First, download the nodeset file "Opc.Ua.Safety.NodeSet2.xml" of the OPC UA Safety Specification V1.05.04 from the GitHub website of the OPC Foundation. You can find the download link here (https://github.com/OPCFoundation/UA-Nodeset/tree/Safety-1.05.04-2025-02-05/Safety).
   The "Opc.Ua.Safety.NodeSet2.xml" file serves as the basis for your individual nodeset file. It contains the type and method definitions you need to create an OPC UA SafetyConsumerType XML file.
2. Start SiOME.
3. First, import the namespace "http://opcfoundation.org/UA/Safety".
   To do so, click the "Import XML" button in the SiOME menu.

   SiOME displays the dialog for opening files.
4. Select the "Opc.Ua.Safety.NodeSet2.xml" file and click the "Open" button to import it.
   Result: SiOME imports the XML file and shows the namespace "http://opcfoundation.org/UA/Safety" in the "Namespaces" area.
5. Create your own namespace for your project.
   To do so, click "Add New Namespace" in the "Namespaces: Editing (current)" area in the SiOME menu.

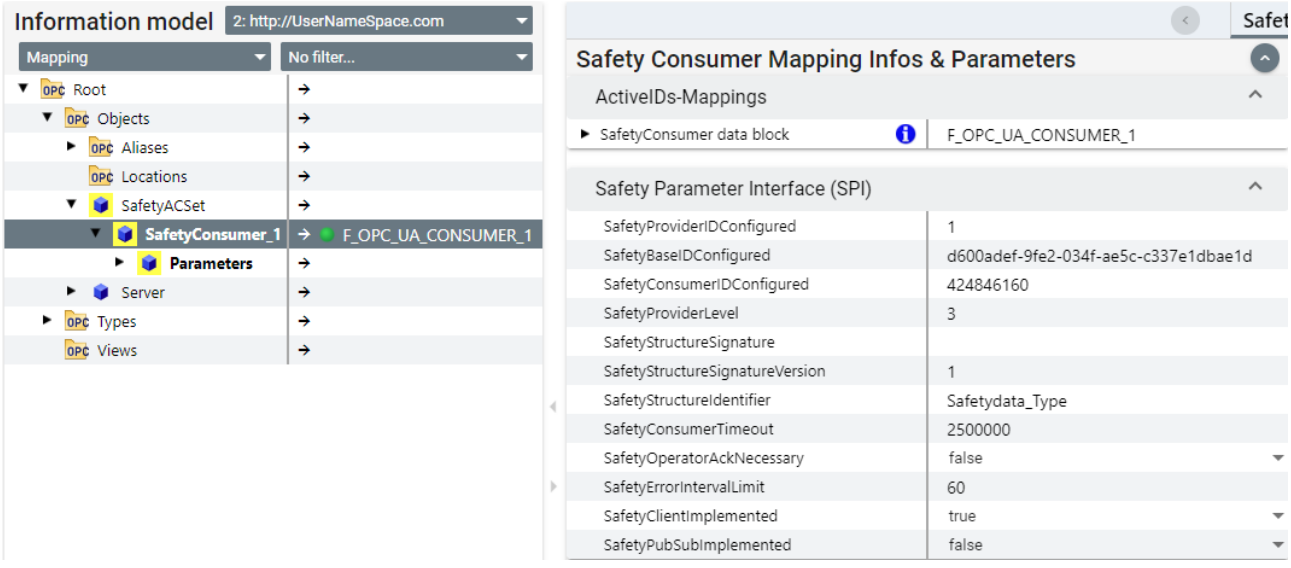
   SiOME opens the "Add Namespace" dialog.
6. Enter the name of the new namespace.
   The namespace "UserNamespace.com" is used in the example.
   SiOME additionally shows the new namespace:



7. Create an instance from the object type "SafetyConsumerType" of the OPC UA Safety Specification.
   To do so, right-click the folder "Root/Objects/SafetyACSet" in the "Information model" area and select "Add Instance".

   NOTE
   Instances of the "SafetyConsumerType" object type must always be located in the folder "SafetyACSet".

   SiOME displays the dialog "Add Instance".
8. Enter a descriptive name for the new instance for "Name".
   The name "SafetyConsumer_1" is used in the example.
   For "TypeDefinition", select "SafetyConsumerType". You can find the type under "BaseObjectTypes/SafetyObjectsType".
9. Click "OK".
   SiOME shows the new instance "SafetyConsumer_1" under "SafetyACSet" in the "Information model" area. This instance already contains the required parameters:

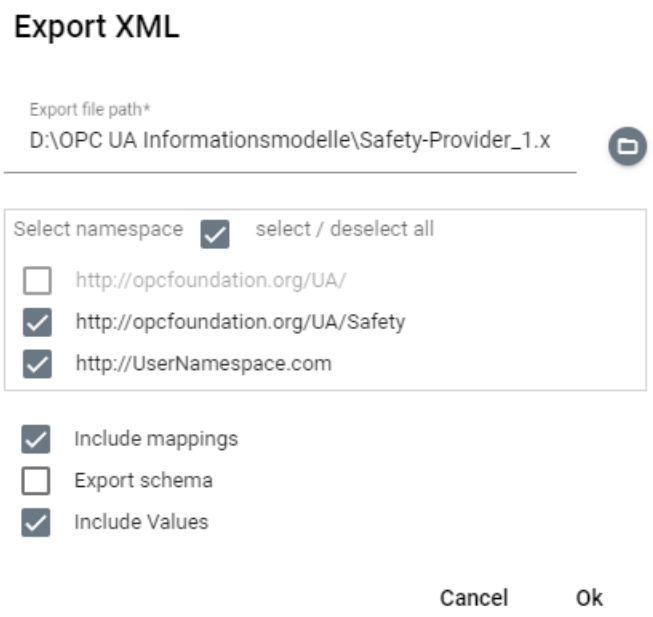


10. Select the safety layout.
    To do so, select the "Safety" layout in the SiOME menu in the "Layout" area under "SIEMENS products functions".

    SiOME now shows the "Safety Configuration" area.

11. Create the local data mapping for the ActiveIDs by entering the name of the F-OPC-UA-Consumer-DB in the designated field in the "ActiveIDs-Mappings" section.
    SiOME automatically generates the associated mappings for the parameters SafetyBaseIDActive, SafetyConsumerIDActive and SafeyProviderIDActive.

12. Optional:
    Transfer the values of the Safety Parameter Interface (SPI) from the SafetyConsumer from TIA Portal (Page 319) manually to the Safety Parameter Interface (SPI) of SiOME, so that this data can be queried via the OPC UA information model after completion of the configuration.

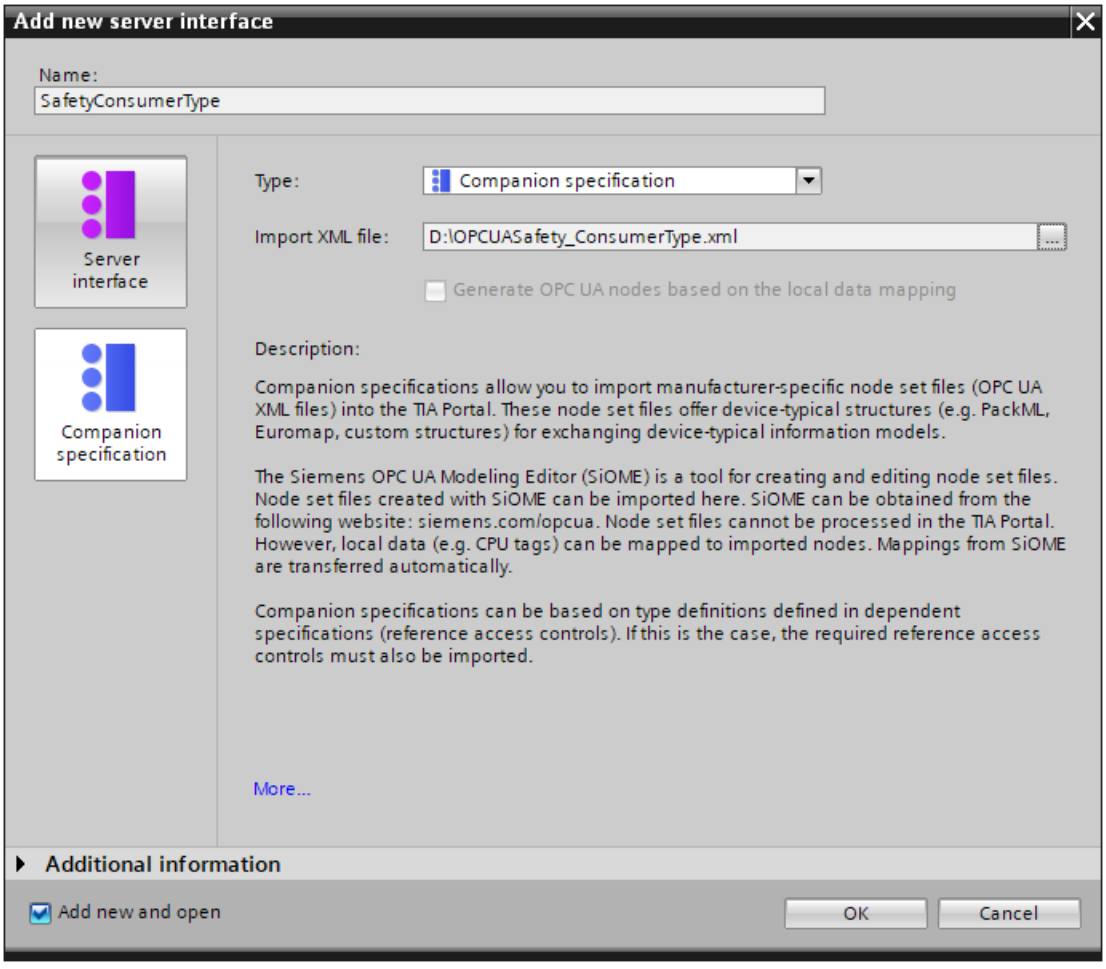


13. Export the XML file.
    To do so, click the "Export XML" button in the SiOME menu.

    SiOME displays the dialog "Export XML".
    Select the path for the export and a descriptive name for the file. The name "SafetyConsumer_1" is used in the example.

Have all namespaces activated and click "OK".

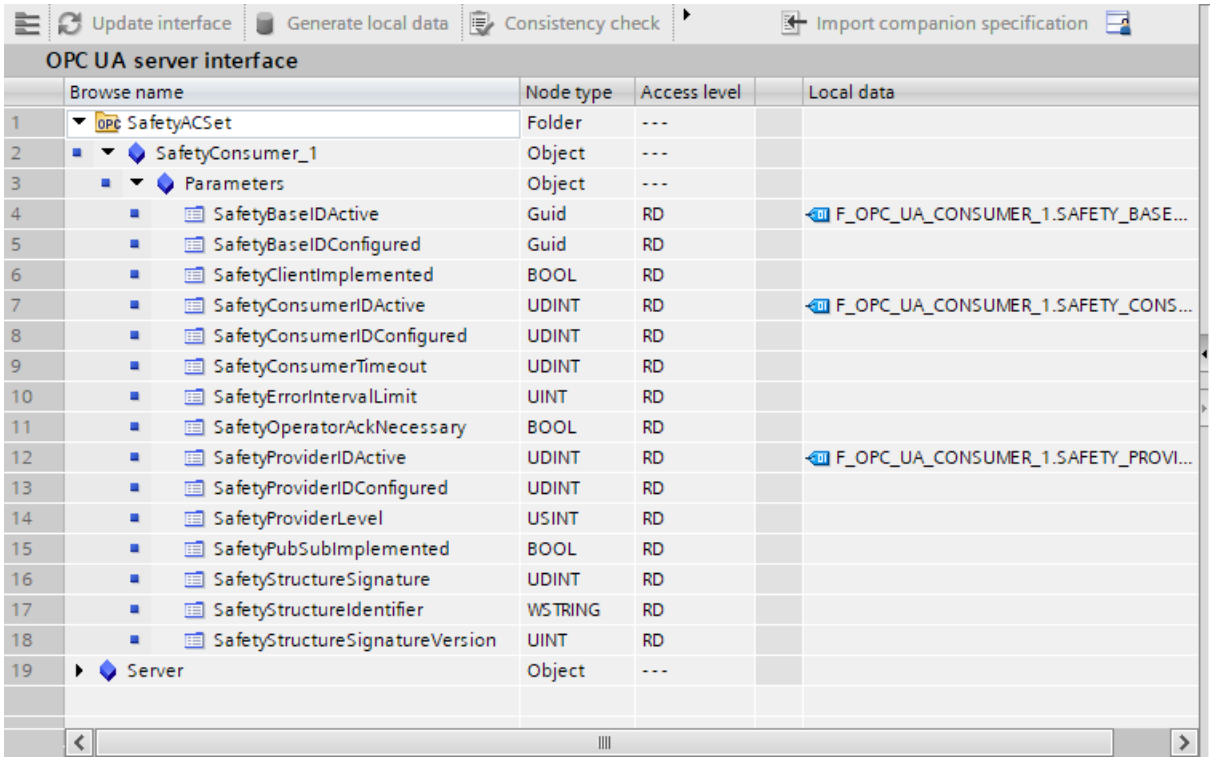
Creating a server interface for an OPC UA SafetyConsumerType information model



You create a server interface for an OPC UA SafetyConsumerType information model in a similar way as a server interface for a companion specification. More information can be found in the *STEP 7* help under "Creating a server interface for a companion specification".

Creating a server interface for an OPC UA SafetyConsumerType information model

Proceed as follows to create a server interface for a companion specification with *STEP 7 (TIA Portal)*:



1. Select the F-CPU you are using as the OPC UA server.
2. In the project tree, click "OPC UA communication > Server interfaces".
3. Double-click "Add new server interface".
4. To select the type of this server interface, click the "Companion specification" button.
   A general name for the new interface, e.g. "Server_Interface_1", is entered in the dialog.

5. Change the name of the new server interface to a descriptive name in your project.
   In the example the name "SafetyConsumerType" is used.

6. In the "Import XML file" field, select the OPC UA SafetyConsumerType XML file that was created and exported in SiOME (Page 331) and contains the description of the information model for your individual data structure.

7. Click the "OK" button.
   STEP 7 (TIA Portal) imports the information model described in the selected XML file.

NOTE

You performed the mapping of your local data previously when creating your OPC UA Safety XML file in SiOME. It is not necessary to create and map further local data with the "Generate local data" button.

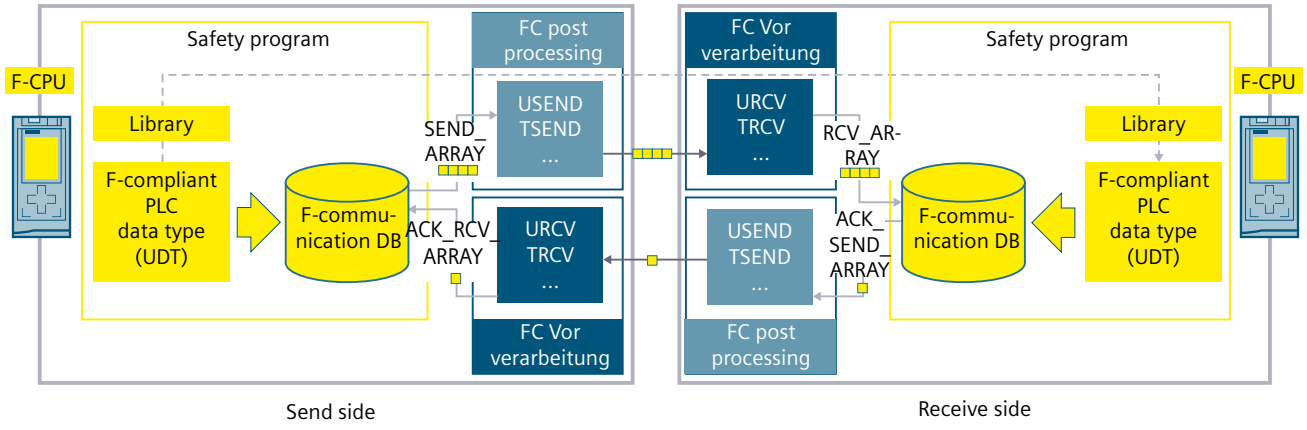
With this OPC UA server interface, you can request information on the associated SafetyConsumer with any OPC UA clients (e.g. UaExpert).

9.6 Communication with Flexible F-Link (S7-1200, S7-1500)

9.6.1 Flexible F-Link

Introduction

The fail-safe CPU-CPU communication "Flexible F-Link" is available for S7-1200 and S7-1500 F-CPUs. This means fail-safe data can be easily exchanged as fail-safe arrays with standard communication mechanisms between F-CPUs.



Flexible F-Link offers a series of advantages for exchanging fail-safe data:

- Collection of fail-safe data to be transmitted in F-compliant PLC data types (UDTs)
  (Nested F-compliant PLC data types (UDT) are not supported.)
- Up to 1500 bytes of fail-safe data per UDT, including a maximum of 800 elements of data type BOOL.
- Easy parameter assignment and automatic generation of fail-safe communication DBs
- Transmission of fail-safe data with standard communication blocks also across network limits
- F-runtime group communication (Page 94) for F-CPUs 1200/1500
- System-integrated and globally sufficiently unique F-communication UUID
- Separate F-communication address signature for easy detection of changes to the F-communication UUID

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 G1 F-CPUs as of firmware V4.2
- S7-1200 G2 F-CPUs as of firmware V1.0
- As of safety system version V2.2

Principles of communication via Flexible F-Link

Proceed as follows on the **send side**:

1. Create an F-compliant PLC data type (UDT) for the data to be sent. The size is up to 1500 bytes, including a maximum of 800 elements of data type BOOL.
2. Create safety-related communication with the "Send" direction in the *Safety Administration Editor* (Page 94).

   A new F-communication DB (Page 341) is created for the safety-related communication under "Program blocks\System blocks\STEP 7 Safety\F-communication DBs".
3. Set the F-monitoring time (Page 621) for the safety-related communication.
4. In the Safety program, supply the tags for the send data (SEND_DATA) in the F-communication DB (Page 341) of the safety-related communication.
5. Create standard blocks in which the fail-safe arrays created automatically in the F-communication DB are sent with the send data and received with the acknowledgment data. For processing the process values in the correct chronological order, you can make use of the F-OB Pre-/post-processing (Page 85). When using the communication instructions, ensure that the fail-safe arrays are available consistently at the time of evaluation and that the F-monitoring time (Page 621) is observed. Observe the note below.

Proceed as follows on the **receive side**:

1. Create an F-compliant PLC data type (UDT) with the same structure as on the send side.

   To do so, copy the F-compliant PLC data type (UDT) from the send side or use the project library or global library.
2. Create safety-related communication with the "Receive" direction in the *Safety Administration Editor* (Page 94).

   A new F-communication DB is created for the safety-related communication under "Program blocks\System blocks\STEP 7 Safety\F-communication DBs".
3. Copy the F-communication UUID of the safety-related communication from the send side.
4. Set the same F-monitoring time as for the send side.
5. In the Safety program, evaluate the tags for the receive data (RCV_DATA) at the F-communication DB (Page 341).
6. Create standard blocks in which the fail-safe arrays automatically created in the F-communication DB are received with the receive data and sent with the acknowledgment data. For processing the process values in the correct chronological order, you can make use of the F-OB Pre-/post-processing (Page 94). When using the communication instructions, ensure that the fail-safe arrays are available consistently at the time of evaluation and that the F-monitoring time (Page 621) is observed. Observe the note below.

NOTE

When using non-deterministic communication protocols (e.g. TCP/IP), you must take into account the following:

- Increased communication load can fundamentally impair the availability of your application (runtime of the F-monitoring time of the F-communication connection). This holds true especially when OPC UA and Secure Open User Communication (OUC) are used in parallel.
- Communication buffer overflows can adversely affect the availability of your application and should be avoided.
  Refer to the following application example for more helpful information: "Configuring Flexible F-Link Communication (https://support.industry.siemens.com/cs/ww/en/view/109768964)".

NOTE

The compilation time increases with increasing data frame size. The compilation times can rise significantly when the maximum frame length of 1500 bytes is fully used.

NOTE

During simulation with *S7-PLCSIM*, the time monitoring that generates an error message after expiration when communication with real communication partners is interrupted (e.g. by setting a CPU to STOP) is not activated. This is why no error message is displayed in this case.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

⚠ WARNING

If the SENDMODE tag in the F-communication DB (Page 341) is set to "1" for receiving during communication with Flexible F-Link, you can no longer assume that the data at the RCV_DATA tag is formed in a safety-related manner.
During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program with SENDMODE = 1 instead of the data in the RCV_DATA tag. *(S086)*

WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, a unique F-communication UUID for the communication is provided by the system. When communication is copied in the Safety Administration Editor within the parameterization table or copied to another F-CPU, the F-communication UUIDs are not regenerated and therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself must ensure the uniqueness. To do this, select the relevant UUIDs and generate them again via the "Generate UUID" context menu. You must ensure the uniqueness in the safety summary during acceptance, at the latest. *(S087)*

WARNING

For each communication connection via Flexible F-Link, you must check that the offsets of the elements of the F-compliant PLC data type (UDT) used for the communication connection match on the transmit and receive sides when you accept the Safety program. You can find the offsets in the respective safety summary. To do this identify the communication connection by means of the UUID. *(S088)*

See also

F-runtime group communication (S7-1200, S7-1500) (Page 141)

9.6.2 F-communication DB (S7-1200, S7-1500)

F-communication DB for sending

The following table shows you the interface of the F-communication DB for the communication connection with the direction "Send":

Section	Name	Data type	Initial value	Description
Input	SEND_DATA	F-compliant PLC data type (UDT)	As in the F-compliant PLC data type (UDT).	User data to be sent.
	ACK_RCV_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the received raw data.
Output	ERROR	BOOL	False	Signals currently pending communication errors or communication errors not acknowledged yet at the receiver (not in the initial start). 1=Communication error
	ACTIVATE_FV	BOOL	True	Communication passivated, in the initial start (for example receiver not started), or HOST sends ACTIVATE_FV. DEVICE sends status bit: FV_ACTVATED, but no 0-values. 1=The communication uses fail-safe values

Section	Name	Data type	Initial value	Description
Output	DIAG	Byte	16#0	Error bits (Timeout or CRC error currently still pending, or communication after error not depassivated yet) Bit 3: Acknowledgement request active at the receiver Bit 4: Timeout detected Bit 6: CRC error detected
	SEND_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the raw data to be sent.
	ACK_RCV_LENGTH	UInt	0	Length information to ACK_RCV_ARRAY in bytes
	SEND_LENGTH	UInt	0	Length information to SEND_ARRAY in bytes
InOut	—	—	—	—
Static	—	—	—	—

F-communication DB for receiving

The following table shows you the interface of the F-communication DB for the communication connection with the direction "Receive":

Section	Name	Data type	Initial value	Description
Input	PASS_ON	BOOL	False	This way you can passivate the output data (output of the passivation values) 1=Enable passivation
	ACK_REI	BOOL	False	Reintegration (in case of reintegration request) by means of positive edge 1=Acknowledgment for reintegration
	RCV_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the received raw data
Output	RCV_DATA	F-compliant PLC data type (UDT)	As in the F-compliant PLC data type (UDT).	Output data (PASS_VALUES or data received).
	ERROR	BOOL	False	Signals currently pending communication errors or communication errors not acknowledged yet (not in the initial start). 1=Communication error
	PASS_OUT	BOOL	True	At PASS_OUT=1 the PASS_VALUES are output Could be: ERROR, PASS_ON, in the initial start (e.g. sender not started), or ACK_REQ is pending (error not acknowledged)
	ACK_REQ	BOOL	False	Reintegration requirement (communication stable again after error, substitute values are still output) 1=Acknowledgment request for reintegration

Section	Name	Data type	Initial value	Description
Output	SENDMODE	BOOL	False	1=The Safety program on the sender side is in disabled Safety mode or is running on an S7-PLCSIM.
	DIAG	Byte	16#0	Error bits (Timeout or CRC error) Bit 0: Timeout detected by the sender Bit 1: Communication error currently pending in the sender Bit 2: CRC error detected by the sender Bit 4: Timeout detected by the receiver Bit 6: CRC error detected by the receiver
	ACK_SEND_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the raw data to be sent.
	RCV_LENGTH	UInt	0	Length information of RCV_ARRAY in bytes
	ACK_SEND_LENGTH	UInt	0	Length information of ACK_SEND_ARRAY in bytes
InOut	—	—	—	—
Static	PASS_VALUES	F-compliant PLC data type (UDT)	Same as the F-compliant PLC data type (UDT) or in the I/O DB	Passivation or substitute values

Compiling and commissioning a safety program 10

10.1 Compiling the safety program

To get a consistent Safety program, follow these steps:

1. Select the "Program blocks" folder or the Safety Unit folder or a higher level.
2. Start the compile.

   To do this, proceed essentially in the same way as when compiling a standard user program. You can start at various points to accomplish this in *STEP 7*. The basics for compiling user programs can be found in the *Help on STEP 7*.

NOTE

Please note that following a safety-related change to the hardware configuration that not only this, but also the Safety program has to be recompiled and downloaded. This also applies for changes to the F-I/O which are not used in the Safety program.

NOTE

The following applies for S7-300/400 F-CPUs:
If you want to compile a know-how-protected F-block after a change, you must remove the know-how protection for this F-block before compiling.

Reporting compiling errors

You can recognize whether or not the compilation was successful based on the message in the inspector window under "Info > Compile", error messages and warnings are output.

For information on the procedure you must follow to eliminate compiling errors, see "Eliminating compiling errors" in the *Help on STEP 7*.

10.2 Safety program work memory requirements (S7-300, S7-400)

Estimation

You can estimate the work memory requirement for the safety program as follows:

Work memory required for the safety program

32 KB for F-system blocks
+ 4.4 KB for safety-related communication between F-runtime groups
+ 4.5 x work memory requirement for all F-FB/F-FCs/main safety blocks

+ 4.5 x work memory requirement of all utilized instructions, which are shown in the "Instructions" task card with the block icon.
(except SENDDP, RCVDP, SENDS7, and RCVS7)
+ Work memory requirement of the utilized SENDDP and RCVDP instructions (4.3 KB each)
+ Work memory requirement of the utilized SENDS7 and RCVS7 instructions (8.5 KB each)

Work memory required for data

5 x work memory requirement for all F-DBs (including F-communication DB, but excluding DB for F-runtime group communication) and I-DBs for main safety block/F-FB

+ 24 x work memory requirement for all DBs for F-runtime group communication
+ 2.3 x work memory requirement for all I-DBs of instructions (except SENDDP, RCVDP, SENDS7 and RCVS7)
+ Work memory requirement of all I-DBs of instructions SENDDP (0.2 KB), RCVDP(0.3 KB), SENDS7 (0.6 KB), and RCVS7 (1.0 KB)
+ 0.7 KB per F-FC
+ 0.7 KB per F-I/O (for F-I/O DBs, etc.)
+ 4.5 KB

Block size of automatically generated F-blocks

Do not utilize the entire maximum size of an F-block, because the automatically generated F-blocks are larger and as a result, the maximum possible size may be exceeded in the F-CPU. If the block size is exceeded, this triggers a corresponding error message with information on which F-blocks are too large. These must be divided up, if necessary.

10.3 Downloading project data

Introduction

Once you have successfully compiled your safety program, you can download it together with the standard application program to the F-CPU.

(S7-1500) If the safety program is in a Safety Unit, you can load the Safety Unit independently into the F-CPU.

To download a safety program, you follow essentially the same approach as for downloading a standard user program, via different starting points in *STEP 7*.

- In the "Load preview" dialog, enter data (e.g. password for the F-CPU) and set the requirements for downloading (e.g. that the F-CPU is switched to STOP mode before downloading).
- The "Load results" dialog shows the results after loading.

We will show you the options for downloading the safety program later. For basic information on downloading, refer to the *Help on STEP 7*.

Rules for downloading the project data into an F-CPU

⚠ WARNING

(S7-300, S7-400) If **several F-CPUs** can be reached via a network (such as Industrial Ethernet) by **the same programming device or PC**, you must take the following additional measures to ensure that the safety-related project data is downloaded to the correct F-CPU:
Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.
Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety-related project data to an F-CPU, existing access permission for any other F-CPU must first be cancelled.
- The last download of the safety-related project data prior to switching to productive operation must be made with enabled access protection. *(S021)*

⚠ WARNING

(S7-1200, S7-1500) If **several F-CPUs** can be reached via a network (such as Industrial Ethernet) by the **same PG/PC**, you must take the following additional measures to ensure that the safety-related project data is downloaded to the correct F-CPU or that safety mode is deactivated in the correct F-CPU:

- Enter the serial number of the specific F-CPU in the *Safety Administration Editor*.

Depending on the respective CPU type (see documentation of the CPU), you have several possibilities for determining the serial number of an F-CPU:

- Print of the serial number on the housing of the F-CPU.
- Scanning of the ID link on the F-CPU.
- Display of the F-CPU
- Web server*
- Industrial Edge application user interface under /SIMATIC_MC/system/serialno* and via the UI or API of the Industrial Edge application
- TIA Portal (I&M data)*

Note the following when downloading:

- If the "Load preview" window does not contain a warning, the connection to the correct F-CPU has been established. You can confirm the download of the safety-related project data without an additional check.
- If a serial number has not yet been entered in the *Safety Administration Editor* or if the connected F-CPU has a different serial number, check the proposed serial number of the F-CPU in the "Load preview" window or "Disable safety mode" window. If you determine an error, cancel the download or the disabling of safety mode. Otherwise, you can confirm the procedure.
- When the serial number is confirmed (online), it is always applied in the *Safety Administration Editor* and any existing entry is overwritten.
  (S099)

* To make use of these possibilities, you must ensure a connection to the expected F-CPU. You achieve this through:

- A point-to-point connection to the respective F-CPU
- Verification of the flashing of the F-CPU after selecting the "Flash LED" check box in the online and diagnostics view of the F-CPU.
- Unplugging the network cable to the respective F-CPU
- For an S7-1500 F Virtual Controller, a unique connection can be achieved by a targeted switch to STOP of the Industrial Edge application.

NOTE

You can perform the downloading of a consistent safety program only in STOP mode.

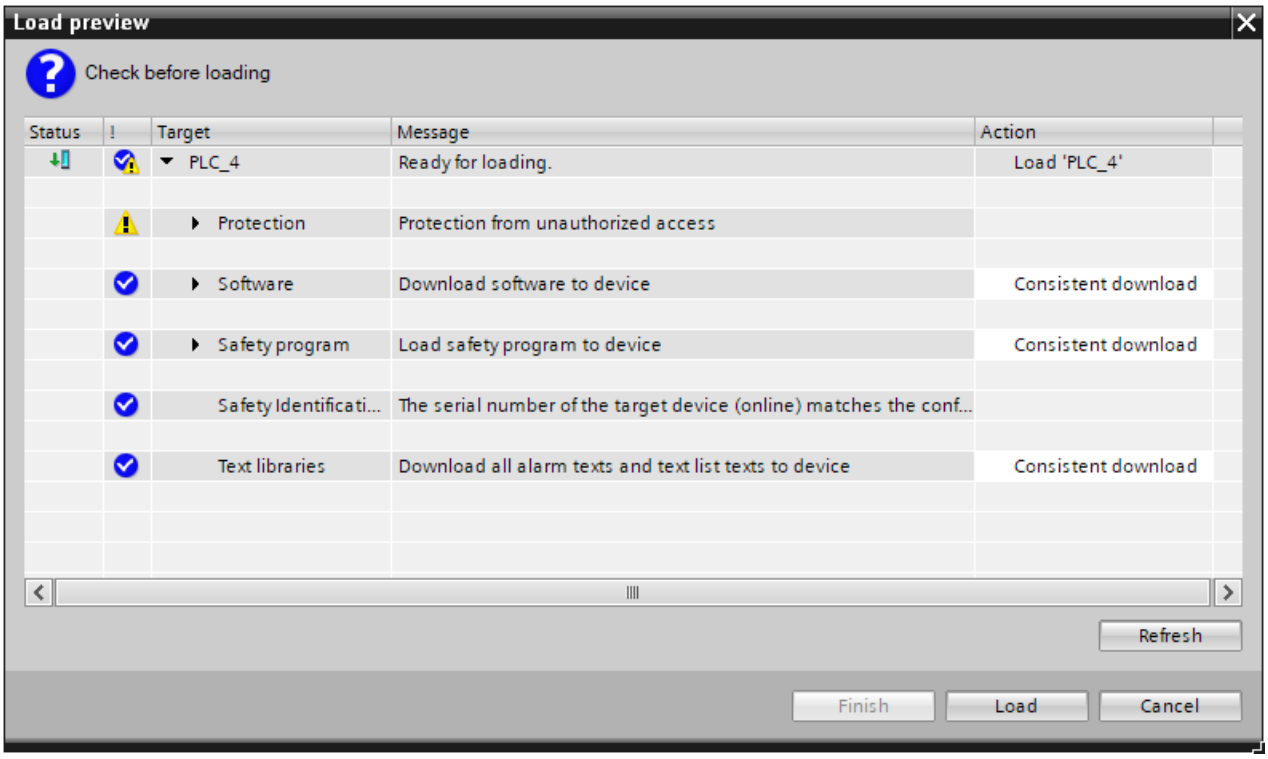
NOTE

If *STEP 7 Safety* detects an inconsistent safety program during startup of the F-CPU, the F-CPU startup is prevented, provided the F-CPU supports this detection. (see product information for the respective S7-300/400 F-CPU. This is always supported with S7-1200/1500 F-CPUs.) A corresponding diagnostics event is entered in the diagnostics buffer of the F-CPU.
If the F-CPU does not support this detection function, the F-CPU can go to STOP mode if an inconsistent safety program is executed in activated safety mode.
The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

When downloading the safety program, ensure that the "Consistent download" action is set for the "Safety program" selection in the "Load preview" dialog.

Inconsistent downloading is only possible in disabled safety mode.

Password prompt before downloading to an F-CPU



Before the download or, at the latest, during the download (in the "Load preview" dialog), you must gain access permission (Page 100) through legitimation with a user with F-right.

Check of serial number before the download to an S7-1200/1500 F-CPU

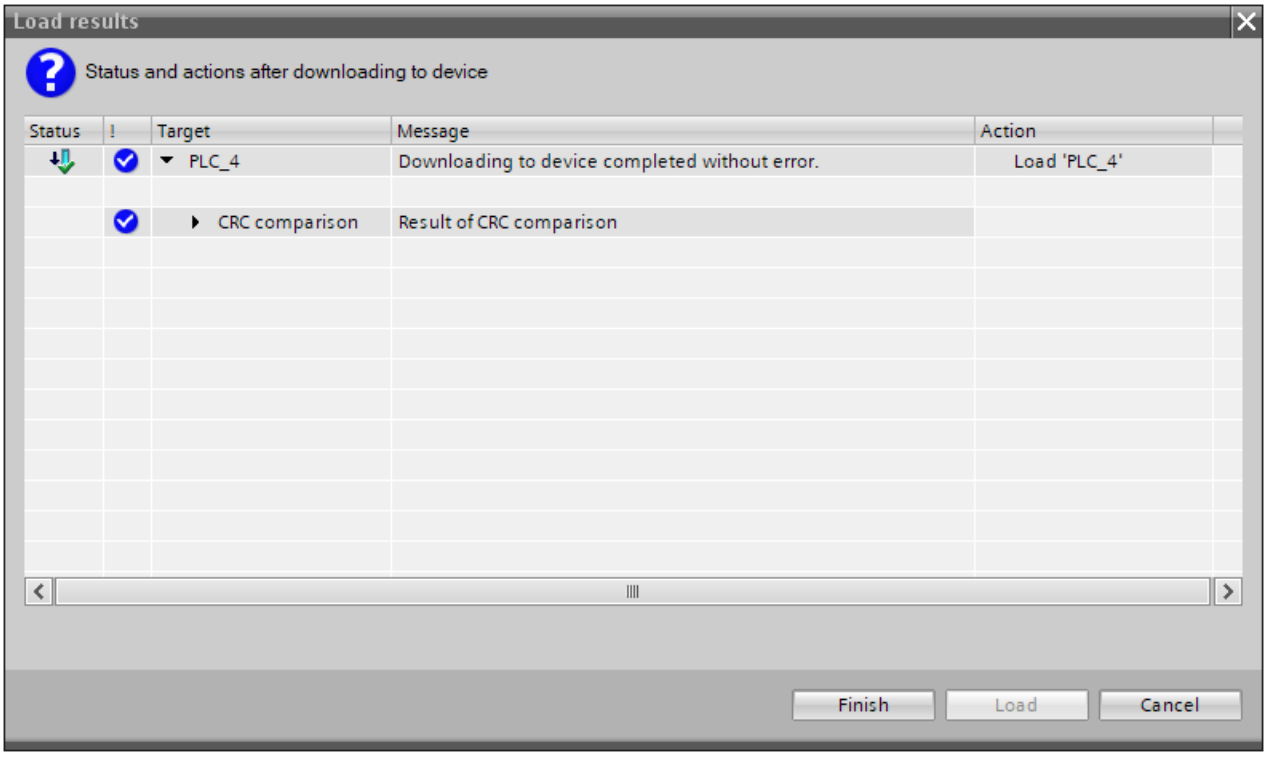
Before loading, the serial number of the F-CPU to be loaded is compared with the serial number entered in the *Safety Administration Editor*. If the serial numbers match, you can continue loading. If the serial numbers do not match or no serial number was entered in the *Safety Administration Editor*, you must check whether the serial number of the expected F-CPU is shown. If this is the case, confirm this with a check box in the "Load preview" dialog. The serial number is entered in the *Safety Administration Editor* for subsequent load processes.

"Load preview" dialog

For an F-CPU, the "Load preview" dialog also contains the section "Safety program".

Make the following selection:

- In order to download a consistent safety program, select the "Consistent download" action under target "Safety program".
- (S7-300, S7-400) To download individual F-blocks selectively (Page 351), select the "Download selection" action under the target "Safety program", and then select the required F-blocks. If necessary, you will be prompted to disable safety mode under "Disable safety mode". This setting is only suitable for the online test of individual F-blocks.
- (S7-300, S7-400) In order to download the safety program only, select the "Consistent download" action under target "Safety program" and the "Download selection" action under target" Standard software", and then select only the standard blocks that call the main safety block.
- (S7-300, S7-400) To download no safety program, for example, because you do not know the password of the F-CPU, select the "No action" action under target "Safety program".



For S7-1200/1500 F-CPUs, only the "Consistent download" value is possible as an action in the "Load preview" dialog. You cannot change the selection of program parts to be loaded in this dialog. The selection is made automatically based on the selection in the project tree when starting the loading process.

NOTE

If the function "Security Logging" is activated, the event "Download fail-safe program to a CPU" is entered as a log entry during the download.
For more information on the "Security Logging" function and its activation, refer to the help on STEP 7 under "Using Security Logging".

Dialog "Load results"

After downloading into the F-CPU, the dialog "Load results" is opened. This dialog shows you the status and the necessary actions after downloading.

Verify that the "Downloading to device completed without error" message appears in the "Load results" dialog. If not, repeat the download operation.

10.3.1 Downloading project data to an S7-300/400 F-CPU

10.3.1.1 Downloading project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card or flash card)

When you download project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro Memory Card for S7-300 or flash card for S7-400), you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that no "old" safety-related project data is stored in the F-CPUs:

- Download the safety-related project data to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline).
- Perform a memory reset of the F-CPU using the mode switch or via the PG/PC. During the reset, after the work memory has been deleted, the project data is again transferred from the load memory (memory card, SIMATIC Micro Memory Card for S7-300 F-CPUs, flash card for S7-400 F-CPUs) to the work memory. *(S022)*

10.3.1.2 Downloading project data to an S7-400 F-CPU without flash card inserted

When you download project data to an S7-400 F-CPU without flash card inserted, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that the F-CPU does not contain any "old" safety-related project data:

- Perform a memory reset of the F-CPU using the **mode switch** or via the **PG/PC**.
- Download the safety-related project data to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S023)*

10.3.1.3 Downloading individual F-blocks to an S7-300/400 F-CPU

Download F-blocks in disabled safety mode.

You can download F-blocks and standard blocks simultaneously to the F-CPU via the project tree. However, as soon as F-blocks are to be downloaded, a check is carried out to determine whether or not the F-CPU is in STOP mode or disabled safety mode. If not, you have the option of switching to disabled safety mode or placing the F-CPU in STOP mode.

If you want to load individual F-blocks into the F-CPU, e.g. to test changes, make sure that you have not selected the "Program blocks" folder or the F-CPU in the project navigation, but only the blocks to be loaded.

Only then will you be prompted in the "Load preview" dialog to disable Safety mode once you have changed the option from "Consistent download" to "Download selection" and have changed the option "Stop modules" to "No action".

If you fail to observe this prompt, the blocks will be downloaded without disabling safety mode, which can lead to STOP of the F-CPU.

You can also deactivate the safety mode explicitly in the *Safety Administration Editor* before you start the download.

Be aware that the consistency of the safety program in the F-CPU cannot be guaranteed when individual F-blocks are downloaded. For a consistent safety program, always download the entire safety program to the F-CPU.

Rules for downloading individual F-blocks

The following rules apply to downloading of individual F-blocks:

- Downloading is only possible in disabled safety mode or when the F-CPU is in STOP mode.
- F-blocks can only be downloaded to an F-CPU to which a safety program has already been downloaded.

Consequently, you have to download the entire safety program when initially downloading the safety program and after changing the password for the safety program.

NOTE

If you are downloading F-blocks only, the blocks in which the main safety blocks are called (e.g., cyclic interrupt OB 35) are not downloaded. To do so, select the "Selection" option under "Standard software" in the preview dialog, and select the necessary blocks.

NOTE

Downloading of individual F-blocks is only suitable for testing F-blocks. Prior to the transition to productive mode, you must download the safety program consistently to the F-CPU.

10.3.1.4 Downloading project data to a memory card and inserting at an F-CPU S7-300/400

Follow the same procedure as for a standard CPU to load project data of an F-CPU to a memory card (flash card for S7-400, SIMATIC Micro Memory Card for S7-300) or save it to a file folder. You must also observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination CPU, you must ensure that the correct safety-related project data is on the memory card or in the file folder after loading or saving.
Follow these steps:

1. Always load or save the project data to an empty memory card or file folder. Existing project data must not be overwritten.
2. Label the memory card or file folder uniquely (e.g. with the Collective F-Signature).

You must limit access to the loaded or saved safety-related project data to authorized persons through organizational measures. *(S043)*

When inserting a memory card (flash card for S7-400 or SIMATIC Micro Memory Card for S7-300) with project data of an F-CPU, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must ensure through program identification (Page 378) or other suitable measures (for example, by checking the label of the memory card or removable data storage medium) that the inserted memory card or removable data storage medium contains the correct safety-related project data. *(S025)*

When you insert a memory card (flash card for S7-400 or SIMATIC Micro Memory Card for S7-300) into S7-300/400 F-CPUs, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you must adhere to the following procedure when inserting the memory card to ensure that no "old" safety-related project data is stored in the F-CPUs:

- Switch off the power to the F-CPU. For F-CPUs with battery backup (e.g. CPU 416F-2), remove any battery. (To ensure that the F-CPU is de-energized, wait for the buffer time of the power supply you are using or, if this is not known, remove the F-CPU.)
- Remove the memory card with the old safety-related project data from the F-CPU.
- Insert the memory card with the new safety-related project data into the F-CPU.
- Switch on the F-CPU again and reinsert the battery, if it was removed.

(S026)

10.3.2 Downloading project data into an F-CPU S7-1200

10.3.2.1 Downloading project data to an S7-1200 F-CPU without program card inserted

When you download project data to an S7-1200 F-CPU without program card inserted, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that the F-CPU does not contain any "old" safety-related project data:

- Download the safety-related project data to the F-CPU.
- Perform a program identification (Page 378). *(S042)*

10.3.2.2 Downloading project data to an S7-1200 F-CPU with program card inserted

When you download project data to an S7-1200 F-CPU G2 with program card inserted, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety-related project data in the internal load memory of the F-CPU when you insert a program card into an S7-1200 F-CPU G2:

1. Check whether the STOP/RUN LED (yellow) and the maintenance LED flash for 3 seconds during startup **when the card slot is empty.** If this is the case, the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as external load memory), step 3 is skipped and you can skip step 5.
2. Insert the program card into the F-CPU.
   The F-CPU then performs an automatic restart, regardless of whether it is in RUN or STOP.
3. If the internal load memory contains project data, **the STOP/RUN LED (yellow) and the maintenance LED must flash after the restart**. In this case, the internal load memory of the F-CPU is deleted (therefore no longer contains any "old" safety-related project data) and step 5 can be skipped.
   Use one of the following variants to evaluate the program card:
   - Turn the F-CPU off and back on.
   - Remove and insert the program card.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU then performs a restart.
4. After the restart, the program card is evaluated. The F-CPU then enters the startup mode (RUN or STOP) that was set up for the F-CPU (variant 1 of step 3) or remains in STOP (variant 2 or 3 of step 3 or if step 3 is skipped because the internal load memory was empty).
5. Perform a program identification. *(S106)*

When you download project data to an S7-1200 F-CPU G1 with program card inserted, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety-related project data in the internal load memory of the F-CPU when you insert a program card into an S7-1200 G1 F-CPU:

1. Check to see whether **the STOP/RUN LED (yellow) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**.
   If this is the case, the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as external load memory) and you can skip steps 3 and 5.
2. Insert the program card into the F-CPU.
   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program card has to be evaluated or that the internal load memory has to be deleted.
3. Use one of the following methods to delete the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart of the F-CPU and deletion of the internal load memory, **the STOP/RUN LED (yellow) and the maintenance LED must be flashing**. In this case, the internal load memory of the F-CPU is deleted (no longer contains any "old" safety-related project data) and step 5 can be skipped.
4. Use one of the following methods to trigger evaluation of the program card on the F-CPU:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.
   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S061)*
5. Perform a program identification.

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Yellow/Green	ERROR Red	MAINT Yellow
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (yellow) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

When you download project data to an S7-1200 F-CPU with program card inserted, you must observe the following warning:

⚠ WARNING

If you use a programming device/PC to download F-blocks to an S7-1200 F-CPU with inserted program card (external load memory), you must ensure that the transfer takes place to the external load memory. This can be accomplished by the following measure:

- Insert a program card whose memory size is different from the size of the internal load memory. Check in the project tree under "Online & Diagnostics > Diagnostics > Memory" if the memory size displayed for the load memory matches the memory size of the program card. *(S058)*

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that the F-CPU does not contain any "old" safety-related project data:

- Download the safety-related project data to the F-CPU.
- Perform a program identification (Page 378). *(S042)*

10.3.2.3 Loading project data of an F-CPU S7-1200 with a transfer card into the internal load memory

When you insert a transfer card into an S7-1200 F-CPU G2, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety-related project data in the internal load memory when you copy the safety-related project data to an S7-1200 F-CPU G2 using a transfer card:

1. Check whether the STOP/RUN LED (yellow) and the maintenance LED flash for 3 seconds during startup **when the card slot is empty.** If this is the case, the internal load memory of the F-CPU has already been deleted, step 3 is skipped and you can skip step 7.
2. Insert the transfer card into the F-CPU.
   The F-CPU then performs an automatic restart, regardless of whether it is in RUN or STOP.
3. If the internal load memory contains project data, **the STOP/RUN LED (yellow) and the maintenance LED must flash after the restart**. In this case, the internal load memory of the F-CPU is deleted (therefore no longer contains any "old" safety-related project data) and step 7 can be skipped.
   Use one of the following variants to evaluate the transfer card (transfer from the transfer card to the internal load memory):
   - Turn the F-CPU off and back on.
   - Remove and insert the transfer card.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU then performs a restart.
4. After restart of the F-CPU and evaluation of the SIMATIC Memory Card, the F-CPU copies the project data to the internal load memory of the F-CPU. Once the copy process is complete, the maintenance LED on the F-CPU is flashing to indicate that you can remove the transfer card.
5. Remove the transfer card from the F-CPU. The F-CPU then performs an automatic restart.
6. The F-CPU remains in STOP after the restart.
7. Perform a program identification. *(S105)*

When you insert a transfer card into an S7-1200 F-CPU G1, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety-related project data in the internal load memory when you copy the safety-related project data to an S7-1200 F-CPU G1 using a transfer card:

1. Check whether **the STOP/RUN LED (yellow) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**.
   If this is the case, the internal load memory of the F-CPU has already been deleted and you can skip steps 3 and 6.
2. Insert the transfer card into the F-CPU.
   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the transfer card has to be evaluated or that the internal load memory has to be deleted.
3. Use one of the following methods to delete the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart of the F-CPU and deletion of the internal load memory, **the STOP/RUN LED (yellow) and the maintenance LED must be flashing**. In this case, the internal load memory of the F-CPU is deleted (no longer contains any "old" safety-related project data) and step 6 can be skipped.
4. Use one of the following methods to evaluate the transfer card (transfer from the transfer card to the internal load memory):
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart of the F-CPU and evaluation of the SIMATIC Memory Card, the F-CPU copies the project data to the internal load memory of the F-CPU. Once the copy process is complete, the maintenance LED on the F-CPU is flashing to indicate that you can remove the transfer card.
5. Remove the transfer card from the F-CPU.
6. Perform a program identification.
7. Use one of the following methods to initiate evaluation of the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S059)*

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Yellow/Green	ERROR Red	MAINT Yellow
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (yellow) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

When you want to update the project data on an S7-1200 F-CPU using a transfer card, you must observe the following warning:

WARNING

If you run an update of the safety-related project data on an S7-1200 F-CPU using a transfer card, you must ensure that the transfer to the internal load memory took place correctly by means of a subsequent program identification (Page 378). *(S060)*

10.3.2.4 Downloading project data of an S7-1200 F-CPU from the internal load memory to an empty SIMATIC Memory Card

When you download project data from the internal load memory of an S7-1200 F-CPU G2 to an empty SIMATIC Memory Card, you must observe the following warning:

⚠ WARNING

To ensure that the safety program is downloaded from the internal load memory of the F-CPU to the SIMATIC Memory Card when plugging an empty SIMATIC Memory Card into an S7-1200 F-CPU G2 and that the internal load memory of the F-CPU is deleted afterward, you must observe the following procedure:

1. Make sure that you are using an empty SIMATIC Memory Card, for example, by checking in the Windows Explorer that the "SIMATIC.S7S" folder and the "S7_JOB.S7S" file are deleted.
2. Insert the empty SIMATIC Memory Card into the F-CPU.
   The F-CPU then performs an automatic restart, regardless of whether it is in RUN or STOP.
3. If copying the project data from the internal to the external load memory is permitted, this will be performed automatically after the restart. The internal load memory is then deleted (therefore no longer contains any "old" safety-related project data) and **the STOP/RUN LED (yellow) and the maintenance LED must flash**. The SIMATIC Memory Card is now a program card. If copying the project data is not permitted, the error LED flashes and the project data remains in the internal load memory.
4. Use one of the following variants to evaluate the program card:
   - Turn the F-CPU off and back on.
   - Remove and insert the program card.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.
   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU (variant 1) or remains in STOP (variant 2 or 3). *(S107)*

When you download project data from the internal load memory of an S7-1200 F-CPU G1 to an empty SIMATIC Memory Card, you must observe the following warning:

⚠ WARNING

To ensure that the safety-related project data is transferred from the internal load memory of the F-CPU to the SIMATIC Memory Card when plugging an empty SIMATIC Memory Card into an S7-1200 F-CPU G1 and that the internal load memory of the F-CPU is deleted afterward, you must observe the following procedure:

1. Make sure that you are using an empty SIMATIC Memory Card, for example, by checking in the Windows Explorer that the "SIMATIC.S7S" folder and the "S7_JOB.S7S" file are deleted.
2. Insert the empty SIMATIC Memory Card into the F-CPU.
   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program can be copied from the internal load memory to the SIMATIC Memory Card and that the internal load memory is deleted afterward.
3. Use one of these methods to trigger copying from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart of the F-CPU and copying of the project data from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory, **the STOP/RUN LED (yellow) and the maintenance LED must flash**. In this case, the internal load memory of the F-CPU is deleted and no longer contains any safety-related project data. The SIMATIC Memory Card is now a program card.
4. Use one of the following methods to trigger evaluation of the program card on the F-CPU:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.
   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S057)*

NOTE

Also observe the setting "Disable copying from internal load memory to external load memory" in the hardware configuration of your F-CPU.

10.3.2.5 Downloading project data to a SIMATIC Memory Card and inserting it at an F-CPU S7-1200

When loading project data of an F-CPU to a SIMATIC Memory Card or saving it to a file folder, follow the same procedure as for a standard CPU. You must also observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination CPU, you must ensure that the correct safety-related project data is on the memory card or in the file folder after loading or saving.
Follow these steps:

1. Always load or save the project data to an empty memory card or file folder. Existing project data must not be overwritten.
2. Label the memory card or file folder uniquely (e.g. with the Collective F-Signature).

You must limit access to the loaded or saved safety-related project data to authorized persons through organizational measures. *(S043)*

When inserting a SIMATIC Memory Card with project data from an F-CPU, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must ensure through program identification (Page 378) or other suitable measures (for example, by checking the label of the memory card or removable data storage medium) that the inserted memory card or removable data storage medium contains the correct safety-related project data. *(S025)*

10.3.3 Downloading project data to an S7-1500 F-CPU

10.3.3.1 Downloading project data to an S7-1500 F-CPU

When you download project data to an S7-1500 F-CPU, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that the F-CPU does not contain any "old" safety-related project data:

- Download the safety-related project data to the F-CPU.
- Perform a program identification (Page 378). *(S042)*

10.3.3.2 Downloading project data into a redundant S7-1500HF system

With a redundant S7-1500HF system, a consistent safety program can only be downloaded in STOP mode of the redundant S7-1500HF system.

To do this, you must heed one of the following warnings:

- Loading the redundant S7-1500HF system in STOP.

⚠ WARNING

If the function test of the safety program is not performed in the redundant destination system S7-1500HF, you must adhere to the following procedure when downloading the safety-related project data to the HF-CPUs with a PG/PC. This way you ensure that no "old" safety-related project data is stored in the HF-CPUs:

1. Switch the two HF-CPUs to STOP.
2. If you did not program restart/startup protection in your previous safety program (Programming startup protection (Page 150)), you must format the SIMATIC Memory Card or delete the program, for example, via the display for both HF-CPUs.
3. Download the safety-related project data to one of the two HF-CPUs.
4. Switch the HF-CPU, to which you have downloaded the new safety-related project data, to RUN mode.
5. Switch the second HF-CPU to RUN mode.
6. As soon as the RUN-Redundant mode is reached, perform a program identification on one of the two HF-CPUs (i.e. check whether the Collective F-Signatures match online and offline).
   If you have programmed restart/startup protection in your new safety program, you may only acknowledge this after successful program identification.*(S090)*

- Loading the redundant S7-1500HF system with reduced STOP time.

⚠ WARNING

If the function test of the safety program is not performed in the redundant destination system S7-1500HF, you must adhere to the following procedure when downloading the safety-related project data to the HF-CPUs with a PG/PC. This way you ensure that no "old" safety-related project data is stored in the HF-CPUs:

1. Switch one of the two HF-CPUs to STOP.
2. If you did not program restart/startup protection in your previous safety program (Programming startup protection (Page 150)), you must format the SIMATIC Memory Card or delete the program, for example, via the display for the HF-CPU in STOP mode.
3. Download the safety-related project data to the HF-CPU, which is in STOP mode (to the backup CPU with the context menu command "Load into backup CPU").
4. Switch the HF-CPU that is still in RUN mode to STOP mode.
5. If you did not program restart/startup protection in your previous safety program, you must format the SIMATIC Memory Card or delete the program, for example, via the display for the HF-CPU recently switched in STOP mode.
6. Switch the HF-CPU with the newly downloaded safety-related project data to RUN mode.
7. Switch the second HF-CPU to RUN mode.
8. As soon as the RUN-Redundant mode is reached, perform a program identification on one of the two HF-CPUs (i.e. check whether the Collective F-Signatures match online and offline).
   If you have programmed restart/startup protection in your new safety program, you may only acknowledge this after successful program identification. *(S091)*

10.3.3.3 Downloading project data to an S7-1500 F Software Controller

When you download project data to an S7-1500 F Software Controller, you must observe the following warnings:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety-related project data to the F-CPU with a **PG/PC** to ensure that the F-CPU does not contain any "old" safety-related project data:

- Download the safety-related project data to the F-CPU.
- Perform a program identification (Page 378). *(S042)*

The following warning applies to an S7-1500 F Software Controller with firmware ≤ V21.9.x on an IPC 627E, IPC 647E, IPC 677E, or IPC 847E:

⚠ WARNING

When you download the safety program, you must perform a POWER OFF/POWER ON afterwards before you run a program identification for acceptance. *(S097)*

The following warning applies to an S7-1500 F Software Controller with firmware < V30.1

⚠ WARNING

For safety reasons, the password of an S7-1500 F Software Controller is stored in a separate memory in addition to the load memory.
Unlike the load memory, this separate memory is not deleted. This means the previous passwords are once again active after deleting the S7-1500 F Software Controller followed by a start-up.
For this reason, note the following:

- The S7-1500 F Software Controller is deleted in case of the following download scenarios of the PC station:
  - Downloading a PC station with revised interface assignment.
  - Downloading a PC station with revised storage location for retentive data.
- We recommend that you do not set up F-access protection until after commissioning. If you still have to change the interface assignment of the PC station or the storage location for retentive data, you do not have to enter the F-password during the subsequent mandatory download of the S7-1500 F Software Controller.
- We recommend that you remove the F-access protection from an S7-1500 F Software Controller that is no longer in use. If you use the S7-1500 F Software Controller later and don't remember the password, the F-password can only be removed by performing an uninstall/install/repair, installing an image file or importing a configuration file. *(S076)*

Downloading project data (Page 345)
Software Controller (https://support.industry.siemens.com/cs/ww/en/view/109249299)

10.3.3.4 Downloading project data to a SIMATIC Memory Card or removable storage device and inserting it into an F-CPU S7-1500

When loading project data of an (H)F-CPU to a SIMATIC Memory Card or saving it to a file folder, follow the same procedure as for a standard CPU. You must also observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination CPU, you must ensure that the correct safety-related project data is on the memory card or in the file folder after loading or saving.
Follow these steps:

1. Always load or save the project data to an empty memory card or file folder. Existing project data must not be overwritten.
2. Label the memory card or file folder uniquely (e.g. with the Collective F-Signature).

You must limit access to the loaded or saved safety-related project data to authorized persons through organizational measures. *(S043)*

When inserting a SIMATIC Memory Card or an S7-1500 F Software Controller removable disk with project data of an (H)F-CPU, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must ensure through program identification (Page 378) or other suitable measures (for example, by checking the label of the memory card or removable data storage medium) that the inserted memory card or removable data storage medium contains the correct safety-related project data. *(S025)*

Inserting SIMATIC Memory Cards in a redundant S7-1500HF system

⚠ WARNING

When inserting **two** new SIMATIC Memory Cards with new safety-related project data for a redundant S7-1500HF system, proceed as follows:

1. Switch the two HF-CPUs to STOP.
2. Replace the SIMATIC Memory Cards of both HF-CPUs with
   - Two SIMATIC Memory Cards, each with the new safety-related project data, or
   - One SIMATIC Memory Card with the new safety-related project data and one empty SIMATIC Memory Card

Procedure for ensuring correct safety-related project data through program identification:

1. Check on both HF CPUs in STOP mode, e.g. via the display, whether the correct safety-related project data is located on the SIMATIC Memory Card and that the second SIMATIC Memory Card is empty.
2. After a successful check, switch the HF-CPUs to RUN mode. If the new safety-related project data is only available on one SIMATIC Memory Card, you must first switch the HF-CPU with the new safety-related project data to RUN mode and then the HF-CPU with the empty SIMATIC Memory Card.

Procedure when it is ensured with clear identifiers that the correct safety-related project data is stored on the SIMATIC Memory Cards:

1. Switch the F-CPUs to RUN mode. If the new safety-related project data is only available on one SIMATIC Memory Card, you must first switch the HF-CPU with the new safety-related project data to RUN mode and then the HF-CPU with the empty SIMATIC Memory Card. *(S092)*

⚠ WARNING

When inserting **one** new SIMATIC Memory Card with new safety-related project data for a redundant S7-1500HF system, proceed as follows:

1. Switch the two HF-CPUs to STOP.
2. Remove the SIMATIC Memory Card on one of the two HF-CPUs.
3. Format the SIMATIC Memory Card or delete the program, for example via the display, for the HF-CPU that you did not remove.
4. Insert the SIMATIC memory card with the new safety-related project data into the HF-CPU without SIMATIC Memory Card.
5. If you cannot ensure by other suitable measures (e.g. by clear labeling of the SIMATIC Memory Card) that the correct safety-related project data is located on the SIMATIC Memory Card, you have to carry out a program identification on the HF-CPU with the new safety-related project data.
6. Switch the HF-CPU with the new safety-related project data to RUN mode.
7. Switch the second HF-CPU to RUN mode. *(S093)*

10.3.4 Restoring a backup of the safety program to an F-CPU

You have the option of backing up an F-CPU in the same way as a standard CPU and then restoring it. You can find information on backing up a CPU in the *help on STEP 7* under "Creating a backup of an S7-CPU". Saving an F-CPU S7-400 is only possible with an inserted flash card.

Note the following warnings when restoring the software and hardware configuration of an F-CPU:

⚠ WARNING

Once you have restored a backup of an F-CPU, you must perform a program identification (Page 378).
In a redundant S7-1500HF system, you must perform the program identification (Page 378) in RUN-Redundant mode. *(S055)*

NOTE

We recommend that you use the Collective F-Signature that is included in the name of the backup file for program identification. You must not change the Collective F-Signature in the name in this case.

⚠ WARNING

(S7-1200 G1, S7-1200 G2 as of FW 4.1, S7-1500) If several F-CPUs with activated web server can be accessed from a PG/PC, you must ensure through additional measures that the safety program is restored in the correct F-CPU when safety-relevant project data is restored via the web server. Use unique identifiers for this, such as the Collective F-Signature, serial number, station name or plant designation. *(S065)*

NOTE

When restoring, you must enter the previous password for the F-CPU.

10.3.5 Specifics on creating and installing an image file of an S7-1500 F Software Controller

Creating an image file

⚠ WARNING

When creating image files (for example, of an image) with safety-related project data, you must comply with the following points:

- You must take organizational measures to limit access to an S7-1500 F Software Controller to persons who are authorized to create image files.
- Before creating an image file, you must ensure through program identification (Page 378) that the correct safety-related project data is located in the S7-1500 F Software Controller.
- Image files with safety-related project data must be created on an empty data storage medium (deleted or formatted). Existing image files on a data storage medium or in a file system must be explicitly deleted; you are not permitted to overwrite an existing image file.
- After creating the image file, remove the data storage medium containing the image file or remove the image file from the file system.
- Clearly label the data storage medium or image file (e.g. with the Collective F-Signature). *(S073)*

Installing an image file

⚠ WARNING

When installing an image file (for example, of an image) with safety-related project data, you must comply with the following points:

- You must take organizational measures to limit access to an S7-1500 F Software Controller to persons who are authorized to install image files.
- When installing an image file via LAN, remote access or comparable access, you must ensure access protection (for example, using Windows administrator rights (ADMIN) or the Linux root user). Note, however, that only authorized persons are set up as users.
- To ensure that the image file is written to the correct S7-1500 F Software Controller, you must make sure when installing that the safety-related project data is installed in the correct device (for example, by comparing the serial number or the hardware identification of the device determined by the operating system).
- You must ensure that the image file contains the correct safety-related project data, for example, by checking the labeling of the data storage medium or image file.
- Remove the image file once you have installed it in the S7-1500 F Software Controller. Also remove any copies.

The following applies to firmware version as of V40.0 of the S7-1500 F Software Controller:

- After installing the image file, you must ensure through program identification (Page 378) that the correct safety-related project data is in the S7-1500 F Software Controller, for example with the display or with the command line command "GetCollectiveFSignature".

The following applies to firmware versions V30.0 and higher and < V40.0 of the S7-1500 F Software Controller:

- After installing the image file, you must ensure that the correct safety-related project data is in the S7-1500 F Software Controller through a program identification, for example, by reading out the Collective F-Signature with the command line command "GetCollectiveFSignature" or the display.
- Then you must enter and confirm the expected Collective F-Signature with the command line command "ConfirmCollectiveFSignature".

The following applies to firmware versions < V30.0 of the S7-1500 F Software Controller:

If the safety-related project data in the image file and the safety-related project data on the S7-1500 F Software Controller is different, the installed Safety program would not start up. In this case, you must download the project data to the F-CPU once again. For example, with TIA Portal. Therefore, you should always keep up-to-date backups of the image file.

In the same way that you can start up a Safety program from another CFast card, you can also install and run the image file created by another device or data storage medium.

(S074)

10.3.6 Loading project data (including safety-related project data) from an F-CPU into a PG/PC (S7-1500/S7-1200 G2 V4.1)

The "Upload from device (software)" or "Upload device as new station (hardware and software)" function is only possible for S7-1500/S7-1200 G2 V4.1 F-CPUs if the "Enable consistent upload from the F-CPU" option is activated for the F-CPU in the *Safety Administration Editor* and the project data is loaded to the F-CPU afterwards.

To load the project data (including safety-related project data) to a programming device or PC, proceed as in the standard scenario.

If "Delayed transfer" (internal value 0x7C6) was set for the F-BaseID in the original hardware configuration in the F-CPU, the actually assigned value is read when loading from the F-CPU and the option "Delayed transfer" is activated at the same time in the hardware configuration of the F-CPU. For connected F-I/Os of PROFIsafe address type 3, the setting "Delayed transfer" (internal value 0x7C6) remains in the hardware configuration.

When the data is downloaded to the F-CPU again, the actually assigned value for F-BaseID is thus retained and is transferred again to the F-I/O of PROFIsafe address type 3. If this behavior is not desired, you must deactivate the "Delayed transfer" option and generate the F-BaseID again, if necessary. The value for F-BaseID set in the hardware configuration then takes effect directly in the F-CPU and F-I/O of PROFIsafe address type 3 after a new compile and download of hardware and software.

If multiple F-CPUs can be reached over a network (e.g. Industrial Ethernet) by the programming device / PC, you have to ensure that the project data is uploaded from the correct F-CPU. For example, with "Online & diagnostics" > "Online access " > "Flash LED".

After successful loading from the device you can continue working as with a project that was created offline.

⚠ WARNING

If you want to carry out an acceptance with the project data loaded to the programming device / PC or want to carry out changes to the safety-related project data, you must ensure that the safety program is executable before loading.
This is fulfilled when loading from an F-CPU if the F-CPU is in RUN mode and in activated safety mode or can be set to RUN before loading. If the F-CPU remains in STOP, you are not allowed to perform acceptance or changes with the safety-related project data.
When loading from a memory card, it must have been in a suitable S7-1500/S7-1200 G2 V4.1 CPU beforehand. The same conditions apply as for loading from an F-CPU. *(S080)*

You can upload individual F-blocks into a PG/PC irrespective of the "Enable consistent upload from the F-CPU" option.

You cannot upload individual know-how protected F-blocks to a programming device / PC.

As of STEP 7 Safety V18, loading the project data from a memory card is possible as a new station (hardware and software) and device (software).

See also

"Settings" area of the Safety Administration Editor (Page 89)

10.3.7 Loading project data (including safety-related project data) from a memory card into a PG/PC (S7-1500/S7-1200 G2 V4.1)

The "Upload from device (software)" or "Upload device as new station (hardware and software)" function is only possible for S7-1500/S7-1200 G2 V4.1 F-CPUs if the "Enable consistent upload from the F-CPU" option is activated for the F-CPU in the *Safety Administration Editor* and the project data is loaded to the memory card afterwards.

To load the project data (including safety-related project data) to a programming device or PC, proceed as in the standard scenario.

If "Delayed transfer" (internal value 0x7C6) was set for the F-BaseID in the original hardware configuration in the F-CPU, the actually assigned value is read when loading from the F-CPU and the option "Delayed transfer" is activated at the same time in the hardware configuration of the F-CPU. For connected F-I/Os of PROFIsafe address type 3, the setting "Delayed transfer" (internal value 0x7C6) remains in the hardware configuration.

When the data is downloaded to the F-CPU again, the actually assigned value for F-BaseID is thus retained and is transferred again to the F-I/O of PROFIsafe address type 3. If this behavior is not desired, you must deactivate the "Delayed transfer" option and generate the F-BaseID again, if necessary. The value for F-BaseID set in the hardware configuration then takes effect directly in the F-CPU and F-I/O of PROFIsafe address type 3 after a new compile and download of hardware and software.

After successful loading from the memory card, you can continue working as with a project that was created offline.

⚠ WARNING

If you want to carry out an acceptance with the project data loaded to the programming device / PC or want to carry out changes to the safety-related project data, you must ensure that the safety program is executable before loading.
This is fulfilled when loading from an F-CPU if the F-CPU is in RUN mode and in activated safety mode or can be set to RUN before loading. If the F-CPU remains in STOP, you are not allowed to perform acceptance or changes with the safety-related project data.
When loading from a memory card, it must have been in a suitable S7-1500/S7-1200 G2 V4.1 CPU beforehand. The same conditions apply as for loading from an F-CPU. *(S080)*

See also

"Settings" area of the Safety Administration Editor (Page 89)

10.3.8 Loading a PC system configuration file for S7-1500 F software controllers

You can save the entire configuration of your S7-1500 F Software Controller in a configuration file, transport it and load it to a target system. The entire configuration of your S7-1500 F Software Controller is saved from the TIA Portal in a configuration file with the extension *.psc.

Saving and loading of the configuration file is supported as of:

- *STEP 7 Safety V15*
- S7-1500 F Software Controller V2.5

Example

You can find a detailed example on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109759142).

Identification parameters

The identification parameters include:

- File name
- Information in the project and the station that was stored from the TIA Portal in the PSC file in the metadata.

  For example:

  – Project version
  – Plant designation
  – Station comment

Save the identification parameters in a file, if necessary, that you store on the target system.

For evaluating and testing these identification parameters via script, you must store this information directly in the script or save the identification parameters in a separate file, if necessary, that you store on the target system.

10.3.8.1 Creating a configuration file

1. In TIA Portal create a new configuration file with "Project > Memory Card file > New > PC system configuration file (.psc)".
   The configuration file is created in the project tree under "Card Reader/USB memory".
2. Use the Collective F-Signature and, if necessary, the F-BaseID to check in the *Safety Administration Editor* that you have selected the correct project/station.
3. Use your mouse to drag the selected PC station to the configuration file.
   This loads the PC station to the configuration file.

⚠ WARNING

Instead of program identification, you can use a unique name for the PC system configuration file *.psc (**P**C **S**ystem **C**onfiguration) to ensure that the correct safety-related project data is located in the configuration file.
In addition, you have to observe the following when creating a configuration file:
When creating a configuration file with the safety-related project data, an existing file must not be used. You have to create a new file.
You should also delete configuration files with incorrect safety-related project data from the data storage.
You must limit access to the configuration file (*.psc) through organizational measures to persons who are authorized to import and modify the configuration file. *(S081)*

10.3.8.2 Importing the configuration file

You have the following options for importing the configuration file:

- Via the PC Station Panel menu (Import configuration file) **(only FW < V30.0)**
- By means of a script

Import via the PC Station Panel menu (only possible with firmware < V30.0)

Requirement

If you want to start the import of the configuration file via the menu in the PC Station Panel of an S7-150xS(P) F, the executing user must be in the Windows user group "Failsafe Operators".

Procedure

⚠ WARNING

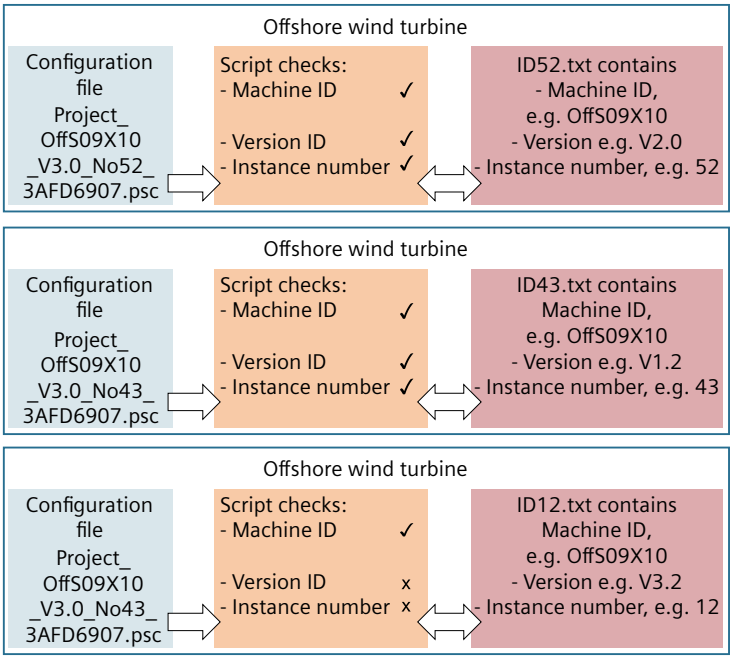
If the import operation was successful, you will receive a positive feedback. If you do not receive a positive message, you must assume that the import operation was not successful and that the old safety-related project data is still present.
When a configuration file with safety-related project data is imported, you must adhere to the following points:

- Use the unique name of the configuration file to check that you have selected the required configuration file.
- To ensure that a configuration file imported via LAN is imported to the correct S7-1500 F Software Controller, use the following measures:
  - Remove the physical connections and possible routings to other S7-1500 F Software Controllers.
  - Use unique computer names and unique user logins or use other identification options. *(S084)*

Import by means of a script

⚠ WARNING

You must check in the script based on the specified identification parameters whether the import of the configuration file is permitted for the respective target system (e.g. by evaluating the F-CPU name, project name or using the plant designation).
In addition, it may be necessary or useful to check the respective instance of the target system. This means a diversity check of your addressing and/or checking the version of the configuration file, for example, only higher versions or the exclusion of specific versions (block list).
Example of checking the respective version for validity:



- The script evaluates the information about the version and only allows configuration files of a higher version, for example.

As a machine manufacturer, you must ensure that the script is protected against manipulation (unauthorized change of content or name).
If, as a machine manufacturer, you only make available the configuration files, you have to ensure that no incorrect configuration file is imported during import. You achieve this through technical measures (extended checks in the script) and training of the machine operators. *(S082)*

The script checks for:

- Matching machine ID
- Version ID greater than current one. If so, the new version is written to the txt file.
- Instance number

The figure below contains a systematic overview of checking the configuration file in the script with the help of an identification parameter stored in a separate file (shown in violet in the figure below):

⚠ WARNING

You must determine whether the safety-related project data was successfully imported via the script by evaluating the corresponding return value (0x51A3 or 20899). If the corresponding return value is not returned, the import has failed and the old safety-related project data may still be present.
If the import operation is triggered by a server, feedback about the positive return value must also be given.
For traceability we recommend that you document the import operation in a log file.
The following applies to firmware versions V40.0 and higher of the S7-1500 F Software Controller:
To have the return value 0x51A3 displayed after the import, you must call the import command with extension "/v" for verbose.
After a successful import, you must perform a program identification (for example, manually or via a script).
The following applies to firmware versions V30.0 and higher and < V40.0 of the S7-1500 F Software Controller:
To have the return value 0x51A3 displayed after the import, you must call the import command with extension "/v" for verbose.
After successful import, you must read out the Collective F-signature from the meta file (PSC file) and enter and confirm it with the command line command "ConfirmCollectiveFSignature". This confirmation is required to restart the safety program.
The following applies to firmware versions < V30.0 of the S7-1500 F Software Controller:
To ensure that the return value is not from the previous import, you must reset the return value to 0x3FF ("PCSystem_Control /ImportConfig" without entering a file name) before the import. Then check whether the return value was reset to 0x3FF (enter "PCSystem_Control/GetStatus /ImportConfig" and then enter "echo %errorlevel%". This instruction must deliver the return value 0x3FF).
If the configuration file is imported manually via the Windows command line (via script command), you need to do one of the following:

- Reset the return value to 0x3FF and check it before the import (see above).
  - Carry out the import.
  - Evaluate return value (enter "PCSystem_Control /GetStatus /ImportConfig" and then enter "echo %errorlevel%". This instruction must return the return value 0x51A3 or 20899).
- Carry out the import.
  - Perform a manual program identification, for example, using the display of the F-CPU.

(S083)

NOTE

The positive return value when importing a configuration file via script is "0x51A3" for an S7-1500 F Software Controller, in contrast to the S7-1500 Software Controller, in which case it is "0x0000".

When the file is imported via script, the authorization should be moved to the script. This means that the executing user does not need a higher authorization level, since the script that was made available to the user by the machine manufacturer contains the necessary authorizations (user group "Failsafe Operators").

The rights are assigned via script by assignment of the Windows service to the corresponding user group. This initial installation must be performed beforehand by the Windows administrator on every computer with S7-150xS(P) F. The Windows service can be called by the executing user and the Windows service executes the script.

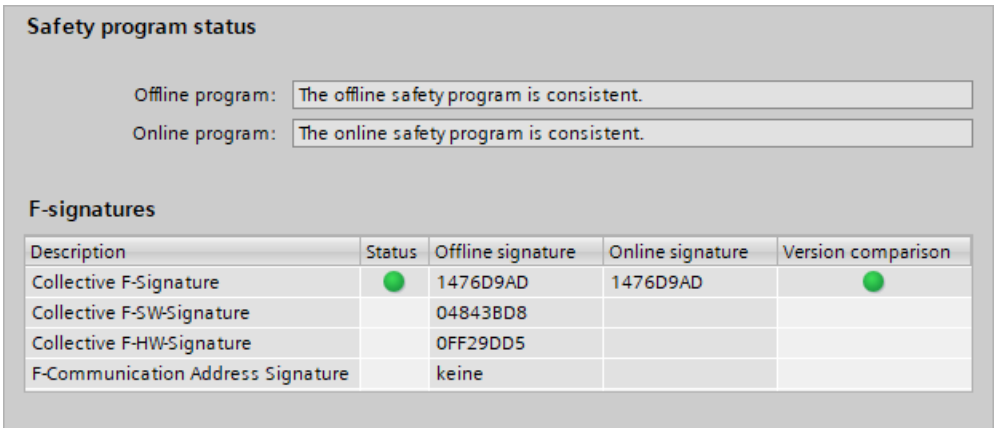
10.4 Program identification

You use the program identification to determine that the correct safety-related project data has been downloaded to the F-CPU To do so, you compare the Collective F-Signature with an expected value. The expected value can be, for example, the offline Collective F-Signature from the *Safety Administration Editor* or from the safety summary.

For S7-1500 F-CPUs with firmware < V3.1 and S7-1200 G1 F-CPUs with firmware < V4.7, you also compare the "F-admin" right online and offline in the *Safety Administration Editor*.

F-I/Os of PROFIsafe address type 3 (with active F-BaseID or the value "Delayed transfer") can be used for S7-1500 and S7-1200 G2 F-CPUs with firmware V4.1 or higher, or S7-1500 F-Software Controllers with firmware V40.1 or higher, as well as Safety System Version V2.8. The F-BaseID is not part of the Collective F-Signature and may need to be checked separately. In general, this is not necessary because the F-I/Os passivate if inconsistencies occur. Checking the F-BaseID could be useful if, for example, you want to check which value is active online.

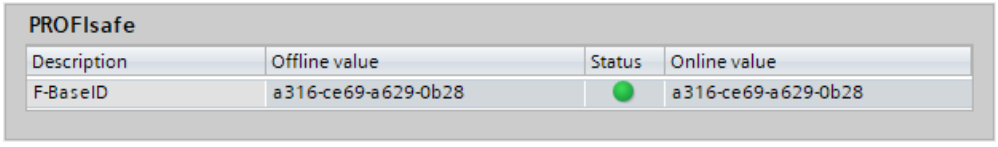
For information on the F-BaseID, see also sections "Configuring an F-CPU (Page 39)" and "PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68)". To check the F-BaseID using the *Safety Administration Editor*, see the section "General" area of the *Safety Administration Editor* (Page 81).



Use organizational measures to ensure that the safety-related project data is not downloaded by any other TIA Portal (on a separate programming device or PC) during the program identification.

With the *Safety Administration Editor*

For a program identification using the *Safety Administration Editor* (Page 78), follow these steps:



1. Open the *Safety Administration Editor* of the F-CPU you want to check.
2. Connect online with the F-CPU you want to check.
3. Compare the Collective F-Signature displayed online with the expected value in the "General" section.
4. Check whether the offline and online program are consistent (Page 424).

5. Check whether the green symbol is displayed in the column "status" and "Version comparison".

6. For S7-1500 F-CPUs with firmware < V3.1 and S7-1200 G1 F-CPUs with firmware < V4.7: Check in the "Web server F-admins" section whether only authorized users have the "F-admin" right offline and online.
7. If the check of the F-BaseID is required:

   Check in the "General" area of the *Safety Administration Editor* under "PROFIsafe" to see if the F-BaseID is the same offline and online. If it is the same, this is indicated by the green icon. (For information on checking the F-BaseID using the *Safety Administration Editor*, see also section "General" area of the Safety Administration Editor (Page 81).)

With HMI

For a program identification using the HMI, follow these steps:

1. Read the Collective F-Signature of the safety program from the F_PROG_SIG tag of the F-global DB (Page 148) (S7-300, S7-400) or the F_SYSINFO.F_PROG_SIG tag of the F-runtime group information DB (Page 149) (S7-1200, S7-1500).
2. Compare the value of the F_PROG_SIG tag with the expected value.
3. If the check of the F-BaseID is required:

   Compare the value of parameter BASEID_ACTIVE at the F-I/O DB of any F-I/O of PROFIsafe address type 3 of the relevant F-CPU with the expected value of the F-BaseID (e.g. from the safety summary). For information regarding BASEID_ACTIVE, see also section BASEID_ACTIVE (Page 165).

With the display of an S7-1500 F-CPU

For a program identification using the display of an F-CPU, follow these steps:

1. In the display menu, go to "Overview > Fail-safe".
2. Compare the displayed Collective F-Signature with the expected value.
3. If the check of the F-BaseID is required:
   Compare the displayed F-BaseID with the expected value (e.g. from the safety summary).

With the web server of an S7-1200 G1/S7-1200 G2 F-CPU as of V4.1/S7-1500

For a program identification with the web server of an S7-1200 G1/S7-1200 G2 F-CPU as of V4.1/S7-1500, follow these steps:

1. Read the Collective F-Signature on the homepage of the Web server.
2. Compare the displayed Collective F-Signature with the expected value.
3. If the check of the F-BaseID is required:
   Compare the displayed F-BaseID with the expected value (e.g. from the safety summary).

With the application UI of the S7-1500VF

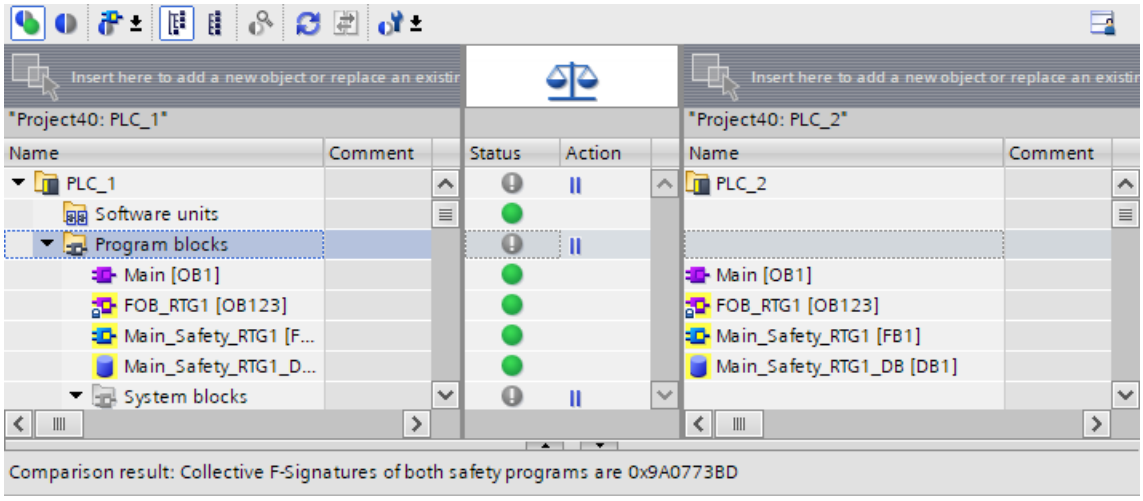
For program identification using the UI of the S7-1500VF application, follow these steps:

1. Open the UI of the S7-1500VF by clicking on the app icon.
2. Compare the displayed Collective F-Signature with the expected value.

10.5 Comparing Safety Programs

Compare safety programs as in standard

You can use the *comparison editor* in *STEP 7* for offline-online or offline-offline comparison of safety programs. The procedure is the same as for standard user programs. The contents of F-blocks are also compared for the comparison of safety programs. As a result, an offline-offline comparison can also be used for an acceptance of changes (Page 427). You enable this comparison by selecting the "Safety" comparison criterion and disabling all other comparison criteria.



NOTE

You must not use the *Comparison editor* to detect changes offline-online in the safety program/configuration of the F-IOs when accepting changes. Only the offline-offline comparison is suitable for this purpose. To accept changes, proceed as described under Acceptance of Changes (Page 427).

Comparison result for safety programs

The representation of the comparison result corresponds to the representation of *STEP 7*.

Please note:
The status symbol of the "Program blocks" folder merely summarizes the comparison result of all lower-level program blocks, without taking into account the comparison values of program consistency and the collective F-signature.
To establish whether the two Safety programs are the same, you need to click the "Program blocks" folder on the left of the comparison editor. Then the collective F-signatures of both Safety programs are shown under "Comparison result". You also receive information about whether the safety program is consistent.

If you click on an F-block, you can see the respective signatures and interface signatures in addition to the standard information.

NOTE

If you interrupt the connection to the F-CPU during the online/offline comparison, the comparison result will be incorrect.

Comparison filter options

You can use filters in the *comparison editor* to limit the comparison result to the following block groups:

- Compare only F-blocks
- Compare only F-blocks relevant for certification
- Compare only standard blocks

You also have the *STEP 7* filter options "Show only objects with differences" and "Show identical and different objects".

For comparison of safety programs, F-blocks in the "System blocks" folder are also relevant.

Comparison criteria

Make sure that under only the comparison criterion "Safety" is enabled.

Classification of displayed changes

Regardless of whether you carried out an offline/online or offline/offline-comparison, the following changes could account for the indicated changes to the automatically generated F-blocks:

- Changing in the maximum cycle time of the F-runtime group and warning limit F-cycle time of the
  F-runtime group
- Change in F-parameters of the F-CPU
- (S7-1200/1500) Modified Safety system version
- (S7-300, S7-400) Change in the F-runtime group communication, for example, change in the number of a DB for F-runtime group communication
- Change in main safety block, F-FB, F-FC, F-DB
- Change of the hardware configuration for the F-I/O addressed in the safety program
- (S7-1200, S7-1500) Change in the communication with Flexible F-Link
- (S7-1500) Change in the communication with OPC UA Safety

It is possible that a block is displayed as changed, but no changes are displayed in the detailed comparison of the block content. This is not a display problem but means that changes of addresses in the tag table, for example, have an effect on this block. Test this block in case of doubt.

Document the result of the comparison

The comparison result can be printed via "Project > Print" in the menu bar or the "Print" icon in the toolbar or create a PDF file. Select "Print objects/area" "All" and "Properties" "All".

10.6 Creating a safety summary

The documentation of the safety-related project data (safety summary) serves, in addition to other system documentation, as the basis for checking the correctness of the individual components of the system. Correctness is a prerequisite for system acceptance.

The Collective F-Signature in the footer on the pages of the safety summary guarantees unambiguous assignment of the safety summary to a Safety program.

Bear in mind, however, that the F-BaseID does not enter into the Collective F-Signature. If this parameter is relevant to your archiving, you must separately check that the right F-BaseID was printed.

The safety summary can be created in printed or electronic form, for example, as a PDF file.

Procedure for creating the safety summary

To create the safety summary, follow these steps:

1. Open the *Safety Administration Editor* (Page 81) of the F-CPU whose safety summary you want to create.
2. Under "Safety summary" in the "General" section, press the "Create safety summary" button.

   In the displayed dialog, you can make layout settings for the printout and specify the scope of the printout (all/subset), among other things.

   Alternatively, you can select an F-CPU in the project tree and open the dialog using "Print" in the shortcut menu, "Project > Print" in the menu bar or the print button in the toolbar.
3. If you want to print the safety summary on paper, we recommend one of the ISO formats, e.g. "DocuInfo_Simple_A4_Portrait_Small_Footer" or "DocuInfo_ISO_A4_Portrait".

   In these formats, the summary contains page numbers with which you can verify the completeness of the summary.
4. Select the "All" option, if the F-blocks and F-compliant PLC data types (UDT) are to be shown in the printout. This is necessary, for example, to document the program code for the acceptance (see Acceptance of system (Page 407)). Select the "Compact" option to exclude the source code from the printout.
5. Click the "Print" button.

As a result, you receive the safety summary for the F-CPU.

After printing, make sure that all pages were printed. Incomplete printouts (e.g. lines cut off, insufficient toner when printing to paper) must not be used for an acceptance.

Overview of the contents of the safety summary

The information included in the safety summary is summarized below:

- General information on program identification, signatures, software versions, access protection, settings of the Safety program (from the "Settings" work area of the *Safety Administration Editor*), for example safety system version.
- System library elements used in Safety program (from the "Instructions" task card) along with their versions
- Information about the F-runtime groups (e.g. cycle time warning limit of the F-runtime group, maximum cycle time of the F-runtime group)
- List of F-blocks within the "Program blocks" folder (e.g. name, function, associated F-runtime group, signature)
- (S7-1200, S7-1500) List of the know-how protected F-blocks used in the Safety program (e.g., name, signature, used safety system version, used versioned instructions, named value types (NVT) or called F-blocks).
- (S7-1200, S7-1500) List of F-compliant PLC data types (UDT) used in the Safety program, if these exist in the Safety program.
- (S7-1200, S7-1500) List of the definitions of all named-value types (NVT) used in the safety program and all named-value types (NVT) that can be used in the safety program via a relation to another software unit.
- (S7-1200, S7-1500) List of all named-value types (NVT) used in the Safety program.
- (S7-1200, S7-1500) List of all system NVTs used in the safety program.
- List of all global constants used in the Safety program.

- Data from the standard user program that are evaluated in the Safety program
- Block parameters of the safety-related CPU-CPU communication by means of the instructions SENDDP/RCVDP or SENDS7/RCVS7
- (S7-300, S7-400) Absolute addresses and names of the F-shared DB tags that can be accessed from the standard user program.
- Information on the F-CPU used (e.g. firmware version, central F-source address, F-BaseID) Information on the F-I/O used (e.g. firmware version, general and specific parameters)
- Information on the printout (print date, number of pages)
- Parameters of the safety-oriented communication with OPC UA Safety
- Parameters of the safety-oriented communication with Flexible F-Link

Content of the footer of the safety summary

Based on the footer of the safety summary, you can see whether the printed safety-related project data is consistent and whether all pages of the safety summary belong to the same Safety program and the same version (the same Collective F-Signature in the footer of every page means that the safety summary belongs to the Safety program with this Collective F-Signature).

The footer is only added to the source code of the F-blocks if the "All" option was selected when creating the Safety program. If F-blocks are printed by other means, the footer is omitted, and you can no longer easily identify whether the block printout belongs to the current Safety program version.

Safety summary for a migrated project

You can only create the safety summary for a project migrated from *S7 Distributed Safety V5.4 SP5* if the project was compiled with *STEP 7 Safety Advanced* and the new program structure for safety programs (main safety block) was thereby applied. Otherwise, the safety documentation cannot be created and you will receive a corresponding error message.

We recommend that you create a safety summary for your project in *S7 Distributed Safety V5.4 SP5* before the migration.

10.7 Testing the safety program

10.7.1 Overview of Testing the Safety Program

Complete function test or test of changes

After creating a safety program, you must carry out a complete function test in accordance with your automation task.

For changes made to a safety program that has already undergone a complete function test, only the changes and that there is no effect on the parts of the safety program that were not changed need be tested.

Monitoring

Read-only test functions (such as monitoring tags of the safety program) are available for safety programs as in the standard.

Modifying

Read and write test functions (such as controlling tags of the safety program) are only available to a limited extent for safety programs and only in disabled safety mode.

Simulation via *S7-PLCSIM*

You can test the safety program using *S7-PLCSIM*. You use *S7-PLCSIM* in the same way as for standard user programs.

You start the simulation with *S7-PLCSIM* using menu item "Online > Simulation > Start"

Rules for testing

- Forcing of F-I/O inputs and F-I/O outputs is not possible.
- Controlling F-I/O outputs in connection with the function "Enabling F-I/O outputs" is not possible.
- Setting breakpoints in the standard user program will cause errors in the safety program (see also Testing the safety program (Page 390)).
- Changes in the configuration of F-I/O or safety-related CPU-CPU communication can only be tested after the hardware configuration has been saved and downloaded, and after the safety program has been compiled and downloaded to the F-CPU.

See also

Disabling safety mode (Page 386)

10.7.2 Disabled safety mode

The safety program generally runs in the F-CPU in safety mode after a STOP/RUN transition. This means that all fault control measures are activated. The safety program cannot be modified during operation (in RUN mode) in safety mode. You must disable safety mode of the safety program to, for example, modify tags in the safety program in RUN mode. Safety mode remains disabled until the F-CPU is next switched from STOP to RUN mode.

As of Safety system version V2.4, disabled safety mode for S7-1200/1500 CPUs is time-limited.

After the time limit has expired, the F-CPU or the redundant S7-1500HF system automatically goes to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You can avoid an unplanned STOP of the F-CPU after the time limit has expired as follows:

- Ending the disabled safety mode through a targeted STOP/RUN transition.
- Resetting the remaining runtime. Resetting can be used as often as needed.

10.7.2.1 Configuring the time limit for disabled safety mode (S7-1200, S7-1500)

Introduction

You can configure the duration of the time limit.

Requirements

- In the *Safety Administration Editor*, the "Safety mode can be disabled" option is activated.
- The minimum Safety system version is set to V2.4.

Procedure for configuring the runtime

To configure the time limit, follow these steps:

1. Open the *Safety Administration Editor* of the F-CPU.
2. Open the "Settings (Page 89)" area in the area navigation.
3. Under "Runtime for the deactivated safety mode", configure the time limit for the safety mode. The default time is 4 hours. You have the option to configure the time limit to a maximum of 8 hours and a minimum of 1 minute.

NOTE
The value of the configured time is not included in the Collective F-Signature.

10.7.2.2 Disabling safety mode

Requirements

- In the *Safety Administration Editor*, the "Safety mode can be disabled" option is activated.
- (S7-1200, S7-1500) The serial number of the F-CPU (Page 81) has been entered in the *Safety Administration Editor*.
- The project is loaded to the F-CPU.
- The F-CPU is in RUN.
- The Safety program runs in safety mode.

Rules for disabling safety mode

⚠ WARNING

When safety mode is disabled, you must take the following into consideration:

- Disabling of safety mode is intended for test purposes, commissioning, etc. While safety mode is disabled, plant security must be ensured by organizational measures.
  After the test or commissioning, safety mode must be enabled again. To do this, execute a STOP/RUN transition of the F-CPU.
  In a redundant S7-1500HF system you have to set both HF-CPUs or the redundant system S7-1500HF to STOP before you restart the HF-CPUs.
- A disabling of the safety mode must be displayed.
  Use the MODE tag in the F-shared DB ("F_GLOBDB".MODE) for S7-300/400 F-CPUs or in the F-runtime group information DB (e.g. RTG1SysInfo.F_SYSINFO.MODE) for S7-1200/1500 F-CPUs, which you can evaluate to read the operating mode (1 = Disabled safety mode).
- It must be possible to verify that safety mode has been disabled. A log is required, if possible by recording and, if applicable, archiving alarms to the operator control and monitoring system or, if need be, through organizational measures. In addition, it is recommended that a disabling of the safety mode be indicated on the operator control and monitoring system.
- With safety-related communication, you must also take into account a possible deactivation of Safety mode on the communication partner's side*. You can then no longer assume that the data provided by the communication partner is formed in a safety-related manner.
  During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program instead of the received data.

(S027)

*You can determine whether Safety mode has been deactivated on the communication partner's side as follows:

- Communication via SENDDP/RCVDP instructions: SENDMODE output at RCVDP (Page 599)
- Communication via SENDS//RCVS7 instructions: SENDMODE output at RCVS7 (Page 608)
- Communication with OPC UA Safety: TEST_MODE_ACTIVATED variable in the F-OPC UA Consumer DB
- Communication with Flexible F-Link: SENDMODE tag in the F-Communication DB (Page 341) for receiving

⚠ WARNING

(S7-1200, S7-1500) If **several F-CPUs** can be reached via a network (such as Industrial Ethernet) by the **same PG/PC**, you must take the following additional measures to ensure that the safety-related project data is downloaded to the correct F-CPU or that safety mode is deactivated in the correct F-CPU:

- Enter the serial number of the specific F-CPU in the *Safety Administration Editor*.

Depending on the respective CPU type (see documentation of the CPU), you have several possibilities for determining the serial number of an F-CPU:

- Print of the serial number on the housing of the F-CPU.
- Scanning of the ID link on the F-CPU.
- Display of the F-CPU
- Web server*
- Industrial Edge application user interface under /SIMATIC_MC/system/serialno*
- TIA Portal (I&M data)*

Note the following when downloading:

- If the "Load preview" window does not contain a warning, the connection to the correct F-CPU has been established. You can confirm the download of the safety-related project data without an additional check.
- If a serial number has not yet been entered in the *Safety Administration Editor* or if the connected F-CPU has a different serial number, check the proposed serial number of the F-CPU in the "Load preview" window or "Disable safety mode" window. If you determine an error, cancel the download or the disabling of safety mode. Otherwise, you can confirm the procedure.
- When the serial number is confirmed (online), it is always applied in the *Safety Administration Editor* and any existing entry is overwritten.
  (S099)

* To make use of these possibilities, you must ensure a connection to the expected F-CPU. You achieve this through:

- A point-to-point connection to the respective F-CPU
- Verification of the flashing of the F-CPU after selecting the "Flash LED" check box in the online and diagnostics view of the F-CPU.
- Unplugging the network cable to the respective F-CPU
- For an S7-1500 F Virtual Controller, a unique connection can be achieved by a targeted switch to STOP of the Industrial Edge application.

Procedure for disabling safety mode

To disable safety mode, follow these steps:

1. Open the *Safety Administration Editor* of the corresponding F-CPU.
2. Open the "General (Page 81)" area in the area navigation.
3. Click the "Disable safety mode" button.
4. If access protection is set up for the F-CPU, enter the password for the F-CPU or legitimate yourself again as a user with F-right.
5. Only for S7-300/400 F-CPUs for which access protection is **not** set up:
   Make sure that you disable safety mode of the desired F-CPU by checking the Collective F-Signature in the dialog that is displayed next.
6. Confirm the deactivation.

Safety mode is then disabled.

The remaining runtime until an S7-1200/1500 F-CPU goes into STOP starts immediately after the safety mode is disabled. The remaining runtime is displayed in the *Safety Administration Editor* in the "General (Page 81)" area in online mode. In addition, the remaining runtime is displayed in the web server of an S7-1500 F-CPU as of firmware V2.9.

Reset remaining runtime until the F-CPU goes to STOP

To avoid the expiration of the remaining runtime and the associated STOP of the F-CPU, you can reset the remaining runtime in the *Safety Administration Editor*. This resets the remaining runtime to the configured value and starts it running again immediately after that.

Proceed as follows:

1. Open the *Safety Administration Editor* of the corresponding F-CPU.
2. Open the "General (Page 81)" area in the area navigation.
3. Click the "Reset remaining runtime" button.
4. If access protection is set up for the F-CPU, enter the password for the F-CPU or legitimate yourself again as a user with F-right.
5. Only for S7-300/400 F-CPUs for which access protection is **not** set up:
   Make sure that you disable the remaining runtime of the correct F-CPU by checking the Collective F-Signature in the dialog that is displayed next.
6. Confirm the reset of the remaining runtime.

NOTE

The remaining runtime is also displayed in the F-runtime group information DB (Page 149) of the respective F-runtime group in the MODE_REMAINING_TIME tag.
In case of two F-runtime groups, different values may be displayed caused by different update times.
The value "0" is not displayed after expiration of the remaining runtime, but the remaining runtime existing in the last cycle.

Enabling safety mode

To enable safety mode, the F-CPU must be switched from STOP to RUN mode.

In a redundant S7-1500HF system you have to set both HF-CPUs or the redundant system S7-1500HF to STOP before you restart the HF-CPUs.

Switching the F-CPU from STOP to RUN mode always enables safety mode, even if the Safety program has been modified or is not consistent.

If you have changed your Safety program, but have not recompiled and downloaded it, the F-CPU can revert to STOP mode.

Evaluating safety mode/disabled safety mode

If you wish to evaluate safety mode/disabled safety mode in the Safety program, you can evaluate the "MODE" tag in the F-shared DB (Page 148) for S7-300/400 F-CPUs or F-runtime group information DB for S7-1200/1500 F-CPUs (1 = Disabled safety mode). You use fully qualified access to access this tag (e.g. "F_GLOBDB".MODE or RTG1SysInfo.MODE).

You can use this evaluation, for example, to passivate F-I/O when the Safety program is in disabled safety mode. To do so, assign the "MODE" tag in the F-shared DB or F-runtime group information DB to all "PASS_ON" tags in the F-I/O DBs of the F-I/O that you wish to passivate.

⚠ WARNING

When the Safety program is in disabled safety mode, the "MODE" tag in the F-shared DB or F-runtime group information DB is also evaluated in disabled safety mode.
Even if the F-I/O is passivated in disabled safety mode by evaluating the "MODE" tag, the safety of the plant must be ensured during disabled safety mode by organizational measures. *(S028)*

See also

Configuring the time limit for disabled safety mode (S7-1200, S7-1500) (Page 386)

10.7.3 Testing the safety program

Introduction

Tags of the safety program can be monitored at any time.

Controlling tags of the safety program is only possible in deactivated safety mode as some fault control measures of the safety program have to be disabled for this.

You can control the following tags of the safety program:

- Inputs and outputs of the F-I/O (channel values and value status (S7-1200, S7-1500))
- Tags in F-global DB (except DB for F-runtime group communication)
- Tags in instance DBs of F-FBs
- Tags in F-I/O DBs (for permitted tags see F-I/O DB (Page 157))

Procedure for monitoring tags of the safety program

Monitor the required tags of the safety program from an open watch table or from the *program editor* (program status).

1. Proceed as in the standard. More information can be found in the *STEP 7 help* in "Testing user programs".

Procedure for controlling tags of the safety program

Control the required tags of the safety program from an open watch table:

1. For modifying, deactivate the safety mode (Page 386) in the automatically shown dialog.
2. Terminate existing modify requests after testing is complete before activating safety mode.

Values in F-DBs can only be modified online in the F-CPU. If the value is also to be changed offline, you must do this by editing the start value offline and compiling the safety program.

Proceed as follows to control tags of F-I/O:

1. Create a separate row for each channel value and value status (S7-1200, S7-1500) to be modified. The control value must correspond to the channel value or value status.
2. Set "start of scan cycle" or "end of scan cycle" and "permanent" or "once".

   Regardless of the trigger point setting, requests to modify inputs (PII) of F-I/O always become effective before the main safety block is executed and requests to modify outputs (PIQ) always become effective after execution of the main safety block.
3. (S7-300, S7-400) Create an additional watch table if you want to control more than 5 inputs/outputs.

NOTE

F-I/O can only be modified in RUN mode of the F-CPU.

You cannot modify a configured F-I/O from which neither a channel value or a value status (S7-1200, S7-1500), nor any tag from the associated F-I/O DB has been used in the safety program. In your safety program, you should therefore always use at least one tag from the associated F-I/O DB or at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be modified.

For inputs (PII), modify requests take priority over fail-safe value output, while for outputs (PIQ), fail-safe value output takes priority over modify requests. For outputs (channels) that are not activated in the properties for the F-I/O, modify requests affect the PIQ only, and not the F-I/O.

NOTE

The following applies for S7-1200/1500 F-CPUs:

To avoid invalid combinations of channel value and status value:

- The value status is set by the F-system automatically to 1 when setting a channel value to a value <> fail-safe value 0
- The fail-safe value 0 is automatically output when setting the value status to 0 for the associated channel value

---

⚠ WARNING

You need to specifically reset constant modify requests in the watch table in disabled safety mode.
Note that constant modify requests that are not correctly reset can remain active in the background even after a STOP/RUN transition of the F-CPU.
Because the F-CPU is in safety mode again after a STOP/RUN transition, the constant modify requests are no longer effective and are not shown in the watch table.
The requests become active again as soon as you disable safety mode again.
With a memory reset of the F-CPU, you can make sure that no constant modify requests are active in the background on the F-CPU. *(S029)*

Wiring test using watch table

You can carry out a wiring test for an input by changing an input signal and verifying whether or not the new value arrives in the PII.

You can carry out a wiring test for an output by changing the output with the Modify function and verifying whether the required actuator responds.

For the wiring test, note that a safety program must be running on the F-CPU, in which at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be monitored or modified or one tag from the associated F-I/O DB has been used.

For F-I/O that can also be operated as standard I/O (e.g., S7-300 fail-safe signal modules), you can also carry out the wiring test for outputs using the Modify function in STOP mode by operating the F-I/O as standard I/O rather than in safety mode.

Additional rules for testing (S7-300, S7-400, S7-1500)

Setting breakpoints in the standard user program will cause the following errors in the safety program:

- F-cycle time monitoring has expired
- Error during communication with the F-I/O

  (S7-1500) Fail-safe modules switch to safe mode after the configured F-monitoring time has expired.
- Error during safety-related CPU-CPU communication
- Internal CPU faults

If you nevertheless want to use breakpoints for testing, you must first disable safety mode. This will result in the following errors:

- Error during communication with the F-I/O
- Error during safety-related CPU-CPU communication

Difference between S7-1500 F-CPUs and S7-300/400 F-CPUs:

- If a breakpoint is activated and reached, the F-CPU goes directly to STOP after HOLD.
- If you want to switch to RUN again after HOLD to test your standard user program further, you can simulate this with S7-PLCSIM.

No access protection is initially necessary for test purposes, commissioning, etc. This means you can execute all offline and online actions without access protection, that is, without password prompt.

Changing the safety program in RUN mode (S7-300, S7-400) (Page 397)
Downloading project data (Page 345)

10.7.4 Testing the Safety program with S7-PLCSIM/S7-PLCSIM Advanced

You can test your Safety program together with your standard program on a simulated CPU with *S7-PLCSIM* and without the need for hardware. Also observe warning S030 in the section "Notes on Safety Mode of the Safety Program (Page 435)".

You use *S7-PLCSIM* for SIMATIC Safety F-systems as you would for S7 standard systems. Note the following special features:

Safety mode/disabled safety mode

We recommend that you test your Safety program in safety mode to detect whether the F-CPU goes into STOP as early as in the test phase of your Safety program in *S7-PLCSIM* as a result of, for example, that the results of instructions were outside the permitted range for the data type.

The following simulations can be run in *S7-PLCSIM*, just as on an actual F-CPU, in disabled safety mode only.

- Modifying tags in F-DBs and F-I/O DBs.

(S7-1200, S7-1500) To prevent unintentional modification of tags in F-DBs and F-I/O DBs in Safety mode, we recommend that you do not select the "Enable/disable modification of non-inputs" button in *S7-PLCSIM*

During the simulation with *S7-PLCSIM* , monitoring of the maximum cycle time of the F-runtime group and the cycle time warning limit of the F-runtime group (S7-1200, S7-1500) are disabled.

Differences between a simulated F-CPU and real F-CPU

Note that *S7-PLCSIM* does not fully behave like a real F-CPU down to the individual details. In particular, the startup behavior of an F-I/O cannot be simulated exactly.

Input simulation of F-I/O

Simulation of inputs (channel values) in *S7-PLCSIM:*
You simulate inputs (channel values) of F-I/O in *S7-PLCSIM* as you would inputs (channel values) of standard I/O. Keep in mind the following notes/restrictions:

During the transition of the F-CPU from "STOP" to "RUN" mode in *S7-PLCSIM*, all inputs (channel values) of F-I/O are initialized with 0 in the process image input (PII).

The inputs (channel values) can be simulated starting from the 2nd cycle and are then available in the PII.

Simulation of inputs (value status) in *S7-PLCSIM:*
(S7-1200 G1, S7-1500) By simulating inputs (value status) of F-I/O, you can simulate incoming and outgoing F-I/O / channel faults. Keep in mind the following notes/restrictions:

- To realistically simulate the behavior of the F-I/O, you must note the connection between channel value and value status on the real F-I/O. The combination value status = 0 and channel value <> fail-safe value (0) is invalid and can result in the simulation deviating from the behavior of the real F-CPU.
- During the transition of the F-CPU from "STOP" to "RUN" in *S7-PLCSIM*, all inputs (value status) of F-I/O are initialized with 1 in the process image input (PII). This means you can start with the simulation of inputs (channel values) immediately without simulation of the inputs (value status). For more information, refer to the sections "Addressing F-I/O (Page 151)" and "Value status (S7-1200, S7-1500) (Page 153)".
- The simulation of inputs (value status) in *S7-PLCSIM* does not have an effect on the QBAD and PASS_OUT tags in the F-I/O DB. Note that with real F-I/O, QBAD and PASS_OUT can be 1 as soon as the value status is 0 for at least one channel of the F-I/O (see tags of the F-I/O DB: PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 162)).
- For F-I/O configured with "Behavior after channel fault" = "Passivation of the complete F-I/O", use the tag PASS_ON in the F-I/O DB for simulation of the passivation of the complete F-I/O for F-I/O / channel faults. If you limit the simulation to passivation of individual inputs (channel value including value status), the behavior of the simulation will deviate from that of the real F-CPU.
- You can also use the PASS_ON tag in the F-I/O DB for F-I/O without value status to simulate the passivation of the entire F-I/O in case of F-I/O or channel faults.
- To simulate an F-I/O / channel fault of the SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4...20 mA HART with configuration "Behavior after channel fault" = "Passivate channel", you must simulate the inputs (channel values) with $7FFF_H$ (for overflow) or 8000_H (for underflow).
- For F-I/O which does not support the "RIOforFA-Safety" profile, you must run a user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB as with a real F-I/O for reintegration after the value status has changed from 0 to 1 or when the channel value has changed from $7FFF_H$/8000_H to unequal $7FFF_H$/8000_H (see above) when ACK_NEC = 1 of the F-I/O DB. Reintegration takes place automatically in all other cases possibly deviating from the real F-I/O.

Update times

Keep in mind that the status of the inputs (channel values or value status (S7-1200 G1, S7-1500)) that you are monitoring in the SIM table in *S7-PLCSIM* is only identical to the status being processed in the Safety program if there is no passivation of the associated F-I/O.

When the F-I/O is passivated, the Safety program operates with substitute values (channel value and value status (S7-1200 G1, S7-1500) =0).

Communication via SENDDP/RCVDP instructions

The following applies for SENDDP/RCVDP (S7-300, S7-400) instructions and SENDDP/RCVDP instructions with Version < 3.0 (S7-1200, S7-1500):

You cannot simulate communication between F-CPUs with the SENDDP and RCVDP instructions in *S7-PLCSIM*. You can, however, use the SENDDP and RCVDP instructions together with *S7-PLCSIM*. During simulation in *S7-PLCSIM*, the RCVDP instruction outputs the

substitute values pending at its inputs SUBBO_xx and SUBI_xx ((S7-1200, S7-1500) or alternatively SUBDI_00). The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON.

For SENDDP/RCVDP instructions with Version >= 3.0 (S7-1200, S7-1500) the following applies:

During the simulation with *S7-PLCSIM* it is possible to simulate the received data and the information "Deactivated Safety Mode" (RCVDP) or respectively the information "Substitute value output" (SENDDP) in the corresponding transfer area for inputs. Note the following notes:

- The simulated values do not become active until you set the SIMULATION bit for the first time in the respective simulation control word (see the following table) after the F-system has started up. Before setting the SIMULATION bit, the RCVDP instruction outputs the fail-safe values that are pending at its inputs SUBBO_xx and SUBI_yy (or alternatively SUBDI_00).
- The setting of the SEND_MODE bit in the simulation control word causes a setting of the SENDMORE output for the RCVDP instruction.
- The setting of the STATUS_SUBS bit in the simulation control word causes a setting of the SUBS_ON output for the SENDDP instruction.
- Reserved bits in the simulation control word always have to be 0.
- During a STOP/RUN transition from *S7-PLCSIM* the most recently simulated values in the transfer area for inputs are kept.

The start address(es) of the configured transfer area for the input and output data can be found in the respective configuration (see also "Communication via SENDDP/RCVDP instructions (S7-1200, S7-1500): (Page 241)").

Table 2-15 Structure of the relevant transfer area for inputs of the simulation control word (instruction RCVDP)

Byte	Meaning	Comment
0	RD_BO_15 ... RD_BO_08	
1	RD_BO_07 ... RD_BO_00	
	DINTMODE=0:	
2	RD_I_00	Word RD_I_00, MSB[1] first
3		
4	RD_I_01	Word RD_I_01, MSB[1] first

5		
6	Simulation control word (High Byte)	Bit 0...6: Reserved Bit 7: SIMULATION: Activating RCVDP simulation
7	Simulation control word (Low Byte)	Bit 0: SEND_MODE: Set output SENDMODE Bit 1...7: Reserved
8 ... 11	Reserved	

[1] MSB: most significant bit

Table 2-16 Structure of the relevant transfer area for inputs of the simulation control word (instruction SENDDP)

Byte	Meaning	Comment
0	Simulation control word (High Byte)	Bit 0: STATUS_SUBS: Set output SUBS_ON Bit 1...6: Reserved Bit 7: SIMULATION: Activating SENDDP simulation
1	Simulation control word (Low Byte)	Bit 0...7: Reserved
2 ... 5	Reserved	

(S7-300, S7-400) Communication via the SENDS7/RCVS7 instructions

You cannot simulate communication between F-CPUs with the SENDS7 and RCVS7 instructions in *S7-PLCSIM*. You can, however, use the SENDS7 and RCVS7 instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVS7 instruction outputs the initial values specified in the communication DB as fail-safe values. The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON.

Communication with OPC UA Safety

You can simulate CPU-CPU communication with OPC UA Safety with S7-PLCSIM Advanced as of V7.0. Use the "TCP/IP Single Adapter" option under "Online Access" for this. Note the following warning if the Safety program associated with the connected SafetyProvider is running on an S7-PLCSIM:

⚠ WARNING

If the TEST_MODE_ACTIVATED variable in the F-OPC-UA-Consumer-DB is set to "1" during communication with OPC UA Safety, you can no longer assume that the data at the SAFETY_DATA variable is formed in a safety-related manner. This is the case when the connected SafetyProvider is in deactivated safety mode on a PLCSIM instance or the EnableTestMode SAPI parameter of the connected SafetyProvider has been set in the associated user program. During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program with TEST_MODE_ACTIVATED = 1 instead of the data in the SAFETY_DATA tag. *(S108)*

Communication with Flexible F-Link

Note the following warning if the Safety program on the sender side is running on an S7-PLCSIM:

⚠ WARNING

If the SENDMODE tag in the F-communication DB (Page 293) is set to "1" for receiving during communication with Flexible F-Link, you can no longer assume that the data at the RCV_DATA tag is formed in a safety-related manner.
During this time, you must take organizational measures to ensure the safety of the system components that are affected by this data. Alternatively, you can also use safe substitute values in your Safety program with SENDMODE = 1 instead of the data in the RCV_DATA tag. *(S086)*

Inconsistent Safety program (S7-1200, S7-1500)

If the CPU goes into STOP in *S7-PLCSIM* with the diagnostic entry "Safety program: inconsistent", the F-CPU is not initialized correctly in *S7-PLCSIM* yet. Perform a memory reset of the F-CPU in *S7-PLCSIM* and download the project data once again to the CPU in *S7-PLCSIM*.

F-communication DB (S7-1200, S7-1500) (Page 341)

10.7.5 Changing the safety program in RUN mode (S7-300, S7-400)

Introduction

You make changes to F-blocks offline in the *program editor* in the same way as for a standard program. You download the changed F-blocks in RUN to the F-CPU in the "disabled safety mode (Page 386)".

NOTE

If you do **not** want to make changes to the safety program during operation, see Creating F-blocks in FBD/LAD (Page 145).

Procedure for changing the safety program in RUN mode

To change the safety program, follow these steps:

1. Change the main safety block or F-FB and its associated instance DB, F-FC, or F-DB in the *Program editor*.
2. Download the changed F-block(s) to the F-CPU (for procedure, see Downloading project data (Page 345)). The entire program is then automatically compiled.

3. If safety mode is active, the "Load preview" dialog will prompt you to deactivate it and to enter the password for the safety program.

NOTE
When downloading in disabled safety mode, you can only download the fail-safe blocks created by you (main safety blocks, F-FB, F-FC, or F-DB), F-application blocks, or standard blocks and their associated instance DBs. If you download automatically added F-blocks (F-SBs or automatically generated F-blocks and associated instance DBs, F-shared DB), the F-CPU can go to STOP mode or safety mode can be activated.
Therefore, always select individual blocks only when downloading in disabled safety mode.

Sequence for downloading changes

Changes in the safety program in RUN mode when safety mode is disabled can, for example, cause the status of an actuator to change as a result of program changes.

After changes, start by downloading the safety program and then the function of the standard user program monitored by the safety program.

Restrictions on safety-related CPU-CPU communication

During operation (in RUN mode), you cannot establish new safety-related CPU-CPU communication by means of new SENDDP/RCVDP or SENDS7/RCVS7 instructions.

To establish new safety-related CPU-CPU communication you must always download the relevant safety program consistently to the F-CPU while in STOP mode after inserting a new SENDDP, SENDS7, RCVDP, or RCVS7 instruction.

Restrictions on F-runtime group communication

You cannot make any changes to the safety-related communication between F-runtime groups in RUN mode. This means that you cannot assign, delete, or change any DBs for F-runtime group communication of an F-runtime group.

Following changes in the F-runtime group communication, you must always download the safety program consistently to the F-CPU while in STOP mode.

Restrictions on F-I/O access

If during operation (in RUN mode), you insert an F-I/O access to an F-I/O of which no single channel value or tag from the associated F-I/O DB has yet been used in the safety program, the F-I/O access only becomes effective when the safety program is downloaded consistently to the F-CPU.

Changing the standard user program

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

⚠ WARNING

(S7-300, S7-400) In productive operation, it must be prevented that changes to the standard user program are unintentionally made in the safety program as well. For this purpose, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU.
With the "Write protection" or "Write/read protection" protection level, the password would apply to the standard and the safety program. *(S001)*

Procedure for applying changes to the safety program

If you download individual F-blocks to the F-CPU during operation (in RUN mode), the F-system blocks (F-SBs) and the automatically generated F-blocks are neither updated nor downloaded, resulting in an inconsistent safety program in the F-CPU. Use the following procedure to apply changes to the safety program:

1. Download the safety program consistently to the F-CPU, and activate safety mode by switching the F-CPU from STOP to RUN mode (for procedure, see Downloading project data (Page 345)).
2. Follow the steps described in Acceptance of Changes (Page 427).

10.7.6 Safety program in RUN mode (S7-1200, S7-1500)

Introduction

You make changes to F-blocks offline in the *program editor* in the same way as for a standard program. Loading the changed F-blocks in RUN to the F-CPU is done with the Fast Commissioning mode in deactivated safety mode (Page 386).

The Fast Commissioning mode distinguishes between "Fast Compile" (default setting) and "Consistent Compile".

Fast Commissioning mode with "Fast Compile"can be used for minor software changes to the Safety program, e.g. for testing and commissioning. It enables a fast compile, as only the F-blocks created by the user are compiled here.

In contrast, the Fast Commissioning mode with "Consistent Compile" can be used, for example, at the end of commissioning to compile the safety program consistently and then download it consistently to the F-CPU. In this case, you forego the advantage of the fast compiling, but after downloading the safety program to the F-CPU, you can enable safety mode again immediately with a short STOP-RUN transition of the F-CPU.

NOTE

Do not switch the F-CPU to STOP in Fast Commissioning mode with "Fast Compile". Otherwise, the F-CPU does not restart afterwards because the F-CPU contains an inconsistent safety program.
Solution:

- Download a consistent safety program to the F-CPU and then carry out a STOP-RUN transition. The deactivated safety mode is hereby terminated.
- If your F-CPU supports "Consistent Compile", select "Consistent Compile" and download the safety program consistently to your F-CPU. After that, a STOP-RUN transition is possible.

NOTE

Fast Commissioning mode with "Fast Compile" behaves differently with *S7-PLCSIM* than with a real F-CPU.
An *S7-PLCSIM* restarts after a STOP.

Requirements

To activate and use Fast Commissioning mode, the following requirements must be met:

- You can use Fast Commissioning mode with "Fast Compile" as of Safety System version V2.4. It is available for S7-1200 G2 F-CPUs as of firmware V1.0, S7-1200 G1 F-CPUs as of firmware V4.5 and S7-1500 F-CPUs as of firmware V2.0.
- You can use the Fast Commissioning mode with "Consistent Compile" from Safety System version V2.5. It is available for S7-1200 G2 F-CPUs as of firmware V1.0 and for S7-1500 F-CPUs as of firmware V3.0. With S7-1500 F-Software Controller, it is available as of Safety System version V2.5 only for approved IPCs as of firmware V30.0.

  NOTE

  S7-1500 F Software Controller
  The approved IPCs can be found in the table in the Product information for the F-CPUs (https://support.industry.siemens.com/cs/ww/en/view/109478599).
  If IPCs that have not been approved are used, an error or restart of the F Software Controller occurs. The download must then be repeated in STOP.

- The "Safety mode can be disabled" option must be selected in the "Settings" area of the *Safety Administration Editor*.
- The offline Safety program must be consistent and identical to the online Safety program.
- The F-CPU is in RUN.

Enabling Fast Commissioning mode

You enable Fast Commissioning mode by clicking the "Enable Fast Commissioning" button in the "General" area of the Safety Administration Editor.

Here, "Fast Compile" is selected as the default setting.

Once Fast Commissioning mode with "Fast Compile" is active, the behavior when compiling changes (shortcut menu "Compile > Software (only changes)" and "Compile > Hardware and software (only changes)") switches to the behavior when compiling changes in Fast Commissioning mode with "Fast Compile".

As soon as you change to the "Consistent Compile" setting, you can also compile the safety program consistently and download it to the F-CPU in RUN.

NOTE

After enabling Fast Commissioning mode, all other areas in the *Safety Administration Editor* are grayed out except the "General" area. Write access in the *Safety Administration Editor* is not permitted, also not via Openness. Read access is still possible.
While Fast Commissioning mode with "Fast Compile" is activated, the *Safety Administration Editor* displays the information "Fast Commissioning is activated" as the status of the safety program.
No signatures are calculated in Fast Commissioning mode with "Fast Compile". Therefore, no statement can be made in this mode about the status of the safety program and the F-blocks with regard to the offline-online comparison. The status of the signature comparisons is displayed with the icon in this case.

Downloading changes in Fast Commissioning mode

To download changes to the Safety program to the F-CPU in RUN in Fast Commissioning mode, the following 3 conditions must be met:

- The F-CPU is in RUN.
- Safety mode is deactivated.
- Fast Commissioning is enabled.

If at least one of these 3 conditions is not met, the "Download" dialog displays a note that download in RUN mode is not possible.

NOTE

In case of a connection abort between the PG/PC and the F-CPU during loading in RUN mode, loading to the F-CPU can **not** be completed properly. Even the indicators of the safety program on the display and in the web server of the F-CPU are no longer current.
A subsequent loading in RUN is no longer possible in this case, even though all requirements for Fast Commissioning mode are being met.
Solution: Switch the F-CPU to STOP mode and download a consistent safety program to the F-CPU.

NOTE

If the work memory utilization of the F-CPU is > 80%, a download in RUN mode with "Consistent Compile" may be aborted and the download to the F-CPU may not be properly completed. Even the indicators regarding the safety program on the display and in the web server of the F-CPU are no longer current.
A subsequent download in RUN is no longer possible, even though all requirements for Fast Commissioning mode are met.
Solution: Switch the F-CPU to STOP mode and download a consistent safety program to the F-CPU.

Supported changes in Fast Commissioning mode

While Fast Commissioning mode is enabled, you cannot arbitrarily change your Safety program. The following is an overview of the supported changes.

- Changes to F-FBs/F-FCs/F-DBs. See "Changes not supported" for exceptions.
- Changes to fail-safe-compliant PLC data types. See "Changes not supported" for exceptions.
- Changes to the standard user program that influence the safety program, for example, DBs used in both the standard user program and the safety program.
- Creating and using F-blocks. See "Changes not supported" for exceptions.

Unsupported changes in Fast Commissioning mode with "Fast Compile"

While Fast Commissioning mode with "Fast Compile" is activated, you cannot make changes to your safety program at will. The following is an overview of the changes **not** supported .

Type of change	System response
All changes to the hardware configuration.	A STOP is required for the download to the F-CPU.
Change in an F-FB/F-FC:	
• Insertion of a new call of a time-processing instruction (for example, TON, TOF, TP, MUT_P...) or an ACK_OP/ACK_GL instruction. (Time value parameters can be reassigned in existing calls).	Compiling errors
• Insertion of a new call of a SENDDP/RCVDP instruction.	
• Insertion of a new access to an F-I/O (access to a tag of the F-I/O DB or to the process image) that has not yet been used in the F-runtime group.	
• Insertion of a new access to a communication with Flexible F-Link (access to a tag of the F-communication DB) which has not yet been used in the F-runtime group.	
Deleting in an F-FB/F-FC:	
• Deletion of a call of a time-processing instruction (for example, TON, TOF, TP, MUT_P...) or an ACK_OP/ACK_GL instruction.	Compiling errors when the instances are also deleted
• Delete a call to a SENDDP/RCVDP instruction.	Compiling errors

Type of change	System response
• Deletion of the last access to an F-IO (access to a tag of the F-I/O DB or to the process image) so that it is no longer used in the F-runtime group.	Compiling errors
• Deletion of the last access to a communication with Flexible F-Link (access to a tag of the F-communication DB) so that it is no longer used in the F-runtime group.	
Deleting an F-FB or F-FC when it was called before Fast Commissioning mode was activated. However, a call can be deleted.	Compiling errors
Deleting an F-DB when tags of this F-DB were already being used before Fast Commissioning mode was activated.	Compiling errors
Deleting a standard DB when tags of this DB were already being used for reading before Fast Commissioning mode was activated.	Compiling errors
Deleting a tag from the standard user program when it was already being used for reading before Fast Commissioning mode was activated.	Compiling errors
Structural changes of fail-safe-compliant PLC data types that are referenced in a Flexible F-Link communication.	Compiling errors
Creating library types of blocks	Compiling errors
Adding/deleting of:	
• F-OBs	Compiling errors
• Flexible F-Link communications	Blocking in the Safety Administration Editor
• F-runtime groups (including changes)	
• F-CD/F-MS connections (including changes)	
Inserting an F-FB/F-FC (e.g. from a library or a different F-CPU) with global access to an F-DB.	Compiling errors
Changing the instruction version in the "Instructions" task card.	Compiling errors
Creating and changing instruction profiles	
Downloading a Safety program compiled in Fast Commissioning mode from the F-CPU to the PG/PC.	Interlocking by loading the station from the device
Changes in the "Settings" area of the *Safety Administration Editor*.	Blocking in the *Safety Administration Editor*
Changes to the password for the safety program.	
Renaming of the F-OB	Errors during download
All changes with Openness. (Name area *SafetyAdministration*)	Are rejected with an exception.

NOTE

For the changes marked with "Compiling errors", the compiling of the safety program is aborted in Fast Commissioning mode. An additional note is displayed in the inspector window under "Info > Compile" indicating the F-block containing the unsupported change.

NOTE

The table "Unsupported changes in Fast Commissioning mode with Fast Compile" serves as an aid. When you see errors during compiling that refer to blocks that you have not programmed yourself, an unsupported change was most likely made. In this case, undo the previous changes or exit Fast Commissioning mode and compile the entire safety program.

NOTE

Logging in the F-change history is incomplete when Fast Commissioning mode with "Fast Compile" is activated, the following entries are not recorded:

- Collective F-Signature
- Compiling time stamp
- Compiled F-blocks with signature and time stamp

Unsupported changes in Fast Commissioning mode with "Consistent Compile"

In Fast Commissioning mode with "Consistent Compile", you also cannot change your safety program at will. Compared to "Fast Compile", however, many more changes to the safety program are possible. The following is an overview of the changes **not** supported .

NOTE

Note that the changes mentioned here must not be present when enabling Fast Commissioning mode with "Consistent Compile". Therefore, make sure that the offline safety program is consistent and identical to the online safety program. If you do not observe this, the F-CPU may STOP.

Type of change	System response
All changes to the hardware configuration.	A STOP is required for the download to the F-CPU.
Adding/deleting of:	
• Flexible F-Link communications	Blocking in the *Safety Administration Editor*
• F-runtime groups (including changes)	
Changes in the "Settings" area of the *Safety Administration Editor*.	
Changes to the password for the safety program.	
Renaming of the F-OB	CPU goes to STOP
All changes with Openness. (Name area *SafetyAdministration*)	Are rejected with an exception.
Insertion of a new call of an ACK_GL instruction.	Possible, but results in passivation of all F-I/Os. Reintegration is only possible with a STOP-RUN transition.
Insertion of a new access to an F-I/O (access to a tag of the F-I/O DB or to the process image) that has not yet been used in the F-runtime group.	Possible, but results in passivation of the affected F-I/O. Reintegration is only possible with a STOP-RUN transition.
Deletion of a call to an ACK_GL instruction.	Possible, but results in passivation of all F-I/Os. Reintegration is only possible with a STOP-RUN transition.
Deletion of the last access to an F-IO (access to a tag of the F-I/O DB or to the process image) so that it is no longer used in the F-runtime group.	Possible, but results in a diagnostic buffer entry via a "Profisafe communication error".

Exiting Fast Commissioning mode

To exit Fast Commissioning mode with "Fast Compile" and return to Safety mode, proceed as follows:

1. Click on the "Deactivate Fast Commissioning" button.
2. Compile the Safety program with Software (rebuild all).
3. Download the safety program to the F-CPU. The F-CPU is set to STOP mode by this.
   In a redundant S7-1500HF system, you have to select "Stop R/H system" in the "Load preview" dialog.

After that, the online Safety program is consistent again and the F-CPU can be switched to RUN with Safety mode enabled.

To exit Fast Commissioning mode with "Consistent Compile" and return to Safety mode, proceed as follows:

1. Click on the "Deactivate Fast Commissioning" button.
2. Perform a STOP-RUN transition to enable safety mode again.

10.8 F-change history

Enable the logging of changes of the safety-related project data by using the option "Enable F-change history" in the *Safety Administration Editor*.

An F-change history is created for each F-CPU in the project navigation under "Common data/logs".

The following is logged in the F-change history:

- Collective F-Signature
- User name
- Compile time stamp
- Download of the safety-related project data with time stamp
- Compiled F-blocks with signature and time stamp

The F-change history can contain a maximum of 5000 entries per F-CPU. When the 5000 entries are exceeded, a new F-change history is created using the naming scheme "F-change history <CPU name> YYYY-MM-DD hh:mm:ss".

After a project upgrade, the "Go to" function is not supported anymore for the F-change history of the project for the entries which were created before *STEP 7 Safety* V15.1.

NOTICE
The connection between the F-CPU and the associated F-change history is made through the name of the F-change history. Therefore, do not rename the F-CPU and the F-change history. If you rename the F-CPU or the F-change history, a new F-change history with the current name of the F-CPU is started.

NOTE

You are not permitted to use the F-change history to identify changes of the safety-related project data for acceptance of changes.

To accept changes, proceed as described under Acceptance of Changes (Page 427).

NOTE
We recommend activating the F-change history before changing over to productive operation.

System acceptance

11

11.1 Overview of System Acceptance

Introduction

When performing a system acceptance test, all the standards and guidelines (for example PROFINET Installation Guidelines) relevant to the specific application must be complied with. This also applies to systems that are not "subject to acceptance". For the acceptance, you must consider the requirements in the Certification Report (https://support.industry.siemens.com/cs/ww/en/view/109825198).

As a general rule, the acceptance of an F-System is performed by an independent expert. The independence required of the expert must be defined in the safety plan and depends on the required PL/SIL.

Observe all warnings in this manual.

⚠ WARNING

The configuration of F-CPUs and F-I/Os as well as the programming of F-blocks must be carried out in TIA Portal as described in this documentation. To ensure safe operation with the SIMATIC Safety system, you must comply with the requirements of the relevant standards, such as IEC 61508. The section System acceptance (Page 407) describes procedures and tools of STEP 7 Safety to meet these requirements. *(S056)*

Proof of the correct implementation of the safety-related project data

In order for a system acceptance to be granted, you must assess and document the correctness of the individual components. For documentation of the component characteristics, you must create the safety summary.

The following characteristics must be covered:

- Correctness of the safety program including hardware configuration (including testing) (Page 408)
- Completeness of the safety summary (Page 409)
- Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate (Page 410)
- Compliance of the know-how protected F-blocks used in the Safety program with their safety summary. (Page 411)
- Completeness and correctness of the hardware configuration (Page 412)
- Completeness and correctness of safety-related communication (Page 418)
- Identity of online and offline program (Page 424)
- Other characteristics (Page 425) such as software version, use of data from the standard user program

After the acceptance, you should archive all relevant documents and also the project data so as to make the accepted project available as a reference for a subsequent acceptance.

Safety summary

The safety summary (Page 382) is the documentation of the project that is required for system acceptance

11.2 Correctness of the safety program including hardware configuration (including testing)

The correctness of software cannot only be ensure through tests and verifications during commissioning, but rather already requires the observance of a wide variety of measures during creation. Also see warning S062 on this in chapter "Overview (Page 22)".

Verification/function test

Already during the creation, you will test (Page 384) your safety program and the associated hardware configuration. You must carry out these tests with regard to the specification of your safety functions and document them before you perform the system acceptance.

In order to perform a code review of your safety program and/or document the accepted program code, you can include the source code of all F-blocks in the safety summary (Page 382). To do this, select the "All" option when printing.

If you want to carry out a function test after loading, you have to carry out program identification. More information is available in "Downloading project data (Page 345)".

The correct function of the safety program must be guaranteed by complying with all steps from the "Overview of System Acceptance (Page 407)" chapter before it can be used productively. When using configuration control (option handling), you must ensure correct operation of the safety program for all possible station options by performing appropriate functional tests. You should archive the test reports along with the safety summary and the acceptance documents.

Times, for example monitoring times (Page 615) and delay times, can only be verified to a limited extent with functional tests (Page 345). For this reason, you should check these times selectively to determine whether they are dimensioned correctly, for example, using the safety summary.

Some of these times are itemized specifically in the safety summary, for example, the F-monitoring time (for communication between F-CPU and F-I/O) and the monitoring time of the safety-related CPU-CPU communication (TIMEOUT). To determine the monitoring times derived under normative conditions, the Excel file for response time calculation is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109783831). These have to be considered together with the practically determined conditions of the application. Note that these monitoring times have an impact on the response times of your safety functions.

Consistency of the safety program

Check in the "General information" section of the safety summary to determine whether the safety program was recognized as "consistent".

This is the case for S7-300/400 F-CPUs only if the following signatures are also identical:

- Collective F-Signature ("General information" section, "Collective F-Signature")
- "Signature of F-blocks with F-attribute" ("General information" section, "Current compilation")

Consistency of the safety program is required for the acceptance. If the signatures are not identical, you have the possibility to establish consistency by recompiling the safety program and re-creating the safety summary.

11.3 Completeness of the safety summary

Introduction

When you have an acceptance-ready version of your safety-related project data, you must perform and document additional checks of the safety summary to prove that the safety summary is complete and belongs to the safety program to be accepted.

Creating a safety summary

Follow the procedures described in Creating a safety summary (Page 382) to create the safety summary. In so doing, select "All" under Properties in the "Print" dialog to include the source code of your F-blocks and their utilized named value data types and PLC data types in the documentation.

Completeness of the safety summary

The safety summary of *STEP 7 Safety* is always created in its entirety. When performing subsequent processing steps (for example, creating copies, inserting (electronic) signatures, comments, etc.), the completeness must continue to be maintained.

If you created the safety summary with the "All" option, the source code of all F-blocks will also be printed. The printout of this source code also includes the footer, which contains the collective F-signature of the associated safety program.

The information "Number of pages in the safety summary" does not include the pages on which the source code of the F-blocks is output.

Association with the safety program

In the "General information" section of the safety summary, check whether the Collective F-Signature corresponds online and offline to the Collective F-Signature of the safety program to be accepted in the work area of the *Safety Administration Editor* under "General". If they are not the same, then the summary and safety program do not match. Bear in mind that the F-BaseID is not included in the Collective F-Signature and, if relevant, must be checked separately.

11.4 Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate

Introduction

STEP 7 Safety contains LAD/FBD instructions for programming of your safety program as well as F-system blocks for creating an executable safety program that have been created and tested by SIEMENS and certified by TÜV. The F-system blocks used are automatically inserted by the F-system based on the set safety system version (see section "Settings" area of the Safety Administration Editor (Page 89)).

To allow you to check whether the used versioned LAD/FBD instructions and F-system blocks correspond to Annex 1 of the Report for the TÜV certificate and to the versions you intend to use, these are listed in the safety summary.

Procedure

To check, download the current Annex 1 of the report for the TÜV certificate "SIMATIC Safety" from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109825198).

Proceed as follows for the check:

⚠ WARNING

- (S7-1200, S7-1500) The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions in Annex 1 of the Report for the TÜV certificate.
- (S7-300, S7-400) The versions, signatures and initial value signatures of the versioned LAD/FBD instructions and F-system blocks listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions, signatures and initial value signatures in Annex 1 of the Report for the TÜV certificate.
- The versions of the versioned LAD/FBD instructions listed in the safety summary must meet the safety requirements of your application.
  Keep in mind possible differences in functionality of different versions specified in the section for the respective instruction.
- The safety system version listed in the safety summary under "Safety program settings" must match the versions in Annex 1 of the Report for the TÜV certificate. *(S054)*

In case of discrepancies, recheck whether you have the correct versions.

(S7-300, S7-400) Differences can also arise when there are F-blocks / instructions in your safety program that are not used.

11.5 Compliance of the know-how protected F-blocks used in the Safety program with their safety summary.

If you use know-how protected F-blocks (for example, from libraries) to program your Safety program, the source code for these is not output in the safety summary.

Therefore, the author of the know-how protected F-block must already carry out acceptance of the F-block and provide the following information:

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-blocks
- Signatures of all F-DBs accessed by the fail-safe block to be reused.

For system acceptance, you must perform the following checks using the safety summary:

- The signature and initial value signature of each know-how protected F-block listed in the safety summary in the section "F-blocks in Safety program" must correspond to the signature and initial value signature documented by the author.
- The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in Safety program" must correspond to the versions of each know-how protected F-block documented by the author or must be functionally identical with them.
- The signatures and initial value signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "F-blocks in Safety program" must correspond to the signatures and initial value signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures and initial value signatures. If the version conflicts cannot be eliminated due to other dependencies, contact the author of the know-how protected block in order to obtain a compatible approved version.

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version that was set while setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-FBs/F-FCs in the know-how protected F-block.
- Signatures of all F-DBs accessed by the know-how protected F-block.

For system acceptance, you must perform the following checks using the safety summary:

- The signature of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the Safety program" must correspond to the signature documented by the author.
- The safety system version of each know-how protected F-block listed in the safety summary under "Know-how protected F-blocks in the Safety program" must correspond to one of the versions listed in Annex 1 of the Report for the TÜV certificate.

- The versions of the versioned LAD/FBD instructions of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the Safety program" must correspond to the versions documented by the author or must be functionally identical with them.
- The signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the Safety program" must correspond to the signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures. If the version conflicts cannot be eliminated due to other dependencies, contact the author of the know-how protected block in order to obtain a compatible approved version.

11.6 Completeness and correctness of the hardware configuration

Introduction

The hardware configuration is an essential component of the project to be accepted. With the configuration of the hardware, you have set properties that can influence the safety of signals. You must document these settings with the safety summary to prove that you fulfill the safety requirements of your application.

The section "Hardware configuration of F-I/O" is available in the safety summary for this. This section consists of several tables:

- A table with information about the F-CPU and about the ranges of F-destination addresses used, the "Central F-source address" and the F-BaseID of the F-CPU.
- Overview tables with the F-I/O used.
- A table for each F-I/O with information on the F-I/O and all parameters of the F-I/O with the configured values.

NOTE

Note that you will find F-I/O that you address via safety-related I-slave-slave communication in the safety summary of the F-CPU of the I-slave and not in the safety summary of the F-CPU of the assigned DP master.

The safety summary of the F-CPU of the DP master contains a note in the overview table for this F-I/O indicating that it is not assigned to this F-CPU.

NOTE

When using shared devices:

Note that F-I/O that you address in a shared device can be found in the safety summary of the F-CPU of the IO controller to which it is assigned.

The safety summary of the other F-CPUs (IO controllers) that share the cross-project shared device contains a note in the overview table for this F-I/O indicating that it is not assigned to this F-CPU.

Procedure for checking that the hardware configuration is complete

Check whether the safety summary contains all the configured F-I/O. Also make sure that there is no F-I/O that you have not configured as belonging to this F-CPU.

NOTE

If configuration control (option handling) is used, the safety summary must contain all the F-I/Os of the maximum configuration. The following checks are to be carried out for al the F-I/Os of the maximum configuration.

Procedure for checking the correctness of the hardware configuration using the safety summary

To check the hardware configuration for correctness, proceed as follows:

1. Check in the "Hardware configuration of F-IO" section to verify the uniqueness of the PROFIsafe addresses.

   Observe the information in sections

   PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 65)

   PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 66)

   PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68)

   Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 37)

   Recommendation for PROFIsafe address assignment (Page 61)

   – For F-CPUs to which F-I/Os of PROFIsafe address type 2 are assigned:

     Check if the "Central F-source address" parameter of the individual F-CPUs differs network-wide.

     (This also applies to F CPUs that have F-I/O of PROFIsafe address type 3 assigned to them, unless an individual active F-BaseID is generated for each F-CPU.)

   – Check that the setting of the F-BaseID parameter is as expected, i.e. inactive (value 0), "Delayed transfer" (value 0x7C6) or an individually generated value for the F-CPU. Observe also warnings S115 and S116.

   – For F-I/Os of PROFIsafe address type 1 check whether the F-destination addresses comply with the following warning:

     ⚠ WARNING

     F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).
     The F-destination address (and therefore also the switch position on the address switch) of the F-I/O of PROFIsafe address type 1 must be unique network-wide* and CPU-wide**/*** (system-wide) **for the entire** F-I/O. For this, the F-I/O of PROFIsafe address type 2 and PROFIsafe address type 3 when F-BaseID is inactive (value = 0) must also be taken into account. *(S051)*

     * A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/O assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

*** In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

– For F-I/Os of PROFIsafe address type 2 check whether the F-destination addresses comply with the following warning:

⚠ WARNING

F-I/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.
The combination of F-source address and F-destination address for each F-I/O of PROFIsafe address type 2 must be unique network-wide* and CPU-wide**/*** (system-wide). In addition, the F-destination address must not be occupied by F-I/O of PROFIsafe address type 1.
If you use a supported configuration (Page 62), you only have to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/O assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

*** In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

– For F-I/O of PROFIsafe address type 3, check whether the F-destination addresses comply with the following warning:

> **⚠ WARNING**
>
> The F-BaseID may only be assigned manually in exceptional cases, when you are sure that the PROFIsafe addresses of the F-I/Os of the F-CPU are unique (worldwide). F-I/Os with the same F-BaseID must differ in the combination of F-source and F-destination address. We explicitly advise against manual assignment and recommend generation with the tools offered in the TIA Portal.
> With the manual assignment of value "0" as F-BaseID, you lose the advantages of PROFIsafe address type 3 and must adhere to the specifications for PROFIsafe address type 2 (see warning S052). *(S115)*

– Check whether the PROFIsafe addresses of fail-safe GSD based DP slaves / GSD based I/O devices comply with the following warning:

> **⚠ WARNING**
>
> Check the documentation for your fail-safe GSD based DP slaves / fail-safe GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. For configuring, proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 65), PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 66) or PROFIsafe addresses for F-I/O of PROFIsafe address type 3 (Page 68).
> Set the F-source address for fail-safe GSD based DP slaves / fail-safe GSD based I/O devices according to the manufacturer's specifications. If the F-source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, check the safety summary to verify that the value for the "Central F-source address" parameter corresponds to the value of the F-source address of the fail-safe GSD based DP slave/fail-safe GSD based I/O device. *(S053)*

2. Check the safety-related parameters (including F-monitoring time or F_WD_Time) of all configured F-I/O.

   You can find these parameters in the "Hardware configuration of F-I/O" section in the detailed tables for the F-I/O.

   The table consists of two parts:

   – The left part contains the parameters which refer to the F-I/O itself ("Module data").
   – The right part contains the parameters of the individual channels ("Channel parameters")

   These parameters must be set as prescribed by the safety requirements of your application.

When using fail-safe GSD based DP slaves/GSD based I/O devices, note the relevant documents for the possible additional safety-related (technological) parameters.

NOTE

F-I/O that are to be assigned the same safety-related parameters (except for PROFIsafe addresses) can be copied during configuration. Except for the PROFIsafe addresses, you no longer have to check the safety-related parameters individually. It is sufficient to compare the "F-parameter signature (without addresses)" in the "Hardware configuration of the F-I/O" section in the overview table. This also applies to fail-safe GSD based DP slaves/GSD based I/O devices without i-parameters. For GSD based DP slaves/GSD based I/O devices with i-parameters, it might be that the "F-parameter signature (without addresses)" does not match, even though all safety-related parameters, except for the PROFIsafe addresses, do match. In this case, you need to compare all safety-related parameters.
Exception:
For F-I/Os that do not support the "RIOforFA-Safety" profile, you need to compare the "Behavior after channel fault" parameter, if any, in addition to the "F-parameter signature (without addresses)".

3. Check whether the article numbers of the F-I/O in the safety summary correspond to the article numbers of the F-I/O actually present in the system. If the article numbers are different, the F-I/O present must be compatible as a replacement part for the F-I/O listed in the safety summary.

4. For non-supported configuration, see Configurations supported by the SIMATIC Safety F-system (Page 62).

⚠ WARNING

If you create a configuration that is not one of the supported configurations, you must observe the following in addition to the warnings S051, S052, S053 and S115:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/O in the PROFINET IO environment[1], you must check the safety summary for correctness of the PROFIsafe operating mode parameter (F_Par_Version). V2 mode must be set in the PROFINET IO environment. F-I/O that support only V1 mode must not be used in the PROFINET IO environment.
- Based on the safety summary, you must check whether the components of the PROFIsafe address centrally assigned for the F-CPU were transferred correctly into the respective F-I/Os:
  - PROFIsafe address type 3: F-BaseID from the "F-BaseID" parameter of the F-CPU.
  - PROFIsafe address type 2 and 3: F-source addresses from the "Central F-source address" parameter of the F-CPU.
- You must ensure the CPU-wide[2,3] and/or network-wide[4] unique assignment of the F-destination address for F-I/Os:
  - For F-I/O of PROFIsafe address type 1 or 2 (if you cannot set the F-source address to match the "Central F-source address" parameter of the F-CPU), you must ensure the network-wide[4] uniqueness of the PROFIsafe address through the unique assignment of the F-destination address alone.
  - In an unsupported configuration, you must check the uniqueness of the F-destination address individually for each F-I/O using the safety summary, regardless of the PROFIsafe address type.
    PROFIsafe address type 1: Network-wide[4] and CPU-wide[2,3]
    PROFIsafe address type 2 and 3: Only CPU-wide[2,3].

(S050)

1) The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

2) "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU, F-I/O for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

3) In a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be considered as one F-CPU with regard to the PROFIsafe addresses. The "Central F-source address" and, if present, the F-BaseID are therefore set identically for both F-CPUs by the system.

4) A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via

RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

NOTE

For more information on the assignment of PROFIsafe addresses that are unique for the CPU and across the network, see this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).

11.7 Completeness and correctness of safety-related communication

Introduction

Safety-related communication is based on the mechanisms of the standard communication of *STEP 7*.

Safety-related communication must also detect and uncover communication errors, which remain undetected in the lower-level standard communication. Further parameters are required for this, which you have to document and check on acceptance.

For this purpose, the "Block parameters for safety-related CPU-CPU communication", "Communications via Flexible F-Link Overview" and "Communications via OPC UA Safety Overview" sections are available in the safety summary.

The section "Block parameters for safety-related CPU-CPU-communication" contains up to two tables (for communication via PROFIBUS DP or PROFINET IO and for communication via S7 connections).

The section "Communications via Flexible F-Link Overview" contains a table with an overview of the connection configurations and a "Communications via Flexible F-Link for UDT" table for each used F-compliant PLC data type (UDT).

The section "Communications via OPC UA Safety Overview" contains multiple tables with an overview of all OPC UA data types used by SafetyProviders or SafetyConsumers, as well as a detailed view of all communication parameters for every SafetyProvider and every SafetyConsumer.

Not all safety-related communication is available for all F-CPUs. More information can be found in the section "Safety-related communication (Page 196)".

NOTE

The statements made regarding communication via Flexible F-Link in this section also apply when this communication is used between F-runtime groups.

11.7.1 Completeness and correctness of safety-related communication

(S7-300, S7-400) Observe the following warning for safety-related communication with the SENDS7/RCVS7 instructions:

⚠ WARNING

The value of the respective F-communication ID (input R_ID; data type: DWORD) can be freely selected; however, it must be odd and unique for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.
You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to ID and R_ID in the associated instance DB is not permitted in the Safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

Observe the following warning for safety-related communication with the SENDDP/RCVDP instructions:

⚠ WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide**** at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.
You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

**** With a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be regarded as one single F-CPU with regard to the DP_DP_ID.

Observe the following warnings for communication via Flexible F-Link:

⚠ WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, a unique F-communication UUID for the communication is provided by the system. When communication is copied in the Safety Administration Editor within the parameterization table or copied to another F-CPU, the F-communication UUIDs are not regenerated and therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself must ensure the uniqueness. To do this, select the relevant UUIDs and generate them again via the "Generate UUID" context menu. You must ensure the uniqueness in the safety summary during acceptance, at the latest. *(S087)*

⚠ WARNING

For each communication connection via Flexible F-Link, you must ensure that the offsets of the elements of the F-compliant PLC data type (UDT) used for the communication connection match on the transmit and receive sides during acceptance of the safety program.
You can find the offsets in the respective safety summary. To do this identify the communication connection by means of the UUID. *(S088)*

11.7.2 Procedure to check the correctness of the configuration of communication with OPC UA Safety

Procedure to check the correctness of the project planning for every SafetyProvider

You must carry out the following verifications for each SafetyProvider in the respective SafetyProvider detail view of your safety summary.

- Check the correctness of the values of the SPI parameters.
- Check the correctness of the assignments of the local data on the SAPI parameters.
- Check whether the necessary uniqueness of the combination of active SafetyProviderID and active SafetyBaseID of all SafetyProviders is available at all times.
  - For static connections:

    The set values can be found in the respective SafetyProvider detail view.

    If the value for SafetyBaseIDConfigured has been generated by the system, you do not have to undergo the SafetyBaseID, since the sufficient uniqueness is ensured by the STEP 7 Safety Engineering. If you have entered the value yourself, you must verify sufficient uniqueness. You will be shown whether this is necessary in the respective SafetyProvider detail view.
  - For dynamic connections:

    Ensure correct implementation of the algorithm for generating the values of the local data that is mapped to the SafetyProviderID and SafetyBaseID SAPI parameters.

Note the following warnings:

WARNING

For the unique and secure authentication of a SafetyProvider, the combination of active SafetyProviderID and active SafetyBaseID at any point in time must be unique for all OPC UA Safety communication connections network-wide. **
If your network is not safely separated from the outside world through physical separation, the active SafetyBaseID at any point in time must be a value that was generated randomly in accordance with the OPC UA Specification OPC 10000-15. ***
You must ensure the uniqueness in the safety summary during acceptance of the safety program. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S102)*

* If you cannot ensure a unique combination during startup of the Safety program because the active SafetyProviderID or active SafetyBaseID is not formed until runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID is "0" during this phase.

** SafetyProviders to which the same local data element of your safety program is mapped (Safety Multicast (Page 325)) at the SafetyData SAPI parameter are permitted to use the same combination.

*** If you have entered a value for the SPI parameter SafetyBaseIDConfigured of a SafetyProvider (either in the NodeSet or in the properties of a SafetyProvider), you yourself must ensure that the value meets the safety requirements of the OPC UA Specification OPC 10000-15. Alternatively, generate the value of SafetyBaseIDConfigured again by opening the properties tab of the affected SafetyProvider and clicking on the "Generate" button.

WARNING

Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
Note that these program sections are therefore not captured by the collective F-signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
Print the relevant program sections and supplement your safety summary with this printout. *(S103)*

⚠ WARNING

If you have not defined any value for the SPI parameter of a SafetyProvider in the NodeSet for the SPI parameter, a sufficiently clear UUIDV4 is made available from the system as a value for the parameter of the respective SafetyProvider when importing the NodeSet into the TIA Portal.
Through subsequent copying of a SafetyProvider (e.g. copying the NodeSet to another F-CPU, copying the F-CPU or copying the project), values provided by the system are not generated again and are therefore not unique anymore.
If such a copy is used to configure a new communication relationship, you yourself need to ensure the uniqueness. To do this, open the properties tab of all affected SafetyProvider and generate the value of SafetyBaseIDConfigured again by clicking on the "Generate" button. The uniqueness must be checked in the safety summary during acceptance. *(S110)*

Procedure to check the correctness of the configuration for every SafetyConsumer

You must carry out the following verifications for each SafetyConsumer in the respective SafetyConsumer detail view of your safety summary.

- Check the correctness of the values of the SPI parameters.
- Check for compliance of the active SafetyProviderID and active SafetyBaseID with the SafetyProvider intended for communication.
  - For static connections:
    The set values can be found in the respective SafetyConsumer detail view.
  - For dynamic connections:
    Ensure correct implementation of the algorithm for generating the values of the local data that is assigned to the SAFETY_PROVIDER_ID and SAFETY_BASE_ID variables of the associated F-OPC-UA-Consumer-DB.
- Check the correctness of the substitute value.
- Check that the data structure of SafetyData of the SafetyConsumer matches the data structure of SafetyData of the intended SafetyProvider. This means that at each position of the data structure, the data type must match the data type on the corresponding position on the side of the SafetyProvider on the side of the SafetyConsumer. Different names may be permitted if it is ensured that there are no confusion of the meanings of the individual elements of the data structure. In particular, the correct order of elements of the same data type is relevant.

Note the following warnings:

WARNING

Due to system constraints, formation of a SafetyBaseID at runtime of your Safety program is only possible in your standard user program.
Note that these program sections are therefore not captured by the collective F-signature and are not protected by "Access protection for safety-related project data (Page 97)" or "F-CPU access protection (Page 100)".
For this reason, you must take organizational measures to ensure that only authorized persons can change these program sections.
Print the relevant program sections and supplement your safety summary with this printout.
(S103)

WARNING

For secure authentication of the SafetyProvider whose SafetyData is to be evaluated, the values of the active SafetyProviderID and active SafetyBaseID of the SafetyConsumer must correspond to the values of the active SafetyProviderID and active SafetyBaseID of this SafetyProvider at all times*.
When accepting the Safety programs, you must ensure compliance in the relevant safety summary. If the active SafetyProviderID or active SafetyBaseID is not generated until runtime of your Safety program, you must ensure the correct implementation of the algorithm for the generation of the values. *(S104)*

* If you cannot yet provide the values when starting the Safety program because they are only created during the runtime of your Safety program, you must ensure that the active SafetyProviderID or active SafetyBaseID or the Enable "0" SAPI parameter in this phase.

WARNING

For each communication connection with OPC UA Safety, you must ensure when accepting the Safety program that the data structure of the OPC UA data types used by SafetyData matches on the SafetyProvider and SafetyConsumer side. In particular, the correct order of elements of the same data type is relevant. You can find the structures of the OPC UA data types used in the respective safety summary.
To identify the communication connection, note the following points:

- For static connections:
  To do this identify the communication connection by means of the combination of SafetyProviderIDConfigured and SafeBaseIDConfigured.
- For dynamic connections:
  To do this, identify the communication connection by means of the algorithm for the allocation of the values for SafetyProviderID and SafetyConsumerID.

(S111)

11.8 Identity of online and offline program

Once you have checked all properties of the offline safety program you must ensure that the safety program is identical on the F-CPU on which it is supposed to be run.

WARNING

In a redundant S7-1500HF system, you must perform the verification of identity of the online and offline program in RUN-Redundant mode. In so doing, it is sufficient to perform the verification only for one S7-1500 HF-CPU. *(S098)*

1. Connect online with the F-CPU. If multiple F-CPUs can be reached over a network (e.g. Industrial Ethernet) by the programming device / PC, you have to ensure that you are connected with the correct F-CPU. For example with "Online & diagnostics" > "Online accesses " > "Flash LED".
2. Open the *Safety Administration Editor*.
3. Check whether the online and offline Collective F-Signatures correspond to the Collective F-Signature from the safety summary.
4. Now check in the "General" area under "Safety program status" whether the safety programs are identical online and offline.
   Use the "Status" and "Version comparison" display to check which situation you are dealing with and, if necessary, execute the recommended measure:

Status	Version comparison	Statement	Measure
	Not relevant	The safety programs are different.	– Ensure that you are connected to the desired F-CPU. – Download the safety program to the F-CPU.
		The safety programs are identical but different versions of F-blocks are used.	The safety program must be downloaded to the F-CPU for the latest versions to become effective.
		The safety programs are identical.	None

5. If relevant:
   Check in the "General" area under "PROFIsafe" to see if the values for the F-BaseID match offline and online. See also warning S116.

Status	Meaning
	The online and offline F-BaseIDs match.
	The online and offline F-BaseIDs do *not* match.
	The F-BaseID could not be determined online or is not supported.

11.9 Other characteristics

Introduction

In addition, you must check a few more characteristics that are also relevant for the acceptance of the project.

Plausibility check for data transfer from the standard program to the safety program

Check to determine whether a plausibility check was programmed for all data transferred from the standard user program to the safety program. For this purpose, the "Data from the standard user program" section lists all tags of the standard user program that you are reading in the safety program. Tags of the standard user program that you are writing in the safety program are not listed here because a plausibility check is not required for them. For more information, refer to the S015 warning in section "Data Transfer from Standard User Program to Safety Program (Page 194)".

Multiple call of an F-FB or an instruction with the same instance (single instance or multi-instance)

Check whether you used a separate instance for each call of an F-FB or an instruction.

Multiple calls with the same instance are usually not worthwhile and require special care:

For example, if you explicitly transfer an operand (for example, as a constant) in the 1st call to the instance, and there is no explicit transfer in the 2nd call (so that the start value is valid), you must verify which value in the 2nd call is valid for this operand. Also consider startup processes in this regard; higher priority OBs or similar in which the 1st call may be present.

Checking the program version

Check whether the version of *STEP 7 Safety* used to create the summary (in the footer of the printout) is as least as high as the version used to compile the safety program. You can find the latter version in the section "General information" of the safety summary under "Used versions". Both versions must be listed in Annex 1 of the Report for the TÜV certificate.

Ability to disable safety mode

Make sure that safety mode cannot be disabled. For information about this, refer to section "General information" under "Safety program settings". This setting ensures that the safety mode of the safety program cannot be disabled inadvertently. For more information, refer to the S027 warning in section "Disabling safety mode (Page 386)".

Safety system version with an S7-1500 HF-CPU

Check whether the safety system version is V2.4 or higher when using an S7-1500 HF-CPU.

For information about this, refer to section "General information" under "Safety program settings".

Access protection

Check in the "General information" section under "Access protection" to determine whether the setting for access protection is permitted. Note the following warnings.

Otherwise, the project must not be accepted, because the safety program in the F-CPU is not protected against unauthorized accesses.

⚠ WARNING

(S7-300, S7-400) In productive operation, it must be prevented that changes to the standard user program are unintentionally made in the safety program as well. For this purpose, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU.
With the "Write protection" or "Write/read protection" protection level, the password would apply to the standard and the safety program. *(S001)*

⚠ WARNING

(S7-1200, S7-1500) In productive operation, the safety-related project data must be protected against unintentional changes.
If you use user management, the Runtime rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" and the engineering right "Manage users and roles" may only be granted to authorized users. You must also limit the assignment of user rights to trained personnel. Before the transition into productive operation, you must remove the "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" rights from the "Anonymous" user.
If you are not using user management or the "Access control via access levels" parameter is activated, then configure at least the "Full access (no protection)" protection level and assign a password under "Full access incl. fail-safe (no protection)". This protection level allows full access only to the standard user program and not the safety program.
If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".
Assign different passwords for the individual access levels. *(S041)*

F-Admin right of the web server

For S7-1200 G1 F-CPUs with firmware < V4.7 and S7-1500 F-CPUs with firmware < V3.1, the user management of the web server is part of the hardware configuration.

For S7-1500 F-CPUs as of firmware V3.1 and S7-1200 G1 as of firmware V4.7 or S7-1200 G2 as of firmware V1.0, this right is set in the Runtime rights of the respective F-CPU in the "Users and roles" area.

When downloading for the last time before the transition to productive operation, ensure that only authorized persons have the "F-admin" right for the web server.

After the download, the "F-Admin" right setting can only be checked online in the TIA Portal in the *Safety Administration Editor* (S7-1200 G1 F-CPUs with firmware < V4.7 and S7-1500 F-CPUs with firmware < V3.1) or in the "Security settings\Users and roles" tab (F-CPUs

S7-1500 as of firmware V3.1 and S7-1200 G1 as of firmware V4.7 or S71200 G2 as of firmware V1.0).

WARNING

The "Change parameter of the F-System (F-Admin)" authorization for the web server (including web server API) without password protection (user "Everybody", or user "Anonymous" when using the user management) is intended only for testing, commissioning, etc. This means only when the system is not in productive operation. In this case, you must ensure the safety of the system through other organizational measures.
Before the transition to productive operation, you must remove the rights "Change parameter of the F-System (F-Admin)" and "Full access including fail-safe" from the "Everybody" or "Anonymous" user.
The password of the web server user with "Change parameter of the F-System (F-Admin)" right may only be disclosed to authorized persons. After downloading the hardware configuration, check whether only permitted users of the web server have the "Change parameter of the F-System (F-Admin)" right on the F-CPU. To do so, use the online mode of the *Safety Administration Editor* for an F-CPU without user management or the "Security settings\Users and roles" tab for an F-CPU with user management.
Saving the login file and the password of the web server in the browser is only permitted when usage by unauthorized persons is prevented through other organizational measures.
If you use the ticket mechanism, handling of the tickets must be just as restrictive as handling of the user password of the web server with the "Change parameter of the F-System (F-Admin)" right. *(S064)*

11.10 Acceptance of Changes

Introduction

In general, you can adopt the same approach for the acceptance of changes as the initial system acceptance (see Overview of System Acceptance (Page 407)).

You have to check the entire safety-related project data (Safety program and safety-related hardware configuration) for changes and determine the safety-related project data to be validated and approved as part of an impact analysis.

WARNING

In the case of acceptance of changes, you must check whether the intended changes were made correctly and completely.
You must also check whether unintentional changes may have been made at another location (for example, F-I/O or instructions that were added). *(S072)*

To avoid the acceptance of the entire system in case of negligible changes, *STEP 7 Safety* helps you to identify those parts of your Safety program that have changed.

To accept changes, proceed as follows:

1. Localize the changes in the safety-related project data:
   - changed or newly added F-blocks
   - changed or newly added instructions and F-system blocks
   - safety-related parameters of the changed or newly added F-I/O
   - structure of the safety-related hardware configuration (e.g. slot positions or start addresses of the F-I/Os)
   - changed safety-related communication via Flexible F-Link
   - changed safety-related communication via OPC UA Safety
2. From these changes, determine the safety-related project data affected by them (impact analysis). This can also be safety-related project data that has not been changed.
3. Then you carry out a validation and acceptance of the safety-related project data affected by the changes.

NOTE

Acceptance of changes is not possible after CPU migration.

⚠ WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test (Page 390).
Examples for such changes are:

- Adding F-I/Os
- Changing the start address of F-I/Os
- Changing the slot position of F-I/Os
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Localization of changes in the safety-related project data

To be able to localize relevant changes, you need two TIA projects:

- Reference project: Contains the initially accepted project data. They are the starting point for the upcoming comparison.
- Project to be accepted: Contains the current safety-related project data. It is the result of the reference project and the changes made in it.

To localize changes you have to compare the safety-related project data from the reference project with the safety-related data of the project to be accepted (see Comparing Safety Programs (Page 380)). Use filter setting "Compare only F-blocks relevant for certification". This limits the output of the comparison to the relevant F-blocks.

We recommend adding the summary (possibly as PDF) of the compare result to the acceptance documents.

The Collective F-Signature is a quick first step to determine whether relevant changes have been made. If the signature has changed, relevant changes are present in the safety-related project data.

(S7-1200, S7-1500) You can now use the Collective F-SW-Signature, the Collective F-HW-Signature and the F-Communication Address Signature to narrow down whether these changes are contained in the Safety program (Collective F-HW-Signature changed) and/or in the safety-related hardware configuration (Collective F-HW-Signature) and/or in the communication data (with Flexible F-Link, F-Communication Address Signature).

Bear in mind that the F-BaseID does not enter into any of the specified signatures and, if relevant, must be checked separately (see "Completeness and correctness of the hardware configuration (Page 412)").

Localization of changes in the Safety program

(S7-1200, S7-1500) A quick possibility to detect changes in the Safety program is the comparison of the Collective F-SW-Signature of the safety-related project data in the reference project with the Collective F-SW-Signature in the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the Safety program which need to be validated and, if necessary, accepted.

To localize changes in the Safety program, perform an offline-offline comparison between the Safety program to be accepted of the project to be accepted and the Safety program of the reference project (see Comparing Safety Programs (Page 380)).

⚠ WARNING

Make sure that the comparison criterion "Safety" is enabled and all other comparison criteria are disabled so that the criteria relevant for acceptance of changes are taken into consideration in the comparison. *(S069)*

If additional comparison criteria are enabled, you will see additional changes not relevant for the acceptance of changes (e.g. time stamp).

The status of the comparison helps you to identify which F-blocks were changed.

(S7-1200, S7-1500) As an alternative to the offline-offline comparison, you can localize the changes in the Safety program by comparing the group signatures. Use the safety summary of the reference project and of the project to be accepted for this purpose. Groups with an unchanged signature indicate that no F-blocks in them or lower-level groups have been changed. In groups with a changed group signature, you can localize the changed F-blocks using their changed block signature. Note that the assignment of F-blocks to groups is not recorded by the Collective F-Signature.

Changes to the maximum cycle time of an F-runtime group and F-cycle time warning limit of an F-runtime group are visible during comparison output through changes to the system block F-runtime group info DB.

The following changes do not influence the behavior of the Safety program directly and neither lead to a change of the Collective F-Signature nor are they shown during an offline-offline comparison. In the event of a change acceptance test, you should be able to identify these specifically using the safety summaries:

- Changes to the runtime for the deactivated safety mode
- Changes of the Safety System version
- Changes in the group structuring of the program blocks

Localization of changes in the safety-related hardware configuration

(S7-1200, S7-1500) A quick possibility to detect changes in the safety-related hardware configuration is the comparison of the Collective F-HW-Signature of the safety-related project data in the reference project with the Collective F-HW-Signature of the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the safety-related hardware configuration which need to be validated and, if necessary, accepted.

(S7-1200, S7-1500) If the Collective F-HW-Signature has changed and all F-IOs are unchanged, this indicates that safety-related parameters of the F-CPU have changed, or that the structure of the safety-related hardware configuration has changed, for example, slot positions.

Bear in mind that the F-BaseID does not enter into the Collective F-HW-Signature.

There are two possible ways for localizing safety-related changes in the safety-related hardware configuration:

- Localization by offline-offline comparison
- Localization by comparison of two safety summaries

The procedure is described below.

Localization by offline-offline comparison

The reference project and the project to be accepted must be consistent and compiled for a comparison. To perform the comparison, see Comparing Safety Programs (Page 380).

1. Navigate in the comparison result to the "System blocks > STEP 7 Safety > F-I/O DBs" folder. All data blocks listed in this folder are F-I/O-DBs and are each assigned to an F-I/O.
   - If the F-I/O-DBs in the comparison result are identical, this means that the safety-related configuration of the assigned F-I/O was also not changed. Standard-parameters might have changed.
   - If the F-I/O-DBs in the comparison result are not identical, this means that the safety-related configuration of the assigned F-I/O was also changed.
   - If F-IO DBs in the comparison result are marked as "not existing", associated F-IOs might have been deleted or added or the name or start addresses of the F-IOs have been changed. In this case, you can find the assignment of an F-I/O DB to a specific F-I/O in the safety summary under "Hardware configuration of F-I/O".
2. If you have found changed F-I/O, you can check the changed parameters in the safety summary as described below.

Note that this method is not suitable for identifying differences for the following parameters: HW ID, slot address, F-BaseID.

Localization by comparison of two safety summaries
Carry out a comparison based on two safety summaries as follows:

1. In the section "Hardware configuration of the F-I/Os" compare the start addresses (I/O addresses), the parameter "Behavior after channel fault" and the slot of the F-I/Os.
2. In the "Hardware configuration of F-I/O" section in the overview table of the F-I/O used, compare the parameter CRCs of the F-I/O with those in the safety summary of the corresponding F-CPU from the reference project.
   - If the "Parameter signature (without addresses)" is different for an F-I/O, this indicates the existence of a change in the safety-related parameters of the F-I/O.

     In this case, check the corresponding detail table of the safety-related parameters of the F-I/O and verify the uniqueness of the PROFIsafe addresses.
   - If the "Parameter signature (w/o addresses)" is identical, only the PROFIsafe addresses have been changed.

     In this case it is sufficient to verify the uniqueness of the PROFIsafe addresses.

Check as described in section "Completeness and correctness of the hardware configuration (Page 412)".

(S7-1200, S7-1500) Detecting changes in the communication with Flexible F-Link

A quick possibility to detect changes in the configuration of the communication with Flexible F-Link is the comparison of the F-communication address signature of the safety-related project data in the reference project with the F-communication address signature of the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the configuration of the communication (UUID only) with Flexible F-Link that must be validated and, if necessary, accepted. Other communication parameters such as timeout or transmission direction are covered by the Collective F-SW-Signature (see "Localization of changes in the Safety program" above).

There are two ways to localize safety-related changes in the communication with Flexible F-Link:

- Localization by offline-offline comparison
- Localization by comparison of two safety summaries

The procedure is described below.

Localization by offline-offline comparison
The reference project and the project to be accepted must be consistent and compiled for a comparison. For information on performing the comparison, see Comparing Safety Programs (Page 380).

1. Navigate in the comparison result to the "System blocks > STEP 7 Safety > Flexible F-Link" folder. All data blocks listed in this folder are F-communication DBs, and they are each assigned to a Flexible F-Link communication.
   - If F-communication DBs in the comparison result are identical, this means that the safety-related configuration of the assigned Flexible F-Link communication was not changed.
   - If F-communication DBs in the comparison result are different, this means that the safety-related configuration of the assigned Flexible F-Link communication was changed.
   - If F-communication DBs in the comparison result are marked as "not available", associated Flexible F-Link communications might have been deleted or added. In this case, you can find the assignment of an F-communication DB to a specific Flexible F-Link communication in the safety summary in the "Overview of communication via Flexible F-Link" table.
2. If you have identified a changed Flexible F-Link communication, you can check the changed parameters in the safety summary as described below.

Localization by comparison of two safety summaries
To localize changes in the configuration of the communication with Flexible F-Link, compare the section "Communications via Flexible F-Link Overview" of the reference project with that of the project to be accepted in the respective safety summary.

(S7-1500) Detecting changes in the communication with OPC UA Safety

There are two ways to localize safety-related changes in communication with OPC UA Safety:

- Localization by offline-offline comparison
- Localization by comparison of two safety summaries

The procedure is described below.

Localization by offline-offline comparison
The reference project and the project to be accepted must be consistent and compiled for a comparison. For information on performing the comparison, see Comparing Safety Programs (Page 380).

- For a comparison of SafetyConsumers, follow these steps:
  Navigate in the comparison result to the "System blocks > STEP 7 Safety > OPC UA Safety" folder. All data blocks listed in this folder are F-OPC-UA-Consumer-DBs, and they are each assigned to a SafetyConsumer. You can determine the specific SafetyConsumer based on the safety summary under "OPC UA Safety communication".
  - If F-OPC-UA-Consumer-DBs in the comparison result are identical, this means that the safety-related configuration of the associated SafetyConsumer was not changed.
  - If F-OPC-UA-Consumer-DBs in the comparison result are different, this means that the safety-related configuration of the associated SafetyConsumer was changed.
  - If F-OPC-UA-Consumer-DBs in the comparison result are marked as "not available", associated SafetyConsumers might have been deleted or added.
- You can perform the comparison of SafetyProviders using the F-OPC-UA-Provider-DBs. Follow these steps:
  Navigate in the comparison result to the "System blocks > STEP 7 Safety > Compiler blocks" folder. You can recognize the F-OPC-UA-Provider-DBs from the prefix "F_OPC_UA_PROVIDER_IDB_". Each F-OPC-UA-Provider-DB has been assigned to a SafetyProvider. You can determine the specific SafetyProvider based on the safety summary under "OPC UA Safety communication".
  - If F-OPC-UA-Provider-DBs in the comparison result are identical, this means that the safety-related configuration of the associated SafetyProvider was not changed.
  - If F-OPC-UA-Provider-DBs in the comparison result are different, this means that the safety-related configuration of the associated SafetyProvider was changed.
  - If F-OPC-UA-Provider-DBs in the comparison result are marked as "not available", associated SafetyProviders might have been deleted or added.

If you have identified a changed OPC UA Safety communication, you can check the changed parameters in the safety summary as described below.

Localization by comparison of two safety summaries
To localize changes in the configuration of the communication with OPC UA Safety, compare the detailed views of all SafetyProviders and all SafetyConsumers in the "Communications with OPC UA Safety Overview" area of the reference project with that of the project to be accepted in the respective safety summary.

Accessing tags of the F-I/O DB (Page 165)

Operation and maintenance 12

12.1 Notes on startup of the F-system

In "STARTUP" mode of an F-CPU, the startup of the standard user program occurs as usual.

In the safety program, all DB contents of the F-DBs are generally reset to their start values from the load memory.

An automatic reintegration of the F-I/O (Page 166) takes place starting from the 2nd cycle of the F-runtime group.

NOTE

Resetting the F-DBs to start values from the load memory also triggers the following:

- Any stored error information is reset.
- Edge memory bits in instructions or F-FBs with edge evaluations (e.g. TON instruction) are reset, so that for a signal that already has the "TRUE" state in the 1st cycle of an F-runtime group, a positive signal edge is detected immediately at a query for positive signal edge.

12.2 Notes on Safety Mode of the Safety Program

Introduction

Pay attention to the following important notes on safety mode of the Safety program.

Use of simulation devices/simulation programs

⚠ WARNING

Use of simulation devices/simulation programs in plants
If you operate simulation devices or simulation programs that generate safety message frames, for example, based on PROFIsafe, and make them available to the SIMATIC Safety F-system via the bus system (such as PROFIBUS DP or PROFINET IO), you must ensure the safety of the plant through organizational measures.
Note, for example, that a protocol analyzer is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior.

- **S7-PLCSIM version < 15.1 or S7-PLCSIM Advanced version < 2.0 SP1 and Safety System version < V2.2**
  If you use *S7-PLCSIM* (Page 384) to simulate Safety programs, the measures mentioned above are not necessary because S7-PLCSIM cannot establish an online connection to a real component.
- **S7-PLCSIM version ≥ 15.1 or S7-PLCSIM Advanced version ≥ 2.0 SP1 or Safety System version ≥ V2.2**
  You must ensure the safety of the plant through organizational measures.
  In addition, the loading of the safety-related project data with Safety System version V2.2 and higher onto an *S7-PLCSIM* is only permissible as of *S7-PLCSIM* V15.1 or *S7-PLCSIM Advanced* V2.0 SP1 and higher.

(S030)

NOTE

For an *S7-PLCSIM* before V15.1 or *S7-PLCSIM Advanced* before V2.0 SP1 and a Safety system version V2.2 and higher, the Safety program changes to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Switching F-CPU to STOP mode

⚠ WARNING

Unintentional restart

In contrast to the standard user program, when the Safety program starts up, all tags of the F-DBs are generally initialized with their start values. This means that saved error information is lost. The F-system performs automatic reintegration of the F-I/O.

If an unintentional startup of your process is not allowed, you must program restart/startup protection in the Safety program. For this, the output of process values must be blocked until user acknowledgment takes place (see "Implementation of user acknowledgment (Page 184)"). This user acknowledgment must not take place until safe output of process values is possible (see "Programming startup protection (Page 150)").

You must expect an unintentional restart in the following cases:

- After a STOP generated by PG/PC operation, mode switch, communication function or "STP" instruction
- After an operating error
- After a STOP caused by a fault reaction function
- The following applies to the S7-1500 F Virtual Controller:
  After a STOP or a restart of the S7-1500 F Virtual Controller via Industrial Edge Management.

(S008)

CRC error in F-I/O or safety-related communication

If you observe that a manual acknowledgment is requested more than once every 100 hours due to a CRC error and this occurs repeatedly, this indicates that the underlying communication infrastructure (cabling, wireless connections, network components, etc.) does not have the required reliability.

CRC errors are present:

- For F-I/O access, the ACK_REQ tag of the F-I/O DB is set and the DIAG tag of the F-I/O DB indicates CRC errors with bit 2 or bit 6.
- For communication with the SENDDP/RCVDP instructions, the ACK_REQ output of the RCVDP instruction is set and the DIAG output of the SENDDP/RCVDP instruction indicates CRC errors with bit 6.
- For communication with the SENDS7/RCVS7 instructions, the ACK_REQ output of the RCVS7 instruction is set and the DIAG output of the SENDS7/RCVS7 instruction indicates CRC errors with bit 6.
- For communication with Flexible F-Link, the ACK_REQ tag of the F-communication DB is set for receiving and the DIAG tag of the F-communication DB for sending/receiving indicates CRC errors with bit 6.

  or

- A CRC error is entered in the diagnostic buffer of the F-CPU.

In this case, the failure probability values (Page 439) (PFD_{avg}/PFH) for safety-related communication no longer apply.

Errors in safety-related communication with OPC UA Safety

The OPC UA Safety communication protocol contains a mechanism that tolerates a communication error within a configurable period of time (see description SafetyErrorIntervalLimit (Page 288) in the SPI of the SafetyConsumer).

If you observe that, despite this mechanism, a manual acknowledgment is requested more than once within 24 hours due to a communication error, this indicates that the underlying communication infrastructure (cabling, wireless connections, network components, etc.) does not have the required reliability.

You can recognize communication errors by the fact that the FSV_ACTIVATED output of an F-OPC UA Consumer DB is set and the DIAG output is set according to the type of error.

In this case, the failure probability values (Page 439) (PFDavg/PFH) for safety-related communication no longer apply.

12.3 Replacing Software and Hardware Components

Introduction

Proceed as in the standard. Also note the following sections.

Replacement of software components

When replacing software components on your programming device or PC, e.g. with a new version of *STEP 7*, you must adhere to the information regarding upward and downward compatibility in the documentation and readme files for these products (e.g. *STEP 7 Safety*).

When replacing *STEP 7 Safety*, check whether the version of *STEP 7 Safety* is listed in Annex 1 of the Report for the TÜV certificate.

Replacement of hardware components

Hardware components for SIMATIC Safety (F-CPU, F-I/O, batteries, etc.) are replaced in the same way as in Standard automation systems.

If you replace an F-I/O in the TIA Portal with an F-I/O with a newer article number that occupies more I/O addresses, the now larger I/O address range may already be occupied by another F-I/O.

For example, if you replace an F module F-DI 8x24VDC HF with part number 6ES7136-6BA00-0CA0 by an F module with 6ES7136-6BA01-0CA0. The end address of the input and output addresses is increased by 1 byte each by the exchange. In this case, *STEP 7* assigns a new free I/O address range to the F module. The corresponding tag in the tag table must then be manually adapted to the new I/O addresses.

Replacement of an HF-CPU in the redundant S7-1500 HF system

Note the following warning when replacing an HF-CPU of a redundant S7-1500HF system:

WARNING

If you replace an F-CPU of a redundant S7-1500HF system (e.g. due to CPU failure, defect, etc.), you must put into operation the replacement F-CPU with the SIMATIC Memory Card of the previous F-CPU or with an empty SIMATIC Memory Card. This ensures that after successful SYNCUP of the replacement F-CPU, only the previous safety program is executed. *(S094)*

Replacement of S7-1500 F Software Controllers

WARNING

The following applies to firmware versions V30.0 and higher and < V40.0 of the S7-1500 F Software Controller:
After a CPU module replacement (for example, new PC with data storage medium from old PC), a data storage medium replacement (for example, data storage medium with safety-related project data 1 is replaced by data storage medium with safety-related project data 2) or a UEFI update (if no NVRAM is present), you must ensure that the correct safety program is located in the S7-1500 F Software Controller by reading out the Collective F-signature with the command line command "GetCollectiveFSignature" or the display.
Then you must enter and confirm the expected Collective F-signature with the command line command "ConfirmCollectiveFSignature". This confirmation is required to restart the safety program.
For both command line commands, you must be a member of the "Software Controller Operators" (Windows) or "software_controller_operators" (Linux) user group and the "Failsafe Operators" (Windows) or "failsafe_operators" (Linux) user group.
The following applies to firmware versions < V30.0 of the S7-1500 F Software Controller:
After a CPU module replacement (e.g. new PC with data storage medium from old PC), a data storage medium replacement (e.g. data storage medium containing safety program 1 is replaced with data storage medium containing safety program 2) or a UEFI update, you must check via the display whether the correct collective F-signature is displayed or perform a program identification. *(S066)*

Removing and inserting F-I/O during operation

If removing and inserting is possible for standard I/O during operation, it is also possible for the respective F-I/O. However, be aware that replacing an F-I/O module during operation can cause a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 157) or, alternatively, by using the "ACK_GL (Page 520)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

CPU firmware update

Check of the CPU operating system for F-approval: When using a new CPU operating system (firmware update), you must check to see if the CPU operating system you are using is approved for use in an F-system.

The minimum CPU operating system versions with guaranteed F-capability are specified in the appendix of the Certificate. This information and any notes on the new CPU operating system must be taken into account.

Firmware update for interface module

When using a new operating system for an interface module, such as IM 151-1 HIGH FEATURE for ET 200S (firmware update), you must observe the following:

If you have selected the "Activate firmware after update" option for the firmware update (see *Help on STEP 7*, "Online & Diagnostics"), the interface module is automatically reset following a successful download operation and then runs on the new operating system. Note that the firmware update for interface modules during operation causes a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 157) or, alternatively, by using the "ACK_GL (Page 520)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

Preventive maintenance (proof test)

Proof test for complex electronic components generally means replacement with new, unused components.

12.4 PFDavg and PFH values

PFD_{avg} and PFH values for S7-300/400 F-CPUs and F-I/O

You will find a list of the failure probability values (PFD_{avg}, PFH values) for components that can be used in SIMATIC Safety on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481784).

PFD_{avg} and PFH values for S7-1200/1500 F-CPUs

Below are the probability of failure values (PFD_{avg}, PFH values) for S7-1200/1500 F-CPUs with a service life of 20 years and a mission time of 100 hours:

Operation in low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	**Operation in high demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09 up to an operating altitude of 3 000 m or < 2E-09 at an operating altitude above 3 000 m and up to 5 000 m

More information can be found on the operating conditions of the F-CPUs in the PI F-CPUs (https://support.industry.siemens.com/cs/ww/en/view/109478599) and in the PI of the PFD_{avg}, PFH values (https://support.industry.siemens.com/cs/ww/en/view/109481784).

PFD_{avg} and PFH values for safety-related communication without OPC UA Safety

Below you will find the failure probability values (PFD_{avg}, PFH values) for safety-related communication:

Operation in low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	**Operation in high demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure [h^{-1}]**
< 1E-05*	< 1E-09*

*** Note on S7-300/400 F-CPUs:**
The PFH value is valid under the assumption that a maximum of 100 F-I/Os are involved in a safety function. If you use more than 100 F-I/Os, you have to also add 4E-12 per F-I/O for the safety function.
The PFD_{avg} value is valid for a mission time of 20 years and under the assumption that a maximum of 25 F-I/Os are involved in a safety function. If more than 25 F-I/Os are used, you need to add 3.5E-7 per F-I/O for this safety function.

More information can be found on the operating conditions of the F-CPUs in the PI of the PFD_{avg} and PFH values (https://support.industry.siemens.com/cs/ww/en/view/109478599).

PFD_{avg} and PFH values for safety-related communication with OPC UA Safety (S7-1500)

Below you will find the probability of failure values (PFD_{avg} and PFH values) for safety-related communication via OPC UA Safety:

Operation in low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	**Operation in high demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure [h^{-1}]**
< 8E-08*	< 4E-11*

*** Note**:
The values listed in the table above apply when configuring the SafetyErrorIntervalLimit (Page 288) SPI parameter of a SafetyConsumer with the value 600.
In exceptional cases, you can consider a lower setting (60 or 6). A lower setting may reduce the risk of false tripping. A lower setting is appropriate if the unnecessary triggering of the safety function or the output of fail-safe substitute values would have particularly serious consequences. However, this also worsens the PFD_{avg}/PFH values as follows:

SafetyErrorIntervalLimit	**PFD_{avg} value**	**PFH value**
60	< 2.5E-07	< 4E-10
6 (not permitted for SIL3)	< 1E-06	< 4E-09

12.5 Guide to Diagnostics

Introduction

Here you find a compilation of diagnostic capabilities that can be evaluated for your system when an error occurs. Most of the diagnostic capabilities are the same as those in standard automation systems. The sequence of steps represents a recommendation.

Steps for evaluating diagnostic capabilities

The following table shows the steps you take to evaluate diagnostic capabilities.

Step	Procedure	Reference
1	**Evaluate LEDs on the hardware (F-CPU, F-I/O):** • BUSF LED on the F-CPU: Flashes when a communication error occurs on PROFIBUS DP/PROFINET IO; On if a programming error occurs when OB 85 and OB 121 are programmed (e.g. instance DB is not loaded) • STOP LED on the F-CPU: illuminates when the F-CPU is in STOP mode • Fault LEDs on the F-I/O: e.g. SF-LED (group error LED) on if any fault occurs in the individual F-I/O	*Manuals for F-CPU and F-I/O*
2	**Evaluate diagnostic buffer of the modules:** You read the diagnostic buffer of a module (F-CPU, F-I/O, CP) in its online and diagnostic view in the "Diagnostic buffer" group under the "Online & Diagnostics" folder.	*Help on STEP 7 and manuals for the F-CPU and F-I/O*
3	**Evaluate stacks of the F-CPU:** when the F-CPU is in STOP mode, read the following successively: • Block stack: Check whether STOP mode of the F-CPU was triggered by an F-block of the Safety program • Interruption stack • Local data stack	*STEP 7 help, Diagnostics Function Manual, system manuals*
4	**Evaluate diagnostic tag of the F-I/O DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** Evaluate the DIAG tag in the F-I/O DB	DIAG (Page 164)
5	**Evaluate diagnostic tag of the F-OPC UA Consumer DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** in the F-OPC UA Consumer DB of the variable DIAG	Other variables in the F-OPC UA Consumer DB (Page 297) OPC UA access to SafetyProvider and SafetyConsumer information models (Page 330)
6	**Evaluate diagnostic tag of the F-communication DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** Evaluate the DIAG tag in the F-communication DB	F-communication DB (S7-1200, S7-1500) (Page 341)
7	**Evaluate diagnostic outputs of the instance DBs of instructions using testing and commissioning functions, using an operator control and monitoring system, or in the standard user program:** • Evaluate the following for MUTING, EV1oo2DI, TWO_H_EN, MUT_P, ESTOP1, FDBACK, SFDOOR in the assigned instance DB: – Output DIAG • Evaluate the following for SENDDP or RCVDP in the assigned instance DB: – Output RET_DPRD/RET_DPWR – Output DIAG • Evaluate the following for SENDS7 or RCVS7 in the assigned instance DB: – Output STAT_RCV – Output STAT_SND – Output DIAG	Instructions

Tip on RET_DPRD/RET_DPWR

The diagnostic information of the RET_DPRD/RET_DPWR outputs of the SENDDP or RCVDP instructions corresponds to the diagnostic information of the RETVAL return value of the "DPRD_DAT" and "DPWR_DAT" instructions. You can find the description in the help on *STEP 7* for the "DPRD_DAT" and "DPWR_DAT" instructions.

Tip: STAT_RCV and STAT_SND

The diagnostic information of the STAT_RCV output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "URCV" instruction. The diagnostic information of the STAT_SND output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "USEND" instruction. You can find the description in the help on *STEP 7* for the instruction "UCRV" or "USEND" .

STEP 7 Safety V21 instructions

13

Overview of instructions for the safety program

When programming an F-block, you can find all instructions available for programming an F-block in LAD or FBD with the configured F-CPU in the "Instructions" task card.

In addition to the instructions that are familiar to you from programming a standard block, there are also special safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, and feedback monitoring and instructions for safety-related CPU-CPU communication.

13.1 Connection of the Enable input EN and Enable output ENO

The enable input EN cannot be connected.

(S7 -300, S7-400) It is not possible to connect the ENO output.

(S7-1200, S7-1500) The ENO output can only be wired with the following instructions:

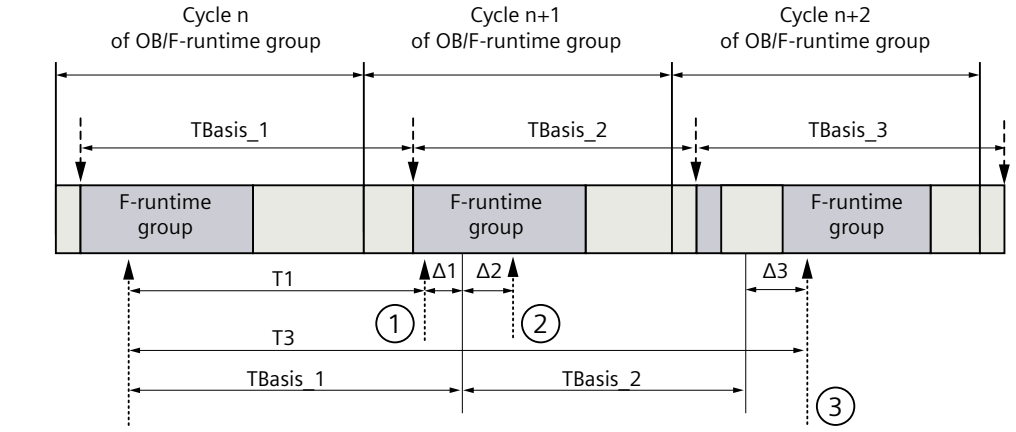
- ADD: Add (Page 542)
- SUB: Subtract (Page 545)
- MUL: Multiply (Page 548)
- DIV: Divide (Page 551)
- NEG: Create two's complement (Page 554)
- ABS: Form absolute value (Page 556)
- CONVERT: Convert value (Page 566)

13.2 Temporal blurring for instructions with time processing

Observe the following warning for the following instructions with time processing:

- ESTOP1: Emergency STOP/emergency OFF up to stop category 1 (STEP 7 Safety V21) (Page 478)
- TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V21) (S7-300, S7-400) (Page 482)
- TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V21) (Page 483)
- MUTING: Muting (STEP 7 Safety Advanced V21) (S7-300, S7-400) (Page 486)
- MUT_P: Parallel muting (STEP 7 Safety V21) (Page 495)
- EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V21) (Page 505)
- FDBACK: Feedback monitoring (STEP 7 Safety V21) (Page 510)
- TP: Generate pulse (STEP 7 Safety V21) (Page 522)
- TON: Generate on-delay (STEP 7 Safety V21) (Page 524)
- TOF: Generate off-delay (STEP 7 Safety V21) (Page 527)
- ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V21) (Page 591)

⚠ WARNING



When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- The temporal blurring known from the standard user program, which is caused by the cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value
- Tolerance of internal time monitoring in the S7-1500 HF-CPU
  - For time values up to 500 ms, a maximum of 10 ms
  - For time values greater than or equal to 500 ms, a maximum of 2% of the (assigned) time value
- Tolerance of internal time monitoring in the S7-1500 F Virtual Controller
  Without setup of Virtual Time Service:
  - For time values up to 200 ms, a maximum of 5 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value plus 1 ms

  With setup of Virtual Time Service:
  - For time values up to 200 ms, a maximum of 10 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value plus 6 ms

You must choose the interval between two calls of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Timing imprecision resulting from the update time of the time base used in the instruction:

= Update of the time basis TBasis_n

= Productive operation of an instruction with time processing

① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the Safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

13.3 General

13.3.1 LAD

13.3.1.1 New network (STEP 7 Safety V21)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

NOTE
If you insert an element into the last empty network of the F-block in an LAD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.3.1.2 Empty box (STEP 7 Safety V21)

Requirement

A network is available.

Procedure

To insert an LAD instruction into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.
   A drop-down list is displayed.
5. Select the required instruction from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are

stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

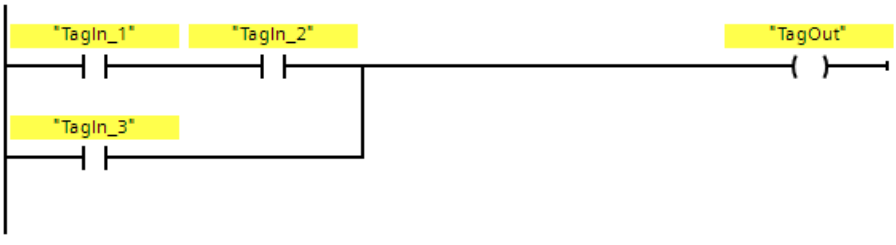
13.3.1.3 Open branch (STEP 7 Safety V21)

Description

Use branches to program parallel connections with the Ladder Logic (LAD) programming language. Branches are inserted into the main current path. You can insert several contacts into the branch, thereby creating a parallel connection from series connections. You can program complex ladder diagrams in this way.

Requirement

- A network is available.
- The network contains elements.



Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Open branch".
3. Use a drag-and-drop operation to move the element to the desired place in the network.
4. If you want to connect the new branch directly to the power rail, drag the element to the power rail.

Example

The following figure provides an example of how to use branches:

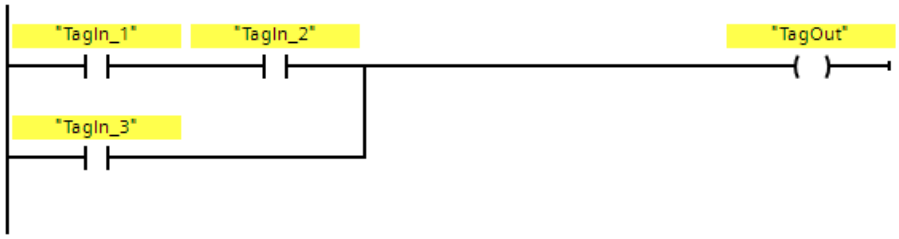
13.3.1.4 Close branch (STEP 7 Safety V21)

Description

Branches must be closed again at suitable places. If necessary, branches will be arranged so that they do not cross each other.

Requirement

A branch is available.



Procedure

To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.
   A dashed line will appear as soon as the cursor is moved.
3. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
4. Release the left mouse button.

Example

The figure below provides an example of how to use branches:

13.3.2 FBD

13.3.2.1 New network (STEP 7 Safety V21)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

NOTE

If you insert an element into the last empty network of the F-block in an FBD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.3.2.2 Empty box (STEP 7 Safety V21)

Requirement

A network is available.

Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.
   A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program

resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

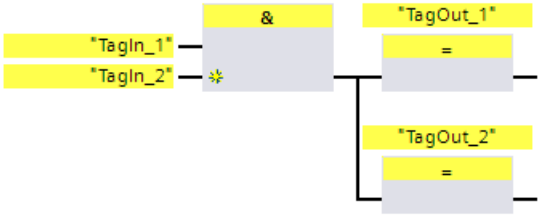
13.3.2.3 Open branch (STEP 7 Safety V21)

Description

You use branches, which you insert between the boxes, to program parallel connections with the Function Block Diagram (FBD) programming language You can insert additional boxes in the branch, thereby programming complex function block diagrams.

Requirement

A network is available.



Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate in the pane to "Basic instructions > General > Branch".
3. Use a drag-and-drop operation to move the element to the desired place to a connecting line between two boxes.

Example

The following figure provides an example of how to use branches:

13.3.2.4 Insert binary input (STEP 7 Safety V21)

Description

Use the "Insert binary input" instruction to expand the box of one of the following instructions by a binary input:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by expanding the instruction box.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

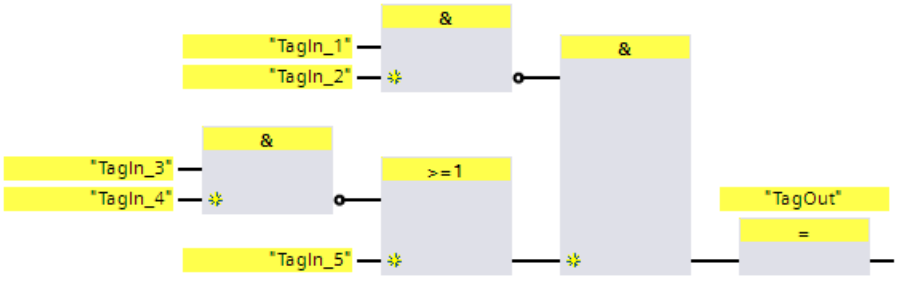
Example

The following example shows how the instruction works:

The box of instruction "AND logic operation" has been expanded by an additional binary input at which the signal state of operand "TagIn_3" is queried. Output "TagOut" is set when the signal state of operands "TagIn_1", "TagIn_2", and "TagIn_3" is "1".

See also

AND logic operation (STEP 7 Safety V21) (Page 465)
OR logic operation (STEP 7 Safety V21) (Page 466)
X: EXCLUSIVE OR logic operation (STEP 7 Safety V21) (Page 467)



13.3.2.5 Invert RLO (STEP 7 Safety V21)

Description

You can use the "Invert RLO" instruction to invert the result of logic operation (RLO).

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- The "TagIn_1" and/or "TagIn_2" input has the signal state "0".
- The "TagIn_3" or "TagIn_4" input has the signal state "0" or the "TagIn_5" input has the signal state "1".

13.4 Bit logic operations

13.4.1 LAD

13.4.1.1 ---| |---: Normally open contact (STEP 7 Safety V21)

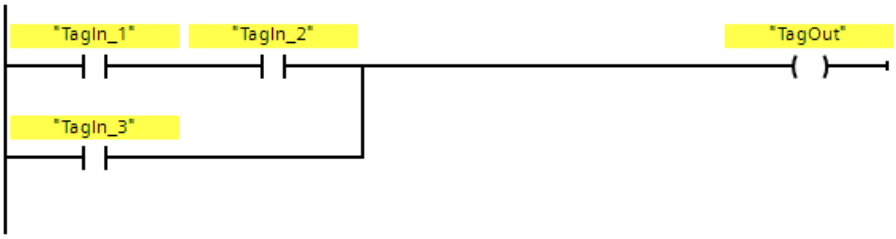
Description

The activation of the normally open contact depends on the signal state of the associated operand. If the operand has signal state "1," the normally open contact is closed. Power flows from the left power rail through the normally open contact into the right power rail and the signal state at the output of the instruction is set to "1".

If the operand has signal state "0," the normally open contact is not activated. The power flow to the right power rail is interrupted and the signal state at the output of the instruction is reset to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "1".

13.4.1.2 ---| / |---: Normally closed contact (STEP 7 Safety V21)

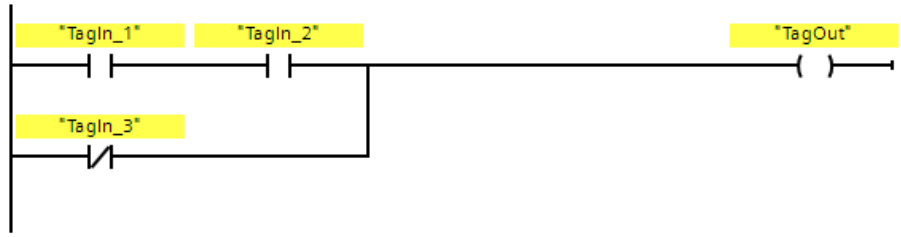
Description

The activation of the normally closed contact depends on the signal state of the associated operand. If the operand has signal state "1", the normally closed contact is opened and the signal state at the output of the instruction is reset to "0".

If the operand has signal state "0", the normally closed contact is not activated and the signal state at the output of the instruction is set to "1".

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.



Parameters

The following table shows the parameters of the instruction:

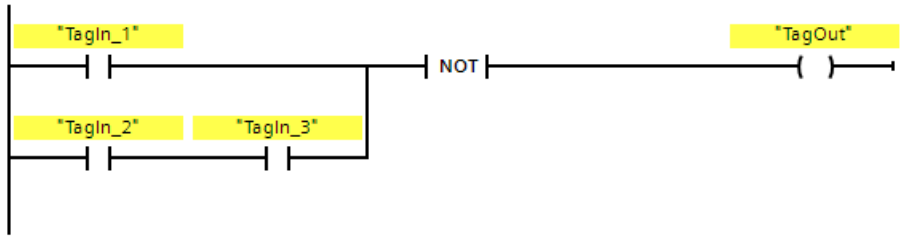
Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".



13.4.1.3 --|NOT|--: Invert RLO (STEP 7 Safety V21)

Description

You can use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). When the signal state is "1" at the input of the instruction, the output of the instruction has the signal state "0". When the signal state is "0" at the input of the instruction, the output has the signal state "1".

Example

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operands "TagIn_2" and "TagIn_3" have signal state "1".

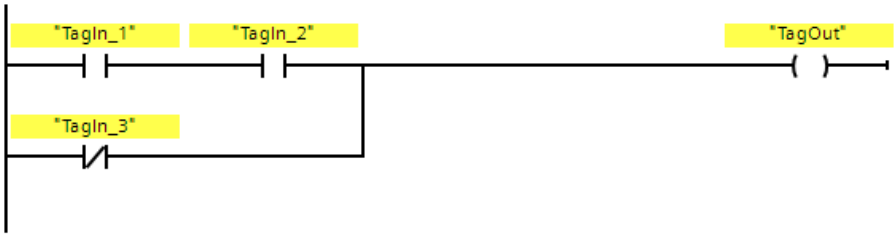
13.4.1.4 ---( )---: Assignment (STEP 7 Safety V21)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. When the result of logic operation (RLO) at the input of the coil is "1," the specified operand is set to signal state "1". When the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent immediately to the output.

The "Assignment" instruction can be placed at any position in the network.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

13.4.1.5 ---(R)---: Reset output (STEP 7 Safety V21)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

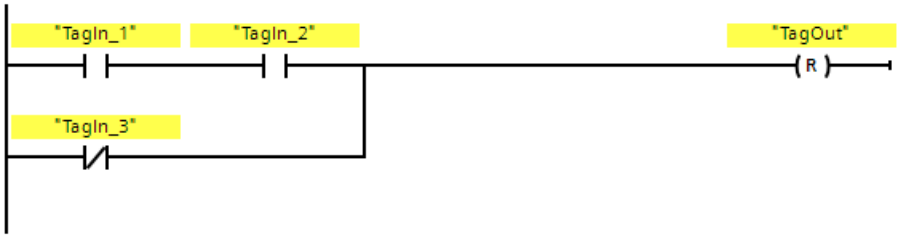
If power flows to the coil (RLO is "1"), the specified operand is set to "0". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

NOTE
If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE
If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

NOTE
You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset when RLO = "1".

Example

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.4.1.6 ---(S)---: Set output (STEP 7 Safety V21)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If power flows to the coil (RLO is "1"), the specified operand is set to "1". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

NOTE

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.
An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

NOTE

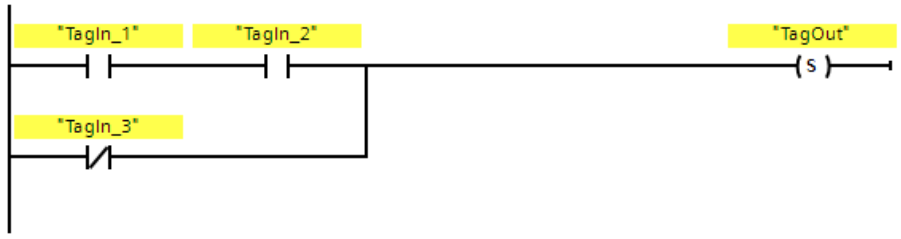
If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

NOTE

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:

Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.4.1.7 SR: Set/reset flip-flop (STEP 7 Safety V21)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

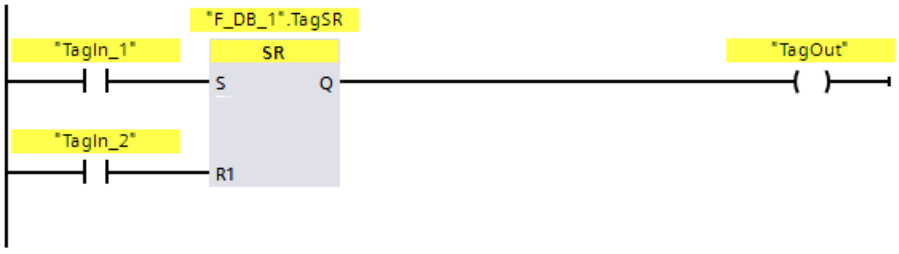
The current signal state of the operand is transferred to output Q and can be queried there.

NOTE

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.
If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:

Operands ""F_DB_1".TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.4.1.8 RS: Reset/set flip-flop (STEP 7 Safety V21)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

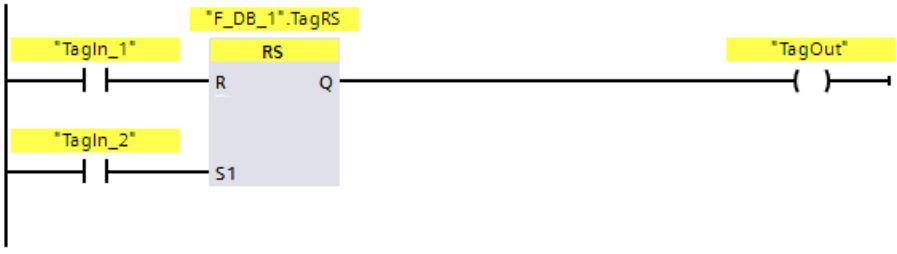
The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

NOTE

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE
You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.
If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:

Operands ""F_DB_1".TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.4.1.9 --|P|--: Scan operand for positive signal edge (STEP 7 Safety V21)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

NOTE

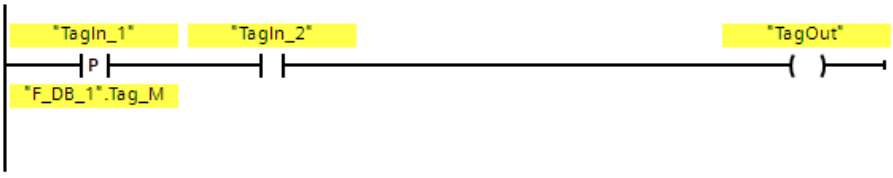
The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an InOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.
If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1". The signal state of the previous query is saved at edge memory bit ""F_DB_1".Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.4.1.10 --|N|--: Scan operand for negative signal edge (STEP 7 Safety V21)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

NOTE

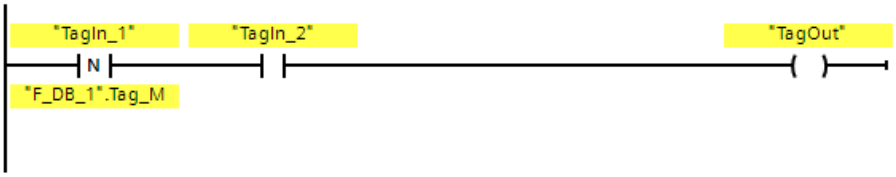
The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an InOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.
If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at operand "TagIn_1". The signal state of the previous query is saved at edge memory bit ""F_DB_1".Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.4.1.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V21)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation (RLO) with the signal state of the previous query, which is saved in the edge bit memory (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

NOTE

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

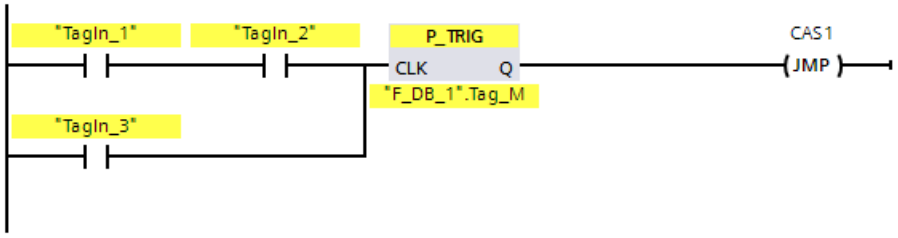
NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an iInOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:

The RLO from the previous bit logic operation is saved in edge memory bit ""F_DB_1".Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.4.1.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V21)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

NOTE

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

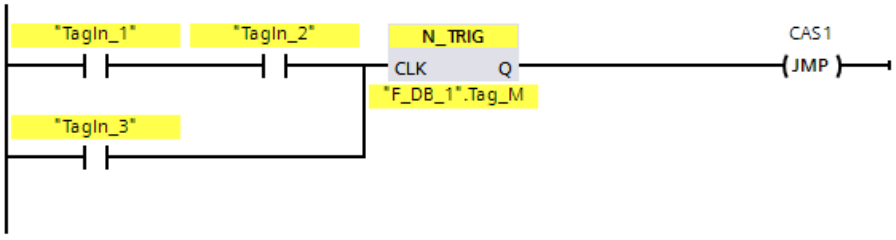
NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an iInOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:

The RLO of the previous bit logic operation is saved in edge bit memory ""F_DB_1".Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.4.2 FBD

13.4.2.1 AND logic operation (STEP 7 Safety V21)

Description

You can use the "AND logic operation" instruction to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "AND logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "AND logic operation" instruction that is not the first instruction in the logic string logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the AND truth table.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the signal state of operands "TagIn_1" and "TagIn_2" is "1".

AND truth table

The following table shows the results when linking two operands by an AND logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	1	1
0	1	0
1	0	0
0	0	0

See also

Insert binary input (STEP 7 Safety V21) (Page 451)

13.4.2.2 OR logic operation (STEP 7 Safety V21)

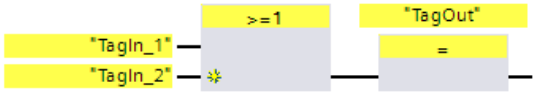
Description

You can use the "OR logic operation" instruction to get the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of at least one of the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of all of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "OR logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "OR logic operation" instruction that is not the first instruction in the logic string, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the OR truth table.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the signal state of operand "TagIn_1" or "TagIn_2" is "1".

OR truth table

The following table shows the results when linking two operands by an OR logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	1
0	0	0

See also

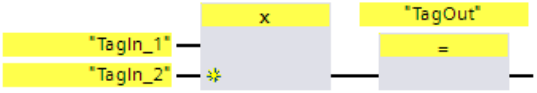
Insert binary input (STEP 7 Safety V21) (Page 451)

13.4.2.3 X: EXCLUSIVE OR logic operation (STEP 7 Safety V21)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to get the result of a signal state query according to the the EXCLUSIVE OR truth table.

With an "EXCLUSIVE OR logic operation" instruction, the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the overall result of logic operation is "1" if an odd-numbered quantity of queried operands returns the result "1".



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the signal state of one of the two operands "TagIn_1" and "TagIn_2" is "1". When both operands have signal state "1" or "0" then output "TagOut" is reset.

EXCLUSIVE OR truth table

The following table shows the results when two operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	0
0	0	0

The following table shows the results when three operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Signal state of the third operand	Result of logic operation
1	0	0	1
0	1	1	0
0	1	0	1
1	0	1	0
0	0	1	1
1	1	0	0
1	1	1	1
0	0	0	0

See also

Insert binary input (STEP 7 Safety V21) (Page 451)

13.4.2.4 =: Assignment (STEP 7 Safety V21)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand located above the Assign box.

The "Assignment" instruction can be placed at any position in the logic operation sequence.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:

Operand "TagOut" at the output of the "Assignment" instruction is set when one of the following conditions is fulfilled:

- Inputs "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at input "TagIn_3" is "0".

13.4.2.5 R: Reset output (STEP 7 Safety V21)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is reset to "0". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

NOTE

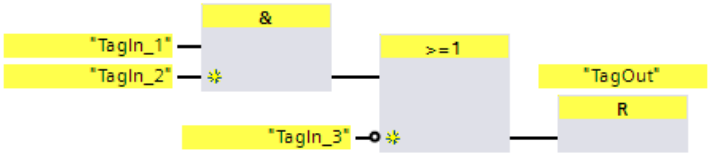
If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

NOTE

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset with RLO = "1".

Example

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.4.2.6 S: Set output (STEP 7 Safety V21)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to "1". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

NOTE

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

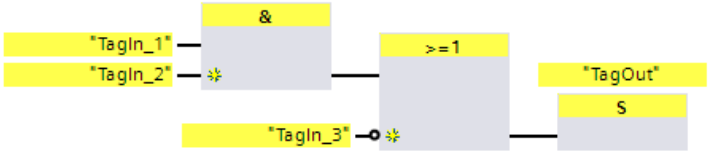
NOTE

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

NOTE
You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:

Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.4.2.7 SR: Set/reset flip-flop (STEP 7 Safety V21)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

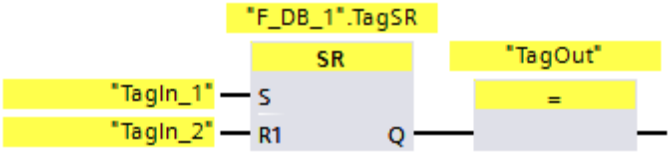
Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

NOTE
If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE
You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.
If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:

Operands ""F_DB_1".TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.4.2.8 RS: Reset/set flip-flop (STEP 7 Safety V21)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

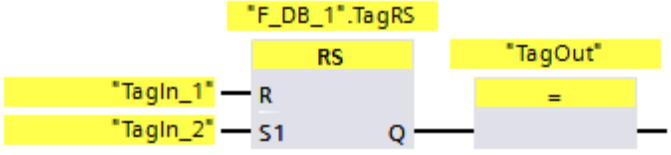
Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

NOTE
If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an InOut parameter.

NOTE
You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.
If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:

Operands ""F_DB_1".TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.4.2.9 P: Scan operand for positive signal edge (STEP 7 Safety V21)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

NOTE

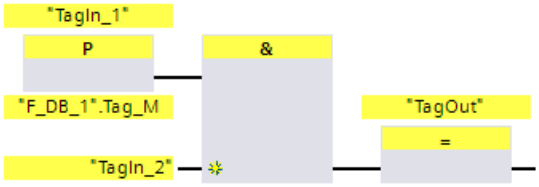
The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an InOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.
If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

"TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.4.2.10 N: Scan operand for negative signal edge (STEP 7 Safety V21)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

NOTE

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

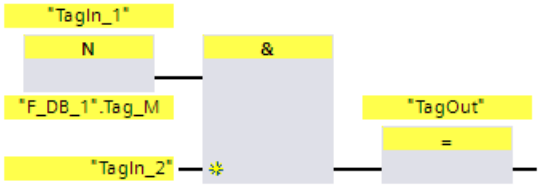
NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an InOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.4.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V21)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

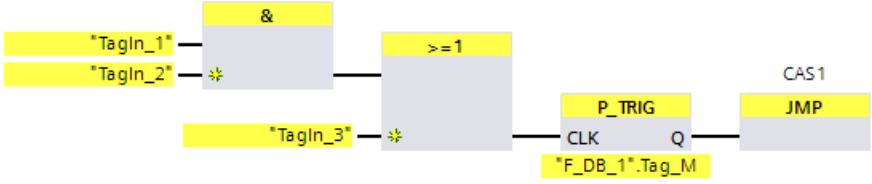
NOTE

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an iInOut parameter.

NOTE
You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.
If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:

The RLO from the previous bit logic operation is saved in edge memory bit ""F_DB_1".Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.4.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V21)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

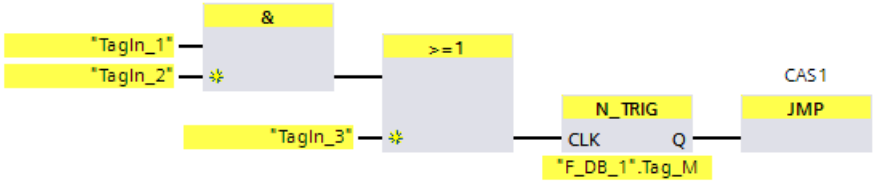
NOTE
The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

NOTE

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an iInOut parameter.

NOTE

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.
If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.



Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:

The RLO of the previous bit logic operation is saved in edge bit memory ""F_DB_1".Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.5 Safety functions

13.5.1 ESTOP1: Emergency STOP/emergency OFF up to stop category 1 (STEP 7 Safety V21)

Description

This instruction supports the implementation of an EMERGENCY STOP/EMERGENCY OFF shutdown with acknowledgment for STOP categories 0 and 1 for the purpose of complying with requirements of IEC 60204 or IEC 61800-5-2. However, additional measures described in the respective standard may have to be taken in order to fully comply with the requirements of the respective standard.

Enable signal Q is reset to 0, as soon as input E_STOP takes a signal state of 0 (Stop category 0). Enable signal Q_DELAY is reset to 0 after the time delay set at input TIME_DEL (Stop Category 1).

Enable signal Q is reset to 1 not before input E_STOP takes a signal state of 1 and an acknowledgment occurs. The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets output ACK_REQ to 1, as soon as input E_STOP = 1.

Following an acknowledgment, the instruction resets ACK_REQ to 0.

Every call of the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ESTOP1_DB_1) or a multi-instance (e.g., ESTOP1_Instance_1) for the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of "0" unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Note: In case of two channels according to category 3.4 of ISO 13849-1:2015 or EN ISO 13849-1:2015, the discrepancy monitoring of the two NC contacts of the EMERGENCY STOP/EMERGENCY OFF must already take place in the F-I/O. The F-I/O has to be configured accordingly (sensor evaluation: two-channel, equivalent), and the result of the evaluation interconnected with the E_STOP input. In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
E_STOP	Input	BOOL	EMERGENCY STOP/EMERGENCY OFF
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	1=Acknowledgment
TIME_DEL	Input	TIME	Time delay
Q	Output	BOOL	1=Enable
Q_DELAY	Output	BOOL	Enable is OFF delayed
ACK_REQ	Output	BOOL	1=Acknowledgment necessary
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder.
1.1	x	—	—	—	These versions have identical functions to version 1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	o	—	o	
1.5	x	x	—	x	
1.6	x	x	x	x	The reaction of the delay time TIME_DEL for F-CPUs S7-1200/1500 was adapted to the reaction of F-CPUs S7-300/400: If the input ESTOP (0 -> 1 (including acknowledgment) -> 0) is changed while the delay time is running, the delay time is restarted.

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup behavior

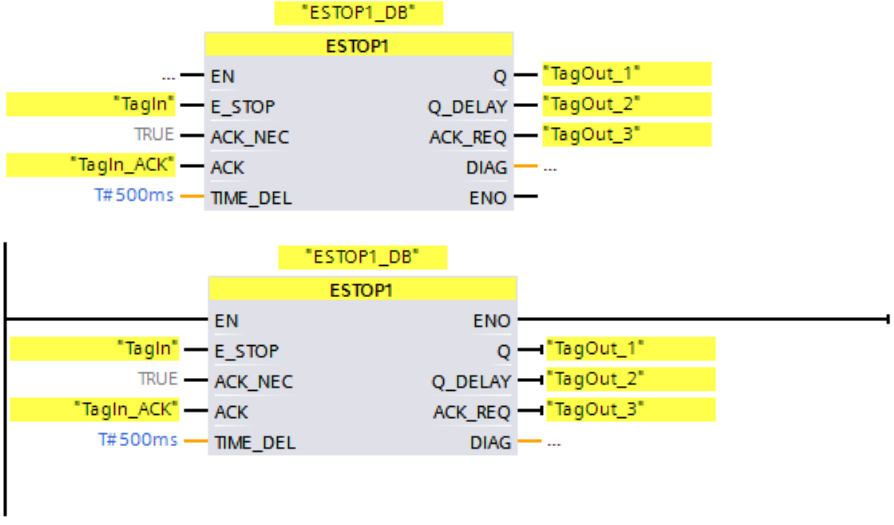
After an F-system startup, when ACK_NEC = 1, you must acknowledge the instruction using a rising edge at input ACK.

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 4 and 5 are saved until you acknowledge at the ACK input.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect TIM_DEL setting	Time delay setting < 0	Set time delay > 0
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Acknowledgment not possible because emergency STOP/emergency OFF is still active	Emergency STOP/Emergency OFF pushbutton is locked	Release Emergency STOP/Emergency OFF pushbutton



Bit no.	Assignment	Possible error causes	Remedies
Bit 4	Acknowledgment not possible because emergency STOP/emergency OFF is still active	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of emergency STOP/emergency OFF pushbutton	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		Emergency STOP/Emergency OFF pushbutton is defective	Check emergency STOP/emergency OFF pushbutton
		Wiring fault	Check wiring of the emergency STOP/emergency OFF pushbutton
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

This instruction supports the implementation of two-hand monitoring for the purpose of complying with requirements of ISO 13851. However, additional measures described in the standard may have to be taken in order to fully comply with the requirements of the standard.

NOTE
This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Two-hand monitoring with enable". The application "Two-hand monitoring with enable" replaces the instruction "Two-hand monitoring" with compatible functions.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN2 = 0). Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time. Enable signal Q can never be set to 1 if the discrepancy time is set to values less than 0 or greater than 500 ms.

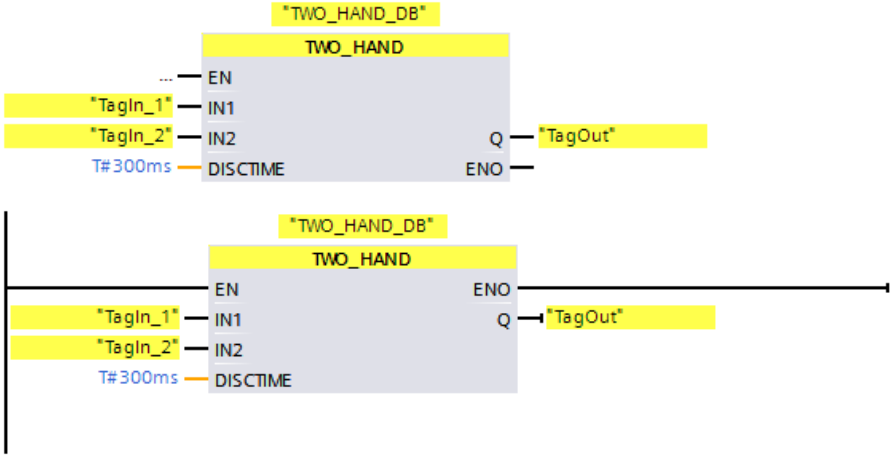
Every call of the "Two-hand monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_HAND_DB_1) or a multi-instance (e.g., TWO_HAND_Instance_1) for the "Two-hand monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration. If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 is set in the relevant F-I/O DB. (See also F-I/O access (Page 151))

Parameters

The following table shows the parameters of the instruction:



Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable

Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction:

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V21)

Description

This instruction supports the implementation of two-hand monitoring with enable for the purpose of complying with requirements of ISO 13851. However, additional measures described in the standard may have to be taken in order to fully comply with the requirements of the standard.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1 when existing ENABLE = 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN 2 = 0) or ENABLE = 0. Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time when existing ENABLE = 1.

Every call of the "Two-hand monitoring with enable" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_H_EN_DB_1) or a multi-instance (e.g., TWO_H_EN_Instance_1) for the "Two-hand monitoring with enable" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during corresponding configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 or respectively value status = 0 is set in the relevant F-I/O DB.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
ENABLE	Input	BOOL	Enable input
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms) For productive use, select a discrepancy time > 0 ms.
Q	Output	BOOL	1=Enable
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	

o This version is no longer supported.

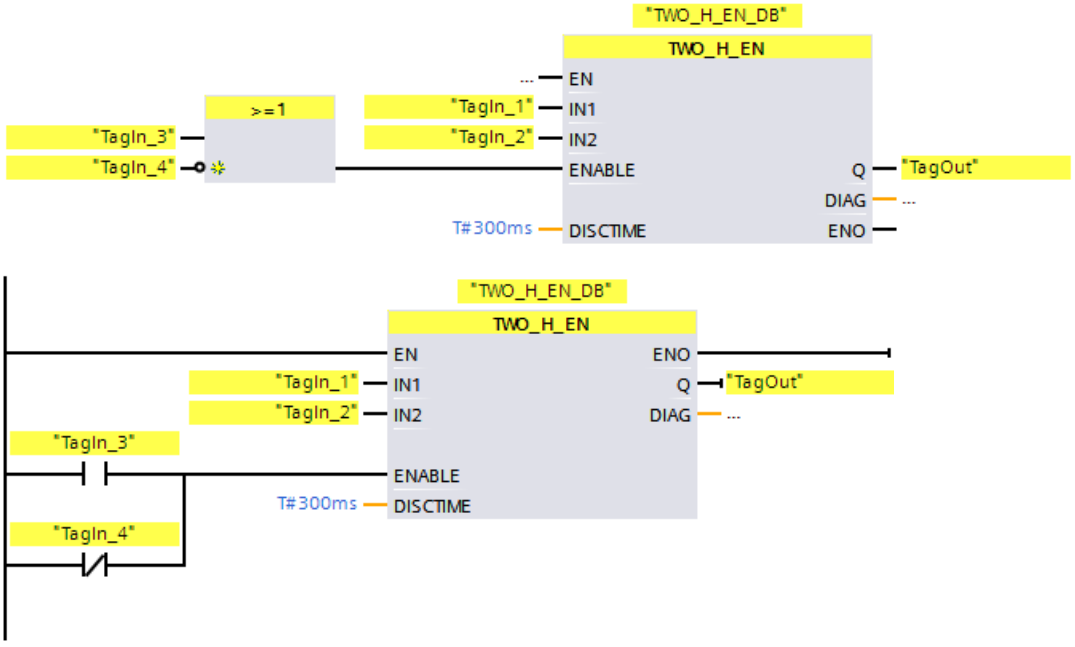
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 5 are saved until the cause of the error has been eliminated.

Structure of DIAG



Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect discrepancy time DISCTIME setting	Discrepancy time setting is <0 or > 500 ms	Set discrepancy time in range of 0 to 500 ms
Bit 1	Discrepancy time elapsed	Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Pushbuttons were not activated within the discrepancy time	Release pushbuttons and activate them within the discrepancy time
		Wiring fault	Check wiring of pushbuttons
		Pushbuttons defective	Check pushbuttons
		Pushbuttons are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Incorrect activation sequence	One pushbutton was not released	Release pushbuttons and activate them within the discrepancy time
		Pushbuttons defective	Check pushbuttons
Bit 5	ENABLE does not exist	ENABLE = 0	Set ENABLE = 1, release pushbutton and activate it within the discrepancy time
Bit 6	Reserved	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.4 MUTING: Muting (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

This instruction performs parallel muting with two or four muting sensors.

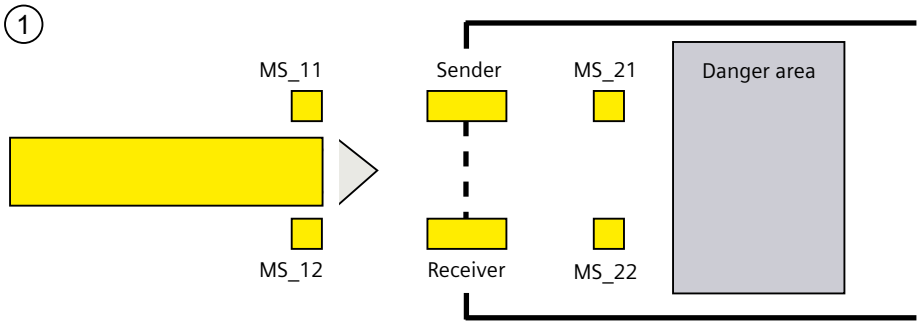
NOTE

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Parallel muting (Page 495)". The instruction "Parallel muting" replaces the instruction "Muting" with compatible functions.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUTING_DB_1) or a multi-instance (e.g., MUTING_Instance_1) for the "Muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.



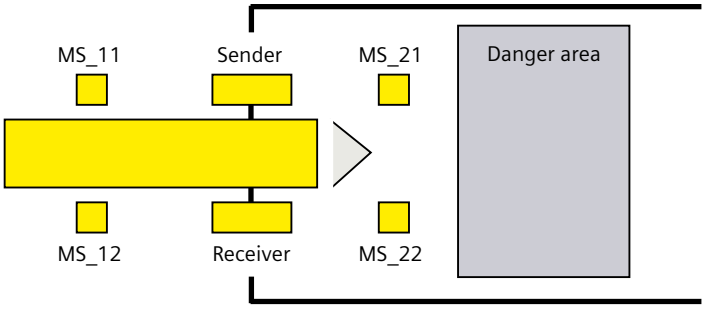
Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

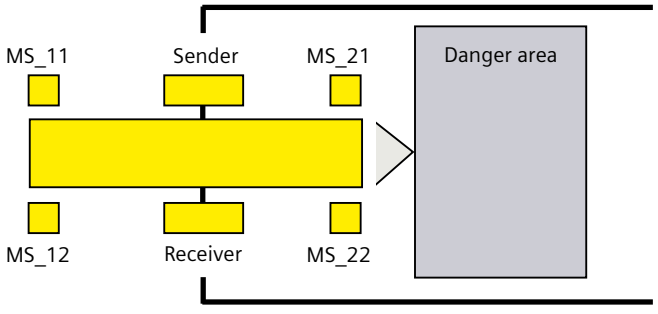
Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 1 of sensor pair 1
MS_12	Input	BOOL	Muting sensor 2 of sensor pair 1
MS_21	Input	BOOL	Muting sensor 1 of sensor pair 2
MS_22	Input	BOOL	Muting sensor 2 of sensor pair 2
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal of the muting lamp channel
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
ACK	Input	BOOL	Acknowledgment of restart inhibit
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	BYTE	Non-fail safe service information

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)



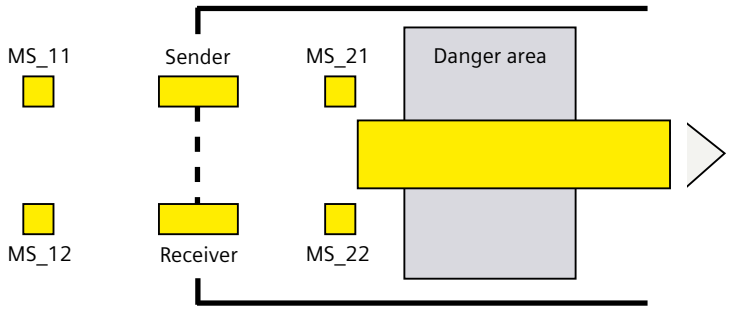
- If both muting sensors MS_11 and MS_12 are activated by the product within DISCTIM1 (apply signal state = 1), the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

NOTE



The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.
F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).

②

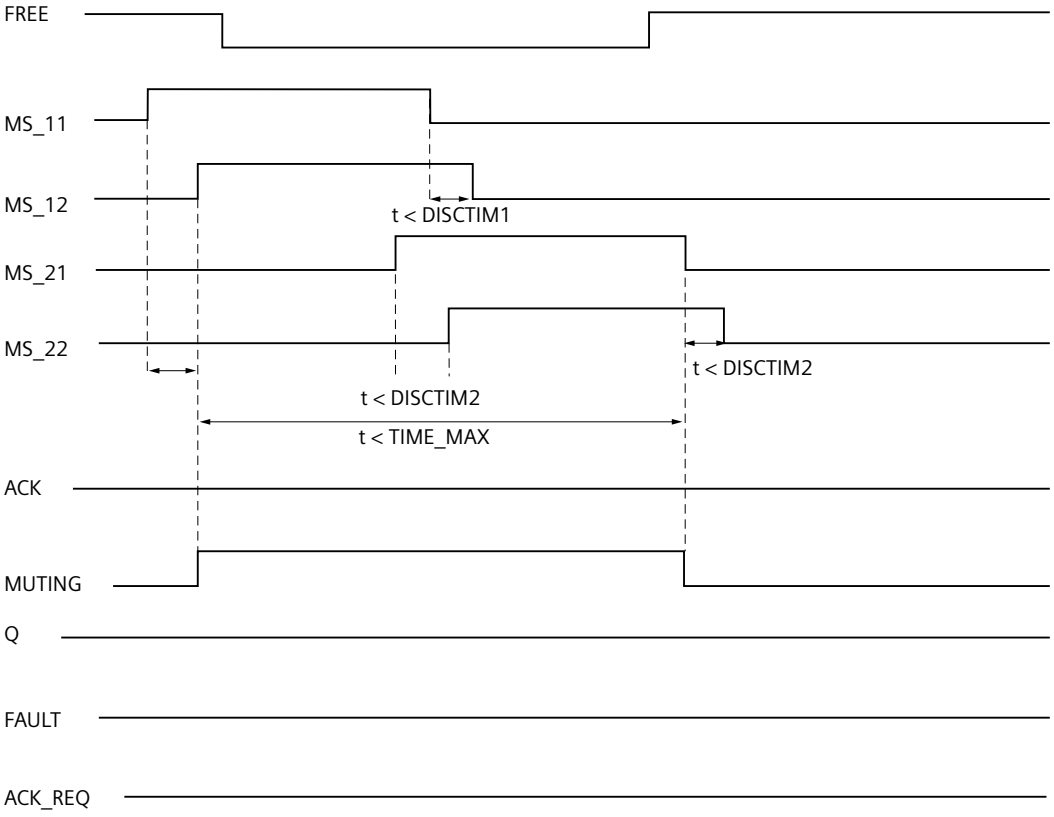


- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop).

③

- The two muting sensors MS_21 and MS_22 must be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

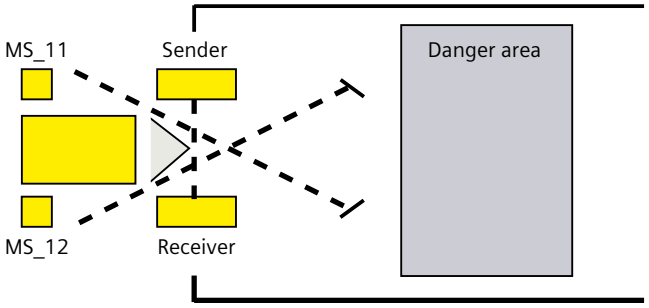


- Only if one of the two muting sensors MS_21 and MS_22 is switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

NOTE

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors



Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.

Restart inhibit upon interruption of light curtain (if MUTING is not active), when errors occur, and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- The muting lamp monitoring function responds at input QBAD_MUT
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min

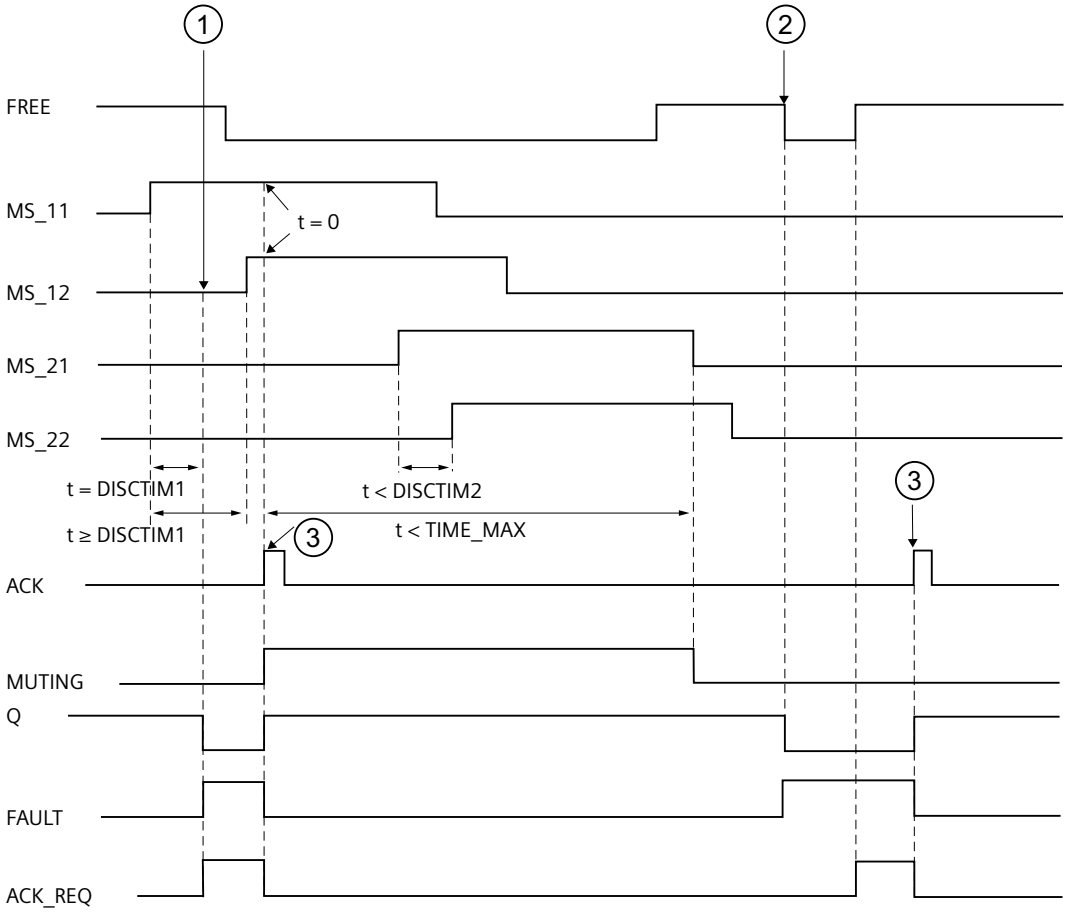
In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

⚠ WARNING

When a valid combination of signal states of muting sensors is immediately detected at startup of the F-system (for example, because the muting sensors are interconnected to inputs of a standard I/O that immediately provide process values during the F-system startup), the MUTING function is immediately started and the MUTING output and enable signal Q are set to 1. The FAULT output (group error) is not set to 1 (no restart inhibit!). *(S035)*

Acknowledgment of restart inhibit

Enable signal Q becomes 1 again, when:



- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)
  and
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 184)).

The FAULT output is set to 0. Output ACK_REQ = 1 signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

NOTE

Following discrepancy errors and once the maximum muting time has been exceeded, ACK_REQ is immediately set to 1. As soon as a user acknowledgment has taken place at input ACK, discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (if MUTING is not active)

① Sensor pair 1 (MS_11 and MS_12) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though the MUTING function is not active.

③ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

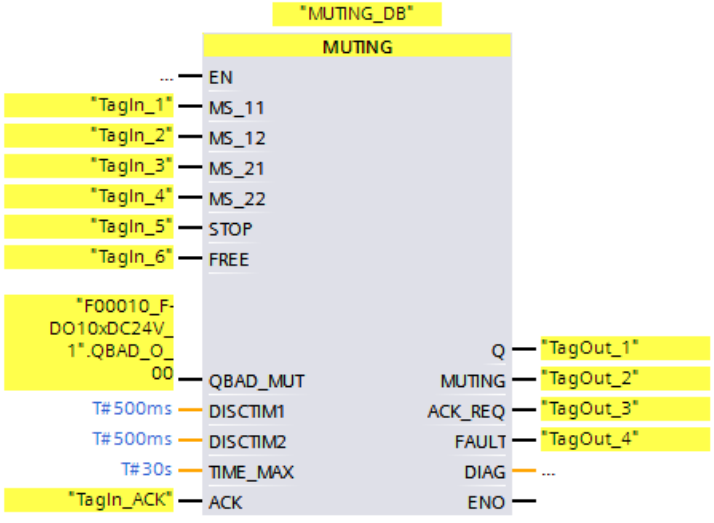
When STOP = 1, the discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, for example, because both muting sensors have adopted signal state 1 in the event of an error, the fault is not detected and the MUTING function can be started unintentionally. *(S036)*

Output DIAG

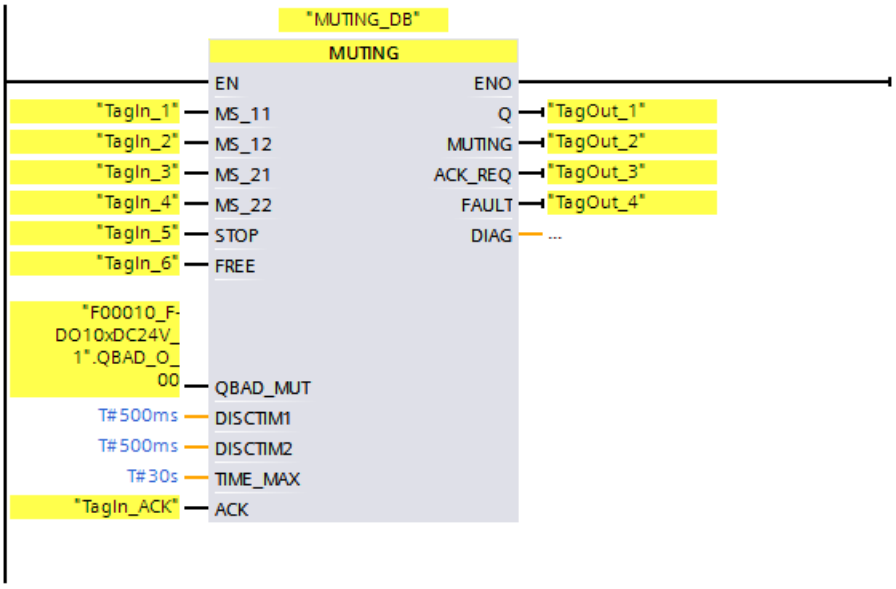
The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)



Bit no.	Assignment	Possible error causes	Remedies
Bit 3	Light curtain interrupted and muting not active	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 5	Reserved	—	—
Bit 6	Reserved	—	—
Bit 7	Reserved	—	—



Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction:

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.5 MUT_P: Parallel muting (STEP 7 Safety V21)

Description

This instruction performs parallel muting with two or four muting sensors.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Parallel muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUT_P_DB_1) or a multi-instance (e.g., MUT_P_Instance_1) for the "Parallel muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 11
MS_12	Input	BOOL	Muting sensor 12
MS_21	Input	BOOL	Muting sensor 21

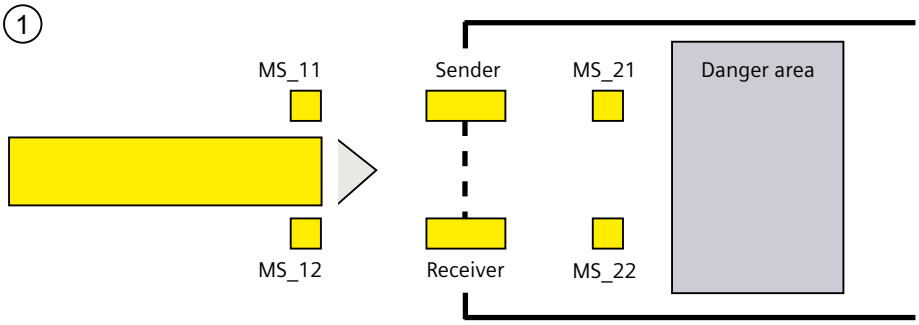
Parameter	Declaration	Data type	Description
MS_22	Input	BOOL	Muting sensor 22
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
ENABLE	Input	BOOL	1=Enable MUTING
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the muting lamp channel
ACK	Input	BOOL	Acknowledgment of restart inhibit
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	WORD	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x*	—	—	—	
1.1	x*	—	—	—	These versions have identical functions to version 1.0. The output DIAG can now be correctly interconnected with the operand of data type WORD.
1.2	x*	—	—	o	
1.3	x*	o	—	o	
1.4	x	x	x	x	

o This version is no longer supported.



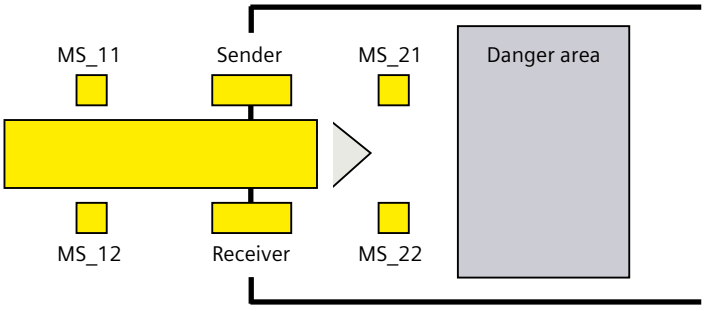
* S7-300/400: When a restart inhibit (output FAULT = 1) and ENABLE = 1 is present, output ACK_REQ is set to 1 even if not at least one muting sensor is activated. Use the DIAG bits 5 and 6 for more information.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

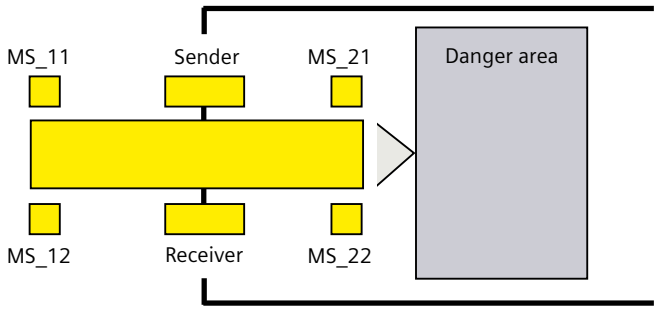
Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

①



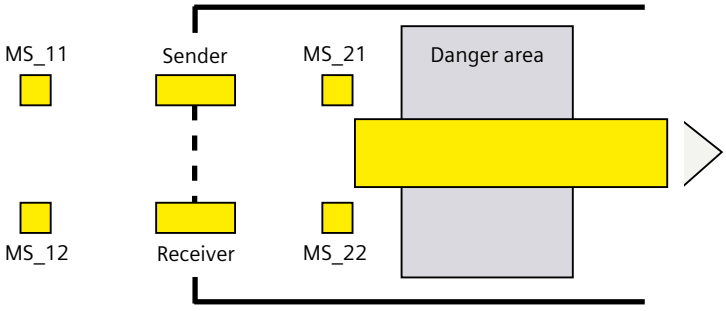
- If muting sensors MS_11 and MS_12 are both activated by the product within DISCTIM1 (apply signal state = 1) and MUTING is enabled by setting the ENABLE input to 1, the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

NOTE



The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / with inverted value statues of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.
F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).

②

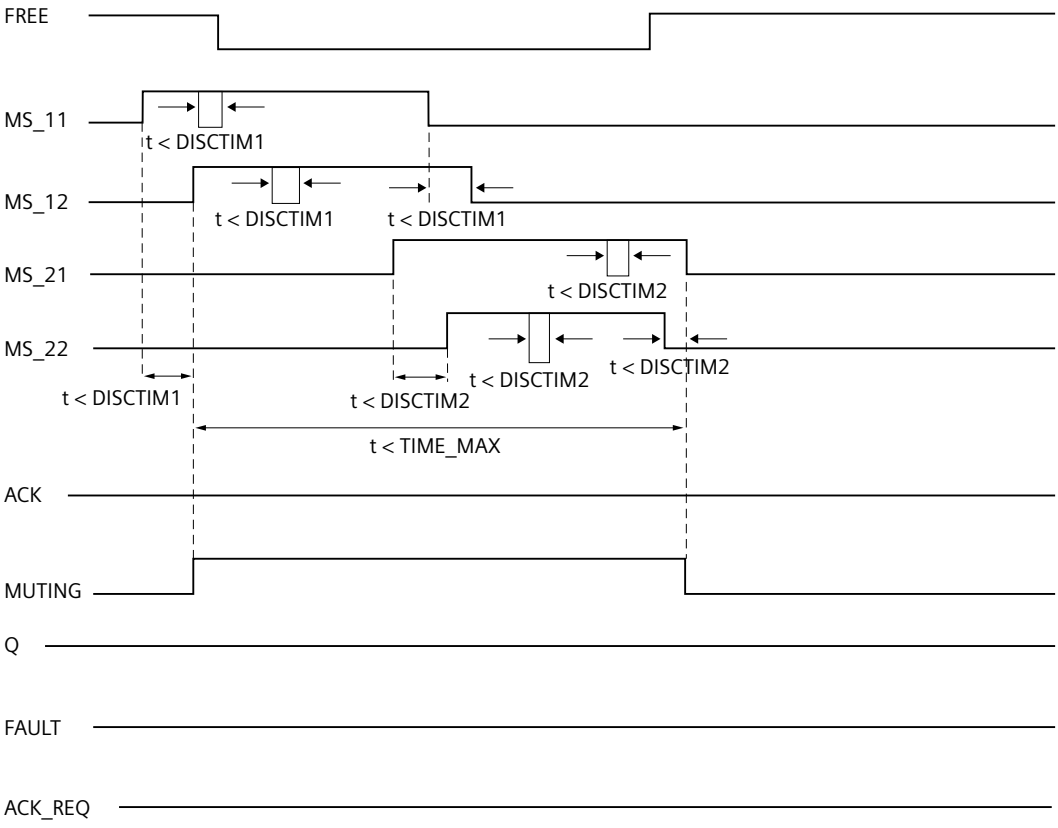


- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop). Each of the two muting sensors MS_11 and MS_12 may be switched to inactive (t < DISCTIM1) for a short time (apply signal state 0).

③

- Muting sensors MS_21 and MS_22 must both be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

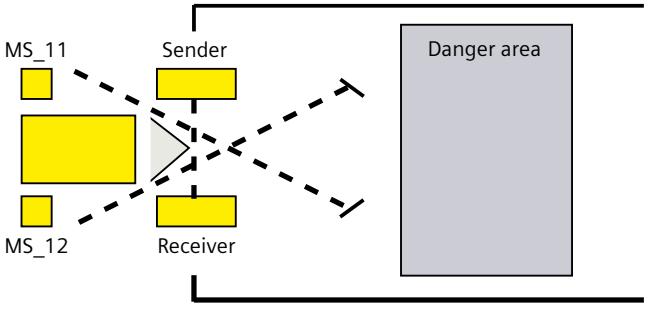


Only if muting sensors MS_21 and MS_22 are both switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

NOTE

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors



Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.

Restart inhibit upon interruption of light curtain (MUTING is not active), as well as when errors occur and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- Light curtain is (being) interrupted and the muting lamp monitoring at input QBAD_MUT is set to 1
- Light curtain is (being) interrupted and the MUTING function is not enabled by setting input ENABLE to 1
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min
- The F-system starts up (regardless of whether or not the light curtain is interrupted, because the F-I/O is passivated after F-system startup and, thus, the FREE input is initially supplied with 0)

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

User acknowledgment of restart inhibit (no muting sensor is activated or ENABLE = 0)

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)

  and
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 184)).

The FAULT output is set to 0. Output ACK_REQ = 1 (and DIAG bit 6) signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

User Acknowledgment of restart inhibit (at least one muting sensor is activated and ENABLE = 1)

Enable signal Q becomes 1 again, when:

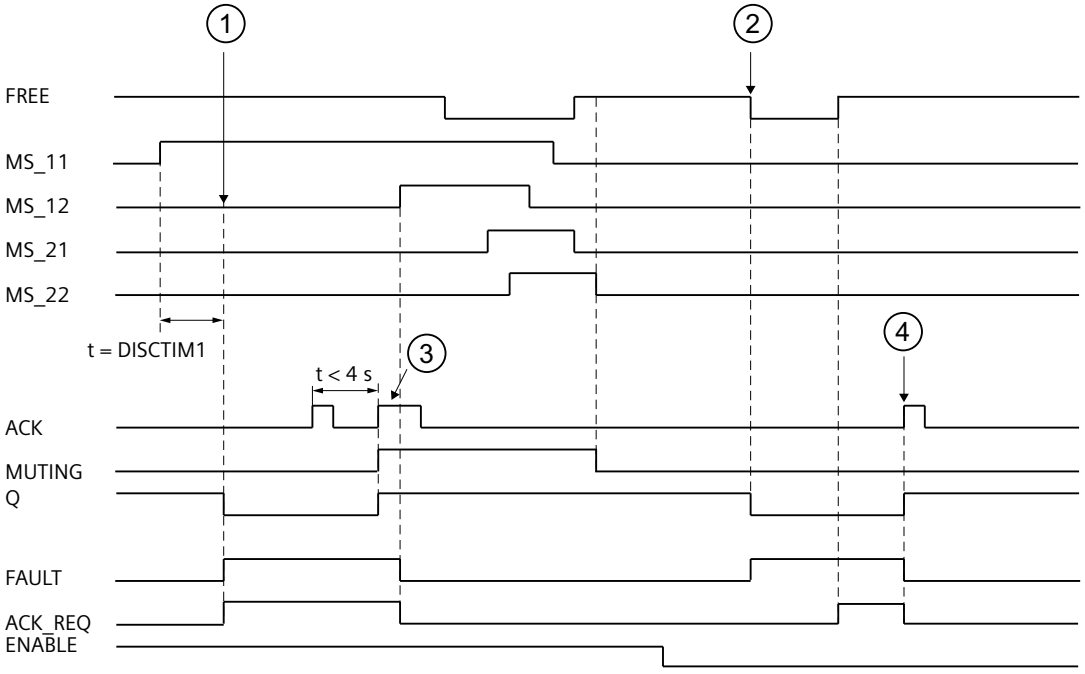
- If present, errors are eliminated (see output DIAG)
- FREE function occurs until a valid combination of muting sensors is detected

The FAULT output is set to 0. The MUTING function is restarted, if necessary, and the MUTING output becomes 1 if a valid combination of muting sensors is detected. When ENABLE = 1, output ACK_REQ = 1 (and DIAG-Bit 5) signals that FREE function is necessary for error elimination and for removal of the restart inhibit. Once FREE function has occurred successfully, the instruction resets ACK_REQ to 0.

NOTE

Once the maximum muting time is exceeded, TIME_MAX is reset as soon as the MUTING function is restarted.

FREE function



If an error cannot be corrected immediately, the FREE function can be used to free the muting range. Enable signal Q and output MUTING =1 temporarily. The FREE function can be used if:

- ENABLE = 1
- At least one muting sensor is activated
- A user acknowledgment with rising edge at input ACK occurs twice within 4 s, and the second user acknowledgment at input ACK remains at a signal state of 1 (acknowledgment button remains activated)

⚠ WARNING

When using the FREE function, the action must be observed. A dangerous situation must be able to be interrupted at any time by releasing the acknowledgment button. The acknowledgment button must be mounted in such a way that the entire danger area can be observed by the operator. *(S037)*

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (MUTING is not active)

① Sensor pair 1 (MS_11 and MS_22) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though there is no enable (ENABLE=0)

③ FREE function

④ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

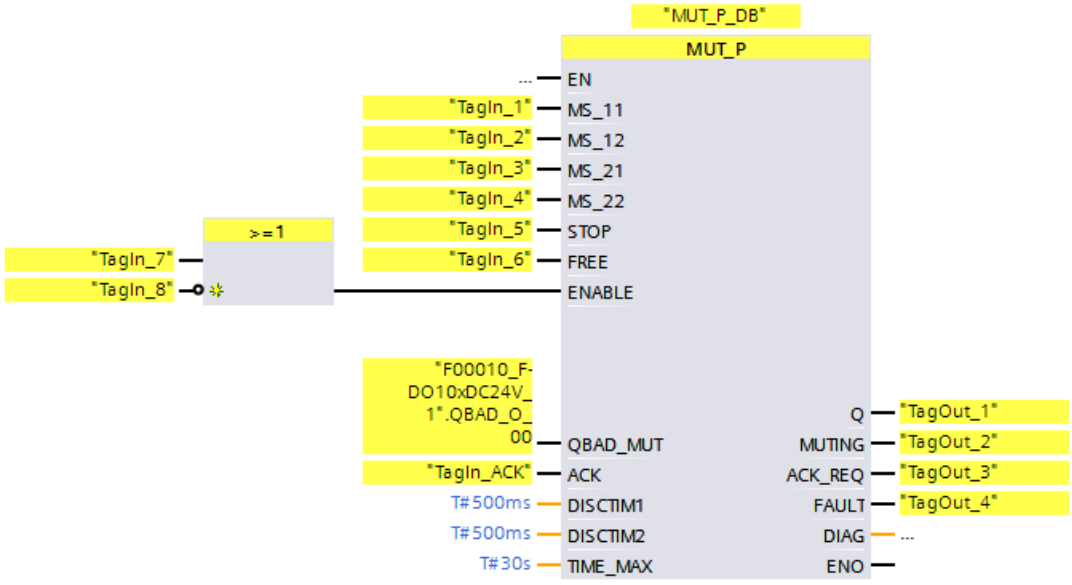
When STOP = 1 or ENABLE = 0, discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, for example, because both muting sensors have adopted signal state 1 in the event of an error, the fault is not detected and the MUTING function can be started unintentionally (when ENABLE =1). *(S038)*

Output DIAG

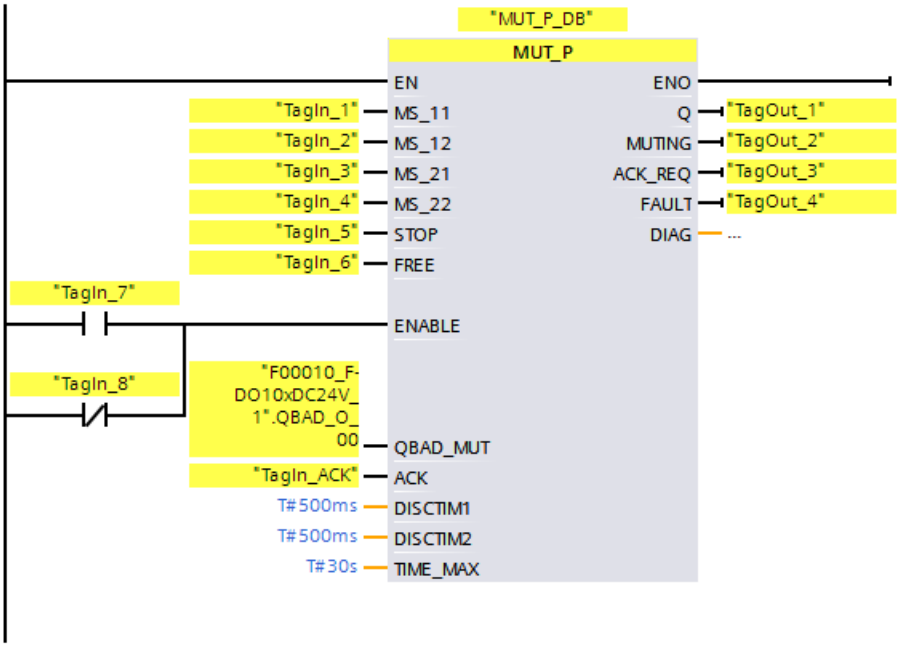
The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 6 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	ENABLE = 0	Set ENABLE = 1
		Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		Startup of F-system	For FREE function, see DIAG Bit 5
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 5	FREE function is necessary	See other DIAG bits	Two rising edges at ACK within 4 s, and activate acknowledgment button until ACK_REQ = 0



Bit no.	Assignment	Possible error causes	Remedies
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—
Bit 8	State of output MUTING	—	—
Bit 9	FREE function active	—	—
Bit 10	Reserved	—	—
...			
Bit 15	Reserved	—	—



Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V21)

Description

This instruction implements a 1oo2 evaluation of two single-channel sensors combined with a discrepancy analysis.

Output Q is set to 1, if the signal states of inputs IN1 and IN2 both equal 1 and no discrepancy error DISC_FLT is stored. if the signal state of one or both inputs is 0, output Q is set to 0.

As soon as the signal states of inputs IN1 and IN2 are different, the discrepancy time DISCTIME is started. If the signal states of the two inputs are still different once the discrepancy time expires, a discrepancy error is detected and DISC_FLT is set to 1 (restart inhibit).

If the discrepancy between inputs IN1 and IN2 is no longer detected, the discrepancy error is acknowledged according to the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK to acknowledge the discrepancy error.

The output ACK_REQ = 1 signals that a user acknowledgment at input ACK is necessary to acknowledge the discrepancy error (cancel the restart inhibit). The instruction sets ACK_REQ = 1 as soon as discrepancy is no longer detected. After acknowledgment or if, prior to acknowledgment, there is once again a discrepancy between inputs IN1 and IN2, the instruction resets ACK_REQ to 0.

Output Q can never be set to 1 if the discrepancy time setting is < 0 or > 60 s. In this case, output DISC_FLT is also set to 1 (restart inhibit). The call interval of the safety program (e.g., OB 35) must be less than the discrepancy time setting.

Every call of the "1oo2 evaluation with discrepancy analysis" instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., EV1oo2DI_DB_1) or a multi-instance (e.g.,

EV1oo2DI_Instance_1) for the "1oo2 evaluation with discrepancy analysis" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of "0" unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Sensor 1
IN2	Input	BOOL	Sensor 2
DISCTIME	Input	TIME	Discrepancy time (0 to 60 s)
ACK_NEC	Input	BOOL	1 = acknowledgment necessary for discrepancy error
ACK	Input	BOOL	Acknowledgment of discrepancy error
Q	Output	BOOL	Output
ACK_REQ	Output	BOOL	1 = acknowledgment required
DISC_FLT	Output	BOOL	1 = discrepancy error
DIAG	Output	BYTE	Non-fail safe service information

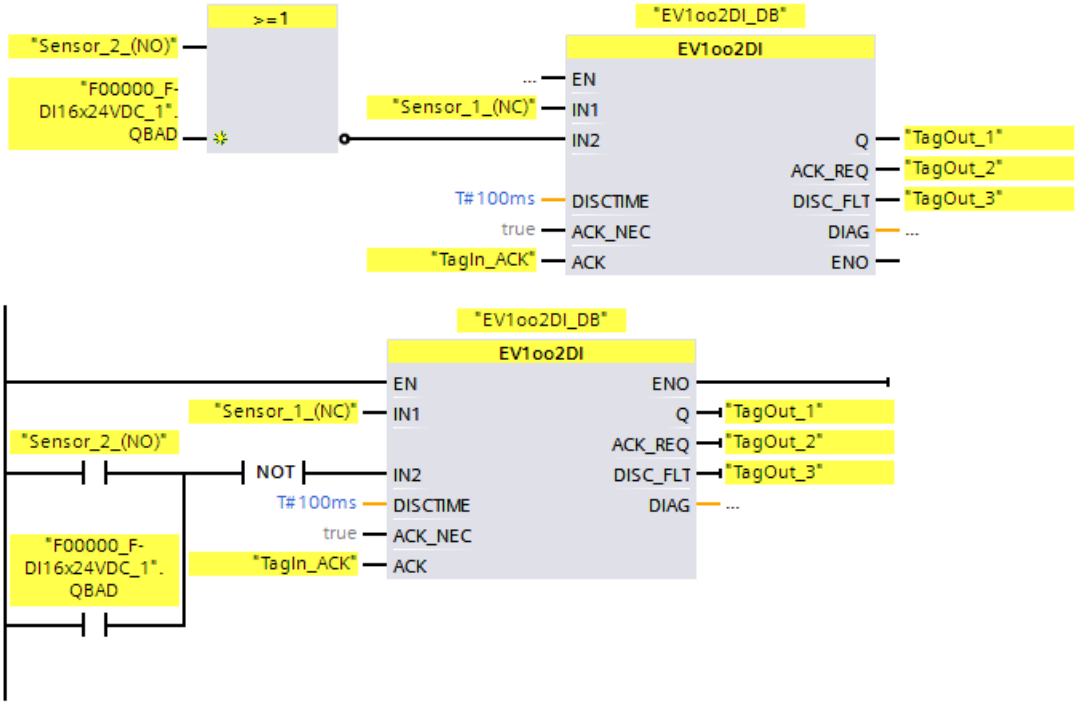
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	

o This version is no longer supported.

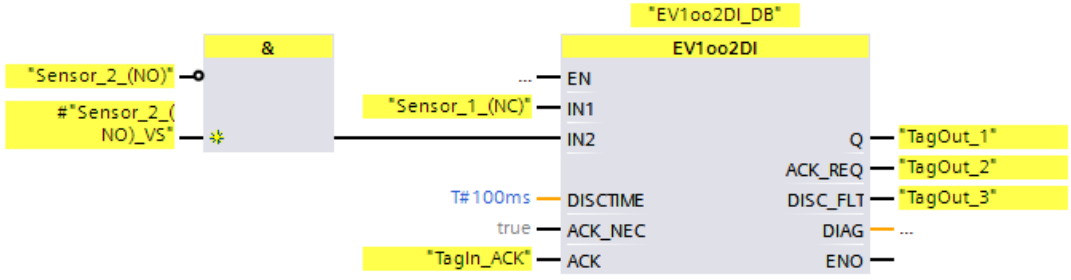
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.



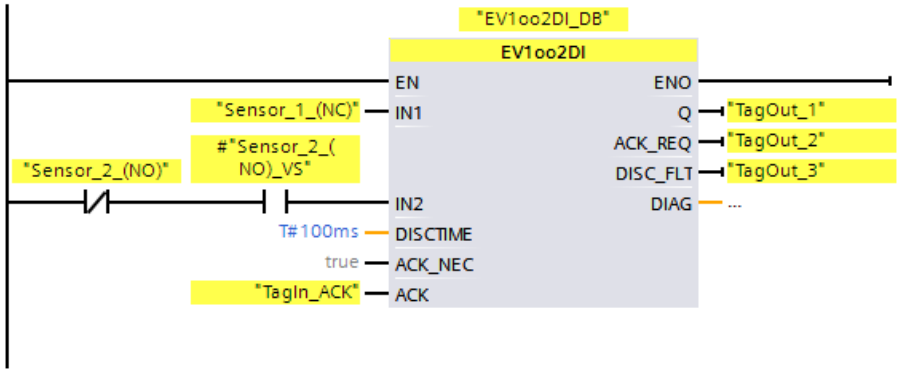
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Activating inputs IN1 and IN2

Inputs IN1 and IN2 must both be activated in such a way that their safe state is 0.

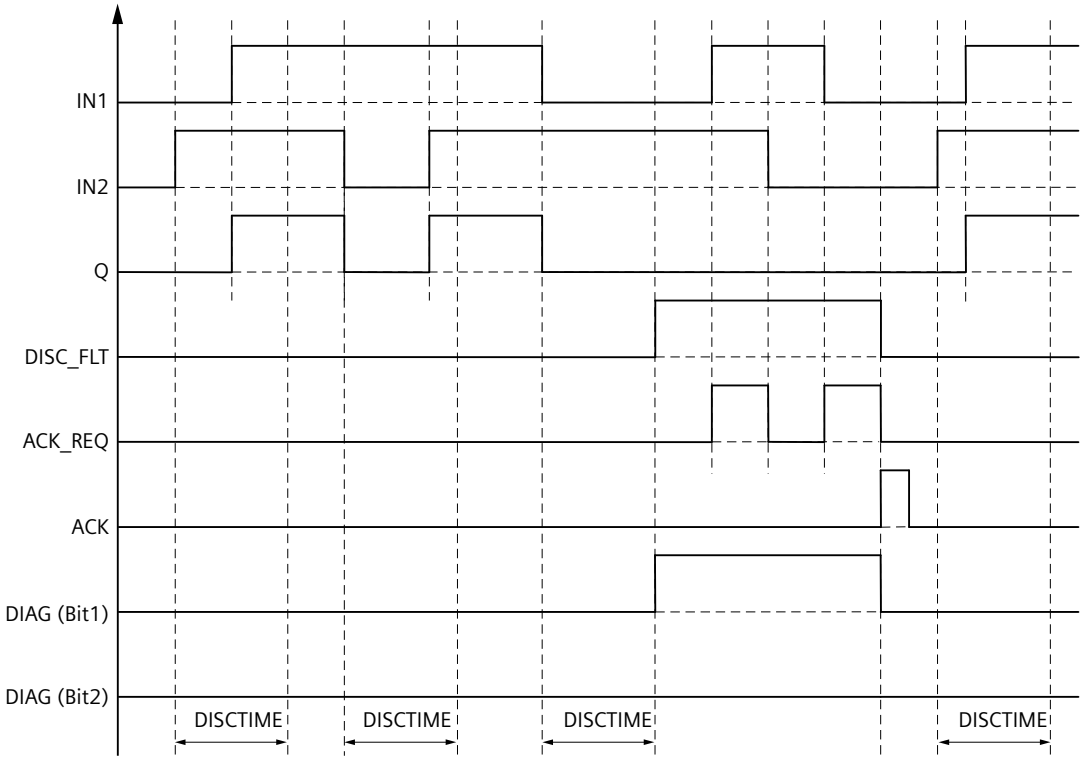


Example with QBAD or QBAD_I_xx signal



For non-equivalent signals you need to OR the input (IN1 and IN2) with which you assign the encoder signal to the safe state 1, with the QBAD signal of the associated F-I/O or the QBAD_I_xx signal of the associated channel (with S7-300/400 F-CPUs) and negate the result. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Example with value status



For non-equivalent signals, you have to negate the input (IN1 or IN2) with which you have assigned the encoder signal to a safe state of 1 and AND it with the value status of the associated channel. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Timing diagrams EV1oo2DI

If ACK_NEC = 1:

Startup behavior

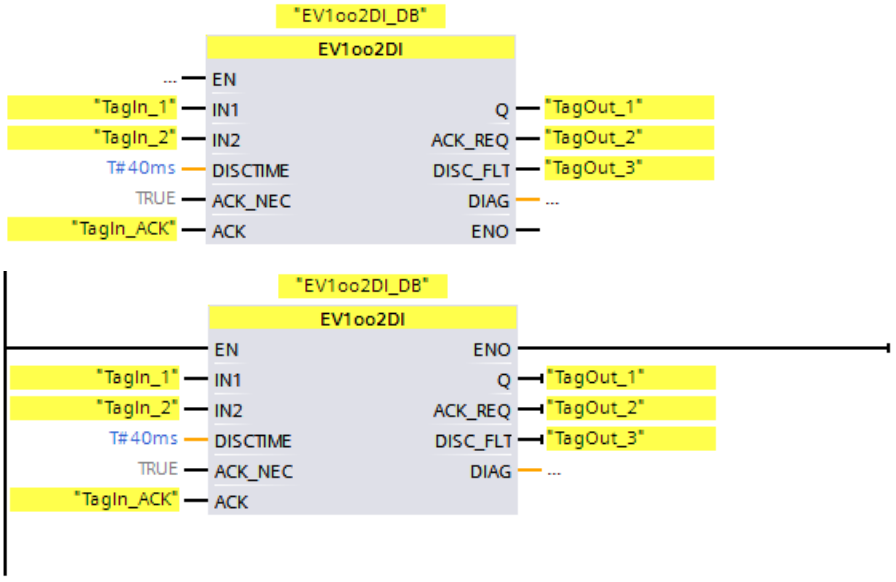
NOTE

If the sensors at inputs IN1 and IN2 are assigned to different F-I/O, it is possible that the fail-safe values are output for different lengths of time following startup of the F-system due to different startup behavior of the F-I/O. If the signal states of inputs IN1 and IN2 remain different after the discrepancy time DISCTIME has expired, a discrepancy error is detected after the F-system starts up.
If ACK_NEC = 1 you must acknowledge the discrepancy error with a rising edge at input ACK.

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG



Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time setting (= status of DISC_FLT)	Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 60 s	Set discrepancy time in range between 0 s and 60 s
Bit 1	For discrepancy errors: last signal state change was at input IN1	—	—
Bit 2	For discrepancy errors: last signal state change was at input IN2	—	—
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For discrepancy errors: input ACK has a permanent signal state of 1	Acknowledgment button defective	Replace acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

13.5.7 FDBACK: Feedback monitoring (STEP 7 Safety V21)

Description

This instruction implements feedback monitoring.

The signal state of output Q is checked to see whether it corresponds to the inverse signal state of the feedback input FEEDBACK.

Output Q is set to 1 as soon as input ON = 1. Requirement for this is that the feedback input FEEDBACK = 1 and no feedback error is saved.

Output Q is reset to 0, as soon as input ON = 0 or if a feedback error is detected.

A feedback error ERROR = 1 is detected if the inverse signal state of the feedback input FEEDBACK (to input Q) does not follow the signal state of output Q within the maximum tolerable feedback time. The feedback error is saved.

If a discrepancy is detected between the feedback input FEEDBACK and the output Q after a feedback error, the feedback error is acknowledged in accordance with the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must acknowledge the feedback error with a rising edge at input ACK.

The ACK_REQ = 1 output then signals that a user acknowledgment is necessary at input ACK to acknowledge the feedback error. Following an acknowledgment, the instruction resets ACK_REQ to 0.

To avoid a feedback errors from being detected and acknowledgment from being required when the F-I/O controlled by the Q output are passivated, you need to supply input QBAD_FIO with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / inverted value status of the associated channel.

Every call of the "Feedback monitoring" instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., FDBACK_DB_1) or a multi-instance (e.g., FDBACK_Instance_1) for the "Feedback monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of "0" unless an automatic restart of the affected process is otherwise excluded. *(S033)*

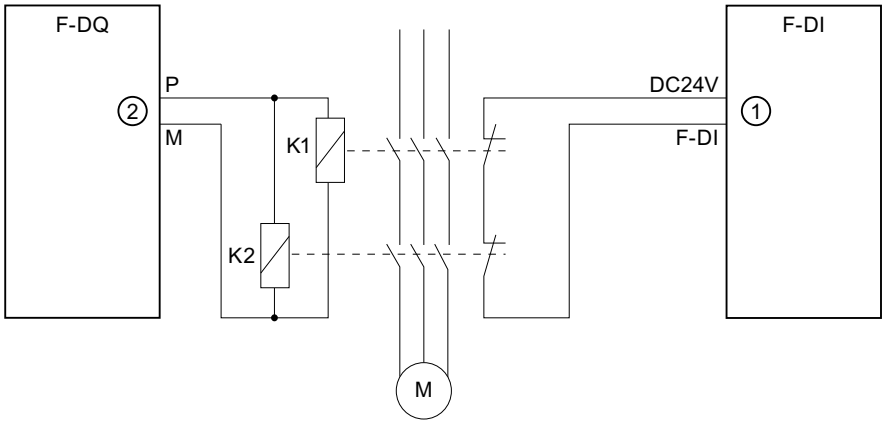
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ON	Input	BOOL	1= Enable output
FEEDBACK	Input	BOOL	Feedback input
QBAD_FIO	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the Q output
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
FDB_TIME	Input	TIME	Feedback time
Q	Output	BOOL	Output
ERROR	Output	BOOL	Feedback error
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:



Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder.
1.1	x	—	—	—	These versions have identical functions to version 1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	o	—	o	
1.5	x	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

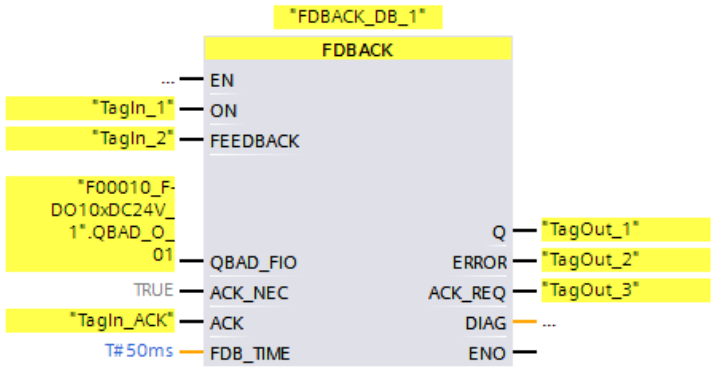
Interconnection example

① Sent to the FEEDBACK input of the instruction
② from output Q of the instruction

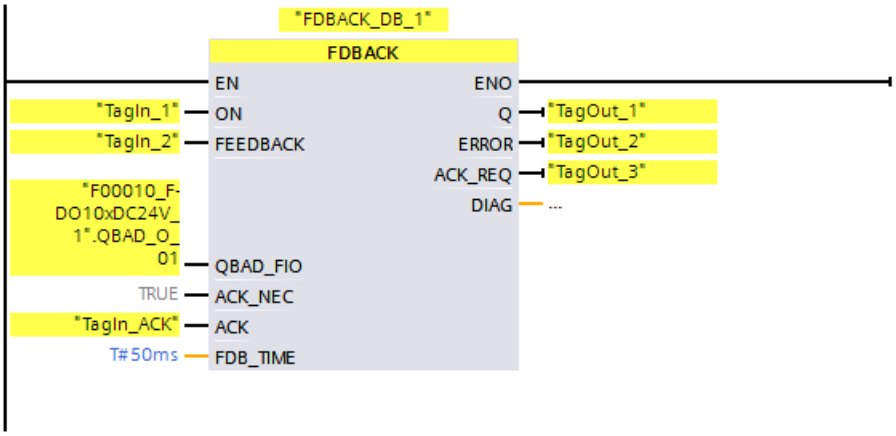
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0, 2, and 5 are saved until acknowledgment at input ACK.

Structure of DIAG

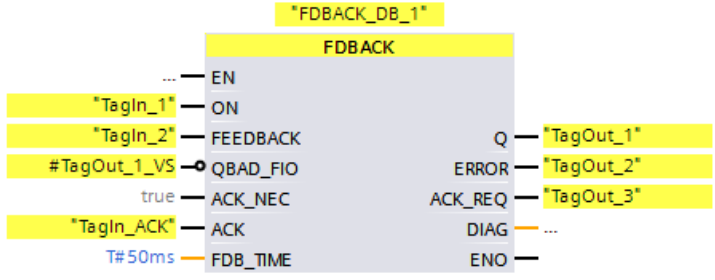


Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Feedback error or incorrect feedback time setting (= state of ERROR)	Feedback time setting < 0	Set feedback time > 0
		Feedback time setting is too low	If necessary, set a higher feedback time
		Wiring fault	Check wiring of actuator and feedback contact
		Actuator or feedback contact is defective	Check actuator and feedback contact
		I/O fault or channel fault of feedback input	Check I/O
Bit 1	Passivation of F-I/O/channel controlled by output Q (= state of QBAD_FIO)	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 2	After feedback error: feedback input has permanent signal state of 0	F-I/O fault or channel fault of feedback input	Check I/O
		Feedback contact is defective	Check feedback contact
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of feedback input	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For feedback error: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

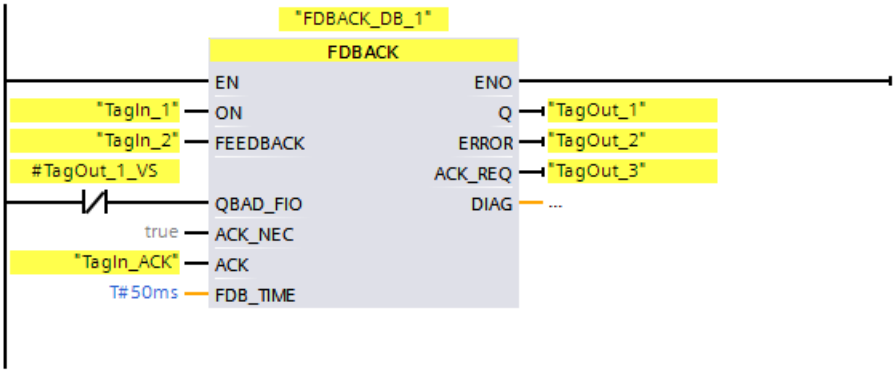


Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.



Example



The following example shows how the instruction for S7-300/400 F-CPUs works:

The following example shows how the instruction for S7-1200/1500 F-CPUs works:

13.5.8 SFDOOR: Safety door monitoring (STEP 7 Safety V21)

Description

This instruction implements safety door monitoring.

Enable signal Q is reset to 0 as soon as one of the inputs IN1 or IN2 take a signal state of 0 (safety door is opened). The enable signal can be reset to 1, only if:

- Inputs IN1 and IN2 both take a signal state of 0 prior to opening the door (safety door has been completely opened)
- Inputs IN1 and IN2 then both take a signal state of 1 (safety door is closed)
- An acknowledgment occurs

The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ = 1 is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets ACK_REQ = 1 as soon as the door is closed. Following an acknowledgment, the instruction resets ACK_REQ to 0.

In order for the instruction to recognize whether inputs IN1 and IN2 are 0 merely due to passivation of the associated F-I/O, you need to supply inputs QBAD_IN1 or QBAD_IN2 with the QBAD signal of the associated F-I/O or QBAD_I_xx signal / inverted value status of the associated channel. Among other things, this will prevent you from having to open the safety door completely prior to an acknowledgment in the event the F-I/O are passivated.

Every call of the "Safety door monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SFDOOR_DB_1) or a multi-instance (e.g., SFDOOR_Instance_1) for the "Safety door monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of "0" unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Input 1
IN2	Input	BOOL	Input 2

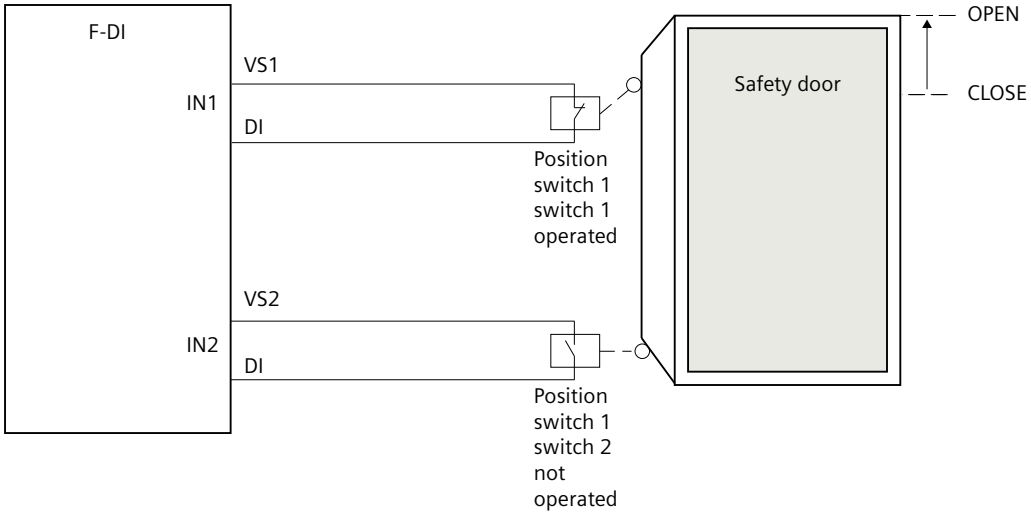
Parameter	Declaration	Data type	Description
QBAD_IN1	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN1
QBAD_IN2	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN2
OPEN_NEC	Input	BOOL	1= Open necessary at startup
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
Q	Output	BOOL	1= Enable, safety door closed
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

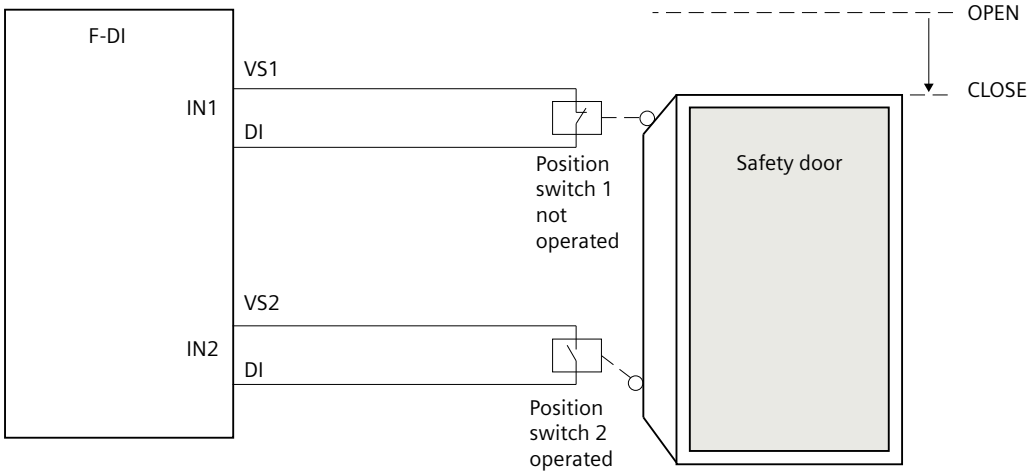
Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	

o This version is no longer supported.



When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".



Interconnection example

You must interconnect the NC contact of position switch 1 of the safety door at input IN1 and the NO contact of position switch 2 at input IN2. Position switch 1 must be mounted in such a way that it is positively operated when the safety door is open. Position switch 2 must be mounted in such a way that it is operated when the safety door is closed.

Safety door open:

Safety door closed:

Startup behavior

After an F-system startup, enable signal Q is reset to 0. The acknowledgment for the enable takes place according to the parameter assignment at inputs OPEN_NEC and ACK_NEC:

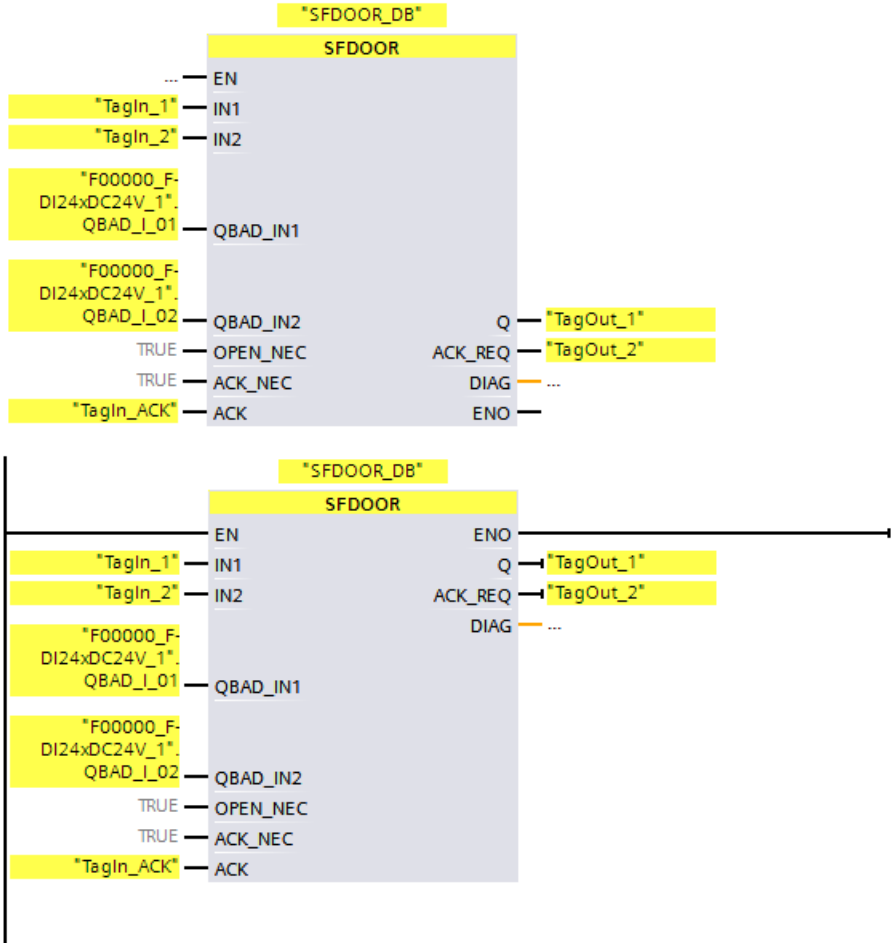
- When OPEN_NEC = 0, an automatic acknowledgment occurs **independently** of ACK_NEC, as soon as the two inputs IN1 and IN2 take signal state 1 for the first time following reintegration of the associated F-I/O (safety door is closed).
- When OPEN_NEC = 1 **or** if at least one of the IN1 and IN2 inputs still has a signal state of 0 after reintegration of the associated F-I/O, an automatic acknowledgment occurs **according** to ACK_NEC or you have to use a rising edge at input ACK for the enable. Prior to acknowledgment, inputs IN1 and IN2 both have to take a signal state of 0 (safety door has been completely opened) followed by a signal state of 1 (safety door is closed).

⚠ WARNING

The OPEN_NEC tag must not be assigned a value of "0" unless an automatic restart of the affected process is otherwise excluded. *(S039)*

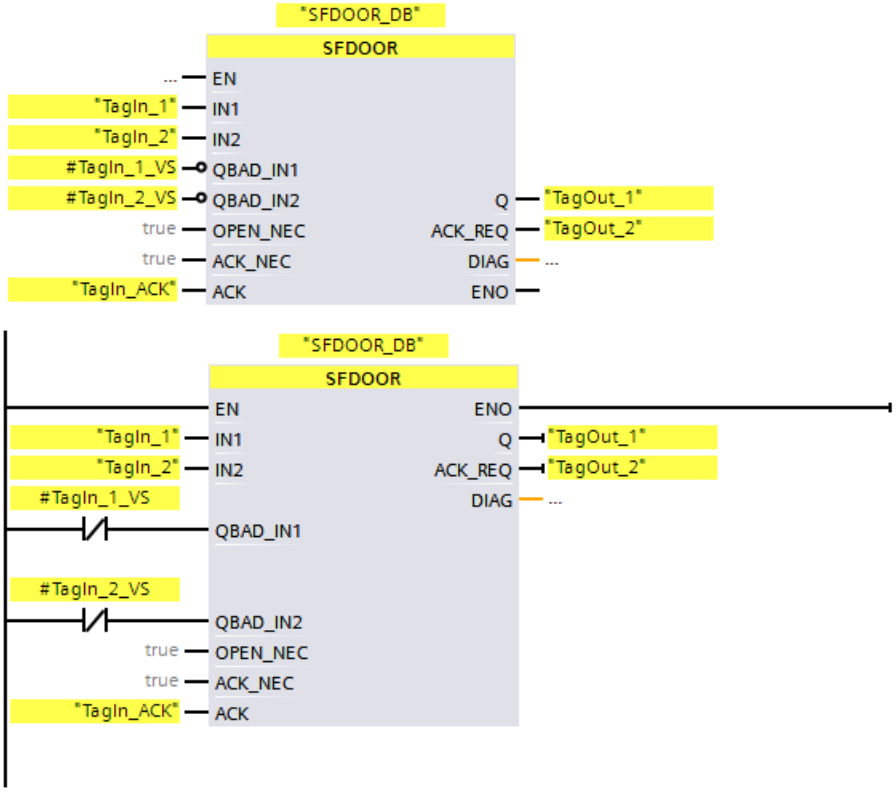
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.



Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Signal state 0 is missing at both IN1 and IN2 inputs	Safety door was not completely opened when OPEN_NEC = 1 after F-system startup	Open safety door completely
		Open safety door was not completely opened	Open safety door completely
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 2	Signal state 1 is missing at both IN1 and IN2 inputs	Safety door was not closed	Close safety door
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 3	QBAD_IN1 and/or QBAD_IN2 = 1	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O or channel of IN1 and/or IN2	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 164)
Bit 4	Reserved	—	—



Bit no.	Assignment	Possible error causes	Remedies
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Example

The following example shows how the instruction for S7-300/400 F-CPUs works:

The following example shows how the instruction for S7-1200/1500 F-CPUs works:

13.5.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V21)

Description

This instruction creates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F-I/O of an F-runtime group after communication errors, F-I/O errors, or channel faults.

A user acknowledgment (Page 184) with a positive edge at input ACK_GLOB is required for reintegration. The acknowledgment occurs analogously to the user acknowledgment via the ACK_REI tag of the F-I/O DB (Page 160), but it acts simultaneously on all F-I/O of the F-runtime group in which the instruction is called.

If you use the instruction ACK_GL, you do not have to provide a user acknowledgment for each F-I/O of the F-runtime group via the ACK_REI tag of the F-I/O DB.

Every call of the "Global acknowledgment of all F-I/O of a runtime group" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_GL_DB_1) or a multi-instance (e.g., ACK_GL_Instance_1) for the "Global acknowledgment of all F-I/O of a runtime group" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

NOTE

An acknowledgment via the ACK_GL instruction is only possible if the tag ACK_REI of the F-I/O DB = 0. Accordingly, an acknowledgment via the tag ACK_REI of the F-I/O DB is only possible if the input ACK_GLOB of the instruction = 0.
The instruction is only allowed to be called once per F-runtime group.

Parameters

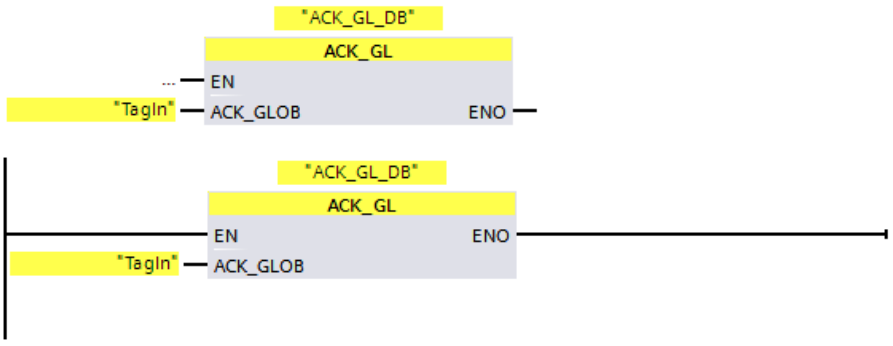
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_GLOB	Input	BOOL	1=acknowledgment for reintegration

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	



o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

13.6 Timer operations

13.6.1 TP: Generate pulse (STEP 7 Safety V21)

Description

You can use the "Generate pulse" instruction to set output Q for a programmed period. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. Output Q is set for period PT, regardless of the subsequent sequence of the input signal. Also the detection of a new positive signal edge does not influence the signal state at output Q as long as period PT runs.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. If period PT is reached and the signal state at input IN is "0", output ET is reset.

Every call of the "Generate pulse" instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate pulse" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Generate pulse" instruction on a startup of the F-system.

NOTE

The functionality of this instruction differs from the corresponding standard TP instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

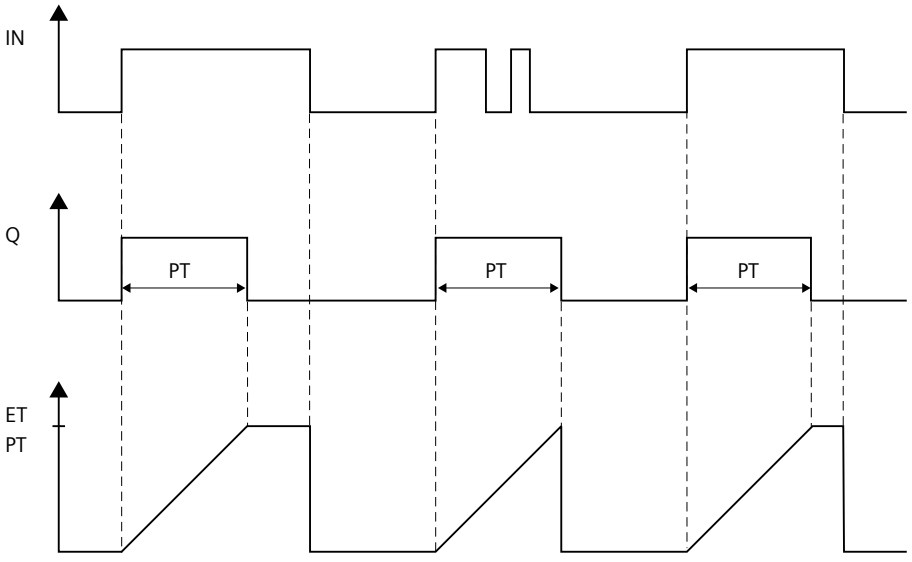
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of pulse; must be positive.
Q	Output	BOOL	Pulse output
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	o	—	o	
1.4	x	x	x	x	



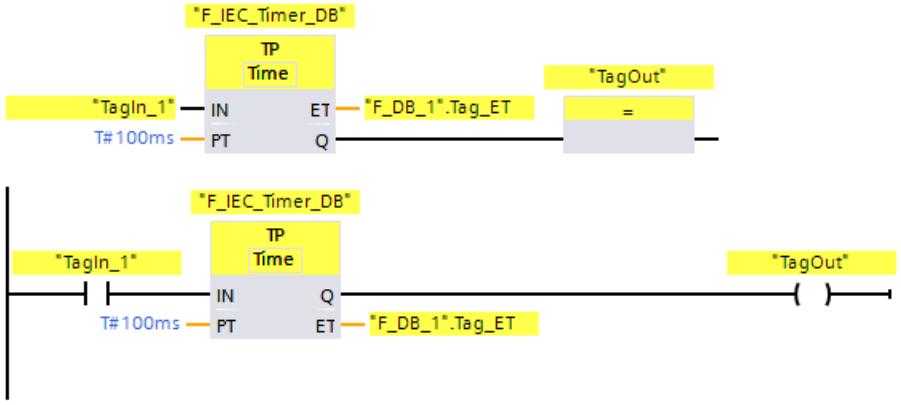
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate pulse":



Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

If the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate pulse" instruction is started and the period assigned at input PT (100 ms) runs, regardless of the further course of operand "TagIn_1".

Operand "TagOut" at output Q has signal state "1" as long as the period is running. Operand ""F_DB_1".Tag_ET" contains the current time value.

13.6.2 TON: Generate on-delay (STEP 7 Safety V21)

Description

You use the "Generate on-delay" instruction to delay the setting of output Q by the assigned period PT. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. When period PT has expired, output Q is set to signal state "1". Output Q remains set as long as the start input is set to "1". When the signal state at the start input changes from "1" to "0", output Q is reset. The time function is restarted when a new positive signal edge is detected at the start input.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. Output ET is reset, as soon as the signal state at input IN changes to "0".

Every call of the "Generate on-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate on-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Generate on-delay" instruction on a startup of the F-system.

NOTE

The functionality of this instruction differs from the corresponding standard TON instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the output ET is reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

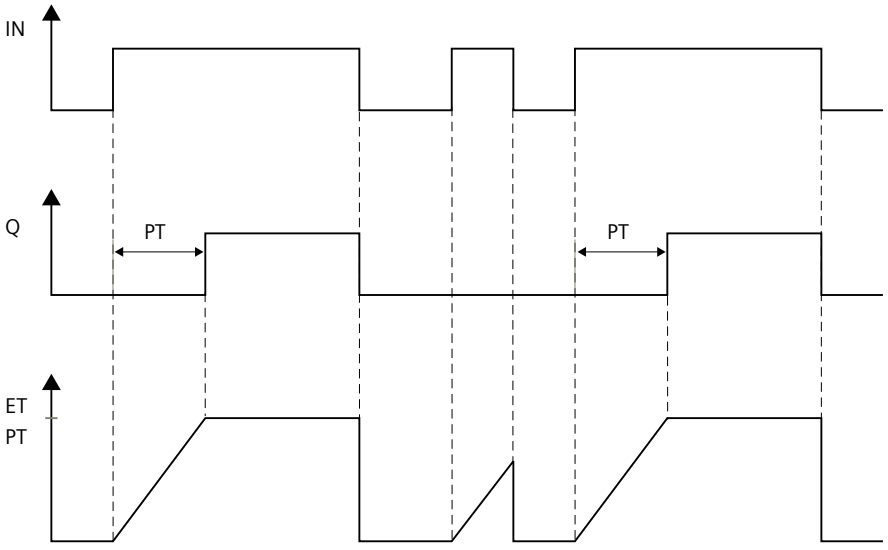
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of on-delay; must be positive.
Q	Output	BOOL	Output that is set after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	o	—	o	
1.4	x	x	x	x	



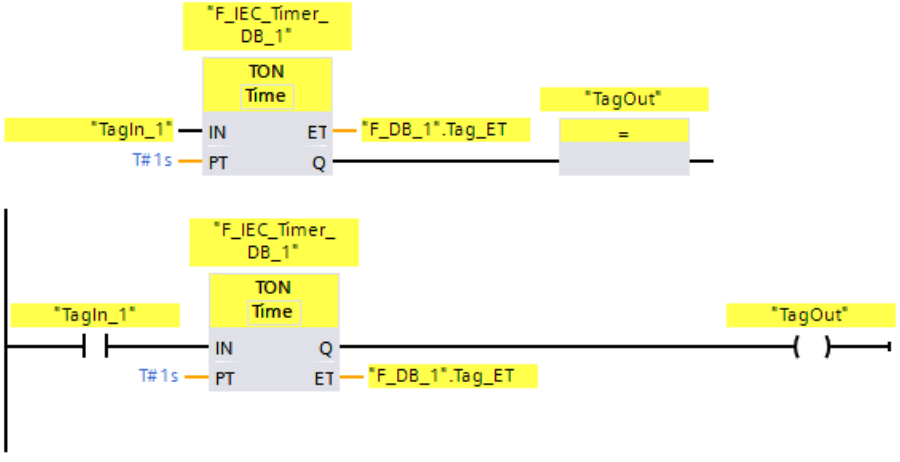
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate on-delay":



Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

When the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate on-delay" instruction is started and the period assigned at input PT (1 s) runs.

Operand "TagOut" at output Q feeds signal state "1" when the period has elapsed and remains set as long as operand "TagIn_1" still feeds signal state "1". Operand ""F_DB_1".Tag_ET" contains the current time value.

13.6.3 TOF: Generate off-delay (STEP 7 Safety V21)

Description

You use the "Generate off-delay" instruction to delay the resetting of output Q by the assigned period PT. Output Q is set if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. When the signal state at input IN changes back to "0", the programmed period PT starts. Output Q remains set as long as period PT runs. After period PT expires, output Q is reset. If the signal state at input IN changes to "1" before period PT has expired, then the time is reset. The signal state at output Q remains at "1".

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. After time PT has elapsed, output ET remains at its current value until input IN changes back to "1". If input IN changes to "1" before time PT has expired, the output ET is reset to value T#0.

Every call of the "Generate off-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is in inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate off-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Generate off-delay" instruction on a startup of the F-system.

NOTE

The functionality of this instruction differs from the corresponding standard TOF instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.

Parameters

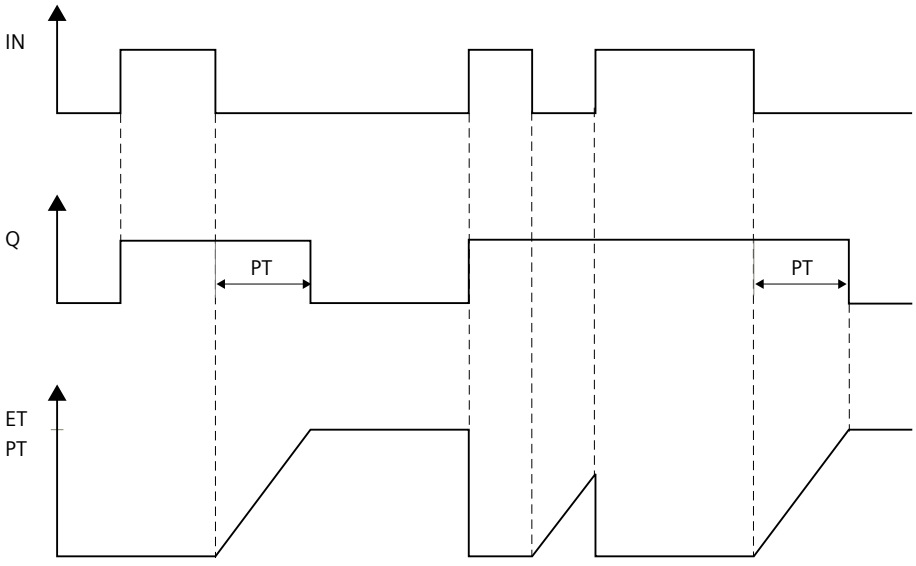
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of off delay; must be positive.
Q	Output	BOOL	Output that is reset after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	o	—	o	
1.4	x	x	x	x	



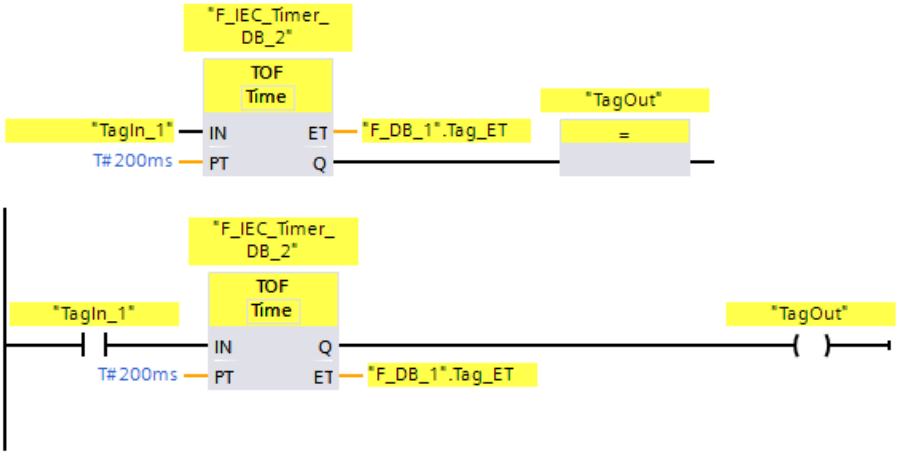
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate off-delay":



Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

The following example shows how the instruction works:

If the signal state of operand "TagIn_1" changes from "0" to "1", the signal state of operand"TagOut" at output Q is set to "1".

If the signal state of operand "TagIn_1" changes back to "0", the period assigned at input PT (200 ms) runs.

The "TagOut" operand at output Q is set back to "0" when the period expires. Operand ""F_DB_1".Tag_ET" contains the current time value.

13.7 Counter operations

13.7.1 CTU: Count up (STEP 7 Safety V21)

Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at the CU input changes from "0" to "1" (positive signal edge), the instruction is executed and the current count at the CV output increases by one. The count value is increased on each detection of a positive signal edge until it reaches the high limit of the data type specified at the CV output. When the high limit is reached, the signal state at the CU input no longer affects the instruction.

The counter status can be queried at output Q. The signal state at output Q is determined by parameter PV. When the current count value is greater than or equal to the value of parameter PV, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is reset to zero when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at input CU has no effect on the instruction.

Every call of the "Count up" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as

a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up" instruction on a startup of the F-system.

Parameters

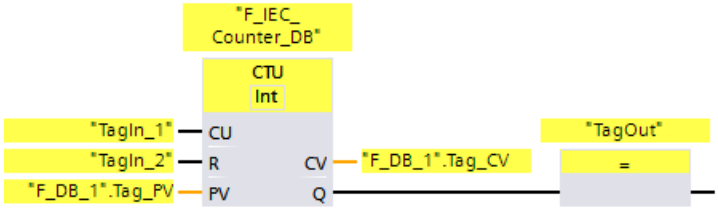
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Counter input
R	Input	BOOL	Reset input
PV	Input	INT	Value for which output Q is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

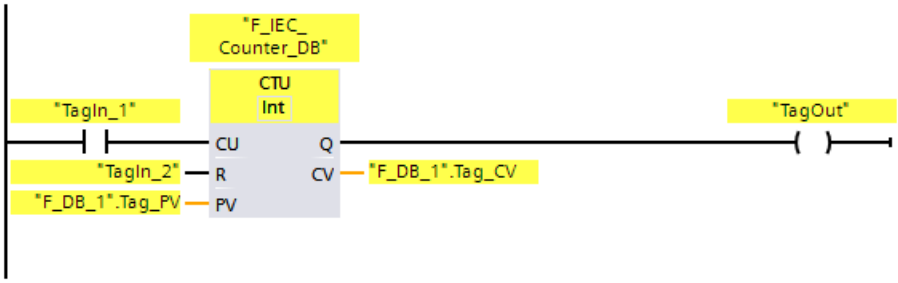
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	



o This version is no longer supported.



When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

When the signal state of the "CU" input changes from "0" to "1", the "Count up" instruction is executed and the current count of the "CV" output increases by one. The count value is increased on every additional positive signal edge until the high limit of the specified data type (32767) is reached.

The value at the PV parameter is applied as the limit for determining the "TagOut" operands at the Q output. Output "Q" returns the signal state "1" as long as the current count is greater than or equal to the value of operand "PV". In all other cases, the "Q" output has the signal state "0".

13.7.2 CTD: Count down (STEP 7 Safety V21)

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at input CD changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is decreased by one. The count value is decreased on each detection of a positive signal edge until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at input CD no longer affects the instruction.

The counter status can be queried at output Q. When the current count value is less than or equal to zero, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is set to the value of parameter "PV" when the signal state at input LD changes to "1". As long as signal state "1" exists at input LD, the signal state at input CD has no effect on the instruction.

Every call of the "Count down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count down" instruction on a startup of the F-system.

Parameters

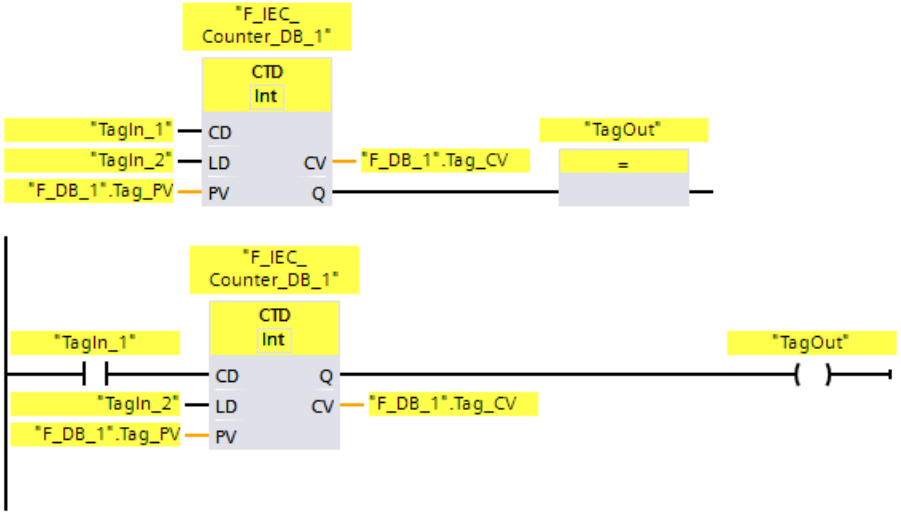
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Counter input
LD	Input	BOOL	Load input
PV	Input	INT	Value at the output CV when LD = 1 is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	



o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

When the signal state of the "CD" input changes from "0" to "1", the "Count down" instruction is executed and the current count at "CV" output decreases by one. The count value is

decreased on each additional positive signal edge until the low limit of the specified data type (-32768) is reached.

Output "Q" returns the signal state "1" as long as the current count is less than or equal to zero. In all other cases, output "Q" has signal state "0".

13.7.3 CTUD: Count up and down (STEP 7 Safety V21)

Description

You can use the "Count up and down" instruction to increment and decrement the count value at output CV. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current count at the CV output increases by one. If the signal state at input CD changes from "0" to "1" (positive signal edge), the count value at output CV is decreased by one. If a positive signal edge is present at inputs CU and CD in one program cycle, the current count value at output CV remains unchanged.

The count value can be increased until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is no longer decreased.

When the signal state at input LD changes to "1", the count value at output CV is set to the value of parameter PV. As long as signal state "1" exists at input LD, the signal state at inputs CU and CD has no effect on the instruction.

The count value is set to zero, when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at inputs CU, CD, and LD has no effect on the "Count up and down" instruction.

The status of the up counter can be queried at output QU. When the current count value is greater than or equal to the value of parameter PV, output QU delivers signal state "1". In all other cases, the signal state at output QU is "0".

The status of the down counter can be queried at output QD. When the current count value is lesser than or equal to zero, output QD delivers signal state "1". In all other cases, the signal state at output QD is "0".

Every call of the "Count up and down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up and down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up and down" instruction when the F-system is started up.

Parameters

The following table shows the parameters of the instruction:

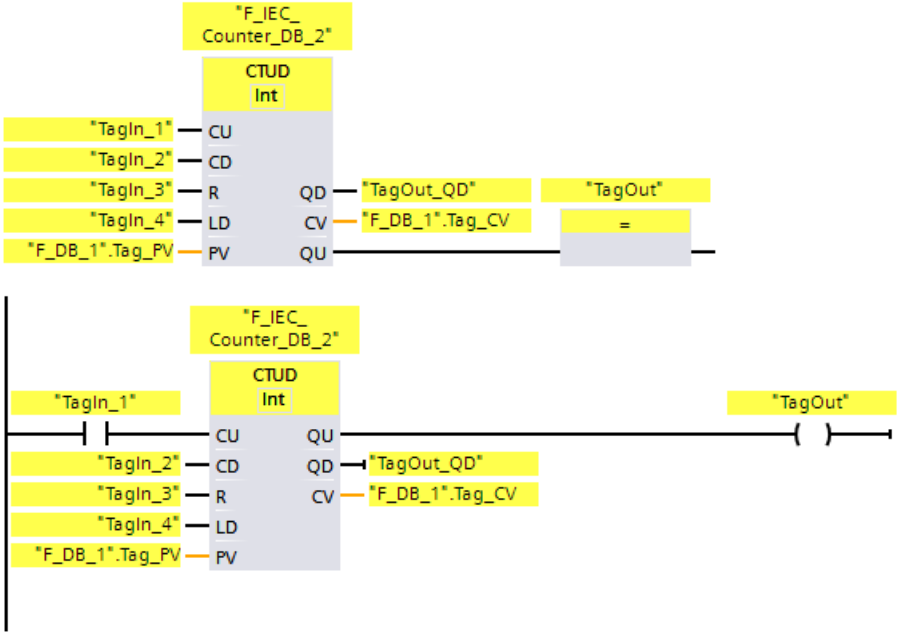
Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input

Parameter	Declaration	Data type	Description
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input
PV	Input	INT	Value at which the output QU is set / to which the output CV is set when LD = 1
QU	Output	BOOL	Status of up counter
QD	Output	BOOL	Status of down counter
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	o	—	o	
1.3	x	x	x	x	



o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

When the signal state at the "CU" input or at the "CD" input changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When a positive signal edge is present at the "CU" input, the current count of the "CV" output increases by one. When a positive signal edge is present at the "CD" input, the current count at the "CV" output decreases by one. The count value is increased on each positive signal edge at the CU input until it reaches the high limit of 32767. The count value is decreased on each positive signal edge at the CD input until it reaches the low limit of -32768.

Output "QU" returns the signal state "1" as long as the current count is greater than or equal to the value at the "PV" input. In all other cases, output "QU" has signal state "0".

Output "QD" returns the signal state "1" as long as the current count is less than or equal to zero. In all other cases, output "QD" has signal state "0".

13.8 Comparator operations

13.8.1 CMP ==: Equal (STEP 7 Safety V21)

Description

You can use the "Equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

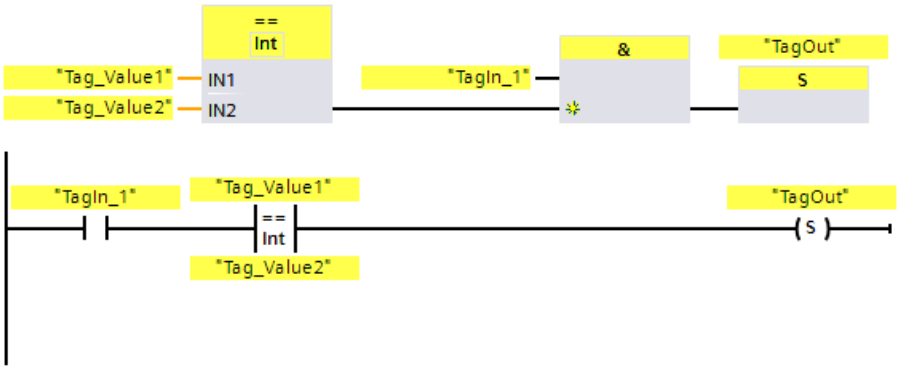
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300, S7-400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300, S7-400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" = "Tag_Value2").

13.8.2 CMP <>: Not equal (STEP 7 Safety V21)

Description

You can use the "Not equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is not equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

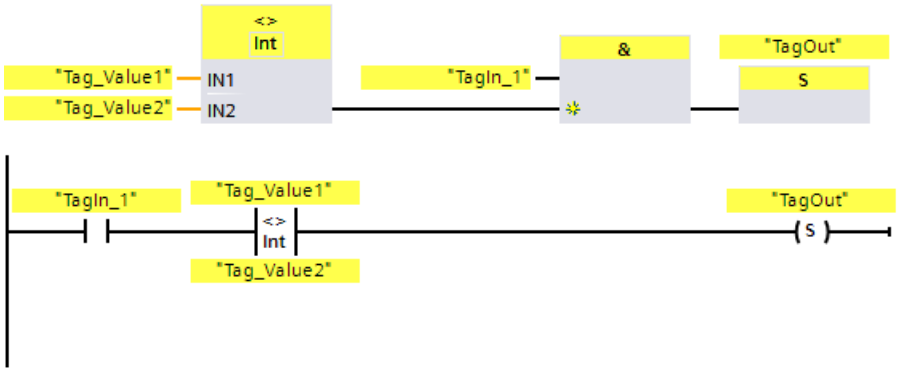
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300, S7-400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300, S7-400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <> "Tag_Value2").

13.8.3 CMP >=: Greater or equal (STEP 7 Safety V21)

Description

You can use the "Greater or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

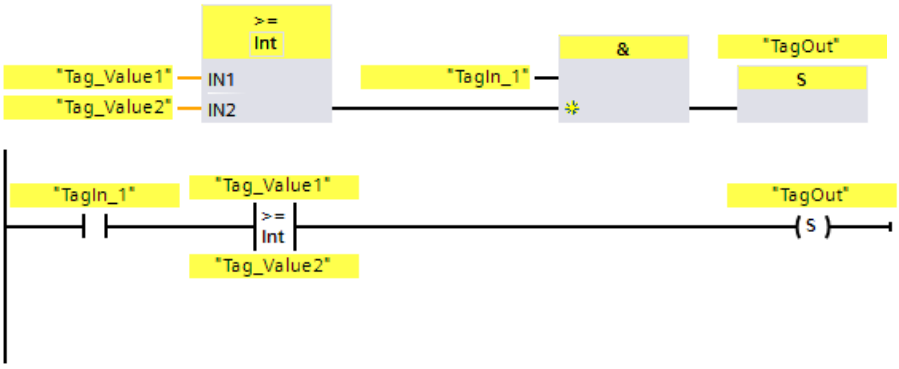
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" >= "Tag_Value2").

13.8.4 CMP <=: Less or equal (STEP 7 Safety V21)

Description

You can use the "Less or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

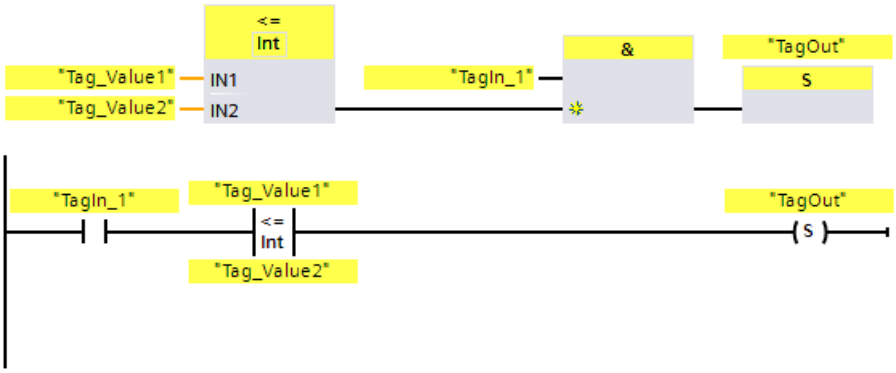
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <= "Tag_Value2").

13.8.5 CMP >: Greater than (STEP 7 Safety V21)

Description

You can use the "Greater than" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

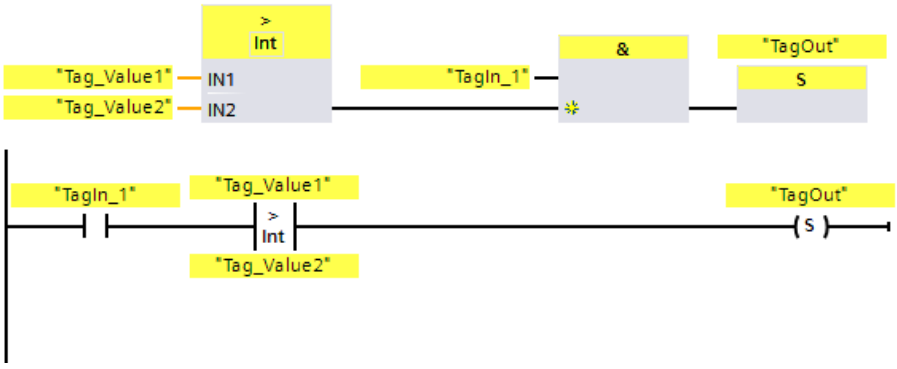
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" > "Tag_Value2").

13.8.6 CMP <: Less than (STEP 7 Safety V21)

Description

You can use the "Less than" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

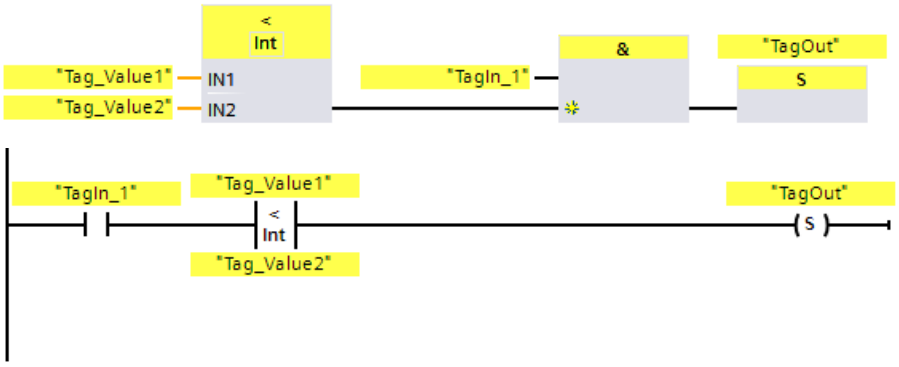
For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" < "Tag_Value2").

13.9 Math functions

13.9.1 ADD: Add (STEP 7 Safety V21)

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at the OUT output (OUT = IN1 + IN2).

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

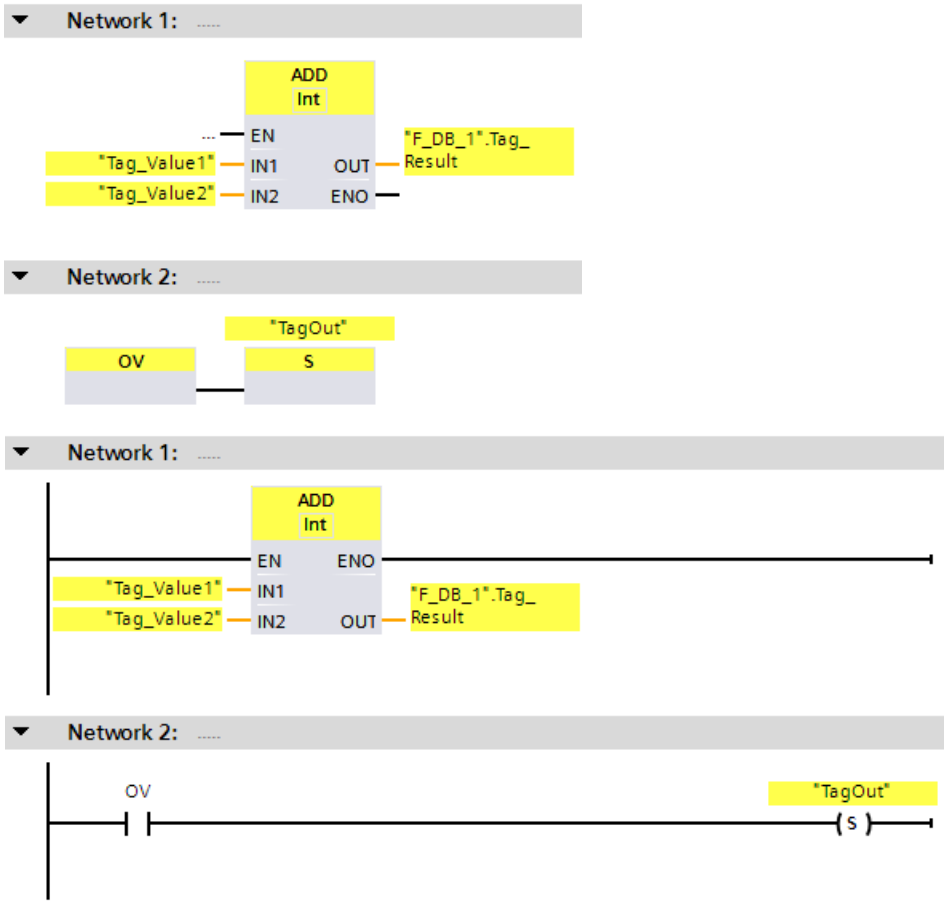
- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters



The following table shows the parameters of the instruction:

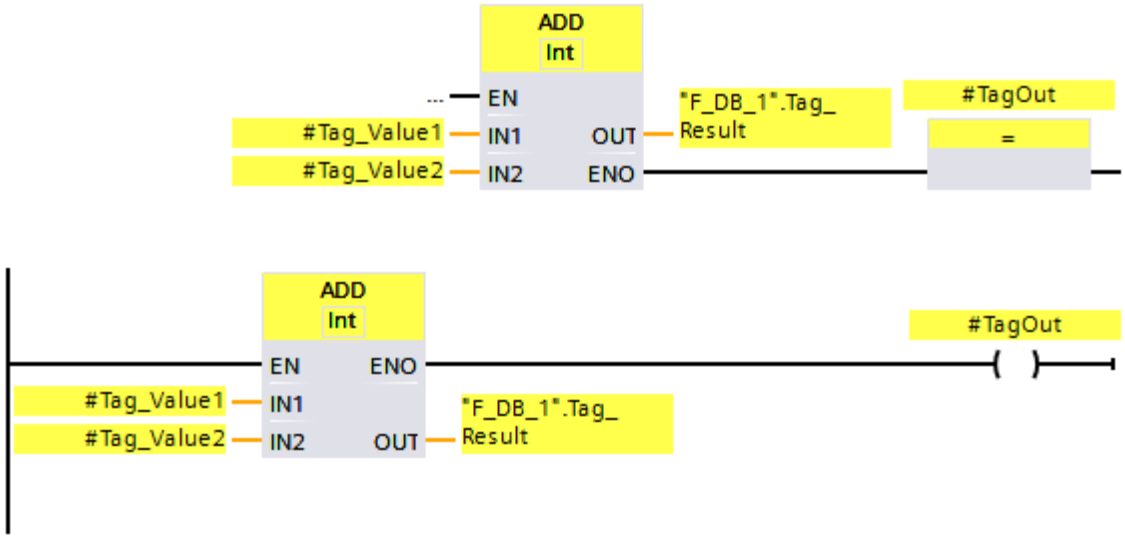
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	First addend
IN2	Input	INT, DINT	Second addend
OUT	Output	INT, DINT	Total

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:

The "Add" instruction is always executed regardless of the signal state at enable input EN.



The value of the "Tag_Value1" operand is added to value of the "Tag_Value2" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If needed, you can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

When an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:

The "Add" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is added to value of the "#Tag_Value2" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Add" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

If needed, you can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

13.9.2 SUB: Subtract (STEP 7 Safety V21)

Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at the OUT output (OUT = IN1 − IN2).

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

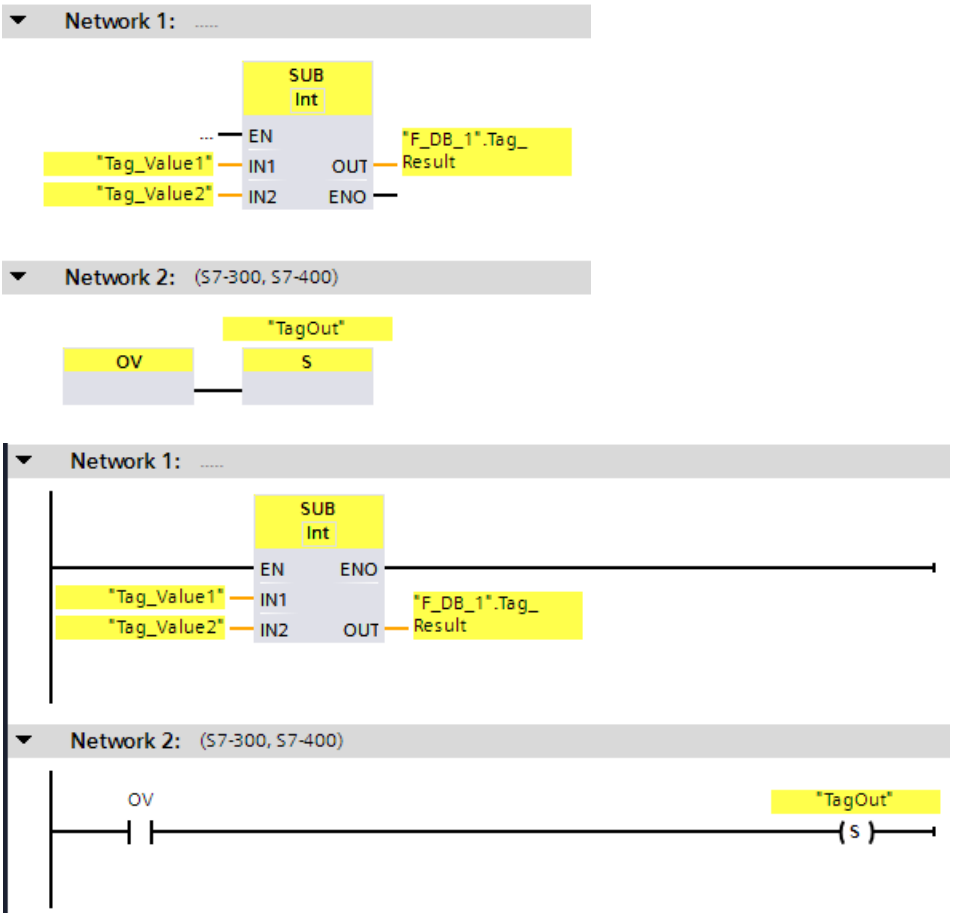
- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters



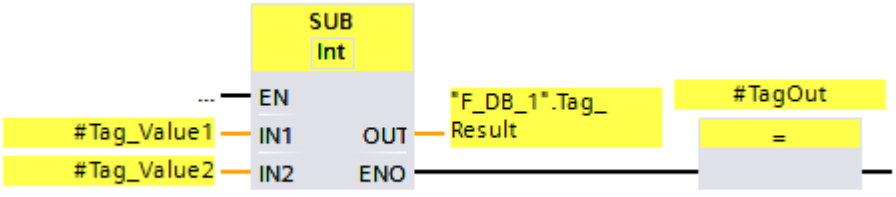
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Minuend
IN2	Input	INT, DINT	Subtrahend
OUT	Output	INT, DINT	Difference

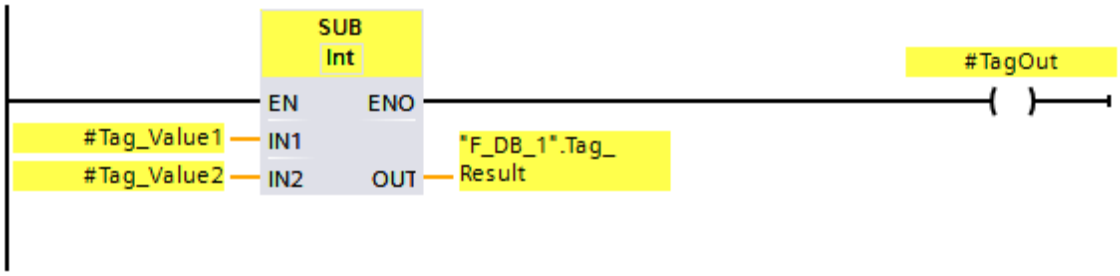
You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:



The "Subtract" instruction is always executed regardless of the signal state at enable input EN.



The value of the "Tag_Value2" operand is subtracted from the value of the "Tag_Value1" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Subtract" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:

The "Subtract" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value2" operand is subtracted from the value of the "#Tag_Value1" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Subtract" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.9.3 MUL: Multiply (STEP 7 Safety V21)

Description

You can use the "Multiply" instruction to multiply the value at input IN1 by the value at input IN2 and query the product at output OUT (OUT = IN1 × IN2).

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

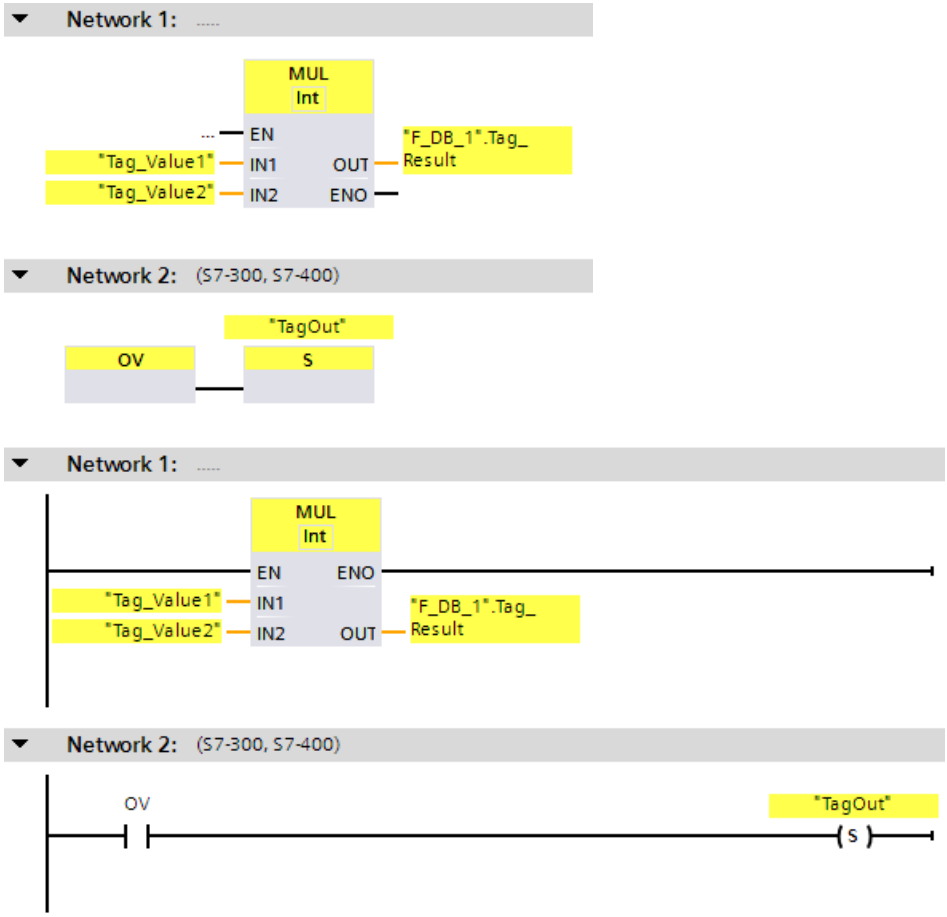
- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters



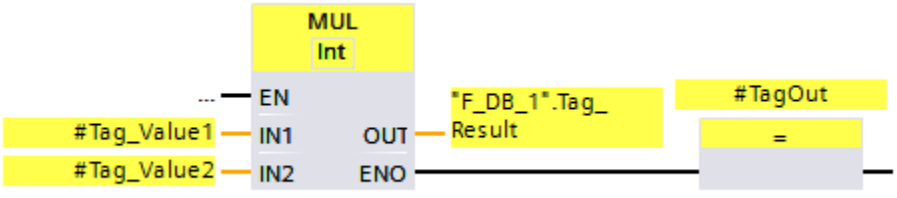
The following table shows the parameters of the instruction:

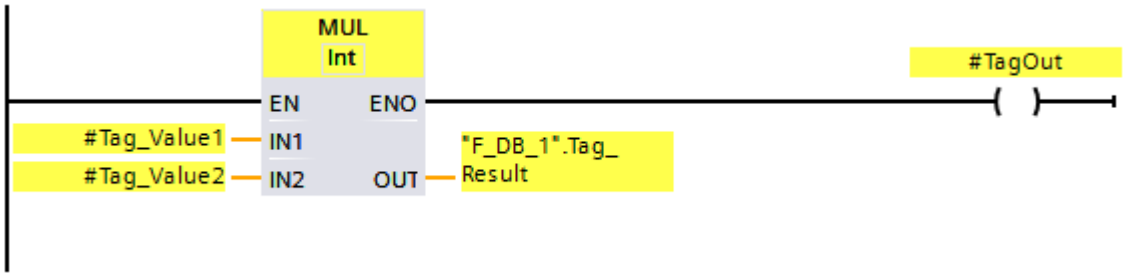
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Multiplier
IN2	Input	INT, DINT	Multiplicand
OUT	Output	INT, DINT	Product

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





The "Multiply" instruction is always executed regardless of the signal state at enable input EN. The value of the "Tag_Value1" operand is multiplied by the value of the "Tag_Value2" operand. The result of the multiplication is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Multiply" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:

The "Multiply" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is multiplied by the value of the "#Tag_Value2" operand. The result of the multiplication is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Multiply" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.9.4 DIV: Divide (STEP 7 Safety V21)

Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at the OUT output (OUT = IN1 / IN2).

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

NOTE

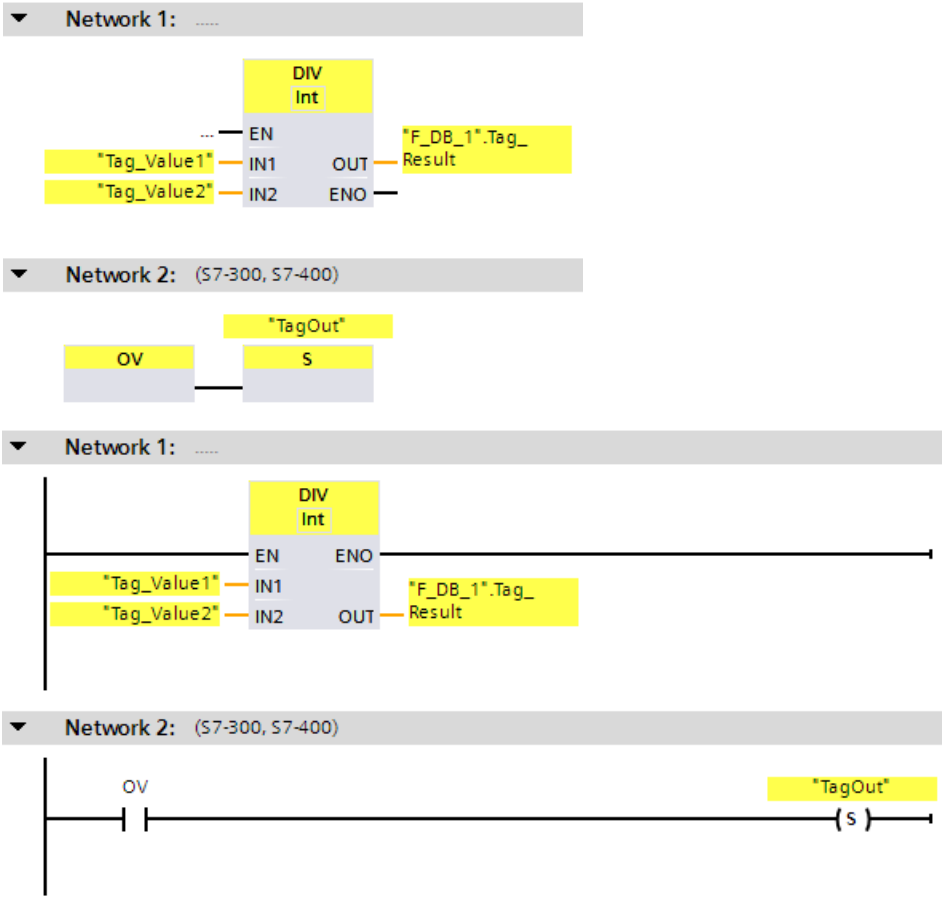
S7-300/400, S7-1200/1500 (enable output ENO connected):

If the divisor (input IN2) of a DIV instruction = 0, the quotient of the division (result of division at output OUT) = 0. The result reacts like the corresponding instruction in a standard block. The F-CPU does *not* go to STOP mode.

S7-1200/1500 (enable output ENO not connected):

If the divisor (input IN2) of a DIV instruction = 0, the F-CPU goes to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU. We recommend that you rule out a divisor (input IN2) = 0 when creating the program.

Parameters



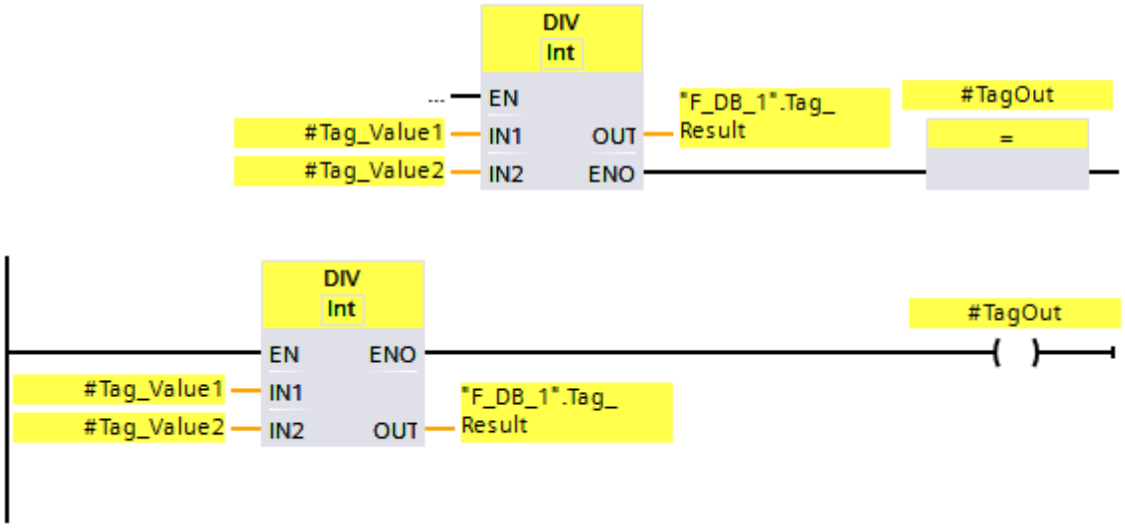
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Dividend
IN2	Input	INT, DINT	Divisor
OUT	Output	INT, DINT	Quotient

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:



The "Divide" instruction is always execute regardless of the signal state at enable input EN.

The value of the "Tag_Value1" operand is divided by the value of the "Tag_Value2" operand. The result of the division is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Divide" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:

The "Divide" instruction is always execute regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is divided by the value of the "#Tag_Value2" operand. The result of the division is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Divide" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.9.5 NEG: Create twos complement (STEP 7 Safety V21)

Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN input and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

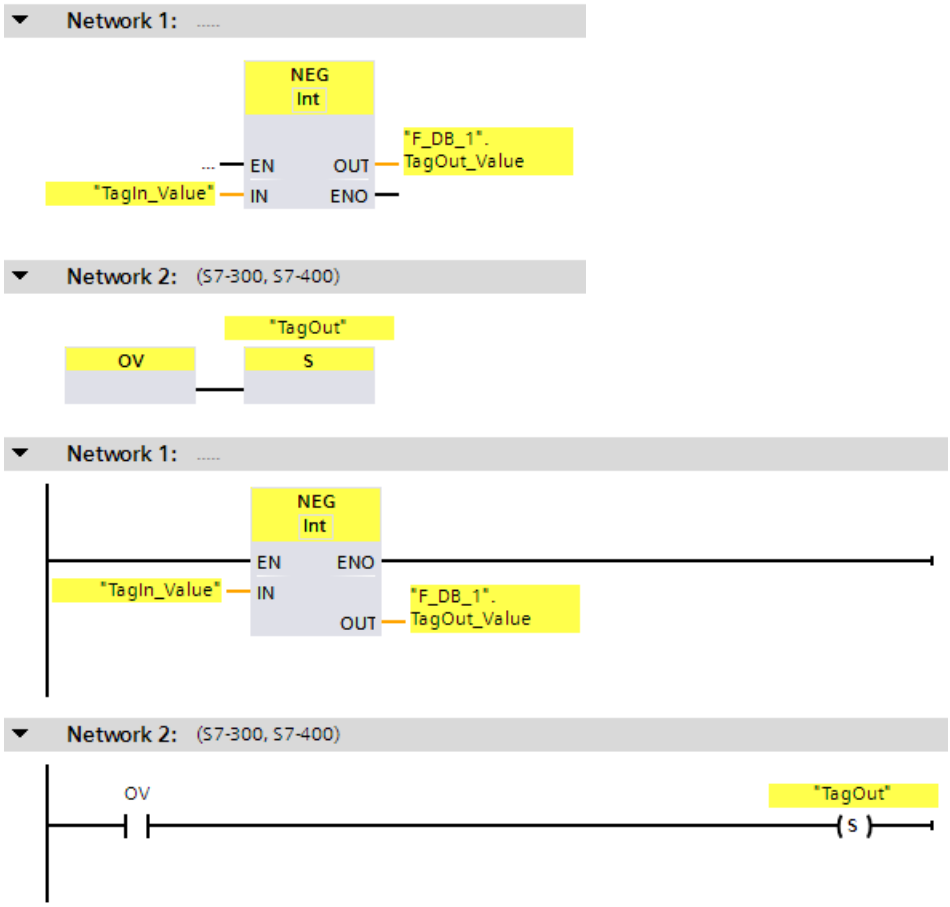
- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters



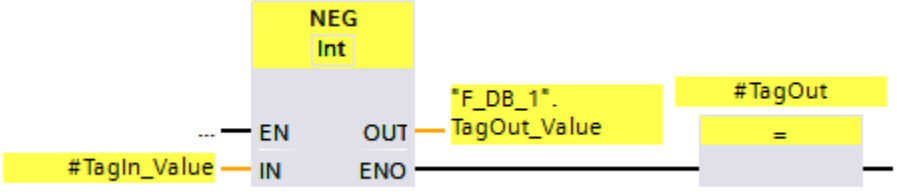
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Twos complement of the input value

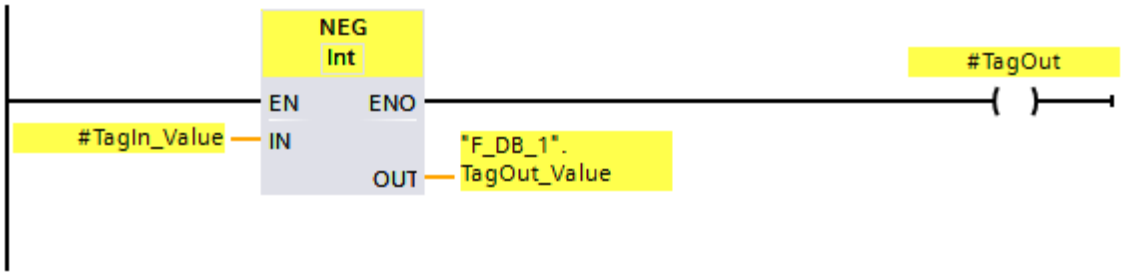
You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:



The "Create two's complement" instruction is always executed regardless of the signal state at enable input EN.



The sign of the "TagIn_Value" operand is changed and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When an overflow occurs during execution of the "Create two's complement" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:

The "Create two's complement" instruction is always executed regardless of the signal state at enable input EN.

The sign of the "#TagIn_Value" operand is changed and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Create two's complement" instruction, the ENO enable output has the signal state "1" and the "TagOut" operand is set.

13.9.6 ABS: Form absolute value (STEP 7 Safety V21) (S7-1200, S7-1500)

Description

You use the "Form absolute value" instruction to calculate the absolute amount of the value which is specified at the input "IN". The result of the instruction is output at the OUT output and can be queried there.

Enable input "EN" or (S7-300, S7-400) enable output "ENO" cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

NOTE

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

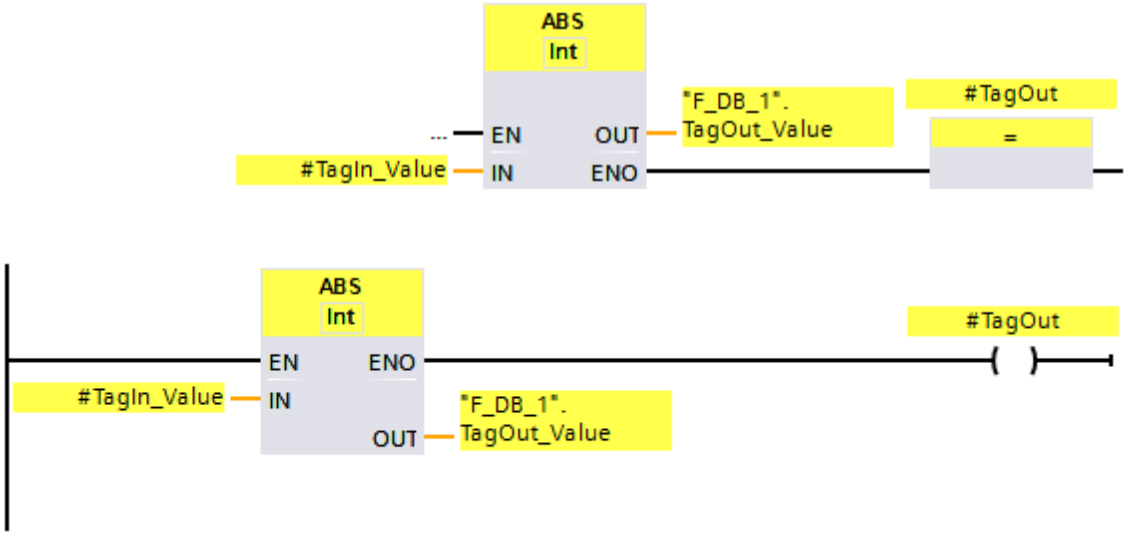
You must therefore ensure that the permitted range for the data type is observed when creating the program!

You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).
- Work memory requirement of safety program is increased.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Absolute value of the input value

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

The instruction "Form absolute value"is always executed regardless of the signal state at enable input "EN".

The absolute amount of the value at the "TagIn_Value" operand is calculated and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Form absolute value" instruction, the enable output ENO has the signal state "1" and the "#TagOut" operand is set.

13.10 Move operations

13.10.1 MOVE: Move value (STEP 7 Safety V21)

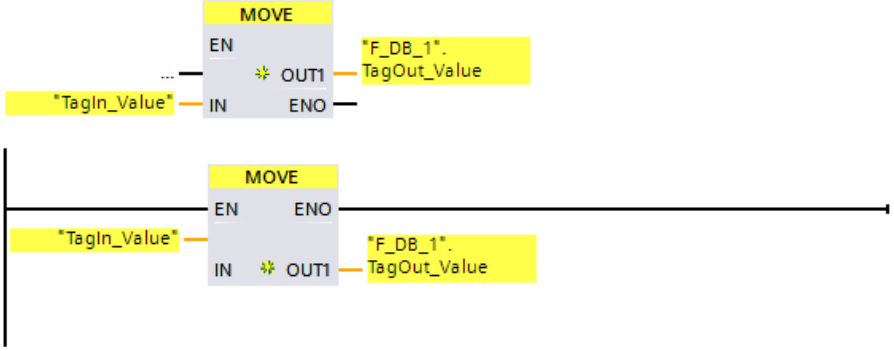
Description

You can use the "Move value" instruction to transfer the content of the operand at input IN to the operand at output OUT1.

Only operands with identical operand width and identical data structure can be specified for input IN and output OUT1.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

(S7-1200, S7-1500) In the basic state, the instruction box contains an output (OUT1). The number of outputs can be expanded. The inserted outputs are numbered in ascending order on the box. During execution, the content of the operand at the IN input is transferred to all available outputs. The instruction box cannot be expanded if operands with F-compliant PLC data types (UDT) are transferred.



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT, WORD, (S7-300, S7-400) DWORD, TIME, F-compliant PLC data type (UDT)	Source value
OUT1	Output	INT, DINT, WORD, (S7-300, S7-400) DWORD, TIME, F-compliant PLC data type (UDT)	Destination address

Example

The following example shows how the instruction works:

The instruction is always executed regardless of the signal state at enable input "EN". The instruction copies the content of operand "TagIn_Value" to operand ""F_DB_1".TagOut_Value".

13.10.2 RD_ARRAY_I: Read value from INT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500)

Description

You use the "Read value from INT F-array" instruction to read an element from the array at the ARRAY input, which refers to the index at the INDEX input, and write its value at the OUT output. If an error occurs while accessing the array during runtime, this is displayed at the output ERROR.

The array must be created in an F-DB and can contain only one dimension. The elements of the ARRAY must be data type INT. The following applies for the array limits in contrast:

- The low limit must be 0.
- The high limit can be 10000 maximum.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ARRAY	Input	VARIANT	Array from which is read
INDEX	Input	DINT	Element in the array which is read. The specification may be a constant or a tag.
OUT	Output	INT	Value which is read and output.
ERROR	Output	BOOL	Error information The parameter ERROR is set if an error occurs during the processing of the instruction.

ARRAY parameter

In addition to the direct connection with an array within a fail-safe global DB, this input can also be interconnected with an INOUT of data type ARRAY[*] of INT. This enables the decoupling of data and program logic in order, for example, to create a library function without any connection existing to a dedicated data block.

ERROR parameter

The table below shows the meaning of the value of the ERROR parameter:

Value	Description
FALSE	No error
TRUE	Value at the INDEX parameter is outside the limit value of the ARRAY.

Instruction versions

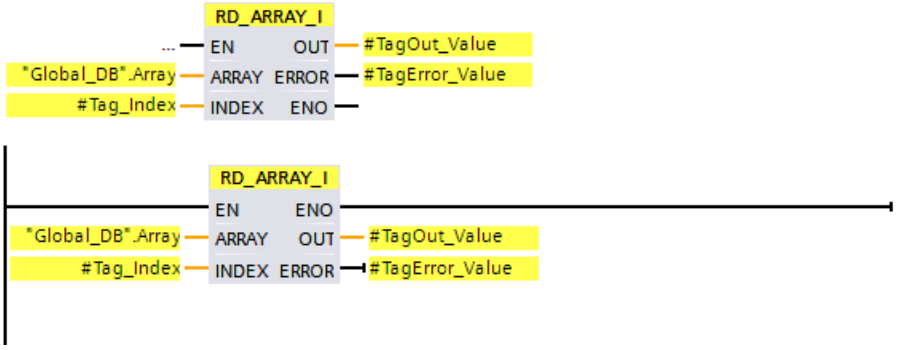
One version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x	x[1]	

[1] supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".



Reaction to errors

If the value at the INDEX input is outside the array limits, the output ERROR = 1 is set, and the array value of the element with index = 0 is output at OUT output, regardless of the value passed at the INDEX input.

Therefore, set the value of the element with index = 0 as a fail-safe substitute value.

Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
ARRAY	"Global_DB".Array	The "Global_DB".Array operand is an ARRAY of data type Array[0..10] of INT
INDEX	#Tag_Index	2
OUT	#TagOut_Value	Value of the element at the location array[2]
ERROR	#TagError_Value	False

The instruction "Read value from INT F-array" is always executed regardless of the signal state at enable input "EN".

The content of the 2nd element of the operand "Global_DB.Array" is output at the "#TagOut_Value" output.

13.10.3 RD_ARRAY_DI: Read value from DINT F-array (STEP 7 Safety V21) (S7-1200 G2, S7-1500)

Description

You use the "Read value from DINT F-array" instruction to read an element from the array at the ARRAY input, which refers to the index at the INDEX input, and write its value at the OUT output. If an error occurs while accessing the array during runtime, this is displayed at the output ERROR.

The array must be created in an F-DB and can contain only one dimension. The elements of the array must be of the DINT data type. The following applies for the array limits in contrast:

- The low limit must be 0.
- The high limit can be 10000 maximum.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ARRAY	Input	VARIANT	Array from which is read
INDEX	Input	DINT	Element in the array which is read. The specification may be a constant or a tag.
OUT	Output	DINT	Value which is read and output.
ERROR	Output	BOOL	Error information The parameter ERROR is set if an error occurs during the processing of the instruction.

ARRAY parameter

In addition to the direct connection with an array within a fail-safe global DB, this input can also be interconnected with an INOUT of data type ARRAY[*] of DINT. This enables the decoupling of data and program logic in order, for example, to create a library function without any connection existing to a dedicated data block.

ERROR parameter

The table below shows the meaning of the value of the ERROR parameter:

Value	Description
FALSE	No error
TRUE	Value at the INDEX parameter is outside the limit value of the ARRAY.

Instruction versions

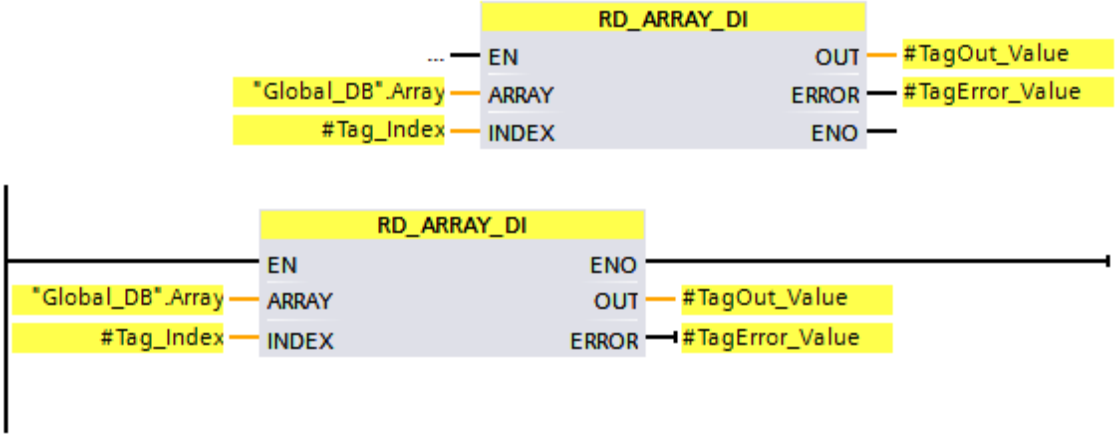
One version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x	x[1]	

[1] supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".



Reaction to errors

If the value at the INDEX input is outside the array limits, the output ERROR = 1 is set, and the array value of the element with index = 0 is output at OUT output, regardless of the value passed at the INDEX input.

Therefore, set the value of the element with index = 0 as a fail-safe substitute value.

Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
ARRAY	"Global_DB".Array	The operand "Global_DB".Array is an ARRAY of data type Array[0..10] of DINT
INDEX	#Tag_Index	2
OUT	#TagOut_Value	Value of the element at the location array[2]
ERROR	#TagError_Value	False

The instruction "Read value from DINT F-array" is always executed regardless of the signal state at enable input "EN".

The content of the 2nd element of the operand "Global_DB.Array" is output at the "#TagOut_Value" output.

13.10.4 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

This instruction writes the value specified in input IN to the tag addressed by INI_ADDR and OFFSET in an F-DB.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB to which the value at input IN is to be written is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

As shown in the following example, the INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted.

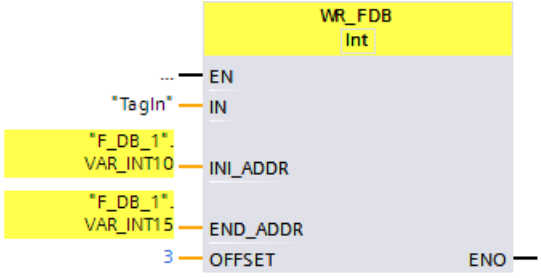
Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

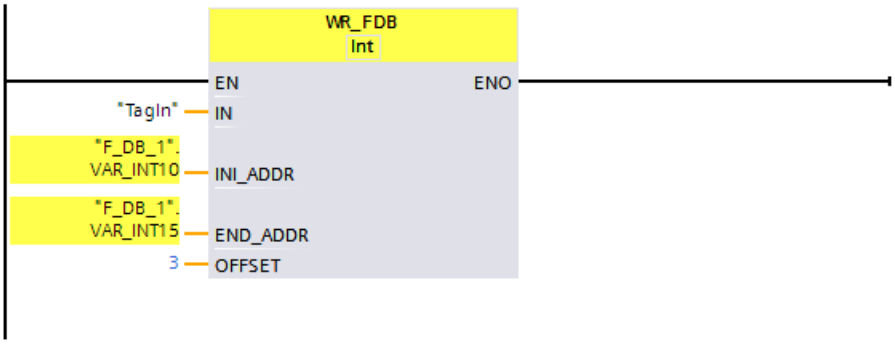
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Value to be written to the F-DB
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.



Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFS



Name	Data type	Initial value	Comment
Static			
VAR_BOOL10	BOOL	false	
VAR_BOOL11	BOOL	false	
VAR_BOOL12	BOOL	false	
VAR_BOOL13	BOOL	false	
VAR_TIME10	TIME	T#0MS	
VAR_TIME11	TIME	T#0MS	

Name	Data type	Initial value	Comment
VAR_INT10	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT10 Example 1
VAR_INT11	INT	0	
VAR_INT12	INT	0	
VAR_INT13	INT	0	<- OFFSET = 3
VAR_INT14	INT	0	
VAR_INT15	INT	0	<- END_ADDR = "F-DB_1".VAR_INT15
VAR_BOOL20	BOOL	false	
VAR_BOOL21	BOOL	false	
VAR_BOOL22	BOOL	false	
VAR_BOOL23	BOOL	false	
VAR_INT20	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT20 Example 2
VAR_INT21	INT	0	
VAR_INT22	INT	0	
VAR_INT23	INT	0	<- END_ADDR = "F-DB_1".VAR_INT23
VAR_INT30	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT30 Example 3
VAR_INT31	INT	0	<- OFFSET = 1
VAR_INT32	INT	0	
VAR_INT33	INT	0	
VAR_INT34	INT	0	<- END_ADDR = "F-DB".VAR_INT34
VAR_TIME20	TIME	T#0MS	
VAR_DINT10	DINT	0	<- INI_ADDR = "F-DB_1".VAR_DINT10 Example 4
VAR_DINT11	DINT	0	
VAR_DINT12	DINT	0	<- OFFSET = 2
VAR_DINT13	DINT	0	<- END_ADDR = "F-DB_1".VAR_DINT13

Example

The following example shows how the instruction works:

13.10.5 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

This instruction reads the tag addressed via INI_ADDR and OFFSET in an F-DB and provides it at output OUT.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

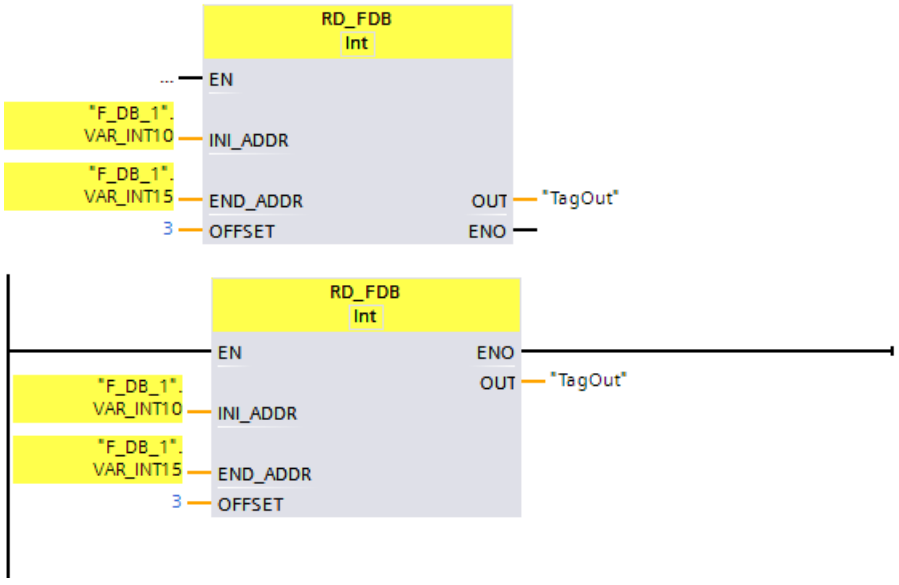
The start address of the area in an F-DB from which the tag is to be read is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

The INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted. Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFSET are contained in WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V21) (S7-300, S7-400) (Page 563).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset
OUT	Output	INT, DINT	Value to be read from the F-DB

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:

13.11 Conversion operations

13.11.1 CONVERT: Convert value (STEP 7 Safety V21)

Description

The "Convert value" instruction reads the content of parameter IN and converts it according to the data types selected in the instruction box. The converted value is output at the OUT output .

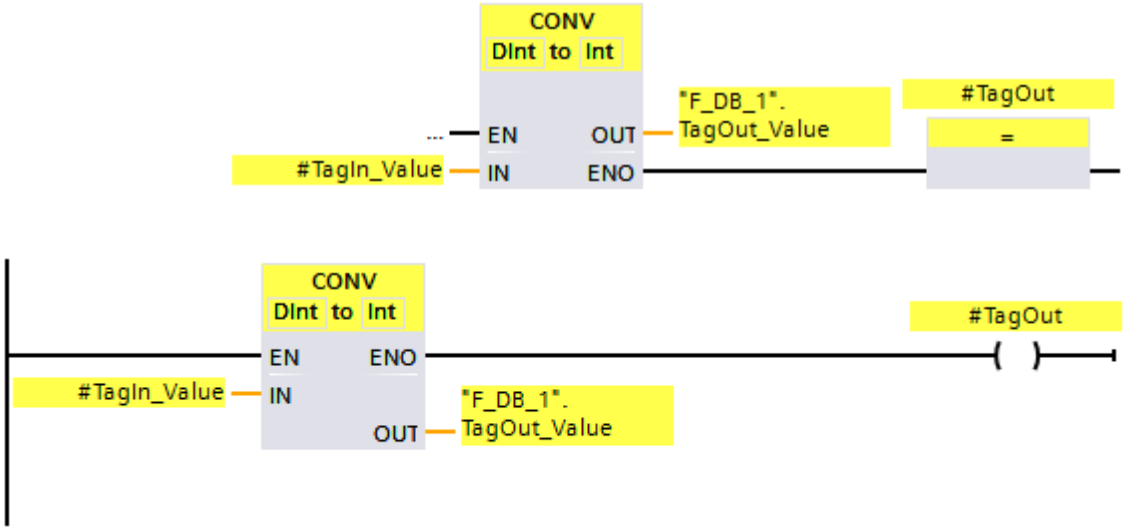
Enable input "EN" cannot be connected. The instruction is therefore always executed (regardless of the signal state at the "EN" enable input). The connection of the "ENO" enable output is only possible and required when converting from the "DINT" to the "INT" data type.

NOTE

When converting from "DINT" to the "INT" data type, you need to connect the ENO enable output and thereby programming overflow detection.
Note the following:

- If the value at the input is outside the INT range, ENO returns 0.
- The result of the instruction reacts like the analogous instruction in a standard block.

Parameters



The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	Enable output
IN	Input	INT, DINT	Value to be converted.
OUT	Output	INT, DINT	Result of the conversion

You can select the data types of the instruction in the "<???>" drop-down lists of the instruction box. The supported conversions are from "INT to DINT" and "DINT to INT".

Example

The following example shows how the "Convert value "DINT to INT"" instruction for S7-1200/1500 F-CPUs works:

The instruction is always executed regardless of the signal state at enable input EN.

The value of the "TagIn_Value" operand is converted to an integer (16-bit) and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Convert value "DINT to INT"" instruction, the ENO enable output has the signal state "1" and the "TagOut" operand is set.

You can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

13.11.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V21)

Description

This instruction converts the 16 values of data type BOOL at inputs IN0 to IN15 to a value of data type WORD, which is made available at output OUT. The conversion takes place as follows: The i-th bit of the WORD value is set to 0 (or 1), if the value at input INi = 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN0	Input	BOOL	Bit 0 of WORD value
IN1	Input	BOOL	Bit 1 of WORD value
...			...
IN15	Input	BOOL	Bit 15 of WORD value
OUT	Output	WORD	WORD value consisting of IN0 to IN15

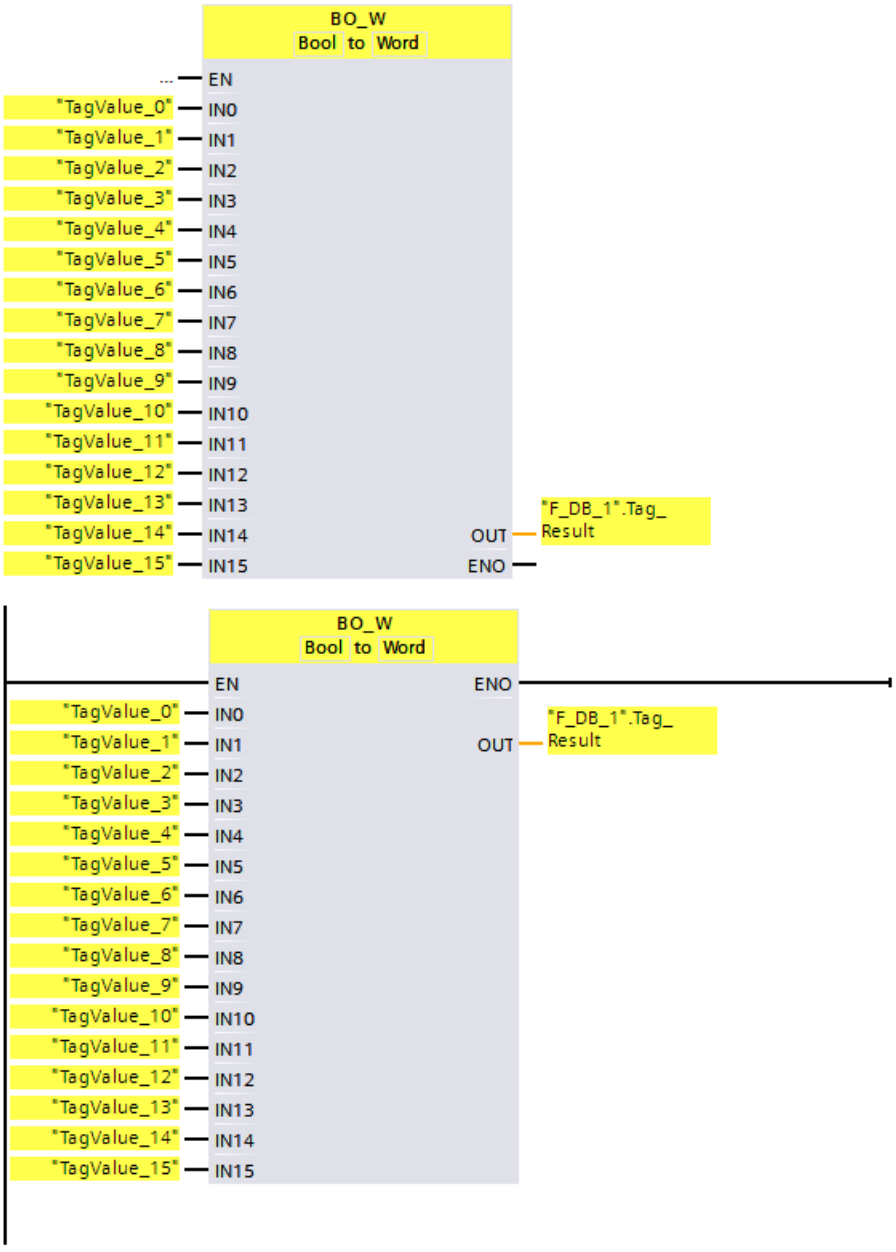
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	o	—	—	o	These versions have identical functions to version 1.0.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	x	—	x	
2.0	x	x[1]	x	x[2]	

o This version is no longer supported.

1 supported as of firmware V4.2



2 supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN0	TagValue_0	FALSE
IN1	TagValue_1	FALSE
...		...
IN13	TagValue_13	FALSE

Parameter	Operand	Value
IN14	TagValue_14	TRUE
IN15	TagValue_15	TRUE
OUT	"F_DB_1".Result	W#16#C000

The values of operands "TagValue_0" to "TagValue_15" are combined into a value of the data type WORD and assigned to operand ""F_DB_1".TagResult".

13.11.3 W_BO: Convert a data element of data type WORD to 16 data elements of data type BOOL (STEP 7 Safety V21)

Description

This instruction converts the value of data type WORD at input IN to 16 values of data type BOOL, which are provided at outputs OUT0 to OUT15. The conversion takes place as follows: Output OUTi is set to 0 (or 1), if the i-th bit of the WORD value is 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	WORD value
OUT0	Output	BOOL	Bit 0 of WORD value
OUT1	Output	BOOL	Bit 1 of WORD value
...			...
OUT15	Output	BOOL	Bit 15 of WORD value

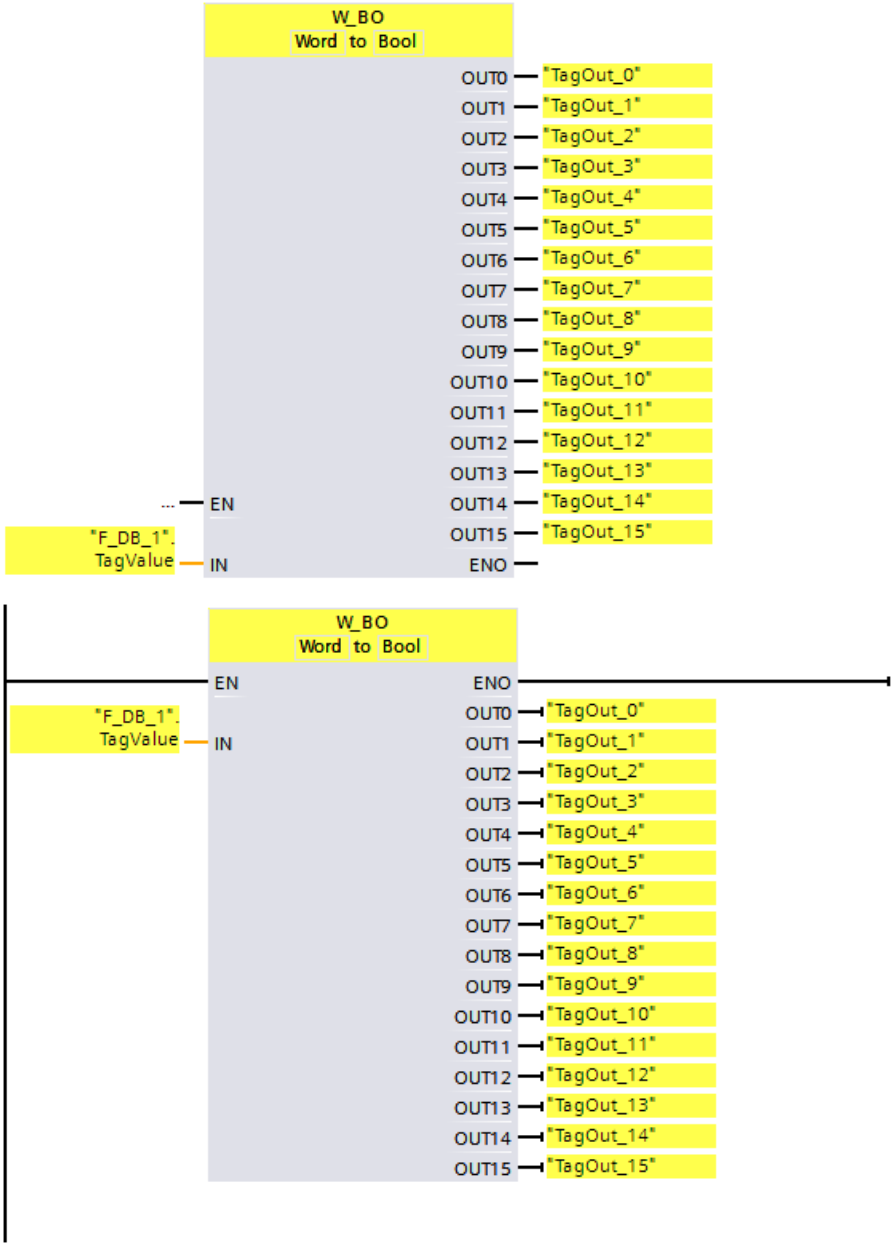
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	o	—	—	o	These versions have identical functions to version 1.0.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	x	—	x	
2.0	x	x[1]	x	x[2]	

o This version is no longer supported.

1 supported as of firmware V4.2



2 supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagValue	W#16#C000
OUT0	TagOUT_0	FALSE

Parameter	Operand	Value
OUT1	TagOUT_1	FALSE
...		...
OUT13	TagOUT_13	FALSE
OUT14	TagOUT_14	TRUE
OUT15	TagOUT_15	TRUE

The value of operand ""F_DB_1".TagValue" of data type WORD is converted to the 16 values "TagOUT_0" to "TagOUT_15" of data type BOOL.

13.11.4 SCALE: Scale (STEP 7 Safety V21)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale value" instruction must be assigned a data area in which the instruction data is stored. In addition, when the instruction is inserted in the program, the "Call options" dialog is automatically opened, where you can create a data block (single instance) (e.g., SCALE_DB_1) or a multi-instance (e.g., SCALE_Instance_1) for the "Scale value" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	INT	High limit value of value range of OUT
LO_LIM	Input	INT	Low limit value of value range of OUT
OUT	Output	INT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0.
1.2	x	x	x	x	

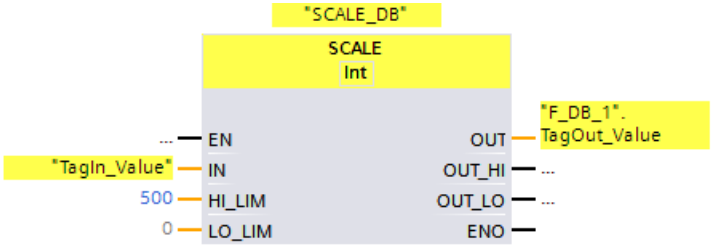
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

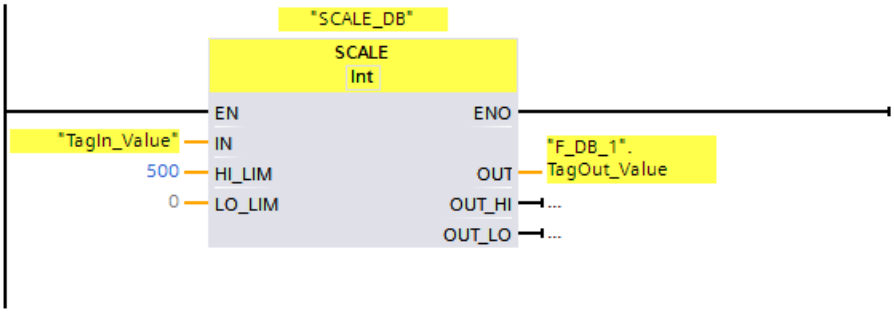
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

NOTE



If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.



If other fail-safe values should be output in this case, you need to evaluate the QBAD signal of the associated F-I/O or QBAD_I_xx signal / value status of the corresponding channel.

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:

When operand "TagIn_Value" = 20000, the result for ""F_DB_1".TagOut_Value" is 361.

13.11.5 SCALE_D: Scale to data type DINT (STEP 7 Safety V21) (S7-1200, S7-1500)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale value to data type DINT" instruction must be assigned a data area in which the instruction data is stored. In addition, when the instruction is inserted in the program, the "Call options" dialog is automatically opened, where you can create a data block (single instance) (e.g., SCALE_D_DB_1) or a multi-instance (e.g., SCALE_D_Instance_1) for the "Scale value to data type DINT" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	DINT	High limit value of value range of OUT
LO_LIM	Input	DINT	Low limit value of value range of OUT
OUT	Output	DINT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

One version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
2.0	—	x[1]	x	x[2]	

[1] supported as of firmware V4.2

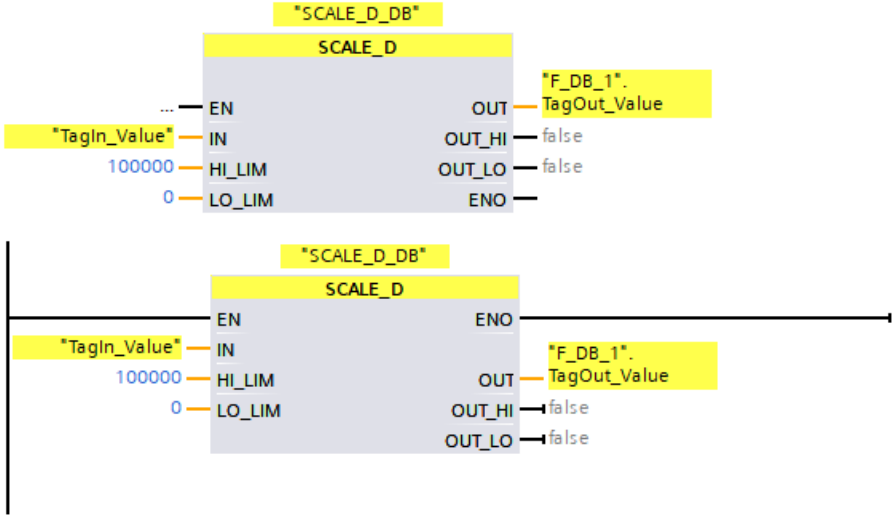
[2] supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

NOTE



If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If other fail-safe values should be output in this case, you need to evaluate the QBAD signal of the associated F-I/O or QBAD_I_xx signal / value status of the corresponding channel.

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:

When the operand "TagIn_Value" = 20000, the result for ""F_DB_1".TagOut_Value" is 72337.

13.12 Program control operations

13.12.1 JMP: Jump if RLO = 1 (STEP 7 Safety V21)

Description

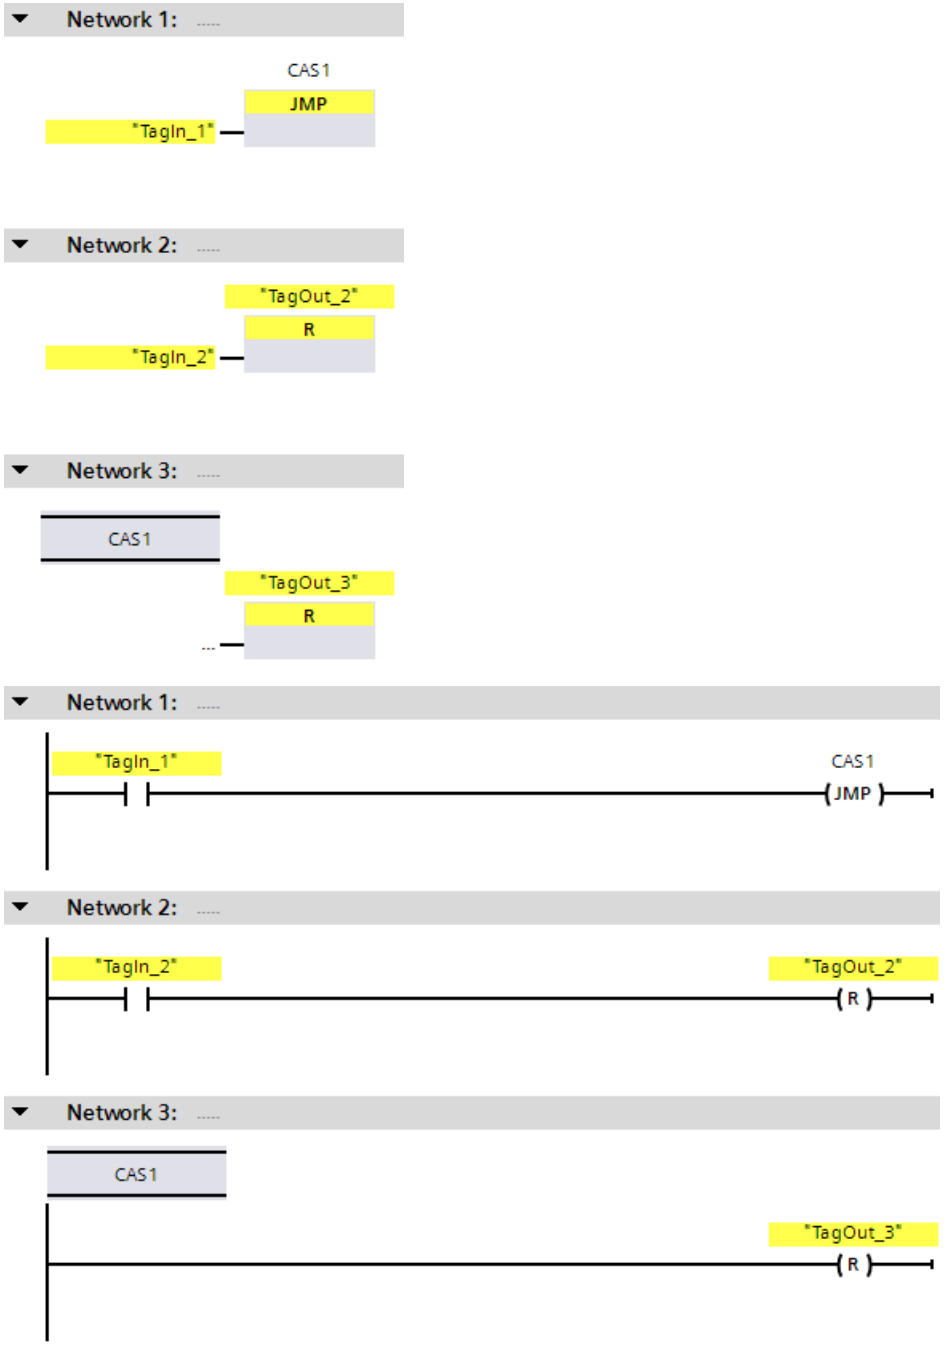
You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (Page 580) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1" or the input is not connected, the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "0", the program continues executing in the next network.

NOTE



(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

NOTE

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:

When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.12.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V21)

Description

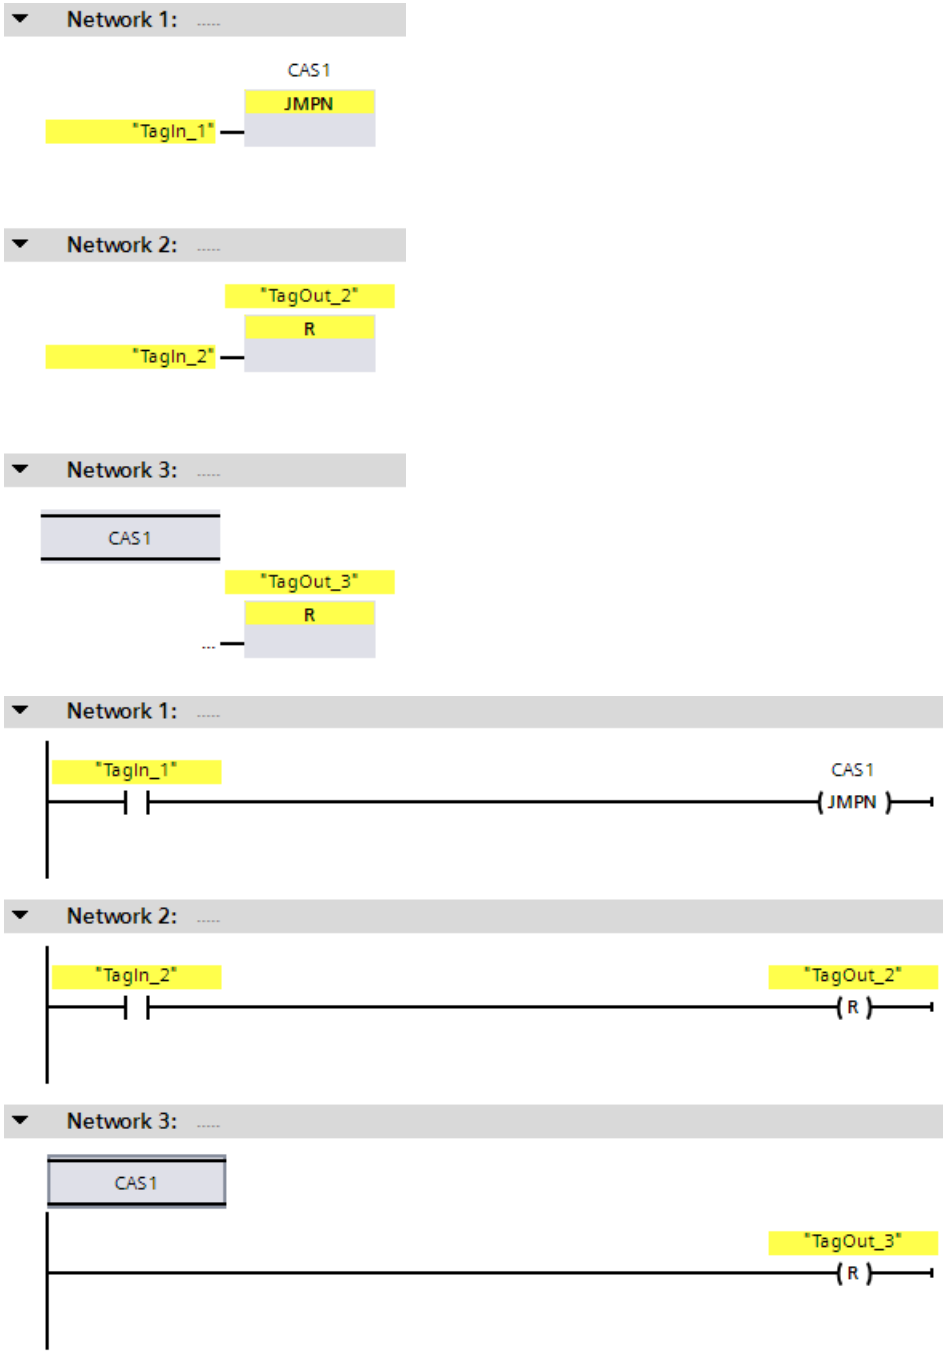
You can use the "Jump if RLO = 0" instruction to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (Page 580) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "1", the program continues executing in the next network.

NOTE



(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

NOTE

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

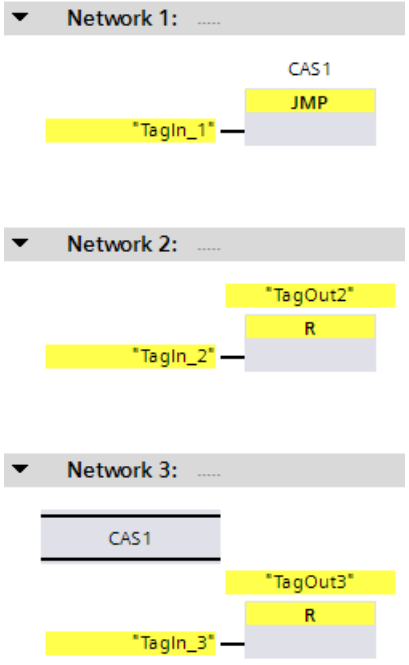
Example

The following example shows how the instruction works:

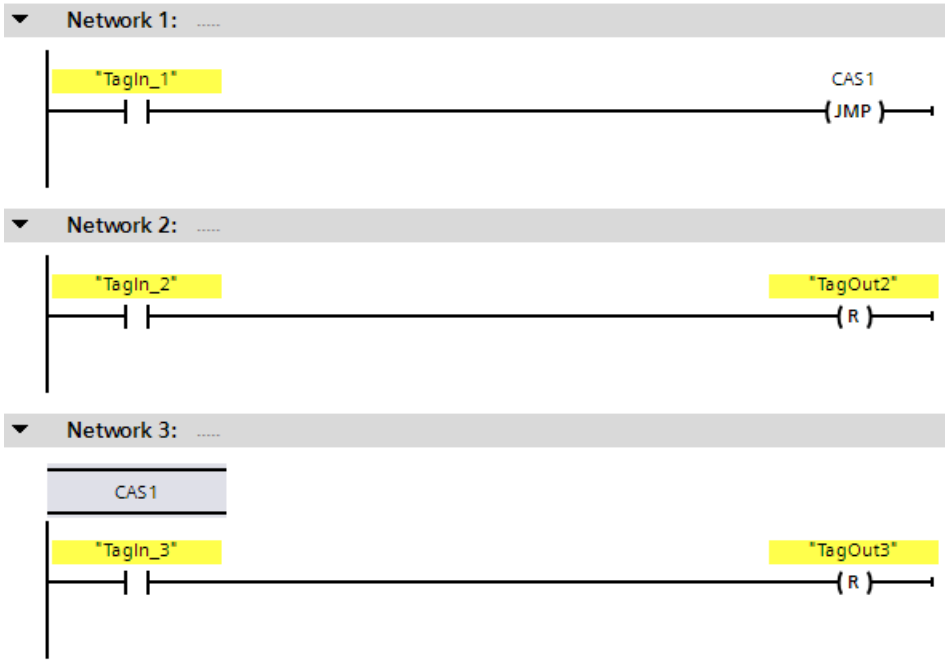
When operand "TagIn_1" has signal state "0", the "Jump if RLO = 0" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.12.3 LABEL: Jump label (STEP 7 Safety V21)

Description



You can use a jump label to specify a destination network, in which the program execution should resume after a jump.



The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. To each jump label can be jumped from several locations.

Example

The following example shows how the instruction works:

When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

See also

JMP: Jump if RLO = 1 (STEP 7 Safety V21) (Page 576)
JMPN: Jump if RLO = 0 (STEP 7 Safety V21) (Page 578)
RET: Return (STEP 7 Safety V21) (Page 581)

13.12.4 RET: Return (STEP 7 Safety V21)

Description

You can use the "Return" instruction to stop the processing of a block.

If the result of logic operation (RLO) at the input of the "Return" instruction is "1" or the box input of the S7-1200/1500 F-CPUs is not connected in FBD, program execution is terminated in the currently called block and continued in the calling block (for example, in the main safety block) after the call function. If the RLO at the input of the "Return" instruction is "0", the instruction is not executed. Program execution continues in the next network of the called block.

Influencing the status of the call function (ENO) is irrelevant, because the enable output "ENO" cannot be connected.

NOTE

(S7-300, S7-400) You may not program a RET instruction in the main safety block.

Example

The following example shows how the instruction works:

When the "TagIn" operand delivers signal state "1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block.

13.12.5 OPN: Open global data block (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

You can use the "Open global data block" instruction to open a data block. The number of the data block is transferred to the DB register. Subsequent DB commands access the relevant blocks depending on the register contents.

NOTE

Note when using the "Open global data block" instruction that the content of the DB register can be changed after calls of F-FB/F-FC and "fully qualified DB accesses", such that there is no guarantee that the last data block you opened with "Open global data block" is still open. You should therefore use the following method for addressing data to avoid errors when accessing data of the DB register:

- Use symbolic addressing.
- Use only fully qualified DB accesses.

If you still want to use the "Open global data block" operation, you must ensure that the DB register is restored by repeating the "Open global data block" instruction following calls of F-FB/F-FC and "fully qualified DB accesses." Otherwise, a malfunction could result.

Parameters

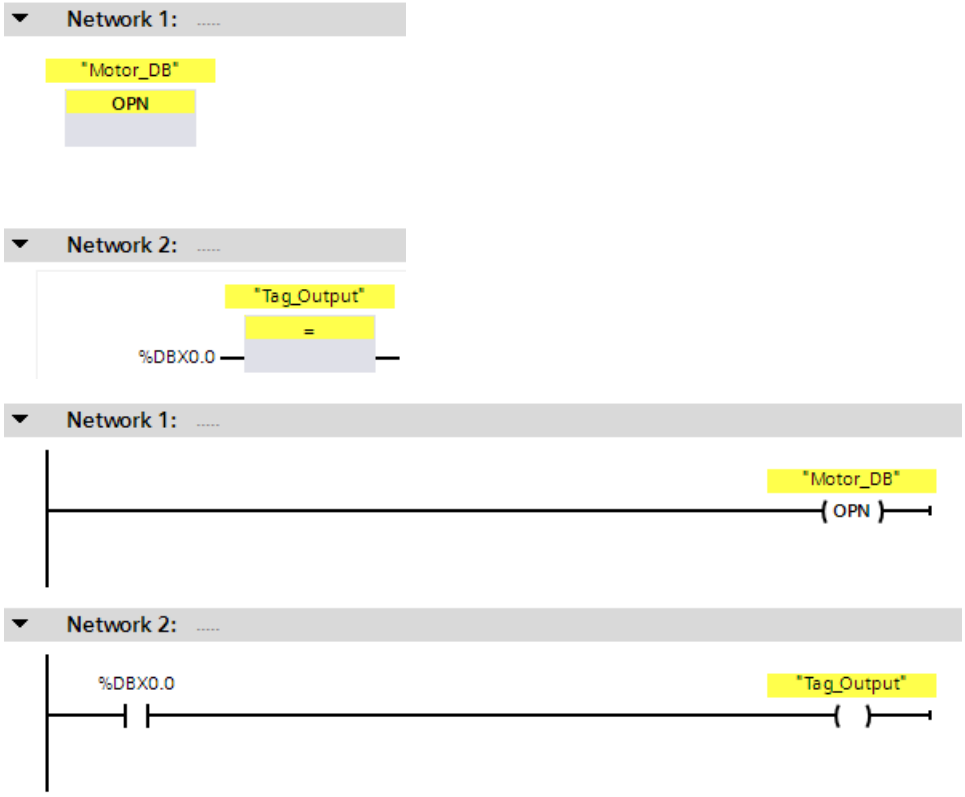
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Data block>	Input	BLOCK_DB	Data block that is opened

"Fully qualified DB access"

The initial access to data of a data block in an F-FB/F-FC must always be a "fully qualified DB access," or it must be preceded by the "Open global data block" instruction. This also applies to the initial access to data of a data block after a jump label.

An example of "fully qualified DB access" and "non-fully qualified DB access" is provided in Restrictions in the programming languages FBD/LAD (Page 116).



Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

Example

The following example shows how the instruction works:

The "Motor_DB" data block is called in network 1. The number of the data block is transferred to the DB register. The "DBX0.0" operand is queried in network 2. The signal state of the "DBX0.0" operand is assigned to the "Tag_Output" operand.

13.13 Word logic operations

13.13.1 AND: AND logic operation (STEP 7 Safety V21)

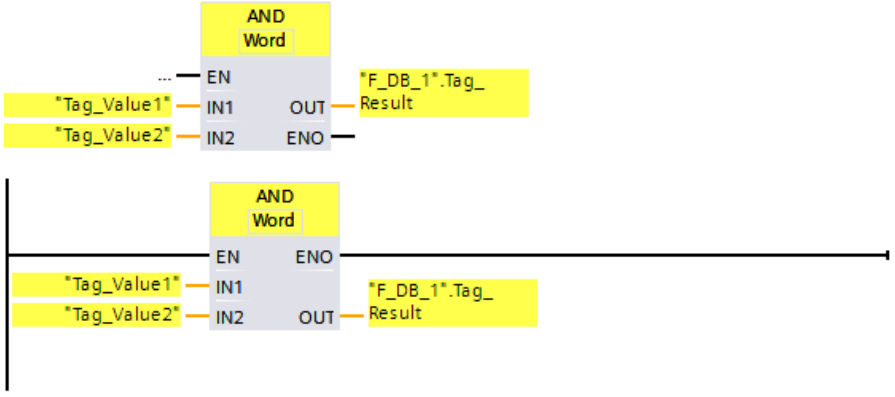
Description

You can use the "AND logic operation" instruction to combine the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:

IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"F_DB_1"."Tag_Result" = 00000000 00000101

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ANDed. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.13.2 OR: OR logic operation (STEP 7 Safety V21)

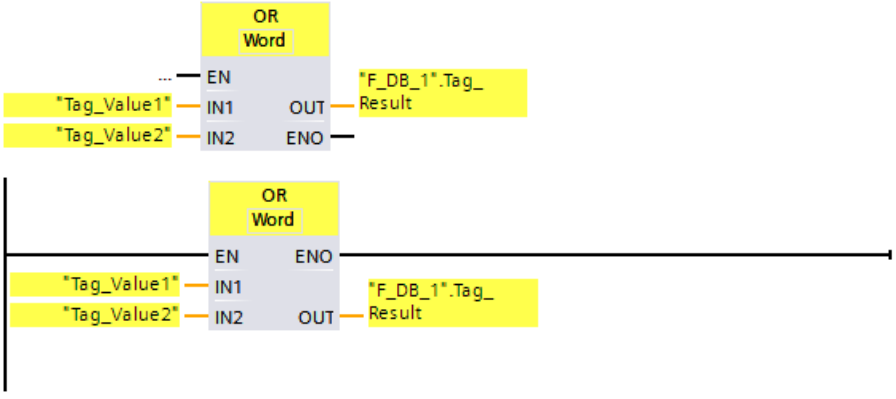
Description

You can use the "OR logic operation" instruction to connect the value at input IN1 input to the value at input IN2 bit-by-bit by OR logic and query the result at output OR.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ORed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The result bit has signal state "1" when at least one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:

IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"F_DB_1"."Tag_Result" = 01010101 01011111

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ORed. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.13.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V21)

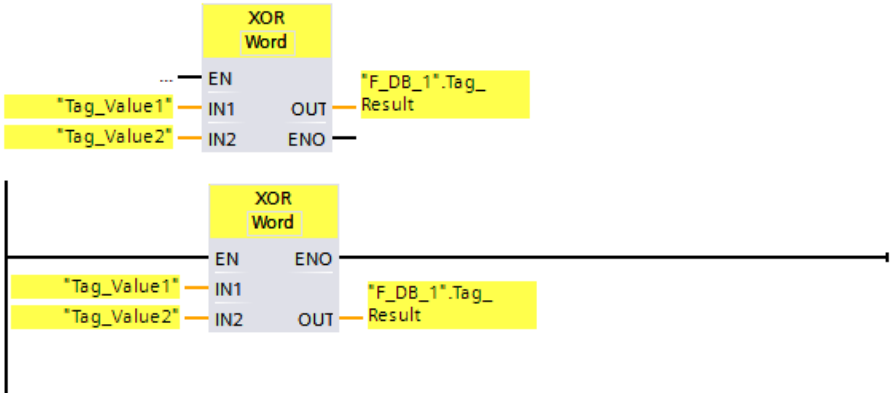
Description

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at input IN1 and the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 input and bit 0 of the value at input IN2 are logically combined by EXCLUSIVE OR. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The result bit has signal state "1" when one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").



Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:

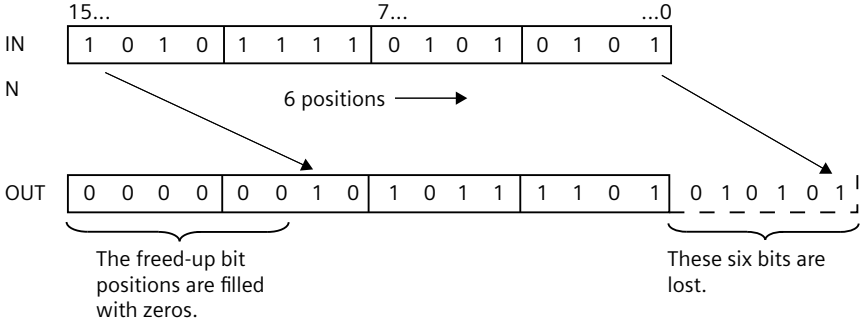
IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"F_DB_1"."Tag_Result" = 01010101 01011010

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are logically combined by EXCLUSIVE OR. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.14 Shift and rotate

13.14.1 SHR: Shift right (STEP 7 Safety V21)

Description



Use the "Shift right" instruction to shift the content of the operand at input IN bit-by-bit to the right and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The bit locations that are freed up in the left area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the right:

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

NOTE

S7-300/400:
Only the low-byte is evaluated from input N.
S7-1200/1500:
If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

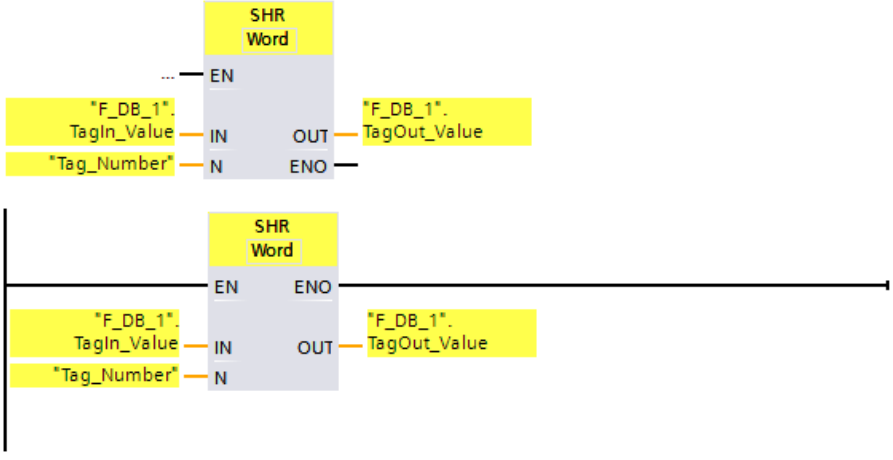
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	o	—	—	o	These versions have identical functions to version 1.0.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	x	—	x	
2.0	x	x[1]	x	x[2]	

o This version is no longer supported.

[1] supported as of firmware V4.2



[2] supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

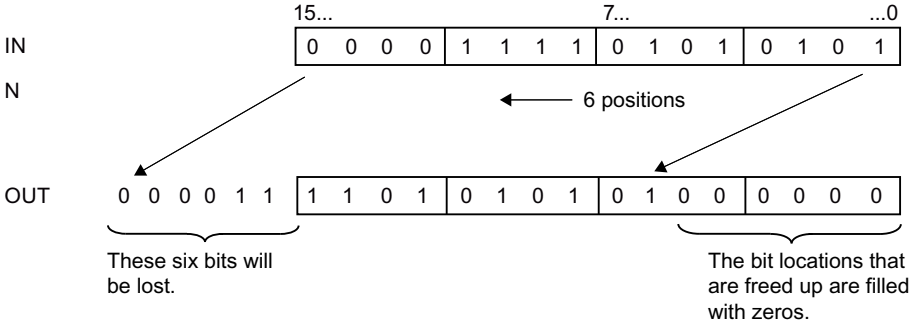
The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	"F_DB_1".TagOut_Value	0000 0111 1111 0101

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand ""F_DB_1".TagIn_Value" is moved three bit positions to the right. The result is output at output ""F_DB_1".TagOut_Value".

13.14.2 SHL: Shift left (STEP 7 Safety V21)

Description



Use the "Shift left" instruction to shift the content of the operand at input IN bit-by-bit to the left and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions that are freed up in the right area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the left:

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

NOTE

S7-300/400:
Only the low-byte is evaluated from input N.
S7-1200/1500:
If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

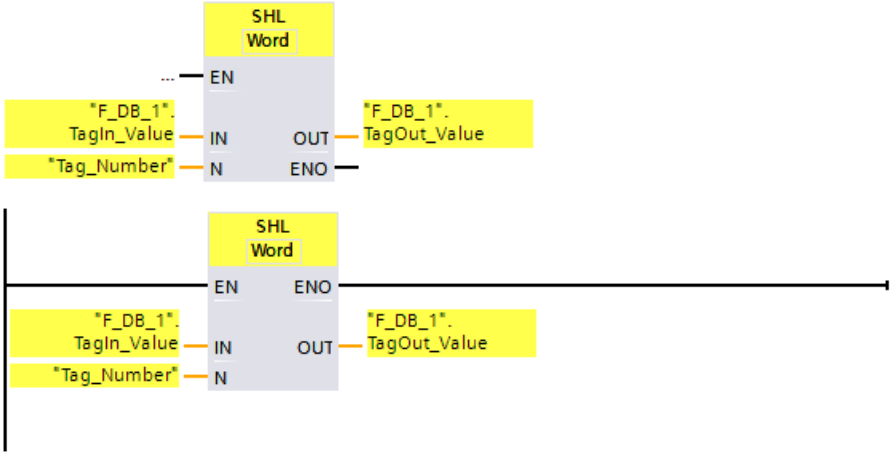
Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	o	—	—	o	These versions have identical functions to version 1.0.
1.2	x	—	—	o	
1.3	x	o	—	o	
1.4	x	x	—	x	
2.0	x	x[1]	x	x[2]	

o This version is no longer supported.

[1] supported as of firmware V4.2



[2] supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	"F_DB_1".TagOut_Value	1111 1010 1111 0000

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand ""F_DB_1".TagIn_Value" is moved four bit positions to the left. The result is output at output ""F_DB_1".TagOut_Value".

13.15 Operating

13.15.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V21)

Description (S7-300, S7-400)

This instruction enables fail-safe acknowledgment from an operator control and monitoring system. It allows, for example, reintegration of F-I/O to be controlled from the operator control and monitoring system. Acknowledgment takes place in two steps:

- InOut IN changes to a value of 6 for exactly one cycle
- InOut IN changes to a value of 9 within a minute for exactly one cycle

Once InOut IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value of 9 after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if InOut IN has not changed to the value 9 within one minute or the change occurred before one second has elapsed, then InOut IN is reset to 0, and both steps listed above must be repeated.

During the time in which InOut IN must change from 6 to the value 9, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

NOTE

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.
If this is not observed, the behavior described under "Description" is no longer ensured.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example, by programming them including the time conditions and using one function key to trigger them.
The two separate acknowledgment steps also prevent erroneous triggering of an acknowledgment, for example, by your non-fail-safe operator control and monitoring system. *(S013)*

⚠ WARNING

If you have operator control and monitoring systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- Store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your operator control and monitoring system, set up a text box from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  In your operator control and monitoring system, set up a text box to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

NOTE

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.
You can supply InOut IN with a separate memory word or DBW of a DB of the standard user program supply for each call of the ACK_OP instruction.

NOTE

The configuration of your operator control and monitoring system does not have any effect on the Collective F-Signature.

Description (S7-1200, S7-1500)

This instruction enables fail-safe acknowledgment from an operator control and monitoring system. It allows, for example, reintegration of F-I/O to be controlled from the operator control and monitoring system. Acknowledgment takes place in two steps:

- InOut IN changes to a value of 6 for exactly one cycle
- InOut IN changes to the value at the ACK_ID input within a minute for exactly one cycle

Once InOut IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value at the ACK_ID input after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if InOut IN has not changed to the value at the ACK_ID input within one minute or the change occurred before one second has elapsed, then iInOut IN is reset to 0, and both steps listed above must be repeated.

During the time in which InOut IN must change from 6 to the value at the ACK_ID input, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

NOTE

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.
If this is not observed, the behavior described under "Description" is no longer ensured.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example, by programming them including the time conditions and using one function key to trigger them.
The two separate acknowledgment steps also prevent erroneous triggering of an acknowledgment, for example, by your non-fail-safe operator control and monitoring system. *(S013)*

⚠ WARNING

If you have operator control and monitoring systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.
Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access to the ACK_ID tag in the associated instance DB is not permitted!

Alternative 2:

- Store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your operator control and monitoring system, set up a text box from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  In your operator control and monitoring system, set up a text box to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

NOTE

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.
You must supply InOut IN with a separate memory word or DBW of a DB of the standard user program for each call of the ACK_OP instruction.

NOTE

The supply of the IN iInOut of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the Collective F-Signature, the Collective F-SW-Signature or the signature of the block that calls the ACK_OP instruction. Changes to the supply of the IN InOut or to the configuration of your operator control and monitoring system therefore do not result in a changed Collective F-Signature/Collective F-SW-Signature/signature of the calling block.

Parameters (S7-300, S7-400)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	InOut	INT	Input variable from operator control and monitoring system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Parameters (S7-1200, S7-1500)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_ID	Input	INT	Identifier of the acknowledgment (9 to 30000)
IN	InOut	INT	Input variable from operator control and monitoring system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	x	—	—	o	These versions have identical functions to version 1.0 for S7-300/400 F-CPUs. The input ACK_ID must also be taken into consideration for S7-1200/1500 F-CPUs.
1.2	x	o	—	o	
1.3	x	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing imprecision resulting from the update time and the tolerance of the time base used in the instruction

Refer to section "Temporal blurring for instructions with time processing (Page 444)" for more on this.

Example

An example how the instruction is used is available under Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 184).

See also

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 189)

13.16 Additional instructions

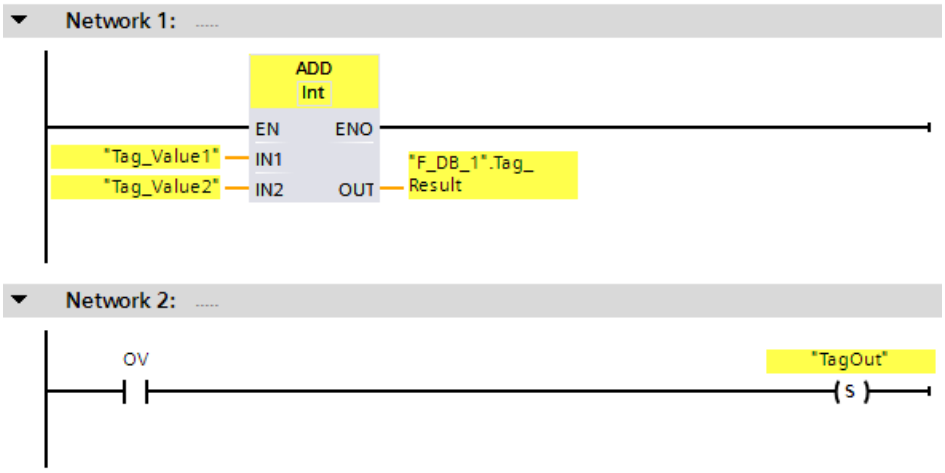
13.16.1 LAD

13.16.1.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" instruction functions like a normally open contact. If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".



The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

NOTE

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).

Example

The following example shows how the instruction works:

The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

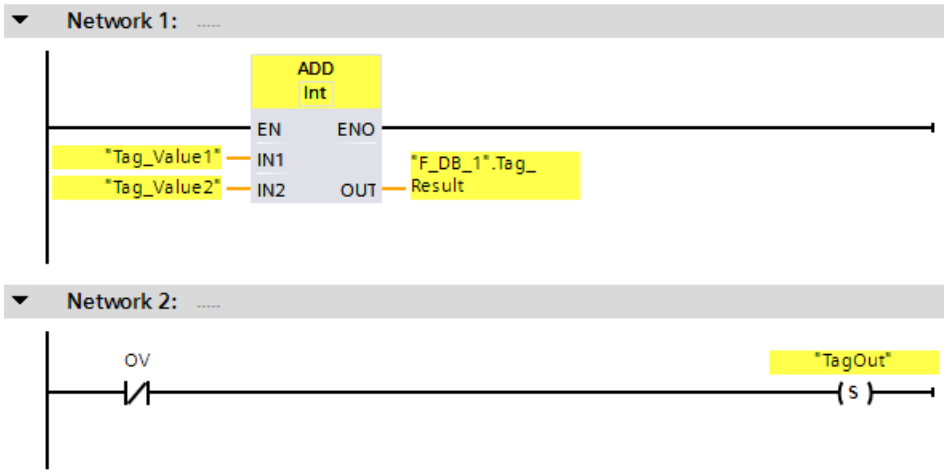
If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.16.1.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

You can use the "Get negated status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed. This instruction is only available in LAD.

The "Get negated status bit OV" instruction functions like a normally closed contact. If the query is satisfied, the instruction has signal state "0". If the query is not satisfied, the instruction has signal state "1".



The "Get negated status bit OV" evaluation must be inserted in the network following the instruction that influences the OV. This network must not contain any jump labels.

NOTE

The execution time of the OV-affecting instruction is extended when the "Get negated status bit OV " instruction is used (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).

Example

The following example shows how the instruction works:

The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If an overflow does *not* occur during execution of the "Add" instruction, the status bit OV is reset to "0". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.16.2 FBD

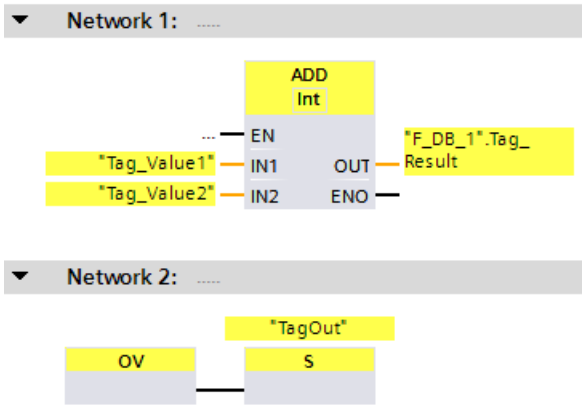
13.16.2.1 OV: Get status bit OV (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".



You can program a query of status bit OV for "0" with the "Invert RLO" instruction.

NOTE

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831)).

Example

The following example shows how the instruction works:

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.17 Communication

13.17.1 PROFIBUS/PROFINET

13.17.1.1 SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V21)

Introduction

You use the SENDDP and RCVDP instructions for fail-safe sending and receiving of data using:

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication

Description

The SENDDP instruction sends 16 data elements of data type BOOL and 2 data elements of data type INT or one data element of the data type DINT (S7-1200, S7-1500) in a fail-safe manner to another F-CPU via PROFIBUS DP/PROFINET IO. The data can be received there by the related RCVDP instruction.

Every call of this instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g. RCVDP_DB_1) for these instructions. Once it is created, the new data block can be found in the "STEP 7 Safety" folder in the project tree under "Program blocks > System blocks". For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

With the SENDDP instruction, the data to be sent (for example, outputs of other F-blocks/instructions) are available at input SD_BO_xx or SD_I_xx or SD_DI_00 as alternative.

With the RCVDP instruction, the data received are available at outputs RD_BO_xx and RD_I_xx or RD_DI_00 as alternative for additional processing by other F-blocks/instructions.

(S7-1200, S7-1500) At the DINTMODE input of the SENDDP instruction you specify if the data at the inputs SD_I_00 and SD_I_01 or the data at the input SD_DI_00 is sent.

The operating mode of the F-CPU with the SENDDP instruction is provided at output SENDMODE. If the F-CPU with the SENDDP instruction is in disabled safety mode, output SENDMODE = 1.

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define the communication relationship between a SENDDP instruction in one F-CPU and a RCVDP instruction in the other F-CPU by specifying an F-communication ID at the DP_DP_ID inputs of the SENDDP and RCVDP instructions. Associated SENDDP and RCVDP instructions are assigned the same value for DP_DP_ID.

⚠ WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique network-wide* and CPU-wide**** at all times for all safety-related communication connections. You must check the uniqueness in the safety summary during acceptance of the safety program.

You must supply constant values*** to the DP_DP_ID and LADDR inputs when calling the instruction. Direct write access to DP_DP_ID and LADDR in the associated instance DB is not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case also, you have to check during acceptance of the safety program that uniqueness is ensured at all times. You need to check the algorithm for forming the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only

specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

**** With a redundant S7-1500HF system, both F-CPUs of the redundant S7-1500HF system are to be regarded as one single F-CPU with regard to the DP_DP_ID.

NOTE

Within a safety program, you must assign a different start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) for every call of the SENDDP and RCVDP instructions at input LADDR.

A separate instance DB must be used for each call of the SENDDP and RCVDP instructions. You must not declare and call these instructions as multi-instances.

(S7-300, S7-400) The inputs of the RCVDP and RCVS7 instructions may not have preceding logic operations (for example "AND logic operation").

The inputs of the RCVDP instruction cannot be initialized using fully qualified DB accesses with outputs of a RCVDP or RCVS7 instruction called in an upstream network.

(S7-1200, S7-1500) The RD_D_00 output must not be evaluated for DINTMODE = 0; the RD_I_xx outputs of the RCVDP instruction must not be evaluated for DINTMODE = 1.

(S7-1200, S7-1500) The outputs of the SENDDP and RCVDP instructions must not be supplied with tags from the standard user program. Exception: RET_DPRD, RET_DPWR and DIAG outputs.

Fully qualified access to DP_DP_ID and LADDR is not possible in the safety program.

You cannot use an actual parameter for an output of an RCVDP instruction, if it is already being used for an input of the same or another RCVDP or RCVS7 instruction.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

NOTE

You are not permitted to insert any SENDDP/RCVDP instructions between a JMP or JMPN instruction and the associated jump destination (jump label).

You cannot insert a RET instruction prior to a SENDDP instruction.

SENDDP parameter

The following table shows the parameters of the SENDDP instruction:

Parameter	Declaration	Data type	Description
SD_BO_00	Input	BOOL	Send data BOOL 00
...			...
SD_BO_15	Input	BOOL	Send data BOOL 15
SD_I_00	Input	INT	Send data INT 00
SD_I_01	Input	INT	Send data INT 01
SD_DI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Send data DINT 00
DINTMODE	Input	DINT	(S7-1200, S7-1500) (hidden) 0=SD_I_00 u. SD_I_01 are sent 1=SD_DI_00 is sent

Parameter	Declaration	Data type	Description
DP_DP_ID	Input	INT	F-communication ID between SENDDP and RCVDP
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 615))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=RCVDP outputs fail-safe values
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other")).
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other")).
DIAG	Output	BYTE	Non-fail safe service information

RCVDP parameter:

The following table shows the parameters of the RCVDP instruction:

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	1=Acknowledgment for reintegration of send data following communication error
SUBBO_00	Input	BOOL	Fail-safe value for receive data BOOL 00
...			...
SUBBO_15	Input	BOOL	Fail-safe value for receive data BOOL 15
SUBI_00	Input	INT	Fail-safe value for receive data INT 00
SUBI_01	Input	INT	Fail-safe value for receive data INT 01
SUBDI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Fail-safe value for receive data DINT 00
DP_DP_ID	Input	INT	F-communication ID between SENDDP and RCVDP
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 615))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication

Parameter	Declaration	Data type	Description
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with SENDDP instruction in disabled safety mode
RD_BO_00	Output	BOOL	Receive data BOOL 00
...			...
RD_BO_15	Output	BOOL	Receive data BOOL 15
RD_I_00	Output	INT	Receive data INT 00
RD_I_01	Output	INT	Receive data INT 01
RD_DI_00	Output	DINT	(S7-1200, S7-1500) (hidden) Receive data DINT 00
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other")).
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other")).
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	x	—	—	—	
1.1	o	—	—	o	These versions have identical functions to version 1.0.
1.2	x	—	—	o	
1.4	x	—	—	x	
1.3	x	—	—	o	S7-300/400: These versions have identical functions to version 1.0. S7-1200/1500: Instead of 2 data of data type INT, one data of data type DINT can be sent/received as alternative. Otherwise functionally identical to version 1.0.
1.5	x	x	—	x	
2.0	x	x[1]	—	x[2]	

o This version is no longer supported.

1 supported as of firmware V4.2

2 supported as of firmware V2.0

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
3.0	x	x[1]	—	x[2]	S7-300/400: This version has identical functions to version 2.0. S7-1200/1500: • The DP_DP_ID input can also be supplied with tags of a global F-DB. In case of DP_DP_ID = 0 no connection is established. • Supports the data status byte of the PN/PN coupler as of firmware V4.0 • Supports the simulation of the communication in S7-PLCISM operation • Use for communication with S7-1200/1500 CPUs is not recommended Otherwise functionally identical to version 2.0
3.1	x	x[1]	x	x[2]	S7-300/400: This version has identical functions to version 3.0. S7-1200/1500: • This version has identical functions to version 3.0. If the communication partner also uses a version > V3.0, a communication protocol with improved safety features becomes active. Upgrading to version V3.1 is recommended before new acceptance of an existing system. • Incompatible with S7-300/400 F-CPUs.

o This version is no longer supported.

1 supported as of firmware V4.2

2 supported as of firmware V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

Check if all communication partners of this F-CPU with SENDDP/RCVDP are S7-1200/1500 F-CPUs. In this case, use version 3.1. Otherwise, only version 3.0 or lower is possible.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

You must insert the RCVDP instruction *either* at the start of the main safety block *or* (for S7-1200/1500 F-CPUs) in an F-FB/F-FC called directly at the start of the main safety block. No other instructions can be located before in the main safety block and no other instructions can be located before or afterwards in the F-FB/F-FC.

You need to insert the SENDDP instruction *either* at the end of the main safety block *or* (with S7-1200/1500 F-CPUs) in an F-FB/F-FC called directly at the end of the main safety block. No other instructions can be located afterwards in the main safety block and no other instructions can be located before or afterwards in the F-FB/F-FC.

Startup behavior

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDDP and RCVDP instructions). During this time, the receiver (RCVDP instruction) outputs the fail-safe values present at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00.

The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON. The SENDMODE output has default setting "0" and is not updated as long as output SUBS_ON = 1.

As of version V3.0 of the SENDDP and RCVDP instructions, communication is only established when DP_DP_ID <> 0.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires or for S7-1200/1500 F-CPUs as of V3.0 due to a change of DP_DP_ID to 0 after establishment of communication, the outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVDP instruction) then outputs the fail-safe values assigned at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs. Output SENDMODE is not updated while output SUBS_ON = 1.

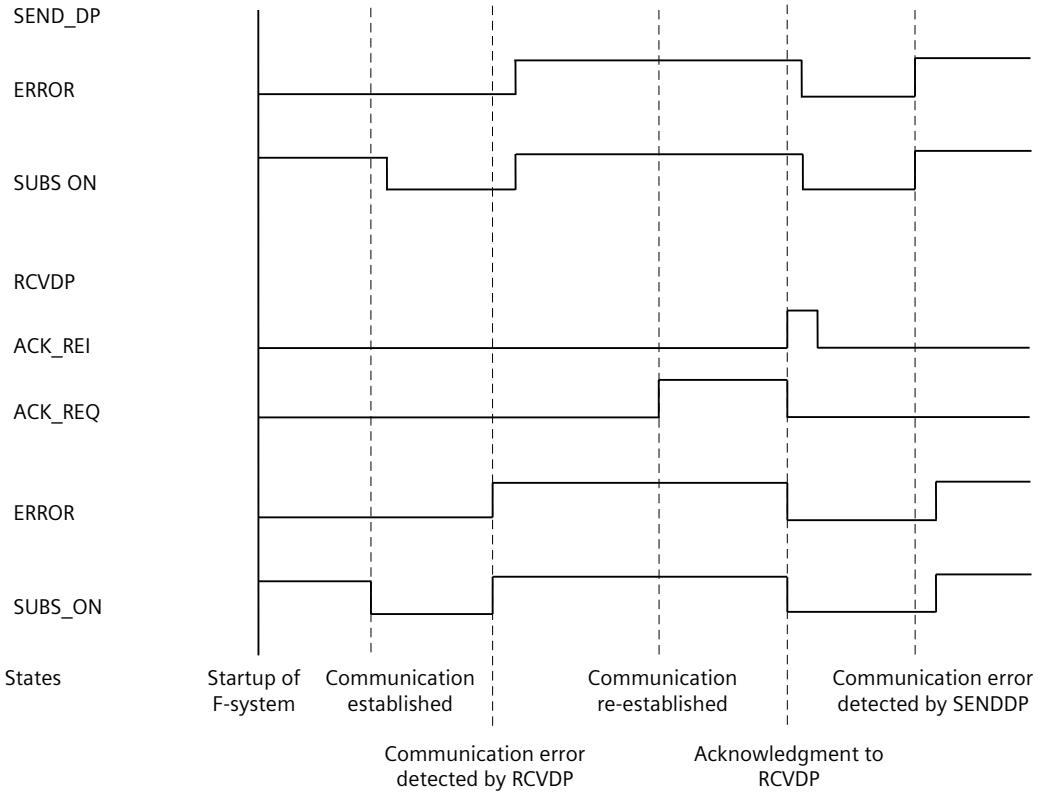
The send data of the SENDDP instruction present at inputs SD_BO_xx and SD_I_xx, SD_DI_00 as alternative, are only output again when communication errors are no longer detected (ACK_REQ = 1) and you acknowledge (Page 184) the RCVDP instruction with a positive edge at input ACK_REI.

Communication errors also occur if the values of the DP_DP_IDs between associated SENDDP and RCVDP are temporarily different on a change of the values of variable DP_DP_IDs after communication establishment.

⚠ WARNING

A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted.* *(S011)*

* If variable F-communication IDs are used, the communication partner of the SENDDP or RCVDP instructions can be changed during running operation. The resultant communication errors may only be acknowledged with an automatically generated signal at the ACK_REI input under the following conditions:



- The safety program reliably forms a signal "Communication partner change is in progress" with the RCVDP instruction on the basis of the process state.
- The signal "Communication partner change is in progress" is only formed if there is no communication error.
- While the signal "Communication partner change is in progress" is active, no evaluation of the received process values is carried out at the RCVDP instruction.
- Automatic acknowledgment takes place only if the "Communication partner change is in progress" signal is present.
- From a safety standpoint automatic reintegration is permitted for the relevant process.

Note that output ERROR (1=communication error) for a communication error will not be set unless communication between the connection partners (SENDDP and RCVDP instructions) has been previously established. If communication cannot be established after startup of the

sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDDP and the RCVDP instructions, and the bus connection. You also obtain information on possible error causes by evaluating outputs DIAG, RET_DPRD and RETDP_WR.

In general, always evaluate RET_DPRD and RETDP_WR, since it is possible that only one of the two outputs will contain error information.

Timing diagrams SENDDP/RCVDP

Output DIAG

In addition, non-fail-safe information about the communication states that occurred is provided at output DIAG of the SENDDP and RCVDP instructions for service purposes.

You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0-6 remain saved until you acknowledge the RCVDP instruction at the ACK_REI input.

Structure of DIAG of the SENDDP/RCVDP instruction

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Invalid DP_DP_ID	The DP_DP_ID is 0.	Check the DP_DP_ID of SENDDP or RCVDP.
Bit 4	Timeout of SENDDP/RCVDP detected	The standard user program overwrites transfer areas of SENDDP and RCVDP.	Check the standard user program for write access to the transfer areas of SENDDP and RCVDP. Also take indirect accesses into account.
		DP_DP_ID of SENDDP and RCVDP different.	Check the DP_DP_ID of SENDDP and RCVDP.
		For variable F-communication IDs the values are changed at the DP_DP_ID input.	When the DP_DP_ID of SENDDP and RCVD is consistent again, perform an acknowledgment at the ACK_REI input.
		Interference in bus connection to partner F-CPU.	Check the bus connection and ensure that there are no external sources of interference.
		The values at the TIMEOUT input are different for SENDDP and RCVDP.	Configure identical values at the TIMEOUT input of SENDDP and RCVDP.
		Monitoring time setting for F-CPU and partner F-CPU is too low.	Check the parameterized monitoring time TIMEOUT at SENDDP and RCVDP of both CPUs. Set a higher value if necessary. Recompile the safety program.
		Configuration of the DP/DP coupler or PN/PN coupler is invalid.	Check the configuration of the DP/DP coupler or of the PN/PN coupler.
		Data validity indicator "DIA" of the DP/DP coupler is "ON".	Set the data validity indicator "DIA" at the DIL switch of the DP/DP coupler to "OFF".
		Parameter "Data validity indicator DIA" of the PN/PN coupler is activated.	Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler.
		Parameter "Activate data status" of the PN/PN coupler (as of V4.0) is activated.	Deactivate the "Activate data status" parameter in the properties for the PN/PN coupler (as of V4.0) or S7-1200/1500: Use Version V3.0 of the SENDDP and RCVDP instructions.
		Internal fault of DP/DP coupler or PN/PN coupler	Replace the DP/DP coupler or PN/PN coupler
		CP in STOP mode, or internal fault in CP	Switch the CP to RUN. Check the diagnostics buffer of the CP. If necessary, replace the CP.
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	Switch the F-CPUs to RUN. Check the diagnostics buffer of the F-CPUs. If necessary, replace the F-CPUs.
Bit 5	Sequence number error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 6	CRC-error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 7	Communication protocol with improved safety features is not active.	Communication partner uses an instruction version < V3.1	Upgrade the communication partner to an instruction version > V3.0 at the next opportunity.

13.17.2 S7 communication

13.17.2.1 SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V21) (S7-300, S7-400)

Introduction

You use the SENDS7 and RCVS7 instructions for fail-safe sending and receiving of data using S7 connections.

NOTE
In *STEP 7 Safety Advanced*, S7 connections are generally permitted over Industrial Ethernet only.
Safety-related communication via S7 connections is possible from and to F-CPUs with PROFINET interface or S7-400 F-CPUs with PROFINET-capable CPs. See also Safety-related communication via S7 connections (Page 230).

Description

The SENDS7 instruction sends the send data contained in an F-communication DB to the F-communication DB of the associated RCVS7 instruction of another F-CPU in a fail-safe manner using an S7 connection.

Every call of this instruction must be assigned a data area in which the instruction data is stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SENDS7_DB_1) or a multi-instance (e.g., SENDS7_Instance_1) for this instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Information on the F-communication DB is contained in "Programming safety-related communication via S7 connections (Page 232)".

An F-communication DB is an F-DB for safety-related CPU-CPU communication with special properties. You must specify the numbers of the F-communication DBs at inputs SEND_DB and RCV_DB of instructions SENDS7 and RCVS7.

The operating mode of the F-CPU with the SENDS7 instruction is provided at output SENDMODE of the RCVS7 instruction. If the F-CPU with the SENDS7 instruction is in disabled safety mode, then output SENDMODE = 1.

To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND with "0" (default = "1"). In this case, send data is no longer sent to the F-communication DB of the associated RCVS7 instruction, and the receiver provides fail-safe values for this period of time (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.

You must specify the local ID - from the perspective of the F-CPU - of the S7 connection (from the connection table in the network view) at input ID of the SENDS7 instruction (see also Configuring (Page 33)).

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define a communication relationship between an SENDS7 instruction in one F-CPU and a communication relationship between an RCVS7 instruction and the other F-CPU by assigning an odd number at input R_ID (of the SENDS7 and RCVS7 instructions). Associated SENDS7 and RCVS7 instructions receive the same value for R_ID.

⚠ WARNING

The value of the respective F-communication ID (input R_ID; data type: DWORD) can be freely selected; however, it must be odd and unique for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.
You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to ID and R_ID in the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

NOTE

A separate instance DB must be used for each call of the SENDS7 and RCVS7 instructions within a safety program. You must not declare and call these instructions as multi-instances.
The inputs of the RCVS7 instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVS7 or RCVDP instruction called in an upstream network.
You cannot use an actual parameter for an output of an RCVS7 instruction, if it is already being used for an input of the same or another RCVS7 or RCVDP instruction.
The F-CPU can go to STOP if this is not observed. A diagnostics event is entered in the diagnostics buffer of the F-CPU.

NOTE

You must not program any SENDS7/RCVS7 instruction between a JMP or JMPN instruction and the associated destination network of the JMP or JMPN instruction.
You cannot program a RET instruction prior to a SENDS7 instruction.

SENDS7 parameter

The following table shows the parameters of the SENDS7 instruction:

Parameter	Declaration	Data type	Description
SEND_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 615))
EN_SEND	Input	BOOL	1= Send enable
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for a F-communication ID between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Receiving block outputs fail-safe values
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail-safe service information

RCVS7 parameter

The following table shows the parameters of the RCVS7 instruction.

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	Acknowledgment for reintegration of send data after communication error
RCV_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 615))
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for a F-communication ID between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with the SENDS7 instruction in disabled safety mode

Parameter	Declaration	Data type	Description
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail-safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1500	Function
1.0	x	—	
1.1	x	—	This version has identical functions to version 1.0. It also supports later versions of internally called instructions.
1.2	x	—	This version has identical functions to version 1.0/1.1. It also supports later versions of internally called instructions.

When a new F-CPU is created with *STEP 7 Safety Advanced*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

You must insert the RCVS7 instruction at the start of the main safety block. No other instructions may be located before it in the main safety block.

You must insert the SENDS7 instruction at the end of the main safety block. No other instructions may be located after it in the main safety block.

Startup behavior

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDS7 and RCVS7 instructions). The receiver (RCVS7 instruction) provides fail-safe values for this time period (initial values in its F-communication DB).

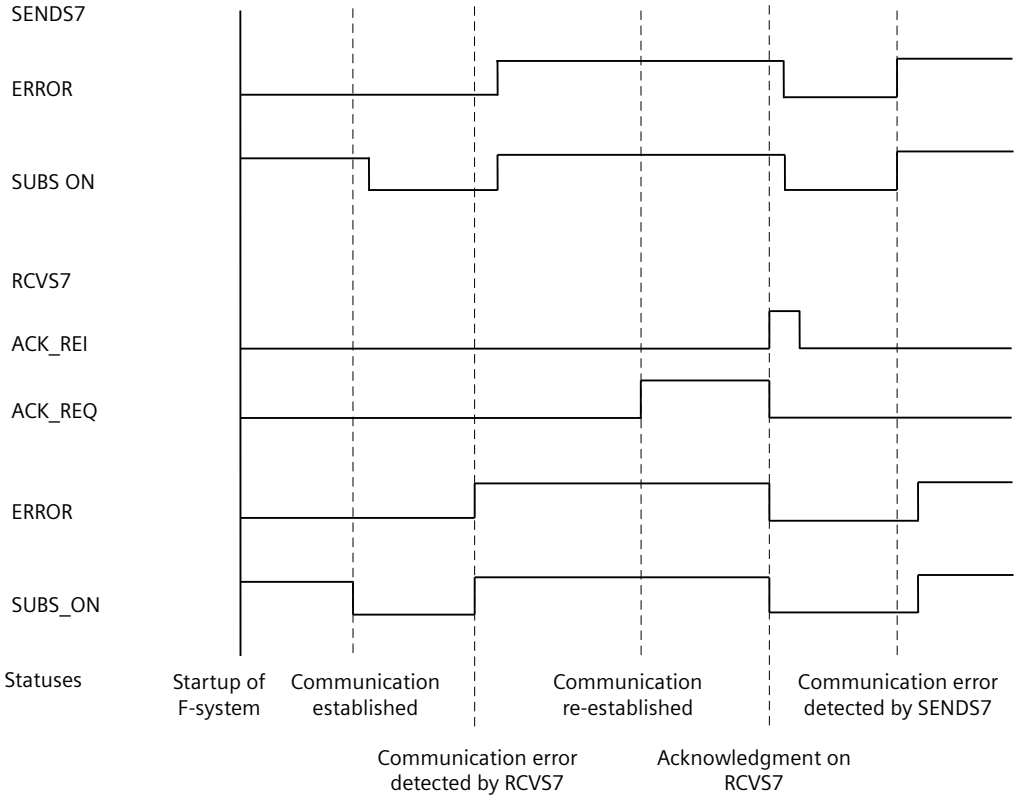
The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON. The SENDMODE output (RCVS7 instruction) has default setting "0" and is not updated as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVS7 instruction) then provides fail-safe values (initial values in its F-communication DB). Output SENDMODE is not updated while output SUBS_ON = 1.

The send data present in the F-communication DB (SENDS7 instruction) are not output before the communication error is no longer detected (ACK_REQ = 1) and you acknowledge (Page 184) with a positive edge at input ACK_REI of the RCVS7 instruction.

WARNING



A user acknowledgment (Page 184) must always take place with a signal that was generated by manual operation. Implementation with an automatically generated signal is not permitted. *(S011)*

Note that output ERROR (1=communication error) will be set for the first time on a communication error if communication has already been established between the connection partners (SENDS7 and RCVS7 instructions). If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions, and the bus connection. You can also receive information on possible error causes by evaluating the STAT_RCV and STAT_SND outputs.

In general, always evaluate STAT_RCV and STAT_SND, since it is possible that only one of the two outputs will contain error information.

If one of the DIAG bits is set at output DIAG, also check whether the length and structure of the associated F-communication DB on both the sending and receiving ends match.

Timing diagrams SENDS7 and RCVS7

Output DIAG

Non-fail-safe information on the type of communication errors that have occurred is made available at output DIAG for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge them at input ACK_REI of the associated RCVS7 instruction.

Structure of DIAG

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout detected by SENDS7 and RCVS7	Fault in bus connection to partner F-CPU	Check bus connection and ensure that no external fault sources are present.

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 4	Timeout detected by SENDS7 and RCVS7	Monitoring time setting for F-CPU and partner F-CPU is too low	Check assigned monitoring time TIMEOUT for SENDS7 and RCVS7 of both F-CPUs. If possible, set a higher value. Recompile safety program
		CPs in STOP mode, or internal fault in CPs	• Switch CPs to RUN mode • Check diagnostic buffer of CPs • Replace CPs, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	• Switch F-CPUs to RUN mode • Check diagnostic buffer of F-CPUs • Replace F-CPUs, if necessary
		Communication was shut down with EN_SEND = 0.	Enable communication again at the associated SENDS7 with EN_SEND = 1
		S7 connection has changed, the IP address of the CP has changed, for example	Recompile the safety programs and download them to the F-CPUs

Monitoring and response times

A

Introduction

In the following, you will learn:

- Which F-specific monitoring times you must configure
- Which rules must be followed when specifying monitoring times
- Where you enter the F-specific monitoring times
- Which rules must be followed with regard to the maximum response time of a safety function

Support for calculations

An Excel file is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109783831) to support you in the approximative calculation of the runtimes of the F-runtime groups, the F-specific minimum monitoring times and the maximum response times for your F-system.

Additional information

The monitoring and response times for the standard part are calculated in SIMATIC Safety in exactly the same way as for standard S7-300, S7-400, S7-1200 and S7-1500 automation systems and are not addressed here. For a description of this calculation, refer to the *hardware manuals for the CPUs*. For redundant S7-1500HF systems, also observe the system manual "Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)".

A.1 Configuring monitoring times

Monitoring times to be configured

You must configure the following monitoring times:

Monitoring...	Setting...	Parameter	See
F-cycle time or cycle time warning limit of the F-runtime groups that contain the Safety program	in *Safety Administration Editor*: • Dialog for definition of an F-runtime group	Maximum cycle time of the F-runtime group	• Procedure for defining an F-runtime group (S7-300, S7-400) (Page 130) • Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 134)
of the safety-related communication between F-CPU and F-I/O via PROFIsafe (PROFIsafe monitoring time)	In the *hardware and network editor*: • Centrally when configuring the F-CPU; properties of the F-CPU; or • when configuring the F-I/O; properties of the F-I/O	F-monitoring time F_WD_TIME	• Configuring an F-CPU (Page 39) • Configuring F-I/O (Page 51) • Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 37)
Communication via SENDDP/RCVDP or SENDS7/RCVS7 instructions:	At the TIMEOUT input of the instructions: • SENDDP; RCVDP; SENDS7; RCVS7	TIMEOUT	• Communication (Page 599)
(S7-1500) Communication via OPC UA Safety	After adding a SafetyProvider to a SafetyProvider list of a client interface (Page 315) in the properties of the SafetyConsumer in the editor for client interfaces (Page 319)	SafetyConsumer-Timeout	• Safety Parameter Interface (SPI) of the SafetyConsumer (Page 288)
(S7-1200, S7-1500) Communication with Flexible F-Link	in Safety Administration Editor: • "Flexible F-Link" area	F-monitoring time of F-communication	• "Flexible F-Link" area of the Safety Administration Editor (S7-1200, S7-1500) (Page 94) • F-runtime group communication (S7-1200, S7-1500) (Page 141) • Communication with Flexible F-Link (S7-1200, S7-1500) (Page 338)

(S7-300, S7-400) You do not have to configure the monitoring time for safety-related communication between F-runtime groups.

Rules for configuring monitoring times

When configuring monitoring times, you must take into account the availability as well as the safety of the F-system as follows:

- Availability: Sufficiently large monitoring times must be selected so that time monitoring is not exceeded in an error-free scenario.
- Safety: Sufficiently small monitoring times must be selected so that the process safety time of the process is not exceeded.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

General procedure for configuring monitoring times

Use the following procedure for configuring monitoring times:

1. Configure the standard system.
   Refer to the applicable *hardware manuals* and *Help on STEP 7* for the necessary information.
2. Configure the specific monitoring times of the F-System with respect to availability. You use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) to calculate the approximate minimum monitoring time.

   NOTE
   To avoid a triggering of the time monitoring in the special operating and system states of the redundant S7-1500HF system in case of error-free operation, higher minimum monitoring times are required for a redundant S7-1500HF system with regard to availability. This is taken into account accordingly in the Excel file for the response time calculation.

3. Use the Excel file for response time calculation to calculate the maximum response time and then verify that the process safety time of the process is not exceeded. If necessary, you must reduce the specific monitoring times of the F-System.

See also

Redundant System S7-1500R/H
(https://support.industry.siemens.com/cs/ww/en/view/109754833)

A.1.1 Minimum monitoring time for the F-runtime group cycle time

Parameter "Maximum cycle time of the F-runtime group"

You configure the monitoring time for the F-runtime group cycle time in the *Safety Administration Editor* in the work area for definition of the F-runtime group (Page 129).

To prevent F-runtime group cycle time monitoring from being triggered when there are no pending faults and causing the F-CPU to go to STOP, you must set the maximum cycle time of the F-runtime group high enough.

Use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) to determine the minimum monitoring time for the F-runtime group cycle time. Note also the comments in the Excel file.

For S7-1200/1500 F-CPUs, you can also use the tags TCYC_CURR (Page 149) and TCYC_LONG (Page 149) to determine the current and longest cycle time of the F-runtime group that occurred since the last STOP-RUN transition for dimensioning.

A.1.2 Minimum monitoring time of the F-I/O access

Parameter "F-monitoring time"

You have two options for configuring the monitoring time of safety-related communication between the F-CPU and F-I/O:

- Centrally in the *hardware and network editor* during parameter assignment of the F-CPU (Page 39); in the properties of the F-CPU, or
- During parameter assignment of the F-I/O (Page 51) in the *hardware and network editor*; in the properties of the F-I/O

NOTE

Note that in a redundant S7-1500HF system and use of an IO device that does not support system redundancy S2, there is an interruption of PROFINET communication with this device when the primary CPU fails and thus a communication error in the F-I/Os of this IO device, which requires reintegration of the F-I/Os (see section "After communication errors (Page 169)").
For IO devices with system redundancy S2, the redundant S7-1500HF system switches to the backup CPU without interruption if the primary CPU fails. During the primary backup switchover, the fail-safe outputs remain active.

"F-monitoring time" = PROFIsafe monitoring time T_{PSTO}

The specified PROFIsafe monitoring time T_{PSTO} must be high enough to prevent tripping the F-cycle time monitoring when no faults are present.

Use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) available for SIMATIC Safety to calculate the minimum monitoring time for safety-related communication between the F-CPU and F-I/O.

Note also the comments in the Excel file.

Check to determine whether configured PROFIsafe monitoring time is too short

NOTE

During commissioning of the F-system, you can perform a check while safety mode is active to determine whether the configured PROFIsafe monitoring time is too short.

This check of the PROFIsafe monitoring time is useful if you want to ensure that the configured monitoring time exceeds the minimum monitoring time by a sufficient amount. In this way, you can avoid the possible occurrence of sporadic monitoring time errors.

Procedure:

1. Insert an F-I/O (one that will not be needed later for system operation).
2. Assign a shorter monitoring time for this F-I/O than for the F-I/O of the system.
3. If the additional F-I/O fails and the "Monitoring time for safety message frame exceeded" diagnostic is signaled, you have fallen below the minimum possible PROFIsafe monitoring time.
4. Increase the monitoring time for the added F-I/O just to the point where it no longer fails. This monitoring time corresponds approximately to the minimum possible monitoring time.

Conditions:

The F-I/O to be inserted additionally and the F-I/O whose PROFIsafe monitoring time is to be checked must have the following properties in common:

- They must be inserted in the same rack
- They must be nodes in the same subnet

Tip:

It may be useful to leave the additional F-I/O in place for systems that will be modified or expanded during operation after commissioning. This F-I/O will then provide an early warning in the event of changes in the time behavior, enabling you to avoid a process shutdown triggered by the F-I/O in the process.

In a redundant S7-1500HF system, the check as to whether the configured PROFIsafe monitoring time is too short should be carried out in all operating and system states, because the response times there also depend on the respective operating and system state.

A.1.3 Minimum monitoring time for communication via the SENDDP/RCVDP or SENDS7/RCVS7 instructions

TIMEOUT Input at SENDDP and RCVDP or SENDS7 and RCVS7

The time monitoring is performed in the SENDDP and RCVDP (Page 599) or SENDS7 and RCVS7 (Page 608) instructions of the communication partners. You must assign the time monitoring with identical monitoring time for both instructions at the TIMEOUT input.

You must specify a monitoring time TIMEOUT that is large enough so that monitoring is not initiated when no faults are present.

Use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) that is available for SIMATIC Safety to determine the minimum value for TIMEOUT.

Note also the comments in the Excel file.

A.1.4 Minimum monitoring time of communication with OPC UA Safety

"SafetyConsumerTimeout" SAPI parameter

For communication with OPC UA Safety, specify the F-monitoring time for this safety-related communication after adding a SafetyProvider to a SafetyProvider list of a client interface (Page 321) in the properties of the SafetyConsumer in the editor for client interfaces (Page 315).

You must specify a monitoring time that is high enough so that SafetyConsumerTimeout is not triggered when no error has occurred.

Use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) that is available for SIMATIC Safety to determine the minimum value for SafetyConsumerTimeout.

Note also the comments in the Excel file.

A.1.5 Minimum monitoring time for communication with Flexible F-Link

"F-monitoring time" parameter in the settings for Flexible F-Link

For communication with Flexible F-Link, you specify the F-monitoring time for the safety-related communication when establishing safety-related communication (Page 94).

You must specify a monitoring time that is large enough so that F-monitoring is not initiated when no faults are present.

Use the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) that is available for SIMATIC Safety to determine the minimum value for the F-monitoring time.

Note also the comments in the Excel file.

A.1.6 Monitoring Time for Safety-Related Communication between F-Runtime Groups

Monitoring time for safety-related communication between F-runtime groups (S7-300, S7-400)

The monitoring time for safety-related communication between F-runtime groups with Flexible F-Link is determined automatically from the values of the "Maximum cycle time of F-runtime group" (work area for Definition of the F-runtime group (Page 129) in the *Safety Administration Editor*).

Monitoring time = (maximum cycle time of the 1st F-runtime group) + (maximum cycle time of the 2nd F-runtime group)

Monitoring time for safety-related communication between F-runtime groups (S7-1200, S7-1500)

You can calculate the monitoring time for safety-related communication between F-runtime groups from the values for the "Maximum cycle time of the F-runtime group" (area for Definition of the F-runtime group (Page 129) in the *Safety Administration Editor*), if you place the default user program for the F-runtime group communication into pre-/postprocessing (Page 85).

Monitoring time = (Maximum cycle time of the 1st F-runtime group) + (Maximum cycle time of the 2nd F-runtime group).

A.2 Response Times of Safety Functions

Definition of response time

The response time is the time from detection of an input signal until the linked output signal changes.

Fluctuation range

The actual response time lies between a minimum response time and maximum response time. You must always take the maximum response time into account in your system configuration.

Also note the comments in the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831).

NOTE

In a redundant S7-1500HF system, the current operating and system state influences the actual response time.

Rules for maximum response time of a safety function

The maximum response time of a safety function must be shorter than the process safety time of the process.

Definition for process safety time of a process

The process safety time of a process is the time interval between the occurrence of an error, within which the process can be left on its own without causing injury to operating personnel or damage to the environment, and the point in time the response is completed.

The controlling F-system can perform any control during the process safety time, this includes incorrectly or not at all. The process safety time of a process depends on the process type and must be determined on a case-by-case basis.

Procedure for response time calculation

The Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) is available for calculating the maximum response time of a safety function.

Use the Excel file to calculate the approximate maximum response time of the safety function and then check that the process safety time of the process is not exceeded.

If necessary, you must reduce the specific monitoring times of the F-system (see Minimum monitoring time of the F-I/O access (Page 618)).

⚠ WARNING

The response time of your safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.
Therefore, the configuration/parameter assignment of the standard system influences the response time of your safety function.
Examples:

- Increasing the priority of a standard OB compared to an F-OB can extend the cycle time of the F-OB or the runtime of the F-runtime group due to the higher-priority processing of the standard OB. Note that during the creation of technology objects, OBs with very high priority may be created automatically.
- The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".

Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety-related project data and does not lead to a modification of the collective F-signature.
If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always use the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 616)).
The monitoring times are protected against change with the access protection of the safety-related project data and are captured by the Collective F-Signature as well as the collective F-SW-signature.
When calculating with the Excel file for response time calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

⚠ WARNING

You may only use the Excel file for response time calculation or for timeout calculation when using Flexible F-Link communication, if you have observed the following rules with regard to the standard instructions for consistent transfer of data:
CPU-CPU communication (Page 338)
You must call the standard instruction for consistent sending of data and acknowledgment in the post-processing of the F-runtime group (Page 85). With the standard instructions for receiving data and acknowledgments consistently, you must differentiate whether or not the standard communication connection is deterministic. For deterministic connections (such as DPRD_DAT / DPWR_DAT), you need to call the standard instruction in the pre-processing of the F-runtime group (Page 85). If the connection is non-deterministic (e.g. S7 connection, TCP connections), you must call the standard instruction in a cyclic interrupt OB. This cyclic interrupt OB must be called at shorter intervals than the F-runtime group. A ratio of 1:5 is recommended for this.
F-runtime group communication (Page 141)
You have to call up the standard instruction UMOVE_BLK for transferring the data to be sent in the postprocessing of the sending F-runtime group. You have to call the standard instruction UMOVE_BLK for transferring the acknowledgment to be sent in the postprocessing of the receiving F-runtime group. *(S089)*

⚠ WARNING

You may only use the Excel file for response time calculation or for timeout calculation (https://support.industry.siemens.com/cs/ww/en/view/109783831) when using OPC UA Safety communication, if you have observed the following rules with regard to the standard instruction OPC_UA_MethodCall:
You must call up the standard instruction OPC_UA_METHODCALL to receive the data in the pre-processing of the F-runtime group (Page 85) and to send the request in the post-processing of the F-runtime group (Page 85). The REQ input of the instruction must be supplied with a positive signal edge during preprocessing. You can use the F-OPC-UA-Consumer-Com-FB provided by the system for this. *(S112)*

Checklist

B

Life cycle of fail-safe automation systems

The following table contains a checklist summarizing all activities in the life cycle of a fail-safe SIMATIC Safety system, including requirements and rules that must be observed for each activity.

Checklist

Assignment of the F-BaseID during runtime (delayed transfer) (S7-1200 G2, S7-1500)

C

If the F-BaseID with the value "Delayed transfer" (0x7C6) has been configured, you must generate an active F-BaseID in runtime and assign it to the F-CPU and the F-I/O. The following instructions are available to you for this purpose.

- BASEID_GEN
- BASEID_DATA
- BASEID_CODING
- BASEID_HOST

The instructions are made available in the "Extended instructions" area under "Safety-Extensions".

These instructions are not fail-safe instructions and can only be placed in a standard block. They may only be used in the case "Delayed transfer of the F-BaseID".

In the case "Delayed transfer of the F-BaseID", the F-BaseID is generated once by these instructions on the first startup of the F-CPU, saved in the F-CPU and assigned to the F-I/Os. After the F-CPU starts up again, the F-BaseID previously saved in the F-CPU is applied again and forwarded to the F-I/O.

NOTE

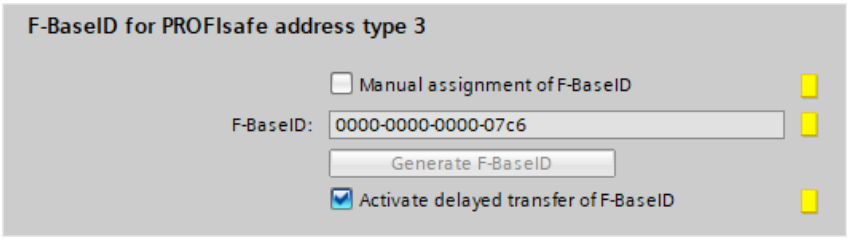
The F-I/Os of PROFIsafe address type 3 remain passivated until the logic for assignment of the F-BaseID is complete.

NOTE

You can find the BaseIDAssign application example on the Internet. It presents a possible interconnection of the above-named instructions for the delayed transfer of the F-BaseID.

NOTE

The BASEID_GEN instruction is only supported for S7-1500 HF-CPUs as of firmware V4.2.



Configuring delayed transfer of the F-BaseID

For delayed transfer of the F-BaseID, configure the F-CPUs and the F-I/Os with the "Activate delayed transfer of F-BaseID" option enabled in accordance with the PROFIsafe specification.

Proceed as follows:

1. For the F-I/Os of PROFIsafe address type 3, configure (Page 68) the F-BaseID with the value 0 and with the intended F-source and F-destination addresses.
2. Download (Page 345) the project data to the F-CPU.
3. Assign (Page 70) the PROFIsafe addresses with SIMATIC Safety.
4. Create the user program.

5. In the F-CPU parameters (Page 39), enable the "Activate delayed transfer of the F-BaseID" option. The F-BaseID changes to 0x7C6.

6. In the standard program, program the logic for assigning the F-BaseID with BASEID_GEN, BASEID_DATA, BASEID_CODING and BASEID_HOST.
7. Download (Page 345) the project data to the F-CPU.
8. Switch the F-CPU to RUN. The F-BaseID is assigned.

⚠ WARNING

During assignment of the F-BaseID by means of the BASEID_CODING instruction, only the F-modules to which the F-BaseID is to be assigned should be accessible. Therefore, temporarily isolate the network in which the F-CPU and the assigned F-modules are located. *(S119)*

As an alternative to the BASEID_CODING instruction, you can use the instruction PROFIsafeAddrAssign (https://support.industry.siemens.com/cs/ww/en/view/109748466) (as of Version 3.0). With this instruction, you can additionally assign the F-destination and F-source addresses. Steps 1 to 3 are omitted in this case.

⚠ WARNING

Note that when the PROFIsafeAddrAssign instruction with F-I/Os of PROFIsafe address type 3 is being used, you must always confirm the correctness of the assignment using suitable measures. This applies even if you only changed the F-BaseID, because all parts of the PROFIsafe address are assigned at the same time in this case. In addition, you must prevent an unintended execution of the PROFIsafeAddrAssign instruction. You can find details on this in the named application example. *(S118)*

Order when programming the instructions for F-BaseID

In order to set the F-BaseID at runtime, you must interconnect the following instructions from the standard library under "Safety Extensions" in a cyclic standard user program:

- BASEID_GEN
- BASEID_DATA
- BASEID_CODING
- BASEID_HOST

NOTE

The instructions BASEID_GEN, BASEID_DATA, BASEID_CODING and BASEID_HOST are processed asynchronously. You must interconnect these instructions in such a way that they are processed sequentially in the above-named order.

C.1 Safety Extensions

C.1.1 BASEID_GEN

Description

At a positive edge at input REQ, the BASEID_GEN instruction generates the F-BaseID once and provides it at output BASEID.

If the F-CPU already has a set F-BaseID, this F-BaseID is provided at output BASEID.

Parameters

The following table shows the parameters of the BASEID_GEN instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = 1: Runs BASEID_GEN.
HW_IDENTIFIER_IM	Input	HW_IO	The HW identifier of the executing F-CPU.
BASEID	Output	LINT	The read or generated F-BaseID.
CALCULATED	Output	BOOL	CALCULATED = 1: The output F-BaseID was generated.
DONE	Output	BOOL	DONE = 1: Processing of the instruction is complete.
BUSY	Output	BOOL	BUSY = 1: Generation of the F-BaseID is active.
ERROR	Output	BOOL	ERROR = 1: An error has occurred.
STATUS	Output	DWORD	Error information

NOTE

If you want to regenerate the F-BaseID but the parameter of the F-CPU no longer has the value 0x7C6, you must first reset this to 0x7C6 using the BASEID_Host instruction.

Instruction versions

The following version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x[1]	x[1]	BASEID_GEN reads the F-BaseID from the parameters of the F-CPU or, if F-BaseID = 0x7C6 was read, generates a new F-BaseID.

[1] Supported as of firmware V4.1 (for S7-1500 HF-CPUs only as of V4.2) or as of V40.1 for S7-1500 F Software Controllers

STATUS output

The table below shows the meaning of the values for the STATUS parameter:

Error code	Explanation
0x0000	No error
0x8001	Error in the generation of the F-BaseID

C.1.2 BASEID_DATA

Description

The instruction BASEID_DATA calculates the F-BaseID CRC according to the PROFIsafe specification and writes the F-BaseID with the calculated F-BaseID CRC to the data record of the F-module specified at input HW_WRITE_RECORD_NR. To calculate the F-BaseID CRC, the F_Par_CRC is read from the data record of the F-module specified at the HW_READ_RECORD_NR input.

Parameters

The following table shows the parameters of the BASEID_DATA instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = 1: Runs BASEID_DATA.
BASEID	Input	LINT	The F-BaseID to be written.
HW_IDENTIFIER_MODULE	Input	HW_IO	The HW identifier of the F-module.
HW_READ_RECORD_NR	Input	DINT	Data record number of the F-module for reading the F_Par_CRC (needed to calculate the F-BaseID CRC).
HW_WRITE_RECORD_NR	Input	DINT	Data record number of the F-module for writing the F-BaseID.
DONE	Output	BOOL	DONE = 1: Processing of the instruction is complete.
BUSY	Output	BOOL	BUSY = 1: The instruction is running.
ERROR	Output	BOOL	ERROR = 1: An error has occurred.
STATUS	Output	DWORD	Error information

NOTE
The inputs HW_READ_RECORD_NR (128) and HW_WRITE_RECORD_NR (130) are preassigned with the usual data record numbers for F-modules by SIEMENS.

Instruction versions

The following version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x[1]	x[1]	BASEID_DATA writes the F-BaseID to the data record of an F-module

[1] Supported as of firmware V4.1 or as of V40.1 for S7-1500 F Software Controllers

STATUS output

The table below shows the meaning of the values for the STATUS parameter:

Error code	Explanation
0x0000	No error
0x8001	Error during generation of the F-BaseID CRC
0x0050	The F-BaseID is in the reserved range.

C.1.3 BASEID_CODING

Description

The instruction BASEID_CODING writes the F-BaseID to the electronic coding element of the F-module specified at input HW_IDENTIFIER_MODULE. If the values in the data record and the electronic coding element do not match, an inconsistency occurs and the F-module is passivated until the values match.

NOTE

Using the BASEID_CODING instruction, the F-BaseID in the electronic coding element can only be overwritten if it still has the value 0.
Otherwise, the firmware prevents the writing of the new F-BaseID and the existing value in the electronic coding element is retained. To be able to change an F-BaseID, a project with F-BaseID with value 0 must therefore first be loaded and an assignment made via TIA Portal. "Delayed transfer" must then be parameterized again in the project and this project must be loaded. Now the F-BaseID can be set at the electronic coding element again with the BASEID_CODING instruction.

NOTE

As an alternative to using the BASEID_CODING instruction, the F-BaseID can also be assigned together with the PROFIsafe addresses. For this you can use the instruction PROFIsafeAddrAssign (https://support.industry.siemens.com/cs/ww/en/view/109748466) (as of Version 3.0) available on the Internet.

⚠ WARNING

Note that when the PROFIsafeAddrAssign instruction with F-I/Os of PROFIsafe address type 3 is being used, you must always confirm the correctness of the assignment using suitable measures. This applies even if you only changed the F-BaseID, because all parts of the PROFIsafe address are assigned at the same time in this case. In addition, you must prevent an unintended execution of the PROFIsafeAddrAssign instruction. You can find details on this in the named application example. *(S118)*

⚠ WARNING

During assignment of the F-BaseID by means of the BASEID_CODING instruction, only the F-modules to which the F-BaseID is to be assigned should be accessible. Therefore, temporarily isolate the network in which the F-CPU and the assigned F-modules are located. *(S119)*

Parameters

The following table shows the parameters of the BASEID_CODING instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = 1: Runs BASEID_CODING.
BASEID	Input	LINT	The F-BaseID to be written.
HW_IDENTIFIER_MODULE	Input	HW_IO	The HW identifier of the F-module.
DONE	Output	BOOL	DONE = 1: Processing of the instruction is complete.
BUSY	Output	BOOL	BUSY = 1: The instruction is running.
ERROR	Output	BOOL	ERROR = 1: An error has occurred.
STATUS	Output	DWORD	Error information

Instruction versions

The following version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x[1]	x[1]	BASEID_CODING writes the F-BaseID to the electronic coding element of an F-module.

[1] Supported as of firmware V4.1 or as of V40.1 for S7-1500 F Software Controllers

STATUS output

The table below shows the meaning of the values for the STATUS parameter:

Error code	Explanation
0x0000	No error
0x0050	The F-BaseID is in the reserved range.

C.1.4 BASEID_HOST

Description

The instruction BASEID_HOST writes the specified F-BaseID to the parameters of the executing F-CPU.

Parameters

The following table shows the parameters of the BASEID_HOST instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = 1: Runs BASEID_HOST.
BASEID	Input	LINT	The F-BaseID to be written.
DONE	Output	BOOL	DONE = 1: Processing of the instruction is complete.
BUSY	Output	BOOL	BUSY = 1: The instruction is running.
ERROR	Output	BOOL	ERROR = 1: An error has occurred.
STATUS	Output	DWORD	Error information

Instruction versions

The following version is available for this instruction:

Version	S7-300/400	S7-1200 G1	S7-1200 G2	S7-1500	Function
1.0	—	—	x[1]	x[1]	BASEID_HOST writes the F-BaseID to the parameters of the F-CPU.

[1] Supported as of firmware V4.1 or as of V40.1 for S7-1500 F Software Controllers

STATUS output

The table below shows the meaning of the values for the STATUS parameter:

Error code	Explanation
0x0000	No error
0x0050	The F-BaseID is in the reserved range.

F-CPUs
Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://www.siemens.com/cert.

Content

Introduction
This Product Information contains important information on the F-CPUs specified in the section "Scope of validity". The Product Information is part of the product supplied. The information in this Product Information should be considered more up-to-date than other documentation if uncertainties arise.

Scope of validity
The statements in this Product Information apply to the F-CPUs listed below:

S7-1200 F-CPUs	
S7-1200 F-CPUs G1	**S7-1200 F-CPUs G2**
• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly • CPU 1215FC DC/DC/DC • CPU 1215FC DC/DC/Rly	• CPU 1212FC DC/DC/DC • CPU 1212FC DC/DC/Rly • CPU 1214FC DC/DC/DC • CPU 1214FC DC/DC/Rly

Areas of application

Main areas of application of the S7-1200/1500 F-CPUs are personal and machine safety and burner controls. In addition to the safety program, you can also program standard applications.

You can operate the S7-1200/1500 F-CPUs in safety or standard mode. In standard mode, S7-1200/1500 F-CPUs behave like standard S7-1200/1500 CPUs.

For S7-1500 F-CPUs, an installed license for *STEP 7 Safety* is required for safety mode. Without an installed license for *STEP 7 Safety*, you can use the S7-1500 F-CPUs in standard mode.

An installed license for *STEP 7 Safety* is not required for S7-1200 F-CPUs for safety mode.

Additional information on using the S7-1200/1500 F-CPUs in safety mode is available in the programming and operating manual "SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)".

Information on using the S7-1200 F-CPUs in standard mode is available in the relevant system manuals for the S7-1200 standard CPUs at the following links:

- CPUs 121x G1 (https://support.industry.siemens.com/cs/ww/en/view/109772940)
- CPUs 121x G2 (https://support.industry.siemens.com/cs/ww/en/ps/30069/man)

Additional information on using the S7-1500 F-CPUs in standard mode is available in the relevant manuals for the S7-1500 and the standard-T-CPUs S7-1500 at the following links:

- CPUs 151x (http://support.automation.siemens.com/WW/view/en/67295862/133300)
- CPU 1518HF-4 PN (https://support.industry.siemens.com/cs/ww/en/view/109784207)
- CPUs 151xT (https://support.industry.siemens.com/cs/ww/en/ps/22057/man)
- CPUs 151xSP (http://support.automation.siemens.com/WW/view/en/90466439/133300)
- CPU 151xpro-2 PN (https://support.industry.siemens.com/cs/ww/en/ps/13906/man)
- CPU 151xV-1 PN (https://support.industry.siemens.com/cs/ww/en/view/109996319)
- S7-1500 Software Controller (https://support.industry.siemens.com/cs/ww/en/ps/13911/man)

You can find the latest firmware for the relevant F-CPU by searching for downloads with the respective article number in the Industry Online Support (https://support.industry.siemens.com).

NOTE

Observe any application-specific requirements, for example on mains buffering for power supplies/power packs.

PFD_{avg} and PFH values for F-CPUs
Below are the probability of failure on demand values (PFD_{avg}, PFH values) for the above-named F-CPUs with a mission time of 20 years and an MTTR of 100 hours:

Low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	High demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure [h^{-1}]
< 2E-05	< 1E-09 up to an operational altitude of 3 000 m or < 2E-09 at an operating altitude greater than 3 000 m up to 5 000 m

* with condensation

NOTE

Operation of an (F-)CPU is permitted only up to 100% of the indicated CPU work memory in the TIA Portal.

Restrictions on the maximum specified ambient air temperature with reference to the installation altitude

Installation altitude	Derating factor for ambient air temperature [1]
-1 000 to 2 000 m	1.0
2 000 to 3 000 m	0.9
3 000 to 4 000 m	0.8
4 000 to 5 000 m	0.7

[1] The basic value for the application of the derating factor is the maximum permissible ambient temperature in °C for 2 000 m

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air at higher altitudes due to lower density.
- Pay attention to the mounting position of the respective module in the technical data. Based on the IEC 61131-2 standard.
- Ensure that the power supply units used are also adequate for altitudes > 2 000 m.
- The displays of the S7-1500 CPUs are designed for an altitude of ≤ 3 000 m. If used at > 3 000 m, in rare cases, there can be problems in the representation of the CPU display; however, these do not have an effect on the functional safety of the F-CPU.
- The "Safety-oriented tripping of standard modules" function, as described on the SIEMENS Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/39198632) pages, is only approved up to max. 2 000 m.

Effects on the availability

The higher cosmic radiation present during operation at altitudes above 2 000 m will also start to have an effect on the failure rate of electronic components (the so-called soft error rate). In rare cases, this can result in a transition of the F-CPU into the safe state. However, the functional safety of the F-CPU is fully retained.

Currently valid markings and approvals

NOTE

Information on the components of the S7-1200/S7-1500

The currently valid markings and approvals are printed on the components of the S7-1500.

The F-CPUs are certified for use in safety mode up to 3 000 m or 5 000 m. All other markings and approvals are currently based on a height of up to 2 000 m.

Shipping and storage conditions

The S7-1200/S7-1500 fulfills the requirements according to IEC 61131-2 with regard to the shipping and storage conditions. The following information applies to modules shipped or stored in their original packaging.

Type of condition	Permissible range
Air pressure	from 1 140 to 540 hPa (corresponds to an altitude of -1 000 m to 5 000 m)

Equipment manual for CPU 1517F-3 PN/DP (6ES7517-3FP01-0AB0)

You can find the technical specifications in the equipment manual for the CPU 1517-3 PN/DP (6ES7517-3AP00-0AB0) (https://support.industry.siemens.com/cs/ww/en/view/90471765).

The following values differ with the CPU 1517F-3 PN/DP (6ES7517-3FP01-0AB0):

- Current consumption (nominal value) is 1.7 A
- The current consumption (max.) and inrush current (max.) amounts to 2.2 A
- I^2t is 0.5 A^2s
- The power loss is 29 W

Overview of the behavior of the F-CPUs regarding communication network disconnectors according to IEC 61784-3-3 (PROFIsafe standard)

F-CPU	Network disconnector according to IEC 61784-3-3	Remark
S7-1200 G1	• Network disconnection between Ethernet X1 and CP/CM on the backplane bus.	See [1] and [2]
CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly		
CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly		
CPU 1215FC DC/DC/DC CPU 1215FC DC/DC/Rly		
S7-1200 G2	• Network disconnection between Ethernet X1 and CP/CM on the backplane bus.	See [1] and [2]
CPU 1212FC DC/DC/DC CPU 1212FC DC/DC/Rly		
CPU 1214FC DC/DC/DC CPU 1214FC DC/DC/Rly		

[1] Absolute network disconnector between socket A and B:

a) If A and B belong to different local Ethernet interfaces (for example, X1 and X2) and no bridging is implemented at communication level 2 for these interfaces.

a) If either A or B are part of a local Ethernet interface and the other is part of a backplane bus module with an Ethernet interface (CP, CM), and no bridging is implemented at communication level 2 for these interfaces.

[2] No network disconnector between socket A and B:

a) If A and B belong to the same local Ethernet interface (for example, X1).

b) If A and B both belong to a backplane bus module (CP, CM).

[3] As of firmware V3.0, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

[4] As of firmware V3.1, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

[5] As of firmware V4.0, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

[6] With firmware higher than V40.0.0 with configured CP1625-2 (in TIA Portal and Resource Configurator), the F-CPU is only a network disconnector between the two interfaces of the CP1625-2 if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

S7-1500	• Network disconnection between Ethernet X1 and CP/CM on the backplane bus.	See [1] and [2]
CPU 1511(T)F-1 PN

CPU 1512SP F-1 PN		
CPU 1514SP (T)F-2 PN [3]	• Network disconnection between Ethernet X1 and X2. • Network disconnection between Ethernet X1 and CP/CM on the backplane bus. • Network disconnection between Ethernet X2 and CP/CM on the backplane bus.	
CPU 1515(T)F-2 PN [3]		
CPU 1516F-3 PN/DP [3]		
CPU 1516TF-3 PN/DP		
CPU 1517(T)F-3 PN/DP		
CPU 1513proF-2 PN [4]		
CPU 1516proF-2 PN [4]		
CPU 1516TF-3 PN [5] CPU 1517(T)F-3 PN [5] CPU 1518(T)F-3 PN [5] CPU 1518(T)F-4 PN/DP (ODK) CPU 1518HF-4 PN [5]	• Network disconnection between Ethernet X1, X2 and X3. • Network disconnection between Ethernet X1 and CP/CM on the backplane bus. • Network disconnection between Ethernet X2 and CP/CM on the backplane bus. • Network disconnection between Ethernet X3 and CP/CM on the backplane bus.	
CPU 1511VF-1 PN CPU 1517VF-1 PN	**No**	-
CPU 1518F-4 PN/DP MFP		
CPU 1505SP (T)F	• With Open Controller CPU 1515SP PC1 and PC2: **No** • With Open Controller CPU 1515SP PC3: Network disconnection between Ethernet X1 and X10.	See [1] and [2]
CPU 1507S F [6]	• With firmware lower than V40.0.0: **No** • With firmware V40.0.0: Network disconnection between local Ethernet interface X2 and CP. Note: There is no network disconnection between multiple local Ethernet interfaces and between multiple Ethernet interfaces on a CP. • With firmware higher than V40.0.0: Network separation between local and external Ethernet interfaces, between different external Ethernet interfaces and between the two interfaces of the CP1625-2.	
CPU 1508S (T)F [6]		

1 Absolute network disconnector between socket A and B:

a) If A and B belong to different local Ethernet interfaces (for example, X1 and X2) and no bridging is implemented at communication level 2 for these interfaces.

a) If either A or B are part of a local Ethernet interface and the other is part of a backplane bus module with an Ethernet interface (CP, CM), and no bridging is implemented at communication level 2 for these interfaces.

2 No network disconnector between socket A and B:

a) If A and B belong to the same local Ethernet interface (for example, X1).

b) If A and B both belong to a backplane bus module (CP, CM).

3 As of firmware V3.0, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

4 As of firmware V3.1, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

5 As of firmware V4.0, the F-CPU is only a network disconnector if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

6 With firmware higher than V40.0.0 with configured CP1625-2 (in TIA Portal and Resource Configurator), the F-CPU is only a network disconnector between the two interfaces of the CP1625-2 if it contains a safety program with an F-communication partner (e.g.: fail-safe I/O or F-CPU).

Even when using a communication network disconnector according to IEC 61784-3-3 (PROFIsafe standard), you must still ensure that the individual isolated networks are not connected by other standard components. See also this FAQ (https://support.industry.siemens.com/cs/ww/en/view/109740240).
Standard CPUs are generally not network disconnectors according to IEC 61784-3-3 (PROFIsafe standard).

Support of PROFIsafe V2 for PROFINET IO
Interfaces that support PROFINET IO also support PROFIsafe V2.

Support of PROFIsafe V2.4 for PROFIBUS DP
Interfaces that support PROFIBUS DP also support PROFIsafe V2.4 but not PROFIsafe V2.6.

Restriction with "CREAT_DB" and "DELETE_DB" instructions
F-DBs can neither be created nor deleted.

Restriction with "READ_DBL" and "WRIT_DBL" instructions
The destination address must not point to an F-DB.

Restrictions when configuring the retentive behavior of data blocks
The configuration of the retentive behavior of data blocks is not supported for F-DBs. This means that the actual values of the F-DBs will not be retentive in the event of POWER OFF/POWER ON and restart (STOP-RUN) of the F-CPU. The F-DBs retain the initial values from the load memory.
The "Retain" check box is grayed-out for all tags in F-DBs.

Configuration control (option handling) on an S7-1200 F-CPU G1
Configuration control (option handling) on an S7-1200 F-CPU G1 is possible with central modules subject to the following limitation:

- The fail-safe S7-1200 G1 modules cannot be swapped and must also always be physically inserted into their configured slot.

Position the fail-safe S7-1200 G1 modules directly next to the F-CPU. Position the standard modules on the right next to the fail-safe S7-1200 G1 modules.

Fail-safe runtime rights when using the user management (UMAC)
When using the user management (UMAC), you can assign the following fail-safe runtime rights:

- "Full access incl. fail-safe access" for use in the TIA Portal
- "Change parameter of the F-System (F-Admin)" for use in the web server environment

Procedure for loading a configuration for firmware < V2.0 for S7-1500 F-CPUs
If you have loaded an S7-1500 F-CPU with a configuration for firmware as of V2.0 with configured protection level "Full access incl. fail-safe (no protection)" and you now want to load a configuration for firmware <= V1.8 to this F-CPU, you must observe the following:
When the configuration with firmware <= V1.8 is loaded to the F-CPU, you will be prompted to enter the password and the entered password will be identified as invalid.
As a remedy, format the SIMATIC Memory Card as described in the online help for STEP 7 under "Formatting an S7-1500 memory card". You can then load the configuration for firmware <= V1.8 to the F-CPU.

Procedure for loading a configuration for firmware V4.1 S7-1200 F-CPUs G1
If you have loaded an S7-1200 F-CPU G1 with a configuration for firmware as of V4.5 with configured protection level "Full access incl. fail-safe (no protection)" and you now want to load a configuration for firmware 4.1 to this F-CPU, you must observe the following:
When the configuration with firmware V4.1 is loaded onto the F-CPU, you are prompted to enter the password and the entered password will be identified as invalid.
As a remedy, format the SIMATIC Memory Card if you are working with an external load memory (SIMATIC Memory Card). If you are working with the internal load memory, proceed as you would for a lost password. You can then load the configuration for firmware V4.1 to the F-CPU.

Migrating or upgrading to TIA Portal V17 or higher
When migrating or upgrading to TIA Portal V17 or higher and current firmware (S7-1500F V2.9/S7-1200F G1 V4.5), we recommend that you create a new backup file.
If the existing backup file is still used, an access authorization for the F-CPU may be required when restoring the software and hardware configuration of the F-CPU.

Use of isochronous mode interrupt (F-)OBs
The number of isochronous mode interrupt (F-)OBs depends on the F-CPU used. You can obtain information in the technical specification of the F-CPU.
If the sum of the isochronous mode interrupt OBs and the isochronous mode interrupt F-OBs exceeds the number specified in the technical specifications of the F-CPU, it is no longer possible to load the standard user program in RUN.

Supplement to syslog messages for F-CPUs
For F-CPUs S7-1500/S7-1200 G2 as of V4.1, at the event "SE_USER_PROGRAM_CHANGED" the collective F signature is entered in the syslog message. If the change is rejected, the previous collective F signature is entered.
For more information about the "Syslog messages" function, see:

- SIMATIC S7-1500/ET 200MP Automation System system manual (https://support.industry.siemens.com/cs/ww/en/view/59191792) in the section "Syslog messages"
- Syslog messages product information (https://support.industry.siemens.com/cs/ww/en/view/109823696)

F-diagnostic messages with an S7-1500 HF CPU

NOTE
On a redundant system S7-1500HF, F-diagnostic messages are entered duplicated on both HF-CPUs (primary and backup CPU).
If one of the two HF CPUs is not available (e.g. STOP, POWER OFF, etc.), then the F-diagnostics is simply entered on the accessible HF CPU only. When the redundant HF-CPU returns, the diagnostics is duplicated again.

Download in Multiuser Commissioning mode

NOTE
When downloading in the Multiuser Commissioning mode, the serial number is read exclusively from the server project and compared to the linked F-CPU.
In the same manner the transferred serial number of the linked F-CPU is written back solely to the server project. The serial number from the local session is not used.

TIA Portal with CFC
STEP 7 Safety and F-CPUs with active F-functionality are not supported. You can use either CFC or the F-capability on an F-CPU.

Resetting a (T)F-CPU to factory settings

If you want to reset a (T)F-CPU online to factory settings including formatting of the SIMATIC Memory Card and are logged in with the password for "Full access (no protection)", the message "The device could not be reset" may be displayed.
Follow these steps:

1. Go to "Online und diagnostics".
2. Format the SIMATIC Memory Card under "Functions" with "Format memory card".
3. Enter the password for "Full access incl. fail-safe (no protection)".

Alternatively, follow these steps:

1. Go to the "Online" menu command. Select "Delete access rights".
2. Go to "Online und diagnostics".
3. Under "Functions", go to "Reset to factory settings".
4. Select "Format memory card".
5. Click on "Reset PLC".
6. Enter the password for "Full access incl. fail-safe (no protection)".

Requirements for power supplies in the event of voltage interruption

NOTE

To ensure adherence to IEC 61131-2 and NAMUR Recommendation NE 21, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least 20 ms. Observe the relevant requirements in your product standards (e.g. 30 ms for "burners" pursuant to EN 298) as regards possible voltage interruptions. The latest up-to-date information on PS components is available on the Internet (https://mall.industry.siemens.com).
These requirements, of course, also apply to power packs/power supply units not constructed using ET 200SP or S7-300-/400-/1500 technology.

Display (for S7-1500 F-CPUs with display)

S7-1500 F-CPUs with display show you the following in the "Overview" menu under "Fail-safe":

- Safety mode activated/deactivated
- Collective F-signature
- Last fail-safe change
- Version of *STEP 7 Safety* with which the safety program was compiled.
- Remaining runtime in deactivated safety mode (for F-CPUs FW V4.0 or higher)
- F-BaseID (for F-CPUs FW 4.1 or higher)
- Information on the F-runtime groups
  - Name of F-runtime group
  - F-runtime groups signature
  - Current cycle time
  - Max. cycle time
  - Current runtime
  - Max. runtime
  - For F-CPUs from FW V3.0 to <V4.0 (valid from CPU 1511SP F-1 PN to CPU 1516F-3 PN/DP), "Remaining runtime in deactivated safety mode" is also displayed here.

The following is displayed for each F-I/O under "Fail-safe parameters":

- F-parameter signature (with addresses)
- safety mode (for F-CPUs with FW <V4.0)
- F-monitoring time
- F-source address
- F-destination address

The following additional menu command is displayed in the "Settings" menu under "Protection":

- Enable/disable F-password

Write access to F-blocks is not permitted.

NOTE

Controlling fail-safe inputs/outputs can result set the F-CPU to STOP.

NOTE

With the display firmware V2.5, the display is not refreshed and cannot be operated for a few minutes after loading program changes. Afterwards, the display restarts.

NOTE

In the case of a redundant S7-1500HF system, the display of the "Last fail-safe change" in the display and web server is only synchronized in the RUN-Redundant mode.

Web server/Web API

The F-CPUs S7-1200/1500 show you the following on the previous web pages (except S7-1200 G2) or the system web pages (except S7-1200 G1) of the web server and via the Web API:

- Safety mode activated/deactivated
- Collective F-signature
- Last fail-safe change
- Version of *STEP 7 Safety* with which the safety program was compiled. (Not supported by Web API).
- Remaining runtime in deactivated safety mode (not on the existing web pages)
- F-BaseID (not on the existing web pages)
- Information on the F-runtime groups
  - Name of F-runtime group
  - Remaining runtime in deactivated safety mode (only on existing web pages; in the case of Web API, the smaller of the two F-runtime groups is always returned.)
  - F-runtime groups signature
  - Current cycle time
  - Max. cycle time
  - Current runtime
  - Max. runtime

The following is displayed for each F-I/O on the "Module Information" web page in the "Fail-safe" tab:

- F-parameter signature (with addresses)
- Safety mode (only on existing web pages; not supported by Web API).
- F-monitoring time
- F-source address
- F-destination address

Write access to F-blocks is not permitted.

NOTE

Controlling fail-safe inputs/outputs can result set the F-CPU to STOP.

The new system web pages on the F-CPUs S7-1200G2/S7-1500 only show information on the safety-related project data from FW V4.1 onwards.

To use a program card as external load memory with an S7-1200F G2, the following warning must be observed, contrary to the information in the "SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)" programming and operating manual:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety-related project data in the internal load memory of the F-CPU when you insert a program card into an S7-1200 F-CPU G2:

1. Check whether **the STOP/RUN LED (yellow) and the maintenance LED flash for 3 seconds during startup when the card slot is empty.**
   If this is the case, the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as an external load memory), step 3 is skipped (except with FW V4.1.x) and you can skip step 5.
2. Insert the program card into the F-CPU.
   The F-CPU then performs an automatic restart, regardless of whether it is in RUN or STOP.
3. **After the restart, the STOP/RUN LED (yellow) and the maintenance LED must be flashing**. In this case, the internal load memory of the F-CPU is deleted (therefore no longer contains any "old" safety-related project data) and step 5 can be skipped.
   Use one of the following variants to evaluate the program card:
   – Turn the F-CPU off and back on.
   – Remove and insert the program card.
   – Execute the "Memory reset" (MRES) function.
4. After the restart, the program card is evaluated. The F-CPU then enters the startup mode (RUN or STOP) that was set up for the F-CPU (variant 1 of step 3) or remains in STOP (variant 2 or 3 of step 3 or if step 3 was skipped because the internal load memory was empty).
5. Perform a program identification. *(S106)*

Application UI with API (for F-CPUs S7-1500V)

S7-1500V F-CPUs as of V2.1 show you the following in the menu "PLC" under "Failsafe" (the language of the S7-1500V UI is English):

- Safety mode activated/deactivated ("Safety mode")
- Collective F signature ("F-Signature")
- Last fail-safe change ("Last modification")
- Redundancy of the available Virtual Timeservices ("Virt. Timeservice redundant")
- ID of the last active Virtual Timeservice ("Last active Virt. Timeservice")

NOTE

The "Last modification" parameter in the UI or API of the S7-1500VF corresponds with the PLC time. Note that the PLC time in the virtualized environment does generally not correspond with the IE(V)D time. If you use the "Cyclic Retentive Backup" functionality, note that "Last modification" will be overwritten with the current timestamp when restoring the S7-1500VF.

NOTE

The "Virt. Timeservice redundant" parameter is returned in STOP of the S7-1500VF in the API as the Boolean value "false" and displayed in the WebUI as "-".

The following points relate to the S7-1500 F Virtual Controller

Information on the type tests

Edge-enabled devices are approved for use with the S7-1500 F Virtual Controller. With STEP 7 Safety, these are fail-safe even in the case of elevated electromagnetic interference. Special type tests for functional safety are therefore not required for these devices – unlike for F-I/O. With regard to availability, however, you must observe the application-specific requirements, especially the standards for burner control.

The following points relate to the S7-1500 F-Software Controller

The S7-1500 F Software Controller is a fail-safe software CPU that is used on the following devices and is also only approved for these devices:

S7-1500 F-Software Controller	Device as of V30.0 and below V40.0	Device with V40.0	Device as of V40.1
CPU 1505SP F	• CPU 1515SP PC(2)[1]	• CPU 1515SP PC(3)[1]	• CPU 1515SP PC(3)[1]
CPU 1505SP TF	• CPU 1515SP PC(2)[1]	---	• CPU 1515SP PC(3)[1]
CPU 1507S F	• IPC 427E[2] and IPC 477E[2] • IPC 627E[2], IPC 647E[2] and IPC 677E[2] • IPC 847E[2] • IPC 227G and IPC 277G[3] • IPC BX-39A[2] and IPC PX-39A (PRO)[2]	• IPC BX-59A[1]	• IPC BX-39A[1] • IPC BX-59A[1]

1 These devices support Fast Commissioning mode.

2 Can be used even without NVRAM memory, but Fast Commissioning mode is then not supported. If NVRAM is present and assigned to the SW Controller via the Resource Configurator Tool, then Fast Commissioning mode is supported.

3 Can be used even without NVRAM memory. Fast Commissioning mode is not supported.

The devices specified in the table above react in a fail-safe manner when the S7-1500 F-Software Controller and *STEP 7 Safety* are used, even in the case of elevated electromagnetic interference. Special type tests for functional safety are therefore not required for these devices – unlike for F-I/O. With regard to availability, however, you must observe the application-specific requirements, especially the standards for burner control.

The yellow adhesive label with the TÜV SÜD test mark for functional safety included in the scope of delivery is exclusively intended for use in connection with S7-1500 F-Software Controllers (not included in the download version of the product package). You can use the adhesive label to mark the hardware on which the S7-1500 F-Software Controller is installed. You must remove the adhesive label when you uninstall the S7-1500 F-Software Controller.

Backup and restore

Backup and restoration of project data is not supported.

NOTE

The Windows user "Everyone" is not taken into consideration if it is in the "Failsafe Operators" Windows user group.

TPM functionality

The TPM functionality cannot be used for S7-1500 F-Software Controllers because it could result in a STOP.

Using EWF or UWF and the EWF or UWF Manager

You cannot select EWF or UWF and the EWF or UWF Manager for the CPU volume.

Other particularities

NOTE

The NVRAM must inserted in an IPC before installation of an S7-1500 F Software Controller. If the NVRAM is inserted subsequently, the S7-1500 F Software Controller must be uninstalled and then reinstalled.

NOTE

No NVRAM is required for the operation of an S7-1500 F Software Controller as of firmware V40.0.

NOTE

If you want to start the import of the configuration file of an S7-1500 F Software Controller, the user performing the import must be in the "Failsafe Operators" (Windows) or "failsafe_operators" (Linux) user group.

NOTE

The lock symbol is only set in the panel if you have set up a standard password.

NOTE

For an S7-1500 F Software Controller on an IPC 627E, IPC 647E, IPC 677E or IPC 847E, you must use at least the BIOS version V25.02.10.

NOTE

The CPU clock must not be changed in RUN because this would result in a STOP. You can prevent this by disabling the energy-saving function.

SIEMENS

SIMATIC
Industrial software
PFDavg and PFH values according to IEC 61508:2010 for components with use in SIMATIC Safety, Distributed Safety, PCS neo Safety and S7 F/FH Systems

Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://new.siemens.com/cert.

PFDavg and PFH values according to IEC 61508:2010 for components with use in SIMATIC Safety, Distributed Safety, PCS neo Safety and S7 F/FH Systems

This product information contains **important information on the F-systems SIMATIC Safety, Distributed Safety, PCS neo Safety and S7 F/FH Systems**. The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

PFD_{avg} and PFH values

The following tables contain the PFD_{avg} and PFH values for individual components with use in SIMATIC Safety (S), Distributed Safety (D), PCS neo Safety (N) and S7 F/FH Systems (F) with a repair time of 100 hours, an operational altitude of up to 2 000 m above sea level and, unless marked otherwise, an ambient temperature of 60 °C.

S7-1200/1500 F-CPUs	Low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	High demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure per hour [h^{-1}]	With a mission time of	S	D	N	F
For all **S7-1200/1500 F-CPUs**	< 2E-05	< 1E-09 up to an operational altitude[1] of 3 000 m or < 2E-09 at an operational altitude[1] greater than 3 000 m up to 5 000 m	20 years	x	-	-	-

[1] Information on which F-CPU supports an operational altitude > 2 000 m can be found in the F-CPU Product Information (https://support.industry.siemens.com/cs/ww/en/view/109478599).

S7-300 F-CPUs	Low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	High demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure per hour [h^{-1}]	With a mission time of	S	D	N	F
For all F-CPUs	< 2E-04	< 3E-09 at an operational altitude[1] greater than 2 000 m up to 5 000 m	20 years	x	-	-	-

[1] Information on which F-CPU supports an operational altitude > 2 000 m can be found in the S7-300 Product Information: Use of (F-)CPUs at altitudes > 2,000 m (https://support.industry.siemens.com/cs/ww/en/view/109763261).

Safety-related communication	Low demand mode low demand mode According to IEC 61508:2010: PFD_{avg} = Average probability of dangerous failure on demand	High demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure per hour [h^{-1}]	With a mission time of	S	D	N	F
	< 1E-05[1]	< 1E-09[1]	20 years	x	x	x	x

1 **Note on S7-300/400 F-CPUs:**

The PFD_{avg} value is valid under the assumption that a maximum of 25 F-modules are involved in a safety function. If more than 25 F-modules are used, you need to add 3.5E-7 per F-modules for this safety function.

The PFH value is valid under the assumption that a maximum of 100 F-modules are involved in a safety function. If more than 100 F-modules are used, you need to add a 4E-12 1/h for each F-modules for this safety function.

Determine the contribution of the F-system to the PFD_{avg} and PFH values

The contribution of the fail-safe system to the PFD_{avg} and PFH values of a safety function is determined by adding the PFD_{avg}- and PFH values of the F-CPUs and F-I/Os involved.

The contribution of the safety-oriented communication is added to this. Note that several F-systems can be involved in a safety function.

You determine the PFD_{avg} and PFH values of a safety function by adding the contribution of the fail-safe system to the contribution of the encoders and actuators involved in the safety function.

Calculation example

A safety function is implemented with a SIMATIC Safety F-system. The F-CPU and fail-safe modules listed in the following table are involved in the safety function.

20 years was selected as the mission time. The fail-safe modules are in safety mode for SIL3/Cat.4/PLe. Operation is in high demand mode:

F-CPU, F-modules and safety-related communication involved in the safety function	Quantity	High demand or continuous mode high demand/continuous mode According to IEC 61508:2010: PFH = Average frequency of a dangerous failure per hour [h^{-1}]

Using the application examples

The application examples illustrate automation task solutions with the interaction of several components in the form of text, graphics and/or software blocks. The application examples are a free-of-charge service provided by Siemens AG and/or a subsidiary company of Siemens AG ("Siemens"). They are not binding and do not claim to be complete or functional with regard to configuration or equipment. The application examples do not represent customer-specific solutions, but rather, only provide help for typical tasks. You are responsible for the proper and safe operation of products in compliance with the applicable regulations. You must check the function of the associated application example and adapt it specifically to your system.

Siemens grants you the non-exclusive, non-sub-licensable and non-transferable right of use of the application examples by professionally trained personnel. Any change to the application examples is made purely at your own risk. Transfer to third parties or duplication of the application examples or extracts thereof is permitted only in combination with your own products. The application examples do not necessarily undergo the usual tests and quality checks of a paid product, may contain functional and performance defects and may be subject to errors. You are fully responsible for ensuring that the application examples are used in such a way that any potentially defective functions do not lead to property damage which leads to injury to persons.

Disclaimer of liability

Siemens excludes any liability, irrespective of the legal ground, in particular for the use as well as associated notes, configuration and performance data and any damage they may cause. This shall not apply in cases of mandatory liability of Siemens, for example under the German Product Liability Act, or in cases of intent, gross negligence or culpable breach of material contractual obligations. The claims for compensation for the breach of essential contractual obligations are, however, limited to the foreseeable damage typical for the type of contract, except in the event of intent or gross negligence or death or injury or health impairment. The above provisions do not imply a change in the burden of proof to your detriment. You exempt Siemens from any third-party claims that may exist or arise in this connection, unless Siemens is compulsorily liable by law.

By using the application examples, you agree that Siemens cannot be made liable for any possible damage beyond the liability provisions described.

Additional notes:

Siemens reserves the right to make changes to these application examples at any time without prior notice. In cases of discrepancies between the suggestions in the application examples and other Siemens publications, such as catalogs, then the content of the other documentation shall have precedence.

In addition to this, the Siemens terms and conditions of use (https://support.industry.siemens.com) apply.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens products and solutions represent only one component of such a concept.

The customer is responsible for preventing unauthorized access to their plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the Internet if, and to the extent, necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

In addition, Siemens' recommendations for appropriate protective measures should be followed. Further information about industrial security can be found here (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens expressly recommends that updates are carried out as soon as they become available, and that only the current product version is used at all times. The use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed here (https://www.siemens.com/industrialsecurity).

About this documentation 2

2.1 Additional documentation

This documentation and the associated sample files are available free of charge in the Internet (http://support.automation.siemens.com/WW/view/en/109769506) for downloading.

2.2 Purpose of the documentation

This documentation provides the introduction to communication via the AS-Interface and AS-i Safety, and uses a typical circuit diagram to show how safety functions can be implemented with AS-i in the ET 200SP distributed I/O system.

Further information on the topic of AS-i can be found in the AS-i System Manual (https://support.automation.siemens.com/WW/view/de/51579885) and on the Internet (https://www.siemens.com/as-interface).

2.3 Target group

This documentation contains information for the following target groups:

- Decision makers
- Technologists
- Configuration engineers
- Commissioning engineers

2.4 Required knowledge

A general knowledge of the following areas is needed to understand this documentation:

- Low-voltage controls and distribution
- Digital circuit logic
- Automation technology
- AS-Interface
- Safety engineering
- SIMATIC STEP 7 or TIA Portal

Introduction 3

3.1 AS-Interface

3.1.1 AS-Interface basics

AS-Interface is an industrial fieldbus system and international standard in accordance with IEC/EN 62026-2.

AS-Interface (in short: AS-i) stands for "Actuator Sensor Interface". It was developed to connect numerous individual sensors and actuators in a system to the PLC as simply as possible:

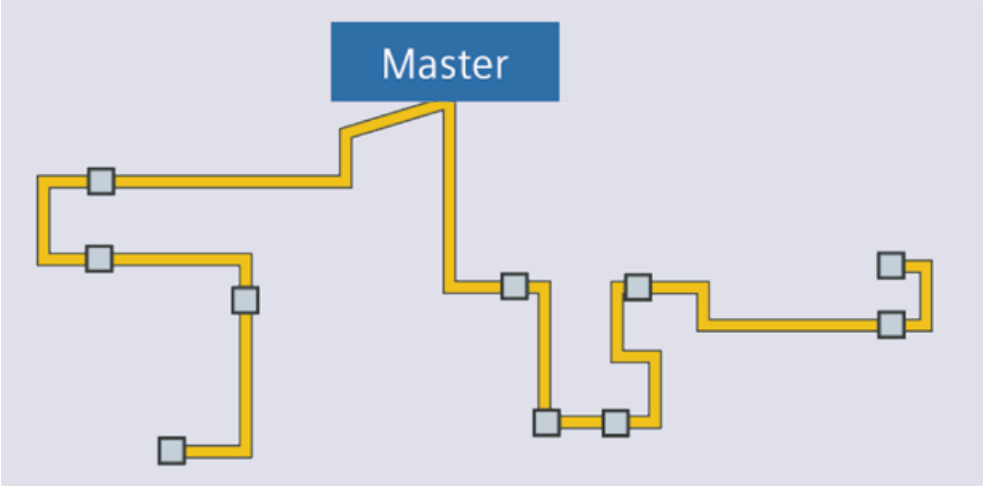
- Straightforward bus system with space-saving slave modules directly in the field
- Data transmission and power supply over a single unshielded 2-wire flat cable
- Extremely fast installation and integrated fast connection system (insulation piercing method)
- Real-time capable system response time
- Economically attractive replacement for elaborate cable harnesses

AS-Interface transmits standard signals and safe signals, e.g. for safety doors or emergency stop buttons, together on one AS-i cable.

With safety-related sensors in particular, the savings potential can be fully exploited because the dual cabling for two-channel safety sensors is only necessary up to the safe AS-i input module.

For safety sensors with integrated AS-i interface, the sensor cables and their protected routing are completely eliminated.

The safe AS-i signals are transmitted directly to a safe PLC, where they can be further processed.

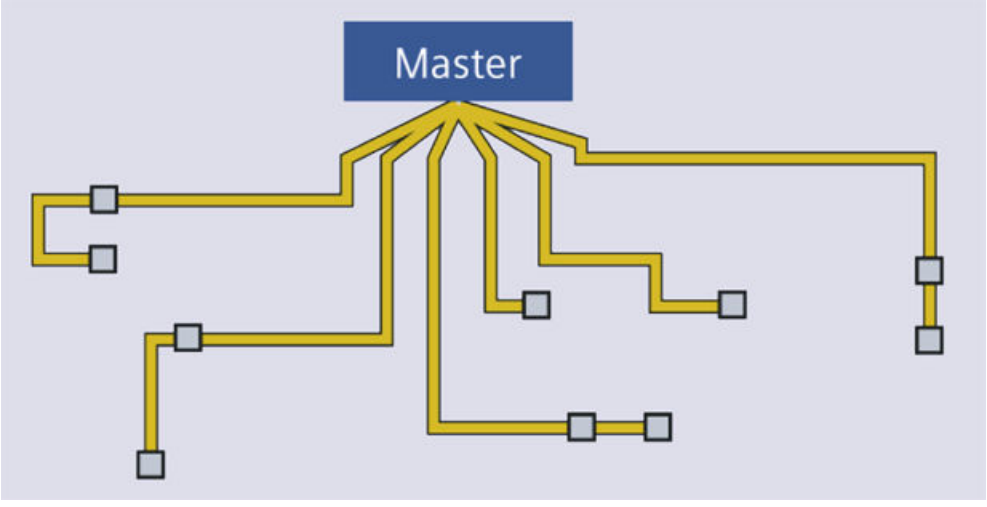


Siemens AS-i masters and Siemens AS-i modules are integrated in SIMATIC STEP 7, and can be inserted into the configuration at the click of a mouse.

- Familiar work environment since the procedure for the AS-Interface network configuration with Siemens AS-i modules is the same as for other SIMATIC components.
- Problem-free data management and documentation because the configuration of the Siemens AS-i master and the associated AS-i network along with all other SIMATIC controller components is stored in one STEP 7 project.
- In the STEP 7 program, the AS-i signals are accessed in the same way as by other I/O modules.
- Safe AS-i signals are easily forwarded to the F-CPU or SINUMERIK via the Siemens F-CM AS-i Safety ST module, without external PC programs or additional file management.

3.1.2 Network structure

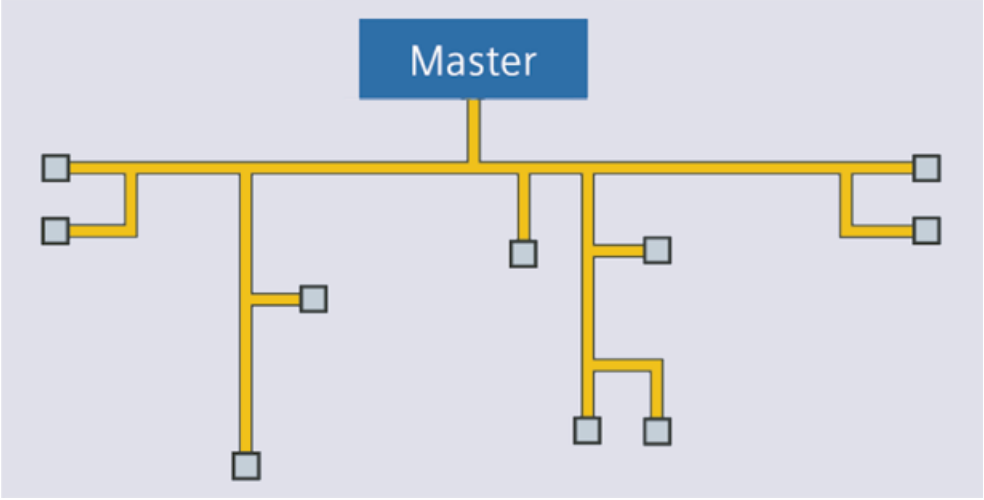
Linear, star, and tree topologies are supported by the AS-Interface, making assembly practical with hardly any restrictions.



Linear structure

Nodes

All devices are connected to a continuous cable.



Star structure

Nodes

The nodes are connected to one another in a star-shaped structure.

Tree topology

Nodes

The tree topology is similar to the star topology, but with any number of branches.

3.1.3 Creating an AS-Interface network

An AS-i network always comprises a master, an AS-i power supply unit, and the AS-i slaves. AS-i is a single master system, i.e. a master module collects the data from multiple AS-i slaves and transfers it to the process image of the PLC. From the perspective of the PLC CPU, the AS-i master acts like an I/O module with numerous inputs and outputs.

AS-i master and AS-i slaves are connected to one another via an AS-i cable. The AS-i master and the AS-i slaves are positioned freely on the cable.

The AS-i cable has only two wires: ASI+ and ASI–. The AS-i master and all AS-i slaves only have to be connected to these two wires. Slaves in the IP65 version are easily connected to the AS-i flat cable.

To supply power to the AS-i network, an AS-i power supply unit can be connected to the AS-i cable at any position.

The AS-i power supply unit contains a data decoupling circuit that enables the AS-i communication signals and the direct voltage to supply the modules and sensors to run on the same AS-i cable. Parallel connection of two AS-i power supply units is not permissible. This is in order to maintain the function of the data decoupling.

In an AS-i network with repeaters, a new segment is inserted downstream of each repeater; each repeater requires a separate AS-i power supply unit.

The AS-Interface is designed as a single-master system with cyclic polling.

An AS-i network always contains only one master, which queries the data of all the nodes at regular, defined intervals.

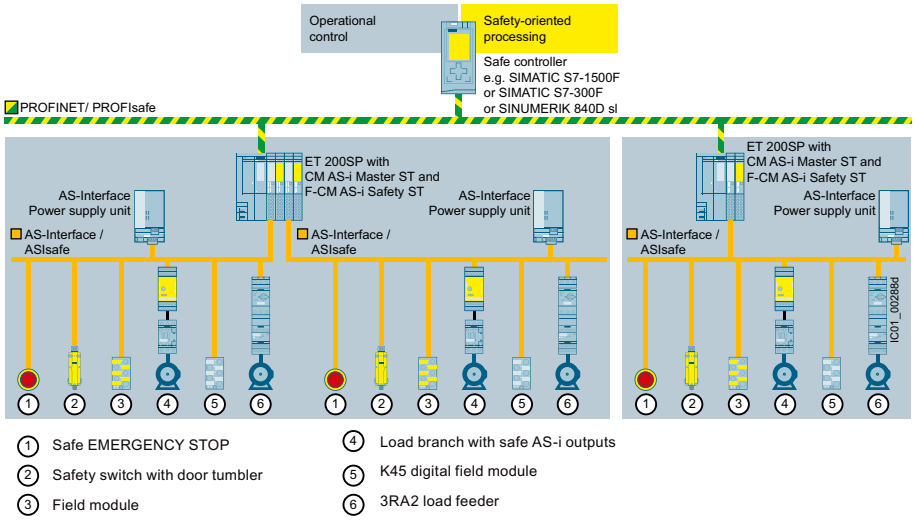


Figure 2-4 AS-Interface configuration with AS-i Master modules in the ET 200SP

3.1.4 Number of nodes

An AS-i network contains a maximum of 62 slaves with unique AS-i addresses. The AS-i master can manage 31 different addresses for the data exchange, whereby it can subdivide and reference each address as an A address or B address.

Slaves with standard addressing can be set to an address in the range 1 ... 31.

Slaves with extended addressing have address numbers followed by A or B. They are set to an address in the range 1A ... 31A or 1B ... 31B (often referred to as A/B slaves for short).

All slaves, whether with standard or extended addressing, are operated together on one AS-i network. The AS-i master automatically manages the addresses.

Backup AS-i slaves always use standard addressing. Slaves with standard addressing or extended addressing can be used for acknowledgment and other non-safety-related signals.

3.1.5 Network extension

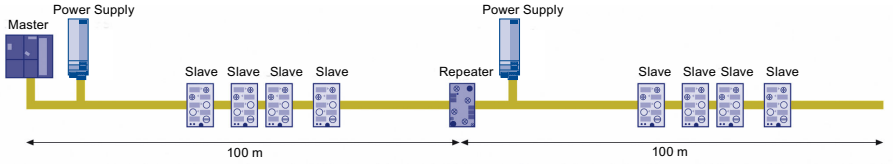

Figure 2-5 Network extension – previously a maximum of 100 m per segment

An AS-i line can be up to 100 m long without additional components. Repeaters can be used to increase the maximum possible cable length. Two repeaters can be connected in series, which can extend the network to 300 m as a linear structure. A separate AS-i power supply unit must be provided in each new segment.

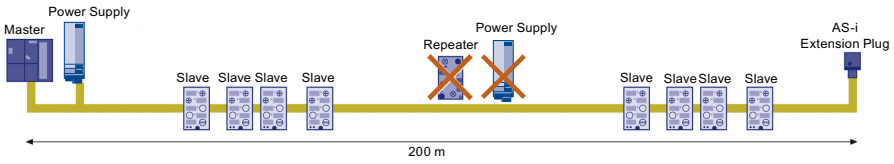

Figure 2-6 Network extension - now with AS-i extension plug, max. 200 m per segment

An extension plug can be used to double the length of an AS-i line to 200 m. Repeaters cannot be connected in series when they are used in conjunction with AS-i extension plugs. A maximum distance of 400 m between the master and slave and a total cable extension of 600 m can be achieved by using 2 repeaters and one extension plug per segment (master in the middle of the network). Repeaters can be connected in parallel in a star configuration, each with up to 200 m long segments.

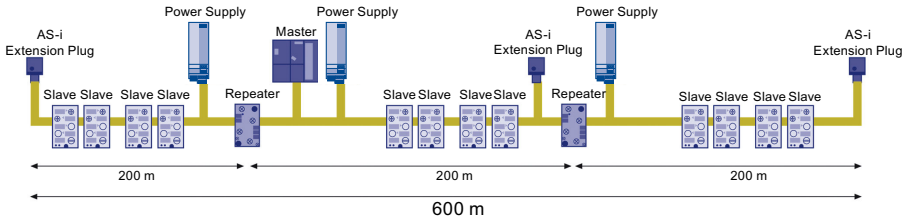

Figure 2-7 The maximum network extension with an AS-i extension plug is 200 m per segment, with only one repeater connected in series between master and any slave.

3.1.6 AS-i Safety

AS-i Safety enables safety-related components – such as EMERGENCY-STOP devices, protective door switches or safety light arrays – to be integrated in an AS-Interface network. The safety-related slaves are fully compatible with the familiar AS-Interface components (masters, slaves, power supplies, repeaters, etc.) in accordance with IEC 62026-2 and are operated in conjunction with them on the yellow AS-Interface cable.

The transmission method for safety-related signals is approved for applications up to PL e according to EN ISO 13849-1 and up to SIL 3 according to EN 62061.

As usual, nodes on the AS-Interface bus are controlled in operation by the standard program of the higher-level SIMATIC (F) CPU or by a SINUMERIK controller.

In order to implement safe functions, the information from the safe and standard nodes must be combined logically, and additional parameters set. The configuration of the safety functions depends on which safety solution is being used:

In conjunction with the modular safe AS-i master, which is formed by combining the CM AS-i Master ST and F-CM AS-i Safety ST modules in an ET 200SP station, all safety functions and combinations are configured via STEP 7 and processed in the controller (F-CPU) by the fail-safe program.

The AS-i communication modules in the ET 200SP facilitate the use of an AS-Interface under fail-safe SIMATIC or SINUMERIK controllers.

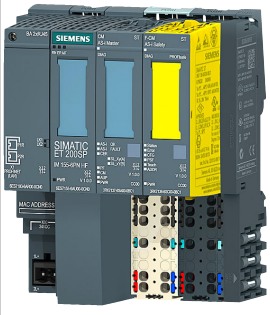
Tasks are allocated as follows:

- Acquisition of safety-related signals is via safe input slaves on the AS-Interface bus. Further signals can be detected through F-DI modules of the SIMATIC.
- Evaluation and processing of signals is via the fail-safe SIMATIC or SINUMERIK controller
- Reaction via safe output modules on the AS-Interface bus or via F-DQ modules of the SIMATIC

Simple combination of the CM AS-i Master ST and F-CM AS-i Safety ST modules in one ET 200SP station results in a powerful, safety-related router between PROFINET (or PROFIBUS) and PROFIsafe and AS-Interface, which can be expanded further in a modular fashion with further I/O modules of the ET 200SP.

In this way, it is possible to create expansion versions for almost all cases. Besides the single AS-i master, double, triple or generally multiple masters can also be realized with or without fail-safe functionality.

NOTE

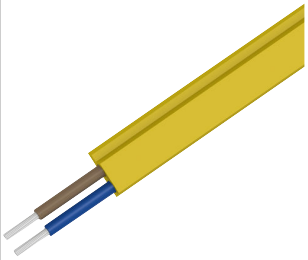


The SIRIUS 3RK3 modular safety system, MSS for short, with connection to AS-Interface can be used for a safety application without a fail-safe controller (F-CPU). This system is not covered in this documentation. Further information can be found on the Internet (http://www.siemens.de/sirius-mss).

AS-i Safety is also referred to as ASIsafe.

3.2 AS-i Safety product overview

This section provides an overview of ASIsafe components as well as the accessories available to help you assemble, install, and use these components. The tables contain images of the products and their features.



AS-i safety components

Product	Features
F-CM AS-i Safety ST and CM AS-i Master ST 	Expansion of a standard AS-Interface network to include safety-related communication through an F-CM AS-i Safety ST fail-safe communication module. The F-CM AS-i Safety ST module has no AS-i master functionality. A CM AS-i Master ST module is required for operation of the AS-i network. • Gateway between PROFIsafe and ASIsafe, without master functionality • Expands a standard AS-i network to include safety-related communication (ASIsafe) • Monitoring of up to 31 safety-related input slaves • Control of up to 16 safety-related AS-i output slaves or switch-off groups • Power supplied from the AS-i voltage • Various interconnection types (1oo1 and 1oo2) may be used • A parameterizable input delay from 0 ms to 150 ms can be assigned to each channel • Startup test can be activated for each channel • Discrepancy monitoring can be configured for each channel • Sequential monitoring can be set for each channel • Channel-wise passivation

	• Test for 0 signal before reintegration • 8 LED displays for status and error diagnostics
Safe modules  K45F K20F SlimLine Compact	Easy integration of safe signals, both in the control cabinet and in the field • IP65 / IP67 or IP20 degree of protection • Compact dimensions from a width of 17.5 mm • Inputs: – Two single-channel inputs / one two-channel input – Four single-channel inputs / two two-channel inputs • Standard position switch or magnetically operated switch can be connected • Versions also available with two standard outputs
3SU1 EMERGENCY STOP command devices 	Simple, direct connection of tried-and-tested command devices to ASIsafe • Enclosure with IP65 / IP67 degree of protection • EMERGENCY STOP directly on AS-Interface via integrated modules • Metal or plastic version • Any combination of pushbuttons, indicator lights, and toggle switches can be controlled with just one cable • AS-i F adapter in IP20 degree of protection
3SF1 position switches Position switches With tumbler 	Conventional wiring of safety functions no longer required • IP65 degree of protection • Direct connection of position switches to AS-i • Available with separate actuator or tumbler • Encased in plastic or metal

System components and accessories

Function / product	Properties
Power supply units and data decoupling 	The AS-i power supply unit allows the simultaneous transmission of data and power on the same two-wire line. Alternatively, a combination of a standard power supply unit and AS-i data decoupling can be used. • Various levels (3 A, 5 A, 8 A etc.) • Ground fault detection included • AS-i power supply unit (30 V) with integrated data decoupling • 30 V power supply units without data decoupling • AS-i data decoupling modules

Addressing unit for commissioning 	Simple address assignment to the slaves with wiring test during commissioning • Addressing of all nodes in the AS-Interface network (standard and A/B slaves) • Readout of the slave profile (IO, ID, ID2) and ID1 code • Adjusting the slave parameters for commissioning • Measurement of the AS-Interface voltage • Enables direct setting of outputs and reading in of inputs in a slave • Readout of the code table of safe input slaves • Saving of complete plant configurations
Analyzer for maintenance and service 	Quality assessment of an AS-Interface network with report printout and frame recording for on-site and remote diagnostics • Checks quality and proper functioning of AS-Interface installation • Transfers data to a PC/PG via an RS 232 interface • Software-based evaluation • Automatic generation of test reports • Advanced trigger functions for accurate analysis • Bundle error display for support of preventive diagnostics • Process data can be monitored online
Cable 	Rapid replacement and connection to AS-Interface thanks to piercing technology • Trapezoidal profile prevents reverse polarity • Cables for various application conditions made of correspondingly optimized material
Range extension Extension plug  Repeater 	Lower infrastructure costs, more possibilities of use and greater freedom for plant planning • Extension of an AS-i segment to a max. of 200 m with extension plug (without additional power supply unit) • Extension by one bus segment with AS-i Repeater Maximum combined extension increases to 600 m or more (with parallel connection of repeaters)

Compact distributor  **M12 branches** 	Quick and easy distribution and branching to the AS-i shaped cable • Simple distribution/connection of AS-i shaped cable with high degree of protection • Branching from AS-i and U_{aux} to round cable • Connection of slaves with M12 bus connection • M12 branch with direct M12 socket or M12 round cable available • Easy to use
Overvoltage protection 	Protection against overvoltage on AS-i • Special module: Overvoltage protection

NOTE

Ground fault detection is integrated into the CM AS-i Master ST, AS-i power supply units and the data decoupling unit

Circuit diagram example

4

4.1 Knowledge required

The following application example shows how conventional safety functions, such as emergency stop shutdown and protective door monitoring in the ET 200SP system can be configured and programmed with AS-Interface via the TIA Portal.

Knowledge required

The following knowledge and skills are required:

- Fundamentals of functional safety
- Fundamentals of AS-Interface
- Fundamentals in STEP 7 programming

4.2 Operating principle

4.2.1 Overview

Protective doors are frequently used to fence off danger zones. These are monitored for position and, if necessary, the area from which the hazard emanates is switched off. If the machine continues to present a hazard even after switching off, access can be prevented for this period by a tumbler. An emergency stop command device is additionally monitored for shutting down the machine in an emergency. CM AS-i Master and F-CM AS-i Safety are used to connect to the fail-safe controller.

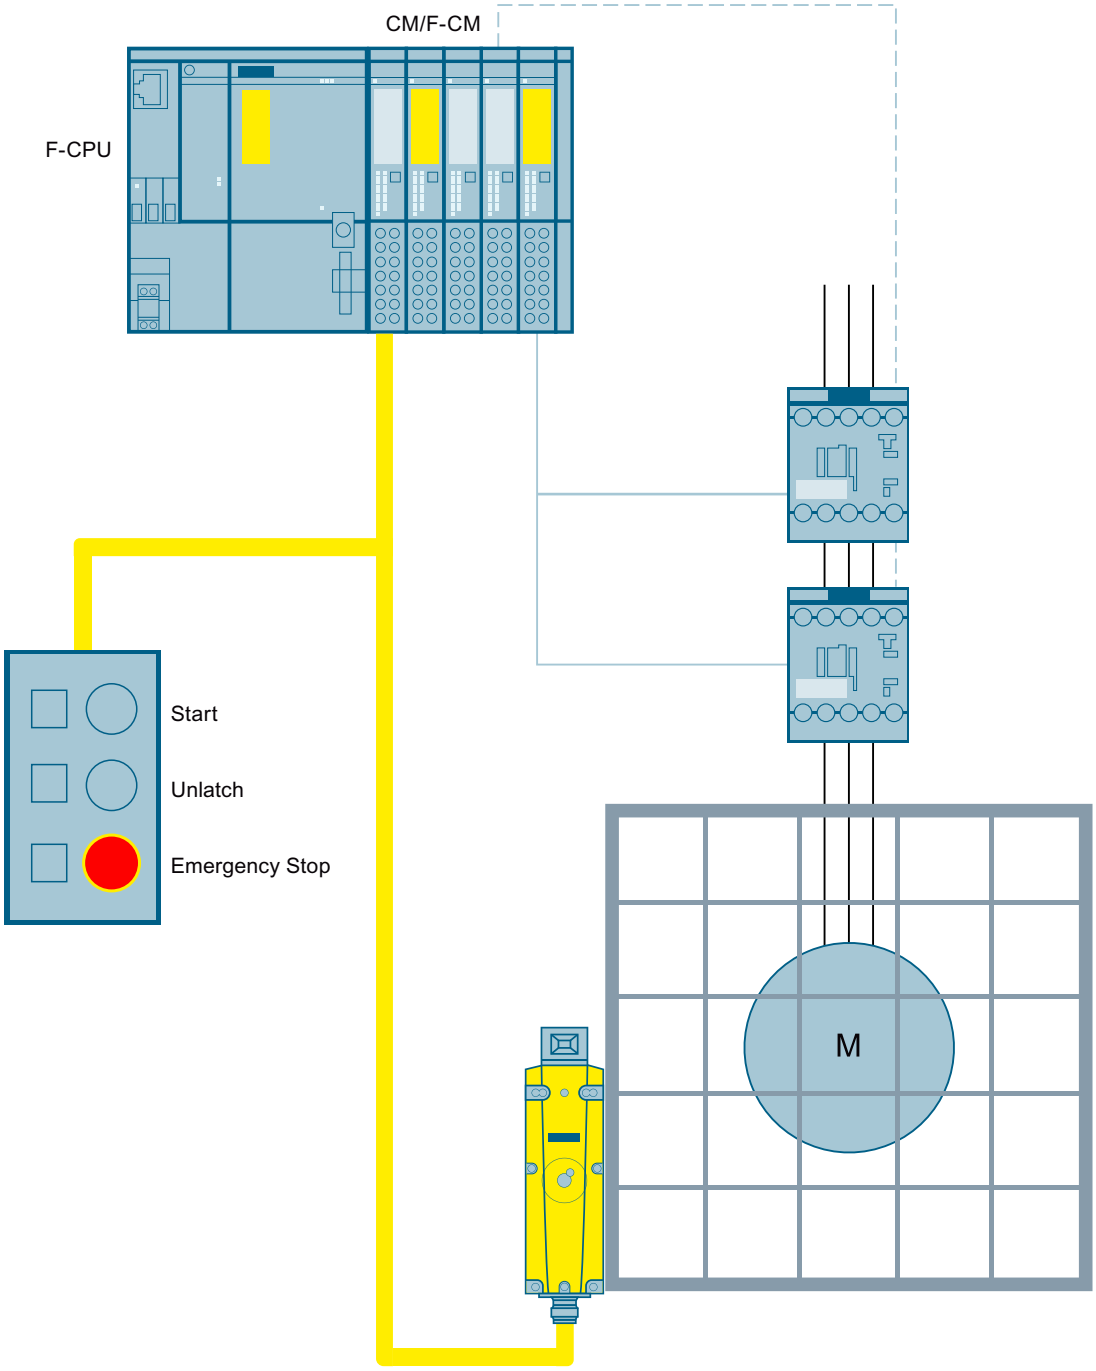


Figure 2-8 Circuit diagram example

The fail-safe controller monitors the emergency stop command device and the safety switch on two channels. Both devices have an integrated AS-i slave and are thereby connected to the AS-Interface. The two signals are transmitted to the fail-safe controller using the combination of CM AS-i Master and F-CM AS-i Safety (ET 200SP station modules).

The protective door position is monitored by a safety switch. In addition, the door is locked by means of a tumbler integrated in the safety switch. When the command to release the door is issued by means of a toggle switch, safety switch-off of the power contactors takes place via the fail-safe controller. On expiry of a set time, the tumbler is unlocked and access to the machine is enabled.

After the door has been closed and locked again, and the feedback circuit of the power contactors is closed, the Start button can be used to switch on again. When the emergency stop command device is actuated, the fail-safe controller also switches off the power contactors in a safety-related way. If the emergency stop command device is reset and the feedback circuit is closed, the Start button can be used to switch on again. Start pushbuttons and toggle switches are also read in via the AS-Interface.

The "Stopping in an emergency" safety function is designed up to SIL 3 or PL e.

The "Protective door monitoring" safety function is designed up to SIL 2 or PL d.

Safety function	Description	Requirement
SF1	If the emergency stop command device is actuated, the machine is shut down safely.	SIL 3 or PL e
SF2	If the protective door is opened, the machine is shut down safely.	SIL 2 or PL d

NOTE

Non-safety-related tumbler via integrated standard output of 3SF1324-1S.21-1BA4: The protective door tumbler is not a safety function (non-safety-related control of the solenoid). It can be used to safeguard the production process.
If during the risk assessment a safety level for the tumbler was defined in addition to the protective door monitoring, it is then possible to use a mechanical safety position switch with tumbler 3SE53 without an integrated AS-i slave. This means that control of the tumbler solenoids can take place via a fail-safe digital output on the F-PLC, for example.

NOTE

Taking account of fault exclusions, the use of only one safety switch with or without tumbler is permissible up to SIL 2 or PL d. Further information is contained in the PDF under the following link "concerning the use of safety switches up to SIL 2 or PL d (http://support.automation.siemens.com/WW/view/de/35443942)".

4.2.2 Emergency stop

The emergency stop command device is a component that is widely used to protect people, equipment and the environment against possible hazards, and to initiate stopping in an emergency. Equipment, functional aspects and design guidelines for emergency stop are listed in EN ISO 13850. The EN 60204-1 standard must also be observed.

The emergency stop command device with its two positive opening contacts is monitored by the F-CPU. If the emergency stop is actuated, the F-CPU switches the downstream actuators off via safe outputs in accordance with Stop Category 0 as per EN 60204-1. Before restarting or acknowledging the emergency stop shutdown, a check is made as to whether the contacts of the emergency stop command device have been closed and the feedback circuit of the downstream actuators is closed.

To connect the two normally closed contacts of the emergency stop command device to the AS-i bus, an AS-i interface module with two safe inputs (3SU1401-2EE60-6AA0) is installed in the enclosures of the command devices.

NOTE

Emergency stop is not a way of reducing the risk. "Emergency stop" is a supplementary safety function. (When "emergency stop" is operated, the motor must be shut down).

4.2.3 Monitoring the position of the protective door and tumbler function

The position of the protective door is monitored by a SIRIUS 3SF1 position switch. The position switch detects the position of the protective door by a separate actuator. This moves into the position switch when the protective door closes.

The SIRIUS 3SF1 position switch also contains an integrated tumbler which can keep the protective door closed during operation and thus prevent entry into the danger zone. An actuator mounted on the protective door moves into the positively-driven position switch with tumbler. The SIRIUS 3SF1 position switch with tumbler used here has a spring-actuated lock. This means that door is held shut in the de-energized state and the door is unlocked by applying a voltage.

Operating principle: If the door is closed and no voltage is applied, a locking mechanism moves into the separate actuator, which prevents the door from being opened. If a voltage is applied, the locking mechanism is drawn out of the separate actuator by a solenoid, which unlocks the tumbler.

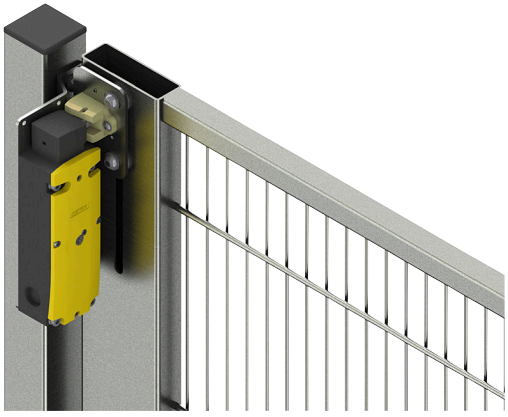

Figure 2-9 Position switch with tumbler

The SIRIUS 3SF1 position switches are equipped with mechanical protection against incorrect locking. This ensures that the door or locking mechanism can only be locked if the door is closed.

The SIRIUS 3SF1 position switch has an integrated AS-i slave, in contrast to the 3SE5 standard position switch.

Two contacts are evaluated internally in order to reach the required (SIL 2 or PL d) safety level. If one of the contacts is defective, opening of the protective door is still detected by the second contact. Failure of a contact is detected by a discrepancy monitor, which prevents a renewed switch on until the fault has been rectified.

There are basically three different combinations for forwarding the contacts of the AS-i position switch with tumbler as ASIsafe channel 1 and 2 to the controller for evaluation:

3SF13 version	ASIsafe channel 1	ASIsafe channel 2
3SF13 ... 1BA1	1st normally closed contact of actuator	Normally closed contact of solenoid
3SF13 ... 1BA3	1st normally closed contact of actuator	2nd normally closed contact of actuator
3SF13 ... 1BA4	1st and 2nd normally closed contacts of actuator	Normally closed contact of solenoid

Version 3SF13 ... 1BA3

In the 1BA3 version, both ASIsafe channels are supplied with a normally closed actuator contact. The signaling contact of the solenoid for the tumbler is not taken into account. This means that the user program cannot be used to evaluate whether the door is actually locked (diagnostics not possible). The 1BA3 version must be parameterized in the TIA Portal as 1oo2 (equivalent). The discrepancy time must be adapted to the conditions where the position switch is installed. The default setting of the discrepancy time (500 ms) is normally suitable for this position switch.

Version 3SF13 ... 1BA1

In contrast to the 1BA3 version, the signaling contact (normally closed contact) of the solenoid is evaluated as the second ASIsafe channel in the 1BA1 version. This means that the user program can be used to evaluate whether the door is actually locked (diagnostics possible). However this means that the two ASIsafe channels run asynchronously, resulting in the following requirement on the machine operator:
Each time unlocking the door is requested, the door also has to be opened. In the parameter assignment of the position switch, a 1oo2 evaluation (equivalent) must be set with the "Discrepancy time unlimited" option, whereby the F-CM AS-i Safety module expects a zero crossing of both ASIsafe channels before reclosing becomes possible. Therefore, in the case of a door release request without subsequent door opening, the F-CPU would prevent a hot restart of the machine.

Version 3SF13 ... 1BA4

In the 1BA4 version, for the first ASIsafe channel both normally closed contacts of the actuator are already linked in the switch and automatically evaluated for discrepancy. Therefore, for this version it must be ensured that the discrepancy analysis is deactivated (1oo1 evaluation) in the configuration of the AS-i slave in the TIA Portal. The signaling contact (normally closed contact) of the solenoid is evaluated as the second ASIsafe channel. This means that the user program can be used to evaluate whether the door is actually locked (diagnostics possible). The 1BA4 version of the 3SF1 position switch thus offers the advantage that with a door release request the door does not then have to be opened immediately. Nevertheless, malfunctioning of the tumbler solenoid can still be diagnosed by evaluating the signaling contact.

For this reason, a 1BA4 version of the 3SF1 position switch is used in the application example described here.

See the figure below:

- 1st normally closed contact of actuator (state: door closed): 11 / 12
- 2nd normally closed contact of actuator (state: door closed): 21 / 22
- Normally closed contact / signaling contact of the solenoid (state: tumbler active): 41 / 42
- Control of the solenoid (state: door release inactive): E1 / E2

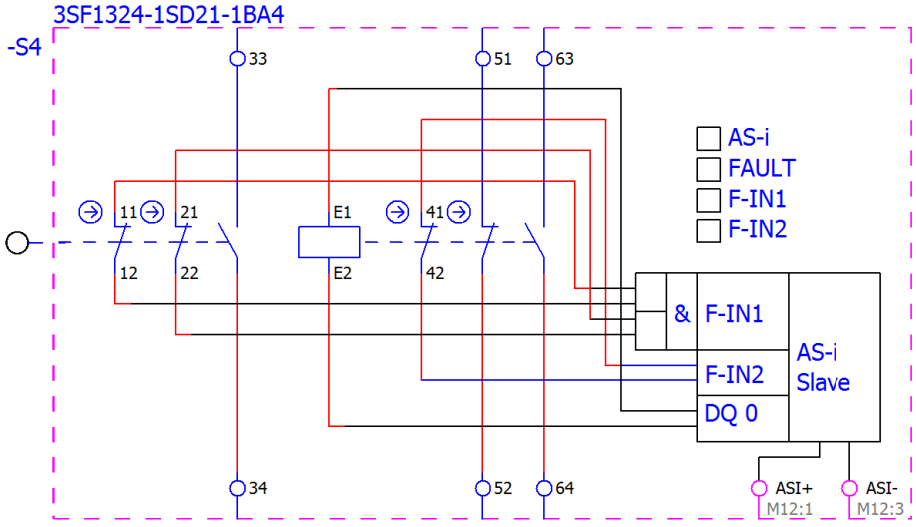

Figure 2-10 3SF1324-1SD21-1BA4 internal circuit diagram

4.2.4 Control and monitoring of the actuator

In order to achieve PL e according to ISO 13849-1 or SIL 3 according to IEC 62061, the shutdown of the machine is designed redundantly. Here, two SIRIUS 3RT2 contactors are used and their correct functioning is monitored by the failsafe controller (feedback circuit monitoring) through their auxiliary contacts (mirror contacts). The mirror contacts can be read by a standard input module.

If one of the two contactors welds, the second contactor can continue to ensure a safe shutdown. The welding of a contact is detected by the feedback circuit monitoring at the next signal change, and a new switch on is prevented until the fault is rectified.

4.3 Hardware and software components

4.3.1 Validity

This application example is valid for:

- All SIMATIC F controllers
- STEP 7 Professional as from V 15

4.3.2 Components used

The application was created with the following components.

Hardware components

Component	Quantity	Article No.	Note
Power supply	1	6EP1333-2BA20	SITOP PSU100S 24 V/5 A
Fail-safe S7-CPU	1	6ES7512-1SK01-0AB0	CPU 1512SP F-1 PN ET 200SP including server module
PROFINET bus adapter	1	6ES7193-6AR00-0AA0	Bus adapter 2 x RJ45 plug sockets
SIMATIC Memory Card	1	6ES7954-8LC02-0AA0	SMC 4 MB
AS-Interface communication module	1	3RK7137-6SA00-0BC1	CM AS-i Master
AS-Interface safety communication module	1	3RK7136-6SC00-0BC1	F-CM AS-i Safety
Digital input module	1	6ES7131-6BF00-0CA0	DI 8X24VDC HF
Fail-safe digital output module	1	6ES7136-6DB00-0CA0	F-DQ 4X24VDC/2A PM HF
Base unit	1	6ES7193-6BP20-0DC0	Light base unit 20 mm, type C0 (new load group)
Base unit	1	6ES7193-6BP20-0BC1	Dark base unit 20 mm, type C1 (jumpered to the left)
Base unit	1	6ES7193-6BP00-0DA0	Light base unit 15 mm, type A0 (new load group)
Base unit	1	6ES7193-6BP00-0BA0	Dark base unit 15 mm, type A0 (jumpered to the left)
3SU AS-Interface enclosure	1	CIN 20180516133320114162	EMERGENCY STOP mushroom pushbutton Illuminated push-button, toggle switch
Safety position switch	1	3SF1324-1SD21-1BA4	With tumbler and auxiliary release
Power contactor	2	3RT2015-1BB42	S00 AC-3 7A
AS-i power supply unit	1	3RX9501-0BA00	IN: 120 V ... 230 V AC, OUT: 3 A AS-i
AS-i cable	1	3RX9010-0AA00	100 m roll, rubber

Software components

Component	Quantity	Article No.	Note
STEP 7 Professional	1	6ES7810-5CC12-0YA5	V 15.1
STEP 7 Safety Advanced	1	6ES7833-1FA15-0YA5	V 15.1

4.3.3 Example of wiring

The wiring example is available for download in the Internet (http://support.automation.siemens.com/WW/view/en/109769506) as a PDF and EPLAN macro.

4.3.4 Sample data and projects

The following table contains all the files and projects used in this example.

Component	Note
E-Stop_SIL3_Protective_door_tumbler_SIL2_AS-i.zap15_1	TIA Portal project
Wiring_E-Stop_SIL3_Protective_door_tumbler_SIL2_AS-i.emp	EPLAN macro
E-Stop_SIL3_Protective_door_tumbler_SIL2_AS-i_de.set	SET file

4.4 TIA Portal configuration

4.4.1 TIA Portal engineering

The supplied TIA Portal project contains the example configuration. The most important settings for reuse in one's own project are shown in this section.

NOTICE
Loss of safety function The settings shown below contribute toward meeting the required safety. Changes to the settings may lead to a loss of the safety function.

In the following, the hardware configuration of the ET 200SP F-CPU is performed with I/O and the AS-i slaves.

After a new CPU 1512SP F-1 PN has been created in the project, the ET 200SP station is configured. In addition to the CM AS-i Master ST and F-CM AS-i Safety ST ET 200SP modules, a fail-safe digital output module and a standard digital input module are needed for this typical circuit diagram. The order numbers are to be taken from the table "Components used" (Section 4.3.2 (Page 23)).

4.4.2 Configuration of the ET 200SP modules CM AS-i Master ST and F-CM AS-i Safety ST

NOTE

Configuration of the CM AS-i Master ST
A detailed guide to configuring CM AS-i Master ST is available in the "Configuration" Section of the "AS-Interface Master CM AS-i Master ST (https://support.industry.siemens.com/cs/ww/view/71756485)" Manual.

Configuration of the F-CM Safety ST
A detailed guide to configuring the F-CM Safety ST is available in the "Configuration" Section of the "ET 200SP Failsafe Module F-CM AS-i Safety ST (https://support.industry.siemens.com/cs/ww/view/90265988)" Manual.

Programming the safety program in SIMATIC STEP 7 Safety Advanced
Programming of the safety program in SIMATIC STEP 7 Safety Advanced is described in detail in the "SIMATIC Industry Software SIMATIC Safety - Configuration and Programming (https://support.industry.siemens.com/cs/ww/de/view/54110126)" Manual.

CM AS-i Master ST and F-CM AS-i Safety ST can also be configured under SIMATIC S7 Distributed Safety in STEP 7 classic. Here the comfort functions and diagnostics may be restricted in comparison to TIA Portal STEP 7 (Safety Advanced).

4.4.3 Configuring ET 200SP System

In this example, an ET 200SP F-CPU is configured

with TIA Portal V15.1. In other versions, the representation may be slightly different; it then applies analogously.

The steps shown apply correspondingly if an ET 200SP station is used with an interface module (e.g. IM 155-6 PN ST) on a SIMATIC F-CPU (e.g. CPU 1515F-2PN). Alternatively to the SIMATIC F-CPU, a fail-safe SINUMERIK controller can be used. The safety program is always executed in the safe controller.

Configure the CM AS-i Master ST and F-CM AS-i Safety ST modules in the ET 200SP station.

Procedure:

1. Open your STEP 7-project in the TIA Portal.
2. Add your ET 200SP station from the hardware catalog.
3. Switch to the device view of the ET 200SP station.
4. Select the CM AS-i Master ST module from the ET 200SP folder in the "Hardware catalog" window.

   Communication module > AS-Interface > CM AS-i Master ST > 3RK7137-6SA00-0BC1. Ensure that the selected version is the same as that of your device, otherwise update the FW.
5. Drag & drop the selected AS-i Master to the next free slot of your ET 200SP station. The CM AS-i Master ST module is plugged into a light base unit.
6. Select the F-CM AS-i Safety ST module from the ET 200SP folder in the "Hardware catalog" window: Communication module > AS-Interface > F-CM AS-i Safety ST > 3RK7136-6SC00-0BC1. Ensure that the selected version is the same as that of your device, otherwise update the FW.

7. Drag & drop the selected F-CM AS-i Safety ST module directly to the right of the AS-i Master in your ET 200SP station. Select a dark base unit for the F-CM AS-i Safety ST module.
8. Open the Properties window of the CM AS-i Master ST and switch to the AS-Interface tab in the "General" area. Create a new AS-i network by clicking the "Add new subnet" button.

Result:

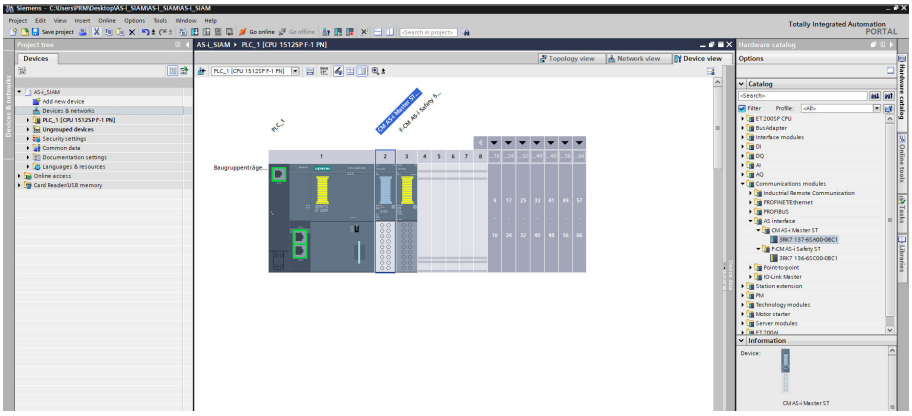

Figure 2-11 Adding the two AS-i modules to the ET 200SP station

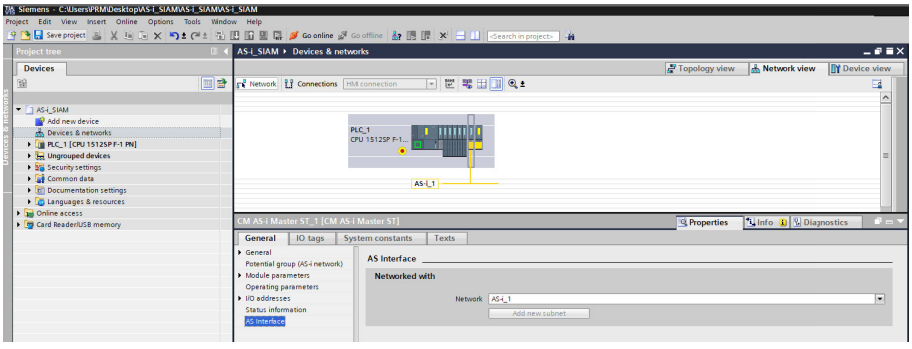

Figure 2-12 Creating a new AS-i network

9. Insert the F-DQ 4x24VDC/2A PM HF module on the right of the F-CM module, and activate its 1st channel in its "DQ parameters".

10. Insert the DI 8x24VDC HF module and a server module on the right of the F-DQ module.

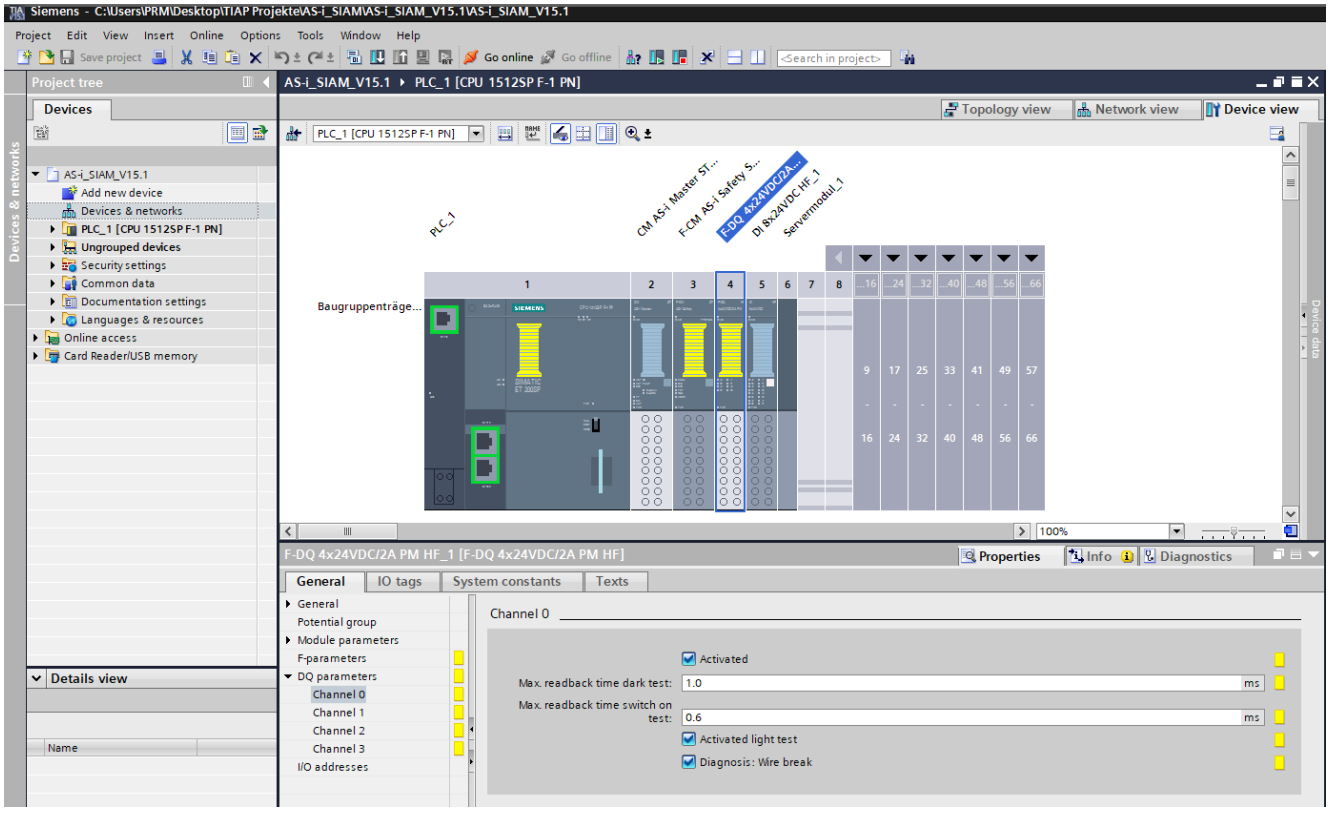

Figure 2-13 Complete configuration of the ET 200SP station

NOTE
The setting of the correct base units (light or dark) must be observed for all four modules.

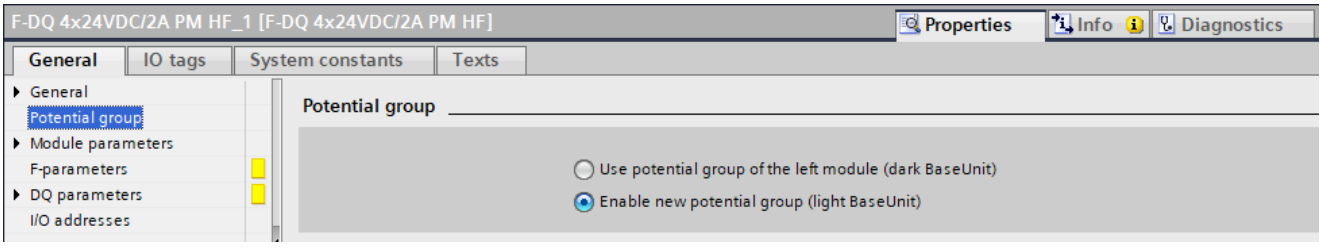

Figure 2-14 Selecting the correct base unit

4.4.4 Adding AS-i slaves

Configure an AS-i slave in the AS-i subnet.

In the following example, an emergency stop command device is connected to an ASIsafe F adapter. Other AS-i (ASIsafe) slaves can be correspondingly configured.

Procedure:

1. Open the Network view of your project.
2. Select the ASIsafe F adapter in the "Hardware catalog" window from the folder: Field devices > AS-Interface > Command and signaling devices > F adapter > ASIsafe F-ADAP, 2 F-DI > 3SU1400-4AA0
3. Drag & drop the selected AS-i slave into the empty space below your ET 200SP station.
4. Connect the emergency stop command device to the AS-i network created in Chapter 4.4.3 by moving the port (yellow square) of the F adapter with drag & drop to the port of the CM AS-i Master ST. Connecting the AS-i slave to the AS-i network automatically assigns the next free AS-i address. If required, the address can be changed in the Properties window of the AS-i slave.

Result:

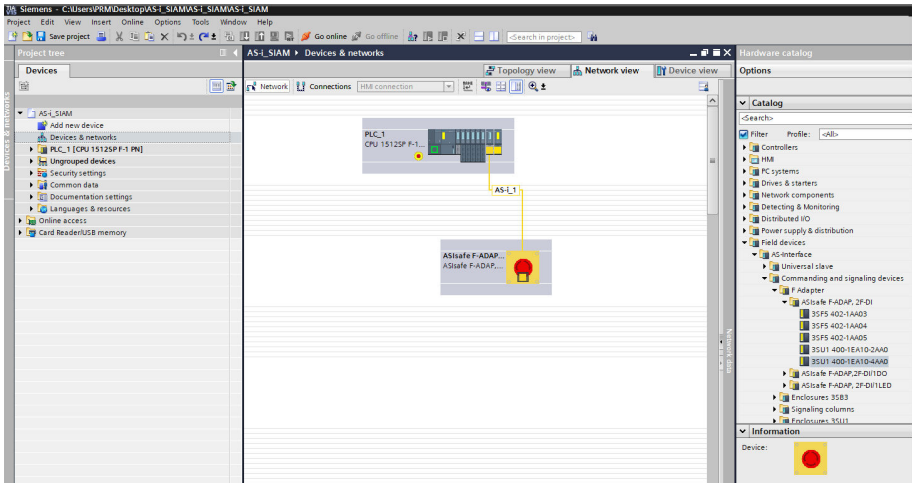

Figure 2-15 Adding and connecting an AS-i slave

5. Perform the steps listed above for two further AS-i slaves:

- ASIsafe position switch with tumbler (Field devices > AS-Interface > Detecting devices > Position switches > Operation with tumbler > ASIsafe POS-SWITCH-LOCK)

- AS-i 3SU1 (Field devices > AS-Interface > Command and signaling devices > 3SU1 enclosure > AS-i 3SU1, 4DI/3DO, AB)

Tip: Display the AS-i addresses on the slaves by activating the "Show addresses" function (symbol with eye in the menu bar of the network view, above the empty area).

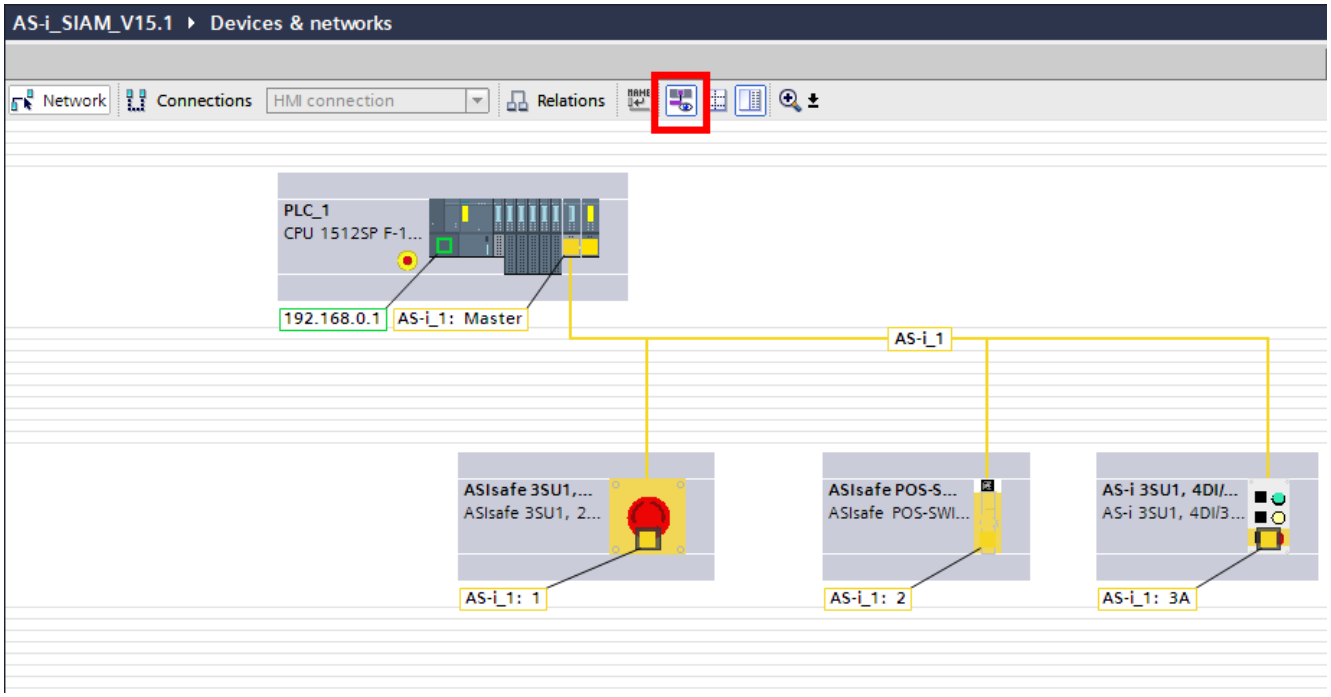

Figure 2-16 Display addresses

4.4.5 Setting F parameters

To set the F parameters, open the "General" dialog box of the F-CM AS-i Safety ST in the device view of the ET 200SP station.

Settings made in the "F parameter" tab affect the fail-safe communication of the module with the F-CPU.

The individual parameters are explained briefly below. Further information may be found in the "SIMATIC Safety - Configuring and Programming (https://support.automation.siemens.com/WW/view/de/54110126)" Manual.

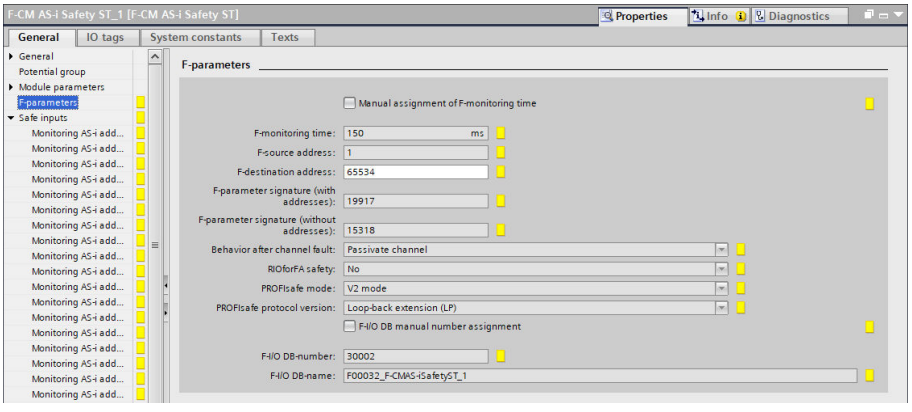

Figure 2-17 Parameters of the F-CM AS-i Safety ST

The **F monitoring time [ms]** is the PROFIsafe monitoring time for the safety-related communication between F-CPU and F I/O. If the F-I/O does not receive a valid safety message frame from the F-CPU within the parameterizable monitoring time, the F module passivates with a "communication error". The F monitoring time can assigned manually or on a module-specific basis (check "Manual assignment of monitoring time") or be assigned centrally in the F parameters of the CPU for all I/O modules.

Via the **F source address**, the F-I/O module F-CM AS-i Safety ST is uniquely assigned to an F-CPU with the corresponding F source address. The F-source address must be unique throughout the network.

The **F destination address** is the PROFIsafe address and uniquely identifies source (F-CPU) and destination (F module). The PROFIsafe addresses must be unique across stations and the network. To prevent incorrect parameter assignment, the F destination address is assigned automatically. When changing the F destination address manually, its station-wide uniqueness is checked automatically, but not its network-wide uniqueness. This has to be ensured by the user him/herself.

Behavior after channel faults: In the event of a channel fault, the F-CM AS-i Safety ST F-I/O module only ever passivates the faulty channel(s).

In this example, the default settings are accepted for the F parameters of the F-CM AS-i Safety ST module.

4.4.6 Configuring safe AS-i slave monitoring

To change the safe I/O addresses and AS-i slave parameters, open the Properties dialog box of the F-CM AS-i Safety ST in the device view of the ET 200SP station.

Under the "Safe inputs" tab there is an entry for each AS-i address in the range 1 ... 31. Initially, all addresses for safe evaluation are deactivated. Select the tab for monitoring AS-i address 1, and activate the "Activate input monitoring" option.

The individual module parameters are explained briefly below.

Tip: Clicking the green arrow to the right of the "Name" field to switch directly between the F parameter dialog window of F-CM AS-i Safety ST and the fail-safe AS-i slave.

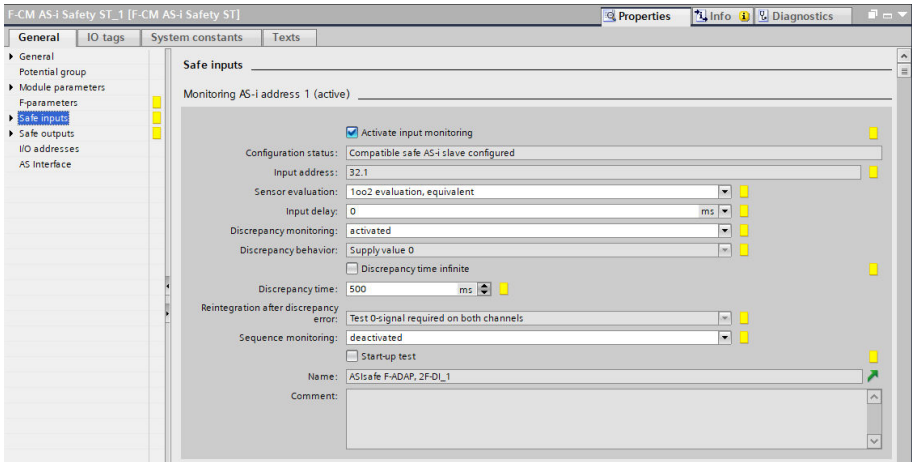

Figure 2-18 Setting the safe input monitoring of the F-CM AS-i Safety ST

By activating the **input monitoring**, you can enable the corresponding AS-i slave as an input channel for signal processing in the safety program. The AS-i address must be assigned to a safe AS-i input slave.

The **configuration status** provides information about whether a safe AS-i slave is configured at this AS-i address ("Compatible safe AS-i slave configured"). Free AS-i addresses or those occupied by a non-safe AS-i slave can also be configured (configuration status: "AS-i slave missing"). The safe AS-i slaves can be inserted later.

Input address: The input bit address of the input channel for the signal processing in the safety program is shown here. It is calculated automatically from the start of the inputs entered in the "Addresses" tab.

Encoder evaluation: Two options are available here.

For the **1oo1 evaluation** , the encoder is present once and connected to a single channel on the first input of the safe AS-i slave. To achieve this, jumper the second input of the AS-i slave. Instead of the jumper, you can also connect another single-channel sensor to the second input. Only when both inputs supply an ON signal does the F-CM AS-i Safety ST module transfer the "1" value to the safety program (the two inputs are ANDed). A discrepancy analysis is not performed in the 1oo1 evaluation.

In the **1oo2 evaluation, equivalent** both inputs of the safe AS-i slave are occupied, either by a 2-channel encoder or by two single-channel encoders. The two single-channel sensors then belong together functionally as a pair, e.g. two position switches of one door monitoring. The input signals are compared internally for equivalence. A discrepancy analysis is possible in the 1oo2 evaluation equivalent.

To suppress coupled-in interference or brief switching pulses, you can set an **input delay** for each AS-i slave.

For fail-safe inputs, the **discrepancy monitoring** for equivalence is used to infer errors from the time characteristic of two signals with the same functionality. If different levels for two associated input signals are detected after the input delay time has expired, the discrepancy analysis is started. A check is made to determine if the difference has disappeared after expiration of an assignable time period, the so-called **discrepancy time**. If not, there is a discrepancy error. Before reclosing, the signal value 0 must be present at both inputs.

The **discrepancy behavior** determines the value that is made available to the safety program in the F-CPU during the discrepancy, i.e. while the discrepancy time is running. This parameter is permanently set to "Provide 0 value".

Reintegration after discrepancy error: This parameter is permanently set to "Test 0 signal necessary on both channels". A discrepancy error is not considered to be rectified until an "OFF" signal is present again at both input channels. Reintegration of the PROFIsafe channel is then possible.

The **sequence monitoring** monitors the sequence of the signals of the channel pair when there is a signal change OFF >>> ON at the inputs of the safe AS-i slave.

If the **Startup test** parameter is activated, the value transferred to the safety program is kept at the substitute value "0" until the connected sensor has been correctly actuated at least once.

You can specify the start address of the process image in the "I/O addresses" tab of the Properties dialog box of the F-CM AS-i Safety ST. Which actual bit in the safety program is accessed, for example for a safe input slave, can be found in the "Input address" described above.

The "I/O addresses" tab also appears in the Properties dialog box of the AS-i slaves. Taking the example of the AS-i F adapter, a distinction is made between "Digital I/O" and "Safe inputs". Under "Digital I/O", the data area of the communication is set with the AS-i master. This area in the user program can be accessed e.g. for diagnostic purposes. Under "Safe inputs", the same input bit as under the AS-i address in the Properties dialog box of the F-CM AS-i Safety (see "Input address") is present. As described above, this bit is accessed in the safety program.

Emergency stop and pushbutton and toggle switch are in an enclosure together with the two necessary AS-i slaves (a safety slave and a standard slave). The two installed slaves are configured separately in the TIA Portal.

The safe monitoring of the position switch is then configured as follows. The explanation of the individual parameters can be found in Section 4.4.5 (Page 29). A 1oo1 evaluation is selected to monitor the position switch because the switch used (version 3SF13 ... 1BA4) is already monitored for discrepancy (see Section 4.2.3 (Page 20)).

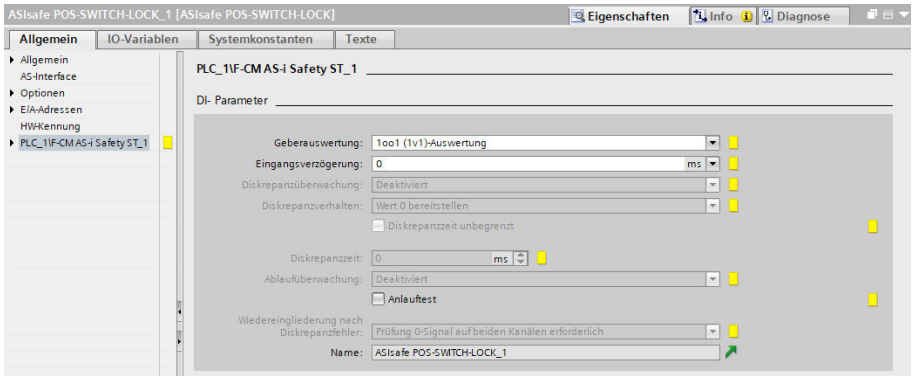

Figure 2-19 Configuration of the position switch

The position signal of the position switch is transferred to the safety program as a safe input bit. The address of the safe input is shown in the following figure (I32.1 in this example).

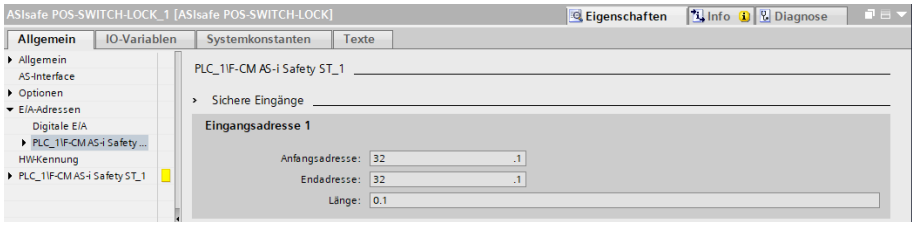

Figure 2-20 Address for reading out the position of the position switch

The solenoid for releasing the door tumbler is controlled via a standard output of the AS-i slave installed in the position switch (output bit 0, see "Digital I/O"; Q0.0 in this example).

The read back signal (normally closed contact) of the solenoid is the second fail-safe channel of the AS-i slave (see Section 4.2.3 (Page 20), 1BA4 version). Since it is directly processed to a fail-safe digital input bit (in this example I32.1, see below) with the first fail-safe channel in the F-CM AS-i Safety ST module, the read-back signal of the solenoid is accessed via the associated standard input bit of the AS-i slave installed in the position switch (input bit 0, see "Digital I/O"; in this example I0.0).

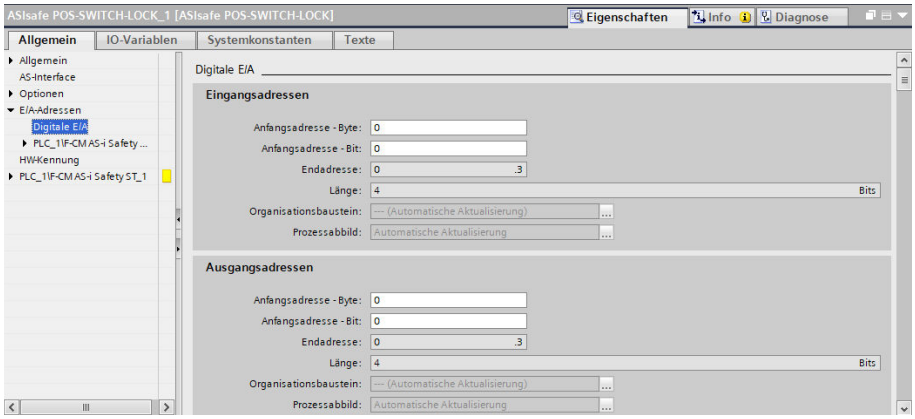

Figure 2-21 Address for controlling the solenoid

The safe monitoring of the emergency stop command device is then configured as follows.

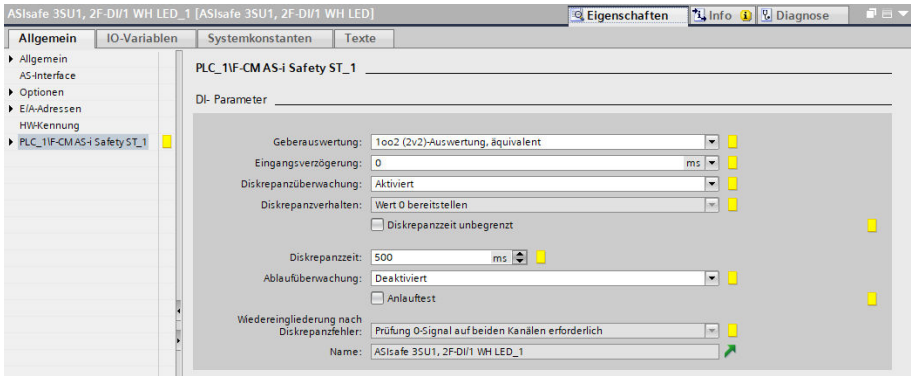

Figure 2-22 Configuration of the emergency stop command device

Finally, the F-DQ module is configured to control the redundant contactors. Here again, the F parameters remain unchanged (default setting). The setting of the safe monitoring can be taken from the following figure.

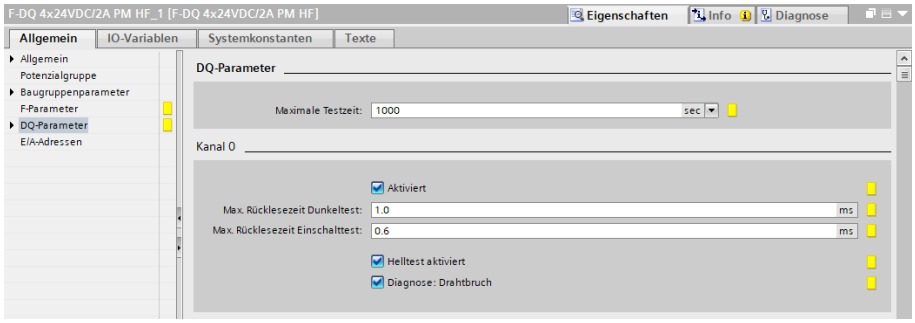

Figure 2-23 Configuration of the F-DQ module

NOTE

Unused channels, such as channels 1 to 3 of the F-DQ module, should be deactivated for reasons of clarity and improved performance. For this purpose, the check is removed from "Activated" for the corresponding channels. For the F-CM AS-i Safety ST module, the user must activate the input channels required for the configured AS-i slaves.

4.4.7 Minimum number of slaves for AS-i Safety applications

In a normal application, an AS-i network contains more than 5 AS-i slaves.

However, only 3 AS-i slaves are used for this example. In this case, the specifications in EN 60262-2 (AS-i specification) for the minimum cycle time and minimum number of slaves for AS-i Safety applications must be observed.

In an AS-i network with at least 5 different slave addresses in the numerical part of the address, each safety component functions as intended. "In the numerical part of the address" means that two slaves with the addresses 5A and 5B are counted here as 1 address, whereas two slaves with the addresses 10A and 11B are counted as 2 addresses. For the count, it is irrelevant whether or not these are safety slaves.

With less than 5 slave addresses, only restricted plant availability is possible, i.e. instead of an "ON" signal in the safety transmission report, it is possible to switch back to the "OFF" safe state, since the affected safety component cannot execute the report for the "ON" signal quickly enough in the short bus cycle time. An "OFF" signal remains of course in the safe state "OFF".

The TIA Portal outputs a corresponding warning message on compilation if not enough slaves have been configured as AS-i slaves in the TIA project.

An AS-i Safety network usually still functions with fewer slaves. However, to avoid an unwanted shutdown, the rules in the standard should be observed. The F-CM AS-i Safety module offers a simple solution for this, without installing additional slaves.

Open the Properties dialog of the F-CM AS-i Safety, and navigate to the "Safe outputs" tab. Select the vector group 0, and set the option "Activate output control". The F-CM AS-i Safety module now generates an AS-i address internally. At the same time, an associated virtual module (AS-i Safe Out Ctrl) is configured on the AS-i subnet, so that the AS-i master is instructed to accept the additional AS-i address into the cyclic operation.

Repeat this step four more times, so that a total of 5 additional AS-i addresses are activated in the F-CM AS-i module. These act as a "base load" in the AS-i network, irrespective of the number of other AS-i modules in the AS-i network.

If your AS-i network has enough modules, you can correspondingly deactivate the output control in the vector groups of the F-CM AS-i Safety.

When a vector group is activated, additional safe output bits are made available. Do not interconnect these safe output bits in the safety program if the vector group is only used to increase the number of slaves.

You can use the vector groups of the F-CM AS-i Safety and the associated safe output bits as required to control safe AS-i output modules in the AS-i network (see e.g. Art. No. 3RK1405-1SG15-0AA2). In this case, you use the safe output bits in the safety logic of the safety program in a similar way as for F-DQ modules of the ET 200SP. This Function Manual does not include a detailed example for this application.

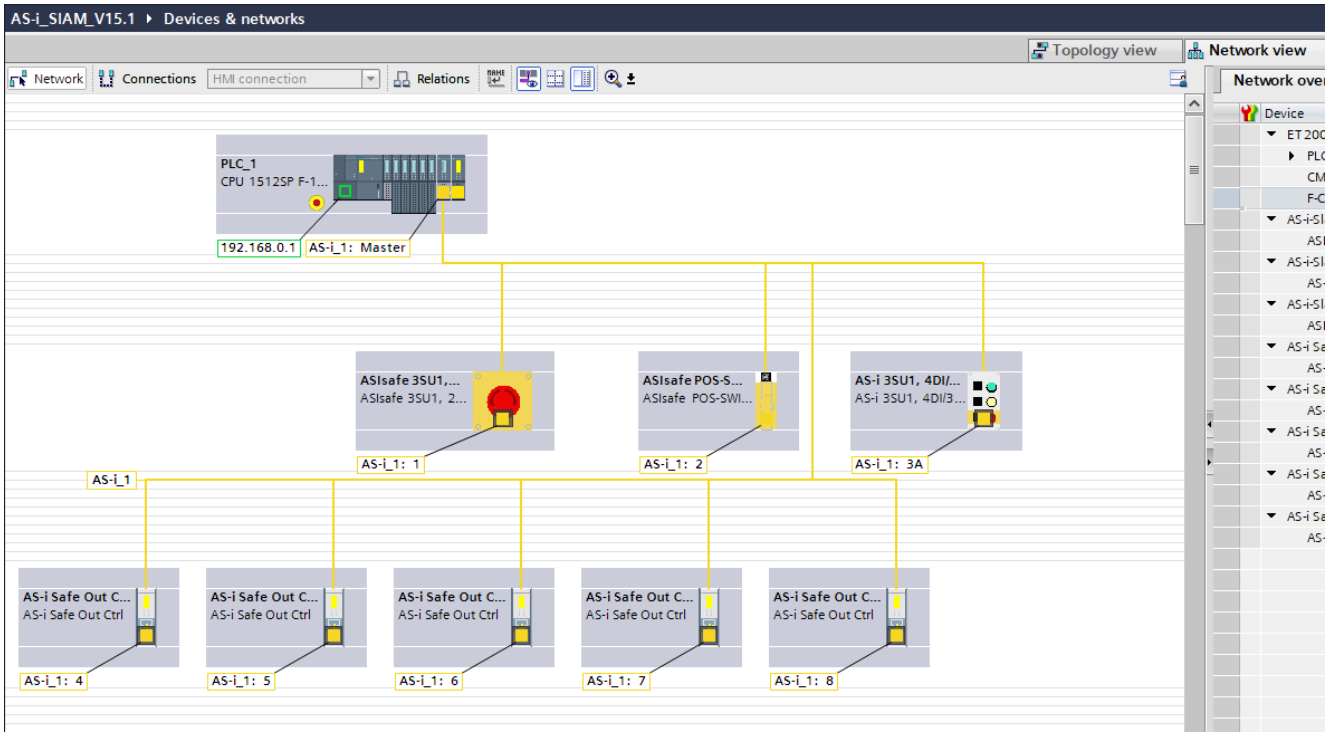

Figure 2-24 Hardware configuration with virtual slaves

4.4.8 Assigning fail-safe addresses to ET 200SP

After setting the F parameters of the F-CM AS-i Safety ST module, the PROFIsafe-/F destination address still has to be assigned to the extended module (real hardware).

Fail-safe ET 200SP modules do not have DIP switches with which you can assign the unique F destination address (= PROFIsafe address) to each module. Instead, assign the PROFIsafe address directly from STEP 7. F destination addresses are assigned in the hardware configuration for the F module. An assignment is necessary when a system is commissioned for the first time, for example. The F destination address can only be assigned if the PROFINET device name is also assigned.

Open the shortcut menu of the F-CM AS-i Safety ST (right click on the F-CM AS-i Safety module) and select "Assign F destination address". In the dialog which then appears, identify the F-CM AS-i Safety ST module, and then assign the PROFIsafe address.

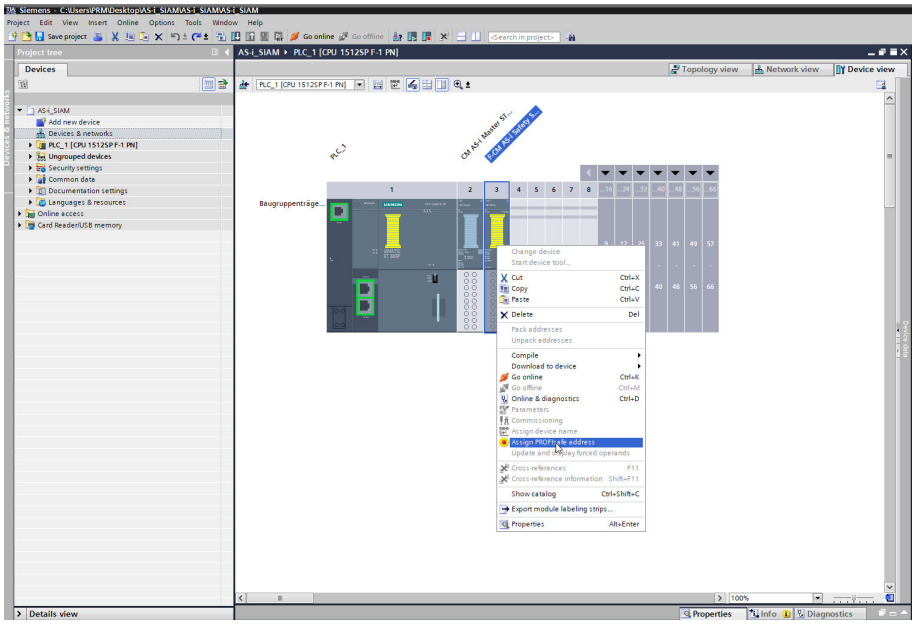

Figure 2-25 Assigning the PROFIsafe address

Repeat the described procedure for assigning the fail-safe address for the F-DQ module.

4.4.9 Teaching ASIsafe code sequences

To perform safety-related communication, each safe AS-i input slave sends a code sequence over the AS-i bus. To prevent a mix-up of AS-i input slaves on the AS-i bus, each AS-i input slave sends a different code sequence. The code sequences are permanently stored in the AS-i input slave.

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus.

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component. Two methods of accepting code sequences are available:

Transfer the code sequences via STEP 7 online access:

Open the F-CM AS-i Safety ST shortcut menu and select "Online & Diagnostics". Change to the "Functions > ASIsafe code sequences" tab. The "Teach ASIsafe code sequences" dialog contains an overview of the code sequences of the existing safety-related AS-i slaves. Start the acceptance of the code sequences read on the AS-i bus into the memory of the F-CM AS-i Safety ST module in this dialog. To do so, click the "Transfer taught code sequences" button.

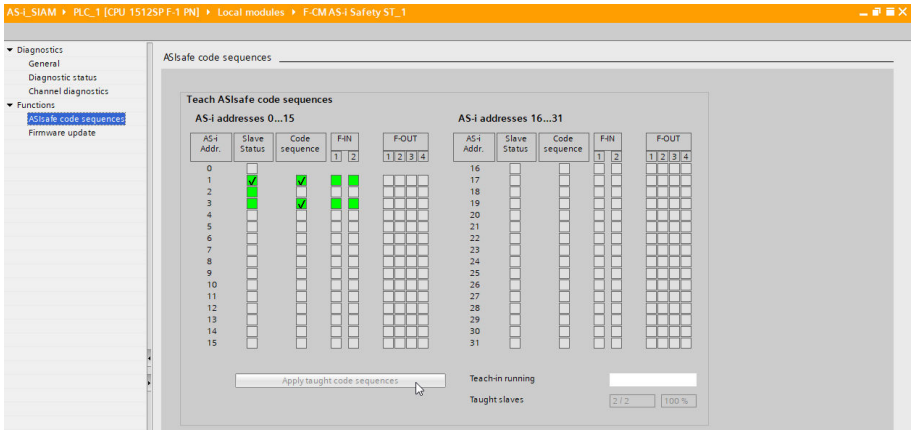

Figure 2-26 Accepting code sequences

Transfer the code sequences with the "TEACH" button:

As an alternative, the "TEACH" button can be used to provide an easy way of transferring taught code sequences. The "TEACH" button can be used, for example, to transfer code sequences of modules replaced during operation. However, it is also suitable for initial commissioning.

The "TEACH" pushbutton is connected to the terminals "TEACH1" and "TEACH2" (terminals 1 and 2) of the base unit of the F-CM AS-i Safety ST module.

Press the "TEACH" button for at least 3 s. This action causes all currently taught code sequences that are unique and consistent to be transferred to the non-volatile memory. Next, the input data of the safe AS-i input slaves is evaluated, allowing reintegration in the safety program.

Further information on the topic of code sequences can be found in the "T 200SP fail-safe module F-CM AS-i Safety ST (https://support.industry.siemens.com/cs/ww/de/view/90265988)" Manual in the "Code sequences" section.

4.5 TIA Portal programming

In this typical circuit diagram, the focus is on the safety-related switching of the machine. Therefore, operational switching is not taken into account, and no standard user program is programmed. In this example, the user must implement the operational switching – adapted to the conditions of the machine – in their program with the aid of the "operativeOn" variable in the DB "DataToSafety" via the FB "StartStop".

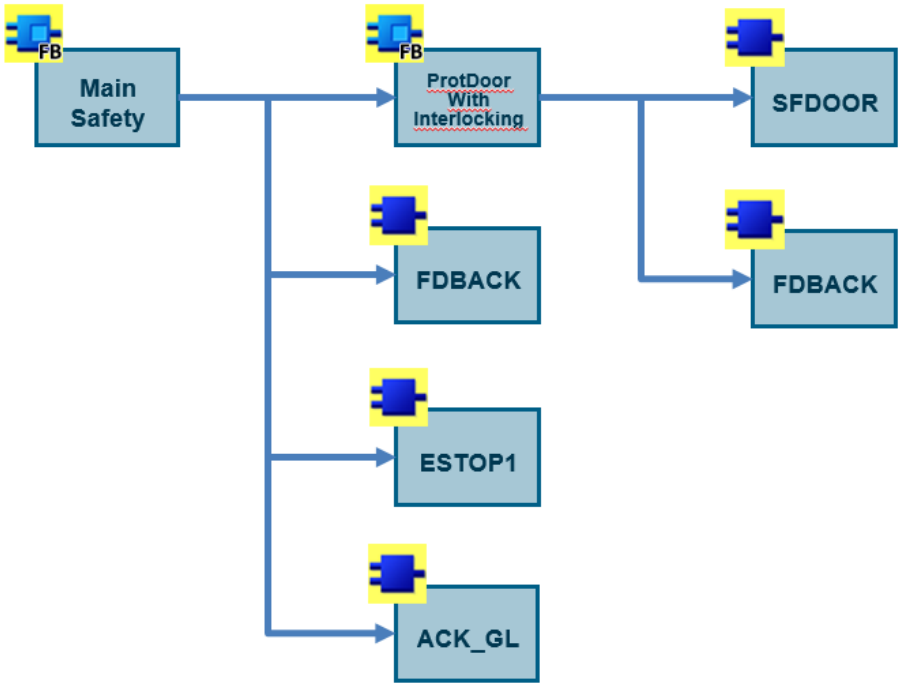

Figure 2-27 Safety program

The MainSafety function block is called cyclically by an F-runtime group. This contains all other safety-related program parts.

Reintegration of passivated channels

The ACK_GL instruction in STEP 7 Safety is used for this purpose. It generates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F I/O of an F runtime group after communication faults or F I/O / channel faults.

Figure 2-28 Call ACK_GL

Examples of events that lead to passivation:

- Wire break in an F-DQ module
- Fault on a AS-i safety slave, e.g. slave failure or discrepancy fault at the safety inputs

NOTE

If a fault occurs in the hardware (e.g. wire break detected), depending on the fault it may take several seconds before the module detects the rectification of the fault. The acknowledgment does not have an effect until after this.

Data exchange between standard user program and safety program

In the event of inadequate programming, data corruption resulting in a CPU/ system stop may occur in the communication between standard user program and safety program (see (https://support.industry.siemens.com/cs/document/19183712/what-should-you-do-if-the-f-cpu-goes-into-stop-mode-and-the-message-data-corruption-in-the-safety-program-appears-in-the-diagnostics-buffer-?dti=0&lc=en-WW)).

Therefore two global data blocks should be used to exchange data between the standard user program and the safety program.

- DataToSafety
- DataFromSafety

The values in the DataToSafety data block are written by the standard user program and read by the safety program. The values in the DataFromSafety data block are written by the safety program and read by the standard user program. Since this example does not contain a standard user program, these two global data blocks were not included. They should be added by the user of this example.

NOTE

Further information on the data exchange between standard user program and safety program can be found in the "SIMATIC Safety - Configuring and Programming" Manual. (https://support.industry.siemens.com/cs/ww/en/view/54110126)

Commissioning and operation

5

5.1 Commissioning

5.1.1 Preparation

1. Download the "E-Stop_SIL3_Protective_door_tumbler_SIL2_AS-i.zap15_1" project file. Link: . (http://support.automation.siemens.com/WW/view/en/109769506)
2. Save the file in any folder on your computer.
3. Set the IP address of the PG/PC so that the PG/PC is in the same subnet as the CPU.
4. Connect the PG/PC to the Ethernet interface of the CPU 1512SP F-1 PN using an Ethernet cable.

The following IP address has been used for this application example:

CPU S7-1512SP F-1 PN

IP address: 192.168.0.1

Subnet mask: 255.255.255.0

5.1.2 Load S7 project into the CPU

1. Open "TIA Portal V15.1".
2. Switch to the project view.
3. Click "Project > Dearchive" in the menu bar of the TIA Portal.
4. Click "Browse" and dearchive the project.
5. Set the CPU 1512SP-1 F-1 PN to STOP.
6. Right mouse click in the project topology on "PLC_1 [CPU1512SP F-1 PN] and then on "Load into device > Hardware and software (changes only)".
7. In the open window, select the desired interface and click "Start search".
8. Select the CPU on the basis of the MAC address, and the click "Load".

NOTE

The IP address and the device name are automatically assigned when the project is loaded into the CPU.

9. Confirm the dialog by clicking "Load".
10. Click "Finished" when the loading process has finished.

5.1.3 Assigning PROFIsafe addresses

For safe communication between the F-CPU and the fail-safe modules (F-CM AS-i Safety and F-DQ), the correct PROFIsafe addresses must be assigned to the modules. To do this, follow the steps in Section 4.4.8. (Page 35)

NOTE

Since the PROFIsafe address is stored in the electronic coding element of the ET 200SP slot, this step is only necessary if a PROFIsafe address is missing, or if a different one was assigned.

Now set the CPU 1512SP F-1 PN to RUN.

NOTE

All red LEDs of the fail-safe modules should go out after the PROFIsafe addresses have been assigned. If this is not the case, there may be a fault in the wiring.

Apart from that, the ASIsafe code sequences still have to be read. The procedure for loading the code tables is described in Section 4.4.9 (Page 36) "Teach ASIsafe code sequences".

5.2 Using the application

Starting a machine

No.	Action	Note
1	Close the protective door.	
2	Move the toggle switch into the position that locks the protective door.	The voltage in the solenoid is switched off and the locking mechanism moves into the actuator. The protective door is locked.
3	Unlock the emergency stop button.	
4	Press the start pushbutton.	After the emergency stop button has been unlocked, acknowledgment is required. The machine starts.

Unlock and open the protective door

No.	Action	Note
1	Move the toggle switch into the position that unlocks the protective door.	The machine switches off and runs down.
2	Wait for the parameterized delay time before unlocking the protective door.	In this example: 5 seconds After the time has expired, the solenoid is supplied with power, and moves the locking mechanism out of the actuator. The protective door is unlocked.
4	Open the protective door.	

Acknowledging other faults in the safety function

If another fault occurs in the safety function, the machine is immediately switched off and a restart is prevented. Proceed as follows to acknowledge the fault.

Possible faults that are acknowledged in this way include:

- Cross circuit between the two emergency stop channels.
- External voltage on the fail-safe outputs
- Withdrawing a fail-safe module
- Contact welding of a contactor

No.	Action	Note
1	Check the LEDs on the fail-safe modules. If one red LED illuminates, a fault in the hardware has been detected. Search for the fault by means of the online diagnostics in the TIA Portal.	
2	If all LEDs are green, the safety program has detected a fault. Look at the variable table to find the fault.	The #fault and #ackReg variables of the ProtDoorWithInterlocking block instructions can help with the search.
3	Eliminate the fault.	
4	Close the protective door.	
5	Unlock the emergency stop button.	
6	Move the toggle switch to lock the protective door.	The voltage in the solenoid is switched off and the locking mechanism moves into the actuator.
7	Press the start pushbutton.	Passivated channels of the fail-safe modules are re-integrated. Faults detected by the safety program are acknowledged. The machine starts.

5.3 Evaluating the safety function

An evaluation is made according to both EN ISO 13849-1 and EN 62061 with the Safety Evaluation Tool (SET) (http://siemens.de/safety-evaluation-tool).

The result of the evaluation - the SET file (http://support.automation.siemens.com/WW/view/en/109769506)- is added to the SIOS entry of this document.

Appendix 6

6.1 Service and Support

Industry Online Support

Do you have any questions or need assistance?

Siemens Industry Online Support offers round-the-clock access to our entire service and support know-how and portfolio.

The Industry Online Support is the central address for information about our products, solutions and services.

Product information, manuals, downloads, FAQs and application examples – all information is accessible with just a few mouse clicks here (https://support.industry.siemens.com).

Technical Support

The Technical Support of Siemens Industry provides you with fast and competent support regarding all technical queries with a variety of customized portfolio elements – from basic support to customized support contracts.

Send queries to Technical Support using the web form (https://www.siemens.de/industry/supportrequest).

SITRAIN – Training for Industry

With our globally available training courses for our products and solutions, we help you with innovative learning methods.

For more information on our various training courses as well as their locations and dates, go to the Internet (https://www.siemens.de/sitrain).

Service portfolio

Our service portfolio includes the following:

- Plant data services
- Spare parts services
- Repair services
- On-site and maintenance services
- Retrofitting and modernization services
- Service programs and contracts

You can find detailed information on our range of services in the Service Catalog (https://support.industry.siemens.com/cs/sc).

Industry Online Support app

You will receive optimum support wherever you are with the "Siemens Industry Online Support" (https://support.industry.siemens.com/cs/ww/de/sc/2067) app. The app is available for Apple iOS, Android and Windows Phone.

Preface

Conventions

Please also observe the notes identified as follows:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which particular attention should be paid.

Incorporation in the information landscape

System Manuals and Equipment Manuals of the respective F-I/Os describe the hardware of the F-I/Os, including configuration, wiring, parameter assignment, diagnostics and technical specifications.

Online help for SIMATIC S7-FCT

You can easily open this manual from the SIMATIC S7-FCT by placing the focus on a SIMATIC S7-FCT dialog or SIMATIC S7-FCT window and pressing "F1".

Important note for maintaining the operational safety of your system

NOTE

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.
You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.
Log on to Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

- Distributed I/O (https://support.industry.siemens.com/cs/products?pnid=14029&lc=en-WW)

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**
  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**
  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**
  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**
  For answers and solutions concerning automation technology.
- **mySupport**
  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

Introduction

1

SIMATIC S7-FCT enables you to calculate the F_iPar_CRC and to assign the PROFIsafe address for selected F-I/Os from Siemens, which you integrate into your engineering system via a PROFINET GSD file.

SIMATIC S7-FCT fulfills the function of a CPD tool according to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO".

Approved F-I/Os and hardware configurations

WARNING

You may use SIMATIC S7-FCT only for F-I/Os that have been approved for the version of SIMATIC S7-FCT you are using.
You can find a list of the F-I/Os and hardware configurations approved for SIMATIC S7-FCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

NOTE

- The "Shared Device" function is not supported.
- Redundant interface modules are not supported.

Installing SIMATIC S7-FCT

2

Requirements

SIMATIC S7-FCT can be operated under the following operating systems:

- Windows Server 2019 (version 1809) Standard (full installation)
- Windows Server 2022 Standard (full installation)
- Windows 10 Home Version 22H2 (OS Build 19045)
- Windows 10 Pro Version 22H2 (OS Build 19045)
- Windows 10 Enterprise Version 22H2 (OS Build 19045) in General Availability Channel
- Windows 10 Enterprise 21H2/ 2021 LTSC (OS Build 19044) (Test for IPC)
- Windows 10 Enterprise 1809/ 2019 LTSC (OS Build 17763) (Test for IPC)
- Windows 10 Enterprise 1607/ 2016 LTSC (OS Build 14393) (Test for IPC) Anniversary Update
- Windows 11 Home Version 23H2 (OS Build 22631)
- Windows 11 Home Version 22H2 (OS Build 22621)
- Windows 11 Pro Version 23H2 (OS Build 22631)
- Windows 11 Pro Version 23H2 (OS Build 22631)
- Windows 11 Enterprise 23H2(OS Build 22631)
- Windows 11 Enterprise 22H2(OS Build 22621)

Requirements for your engineering system:

- So that you can call the functions of SIMATIC S7-FCT in your engineering system, your engineering system must support CPD system integration.

Installing SIMATIC S7-FCT

1. Call the SIMATIC_S7_FCT_V4.EXE program.
2. Follow the setup program instructions.

NOTE

If you want to install SIMATIC S7-FCT over an existing version older than V4.0, you must uninstall the existing version first. Then start the SIMATIC_S7_FCT_V4.EXE program and follow the installation instructions. For existing versions starting from V4.0, the setup routine offers a modification/upgrade to the newer version.

2.1 Uninstalling

Uninstall the SIMATIC S7-FCT in the usual way on your operating system, for example, using Add-Remove Program.

SIMATIC S7-FCT procedure

3

Requirement

The device must be integrated into your engineering system as PROFINET GSD file.

Procedure

The device is configured in the usual way according to the engineering system used. The following steps are an example of what is required:

1. Install the PROFINET GSD file in your engineering system.
2. Configure an F-CPU and the GSD device, connect the F-CPU and the device via PROFINET.
3. Configure the F-I/Os.
4. Paramaterize all parameters of the F-CPU and the F-I/Os according to the manufacturer's specifications.
5. Start SIMATIC S7-FCT from your engineering system for calculation of F_iPar_CRC.
6. In your engineering system, copy the value for F_iParCRC (Page 11) calculated by SIMATIC S7-FCT into the PROFIsafe parameter "F_iPar_CRC" of the F-I/O.
7. In your engineering system, download the hardware configuration to the F-CPU.

   Depending on your engineering system, you may need to compile the hardware configuration before loading.
8. Start SIMATIC S7-FCT for the assignment of the PROFIsafe address (Page 13).

NOTE

If you have problems connecting to the interface module when assigning the PROFIsafe address, deactivate the Internet protocol version 6 (TCP/IPv6) for the network adapter you are using.

3.1 Registering the TCI Communication Server for 64-bit version

To assign the PROFIsafe address, SIMATIC S7-FCT communicates with the engineering system via the standardized TCI interface with the TCI Communication Server. The TCI Communication Server must be available in the 64-bit version.

Registering the TCI Communication Server for 64-bit version

If the TCI Communication Server does not already exist as a 64-bit version, a dialog prompts you to register the TCI Communication Server for calling with 64-bit applications when you start SIMATIC S7-FCT from your engineering system the first time.

Start the registration with a double-click on the automatically created file "Register_S7-FCT.reg". The dialog shows you the path to the file.

It is recommended to manually undo the registration when uninstalling SIMATIC S7-FCT. Start the removal of the registration with a double-click on the file "UnRegister_S7-FCT.reg". The path to the file corresponds to that from the registration dialog.

NOTE

If the rights granted to you by your system administrator do not permit you to write to the hard disk and/or registry, the system administrator must ensure that the TCI Communication Server is registered prior to installation of S7-FCT.

Procedure for the system administrator:
Besides the installation file there is a PowerShell script (/Tools/RegisterTciCommunicationServers.ps1) you can use to register the TCI Communication Server. You can also find this script in the installed folder after finishing the setup.
The script requires the COM ProgId of the TCI Communication Server of the target engineering system. Already provided in the script are the TCI Communication Server COM ProgIds of several current Siemens TIA Portal versions, the SIMATIC Manager (STEP 7 V5.6) and several selected third-party engineering systems. You must add the COM ProgId of the TCI Communication Server of the target engineering system there. You must execute the script **after** installation of the target engineering system.
The ProgId of the TCI Communication Server is named by the target engineering system, or you read it from the TPF file Tpf0.xml, which you can find under <user>/AppData/Local/Temp, possibly in a subdirectory "TCI", after starting S7-FCT. Note, however, that the TPF file Tpf0.xml is deleted again when you close SIMATIC S7-FCT.
You will find the ProgId of the target engineering system under the tag <General />, e.g. CommServer-ProgID="Tci.SimaticCommunicationServerV19".

Calculating F_iPar_CRC for an F-I/O

4

Introduction

This dialog allows you to calculate the value of F_iPar_CRC from the safety-related fail-safe iParameters of an F-I/O.

Requirement

The following requirements must be met:

- The PROFINET GSD file is installed in your engineering system.
- The F-I/O is configured and parameterized in your engineering system.

Procedure

1. Open the "F_iPar_CRC calculation" dialog for the desired F-I/O. Proceed as described in the documentation of your engineering system. For example, via the shortcut menu of the F-I/O with "Start device tool > SIMATIC S7-FCT V4.0 > F_iPar_CRC calculation".

   NOTE

   If your engineering system does not offer the start of SIMATIC S7-FCT, check whether the F-I/O is supported by SIMATIC S7-FCT (https://support.industry.siemens.com/cs/ww/en/view/109762827). Try reinstalling SIMATIC S7-FCT. If SIMATIC S7-FCT is still not shown, contact the manufacturer of the engineering system.

   The fail-safe iParameters of the F-I/O are displayed in the dialog.
2. Check the fail-safe iParameters of the F-I/O.

   ⚠ WARNING

   Setting of the fail-safe iParameters
   You are responsible for the correct setting of the fail-safe iParameters.
   Before calculating the value of F_iPar_CRC, check the fail-safe iParameters displayed in the SIMATIC S7-FCT dialog and their values for consistency with all iParameters and their value settings displayed in your engineering system for the F-I/O.
   If you notice missing fail-safe iParameters or deviating values, you must abort the F_iPar_CRC calculation. Contact Siemens Industry Online Support.

3. Then click "Confirm iParameters".
   F_iPar_CRC is calculated for the values of the safety-related fail-safe iParameters.

   NOTE
   You need to close and restart SIMATIC S7-FCT after changing the safety-related iParameters in the engineering system. The changes in the safety-related iParameters for the calculation of F_iPar_CRC only take effect after a restart.

4. Copy the calculated value for F_iPar_CRC from one of the two fields (decimal or hexadecimal format) with the corresponding button.
5. Insert the calculated value for F_iPar_CRC in your engineering system as value for the "F_iPar_CRC" parameter of the F-I/O.
6. In your engineering system, download the hardware configuration to the F-CPU.
   Depending on your engineering system, you may need to compile the hardware configuration before loading.

Assigning the PROFIsafe addresses to the F-I/Os 5

5.1 Introduction

For F-I/Os from Siemens that do not have a DIP switch for setting the F-destination address, assign the PROFIsafe address (combination of F-source address and F-destination address) with SIMATIC S7-FCT.

In the following cases, reassignment of the PROFIsafe address is required:

- Changing the F-destination address or F-source address
- Replacement of the coding element

In the following cases, reassignment of the PROFIsafe address is not required:

- When you replace an F-I/O / BaseUnit and apply the original coding element
- Replacement of the interface module

Basic procedure

1. Configure and parameterize your F-I/Os, including the PROFIsafe address (combination of F-source address and F-destination address), with your engineering system. You calculate the value for F_iPar_CRC (Page 11) with SIMATIC S7-FCT.
2. Identify (Page 14) the F-I/Os to which you want to assign the parameterized PROFIsafe address.
3. Assign (Page 15) the PROFIsafe address to the F-I/Os.

⚠ WARNING

If you make changes in which the assignment of the input/output channels of the F-I/O and the inputs/outputs can change in the safety program, you need to test the following for the relevant F-I/Os, regardless of whether the PROFIsafe addresses change or not:

- Whether a signal at an input channel at the F-I/O arrives at the expected input in the safety program
- Whether the value of an output in the safety program arrives at the expected output channel of the F-I/O

Examples for such changes are:

- Adding F-I/Os
- Changing the input/output addresses of F-I/Os
- Changing the slot position of F-I/Os
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

5.2 Identifying F-I/Os

Requirement

The following requirements must be met:

- The F-CPU is configured and parameterized.
- The F-I/Os are configured and parameterized (Page 11) including correct values for F_iPar_CRC.
- The current hardware configuration has been saved and loaded and, depending on your engineering system, compiled before loading.
- The F-I/Os and, if necessary, the F-CPU can be reached online.

⚠ WARNING

Make sure that the latest hardware configuration has been downloaded to the F-CPU before the identification. By clicking the "Identification" button and then clicking on "Assign PROFIsafe address", you confirm the correctness of the PROFIsafe addresses for the F-I/Os.
Therefore, proceed carefully when confirming the F-I/Os by LED flashing or by checking the serial number of the interface module with F-I/Os.
To do this, you have to read and write down the serial number directly at the interface module. It is not permitted to read out the serial number via your engineering system.
A special rule applies for F-I/Os of the ET 200AL distributed I/O system. For these F-I/Os, only identification by LED flashing is permissible and only exactly one F-I/O at a time may be selected for assignment of the PROFIsafe address.

Procedure

Proceed as follows to identify the F-I/Os:

1. Open the "PROFIsafe address assignment" dialog for the desired F-I/Os / device. Proceed as described in the documentation of your engineering system. For example, via the shortcut menu of the F-I/O / device with "Start Device Tool > SIMATIC S7-FCT V4.0 > PROFIsafe address assignment".

NOTE

If you integrate an F-I/O of the ET 200AL distributed I/O system in a configuration of the ET 200SP distributed I/O system (mixed configuration ET 200AL/ET 200SP with ET-Connection), you need to open the dialog "PROFIsafe address assignment" for the F-I/Os / device of the respective distributed I/O systems separately.

NOTE

If your engineering system does not offer the start of SIMATIC S7-FCT, check whether the F-I/Os are supported by SIMATIC S7-FCT (https://support.industry.siemens.com/cs/ww/en/view/109762827). Try reinstalling SIMATIC S7-FCT. If SIMATIC S7-FCT is still not shown, contact the manufacturer of the engineering system.

2. Under "Assign PROFIsafe address via", select the method to be used for identifying the F-I/O.
   – "Identification by LED flashing"
     This is the default setting. The DIAG and STATUS LEDs of the F-I/Os to be identified flash upon identification.
   – "Identification by serial number"
     If you cannot see the F-I/Os directly, you can identify the F-I/Os by the previously noted serial number of the interface module.

     NOTE
     The displayed serial number may be amended with a year number compared to the serial number printed on the interface module. The serial numbers are still considered identical, however.

3. With identification by LED flashing, select all the F-I/Os to which you want to assign the PROFIsafe addresses in the "Assign" column.
   If you select the interface module in the "Assign" column, all F-I/Os of the station are selected.
4. If you have configured more F-I/Os for an ET 200MP device than are actually available, a dialog appears. In this dialog, enter the number of actually existing ET 200MP F-I/Os and confirm the dialog. If you have configured fewer ET 200MP F-I/Os than are actually available, an online-offline difference is shown and the assignment of the PROFIsafe address is not possible.
5. Click the "Identification" button. Check whether the DIAG and STATUS LEDs for the F-I/Os whose PROFIsafe addresses you want to assign are flashing green. If you identify using the serial number, compare the displayed serial number to the noted serial number of the interface module.

5.3 Assign PROFIsafe address

Introduction

After you have identified the F-I/Os, you can assign the PROFIsafe addresses to the F-I/Os.

Requirement

- The F-I/Os and, if necessary, the F-CPU can be reached online.
- The F-I/Os have been successfully identified.

Procedure

Follow these steps to assign the PROFIsafe addresses:

1. In the "Confirm" column, select all the F-I/Os to which you want to assign the PROFIsafe addresses.
2. Use the "Assign PROFIsafe address" button to assign the PROFIsafe addresses to the F-I/Os.
   You must confirm the "Confirm assignment" dialog within 60 seconds to assign the PROFIsafe addresses.

NOTE
Note that SIMATIC S7-FCT communicates directly with the interface module when assigning the PROFIsafe address. For this reason, it is not possible to protect this operation using the access protection of the host system.
Access protection to protect against unauthorized personnel is not required for the SIMATIC S7-FCT, as automatic start-up of the F-I/Os is not possible.

5.4 Changing the PROFIsafe address

Procedure

NOTE
Please note that the uniqueness of the PROFIsafe addresses (combination of F-source address and F-destination address) must be ensured even after changing the F-source address or F-destination address of the F-I/Os.

1. Change the F-source address or F-destination address in the hardware configuration.
2. Compile and download the hardware configuration to the F-CPU.
3. Proceed as described under Identifying F-I/Os (Page 14) and Assign PROFIsafe address (Page 15).

SIEMENS

SIMATIC
Industrial Software
Product Information on the SIMATIC S7-FCT V3.0 - Fail-safe Configuration Tool configuration manual

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

Content

The configuration manual "SIMATIC S7-FCT V3.0 – Fail-safe Configuration Tool" remains valid with Update 1 and includes version SIMATIC S7-FCT V3.0 Update 1.
In the "Installation" section, use file "SIMATIC_S7_FCT_V3_Update1.EXE" instead of file "SIMATIC_S7_FCT_V3.EXE".

Introduction

Note the following dependencies for PROFINET IO during configuration of ET 200SP fail-safe modules per with GSD file.

NOTE

When using ET 200SP fail-safe modules with the GSD file on F-CPUs, note that the warnings, information and references contained in the F-module manuals are still valid for other manuals.

Also observe the specifications of the F-CPU.

An F-CPU is an F-capable IO controller that supports PROFIsafe.

Requirement

ET 200SP fail-safe modules can be used with the GSD file on the following interface modules:

- IM 155-6 PN ST as of V3.1
- IM 155-6 PN HF as of V3.1
- IM 155-6 PN/2 HF as of V4.2
- IM 155-6 PN/3 HF as of V4.2
- IM 155-6 PN HS as of V4.0
- IM 155-6 MF HF as of V5.0

© Siemens 2020 - 2025. All rights reserved
A5E32311847-AF , 11/2025

An S7-FCT is required to calculate the F_iParCRC and address the F-I/O.

NOTE

If the identification during the assignment of the PROFIsafe address does not succeed, e.g. the F module flashes continuously, the following corrective measures are possible:

- Pull/plug the F module.
- Repeat the assignment of the PROFIsafe address after approx. 2 minutes.
- Increase the PROFINET update time of the F-CPU and IM for the duration of the F-address assignment.

S7-FCT allows you to configure selected F-I/Os from SIEMENS in an engineering system from another manufacturer.
You can find S7-FCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).
Observe the minimum requirements for the installation of the F-system to be used.

Table 1 Configuration software and requirements

Configuration software	Requirements	Information on installation
STEP 7 (TIA Portal) as of V15	S7-FCT as of V2.0	STEP 7 online help
STEP 7 as of V5.5 SP4 HF19		
STEP 7 as of V5.6 HF5 or higher		
STEP 7 as of V5.6 SP1 HF5		
Software of another manufacturer		Documentation of the manufacturer

We recommend that you use the latest HF.

NOTE

Observe the module-specific restrictions.

Dependencies F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0) as of firmware version V2.0.0

Reintegration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F module supports configuration per GSD file PROFIsafe V2.4.
When configuring with GSD file, only module-wide passivation is possible.
In TIA Portal, the "IO Tags" tab displays more tags than supported by the F module.

F-DQ 4x24VDC/2A PM HF (6ES7136-6DB01-0CA0) dependencies as of firmware version V1.0.0

The same dependencies apply to this F-module as to F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0).
In addition, channel-by-channel passivation is also possible due to the support of PROFIsafe V2.6MU1.
With the "Keep last valid value" setting of the "Behavior at loss of communication" parameter, the I/O module is only compliant with EN 54-2.

Dependencies for "Disable Dark Test (max. SIL2, CAT3, PLd)"
If you have enabled "Disable Dark Test (max. SIL2, CAT3, PLd)", "Disable Dark Test for 48 hours" and "Enable Dynamic Read Back" cannot be set.

Dependencies for "Disable Dark Test for 48 hours"
If you have enabled "Disable Dark Test for 48 hours", you must configure the "Max. readback time light test / dark test" parameter the same for all channels.
"Disable Dark Test (max. SIL2, CAT3, PLd)" and "Enable Dynamic Read Back" cannot be set.

Dependencies for "Enable Dynamic Read Back"
If you have enabled "Enable Dynamic Read Back", then "Disable Dark Test (max. SIL2, CAT3, PLd)" and "Disable Dark Test for 48 hours" cannot be set.
Limit the range of values of the "Max. readback time, dark test and switch-off test" parameter to between 0.6 ms and 20 ms.

Dependencies F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)

General dependencies
The following applies to the "Input delay" parameter, depending on the sensor supply and activation of the short-circuit test:
"Input delay" < MIN ("Startup time of the sensor after a short-circuit test", "Time for the short-circuit test").
The "Startup time of the sensor after a short circuit test" must be configured to be at least 1% of the "Time for the short circuit test".
If a sensor supply is selected for a channel, this sensor supply must also be activated. You also need to disable unused encoder supplies.
Reintegration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F module supports configuration per GSD file PROFIsafe V2.4.
When configuring with GSD file, only module-wide passivation is possible.

Dependencies for 1oo2 evaluation
Both channels must be activated.
The "Input delay" parameter must be identical for each pair. The "Input delay" parameter for the channel pair is determined as follows:
"Input delay" < MIN("Input delay" for channel n, "Input delay" for channel n+4).
The configured discrepancy time must be greater than the configured input delay.
Disable chatter monitoring for both channels.

Dependencies F-DI 8x24VDC HF (6ES7136-6BA01-0CA0)

The same dependencies apply to this F-module as for F-DI 8x24VDC HF (6ES7136-6BA00-0CA0).
In addition, channel-by-channel passivation is also possible due to the support of PROFIsafe V2.6MU1.

Dependencies for safety mat evaluation (as of firmware version V2.0.0)
If you have configured a channel group as a safety mat evaluation, you must assign the sensor supplies to the digital inputs as follows:

- VS_0 to DI_0 and VS_4 to DI_4
- VS_1 to DI_1 and VS_5 to DI_5
- VS_2 to DI_2 and VS_6 to DI_6
- VS_3 to DI_3 and VS_7 to DI_7

The short-circuit test must be activated on both sensor supplies.
You must set the parameters "Time for short-circuit test" and "Startup time of sensor after short-circuit test" to 4.2 ms.
Both channels must be activated.
You must set the parameter "Input delay" to the fixed value 1.6 ms for each channel of the channel pair.
Disable chatter monitoring for both channels.
The parameter "Channel failure acknowledge" must have the same value for both channels of the channel pair.

Dependencies for the "Counter" operating mode (as of firmware version V3.0.0)
Ensure that the value of the "High counting limit" parameter is higher than the value of the "Start value" parameter.
Ensure that the value of the "Start value" parameter is higher than the value of the "Low counting limit" parameter.
Configure the "Input delay" parameter for "Gate hardware control - Channel 1, 5" so that it is equal to the "Input delay" parameter of "Counter - Channel 0, 4".
Configure the "Input delay" parameter for "Direction hardware control - Channel 3, 7" so that it is equal to the "Input delay" parameter of "Counter - Channel 0, 4".

Dependencies for the "Standstill and overspeed monitoring" operating mode (as of firmware version V3.0.0)
Ensure that the value of the "Overspeed threshold" parameter is at least 2 greater than the value of the "Standstill threshold" parameter.
Configure the "Input delay" parameter for "Gate hardware control - Channel 1, 5" so that it is equal to the "Input delay" parameter of "Standstill and overspeed monitoring - Channel 0, 4".

NOTE

Note that the following parameters are connected to each other and influence each other:

- Overspeed threshold
- Standstill threshold
- Input delay
- Monitoring window duration [100 ms]

If one of these parameters is changed, you have to ensure by means of the following formula that the Overspeed threshold and Standstill threshold can be reached:

$$\text{Maximum reachable value} = \text{maximum frequency} * \frac{\text{Monitoring window duration [100 ms]}}{10}$$

The "Maximum reachable value" is the highest possible value that can be reached in a monitoring window.
The value of the "Overspeed threshold" parameter must be less than or equal to "Maximum reachable value" to ensure that the limit is reachable.
The value of the "Standstill threshold" parameter must be less than or equal to "Maximum reachable value" - 2.

The "Maximum frequency" tag is determined by the "Input delay" parameter:

- If the "Input delay" is 0.4 ms, the maximum frequency is 480 Hz.
- If the "Input delay" is 0.8 ms, the maximum frequency is 350 Hz.
- If the "Input delay" is 3.2 ms, the maximum frequency is 120 Hz.

The value of the "Monitoring window duration" parameter is set as a multiple of 100 ms.

Dependencies F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0) as of firmware version V2.0.0

The same dependencies apply to this F-module as for the two F-modules with article numbers 6ES7136-6DB00-0CA0 and 6ES7136-6BA00-0CA0 described above.
In TIA Portal, the "IO Tags" tab displays more tags than supported by the F module.

Dependencies F-DQ 8x24VDC/0.5A PP HF (6ES7136-6DC00-0CA0)

If you have enabled "Disable Dark Test for 48 hours", you must configure the "Max. readback time light test / dark test" parameter the same for all channels.
Reintegration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F module supports configuration per GSD file PROFIsafe V2.4.
When configuring with GSD file, only module-wide passivation is possible.

Dependencies F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)

The F module has no F_iPar_CRC and no PROFIsafe address. You do not need to assign a PROFIsafe address to the F module. If you nevertheless assign a PROFIsafe address to the F module with S7-FCT, an error message is displayed.

Dependencies of F-AI 4xI 0(4)..20mA 2-/4-wire HF (6ES7136-6AA00-0CA1) as of firmware version V1.0.2

NOTE

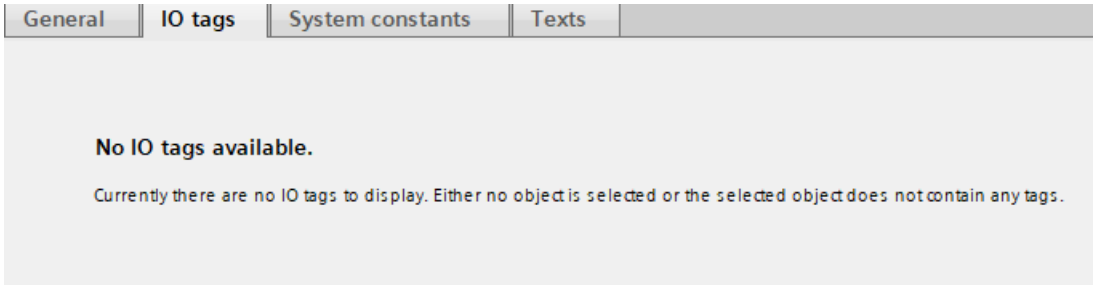
If the F-module is not visible in the module selection after the installation of the GSDML, check whether your configuration software supports the GSDML specification V2.35 or higher.

Reintegration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU.
In the module parameters, you can set the reintegration method a channel at a time. Manual or automatic reintegration is possible. When configuring with GSD file, only module-wide passivation is possible.
With configuration by GSD file, the F-module supports PROFIsafe V2.6MU1. An F-CPU is required which also supports a PROFIsafe V2.6MU1 or higher.

With "Evaluation of the sensors" with the setting "1oo1 evaluation (max. SIL3/Cat.3/PLd)"
The following parameters do not have any influence on the measured values and can be ignored.

- Standard value
- Discrepancy time
- Tolerance window % absolute
- Tolerance window % relative

With "Evaluation of the sensors" with the setting "1oo2 evaluation (max. SIL3/Cat.4/PLe)"
When switching from 1oo1 evaluation to 1oo2 evaluation, you have to activate the two corresponding channels.
The following parameters must have the same settings for the primary and secondary channel:



- Channel failure acknowledge
- Measuring range
- Diagnosis: Wire break
- Smoothing

NOTE

For the measuring range 0...20 mA, you have to activate the parameter "Diagnosis: Wire break".

NOTE

Ignore the following error message. This is a representation problem in the GSDML configuration. When you access the process data in your application, the IO variables are available.

Dependencies of F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)

NOTE

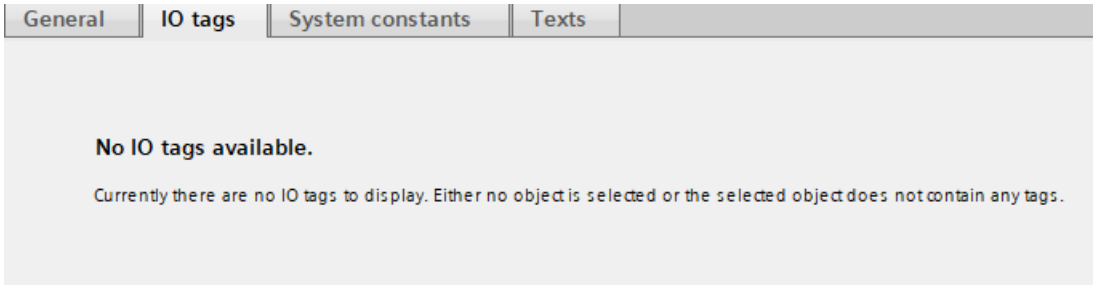
If the F-module is not visible in the module selection after the installation of the GSDML, check whether your configuration software supports the GSDML specification V2.35 or higher.

Reintegration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU.
In the module parameters, you can set the reintegration method a channel at a time. Manual or automatic reintegration is possible. When configuring with GSD file, only module-wide passivation is possible.
With configuration by GSD file, the F-module supports PROFIsafe V2.6MU1. An F-CPU is required which also supports a PROFIsafe V2.6MU1 or higher.

With "Evaluation of the sensors" with the setting "1oo1 evaluation (max. SIL2/Cat.3/PLd)"
The following parameters do not have any influence on the measured values and can be ignored:

- Standard value
- Discrepancy time
- Tolerance window % absolute
- Tolerance window % relative

With "Evaluation of the sensors" with the setting "1oo2 evaluation (max. SIL3/Cat.4/PLe)"
When switching from 1oo1 evaluation to 1oo2 evaluation, you have to activate the two corresponding channels.
The following parameters must have the same settings for the primary and secondary channel:



- Channel failure acknowledge
- Diagnosis: Wire break
- Smoothing

NOTE

If the above-mentioned condition is not met, a parameter assignment error occurs or the parameter assignment is refused.

NOTE

Ignore the following error message. This is a representation problem in the GSDML configuration. When you access the process data in your application, the IO variables are available.

General

Introduction

Note the following dependencies when configuring ET 200MP fail-safe modules with a GSD file for PROFINET IO.

NOTE

When using ET 200MP fail-safe modules with the GSD file on F-CPUs, note that the warnings, notes and references to other manuals in the equipment manuals of the F-modules are still valid.

Also observe the specifications of the F-CPU.

An F-CPU is an F-capable IO controller that supports PROFIsafe.

Requirement

The described modules have the process data lengths listed in the table. Column 2 shows the net data length. Column 3 lists the process data lengths including a PROFIsafe driver of 5 bytes. Make sure that your F-CPU supports the process data lengths.

Module designation	Process data (input/output) in bytes	Process data incl. PROFIsafe driver data (input/output) in bytes
F-DI 16x24VDC	4/0	9/5
F-DQ 8x24VDC/2A PPM	1/1	6/6
F-AI 8xI 0(4)..20mA	18/1	23/6

© Siemens 2022 - 2024. All rights reserved

ET 200MP fail-safe modules can be used with the GSD file on the following interface modules:

- IM 155-5 PN ST as of V3.0
- IM 155-5 PN HF as of V3.0
- IM 155-5 PN BA as of V4.3
- IM 155-5 MF HF as of V5.0

An S7-FCT is required to calculate the F_iParCRC and address the F-I/Os (see table "Configuration software and requirements" under).

NOTE

If identification during assignment of the PROFIsafe address is unsuccessful, e.g. the F-module flashes continuously, the following corrective measures are possible:

- Pull/plug the F module.
- Repeat the assignment of the PROFIsafe address after approx. two minutes.
- Increase the PROFINET update time of F-CPU and IM for the duration of the F-address assignment.

S7-FCT allows you to use selected F-I/Os from SIEMENS in an engineering system of a third-party manufacturer.
You can find S7-FCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).
Observe the minimum requirements for installation of the F-system to be used.

Table 1 Configuration software and requirements

Configuration software	Requirements	Information on installation
STEP 7 as of (TIA Portal) V15	S7-FCT as of V3.0 Update 1 When using S7-FCT submodules as of V4.0	STEP 7 online help
STEP 7 as of V5.5 SP4 HF19		
STEP 7 as of V5.6 HF5		
STEP 7 as of V5.6 SP1 HF5		
Software of another manufacturer		Documentation of the manufacturer

We recommend that you use the latest HF.

NOTE

Observe the module-specific restrictions.

Dependencies for F-DI 16x24VDC (6ES7526-1BH00-0AB0)

The fail-safe module F-DI 16x24VDC supports the configuration with PROFIsafe profile 2.4 and profile 2.6.1 respectively.
F-DI 16x24VDC V1.0, BP (Basic protocol, PROFIsafe protocol version V2.4)

- Module-wide passivation

F-DI 16x24VDC V1.0, XP (Extended protocol, PROFIsafe protocol version V2.6.1)

- Channel-specific passivation (RIOforFA-Safety)

Dependencies for F-DI 16x24VDC, BP

General dependencies

The following applies to the "Input delay" parameter, depending on the sensor supply and activation of the short-circuit test:
"Input delay" < MIN("Startup time of sensor after short-circuit test", "Time for short-circuit test").
The "Startup time of sensor after short-circuit test" must be configured to be at least 1% of "Time for short-circuit test".
If a sensor supply has been selected for a channel, this sensor supply must also be enabled. In addition, you must disable unused sensor supplies and the associated short-circuit tests.
Re-integration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F-module supports PROFIsafe V2.4 when configuring with a GSD file.

When configuring with a GSD file, only module-wide passivation is possible.

Dependencies for 1oo2 evaluation
Both channels must be activated.
The "Input delay" configuration must be identical for each pair. You determine the "Input delay" parameter for the channel pair as follows:
"Input delay" < MIN("Input delay" for channel n, "Input delay" for channel n+8).
The configured discrepancy time must be greater than the input delay.
Disable chatter monitoring for both channels.
The "Channel failure acknowledge" parameter must have the same value for both channels of the channel pair.
Differing configuration of the 1oo2 channel pairs results in a parameter error.
Channel groups 0..3, 4..7, 8..11 and 12..15 must be connected to the same sensor supply.

Dependencies for F-DI 16x24VDC, XP

General dependencies
The following applies to the "Input delay" parameter, depending on the sensor supply and activation of the short-circuit test:
"Input delay" < MIN("Startup time of sensor after short-circuit test", "Time for short-circuit test").
The "Startup time of sensor after short-circuit test" must be configured to be at least 1% of "Time for short-circuit test".
If a sensor supply has been selected for a channel, this sensor supply must also be enabled. In addition, you must disable unused sensor supplies and the associated short-circuit tests.
Re-integration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F-module supports PROFIsafe V2.6.1 when configuring with a GSD file.

Dependencies for 1oo2 evaluation
Both channels must be activated.
The "Input delay" configuration must be identical for each pair. You determine the "Input delay" parameter for the channel pair as follows:
"Input delay" < MIN("Input delay" for channel n, "Input delay" for channel n+8).
The configured discrepancy time must be greater than the input delay.
Disable chatter monitoring for both channels.
The "Channel failure acknowledge" parameter must have the same value for both channels of the channel pair.
Differing configuration of the 1oo2 channel pairs results in a parameter error.
Channel groups 0..3, 4..7, 8..11 and 12..15 must be connected to the same sensor supply.

Dependencies for F-DQ 8x24VDC/2A PPM (6ES7526-2BF00-0AB0)

The fail-safe module F-DQ 8x24VDC/2A PPM supports the configuration with PROFIsafe profile 2.4 and profile 2.6.1 respectively.
F-DQ 8x24VDC/2A PPM, BP (Basic protocol, PROFIsafe protocol version V2.4)
- Module-wide passivation

F-DQ 8x24VDC/2A PPM, XP (Extended protocol, PROFIsafe protocol version V2.6.1)
- Channel-specific passivation (RIOforFA-Safety)

Dependencies for F-DQ 8x24VDC/2A PPM, BP

Re-integration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F-module supports PROFIsafe V2.4 when configuring with a GSD file.
When configuring with a GSD file, only module-wide passivation is possible.
In TIA Portal, the "IO tags" tab displays more tags than supported by the F-module.
You can operate the module in two variants:
PP switching
The following parameters are affected:

- Max. readback time switch on test 0.8 to 5 ms
- Max. readback time dark test 0.8 to 400 ms
- The light test is always active in this operation case.

PM switching
You can configure each channel 0..7 independent of the other channels.

Dependencies in PP switching mode
You must not deactivate channel 0.
You must activate the light text for all activated channels.
You must not select the "Disable dark test for 48 hours" parameter for all activated channels.
The values of the "Max. readback time dark test" and "Max. readback time switch on test" parameters must be identical to the values for channel 0 for all activated channels.

Dependencies for F-DQ 8x24VDC/2A PPM, XP

General dependencies
Re-integration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The F-module supports PROFIsafe V2.6.1 when configuring with a GSD file.
In TIA Portal, the "IO tags" tab displays more tags than supported by the F-module.
You can operate the module in two variants:
PP switching
The following parameters are affected:

- Max. readback time switch on test 0.8 to 5 ms
- Max. readback time dark test 0.8 to 400 ms
- The light test is always active in this operation case.

PM switching
You can configure each channel 0..7 independent of the other channels.

Dependencies in PP switching mode
You must not deactivate channel 0.
You must activate the light text for all activated channels.
You must not select the "Disable dark test for 48 hours" parameter for all activated channels.
The values of the "Max. readback time dark test" and "Max. readback time switch on test" parameters must be identical to the values for channel 0 for all activated channels.

Dependencies F-AI 8xI 0(4)..20mA (6ES7536-1MF00-0AB0)

The fail-safe module F-AI 8xI 0(4)..20mA supports the configuration with PROFIsafe profile 2.6.1.
F-AI 8xI 0(4)..20mA V1.0, XP (Extended protocol, PROFIsafe protocol version V2.6.1)

- Channel-specific passivation (RIOforFA-Safety)

F-AI 8xI 0(4)..20mA V2.0, XP (Extended protocol, PROFIsafe protocol version V2.6.1)

- Channel-specific passivation (RIOforFA-Safety)

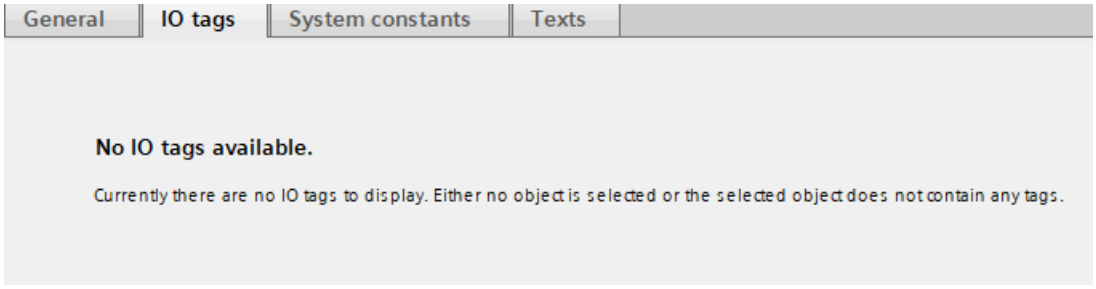
F-AI 8xI 0(4)..20mA V2.0, XP, Submodules (Extended protocol, PROFIsafe protocol version V2.6.1)

- Channel-specific passivation (RIOforFA-Safety)

Dependencies F-AI 8xI 0(4)..20mA V1.0, XP

Re-integration after a channel fault depends on the F-CPU used. You can find information on this in the documentation of the F-CPU. The fail-safe module supports PROFIsafe V2.6.1 when configuring with a GSD file.

With "Sensor evaluation" with the setting "1oo1 evaluation (max. SIL3/Cat.3/PLd)"
The following parameters do not have any influence on the measured values and can be ignored.



- Unit value
- Discrepancy time
- Tolerance window abs.
- Tolerance window rel.

Dependencies with "1oo2 evaluation (max. SIL3/Cat.4/PLe)"
When switching from 1oo1 evaluation to 1oo2 evaluation, you have to activate the two corresponding channels.
The following parameters must have the same settings for the primary and secondary channel:

- Channel failure acknowledge
- Measuring range
- Diagnosis: Wire break
- Smoothing

NOTE
For the measuring range 0 ... 20 mA, you have to activate the parameter "Diagnosis: Wire break".

NOTE
Ignore the following error message: This is a representation problem in the GSDML configuration. When you access the process data in your application, the IO variables are available.

Dependencies F-AI 8xI 0(4)..20mA V2.0, XP

The dependencies for "F-AI 8xI 0(4)..20mA V1.0, XP" apply as well as the dependencies described below.

Dependencies at the activation of HART communication
To activate the HART communication of a channel, follow these steps:

1. Set the "Measuring range" parameter to "4..20mA".
2. Set the "HART gate" parameter to "On" or "Switchable".
3. Activate the "HART function" parameter.

Dependencies F-AI 8xI 0(4)..20mA V2.0, XP, Submodules

The dependencies for "F-AI 8xI 0(4)..20mA V2.0, XP" apply as well as the dependencies described below.

Dependencies when using additional submodules

You can use MSI and HART variables at the same time in up to 3 additional submodules. For example, MSI ("F-AI 8xI 0(4)..20mA V2.0, XP, MSI") in the 1st additional submodule and HART variables in the 2nd and 3rd additional submodule. However, you can only use one type of HART variable submodule:

- "F-AI 8xI 0(4)..20mA V2.0, XP, 1 multiHART" or
- "F-AI 8xI 0(4)..20mA V2.0, XP, 4 HART" or
- "F-AI 8xI 0(4)..20mA V2.0, XP, 8 HART"

If you use the submodule "F-AI 8xI 0(4)..20mA V2.0, XP, 8 HART", all 8 variables that are set under "HART Mapping" are stored in the input address space of the submodule.
If you use the submodule "F-AI 8xI 0(4)..20mA V2.0, XP, 4 HART", the first 4 variables that are set under "HART Mapping" are stored in the input address space of the submodule.
If you use the submodule "F-AI 8xI 0(4)..20mA V2.0, XP, 1 multiHART", the variables set under "HART Mapping" are irrelevant.

SIEMENS

SIMATIC
Distributed I/O
Configuring ET 200AL F-DI 4+F-DQ 2x24VDC/2A, 4xM12 (6ES7146-5FF00-0BA0) with a GSDML File

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Introduction

Note the following dependencies for PROFINET IO during configuration of ET 200AL fail-safe modules with a GSDML file.

NOTE

When using ET 200AL fail-safe modules with a GSDML file on non-Siemens PROFIsafe masters, note that the warnings, information, and references contained in the F-module device manuals are still valid.
Please also observe the warnings, information, and references of the non-Siemens master.

Requirement

S7-FCT is required to calculate the F_iPar_CRC and perform PROFIsafe addressing for the F-I/O according to PROFIsafe address type 2.
You can find instructions and additional information for the SIMATIC S7-FCT V3.0 - Fail-safe Configuration Tool on the Internet (https://support.industry.siemens.com/cs/us/en/view/109763833).
You can find S7-FCT on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

NOTE

If identification of the F-module does not succeed during the assignment of the PROFIsafe address (for example, the F-module's channel LEDs flash continuously), you can take the following corrective measures:

- Repeat the assignment of the PROFIsafe address after approximately 5 minutes.
- Power cycle the F-module and then repeat the assignment of the PROFIsafe address.
- Increase the PROFINET update time of F-host and IM for the duration of the PROFIsafe address assignment.

© Siemens 2022. All rights reserved

S7-FCT, in conjunction with a GSDML file, allows you to configure selected F-I/Os from Siemens in versions of STEP 7 that do not natively support the F-I/O and in an engineering system from another manufacturer.

Configuration software	Support as of	Information on installation	Requirements
STEP 7 (TIA Portal) V17	or later	STEP 7 online help	S7-FCT V3.0 or later

STEP 7 (TIA Portal) V15.1	Upd5 or later		
STEP 7 (Classic) V5.7	or later	STEP 7 help	
STEP 7 (Classic) V5.6 SP2	HF2 or later		
STEP 7 (Classic) V5.5 SP4	HF19 or later		
Software of other manufacturer		Documentation of the manufacturer	

Configuring the ET 200AL F-DI 4+F-DQ 2x24VDC/2A, 4xM12 (6ES7 146-5FF00-0BA0) as of firmware version V1.0.0 or later

In TIA Portal, the "IO Tags" tab displays more tags than are supported by the F-module.

Configuring F-I/O module parameters using GSDML

You specify the properties of the F-I/O module in STEP 7 using various parameters. Depending on the settings, not all parameters are available.

You set the parameters of the module as follows:

1. Insert the IM 157-1 PN interface module. When using STEP 7, the interface module is found in the hardware catalog under "Other field devices->PROFINET IO->I/O->SIEMENS AG->ET 200AL".
2. Insert the F-I/O module. When using STEP 7, the F-I/O module is found in the hardware catalog under "Module->DIQ->F-DI 4+F-DQ 2x24VDC/2A, 4xM12". Select PROFIsafe V2.4 or PROFIsafe V2.6 based upon the specifications of your fail-safe controller. If you are using Siemens fail-safe controllers, select PROFIsafe V2.4 if you are using an S7-300 or S7-400 F-CPU or select PROFIsafe V2.6 if you are using an S7-1200 or S7-1500 F-CPU.
3. Access the F-I/O module's parameters in your programming package. To display the module's parameters in STEP 7, on the Device view or Device overview select the F-I/O module and select the module's "Properties" tab.
4. In the "Properties" view, on the "General" tab, select "PROFIsafe" and the drop-down arrows for "Module parameters>I/O parameters" to see a subset of the properties of the "PROFIsafe" and "I/O parameters".
5. Set values for "PROFIsafe" or "I/O parameters" in the right side property fields.
6. Right click the F-I/O module name in the Device view and click "Start device tool ..." to launch S7-FCT.
   - Select "F_iPar_CRC calculation" and click Start.
   - If asked, choose and confirm the desired communication interface.
   - Examine the parameters, and if correct, press "Confirm i-parameters" to calculate the F_iPar_CRC.
   - If parameters are not correct, close out of S7-FCT and return to the module Properties dialog to correct the parameter settings.
   - Click the copy button next to the hexadecimal representation of the F_iPar_CRC (left value) to place this value on the clipboard.
   - Close out of S7-FCT.
7. In the "Properties" view on the "General" tab for the module, select "PROFIsafe" in the tree and paste the clipboard value into the F_iPar_CRC field.
8. A successful compile and download of your hardware configuration to an F-CPU automatically configures your F-I/O module.

Assigning PROFIsafe addresses for F-I/Os

These are the three basic steps for assigning PROFIsafe addresses:

1. Configure the F-destination address of each F-module and the F-source address of the F-CPU in the hardware configuration in STEP 7 Safety and download the hardware configuration.
2. Identify the F-I/O module to which you want to assign the configured F-destination and F-source addresses. F-destination addresses are generally assigned with lower numbers (for example, less than 100) for GSDML configured devices.
3. Use "Assigning the PROFIsafe addresses to the F-I/Os" section in the instructions for the SIMATIC S7-FCT V3.0 - Fail-safe Configuration Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109763833) to assign the PROFIsafe address (F-destination address together with F-source address) to each F-module before you put it into operation. To launch the PROFIsafe-Address Assignment dialog:
   - Right click the F-I/O module name in the Device view and click "Start device tool ..." to launch S7-FCT.
   - Select "PROFIsafe address assignment" and click Start.
   - If asked, choose and confirm the desired communication interface.

NOTE

Refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126) for further information about PROFIsafe address identification and assignment.

Dependencies ET 200AL F-DI 4+F-DQ 2x24VDC/2A, 4xM12 (6ES7146-5FF00-0BA0) as of firmware version V1.0.0 or later

Dependencies for 1oo2 evaluation

In a 1oo2 channel configuration, you must set the following 1oo2 DI channel parameters to the same value:

- Activated check box
- Input filter
- Channel failure knowledge (PROFISAFE V2.6 only)
- Sensor supply

Configuring the ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12 (6ES7146-6FF00-0AB0) as of firmware version V1.0.0 or later

In TIA Portal, the "IO Tags" tab displays more tags than are supported by the F-module.

Configuring F-I/O module parameters using GSDML
You specify the properties of the F-I/O module in STEP 7 using various parameters. Depending on the settings, not all parameters are available.
You set the parameters of the module as follows:

1. Insert the IM 157-1 PN interface module. When using STEP 7, the interface module is found in the hardware catalog under "Other field devices->PROFINET IO->I/O->SIEMENS AG->ET 200AL".
2. Insert the F-I/O module. When using STEP 7, the F-I/O module is found in the hardware catalog under "Module->DIQ->F-DI 4+F-DQ 2x24VDC/2A, 4xM12". Select PROFIsafe V2.4 or PROFIsafe V2.6 based upon the specifications of your fail-safe controller. If you are using Siemens fail-safe controllers, select PROFIsafe V2.4 if you are using an S7-300 or S7-400 F-CPU or select PROFIsafe V2.6 if you are using an S7-1200 or S7-1500 F-CPU.
3. Access the F-I/O module's parameters in your programming package. To display the module's parameters in STEP 7, on the Device view or Device overview select the F-I/O module and select the module's "Properties" tab.
4. In the "Properties" view, on the "General" tab, select "PROFIsafe" and the drop-down arrows for "Module parameters>I/O parameters" to see a subset of the properties of the "PROFIsafe" and "I/O parameters".
5. Set values for "PROFIsafe" or "I/O parameters" in the right side property fields.
6. Right click the F-I/O module name in the Device view and click "Start device tool ..." to launch S7-FCT.
   - Select "F_iPar_CRC calculation" and click Start.
   - If asked, choose and confirm the desired communication interface.
   - Examine the parameters, and if correct, press "Confirm i-parameters" to calculate the F_iPar_CRC.
   - If parameters are not correct, close out of S7-FCT and return to the module Properties dialog to correct the parameter settings.
   - Click the copy button next to the hexadecimal representation of the F_iPar_CRC (left value) to place this value on the clipboard.
   - Close out of S7-FCT.
7. In the "Properties" view on the "General" tab for the module, select "PROFIsafe" in the tree and paste the clipboard value into the F_iPar_CRC field.
8. A successful compile and download of your hardware configuration to an F-CPU automatically configures your F-I/O module.

Assigning PROFIsafe addresses for F-I/Os

These are the three basic steps for assigning PROFIsafe addresses:

1. Configure the F-destination address of each F-module and the F-source address of the F-CPU in the hardware configuration in STEP 7 Safety and download the hardware configuration.
2. Identify the F-I/O module to which you want to assign the configured F-destination and F-source addresses. F-destination addresses are generally assigned with lower numbers (for example, less than 100) for GSDML configured devices.
3. Use "Assigning the PROFIsafe addresses to the F-I/Os" section in the instructions for the SIMATIC S7-FCT V3.0 - Fail-safe Configuration Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109763833) to assign the PROFIsafe address (F-destination address together with F-source address) to each F-module before you put it into operation. To launch the PROFIsafe-Address Assignment dialog:
   - Right click the F-I/O module name in the Device view and click "Start device tool ..." to launch S7-FCT.
   - Select "PROFIsafe address assignment" and click Start.
   - If asked, choose and confirm the desired communication interface.

NOTE

Refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126) for further information about PROFIsafe address identification and assignment.

Dependencies ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12 (6ES7146-6FF00-0AB0) as of firmware version V1.0.0 or later

Re-integration after a channel fault depends on the host used. You can find information on this in the documentation of the host.
In TIA Portal, the "IO Tags" tab displays more tags than supported by the F-module.

Dependencies for 1oo2 evaluation

In a 1oo2 channel configuration, you must set the following 1oo2 DI channel parameters to the same value:

- Activated check box
- Input filter
- Sensor supply

Introduction

Observe the following notes and explanations for PROFINET IO during parameterization of fail-safe modules with GSD file in the PROFIsafe profile 2.4 (BP mode).

NOTE

When using fail-safe modules with the GSD file on an F-host, note that the warnings, information and references to other manuals contained in the F-module equipment manuals are still valid.
Please also observe the F-host specifications.

Implementation of the Device_Fault bit in BP (Basic Protocol) mode of the fail-safe modules

PROFIsafe 2.4 with automatic reintegration:
In this mode, the F-host is responsible for module-wide passivation in the event of a channel fault. This means that if an individual channel reports a fault, the F-host performs passivation of all channels within an F-module. Notification of the F-CPU about faults and the consequent reaction of the F-CPU takes place via PROFIsafe status and control bits.
Reintegration of an F-module with faults in this mode takes place automatically after all channel faults have been completely eliminated.
After all pending faults have been corrected, the F-module returns to the normal state and process values are updated cyclically again.

PROFIsafe 2.4 with operator acknowledgment for reintegration:
This is the same mode as before, but the reintegration can only be completed after a pending operator acknowledgment signal is released by the F-host (i.e. operator acknowledgment is handled by the F-host).
From the operator's perspective, waiting for the operator acknowledgment signal is indicated by specific LED flashing (red-green). This means that, after pending faults of an affected channel have been eliminated, the value status is set to "good" and the LED flashing will show optically that the channel is ready to finish reintegration.
After all channel faults have been eliminated, the F-module checks whether operator acknowledgment from the F-host is pending by evaluating the PROFIsafe control bit **OA_Req**. As long as this control bit is set to "true", the channel shows "Waiting for reintegration" through flashing LEDs. In this state, note that the value status bits for the channels have already been set to "good" and the F-module is ready to function normally. For this reason, the received operator acknowledgment only affects the LED flashing.

Summary of failure and reintegration from the perspective of the F-module

1. Fault occurs and is detected.
2. Device_Fault is sent to the F-host.

NOTE

This can be viewed as an implicit request for an operator acknowledgment.

3. Channel fault is corrected, Device_Fault=0 is sent to the F-host and the F-module is reintegrated
4. Operator acknowledgment via the PROFIsafe control bit OA_Req is received by the F-host and the alternating flashing of the LEDs is switched off.

Restart
After all channel faults have been corrected (all I/O self-tests are completed successfully), the process values are automatically output or supplied again.

⚠ WARNING

Manual reintegration must be realized on the F-host side
You can find a description of suitable measures in the technical specification PROFISafe Version 2.6, Annex C, subsection *"C.1.4.2 Prevent unintentional restart by application measures"*.
